Table 27.49 RHSIFnCMD ( $0,1,2,3$ ) Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TNME(N) | This bit specifies whether to enable the target node function. |
|  |  | 0 : Disables reception of Read, Write, Event, ID, and Stream Commands (ignores these Commands without any response). |
|  |  | 1: Enables reception of Read, Write, Event, ID, and Stream Commands. |
|  |  | Even when this bit is 1 , whether Read, Write, and Stream Commands can be received depends on other individual settings. |
|  |  | For details, see Sections 27.4.3.3, Non-Stream Command Reception by Target Node and Section 27.4.3.5, Stream Command Reception by Target Node. |
| 15 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | INME(N) | This bit specifies whether to enable the initiator node function. |
|  |  | 0: Disables transmission of Read, Write, Event, ID, and Stream Commands. |
|  |  | 1: Enables transmission of Read, Write, Event, ID, and Stream Commands. |
|  |  | This bit must not be cleared to 0 while L2 is transmitting data or waiting for a response by using the initiator node function. |

(32) RHSIFnCCT (0, 1, 2, 3) — Channel (0, 1, 2, 3) Control Register

Value after reset: $\quad 00000000_{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 27.50 RHSIFnCCT (0, 1, 2, 3) Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | CTYW(N) | " 1 " must be written to this bit at the same time as writing data to the CTY $(N)$ bits when L2, operating as an initiator node, transmits a request Command other than a Stream Command. When this bit is 0 , the data written to the $\operatorname{CTY}(N)$ bits is ignored. |
| 6, 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | CTY(N) | A Command type must be set in these bits when L2, operating as an initiator node, transmits a request Command other than a Stream Command. When L2 transmits a Command, 1 must be written to the CTYW(N) bit at the same time as writing data to these bits. |
|  |  | 00000: Read Command (8 bits) |
|  |  | 00001: Read Command (16 bits) |
|  |  | 00010: Read Command (32 bits) |
|  |  | 00100: Write Command (8 bits) |
|  |  | 00101: Write Command (16 bits) |
|  |  | 00110: Write Command (32 bits) |
|  |  | 01100: Event Command |
|  |  | 10010: ID Command |
|  |  | Only the above Command types can be set. |

Table 27.51 RHSIFnCST (0, 1, 2, 3) Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CRE(N) | This bit is set to 1 when a Command causing a CRC error is detected in the channel corresponding to the bit number. <br> For details, see Section 27.4.3.6, CRC Error Handling. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | BRE(N) | This bit is set to 1 when an error has occurred during data transfer in the H-Bus by a Read or Write Command received by L2 operating as a target node. |
| 19 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TER(N) | This bit is set to 1 when L2, operating as a target mode, receives an Event Command. Note that L2 ignores an event if another Event Command is received when this bit is already set to 1. |
| 15 | RDY(N) | This bit indicates whether L2, operating as an initiator node, can transmit request Commands other than Stream Commands. <br> 0 : Request Commands cannot be transmitted (the initiator node function is disabled or L2 is waiting for a reply Command). <br> 1: Request Commands can be transmitted. <br> Transmission of request Commands (writing 1 to the RHSIFnCCT(N).CTYW(N) bit) must be done only when this bit is 1 . |
| 14 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 27.51 RHSIFnCST ( $0,1,2,3$ ) Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | AOE(N) | This bit is set to 1 when an error that cannot be classified as the one indicated by the AKE or IDE bit is detected after L2, operating as an initiator node, has transmitted a Read, Write, Event, or ID Command. <br> In particular, the following event corresponds to this error: <br> - A Read Command transmitted by RHSIF has met the "Any Other" condition in Table 18 of the HSSL / SIPI Interprocessor Bus Protocol Specification. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | IDE(N) | This bit is set to 1 when a reply Command (ACK, NACK, or Read Answer) causing a transaction ID error is detected after L2, operating as an initiator node, has transmitted a Read, Write, Event or ID Command. |
| 4 | TOE(N) | This bit is set to 1 when L2 cannot receive a response within the time set in RHSIFnMRT after L2, operating as an initiator node, has transmitted a Read, Write, Event, or ID Command. |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | AKE(N) | This bit is set to 1 when L2 receives an NACK Command after L2, operating as an initiator node, has transmitted a Read, Write, Event, or ID Command. |
| 1 | AKR(N) | This bit is set to 1 when L2 receives an ACK Command after L2, operating as an initiator node, has transmitted a Write or Event Command. |
| 0 | RAR(N) | This bit is set to 1 when L2 receives a Read Answer Command after L2, operating as an initiator node, has transmitted a Read or ID Command. |

(34) RHSIFnCSC (0, 1, 2, 3) — Channel ( $0,1,2,3$ ) Status Clear Register

Table 27.52 RHSIFnCSC ( $0,1,2,3$ ) Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CREC(N) | Writing 1 to this bit clears the RHSIFnCST(N).CRE(N) bit. Writing 0 to this bit is ignored. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | BREC(N) | Writing 1 to this bit clears the RHSIFnCST(N).BRE(N) bit. Writing 0 to this bit is ignored. |
| 19 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TERC(N) | Writing 1 to this bit clears the RHSIFnCST(N).TER(N) bit. Writing 0 to this bit is ignored. |
| 15 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | AOEC(N) | Writing 1 to this bit clears the RHSIFnCST(N).AOE(N) bit. Writing 0 to this bit is ignored. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | IDEC(N) | Writing 1 to this bit clears the RHSIFnCST(N).IDE(N) bit. |
| 4 | TOEC(N) | Writing 1 to this bit clears the RHSIFnCST(N).TOE(N) bit. Writing 0 to this bit is ignored. |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | AKEC(N) | Writing 1 to this bit clears the RHSIFnCST(N).AKE(N) bit. Writing 0 to this bit is ignored. |
| 1 | AKRC(N) | Writing 1 to this bit clears the RHSIFnCST(N).AKR(N) bit. Writing 0 to this bit is ignored. |
| 0 | RARC(N) | Writing 1 to this bit clears the RHSIFnCST(N).RAR(N) bit. Writing 0 to this bit is ignored. |

(35) RHSIFnCIE (0, 1, 2, 3) — Channel (0, 1, 2, 3) Interrupt Enable Register

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |

Table 27.53 RHSIFnCIE (0, 1, 2, 3) Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CREE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).CRE(N) bit. <br> 0: Does not assert int_hsif_err when the RHSIFnCST(N).CRE(N) bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).CRE(N) bit is 1 . |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | BREE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).BRE(N) bit. <br> 0: Does not assert int_hsif_err when the RHSIFnCST(N).BRE(N) bit is 1 . <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).BRE(N) bit is 1. |
| 19 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TERE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).TER(N) bit. <br> 0 : Does not assert int_hsif_ch(N) when the RHSIFnCST(N).TER(N) bit is 1. <br> 1: Asserts int_hsif_ch(N) when the RHSIFnCST(N).TER(N) bit is 1. |
| 15 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | AOEE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).AOE(N) bit. <br> 0: Does not assert int_hsif_err when the RHSIFnCST(N).AOE(N) bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).AOE(N) bit is 1. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | IDEE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).IDE(N) bit. <br> 0 : Does not assert int_hsif_err when the RHSIFnCST(N).IDE(N) bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).IDE(N) bit is 1. |
| 4 | TOEE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).TOE(N) bit. <br> 0: Does not assert int_hsif_err when the RHSIFnCST(N).TOE(N) bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).TOE(N) bit is 1 . |
| 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 27.53 RHSIFnCIE ( $0,1,2,3$ ) Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 2 | AKEE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).AKE(N) bit. <br> 0: Does not assert int_hsif_err when the RHSIFnCST(N).AKE(N) bit is 1. <br> 1: Asserts int_hsif_err when the RHSIFnCST(N).AKE(N) bit is 1. |
| 1 | AKRE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).AKR(N) bit. <br> 0: Does not assert int_hsif_ch(N) when the RHSIFnCST(N).AKR(N) bit is 1. <br> 1: Asserts int_hsif_ch(N) when the RHSIFnCST(N).AKR(N) bit is 1. |
| 0 | RARE(N) | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnCST(N).RAR(N) bit. <br> 0 : Does not assert int_hsif_ch(N) when the RHSIFnCST(N).RAR(N) bit is 1. <br> 1: Asserts int_hsif_ch(N) when the RHSIFnCST(N).RAR(N) bit is 1. |

(36) RHSIFnCAR (0, 1, 2, 3) — Channel ( $0,1,2,3$ ) Read/Write Address Register

Value after reset: $00000000_{\mathrm{H}}$

Table 27.54 RHSIFnCAR (0, 1, 2, 3) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | $\operatorname{CAR}(\mathrm{~N})$ | These bits specify the address of the area that is the target of a Read or Write Command |
|  | when L2, operating as an initiator node, transmits the Read or Write Command. |  |
|  | When the request size is 16 bits, the $\operatorname{CAR}(\mathrm{N})[0]$ bit must always be 0. |  |
|  | When the request size is 32 bits, the $\operatorname{CAR}(\mathrm{N})[1: 0]$ bits must always be 00. |  |

(37) RHSIFnCWD (0, 1, 2, 3) — Channel (0, 1, 2, 3) Write Data Register

Table 27.55 RHSIFnCWD ( $0,1,2,3$ ) Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | $\operatorname{CWD}(\mathrm{~N})$ | These bits are used to set the data to be transmitted when L2, operating as an initiator node, |
|  | transmits a Write Command. |  |
|  | When the request size is 8 bits, set the data in the $C D W(N)[7: 0]$ bits. |  |
|  | When the request size is 16 bits, set the data in the $C D W(N)[15: 0]$ bits. |  |
|  | When the request size is 32 bits, set the data in the $C D W(N)[31: 0]$ bits. |  |

(38) RHSIFnCRD (0, 1, 2, 3) — Channel (0, 1, 2, 3) Read Data Register

Value after reset: $00000000_{\mathrm{H}}$

Table 27.56 RHSIFnCRD ( $0,1,2,3$ ) Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 0 | CRD(N) | These bits contain the data that is received from a target node after L2, operating as an initiator node, has transmitted a Read or ID Command to the target node. |
|  |  | When the request size is 8 bits, reference the $\mathrm{CRD}(\mathrm{N})[7: 0]$ bits. |
|  |  | When the request size is 16 bits, reference the $\operatorname{CRD}(\mathrm{N})$ [15:0] bits. |
|  |  | When the request size is 32 bits, reference the CRD(N)[31:0] bits. |
|  |  | These bits are valid only when RHSIFnCST( N$) \cdot \operatorname{RAR}(\mathrm{N})=1$. |

### 27.4.3 Operation

### 27.4.3.1 Initial Settings

The procedure for the initial settings of L2 is as follows:
(1) Set the memory windows
(2) Set the channels
(3) Set the link partner authentication (only for the systems that use the target node function and require authentication)*1
(4) Set the transmission stream (only for the systems that transmit Stream Commands by using the initiator node function)
(5) Set the reception stream (only for the systems that receive Stream Commands by using the target node function)

Note 1. To complete link partner authentication, you need to at least specify the settings below before step (3).
At step (1): Open memory window for the IP's register space.
for first authentication: RHSIFnAID0-7
for second authentication: RHSIFnARD0-3
At step (2): Enable target node function on at least one channel.

The following sections describe how to specify settings with individual procedural steps.

## (1) Setting Memory Windows

Figure $\mathbf{2 7 . 6}$ shows the flow to set memory windows in L2.
When the target node function of L2 is enabled, link partners can access (read and write) information in the product with L2 installed. If, however, unspecified link partners are permitted to access L2 without restriction, security problems can occur. Therefore, L2 has a function to enable you to specify the space (called a "window") that is permitted to be accessed.

You can set up to four windows independently of channels. For each window, specify a start address and a size to prevent window areas from overlapping. You can also set read and write permissions separately for individual windows.

This window setting is valid for H-Bus requests that are issued by RHSIF as master. For details, refer to Section

### 27.4.3.3, Non-Stream Command Reception by Target Node, Section 27.4.3.4, Stream Command

 Transmission by Initiator Node and Section 27.4.3.5, Stream Command Reception by Target Node.If you set windows at a time other than during the initial settings after a reset, you must disable the initiator node function on all channels (clear the RHSIFnCMD(N).INME(N) bit to 0 ), and the target node function on all channels (clear the RHSIFnCMD $(\mathrm{N}) . \operatorname{TNME}(\mathrm{N})$ bit to 0 ) before setting windows.

In normal mode, RHSIFnMCT, RHSIFnMW(X)A, and RHSIFnMW(X)S cannot be written to RHSIF's master port. Reading data from these registers is possible from all master modules.

Note 1. Current Value $=$ " $A$ " $\rightarrow$ Change to " $B$ ", $\ldots$, Current Value $=$ " $C$ " $\rightarrow$ Change to " $D$ "

Figure 27.6 Setting Memory Windows

Figure 27.7 shows an example of setting memory windows.

Figure 27.7 Example of Setting Memory Windows

## (2) Setting Channels

Figure 27.8 shows the flow of setting channels for L2. Enable the functions to be used for individual channels.
When the RHSIFnCMD(N).INME(N) bit is set to 1 for a channel, L2 is enabled to transmit non-Stream Commands (Read, Write, Event, and ID Commands) through the channel. For details, see Section 27.4.3.2, Non-Stream

## Command Transmission by Initiator Node.

Also, specify a reply timeout time according to the system. The reply timer starts when L2 (Layer 2) finishes to transmit last symbol of a request Command. The reply timer stops when one of the following events occurs:

- L2 detects an expected reply Command.
- For Read Command, L2 detects reply Command with error (except CRC error).
- Reply timeout occurs

The reply timeout time that is specified applies to all channels.
When the RHSIFnCMD(N).TNME(N) bit is set to 1 for a channel, L2 is enabled to receive non-Stream Commands (Read, Write, Event, and ID Commands) through the channel. For details, see Section 27.4.3.3, Non-Stream

## Command Reception by Target Node.

Figure 27.8 Setting Channels

## (3) Setting Link Partner Authentication

When the target node function of L2 is enabled, link partners can access (read and write) information in the product with L2 installed. If, however, unspecified link partners are permitted to access L2, security problems can occur. Therefore, L 2 has a function to authenticate link partners.

Link partner authentication is performed by using the following two steps:

1. Authentication based on a 256 -bit key ID*1
2. Challenge-and-response authentication*2

You can enable or disable each type of authentication by using FLASH option byte. When link partner authentication is disabled, link partners can access the internal space of the product with L2 installed without performing the authentication procedure described in this section. Specify settings of the relevant FLASH option byte for RHSIF according to the security level required of the product with L2 installed.

Note 1. First Authentication (ID-based Authentication) needs setting.
Product shipping setting is invalid.
For the values of the FLASH option byte, refer to Section 42, Basic Hardware Protection (BHP). Refer to Table 42.18 for details.
Note 2. Second Authentication (Challenge and Response Authentication) needs setting. Product shipping setting is invalid.
For the values of the FLASH option byte, refer to the RH850/E2x ICUMD User's Manual.

## (a) First Authentication (ID-Based)

Figure 27.9 shows a concept of the first authentication (ID-based authentication), and the procedure for the authentication is described below.
(1) The link partner issues a Write Command (32 bits) for the address corresponding to the RHSIFnAID0 register in L2. Write data is the [31:0] bits of key ID (256 bits).
(2) Upon receiving the Write Command, the target controller of L2 checks the address in the Command.
A) When the address matches any of RHSIFnAID0 to RHSIFnAID7, the target controller determines the Write Command to be valid, and then issues a master write request to the H -Bus.
B) When the address does not match any of RHSIFnAID0 to RHSIFnAID7, the target controller ignores the Write Command without returning any reply Command.
(3) Upon receiving the H -Bus write request, the register unit of L 2 checks the master ID in the request.
A) When the master ID matches the ID of L2, L2 determines the request to be valid, and then writes data to RHSIFnAID0.
B) When the master ID does not match, L2 does not execute the Write Command to RHSIFnAID0, and then returns an OKAY response.
(4) In a manner similar to steps (1) to (3), data is set in the RHSIFnAID1 to RHSIFnAID7 registers.
(5) When data is set in RHSIFnAID7, L2 compares the data ( 32 bits $\times 8=256$ bits) in RHSIFnAID0 to RHSIFnAID7 with the data of FLASH option byte.
Refer to Section 42, Basic Hardware Protection (BHP) and Table 42.25 for details.
A) If the data matches each other, L2 determines that the link partner passes the authentication. When only the first authentication is required, L2 determines whether the Read or Write Command from the link partner is valid according to the window setting described in Section 27.4.3.1(1), Setting Memory Windows.

When the second authentication is also required, the procedure described in Section 27.4.3.1(2), Setting Channels is performed.
B) If the data does not match, L2 determines that the link partner fails the authentication. In such a case, the authentication procedure must be repeated beginning from step (1). If the link partner fails the authentication three consecutive times, L2 determines that the link partner is unauthorized, and will not let the link partner pass the authentication until a reset signal is asserted.

Figure 27.9 Concept of ID-Based Authentication

## (b) Second Authentication (Challenge and Response)

Figure 27.10 and Figure 27.11 show a concept of the second authentication (challenge-and-response authentication), and the procedure for the authentication is described below. Note that this manual describes only how to set the data to be used for challenge and response. For the procedure of challenge and response, see the manual for the product in which L2 is installed.

## Step 1 Preparation of the challenge data (Figure 27.10)

(1) Prepare the challenge data, and send it to the Link Partner. The way to generate the challenge data can be selected. In the example in this figure, challenge data is generated by ICUM and send it via RHSIF to the Link Partner.

## Step1

Figure 27.10 Concept of Challenge and Response Authentication (Preparation of the challenge data)

## Step 2 Calculate the response data and compare it (Figure 27.11)

(1) The security module (ICUM) connected to the H-Bus calculates Answer (Response) data from Challenge data, and then sets the [31:0] bits of the Response data in the RHSIFnAAD0 register in L2.
(2) Upon receiving the H -Bus write request, the register unit of L 2 checks the master ID in the request.
A) When the master ID matches the one in the ICUM, L2 determines the request to be valid, and then writes data to RHSIFnAAD0.
B) When the master ID does not match, L2 does not execute the Write Command to RHSIFnAAD0, and then returns an OKAY response.
(3) In a manner similar to steps (1) and (2), data is set in the RHSIFnAAD1 to RHSIFnAAD3 registers.
(4) The link partner issues a Write Command (32 bits) for the address corresponding to the RHSIFnARD0 register in L2. Write data is the [31:0] bits of Response data.
(5) Upon receiving the Write Command, the target controller of L2 checks the address in the Command.
A) When the address matches any of RHSIFnARD0 to RHSIFnARD3, the target controller determines the Write Command to be valid, and then issues a master write request to the H -Bus.
B) When the address does not match any of RHSIFnARD0 to RHSIFnARD3, the target controller ignores the Write Command without returning any reply Command.
(6) Upon receiving the H -Bus write request, the register unit of L 2 checks the master ID in the request.
A) When the master ID matches the ID of L2, L2 determines the request to be valid, and then writes data to RHSIFnARD0.
B) When the master ID does not match, L2 does not execute the Write Command to RHSIFnARD0, and then returns an OKAY response.
(7) In a manner similar to steps (4) to (6), data is set in the RHSIFnARD1 to RHSIFnARD3 registers.
(8) When data is set in RHSIFnARD3, L2 compares the data ( 32 bits $\mathrm{x} 4=128$ bits) in RHSIFnARD0 to RHSIFnARD3 with the data ( 32 bits $\mathrm{x} 4=128$ bits) preset in RHSIFnAAD0 to RHSIFnAAD3.
A) If the data matches each other, L2 determines that the link partner passes the authentication. After that, L2 determines whether the read or Write Command from the link partner is valid according to the window setting described in Section 27.4.3.1(1), Setting Memory Windows.
B) If the data does not match, L2 determines that the link partner fails the authentication. In such a case, the authentication procedure must be repeated beginning from step (1). If the link partner fails the authentication three consecutive times, L2 determines that the link partner is unauthorized, and will not let the link partner pass the authentication until a reset signal is asserted.

## Step2

Figure 27.11 Concept of Challenge and Response Authentication (Calculates and Compares Response Data)

## (4) Setting Tx Stream for Initiator Node

Figure 27.12 shows the flow of the initial settings of Stream Command transmission by L2.
RHSIF's protocol defines the data payload size of a Stream Command as 256 bits. You, however, can also set the data payload size to 128 bits for L2. Note that the data payload size can be changed only at the time of the initial settings. You cannot change this setting dynamically during system operation. Specify an appropriate value in the relevant parameter during the initial settings according to the system.

There are two modes for receiving NACK Command.

- RHSIFnSTMD.STNK $=0:$ L2 regards reception of the NACK Command as occurrence of an error.
- RHSIFnSTMD.STNK = 1: L2 regards reception of the NACK Command as reception of an ACK Command.

Select an appropriate mode according to the application program.
For details about the flow of Stream Command transmission, see Section 27.4.3.4, Stream Command Transmission by Initiator Node.

Figure 27.12 Initial Setting of Tx Stream

## (5) Setting Rx Stream for Target Node

Figure 27.13 shows the flow of the initial settings of Stream Command reception by L2.
RHSIF defines the data payload size of a Stream Command as 256 bits. You, however, can also set the data payload size to 128 bits for L2. Note that the data payload size can be changed only at the time of the initial settings. You cannot change this setting dynamically during system operation. Specify an appropriate value in the relevant parameter during the initial settings according to the system.

How to handle an error occurring in a command that is received or during data transfer depends on the application program. L2 allows you to select the operation that is necessary when an error occurs in the following two modes:

- RHSIFnSRMD.SRMC $=0$ : The RHSIFnSRCT.SRDE bit is cleared automatically when an error occurs.

Select this mode when you want to stop data storage immediately after the error occurs.
Note that, because L2 can receive two Stream Commands concurrently, if an H-Bus error occurs, L2 might store the data up to the data causing the error.

- RHSIFnSRMD.SRMC $=1$ : The RHSIFnSRCT.SRDE bit is not cleared automatically when an error occurs.

Select this mode when you want to let the firmware determine the processing that is necessary if an error occurs. To stop data storage after the processing is determined, clear the RHSIFnSRCT.SRDE bit by the firmware.

Select an appropriate mode according to the application program.
For details about the flow of Stream Command reception, see Section 27.4.3.5, Stream Command Reception by Target Node.

Figure 27.13 Initial Setting of Rx Stream

### 27.4.3.2 Non-Stream Command Transmission by Initiator Node

Figure 27.14 to Figure 27.17 show the flows for transmitting non-stream requests (Read, Write, Event, and ID Commands) by using the initiator node function of L2.

Transmission of non-stream requests is performed under control of the firmware. A request is transmitted by accessing a register, and an interrupt is used as the trigger for checking response.

The following describes the transmission operation, using Read Command transmission (Figure 27.14) for example.
When a Command transmission request is found, whether transmission is enabled must be checked first. Transmission is enabled when the RHSIFnCST(N).RDY(N) bit is 1 . Then, a target address must be set in the RHSIFnCAR(N) register, and a trigger for transmission must be issued by using the RHSIFnCCT(N) register. When the trigger is issued, L2 generates and transmits the Command.

After transmitting the Command, L2 waits for a reply Command from the link partner. L2 subsequently performs one of the following four operations depending on the response of the link partner and whether a frame error occurs:
(1) When the link partner returns a Read Answer Command (normal case)

L2 sets the RHSIFnCST(N).RAR(N) bit, and (when interrupt is enabled) generates an int_hsif_ch(N) interrupt. Checking of read data in the RHSIFnCRD(N) register and other necessary processing must be performed.
(2) When the link partner returns an NACK Command

L2 sets the RHSIFnCST(N).AKE(N) bit, and (when interrupt is enabled) generates an int_hsif_err interrupt. Retransmission of the Command and other necessary processing must be performed.
(3) When the reply Command from the link partner involves an error

L2 sets the RHSIFnCST(N).IDE(N) or RHSIFnCST(N).AOE(N) bit according to the type of the error, and (when interrupt is enabled) generates an int_hsif_err interrupt.
Retransmission of the Command and other necessary processing must be performed.
In case reply Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.
(4) When the link partner does not respond (reply timeout occurs)

If the reply Command from the link partner cannot be detected within the time set in the RHSIFnMRT register after Command transmission, L2 sets the RHSIFnCST(N).TOE(N) bit, and (when interrupt is enabled) generates an int_hsif_err interrupt.
Retransmission of the Command and other necessary processing must be performed.

Note 1. RHSIFnCST(N).RDY(N) $=1$
Note 2. In case Rx Command has CRC error, RHSIF performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.14 Tx Read Command Operation

Note 1. $\operatorname{RHSIFnCST}(\mathrm{N}) \cdot \operatorname{RDY}(\mathrm{N})=1$
Note 2. In case Rx Command has CRC error, RHSIF performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Note 2. In case Rx Command has CRC error, RHSIF performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.17 Tx ID Command Operation

### 27.4.3.3 Non-Stream Command Reception by Target Node

Figure 27.18 to Figure 27.21 show the flows for receiving non-stream requests (Read, Write, Event, and ID Commands) by using the target node function of L2.

Because the hardware of L2 automatically processes Commands that are received, the firmware of L2 does not need to perform any processing.

The following describes the reception operation, using the Read Command reception (Figure 27.18) for example.
Upon receiving a Command, L2 first checks whether an error has occurred. When an error is detected, L2 discards the command that is received without returning any reply Command. If the command that is received has a CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

When no error is detected, L2 checks the following items to determine whether read access is enabled:
(1) Whether the target node function has been enabled for the relevant channel
(2) Whether authentication has been performed (when authentication is required)
(3) Whether the target address corresponds to a valid memory window
(4) Whether reading of the window described in (3) above is permitted

If the result of any of the above checks is negative, L2 discards the command that is received without returning any reply Command.

If the results of all of the above checks are positive, L 2 issues a Master Read request to the H -Bus. After receiving a response from the H-Bus, L2 transmits a Read Answer Command (when no H-Bus response error is detected) or an NACK Command (when an H-Bus response error is detected) to the link partner.

Note 1. All of following conditions are satisfied:

1. $\operatorname{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{TNME}(\mathrm{N})=1$
2. Authentication(s) is PASSed. (As required)
3. Address is inside of any Memory Windows which are defined by RHSIFnMW(X)A and RHSIFnMW(X)S
4. Read is allowed for a Memory Window whose address is hit (RHSIFnMCT.W(X)RE =1)

Note 2. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.18 Rx Read Command Operation

Note 1. All of following conditions are satisfied:

1. $\operatorname{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{TNME}(\mathrm{N})=1$
2. Authentication(s) is PASSed. (As required)
3. Address is inside of any Memory Windows which are defined by RHSIFnMW(X)A and RHSIFnMW(X)S
4. Write is allowed for a Memory Window whose address is hit (RHSIFnMCT.W(X)WE = 1)

Note 2. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.19 Rx Write Command Operation

Note 1. The following conditions are satisfied:

1. $\operatorname{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{TNME}(\mathrm{N})=1$
2. Authentication(s) is PASSed. (As required)

Note 2. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.20 Rx Event Command Operation

Note 1. The following conditions are satisfied:

1. $\operatorname{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{TNME}(\mathrm{N})=1$
2. Authentication(s) is PASSed. (As required)

Note 2. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Figure 27.21 Rx ID Command Operation

### 27.4.3.4 Stream Command Transmission by Initiator Node

Figure 27.22 and Figure 27.23 show the flow for transmitting Stream Commands by using the initiator node function and internal DMAC of L2.

After preparing stream data, the firmware must set the start address of the area containing the data and the number of bytes to be transferred, and then enable the DMAC.

L2 internally has a 512-bit data buffer, and obtains data by issuing a Master Read request to the H -Bus with the maximum size is 256 -bit. For L2, the maximum number of outstanding requests to the H -Bus is set to 2 .

If source address does not hit any window or read operation is not allowed for a memory window whose address is hit RHSIF does not issue H-Bus read request. When RHSIF collects all the responses to transmitted H-Bus requests and transmitted request commands, it sets the RHSIFnSTST.STE4 bit, and then stops the DMAC.

If an error is detected in the response from the H -Bus, L 2 collects all the responses to transmitted H -Bus requests and transmitted request commands, sets the RHSIFnSTST.STE3 bit, and then stops the DMAC.

If no error is detected in the response from the H-Bus, L2 generates and transmits a Stream Command in units of the size specified by the RHSIFnSTMD.STPS bit. RHSIF allows up to two Stream Commands to be transmitted to a link partner before the link partner responds. Compliant with this specification, L2 can transmit a maximum of two outstanding requests to a link partner.

The Stream Command data to be transmitted is realigned in L2 so that the data alignment meets the specification. For the data alignment, see Figure 27.24.

After normally transmitting all data (specified number of bytes to be transferred), L2 sets the RHSIFnSTST.STC bit, and (when interrupt is enabled) generates an int_hsif_str interrupt.

If an error (including timeout) is caused by a reply command during transmission, L2 collects all the responses to transmitted H-Bus requests and transmitted request commands, sets the RHSIFnSTST.STE1 or RHSIFnSTST.STE2 bit, and then stops the DMAC.

Note that the operation L2 performs when it receives an NACK Command depends on the value of the RHSIFnSTMD.STNK bit. When the RHSIFnSTMD.STNK bit is 0 , L2 regards reception of the NACK Command as occurrence of an error. It sets the RHSIFnSTST.STE0 bit, and then stops the DMA transfer. When the RHSIFnSTMD.STNK bit is 1, L2 regards reception of the NACK Command as reception of an ACK Command, and continues the DMA transfer. Specify an appropriate value in the RHSIFnSTMD.STNK bit according to the usage of the data to be transferred.

If more than one error (receives NACK, detects T-ID error, or reply timeout) occurs during a DMA operation, only the first error is set to RHSIFnSTST.STE0, STE1, or STE2.

In case reply Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

Note that Stream Commands must not be issued together with a non-Stream Command (Read, Write, Event, or ID Command). The firmware must be controlled so that non-Stream Commands are not transmitted while a Stream Command is being transmitted.

Note 1. All of following conditions are satisfied:

1. Source address is inside of any memory window which are defined by RHSIFnMW (X)A and RHSIFnMW(X)S
2. Read is allowed for a memory window whose address is hit (RHSIFnMCT.W(X)WE=1)

Note 2. This bit is set after all responses/replies are received for all H-Bus requests/request commands that are already transmitted.

Figure 27.22 Tx Stream Command Operation (1)

Note 1. This bit is set after all responses/replies are received for all H-Bus requests/request commands that are already transmitted.
Note 2. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

1st Stream Command

2nd Stream Command

Figure 27.24 Tx Stream Data Alignment

### 27.4.3.5 Stream Command Reception by Target Node

Figure 27.25 and Figure 27.26 show the flow for receiving Stream Commands by using the target node function and internal DMAC of L2.

First, the type of interrupt must be selected. L2 provides the following two status types:
(1) Status indicating that the size of unprocessed data is not 0 (RHSIFnSRST.SRC0)
(2) Status indicating that the size of unprocessed data is at least the specified size (RHSIFnSRST.SRC1)

An appropriate type must be selected according to the system.
Upon receiving a Stream Command, L2 first checks whether an error has occurred. When an error is detected, L2 discards the received Command without returning any reply Command. If the command that is received has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.

When the RHSIFnSRMD.SRMC bit is 0 , L2 automatically clears the RHSIFnSRCT.SRDE bit to 0 and sets the RHSIFnSRST.SRA to prevent extra data from being stored subsequently.

When no error is detected, L2 checks the following items to determine whether stream transfer is enabled:
(1) Whether the target node function has been enabled for channel 2
(2) Whether authentication has been performed (when authentication is required)
(3) Whether DMA for stream reception has been enabled

If the result of any of the above checks is negative, L2 discards the command that is received without returning any reply Command.

If destination address does not hit any window or write operation is not allowed for a memory window whose address is hit, RHSIF discards the command that is received without returning any reply Command, and sets the RHSIFnSRST.STE2 bit to 1 . When the RHSIFnSRMD.SRMC bit is 0 , RHSIF automatically clears the RHSIFnSRCT.SRDE bit to 0 and sets the RHSIFnSRST.SRA to prevent extra data from being stored subsequently.

If the results of all the above checks are positive, L2 checks the size of the free space in the stream storage buffer. If the buffer does not have enough free space to store the data that is received, L2 discards the command that is received, returns a NACK Command, and sets the RHSIFnSRST.SRE1 bit to 1 . When the RHSIFnSRMD.SRMC bit is 0 , L2 automatically clears the RHSIFnSRCT.SRDE bit to 0 and sets the RHSIFnSRST.SRA to prevent extra data from being stored subsequently.

If the buffer has enough free space to store received data, L2 issues a Master Write request to the H-Bus. RHSIF allows up to two Stream Commands to be transmitted to a link partner before the link partner responds. Compliant with this specification, L2 can receive up to two Stream Commands concurrently. The maximum number of outstanding requests to the H -Bus is 2 .

The data alignment of the Stream Commands that are received complies with the specifications. Therefore, the Stream Command data to be transmitted is realigned in L2 before transmission to the H -Bus. For the data alignment, see
Figure 27.24.
After receiving a response from the H-Bus, L2 subsequently performs one of the following operations depending on whether an error occurs in the response from the H-Bus:
(1) When no H-Bus response error is detected

L2 updates the write pointer (RHSIFnSRWP) for the data payload size of the command that is received, and returns an ACK Command to the link partner.
(2) When an H-Bus response error is detected

L2 updates the write pointer (RHSIFnSRWP) for the data payload size of the command that is received, returns a NACK Command to the link partner, and sets the RHSIFnSRST.SRE0 bit to 0 . When the RHSIFnSRMD.SRMC
bit is 0 , L2 automatically clears the RHSIFnSRCT.SRDE bit to 0 and sets the RHSIFnSRST.SRA to prevent extra data from being stored subsequently.

If the values of write pointer and read pointer differ from each other, an int_hsif_str interrupt is generated (when the RHSIFnSRIE.SRCE0 bit is 1). Also, if the size of unprocessed data reaches or exceeds the size specified in the RHSIFnSRBC register, an int_hsif_str interrupt is generated (when the RHSIFnSRIE.SRCE1 bit is 1).

The firmware must check the data size with the write pointer as needed, and process the data in the data storage area. After data processing ends, the firmware must update the read pointer for the size of processed data. Updating of the read pointer must always be performed in units of the size specified by the RHSIFnSRMD.SRPS bit. Figure $\mathbf{2 7 . 2 7}$ shows an example of updating the pointer.

Note 1. The following conditions are satisfied:

1. $\mathrm{RHSIFnCMD}(\mathrm{N}) \cdot \operatorname{TNME}(\mathrm{N})=1$
2. Authentication(s) is PASSed. (As required)
3. DMA is enabled (RHSIFnSRCT.SRDE = 1)

Note 2. All of following conditions are satisfied:

1. Destination address is inside of any memory window which are defined by RHSIFnMW (X)A and RHSIFnMW (X)S
2. Write is allowed for a memory window whose address is hit (RHSIFnMCT.W(X)WE=1)

Note 3. In case Rx Command has CRC error, L2 performs special action. For details, see Section 27.4.3.6, CRC Error Handling.
Note 4. If DMA is enabled (RHSIFnSRCT.SRDE = 1), clear DMA Enable (RHSIFnSRCT.SRDE) and set DMA abort (RHSIFnSRST.SRA) if RHSIFnSRMD.SRMC $=0$.

Figure 27.25 Rx Stream Command Operation (1)

Note 4. If DMA is enabled (RHSIFnSRCT.SRDE = 1), clear DMA Enable (RHSIFnSRCT.SRDE) and set DMA abort (RHSIFnSRST.SRA) if RHSIFnSRMD.SRMC $=0$.

Figure 27.26 Rx Stream Command Operation (2)

Register Values
RHSIFnSRDA $=32$ 'h 12345600
RHSIFnSRDS $=32$ 'h0000_00F0 ( 256 Byte)
RHSIFnSRBC $=32$ 'h0000_0080 (128 Byte)
(1) Initial State

RHSIFnSRST.SCR0 $=0$ RHSIFnSRST.SCR1 $=0$
(2) After receiving 2 Commands

RHSIFnSRST.SCR0 $=1$ RHSIFnSRST.SCR1 $=0$
(3) After receiving 4 Commands

RHSIFnSRST.SCR0 $=1$ RHSIFnSRST.SCR1 $=1$
(4) After processing 4 Commands

RHSIFnSRST.SCR0 $=1$ RHSIFnSRST.SCR1 $=0$
(5) After receiving 2 Commands

(7) After processing 4 Commands

RHSIFnSRST.SCR0 $=1$ RHSIFnSRST.SCR1 $=1$
(8) After processing 4 Commands

RHSIFnSRST.SCR0 $=0$ RHSIFnSRST.SCR1 $=0$

Note: Number in brackets of each pointer means "Toggle bit".

Figure 27.27 Rx Stream Pointer Operation Example

If an error occurs during Stream Command reception when the RHSIFnSRMD.SRMC bit is $0, \mathrm{~L} 2$ automatically clears the RHSIFnSRCT.SRDE bit and stops receiving any more Commands. (For detailed conditions, see the description of the RHSIFnSRCT.SRDE bit.)

If reception of Stream Commands is to be resumed in this status, the following procedure must be followed:
(1) Detect interrupt by the RHSIFnSRST.SRA bit. (If RHSIFnSRIE.SRAE bit is 1.)
(2) Check that the RHSIFnSRCT.SRDE bit is 0 .
(3) Wait until L2 can check that the RHSIFnSRST.SRTA bit is 0 .
(4) Reset the RHSIFnSRCT.SRDE bit to 1 .

This procedure also applies when the firmware has cleared the RHSIFnSRCT.SRDE bit to 0 because of the system. (In this case, RHSIFnSRST.SRA is not set.)

### 27.4.3.6 CRC Error Handling

If a CRC error is detected in a command that is received, the header information also cannot be trusted, and, therefore, the command that is received cannot be determined to be a request or a reply. For this reason, the operation of L2 differs from those of other errors.

Upon receiving a Command involving a CRC error, L2 performs the following operations:

- Sets the RHSIFnCST(N).CRE(N) bit
- Discards the command that is received
- Clears the RHSIFnSRCT.SRDE bit when the error has occurred in channel 2 and the RHSIFnSRMD.SRMC bit is 0

Based on the above operations, necessary processing must be executed when a CRC error is detected.

### 27.4.4 Interrupt Specification

### 27.4.4.1 Interrupt Signals and Corresponding Interrupt Sources

Table 27.57 shows a list of interrupt signals, interrupt status register fields, interrupt source register fields and interrupt enable register fields. The interrupt signal is output as long as the corresponding interrupt enable bit is set to 1 and the corresponding status/flag bit is set to 1 .

All interrupt signals are synchronized to ACLK, level signal, and active high.
Table 27.57 Interrupt Signal List (1/2)

| Signal | Status | Source | Enable | Description |
| :---: | :---: | :---: | :---: | :---: |
| int_hsif_ch0 | RHSIFnMIST.RARS0 | RHSIFnCST0.RAR0 | RHSIFnCIE0.RARE0 | Read Answer received at Ch. 0 |
|  | RHSIFnMIST.AKRS0 | RHSIFnCSTO.AKR0 | RHSIFnCIE0.AKRE0 | ACK received at Ch. 0 |
|  | RHSIFnMIST.TERS0 | RHSIFnCST0.TER0 | RHSIFnCIE0.TERE0 | Event received at Ch. 0 |
| int_hsif_ch1 | RHSIFnMIST.RARS1 | RHSIFnCST1.RAR1 | RHSIFnCIE1.RARE1 | Read Answer received at Ch. 1 |
|  | RHSIFnMIST.AKRS1 | RHSIFnCST1.AKR1 | RHSIFnCIE1.AKRE1 | ACK received at Ch. 1 |
|  | RHSIFnMIST.TERS1 | RHSIFnCST1.TER1 | RHSIFnCIE1.TERE1 | Event received at Ch. 1 |
| int_hsif_ch2 | RHSIFnMIST.RARS2 | RHSIFnCST2.RAR2 | RHSIFnCIE2.RARE2 | Read Answer received at Ch. 2 |
|  | RHSIFnMIST.AKRS2 | RHSIFnCST2.AKR2 | RHSIFnCIE2.AKRE2 | ACK received at Ch. 2 |
|  | RHSIFnMIST.TERS2 | RHSIFnCST2.TER2 | RHSIFnCIE2.TERE2 | Event received at Ch. 2 |
| int_hsif_ch3 | RHSIFnMIST.RARS3 | RHSIFnCST3.RAR3 | RHSIFnCIE3.RARE3 | Read Answer received at Ch. 3 |
|  | RHSIFnMIST.AKRS3 | RHSIFnCST3.AKR3 | RHSIFnCIE3.AKRE3 | ACK received at Ch. 3 |
|  | RHSIFnMIST.TERS3 | RHSIFnCST3.TER3 | RHSIFnCIE3.TERE3 | Event received at Ch. 3 |
| int_hsif_str | RHSIFnMIST.STCS | RHSIFnSTST.STC | RHSIFnSTIE.STCE | Tx stream completed |
|  | RHSIFnMIST.SRCS0 | RHSIFnSRST.SRC0 | RHSIFnSRIE.SRCE0 | Rx stream completed (more than 1 Stream Command data size) |
|  | RHSIFnMIST.SRCS1 | RHSIFnSRST.SRC1 | RHSIFnSRIE.SRCE1 | Rx stream completed (more than RHSIFnSRBC) |
| int_hsif_err | RHSIFnMIST.CERS(N) | RHSIFnCST0.AKE(N) | RHSIFnCIE0.AKEE(N) | NACK received at Ch.(N) |
|  |  | RHSIFnCST0.TOE(N) | RHSIFnCIE0.TOEE(N) | Reply timeout detected at Ch.(N) |
|  |  | RHSIFnCST0.IDE(N) | RHSIFnCIE0.IDEE(N) | Transaction-ID error detected at Ch. N ) |
|  |  | RHSIFnCST0.AOE(N) | RHSIFnCIE0.AOEE(N) | Any other error detected at Ch.(N) |
|  |  | RHSIFnCST0.BRE(N) | RHSIFnCIE0.BREE(N) | Bus error detected at Ch.(N) |
|  |  | RHSIFnCST0.CRE(N) | RHSIFnCIE0.CREE(N) | CRC error detected at Ch.(N) |
|  | RHSIFnMIST.STES | RHSIFnSTST.STE0 | RHSIFnSTIE.STEE0 | NACK received at Tx stream Ch. |
|  |  | RHSIFnSTST.STE1 | RHSIFnSTIE.STEE1 | Reply timeout detected at Tx stream Ch |
|  |  | RHSIFnSTST.STE2 | RHSIFnSTIE.STEE2 | Transaction-ID error detected at Tx stream Ch. |
|  |  | RHSIFnSTST.STE3 | RHSIFnSTIE.STEE3 | Bus error detected at Tx stream Ch. |
|  |  | RHSIFnSTST.STE4 | RHSIFnSTIE.STEE4 | Window mis-hit detected at Tx stream Ch. |
|  | RHSIFnMIST.SRES | RHSIFnSRST.SRE0 | RHSIFnSRIE.SREE0 | Bus error detected at Rx stream Ch. |
|  |  | RHSIFnSRST.SRE1 | RHSIFnSRIE.SREE1 | Buffer overflow detected at Rx stream Ch. |
|  |  | RHSIFnSRST.SRE2 | RHSIFnSRIE.SREE2 | Window mis-hit detected at Rx stream Ch. |
|  |  | RHSIFnSRST.SRA | RHSIFnSRIE.SRAE | Rx stream aborted by error. |

Table 27.57 Interrupt Signal List (2/2)

| Signal | Status | Source | Enable | Description |
| :---: | :---: | :---: | :---: | :---: |
| int_hsif_sec | RHSIFnMIST.AESS | RHSIFnAEST.AEE(N) | RHSIFnAEIE.AEEE(N) | Event received at Ch.(N) before authentication is completed. |
|  |  | RHSIFnAEST.AEI(N) | RHSIFnAEIE.AEIE(N) | ID received at Ch.(N) before authentication is completed. |
|  |  | RHSIFnAEST.AER(N) | RHSIFnAEIE.AERE(N) | Read received at Ch.(N) before authentication is completed. |
|  |  | RHSIFnAEST.AEW(N) | RHSIFnAEIE.AEWE(N) | Write received at Ch.(N) before authentication is completed. |
|  |  | RHSIFnAEST.AES | RHSIFnAEIE.AESE | Stream received at Ch. 2 before authentication is completed. |
|  |  | RHSIFnAEST.WER(N) | RHSIFnAEIE.WERE(N) | Received Read at Ch.(N) does not hit any memory window. |
|  |  | RHSIFnAEST.WEW(N) | RHSIFnAEIE.WEWE(N) | Received Write at Ch.(N) does not hit any memory window. |
|  |  | RHSIFnAEST.WESO | RHSIFnAEIE.WESEO | H-Bus Read for Stream does not hit any window. |
|  |  | RHSIFnAEST.WES1 | RHSIFnAEIE.WESE1 | H-Bus Write for Stream does not hit any window. |

Figure 27.28 shows the logic for interrupt generation. The corresponding bit in the source register/field is ANDed with the corresponding enable bit in the interrupt enable register/field. Moreover, respective factors are ORed to an interrupt signal.

Figure 27.28 Interrupt Signal Generation Logic

### 27.4.4.2 Interrupt Signal Status Register

L2 has a register to monitor the interrupt factor state. This register (RHSIFnMIST) indicates the current state of the interrupt factors. Whether an interrupt is active can be checked by a single register read.

### 27.5 Datalink Layer (L1)

### 27.5.1 Overview

Regarding the basic functions and specifications, refer to the protocol specifications.

### 27.5.1.1 Functional Overview

The Renesas High-speed Serial Interface Datalink Layer IP (henceforth, called "L1") is compliant with the following specifications.
(1) L1

- Addition of L1 header information to the L2 frame for data transmission
- Removal of the L1 header from the receive data and transmission to L2
- Generation and transmission of Interface Control Logical Channel (hereafter, ICLC) commands
- Reception and execution of ICLC commands
- Generation of interrupt sources for transmission completion, transmission error, reception completion, reception error, and ICLC command reception
- Generation and transmission of CTS commands
- Frame arbitration: Fixed (Higher) PingAnswer $\rightarrow$ CTS Command $\rightarrow$ ICLC Command $\rightarrow$ L2 Frame (lower)
- Execution of flow control
- Execution of Loopback test mode
- Execution of toggle pattern test mode

## (2) Physcal Interface

This layer consists of LVDS differential interface (input and output) and the reference clock. Regarding the basic functions and specifications, refer to the protocol specification.

Table 27.58 Physical Interface

| External Port | Specification Item | Specification |
| :---: | :---: | :---: |
| Clock (RHSIFnREFCLK) | Electrical Characteristics | TTL / CMOS |
|  | Frequency | $20 \mathrm{MHz}, 10 \mathrm{MHz}$ |
| Data <br> (RHSIFnTXDP, RHSIFnTXDN, RHSIFnRXDP, RHSIFnRXDN) | Electrical Characteristics | LVDS (based on IEEE1596.3-1996 reducedrangelink) |
|  | BaudRate (FastMode) Using PLL | 160 M Baud, 80 M Baud selectable |
|  | BaudRate (SlowMode) Using REFCLK | 5 M Baud |

### 27.5.1.2 Block Diagram

(1) L1

Figure 27.29 Block Diagram of L1 and Physical Interface

### 27.5.2 Registers

This section describes the L1 registers in detail.
In case of a concurrent update of the same register bit, L1 module write (hardware write) has higher priority than CPU write (software write).

### 27.5.2.1 List of Registers

The register map of an L1 module is shown in Table 27.59.
The L1 module remains in reset while RESET.
The values shown in Table 27.59 in the L1 registers description under "Values after Reset" are related to this reset state.

For further information about the L1 operation modes, refer to Section 27.5.3, Operation.
The module specific base address of an L1 module needs to be added to each of the specified offset addresses.

Table 27.59 Registers Address Map

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RHSIFn | Mode Control Register | RHSIFnMDCR | <RHSIFn_L1_base> + 000 ${ }_{\text {H }}$ | 32 | - |
|  | Sleep Mode Control Register | RHSIFnSMCR | <RHSIFn_L1_base> + 004 ${ }_{\text {H }}$ | 32 | - |
|  | PLL Control Register | RHSIFnPCR | <RHSIFn_L1_base> + 008 ${ }_{\text {H }}$ | 32 | - |
|  | Speed Control Register | RHSIFnSPCR | <RHSIFn_L1_base> + 00C ${ }_{\text {H }}$ | 32 | - |
|  | Test Mode Control Register | RHSIFnTMDCR | <RHSIFn_L1_base> + 010 ${ }_{\text {H }}$ | 32 | - |
|  | L1 Status Register | RHSIFnL1SR | <RHSIFn_L1_base> + 018 ${ }_{\text {H }}$ | 32 | - |
|  | Last Tx Frame L1 Result Register | RHSIFnLTXFRMRL1 | <RHSIFn_L1_base> + 030 H | 32 | - |
|  | Last Rx Frame L1 Result Register | RHSIFnLRXFRMRL1 | <RHSIFn_L1_base> + 034 ${ }_{\text {H }}$ | 32 | - |
|  | Last Tx Frame L2 Result Register | RHSIFnLTXFRMRL2 | <RHSIFn_L1_base> + 038 ${ }_{\text {H }}$ | 32 | - |
|  | Last Rx Frame L2 Result Register | RHSIFnLRXFRMRL2 | <RHSIFn_L1_base> + 03C ${ }_{\text {H }}$ | 32 | - |
|  | TX/RX Control Register | RHSIFnTXRXCR | <RHSIFn_L1_base> + 050 H | 32 | - |
|  | ICLC Command Control Register | RHSIFnICCR | <RHSIFn_L1_base> + 060 ${ }_{\text {H }}$ | 32 | - |
|  | CTS Frame Control Register | RHSIFnCCR | <RHSIFn_L1_base> + 070 ${ }_{\text {H }}$ | 32 | - |
|  | Tx Complete Status Register | RHSIFnTXCMPST | <RHSIFn_L1_base> + 080 H | 32 | - |
|  | Tx Complete Status Clear Register | RHSIFnTXCMPSC | <RHSIFn_L1_base> + 084 ${ }_{\text {H }}$ | 32 | - |
|  | Tx Complete Interrupt Enable Register | RHSIFnTXCMPIE | <RHSIFn_L1_base> + 088 ${ }_{\text {H }}$ | 32 | - |
|  | Tx Error Status Register | RHSIFnTXERRST | <RHSIFn_L1_base> + 090 H | 32 | - |
|  | Tx Error Status Clear Register | RHSIFnTXERRSC | <RHSIFn_L1_base> + 094 ${ }_{\text {H }}$ | 32 | - |
|  | Tx Error Interrupt Enable Register | RHSIFnTXERRIE | <RHSIFn_L1_base> + 098 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Complete Status Register | RHSIFnRXCMPST | <RHSIFn_L1_base> + 0A0 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Complete Status Clear Register | RHSIFnRXCMPSC | <RHSIFn_L1_base> + 0A4 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Complete Interrupt Enable Register | RHSIFnRXCMPIE | <RHSIFn_L1_base> + 0 A8 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Error Status Register | RHSIFnRXERRST | <RHSIFn_L1_base> + 0B0 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Error Status Clear Register | RHSIFnRXERRSC | <RHSIFn_L1_base> + 0B4 ${ }_{\text {H }}$ | 32 | - |
|  | Rx Error Interrupt Enable Register | RHSIFnRXERRIE | <RHSIFn_L1_base> + 0B8 ${ }_{\text {H }}$ | 32 | - |
|  | Rx ICLC Command Status Register | RHSIFnRXICST | <RHSIFn_L1_base> + 0C0 ${ }_{\text {H }}$ | 32 | - |
|  | Rx ICLC Command Status Clear Register | RHSIFnRXICSC | <RHSIFn_L1_base> + 0C4 ${ }_{\text {H }}$ | 32 | - |
|  | Rx ICLC Command Interrupt Enable Register | RHSIFnRXICIE | <RHSIFn_L1_base> + 0C8H | 32 | - |

### 27.5.2.2 Legend

This section explains the module state dependent abbreviations used for the L1 registers description.
Conditions:

- R/W: Bit is readable and writable
- R: Read-only bit; the user cannot write to this bit
- W: Write-only bit; Read value is always " 0 "

## Reserved bits:

- Always read as 0
- Writing to these bits has no effect (hardware protection)

### 27.5.2.3 Detailed Register Description

Detailed specifications of each register are described below.

## (1) RHSIFnMDCR — Mode Control Register

Table 27.60 RHSIFnMDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | CTSEN | This bit specifies whether to enable the flow control. |
|  |  | 0: Disable automatic flow control. |
|  |  | 1: Enable automatic flow control. |
|  |  | CTS Commands. |
|  |  | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

## (2) RHSIFnSMCR — Sleep Mode Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.61 RHSIFnSMCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SLP | Specify whether to set the sleep mode during data transmission or in the next transmission |
|  |  | frame. |
|  |  | 1: L1 End bit $=0$ (Normal mode for the link partner) $=1$ (Transitioning to sleep mode for the link partner) |
|  |  |  |

## (3) RHSIFnPCR — PLL Control Register

Value after reset: $\quad 00000001 \mathrm{H}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.62 RHSIFnPCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | PLLSTBY | This bit specifies whether PLL Standby or PLL Active. |
|  |  | This bit is updated only when writing directly. It is not updated when ICLC (Slave interface PLL |
|  | start, Slave interface PLL stop) command reception. |  |
|  | $0:$ PLL Active. |  |
|  |  | 1: PLL Standby. |

## (4) RHSIFnSPCR — Speed Control Register

Table 27.63 RHSIFnSPCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 25 to 24 | FMBR1 | These bits specify Fast Speed Mode Baud Rate. |
|  |  | 00: 80MBaud |
|  |  | 01: 160MBaud |
|  |  | 10: Setting prohibited |
|  |  | 11: Setting prohibited |
| 23 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TXSP*1 | This bit specifies whether Slow Speed Mode or Fast Speed Mode for data transmission. |
|  |  | This bit is updated only when writing directly. It is not updated when ICLC (Select Slow Speed mode for transfers from the Slave interface to the Master interface, Select Fast Speed mode for transfers from the Slave interface to the Master interface) command reception. |
|  |  | 0: Slow Speed Mode. |
|  |  | 1: Fast Speed Mode. |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | RXSP*1 | This bit specifies whether Slow Speed Mode or Fast Speed Mode for data reception. |
|  |  | This bit is updated only when writing directly. It is not updated when ICLC (Select Slow Speed mode for transfers from the Master interface to the Slave interface, Select Fast Speed mode for transfers from the Master interface to the Slave interface) command reception. |
|  |  | 0: Slow Speed Mode. |
|  |  | 1: Fast Speed Mode. |

Note 1. In case of setting '1' to RHSIFnSPCR.TXSP or RHSIFnSPCR.RXSP, please set ' 0 ' to RHSIFnPCR.PLLSTBY for activating PLL.

## (5) RHSIFnTMDCR — Test Mode Control Register

Table 27.64 RHSIFnTMDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | CKTM ${ }^{* 1}$ | This bit is specified for selecting clock test mode. |
|  |  | This bit is updated when ICLC command is for "Turn on testmode" or "Turn off test mode" as well as writing to this bit directly. |
|  |  | 0: Disable. |
|  |  | 1: Clock test mode. |
| 8 | CKTMSEL | Clock Selection of Clock testmode |
|  |  | 0: RX BaudRate/2 Clock |
|  |  | 1: TX BaudRate/2 Clock |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | TXLPBK*1,*3 | This bit is specified for selecting TX-RX loopback testmode. |
|  |  | 0: Disable. |
|  |  | 1: TX-RX loopback testmode. |
| 0 | RXLPBK ${ }^{* 1, * 2}$ | This bit is specified for selecting RX-TX loopback testmode. |
|  |  | This bit is updated when ICLC command is for "Turn on payload loopback" or "Turn off test mode" as well as writing to this bit directly. |
|  |  | 0 : Disable. |
|  |  | 1: RX-TX loopback testmode. |

Note 1. Setting 2 bits or more to 1 at the same time is prohibited.
Note 2. In Rx-Tx loopback testmode, received ICLC Turn off command is output by looping back.
Note 3. In case of setting '1' to RHSIFnTMDCR.TXLPBK, please set the same value to RHSIFnSPCR.TXSP and RHSIFnSPCR.RXSP. Unless the same BaudRate is set to both transmitter/receiver, the communication will not be done normally.

## (6) RHSIFnL1SR - L1 Status Register

Value after reset: $\quad 00010101_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | RCTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.65 RHSIFnL1SR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | RCTS | This bit indicates the CTS value that is received. |
|  |  | 0 : Linkpartner is not receivable |
|  |  | 1: Linkpartner is receivable |
| 15 to 10 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | TFFUL | This bit indicates TX FIFO full status. |
|  |  | 0 : Not full. |
|  |  | 1: Full. |
| 8 | TFEMP | This bit indicates TX FIFO empty status. |
|  |  | 0: Not empty. |
|  |  | 1: Empty. |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | RFFUL | This bit indicates RX FIFO full status. |
|  |  | 0: Not full. |
|  |  | 1: Full. |
| 0 | RFEMP | This bit indicates RX FIFO empty status. |
|  |  | 0 : Not empty. |
|  |  | 1: Empty. |

(7) RHSIFnLTXFRMRL1 — Last Tx Frame L1 Result Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | TL1E |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TL1P[7:0] |  |  |  |  |  |  |  | TL1H[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.66 RHSIFnLTXFRMRL1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TL1E | This bit indicates last Tx Endbit. |
| 15 to 8 | TL1P[7:0] | These bits indicate Last Tx L1 Payload. |
| 7 to 0 | TL1H[7:0] | These bits indicate Last Tx L1 Header. |

(8) RHSIFnLRXFRMRL1 — Last Rx Frame L1 Result Register

Table 27.67 RHSIFnLRXFRMRL1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br>  |
| 16 | RL1E | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 8 | RL1P[7:0] | This bit indicates last Rx Endbit. |
| 7 to 0 | RL1H[7:0] | These bits indicate Last Rx L1 Payload. |

(9) RHSIFnLTXFRMRL2 — Last Tx Frame L2 Result Register

Table 27.68 RHSIFnLTXFRMRL2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathbf{3 1}$ to 16 | T2L2H[15:0] | These bits indicate Last Tx L2 Header of L2 frame. |
| 15 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | T2L1H[7:0] | These bits indicate Last Tx L1 Header of L2 frame. |

(10) RHSIFnLRXFRMRL2 — Last Rx Frame L2 Result Register

Table 27.69 RHSIFnLRXFRMRL2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | R2L2H[15:0] | These bits indicate Last Rx L2 Header of L2 frame. |
| 15 to 8 | - | Reserved <br>  <br> 7 to 0 |
| R2L1H[7:0] | When read, the value after reset is returned. When writing, write the value after reset. |  |

(11) RHSIFnTXRXCR — TX/RX Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | TXEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

Table 27.70 RHSIFnTXRXCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TXEN | This bit specifies whether to enable transmission. |
|  |  | This bit is updated when the ICLC command is for "Enable Slave interface transmitter" or |
|  |  | "Disable Slave interface transmitter" as well as writing to this bit directly. |
|  | 0: Disable. |  |
|  | 1: Enable. |  |
| 15 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | RXEN | This bit specifies whether to enable reception. |
|  |  | 0: Disable. |
|  |  | 1: Enable. |

(12) RHSIFnICCR — ICLC Command Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | ITRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | PLD[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 27.71 RHSIFnICCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | ITRG | ICLC Command Tx Trigger. |
|  |  | This bit is cleared automatically after ICLC command transmission is completed. |
|  | $0:$ Disable. |  |
|  | 1: Trigger. |  |
| 15 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | PLD[7:0] |  |

Note 1. Please do not specify any commands except the commands described in Table 27.12.
(13) RHSIFnCCR — CTS Frame Control Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | CTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CTS | PLD[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 27.72 RHSIFnCCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | CTRG | CTS Frame Tx Trigger. |
|  |  | This bit is cleared automatically after CTS Frame transmission is completed. |
|  |  | 0: Disable. |
|  |  | 1: Trigger. |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | CTS | CTS Value |
| 7 to 0 | PLD[7:0] | CTS Frame (Payload) |

(14) RHSIFnTXCMPST — Tx Complete Status Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | TCL2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 27.73 RHSIFnTXCMPST Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TCL2 | This bit indicates the status of L2 frame transmission. |
|  |  | 0: L2 frame transmission not completed. |
|  |  | 1: L2 frame transmission completed. |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TCCT | This bit indicates the status of L1 CTS frame transmission. |
|  |  | $0: ~ L 1 ~ C T S ~ f r a m e ~ t r a n s m i s s i o n ~ n o t ~ c o m p l e t e d . ~$ |
|  |  | 1: L1 CTS frame transmission completed. |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TCIC | This bit indicates the status of L1 ICLC command transmission. |
|  |  | 0 : L1 ICLC command transmission not completed. |
|  |  | 1: L1 ICLC command transmission completed. |

(15) RHSIFnTXCMPSC - Tx Complete Status Clear Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | - | - | - | - | - | - | - | TCCL2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

Table 27.74 RHSIFnTXCMPSC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TCCL2 | Writing 1 to this bit clears the RHSIFnTXCMPST.TCL2 bit. <br> Writing 0 to this bit is ignored. |
| 15 to 9 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TCCCT | Writing 1 to this bit clears the RHSIFnTXCMPST.TCCT bit. <br> Writing 0 to this bit is ignored. |
| 7 to $\mathbf{1}$ | - | Reserved <br>  <br> 0 |
|  | TCCIC | When read, the value after reset is returned. When writing, write the value after reset. |

(16) RHSIFnTXCMPIE - Tx Complete Interrupt Enable Register

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 27.75 RHSIFnTXCMPIE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | TCEL2 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnTXCMPST. TCL2 bit. |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | TCECT | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnTXCMPST.TCCT bit. |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TCEIC | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnTXCMPST.TCIC bit. |

## (17) RHSIFnTXERRST — Tx Error Status Register

Value after reset: $00000000_{\mathrm{H}}$

Table 27.76 RHSIFnTXERRST Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | TERSZ | This bit indicates the status of payload size error of transmission. <br> 0: Payload size error has not occurred. <br> 1: Payload size error occurred. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | TERSZI5 | This bit indicates that the payload size of transmission is $3^{\prime} \mathrm{b} 101$. <br> 0 : Payload size index is not $3^{\prime} \mathrm{b} 101$. <br> 1: Payload size index is 3 'b101. |
| 19 | TERSZI4 | This bit indicates the payload size of transmission is $3^{\prime} \mathrm{b} 100$. <br> 0 : Payload size index is not $3^{\prime} \mathrm{b} 100$. <br> 1: Payload size index is 3 'b100. |
| 18 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | TERCTF | This bit indicates that the logical channel type of transmission is 4 'b1111. <br> 0 : Logical channel type of transmission is not 4'b1111. <br> 1: Logical channel type of transmission is 4 'b1111. |
| 14 | TERCTE | This bit indicates that the logical channel type of transmission is 4 'b1110. <br> 0 : Logical channel type of transmission is not 4'b1110. <br> 1: Logical channel type of transmission is 4 'b1110. |
| 13 | TERCTD | This bit indicates that the logical channel type of transmission is 4 'b1101. <br> 0 : Logical channel type of transmission is not 4'b1101. <br> 1: Logical channel type of transmission is 4 'b1101. |
| 12 | TERCTC | This bit indicates that the logical channel type of transmission is 4 'b1100. <br> 0 : Logical channel type of transmission is not 4'b1100. <br> 1: Logical channel type of transmission is 4 'b1100. |
| 11 | TERCTB | This bit indicates that the logical channel type of transmission is 4'b1011. <br> 0 : Logical channel type of transmission is not 4'b1011. <br> 1: Logical channel type of transmission is 4 'b1011. |
| 10 | TERCTA | This bit indicates that the logical channel type of transmission is 4'b1010. <br> 0 : Logical channel type of transmission is not 4'b1010. <br> 1: Logical channel type of transmission is 4'b1010. |
| 9 | TERCT9 | This bit indicates that the logical channel type of transmission is $4^{\prime} \mathrm{b} 1001$. <br> 0 : Logical channel type of transmission is not 4'b1001. <br> 1: Logical channel type of transmission is 4 'b1001. |

Table 27.76 RHSIFnTXERRST Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | TERCT8 | This bit indicates that the logical channel type of transmission is 4'b1000. <br> 0 : Logical channel type of transmission is not 4'b1000. <br> 1: Logical channel type of transmission is 4'b1000. |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TERCT2 | This bit indicates that the logical channel type of transmission is 4'b0010. <br> 0: Logical channel type of transmission is not 4 b 0010 . <br> 1: Logical channel type of transmission is 4'b0010. |
| 1 | TERCT1 | This bit indicates that the logical channel type of transmission is 4'b0001. <br> 0 : Logical channel type of transmission is not 4'b0001. <br> 1: Logical channel type of transmission is 4'b0001. |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

(18) RHSIFnTXERRSC — Tx Error Status Clear Register

Value after reset: $\quad 00000000_{H}$

Table 27.77 RHSIFnTXERRSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | TERCSZ | Writing 1 to this bit clears the RHSIFnTXERRST.TERSZ bit. Writing 0 to this bit is ignored. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | TERCSZI5 | Writing 1 to this bit clears the RHSIFnTXERRST.TERSZI5 bit. Writing 0 to this bit is ignored. |
| 19 | TERCSZI4 | Writing 1 to this bit clears the RHSIFnTXERRST.TERSZI4 bit. Writing 0 to this bit is ignored. |
| 18 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | TERCCTF | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTF bit. Writing 0 to this bit is ignored. |
| 14 | TERCCTE | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTE bit. Writing 0 to this bit is ignored. |
| 13 | TERCCTD | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTD bit. Writing 0 to this bit is ignored. |
| 12 | TERCCTC | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTC bit. Writing 0 to this bit is ignored. |
| 11 | TERCCTB | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTB bit. Writing 0 to this bit is ignored. |
| 10 | TERCCTA | Writing 1 to this bit clears the RHSIFnTXERRST.TERCTA bit. Writing 0 to this bit is ignored. |
| 9 | TERCCT9 | Writing 1 to this bit clears the RHSIFnTXERRST.TERCT9 bit. Writing 0 to this bit is ignored. |
| 8 | TERCCT8 | Writing 1 to this bit clears the RHSIFnTXERRST.TERCT8 bit. Writing 0 to this bit is ignored. |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | TERCCT2 | Writing 1 to this bit clears the RHSIFnTXERRST.TERCT2 bit. Writing 0 to this bit is ignored. |
| 1 | TERCCT1 | Writing 1 to this bit clears the RHSIFnTXERRST.TERCT1 bit. Writing 0 to this bit is ignored. |
| 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

(19) RHSIFnTXERRIE — Tx Error Interrupt Enable Register

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 27.81 RHSIFnRXCMPIE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | RCEL2 | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXCMPST.RCL2 bit. |
|  |  | 0 : Does not assert RHSIFnRXERR when the RHSIFnRXCMPST.RCL2 bit is 1. |
|  |  | 1: Assert RHSIFnRXERR when the RHSIFnRXCMPST.RCL2 bit is 1. |
| 15 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 | RCECT | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXCMPST.RCCT bit. |
|  |  | 0: Does not assert RHSIFnRXERR when the RHSIFnRXCMPST.RCCT bit is 1. <br> 1: Assert RHSIFnRXERR when the RHSIFnRXCMPST.RCCT bit is 1. |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | RCEIC | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXCMPST.RCIC bit. |
|  |  | 0: Does not assert RHSIFnRXERR when the RHSIFnRXCMPST.RCIC bit is 1. <br> 1: Assert RHSIFnRXERR when the RHSIFnRXCMPST.RCIC bit is 1. |

## (23) RHSIFnRXERRST — Rx Error Status Register

Value after reset: $\quad 00000000_{H}$

Table 27.82 RHSIFnRXERRST Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RERSZ | This bit indicates the status of payload size error of reception. <br> 0 : Payload size error not occurred. <br> 1: Payload size error occurred. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | RERSZI5 | This bit indicates that the payload size of reception is 3 'b101. <br> 0 : Payload size index is not 3 'b101. <br> 1: Payload size index is 3 'b101. |
| 19 | RERSZI4 | This bit indicates that the payload size of reception is $3^{\prime} \mathrm{b} 100$. <br> 0 : Payload size index is not 3 'b100. <br> 1: Payload size index is $3^{\prime} \mathrm{b} 100$. |
| 18 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | RERCTF | This bit indicates that the logical channel type of reception is 4 'b1111. <br> 0 : Logical channel type of reception is not 4 'b1111. <br> 1: Logical channel type of reception is 4 'b1111. |
| 14 | RERCTE | This bit indicates that the logical channel type of reception is 4 'b1110. <br> 0 : Logical channel type of reception is not 4 'b1110. <br> 1: Logical channel type of reception is 4 'b1110. |
| 13 | RERCTD | This bit indicates that the logical channel type of reception is 4 'b1101. <br> 0 : Logical channel type of reception is not 4 'b1101. <br> 1: Logical channel type of reception is 4 'b1101. |
| 12 | RERCTC | This bit indicates that the logical channel type of reception is 4 'b1100. <br> 0 : Logical channel type of reception is not 4 'b1100. <br> 1: Logical channel type of reception is 4 'b1100. |
| 11 | RERCTB | This bit indicates that the logical channel type of reception is 4 'b1011. <br> 0 : Logical channel type of reception is not 4'b1011. <br> 1: Logical channel type of reception is 4 b 1011. |
| 10 | RERCTA | This bit indicates that the logical channel type of reception is 4 'b1010. <br> 0 : Logical channel type of reception is not 4'b1010. <br> 1: Logical channel type of reception is 4'b1010. |
| 9 | RERCT9 | This bit indicates that the logical channel type of reception is 4 'b1001. <br> 0 : Logical channel type of reception is not 4'b1001. <br> 1: Logical channel type of reception is 4 b 1001. |

Table 27.82 RHSIFnRXERRST Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 8 | RERCT8 | This bit indicates that the logical channel type of reception is 4 'b1000. <br> 0 : Logical channel type of reception is not 4'b1000. <br> 1: Logical channel type of reception is 4 b 1000. |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RERCT2 | This bit indicates that the logical channel type of reception is $4^{\prime} \mathrm{b} 0010$. <br> 0 : Logical channel type of reception is not 4 'b0010. <br> 1: Logical channel type of reception is 4 b 0010. |
| 1 | RERCT1 | This bit indicates that the logical channel type of reception is $4{ }^{\prime} b 0001$. <br> 0 : Logical channel type of reception is not 4 'b0001. <br> 1: Logical channel type of reception is 4 b 0001 . |
| 0 | RERIPV | This bit indicates whether or not the command undefined in Table 27.12 is received. <br> 0 : Command defined in the table is received. <br> 1: Command undefined in the table is received. |

## (24) RHSIFnRXERRSC — Rx Error Status Clear Register

Value after reset: $\quad 00000000_{H}$

Table 27.83 RHSIFnRXERRSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | RERCSZ | Writing 1 to this bit clears the RHSIFnRXERRST.RERSZ bit. Writing 0 to this bit is ignored. |
| 30 to 21 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 20 | RERCSZI5 | Writing 1 to this bit clears the RHSIFnRXERRST.RERSZI5 bit. Writing 0 to this bit is ignored. |
| 19 | RERCSZI4 | Writing 1 to this bit clears the RHSIFnRXERRST.RERSZI4 bit. Writing 0 to this bit is ignored. |
| 18 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | RERCCTF | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTF bit. Writing 0 to this bit is ignored. |
| 14 | RERCCTE | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTE bit. Writing 0 to this bit is ignored. |
| 13 | RERCCTD | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTD bit. Writing 0 to this bit is ignored. |
| 12 | RERCCTC | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTC bit. Writing 0 to this bit is ignored. |
| 11 | RERCCTB | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTB bit. Writing 0 to this bit is ignored. |
| 10 | RERCCTA | Writing 1 to this bit clears the RHSIFnRXERRST.RERCTA bit. Writing 0 to this bit is ignored. |
| 9 | RERCCT9 | Writing 1 to this bit clears the RHSIFnRXERRST.RERCT9 bit. Writing 0 to this bit is ignored. |
| 8 | RERCCT8 | Writing 1 to this bit clears the RHSIFnRXERRST.RERCT8 bit. Writing 0 to this bit is ignored. |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | RERCCT2 | Writing 1 to this bit clears the RHSIFnRXERRST.RERCT2 bit. Writing 0 to this bit is ignored. |
| 1 | RERCCT1 | Writing 1 to this bit clears the RHSIFnRXERRST.RERCT1 bit. Writing 0 to this bit is ignored. |
| 0 | RERCIPV | Writing 1 to this bit clears the RHSIFnRXERRST.RERIPV bit. Writing 0 to this bit is ignored. |

(25) RHSIFnRXERRIE — Rx Error Interrupt Enable Register

| 0 | REREIPV | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXERRST.RERIPV bit. <br> 0: Does not assert RHSIFnRXERR when the RHSIFnRXERRST.RERIPV bit is 1. <br> 1: Assert RHSIFnRXERR when the RHSIFnRXERRST.RERIPV bit is 1. |

(26) RHSIFnRXICST — Rx ICLC Command Status Register

Value after reset: $\quad 00000000_{H}$

Table 27.85 RHSIFnRXICST Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | RIPA | This bit indicates the status of ICLC ping answer. |
|  |  | 0 : Ping answer not received. |
|  |  | 1: Ping answer received. |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | RITOL | This bit indicates the status of ICLC turn on payload loopback. |
|  |  | 0: Turn on payload loopback not received. |
|  |  | 1: Turn on payload loopback received. |
| 10 | RITOF | This bit indicates the status of ICLC turn off payload loopback. |
|  |  | 0 : Turn off payload loopback not received. |
|  |  | 1: Turn off payload loopback received. |
| 9 | RITON | This bit indicates the status of ICLC turn on test mode. |
|  |  | 0: Turn on test mode not received. |
|  |  | 1: Turn on test mode received. |
| 8 | RIDT | This bit indicates the status of ICLC disable Tx port. |
|  |  | 0: Disable Tx port not received. |
|  |  | 1: Disable Tx port received. |
| 7 | RIET | This bit indicates the status of ICLC enable Tx port. |
|  |  | 0: Enable Tx port not received. |
|  |  | 1: Enable Tx port received. |
| 6 | RIFT | This bit indicates the status of ICLC select FastMode Tx port. |
|  |  | $0:$ Select FastMode Tx port not received. |
|  |  | 1: Select FastMode Tx port received. |
| 5 | RIST | This bit indicates the status of ICLC select SlowMode Tx port. |
|  |  | 0 : Select SlowMode Tx port not received. |
|  |  | 1: Select SlowMode Tx port received. |
| 4 | RIFR | This bit indicates the status of ICLC select FastMode Rx port. |
|  |  | 0: Select FastMode Rx port not received. |
|  |  | 1: Select FastMode Rx port received. |
| 3 | RISR | This bit indicates the status of ICLC select SlowMode Rx port. |
|  |  | 0 : Select SlowMode Rx port not received. |
|  |  | 1: Select SlowMode Rx port received. |

Table 27.85 RHSIFnRXICST Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 | RIPSTP | This bit indicates the status of ICLC PLL Stop. |
|  | $0:$ PLL Stop not received. |  |
|  | 1: PLL Stop received. |  |
| 1 | RIPSRT | This bit indicates the status of ICLC PLL Start. |
|  | $0:$ PLL Start not received. |  |
|  | 1: PLL Start received. |  |
| 0 | RIPG | This bit indicates the status of ICLC Ping. |
|  | $0:$ Ping not received. |  |
|  | 1: Ping received. |  |

## (27) RHSIFnRXICSC — Rx ICLC Command Status Clear Register

Value after reset: $\quad 00000000_{H}$

Table 27.86 RHSIFnRXICSC Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | RICPA | Writing 1 to this bit clears the RHSIFnRXICST.RIPA bit. Writing 0 to this bit is ignored. |
| 15 to 12 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | RICTOL | Writing 1 to this bit clears the RHSIFnRXICST.RITOL bit. Writing 0 to this bit is ignored. |
| 10 | RICTOF | Writing 1 to this bit clears the RHSIFnRXICST.RITOF bit. Writing 0 to this bit is ignored. |
| 9 | RICTON | Writing 1 to this bit clears the RHSIFnRXICST.RITON bit. Writing 0 to this bit is ignored. |
| 8 | RICDT | Writing 1 to this bit clears the RHSIFnRXICST.RIDT bit. Writing 0 to this bit is ignored. |
| 7 | RICET | Writing 1 to this bit clears the RHSIFnRXICST.RIET bit. Writing 0 to this bit is ignored. |
| 6 | RICFT | Writing 1 to this bit clears the RHSIFnRXICST.RIRF bit. Writing 0 to this bit is ignored. |
| 5 | RICST | Writing 1 to this bit clears the RHSIFnRXICST.RIRS bit. Writing 0 to this bit is ignored. |
| 4 | RICFR | Writing 1 to this bit clears the RHSIFnRXICST.RITF bit. Writing 0 to this bit is ignored. |
| 3 | RICSR | Writing 1 to this bit clears the RHSIFnRXICST.RITS bit. Writing 0 to this bit is ignored. |
| 2 | RICPSTP | Writing 1 to this bit clears the RHSIFnRXICST.RIPSTP bit. Writing 0 to this bit is ignored. |
| 1 | RICPSRT | Writing 1 to this bit clears the RHSIFnRXICST.RIPSRT bit. Writing 0 to this bit is ignored. |
| 0 | RICPG | Writing 1 to this bit clears the RHSIFnRXICST.RIPG bit. Writing 0 to this bit is ignored. |

## (28) RHSIFnRXICIE — Rx ICLC Command Interrupt Enable Register

Table 27.87 RHSIFnRXICIE Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 17 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | RIEPA | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPA bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPA bit is 1. <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPA bit is 1 . |
| 15 to 12 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 11 | RIETOL | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITOL bit. <br> 0 : Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITOL bit is 1 . <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITOL bit is 1 . |
| 10 | RIETOF | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITOF bit. <br> 0 : Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITOF bit is 1 . <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITOF bit is 1. |
| 9 | RIETON | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RITON bit. <br> 0 : Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RITON bit is 1. <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RITON bit is 1. |
| 8 | RIEDT | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIDT bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIDT bit is 1 . <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIDT bit is 1. |
| 7 | RIEET | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIET bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIET bit is 1 . <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIET bit is 1. |
| 6 | RIEFT | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIFT bit. <br> 0 : Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIFT bit is 1 . <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIRF bit is 1. |
| 5 | RIEST | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIST bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIST bit is 1. <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIST bit is 1. |
| 4 | RIEFR | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIFR bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIFR bit is 1. <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIFR bit is 1. |
| 3 | RIESR | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RISR bit. <br> 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RISR bit is 1. <br> 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RISR bit is 1. |

Table 27.87 RHSIFnRXICIE Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 | RIEPSTP | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPSTP bit. |
|  |  | 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSTP bit is 1. |
|  | 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSTP bit is 1. |  |
| 1 | RIEPSRT | This bit specifies whether to enable the interrupt that is triggered by the RHSIFnRXICST.RIPSRT bit. |
|  |  | 0: Does not assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSRT bit is 1. |
|  | 1: Assert RHSIFnRXICLC when the RHSIFnRXICST.RIPSRT bit is 1. |  |

### 27.5.3 Operation

### 27.5.3.1 Initial Settings

## (1) Clocks generated by CLKGEN and transfer mode

The CLKGEN generates the clock for data transmission/reception. Table 27.88 below shows the correspondence between the clocks to be generated and the transfer mode. The switching between master mode and slave mode, the transfer mode, and the baud rate for fast transfer mode are specified by setting the registers.
During operation in slave mode, the transfer mode can be switched between fast and slow by the ICLC command transmitted from the master.

Table 27.88 Clocks Generated by CLKGEN

| Data Transfer Modes |  |  | Sampling Clock |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Operation Modes | Clock Sources | Frequency | Baud Rate |
|  | Master/slave | Internal PLL | $160,80 \mathrm{MHz}$ | $160,80 \mathrm{M}$ Baud |

## (2) L1 settings

(1) Master/slave setting

Specify the master or slave operation by setting the RHSIFnMDCR.MST register. When the master operation is specified, also specify the frequency of the clock to be output to communication device by setting the RHSIFnMDCR.CLKSEL.
(2) Flow control setting

Specify the automatic flow control setting by setting the RHSIFnMDCR.CTSEN register.
(3) RxD enable setting

Enable or disable RxD reception by setting the RHSIFnTXRXCR.RXEN register.
(4) TxD enable setting

Enable or disable TxD transmission by setting the RHSIFnTXRXCR.TXEN.
(5) Interrupt enable setting

Enable or disable interrupts by setting the RHSIFn*IE registers for L2 and L1, respectively.
(6) Transmission/reception speed setting for fast transfer mode

Specify the transmission/reception speed (baud rate) by setting the RHSIFnSPCR.FMBR register.
(7) Transfer mode setting for transmission/reception

Specify the transfer speed mode for transmission and reception by setting the RHSIFnSPCR.TXSP and RHSIFnSPCR.RXSP registers, respectively.
(8) Procedure for releasing CLKGEN standby

After power-on reset release, the PLL in the CLKGEN is in the standby (OFF) state. It is necessary to release the PLL from the standby state (ON) to perform data transmission/reception in fast transfer mode. When switching from PLL OFF to PLL ON, be sure to release the standby state of the PLL by using the procedures of steps (a) to (e) described below.

If data transmission/reception is performed in fast transfer mode without following the procedure, the baud rate is unstable and normal operation may not be achieved.
(a) Insert waits by software so that the external reference clock (RHSIF0_REFCLK) becomes stable $1 \mu$ sefore the PLL is released from the standby state (indicated by step (d) below).
During master operation, however, no wait is required because the internal clock is used as the reference clock for PLL at this time.
(b) Set the following registers as required.

RHSIFnMDCR.MST
RHSIFnMDCR.CLKSEL
RHSIFnSPCR.FMBR
RHSIFnSPCR.TXSP
RHSIFnSPCR.RXSP
Be sure to update these registers when the PLL is in the standby state.
(c) Insert waits for at least $1 \mu$ sy software.
(d) Clear the RHSIFnPCR.PLLSTBY bit to " 0 ". The PLL released from the standby starts running.
(e) Insert waits for at least $\mathrm{t}_{\text {RHPLLLCT }} \mu \mathrm{s}$ by software until the PLL locks up. For details of PLL locked time, refer to the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

Note: When switching from PLL ON to PLL OFF, set the RHSIFnPCR.PLLSTBY bit to "1" first to set the PLL in standby state, and then change the registers described in step (b) above. If setting values of these registers are changed while the PLL is running, the PLL may not operate normally.

Figure 27.30 below shows a timing chart for the procedure of steps (a) to (e) above.

Figure 27.30 Timing Chart for Releasing CLKGEN from Reset State

### 27.5.3.2 ICLC Command Control Method

## (1) Basic operation: ICLC command issuance

An ICLC command can be issued from the master to a slave. An ICLC command request is transmitted by firmware. Transmit a request by accessing the register and check the response by using an interrupt as trigger.

Figure 27.31 below shows the procedure flow for issuing an ICLC command.

Figure 27.31 Procedure Flow for Issuing ICLC Command

For details about the ICLC commands supported by this product, see Table 27.12, List of ICLC Command.

## (2) Basic operation: Interrupt

Figure 27.32 below shows the procedure flow for processing an interrupt, using transmission completion interrupt as example.

Note 1. Write "1" to the bit corresponding to the interrupt source. For details about the interrupt source, see Section 27.5.2.1, List of Registers.

Figure 27.32 Procedure Flow for Processing Transmission Completion Interrupt

The processing is similar to the other interrupts. See Table 27.89 below for the status registers, status clear registers and interrupt enable registers for the other interrupts.

Table 27.89 List of Interrupt Related Registers

| Interrupt | Status Register | Status Clear Register | Interrupt Enable Register |
| :--- | :--- | :--- | :--- |
| RHSIFnTXCMP | RHSIFnTXCMPST | RHSIFnTXCMPSC | RHSIFnTXCMPIE |
| RHSIFnTXERR | RHSIFnTXERRST | RHSIFnTXERRSC | RHSIFnTXERRIE |
| RHSIFnRXCMP | RHSIFnRXCMPST | RHSIFnRXCMPSC | RHSIFnRXCMPIE |
| RHSIFnRXERR | RHSIFnRXERRST | RHSIFnRXERRSC | RHSIFnRXERRIE |
| RHSIFnRXICLC | RHSIFnRXICST | RHSIFnRXICSC | RHSIFnRXICIE |

## (3) Basic operation: Execution of ICLC "PING" command

Figure 27.33 below shows a flow for transmitting an ICLC "PING" command and receiving an ICLC "PING Answer". The ICLC "PING Answer" can automatically be transmitted without firmware.

After completion of transmission, the device waits for a response from the link partner. The following five cases can be considered according to the responding state of the link partner and whether there is a frame error.
(a) When the device operates as the master and the link partner sends back an ICLC "PING Answer" (normal case) When the device completes transmission of a PING command, a transmission completion interrupt is generated.
Wait until the device receives the ICLC "PING Answer".
When the device receives the "PING Answer", a reception completion interrupt and an ICLC reception interrupt are generated.
(b) Transmission errors when the device operates as the master

If an error occurs after the device transmits an ICLC "PING" command, a transmission error interrupt is generated.
(c) Reception errors when the device operates as the master

If an error occurs after the device receives the ICLC "PING Answer", a reception error interrupt is generated.
(d) Reception errors when the device operates as a slave

If an error occurs after the device receives the ICLC "PING" command, a reception error interrupt is generated.
(e) Transmission errors when the device operates as a slave

If an error occurs after the device transmits an ICLC "PING Answer", a transmission error interrupt is generated.

Figure 27.33 Flow for ICLC "PING" Command Execution

For the ICLC commands other than "PING", the processing is the same except the slave does not send back an ICLC "PING Answer".

### 27.5.3.3 Changing Communication Speed Using ICLC Commands

## (1) Changing from slow transfer mode to fast transfer mode

Figure 27.34 to Figure 27.40 show the procedure for changing the communication speed (transfer mode) from slow transfer mode to fast transfer mode.

For fast transfer mode, the transfer rate (baud rate) can be selected from 160 and 80 M Baud. Be sure to specify the transfer rate in advance, by setting the RHSIFnSPCR register.

Also, be sure to enable transmission for the master.
(a) Enable transmission for the RX link slave.

Transmit the ICLC "Enable Slave interface transmitter" command.

Figure 27.34 Enabling Transmission for RX Link Slave
(b) Start operation of the PLL in slave

Transmit the ICLC "Slave interface PLL start" command. Refer to (8), Procedure for releasing CLKGEN standby in Section 27.5.3.1(2), L1 setting of Section 27.5.3.1, Initial Setting for details.

Note: When the slave receives the ICLC "Slave interface PLL start" command, RHSIFnRXICST.RIPSRT becomes "1" (PLL Start received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEPSRT is set to " 1 ". From the status of RHSIFnRXICST.RIPSRT, the slave should perform software processing of PLL start.

Figure 27.35 Starting Operation of PLL in Slave
(c) Set the transmission speed mode for Rx link slave to fast mode

Transmit the ICLC "Select Fast Speed mode for transfers from the Slave interface to the Master interface" command.

| Master (PLL OFF) | ICLC "Select Fast Speed mode for transfers from the Slave interface to the Master interface"Command | Slave (PLL ON) RX (Enable) |
| :---: | :---: | :---: |
| (Slow) | TX Link | (Slow) |
| RX (Enable) (Slow) | RX Link | TX (Enable) (Slow $\rightarrow$ Fast) |

Note: When the slave receives the ICLC "Select Fast Speed mode for transfers from the Slave interface to the Master interface" command, RHSIFnRXICST.RIFT becomes " 1 " (Select FastMode Tx port received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEFT is set to " 1 ". From the status of RHSIFnRXICST.RIFT, the slave should perform software processing of fast speed mode for data transmission.

Figure 27.36 Setting Transmission Speed Mode for Slave to Fast
(d) Set the reception speed mode for Tx link slave to fast mode

Transmit the ICLC "Select Fast Speed mode for transfers from the Master interface to the Slave interface" command.

| Master (PLL OFF) | ICLC "Select Fast Speed mode for transfers from the Master interface to the Slave interface" Command | Slave (PLL ON) <br> RX (Enable) |
| :---: | :---: | :---: |
| (Slow) | TX Link | (Slow $\rightarrow$ Fast) |
| RX (Enable) (Slow) | RX Link | TX (Enable) (Fast) |

Note: When the slave receives the ICLC "Select Fast Speed mode for transfers from the Master interface to the Slave interface" command, RHSIFnRXICST.RIFR becomes " 1 " (Select FastMode Rx port received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEFR is set to "1". From the status of RHSIFnRXICST.RIFR, the slave should perform software processing of fast speed mode for data reception.

Figure 27.37 Setting Reception Speed for Slave to Fast
(e) Start operation of the PLL in master

Release the PLL from the standby state and start operation of the PLL by setting the APB registers. Refer to (8),
Procedure for releasing CLKGEN standby in Section 27.5.3.1(2), L1 setting of Section 27.5.3.1, Initial Setting for details.

Figure 27.38 Starting Operation of PLL in Master
(f) Set the reception speed mode for Rx link and the transmission speed mode for Tx link of master to fast mode Set the Rx and Tx speed modes to fast mode by setting RHSIFnSPCR.TXSP to " 1 " and RHSIFnSPCR.RXSP to " 1 ".

Figure 27.39 Setting Rx and Tx Speed Modes for Master to Fast
(g) Check the link establishment

Transmit the ICLC "PING" command and make sure that a "PING ANSWER" is sent back.

Figure 27.40 Checking Link Establishment

## (2) Changing from fast transfer mode to slow transfer mode

Figure 27.41 to Figure 27.47 show the procedure for changing the communication speed (transfer mode) from fast transfer mode to slow transfer mode.

Be sure to enable transmission for the master in advance
(a) Enable transmission for the RX link slave

Transmit the ICLC "Enable Slave interface transmitter" from the master to slave.

Figure 27.41 Enabling Transmission for RX Link Slave
(b) Set the transmission speed mode for slave to slow mode

Transmit the ICLC "Select Slow Speed mode for transfers from the Slave interface to the Master interface" command from the master to slave.

| Master (PLL ON) | ICLC "Select Slow Speed mode for transfers from the Slave interface to the Master interface"Command | Slave (PLL ON) |
| :---: | :---: | :---: |
| (Fast) | TX Link | (Fast) |
| RX (Enable) <br> (Fast) | RX Link | TX (Enable) (Fast $\rightarrow$ Slow) |

Note: When the slave receives the ICLC "Select Slow Speed mode for transfers from the Slave interface to the Master interface" command, RHSIFnRXICST.RIST becomes "1" (Select SlowMode Tx port received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEST is set to " 1 ". From the status of RHSIFnRXICST.RIST, the slave should perform software processing of slow speed mode for data transmission.

Figure 27.42 Setting Transmission Speed Mode for Slave to Slow
(c) Set the reception speed mode for slave to slow mode

Transmit the ICLC "Select Slow Speed mode for transfers from the Master interface to the Slave interface" command from the master to slave.

Note: When the slave receives the ICLC "Select Slow Speed mode for transfers from the Master interface to the Slave interface" command, RHSIFnRXICST.RISR becomes "1" (Select SlowMode Rx port received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIESR is set to "1". From the status of RHSIFnRXICST.RISR, the slave should perform software processing of slow speed mode for data reception.

Figure 27.43 Setting Reception Speed for Slave to Slow
(d) Set the reception and transmission speed modes for master to slow mode

Set the Rx and Tx speed modes to slow by setting RHSIFnSPCR.RXSP to " 0 " and RHSIFnSPCR.TXSP to " 0 ".

Figure 27.44 Setting Rx and Tx Speed Modes for Master to Slow
(e) Stop the operation of the PLL in slave

Transmit the ICLC "Slave interface PLL stop" command.

Note: When the slave receives the ICLC "Slave interface PLL stop" command, RHSIFnRXICST.RIPSTP becomes "1" (PLL Stop received). Also, an ICLC receive interrupt (INTRHSIFnICLCR) occurs when RHSIFnRXICIE.RIEPSTP is set to " 1 ". From the status of RHSIFnRXICST.RIPSTP, the slave should perform software processing of PLL stop.

Figure 27.45 Stopping Operation of PLL in Slave
(f) Stop the operation of the PLL in master

Set RHSIFnPCR.PLLSTBY to " 1 " to stop the PLL operation in master.

Figure 27.46 Stopping PLL Operation in Master
(g) Check the link establishment

Transmit the ICLC "PING" command from the master to slave, and make sure that a "PING ANSWER" is sent back.

Figure 27.47 Checking Link Establishment

### 27.5.3.4 Transiting Slave State Using ICLC Commands

When the device is operating as a slave, the state transitions according to the ICLC command that is received as follows.
(1) Transmission enabled/disabled state

Figure 27.48 Transition between Transmission Enabled and Disabled States
(2) Tx Speed Mode Slow/Fast

Figure 27.49 Transition between Tx Speed Modes Slow and Fast

## (3) Rx Speed Mode Slow / Fast

Figure 27.50 Transition between the Slow and Fast RX Speed Modes

## (4) Test Mode

Figure 27.51 Transition between Test Modes

### 27.5.3.5 CTS Commands

## (1) For Flow Control by CTS

The automatic flow control is enabled after PowerOnReset.
The automatic flow control is disabled by the RHSIFnMDCR.CTSEN $=0$.
(a) When the Automatic Flow Control is Enabled
(i) Link partner is not ready

Link partner: Transmits a frame with a CTS value $=0$.
This Product: Receives a frame and reflects the CTS value to RHSIFnL1SR.RCTS.
This Product: Suppresses the next frame transmission.
Link partner: Transmits a frame with a CTS value $=1$ after becoming receivable.
This Product: Receives a frame and reflects the CTS value to RHSIFnL1SR.RCTS.
This Product: Resumes the transmission of the next frame.
(ii) This product is not ready

This Product: When RxDFIFO is full, transmits a CTS command frame of CTS value $=0$.
This Product: When RxDFIFO is not full, transmits a CTS command frame with a CTS value $=1$.
Caution: Do not write ' 0 ' to RHSIFnMDCR.CTSV while Automatic Flow Control is enabled.
(b) When the Automatic Flow Control is Disabled

By using the following register, it is possible to control the flow manually.
(i) reception status of Link partner

RHSIFnL1SR.RCTS
(ii) reception status of This Product

RHSIFnL1SR.RFFUL
RHSIFnMDCR.CTSV

## (2) Basic Operation: CTS Command Issuance

A CTS command request is transmitted by firmware. Transmit a request by accessing the register.
Figure $\mathbf{2 7 . 5 2}$ below shows the procedure flow for issuing a CTS command.

Figure 27.52 Procedure Flow for Issuing CTS Command

### 27.5.3.6 Sleep Mode

## (1) Transitioning to Sleep Mode for the Link Partner

If an L2 frame, ICLC command, or CTS command is transmitted after RHSIFnSMCR.SLP is set to " 1 ", the L1 END bit continues to transmit " 1 ". This makes the Link Partner to transit to sleep mode.

## (2) Recovering from Sleep Mode

This device does not support sleep mode when receiving.
RHSIF communication has no issues if RHSIF receives the sleep mode restoration condition specified by the communication protocol standard shown below.

- In fast transfer mode: Zero-level signal of 8-bit rate or more
- In slow transfer mode: Zero-level signal of 1-bit rate or more

### 27.5.4 Interrupt Specification

### 27.5.4.1 Interrupt Source List

The tables below list the error interrupt sources detected in L1.
Table 27.90 Transmission Completion Interrupt

| No. | Register |  |  |
| :--- | :--- | :--- | :--- |
|  | Register Name | Bit Name |  |
| 1 | RHSIFnTXCMP | TCL2 | Transmission frame L2 completion interrupt |
| 2 |  | TCCT | Transmission frame CTS completion interrupt |
| 3 |  | TCIC | Transmission frame ICLC completion interrupt |

Table 27.91 Transmission Error Interrupts

| No. | Register |  |  |
| :--- | :--- | :--- | :--- |
|  | Register Name | Bit Name | Description |

Table 27.92 Reception Completion Interrupt

| No. | Register |  |  |
| :--- | :--- | :--- | :--- |
|  | Register Name | Bit Name | Description |
|  | RHSIFnRXCMPST | RCL2 | Reception frame L2 completion interrupt |
| 2 |  | RCCT | Reception frame CTS completion interrupt |
| 3 |  | RCIC | Reception frame ICLC completion interrupt |

Table 27.93 Reception Error Interrupts

| No. | Register |  | Description |
| :---: | :---: | :---: | :---: |
|  | Register Name | Bit Name |  |
| 1 | RHSIFnRXERRST | RERSZ | This bit indicates the status of payload size error of reception. |
| 2 |  | RERSZI5 | Reception frame L1 header payload code error (undefined code 0x5 detected) |
| 3 |  | RERSZI4 | Reception frame L1 header payload code error (undefined code 0x4 detected) |
| 4 |  | RERCTF | Reception frame L1 header channel type code error (undefined code 0xF detected) |
| 5 |  | RERCTE | Reception frame L1 header channel type code error (undefined code 0xE detected) |
| 6 |  | RERCTD | Reception frame L1 header channel type code error (undefined code 0xD detected) |
| 7 |  | RERCTC | Reception frame L1 header channel type code error (undefined code 0xC detected) |
| 8 |  | RERCTB | Reception frame L1 header channel type code error (undefined code 0xB detected) |
| 9 |  | RERCTA | Reception frame L1 header channel type code error (undefined code 0xA detected) |
| 10 |  | RERCT9 | Reception frame L1 header channel type code error (undefined code $0 \times 9$ detected) |
| 11 |  | RERCT8 | Reception frame L1 header channel type code error (undefined code 0x8 detected) |
| 12 |  | RERCT2 | Reception frame L1 header channel type code error (undefined code 0x2 detected) |
| 13 |  | RERCT1 | Reception frame L1 header channel type code error (undefined code $0 \times 1$ detected) |
| 14 |  | RERIPV | Reception ICLC command undefined error. |

Table 27.94 ICLC Reception Completion Interrupt

| No. | Register |  | Description |
| :---: | :---: | :---: | :---: |
|  | Register Name | Bit Name |  |
| 1 | RHSIFnRXICST | RIPA | Reception of PING answer frame |
| 2 |  | RITOL | Reception of Turn on payload loopback frame |
| 3 |  | RITOF | Reception of Turn off test mode frame |
| 4 |  | RITON | Reception of Turn on test mode frame |
| 5 |  | RIDT | Reception of Disable Slave interface transmitter frame |
| 6 |  | RIET | Reception of Enable Slave interface transmitter frame |
| 7 |  | RIFT | Reception of Select Fast Speed mode for transfers from the Slave interface to the Master interface frame |
| 8 |  | RIST | Reception of Select Slow Speed mode for transfers from the Slave interface to the Master interface frame |
| 9 |  | RIFR | Reception of Select Fast Speed mode for transfers from the Master interface to the Slave interface frame |
| 10 |  | RISR | Reception of Select Slow Speed mode for transfers from the Master interface to the Slave interface frame |
| 11 |  | RIPSTP | Reception of Slave interface PLL stop |
| 12 |  | RIPSRT | Reception of Slave interface PLL start |
| 13 |  | RIPG | Reception of PING frame |

### 27.5.4.2 Error Detect Conditions

The tables below list the error detect conditions.
Table 27.95 The combination of Transmission Payload size index and Transmission Logical channel type

|  |  |  | Logical Channel Type |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | $\begin{array}{\|l\|} \hline \text { ICLC }^{* 2} \\ \hline \text { b0000 } \\ \hline \end{array}$ | $\begin{array}{\|l} \hline \text { CTS*2 } \\ \hline \text { b0011 } \\ \hline \end{array}$ | L2Frame |  |  |  |  |
|  |  |  | b0100 |  | b0101 | b0110 | b0111 | others*3 |
| Payload_Size_Index | 8 bit | b000 |  | TCIC | TCCT | TERSZ | TERSZ | TERSZ | TERSZ | TERSZ |
|  | 32 bit | b001 | TCIC | -*1 | TCL2 | TCL2 | TCL2 | TCL2 | TERSZ |
|  | 64 bit | b010 | -*1 | -*1 | TCL2 | TCL2 | TCL2 | TCL2 | TERSZ |
|  | 96 bit | b011 | - *1 | - *1 | TCL2 | TCL2 | TCL2 | TCL2 | TERSZ |
|  | Not used | b100 | - *1 | -*1 | TERSZI4 | TERSZI4 | TERSZI4 | TERSZI4 | TERSZ TERSZI4*4 |
|  |  | b101 | - *1 | -*1 | TERSZI5 | TERSZI5 | TERSZI5 | TERSZI5 | TERSZ TERSZI5*4 |

|  | 288 bit | b111 | - *1 | -*1 | TCL2 | TCL2 | TCL2 | TCL2 | TERSZ |

Note 1. These conditions will not occur.
Note 2. In L1 Frame, error bits are generated only when Logical Channel Type is b0000(ICLC) or b0011(CTS).
Note 3. In L2 Frame, the generated error bit is always TERSZ when the Logical Channel Type is other than b01xx.
Note 4. Either TERSZI4 or TERSZI5 is simultaneously generated with TERSZ according to the Payload Size Index value.

Table 27.96 The combination of Reception Payload size index and Reception Logical channel type (1 of 2)

|  |  |  | Logical_Channel_Type |  |  |  |  |  |  |  |

Note 1. Either RERSZI4 or RERSZI5 is simultaneously generated with RERCT8~RERCTF according to the Payload Size Index value.

### 27.5.4.3 Operation Upon Error Occurrence

The operations upon error occurrence in L1 consist only of the following.

- Assertion of error interrupt
- Indication of error interrupt status by register

### 27.5.5 Debug

Table 27.98 List of Debug Function

| Purpose | Item | Content |  | APB Register |
| :---: | :---: | :---: | :---: | :---: |
| Debug | ICLC(0x34) | Turn on test mode (Send 101010.. Txline data rate) |  | RHSIFnTMDCR.CKTMSEL |
|  | Loopback | TxD->RxD |  | RHSIFnTMDCR.TXLPBK |
|  | Sent Frame information | Last sent frame information display | L1 frame | RHSIFnLTXFRMRL1.TL1E |
|  |  |  |  | RHSIFnLTXFRMRL1.TL1P |
|  |  |  |  | RHSIFnLTXFRMRL1.TL1H |
|  |  |  | L2 frame | RHSIFnLTXFRMRL2.T2L2H |
|  |  |  |  | RHSIFnLTXFRMRL2.T2L1H |
|  | Received frame information | Last received frame information display | L1 frame | RHSIFnLRXFRMRL1.RL1E |

|  |  |  |  | RHSIFnLRXFRMRL1.RL1H |
|  |  |  | L2 frame | RHSIFnLRXFRMRL2.R2L2H |
|  |  |  |  | RHSIFnLRXFRMRL2.R2L1H |

### 27.5.6 Usage Note

### 27.5.6.1 About Fast Mode of Slave

A fast mode of Slave (It's sampled using a reference clock.) recommends following correspondence because there is a possibility that BER (the bit error rate) deteriorates by influence of a jitter.

- Use Slave's fast mode only when sending / receiving various ICLC commands (during communication establishment).
- After confirming the establishment of communication by the PING command of ICLC when communicating by a fast mode, begin to change to Master (sampling by MOSC) and communicate from $\mathrm{t}_{\text {RHPLLLCT }} \mu \mathrm{S}$ later (PLL locked time of a clock change). For details of PLL locked time, refer to the RH850/E2x-FCC1 Electrical Characteristics, User's Manual: Hardware.

## Section 28 Window Watchdog Timer (WDTB)

### 28.1 Features of WDTB

### 28.1.1 Units and Channels

This microcontroller has the following number of WDTB units.
Each WDTB unit has one channel interface.

Table $28.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 Series |  |
| :--- | :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  |  | 2 |
| Name |  | WDTBn (n = 0 to 1) |

## Meaning of $\mathbf{n}$

Throughout this section, the individual units of a window watchdog timer are identified by the index " n " ( $\mathrm{n}=0,1$ ), for example, WDTBnWDTE for the WDTBn enable register.

### 28.1.2 Register Base Addresses

All WDTBn register addresses are given as address offsets from the individual base address < WDTBn_base $>$.
Table 28.2 shows the register base address of each WDTBn.

Table 28.2 Register Base Addresses of WDTBn

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <WDTB0_base> | FFED $0000_{\mathrm{H}}$ | Peripheral Group 2L |
| <WDTB1_base> | FFED $1000_{\mathrm{H}}$ | Peripheral Group 2L |

### 28.1.3 Clock Supply

The window watchdog timer uses WDTBTCKI and PCLK as a clock input.
Table 28.3 Clock Supply of WDTB

| Unit Name | Unit Clock Name | Clock Supply Name |
| :--- | :--- | :--- |
| WDTBn | WDTBTCKI | CLK_WDT*1 |
|  | PCLK | CLK_LSB*2 |

Note 1. CLK_WDT is a 250 kHz clock selectable from CLK_MOSC or CLK_IOSC
Note 2. CLK_LSB is a 40 MHz clock. For details on the clock, see Section 15, Clock Controller.

### 28.1.4 Interrupt Requests

WDTBn interrupt requests are listed in the following table.
Table $28.4 \quad$ Interrupt Requests

|  |  |  | sDMA Trigger | DTS Trigger |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Interrupt Symbol Name | Unit Interrupt Signal | Description | Interrupt Number | Number | Number |
| INTWDTB0TIT | WDTBnTIT $(\mathrm{n}=0)$ | WDTB0 interrupt | CPU0-22 | - | - |
| INTWDTB1TIT | WDTBnTIT $(\mathrm{n}=1)$ | WDTB1 interrupt | CPU1-22 | - | - |

### 28.1.5 Reset Sources

WDTBn reset source are listed in the following table. WDTBn is initialized by these reset sources.
Table 28.5 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| WDTBn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 28.1.6 Correspondence of WDTB and CPU

Table 28.6 Correspondence of WDTB and CPU

| WDTBn | CPU Unit |
| :--- | :--- |
| WDTB0 | CPU0 |
| WDTB1 | CPU1 |

### 28.2 Overview

### 28.2.1 Functional Overview

The WDTB has the following functions:

- WDTB counter start function by software.
- Default start function (WDTB0 only)
- Selection of the operating mode after release from reset using the option byte.
- Starting/stopping of the counter after WDTB is reset, enabling/disabling of interrupt requests, selection of the window-open period and the overflow interval time.
- Interrupt request signals
- The interrupt request output timing can be set using a register.
- Window function
- The period during which writing to the WDTB trigger register is valid (window-open period) can be set. Writing to the WDTB trigger register outside the window-open period causes an error.
- The window open period can be set using a register.
- WDTB error detection
- When an error is detected, the WDTBnTRES signal indicates the error to the ECM. For details on WDTB error detection, see Section 28.4.3, WDTB Error Detection.
- Selectable counter clock for internal clock or external clock by option byte.
- External clock is CLK_MOSC, and internal clock is CLK_IOSC. For details on the clock, see Section 15, Clock Controller.

### 28.2.2 Block Diagram

Figure 28.1 shows the main components of WDTB.

Figure 28.1 Block Diagram of WDTB

### 28.3 Registers

WDTB is controlled and operated by the following registers.

### 28.3.1 List of Registers

The following shows the list of registers and the memory address of WDTBn.
For the base addresses, see Table 28.2.
The actual address can be obtained by adding the offset shown in the table to this base address.
Table 28.7 List of Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| WDTBn | WDTB Enable Register | WDTBnWDTE | <WDTBn_base> + 0000 H | 8 | - |
|  | WDTB Mode Register | WDTBnMD | <WDTBn_base> + 000C H | 8 | - |
|  | WDTB Window Open Start Register | WDTBnWOST | <WDTBn_base> + 0010 ${ }_{\text {H }}$ | 16 | - |
|  | WDTB Interrupt Output Timing Setting Register | WDTBnWIS | <WDTBn_base> + 0014 ${ }_{\text {H }}$ | 16 | - |

### 28.3.2 Detail of Registers

### 28.3.2.1 WDTBnWDTE — WDTB Enable Register

This register is the WDTB start control and trigger register.
Writing $\mathrm{AC}_{\mathrm{H}}$ to this register generates a WDTB trigger and starts or restarts the WDTB counter.
Please refer to Section 28.4.2, WDTB Trigger for details.
The value that can be written in this register is only $\mathrm{AC}_{\mathrm{H}}$.

| Value after reset: (1) WDTB0 |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| This value depends on the set value of ОРВTO. |  |  |  |  |  |  |  |  |
| The value after reset depends on the setting of the OPWDRUN bit. |  |  |  |  |  |  |  |  |
| The initial state of the OPWDRUN bit at shipment is OPWDRUN $=0_{B}$. |  |  |  |  |  |  |  |  |
| Therefore, the register value after reset of WDTB0 at shipment is $2 \mathrm{C}_{\mathrm{H}}$. |  |  |  |  |  |  |  |  |
| (2) WDTBn $(\mathrm{n}=1)$ |  |  |  |  |  |  |  |  |
| The register value after reset is also $2 \mathrm{C}_{\mathrm{H}}$. |  |  |  |  |  |  |  |  |
| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | WDTBnRUN[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 28.8 | WDTBnWD | TE Regis | ster Contents |  |  |  |  |  |
| Bit Position | Bit Name |  | Function |  |  |  |  |  |
| 7 to 0 | WDTBnRUN[7:0] |  | The WDTB trigger is generated by writing fixed start code $\left(\mathrm{AC}_{\mathrm{H}}\right)$, and start/restart of the WDTB counter is controlled. |  |  |  |  |  |
|  |  |  | An error occurs when values other than $\mathrm{AC}_{H}$ are written. After it starts, WDTB counter cannot be stopped. |  |  |  |  |  |

The values after reset of the WDTB0RUN[7] bit, which differ according to the start-up option, are indicated in the following table.

Table 28.9 WDTBORUN[7] Value After Reset

| Start-up Options | WDTB0RUN[7] Value after Reset |
| :--- | :--- |
| OPWDRUN |  |
| 1 |  |
| 0 |  |

### 28.3.2.2 WDTBnMD — WDTB Mode Register

This register specifies the overflow interval time, enabling or disabling of the interrupt, window-open function mode selection, and the window-open period.

This value depends on a set value of the OPBTO.
The value after reset depends on the setting of OPWDWMS bit, OPWDOVF[2:0] bits, OPWDINT bit, and OPWDWS[1:0] bits.
The value of OPWDWMS bit is set to $0_{B}$; the values of OPWDOVF[2:0] bits, OPWDINT bit and OPWDWS[1:0] bits are set to
$1_{B}$ because the initial state of WDTB0 set by the option byte at shipment is the same as that of WDTBn $(n=1)$.
Therefore, the register value after reset of WDTB0 at shipment is $7 \mathrm{~F}_{\mathrm{H}}$.
(2) WDTBn ( $\mathrm{n}=1$ )

The value after reset is $7 \mathrm{~F}_{\mathrm{H}}$.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | WDTBnWMS | WDTBnOVF[2:0] |  |  | WDTBnWIE | - | WDTBnWS[1:0] |  |
| Value after reset | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W |

Table 28.10 WDTBnMD Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | WDTBnWMS | Window Open function mode selection <br> 0: Window size of Window Open function is set by WDTBnWS[1:0]. <br> WDTBnTIT outputs when the counter reaches 75\% of the overflow interval time defined <br> by WDTBnMD.WDTBnOVF[2:0]. <br> 1: Window size of Window Open function is set by WDTBnWOST register. <br> WDTBnTIT outputs when WDTBnWIS matches WDTB counter. |
| 6 to 4 | WDTBnOVF[2:0] | These bits select the overflow interval time. |

Table 28.10 WDTBnMD Register Contents (2/2)

| Bit Position | Bit Name | Function |  |
| :--- | :--- | :--- | :--- |
| 1,0 | WDTBnWS[1:0] | These bits select the period over which the window is open. |  |
|  |  | If WDTBnWMS $=1$, this register is disabled. |  |
|  |  | WDTBnWS1 | WDTBnWSO |

NOTE
WDTBnMD register update timing

- Default start mode: The WDTBnMD register cannot be updated after any reset.
- Software trigger start mode: The WDTBnMD register can be updated only once before the first write to the trigger register.

The WDTBnWS[1:0] setting is applied after the first trigger.

### 28.3.2.3 WDTBnWOST — WDTB Window Open Start Register

This register configures the start time of the open-window period.

Table 28.11 WDTBnWOST Register Contents

| Bit position | Bit name | Function |
| :--- | :--- | :--- |
| 15 to 0 | WDTBnWOST[15:0] | If WDTBnMD.WDTBnWMS $=1$, this register is enabled. |
|  |  | When WDTB counter value $\geq$ WDTBnWOST, WDTB is inside the window-open period. |
| NOTE |  |  |

WDTBnWOST register update timing

- Default start mode: WDTBnWOST register cannot be updated after any reset.
- Software trigger start mode: WDTBnWOST register can be updated only once before first WDTB trigger.

The WDTBnWOST register must be set to a value greater than $0010_{\mathrm{H}}$ (when WDTBnMD.WDTBnWMS $=1$ ). The WDTBnWOST register setting is applied after the first trigger.

### 28.3.2.4 WDTBnWIS — WDTB Interrupt Output Timing Setting Register

This register configures the timing of WDTB interrupt (WDTBnTIT) generation.

Table 28.12 WDTBnWIS Register Contents

| Bit position | Bit name | Function |
| :--- | :--- | :--- |
| 15 to 0 | WDTBnWIS[15:0] | If WDTBnMD.WDTBnWMS $=1$ and WDTBnMD.WDTBnWIE $=1$, this register is enabled. |
|  |  | When WDTB counter value $=$ WDTBnWIS[15:0], interrupt request WDTBnTIT is generated. |
| NOTE |  |  |

WDTBnWIS register update timing

- Default start mode: The WDTBnWIS register cannot be updated after any reset.
- Software trigger start mode: The WDTBnWIS register can be updated only once before the first WDTB trigger.

## CAUTION

The register value after reset is 0000 H .
When using this register, it must be set to a value greater than 0001 H .

### 28.4 Operation

### 28.4.1 WDTB after Reset Release

### 28.4.1.1 Start Modes

The WDTB provides two modes for the counter start after release from the reset state:

- Software trigger start mode (for all WDTB)

The counter value remains $0000_{\mathrm{H}}$ after reset release
The counter is started with the first WDTB trigger.

- Default start mode (only for WDTB0)

The counter starts automatically after release from the reset state. However, default start mode is disabled in serial programming mode even if OPWDRUN is set to $1_{\mathrm{B}}$ for the start-up options.

WDTB other than WDTB0 are fixed to software trigger start mode, and cannot be set by the option byte.

### 28.4.1.2 Start Mode Selection (Only for WDTBO)

The start mode can be selected by the start-up options.
Table 28.13 shows the selection of the start mode.
Table 28.13 Start Modes

| Start-up Option |  |
| :--- | :--- |
| OPWDRUN | Start Mode |
| 0 | Software trigger |
| 1 | Default |

### 28.4.1.3 WDTB Settings after Reset Release

The following table shows the settings of WDTB after reset release.
Table 28.14 Setting of WDTB after Reset Release

| Function | Setting after WDTB0 is Reset | Setting after WDTB other than WDTB0 is <br> Reset |
| :--- | :--- | :--- |
| Start mode | Specified by the start-up option. | Software trigger mode |
| Overflow interval time | Specified by the start-up option. | $2^{16} /$ WDTBTCKI |
| Interrupt mode | Specified by the start-up option. | Interrupt disabled |
| Window-open period | Specified by the start-up option. | $100 \%$ |
| Window open function mode selection | Specified by the start-up option. | Window size of Window Open function is <br> set by WDTBnMD.WDTBnWS[1:0] and <br> interrupt is generated when the counter |
|  |  | reaches 75\% of the overflow interval time <br> defined by WDTBnMD.WDTBnOVF[2:0]. |
| Counter value of window open start | Specified by the start-up option. | $0010_{H}$ |
| Counter value of WDTB interrupt output timing | Specified by the start-up option.*1 | $0000^{* * 1}$ |

Note 1. When using this register, it must be set to a value greater than $0001_{\mathrm{H}}$.

For details on the option bytes, see Section 41, Flash Memory.

## Change WDTB settings

In default start mode, WDTB cannot be changed after any reset.
In software trigger start mode, WDTB can be changed only once before the first WDTB trigger.

### 28.4.1.4 Default Start Mode Timing (Only for WDTBO)

Figure 28.2 shows the timing of the default start mode.

Figure 28.2 Timing Diagram of WDTB Start in Default Start Mode

The timing chart of Figure $\mathbf{2 8 . 2}$ shows the following behaviors:
(1) In default start mode, the WDTB counter starts after release from the reset state. The overflow interval time after release from the reset state is set by start-up options.
Example: overflow interval time after release from the reset state

$$
\left.=2^{16} / \text { WDTBTCKI (OPWDOVF[2:0] = } 111_{\mathrm{B}}\right)
$$

In default start mode, after reset release, the WDTBnMD register cannot be changed because WDTBnRUN $=1$.
(2) Write to the WDTB trigger register before the WDTB counter overflows. The WDTB counter restarts with the WDTB trigger.

### 28.4.1.5 Software Trigger Start Mode Timing (Common to all WDTB)

Figure 28.3 shows the timing of the software trigger start mode and the change to the WDTB setting.

Figure 28.3 Timing Diagram of WDTB Start in Software Trigger Start Mode

The timing diagram in Figure $\mathbf{2 8 . 3}$ shows the following:
(1) After release from the reset state, the counter remains $0000_{\mathrm{H}}$ until the first WDTB trigger. The overflow interval time is set by using the start-up options, but it does not have any effect.
(2) WDTBnMD is set before the first WDTB trigger. However, the settings are not applied immediately.
(3) The WDTB counter starts at the first WDTB trigger.

The overflow interval time and other settings specified in WDTBnMD are applied.

### 28.4.2 WDTB Trigger

The WDTB trigger is generated in WDTB enable register (WDTBnWDTE) by writing the specific value that is called a start code.

The WDTB trigger has the following functions:

- Starting the WDTB counter in software trigger start mode
- Restarting the WDTB counter
- Setting the WDTB mode specified by the WDTBnMD register in software trigger start mode (only for the first WDTB trigger after release from the reset state).
Only the WDTBnWS[1:0] setting by WDTBnMD register in default start mode.

The WDTB can be triggered by writing a fixed activation code to the trigger register.
Table 28.15 Trigger Register and Activation Code

| Type of Activation Code | Trigger Register | Activation Code |
| :--- | :--- | :--- |
| Fixed | WDTBnWDTE | $\mathrm{AC}_{\mathrm{H}}$ |

### 28.4.3 WDTB Error Detection

The WDTB detects an overflow of the WDTB counter and illegal operations as an error.
The conditions for error detection are:

- WDTB counter overflow
- Wrong activation code is written to the WDTB trigger register
- Writing to the trigger register outside the window-open period
- Illegal update of WDTBnMD, WDTBnWOST and WDTBnWIS registers

The following table describes illegal updates of WDTBnMD,WDTBnWOST and WDTBnWIS registers.
Table 28.16 Condition of WDTB Error Detection

| Condition |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Start Mode | Register Write First or <br> Second | Write Value | Error Detection |  |
|  |  | This condition does <br> not happen. |  |  |

|  |  |  | Another | Not Detect |

### 28.4.3.1 WDTB Error Mode

When an error is detected, it is notified to the ECM by the WDTBnTRES signal.
Figure 28.4 shows the generation of a reset when the counter overflows when the default start mode has been selected.

Figure 28.4 Timing Diagram of WDTB Internal Reset Generation

The timing diagram of Figure 28.4 shows the following:
(1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
(2) The counter restarts with the WDTB trigger.
(3) The error is detected when the counter overflows.

Errors are notified to the ECM by the WDTBnTRES signal. The counter value does not change until internal reset is generated.
(4) The WDTB counter stops until the counter is cleared when an internal reset is generated by a factor such as ECM, and reset is released.

### 28.4.4 WDTB Interrupt Output

When the WDTB counter reaches $75 \%$ of the overflow interval time and WDTBnWMS $=0$, interrupt request WDTBnTIT is generated.

When the WDTB counter $=$ WDTBnWIS and $\mathrm{WDTBnWMS}=1$, an interrupt request WDTBnTIT is generated.
This function can be selected by the WDTBnMD.WDTBnWIE register.
Figure $\mathbf{2 8 . 5}$ and Figure $\mathbf{2 8 . 6}$ show the generation of the interrupt request under the following condition:

- The default start mode is selected.
- Interrupt request is enabled after the first WDTB trigger is generated.
- WDTB Overflow interval time: $2^{16}$ / WDTBTCKI
- When WDTBnWMS $=0$ :

Figure 28.5 Timing Diagram of WDTB Interrupt Request Signals (WDTBnWMS = 0)
(1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
(2) The counter restarts with the WDTB trigger.
(3) When the WDTB counter reaches $75 \%$ of the overflow interval time, interrupt request WDTBnTIT is generated.
(4) The counter restarts with the WDTB trigger.
(5) When the WDTB counter reaches $75 \%$ of the overflow interval time, interrupt request WDTBnTIT is generated.
(6) An error is detected when the counter overflows.

The error is notified to the ECM by the WDTBnTRES signal. The counter value does not change until an internal reset is generated.

- When WDTBnWMS = 1 :

Figure 28.6 Timing Diagram of WDTB Interrupt Request Signals (WDTBnWMS =1)
(1) After reset is released, the WDTB counter is started in the default start mode. The overflow interval time after reset is released is set by the start-up option.
(2) The counter restarts with the WDTB trigger.
(3) When the WDTB counter value $=$ WDTBnWIS[15:0], interrupt request WDTBnTIT is generated.
(4) The counter restarts with the WDTB trigger.
(5) When the WDTB counter value $=$ WDTBnWIS[15:0], interrupt request WDTBnTIT is generated.
(6) An error is detected when the counter overflows.

The error is notified to the ECM by the WDTBnTRES signal. The counter value does not change until an internal reset is generated.

### 28.4.5 Window Function

The period when a WDTB trigger is valid (window-open period) can be set. If the window-open period is set to a value less than $100 \%$, an error occurs when the WDTB trigger is generated outside of the window-open period.

The window-open period after reset release is $100 \%$. The period is set to the value configured by the WDTBnMD.WDTBnWS[1:0] or the WDTBnWOST register setting after the first WDTB trigger is generated.

Figure 28.7 and Figure 28.8 show the window function operation under the following conditions.

- The default start mode is selected.
- $25 \%$ window-open period is effective after the first WDTB trigger (WDTBnWS[1:0] $=00_{\mathrm{B}}$ ).
- WDTB Overflow interval time: $2^{16}$ / WDTBTCKI
- When WDTBnWMS = 0 :

Figure 28.7 Timing Diagram of WDTB Window Function
(1) In default start mode, the WDTB counter starts after reset is released.

The overflow interval time after reset is released is set by the start-up option.
(2) The WDTBnMD.WDTBnWS[1:0] setting is applied at the WDTB trigger.
(3) The WDTB counter restarts at the WDTB trigger during the window-open period.
(4) An error is detected at the WDTB trigger during the window-close period and then the WDTBnTRES signal indicates the error the ECM.
The counter value remains unchanged until a System reset is performed.
(5) If an internal reset occurs due to the ECM or some other sources, the counter is cleared and stops until release from the reset state.

- When WDTBnWMS = 1 :

Figure 28.8 Timing Diagram of WDTB Window Function
(1) In default start mode, the WDTB counter starts after reset is released.

The overflow interval time after reset is released is set by the start-up option.
(2) The WDTBnWOST register setting is applied at the WDTB trigger.
(3) The WDTB counter restarts at the WDTB trigger during the window-open period.
(4) An error is detected at the WDTB trigger during the window-close period and then the WDTBnTRES signal indicates the error the ECM.
The counter value remains unchanged until a System reset is performed.
(5) If an internal reset occurs due to the ECM or some other source, the counter is cleared and stops until release from the reset state.

## Section 29 OS Timer (OSTM)

### 29.1 Features of OSTM

### 29.1.1 Number of Units

This microcontroller has the following number of OSTM units.
Each OSTM unit has one channel interface.

Table $29.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 Series |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  |  | 3 |
| Name |  | OSTMn (n $=0$ to 2$)$ |

## Meaning of $\mathbf{n}$

Throughout this section, the individual units of the OS timer are identified by the index " n " ( $\mathrm{n}=0$ to 2 ), for example, OSTMnTO for the OS timer $n$ output register.

### 29.1.2 Register Base Addresses

All OS timer register addresses are given as address offsets from the individual base addresses $<$ OSTMn_base $>$.
The register base address of each OSTMn is listed in the following table.
Table 29.2 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <OSTM0_base> | FFEC $0000_{\mathrm{H}}$ | Peripheral Group 2L |
| <OSTM1_base> | FFEC $1000_{\mathrm{H}}$ | Peripheral Group 2L |
| <OSTM2_base> | FFEC $2000_{\mathrm{H}}$ | Peripheral Group 2L |

### 29.1.3 Clock Supply

Table 29.3 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| OSTMn | PCLK | CLK_LSB |
|  | Register access clock | CLK_LSB |

### 29.1.4 Interrupts Requests

The OS timers can generate the following interrupt requests.
Table 29.4 OSTMn Interrupt Requests

|  |  |  | sDMA Trigger <br> Numb Trigger <br> Interrupt Symbol Name | Unit Interrupt Signal | Description |
| :--- | :--- | :--- | :--- | :--- | :--- |

### 29.1.5 Reset Sources

OSTM reset sources are listed in the following table.
Table 29.5 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| OSTMn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 29.1.6 Correspondence of OSTM and CPU

Table 29.6 Correspondence of OSTM and CPU

| OSTMn | CPU Unit |
| :--- | :--- |
| OSTM0*1 | all CPUs |
| OSTM1 | CPU0 |
| OSTM2 | CPU1 |

Note 1. The global timer can be accessed from all CPU units.

### 29.2 Overview

### 29.2.1 Function Overview

- OSTM has two operating modes.
- Interval timer mode
- Free-run compare mode
- Simultaneous starting of multiple units of the OS timer (timer synchronization of PIC1)
- Interrupt and sDMA/DTS notification when counting by the counter is started, restarted, or ends
- Notifying the ECM of errors when an OSTMn ( $\mathrm{n}=$ other than 0 ) interrupt occurs
- Generation of output waveform from the $\overline{E R R O R O U T}$-M and $\overline{E R R O R O U T \_C ~}$ pins with the OSTMOTTOUT signal of OSTM0 when ECM is in dynamic mode
- Counter start and restart of OSTM can be performed by software.
- The counter value at counter operation start can be set by software.
- Interrupt request of OSTM will be notified to the corresponding CPU.
- Interrupt request of OSTM0 assigned to all CPUs
- Interrupt request of OSTM1 assigned to CPU0
- Interrupt request of OSTM2 assigned to CPU1
- Module standby can be set for each unit (see Section 16, Standby Controller, for details).

### 29.2.2 Block Diagram

The following block diagram shows the main components of OSTMn.

Figure 29.1 Block Diagram of OSTMn

### 29.2.3 Output Modes (only for OSTMO)

The OSTMn has the following output modes. The mode is selected by the setting of the OSTMnTOE.OSTMnTOE bit.

- Software control mode (the OSTMnTOE.OSTMnTOE bit is 0 ): The value set in the OSTMnTO.OSTMnTO bit is output to OSTMnTTOUT.
- Timer-output toggling mode (the OSTMnTOE.OSTMnTOE bit is 1 ): The OSTMnTTOUT output is toggled each time an OSTMnTINT request is generated.

Both output modes are illustrated in the following figure.

Figure 29.2 Timing Diagram of Output Modes

The above timing diagram shows the following operations.

- In software control mode, the level of the OSTMnTTOUT output changes in accordance with the value set in the OSTMnTO.OSTMnTO bit.
- In timer-output toggling mode, the value of the OSTMnTO.OSTMnTO bit and level of the OSTMnTTOUT output are toggled each time an OSTMnTINT interrupt request is generated.

### 29.2.4 Interrupt Requests (OSTMnTINT)

An OSTMnTINT interrupt request is generated whenever the counter reaches $00000000_{\mathrm{H}}$ (in interval timer mode) or matches the comparison value (in free-run compare mode).

An interrupt request can also be generated on starting and restarting of the counter. This is controlled by the OSTMnCTL.OSTMnMD0 bit.

Since OSTMnTINT triggers toggling of the OSTMnTTOUT output in timer output toggling mode (OSTMnTOE.OSTMnTOE is 1), the setting of the OSTMnCTL.OSTMnMD0 bit also affects the output (OSTMnTTOUT).

Figure 29.3 Generating an Interrupt when Counting Starts (Interval Timer Mode)

### 29.3 Registers

The OS timers are controlled and operated by the following registers.

### 29.3.1 List of Registers

The list of OSTMn registers and the memory addresses are as follows.
For the base addresses, see Table 29.2.
Table 29.7 List of Registers

| Module Name | Register Name | Symbol | Address | Access Size | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| OSTMn | OSTM Compare Register | OSTMnCMP | <OSTMn_base> + 00 ${ }_{\text {H }}$ | 32 | - |
|  | OSTM Counter Register | OSTMnCNT | <OSTMn_base> + 04H | 32 | - |
|  | OSTM Output Register | OSTMnTO | <OSTMn_base> + 08H | 8 | - |
|  | OSTM Output Enable Register | OSTMnTOE | <OSTMn_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
|  | OSTM Count Enable Status Register | OSTMnTE | <OSTMn_base> + 10 ${ }_{\text {H }}$ | 8 | - |
|  | OSTM Count Start Trigger Register | OSTMnTS | <OSTMn_base> + $14_{\text {H }}$ | 8 | - |
|  | OSTM Count Stop Trigger Register | OSTMnTT | <OSTMn_base> + 18 H | 8 | - |
|  | OSTM Control Register | OSTMnCTL | <OSTMn_base> + $20_{\text {H }}$ | 8 | - |

### 29.3.2 Detail of Registers

### 29.3.2.1 OSTMnCMP — OSTM Compare Register

Depending on the mode of operation, this register holds the start value for the down-counter or the value for comparison with that of the counter.

Table 29.8 OSTMnCMP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OSTMnCMP[31:0] | In interval timer mode: Start value of the down-counter |
|  |  | In free-run compare mode: Value for comparison |

### 29.3.2.2 OSTMnCNT — OSTM Counter Register

This register indicates the counter value of the timer.

Table 29.9 OSTMnCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OSTMnCNT[31:0] | 32-bit counter value |

Table 29.10 lists the correspondence between the OSTM operating mode, counting direction, and start value.
The start value indicates the value to be read after the operating mode is changed.
Table 29.10 Correspondence between Operating Mode, Counting Direction and Start Value

| Timer Operating Mode | OSTMnCTL.OSTMnMD1 | Counting Direction | Start Value $^{\star 2}$ |
| :--- | :--- | :--- | :--- |
| Interval timer mode | $0^{\star 1}$ | Down count | FFFF FFFF $_{\mathrm{H}}$ |
| Free-run compare mode | 1 | Up count | $00000000_{\mathrm{H}}$ |

Note 1. Value after reset
Note 2. The start value is the value that is read after the operating mode has been changed following reset input.
When OSTMnTE.OSTMnTE $=0$ (counter stop status), the OSTMnCNT register can be written.
When the operation mode of the counter is changed with OSTMnCTL.OSTMnMD2 $=1$, write any value to the OSTMnCNT register before the counter operation starts.

### 29.3.2.3 OSTMnTO — OSTM Output Register

The OSTM output register is used to specify and read the level of OSTMnTTOUT output signals. The setting of this register is only valid in OSTM0.

Value after reset: $\quad 00_{H}$

Table 29.11 OSTMnTO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | OSTMnTO | This bit specifies/reads the level of OSTMnTTOUT output signals. |
|  |  | 0: Low level |
|  | 1: High level |  |

### 29.3.2.4 OSTMnTOE — OSTM Output Enable Register

The OSTM output enable register specifies OSTMnTTOUT output mode. The setting of this register is only valid in OSTM0.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OStMnTOE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 29.12 OSTMnTOE Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | OSTMnTOE | This bit specifies the OSTMnTTOUT output mode. |
|  |  | 0 : Software control mode: <br> The level corresponding to the setting of OSTMnTO.OSTMnTO is output to OSTMnTTOUT. |
|  |  | 1: Timer-output toggling mode: <br> OSTMnTTOUT output is toggled whenever an OSTMnTINT interrupt request is generated. |

### 29.3.2.5 OSTMnTE — OSTM Count Enable Status Register

This register indicates whether the counter is enabled or disabled.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OSTMnTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 29.13 OSTMnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is read. |
| 0 | OSTMnTE | This bit indicates whether the counter is enabled or disabled. |
|  | 0: Counter disabled |  |
|  |  | 1: Counter enabled |
|  |  | This bit is set to 1 in response to OSTMnTS.OSTMnTS being set to 1, or to the OSTMnTSST |
|  | signal (when timer synchronization of PIC1 is in use) becoming 1. |  |
|  |  |  |
|  |  |  |
| NOTE bit is reset to 0 when the OSTMnTT.OSTMnTT bit is set to 1. |  |  |

When OSTMnTS.OSTMnTE $=0$, the counter retains its value .
If the counter is restarted when OSTMnCTL.OSTMnMD2 $=0$,

- It restarts counting down from the value in the OSTMnCMP register in interval timer mode.
- It restarts counting up from the counter value 00000000 H in free-run compare mode.

If OSTMnCTL.OSTMnMD2 = 1, the counter is not initialized.

### 29.3.2.6 OSTMnTS — OSTM Count Start Trigger Register

This register starts the counter.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OSTMnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 29.14 OSTMnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | OSTMnTS | This bit starts the counter. |
|  | $0:$ This setting is invalid. |  |
|  |  | 1: Starts the counter and sets OSTMnTE.OSTMnTE $=1$. |
|  | In interval timer mode, a forced restart is executed if this bit is set while OSTMnTE.OSTMnTE |  |
|  | $=1$. |  |
|  |  | In free-run compare mode, setting this bit is ignored as long as OSTMnTE.OSTMnTE $=1$. |

### 29.3.2.7 OSTMnTT — OSTM Count Stop Trigger Register

This register stops the counter.

## Value after reset: $\quad 00_{H}$

Table 29.15 OSTMnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | OSTMnTT | Stops the counter. |
|  | $0:$ This setting is invalid. |  |
|  |  | 1: Stops the counter and clears the OSTMnTE.OSTMnTE bit. |

### 29.3.2.8 OSTMnCTL — OSTM Control Register

This register specifies the operating mode for the counter and controls enabling/disabling of OSTMnTINT interrupt requests when counting starts.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OSTMnIE | - | - | - | - | OSTMnMD2 | OSTMnMD1 | OSTMnMD0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R/W | R/W | R/W |

Table 29.16 OSTMnCTL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | OSTMnIE | OSTM Interrupt enable <br> This bit is the enable bit of the OSTM Interrupt (OSTMnTINT) <br> 0 : OSTMn interrupt request is disabled. <br> 1: OSTMn interrupt request is enabled. |
| 6 to 3 | - | Reserved <br> When read, the value after reset is read. When writing, write the value after reset. |
| 2 | OSTMnMD2 | Control of the counter operation at counter operation start <br> This bit controls the counter operation at counter operation start regardless of whether the counter currently is disabled or enabled (OSTMnTE.OSTMnTE $=0$ to 1 ). <br> 0 : OSTMnCNT is loaded at counter operation start <br> The following describes the value of the counter at counter operation start. <br> - Interval timer mode: <br> The OSTMnCMP[31:0] value is loaded to OSTMnCNT[31:0] at counter start. <br> - Free-run compare mode: <br> The value of $00000000_{H}$ is loaded to OSTMnCNT[31:0] at counter operation start. <br> 1: OSTMnCNT is not loaded at counter operation start |
| 1 | OSTMnMD1 | Specifies the operating mode for the counter. <br> 0 : Interval timer mode <br> 1: Free-run compare mode |
| 0 | OSTMnMD0 | Controls enabling/disabling of OSTMnTINT interrupt requests when counting starts. <br> 0 : Disables the interrupts when counting starts. <br> 1: Enables the interrupts when counting starts. |

### 29.4 Operation

Each OS timer is a 32-bit timer/counter.
The settings for the operating mode specify the direction of counting (up or down) and the generation of interrupt requests.

### 29.4.1 Starting and Stopping OSTM

The OS timer is started and stopped as follows.

## Starting the timer

Figure 29.4 shows the flow of starting the counter of OSTMn. For details on the operations of the timer in interval timer mode and free-run timer mode in a given step of the figure, see the descriptions in Section 29.4.2, Interval Timer Mode, and Section 29.4.3, Free-Run Compare Mode.

Note 1. For generating an output waveform on the $\overline{\text { ERROROUT_M }}$ pin or $\overline{\text { ERROROUT_C }}$ pin, make settings for only OSTM0 to control OSTMOTTOUT.
This setting is not required for OSTMn ( $\mathrm{n}=$ other than 0 ).

Figure 29.4 Flow of Starting the OS Timer

## Stopping the timer

Setting the OSTMnTT.OSTMnTT bit to 1 stops the timer and clears the OSTMnTE.OSTMnTE status flag bit.

## Timer Synchronization (PIC1)

The OSTMnTSST signal can be used to start multiple timers at the same time. For detailed connections, refer to Section 33, Peripheral Interconnection (PIC).

### 29.4.2 Interval Timer Mode

Select the interval timer mode when an OS timer is to be used as a reference timer for generating interrupt requests at a fixed interval.

### 29.4.2.1 Basic Operation in Interval Timer Mode

The interval timer mode is set when count mode selection bit OSTMnMD1 is set to " 0 ". In the interval timer mode, the OSTM can be used as the reference timer generating the OSTMnTINT interrupt at fixed intervals. Upon occurrence of an interrupt, OSTMnTTOUT performs a toggle operation and outputs a square wave. The periods of OSTMnTINT and OSTMnTTOUT are as follows.

- OSTMnTINT generation cycle $=$ Count-clock cycle $\times($ OSTMnCMP +1$)$
- OSTMnTTOUT output cycle $=$ OSTMnTINT generation period $\times 2$

OSTMnCMP can be rewritten at any timing, and if it is rewritten during OSTMnCNT operation $($ OSTMnTE $=1)$, OSTMnCNT reloads the new OSTMnCMP value upon the next $00000000_{\mathrm{H}}$ match detection, and the count operation continues. Then, when " 1 " is written to OSTMnTT to clear OSTMnTE to " 0 ", the counter and OSTMnTO stops operation while holding their values as they are.

When OSTMnMD2 $=0$, OSTMnCMP[31:0] value is stored to OSTMnCNT at counter operation start.
When OSTMnMD2 $=1, \operatorname{OSTMnCMP}[31: 0]$ value is not stored to OSTMnCNT at counter operation start.

Note: $\quad$ OSTMnMDO $=1$ (interrupts at count start enabled), OSTMnTOE $=1$ (OSTMnTTOUT performs toggle output), OSTMnIE=1 (interrupt output is enabled)

Figure 29.5 Timing Diagram of OSTMn in Interval Timer Mode (OSTMnMD2 = 0)

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$ or OSTMnTSST $=1$. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.

The counter starts counting-down from the value of OSTMnCMP. If OSTMnCTL.OSTMnMD0 is 1 ,

OSTMnTINT interrupt requests are generated at the start of counting and the OSTMnTTOUT signal is toggled The OSTMnCNT register indicates the counter value.
(2) When the counter reaches $00000000_{\mathrm{H}}$, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled. The counter loads the new start value from OSTMnCMP and continues counting down.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
(4) When counting is restarted ( $\mathrm{OSTMnTS} . \mathrm{OSTMnTS}=1$, or $\mathrm{OSTMnTSST}=1$ ), the counter loads the new start value from OSTMnCMP and starts counting down.

Note: OSTMnMD0 = 1 (interrupts at count start enabled), OSTMnTOE = 1 (OSTMnTTOUT performs toggle output), OSTMnIE=1 (interrupt output is enabled)

Figure 29.6 Timing Diagram of OSTMn in Interval Timer Mode (OSTMnMD2 = 1)

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$ or OSTMnTSST $=1$. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter.
The counter starts counting-down from the value written to OSTMnCNT.
If OSTMnCTL.OSTMnMD0 is 1 , OSTMnTINT interrupt requests are generated at the start of counting and the OSTMnTTOUT signal is toggled. The OSTMnCNT register contains the current value as the counter.
(2) When the counter reaches $00000000_{\mathrm{H}}$, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled. The counter loads the new start value from OSTMnCMP and continues counting down.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
(4) When counting is restarted (OSTMnTS.OSTMnTS $=1$, or OSTMnTSST $=1$ ), the counter keeps the value when it was stopped and starts counting down.

### 29.4.2.2 Operation when $O S T M n C M P=00000000_{H}^{H}$

When OSTMnCMP $=00000000_{\mathrm{H}}$, the OS timer behaves as follows.

- If the counter is enabled, the OSTMnTINT interrupt request will always be set to 1 . However, the timer (OSTMnTTOUT) output signal can still be used. Timer (OSTMnTTOUT) output using timer output toggling mode results in OSTMnTTOUT being toggled at every cycle of the count clock.

The following figure shows the operation of OSTMn when $\mathrm{OSTMnCMP}=00000000_{\mathrm{H}}$, the counter start interrupt is enabled (OSTMnCTL.OSTMnMD0 = 1), and the timer is in timer output toggling mode, where OSTMnTTOUT is toggled (OSTMnTOE.OSTMnTOE $=1$ ).

Figure 29.7 Timing Diagram when OSTMnCMP $=00000000_{\mathrm{H}}$ in Interval Timer Mode

The timing diagram above shows the following operations:
(1) The counter is reloaded with the value in OSTMnCMP as soon as it starts counting, so the value $00000000_{\mathrm{H}}$ is retained in OSTMnCNT.
(2) While the OSTMnTINT interrupt request signal is continuously asserted, OSTMnTTOUT is toggled (in Figure 29.7, OSTMnTINT is fixed to the high level because PCLK is selected as the count clock).
(3) After the counter stops, the OSTMnTINT interrupt request signal is deasserted and the output level of the OSTMnTTOUT signal is maintained.

When an interrupt is prohibited when the counter starts, 1 clock cycle of the count clock is not generated at the start timing of the counter.

### 29.4.2.3 Forced Restart Operation in Interval Timer Mode

Forced restart operation is performed by writing " 1 " to the OSTMnTS count start register during the count operation (OSTMnTE = 1) in the interval timer mode. At this time, the OSTMnCNT counter immediately reloads the OSTMnCMP compare register and the count operation continues.

## CAUTION

If the OSTMnTS.OSTMnTS bit for a desired channel is set to 1 while simultaneous starting of multiple channels of the timer is in progress, the individual channels are forcibly restarted, so synchronous operation between the channels is not guaranteed.

If simultaneous starting of PIC1 is used while multiple channels of the timer start individually, the timers set for simultaneous starting are forcibly restarted at the same time.

Forced restart operation is performed regardless of the value of OSTMnCTL.OSTMnMD2.

Writing " 1 " to OSTMnTS during counter operation in interval timer mode
$\rightarrow$ Enabled (forced restart operation is performed)

Note: OSTMnMD0 = 1 (interrupts at count start enabled), OSTMnTOE = 1 (OSTMnTTOUT performs toggle output), OSTMnIE=1 (interrupt output is enabled).

Figure 29.8 Forced Restart Operation in Interval Timer Mode

The operations shown in the above timing diagram are as follows.
(1) The counter is started and stopped as described under Figure 29.5 or Figure 29.6.
(2) Setting OSTMnTS.OSTMnTS $=1$ or OSTMnTSST $=1$ restarts the counter while counting is in progress (i.e. while OSTMnTE.OSTMnTE = 1).
The counter immediately restarts counting down, starting with the current value of OSTMnCMP.
When OSTMnCTL.OSTMnMD0 $=1$, an OSTMnTINT interrupt request is generated when counting starts and the OSTMnTTOUT signal is toggled.

### 29.4.3 Free-Run Compare Mode

### 29.4.3.1 Basic Operation in Free-Run Compare Mode

The free-run compare mode is set when count mode selection bit OSTMnMD1 is set to " 1 ". In the free-run compare mode, the OSTMnTINT interrupt is output when the value of the OSTMnCMP compare register and the count value match. OSTMnTTOUT performs a toggle operation.

When OSTMnMD2 $=0, \operatorname{OSTMnCNT}[31: 0]$ is cleared to $00000000_{\mathrm{H}}$ at counter operation start.
When OSTMnMD2 $=1$, OSTMnCNT is not cleared at counter operation start.

Note: $\quad$ OSTMnMDO $=1$ (interrupts at count start enabled), OSTMnTOE $=1$ (OSTMnTTOUT performs toggle output), OSTMnIE = 1 (interrupt output is enabled).

Figure 29.9 Timing Diagram of OSTMn in Free-Run Compare Mode (OSTMnMD2 = 0)

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$, or when $\operatorname{OSTMnTSST}=1$. The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter counts up from $00000000_{\mathrm{H}}$ to FFFF $\mathrm{FFFF}_{\mathrm{H}}$. The OSTMnCNT register indicates the counter value. When the OSTMnCTL.OSTMnMD0 set to 1 , the interrupt request OSTMnTINT is generated when the counting starts.
(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
(4) When restarting the counter by setting OSTMnTS.OSTMnTS $=1$, the counter starts from $00000000_{\mathrm{H}}$.

The OSTMnTINT and OSTMnTTOUT occurrence timing in the free-run compare mode may not be a constant period depending on the usage conditions. This occurs at count start and when OSTMnCMP is rewritten during the count operation. This is explained using Figure 29.9.

Table 29.17 Timing of OSTMnTINT Generation
$\left.\begin{array}{l|l|l|l|l}\hline \begin{array}{l}\text { Old value for } \\ \text { comparison }\end{array} & \begin{array}{l}\text { New value for } \\ \text { comparison }\end{array} & \begin{array}{l}\text { Counter value at time of } \\ \text { rewriting }\end{array} & \text { Period of OSTMnTINT Generation }\end{array} \begin{array}{l}\text { Label in } \\ \text { timing } \\ \text { diagram }\end{array}\right]$

Even during the count operation, OSTMnCMP rewrite is immediately reflected, and OSTMnCNT match judgment is executed. When " 1 " is written to OSTMnTT to set OSTMnTE $=0$, the counter and OSTMnTO stop operation while holding their values.

Basic operation in free-run compare mode (OSTMnMD2 = 1)

Note: $\quad$ OSTMnMDO $=1$ (interrupts at count start enabled), OSTMnTOE $=1$ (TOUT performs toggle output), OSTMnIE = 1 (interrupt output is enabled)

Figure 29.10 Timing Diagram of OSTMn in Free-Run Compare Mode (OSTMnMD2 = 1)

The timing diagram above shows the following:
(1) The counter starts counting when OSTMnTS.OSTMnTS $=1$, or when $\operatorname{OSTMnTSST}=1$.

The OSTMnTE.OSTMnTE bit is set to indicate enabling of the counter. The counter starts count up to FFFF FFFFH from the value written to the OSTMnCNT register. The OSTMnCNT register is the counter, so it contains the current value. When the OSTMnCTL.OSTMnMD0 set to 1 , the OSTMnTINT interrupt request is generated when counting starts.
(2) When the current counter value matches the value in the OSTMnCMP register, an OSTMnTINT interrupt request is generated and the OSTMnTTOUT signal is toggled.
(3) When the counter is stopped (OSTMnTT.OSTMnTT = 1), the OSTMnTE.OSTMnTE bit is cleared to indicate disabling of the counter. The counter retains its current value until it is restarted.
(4) Counting by the counter restarts from the value at which counting stopped when OSTMnTS.OSTMnTS $=1$, or when $\operatorname{OSTMnTSST}=1$.

### 29.4.3.2 Operation when OSTMnCMP $=00000000^{\boldsymbol{H}}$

The following figure shows the operation of OSTMn when $\mathrm{OSTMnCMP}=00000000_{\mathrm{H}}$, counter-start interrupts are enabled (OSTMnCTL.OSTMnMD0 $=1$ ) and the timer is in timer output toggling mode, where OSTMnTTOUT is toggled (OSTMnTOE.OSTMnTOE = 1).

Figure 29.11 Timing Diagram when OSTMnCMP $=0000$ 0000H in Free-Run Compare Mode

The timing diagram above shows the following operations.
(1) Once the counter starts, it counts up from $00000000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$.
(2) An OSTMnTINT interrupt request is generated when counting starts and the OSTMnTTOUT signal is toggled.
(3) If the current counter value matches OSTMnCMP, the interrupt request OSTMnTINT is generated. If OSTMnCMP $=00000000_{\mathrm{H}}$ as shown above, OSTMnTINT is generated over two clock cycles and the OSTMnTTOUT signal is toggled.
(4) For every ( $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}+1$ ) clock cycles, the OSTMnTINT interrupt request signal is asserted and the OSTMnTTOUT signal is toggled.

When an interrupt is prohibited when the counter starts, 1 clock cycle of the count clock is not generated at the start timing of the counter.

### 29.4.3.3 Forced Restart Operation in Free-Run Compare Mode

In the free-run compare mode, forced restart operation is not performed even when " 1 " is written to OSTMnTS during the count operation ( $\mathrm{OSTMnTS}=1$ ). The OSTMnCNT counter continues counting at this time.

Forced restart operation is performed regardless of the value of OSTMnCTL.OSTMnMD2.

## Section 30 ATU-V

### 30.1 Features of ATU-V

### 30.1.1 Units and Channels

This microcontroller has the following number of ATU-V units.
Table 30.1 Number of Units (1/2)

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
|  | 1 | 1 |
| Unit Name | ATU-Vn $(\mathrm{n}=0)$ | ATU-Vn $(\mathrm{n}=0)$ |

Table $30.1 \quad$ Number of Units (2/2)

| Product Name | RH850/E2M |  |
| :--- | :--- | :--- |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Unit Name | ATU-Vn $(\mathrm{n}=0)$ | ATU-Vn $(\mathrm{n}=0)$ |

Table 30.2 Index

| Index | Description |
| :--- | :--- |
| n | This section identifies each ATU-V channel by " n " $(\mathrm{n}=0)$. |

### 30.1.2 Register Base Address

ATU-V register addresses are represented by an offset from the base address.
The following table shows the base address of each ATU-V.
Table 30.3 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ATU5CTRL_base> | FFE6 $0000_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5A_base> | FFE6 $0200_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5B_base> | FFE6 $0400_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5C_base> | FFE6 $0800_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5D_base> | FFE6 $2000_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5E_base> | FFE6 $4000_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5F_base> | FFE6 $5000_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5G_base> | FFE6 $5 \mathrm{C} 00_{\mathrm{H}}$ | Peripheral Group 2H |
| <ATU5TRG_base> | FFE6 $8000_{\mathrm{H}}$ | Peripheral Group 2H |

### 30.1.3 Clock Supply

The ATU-V clock supply is shown in the following table.
Table 30.4 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| ATU-Vn | ATU-V counter clock source (PCLK) | CLK_LSB |

### 30.1.4 Interrupts Requests

ATU-V interrupt requests are listed in the following table.
Table 30.5 Interrupt Requests (1/24)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt Number |  |  | Note. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INTATUASLIAO | INTATUASLIAO | ICRA0 input capture interrupt ICRA1 input capture interrupt ICRA2 input capture interrupt ICRA3 input capture interrupt ICRA4 input capture interrupt ICRA5 input capture interrupt ICRA6 input capture interrupt ICRA7 input capture interrupt | 10 | - | - | Selected by ATU_INTSEL_A0[2:0] bits of ATUINTSELA register. |
| INTATUASLIA1 | INTATUASLIA1 | ICRA0 input capture interrupt ICRA1 input capture interrupt ICRA2 input capture interrupt ICRA3 input capture interrupt ICRA4 input capture interrupt ICRA5 input capture interrupt ICRA6 input capture interrupt ICRA7 input capture interrupt | 11 | - | - | Selected by ATU_INTSEL_A1[2:0] bits of ATUINTSELA register. |
| INTATUASLIA2 | INTATUASLIA2 | ICRA0 input capture interrupt ICRA1 input capture interrupt ICRA2 input capture interrupt ICRA3 input capture interrupt ICRA4 input capture interrupt ICRA5 input capture interrupt ICRA6 input capture interrupt ICRA7 input capture interrupt | 12 | - | - | Selected by ATU_INTSEL_A2[2:0] bits of ATUINTSELA register. |
| INTATUASLIA3 | INTATUASLIA3 | ICRA0 input capture interrupt ICRA1 input capture interrupt ICRA2 input capture interrupt ICRA3 input capture interrupt ICRA4 input capture interrupt ICRA5 input capture interrupt ICRA6 input capture interrupt ICRA7 input capture interrupt | 13 | - | - | Selected by <br> ATU_INTSEL_A3[2:0] bits of ATUINTSELA register. |
| INTATUAICIAO | INTATUAICIAO | ICRA0 input capture interrupt | 78 | group1-38, group1-166 | group2-38, group2-102 | - |
| INTATUAICIA1 | INTATUAICIA1 | ICRA1 input capture interrupt | 79 | group1-39, group1-167 | group2-39, group2-103 | - |
| INTATUAICIA2 | INTATUAICIA2 | ICRA2 input capture interrupt | 80 | group1-40, <br> group1-168 | group2-40, group2-104 | - |

Table 30.5 Interrupt Requests (6/24)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number |  |  | Note. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INTATUDSLID11 | INTATUDSLID11 | OCR1D1_1 compare match interrupt | 145 | - | - | Selected by ATU_INTSEL_D11[2:0] bits of ATUINTSELDO register. |
|  |  | OCR2D1_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D1_1 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D1_1 occurrence interrupt |  |  |  |  |
|  |  | UDID1_1 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID12 | INTATUDSLID12 | OCR1D1_2 compare match interrupt | 146 | - | - | Selected by ATU_INTSEL_D12[2:0] bits of ATUINTSELDO register. |
|  |  | OCR2D1_2 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D1_2 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D1_2 occurrence interrupt |  |  |  |  |
|  |  | UDID1_2 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID13 | INTATUDSLID13 | OCR1D1_3 compare match interrupt | 147 | - | - | Selected by ATU_INTSEL_D13[2:0] bits of ATUINTSELDO register. |
|  |  | OCR2D1_3 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D1_3 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D1_3 occurrence interrupt |  |  |  |  |
|  |  | UDID1_3 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID20 | INTATUDSLID20 | OCR1D2_0 compare match interrupt | 148 | - | - | Selected by ATU_INTSEL_D20[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D2_0 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D2_0 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D2_0 occurrence interrupt |  |  |  |  |
|  |  | UDID2 0 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID21 | INTATUDSLID21 | OCR1D2_1 compare match interrupt | 149 | - | - | Selected by ATU_INTSEL_D21[2:0] bits of ATUİNTSELD1 1 register. |
|  |  | OCR2D2_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D2_1 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D2_1 occurrence interrupt |  |  |  |  |
|  |  | UDID2_1 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID22 | INTATUDSLID22 | OCR1D2_2 compare match interrupt | 150 | - | - | Selected by ATU_INTSEL_D22[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D2_2 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D2_2 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D2_2 occurrence interrupt |  |  |  |  |
|  |  | UDID2_2 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID23 | INTATUDSLID23 | OCR1D2_3 compare match interrupt | 151 | - | - | Selected by ATU_INTSEL_D23[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D2_3 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D2_3 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D2_3 occurrence interrupt |  |  |  |  |
|  |  | UDID2_3 down-counter underflow interrupt |  |  |  |  |

Table 30.5 Interrupt Requests (7/24)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number |  |  | Note. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INTATUDSLID30 | INTATUDSLID30 | OCR1D3_0 compare match interrupt | 152 | - | - | Selected by ATU_INTSEL_D30[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D3_0 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D3_0 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D3_0 occurrence interrupt |  |  |  |  |
|  |  | UDID3_0 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID31 | INTATUDSLID31 | OCR1D3_1 compare match interrupt | 153 | - | - | Selected by ATU_INTSEL_D31[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D3_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D3_1 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D3_1 occurrence interrupt |  |  |  |  |
|  |  | UDID3_1 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID32 | INTATUDSLID32 | OCR1D3_2 compare match interrupt | 154 | - | - | Selected by ATU_INTSEL_D32[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D3_2 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D3_2 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D3_2 occurrence interrupt |  |  |  |  |
|  |  | UDID3_2 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID33 | INTATUDSLID33 | OCR1D3_3 compare match interrupt | 155 | - | - | Selected by ATU_INTSEL_D33[2:0] bits of ATUINTSELD1 register. |
|  |  | OCR2D3_3 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D3_3 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D3_3 occurrence interrupt |  |  |  |  |
|  |  | UDID3_3 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID40 | INTATUDSLID40 | OCR1D4_0 compare match interrupt | 156 | - | - | Selected by ATU_INTSEL_D40[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D4_0 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D4_0 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D4_0 occurrence interrupt |  |  |  |  |
|  |  | UDID4_0 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID41 | INTATUDSLID41 | OCR1D4_1 compare match interrupt | 157 | - | - | Selected by ATU_INTSEL_D41[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D4_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D4_1 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D4_1 occurrence interrupt |  |  |  |  |
|  |  | UDID4_1 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID42 | INTATUDSLID42 | OCR1D4_2 compare match interrupt | 158 | - | - | Selected by ATU_INTSEL_D42[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D4_2 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D4_2 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D4_2 occurrence interrupt |  |  |  |  |
|  |  | UDID4_2 down-counter underflow interrupt |  |  |  |  |

Table 30.5 Interrupt Requests (8/24)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number |  |  | Note. |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| INTATUDSLID43 | INTATUDSLID43 | OCR1D4_3 compare match interrupt | 159 | - | - | Selected by ATU_INTSEL_D43[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D4_3 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D4_3 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D4_3 occurrence interrupt |  |  |  |  |
|  |  | UDID4_3 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID50 | INTATUDSLID50 | OCR1D5_0 compare match interrupt | 160 | - | - | Selected by ATU_INTSEL_D50[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D5_0 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D5_0 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D5_0 occurrence interrupt |  |  |  |  |
|  |  | UDID5 0 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID51 | INTATUDSLID51 | OCR1D5_1 compare match interrupt | 161 | - | - | Selected by ATU_INTSEL_D51[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D5_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D5_1 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D5_1 occurrence interrupt |  |  |  |  |
|  |  | UDID5_1 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID52 | INTATUDSLID52 | OCR1D5_2 compare match interrupt | 162 | - | - | Selected by ATU_INTSEL_D52[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D5_2 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D5_2 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D5_2 occurrence interrupt |  |  |  |  |
|  |  | UDID5 2 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID53 | INTATUDSLID53 | OCR1D5_3 compare match interrupt | 163 | - | - | Selected by ATU_INTSEL_D53[2:0] bits of ATUINTSELD2 register. |
|  |  | OCR2D5_3 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D5_3 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D5_3 occurrence interrupt |  |  |  |  |
|  |  | UDID5_3 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID60 | INTATUDSLID60 | OCR1D6_0 compare match interrupt | 164 | - | - | Selected by ATU_INTSEL_D60[2:0] bits of ATUINTSELD3 register. |
|  |  | OCR2D6_0 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D6_0 occurrence interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D6_0 occurrence interrupt |  |  |  |  |
|  |  | UDID6_0 down-counter underflow interrupt |  |  |  |  |
| INTATUDSLID61 | INTATUDSLID61 | OCR1D6_1 compare match interrupt | 165 | - | - | Selected by ATU_INTSEL_D61[2:0] bits of ATUİNTSELD̄̄3 register. |
|  |  | OCR2D6_1 compare match interrupt |  |  |  |  |
|  |  | 1shot pulse ON D6_1 occurrence interrupt interrupt |  |  |  |  |
|  |  | 1shot pulse OFF D6_1 occurrence interrupt |  |  |  |  |
|  |  | UDID6_1 down-counter underflow interrupt |  |  |  |  |

Table 30.5 Interrupt Requests (9/24)

| Interrupt Symbol Name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA <br> Trigger <br> Number | DTS <br> Trigger <br> Number | Note. |

## Timer G

Not provided

### 30.2 Overview

The ATU-V has the following features.

- ATU-V consists of 7 timer blocks (timer A to timer G), prescalers, and a controller. The timer blocks have different functions and each can operate independently; timer blocks can also be linked via the clock bus. Each timer block consists of one or more timer subblocks, and each subblock has one or more channels. The Numbers of subblocks/channels are shown in "Table 30.13, Block Configuration", please refer.
- Timer A has a free run counter, and can capture by an assertion of the external event inputs.
- Timer B can generates a multiplied-and-corrected clock signal based on an external event input. It can also supply the generated signal to other timers.
- Timer C is a general-purpose timer, input capture or output compare is selectable.
- Timer D can output one-shot pulses.
- Timer E is a PWM output timer.
- Timer F can be used as a measurement timer for external inputs. 7 operation modes are available.
- Timer $G$ has a counter and can use as an interval timer.
- Equipped with a function to output pulses to A/D and DFE
- On-chip 4-channel prescaler provided, which generates four types of clocks by dividing on-chip peripheral clock (PCLK) by $1 / 1$ to $1 / 1024$
- Each channel for a timer can select a count source from among four divided clocks generated by prescaler, two external clocks, and angle clock generated by timer B.
- Pin output values of timers C, D, and E can be selected by the RHSB cross bar and then output as data to the RHSB.

## <<Timer A>>

Timer A has a 32-bit free-run counter and $\mathrm{SB}_{\mathrm{A}}$ 32-bit input capture registers. Its features are shown below.

- Detection by rising edges, falling edges, or both edges
- Activating the DMAC at the capture timing
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per channel
- The level of each external input pin can be read.
- A capture interrupt request and a counter overflow interrupt request can be generated.
- Signals after noise cancellation can be sent to external input pins of timer F.

## <<Timer B>>

Timer B consists of three subblocks: an edge-interval measuring block, frequency-multiplied clock generator, and frequency-multiplied clock signal corrector.

## Edge-Interval Measuring Block

The edge-interval measuring block is provided with a 32 -bit input edge-interval measuring timer, three output compare and input capture registers, six edge-interval time measured value recording registers, seven edge-interval time measured value history registers, 8 -bit event counter, and output compare register. This provides the following operations:

- Capture by edges of external event input (rising edge, falling edge, or both edges are selectable)
- Capture by event compare match of external event input
- Automatic event counter clear by event compare match
- Capture interrupt and compare match interrupt (edge-interval compare match, event compare match)
- Captures event counter values individually by detection of $\mathrm{SB}_{\mathrm{A}}$ external event inputs from timer A .
- Generates reference data for down-count values used in the frequency-multiplied clock generator, from 24 sequencer states.

## Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator is provided with 24-bit reloadable counter, reload register, 20-bit multiplied clock counter, 26 -bit multiplied clock counter, capture register, and output compare register. This provides the following operations:

- Reloadable counting of values captured by edge-interval measuring block with arbitrary number (1 to 4095)
- Reloadable down-count values can be modified by event compare match of the edge-interval measuring block.
- Internal clock generated by the underflow of reloadable counter can be used as input of 20-bit multiplied clock counter and 26-bit multiplied clock counter.
- The 20-bit multiplied clock counter value can be captured by an edge input of external input event.
- An interrupt request for compare match between 20-bit multiplied clock counter and output compare register and an interrupt request for compare match between 26-bit multiplied clock counter and capture register can be generated.

## Frequency-Multiplied Clock Signal Corrector

Frequency-multiplied clock signal corrector is provided with 20-bit correcting event counter, 20-bit correcting multiplied clock counter, 20-bit multiplied-and-corrected clock generating counter, and correcting counter clearing register. This provides the following operations:

- Frequency-multiplied correcting clock that serves as the count source for other timers can be generated based on the read count in frequency-multiplied clock generator.
- The counter of timer D can be cleared by compare match (enabling or disabling this function selectable) between multiplied-and-corrected clock generating counter and correcting counter clearing register.
- The correcting event counter can be automatically cleared at the event compare match timing due to an external input event of the edge-interval measuring block.

## <<Timer C>>

Timer C consists of $\mathrm{SB}_{\mathrm{C}}$ subblocks that have the same functions. Each subblock is provided with a 32-bit counter, four 32-bit general registers, four 32-bit compare match registers, four range comparison value setting registers, four 32-bit general mirror registers, four 32-bit output comparison mirror registers, and a 32-bit upper-limit value setting register. This provides the following operations:

- Choice of rising edge, falling edge, or both edge sensing as the edge of input capture trigger signal.
- When timer C is used for input capture, capturing is possible at the timing of event output $1,2 \mathrm{~A}$, and 2 B from timer A.
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per subblock or channel
- 1,0 , toggle, or one-shot pulse waveform can be output by a compare match.
- Three PWM waveforms can be output for each subblock in PWM mode.
- Input capture/compare match interrupt and overflow interrupt can be generated. Input capture/compare match interrupts activate DMAC.
- One-shot pulse mode is possible for output.
- Upper-limit value setting function for 32-bit counters
- The range compare value setting register enables the range compare function for compare match output by compare match register.

## <<Timer D>>

Timer D consists of $\mathrm{SB}_{\mathrm{D}}$ subblocks that have the same function. Each subblock is provided with two 32-bit counters, an offset base register, an output value register, and an output setting register, and four channels. Each channel is provided with two 32-bit output compare registers, two range comparison value setting registers, two input capture registers, a 32-bit down-counter for outputting one-shot pulse, and two 32-bit upper-limit value setting registers. This provides the following operations:

- Enables to start down-counter by software. One-shot pulse can also be generated.
- Compare match in compare match register can be used as the start trigger for down-counter. One-shot pulse with offset can also be generated.
- Compare match in compare match register can stop down-counter and forcibly cut off one-shot pulse output.
- Compare match in compare match register can be output.
- Compare match range can be set by the range comparison value setting register (range compare function).
- Compare match in compare match register can be used as a trigger for capturing the count value into input capture register.
- Counter value can be captured triggered by timer A.
- Provided with counter clearing function from timer B
- Generation of $8 \times \mathrm{SB}_{\mathrm{D}}$ compare match interrupts, $2 \times \mathrm{SB}_{\mathrm{D}}$ counter overflow interrupts, and $4 \times \mathrm{SB}_{\mathrm{D}}$ underflow interrupts. The $4 \times \mathrm{SB}_{\mathrm{D}}$ underflow interrupts correspond to DMAC activation.
- Output waveform can be inverted.
- The value set in the output value register can be output from each pin by the output setting register.
- Upper-limit value setting function for 32-bit counters
- The MIN guard function which guarantees the MIN width for the "the MIN width of ON waveform", "the MIN width of the OFF waveform", and "ON to next ON" is loaded to the output waveform.

## <<Timer E>>

Timer E consists of $\mathrm{SB}_{\mathrm{E}}$ subblocks that have the same function. Each subblock consists of four channels. Each channel is provided with a 24 -bit counter, a 24 -bit duty cycle setting register, a 24 -bit cycle setting register, a 24 -bit duty cycle reload register, and a 24 -bit cycle reload register. This provides the following operations:

- PWM output with programmable cycle time and duty cycle ranging from 0 to $100 \%$ is possible by setting the cycle setting register and duty cycle setting register.
- The duty mode can be switched between on-state and off-state by setting the output control register.
- Values in duty cycle reload register and cycle reload register can be transferred to duty cycle setting register and cycle setting register at every cycle, respectively. The reload function can be enabled or disabled.
- Writing $000000_{\mathrm{H}}$ to the counter can forcibly finish the current PWM cycle and start another PWM cycle.
- PWM output can be blocked by shutoff input.
- $4 \times 2 \times \mathrm{SB}_{\mathrm{E}}$ interrupt requests can be output for cycle match and duty match. Also, $\mathrm{SB}_{\mathrm{E}}$ DMAC activation requests can be output by cycle match in channel 0 of each subblock.
- Compare match between TCNTExy and CYLRExy can forcibly be generated by setting the forced compare match bit.

## <<Timer F>>

Timer F consists of $\mathrm{SB}_{\mathrm{F}}$ subblocks. Each subblock is provided with two 32 -bit counters, a 16 -bit counter, three 32 -bit general registers, a 16-bit general register, three 32-bit backup registers, and input processing block. This provides the following operations:

- Detection level can be selected from rising edge, falling edge or both edges
- TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$ signals of timer A after noise cancellation can be used as external input signals.
- Noise canceling function for each external input pin with maximum length of 0.21 s or noise cancelling function using the angle clock
- Selectable noise canceling mode per subblock or channel
- Seven operation modes: edge counting in a specified period, effective edge input interval counting, measurement of time during high/low input, measurement of PWM input waveform timing, rotation speed/pulse measurement (subblocks 3 to $\mathrm{SB}_{\mathrm{F}}-1$ ), up/down count (subblocks 0 to 2 ), and four-time multiplication event count (subblocks 0 to 2).
- Activates DMAC by input capture interrupt request
- Generates an interrupt upon overflow, underflow, or capturing.
- A interrupt request can be generated on compare match in specified-period edge count mode, effective edge input interval measurement mode, input high/low level measurement mode, PWM input waveform measurement mode, up/down count mode, and four-time multiplication event count mode.

## <<Timer G>>

Timer G consists of $\mathrm{SB}_{\mathrm{G}}$ subblocks that have the same function. Each channel is provided with a 32 -bit timer counter and compare match register. This provides the following operations:

- An event can be output by using compare match as a trigger, which is used as A/D activation/interrupt request trigger.
- Activates DMAC by compare match interrupt request

### 30.2.1 Configuration of ATU-V

ATU-V is a macro for engine control that operates by using multiple timer block in combination.
ATU-V consists of seven timer blocks from timer A to timer G, prescalers, and a common controller unit. The timer blocks have different functions and each can operate independently; timer blocks can also be linked via the clock bus. Each timer block consists of one or more timer subblocks that have the same function, and each subblock has one or more channels (see Table 30.13, Block Configuration).

Table 30.13 Block Configuration

| Modules | Remarks |  |
| :---: | :---: | :---: |
| Blocks | Total_ch: Total number of channels |  |
| Subblock | SB: Number of subblocks SB_ch: Number of channels per subblock |  |
| ATU-V | RH850/E2x-FCC1 | RH850/E2M |
| Common controller unit | - | - |
| Prescaler | Total_ch: 4 | Total_ch: 4 |
| Chanel 0 |  |  |

### 30.3 Common Controller

### 30.3.1 Overview of Operation

The common controller controls the ATU-V module as a whole. For example, it enables and disables the prescalers and timer counters for timers A to $G$ and controls the clock bus.

## Clock Bus

The clock bus consists of six signal lines used to distribute the clock signals for counting (counter enabling signals) to the timer channels. The timer counters on each of the channels run in synchronization with the internal peripheral clock (PCLK), and the signals on the clock bus functions as the counter enabling signal for these timer counters.

The following table shows the signals that can be input on the clock bus.

| Bit Number of Clock <br> Bus | Input Signals |
| :--- | :--- |
| 5 | Output signal from timer B (angle clock) or external input clock B (TCLKB) |
| 4 | External input clock A (TCLKA) |
| 3 | Output signal from prescaler 3 |
| 2 | Output signal from prescaler 2 |
| 1 | Output signal from prescaler 1 |
| 0 | Output signal from prescaler 0 |

### 30.3.2 Registers Related to Common Controller

### 30.3.2.1 ATUENR — ATU Master Enable Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TGE | TFE | TEE | TDE | TCE | TBE | TAE | PSCE |

| 3 | TCE | Timer C enable bit <br> 0 : Timer C counter operation disabled <br> 1: Timer C counter operation enabled |
| 2 | TBE | Timer B enable bit <br> 0 : Timer B counter operation disabled <br> 1: Timer B counter operation enabled |
| 1 | TAE | Timer A enable bit <br> 0 : Timer A counter operation disabled <br> 1: Timer A counter operation enabled |
| 0 | PSCE | Prescaler enable bit <br> 0: Prescaler counter operation disabled <br> 1: Prescaler counter operation enabled |

ATUENR is an 8-bit readable/writable register. This register is used to enable and disable the prescalers and the individual blocks in ATU-V. Setting an enable bit to 1 enables the corresponding block. Clearing the bit to 0 disables the corresponding block. Even when the enable bit is cleared to 0 , the registers of these blocks remain accessible.

Timers can be synchronized by simultaneously setting multiple bits to 1 .

## Timer A Enable Bit (TAE)

Enables and disables counter operation of timer A.
When this bit is set to " 1 ", the timer A counter starts working. When this bit is cleared to " 0 ", the timer A counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

## Timer B Enable Bit (TBE)

Enables and disables counter operation of timer B.
When this bit is set to " 1 ", the timer B counter starts working. When this bit is cleared to " 0 ", the timer B counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

## Timer C Enable Bit (TCE)

Enables and disables counter operation of timer C.
When this bit is set to " 1 ", the timer C counter starts working. When this bit is cleared to " 0 ", the timer C counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TCE bit is set of the corresponding bit in the timer C start register is not set to " 1 ".

## Timer D Enable Bit (TDE)

Enables and disables counter operation of timer D.
When this bit is set to " 1 ", the timer D counter starts working. When this bit is cleared to " 0 ", the timer D counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TDE bit is set of the corresponding bit in the timer D start register is not set to " 1 ".

## Timer E Enable Bit (TEE)

Enables and disables counter operation of timer E.
When this bit is set to " 1 ", the timer E counter starts working. When this bit is cleared to " 0 ", the timer E counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TEE bit is set of the corresponding bit in the timer E start register is not set to " 1 ".

## Timer F Enable Bit (TFE)

Enables and disables counter operation of timer F.
When this bit is set to " 1 ", the timer F counter starts working. When this bit is cleared to " 0 ", the timer F counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TFE bit is set of the corresponding bit in the timer F start register is not set to " 1 ".

## Timer G Enable Bit (TGE)

Enables and disables counter operation of timer G.
When this bit is set to " 1 ", the timer G counter starts working. When this bit is cleared to " 0 ", the timer $G$ counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

Note, however, that the subblock counter does not start working when the TGE bit is set of the corresponding bit in the timer G start register is not set to " 1 ".

## Prescaler Enable Bit (PSCE)

Enables and disables counter operation of the prescaler.
When this bit is set to " 1 ", the prescaler counter starts working. When this bit is cleared to " 0 ", the prescaler counter stops working. When the counter is disabled, its value is retained. When this bit is set to " 1 " again, the counter resumes counting from the retained value.

## CAUTION

Timer operation setting should be done before starting.
Also, be sure to observe the cautions when using registers to be operated after startup.

### 30.3.2.2 CBCNT — Clock Bus Control Register

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | CB4EG[1:0] |  | - | CB5SEL | CB5EG[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R/W | R/W | R/W |

Table 30.15 CBCNT Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | These bits are not used. Fix these bits to 0 . |
| 5, 4 | CB4EG[1:0] | Clock bus 4 edge select bits <br> These bits specify the edge sense for external input clock (TCLKA) to be output on signal line 4 of the clock bus. <br> 00: Neither edge of the external clock is sensed. <br> 01: Rising edges of the external clock are sensed. <br> 10: Falling edges of the external clock are sensed. <br> 11: Both rising and falling edges of the external clock are sensed. |
| 3 | - | These bits are not used. Fix these bits to 0 . |
| 2 | CB5SEL | Clock bus 5 source select bit <br> This bit specifies the clock to be output on signal line 5 of the clock bus. <br> 0: External clock B (TCLKB) <br> 1: Angle clock output by timer B |
| 1, 0 | CB5EG[1:0] | Clock bus 5 edge select bits <br> These bits specify the edge sense for external input clock to be output on signal line 5 of the clock bus when CB5S is cleared to " 0 ". <br> 00: Neither edge of the external clock is sensed. <br> 01: Rising edges of the external clock are sensed. <br> 10: Falling edges of the external clock are sensed. <br> 11: Both rising and falling edges of the external clock are sensed. |

CBCNT is an 8-bit readable/writable register that selects the source of the clock signal to be supplied on the signal lines of the clock bus and the effective edge of the external clock signal.

## Clock Bus 4 Edge Select Bits (CB4EG[1:0])

These bits select the edge sense for externally input clock A (TCLKA). The clock signal is output on signal line 4 of the clock bus. Counters for which signal line 4 of the clock bus has been selected as the source for counting count on the edge selected by these bits.

## Clock Bus 5 Source Select Bit (CB5SEL)

This bit selects the source of the clock to be output on signal line 5 of the clock bus.

## Clock Bus 5 Edge Select Bits (CB5EG[1:0])

These bits select the edge sense for external input clock B (TCLKB). The clock signal is output on signal line 5 of the clock bus. Counters for which signal line 5 of the clock bus has been selected as the source for counting count on the edge selected by these bits.

The setting of these bits is only valid when the TCLKB signal is selected as the source for line 5 of the clock bus. When the angle clock is selected as the source for line 5 of the clock bus, the setting of these bits is ignored.

### 30.3.2.3 NCMR — Noise Cancellation Mode Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 4 | NCMSEL | Noise cancellation mode select bit <br> This bit selects minimum time-at-level cancellation mode or level accumulation cancellation mode. <br> 0 : Minimum time-at-level cancellation mode <br> 1: Level accumulation cancellation mode |
| 3 | - | This bit is not used. Fix this bit to 0 . |
| 2 | NCMF | Timer F noise cancellation mode bit <br> This bit specifies the operating mode of the timer F noise canceler. <br> 0 : Premature-transition cancellation mode <br> 1: Minimum time-at-level cancellation mode (when NCMSEL $=0$ ) <br> 1: Level accumulation cancellation mode (when NCMSEL = 1) |
| 1 | NCMC | Timer $C$ noise cancellation mode bit <br> This bit specifies the operating mode of the timer C noise canceler. <br> 0 : Premature-transition cancellation mode <br> 1: Minimum time-at-level cancellation mode (when NCMSEL $=0$ ) <br> 1: Level accumulation cancellation mode (when NCMSEL = 1) |
| 0 | NCMA | Timer A noise cancellation mode bit <br> This bit specifies the operating mode of the timer A noise canceler. <br> 0 : Premature-transition cancellation mode <br> 1: Minimum time-at-level cancellation mode (when NCMSEL = 0) <br> 1: Level accumulation cancellation mode (when NCMSEL = 1) |

NCMR is an 8-bit readable/writable register that selects the operating mode and clock to drive the counter for of the noise canceler in each of timers $\mathrm{A}, \mathrm{C}$, and F .

In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.
The period is set by noise canceler registers in each of the applicable blocks (i.e. in timers A, C, and F) and is counted by a noise canceler counter.

To disable noise cancellation mode from premature-transition/minimum time-at-level cancellation mode, do so after the value of the counter (timer A: NCNTA0 to 6; timer C: NCNTC00 to NCNTC03, NCNTC10 to NCNTC13, NCNTC20 to NCNTC23, NCNTC30 to NCNTC33, NCNTC40 to NCNTC43, NCNTC50 to 53, NCNTC60 to 63, NCNTC70 to 73; timer F: NCNTFA0 to 15 , NCNTFB0 to 2) held in each timer becomes $0000_{\mathrm{H}}$.

Outline of noise canceling operation (example of TIA00 input signal of timer A) is shown in Figure 30.1 (in premature-transition cancellation mode), Figure $\mathbf{3 0 . 2}$ (in minimum time-at-level cancellation mode), and Figure $\mathbf{3 0 . 3}$ (in level accumulation cancellation mode).

Each timer (A, C, and F) detects the edge of a signal that has passed through the noise canceler. Figure 30.1, Figure
30.2, and Figure $\mathbf{3 0 . 3}$ show an example of detecting the rising edge of a signal that has passed through the noise canceler.

## Noise Canceler Counter Clock Select Bit (NCCSEL)

Selects the clock for counting by the noise cancelers. Either of the internal peripheral clock (PCLK) divided by 128 or the internal peripheral clock can be selected. The default setting is the clock divided by 128 . The same counter clock must be used for all timers other than timer A. In the case of timer A, the clock signal on signal line 5 of the clock bus is also available. For setting the counter clock, see the description of the TIOR2A register in timer A.

## Noise Cancellation Mode Select Bit (NCMSEL)

Noise cancellation mode when each noise cancellation mode bit (NCMA, NCMC, or NCMF) is set to " 1 " can be set to minimum time-at-level cancellation mode or level accumulation cancellation mode.

## Timer F Noise Cancellation Mode Bit (NCMF)

Selects the noise cancellation mode for timer F. This bit cannot be used to specify the operating mode for each channel of timer F individually.

To specify the operation mode for each channel of timer F individually, set this bit to " 0 " and then set noise cancellation mode channel registers 1 F (NCMCR1F) and 2F (NCMCR2F).

## Timer C Noise Cancellation Mode Bit (NCMC)

Selects the noise cancellation mode for timer C. This bit cannot be used to specify the operating mode for each channel of timer C individually.

To specify the operation mode for each channel of timer C individually, set this bit to " 0 " and then set noise cancellation mode channel registers 1C (NCMCR1C) and 2C (NCMCR2C).

## Timer A Noise Cancellation Mode Bit (NCMA)

Selects the noise cancellation mode for timer A. This bit cannot be used to specify the operating mode for each channel of timer A individually.

To specify the operation mode for each channel of timer A individually, set this bit to " 0 " and then set noise cancellation mode channel registers 1A (NCMCR1A) and 2C (NCMCR2A).

The tables below show the truth table for settings that determine the noise cancellation mode.

## <<Timer A>>

Settings that Determine Noise Cancellation Modes for Timer A

| Channel <br> Enable | Filter Mode |  | Channel Register |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TIOR2A. <br> NCEAx | NCMR. <br> NCMA | NCMR. <br> NCMSEL | NCMCR1A. <br> NCM1Ax | NCMCR2A. <br> NCM2Ax | Mode of Cancellation | Unit of Filtering |
| 0 | - | - | - | - |  | - |
| 1 | 0 | $(-)$ | 0 | $(-)$ | Premature-transition | Individual channel/ <br> All channels |
| 1 | 0 | $(-)$ | 1 | 0 | Minimum time-at-level | Individual channel |
| 1 | 0 | $(-)$ | 1 | 1 | Level accumulation | Individual channel |
| 1 | 1 | $(0)$ | - | - | Minimum time-at-level | All channels |
| 1 | 1 | 1 | - | - | Level accumulation | All channels |

Note 1: $x=S B_{A}-1,0$
Note 2: The noise canceller enable bit (NCEAx) can be set for each channel.

## Methods of Setting Noise Cancellation for Timer A when the Unit of Filtering is Individual Channel (precondition: channel enable =1)

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) to " 0 ", set any noise cancellation mode channel setting bit (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A to " 1 ".

- Settings for all channels:

Set the noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) to " 1 ", or set all noise cancellation mode channel setting bits (NCM1Ax) in noise cancellation mode channel register 1 A (NCMCR1A) to "0".

## <<Timer C>>

Settings that Determine Noise Cancellation Modes for Timer C

| Channel <br> Enable | Filter Mode |  | Channel Register |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| NCCRCx. <br> NCECxy | NCMR. <br> NCMC | NCMR. <br> NCMSEL | NCMCR1C. <br> NCM1Cx | NCMCR2C. <br> NCM2Cx | Mode of Cancellation | Unit of Filtering |
| 0 | - | - | - | - |  |  |
| 1 | 0 | $(-)$ | 0 | $(-)$ | Premature-transition | Individual subblock/ <br> All subblocks |
| 1 | 0 | $(-)$ | 1 | 0 | Minimum time-at-level | Individual subblock |
| 1 | 0 | $(-)$ | 1 | 1 | Level accumulation | Individual subblock |
| 1 | 1 | $(0)$ | - | - | Minimum time-at-level | All subblocks |
| 1 | 1 | 1 | - | - | Level accumulation | All subblocks |

Note 1: $x=S B_{c}-1,0$ (subblock), $y=3$ to 0 (channel)
Note 2: The noise canceller enable bit (NCECxy) can be set for each channel.

## Methods of Setting Noise Cancellation for Timer C when the Unit of Filtering is Individual Subblock (precondition: channel enable =1)

Only timer C is set in units of subblock. Each subblock of timer C consists of four channels.

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) to " 0 ", set any noise cancellation mode channel setting bit (NCM1Cx) in noise cancellation mode channel register 1C (NCMCR1C) of timer C to " 1 ".

- Settings for all channels:

Set the noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) to " 1 ", or set all noise cancellation mode channel setting bits (NCM1Cx) in noise cancellation mode channel register 1C (NCMCR1C) to "0".

## <<Timer F>>

Settings that Determine Noise Cancellation Modes for Timer F

| Channel <br> Enable | Filter Mode |  | Channel Register |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| TCCRF. <br> NCEFx | NCMR. <br> NCMF | NCMR. <br> NCMSEL | NCMCR1F. <br> NCM1Fx | NCMCR2F. <br> NCM2Fx | Mode of Cancellation | Unit of Filtering |
| 0 | - | - | - | - |  | - |
| 1 | 0 | $(-)$ | 0 | $(-)$ | Premature-transition | Individual channel/ <br> All channels |
| 1 | 0 | $(-)$ | 1 | 0 | Minimum time-at-level | Individual channel |
| 1 | 0 | $(-)$ | 1 | 1 | Level accumulation | Individual channel |
| 1 | 1 | $(0)$ | - | - | Minimum time-at-level | All channels |
| 1 | 1 | 1 | - | - | Level accumulation | All channels |

Note 1: $\mathrm{x}=\mathrm{SB}_{\mathrm{F}}-1,0$
Note 2: The noise canceller enable bit (NCEFx) can be set for each channel.

## Methods of Setting Noise Cancellation for Timer F when the Unit of Filtering is Individual Channel (precondition: channel enable =1)

- Settings for individual channels:

After setting the noise cancellation mode bit (NCMF) in the noise cancellation mode register (NCMR) to " 0 ", set any noise cancellation mode channel setting bit (NCM1Fx) in noise cancellation mode channel register 1F (NCMCR1F) of timer F to " 1 ".

- Settings for all channels:

Set the noise cancellation mode bit (NCMF) in the noise cancellation mode register (NCMR) to " 1 ", or set all noise cancellation mode channel setting bits (NCM1Fx) in noise cancellation mode channel register 1F (NCMCR1F) to " 0 ".

The figures below show an overview of the timing of operations for noise cancellation in the respective modes. Detailed descriptions and timing charts of operations in the respective modes follow that. Since these figures and descriptions are provided for the case of timer A, be sure to replace the registers, bits, and input pin for timers C and F by referring to the following table.

List of Registers, Bits, and Input Pins of Timers Related to Noise Canceller

|  | Timer A | Timer C | Timer F |
| :---: | :---: | :---: | :---: |
| Common units |  |  |  |
| Noise cancel mode register (NCMR register bit name $\rightarrow$ ) | NCMA | NCMC | NCMF |
|  | NCMSEL | NCMSEL | NCMSEL |
| Each timer |  |  |  |
| Noise cancellation mode channel register (register name $\rightarrow$ ) | NCMCR1A | NCMCR1C | NCMCR1F |
|  | NCMCR2A | NCMCR2C | NCMCR2F |
| Noise canceller enable bit (register name, bit name $\rightarrow$ ) | TIOR2A. NCEAx | NCCRCx. NCECxy | NCCRF. NCEFx |
| Noise cancellation counter (register name $\rightarrow$ ) | NCNTAx | NCNTCxy | NCNTFAx NCNTFBx |
| Noise cancellation register (register name $\rightarrow$ ) | NCRAx | NCRCxy | NCRFAx NCRFBx |
| Input pin | TIAx | TIOCxy | $\begin{aligned} & \text { TIFxA } \\ & \text { TIFxB } \end{aligned}$ |

Note: $x$ indicates the number of subblocks of each timer; $y$ indicates the number of channels of each timer.

Note: This figure is schematic and does not show accurate timing.

Figure 30.1 Outline of Noise Canceling Operation in Premature-Transition Cancellation Mode

Figure 30.2 Outline of Noise Canceling Operation in Minimum Time-at-Level Cancellation Mode

Note: This figure is schematic and does not show accurate timing.

Figure 30.3 Outline of Noise Canceling Operation in Level Accumulation Cancellation Mode

### 30.3.2.4 Description of Operations for Noise Cancellation

The noise canceller has three operating modes: minimum time-at-level cancellation mode, premature-transition cancellation mode, and level- accumulative cancellation mode. Either of these modes can be selected by setting the noise cancellation mode register (NCMR) of the common controller unit, the noise cancellation mode channel register 1A (NCMCR1A) of timer A, and noise cancellation mode channel register 2A (NCMCR2A) of timer A.

Figure 30.4 shows an example of operations for noise cancellation in premature-transition cancellation mode and
Figure $\mathbf{3 0 . 6}$ shows an example of operations for noise cancellation in minimum time-at-level cancellation mode. These figures show an example in which TIA00 input is used and the edge deletion level is the rising.

In premature-transition cancellation mode, the noise cancellation counter (NCNTAx) starts counting in response to a change in the level of the input signal as a trigger. At the same time as counting starts, changes in the level of the input signal are output as the signal after noise cancellation.

Counting continues until the count value matches the value set in the noise cancellation register (NCRAx). All changes in the level of the input signal are ignored during the counting and are not output as the signal after noise cancellation.

When the count value matches the value set in the noise cancellation register, the level of the input signal at that time is output as the signal after noise cancellation. Note that the signal after noise cancellation changes upon compare match if the input level at the start of counting (after transition) differs from that upon compare match. Figure $\mathbf{3 0 . 5}$ shows difference in noise cancellation processing between two input waveforms in premature-transition cancellation mode.

Note: Rising-edge sensing and premature-transition cancellation mode are selected in this example.

Figure 30.4 Example of Noise Cancellation in Premature-Transition Cancellation Mode

Figure 30.5 Example of Noise Cancellation for Two Types of Waveforms (in Premature-Transition Cancellation Mode)

In minimum time-at-level cancellation mode, the noise cancellation counter (NCNTAx) starts counting in response to a change in the level of the input signal as a trigger. Counting continues until the count value matches the value set in the noise cancellation register (NCRAx) or until the level of the input signal changes.

When the count value matches the value set in the noise cancellation register, any change in the level of the input signal after the start of counting is output as the signal after noise cancellation. If the level of the input signal changes before the count value and the value of the noise cancellation register match, the changes in the level from that when counting started are deemed to be noise, and are not output as the signal after noise cancellation.

Figure $\mathbf{3 0 . 7}$ shows an example of operations for noise cancellation in level accumulation cancellation mode. This figure shows an example in which TIA00 input is used and the edge deletion level is the rising.

In level accumulation cancellation mode, noise cancellation counter (NCNTAx) counts up or down according to the level of the input signal. If the counter is counting up, the counting operation continues until the count value matches the value set in the noise cancellation register (NCNTAx). If the counter is counting down, the counting operation continues until the count value matches $0000_{\mathrm{H}}$.
The noise canceller output is updated upon compare match. If the count value matches the NCRAx value during counting-up operation, the noise canceller output value is updated to " 1 ". If the counter value matches $0000_{\mathrm{H}}$ during counting-down operation, the noise canceller output value is updated to " 0 ".

Note: Rising-edge sensing and minimum time-at-level cancellation mode are selected in this example.

Figure 30.6 Example of Noise Cancellation in Minimum Time-at-Level Cancellation Mode

Figure 30.7 Example of Noise Cancellation in Level Accumulation Cancellation Mode

### 30.4 Prescaler

### 30.4.1 Overview of Operation

ATU-V includes general prescalers of four channels and a prescaler for the noise-canceler clock.
Each general prescaler are implemented as 10-bit down-counters, in which the prescaled clock signals are generated by frequency-dividing the internal peripheral clock (PCLK) by $\mathrm{N}(1 \leq \mathrm{N} \leq 1024)$. The generated clock signals are supplied to the individual timers via the clock bus. The prescalers for each channel operate independently.

The prescaler for the noise-canceler clock is implemented as a 7-bit down-counter. It generates a clock signal by frequency-dividing the peripheral clock (PCLK) by 128. The clock signal thus generated is supplied to the noise cancelers of timers A, C, and F.

Whether to generate a noise canceler clock by frequency-dividing the peripheral clock frequency by 1 or 128 can be selected by the NCCSEL bit in NCMR of the common controller. No other division ratios are available.

The down-counters of the prescalers are initialized to $0000_{\mathrm{H}}$ after reset.

### 30.4.2 Registers Related to Prescaler

### 30.4.2.1 PSCRx — Prescaler Registers $x$

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 30.17 PSCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 10 | - | This bit is not used. Fix this bit to 0. |
| 9 to 0 | PSCx[9:0] | Division ratio bits |
|  |  | These bits specify the division ratio for the corresponding prescaler. |

Note: $x=0$ to 3

Prescaler registers are 16-bit readable/writable registers, each of which holds a division ratio for one of the four prescalers.

When the value in prescaler register x is changed, the prescaler updates the value on its underflow. The setting range is from $000_{\mathrm{H}}$ to $3 \mathrm{FF}_{\mathrm{H}}$.

The division ratio is obtained from the following expression.

Division ratio of prescaler $=\frac{1}{\operatorname{PSCx}[9: 0]+1}($ setting range: $1 / 1$ to $1 / 1024)$

A duty ratio of $50 \%$ is not guaranteed for the clock output by the prescaler. The level of the PCLK is high during onecycle period only, and is low during the other periods.

### 30.4.3 Details of Operation

### 30.4.3.1 Starting Prescalers

The prescalers start operating when the PSCE bit in the ATU master enable register is set to 1 and generates a clock with a frequency given by the division ratio in the PSCx bits. While a prescaler is operating, the high level is output for one cycle of the PCLK clock each time the corresponding prescaler counter underflows.

When the setting in the PSCx bits is changed during operation, the division ratio of the output clock is updated on the first subsequent counter underflow.

Figure 30.8 Starting Prescaler

### 30.4.3.2 Stopping and Restarting Operation

The prescaler stops operating when the PSCE bit in the ATU master enable register is cleared to " 0 ". The clock signal retains the low level while the prescaler is stopped.

Figure 30.9 Stopping Prescaler

### 30.5 Timer A

### 30.5.1 Overview of Operation

Timer A integrates a 32-bit free-running counter A (TCNTA) and $\mathrm{SB}_{\mathrm{A}}$ 32-bit input capture registers (ICRA0 to $\left.I^{I C R A S B} B_{A}-1\right)$. TCNTA is a free-running up counter. An interrupt request can be output when the counter overflows.
$\mathrm{SB}_{\mathrm{A}}$ input capture registers A 0 to $\mathrm{ASB}_{\mathrm{A}}-1$ (ICRA0 to $\mathrm{ICRASB}_{\mathrm{A}}-1$ ) capture the value of free-running counter A (TCNTA) on an assertion of the corresponding external input signal (TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$ ). The rising edge, falling edge, or both edges can be selected as the trigger for capture. The detection edge is selected by timer I/O control register 1 (TIOR1A). An interrupt request can be issued at the same timing as capturing.

Noise on the external input signals can be removed by the noise canceler. The pin level of these external signal input pins (TIA00 to TIA $0 \mathrm{SB}_{\mathrm{A}}-1$ ) after noise cancellation can be read. Input pin (TIA00 to TIA0SB ${ }_{A}-1$ ) signals after noise cancellation can be output as input signals to timer F . Some input pin signals can be output to timer $\mathrm{B}, \mathrm{C}$ or D as event signals after noise has been removed and their edges have been extracted. One of TIA00 to TIA0 SB $_{\mathrm{A}}-1$ can be output to timer B as an event signal (event output $1 \_0,1 \_1$, or $1 \_2$ ). $\mathrm{SB}_{\mathrm{A}}$ event signals TIA00 to TIA0SB ${ }_{\mathrm{A}}-1$ are output (event outputs 1B to 1I) to timer B to be used as the capture trigger of the event counter B1 (TCNTB1). One of $\mathrm{SB}_{\mathrm{A}}$ event signals TIA00 to TIA $0 \mathrm{SB}_{\mathrm{A}}-1$ is output (event output 2 A and 2 B ) to timer D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$ respectively to be used as the capture trigger of timer offset base registers OSBRD0 to OSBRDSB ${ }_{D}-1$. The signals of these event outputs $1 \_0,1 \_1$, $1 \_2$, and event outputs 2 A and 2 B can be used as the input capture trigger of timer C .

Figure $\mathbf{3 0 . 1 0}$ shows a block diagram of timer A.

Figure 30.10 Block Diagram of Timer A Configuration

### 30.5.2 Registers Related to Timer A

### 30.5.2.1 TCR1A — Timer Control Register 1A

Value after reset: $\quad 00_{H}$

Table 30.18 TCR1A Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | EVOSEL2A | Event output 2A select <br> 0 : TIA01 is selected as event output 2A. <br> 1: TIA02 is selected as event output 2A. |
| 6 | EVOSEL2B | Event output 2B select <br> 0 : TIA01 is selected as event output 2B. <br> 1: TIA02 is selected as event output 2B. |

TCR1A is an 8-bit readable/writable register that sets the event output generated from external input signals (TIA00 to TIA02) and the counter clock.

TCR1A is initialized to $00_{\mathrm{H}}$ after reset.

## Event Output 2A Select (EVOSEL2A)

Selects either of the externally input signals TIA01 and TIA02 (after the noise cancellation and edge detection) to be output as the event output 2 A signal. Timers C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ and timers D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$ can use the event output 2 A signal as a capture trigger.

## Event Output 2B Select (EVOSEL2B)

Selects either of the externally input signals TIA01 and TIA02 (after the noise cancellation and edge detection) to be output as the event output 2 B signal. Timers C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ and timers D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$ can use the event output 2B signal as a capture trigger.

## Event Output 1_0 Select (EVOSEL1)

Selects either of the externally input signals TIA02 to TIA00 (after the noise cancellation and edge detection) to be output to timers B and C as the event output $1 \_0$ signal. Furthermore, input edge combinations of TIA00 and TIA01, TIA00 and TIA02, TIA01 and TIA02, and TIA00, TIA01, and TIA02 can be output together to timer B as the event output 1_0.

## Clock Select A (CKSELA)

These bits select the signal on one of clock-bus lines 0 to 5 as the clock signal for counting. The signals on lines 0 to 3 have been frequency-divided by prescalers 0 to 3 , respectively. Clock-bus line 4 supplies external clock input A (TCLKA). Clock-bus line 5 supplies external input clock B (TCLKB) or the multiplied-and-corrected clock output by timer B according to the setting of the clock bus control register.

Be sure to stop timer A before selecting the counter clock.

## CAUTION

The edge of an external input clock is detected before it is output on a clock bus. When using external input clock A or B, select the edge to be detected by setting the edge select bit in the clock bus control register (CBCNT).

### 30.5.2.2 TCR2A - Timer Control Register 2A

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | EVOSE | - | - | - | - | - | - | - | EVOSELE1[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.19 TCR2A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | EVOSELE1E | Event output $1 \_0$ extension select enable |
|  |  | 0: Event output $1 \_0$ extension selection is disabled. |
|  | 1: Event output $1 \_0$ extension selection is enabled. |  |
| $14-$ SB $_{\text {A }}$ | - | These bits are not used. Fixe these bits to " 0 ". |
| bSB $_{A}-1$ to 0 | EVOSELE1 | Event output $1 \_0$ extension select register |
|  | These bits select the combination of inputs (TIA0x) to be output as an event. |  |
|  | $0:$ TIA0x input edge is not output. |  |
|  |  |  |
|  |  |  |
|  | Example: For b0 input edge is output. |  |
|  | b0 $=0:$ TIA00 input edge is not output. |  |
| b0 $=1:$ TIA00 input edge is output. |  |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$.

## Event Output 1_0 Extension Select Enable (EVOSELE1E)

Event output 1_0 extension select enable (EVOSELE1E) is an 8-bit/16-bit readable/writable register to enable or disable the event output $1 \_0$ extension selection.

EVOSELE1E is initialized to $0_{\mathrm{B}}$ after reset.

## Event Output 1_0 Extension Select Register (EVOSELE1)

Event output $1 \_0$ extension select register (EVOSELE1) is an 8-bit/16-bit readable/writable register to set event output $1 \_0$ of external input edge TIA0x when EVOSELE1E is enabled.

EVOSELE1 is initialized to $00_{\mathrm{H}}$ after reset.
Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B or timer C as event $1 \_0$ according to the setting of this register.

When this function is enabled, event output selection specified by TCR1A is disabled.

### 30.5.2.3 TCR2AS1 - Timer Control Register 2AS1

Value after reset: $\quad 00_{H}$

Table 30.20 TCR2AS1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| SB $_{\mathrm{A}}-1$ to 0 | EVOSELE1S1 | Event output $1 \_1$ extension select register |
|  | These bits select the combination of inputs (TIA0x) to be output as an event. |  |
| $0:$ TIA0x input edge is not output. |  |  |
| 1: TIA0x input edge is output. |  |  |
|  |  |  |
|  | Example: For b0 |  |
| b0 $=0:$ TIA00 input edge is not output. |  |  |
| b0 $=1:$ TIA00 input edge is output. |  |  |

Note: $x=0$ to $S B_{A}-1$ : Corresponding to channels 0 to $S B_{A}-1$.

## Event Output 1_1 Extension Select Register (EVOSELE1S1)

Event output 1_1 extension select register (EVOSELE1S1) is an 8-bit readable/writable register to set event output 1_1 of external input edge TIA0x.

EVOSELE1S1 is initialized to $00_{\mathrm{H}}$ after reset.
Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B as event 1_1 according to the setting of this register.

### 30.5.2.4 TCR2AS2 - Timer Control Register 2AS2

Value after reset: $\quad 00_{H}$

Table 30.21 TCR2AS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| SB $_{\mathrm{A}}-1$ to 0 | EVOSELE1S2 | Event output $1 \_2$ extension select register |
|  | These bits select the combination of inputs (TIA0x) to be output as an event. |  |
| $0:$ TIA0x input edge is not output. |  |  |
| 1: TIA0x input edge is output. |  |  |
|  |  |  |
|  | Example: For b0 |  |
| b0 $=0:$ TIA00 input edge is not output. |  |  |
| b0 $=1:$ TIA00 input edge is output. |  |  |

Note: $x=0$ to $S B_{A}-1$ : Corresponding to channels 0 to $S B_{A}-1$.

## Event Output 1_2 Extension Select Register (EVOSELE1S2)

Event output $1 \_2$ extension select register (EVOSELE1S2) is an 8 -bit readable/writable register to set event output $1 \_2$ of external input edge TIA0x.

EVOSELE1S2 is initialized to $00_{\mathrm{H}}$ after reset.
Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output to timer B as event $1 \_2$ according to the setting of this register.

### 30.5.2.5 TCR3A — Timer Control Register 3A

Value after reset: $\quad 0000 \mathrm{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | EVOSE LE2AE | - | - | - | - | - | - | - |  |  |  | EVO | E2A |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.22 TCR3A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | EVOSELE2AE | Event output 2A extension select enable |
|  | 0 : Event output 2 A extension selection is disabled. |  |
|  | 1: Event output 2A extension selection is enabled. |  |
| $14-\mathrm{SB}_{\mathrm{A}}$ | - | These bits are not used. Fixe these bits to "0". |
| $\mathrm{SB}_{\mathrm{A}}-1$ to 0 | EVOSELE2A | Event output 2A extension select register |
|  | These bits select the combination of inputs (TIA0x) to be output as an event. |  |
|  | $0:$ TIA0x input edge is not output. |  |
|  | 1: TIA0x input edge is output. |  |
|  | Example: For b0 |  |
|  | b0 $=0:$ TIA00 input edge is not output. |  |
|  | b0 $=1:$ TIA00 input edge is output. |  |

Note 1: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$.

## Event Output 2A Extension Select Enable (EVOSELE2AE)

Event output 2A extension select enable (EVOSELE2AE) is an 8-bit/16-bit readable/writable register to enable or disable the event output 2 A extension selection.

EVOSELE2AE is initialized to $0_{\mathrm{B}}$ after reset.

## Event Output 2A Extension Select Register (EVOSELE2A)

Event output 2A extension select register (EVOSELE2A) is an 8-bit/16-bit readable/writable register to set event output 2 A of external input edge TIA0x when EVOSELE2AE is enabled.

EVOSELE2A is initialized to $00_{\mathrm{H}}$ after reset.
Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output as event 2 A according to the setting of this register. Timers C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ and timers D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$ can use this event 2A signal as the capture trigger.

When this function is enabled, event output selection specified by TCR1A is disabled.

### 30.5.2.6 TCR4A — Timer Control Register 4A

Value after reset: $0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | EVOSE LE2BE | - | - | - | - | - | - | - | EVOSELE2B[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.23 TCR4A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | EVOSELE2BE | Event output 2B extension select enable |
|  | 0 : Event output 2B extension selection is disabled. |  |
|  | 1: Event output 2B extension selection is enabled. |  |
| $14-$ SB $_{A}$ | - | These bits are not used. Fixe these bits to "0". |
| $\mathrm{SB}_{\mathrm{A}}-1$ to 0 | EVOSELE2B | Event output 2B extension select register |
|  | These bits select the combination of inputs (TIA0x) to be output as an event. |  |
|  | $0:$ TIA0x input edge is not output. |  |
|  | 1: TIA0x input edge is output. |  |
|  | Example: For b0 |  |
|  | b0 $=0:$ TIA00 input edge is not output. |  |
|  | b0 $=1:$ TIA00 input edge is output. |  |

Note 1: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$.

## Event Output 2B Extension Select Enable (EVOSELE2BE)

Event output 2B extension select enable (EVOSELE2BE) is an 8-bit/16-bit readable/writable register to enable or disable the event output 2 B extension selection.

EVOSELE2BE is initialized to $0_{\mathrm{B}}$ after reset.

## Event Output 2B Extension Select Register (EVOSELE2B)

Event output 2B extension select register (EVOSELE2B) is an 8-bit/16-bit readable/writable register to set event output 2B of external input edge TIA0x when EVOSELE2BE is enabled.

EVOSELE2B is initialized to $00_{\mathrm{H}}$ after reset.
Any external input signal TIA0x (after noise cancellation and edge detection) or combination of the input edges can be output as event 2 B according to the setting of this register. Timers C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ and timers D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$ can use this event 2B signal as the capture trigger.

When this function is enabled, event output selection specified by TCR1A is disabled.

### 30.5.2.7 TCR5A — Timer Control Register 5A

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ICRA2SEL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 30.24 TCR5A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. Fixe these bits to "0". |
| 0 | ICRA2SEL | ICRA2x register capture data select |
|  | $0:$ The value in timer D counter TCNT1D0 is captured. |  |
|  | 1: The value in timer D counter TCNT2D0 is captured. |  |

Note: $x=0$ to $S B_{A}-1$ : Corresponding to channels 0 to $S B_{A}-1$.

## Input Capture Register 2 Capture Select (ICRA2SEL)

ICRA2SEL selects the value that is captured to input capture register 2Ax when the valid edge of the external signal (TIA0x) selected by TIOR1A is detected, from the value of timer D counter TCNT1D0 or TCNT1D0.

### 30.5.2.8 NCMCR1A — Noise Cancellation Mode Channel Register 1A

## Value after reset: $\quad 00_{H}$

Table 30.25 NCMCR1A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| SB $_{A}-1$ to 0 | NCM1Ax | Noise cancellation mode bit of channel $x$ |
|  | Specify the operating mode of noise canceler in channel $x$. |  |
|  | 0: Premature-transition cancellation mode |  |
|  | 1: Minimum time-at-level cancellation mode (When NCMA $=0$ and NCM2Ax $=0)$ |  |
|  | 1: Level accumulation cancellation mode (When NCMA $=0$ and NCM2Ax $=1)$ |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$.

NCMCR1A is an 8-bit readable/writable register that selects the operation mode of noise canceler for channel unit.
In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.
To disable noise cancellation mode from premature-transition cancellation mode or minimum time-at-level cancellation mode, do so after the value of the counter (NCNTAx) held in each timer becomes $0000_{\mathrm{H}}$.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section

### 30.3.2, Registers Related to Common Controller.

## Noise Cancellation Mode Bit of Channel x (NCM1Ax)

Specify the operating mode of noise canceler in channel $x$.

## CAUTION

This register is only effective when the NCMA bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 ". Furthermore, when the corresponding channel bit (NCM1Ax) in this register is set to " 1 ", the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2A (NCMCR2A).

### 30.5.2.9 NCMCR2A — Noise Cancellation Mode Channel Register 2A

## Value after reset: $\quad 00_{H}$

Table 30.26 NCMCR2A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathrm{SB}_{\mathrm{A}}-1$ to 0 | NCM2Ax | Noise cancellation mode bit of channel x |
|  |  | Specify the operating mode of noise canceler in channel x. |
|  | $0:$ Minimum time-at-level cancellation mode $($ When $\mathrm{NCMA}=0$ and $\mathrm{NCM} 1 \mathrm{Ax}=1)$ |  |
|  | 1: Level accumulation cancellation mode $($ When $\mathrm{NCMA}=0$ and $\mathrm{NCM} 1 \mathrm{Ax}=1)$ |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

NCMCR2A is an 8-bit readable/writable register that selects the operation mode of noise canceler for channel unit.
In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.
For details on the operations for noise cancellation, see the description of the noise cancellation mode register in
Section 30.3.2, Registers Related to Common Controller.

## Noise Cancellation Mode Bit 2 of Channel x (NCM2Ax)

Specify the operating mode of noise canceler in channel $x$.

## CAUTION

This register is only effective when the NCMA bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 " and the noise cancellation mode bit of the corresponding channel (NCM1Ax) in the noise cancellation mode channel register 1A of timer A (NCMCR1A) is " 1 ".

### 30.5.2.10 TIOR1A — Timer I/O Control Register 1

Value after reset: $\quad 0000_{H}$

Table 30.27 TIOR1A Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathrm{SB}_{\mathrm{A}}-1$ to 0 | IOAx | I/O control Ax |
|  |  | 00: TIA0x input capturing is prohibited |
|  | 01: TCNTA is captured in ICRAx at the rising edge of TIA0x. |  |
|  | 10: TCNTA is captured in ICRAx at the falling edge of TIA0x. |  |
|  | 11: TCNTA is captured in ICRAx at both the rising and falling edges of TIA0x. |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

Timer I/O control register 1 (TIOR1A) is used to select the edge of event outputs 2A, 2B, 1_0, and 1B to 1 H .
This is a 16-bit readable/writable register that sets the edge of external input (TIA0x) to be detected.
TIOR1A is initialized to $0000_{\mathrm{H}}$ after reset.

## I/O Control Ax (IOAx)

These bits select the edge of external inputs (TIA00 to TIA $0 \mathrm{SB}_{\mathrm{A}}-1$ ) that is to be detected as a trigger for input capture. When these bits are set to " 00 ", input capturing is not performed. When the bit is set to " 01 ", " 10 " or " 11 ", the contents of free-running counter $\mathrm{A}\left(\mathrm{TCNTA}\right.$ ) are transferred to input capture register A 0 to $\mathrm{ASB}_{\mathrm{A}}-1$ (ICRA0 to $\mathrm{ICRASB}_{\mathrm{A}}-1$ ) on detection of the selected edge from one of the external inputs.

Edge detection is synchronized with the PCLK clock. Make sure that the cycle of the external input signal is at least twice the cycle of the PCLK clock. Otherwise, edge detection is not performed correctly.

Edge detection is performed for signals that have passed through the noise canceler. When the noise canceler is disabled, edge detection is performed for the external inputs (TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$ ). When the noise canceler is enabled, edge detection is performed for the signals after noise cancellation.

The edge detection signals of TIA00 to TIA $0 \mathrm{SB}_{\mathrm{A}}-1$ are directly output to event outputs 1 B to 1 H . TIA 00 corresponds to event output 1B, TIA01 to event output 1C, TIA02 to event output 1D, TIA03 to event output 1E, TIA04 to event output 1 F, TIA 05 to event output 1 G, TIA 06 to event output 1 H , and TIA0 07 to event output 1 I, respectively.

Furthermore, the signal detected by the valid edge is output to other timer modules by setting the event output $1 \_0$, event output 2A, and event output 2B select bits (EVOSEL1, EVOSEL2A, and EVOSEL2B) in TCR1A, the event output $1 \_0$ extension select bits (EVOSELE1) in TCR2A, the event output 2A extension select bits (EVOSELE2A) in TCR3A, and the event output 2B extension select bits (EVOSELE2B) in TCR4A. (Signals to be output after edge detection are generated in positive logic.)

### 30.5.2.11 TIOR2A — Timer I/O Control Register 2

| 31 to 24 | - | These bits are not used. Fixe these bits to " 0 ". |
| 23 to 16 | NCKGAx | Noise canceler clock select G Ax <br> 0: The clock selected by NCKAx is selected as the count source clock of NCNTAx. <br> 1: Noise canceler count clock (AGCK1) is selected as the count source clock of NCNTAx |
| 15 to 8 | NCKAx | Noise canceler clock select Ax <br> 0 : Noise canceler count clock (PCLK or PCLK/128) is selected as the count source clock of NCNTAx. <br> 1: Clock-bus line 5 is selected as the count source clock of NCNTAx. |
| 7 to 0 | NCEAx | Noise canceler enable Ax <br> 0 : Noise cancellation function for TIA0x is disabled. <br> 1: Noise cancellation function for TIA0x is enabled. |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$.

Timer I/O control register 2 (TIOR2A) is an 8-bit/16-bit/32-bit readable/writable register that selects the noise canceler clock and enables and disables the noise cancelers for external input signals (TIA0x).

TIOR2A is initialized to $00000000_{\mathrm{H}}$ after reset.

## Noise Canceler Clock Select G Ax (NCKGAO to x)

These bits select the count source clock of noise canceler counters Ax (NCNTAx).
The noise canceler count clock selected by the noise canceler clock select bits (NCKAx) or AGCK1 can be selected as the count source clock.

## Noise Canceler Clock Select Ax (NCKAx)

These bits select the count source clock of noise canceler counter Ax (NCNTAx).
The noise canceler count clock or the signal on clock-bus line 5 can be selected as the count source clock. Either the PCLK clock frequency divided by 128 or the PCKL clock can be selected as the noise canceler count clock by setting the NCCSEL bit of the common controller.

## Noise Canceler Enable Ax (NCEAx)

These bits enable and disable the noise cancelers for external input signal TIA0x.
When a level change of the external input signal TIA0x is detected while this bit is set to " 1 ", it is processed in premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode depending on the setting in the noise cancellation mode register (NCMR) of the common controller, noise cancellation mode channel register 1A (NCMCR1A) of timer A, and noise cancellation mode channel register 2A (NCMCR2A) of timer A.

In premature-transition cancellation mode, when a level change of the external input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter Ax (NCNTAx) starts counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register Ax (NCRAx). This this compare match occurs, the level of the external input signal at that time is output as the signal after noise cancellation.

When these bits are cleared to " 0 " while NCNTAx is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes of TIA0x are also masked over this period.

In minimum time-at-level cancellation mode, when a level change of the external input signal is detected, the corresponding noise canceler counter Ax (NCNTAx) starts counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register Ax (NCRAx), the previously accepted level change is output as the signal after noise cancellation upon compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore, the noise canceler assumes that the levels of external input signals have not changed and does not change the signal after cancellation.

When these bits are cleared to " 0 " while NCNTAx is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the external input signal is detected.

In level accumulation cancellation mode, the corresponding noise canceler counter Ax (NCNTAx) increments or decrements according to the input signal level. NCNTAx increments (up-counting) when the input signal level is high, and decrements (down-counting) when the input signal level is low. Up-counting continues until NCNTAx reaches the value set in the noise canceler register Ax (NCRAx). Down- counting continues until NCNTAx reaches $00_{\mathrm{H}}$.

When a compare match with NCRAx occurs during up-counting, the noise canceler output is updated to " 1 ". When a compare match with $00_{\mathrm{H}}$ occurs during down-counting, the noise canceler output is updated to " 0 ".

In minimum time-at-level cancellation mode and premature-transition cancellation mode, level changes are always detected by PCLK regardless of the selected noise-canceler clock. In level accumulation cancellation mode, input level sampling is performed by the clock selected by the noise canceler clock select bit Ax (NCKAx).

For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section
30.3.2, Registers Related to Common Controller.

### 30.5.2.12 TIERA - Timer Interrupt Enable Register A

Value after reset: $\quad 0000_{H}$

Table 30.29 TIERA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | OVEA | Overflow interrupt enable |
|  |  | $0:$ Interrupt request due to TCNTA overflow is disabled. |
|  | 1: Interrupt request due to TCNTA overflow is enabled. |  |
| 14 to 8 | - | These bits are not used. Fixe these bits to " 0 ". |
| 7 to 0 | ICIEAx | Input capture interrupt enable |
|  |  | $0:$ Interrupt request due to input capture x is disabled. |
|  |  | 1: Interrupt request due to input capture x is enabled. |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

Timer interrupt enable register A (TIERA) is 8 -bit/16-bit readable/writable registers used to set interrupt requests due to comparison in overflow and input capture.

### 30.5.2.13 TSRA — Timer Status Register A

| Value after reset: $\mathbf{0 0 0 0}^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bi | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | OVFA | - | - | - | - | - | - | - | ICFA[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 30.30 TSRA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | OVFA | Overflow flag A |
|  |  | $0:$ Indicates that TCNTA has not overflowed |
|  | 1: Indicates that TCNTA has overflowed |  |
| 14 to 8 | - | These bits are not used. Fixe these bits to " 0 ". |
| 7 to 0 | ICFAx | Input capture flag Ax |
|  | $0:$ No input capture has occurred. |  |
|  |  | 1: Input capture has occurred |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

Timer status register A (TSRA) is an 8-bit/16-bit read-only register that indicates occurrence of overflow of the freerunning counter A (TCNTA) and input capture of input capture registers Ax (ICRAx)

These status flags indicate occurrence of an interrupt request, and can be cleared to " 0 " by setting the corresponding bit in timer status clear register A (TSCRA). If an interrupt source takes effect when one of these flags is set to " 1 ", an interrupt request is issued again. An interrupt request is issued even if flag clearing by the corresponding timer status clear register conflicts with flag setting by an interrupt source.

TSRA is initialized to $0000_{\mathrm{H}}$ after reset.

## Overflow Flag A (OVFA)

This bit indicates whether free-running counter A (TCNTA) has overflowed. This flag indicates that an overflow occurred in TCNTA when this bit is read as " 1 ". This flag cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition

When TCNTA overflows (from FFFF FFFF ${ }_{\mathrm{H}}$ to $00000000_{\mathrm{H}}$ )

- Clearing (to 0 ) condition

When " 1 " is written to OVFCA in timer status clear register A (TSCRA)

## Input Capture Flag Ax (ICFAx)

These bits indicate whether the value in free-running counter A (TCNTA) has been captured by input capture register Ax (ICRAx). When one of these bits is read as " 1 ", the value in TCNTA has been stored in the corresponding ICRAx.

These bits cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition

When the value of TCNTA is transferred to ICRAx on assertion of the input capture signal TIA0x

- Clearing (to 0 ) condition

When " 1 " is written to ICFCAx in timer status clear register A (TSCRA)

### 30.5.2.14 TSCRA — Timer Status Clear Register A

Value after reset: $\quad 0000 \mathrm{H}$

|  | OVFCA | - | - | - | - | - | - | - |  |  |  | ICF |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | R | R | R | R | R | R | R | W | W | W | W | W | W | W | W |

Table 30.31 TSCRA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 | OVFCA | Overflow flag clear A enable |
|  |  | $0:$ Disabled (default) |
|  |  | 1: OVFA in the timer status register A (TSRA) is cleared to 0. |
| 14 to 8 | - | These bits are not used. Fixe these bits to " 0 ". |
| 7 to 0 | ICFCAx | Input capture flag clear Ax enable |
|  |  | $0:$ Disabled (default) |
|  |  | 1: ICFAx in the timer status register A (TSRA) is cleared to 0 |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

TSCRA is an 8-bit/16-bit readable/writable register that sets clearing of flags at occurrence of an overflow or input capture.

When TSCRA is read, " 0 " is always returned.
TSCRA is initialized to $0000_{\mathrm{H}}$ after reset.

## Overflow Flag Clear A Enable (OVFCA)

Writing " 1 " to this bit while overflow flag A (OVFA) in the timer status register A (TSRA) is set to " 1 " clears OVFA to " 0 ". When this bit is read, " 0 " is always returned.

## Input Capture Flag Clear Ax Enable (ICFCAx)

Writing " 1 " to this bit while input capture flag Ax (ICFAx) in the timer status register A (TSRA) is set to " 1 " clears ICFAx to " 0 ". When this bit is read, " 0 " is always returned.

### 30.5.2.15 ICRAx — Input Capture Registers Ax

Table 30.32 ICRAx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICAx | Input capture Ax |
|  |  | These bits store 32-bit input capture value. |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

Input capture registers Ax (ICRAx) are 32-bit read-only registers dedicated to input capture. No value can be written to these registers.

These input capture-dedicated registers detect an external input capture signal (TIA0x) and store the free-running counter A (TCNTA) value. At this time, the corresponding bit in the timer status register A (TSRA) is set to " 1 ".

The detection edge for the input capture signal is set by the I/O control bits in the timer I/O control register 1 (TIOR1A).

ICRAx can be read only in 32-bit units. Do not read these registers in 16-bit or 8-bit units.
ICRAx is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.5.2.16 ICRA2x — Input Capture Registers A2x

Table 30.33 ICRA2x Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICA2x | Input capture A2x |
|  |  | These bits store 32-bit input capture value. |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

Input capture registers A2x (ICRA2x) are 32-bit read-only registers dedicated to input capture. No value can be written to these registers.

These input capture-dedicated registers detect an external input capture signal (TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$ ) and store the values of timer D counters (TCNT1D0, TCNT2D0). At this time, the corresponding bit in the timer status register A (TSRA) is set to " 1 ". Whether to store the value of TCNT1D0 or TCNT2D0 is determined by setting the ICRA2SEL bit in the timer control register 5A (TCR5A).

The detection edge for the input capture signal is set by the I/O control bits in the timer I/O control register 1 (TIOR1A).

ICRA2x can be read only in 32-bit units. Do not read these registers in 16-bit or 8-bit units.
ICRA2x is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.5.2.17 TCNTA — Free-Running Counter A

Table 30.34 TCNTA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CNTA | Timer count A |
|  |  | These bits store the counter value in 32-bit units. |

TCNTA is a 32-bit readable/writable register that counts on the signal output by the prescaler via the clock bus, external input clock signal, or multiplied-and-corrected signal output by timer B.

TCNTA starts counting up when the TAE bit in the ATU master enable register (ATUENR) is set to " 1 ". The clock input to the counter is selected by setting the clock select A bit (CKSELA) in timer control register 1A (TCR1A).

When TCNTA overflows (FFFF $\mathrm{FFFF}_{\mathrm{H}}$ to $00000000_{\mathrm{H}}$ ), an overflow interrupt is issued and the overflow flag (OVFA) in timer status register A (TSRA) is set to " 1 ".

TCNTA can be read and written only in 32-bit units. Do not read or write TCNTA in 16-bit or 8-bit units.
TCNTA is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.5.2.18 TILRA — Timer Input Signal Level Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TIALO7 | TIAL06 | TIALO5 | TIAL04 | TIAL03 | TIAL02 | TIAL01 | TIAL00 |

Table 30.35 TILRA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $\mathrm{SB}_{\mathrm{A}}-1$ to 0 | TIAL0x | Input signal level read |
|  |  | Register only for reading the TIA0x pin level |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{A}}-1$ : Corresponding to channels 0 to $\mathrm{SB}_{\mathrm{A}}-1$

The timer input signal level register (TILRA) is an 8 -bit read-only register that can read external input (TIA0x) pin levels after noise cancellation.

TILRA can be read only in 8-bit units.
TILRA is initialized to $00_{\mathrm{H}}$ after reset.

### 30.5.2.19 NCNTAx — Noise Canceler Counters Ax

Table 30.36 NCNTAx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCNTAx | Noise canceler count Ax |
|  |  | These bits store a 16-bit count value. |

Note: $x=0$ to $S B A_{A}-1$ : Corresponding to channels 0 to $S_{A}-1$

Noise canceler counters Ax (NCNTAx) are 16-bit readable/writable registers.
In premature-transition cancellation mode or minimum time-at-level cancellation mode, NCNTAx starts counting up by an assertion of external input signals (TIA0x) as a trigger when the noise canceler function is enabled by the noise canceler enable bit (NCEAx) in timer I/O control register 2 (TIOR2A). In level accumulation cancellation mode, NCNTAx performs up-counting or down-counting according to the external input level. The count clock for the noise cancelers or the signal on clock-bus line 5 can be selected as the count source by setting the noise canceler clock select bits (NCKAx) in TIOR2A.

NCNTAx is initialized to $00_{\mathrm{H}}$ after reset.
The noise cancellation mode can be selected from premature-transition cancellation mode, minimum time-at-level cancellation mode, and the level accumulation cancellation mode, by setting the noise cancellation mode select bit (NCMSEL) and the timer A noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) of the common controller, the noise cancellation mode bits (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A, and the noise cancellation mode bits (NCM2Ax) in noise cancellation mode channel register 2A (NCMCR2A) of timer A.

- Premature-transition cancellation mode

If a level change on pin TIA0x is detected when the NCEAx bit is " 1 " and NCNTAx is stopped, NCNTAx starts counting up. The counter is cleared to $0000_{\mathrm{H}}$ and stopped on the first edge of the PCLK after the counter value matches the value in noise canceler register Ax (NCRAx).

NCNTAx is incremented regardless of the TAE bit in the ATU master enable register (ATUENR).
The level change at the start of counting is output as the signal after noise cancellation and its edge is to be detected. However, since subsequent level changes are masked until the counter value matches the value in NCRAx, the signal after noise cancellation does not change. When the values in the counter and NCRAx match, the input signal level at that time is output as the signal after noise cancellation.

When NCEAx bits are cleared to " 0 " while the counter is being incremented, counting continues until the values in the counter and NCRAx match. The subsequent level changes are also masked over this period.

- Minimum time-at-level cancellation mode

If a level change on pin TIA0x is detected when the NCEAx bit is " 1 " and NCNTAx is stopped, NCNTAx starts counting up. If subsequent level change is detected or the values in the counter and the noise canceler register Ax (NCRAx) match, the counter is cleared to $0000_{\mathrm{H}}$ and stopped on the next PCLK cycle.

NCNTAx is incremented regardless of the TAE bit in the ATU master enable register (ATUENR).
The signal after noise cancellation changes only upon compare match between the counter and NCRAx in synchronization with the level change at the start of counting. When the counter is stopped before the compare match with NCRAx, level changes at the start and stop of counting are masked and the signal after noise cancellation does not change.

When the NCEAx bit is cleared during the counter operation, counting continues until compare match or a level change on the pin is detected.

- Level accumulation cancellation mode

When the NCEAx bit is set to " 1 ", NCNTAx performs up-counting or down-counting depending on the input signal level. NCNTAx performs up-counting when the input level is high, and if the counter value matches the value of the noise cancel register Ax (NCRAx), the up-counting stops at the next PCLK cycle. NCNTAx performs down-counting when the input level is low, and if the counter value reaches $0000_{\mathrm{H}}$, the down-counting stops at the next PCLK cycle.

Counting of NCNTAx is performed regardless of the setting of the TAE bit of the ATU master enable register (ATUENR).

If an up-count results in a compare match of NCRAx, the noise canceler output is updated to " 1 ". If a down-count results in a compare match with $0000_{\mathrm{H}}$, the noise canceler output is updated to " 0 ".

If the NCEAx bit is cleared during counting operation, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Note that clearing the NCEAx bit in level accumulation cancellation mode might cause an edge detection due to this value change.

For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section

### 30.3.2, Registers Related to Common Controller.

### 30.5.2.20 NCRAx — Noise Cancel Registers Ax

Table 30.37 NCRAx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCTAx | Noise cancellation time Ax |
|  |  | These bits store the TIA0x noise cancellation time (16-bit compare value) |

Note: $x=0$ to $S B_{A}-1$ : Corresponding to channels 0 to $S B_{A}-1$

Noise cancel registers Ax (NCRAx) are 16-bit readable/writable registers that set the upper limit value of the noise cancel counters Ax (NCNTAx). When the PCLK cycle divided by 128 is selected as the noise cancel clock, setting $\mathrm{FFFF}_{\mathrm{H}}$ to this register can cancel noise for maximum of 0.21 second period (when PCLK $=40 \mathrm{MHz}$ ).

The noise cancellation mode can be selected from premature-transition cancellation mode, minimum time-at-level cancellation mode, and the level accumulation cancellation mode, by setting the noise cancellation mode select bit (NCMSEL) and the timer A noise cancellation mode bit (NCMA) in the noise cancellation mode register (NCMR) of the common controller, the noise cancellation mode bits (NCM1Ax) in noise cancellation mode channel register 1A (NCMCR1A) of timer A, and the noise cancellation mode bits (NCM2Ax) in noise cancellation mode channel register 2A (NCMCR2A) of timer A.

- Premature-transition cancellation mode

While NCNTAx counting is in progress, level changes of succeeding input signals are masked. Values of NCNTAx and NCRAx are always compared. If a compare match occurs, the NCNTAx counter value is cleared, the counting is stopped, and the input signal mask is released at the next PCLK cycle.

- Minimum time-at-level cancellation mode

While NCNTAx counting is in progress, the noise canceler processing is waited for. Values of NCNTAx and NCRAx are always compared. If a compare match occurs, the NCNTAx counter value is cleared, the counting is stopped, and the noise canceler starts to output the input signal after noise cancellation at the next PCLK cycle.

- Level accumulation cancellation mode

When NCNTAx is performing up-counting, values of NCNTAx and NCRAx are compared. When a compare match occurs, the up-counting of NCNTAx stops at the next PCLK cycle. When NCNTAx is performing down-counting, NCNTAx is compared with $0000_{\mathrm{H}}$.

NCRAx is initialized to $0000_{\mathrm{H}}$ after reset.
For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section
30.3.2, Registers Related to Common Controller.

### 30.5.3 Details of Operation

### 30.5.3.1 Operation of Noise Canceler

For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section

### 30.3.2, Registers Related to Common Controller.

### 30.5.3.2 Operation of Free-Running Counter

Free-running counter A (TCNTA) starts counting up by setting the TAE bit in ATU master enable register (ATUENR) to " 1 ". When TCNTA overflows (FFFF FFFF $_{H}$ to $00000000_{H}$ ), the OVFA bit in timer status register A (TSRA) is set to " 1 ". An interrupt request is issued to the CPU at this time. After overflow, TCNTA continues counting up from $00000000_{\mathrm{H}}$.

If the TAE bit in ATU master enable register (AUTENR) is cleared to " 0 " when TCNTA is operating, TCNTA stops counting while retaining the value at that time. By setting the TAE bit to " 1 " again, TCNTA resumes counting from the value when it is stopped.

TCNTA can be written during operation and writing takes priority over counting. After that, TCNTA resumes counting from the written value. The write access is completed in two cycles of the PCLK clock, regardless of the count source.

## CAUTION

The prescalers run independently of the setting of the TAE bit and are not initialized when the TCNTA starts counting. Therefore, the time from when the TAE bit is set to when TCNTA starts counting may be less than the cycle of the selected count source clock (resolution), being undetermined due to hardware factors.

Figure 30.11 shows an example of free-running counter A (TCNTA) operation.

Figure 30.11 Example of Free-Running Counter A (TCNTA) Operation: Overflow Timing

### 30.5.3.3 Input Capture

Input capture is performed by input capture register $A x$ (ICRAx) when input capture is enabled in bits IOAx in timer I/O control register 1 (TIOR1A). ICRAx capture the value in free-running counter A (TCNTA) by detecting the edge of external input signals (TIA0x).

Noise on the external input signals can be removed by the noise cancelers. TCNTA starts counting up by setting the TAE bit in ATU master enable register (ATUENR). When the valid edge of the signal corresponding to ICRA is detected, the corresponding bit in timer status register A (TSRA) is set to " 1 " and the value in TCNTA is transferred to ICRA. The detection edge can be selected from rising edge, falling edge, or both rising and falling edges. It is also possible to output an interrupt request to the CPU upon input capture.

When input capture and writing to free-running counter A (TCNTA) occur simultaneously, the counter value before the write is captured.

Figure $\mathbf{3 0 . 1 2}$ shows an example of input capture when the edges to be sensed are rising edges for TIA 00 , falling edges for TIA01, and both edges for TIA02

Figure 30.12 Example of Input Capture of Timer A

Note: When the rising-edge sensing is selected for TIA00 to TIA02.

Figure 30.13 Example of TIA00 to TIA02 Event Output

By setting the EVOSEL1 bit in timer control register 1A (TCR1A), any of external input signals TIA02 to TIA00 after edge detection and noise cancellation can be output to timers $B$ and $C$ as an event (event output $1 \_0$ ).

Furthermore, either TIA01 or TIA02 or a combination of them (after edge detection and noise cancellation) can be output to timers C and D as an event (event outputs 2A and 2B) by setting the EVOSEL2A and EVOSEL2B bits. In addition, any one of external input pins TIA $0 x$ or a combination of them (after edge detection and noise cancellation) can be output to timers B and C as an event (event output 1_0) by setting the EVOSELE1E and EVOSELE1 bits in timer control register 2 A (TCR2A). Any one of external input pins TIAs or a combination of them (after edge detection and noise cancellation) can be output to timers C and D as an event (event outputs 2 A and 2B ) by setting the EVOSELE2AE and EVOSELE2A bits in timer control register 3A (TCR3A) and the EVOSELE2BE and EVOSELE2B bits in timer control register 4A (TCR4A).

Figure $\mathbf{3 0 . 1 3}$ shows an example of event output operation in case EVOSEL1 is set to $001_{\mathrm{B}}$ (TIA00 input edge output), $010_{\mathrm{B}}$ (TIA01 input edge output), and $100_{\mathrm{B}}$ (TIA02 input edge output).

### 30.5.3.4 Pin Level Capture Operation

Levels of the external input pins (TIA0x) after noise cancellation can be read from the timer input signal level register (TILRA). Figure $\mathbf{3 0 . 1 4}$ shows an example of operation of the TILRA register when signals are input to TIA0x.

Figure 30.14 Example of TILRA Capture Operation

### 30.6 Timer B

### 30.6.1 Overview of Operation

Timer B generates a multiplied-and-corrected clock signal based on an external-event input and supplies the generated signal to other timers. Timer B consists of an edge-interval measuring block, frequency-multiplying clock generator, and corrector for the frequency-multiplied clock signal.

## Edge-Interval Measuring Block

The edge-interval measuring block measures the intervals between edges of external-event signals $1 \_0$ input via timer A (TCNTB0, ICRB0). Interrupt requests can be issued for the CPU in response to matches between edge interval measuring counter (TCNTB0) and output compare register B0 (OCRB0). TCNTB0 can also be captured in ICRB2 via ICRB1 on matches between event counter B1 (TCNTB1) that uses and external event input 1_0 as the count source and output compare register B 1 (OCRB1). This provides a way to measure the intervals between multiple event inputs. Although TCNTB0 is cleared every event input 1_0, ICRB1 keeps a running total of the TCNTB0 value. ICRB2 latches the running totals on compare matches of the event counter. Furthermore, it is also possible to set the value of the event counter B1 (TCNTB1) that uses an external event input $1 \_0$ as a count source to $01_{H}$ by the CLRB1 bit (TCNTB1 clear bit) in the timer control register B (TCRB) at the next external event input timing after an event compare match with OCRB10. Furthermore, up to seven capture values (ICRB0) can be retained in record registers B1 to B6 (RECRB1 to RECRB6) at the external input event timing. Values retained in ICRB0 and RECRB1 to RECRB6 can be backed up in record backup registers B0 to B6 (RBURB0 to RBURB6) on event compare match between the event counter B1 (TCNTB1) and OCRB12.

For event counter (TCNB1), 24 compare registers (OCRB20 to OCRB 43) are provided for sequencer control. The sequencer transits to 24 states upon compare match between event counter (TCNTB1 and compare register (OCRB20 to OCRB 43). When the sequencer has transited, it generates a correction value for generating a frequency-multiplied clock by calculating the correction formula that uses the captured value (ICRB0) and Record Registers B1 to 6(RECRB1 to RECRB 6).

In the edge-interval measuring block, the event counter B1 (TCNTB1) value is captured for the event counter B1 (TCNTB1) at occurrence of any of seven external event input signals 1B to 1I that are input via timer A (ICRB30 to ICRB37). The event counter B1 (TCNTB1) is not cleared at occurrence of any of external event input signals 1B to 1I.

The edge-interval measuring block consists of three channels. Edge-interval blocks 0 to 3 operate based on the external event signals $1 \_0,1 \_1$, and $1 \_2$ input via timer A, respectively.

Table $\mathbf{3 0 . 3 8}$ below shows the events that correspond to each channel of the edge-interval measuring block and the registers provided for each channel.

What external-event and register value of the channel is used for other blocks can be selected by channel select register B (CHSELBR).

Table 30.38 Edge-Interval Measuring Blocks

| Cogresponding event | Edge-interval block 0 | Edge-interval block 1 | Edge-interval block 2 |
| :--- | :--- | :--- | :--- |
|  | External event 1_0 | External event 1_1 | External event 1_2 |
|  | TCNTB0 | ICRB0 | TCNTB0S1 |
|  | OCRB0 | ICRB0S1 | TCNTB0S2 |
|  | TCNTB1 | OCRB0S1 | ICRB0S2 |
|  | OCRB1 | OCNTB1S1 | OCRB0S2 |
|  | OCRB10 | OCRB10S1 | TCNTB1S2 |
|  | OCRB11 | OCRB11S1 | OCRB1S2 |
|  | OCRB12 | OCRB12S1 | OCRB10S2 |
|  | ICRB1 | ICRB1S1 | OCRB11S2 |
|  | ICRB2 | OCRB2S1 | ICRB1S2 |

Figure 30.15 Timer B Edge-Interval Measuring Blocks 0 to 2

NOTE
The output event selection (AGCK) is selected from output event $1 \_0,1 \_1$ and $1 \_2$ in CHSELB[1:0]. When CHSELB [1:0] is 00B, output event $1 \_0$ is selected. When CHSELB [1:0] is 01 B , output event $1 \_1$ is selected. When CHSELB [1:0] is 10B, output event $1 \_2$ is selected.

## Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator generates a clock signal obtained by frequency-multiplying an external-event selection (AGCK) input signal by a value from 1 to 4095.

In the edge-interval measuring block, down-counting (TCNTB2) with reload (RLDB) is performed for the capture value (ICRB0) in the input edge-interval measuring counter B0 (TCNTB0) or the corrected value calculated through sequencer control. Down-counting is performed by the set division ratio value specified in the PIMR select register. In addition to PIMR1, a division ratio value of PIMR2 can be selected by an event compare match between the event counter B1 (TCNTB1) in the edge-interval measuring block and OCRB11. When the down counter underflows, the multiplied clock (AGCK1) signal is asserted. (The multiplied clock is supplied as the count clock source for the noise canceler of timer A.)

TCNTB6 is a measuring counter using the multiplied clock as a source clock, and an interrupt request to the CPU can be output due to the compare match with OCRB6. ICRB6 is a capture register, and this TCNTB6 value is captured when an external event selection (AGCK) input occurs.

TCNTB6M is a measuring counter using the multiplied clock as a source clock. The up-count value can be set within a range from 0 to less than 4 in units of $1 / 64$. When an external event selection (AGCK) input occurs, the TCNTB6M value is compared with the ICRB6 value. When the TCNTB6M value is smaller than the ICRB6 value, an interrupt request to the CPU can be output.

## Frequency-Multiplied Clock Signal Corrector

The multiplied clock signal (AGCK1) needs to be corrected when two consecutive edge intervals differ significantly, since the earlier interval is referred to in calculating the multiplier for the current interval. The frequency-multiplied clock signal corrector generates a multiplied-and-corrected clock signal (AGCKM) by using three correcting counters (TCNTB3 to TCNTB5) and correcting counter clearing register B (TCCLRB). Output of the clock signal thus produced on clock-bus line 5 can be selected by using the clock-bus control register (CBCNT). Other timers can then use this clock as a source for counting. For the automatic up-counting function that continues counting until the multiplied-andcorrected clock generating counter B5 (TCNTB5) value matches the correcting counter clear register B (TCCLRB) value when the multiplied-and-corrected clock (AGCKM) is generated, whether to enable or disable this function is selectable. Furthermore, the correcting counter (TCNTB3) can be automatically cleared by the CLRB3 bit (TCNTB3 clear bit) in the timer control register B (TCRB) at the timing of an event compare match between the event counter B1 (TCNTB1) in the edge-interval measuring block and OCRB10 or between the correcting event counter B3 (TCNTB3) and OCRB8.

Figure $\mathbf{3 0 . 1 6}$ is a block diagram of timer B.

Figure 30.16 Block Diagram of Timer B

## CAUTION

The edge-interval measuring block consists of three channels. The channel to be used is selected by channel select register B (CHSELBR). See Table $\mathbf{3 0 . 3 8}$ for the registers provided for each channel.

### 30.6.2 Timer B Control Registers

### 30.6.2.1 TCRB — Timer Control Register B

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PIMRSEL | CLRB3 | CLRB1 |  |  | CLRB1SEL |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.39 TCRB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | PIMRSEL | PIMR select <br> 0 : PIMR1 is always selected. <br> 1: PIMR2 is selected instead of PIMR1 while TCNTB1 and OCRB11 match. |
| 6 | CLRB3 | TCNTB3 clear <br> 0 : TCNTB3 is not cleared. <br> 1: TCNTB3 is cleared. |
| 5 | CLRB1 | TCNTB1 clear select <br> 0 : TCNTB1 is not cleared. <br> 1: TCNTB1 is cleared. |
| 4, 3 | CLRB3SEL | TCNTB3 clear select <br> 00: Compare match between TCNTB1 and OCRB10 is used to clear TCNTB3 <br> 01: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB3 <br> 10: Compare match between TCNTB3 and OCRB8 is used to clear TCNTB3 <br> 11: Setting prohibited |
| 2 | CLRB1SEL | TCNTB1 clear select <br> 0 : Compare match between TCNTB1 and OCRB10 is used to clear TCNTB1 <br> 1: Compare match between TCNTB6 and OCRB6 is used to clear TCNTB1 |
| 1, 0 | CKSELB | Clock select B <br> 00: Clock-bus line 0 is selected for count source <br> 01: Clock-bus line 1 is selected for count source <br> 10: Clock-bus line 2 is selected for count source <br> 11: Clock-bus line 3 is selected for count source |

TCRB is an 8-bit readable/writable register that allows you to select a count source for the input edge interval measuring counter B 0 (TCNTB0) and the reload counter B 2 (TCNTB2), select whether to clear the TCNTB1 and TCNTB3 values at a compare match between TCNTB1 and OCRB10 or a compare match between TCNTB6 and OCRB6, and to select a pulse interval multiplier.

TCRB can be read and written in 8-bit units.
TCRB is initialized to $00_{\mathrm{H}}$ after reset.

## Clock Select B (CKSELB)

These bits select the clock driving TCNTB0 and TCNTB2 from clock-bus lines 0 to 3, which are clock signals divided by prescalers 0 to 3 . The counters are incremented on the rising edge of the selected clock.

To select the clock, stop timer B operation.

## Pulse Interval Multiplier Select (PIMRSEL)

By setting the PIMRSEL bit to 1 while TCNTB1 matches OCRB11, PIMR2 is selected for down-count values to be loaded to reload register B (RLDB) or for down-count values of TCNT2B. In other cases, PIMR1 is selected. However, PIMR1 is always used for adding the TCNTB3 value.

While the PIMRSEL bit is 0 , PIMR1 is always used.

## TCNTB1 Clear (CLRB1)

Setting the TCNTB1 clear bit (CLRB1) to 1 clears the TCNTB1 value at the timing of the first event input after a compare match between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 for the CLRB1SEL setting condition.

## TCNTB3 Clear (CLRB3)

Setting the TCNTB3 clear bit (CLRB3) to 1 clears the TCNTB3 value in synchronization with the first PCLK after a compare match between TCNTB1 and OCRB10, between TCNTB6 and OCRB6, or between TCNTB3 and OCRB8 for the CLRB3SEL setting condition.

## TCNTB1 Clear Select (CLRB1SEL)

Setting the TCNTB1 clear select bit (CLRB1SEL) sets the TCNTB1 clearing condition. When CLRB1SEL is 0 , TCNTB1 can be cleared on compare match between TCNTB1 and OCRB10. When CLRB1SEL is 1, TCNTB1 can be cleared on compare match between TCNTB6 and OCRB6.

## TCNTB3 Clear Select (CLRB3SEL)

Setting the TCNTB1 clear select bit (CLRB3SEL) sets TCNTB3 clearing condition. When CLRB3SEL is 00, TCNTB3 can be cleared on compare match between TCNTB1 and OCRB10. When CLRB3SEL is 01 , TCNTB3 can be cleared on compare match between TCNTB6 and OCRB6. When CLRB3SEL is 10, TCNTB3 can be cleared on compare match between TCNTB3 and OCRB8.

### 30.6.2.2 TCRBS1 — Timer Control Register BS1

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | CLRB1S1 | - | - | CLRB1SELS1 | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R | R | R/W | R | R |

Table 30.40 TCRBS1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | These bits are not used. Fix these bits to "0". |
| 5 | CLRB1S1 | TCNTB1S1 clear |
|  | $0:$ TCNTB1S1 is not cleared. |  |
|  | 1: TCNTB1S1 is cleared. |  |
| 4,3 | - | These bits are not used. Fix these bits to " 0 ". |
| 2 | CLRB1SELS1 | TCNTB1S1 clear select |
|  | $0:$ Compare match between TCNTB1S1 and OCRB10S1 is used to clear TCNTB1S1. |  |
|  |  | 1: Compare match between TCNTB6and OCRB6 is used to clear TCNTB1S1. |

$1,0 \quad$ These bits are not used. Fix these bits to " 0 ".

TCRBS1 is an 8-bit readable/writable register that allows you to select whether or not to clear TCNTB1S1 upon compare match between TCNTB1S1 and OCRB10S1 or compare match between TCNTB6 and OCRB6.

TCRBS1 can be read and written in 8-bit units.
TCRBS1 is initialized to $00_{\mathrm{H}}$ after reset.

## TCNTB1S1 Clear (CLRB1S1)

Setting the TCNTB1S1 clear bit (CLRB1S1) to 1 clears the TCNTB1S1 value at the timing of the first event input after a compare match between TCNTB1S1 and OCRB10S1 or between TCNTB6 and OCRB6 for the CLRB1SELS1 setting condition.

## TCNTB1S1 Clear Select (CLRB1SELS1)

Setting the TCNTB1S1 clear select bit (CLRB1SELS1) sets the TCNTB1S1 clearing condition. When CLRB1SELS1 is 0 , TCNTB1S1 can be cleared on compare match between TCNTB1S1 and OCRB10S1. When CLRB1SELS1 is 1 , TCNTB1S1 can be cleared on compare match between TCNTB6 and OCRB6.

### 30.6.2.3 TCRBS2 - Timer Control Register BS2

Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | CLRB1S2 | - | - | CLRB1SELS2 | - | - |

Table 30.41 TCRBS2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | These bits are not used. Fix these bits to "0". |
| 5 | CLRB1S2 | TCNTB1S2 clear |
|  | $0:$ TCNTB1S2 is not cleared. |  |
|  | 1: TCNTB1S2 is cleared. |  |
| 4,3 | - | These bits are not used. Fix these bits to "0". |
| 2 | CLRB1SELS2 | TCNTB1S2 clear select |
|  | $0:$ Compare match between TCNTB1S2 and OCRB10S2 is used to clear TCNTB1S2. |  |
|  |  | 1: Compare match between TCNTB6and OCRB6 is used to clear TCNTB1S2 |

1,0 - These bits are not used. Fix these bits to " 0 ".

TCRBS2 is an 8-bit readable/writable register that allows you to select whether or not to clear TCNTB1S2 upon compare match between TCNTB1S2 and OCRB10S2 or compare match between TCNTB6 and OCRB6.

TCRBS2 can be read and written in 8-bit units.
TCRBS2 is initialized to $00_{\mathrm{H}}$ after reset.

## TCNTB1S2 Clear (CLRB1S2)

Setting the TCNTB1S2 clear bit (CLRB1S2) to 1 clears the TCNTB1S2 value at the timing of the first event input after a compare match between TCNTB1S2 and OCRB10S2 or between TCNTB6 and OCRB6 for the CLRB1SELS2 setting condition.

## TCNTB1S2 Clear Select (CLRB1SELS2)

Setting the TCNTB1S2 clear select bit (CLRB1SELS2) sets the TCNTB1S2 clearing condition. When CLRB1SELS2 is 0 , TCNTB1S2 can be cleared on compare match between TCNTB1S2 and OCRB10S2. When CLRB1SELS2 is 1, TCNTB1S2 can be cleared on compare match between TCNTB6 and OCRB6.

### 30.6.2.4 TIORB - Timer I/O Control Register B

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | LDSEL | CTCNTB5 | EVCNTB | LDEN | ccs | - | - | $10 B 6$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R | R | R/W |

Table 30.42 TIORB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | LDSEL | Loading Data Select <br> 0 : ICRB0 value is used to calculate the data to be loaded to TCNTB2 and RLDB. <br> 1: LDB value is used to calculate the data to be loaded to TCNTB2 and RLDB |
| 6 | CTCNTB5 | Count Control B5 <br> 0 : TCNTB5 count operation is enabled. <br> 1: TCNTB5 count operation is disabled. |
| 5 | EVCNTB | Event Control B <br> 0 : External event input $1 \_0,1 \_1,1 \_2$ is disabled. <br> 1: External event input $1 \_0,1 \_1,1 \_2$ is enabled. |
| 4 | LDEN | Load Enable <br> 0: TCNTB2 and RLDB are updated on ICEB0 input capture. <br> 1: TCNTB2 and RLDB are not updated on ICEB0 input capture. |
| 3 | CCS | Counter Correction Select <br> 0: TCNTB4 is in operation when TCNTB3 $=$ TCNTB4 <br> 1: <br> [When CU4SEL bit is 0] <br> TCNTB4 is stopped when TCNTB3 = TCNTB4 <br> [When CU4SEL bit is 1] <br> TCNTB4 is stopped when TCNTB3 $=$ TCNTB4 -1 |
| 2, 1 | - | These bits are not used. Fix these bits to "0". |
| 0 | IOB6 | I/O Control B6 <br> 0 : Compare match between TCNTB6 and OCRB6 is disabled. <br> 1: Compare match between TCNTB6 and OCRB6 is enabled. |

TIORB is an 8-bit readable/writable register that selects the source of the frequency-multiplied clock and enables and disables the externally input signals, loading data, and correcting frequency multiplied clock. TIORB also controls multiplied-and-corrected clock generating counter B5 (TCNTB5) and output compare register B6 (OCRB6).

TIORB can be read and written in 8 -bit units.
TIORB is initialized to $00_{\mathrm{H}}$ after reset.

## Loading Data Select (LDSEL)

Selects the register to be loaded to reloadable counter B2 (TCNTB2) and to be used for calculating data to be loaded to reload register $B$ (RLDB) from ICRB0 or LDB.

## Count Control B5 (CTCNTB5)

Selects whether the multiplied-and-corrected clock generating counter B5 (TCNTB5) is enabled or stopped.
Setting this bit to 1 stops TCNTB5 and the multiplied-and-corrected clock to be output to other timers. Even if the counter is stopped, it is not cleared. Clearing this bit to 0 resumes TCNTB5 and multiplied- and-corrected clock.

## Event Control B (EVCNTB)

Disables and enables the externally input $1 \_0,1 \_1,1 \_2$ events. Clearing this bit to 0 disables the input. Setting this bit to 1 enables the input with which input capture or generating the multiplied-and-corrected clock signal.

## Load Enable (LDEN)

Selects whether to update the input capture register B0 (ICRB0) value, the reload counter B2 (TCNTB2) value, and the reload register B (RLDB) value at the input capture of the input edge interval measuring counter B 0 (TCNTB0).

## Counter Correction Select (CCS)

Selects whether or not correcting multiplied clock counter B4 (TCNTB4) is stopped when TCNTB3 $=$ TCNTB4 $(\mathrm{CU} 4 \mathrm{SEL}=0)$ or TCNTB3 $=$ TCNTB4-1 (CU4SEL $=1)$.

## I/O Control B6 (IOB6)

Enables and disables compare match between TCNTB6 and OCRB6. When this bit is cleared to 0 , compare match between TCNTB6 and OCRB6 is disabled. When it is set to 1 , compare match between TCNTB6 and OCRB6 is enabled. At this time, an interrupt request is output to the CPU at a compare match.

## CAUTION

When setting " 1 " to the CU4SEL bit of TCNT4CRB, be sure to set " 1 " to the CCS bit.

### 30.6.2.5 TSRB — Timer Status Register B

| Value after reset: |  |  | 0000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | - | $\underset{\mathrm{E}}{\mathrm{CMFB6}}$ | $\begin{array}{\|c} \hline \text { CMFB6 } \\ \mathrm{M} \end{array}$ | - | $\begin{gathered} \text { CMFB1 } \\ 2 \end{gathered}$ | CMFB1 <br> 1 | $\begin{gathered} \text { CMFB1 } \\ 0 \end{gathered}$ | CMFB6 | CMFB1 | ICFB0 | CMFB0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 30.43 TSRB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15-10 | - | These bits are not used. Fix these bits to "0". |
| 9 | CMFB6E | Compare Match Flag B6E <br> 0 : Function is not selected or no compare match has occurred. <br> 1: A compare match has occurred under the condition set for IREGB6E in TICRB. |
| 8 | CMFB6M | Compare Match Flag B6M <br> 0 : The TCNTB6M value is the ICRB6 value or larger. <br> 1: When the TCNTB6M value is smaller than ICRB6, the next event input occurs |
| 7 | - | This bit is not used. Fixe this bit to " 0 ". |
| 6 | CMFB12 | Compare Match Flag B12 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |
| 5 | CMFB11 | Compare Match Flag B11 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |
| 4 | CMFB10 | Compare Match Flag B10 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |
| 3 | CMFB6 | Compare Match Flag B6 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |
| 2 | CMFB1 | Compare Match Flag B1 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |
| 1 | ICFB0 | Input Capture Flag B0 <br> 0 : No input capture has occurred <br> 1: Input capture has occurred |
| 0 | CMFB0 | Compare Match Flag B0 <br> 0: No compare match has occurred. <br> 1: Compare match has occurred. |

The timer status register B (TSRB) is an 8-bit or 16-bit read-only register that indicates occurrence of input capture and compare match.

These status flags indicate occurrence of an interrupt request, and can be cleared to 0 by setting the corresponding bit in timer status clear register B (TSCRB). When an interrupt source occurs while one of these flags is set to 1 , an interrupt request is generated again.
Even if flag clear by the corresponding timer status clear register conflicts with flag setting due to occurrence of an interrupt source, an interrupt request is generated.

## NOTE

If an interrupt source is generated while the CMFB6 flag is set, the interrupt request is not generated.

TSRB can be read in 8-bit or 16-bit units only.
TSRB is initialized to $0000_{\mathrm{H}}$ after reset.

## Compare Match Flag B6E (CMFB6E)

This status flag indicates that both (or one of) CMFB6 and CMFB6M flags have been set by the setting for IREGB6E in the timer interrupt control register B (TICRB). When 1 is read from this flag, it shows that both (or one of) CMFB6 and CMFB6M flags have been set. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1 ) condition

When a CMFB6E interrupt request has occurred by the setting of IREGB6E in the timer interrupt control register B (TICRB). For details, see the description of the setting for IREGB6E in TICRB.

- Clearing (to 0 ) condition

Writing 1 to CMFCB6E in timer status clear register B (TSCRB)

## Compare Match Flag B6M (CMFB6M)

This status flag indicates that the multiplied clock counter B6M (TCNTB6M) value was smaller than the input capture register B6 (ICRB6) value at the external input event timing. When 1 is read from this flag, the TCNTB6M value is not larger than the ICRB6 value and the next event input has occurred. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1 ) condition

When the TCNTB6M count value does not exceed the ICRB6 value and the next event input has occurred

- Clearing (to 0) condition

Writing 1 to CMFCB6M in timer status clear register B (TSCRB)

## Compare Match Flag B12 (CMFB12)

This status flag indicates occurrence of a compare match of output compare register B12 (OCRB12) or output compare register B12S1 (OCRB12S1) or output compare register B12S2 (OCRB12S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB12. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1 ) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB1 count value matches the OCRB12 value and the next PCLK has occurred |
| 01 | When the TCNTB1S1 count value matches the OCRB12S1 value and the next PCLK has occurred |
| 10 | When the TCNTB1S2 count value matches the OCRB12S2 value and the next PCLK has occurred |
| 11 (Prohibited) | - |

## Compare Match Flag B11 (CMFB11)

This status flag indicates occurrence of a compare match of output compare register B11 (OCRB11) or output compare register B11S1 (OCRB11S1) or output compare register B11S2 (OCRB11S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB11. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1 ) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB1 count value matches the OCRB11 value and the next PCLK has occurred |
| 01 | When the TCNTB1S1 count value matches the OCRB11S1 value and the next PCLK has occurred |
| 10 | When the TCNTB1S2 count value matches the OCRB11S2 value and the next PCLK has occurred |
| 11 (Prohibited) | - |

- Clearing (to 0 ) condition

Writing 1 to CMFCB11 in timer status clear register B (TSCRB)

## Compare Match Flag B10 (CMFB10)

This status flag indicates occurrence of a compare match of output compare register B10 (OCRB10) or output compare register B10S1 (OCRB10S1) or output compare register B10S2 (OCRB10S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB10. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1 ) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB1 count value matches the OCRB10 value and the next PCLK has occurred |
| 01 | When the TCNTB1S1 count value matches the OCRB10S1 value and the next PCLK has occurred |
| 10 | When the TCNTB1S2 count value matches the OCRB10S2 value and the next PCLK has occurred |
| 11 (Prohibited) | - |

## Compare Match Flag B6 (CMFB6)

This status flag indicates occurrence of a compare match of output compare register B6 (OCRB6). When 1 is read from this flag, it shows that a compare match has occurred in CMFB6. This flag cannot be set to 1 or 0 by the software.

This flag is automatically cleared to 0 at an OCRB7 compare match only when IREGB6 in TICRB is set to 10 .

- Setting (to 1 ) condition

When the TCNTB6 count value matches the OCRB6 value and the next AGCK1 has occurred with compare match enabled by the IOB6 bit in timer I/O control register B (TIORB)

- Clearing (to 0 ) condition
- Writing 1 to CMFCB6 in timer status clear register B (TSCRB)
- Automatically cleared to 0 at an OCRB 7 compare match when $\operatorname{IREGB} 6=10$.

## Compare Match Flag B1 (CMFB1)

This status flag indicates occurrence of a compare match of output compare register B1 (OCRB1), output compare register B1S1 (OCRB1S1), output compare register B1S2 (OCRB1S2). When 1 is read from this flag, this indicates that a compare match has occurred in CMFB1. This flag cannot be set to 1 or 0 by the software.

The compare match for which this status flag is set is specified by the channel select bit (CHSELB).

- Setting (to 1 ) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB1 count value matches the OCRB1 value and the next PCLK has occurred |
| 01 | When the TCNTB1S1 count value matches the OCRB1S1 value and the next PCLK has occurred |
| 10 | When the TCNTB1S2 count value matches the OCRB1S2 value and the next PCLK has occurred |
| 11 (Prohibited) | - |

- Clearing (to 0 ) condition

Writing 1 to CMFCB1 in timer status clear register B (TSCRB)

## Input Capture Flag B0 (ICFB0)

This status flag indicates occurrence of an input capture of input capture register B0 (ICRB0), input capture register B0S1 (ICRB0S1), or input capture register B0S2 (ICRB0S2). When 1 is read from this flag, it shows that an input capture has occurred in ICRB0, ICRB0S1, or ICRB0S2. This flag cannot be set to 1 or 0 by the software.

The input capture to set this flag is selected by channel select bit (CHSELB).

- Setting (to 1 ) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event $1 \_0$ |
| 01 | When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event $1 \_1$ |
| 10 | When the TCNTB0 value has been transferred to ICRB0 at an input capture trigger due to an external event $1 \_0$ |
| 11 (Prohibited) | - |

- Clearing (to 0 ) condition

Writing 1 to ICFCB0 in timer status clear register B (TSCRB)

## Compare Match Flag B0 (CMFB0)

This status flag indicates occurrence of a compare match of output compare register B0 (OCRB0) or output compare register B0S1 (OCRB0S1) or output compare register B0S2 (OCRB0S2). When 1 is read from this flag, it shows that a compare match has occurred in CMFB0. This flag cannot be set to 1 or 0 by the software.

It's established by channel select bit (CHSELB) whether it's set when which comparing match occurred.

- Setting (to 1) condition

| CHSELB | Setting (to 1) conditions |
| :--- | :--- |
| 00 | When the TCNTB0 count value matches the OCRB0 value and the next clock set by the prescaler has occurred |
| 01 | When the TCNTB0 count value matches the OCRB0S1 value and the next clock set by the prescaler has <br> occurred |
| 10 | When the TCNTB0 count value matches the OCRB0S2 value and the next clock set by the prescaler has <br> occurred |
| 11 (Prohibited) | - |

- Clearing (to 0 ) condition

Writing 1 to CMFCB0 in the timer status clear register B (TSCRB)

### 30.6.2.6 TSCRB — Timer Status Clear Register B

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | $\left.\begin{array}{\|c} \text { CMFCB } \\ 6 \mathrm{E} \end{array} \right\rvert\,$ | $\begin{gathered} \text { CMFCB } \\ 6 \mathrm{M} \end{gathered}$ | - | $\begin{array}{\|c} \hline \text { CMFCB } \\ 12 \end{array}$ | $\begin{gathered} \text { CMFCB } \\ 11 \end{gathered}$ | CMFCB $10$ | $\begin{gathered} \text { CMFCB } \\ 6 \end{gathered}$ | $\begin{array}{\|c} \text { CMFCB } \\ 1 \end{array}$ | ICFCB0 | $\begin{array}{\|c} \text { CMFCB } \\ 0 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W | R | W | W | w | w | W | W | W |

Table 30.44 TSCRB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 10 | - | These bits are not used. Fix these bits to "0". |
| 9 | CMFCB6E | Compare Match Flag Clear B6E Enable <br> 0: Disabled (Default) <br> 1: CMFB6E in timer status register B (TSRB) is cleared to 0 . |
| 8 | CMFCB6M | Compare Match Flag Clear B6M Enable <br> 0: Disabled (Default) <br> 1: CMFB6M in timer status register B (TSRB) is cleared to 0 . |
| 7 | - | This bit is not used. Fix this bit to " 0 ". |
| 6 | CMFCB12 | Compare Match Flag Clear B12 Enable <br> 0 : Disabled (Default) <br> 1: CMFB12 in timer status register $B$ (TSRB) is cleared to 0 . |
| 5 | CMFCB11 | Compare Match Flag Clear B11 Enable <br> 0: Disabled (Default) <br> 1: CMFB11 in timer status register B (TSRB) is cleared to 0 . |
| 4 | CMFCB10 | Compare Match Flag Clear B10 Enable <br> 0: Disabled (Default) <br> 1: CMFB10 in timer status register $B$ (TSRB) is cleared to 0 . |
| 3 | CMFCB6 | Compare Match Flag Clear B6 Enable <br> 0 : Disabled (Default) <br> 1: CMFB6 in timer status register $B$ (TSRB) is cleared to 0 . |
| 2 | CMFCB1 | Compare Match Flag Clear B1 Enable <br> 0 : Disabled (Default) <br> 1: CMFB1 in timer status register $B$ (TSRB) is cleared to 0 . |
| 1 | ICFCB0 | Input Capture Flag Clear B0 Enable <br> 0 : Disabled (Default) <br> 1: ICFB0 in timer status register $B$ (TSRB) is cleared to 0 . |
| 0 | CMFCB0 | Compare Match Flag Clear B0 Enable <br> 0 : Disabled (Default) <br> 1: CMFB0 in timer status register $B$ (TSRB) is cleared to 0 . |

The timer status clear register B (TSCRB) is an 8-bit or 16-bit readable/writable register to set clearing of flags at occurrence of an input capture or compare match.

TSCRB can be read and written in 16-bit units. When read, " 0 " is always returned.
TSCRB is initialized to $0000_{\mathrm{H}}$ after reset.

## Compare Match Flag Clear B6E Enable (CMFCB6E)

Writing 1 to this bit while the compare match flag B6E (CMFB6E) in timer status register B (TSRB) is set to 1 clears CMFB6E to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B6M Enable (CMFCB6M)

Writing 1 to this bit while the compare match flag B6M (CMFB6M) in timer status register B (TSRB) is set to 1 clears CMFB6M to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B12 Enable (CMFCB12)

Writing 1 to this bit while the compare match flag B12 (CMFB12) in timer status register B (TSRB) is set to 1 clears CMFB12 to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B11 Enable (CMFCB11)

Writing 1 to this bit while the compare match flag B11 (CMFB11) in timer status register B (TSRB) is set to 1 clears CMFB11 to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B10 Enable (CMFCB10)

Writing 1 to this bit while the compare match flag B10 (CMFB10) in timer status register B (TSRB) is set to 1 clears CMFB10 to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B6 Enable (CMFCB6)

Writing 1 to this bit while the compare match flag B6 (CMFB6) in timer status register B (TSRB) is set to 1 clears CMFB6 to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B1 Enable (CMFCB1)

Writing 1 to this bit while the compare match flag B1 (CMFB1) in timer status register B (TSRB) is set to 1 clears CMFB1 to 0 . This bit is always read as 0 .

## Input Capture Flag Clear B0 Enable (ICFCB0)

Writing 1 to this bit while the input capture flag B0 (ICFB0) in timer status register B (TSRB) is set to 1 clears ICFB0 to 0 . This bit is always read as 0 .

## Compare Match Flag Clear B0 Enable (CMFCBO)

Writing 1 to this bit while the compare match flag B0 (CMFB0) in timer status register B (TSRB) is set to 1 clears CMFB0 to 0 . This bit is always read as 0 .

### 30.6.2.7 TICRB — Timer Interrupt Control Register B

## Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | IREGB6E[1:0] |  | IREGB6[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 30.45 TICRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. Fix these bits to "0". |
| 3,2 | IREGB6E | Interrupt Enable Edge B6E |
|  |  | 00: No interrupt request is output. |
|  | 01: An interrupt request is output when CMFB6 is enabled and then CMFB6M is enabled or |  |
|  | when CMFB6M is enabled and then CMFB6 is enabled (AND condition). |  |
|  | 10: An interrupt request is output when CMFB6 or CMFB6M is enabled (OR condition) |  |
|  | 11: Setting prohibited |  |
| 1,0 | IREGB6 | Interrupt Enable Edge B6 |
|  | 00: An interrupt request is output when CMFB6 is enabled |  |
|  | 01: An interrupt request is output at the next external event selection (AGCK) input timing |  |
|  | after CMFB6 is enabled. |  |
|  | 10: An interrupt request is output at the second external event selection (AGCK) input |  |
|  | timing after CMFB6 is enabled. However, no interrupt request is output if compare match |  |
|  | B7 occurs before the second external event selection (AGCK) is input. |  |
|  | 11: Setting prohibited |  |

The timer interrupt control register B (TICRB) is an 8-bit readable/writable register to control the compare match interrupt request output timing.

TICRB can be read and written in 8-bit units.
TICRB is initialized to $00_{\mathrm{H}}$ after reset.

## Interrupt Enable Edge B6E (IREGB6E)

These bits select conditions for CMFB6E interrupt request output of TSRB. Operation of these bits is disabled if these bits are set to 00 .

While these bits are set to 01 , an interrupt request is output at the external event selection (AGCK) input timing at the time when CMFB6M is enabled while a CMFB6 interrupt by the IREGB6 setting is present or at the timing of a CMFB6 interrupt request by the IREGB6 setting with CMFB6M enabled (AND condition). If CMFB6 is cleared even after a CMFB6 interrupt has occurred, no CMFB6E interrupt request is output even while CMFB6M is enabled.
Otherwise, if CMFB6M is cleared even while CMFB6M is enabled, a CMFB6 interrupt request by the IREGB6 setting occurs but no CMFB6E interrupt request is output.

While these bits are set to 10 , an interrupt request is output when a CMFB6 interrupt by the IREGB6 setting occurs or when CMFB6M is enabled (OR condition). Note that, if the CMFB6 interrupt request timing by the IREGB6 setting differs from the CMFB6M interrupt request timing, respective interrupt requests occur.

However, if the CMFB6 interrupt request timing matches the CMFB6M interrupt request timing, an interrupt request occurs once.

Do not modify these bits while the counter is working or the CMFB6 or CMFB6M bit in TSRB is set to 1 . If these bits are modified, this register does not function correctly.

## Interrupt Enable Edge B6 (IREGB6)

These bits select CMFB6 interrupt request output timing of TSRB. While these bits are set to 00, a CMFB6 interrupt request is output when CMFB6 is enabled. While these bits are set to 01 , an interrupt request is output at the first external event selection (AGCK) input timing after CMFB6 is enabled.

While these bits are set to 10 , an interrupt request is output at the second external event selection (AGCK) input timing after CMFB6 is enabled. However, if compare match B7 occurs during the period of waiting for the second external event selection (AGCK) input, CMFB6 is automatically cleared and no interrupt request is output even if the second external event selection (AGCK) is input.

Do not modify these bits while the counter is working or the CMFB6 bit in TSRB is set to 1 . If these bits are modified, this register does not function correctly.

### 30.6.2.8 TIERB — Timer Interrupt Enable Register B

| Value after reset: |  |  | 0000 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.46 TIERB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 10 | - | These bits are not used. Fix these bits to " 0 ". |
| 9 | CMFB6EIE | Compare Match B6E Interrupt Enable <br> 0 : Interrupt request by CMFB6E is disabled. <br> 1: Interrupt request by CMFB6E is enabled. |
| 8 | CMFB6MIE | Compare Match B6M Interrupt Enable <br> 0 : Interrupt request by CMFB6M is disabled. <br> 1: Interrupt request by CMFB6M is enabled. |
| 7 | - | This bit is not used. Fix this bit to " 0 ". |
| 6 | CMFB12IE | Compare Match B12 Interrupt Enable <br> 0 : Interrupt request by CMFB12 is disabled. <br> 1: Interrupt request by CMFB12 is enabled. |
| 5 | CMFB11IE | Compare Match B11 Interrupt Enable <br> 0 : Interrupt request by CMFB11 is disabled. <br> 1: Interrupt request by CMFB11 is enabled. |
| 4 | CMFB10IE | Compare Match B10 Interrupt Enable <br> 0 : Interrupt request by CMFB10 is disabled. <br> 1: Interrupt request by CMFB10 is enabled. |
| 3 | CMFB6IE | Compare Match B6 Interrupt Enable <br> 0 : Interrupt request by CMFB6 is disabled. <br> 1: Interrupt request by CMFB6 is enabled. |
| 2 | CMFB1IE | Compare Match B1 Interrupt Enable <br> 0 : Interrupt request by CMFB1 is disabled. <br> 1: Interrupt request by CMFB1 is enabled. |
| 1 | ICFBOIE | Input Capture BO Interrupt Enable <br> 0 : Interrupt request by ICFB0 is disabled. <br> 1: Interrupt request by ICFB0 is enabled. |
| 0 | CMFBOIE | Compare Match B0 Interrupt Enable <br> 0 : Interrupt request by CMFB0 is disabled. <br> 1: Interrupt request by CMFBO is enabled. |

The timer interrupt enable register B (TIERB) is an 8-bit or 16-bit readable/writable register that enables or disables interrupt requests corresponding to the status flags of timer status register B.

TIERB is initialized to $0000_{\mathrm{H}}$ after reset.

### 30.6.2.9 CHSELBR — Channel Select Register B

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | CHSELB[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 30.47 CHSELBR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. When these bits are read, " 0 " is returned. When writing, write " 0 ". |
| 1,0 | CHSELB[1:0] | Timer B Channel Select |
|  | $00:$ Edge-interval measuring block 0 is selected. |  |
|  | $01:$ Edge-interval measuring block 1 is selected. |  |
|  | 10: Edge-interval measuring block 2 is selected. |  |
|  | 11: Setting prohibited (Edge-interval measuring block 0 is selected, as same as 00 is |  |
|  | specified.) |  |

The channel select register B (CHSELBR) is an 8-bit readable/writable register.
CHSELBR is initialized to $00_{\mathrm{H}}$ after reset.

## Channel Select (CHSELB)

Select the counter to be compared with OCRB20 to OCRB43 for compare match, the output of the edge-interval measuring block to be used in frequency-multiplied clock generator, the source for setting input capture flag B0 (ICFB0), compare match flag B0 (CMFB0), compare match flag B1 (CMFB1), compare match flag B10 (CMFB10), compare match flag B11 (CMFB11) and compare match flag B12 (CMFB12).

### 30.6.2.10 TCNT4CRB — Multiplied-and-Corrected Clock Generating Counter B4 Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CU4SEL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 30.48 TCNT4CRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. When these bits are read, " 0 " is returned. When writing, write " 0 ". |
| 0 | CU4SEL | TCNTB4 count up setting. |
|  | $0:$ TCNTB4 is stopped when TCNTB3 = TCNTB4. |  |
|  | The clear value of TCNTB5 is H'00001000. (ATU-IV movement) |  |
|  | 1: TCNTB4 is stopped when (TCNTB3 - 1 ) $=$ TCNTB4. |  |
|  | The clear value of TCNTB5 is H'00000000. |  |
|  |  |  |

The Multiplied-and-Corrected clock generating counter B4 control register (TCNT4CRB) is an 8-bit readable/writable register.

TCNT4CRB is initialized to $00_{\mathrm{H}}$ after reset.

## TCNTB4 count up setting (CU4SEL)

This bit can select the count up conditions of Multiplied-and-Corrected Clock Counter B4 (TCNTB4) and the clear value of Multiplied-and-Corrected Clock Generating Counter B5 (TCNTB5).

## CAUTION

When setting " 1 " to the CU4SEL bit of TCNT4CRB, be sure to set " 1 " to the CCS bit of Timer I/O Control Register B (TIORB).

### 30.6.2.11 TCNTBO — Edge Interval Measuring Counter BO

Table 30.49 TCNTB0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CNTB0 | Edge Interval Count |
|  |  | These bits store 32-bit counter value. |

TCNTB0 is a 32-bit readable/writable register that functions as a counter driven by the clock selected in the clock select bit B (CKSELB) of timer control register B (TCRB). TCNTB0 is cleared to $00000001_{\mathrm{H}}$ on input capture by external input event 1_0.

TCNTB0 is started when the timer B enable bit (TBE) in ATU master enable register (ATUENR) is set to 1 . Clearing the TBE bit to 0 stops the counting but the counter value is not cleared.

TCNTB0 can be read and written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB0 is initialized to $00000001_{\mathrm{H}}$ after reset.

### 30.6.2.12 TCNTB0S1 — Edge Interval Measuring Counter B0S1

Table 30.50 TCNTB0S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CNTB0S1 | Edge Interval Count |
|  |  | These bits store 32-bit counter value. |

TCNTB0S1 is a 32-bit readable/writable register that functions as a counter driven by the clock selected in the clock select bit B (CKSELB) of timer control register B (TCRB). TCNTB0S1 is cleared to $00000001_{\mathrm{H}}$ on input capture by external input event 1_1.

TCNTB0S1 is started when the timer B enable bit (TBE) in ATU master enable register (ATUENR) is set to 1 . Clearing the TBE bit to 0 stops the counting but the counter value is not cleared.

TCNTB0S1 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB0S1 is initialized to $00000001_{\mathrm{H}}$ after reset.

### 30.6.2.13 TCNTB0S2 — Edge Interval Measuring Counter B0S2

Table 30.51 TCNTB0S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CNTB0S2 | Edge Interval Count |
|  |  | These bits store 32-bit counter value. |

TCNTB0S2 is a 32-bit readable/writable register that functions as a counter driven by the clock selected in the clock select bit B (CKSELB) of timer control register B (TCRB). TCNTB0S2 is cleared to $00000001_{\mathrm{H}}$ on input capture by external input event 1_2.

TCNTB0S2 is started when the timer B enable bit (TBE) in ATU master enable register (ATUENR) is set to 1 . Clearing the TBE bit to 0 stops the counting but the counter value is not cleared.

TCNTB0S2 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB0S2 is initialized to $00000001_{\mathrm{H}}$ after reset.

### 30.6.2.14 ICRBO — Input Capture Register BO DICRB0 - Input Capture Register B0 MIICRB0 - Mirror Input Capture Register B0

Table 30.52 ICRB0 / DICRB0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB0 | Input Capture B0 |
|  |  | These bits store 32-bit captured value. |

ICRB0 is a 32 -bit read-only register that is loaded with the value in TCNTB0 when external input event $1 \_0$ is detected. At this time, ICFB0 in timer status register B (TSRB) is set to 1 .

When the timer B channel select bits (CHSELB[1:0]) are set to " 00 ", an interrupt request can be output to the CPU at this ICRB0 input capture timing. TCNTB0 is cleared to $00000001_{\mathrm{H}}$.

ICRB0 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
ICRB0 is initialized to $00000000_{\mathrm{H}}$ after reset.
The read value of ICRB0 and DICRB0 is select by the set value of CHSELB[1:0], and when CHSELB[1:0] are set to " 00 ", the value of ICRB0 (edge-interval measuring block) is read. When CHSELB[1:0] are set to " 01 ", the value of ICRB0S1 (edge-interval measuring block 1) is read, and when CHSELB[1:0] are set to "10", the value of ICRB0S2 (edge-interval measuring block 2 ) is read. The read value of MIICRB0 is always that of input capture register B0 (ICRB0).

Figure 30.17 Input Capture Register B0

### 30.6.2.15 ICRB0S1 - Input Capture Register BOS1

Table 30.53 ICRB0S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB0S1 | Input Capture B0S1 |
|  |  | These bits store 32-bit captured value. |

ICRB0S1 is a 32 -bit read-only register that is loaded with the value in TCNTB0S1 when external input event $1 \_1$ is detected.

When the timer B channel select bits (CHSELB[1:0]) are set to " 01 ", an interrupt request can be output to the CPU at this ICRB0S1 input capture timing. TCNTB0S1 is cleared to $00000001_{\mathrm{H}}$.

ICRB0S1 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
ICRB0S1 is initialized to $00000000_{\mathrm{H}}$ after reset.
A mirror register DICRB0 is provided to ICRB0S1. When the timer B channel select bits (CHSELB[1:0]) are set to " 01 ", the contents in ICRB0S1 and DICRB0 are the same.

### 30.6.2.16 ICRBOS2 — Input Capture Register BOS2

Table 30.54 ICRB0S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB0S2 | Input Capture B0S2 |
|  |  | These bits store 32-bit captured value. |

ICRB0S2 is a 32 -bit read-only register that is loaded with the value in TCNTB0S2 when external input event $1 \_2$ is detected.

When the timer B channel select bits (CHSELB[1:0]) are set to " 10 ", an interrupt request can be output to the CPU at this ICRB0S2 input capture timing. TCNTB0S2 is cleared to $00000001_{\mathrm{H}}$.

ICRB0S2 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
ICRB0S2 is initialized to $00000000_{\mathrm{H}}$ after reset.
A mirror register DICRB0 is provided to ICRB0S2. When the timer B channel select bits (CHSELB[1:0]) are set to " 10 ", the contents in ICRB0S2 and DICRB0 are the same.

### 30.6.2.17 RECRB1 to RECRB6 — Record Registers B1 to B6 DRECRB1 - Record Registers B1

| Value after reset: |  |  | $00000000{ }_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | RECRB1-6[31:16] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | RECRB1-6[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.55 RECRB1 to RECRB6 / DRECRB1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RECRB1 to 6 | Record Register B1 to B6 |
|  |  | These bits store 32-bit event capture value. |

Record registers B1 to B6 (RECRB1 to RECRB6) are 32-bit registers that capture the ICRB0, ICRB0S1 or ICRB0S2 value at the timing of external event selection (AGCK) input (event 1 input). Which register RECRB1 captures is selected with the channel select bit (CHSELB).

| CHSELB | Captured register RECRB1 |
| :--- | :--- |
| 00 | ICRB0 |
| 01 | ICRB0S1 |
| 10 | ICRB0S2 |
| 11 (Prohibited) | - |

Each time an external event selection (AGCK) is input, the ICRB0, ICRB0S1, ICRB0S2 value is captured by shifting the ICRB0 value to RECRB1, the RECRB1 value to RECRB2, and the RECBR2 value to RECRB3. Thus up to seven past TCNT0B, TCNT0BS1 or TCNT0BS2 values can be retained in ICRB0 and RECRB1 to RECRB6.

RECRB1 to RECRB6 can be read or written in 32-bit units only
RECRB1 to RECRB6 are used as the calculation value for correction formula in sequencer control.
To initialize these registers, write $00000000_{\mathrm{H}}$ to them.
RECRB1 to RECRB6 are initialized to $00000000_{\mathrm{H}}$ after reset.
A mirror register DRECRB1 is provided to RECRB1. The contents in RECRB1 and DRECRB1 are the same.

### 30.6.2.18 RBURB0 to RBURB6 — Record Backup Register B0 to B6

Table 30.56 RBURB0 to RBURB6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | RBURB0-6 | Record Backup Registers B0 to B6 |
|  |  | These bits store 32-bit event capture backup value. |

Record backup registers B0 to B6 (RBURB0 to RBURB6) are 32-bit registers that back up values of ICRB0 and RECRB1 to RECRB6 in this register at the timing of event compare match between "event counter B1 (TCNTB1) and OCRB12" or "event counter B1S1 (TCNTB1) and OCRB12S1" or "event counter B1S2 and OCRB12S2".

Which register RBURB0 captures is selected with the channel select bit (CHSELB).

| CHSELB | RBURB0 backup factor | Register of a backup target |
| :--- | :--- | :--- |
| 00 | Compare match of TCNTB1 and OCRB12 | ICRB0 |
| 01 | Compare match of TCNTB1S1 and OCRB12S1 | ICRB0S1 |
| 10 | Compare match of TCNTB1S2 and OCRB12S2 | ICRB0S2 |
| 11 (Prohibited) | - | - |

The ICRB0 value is retained in RBURB0, the RECRB1 value in RBURB1, the RECRB2 value in RBURB2, the RECRB3 value in RBURB3, the RECRB4 value in RBURB4, the RECRB5 value in RBURB5, and the RECRB6 value is retained in RBURB6 by compare match genesis timing of OCRB12, OCRB12S1 or OCRB12S2.

RBURB0 to RBURB6 can be read or written in 32-bit units only.
RBURB0 to RBURB6 are initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.19 ICRB30 to ICRB37 — Input Capture Registers B30 to B37

Value after reset: $\quad 00_{H}$

Table 30.57 ICRB30 to ICRB37 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | ICRB30 to ICRB37 | Input Capture Registers B30 to B37 |
|  |  | These bits store 8-bit event capture value. |

Input capture registers B30 to B37 (ICRB30 to ICRB37) are 8-bit read-only registers. The event counter B1 (TCNTB1) value is captured at occurrence of any of seven external event inputs 1B to 1I that are input via timer A (ICRB30 to ICRB37). The event counter B1 (TCNTB1) is not cleared at occurrence of any of external event inputs 1B to 1I.

Which register ICRB30-37 captures is selected with the channel select bit (CHSELB).

| CHSELB | Register of a backup target |
| :--- | :--- |
| 00 | TCNTB1 |
| 01 | TCNTB1S1 |
| 10 | TCNTB1S2 |
| 11 (Prohibited) | - |

ICRB30 to ICRB37 can be read in 8-bit units only.
ICRB30 to ICRB37 are initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.20 OCRBO — Output Compare Register BO

Table 30.58 OCRBO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OCB0 | These bits store 32-bit data to be compared with TCNTB0. |
|  | Output Compare B0 |  |

The output compare register $\mathrm{B} 0(\mathrm{OCRB} 0)$ is a 32 -bit readable/writable register that is constantly compared with the input edge interval measuring counter B 0 (TCNTB0). When the timer B channel select bits (CHSELB[1:0]) are set to " 00 " and the OCRB0 value matches the TCNTB0 value, an interrupt request due to this compare match can be output to the CPU and the CMFB0 bit in timer status register B (TSRB) is set to 1 .

OCRB0 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
OCRB0 is initialized to $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$ after reset.

### 30.6.2.21 OCRB0S1 — Output Compare Register B0S1

Table 30.59 OCRB0S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OCB0S1 | These bits store 32-bit data to be compared with TCNTB0S1. |
|  | Output Compare |  |
|  | B0S1 |  |

The output compare register B0S1 (OCRB0S1) is a 32-bit readable/writable register that is constantly compared with the input edge interval measuring counter B0S1 (TCNTB0S1). When the OCRB0S1 value matches the TCNTB0S1 value at CHSELB $=01_{\mathrm{B}}$, an interrupt request due to this compare match can be output to the CPU and the CMFB0 bit in timer status register B (TSRB) is set to 1 .

OCRB0S1 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
OCRB0S1 is initialized to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.6.2.22 OCRB0S2 - Output Compare Register B0S2

Table 30.60 OCRB0S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OCB0S2 | These bits store 32-bit data to be compared with TCNTB0S2. |
|  | Output Compare |  |
|  | BOS2 |  |

The output compare register B0S2 (OCRB0S2) is a 32-bit readable/writable register that is constantly compared with the input edge interval measuring counter B0S2 (TCNTB0S2). When the OCRB0S2 value matches the TCNTB0S2 value at $\mathrm{CHSELB}=10_{\mathrm{B}}$, an interrupt request due to this compare match can be output to the CPU and the CMFB0 bit in timer status register B (TSRB) is set to 1 .

OCRB0S2 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
OCRB0S2 is initialized to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.6.2.23 TCNTB1 - Event Counter B1

Value after reset: $\quad 00_{H}$

Table 30.61 TCNTB1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CNTB1 | Event Count B1 |
|  |  | These bits store 8-bit counter value. |

The event counter B1 (TCNTB1) is an 8-bit readable/writable register that counts external event $1 \_0$. According to the setting for the CLRB1 and CLRB1SEL bits in the timer control register B (TCRB), the TCNTB1 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after a compare match between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event $1 \_0$ is input.

TCNTB1 can be read or written in 8-bit units only.
TCNTB1 can be written only when TSECRB.EVSEQENB is " 0 ". Writing to TCNTB1 when TSECRB.EVSEQENB is " 1 " is prohibited.

TCNTB1 is initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.24 TCNTB1S1 — Event Counter B1S1

Value after reset: $\quad 00_{H}$

Table 30.62 TCNTB1S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CNTB1S1 | Event Count B1S1 |
|  |  | These bits store 8-bit counter value. |

The event counter B1S1 (TCNTB1S1) is an 8-bit readable/writable register that counts external event 1_1. According to the setting for the CLRB1S1 and CLRB1SELS1 bits in the timer control register B (TCRB), the TCNTB1S1 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after a compare match between TCNTB1S1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event $1 \_1$ is input.

TCNTB1S1 can be read or written in 8-bit units only.
TCNTB1S1 can be written only when TSECRB.EVSEQENB is " 0 ". Writing to TCNTB1S1 when TSECRB.EVSEQENB is " 1 " is prohibited.

TCNTB1S1 is initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.25 TCNTB1S2 — Event Counter B1S2

Value after reset: $\quad 00_{H}$

Table 30.63 TCNTB1S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | CNTB1S2 | Event Count B1S2 |
|  |  | These bits store 8-bit counter value. |

The event counter B1S2 (TCNTB1S2) is an 8-bit readable/writable register that counts external event 1_2. According to the setting for the CLRB1S2 and CLRB1SELS2 bits in the timer control register B (TCRB), the TCNTB1S2 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after a compare match between TCNTB1S2 and OCRB10 or between TCNTB6 and OCRB6 occurs.

Unless count operation is enabled by the TBE bit in the ATU master enable register (ATUENR), count operation is not performed even if an external event $1 \_2$ is input.

TCNTB1S2 can be read or written in 8-bit units only.
TCNTB1S2 can be written only when TSECRB.EVSEQENB is " 0 ". Writing to TCNTB1S2 when TSECRB.EVSEQENB is " 1 " is prohibited.

TCNTB1S2 is initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.26 OCRB1 — Output Compare Register B1

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.64 OCRB1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB1 | Output Compare B1 |
|  |  | These bits store 8-bit data to be compared with TCNTB1. |

The output compare register B1 (OCRB1) is an 8-bit readable/writable register that is constantly compared with the event counter B1 (TCNTB1). When the timer B channel select bits (CHSELB[1:0]) are set to " 00 " and the OCRB1 value matches the TCNTB1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

The input capture register B1 (ICRB1) value is transferred to input capture register B2 (ICRB2) and ICRB1 is cleared at this compare match timing.

OCRB1 can be read or written in 8-bit units only.
OCRB1 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.27 OCRB1S1 — Output Compare Register B1S1

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.65 OCRB1S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB1S1 | Output Compare B1S1 |
|  |  | These bits store 8-bit data to be compared with TCNTB1S1. |

The output compare register B1S1 (OCRB1S1) is an 8-bit readable/writable register that is constantly compared with the event counter B1S1 (TCNTB1S1). When the timer B channel select bits (CHSELB[1:0]) are set to " 01 " and the OCRB1S1 value matches the TCNTB1S1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

The input capture register B1S1 (ICRB1S1) value is transferred to input capture register B2S1 (ICRB2S1) and ICRB1S1 is cleared at this compare match timing

OCRB1S1 can be read or written in 8-bit units only.
OCRB1S1 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.28 OCRB1S2 — Output Compare Register B1S2

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.66 OCRB1S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB1S2 | Output Compare B1S2 |
|  |  | These bits store 8-bit data to be compared with TCNTB1S2. |

The output compare register B1S2 (OCRB1S2) is an 8-bit readable/writable register that is constantly compared with the event counter B1S2 (TCNTB1S2). When the timer B channel select bits (CHSELB[1:0]) are set to " 10 " and the OCRB1S2 value matches the TCNTB1S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

The input capture register B1S2 (ICRB1S2) value is transferred to input capture register B2S2 (ICRB2S2) and ICRB1S2 is cleared at this compare match timing

OCRB1S2 can be read or written in 8-bit units only.
OCRB1S2 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.29 OCRB10 — Output Compare Register B10

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.67 OCRB10 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB10 | Output Compare B10 |
|  |  | These bits store 8-bit data to be compared with TCNTB1. |

The output compare register B 10 (OCRB10) is an 8-bit readable/writable register that is constantly compared with the event counter B1 (TCNTB1). When the timer B channel select bits (CHSELB[1:0]) are set to " 00 " and the OCRB10 value matches the TCNTB1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB10 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

According to the setting for the CLRB1 and CLRB1SEL bits in timer control register B (TCRB), the TCNTB1 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after this compare match occurs. Furthermore, according to the setting for the CLRB3 and CLRB3SEL bits in timer control register B (TCRB), the TCNTB3 value can be cleared to $00000000_{\mathrm{H}}$ at the next PCLK timing after this compare match occurs.

OCRB10 can be read or written in 8-bit units only.
OCRB10 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.30 OCRB10S1 — Output Compare Register B10S1

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.68 OCRB10S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB10S1 | Output Compare B10S1 |
|  |  | These bits store 8-bit data to be compared with TCNTB1S1. |

The output compare register B10S1 (OCRB10S1) is an 8-bit readable/writable register that is constantly compared with the event counter B1S1 (TCNTB1S1). When the timer B channel select bits (CHSELB[1:0]) are set to " 01 " and the OCRB10S1 value matches the TCNTB1S1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB10 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

According to the setting for the CLRB1S1 and CLRB1SELS1 bits in timer control register BS1 (TCRBS1), the TCNTB1S1 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after this compare match occurs.

OCRB10S1 can be read or written in 8-bit units only.
OCRB10S1 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.31 OCRB10S2 - Output Compare Register B10S2

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OCB10S2[7:0] |  |  |  |  |  |  |  |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.69 OCRB10S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB10S2 | Output Compare B10S2 |
|  |  | These bits store 8-bit data to be compared with TCNTB1S2. |

The output compare register B10S2 (OCRB10S2) is an 8-bit readable/writable register that is constantly compared with the event counter B1S2 (TCNTB1S2). When the timer B channel select bits (CHSELB[1:0]) are set to " 10 " and the OCRB10S2 value matches the TCNTB1S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB10 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

According to the setting for the CLRB1S2 and CLRB1SELS2 bits in timer control register BS2 (TCRBS2), the TCNTB1S2 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing after this compare match occurs.

OCRB10S2 can be read or written in 8-bit units only.
OCRB10S2 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.32 OCRB11 — Output Compare Register B11

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.70 OCRB11 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB11 | Output Compare B11 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B11 (OCRB11) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to " 00 ", this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1 and OCRB11. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to " 00 " and the TCNTB1 value matches the OCRB11 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11 can be read or written in 8-bit units only.
OCRB11 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.33 OCRB11S1 — Output Compare Register B11S1

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.71 OCRB11S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB11S1 | Output Compare B11S1 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B11S1 (OCRB11S1) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to " 01 ", this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1S1 and OCRB11S1. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to " 01 " and the TCNTB1S1 value matches the OCRB11S1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11S1 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11S1 can be read or written in 8-bit units only.
OCRB11S1 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.34 OCRB11S2 - Output Compare Register B11S2

## Value after reset: $\quad \mathrm{FF}_{H}$

Table 30.72 OCRB11S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB11S2 | Output Compare B11S2 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B11S2 (OCRB11S2) is an 8-bit readable/writable register. According to the setting for the PIMRSEL bit in timer control register B (TCRB), when the timer B channel select bits (CHSELB[1:0]) are set to " 10 ", this register can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 during a compare match between TCNTB1S2 and OCRB11S2. PIMR1 is always used for up-count values of TCNTB3.

When the timer B channel select bits (CHSELB[1:0]) are set to " 10 " and the TCNTB1S2 value matches the OCRB11S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB11S2 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB11S2 can be read or written in 8-bit units only.
OCRB11S2 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.35 OCRB12 — Output Compare Register B12

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.73 OCRB12 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB12 | Output Compare B12 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B12 (OCRB12) is an 8-bit readable/writable register. When the timer B channel select bits (CHSELB[1:0]) are set to " 00 ", values of ICRB0 and RECRB1 to RECRB6 can be backed up in RBURB0 to RBURB6 at the timing of event compare match between the event counter B1 (TCNTB1) and this register.

CHSELB[1:0] are set to " 00 " and the TCNTB1 value matches the OCRB12 value, an interrupt request due to this compare match can be output to the CPU and the CMFB12 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB12 can be read or written in 8-bit units only.
OCRB12 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.36 OCRB12S1 — Output Compare Register B12S1

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.74 OCRB12S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB12S1 | Output Compare B12S1 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B12S1 (OCRB12S1) is an 8-bit readable/writable register. When the timer B channel select bits (CHSELB[1:0]) are set to " 01 ", values of ICRB0S1 and RECRB1 to RECRB6 can be backed up in RBURB0 to RBURB6 at the timing of event compare match between the event counter B1S1 (TCNTB1S1) and this register.

CHSELB[1:0] are set to " 01 " and the TCNTB1S1 value matches the OCRB12S1 value, an interrupt request due to this compare match can be output to the CPU and the CMFB12 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB12S1 can be read or written in 8-bit units only.
OCRB12S1 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.37 OCRB12S2 - Output Compare Register B12S2

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

Table 30.75 OCRB12S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB12S2 | Output Compare B12S2 |
|  |  | These bits store 8-bit data to be compared. |

The output compare register B12S2 (OCRB12S2) is an 8-bit readable/writable register. When the timer B channel select bits (CHSELB[1:0]) are set to " 10 ", values of ICRB0S2 and RECRB1 to RECRB6 can be backed up in RBURB0 to RBURB6 at the timing of event compare match between the event counter B1S2 (TCNTB1S2) and this register.

CHSELB[1:0] are set to " 10 " and the TCNTB1S1 value matches the OCRB12S2 value, an interrupt request due to this compare match can be output to the CPU and the CMFB12 bit in timer status register B (TSRB) is set to 1 on the next PCLK.

OCRB12S2 can be read or written in 8-bit units only.
OCRB12S2 is initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.

### 30.6.2.38 ICRB1 — Input Capture Register B1

Table 30.76 ICRB1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB1 | Input Capture B1 |
|  |  | These bits store 32-bit input capture value. |

ICRB1 is a 32-bit read-only register. ICRB1 accumulates and stores the input inter-edge measuring counter B0
(TCNTB0) value in ICRB1 at the input timing of the external event $1 \_0$. ICRB1 is cleared to $00000000_{\mathrm{H}}$ on compare match between the event counter B1 (TCNTB1) and output compare register B1 (OCRB1).

ICRB1 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB1 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.39 ICRB1S1 — Input Capture Register B1S1

Table 30.77 ICRB1S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB1S1 | Input Capture B1S1 |
|  |  | These bits store 32-bit input capture value. |

ICRB1S1 is a 32-bit read-only register. ICRB1S1 accumulates and stores the input inter-edge measuring counter B0S1 (TCNTB0S1) value in ICRB1S1 at the input timing of the external event $1_{-} 1$. ICRB1S1 is cleared to $00000000_{\mathrm{H}}$ on compare match between the event counter B1S1 (TCNTB1S1) and output compare register B1S1 (OCRB1S1).

ICRB1S1 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB1S1 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.40 ICRB1S2 — Input Capture Register B1S2

Table 30.78 ICRB1S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB1S2 | Input Capture B1S2 |
|  |  | These bits store 32-bit input capture value. |

ICRB1S2 is a 32-bit read-only register. ICRB1S2 accumulates and stores the input inter-edge measuring counter B0S2 (TCNTB0S2) value in ICRB1S2 at the input timing of the external event $1 \_2$. ICRB1S2 is cleared to $00000000_{\mathrm{H}}$ on compare match between the event counter B1S2 (TCNTB1S2) and output compare register B1S2 (OCRB1S2).

ICRB1S2 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB1S2 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.41 ICRB2 — Input Capture Register B2

Table 30.79 ICRB2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB2 | Input Capture B2 |
|  |  | These bits store 32-bit input capture value. |

ICRB2 is a 32-bit read-only register. ICRB1 keeps a running total of the value in input capture register B1 (ICRB1) on compare match between event counter B1 (TCNTB1) and output compare register B1 (OCRB1).

ICRB2 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB2 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.42 ICRB2S1 - Input Capture Register B2S1

Table 30.80 ICRB2S1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB2S1 | Input Capture B2S1 |
|  |  | These bits store 32-bit input capture value. |

ICRB2S1 is a 32-bit read-only register. ICRB1S1 keeps a running total of the value in input capture register B1S1 (ICRB1S1) on compare match between event counter B1S1 (TCNTB1S1) and output compare register B1S1 (OCRB1S1).

ICRB2S1 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB2S1 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.43 ICRB2S2 — Input Capture Register B2S2

Table 30.81 ICRB2S2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ICB2S2 | Input Capture B2S2 |
|  |  | These bits store 32-bit input capture value. |

ICRB2S2 is a 32-bit read-only register. ICRB1S2 keeps a running total of the value in input capture register B1S2 (ICRB1S2) on compare match between event counter B1S2 (TCNTB1S2) and output compare register B1S2 (OCRB1S2).

ICRB2S2 can be read in 32-bit units only. Do not read 8-bit or 16-bit data for this register.
ICRB2S2 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.44 LDB — Load Register B

Table 30.82 LDB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | These bits are not used. Fix these bits to "0". |
| 23 to 0 | LDVAL | Load Value |
|  |  | These bits store 24-bit data to be loaded to TCNTB2 and RLDB. |

LDB is a 32-bit readable/writable register that is mapped to the lower-order 24 bits on a 32-bit boundary. The lower 24 bits are available.

When the LDSEL bit in timer I/O control register B (TIORB) is set to 1 , the value in this register is loaded to reloadable counter B2 (TCNTB2) and reload register B (RLDB).

LDB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
LDB is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.45 RLDB — Reload Register B

Table 30.83 RLDB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | RLDVAL | Reload Value |
|  |  | These bits store 24-bit reload value. |
| 7 to 0 | - | These bits are not used. Fix these bits to "0". |

RLDB is a 32-bit readable/writable register that is aligned with a longword boundary. The upper 24 bits are available.
This register is updated when the externally input event selection (AGCK) is detected while the LDEN bit in timer I/O control register B (TIORB) is cleared to 0 .

The value in input capture register B0 (ICRB0)*1 or load register B (LDB) minus the value in the PIMR bits in PIM is used for updating. According to the setting for the PIMRSEL bit in timer control register B (TCRB) and a compare match between TCNTB1 and OCRB11*2, PIMR2 is used as the PIMR value. In other cases, PIMR1 is used as the PIMR value. ICRB0*1 or LDB is set by the LDSEL bit in TIORB. For subtraction on ICRB0*1 and PIMR, the lower 24 bits of ICRB0*1 and PIM which is zero-extended.

The value in this register is added to the value in TCNTB2 on the first counter clock after the value in bits reload count B 2 (CNTB2) is equal to or less than the value in the pulse interval multiplier register (PIM).

RLDB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
RLDB is initialized to $00000000_{\mathrm{H}}$ after reset.
Initial setting is required for RLDB before starting timer B counter operation. For details, see Section 30.6.3, Details of Operation.

Note 1. CHSELB is used for ICRB0 at $00_{\mathrm{B}}$, and CHSELB is used for ICRB0S1 at $01_{\mathrm{B}}$, and CHSELB is used for ICRBOS2 at $10_{\text {b }}$.
Note 2. CHSELB moves at $00_{\mathrm{B}}$ for a compare match of TCNTB1 and OCRB11, and CHSELB moves at $01_{\mathrm{B}}$ for a compare match of TCNTB1S1 and OCRB11S1, and CHSELB moves at $10_{\mathrm{B}}$ for a compare match of TCNTB1S2 and OCRB11S2.

### 30.6.2.46 TCNTB2 — Reloadable Counter B2

Table 30.84 TCNTB2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 8 | CNTB2 | Reload Counter B2 |
|  |  | These bits store 24-bit reload counter value. |
| 7 to 0 | - | These bits are not used. Fix these bits to "0". |

TCNTB2 is a down counter mapped to 24 bits in a 32 -bit readable and writable register and functions as a counter driven by the clock selected by the clock selection B bits (CKSELB0 to CKSELB2) in timer control register B (TCRB). Each decrementation by the value set in the pulse interval multiplier register (PIMR). According to the setting for the PIMRSEL bit in timer control register B (TCRB) and in response to a compare match between TCNTB1 and OCRB11*1, PIMR2 is used as the PIMR value. In other cases, PIMR1 is used as the PIMR value.

When the TBE bit in ATU master enable register (ATUENR) is set to 1 , counting is not performed. Even if the TBE bit is cleared to 0 , this counter is not cleared.

The TCNTB2 value is updated when the externally input event selection (AGCK) is detected while the LEDN bit in timer I/O control register B (TIORB) is cleared to 0 .

The value in input capture register B0 (ICRB0)*2 or load register B (LDB) is used for updating. ICRB0*2 or LDB can be set by the LDSEL bit in TIORB.

The value in reload register B (RLDB) is added to the value stored in this counter on the first counter clock cycle after the value in this counter is equal to or less than the value in PIM. The frequency- multiplied clock (AGCK1) is output as a train of single pulses equal in width to the cycle of the PCLK clock on reloading.

TCNTB2 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB2 is initialized to $00000000_{\mathrm{H}}$ after reset.
Initial setting is required for TCNTB2 before starting timer B counter operation. For details, see Section 30.6.3,

## Details of Operation.

Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at $00{ }_{\mathrm{B}}$, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 018, the compare match of TCNTB1S2 and OCRB11S2 at 10 в.
Note 2. CHSELB uses ICRB0 as renewal data at $00_{\mathrm{b}}$. When CHSELB is $01_{\mathrm{B}}$, ICRB0S1 is used, and CHSELB uses ICRBOS2 as renewal data at 10в.

### 30.6.2.47 PIMR1 — Pulse Interval Multiplier Register 1

| Value after reset: 0001 H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | PIM1[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.85 PIMR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. Fix these bits to " 0 ". |
| 11 to 0 | PIM1 | Pulse Interval Multiplier 1 |
|  |  | These bits set the multiplication ratio for the frequency-multiplied clock. |
|  | The settable value ranges from 1 to 4095. |  |

PIMR1 is a 16-bit readable/writable register that sets the multiplication ratio of the externally input event for generation of the frequency-multiplied clock.

The settable value ranges from $1\left(001_{\mathrm{H}}\right)$ to $4095\left(\mathrm{FFF}_{\mathrm{H}}\right)$. Do not set the PIM bits to $000_{\mathrm{H}}$. If the PIM bits are set to $000_{\mathrm{H}}$, operation cannot be guaranteed.

The value in this register is used in various registers: as the step size in decrementation of reloadable counter B2 (TCNTB2); for calculation of the value to be input to reload register B (RLDB); and for calculation of the value to be input to corrected event counter B3 (TCNTB3). However, when a compare match between TCNTB1 and OCRB11*1 occurs with the PIMRSEL bit in timer control register B (TCRB) set to 1, PIMR2 is used to calculate the TCNTB2 down-count value and the RLDB input value. PIMR1 is always used to calculate the TCNTB3 input value PIMR1 can be read or written in 16-bit units only. Do not write or read 8-bit data for this register.

PIMR1 is initialized to $0001_{\mathrm{H}}$ after reset.
Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at $00_{\mathrm{B}}$, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 018, the compare match of TCNTB1S2 and OCRB11S2 at $10_{\mathrm{B}}$.

### 30.6.2.48 PIMR2 — Pulse Interval Multiplier Register 2

| Value after reset: $\quad 0001 \mathrm{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | PIM2[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.86 PIMR2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. Fix these bits to "0". |
| 11 to 0 | PIM2 | Pulse Interval Multiplier 2 |
|  |  | These bits set the multiplication ratio for the frequency-multiplied clock. |
|  | The settable value ranges from 1 to 4095. |  |

The pulse interval multiplier register 2 (PIMR2) is a 16-bit readable/writable register that is mapped to the lower 12 bits. PIMR2 sets the multiplication ratio of the frequency-multiplied clock when tooth is missing.

The settable value ranges from $1\left(001_{\mathrm{H}}\right)$ to $4095\left(\mathrm{FFF}_{\mathrm{H}}\right)$. Do not set the PIM2 bits to $000_{\mathrm{H}}$. If the PIM2 bits are set to $000_{\mathrm{H}}$, operation cannot be guaranteed.

By setting the PIMRSEL bit in timer control register B (TCRB), the reload counter B2 (TCNTB2) performs downcounting with the set PIMR2 value (PIM2) (not with the PIMR1 value) while the TCNTB1 value is equal to the OCRB11 value*1. The PIMR2 value is also used to calculate the reload register B (RLDB) input value, but is not used to calculate the correction event counter B3 (TCNTB3) input value. The multiplication ratio of the frequency-multiplied clock at missing tooth is corrected by setting a value of ( N (number of missing teeth) +1 ) times for the PIMR1 value. When the number of missing teeth is 2 , for example, a value of (PIMR1 value $\times 3$ ) is set for PIMR2.

PIMR2 can be read or written in 16-bit units only. Do not write or read 8 -bit data for this register.
PIMR2 is initialized to $0001_{\mathrm{H}}$ after reset.

Note 1. CHSELB uses PIMR2 by a compare match of TCNTB1 and OCRB11 at 00 ${ }_{\mathrm{B}}$, the compare match by which CHSELB is TCNTB1S1 and OCRB11S1 at 01в, the compare match of TCNTB1S2 and OCRB11S2 at 10в.

### 30.6.2.49 TCNTB6 — Multiplied Clock Counter B6

Table 30.87 TCNTB6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | CNTB6 | Frequency-Multiplied Clock Count B6 |
|  |  | These bit store 20-bit counter value driven by the frequency-multiplied clock. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

The multiplied clock counter B6 (TCNTB6) is a 20-bit up-counter mapped in the 32-bit readable/ writable register. TCNTB6 performs up-counting on the frequency-multiplied clock (AGCK1). This counter is cleared to $00000_{\mathrm{H}}$ when the external input event selection (AGCK) is detected.

When the TBE bit in ATU master enable register (ATUENR) is set to 1 , counting is not performed. Even if the TBE bit is cleared to 0 and counting up is stopped, the counter value is not cleared.

TCNTB6 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.
TCNTB6 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.50 ICRB6 — Input Capture Register B6

Table 30.88 ICRB6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | ICB6 | Input Capture B6 |
|  |  | These bits store 20-bit input capture value. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

The input capture register B6 (ICRB6) is a 32-bit read-only register that is mapped to upper 20 bits. No value can be written to this register.

When an external event selection (AGCK) input is detected, ICRB6 stores the TCNTB6 value at the next clock (PCLK) timing. The value stored in ICRB6 is compared with the TCNTB6M value at the next external event selection input timing. When the ICRB6 value is larger than the TCNTB6M value, an interrupt request can be output.

ICRB6 can be read in 32-bit units only.
ICRB6 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.51 RARB6 — Multiplication Setting Register B6

Value after reset: $\quad 40 \mathrm{H}$

Table 30.89 RARB6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | RARB6 | Multiplication Setting Register B6 |
|  |  | These bits set the TCNTB6M count value. |

The multiplication setting register B6 (RARB6) is an 8-bit readable/writable register to set an up-count value of the frequency-multiplied clock counter B6M (TCNTB6M). RARB6 handles the lower 6 bits as fixed point. A multiplication of 1 to 3.984375 can be set with a resolution of $1 / 64$.

RARB6 can be read or written in 8-bit units only.
RARB6 is initialized to $40_{\mathrm{H}}$ after reset.

### 30.6.2.52 TCNTB6M — Frequency-Multiplied Clock Counter B6M

Table 30.90 TCNTB6M Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 6 | CNTB6M | Frequency-Multiplied Clock Count B6M |
|  |  | 26-bit frequency-multiplied clock count value |
| 5 to 0 | - | These bits are not used. Fix these bits to "0". |

The frequency-multiplied clock counter B6M (TCNTB6M) is a 32-bit readable/writable register (up-counter) that is mapped to upper 26 bits. TCNTB6M performs count-up operation with a count value of multiplication that is set in multiplication setting register B6 (RARB6) for the frequency-multiplied clock (AGCK1). TCNTB6M handles the lower 6 bits (b11 to b6) as fixed point, and can count within a range of 1 to 1048575.984375 with a resolution of $1 / 64$. Each time an external event selection (AGCK) is input, the TCNTB6M value is compared with the ICRB6 value. When ICRB6 is larger than TCNTB6M, an interrupt request can be output. TCNTB6M is initialized to $00000000_{\mathrm{H}}$ at the first clock (PCLK) timing after occurrence of an external event selection input.

Setting the TBE bit in the ATU master enable register (ATUENR) to 1 starts counting of this counter. Clearing the TBE bit to 0 stops counting but the counter value is not cleared.

TCNTB6M can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB6M is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.53 OCRB6 — Output Compare Register B6

Table 30.91 OCRB6 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | OCB6 | Output Compare B6 |
|  |  | These bits store 20-bit data to be compared |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

OCRB6 is a 32-bit readable/writable register in which output compare B 6 (OCB6) is mapped to upper 20 bits in 32 bits. Whether to perform compare match between multiplied-clock counter B6 and OCRB6 can be selected by the IOB6 setting of timer I/O control register B (TIORB).

The OCRB6 value is compared with the TCNTB6 value. When input of the frequency-multiplied clock signal (AGCK1) leads to the values matching, a missing tooth detection trigger is generated, which leads to setting of the CMFB6 bit in timer status register B (TSRB) to 1 and can also cause the output of an interrupt request for the CPU.

According to the setting for the CLRB1 and CLRB1SEL bits in the timer control register B (TCRB) and this compare match occurrence, the TCNTB1, TCNT1S1 and TCNT1S2 value can be cleared to $01_{\mathrm{H}}$ at the next event input timing. Furthermore, according to the setting for the CLRB3 and CLRB3SEL bits in the timer control register B (TCRB) and this compare match occurrence, the TCNTB3 value can be cleared to $00000000_{\mathrm{H}}$ at the next PCLK timing.

OCRB6 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
OCRB6 is initialized to FFFF $\mathrm{F} 000_{\mathrm{H}}$ after reset.

### 30.6.2.54 OCRB7 — Output Compare Register B7

Table 30.92 OCRB7 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | OCB7 | Output Compare B7 |
|  |  | These bit store 20-bit data to be compared. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

OCRB7 is a 32-bit readable/writable register in which output compare B7 (OCB7) is mapped to upper 20 bits in 32 bits.
The OCRB7 value is compared with the TCNTB6 value. When the frequency-multiplied clock (AGCK1) is input with these values matching, a compare match occurs. When the IREGB6 bits in timer interrupt control register B (TICRB) are set to 10, the CMFB6 bit in timer status register B (TSRB) is cleared to 0 at an occurrence of this compare match.

There is no status flag or interrupt request that indicates occurrence of a compare match of OCRB7.
OCRB7 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.
OCRB7 is initialized to FFFF $\mathrm{F} 000^{\mathrm{H}}$ after reset.

### 30.6.2.55 OCRB20 to OCRB43 — Output Compare Registers B20 to 43

Value after reset: $\quad \mathrm{FF}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OCB20-43[7:0] |  |  |  |  |  |  |  |
| Value after reset | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.93 OCRB20 to OCRB43 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | OCB20 to OCB43 | Output Compare B20 to B43 |
|  |  | These bits store 8-bit value to be compared. |

The output compare registers B20 to B43 (OCRB20 to OCRB43) are 8-bit readable/writable register.
During timer B operation, one of OCRB20 to OCRB43 that is selected by the sequencer is constantly compared with TCNTB1, and if it value matches the TCNTB1 value, the sequencer transits at the next external event selection (AGCK).

There is no status flag or interrupt request that indicates occurrence of a compare match of OCRB20 to OCRB43.
OCRB20 to OCR43 can be read or written in 8-bit units only.
OCRB20 to OCRB43 are initialized to $\mathrm{FF}_{\mathrm{H}}$ after reset.
The register that is compared with TCNTB1*1 functions as following according to the status of the sequencer.
If the sequencer status bit (SEQB) in the timer sequencer register (TSEQRB) is " $x$ ", the output compare register OCRB $(20+x-1)$ is compared with TCNTB1 $(x=1$ to 24$)$.

While the sequencer is running, it is prohibited to rewrite the compare registers corresponding to the sequence numbers enabled by the timer sequencer enable bits TSEQNEN[23:0].

| Compare register/Compare match | Transition of sequencer |
| :--- | :--- |
| OCRB20 compare match | The sequencer transits at the first external event selection (AGCK) after <br> compare match. |
| $:$ | Example: State $0 \rightarrow$ State 1 |
| OCRB43 compare match |  |

Note 1. When CHSELB is $00_{\mathrm{B}}$, TCNTB1 counter compares, and when CHSELB is $01_{\mathrm{B}}$, TCNTB1S1 counter compares, and when CHSELB is 108, TCNTB1S2 counter compares.

### 30.6.2.56 TSEQCRB — Timer Sequencer Control Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | EVSEQENB |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 30.94 TSEQCRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. Fix these bits to "0". |
| 0 | EVSEQENB | Event Input Cycle Correction Sequencer Enable |
|  | $0:$ Sequencer operation is disabled. Correction is not performed. |  |
|  | 1: Sequencer operation is enabled. |  |

The timer sequencer control register (TSEQRB) is an 8 -bit readable/writable register.
The ECSEQENB bit enables the sequencer operation for correcting the timer B event input cycle. If ECSEQENB is changed from 1 to 0 , the sequencer inside is initialized after next external event selection (AGCK) input timing.

TSEQRB can be read or written in 8-bit units only.
TSEQRB is initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.57 TSEQRB — Timer Sequencer Register

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | FONS | - | - | SEQB[4:0] |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 30.95 TSEQRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | FONS | Correction Formula Enable Status |
|  | $0:$ Correction is disabled. |  |
|  | 1: Correction is enabled. |  |
| 6,5 | - | These bits are not used. Fix these bits to "0". |
| 4 to 0 | SEQB | Sequencer Status |
|  | $00000:$ The sequencer is in State 0. |  |
|  |  |  |
|  |  | $11000:$ The sequencer is in State 24. |

The timer sequencer register (TSEQRB) is an 8-bit read-only register that generates AGCK cycle according to the sequencer state.

TSEQRB can be read or written in 8-bit units only.
TSEQRB is initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.58 TSEQENB0 to TSEQENB2 - Timer Sequencer Enable Registers 0 to 2

Table 30.96 TSEQENB0 to TSEQENB2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | These bits are not used. Fix these bits to "0". |
| 23 to 16 | TSEQNENB $x$ | Sequencer Enable |
|  | $(x=23$ to 16) | 0: Do not transit to the target sequencer state. |
|  |  | 1: Transit to the target sequencer state and perform correction. |
| 15 to 8 | TSEQNENB $x$ | Sequencer Enable |
|  | $(x=15$ to 8$)$ | $0:$ Do not transit to the target sequencer state. |
|  |  | 1: Transit to the target sequencer state and perform correction. |
| 7 to 0 | TSEQNENB $x$ | Sequencer Enable |
|  | $(x=7$ to 0$)$ | $0:$ Do not transit to the target sequencer state. |
|  |  | 1: Transit to the target sequencer state and perform correction. |

Timer sequencer enable registers 0 to 2 (TSEQENB0 to TSEQENB2) are 8 -bit readable/writable registers that control transition of the sequencer to the state upon detection of a compare match between TCNTB1*1 and OCRB20 to OCRB43.

TSEQENB0 to TSEQENB2 can be read or written in 8-bit units only.
TSEQENB0 to TSEQENB2 are initialized to $00_{\mathrm{H}}$ after reset.
Note 1. When CHSELB is $00_{\mathrm{B}}$, TCNTB1 counter compares, and when CHSELB is $01_{\mathrm{B}}$, TCNTB1S1 counter compares, and when CHSELB is 10 B , TCNTB1S2 counter compares.

### 30.6.2.59 TEPCFB0 to TEPCFB23 - Timer Event Cycle Correction Formula Definition Registers $\mathbf{B 0}$ to 23

| Value after reset: |  |  | $0300_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | $\begin{array}{\|c} \text { HALFE } \\ \mathrm{Nx} \end{array}$ | - | COEFFx[2:0] |  |  | - | CRFIT1x[2:0] |  |  | - | CRFIT2x[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

## CAUTION

While the sequencer is running, it is prohibited to rewrite the timer event cycle correction formula definition registers corresponding to the sequence numbers enabled by the timer sequencer enable bits TSEQNEN[23:0].

Table 30.97 TEPCFB0 to TEPCFB23 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 13 | - | These bits are not used. Fix these bits to "0". |
| 12 | HALFENx | Event Input Cycle Correction Formula 1/2 Multiplication Enable <br> 0 : The event input cycle correction formula is not multiplied by $1 / 2$. (Default) <br> 1: The event input cycle correction formula is multiplied by $1 / 2$. |
| 11 | - | This bit is not used. Fix this bit to " 0 ". |
| 10 to 8 | COEFFx | Correction Formula Coefficient <br> 000: Coefficient $K(x)=0.25$ <br> 001: Coefficient $K(x)=0.5$ <br> 010: Coefficient $K(x)=0.75$ <br> 011: Coefficient $K(x)=1.0$ (Default) <br> 100: Coefficient $K(x)=1.25$ <br> 101: Coefficient $K(x)=1.5$ <br> 110: Coefficient $K(x)=1.75$ <br> 111: Coefficient $K(x)=2.0$ |
| 7 | - | This bit is not used. Fix this bit to " 0 ". |
| 6 to 4 | CRFIT1x | Event Input Cycle Correction Formula 2nd Term Cycle <br> 000: Use ICRBO for the 2nd term of correction formula. <br> 001: Use RECRB1 for the 2nd term of correction formula. <br> 010: Use RECRB2 for the 2nd term of correction formula. <br> 011: Use RECRB3 for the 2nd term of correction formula. <br> 100: Use RECRB4 for the 2nd term of correction formula. <br> 101: Use RECRB5 for the 2nd term of correction formula. <br> 110: Use RECRB6 for the 2nd term of correction formula. <br> 111: Setting prohibited |
| 3 | - | This bit is not used. Fix this bit to " 0 ". |
| 2 to 0 | CRFIT2x | Event Input Cycle Correction Formula 3rd Term Cycle <br> 000: Use ICRBO for the 3rd term of correction formula. <br> 001: Use RECRB1 for the 3rd term of correction formula. <br> 010: Use RECRB2 for the 3rd term of correction formula. <br> 011: Use RECRB3 for the 3rd term of correction formula. <br> 100: Use RECRB4 for the 3rd term of correction formula. <br> 101: Use RECRB5 for the 3rd term of correction formula. <br> 110: Use RECRB6 for the 3rd term of correction formula. <br> 111: Setting prohibited |

Timer event cycle correction formula definition registers B0 to B23 (TEPCFB0 to TEPCFB23) are 16-bit readable/writable registers.
TEPCFB is initialized to $0300_{\mathrm{H}}$ after reset.

### 30.6.2.60 TCNTB3 — Correction Event Counter B3

Table 30.98 TCNTB3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | CNTB3 | Correction Event Counter B3 |
|  |  | 20-bit event counter value |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

Correction event counter B3 (TCNTB3) is a 20-bit up-counter that is mapped a 32-bit readable/writable register.
When ex external event selection (AGCK) is input, TCNTB3 transfers the counter value to correction counter B4 (TCNTB4) and then starts up counting using the value of pulse interval multiplier register 1 (PIMR1). The value of pulse interval multiplier register 2 (PIMR2) is not used for up-counting of TCNTB3.

TCNTB3 does not perform counting if the TBE bit of ATU master enable register (ATUENR) is not set to " 1 ". The counter value is not cleared if TBE is cleared to " 0 ".

According to the setting for the CLRB3 and CLRB3SEL bits in the timer control register B (TCRB), the TCNTB3 value can be cleared to $00000000_{\mathrm{H}}$ at the next PCLK timing after a compare match*1 between TCNTB1 and OCRB10 or between TCNTB6 and OCRB6 occurs.

TCNTB3 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB3 is initialized to $00000000_{\mathrm{H}}$ after reset.
Note 1. CHSELB uses by compare match of TCNTB1 and OCRB11 at $00_{\mathrm{B}}$, the compare match by which CHSELB is TCNTB1S1 and OCRB10S1 at 01в, the compare match of TCNTB1S2 and OCRB10S2 at 10в.

### 30.6.2.61 OCRB8 — Output Compare Register B8

Table 30.99 OCRB8 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | OCB8 | Output Compare B8 |
|  |  | These bits store 20-bit value to be compared with TCNTB3. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

Output Compare Register B8 (OCRB8) is a 32-bit readable/writable register in which output compare B8 (OCB8) bits are mapped to the upper 20 bits.

The OCRB8 value is compared with the TCNTB3 value. When TCNTB3 clear (due to a compare match between OCRB8 and TCNTB3) is enabled by bit 4 and bit 3 in the timer control register B (TCRB), the TCNTB3 value is cleared to 0 at the first PCLK timing after a compare match between the OCRB8 value and the TCNTB3 value. OCRB8 has no compare match status flag or interrupt

OCRB8 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
OCRB8 is initialized to $\operatorname{FFFF}{\mathrm{F} 000_{\mathrm{H}}}$ after reset.

### 30.6.2.62 TEPCFENB0 to TEPCFENB2 - Timer Event Cycle Correction Enable Registers 0 to 2

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | - | FON23-16 |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | FON15-8 |  |  |  |  |  |  |  | FON7-0 |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.100 TEPCFENB0 to TEPCFENB2 TEPCFENB0 to TEPCFENB2

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 24 | - | These bits are not used. Fix these bits to "0". |
| 23 to 16 | FONx | Event Input Cycle Correction Formula $x$ Correction Enable |
|  |  | 0: The correction formula is disabled in sequencer state $x$. |
| (AGCK1 multiplication cycle is calculated using the ICRB0 value only.) |  |  |
|  |  | 1: The correction formula is enabled in sequencer state $x$. |

Timer event cycle correction enable registers 0 to 2 (TEPCFENB0 to TEPCFENB2) are 8-bit readable/writable registers. TEPCFENB0 to TEPCFENB2 enables and disables the correction formula that is set by the TEPCFBx and TEPCOEFFBx registers in sequencer state $x$ indicated by the TSEQRB register ( $\mathrm{x}=0$ to 23) .

TEPCFENB0 to TEPCFENB2 can be read or written in 8-bit units only.
TEPCFENB 0 to TEPCFENB2 are initialized to $00_{\mathrm{H}}$ after reset.

### 30.6.2.63 TEPCVALRBO — Timer Event Input Cycle Correction Result Retention Register

Table 30.101 TEPCVALRB0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $31-0$ | TEPCVALB0 | Timer Event Input |
|  |  | Cycle Correction Result Retention 0 |
|  |  | These bits store 32-bit timer event input cycle correction result. |

The timer event input cycle correction result retention register (TEPCVALRB0) is a 32-bit read-only register. TEPCVALRB0 captures the ICRB0 register value*1 that is corrected according to the setting in timer event cycle correction formula definition registers B 0 to B 23 (TEPCFB0 to TEPCFB23) and timer event cycle correction formula enable register B 0 to B 2 (TEPCFENB0 to TEPCFENB2).

TEPCVALRB0 can be read in 32-bit units only.
TEPCVALRB0 is initialized to $00000000_{\mathrm{H}}$ after reset.
Note 1. CHSELB revises ICRB0 register value at $00_{b}$. CHSELB revises ICRB0S1 register value at $01_{\mathrm{B}}$ also CHSELB revises ICRBOS2 register value at $10_{B}$.

### 30.6.2.64 TEPCRECRB1 — Timer Event Input Cycle Correction Result Log Register

Table 30.102 TEPCRECRB1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TEPCRECRB1 | Timer Event Input Cycle Correction Log 1 |
|  |  | These bits store 32-bit event captured value. |

The timer event input cycle correction result log register (TEPCRECRB1) is a 32-bit read-only register that captures the TEPCVALRB0 register value when a timer B external event selection (AGCK) is input.

TEPCRECRB1 can be read in 32-bit units only.
TEPCRECRB1 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.2.65 TCNTB4 — Multiplied-and-Corrected Clock Counter B4

Table 30.103 TCNTB4 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | CNTB4 | Multiplied-and-Corrected Clock Counter B4 |
|  |  | These bits store 20-bit frequency-multiplied clock count value. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

The multiplied-and-corrected clock counter B4 (TCNTB4) is a 20-bit up-counter mapped in the 32-bit readable/writable register.

The value in TCNTB3 is loaded to this counter when the externally input event selection (AGCK) is detected.
This up-counter is driven by the frequency-multiplied clock (AGCK1) output by reload counter B2 (TCNTB2) and is cleared to $00000_{\mathrm{H}}$ when the externally input event selection is detected while CNTB3 $=00000_{\mathrm{H}}$.

When the values in this counter and TCNTB3 match with the CCS bit in timer I/O control register B (TIORB) set to 1, counting is stopped ${ }^{* 1}$. When the CCS bit is set to 0 , counting is continued.

When the TBE bit in ATU master enable register (ATUENR) is set to 1 , counting is not performed. Even if the TBE bit is cleared to 0 and counting is stopped, the counter value is not cleared.

TCNTB4 can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCNTB4 is initialized to $00000000_{\mathrm{H}}$ after reset.
Note 1. When CU4SEL is 0 , and then count up to the value of TCNTB3 matches TCNTB4. When CU4SEL is 1 , and then count up to the value of "TCNTB3-1" matches TCNTB4.

### 30.6.2.66 TCNTB5 — Multiplied-and-Corrected Clock Generating Counter B5

Table 30.104 TCNTB5 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | CNTB5 | Multiplied-and-Corrected Clock Generation Count B5 |
|  |  | These bit store 20-bit multiplied-and-corrected clock count value. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

The multiplied-and-corrected clock generating counter B5 (TCNTB5) is a 20-bit up-counter mapped in the 32-bit readable/writable register.

This counter is enabled by the TBE bit in ATU master enable register (ATUENR) and the count control B5 bit (CTCNTB5). Incrementation of this counter is driven by the PCLK as long as the counter value is less than the value in multiplied-and-corrected clock counter B4 (TCNTB4).

Incrementation is stopped when the counter value matches the value in correcting counter clearing register (TCCLRB).
The value in this counter is corrected and cleared when the externally input event selection (AGCK) is detected while CNTB3 $=00000_{\mathrm{H}}$. The value for the clearing depends on the counter value.

- When TCNTB5 = TCCLRB

This counter is cleared. The corrected counter clear flag register B (TCCLFRB) retains 0 .

- When TCNTB5 $=$ TCCLRB

The TCCLFB bit of correction counter clear flag register (TCCLFRB) is set to " 1 ", and TCNTB5 continues counting automatically. When the counter value reaches the value in TCCLRB, TCNTB5 is cleared and the TCCLFB bit is cleared to " 0 ".

The clear value of TCNTB5 is different depending on setting of the CU4SEL bit of "Multiplied-and-Corrected Clock Generating Counter B4 Control Register (TCNT4CRB)".

When the CU4SEL bit is set to " 0 ", the value is cleared to $00001000_{\mathrm{H}}$.
When the CU4SEL bit is set to " 1 ", the value is cleared to $00000000_{\mathrm{H}}$.
Every incrementation of this counter, a single pulse of the multiplied-and-corrected clock (AGCKM) is output. The clock can be output on clock-bus line 5 by setting the CB5SEL bit in clock bus control register (CBCNT) to 1 . The output of the clock is temporarily stopped by altering the setting in bit CTCNTB5 in the TIORB during counting.

TCNTB5 can be read or written in 32-bit units only. Do not write or read 16-bit data for this register.
TCNTB5 is initialized to $00001000_{\mathrm{H}}$ after reset.

Initial setting is required for TCNTB5 (make the contents of TCNTB5 and TCCLRB the same) before starting timer B counter operation. For details, see Section 30.6.3, Details of Operation.

### 30.6.2.67 TCCLFRB — Correcting Counter Clear Flag Register B

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TCCLFB |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 30.105 TCCLFRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to1 | - | These bits are not used. Fix these bits to "0". |
| 0 | TCCLFB | Correcting Counter Clear Flag B |
|  |  | $0:$ TCNTB5 is not automatically counting up. (Default) |
|  | 1: TCNTB5 is automatically counting up until it matches the TCCLRB value. |  |

The correcting counter clear flag register B (TCCLFRB) is an 8-bit read-only register that indicates whether the function of correcting TCNTB5 (the automatic up-counting function that continues counting until TCNTB5 = TCCLRB) is enabled or disabled.

TCCLFRB can be read in 8 -bit units only.
TCCLFRB is initialized to $00_{\mathrm{H}}$ after reset.

## Correcting Counter Clear Flag B (TCCLFB)

This status flag shows that the function of correcting TCNTB5 is enabled and the automatic up- counting function continues until TCNTB5 = TCCLRB. When 1 is read from this flag, it shows that TCNTB5 is automatically upcounting until TCNTB5 $=$ TCCLRB. This flag cannot be set to 1 or 0 by the software.

- Setting (to 1 ) conditions
- When an external event selection is input with TCNTB3 $=00000_{\mathrm{H}}$ and TCNTB5 $\neq$ TCCLRB while TCNTB5 is automatically up-counting until it reaches the TCCLRB value
- Clearing (to 0 ) condition
- When TCNTB5 value has reached the TCCLRB value after counting with the TCCLFB bit set to 1 , the TCNTB5 value has matched the TCCLRB value, and TCNTB5 has been cleared*1

Note 1. CU4SEL clears TCNTB5 in 0000 1000н at 0. CU4SEL clears TCNTB5 in 00000000 н at 1.

### 30.6.2.68 TCCLRB — Correcting Counter Clearing Register B

Table 30.106 TCCLRB Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 12 | CCLRB | Correcting Counter Clear B |
|  |  | These bits store 20-bit correcting counter clear value. |
| 11 to 0 | - | These bits are not used. Fix these bits to "0". |

The correcting counter clearing register B (TCCLRB) is a 32-bit readable/writable register mapped to upper 20 bits in 32 bits.

TCCLRB is constantly compared with TCNTB5. When they match, TCNTB5 is stopped and a counter clearing trigger is output to timer D. TCNT1Dx and TCNT2Dx in timer D are separately cleared by setting the corresponding counter clearing enable bit in timer control register Dx (TCRDx).

TCCLRB can be read or written in 32-bit units only. Do not write or read 8-bit or 16-bit data for this register.
TCCLRB is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.6.3 Details of Operation

### 30.6.3.1 Edge Interval Measuring Function and Edge Input Stopping Function

For timer B, input-capture and compare-match operations are unconditionally performed with 32-bit input capture register B0 (ICRB0) and 32-bit output compare register B0 (OCRB0), respectively.

These registers are connected to input edge-interval measuring counter B0 (TCNTB0).
Operation of timer B is started by setting the TBE bit in the ATU master enable register (ATUENR).
ICRB0 captures the TCNTB0 value when an external-event $1 \_0$ is input via timer A. At the same time, TCNTB0 is set to $00000001_{\mathrm{H}}$. An interrupt request can be output to the CPU at this capture timing*1. This enables measurement of the time of edge-to-edge interval.

The value captured in ICRB0*1 is transferred to the frequency-multiplied clock generating block to be used as an input value to the reload counter B2 (TCNTB2) and the reload register B (RLDB).

Furthermore, up to six captured values (ICRB0*1) can be retained in the record registers B1 to B6 (RECRB1 to RECRB6) at the external input event selection (AGCK) timing. Values retained in ICRB0*1 and RECRB1 to RECRB6 are backed up in the record backup registers B0 to B6 (RBURB0 to RBURB6) at the timing of B12 (OCRB12) event compare match*2 between TCNTB1 and the output compare register B12 (OCRB12).

When TCNTB0 reaches the value set in OCRB0, an interrupt request due to this compare match can be output*3. This interrupt indicates that active edge input has stopped for at least time equivalent to the setting in OCRB0.

Note 1. CHSELB [1:0] outputs interrupt by capture timing of ICRB0 at $00_{\mathrm{B}}$, and a flag (IMFBO) is set. CHSELB [1:0] outputs interrupt by capture timing of ICRB0S1 at 018, and a flag (IMFB0) is set. CHSELB [1:0] outputs interrupt by capture timing of ICRBOS2 at 10в, and a flag (IMFBO) is set.
Note 2. CHSELB [1:0] is a compare match of TCNTB1 and OCRB12 at 00 B , and it's backup in RBURB0-6. CHSELB [1:0] is a compare match of TCNTB1 and OCRB12S1 at 018, and it's backup in RBURB0-6. CHSELB [1:0] is a compare match of TCNTB1 and OCRB12S2 at 10 ${ }_{\mathrm{B}}$, and it's backup in RBURB0-6.
Note 3. CHSELB [1:0] is a compare match of TCNTBO and OCRBO and outputs interrupt at $00_{\mathrm{B}}$, and a flag (CMFB0) is set. CHSELB [1:0] is a compare match of TCNTB0S1 and OCRB0S1 and outputs interrupt at 018, and a flag (CMFB0) is set. CHSELB [1:0] is a compare match of TCNTB0S2 and OCRBOS2 and outputs interrupt at $10_{\mathrm{B}}$, and a flag (CMFBO) is set.

Figure 30.18 shows input-capture and compare-match operation of TCNTB0 at CHSELB[1:0] $=00_{\mathrm{B}}$.

Figure 30.18 Input-Capture and Compare-Match Operation of TCNTB0 at CHSELB[1:0] $=00_{B}$

Event counter B1 (TCNTB1) counts the input of signals indicating external events $1 \_0$. When a predetermined value is set in output compare register B1 (OCRB1) and TCNTB1 reaches that value, a compare-match occurs. When a value is set in output compare register B10 (OCRB10) by the setting of the TCNTB1 clear setting bit (CLRB1) in the timer control register B (TCRB), TCNTB1 can be cleared at the first event input timing after an event compare match between TCNTB1 and OCRB10. Furthermore, by the setting of the TCNTB3 clear setting bit (CLRB3SEL) in the timer control register B (TCRB), TCNTB3 can be cleared at a compare match between TCNTB1 and OCRB10*1. Input capture register B2 (ICRB2) can capture input capture register B1 (ICRB1) at the timing of a compare match between TCNTB1 and OCRB1. This compare match ${ }^{* 2}$ makes it possible to output an interrupt request to the CPU, allowing detection of edge input stop of external event. In addition, event counter B1 (TCNTB1) has a function for compare match with output compare register B11 (OCRB11). When the pulse interval multiplier select bit (PIMRSELR) is set to 1, TCNTB1 can operate by using PIMR2 for down-count values to be loaded to RLDB and for down-count values of TCNTB2 at a compare match between TCNTB1 and OCRB11*3. When the TCNTB1 value matches the OCRB11 value, an interrupt request due to this compare match*3 can be output to the CPU.

The external event signal 1_0 drives the capturing of TCNTB0 values in ICRB1. Moreover, latching of ICRB1 in ICRB2 on matches between TCNTB1 and OCRB1 can also be selected. This enables the measurement of multiple edge-to-edge intervals.

Registers ICRB30 to ICRB37 capture the TCNTB1*4 value by using the external event input 1B to 1 I as a trigger. ICRB30 corresponds to external event input 1B and ICRB31 to ICRB37 correspond to respective external event input 1 C to 1 I .

Note 1. When CHSELB [1:0] is $00_{\mathrm{B}}$, TCNTB3 can be cleared by a compare match of TCNTB1 and OCRB10. When CHSELB [1:0] is 01в, TCNTB3 can be cleared by a compare match of TCNTB1S1 and OCRB10S1. When CHSELB [1:0] is 10, TCNTB3 can be cleared by a compare match of TCNTB1S2 and OCRB10S2.

Note 2. When CHSELB [1:0] is 008, interrupt request can be output by a comparing match of TCNTB1 and OCRB1. When CHSELB [1:0] is 018, interrupt request can be output by a comparing match of TCNTB1S1 and OCRB1S1. When CHSELB [1:0] is 10B, interrupt request can be output by a comparing match of TCNTB1S2 and OCRB1S2.
Note 3. When CHSELB [1:0] is $00_{\mathrm{B}}$, PIMR2 can be used by a compare match of TCNTB1 and OCRB11, and interrupt request can be output. When CHSELB [1:0] is 01в, PIMR2 can be used by a compare match of TCNTB1S1 and OCRB11S1, and interrupt request can be output. When CHSELB [1:0] is $10_{\mathrm{B}}$, PIMR2 can be used by a compare match of TCNTB1S2 and OCRB11S2, and interrupt request can be output.

Note 4. When CHSELB [1:0] is $00_{\mathrm{B}}$, the value of TCNTB1 can be captured in ICRB30-37. When CHSELB [1:0] is 018, the value of TCNTB1S1 can be captured in ICRB30-37. When CHSELB [1:0] is $10_{\mathrm{B}}$, the value of TCNTB1S2 can be captured in ICRB30-37.

Figure 30.19 shows compare-match operation of TCNTB1 and capture operation of ICRB1 and ICRB2 at CHSELB $[1: 0]=00_{\mathrm{B}}$, and Figure $\mathbf{3 0 . 2 0}$ shows capture operation of TCNTB1 and ICRB3x.

Figure 30.19 Compare-Match Operation of TCNTB1 and Capture Operation of ICRB1 and ICRB2 at CHSELB[1:0] $=00_{\text {B }}$

Figure 30.20 Count Operation of TCNTB1 and Capture Operation of ICRB3x at CHSELB[1:0] $=00_{B}$

Upon detection of a compare match between event counter B1 (TCNTB1)*1 and output compare register (OCRB20 to OCRB43), the state of the sequencer that control correction for edge interval measurement values is determined. The condition for transiting to the corresponding sequencer state upon compare match between TCNB1*1 and OCRB20 to OCRB43 is controlled by the SEQEN23 to SEQEN0 bits. IF the same value is set for OCRB20 to OCRB43, the transition caused by a compare match with upper OCRB (OCRB43 < OCRB42 $<\ldots<$ OCRB21 < OCRB20) takes priority. According to the TEPCFB20 to TEPCFB43 set values for the sequencer state after transition, the correction value is calculated and the result is saved in timer event input cycle correction result retention register (TEPCVALRB0) The TEPCVALRB0 value is saved into timer event input cycle correction result log register (TEPCRECRB1) at the external event selection (AGCK) detection timing. The value of ICRB0*2 or TEPCVALRB0 is supplied to the frequency-multiplied clock generator, according to the EVSEQENB bit setting.

Note 1. When CHSELB [1:0] is $00_{\mathrm{B}}$, a comparing match with TCNTB1 is put into effect. When CHSELB [1:0] is $01_{\mathrm{B}}$, a comparing match with TCNTB1S1 is put into effect. When CHSELB [1:0] is $10_{\mathrm{B}}$, a comparing match with TCNTB1S2 is put into effect.
Note 2. When CHSELB [1:0] is $00_{\mathrm{B}}$, the value of ICRB0 is communicated to frequency-multiplying clock generator. When CHSELB [1:0] is $01_{\mathrm{B}}$, the value of ICRB0S1 is communicated to frequency-multiplying clock generator. When CHSELB [1:0] is 10в, the value of ICRB0S2 is communicated to frequency-multiplying clock generator.

Figure 30.21 Operation upon Compare Match between TCNTB1 and OCRB20-43 and Sequencer State Transition at CHSELB[1:0] = 00 B $_{\text {в }}$

NOTE
TCNTB1 and ICRB0 are used by sequencer control of the figure above because CHSELB [1:0] is $00_{B}$ but TCNTB1S1 and ICRB0S1 use the time when CHSELB [1:0] is $01_{\mathrm{B}}$ and TCNTBS2 and ICRBS2 use the time when CHSELB [1:0] is 10 B .

Figure 30.22 Switching between ICRB0 and TEPCVALRB0 by EVSEQENB at CHSELB[1:0] $=00$ в NOTE

ICRB0 is used by control of the figure above because CHSELB [1:0] is $00_{\mathrm{B}}$ but ICRB0S1 is used by the time when CHSELB [1:0] is 018 and ICRBS2 is used by the time when CHSELB [1:0] is 10b.

Figure 30.23 Operation of Compare Match between TCNTB1 and OCRB20-43 and Sequencer Control at CHSELB[1:0] $=00_{\text {B }}$

### 30.6.3.2 Frequency-Multiplied Clock Generator

The frequency-multiplied clock generator generates a clock signal (AGCK1) for use within timer B. The cycle of this clock signal is obtained by dividing the intervals between selected transitions of the external-event selection (AGCK) input by the value in the pulse interval multiplier register (PIMR1 or PIMR2).

When the LDEN bit in the TIORB is 0 , On the selected transition of the external-event selection (AGCK) input signal, the lower 24 bits of the value captured in $\mathrm{ICRB} 0^{* 1}$ of the edge-interval measuring block are transferred to 24 -bit reloadable counter B2 (TCNTB2). At the same time, the value transferred to TCNTB2 minus the value in PIMR (PIM1 or PIM2) is transferred to 24-bit reload register B (RLDB). When the LDEN bit in the TIORB is 1 , the values of TCNTB2 and RLDB are not updated on ICRB0*1 input capture.

When the LDSEL bit in timer I/O control register B (TIORB) is set to 1 , the value in load register B (LDB) instead of that in ICRB0*1 can be transferred to TCNTB2 and RLDB. When the pulse interval multiplier select bit (PIMRSELR) is set to 1 , the above operation is performed using the PIMR2 value instead of PIMR1 value while TCNTB1 matches OCRB11*2.

24-bit reloadable counter B2 (TCNTB2) is driven to count down by the clock selected by the CKSELB bits in timer control register B (TCRB). Each decrementation is by the value set in PIMR (TCNTB2- = PIM). When the value in the down counter is less than or equal to that of the PIM bits, RLDB is automatically read out into TCNTB2 and added to the count value (TCNTB2 + the RLDB value), and which again starts to count down. A single pulse of the multiplied clock signal (AGCK1) is output in synchronization with the reloading of TCNTB2. The pulse width is equal to the cycle of the PCLK.

Compare match operation by frequency-multiplied clock (AGCK1) can be performed by using 20-bit output compare register B6 (OCRB6) and 20-bit frequency-multiplied clock counter B6 (TCNTB6).

Incrementation of TCNTB6 on the assertion of AGCK1 is unconditional. The values in TCNTB6 and output compare register B 6 (OCRB6) are tested for matches, and an interrupt request will be generated to the CPU when the values match. The IREGB6 bits in TICRB can be set so that the interrupt is generated on the match, on the first AGCK pulse (external event) after the match, or on the second AGCK pulse (external event) after the match.

When an external event selection input (AGCK) is detected, ICRB6 stores the TCNTB6 value at the next clock (PCLK) timing. The frequency-multiplied clock counter B6M (TCNTB6M) performs count-up operation with a count value of multiplication that is set in multiplication setting register B6 (RARB6) for the frequency-multiplied clock (AGCK1). Each time an external event selection (AGCK) is input, the TCNTB6M value is compared with the ICRB6 value. When the ICRB6 value is larger than the TCNTB6M value as a result of comparison, an interrupt request can be output.

Since AGCK1 is generated with reference to the previous edge-to-edge interval, if two consecutive edge intervals differ significantly, the clock will not be generated correctly. To correct this error, AGCK1 is corrected by the frequencymultiplied clock signal corrector, whose description is provided in the next section, and is to be converted into AGCKM.

Figure 30.24 and Figure 30.25 show counting operations with reloading and output of the frequency-multiplied clock and Figure $\mathbf{3 0 . 2 6}$ and Figure $\mathbf{3 0 . 2 7}$ show the generation of interrupt requests on matches between TCNTB6 and CMFB6, enabled or disabled by the setting in IREG. Figure $\mathbf{3 0 . 2 8}$ shows the Switching Timing of PIMR1 and PIMR2. Figure $\mathbf{3 0 . 2 9}$ shows comparison of TCNTB6M and ICRB6 operations and interrupt request output.

Note 1. When CHSELB [1:0] is $00_{\mathrm{B}}$, ICRB0 is used. When CHSELB [1:0] is $01_{\mathrm{B}}$, ICRB0S1 is used. When CHSELB [1:0] is $10_{\mathrm{B}}$, ICRB0S2 is used.
Note 2. When CHSELB [1:0] is $00_{\mathrm{B}}$, PIMR2 is used by a compare match of TCNTB1 and OCRB11. When CHSELB [1:0] is $01_{\mathrm{B}}$, PIMR2 is used by a compare match of TCNTB1S1 and OCRB11S1. When CHSELB [1:0] is $10_{\mathrm{B}}$, PIMR2 is used by a compare match of TCNTB1S2 and OCRB11S2.

### 30.6.3.3 Frequency-Multiplied Clock Signal Corrector

The frequency-multiplied clock signal which is generated by dividing the intervals between external event selection (AGCK) inputs by the multiplication ratio set in the PIM bits in PIMR can be corrected by using 20-bit correcting event counter B3 (TCNTB3), 20-bit multiplied-and-corrected clock counter B4 (TCNTB4), 20-bit multiplied-and-corrected clock generating counter B5 (TCNTB5), and correcting counter clearing register B (TCCLRB).

TCNTB3 is a 20-bit up-counter that is driven by the external event selection (AGCK) input. On the selected transition of the external event selection (AGCK) signal, the value in TCNTB3 is transferred to TCNTB4, after which TCNTB3 is incremented by the value in the PIM bits (TCNTB3+ = PIM). According to the setting for the CLRB3SEL bit (TCNTB3 clear select bit) in the timer control register B (TCRB), TCNTB3 can be cleared by a compare match between TCNTB1 and OCRB10*1, between TCNTB6 and OCRB6, or between TCNTB3 and OCRB8.

TCNTB4 is a 20-bit up-counter that is driven by the multiplied clock signal (AGCK1). TCNTB3 is loaded to TCNTB4 with the external event selection (AGCK) input as a trigger, and incrementation of TCNTB4 is driven by the AGCK1 input.

The counter correcting select bit (CCS) in TIORB controls counting by TCNTB4. When CU4SEL is set to " 0 ", movement or a stop of TCNTB4 up count can be select at TCNTB3 = TCNTB4, and when CU4SEL is set to " 1 ", movement or a stop of TCNTB4 up count can be select at $($ TCNTB3-1 $)=$ TCNTB4.

TCNTB5 is a 20-bit up-counter that is driven by the PCLK clock, meaning that it operates at a high speed. TCNTB5 is constantly compared with TCNTB4 and is incremented as long as its value is lower than that in TCNTB4. Each time TCNTB5 is actually incremented, it produces a single pulse whose width is equal to one cycle of the PCLK clock. Pulse of the peripheral clock signal, namely the multiplied-and -corrected clock signal (AGCKM), for which output on clockbus line 5 can be selected by bit CB5SEL in the clock bus control register (CBCNT). The AGCKM signal is then available on clock-bus line 5 as a source to drive counting by other timers.

As state above, TCNTB5 is not incremented when its value is greater that in TCNTB4 (for example, after TCNTB3 has been loaded to TCNTB4), TCNTB5 can also be disabled by the count control B5 (CTCNTB5) bit in timer I/O control register B (TIORB). This halts the output of the AGCKM signal.

As long as its value is lower than TCNTB4, TCNTB5 is incremented until it reaches the value in correcting counter clearing register B (TCCLRB). This function allows you to check the automatic up- count status by using correcting counter clear flag register B (TCCLFRB). Incrementation of TCNTB5 then stops, regardless of the relation between its value and that of TCNTB4. In addition, timer counters 1Dx and 2Dx of timer D (TCNT1Dx and TCNT2Dx) can be separately cleared by this match as a trigger when the corresponding counter clearing enable bit (C1CEDx/C2CEDx) in timer control register Dx (TCRDx) is set to 1 .

TCNTB4 is unconditionally cleared to $00000000_{\mathrm{H}}$ when a pulse of the external-event selection signal (AGCK) is input while TCNTB3 $=00000000_{\mathrm{H}}$. TCNTB5 is unconditionally set to $00001000_{\mathrm{H}}$ at CU4SEL $=0$, or cleared to $00000000_{\mathrm{H}}$ at CU4SEL $=1$ when a pulse of the external-event selection signal $(A G C K)$ is input while TCNTB3 $=00000000_{\mathrm{H}}$.

However, when TCNTB5 has not reached TCCLRB, TCNTB5 is incremented until it reaches TCCLRB. After that, it is set to $00001000_{\mathrm{H}}$.

Figure $\mathbf{3 0 . 3 0}$ shows operations of TCNTB3 and TCNTB4, Figure $\mathbf{3 0 . 3 1}$ shows operation when TCNTB5 is being started up, Figure $\mathbf{3 0 . 3 2}$ shows TCNTB5 operation with correction at the end of a cycle.

Note 1. When CHSELB [1:0] is 00 B , TCNTB3 can be cleared by a comparing match of TCNTB1 and OCRB10. When CHSELB [1:0] is 018, TCNTB3 can be cleared by a comparing match of TCNTB1S1 and OCRB10S1. When CHSELB [1:0] is $10_{\mathrm{B}}$, TCNTB3 can be cleared by a comparing match of TCNTB1S2 and OCRB10S2.

Note: When PIM = '020H' (multiplying by 3 )

### 30.7 Timer C

### 30.7.1 Overview of Operation

The timer C block is a general-purpose timer consisting of $\mathrm{SB}_{\mathrm{C}}$ subblocks having the same function. Each subblock consists of four channels.

Each timer C subblock can achieve the following functions.

- Input capture and output compare matches
- Choice of rising edge, falling edge, or both edge sensing as the edge of input capture trigger signal
- Capturing at the timing of event output $1 \_0,2 \mathrm{~A}$, or 2 B from timer A when used as input capture
- Output of a waveform on compare match. Choice of a logical one, a logical zero, a toggled output, or a one-shot pulse output by setting a register
- Output of an interrupt request on capture or compare match
- Output of an interrupt request on timer counter overflow
- Clearing counter (TCNTCx) on compare match (two types)
- The counter can be cleared on compare match of GRCx0 in PWM mode (not supported by GRCx1 to GRCx3)
- When the counter upper-limit setting function is used in any mode other than PWM mode, the counter can be cleared on compare match of CUCRCx.
- Output of forced compare match by setting the forced compare match bit
- There is noise cancellation of at most 0.21 sec or a noise cancellation function by the angle clock in each input terminal.
- A noise cancellation mode setting by the subblock/channel unit is possible.
- High/Low/toggle corrugated output is possible by a comparing match.
- The range comparison can be used for compare match output by the compare match register by setting the range comparison value setting register.

Timer C subblock consists of a 32-bit counter (TCNTCx), four 32-bit general registers (GRCxy), four 32-bit output compare registers (OCRCxy), a 32-bit counter upper-limit setting compare register (CUCRCx), four range comparison value setting registers (RCRCxy), four 32-bit general mirror registers (GMRCxy), and controller. The general registers (GRCxy) can be used for input capture/compare match operations and input capture trigger input and output compare output signals (TIOCxy) are available.

The initial output value on the TIOCxy pin is 0 for output compare operation. During operation, the previous state is reflected. An input/output mode of a TIOCxy terminal is selectable by setting of TIORCx.IOCxy.

Figure 30.37 Block Diagram of Timer C Subblock

### 30.7.2 Registers Related to Timer C

### 30.7.2.1 TSTRC — Timer Start Register C

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.107 TSTRC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to $\mathrm{SB}_{\mathrm{C}}$ | - | These bits are not used. Fix these bits to "0". |
| $\mathrm{SB}_{\mathrm{C}}-1$ to 0 | STRCx | Counter Cx start |
|  | $0:$ TCNTCx is disabled |  |
|  | 1: TCNTCx is enabled |  |

Note: Start bits are provided for subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ respectively.

TSTRC is an 8-bit or a 16-bit readable/writable register that enables and disables timer counter (TCNTCx) in $\mathrm{SB}_{\mathrm{C}}$ subblocks $\mathrm{Cx}\left(\mathrm{x}=0\right.$ to $\left.\mathrm{SB}_{\mathrm{C}}-1\right)$. When the both the STRC bits in this register and the TCE bit in ATU master enable register (ATUENR) are set to 1 , counting is enabled.

TSTRC is initialized to $00_{\mathrm{H}}$ after reset.

## Counter Cx Start (STRCx)

These bits enable and disable timer counter Cx (TCNTCx) in a subblock.
When bit STRCx is cleared to 0 , TCNTCx is stopped. While TCNTCx is stopped, the previous counter value is retained and TCNTCx is resumed from the value when this bit is set to 1 again.

Even if the counter Cx start bit is set to 1 , counting does not start unless the timer Cx master enable bit in the ATU master enable register (ATUENR) is set to 1 .

## CAUTION

The prescalers run independently of the setting of the STRCx bit and are not initialized at the start of TCNTCx.
Therefore, during the time between the activation and the start of actual count operation by the above counter, hardwarerelated uncertainty shorter than the period of selected count source (resolution) accompanies.

### 30.7.2.2 NCCRCx — Noise Canceler Control Register Cx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | NCKCx3 | NCKCx2 | NCKCx1 | NCKCx0 | NCECx3 | NCECx2 | NCECx1 | NCECx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$
Table 30.108 NCCRCx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | NCKCxy | Noise canceler clock select |
|  |  | These bits select the count source clock for noise canceler counter Cxy (NCNTCxy). |
| 3 to0 | NCECxy | Noise canceler enable Cxy |

Note: $x=0$ to $S B_{c}-1, y=0,1,2,3$

The noise canceler control register Cx ( NCCRCx ) is an 8-bit readable/writable register. The noise cancellation is performed on the input capture trigger signal input from pin TIOCxy in subblock Cx by setting this register. Three modes are available in noise cancellation and can be switched by the NCMC bit in the noise cancel mode register (NCMR). Noise canceler count clock or clock bus 5 can be selected as the count source by the noise canceler clock select bits (NCKCxy) in this register.

NCCRCx is initialized to $00_{\mathrm{H}}$ after reset.

## Noise Canceler Clock Select (NCKCxy)

These bits select the count source clock of noise canceler counter Cx (NCNTCx).

| NCKCxy | Function |
| :--- | :--- |
| 0 | Noise canceler count clock (PCLK or PCLK/128) is selected as the count source clock of |
| NCNTCx |  |

Selects the count source clock for noise cancellation counters C4 to C0 (NCNTC4 to NCNTC0).
Noise canceler count clock or clock bus 5 is selectable as the count source clock. As the noise canceler count clock, a clock of PCLK or PCLK/128 can be selected by the NCCSEL bit in the common control unit.

## Noise canceler Enable Cxy (NCECxy)

These bits enable or disable the noise canceling function for input/output pins TIOCx 0 to Cx 3 of subblock Cx .

| NCECxy | Function |  |
| :--- | :--- | :--- |
| 0 | The TIOCxy input noise canceling function is disabled | (Default) |
| 1 | The TIOCxy input noise canceling function is enabled. |  |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{c}}-1, y=0,1,2,3$ |  |  |

When a change in input signal level from TIOCxy is detected with these bits set to 1 , processing for prematuretransition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode starts according to the settings of the noise cancellation mode register (NCMR) and the noise canceler clock select bit (NCKC) in the common control unit.

- In premature-transition cancellation mode

When a level change of the externally input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter Cxy (NCNTCxy) is started for counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register Cxy (NCRCxy). The level of the externally input signal is output on this compare match.

When these bits are cleared to 0 while the counter (NCNTCxy) is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes are also masked over this period.

- In minimum time-at-level cancellation mode

When a level change of the externally input signal is detected, the corresponding noise canceler counter Cxy (NCNTCxy) is started for counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register Cxy (NCRCxy), the previously accepted level change is output as the signal whose noise is removed on compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore the signal whose noise is removed is not changed.

When these bits are cleared to 0 while the counter (NCNTCxy) is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the externally input signal is detected.

- In level accumulation cancellation mode

The corresponding noise canceler counter Cxy (NCNTCxy) is started for counting up or down according to the input signal level (high level: up-count, low level: down-count). Up-count continues until the noise canceler counter value matches the noise canceler register Cxy (NCRCxy) value. Down-count continues until the noise canceler counter value reaches $0000_{\mathrm{H}}$. When a compare match (NCRCxy) occurs during up-counting, the noise canceler output is updated to 1 . When a compare match $\left(0000_{\mathrm{H}}\right)$ occurs during down-counting, the noise canceler output is updated to 0 .

In minimum time-at-level cancellation mode and premature-transition cancellation mode, clock PCLK is always used to detect input signal level changes regardless of the selected noise canceler clock. In level accumulation cancellation mode, the clock selected by the noise canceler clock select Cxy bits (NCKCxy) is used for sampling the input level.

For details of operations for noise cancellation, see Figure 30.1, Figure 30.2, and Figure $\mathbf{3 0 . 3}$.

### 30.7.2.3 TCRCx — Timer Control Registers Cx

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\begin{gathered} \text { FOCMC } \\ \text { x3 } \end{gathered}$ | $\left\lvert\, \begin{gathered} \text { FOCMC } \\ \text { x2 } \end{gathered}\right.$ | $\left\lvert\, \begin{gathered} \text { FOCMC } \\ \mathrm{x} 1 \end{gathered}\right.$ | $\begin{gathered} \text { FOCMC } \\ \times 0 \end{gathered}$ | - | - | $\begin{array}{\|l\|l\|} \hline \text { CLRCS } \\ \text { ELCx } \end{array}$ | CLRCx | $\left\lvert\, \begin{gathered} \text { FCMCx } \\ 3 \end{gathered}\right.$ | $\begin{gathered} \text { FCMCx } \\ 2 \end{gathered}$ | $\begin{gathered} \text { FCMCx } \\ 1 \end{gathered}$ | $\left\lvert\, \begin{gathered} \text { FCMCx } \\ 0 \end{gathered}\right.$ | PWMx0 | CKSELCx[2:0] |  |  |
| Value after reset | 0*1 | 0*1 | 0*1 | 0*1 | 0 | 0 | 0 | 0 | 0*1 | 0*1 | 0*1 | 0*1 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | R | R | R/W | R/W | W | W | W | W | R/W | R/W | R/W | R/W |

Note: $\quad \mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$, corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$
Note 1. Value 0 cannot be written. The value is not retained when 1 is written. These bits are always read as 0 .
Table 30.109 TCRCx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | FOCMCxy | Forced output compare match Cxy |
|  |  | Forced compare match is performed by output compare register (OCRCxy). ${ }^{* 1}$ |
| 11 to 10 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 9 | CLRCSELCx | TCNTCx clear timing select bit Cx |
|  |  | Select the timing for clearing TCNTCx. |
|  |  | $0:$ Clear in sync with PCLK (equivalent to ATU-IV) |
|  |  | 1: Clear in sync with the count clock |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$.
$y=0,1,2,3$ : Corresponding to general registers Cx0, Cx1, Cx2, and Cx3.
Note 1. Do not use forced compare match in input capture mode.

The timer control registers Cx (TCRCx) are 8-bit/16-bit readable/writable registers that select the counter clock for subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$, set operating mode, set forced compare matches, and enable/ disable clearing of timer counters.

Even if the respective "Forced output compare match Cxy(FOCMCxy)" and "Forced compare match Cxy(FCMCxy)" are made effective when using "Output Compare Registers Cxy(OCRCxy)" and "Timer General Registers Cxy(GRCxy)" as a capture register, a forced compare matches doesn't occur.

## TCNTCx Clock Select (CKSELCx[2:0])

These bits select the counter clock of subblock Cx. Counters (TCNTCx) in subblock Cx are driven by the clock selected in these bits.

| CKSELCx |  | Function |  |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 | 0 | 0 | Counters are driven by clock-bus line 0 | (Default) |
| 0 | 0 | 1 | Counters are driven by clock-bus line 1 |  |
| 0 | 1 | 0 | Counters are driven by clock-bus line 2 |  |
| 0 | 1 | 1 | Counters are driven by clock-bus line 3 |  |
| 1 | 0 | 0 | Counters are driven by clock-bus line 4 |  |
| 1 | 0 | 1 | Counters are driven by clock-bus line 5 |  |
| 1 | 1 | 0 | Setting prohibited |  |
| 1 | 1 | 1 | Setting prohibited |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$.

## PWM Mode (PWMx0)

Setting this bit to 1 makes subblock Cx operate in PWM mode. In PWM mode, TCNTCx is cleared on compare match between TCNTCx and general register Cx0 (GRCx0). The setting of this bit is valid when GRCx0 functions as a compare match register.

When general register GRCxm ( $\mathrm{m}=1$ to 3 ) functions as a compare match register, aIOCx0 setting value in the TIORCx is output to its output pins (TIOCx1, TIOCx2, TIOCx3) at the timing of clearing of the TCNTCx.

PWM output from pins TIOCx1 to TIOCx3 is enabled by setting a PWM cycle in GRCx0 and setting a duty cycle in GRCx1 to GRCx3.

## CAUTION

To make the subblock operate in PWM mode, further settings are also required.
Select the compare match (IOCxy[3:0] = 0001B or 0010 ${ }_{\mathrm{B}}$ ) by the IOCxy bits in timer I/O control register C (TIORCx) for GRCx0 and GRCx1 to GRCx3 (for PWM output). The active polarity of PWM can be specified by the IOCxy[1:0] bits.

| PWMx0 | Function |  |
| :--- | :--- | :--- |
| 0 | $0:$ Subblock Cx does not operate in PWM mode | (Default) |
| 1 | 1: Subblock Cx operates in PWM mode |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$.

When TCNTCx matches GRCx 0 while this bit is set to 1 , the counter is cleared to $00000000_{\mathrm{H}}$. However, when clearing the counter on compare match and incrementation occur simultaneously, TCNTCx is set to $00000001_{\mathrm{H}}$. This occurs when TCNTCx is driven by the clock whose frequency is equal to the PCLK clock.

In PWM mode, do not set from GRCx0 to GRCx 3 to $00000000_{\mathrm{H}}$. If GRCx0 is set to $00000000_{\mathrm{H}}$, note that compare match occurs at illegal cycles.

## Forced Compare Match Cxy (FCMCxy)

Setting these bits to 1 generates forced compare match when a general register Cxy (GRCxy) is used for compare match. Refer to Figure 30.44, Figure 30.45, Figure 30.46, and Figure $\mathbf{3 0 . 4 7}$ as a use example.

| FCMCxy | Function |  |
| :--- | :--- | :--- |
| 0 | No forced compare match is disabled on general register (GRCxy) | (Default) |
| 1 | Forced compare match generated on general register (GRCxy) |  |
| Note: | $x=0$ to SB $_{C}-1$. |  |
|  | $y=0,1,2,3:$ Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$. |  |
|  |  |  |

When GRCxy is used as a comparing register at a comparing match mode (TIORCx.IOCxy [3:2] $=00_{B}$ ), Setting the FCMCxy bit to 1 sets the IMFCxy bit (compare match flag) in TSRCx (timer status register Cx) to 1 and outputs a compare match interrupt to the CPU. Even when the IMFCxy bit is set to 1 , a compare match interrupt is output. Furthermore, TIOCxy output data also changes as in the case of compare match. This operation is performed only once when the FCMCxy bit is set to 1 . Writing 0 to these bits is disabled. If 1 is written to these bits, data is not retained. These bits are always read as 0 .

Even if a forced compare match is established effectively, then a forced compare match doesn't generate an input capture mode (TIORCx.IOCxy [3:2], $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ). A one shot pulse mode (TIORCx.IOCxy [3:2] $=10_{\mathrm{B}}$ ), then FCMCxy setting becomes effective after GRCxy setting with a one shot pulse mode programming procedure. Even if FCMCxy is made effective before GRCxy setting without following a one shot pulse mode programming procedure, a forced compare match doesn't occur. The change of state of TSRCx in the back writing in became effective where to FCMCxy is same as the time of a compare match mode.

The FCMCxy bit can be established only by the following condition.

| Mode | TIORCx.IOCxy |  |  |  | TCRCx.PWMx0*1 | The setting propriety of the FCMCxy bit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | [3] | [2] | [1] | [0] |  |  |
| Compare match mode | 0 | 0 | 0 | 0 | 0 | Setting prohibited |
|  | 0 | 0 | 0 | 1 | 0 | Possible to establish |
|  |  |  |  |  | 1 | Setting prohibited |
|  | 0 | 0 | 1 | 0 | 0 | Possible to establish |
|  |  |  |  |  | 1 | Setting prohibited |
|  | 0 | 0 | 1 | 1 | 0 | Possible to establish |
| Input capture mode | 0 | 1 | 0/1 | 0/1 | 0 | Setting prohibited |
| One shot pulse mode | 1 | 0 | 0/1 | 0/1 | 0 | Possible to establish |
| Input capture mode | 1 | 1 | 0/1 | 0/1 | 0 | Setting prohibited |

Note 1. TCRCx.PWMx0 can set only at TIORC.IOCxy $=0001_{\mathrm{B}}$ or $0010_{\mathrm{B}}$.

## TCNTCx Clear Cx (CLRCx)

When the TCNTCx clear bit is set to 1 , the TCNTCx is cleared in synchronization with PCLK after occurrence of a compare match between timer counter Cx (TCNTCx) and counter upper limit value setting compare register (CUCRCx) or in synchronization with count clock input (according to the setting of CLRCSELx).

| CLRCx | Function |  | (Default) |
| :--- | :--- | :--- | :--- |
| 0 | CUCRCx compare match is not used to clear TCNTCx. |  |  |
| 1 | CUCRCx compare match is used to clear TCNTCx |  |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$. Supports timer counter Cx .

The upper limit value setting function can be enabled $(\operatorname{CLRCx}=1)$ in other than PWM mode $(\mathrm{PWMx} 0=0)$.
If the upper limit value setting function ( $\mathrm{CLRCx}=1$ ) is used in PWM mode $(\mathrm{PWMx} 0=1)$, timer counter Cx (TCNTCx) is cleared in a cycle other than PWM cycle, so the PWM output may become an unintended waveform.

The upper limit value of the counter is different depending on setting. Refer to the following table.

| PWMx0 | CLRCx | The upper limit value of the TCNTCx counter |
| :--- | :--- | :--- |
| 1 | 0 | (Setting prohibited) The value of GRCx0 (PWM cycle) |
| 0 | 0 | FFFF_FFFF |
| 0 | 1 | The value of CUCRCx (When the writing in value to CUCRCx is smaller than TCNTCx, it'll be FFFF_FFFF $H_{H}$.) |

## TCNTCx Clear Timing Select Cx (CLRCSELCx)

Select the timing for clearing timer counter Cx (TCNTCx) after occurrence of a compare match between timer counter Cx (TCNTCx) and counter upper limit value setting compare register (CUCRCx).

| CLRCSELCx | Function |  |
| :--- | :--- | :--- |
| 0 | Clear in sync with PCLK (equivalent to ATU-IV) | (Default) |
| 1 | Clear in sync with count clock |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ of timer counter Cx

CLRCSELCx can be set at all except for a PWM mode ( $\mathrm{PWMx} 0=0$ ).
When comparing match occurrence with Timer Counter Cx(TCNTCx) and Counter Upper-Limit Setting Compare Registers Cx(CUCRCx) and a count up of TCNTCx occurred at the same time in case of CLRCSELx $=0$, TCNTCx is cleared by $00000001_{\mathrm{H}}$. When a count up isn't simultaneous with a compare match, timer counter Cx (TCNTCx) is cleared by $00000000_{\mathrm{H}}$. Timer counter Cx (TCNTCx) doesn't depend on division ratio of a count clock in case of CLRCSELCx $=1$, and is cleared in 0 .

| PWMx0 | The setting propriety of CLRCSELCx |
| :--- | :--- |
| 0 | It's possible to set it as 0 or 1. |
| 1 | Setting prohibited (The PWM cycle is prohibited to collapse) |

## Forced Output Compare Match Cxy (FOCMCxy)

When the output compare register (OCRCxy) is used as a compare match register, a compare match is forcibly generated by setting FOCMCxy to 1 . Refer to Figure 30.44, Figure 30.45, Figure 30.46, and Figure 30.47 as a use example.

| FOCMCxy | Function |  | (Default) |
| :--- | :--- | :--- | :--- |
| 0 | Forced compare match is disabled for the output compare register (OCRCxy). |  |  |
| 1 | Forced compare match is generated in the output compare register (OCRCxy). |  |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$.
$y=0,1,2,3$ : Corresponding to output compare registers Cx0 to Cx3.

When OCRCxy is used as a compare register by a compare match mode (TIORCx.IOCxy [3:2] $=00_{\mathrm{B}}$ ) and an input capture mode (TIORCx.IOCxy [3:2] $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ), setting the FOCMCxy bit to 1 sets the OCMFCxy bit (compare match flag) in TSRCx (timer status register Cx) to 1 and outputs a compare match interrupt to the CPU. Even when the OCMFCxy bit is 1 , a compare match interrupt is generated and the output from TIOCxy changes as when a compare match occurs. This operation is performed only once when 1 is written to this bit. Writing 0 is disabled. If 1 is written to this bit, data is not retained. This bit is always read as 0 .

Even if a forced compare match is established effectively when using OCRCxy as a capture register by an input capture mode (TIORCx.IOCxy [3:2] $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ), a forced compare match doesn't occur. A one shot pulse mode (TIORCx.IOCxy [3:2] = $10_{\mathrm{B}}$ ), then FOCMCxy setting becomes effective after GRCxy setting with a one shot pulse mode programming procedure. Even if FOCMCxy is made effective before GRCxy setting without following a one shot pulse mode programming procedure, it becomes invalid.

Even if FOCMCxy is also made effective before GRCxy setting after a one shot pulsed output, it becomes invalid.
The change of state of after TSRCx writing in to FOCMCxy became effective where is same as a compare match mode and the time of an input capture.

The FOCMCxy bit can be established only by the following condition.

| Mode | TIORDCx.IOCxy |  |  |  | TCRCx.PWMx0*1 | The setting propriety of the FOCMCxy bit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | [3] | [2] | [1] | [0] |  |  |
| Compare match mode | 0 | 0 | 0 | 0 | 0 | Possible to establish |
|  | 0 | 0 | 0 | 1 | 0 | Possible to establish |
|  |  |  |  |  | 1 | Setting prohibited |
|  | 0 | 0 | 1 | 0 | 0 | Possible to establish |
|  |  |  |  |  | 1 | Setting prohibited |
|  | 0 | 0 | 1 | 1 | 0 | Possible to establish |
| Input capture mode | 0 | 1 | 0 | 0 | 0 | Possible to establish |
|  | 0 | 1 | 0 | 1 | 0 | Setting prohibited |
|  | 0 | 1 | 1 | 0 | 0 |  |
|  | 0 | 1 | 1 | 1 | 0 | Possible to establish |
| One shot pulse mode | 1 | 0 | 0/1 | 0/1 | 0 | Possible to establish |
| Input capture mode | 1 | 1 | 0/1 | 0/1 | 0 | Possible to establish |

Note 1. TCRCx.PWMx0 can set only at TIORC.IOCxy $=0001_{B}$ or $0010_{B}$

### 30.7.2.4 TSRCx — Timer Status Registers Cx

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$, corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$
Table 30.110 TSRCx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $15-12$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 11 to 8 | OCMFCxy | Output compare match/input capture flag Cxy |
|  |  | 1: Input capture or compare match with OCRCxy has occurred. |
|  | 0: Input capture or compare match with OCRCxy has not occurred. (Default) |  |
| 7 to 3 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 4 | OVFCx | Overflow flag Cx |
|  |  | 1: An overflow has occurred. |
|  |  | 0: No overflow has occurred. |
| 3 to 0 | IMFCxy | Input capture/compare match flag Cxy |
|  |  | 1: Input capture and compare match by the GRCxy register have occurred. |
|  |  | 0: No input capture or compare match by the GRCxy register has occurred. |

Note: $x=0$ to $S B B_{c}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1 . \mathrm{y}=0,1,2,3$ : Corresponding to channels 0 to 3 .

Timer status registers Cx (TSRCx) are 8-bit/16-bit read-only registers that indicate occurrence of overflow of timer counter (TCNTCx) in subblocks $\mathrm{Cx}\left(\mathrm{x}=0\right.$ to $\left.\mathrm{SB}_{\mathrm{C}}-1\right)$, occurrence of input capture or compare match of general registers (GRCxy, y = 0 to 3 ), and occurrence of output compare match or input capture in output compare/input capture registers (OCRCxy, $\mathrm{y}=0$ to 3 ).

These status flags indicate occurrence of an interrupt request. These flags can be cleared by setting corresponding bits in the timer status clear register (TSCRCx). If an interrupt source occurs with one of these flags set to 1 , an interrupt request is generated again. Even when clearing a flag by using the corresponding timer status clear register conflicts with setting the flag due to occurrence of an interrupt source, an interrupt request is generated.

TSRCx is initialized to $0000_{\mathrm{H}}$ after reset.

## Output Compare Match/Input Capture Flag Cxy (OCMFCxy)

This status flag indicates occurrence of a compare match of the compare register xy (OCRCxy). This flag cannot be set to 1 or 0 by the software. Setting and clearing conditions are described below.

Note: $x=0$ to $S B B_{c}-1$. Corresponding to subblocks $C 0$ to $C S B_{C}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The next output compare processing is enabled even when the output compare match flag xy (OCMFCxy) is 1 (the flag is not cleared). At this time, 1 is overwritten to OCMFCxy.

Even if the output compare match status is cleared while the TCNTCx and OCMFCxy values are equal after an output compare match is detected, no status is set newly.

The value of TCNTCx, OCRCxy is in the identical state, and even if output comparing match status is cleared, status isn't set newly. Because the rising edge which is at the time of comparing match signal detection is detected and status is being set.

## Overflow Flag Cx (OVFCx)

Indicates whether or not TCNTCx has overflowed. This flag cannot be set to 1 or 0 by software.

| OVFCx | Function |  |
| :--- | :--- | :--- |
| 0 | [Clearing condition] | (Default) |
|  | Writing 1 to OVFCCx in timer status clear register C (TSCRC) |  |
| 1 | [Setting condition] |  |
|  | $\bullet$ When the TCNTCx value overflows (FFFF FFFF ${ }_{H}$ to $00000000_{H}$ ) |  |
|  | $\bullet$ When the counter is cleared with the upper-limit setting function enabled |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{c}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$.

The overflow flag is set to 1 when the up-count clock is input with TCNTCx set to FFFF FFFF $H$ or at the next PCLK (when CLRCSELCx $=0$ ) and at the next count (when CLRCSELCx $=1$ ) clock after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. When writing $00000000_{\mathrm{H}}$ to TCNTCx or TCNTCx is started from $00000000_{\mathrm{H}}$, this bit is not set to 1 .

When writing to TCNTCx at the same time as incrementation while it is FFFF FFFF $_{\mathrm{H}}$, this bit is set to 1 . However, TCNTCx is started from the written value.

## Input Capture/Compare Match Flag Cxy (IMFCxy)

These bits indicate whether or not input capture and compare match between general register (GRCxy) and TCNTCx has occurred. This flag cannot be set to 1 or 0 by software. Setting and clearing conditions are shown below.

| IMFCxy | Function |
| :---: | :---: |
| 0 | [Clearing conditions in compare match mode, input capture mode, or one-shot pulse mode] Writing 1 to IMFCCxy in timer status clear register C (TSCRC) |
| 1 | It's set by the condition besides the TIORCx.IOCxy[1:0] $=00_{B}$. <br> [Setting condition in input capture mode] (when TIORCx.IOCxy[3:2] $=01_{\mathrm{B}}$ or $11_{\mathrm{B}}$ ) <br> - When the rising edge of TIOCxy is detected when IOCxy[3:0] $=0101_{B}$ <br> - When the falling edge of TIOCxy is detected when IOCxy[3:0] $=0110_{\mathrm{B}}$ <br> - When the both edge of TIOCxy is detected when IOCxy[3:0] $=0111_{B}$ <br> when edge detection. <br> -When Event1_0 from Timer A is detected when IOCxy[3:0] = 1101 ${ }_{B}$ <br> $\bullet$ When Event2A from Timer A is detected when IOCxy[3:0] = 1110 ${ }_{B}$ <br> $\bullet$ When Event2B from Timer A is detected when IOCxy[3:0] = 1111 ${ }_{B}$ <br> [Setting conditions in output compare mode] (when TIORCx.IOCxy[3:2] $=00_{B}$ ) <br> - When GRCxy functions as a compare match register and the values in TCNTCx and GRCxy match <br> - When the forced compare match bit (FCMCxy) in TCRCx is set to 1 <br> - When all except for $00_{\mathrm{H}}$ is in the established state in "Range Comparison Value Setting Register 2Cx(RCR2Cx)", and TCNTCx is in the range set in RCR2Cx at the time of writing in GRCxy. <br> [Setting conditions in one-shot pulse output mode] (when TIORCx.IOCxy[3:2] = 10 ${ }_{\mathrm{B}}$ ) <br> - When the TCNTCx value is equal to the GRCxy after (or at the same time when) a compare match of OCRCxy is generated while one-shot pulse is output <br> - When the forced compare match bit (FCMCxy) in TCRCx is set to 1 after (or at the same time when) a compare match of OCRCxy is generated while one-shot pulse is output <br> - When TCNTCx writes in GRCxy during a one shot pulsed output in the state as which all except for $00_{H}$ is set by RCR2Cx, and TCNTCx is in the range set in RCR2Cx. |

Note: $x=0$ to $S B B_{C}-1$. Corresponding to subblocks $C 0$ to $C S B_{C}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Even if these bits are set to 1 meaning that the flag has not been cleared, another input capture or output compare signal can be input. A value of 1 is written to these bits.

Even if the compare match flag is cleared to 0 while TCNTCx and GRCxy after the compare match is detected, these bits are not set to 1 .

The value of TCNTCx and GRCxy is in the identical state because rising edge of a comparing match signal is detected and status is being set, and even if input capture comparing match status is cleared, status isn't set newly.

### 30.7.2.5 TSCRCx — Timer Status Clear Register Cx

Value after reset: $\quad 0000_{H}$

Table 30.111 TSCRCx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. Fix these bits to 0. |
| 11 to 8 | OCMFCCxy | Output compare match flag clear Cxy enable |
|  |  | 0: Disabled (Default) |
|  | 1: OCMFCxy in timer status register Cx (TSRCx) is cleared to 0. |  |
| 7 to 5 | - | These bits are not used. Fix these bits to 0. |
| 4 | OVFCCx | Overflow flag clear Cx enable |
|  | $0:$ Disabled (Default) |  |
|  |  | 1: OVFCx in timer status register C (TSRCx) is cleared to 0. |
| 3 to 0 | IMFCCxy | Input capture flag clear Cxy enable |
|  | $0:$ Disabled (Default) |  |
|  |  | 1: IMFCxy in timer status register C (TSRCx) is cleared to 0. |

Note: $x=0$ to $S B_{c}-1$, corresponding to subblocks $C 0$ to $\mathrm{CSB}_{\mathrm{c}}-1 . \mathrm{y}=0,1,2,3$, corresponding to channels 0 to 3 .

TSCRCx is an 8-bit/16-bit readable/writable register to set clearing of flags at occurrence of an overflow or input capture or compare match. This register is always read as 0 .

TSCRCx is initialized to $0000_{\mathrm{H}}$ after reset.

## Output Compare Match Flag Clear Cxy enable (OCMFCCxy)

Writing 1 to this register while the compare match flag (OCMFCxy) in the timer status register (TSRCx) is set to 1 clears OCMFCCxy to 0 . This bit is always read as 0 .

## Overflow Flag Clear C enable (OVFCCx)

Writing 1 to this bit while overflow flag C (OVFCx) in the timer status register C (TSRCx) is set to 1 clears OVFCx to 0 . This bit is always read as 0 .

## Input Capture Flag Clear Cxy Enable (IMFCCxy)

Writing 1 to this bit while input capture flag Cxy (IMFCxy) in the timer status register x (TSRCx) is set to 1 clears IMFCCxy to 0 . This bit is always read as 0 .

### 30.7.2.6 TIORCx - Timer I/O Control Registers Cx

| 18 |  |  |  | 1 | 1 |  |  | Cap <br> (Event2B) |  |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1, \mathrm{y}=0,1,2,3$.
Cmp: It can be used as a compare match register.*4
Cap: It can be used as a capture register. () indicates a capture trigger.
$\times$ : don't use

Note 1. If a compare match by OCRCxy and a compare match by GRCxy occur at the same time, the compare match by GRCxy takes precedence.
Note 2. Before selecting one-shot pulse mode $\left(I O C x y[3: 2]=10_{B}\right)$, set the PWMXO bit to 0 .
It is prohibited to set PWMXO bit to 1.
(The circuit operates in PWM mode.)
Note 3. Output operation of a one shot pulse is permitted by write to GRCxy. Set OCRCxy before writing in to GRCxy. The value of TCNTCx and OCRCxy is to be identical, and the active level is output. Set OCRCxy, GRCxy so that an OCRCxy compare match may occur or occur at the same time first than a GRCxy compare match after GRCxy writing in at the time of one shot pulsed output movement.
Note 4. A range compare match by RCR1Cx, and RCR2Cx and a range compare match by FCMCxy and FOCMCxy are also included.
Note 5. A compare match of TCNTCx and OCRC doesn't influence output of a TIOC by a mode except for a one shot pulse mode. When interrupt occurred to the time of a comparing match, that notifies outside of a comparing match's occurring.

Page 2859 of 4595

The IOCxy[3:2] bits are used to set operating mode (compare match mode, input capture mode, or one-shot pulse mode). Change operating mode (IOCxy[3:2]) while the counter is not working.

Disable compare match and input capture (by setting IOCxy[1:0] to $00_{B}$ ) before switching output mode for compare match mode $\left(\operatorname{IOCxy}[3: 2]=00_{\mathrm{B}}\right)$ or switching edge detection/trigger for input capture mode $\left(\operatorname{IOCxy}[3: 2]=01_{\mathrm{B}}\right.$ or $\left.11_{\mathrm{B}}\right)$ ).
Change operating mode to one-shot pulse mode (IOCxy[3:2] $=10_{\mathrm{B}}$ ) and change active polarity (IOCxy[1:0]) in oneshot pulse mode ( $\mathrm{IOCxy}[3: 2]=10_{\mathrm{B}}$ ) while the counter is not working.
When one-shot pulse mode (IOCxy[3:2] $=10_{B}$ ) is used, initialize the external pins (TIOCxy) by forced compare match Cxy (FCMCxy) after operating mode is set, and then start counting.

When IOCxy[3:2] $=x 1_{\mathrm{B}}$ and the mode setting is for input-capture, output operations do not proceed (the existing level on TIOCxy is retained).

The condition of the register who can establish it is different in each mode, so confirm each register condition to refer to the following table and establish it by TIORCx.IOCxy and TCRCx.PWMx0.

|  |  | IOCxy |  |  |  | TCRCx | TCRCx |  | OCRCx | GRCx | CUCR | RCR1C | RCR2C | The upper limit value of TCNTCx |

०: Setting possible, $x$ : Setting prohibited, 1 : Setting possible, 0 : Setting possible
Note 1. When the writing in value to CUCRC is smaller than TCNTCx, it'll be FFFF_FFFF ${ }_{H}$.

### 30.7.2.7 TCNTCx — Timer Counters Cx

Note: $x=0$ to $\mathrm{SB}_{\mathrm{C}}-1$, corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$ )

Timer counter $\mathrm{Cx}(\mathrm{TCNTCx})$ is 32-bit readable/writable registers driven by the input clock. These counters can be read from and written to while they are being run.

Timer counter Cx (TCNTCx) is started for counting by setting the bit in timer start register (TSTRC) to 1 . The clock signal is selected by the clock select bits (CKSEL) in timer control register (TCRCx). A timer overflow causes an overflow interrupt request to be output to the CPU. TCNTCx is initialized to $00000000_{\mathrm{H}}$ after reset.

The upper limit value of timer counter Cx (TCNTCx)

| PWMx0 | CLRCx | Upper limit value of timer counter Cx (TCNTCx) |
| :--- | :--- | :--- |
| 1 | $0 / 1$ | GRCx0 |
| 0 | 0 | FFFF_FFFF |
| 0 | 1 | CUCRCx $^{* 1}$ |

Note 1. When the writing in value to CUCRC is smaller than TCNTCx, it'll be FFFF_FFFF ${ }_{H}$.

### 30.7.2.8 GRCxy — Timer General Registers Cxy

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1 . \mathrm{y}=0,1,2$, 3: Corresponding to channels 0 to 3 .

These timer general registers Cxy (GRCxy) are 32-bit readable/writable registers that function as the input capture register or output compare register. These functions are switched by setting timer I/O control register Cx (TIORCx).

- Operation in input capture mode

When GRCxy is used as an input capture register, it detects an external input capture signal, stores the TCNTCx value, and outputs an input capture interrupt request to the CPU. At this time, the IMFCxy bit in timer status register x (TSRCx) is set to 1 . The edge to be detected is selected by the corresponding TIORCx.
Input capture is performed even if the counter is stopped (the TCE bit in ATUENR is cleared to 0 or the STRCx bit in TSTRC is cleared to 0 ). The value in the counter stopped is loaded to GRCxy.

- Operation in compare match mode

When GRCxy is used as an output compare register, the values in GRCxy and the timer counter (TCNTCx) are constantly compared. When these values match, TIOCxy output is changed according to the method ( 0 output, 1 output, or toggle output) specified in TIORCx, a compare match interrupt request is output to the CPU. At this time, the IMFCxy bit in the timer status register (TSRCx) is set to 1 . Initially, logical zero is output on the TIOCxy pin (immediately after a reset or output compare modes are switched). During operation, the previous value is output. If these registers function as the output compare register for one-shot pulse output, one-shot pulse output starts by writing to GRCxy. Set OCRCxy before writing to GRCxy.

TCNTCx value is captured in GRCx at the time of range compare match occurrence by RCR2Cx. Regarding the range compare function, refer to Section 30.7.3.6 Range Compare Function.

- Operation in one-shot pulse mode

When GRCxy is used as an output compare register for one-shot pulse output, one-shot pulse output starts when a value is written to GRCxy. Be sure to set OCRCxy before writing to GRCxy.
The values in GRCxy and timer counter (TCNTCx) are compared after a compare match with OCRCxy is detected (or when GRCxy = OCRCxy).
Compare match of GRCxy inactivates one-shot pulse (compare match with OCRCxy activates one- shot pulse) and the IMFC bit in the timer status register (TSRCx) is set to 1 . TCNTCx value is captured in GRCx at the time of range compare match occurrence by RCR2Cx. Regarding the range compare function, refer to Section 30.7.3.6, Range Compare Function.
Once the one-shot pulse is output, another output is not performed until new value is set to GRCxy. Also, the IMFC bit in the timer status register (TSRCx) is not changed.

When these registers are used as output compare registers for compare match or one-shot pulse output, if CLRCSELCx bit is set to 0 and the counter upper-limit setting function (see Section 30.7.3.5, Counter Upper-Limit Setting Function) is used, and moreover either clock-bus line 5 or a prescaler division ratio as $1 / 1$ is selected for the count clock, the timer counter counts between 1 and the value of CUCRCx and the counter value may not become $00000000_{\mathrm{H}}$. Therefore, do not set these registers to $00000000_{\mathrm{H}}$ in such cases.

GRCxy is initialized to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.7.2.9 NCNTCxy — Noise Canceler Counters Cxy

Note: $x=0$ to $S B B_{c}-1$. Corresponding to subblocks $C 0$ to $C S B_{c}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Noise Canceler counters Cxy (NCNTCx0 to x3) are 16-bit readable/writable registers. NCNTCx0 to x 3 are started by the external input pins (TIOCx0 to TIOCx3) as triggers when the noise canceler is enabled by the noise cancel enable bit (NCECx0 to x3) in timer I/O control register Cx (TIORCx). In level accumulation cancellation mode, these counters increment or decrement according to the external input level. Up-count or down-count after operation start is performed in synchronization with the noise canceler count clock or clock bus 5 supplied from the prescaler.

NCNTCxy continues counting regardless of the settings in the timer C enable bit (TCE) in ATU master enable register (ATUENR) and in TSTRC (regardless of the TCNTCx).

NCNTCxy operates in one of three modes (premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode) according to the settings of the noise cancellation mode select bit (NCMSEL) and the timer C noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) in the common control unit.

- In premature-transition cancellation mode

When a level change of the externally input signal (TIOCxy) is detected while bit NCECxy is set to 1 and NCNTCxy is stopped, NCNTCxy is started for counting up. This counter is cleared to $0000_{\mathrm{H}}$ and stopped on the first edge of the PCLK after the value in NCNTCxy matches the value in noise cancel register (NCRCxy).
NCNTCxy is incremented regardless of the timer C enable bit (TCE) in ATU master enable register (ATUENR). The first change is output as the signal whose noise is removed and the edge is to be extracted. Subsequent level changes are masked until the value in the counter reaches the value in the noise cancel register (NCRCxy). The level of the externally input signal is output on this compare match.
When the NCECxy bit is cleared to 0 while the counter (NCRCxy) is being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes are also masked over this period.

- In minimum time-at-level cancellation mode

When a level change of the externally input signal (TIOCxy) is detected while the NCECxy bit is set to 1 and NCNTxy is stopped, NCNTxy is started for counting up. This counter is cleared to $0000_{\mathrm{H}}$ and stopped on the first edge of the PCLK after the value in NCNTxy matches the value in noise cancel registers (NCRCxy) or after the level of the externally input signal (TIOCxy) is changed.
NCNTxy is incremented regardless of the timer C enable bit (TCE) in ATU master enable register (ATUENR). When a level change of the externally input signal is detected, the corresponding noise canceler counter (NCNTxy) is started for counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register (NCRCxy), the previously accepted level change is output as the signal whose noise is removed on compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes is treated as noise. Therefore the signal whose noise is removed is not changed.
When the NCECxy bits are cleared to 0 while the counter (NCNTCxy) is being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the externally input signal is detected.

- In level accumulation cancellation mode

When the NCECxy bit is 1, NCNTCxy increments or decrements according to the input signal level. While the input level is high, NCNTCxy increments. When the counter value matches the noise cancel register (NCRCxy) value, upcounting stops on the next PCLK. While the input level is low, NCNTCxy decrements. When the counter value reaches $0000_{\mathrm{H}}$, down-counting stops on the next PCLK.
NCNTCxy counts regardless of the timer C enable bit (TCE) value in the ATU master enable register (ATUENR). When the counter value matches the NCRCxy value during up-counting, the noise canceler output is updated to 1 . When the counter value reaches $0000_{\mathrm{H}}$ during down-counting, the noise canceler output is updated to 0 . When the NCECxy bit is cleared during counting, the noise canceler counter stops working and the value changes from the noise canceler output to the input signal level at that time. For this reason, note that when clearing the NCECxy bit in level accumulation cancellation mode, edge detection may be made at this changeover.

NCNTCxy is initialized to $0000_{\mathrm{H}}$ after reset.

### 30.7.2.10 NCRCxy — Noise Canceler Registers Cxy

Table 30.114 NCRCxy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCRCxy | Noise Canceling Time Cxy |
|  |  | TIOCxy noise canceling period (16-bit comparison value) |

Note: $x=0$ to $S B B_{c}-1$. Corresponding to subblocks $C 0$ to $C S B_{c}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Noise cancel registers Cxy (NCSCx0 to Cx3) are 16-bit readable/writable registers that are provided in each subblock and set the upper limitations of noise cancel counters Cxy (NCNTCx0 to Cx3).

When PCLK/ 128 clock is selected as a noise canceler clock, noise with maximum length of 0.21 s (at PCLK $=40 \mathrm{MHz}$ ) can be canceled when this register is set to $\mathrm{FFFF}_{\mathrm{H}}$.

NCSCx0 to NCSCx3 operate in one of three modes (premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode) according to the settings of the noise cancellation mode select bit (NCMSEL) and the timer C noise cancellation mode bit (NCMC) in the noise cancellation mode register (NCMR) in the common control unit.

- In premature-transition cancellation mode

While NCNTCxy is in count operation, the level change of the subsequent input signal is masked. Values in NCNTCxy and NCRCxy are always compared. If a compare match occurs, the value in NCNTCxy is cleared on the next PCLK, the count operation is stopped, and the masking of the input signal is canceled.

- In minimum time-at-level cancellation mode

While NCNTCxy is in count operation, noise canceler processing waiting state is entered. Values in NCNTCxy and NCRCxy are always compared. If a compare match occurs, the value in NCNTCxy is cleared on the next PCLK, the count operation is stopped, and at the same time the noise canceler outputs the input signal that has passed through the noise canceling processing.

- In level accumulation cancellation mode

While NCNTCxy is counting up, the NCNTCxy value is compared with the NCRCxy value. When a compare match occurs, NCNTCxy stops up-counting on the next PCLK. While NCNTCxy is counting down, the NCNTCxy value is compared with $0000_{\mathrm{H}}$.

NCRCx 0 to NCRCx 3 can be read and written only in 16-bit units.
NCRCx 0 to NCRCx 3 are initialized to $0000_{\mathrm{H}}$ after reset.

### 30.7.2.11 OCRCxy — Output Compare Registers Cxy

Note: $\quad \mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1 . \mathrm{y}=0,1,2$, 3: Corresponding to channels 0 to 3 .

Output compare registers Cxy (OCRCxy) are 32-bit readable/writable registers that function as an output compare register. These registers are used as a compare register in modes other than one-shot pulse mode.

- Operation in input capture mode:

When GRCxy is used as an input capture register, it detects an external input capture signal, stores the TCNTCx value, and outputs an input capture interrupt request to the CPU. At this time, the IMFCxy bit in timer status register x (TSRCx) is set to 1 . The edge to be detected is selected by the corresponding TIORCx.
Input capture is performed even if the counter is stopped (the TCE bit in ATUENR is cleared to 0 or the STRCx bit in TSTRC is cleared to 0 ). The value in the counter stopped is loaded to GRCxy.

- Operation in compare match mode:

The values in OCRCxy and timer counter (TCNTCx) are always compared. When these values match, a compare match interrupt request is outputs to the CPU. At this time, the OCMFC bit in the timer status register (TSRCx) is set to 1 . TCNTCx value is captured in OCRCx at the time of range compare match occurrence by RCR1Cx. Regarding the range compare function, refer to Section 30.7.3.6, Range Compare Function.

- Operation in one-shot pulse mode:

When GRCxy is used as an output compare register for one-shot pulse output, one-shot pulse output starts when a value is written to GRCxy. Be sure to set OCRCxy before writing to GRCxy.
When one-shot pulse output starts, the values in OCRCxy and timer counter (TCNTCx) are compared.
Compare match with OCRCxy activates one-shot pulse (compare match with GRCxy inactivates one-shot pulse) and the OCMFCxy bit in the timer status register (TSRCx) is set to 1 . TCNTCx value is captured in OCRCx at the time of range compare match occurrence by RCR1Cx. Regarding the range compare function, refer to Section 30.7.3.6,
Range Compare Function.
Once the one-shot pulse is output, another output is not performed until new value is set to GRCxy. Also, the OCMFCxy bit in the timer status register (TSRCx) is not changed. When these registers are used as output compare registers for compare match or one-shot pulse output, if the counter upper-limit setting function (see Section
30.7.3.5, Counter Upper-Limit Setting Function) is in use with clock-bus line 5, or with a division ratio of $1 / 1$ selected for the prescaler, the timer counter counts between 1 and the value of CUCRCx and the counter value never reaches $00000000_{\mathrm{H}}$. Therefore, do not set these registers to $00000000_{\mathrm{H}}$ in such cases.

OCRCxy is initialized to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.7.2.12 OCMRCxy — Output Compare Mirror Registers Cxy

Note: $x=0$ to SBc-1: Corresponding to subblocks C0 to CSBc-1. y = 0, 1, 2, 3: Corresponding to channels 0 to 3 .

The output compare mirror registers Cxy (OCMRCxy) are 32-bit read-only registers that have a function mirroring the output compare registers Cxy (OCRCxy) for DMA transfer. Writing to this register is prohibited.

The mirroring function is provided to DMA-transfer the value captured to OCRCxy or GRCxy in input capture mode. During DMA transfer, read the values in OCMRCxy and GMRCxy consecutively in this order.

### 30.7.2.13 GMRCxy — Timer General Mirror Registers Cxy

Note: $x=0$ to $S B C_{c}-1$ : Corresponding to subblocks $C 0$ to $C S B_{c}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
The timer general mirror registers Cxy (GMRCxy) are 32-bit read-only registers that have a function mirroring the timer general registers Cxy (GRCxy) for DMA transfer. Writing to this register is prohibited.

The mirroring function is provided to DMA-transfer the value captured to OCRCxy or GRCxy in input capture mode. During DMA transfer, read the values in OCMRCxy and GMRCxy consecutively in this order.

### 30.7.2.14 TIERCx — Timer Interrupt Enable Registers Cx

Note: $x=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$
Table 30.115 TIERCx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. Fix these bits to 0. |
| 11 to 8 | OCRCExy | OCRC interrupt enable xy |
|  |  | Interrupt request due to comparison and capture by OCRCExy |
|  | 0: Interrupt request due to comparison and capture by OCRCxy is disabled. |  |
|  | 1: Interrupt request due to comparison and capture by OCRCxy is enabled. |  |
| 7 to 5 | - | These bits are not used. Fix these bits to 0. |
| 4 | OVCEx | Overflow interrupt enable $x$ |
|  |  | 0: Interrupt request due to overflow is disabled. |
|  |  | 1: Interrupt request due to overflow is enabled. |
| 3 to 0 | GRCExy | GRC interrupt enable xy |
|  |  | 0: Interrupt request due to comparison and capture by GRCExy is disabled. |
|  |  | 1: Interrupt request due to comparison and capture by GRCExy is enabled. |

Note: $x=0$ to $S B B_{c}-1$. Corresponding to subblocks $C 0$ to $C S B_{c}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Timer interrupt enable registers Cx (TIERCx) are 8-bit/16-bit readable/writable registers used to set interrupt requests due to comparison in subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$.

## Interrupt request Cxy due to comparison (OCRCExy)

An interrupt is generated on compare match by the output compare register (OCRCxy).

## Interrupt request Cxy due to overflow (OVCEx)

An interrupt is generated upon occurrence of an overflow.

## Interrupt request Cxy due to comparison and capture (GRCExy)

An interrupt is generated on compare match or capture operation by the general register GRCxy.

### 30.7.2.15 CUCRCx — Counter Upper-Limit Setting Compare Registers Cx

Note: $\quad x=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$

Counter upper-limit value compare registers Cx (CUCRCx) are 32-bit readable/writable registers that has a function to be compared with the TCNTCx counter. Compare match between this register and the TCNTCx counter is enabled by setting the TCNTCx clear bit Cx (CLRCx) in the timer control register (TCRCx) to 1 . The TCNTCx counter is cleared to $00000000_{\mathrm{H}}$ on compare match between the TCNTCx counter and counter upper-limit setting compare register (CUCRCx).

If this compare match occurs at the same time as counting up by the timer counter Cx (TCNTCx), the timer counter Cx (TCNTCx) is cleared to $00000001_{\mathrm{H}}$.

The OVFCx bit in timer status register C (TSRCx) is set to 1 and an overflow interrupt is output on compare match between the TCNTCx counter and counter upper-limit setting compare register Cx (CUCRCx).

Establish "CUCRCx $\geqq$ GRCxy" by occurrence condition of a compare match of GRCxy by Counter Upper-Limit Setting Compare Registers Cx(CUCRCx) when GRCxy is used as a comparing register at CLRCx $=1$.

When not establishing it, an expectancy wave-shaped isn't output from an output terminal TIOC.
Do not set CUCRCx to $00000000_{\mathrm{H}}$. If $00000000_{\mathrm{H}}$ is set, a compare match may occur at an unintended timing.

## CAUTION

The upper limit value setting function can be enabled ( $C L R C x=1$ ) in other than PWM mode ( $\mathrm{PWMx0}=0$ ).

### 30.7.2.16 RCR1Cx — Range Comparison Value Setting Register 1Cx

Value after reset: $\quad 00_{H}$

Note: $x=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$
Note 1. These bits are not used. Fix these bits to " 0 ".

The range comparison value setting registers $1 C x(R C R 1 C x)$ are 8 -bit readable/writable registers.
This register can enable / disable range compare function and set range value. Regarding the range compare function, refer to Section 30.7.3.6, Range Compare Function.

RCR1Cx is initialized to $00_{\mathrm{H}}$ after reset.

### 30.7.2.17 RCR2Cx — Range Comparison Value Setting Register 2Cx

Value after reset: $\quad 00_{H}$

Note: $x=0$ to $\mathrm{SB}_{\mathrm{C}}-1$ : Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$
Note 1. These bits are not used. Fix these bits to " 0 ".

The range comparison value setting registers 2 Cx ( RCR 2 Cx ) are 8 -bit readable/writable registers. This register can enable / disable range compare function and set range value. Regarding the range compare function, refer to Section 30.7.3.6, Range Compare Function.

RCR2Cx is initialized to $00_{\mathrm{H}}$ after reset.

The following table shows ranges that can be set as range comparison values (power of 2 (excluded only when RCR1Cx and RCR2Cx are 0 )).

| RCR1Cx[4:0], RCR2Cx[4:0] | Selectable Range | Remarks |
| :--- | :--- | :--- |
| 00000 | None | Range comparison is invalid (Default) |
| 00001 | $2^{1}-1$ | - |
| 00010 | $2^{2}-1$ | - |
| 00011 | $2^{3}-1$ | - |
| 00100 | $2^{4}-1$ | - |
| 00101 | $2^{5}-1$ | - |
| 00110 | $2^{6}-1$ | - |
| 00111 | $2^{7}-1$ | - |
| 01000 | $2^{8}-1$ | - |
| 01001 | $2^{9}-1$ | - |
| 01010 | $2^{10}-1$ | - |
| 01011 | $2^{11}-1$ | - |
| 01100 | $2^{12}-1$ | - |
| 01101 | $2^{13}-1$ | - |
| 01110 | $2^{14}-1$ | - |
| 01111 | $2^{15}-1$ | - |
| 10000 | $2^{16}-1$ | - |
| 10001 | $2^{17}-1$ | - |
| 10010 | $2^{18}-1$ | - |
| 10011 | $2^{19}-1$ | - |
| 10100 | $2^{20}-1$ | - |
| 10101 | $2^{21}-1$ | - |
| 10110 | $2^{22}-1$ | - |
| 10111 | $2^{23}-1$ | - |
| 11000 | $2^{24}-1$ | - |
| 11001 | $2^{25}-1$ | $2^{26}-1$ |

### 30.7.2.18 NCMCR1C — Noise Cancellation Mode Channel Register 1C

| Value after reset: $\quad 000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | - | $\left\|\begin{array}{c} \text { NCM1C } \\ 10 \end{array}\right\|$ | $\left\|\begin{array}{c} \text { NCM1C } \\ 9 \end{array}\right\|$ | $\left\|\begin{array}{c} \text { NCM1C } \\ 8 \end{array}\right\|$ | NCM1C | $\left\|\begin{array}{c} \text { NCM1C } \\ 6 \end{array}\right\|$ | $\left\lvert\, \begin{gathered} \text { NCM1C } \\ 5 \end{gathered}\right.$ | $\begin{gathered} \text { NCM1C } \\ 4 \end{gathered}$ | $\left\|\begin{array}{c} \text { NCM1C } \\ 3 \end{array}\right\|$ | $\left\|\begin{array}{c} \text { NCM1C } \\ 2 \end{array}\right\|$ | NCM1C $1$ | $\left\lvert\, \begin{gathered} \text { NCM1C } \\ 0 \end{gathered}\right.$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.116 NCMCR1C Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to SBc | - | These bits are not used. Fix these bits to "0". |
| $\mathrm{SB}_{\mathrm{C}}-1$ to 0 | NCM1Cx | Subblock $x$ all channels noise cancellation mode <br> This bit specifies the operating mode of all the noise cancellers in subblock $x$. <br> 0: Premature-transition cancellation mode <br> 1: Minimum time-at-level cancellation mode (When NCMC $=0$ and NCM2Cx=0) <br> 1: Level accumulation cancellation mode (When NCMC = 0 and NCM2Cx = 1) |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{C}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{C}}-1$.

The noise cancellation mode channel register 1C is an 8-bit or a 16-bit readable/writable register used to select an operating mode of noise canceler in each channel. However, the setting of this register applies to all channels in the corresponding subblock and the setting cannot be made for the individual channels.

Premature-transition cancellation mode detects a change in input signal level, and then ignores changes in input signal level within the specified time period. Changes in input signal level within the specified time period after the first level change are regarded as noise in this mode.

Level accumulation cancellation mode accumulates input signal levels and regards that the input level has reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise cancellation register in each channel, and the noise cancellation counter measures the time.

## Subblock x All Channels Noise Cancellation Mode (NCM1Cx)

This bit specifies the operating mode of all the noise cancellers in subblock x .

## CAUTION

This register is only effective when the NCMC bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 ". Furthermore, when the corresponding channel bit (NCM1Cx) in this register is set to " 1 ", the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2C (NCMCR2C).
Note: x indicates 0 to $\mathrm{SBc}-1$.

### 30.7.2.19 NCMCR2C — Noise Cancellation Mode Channel Register 2C

Table 30.117 NCMCR2C Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to SBc | - | These bits are not used. Fix these bits to " 0 ". |
| SB $_{\mathrm{C}}-1$ to 0 | NCM2Cx | Subblock $x$ all channels noise cancellation mode |
|  |  | This bit specifies the operating mode of all the noise cancellers in subblock $x$. |
|  | $0:$ Minimum time-at-level cancellation mode (When NCMC $=0$ and NCM1Cx =1) |  |
|  |  | 1: Level accumulation cancellation mode (When NCMC $=0$ and NCM1Cx =1) |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{c}}-1$. Corresponding to subblocks C 0 to $\mathrm{CSB}_{\mathrm{c}}-1$.

The noise cancellation mode channel register 2C is an 8-bit or a 16-bit readable/writable register used to select an operating mode of noise canceler in each channel. However, the setting of this register applies to all channels in the corresponding subblock and the setting cannot be made for the individual channels.

Level accumulation cancellation mode accumulates input signal levels and regards that the input level has reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise cancellation register in each channel, and the noise cancellation counter measures the time.

## Subblock x All Channels Noise Cancellation Mode 2 (NCM2Cx)

This bit specifies the operating mode of all the noise cancellers in subblock x .

## CAUTION

This register is only effective when the NCMC bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 " and the corresponding channel bit (NCM1Cx) in noise cancellation mode channel register 1C (NCMCR1C) is "1".
Note: x indicates 0 to $\mathrm{SBc}-1$.

### 30.7.3 Details of Operation

### 30.7.3.1 Input Capture Mode (Input Capture Function)

Timer general registers Cxy (GRCxy) and output compare registers Cxy (OCRCxy) perform input capture when an edge is input from the corresponding external pin (TIOCxy) or an event output (event $1,2 \mathrm{~A}$, or 2 B ) from timer A is input by setting input capture in timer I/O control registers (TIORCx).

The timer counter (TCNTCx) starts up-counting by setting the timer start register (TSTRx). When an edge of the corresponding external pin of GRCxy and OCRCxy is input or an event output from timer A used as a capture timing signal of GRCx is input, the corresponding bit (IMFCxy/OCMFCxy) in the timer status register (TSRC) is set to 1 and the counter value is transferred to GRCxy and OCRCxy. After a changed edge of TIOCxy has been extracted and then two internal operating clock (PCLK) cycles have passed, the interrupt output changes. Input capture flags (IMFCxy/OCMFCxy bits in TSRCx) can be cleared by writing 1 to the corresponding clear bit in the timer status clear register (TSCRCx).

An edge to be input can be selected from rising edge, falling edge, and both edges according to the setting of the IOC bit in the TIORCx register.

Furthermore, an interrupt request can be output to the CPU at the input capture timing.
The value in timer counter $C x$ (TCNTCx) is cleared when its value matches the value of counter upper limit value setting compare register Cx (CUCRCx) while the CLRCx bit in timer control register Cx (TCRCx) is set to enabled. But, when the writing in value to CUCRC is smaller than TCNTCx, it'll be FFFF_FFFF ${ }_{H}$.

Figure $\mathbf{3 0 . 3 8}$ shows an operation example of input capture in subblock C0. TIOC00 is captured at active high, and TIOC01 is captured at active low.

Input capture is performed even if TCNTCx is stopped (when the TCE bit in ATUENR or bit STRCx is cleared to 0). The counter value of the TCNTCx stopped is captured in GRCxy and OCRCxy.

| TIORC.IOCxy |  |  |  | $\begin{array}{\|l} \hline \text { TCRCx. } \\ \hline \text { PWM } 00 \\ \hline \end{array}$ | $\begin{array}{\|l\|} \hline \text { TCRC. } \\ \hline \text { CLRCX } \end{array}$ | $\begin{array}{\|l\|} \hline \text { TCRC. } \\ \hline \text { CLRCSELCX } \end{array}$ | OCRCxy | GRCxy | CUCRCx | RCR1Cx | RCR2Cx | The upper limit value of TCNTCx |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Figure 30.38 Operation Example of Input Capture

### 30.7.3.2 Compare Match Mode (Compare Match Function)

The following table can be set as a compare match mode. The PWM function explains the explanation at the time of on/off below.

| TIORC.IOCxy |  |  |  | TCRCx. | TCRC. | TCRC. | OCRCxy | GRCxy | CUCRCx | RCR1Cx | RCR2Cx | The upper limit value of TCNTCx |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| [3] | [2] | [1] | [0] | PWMx0 | CLRCx | CLRCSELCx |  |  |  |  |  |  |
| 0 | 1 | 0 | 0 | 0 | 0/1 |  | Cmp | $\times$ | - | - | $\times$ | [When TCRC.PWMx0 = 1] GRCx0 <br> [When TCRC.CLRCx = 0] <br> FFFF_FFFF ${ }_{H}$ <br> [When TCRC.CLRCx = 1] <br> CUCRCx or FFFF_FFFFH |
|  |  | 0 | 1 | 0 | 0/1 |  |  | Cmp <br> [When PWMx0 = 1] <br> - GRCx0 PWM cycle <br> - GRCx1-3 <br> duty ratio |  |  | - |  |
|  |  |  |  | 1 | 0 *(1 setting prohibited) |  |  |  | $\times$ | $\times$ | $\times$ |  |
|  |  | 1 | 0 | 0 | 0/1 |  |  |  | - | $\bigcirc$ | - |  |
|  |  |  |  | 1 | 0 *(1 setting prohibited) |  |  |  | $\times$ | $\times$ | $\times$ |  |
|  |  | 1 | 1 | 0 | 0/1 |  |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |

Note: Cmp: It can be used as a compare match.
$\circ$ : Setting possible, $\times$ : Setting prohibited

General registers (GRCxy) of timer C output compare match from the corresponding external pin (TIOCxy) by setting compare match operation in timer I/O control registers (TIORCx). A comparing match by Output Compare Registers Cxy (OCRCxy) isn't precocious in relation to output control of the outside terminal (TIOCxy).

Timer counter (TCNTCx) is started for counting up by setting a bit in timer start register (TSTRC) to 1 . Set the value in GRCxy before starting the counter. When the values in GRCxy and TCNTCx match, a bit corresponding to GRCxy in timer status register (TSRCx) is set and a waveform is output on external pin TIOCxy.

The compare match flag is set and the signal level on pin TIOCxy is changed on the first edge of the PCLK immediately after compare match between GRCxy and TCNTCx. Compare match flags (IMFCxy bits in TSRCx) can be cleared to 0 by writing 1 to the corresponding clear bit in the timer status clear register (TSCRCx).

A logical one, a logical zero, or a toggled output can be selected for the signal to be output on pin TIOCxy.
An interrupt request can be output to the CPU at occurrence of a compare match.
When PWM mode is disabled (TCRCx.PWMx $0=0$ ) and the CLRCx bit of timer control register Cx $(\mathrm{TCRCx})$ is enabled, timer counter (TCNTCx) is cleared if its value matches the value of counter upper limit value setting compare register Cx (CUCRCx).

Figure $\mathbf{3 0 . 3 9}$ shows an operation example of compare match. In this example, a toggled output on GRC00, a logical one output on GRC01, and a logical zero output on GRC02 are externally output. A value of 004004 is set for GRC0y, which changes the TIOC0y output on the next PCLK after compare match with the TCNTC0 value.
Output compare registers Cxy (OCRCxy) is compared with timer counter (TCNTCx), and if they match, the OCMFCxy bit in timer status register (TSRCx) corresponding to OCRCxy is set.

Figure 30.39 Operation Example of Compare Match

By setting a forced compare match bit (FMCMxy) in timer control register (TCRCx), compare match can be generated even if TCNTCx has not matched GRCxy. The compare match flag and the signal level on pin TIOCxy are changed on the first edge of the PCLK after bit FCMFCxy is set to 1.

Compare match is detected by GRCxy when any of the following occurs.

- When the values in TCNTCx and GRCxy match (forced compare match is OFF)
- When the forced compare match bit (bit FCMCxy in TCRCx) is changed from 0 to 1
- When TCNTCx sets the value besides $00_{\mathrm{H}}$ as RCR2Cx , and it's in the range set as RCR2Cx at the time of writing in GRCxy.

Compare match is detected by OCRCxy when any of the following occurs.

- When the values in TCNTCx and OCRCxy match (forced compare match is OFF)
- When the forced compare match bit (bit FOCMCxy in TCRCx) is changed from 0 to 1
- When TCNTCx sets the value besides $00_{\mathrm{H}}$ as RCR1Cx, and it's in the range set as RCR1Cx at the time of writing in GRCxy.

The compare match flag and the signal level on pin TIOCxy is changed on the first edge of the PCLK after bit FCMCxy is set to 1 . Make sure that the compare match operation is selected by bits IOCxy[2:0] in TIORCx before starting operation. At the moment TCNTCx and GRCxy are set to the same value, or when the forced compare match bit is set to " 1 ", compare match is not detected at the moment when compare match is enabled.

Compare match is detected regardless of the counter operating state. Even if the counter is stopped, compare match occurs when the condition is satisfied.

When the compare match status flag is cleared before GRCxy and TCNTCx are changed (such as before counting while the counter has been stopped), the compare match is not detected.

### 30.7.3.3 PWM Function

Setting bit PWMx in timer control register C (TCRCx) to 1 makes channels 1 to 3 in each subblock function as PWM timers with the same frequency. In PWM mode, GRCx0 as a cycle setting register and GRCx1 to GRCx3 as duty cycle setting registers are used. External pins TIOCx1 to TIOCx3 corresponding GRCx1 to GRCx3 are used to output PWM signals. To use them as PWM signal outputs, select the compare match operation by bits IOCxy in TIORCx as well as setting bit PWMx so that GRCn0 to GRCn3 function as compare match registers.

Timer counter (TCNTCx) is started by setting timer start register (TSTRC). When the value in TCNTCx reaches the value in the cycle setting register (GRCx0), compare match occurs and the bit in timer status register C (TSRCx) is set to 1 . At this time, TCNTCx is cleared and a signal is output on external pins TIOCx1 to TIOCx3 according to bit IOCx0 in PWM mode. The output signal levels on pin TIOCx0 depend on bit IOCx0.
When the value in TCNTCx reaches the value in the duty cycle setting register (GRCx1 to GRCx3), the bit in timer status register C (TSRCx) is set to 1 and a signal is output on external pins TIOCx1 to TIOCx3 according to bits IOCx1 to IOCx3.

When the same value is set in the cycle and duty cycle setting registers, priority is given to bit IOCx 0 corresponding to the cycle setting register.

Figure $\mathbf{3 0 . 4 0}$ shows an operation example of block C0 in PWM mode.

Figure 30.40 Operation Example of PWM Mode

The settings to obtain the above waveforms are IOC $00=10$ (for the output of 1 on TIOC00) and IOC01, 02, $03=01$ or 11 (for the output of 0 on or inversion of TIOC01, 02, 03).

## CAUTION

Operation will not be correct for PWM output with a duty cycle of $0 \%$. Do not set GRCxy to 0 , since the output will not be as expected in this case (in the case of frequency division by one, operation becomes the same as with a duty cycle of $100 \%$, and in the case of division by two, pulses of one cycle of PCLK will be generated).

Setting procedure for PWM operation

Figure 30.41 PWM Operation Setting Procedure

### 30.7.3.4 One-Shot Pulse Mode (One-Shot Pulse Function)

By setting the PWMx0 bits in timer control register Cx (TCRCx) to $0_{\mathrm{B}}$ and setting the IOCxy[3:2] bits in timer I/O control register Cx (TIORXCx) to $10_{\mathrm{B}}$, one-shot pulses are output from the corresponding external pin (TIOCxy).

Setting the timer start register (TSTRC) starts up-count of the timer counter (TCNTCx).
In one-shot pulse mode, a one-shot pulse is output at a trigger of write access to the GRCxy register.
After the write access to the GRCxy register, a compare match interrupt is output on compare match between timer counter Cx (TCNTCx) and OCRCxy register, set the external pin (TIOCxy) to active level, a compare match interrupt is output on compare match between timer counter Cx (TCNTCx) and GRCxy register, and then reset the external pin (TIOCxy) to inactive level. When a single one-shot pulse output has been completed after an access to the GCRxy register, no interrupt occurs until the next write access to the GCRxy register is made and the external pin (TIOCxy) retains inactive level.

When one-shot pulse mode (IOCxy[3:2] $=10_{\mathrm{B}}$ ) is used, initialize the external pin (TIOCxy) by forced compare match Cxy (FCMCxy) after operating mode is set, and then start counting.

If one-shot pulse mode is activated without initializing the external pin (TIOCxy) to inactive level, output level becomes unstable.

To cancel one-shot pulse mode after a value is written to the GRCxy register, write 1 to forced compare match Cxy (FCMCxy) and forced output compare match Cxy (FOCMCxy) simultaneously.

| TIORC.IOCxy |  |  |  | TCRCx. | TCRC. | TCRC. | OCRCxy | GRCxy | CUCRCx | RCR1Cx | RCR2Cx | The upper limit value of TCNTCx |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| [3] | [2] | [1] | [0] | PWMx0 | CLRCx | CLRCSELCx |  |  |  |  |  |  |
| 1 | 0 | 0 | 0 | *(1 setting prohibited) | 0/1 |  | * | × | 0/1 | $\times$ | * | [When TCRC.CLRCx $=0$ ] |
|  |  | 0 | 1 |  |  |  | FFFF_FFFFH |  |  |  |  |  |
|  |  | 1 | 0 |  |  |  | Cmp | Cmp |  | - | - | [When TCRC.CLRCx $=1$ ] |
|  |  | 1 | 1 |  |  |  | CUCRCx or FFFF_FFFFH |  |  |  |  |  |

Note: Cmp: It can be used as a compare match Cap: It can be used as a capture
$\circ$ : Setting possible, $\times$ : Setting prohibited

Figure $\mathbf{3 0 . 4 2}$ shows an example of one-shot pulse mode operation in block C 0 .

Figure 30.42 One-Shot Pulse Mode Operation

## NOTE

The active width of one-shot pulse can be obtained from the following formula.

- GRCxy = OCRCxy:

One-shot pulse (active) width $=0$

- GRCxy > OCRCxy:

One-shot pulse (active) width = GRCxy[31:0] - OCRCxy[31:0]

- GRCxy < OCRCxy:
- Upper-limit setting function is off One-shot pulse (active) width $=($ FFFF FFFFH - OCRCxy[31:0] $)+(G R C x y[31: 0]+1)$
- Upper-limit setting function is on One-shot pulse (active) width = (CUCRCx - OCRCxy[31:0]) + GRCxy[31:0]

To output a one-shot pulse in the second and subsequent cycles, be sure to confirm that the previously set one-shot pulse output has been completed, and then set GRCxy and OCRCxy in the second and subsequent cycles. If the GRCxy or OCRCxy register value is modified before the one-shot pulse output has been completed, the modified value is reflected to the ongoing one-shot-pulse output.

### 30.7.3.5 Counter Upper-Limit Setting Function

The timer counter (TCNTCx) upper-limit value in each subblock can be changed by the counter upper-limit setting compare register Cxy (CUCRCx) to perform interval operation. To enable the counter upper-limit setting function, set the CLRCx bit in the timer control register C (TCRCx) to 1.

Figure 30.48 shows an example of operation with the counter upper-limit setting function of block C 0 enabled.

Clear timing and count-up timing are not same

### 30.7.3.6 Range Compare Function

(1) Range compare function

The range compare function generates a compare match when the counter value (TCNTCx) is within the set compare range when writing to "output compare register (OCRCxy) and timer general register Cxy (GRCxy)". When using "PWM mode ( $\mathrm{PWMx} 0=1$ )" or "TIORCx.IOCxy setting OCRCxy, GRCxy as the capture register", the range compare function is prohibited. The range compare function is enabled when setting other than 00 H to the range compare value setting register (RCR1Cx or RCR2Cx).

The range compare value setting register $1 \mathrm{Cx}(\mathrm{RCR} 1 \mathrm{Cx}$ ) and the range compare value setting register 2Cx (RCR2Cx) correspond to the output compare register (OCRCxy) and timer general register Cxy (GRCxy), respectively.

Range of OCRCxy, GRCxy Judge the range of compare match using the following values.

OCRCxy Range Compare Match

- Write value of OCRCxy
- Value of TCNTCx
- Range value set in RCR1Cx
- $\operatorname{TCNTCx}$ upper limit value $\left(\right.$ FFFFFFFF $_{\mathrm{H}}[$ TCRCx.CLRCx $=0]$ or CUCRCx setting value $[$ TCRCx.CLRCx $\left.=1]\right)$

GRCxy Range Compare Match

- Write value of GRCxy
- Value of TCNTCx
- Range value set in RCR2Cx
- $\operatorname{TCNTCx}$ upper limit value $\left(\right.$ FFFFFFFF $_{H}[$ TCRCx.CLRCx $=0]$ or CUCRCx setting value $[$ TCRCx.CLRCx $\left.=1]\right)$

Figure 30.51, Figure $\mathbf{3 0 . 5 2}$ show the operation diagram of OCRCxy range compare match.
Also, OCRCxy and GRCxy capture the counter value (TCNTCx) when a compare match is generated by the range compare function. Figure $\mathbf{3 0 . 5 3}$ shows the capture operation when range compare match occurs.

Figure 30.51 Operation of the Range Comparison Function(1)

Upper limit of TCNTCx=FFFF_FFFFH $(C L R C x=0)$ or CUCRCx $(C L R C x=1)$, Range value=Set by RCR1Cx

Figure 30.52 Operation of the Range Comparison Function(2)

Figure 30.53 Range Compare Counter Value Capturing Operation

OCRCxy range compare match occurs when the condition of Table $\mathbf{3 0 . 1 1 8}$ is satisfied when writing to OCRCxy by setting the range compare function to valid (except for $00_{\mathrm{H}}$ in RCR1Cx).

Table 30.118 OCRCxy Range Compare Match Generation Condition

|  | Range condition | Range compare match generation condition in OCRCxy |
| :--- | :--- | :--- |
| Condition 1 | When the set compare range is less than or equal to the <br> TCNTCx upper limit value. <br> OCRCxy + Range value set in RCR1Cx $\leq$ TCNTCx upper <br> limit value. | OCRCxy $\leq$ TCNTCx value $\leq$ Range value set for OCRCxy <br> + RCR1Cx |
| Condition 2 | When the set compare range exceeds the TCNTCx upper <br> limit value. | Range(i): OCRCxy $\leq$ TCNTCx value $\leq$ TCNTCx upper limit <br> value <br> or <br> Range(ii): $00000000 \leq$ TCNTCx value $\leq$ OCRCxy + Range <br> value set for RCR 1Cx + TCNTCx upper limit value |

Note 1. "Condition 1 When a set comparing area is below the TCNTCx upper limit value.", The range condition shown in the Figure 30.51 .

Note 2. "Condition 2 When a set comparing area exceeds TCNTCx.", The range condition shown in the Figure $\mathbf{3 0 . 5 2}$.
Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in Figure 30.52.

GRCxy range compare match occurs if the condition of Table 30.119 is satisfied when writing to GRCxy by setting the range compare function to valid (except for $\mathrm{H}^{\prime} 00$ in RCR2Cx).

Table 30.119 GRCxy Range Compare Match Generation Condition

|  | Range condition | Range compare match generation condition in GRCxy |
| :--- | :--- | :--- |
| Condition 1 | When the set compare range is less than or equal to the <br> TCNTCx upper limit value. <br> Range value set for GRCxy + RCR2Cx $\leq$ TCNTCx upper <br> limit value | GRCxy $\leq$ TCNTCx value $\leq$ Range value set for GRCxy + <br> $R C R 2 C x$ |
| Condition 2 | When the set compare range exceeds the TCNTCx upper <br> limit value | Range(i): GRCxy $\leq$ TCNTCx value $\leq$ TCNTCx upper limit <br> value <br> or <br> Range(ii): $00000000_{H} \leq$ TCNTCx value $\leq R a n g e ~ v a l u e ~ s e t ~$ <br> for GRCxy + RCR2Cx - TCNTCx upper limit value |

Note 1. "Condition 1 When a set comparing area is below the TCNTCx upper limit value.", The range condition shown in the Figure 30.51.

Note 2. "Condition 2 When a set comparing area exceeds TCNTCx.", The range condition shown in the Figure $\mathbf{3 0 . 5 2}$
Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in Figure 30.52.

The table below shows the setting example when the range compare function is used and the counter value at which the range compare match occurs.

No.1, No. 3 are examples of the condition "When the set compare range is less than or equal to the TCNTCx upper limit value", and No.2, No. 4 are examples of the condition "When the set compare range exceeds the TCNTCx upper limit value".

Table 30.120 Range Compare Function Register Setting Example

| No. | CLRCx <br> setting <br> value | CUCRCx setting value | The write value of OCRCxy or GRCxy | Set value (range value) of range compare value setting register (RCR1Cx, RCR1Cx) | When writing to the compare register (OCRCxy, GRCxy), the value of the counter where range compare match occurs |

### 30.8 Timer D

### 30.8.1 Overview of Operation

The timer D block is a one-shot pulse output timer that consists of $\mathrm{SB}_{\mathrm{D}}$ subblocks. Each subblock has four channels.
Timer D has the following functions.

- A compare match between the counter and output compare register is generated. Compare match A by compare match of TCNT1Dx (or TCNT2Dx) and OCR1Dx and compare match B by compare match of TCNT2Dx (or TCNT1Dx) and OCR2Dx are generated respectively.
- Down counter is started on compare match A or B of the output compare register or writing to the counter start bit in the down-counter start register. A one-shot pulse with an offset can be output.
- The output waveform can be forcibly shutoff regardless of the down-counter value by compare match B of the compare match register. If compare match A or counter start bit writing occurs concurrently with compare match B , output shutoff takes precedence.
- The input capture register enables to capture the TCNT2Dx (or TCNT1Dx) value using compare match A as a trigger and the TCNT1Dx (or TCNT2Dx) value using compare match B as a trigger.
- Pulse indicating that compare match A or B can be output.
- Interrupt requests can be output on compare matches $A$ and $B\left(8 \times \mathrm{SB}_{D}\right.$ lines supported).
- Range compare function by the compare match register is enabled according to the range comparison value setting register.
- The counters (TCNT1Dx and TCNT2Dx) can be cleared upon compare match.
- When the upper limit setting of TCNT1Dx is valid, the counters can be cleared upon compare match with CUCR1Dx.
- When the upper limit setting of TCNT2Dx is valid, the counters can be cleared upon compare match with CUCR2Dx.
- Interrupt requests ( $2 \times \mathrm{SB}_{\mathrm{D}}$ in total) can be output on counter overflow: $\mathrm{SB}_{\mathrm{D}}$ outputs from TCNT1Dx and $\mathrm{SB}_{\mathrm{D}}$ outputs from TCNT2Dx.
- Interrupt requests can be output on down-counter underflow ( $4 \times \mathrm{SB}_{\mathrm{D}}$ lines supported).
- Offset base register can capture the counter value by a trigger signal from timer A and a PH notification trigger from DFE
- Clearing TCNT1Dx and TCNT2Dx is possible by a clear signal issued from timer B.
- The value configured in the output value register can be output from pins according to the output select register.

Figure 30.54 Block Diagram of Timer D

Figure 30.54 is a block diagram of timer D. Components of timer D subblock Dx include two range compare setting registers (RCR1Dx and RCR2Dx), two 32-bit timer counters (TCNT1Dx and TCNT2Dx), one offset base register (OSBRDx), one output value register (ORDx), one output select register (OSELRDx), $\mathrm{SB}_{\mathrm{D}}$ compare match registers (OCR1Dxy and OCR2Dxy), two counter upper-limit setting registers (CUCR1Dx and CUCR2Dx), four timer downcounters Dxy (DCNTDxy), $\mathrm{SB}_{\mathrm{D}}$ input capture registers (ICR1Dxy and ICR2Dxy), and a controller. Each channel includes two output pins; TODxyA for compare match output and TODxyB for one-shot pulse output. (Output pins are supported by subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}-1}$.)

TODxyA and TODxyB are output a level of 0 as a default.
When compare match A or B is detected, a pulse is output as an interrupt request.

Figure 30.55 Timer D Channel xy MIN Guard Unit Connection Diagram

Figure $\mathbf{3 0 . 5 5}$ shows the block diagram of the timer D MIN guard unit.
The MIN guard unit is connected to each channel of timer D, and it is possible to add MIN guard function to TODxyA (compare match output) or TODxyB (one shot pulse output) and it can output as TODxyMA, TODxyMB and TODMIGOxy.

It is also possible to output an interrupt request at the ON timing and OFF timing of the output waveform after the MIN guard to the output that selected the MIN guard function, and capture the values of TCNT1Dx and TCNT2Dx at the timing of interrupt output.

Figure 30.56 Common Input Capture Register

Figure $\mathbf{3 0 . 5 6}$ is a common input capture select register. A common input capture register (CICRD0-7) is prepared 8, and stocks the value of TCNT1D0 in subblock 0 or TCNT2D0 at the time of PH renewal notice trigger 0-7 occurrence from DFE.

## Transmission of DFE to timer trigger

Timer $D$ trigger of compare match $A(T O D x y A)$ and compare match $B(T O D x y B)$ can be used as a timer trigger source for DFE. Table 30.121 shows pairs of DFE's timer trigger (compare A0/B0 to A19/B19 from the Timer) and compare match A / compare match B.

Table 30.121 Timer D to DFE Timer Trigger Pair Table (1/2)

| Timer D (compare match A, B) | DFE (Timer Trigger) |
| :--- | :--- |
| Timer D0 compare match A (channel 0) | Timer trigger Compare (Compare A0) |
| Timer D0 compare match A (channel 1) | Timer trigger Compare (Compare A1) |
| Timer D0 compare match A (channel 2) | Timer trigger Compare (Compare A2) |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.122 TSTRD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to $\mathrm{SB}_{\mathrm{D}}$ | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, <br>  <br>  <br> always write "0". |
| $\mathrm{SB}_{\mathrm{D}}-1$ to 0 | STRDx | Counter Dx Start |
|  | 0: TCNT1Dx, TCNT2Dx, and DCNTDxy are disabled |  |
| 1: TCNT1Dx, TCNT2Dx, and DCNTDxy are enabled |  |  |
|  | Example: For b0 |  |
| 0: TCNT1D0, TCNT2D0, and DCNTD0y are disabled |  |  |
|  | 1: TCNT1D0, TCNT2D0, and DCNTD0y are enabled |  |

Note: A start bit is provided for each subblock D0 to $\mathrm{DSB}_{\mathrm{D}}-1 .(\mathrm{y}=0,1,2,3$ : Corresponding to Dx 0 to Dx 3 .)

Timer start register (TSTRD) is an 8-bit/16-bit readable/writable register. This register is set to enable or disable two timer counters (TCNT1Dx and TCNT2Dx) and down counters (DCNTDxy) in $\mathrm{SB}_{\mathrm{D}}$ subblocks Dx ( $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ ). When the counter Dx start bit and the TDE bit in the ATU master enable register (ATUENR) are both set to 1 , the counters are started.

TSTRD is initialized to $0000_{\mathrm{H}}$ after reset.

## Counter Dx Start Bit (STRDx)

These bits enable and disable timer counters 1Dx and 2Dx (TCNT1Dx, TCNT2Dx) and down counters (DCNTDxy). When this bit is cleared to 0 , TCNT1Dx, TCNT2Dx, and DCNTDxy stop operation. The counter value is retained while the counter is stopped. When this bit is set to 1 again, the counter is restarted from the value. Note, however, that the counter is cleared if a clear upon match with the upper limit value setting register occurs while operation is stopped. When the count clear signal is input from timer B , the counter is cleared when restarting operation at C1CEDx in TCRDx or the C2CEDx bit is effective.

Even if the counter D start bit is set to 1 , counting does not start unless the timer D enable bit (TDE) is set to 1 by the ATU master enable register (ATUENR).

## CAUTION

The prescalers run independently of the setting of the STRDx bit and are not initialized at the start of TCNT1Dx and TCNT2Dx. Therefore, during the time between the activation and the start of actual count operation by the above counters, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

### 30.8.2.2 TCRDx — Timer Control Registers Dx

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 30.123 TCRDx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | - | This bit is not used. When this bit is read, "0" is always returned. When writing, always write "0". |
| 14 | OBREDx | Timer Offset Base Register Enable <br> Enables and disables input capture to the offset base register. |
| 13 | C2CEDx | Counter 2 Clear Enable <br> Enables and disables a timer counter 2 clearing request from timer $B$. |
| 12 | C1CEDx | Counter 1 Clear Enable <br> Enables and disables a timer counter 1 clearing request from timer B. |
| 11 | CLR2Dx | TCNT2Dx Clear Setting <br> Enables and disables clearing the timer counter at CUCR2Dx and TCNT2Dx are identical. |
| 10 to 8 | CKSEL2Dx[2:0] | TCNT2Dx Clock Select <br> These bits select the TCNT2Dx counting-up clock from clock-bus lines 0 to 5 . |
| 7 | CLR1Dx | TCNT1Dx Clear Setting <br> Enables and disables clearing the timer counter at CUCR1Dx and TCNT1Dx are identical. |
| 6 to 4 | CKSEL1Dx[2:0] | TCNT1Dx Clock Select <br> These bits select the TCNT1Dx counting-up clock from clock-bus lines 0 to 5 . |
| 3 | - | This bit is not used. When this bit is read, " 0 " is always returned. When writing, always write "0". |
| 2 to 0 | DCSELDx[2:0] | DCNTDxy Clock Select <br> These bits select the DCNTDxy counting-down clock from clock-bus lines 0 to 5 . |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
Timer control registers $\operatorname{Dx}(T C R D x)$ are 8-bit or 16-bit readable/writable registers that select the counter clocks in subblock Dx for 32-bit timer counter 1 (TCNT1Dx), 32-bit timer counter 2 (TCNT2Dx), and 32-bit timer down counter (DCNTDxy) from clock-bus lines 0 to 5 . These registers also enable and disable capture of the timer offset base register, counter clearing requests from timer B for TCNT1Dx and TCNT2Dx, and clearing timer counters 1D
(TCNT1Dx) and 2D (TCNT2Dx).

## Offset Base Register Enable (OBREDx)

This register enables and disables input capture to offset base register (OSBRDx). When this bit is set to 1 , the value in TCNT1Dx is captured by OSBRDx in the PCLK cycles following cycles in which the input signal selected by the TICTSELDx register is asserted. When the pulse width of the event 2A or 2B signal from timer A exceeds one cycle of the PCLK, the counter value is captured every clock cycle.

| OBREDx | Function |  |
| :--- | :--- | :--- |
| 0 | Input capture by OSBRDx is enabled |  |
| 1 | Input capture by OSBRDx is disabled | (Default) |
| Note: $x=0$ to SB $_{D}-1:$ Corresponding to subblocks $D 0$ to DSB $_{D}-1$ |  |  |

## Counter 2 Clear Enable (C2CEDx)

Enables and disables clearing the counter value in TCNT2Dx by timer B.
When an edge of the counter clearing signal output from timer B is detected while this bit is set to 1 , TCNT2Dx is cleared $\left(00000000_{\mathrm{H}}\right)$ in the following timing.

When the rising edge of the clearing signal is detected in the cycle in which TCNT2Dx is counted up, the counter is cleared on the counting up timing. When the rising edge of the clearing signal is detected in other than the TCNT2Dx counting-up cycle, the counter is cleared on the first counting up timing after edge detection. In other words, the request for clearing remains in place from the rising edge of the counter-clearing signal from timer B until completion of the first clock cycle to drive counting up. Even if C2CEDx is changed to 0 during this period of retention, and even if timer D is disabled and the clock is stopped, the request for clearing remains in place.

The counter clearing signal is ignored with this bit set to the initial value.

| C2CEDx | Function |  |
| :--- | :--- | :--- |
| 0 | TCNT2Dx clearing signal from timer B is disabled | (Default) |
| 1 | TCNT2Dx clearing signal from timer B is enabled |  |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$.

## Counter 1 Clear Enable (C1CEDx)

Enables and disables clearing the value in TCNT1Dx by timer B.
When an edge of the counter clearing signal output from timer B is detected while this bit is set to 1 , TCNT1Dx is cleared $\left(00000000_{\mathrm{H}}\right)$ in the following timing.

When the rising edge of the clearing signal is detected in the cycle in which TCNT1Dx is counted up, the counter is cleared on the counting up timing. When the rising edge of the clearing signal is detected in other than the TCNT1Dx counting-up cycle, the counter is cleared on the first counting up timing after edge detection. In other words, the clear request is held from the rising of the counter clear signal from timer B to the first count-up clock. The clear request is held during this period, even if C1CEDx is set to " 0 " or if timer D is disabled and the clock is stopped.

The counter clearing signal is ignored with this bit set to the initial value.

| C1CEDx | Function |  |
| :--- | :--- | :--- |
| 0 | TCNT1Dx clearing signal from timer B is disabled | (Default) |
| 1 | TCNT1Dx clearing signal from timer B is enabled |  |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

## TCNT2Dx Clear 2Dx (CLR2Dx)

Setting the TCNT2Dx clear 2Dx bit to 1 clears $\left(00000000_{H}\right)$ the TCNT2Dx value at the first clock after a compare match between timer counter 2Dx (TCNT2D) and counter upper-limit setting compare register 2Dx (CUCR2Dx). During count operation, a compare match occurs and continues counting even after it is cleared.

| CLR2Dx | Function | (Default) |
| :--- | :--- | :--- |
| 0 | CUCR2Dx compare match is not used to clear the TCNT2Dx value. |  |
| 1 | CUCR2Dx compare match is used to clear the TCNT2Dx value. |  |

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
TCNT2Dx Clock Select (CKSEL2Dx[2:0])
These bits select the TCNT2Dx counting-up clock.

| CKSEL2Dx |  |  |  |
| :--- | :--- | :--- | :--- |
| $[2]$ | $[1]$ | $[0]$ |  |
| 0 | 0 | 0 | Incrementation of TCNT2Dx is driven by clock-bus line 0. |
| 0 | 0 | 1 | Incrementation of TCNT2Dx is driven by clock-bus line 1. |
| 0 | 1 | 0 | Incrementation of TCNT2Dx is driven by clock-bus line 2. |
| 0 | 1 | 1 | Incrementation of TCNT2Dx is driven by clock-bus line 3. |
| 1 | 0 | 0 | Incrementation of TCNT2Dx is driven by clock-bus line 4. |
| 1 | 0 | 1 | Incrementation of TCNT2Dx is driven by clock-bus line 5. |
| 1 | 1 | 0 | Setting prohibited |
| 1 | 1 | 1 | Setting prohibited |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

## TCNT1Dx Clear 1Dx (CLR1Dx)

The TCNT1Dx value is cleared to $00000000_{\mathrm{H}}$ by setting the TCNT1Dx clear 1Dx bit to 1 at the first clock after a compare match between timer counter 1Dx (TCNT1Dx) and counter upper-limit setting compare register 1Dx (CUCR1Dx). During count operation, a compare match occurs and continues counting even after it is cleared.

| CLR1Dx | Function |  |
| :--- | :--- | :--- |
| 0 | CUCR1Dx compare match is not used to clear the TCNT1Dx value. | (Default) |
| 1 | CUCR1Dx compare match is used to clear the TCNT1Dx value. |  |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{D}}-1:$ Corresponding to subblocks D0 to $\mathrm{DSB}_{D-1}$ |  |  |

## TCNT1Dx Clock Select (CKSEL1Dx[2:0])

These bits select the TCNT1Dx counting-up clock.

| CKSEL1Dx |  |  |  |
| :--- | :--- | :--- | :--- |
| $[2]$ | $[1]$ | $[0]$ |  |
| 0 | 0 | 0 | Incrementation of TCNT1Dx is driven by clock-bus line 0. |
| 0 | 0 | 1 | Incrementation of TCNT1Dx is driven by clock-bus line 1. |
| 0 | 1 | 0 | Incrementation of TCNT1Dx is driven by clock-bus line 2. |
| 0 | 1 | 1 | Incrementation of TCNT1Dx is driven by clock-bus line 3. |
| 1 | 0 | 0 | Incrementation of TCNT1Dx is driven by clock-bus line 4. |
| 1 | 0 | 1 | Incrementation of TCNT1Dx is driven by clock-bus line 5. |
| 1 | 1 | 0 | Setting prohibited |
| 1 | 1 | 1 | Setting prohibited |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}-1}$ : Corresponding to subblocks DO to $\mathrm{DSB}_{\mathrm{D}-1}$
DCNTDxy Clock Select (DCSELDx[2:0])
These bits select the clock signal to drive counting down by the 32-bit down counter (DCNTDxy) of the Dx sub-block.

| DCSELDx |  |  |  |
| :--- | :--- | :--- | :--- |
| $[2]$ | $[1]$ | $[0]$ |  |
| 0 | 0 | 0 | Decrementation of DCNTDxy is driven by clock-bus line 0. |
| 0 | 0 | 1 | Decrementation of DCNTDxy is driven by clock-bus line 1. |
| 0 | 1 | 0 | Decrementation of DCNTDxy is driven by clock-bus line 2. |
| 0 | 1 | 1 | Decrementation of DCNTDxy is driven by clock-bus line 3. |
| 1 | 0 | 0 | Decrementation of DCNTDxy is driven by clock-bus line 4. |
| 1 | 0 | 1 | Decrementation of DCNTDxy is driven by clock-bus line 5. |
| 1 | 1 | 0 | Setting prohibited |
| 1 | 1 | 1 | Setting prohibited |

Note 1: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$
Note 2: $y=0,1,2,3$ : Corresponding to channels 0 to 3 in subblock Dx. Channels 0 to 3 of a subblock share a common counter clock.
Output of one-shot pulse (TODxyB) is synchronized with the clock selected in these bits.

### 30.8.2.3 TCCRLRDx - Timer Compare Control Register Dx

Value after reset: $\quad 0000_{H}$

Table 30.124 TCCRLRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 10 | - | These bits are not used. When these bits are read, "0" is always returned. When writing, <br> always write "0". |
| 9 | CLRSEL2Dx | TCNT2Dx clear timing select bit |
|  |  | Select the timing for clearing TCNT2Dx. |
|  | 0: Clear in sync with PCLK (equivalent to ATU-IV) |  |
|  |  | 1: Clear in sync with the count clock |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
The timer compare control register Dx (TCCRLRDx) is an 8-bit/16-bit readable/writable register.
This register specifies the timing for clearing the timer counters 1Dx/2Dx (TCNT1Dx and TCNT2Dx) and the timer counters (TCNT1Dx and TCNT2Dx) to be compared with the output compare registers 1Dxy/2Dxy (OCR1Dxy and OCR2Dxy).

TCCRLRDx is initialized to $0000_{\mathrm{H}}$ after reset.

## TCNT2Dx Clear Timing Select Bit (CLRSEL2Dx)

Selects the timing for clearing the timer counter 2Dx (TCNT2Dx) after occurrence of compare match between the timer counter 2Dx (TCNT2Dx) and the counter upper limit value setting compare register (CUCR2Dx).

| CLRSEL2Dx | Function |  | (Default) |
| :--- | :--- | :--- | :--- |
| 0 | Clear in sync with PCLK (equivalent to ATU-IV) |  |  |
| 1 | Clear in sync with the count clock |  |  |

Note: $x=0$ to $S B B_{D}-1$. Corresponding to subblocks $D 0$ to $D S B_{D}-1$.

If CLRSEL2Dx $=0$, the cleared value of the timer counter 2Dx (TCNT2Dx) after occurrence of compare match between TCNT2Dx and the counter upper limit value setting compare register (CUCR2Dx) may differ. TCNT2Dx is cleared to 0 when the division ratio of the count clock is 2 or greater, while it is cleared to 1 when the division ratio is 1 . If CLRSEL2Dx $=1$, TCNT2Dx is cleared to 0 when spite of the division ratio of the count clock is 1 .

## TCNT1Dx Clear Timing Select Bit (CLRSEL1Dx)

Selects the timing for clearing the timer counter 1Dx (TCNT1Dx) after occurrence of compare match between the timer counter 1Dx (TCNT1Dx) and the counter upper limit value setting compare register (CUCR1Dx).

| CLRSEL1Dx | Function |  |
| :--- | :--- | :--- |
| 0 | Clear in sync with PCLK (equivalent to ATU-IV) | (Default) |
| 1 | Clear in sync with the count clock |  |
| Note: $x=0$ to $\mathrm{SB}_{D}-1$. Corresponding to subblocks D0 to $\mathrm{DSB}_{D}-1$. |  |  |

If CLRSEL1Dx $=0$, the cleared value of the timer counter 1Dx (TCNT1Dx) after occurrence of compare match between TCNT1Dx and the counter upper limit value setting compare register (CUCR1Dx) may differ. TCNT1Dx is cleared to 0 when the division ratio of the count clock is 2 or greater, while it is cleared to 1 when the division ratio is 1 . If CLRSEL1Dx $=1$, TCNT1Dx is cleared to 0 when spite of the division ratio of the count clock is 1 .

## Compare Match B Select Bit (CMPSEL2Dxy)

Selects the timer counter (TCNT1Dx or TCNT2Dx) to be compared with the output compare register 2Dxy (OCR2Dxy).

| CMPSEL2Dxy | Function | (Default) |
| :--- | :--- | :--- |
| 0 | Compare with TCNT2Dx |  |
| 1 | Compare with TCNT1Dx |  |
| Note: $x=0$ to SB $_{D}-1$. Corresponding to subblocks D0 to DSB ${ }_{D}-1$. |  |  |

## Compare Match A Select Bit (CMPSEL1Dxy)

Selects the timer counter (TCNT1Dx or TCNT2Dx) to be compared with the output compare register 1Dx (OCR1Dx).

| CMPSEL1Dxy | Function |  |
| :--- | :--- | :--- |
| 0 | Compare with TCNT1Dx | (Default) |
| 1 | Compare with TCNT2Dx |  |

Note: $x=0$ to $S B B_{D}-1$. Corresponding to subblocks $D 0$ to $D_{S B}-1$.

### 30.8.2.4 TIOR1Dx - Timer I/O Control Registers 1Dx

Value after reset: $\quad 0000_{H}$

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$
Table 30.125 TIOR1Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 8 | OSSDx3-Dx0 | Compare match output source select <br>  <br>  <br> 7 to 0 |
|  | IOADx3-IOADx0 bits select the output level on the compare match output pin (TODxyA). The output is |  |
|  |  | I/O controlled by compare match A, compare match B, or both matches. |

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The timer I/O control registers 1Dx (TIOR1Dx) are 8-bit/16-bit readable/writable registers.
TIOR1Dx selects the source of compare match output (TODxyA), enable and disable compare match of OCRDxy, and set the output level on pin TODxA on compare match A.

TIOR1Dx is initialized to $0000_{\mathrm{H}}$ after reset.

Compare Match Output Source Select (OSSDxy[1:0])

| OSSDxy |  |  |
| :--- | :--- | :--- |
| $[1]$ | $[0]$ |  |
| 0 | 0 | No TODxyA pin output |
| 0 | 1 | Output level on TODxyA depends on the I/O control bit A on compare match A |
| 1 | 0 | Output level on TODxyA depends on the I/O control bit B on compare match B |
| 1 | 1 | Output level on TODxyA depends on the I/O control bit A or B on compare match A respectively |

Note: $x=0$ to $S B_{D}-1, y=0,1,2,3$

These bits select the output level on the compare match output pin (TODxyA). The output is controlled by compare match A , compare match B , or both matches.

Either of compare matches A and B is used as a start/stop trigger of timer down counter D (DCNTDxy), and the other one is used as a trigger of compare match output. In addition, both of compare matches A and B are used to control the output, with one as a trigger of an assertion of the output and the other as a trigger of a negation of the output, enabling a one-shot pulse to be output from pin TODxyA.

When both matches are used as a trigger of the output and they occur at the same time, priority is given to compare match B and the output level depends on the IOBxy bit in TIOR2Dx.

A level of 0 is output on TODxyA as a default. While these bits are set to " 00 ", the output level on TODxyA is not changed even if compare match A or B occurs.

## I/O Control A (IOADxy[1:0])

| IOADxy |  |  |
| :--- | :--- | :--- |
| $[1]$ | $[0]$ | Function |
| 0 | 0 | Compare match $A$ is disabled |
| 0 | 1 | Output level on compare match $A$ is 0 |
| 1 | 0 | Output level on compare match $A$ is 1 |
| 1 | 1 | Output level on compare match $A$ is toggled |

Note: $x=0$ to $S B_{D}-1, y=0,1,2,3$
These bits select the function of the output compare register (OCR1Dxy). When these bits are set to 00B, compare match between OCR1Dxy and timer counter (TCNT1Dx or TCNT2Dx) is not performed. Otherwise, the compare match is performed. An interrupt request is issued on compare match.
When a compare match occurs, if the compare match A is selected as the output source by the compare match output source select bit (OSSDxy) or by the timer compare match control register (TCMPED) and timer I/O control register (TIORDx), the compare match output value set by IOADxy is output to the TODxyA pin (in subblocks D0 to DSB $\mathrm{D}_{\mathrm{D}}-1$ ). See the tables below for correspondence between the I/O control bit A (IOADxy), timer compare match control register (TCMPED), and timer I/O control register (TIORDx).
$\ll$ TCMPED and TIORDx when TIOR1Dx is written>>

| Written to: | Applied to: |  |  |
| :--- | :--- | :--- | :--- |
| TIOR1Dx.IOADxy[1:0] | TCMPED.CMPE1Dx | TIORDx.IO1Dxy[1:0] | Operation |
| 00 | 0 | Value held | Compare match is disabled |
| 01 | 1 | 01 | Output level on compare match is 0 |
| 10 | 1 | 10 | Output level on compare match is 1 |
| 11 | 1 | 11 | Output level on compare match is <br> toggled |

$\ll$ TIOR1Dx when TCMPED or TIORDx is written>>

| 0 | Xx*1 | 00 | Compare match is disabled |
| 1 | $00 * 2$ | 11 | Output level on compare match is <br> toggled |
| 1 | 01 | 01 | Output level on compare match is 0 |
| 1 | 10 | 10 | Output level on compare match is 1 |
| 1 | 11 | 11 | Output level on compare match is <br> toggled |

Note 1. The written value is held. "11" is returned when read.
Note 2. If " 00 " is attempted to be written, the writing in value is " 00 ", but the read value is " 11 ".

### 30.8.2.5 TIOR2Dx - Timer I/O Control Register 2Dx

Value after reset: $\quad 0000 \mathrm{H}$

Table 30.126 TIOR2Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,11 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, |
| 7,3 |  | always write " 0 ". |
| $14-12,10-8$ | IOBDx3-IOBDx0 | I/O control B |
| $6-4,2-0$ |  | Sets permission/prohibition of the output compare register (OCR2Dxy), and the compare <br>  <br>  <br>  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1 . \mathrm{y}=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer I/O control register 2Dx (TIOR2Dx) is an 8-bit/16-bit readable/writable register.
This register can function as capture or output compare registers (OCR2Dxy). TIOR2Dx also enables and disables compare match and set the output level on pin TODxA on compare match.

TIOR2Dx is initialized to $0000_{\mathrm{H}}$ after reset.

## I/O Control B (IOBDxy[2:0])

| IOBDxy |  |  | Function |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| [2] | [1] | [0] |  |  |  |
| 0 | 0 | 0 | Selects compare match output of OCR2Dxy. | Compare match B is disabled | (Default) |
| 0 | 0 | 1 |  | Output level on compare match B is 0 |  |
| 0 | 1 | 0 |  | Output level on compare match B is 1 |  |
| 0 | 1 | 1 |  | Output level on compare match B is toggled |  |
| 1 | 0 | 0 | Setting prohibited | Setting prohibited |  |
| 1 | 0 | 1 |  | Setting prohibited |  |
| 1 | 1 | 0 |  | Setting prohibited |  |
| 1 | 1 | 1 |  | Setting prohibited |  |

Note: $x=0$ to $S B_{D}-1, y=0,1,2,3$

These bits enable and disable of compare match of the output compare register 2Dxy (OCR2Dxy) and select the TODxA pin output value on the compare match B.

When TIOR2Dx is used as the compare match register (IOBDxy[2] $=0$ ) and the IOBDxy[1:0] bits are set to 00B, compare match between GRDxy and timer counter (TCNT1Dx or TCNT2Dx) is not performed. Otherwise, the compare match is performed. At this time, an interrupt request is issued to CPU by compare match.
When a compare match occurs, if the compare match B is selected as the output source by the compare match output source select bit (OSSDxy), the compare match output value set by IOBDxy or by the timer compare match control register (TCMPED) and the timer I/O control register (TIORDx) is output to the TODxyA pin. See the tables below for correspondence between the I/O control bit B (IOBDxy), timer compare match control register (TCMPED), and timer I/O control register (TIORDx).
<<TCMPED and TIORDx when TIOR2Dx is written>>

| Written to: | Applied to: |  |  |
| :--- | :--- | :--- | :--- |
| TIOR2Dx.IOBDxy[2:0] | TCMPED.CMPE2Dx | TIORDx.IO2Dxy[1:0] | Operation |
| 000 | 0 | Value held | Compare match is disabled |
| 001 | 1 | 01 | Output level on compare match is 0 |
| 010 | 1 | 10 | Output level on compare match is 1 |
| 011 | 1 | 11 | Output level on compare match is <br> toggled |
| $1 \times x * 1$ | 0 | Value held | Compare match is disabled |

Note 1. "1xx" Indicates 100, 101, 110, 111.
$\ll$ TIOR2Dx when TCMPED or TIORDx is written>>

| :--- | :--- | :--- | :--- |
| TCMPED.CMPE2Dx | TIORDx.IO2Dxy[1:0] | TIOR2Dx.IOBDxy[2:0] | Operation |
| 0 | $x x x^{* 1}$ | 000 | Compare match is disabled |
| 1 | $00 * 2$ | 011 | Output level on compare match is <br> toggled |
| 1 | 01 | 001 | Output level on compare match is 0 |
| 1 | 10 | 010 | Output level on compare match is 1 |
| 1 | 11 | 011 | Output level on compare match is <br> toggled |

Note 1. The written value is held. If " 00 " is attempted to be written, " 11 " is returned when read.
Note 2. If " 00 " is attempted to be written, the writing in value is " 00 ", but the read value is " 11 ".

### 30.8.2.6 TCMPEDx - Timer Compare Match Control Register Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CMPE2Dx3 | CMPE2Dx2 | CMPE2Dx1 | CMPE2Dx0 | CMPE1Dx3 | CMPE1Dx2 | CMPE1Dx1 | CMPE1Dx0 |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.127 TCMPEDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | CMPE2Dx3-Dx0 | Select counter B compare match control bit |
|  |  | Controls compare match with Select counter B |
|  | $0:$ Disable compare match |  |
|  | 1: Enable compare match |  |
| 3 to0 | CMPE1Dx3-Dx0 | Select counter A compare match control bit |
|  | Controls compare match with Select counter A |  |
|  | $0:$ Disable compare match |  |
|  | 1: Enable compare match |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer compare match control register Dx (TCMPEDx) is an 8-bit readable/writable register.
This register controls the compare match with TCNT1Dx and TCNT2Dx. The output compare register selected by TCCRLRDx.CMPSEL1Dxy and TCCRLRDx.CMPSEL2Dxy will be compared. The setting in this register is reflected to the TIOR1Dx and TIOR2Dx registers. The setting in the TIOR1Dx and TIOR2Dx registers is reflected to this register. For details about how the setting is reflected, see the description about the $\mathrm{I} / \mathrm{O}$ control bit A (IOADxy[1:0]) of the timer I/O control register 1Dx (TIOR1Dx) and the I/O control bit B (IOBDxy[2:0]) of the timer I/O control register 2Dx (TIOR2Dx).

TCMPEDx is initialized to $00_{\mathrm{H}}$ after reset.

### 30.8.2.7 TIORDx - Timer I/O Control Register Dx

Value after reset: FFFFH

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.128 TIORDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 8 | IO2Dx3 to Dx0 | TCNT2D compare match output value |
|  |  | Controls the TCNT2Dx compare match output |
|  | 00: Setting prohibited |  |
|  | 01: Output 0 |  |
|  | 10: Output 1 |  |
| 7 to 0 | IO1Dx3-Dx0 | 11: Toggle output |
|  |  | Controls the TCNT1Dx compare match output |
|  | $00:$ Setting prohibited |  |
|  |  | 01: Output 0 |
|  | 10: Output 1 |  |
|  |  | 11: Toggle output |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer I/O control register Dx (TIORDx) is an 8-bit/16-bit readable/writable register.
This register control the TCNT1Dx and TCNT2Dx compare match output values. The setting of this register is valid when compare match is enabled by the TCMPEDx register. When compare match is enabled by the TCMPEDx register, the setting in this register is reflected to the TIOR1Dx and TIOR2Dx registers. The setting in the TIOR1Dx and TIOR2Dx registers is reflected to this register. For details about how the setting is reflected, see the description about the I/O control bit A (IOADxy[1:0]) of the timer I/O control register 1Dx (TIOR1Dx) and the I/O control bit B (IOBDxy[2:0]) of the timer I/O control register 2Dx (TIOR2Dx).

TIORDx is initialized to $\mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.8.2.8 OSELRDx — Output Select Register Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OSELBDx3 | OSELBDx2 | OSELBDx1 | OSELBDx0 | OSELADx3 | OSELADx2 | OSELADx1 | OSELADx0 |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.129 OSELRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | OSELBDxy | Output selection B |
|  |  | 0: TODxyB provides normal output. |
|  | 1: TODxyB provides the value of the output value register. |  |
| 3 to 0 | OSELADxy | Output selection A |
|  | 0: TODxyA provides normal output. |  |
|  | 1: TODxyA provides the value of the output value register. |  |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The output selection register Dx (OSELRDx) is an 8-bit readable/writable register.
It determines whether to output the value of output value register from the pins (TODxyA and TODxyB).
OSELRDx is initialized to $00_{\mathrm{H}}$ after reset.

## Output Selection Bits A (B) xy (OSELA (B) Dxy)

Writing 1 to this bit outputs the value of the output value register to TODxyA (or TODxyB) pin. Setting of the timer I/O control register D (TIOR1Dx and TIOR2Dx), setting of the timer output control register D (TOCRDx), or one-shot pulse output by the timer down-counter Dxy has no effect on the output value.

When this bit is set to 0 , the TODxyA pin outputs according to the settings of the timer I/O control register D (TIOR1Dx and TIOR2Dx), and settings of the one-shot pulse output by the timer output control register D (TOCRDx).

A glitch may be generated if a change in normal output on TODxyA (or TODxyB) coincides with the setting of this bit. Do not write a new value to the bit if the counter value is in the vicinity of that which leads to a match in comparison.

### 30.8.2.9 ODRDx — Output Value Register Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ODBDx3 | ODBDx2 | ODBDx1 | ODBDx0 | ODADx3 | ODADx2 | ODADx1 | ODADx0 |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.130 ODRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | ODBDxy | Output value B <br> Sets the value to be output to TODxyB. |
| 3 to 0 | ODADxy | Output value A <br> Sets the value to be output to TODxyA. |

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The output value register $\operatorname{Dx}(O D R D x)$ is an 8 -bit readable/writable register.
When a bit of the output selection register Dx (OSELRDx) is set to 1 , the corresponding ODRDx value is issued from respective pins (TODxyA and TODxyB).

ODRDx is initialized to $00_{\mathrm{H}}$ after reset.

### 30.8.2.10 DSTRDx — Down Counter Start Register Dx

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | DSTDx3 | DSTDx2 | DSTDx1 | DSTDx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.131 DSTRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, <br> always write " 0 ". |
| 3 to 0 | DSTDxy*1 | Down Counter Start |
|  | $0:$ No operation |  |
|  |  | 1: Timer down counters (DCNTDx3-Dx0) are started |

Note 1. Value 0 cannot be written. The value is not retained when 1 is written. These bits are always read as 0.
Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The down counter starting register $\mathrm{Dx}(\mathrm{DSTRDx})$ is an 8 -bit writable register.
This register has a start bit for the down counter. Writing " 1 " to a bit starts down counting of the corresponding timer.
DSTRDx is initialized to $00_{\mathrm{H}}$ after reset.

## Down Counter Start Dxy (DSTDxy)

Setting these bits to 1 makes timer down counter Dxy (DCNTDxy) start. The setting in these bits is always valid and regardless of the start trigger setting in the down counter control register. When compare match $B$ and writing 1 to these bits occurs at the same time if the down counter is set so that it is stopped on compare match B (compare match A or B), compare match B (compare match A or B) takes priority and the down counter is not started.

When DCNTDxy $=00000000_{\mathrm{H}}$, writing 1 to these bits has no effect. The DSFDxy bit in the down counter status register 1Dx (DSR1Dx) is retained to " 1 " until the next down counter clock is input. See the description about DSR1Dx described later.

### 30.8.2.11 DSR1Dx — Down Counter Status Registers 1Dx

Value after reset: $\quad 00_{H}$

Table 30.132 DSR1Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | DWFDxy | Down count wait flag |
|  |  | $0:$ Down count compare match start wait status has not occurred. |
|  |  | 1: Down count compare match start wait status has occurred. |
| 3 to 0 | DSFDxy | Down counter status flag |
|  | $0:$ Down counter is disabled |  |
|  |  | 1: Down counter is enabled |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The down count status register 1Dx (DSR1Dx) is an 8-bit read-only register. This register has a flag that indicates the status of the timer down counter (DCNTDxy).

DSR1Dx is initialized to $00_{\mathrm{H}}$ after reset.

## Down Count Wait Flag Dxy (DWFDxy)

These bits are flags that indicate whether timer down count Dxy (DCNTDxy) is in the count start wait status. This flag is valid only when compare match A and B is set for the count start trigger by TRGSELDxy bits in the down counter control register (DCRDx) at DCRDx.TRGSELDxy[3:0] = $0110_{\mathrm{B}}$. This flag is not set to 1 in other settings.

When compare match A and B is set as a count start trigger and DWFDxy is 0 , if compare match A or compare match B occurs, DWFDxy is set to 1 . When a compare match (compare match B if DWFDxy is set to 1 on compare match A) of a source different from setting DWFDxy to 1 occurs, it is recognized as a count start trigger and down-counting starts. At this time, the DWFDxy value is cleared to 0 .

Even when a compare match of the same source as setting DWFDxy to 1 occurs, the DWFDxy value remains 1 and is not recognized as a count start trigger.

If compare match A and compare match B occur simultaneously, it is immediately recognized as a count start trigger. Therefore, this flag does not enter the down count wait status and DWFDxy is not set to 1 .

This flag is read-only flag and cannot be set to 1 or cleared to 0 by the software.

- Setting (to 1 ) condition

When compare match A or compare match B has occurred while TRGSELDxy in the down counter control register Dx (DCRDx) is $0110_{\mathrm{B}}$

- Clearing (to 0 ) condition
- When DWFDxy is set to 1 on compare match A and compare match B has occurred while DWFDxy is 1
- When DWFDxy is set to 1 on compare match B and compare match A has occurred while DWFDxy is 1
- Writing 1 to DWFCDxy in the down count status clear register (DSCRDx)

## Down counter status flag Dxy (DSFDxy)

These bits indicate enabling/disabling of timer down counter Dxy (DCNTDxy). When these bits are read as 1, the counter operation is enabled. If the TDE bit of ATUENR is 1 and the STRDx bit of TSTRD is 1 , the counter is running. When these bits are read as 0 , the counter operation is disabled, so counting cannot be in progress.

This flag is a read-only flag; it cannot be set to 1 or cleared to 0 by software.
When the set/clear condition competed, 0 clear condition is given priority, and DSFDxy will be 0 .

- Setting (to 1 ) condition
- When writing 1 to the down count start bit in the down count starting register (DSTRDx)
- When the condition set as the down counter start trigger is satisfied (compare-match A, compare-match B, compare-match A or B, compare-match A and B)
- Clearing (to 0) condition
- When the down counter is stopped by underflow
- When the condition to stop the down counter (compare match B, compare-match A or B)

These flags are set regardless of the settings of the TDE bit in ATUENR and the STRDx bit in TSTRD. Accordingly, if the TDE bit and the STRDn bit are not set to enable counting, the down counter is not actually running even if these bits indicate that counting is enabled. Clearing proceeds in synchronization with the down-count clock.

## CAUTION

When the value of down counter DCNTDxy is 00000000 H , a trigger to start counting down by the counter being produced by writing 1 to DSTDxy, the bit that starts counting down by the counter, or by a match in compare-match A or B occurring, counting down will not start, although the value of the above counting down status flag (DSFDxy) becomes " 1 " over the period where the clock input to the down counter is " 0 ". The value of DSFDxy returns to " 0 " when the clock input to the down counter becomes " 1 ". If a start trigger is issued through the down-counting start bit or by comparematch A, B over the period where the clock input to the down counter is " 1 ", the value of DSFDxy will remain " 0 ".

### 30.8.2.12 DSR2Dx — Down Count Status Register 2Dx

Value after reset: $\quad 00_{\mathrm{H}}$

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.133 DSR2Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | DWRFDxy[1:0] | 00: No compare match |
|  |  | 01: Down-counting starts on compare match A. |
|  |  | 10: Down-counting starts on compare match B. |
|  | 11: Down-counting starts on simultaneous compare match A and compare match B. |  |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Down count status registers 2Dx (DSR2Dx) are 8-bit read-only registers.
The DWRFDxy register is a flag that indicates the condition for starting count operation of the timer down counter (DCNTDxy).

The status is updated when the timer down counter (DCNTDxy) starts counting.
When the down count start condition is "A and B", the down count start (compare match occurring later) condition is retained in the status register. When down-counting is started by the down count start register Dx (DSTRDx), the status register keeps retaining the previous value.

DSR2Dx is initialized to $00_{\mathrm{H}}$ after reset.

- The condition of the renewal

When a start factor of the down count set as DCRDx.TRGSELDxy (besides setting prohibited) occurred, it's renewed. Further, the condition of DCRDx.TRGSELDxy that DWRFDxy $=11_{\mathrm{B}}$ is set is only when comparing match $\mathrm{A}, \mathrm{B}$ occurred at the same time when establishing one of $0110_{\mathrm{B}}, 1010_{\mathrm{B}}$ and $1011_{\mathrm{B}}$.

When writing 1 in DWRFCDxy of a down count status clear register (DSCRDx), it'll be $00_{\mathrm{B}}$.

- The condition of the state maintenance

When a down count has been begun by DSTRDx, the state is maintained.
The state is maintained in DSR1Dx.DSFDxy $=1$ (A down count is moving.)
When DCRDx.TRGSELDxy is set as setting prohibited, the previous value is maintained.

### 30.8.2.13 DSCRDx — Down Count Status Clear Register Dx

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DWFCDx3 | DWFCDx2 | DWFCDx1 | DWFCDx0 | DWRFCDx3 | DWRFCDx2 | DWRFCDx1 | DWRFCDx0 |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.134 DSCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | DWFCDxy | Down count wait flag clear enable |
|  | 0: Disabled (Default) |  |
|  | 1: DWFDxy in the down count status register 1 (DSR1Dx) is cleared to 0. |  |
| 3 to 0 | DWRFCDxy | Down count wait Record flag clear enable |
|  | $0:$ Disabled (Default) |  |
|  | 1: DWRFDxy in the down count status register 2 (DSR2Dx) is cleared to 0. |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The down count status clear register (DSCRDx) is an 8-bit readable/writable register that sets clearing of the flag for the down count status registers (DSR1Dx and DSR2Dx).

DSCRDx is initialized to $00_{\mathrm{H}}$ after reset.

## Down Count Wait Flag Clear Enable Dxy (DWFCDxy)

These bits set clearing the flag that is set by occurrence of down count wait of the down count status register (DSR1Dx).

Setting each of these bits to 1 clears the down count wait flag (DWFDxy) in the down count status register (DSR1Dx). These bits are always read as 0 .

When DWFDxy in down counter status registers 1Dx (DSR1Dx) sets " 1 " as this bit in case of 1 , the down count WAIT status is cleared.

When " 1 " is set as this bit before compare match A occurs, and compare match B occurs, it's cleared that compare match A occurred.

It'll be similar movement until compare match $B$ occurs, and compare match A occurs.

## Down Count Wait Record Flag Clear Enable Dxy (DWRFCDxy)

These bits set clearing of the flag that is set by occurrence of down count wait of the down count status register (DSR2Dx).

Setting each of these bits to 1 clears the down count wait record flag (DWRFDxy) in the down count status register (DSR2Dx). These bits are always read as 0 .

### 30.8.2.14 DCRDx — Down Counter Control Registers Dx

Table 30.135 DCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $15-12,11-8$ | TRGSELDx3-Dx0 | Down Counter Start/Stop Trigger Select |
| $7-4,3-0$ |  | Compare match A and compare match B can be set as the start or stop condition for counting <br> of the timer down counter (DCNTDxy). |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

Down counter control registers (DCRDx) are 8-bit/16-bit readable/writable registers.
DCRDx starts the timer down counter (DCNTDxy). Besides the down count start by DSTRDx and the down count stop condition when DCNTDx counted a down, and it was $0000 \_0000_{\mathrm{H}}$, Compare match A, compare match B, compare match A or B, or compare match A and B can be set as a starting or stopping trigger of timer down counters
(DCNTDxy).
DCRDx is initialized to $0000_{\mathrm{H}}$ after reset.
To change the TRGSELDx bit, stop the counter. Otherwise operation cannot be guaranteed.

Down Counter Start/Stop Trigger Select Dxy (TRGSELDxy)

| TRGSELDxy |  |  | Function |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $[3]$ | $[2]$ | $[1]$ | $[0]$ | Counter start trigger | Counter stop trigger |  |
| 0 | 0 | 0 | 0 | No trigger | No trigger | (Default) |
| 0 | 0 | 0 | 1 | No trigger | No trigger |  |
| 0 | 0 | 1 | 0 | Compare match A | Compare match B |  |
| 0 | 0 | 1 | 1 | Compare match A | No trigger |  |
| 0 | 1 | 0 | 0 | Compare match B |  |  |
| 0 | 1 | 0 | 1 | Setting prohibited | No trigger |  |
| 0 | 1 | 1 | 0 | Compare match A and B |  |  |
| 0 | 1 | 1 | 1 | Setting prohibited | No trigger |  |
| 1 | 0 | 0 | 0 | No trigger | No trigger |  |
| 1 | 0 | 0 | 1 | No trigger | Compare match A or B |  |
| 1 | 0 | 1 | 0 | Compare match A or B |  |  |
| 1 | 0 | 1 | 1 | Compare match A or B |  |  |
| 1 | 1 | 0 | 0 | Setting prohibited |  |  |
| 1 | 1 | 0 | 1 | Setting prohibited |  |  |
| 1 | 1 | 1 | 0 | Setting prohibited |  |  |
| 1 | 1 | 1 | 1 | Setting prohibited |  |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{o}}-1$ : Corresponding to subblocks $\mathrm{DO}^{\text {to }} \mathrm{DSB}_{\mathrm{o}}-1 . \mathrm{y}=0,1,2,3$ : Corresponding to channels 0 to 3 . "No trigger" of a count start shows a down count start by DSTRDx, and DCNTDxy counts a down, and "No trigger" of a count stop shows the case which became $0000 \_0000_{\text {H. }}$. These factors are relevant to everything's condition besides the setting prohibited.

Besides the down count start by DSTRDx and the down count stop condition when DCNTDx counted a down, and it was $0000 \_0000_{\mathrm{H}}$, the trigger source to start and stop the timer down counter (DCNTDxy) can be selected by these TRGSELDxy bits. Compare-match A, compare-match B, compare-match A or B, or compare-match A and B can be set as a count start trigger. When it's "No trigger", a down count is begun by DSTRDx. Compare match A and B starts down-counting when both compare match A and compare match B are satisfied. (Simultaneous occurrence of compare match A and compare match B is not necessary.)

Compare-match B, compare-match A or B, or compare-match A and B can be set as a count stop trigger. DCNTDxy counts a down in case of "No trigger", and when it was $0000 \_0000_{\mathrm{H}}$, a trigger of a count stop occurs.

If the source of down counter start trigger and the source of down counter stop trigger occur simultaneously, the down counting is stopped.

A signal from compare-match A or B acts as a stop-trigger and as a start-trigger for counting when the setting of TRGSELDxy is $1011_{\mathrm{B}}$. Specifically, a trigger generated while down counting is stopped acts as a start trigger and a trigger generated while down counting is in progress acts as a stop trigger. It can be judged in DSR1Dx.DSFDxy whether a down count is moving.

## CAUTION

When an underflow and compare match A occur simultaneously while TRGSELDxy is 1010 B , an underflow interrupt is not generated and the underflow flag is not set to 1 . When a count start trigger and a compare match A occur simultaneously when the timer downcounter Dxy (DCNTDxy) stops with 0000 0000H while TRGSELDxy is 1010 B , an underflow interrupt is not generated and the underflow flag is not set to 1.

In this case, to execute software processing for underflow occurrence, write the underflow interrupt flag to 1 (EICn.EIRFn $=1$ ) only when the down counter is stopped (DSR1Dx.DSFDxy $=0$ ) and the underflow interrupt flag of the interrupt controller is 0 (EICn.EIRFn = 0 ).

### 30.8.2.15 TSRDx — Timer Status Registers Dx

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | $\begin{gathered} \text { OVF2D } \\ x \end{gathered}$ | $\underset{x}{\text { OVF1D }}$ | $\begin{array}{\|c} \text { UDFDx } \\ 3 \end{array}$ | $\begin{array}{\|c} \text { UDFDx } \\ 2 \end{array}$ | $\begin{array}{\|c} \text { UDFDx } \\ 1 \end{array}$ | $\begin{gathered} \text { UDFDx } \\ 0 \end{gathered}$ | $\begin{gathered} \text { CMFAD } \\ \times 3 \end{gathered}$ | $\begin{array}{\|c} \text { CMFAD } \\ \times 2 \end{array}$ | $\begin{gathered} \text { CMFAD } \\ \mathrm{x} 1 \end{gathered}$ | $\begin{gathered} \text { CMFAD } \\ \times 0 \end{gathered}$ | $\begin{gathered} \text { CMFBD } \\ \mathrm{x} 3 \end{gathered}$ | $\begin{array}{\|c} \hline \text { CMFBD } \\ \times 2 \end{array}$ | $\begin{array}{\|c} \text { CMFBD } \\ \times 1 \end{array}$ | $\begin{array}{\|c} \hline \text { CMFBD } \\ \times 0 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.136 TSRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | - | These bits are not used. When these bits are read, "0" is always returned. When writing, <br> always write "0". |
| 13 | OVF2Dx | Overflow flag 2Dx |
|  |  | 0: TCNT2Dx has not overflowed |
|  | 1: TCNT2Dx has overflowed |  |
| 12 | OVF1Dx | Overflow flag 1Dx |
|  |  | 0: TCNT1Dx has not overflowed |
|  |  | 1: TCNT1Dx has overflowed |
| 11 to 8 | UDFDx3 to UDFDx0 | Underflow flag Dx3 to Dx0 |
|  |  | 0: DCNTDxy has not underflowed |
|  |  | 1: DCNTDxy has underflowed |
| 7 to 4 | CMFADx3 to | Compare match A flag Dx3 to Dx0 |
|  | CMFADx0 | 0: Compare match A has not occurred |
|  |  | 1: Compare match A has occurred |
| 3 to 0 | CMFBDx3 to | Compare match B flag Dx3 to Dx0 |
|  | CMFBDx0 | 0: Compare match B has not occurred |
|  |  | 1: Compare match B has occurred |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The timer status register (TSRDx) is an 8-bit/16-bit read-only register. This register indicates overflow of two timer counters (TCNT2Dx and TCNT1Dx) of subblock $\mathrm{Dx}\left(\mathrm{x}=0\right.$ to $\mathrm{SB}_{\mathrm{D}}-1$ ), underflow of the timer down counters (DCNTDxy) of channels 0 to 3, and compare match of the output compare registers (OCRD1xy and OCR2Dxy). If an interrupt source takes effect when this flag is set, an interrupt request is made again. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

Overflow flags 2 and 1 as well as underflow flags and compare match flags A and B can be cleared by setting the corresponding bits of the timer status clear register (TSCRDx).

TSRDx is initialized to $0000_{\mathrm{H}}$ after reset.

## Overflow Flag 2Dx (OVF2Dx)

| OVF2Dx | Function | (Default) |
| :--- | :--- | :--- |
| 0 | [Clearing condition] |  |
| 1 | When 1 is written to the OVFC2Dx bit of the timer status clear register (TSCRDx). |  |
|  | [Setting condition] |  |
|  | When TCNT2Dx overflowed (from FFFF FFFF |  |
|  | When the counter is cleared with the upper-limit setting function enabled |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

Indicates whether or not timer counter 2Dx (TCNT2Dx) has overflowed. If the reading value of this flag is 1 , it means that an overflow in TCNT2Dx has occurred. This flag cannot be set to 1 .

The overflow flag is set when the count-up clock is input while TCNT2Dx is FFFF FFFF $H$ or at the first edge of the PCLK after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. Writing $00000000_{\mathrm{H}}$ to TCNT2Dx or starting TCNT2Dx from an initial value of $00000000_{\mathrm{H}}$ has no effect on this bit.

When writing to TCNT2Dx at the same time as incrementation while it is FFFF FFFF $_{\mathrm{H}}$, this bit is set to 1 . However, TCNT2Dx is updated with the written value, but not $00000000_{\mathrm{H}}$.

When an assertion of counter clearing signal from timer B and overflow due to count up occur, overflow does not occur. Simultaneous occurrence of counter clearing by timer B and counter clearing with the upper-limit setting function enabled is detected as an overflow.

Overflow Flag 1Dx (OVF1Dx)

| OVF1Dx | Function | (Default) |
| :--- | :--- | :--- |
| 0 | [Clearing condition] |  |
| 1 | When 1 is written to the OVFC1Dx bit of the timer status clear register (TSCRDx). |  |
|  | When TCNT1Dx overflowed (from FFFF FFFF ${ }_{H}$ to $00000000_{H}$ ) |  |
|  | When the counter is cleared with the upper-limit setting function enabled |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

Indicates whether or not timer counter 1Dx (TCNT1Dx) has overflowed. If the reading value of this flag is 1 , it means that an overflow in TCNT1Dx has occurred. This flag cannot be set to 1 .

The overflow flag is set when the count-up clock is input while TCNT1Dx is FFFF FFFF ${ }_{H}$ or at the first edge of the PCLK after the counter value matches the upper-limit setting register value with the upper-limit setting function enabled. Writing $00000000_{\mathrm{H}}$ to TCNT1Dx or starting TCNT1Dx from an initial value of $00000000_{\mathrm{H}}$ has no effect on this bit.

When writing to TCNT1Dn at the same time as incrementation while it is FFFF FFFF ${ }_{H}$, this bit is set to 1 . However, TCNT1Dx is updated with the written value, but not $00000000_{\mathrm{H}}$.

When an assertion of counter clearing signal from timer B and an overflow by counting up occur simultaneously, the overflow is not detected. Simultaneous occurrence of counter clearing by timer B and counter clearing with the upperlimit setting function enabled is detected as an overflow.

## Underflow Flag Dxy (UDFDxy)

| UDFDxy | Function | (Default) |
| :--- | :--- | :--- |
| 0 | [Clearing condition] |  |
| 1 | When 1 is written to the UDFCDxy bit of the timer status clear register (TSCRDx). |  |
|  | [Setting condition] |  |
|  | When DCNTDxy underflowed (decremented while DCNTDxy $=00000000_{H}$ ) |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

This flag is a status flag that indicates underflow of subblock Dx and down counter Dxy of channel $y$. If the reading value of this flag is 1 , it means that DCNTDxy had an underflow. This flag cannot be set to 1 .

This bit is set to 1 when DCNTDxy is to be decremented while it is $00000000_{\mathrm{H}}$. DCNTDxy holds $00000000_{\mathrm{H}}$ on underflow. Writing FFFF FFFF H to DCNTDxy has no effect on these bits.

These bits are initialized to 0 after reset. Although DCNTDxy is initialized to $00000000_{\mathrm{H}}$, these flags do not indicate underflow because DCNTDxy has not started. For details on control of DCNTDxy, see descriptions of timer D down counters.

Compare Match A Flag Dxy (CMFADxy)

| CMFADxy | Function |  |
| :---: | :---: | :---: |
| 0 | [Clearing condition] | (Default) |
|  | When 1 is written to the CMFCADxy bit of the timer status clear register (TSCRDx). |  |
| 1 | [Setting condition] |  |
|  | The thing set as all except for $00_{\mathrm{B}}$ (comparing match A permission) does a set of TIOR1Dx.IOADxy in the following case by the precondition. |  |
|  | - When the value of the select counter A (TCNT1Dx or TCNT2Dx) is match with OCR1Dxy. |  |
|  | - All except for $00_{H}$ is set as the range comparing value setting register 1Dx (RCR1Dx), and when writing in OCR1Dxy, when selection counter A (TCNT1Dx or TCNT2Dx) is in the range set in RCR1Dx. |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

CMFADxy is a status flag that indicates occurrence of a compare match in the output compare register (OCR1Dxy) of channel $y$ in subblock $D x$. If the reading value of this flag is 1 , it means that a compare match occurs between select counter A(TCNT1Dx or TCNT2Dx) and OCR1Dxy or it's meant that it was in the area select counter A (TCNT1Dx or TCNT2Dx) set as the time of write in RCR1Dx or OCR1Dxy. This flag cannot be set to 1 .

When operation of compare match between OCRDxy and select counter A (TCNT1Dx or TCNT2Dx) is enabled by the setting in timer I/O control register 1 (TIOR1Dx), compare match operation is performed regardless of the state of select counter A (TCNT1Dx or TCNT2Dx). Or when select counter A (TCNT1Dx or TCNT2Dx) is in the area set in RCR1Dx at the time of write in OCR1Dxy, a compare match A flag is set by the following PCLK cycle. These bits are set to 1 on the first edge of the PCLK after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR1Dxy match. Even if these compare match flags are cleared to 0 by software while TCNT1Dx $=$ OCR1Dxy after the compare match is detected, these bits are not set to 1 again.

If select counter A (TCNT1Dx or TCNT2Dx) matches OCR1Dxy again before the status flag is cleared, the compare match A is detected and the status flag is rewritten with 1 .

## Compare match B flag Dxy (CMFBDxy)

| CMFBDxy | Function |
| :--- | :--- |
| 0 | [Clearing condition] |
|  | When 1 is written to the CMFCBDxy bit of the timer status clear register (TSCRDx). |
| 1 | [Setting condition] |
|  | The thing set as all except for $00_{B}$ (comparing match B permission) does a set of TIOR2Dx.IOADxy |
| in the following case by the precondition. |  |
|  | • When the value of the select counter B (TCNT1Dx or TCNT2Dx) is match with OCR1Dxy. |
|  | • All except for 00H is set as the range comparing value setting register 2Dx (RCR2Dx), and |
|  | when writing in OCR2Dxy, when selection counter B (TCNT1Dx or TCNT2Dx) is in the range |
|  | set in RCR2Dx. |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

CMFBDxy is a status flag that indicates occurrence of a compare match in the output compare B register (OCBRDxy) of channel $y$ in subblock $D x$. If the reading value of this flag is 1 , it means that a compare match occurs between select counter B(TCNT1Dx or TCNT2Dx) and OCR2Dxy or it's meant that it was in the area select counter B (TCNT1Dx or TCNT2Dx) set as the time of write in RCR2Dx or OCR2Dxy. This flag cannot be set to 1 .

When operation of compare match between OCR2Dxy and select counter B (TCNT1Dx or TCNT2Dx) is enabled by the setting in timer I/O control register 2 (TIOR2Dx), compare match operation is performed regardless of the state of select counter B (TCNT1Dx or TCNT2Dx). Or when select counter B (TCNT1Dx or TCNT2Dx) is in the area set in RCR2Dx at the time of write in OCR2Dxy, a compare match B flag is set by the following PCLK cycle. These bits are set to 1 on the first edge of the PCLK after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR2Dxy match. Even if these compare match flags are cleared to 0 by software while TCNT2Dx $=$ OCR2Dxy after the compare match B is detected, these bits are not set to 1 again.

If select counter B (TCNT1Dx or TCNT2Dx) matches OCR2Dxy again before the status flag is cleared, the compare match B is detected and the status flag is rewritten with 1 .

### 30.8.2.16 TSCRDx — Timer Status Clear Register Dx

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.137 TSCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15,14 | - | These bits are not used. When these bits are read, "0" is always returned. When writing, <br> always write "0". |
| 13 | OVFC2Dx | Overflow flag clear enable 2Dx |
|  |  | 0: Disabled (Default) |
|  | 1: Clears OVF2Dx of timer status register D (TSRDx) to 0. |  |
| 12 | OVFC1Dx | Overflow flag clear enable 1Dx |
|  |  | 0: Disabled (Default) |
|  |  | 1: Clears OVF1Dx of timer status register D (TSRDx) to 0. |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The timer status clear register (TSCRDx) is an 8-bit/16-bit writable register. This register specifies the flag clearing at the time of overflow of two 32-bit up-counters (TCNT2Dx and TCNT1Dx), compare match and the output compare register (OCR1Dxy), and compare match and the output compare register (OCR2Dxy).

TSCRDx is initialized to $0000_{\mathrm{H}}$ after reset.

## Overflow Flag Clear Enable 2Dx (OVFC2Dx)

This bit specifies flag clearing at the time of overflow of the timer counter 2Dx (TCNT2Dx).
Setting this bit enables clearing of the overflow flag 2 (OVF2Dx) of the timer status register (TSRDx). This bit is always read as 0 .

| OVFC2Dx | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears OVF2Dx to 0. |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks DO to $\mathrm{DSB}_{\mathrm{D}}-1$

## Overflow Flag Clear Enable 1Dx (OVFC1Dx)

This bit specifies flag clearing at the time of overflow of the timer counter 1Dx (TCNT1Dx).
Setting this bit enables clearing of overflow flag 1 (OVF1Dx) of the timer status register (TSRDx). This bit is always read as 0 .

| OVFC1Dx | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears OVF1Dx to 0. |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

## Underflow Flag Clear Enable Dxy (UDFCDxy)

This bit specifies flag clearing at the time of underflow of the timer down counter Dxy (DCNTDxy).
Setting this bit enables clearing of the underflow flag (UDFDxy) of the timer status register (TSRDx). This bit is always read as 0 .

| UDFCDxy | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears UDFDxy to 0. |  |
| Note: $x=0$ to $S B_{D}-1:$ Corresponding to subblocks D0 to $\mathrm{DSB}_{\mathrm{D}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |  |

## Compare Match A Flag Clear Enable Dxy (CMFCADxy)

This flag specifies flag clearing at the time of compare match of the output compare register (OCR1Dxy).
Setting this bit enables clearing of the compare match A flag (CMFADxy) of the timer status register (TSRDx). This bit is always read as 0 .

| CMFCADxy | Function |
| :--- | :--- |
| 0 | Disabled |
| 1 | Clears CMFADxy to 0. |
| Note: $x=0$ to SB $_{D}-1:$ Corresponding to subblocks D0 to DSB $_{D}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. | (Default) |

## Compare Match B Flag Clear Enable Dxy (CMFCBDxy)

This flag specifies flag clearing at the time of compare match of the output compare register (OCR2Dxy).
Setting this bit enables clearing of the compare match B flag (CMFBDxy) of the timer status register (TSRDx). This bit is always read as 0 .

| CMEBDxy | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears CMFBDxy to 0. |  |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1 . \mathrm{y}=0,1,2$, 3 : Corresponding to channels 0 to 3 .

### 30.8.2.17 TOCRDx - Timer Output Control Registers Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TONEBDx | TONEADx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.138 TOCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, <br> always write " 0 ". |
| 1 | TONEBDx | Output inversion select TODxyB |
|  | $0:$ Output level is not inverted |  |
|  | 1: Output level is inverted |  |
| 0 | TONEADx | Output inversion select TODxyA |
|  | $0:$ Output level is not inverted |  |
|  |  | $1:$ Output level is inverted |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks D0 to $D_{B B}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer output control register Dx (TOCRDx) is an 8-bit readable/writable register. This register specifies whether to invert signals of the output pins TODxyA and TODxyB of each subblock Dx.

This register is initialized to $00_{\mathrm{H}}$ after reset.

## Output Inversion Select Dx (TONEBDx, TONEADx)

Specifies whether to invert the output from TODxy and TODxyA.

| TONEBDx | Function |  |
| :---: | :---: | :---: |
| 0 | Normal output from the output pin (TODxyB) | (Default) |
| 1 | Inverted output from the output pin (TODxyB) |  |
| Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks D0 to $\mathrm{DSB}_{\mathrm{D}}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 . |  |  |
| TONEADx | Function |  |
| 0 | Normal output from the output pin (TODxyA) | (Default) |
| 1 | Inverted output from the output pin (TODxyA) |  |

Signals on pins TODxyA and TODxyB are inverted on the first edge of the PCLK after the output inversion select Dx bit is set to 1 .

This function is not affected by the operating state of timer counters 1 Dx and 2Dx (TCNT1Dx, TCNT2Dx).
Output levels on pins TODxyA and TODxyB are initialized to a level of 0 (when TONEADx $=0$ and TONEBDx $=0$ ).
A glitch may be generated if a change in normal output on TODxyA (or TODxyB) coincides with the setting of this bit. Do not write a new value to the bit if the counter value is in the vicinity of that which leads to a match in comparison.

### 30.8.2.18 TOCCRDx — Timer Output Channel Control Registers Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TONEBDx3 | TONEBDx2 | TONEBDx1 | TONEBDx0 | TONEADx3 | TONEADx2 | TONEADx1 | TONEADx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.139 TOCCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | TONEBDxy | Channel output inversion select TODxyB |
|  |  | 0: The signal on channel y is output from ODxyB as is (without inversion). |
|  | 1: The signal on channel y is inverted to be output from ODxyB. |  |
| 3 to 0 | TONEADxy | Channel output inversion select TODxyA |
|  | $0:$ The signal on channel y is output from ODxyA as is (without inversion). |  |
|  |  | 1: The signal on channel y is inverted to be output from ODxyA. |

Note: $\quad x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer output channel control register Dx (TOCCRDx) is an 8-bit readable/writable register that specifies whether to invert the signal on each channel before outputting to the TODxyA and TODxyB output pins of each subblock Dx.

This register is initialized to $00_{\mathrm{H}}$ after reset.

## Channel Output Inversion Select Dx (TONEBDx, TONEADx)

Specifies whether to invert the signal on the channel before outputting to TODxyB and TODxyA.

| TONEBDxy | Function |  |
| :--- | :--- | :--- |
| 0 | The signal on channel $y$ is output to TODxyB as is. | (Default) |
| 1 | The signal on channel $y$ is inverted to be output to TODxyB. |  |
| TONEADxy | Function | (Default) |
| 0 | The signal on channel $y$ is output to TODxyA as is. |  |
| 1 | The signal on channel $y$ is inverted to be output to TODxyA. |  |
| Note: $x=0$ to $S B_{D}-1:$ Corresponding to subblocks $D 0$ to $\mathrm{DSB}_{D}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |  |

When the channel output inversion select Dx bit is changed, it is reflected to the logical output of TODxyB and TODxyA in the next PCLK cycle. The logical output of TODxyB and TODxyA is controlled by the timer output control register Dx (TOCRDx) and timer output channel control register Dx (TOCCRDx). The operation status (running or stopping) of the timer counters 1Dx and 2Dx (TCNT1Dx and TCNT2Dx) does not affect the switching of output inversion.

| Setting for subblock | Setting for channel |  |
| :--- | :--- | :--- |
| TOCRDx (0: Normal, 1: inversion) | TOCCRDx (0: Normal, 1: Inversion) |  |
| Normal output | Normal output | Normal output |
|  | Inversion output | Inversion output |
| Inversion output | Normal output |  |
|  | Inversion output |  |

### 30.8.2.19 OSBRDx — Timer Offset Base Registers Dx

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

Timer offset base registers Dx (OSBRDx) are 32-bit read-only registers that are used only for input capture. The timer counter 1Dx (TCNT1Dx) value is captured and stored by a trigger signal from timer A and PH update notification triggers 0 to 1 from DFE. The trigger signal from timer A is selectable from TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$, and the external input signals TID0 and TID1 are selectable with the timer input capture trigger select register (TICTSELDx). For details, see the description of the timer control registers 1A, 3A, and 4A (TCR1A, TCR3A, TCR4A) and the timer input capture trigger select register (TICTSELDx).

This register is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.20 TICTSELDx — Timer Input Capture Trigger Select Register Dx

Value after reset: $\quad 0 X_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | TIDSELDx[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | *1 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Note 1. The value varies depending on the channel to maintain compatibility with the traditional products.

$$

The timer input capture trigger select register Dx (TICTSELDx) is an 8-bit readable/writable register. This register is used to select event 2A or 2B from timer A and external input signals PH update notification trigger 0 and PH update notification trigger 1 from the DFE, and to capture the TCNT1Dx counter value in the OSBRDx register.

Table 30.140 TICTSELDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. Fix these bits to " 0 ". |
| 1,0 | TIDSELDx[1:0] | 00: Event 2A |
|  |  | 01: Event 2B |
|  |  | 10: PH update notification trigger 0 from the DFE |
|  |  | 11: PH update notification trigger 1 from the DFE |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

### 30.8.2.21 TCNT1Dx - Timer Counter 1Dx

Note: $x=0$ to $S B B D_{D-1}$ : Corresponding to subblocks D0 to $D S B_{D}-1$

Timer counters 1Dx (TCNT1Dx) are 32-bit readable/writable registers.
TCNT1Dx is driven by the clock selected in the CKSEL1Dx[2:0] bits in timer control register (TCRDx). These counters are started by setting the bit in timer start register (TSTRD) to 1.

When overflow interrupt request is permitted (TIER1Dx.OV1EDx $=1$ ), an overflow interrupt request can be issued to CPU when the timer overflows.

The overflow flag OVF1Dx of the timer status register (TSRDx) is set to 1 .
When a clear request from timer B made TCRD.C1CEDx effective, and occurred, TCNT1Dx is cleared by $0000 \_0000_{\mathrm{H}}$. But, when competing with writing in to TCNT1Dx, writing in of TCNT1Dx is given priority.

This register is initialized to $00000000_{\mathrm{H}}$ after reset.

- The upper limit value of timer counter 1Dx (TCNT1Dx)

| TCRDx.CLR1Dx | The upper limit value of TCNT1Dx |
| :--- | :--- |
| 0 | FFFF_FFFF $_{H}$ |
| 1 | CUCR1Dx |
|  | When the writing in value to CUCR1Dx is smaller than TCNT1Dx, it'll be FFFF_FFFF $H$. |

- The clear value of TCNT1Dx after reaching the upper limit value

|  | TCCRLRDx.CLRSEL1Dx | The count clock chosen in |  |
| :--- | :--- | :--- | :--- |
| TCRDx.CLR1Dx | $0 / 1$ | 1 | TCRDx.CKSEL1Dx |

### 30.8.2.22 TCNT2Dx - Timer Counter 2Dx

Note: $x=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$

Timer counters 2Dx (TCNT2Dx) are 32-bit readable/writable registers.
TCNT2Dx is driven by the clock selected in the CKSEL2Dx[2:0] bits in timer control register Dx (TCRDx). These counters are started by setting the bit in timer start register (TSTRD) to 1.

When overflow interrupt request is permitted (TIER1Dx.OV2EDx $=1$ ), an overflow interrupt request can be issued to CPU when the timer overflows.

The overflow flag OVF2Dx of the timer status register (TSRDx) is set to 1 .
When a clear request from timer B made TCRD.C2CEDx effective, and occurred, TCNT2Dx is cleared by $0000^{-} 0000_{\mathrm{H}}$. But, when competing with writing in to TCNT2Dx, writing in of TCNT2Dx is given priority.

This register is initialized to $00000000_{\mathrm{H}}$ after reset.

- The upper limit value of timer counter 2Dx (TCNT2Dx)

| TCRDx.CLR2Dx | The upper limit value of TCNT2Dx |
| :--- | :--- |
| 0 | FFFF_FFFF $_{H}$ |
| 1 | CUCR2Dx |
|  | When the writing in value to CUCR2Dx is smaller than TCNT2Dx, it'll be FFFF_FFFF ${ }_{H}$. |

- The clear value of TCNT2Dx after reaching the upper limit value

| TCRDx.CLR2Dx | TCCRLRDx.CLRSEL2Dx | The count clock chosen in <br> TCRDx.CKSEL2Dx | The clear value of TCNT2Dx |
| :--- | :--- | :--- | :--- |
| 0 | $0 / 1$ | 1 | $0000 \_0000_{\mathrm{H}}$ |
| 1 | 0 | 0 | $0000^{\prime} 0000_{\mathrm{H}}$ |
| 1 | 1 | 0 | $0000 \_0001_{\mathrm{H}}$ |
|  | 1 | 1 | State maintenance <br> (=CUCR2Dx value) |

### 30.8.2.23 CUCR1Dx - Counter Upper-Limit Setting Compare Register 1Dx

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The counter upper-limit setting compare register (CUCR1Dx) is a 32-bit readable/writable register that has a function for comparison with the TCNT1Dx counter. Compare match between this register and the TCNT1Dx counter is enabled by setting the TCNT1Dx clear setting bit 1Dx (CLR1Dx) in the timer control register (TCRDx) to 1. The TCNT1Dx counter value is cleared to $00000000_{\mathrm{H}}$ or $00000001_{\mathrm{H}}$ on compare match between the TCNT1Dx counter and counter upper-limit setting compare register (CUCR1Dx). The clear timing differs depending on TCCRLRDx.CLRSEL1Dx. When TCCRLRDx.CLRSEL1Dx $=0$, clearing occurs without synchronization with the count clock, and when TCCRLRDx.CLRSEL1Dx $=1$, it clears in synchronization with the count clock. For the clear value and clear timing of TCNT1Dx, refer to the description of TCNT1Dx.

The OVF1Dx bit in timer status register D (TSRDx) is set to 1 and an overflow interrupt is output on compare match between the TCNT1Dx counter and counter upper-limit setting compare register (CUCR1Dx).

The output width of overflow interrupt is one clock width of PCLK.
Do not set CUCR1Dx to $00000000_{\mathrm{H}}$. If $00000000_{\mathrm{H}}$ is set, a compare match may occur at an unintended timing.

### 30.8.2.24 CUCR2Dx — Counter Upper-Limit Setting Compare Register 2Dx

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The counter upper-limit setting compare register (CUCR2Dx) is a 32-bit readable/writable register that has a function for comparison with the TCNT2Dx counter. Compare match between this register and the TCNT2Dx counter is enabled by setting the TCNT2Dx clear setting bit 2Dx (CLR2Dx) in the timer control register (TCRDx) to 1 . The TCNT2Dx counter value is cleared to $00000000_{\mathrm{H}}$ or $00000001_{\mathrm{H}}$ on compare match between the TCNT2Dx counter and counter upper-limit setting compare register (CUCR2Dx). The clear timing differs depending on TCCRLRDx.CLRSEL2Dx. When TCCRLRDx.CLRSEL2Dx $=0$, clearing occurs without synchronization with the count clock, and when TCCRLRDx.CLRSEL2Dx $=1$, it clears in synchronization with the count clock. For the clear value and clear timing of TCNT2Dx, refer to the description of TCNT2Dx.

The OVF2Dx bit in timer status register D (TSRDx) is set to 1 and an overflow interrupt is output on compare match between the TCNT2Dx counter and counter upper-limit setting compare register (CUCR2Dx).

The output width of overflow interrupt is one clock width of PCLK.
Do not set CUCR2Dx to $00000000_{\mathrm{H}}$. If $00000000_{\mathrm{H}}$ is set, a compare match may occur at an unintended timing.

### 30.8.2.25 OCR1Dxy — Output Compare Registers 1Dxy

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The output compare registers (OCR1Dxy) are 32-bit readable/writable registers. OCR1Dxy is constantly compared with the select counter A (TCNT1Dx or TCNT2Dx). When compare match operation is selected by bit IOADxy in TIOR1Dx, the compare match A flag (CMFADxy) in TSRDx is set to 1 on the first edge of the PCLK after the values in select counter A(TCNT1Dx or TCNT2Dx) and OCR1Dxy match. When compare match A is selected by an output source select bit, a signal is output to pin TODxyA on compare match.

When compare match A is selected as a down counter starting trigger by the TRGSELDxy bit in DCRDxy, DCNTDxy is ready to be counted down on compare match A.

When the down counter (DCNTDxy) is ready, it is started in synchronization with the down counter clock. At this time, a one-shot pulse can be output on pin TODxyB. If compare match A and down-counter stop trigger are output at the same time, output is disabled without any pulse.

When TCNT1Dx overflows to change from FFFF FFFF ${ }_{H}$ to $00000000_{\mathrm{H}}$ and $O C R D x y$ is set to $00000000_{\mathrm{H}}$, compare match is detected. If the counter upper-limit setting function (see Section 30.8.3.2 Counter Upper-Limit Setting Function) is in use with clock-bus line 5 or 6 , or with a division ratio of $1 / 1$ selected for the prescaler, the timer counter counts between 1 and the value of CUCR1Dx and the counter value never reaches $00000000_{\mathrm{H}}$. Therefore, do not set these registers to $00000000_{\mathrm{H}}$ in such cases.

An interrupt can be issued to CPU by a compare match A detection.
When the range compare function is enabled, the select counter A (TCNT1Dx or TCNT2Dx) value at the compare match timing is stored in OCR1Dxy. Regarding the range compare function, see Section 30.8.3.1 Range

## Comparision Function.

This register is initialized to FFFF $\mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.8.2.26 RCR1Dx — Range Comparison Value Setting Register 1Dx

Value after reset: $\quad 00_{H}$

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Note 1. These bits are not used. Fix these bits to " 0 ".

The range comparison value setting register 1Dx (RCR1Dx) is an 8-bit readable/writable register. This register can enable/disable range compare function and set range value. Regarding the range compare function, see Section 30.8.3.1 Range Comparision Function.

RCR1Dx is initialized to $00_{\mathrm{H}}$ after reset.

The following table shows ranges that can be set as range comparison values (power of 2 (excluded only when RCR1Dx is 0 )).

| RCR1Dx[4:0] | Selectable Range | Remarks |
| :--- | :--- | :--- |
| 00000 | None | Range comparison disable (Default) |
| 00001 | $2^{1}-1$ | - |
| 00010 | $2^{2}-1$ | - |
| 00011 | $2^{3}-1$ | - |
| 00100 | $2^{4}-1$ | - |
| 00101 | $2^{5}-1$ | - |
| 00110 | $2^{6}-1$ | - |
| 00111 | $2^{7}-1$ | - |
| 01000 | $2^{8}-1$ | - |
| 01001 | $2^{9}-1$ | - |
| 01010 | $2^{10}-1$ | - |
| 01011 | $2^{11}-1$ | - |
| 01100 | $2^{12}-1$ | - |
| 01101 | $2^{13}-1$ | - |
| 01110 | $2^{14}-1$ | - |
| 01111 | $2^{15}-1$ | - |
| 10000 | $2^{16}-1$ | - |
| 10001 | $2^{17}-1$ | - |
| 10010 | $2^{18}-1$ | - |
| 10011 | $2^{19}-1$ | - |
| 10100 | $2^{20}-1$ | - |
| 10101 | $2^{21}-1$ | - |
| 10110 | $2^{22}-1$ | - |
| 10111 | $2^{23}-1$ | - |
| 11000 | $2^{24}-1$ | - |
| 11001 | $2^{25}-1$ | $2^{26}-1$ |

### 30.8.2.27 OCR2Dxy — Output Compare Registers 2Dxy

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The output compare registers (OCR2Dxy) are 32-bit readable/writable registers. OCR2Dxy is always compared with select counter B (TCNT1Dx or TCNT2Dx), and if the IOBDxy bit of the TIOR2Dx register permits compare match, a match of select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy values is detected. If the OSSDxy bit specifies compare match B as the output source, the compare match is output to the TODxyA pin at the next PCLK cycle.

When compare match $B$ is selected as a down counter starting trigger by the TRGSELDxy bit in DCRDx, DCNTDxy is ready to be counted down on compare match $B$.

When the down counter (DCNTDxy) is ready, it is started in synchronization with the down counter clock. At this time, a one-shot pulse can be output on pin TODxyB. If compare match A and down- counter stop trigger are output at the same time, output is disabled without any pulse.

If the TRGSELDxy bit of DCRDx specifies compare match $B$ as the down count stop trigger, detection of compare match $B$ disables down counting. At the next down-counting clock cycle, the down counter is cleared to 0 and TODxyB output (one-shot pulse) is negated.

When select counter B (TCNT1Dx or TCNT2Dx) overflows to change from FFFF FFFFF to $00000000_{\mathrm{H}}$ and OCR2Dxy is set to $00000000_{\mathrm{H}}$, compare match is detected.

If the counter upper-limit setting function (see Section 30.8.3.2 Counter Upper-Limit Setting Function) is in use with clock-bus line 5 or 6 , or with a division ratio of $1 / 1$ selected for the prescaler, the timer counter counts between 1 and the value of CUCR2Dx and the counter value never reaches $00000000_{\mathrm{H}}$. Therefore, do not set these registers to $00000000_{\mathrm{H}}$ in such cases.

An interrupt can be issued to CPU by compare match B detection.
When the range compare function is enabled, the select counter $B$ value at the compare match timing is stored in OCR2Dxy. Regarding the range compare function, see Section 30.8.3.1 Range Comparision Function.

This register is initialized to FFFF FFFF $_{\mathrm{H}}$ after reset.

### 30.8.2.28 RCR2Dx — Range Comparison Value Setting Register 2Dx

Value after reset: $\quad 00_{H}$

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Note 1. These bits are not used. Fix these bits to " 0 ".

The range comparison value setting register 2Dx (RCR2Dx) is an 8-bit readable/writable register. This register can enable/disable range compare function and set range value. Regarding the range compare function, see Section 30.8.3.1 Range Comparision Function.

RCR2Dx is initialized to $00_{\mathrm{H}}$ after reset.

The following table shows ranges that can be set as range comparison values (power of 2 (excluded only when RCR2Dx is 0 )).

| RCR2Dx[4:0] | Selectable Range | Remarks |
| :--- | :--- | :--- |
| 00000 | None | Range comparison is invalid (Default) |
| 00001 | $2^{1}-1$ | - |
| 00010 | $2^{2}-1$ | - |
| 00011 | $2^{3}-1$ | - |
| 00100 | $2^{4}-1$ | - |
| 00101 | $2^{5}-1$ | - |
| 00110 | $2^{6}-1$ | - |
| 00111 | $2^{7}-1$ | - |
| 01000 | $2^{8}-1$ | - |
| 01001 | $2^{9}-1$ | - |
| 01010 | $2^{10}-1$ | - |
| 01011 | $2^{11}-1$ | - |
| 01100 | $2^{12}-1$ | - |
| 01101 | $2^{13}-1$ | - |
| 01110 | $2^{14}-1$ | - |
| 01111 | $2^{15}-1$ | - |
| 10000 | $2^{16}-1$ | - |
| 10001 | $2^{17}-1$ | - |
| 10010 | $2^{18}-1$ | - |
| 10011 | $2^{19}-1$ | - |
| 10100 | $2^{20}-1$ | - |
| 10101 | $2^{21}-1$ | - |
| 10110 | $2^{22}-1$ | - |
| 10111 | $2^{23}-1$ | - |
| 11000 | $2^{24}-1$ | - |
| 11001 | $2^{25}-1$ | $2^{26}-1$ |

### 30.8.2.29 ICR1Dxy — Input Capture Register 1Dxy

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register 1Dxy (ICR1Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the counter value of select counter A (TCNT1Dx or TCNT2Dx) into ICR1Dxy triggered by compare match B.

ICR1Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.30 ICR2Dxy — Input capture register 2Dxy

Value after reset: $00000000_{\mathrm{H}}$

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register 2Dxy (ICR2Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the counter value of select counter B (TCNT1Dx or TCNT2Dx) in ICR2Dxy triggered by compare match A.

ICR2Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.31 DCNTDxy — Timer Down Counters Dxy

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Timer down counters (DCNTDxy) are 32-bit readable/writable registers.
DCNTDxy is driven by the clock selected in the DCSELDx[2:0] bits in timer control register D (TCRDx).
While the down counter is enabled, it is decremented every input of the down counter clock. Counting can be stopped by an underflow of DCNTDxy, detection of compare match B, or detection of compare match A or B. When the decrementing is stopped by an underflow, a down counter underflow interrupt request and a DMA transfer request can be issued.

Decrementation is enabled; on the first edge of the PCLK (the same as compare match A) after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCRDxy match; on the first edge of the PCLK (the same as compare match B) after the values in select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy match; on the first edge of the PCLK after the DSTDxy bit is set to 1 . Decrementation is enabled until DCNTDxy underflows or until the first edge of the PCLK (the same as compare match A) after the values in select counter A (TCNT1Dx or TCNT2Dx) and OCR2Dxy or the first edge of the PCLK (the same as compare match B) after the values in select counter B (TCNT1Dx or TCNT2Dx) and OCR2Dxy match. The down counter is decremented every input of the down counter clock while it is enabled.

Once DCNTDxy is enabled, it remains enabled until DCNTDxy underflow, compare match B, or compare match A or $B$ (if selected as a count stop trigger) is detected. While it is enabled, another counter starting trigger or writing 1 to DSTDxy bit has no effect on the enabled state of the counter.

When compare match B or compare match A or B (if selected as a count stop trigger) is detected, the counter is stopped on the first edge of the down counter clock and then cleared to $00000000_{\mathrm{H}}$. If a down count start trigger (compare match A or writing 1 to DSTDxy) and a down count stop trigger (compare match B) are detected at the same time, the count stop trigger takes priority. The counter is not decremented and no signal on pin TODxyB is output.

Moreover, When no down counter clock is input during the time between enabled state due to compare match A or writing 1 to DSTDxy and counter stop state due to compare match $B$, the counter stops without performing down-count. The counter stops down-counting in the down-count stop state regardless of that the DCNTDxy value is $00000000_{\mathrm{H}}$.

A request to stop counting down is retained until the next input of the clock signal to drive counting. Accordingly, after a request to stop counting is issued, a trigger to start counting will not be accepted until the next input of the clock signal to drive counting.

If a value other than $00000000_{\mathrm{H}}$ is set in DCNTDxy after decrementation is terminated by underflow, the counter is not decremented until the counter stopping source is activated. When the DCNTDxy value is $00000000_{\mathrm{H}}$ and the down-
count clock is not input at the beginning of down-counting, only flags in the down count status register 2Dx (DSR2Dx) are updated without performing down-counting. A count down stop interrupt (due to DCNTDxy $=00000000_{\mathrm{H}}$ ) is generated at the next down-count clock. The down-count status flag Dxy (DSFDxy) in the down count status register 1Dx (DSR1Dx) retains 1 until an interrupt occurs.

This register is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.32 TIER1Dx — Timer Interrupt Enable Register 1Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | OV2EDx | OV1EDx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.141 TIER1Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, <br> always write " 0 ". |
| 1 | OV2EDx | Overflow 2 interrupt enable Dx |
|  | Specifies enable/disable of interrupt requests issued by overflow of TCNT2Dx. |  |
|  | $0:$ Interrupt requests are disabled. |  |
|  | 1: Interrupt requests are enabled. |  |
| 0 | OV1EDx | Overflow 1 interrupt enable Dx |
|  | Specifies enable/disable of interrupt requests issued by overflow of TCNT1Dx. |  |
|  | $0:$ Interrupt requests are disabled. |  |
|  | 1: Interrupt requests are enabled. |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The timer interrupt enable register 1Dx (TIER1Dx) is an 8-bit readable/writable register. This register enables and disables interrupt requests triggered by overflow of TCNT2Dx and TCNT1Dx.

TIER1Dx is initialized to $00_{\mathrm{H}}$ after reset.

### 30.8.2.33 TIER2Dx — Timer Interrupt Enable Register 2Dx

| Value after reset: 00000000 |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | - | - | - | - | - | - | - | $\begin{gathered} \text { UNDED } \\ \text { x3 } \end{gathered}$ | $\begin{gathered} \text { UNDED } \\ \mathrm{x} 2 \end{gathered}$ | $\begin{gathered} \text { UNDED } \\ \mathrm{x} 1 \end{gathered}$ | $\begin{gathered} \text { UNDED } \\ \mathrm{x} 0 \end{gathered}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$

Table 30.142 TIER2Dx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | - | These bits are not used. Fixe these bits to "0". |
| 19 to 16 | UNDEDxy | Underflow interrupt enable Dx <br> Specifies enable/disable of interrupt requests issued by underflow of DCNTDxy. <br> 0 : Interrupt requests are disabled. <br> 1: Interrupt requests are enabled. |
| 15 to 12 | - | These bits are not used. Fixe these bits to "0". |
| 11 to 8 | CMPBEDxy | Compare match B interrupt enable Dxy <br> Specifies enable/disable of interrupt requests issued by compare match $B$. <br> 0 : Interrupt requests are disabled. <br> 1: Interrupt requests are enabled. |
| 7 to 4 | - | These bits are not used. Fixe these bits to "0". |
| 3 to 0 | CMPAEDxy | Compare match A interrupt enable Dxy <br> Specifies enable/disable of interrupt requests issued by compare match $A$. <br> 0 : Interrupt requests are disabled. <br> 1: Interrupt requests are enabled. |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The timer interrupt enable register 2Dx (TIER2Dx) is an 8-bit readable/writable register. UNDEDxy register controls enable/disable of interrupts triggered by underflow of DCNTDxy. CMPBEDxy, CMPAEDxy register enables and disables interrupt requests upon compare match A between the counter (TCNT1Dx or TCNT2Dx) set by the CMPSEL1Dxy bit in the timer compare control register Dx (TCCRLRDx) and OCR1Dxy, and compare match B between the counter (TCNT1Dx or TCNT2Dx) set by the CMPSEL1Dxy bit in the timer compare control register Dx (TCCRLRDx) and OCR2Dxy.

TIER2Dx is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.34 TIER3Dx - Timer Interrupt Enable Register 3Dx

Value after reset: $\quad 0000 \mathrm{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | O | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.143 TIER3Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. Fixe these bits to " 0 ". |
| 11 to 8 | FEIEDxy | OFF timing of the output waveform after MIN guard interrupt enable Dxy |
|  |  | Specifies enable/disable of interrupt requests issued by off timing of the output waveform after |
|  | MIN guard interrupt enable Dxy. |  |
|  | $0:$ Interrupt requests are disabled. |  |
|  | 1: Interrupt requests are enabled. |  |
| 7 to 4 | - | These bits are not used. Fixe these bits to " 0 ". |
| 3 to 0 | REIEDxy | ON timing of the output waveform after MIN guard interrupt enable Dxy |
|  |  | Specifies enable/disable of interrupt requests issued by on timing of the output waveform after |
|  | MIN guard interrupt enable Dxy. |  |
|  | $0:$ Interrupt requests are disabled. |  |
|  | 1: Interrupt requests are enabled. |  |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .)
The timer interrupt enable register 3Dx (TIER3Dx) is an 8-bit/16-bit readable/writable register. This register controls enable/disable of interrupts triggered by on/off timing of the output waveform after MIN guard interrupt enable Dxy.

TIER3Dx is initialized to $0000_{\mathrm{H}}$ after reset.

### 30.8.2.35 MIGCRDx — MIN Guard Control Register Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | mIGENDx3 | MIGENDx2 | MIGENDx1 | MIGENDx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.144 MIGCRDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. Fixe these bits to " 0 ". |
| 3 to 0 | MIGENDxy | MIN Guard function Enable Dxy |
|  | $0:$ MIN Guard is disabled. |  |
|  | 1: MIN Guard is enabled. |  |

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

MIN Guard control register Dx (MIGCRDx) is an 8-bit readable/writable register. This register controls enable/disable of min guard function by one shot pulse output TODxyA/TODxyB.

MIGCRDx is initialized to $00_{\mathrm{H}}$ after reset.

## MIN Guard function Enable Dxy (MIGENDxy)

The MIN guard function enable in OFMINDxy, ONMINDxy, OTOMINDxy can be added to one shot pulsed output TODxyA or TODxyB by writing " 1 " in this bit.

When changing this bit to 0 from 1, a counter register for MIN guard (OFMICNTDxy, ONMICNTDxy,
OTOMICNTDxy) is cleared in $00000000_{\mathrm{H}}$ and the function of the MIN guard is suspended.(A generated one shot pulse is output directly.)

### 30.8.2.36 MIGSELDx - MIN Guard Pulse Select Register Dx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | mIGSELx3 | MIGSELx2 | MIGSELx1 | MIGSELx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$
Table 30.145 MIGSELDx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, <br> always write " 0 ". |
| 3 to 0 | MIGSELxy | MIN Guard pulse selected. |
|  | $0:$ MIN Guard function is added to TODxyA output. |  |
|  |  | 1: MIN Guard function is added to TODxyB output. |

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .)

MIN Guard pulse select register Dx (MIGSELDx) is an 8-bit readable/writable register. This register select the one shot pulse output (TODxyA/TODxyB) to which the MIN guard function.

MIGSELDx is initialized to $00_{\mathrm{H}}$ after reset.

## MIN Guard pulse selected (MIGSELDxy)

This bits select the one shot pulse output (TODxyA/TODxyB) to which the MIN guard function.
MIN guard is added to TODxyA at 0 setting and min guard is added to TODxyB at 1 setting in OFMINDxy, ONMINDxy, OTOMINDxy.

### 30.8.2.37 OFMINDxy —Pulse Output Off Minimum Width Setting Register Dxy

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output off minimum width setting register Dxy (OFMINDxy) is a 32 -bit readable/writable register. When an enable the MIN guard function (MIGENDxy = 1), the smallest width of the off period can be set as TODxyA or TODxyB. If a pulse whose OFF period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

### 30.8.2.38 ONMINDxy —Pulse Output On Minimum Width Setting Register Dxy

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output on minimum width setting register Dxy (ONMINDxy) is a 32-bit readable/writable register. When an enable the MIN guard function (MIGENDxy = 1), the smallest width of the on period can be set as TODxyA or TODxyB. If a pulse whose ON period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

### 30.8.2.39 OTOMINDxy —Pulse Output On-to-On Minimum Width Setting Register Dxy

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output on-to-on minimum width setting register Dxy (ONMINDxy) is a 32-bit readable/writable register that specifies the minimum width of the TODxyB (one-shot pulse output) between a change from OFF to ON and the next change from OFF to ON period in pulse type 2 mode. If a pulse whose ON-to-ON period is shorter than the width set by this register is generated, it is automatically corrected to satisfy the set minimum width.

### 30.8.2.40 OFMICNTDxy —Pulse Output Off Minimum Width Measurement Counter Dxy

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output off minimum width measurement counter Dxy (OFMICNTDxy) is a 32 -bit readable register that measures the pulse OFF period for correction to secure the minimum width of the pulse OFF period.

### 30.8.2.41 ONMICNTDxy —Pulse Output On Minimum Width Measurement Counter Dxy

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output on minimum width measurement counter Dxy (ONMICNTDxy) is a 32-bit readable register that measures the pulse ON period for correction to secure the minimum width of the pulse ON period.

### 30.8.2.42 OTOMICNTDxy —Pulse Output On-to-On Minimum Width Measurement Counter Dxy

Value after reset: $00000000_{\mathrm{H}}$

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The pulse output on-to-on minimum width measurement counter Dxy (OTOMICNTDxy) is a 32-bit readable register that measures the pulse ON-to-ON period for correction to secure the minimum width of the pulse ON-to-ON period.

### 30.8.2.43 ONCAP1Dxy — Input Capture Register ONCAP1Dxy

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register ONCAP1Dxy (ONCAP1Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the value of TCNT1Dx0 when TODxyB (pulse output) changes from OFF to ON in min guard function.

ONCAP1Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.44 ONCAP2Dxy — Input Capture Register ONCAP2Dxy

Value after reset: $00000000_{\mathrm{H}}$

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register ONCAP2Dxy (ONCAP2Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the value of TCNT2Dx0 when TODxyB (pulse output) changes from OFF to ON in $\min$ guard function.

ONCAP2Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.45 OFCAP1Dxy — Input Capture Register OFCAP1Dxy

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register OFCAP1Dxy (OFCAP1Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the value of TCNT1Dx0 when TODxyB (pulse output) changes from ON to OFF in min guard function.

OFCAP1Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.46 OFCAP2Dxy — Input Capture Register OFCAP2Dxy

Value after reset: $00000000_{\mathrm{H}}$

Note: $x=0$ to $S B B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

The input capture register OFCAP2Dxy (OFCAP2Dxy) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. This register captures the value of TCNT2Dx0 when TODxyB (pulse output) changes from ON to OFF in $\min$ guard function.

OFCAP2Dxy is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.2.47 TSR2Dx — Timer Status Register 2Dx

Table 30.146 TSR2Dx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. When these bits are read, "0" is always returned. When writing, <br> always write " 0 ". |
| 11 to 8 | FEFDx3 to FEFDx0 | Output pulse after MIN guard OFF flag Dx3 to Dx0 |
|  |  | 0: Output pulse after MIN guard has not changed from ON to OFF |
|  |  | 1: Output pulse after MIN guard has changed from ON to OFF |

Note: $x=0$ to $S B B D_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1$

The timer status register 2 (TSR2Dx) is an 8-bit/16-bit read-only register. This register indicates the change of the output pulse in subblock $\mathrm{Dx}\left(\mathrm{x}=0\right.$ to $\left.\mathrm{SB}_{\mathrm{D}}-1\right)$ after MIN guard, from ON to OFF or OFF to ON.

If an interrupt source takes effect when this flag is set, an interrupt request is made again. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

The flags can be cleared by setting the corresponding bits of the timer status clear register 2 (TSCR2Dx).
TSR2Dx is initialized to $0000_{\mathrm{H}}$ after reset.

Output pulse after MIN guard OFF flag Dxy (FEFDxy)

| FEFDxy | Function |
| :--- | :--- |
|  | [Clearing condition] |
| 0 | When 1 is written to the FEFCDxy bit of the timer status clear register 2 (TSCR2Dx). |$\quad$ (Default) $\quad$|  |  |
| :--- | :--- |
|  | When the output pulse after MIN guard has changed from ON to OFF |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks D0 to $D S B_{D}-1 \quad y=0,1,2,3$ : Corresponding to channels 0 to 3
Output pulse after MIN guard ON flag Dxy (REFDxy)

| REFDxy | Function |  |
| :--- | :--- | :--- |
|  | [Clearing condition] |  |
| 0 | When 1 is written to the REFCDxy bit of the timer status clear register 2 (TSCR2Dx). |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 \quad y=0,1,2,3$ : Corresponding to channels 0 to 3

### 30.8.2.48 TSCR2Dx - Timer Status Clear Register 2Dx

Value after reset: $\quad 0000 \mathrm{H}$

Table 30.147 TSCR2Dx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 12 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, always write " 0 ". |
| 11 to 8 | FEFCDx3 to FEFCDx0 | Output pulse after MIN guard OFF flag clear enable Dx3 to Dx0 <br> 0 : Disabled (Default) <br> 1: Clears FEFDx3-FEFDx0 of timer status register 2D (TSR2Dx) to 0. |
| 7 to 4 | - | These bits are not used. When these bits are read, " 0 " is always returned. When writing, always write " 0 ". |
| 3 to 0 | REFCDx3 to REFCDx0 | Output pulse after MIN guard ON flag clear enable Dx3 to Dx0 <br> 0 : Disabled (Default) <br> 1: Clears REFDx3-REFDx0 of timer status register 2D (TSR2Dx) to 0. |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{D}}-1$ : Corresponding to subblocks D 0 to $\mathrm{DSB}_{\mathrm{D}}-1$.

The timer status clear register 2Dx (TSCR2Dx) is an 8-bit/16-bit readable/writable register. This register clears the flags that indicate the change of output pulse after MIN guard (from ON to OFF or vice versa).

TSCR2Dx is initialized to $0000_{\mathrm{H}}$ after reset.

## Output pulse after MIN guard OFF flag clear enable 2Dxy (FEFCDxy)

This bit clears the flags that indicate the change of output pulse after MIN guard from ON to OFF.
Setting this bit enables clearing of the output pulse after MIN guard OFF flag (FEFDxy) of the timer status register 2Dx (TSR2Dx). When these bits are read, " 0 " is always returned.

| FEFCDxy | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears FEFDxy to 0. |  |

Note: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 y=0,1,2,3$ : Corresponding to channels 0 to 3

## Output pulse after MIN guard ON flag clear enable 2Dxy (REFCDxy)

This bit clears the flags that indicate the change of output pulse after MIN guard from OFF to ON.
Setting this bit enables clearing of the output pulse after MIN guard ON flag (REFDxy) of the timer status register 2Dx (TSR2Dx). When these bits are read, " 0 " is always returned.

| REFCDxy | Function |
| :--- | :--- |
| 0 | Disabled |
| 1 | Clears REFDxy to 0. |
| Note: $x=0$ to $S B_{D}-1:$ Corresponding to subblocks $D 0$ to $D S B_{D}-1 y=0,1,2,3:$ Corresponding to channels 0 to 3 |  |

### 30.8.2.49 CCAPSELD — Common Input Capture Select Register D

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CCAPSEL |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 30.148 CCAPSELD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. When these bits are read, "0" is always returned. When writing, <br> always write " 0 ". |
| 0 | CCAPSEL | Common input capture select. |
|  |  | $0:$ The value of the TCNT1D0 is stocked in CICRD0-7 |
|  |  | 1: The value of the TCNT2D0 is stocked in CICRD0-7 |

Common input capture select register D (CCAPSELD) is an 8-bit readable/writable register.
When a PH renewal notice trigger occurred, Its select which to stock in Common input capture registerD0-7, Timer Counter 1D0 (TCNT1D0) or Timer Counter 2D0 (TCNT2D0).

CCAPSELD is initialized to $00_{\mathrm{H}}$ after reset.

### 30.8.2.50 CICRD0-7 — Common Input Capture Register D0-7

The common input capture register D0-7 (CICRD0-7) is a 32-bit read-only register, and its initial value is $00000000_{\mathrm{H}}$. The value of the timer counter (If CCAPSEL $=0$ then TCNT1D0, CCAPSEL $=1$ then TCNT2D0) is stocked by PH renewal notice trigger $0 \sim 7$ from DFE.

CICRDx is assigned to "PH renewal notice trigger x ". $(\mathrm{x}=0-7)$
CICRD0-7 is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.8.3 Details of Operation

Timer D consists of $\mathrm{SB}_{\mathrm{D}}$ subblocks. Each block has two range compare setting registers (RCR1Dx and RCR2Dx), two 32-bit up-counters (TCNT1Dx and TCNT2Dx), one offset base register (OSBRDx), one output value register (ODRDx), one output select register (OSELRDx), and four channels described below. Each channel consists of the output compare register (OCR1Dxy) to which select counter A(TCNT1Dx or TCNT2Dx) is compared, the output compare register (OCR2Dxy) to which select counter B(TCNT1Dx or TCNT2Dx) is compared, one down-counter Dxy (DCNTDxy), two upper-limit setting registers (CUCR1Dx and CUCR2Dx) for two counters, and two input capture registers (ICR1Dxy and ICR2Dxy).

One-shot pulse can be output from timer D . By using compare match A , compare match B , compare match A or B , (or compare match A and B), 1 writing in to DSTRDx.DSTDxy as a start trigger of a down-counter, one-shot pulse with an offset can also be output.

Setting the TDE bit in ATUENR and bit STRDx in timer start register (TSTRD) to 1 makes two up-counters (TCNT1Dx and TCNT2Dx) in subblock Dx start operation. Also, this becomes a request for counting down by the down counter to start.

The down-counter is started by any of five sources; setting the DSTDxy bit in the down count start register (DSTRD) to 1 , compare match $A$, compare match $B$, compare match $A$ or $B$, and compare match $A$ and $B$ that are set by the TRGSELDxy bit in the down counter control register (DCRD). When any of these triggers occurs, DCNTDxy driven by the down counter clock is started. But, during off-Min guard and during OTO-Min guard or DCNTDxy doesn't begin down count movement at $0000 \_0000_{\mathrm{H}}$.

The down counter is stopped on an underflow of the down counter and compare match B or A or B selected by bit TRGSELxy. When an underflow occurs (during down-counting when the counter value is $00000000_{\mathrm{H}}$ ), the value of the down counter (DCNTDxy) is immediately cleared to $00000000_{\mathrm{H}}$ and the down-counting is terminated. When a compare match B or compare match A or B occurs, the same operation is performed in synchronization with the next down-count clock.

For compare match A between TCNT1Dx (or TCNT2Dx) and OCR1Dxy and compare match B between TCNT2Dx (or TCNT1Dx) and OCR2Dxy are set to 1 on the first edge of the PCLK after the compare match. A compare match interrupt request is issued to CPU triggered by the compare match. According to the settings of range comparison value setting registers (RCR1Dx and RCR2Dx), enable the range compare function, compare match A can be generated if it is within the range set by select counter A when writing to OCR1Dxy, compare match B can be generated if it is within the range set by select counter B when writing to OCR2Dxy. Furthermore, the counter value of select counter B is captured into ICR2Dxy triggered by compare match A and the counter value of select counter A is capture into ICR1Dxy triggered by compare match B. The CMFADxy and CMFBDxy bits in TSRDx are set to 1 in synchronization with PCLK in the occurrence of compare match.

A signal on pin TODxyA is output when the output source selected in the OSSDxy bit in timer I/O control register 1D (TIOR1Dx) is activated. For example, assume that compare match A is selected. A signal level set by the IOAxy bit is output on pin TODxyA on the first edge of the PCLK after the compare match between select counter A and OCR1Dxy.

Output of the one-shot pulse is synchronized with the down counter clock in a way similar to the down counter operation. The five counter starting sources are synchronized with the PCLK, a signal on pin TODxyB is output on the first edge of the down counter clock after the source is activated. Underflow of the down counter, which is a counter stopping source, is synchronized with the down counter clock and compare match B and compare match A or B is synchronized with the PCLK. As to negation timing, the TODxyB signal is negated in synchronization with underflow and on the first edge of the down counter clock after the compare match B or A or B.

| Output Pin | Assertion Timing | Negation Timing | Initial Value |
| :--- | :--- | :--- | :--- |
| TODxyB | On the first edge of the down counter clock after <br> the counter starting source is activated | On the first edge of the down counter clock after <br> compare match B or on DCNTDxy underflow | (inverted |
|  |  |  | depending on |
|  |  |  | TOCRDx) |

Note 1: $x=0$ to $S B_{D}-1$ : Corresponding to subblocks $D 0$ to $D S B_{D}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3.
Note 2: If an assertion and a negation occur simultaneously, the negation takes priority.

The initial values output on pins TODxyA and TODxyB are 0 . However, the output level can be inverted by setting timer output control register (TOCRDx). Setting bit TONEADx to 1 makes pin TODxyA in subblock Dx inverted and setting bit TONEBDx to 1 makes pin TODxyB in subblock Dx inverted. By setting the output select register Dx (OSELRDx), the value of the corresponding output value register Dx (ODRDx) can be output to pins (TODxyA and TODxyB).

To set the clocks for TCNT1Dx, TCNT2Dx, or DCNTDxy or values in registers such as DCNTDxy, OCR1Dxy, and OCR2Dxy while TCNT1Dx or TCNT2Dx is in operation, note that the value to be set may lead to malfunction. For example, while setting the compare match value, the counter value may exceed the value to be set.

Figure $\mathbf{3 0 . 5 7}$ shows an operation example of one-shot pulse output for channel 0 in subblock D0.

Figure 30.57 Operation Example of One-Shot Pulse Output (1) - Counting Started on Compare Match A and Stopped on Compare Match B -

Figure $\mathbf{3 0 . 5 7}$ shows operations of the down counter when the counter is started on compare match A and is stopped on compare match B . It also shows the assertion and negation of a one-shot pulse. Compare match A as the counter starting trigger and compare match B as the counter stopping trigger are set by the TRGSELD00 bits in DCRD0. Both matches are selected as the source of the output signal by the OSSD00 bits in TIOR1D0 and output levels are set by the IOAD00 and IOBD00 bits. A logical one for compare match A and a logical zero for compare match A are selected.

When the timer start register (TSTRD) is set to 1, TCNT1D0 and TCNT2D0 start counting up immediately after the next count clocks for TCNT1D0 and TCNT2D0, respectively. If TCNT1D0 coincides with the output compare register (OCR1D00), compare match A occurs at the next PCLK cycle. At this time, the counter value of TCNT2Dx is captured in ICR2Dxy. In addition, a compare match interrupt request is issued to CPU triggered by compare match A. The compare match A status flag (CMFAD00) is set to 1 . At the same time, TOD00A outputs 1 and the down count status flag (DSFD00) is also set to 1 , entering the down counter enabled state. This down count enabled state continues until
detection of compare match $B$ or under flow of DCNTD00. Input of the down counter clock during this state decrements DCNTD00. TOD00B outputs 1 from the time of the first down counter clock input.

If TCNT2D0 coincides with the output compare register (OCR2D00), compare match B occurs at the next PCLK cycle. At this time, the counter value of TCNT1Dx is captured into ICR1Dxy. In addition, a compare match interrupt request is issued to CPU triggered by compare match B . The compare match B flag (CMFBD00) is set to 1 . At this time, a level of 0 is output on pin TOD00A. The down counter is cleared and a one-shot pulse (TOD00B) is terminated.

Figure 30.58 Operation Example of One-Shot Pulse Output (2) - Counting Started by Writing 1 to Counter Starting Bit and Stopped on Compare Match B -

Figure 30.58 shows an operation example when the down counter is started by writing 1 to the down counter starting bit. In this example, the counter starting trigger is not selected and compare match B is selected as the counter stopping trigger (TRGSELD00 in DCRD0). The source of the output signal is compare match B (OSSD00 in TIOR1D0) and logical one is output (IOBD00 in TIOR1D0).

Figure 30.59 shows an operation example of a one-shot pulse output for channel 0 in subblock D0.
Setting the DSTD00 bit in the down counter starting register (DSTRD0) sets the down counter status flag (DSFD00) to 1. This makes the down counter ready for counting down. DCNTD00 is started on the first edge of the down counter clock after DSFD00 is set to 1 . At this time, a level of 1 is output on pin TOD00B.

Figure 30.59 Operation Example of One-Shot Pulse Output (3) - Underflow Occurs -

Figure $\mathbf{3 0 . 5 9}$ shows an operation example when a one-shot pulse is terminated on underflow. In this example, compare match A as the counter starting trigger is selected and the counter stopping trigger is not selected (TRGSELD00 in DCRD0). Both compare matches A and B as the source of the output signal (OSSD00 in TIOR1D0) are selected. Output levels of 1 for compare match $\mathrm{A}(\mathrm{IOAD} 00)$ and 0 for compare match B (IOBD00) are selected.

Underflow is detected and the underflow flag (UDFD00) in TSRD0 is set on the first edge of the down counter clock after the value in timer down counter Dxy (DCNTD00) is $000000_{\mathrm{H}}$. At the same time, the one-shot pulse output is terminated. The width of the pulse output on pin TOD00B is equal to the value set in DCNTD00 before counting down.

### 30.8.3.1 Range Comparison Function

(1) Range compare function

The range compare function is a function to generate a compare match when the counter value (TCNT1Dx, TCNT2Dx) is within the compare range set when outputting to the output compare register (OCR1Dxy, OCR2Dxy). The range compare function is valid when other than $00_{\mathrm{H}}$ is set in the range compare value setting register (RCR1Dx or RCR2Dx). Range compare match A and B correspond to compare match A and B, respectively. Range Compare range of compare match $\mathrm{A}, \mathrm{B}$ is judged by using the following values.

Range compare match A

- Write value of OCR1Dxy
- Value of select counter A
- Range value for select counter A
- Upper limit value of select counter A

Range compare match B

- Write value of OCR2Dxy
- Value of select counter B
- Range value for select counter B
- Upper limit value of select counter B

Figure $\mathbf{3 0 . 6 0}$ and Figure $\mathbf{3 0 . 6 1}$ show the operation diagram of range compare match.
Also, OCR1Dxy and OCR2Dxy capture counter values (TCNT1Dx, TCNT2Dx) when a compare match is generated by the range compare function.

Figure 30.62 shows the capture operation when range compare match occurs.

Figure 30.60 Operation of the Range Comparison Function(1)

CMPSEL1Dxy=0:
Value of select counter $A=$ Value of TCNT1Dx: Upper limit of select counter $A=F F F F F_{-} F F F_{H}(C L R 1 D x=0)$ or CUCR1Dx(CLR1Dx=1), Range value=Set by RCR1Dx CMPSEL1Dxy=1 :
Value of select counter $A=$ Value of TCNT2Dx: Upper limit of select counter $A=F F F F F_{-} F F F_{H}(C L R 2 D x=0)$ or CUCR2Dx(CLR2Dx=1), Range value=Set by RCR2Dx

Figure 30.61 Operation of the Range Comparison Function(2)

Figure 30.62 Range Compare Counter Value Capturing Operation

Range compare match A occurs if the condition of Table $\mathbf{3 0 . 1 4 9}$ is satisfied when the range compare function is enabled (other than $00_{\mathrm{H}}$ for the range value for select counter A) and writing to OCR1Dxy is performed.

Table 30.149 Range Compare Match A Generation Condition

|  | Range condition | Range compare match A generation condition |
| :--- | :--- | :--- |
| Condition 1 | When the set compare range is lower than select counter <br> A upper limit <br> OCR1Dxy + Range value for select counter A $\leq$ Upper limit <br> value of select counter A | OCR1Dxy $\leq$ Value of select counter A $\leq$ OCR1Dxy + <br> Range value for select counter $A$ |
| Condition 2 | When the set compare range exceeds select counter A <br> upper limit | Range(i): OCR1Dxy <br> limit value of select counter $A$ <br> or of select counter $A \leq$ Upper <br> Range(ii) : 00000000 $\leq$ Value of select counter $A \leq$ <br> OCR1Dxy + Range value for select counter A - Upper limit <br> value of select counter A |

Note 1. "Condition 1 When the set compare range is lower than select counter $A$ upper limit", The range condition shown in the Figure 30.60.
Note 2. "Condition 2 When the set compare range exceeds select counter A", The range condition shown in the Figure 30.61.
Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in Figure 30.61.

Table $\mathbf{3 0 . 1 5 0}$ lists the registers used to determine the compare range of "Range compare match A".
Table 30.150 Register Used in Range Judgment of Compare Match A

| Configuration |  |  | Used registers |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CMPSEL1Dxy | CLR1Dx | CLR2Dx | Value of select counter A | Set value for select counter A | Upper limit value of select counter A | Output compare register |
| 0 | 0 | - | TCNT1Dx | RCR1Dx | FFFFFFFFF ${ }_{\text {H }}$ | OCR1Dxy |
| 0 | 1 | - |  |  | CUCR1Dx |  |
| 1 | - | 0 | TCNT2Dx | RCR2Dx | FFFFFFFF ${ }_{\text {H }}$ |  |
| 1 | - | 1 |  |  | CUCR2Dx |  |

Note 1. "-" indicates that the setting has no effect.

Range compare match B occurs if the condition of Table $\mathbf{3 0 . 1 5 1}$ is satisfied when the range compare function is enabled (other than $00_{\mathrm{H}}$ for the range value for select counter B ) and writing to OCR2Dxy is performed.

Table 30.151 Range Compare Match B Generation Condition

|  | Range condition | Range compare match B generation condition |
| :--- | :--- | :--- |
| Condition 1 | When the set compare range is lower than select counter <br> B upper limit <br> OCR2Dxy + Range value for select counter B $\leq$ Upper limit <br> value of select counter B | OCR2Dxy $\leq$ Value of select counter B $\leq$ OCR2Dxy + <br> Range value for select counter B |
| Condition 2 | When the set compare range exceeds select counter B <br> upper limit | Range(i) : OCR2Dxy $\leq$ Value of select counter B $\leq$ Upper <br> limit value of select counter B <br> or <br> Range(ii) : 00000000 $\leq$ Value of select counter B $\leq$ <br> OCR2Dxy + Range value for select counter B - Upper limit <br> value of select counter B |

Note 1. "Condition 1 When the set compare range is lower than select counter B upper limit", The range condition shown in the Figure 30.60.
Note 2. "Condition 2 When the set compare range exceeds select counter B", The range condition shown in the Figure 30.61.
Note 3. Range (i) and Range (ii) in the table indicate Range (i) and Range (ii) in Figure 30.61.

Table 30.152 lists the registers used to determine the compare range of "Range compare match B".
Table 30.152 Register Used in Range Judgment of Compare Match B

| Configuration |  |  | Used registers |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CMPSEL2Dxy | CLR2Dx | CLR1Dx | Value of select counter B | Set value for select counter B | Upper limit value of select counter B | Output compare register |
| 0 | 0 | - | TCNT2Dx | RCR2Dx | FFFFFFFFF ${ }_{H}$ | OCR2Dxy |
| 0 | 1 | - |  |  | CUCR2Dx |  |
| 1 | - | 0 | TCNT1Dx | RCR1Dx | FFFFFFFFF $_{\text {H }}$ |  |
| 1 | - | 1 |  |  | CUCR1Dx |  |

Note 1. "-" indicates that the setting has no effect.

The table below shows the setting example when the range compare function is used and the counter value at which the range compare match occurs.
No.1, No. 3 are examples of the condition "When the set compare range is less than or equal to the select counter A/B upper limit value", and No.2, No. 4 are examples of the condition "When the set compare range exceeds the select counter A/B upper limit value".

Table 30.153 Range Compare Function Register Setting Example

| No. | CLR1Dx or CLR2Dx bit value | Counter upper limit setting compare register (CUCR1Dx, CUCR2Dx) | The write value of the output compare register (OCR1Dxy, OCR2Dxy) | Set value (range value) of range compare value setting register (RCR1Dx, RCR2Dx) | When writing to the output compare register (OCR1Dxy, OCR2Dxy), the value of the counter where range compare match occurs |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | - | FFFF0000 ${ }_{\text {H }}$ | 12 (range value: $\mathrm{FFF}_{\mathrm{H}}$ ) | FFFF0000 ${ }_{\text {H }}$ to FFFFFOFFF $_{\text {H }}$ *1 |
| 1 | 0 | - | FFFFF0000 ${ }_{\text {H }}$ | 18 (range value: $3 \mathrm{FFFF}_{\mathrm{H}}$ ) | FFFFF0000 $_{H}$ to FFFFFFFFF $_{H}$ $00000000_{\mathrm{H}}$ to $00030000_{\mathrm{H}}$ *2 |
| 2 | 1 | 00000FFF ${ }_{H}$ | 00000E00 ${ }_{\text {H }}$ | 6 (range value: $3 \mathrm{~F}_{\mathrm{H}}$ ) | $00000 \mathrm{E} 00_{\mathrm{H}}$ to $00000 \mathrm{E} 3 \mathrm{~F}_{\mathrm{H}}$ *3 |
| 3 | 1 | $00000 \mathrm{FFF}_{\mathrm{H}}$ | 00000E00 ${ }_{\text {H }}$ | 10 (range value: $3 \mathrm{FF}_{\mathrm{H}}$ ) | $00000 \mathrm{EOO}_{\mathrm{H}}$ to $00000 \mathrm{FFF}_{\mathrm{H}}$ $00000000_{\mathrm{H}}$ to $00000200_{\mathrm{H}}{ }^{* 4}$ |

Note 1. FFFFF0000 ${ }_{H}$ to ( FFFFOOOOO $_{H}+2^{\wedge 12-1) ~}$
Note 2. $00000000_{\mathrm{H}}$ to $\left(\right.$ FFFFOOOOO $_{\mathrm{H}}+2^{\wedge} 18-1-$ FFFFFFFFF $\left._{\mathrm{H}}\right)$
Note 3. $00000 \mathrm{E} 00_{H}$ to $\left(00000 E 00_{H}+2^{\wedge} 6-1\right)$
Note 4. $00000000_{\mathrm{H}}$ to $\left(00000 \mathrm{EOO}_{\mathrm{H}}+2^{\wedge} 10-1-00000 \mathrm{FFF}_{\mathrm{H}}\right)$

### 30.8.3.2 Counter Upper-Limit Setting Function

According to the setting for the counter upper-limit setting compare register 1 (CUCR1Dx), the upper-limit value of the timer counter (TCNT1Dx) in each subblock can be modified to change the one-shot pulse cycle. To enable the counter upper-limit setting function, the CLR1Dx bit in the timer control register D (TCRDx) must be set to 1 .

According to the setting for the counter upper-limit setting compare register 2 (CUCR2Dx), the upper-limit value of the timer counter (TCNT2Dx) in each subblock can be modified to change the one-shot pulse cycle. To enable the counter upper-limit setting function, the CLR2Dx bit in the timer control register D (TCRDx) must be set to 1 .

Figure $\mathbf{3 0 . 6 3}$ shows an example of operation when the counter upper-limit setting function in block D0 is enabled.

Figure 30.63 Operation of the Counter Upper-Limit Setting Function

Counter upper limit setting procedure

Figure 30.64 Counter Upper-Limit Function Setting Procedure

### 30.8.3.3 Capture Function

The input capture registers 1Dxy (ICR1Dxy) and 2Dxy (ICR2Dxy) capture the values counted by timer counters 1Dx (TCNT1Dx) and 2Dx (TCNT2Dx) in response to the compare match B and compare match A triggers, respectively. Capture proceeds on the rising edges of the pulses produced by matches.

Figure 30.65 Capture Operation

### 30.8.3.4 MIN Guard Function

The MIN guard unit is connected to each channel of timer D, and it is possible to add MIN guard function to TODxyA (compare match output) or TODxyB (one shot pulse output).

Figure 30.66 shows the basic operation of the MIN guard function.
When the waveform selected from TODxyA, TODxyB changes from OFF to ON, ONMINDxy setting value is loaded to ONMICNTDxy and ON width of the selected waveform is guarded with ONMICNTDxy.

Similarly, when the waveform selected from TODxyA and TODxyB changes from ON to OFF, the setting value of OFMINDxy is loaded into OFMICNTDxy, and the setting value of OTOMINDxy is loaded into OTOMICNTDxy at the timing when it switches from OFF to ON, and the selected waveform Guard the OFF width and ON to ON width.

Figure 30.66 Basic Operation of the MIN Guard Function

Figure $\mathbf{3 0 . 6 7}$ shows the output waveform when MIN guard correction of ON width is performed for TODxyA, TODxyB.

At the timing from OFF to ON, ONMINDxy setting value is loaded into ONMICNTDxy and start down counting.
If the generated waveform (TODxyA or TODxyB) turns OFF before ONMICNTDxy becomes 0 , the MIN guard correction is performed and the waveform after MIN guard (TODxyMA or TODxyMB) continues to be ON. After that, OFF waveform is output when ONMICNDxy becomes 0 .

Figure 30.67 MIN Guard Function ON Width MIN Correction Operation Diagram

Figure $\mathbf{3 0 . 6 8}$ shows the output waveform when MIN guard correction of OFF width is performed for TODxyA. At the timing from ON to OFF, load OFMINDxy setting value into OFMICNTDxy and start down counting.

If the generated waveform (TODxyA) turns ON before OFMICNTDxy becomes 0 , the MIN guard correction is performed, and the waveform after the MIN guard (TODxyMA) continues to be OFF.

After that, the ON waveform is output at the timing when OFMICNDxy becomes 0 .

Figure 30.68 MIN Guard Function OFF Width MIN Correction Operation Diagram (TODxyA Correction)

Figure 30.69 shows the output waveform when MIN guard correction of OFF width is performed for TODxyB.
In the correction operation for TODxyB, the downcounter DCNTDxy starts down-counting at the OFF to ON timing of the OFF width MIN correction waveform and guarantees the Max value of the ON width of the output waveform.

Figure 30.69 MIN Guard Function OFF Width MIN Correction Operation Diagram (TODxyB Correction)

Figure $\mathbf{3 0 . 7 0}$ shows the output waveform when MIN guard correction with ON to ON width is performed on TODxyA.

At the timing from OFF to ON, load the OTOMINDxy setting value into OTOMICNTDxy and start down counting. If the generated waveform (TODxyA) turns ON before OTOMICNTDxy becomes 0 , the MIN guard correction is performed, and the waveform after MIN guard (TODxyMA) continues to be OFF. After that, the ON waveform is output at the timing when OTOMICNDxy becomes 0 .

Figure 30.70 MIN Guard Function ON to ON Width MIN Correction Operation Diagram (TODxyA Correction)

Figure 30.71 shows the output waveform when MIN guard correction with ON to ON width is performed on TODxyB.

In the correction operation for TODxyB, the downcounter DCNTDxy starts down-counting at the timing from OFF to ON of the ON to ON width MIN correction waveform and guarantees the Max value of the ON width of the output waveform.

Figure 30.71 MIN Guard Function ON to ON Width MIN Correction Operation Diagram (TODxyB Correction)

Figure $\mathbf{3 0 . 7 2}$ shows the output waveform when MIN guard correction of ON width and MIN guard correction of OFF width are performed for TODxyA and TODxyB.

Each compensation counter loads the setting value from OFF to ON or ON to OFF timing of the output waveform after MIN guard.

Figure 30.72 MIN Guard Function ON Width, OFF Width MIN Correction Operation Diagram

Figure $\mathbf{3 0 . 7 3}$ shows the output waveform when MIN guard correction of OFF width and MIN guard correction of ON to ON width are performed for TODxyA.

Both corrections are always valid because MIN guard correction of OFF width and MIN guard correction of ON to ON width individually perform correction.

Figure 30.73 MIN guard function OFF width, ON to ON width MIN correction operation diagram

## Caution

For the above operation, the MIN guard correction setting OTOMINDxy of the ON to ON width has no substantial meaning unless this set the sum of ON width MIN guard correction ONMINDxy and OFF width MIN guard correction.

Figure $\mathbf{3 0 . 7 4}$ shows the operation when ONMINDxy is changed during operation.
ONMICNDxy has a down counter configuration, and when setting value is changed during operation, the new setting value is loaded into ONMICNTDxy at the timing when the output waveform after the next MIN guard turns from OFF to ON.

Figure 30.74 Change Setting while MIN Guard Function is Running

Figure $\mathbf{3 0 . 7 5}$ shows the operation when the generated waveform is turned from OFF to ON again while ON width is being corrected.

The MIN guard function does not hold the number of pulses input during the ON - MIN guard, so even if a waveform is input multiple times during the ON - MIN guard, it will be output as one pulse.

Figure 30.75 MIN Guard Regeneration of Correcting Waveform

Figure $\mathbf{3 0 . 7 6}$ shows the detailed timing when MIN guard correction is applied to TOD00A.
Interrupts are output from TOD00MA OFF to ON and ON to OFF timing after MIN guard correction, and the values of TCNT1D0 and TCNT2D0 are captured to ONCAP1D00, ONCAP2D00, OFCAP1D00, and OFCAP2D00.

Figure 30.76 Detailed Timing Diagram of MIN Guard Function

### 30.9 Timer E

### 30.9.1 Overview of Operation

The timer E block is a PWM output timer that consists of $\mathrm{SB}_{\mathrm{E}}$ timer E subblocks.
Timer E subblocks realize the following features:

- Output of waveform with a duty cycle of 0 to $100 \%$ by setting cycle-setting register and duty cycle setting register
- The values of the cycle-setting and duty-cycle-setting registers are updated every PWM cycle. The values in the cycle reload register and duty cycle reload register are reloaded as update data. The reloading function can be enabled and disabled.
- Writing $00000000_{\mathrm{H}}$ to the counter can forcibly end PWM cycle.
- The shutoff input pins (POEx) shut off the PWM output. (They can also be used as the timer F input pins.) This feature is supported by subblocks E0 to E5. Other subblocks does not support this feature.
- On-state duty and off-state duty modes available
- Interrupt requests can be issued on cycle match (compare match between cycle-setting register and timer counter), that is, interrupts are issued every cycle.
- Compare matches of the duty cycle setting register generate interrupt requests periodically.
- Compare matches between TCNTExy and CYLRExy can be generated forcibly by setting the forced compare match trigger register.

A timer E subblock Ex consists of 4 channels. Components of each channel include a 24 -bit up counter (TCNTExy), a 24-bit cycle-setting register (CYLRExy), a 24-bit duty-cycle-setting register (DTRExy), a 24-bit cycle reload register (CRLDExy), a 24-bit duty-reload register (DRLDExy), and a controller.

Subblocks E0 to E5 have a shutoff input pin (POEx), and each channel of each subblock has a PWM output pin (TOExy). (The default value of TOExy: 0)

POEx can also be used as TIF0A to TIF2A and TIF0B to TIF2B of timer F. For timer E, signals of TIF0A to TIF2A and TIF0B to TIF2B that have been processed by a noise canceler are used, which means that their noise canceler feature can be used. To use the noise canceler for the shutoff input signal of the PWM output shutoff feature, the timer F noise canceler setting is necessary as well as the timer E setting. For more about the setting, see Section 30.10, Timer F.

Table $\mathbf{3 0 . 1 5 4}$ shows the correspondence between TIF0A/B to TIF2A/B and POEx.
Table 30.154 Correspondence between Timer F Primary Inputs and Timer E Shutoff Inputs

| Timer F Primary Inputs | Timer E Shutoff Inputs |
| :--- | :--- |
| TIF0A | POE0 |
| TIF1A | POE1 |
| TIF2A | POE2 |
| TIF0B | POE3 |
| TIF1B | POE4 |
| TIF2B | POE5 |

Be noted that the timer F measurement signals become the shutoff input signals when TIF0A/B to TIF2A/B are used as POEx inputs and the corresponding timer $F$ subblocks are operated simultaneously.

Figure 30.77 shows a block diagram of timer E.

Note 1. The reload function is enabled when $\operatorname{SBRLDENEx}=1$ and RLDENExy $=1$.

Figure 30.77 Block Diagram of Timer E Subblock

### 30.9.2 Registers Related to Timer E

Table 30.155 TSTRE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $15-\mathrm{SB}_{\mathrm{E}}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| $\mathrm{SB}_{\mathrm{E}}-1$ to 0 | STREx | Subblock Ex Start |
|  | $0:$ Subblock Ex is disabled |  |
|  | 1: Subblock Ex is enabled |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks $E 0$ to $\mathrm{ESB}_{\mathrm{E}}-1$

TSTRE controls subblocks E0 to $\mathrm{ESB}_{\mathrm{E}}-1$.
The timer E counters run when the timer E enable bit (TEE) in the ATU master enable register (ATUENR), timer start register E (TSTRE), and subblock starting register E (SSTRE) must be set.

TSTRE is initialized to $0000_{\mathrm{H}}$ after reset.

## CAUTION

To synchronize timer operation for all channels in the subblock, as well as an SSTREx register, use the TSTRE register to enable or disable operation for each subblock.

### 30.9.2.2 SBRLENE — Subblock Reload Enable Register E

Value after reset: $\quad 01 \mathrm{FF}_{\mathrm{H}}$

Table 30.156 SBRLENE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $15-\mathrm{SB}_{\mathrm{E}}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| $\mathrm{SB}_{\mathrm{E}}-1$ to 0 | SBRLDENEx | Subblock Ex reload enable |
|  | 0 : The reload function for subblock Ex is disabled. |  |
|  | 1: The reload function for subblock Ex is enabled. |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks $E 0$ to $\mathrm{ESB}_{\mathrm{E}}-1$

The subblock reload enable register E (SBRLENE) is an 8-bit/16-bit readable/writable register enables and disables the reload function. The reload function is enabled when both the SBRLDENEx and RLDENExy bits are set to " 1 ", and is disabled in the other settings.

SBRLENE is initialized to $01 \mathrm{FF}_{\mathrm{H}}$ after reset.

## Subblock Ex Reload Enable Bit (SBRLDENEx)

When the SBRLDENEx and RLDENExy bits are set to " 1 " to enable the reload function, the values of the cycle reload register (CRLDExy) and the duty reload register (DRLDExy) are transferred to the cycle-setting register and duty cycle setting register, respectively, upon a cycle match between the timer counter (TCNTExy) and the cycle-setting register (CYLRExy).

### 30.9.2.3 SSTREx — Subblock Starting Registers Ex

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SSTREx3 | SSTREx2 | SSTREx1 | SSTREx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.157 SSTREx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | These bits are not used. When read, " 0 " is always returned. When writing, always write 0 . |
| 3 | SSTREx3 | Counter Ex3 start <br> 0 : Counter of channel 3 in subblock Ex is disabled <br> 1: Counter of channel 3 in subblock Ex is enabled |
| 2 | SSTREx2 | Counter Ex2 start <br> 0 : Counter of channel 2 in subblock Ex is disabled <br> 1: Counter of channel 2 in subblock Ex is enabled |
| 1 | SSTREx1 | Counter Ex1 start <br> 0 : Counter of channel 1 in subblock Ex is disabled <br> 1: Counter of channel 1 in subblock Ex is enabled |
| 0 | SSTREx0 | Counter Ex0 start <br> 0 : Counter of channel 0 in subblock Ex is disabled <br> 1: Counter of channel 0 in subblock Ex is enabled |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$

The subblock starting registers Ex (SSTREx) are 8-bit readable/writable registers. These registers control stop/start of timer counters of 4 channels of each subblock. This control is effective only for subblocks enabled by the timer start register (TSTRE).

SSTREx are initialized to $00_{\mathrm{H}}$ after reset.

## Counter Exy Start Bit (SSTRExy)

Enables and disables timer counter Exy (TCNTExy).

| SSTRExy | Function |  |
| :--- | :--- | :--- |
| 0 | Counting of TCNTExy is disabled. | (Default) |
| 1 | Counting of TCNTExy is enabled. |  |

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks E0 to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

When this bit is cleared to 0 , TCNTExy is disabled. TCNTExy retains the previous value while it is stopped. When this bit is set to 1 again, TCNTExy is resumed from the retained value.

Even if the counter Exy start bit is set to 1, counting does not start unless the enable bit of timer E is set to 1 by the ATU master enable register (ATUENR).

## CAUTION

The prescalers run independently of the setting of the SSTRExy bit and are not initialized when TCNTExy starts counting. Therefore, during the time between the activation and the start of actual count operation by the above counter, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

### 30.9.2.4 PSCREx — Prescaler Registers Ex

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | PSCEx[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/ | R/W | R/W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.158 PSCREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | These bits are not used. Fix these bits to 0. |
| 2 to 0 | PSCEx[2:0] | Division ratio |
|  |  | These bits set the division ratio of the prescaler. |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$

Prescaler registers Ex are 8-bit readable/writable registers.
Each subblock of timer E has one prescaler Ex that divides the frequency of the clock supplied via the clock bus. The register sets the division ratio of the prescaler Ex.

When the value in prescaler register Ex (PSCRE) is changed, the prescaler Ex updates the value on its underflow. Timer counter Exy (TCNTExy) ( $\mathrm{y}=0$ to 3 ) in the same subblock is driven by the clock output from prescaler Ex.

The settable value in prescaler register Ex (PSCRE) ranges from $0_{\mathrm{H}}$ to $7_{\mathrm{H}}$. The division ratio is given below.

Division ratio of prescaler $=\frac{1}{\operatorname{PSCEx}[2: 0]+1}($ setting range: $1 / 1$ to $1 / 8)$

A duty cycle of $50 \%$ for the prescaler Ex output clock is not guaranteed. The high level width is equal to the cycle of the PCLK and a low level is output in the remaining cycle of the prescaler E output clock.

Prescaler Ex runs when the TEE bit in the ATU master enable register (ATUENR) and the subblock Ex start bit (STREx) in timer start register E (TSTRE) are both set to 1 .

### 30.9.2.5 PSCCRExy — Prescaler Channel Registers Exy

Value after reset: $\quad 00_{\mathrm{H}}$

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3
Table 30.159 PSCCRExy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | PSCCExy[7:0] | Division Ratio |
|  |  | These bits set the division ratio of the prescaler. |

Note: $\quad x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Prescaler channel registers Exy are 8-bit readable/writable registers.
Each channel of timer E has one prescaler Exy that divides the frequency of the clock supplied via the clock bus. The register sets the division ratio of the prescaler Exy.

When the value in prescaler channel register Exy is changed, the prescaler Exy updates the value on its underflow. Timer counter E (TCNTExy) ( $\mathrm{y}=0$ to 3 ) in the same channel is driven by the clock output from prescaler Exy.

The settable value in prescaler channel register Exy ranges from $00_{\mathrm{H}}$ to $\mathrm{FF}_{\mathrm{H}}$. The division ratio is given below.

Division ratio of prescaler $=\frac{1}{\operatorname{PSCCExy}[7: 0]+1}($ setting range: $1 / 1$ to $1 / 256)$

A duty cycle of $50 \%$ for the prescaler Exy output clock is not guaranteed. The high level width is equal to the cycle of the PCLK and a low level is output in the remaining cycle of the prescaler E output clock

Prescaler Exy runs when the TEE bit in the ATU master enable register (ATUENR) and the subblock Ex start bit (STREx) in timer start register E (TSTRE) are both set to 1. The setting of the counter Exy start bit (SSTRExy) in the subblock start register Ex (SSTREx) does not affect operation of the prescaler Exy

### 30.9.2.6 TCREx - Timer Control Register Ex

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PSCSEL | - | - | - | - | CKSELEx[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R/W | R/W | R/W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.160 TCREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | PSCSEL | Prescaler select |
|  |  | 0: Select the prescaler registers Ex (PSCREx: 3-bit settings for subblock units). |
|  |  | : Selects the prescaler channel registers Exy (PSCCRExy: 8 bit settings for channel <br> units). |
| 6 to 3 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 2 to 0 | CKSELEx[2:0] | TCNTExy clock select |
|  |  | These bits select the counter clock of prescaler E from clock-bus lines 0 to 5. |

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks E0 to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Timer control registers Ex (TCREx) are 8-bit readable/writable registers that select the counter clock of prescaler E from clock-bus lines 0 to 5. 24-bit up counter (TCNTExy) is driven by the clock output from prescaler E.

## Prescaler Select (PSCSEL)

The prescaler can be selected in subblock units or in channel units. This selection makes a difference in the range of division ratios that can be selected for the prescaler.

## Subblock Ex Clock Select (CKSELEx[2:0])

The subblock Ex clock select (CKSELEx) selects the count source of the prescaler of subblock Ex.

| CKSELEx |  |  |  |
| :--- | :--- | :--- | :--- |
| $[2]$ | $[1]$ | $[0]$ |  |
| 0 | 0 | 0 | Clock-bus line 0 is selected as counter clock of prescaler E |
| 0 | 0 | 1 | Clock-bus line 1 is selected as counter clock of prescaler E |
| 0 | 1 | 0 | Clock-bus line 2 is selected as counter clock of prescaler $E$ |
| 0 | 1 | 1 | Clock-bus line 3 is selected as counter clock of prescaler E |
| 1 | 0 | 0 | Clock-bus line 4 is selected as counter clock of prescaler $E$ |
| 1 | 0 | 1 | Clock-bus line 5 is selected as counter clock of prescaler $E$ |
| 1 | 1 | 0 | Setting prohibited |
| 1 | 1 | 1 | Setting prohibited |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$

### 30.9.2.7 RLDCREx — Reload Control Registers Ex

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | RLDENEx3 | RLDENEx2 | RLDENEx1 | RLDENEx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.161 RLDCREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 to 0 | RLDENEx3 to | Reload enable Ex3 to Ex0 |
|  | RLDENEx0 | $0:$ Reload function on cycle match is disabled. |
|  |  | 1: Reload function on cycle match is enabled. |

Note: $x=0$ to $S B E_{E}-1$ : Corresponding to subblocks E0 to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Reload control registers Ex (RLDCREx) are 8-bit readable/writable registers. RLDENExy enables and disables the reload function. The reload function is enabled when both the SBRLDENEx and RLDENExy bits are set to " 1 ", and is disabled in the other settings.

RLDCREx is initialized to $00_{\mathrm{H}}$ after reset.

## Reload Enable Bit (RLDENExy)

When the SBRLDENEx and RLDENExy bits are set to " 1 " to enable the reload function, the values of the cycle reload register Exy(CRLDExy) and the duty reload register Exy(DRLDExy) are transferred to the cycle-setting register and duty cycle setting register, respectively, upon a cycle match between the timer counter Exy(TCNTExy) and the cyclesetting register Exy(CYLRExy).

### 30.9.2.8 POECREx — Output Shutoff Control Register Ex

Note: $x=0$ to $S B_{E}-1$ (MAX:5): Corresponding to subblocks $E 0$ to $E_{S B}{ }_{E}-1$
Note 1. Values written to the write key code are not retained.
Table 30.162 POECREx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 8 | POECRKEY[7:0] | 9C ${ }_{\text {\% }}$ : Values of POEENxy and POEPOLx can be changed. |
|  | Write key code | Other than 9С H: $^{\text {: Values of POEENxy and POEPOLx cannot be changed. }}$ |
| 7 to 5 | - | These bits are not used. When read, " 0 " is always returned. When writing, always write 0 . |
| 4 | POEPOLx | Shutoff input active level selection |
|  |  | 0 : Shutoff input is active low. |
|  |  | 1: Shutoff input is active high. |
| 3 | POEENx3 | Output shutoff enable/disable |
| 2 | POEENx2 | 0 : Output shutoff is disabled. |
| 1 | POEENx1 | 1: Output shutoff is enabled. |
| 0 | POEENx0 |  |

Note: $\quad x=0$ to $S B_{E}-1$ (MAX:5): Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

Output shutoff control register Ex (POECREx) is a 16-bit readable/writable register. To write a value to this register, the data to be written must be provided and the write key code must be set in bits 15 to 8 . This feature is not supported for subblocks 6 to 8 because there is no POE6 to POE8 inputs.

POECREx is initialized to $0000_{\mathrm{H}}$ after reset.

## Write Key Code (POECRKEY)

This code controls the write permission for bits POEENxy ( $y=0$ to 3 ) and POEPOLx. Setting is required to bits 15 to 8 as well as the data to be written to bits POEENxy $(y=0$ to 3$)$ and POEPOLx. Data written to these bits is not retained; Value $00_{\mathrm{H}}$ is always returned when being read.

## Shutoff Input Active Level Selection (POEPOLx)

Controls the active level of the shutoff input (POEx). The setting of this bit applies to all channels of the subblock.

## Output Shutoff Enable/Disable (POEENxy)

Controls disable/enable of the output shutoff feature. This bit can be set for each channel.
For details of the output shutoff feature, see Figure 30.81 in Section 30.9.3, Details of Operation.

### 30.9.2.9 SOLVLEx — Output Shutoff Level Setting Register Ex

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PWMSLVx3 | PWMSLVx2 | PWMSLVx1 | PWMSLVx0 |

Note: $x=0$ to $S B_{E}-1$ (MAX:5): Corresponding to subblocks $E 0$ to $E S B_{E}-1$
Table 30.163 SOLVLEx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 | PWMSLVx3 | Output level H/L selection |
| 2 | PWMSLVx2 | 0: The low level is output to TOExy when output is shutoff. |
| 1 | PWMSLVx1 | 1: The high level is output to TOExy when output is shutoff. |
| 0 | PWMSLVx0 |  |

Note: $x=0$ to $S B_{E}-1$ (MAX:5): Corresponding to subblocks $E 0$ to $E S B_{E}-1$

The output shutoff level setting register Ex (SOLVLEx) is an 8-bit readable/writable register.
SOLVLEx is initialized to $00_{\mathrm{H}}$ after reset.

## Output Level H/L Selection (PWMSLVxy)

This bit specifies the output level of TOExy in the output shutoff state.

### 30.9.2.10 TSREx - Timer Status Registers Ex

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.164 TSREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 11 to 8 | DMFEx3 to DMFEx0 | Duty match flags Ex3 to Ex0 |
|  |  | 0: No duty match has occurred. |
|  |  | 1: A Duty match has occurred. |
| 7 to 4 | OVFEx3 to OVFEx0 | Overflow flags Ex3 to Ex0 |
|  |  | 0: Counter E has not overflowed |
|  |  | 1: Counter E has overflowed |
| 3 to 0 | CMFEx3 to CMFEx0 | Cycle match flags Ex3 to Ex0 |
|  |  | 0: Cycle match has not occurred |
|  |  | 1: Cycle match has occurred |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$

The timer status register Ex (TSREx) is an 8-bit or a 16-bit read-only register. In subblocks E0 to E8, these registers indicate occurrence of compare match (cycle match) of cycle-setting registers (CYLRExy) and timer counters (TCNTExy), compare match (duty match) of duty cycle setting registers (DTRExy) and timer counters (TCNTExy), and overflow of TCNTExy.

The overflow flag is the status flag for indicating the occurrence of overflow. It does not generate interrupts. The cycle match flag and the duty match flag are status flags for requesting interrupts. Interrupts can be issued by setting the corresponding bits of the TIEREx register. When interrupt is permitted at the TIEREx register, setting the corresponding flags issues interrupt requests. Setting a bit of the timer status clear register Ex (TSCREx) clears the corresponding flag. When set and clear competed, clear is given priority to. Also, by setting the corresponding bit of the TIEREx register, it is possible to generate a sDMA / DTS transfer request. If a duty match (or cycle match) occurs again while the duty match flag DMFExy (or the cycle match flag CMFExy) is set, a transfer request to sDMA / DTS can not be generated. To generate a transfer request to sDMA / DTS, it is necessary to clear the flag by "CPU interrupt processing" or "sDMA / DTS chain transfer".

TSREx is initialized to $0000_{\mathrm{H}}$ after reset.

Duty Match Flag Exy (DMFExy)

| DMFExy | Function |
| :--- | :--- |
| 0 | [Clearing condition] |
| 1 | When 1 is written to the DMFCExy bit of the timer status clear register Ex (TSCREx). |
| When the counter clock is input in the condition where the timer counter Exy (TCNTExy) value <br> coincides with the duty cycle setting register Exy (DTRExy) value. |  |

Note: $x=0$ to $S B E_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

This flag cannot be set to 1 or 0 by software. The next duty match can be processed even if DMFExy is 1 (even if the flag is not cleared). In this case, 1 is rewritten to these bits. However, an interrupt request or sDMA / DTS transfer request can be realized only when DMFExy is 0 (only when the flag is cleared).

## Cycle Match Flag Exy (CMFExy)

| CMFExyl | Function |
| :--- | :--- |
| 0 | [Clearing conditions] |
|  | When 1 is written to the CMFCExy bit of the timer status clear register Ex (TSCREx). |
| 1 | [Setting condition 1] |
|  | When timer counter Exy (TCNTExy) is incremented while it is the same value as cycle-setting |
|  | register Exy (CYLRExy) |
|  | [Setting condition 2] |
|  | When a compulsion cycle match (1 write to FCMTxy) occurred. |

Note: $x=0$ to $S B E_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
These bits cannot be set to 1 or 0 by software. Even if these bits are 1 , meaning that the flag has not been cleared, the next cycle match can be input. In this case, 1 is rewritten to these bits. However, an interrupt request or sDMA / DTS transfer request can be realized only when CMFExy is 0 (only when the flag is cleared).

Overflow Flag Exy (OVFExy)

| OVFExy | Function |
| :--- | :--- |
| 0 | [Clearing conditions] |
|  | When 1 is written to the OVFCExy bit of the timer status clear register Ex (TSCREx). |
| 1 | [Setting condition] |
|  | When the 24 higher-order bits of timer counter Exy (TCNTExy) value changes from FFFF FF <br> $H$ |
| to $000000_{\mathrm{H}}$ |  |

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
These bits are set to 1 when timer counter Exy (TCNTExy) overflows. This flag cannot be set to 1 or 0 by software.
Overflow occurs when the 24 higher-order bits of timer counter Exy is incremented while it is $\operatorname{FFFF} \mathrm{FF}_{\mathrm{H}}$. Writing $000000_{\mathrm{H}}$ to the timer counter Exy has no effect on these bits.

When writing a value to the timer counter and incrementation occur simultaneously while the counter is $\mathrm{FFFF}_{\mathrm{FF}}^{\mathrm{H}}$, the overflow flag is set to 1 but the counter value is changed to the written value instead of $000000_{\mathrm{H}}$.

As to cycle match, since the counter is cleared to $000001_{\mathrm{H}}$, overflow will not occur. However, it may occur when the value in the cycle-setting register is changed during counter in operation.

When overflow and cycle match occur simultaneously, overflow is not detected (the counter is incremented while it is FFFF $\mathrm{FF}_{\mathrm{H}}$ and CYLREx is $\mathrm{FFFF} \mathrm{FF}_{\mathrm{H}}$ ). In this case, only the processing upon detection of cycle match is performed. If counter value is $000001_{\mathrm{H}}$ and the reload function is enabled, cycle reload or duty-cycle reload is performed. When overflow and duty match occur simultaneously, the same operation is performed because a cycle match occurs with duty cycle of $100 \%$.

### 30.9.2.11 TSCREx - Timer Status Clear Registers Ex

Value after reset: $\quad 0000 \mathrm{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | $\begin{array}{\|c} \text { DMFCE } \\ \text { x } 3 \end{array}$ | $\begin{array}{\|c} \hline \text { DMFCE } \\ \mathrm{x} 2 \end{array}$ | $\begin{array}{\|c} \text { DMFCE } \\ \times 1 \end{array}$ | $\begin{array}{\|c\|} \hline \text { DMFCE } \\ \times 0 \end{array}$ | $\begin{gathered} \text { OVFCE } \\ \text { x3 } \end{gathered}$ | $\begin{array}{\|c} \text { OVFCE } \\ \text { x2 } \end{array}$ | $\begin{gathered} \text { OVFCE } \\ \times 1 \end{gathered}$ | $\begin{array}{\|c} \text { OVFCE } \\ \text { x } 0 \end{array}$ | $\left\|\begin{array}{c} \text { CMFCE } \\ \text { x } 3 \end{array}\right\|$ | $\begin{array}{\|c} \text { CMFCE } \\ \text { x2 } \end{array}$ | $\begin{array}{\|c} \text { CMFCE } \\ \times 1 \end{array}$ | $\begin{array}{\|c} \hline \text { CMFCE } \\ \text { x } 0 \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W | W | W | W | W | W | W | W | W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.165 TSCREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to12 | - | These bits are not used. When read, "0" is always returned. When writing, always write "0". |
| 11 to 8 | DMFCExy | Duty match flag clear enable Exy |
|  |  | 0: Disabled (Default) |
|  | 1: Clears DMFExy of timer status register Ex (TSREx) to 0. |  |
| 7 to 3 | OVFCExy | Overflow flag clear enable Exy |
|  |  | 0: Disabled (Default) |
|  | 1: Clears OVFExy of timer status register Ex (TSREx) to 0. |  |
| 3 to 0 | CMFCExy | Cycle match flag clear enable Exy |
|  |  | 0: Disabled (Default) |
|  | 1: Clears CMFExy of timer status register Ex (TSREx) to 0. |  |

Note: $x=0$ to $S B E_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
The timer status clear registers Ex (TSCREx) are 8-bit or a 16-bit readable/writable registers. When read, " 0 " is always returned. TSCREx specifies flag clearing in the events of overflow of timer counters Exy (TCNTExy), cycle match of TCNTExy and cycle-setting registers Exy (CYLRExy), and duty match of TCNTExy and duty cycle setting registers Exy (DTRExy).

TSCREx is readable/writable in 16-bit units. When read, " 0 " is always returned.
TSCREx is initialized to $0000_{\mathrm{H}}$ after reset.

## Duty Match Flag Clear Enable Exy (DMFCExy)

This flag specifies flag clearing at the time of duty match of TCNTExy and the duty cycle setting register Exy (DTRExy).

Setting this bit enables clearing of the duty match flag Exy (DMFExy) of the timer status register Ex (TSREx). When this bit is read, " 0 " is always returned.

| DMFCExy | Function |  |
| :--- | :--- | ---: |
| 0 | Disabled | (Default) |
| 1 | Clears DMFExy of timer status register Ex (TSREx) to 0. |  |
| Note: $x=0$ to SB $_{\mathrm{E}}-1:$ Corresponding to subblocks $E 0$ to $\mathrm{ESB}_{\mathrm{E}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |  |

## Overflow Flag Clear Enable Exy (OVFCExy)

This bit specifies flag clearing at the time of overflow of the timer counter Ex (TCNTExy).
Setting this bit enables clearing of the overflow flag Exy (OVFExy) of the timer status register Ex (TSREx). When this bit is read, " 0 " is always returned.

| OVFCExy | Function |  |
| :--- | :--- | :--- |
| 0 | Disabled | (Default) |
| 1 | Clears OVFExy of timer status register E (TSREx) to 0. |  |

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .

## Cycle Match Flag Clear Enable Exy (CMFCExy)

This flag specifies flag clearing at the time of cycle match of TCNTExy and the cycle-setting register Exy (CYLRExy). Setting this bit enables clearing of the cycle match flag Exy (CMFExy) of the timer status register Ex (TSREx). When this bit is read, " 0 " is always returned.

| CMFCExy | Function |
| :--- | :--- |
| 0 | Disabled |
| 1 | Clears CMFExy of timer status register Ex (TSREx) to 0. |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1:$ Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |

### 30.9.2.12 TIEREx - Timer Interrupt Enable Registers Ex

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.166 TIEREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 11 to 8 | DMEEx3 to DMEEx0 | Duty match interrupt enable Ex3 to Ex0 <br> Specifies enable/disable of interrupt requests issued by duty match flags DMFExy. |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 to 0 | CMEEx3 to CMEEx0 | Cycle match interrupt enable Ex3 to Ex0 <br> Specifies enable/disable of interrupt requests issued by cycle match flags CMFExy. |

The timer interrupt enable registers Ex (TIEREx) are 8-bit or a 16-bit readable/writable registers. TIEREx controls enable/disable of interrupts triggered by compare match (cycle match) of the cycle-setting register (CYLRExy) and TCNTExy and compare match (duty match) of the duty cycle setting register (DTRExy) and TCNTExy.

TIEREx is initialized to $0000_{\mathrm{H}}$ after reset.

## Duty Match Interrupt Enable Exy (DMEExy)

This flag specifies enable/disable of interrupt requests triggered by duty match of DTExy.
Setting this bit enables interrupts issued by the duty match flag Ex (DMFExy) of the timer status register (TSREx).

| DMEExy | Function |
| :--- | :--- |
| 0 | Interrupts by DMFExy are disabled. |
| 1 | Interrupts by DMFExy are enabled. |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1:$ Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |
| Cycle Match Interrupt Enable Exy (CMEExy) |  |

This flag specifies enable/disable of interrupt requests triggered by cycle matches of CYLRExy.
A cycle match flag (CMFExy) of the timer status register (TSREx) can be output as an interrupt by setting this bit.

| CMEExy | Function |
| :--- | :--- |
| 0 | Interrupts by CMFExy are disabled. |
| 1 | Interrupts by CMFExy are enabled. |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1:$ Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. | (Default) |

## CAUTION

Interrupt requests by cycle match Ex (CMFExy) and duty match Exy (DMFExy) of timer subblock Ex are issued as the logical sum of CMFExy and DMFExy. Whether the interrupt request is triggered by a cycle match or a duty match of the counter can be determined by referencing TSREx. Clear the corresponding interrupt request flag of TSREx when processing the interrupt.

### 30.9.2.13 TOCREx - Timer Output Control Registers Ex

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | TONEEx3 | TONEEx2 | TONEEx 1 | TONEEx0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.167 TOCREx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 to 0 | TONEExy | TOExy output inversion select <br>  |

Note: $\quad \mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1 . \mathrm{y}=0,1,2,3$ : Corresponding to channels 0 to 3 .

Timer output control registers Ex (TOCREx) are 8-bit readable/writable registers that select whether or not a signal on the output pin TOExy in each subblock Ex is inverted.

TOCREx is initialized to $00_{\mathrm{H}}$ after reset.

## TOExy Output Inversion Select (TONEExy)

These bits select whether to invert the PWM output signal from TOExy.

| TONEExy | Function | (Default) |
| :--- | :--- | :--- |
| 0 | Normal output from the output pin (TOExy) |  |
| 1 | Inverted output from the output pin (TOExy) |  |
| Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1:$ Corresponding to subblocks E0 to $\mathrm{ESB}_{\mathrm{E}}-1 . y=0,1,2,3:$ Corresponding to channels 0 to 3. |  |  |

When the on-state duty/off-state duty setting of TOCREEx is changed, the TOExy output is inverted immediately after the change of the register setting by the next clock cycle (PCLK). The operating state of the timer counter (TCNTExy) has no effect on the mode switching.

The initial level on the PWM output pin is " 0 " (TONEExy $=0$ ).

### 30.9.2.14 FCTRGEx — Forced Compare Match Trigger Registers Ex

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | FCMTx3 | FCMTx2 | FCMTx1 | FCMTx0 |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks E 0 to $\mathrm{ESB}_{\mathrm{E}}-1$
Table 30.168 FCTRGEx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 to 0 | FCMTxy | Forced cycle match trigger |
|  |  | $0:$ disable (initial value) |
|  | 1: Forcibly generate a cycle match between TCNTExy and CYLRExy. |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{E}}-1$ : Corresponding to subblocks $E 0$ to $\mathrm{ESB}_{\mathrm{E}}-1$

The forced compare match trigger registers Ex (FCTRGEx) are 8-bit writable registers. When FCTRGEx is read, " 0 " is always returned. FCTRGEx is used to specify whether to generate a cycle match between TCNTExy and CYLRExy of each subblock forcibly.

FCTRGEx is initialized to $00_{\mathrm{H}}$ after reset.

## CAUTION

This bit can be set to " 1 " only when the operation of the timer counter Exy (TCNTExy) is stopped. (When any bit of TEE, STREx, or SSTRExy is 0 ).

### 30.9.2.15 TCNTExy — Timer Counters Exy

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
Note 1. These bits are not used. Fix these bits to " 0 ".

Timer counters Exy (TCNTExy) are 32-bit readable/writable registers allocated in channel y of subblock Ex. These registers are started by setting the TEE bit in the ATU master enable register (ATUENR), the subblock Ex start bit (STREx) in the timer start register (TSTRE), and the counter Exy start bit (SSTRExy) in subblock starting register (SSTREx). When the 8 lower-order bits are read, 0 is always read.

The counter clock is selected by the TCNTEx clock select bits (CKSELEx[2:0]) in timer control register Ex (TCREx), prescaler register (PSCREx) and prescaler channel registers Exy (PSCCRExy) of timer E.

When a cycle match with the cycle register Exy (CYLRExy) occurs, or when a cycle match between TCNTExy and CYLRExy is forced generated by setting the forced compare match trigger register Ex (FCTRGEx), The 24 higherorder bits of TCNTExy is initialized to $000001_{\mathrm{H}}$. For example, when the 24 higher- order bit value of the cycle-setting register is N and the counter value is to be incremented from N to $\mathrm{N}+1$, the counter value is changed to 1 . This enables counting from 1 to N and PWM pulses with the cycle time of N is produced.

These counters can count from $000001_{\mathrm{H}}$ to FFFF $\mathrm{FF}_{\mathrm{H}}$ (when the 24 higher- order bit value of the cycle-setting register is FFFF $\mathrm{FF}_{\mathrm{H}}$ ).

When writing $000000_{\mathrm{H}}$ to these counters, a PWM cycle is terminated and a new PWM cycle is started from $000001_{\mathrm{H}}$ in the next clock cycle. While the counter value holds $000000_{\mathrm{H}}$, when TONEExy $=0$, the PWM output retains the previous value and outputs a level of 1 at the beginning of the new cycle. When the PWM cycle is terminated before duty match, the duty cycle for that PWM cycle is $100 \%$ ( 1 is always output), that is, a level of 0 will not be output between PWM cycles. For details on writing $000000_{\mathrm{H}}$ to these counters, see Figure $\mathbf{3 0 . 7 9}$ and Figure $\mathbf{3 0 . 8 0}$.

When TCNTExy or CYLRExy is rewritten during the counter in operation, a cycle match may not occur even if the value of the counter reaches $\mathrm{FFFF}_{\mathrm{FF}}^{\mathrm{H}}$. In this case, the counter value is changed from FFFF FFF H to $000000_{\mathrm{H}}$ in the next counter clock cycle. A PWM cycle is terminated in a way similar to writing $000000_{\mathrm{H}}$. The counter value is incremented to $000001_{\mathrm{H}}$ and a new PWM cycle is started. When the reload function is enabled, reloading of the cycle or duty cycle is also performed.

TCNTExy is initialized to $00000100_{\mathrm{H}}$ after reset.

### 30.9.2.16 CYLRExy — Cycle-Setting Registers Exy

Note: $\quad x=0$ to $S B B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2$, 3: Corresponding to channels 0 to 3 .
Note 1. These bits are not used. Fix these bits to " 0 ".

CYLRExy are 32-bit readable/writable registers that store the cycle of PWM. The settable 24 higher- order bit value of the ranges from $000001_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{FF}}^{\mathrm{H}} \mathrm{C}$. When the 8 lower-order bits are read, 0 is always read.

The value in CYLRExy is constantly compared with the value in the timer counter Exy (TCNTExy). When they match, TCNTExy is cleared to $000001_{\mathrm{H}}$. A compare match between CYLRExy and TCNTExy can be generated forcibly by setting the FCTRGEx register. When the SBRLDENEx bit in the subblock reload enable register E (SBRLENE) and the RLDENExy bit in the reload control register Ex (RLDCREx) are set to 1, the values in the cycle reload register Exy (CRLDExy) and duty reload register Exy (DRLDExy) are transferred to cycle-setting register Exy (CYLRExy) and duty cycle setting register Exy (DTRExy), respectively. Writing $000000_{\mathrm{H}}$ to the 24 higher-order bits of TCNTExy can forcibly end PWM cycle and start the same reloading as above at the next clock cycle. Interrupt request to CPU can be made by a compare match (cycle match) of the cycle-setting register.

To rewrite to CYLRExy during TCNTExy in operation, note that the value to be set may lead to malfunction. When TCNTExy in operation is rewritten, a cycle match between TCNTExy and DTRExy may not be detected and TCNTExy continues to be incremented even if the counter value exceeds the value in CYLRExy. In this case, unwanted PWM waveforms are output.

CYLRExy is initialized to $\mathrm{FFFF}_{\mathrm{FF} 00_{\mathrm{H}}}$ after reset.

### 30.9.2.17 DTRExy — Duty Cycle Setting Registers Exy

Note: $x=0$ to $S B B E_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
Note 1. These bits are not used. Fix these bits to " 0 ".

DTRExy are 32-bit readable/writable registers that store the duty cycle of PWM. The settable 24 higher- order bit value of ranges from $000000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{FF}}^{\mathrm{H}}$. When the 8 lower-order bits are read, 0 is always read.

The value in DTRExy is constantly compared with the value in timer counter Exy (TCNTExy). When they match, the output level on the pin for the corresponding channel becomes 0 . When the values in CYLRExy and TCNTExy match while the SBRLDENEx bit in the subblock reload enable register E (SBRLENE) and the RLDENExy bit of the reload control register Ex (RLDCREx) are set to 1 , the value in DRLDExy is reloaded to DTRExy. Writing $000000_{\mathrm{H}}$ to TCNTExy can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

The settable value in DTRExy ranges from 0 to the value in CYLRExy. When 0 is set, the duty cycle is $0 \%$ and the same value as CYLRExy is set, the duty cycle is $100 \%$. Do not set DTRExy to a value greater than CYLRExy.

To rewrite to DTRExy during TCNTExy in operation, note that the value to be set may lead to malfunction. When TCNTExy in operation is rewritten, a duty match may not be detected. In this case, unwanted PWM waveforms may be output.

DTRExy is initialized to FFFF $\mathrm{FFO}_{\mathrm{H}}$ after reset.

### 30.9.2.18 CRLDExy — Cycle Reload Registers Exy

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
Note 1. These bits are not used. Fix these bits to " 0 ".

Cycle reload registers xy (CRLDExy) are 32-bit readable/writable register, and can be set to $000001_{\mathrm{H}}$ to $\mathrm{FFFF} \mathrm{FF}_{\mathrm{H}}$ as the cycle of PWM outputs. When the 8 lower-order bits are read, 0 is always read.

When the reload function is enabled (when the SBRLDENEx bit in the subblock reload enable register (SBRLENE) and the RLDENxy bit in the reload control register (RLDCREx) are set to " 1 "), the value in this register is transferred to the cycle-setting register Exy (CYLRExy) on cycle match. Writing $000000_{\mathrm{H}}$ to TCNTExy can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

CRLDExy is initialized to $\mathrm{FFFF}_{\mathrm{FF} 00_{\mathrm{H}}}$ after reset.

### 30.9.2.19 DRLDExy — Duty Reload Registers Exy

Note: $x=0$ to $S B_{E}-1$ : Corresponding to subblocks $E 0$ to $E S B_{E}-1 . y=0,1,2,3$ : Corresponding to channels 0 to 3 .
Note 1. These bits are not used. Fix these bits to " 0 ".

Duty reload registers Exy (DRLDExy) are a 32-bit readable/writable register, and can be set to $000000_{\mathrm{H}}$ to FFFF $\mathrm{FF}_{\mathrm{H}}$ as the duty cycle. When the 8 lower-order bits are read, 0 is always read.

When the reload function is enabled (when the SBRLDENEx bit in the subblock reload enable register (SBRLENE) and the RLDENxy bit in the reload control register (RLDCREx) are set to " 1 "), the value in this register is transferred to the duty cycle setting register Exy (DTRExy) on cycle match. Writing $000000_{\mathrm{H}}$ to TCNTExy can forcibly end PWM cycle and start the same reloading as above at the next clock cycle.

DRLDExy is initialized to FFFF $_{\mathrm{FF} 00_{\mathrm{H}}}$ after reset.

### 30.9.3 Details of Operation

Timer E consists of 24-bit timer counter Exy (TCNTExy), 24-bit cycle-setting register Exy (CYLRExy), 24-bit duty cycle setting register Exy (DTRExy), 24-bit cycle reload register Exy (CRLDExy), and 24-bit duty reload register Exy (DRLDExy). Timer E can be used as a PWM timer.

TCNTExy starts counting up when a channel is selected by subblock starting register (SSTREx) after a subblock is selected by timer start register (TSTRE). When TONEExy $=0$, a logical zero level is output on pin TOExy on the first edge of the counter clock after TCNTExy matches duty cycle setting register Exy (DTRExy), or a logical one level is output on pin TOExy on the first edge the counter clock after TCNTExy matches cycle-setting register Exy (CYLRExy). After a match with the cycle-setting register, cycle match occurs, the counter is set to $000001_{\mathrm{H}}$ on the next counter clock edge and starts counting up again. A compare match between TCNTExy and the cycle match register Exy (CYLRExy) can be generated forcibly by setting the forced compare match trigger register Ex (FCTRGEx).

Subsequently, duty match and cycle match are repeated, producing a PWM output on pin TOExy
However, external output level retains the default value of " 0 " for one cycle which is from starting up the counter to the first cycle match. In addition, when a forced cycle match is generated by the FCTRGEx register while the counter is stopped, the inactive level is output when the duty is $0 \%$, and the active level is output when the duty is not $0 \%$.

For duty determination, when the reload function is enabled (SBRLDENEx = 1 and RLDENExy $=1$ ), it judges whether the duty of the timer E is set to $0 \%$ by the duty reload register Exy (DRLDExy). When the reload function is disabled (SBRLDENEx $=0$ or RLDENExy $=0$ ), it judges by the duty register Exy (DTRExy).

The settable PWM cycle ranges from $000001_{\mathrm{H}}$ to $\mathrm{FFFF} \mathrm{FF}_{\mathrm{H}}$. The settable duty cycle ranges from $0 \%$ to $100 \%$. The values set in the cycle-setting register and duty cycle setting register are used as the cycle width and duty cycle width, respectively. When the duty cycle setting register is set to $0000_{\mathrm{H}}$, the output level is 0 and remains unchanged (when TONEExy $=0$, duty cycle $=0 \%$ ). When the values in duty cycle setting register and cycle-setting register are the same, the output level is 1 and remains unchanged (when TONEExy $=1$, duty cycle $=100 \%$ ). The value in duty cycle setting register must be equal to or less than the value in cycle-setting register.

An interrupt request can be generated per cycle by a compare match (cycle match) of the cycle-setting register.

Figure 30.78 Operation of PWM (1)

The duty cycle setting and cycle-setting registers have respective reload registers. When the values in the up-counter and cycle-setting register match, the values in the duty cycle reload and cycle reload registers are loaded to the duty cycle setting and cycle-setting registers, respectively. The loaded data is updated in the next PWM cycle after loading. The reload function is enabled and disabled by the SBRLDENEx bit in the subblock reload enable register (SBRLENE) and reload enable bit (RLDENExy) in the reload control register (RLDCREx).
In timer E, a PWM output cycle is terminated by writing $000000_{\mathrm{H}}$ to the counter (TCNTExy). The counter is changed from $000000_{\mathrm{H}}$ to $000001_{\mathrm{H}}$ on the next counter clock and the counter is restarted. When the counter value is changed, the values in the duty cycle reload and cycle reload registers are loaded to the duty cycle setting and cycle-setting registers, respectively.

Figure $\mathbf{3 0 . 7 8}$ shows the operation of the PWM timer of channel 0 , block E0, in which the duty cycle is changed from $75 \%$ to $67 \%, 0 \%$, and to $100 \%$ in every cycle.
Figure $\mathbf{3 0 . 7 9}$ shows the PWM output cycle terminated by writing $000000_{\mathrm{H}}$ to the counter and the counter restarted.

Figure 30.79 Operation of PWM (2)

Writing $000000_{\mathrm{H}}$ to the 24 higher-order bits of the counter changes the 24 higher-order bits values of the counter to $000000_{\mathrm{H}}$. The output waveform (TOEO0) does not change. If the reload function is enabled, an input of counter clock after writing $000000_{\mathrm{H}}$ transfers the values of the cycle reload register and the duty reload register to the cycle-setting register and the duty cycle setting register, respectively. At the same time, counting starts and PWM output also starts.

A waveform is output in off-state duty (active-low output) mode when the off-state duty mode is selected by setting the corresponding bit in the timer output control register Ex (TOCREx). The output waveform on pin TOExy is inverted on the next PCLK cycle after setting.

Figure $\mathbf{3 0 . 8 0}$ shows an example of a waveform when switching on- and off-state duty modes. By selecting the offstate duty mode before the counter is started, the initial output level on the PWM output pin TOE00 is 1 . After the counter started until the first cycle match, the level on pin TOE00 retains 1 . On the following cycle match and duty match, the output levels are alternated. When the PWM cycle is forcibly terminated by writing $000000_{\mathrm{H}}$ to the 24 higher-order bits of the counter, TOE00 retains the previous value. At the timing in which the 24 higher-order bits of the counter is incremented to $000001_{\mathrm{H}}$, a new PWM cycle is started.

Figure 30.80 Operation of PWM (3)

Figure 30.81 illustrates the output waveform when PWM output is shutoff. PWM output is shutoff if the output shutoff enable/disable selection bit (POEENxy) of the output shutoff control register Ex (POECREx) is enabled and shutoff input (POEx) is enabled during a duty period (between a cycle match in the previous PWM cycle to a duty match). POEx being enabled during non-duty period does not trigger a shutoff. During an output shutoff period, the signal is output to TOExy at the level specified by the output level H/L selection bit (PWMSLVxy) of the output shutoff setting register Ex (SOLVLEx). This output level is not affected by the inversion setting (on-state/off-state duty) of the corresponding bit of the timer output control register (TOCREx).

The state of output shutoff is released if POEx is disabled at the time of a cycle match. The state of PWM output being shutoff continues to the next cycle match if POEx is in the enabled state at the above-mentioned timing.

Figure 30.81 Example of PWM Output Shutoff

## - Supplementary note:

The shutdown state continues until the next cycle match, even if POEx is temporarily enabled or disabled within the duty period. When the setting is for a duty cycle of $100 \%$ (except when it becomes $0 \%$ due to reloading), the shutdown state can newly be set by enabling POEx, even at the time of a cycle match. Shutdown or release from shutdown is in accord with POEx for forced ending of the PWM cycle when the counter is $000000_{\mathrm{H}}$, if the setting is not for a duty cycle of $0 \%$ (including it becoming $0 \%$ due to reloading). After POEx has been disabled, only a request for release from shutdown is accepted if the setting is for a duty cycle of $0 \%$ (including it becoming $0 \%$ due to reloading).

### 30.10 Timer F

### 30.10.1 Overview of Operation

The timer F block consists of $\mathrm{SG}_{\mathrm{F}}$ timer F subblocks.
Timer F subblocks realize the following functions:

- Edge counting in a specified period:

Counts the number of edges input to the external input pin (TIFxA)

- Effective edge interval counting:

Measures time until a specified number of edges is input to the external pin (TIFxA).

- Measurement of time during high/low input levels:

Measures a total amount of time when a high or low level is input to the external input pin (TIFxA). The duration of measurement is designated as the number of pulses input to the external pin.

- Measurement of PWM input waveform timing:

Measures the off-duty period and cycle time of the PWM waveform input to the external pin (TIFxA). The duration of measurement is designated as the number of PWM cycles input to the external pin.

- Rotation speed/pulse measurement (for the subblock 3 to $\mathrm{SB}_{\mathrm{F}}-1$ only):

Every time an edge is input to the external pin (TIFxA), the following values are retained edge count, time stamp at edge input, edge input interval (cycle), and high/low input level immediately before input.

- Up/down event count (for subblocks 0 to 2 only):

TIFxA of the two external pins (TIFxA, TIFxB) is used to count as the count source. TIFxB switches between upcounting and down-counting.

- Four-time multiplication event count (for subblocks 0 to 2 only):

Counting operation is executed using two external input pins (TIFxA, TIFxB) as the count sources. Signals in the pins switch between up-counting and down-counting.

Input signals from the external input pins TIFxA and TIFxB can be subject to the noise cancellation function using the input cancellation function. Noise-canceled signals from TIA00 to TIA0 $\mathrm{SB}_{\mathrm{A}}-1$ of timer A can be used instead of external signal input pin TIFxA.

Inputs of TIF0A to TIF2A and TIF0B and TIF2B can also be used as inputs (shutoff inputs) for POE0 to POE5 of timer E. For the correspondence between TIFxA/B and POEx, see Table $\mathbf{3 0 . 1 5 4}$ of timer E.

Note that, if any of TIF0A to TIF2A and TIF0B to TIF2B is used as a shutoff input of timer E, the shutoff input becomes the measurement target of the corresponding timer F subblock.

## Configuration

Figure 30.82 is a block diagram of timer F. Components of a timer F subblock include two external outputs (TIFxA and TIFxB), two 32-bit counters (ECNTAFx and ECNTCFx), three 32-bit general registers (GRAFx, GRCFx, and GRDFx), three 32-bit backup registers (BGRAFx*1, BGRCFx, and BGRDFx*2), 16-bit up/down counters (ENCTBFx), 16-bit general registers (GRBFx), an input processor (edge detection and noise canceler), and a controller.

Figure 30.82 Block Diagram of Timer F Subblock

Note 1. The BGRAFx register is provided for subblocks 3 to $\mathrm{SB}_{\mathrm{F}}-1$ only.
Note 2. The BGRDFx register is provided for subblocks 3 to $\operatorname{SBF}-1$ only.

## Interrupt request

The timer F can output two types of interrupts totaling $\mathrm{SB}_{\mathrm{F}} \times 2$ interrupts.

- OVFFx interrupt requests $\left(\mathrm{SB}_{\mathrm{F}}\right.$ interrupts $\left(0 \leq \mathrm{x} \leq \mathrm{SB}_{\mathrm{F}}-1\right)$ ): An interrupt is output when one of the three counters (ECNTAFx, ECNTBFx, ECNTCFx) in the subblock Fx has overflowed or underflowed (only in ECNTBFx). They can also be used as compare match interrupts in PWM input waveform measurement mode and "rotation speed/pulse measurement" mode. To which counter the interrupt belongs can be known by referring to the timer status register F (ISRF). This request is received by the INTC block and the designated processing is performed.
- ICFFx interrupt requests $\left(\mathrm{SB}_{\mathrm{F}}\right.$ interrupts $\left.\left(0 \leq \mathrm{x} \leq \mathrm{SB}_{\mathrm{F}}-1\right)\right)$ : The interrupt is output when a count value capturing in the timer subblock Fx occurs. This request is received by INTC and performs designated processing by interrupt request.

### 30.10.2 Registers Related to Timer F

### 30.10.2.1 TSTRF — Timer Start Register F

Value after reset: $00000000_{\mathrm{H}}$

Table 30.169 TSTRF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to $S B_{F}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| SB $_{F}-1$ to 0 | STRFx | Timer F start |
|  |  | 0: Stops counting of ECNTAFx, ECNTBFx, and ECNTCFx. |
|  | 1: Permits counting of ECNTAFx, ECNTBFx, and ECNTCFx. |  |

Note: $x$ indicates the subblock number (channel number) of 0 to $S B_{F}-1$.
TSTRF is an 8-bit/16-bit/32-bit readable/writable register that specifies whether to operate or stop each subblock (timer F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$ ) in the timer F .

Count operation is not executed unless TFE bit in ATU master enable register (ATUENR) is enabled even if the start bit in timer $F$ is set to enable the count operation.

TSTRF is initialized to $00000000_{\mathrm{H}}$ after reset.

## Counter F Start (STRFx)

These bits specify whether to operate or stop two time counters (ECNTAFx, ECNTCFx) in subblocks (F0 to $\mathrm{FSB}_{\mathrm{F}}-1$ ) of timer $F$ and event counter (ECNTBFx).

When this bit is cleared to 0 , ECNTAFx, ECNTBFx, and ECNTCFx stop operation. Counter value is retained at stop state. When this bit is set to 1 once again, the operation starts at the retained value.

Count operation is not executed unless TFE bit in ATU master enable register (ATUENR) is enabled even if the start bit in timer F is set enable the count operation.

## CAUTION

The prescalers run independently of the setting of the STRFx bit and are not initialized at the start of counter. Therefore, during the time between the activation and the start of actual count operation by the above counter, hardware-related uncertainty shorter than the period of selected count source (resolution) accompanies.

### 30.10.2.2 NCMCR1F — Noise Cancellation Mode Channel Register 1F

Table 30.170 NCMCR1F Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to $\mathrm{SB}_{\mathrm{F}}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| $\mathrm{SB}_{\mathrm{F}}-1$ to 0 | NCM1Fx | Channel $x$ |
|  | Noise Cancel Mode |  |
|  | Specify the operating mode of noise canceler in channel $x$. |  |
| 0 0: Premature-transition cancellation mode |  |  |
|  | 1: Minimum time-at-level cancellation mode (when NCMF $=0$ and NCM2Fx $=0$ ) |  |
|  | 1: Level accumulation cancellation mode (when NCMF $=0$ and NCM2Fx = 1) |  |

Note: $x$ indicates the subblock number (channel number) of 0 to $\mathrm{SB}_{\mathrm{F}}-1$.
NCMCR1F is an 8-bit/16-bit/32-bit readable/writable register that selects the operation mode of noise canceller for each channel unit.

In premature-transition cancellation mode, after an input signal level change is detected, any input signal level change in the specified period is ignored. This mode regards a signal level change in the specified period as noise after the first level change is detected.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

## Noise Cancellation Mode Bit of Channel x (NCM1Fx)

Specify the operation mode of noise canceller in channel $x$.

## CAUTION

This register is only effective when the NCMF bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 ". Furthermore, when the corresponding channel bit (NCM1Fx) in this register is set to " 1 ", the mode can be set to premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode according to the state of the corresponding channel bit in the noise cancellation mode channel register 2F (NCMCR2F).
Note: x indicates 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

### 30.10.2.3 NCMCR2F — Noise Cancellation Mode Channel Register 2F

Table 30.171 NCMCR2F Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to $S B_{F}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| SB $_{F}-1$ to 0 | NCM2Fx | Specify the operating mode of noise canceler in channel $x$. |
|  | $0:$ Minimum time-at-level cancellation mode (when NCMF $=0$ and NCM1Fx $=1$ ) |  |
|  | 1: Level accumulation cancellation mode (when NCMF $=0$ and NCM1Fx =1) |  |

Note: $x$ indicates the subblock number (channel number) of 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

Noise cancel mode channel register 2F is an 8-bit/16-bit/32-bit readable/writable register that selects the operation mode of the noise canceler for each channel.

In minimum time-at-level cancellation mode, after an input signal level change is detected, the first and subsequent level changes are ignored unless the input signal level remains the same over the specified period. This mode regards a signal level change that occurs within a shorter period as noise.

In level accumulation cancellation mode, input signal levels are accumulated and the input level is regarded to have reached 0 or 1 when the accumulation result becomes 0 or the specified value.

Each period is specified by the noise canceler register of each channel and the noise canceler counter measures time.

## Noise Cancellation Mode Bit 2 of Channel x (NCM2Fx)

Specify the operation mode of noise canceller in channel $x$.

## CAUTION

This register is only effective when the NCMF bit of the noise cancellation mode register (NCMR) in the common control unit is " 0 ". The channel mode when the corresponding bit (NCM2Fx) of this register is set to 1 can be set to the minimum time-at-level cancellation mode or the level accumulation cancellation mode depending on the setting of the corresponding bit of the noise cancel mode channel register 1F (NCMCR1F).
Note: x indicates 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

### 30.10.2.4 NCCRF — Noise Canceller Control Register F

Table 30.172 NCCRF Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to $\mathrm{SB}_{\mathrm{F}}$ | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| $\mathrm{SB}_{\mathrm{F}}-1$ to 0 | NCEFx | Noise canceler enable Fx |
|  | 0: The noise cancellation is disabled for TIFXA and TIFXB. |  |
|  | 1: The noise cancellation is enabled for TIFXA and TIFxB. |  |

Note: $x$ indicates the subblock number (channel number) of 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

The noise canceler control register F (NCCRF) is an 8-bit/16-bit/32-bit readable/writable register that specifies enable/disable of the noise cancellation function of each subblock (timer F 0 to timer $\mathrm{FSB}_{\mathrm{F}}-1$ ) of timer F .

NCCRF is initialized to $00000000_{\mathrm{H}}$ after reset.

## Noise Canceller Enable Fx (NCEFx)

Specify to enable/disable the noise canceller in each subblock. Regarding the subblocks 2 to 0 , each subblock has noise cancellers TIFxA and TIFxB but enabling/disabling these cancellers cannot be specified independently. Setting the NCEFx bit to 1 enables each noise canceller in TIFxA and TIFxB.

When a level change of the external input signal TIFxA or TIFxB is detected while this bit is set to " 1 ", it is processed in premature-transition cancellation mode, minimum time-at-level cancellation mode, or level accumulation cancellation mode depending on the setting in the noise cancel mode register (NCMR) of common controller, noise cancel mode channel register 1F (NCMCR1F) of timer F, and nose cancel mode channel register 2F (NCMCR2F) of timer F.

In premature-transition cancellation mode, when a level change of the input signal is detected, the change is output as the signal whose noise is removed and the corresponding noise canceler counter (NCNTFA0 to NCNTFASB ${ }_{F}-1$, NCNTFB0 to NCNTFB2) starts counting up. Subsequent level changes are masked until the value in the counter reaches the value in the noise canceler register (NCRFA0 to NCRFASB $\mathrm{N}_{\mathrm{F}}-1$ and NCRFB2 to NCRFB0). When this compare match occurs, the level of the input signal at that time is output as the signal after noise cancellation.
When these bits are cleared to " 0 " while NCNTFAx and NCNTFBx are being incremented, counting continues until the values in the counter and the noise canceler register match. The subsequent level changes of TIFAx and TIFBx are also masked over this period.

In minimum time-at-level cancellation mode, when a level change of the external input signal is detected, the corresponding noise canceler counter (NCNTFA0 to NCNTFASB ${ }_{F}-1$, NCNTFB0 to NCNTFB2) starts counting up. If subsequent level changes are not detected until the value in the counter reaches the value in the noise canceler register (NCRFA0 to NCRFASB ${ }_{F}-1$ and NCRFB2 to NCRFB0), the previously accepted level change is output as the signal after noise cancellation upon compare match of the counter and noise canceler register. When the subsequent level change is detected before the values in the counter and noise canceler register match, all the changes are treated as noise. Therefore, the noise canceler assumes that the levels of external input signals have not changed and does not change the signal after cancellation.

When these bits are cleared to " 0 " while NCNTFAx and NCNTFBx are being incremented, counting continues until the values in the counter and the noise canceler register match or a level change on the input signal is detected.

In level accumulation cancellation mode, the corresponding noise canceler counter (NCNTFA0 to NCNTFASB ${ }_{F}-1$, NCNTFB0 to NCNTFB2) increments or decrements according to the input signal level. The noise canceler counter increments (up-counting) when the input signal level is high, and decrements (down-counting) when the input signal level is low. Up-counting continues until the noise canceler counter reaches the value set in the noise canceler register (NCRFA0 to NCRFASB ${ }_{F}-1$ and NCRFB2 to NCRFB0). Down-counting continues until NCNTAx reaches $00_{\mathrm{H}}$.

When a compare match (with NCRFA0 to NCRFASB ${ }_{F}-1$ and NCRFB2 to NCRFB0) occurs during up-counting, the noise canceler output is updated to " 1 ". When a compare match (with $0000_{\mathrm{H}}$ ) occurs during down-counting, the noise canceler output is updated to " 0 ".

In minimum time-at-level cancellation mode and premature-transition cancellation mode, level changes are always detected by PCLK regardless of the selected noise-canceler clock. In level accumulation cancellation mode, input level sampling is performed by the noise canceler clock (PCLK or PCLK/128).

For details of operations for noise cancellation, see Figure 30.1, Figure 30.2, and Figure 30.3.

### 30.10.2.5 PVFCRF — Private Function Control Register F

Value after reset: $\quad 0000_{H}$

Note 1. Values written to the write key code are not retained.
Table 30.173 PVFCRF Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 8 | PVFCRKEY[7:0] | Write key code <br> C9 ${ }_{\mathrm{H}}$ : GRDFCMEN and BKCRWEN values can be changed. <br> Other than $\mathrm{C9}_{\mathrm{H}}$ : GRDFCMEN and BKCRWEN values cannot be changed. |
| 7 to 2 | - | These bits are not used. When read, " 0 " is always returned. When writing, always write 0 . |
| 1 | GRDFCMEN | GRDFx compare match enable <br> 0 : GRDFx compare match function is disabled in PWM input waveform measurement mode. <br> 1: GRDFx compare match function is enabled in PWM input waveform measurement mode. |
| 0 | BKCRWEN | Backup control register Fx write enable <br> 0 : The BKCRFx register is not writable. <br> 1: The BKCRFx register is writable. |

Note: $x$ indicates the subblock number (channel number) of 0 to $S B_{F}-1$.
The private function control register $\mathrm{F}(\mathrm{PVFCRF})$ is a 16 -bit readable/writable register. To write a value to this register, write key code setting is required to bits 15 to 8 as well as the data to be written.

PVFCRF is initialized to $0000_{\mathrm{H}}$ after reset.

## Write Key Code (PVFCRKEY)

This code controls the write permission for bits GRDFCMEN and BKCRWEN. Setting is required to bits 15 to 8 as well as the data to be written to bits GRDFCMEN and BKCRWEN. Data written to this bit is not retained; Value $00_{\mathrm{H}}$ is always returned when being read.

## GRDFx Compare Match Enable (GRDFCMEN)

Controls enable/disable of the compare match between time measurement counter CFx (ECNTCFx) and general register DFx (GRDFx). This bit takes effect in PWM input waveform mode, and is ignored in other modes. (GRDFx compare match function is disabled.)

The setting of this bit is applied to all subblocks of timer F. Subblock-individual setting is not possible.

## Backup Control Register Fx Write Enable (BKCRWEN)

Controls write permission to the backup control register Fx (BKCRFx).
The setting of this bit is applied to all subblocks of timer F. Subblock-individual setting is not possible.

### 30.10.2.6 TCR1Fx — Timer Control Registers 1Fx

Value after reset: $\quad 00_{H}$

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{S B}^{F}-1$
Table 30.174 TCR1Fx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | CKSELFx[2:0] | Clock select Fx <br> Specify the clock sources for the time counters (ECNTAFx, ECNTCFx). <br> 000: Clock bus 0 <br> 001: Clock bus 1 <br> 010: Clock bus 2 <br> 011: Clock bus 3 <br> 100: Clock bus 4 <br> 101: Clock bus 5 <br> 110: Setting prohibited <br> 111: Setting prohibited |
| 4 to 2 | MDFx[2:0] | Timer operation mode Fx <br> Specify the operation mode for the corresponding subblocks Fx. <br> 000: Edge counting in a specified period <br> 001: Effective edge interval counting <br> 010: Measurement of time during high/low input levels <br> 011: Setting prohibited <br> 100: Measurement of PWM input waveform timing <br> 101: Rotation speed/pulse measurement <br> 110: Up/down event count <br> 111: Four-time multiplication event count |
| 1, 0 | EGSELFx[1:0] | Edge select Fx <br> Specify the edge sense mode of TIFXA input or TIA00 to TIAOSB ${ }_{A}-1$ input. <br> 00: Edge detection disabled <br> 01: Rising edge <br> 10: Falling edge <br> 11: Both edges |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Timer control register Fx (TCR1Fx) is an 8-bit readable/writable register that specifies the operation mode of the subblocks F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$.

TCR1Fx is initialized to $00_{\mathrm{H}}$ after reset.

## Clock Select Fx (CKSELFx)

Specify the clock sources for the two time counters (ECNTAFx, ECNTCFx) in the subblocks F0 to FSB ${ }_{F}-1$
Setting these bits to a value from " 000 " to " 101 " selects the corresponding clock bus ( 0 to 5 ) as the clock source. Do not specify " 110 " and " 111 ". If specified, the operation is not guaranteed.

## Timer Operation Mode Fx (MDFx)

Specify the operation mode for the timer subblocks F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$. There are seven modes: up/down event count, fourtime multiplication event count, edge counting in a specified period, effective edge interval counting, measurement of time during high/low input levels, measurement of PWM input waveform timing, and rotation speed/pulse measurement.

Do not set rotation speed/pulse measurement for subblocks other than subblocks 3 to $\mathrm{SB}_{\mathrm{F}}-1$.

## Edge Select Fx (EGSELFx)

Specifies the event input (TIFxA) of timer subblocks F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$ and the edge sense mode of pin inputs (TIA00 to TIA0SB ${ }_{A}-1$ ) from timer A.

Edge detection is done for signals that have passed through the noise canceller. Therefore, edge detection is done to the external input (TIFxA, TIFxB) if the noise cancellation function is disabled, and to signals after noise cancel if the noise cancellation function is enabled.

While measurement of time during high/low input levels is specified, when this bit selects the falling edge, measurement of time during high level is specified. When this bit selects the rising edge, measurement of time during low level is specified. Do not select both edges.

While measurement of PWM input waveform timing and rotation speed/pulse measurement are specified, when this bit selects the rising edge, the period between the two rising edges is regarded as the PWM cycle and the low level period is regarded as the off-duty period. If the falling edge is selected, the period between the two falling edges is regarded as the PWM cycle and the high-level period is regarded as the off-duty period. Do not select both edges.

When up/down event count mode and four-time multiplication event count mode are specified, be sure to designate both the rising and falling edges. If otherwise selected, the operation is not guaranteed.

## CAUTION

The TIFxB pin is only available in up/down event count and four-time multiplication event count mode. TIFxB operates always detecting both the rising and falling edges. In the other modes, TIFxB does not detect edges.

### 30.10.2.7 TCR2Fx - Timer Control Registers 2Fx

Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | EISELEFX | - | - | - | - | EISELFx[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R/W | R/W | R/N |

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F S B_{F}-1$
Table 30.175 TCR2Fx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | EISELEFx | Event input selection enable Fx |
|  | Selects the event input. |  |
|  | 0: Selects TIFxA. |  |
|  | 1: Selects the signal processed by noise cancellation of TIA. |  |
| 6 to 3 | - | These bits are not used. Fix these bits to 0. |
| 2 to 0 | EISELFx | Event input selection Fx |
|  |  | Selects the TIA signal when the signal processed by noise cancellation of TIA is selected by |
|  |  | EISELEFx. |
|  |  | $000:$ Selects the signal of TIA00 of timer A processed by noise canceling. |
|  |  | $010:$ Selects the signal of TIA01 of timer A processed by noise canceling. |
|  |  | 011: Selects the signal of TIA03 of timer A processed by noise canceling. |
|  |  | 100: Selects the signal of TIA04 of timer A processed by noise canceling. |
|  |  | 101: Selects the signal of TIA05 of timer A processed by noise canceling. |
|  |  | 111: Selects the signal of TIA07 of timer A processed by noise canceling. |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

The timer control register 2 Fx (TCR2Fx) is an 8-bit readable/writable register that specifies the event input of each subblock (timer F0 to timer $\mathrm{FSB}_{\mathrm{F}}-1$ ) of timer F .

TCR2F0 to TCR2FSB ${ }_{F}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## Event Input Selection Enable Fx (EISELEFx)

Selects an event input for each subblock (timer F 0 to timer $\mathrm{FSB}_{\mathrm{F}}-1$ ) included in timer F .
By setting this bit, noise-canceled signals from TIA00 to TIA $0 \mathrm{SB}_{\mathrm{A}}-1$ of timer A can be used as the event input instead of external input pin TIFxA.

## Event Input Selection Fx (EISELFx)

When EISELEFx is set to 1 , noise-canceled signal TIA00 to TIA0SB ${ }_{A}-1$ of timer A can be selected as the event input for each subblock (timer F 0 to timer $\mathrm{FSB}_{\mathrm{F}}-1$ ) included in timer F .

### 30.10.2.8 TIERFx — Timer Interrupt Enable Registers Fx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | OVECFx | OVEBFx | OVEAFx | ICIEFx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{S B}^{F}-1$
Table 30.176 TIERFx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0 . |
| 3 | OVECFx | Overflow interrupt enable CFx <br> 0 : Interrupt by OVFCFx disabled <br> 1: Interrupt by OVFCFx enabled |
| 2 | OVEBFx | Overflow interrupt enable BFx <br> 0 : Interrupt by OVFBFx disabled <br> 1: Interrupt by OVFBFx enabled |
| 1 | OVEAFx | Overflow interrupt enable AFx <br> 0 : Interrupt by OVFAFx disabled <br> 1: Interrupt by OVFAFx enabled |
| 0 | ICIEFX | Input capture interrupt enable Fx <br> 0 : Interrupt by ICFFx disabled <br> 1: Interrupt by ICFFx enabled |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

Timer interrupt enable registers Fx (TIERF0 to TIERFSB ${ }_{\mathrm{F}}-1$ ) are 8-bit readable/writable registers that specify whether to enable or disable the interrupt corresponding to the timer status register Fx (TSRFx).

TIERF0 to TIERFSB ${ }_{\mathrm{F}}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## Overflow Interrupt Enable CFx (OVECFx)

Specifies whether to enable or disable interrupt requests of the state (OVFCFx) corresponding to overflow of timer measurement counter Cx (ECNTCFx) (when it is in PWM input waveform measurement mode and the GRDFCMEN bit of the PVFCRF register is 0 ), corresponding to compare match of ECNTCFx and GRDFx (when it is in PWM input waveform measurement mode and the GRDFCMEN bit of the PVFCRF register is 1 ), or corresponding to compare match of ECNTCFx and GRBFx (rotation speed/pulse measurement mode).*1

## Overflow Interrupt Enable BFx (OVEBFx)

Specifies whether to enable or disable the interrupt of the state (OVFBFx) corresponding to the overflow/underflow of the event counter x (ECNTBFx). ${ }^{* 1}$

## Overflow Interrupt Enable AFx (OVEAFx)

Specifies whether to enable or disable the interrupt of the state (OVFAFx) corresponding to the overflow of the time measurement counter Ax (ECNTAFx).*1

## Input Capture Interrupt Enable Fx (ICIEFx)

Specifies whether to enable or disable the interrupt of the state (ICFFx) corresponding to the input capture or compare match detection status in subblock Fx ( F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$ ).*1

Note 1. The overflow of interrupt of the timer subblock Fx is requested as the logical sum of the interrupts OVFAFx, OVFBFx, and OVFCFx, by referring to TSRFx, which counter generated the interrupt by overflow or underflow can be known. Clear the corresponding interrupt request flag of TSRFx when processing the interrupt.

### 30.10.2.9 BKCRFx — Backup Control Register Fx

Value after reset: $\quad 00_{H}$
[Subblocks F00 to F02]

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{F B}-1$
[Subblocks F03 to $\mathrm{FSB}_{\mathrm{F}}$-1]

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$
Note 1. Writing to this register is permitted only when the BKCRWEN bit of the PVFCRF register is 1.
Table 30.177 BKCRFx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | This bit is not used. When read, " 0 " is always returned. When writing, always write 0 . |
| 6 | BKENAFx*1 | Backup enable A <br> Saving GRAFx in BGRAFx when CDRFx is read <br> 0: Not saved <br> 1: Saved |
| 5 | BKENCFx | Backup enable C <br> Saving GRCFx in BGRCFx when CDRFx is read <br> 0: Not saved <br> 1: Saved |
| 4 | BKENDFx*1 | Backup enable D <br> Saving GRDFx in BGRDFx when CDRFx is read <br> 0: Not saved <br> 1: Saved |
| 3 | - | This bit is not used. When read, " 0 " is always returned. When writing, always write 0 . |
| 2 | ARSWAFx*1 | Mapping to access register switching A To FFE6 $5054_{\mathrm{H}}+\left(40_{\mathrm{H}} \times \mathrm{x}\right)$ <br> 0 : GRAFx is mapped. <br> 1: BGRAFx is mapped. |
| 1 | ARSWCFx | Mapping to access register switching C To FFE6 $5064_{\mathrm{H}}+\left(40_{\mathrm{H}} \times \mathrm{x}\right)$ <br> 0 : GRCFx is mapped. <br> 1: BGRCFx is mapped. |
| 0 | ARSWDFx*1 | Mapping to access register switching $D$ To FFE6 $5068_{H}+\left(40_{H} \times x\right)$ <br> 0 : GRDFx is mapped. <br> 1: BGRDFx is mapped. |

Note 1. BKENAFx, BKENDFx, ARSWAFx, and ARSWDFx exist only in subblocks F03 to $\mathrm{FSB}_{\mathrm{F}}-1$. They are not deployed in F 00 to F02. When these bits are read, " 0 " is always returned. When writing, write " 0 ".
Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

The backup control register Fx ( $\mathrm{BKCRF}^{2} 0$ to $\mathrm{BKCRFSB}_{\mathrm{F}}-1$ ) is an 8-bit readable/writable register. Writing to BKCRF00 to BKCRFSB ${ }_{F}-1$ is permitted only when the BKCRWEN bit of the private function control register F (PVFCRF) is 1.

BKCRF00 to BKCRFSB ${ }_{F}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## Backup Enable Bits A, C, and D (BKENAFx, BKENCFx, BKENDFx)

These bits permit or prohibit value saving of GRAFx to BGRAFx, GRCFx to BGRCFx, and GRDFx to BGRDFx when capture output register Fx (CDRFx) is read.

## Access Register Switching Bits A, C, and D (ARSWAFx, ARSWCFx, ARSWDFx)

These bits specify whether BGRAFx is mapped instead of GRAFx to address FFE6 $5054_{\mathrm{H}}+\left(40_{\mathrm{H}} \times \mathrm{x}\right)$, whether BGRCFx is mapped instead of GRCFx to address FFE6 $5064_{\mathrm{H}}+\left(40_{\mathrm{H}} \times \mathrm{x}\right)$, and whether BGRDFx is mapped instead of GRDFx to address FFE6 5068 ${ }_{\mathrm{H}}+\left(40_{\mathrm{H}} \times \mathrm{x}\right)$.

## CAUTION

Setting of this register always takes effect regardless of the operation mode. Value saving and mapping change are performed even for registers that do not operate in some operation mode.

### 30.10.2.10 TSRFx - Timer Status Registers Fx

Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | OVFCFx | OVFBFx | OVFAFx | ICFFx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F S B_{F}-1$
Table 30.178 TSRFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 | OVFCFx | Overflow flag CFx |
|  |  | 0: No overflow in ECNTCFx |
|  | 1: ECNTCFx overflows |  |
| 2 | OVFBFx | Overflow flag BFx |
|  | 0: No overflow or underflow in ECNTBFx |  |
|  |  | 1: ECNTBFx overflows or underflows |
| 1 | OvFAFx | O: No overflow flag AFx in ECNTAFx |
|  |  | 1: ECNTAFx overflows |
| 0 | ICFFx | Input capture flag Fx |
|  |  | 0: Input capture is not detected in the subblock Fx |
|  |  | 1: Input capture in subblock Fx detected |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

Timer status registers Fx (TSRF0 to TSRFSB ${ }_{\mathrm{F}}$-1) are 8-bit readable registers that indicate overflows in the time counters A and C, overflow or underflow in the event counter, and input capture occurrence.

This flag is a status flag that indicates occurrence of an interrupt request. For overflow flags AFx, BFx, and CFx (OVFAx, OVFBx, and OVFCx), interrupt requests can be issued by setting the TIERFx register. Setting a bit of the timer status clear register Fx (TSCRFx) clears the corresponding flag.

For input capture flag Fx (ICFFx), an interrupt request is made again If an interrupt source takes effect while this flag is set. An interrupt request is made even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source.

For overflow flags, an interrupt request is issued when the corresponding flag is set by setting the corresponding bit of timer interrupt enable register Fx (TIERFx).

TSRF0 to TSRFSB ${ }_{F}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## Overflow/Compare Match Flag CFx (OVFCFx)

Values of this flag indicate different conditions depending on the operation mode and the setting of the GRDFx compare match enable bit (GRDFCMEN) of the private function control register (PVFCRF). When the PWM input waveform measurement mode is set, value 0 of the GRDFCMEN bit makes this flag indicate an overflow of time measurement counter Cx (ECNTCFx), and value 1 of the GRDFCMEN bit makes this flag indicate a compare match of ENCTCFx and GRDFx. In "rotation speed/pulse measurement" mode, this flag indicates a compare match of ECNTCFx and GRBFx regardless of the GRDFCMEN bit setting.

This flag cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition
(Measurement of PWM input waveform timing mode)
[GRDFCMEN $=0$ ]
When the value of ECNTCFx has overflown (FFFF $\mathrm{FFFF}_{\mathrm{H}}$ to $00000000_{\mathrm{H}}$ )
[GRDFCMEN = 1]
When the values of ECNTCFx and GRDFx coincide.
(Rotation speed/pulse measurement mode)
When ECNTCFx and GRDFx (the value of zero extension to the 16 lower-order bits) coincide
- Clearing (to 0 ) condition

When 1 is written to OVFCCFx of the timer status clear register Fx (TSCRFx).

## Overflow Flag BFx (OVFBFx)

By this flag, overflow or underflow of the event counter Fx (ECNTBFx) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition

When ECNTBFx overflows $\left(\mathrm{FFFF}_{\mathrm{H}}\right.$ to $\left.0000_{\mathrm{H}}\right)$ or underflows $\left(0000_{\mathrm{H}}\right.$ to $\left.\mathrm{FFFF}_{\mathrm{H}}\right)$

- Clearing (to 0 ) condition

When 1 is written to OVFCBFx of the timer status clear register Fx (TSCRFx).

## Overflow Flag AFx (OVFAFx)

By this flag, overflow of the time counter AFx (ECNTAFx) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1) condition When ECNTAFx overflows (FFFF FFFF ${ }_{H}$ to $00000000_{\mathrm{H}}$ )
- Clearing (to 0 ) condition When 1 is written to OVFCAFx of the timer status clear register Fx (TSCRFx).

## Input Capture/Compare Match Flag Fx (ICFFx)

By this bit, the detection state of input capture and compare match in the subblock $\mathrm{Fx}\left(\mathrm{F} 0\right.$ to $\mathrm{FSB}_{\mathrm{F}}-1$ ) can be monitored. This flag cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition

When input capture is detected in subblock Fx

- Clearing (to 0 ) condition

When 1 is written to ICFCFx of the timer status clear register Fx (TSCRFx)

### 30.10.2.11 TSCRFx - Timer Status Clear Register Fx

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | OVFCCFx | OVFCBFx | OVFCAFx | ICFCFx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | W | W | W | W |

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{S B}^{F}-1$
Table 30.179 TSCRFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. When read, "0" is always returned. When writing, always write 0. |
| 3 | OVFCCFx | Overflow flag clear FC enable |
|  |  | 0: Disabled (Default) |
|  | 1: Clears OVFCFx of timer status register F (TSRFx) to 0. |  |
| 2 | OVFCBFx | Overflow flag clear FB enable |
|  | 0: Disabled (Default) |  |
|  | 1: Clears OVFBFx of timer status register F (TSRFx) to 0. |  |
| 1 | OVFCAFx | Overflow flag clear FA enable |
|  | $0:$ Disabled (Default) |  |
|  | 1: Clears OVFAFx of timer status register F (TSRFx) to 0. |  |
| 0 | Overflow flag clear F enable |  |
|  | $0:$ Disabled (Default) |  |
|  |  | 1: Clears ICFFx of timer status register F (TSRFx) to 0. |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

The timer status clear register Fx (TSCRF00 to TSCRFSB ${ }_{F}-1$ ) is an 8-bit writable register. This register specifies flag clearing in the events of an overflow of time measurement counter A or C , an overflow or an underflow of an event counter, and an input capture occurrence.

TSCRFx is readable/writable only in 8 -bit units. When this register is read, " 0 " is always returned.
TSCRFx is initialized to $00_{\mathrm{H}}$ after reset.

## Overflow Flag Clear FC Enable (OVFCCFx)

When overflow flag FCx (OVFCFx) of timer status register Fx (TSRFx) is set to 1 , writing 1 to this register clears OVFCFx to 0 . This register is always read as 0 .

## Overflow Flag Clear FB Enable (OVFCBFx)

When overflow flag FBx (OVFBFx) of timer status register Fx (TSRFx) is set to 1 , writing 1 to this register clears OVFBFx to 0 . This register is always read as 0 .

## Overflow Flag Clear FA Enable (OVFCAFx)

When overflow flag FAx (OVFAFx) of timer status register Fx (TSRFx) is set to 1 , writing 1 to this register clears OVFAFx to 0 . This register is always read as 0 .

## Input Capture Flag Clear B0 Enable (ICFCFx)

When input capture flag Fx (ICFFx) of timer status register Fx (TSRFx) is set to 1 , writing 1 to this register clears ICFFx to 0 . This register is always read as 0 .

### 30.10.2.12 ECNTAFx - Timer Measurement Counters AFx

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{F B}^{F}-1$
Table 30.180 ECNTAFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ECNTAFx | Time measurement count AFx |
|  |  | Up-counter A |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Timer measurement counters AFx (ECNTAF0 to ECNTAFSB $\mathrm{E}_{\mathrm{F}}-1$ ) are 32-bit readable/writable registers. These registers are readable/writable only in 32-bit units. Do not write or read 8-bit or 16-bit data for these registers.

This register provided one for each subblock, and executes up-count operation using the input clock. One clock bus from clock buses 0 to 5 can be selected as the input clock according to the setting of the corresponding control register. The input clocks for ECNTAFx and ECNTCFx are the same. Clock source cannot be set independently.

When clearing the counter is done at the counting-up timing, ECNTAFX is cleared to $00000001_{\mathrm{H}}$, and to $00000000_{\mathrm{H}}$ in other cases.

ECNTAF0 to ECNTAFSB $_{\mathrm{F}}-1$ are initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.10.2.13 ECNTBFx - Event Counters Fx

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 0 to $\mathrm{FSB}_{\mathrm{F}}-1$
Table 30.181 ECNTBFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | ECNTBFx | Event count Fx |
|  |  | Up/down counter |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.
Event counters Fx (ECNTBF0 to ECNTBFSB ${ }_{\mathrm{F}}-1$ ) are 16-bit readable/writable registers. This register is provided one for each subblock, and executes up-count/down-count operation using the input clock. The input clock is given two external input pins (TIFxA, TIFxB). The external pin and edge used to count differs according to the setting of the corresponding control register (operation mode and edge select). The input clock in each mode is listed in Table 30.182.
When clearing the counter is done at the count-up timing, ECNTBFx is cleared to $0001_{\mathrm{H}}$, and to $0000_{\mathrm{H}}$ in other cases.
ECNTBF0 to $\mathrm{ECNTBFSB}_{\mathrm{F}}-1$ are initialized to $0000_{\mathrm{H}}$ after reset.
Table 30.182 Event Counter Input Clocks and Count Edges for Each Operation Mode of Timer

| Operation Mode | Input Clock | Count Edge |
| :--- | :--- | :--- |
| Edge counting in a specified period | TIFxA | Selectable by EGSELFx |
| Effective edge interval counting | TIFXA | Selectable by EGSELFx |
| Measurement of time during high/ low <br> input levels | TIFxA | Selectable by EGSELFx <br> (other than both edges) |
| Measurement of PWM input waveform <br> timing | TIFxA | Selectable by EGSELFx <br> (other than both edges) |
| Rotation speed/pulse measurement | TIFXA | Selectable by EGSELFx <br> (other than both edges) |
| Up/down event count | TIFxA (Count direction is specified by TIFxB level) | Both rising/falling edges |
| Four-time multiplication event count | TIFxA, TIFxB | Both rising/falling edges |

### 30.10.2.14 ECNTCFx - Time Measurement Counters CFx

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{F B}^{F}-1$
Table 30.183 ECNTCFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ECNTCFx | Time counter CFx |
|  |  | Up-counter C |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Timer counters CFx (ECNTCF00 to ECNTCFSB ${ }_{\mathrm{F}}-1$ ) are 32-bit readable/writable registers. They are up-counters. This register is readable/writable only in 32-bit units. Do not write or read 8-bit or 16-bit data for this register.

This register is provided one for each subblock, and is enabled only in measurement of PWM input waveform timing and rotation speed/pulse measurement modes. This register does not execute count operation in other modes.

This register executes up-count operation using the input clock. One clock bus from clock buses 0 to 6 can be selected as the input clock according to the setting of the corresponding control register. The input clocks for ECNTAFx and ECNTCFx are the same. Clock source cannot be set independently.

The timing of external input and the count value clearing by a compare match with ECNTBFx are synchronized with the count clock of ECNTCFx. At this time, ECNTCFx is cleared to $00000001_{\mathrm{H}}$.

ECNTCFx are initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.10.2.15 GRAFx — General Registers AFx

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 0$ to $F_{F B}^{F}-1$

Table 30.184 GRAFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | GRAFx | General registers AFx |
|  |  | Input capture value or output compare match value for the time counter A. |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

General registers AFx (GRAF00 to GRAFSB $\mathrm{F}_{\mathrm{F}}$-1) are 32-bit readable/writable registers. This register is readable/writable only in 32 -bit units. Do not write or read 8-bit or 16 -bit data for this register. This register is provided one for each subblock, and has two functions such as input capture register and output compare register for the time measurement counter Ax (ECNTAFx).

Do not set GRAFx to $00000000_{\mathrm{H}}$ to function this register as the compare match register. Note that if $00000000_{\mathrm{H}}$ is set, incorrect measurement may occur.

GRAF00 to GRAFSB ${ }_{F}-1$ are initialized to $\operatorname{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.
GRAF00 to GRAFSB ${ }_{\mathrm{F}}-1$ are mapped to target addresses and become readable and writable when the ARSWAFx bit of backup control register Fx (BKCRFx) is 0 (default: 0 ).

### 30.10.2.16 BGRAFx — Backup General Registers AFx

Note: $x=03$ to $S B_{F}-1$ : Corresponding to subblocks $F 03$ to $F_{F B}-1$
Table 30.185 BGRAFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BGRAFx[31:0] | When the BKENAFx bit of BKCRFx is 1, this register retains the value of general register AFx <br> (GRAFx) at the time of reading the capture output register (CDRFx). |

Note: $x$ indicates an integer from 03 to $\mathrm{SB}_{\mathrm{F}}-1$.

Backup general registers AFx (BGRAF03 to $\mathrm{BGRAFSB}_{\mathrm{F}}-1$ ) are 32-bit read-only registers. BGRAFx is provided one for each of subblock 03 to subblock $\mathrm{SB}_{\mathrm{F}}$-1. If the BKENAFx bit of backup control register Fx ( BKCRFx ) is 1 , this register retains the content of general register AFx (GRAFx) when capture output register Fx (CDRFx) is read.

BGRAF03 to BGRAFSB ${ }_{F}-1$ are initialized to FFFF $_{\text {FFFF }}^{H}$ after reset.
BGRAFx is mapped to target addresses and becomes readable when the ARSWAFx bit of backup control register Fx (BKCRFx) is 1 (default: 0 ).

### 30.10.2.17 GRBFx — General Registers BFx

Value after reset: $\mathrm{FFFF}_{\mathrm{H}}$

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 00$ to $F_{S B}^{F}-1$
Table 30.186 GRBFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | GRBFx | General registers BFx |
|  |  | Input capture value or output compare match value for event counter. |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

General registers BFx (GRBF00 to GRBFSB ${ }_{\mathrm{F}}-1$ ) are 16-bit readable/writable registers. GRBFx is provided one for each subblock, and has two functions such as input capture register and output compare register for the event counter (ECNTBFx).

Do not set $0000_{\mathrm{H}}$ when using GRBFx as the compare match register. If $0000_{\mathrm{H}}$ is set, incorrect measurement may occur. GRBF00 to GRBFSB ${ }_{\mathrm{F}}-1$ are initialized to $\mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.10.2.18 GRCFx — General Registers CFx

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 00 to $\mathrm{FSB}_{\mathrm{F}}-1$

Table 30.187 GRCFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | GRCFx | General registers CFx <br>  |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.
General registers CFx (GRCF00 to GRCF SB $\mathrm{F}_{\mathrm{F}}$ 1) are 32-bit readable/writable registers, and can be read from and written to in 32-bit units. Do not write or read 8-bit or 16-bit data for this register.

GRCFx is provided one for each subblock, and has a function as the input capture register for the time measurement counter Cx (ECNTCFx). Triggered by a compare match between ECNTBFx and GRBx (in measurement of PWM input waveform timing mode) or edge input of the TIFxA pin (in rotation speed/pulse measurement mode), ECNTCFx count number is taken in at the next ECNTCFx up-count timing.

GRCFx is valid only in measurement of PWM input waveform timing or rotation speed/pulse measurement mode. Capture operation is not executed in other modes.

GRCF00 to GRCFSB ${ }_{F}-1$ are initialized to FFFF $_{\text {FFFF }}^{H}$ after reset.
GRCF00 to GRCFSB $\mathrm{F}_{\mathrm{F}}-1$ are mapped to target addresses and become readable and writable when the ARSWCFx bit of backup control register Fx (BKCRFx) is 0 (default: 0 ).

### 30.10.2.19 BGRCFx — Backup General Registers CFx

Note: $x=0$ to $S B_{F}-1$ : Corresponding to subblocks $F 00$ to $F_{F B}-1$
Table 30.188 BGRCFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BGRCFx[31:0] | When the BKENCFx bit of BKCRFx is 1, this register retains the value of general register <br>  |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Backup general registers CFx (BGRCF00 to $\mathrm{BGRCFSB}_{\mathrm{F}}-1$ ) are 32-bit read-only registers.
BGRCFx is provided one for each subblock. If the BKENCFx bit of backup control register Fx (BKCRFx) is 1 , this register retains the content of general register CFx (GRCFx) when capture output register Fx (CDRFx) is read.

BGRCF00 to BGRCFSB $_{\mathrm{F}}-1$ are initialized to $\mathrm{FFFF}_{\mathrm{FFFF}}^{\mathrm{H}}$ after reset.
BGRCFx is mapped to target addresses and becomes readable when the ARSWCFx bit of backup control register Fx (BKCRFx) is 1 (default: 0 ).

### 30.10.2.20 GRDFx — General Registers DFx

Note: $\quad \mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 00 to $\mathrm{FSB}_{\mathrm{F}}-1$
Table 30.189 GRDFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | GRDFx | General registers DFx |
|  |  | In PWM input waveform measurement mode: |
|  | Compare match value of time measurement counter C |  |
|  |  | In "rotation speed/pulse measurement" mode: (only for $\mathrm{x}=3$ to $\mathrm{SB}_{\mathrm{F}}-1$ ) |
|  | accumulated value of time measurement counter C |  |
|  |  |  |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.

General registers DFx (GRDF00 to GRDFSB ${ }_{F}-1$ ) are 32-bit readable/writable registers that can be read and written only in 32-bit units. Do not read or write these registers in 16 bit or 8 -bit units.

GRDFx is provided one for each subblock. This register operates differently depending on the subblock. For subblocks F00 to F02, this register works only in PWM input waveform measurement mode. This register does not work in other modes.

For subblocks F03 to $\mathrm{SB}_{\mathrm{F}}-1$, this register works in PWM input waveform measurement mode and in "rotation speed/pulse measurement" mode. This register does not work in other modes.

In PWM input waveform measurement mode, this register works as a compare match register, and is always compared with the value of time measurement counter Cx (ECNTCFx). If the values of both registers coincide, the OVFCFx bit of timer status register Fx (TSRFx) is set to 1 at the next PCLK clock cycle. To make this register work as a compare match register, the GRDFCMEN bit of PVFCRF must be set.

In rotation speed/pulse measurement mode, this register works as an input capture register. Triggered by an edge input of the TIFx pin, this register takes and accumulates the value of time measurement counter Cx (ECNTCFx) at the next cycle of ECNTCFx increment.

GRDF00 to GRDFSB ${ }_{F}-1$ are initialized to FFFF $_{\text {FFFF }}^{H}$ after reset.
GRDF03 to GRDFSB ${ }_{F}-1$ are mapped to target addresses and become readable and writable when the ARSWDFx bit of backup control register Fx (BKCRFx) is 0 (default: 0 ).

### 30.10.2.21 BGRDFx — Backup General Registers DFx

Table 30.190 BGRDFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | BGRDFx[31:0] | When the BKENDFx bit of BKCRFx is 1, this register retains the value of general register DFx <br> (GRDFx) at the time of reading the capture output register (CDRFx). |

Note: x indicates an integer from 3 to $\mathrm{SB}_{\mathrm{F}}-1$.

Backup general registers DFx ( $\mathrm{BGRDF}^{2}$ to $\mathrm{BGRDFSB}_{\mathrm{F}}-1$ ) are 32-bit read-only registers. BGRDFx is readable only in 32-bit units. Do not read this register in 8-bit or 16-bit units.

BGRDFx is provided one for each of subblocks F 03 to subblock $\mathrm{FSB}_{\mathrm{F}}-1$. If the BKENDFx bit of backup control register $\mathrm{Fx}(\mathrm{BKCRFx})$ is 1 , this register retains the content of general register DFx (GRDFx) when capture output register $\mathrm{Fx}(\mathrm{CDRFx})$ is read.

BGRDF3 to BGRDFSB ${ }_{F}-1$ are initialized to FFFF $_{\text {FFFF }}^{\mathrm{H}}$ after reset.
BGRDFx is mapped to target addresses and becomes readable when the ARSWDFx bit of backup control register Fx (BKCRFx) is 1 (default: 0 ).

### 30.10.2.22 CDRFx - Capture Output Registers Fx

Note: $\quad \mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 00 to $\mathrm{FSB}_{\mathrm{F}}-1$

Table 30.191 CDRFx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | CDRFx | Capture output registers Fx |
|  |  | Data retained in GRAFx, GRBFx, or ECNTBFx is read depending on the operation mode. |

Note: x indicates an integer from 0 to $\mathrm{SB}_{\mathrm{F}}-1$.
The capture output register is a 32-bit read-only register. This register is provided one for each subblock. When this register is read, values in GRAFx, GRBFx, or ECNTBFx is read according to the operation mode. A 16-bit value in GRBFx and ECNTBFx are read from the 16 lower-order bits in CDRFx. In this case, the 16 higher-order bits in CDRFx are read as 0 .

Registers corresponding to various modes are listed below. Writing to these registers are ignored.

| Mode | Register |
| :--- | :--- |
| Edge count mode | GRBFx |
| Edge input interval measurement mode | GRAFx |
| Input high/low period measurement mode |  |
| PWM input waveform measurement mode | ECNTBFx |
| Rotation speed/pulse measurement mode | GRBFx |
| Up/down count mode |  |
| Four-time multiplication event count mode |  |

Note: CDRF0 to CDRFSB $_{F}-1$ are initialized to FFFF FFFFF H after reset.
Depending on the setting of bits BKENAFx, BKENCFx, and BKENDFx of backup control register Fx (BKCRFx), reading CDRFx triggers value saving from general register AFx (GRAFx) to backup general register AFx (BGRAFx), from general register CFx (GRCFx) to backup general register CFx (BGRCFx), and from general register DFx (GRDFx) to backup general register DFx (BGRDFx). For more information, see the sections on backup general registers corresponding to individual general registers.

### 30.10.2.23 NCNTFAx — Noise Canceler Counters FAx

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{F}}-1$ : Corresponding to subblocks F 00 to $\mathrm{FSB}_{\mathrm{F}}-1$
Table 30.192 NCNTFAx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCNTFAx | Noise cancel counters FAx |
|  |  | 16-bit count value |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Noise canceler counters registers FAx (NCNTFAx) are 16-bit readable/writable registers.
When the noise canceler is enabled by noise canceler control register Fx (NCCRFx) and the operation mode is the premature-transition cancellation mode or minimum time-at-level cancellation mode, a level change of external input pin TIFxA triggers the up-count operation ticked by the noise canceler counter clock provided by the prescaler. In level accumulation cancellation mode, up/down counting is performed based on the external input level.

NCNTFAx is readable/writable only in 16-bit units.
NCNTFAx is initialized to $0000_{\mathrm{H}}$ after reset.
One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-atlevel cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

## - Premature-transition cancellation mode

NCNTFAx starts up-count operation triggered by the level change of input signal in TIFxA under the condition that the NCEFx bit is set to 1 and NCNTFAx is not in count operation. When the count number matches the value in the noise cancel register FAx (NCRFAx), this register stops the count operation, clearing the count value to $0000_{\mathrm{H}}$ synchronizing with the next PCLK.

NCNTFAx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

A level change at the start of count operation is output as it is as the signal that passed through the noise canceling operation. Although this signal is the subject of edge detection, the signal does not change because any input level change is masked until the count number matches the value of NCRFAx.

Even if the NCEFx bit is cleared during the count operation, the count operation continues until the count number matches the value of NCRFAx. The input signal is masked during all that time.

- Minimum time-at-level cancellation mode

NCNTFAx starts up-count operation triggered by the level change of input signal in TIFxA under the condition that the NCEFx bit is set to 1 and NCNTFAx is not in count operation. When the level change of the input signal occurs during the count operation or the count number matches the value in the noise cancel register FAx (NCRFAx), this register stops the count operation, clearing the count value to $0000_{\mathrm{H}}$ synchronizing with the next PCLK.

NCNTFAx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

Signals that passed through the noise canceling operation can change only when the count number matches the value of NCRFAx according to the level change at the count start. If the count operation stops before the count number matches the value of NCRFAx, signals that passed through the noise canceling operation do not change because the level changes at the start or stop of counting are masked.

Even if the NCEFx bit is cleared during the count operation, the count operation and noise canceling processing continue until a compare match occurs or the level of the input signal changes.

- Level accumulation cancellation mode

When the NCEFx bit is set to 1 , NCNTFAx performs up or down counting depending on the input signal level. Upcounting is performed when the input level is high, and if the counter value coincides with NCRFAx, the up-counting stops at the next PCLK cycle. Down-counting is performed when the input level is low, and if the counter value coincides with $0000_{\mathrm{H}}$, the down- counting stops at the next PCLK cycle.

Counting of NCNTFAx is performed regardless of the setting of the TFE bit of the ATU master enable register (ATUENR).

If up-counting results in a compare match of NCRFAx, the noise canceler output is updated to 1 . If down-counting results in a compare match with $0000_{\mathrm{H}}$, the noise canceler output is updated to 0 .

If the NCEFx bit is cleared when counting is in progress, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Be noted that clearing the NCEFx bit in level accumulation cancellation mode might cause an edge detection due to this value change.

### 30.10.2.24 NCNTFBx — Noise Canceler Counters FBx

Note: $x=0$ to 2: Corresponding to subblocks F00 to F02
Table 30.193 NCNTFBx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCNTFBx | Noise cancel counters FBx |
|  |  | 16 -bit count value |

Note: $x$ indicates an integer from 0 to 2 .

Noise cancel counters FBx (NCNTFBx) are 16-bit readable/writable registers.
These registers are available only in up/down event count mode and 4-time multiplication event count mode.
When the noise canceler is enabled by noise canceler control register Fx (NCCRF) and the operation mode is premature-transition cancellation mode or minimum time-at-level cancellation mode, a level change of external input pin TIFxB triggers the up-count operation ticked by the noise canceler counter clock provided by the prescaler. In level accumulation cancellation mode, up/down counting is performed based on the external input level.

NCNTFBx is readable/writable only in 16-bit units.
NCNTFBx is initialized to $0000_{\mathrm{H}}$ after reset.
One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-atlevel cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

NCNTFBx starts up-count operation triggered by the level change of input signal in TIFxB under the condition that the NCEFx bit is set to 1 and NCNTFBx is not in count operation. When the count number matches the value in the noise cancel register FBx (NCRFBx), this register stops the count operation, clearing the count value to $0000_{\mathrm{H}}$ synchronizing with the next PCLK.

NCNTFBx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

A level change at the start of count operation is output as it is as the signal that passed through the noise canceling operation. Although this signal is the subject of edge detection, the signal does not change because any input level change is masked until the count number matches the value of NCRFBx.

Even if the NCEFx bit is cleared during the count operation, the count operation continues until the count number matches the value of NCRFBx. The input signal is masked during all that time.

- Minimum time-at-level cancellation mode

NCNTFBx starts up-count operation triggered by the level change of input signal in TIFxB under the condition that the NCEFx bit is set to 1 and NCNTFBx is not in count operation. When the level change of the input signal occurs during the count operation or the count number matches the value in the noise cancel register FBx (NCRFBx), this register stops the count operation, clearing the count value to $0000_{\mathrm{H}}$ synchronizing with the next PCLK.

NCNTFBx executes the count operation regardless of the setting of the TFE bit in the ATU master enable register (ATUENR).

Signals that passed through the noise canceling operation can change only when the count number matches the value of NCRFBx, according to the level change at the count start. If the count operation stops before the count number matches the value of NCRFBx, signals that passed through the noise canceling operation do not change because the level changes at the start or stop of counting are masked.

Even if the NCEFx bit is cleared during the count operation, the count operation and noise canceling processing continue until a compare match occurs or the level of the input signal changes.

- Level accumulation cancellation mode

When the NCEFx bit is set to 1 , NCNTFBx performs up or down counting depending on the input signal level. Upcounting is performed when the input level is high, and if the counter value coincides with NCRFBx, the up-counting stops at the next PCLK cycle. Down-counting is performed when the input level is low, and if the counter value coincides with $0000_{\mathrm{H}}$, the down- counting stops at the next PCLK cycle.

Counting of NCNTFBx is performed regardless of the setting of the TFE bit of the ATU master enable register (ATUENR).

If an up-count results in a compare match of NCRFBx, the noise canceler output is updated to 1 . If down-counting results in a compare match with $0000_{\mathrm{H}}$, the noise canceler output is updated to 0 .

If the NCEFx bit is cleared when counting is in progress, the noise cancel counter stops counting, and the value is changed from the noise canceler output to the current input signal level. Be noted that clearing the NCEFx bit in level accumulation cancellation mode might cause edge detection due to this value change.

### 30.10.2.25 NCRFAx — Noise Cancel Registers FAx

Table 30.194 NCRFAx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCTFAx | Noise cancel time FAx |
|  |  | TIFxA noise cancel period (16-bit compare value) |

Note: $x$ indicates an integer from 0 to $S B_{F}-1$.

Noise cancel registers (NCRFAx) are 16-bit readable/writable registers that set the upper limit of the noise canceler counter (NCNTFAx). When a period of 128 PCLK cycles is selected as the noise cancel clock, setting of FFFF $_{H}$ can cancel noise for maximum of 0.21 second period (when PCLK $=40 \mathrm{MHz}$ ).

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-atlevel cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

While NCNTFAx is in count operation, the level change of the subsequent input signal is masked. Values in NCNTFAx and NCRFAx are always compared. If a compare match occurs, these registers clear the value in NCNTFAx synchronizing with the next PCLK, stop the count operation, and cancel the masking of the input signal.

- Minimum time-at-level cancellation mode

While NCNTFAx is in count operation, noise canceler processing waiting state is entered. Values in NCNTFAx and NCRFAx are always compared. If a compare match occurs, these registers clear the value in NCNTFAx synchronizing with the next PCLK, stop the count operation, and then cancel the masking of the input signal and the noise canceler outputs the input signal that has passed through the noise canceling processing.

- Level accumulation cancellation mode

When NCNTFAx up-counting is in progress, values of CNTFAx and NCRFAx are compared. When a compare match occurs, the up-counting of NCNTFAx stops at the next PCLK cycle. When NCNTFAx down-counting is in progress, NCNTFAx is compared with $0000_{\mathrm{H}}$.

NCRFAx is readable/writable only in 16-bit units.
NCRFAx is initialized to $0000_{\mathrm{H}}$ after reset.

### 30.10.2.26 NCRFBx — Noise Cancel Registers FBx

Note: $x=0$ to 2: Corresponding to subblocks F00 to F02
Table 30.195 NCRFBx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | NCTFBx | Noise cancel time FBx |
|  |  | TIFxB noise cancel period (16-bit compare value) |

Note: $x$ indicates an integer from 0 to 2.

Noise cancel registers (NCRFBx) are 16-bit readable/writable registers that set the upper limit of the noise canceler counter (NCNTFBx). When a period of 128 PCLK cycles is selected as the noise cancel clock, setting of FFFF $_{H}$ can cancel noise for maximum of 0.21 second period (when PCLK $=40 \mathrm{MHz}$ ). This register is effective only during up/down counting and the four-time multiplication event count mode.

One of the three different operation modes, which are the premature-transition cancellation mode, the minimum time-atlevel cancellation mode, and the level accumulation cancellation mode, takes place depending on the setting of the noise cancel mode selection bit (NCMSEL) and the timer F noise cancel mode bit (NCMF) of the noise cancel mode register (NCMR) of the common controller, as well as on a couple of timer F bits, which are the noise cancel mode bit (NCM1Fx) of the noise cancel mode channel register 1F (NCMCR1F) and the noise cancel mode bit (NCM2Fx) of the noise cancel mode channel register 2F (NCMCR2F).

- Premature-transition cancellation mode

While NCNTFBx is in count operation, the level change of the subsequent input signal is masked. Values in NCNTFBx and NCRFBx are always compared. If a compare match occurs, these registers clear the value in NCNTFBx synchronizing with the next PCLK, stop the count operation, and cancel the masking of the input signal.

- Minimum time-at-level cancellation mode

While NCNTFBx is in count operation, noise canceler processing waiting state is entered. Values in NCNTFBx and NCRFBx are always compared. If a compare match occurs, these registers clear the value in NCNTFBx synchronizing with the next PCLK, stop the count operation. Simultaneously the noise canceler outputs the input signal that has passed through noise canceling processing.

- Level accumulation cancellation mode

When NCNTFBx up-counting is in progress, values of CNTFBx and NCRFBx are compared. When a compare match occurs, the up-counting of NCNTFBx stops at the next PCLK cycle. When NCNTFBx down-counting is in progress, NCNTFBx is compared with 0000 H .

NCRFBx is readable/writable only in 16-bit units.
NCRFBx is initialized to $0000_{\mathrm{H}}$ after reset.
For details of operations for noise cancellation, see the description of the noise cancellation mode register in Section 30.3.2, Registers Related to Common Controller.

### 30.10.3 Details of Operation

### 30.10.3.1 Edge Counting in a Given Time

When a period over which edges are counted is set in GRAFx, the number of edges within the period is obtained in GRBFx. When no edge is detected within the period, 0 is set to GRBFx. The period set to count is equivalent to the cycle of the ECNTAFx clock (GRAFx value). Operation of the timer Fx is described below. Figure $\mathbf{3 0 . 8 3}$ shows an operation example. In this example, eight edges are input to 12 cycles of the count source clock. Timer counter ECNTAFx and event counter ECNTBFx are driven by the ECNTAFx and ECNTBFx clocks, respectively.

- ECNTAFx: Measures time using one of the clock buses 0 to 5 . When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBFx: Counts edges of the signals provided from TIFxA input. Edge types subject to count can be selected from among rising, falling, or both edges. The example given here counts the falling edges. A delay of two cycles in TIFxA occurs because of synchronization processing. When a compare match in ECNTAFx is detected, the count number is cleared synchronized with the next PCLK. In a case where edges subject to count are given simultaneously at a count clearing by a compare match, both operations are regarded to be done in one cycle, setting the count value to $0001_{\mathrm{H}}$. Figure $\mathbf{3 0 . 8 4}$ shows an example of this.
- GRAFx: Functions as the compare match register for ECNTAFx. A compare match is detected when the count values in ECNTAFx and GRAFx agree.
- GRBFx: Functions as the capture register for ECNTBFx. When a compare match in ECNTAFx is detected, this register captures the ECNTBFx count number synchronizing with the next PCLK.
- Compare match interrupt request output: After compare match detection of ECNTAFx, a compare match interrupt request is issued to CPU at the next PCLK cycle.
- ICFFx: After detecting a compare match in ECNTAFx, sets the ICFFx flag synchronized with the next PCLK.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Figure 30.83 Operation Example of Edge Count in a Given Time

Figure 30.84 Operation Example 2 of Edge Count in a Given Time (Same Timing as Compare Match and Event)

### 30.10.3.2 Effective Edge Interval Counting

When a number of edges are set in GRBFx, the time necessary to count these edges is notified to GRAFx. The average of input edge intervals is obtained by dividing the time by the number of edges. The outcome is given as the unit of the ECNTAFx count source clock (GRAFx). Operation of the timer Fx is described below. Figure $\mathbf{3 0 . 8 5}$ shows an operation example. In this example, 13 cycles of the counter clock are needed to detect 12 input edges. Timer counter ECNTAFx and event counter ECNTBFx are driven by the ECNTAFx and ECNTBFx clocks, respectively.

- ECNTAFx: Measures time using one of the clock buses 0 to 5 . When a compare match between ECNTBFx and GRBFx is detected, the count value is cleared synchronized with the next ECNTAFx clock. Since ECNTAFx count clear occurs at the same time with count-up, the cleared value becomes $00000001_{\mathrm{H}}$.
- ECNTBFx: Counts edges provided from TIFxA. Edge types subject to count can be selected from among rising, falling, or both edges. The example given here counts the falling edges. A delay of two cycles in TIFxA occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- GRAFx: Functions as the capture register for ECNTAFx. When a compare match in ECNTBFx is detected, this register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock.
- GRBFx: Functions as the compare match register for ECNTBFx. A compare match is detected when the count values in ECNTBFx and GRBFx agree
- Compare match interrupt request: After a compare match detection of ECNTBFx, a compare match interrupt request is issued to CPU at the next "ECNTAFx Clock" cycle.
- ICFFx: After detecting a compare match in ECNTBFx, sets the ICFFx flag synchronized with the next ECNTAFx clock.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Figure 30.85 Operation Example of Effective Edge Interval Counting

### 30.10.3.3 Measurement of Time during High/Low Input Levels

Measures the time while TIFxA is driven high or low. The time obtained is indicated using the ECNTAFx clock source as the standard. The width of the measurement time is specified to GRBFx in the form of the pulse number provided for TIFxA (GRBFx value). Operation of the timer F is described below. Figure $\mathbf{3 0 . 8 6}$ shows an operation example. This is the example in which the high level periods of the three pulses are measured as nine count source cycles. Timer counter ECNTAFx and event counter ECNTBFx are driven by the ECNTAFx and ECNTBFx clocks, respectively.

- ECNTAFx: Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx $=2$, falling edge selected), or TIFxA is in low level ( $E G S E L F x=1$, rising edge selected) is measured. After detecting a compare match in ECNTBFx, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx = 2) or low $(E G S E L F x=1)$ at clearing count by the compare match, the count value becomes $00000001_{\mathrm{H}}$. Figure 30.87 is an example of this.
- ECNTBFx: Counts the falling edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the TIFxA falling edge. A delay of two cycles occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- GRAFx: Functions as the capture register for ECNTAFx. When a compare match in ECNTBFx is detected, this register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock.
- GRBFx: Functions as the compare match register for ECNTBFx. A compare match is detected when the count number in ECNTBFx and GRBFx agree.
- Compare match interrupt request: After a compare match detection of ECNTBFx, a compare match interrupt request is issued to CPU at the next "ECNTAFx Clock" cycle.
- ICFFx: After detecting a compare match in ECNTBFx, sets the ICFFx flag synchronized with the next ECNTAFx clock.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Figure 30.86 Operation Example of Measurement of Time during High Input Levels

Figure 30.87 Operation Example of Measurement of Time during High Input Levels (TIFxA is in High Level When Capture is in Operation)

### 30.10.3.4 Measurement of PWM Input Waveform Timing

Measures the off-duty (non-active) period and cycle time of the PWM waveform input to TIFxA. The off-duty period is measured as the period of either the high or low level input on TIFxA, and the PWM cycle is measured as the interval between two rising or falling edges. Both are measured concurrently. The measured time is expressed in the number of cycles of the clock source for ECNTAFx. The duration of the measurement is set in GRBFx, which is specified as the number of PWM pulses input to TIFxA.

Compare match is possible for the number of PWM cycles. A compare match can issue an interrupt request to CPU.
Operation of timer F is described below. Figure $\mathbf{3 0 . 8 8}$ shows an operation example. This is the example in which two PWM cycles in PWM waveform are measured as six counter clock cycles and the off-duty period (low-level period) is measured as four counter clock cycles.

The clocks for ECNTAFx, ECNTBFx, and ECNTCFx in this example provide the timing of counting or clearing operation of the time counter ECNTAFx, event counter ECNTBFx, and ECNTCFx, respectively.

- ECNTAFx: Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA input level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx $=2$, falling edge selected), or TIFxA is in low level ( $\mathrm{EGSELFx}=1$, rising edge selected) is measured. After detecting a compare match in ECNTBFx, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx $=2$ ) or low $(E G S E L F x=1)$ at clearing count by the compare match, the count value becomes $00000001_{\mathrm{H}}$. The operation example shows measurement of low level.
- ECNTBFx: Counts the edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the rising edge. A delay of two cycles occurs because of synchronization processing. When a compare match is detected, the count number is cleared synchronized with the next PCLK.
- GRAFx: Functions as the capture register for ECNTAFx. When a compare match in ECNTBFx is detected, this register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock.
- GRBFx: Functions as the compare match register for ECNTBFx. A compare match is detected when the count number in ECNTBFx and GRBFx agree.
- ECNTCFx: Measures time using the same count source as ECNTAFx. This register clears the count number synchronizing with the next ECNTAFx clock after detecting a compare match in ECNTBFx. Since ECNTCFx count clear occurs at the same time with count-up, the cleared value is $00000001_{\mathrm{H}}$. A compare match with GRDFx does not clear ECNTCFx, and the counting continues.
- GRCFx: Functions as the capture register for ECNTCFx. This register captures the ECNTCFx count number synchronizing with the next ECNTAFx clock after detecting a compare match in ECNTBFx.
- Input capture interrupt request: After a compare match detection of ECNTBFx, an input capture interrupt request is issued to CPU at the next "ECNTAFx Clock" cycle.
- ICFFx: After detecting a compare match in ECNTBFx, sets the ICFFx synchronized with the next ECNTAFx clock.
- GRDFx: This register works as a compare match register of ECNTCFx. A compare match occurs when the ECNTCFx count coincides with GRDFx. (Effective when the GRDFCMEN bit of the private function control register (PVFCRF) is 1.)
- Overflow interrupt request output: After a compare match detection of ECNTCFx, an overflow interrupt request is issued to CPU at the next PCLK cycle. (Effective when the GRDFCMEN bit of the private function control register (PVFCRF) is 1.)
- OVFCFx: After detection of a compare match of ECNTCFx, OVFCFx is set at the next PCLK cycle. (Effective when the GRDFCMEN bit of the private function control register F (PVFCRF) is 1.)

Therefore, ECNTBFx (GRBFx) and ECNTAFx (GRAFx) are operating in measurement of time during low input levels mode and ECNTBFx (GRBFx) and ECNTCFx (GRCFx) are operating in effective edge interval counting mode.

The measured values in PWM input waveform measurement mode are saved in two 32-bit registers: GRAFx and GRCFx. Be noted that, when reading these two registers, a capture might occur in the period between reading one register and reading the other register, resulting in reading incorrect measurements (for example, when an interrupt request was processed in between).

Reading values from backup registers would provide two consistent values. For details, see Section 30.10.3.9, Simultaneous Access of Multiple Registers, described below.

Figure 30.88 Operation Example of Measurement of PWM Input Waveform Timing

Figure 30.89 Operation Example of Measurement of PWM Input Waveform Timing

### 30.10.3.5 Rotation Speed/Pulse Measurement

Measures the number of edges input to TIFxA, the edge input time (time stamp), the off-duty period in the PWM waveform that emerges between the last input edge and the edge this time, and PWM cycle time.

The time obtained is expressed using the ECNTAFx clock source as the standard. The maximum interval of edge input can be set to GRBFx, which enables to output an interrupt request if the edge input interval exceeds the maximum value.

At this moment, the timer F operates as shown below. Figure $\mathbf{3 0 . 8 9}$ shows an example of operation.
The ECNTAFx clock, ECNTBFx clock, and ECNTCFx clock show the timing of count operation or clearing for the time counter ECNTAFx, event counter ECNTBFx, and ECNTCFx, respectively.

- ECNTAFx: Executes up-count using one of the clock buses 0 to 5 as a count source and TIFxA input level as enable. Therefore, the time period in which TIFxA is in high level (EGSELFx $=2$, falling edge selected), or TIFxA is in low level $($ EGSELFx $=1$, rising edge selected $)$ is measured. After inputting the edge to TIFxA, this register clears the count number synchronizing with the next count source clock. If TIFxA is driven high (EGSELFx $=2$ ) or low $(\operatorname{EGSELFx}=1)$ at clearing count by the compare match, the count value becomes $00000001_{\mathrm{H}}$.
- ECNTBFx: Counts the edge of the signal from the TIFxA input. Rising or falling edge is selectable to be counted. The operation example shows counting of the falling edge. A delay of two cycles occurs because of synchronization processing.
- GRAFx: Functions as the capture register for ECNTAFx. This register captures the ECNTAFx count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- GRBFx: Functions as the capture register for ECNTCFx. When the ECNTCFx count and the value in the 16 lowerorder bits in GRBFx extended with 0 match, this register detects a compare match and set the OVFCFx to 1.
- ECNTCFx: Measures time using the same count source as ECNTAFx. This register clears the count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA. Since ECNTCFx count clear occurs in the same timing, the cleared value is $00000001_{\mathrm{H}}$.
- GRCFx: Functions as the capture register for ECNTCFx. This register captures the ECNTCFx count number synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- GRDFx: Functions as the capture register for ECNTCFx. This register captures the ECNTAFx, whose number being accumulated to GRDFx, synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA. The value to be added is the ECNTCFx value before clearing. (Capture value: GRDFx $+=$ ECNTCFx).
- Input capture interrupt request output: After an edge input to TIFxA, an input capture interrupt request is issued to CPU at the next "ECNTAFx Clock" cycle.
- ICFFx: Sets the ICFFx synchronizing with the next ECNTAFx clock after inputting the edge to TIFxA.
- Overflow interrupt request output: An overflow interrupt request is issued to CPU at the next PCLK cycle during which values of ECNTCFx and GRBFx coincide (zero extension of 16 lower- order bits).
- OVFCFx: Sets the OVFCFx synchronizing with the next PCLK after the values in ECNTCFx and GRBFx (zero extension of 16 lower-order bits) match.

At the time of an input capture interrupt request, reading ECNTBFx, GRAFx, GRCFx, and GRDFx provides the number of edges, the off-state duty cycle, the PWM cycle, and the edge input time, respectively.

The capture timing of GRAFx, GRCFx, and GRDFx synchronizes with the count clock of ECNTAFx. Note that if the edge input cycle is shorter than the ECNTAFx count clock cycle, incorrect measurement may occur.

The measured values in "rotation speed/pulse measurement" mode are saved in three 32-bit registers GRAFx, GRCFx, and GRDFx. Be noted that, when reading these three registers, a capture might occur in the period between reading one register and reading another register, resulting in reading incorrect measurements (for example, when an interrupt request was processed in between).

Reading values from backup registers would provide three consistent values. For details, see Section 30.10.3.9,
Simultaneous Access of Multiple Registers, described below.

Note: Do not set this mode for subblocks other than 03 to $\mathrm{SB}_{\mathrm{F}}-1$.

Figure 30.90 Operation Example of Rotation Speed/Pulse Measurement

### 30.10.3.6 Up/Down Event Count

This register uses the TIFxA pin, one of the two external input pins (TIFxA, TIFxB), as the count source, and TIFxB switches up-count to and from down-count. If a count period is designated to GRAFx the count number after designation can be obtained in GRBFx. The counting period is the period of ECNTAFx count source clock (GRAFx value). At this moment, the timer F operates as shown below. Figure $\mathbf{3 0 . 9 0}$ shows an example of operation. The ECNTAFx clock and ECNTBFx clock show the timing that time counter ECNTAFx and event counter ECNTBFx execute the count operation or clearing, respectively.

- ECNTAFx: Measures time using one of the clock buses 0 to 5 . When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBFx: Upcount/downcount operation is performed at both rising and falling edges of TIFxA. Count direction is determined by the TIFxB input level. (See Table 30.196.) Because of synchronization processing, a delay of two cycles occurs in TIFxA and TIFxB.
- GRAFx: Functions as the compare match register for ECNTAFx. A compare match is detected when the count number in ECNTAFx and GRAFx agree.
- GRBFx: Functions as the capture register for ECNTBFx. When a compare match in ECNTAFx is detected, this register captures the ECNTBFx count number synchronizing with the next PCLK.
- Input capture interrupt request output: After compare match detection of ECNTAFx, an interrupt request is issued to CPU at the next PCLK cycle.
- ICFFx: After detecting a compare match in ECNTAFx, sets the ICFFx flag synchronized with the next PCLK.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Table 30.196 Count Direction in Up/Down Event Count Mode

| Input | Count Direction |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Upcount |  | Downcount |  |
| TIFXA |  |  |  | $\square$ |
| TIFxB | Low |  | High |  |

Note: Always set this mode only in subblock 0 to subblock 2.

Figure 30.91 Operation Example of Up/Down Event Count

### 30.10.3.7 Four-time Multiplication Event Count

The count operation is executed using the external two input pins (TIFxA, TIFxB) as the count sources. Upcount or downcount is switched according to their input states. If a count period is designated to GRAFx, the count number after designation can be obtained in GRBFx. The counting period is the period of ECNTAFx count source clock (GRAFx value).

At this moment, the timer F operates as shown below. Figure $\mathbf{3 0 . 9 1}$ shows an example of operation. The ECNTAFx clock and ECNTBFx clock show the timing that time counter ECNTAFx and event counter ECNTBFx execute the count operation or clearing, respectively.

- ECNTAFx: 5Measures time using one of the clock buses 0 to 5 . When a compare match is detected, the count value is cleared synchronized with the next PCLK.
- ECNTBFx: Upcount/downcount operation is performed at both rising and falling edges of TIFxA and TIFxB respectively. Count direction is determined by the other signal input level. (See Table 30.197.) Because of synchronization processing, a delay of two cycles occurs in TIFxA and TIFxB.
- GRAFx: Functions as the compare match register for ECNTAFx. A compare match is detected when the count number in ECNTAFx and GRAFx agree.
- GRBFx: Functions as the capture register for ECNTBFx. When a compare match in ECNTAFx is detected, this register captures the ECNTBFx count number synchronizing with the next PCLK.
- Input capture interrupt request output: After a compare match detection of ECNTAFx, an input capture interrupt request is issued to CPU at the next PCLK cycle.
- ICFFx: After detecting a compare match in ECNTAFx, sets the ICFFx synchronized with the next PCLK.
- ECNTCFx, GRCFx, GRDFx: Do not function.

Table 30.197 Count Direction in Four-time Multiplication Event Count Mode

|  | Count Direction |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Input | Upcount |  |  |  | Downcount |  |  |  |
| TIFxA | High | $7$ | Low | $\square$ | High | $\nabla$ | Low |  |
| TIFxB |  | High | $\checkmark$ | Low | $\square$ | High | $\uparrow$ | High |

## NOTE

Operation when edge inputs in TIFXA and TIFXB are detected simultaneously is not guaranteed. The interval between edge inputs in TIFxA and TIFxB must be at least 1.5 cycles (PCLK).

Do not set this mode for the subblocks other than subblocks 0 to 2 .

Figure 30.92 Operation Example of Four-time Multiplication Event Count Overflow/Underflow

### 30.10.3.8 Overflow and Underflow

Counter clearing of 0xFFFFFFFF (ECNTAFx and ECNTCFx) to 0x00000000 (ECNTAFx and ECNTCFx) or 0xFFFF (ECNTBFx) to 0x0000 (ECNTBFx) causes overflow detection. In this case, the overflow flag is reset and an overflow interrupt request is issued as soon as the counter value becomes $0 \times 00000000$ (or $0 \times 0000$ ). (A figure is omitted.) When an overflow of ECNTAFx is detected, OVFAFx is set and an overflow A interrupt request is issued. When an overflow of ECNTBFx is detected, OVFBFx is set and an overflow B interrupt request is issued. When an overflow of ECNTCFx is detected, OVFCFx is set and an overflow C interrupt request is issued.

An underflow is detected when the counter value changes from 0x0000 (ECNTBFx) to 0xFFFF (ECNTBFx). In this case, OVFBFx is reset and an overflow interrupt request is issued as soon as the counter value becomes $0 x F F F F$. (A figure is omitted.) OVFBFx is also set. An underflow occurs only with ECNTBFx, in which case an overflow B interrupt request is issued.

### 30.10.3.9 Simultaneous Access of Multiple Registers

In PWM input waveform measurement mode and rotation speed/pulse measurement mode, saving register values of measurement results to backup registers provides multiple register values of the same time point. When the CDRFx register is read, register values are saved from GRAFx to BGRAFx, from GRCFx to BGRCFx, and from GRDFx to BGRDFx.

For saving general register values to backup registers and for reading data from backup registers, the backup control register Fx (BKCRFx) must be set. For details, see the section above explaining backup control registers.

With the above method in PWM input waveform measurement mode, reading CDRFx and then BGRCFx provides the PWM cycle and the duty time of the same time point. In "rotation speed/pulse measurement" mode, reading CDRFx and then BGRAFx, BGRCFx, and BGRDFx provides data of the same time point.

### 30.11 Timer G

### 30.11.1 Overview of Operation

The timer G block consists of $\mathrm{SB}_{\mathrm{G}}$ timer G subblocks.
A timer $G$ subblock counts the input clock, and when a predetermined time period has elapsed, generates a pulse signal of one PCLK cycle period.

It is provided with external event synchronization mode in which counter operation starts when a synchronize with an AGCK timing signal from timer B.

An input clock can be selected for the counter from the six clocks on the clock bus.

## Configuration

Timer G subblock consists of a 32-bit counter (TCNTGx), a compare match register (OCRGx), a reload register (RLDGx), and a controller.

Figure 30.93 Block Diagram of Timer G Configuration

## Interrupt Request

Timer G can issue $\mathrm{SB}_{\mathrm{G}}$ interrupt requests as described below.
An interrupt request is issued upon compare match detection at timer subblock Gx.

### 30.11.2 Registers Related to Timer G

### 30.11.2.1 TSTRG — Timer Start Register G

Value after reset: $\quad 0000_{H}$

Table 30.198 TSTRG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to $\mathrm{SB}_{\mathrm{G}}$ | - | These bits are not used. Fix these bits to 0. |
| $\mathrm{SB}_{\mathrm{G}}-1$ to 0 | STRGSB $_{G}-1$ to | Counter G start |
|  | STRG0 | $0:$ TCNTGx is disabled. |
|  | 1: TCNTGx is enabled. |  |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{G}}-1$.

The timer start register G (TSTRG) is a 16 -bit register. This register is an 8-bit/16-bit readable/writable register and specifies whether to start or stop each subblock (timer G0 to timer $\mathrm{GSB}_{\mathrm{G}}-1$ ) included in timer G . The counting is not performed if the TGE bit of the ATU master enable register (ATUENR) is not enabled even if the start bit of timer G permits counting.

TSTRG is initialized to $0000_{\mathrm{H}}$ after reset.

## Counter G Start (STRGx)

These bits enable and disable timer counter (TCNTGx) in the subblocks (G0 to $\mathrm{GSB}_{\mathrm{G}}-1$ ).
When these bits are cleared to " 0 ", TCNTGx is stopped. TCNTGx retains the value at that time while it is stopped.
When these bits are set to " 1 ", TCNTGx resumes counting from the retained value. TCNTGx runs when these bits and the TGE bit in ATU master enable register are both set to " 1 ".

## CAUTION

The prescalers run independently of the setting of the counter $G$ start bit and are not initialized when the TCNTGx starts counting. Therefore, the time from when the STRGx bit is set to when TCNTGx starts counting may be less than the cycle of the selected count source clock (resolution), being undetermined due to hardware factors.

### 30.11.2.2 TIERG - Timer Interrupt Enable Register G

Value after reset: $\quad 0000_{H}$

Table 30.199 TIERG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to $\mathrm{SB}_{\mathrm{G}}$ | - | These bits are not used. Fix these bits to 0. |
| $\mathrm{SB}_{\mathrm{G}}-1$ to 0 | CMPIEGSB $_{\mathrm{G}}-1$ to | Compare match interrupt enable Gx |
|  | CMPIEG0 | 0 Disable interrupt request upon compare match |
|  |  | 1: Enable interrupt request upon compare match |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$

The timer interrupt enable register $G$ (TIERG) is a 16-bit register. This register is an 8-bit/16-bit readable/writable register and specifies whether to enable or disable issuance of an interrupt request upon compare match output from each subblock (timer G0 to timer $\mathrm{GS}_{\mathrm{B}}-1$ ). TIERG is initialized to $0000_{\mathrm{H}}$ after reset.

### 30.11.2.3 RLDCRG — Reload Control Register G

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | $\begin{gathered} \text { RLDEN } \\ \text { G9 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G8 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G7 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G6 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G5 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G4 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G3 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \text { G2 } \end{gathered}$ | $\begin{gathered} \text { RLDEN } \\ \mathrm{G} 1 \end{gathered}$ | $\begin{array}{\|c} \text { RLDEN } \\ \text { G0 } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 30.200 RLDCRG Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to $\mathrm{SB}_{\mathrm{G}}$ | - | These bits are not used. When read, " 0 " is returned. When writing, write " 0 ". |
| $\mathrm{SB}_{\mathrm{G}-1} 1$ to 0 | RLDENGx | Reload Enable Gx |
|  |  | 0 : Disable the compare match register reload function upon compare match |
|  | 1: Enable the compare match register reload function upon compare match |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$

Reload control registers Gx (RLDCRGx) are 8-bit/16-bit readable/writable registers. RLDENGx enables and disables the reload function.

RLDCRGx is initialized to $0000_{\mathrm{H}}$ after reset.

## Reload Enable Gx (RLDENGx)

When this bit is set to " 1 " to enable the reload function, the value of the reload register (RLDGx) is transferred to the compare match register (OCRGx) upon compare match between the timer counter Gx (TCNTGx) and compare match register (OCRGx.

### 30.11.2.4 TCRGx — Timer Control Register Gx

Value after reset: $\quad 00_{H}$

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Table 30.201 TCRGx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | This bit is not used. When read, " 0 " is returned. When writing, write " 0 ". |
| 6 to 4 | CKSELGx[2:0] | Clock Select Gx <br> These bits select the clock source of timer counter G (TCNTGx) of subblock. <br> 000: Clock bus 0 <br> 001: Clock bus 1 <br> 010: Clock bus 2 <br> 011: Clock bus 3 <br> 100: Clock bus 4 <br> 101: Clock bus 5 <br> 110: Setting prohibited <br> 111: Setting prohibited |
| 3 to 1 | - | These bits are not used. When read, " 0 " is returned. When writing, write " 0 ". |
| 0 | EVSYMGx | External event synchronization mode set Gx <br> Specify the operation mode of timer subblock $G x$ <br> 0 : Normal count mode <br> 1: External event synchronization mode |

Note: $x$ indicates an integer from 0 to $\mathrm{SB}_{\mathrm{G}}-1$.

Timer control registers $\mathrm{Gx}\left(\right.$ TCRG0 $^{2}$ to $_{\text {TCRGSB }}^{\mathrm{G}}$-1) $)$ are 8 -bit readable/writable registers that set the operating mode of each subblock of timer $\mathrm{G}\left(\mathrm{G} 0\right.$ to $\left.\mathrm{GSB}_{\mathrm{G}}-1\right)$.

TCRG0 to TCRGSB $_{\mathrm{G}}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## Clock Select Gx (CKSELGx)

These bits select the clock source of timer counter (TCNTGx) of subblocks (G0 to $\mathrm{GSB}_{\mathrm{G}}-1$ ).
Setting these bits to a value from " 000 " to " 101 " selects a clock source from clock bus 0 to clock bus 5 . Do not set these bits to " 111 " or " 111 ". If " 111 " or " 111 " is set, the timer might not work properly.

## External Event Synchronization Mode Set (EVSYMGx)

This bit specifies the operation mode for the timer counter Gx (TCNTGx) of timer subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$. If EVSYMGx is set to " 1 ", external event synchronization mode is set, an input AGCK timing signal is detected in timer B and a count is begun. When selecting the external event synchronous mode, select 101 (Clock bus 5 is selected in a clock source.) in CKSELGx [2:0] and set 1 as CB5SEL (Angle clock of timer B). Also, set CU4SEL of timer B as 1 (Until TCNTB3-1 counts TCNTB4 and, the clear value of TCNTB5 is set as 0 .)

### 30.11.2.5 TSRGx — Timer Status Registers Gx

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | $2 \quad 1$ |  | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | EVDTFGx | OVFGx | CMFGx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Table 30.202 TSRGx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. When read, "0" is returned. When writing, write "0". |
| 2 | EVDTFGx | External event detection flag Gx |
|  |  | $0:$ No external event has occurred. |
|  | 1: An external event has occurred. |  |
| 1 | OVFGx | Overflow flag Gx |
|  | $0:$ TCNTGx has not overflowed |  |
|  | 1: TCNTGx has overflowed |  |
| 0 | CMFGx | Compare match flag Gx |
|  | $0:$ Compare match has not occurred in subblocks $G x$ |  |
|  |  | 1: Compare match has occurred in subblocks $G x$ |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$

Timer status registers Gx (TSRG0 to TSRGSB $_{\mathrm{G}}-1$ ) are 8-bit/16-bit read-only registers that measure the time and indicate occurrence of event counter overflow and compare match.

The overflow flag is the status flag that indicates the occurrence of overflow. It is not used to generate interrupts. The compare match flag is a status flag that indicates occurrence of an interrupt request. Setting a bit of the timer status clear register (TSCRGx) clears the corresponding flag. If an interrupt source takes effect when this flag is set, an interrupt request is issued again. An interrupt request is issued even if there is a conflict between clearing by the corresponding timer status clear register and setting by an interrupt source. When set and clear competed, clear is given priority to.

TSRG0 to $\operatorname{TSRGSB}_{\mathrm{G}}-1$ are initialized to $00_{\mathrm{H}}$ after reset.

## External Event Detection Flag Gx (EVDTFGx)

Indicates whether an external event is detected. This bit cannot be set to 0 or 1 by software.

- Setting (to 1 ) condition

When occurrence of the external event selected by input AGCKM timing signal is detected in timer B. $($ EVSYMGx $=$ " 1 ")

- Clearing (to 0 ) condition

When the counter G start bit (STRGx) is set to " 0 "

## Overflow Flag Gx (OVFGx)

Indicates whether timer counter Gx (TCNTGx) has overflowed. This bit cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition

When TCNTGx has overflowed (from FFFF $\mathrm{FFFF}_{\mathrm{H}}$ to $00000000_{\mathrm{H}}$ )

- Clearing (to 0 ) condition

When " 1 " is written to OVFCGx in timer status clear register Gx (TSCRGx)

## Compare Match Flag Gx (CMFGx)

Indicates whether a compare match has occurred in subblock $\mathrm{Gx}\left(\mathrm{G} 0\right.$ to $\left.\mathrm{GSB}_{\mathrm{G}}-1\right)$. This flag cannot be set to 1 or 0 by software.

- Setting (to 1 ) condition

When compare match is detected in subblock Gx

- Clearing (to 0) condition

When " 1 " is written to CMFCGx of the timer status clear register Gx (TSCRGx)

### 30.11.2.6 TSCRGx — Timer Status Clear Register Gx

Value after reset: $\quad 00_{H}$

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | OVFCGx | CMFCGx |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | W | W |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Table 30.203 TSCRGx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. When read, " 0 " is returned. When writing, write " 0 ". |
| 1 | OVFCGx | Overflow flag clear Gx enable |
|  | $0:$ Disabled (default) |  |
|  | 1: Write 0 to OVFGx |  |
| 0 | CMFCGx | Compare match flag clear Gx enable |
|  | $0:$ Disabled (default) |  |
|  | $1:$ Write 0 to CMFGx |  |

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$

TSCRGx is an 8-bit readable/writable register that clears the overflow and compare match flags.
TSCRGx is readable/writable only in 8-bit units. When this register is read, " 0 " is always returned.
TSCRGx is initialized to $00_{\mathrm{H}}$ after reset.

## Overflow Flag Clear Gx Enable (OVFCGx)

When overflow flag Gx (OVFGx) of timer status register Gx (TSRGx) is set to " 1 ", writing " 1 " to this register clears OVFGx to " 0 ". When read, " 0 " is always returned.

## Compare Match Flag Gx Enable (CMFCGx)

When compare match flag Gx (CMFGx) of timer status register Gx (TSRGx) is set to " 1 ", writing " 1 " to this register clears CMFGx to " 0 ". When read, " 0 " is always returned.

### 30.11.2.7 TCNTGx — Timer Counters Gx

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Table 30.204 TCNTGx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | TCNTGx[31:0] | Timer Counter Gx |
|  |  | These bits store the up-counter value. |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Timer counters Gx (TCNTGx) are 32-bit readable/writable registers. These registers are provided one for each subblock and are incremented by the clock selected in the corresponding control register. Clock bus 0 to 5 can be selected as the input clock.

When 1 is set as EVSYMGx, become the external event synchronous mode, and an input AGCK timing signal is detected in timer B and count start.

These counter values are compared with the value in compare match register Gx (OCRGx). When they match, the compare match flag (CMFGx bit in TSRGx register) is set and the counter value is cleared to $00000000_{\mathrm{H}}$ in the next PCLK cycle. Note, however, that TCNTGx is initialized to $00000001_{\mathrm{H}}$ if counter clearing by compare match and incrementation occur simultaneously. This occurs when TCNTGx is driven by the clock whose frequency is equal to the PCLK. An interrupt request can be issued to the CPU by detection of a compare match.

TCNTGx is initialized to $00000000_{\mathrm{H}}$ after reset.

### 30.11.2.8 OCRGx — Compare Match Registers Gx

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Table 30.205 OCRGx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | OCRGx[31:0] | Compare match $G x$ |
|  |  | These bits set the compare match value. |

Note: $\mathrm{x}=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$

Compare match registers Gx (OCRGx) are 32-bit readable/writable registers. These registers are provided one for each subblock, and function as the output compare register for timer counter Gx. A compare match can trigger an interrupt request.

Do not set OCRGx to $00000000_{\mathrm{H}}$. If set, compare match occurs at unintended timing.
OCRGx is initialized to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.11.2.9 RLDGx — Reload Registers Gx

Note: $x=0$ to $\mathrm{SB}_{\mathrm{G}}-1$ : Corresponding to subblocks G 0 to $\mathrm{GSB}_{\mathrm{G}}-1$
Reload registers Gx (RLDGx) are 32-bit readable/writable registers.
When the reload function is enabled, the value in this register is transferred to the compare match register Gx (OCRGx) upon compare match in the compare register (OCRGx).

Don't set $0000 \_0000_{\mathrm{H}}$ as RLDGx. When setting $0000 \_0000_{\mathrm{H}}$, a comparing match occurs by the timing which isn't intended.

RLDGx is initialized to $\mathrm{FFFF} \mathrm{FFFF}_{\mathrm{H}}$ after reset.

### 30.11.3 Details of Operation

Specifying a time period in OCRGx generates a positive logical pulse of one PCLK cycle when the specified period has elapsed. The initial value of the output signal is " 0 ". The counting period is specified based on the clock source of TCNTGx. The generated signals can be used as interrupt request triggers.

The compare match flag (CMFGx) of the timer status register Gx (TSRGx) is set when a compare match occurs. Compare match can be used as a trigger for issuing an interrupt request to the CPU .

Figure 30.94 illustrates the operation example. In this example, the TCNTGx clock is an ideal signal to show the counting and clearing timing of counter TCNTGx.

If EVSYMGx is set to " 1 ", external event synchronization mode is set, an input AGCK timing signal is detected in timer B and count start.

Figure 30.94 Operation Example of Counter and Compare Match

Figure 30.95 Reload Operation (RLDENGx $=1$ )

Figure 30.96 External Event Synchronization Mode (EVSYMGx = 1)

### 30.12 Automatic Switching of DMA and A/D Requests

### 30.12.1 Operation

This function controls trigger signals to be output to DMA and SAR-AD.
There are three trigger signals of data DMA trigger, count DMA trigger, and SAR-AD trigger signals described below

## (1) Data DMA Trigger

DMA output signals AD skipping DMA transfer request 0 and AD skipping DMA transfer request 1 are provided as the data DMA trigger signals.

The data DMA trigger can be selected from AGCK1 from timer B, timer G sub-block G1, G2 compare interrupt output (timer G1 compare interrupt or timer G2 compare interrupt), DF filter completion signal, ADC scan group 0 to 4 end interrupts (ADC0 scan group 0 end interrupt, ADC 0 scan group 1 end interrupt, ADC 0 scan group 2 end interrupt, ADC0 scan group 3 end interrupt, or ADC 0 scan group 4 end interrupt), and output stop.

Either of two data DMA trigger signals is output, and the DMA output to output the trigger is switched at the comparison timing between TCNT1D0 and OCR1D00 of timer D.

## (2) Count DMA Trigger

DMA output signals AD skipping DMA transfer request 2 and AD skipping DMA transfer request 3 are provided as the count DMA trigger signals.

The count DMA trigger can be selected from AGCK of timer A, timer G sub-block G3 compare interrupt output (timer G3 compare interrupt), and output stop.

Either of two count DMA trigger signals is output, and the DMA output to output the trigger is switched at the comparison timing between TCNT1D0 and OCR1D00 of timer D.

## (3) SAR-AD Trigger

SAR-AD output signal is provided as the SAR-AD trigger signal.
The SAR-AD trigger can be selected from AGCK1 of timer B, timer G sub-block G1, G2 compare interrupt outputs (timer G1 compare interrupt or timer G2 compare interrupt), and output stop.

### 30.12.2 Registers Related to Automatic Switching of DMA and AD Requests

### 30.12.2.1 TRGSRDMAO — Trigger Status Register DMAO

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OUTSRDMAO |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 30.206 TRGSRDMA0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. Fix these bits to 0. |
| 0 | OUTSRDMA0 | 0: AD skipping DMA transfer request 0 is selected |
|  |  | 1: AD skipping DMA transfer request 1 is selected. |

Trigger status register DMA0 is an 8-bit read-only register that indicates the selected data DMA output: AD skipping DMA transfer request 0 or AD skipping DMA transfer request 1 .

### 30.12.2.2 TRGSELDMA00 — Trigger Select Register DMA00

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | INSELDMA00 |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 30.207 TRGSELDMA00 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. Fix these bits to 0. |
| 3 to 0 | INSELDMA00 | 0000: Output stop (output is fixed to "0".) |
|  |  | 0001: AGCK1 is selected. |
|  | 0010: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. |  |
|  | 0011: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected. |  |
|  | 0100: DF filter completion signal is selected. |  |
|  | 0101: Setting prohibited |  |
|  | 0110: Setting prohibited |  |
|  | 0111: Setting prohibited |  |
|  | 1000: ADC0 scan group 0 end interrupt is selected. |  |
|  | 1001: ADC0 scan group 1 end interrupt is selected. |  |
|  | 1010: ADC0 scan group 2 end interrupt is selected. |  |
|  | 1011: ADC0 scan group 3 end interrupt is selected. |  |
|  | 1100: ADC0 scan group 4 end interrupt is selected. |  |
|  | 1101: Setting prohibited |  |
|  | 1110: Setting prohibited |  |
|  | 1111: Setting prohibited |  |

This register is an 8-bit readable/writable register that selects the signal to be output to the data DMA output AD skipping DMA transfer request 0 . This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

### 30.12.2.3 TRGSELDMA01 — Trigger Select Register DMA01

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | INSELDMA01 |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 30.208 TRGSELDMA01 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 4 | - | These bits are not used. Fix these bits to 0. |
| 3 to 0 | INSELDMA01 | 0000: Output stop (output is fixed to "0".) |
|  |  | 0001: AGCK1 is selected. |
|  | 0010: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. |  |
|  | 0011: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected. |  |
|  | 0100: DF filter completion signal is selected. |  |
|  | 0101: Setting prohibited |  |
|  | 0110: Setting prohibited |  |
|  | 0111: Setting prohibited |  |
|  | 1000: ADC0 scan group 0 end interrupt is selected. |  |
|  | 1001: ADC0 scan group 1 end interrupt is selected. |  |
|  | 1010: ADC0 scan group 2 end interrupt is selected. |  |
|  | 1011: ADC0 scan group 3 end interrupt is selected. |  |
|  | 1100: ADC0 scan group 4 end interrupt is selected. |  |
|  | 1101: Setting prohibited |  |
|  | 1110: Setting prohibited |  |
|  | 1111: Setting prohibited |  |

This register is an 8-bit readable/writable register that selects the signal to be output to the data DMA output AD skipping DMA transfer request 1 . This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

### 30.12.2.4 TRGSELAD — Trigger Select Register AD

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | INSELAD |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 30.209 TRGSELAD Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. Fix these bits to 0. |
| 1,0 | INSELAD | 00: Output stop (output is fixed to "0".) |
|  |  | 01: AGCK1 is selected. |
|  | 10: Timer G subblock G1 compare interrupt signal (CMFG1 interrupt) is selected. |  |
|  |  | 11: Timer G subblock G2 compare interrupt signal (CMFG2 interrupt) is selected. |

This register is an 8-bit readable/writable register that selects the signal to be output to the SAR-AD trigger. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

### 30.12.2.5 TRGSRDMA1 — Trigger Status Register DMA1

Value after reset: $\quad 00 \mathrm{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | OUTSRDMA1 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 30.210 TRGSRDMA1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | These bits are not used. Fix these bits to 0. |
| 0 | OUTSRDMA1 | $0:$ AD skipping DMA transfer request 2 is selected |
|  |  | 1: AD skipping DMA transfer request 3 is selected |

This register is an 8 -bit read-only register that indicates the selected count DMA output: AD skipping DMA transfer request 2 or AD skipping DMA transfer request 3 .

### 30.12.2.6 TRGSELDMA10 — Trigger Select Register DMA10

Value after reset: $\quad 0 \mathrm{OH}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | INSELDMA10 |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 30.211 TRGSELDMA10 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. Fix these bits to 0. |
| 1,0 | INSELDMA10 | $00:$ Output stop (output is fixed to "0".) |
|  |  | 01: AGCK is selected |
|  | 10: Timer G subblock G3 compare interrupt signal (CMFG3 interrupt) is selected. |  |
|  | 11: Setting prohibited |  |

This register is an 8-bit readable/writable register that selects the signal to be output to the count DMA output AD skipping DMA transfer request 2. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

### 30.12.2.7 TRGSELDMA11 — Trigger Select Register DMA11

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | INSELDMA11 |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 30.212 TRGSELDMA11 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | These bits are not used. Fix these bits to 0. |
| 1,0 | INSELDMA11 | $00:$ Output stop (output is fixed to "0".) |
|  |  | 01: AGCK is selected |
|  | 10: Timer G subblock G3 compare interrupt signal (CMFG3 interrupt) is selected. |  |
|  | 11: Setting prohibited |  |

This register is an 8-bit readable/writable register that selects the signal to be output to the count DMA output AD skipping DMA transfer request 3. This register can be rewritten during operation. When this register is rewritten, the changed setting becomes valid immediately.

### 30.12.3 Details of Operation

The following describes the operation and block diagram of each trigger.

### 30.12.3.1 Data DMA Trigger

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 0 ) is selected by the INSELDMA00[3:0] bits in TRGSELDMA00.

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 1 ) is selected by the INSELDMA01[3:0] bits in TRGSELDMA00.

The data DMA trigger output pin outputs only AD skipping DMA transfer request 0 when the DMA select signal is low, and only AD skipping DMA transfer request 1 when the DMA select signal is high.

Figure 30.97 Data DMA Trigger Selection Circuit

### 30.12.3.2 Count DMA Trigger

The signal to be output to the count DMA trigger output pin (AD skipping DMA transfer request 2 ) is selected by the INSELDMA10[1:0] bits in TRGSELDMA10.

The signal to be output to the data DMA trigger output pin (AD skipping DMA transfer request 3 ) is selected by the INSELDMA11[1:0] bits in TRGSELDMA11.

The count DMA trigger output pin outputs only AD skipping DMA transfer request 2 when the DMA select signal is low, and only AD skipping DMA transfer request 3 when the DMA select signal is high.

Figure 30.98 Count DMA Trigger Selection Circuit

### 30.12.3.3 SAR-AD Trigger

The signal to be output to the SAR-AD trigger output pin is selected by the INSELAD[1:0] bits in TRGSELDAD.

Figure 30.99 SAR-AD Trigger Selection Circuit

Figure $\mathbf{3 0 . 1 0 0}$ shows the trigger output timing chart.

Figure 30.100 DMA/AD Trigger Timing Chart

### 30.13 Trigger Select Function

### 30.13.1 Overview of Operation

The function for which each trigger indicated on the following is selected.

- Interrupt signal communicated to INTC is selected.
- Interrupt signal communicated to sDMA/DTS is selected.
- "Timer DFE Capture trigger $\mathrm{i}(\mathrm{i}=0$ to 2$)$ " communicated to DFE selected.
- "Timer FIFO Capture trigger" communicated to DFE is selected.
- "read gate" communicated to DSADC is selected.
- "read gate" communicated to C-ADC is selected.
- "time stamp" and "sync pulse" communicated to PSI5S is selected.

### 30.13.2 Registers Related to Trigger Select Function

### 30.13.2.1 ATUINTSELA — ATU TimerA Interrupt Selection Control Register

Value after reset: $\quad 00000000 \mathrm{H}$

Table 30.213 ATUINTSELA Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 15 | - | Reserved. When writing to these bits, write 0. |
| $11,7,3$ |  |  |
| 14 to $12(\mathrm{j}=3)$ | ATU_INTSEL_Aj[2:0] | Select as interrupt factor no. $10+\mathrm{j}$ from the following signals. $(\mathrm{j}=3$ to 0$)$ |
| 10 to $8(\mathrm{j}=2)$ |  | 000: ICRA0 input capture interrupt |
| 6 to $4(\mathrm{j}=1)$ |  | 001: ICRA1 input capture interrupt |
| 2 to $0(\mathrm{j}=0)$ |  | 010: ICRA2 input capture interrupt |
|  | 011: ICRA3 input capture interrupt |  |
|  | 100: ICRA4 input capture interrupt |  |
|  | 101: ICRA5 input capture interrupt |  |
|  | 110: ICRA6 input capture interrupt |  |
|  |  |  |
|  |  |  |

The factor communicated to a CPU system is selected from the interrupt signal output from Timer A.

### 30.13.2.2 ATUINTSELDO — ATU TimerD Interrupt Selection Control Register 0

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | ATU_INTSEL_D13[2:0] |  |  | - | ATU_INTSEL_D12[2:0] |  |  | - | ATU_INTSEL_D11[2:0] |  |  | - | ATU_INTSEL_D10[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | ATU_INTSEL_D03[2:0] |  |  | - | ATU_I | SEL_D | 2[2:0] | - | ATU_IN | TSEL_D | 1[2:0] | - | ATU_I | SEL | [2:0] |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

Table 30.214 ATUINTSELDO Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| $\begin{aligned} & 31,27,23, \\ & 19,15,11,7, \\ & 3 \end{aligned}$ | - | Reserved. When writing to these bits, write 0. |
| $\begin{aligned} & 30 \text { to } 28 \\ & (x y=13) \end{aligned}$ | $\begin{aligned} & \text { ATU_INTSEL_Dxy } \\ & {[2: 0]} \end{aligned}$ | Select as interrupt request no. $\left(140+4^{*} x+y\right)$ from the following signals. 000: OCR1Dxy compare match interrupt |
| $\begin{aligned} & 26 \text { to } 24 \\ & (x y=12) \end{aligned}$ |  | 001: OCR2Dxy compare match interrupt <br> 010: 1shot pulse ON Dxy occurrence interrupt |
| $\begin{aligned} & 22 \text { to } 20 \\ & (x y=11) \end{aligned}$ |  | 011: 1shot pulse OFF Dxy occurrence interrupt 100: UDIDxy down-counter underflow interrupt |
| $\begin{aligned} & 18 \text { to } 16 \\ & (x y=10) \end{aligned}$ |  | 101: All interrupts combined by OR |
| $\begin{aligned} & 14 \text { to } 12 \\ & (x y=03) \end{aligned}$ |  | Others: inhibit: |
| $\begin{aligned} & 10 \text { to } 8 \\ & (x y=02) \end{aligned}$ |  |  |
| 6 to 4 $(x y=01)$ |  |  |
| $\begin{aligned} & 2 \text { to } 0 \\ & (x y=00) \end{aligned}$ |  |  |

Note: x: Number of sub-block, $y$ : Number of channel

The factor communicated to a CPU system is selected from the interrupt signal output from Timer D.

### 30.13.2.3 ATUINTSELD1 — ATU TimerD Interrupt Selection Control Register 1

Value after reset: $00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | ATU_INTSEL_D33[2:0] |  |  | - | ATU_INTSEL_D32[2:0] |  |  | - | ATU_INTSEL_D31[2:0] |  |  | - | ATU_INTSEL_D30[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | ATU_INTSEL_D23[2:0] |  |  | - | ATU_INTSEL_D22[2:0] |  |  | - | ATU_INTSEL_D21[2:0] |  |  | - | ATU_INTSEL_D20[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W | R | R/W | R/W | R/W |

Table 30.215 ATUINTSELD1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $31,27,23$, | - | Reserved. When writing to these bits, write 0. |
| $19,15,11,7$, <br> 3 |  |  |
| 30 to 28 | ATU_INTSEL_Dxy | Select as interrupt request no. $\left.140+4^{*} x+y\right)$ from the following signals. |
| $(x y=33)$ | $[2: 0]$ | 000: OCR1Dxy compare match interrupt |
| 26 to 24 |  | 001: OCR2Dxy compare match interrupt |
| $(x y=32)$ |  | 010: 1shot pulse ON Dxy occurrence interrupt |
| 22 to 20 |  | 100: UDIDxy down-counter underflow interrupt |
| $(x y=31)$ |  |  |
| 18 to 16 |  |  |
| $(x y=30)$ |  |  |
| 14 to 12 |  |  |
| $(x y=23)$ |  |  |
| 10 to 8 |  |  |
| $(x y=22)$ |  |  |
| 6 to 4 |  |  |
| $(x y=21)$ |  |  |
| 2 to 0 |  |  |
| $(x y=20)$ |  |  |

Note: x: Number of sub-block, $y$ : Number of channel

The factor communicated to a CPU system is selected from the interrupt signal output from Timer D.

### 30.13.2.4 ATUINTSELD2 — ATU TimerD Interrupt Selection Control Register 2

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 30.217 ATUINTSELD3 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| $31,27,23$, | - | Reserved. When writing to these bits, write 0. |
| $19,15,11,7$, <br> 3 |  |  |
| 30 to 28 | ATU_INTSEL_Dxy | Select as interrupt request no. $\left.140+4^{*} x+y\right)$ from the following signals. |
| $(x y=73)$ | $[2: 0]$ | 000: OCR1Dxy compare match interrupt |
| 26 to 24 |  | 001: OCR2Dxy compare match interrupt |
| $(x y=72)$ |  | 010: 1shot pulse ON Dxy occurrence interrupt |
| 22 to 20 |  | 100: UDIDxy down-counter underflow interrupt |
| $(x y=71)$ |  |  |
| 18 to 16 |  |  |
| $(x y=70)$ |  |  |
| 14 to 12 |  |  |
| $(x y=63)$ |  |  |
| 10 to 8 |  |  |
| $(x y=62)$ |  |  |
| 6 to 4 |  |  |
| $(x y=61)$ |  |  |
| 2 to 0 |  |  |
| $(x y=60)$ |  |  |

Note: x: Number of sub-block, $y$ : Number of channel

The factor communicated to a CPU system is selected from the interrupt signal output from Timer D.

### 30.13.2.6 ATUINTSELD4 — ATU TimerD Interrupt Selection Control Register 4

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 30.218 ATUINTSELD4 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved. When writing to these bits, write 0. |
| $15,11,7,3$ |  |  |
| 14 to 12 | ATU_INTSEL_Dxy | Select as interrupt request no. $\left(140+4^{*} x+y\right)$ from the following signals. |
| $(x y=83)$ | $[2: 0]$ | $000:$ OCR1Dxy compare match interrupt |
| 10 to 8 |  | $001:$ OCR2Dxy compare match interrupt |
| $(x y=82)$ |  | $010: 1$ shot pulse ON Dxy occurrence interrupt |
| 6 to 4 |  | $011: 1$ shot pulse OFF Dxy occurrence interrupt |
| $(x y=81)$ |  | 100: UDIDxy down-counter underflow interrupt |
| 2 to 0 |  | 101: All interrupts combined by OR |
| $(x y=80)$ |  | Others inhibit: |

Note: x: Number of sub-block, y: Number of channel

The factor communicated to a CPU system is selected from the interrupt signal output from Timer D.

### 30.13.2.7 ATUDMASELB — ATU TimerB DMA Selection Control Register

Value after reset: $00000000_{\mathrm{H}}$

Table 30.219 ATUDMASELB Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved. When writing to these bits, write 0. |
| $\begin{aligned} & 15 \text { to } 12(\mathrm{j}=3) \\ & 11 \text { to } 8(\mathrm{j}=2) \\ & 7 \text { to } 4(\mathrm{j}=1) \\ & 3 \text { to } 0(\mathrm{j}=0) \end{aligned}$ | $\begin{aligned} & \text { ATU_DMASEL_Bj } \\ & {[3: 0]} \\ & (\mathrm{j}=3 \text { to } 0) \end{aligned}$ | Select as DMA request 46+j or 174+j (group 1) or DTS request no. $46+j$ or $110+j$ (group 2) from the following signals. ( $\mathrm{j}=3$ to 0 ) <br> 0000: OCRB0 compare match interrupt <br> 0001: OCRB1 compare match interrupt <br> 0010: OCRB6 compare match interrupt <br> 0011: OCRB10 compare match interrupt <br> 0100: OCRB11 compare match interrupt <br> 0101: OCRB12 compare match interrupt <br> 0110: Comparison between TCNTB6M and ICRB6 condition match interrupt <br> 0111: AND/OR condition of CMFB6 and CMFB6M condition match interrupt <br> 1000: ICRB0 input capture interrupt <br> others: inhibited |

The factor communicated to a DMA system is selected from the interrupt signal output from Timer B.

| 3 | - | Reserved. When writing to these bits, write 0. |
| 2 to 0 | ATU_DMASEL_CD16 | Select as DMA request no.80 or 208 (group 1), |
|  | $[2: 0]$ | DTS request no.16 or 80 (group 3) from the following signals. |
|  |  | 000: GRC40 input capture/compare match interrupt |
|  |  | 001: OCRC40 input capture/compare match interrupt <br> others: inhibit |
|  |  |  |

The factor communicated to a DMA system is selected from the interrupt signal output from Timer C/D.

### 30.13.2.11 ATUDMASELCD3 - ATU TimerC/TimerD DMA Selection Control Register 3

Table 30.223 ATUDMASELCD3 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | - | Reserved. When writing to these bits, write 0. |
| 30 to 28 | $\begin{aligned} & \text { ATU_DMASEL_CD31 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 95 or 223 (group 1), <br> DTS request no.31or 95 (group 3) from the following signals. <br> 000: GRC73 input capture/compare match interrupt <br> 001: OCRC73 input capture/compare match interrupt others: inhibit |
| 27 | - | Reserved. When writing to these bits, write 0. |
| 26 to 24 | $\begin{aligned} & \text { ATU_DMASEL_CD30 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 94 or 222 (group 1), <br> DTS request no. 30 or 94 (group 3) from the following signals. <br> 000: GRC72 input capture/compare match interrupt <br> 001: OCRC72 input capture/compare match interrupt others: inhibit |
| 23 | - | Reserved. When writing to these bits, write 0. |
| 22 to 20 | $\begin{aligned} & \text { ATU_DMASEL_CD29 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 93 or 221 (group 1), <br> DTS request no. 29 or 93 (group 3) from the following signals. 000: GRC71 input capture/compare match interrupt 001: OCRC71 input capture/compare match interrupt others: inhibit |
| 19 | - | Reserved. When writing to these bits, write 0. |
| 18 to 16 | $\begin{aligned} & \text { ATU_DMASEL_CD28 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 92 or 220 (group 1), <br> DTS request no. 28 or 92 (group 3) from the following signals. 000: GRC70 input capture/compare match interrupt 001: OCRC70 input capture/compare match interrupt others: inhibit |
| 15 | - | Reserved. When writing to these bits, write 0 . |

Table 30.223 ATUDMASELCD3 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 14 to 12 | $\begin{aligned} & \text { ATU_DMASEL_CD27 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 91 or 219 (group 1), <br> DTS request no. 27 or 91 (group 3) from the following signals. 000: GRC63 input capture/compare match interrupt 001: OCRC63 input capture/compare match interrupt others: inhibit |
| 11 | - | Reserved. When writing to these bits, write 0. |
| 10 to 8 | $\begin{aligned} & \text { ATU_DMASEL_CD26 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 90 or 218 (group 1), <br> DTS request no. 26 or 90 (group 3) from the following signals. 000: GRC62 input capture/compare match interrupt 001: OCRC62 input capture/compare match interrupt others: inhibit |
| 7 | - | Reserved. When writing to these bits, write 0. |
| 6 to 4 | $\begin{aligned} & \text { ATU_DMASEL_CD25 } \\ & \text { [2:0] } \end{aligned}$ | Select as DMA request no. 89 or 217 (group 1), <br> DTS request no. 25 or 89 (group 3) from the following signals. 000: GRC61 input capture/compare match interrupt 001: OCRC61 input capture/compare match interrupt others: inhibit |
| 3 | - | Reserved. When writing to these bits, write 0. |
| 2 to 0 | ATU_DMASEL_CD24 [2:0] | Select as DMA request no. 88 or 216 (group 1), <br> DTS request no. 24 or 88 (group 3) from the following signals. <br> 000: GRC60 input capture/compare match interrupt <br> 001: OCRC60 input capture/compare match interrupt others: inhibit |

The factor communicated to a DMA system is selected from the interrupt signal output from Timer C/D

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

Table 30.231 ATUDFESELD1T Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 3 | - | Reserved. When writing to these bits, write 0. |
| 2 to 0 | ATU_DFESEL_D1T | Select as DFE Timer FIFO Capture trigger input from the following signals. |
|  | $[2: 0]$ | 000: OCRG0 compare-match interrupt |
|  | 001: OCRG1 compare-match interrupt |  |
|  | 010: OCRG2 compare-match interrupt |  |
|  | 011: OCRG3 compare-match interrupt |  |
|  | 100: OCRG4 compare-match interrupt |  |
|  | 101: OCRG5 compare-match interrupt |  |
|  | 110: OCRG6 compare-match interrupt |  |
|  | 111: OCRG7 compare-match interrupt |  |

The factor communicated to a DFE (as Timer FIFO Capture trigger input) is selected from the interrupt signal output from Timer C/D.

### 30.13.2.20 ATUDSSELDSTS — ATU to DSADC Read Gate Trigger Select

Table 30.232 ATUDSSELDSTS Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 20 | - | Reserved. When writing to these bits, write 0. |
| 19 to 18 | $\begin{aligned} & \text { ATU_DSSEL_DSTS9 } \\ & \text { [1:0] } \end{aligned}$ | Select as DS-ADC read gate trigger 9 from the following signals. <br> 00: TIOC21 Timer C (sub-block 2, channel 1) compare-match output <br> 01: TOD21A Timer D (sub-block 2, channel 1) compare-match A output <br> 10: TOD21B Timer D (sub-block 2, channel 1) compare-match B output <br> 11: TOE21 Timer E (sub-block 2, channel 1) PWM output |
| 17 to 16 | ATU_DSSEL_DSTS8 [1:0] | Select as DS-ADC read gate trigger 8 from the following signals. <br> 00: TIOC20 Timer C (sub-block 2, channel 0) compare-match output <br> 01: TOD20A Timer D (sub-block 2, channel 0) compare-match A output <br> 10: TOD20B Timer D (sub-block 2, channel 0) compare-match B output <br> 11: TOE20 Timer E (sub-block 2, channel 0) PWM output |
| 15 to 14 | ATU_DSSEL_DSTS7 [1:0] | Select as DS-ADC read gate trigger 7 from the following signals. <br> 00: TIOC13 Timer C (sub-block 1, channel 3) compare-match output <br> 01: TOD13A Timer D (sub-block 1, channel 3) compare-match A output <br> 10: TOD13B Timer D (sub-block 1, channel 3) compare-match B output <br> 11: TOE13 Timer E (sub-block 1, channel 3) PWM output |
| 13 to 12 | ATU_DSSEL_DSTS6 [1:0] | Select as DS-ADC read gate trigger 6 from the following signals. <br> 00: TIOC12 Timer C (sub-block 1, channel 2) compare-match output <br> 01: TOD12A Timer D (sub-block 1, channel 2) compare-match A output <br> 10: TOD12B Timer D (sub-block 1, channel 2) compare-match B output <br> 11: TOE12 Timer E (sub-block 1, channel 2) PWM output |
| 11 to 10 | ATU_DSSEL_DSTS5 [1:0] | Select as DS-ADC read gate trigger 5 from the following signals. <br> 00: TIOC11 Timer C (sub-block 1, channel 1) compare-match output <br> 01: TOD11A Timer D (sub-block 1, channel 1) compare-match A output <br> 10: TOD11B Timer D (sub-block 1, channel 1) compare-match B output <br> 11: TOE11 Timer E (sub-block 1, channel 1) PWM output |

Table 30.232 ATUDSSELDSTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 9 to 8 | $\begin{aligned} & \text { ATU_DSSEL_DSTS4 } \\ & \text { [1:0] } \end{aligned}$ | Select as DS-ADC read gate trigger 4 from the following signals. <br> 00: TIOC10 Timer C (sub-block 1, channel 0) compare-match output <br> 01: TOD10A Timer D (sub-block 1, channel 0) compare-match A output <br> 10: TOD10B Timer D (sub-block 1, channel 0) compare-match B output <br> 11: TOE10 Timer E (sub-block 1, channel 0) PWM output |
| 7 to 6 | $\begin{aligned} & \text { ATU_DSSEL_DSTS3 } \\ & \text { [1:0] } \end{aligned}$ | Select as DS-ADC read gate trigger 3 from the following signals. <br> 00: TIOC03 Timer C (sub-block 0, channel 3) compare-match output <br> 01: TOD03A Timer D (sub-block 0 , channel 3 ) compare-match A output <br> 10: TOD03B Timer D (sub-block 0, channel 3) compare-match B output <br> 11: TOE03 Timer E (sub-block 0, channel 3) PWM output |
| 5 to 4 | ATU_DSSEL_DSTS2 [1:0] | Select as DS-ADC read gate trigger 2 from the following signals. <br> 00: TIOC02 Timer C (sub-block 0, channel 2) compare-match output <br> 01: TOD02A Timer D (sub-block 0, channel 2) compare-match A output <br> 10: TOD02B Timer D (sub-block 0 , channel 2 ) compare-match B output <br> 11: TOE02 Timer E (sub-block 0, channel 2) PWM output |
| 3 to 2 | ATU_DSSEL_DSTS1 [1:0] | Select as DS-ADC read gate trigger 1 from the following signals. <br> 00: TIOC01 Timer C (sub-block 0, channel 1) compare-match output <br> 01: TOD01A Timer D (sub-block 0, channel 1) compare-match A output <br> 10: TOD01B Timer D (sub-block 0 , channel 1) compare-match B output <br> 11: TOE01 Timer E (sub-block 0, channel 1) PWM output |
| 1 to 0 | $\begin{aligned} & \text { ATU_DSSEL_DSTS0 } \\ & \text { [1:0] } \end{aligned}$ | Select as DS-ADC read gate trigger 0 from the following signals. <br> 00: TIOC00 Timer C (sub-block 0, channel 0) compare-match output <br> 01: TOD00A Timer D (sub-block 0, channel 0) compare-match A output <br> 10: TOD00B Timer D (sub-block 0 , channel 0 ) compare-match B output <br> 11: TOE00 Timer E (sub-block 0, channel 0) PWM output |

The factor communicated to a DS-ADC (as read gate input) is selected from the external-output signal from Timer C/D/E.

Table 30.234 ATUP5SSEL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 28 | - | Reserved. When writing to these bits, write 0. |
| 27 to 26 | ATU_P5SSEL_SSTS | Select as PSI5-S Run-stop time stamp B from the following signals. |
|  | B[1:0] | 00: TIOC31 Timer C (sub-block 3, channel 1) compare-match output |
|  |  | 01: TOD31A Timer D (sub-block 3, channel 1) compare-match A output |
|  |  | 10: TOD31B Timer D (sub-block 3, channel 1) compare-match B output |
|  |  | 11: TOE31 Timer E (sub-block 3, channel 1) PWM output |
| 25 to 24 | ATU_P5SSEL_SSTS | Select as PSI5-S Run-stop time stamp A from the following signals. |
|  | A[1:0] | 00: TIOC30 Timer C (sub-block 3, channel 0) compare-match output |
|  |  | 01: TOD30A Timer D (sub-block 3, channel 0 ) compare-match A output |
|  |  | 10: TOD30B Timer D (sub-block 3, channel 0 ) compare-match B output |
|  |  | 11: TOE30 Timer E (sub-block 3, channel 0) PWM output |

23 to 22 ATU_P5SSEL_CRTS Select as PSI5-S clear time stamp B from the following signals. $\mathrm{B}[1: \overline{0}] \quad 00:$ TIOC23 Timer C (sub-block 2, channel 3) compare-match output 01: TOD23A Timer D (sub-block 2, channel 3) compare-match A output 10: TOD23B Timer D (sub-block 2, channel 3) compare-match B output 11: TOE23 Timer E (sub-block 2, channel 3) PWM output
21 to 20 ATU_P5SSEL_CRTS Select as PSI5-S clear time stamp A from the following signals. A[1:0] 00: TIOC22 Timer C (sub-block 2, channel 2) compare-match output 01: TOD22A Timer D (sub-block 2, channel 2) compare-match A output 10: TOD22B Timer D (sub-block 2, channel 2) compare-match B output 11: TOE22 Timer E (sub-block 2, channel 2) PWM output
19 to 18 ATU_P5SSEL_CKTS Select as PSI5-S clock time stamp B from the following signals. $\mathrm{B}[1: \overline{0}] \quad$ 00: TIOC21 Timer C (sub-block 2, channel 1) compare-match output 01: TOD21A Timer D (sub-block 2, channel 1) compare-match A output 10: TOD21B Timer D (sub-block 2, channel 1) compare-match B output 11: TOE21 Timer E (sub-block 2, channel 1) PWM output

Table 30.234 ATUP5SSEL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 17 to 16 | ATU_P5SSEL_CKTS | Select as PSI5-S clock time stamp A from the following signals. |
|  | A[1:0] | 00: TIOC20 Timer C (sub-block 2, channel 0) compare-match output |
|  |  | 01: TOD20A Timer D (sub-block 2, channel 0) compare-match A output |
|  |  | 10: TOD20B Timer D (sub-block 2, channel 0) compare-match B output |
|  |  | 11: TOE20 Timer E (sub-block 2, channel 0) PWM output |

The factor communicated to a PSI5-S (as Time Stamp input) is selected from the external-output signal from Timer C/D/E.

### 30.13.3 Details of Operation

### 30.13.3.1 Interrupt signal communicated to INTC is selected.

The function for which interrupt number allocation of an interrupt factor of ATU is selected.

- Timer A

4 of allocation is possible from "ICRA0-7 input capture interrupt" of timer A. One is selected from ICRA0-7 and a factor is assigned by setting of ATUINTSELA register. It can be allocated to interrupt number 10-13.

Figure 30.101 Block Diagram of Timer A Interrupt Selection.

- Timer D

One factor is selected from "OCR1Dxy compare match interrupt", "OCR2Dxy compare match interrupt", "1shot pulse ON Dxy occurrence interrupt", "1shot pulse OFF Dxy occurrence interrupt" and "UDIDxy down-counter underflow interrupt" of timer D and it's assigned to interrupt. The interrupt number and correspondence with subblock x and channel y are shown to Table 30.235.

Figure 30.102 Block Diagram of Timer D Interrupt Selection.

Table 30.235 Interrupt Number and Contrast in a Timer D Subblock Channel

| Interrupt Number | Timer D |  |
| :---: | :---: | :---: |
|  | Sub Block x | Channel y |
| 140 | 0 | 0 |
| 141 | 0 | 1 |
| 142 | 0 | 2 |
| 143 | 0 | 3 |
| 144 | 1 | 0 |
| 145 | 1 | 1 |
| 146 | 1 | 2 |
| 147 | 1 | 3 |
| 148 | 2 | 0 |
| 149 | 2 | 1 |
| 150 | 2 | 2 |
| 151 | 2 | 3 |
| 152 | 3 | 0 |
| 153 | 3 | 1 |
| 154 | 3 | 2 |

| 160 | 5 | 0 |
| 161 | 5 | 1 |
| 162 | 5 | 2 |
| 163 | 5 | 3 |
| 164 | 6 | 0 |
| 165 | 6 | 1 |
| 166 | 6 | 2 |
| 167 | 6 | 3 |
| 168 | 7 | 0 |
| 169 | 7 | 1 |
| 170 | 7 | 2 |
| 171 | 7 | 3 |
| 172 | 8 | 0 |
| 173 | 8 | 1 |
| 174 | 8 | 2 |
| 175 | 8 | 3 |

### 30.13.3.2 Interrupt signal communicated to sDMA/DTS is selected.

- Timer B

One factor is selected from "OCRB0, OCRB1, OCRB6, OCRB10, OCRB11, OCRB12 compare match interrupt", "Comparison between TCNTB6M and ICRB6 condition match interrupt", "AND/OR condition of CMFB6 and CMFB6M condition match interrupt" and "ICRB0 input capture interrupt" of timer B and it's assigned to sDMA / DTS.

Figure 30.103 Block Diagram of Timer B DMA Selection.

- Timer C / Timer D

One factor is selected from "GRCxy input capture/compare match interrupt" and "OCRCxy input capture/compare match interrupt" of timer C and "OCR1Dxy, OCR2Dxy compare match interrupt", "1shot pulse ON Dxy occurrence interrupt", "1shot pulse OFF Dxy occurrence interrupt" and "UDIDxy down-counter underflow interrupt" of timer D and it's assigned sDMA / DTS. The sDMA/DTS number and correspondence with subblock $x$ and channel $y$ are shown to Table 30.236.

Timer C / Timer D DMA selection

Figure 30.104 Block Diagram of Timer C / Timer D DMA Selection.

Table 30.236 sDMA/DTS Trigger Number and Contrast in a Timer C and D Subblock Channel (1/2)

| sDMA Trigger <br> Number (Group1) |  | DTS Trigger <br> Number (Group3) |  | Timer C |  | Timer D |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Sub Block x | Channel y | Sub Block x | Channel y |
| 64 | 192 |  |  | 0 | 64 | 0 | 0 | 8 | 0 |

- Timer E

One factor is selected from "CYLREx0-3 cycle compare match interrupt / DTREx0-3 duty compare match interrupt" of timer E and it's assigned to sDMA/DTS. The sDMA/DTS number and correspondence with subblock x are shown to
Table 30.237.

Figure 30.105 Block Diagram of Timer E DMA Selection.

Table 30.237 sDMA/DTS Trigger Number and Contrast in a Timer E Subblock

### 30.13.3.3 "Timer DFE Capture trigger i ( $\mathrm{i}=0$ to 2 )" communicated to DFE selected.

The factor selected from "GRCxy input capture/compare match interrupt" or "OCRCxy input capture/compare match interrupt" in timer C and "OCR1Dxy, OCR2Dxy compare match interrupt", "1shot pulse ON Dxy occurrence interrupt", "1shot pulse OFF Dxy occurrence interrupt" and "UDIDxy down-counter underflow interrupt" of timer D is assigned to a trigger of DFE. A factor of each timer can change enable or disenable. It can be chosen from several subblocks and a channel from timer C and timer D . The subblock which can be chosen and a channel are shown to
Table 30.238.

Figure 30.106 Block Diagram of ATU to DFE Capture Trigger Selection.

### 30.13.3.4 "Timer FIFO Capture trigger" communicated to DFE is selected.

One factor is selected from "OCRG0-OCRG7 compare-match interrupt" of timer G and it's assigned to interrupt.

Figure 30.107 Block Diagram of ATU to DFE Capture Trigger Selection.

### 30.13.3.5 "read gate" communicated to DSADC is selected.

One factor is selected from TIOCxy, TODxyA, TODxyB and TOExy and it's assigned to read gate in DSADC.
Correspondence with a subblock of the unit of DSADC and each timer and a channel is shown to Table 30.239.

Figure 30.108 Block Diagram of ATU to DSADC Read Gate Trigger Selection.

Table 30.239 DSADC Channel Number and Contrast in a Timer C, D and E Subblock and Channel

| Unit | Timer C |  | Timer D |  | Timer E |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Sub Block x | Channel y | Sub Block x | Channel y | Sub Block x | Channel y |
| DSADC00 | 0 | 0 | 0 | 0 | 0 | 0 |

### 30.14 Usage Notes

In ATU-V, status register (TSR) flags deployed in different timers are status flags indicating occurrences of compare match, overflow, underflow, and input capture. If compare match, overflow, underflow, or input capture occurs when the status flag is set to 1 , the status flag retains the value " 1 ", and an interrupt request is issued to the CPU. To find out whether an interrupt is requested properly, check the corresponding flag on the INTC. If two interrupt conditions occur in succession in a period shorter than a PCLK cycle, an interrupt request is generated for the first interrupt condition, and not for the subsequent one.

This section describes the conflicts and operation that may occur during ATU-V operation.

### 30.14.1 Input Capture Conflict Operation

### 30.14.1.1 Conflict between Writing to General Register and Input Capture

When a write to a general register occurs simultaneously with input capture, writing takes priority (see the left portion of Figure $\mathbf{3 0 . 1 1 1}$ below). However, an input capture interrupt request is issued, and if input capture status is provided, the input capture flag is set. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 1 1}$ show a case in which writing occurs one PCLK cycle prior to input capture.

Figure 30.111 Conflict between Writing to GRCxy and Input Capture

| Timer | Counter (Whose Value is Captured) | Capture Register | Status |
| :--- | :--- | :--- | :--- |
| Timer C | TCNTCx | GRCxy | IMFCxy |
| Timer F | ECNTAFx | GRAFx | ICFFx |
|  | ECNTBFx | GRBFx |  |
|  | ECNTCFx | GRCFx | - |
|  | ECNTCFx + GRDFx | GRDFx | - |

### 30.14.1.2 Conflict between Writing to Counter and Input Capture

When a write to a counter occurs simultaneously with input capture, the value immediately before writing is captured (see the left portion of Figure 30.112). The waveforms in the right portion of Figure $\mathbf{3 0 . 1 1 2}$ show a case in which writing occurs one PCLK cycle prior to input capture, so the written value is captured.

Figure 30.112 Conflict between Writing to TCNTCx and Input Capture

| Timer | Counter (Whose Value is Captured) | Capture Register | Status |
| :---: | :---: | :---: | :---: |
| Timer A | TCNTAx | ICRAx | ICFAx |
| Timer B | TCNTB0 | ICRB0 | ICFB0 |
|  | TCNTB0 + ICRB1 | ICRB1 |  |
|  | TCNTB6 | ICRB6 | - |
| Timer C | TCNTCx | GRCxy | IMFCxy |
| Timer D | TCNT1Dx | OSBRDx | - |
|  | TCNT1Dx | ICR1Dxy |  |
|  | TCNT2Dx | ICR2Dxy | - |
| Timer F | ECNTAFx | GRAFx | ICFFx |
|  | ECNTBFx | GRBFx |  |
|  | ECNTCFx | GRCFx |  |
|  | ECNTCFx + GRDFx | GRDFx |  |

### 30.14.1.3 Conflict between Setting and Clearing of Input Capture Status Flag

Flag clearing by a timer status clear register takes priority over flag setting by an input capture. The left portion of Figure $\mathbf{3 0 . 1 1 3}$ shows an example where an input capture and a flag clearing occur simultaneously, and the flag is cleared. In contrast with this, the waveforms in the right portion of Figure $\mathbf{3 0 . 1 1 3}$ show an example in which input capture is performed immediately after the flag has been cleared.

Figure 30.113 Conflict between Status Clearing by Writing 1 to Status Clear Register and Input Capture

| Flag |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| Timer A | Flag | ICFAx |  | Timer B |
| Timer C IMFCxy Timer F |  |  |  |  |

### 30.14.2 Compare Match Conflict Operation

### 30.14.2.1 Compare Match Signal in Cases of Consecutive Comparison

Matches between the counter and comparison register will take two or more PCLK cycles when the counter clock has a period of or more than two PCLK cycles. Detection of the rising edge of the compare match signal by the timers listed in the table below is handled as the compare match signal.

| Timer | Counter | Compare Match Register |
| :--- | :--- | :--- |
| Timer C | TCNTCx | GRCxy, OCRCxy |
| Timer D | TCNT1Dx, | OCR1Dxy, RCR1Dx |
|  | TCNT2Dx | OCR2Dxy, RCR2Dx |

### 30.14.2.2 Conflict between Writing to Compare Match General Register and Compare Match

A conflict between a write to a register provided with the compare match function and compare match is described below, using timer C as an example. If a write occurs after the values of GRCxy and TCNTCx match (see the left portion of Figure 30.114), a compare match interrupt request is issued, and the compare match status is set. If GRCxy and TCNTCx do not match in any cycles (see the right portion of Figure 30.114), no compare match is detected.

Figure 30.114 Conflict between Writing to GRCxy and Compare Match

| Timer | Counter | Compare Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB1 | OCRB1 | CMFB1 |
|  | TCNTB1 | OCRB10 | CMFB10 |
|  | TCNTB1 | OCRB11 | CMFB11 |
|  | TCNTB1 | OCRB12 | CMFB12 |
| Timer C | TCNTCx | GRCxy | IMFCxy |
| Timer D | TCNT1Dx | OCR1Dxy | CMFADxy |
| Timer F | ECNTAFx | OCR2Dxy | CMFBDxy |
|  | ECNTBFx | GRAFx | - |
|  | ECNTCFx | GRBFx | - |
| Timer G | GRBFx | GRDFx | OVFCFx |

Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare matches. For details, see the next Section 30.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy.

### 30.14.2.3 Conflict between CYLRExy Write and Cycle Match with TCNTExy

Operation when a write to CYLRExy occurs simultaneously with compare match (cycle match) with TCNTExy is shown below. As shown in the left portion of Figure 30.115, if a write to CYLRExy occurs at the same timing as cycle match counter clearing, TCNTExy is cleared as in the same manner as normal cycle match, a cycle match interrupt request is issued, and the cycle match status and PWM output are changed. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 1 5}$ show an example in which CYLRExy is written to before the counter is cleared. In this case, no cycle match is detected and TCNTExy continues counting up.

Figure 30.115 Conflict between Writing to CYLRExy and Cycle Match

| Timer | Counter | Compare (Cycle) Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB0 | OCRB0 | CMFB0 |
|  | TCNTB6 | OCRB6 | CMFB6 |
|  | TCNTB6M | ICRB6 | CMFB6M |
| Timer E | TCNTExy | CYLRExy | CMFExy |

### 30.14.2.4 Conflict between DTRExy Write and Cycle Match with TCNTExy

The operation is the same as the case of conflicts between CYLRExy writes and cycle matches with TCNTExy described above.

### 30.14.2.5 Conflict between Writing to Counter and Compare Match

A conflict between a write to a counter and compare match is described below. If a write occurs after the compare match register and the counter match (see the left portion of Figure 30.116), a compare match interrupt request is issued, and the compare match status is set. If the compare match register and the counter do not match in any cycles (see the right portion of Figure 30.116), a compare match interrupt request is not is issued, and a compare match is not detected.

Figure 30.116 Conflict between Writing to TCNTCx and Compare Match

| Timer | Counter | Compare Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB1 | OCRB1 | CMFB1 |
| Timer C | TCNTCx | GRCxy | IMFCxy |
| Timer D | TCNT1Dx | OCR1Dxy | CMFADxy |
|  | TCNT2Dx | OCR2Dxy | CMFBDxy |
| Timer F | ECNTAFx | GRAFx | - |
|  | ECNTBFx | GRBFx | - |
|  | ECNTCFx | GRBFx | ORDFx |
| Timer G | TCNTGx | OCRGx | OVFCFx |
| Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare |  |  |  |
| matches. For details, see the Section 30.14.2.7, Conflict between Writing to TCNTExy and Counter Clearing by Cycle Match and |  |  |  |
| the Section 30.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy, below. |  |  |  |

### 30.14.2.6 Conflict between Writing to Counter and Counter Clearing by Compare Match

The waveforms shown below are for when the compare match counter clear function is enabled. If a write to a counter and counter clearing by compare match occur simultaneously, the counter is not cleared and the write takes priority (see the left portion of Figure 30.117). However, a compare match interrupt request is issued, and the compare match status is set. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 1 7}$ show a case in which writing to TCNTCx is delayed one PCLK cycle.

Figure 30.117 Conflict between Writing to TCNTCx and Counter Clearing by Compare Match

| Timer | Counter | Compare Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer C | TCNTCx | GRCxy | IMFCxy |
|  | TCNTCx | CUCRCx | OVFCx |
|  | TCNT1Dx | CUCR1Dx | OVF1Dx |
|  | TCNT2Dx | CUCR2Dx | OVF2Dx |
| Timer F | ECNTAFx | GRAFx | - |
|  | ECNTBFx | GRBFx | - |
| Timer G | TCNTGx | OCRGx | CMFGx |

### 30.14.2.7 Conflict between Writing to TCNTExy and Counter Clearing by Cycle Match

When a write to TCNTExy occurs simultaneously with counter clearing by cycle match, the counter is not cleared and TCNTExy is written to. However, a cycle match interrupt request is issued, the cycle match status is set, and reload of the cycle-setting register and the duty cycle setting register are performed (see the right portion of Figure 30.118). PWM waveform output at the time of cycle match is also performed.

The waveforms in the left portion of Figure $\mathbf{3 0 . 1 1 8}$ show operation when writing is performed one PCLK cycle earlier than the count-up clock.

Figure 30.118 Conflict between TCNTExy Write and Counter Clearing by Cycle Match

| Timer | Counter | Compare (Cycle) Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB0 | OCRB0 | CMFB0 |
|  | TCNTB6 | OCRB6 | CMFB6 |
|  | TCNTB6M | ICRB6 | CMFB6M |
| Timer E | TCNTExy | CYLRExy | CMFExy |

### 30.14.2.8 Conflict between Setting and Clearing of Compare Match Status Flag

Flag clearing by a timer status clear register takes priority over flag setting by compare match (see the left portion of Figure 30.119). The right portion of Figure $\mathbf{3 0 . 1 1 9}$ shows the case where a compare match occurs just after flag clearing.

Figure 30.119 Conflict between Setting and Clearing of Compare Match Status Flag

| Timer | Counter | Compare Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB1 | OCRB1 | CMFB1 |
|  | TCNTB1 | OCRB10 | CMFB10 |
|  | TCNTB1 | OCRB11 | CMFB11 |
|  | TCNTB1 | OCRB12 | CMFB12 |
| Timer C | TCNTCx | GRCxy | IMFCxy |
| Timer D | TCNT1Dx | OCR1Dxy | CMFADxy |
|  | TCNT2Dx | OCR2Dxy | CMFBDxy |
| Timer F | TCNTCFx | GRDFx | OVFCFx |
| Timer G | TCNTGx | OCRGx | CMFGx |

Timing of compare match B0 and compare match B6 of timer B and the cycle match of timer E differ from the timing of these compare matches. For details, see the next Section 30.14.2.9, Conflict between Setting of Cycle Match Status Flag and Writing 1 to the Status Clear Register and the Section 30.14.2.3, Conflict between CYLRExy Write and Cycle Match with TCNTExy.

### 30.14.2.9 Conflict between Setting of Cycle Match Status Flag and Writing 1 to the Status Clear Register

If setting of the cycle match flag (cycle match) and clearing of the flag by the timer status clear register occur simultaneously, clearing of the flag takes priority. The left portion of Figure $\mathbf{3 0 . 1 2 0}$ shows an example where flag setting by cycle match and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 2 0}$ show an example in which the flag is cleared one PCLK cycle earlier than flag setting.

Figure 30.120 Conflict between Cycle Match and Cycle Match Status Clear by Writing 1 to the Status Clear Register

| Timer | Counter | Compare (Cycle) Match Register | Status |
| :--- | :--- | :--- | :--- |
| Timer B | TCNTB0 | OCRB0 | CMFB0 |
|  | TCNTB6 | OCRB6 | CMFB6 |
|  | TCNTB6M | ICRB6 | CMFB6M |
| Timer E | TCNTExy | CYLRExy | CMFExy |

### 30.14.2.10 Conflict between Writing 0 to TCNTExy and Cycle Match

Operation when writing " 0 " to TCNTExy occurs simultaneously with cycle match is shown below. The waveforms in the left portion of Figure $\mathbf{3 0 . 1 2 1}$ show a case in which $000000_{\mathrm{H}}$ is written to TCNTExy at the same time TCNTExy is cleared to $000001_{\mathrm{H}}$ due to cycle match. A cycle match interrupt request is issued and the cycle match status is set, but PWM output does not start because writing " 0 " takes priority. PWM output restarts when TCNTExy counts up to $000001_{\mathrm{H}}$. The waveforms in the middle of Figure $\mathbf{3 0 . 1 2 1}$ show a case in which " 0 " is written to TCNTExy one PCLK cycle after the counter has been cleared by cycle match. Cycle match detection and PWM output are restarted at the timing when the TCNTExy counter value changes from " $N$ " to " 1 ". In contrast with this, the waveforms in the right portion of Figure $\mathbf{3 0 . 1 2 1}$ show an example in which " 0 " is written one PCLK before detection of cycle match. In this case, neither cycle match is detected nor PWM output restarted, and the previous state is retained.

Figure 30.121 Conflict between Writing 0 to TCNTExy and Cycle Match

### 30.14.3 Load/Reload Conflict Operation

### 30.14.3.1 Conflict between Data Transfer and Writing to Transfer Destination Register

A conflict between data transfer between registers and a write to the transfer destination register is described below. When data transfer occurs simultaneously with a write to the transfer destination register, writing takes priority and the attempt of data transfer is ignored. Figure $\mathbf{3 0 . 1 2 2}$ shows a conflict between reload to CYLRExy of timer E and a write to it. As shown by the waveforms in the left portion of the figure, if writing to CYLRExy occurs at the same timing as cycle reload, writing takes priority. The waveforms in the right portion of the figure indicate a case in which CYLRExy is written to immediately after cycle reload.

Figure 30.122 Conflict between Writing to CYLRExy and Cycle Reload

| Timer | Transfer Data | Transfer Destination Register | Transfer Timing |
| :--- | :--- | :--- | :--- |
| Timer B | ICRB0 | TCNTB2 | External event |
|  | LDB |  |  |
|  | TCNTB2 - PIMR |  |  |
|  | TCNTB2 + RLDB | RLDB | External event |

|  | DRLDExy | DTRExy | Cycle match |

### 30.14.3.2 Conflict between Data Transfer and Writing to Transfer Source Register

A conflict between data transfer between registers and a write to the transfer source register is described below. When data transfer occurs simultaneously with a write to the transfer source register, the value prior to writing is transferred. At the same time, the value of the transfer source register is modified. Figure $\mathbf{3 0 . 1 2 3}$ shows the operation when writing to CRLDExy occurs at the timing of cycle reload. If writing to CRLDExy occurs at the same timing as cycle reload (waveforms in the left portion of the figure), the value immediately before writing is reloaded. On the other hand, the waveforms in the right portion of the figure show an example in which CRLDExy is written to one cycle earlier than cycle reload.

Figure 30.123 Conflict between Writing to CRLDExy and Cycle Reload

| Timer | Transfer Source Register | Transferred Value | Transfer Destination Register | Transfer Timing |
| :---: | :---: | :---: | :---: | :---: |
| Timer B | LDB | LDB - PIMR | RLDB | External event |
|  |  | LDB | TCNTB2 | External event |

|  | DRLDExy | DRLDExy | DTRExy | Cycle match |

### 30.14.4 Counter Conflict Operation

### 30.14.4.1 Conflict between Writing to Counter and Count-Up/Count-Down

When a write to a counter occurs simultaneously with incrementation/decrementation of the counter, the write operation takes priority. The attempt to increment/decrement the value is ignored and incrementation/decrementation resumes from the value written in the next counter clock.

### 30.14.4.2 Conflict between Count-Up and Counter Clearing

When incrementation of a counter occurs simultaneously with clearing of the counter, the counter is not cleared to " 0 " but cleared to " 1 ".

Figure 30.124 Simultaneous Occurrence of Count-Up and Counter Clearing

| Timer | Counter | Compare Match Register | Remarks |
| :---: | :---: | :---: | :---: |
| Timer C | TCNTCx | GRCx0 | Only when PWMx0 = "1" |
|  | TCNTCx | CUCRCx | Only when PWMx0 = " 0 " and CLRCx $=$ " 1 " |
| Timer D | TCNT1Dx | CUCR1Dx | Only when CLR1Dx = "1" |
|  | TCNT2Dx | CUCR2Dx | Only when CLR2Dx $=$ " 1 " |
| Timer F | ECNTAFx | GRAFx | Only when MDFx = "000", "110", or "111" |
|  | ECNTBFx | GRBFx | Only when MDFx = "001", "010", or "100" |
| Timer G | TCNTGx | OCRGx |  |

### 30.14.4.3 Conflict between Writing to Counter and Overflow

When counter overflow occurs simultaneously with a write to TCNTCx, writing to TCNTCx takes priority. However, an overflow interrupt request is issued, and the overflow status is set (see the left portion of Figure 30.125). If the timing for writing to the counter is earlier than incrementation of the counter (waveforms in the right portion of Figure 30.125), the overflow status flag is not set.

Figure 30.125 Conflict between Writing to TCNTCx and Counter Clearing on Overflow

| Timer | Counter | Status |
| :--- | :--- | :--- |
| Timer A | TCNTA | OVFA |
| Timer C | TCNTCx | OVFCx |
| Timer D | TCNT1Dx | OVF1Dx |
|  | TCNT2Dx | OVF2Dx |
| Timer E | TCNTExy | OVFExy |
| Timer F | ECNTAFx | OVFAFx |
|  | ECNTBFx | OVFBFx |
|  | ECNTCFx | OVFCFx |

| Timer | Counter | Status |
| :--- | :--- | :--- |
| Timer G | TCNTGx | OVFGx |

### 30.14.4.4 Conflict between Setting and Clearing of Overflow Status Flag

When clearing and setting of the overflow status flag occur simultaneously, clearing takes priority. The left portion of Figure $\mathbf{3 0 . 1 2 6}$ below shows an example where status flag setting by an overflow of the counter value (FFFF FFFF to $00000000_{\mathrm{H}}$ ) and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 2 6}$ show the way the overflow status flag is set again immediately after the status flag has been cleared.

Figure 30.126 Conflict between Setting and Clearing of Overflow Status Flag

| Timer | Counter | Status |
| :--- | :--- | :--- |
| Timer A | TCNTA | OVFA |
| Timer C | TCNTCx | OVFCx |
| Timer D | TCNT1Dx | OVF1Dx |
|  | TCNT2Dx | OVF2Dx |
| Timer E | TCNTExy | OVFExy |
| Timer F | ECNTAFx | OVFAFx |
|  | ECNTBFx | OVFBFx |
|  | ECNTCFx | OVFCFx |

| Timer | Counter | Status |
| :--- | :--- | :--- |
| Timer G | TCNTGx | OVFGx |

### 30.14.4.5 Conflict between Overflow and Counter Clearing by Compare Match

If the maximum value is set in a compare match register when the function to clear a counter by compare match is enabled, the counter is cleared when the counter reaches its maximum value. At this time, an overflow interrupt request is not issued even if the counter clock is 1/1PCLK, so an overflow is not detected.

| Timer | Counter | Status | Remarks |
| :--- | :--- | :--- | :--- |
| Timer C | TCNTCx | OVFCx | Only when PWMx0 = "1" |
| Timer F | ECNTAFx | OVFAFx | Only when MDFx = "000"," $110 "$, or "111" |
|  | ECNTBFx | OVFBFx | Only when MDFx = "001" |
| Timer G | TCNTGx | OVFGx |  |

If the compare match counter clear function is not provided or is disabled, an overflow interrupt request is issued and the overflow status is set. Figure $\mathbf{3 0 . 1 2 7}$ shows operation when the PWMx bit of timer C is " 1 " (counter clearing is enabled) and when the PWMx0 bit is " 0 " (counter clearing is disabled)

Figure 30.127 Conflict between Clearing of Compare Match Counter of Timer C and Overflow ( $\mathrm{PWMx0}=1 / 0$ )

### 30.14.5 Noise Canceler Conflict Operation

This section describes conflicts in the noise cancelers.

| Timer | Counter | Compare Match Register |
| :--- | :--- | :--- |
| Timer A | NCNTAx | NCRAx |
| Timer C | NCNTCxy | NCRCxy |
| Timer F | NCNTAFx | NCRAFx |
|  | NCNTBFx | NCRBFx |

### 30.14.5.1 Conflict between Writing to Noise Canceler Counter and Compare Match with Noise Canceler Register

When a write to NCNT occurs simultaneously with a compare match with NCR, writing takes priority. Figure $\mathbf{3 0 . 1 2 8}$ shows an example in minimum time-at-level cancellation mode. In the left portion of the figure, since writing prevents compare match from occurring, input capture is also not performed. The right portion of the figure shows a case in which writing is performed one PCLK cycle later. In this case, compare match occurs and input capture processing is performed.

Figure 30.128 Conflict between Writing to NCNT and Compare Match of NCNT-NCR (Example in Minimum Time-at-level Cancellation Mode)

### 30.14.5.2 Conflict between Writing to Noise Canceler Register and Compare Match with Noise Canceler Counter

When a write to NCR occurs simultaneously with a compare match with NCNT, writing takes priority. Figure $\mathbf{3 0 . 1 2 9}$ shows an example in minimum time-at-level cancellation mode. In the left portion of the figure, since writing prevents compare match from occurring, input capture is also not performed. The right portion of the figure shows a case in which writing is performed one PCLK cycle later. In this case, compare match occurs and input capture processing is performed.

Figure 30.129 Conflict between Writing to NCR and Compare Match of NCR-NCNT
(Example in Minimum Time-at-level Cancellation Mode)

### 30.14.6 Timer Down Counter Dxy Conflict Operation

This section describes conflicts in DCNTDxy.

### 30.14.6.1 Conflict between Writing to DCNTDxy Counter and Count-Down

When a write occurs simultaneously with decrementation of the down counter, writing to DCNTDxy is performed. The attempt to decrement the value is ignored and decrementation restart at the next count-down clock.

### 30.14.6.2 Conflict between Writing to DCNTDxy Counter and Underflow

When a write to DCNTDxy occurs simultaneously with underflow, writing to DCNTDxy is performed. The left portion of Figure $\mathbf{3 0 . 1 3 0}$ shows operation when a count-down clock is input simultaneously with a write to DCNTDxy when the DCNTDxy value is $00000000_{\mathrm{H}}$. Though a new value is written to DCNTDxy, count-down operation is halted because underflow is detected. The underflow status flag is set. The right portion of Figure $\mathbf{3 0 . 1 3 0}$ shows a case where data is written to DCNTDxy one cycle before, in which case an underflow interrupt request is not issued and underflow is not detected.

Figure 30.130 Conflict between Writing to DCNTDxy and Underflow

### 30.14.6.3 Conflict between Writing to DCNTDxy Counter and Compare Match B (Counter Stop Trigger)

When a write to DCNTDxy occurs simultaneously with compare match B, writing to DCNTDxy is performed (if compare match B is selected as a condition to stop the down counter).

The middle portion of Figure $\mathbf{3 0 . 1 2 9}$ below shows an example in which writing to DCNTDxy occurs simultaneously with clearing of the counter by detection of compare match B. Counter clearing of DCNTDxy by compare match B is ignored, and writing takes priority. However, the output on TODxyB is turned off due to compare match B, and DCNTDxy halts with the written value retained. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 3 1}$ show a case in which the write cycle occurs one PCLK cycle earlier. During the PCLK cycle next to writing to DCNTDxy, the counter is cleared by compare match B. The waveforms in the left portion of Figure $\mathbf{3 0 . 1 3 1}$ show an example in which writing is performed immediately after the counter has been cleared by compare match B .

Figure 30.131 Conflict between Writing to DCNTDxy and Counter Clearing by Compare Match B

### 30.14.6.4 Conflict between Setting of Underflow Status Flag and Clearing by Writing 1 to Status Clear Register

When flag clearing by the timer status clear register and an underflow occurs simultaneously, flag clearing is performed. The left portion of Figure $\mathbf{3 0 . 1 3 2}$ below shows an example where status flag setting by an underflow of DCNTDxy and flag clearing by the timer status clear register occur simultaneously. The waveforms in the right portion of Figure $\mathbf{3 0 . 1 3 2}$ show how the status flag is set again by underflow occurrence immediately after the status flag has been cleared.

Figure 30.132 Conflict between Setting and Clearing of Underflow Status Flag

### 30.14.6.5 TODxyB Output upon Occurrence of Down Counter Start Trigger When Down Counter Value is $0000 \mathbf{0 0 0 0}_{\mathrm{H}}$

The TODxyB output is not started by down counter underflow and is terminated.

### 30.14.6.6 TODxyB Output at Simultaneous Occurrence of Start Trigger and Stop Trigger for Down Counter

When the down counter start trigger occurs simultaneously with the down counter stop trigger, the down counter is cleared to " 0 " by the stop trigger. In this case, the TODxyB output is terminated.

Similarly, if the down counter start trigger occurs and then the down counter stop trigger occurs before the first countdown clock is input, the down counter is cleared to " 0 " without being decremented even once and the TODxyB output is terminated.

### 30.14.6.7 Conflict between Down Counter Start Trigger and Underflow

When the down counter start trigger occurs simultaneously with underflow, DCNTDxy remains halted at the value of $00000000_{\mathrm{H}}$ (see the waveforms in the middle of Figure 30.133). If the down counter had been in process of decrementing, the TODxyB output is turned off by underflow (see the waveforms in the left portion of Figure 30.133). If compare match A occurs while the down counter is halted $\left(D C N T D x y=00000000_{\mathrm{H}}\right)$, the TODxyB output is kept negated (see the waveforms in the right portion of Figure 30.133). In both cases, the underflow interrupt request and setting of the underflow flag to 1 are performed upon detection of a down count start trigger or at the first cycle of the down count clock after detection.

Figure 30.133 Conflict between Compare Match A and Underflow

### 30.14.7 Coordinated Operation of Timers A, B, and D

This section describes the conflict between counter clear requests from timer B and TCNT1Dx and TCNT2Dx.

### 30.14.7.1 Conflict Between Counter Clearing of TCNT1Dx and TCNT2Dx and Compare Match

Figure $\mathbf{3 0 . 1 3 4}$ shows the operation when clearing of the TCNT1Dx/TCNT2Dx counter by a counter clearing signal from timer B occurs simultaneously with compare match. The waveforms in the left portion of the figure show a case in which the counter is cleared prior to compare match. On the other hand, the waveforms in the right portion of the figure show a case in which the counter is cleared simultaneously with compare match.

Figure 30.134 Conflict between Counter Clearing by Timer B and Compare Match

| Timer | Counter | Counter Clearing Source | Compare Match Register | Status |
| :--- | :--- | :--- | :--- | :--- |
| Timer D | TCNT1Dx | TCNT1Dx/TCNT2Dx clearing | OCR1Dxy | CMFADxy |
|  | TCNT2Dx | request from timer B | OCR2Dxy | CMFBDxy |

### 30.14.7.2 Conflict between Writing to TCNT1Dx/TCNT2Dx Counter and Counter Clearing by Timer B

When a write to TCNT1Dx/TCNT2Dx occurs simultaneously with a counter clearing signal from timer B, the counter is not cleared but writing to the counter is performed (see the waveforms in the left portion of Figure 30.135). The waveforms in the right portion of Figure $\mathbf{3 0 . 1 3 5}$ show a case in which writing to TCNT1Dx is one PCLK cycle later. This is the same for TCNT2Dx.

Figure 30.135 Conflict between Writing to TCNT1Dx and Counter Clearing

### 30.14.7.3 Conflict between TCNT1Dx/TCNT2Dx Counter Overflow and Counter Clearing by Timer B

When TCNT1Dx overflow by the counting up occurs simultaneously with clearing of TCNT1Dx from timer B, the counter value is cleared to $00000000_{\mathrm{H}}$ by the counter clearing signal. In this case, an overflow interrupt request is not issued and the overflow status flag is not set (only for when C1CEDx $=$ " 1 "). The same applies to TCNT2Dx overflow.

Counter clearing upon match with the value of the upper limit setting register and counter clearing by the signal from timer B must be used exclusively of each other. But if the two events erroneously occur at the same time, the counter gives priority to counter clearing nu the signal from timer B, and its value is cleared to $00000000_{\mathrm{H}}$. In the case of overflow, match with the value of the upper limit setting register takes priority, and interrupt generation and flag setting are performed. The same applies to TCNT2Dx.

Figure 30.136 Conflict between Counter Clearing and Overflow

### 30.14.7.4 Conflict between TCNT1Dx Clearing by Clear Signal from Timer B and Input Capture to OSBRDx

Figure $\mathbf{3 0 . 1 3 7}$ shows the operation when clearing of the TCNT1Dx counter by timer B occurs simultaneously with input capture to an offset base register. If input capture and counter clearing occur simultaneously, the counter value before clearing is captured in OSBRDx and the TCNT1Dx counter is cleared at the same time (see the waveforms in the left portion of the figure). The waveforms in the right portion of the figure show a case in which input capture is performed one PCLK cycle after the counter has been cleared, and the counter value after clearing is captured in OSBRDx.

Figure 30.137 Conflict between TCNT1Dx Counter Clearing and Input Capture to OSBRDx

## Section 31 Generic Timer Module (GTM)

Generic timer module (GTM) is a modular timer unit implementing common timer functionality for capture/compare of external signals and generation of complex output waveforms. It also implements complex angle clock to support powertrain control applications.

### 31.1 GTM Features

### 31.1.1 IP Version

The table below shows GTM-IP version and GTM-IP configuration included in this device.
Table 31.1 IP Version

| Product | IP | Device | Revision |
| :--- | :--- | :--- | :--- |
| RH850/E2x-FCC1 | GTM-IP | GTM-IP_355 | v3.1.5.1 |
| RH850/E2M | GTM-IP | GTM-IP_353 | v3.1.5.1 |

### 31.1.2 Number of Sub-Units and Channels

The table below shows configuration.
Table $31.2 \quad$ Sub-Units and Channels (1/2)

### 31.1.3 Register/RAM Base Address

GTM base addresses are listed in the following table. GTM register and RAM addresses are given as offsets from the base addresses in general.

Table 31.4 Register and RAM Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <GTM0_base> | FF80 $0000_{\mathrm{H}}$ | Peripheral Group 2H |
| <GTM0_1_base> | FF90 $0000_{\mathrm{H}}$ | Peripheral Group 2H |

### 31.1.4 Clock Supply

GTM clock supplies are listed in the following table.
Table 31.5 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| GTM Cluster 0 to 1 | GTM Main Clock | CLK_UHSB |
| (GTM cluster with DPLL core, MCS0-1 and <br> associated RAM) |  | Switchable between $1 / 1$ (high) and 1/2 (low) frequency. |
| GTM Cluster 2 to 8*1 Register access clock | CLK_HSB |  |
| (Other GTM cores and RAM) | GTM Main Clock | CLK_UHSB |
|  |  | $1 / 2$ (low) frequency only. |
|  | Register access clock | CLK_HSB |

Note 1. E2M: GTM Cluster 2 to 7

### 31.1.5 Interrupt Requests

Mapping of ICM outputs to interrupts and DMAC triggers is shown in the following table.
Table $31.6 \quad$ Interrupt Requests (1/3)

| GTM Interrupt Factors | Description | Interrupt Group | DMAC Trigger Group |
| :---: | :---: | :---: | :---: |
| GTM_AEI_IRQ | AEI Shared interrupt | GTM_INT_10 | - |
| GTM_ARU_IRQ0 | ARU_NEW_DATAO Interrupt | GTM_INT_11 | GTM_DMA_9 |
| GTM_ARU_IRQ1 | ARU_NEW_DATA1 Interrupt | GTM_INT_12 | GTM_DMA_9 |
| GTM_ARU_IRQ2 | ARU_ACC_ACK Interrupt | GTM_INT_13 | GTM_DMA_9 |
| GTM_BRC_IRQ | BRC Shared interrupt | GTM_INT_14 | GTM_DMA_9 |
| GTM_CMP_IRQ | CMP Shared interrupt | GTM_INT_15 | GTM_DMA_9 |
| GTM_SPE0_IRQ | SPE0 Shared interrupt | GTM_INT_0 | GTM_DMA_0 |
| GTM_SPE1_IRQ | SPE1 Shared interrupt | GTM_INT_1 | GTM_DMA_1 |
| GTM_SPE2_IRQ*1 | SPE2 Shared interrupt | GTM_INT_2 | GTM_DMA_2 |
| GTM_SPE3_IRQ*1 | SPE3 Shared interrupt | GTM_INT_3 | GTM_DMA_3 |
| GTM_PSM0_IRQ[x] | PSM0 Shared interrupts (x: 0...7) | GTM_INT_8 | GTM_DMA_9 |
| GTM_PSM1_IRQ[x] | PSM1 Shared interrupts (x: 0...7) | GTM_INT_8 | GTM_DMA_9 |
| GTM_DPLL_IRQ0 | DPLL_DCGI: DPLL direction change interrupt | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ1 | DPLL_EDI; DPLL enable or disable interrupt | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ2 | DPLL_TINI: DPLL TRIG. min. hold time (THMI) viol. detected | GTM_INT_9 | - |
| GTM_DPLL_IRQ3 | DPLL_TAXI: DPLL TRIG. max. hold time (THMA) viol. detected | GTM_INT_9 | - |
| GTM_DPLL_IRQ4 | DPLL_SISI: DPLL STATE inactive slope detected | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ5 | DPLL_TISI: DPLL TRIGGER inactive slope detected | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ6 | DPLL_MSI: DPLL Missing STATE interrupt | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ7 | DPLL_MTI: DPLL Missing TRIGGER interrupt | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ8 | DPLL_SASI: DPLL STATE active slope detected | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ9 | DPLL_TASI: DPLL TRIG. active slope detected while NTI_CNT is 0 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ10 | DPLL_PWI: DPLL Plausibility window (PVT) viol. int. of TRIG. | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ11 | DPLL_W2I: DPLL Write access to RAM region 2 interrupt | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ12 | DPLL_W1I: DPLL Write access to RAM region 1b or 1c int. | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ13 | DPLL_GL1I: DPLL Get of lock interrupt for SUB_INC1 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ14 | DPLL_LL1I: DPLL Lost of lock interrupt for SUB_INC1 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ15 | DPLL_EI: DPLL Error interrupt | GTM_INT_9 | - |
| GTM_DPLL_IRQ16 | DPLL_GL21: DPLL Get of lock interrupt for SUB_INC2 | GTM_INT_9 | GTM_DMA_9 |

Table 31.6 Interrupt Requests (2/3)

| GTM Interrupt Factors | Description | Interrupt Group | DMAC Trigger Group |
| :---: | :---: | :---: | :---: |
| GTM_DPLL_IRQ17 | DPLL_LL2I: DPLL Lost of lock interrupt for SUB_INC2 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ18 | DPLL_TEOI: DPLL TRIGGER event interrupt 0 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ19 | DPLL_TE1I: DPLL TRIGGER event interrupt 1 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ20 | DPLL_TE2I: DPLL TRIGGER event interrupt 2 | GTM_INT_9 | GTM_DMA_9 |
| GTM_DPLL_IRQ21 | DPLL_TE3I: DPLL TRIGGER event interrupt 3 | GTM_INT_9 | GTM_DMA_9 |

Table 31.8 DMA Factor Groups

| DMA Groups | Interrupt Symbol Name | Registers | sDMAC Trigger Number | DTS Trigger Number |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Group1 | Group2 | Group3 |
| GTM_DMA_0 | INTGTMODOS0n | GTM_DMA_SELOj | 0 to 7 | 46 to 53 | 88 to 95 |
| GTM_DMA_1 | INTGTM0DOS1n | GTM_DMA_SEL1j | 8 to 15 | 54 to 61 | 96 to 103 |
| GTM_DMA_2 | INTGTMODOS2n | GTM_DMA_SEL2j | 16 to 23 | 62 to 69 | 104 to 111 |
| GTM_DMA_3 | INTGTMODOS3n | GTM_DMA_SEL3j | 24 to 31 | 70 to 77 | 112 to 119 |
| GTM_DMA_4 | INTGTMODOS4n | GTM_DMA_SEL4j | 32 to 39 | 78 to 85 | 120 to 127 |
| GTM_DMA_5 | INTGTM0DOS5n | GTM_DMA_SEL5j | 40 to 47 | 86 to 93 | 46 to 53 |
| GTM_DMA_6 | INTGTM0DOS6n | GTM_DMA_SEL6j | 48 to 55 | 94 to 101 | 54 to 61 |
| GTM_DMA_7 | INTGTMODOS7n | GTM_DMA_SEL7j | 56 to 63 | 102 to 109 | 62 to 69 |
| GTM_DMA_8 | INTGTM0DOS8n | GTM_DMA_SEL8j | 64 to 71 | 110 to 117 | 70 to 77 |
| GTM_DMA_9 | INTGTMODOSOn | GTM_DMA_COM_SELj | 72 to 81 | 118 to 127 | 78 to 87 |

### 31.1.6 Reset Sources

The following table shows GTM reset sources and GTM responses to each reset source.
Table 31.9 Reset Sources

|  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Register Name | Power Up Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - |  |

### 31.1.7 External Input/Output Signals

External input/output signals of GTM are listed in the following table.
Table 31.10 External Input/Output Signals (1/2)

| RH850/E2x-FCC1 |  |  |  |
| :---: | :---: | :---: | :---: |
| Unit Signal Name | 1/0 | Outline | Alternative Port Pin Signal |
| GTM |  |  |  |
| TIM[i]_INO to TIM[i]_IN7 (i: 0 to 7 ) | I | Timer input signals for TIM[i] (i: 0 to 7) | TIM[i]_0 to TIM[i]_ 7 (i: 0 to 7) |
| TOM[i]_OUT0 to TOM[i]_OUT15 (i: 0 to 4) | O | Timer output signals for TOM[i] (i: 0 to 4) | TOM[i]_0 to <br> TOM[i]_15 (i: 0 to 4) |
| TOM[i]_OUTO_N to TOM[i]_OUT7_N (i: 0 to 3) | 0 | Inverted timer output signal for TOM[i] (i: 0 to 3) | TOM[i]_ON to TOM[i]_7N (i: 0 to 3 ) |
| ATOM[i]_OUTO to <br> ATOM[i]_OUT7 (i: 0 to 8) | 0 | Timer output signals for ATOM[i] (i: 0 to 8) | ATOM[i]_0 to <br> ATOM[i]_7 (i: 0 to 8) |
| ATOM[i]_OUTO_N to ATOM[i]_OUT7_N (i: 0 to 4) | 0 | Inverted timer output signal for ATOM[i] (i: 0 to 4) | ATOM[i]_ON to ATOM[i]_7N (i: 0 to 4) |
| ATOM[i]_OUTO_N to ATOM[i]_OUT3_N (i: 5 to 6) | 0 | Inverted timer output signal for ATOM[i] (i: 5 to 6) | ATOM[i]_ON to ATOM[i]_3N (i: 5 to 6) |
| CMU_ECLKO to CMU_ECLK2 | 0 | External Clock | GTMECLK0 to GTMECLK2 |

Table 31.10 External Input/Output Signals (2/2)

| RH850/E2M |  |  |  |
| :---: | :---: | :---: | :---: |
| Unit Signal Name | I/O | Outline | Alternative Port Pin Signal |
| GTM |  |  |  |
| TIM[i]_INO to TIM[i]_IN7 (i: 0 to 7 ) | 1 | Timer input signals for TIM[i] (i: 0 to 7) | $\begin{array}{\|l\|} \hline \text { TIM[i]_0 to } \\ \text { TIM[i]_7 (i: } 0 \text { to 7) } \end{array}$ |
| TOM[i]_OUT0 to TOM[i]_OUT15 (i: 0 to 3) | 0 | Timer output signals for TOM[i] (i: 0 to 3) | TOM[i]_0 to <br> TOM[i]_15 (i: 0 to 3) |
| TOM[i]_OUTO_N to TOM[i]_OUT7_N (i: 0 to 2) | 0 | Inverted timer output signal for TOM[i] (i: 0 to 2) | TOM[i]_ON to TOM[i]_7N (i: 0 to 2) |
| ATOM[i]_OUTO to ATOM[i]_OUT7 (i: 0 to 7) | 0 | Timer output signals for ATOM[i] (i: 0 to 7) | ATOM[i]_0 to <br> ATOM[i]_7 (i: 0 to 7) |
| ATOM[i]_OUTO_N to ATOM[i]_OUT7_N (i: 0 to 4) | 0 | Inverted timer output signal for ATOM[i] (i: 0 to 4) | ATOM[i]_ON to ATOM[i]_7N (i: 0 to 4) |
| CMU_ECLKO to CMU_ECLK2 | 0 | External Clock | GTMECLK0 to GTMECLK2 |

### 31.2 Overview

### 31.2.1 Functional Overview

GTM consists of the following sub-modules.

- Advanced Routing Unit (ARU)
- Data routing between GTM sub-modules.
- Broadcast Module (BRC)
- Data broadcasting from a source sub-module to multiple destination sub-modules via ARU.
- Parameter Storage Module (PSM)
- First In First Out Module. (FIFO)
- AEI-to-FIFO Data Interface. (AFD)
- FIFO-to-ARU Unit. (F2A)
- Clock Management Unit (CMU)
- Clock pre-scaler for GTM internal and external clocks.
- Cluster Configuration Module (CCM)
- Controlling cluster configurations:
- Cluster's clock frequency.
- Module clock gating.
- Status monitoring of the cluster's MCS bus master.
- Address range protection.
- Time Base Unit (TBU)
- Three independent 24-bit time bases.
- One module counter for angular conversions.
- Supporting the following modes:
- Free Running Counter Mode.
- Forward/Backward Counter Mode.
- Connected to angle clock. (DPLL)
- Timer Input Module (TIM)
- Filter, capture/compare with a time stamp and input signal timeout.
- Input from other peripherals to GTM.
- Timer Output Module (TOM)
- Simple PWM waveform generation with 16-bit time base counter.
- Input signal to other peripherals.
- ARU-connected Timer Output Module (ATOM)
- Complex output waveform generation without CPU interactions with 24-bit time base counter.
- Input signal to other peripherals.
- Dead Time Module (DTM)
- Hardware support for dead time generation.
- Multi Channel Sequencer (MCS)
- Programmable sequencer with RISC-like instruction set and dedicated RAM.
- Memory Configuration (MCFG)
- Mapping MCS physical memory to MCS instances.
- TIM0 Input Mapping Module (MAP)
- Mapping TIM0 input signals to DPLL.
- Digital PLL (DPLL)
- Angle calculation and micro tick generation from up to two input signals.
- Prediction of future behavior of input signal.
- Sensor Pattern Evaluation (SPE)
- Hardware support for BLDC motors.
- Interrupt Concentrator Module (ICM)
- Bundling GTM internal interrupts before they are routed to INTC and DMAC.
- Output Compare Unit (CMP)
- Support for safety relevant applications, compare of DTM outputs.
- Monitoring Unit (MON)
- Monitoring GTM internal clocks and MCS functionality.

### 31.2.2 Block Diagram

The following figure shows interconnections between GTM-IP and other peripherals.

Figure 31.1 Block Diagram of GTM

### 31.3 Registers

### 31.3.1 List of Registers

Registers in the table below configure routing between ICM outputs and INTC and DMAC/DTS.
For details about <GTM0_base><GTM0_1_base>, see Section 31.1.3, Register/RAM Base Address.
Table 31.11 List of Registers (1/7)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GTM0 | All of GTM-IP registers | *1 | <GTM0_base> + *1 | 32 | - |
| GTM0_1 | GTM Interrupt selection control register 000 | GTM_IRQ_SEL000 | <GTM0_1_base> + 000 H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 001 | GTM_IRQ_SEL001 | <GTM0_1_base> + 004H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 002 | GTM_IRQ_SEL002 | <GTM0_1_base> + 008 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 003 | GTM_IRQ_SEL003 | <GTM0_1_base> + $00 \mathrm{C}_{\mathrm{H}}$ | 8,16, 32 | - |
|  | GTM Interrupt selection control register 004 | GTM_IRQ_SEL004 | <GTM0_1_base> + 010 H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 005 | GTM_IRQ_SEL005 | <GTM0_1_base> + 014H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 006 | GTM_IRQ_SEL006 | <GTM0_1_base> + 018H | 8,16, 32 | - |
|  | GTM Interrupt selection control register 007 | GTM_IRQ_SEL007 | <GTM0_1_base> + 01- $\mathrm{H}_{\mathrm{H}}$ | 8,16, 32 | - |
|  | GTM Interrupt selection control register 008 | GTM_IRQ_SEL008 | <GTMO_1_base> + 020 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 009 | GTM_IRQ_SEL009 | <GTMO_1_base> + 024 | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 010 | GTM_IRQ_SEL010 | <GTMO_1_base> + 028 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 011 | GTM_IRQ_SEL011 | <GTM0_1_base> + 02CH | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 012 | GTM_IRQ_SEL012 | <GTM0_1_base> + 030 H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 013 | GTM_IRQ_SEL013 | <GTM0_1_base> + 034H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 014 | GTM_IRQ_SEL014 | <GTM0_1_base> + 038 ${ }_{\text {H }}$ | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 015 | GTM_IRQ_SEL015 | <GTM0_1_base> + 03C H | 8, 16, 32 | - |
|  | GTM Interrupt selection control register 100 | GTM_IRQ_SEL100 | <GTM0_1_base> + 040 H | 8, 16, 32 | - |

|  | GTM DMA Common selection function Register 9 | GTM_DMA_COM_SEL9 | <GTM0_1_base> + 444 H | 8, 16, 32 | - |

Table 31.11 List of Registers (7/7)

| Module Name | Register Name | Symbol | Address | Access | Access <br> Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| GTM0_1 | GTM ADCI channel selection register 0 | GTM_ADCI_CHSELO | <GTMO_1_base> + 500 H | 8, 16, 32 | - |
|  | GTM ADCI channel selection register 1 | GTM_ADCI_CHSEL1 | <GTM0_1_base> + 504H | 8, 16, 32 | - |
|  | GTM ADCI channel selection register 2 | GTM_ADCI_CHSEL2 | <GTM0_1_base> + 508H | 8, 16, 32 | - |
|  | GTM ADCI channel selection register 3 | GTM_ADCI_CHSEL3 | <GTMO_1_base> + 50 $\mathrm{CH}_{\mathrm{H}}$ | 8, 16, 32 | - |
|  | GTM ADCI channel selection register 4 | GTM_ADCI_CHSEL4 | <GTM0_1_base> + 510 H | 8, 16, 32 | - |

Note 1. For details of GTM-IP registers, please refer to "GTM-IP Specification" documents. Also, the access size of RAM has to be 32-bit wide.

The table below shows registers that have a different reset value compared to Robert Bosch's GTM-IP specification.
Table 31.12 Initial Value Difference between "GTM-IP Specification Appendix B" and Actual Device

|  | Reset Value |  |
| :--- | :--- | :--- |
| Register Name | GTM-IP Specification | GTM-IP_355, GTM-IP_353 |
| GTM_IRQ_MODE | $00000000_{H}$ | $00000002_{\mathrm{H}}$ |
| GTM_BRIDGE_PTR1 | $00400000_{\mathrm{H}}$ | 004 X XXXX |

### 31.3.2 GTM_IRQ_SELij — GTM Interrupt Selection Control Register ij

GTM interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in "GTM-IP Specification" for list of ICM outputs. ( $\mathrm{i}=0$ to $7, \mathrm{j}=00$ to 15 )

| Value after reset: $0000000 \mathrm{H}_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | $\begin{array}{\|c\|} \hline \text { GTM } \\ -\mathrm{SPE}[\mathrm{i}] \\ -\mathrm{IRQ} \end{array}$ | GTM_MCS[i]_IRQ[7:0] |  |  |  |  |  |  |  | GTM_ATOM[i]_IRQ[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GTM_TOM[i]_IRQ[7:0] |  |  |  |  |  |  |  | GTM_TIM[i]_IRQ[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.13 GTM_IRQ_SELij Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 28 | GTM_SPE[i]_IRQ | SPE[i] Shared interrupt (GTM_SPE[i]_IRQ) |
|  |  | 0 : Interrupt will not be forwarded to INTC. |
|  |  | 1: Interrupt will be forwarded to INTC. |
| 27 to 20 | GTM_MCS[i]_IRQ | MCS[i] Interrupt for channel 7 to 0 (GTM_MCS[i]_IRQ[7:0]) |
|  | [7:0] | 0: Interrupt will not be forwarded to INTC. |
|  |  | 1: Interrupt will be forwarded to INTC. |
| 19 to 16 | GTM_ATOM[i]_IRQ | ATOM[i] Shared interrupts for 3 to 0 (GTM_ATOM[i]_IRQ[3:0]) |
|  | [3:0] | 0 : Interrupt will not be forwarded to INTC. |
|  |  | 1: Interrupt will be forwarded to INTC. |
| 15 to 8 | GTM_TOM[i]_IRQ | TOM[i] Shared interrupts for 7 to 0 (GTM_TOM[i]_IRQ[7:0]) |
|  | [7:0] | 0 : Interrupt will not be forwarded to INTC. |
|  |  | 1: Interrupt will be forwarded to INTC. |
| 7 to 0 | GTM_TIM[i]_IRQ | TIM[i] Shared interrupts for 7 to 0 (GTM_TIM[i]_IRQ[7:0]) |
|  | [7:0] | 0: Interrupt will not be forwarded to INTC. |
|  |  | 1: Interrupt will be forwarded to INTC. |

Note: i: Number of clusters, j: Number of interrupts per cluster
The bit of cluster i beyond the equipped maximum number of TIM/TOM/ATOM/MCS/SPE will be Reserved.

### 31.3.3 GTM_IRQ_SEL8j — GTM Interrupt Selection Control Register 8j

GTM interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in "GTM-IP Specification" for list of ICM outputs. ( $\mathrm{j}=00$ to 15)

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\left.\begin{array}{\|l\|} \mid \mathrm{INTENC} \\ \mathrm{~A}[\mathrm{n}] \mid \mathrm{ICC} \end{array} \right\rvert\,$ | INTENC A[n]I1 | INTENC A[n]IO | INTENC A[n]IUD | INTENC A[n]IOV | - | - | - | - | - | - | - | GTM_ATOM8_IRQ[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GTM_PSM1_IRQ[7:0] |  |  |  |  |  |  |  | GTM_PSM0_IRQ[7:0] |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 31.14 GTM_IRQ_SEL8j Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | INTENCA[n]IEC | Encoder clear interrupt ( $\mathrm{n}=0: \mathrm{j}=00$ to $07, \mathrm{n}=1: \mathrm{j}=08$ to 15 ) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 30 | INTENCA[n]11 | Capture / compare match interrupt 1 ( $\mathrm{n}=0: \mathrm{j}=00$ to $07, \mathrm{n}=1: \mathrm{j}=08$ to 15) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 29 | INTENCA[n]IO | Capture / compare match interrupt 0 ( $\mathrm{n}=0$ : $\mathrm{j}=00$ to $07, \mathrm{n}=1: \mathrm{j}=08$ to 15) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 28 | INTENCA[n]IUD | Underflow interrupt ( $\mathrm{n}=0$ : $\mathrm{j}=00$ to $07, \mathrm{n}=1: \mathrm{j}=08$ to 15) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 27 | INTENCA[n]IOV | Overflow interrupt ( $n=0: j=00$ to $07, n=1: j=08$ to 15 ) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 26 to 20 | - | Reserved <br> When writing to these bits, write 0 . |
| 19 to 16 | $\begin{aligned} & \text { GTM_ATOM8_IRQ } \\ & {[3: 0]} \end{aligned}$ | ATOM8 Shared interrupts for 3 to 0 (GTM_ATOM8_IRQ[3:0]) <br> 0 : Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 15 to 8 | GTM_PSM1_IRQ[7:0] | PSM1 Shared interrupts (GTM_PSM1_IRQ[7:0]) <br> 0: Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |
| 7 to 0 | GTM_PSM0_IRQ[7:0] | PSMO Shared interrupts (GTM_PSM0_IRQ[7:0]) <br> 0: Interrupt will not be forwarded to INTC. <br> 1: Interrupt will be forwarded to INTC. |

Note: j: Number of interrupts per cluster, n: Number of Encode Timer (ENCAn)

### 31.3.4 GTM_IRQ_DPLL_SELj — GTM Interrupt DPLL Selection Register j

DPLL interrupt factors forwarded to INTC are selected from ICM outputs. Please refer to ICM Chapter in "GTM-IP Specification" for list of ICM outputs. ( $\mathrm{j}=0$ to 15 )

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | GTM_DPLL_IRQ[26:16] |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | GTM_DPLL_IRQ[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Table 31.15 | GTM_IRQ_DPLL_SELj Register Contents (1/3) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Bit Position | Bit Name |  |  | Function |  |  |  |  |  |  |  |  |  |  |  |  |
| 31 to 27 | - |  |  | Reserved |  |  |  |  |  |  |  |  |  |  |  | When writing to these bits, write 0. |
| 26 | GTM_DPLL_IRQ[26] |  |  | ```DPLL_SORI: STATE out of range interrupt (GTM_DPLL_IRQ[26]) 0: Interrupt will not be forwarded to INTC. 1: Interrupt will be forwarded to INTC.``` |  |  |  |  |  |  |  |  |  |  |  |  |

Note: j: Number of DPLL interrupts

### 31.3.5 GTM_DMA_SELij — GTM DMA Selection Control Register ij

GTM outputs and ICM outputs can be forwarded to DMAC/DTS. Please refer to ICM, TOM and ATOM Sections in "GTM-IP Specification" for list of ICM outputs. ( $\mathrm{i}=0$ to $7, \mathrm{j}=0$ to 7 )

Table 31.16 GTM_DMA_SELij Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 7 to 6 | EDGSEL[1:0] | Select an effective edge of GTM Timer Output GTM_TOM[i]_OUT[x] ( $x=0$ to 7 ) and GTM_ATOM[i]_OUT[x] ( $\mathrm{x}=0$ to 7 ) |
|  |  | 00 : Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |
| 5 to 0 | GTM_DMA_SEL[5:0] | Selects a DMA trigger from ICM outputs or GTM outputs. |
|  |  | $0+\mathrm{x}$ : GTM_TIM[i]_IRQ[x] $(x=0$ to 7$)$ |
|  |  | $8+\mathrm{x}$ : GTM_TOM[i]_IRQ[x] ( $\mathrm{x}=0$ to 7) |
|  |  | $16+x$ : GTM_TOM[i]_OUT[x] ( $x=0$ to 15) |
|  |  | $32+x$ : GTM_ATOM[i]_IRQ[x] ( $x=0$ to 3$)$ |
|  |  | $36+x$ : GTM_ATOM[i]_OUT[x] ( $x=0$ to 7 ) |
|  |  | $44+\mathrm{x}$ : GTM_MCS[i]_IRQ[x] (x = 0 to 7 ) |
|  |  | 52: GTM_SPE[i]_IRQ |
|  |  | Other: Reserved |

Note: i: Number of clusters, j: Number of DMA triggers per cluster
The bit of cluster i beyond the equipped maximum number of TIM/TOM/ATOM/MCS/SPE will be Reserved

### 31.3.6 GTM_DMA_SEL8j — GTM DMA Selection Control Register 8j

GTM interrupt factors forwarded to DMAC/DTS are selected from ICM outputs. Please refer to ICM Chapter in "GTMIP Specification" for list of ICM outputs. $(\mathrm{j}=0$ to 7$)$

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 31.17 GTM_DMA_SEL8j Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 5 to 0 | GTM_DMA_SEL[5:0] | Selects a DMA trigger from ICM. |
|  |  | $16+\mathrm{x}$ : GTM_ATOM8_IRQ[x] ( $\mathrm{x}=0$ to 3 ) |
|  |  | 32: ENCAO INTENCAOIOV Overflow interrupt |
|  |  | 33: ENCAO INTENCAOIUD Underflow interrupt |
|  |  | 34: ENCAO INTENCA0IO Capture / compare match interrupt 0 |
|  |  | 35: ENCAO INTENCA011 Capture / compare match interrupt 1 |
|  |  | 36: ENCAO INTENCAOIEC Encoder clear interrupt |
|  |  | 37: ENCA1 INTENCA1IOV Overflow interrupt |
|  |  | 38: ENCA1 INTENCA1IUD Underflow interrupt |
|  |  | 39: ENCA1 INTENCA1I0 Capture / compare match interrupt 0 |
|  |  | 40: ENCA1 INTENCA1I1 Capture / compare match interrupt 1 |
|  |  | 41: ENCA1 INTENCA1IEC Encoder clear interrupt |
|  |  | Other: Reserved |

Note: j: Number of DMA triggers per cluster

### 31.3.7 GTM_DMA_COM_SELj — GTM DMA Common Selection Function Register j

GTM-IP interrupt factors forwarded to DMAC/DTS are selected from ICM outputs. Please refer to ICM Chapter in "GTM-IP Specification" for list of ICM outputs. ( $\mathrm{j}=0$ to 9 )

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 31.18 GTM_DMA_COM_SELj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 6 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 5 to 0 | $\begin{aligned} & \text { GTM_DMA_COM_ } \\ & \text { SEL[5:0] } \end{aligned}$ | Selects a DMA trigger from ICM. |
|  |  | 0: GTM_AEI_IRQ |
|  |  | $1+x$ : GTM_ARU_IRQ[x] ( $x=0$ to 2 ) |
|  |  | 4: GTM_BRC_IRQ |
|  |  | 5: GTM_CMP_IRQ |
|  |  | $6+\mathrm{x}$ : GTM_PSM0_IRQ[x] ( $\mathrm{x}=0$ to 7 ) |
|  |  | $14+x$ : GTM_PSM1_IRQ[x] ( $\mathrm{x}=0$ to 7$)$ |
|  |  | $22+x$ : GTM_DPLL_IRQ[x] $(x=0$ to 1$)$ |
|  |  | $20+x$ : GTM_DPLL_IRQ[x] ( $x=4$ to 14) |
|  |  | $19+x:$ GTM_DPLL_IRQ[x] ( $\mathrm{x}=16$ to 26) |
|  |  | Other: Reserved |

Note: j: Number of DMA triggers per cluster

### 31.3.8 GTM_ADCI_CHSELn - GTM ADCI channel selection register n

Results of A/D conversion are stored in ADC_CH[y]_DATA registers ( $\mathrm{y}=0 . .31$ ). Either registers 0 to 15 or registers 16 to 31 can be used based on GTM_ADCI_CHSELn.CHS. In addition, a register designation is also based on DFTAG (ADCH and CADC) or DFES (DSADC). For more information about DFTAG and DFES configuration please refer to Section 34, Analog to Digital Converter (ADCH), Section 35, Delta-Sigma Analog to Digital Converter (DSADC) and Section 36, Cyclic Analog to Digital Converter (CADC). $(\mathrm{n}=0$ to 3: ADCHn, $\mathrm{n}=4$ : CADC)

Value after reset: $00000000_{\mathrm{H}}$

Table 31.19 GTM_ADCI_CHSELn Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 0 | CHS | The analog to digital conversion data storage territory related in DFTAG of ADCH is <br> designated. <br>  <br>  |
|  | $0:$ AD data is stored in ADC_CH[y]_DATA $(y=0$ to15 $)$ |  |
|  | $1:$ AD data is stored in ADC_CH[y]_DATA $(y=16$ to 31$)$ |  |

### 31.4 Operation

### 31.4.1 Peripheral Bus Access

GTM is connected to a system bus as a slave. Access by CPU or DMA to registers and RAM (MCS and DPLL) is provided through AEI interface. Only 32 bit access to GTM registers and RAM is supported.

GTM MCS and DPLL RAM are not shared with other functionality. They can be accessed via system bus in a certain address range. For details of the memory map, please refer to Figure 31.2, Figure 31.3.

GTM is accessible by all cores with the same access speed except the ICU-M core. Please refer to Section 3, CPU System for more details on CPU to peripheral access speed.

Figure 31.2 Memory Map - GTM (1/2)

Figure $31.2 \quad$ Memory Map - GTM (2/2)

Note 1. Refer to Section 41, Flash Memory Configuration Setting Area (Option Bytes, Reset Vector) about GTM_HALF_MODE change method of E2x-FCC1.

Figure 31.3 Memory Map - GTM RAM (1/3)

Figure 31.3 Memory Map - GTM RAM (2/3)

Figure 31.3 Memory Map - GTM RAM (3/3)

### 31.4.2 Reset

GTM is resettable by a dedicated bit, which allows the software to set GTM in reset state without using external reset. Please refer to "GTM-IP Specification" document.

### 31.4.3 Interconnections of Interrupt Factors

GTM internal interrupt factors are consolidated by GTM Interrupt Concentrator Module (ICM) into fewer interrupts visible outside GTM. The functionality of ICM is described in GTM-IP Specification. For list of interrupt factors visible outside GTM-IP chapter see Section 31.1.5, Interrupt Requests.

Outputs of ICM are further multiplexed outside GTM and then routed to interrupt controller (INTC) and DMA controller (DMAC/DTS). This multiplexing is described here. For register definitions please see Section 31.3.1, List of Registers.

Figure 31.4 Interrupt Signal Bundling (4/6)

Figure 31.4 Interrupt Signal Bundling (5/6)

Figure 31.4 Interrupt Signal Bundling (6/6)

### 31.4.4 Outputs to AD

### 31.4.4.1 Outputs to ADCH

GTM outputs can trigger start of ADCH conversion. The following GTM outputs can be used as ADCH trigger sources:

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the ADCH. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). The GTM can trigger AD groups 0 to 4. TOM_OUT and ATOM_OUT are described in "GTM-IP Specification". For more information about ADCH functionality please refer to Section 34, Analog to Digital Converter (ADCH).

### 31.4.4.2 Outputs to DSADC

GTM outputs can trigger

- Starting and stopping of DSADC conversion
- Incrementing of DSADC input channel
- Gate reading of DSADC samples and time stamps

The following GTM outputs can be used as DSADC trigger sources

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the DSADC. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). All DSADC triggers can be mapped to GTM outputs. TOM_OUT and ATOM_OUT are described in "GTM-IP Specification". For more information about DSADC functions please refer to Section 35, Delta-Sigma Analog to Digital Converter (DSADC).

### 31.4.4.3 Outputs to CADC

GTM outputs can trigger

- Starting and stopping of CADC conversion
- Incrementing of CADC input channel
- Gate reading of CADC samples

The following GTM outputs can be used as CADC trigger sources

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the CADC. Each CADC trigger can be mapped to GTM outputs. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). TOM_OUT and ATOM_OUT signals are described in "GTM-IP Specification". For more information about CADC functions please refer to Section 36, Cyclic Analog to Digital Converter (CADC).

### 31.4.5 Outputs to ENCA

GTM outputs can trigger the ENCA timer counter capture. The following GTM outputs can be used as ENCS trigger sources.

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the ENCA. The GTM outputs can trigger capture trigger inputs 0 and 1. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). TOM_OUT and ATOM_OUT signals are described in "GTM-IP Specification". For more information about ENCA functionality please refer to Section 32, Encoder Timer (ENCA).

### 31.4.6 Outputs to DFE

GTM outputs can trigger DFE

- Timer trigger compare
- Timer DFE Capture trigger
- Timer FIFO Capture trigger

The following GTM outputs can be used as DFE trigger sources.

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the DFE. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). TOM_OUT and ATOM_OUT signals are described in "GTM-IP Specification". For more information about DFE functionality please refer to Section 37, Digital Filter Engine (DFE).

### 31.4.7 Outputs to PSI5-S

GTM outputs can be routed to PSI5-S signals enable, clear, clock and sync pulse signal. The following GTM outputs can be routed to PSI5-S

- TOM_OUT
- ATOM_OUT

Signals specified above are multiplexed together and routed to the PSI5-S. Multiplexing scheme is described in Section 33, Peripheral Interconnection (PIC). TOM_OUT and ATOM_OUT signals are described in "GTM-IP Specification". For more information about PSI5-S functionality please refer to Section 25, Peripheral Sensor Interface 5 S (PSI5-S).

### 31.4.8 Peripheral Inputs

Outputs of other peripherals can be connected to GTM inputs. Those outputs are routed to TIM input channels. See
Section 33, Peripheral Interconnection (PIC) for routing schemes.

### 31.4.8.1 Inputs from PORT

If port pin alternative GTM function is selected, a signal from a micro pin is routed to a corresponding TIM channel. Please see Section 2, Pin Function for possible routing options to TIM channels. Whether a signal from a micro pin is used by TIM channel as an input also depends on TIM sub-module configuration inside GTM. For more details about TIM please refer to "GTM-IP Specification".

### 31.4.8.2 Inputs from ADCH

The following interrupt factors of ADCH can be routed to TIM input channels

- Conversion ending of the ADCH scan group
- Analog Boundary Flag (via Virtual PORT)

### 31.4.8.3 Inputs from DSADC

The following interrupt factors of DSADC can be routed to TIM input channels

- completion of DSADC conversion
- Analog Boundary Flag (via Virtual PORT)

### 31.4.8.4 Inputs from CADC

The following interrupt factors of CADC can be routed to TIM input channels

- completion of CADC conversion
- Analog Boundary Flag (via Virtual PORT)

### 31.4.8.5 Input from ENCA

All ENCA interrupt factors can be routed to GTM TIM input channels:

- Encoder input (phase A, B, Z)
- Compare match or capture
- clear interrupt by ENCA input
- clock enable output
- encoder output count status

### 31.4.8.6 Inputs from DFE

The following DFE interrupt factors can be routed to TIM input channels:

- peak and hold update
- output data available

### 31.4.9 ADC Interface

Results of A/D conversion are stored in ADC_CH[y]_DATA registers ( $\mathrm{y}=0 . .31$ ). Either registers 0 to 15 or registers 16 to 31 can be used based on GTM_ADCI_CHSELj.CHS. In addition, a register designation is also based on DFTAG (ADCH and CADC) or DFES (DSADC). For more information about DFTAG and DFES configuration please refer to
Section 34, Analog to Digital Converter (ADCH), Section 35, Delta-Sigma Analog to Digital Converter (DSADC) and Section 36, Cyclic Analog to Digital Converter (CADC).

It is not possible to send one piece of A/D data to multiple ADC_CH[y]_DATA registers based on DFTAG. Sending multiple A/D results to a same ADC_CH[y]_DATA register based on DFTAG is possible but has to be carefully designed to avoid data overwrites.*1
The data format in ADC_CH[y]_DATA register matches configuration of corresponding A/D channel.
Note 1. For example, choosing DFTAG=3h for conversion result of $A D C H$ and DFES=0h and DFTAG=3h for conversion result of Delta/Sigma ADC is not allowed.

Table 31.20 Allocation of an ADC_CH[y]_DATA Register and DFTAG, DFES Setting (1/2)

| GTM Registers | ADCH |  | DSADC |  | CADC |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

The figure below shows the bit correspondence between the AD conversion result and the ADC _ $\mathrm{CH}[\mathrm{y}]$ _DATA register of GTM.

Figure 31.5 Comparison of AD conversion result with ADC_CH[y]_DATA register of GTM

## CAUTION

ADC_CH[y]_STA has no information and returns the same value as ADC_CH[y]_DATA when read.
Bits 31 to 24 of ADC_CH[y]_DATA are always reads as $0 \times C 0$. ADC_NEW_DATA is not supported. For details about ADC_NEW_DATA, please refer to "GTM-IP Specification" documents.

### 31.4.10 Safety Mechanism

MCS RAM is protected by ECC function. ECC error of MCS RAM is also reported by MCS channel. For more details about the ECC function, please refer to Section 38, Functional Safety.

### 31.4.11 GTM Debug Function

GTM debug feature is as follows.

- Run, break
- Single step execution of MCS
- On-chip breakpoint by:
- MCS instruction or data access
- DPLL RAM data access
- ARU data access
- TBU counter
- Trace the followings with timestamp: (E2xFCC1 only)
- MCS instruction or data access
- DPLL RAM data access
- ARU data access
- TBU counter
- TIM/TOM/ATOM state change

## CAUTION

The register behaviors of AFD[i]_CH[x]_BUFFACC, TIM[i]_CH[x]_GPRO/1 and ATOM[i]_CH[x]_SR0/1 in case of debugger read access described in "GTM-IP Specification" are not supported.

## Section 32 Encoder Timer (ENCA)

This section contains general descriptions of the Encoder Timer (ENCA).
The first part in this section describes all specific properties of this product, such as the number of units, and register base addresses.

The remainder of the section describes the functions and registers of the ENCA.

### 32.1 Features of ENCA

### 32.1.1 Number of Units

This microcontroller has the following number of ENCA units.
Each ENCA unit has one-channel encoder timer.
Table $32.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1 |  |
| :--- | :---: | :---: |
|  | 373 pins | 292 pins |
|  | 2 | 2 |
| Name | ENCAn $(\mathrm{n}=0$ to 1$)$ | ENCAn $(\mathrm{n}=0$ to 1$)$ |

Table $32.2 \quad$ Number of Units

| Product Name | RH850/E2M |  |
| :--- | :---: | :---: |
|  | 373 pins | 292 pins |
|  | 2 | 2 |
| Name | ENCAn $(\mathrm{n}=0$ to 1$)$ | ENCAn $(\mathrm{n}=0$ to 1$)$ |

Table 32.3 Index

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual ENCA units are identified by the index " n " ( $\mathrm{n}=0,1$, ; for example, |
|  | ENCAnCTL is the ENCAn control register. |

### 32.1.2 Register Base Addresses

The ENCAn base addresses are listed in the following table.
The ENCAn register addresses are given as offsets from the base addresses.
Table 32.4 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ENCA0_base> | FFE8 $0000_{H}$ | Peripheral Group 2H |
| <ENCA1_base> | FFE8 $1000_{H}$ | Peripheral Group 2H |

### 32.1.3 Clock Supply

The ENCAn clock supply is shown in the following table.
Table 32.5 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| ENCAn | PCLK | CLK_HSB |

### 32.1.4 Interrupt Requests

The ENCAn interrupt requests are listed in the following table.
Table 32.6 Interrupts and DMA/DTS Requests

| Interrupt Symbol Name | Description | Interrupt Number | sDMA Trigger Number | DTS Trigger Number |
| :---: | :---: | :---: | :---: | :---: |
| ENCAO |  |  |  |  |
| INTENCAOIOV | ENCATIOV | 206-213 <br> (selectable) | group1 64-71 (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCAOIUD | ENCATIUD | 206-213 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 <br> (selectable) |
| INTENCAOIO | ENCATINTO | 206-213 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCAOI1 | ENCATINT1 | 206-213 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCAOIEC | ENCATIEC | 206-213 <br> (selectable) | group1 64-71 (selectable) | group2 110-117, group3 70-77 (selectable) |
| ENCA1 |  |  |  |  |
| INTENCA1IOV | ENCATIOV | 214-221 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCA1IUD | ENCATIUD | 214-221 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCA110 | ENCATINTO | 214-221 <br> (selectable) | group1 64-71 (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCA111 | ENCATINT1 | 214-221 <br> (selectable) | group1 64-71 (selectable) | group2 110-117, group3 70-77 (selectable) |
| INTENCA1IEC | ENCATIEC | 214-221 <br> (selectable) | group1 64-71 <br> (selectable) | group2 110-117, group3 70-77 (selectable) |
| NOTES |  |  |  |  |

1. Interrupt Number can be selected at the GTM_IRQ_SEL8j register. ( $\mathrm{j}=0$ to 15)
2. DMAC Trigger Number can be selected at the GTM_DMA_SEL8j ( $\mathrm{j}=0$ to 7 )
3. GTM_IRQ_SEL8j ( $\mathrm{j}=0$ to 15) and GTM_DMA_SEL8j $(\mathrm{j}=0$ to 7 ) can be set without depending on the setting of option byte (OPBT8.ATU_GTM_SEL) and module standby (MSR_GTM.MS_GTM).

### 32.1.5 Reset Sources

The ENCAn reset sources are listed in the following table. The ENCAn is initialized by these reset sources.
Table 32.7 Reset Sources

|  | Register Name | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name |  | Power Up <br> Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG <br> Reset |
| ENCAn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 32.1.6 External Input/Output Signals

The external input/output signals of ENCAn are listed below.
Table 32.8 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal Name |
| :--- | :--- | :--- |
| ENCA0 |  | Encoder input (phase A)*1 |
| ENCA0E0 | Encoder input (phase B)*1 | ENCAnE0 |
| ENCA0E1 | Encoder input (phase Z) |  |
| ENCA0EC | Encoder input (phase A)*1 | ENCAnE1 |
| ENCA1 | Encoder input (phase B)*1 | ENCAnEC |
| ENCA1E0 | Encoder input (phase Z) |  |
| ENCA1E1 |  | ENCAnE1 |
| ENCA1EC |  | ENCAnEC |

Note 1. This input passes PIC.

### 32.2 Overview

### 32.2.1 Functional Overview

- Counter control signal generation from the encoder input signal, and count operation in synchronization with PCLK
- Capture function for capturing the count value with an external trigger signal
- Compare function for compare match judgment with the count value
- Two capture/compare registers that can be set separately for capture operation and for compare operation
- Interrupt mask function for masking the interrupt request signal output as a result of compare match judgment during compare operation
- Function for loading the value of the capture/compare register to the counter upon underflow occurrence
- Encoder input signal can be used as the timer counter clear condition
- Edge or level can be selected for determining the presence of the encoder input signal that is used as the timer counter clear condition
- Detection of counter overflow and underflow, and output of error flags and error occurrence interrupts
- Five interrupts: two capture/compare interrupts, one counter clear interrupt, one overflow interrupt, and one underflow interrupt

### 32.2.2 Block Diagram

Figure 32.1 ENCA Block Diagram

### 32.3 Registers

### 32.3.1 List of Registers

The ENCA registers are listed in the following table.
$<$ ENCAn_base> is defined in Register Base Address.
Table 32.9 Registers

| Module | Register | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ENCAn | ENCAn Capture/Compare Register 0 | ENCAnCCR0 | <ENCAn_base> | 16 | - |
| ENCAn | ENCAn Capture/Compare Register 1 | ENCAnCCR1 | <ENCAn_base> + 04 ${ }_{\text {H }}$ | 16 | - |
| ENCAn | ENCAn Counter Register | ENCAnCNT | <ENCAn_base> + $08{ }_{\mathrm{H}}$ | 16 | - |
| ENCAn | ENCAn Status Flag Register | ENCAnFLG | <ENCAn_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
| ENCAn | ENCAn Status Flag Clear Register | ENCAnFGC | <ENCAn_base> + $10{ }_{\text {H }}$ | 8 | - |
| ENCAn | ENCAn Timer Enable Status Register | ENCAnTE | <ENCAn_base> + 14 н | 8 | - |
| ENCAn | ENCAn Timer Start Trigger Register | ENCAnTS | <ENCAn_base> $+18{ }_{\mathrm{H}}$ | 8 | - |
| ENCAn | ENCAn Timer Stop Trigger Register | ENCAnTT | <ENCAn_base> + $1 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
| ENCAn | ENCAn I/O Control Register 0 | ENCAnIOC0 | <ENCAn_base> + $20_{\text {H }}$ | 8 | - |
| ENCAn | ENCAn Control Register | ENCAnCTL | <ENCAn_base> + $40{ }_{\mathrm{H}}$ | 16 | - |
| ENCAn | ENCAn I/O Control Register 1 | ENCAnIOC1 | <ENCAn_base> $+44_{\text {H }}$ | 8 | - |
| ENCAn | ENCAn Emulation Register | ENCAnEMU | <ENCAn_base> + $48_{H}$ | 8 | - |

### 32.3.2 Details of Registers

### 32.3.2.1 ENCAnCTL — ENCAn Control Register

This register is used to configure various operation settings of the Encoder Timer.
Writing to this register during operation is prohibited.

| Value after reset: $\quad 0000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Table 32.10 ENCAnCTL Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ENCAnCME | Encoder Clear Mask Enable <br> This bit is used to enable/disable masking of compare-match interrupt detection when the compare function is used. <br> 0: Disables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register <br> 1: Enables the compare-match interrupt (ENCATINT1) mask function for the ENCAnCCR1 register. <br> This bit is valid only when ENCAnCRM1 $=0$. <br> When this bit is set to " 1 ", setting ENCAnECM1 to " 1 " is prohibited. |
| 14 | ENCAnMCS | Encoder Mask Clear Select <br> This bit is used to select the trigger for cancelling masking of compare-match interrupt detection ENCATINT1 when the compare function is used. <br> This bit is valid only when ENCAnCRM1 $=0$. <br> 0: Masking of compare-match interrupt detection is canceled when the ENCAnCCR1 register is written. <br> 1: Masking of compare match interrupt detection is canceled when one of the following three operations is performed. <br> Timer counter clear operation accompanying encoder clear input. <br> Timer counter clear operation upon compare-match between ENCAnCNT and ENCAnCCR0 when ENCAnECM0 $=1$. <br> Loading from ENCAnCCR0 to the timer counter upon underflow detection when ENCAnLDE $=1$. |
| 13 to 10 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 9 | ENCAnCRM1 | ENCAnCCR1 Register Mode <br> 0: ENCAnCCR1 used as compare register. <br> 1: ENCAnCCR1 used as capture register. |
| 8 | ENCAnCRM0 | ENCAnCCR0 Register Mode <br> 0: ENCAnCCR0 used as compare register. <br> 1: ENCAnCCR0 used as capture register. |

Table 32.10 ENCAnCTL Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ENCAnCTS | ENCAnCCR1 Capture Trigger Select <br> This is a trigger selection bit for the capture operation to the ENCAnCCR1 register. <br> This bit is valid only when ENCAnCRM1 = 1 . <br> 0 : Uses ENCATTIN1 of capture trigger 1 signal as the capture trigger for the ENCAnCCR1 register. <br> 1: Uses the counter clear signal selected with ENCAnSCE as the capture trigger for the ENCAnCCR1 register. |
| 6, 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ENCAnLDE | ENCAn Counter Load Enable <br> This bit is used to enable/disable setting value loading to the counter upon underflow occurrence. <br> This bit is valid only when ENCAnCRMO $=0$. <br> When ENCAnCRM0 $=1$, ENCAnCCR0 register setting value is not loaded to the counter upon occurrence of an underflow, regardless of the value of this bit. <br> 0 : Disables loading of ENCAnCCRO register setting value to counter upon occurrence of a counter underflow. <br> 1: Enables loading of ENCAnCCRO register setting value to counter upon occurrence of a counter underflow. |

| 3 | ENCAnECM1 | Encoder Clear Mode 1 |
| :--- | :--- | :--- |
|  | This bit is used to set the counter clear operation upon match between the count value and |  |

ENCAnCCR1 setting value.
This bit is valid only when ENCAnCRM1 $=0$.
0 : Does not clear the counter to $0000_{\mathrm{H}}$ upon match of timer count value and ENCAnCCR1 setting value.
1: Clears the counter to $0000_{\mathrm{H}}$ upon match of timer count value and ENCAnCCR1 setting value if the next count is a down-count.

| 2 | ENCAnECMO | Encoder Clear Mode 0 |
| :---: | :---: | :---: |
|  |  | This bit is used to set the counter clear operation upon match between the count value and ENCAnCCR0 setting value. |
|  |  | This bit is valid only when ENCAnCRM0 $=0$. |
|  |  | 0 : Does not clear the counter to $0000_{\mathrm{H}}$ upon match of timer counr value and ENCAnCCRO setting value. |
|  |  | 1: Clears the counter to $0000_{H}$ upon match of timer count value and ENCAnCCRO setting value if the next count is an up-count. |
| 1, 0 | ENCAnUDS[1:0] | Up/down Count Selection 1 and 0 |
|  |  | These are the counter up/down control bits using ENCAnE0 and ENCAnE1. |
|  |  | 00: Upon detection of valid edge of ENCAnE0, <br> - down-count when ENCAnE1 = H <br> - up-count when ENCAnE1 = L |
|  |  | 01: Upon detection of valid edge of ENCAnE0, up-count, Upon detection of valid edge of ENCAnE1, down-count |
|  |  | 10: At rising edge of ENCAnE0, down-count <br> At falling edge of ENCAnE0, up-count <br> However, count operation is performed only when ENCAnE1 $=\mathrm{L}$. |
|  |  | 11: Detection of both edges of ENCAnE0, ENCAnE1. <br> The count operation is determined based on the combination of the detected edge and level. |

### 32.3.2.2 ENCAnIOCO — ENCAn I/O Control Register 0

This register is used to select the input edge of capture triggers 0 and 1 (ENCATTIN0, ENCATTIN1).

## Value after reset: $\quad 00_{H}$

Table 32.11 ENCAnIOC0 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 3, 2 | ENCAnTIS[3:2] | Input Edge Selection for Capture Trigger 1 <br> These bits are valid only when ENCAnCTL.ENCAnCRM1 = 1 and ENCAnCTL.ENCAnCTS $=0$. <br> All other settings of ENCAnCRM1 and ENCAnCTS are invalid. <br> 00: No edge detection <br> 01: Rising edge detection <br> 10: Falling edge detection <br> 11: Both edges detection |
| 1, 0 | ENCAnTIS[1:0] | Input Edge Selection for Capture Trigger 0 <br> These bits are valid only when ENCAnCTL.ENCAnCRM0 $=1$. <br> 00: No edge detection <br> 01: Rising edge detection <br> 10: Falling edge detection <br> 11: Both edges detection |

### 32.3.2.3 ENCAnIOC1 — ENCAn I/O Control Register 1

This register is used to perform the clear condition setting and edge selection for input from the encoder.
Writing to this register during operation is prohibited.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ENCAnSCE | ENCAnZCL | ENCAnBCL | ENCAnACL |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 32.12 ENCAnIOC1 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ENCAnSCE | Encoder Special-Clear Enable <br> This is an encoder special clear enable bit. <br> When setting this bit to 1 , set ENCAnUDS1 and ENCAnUDS0 to $10_{\mathrm{B}}$ or $11_{\mathrm{B}}$. <br> The operation is not guaranteed if this bit is set to 1 with ENCAnUDS1 and ENCAnUDS0 set to $00_{\mathrm{B}}$ or $01_{\mathrm{B}}$. <br> 0 : Clears the counter upon detection of ENCAnEC valid edge (set with ENCAnECS1 and ENCAnECSO). <br> 1: Clears the counter upon detection of input level condition of ENCAnE0, ENCAnE1 and ENCAnEC (set with ENCAnZCL bit, ENCAnBCL bit, and ENCAnACL bit). |
| 6 | ENCAnZCL | Input-Z Clear Condition Selection <br> This bit is used to set the condition for clearing the encoder clear input (ENCAnEC) when the encoder special clear function is used. <br> This bit is valid only when ENCAnSCE $=1$; and is invalid when ENCAnSCE $=0$. <br> 0 : Clear condition: Low level <br> 1: Clear condition: High level |
| 5 | ENCAnBCL | Input-B Clear Condition Selection <br> This bit is used to set the condition for clearing the encoder input 1 (ENCAnE1) when the encoder special clear function is used. <br> This bit is valid only when ENCAnSCE $=1$; and is invalid when ENCAnSCE $=0$. <br> 0: Clear condition: Low level <br> 1: Clear condition: High level |
| 4 | ENCAnACL | Input-A Clear Condition Selection <br> This bit is used to set the condition for clearing the encoder input 0 (ENCAnEO) when the encoder special clear function is used. <br> This bit is valid only when ENCAnSCE $=1$; and is invalid when ENCAnSCE $=0$. <br> 0: Clear condition: Low level <br> 1: Clear condition: High level |
| 3, 2 | ENCAnECS[1:0] | Encoder Clear Input Edge Selection 1 and 0 <br> These are the encoder clear input edge selection bits. <br> These bits are valid only when ENCAnSCE $=0$; and are invalid when ENCAnSCE $=1$. <br> 00: No edge detection <br> 01: Rising edge detection <br> 10: Falling edge detection <br> 11: Both edges detection |

Table 32.12 ENCAnIOC1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1,0 | ENCAnEIS[1:0] | Encoder Edge Input Selection 1 and 0 |
|  |  | These are the encoder input edge selection bits. |
|  | These bits are valid when ENCAnUDS1 and ENCAnUDSO $=00_{\mathrm{B}}$ or $01_{\mathrm{B}}$, and are invalid when |  |
|  | ENCAnUDS1 and ENCAnUDS0 $=10_{\mathrm{B}}$ or $11_{\mathrm{B}}$. |  |
|  | $00:$ No edge detection |  |
|  | 01: Rising edge detection |  |
|  | 10: Falling edge detection |  |
|  | 11: Both edges detection |  |

### 32.3.2.4 ENCAnFLG - ENCAn Status Flag Register

This register holds the status flags of the timer counter of ENCAn.

## Value after reset: $\quad 00_{H}$

Table 32.13 ENCAnFLG Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 2 | ENCAnCSF | Counter Status Flag |
|  |  | This bit reflects the current timer counter operation. |
|  |  | 0 : Timer counter in up-count status |
|  |  | 1: Timer counter in down-count status |
| 1 | ENCAnUDF | Underflow Flag |
|  |  | This bit reflects the occurrence of an underflow during the timer counter operation. This bit is cleared at the start of count operation. |
|  |  | 0 : This flag is cleared to 0 upon any of the following events: <br> - " 1 " is written to ENCAnFGC.ENCAnCLUD. <br> - The flag is cleared to 0 by setting ENCAnTS bit to " 1 " when ENCAnTE $=0$. |
|  |  | 1: This flag is set to " 1 " upon occurrence of an underflow during the encoder timer count operation. |
| 0 | ENCAnOVF | Overflow Flag |
|  |  | This bit reflects the occurrence of an overflow during the timer counter operation. |
|  |  | This bit is cleared at the start of count operation. |
|  |  | 0 : This flag is cleared to 0 upon any of the following events: <br> - " 1 " is written to ENCAnFGC.ENCAnCLOV. <br> - The flag is cleared to 0 by setting ENCAnTS bit to " 1 " when ENCAnTE $=0$. |
|  |  | 1: This flag is set to " 1 " upon occurrence of an overflow during the encoder timer count operation. |

### 32.3.2.5 ENCAnFGC - ENCAn Status Flag Clear Register

This register is used to clear the timer counter status flags of ENCAnFLG.
This register always returns 0 when read.

Value after reset: 00 H

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | ENCAnCLUD | ENCAnCLOV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | w | W |

Table 32.14 ENCAnFGC Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 2 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 1 | ENCAnCLUD | Underflow Flag Clear |
|  | This bit clears the underflow flag. |  |
|  | $0:$ Writing is ignored. |  |
|  | 1: Clears ENCAnUDF of the ENCAnFLG register (clears underflow detection). |  |
| 0 | ENCAnCLOV | Overflow Flag Clear |
|  | This bit clears the overflow flag. |  |
|  | $0:$ Writing is ignored. |  |
|  | 1: Clears ENCAnOVF of the ENCAnFLG register (clears overflow detection). |  |

### 32.3.2.6 ENCAnCCRO — ENCAn Capture/Compare Register 0

This register is a 16 -bit capture/compare register 0 .
When this register functions as a capture register, only reading is possible, and write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

Table 32.15 ENCAnCCR0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | ENCAnCCR0 | Capture/Compare Register 0 |
|  | $[15: 0]$ | Upon occurrence of an underflow, the setting value of this register may be loaded to the |
|  | counter according to the ENCAnCTL.ENCAnLDE setting. See the description of the |  |
|  | ENCAnLDE bit in ENCA control register ENCAnCTL for details. |  |
|  | - If ENCAnCTL.ENCAnCRM0 $=0$ : ENCAnCCRO is a compare register. |  |
|  | Set the value to be compared with the timer count value. |  |
|  | - If ENCAnCTL.ENCAnCRM0 = 1: ENCAnCCRO is a capture register. |  |
|  |  | The captured timer count value is stored. |

### 32.3.2.7 ENCAnCCR1 — ENCAn Capture/Compare Register 1

This register is a 16 -bit capture/compare register 1 .
When this register functions as a capture register, only reading is possible, and write operation is ignored.
When this register functions as a compare register, reading and writing is possible.

Table 32.16 ENCAnCCR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | ENCAnCCR1 | Capture/Compare Register 1 |
|  | $[15: 0]$ | During capture operation, the capture trigger to this register differs according to the |
|  | ENCAnCTL.ENCAnCTS setting. See the description of the ENCAnCTS bit in ENCA control |  |
|  | register ENCAnCTL for details if ENCAnCTL.ENCAnCRM1 = 0: ENCAnCCR1 is a compare |  |
|  | register. |  |
|  | Set the value to be compared with the timer count value. |  |
|  | If ENCAnCTL.ENCAnCRM1 $=1:$ ENCAnCCR1 is a capture register. |  |
|  | The captured timer count value is stored. |  |

### 32.3.2.8 ENCAnCNT — ENCAn Counter Register

This register is the 16 -bit timer counter register.
This register can be written only when the operation is stopped.

Value after reset: $\quad 0000_{H}$

Table 32.17 ENCAnCNT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 0 | ENCAnCNT | Counter Register |
|  | $[15: 0]$ | - ENCAnTE.ENCAnTE status: 0 (initial setting): Count stop |
|  |  | An arbitrary value can be set to timer counter. |
|  | - ENCAnTE. ENCAnTE status: $0 \rightarrow 1$ (operation start): Count operation start |  |
|  | Up/down count operation is started with the set arbitrary value. |  |
|  | - ENCAnTE.ENCAnTE status: 1 (operating): Counting |  |
|  | Up/down count operation is performed. |  |
|  | - ENCAnTE. ENCAnTE status: $1 \rightarrow 0$ (stopped): Count stop |  |
|  |  |  |
|  | The count value immediately before the operation was stopped is held, and the count |  |
|  | operation is stopped. |  |

### 32.3.2.9 ENCAnTE - ENCAn Timer Enable Status Register

This register indicates the operating status of ENCAn.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 32.18 ENCAnTE Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. |
| 0 | ENCAnTE | Timer Status Enable |
|  | This is a status bit that indicates the operation enabled/stopped status of ENCAn. |  |
|  | This bit is cleared to 0 when " 1 " is written to ENCAnTT.ENCAnTT. |  |
|  | This bit is set to " 1 " when " 1 " is written to ENCAnTS.ENCAnTS. |  |
|  | $0:$ Operation stopped |  |
|  | $1:$ Operation enabled |  |
|  |  |  |

### 32.3.2.10 ENCAnTS — ENCAn Timer Start Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation enabled state.
This register is always read as $00_{\mathrm{H}}$. It can be written only when ENCAnTE.ENCAnTE is 0 .

Value after reset: $00 \mathrm{H}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 32.19 ENCAnTS Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | ENCAnTS | Timer Start Trigger |
|  |  | This is the trigger bit that sets the ENCAn to the operation enabled state. |
|  | $0:$ Writing is ignored. |  |
|  |  | 1: The ENCAn is set to the operation enabled state by setting ENCAnTE. ENCAnTE $=1$. |

### 32.3.2.11 ENCAnTT — ENCAn Timer Stop Trigger Register

This register provides the trigger bit for setting the ENCAn to the operation stopped state.
This register is always read as $00_{\mathrm{H}}$.

Value after reset: $\quad 0 \mathrm{OH}_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ENCAnTT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 32.20 ENCAnTT Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing, write the value after reset. |
| 0 | ENCAnTT | Timer Stop Trigger |
|  |  | This is the trigger bit that sets the ENCAn to the operation stopped state. |
|  | $0:$ Writing is ignored. |  |
|  |  | 1: Clears ENCAnTE.ENCAnTE to " 0 ", to set the ENCAn to the count operation stopped |
|  |  |  |
|  |  |  |

### 32.3.2.12 ENCAnEMU — ENCAn Emulation Register

This register controls operations by SVSTOP.
Writing to this register should be performed in the counter operation stopped status (ENCAnTE.ENCAnTE $=0$ and EPC.SVSTOP $=0$ ).

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ENCAnSVSDIS | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

Table 32.21 ENCAnEMU Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | ENCAnSVSDIS | When EPC.SVSTOP bit $=0$ : |
|  |  | The count clock continues when the debugger assumes control of the microcontroller (at a break point, etc.), regardless of the value of this bit (1 or 0 ). |
|  |  | When EPC.SVSTOP bit $=1$ : |
|  |  | 0 : The count clock stops when the debugger assumes control of the microcontroller (at a break point, etc.). |
|  |  | 1: The count clock continues when the debugger assumes control of the microcontroller (at a break point, etc.). |
| 6 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 32.4 Operation

The ENCAn operates the timer counter with counter up/down control and clear control by encoder inputs. The ENCAnCCR0 and ENCAnCCR1 registers can be used as dedicated compare registers or as dedicated capture registers.

### 32.4.1 Timer Counter Operation

The timer counter operations of the ENCAn are described below.
The figure below shows the operation phases. See the corresponding section with the section number for detailed descriptions on each operation.

Figure 32.2 Timer Counter Initial Value Setting/Start/Stop
(1) Timer Counter Initial Value Setting

The initial value of the ENCAn counter register (ENCAnCNT) can be set to the counter operation stopped state $($ ENCAnTE $=0)$.
(2) Timer Counter Startup

By writing " 1 " to the timer start trigger bit (ENCAnTS), the timer status enable bit (ENCAnTE) is set to " 1 ", the count operation is enabled, and counting is performed upon detection of the valid edge of the encoder input.
(3) Overflow Operation

An overflow occurs when up-counting is performed when the count value is $\mathrm{FFFF}_{\mathrm{H}}$. If the count value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, an overflow interrupt (ENCATIOV) is generated, and the overflow flag (ENCAnOVF) is set to " 1 ". The overflow flag (ENCAnOVF) is cleared to " 0 " when " 1 " is set to the overflow flag clear bit (ENCAnCLOV). For details about the operation, see "Section 32.6.1, Overflow Occurrence and Overflow Flag Clear Operation"
(4) Underflow Operation

An underflow occurs when down-counting is performed when the count value is $0000_{\mathrm{H}}$. If the count value changes
from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, an underflow interrupt (ENCATIUD) is generated, and the underflow flag (ENCAnUDF) is set to " 1 ". The underflow flag (ENCAnUDF) is cleared to " 0 " when " 1 " is set to the underflow flag clear bit (ENCAnCLUD). For details about the operation, see "Section 32.6.2, Underflow Occurrence and Underflow Flag Clear Operation".
(5) Timer Counter Stop

By writing " 1 " to the timer stop trigger bit (ENCAnTT), the timer status enable bit (ENCAnTE) is cleared to " 0 ", and the count operation is stopped. At this time, the timer counter is not reset to $0000_{\mathrm{H}}$ and holds the value before count operation stops.

### 32.4.2 Up/Down Control of Timer Counter

Up/down control is performed by judging the phase of the encoder inputs (ENCAnE0, ENCAnE1) according to the settings of ENCAnUDS1 and ENCAnUDS0.

### 32.4.2.1 When the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{B}$

Table 32.22 When ENCAnUDS1/ENCAnUDSO Bits $=00_{\mathrm{B}}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 0 | 0 | Rising edge | High level | Down |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Rising edge | Low level | Up |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |

The valid edge for ENCAnE0 is specified by setting ENCAnEIS1 and ENCAnEIS0.
$\mathrm{Up} /$ down count operation is performed when the valid edges and levels of ENCAnE0 and ENCAnE1 match.
The following timing chart shows the count operation when ENCAnUDS1 and ENCAnUDS0 bits $=00_{\mathrm{B}}$.

Figure 32.3 Count Operation when the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=00_{B}$

### 32.4.2.2 When the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=01_{\mathrm{B}}$

Table 32.23 When the ENCAnUDS1/ENCAnUDS0 Bits $=01$ в

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 0 | 1 | Low level | Rising edge | Down |
|  |  |  | Falling edge |  |
|  |  |  | Rising and falling edges |  |
|  |  | High level | Rising edge |  |
|  |  |  | Falling edge |  |
|  |  |  | Rising and falling edges |  |
|  |  | Rising edge | Low level | Up |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Rising edge | High level |  |
|  |  | Falling edge |  |  |
|  |  | Rising and falling edges |  |  |
|  |  | Simultaneous input |  | Hold |

The valid edges for ENCAnE0 and ENCAnE1 are specified by setting ENCAnEIS1 and ENCAnEIS0.
$\mathrm{Up} /$ down count operation is performed when the valid edges and levels of the ENCAnE0/ENCAnE1 pins match, and the count is held when the valid edges overlap.
The following timing chart shows the count operation when ENCAnUDS1 and ENCAnUDS0 bits $=01_{\mathrm{B}}$.

Figure 32.4 Count Operation when the ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=01_{\mathrm{B}}$

### 32.4.2.3 When the ENCAnUDS1 and ENCAnUDS0 Bits in the ENCAnCTL Register $=1 \mathbf{1 0}_{\mathrm{B}}$

Table 32.24 When the ENCAnUDS1, ENCAnUDS0 Bits $=10_{B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 0 | Rising edge | Low level | Down |
|  |  | Rising edge | Falling edge |  |
|  |  | Falling edge | Low level | Up |
|  |  | Falling edge | Falling edge |  |
|  |  | Low level | Rising edge | Hold |
|  |  | Rising edge | Rising edge |  |
|  |  | High level | Rising edge |  |
|  |  | Falling edge | Rising edge |  |
|  |  | Low level | Falling edge |  |
|  |  | Rising edge | High level |  |
|  |  | High level | Falling edge |  |
|  |  | Falling edge | High level |  |

Specification of valid edges for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid. The following timing chart shows the count operation when the ENCAnUDS1/ENCAnUDS0 bits $=10_{\mathrm{B}}$.

Figure 32.5 Count Operation when ENCAnUDS1/ENCAnUDS0 Bits in ENCAnCTL Register $=10_{\mathrm{B}}$

### 32.4.2.4 When ENCAnUDS1/ENCAnUDS0 Bits in the ENCAnCTL Register $=11_{\mathrm{B}}$

Table 32.25 When ENCAnUDS1/ENCAnUDS0 Bits $=11 \mathrm{~B}$

| ENCAnUDS1 | ENCAnUDS0 | Operation Description |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | ENCAnE0 Pin | ENCAnE1 Pin | Count Operation |
| 1 | 1 | Low level | Falling edge | Down |
|  |  | Rising edge | Low level |  |
|  |  | High level | Rising edge |  |
|  |  | Falling edge | High level |  |
|  |  | Rising edge | High level | Up |
|  |  | High level | Falling edge |  |
|  |  | Falling edge | Low level |  |
|  |  | Low level | Rising edge |  |
|  |  | Simultaneous input |  | Hold |

Specification of valid edges for ENCAnE0 and ENCAnE1 (settings of ENCAnEIS1 and ENCAnEIS0) is invalid.
The count value is held when the valid edges of ENCAnE0 and ENCAnE1 overlap.
The following timing chart shows the count operation when ENCAnUDS1/ENCAnUDS0 Bits $=11_{\mathrm{B}}$.

Figure 32.6 Count Operation when ENCAnUDS1 and ENCAnUDS0 Bits in the ENCAnCTL Register $=11_{\mathrm{B}}$

### 32.4.3 Timer Counter Clear Control by Encoder Input

The timer counter is cleared to $0000_{\mathrm{H}}$ by encoder clear input (ENCAnEC).
Two types of clearing methods can be selected by controlling the ENCAnSCE, ENCAnZCL, ENCAnBCL, ENCAnACL, ENCAnECS1, and ENCAnECS0 bits of the ENCAnIOC1 register.

Table 32.26 Timer Counter Clear Control by Encoder Input

| Clearing <br> Method | ENCAnSCE | ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnECS1, |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $(1)$ | 0 | Invalid | Invalid | ENCAnECSO |  |
| $(2)$ | 1 | Valid | Valid | Invalid | Valid |

### 32.4.3.1 Clearing Method when ENCAnSCE $=0$

- Upon detection of the valid edge of ENCAnEC, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operation clock.
- The valid edge of ENCAnEC is specified by the setting of the ENCAnECS1 and ENCAnECS0 bits.
- The settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

For details about clear operation when $\mathrm{ENCAnSCE}=0$, see the timing chart in 32.6.19 Capture Operation

## Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$.

### 32.4.3.2 Clearing Method when ENCAnSCE $=1$

- When the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs are detected, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock.
- Specify the clear levels of the ENCAnEC, ENCAnE1, ENCAnE0 inputs by the settings of the ENCAnZCL, ENCAnBCL, and ENCAnACL bits.
- The settings of the ENCAnECS1 and ENCAnECS0 bits are invalid.
- An encoder clear interrupt request signal (ENCATIEC) is output simultaneously with timer counter clearing.

The clearing conditions of the timer counter according to the ENCAnZCL, ENCAnBCL, and ENCAnACL settings are listed in the table below.

Table 32.27 Clearing Conditions of the Timer Counter

| Counter Clear Condition Setting |  | Encoder Pin Input Level |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| ENCAnZCL | ENCAnBCL | ENCAnACL | ENCAnEC | ENCAnE1 | ENCAnE0 |
| 0 | 0 | 0 | Low | Low | Low |
| 0 | 0 | 1 | Low | Low | High |
| 0 | 1 | 0 | Low | High | Low |
| 0 | 1 | 1 | Low | High | High |
| 1 | 0 | 0 | High | Low | Low |
| 1 | 0 | 1 | High | Low | High |
| 1 | 1 | 0 | High | High | Low |
| 1 | 1 | 1 | High | High |  |

### 32.4.4 Functions of ENCAnCCRO

### 32.4.4.1 Compare Function

- When ENCAnCRM0 $=0$, the ENCAnCCR0 register functions as a dedicated compare register.
- Upon compare match between the values of the timer counter and the ENCAnCCR0 setting value, a compare 0 match interrupt (ENCATINT0) is output.
- When ENCAnECM0 $=1$, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock upon compare match if the next count operation is up-count.

Table 32.28 Compare Function of ENCAnCCRO

| ENCAnCCR0 <br> Function | Compare Match <br> Clear Control | Next Count <br> Operation | Timer Counter Clearing Upon Compare Match with <br> ENCAnCCR0 |
| :--- | :--- | :--- | :--- |
| ENCAnCRM0 | ENCAnECM0 |  | Does not clear (continues count operation). |
| 0 (Compare) | 0 |  |  |
|  | 1 | Up-count | Clears timer counter to $0000_{\mathrm{H} .}$ |
|  | Down-count | Does not clear (continues count operation). |  |

- When $\operatorname{ENCAnLDE}=1$
- Upon occurrence of an underflow, the setting value of the ENCAnCCR0 register is loaded to the timer counter.
- An underflow interrupt (ENCATIUD) is output.

## NOTE

For the timing chart when ENCAnLDE = 1, see "Section 32.6.8, Using the ENCAnLDE Function Immediately after Startup" to "Section 32.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Count Value) and Encoder Clearing".

### 32.4.4.2 Capture Function

- When ENCAnCRM0 $=1$, the ENCAnCCR0 register functions as a dedicated capture register.
- Upon valid edge detection of the capture trigger input 0 (ENCATTIN0), the value of the timer counter is stored into ENCAnCCR0.
- A capture 0 interrupt (ENCATINT0) is output during capture operation.

NOTE
For details about capture operation for ENCAnCCRO, see the timing charts in "Section 32.6.15, Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0" and "Section 32.6.17, Encoder Operation when Compare Match Clear Control is Disabled".

### 32.4.5 Functions of ENCAnCCR1

### 32.4.5.1 Compare Function

- When $E N C A n C R M 1=0$, the $E N C A n C C R 1$ register functions as a dedicated compare register.
- Upon compare match between the value of the timer counter and the ENCAnCCR1 setting value, a compare 1 match interrupt (ENCATINT1) is output.
- When ENCAnECM1 $=1$, the timer counter is cleared to $0000_{\mathrm{H}}$ in synchronization with the operating clock upon compare match if the next count operation is down-count.

Table 32.29 Compare Function of ENCAnCCR1

| ENCAnCCR1 <br> Function | Compare Match Clear <br> Control | Next Count <br> Operation | Timer Counter Clearing Upon Compare Match with <br> ENCAnCCR1 |
| :--- | :--- | :--- | :--- |
| ENCAnCRM1 | ENCAnECM1 |  | Does not clear (continues count operation). |
|  | 0 |  |  |
|  | 1 | Up-count | Does not clear (continues count operation). |
|  | 1 | Down-count | Clears timer counter to $0000_{\mathrm{H} .}$ |

## Compare match interrupt mask function

- When $\mathrm{ENCAnCME}=1$, the compare 1 match interrupt mask function is enabled. In this state, the compare 1 match interrupt is output upon the first match of the value of the timer counter and the ENCAnCCR1 setting value, and interrupts are then masked for the second and subsequent compare matches.
- When $\operatorname{ENCAnCME}=1$ and $\mathrm{ENCAnMCS}=0$, a compare 1 match interrupt is output once upon the first compare match by writing to the ENCAnCCR1 register (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When $\operatorname{ENCAnCME}=1$ and $\mathrm{ENCAnMCS}=1$, a compare 1 match interrupt is output once upon the first compare match by a timer counter clear operation accompanying encoder clear input or by a timer counter clear operation upon match between the ENCAnCCR0 register value and the timer count value (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- When $\operatorname{ENCAnCME~=~1,~ENCAnMCS~=~} 1$ and $E N C A n L D E=1$, a compare 1 match interrupt is output once upon the first compare match by a loading operation of the ENCAnCCR0 register to the timer counter upon underflow detection (interrupts are masked for the second and subsequent matches until the cancel trigger occurs again).
- Setting ENCAnECM1 to "1" is prohibited when enabling the compare 1 match interrupt mask function.

Table 32.30 Compare Match Interrupt Mask Function of ENCAnCCR1

| ENCAnCCR1 <br> Function | Compare 1 <br> Match Interrupt <br> Mask | Interrupt Mask Cancel Trigger |
| :--- | :--- | :--- | :--- |$\quad$ Compare 1 Match Interrupt Output upon | Compare Match with ENCAnCCR1 |
| :--- |

### 32.4.5.2 Capture Function

When ENCAnCRM1 $=1$, the ENCAnCCR1 register functions as a dedicated capture register.
NOTE
For details about capture operation of ENCAnCCR1, see the timing chart in "Section 32.6.13, Capture Operation between Count Clocks (ENCAnCCR1)".

The operations for each of the ENCAnCTS settings are shown in the table below.
Table 32.31 Operations for Each of the ENCAnCTS Settings

| ENCAnCCR1 <br> Function | Capture Trigger <br> Selection |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
| ENCAnCRM1 | ENCAnCTS | Capture Trigger Signal | Timer Counter Clearing | Interrupt Occurrence |

For details about the timing chart when ENCAnCTS $=0$ or ENCAnCTS $=1$, see the following: "Section 32.6.3, Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)", "Section 32.6.4, Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)", "Section 32.6.5, Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)", "Section 32.6.11, Conflict between ENCAnLDE Function (Loading Count Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)" and "Section 32.6.12, Up-count after Conflict between ENCAnLDE Function (Loading Count Value) and Encoder Clearing".

### 32.4.5.3 Timer Counter Clearing upon Compare Register Match

Timer counter clearing upon compare match between the values of the timer counter and the ENCAnCCR0/1 setting value, according to the settings of the ENCAnECM1 and ENCAnECM0 bits in the ENCAnCTL register, is detailed in the following table.

Table 32.32 Timer Counter Clearing Operation upon Compare Register Match

| ENCAnECM1 and ENCAnECMO | Next Count Operation | Timer Counter Clearing upon Compare Match with ENCAnCCR1 | Timer Counter Clearing upon Compare Match with ENCAnCCR0 |
| :---: | :---: | :---: | :---: |
| 00 | Up-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
|  | Down-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| 01 | Up-count | Does not clear (continues count operation). | Clears timer counter to $000 \mathrm{H}_{\mathrm{H}}$. |
|  | Down-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
| 10 | Up-count | Does not clear (continues count operation). | Does not clear (continues count operation). |
|  | Down-count | Clears timer counter to $000 \mathrm{O}_{\mathrm{H}}$. | Does not clear (continues count operation). |
| 11 | Up-count | Does not clear (continues count operation). | Clears timer counter to $000 \mathrm{H}_{\mathrm{H}}$. |
|  | Down-count | Clears timer counter to $0000_{\mathrm{H}}$. | Does not clear (continues count operation). |

### 32.5 ENCAn Setting Sequences

### 32.5.1 ENCAn Setting Procedure

The ENCAn setting procedure is described below.
Table 32.33 ENCAn Setting Procedure

| Initial Setting | Action | Setting status |
| :---: | :---: | :---: |
| Initial setting | Reset deassertion | Power-on, operation stopped. <br> (Writing to each register is enabled) |
| ENCAn initial setting | Perform the following initial settings. <br> - Setting for counter <br> - Setting for counter clear <br> - Setting for ENCAnCCRO register <br> - Setting for ENCAnCCR1 register | Count operation stopped. <br> The value of the ENCAnTE bit indicating the operating status is 0 . |
|  | Perform the counter initial value settings. <br> - Set any 16 -bit value to ENCAnCNT register. (When, after setting this register, the ENCAnTS bit is set to " 1 ", the counter operation starts from the set count value.) | The value is set as the initial value of the counter register. |
| Operation start | Start the counter operation. <br> - Set the ENCAnTS bit to "1". | Counter operation started. <br> The value of the ENCAnTE bit indicating the operating status is 1 , and the count clock is supplied to the internal circuit. |
| Operating | Only those registers whose setting can be changed during operation can be rewritten. <br> - ENCAnCCR0 register setting. <br> - ENCAnCCR1 register setting. <br> - ENCAnIOCO register setting. | The count operation set with the initial setting is performed, and up/down counting is performed according to ENCAnE0 and ENCAnE1 pins. |
| Operation stop | Stop the counter operation during operation. <br> - Set the ENCAnTT bit to " 1 ". | Counter operation stopped. <br> The value of the ENCAnTE bit indicating the operating status is 0 . |
| ENCAn stop | Reset | The setting registers are initialized. |

### 32.5.1.1 Initial Setting Procedure for the Counter

Figure 32.7 Initial Setting Procedure for the Counter

### 32.5.1.2 Initial Setting Procedure for Counter Clearing

Figure 32.8 Initial Setting Procedure for Counter Clearing

### 32.5.1.3 Setting Procedure for ENCAnCCRO Register

Figure 32.9 Setting Procedure for ENCAnCCRO Register

### 32.5.1.4 Setting Procedure for ENCAnCCR1 Register

Figure 32.10 Setting Procedure for ENCAnCCR1 Register

### 32.6 Timing Chart

### 32.6.1 Overflow Occurrence and Overflow Flag Clear Operation

An overflow occurs when up-counting is performed when the count value is $\mathrm{FFFF}_{\mathrm{H}}$. Once an overflow occurs, an overflow interrupt (ENCATIOV) is output and the overflow flag (ENCAnOVF) is set to 1 . When the overflow clear bit (ENCAnCLOV) is set to 1 , the overflow flag (ENCAnOVF) is cleared to 0 .

The operations of overflow occurrence and overflow flag clearing are described below.

Figure 32.11 Settings of Overflow Occurrence and Overflow Flag Clear Operation
(1) The count value is counted up from $\mathrm{FFFE}_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$.
(2) When the count value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, an overflow occurs. At the same time, an overflow interrupt is output and the overflow flag is set to 1 .
(3) By setting the ENCAnCLOV bit in the ENCAnFGC register to 1 using the overflow flag clearing method, the overflow flag is cleared to 0 . The overflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0 .

### 32.6.2 Underflow Occurrence and Underflow Flag Clear Operation

An underflow occurs when down-counting is performed when the count value is $0000_{\mathrm{H}}$.
Once an underflow occurs, an underflow interrupt (ENCATIUD) is output and the underflow flag (ENCAnUDF) is set to 1 . When the underflow clear bit (ENCAnCLUD) is set to 1 , the underflow flag (ENCAnUDF) is cleared to 0 .

The operations of underflow occurrence and underflow flag clearing are described below.

Figure 32.12 Settings of Underflow Occurrence and Underflow Flag Clear Operation
(1) The count value is counted down from $0001_{\mathrm{H}}$ to $0000_{\mathrm{H}}$.
(2) When the count value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, an underflow occurs. At the same time, an underflow interrupt is output and the underflow flag is set to 1 .
(3) By setting the ENCAnCLUD bit in the ENCAnFGC register to 1 using the underflow flag clearing method, the underflow flag is cleared to 0 . The underflow flag is also cleared by setting the ENCAnTS bit in the ENCAnTS register to 1 when the ENCAnTE bit in the ENCAnTE register is 0 .

### 32.6.3 Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 32.13 Timing Chart of Count Clearing and Capture Operation by Encoder Clear Input (ENCAnEC Pin)

## Setting conditions

- ENCAnCRM1 bit in the ENCAnCTL register = 1
(Select the ENCAnCCR1 register as capture.)
- ENCAnCTS bit in the ENCAnCTL register = 1
(Select the ENCAnEC pin input as capture trigger input.)
- ENCAnECS1 and ENCAnECS0 bits in the ENCAnIOC1 register $=01_{\mathrm{B}}$
(Select the ENCAnEC pin input as rising edge detection.)
(1) Capture operation is performed by the rising edge of the ENCAnEC pin input trigger.
(2) Clearing is performed by the ENCAnEC pin input and the counter value is set to $0000_{\mathrm{H}}$.
(3) The count value $\left(0002_{\mathrm{H}}\right)$ is captured in the ENCAnCCR1 register by the rising edge of the ENCAnEC pin input.
(4) At the same time, a clear interrupt (ENCATIEC) and capture interrupt (ENCATINT1) due to the ENCAnEC pin input are output.

### 32.6.4 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 32.14 Conflict between Overflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC pin)
(1) An up-count from $\mathrm{FFFD}_{\mathrm{H}}$ is continuously performed.
(2) When an overflow occurs if the count value is $\mathrm{FFFF}_{\mathrm{H}}$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. The count value is cleared to $0000_{\mathrm{H}}$.
(3) When the counter value is cleared by the encoder clear input, a clear interrupt (ENCATIEC) by encoder clear input is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the overflow occurrence, an overflow interrupt is not output. (An overflow does not occur. Clear operation is performed by the encoder clear input.).
(4) Because an overflow does not occur as is the case with step 3, the overflow flag is not set.

### 32.6.5 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 32.15 Conflict between Underflow Occurrence and Clear Operation by Encoder Clear Input (ENCAnEC Pin)
(1) A down-count from $0002_{\mathrm{H}}$ is continuously performed.
(2) When an underflow occurs if the count value is $0000_{\mathrm{H}}$, and the rising edge of ENCAnEC is detected simultaneously, clear operation by the encoder clear input is performed. Even if the next clock signal is input during clear operation, the counter value remains at $0000_{\mathrm{H}}$.
(3) When the counter value is cleared by the encoder clear input, an encoder clear interrupt (ENCATIEC) is output simultaneously. Because a clear operation by the encoder clear input is performed simultaneously with the underflow occurrence, an underflow interrupt is not output. (An underflow does not occur. Clear operation is performed by the encoder clear input.).
(4) Because an underflow does not occur as is the case with step 3, the underflow flag is not set.
(5) When a further down-count is performed after the count value changes to $0000_{\mathrm{H}}$ by clear operation of the encoder clear input, the count value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, and an underflow occurs.
(6) When an underflow occurs, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 32.6.6 Overflow Operation Immediately after Startup

Figure 32.16 Overflow Operation Immediately after Startup
(1) When the RESET value changes from " 0 " to " 1 ", the status changes from reset asserted to reset deasserted.
(2) The timer counter is set to $\mathrm{FFFF}_{\mathrm{H}}$ as the initial value.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When an up-count is performed from $\mathrm{FFFF}_{H}$ which is the initially set count value, the count value changes from $\mathrm{FFFF}_{\mathrm{H}}$ to $0000_{\mathrm{H}}$, and an overflow occurs immediately after operation starts.
(5) At the same time, by an overflow occurrence immediately after operation starts, an overflow interrupt (ENCATIOV) is output, and the overflow flag (ENCAnOVF) is set.

### 32.6.7 Underflow Operation Immediately after Startup

Figure 32.17 Underflow Operation Immediately after Startup
(1) When the RESET value changes from " 0 " to " 1 ", the status changes from reset asserted to reset deasserted.
(2) The timer counter is set to $0000_{\mathrm{H}}$ as the initial value.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When a down-count is performed from $0000_{\mathrm{H}}$ which is the initially set count value, the count value changes from $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$, and an underflow occurs immediately after operation starts.
(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.

### 32.6.8 Using the ENCAnLDE Function Immediately after Startup

Figure 32.18 Using the ENCAnLDE Function Immediately after Startup
(1) When the RESET value changes from " 0 " to " 1 ", the status changes from reset asserted to reset deasserted".
(2) The load enable bit (ENCAnLDE) is set to " 1 ", capture/compare register 0 (ENCAnCCR0) is set to $3 C 5 A_{H}$, and the timer counter is set to the initial value $0000_{\mathrm{H}}$.
(3) ENCAnTS is set to " 1 ", and operation starts. ENCAnTE changes to " 1 ", which indicates that operation is enabled.
(4) When a down-count is performed from $0000_{\mathrm{H}}$ which is the initially set count value, an underflow occurs immediately after operation starts. Because ENCAnLDE is set to " 1 ", the ENCAnCCR0 value, 3C5A , is loaded to the timer counter (ENCATINT0 is not output during loading).
(5) At the same time, by an underflow occurrence immediately after operation starts, an underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set (after an underflow occurs, down-count operation from the loaded value $\left(3 \mathrm{C} 5 \mathrm{~A}_{\mathrm{H}}\right)$ continues).
(6) After the ENCAnCCR0 value is loaded to ENCAnCNT, a match with ENCAnCCR0 is detected, and ENCATINT0 is output.

### 32.6.9 ENCAnLDE Function (Loading Count Value)

(a) <When ENCAnLDE $=0>$

Figure 32.19 ENCAnLDE Function (when ENCAnLDE = 0)
(1) ENCAnLDE is set to "0" (even if an underflow occurs, the ENCAnCCR0 value is not loaded).
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When a further down-count is performed after the count value changes to $0000_{\mathrm{H}}$, an underflow occurs.
(4) Because ENCAnLDE is set to " 0 ", the setting value of the ENCAnCCR0 register is not loaded to the counter even if an underflow occurs.
(5) Operation changes to underflow operation (count value: $0000_{\mathrm{H}} \rightarrow \mathrm{FFFF}_{\mathrm{H}}$ ).
(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(b) <When ENCAnLDE = 1>

Figure 32.20 ENCAnLDE Function (when ENCAnLDE = 1)
(1) ENCAnLDE is set to " 1 " (if an underflow occurs, the ENCAnCCR0 value is loaded to the counter).
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When a further down-count is performed after the count value changes to $0000_{\mathrm{H}}$, an underflow occurs.
(4) An underflow interrupt is output, and the underflow flag is set.
(5) Because ENCAnLDE is set to " 1 ", the setting value of the ENCAnCCR0 register is loaded to the counter if an underflow occurs. ENCAnCNT is set to $3 \mathrm{C}^{2} \mathrm{~A}_{\mathrm{H}}$.
(6) After the ENCAnCCR0 value is set to ENCAnCNT, if the ENCAnCNT value matches the ENCAnCCR0 value on a count clock, a compare match interrupt (ENCATINT0) is output.

### 32.6.10 Conflict between ENCAnLDE Function (Loading Count Value) and Rewrite of ENCAnCCRO Register

Figure 32.21 Conflict between ENCAnLDE Function and Rewrite of ENCAnCCR0 Register
(1) The ENCAnCCR0 register is currently set to $5555_{\mathrm{H}}$.
(2) ENCAnLDE is currently set to " 1 ".
(3) A down-count is performed $\left(0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}\right)$, and an underflow occurs.
(4) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(5) When an underflow occurs, the ENCAnCCR0 register value is changed from $5555_{\mathrm{H}}$ to AAAA $_{H}$.
(6) Additionally, when an underflow occurs, the ENCAnCCR0 value before the rewrite is performed $\left(5555_{\mathrm{H}}\right)$ is set in ENCAnCNT.

### 32.6.11 Conflict between ENCAnLDE Function (Loading Count Value) and Clear Operation by Encoder Clear Input (ENCAnEC Pin)

Figure 32.22 Conflict between ENCAnLDE Function and Clear Operation by Encoder Clear Input
(1) The values are set as follows: $\mathrm{ENCAnCTS}=0$, $\operatorname{ENCAnECS}[1: 0]=01_{\mathrm{B}}, \mathrm{ENCAnLDE}=1$, and $\operatorname{ENCAnCCR} 0=$ $5555_{\mathrm{H}}$.
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When the count value becomes $0000_{\mathrm{H}}$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.
(4) Because a count clear is performed when the count value reaches $0000_{\mathrm{H}}$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is $0000_{\mathrm{H}}$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.
(5) After the count value is cleared to $0000_{\mathrm{H}}$ by clear operation of the encoder clear input, a down-count is performed and an underflow occurs.
(6) An underflow interrupt (ENCATIUD) is output, and the underflow flag (ENCAnUDF) is set.
(7) Because ENCAnLDE $=$ " 1 ", if an underflow occurs, the ENCAnCCR0 value is loaded to ENCAnCNT.
(8) After the ENCAnCCR 0 value is set to ENCAnCNT, a compare match is detected according to the count clock. If the ENCAnCNT value matches the ENCAnCCR0 value, a compare match interrupt (ENCATINT0) is output.

### 32.6.12 Up-count after Conflict between ENCAnLDE Function (Loading Count Value) and Encoder Clearing

Figure 32.23 Up-count after Conflict between ENCAnLDE Function and Encoder Clearing
(1) The values are set as follows: $\mathrm{ENCAnCTS}=0, \mathrm{ENCAnECS}[1: 0]=01 \mathrm{~B}, \mathrm{ENCAnLDE}=1$, and $\mathrm{ENCAnCCR} 0=$ $5555_{\mathrm{H}}$.
(2) A down-count is performed: $0002_{\mathrm{H}} \rightarrow 0001_{\mathrm{H}} \rightarrow 0000_{\mathrm{H}}$
(3) When the count value becomes $0000_{\mathrm{H}}$, the rising edge of ENCAnEC pin is detected, and clear operation by the encoder clear input is performed.
(4) Because a count clear is performed when the count value reaches $0000_{\mathrm{H}}$, a counter clear interrupt (ENCATIEC) by the encoder clear input is output. An underflow does not occur because a down-count is not performed when the count value is $0000_{\mathrm{H}}$. Therefore, an underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.
(5) After the count value is cleared to $0000_{\mathrm{H}}$ by clear operation of the encoder clear input, an up-count is performed.
(6) An underflow interrupt (ENCATIUD) is not output, and the underflow flag (ENCAnUDF) is not set.

### 32.6.13 Capture Operation between Count Clocks (ENCAnCCR1)

Figure 32.24 Capture Operation between Count Clocks (ENCAnCCR1)
(1) The values are set as follows: ENCAnCRM1 $=1$, and ENCAnTIS[3:2] $=01_{\mathrm{B}}$.
(2) An up-count is performed.
(3) The rising edge of the ENCATTIN1 input is detected, and the count value is captured in ENCAnCCR1.
(4) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.

### 32.6.14 Capture Operation between Count Clocks (ENCAnCCRO)

Figure 32.25 Capture Operation between Count Clocks (ENCAnCCRO)
(1) The values are set as follows: ENCAnCRM0 $=1$, and ENCAnTIS[1:0] $=01_{\mathrm{B}}$.
(2) A down-count is performed.
(3) The rising edge of the ENCATTIN0 input is detected, and the count value is captured in ENCAnCCR0.
(4) An interrupt (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.

### 32.6.15 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 0

Figure 32.26 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS $=0$
(1) The values are set as follows: $\mathrm{ENCAnCCR} 0=4444_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=0, \mathrm{ENCAnCRM} 1=1, \mathrm{ENCAnECM}[1: 0]$ $=01_{\mathrm{B}}$, and ENCAnCTS $=0$.
(2) A down-count is performed.
(3) The rising edge of the ENCATTIN1 input is detected, and the ENCAnCNT value $\left(4444_{\mathrm{H}}\right)$ is captured in the ENCAnCCR1 register.
(4) An interrupt signal (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register is output.
(5) When a compare match occurs between ENCAnCNT (counted down from $4445_{\mathrm{H}}$ to $4444_{\mathrm{H}}$ ) and ENCAnCCR0 $\left(4444_{\mathrm{H}}\right)$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.
(6) The count operation changes to up-count.
(7) When ENCAnCNT is counted up from $4443_{\mathrm{H}}$ to $4444_{\mathrm{H}}$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 $\left(01_{\mathrm{B}}\right)$, and the ENCAnCNT value changes to $0000_{\mathrm{H}}$.
(8) When ENCAnCNT changes to $4444_{\mathrm{H}}$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.

### 32.6.16 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS = 1

Figure 32.27 Encoder Operation when Compare Match Clear Control is Enabled and ENCAnCTS $=1$
(1) The values are set as follows: $\operatorname{ENCAnCCR} 0=4444_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=0, \mathrm{ENCAnCRM} 1=1$, $\mathrm{ENCAnECM}[1: 0]$ $=01_{\mathrm{B}}$, and ENCAnCTS $=1$.
(2) A down-count is performed.
(3) When a compare match occurs between ENCAnCNT (counted down from $4445_{\mathrm{H}}$ to $4444_{\mathrm{H}}$ ) and ENCAnCCR0 $\left(4444_{\mathrm{H}}\right)$, a compare/capture interrupt (ENCATINT0) is output.
(4) The count operation changes to up-count.
(5) When ENCAnCNT is counted up from $4443_{\mathrm{H}}$ to $4444_{\mathrm{H}}$, a compare match with ENCAnCCR0 occurs again. Because the count operation is up-count when the compare match occurs, the count value is cleared according to the setting of ENCAnECM1 and ENCAnECM0 $\left(01_{\mathrm{B}}\right)$, and the ENCAnCNT value changes to $0000_{\mathrm{H}}$.
(6) When ENCAnCNT changes to $4444_{\mathrm{H}}$, a compare match interrupt (ENCATINT0) with ENCAnCCR0 is output.
(7) After the count value is cleared, an up-count is performed, and the count value changes to $0001_{\mathrm{H}}$. At this point, the ENCAnCNT value $\left(0001_{\mathrm{H}}\right)$ is captured in ENCAnCCR1 by detecting the rising edge of the ENCAnEC signal, and the counter is cleared to $0000_{\mathrm{H}}$.
(8) An interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

### 32.6.17 Encoder Operation when Compare Match Clear Control is Disabled

Figure 32.28 Encoder Operation when Compare Match Clear Control is Disabled
(1) The values are set as follows: $\operatorname{ENCAnCCR} 1=4446_{\mathrm{H}}, \mathrm{ENCAnCRM} 0=1$, $\mathrm{ENCAnCRM} 1=0$, $\mathrm{ENCAnECM}[1: 0]$ $=00_{\mathrm{B}}$, and ENCAnCTS $=0$.
(2) A down-count is performed.
(3) When the rising edge of ENCATTIN0 is detected, the ENCAnCNT value (4444 ${ }_{\mathrm{H}}$ ) is captured in ENCAnCCR0.
(4) An interrupt signal (ENCATINT0) corresponding to the capture to the ENCAnCCR0 register is output.
(5) The count operation changes to up-count.
(6) When ENCAnCNT changes to $4446^{H}$, a compare match with ENCAnCCR1 is detected.
(7) A compare match interrupt (ENCATINT1) with ENCAnCCR1 is output.

### 32.6.18 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, or ENCAnE1 when ENCAnSCE = 1

### 32.6.18.1 Accompanying Capture Operation

Figure 32.29 Capture Operation Performed upon Clearing by ENCAnEC, ENCAnE0, or ENCAnE1 when ENCAnSCE = 1
(1) The values are set as follows: $\mathrm{ENCAnSCE}=1, \mathrm{ENCAnCTS}=1, \mathrm{ENCAnUDS}[1: 0]=11_{\mathrm{B}}, \mathrm{ENCAnACL}=0$, ENCAnBCL $=0$, and $\mathrm{ENCAnZCL}=1$.
(2) An up-count is performed.
(3) The count value is not cleared upon the rising edge of ENCAnEC.
(4) When ENCAnE0, ENCAnE1 and ENCAnEC reach the set clear level, the count value is cleared. The count value is captured in ENCAnCCR1 at the time of the clearing.
(5) At the time of the clearing, an interrupt (ENCATINT1) corresponding to the capture to the ENCAnCCR1 register and a clear interrupt (ENCATIEC) by ENCAnEC are output.

### 32.6.18.2 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 ${ }_{\text {B }}$ )

Figure 32.30 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Up-count
32.6.18.3 When the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count (When ENCAnACL = 1, ENCAnBCL = 0, ENCAnZCL = 1, and ENCAnUDS[1:0] = 11 ${ }_{\mathrm{B}}$ )

Figure 32.31 Clearing Timing for when the Timing of the ENCAnEC Input is the Same as that of the ENCAnE1 Input during Up-count
32.6.18.4 When the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count (When ENCAnACL $=1$, ENCAnBCL $=0$, ENCAnZCL $=1$, and ENCAnUDS[1:0] = 11 ${ }_{\mathrm{B}}$ )

Figure 32.32 Clearing Timing for when the Timing of the ENCAnEC Input is Earlier than that of the ENCAnE1 Input during Up-count

### 32.6.18.5 When the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count (When ENCAnACL $=1$, ENCAnBCL $=0$, ENCAnZCL $=1$, and ENCAnUDS[1:0] = 11 ${ }_{\mathrm{B}}$ )

Figure 32.33 Clearing Timing for when the Timing of the ENCAnEC Input is Later than that of the ENCAnE1 Input during Down-count

### 32.6.19 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$

Figure 32.34 Capture Operation Performed upon Clearing by ENCAnEC when ENCAnSCE $=0$
(1) The values are set as follows: $\operatorname{ENCAnSCE}=0, \mathrm{ENCAnCTS}=1$, and $\operatorname{ENCAnECS}[1: 0]=01_{\mathrm{B}}$.
(2) An up-count is performed.
(3) The rising edge of the ENCAnEC input is detected, and the ENCAnCNT value ( $\mathrm{AAAB}_{\mathrm{H}}$ ) is captured in the ENCAnCCR1 register. Concurrently, clear operation by ENCAnEC is performed, and ENCAnCNT is cleared to $0000_{\mathrm{H}}$.
(4) A capture interrupt 1 (ENCATINT1) to the ENCAnCCR1 register and an encoder clear interrupt (ENCATIEC) by ENCAnEC are output.
(5) After the count value is cleared, an up-count is performed, and the count value changes to $0001_{\mathrm{H}}$.

## Section 33 Peripheral Interconnection (PIC)

### 33.1 Features of PIC

This section contains a generic description of the peripheral interconnection (PIC).
The first part of this section describes specific properties of this peripheral, such as the number of units, and register base addresses. The remainder of the section describes the functions and registers of the PIC (PIC1, PIC2).

### 33.1.1 Number of Units

This microcontroller has the following number of PIC units.
Table 33.1 Number of Units (PIC1)

| Product Name | RH850/E2x-FCC1 Series |
| :--- | :--- |
| Number of Units | 1 |
| Name | PIC1 |
| Table 33.2 | Number of Units (PIC2) |
| Product Name | RH850/E2x-FCC1 Series |
| Number of Units | 3 |
| Name | PIC2 |

### 33.1.2 Register Base Addresses

PIC base addresses are listed in the following table.
PIC register addresses are given as offsets from the base addresses in general.
Table 33.3 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <PIC1_base> | FFDD $0000_{\mathrm{H}}$ | Peripheral Group 2H |
| <PIC20_base> | FFDD $1000_{\mathrm{H}}$ | Peripheral Group 2H |
| <PIC21_base> | FFDD $1800_{\mathrm{H}}$ | Peripheral Group 2H |
| <PIC22_base> | FFDD $2000_{\mathrm{H}}$ | Peripheral Group 2H |

### 33.1.3 Clock Supply

PIC clock supplies are listed in the following table.
Table 33.4 Clock Supply

| Unit Name | Unit Clock Name | Supply Clock Name |
| :--- | :--- | :--- |
| PIC1 | CLK_HSB | Peripheral high speed |
| PIC2 | CLK_HSB | Peripheral high speed |

### 33.1.4 Reset Sources

PIC reset sources are listed in the following table. PIC is initialized by these reset sources.
Table 33.5 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System <br> Reset 2 | Application Reset | Module Reset | JTAG Reset |
| PIC1 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| PIC2 | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 33.1.5 External Input/Output Signals

External input/output signals of PIC are listed in the following table.
Table 33.6 External Input/Output Signals

| Unit Signal Name | Description | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| ADTRG0 | ADCH0 conversion startup trigger input | S_INEXT0Z |
| ADTRG1 | ADCH1 conversion startup trigger input | S_INEXT1Z |
| ADTRG2 | ADCH2 conversion startup trigger input | S_INEXT2Z |
| ADTRG3 | ADCH3 conversion startup trigger input | S_INEXT3Z |
| DSADTRG00 | DSADC00 conversion trigger input | D_INEXTZ0 |
| DSADTRG10 | DSADC10 conversion trigger input | D_INEXTZ1 |
| DSADTRG20 | DSADC20 conversion trigger input | D_INEXTZ2 |
| DSADTRG12 | DSADC12 conversion trigger input | D_INEXTZ3 |
| DSADTRG13 | DSADC13 conversion trigger input | D_INEXTZ4 |
| DSADTRG11 | DSADC11 conversion trigger input | D_INEXTZ5 |
| CADTRG00 | CADC00 conversion trigger input | D_INEXTZ10 |
| ENCA0E0 | ENCA0 encoder input (Phase A) | ENCA0E0 |
| ENCA0E1 | ENCA0 encoder input (Phase B) | ENCA0E1 |
| ENCA0EC | ENCA0 encoder input (Phase Z) | ENCA0EC |
| ENCA1E0 | ENCA1 encoder input (Phase A) | ENCA1E0 |
| ENCA1E1 | ENCA1 encoder input (Phase B) | ENCA1E1 |
| ENCA1EC | ENCA1 encoder input (Phase Z) | ENCA1EC |

### 33.2 Timer Synchronization Function (PIC1)

### 33.2.1 Overview

### 33.2.1.1 Functional Overview

The peripheral interconnection (PIC1) handles synchronous start of multiple OSTM timers.
The overview of PIC1 specification is shown in Table 33.7.
Table 33.7 PIC1 Specification Overview

| Item | Description |
| :--- | :--- |
| Timer synchronization | Simultaneous start of any combination of timers (OSTMn). |

### 33.2.1.2 Block Diagram

The following figure shows a block diagram of PIC1.

Figure 33.1 Block Diagram of PIC1

### 33.2.2 Registers

### 33.2.2.1 List of Registers

The list of PIC1 registers is shown in Table 33.8.
For information about restrictions on the individual registers and bits, see the register description in the following sections.

Table 33.8 List of PIC1 Registers

| Register Name | Symbol | Address | Access | Access Protection |
| :--- | :--- | :--- | :--- | :--- |
| Simultaneous Start Trigger Control Register | PIC1SST | <PIC1_base> + 04 | 8 | 8 |
| Simultaneous Start Control Register 0 | PIC1SSER0 | <PIC1_base> + 10 | - |  |

### 33.2.2.2 PIC1SST — Simultaneous Start Trigger Control Register

The PIC1SST register generates start triggers for timers for which simultaneous start is enabled.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | SYNCTRG |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 33.9 PIC1SST Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 0 | SYNCTRG |  |
|  |  | Generate start triggers for timers for which simultaneous start is enabled. |
|  | $0:$ Invalid setting |  |
|  | 1: Trigger simultaneous start (generates a trigger pulse of 1-PCLK-cycle to timers for which |  |
|  | simultaneous start is enabled) |  |

Note 1. When this bit is read, the result is always 0.

### 33.2.2.3 PIC1SSER0 — Simultaneous Start Control Register 0

The PIC1SSER0 register defines OSTMn timers $(\mathrm{n}=0$ to 2$)$ for which simultaneous start is enabled.

Value after reset: $\quad 0000_{H}$

Table 33.10 PIC1SSER0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 3 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 2 | PIC1SSER002 | Enable simultaneous start for OSTM2. |
|  |  | $0:$ Simultaneous start not enabled for OSTM2. |
|  |  | 1: Simultaneous start is enabled for OSTM2. |
| 1 | PIC1SSER001 | Enable simultaneous start for OSTM1. |
|  |  | $0:$ Simultaneous start not enabled for OSTM1. |
|  |  | 1: Simultaneous start is enabled for OSTM1. |
| 0 | PIC1SSER000 | Enable simultaneous start for OSTM0. |
|  |  | $0:$ Simultaneous start not enabled for OSTM0. |
|  |  | 1: Simultaneous start is enabled for OSTM0. |

### 33.2.3 Operation

### 33.2.3.1 Timer Synchronization

(1) Configure timers (OSTMn). For more details about the configuration of the OSTMn timers see Section 29, OS Timer (OSTM).
(2) For the timers that should be started simultaneously, write 1 to their corresponding PIC1SSER00n bits of PIC1SSER0.
(3) Write 1 to the SYNCTRG bit of PIC1SST0 to generate a start trigger.
(4) Repeat (2) and (3) for timers that are not started yet to allow different timer groups to operate in a different timing.

### 33.3 Trigger Selection Function (PIC2)

### 33.3.1 Overview

### 33.3.1.1 Functional Overview

Peripheral interconnection (PIC2) handles configuration of triggers to ADCH, DSADC, ENCA, DFE, PSI5-S, GTM and CADC from various peripheral modules.

The overview of PIC2 specifications with ATU is shown in Table 33.11.
Table 33.11 Overview of PIC2 Specifications with ATU

| Item | Description |
| :--- | :--- |
| ADC trigger selection | Selects sources from ATU for ADC |
| (selection from ATU timers, peripheral IPs, and above <br> described sources) | Selects an AD trigger from the above selected sources and internal signals <br> from peripheral IPs. |
| DSADC trigger selection | Selects an AD trigger for DSADC from ATU and external pins. |
| CADC trigger selection | Selects an AD trigger for CADC from ATU and external pins. |

The overview of PIC2 specifications with GTM is shown in Table 33.12.
Table 33.12 Overview of PIC2 Specifications with GTM

| Item | Description |
| :---: | :---: |
| ADC trigger selection <br> (selection from GTM timers, peripheral IPs, and above described sources) | Selects sources from GTM for ADC |
|  | Selects an AD trigger from the above selected sources and internal signals from peripheral IPs. |
| DSADC trigger selection | Selects an AD trigger for DSADC from GTM and external pins. |
|  | Selects an AD read gate for DSADC from GTM. |
| CADC trigger selection | Selects an AD trigger for CADC from GTM and external pins. |
|  | Selects an AD read gate for CADC from GTM. |
| ENCA trigger selection | Selects capture timing trigger from GTM for ENCA. |
|  | Selects an ENCA capture timing trigger from the above selected sources and internal signals from peripheral IPs. |
| DFE trigger selection | Selects compere timer trigger and capture trigger, angle 1 deg trigger from GTM for DFE. |
| PSI5-S time stamp and sync signal selection | Selects time stamp and sync pulse signal from GTM for PSI5-S. |
| GTM timer input selection |  |
| -PORT | Selects a timer input signal for GTM from GPIO. |
| - ADCH | Selects an AD scan end interrupt for GTM from ADCH. |
| -DSADC | Selects an AD conversion end timing interrupt for GTM from DSADC. |
| -CADC | Selects an AD conversion end timing interrupt for GTM from CADC. |
| -ENCA | Selects an ENCA count clock output and direction of rotation notice from encoder input (phases $A / B / Z$ ) and compare capture interrupt and phase $Z$ edge detection for GTM from ENCA. |
| -DFE | Selects a DFE peak hold update notification for GTM from DFE. |
| ENCA encoder input selection | Selects an encoder input signal for ENCA from GPIO. |

### 33.3.1.2 Block Diagrams

The following figure shows a block diagram of PIC2 configured with ATU.

Figure 33.2 Block Diagram of PIC2 Configured with ATU

The following figure shows a block diagram of PIC2 configured with GTM.

Figure 33.3 Block Diagram of PIC2 Configured with GTM

### 33.3.2 Registers

### 33.3.2.1 List of Registers

The list of PIC2 registers is shown in Table 33.13.
For information about restrictions on the individual registers and bits, see the register description in the following sections.

Table 33.13 List of PIC2 Registers (1/6)

| Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: |
| ADC Trigger Selection Control Register |  |  |  |  |
| AD Converter 0 Trigger Selection Control Register 0 | PIC2ADCH0TSELO | <PIC20_base> + 00 H | 16, 32 | - |
| AD Converter 0 Trigger Selection Control Register 1 | PIC2ADCH0TSEL1 | <PIC20_base> + $04_{\text {H }}$ | 16, 32 | - |
| AD Converter 0 Trigger Selection Control Register 2 | PIC2ADCH0TSEL2 | <PIC20_base> + $08_{\text {H }}$ | 16, 32 | - |
| AD Converter 0 Trigger Selection Control Register 3 | PIC2ADCH0TSEL3 | <PIC20_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter 0 Trigger Selection Control Register 4 | PIC2ADCH0TSEL4 | <PIC20_base> + 10 H | 16, 32 | - |
| AD Converter 0 Trigger Edge Selection Control Register | PIC2ADCH0EDGSEL | <PIC20_base> + $1 \mathrm{C}_{\mathrm{H}}$ | 16 | - |
| AD Converter 1 Trigger Selection Control Register 0 | PIC2ADCH1TSEL0 | <PIC20_base> + $2 \mathrm{O}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter 1 Trigger Selection Control Register 1 | PIC2ADCH1TSEL1 | <PIC20_base> + 24 $_{\text {H }}$ | 16, 32 | - |
| AD Converter 1 Trigger Selection Control Register 2 | PIC2ADCH1TSEL2 | <PIC20_base> + $28_{\text {H }}$ | 16, 32 | - |
| AD Converter 1 Trigger Selection Control Register 3 | PIC2ADCH1TSEL3 | <PIC20_base> + $2 \mathrm{C}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter 1 Trigger Selection Control Register 4 | PIC2ADCH1TSEL4 | <PIC20_base> + 30 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 1 Trigger Edge Selection Control Register | PIC2ADCH1EDGSEL | <PIC20_base> + 3 $\mathrm{C}_{\mathrm{H}}$ | 16 | - |
| AD Converter 2 Trigger Selection Control Register 0 | PIC2ADCH2TSELO | <PIC20_base> + 40 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 2 Trigger Selection Control Register 1 | PIC2ADCH2TSEL1 | <PIC20_base> + 44 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 2 Trigger Selection Control Register 2 | PIC2ADCH2TSEL2 | <PIC20_base> + 48 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 2 Trigger Selection Control Register 3 | PIC2ADCH2TSEL3 | $<\mathrm{PIC20}$ _base> + 4 $\mathrm{CH}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter 2 Trigger Selection Control Register 4 | PIC2ADCH2TSEL4 | <PIC20_base> + 50 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 2 Trigger Edge Selection Control Register | PIC2ADCH2EDGSEL | $<\mathrm{PIC2O}$ _base> + $5 \mathrm{C}_{\mathrm{H}}$ | 16 | - |
| AD Converter 3 Trigger Selection Control Register 0 | PIC2ADCH3TSELO | <PIC20_base> + 60 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 3 Trigger Selection Control Register 1 | PIC2ADCH3TSEL1 | <PIC20_base> + 64 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 3 Trigger Selection Control Register 2 | PIC2ADCH3TSEL2 | <PIC20_base> + 68 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter 3 Trigger Selection Control Register 3 | PIC2ADCH3TSEL3 | <PIC20_base>+6CH | 16, 32 | - |
| AD Converter 3 Trigger Selection Control Register 4 | PIC2ADCH3TSEL4 | <PIC20_base> + 70 H | 16, 32 | - |
| AD Converter 3 Trigger Edge Selection Control Register | PIC2ADCH3EDGSEL | <PIC20_base> + 7 $\mathrm{C}_{\mathrm{H}}$ | 16 | - |
| AD Converter Trigger Output Control Register 500 | PIC2ADTEN500 | <PIC20_base> + 180 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 501 | PIC2ADTEN501 | <PIC20_base> + 184 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 502 | PIC2ADTEN502 | <PIC20_base> + 188 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 503 | PIC2ADTEN503 | <PIC20_base> + 18C ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 504 | PIC2ADTEN504 | <PIC20_base> + 190 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 510 | PIC2ADTEN510 | <PIC20_base> + 1A0 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 511 | PIC2ADTEN511 | <PIC20_base> + 1A4H | 16, 32 | - |
| AD Converter Trigger Output Control Register 512 | PIC2ADTEN512 | $<$ PIC20_base $>+1 \mathrm{AB}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 513 | PIC2ADTEN513 | <PIC20_base> + 1ACH | 16, 32 | - |
| AD Converter Trigger Output Control Register 514 | PIC2ADTEN514 | <PIC20_base> + 180 ${ }_{\text {H }}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 520 | PIC2ADTEN520 | <PIC20_base> + 1 $\mathrm{CO}_{\mathrm{H}}$ | 16, 32 | - |
| AD Converter Trigger Output Control Register 521 | PIC2ADTEN521 | <PIC20_base> + 1C4 ${ }_{\text {H }}$ | 16, 32 | - |

Table 33.13 List of PIC2 Registers (2/6)

| Register Name | Symbol | Address | Access | Access Protection |

### 33.3.2.2 PIC2ADCHnTSELj - AD Converter $n$ Trigger Selection Control Register $\mathbf{j}$ ( $\mathrm{n}=0$ to $3^{* 1}$; $\mathrm{j}=0$ to 4 )

The PIC2ADCHnTSELj register selects a trigger for ADCHn scan group $j\left(n=0\right.$ to $3^{* 1} ; j=0$ to 4$)$.

Table 33.14 PIC2ADCHnTSELj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 15 | PIC2ADCHnTSELj15 | Selects the trigger selected by the "PIC2ADTEN5nj PIC2ADTEN6nj PIC2ADTEN7nj PIC2ADTEN8nj" register as a trigger source of ADCHn scan group i. |
|  |  | 0 : Does not select the trigger selected by register "PIC2ADTEN5nj,6nj,7nj,8nj". |
|  |  | 1: Selects the trigger selected by register "PIC2ADTEN5nj,6nj,7nj,8nj". |
| 14 to 9 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 8 | PIC2ADCHnTSELj08 | Selects the ADTRGn pin as a trigger source of ADCHn scan group j. |
|  |  | 0 : The ADTRGn pin is not selected. |
|  |  | 1: The ADTRGn pin is selected. |
| 7 to 0 | - | Reserved |
|  |  | When writing to these bits, write 0. |

Note 1. ADCH1 and ADCH3 are implemented only on E2x-FCC1 and E2M(373 pins), they are not supported for E2M(292 pins).

### 33.3.2.3 PIC2ADCHnEDGSEL — AD Converter $\mathrm{n}^{* 1}$ Trigger Edge Selection Control Register ( $\mathrm{n}=0$ to $\mathbf{3}^{* 1}$ )

The PIC2ADCHnEDGSEL register selects an effective edge for the one-shot pulse generation circuit which generates an ADCH trigger.

The ADCH external pin trigger is input in negative logic, but it is converted to positive logic for trigger source selection. Since edge detection is made for a trigger source after selection, note that the definition of an edge is reversed for an ADCH external pin signal. (Setting 00 enables selection of a falling edge of ADCH external pin triggers ADTRG0, ADTRG1, ADTRG2, and ADTRG3.)

Value after reset: $\quad 0000_{H}$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 98 | $7 \quad 6$ | $5 \quad 4$ | $3 \quad 2$ | 10 |

Table 33.15 PIC2ADCHnEDGSEL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 10 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 9, 8 | PIC2ADCHnEDGSEL | Select an effective edge of ADCHn scan group 4. |
|  | 98[9:8] | 00 : Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |
| 7, 6 | PIC2ADCHnEDGSEL | Select an effective edge of ADCHn scan group 3. |
|  | 76[7:6] | 00: Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |
| 5, 4 | PIC2ADCHnEDGSEL | Select an effective edge of ADCHn scan group 2. |
|  | $54[5: 4]$ | 00: Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |
| 3, 2 | PIC2ADCHnEDGSEL | Select an effective edge of ADCHn scan group 1. |
|  | $32[3: 2]$ | 00: Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |
| 1, 0 | PIC2ADCHnEDGSEL | Select an effective edge of ADCHn scan group 0 . |
|  | 10[1:0] | 00: Rising edge is selected. |
|  |  | 01: Falling edge is selected. |
|  |  | 10: Both edges are selected. |
|  |  | 11: - (setting prohibited) |

Note 1. ADCH1 and ADCH3 are implemented only on E2x-FCC1 and E2M(373 pins), they are not supported for E2M(292 pins).

### 33.3.2.4 PIC2ADTEN5nj — AD Converter Trigger Output Control Register 5nj ( $\mathrm{n}=0$ to $\mathbf{3}^{* 1}$; $\mathrm{j}=0$ to 4)

The PIC2ADTEN5nj register enables a trigger source from ATU timer C compare match, ATU timer G compare match, and ATU DMA request switch function to be selected as an ADCH trigger ( $n=0$ to $3^{* 1} ; j=0$ to 4 ).

Table 33.16 PIC2ADTEN5nj Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | PIC2ADTEN5nj31 | GRC73 input capture / compare match interrupt (ATU5 timer C subblock 7 channel 3 input capture / compare match interrupt) <br> 0 : Selection of the above signal as an ADCH trigger is disabled. <br> 1: Selection of the above signal as an ADCH trigger is enabled. |

### 33.3.2.5 PIC2ADTEN6nj - AD Converter Trigger Output Control Register 6nj ( $\mathrm{n}=0$ to 3*1; $\mathrm{j}=0$ to 4)

The PIC2ADTEN6nj register enables a trigger source from ATU timer D compare match A to be selected as an ADCH trigger ( $\mathrm{n}=0$ to $3^{* 1} ; \mathrm{j}=0$ to 4 ).

| 6 | PIC2ADTEN8nj6 | Output value of GTM timer output selected by PIC2ADTCFG1 bits 23 to 16. <br> 0 : Selection of the above signal as an ADCH trigger is disabled. <br> 1: Selection of the above signal as an ADCH trigger is enabled. |

Table 33.19 PIC2ADTEN8nj Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 5 | PIC2ADTEN8nj5 | Output value of GTM timer output selected by PIC2ADTCFG1 bits 15 to 8. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  | 1: Selection of the above signal as an ADCH trigger is enabled. |  |
| 4 | PIC2ADTEN8nj4 | Output value of GTM timer output selected by PIC2ADTCFG1 bits 7 to 0. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  | 1: Selection of the above signal as an ADCH trigger is enabled. |  |
| 3 | PIC2ADTEN8nj3 | Output value of GTM timer output selected by PIC2ADTCFG0 bits 31 to 24. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  |  | 1: Selection of the above signal as an ADCH trigger is enabled. |
| 2 | PIC2ADTEN8nj1 | Output value of GTM timer output selected by PIC2ADTCFG0 bits 23 to 16. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  |  | 1: Selection of the above signal as an ADCH trigger is enabled. |
| 1 | PIC2ADTEN8nj0 | Output value of GTM timer output selected by PIC2ADTCFG0 bits 7 to 0. |
|  |  | 0: Selection of the above signal as an ADCH trigger is disabled. |
|  |  | 1: Selection of the above signal as an ADCH trigger is enabled. |

### 33.3.2.8 PIC2DSADTEN0n0 — DSADC Start Trigger Output Control Register n0 ( $\mathrm{n}=0$ to 5)

DSADC start trigger output control register n0 enables a trigger source from ATU timer G compare match to be selected as a trigger for starting DSADC.
( $\mathrm{n}=0$ DSADC00, $\mathrm{n}=1$ DSADC10, $\mathrm{n}=2$ DSADC20, $\mathrm{n}=3$ DSADC12, $\mathrm{n}=4$ DSADC13, $\mathrm{n}=5$ DSADC11)

Table 33.20 PIC2DSADTENOn0 Register Contents

### 33.3.2.15 PIC2DSADTEN1n3 — DSADC Stop Trigger Output Control Register n3 ( $\mathrm{n}=0$ to 5)

DSADC stop trigger output control register n3 enables a trigger source from GTM and ENCA encoder to be selected as a trigger for stopping DSADC. Whether enabled trigger source is used or not is defined by set timer output in DSADC Start / Stop trigger output configuration register. ( $\mathrm{n}=0$ DSADC00, $\mathrm{n}=1 \mathrm{DSADC} 10, \mathrm{n}=2$ DSADC20, $\mathrm{n}=3$ DSADC12, $\mathrm{n}=4$ DSADC13, $\mathrm{n}=5 \mathrm{DSADC} 11)$

Table 33.27 PIC2DSADTEN1n3 Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | PIC2DSADTEN1n331 | Selects the INTENCA1IEC as a trigger source of DSADCn. |

|  |  | When writing to these bits, write 0. |
| 11 | DSADCATSEL111 | Selects the DSADTRG11 pin as a trigger source for stopping DSADC11. |
|  |  | 0: DSADTRG11 is not selected. |
|  |  | 1: DSADTRG11 is selected. |
| 10 | DSADCATSEL110 | Selects the trigger selected by DSADC stop trigger output control register $5 \mathrm{j}(\mathrm{j}=0$ to 2 ) as a trigger source for stopping DSADC11. |
|  |  | 0: Does not select the trigger selected by register PIC2DSADTEN15j. |
|  |  | 1: Selects the trigger selected by register PIC2DSADTEN15j. |
| 9 | DSADCATSEL109 | Selects the DSADTRG13 pin as a trigger source for stopping DSADC13. |
|  |  | 0 : DSADTRG13 is not selected. |
|  |  | 1: DSADTRG13 is selected. |
| 8 | DSADCATSEL108 | Selects the trigger selected by DSADC stop trigger output control register $4 \mathrm{j}(\mathrm{j}=0$ to 2$)$ as a trigger source for stopping DSADC13. |
|  |  | 0: Does not select the trigger selected by register PIC2DSADTEN14j. |
|  |  | 1: Selects the trigger selected by register PIC2DSADTEN14j. |
| 7 | DSADCATSEL107 | Selects the DSADTRG12 pin as a trigger source for stopping DSADC12. |
|  |  | 0 : DSADTRG12 is not selected. |
|  |  | 1: DSADTRG12 is selected. |
| 6 | DSADCATSEL106 | Selects the trigger selected by DSADC stop trigger output control register $3 \mathrm{j}(\mathrm{j}=0$ to 2 ) as a trigger source for stopping DSADC12. |
|  |  | 0: Does not select the trigger selected by register PIC2DSADTEN13j. |
|  |  | 1: Selects the trigger selected by register PIC2DSADTEN13j. |
| 5 | DSADCATSEL105 | Selects the DSADTRG20 pin as a trigger source for stopping DSADC20. |
|  |  | 0: DSADTRG20 is not selected. |
|  |  | 1: DSADTRG20 is selected. |
| 4 | DSADCATSEL104 | Selects the trigger selected by DSADC stop trigger output control register $2 \mathrm{j}(\mathrm{j}=0$ to 2 ) as a trigger source for stopping DSADC20. |
|  |  | 0 : Does not select the trigger selected by register PIC2DSADTEN12j. |
|  |  | 1: Selects the trigger selected by register PIC2DSADTEN12j. |
| 3 | DSADCATSEL103 | Selects the DSADTRG10 pin as a trigger source for stopping DSADC10. |
|  |  | $0:$ DSADTRG10 is not selected. |
|  |  | 1: DSADTRG10 is selected. |

Table 33.29 PIC2DSADCATSEL1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 2 | DSADCATSEL102 | Selects the trigger selected by DSADC stop trigger output control register $1 \mathrm{j}(\mathrm{j}=0$ to 2$)$ as a |
|  |  | trigger source for stopping DSADC10. |
|  | 0: Does not select the trigger selected by register PIC2DSADTEN11 j. |  |
|  | 1: Selects the trigger selected by register PIC2DSADTEN11j. |  |
| 1 | DSADCATSEL101 | Selects the DSADTRG00 pin as a trigger source for stopping DSADC00. |
|  | 0: DSADTRG00 is not selected. |  |
|  | 1: DSADTRG00 is selected. |  |
| 0 | DSADCATSEL100 | Selects the trigger selected by DSADC stop trigger output control register $0 \mathrm{j}(\mathrm{j}=0$ to 2$)$ as a |
|  |  | trigger source for stopping DSADC00. |
|  | 0: Does not select the trigger selected by register PIC2DSADTEN10 j. |  |
|  |  | 1: Selects the trigger selected by register PIC2DSADTEN10j. |

### 33.3.2.18 PIC2ENCAnTSELj — Encoder Timer n Trigger Selection Control Register j ( $\mathrm{n}=\mathbf{0}$ to $\mathbf{1 ; ~} \mathbf{j}=0$ to 1)

The PIC2ENCAnTSELj register selects a trigger for ENCAn ENCATTNj $(\mathrm{n}=0$ to $1 ; \mathrm{j}=0$ to 1$)$.

### 33.3.2.22 PIC2CADTEN003 — CADC Start Trigger Output Control Register 03

CADC start trigger output control register 03 enables a trigger source from GTM and ENCA to be selected as a trigger for starting CADC00. Whether enabled trigger source is used or not is defined by set timer output in CADC Start / Stop trigger output configuration register.

| 25 to 2 | - | Reserved <br> When writing to these bits, write 0 . |

Table 33.38 PIC2CADTEN103 Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 1 | PIC2CADTEN1031 | Output value of GTM timer output selected by PIC2CADTCFG0 bits 15 to 8 |
|  |  | 0: Selection of the above signal as a CADC00 end trigger is disabled. |
|  | 1: Selection of the above signal as a CADC00 end trigger is enabled. |  |
| 0 | PIC2CADTEN1030 | Output value of GTM timer output selected by PIC2CADTCFG0 bits 7 to 0 |
|  |  | 0: Selection of the above signal as a CADC00 end trigger is disabled. |
|  | 1: Selection of the above signal as a CADC00 end trigger is enabled. |  |

### 33.3.2.27 PIC2CADCATSELO — CADC Trigger Selection Control Register 0

CADC trigger selection control register 0 selects a trigger for starting CADCj $(\mathrm{j}=00)$.

Table 33.39 PIC2CADCATSELO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 1 | CADCATSEL001 | Selects the CADTRG00 pin as a trigger source for starting CADC00. |
|  | 0: CADTRG00 is not selected. |  |
|  | 1: CADTRG00 is selected. |  |
| 0 | CADCATSEL000 | Selects the trigger selected by CADC start trigger output control register $0 \mathrm{j}(\mathrm{j}=0$ to 3$)$ as a |
|  |  | trigger source for starting CADC00. |
|  | $0:$ Does not select the trigger selected by register PIC2CADTEN00 j. |  |
|  |  | 1: Selects the trigger selected by register PIC2CADTENOOj. |
|  |  |  |

### 33.3.2.28 PIC2CADCATSEL1 — CADC Trigger Selection Control Register 1

CADC trigger selection control register 1 selects a trigger for stopping CADCj $(\mathrm{j}=00)$.

Table 33.40 PIC2CADCATSEL1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 2 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 1 | CADCATSEL101 | Selects the CADTRG00 pin as a trigger source for stopping CADC00. |
|  | 0: CADTRG00 is not selected. |  |
|  | 1: CADTRG00 is selected. |  |
| 0 | CADCATSEL100 | Selects the trigger selected by CADC stop trigger output control register $0 \mathrm{j}(\mathrm{j}=0$ to 2$)$ as a |
|  |  | trigger source for stopping CADC00. |
|  | $0:$ Does not select the trigger selected by register PIC2CADTEN10j. |  |
|  |  | 1: Selects the trigger selected by register PIC2CADTEN10j. |

### 33.3.2.29 PIC2ADTCFGx - A/D Converter Trigger Output Configuration Register $\mathbf{x}$ ( $x=0$ to 4 )

The PIC2ADTCFGx register assigns timer output of GTM ([A]TOM) to PIC2ADTEN800-834 ( $\mathrm{x}=0$ to 4 ).

Table 33.41 PIC2ADTCFGx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | PIC2ADTCFGx[31:24] | Selects the GTM [A]TOM output as a PIC2ADTEN800-834 Bit[3+(x $\times 4)$ ] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 23 to 16 | PIC2ADTCFGx[23:16] | Selects the GTM [A]TOM output as a PIC2ADTEN800-834 Bit[2 + $(x \times 4)$ ] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}:$ GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 15 to 8 | PIC2ADTCFGx[15:8] | Selects the GTM [A]TOM output as a PIC2ADTEN800-834 Bit[1 + $(x \times 4)$ ] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 7 to 0 | PIC2ADTCFGx[7:0] | Selects the GTM [A]TOM output as a PIC2ADTEN800-834 Bit[0 + (x $\times 4$ )] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m] ${ }^{* 1}$ is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |

Note 1. E2xFCC1: $(n=0$ to $4, m=0$ to 15), E2M: $(n=0$ to $3, m=0$ to 15)
Note 2. E2xFCC1: $(n=0$ to $8, m=0$ to 7$)$, E2M: $(n=0$ to $7, m=0$ to 7$)$

### 33.3.2.30 PIC2DSADTCFGx — DSADC Start / Stop Trigger Output Configuration Register $x$ ( $x=0$ to 2 )

The PIC2DSADTCFGx register assigns timer output of GTM ([A]TOM) to PIC2DSADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ to $5, \mathrm{x}$ $=0$ to 2 ).

Table 33.42 PIC2DSADTCFGx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | PIC2DSADTCFGX [31:24] | Selects the GTM [A]TOM output as a PIC2DSADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ to 5 ) Bit[3+(x $\times 4)]$ register configuration. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m] ${ }^{* 1}$ is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 23 to 16 | $\begin{aligned} & \text { PIC2DSADTCFGx } \\ & \text { [23:16] } \end{aligned}$ | Selects the GTM [A]TOM output as a PIC2DSADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ to 5 ) Bit[2 + (x $\times 4$ )] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 15 to 8 | $\begin{aligned} & \text { PIC2DSADTCFGx } \\ & {[15: 8]} \end{aligned}$ | Selects the GTM [A]TOM output as a PIC2DSADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ to 5 ) Bit[1 + (x $\times 4$ )] register configuration. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m] ${ }^{* 1}$ is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 7 to 0 | $\begin{aligned} & \text { PIC2DSADTCFGx } \\ & \text { [7:0] } \end{aligned}$ | Selects the GTM [A]TOM output as a PIC2DSADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ to 5 ) $\operatorname{Bit}[0+(x \times 4)]$ register configuration. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |

Note 1. E2xFCC1: $(n=0$ to $4, m=0$ to 15), E2M: $(n=0$ to $3, m=0$ to 15)
Note 2. E2xFCC1: $(\mathrm{n}=0$ to $8, \mathrm{~m}=0$ to 7$)$, E2M: $(\mathrm{n}=0$ to $7, \mathrm{~m}=0$ to 7 )

### 33.3.2.31 PIC2CADTCFG0 — CADC Start / Stop Trigger Output Configuration Register 0

The PIC2CADTCFG0 register assigns timer output of GTM ([A]TOM) to PIC2CADTENjk3 ( $\mathrm{j}=0$ to $1, \mathrm{k}=0$ ).

Table 33.43 PIC2CADTCFG0 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 16 | - | Reserved |
|  |  | When writing to these bits, write 0. |
| 15 to 8 | PIC2CADTCFG0 | Selects the GTM [A]TOM output as a PIC2CADTENjk3 $(\mathrm{j}=0$ to $1, \mathrm{k}=0)($ Bit 1$)$ register |
|  | $[23: 16]$ | configuration. |
|  | $0:$ GTM signal is not selected. |  |
|  | $1+(\mathrm{n} \times 16)+\mathrm{m}:$ GTM TOM[ n$] \_\mathrm{CH}[\mathrm{m}]^{\star 1}$ is selected. |  |
|  | $97+(\mathrm{n} \times 8)+\mathrm{m}:$ GTM ATOM[n]_CH[m]*2 is selected. |  |

7 to $0 \quad$ PIC2CADTCFG0[7:0] Selects the GTM [A]TOM output as a PIC2CADTENjk3 $(\mathrm{j}=0$ to $1, \mathrm{k}=0)($ Bit 0$)$ register configuration.

0 : GTM signal is not selected.
$1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected.

[^12]
### 33.3.2.32 PIC2DSADTSENx — DSADC Read Gate Trigger Selection Control Register x ( $x=0$ to 1)

The PIC2DSADTSENx register selects a trigger for DSADC read gate. ( $\mathrm{x}=0$ to 1 ).

Table 33.44 PIC2DSADTSENx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | PIC2DSADTSENx [31:24] | Selects the GTM [A]TOM output as a read gate source for DSADC. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. <br> $193+(\mathrm{n} \times 8)+\mathrm{m}:$ GTM TIM[n]_CH[m]*3 is selected. |
| 23 to 16 | PIC2DSADTSENx [23:16] | Selects the GTM [A]TOM output as a read gate source for DSADC. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m]** is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. <br> $193+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM TIM[n]_CH[m]*3 is selected. |
| 15 to 8 | PIC2DSADTSENx $[15: 8]$ | Selects the GTM [A]TOM output as a read gate source for DSADC. <br> 0 : GTM signal is not selected. <br> $1+(\mathrm{n} \times 16)+\mathrm{m}$ : GTM TOM[n]_CH[m]** is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. <br> $193+(\mathrm{n} \times 8)+\mathrm{m}:$ GTM TIM[n]_CH[m]*3 is selected. |
| 7 to 0 | $\begin{aligned} & \text { PIC2DSADTSENx } \\ & \text { [7:0] } \end{aligned}$ | Selects the GTM [A]TOM output as a read gate source for DSADC. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. <br> $193+(\mathrm{n} \times 8)+\mathrm{m}:$ GTM TIM[n]_CH[m]*3 is selected. |

Note 1. E2xFCC1: $(n=0$ to $4, m=0$ to 15), E2M: $(n=0$ to $3, m=0$ to 15)
Note 2. E2xFCC1: $(n=0$ to $8, m=0$ to 7$)$, E2M: $(n=0$ to $7, m=0$ to 7$)$
Note 3. E2xFCC1: $(n=0$ to $6, m=0$ to 7$)$, E2M: $(n=0$ to $6, m=0$ to 7$)$

### 33.3.2.37 PIC2DFETEDGSEL2 — DFE Timer Trigger Edge Selection Control Register 2

The PIC2DFETEDGSEL2 register selects an effective edge of the GTM timer output as trigger signal for DFE.

Table 33.51 PIC2DFETEDGSEL2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 4 | - | Reserved <br> When writing to these bits, write 0. |
| 3 | PIC2DFETEDGSEL2 | Selects the effective edge of Timer FIFO Capture trigger |
|  | 03 | 0: Rising edge is selected |
|  | 1: Falling edge is selected |  |
| 2 | PIC2DFETEDGSEL2 | Selects the effective edge of Timer DFE Compare trigger 2 |
|  | 02 | 0: Rising edge is selected |
|  |  | 1: Falling edge is selected |
|  | PIC2DFETEDGSEL2 | Selects the effective edge of Timer DFE Compare trigger 1 |
|  | 01 | 0: Rising edge is selected |
|  |  | 1: Falling edge is selected |
| 0 | PIC2DFETEDGSEL2 | Selects the effective edge of Timer DFE Compare trigger 0 |
|  | 00 | 0: Rising edge is selected |
|  |  | 1: Falling edge is selected |

### 33.3.2.38 PIC2PSI5SENx — PSI5-S Sync Output Control Register $\mathbf{x}$ ( $\mathrm{x}=0$ to 3)

The PIC2PSI5SENx register selects a source of a sync trigger of PSI5-S ( $\mathrm{x}=0$ to 3 ).

Table 33.52 PIC2PSI5SENx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | $\begin{aligned} & \text { PIC2PSI5SENx } \\ & \text { [31:24] } \end{aligned}$ | Selects the GTM [A]TOM output as a signal source for PSI5-S. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 23 to 16 | PIC2PSI5SENx [23:16] | Selects the GTM [A]TOM output as a signal source for PSI5-S. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 15 to 8 | $\begin{aligned} & \text { PIC2PSI5SENx } \\ & {[15: 8]} \end{aligned}$ | Selects the GTM [A]TOM output as a signal source for PSI5-S. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m]*1 is selected. <br> $97+(\mathrm{n} \times 8)+\mathrm{m}$ : GTM ATOM[n]_CH[m] ${ }^{* 2}$ is selected. |
| 7 to 0 | $\begin{aligned} & \text { PIC2PSI5SENx } \\ & \text { [7:0] } \end{aligned}$ | Selects the GTM [A]TOM output as a signal source for PSI5-S. <br> 0 : GTM signal is not selected. <br> $1+(n \times 16)+m$ : GTM TOM[n]_CH[m] ${ }^{* 1}$ is selected. <br> $97+(n \times 8)+m$ : GTM ATOM[n]_CH[m]*2 is selected. |

Note 1. E2xFCC1: $(\mathrm{n}=0$ to $4, \mathrm{~m}=0$ to 15), E2M: $(\mathrm{n}=0$ to $3, \mathrm{~m}=0$ to 15)
Note 2. E2xFCC1: $(\mathrm{n}=0$ to $8, \mathrm{~m}=0$ to 7$)$, E2M: $(\mathrm{n}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Table 33.53 List of Destination (1/2)

| PIC2PSI5SENx | Bit Position | Destination |
| :--- | :--- | :--- |
| PIC2PSI5SEN0 | 31 to 24 | PSI5-S Synchronous trigger Ch3 |
| PIC2PSI5SEN0 | 23 to 16 | PSI5-S Synchronous trigger Ch2 |
| PIC2PSI5SEN0 | 15 to 8 | PSI5-S Synchronous trigger Ch1 |
| PIC2PSI5SEN0 | 7 to 0 | Reserved |
| PIC2PSI5SEN1 | 31 to 24 | PSI5-S Synchronous trigger Ch7 |
| PIC2PSI5SEN1 | 23 to 16 | PSI5-S Synchronous trigger Ch6 |
| PIC2PSI5SEN1 | 15 to 8 | PSI5-S Synchronous trigger Ch5 |
| PIC2PSI5SEN1 | 7 to 0 | PSI5-S Synchronous trigger Ch4 |

Table 33.53 List of Destination (2/2)

| PIC2PSI5SENx | Bit Position | Destination |
| :--- | :--- | :--- |
| PIC2PSI5SEN2 | 31 to 24 | PSI5-S Timestamp counter B clear |
| PIC2PSI5SEN2 | 23 to 16 | PSI5-S Timestamp counter A clear |
| PIC2PSI5SEN2 | 15 to 8 | PSI5-S Timestamp counter B clock |
| PIC2PSI5SEN2 | 7 to 0 | PSI5-S Timestamp counter A clock |
| PIC2PSI5SEN3 | 31 to 24 | Reserved |
| PIC2PSI5SEN3 | 23 to 16 | Reserved |
| PIC2PSI5SEN3 | 15 to 8 | PSI5-S Timestamp counter B enable |
| PIC2PSI5SEN3 | 7 to 0 | PSI5-S Timestamp counter A enable |

### 33.3.2.39 PIC2GTMINENx — GTM Timer Input Module (TIM) Source Select Register $\mathbf{x}$ ( $x=0,2,4,6,8,10,12,14$ )

The PIC2GTMINENx register selects a source of timer input of GTM (TIM) $(x=0,2,4,6,8,10,12,14)$.

### 33.3.2.40 PIC2GTMINENx — GTM Timer Input Module (TIM) Source Select Register $\mathbf{x}$ ( $x=1,3,5,7,9,11,13,15$ )

The PIC2GTMINENx register selects a source of timer input of GTM (TIM) $(x=1,3,5,7,9,11,13,15)$.

Table 33.56 PIC2GTMINENx Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 24 | $\begin{aligned} & \text { PIC2GTMINENx } \\ & \text { [31:24] } \end{aligned}$ | Selects a GTM timer input signal from peripheral IPs. (GTM_TIM[((x-1)/2)]_CH7) 0 to 127: Please refer to "Table 33.57". |
| 23 to 16 | $\begin{aligned} & \text { PIC2GTMINENx } \\ & \text { [23:16] } \end{aligned}$ | Selects a GTM timer input signal from peripheral IPs. (GTM_TIM[((x-1)/2)]_CH6) 0 to 127: Please refer to "Table 33.57". |
| 15 to 8 | $\begin{aligned} & \text { PIC2GTMINENx } \\ & \text { [15:8] } \end{aligned}$ | Selects a GTM timer input signal from peripheral IPs. (GTM_TIM[((x-1)/2)]_CH5) 0 to 127: Please refer to "Table 33.57". |
| 7 to 0 | $\begin{aligned} & \text { PIC2GTMINENx } \\ & \text { [7:0] } \end{aligned}$ | Selects a GTM timer input signal from peripheral IPs. (GTM_TIM[((x-1)/2)]_CH4) 0 to 127: Please refer to "Table 33.57". |

### 33.3.3 Function

### 33.3.3.1 ADCH Trigger Selection Function

Each of $5 \mathrm{ADCHn}^{* 1}$ scan groups can be triggered by a hardware trigger.
Trigger signals from ATU or GTM selected by ADCHnTSELm are ORed with trigger signal from external pin ADTRG before they are mapped to ADCH scan group hardware triggers.

Note 1. E2xFCC1: $(\mathrm{n}=0$ to 3$)$, $\mathrm{E} 2 \mathrm{M}:(\mathrm{n}=0$ to 3$)$

NOTE
One external ADTRG pin is mapped to all ADCH scan groups.

## - ATU Trigger Selection

Hardware triggers for each scan group in each $\mathrm{ADCHn}{ }^{* 1}$ can be generated from 16 sources of ATU timer C compare match, 16 sources of ATU timer D compare match A, 16 sources of ATU timer D compare match B, 8 sources of ATU timer G compare match, and 1 source of ATU DMA switch function. Total of 20 ADCH scan group triggers can be mapped to ATU outputs.

Note 1. E2xFCC1: $(\mathrm{n}=0$ to 3$)$, E2M: $(\mathrm{n}=0$ to 3$)$

Note: The levels of the input signals to the ADTRGn pins are inverted and the logical OR of the result is taken.

Figure 33.4 Block Diagram of Trigger Selection for ADCHn Scan Group jin ATU Configuration

- GTM Trigger Selection

Hardware triggers for each scan groups in each $\mathrm{ADCHn}{ }^{* 1}$ can be generated from GTM TOM[i]_CH[n] ${ }^{* 2}$ and ATOM[j]_CH[m]*3.
PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time. Each pulse is used as the trigger source for each ADCHn instead of the above GTM signals.

Therefore, to use falling edges of the above GTM signals to trigger the ADCHn scan group, select the rising edge detection by the PIC2ADCHnEDGSEL register, and generate a pulse at the falling edge with reference to one of the examples shown below.

- Invert the polarity of the GTM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.

When using both rising and falling edges to trigger the ADCHn scan group, choose one of the following options:

- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using the PIC2.
- Generate the pulses at both edges by the DTM in the GTM.

Note 1. E2xFCC1: $(\mathrm{n}=0$ to 3$)$, E2M: $(\mathrm{n}=0$ to 3$)$
Note 2. E2xFCC1: $(i=0$ to $4, n=0$ to 15), E2M: $(i=0$ to $3, n=0$ to 15$)$
Note 3. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7$), \quad E 2 M:(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Note: The levels of the input signals to the ADTRGn pins are inverted and the logical OR of the result is taken.

Figure 33.5 Block Diagram of Trigger Selection for ADCHn Scan Group jin GTM Configuration

### 33.3.3.2 DSADC Trigger Selection Function

DSADC has hardware triggers for start and stop. ATU or GTM outputs and external pin DSADTRGn are ORed before they are mapped to DSADC hardware triggers.

DSADC has hardware triggers for the read gate function. GTM outputs can be mapped to DSADC hardware read gate triggers. In this case GTM outputs are multiplexed.

- ATU trigger selection

Hardware triggers for each DSADC channel can be generated from 16 sources of ATU timer D compare match A, 16 sources of ATU timer D compare match B, and 8 sources of ATU timer G compare match.

Note: The levels of the input signals to the DSADTRGn pins are inverted and the logical OR of the result is taken.

Figure 33.6 Block Diagram of Trigger Selection Function for DSADCn in ATU Configuration

- GTM trigger selection

Hardware triggers for each DSADC channel can be generated from GTM TOM[i]_CH[n]*1 and ATOM[j]_CH[m]*2.
Note 1. E2xFCC1: $(\mathrm{i}=0$ to $4, \mathrm{n}=0$ to 15$)$, E2M: $(\mathrm{i}=0$ to $3, \mathrm{n}=0$ to 15$)$
Note 2. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7$)$, E2M: $(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Note: The levels of the input signals to the DSADTRGn pins are inverted and the logical OR of the result is taken.

Figure 33.7 Block Diagram of Trigger Selection Function for DSADCn in GTM Configuration

### 33.3.3.3 CADC Trigger Selection Function

CADC has hardware triggers for start and stop. ATU or GTM signals and external pin CADTRG00 are ORed before result is input to CADC hardware triggers.

CADC has hardware triggers for the read gate function. GTM outputs can be mapped to CADC hardware read gate triggers. In this case GTM outputs are multiplexed.

- ATU trigger selection

Hardware triggers for each CADC channel can be generated from 16 sources of ATU timer D compare match A, 16 sources of ATU timer D compare match B, and 8 sources of ATU timer G compare match.

Note: The levels of the input signals to the CADTRG00 pins are inverted and the logical OR of the result is taken.

Figure 33.8 Block Diagram of Trigger Selection Function for CADC00 in ATU Configuration

- GTM Trigger selection

Hardware triggers for each CADC channel can be generated from GTM TOM $[\mathrm{i}] \_\mathrm{CH}[\mathrm{n}]^{* 1}$ and ATOM $[\mathrm{j}] \_\mathrm{CH}[\mathrm{m}]^{* 2}$
Note 1. E2xFCC1: $(\mathrm{i}=0$ to $4, \mathrm{n}=0$ to 15$)$, E2M: $(\mathrm{i}=0$ to $3, \mathrm{n}=0$ to 15$)$
Note 2. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7$), \quad E 2 M:(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Note: The levels of the input signals to the CADTRG00 pins are inverted and the logical OR of the result is taken.

Figure 33.9 Block Diagram of Trigger Selection Function for CADC00 in GTM Configuration

### 33.3.3.4 ENCA Trigger Selection Function

ENCA has the trigger which captures the encoder counter value to a capture register. It's possible to map GTM output to capture trigger of ENCA. In this case GTM outputs are multiplexed.

## - GTM Trigger selection

ENCA trigger can be generated from the GTM TOM $[\mathrm{i}]_{\_} \mathrm{CH}[\mathrm{n}]^{* 1}$, ATOM $[\mathrm{j}] \_\mathrm{CH}[\mathrm{m}]^{* 2}$ and TIM $[\mathrm{k}] \_$IRQ $[\mathrm{p}]^{* 3}$.
PIC2 detects only the rising edge from the above GTM signals and generates a pulse at the time. Each pulse is used as the trigger source for each ENCAn instead of the above TOM and ATOM signals.

Therefore, to use falling edges of the above TOM or ATOM signals to capture the encoder counter value, select the rising edge detection by the ENCAnIOC0 register, and generate a pulse at the falling edge with reference to one of the examples shown below.

- Invert the polarity of the TOM or ATOM signal in the GTM, and select the inverted signal as the trigger source in the PIC2.
- Use the DTM in the GTM to generate a pulse synchronized with the falling edge of the GTM signal.
- Use a TIM in the GTM, route the TOM or ATOM signal to the TIM auxiliary input (TIM_AUX_IN), and generate an interrupt pulse (TIM[k]_IRQ[p]) by detecting the falling edge of the TOM or ATOM signal with the TIM.

When using both rising and falling edges to capture the encoder counter value, choose one of the following options:

- Generate the trigger pulses at the rising edge and the falling edge individually and merge them by using the PIC2.
- Generate the pulses at both edges by the DTM from the TOM or ATOM signals.
- Generate TIM interrupts at the rising and falling edges of TOM or ATOM signals.

Note 1. E2xFCC1: $(\mathrm{i}=0$ to $4, \mathrm{n}=0$ to 15$)$, E2M: $(\mathrm{i}=0$ to $3, \mathrm{n}=0$ to 15$)$
Note 2. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7$)$, E2M: $(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$
Note 3. E2xFCC1: $(k=0$ to $7, p=0$ to 7$)$, E2M: $(k=0$ to $7, p=0$ to 7$)$

Figure 33.10 Block Diagram of Trigger Selection Function of ENCA

### 33.3.3.5 DFE Trigger Selection Function

DFE has a comparing timer trigger, a filter result capture trigger and an FIFO capture trigger. GTM outputs can be mapped to each DFE trigger. GTM outputs in this case are multiplexed.

- GTM Trigger selection

DFE triggers can be generated for each DFE channel from the GTM TOM $[\mathrm{i}] \_\mathrm{CH}[\mathrm{n}]^{* 1}$ and ATOM $[\mathrm{j}] \_\mathrm{CH}[\mathrm{m}]^{* 2}$
Note 1. E2xFCC1: $(\mathrm{i}=0$ to $4, \mathrm{n}=0$ to 15$)$, E2M: $(\mathrm{i}=0$ to $3, \mathrm{n}=0$ to 15$)$
Note 2. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7 ), E2M: $(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Figure 33.11 Block Diagram of Trigger Selection Function of DFE

### 33.3.3.6 PSI5-S Timestamp and the Sync Pulse Signal Selection Function

PSI5-S has Time stamp and Sync Pulse Generation. GTM outputs can be mapped to Time stamp (clock, enable, clear) and Sync Pulse of PSI5-S. GTM outputs in this case are multiplexed.

- GTM Trigger selection

PSI5-S time stamp trigger and sync pulse can be generated from GTM TOM[i]_CH[n]*1 and ATOM[j]_CH[m]*2
Note 1. E2xFCC1: $(\mathrm{i}=0$ to $4, \mathrm{n}=0$ to 15$)$, $\mathrm{E} 2 \mathrm{M}:(\mathrm{i}=0$ to $3, \mathrm{n}=0$ to 15$)$
Note 2. E2xFCC1: $(\mathrm{j}=0$ to $8, \mathrm{~m}=0$ to 7$)$, E2M: $(\mathrm{j}=0$ to $7, \mathrm{~m}=0$ to 7$)$

Figure 33.12 Block Diagram of Trigger Selection Function of PSI5-S

### 33.3.3.7 GTM Timer Input (TIM) Selection Function

Source of GTM Timer Input signals for TIM[i] (i: 0 to 7) can be selected from the following:

- PORT

It's possible to select the GTM timer input chosen in GPIO. (Defaults)

- ADCH

It's possible to select AD conversion end interrupt as timer input of GTM.

- DSADC

It's possible to select AD conversion update interrupt as timer input of GTM.

- CADC

It's possible to select AD conversion update interrupt as timer input of GTM.

- ENCA

It's possible to select count clock output and direction of rotation notifications from encoder inputs (phase A, phase B, phase $Z$ ) and compare capture interrupt and phase $Z$ edge detection as timer input of GTM.

- DFE

It's possible to select peak hold renewal notice of a filter result as timer input of GTM.

Figure 33.13 Block Diagram of Trigger Selection Function of GTM

### 33.3.3.8 ENCA Encoder Input Selection

It's possible to select encoder inputs of an encoder timer (phase A, phase B, phase Z) to ENCAn.
Encoder inputs can be selected for a series, parallel or cascade connection.

Figure 33.14 Block Diagram of ENCA Encoder Input Selection Function

## Section 34 Analog to Digital Converter (ADCH)

This section contains a description of the $\mathrm{A} / \mathrm{D}$ Converter (ADCH).
The first part of this section describes all of this products specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of the ADCH.

### 34.1 Features

### 34.1.1 Number of Units and Channels

This microcontroller has the following number of ADCH units.
Table 34.1 Number of Units (For RH850/E2x-FCC1, E2M)

| Product Name | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
| Name of ADCH Units | 2 | 4 |
| Number of IFC Units | ADCHn $(\mathrm{n}=0,2)$ | ADCHn ( $\mathrm{n}=0$ to 3) |
| Name of IFC Units | 1 | 2 |
| Number of ASF Units | IFCu $(\mathrm{u}=0)$ | IFCu (u = 0, 1) |
| Name of ASF Units | 1 | 1 |
| Number of AVSEG Units | ASFr $(\mathrm{r}=0)$ | 1 |
| Name of AVSEG Units | 1 | 1 |
| Number of ABFG Units | AVSEG |  |
| Name of ABFG Units | 1 | 1 |
| Number of AIR Units | ABFG | 1 |
| Name of AIR Units | AIR |  |

An ADCHn unit has the same number of physical channels as the number of $\mathrm{A} / \mathrm{D}$ input pins and the same number of virtual channels as the number of addresses where the results of A/D conversion will be stored. The numbers of channels on individual products are listed below.

Table 34.2 Unit Configurations and Physical Channels (For RH850/E2x-FCC1, E2M)

| Unit Name (Number of Channels) <br> ADCHn | RH850/E2x-FCC1, E2M |  |  |
| :--- | :--- | :--- | :--- |
|  | Dedicated inputs | 292 Pins | 373 Pins |
| ADCH1 | Dedicated inputs | - | 20 |
| ADCH0, 1 | Shared inputs | - | 12 |
| ADCH2 | Dedicated inputs | 24 | 8 |
| ADCH3 | Dedicated inputs | - | 20 |
| ADCH2, 3 | Shared inputs | - | 12 |

Table 34.3 Unit Configurations and Virtual Channels (For RH850/E2x-FCC1, E2M)

| Unit Name (Number of Channels) | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
| ADCH0 | 40 | 40 |
| ADCH1 | 40 | 40 |
| ADCH2 | 40 | 40 |
| ADCH3 | 40 | 40 |

Floating-point data register 0 j and 2 j of an IFC0 unit has the same number of virtual channels with ADCH0 and ADCH2.
Floating-point data register 1 j and 3 j of an IFC1 unit has the same number of virtual channels with ADCH1 and ADCH3.

An ASFr unit has the same number of channels.
Table 34.4 Unit Configurations and Channels of ASF (For RH850/E2x-FCC1, E2M)

| Unit Name (Number of Channels) <br> ASFr | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
| ASF0 | 16 | 16 |

An ABFG unit has the same number of boundary flags.
Table 34.5 Unit Configurations and Boundary Flags of ABFG (For RH850/E2x-FCC1, E2M)

| Unit Name | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
|  | 40 | 40 |

Table $34.6 \quad$ Indices

| Index | Description |
| :---: | :---: |
| n | Throughout this section, the individual ADCH units are identified by the index " n " ( $\mathrm{n}=0$ to 3 ); for example, ADCHnADHALTR indicates the A/D force halt register. |
| p | Throughout this section, the individual physical channel groups (channel group in the unit) of ADCHn are identified by the index "p"; for example, ANnpq. |
| q | Throughout this section, the individual physical sub channels (sub channel in the unit) of ADCHn are identified by the index "q"; for example, ANnpq. |
| j | Throughout this section, the individual virtual channels of ADCHn are identified by the index " j "; for example, ADCHnVCRj indicates the virtual channel register |
| x | Throughout this section, the individual scan groups (SG) of ADCHn are identified by the index "x" ( $\mathrm{x}=0$ to 4 ); for example, ADCHnSGSTCRx indicates the scan group x start control register. |
| y | Throughout this section, the individual A/D timers of ADCHn are identified by the index "y" ( $y=3$ to 4); for example, ADCHnADTSTCRy indicates the A/D timer y start control register. |
| $u$ | Throughout this section, the individual IFC units are identified by the index " $u$ " ( $u=0$ to 1) |
| r | Throughout this section, the individual ASF units are identified by the index "r" ( $r=0$ ); for example, ASFrDRi indicates the Accumulation data register i. |
| i | Throughout this section, the individual ASF units are identified by the index "i"; for example, ASFrDRi indicates the Accumulation data register i. |
| w | Throughout this section, the individual boundary flags of ABFG are identified by the index " $w$ "; for example, ABFGBFGCRw indicates the Input boundary flag control register w. |

Page 3375 of 4595

Table 34.7 Indices of Products (For RH850/E2x-FCC1, E2M)

| Indices of Each Product |  |
| :---: | :---: |
| RH850/E2x-FCC1, E2M 292 Pins | RH850/E2x-FCC1, E2M 373 Pins |
| $\begin{aligned} & \mathrm{p}=0 \text { to } 6(\mathrm{ADCH}) \\ & \bar{p}=0 \text { to } 5(\mathrm{ADCH} 2) \end{aligned}$ | $\begin{aligned} & p=0 \text { to } 6 \text { (ADCHO) } \\ & p=0 \text { to } 4 \text { (ADCH1) } \\ & p=0 \text { to } 6 \text { (ADCH2) } \\ & p=0 \text { to } 4 \text { (ADCH3) } \end{aligned}$ |
| $\begin{aligned} & \mathrm{q}=0 \text { to } 3(\mathrm{ADCH}) \\ & \mathrm{q}=0 \text { to } 3(\mathrm{ADCH} 2) \end{aligned}$ | $\begin{aligned} & \mathrm{q}=0 \text { to } 3 \text { (ADCH0) } \\ & \mathrm{q}=0 \text { to } 3 \text { (ADCH1) } \\ & \mathrm{q}=0 \text { to } 3 \text { (ADCH2) } \\ & \mathrm{q}=0 \text { to } 3 \text { (ADCH3) } \end{aligned}$ |
| $\begin{aligned} & \mathrm{j}=0 \text { to } 39 \text { (ADCH0) } \\ & \overline{\mathrm{j}=} 0 \text { to } 39 \text { (ADCH2) } \end{aligned}$ - | $\begin{aligned} & j=0 \text { to } 39 \text { (ADCH0) } \\ & j=0 \text { to } 39 \text { (ADCH1) } \\ & j=0 \text { to } 39 \text { (ADCH2) } \\ & j=0 \text { to } 39 \text { (ADCH3) } \\ & \hline \end{aligned}$ |
| $x=0$ to 4 | $\mathrm{x}=0$ to 4 |
| $y=3$ to 4 | $y=3$ to 4 |
| $\mathrm{i}=0$ to 15 (ASFO) | $\mathrm{i}=0$ to 15 (ASFO) |
| $\mathrm{w}=0$ to 39 (ABFG) | w = 0 to 39 (ABFG) |

### 34.1.2 Register Base Address

The ADCHn base addresses are listed in the following table.
The ADCHn register addresses are given as offsets from the base address.
Table 34.8 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <ADCH0_base> | FFF2 $0000_{\mathrm{H}}$ | Peripheral Group 7 |
| <ADCH2_base> | FFF2 $1000_{\mathrm{H}}$ | Peripheral Group 7 |
| <ASF0_base> | FFF2 $2000_{\mathrm{H}}$ | Peripheral Group 7 |
| <IFC0_base> | FFF2 $3000_{\mathrm{H}}$ | Peripheral Group 7 |
| <ADCH1_base> | FFF2 $8000_{\mathrm{H}}$ | Peripheral Group 8 |
| <ADCH3_base> | FFF2 $9000_{\mathrm{H}}$ | Peripheral Group 8 |
| <IFC1_base> | FFF2 $\mathrm{A} 000_{\mathrm{H}}$ | Peripheral Group 8 |
| <AVSEG_base> | FFF4 $4000_{\mathrm{H}}$ | Peripheral Group 7 |
| <ABFG_base> | FFF4 $5000_{\mathrm{H}}$ | Peripheral Group 7 |
| <AIR_base> | FFF4 $6000_{\mathrm{H}}$ | Peripheral Group 7 |

### 34.1.3 Clock Supply

The ADCHn clock supplies are shown in the following table.
Table $34.9 \quad$ Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| ADCHn | ADCLK | CLK_LSB |
|  | Register access clock | CLK_LSB |
| IFCu | Register access clock | CLK_LSB |
| ASFr | Register access clock | CLK_LSB |
| AVSEG | Register access clock | CLK_LSB |
| ABFG | Register access clock | CLK_LSB |
| AIR | Register access clock | CLK_LSB |

### 34.1.4 Interrupt Requests

The ADCHn interrupt requests are listed in the following table.
Table 34.10 Interrupt Requests (1)

| Interrupt <br> symbol name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA <br> Trigger <br> Number | DTS Trigger <br> Number | Other <br> Trigger <br> Signals |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| ADCH0 |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| *1 | ADEO <br> (merged INT_ULO) | A/D error interrupt Upper/lower limit error interrupt | *1 | - | - | - |
| *1 | ADI00 | Scan group 0 (SG0) end interrupt | *1 | *1 | *1 | GTM*2/ATU |
| *1 | ADI01 | Scan group 1 (SG1) end interrupt | *1 | *1 | *1 | GTM*2/ATU |
| *1 | ADI02 | Scan group 2 (SG2) end interrupt | *1 | *1 | *1 | GTM*2/ATU |
| *1 | ADI03 | Scan group 3 (SG3) end interrupt | *1 | *1 | *1 | GTM*2/ATU |
| *1 | ADI04 | Scan group 4 (SG4) end interrupt | *1 | *1 | *1 | GTM*2/ATU |
| *1 | ADMPXIO | MPX interrupt | *1 | *1 | *1 | - |

ADCH2

| *1 | ADE2 <br> (merged INT_UL2) | A/D error interrupt Upper/lower limit error interrupt | *1 | - | - | - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| *1 | ADI20 | Scan group 0 (SG0) end interrupt | *1 | *1 | *1 | GTM*2 |
| *1 | ADI21 | Scan group 1 (SG1) end interrupt | *1 | *1 | *1 | GTM*2 |
| *1 | ADI22 | Scan group 2 (SG2) end interrupt | *1 | *1 | *1 | GTM*2 |
| *1 | ADI23 | Scan group 3 (SG3) end interrupt | *1 | *1 | *1 | GTM*2 |
| *1 | ADI24 | Scan group 4 (SG4) end interrupt | *1 | *1 | *1 | GTM*2 |
| *1 | ADMPXI2 | MPX interrupt | *1 | *1 | *1 | - |

Note 1. ADE0, ADE2, ADI00 to ADI04, ADI20 to ADI24, ADMPXIO and ADMPXI2 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.
For the Interrupt Number and DMA Trigger Number, refer to Table 34.15 to Table 34.28.
Note 2. ADI00 to ADI04 and ADI20 to ADI24 are chosen by the PIC (Peripheral Interconnection), and these are forwarded to the GTM. For details, refer to Section 33, Peripheral Interconnection (PIC).

Table 34.11 Interrupt Requests (2)

| Interrupt <br> symbol name | Unit Interrupt Signal | Outline | Interrupt <br> Number | sDMA <br> Trigger <br> Number | DTS <br> Trigger <br> Number | Other <br> Trigger <br> Signals |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |

ADCH1

| $* 1$ | ADE1 <br> (merged INT_UL1) | A/D error interrupt <br> Upper/lower limit error interrupt | $* 1$ | - | - | - |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $* 1$ | ADI10 | Scan group 0 (SG0) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADI11 | Scan group 1 (SG1) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADI12 | Scan group 2 (SG2) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADI13 | Scan group 3 (SG3) end interrupt | $* 1$ | $* 1$ | $* *$ | GTM $^{* 2}$ |
| $* 1$ | ADI14 | Scan group 4 (SG4) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | MPX interrupt | $* 1$ | $* 1$ | $* 1$ | - |  |

| ADCH3 | ADE3 <br> (merged INT_UL3) | A/D error interrupt <br> Upper/lower limit error interrupt | $* 1$ | - | - | - |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $* 1$ | ADI30 | Scan group 0 (SG0) end interrupt | $* 1$ | $* 1$ | $* 1$ |  |
| $* 1$ | ADI31 | Scan group 1 (SG1) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADI32 | Scan group 2 (SG2) end interrupt | $* 1$ | $* 1$ | $* *$ | GTM $^{* 2}$ |
| $* 1$ | ADI33 | Scan group 3 (SG3) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADI34 | Scan group 4 (SG4) end interrupt | $* 1$ | $* 1$ | $* 1$ | GTM $^{* 2}$ |
| $* 1$ | ADMPXI3 | MPX interrupt | $* 1$ | $* 1$ | $* 1$ | - |

Note 1. ADE1, ADE3, ADI10 to ADI14, ADI30 to ADI34, ADMPXI1 and ADMPXI3 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.
For the Interrupt Number and DMA Trigger Number, refer to Table 34.15 to Table 34.28 .
Note 2. ADI10 to ADI14 and ADI30 to ADI34 are chosen by the PIC (Peripheral Interconnection), and these are forwarded to the GTM. For details, refer to Section 33, Peripheral Interconnection (PIC).

Table 34.12 Interrupt Requests (3)

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS Trigger Number | Other Trigger Signals |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ASF0 |  |  |  |  |  |  |
| *1 | ASIO | Ch0 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI1 | Ch1 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI2 | Ch2 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI3 | Ch3 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI4 | Ch4 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI5 | Ch5 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI6 | Ch6 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI7 | Ch7 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI8 | Ch8 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI9 | Ch9 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI10 | Ch10 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI11 | Ch11 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI12 | Ch12 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI13 | Ch13 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI14 | Ch14 integration end interrupt | *1 | *1 | *1 | - |
| *1 | ASI15 | Ch15 integration end interrupt | *1 | *1 | *1 | - |

Note 1. ASIO to ASI15 are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.
For the Interrupt Number and DMA Trigger Number, refer to Table 34.15 to Table 34.28.

Table 34.13 Interrupt Requests (4)

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS <br> Trigger Number | Other Trigger Signals |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ABFG |  |  |  |  |  |  |
| *1 | BFP0 | Boundary flag pulse 0 interrupt | *1 | *1 | *1 | - |
| *1 | BFP1 | Boundary flag pulse 1 interrupt | *1 | *1 | *1 | - |
| *1 | BFP2 | Boundary flag pulse 2 interrupt | *1 | *1 | *1 | - |
| *1 | BFP3 | Boundary flag pulse 3 interrupt | *1 | *1 | *1 | - |
| *1 | BFP4 | Boundary flag pulse 4 interrupt | *1 | *1 | *1 | - |
| *1 | BFP5 | Boundary flag pulse 5 interrupt | *1 | *1 | *1 | - |
| *1 | BFP6 | Boundary flag pulse 6 interrupt | *1 | *1 | *1 | - |
| *1 | BFP7 | Boundary flag pulse 7 interrupt | *1 | *1 | *1 | - |
| *1 | BFP8 | Boundary flag pulse 8 interrupt | *1 | *1 | *1 | - |
| *1 | BFP9 | Boundary flag pulse 9 interrupt | *1 | *1 | *1 | - |
| *1 | BFP10 | Boundary flag pulse 10 interrupt | *1 | *1 | *1 | - |
| *1 | BFP11 | Boundary flag pulse 11 interrupt | *1 | *1 | *1 | - |
| *1 | BFP12 | Boundary flag pulse 12 interrupt | *1 | *1 | *1 | - |
| *1 | BFP13 | Boundary flag pulse 13 interrupt | *1 | *1 | *1 | - |
| *1 | BFP14 | Boundary flag pulse 14 interrupt | *1 | *1 | *1 | - |
| *1 | BFP15 | Boundary flag pulse 15 interrupt | *1 | *1 | *1 | - |
| *1 | BFP16 | Boundary flag pulse 16 interrupt | *1 | *1 | *1 | - |
| *1 | BFP17 | Boundary flag pulse 17 interrupt | *1 | *1 | *1 | - |
| *1 | BFP18 | Boundary flag pulse 18 interrupt | *1 | *1 | *1 | - |
| *1 | BFP19 | Boundary flag pulse 19 interrupt | *1 | *1 | *1 | - |
| *1 | BFP20 | Boundary flag pulse 20 interrupt | *1 | *1 | *1 | - |
| *1 | BFP21 | Boundary flag pulse 21 interrupt | *1 | *1 | *1 | - |
| *1 | BFP22 | Boundary flag pulse 22 interrupt | *1 | *1 | *1 | - |
| *1 | BFP23 | Boundary flag pulse 23 interrupt | *1 | *1 | *1 | - |
| *1 | BFP24 | Boundary flag pulse 24 interrupt | *1 | *1 | *1 | - |
| *1 | BFP25 | Boundary flag pulse 25 interrupt | *1 | *1 | *1 | - |

Note 1. The BFPw are chosen by the AIR (ADC Interrupt Router), and these are forwarded to the INTC and DMAC.
For the Interrupt Number and DMA Trigger Number, refer to Table 34.15 to Table 34.28.

Table 34.14 Interrupt Requests (5)

| Interrupt symbol name | Unit Interrupt Signal | Outline | Interrupt Number | sDMA Trigger Number | DTS <br> Trigger <br> Number | Other <br> Trigger <br> Signals |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |

### 34.1.5 Reset Source

The ADCHn reset sources are listed in the following table. The ADCHn is initialized by the following reset sources.
Table 34.29 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Unit Name | Register Name | Power Up <br> Reset | System <br> Reset 1 | System <br> Reset 2 | Application <br> Reset | Module Reset | JTAG Reset |
| ADCHn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| IFCu | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ASFr | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| AVSEG | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| ABFG | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| AIR | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 34.1.6 External Input/Output Signals

The External Input/Output signals of the ADCHn are listed below.
Table 34.30 ADCH0 External Input / Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| ADCH0 |  |  |
| A0VCC | Power supply pin for the analog part | A0VCC |
| AOVSS | Ground pin for the analog part | AOVSS |
| AOVREFH | Reference voltage pin for the analog part | AOVREFH |
| AN000 | Analog input pin | AN000 |
| AN001 | Analog input pin | AN001 |
| AN002 | Analog input pin | AN002 |
| AN003 | Analog input pin | AN003 |
| AN010 | Analog input pin | AN010 |
| AN011 | Analog input pin | AN011 |
| AN012 | Analog input pin | AN012 |
| AN013 | Analog input pin | AN013 |
| AN020 | Analog input pin | AN020 |
| AN021 | Analog input pin | AN021 |
| AN022 | Analog input pin | AN022 |
| AN023 | Analog input pin | AN023 |
| AN030 | Analog input pin | AN030 |
| AN031 | Analog input pin/ External analog multiplexer input pin | AN031 |
| AN032 | Analog input pin | AN032 |
| AN033 | Analog input pin | AN033 |
| AN040 | Analog input pin | AN040 |
| AN041 | Analog input pin | AN041 |
| AN042 | Analog input pin | AN042 |
| AN043 | Analog input pin | AN043 |
| AN050 | Analog input pin | AN050 |
| AN051 | Analog input pin | AN051 |
| AN052 | Analog input pin | AN052 |
| AN053 | Analog input pin | AN053 |
| AN060 | Analog input pin | AN060 |
| AN061 | Analog input pin | AN061 |
| AN062 | Analog input pin | AN062 |
| AN063 | Analog input pin | AN063 |
| ADTRG0 | External trigger pin*1 | ADTRG0 |
| ADEND0 | A/D conversion timing monitor pin | ADEND0 |
| ADMPX00 | ADMPX value | ADMPX00 |
| ADMPX01 | ADMPX value | ADMPX01 |
| ADMPX02 | ADMPX value | ADMPX02 |
| ADMPX03 | ADMPX value | ADMPX03 |
| ADMPX04 | ADMPX value | ADMPX04 |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to Section 2, Pin Function.

Table 34.31 ADCH2 External Input / Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| ADCH2 |  |  |
| A2VCC | Power supply pin for the analog part | A2VCC |
| A2VSS | Ground pin for the analog part | A2VSS |
| A2VREFH | Reference voltage pin for the analog part | A2VREFH |
| AN200 | Analog input pin | AN200 |
| AN201 | Analog input pin | AN201 |
| AN202 | Analog input pin | AN202 |
| AN203 | Analog input pin | AN203 |
| AN210 | Analog input pin | AN210 |
| AN211 | Analog input pin | AN211 |
| AN212 | Analog input pin | AN212 |
| AN213 | Analog input pin | AN213 |
| AN220 | Analog input pin | AN220 |
| AN221 | Analog input pin | AN221 |
| AN222 | Analog input pin | AN222 |
| AN223 | Analog input pin | AN223 |
| AN230 | Analog input pin | AN230 |
| AN231 | Analog input pin | AN231 |
| AN232 | Analog input pin | AN232 |
| AN233 | Analog input pin | AN233 |
| AN240 | Analog input pin | AN240 |
| AN241 | Analog input pin | AN241 |
| AN242 | Analog input pin | AN242 |
| AN243 | Analog input pin / External analog multiplexer input pin | AN243 |
| AN250 | Analog input pin | AN250 |
| AN251 | Analog input pin | AN251 |
| AN252 | Analog input pin | AN252 |
| AN253 | Analog input pin | AN253 |
| AN260 | Analog input pin | AN260*2 |
| AN261 | Analog input pin | AN261*2 |
| AN262 | Analog input pin | AN262*2 |
| AN263 | Analog input pin | AN263*2 |
| ADTRG2 | External trigger pin*1 | ADTRG2 |
| ADEND2 | A/D conversion timing monitor pin | ADEND2 |
| ADMPX20 | ADMPX value | ADMPX20 |
| ADMPX21 | ADMPX value | ADMPX21 |
| ADMPX22 | ADMPX value | ADMPX22 |
| ADMPX23 | ADMPX value | ADMPX23 |
| ADMPX24 | ADMPX value | ADMPX24 |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to Section 2, Pin Function.
Note 2. These signals are not allocated to terminals in the 292-pin package.

Table 34.32 ADCH1 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :---: | :---: | :---: |
| ADCH1 |  |  |
| A1VCC | Power supply pin for the analog part | A1VCC |
| A1VSS | Ground pin for the analog part | A1VSS |
| A1VREFH | Reference voltage pin for the analog part | A1VREFH |
| AN100 | Analog input pin / External analog multiplexer input pin | AN100 |
| AN101 | Analog input pin | AN101 |
| AN102 | Analog input pin | AN102 |

Note 1. When the external trigger pin is used, the noise filter for the port needs to be set. For details, refer to Section 2, Pin Function.

For ADCHn , it's possible to perform an $\mathrm{A} / \mathrm{D}$ conversion of an analog input with the assistance of RRAMP.
For ADCH0, it's possible to perform an A/D conversion of VCC, E0VCC (called EVCC hereafter) and VDD as secondary power supply voltage monitor.

For analog inputs and VMON (Secondary power supply voltage monitor), the correspondence list of physical channel, physical channel groups, physical sub channel and RRAMP is shown in the following table.

Table 34.34 ADCH0 Physical Channel, Physical Channel Group, Physical Sub Channel and RRAMP

| Analog Input or VMON | Physical <br> Channel | Physical <br> Channel Group | Physical <br> Sub Channel | RRAMP Correspondence |  |  |  |

### 34.2 Overview

### 34.2.1 Functional Overview

The ADCH has the following features.

- Configuration of analog input pins

See Section 34.1.1, Number of Units and Channels about the number of modules, the number of total analog input pins, the number of dedicated analog input pins and the number of shared analog input pins.

- Sample-and-hold function

Each module has an internal sample-and-hold circuit that enables each module to perform an A/D conversion independently.

- Advanced A/D converter

Resolution: 12 / 10 bits
A/D conversion method: Successive approximation
Conversion speed: $1.0 \mu \mathrm{~s}$

- Supporting five scan groups

Each ADCH has five scan groups. Scan settings can be made independently for each scan group.

- Two scan modes

Each ADCH has two scan modes.
Multicycle scan mode executes the specified number of scans.
Continuous scan mode executes scans repeatedly without limit.

- Virtual channels

Each ADCH has several virtual channels. See Section 34.1.1, Number of Units and Channels about the number of virtual channels. Analog channels for which A/D conversion is to be made and other accompanying information are set for each virtual channel. By sequentially performing the processing for the virtual channels indicated by the start virtual channel pointer and the end virtual channel pointer in each scan group, scans (which can perform A/D conversion for any analog channels in any order) can be executed. Each virtual channel can be mapped to any physical channel.

- Extended physical channels

Each ADCH can extend physical channels by using an external analog multiplexer. Furthermore, an external analog multiplexer can be used with either I/O port (pins) or the CSIH (peripheral). The I/O port and/or CSIH is under the control of the ADCH for multiplexer channel selection. The CSIH interface requires DMA when used. (One channel can be set for each ADCH.)

- Interval function

The ADCH can start scan groups in any cycle by using the $\mathrm{A} / \mathrm{D}$ timer equipped in the scan groups 3 and 4 . This enables scans with intervals inserted.

- A/D-converted value adding function

The ADCH performs A/D conversion sequentially twice or four times for a channel, and stores the addition result in the data register. The setting of use or not use of the addition function can be set each virtual channel. But the setting of addition count can be set as common setting in all virtual channels.
The effect of the moving average filter can be gained by using this function.
In addition, using the optional ADC Summation Function (ASF) makes an extended summation function available.
For details, see Section 34.8, ADC Summation Function (ASF).

- Data registers

Data registers corresponding to virtual channels are provided.

- Start trigger for each scan group

Hardware triggers and software triggers can start the processing of each scan group. Only scan groups 3 and 4 can start processing by an $\mathrm{A} / \mathrm{D}$ timer trigger.

- Asynchronous/synchronous suspend and resume function Processing for a scan group can interrupt an ongoing processing for another scan group. The priority is as follows:

| Low | High |
| :--- | :---: |
|  |  |
| $\mathrm{SG} 0<\mathrm{SG} 1<\mathrm{SG} 2<\mathrm{SG} 3<\mathrm{SG} 4$ | (SG: Scan group) |

The following suspend methods can be chosen:
Synchronous suspend: Processing is suspended after the ongoing virtual channel processing has stopped.
Asynchronous suspend: Processing is suspended immediately.
Synchronous/asynchronous mixture type suspend:
SGx except for SG0 is "synchronous suspend" mode.
SG0 is in "asynchronous suspend" mode.

- Entry to the digital filter engine, and the ADC summation function, and the Generic Timer Module

A/D-converted values can be directly entered into the Digital Filter Engine (DFE), or the ADC Summation Function (ASF), or the Generic Timer Module (GTM). Whether to enable or disable entry and a tag used to define the target channel to be entered can be set for each virtual channel. Entry to the DFE (GTM) or entry to the ASF can be set for each scan group.
For details of the DFE, refer to Section 37, Digital Filter Engine (DFE).
For details of the ASF, refer to Section 34.8, ADC Summation Function (ASF). For details of the GTM, refer to Section 31, Generic Timer Module (GTM).

- Scan end interrupt and DMA transfer

Each scan group can generate an interrupt request to the INTC and activate the DMAC each time a processing for the virtual channel indicated by the end virtual channel pointer ends or a virtual channel ends.

- Interrupt and DMA transfer for an external analog multiplexer

The ADCH can generate an interrupt request to the INTC and activate the DMAC when the specified virtual channel is started. This enables transfer of the MPX value to an external analog multiplexer in cooperation with an I/O port or CSIH. There is a register to provide for a programmable ADC conversion delay ( N us $(\mathrm{N}=0,1,2, \ldots, 10)$ ) for DMA transfer time and external multiplexer settling time.

- Selectable analog conversion voltage

The AnVREFH pin can be used to set the voltage range for analog conversion.

- A/D conversion monitor output

The processing timing of a desired virtual channel can be output to the $\mathrm{A} / \mathrm{D}$ conversion monitor output pin (ADENDn).

- A wide range of safety functions

The ADCH has various safety functions, including self-diagnosis, pin-level self-diagnosis, wiring-break detection, self-diagnosis of the wiring-break detection function, self-diagnosis of the secondary power supply voltage monitor function, normality check for analog selection; and for the data registers, upper-limit/lower-limit check, parity check, overwrite check, and read and clear functions.

- Upper/lower-limit-excursion-notice-function to ADC VMON secondary error generator (AVSEG) or ADC boundary flag generator (ABFG) in each virtual channel
The ADCHn can output to the ADC-VMON-secondary-error-generator (AVSEG) (The output to AVSEG is ADCH0 only) or the ADC-boundary-flag-generator (ABFG) a signal to notify that an A/D conversion result has increased above the upper limit value of the designated table in each virtual channel or that an $A / D$ conversion result has decreased below the lower limit value of the designated table in each virtual channel.
Once the Table register for the upper/lower limit value is set, it can be rewritten at any time.
For details of the AVSEG, Section 34.9, ADC VMON Secondary Error Generator (AVSEG). For details of the ABFG, Section 34.10, ADC Boundary Flag Generator (ABFG).
- Secondary power supply voltage monitor (VMON)

The ADCH0 can convert the voltage of VCC, EVCC, and the VDD power supply in AD.
Secondary HDET, Secondary LDET of each power supply (VCC, EVCC and VDD) can be notified to ECM by using the upper/lower-limit-excess-notice-function of ADCH0 and AVSEG.
For details of AVSEG, Section 34.9, ADC VMON Secondary Error Generator (AVSEG).
For the whole description of power supply voltage monitor, refer to Section 12, Power Supply Voltage
Monitor.

### 34.2.2 Block Diagram

The block diagram of ADCH 0 is shown in Figure 34.1. The block diagram of ADCH 2 is shown in Figure 34.2. The block diagram of ADCH 1 is shown in Figure 34.3. The block diagram of ADCH 3 is shown in Figure 34.4.

### 34.3 Registers

### 34.3.1 List of Registers

The ADCH registers are listed in the following table.
For details about <ADCHn_base>, see Section 34.1.2, Register Base Address.
Table 34.38 List of Registers (1/3)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| ADCH Common Registers |  |  |  |  |  |
| ADCH0 | A/D Synchronization Start Control Register | ADCH0ADSYNSTCR | $\begin{aligned} & \text { <ADCHO_base> + } \\ & 300_{\mathrm{H}} \end{aligned}$ | 8 | - |
| ADCH0 | A/D Timer Synchronization Start Control Register | ADCHOADTSYNSTCR | $\begin{aligned} & \text { <ADCH0_base> + } \\ & 304_{H} \end{aligned}$ | 8 | - |
| ADCH0 | Voltage Monitor Voltage Divider Control Register 1 | ADCH0VMONVDCR1 | $\begin{aligned} & <\mathrm{ADCHO}_{1} \text { base> + } \\ & 30 \mathrm{C}_{\mathrm{H}} \end{aligned}$ | 8 | - |
| ADCH0 | Voltage Monitor Voltage Divider Control Register 2 | ADCHOVMONVDCR2 | $\begin{array}{\|l} \text { <ADCHO_base> + } \\ 310_{\mathrm{H}} \end{array}$ | 8 | - |
| ADCH Specific Registers (Virtual Channel) |  |  |  |  |  |
| ADCHn | Virtual Channel Register j | ADCHnVCRj | $\begin{aligned} & <A D C H n \_b a s e>+j \\ & \times 4_{H} \end{aligned}$ | 8, 16, 32 | - |
| ADCHn | Data Register j | ADCHnDRj | $\begin{aligned} & \text { <ADCHn_base> + } \\ & 100_{H}+j \times 2_{H} \end{aligned}$ | 16, 32 (j is even) 16 ( j is odd) | - |
| ADCHn | Data Supplementary Information Register j | ADCHnDIRj | $\begin{aligned} & \text { <ADCHn_base> + } \\ & 200_{\mathrm{H}}+\mathrm{j} \times 4_{\mathrm{H}} \end{aligned}$ | 16, 32 | - |
| ADCH Specific Registers (Control) |  |  |  |  |  |
| ADCHn | A/D Halt Register | ADCHnADHALTR | $\begin{aligned} & <\mathrm{ADCHn}^{2} \text { base> + } \\ & 380_{\mathrm{H}} \end{aligned}$ | 8 | - |
| ADCHn | A/D Control Register 1 | ADCHnADCR1 | $\begin{aligned} & <\mathrm{ADCHn}^{2} \text { base> + } \\ & 384_{\mathrm{H}} \end{aligned}$ | 8 | - |
| ADCHn | MPX Current Control Register | ADCHnMPXCURCR | $\begin{aligned} & <\mathrm{ADCHn}^{2} \text { base> + } \\ & 388_{\mathrm{H}} \end{aligned}$ | 8 | - |
| ADCHn | MPX Interrupt Enable Register | ADCHnMPXINTER | $\begin{aligned} & <\mathrm{ADCHn}^{2} \text { base> + } \\ & 38 \mathrm{~A}_{H} \end{aligned}$ | 8 | - |

### 34.3.2 ADCH Common Registers

This section describes the common registers for each ADCH.

### 34.3.2.1 ADCHOADSYNSTCR — A/D Synchronization Start Control Register

ADCH0ADSYNSTCR is an 8-bit write-only register that controls the simultaneous start of $\mathrm{A} / \mathrm{D}$ conversions for scan groups of each ADCH. The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADSTART |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.39 ADCHOADSYNSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADSTART | This bit starts an A/D conversion for scan groups of each ADCH. |
|  |  | The Start condition for SGx of ADCHn: |
|  | 1 is written to ADSTART when SGACT for SGx of ADCHn is 0 and ADSTARTE is 1. |  |
|  |  | The A/D conversion is started simultaneously for the scan groups (of each ADCH) for which |
|  | ADSTARTE has been set to 1. |  |

### 34.3.2.2 ADCHOADTSYNSTCR — A/D Timer Synchronization Start Control Register

ADCH0ADTSYNSTCR is an 8-bit write-only register that controls the simultaneous start of counting by the $\mathrm{A} / \mathrm{D}$ timers of each ADCH. The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADTSTART |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.40 ADCHOADTSYNSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADTSTART | This bit starts the counting by the A/D timers of each ADCH. |
|  |  | The start condition for SGx of ADCHn: |
|  | 1 is written to ADTSTART when ADTACT for A/D timer y of ADCHn is 0 and ADTSTARTE |  |
|  | is 1. |  |
|  | The A/D timers (of each ADCH) for which ADTST has been set to 1 start counting |  |
|  | simultaneously. |  |
|  | Writting 0 to this bit is ignored. |  |
|  |  |  |

### 34.3.2.3 ADCHOVMONVDCR1 — Voltage Monitor Voltage Divider Control Register 1

ADCH0VMONVDCR1 is an 8-bit readable / writable register that controls the voltage monitor voltage divider of the power supply. This is only present in ADCH 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | VDE1 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 34.41 ADCH0VMONVDCR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | VDE1 | Voltage divider enable (resistance voltage divider control) |
|  |  | The resistance voltage divider is controlled by ADCHOVMONVDCR2.VDE2 and VDE1. |
|  |  | For details, refer to Table 34.43. |
| CAUTION |  |  |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.
Do not perform an A/D conversion with ADCHOVMONVDCR1.VDE1, $\operatorname{ADCHOVMONVDCR2.VDE2~}=01_{\mathrm{B}}$ or 10 B .

### 34.3.2.4 ADCHOVMONVDCR2 — Voltage Monitor Voltage Divider Control Register 2

ADCH0VMONVDCR2 is an 8-bit readable / writable register that controls the voltage monitor voltage divider of the power supply. This is only present in ADCH 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | VDE2 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 34.42 ADCHOVMONVDCR2 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | VDE2 | Voltage divider enable (resistance voltage divider control) |
|  |  | The resistance voltage divider is controlled by ADCHOVMONVDCR1.VDE1 and VDE2. |
|  | For details, refer to Table 34.43. |  |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.
Do not perform an A/D conversion with ADCHOVMONVDCR1.VDE1, $A D C H O V M O N V D C R 2 . V D E 2=01_{\mathrm{B}}$ or $10_{\mathrm{B}}$ setting.

Table 34.43 Resistance Voltage Divider and Pull-down Control Setting Table

| VDE1 | VDE2 | Resistance voltage divide | Pull-down |
| :--- | :--- | :--- | :--- |
| 0 | 0 | Off | On |
| 0 | 1 | Off | Off |
| 1 | 0 | Off | Off |
| 1 | 1 | On | Off |

### 34.3.3 ADCH Specific Registers (Virtual Channel, Control, Safety-related)

### 34.3.3.1 ADCHnVCRj — Virtual Channel Register j

ADCHnVCRj is a 32-bit readable/writable register used for each virtual channel. ADCHnVCRj is initialized to $00000000_{\mathrm{H}}$ at reset.

| Value after reset: 0000 0000H |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | $\underset{\mathrm{E}}{\text { VCULM }}$ | $\underset{\mathrm{E}}{\mathrm{VCLLM}}$ | - | - | - | VCULLMTBS[2:0] |  |  | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R | R | R | R/W | R/W | R/W | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | CNVCLS[2:0] |  |  | DFENT | DFTAG[3:0] |  |  |  | ADIE | - | GCTRL[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.44 ADCHnVCRj Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | VCULME | Virtual channel upper limit excess notice enable <br> 0 : An $A / D$ conversion result greater than the upper limit of the virtual channel is not notified. <br> 1: An A/D conversion result greater than the upper limit of the virtual channel is notified. <br> Notification is made by vcend[j] (A/D conversion end notice of ADCHnVCRj) and vculmo (virtual channel upper limit excess notice). For details, first see Figure 34.27 and see Section 34.4.9, Virtual Channel Upper/Lower Limit Excess Notice. |
| 30 | VCLLME | Virtual channel lower limit excess notice enable <br> 0 : An A/D conversion result is less than the lower limit of the virtual channel is not notified. <br> 1: An A/D conversion result is less than the lower limit of the virtual channel is notified. <br> Notification is made by vcend[j] (A/D conversion end notice of ADCHnVCRj) and vcllmo (virtual channel lower limit excess notice).For details, first see Figure 34.27 and see Section 34.4.9, Virtual Channel Upper/Lower Limit Excess Notice. |
| 29 to 27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 34.44 ADCHnVCRj Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 26 to 24 | VCULLMTBS[2:0] | Virtual channel upper/lower limit table register selection <br> Selects Virtual channel upper/lower limit table register that is the comparative target. <br> $0_{H}$ : ADCHnVCULLMTBRO is chosen [default] <br> $1_{\mathrm{H}}$ : ADCHnVCULLMTBR1 is chosen <br> $2_{\mathrm{H}}$ : ADCHnVCULLMTBR2 is chosen <br> $3_{H}$ : ADCHnVCULLMTBR3 is chosen <br> $4_{H}$ : ADCHnVCULLMTBR4 is chosen <br> $5_{\mathrm{H}}$ : ADCHnVCULLMTBR5 is chosen <br> $6_{\mathrm{H}}$ : ADCHnVCULLMTBR6 is chosen <br> $7_{\mathrm{H}}$ : Setting prohibited |
| 23 to 16 | Reserved | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 13 | CNVCLS[2:0] | Conversion Class <br> $\mathrm{O}_{\mathrm{H}}$ : Normal A/D conversion <br> $3_{H}$ : A/D converter self-diagnosis <br> $4_{\mathrm{H}}$ : Normal A/D conversion in addition mode <br> $5_{\mathrm{H}}$ : Normal A/D conversion with the MPX <br> $6_{H}$ : Normal A/D conversion with the MPX in addition mode Other than above: Setting prohibited |
| 12 | DFENT | DFE Entry <br> 0 : Entry disabled <br> 1: Entry enabled <br> This bit specifies whether to enable or disable entry to the DFE (Digital Filter Engine), or ASF (ADC summation function). Only the scan groups enabled by DFENTSGxE and ASENTSGxE in the ADCHnDFASENTSGER are entered. |
| 11 to 8 | DFTAG[3:0] | DFE-TAG <br> When entry to the DFE is requested, entry is made to the DFE channel for which the same tag with DFTAG[3:0] is set. If this applies to multiple channels, entry is made to multiple channels. When entry to the ASF is requested, entry is made to the ASF channel corresponding to the values set in DFTAG[3:0]. When entry to the ASF is requested, set the DFTAG [3:0] of each ADCHnVCRj to a different value. When the DFTAG [3:0] of several ADCHnVCRj is set to the same value, accumulation data of ASF can't be guaranteed. |
| 7 | ADIE | Virtual Channel End Interrupt Enable <br> 0 : ADInx is not output when the A/D conversion for virtual channel $n$ ends in $S G x$. <br> 1: ADInx is output when the A/D conversion for virtual channel $n$ ends in SGx. <br> ADIE in ADCHnSGCRx is independent of ADIE in ADCHnVCRj. For details, see Section 34.4.6.1, Scan End Interrupt Request. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table $34.44 \quad$ ADCHnVCRj Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 5 to 0 | GCTRL[5:0] | General Control |
|  |  | -For normal A/D conversions (CNVCLS[2:0] = $0_{H}$ ) |
|  |  | -GCTRL[4:2]: Physical Channel Group These bits specify a physical channel group. |
|  |  | -GCTRL[1:0]: Physical Sub channel <br> These bits specify a physical sub channel. |
|  |  | Always set the other GCTRL bits to 0 . |
|  |  | -For self-diagnosis (CNVCLS[2:0] $=3$ H ) |
|  |  | - GCTRL[4:0]: Self-diagnostic Voltage Level |
|  |  | 10н: AnVREFH $\times 1$ |
|  |  | $0 C_{H}$ : AnVREFH $\times 3 / 4$ |
|  |  | 08\%: AnVREFH $\times 1 / 2$ |
|  |  | 04\%: AnVREFH $\times 1 / 4$ |
|  |  | $00_{\text {H: }}$ AnVREFH $\times 0$ |

Other than the above: Setting prohibited
Always set the other GCTRL bits to 0 .
-For normal A/D conversions in addition mode (CNVCLS[2:0] = 4H)
-GCTRL[4:2]: Physical Channel Group
These bits specify a physical channel group.
-GCTRL[1:0]: Physical sub channel
These bits specify a physical sub channel.
Always set the other GCTRL bits to 0 .
The count specified by ADDNT is reflected as the number of addition times.
-For normal A/D conversions with the MPX (CNVCLS[2:0] = $5_{H}$ )
-GCTRL[4:0]: MPX Channel Setting
These bits set the MPX value to be transferred to an external analog multiplexer. The GCTRL[4:0] value is transferred to ADCHnMPXCURR at the start of a virtual channel, and an interrupt request (ADMPXIn) or a DMA request is issued.
Activating an interrupt or the DMAC, and transferring ADCHnMPXCURR toPSRn of the I/O port, or to CSIHnTXOH of CSIH enables the transfer of the MPX value to an external analog multiplexer. For details, see Section 34.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode.
Always set the other GCTRL bits to 0 .

- For normal A/D conversions with the MPX in addition mode (CNVCLS[2:0] = $6_{\mathrm{H}}$ )
-GCTRL[4:0]: MPX Channel Setting
These bits set the MPX value to be transferred to an external analog multiplexer. The GCTRL[4:0] value is transferred to ADCHnMPXCURR at the start of a virtual channel, and an interrupt request (ADMPXIn) or a DMA request is issued.
Activating an interrupt or the DMAC, and transferring ADCHnMPXCURR to PSRn of the I/O port, or to CSIHnTXOH of CSIH enables the transfer of the MPX value to an external analog multiplexer. For details, see Section 34.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode.
The count specified by ADDNT is reflected as the number of addition times.
Always set the other GCTRL bits to 0 .

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update. But when scan group is terminated, clearing ADIE to 0 isn't included in the limitations.

### 34.3.3.2 ADCHnDRj — Data Register j

ADCHnDRj is a 16 -bit read-only register that stores an $\mathrm{A} / \mathrm{D}$ converted value.
ADCHnDRj is provided for each virtual channel, and its format depends on the DFMT[1:0] setting for the ADCHnADCR2 and the ADDNT setting when CNVCLS[2:0] $=4_{\mathrm{H}}$ or $6_{\mathrm{H}}$. The format of data transferred to the Digital Filter Engine (DFE), ADC Summation Function (ASF), and Integer/Floating-point Conversion module (IFC) also depends on the above settings.

When unsigned fixed-point format is selected, the format of the data transferred to the DFE, ASF and IFC is signed fixed-point format.

ADCHnDRj is initialized to $0000_{\mathrm{H}}$ at reset.

A method of rounding from 12-bit to 10 -bit resolution is described below.
Table 34.45 A rounding method from 12-bit to 10-bit resolution

| Addition | 12 bit A/D conversion value |  |  | 10 bit A/D conversion value |
| :---: | :---: | :---: | :---: | :---: |
|  | [11:2] | [1] | [0] | [9:0] |
| None (One time conversion) | $3 \mathrm{FF}_{\mathrm{H}}$ | Round-down | Round-down | 12 bit A/D conversion value[11:2] |
|  | $3 \mathrm{FE}_{\mathrm{H}}$ to $000{ }_{\text {H }}$ | This bit is added to [11:2] |  | 12 bit A/D conversion value[11:2] + 12 bit A/D conversion value[1] |

| Addition | 12 bit A/D conversion value |  |  | 10 bit A/D conversion value |
| :---: | :---: | :---: | :---: | :---: |
|  | [12:2] | [1] | [0] | [10:0] |
| Twice | $7 \mathrm{FF}_{\mathrm{H}}$ | Round-down | Round-down | 12 bit A/D conversion value[12:2] |
|  | $7 \mathrm{FE}_{\mathrm{H}}$ to $000{ }_{\mathrm{H}}$ | This bit is added to [12:2] |  | 12 bit A/D conversion value[12:2] + 12 bit A/D conversion value[1] |

| Addition | 12 bit A/D conversion value |  |  | 10 bit A/D conversion value |
| :---: | :---: | :---: | :---: | :---: |
|  | [13:2] | [1] | [0] | [11:0] |
| 4 times | $\mathrm{FFF}_{\mathrm{H}}$ | Round-down | Round-down | 12 bit A/D conversion value[13:2] |
|  | $\mathrm{FFE}_{H}$ to $000_{H}$ | This bit is added to [13:2] |  | 12 bit A/D conversion value[13:2] + 12 bit A/D conversion value[1] |

The format of ADCHnDRj or ADCHnDIRj.ADCHnDRj by the combination of the data format (ADCHnADCR2.DFMT [1:0]), the addition mode (ADCHnVCRj.CNVCLS [2:0]) and the number of addition times (ADCHnADCR2.ADDNT) is described below.

When the data format (ADCHnADCR2.DFMT [1:0]), the addition mode (ADCHnVCRj.CNVCLS [2:0]) and the number of addition times (ADCHnADCR2.ADDNT) are rewritten before reading ADCHnDRj or ADCHnDIRj, ADCHnDRj or ADCHnDIRj are read in the rewritten format.
(1) The format when reading from the P-Bus

For signed 12 bit fixed-point format (DFMT[1:0] = 00 ${ }_{\mathrm{B}}$ )

| Addition | CNVCLS | ADDNT | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 4 times |  | 1 |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 |
| Position of decimal point |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

For unsigned 10 bit fixed-point format (DFMT[1:0] = 11 ${ }_{\text {B }}$ )

| S | : Sign bit (always 0 ) |
| :--- | :--- |
|  | : Zero extension |

(2) The format of the data transferred to the DFE, GTM, ASF, IFC

For unsigned 12 bit fixed-point format (DFMT[1:0] = $00_{B} / 10_{B} / 11_{B}$ )

| Addition | CNVCLS | ADDNT | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| None (One time conversion) | $\neq 4_{H}, 6_{H}$ | - | S |  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 |
| Twice | $=4_{H}, 6_{\text {H }}$ | 0 | S |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 |
| 4 times |  | 1 | S |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |
|  | Position |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

| $S$ | $:$Sign bit (always 0$)$ <br> 0 |
| :--- | :--- |
|  | $:$ Zero extension |
| : When DFMT is $11_{\mathrm{B}}$, , it's fixed to zero. |  |

ADCHnDRj is cleared to $0000_{\mathrm{H}}$ when the ACDHnDRj or the ADCHnDIRj is read or ADCHnDRj is read via the IFC while RDCLRE is set to 1 .

ADCHnDRi and $\mathrm{ADCHnDRi}+1(\mathrm{i}=0,2,4, \ldots$ (even number)) must always be read together as 32 -bit data.

Note 1. $i=0,2,4 \ldots$ (even number)

When reading the ADCHnDRj by 16 bits, set the "Read and Clear Enable" to invalid (ADCHnSFTCR.RDCLRE=0) and set "Overwrite check Function" to invalid and then read ADCHnDRj*1.

Note 1. - Don't perform the expected value comparison of the WFLG bit of ADCHnDIRj.

- Don't perform the expected value comparison of an overwrite error register.
- Set the "Overwrite Error Interrupt Enable (OWEIE)" of the "Safety Control Register (ADCHnSFTCR)" to 0 (disable).
Note 2. When using DFE, ASF and IFC, setting to the signed 12 bit integer point format is prohibited.
Note 3. When after one of them of (i) to $(v)$ is done and before A/D conversion value is updated, then ADCHnDRi and ADCHnDRi+1 where the A/D conversion value was stored is read, there is a possibility that parity error which isn't intended occur, so be careful and use.
(i) The set value of ADCHnADCR2.DFMT[1:0] is changed from one of $0_{\mathrm{H}}, 1_{\mathrm{H}}$ and $2_{\mathrm{H}}$ to $3_{\mathrm{H}}$.
(ii) The set value of ADCHnADCR2.DFMT[1:0] is changed from $3_{\mathrm{H}}$ to one of $0_{\mathrm{H}}, 1_{\mathrm{H}}$ and 2 H .
(iii) The set value of ADCHnADCR2.ADDNT is changed.
(iv) The set value of ADCHnVCRj.CNVCLS[2:0] of corresponding scan group is changed from one of $0_{\mathrm{H}}, 3_{\mathrm{H}}$ and $5_{H}$ to one of 4 H and 6 H .
(v) The set value of ADCHnVCRj.CNVCLS[2:0] of corresponding scan group is changed from one of 4 H and $6_{\mathrm{H}}$ to one of $\mathrm{OH}_{\mathrm{H}} 3_{\mathrm{H}}$ and $5_{\mathrm{H}}$.

Note 4. For ADCHnDRj reading, when ADCHnDRi or ADCHnDRi+1 is read by 16 bits, $\operatorname{ADCHnDRi}$ and ADCHnDRi+1 are made the target of reading.
For example, one of them of (i) to (v) is done after scan group completion, then the scan group is performed again in setting of ADCHnSFTCR.RDCLRE=0.
Then if ADCHnDRi is read by 16 bits or 32bits before the A/D conversion value is stored in $A D C H n D R i+1$, there is a possibility that parity error which isn't intended occur.

### 34.3.3.3 ADCHnDIRj — Data Supplementary Information Register j

ADCHnDIRj is a 32-bit read-only register that stores the supplementary information of ADCHnDRj and the $\mathrm{A} / \mathrm{D}$ converted value. This register is readable as 32 -bit or as 16 -bit data.

When reading the ADCHnDIRj by 16 bits, read along with the indicated restrictions for reading of 16 bits as described in on Section 34.3.3.2, ADCHnDRj — Data Register j.

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | - | - | - | - | - | IDEF | WFLG | PRTY | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | ADCHnDRj |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 34.46 ADCHnDIRj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | IDEF | ID error |
|  |  | 0 : There is an error |
|  |  | 1: There is no error |
| 25 | WFLG | Write Flag |
|  |  | Setting condition |
|  |  | An A/D converted value is stored in the ADCHnDRj. |
|  |  | Clearing conditions |
|  |  | ADCHnDRj or ADCHnDIRj is read. |
|  |  | $A D C H n D R j$ is read via the IFC. |
| 24 | PRTY | Parity |
|  |  | Parity bit (even parity) for ADCHnDRj and IDEF. |
| 23 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

The IDEF bit will be 0 at the initial condition or when using a Read-and-Clear or at occurrence of an ID error. When an ID error is not detected by an $A / D$ conversion, the IDEF bit will be 1 . The timing for when this bit is set is simultaneous with the timing for which an $\mathrm{A} / \mathrm{D}$ conversion result is stored in a data register ( ADCHnDRj ).

The WFLG is cleared when ADCHnDRj or ADCHnDIRj is read or when ADCHnDRj is read via the IFC regardless of the RDCLRE setting.

The IDEF, PRTY and ADCHnDRj[15:0] bits are cleared when ADCHnDRj or ADCHnDIRj is read or when ADCHnDRj is read via the IFC while RDCLRE is set to 1 .

### 34.3.3.4 ADCHnADHALTR — A/D Halt Register

ADCHnADHALTR is an 8-bit write-only register that forcibly terminates the $\mathrm{A} / \mathrm{D}$ conversion. The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | HALT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.47 ADCHnADHALTR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | HALT | Halt |
|  |  | All scan groups and all AD timers are halted and initialized, and the ADC changes to the idle |
|  | state. |  |
|  | Writing 0: Scan groups and timers are not halted. |  |
|  |  | Writing 1: Scan groups and timers are halted. |

### 34.3.3.5 ADCHnADCR1 - A/D Control Register 1

ADCHnADCR 1 is an 8 -bit readable/writable register for ADC common control. ADCHnADCR 1 is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 34.48 ADCHnADCR1 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | SUSMTD[1:0] | Suspend Method |
|  |  | These bits select the suspend method when a higher-priority scan group interrupts a lowerpriority scan group. |
|  |  | Synchronous suspend: If a request from a higher-priority SG is present while a lower-priority SG is being processed, processing for the lower-priority SG is suspended after the ongoing virtual channel processing is completed, and then processing for the higher-priority SG is executed. After processing for the higher-priority SG is completed, the suspended virtual channel processing for the lower-priority SG is resumed. |
|  |  | Asynchronous suspend: If a request from a higher-priority SG is present while a lower-priority SG is being processed, the ongoing virtual channel processing is immediately suspended, and then processing for the higher-priority SG is executed. After processing for the higher-priority SG is completed, the suspended virtual channel processing for the lower-priority SG is resumed. |
|  |  | $0_{\mathrm{H}}$ : Synchronous suspend |
|  |  | $1_{\mathrm{H}}$ : Asynchronous suspend when a higher-priority SG interrupts SG0, Synchronous suspend when a higher-priority SG interrupts a lower-priority SG (except for SG0) |
|  |  | 2 H : Asynchronous suspend |
|  |  | $3_{\mathrm{H}}$ : Setting prohibited |
|  |  | For details, see Figure 34.11 and Figure 34.12. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.6 ADCHnMPXCURCR — MPX Current Control Register

ADCHnMPXCURCR is an 8-bit readable/writable register that controls the ADCHnMPXCURR format. ADCHnMPXCURCR is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | MSKCFMT[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 34.49 ADCHnMPXCURCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | MSKCFMT[3:0] | MSKC Format Specification |
|  |  | These bits specify the MSKC[15:0] format of ADCHnMPXCURR. |
|  |  | MSKCFMT[3] |
|  |  | 0: MSKC[15:12] $=0000_{\text {B }}$ |
|  |  | 1: MSKC[15:12] $=1111_{\mathrm{B}}$ |
|  |  | MSKCFMT[2] |
|  |  | 0: MSKC[11:8] $=0000{ }_{\text {B }}$ |
|  |  | 1: $\operatorname{MSKC}[11: 8]=1111_{\mathrm{B}}$ |
|  |  | MSKCFMT[1] |
|  |  | 0: MSKC[7:4] $=0000{ }_{\text {B }}$ |
|  |  | 1: MSKC[7:4] $=0001_{\mathrm{B}}$ |
|  |  | MSKCFMT[0] |
|  |  | 0: MSKC[3:0] $=0000{ }_{\text {B }}$ |
|  |  | 1: $\operatorname{MSKC}[3: 0]=1111_{\mathrm{B}}$ |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.7 ADCHnMPXINTER — MPX Interrupt Enable Register

ADCHnMPXINTER is an 8-bit readable/writable register that controls the interrupt (ADMPXIn) output. ADCHnMPXINTER is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADMPXIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 34.50 ADCHnMPXINTER Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADMPXIE | MPX interrupt enable |
|  | This bits controls the ADMPXIn interrupt (ADMPXIn) output. |  |
|  | $0:$ ADMPXIn is not output |  |
|  | 1: ADMPXIn is output |  |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.8 ADCHnMPXCURR — MPX Current Register

ADCHnMPXCURR is a 32-bit read-only register that stores the MPX value for an external analog multiplexer.
ADCHnMPXCURR is initialized to $00000000_{\mathrm{H}}$ at reset.

Table 34.51 ADCHnMPXCURR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | MSKC[15:0] | Mask Control <br> When a virtual channel in which CNVCLS[2:0] in ADCHnVCRj is set to 5 H or 6 H is started, value of the format that depends on the MSKCFMT[3:0] setting of ADCHnMPXCURCR is transferred to MSKC[15:0] in ADCHnMPXCURR. For details, see Section 34.3.3.6, ADCHnMPXCURCR — MPX Current Control Register. |
| 15 to 8 | MPXCMD[7:0] | SPI Communication Command Information <br> A command information register to control an external analog multiplexer by using SPI communication. When a virtual channel in which CNVCLS[2:0] in ADCHnVCRj is set to $5_{H}$ or $6_{H}$ is started, the MPXCMD[7:0] value in ADCHnMPXCMDR is transferred to MPXCMD[7:0] in ADCHnMPXCURR. |
| 7 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | MPXCUR[4:0] | Current MPX Value <br> When a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is set to $5_{H}$ or $6_{H}$ is started, GCTRL[4:0] in ADCHnVCRj is transferred to MPXCUR[4:0].At this time, an interrupt request to the INTC or a DMA transfer request is generated. The DMAC transfers ADCHnMPXCURR to PSRn of the I/O port or to CSIHnTXOH of CSIH, enabling the MPX value to be sent to an external analog multiplexer. <br> When PSRn is used, transfer the MPX value as a 32-bit value. This enables rewriting of only the necessary ports by using the format control in MSKC[15:0]. When transferring the value to CSIHnTXOH, transfer the lower 16 bits. For details, see Section 34.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode. |

### 34.3.3.9 ADCHnMPXOWR — MPX Optional Wait register

ADCHnMPXOWR is an 8-bit readable/writable register that specifies the wait time to be inserted for an external analog multiplexer. ADCHnMPXOWR is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | MPXOW[3:0] |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W |

Table 34.52 ADCHnMPXOWR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 4 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 3 to 0 | MPXOW[3:0] | MPX Optional Wait |
|  |  | These bits specify the wait time to be inserted before an A/D conversion is started after a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is $5_{\mathrm{H}}$ or $6_{\mathrm{H}}$ is started. |
|  |  | $0_{\mathrm{H}}: 0 \mu \mathrm{~s}$ |
|  |  | $1_{\mathrm{H}}: 1 \mu \mathrm{~s}$ |
|  |  | $2 \mathrm{H}: 2 \mu \mathrm{~s}$ |
|  |  | $3_{\mathrm{H}}: 3 \mu \mathrm{~s}$ |
|  |  | 4H: $4 \mu \mathrm{~s}$ |
|  |  | $5_{\mathrm{H}}: 5 \mu \mathrm{~s}$ |
|  |  | $6 \mathrm{H}: 6 \mu \mathrm{~s}$ |
|  |  | $7_{\mathrm{H}}: 7 \mu \mathrm{~s}$ |
|  |  | 8\%: $8 \mu \mathrm{~s}$ |
|  |  | $9_{\mathrm{H}}: 9 \mu \mathrm{~s}$ |
|  |  | $\mathrm{A}_{\mathrm{H}}: 10 \mu \mathrm{~s}$ |
|  |  | $\mathrm{B}_{\mathrm{H}}$ to $\mathrm{F}_{\mathrm{H}}$ : Setting prohibited |
|  |  | For details, see Section 34.4.4.4, Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.10 ADCHnMPXCMDR — MPX Command Information Register

ADCHnMPXCMDR is an 8-bit readable/writable register that stores SPI communication command information to be transferred to an external analog multiplexer. ADCHnMPXCMDR is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

|  | MPXCMD[7:0] |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.53 ADCHnMPXCMDR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | MPXCMD[7:0] | SPI Communication Command Information |
|  |  | These bits store command information for controlling an external analog multiplexer by using |
|  | the SPI communication. When a virtual channel for which CNVCLS[2:0] in ADCHnVCRj is set |  |
|  | to $5_{\mathrm{H}}$ or $6_{\mathrm{H}}$ is started, MPXCMD[7:0] in ADCHnMPXCMDR is transferred to MPXCMD[7:0] in |  |
|  |  | ADCHnMPXCURR and it can be read by ADCHnMPXCURR together with MPXCUR[4:0]. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.11 ADCHnADCR2 - A/D Control Register 2

ADCHnADCR 2 is an 8-bit readable/writable register for ADC common control.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | DFMT[1:0] |  | - | - | - | ADDNT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R/W |

Table 34.54 ADCHnADCR2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 4 | DFMT[1:0] | Data Format |
|  |  | $00_{\mathrm{B}}$ : Signed 12bit fixed-point format |
|  |  | $01_{\mathrm{B}}$ : Signed 12bit integer format |
|  |  | $10_{\mathrm{B}}$ : Unsigned 12bit fixed-point format |
|  |  | $11_{\mathrm{B}}$ : Unsigned 10bit fixed-point format |
|  |  | For data transferred to the DFE.GTM and ASF, it is always signed fixed-point format regardless of the DFMT setting. |
|  |  | For details of data format, see Section 34.3.3.2, ADCHnDRj - Data Register j. |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADDNT | Addition Count Select |
|  |  | 0 : Add twice |
|  |  | 1: Add 4 times |
|  |  | This register is valid only when CNVCLS[2:0] is $4_{\mathrm{H}}$ or $6_{\mathrm{H}}$. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.12 ADCHnDFASENTSGER — DFE/ASF Entry Scan Group Enable Register

ADCHnDFASENTSGER is a 16-bit readable/writable register that enables or disables scan groups to be transferred to the DFE, and the ASF. ADCHnDFASENTSGER is initialized to $0000_{\mathrm{H}}$ at reset.

Table 34.55 ADCHnDFASENTSGER Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 to 13 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 12 to 8 | DFENTSGxE | DFE Entry Scan Group Enable |
|  |  | 0 : Entry to DFE is disabled when starting SGx. |
|  |  | 1: Entry to DFE is enabled when starting SGx. |
|  |  | Entry is performed for virtual channels for which DFENT in ADCHnVCRj is set to 1. |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | ASENTSGxE | ASF Entry Scan Group Enable |
|  |  | 0: Entry to ASF is disabled when starting SGx. |
|  |  |  |
|  |  | Entry is performed for virtual channels for which DFENT in ADCHnVCRj is set to 1. Use the ASENTSGxE bits by setting one of these bits to 1 . |

## CAUTIONS

1. To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.
2. Do not set both DFENTSGxE and ASENTSGxE for the same scan group to 1 . If it is enabled for the same scan group, entry is performed for both DFE and ASF of virtual channels for which DFENT in ADCHnVCRj is set to 1 for the scan group.

### 34.3.3.13 ADCHnADENDP — A/D Conversion Monitor Virtual Channel Pointer

ADCHnADENDP is an 8-bit readable/writable register that selects a virtual channel that outputs the $\mathrm{A} / \mathrm{D}$ conversion timing to $\mathrm{ADENDn} . \mathrm{ADCHnADENDP}$ is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | ENDP[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.56 ADCHnADENDP Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | ENDP[5:0] | A/D Conversion Monitor Virtual Channel Pointer |
|  |  | Set virtual channel number which monitor ongoing A/D conversion. |
|  | $00_{\mathrm{H}}$ to $27_{\mathrm{H}:}$ Virtual channel 0 to 39 |  |
|  |  | Other than above: Setting prohibited |
|  |  | When the virtual channel selected by ADCHnADENDP is started, a high level is output to |
|  |  |  |
|  |  |  |
| CADENDn. When the virtual channel selected by ADCHnADENDP ends, a low level is output. |  |  |

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.14 ADCHnSFTCR — Safety Control Register

ADCHnSFTCR is an 8-bit readable/writable register for safety control. ADCHnSFTCR is initialized to $00_{\mathrm{H}}$ at reset.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R/W | R/W | R/W |

Table 34.57 ADCHnSFTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | RDCLRE | Read and Clear Enable |
|  |  | 0: ADCHnDRj and ADCHnDIRj are not cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC. |
|  |  | 1: ADCHnDRj and ADCHnDIRj are cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC. |
|  |  | CAUTION: WFLG in ADCHnDIRj is cleared by reading ADCHnDRj or ADCHnDIRj or by reading ADCHnDRj via the IFC regardless of the RDCLRE setting. |
| 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | OWEIE | Overwrite Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 1 | PEIE | Parity Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 0 | IDEIE | ID Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.15 ADCHnTDCR — Pin-Level Self-Diagnosis Control Register

ADCHnTDCR is an 8-bit readable/writable register that controls the pin-level self-diagnosis. ADCHnTDCR is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TDE | - | - | - | - | - | TDLV[1:0] |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R/W | R/W |

Table 34.58 ADCHnTDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | TDE | Pin-Level Self-Diagnosis |
|  |  | 0 : Pin-level self-diagnosis is disabled. |
|  |  | 1: Pin-level self-diagnosis is enabled. |
|  |  | When TDE is set to 1 , all analog pins are disconnected from the input buffer. |
|  |  | When TDE is set to 0 , all analog pins are connected to the input buffer. |
|  |  | When TDE is set to 1 , the voltage is fixed to the level specified by TDLV[1:0]. Performing an A/D conversion in this state and checking the A/D converted value allows diagnosis of the path from an analog pin to the ADC. |
| 6 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1, 0 | TDLV[1:0] | Pin-Level Self-Diagnosis |
|  |  | $0_{H}$ : Even numbers of physical channel groups are discharged to AnVSS, and odd numbers of physical channel groups are charged to AnVCC. |
|  |  | $1_{\mathrm{H}}$ : Even numbers of physical channel groups are charged to AnVCC, and odd numbers of physical channel groups are discharged to AnVSS. |
|  |  | 2н: Even numbers of physical channel groups are discharged to AnVSS, and odd numbers of physical channel groups are charged to $1 / 2^{*}$ AnVCC. |
|  |  | $3_{H}$ : Even numbers of physical channel groups are charged to $1 / 2^{*} \mathrm{AnVCC}$, and odd numbers of physical channel groups are discharged to AnVSS. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.16 ADCHnODCR — Wiring-break Detection Control Register

ADCHnODCR is a 32 -bit readable/writable register that controls wiring-break detection.

Table 34.59 ADCHnODCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | ODDE | Wiring-break Detection Self-diagnosis Enable <br> 0 : Wiring-break detection self-diagnosis is not enabled. <br> 1: Wiring-break detection self-diagnosis is enabled. <br> When ODDE is set to 1 , wiring-break detection self-diagnosis is enabled for all analog pins. |
| 30 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ODE | Wiring-break Detection Enable <br> 0 : Wiring-break detection is not enabled. <br> 1: Wiring-break detection is enabled. <br> When ODE is set to 1 , wiring-break detection is enabled for all analog pins. After sampling for an A/D conversion ends, analog pins for which an A/D conversion is to be performed are discharged with the pulse width specified in ODPW[5:0]. |
| 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | ODPW[5:0]*1 | Wiring-break Detection Pulse Width <br> $04_{\mathrm{H}}$ : 1 state (of internal clock) <br> $05_{\mathrm{H}}$ : 2 states (of internal clock) <br> $13_{\mathrm{H}}: 16$ states (of internal clock) <br> 14н: 17 states (of internal clock) |

Note 1. The setting of ODPW[5:0] must be greater than $03_{\mathrm{H}}$ and less than $15_{\mathrm{H}}$.

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.17 ADCHnECR — Error Clear Register

ADCHnECR is an 8 -bit write-only register that controls error clearing. The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | OWEC | PEC | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | w | W | R |

Table 34.60 ADCHnECR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | OWEC | Overwrite Error Clear |
|  |  | Writing 0: Not cleared |
|  |  | Writing 1: Cleared |
| 1 | PEC | Parity Error Clear |
|  |  | Writing 0: Not cleared |
|  |  | Writing 1: Cleared |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 34.3.3.18 ADCHnOWER — Overwrite Error Register

ADCHnOWER is an 8 -bit read-only register that indicates an overwrite error.
ADCHnOWER is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OWE | - | OWECAP[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.61 ADCHnOWER Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | OWE | Overwrite Error |
|  | 0: No error is present |  |
|  | 1: An error is present. |  |
|  | Setting condition |  |
|  | The A/D converted value is written to ADCHnDRj when WFLG $=1$. |  |
|  | Clearing condition |  |
|  | A value of 1 is written to OWEC in ADCHnECR. |  |
|  |  | Reserved |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |

## CAUTION

ADCHnOWER is updated when the A/D converted value is written to ADCHnDRj.

### 34.3.3.19 ADCHnPER — Parity Error Register

ADCHnPER is an 8 -bit read-only register that indicates a parity error. ADCHnPER is initialized to $00_{\mathrm{H}}$ at reset.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PE | - | PECAP[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.62 ADCHnPER Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 | PE | Parity Error <br> 0: No errors present <br> 1: An error is present. <br> Setting condition <br> A parity error is detected. <br> Clearing condition <br> A value of 1 is written to PEC in ADCHnECR. |
| 6 | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |  |
| 5 to 0 | PECAP[5:0] | Parity Error Capture <br> The virtual channel at the time when a parity error occurred is captured. <br> Capturing condition <br> A parity error is detected when PE $=0$. <br> Clearing condition <br> A value of 1 is written to PEC in ADCHnECR. |
| CAUTION |  |  |

### 34.3.3.20 ADCHnVCULLMTBR0 to 6 - Virtual Channel Upper/Lower Limit Table Register 0 to 6

ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 are 32-bit readable/writable registers. ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 are selected from ADCHnVCRj.VCULLMTBS[2:0]. These registers are initialized to 7 FFE $0000_{\mathrm{H}}$ by reset.

| Value after reset: |  |  | 7FFE 0000 ${ }_{\text {H }}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | VCULMTB[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | VCLLMTB[15:0] |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

Table 34.63 ADCHnVCULLMTBR Register Contents 0 to 6

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | VCULMTB[15:0] | Upper Limit Table |
|  |  | These bits specify the upper-limit value of an A/D converted value. Setting range: $0000_{\mathrm{H}}$ to $7 \mathrm{FFE}_{\mathrm{H}}$ |
|  |  | Be sure to set it to the signed fixed-point format. |
|  |  | VCULMTB[15] and VCULMTB[0] are always fixed to 0. |
|  |  | When in normal-A/D-conversion-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = 4 ), or normal-A/D-conversion-with-the-MPX-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = 6 $\mathrm{H}_{\mathrm{H}}$ ), set the comparative value to the addition sum. |
| 15 to 0 | VCLLMTB[15:0] | Lower Limit Table |
|  |  | These bits specify the lower-limit value of an A/D converted value. Setting range: $0000_{\mathrm{H}}$ to $7 \mathrm{FFE}_{\mathrm{H}}$ |
|  |  | Be sure to set it to the signed fixed-point format. |
|  |  | VCLLMTB[15] and VCLLMTB[0] are always fixed to 0. |
|  |  | When in normal-A/D-conversion-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = $4_{\mathrm{H}}$ ), or normal-A/D-conversion-with-the-MPX-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] = 6 $\mathrm{H}_{\mathrm{H}}$ ), set the comparative value to the addition sum. |

### 34.3.3.21 ADCHnVCLMINTER1 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 1

ADCHnVCLMINTER1 is a 32-bit readable/writable register for output control of the upper/lower limit error interrupt for virtual channels 0 to 31 . ADCHnVCLMINTER1 is initialized to $00000000_{\mathrm{H}}$ at reset.

| Value after reset: |  |  | $00000000^{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | ADUL3 | $\begin{array}{\|c} \text { ADUL3 } \\ \text { OIE } \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ 9 \mathrm{IE} \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ 8 \mathrm{IE} \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ 7 \mathrm{IIE} \end{array}$ | $\begin{array}{\|c\|} \text { ADUL2 } \\ \text { 6IE } \end{array}$ | $\begin{array}{\|c\|} \hline \text { ADUL2 } \\ 5 \mathrm{IE} \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ 4 \mathrm{IE} \end{array}$ | $\begin{array}{\|c\|} \text { ADUL2 } \\ 3 I E \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ 2 \mathrm{IE} \end{array}$ | $\begin{array}{\|l\|l\|} \hline \text { ADUL2 } \\ \text { 1IE } \end{array}$ | $\begin{array}{\|c} \text { ADUL2 } \\ \text { OIE } \end{array}$ | $\begin{array}{\|c\|} \hline \text { ADUL1 } \\ \text { 9IE } \end{array}$ | $\begin{array}{\|c\|} \hline \text { ADUL1 } \\ 8 \mathrm{BIE} \end{array}$ | $\begin{array}{\|l\|} \hline \text { ADUL1 } \\ 7 \mathrm{IIE} \end{array}$ | $\begin{array}{\|c\|} \hline \text { ADUL1 } \\ \text { 6IE } \end{array}$ |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.64 ADCHnVCLMINTER1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ADULjIE | Virtual channel upper / lower limit error enable <br> 0: The upper / lower limit error interrupt (INT_ULn) is not output by result of the virtual <br> channel j. |
|  |  | 1: The upper / lower limit error interrupt (INT_ULn) is output by the result of the virtual <br> channel j. |
| CAUTION |  |  |

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.22 ADCHnVCLMINTER2 — Virtual Channel Upper/Lower Limit Error Interrupt Enable Register 2

ADCHnVCLMINTER2 is a 32-bit readable/writable register for output control of the upper/lower limit error interrupt for virtual channels 32 to 39 . ADCHnVCLMINTER2 is initialized to $00000000_{\mathrm{H}}$ at reset.

Table 34.65 ADCHnVCLMINTER2 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 7 to 0 | ADULjIE | Virtual channel upper / lower limit error enable |
|  |  | 0 : The upper / lower limit error interrupt (INT_ULn) is not output by the result of the virtual channel j . |
|  |  | 1: The upper / lower limit error interrupt (INT_ULn) is output by the result of the virtual channel j . |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.3.23 ADCHnVCLMSR1 - Virtual Channel Upper/Lower Limit Excess Status Register 1

ADCHnVCLMSR1 is a 32-bit read-only register that indicates an upper/lower limit excursion of virtual channel 0 to 31. ADCHnVCLMSR 1 is initialized to $00000000_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|  |  | $0:$ Not cleared. |
|  |  | 1: VCjLMS of ADCHnVCLMSR2 is cleared. |

### 34.3.4 Scan Group Specific Registers

This section describes registers provided for each scan group.

### 34.3.4.1 ADCHnSGSTCRx — Scan Group x Start Control Register

ADCHnSGSTCRx is an 8-bit write-only register that controls the start of scan group $x$. The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

Table 34.70 ADCHnSGSTCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SGST | Scan Group Start |
|  |  | Condition for starting scan group $\mathrm{x}:$ |
|  | A value of 1 is written to SGST when SGACT $=0$ |  |
|  |  | Writting 0 to this bit is ignored. |

### 34.3.4.2 ADCHnSGSTPCRx — Scan Group x Stop Control Register

ADCHnSGSTPCRx is an 8-bit write-only register that controls the stop of scan group x . The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | SGSTP |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.71 ADCHnSGSTPCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | SGSTP | Scan Group Stop |
|  |  | Condition for stopping scan group x: |
|  | A value of 1 is written to SGSTP when SGACT =1 |  |
|  |  | When SGACT $=0$, writting 1 to this bit is ignored. |
|  |  | Writting 0 to this bit is ignored. |

### 34.3.4.3 ADCHnADTSTCRy — A/D Timer y Start Control Register

ADCHnADTSTCRy is an 8 -bit write-only register that controls the start of $\mathrm{A} / \mathrm{D}$ timer y . The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADTST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.72 ADCHnADTSTCRy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADTST | A/D Timer Start |
|  |  | Condition for starting A/D timer $\mathrm{y}:$ |
|  |  | A value of 1 is written to ADTST when ADTACT $=0$ |
|  |  | Writting 0 to this bit is ignored. |

### 34.3.4.4 ADCHnADTENDCRy — A/D Timer y End Control Register

ADCHnADTENDCRy is an 8-bit write-only register that controls stop of $\mathrm{A} / \mathrm{D}$ timer y . The register bits are always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADTEND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 34.73 ADCHnADTENDCRy Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADTEND | A/D Timer End |
|  |  | Condition for finishing A/D timer y: |
|  |  | A value of 1 is written to ADTEND when ADTACT $=1$ |
|  |  | Writting 0 to this bit is ignored. |
|  |  |  |

### 34.3.4.5 ADCHnSGCRx — Scan Group x Control Register

ADCHnSGCRx is an 8 -bit readable/writable register that controls scan group x . ADCHnSGCRx is initialized to $00_{\mathrm{H}}$ at reset.

$$
\text { Value after reset: } \quad 00_{H}
$$

## CAUTIONS

1. To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.
2. If a higher-priority scan group is set to continuous scan mode (SCANMD $=1$ ), a lower-priority scan group can not operate.
3. Hardware trigger (scan group x start) input to a started scan group x is ignored.

### 34.3.4.6 ADCHnSGVCSPx — Scan Group x Start Virtual Channel Pointer

See Section 34.3.4.12, ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register together.
ADCHnSGVCSPx is an 8-bit readable/writable register that specifies the start pointer of a virtual channel. ADCHnSGVCSPx is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 to 0 | VCSP[5:0] | Start Virtual Channel Pointer |
|  |  | These bits select the virtual channel from which the scan is to be started. |
|  |  | When an SGx is started, processing for the virtual channels from ADCHnSGVCSPx to ADCHnSGVCEPx is executed. |

## CAUTIONS

1. Do not set the value greater than 39.
2. ADCHnSGVCSPx must be equal to or less than ADCHnSGVCEPx.
3. This register has a mirror structure as follows. While scan group $x$ is executing, if it is necessary to rewrite SGVCSP and SGVCEP, be sure to use a mirror register.

| This Register | Mirror Register |
| :--- | :--- |
| ADCHnVCSPx.VCSP[5:0] | ADCHnVCPRx.VCSP[5:0] |

4. It is possible to set same virtual channel $n(A D C H n V C R j)$ in more than one scan group $x$ by setting the start / end virtual channel pointer.
But, when a virtual channel is overwritten while one scan group is operating, the setting for $A / D$ conversion might be different from the desired setting for this scan group.
Make sure to use caution of the information below to avoid this problem.

- When designing a system, always specify the same value for the ADCHnVCRj setting when it is used by multiple scan groups for the target channel.
- Rewrite ADCHnVCRj after stopping all scan groups of a target channel.

When these are not obeyed, A/D conversion results can't be guaranteed.
5. To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.4.7 ADCHnSGVCEPx — Scan Group x End Virtual Channel Pointer

See Section 34.3.4.12, ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register together.
ADCHnSGVCEPx is an 8-bit readable/writable register that specifies the end pointer of a virtual channel.
ADCHnSGVCEPx is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | VCEP[5:0] |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

Table 34.77 ADCHnSGVCEPx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7,6 | - | Reserved <br>  <br>  <br> 5 to 0 |
|  | VCEP[5:0] read, the value after reset is returned. When writing, write the value after reset. |  |
|  |  | End Virtual Channel Pointer <br>  <br>  <br>  <br>  <br>  <br> Whese bits select the virtual channel at which the scan is to be ended. processing for the virtual channels from ADCHnSGVCSPx to <br> ADCHnSGVCEPx is executed. |

## CAUTIONS

1. This register has a mirror structure as follows. While scan group x is executing, if it is necessary to rewrite SGVCSP and SGVCEP, be sure to use a mirror register.

| This Register | Mirror Register |
| :--- | :--- |
| ADCHnVCEPx.VCSP[5:0] | ADCHnVCPRx.VCEP[5:0] |

See Section 34.3.4.6, ADCHnSGVCSPx - Scan Group x Start Virtual Channel Pointer for other cautions.
2. To prevent a malfunction, there is the limitations of setting update in this register.

For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.4.8 ADCHnSGMCYCRx — Scan Group x Multicycle Register

ADCHnSGMCYCRx is an 8-bit readable/writable register that specifies the number of scan cycles in multicycle scan mode. ADCHnSGMCYCRx is initialized to $00_{\mathrm{H}}$ at reset.

Value after reset: $\quad 00_{H}$

Table 34.78 ADCHnSGMCYCRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 0 | MCYC[7:0] | Multicycle Specification |
|  |  | These bits specify the number of scan cycles in multicycle scan mode. |
|  | Number of scan cycles $=$ MCYC[7:0] +1 |  |
|  | When SGx is started, scans are repeated for virtual channels from ADCHnSGVCSPx to |  |
|  |  | ADCHnSGVCEPx for many cycles as specified in ADCHnSGMCYCRx. |

## CAUTION

To prevent malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.4.9 ADCHnSGSRx - Scan Group x Status Register

ADCHnSGSRx is an 8-bit read-only register that indicates the status of scan group x .

Value after reset: $\quad 00_{H}$

- When $\mathrm{x}=0$ to 2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.79 ADCHnSGSRx Register Contents ( $\mathrm{x}=0$ to 2 )

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | SGACT | Scan Group Status |
|  |  | 0 : There is no source in SGx. |
|  |  | 1: There is a source in SGx. <br> (The period from the reception of a starting trigger until $A / D$ conversion completion, or until aborting by ADHALT or SGSTP.) |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

- When $\mathrm{x}=3$ or $\mathbf{4}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | ADTACT | SGACT | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 34.80 ADCHnSGSRx Register Contents ( $\mathrm{x}=3$, 4)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved <br>  <br>  <br>  <br> 2 |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |
|  |  | A/D Timer Status |
|  | 0: A/D timer $x$ is in idle state. |  |
| 1: A/D timer $x$ is running. |  |  |

### 34.3.4.10 ADCHnADTIPRy — A/D Timer y Initial Phase Register

ADCHnADTIPRy is a 32-bit readable/writable register that sets the initial count of $\mathrm{A} / \mathrm{D}$ timer y . ADCHnADTIPRy is initialized to $00000000_{\mathrm{H}}$ at reset.

Table 34.81 ADCHnADTIPRy Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 0 | ADTIP[20:0] | A/D Timer Initial Phase |
|  |  | These bits set the initial phase of $A / D$ timer y . |
|  |  | (1) After A/D timer $y$ is started, ADCHnADTIPRy is loaded to A/D timer $y$ and the timer counts down. |
|  |  | (2) After $A / D$ timer $y$ becomes $0, A / D$ timer trigger $y$ is output for one cycle, ADCHnADTPRRy is loaded to A/D timer y, and the timer counts down again. |
|  |  | After that, (2) is repeated. |
|  |  | For details, see Section 34.4.5.3, A/D Timer Trigger. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.4.11 ADCHnADTPRRy - A/D Timer y Cycle Register

ADCHnADTPRRy is a 32-bit readable/writable register that sets the cycle count of A/D timer y. ADCHnADTPRRy is initialized to 001F $\mathrm{FFFF}_{\mathrm{H}}$ at reset.

Table 34.82 ADCHnADTPRRy Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 21 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 20 to 0 | ADTPR[20:0] | A/D Timer Cycle |
|  |  | These bits set the cycle of A/D timer y . |
|  |  | (1) After A/D timer $y$ is started, ADCHnADTIPRy is loaded to A/D timer $y$ and the timer counts down. |
|  |  | (2) After A/D timer y becomes $0, A / D$ timer trigger $y$ is output for one cycle, ADCHnADTPRRy is loaded to A/D timer $y$, and the timer counts down again. |
|  |  | After that, (2) is repeated. |
|  |  | For details, see Section 34.4.5.3, A/D Timer Trigger. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.3.4.12 ADCHnSGVCPRx — Scan Group x Virtual Channel Pointer Register

ADCHnSGVCPRx is a 16-bit readable/writable register that specifies the start/end pointer of a virtual channel. For this register, write as 16 -bit.

Table 34.83 ADCHnSGVCPRx Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 14 | - | Reserved <br>  <br> 13 to 8 <br> 7 to 6 |
|  | VCEP[5:0] |  |
| 5 to 0 | - | End Virtual Channel Pointer (mirror of ADCHnSGVCEP) |

Note 1. For details of this function, see Section 34.3.4.6, ADCHnSGVCSPx - Scan Group x Start Virtual Channel Pointer and Section 34.3.4.7, ADCHnSGVCEPx - Scan Group x End Virtual Channel Pointer.

### 34.3.4.13 ADCHnSGVCOWRx — Scan Group x Virtual Channel Optional Waiting Times Register

ADCHnSGVCOWRx is a 16-bit readable/writable register that specifies an optional wait time in an execution interval of virtual channel j and virtual channel $\mathrm{j}+1$.

| Value after reset: $\quad 0000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | VCow[11:0] |  |  |  |  |  |  |  |  |  |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 15 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 11 to 0 | VCOW[11:0] | Wait Time Specification Between Virtual Channels of same scan group |
|  | $000_{\mathrm{H}}:$ No wait. |  |
|  | $001_{\mathrm{H}}$ to $\mathrm{FFF}_{\mathrm{H}}$ : set value x 4 ADCLK |  |
|  | Note: For example, to set wait times to 1 us, set VCOW[11:0] to $00 \mathrm{~A}_{\mathrm{H}}$. |  |
|  |  | Wait time, please set the VCOW value in the range of $1 \ldots 400$ us at 1 us intervals. |

## CAUTION

To prevent a malfunction, there is the limitations of setting update in this register.
For the limitations of setting update, refer to Section 34.4.1.4, Limitations of Setting Update.

### 34.4 Operation

$\mathrm{A} / \mathrm{D}$ conversion is performed by scan group.
Virtual channels that are assigned by the scan group start/end pointer are scanned in ascending order.
When multiple scan groups start up, the processing is performed from the scan group with the highest priority.
After the initial settings, scan starts by input of the start trigger.
Scan ends when A/D conversion ends for the specified count or by forced termination.
Information about the settings, functions, and operations is described below.

### 34.4.1 Setting Procedure

### 34.4.1.1 Initial Settings

The initial settings must be specified while the trigger of all the scan groups is disabled and all the scan groups and all accumulation channels stop.

If such items shown above are running, perform the termination procedure.
Use the value after reset for the register setting value of the function that is not to be used.

## (1) Registers that must be set

The control bit that is required to be set at minimum for executing $\mathrm{A} / \mathrm{D}$ conversion is defined as a required setting bit.
The required setting bit contains the following bits:

- Bits that determine the operating mode of the SAR-ADC (SM).
- Bits that determine physical channels and virtual channels to be subject to $\mathrm{A} / \mathrm{D}$ conversion.

Registers that contain the required setting bits are as below:
Table 34.85 Required Registers which must be set for proper operation

| Classification | Indispensable <br> Setting Bit | Explanation | Addition |
| :--- | :--- | :--- | :--- | :--- |

Please set registers other than these properly according to the function to use.

## (2) About Setting Order

Any register setting sequence is acceptable regardless of whether the register contains the required setting bit.
Set registers in the desired order.
The initial setting flow is shown below. The setting order in the flow is for convenience.

Figure 34.5 Initial Setting Flow

### 34.4.1.2 Startup Method

This section describes how to start up scan group $\mathrm{x}, \mathrm{AD}$ timer x .
The procedure differs depending on the startup target.
Perform the startup procedure during the initial setting, or while scan group x to be started is stopped (ADCHnSGSRx.SGACT $=0$ ) after the settings have been updated.

The startup procedure is ignored if the target is already operating.
Table 34.86 Startup Method of Scan Group x, AD Timer y and ASF

| Starting target | Trigger type | Starting method |
| :---: | :---: | :---: |
| Scan group x | S/W trigger | Write 1 to ADCHnSGSTCRx.SGST. |
|  | H/W trigger | 1. Set $1_{\mathrm{H}}$ to SGCRx.TRGMD [1:0]. <br> 2. Input a High pulse signal of 1ADCLK width to the SGx_TRG terminal. |
| A/D conversion synchronous start | S/W trigger | 1. Set SGCRx.ADSTARTE to 1 for scan group $x$ of ADCH0. <br> 2. Set SGCRx.ADSTARTE to 1 for scan group $x$ of ADCH2. <br> 3. Set SGCRx.ADSTARTE to 1 for scan group $x$ of ADCH1. <br> 4. Set SGCRx.ADSTARTE to 1 for scan group $x$ of ADCH3. <br> 5. Write 1 to ADSYNSTCR.ADSTART. |
| A/D timer y | S/W trigger | Write 1 to ADTSTCRx.ADTST. |
|  | H/W trigger | 1. Set SGCRx.TRGMD[1:0] to $3 H$. <br> 2. Input the H pulse signal with 1 clkad width to the SGx_TRG pin. |
| A/D timer synchronous start | S/W trigger | 1. Set SGCRx.ADTSTARTE to 1 for scan group $x$ of ADCH0. <br> 2. Set SGCRx.ADTSTARTE to 1 for scan group $x$ of $A D C H 2$. <br> 3. Set SGCRx.ADTSTARTE to 1 for scan group $x$ of $A D C H 1$. <br> 4. Set SGCRx.ADTSTARTE to 1 for scan group $x$ of ADCH3. <br> 5. Write 1 to ADTSYNSTCR.ADTSTART. |
| Setting of ASF | - | See Section 34.8, ADC Summation Function (ASF). |

### 34.4.1.3 Terminating Procedure

This section describes the procedure to terminate scan groups.
There are three termination methods: termination of all scan groups (forced termination), termination of scan group x 1 and termination of scan group x 2 .

For the detailed description of ASFrCTL1 register in each flow, please see Section 34.8, ADC Summation Function (ASF).

## (1) To Terminate All Scan Groups (Forced Termination)

This procedure is to terminate all scan groups.
Please clear the multiplication counter in ASF and all intermediate buffers as ASFrCTL1.ASFrST $=0$ of ASF when either of scanning group is using ASF.

Figure 34.6 All Scan Group (A/D halt) Flow

For the detailed description of termination timing, please see Section 34.4.14.1, Example of All Scan Group Stop (A/D Halt).

## (2) Scan Group x Termination Procedure 1

This procedure is to terminate scan group x individually.
To terminate multiple scan groups, perform this termination procedure for each scan group.
This procedure can be applied to scan groups that are operating in multicycle scan mode.
When terminating a scan group that is operating in continuous scan mode, please see Section 34.4.1.3(1), To
Terminate All Scan Groups (Forced Termination) or Section 34.4.1.3(3), Scan Group x Termination Procedure 2.

Please clear the multiplication counter in ASF and all intermediate buffers as ASFrCTL1.ASFrST $=0$ of ASF when the scanning group that stops is using ASF.

Figure 34.7 Scan Group x Termination Flow 1

## (3) Scan Group $x$ Termination Procedure 2

This procedure stops individual scanning group x .
Please execute the shutdown procedure to each scanning group when stopping two or more scanning groups.
This procedure can be applied to the scanning group operating by either of the multi cycle scanning mode/mode of a continuous scanning.
When scan group x is stopped by this procedure, it operates as the following.
When scan group x stop control register is written as 1 , an ongoing virtual channel is ended with waiting completion of the remaining processing.

When an ongoing virtual channel is ended, scan group x is ended.
Please clear the multiplication counter in ASF and all intermediate buffers as ASF1nCTL1.ASF1nST=0 of ASF when the scanning group that stops is using ASF.

Figure $34.8 \quad$ Scan Group $\times$ Termination Flow 2

When scan group $x$ stop control register is written as 1 in near the end of the $A / D$ conversion, scan group which corresponds changes to IDLE as intended.

But if interrupt-enable-bit (ADCHnSGCRx.ADIE and ADCHnVCRj.ADIE) is set as 1 , there is potential which the scan end interrupt request (ADInx) is output.

So if this is dissatisfied, set interrupt-enable-bit (ADCHnSGCRx.ADIE and ADCHnVCRj.ADIE) as 0 before scan group x stop control register is written as 1 .

For the detailed description of termination timing, please see Section 34.4.14.2, Example of Scan Group x Stop.

### 34.4.1.4 Limitations of Setting Update

A period to update the setting is limited for the registers shown in the initial setting flow.
To update:
Scan group stop $\rightarrow$ Register setting update $\rightarrow$ Scan group startup
Note 1. When a scan group of a stop target is using H/W trigger, invalidate H/W trigger before stopping.

The period for updating differs depending on registers as follows.
Update settings after the specified termination procedure according to the following table:
Table 34.87 Possible Period of Setting Update of Register for Initial Setup

| Register | Bits | Update Possible Period |
| :---: | :---: | :---: |
| ADCHnADCR1 | All bits | 1) All scan groups stop |
| ADCHnADCR2 |  |  |
| ADCHnSFTCR |  |  |
| ADCHnTDCR |  |  |
| ADCHnODCR |  |  |
| ADCHnMPXCURCR |  |  |
| ADCHnMPXOWR |  |  |
| ADCHnMPXINTER |  |  |
| ADCHnDFASENTSGER |  |  |
| ADCHnADENDP |  |  |
| ADCHnVMONVDCR1, 2 |  |  |
| ADCHnVCLMINTER1, 2 |  |  |
| ADCHnSGVCOWRx |  |  |
| ADCHnSGCRx | SCANMD, ADIE (Set only) | 2) Setting target scan group $x$ stop |
| ADCHnSGMCYCRx | All bits |  |
| ADCHnSGVCSPx |  |  |
| ADCHnSGVCEPx |  |  |
| ADCHnVCR00 to 39 |  |  |
| ADCHnSGCRx | ADTSTARTE, ADSTARTE, <br> TRGMD[1:0] *, ADIE (Clear only) | 3) Always updatable |
| ADCHnSGVCPRx | All bits |  |
| ADCHnVCULLMTBR0 to 6 |  |  |
| ADCHnMPXCMDR |  |  |
| ADCHnADTIPR3 to 4 | All bits | 4) Setting target $A D$ timer $y$ stop |
| ADCHnADTPRR3 to 4 |  |  |

Note: For TRGMD[1:0], ADTSTARTE and ADSTARTE, see Section 34.4.1.2, Startup Method and Section 34.4.1.3, Terminating Procedure also.

The updated setting value is applied at the following timing.
ADCHnSGCRx: Immediately
ADCHnSGVCPR: Next time the corresponding scan group x starts up
ADCHnVCULLMTBR0~6: Immediately
ADCHnMPXCMDR: Start time of normal A/D conversion with the MPX or normal A/D conversion with the MPX in addition mode

### 34.4.2 Scan Mode

There are two scan modes.

### 34.4.2.1 Multicycle Scan Mode

A/D conversion for virtual channels assigned to the target SGx is repeated for a specified count ( 1 to 256 times.)
Set the SGCRx.SCANMD bit to 0 to start multicycle scan mode.
Specify the scan count in the SGMCYCR register. The setting range of the values is from 00 H to FFH . The setting value should be a value obtained by subtracting 1 from the desired execution count.

The following figure shows an operation example when the scan count is 2 .

- Conversion type: Normal A/D conversion mode (CNVCLS[2:0] $=0 \mathrm{H}$ )
- Scan group 0
- Virtual channel: ADCHnVCR0 to ADCHnVCR3

Figure 34.9 Example of Operation in Multicycle Scan Mode

### 34.4.2.2 Continuous Scan Mode

$\mathrm{A} / \mathrm{D}$ conversion for virtual channels assigned to the target SGx is repeated with unlimited count.
Set the SGCRx.SCANMD bit to 1 to start continuous scan mode. The setting value of the SGMCYCR register is not effective.

The following figure shows an operation example.

- Conversion type: Normal A/D conversion mode (CNVCLS[2:0] = 0H)
- Scan group 0
- Virtual channel: ADCHnVCR0 to ADCHnVCR3

Figure 34.10 Example of Operation in Continuous Scan Mode

### 34.4.3 Suspend Method

When a start trigger for a scan group with higher priority is accepted during operation of a scan group with lower priority, the suspend function interrupts the scan group with lower priority and executes the scan group with higher priority.

After the processing of the scan group with higher priority is finished, the suspended scan group with lower priority resumes.

While a higher priority scanning group is operating, the start trigger for the lower priority scanning group is held pending. After the higher priority scanning group is processed, the process of the suspended lower priority scanning group is resumed.

The start trigger of the same scanning group is not accepted while the scanning group is operating or suspended.
There are three types of suspend methods.

The priority of scan groups 0 to 4 is as follows:
Low
$S G 0<S G 1<S G 2<S G 3<S G 4$

### 34.4.3.1 Synchronous Suspend

The synchronous suspend function interrupts the processing after $\mathrm{A} / \mathrm{D}$ conversion operation for the virtual channel in progress ends and then starts $\mathrm{A} / \mathrm{D}$ conversion for the scan group with higher priority.

After $\mathrm{A} / \mathrm{D}$ conversion for the scan group with higher priority is completed, $\mathrm{A} / \mathrm{D}$ conversion for the interrupted virtual channel resumes.

The following figure shows an operation example of synchronous suspend.

Figure 34.11 Example of Synchronous Suspend and Resume Operation

### 34.4.3.2 Asynchronous Suspend

The asynchronous suspend function immediately interrupts the processing without waiting until $\mathrm{A} / \mathrm{D}$ conversion operation for the virtual channel in progress ends and then starts $A / D$ conversion for the scan group with higher priority.

After A/D conversion for the scan group with higher priority is completed, $\mathrm{A} / \mathrm{D}$ conversion for the interrupted virtual channel resumes from the beginning.

The following figure shows an operation example of asynchronous suspend.

Figure 34.12 Example of Asynchronous Suspend and Resume Operation

### 34.4.3.3 Synchronous/Asynchronous Mixture Type Suspend

When a scan group with higher priority interrupts scan group 0 , the asynchronous suspend method is applied. When a scan group with higher priority interrupts scan groups other than scan group 0 , the synchronous suspend method is applied.

The following figure shows an operation example of synchronous/asynchronous-mixed suspend.

Figure 34.13 Synchronous/Asynchronous-Mixed Suspend

### 34.4.4 Conversion Class

There are 5 conversion types. The conversion type must be set for each virtual channel, see Section 34.4.13, Optional Waiting Times Insertion Function of Between Virtual Channels.

### 34.4.4.1 Normal A/D Conversion

Normal A/D conversion converts an analog signal in the physical channel to a digital signal as-is.
For details about the operation, see Section 34.4.2, Scan Mode.

### 34.4.4.2 A/D Converter Self-Diagnosis

This conversion method is one of the safety functions.
A/D converter self-diagnosis $A / D$ conversion separates the physical channel and applies the specified voltage to the analog input pin of the $A / D$ converter to perform $A / D$ conversion.

For details about the operation, see Section 34.4.11.2, A/D Converter Self-Diagnosis.

### 34.4.4.3 Example of Addition Mode A/D Conversion Operation

Addition mode $\mathrm{A} / \mathrm{D}$ conversion converts an analog signal in the physical channel to a digital signal two or four times continuously, and then stores the addition value in the data register. The number of addition times (two or four times) is common among all the virtual channels.

The following figure shows an example of the operation:

Figure 34.14 Example of Normal A/D Conversion Operation in Addition Mode

For operation when suspend occurs during execution of addition mode A/D conversion, refer to Section 34.4.3, Suspend Method.

### 34.4.4.4 Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode

These functions perform A/D conversion by selecting the MPX input channel (MPX value) in the physical channel for which the MPX is connected to the external of the LSI.

There are two methods: normal A/D conversion (without addition) and addition mode A/D conversion.
To transfer the MPX value to the external of the LSI, use functions of the DMAC, IO port, CSIH, and ADMPXn4 to ADMPXn0.

The following registers must be set in advance. See the specifications of each function to set the following registers:

- MPX current control register (ADCHnMPXCURCR)
- MPX command information register (ADCHnMPXCMDR)
- MPX physical channel number of the virtual channel register $n$ (ADCHnVCRj.GCTRL[4:0])
- MPX optional wait register (ADCHnMPXOWR)
- MPX interrupt enable register (ADCHnMPXINTER)

The ADCHn operates as follows:
(1) Stores the values of ADCHnMPXCURCR, ADCHnMPXCMDR, ADCHnVCRj.GCTRL[4:0] in the MPX current register (ADCHnMPXCURR) when starting the virtual channel and outputs an interrupt signal (ADMPXIn).
(2) Output the ADCHnMPXCURR.MPXCUR[4:0] value to ADMPXn4 to ADMPXn0 when ADMPXIn outputs.
(3) Inserts wait states specified in MPXOWR.
(Waits until the MPX value is transferred by the DMAC, IO port, or CSIH and MPX output is settled.)
(4) Performs A/D conversion for the physical channel connected with the MPX.

Wait states must be set so that the MPX value transfer time and MPX output settling time can be secured.
Wait states can be set within the range from 0 to 10.1 wait state is 40 ADCLK.
See the IO port specifications to set the mask setting value of the MPX current control register.
This setting value is used for IO port output and is not used for CSIH output.

Set the CSIH command information in the SPI command information register.
This setting value is used for CSIH output and is not used for IO port output.

For operation when suspend occurs during execution of Normal A/D Conversion with the MPX and Normal A/D Conversion with the MPX in Addition Mode, refer to Section 34.4.3, Suspend Method.

## (1) Using I/O Port Output

The following figure shows a structure and operation example when the DMA and IO port output are used.

- Normal A/D conversion w/MPX
- MPX wait state $=2$ wait states
- ADCHnVCR2 to ADCHnVCR5 are used.

Figure 34.15 Example of Using an External Analog Multiplexer - I/O Port Output
NOTE
ADCH0: ANMPX $=$ AN031; $\operatorname{ADCH2}: \operatorname{ANMPX}=\mathrm{AN} 243 ; \mathrm{ADCH} 1: A N M P X=A N 100 ; A D C H 3: A N M P X=A N 300$

## (2) Using CSIH Output

The following figure shows a structure and operation example when the DMA and CSIH output are used.

- Addition mode A/D conversion w/MPX
- MPX wait state $=2$ wait states
- ADCHnVCR2 to ADCHnVCR5 are used.

Figure 34.16 Example of Using an External Analog Multiplexer — CSIH Output
NOTE
ADCH0: ANMPX = AN031; ADCH2: ANMPX = AN243; ADCH1: ANMPX = AN100; ADCH3: ANMPX = AN300

### 34.4.5 Trigger Functions

The ADCHn has an S/W and H/W trigger.
When the scan group is operating ( $\mathrm{ADCHnSGSRx} \cdot \mathrm{SGACT}=1$ ), start trigger for the same scan group is ignored.
When the AD timer is operating (ADCHnSGSRx.ADTACT $=1$ ), start trigger for the same AD timer is ignored.
The following table shows availability of the trigger function in each scan group:
Table 34.88 List of trigger functions for each a scan group

| Classification | Function | Register bit name or terminal name | SG0 | SG1 | SG2 | SG3 | SG4 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| S/W Trigger | Scan Group x Starting | ADCHnSGSTCRx.SGST | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | Scan Group x End | ADCHnSGSTPCRx.SGSTP | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | A/D Conversion Synchronous Start | ADCHnADSYNSTCR.ADSTART | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | A/D Abort | ADCHnADHALTR.HALT | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
|  | AD Timer Start | ADCHnADTSTCRy.ADTST | - | - | - | $\checkmark$ | $\checkmark$ |
|  | AD Timer Synchronous Start | ADCHnADSYNSTCR.ADTSTART | - | - | - | $\checkmark$ | $\checkmark$ |
|  | AD Timer end | ADCHnADTENDCRx.ADTEND | - | - | - | $\checkmark$ | $\checkmark$ |
| H/W Trigger | SGx Trigger | SGx_TRG | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note: $\checkmark$ : Function present
-: Function not present

### 34.4.5.1 S/W Trigger

A S/W trigger occurs when a bit of a register is set to 1 . Each $\mathrm{S} / \mathrm{W}$ trigger possesses a single function.
(1) Scan Group $x$ Starting Trigger

The $A / D$ conversion of scan group $x$ is started.
This trigger is always valid.

## (2) Scan Group $x$ Stop Trigger

The $A / D$ conversion of scan group $x$ is stopped.
This trigger is always valid.

## (3) A/D Conversion Synchronous Start Trigger

The A/D conversion of scan group $x$ in each $A D C H$ is started at the same time.
This trigger is valid for each scan group x where an $\mathrm{A} / \mathrm{D}$ conversion synchronous starting enable bit of scan group x control register (ADCHnSGCRx.ADSTARTE) of each ADCH is set 1 .

## (4) A/D Halt Trigger

Operation of all scan groups of the whole $\mathrm{A} / \mathrm{D}$ conversion operation (including the scan group which is suspended) is halted and the internal state machine is initialized.

It is not possible to halt only a specific scan group x .
When scan group x has been started once again, scan group x cannot be resumed from the virtual channel set at the end of the prior conversion.

Processing is started from the virtual channel indicated by a start pointer.
This trigger is always valid.

## (5) A/D Timer Starting Trigger

The Count operation of AD timer y is started.
It is possible to start scan group x at desired periods.
This trigger is always valid.
For details, see Section 34.4.5.3, A/D Timer Trigger.

## (6) A/D Timer Synchronous Starting Trigger

The Count operation of $\mathrm{A} / \mathrm{D}$ timer y in each ADCH is started at the same time.
It is possible to start scan group y at the desired periods.
This trigger is valid to scan group x where the $\mathrm{A} / \mathrm{D}$ timer synchronous starting enable bit of scan group y control register (SGCRy.ADTSTARTE) of each ADCH is set 1.

For details, see Section 34.4.5.3, A/D Timer Trigger.

## (7) A/D Timer Stop Trigger

The Count operation of AD timer y is stopped.
This trigger is always valid.
For details, see Section 34.4.5.3, A/D Timer Trigger.

### 34.4.5.2 H/W Trigger

A H/W trigger is a rising edge of SGx_TRG.
There are external triggers (ADTRGn) as well as ATU and GTM as a trigger sources of SGx_TRG of each ADCHn, and they are chosen by the PIC. For details, refer to Section 33, Peripheral Interconnection (PIC).

It functions as scan group start/AD timer start.
The function is chosen by a register setting.

## (1) H/W Trigger List

The $\mathrm{H} / \mathrm{W}$ trigger function chosen by each setting is indicated in the following table.
Table 34.89 H/W Trigger Functions List

| SGx_TRG |  |  |  | ADCHnSGCRx |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 4 | 3 | 2 | 1 | 0 | TRGMD[1] | TRGMD[0] | SGx_TRG Functions | Notes |
| $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | 0 | 0 | Invalid | Scan of SGx is not <br> started. |
| $\checkmark$ | $\checkmark$ | - | - | - | 1 |  |  |  |
|  |  |  |  |  |  |  |  |  |

## (2) H/W Trigger Route

The route of $\mathrm{H} / \mathrm{W}$ trigger input is illustrated using figure.

Figure 34.17 Route of Trigger Input

### 34.4.5.3 A/D Timer Trigger

It is possible to start a scan group y at a constant interval by using an $\mathrm{A} / \mathrm{D}$ timer trigger.
The A/D timer counts in synchronization with the ADCLK.
[Recommendation flow]
The $\mathrm{A} / \mathrm{D}$ timer y initial phase register (ADCHnADTIPRy) and $\mathrm{A} / \mathrm{D}$ timer y cycle register (ADCHnADTPRR) is set according to the initial settings.

The range of these registers is $00 \_0000_{\mathrm{H}}$ to $1 \mathrm{~F} \_\mathrm{FFFF}_{\mathrm{H}}$.
Set these register so that the period of the A/D timer trigger does not become shorter than the execution time of scan group $y$.

The AD timer y is started by an AD timer starting trigger.
The AD timer y is stopped by an AD timer stop trigger or $\mathrm{A} / \mathrm{D}$ conversion halt $(\mathrm{ADCHnADHALTR} \cdot \mathrm{HALT}=1)$.

An operation example is shown in the following.
(1) When $\mathrm{A} / \mathrm{D}$ timer y is started, ADCHnADTIPRx is loaded in $\mathrm{A} / \mathrm{D}$ timer y and the timer counts down.
(2) When $A / D$ timer $y$ reaches $0, A / D$ timer trigger $y$ is output in 1 ADCLK period, and ADCHnADTPRRx is loaded in $\mathrm{A} / \mathrm{D}$ timer y and the timer counts down again.

After this, Step (2) will be repeated until A/D timer y is stopped.
When $A / D$ timer y accepts the $A / D$ timer starting trigger after $A / D$ timer $y$ is stopped, it is started from step (1).
It is possible to begin an AD timer of each ADCHn at the same time by an AD timer synchronous start trigger.
The operation after a synchronous start is same as above.

Figure 34.18 Example of A/D Timer Operation

### 34.4.6 Interrupt Request Functions

There is a scan end interrupt, A/D error interrupt, parity error interrupt, MPX interrupt, and upper/lower limit error interrupt.

The interrupt request is output in 1 register access clock period.

### 34.4.6.1 Scan End Interrupt Request

When scan group $\mathrm{x}\left({ }^{* 1}\right)$, or ADCHnVCRj has ended, a scan end interrupt request (ADInx) is generated.
A DMAC can be started by a scan end interrupt.
Output of ADInx is set by the permissions determined by the following bit.

- Scan end interrupt enable bit (ADCHnSGCRx.ADIE) in scan group $x$
- Virtual channel end interrupt enable bit (ADCHnVCRj.ADIE) in virtual channel register n

Table 34.90 ADInx Generation Permission / No Permission Settling List

| ADCHnSGCRx | ADCHnVCR |  |  |
| :--- | :--- | :--- | :--- |
| ADIE | ADIE |  | Generation Condition |
| 0 | 0 |  | - |
|  | 1 | Permitted | Virtual channel $j$ is ended |
| 1 | 0 | Permitted | Scan group $x$ is ended $\left.*^{* 1}\right)$ |
|  | 1 | Permitted | Scan group $x$ is ended $\left({ }^{* 1}\right)$, or virtual channel $j$ is <br> ended |

Note 1. The meaning of 'the end the time of scan group $x$ ' is shown in the following.

- When an A/D conversion of the virtual channel indicated by 'the Scan Group x End Virtual Channel Pointer (ADCHnSGVCEPx)' is completed.
- When an A/D conversion of the virtual channel indicated by 'VCEP of the Scan Group x Virtual Channel Pointer Register (ADCHnSGVCPRx)' is completed.

Note: ADInx is generated when an A/D conversion result is stored in a data register (ADCHnDRj)

Figure 34.19 Scan Conversion End Interrupt Occurrence Timing

### 34.4.6.2 A/D Error Interrupt Request

When the following $\mathrm{A} / \mathrm{D}$ error occurs, an $\mathrm{A} / \mathrm{D}$ error interrupt ( ADEn ) is generated.
The generation timing of the $A / D$ error interrupt is same as the generation timing of the scan end interrupt.
Clear the error status in the interrupt handler, after the interrupt is generated.
A/D error interrupt is generated when the OR-condition of the interrupt-enable-bit of the safety-control-register (ADCHnSFTCR) is valid.

Table 34.91 ADEn Generation Permitted List

| ADCHETFR |  |  |  |
| :--- | :--- | :--- | :--- |
| OWEIE | IDEIE | ADEn | Generation Condition |
| 0 | 0 | Not permitted | - |
| 0 | 1 | Permitted | ID error is occurred |
| 1 | 0 | Permitted | Overwrite error is occurred |
| 1 | 1 | Permitted | Overwrite error is occurred, ID error is occurred |

Each error detection is always valid.
Error status information is stored in the error register for each error.
When overwrite error were detected, the error flag bit is set 1 , and the virtual channel number for the error generated is captured in the capture bit.

When ID error is detected, the error bit of the data supplementary information register j ( ADCHnDIRj ) which corresponds with the virtual channel ( ADCHnVCRj ) where an ID error is detected is set to 0 . When an ID error is not detected, the error bit is set to 1 .

Error status information except for that in the ADCHnDIRj.IDEF is maintained until it's cleared by the clear bit of each error flag of an error-clear-register. When the Read-and-Clear-Enable (RDCLRE) is set 1, ADCHnDIRj.IDEF maintains its status until the flag bit of the relevant error is read.
When the same error occurs once again without being cleared, the error is ignored.
If the interrupt-enable-bit is set to a valid state, when an error of following type occurs, the AD error interrupt is output.
Table 34.92 ADEn Error Factor Register List

| Error Name | Error Register |  | Error Clear Register |
| :--- | :--- | :--- | :--- |
|  | Flag Bit | Capture Bit | Clear Bit |
| Overwrite error | ADCHnQWER.OWE | ADCHnOWER.OWECAP[5:0] | ADCHnECR.OWEC |
| ID error | ADCHnDIRj.IDEF | no function. | no function.*1 |

Note 1. When the Read-and-Clear-Enable (RDCLRE) is set 1, and the data supplementary information register $j$ (ADCHnDIRj) is read, the Error Clear Register clear bit set to 0.

Figure 34.20 Timing of A/D Error Interrupt and Parity Error Interrupt Generation

### 34.4.6.3 Overwrite Error

This error indicates that the new A/D conversion result is overwritten to the data register before the data register ( ADCHnDRj ) is read.

When the write flag (ADCHnDIRj.WFLG) of the data accessory information register is 1 and the new $\mathrm{A} / \mathrm{D}$ conversion result is stored in the corresponding data register $\mathrm{j}(\mathrm{ADCHnDRj})$, the error is detected.

### 34.4.6.4 ID Error

This error indicates that the physical channel specified in the virtual channel register ( ADCHnVCRj ) is inconsistent with the actually-converted physical channel, that is, an operational failure occurred in the internal analog switch of the IO buffer/RRAMP.

ID Error detection result is stored in the ID error bit of Data Supplementary Information Register $j$ (ADCHnDIRj) that is corresponded to detect the Virtual Channel Register n ( ADCHnVCRj ) that detected ID error.

The signal level of feedback from IO buffer/RRAMP is checked.
The setting of ADCHnVCRj.GCTRL[5:0] is compared with IO buffer/RRAMP number that is activated, then when the result is not equal, the error is detected. Because IO buffer/RRAMP are controlled by one-hot, if feedback signal is not one-hot signal, the error is detected.

The ID error is detected when any of the following condition is met.
(1) Mismatched between selecting physical channel number and activated I/O buffer number.
(2) Mismatched between physical channel number that is assigned to the MPX and the I/O buffer number that is activated.*1
(3) Mismatched between activated I/O buffer number and activated RRAMP number.*2
(4) More than two of I/O buffer are activated (One-hot error) when $\mathrm{A} / \mathrm{D}$ conversion is executed.
(5) More than two of RRAMP are activated (One-hot error) when A/D conversion is executed.
(6) More than one of RRAMP are activated in the period that all RRAMP output should off when A/D conversion is executed.

Note 1. Because there are no feedback from MPX, the check cannot be done comparing with MPXvalue.
Note 2. The RRAMP number of physical channel number change by ADCHn. For a detail description, please see Section 34.1.6, External Input/Output Signals.

The detection condition changes by the detection factor.
Table 34.93 ID Error Detect List

| Class of Conversion | $(1)$ | $(2)$ | $(3)$ | $(4)$ | $(5)$ | $(6)$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Normal A/D conversion | $\checkmark$ | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Normal A/D conversion in addition mode | $\checkmark$ | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Normal A/D conversion with MPX | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| Normal A/D conversion with MPX in addition mode | - | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| A/D convertor self-diagnosis | - | - | - | - | - | - |

### 34.4.6.5 Parity Error Interrupt Request

The ADCHn can issue a Parity Error notification (ADPEn) to the ECM.
The Parity Error is detected in second cycle when ADCHmDRj or ADCHmDIRj is read.
The Parity Error notification is generated by parity error when ADCHnSFTCR.PEIE is set to 1 .
The Parity Error can checked by reading ADCHnDIRj.PRTY.
The parity bit is even parity for ADCHnDRj and ADCHnDIRj .IDEF.
The error status information is stored in PER register. When parity error is detected, PER.PE is set to 1 and PER.PRCAP[5:0] is set the virtual channel number that generate parity error.

The error status information is cleared by writing to 1 to ADCHnECR.PEC.
When PER.PE is set, next error is ignored, but when ADCBnSFTCR.PEIE is set to 1 , the parity error is output to ECM if next error is generated.

### 34.4.6.6 MPX Interrupt Request

The ADCHn can issue an MPX interrupt request (ADMPXIn) to the INTC.
If the MPX-interrupt-enable-bit is set to a valid (ADCHnMPXINTER.ADMPXIE = 1) level, ADMPXIn is generated when a virtual channel for which normal-A/D-conversion-with-MPX (ADCHnVCRj.CNVCLS[2:0] $=5_{\mathrm{H}}$ ) or normal-A/D-conversion-with-MPX-in-addition-mode (ADCHnVCRj.CNVCLS[2:0] $=6_{H}$ ) is started.

In both cases such as MPX wait and wait between virtual channels, ADMPXIn is output 4 register access clocks after the conversion is started.

The DMAC can be activated when an ADMPXIn occurs.
If the MPX-interrupt-enable-bit was set to an invalid state (ADCHnMPXINTER.ADMPXIE $=0$ ), ADMPXIn is not output.

However, the ADMPXn0 to ADMPXn4 of the output ports is updated irrespective of the value of ADCHnMPXINTER.ADMPXIE.

ADMPXn0 to ADMPXn4 is output just as ADCHnMPXCURR.MPXCUR[4:0] is transferred, so the update timing is the same as ADCHnMPXCURR.MPXCUR[4:0].

Figure 34.21 Timing of an MPX Interrupt Occurrence

### 34.4.6.7 Virtual Channel Upper/Lower Limit Error Interrupt

ADCHn detects that the $\mathrm{A} / \mathrm{D}$ conversion result is above the upper limit or below the lower limit for each virtual channel, and generates an interrupt request (INT_ULn).

## (1) Setting Registers

INT_ULn is to set the upper/lower-limit-error-interrupt-enable-bit (ADCHnVCLMINTER1.ADULjIE, ADCHnVCLMINTER2.ADULjIE) and the virtual-channel-upper-limit-excess-notice-enable-bit (ADCHnVCRj.VCULME) or virtual-channel-lower-limit-excess-notice-enable-bit (ADCHnVCRj.VCLLME) as 1 , and this function is set to valid or invalid in each virtual channel.

When it is set as valid, the result which compares the $\mathrm{A} / \mathrm{D}$ conversion result with the virtual-channel-upper/lower-limit-table-register (ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6) is output to INT_ULn.

When ADULnIE is set as " 0 " or both of VCULME and VCLLME are set as " 0 ", INT_ULn is not output (the output is fixed low.)

Table 34.94 INT_ULn, vcend[j], vculmo and vcllmo Output Setting

| ADULJIE | VCULME | VCLLME | INT_ULn | vculmo | vcllmo | vcend[j] |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | - | - | - | - |
|  |  | 1 | - | - | $\checkmark$ | $\checkmark$ |
|  | 1 | 0 | - | $\checkmark$ | - | $\checkmark$ |
|  |  | 1 | - | $\checkmark$ | $\checkmark$ | $\checkmark$ |
| 1 | 0 | 0 | - | - | - | - |
|  |  | 1 | $\checkmark$ | - | $\checkmark$ | $\checkmark$ |
|  | 1 | 0 | $\checkmark$ | $\checkmark$ | - | $\checkmark$ |
|  |  | 1 | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ |

Note: For details of vcend[j], vculmo and vcllmo, first see Figure 34.27 and see Section 34.4.9, Virtual Channel Upper/Lower Limit Excess Notice.
$\checkmark$ : Valid —: Invalid

The output condition of the upper/lower limit error interrupt signal (INT_ULn) is as follows.
Precondition: When the $A / D$ conversion value is greater than the upper limit value or less than the lower limit value.
(1) INT_ULn is not output irrespective of the setting of VCULME and VCLLME if ADULjIE=0.
(2) INT_ULn is not output irrespective of the setting of ADULjIE if VCULME=0 and VCLLME=0.
(3), (4), (5) When ADULjIE = 1 and both VCULLME, VCLLME are set to " 1 " or VCULLME = 1 or VCLLME = 1 , INT_ULn is output at same timing as scan end interrupt (ADIn).

When the class of conversion is "normal A/D conversion in addition mode", INT_ULn is output only after the end of the addition number of times of the designated $A / D$ virtual channel.

Figure 34.22 Output Condition of Upper / Lower Limit Error Interrupt

Table 34.95 INT_ULn Output Permitted List for Each Conversion Class

| ADCHnVCRj. <br> CONVCLS[2:0] | Conversion Class | Valid/Invalid | Notes |
| :--- | :--- | :--- | :--- |
| $0_{\mathrm{H}}$ | Normal A/D conversion | $\checkmark$ |  |
| $1_{\mathrm{H}}$ | Setting prohibited | - |  |
| $2_{\mathrm{H}}$ | Setting prohibited | - | It is asserted only at the end of the designated <br> addition counts. |
| $3_{\mathrm{H}}$ | A/D converter self-diagnosis | $\checkmark$ |  |
| $4_{\mathrm{H}}$ | Normal A/D conversion in addition mode | It is asserted only at the end of the designated <br> addition counts. |  |
| $5_{\mathrm{H}}$ | Normal A/D conversion with the MPX | $\checkmark$ |  |
| $6_{\mathrm{H}}$ | Normal A/D conversion with the MPX in | $\checkmark$ |  |
| $7_{\mathrm{H}}$ | Setting prohibited |  |  |
| Note: $\checkmark:$ Valid | —: Invalid |  |  |

(2) Table Registers

## See Section 34.4.9.2, Table Registers.

## (3) Interface Signals

When this function is set as valid, every time $\mathrm{A} / \mathrm{D}$ conversion in a virtual channel ends, a table register is compared with an A/D conversion result, and INT_ULn is output.
INT_ULn is a common signal for all virtual channels.
INT_ULn is one-shot-pulse signal output by a register access clock.
It's possible to determine the detected number of the virtual channel by reading the virtual-channel-upper/lower-limit-excess-status-register 1 (ADCHnVCLMSR1) and virtual-channel-upper/lower-limit-excess-status-register 2 (ADCHnVCLMSR2).

## (4) Operating Timing

INT_ULn signals are synchronized with the register access clock.
Asserting-timing of this signal is the same as the assert-timing of a scan end interrupt signal (ADIn).
The operating timing chart is indicated below.

- 1st comparison period: A/D conversion result $=7 \mathrm{FF}_{\mathrm{H}}$, INT ULn is generated by upper limit value excess and flag is set.
- 2 nd comparison period: $\mathrm{A} / \mathrm{D}$ conversion result $=4 \mathrm{FF}_{\mathrm{H}}, \mathrm{INT}$ _ULn is generated by lower limit value excess and flag is set.

Figure 34.23 Timing Chart of Upper / Lower Limit Error Interrupt

### 34.4.7 DFE/GTM/ASF Entry Function

The ADCHn can issue a request for entry to the DFE or GTM and a request for entry to the ASF for DFE, GTM, and ASF according to the settings of DFENT in ADCHnVCRj and DFENTSGxE and ASENTSGxE in ADCHnDFASENTSGER. At the same time, ADCHn outputs the TAG information and A/D conversion data that are set in DFTAG in ADCHnVCRj. For the format of the output A/D conversion data, see Section 34.3.3.2, ADCHnDRj — Data Register j.

For allocation of each ADCHn and each channel of DFE, refer to Section 37, Digital Filter Engine (DFE).
For allocation of each ADCHn and each channel of GTM, refer to Section 31, Generic Timer Module (GTM).
For allocation of ADCH0 and each channel of ASF, refer to Section 34.8, ADC Summation Function (ASF).

Figure 34.24 DFE/ASF Entry Timing

Figure 34.25 DFE/GTM/ASF Entry Timing

### 34.4.8 Monitoring Function Using the A/D Conversion Monitor Pin

ADENDn can be used to monitor the processing timing of the virtual channel specified by ADCHnADENDP. For details of pin settings, see Section 2, Pin Function.

Figure 34.26 shows the $\mathrm{A} / \mathrm{D}$ conversion monitor timing.

Figure 34.26 A/D Conversion Monitor Timing

## CAUTION

If the high-level voltage is output from ADENDn in a lower-priority scan group and a higher-priority scan group suspends (asynchronous suspend) the processing of the lower-priority scan group, the low-level voltage is output from ADENDn. Since the suspended virtual channel processing for the lower-priority scan group resumes after that, the high-level voltage is output again from ADENDn.

### 34.4.9 Virtual Channel Upper/Lower Limit Excess Notice to ADC VMON Secondary Error Generator (AVSEG), or to ADC Boundary Flag Generator (ABFG)

The ADCHn can detects that the $\mathrm{A} / \mathrm{D}$ conversion result is greater than the upper limit value or less than the lower limit value for each virtual channel, and it is possible to notify the ADC VMON secondary error generator (AVSEG), or ADC boundary flag generator (ABFG).

### 34.4.9.1 Setting Registers

It is possible to set this function as valid or invalid in each virtual channel if the virtual-channel-upper-limit-excess-notice-enable-bit (ADCHnVCRj.VCULME) or virtual-channel-lower-limit-excess-notice-enable-bit (ADCHnVCRj.VCLLME) is set.

When it is set as valid, the $\mathrm{A} / \mathrm{D}$ conversion result is compared with the virtual-channel-upper/lower-limit-table-register (ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6) and is output to vcend[j] (A/D conversion end notice), vculmo (virtual channel upper limit excess notice) and vcllmo (virtual channel lower limit excess notice).

When both of VCULME and VCLLME are set to " 0 ", vculmo, vcllmo, and vcend[j] are not output (output is fixed low).

For details of vculmo, vcllmo, and vcend[j], see Figure 34.27.
Table 34.96 vcend[j], vculmo and vcllmo Output Setting

| VCULME | VCLLME | Virtual Channel Upper Limit <br> Excess Noticevculmo | Virtual Channel Lower Limit <br> Excess Noticevclimo | A/D Conversion End <br> Noticevcend[j] |

| Note: $\quad \checkmark:$ Valid | $-:$ Invalid |  |  |

### 34.4.9.2 Table Registers

The virtual-channel-upper/lower-limit-table-register (ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6) are specified by the VCULLMTBS [2:0] bits of the virtual channel register (ADCHnVCRj).

The upper limit value table and the lower limit table are sets.
Therefore it isn't possible to choose the lower limit table for the register number different from the upper limit value table in one virtual channel.

Set the upper limit value to the upper-side 16 bits of the chosen ADCHnVCULLMTBR and set the lower limit value to the lower-side 16 bits of the chosen ADCHnVCULLMTBR.

Write using a 32 bit width. This register cannot be written using a 16 bit width or 8 bit width.
ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6 can be rewritten at any time irrespective of the timing before scan group start and after scan group start.

Table 34.98 Correlation between ADCHnVCRj.VCULLMTBS[2:0] and ADCHnVCULLMTBR0 to ADCHnVCULLMTBR6

| $\begin{array}{l}\text { ADCHnVCRj. } \\ \text { VCULLMTBS[2:0] }\end{array}$ | Register Name |  | Lpper Limit Side Condition |
| :--- | :--- | :--- | :--- |$)$

### 34.4.9.3 Interface Signals

When this function is used, every time an $A / D$ conversion in a virtual channel has ended, a table register is compared with an $A / D$ conversion result, and vcend[j] (A/D conversion end notice), vculmo (virtual channel upper limit excess notice) and vcllmo (virtual channel lower limit excess notice) are output.
vcend[j], vculmo and vcllmo are one-shot-pulse signals output by the register access clock.
These signals are output when the A/D conversion ends.
vcend[ j$]$ is output irrespective of the result of the comparison.
Only when the upper limit value excess is detected, vculmo is output, and only when the lower limit value excess is detected, vcllmo is output.
vculmo and vcllmo are common signals for all virtual channels.
It's possible to determine the detected number of the virtual channel by using a pair of vcend[j] and vculmo, or using a pair of vcend[j] and vcllmo.

For details of vculmo, vcllmo, and vcend[j], see Figure 34.27.
Table 34.99 vcend[j], vculmo and vcllmo Output Timing

| Signal Name | Means | Operation | Synchronizing Clock |
| :--- | :--- | :--- | :--- |
| vcend[j] | Virtual channel A/D conversion end notice | It is output at the A/D conversion end. | register access clock |
| vculmo | Virtual channel upper limit excess notice | When it occurs, it is output at the time of <br> A/D conversion end. |  |
| vcllmo | Virtual channel lower limit excess notice | When it occurs, it is output at the time of <br> A/D conversion end. |  |

### 34.4.9.4 Operating Timing

The operation timing chart is indicated below.
vcend[j], vculmo and vcllmo are the signals which are with the register access clock.
Assert-timing of these signals is same as the assert-timing of the scan end interrupt signal (ADIn).

Figure 34.27 Output Timing Chart of Virtual Channel Upper / Lower Limit Excess Notice

The following diagram shows the timing chart when ADCHnDRj storage and ADCHnVCLLMTBR rewrite compete against each other.

Comparison is performed 1 register access clock period before ADCHnDRj storage. Therefore, if ADCHnDRj storage and ADCHnVCULLMTBR rewrite are performed simultaneously, the previous value of ADCHnVCULLMTBR is used for comparison.

Figure 34.28 Timing Chart of Competition of Storing of ADCHnDRj and Rewriting of ADCHnVCULLMTBR

### 34.4.10 Wiring-Break Detection Function

The wiring-break detection function detects a wiring-break of the ANI. If a wiring-break is present, the conversion result attenuates to approximately 0 V , and an abnormal value is detected in the conversion result by repeating the $\mathrm{A} / \mathrm{D}$ conversion several times. This can be determined as a wiring-break. For details timing, refer to Figure 34.29.
[Feature]
(1) Users can select desired physical channels for which the wiring-break is to be detected.
[Recommendation flow]
(1) Set registers according to the initial settings (Figure 34.5).
(2) Set CNVCLS[2:0] in the virtual channel register ADCHnVCRj to $0_{\mathrm{H}}$ and set GCTRL[5:0] to select desired channels.
(3) Set ODE in the wiring-break detection control register to $1_{\mathrm{H}}$ and set $\mathrm{ODPW}[5: 0$ ] to specify the desired wiringbreak detection pulse width.
(4) Assert SG0 to SG4 trigger signals to perform an A/D conversion.
(5) When the read $\mathrm{A} / \mathrm{D}$ conversion result has attenuated to approximately 0 V after repeating $\mathrm{A} / \mathrm{D}$ conversion several times, judge that a wiring-break has occurred.

Figure 34.29 Timing Chart of Wiring-Break Detection Function

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, refer to Section 34.4.11.1, Pin-Level Self-Diagnosis

### 34.4.11 Self-Diagnostic Functions

The ADC is equipped with the following four self-diagnostic functions.

- Pin-level self-diagnosis
- A/D conversion circuit self-diagnosis
- Wiring-break detection self-diagnosis
- Secondary power supply voltage monitor self-diagnosis

### 34.4.11.1 Pin-Level Self-Diagnosis

The pin-level self-diagnosis performs an A/D conversion that is set to a different voltage for even-numbered physical channel groups and odd-number physical channel groups to check for an abnormal path from the analog input.

When an $A / D$ conversion result is not a static value, there is a possibility that the $A / D$ converter is broken.
[Analog input route]
I/O Buffer $\rightarrow$ RRAMP $\rightarrow$ A/D Converter
[Recommendation flow]
Set the virtual channel register j ( ADCHnVCRj ) and pin level self-diagnosis register ( ADCHnTDCR ) according to the initial setting flow.

## ADCHnVCRj

| VCR number | CNVCLS[2:0] | GCTRL[5:0] |
| :--- | :--- | :--- |
| N | 0 H | ANIxx number |

ADCHnTDCR

| ADCHnTDCR |  | Injection Voltage to Physical Channel Group |  |
| :--- | :--- | :--- | :--- |
| TDE | TDLV[1:0] | Even Group | Odd Group |
| 0 | $*$ | - | - |
| 1 | HH | AnVSS | AnVCC |
| 1 | $1 H$ | AnVCC | AnVSS |
| 1 | $2 H$ | AnVSS | $1 / 2 \times$ AnVCC |
| 1 | $3 H$ | $1 / 2 \times$ AnVCC | AnVSS |

Allocate the above-mentioned virtual channel n to scan group x .

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, set
ADCHnODCR.ODE, ADCHnODCR.ODDE and ADCHnTDCR.TDE as the following.

| Setting |  | Pin function |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| ODDE | ODE | TDE | Analog <br> input | Discharge | Voltage <br> injention | Operation |
| 0 | 0 | 0 | $\checkmark$ | - | - | Normal |
| 0 | 0 | 1 | - | - | $\checkmark$ | Pin level self-diagnosis |
| 0 | 1 | 0 | $\checkmark$ | $\checkmark$ | - | Wiring-break detection |
| 1 | 1 | 0 | - | $\checkmark$ | - | Wiring-break detection self-diagnosis |
|  |  |  |  |  |  |  |
| Other than above |  |  |  |  | Setting prohibited |  |
| $\checkmark$ Valid | $-:$ Invalid |  |  |  |  |  |

### 34.4.11.2 A/D Converter Self-Diagnosis

The A/D converter self-diagnosis is used to verify that A/D conversion operates correctly.
When the $\mathrm{A} / \mathrm{D}$ conversion value is different from the expected value, there is a possibility that the $\mathrm{A} / \mathrm{D}$ converter is broken.

The voltage value setting is made in GCTRL[4:0] when CNVCLS[2:0] $=3_{\mathrm{H}}$, and can be converted for AnVREFH $\times 1$, AnVREFH $\times 3 / 4$, AnVREFH $\times 1 / 2$, AnVREFH $\times 1 / 4$, and AnVREFH $\times 0$.

Features of the A/D conversion circuit self-diagnosis are described below.
[Recommendation flow]
(1) Set registers according to the initial settings (Figure 34.5).
(2) Set CNVCLS[2:0] in the virtual channel register ADCHnVCRj to $3_{\mathrm{H}}$ and set GCTRL[5:0] to specify the desired self-diagnosis voltage level.
(3) Set registers required for $\mathrm{A} / \mathrm{D}$ conversion according to the initial settings (Figure 34.5).
(4) Assert SG0 to SG4 trigger signals to perform A/D conversions.

### 34.4.11.3 Wiring-Break Detection Self-Diagnosis

The self-diagnosis function of wiring-break detecting function is used to check that the wiring-break detecting function works normally.

A/D conversion execute in disabling ANI input and pull-down the ANI by ADCHnODCR setting. A/D conversion repeat several times, then the $\mathrm{A} / \mathrm{D}$ conversion result of pull-down attenuates to approximately 0 V , the wiring-break detecting function is judged to be working normally. For the detail, refer to Figure 34.30.

## [Feature]

1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.
[Recommended flow]
2) Set the initial value (refer to (Figure 34.5))
3) Set the physical channel by setting of ADCHnVCRj of CNVCLS[2:0] $=0_{\mathrm{H}}$ and GCTRL[5:0].
4) Set ODE and ODDE in the wiring-break detection control register(ADCHnODCR) to 1 and set ODPW[5:0] to specify the desired wiring-break detection pulse width.
5) Execute the $\mathrm{A} / \mathrm{D}$ conversion by asserting SG0-4 trigger.
6) After repeat the $A / D$ conversion several times, read the result of $A / D$ conversion value. If the value attenuates to approximately 0 V , the wiring-break detecting function is judged to be working normally.

Figure 34.30 Timing Chart of Wiring-Break Detection Self-Diagnosis

Note: About prohibiting using the pin level self-diagnosis function and the wiring-break-detection functions at same time, refer to Section 34.4.11.1, Pin-Level Self-Diagnosis

### 34.4.11.4 Secondary Power Supply Voltage Monitor Self-Diagnosis

The self-diagnosis function of secondary power supply voltage monitor function is used to check that the secondary power supply voltage monitor function works normally.

A/D conversion is performed when divided resistance is off by VMONVDCR1 and VMONVDCR2. Then the A/D conversion result becomes proximity 0 V , the function is judged to be working normally.

When secondary power supply voltage monitor self-diagnosis function is used, $\mathrm{A} / \mathrm{D}$ conversion of power supply and secondary power supply voltage monitor self-diagnosis should alternately be performed each power supply. For operation example, refer to Figure 34.31.

## [Recommended flow]

1) Set the initial value (refer to (Figure 34.5))
2) Set the secondary power supply voltage monitor channel by setting of ADCH 0 VCRj of $\mathrm{CNVCLS}[2: 0]=0_{\mathrm{H}}$ and GCTRL[5:0] (VCC=28, EVCC=29, VDD=30).
3) Set VDE1 to 1 , set VDE2 to 1 .
4) $\mathrm{A} / \mathrm{D}$ conversion is performed, then check that the result is same as power supply voltage.
5) Set VDE1 to 0, set VDE2 to 0 .
6) $\mathrm{A} / \mathrm{D}$ conversion (secondary power supply voltage monitor self-diagnosis) is performed, then check that the result is approximately 0 V .

Figure 34.31 Example of Operation of Secondary Power Supply Voltage Monitor Self-Diagnosis

### 34.4.12 Timing Regulations

The operating timing of ADCHn is shown below.
Table 34.100 Timing in Normal A/D Conversion

| Item | Symbol | Period | Unit |
| :---: | :---: | :---: | :---: |
| Scan group start delay time | tD | (2 to 4 ) $\times \mathrm{P} \phi+5 \times 1 \phi$ | $\mathrm{P} \phi$ (register access clock) |
|  |  |  | I (ADCLK) |
| Sampling time | tSPL | $18 \times 19$ | I $\phi$ (ADCLK) |
| Successive approximation conversion processing time | tSAR | $22 \times 1 \phi$ | I ${ }^{\text {(ADCLK }}$ ) |
| Scan group end delay time | tED | $(2$ to 4$) \times 1 \phi+3 \times P \phi$ | $\mathrm{P} \phi$ (register access clock) |
|  |  |  | I $\phi$ (ADCLK) |
| Scan group processing time | tSG | $47 \times 1 \phi+5 \times \mathrm{P} \phi$ to $49 \times 1 \phi+7 \times \mathrm{P} \phi$ | $\mathrm{P} \phi$ (register access clock) |
|  |  |  | I ${ }^{\text {(ADCLK) }}$ |

The processing time for a scan group (tSG) can be obtained from the following formula, where the number of virtual channels is $i$ and the number of multicycles is $j$ in multicycle scan mode:

$$
t S G=t D+(t S P L+t S A R) \times i \times j+t E D
$$

The processing time for the first cycle of a scan in continuous scan mode is as follows:

$$
t D+(t S P L+t S A R) \times i
$$

The processing time for the second (or subsequent) cycle of a scan in continuous scan mode is as follows:

$$
(t S P L+t S A R) \times i
$$

Figure 34.32 Timing Chart of Normal A/D Conversion Operation

### 34.4.13 Optional Waiting Times Insertion Function of Between Virtual Channels

The wait function is the function to insert any wait time in the processing between a virtual channel processing and a virtual channel processing. The wait time can set each scan group, but cannot set difference time in same scan group.

This function inserts waiting times before virtual channel (other than first virtual channel of first scan) processing of the following.

The conversion class is:

- Normal A/D conversion
- Addition mode $\mathrm{A} / \mathrm{D}$ conversion
- Normal A/D conversion with the MPX
- Normal A/D conversion with the MPX in addition mode

This function doesn't insert waiting times before virtual channel processing of the following.
The conversion class is:

- A/D converter self-diagnosis

The waiting times is specified by ADCHnSGVCOWRx.VCOW[11:0] to each scan group.

### 34.4.13.1 Waiting Times Insertion in Normal A/D Conversion

When the normal $\mathrm{A} / \mathrm{D}$ conversion is executed by using the wait function, a wait is inserted between virtual channel processes regardless of using MPX wait function.

A case by which the number of scan is 3 times is shown in Figure 34.33.

Figure 34.33 Example of Operation of Waiting Timing Insertion in Normal A/D Conversion (the number of scan is 3 times)

It is shown in the following for (1) to (3) in Figure 34.33.
(1) Waiting times is not inserted before the first virtual channel processing of the first scan. The continuous scan mode is also same.
(2) Waiting times is inserted between virtual channel processing. The continuous scan mode is also same.
(3) Waiting times is not inserted after the last virtual channel processing of the last scan.

A case by which the number of scan is 1 time is shown in Figure 34.34.

Figure 34.34 Example of Operation of Waiting Timing Insertion in Normal A/D Conversion (the number of scan is 1 time)

When using "Addition mode A/D conversion" or "Normal A/D conversion with the MPX in addition mode", the waiting times is not inserted in ongoing addition processing (within completion of second $\mathrm{A} / \mathrm{D}$ conversion in 2 times addition mode, or within completion of fourth $\mathrm{A} / \mathrm{D}$ conversion in 4 times addition mode).

### 34.4.13.2 Waiting Time Insertion in Synchronous Suspend Movement

There are two cases that scan group with higher priority (SG2) interrupt to scan group with lower priority (SG1).
$<$ Case $1>$ Processing a virtual channel of scan group with lower priority (SG1)
$<$ Case 2> Waiting between virtual channels of scan group with lower priority (SG1)
A sample case shows in Figure $\mathbf{3 4 . 3 5}$.

Figure 34.35 Example of Operation of Waiting Timing Insertion in Synchronous Suspend Movement

### 34.4.13.3 Waiting Times Insertion in Asynchronous Suspend Movement

There are two cases that scan group with higher priority (SG2) interrupt to scan group with lower priority (SG1).
<Case $1>$ First virtual channel processing of scan group with lower priority (SG1)
$<$ Case 2> A virtual channel processing other than first of scan group with lower priority (SG1).
$<$ Case 3> Waiting times between virtual channels processing of scan group with lower priority (SG1).
When a scan group with lower priority (SG1) restart, a wait is not asserted in $<$ Case $1>$, but a wait is asserted in $<$ Case $2>$ and $<$ Case $3>$.

A sample case shows in Figure 34.36.

Figure 34.36 Example of Operation of Waiting Timing Insertion in Asynchronous Suspend Movement

### 34.4.14 Example of Scan Group Stop

The example shows about the function of all scan groups stop (ADCHnADHALTR.HALT) and each scan group stop (ADCHnSGSTPCRx.SGSTP).

### 34.4.14.1 Example of All Scan Group Stop (A/D Halt)

When ADCHnADHALTR.HALT is set to 1 , all scan groups and all AD timers are halted and initialized, and the ADC becomes the idle state ( $\mathrm{ADCHnSGSRx} . \mathrm{SGACT}=0$ ) immediately (by at most 4 register access clocks).

Figure 34.37 Example of All Scan Group Stop (A/D Halt)

### 34.4.14.2 Example of Scan Group x Stop

When ADCHnSGSTPCRx.SGSTP is set to 1 , corresponding scan group become to be idle state
$(A D C H n S G S R x . S G A C T=0)$ after finishing current virtual channel process. A sample case shows in Figure 34.38.

Figure 34.38 Example of Scan Group x Stop 1

ADCHnSGSTPCRx.SGSTP is set to 1 , and when processing of ongoing virtual channel is suspended by asynchronous suspend function of higher priority scan group, processing of ongoing virtual channel is stopped and transits to idle state $(S G A C T=0)($ Case 1 of Figure 34.39).

When ADCHnSGSTPCRx.SGSTP is set to 1 in suspended state by synchronous suspend function or asynchronous suspend function, ADCH is not resumed and transits to idle state $(\mathrm{SGACT}=0)$ (Case 2 of Figure 34.39).

When synchronous suspend is occurred by higher priority scan group during the $A / D$ conversion process, ADCH transits to idle state $(\mathrm{SGACT}=0)$ after the $\mathrm{A} / \mathrm{D}$ conversion for the virtual channel is finished.

Figure 34.39 Example of Scan Group $x$ Stop 2

### 34.4.15 Secondary Power Supply Voltage Monitor Function

ADCH0 can convert the voltage of VCC, EVCC, and the VDD power supply in AD. When voltage divider enable bit 1 and 2(VDE1 and VDE2) of voltage monitor voltage divider control register 1 and 2 (ADCH0VMONVDCR1 and ADCH0VMONVDCR2) are set as 1 , it is possible to perform $A / D$ conversion of each power supply voltage.

About VCC and EVCC, A/D conversion of divided voltage are performed.
For the self-diagnosis flow of the secondary power supply voltage monitor function, refer to Section 34.4.11.4

## Secondary Power Supply Voltage Monitor Self-Diagnosis.

[Recommendation flow]

1) Set the initial value (refer to Figure 34.5)
2) Set CNVCLS[2:0] $=0 \mathrm{H}$, and set each power supply voltage ( $\mathrm{VCC}=28, \mathrm{EVCC}=29, \mathrm{VDD}=30$ ) to $\mathrm{GCTRL}[5: 0]$ of ADCH0VCR0, ADCH0VCR1, and ADCH0VCR2. (When they are three consecutive ADCH0VCRj, arbitrary setting is permitted.).
Additionally, set VCULME=1, VCLLME=1 and VCULLMTBS[2:0] to the corresponding values defined in ADCH0VCULLMTBR
3) Set VDE1 to 1 , set VDE2 to 1 .
4) Set upper limit value and lower limit value of each power supply voltage to ADCH0VCULLMTBR0, ADCH0VCULLMTBR1 and ADCH0VCULLMTBR2 (any of ADCH0VCULLMTBR (ADCH0VCULLMTBR0 to ADCH0VCULLMTBR6) can be used as voltage monitor). For reference value of upper / lower limit value, refer to Figure 34.40
5) Allocate AVSEGVCCCHSCR (for VCC), AVSEGEVCCCHSCR (for EVCC) and AVSEGVDDCHSCR (for VDD) a virtual channels which corresponds to each power source. For details of this setting, refer to Section 34.9 ADC VMON Secondary Error Generator (AVSEG).
6) Set configuration of a filter to AVSEGVCCCNTCR (for VCC), AVSEGEVCCCNTCR (for EVCC) and AVSEGVDDCNTCR (for VDD). For details of this setting, refer to Section 34.9 ADC VMON Secondary Error Generator (AVSEG).
7) Start SG, and perform A/D conversion.

Note 1. EVCC operation can be guaranteed in $5 \mathrm{~V}(4.5$ to 5.5 V$)$, and not guaranteed in $3 \mathrm{~V}(3.0$ to 3.6 V$)$.
Note 2. Set the upper / lower limit value as the value with which the absolute error of $A / D$ conversion of power supply voltage is added to a reference value of this figure.

Figure 34.40 Reference Value of Upper / Lower Limit Value of Secondary Power Supply Voltage Monitor

Figure 34.41 Example of Operation of Secondary Power Supply Voltage Monitor

NOTE

- When making it to the module standby, set VDE1 and VDE2 as 0 respectively, before it changes to the module standby.
- Please remove voltage fluctuation of AOVREFH as much as possible.

### 34.5 Definition of A/D Conversion Accuracy

A/D conversion accuracy is defined below.

- Resolution

Number of digital output codes of the A/D converter

- Quantization error

An error essentially contained in $\mathrm{A} / \mathrm{D}$ converters, which is given as $1 / 2 \mathrm{LSB}$ (Figure 34.42).

- Offset error

Deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristics when the digital output changes from the minimum voltage value $000_{\mathrm{H}}$ to $001_{\mathrm{H}}$. However, the quantization error is not included (Figure 34.42).

- Full-scale error

Deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristics when the digital output changes from $\mathrm{FFE}_{\mathrm{H}}$ to $\mathrm{FFF}_{\mathrm{H}}$. However, the quantization error is not included (Figure 34.42).

- DNL (Differential nonlinear error)

Deviation between the ideal digital output code width $(\mathrm{Vq})$ and the actual digital output code width $(\mathrm{Va})$, which is given as $(\mathrm{Va}-\mathrm{Vq}) / \mathrm{Vq}$. However, the offset error, the full-scale error, and the quantization error are not included
(Figure 34.42).

- INL (Integral nonlinear error)

Deviation of the actual value from the ideal A/D conversion characteristics, from the zero voltage to the full-scale voltage, which is given as an integral of DNL from $000_{\mathrm{H}}$ to a digital output code. However, the offset error, the fullscale error, and the quantization error are not included (Figure 34.42).

- TUE (Total unadjusted error)

Deviation between the digital value and the analog input value. The offset error, the full-scale error, the quantization error, DNL, and INL are included (Figure 34.42).

Figure 34.42 Definition of A/D Conversion Accuracy

### 34.6 Usage Notes

### 34.6.1 Notes on Using an External Analog Multiplexer

When using an external multiplexer, observe the following notes so as not to cause system issues.
Other than for the exceptions below, set the MPX wait as follows:

- When an MPX value is transferred to a port: Insert a wait of at least $1 \mu \mathrm{~s}$.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least the SPI transmission time $+1 \mu \mathrm{~s}$.

## Exception 1) When an external multiplexer is used for one scan group

When an external multiplexer is used for SG0 with $\operatorname{SUSMTD}\left[1: 0\right.$ ] set to $1_{\mathrm{H}}$, or when an external multiplexer is used for any of SG0 to SG3 with SUSMTD[1:0] set to $2_{\mathrm{H}}$, set the MPX wait as follows:

- When an MPX value is transferred to a port: Insert a wait of at least $1 \mu \mathrm{~s}$.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least SPI transmission time $\times 2$.

## Exception 2) When an external multiplexer is used for multiple scan groups

When an external multiplexer is used with $\operatorname{SUSMTD}[1: 0]$ set to $1_{\mathrm{H}}$ or $2_{\mathrm{H}}$, observe the following notes.

- For the starting virtual channel of each scan group, setup so as not to use an external multiplexer. (However, for the start virtual channel of the scan group whose priority is lowest among the scan groups for which the external multiplexer is used, settings to use an external multiplexer does not cause any problem.)
- Up to two scan groups can be transferred with the SPI interface.

Furthermore, set the MPX wait time as follows:

- When an MPX value is transferred to a port: Insert a wait of at least $1 \mu \mathrm{~s}$.
- When an MPX value is transferred with the SPI interface: Insert a wait of at least SPI transmission time $\times 2$.

### 34.6.2 Notes on Using Analog Input Pins

Do not perform an A/D conversion for the same analog pin with Delta-Sigma ADC, Cyclic ADC and SAR-ADC at the same time. Also, do not perform an A/D conversion with the SAR-ADC for an analog pin that is being used for a digital input. Doing so may degrade the $A / D$ conversion accuracy.

When a digital input or output signal is multiplexed with an analog input signal, it can also be used as a digital generalpurpose input or output pin. Changes in a digital input or output during an AD conversion may reduce the precision of conversion. Noise from the operation of digital pins near analog input pins may also reduce the precision of conversion. Notes on how to reduce the effects of digital input and output noise on the results of AD conversion are given below.
(1) Notes on Analog Input Pins
(a) Place the capacitors of RC circuits as close to the LSI pin as is possible. This reduces the effects of digital inputs and outputs on the precision of conversion. Since the improvement in precision also depends on other conditions of the board, evaluate the situation on the actual board.
(2) Notes on Digital Input and Output Pins near Analog Pins
(a) If digital input through the pin is not essential, disable the digital input.
(b) If a digital signal is input to such a pin, the signal should not include overshoot or undershoot.
(c) Design the board so that load capacitances connected to output pins to suppress discharge currents are small.
(d) Lower the output driving ability of pins that may be affected.
(3) Software Measures against Effects on the Results of Conversion
(a) Use an average of multiple results of AD conversion.
(b) When using multiple consecutive results of ADC conversion, exclude outlying results.

### 34.6.3 Module Standby Function

The ADCHn has a module standby function.
Module standby stops the clock supply to ADCH0, ASF0 and AVSEG by setting MSR_SAD.MS_SAD0.
Module standby stops the clock supply to ADCH2 by setting MSR_SAD.MS_SAD2.
Module standby stops the clock supply to ADCH1 by setting MSR_SAD.MS_SAD1.
Module standby stops the clock supply to ADCH3 by setting MSR_SAD.MS_SAD3.
Module standby stops the clock supply to IFC0. For the clock supply stop condition of IFC0, refer to Table 34.101.
Module standby stops the clock supply to IFC1. For the clock supply stop condition of IFC1, refer to Table 34.102.
Module standby stops the clock supply to ABFG and AIR. For the clock supply stop condition of ABFG and AIR, refer to Table 34.103.

Table 34.101 Clock Supply Stop Condition of IFC0 by Module Standby

| States | MSR_SAD.MS_SAD0 | MSR_SAD.MS_SAD2 |
| :--- | :--- | :--- |
| Clock Supply Active | 0 | 0 or 1 |
| Clock Supply Active | 1 | 0 |
| Clock Supply Stopped | 1 | 1 |

Table 34.102 Clock Supply Stop Condition of IFC1 by Module Standby

| States | MSR_SAD.MS_SAD1 | MSR_SAD.MS_SAD3 |
| :--- | :--- | :--- |
| Clock Supply Active | 0 | 0 or 1 |
| Clock Supply Active | 1 | 0 |
| Clock Supply Stopped | 1 | 1 |

Table 34.103 Clock Supply Stop Condition of ABFG and AIR by Module Standby

### 34.7 Integer/Floating-Point Conversion Module (IFC)

The IFC module can read data in the data register of ADCH via the IFC and convert it to floating-point format.

### 34.7.1 Overview

### 34.7.1.1 Function Overview

The IFC has the following features:

- Floating-point format: IEEE754 standard single-precision
- Supported registers: Data registers for all virtual channels of the ADCH IFC0: ADCH0, ADCH2
IFC1: ADCH1, ADCH3

### 34.7.1.2 Block Diagram

Figure 34.43 is a configuration block diagram of the IFC0.

### 34.7.2.2 IFC Specific Registers

## (1) IFCuFDRnj — Floating-Point Data Register nj

IFCuFDRnj is a 32-bit read-only register that can read the ADCHnDRj of ADCHn , converting it to the floating-point format. Data in an ADC data register is converted from the signed fixed-point format to the floating-point format. Even data in the signed integer format (DFMT bit in ADCHnADCR2 of ADCHn is set to 1 ) is regarded as data in the signed fixed-point format, and converted to the floating-point format.

## Value after reset: $00000000_{H}$

## - Reference: ADCHnDRj signed fixed-point format

Floating-point data register 0 j of IFC0 (IFC0FDR0j) correspond with virtual channel j of ADCH0 (ADCH0DRj).
Floating-point data register 2 j of IFC0 (IFC0FDR2j) correspond with virtual channel j of ADCH 2 (ADCH2DRj).
Floating-point data register 1 j of IFC1 (IFC1FDR1j) correspond with virtual channel j of ADCH1 (ADCH1DRj).
Floating-point data register 3 j of IFC1 (IFC1FDR3j) correspond with virtual channel j of ADCH 3 (ADCH3DRj).

### 34.8 ADC Summation Function (ASF)

The ASF is a function that accumulates the $\mathrm{A} / \mathrm{D}$ converted value from the ADCH the specified number of times, and then stores the total value in a register.

### 34.8.1 Overview

### 34.8.1.1 Function Overview

The ASF has the following features:

- Compatible module: ADCH0
- Number of accumulation channels: 16
- Entry from ADCH:

Upon receiving an ASF entry request, TAG for DFE, and data for DFE from the ADCH, is transferred by the ASF to each accumulation channel (with the same number as the TAG value for DFE) of the ASF.

- Accumulation data register: 32 bits
- Accumulation end interrupt:

Each time accumulation for the number of cycles specified in each channel ends, an interrupt request (ASI00 to ASI15) to the CPU can be generated.

### 34.8.2.2 ASF Specific Registers

## (1) ASFrDRi - Accumulation Data Register i

ASFrDRi is a 32-bit read-only register that stores an accumulation value. When ASFrCNT matches ASFrCMPi, data in intermediate buffer $i$ is updated to ASFrDRi. The ASFrDRi value is retained until the next compare match occurs.

Table 34.107 ASFrDRi Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 11 | ASFrDRi[20:0] | Accumulation Data |
|  |  | When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi. |
| 10 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

A 12-bit (bit14 to bit3) value is extracted from the data for DFE from the ADCHn for use in the input of accumulation as a 12-bit integer. Therefore, even if the valid number of digits of the data for DFE is 13 or 14 bits after addition is performed twice or four times in the ADCHn , the valid number of digits is regarded as 12 bits and accumulation processing is performed. The signed integer format ( $\mathrm{DFMT}[1: 0]=01_{\mathrm{B}}$ is set in the ADCHn ) is regarded as signed fixed-point format and accumulation processing is performed. For this reason, when using the ASF function, conversion-class of ADCHn must be set to normal-A/D-conversion, or A/D-converter-self-diagnosis, or normal-A/D-conversion-with-the-MPX, and DFMT[1:0] must be set to a value different from $01_{\mathrm{B}}$.

An effective bit is also dealt with as 12 bit in case of 10 -bit-format (at the time of DFMT[1:0] $=11_{\mathrm{B}}$ set by ADCHn), but lower 2bit of the accumulation-input-format, accumulation-value-format and ASFrDRi will be fixed to 0 .

ASFrDRi is a format with left-aligned valid bits according to the accumulation count of 21-bit accumulation value.

Figure 34.46 Accumulation Data Reading Register i (ASFrDRi) Bit Format

## (2) ASFrCMPi - Accumulation Compare Match Register i

ASFrCMPi is a 16-bit readable/writable register that control the accumulation end interrupt output control, enables or disables accumulation processing for accumulation channel i and specifies the ASFrCNT compare match value for updating ASFrDRi. ASFrCMPi is initialized to $0000_{\mathrm{H}}$ at reset.

| Value after reset: |  |  | 0000 H |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W |

Table 34.108 ASFrCMPi Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 15 | ASIIIE | Accumulation end interrupt enable <br> 0 : Accumulation end interrupt (ASli) is not output. <br> 1: Accumulation end interrupt (ASII) is output. |
| 14 to 8 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 7 | ASFrCHEi | Accumulation Channel i Enable <br> 0 : Accumulation is disabled. <br> - Intermediate buffer $i$ is cleared to 0 . <br> -ASFrDRi is not updated. <br> - Accumulation end interrupt (ASli) is not generated. <br> 1: Accumulation is enabled. <br> - Each time an ASF entry request of TAG for DFE (TAG for DFE $=i$ ) that matches accumulation channel $i$ is accepted, the result of sum of data for DFE and intermediate buffer $i$ is stored in intermediate buffer $i$ (accumulation processing for accumulation channel i). <br> -When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi and intermediate buffer $i$ is cleared to 0 (ASFrDRi update). <br> -An accumulation end interrupt (ASli) is generated on compare match. |
| 6 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 to 0 | ASFrCMPi[4:0] | Accumulation Compare Match <br> [When ASFrCTLO.ASFrRTD = 0] <br> When ASFrCNT matches ASFrCMPi, data in intermediate buffer i is updated to ASFrDRi. <br> [When ASFrCTLO.ASFrRTD=1] <br> Regardless of the set ASFrCMPi value, the accumulator i value is stored in ASFrDR i when ASFrRTCNTi[8:0] $=0$. <br> These bits must not be modified during operation (while ASFrST = 1 ). |

## CAUTIONS

1. Each time ASFrCNT[8:0] matches $\left\{0000_{\mathrm{B}}, \mathrm{ASFrCMPi}[4: 0]\right\}$, the intermediate buffer i value is stored in ASFrDRi[20:0] and an ASli interrupt is generated.
Therefore, the first accumulation count in ASFrDRi[20:0] is not ensured after accumulation processing (where ASFrST is changed from 0 to 1 ) is started, or immediately after an accumulation channel (for which ASFrCHEi is changed from 0 to 1 during accumulation processing) is enabled (the accumulation count is variable).
For example of operation, see Section 34.8.3.1, Example of Accumulation Processing Operation.
2. Set ASFrCMPi[4:0] to a value less than the accumulation count selected by ASFrACSL[2:0]. If a value equal to or greater than the accumulation count is set in ASFrCMPi[4:0], ASFrCNT[8:0] does not match $\left\{0000_{\mathrm{B}}\right.$, ASFrCMPi[4:0]\}, so the ASFrDRi[20:0] value is not updated.

## (3) ASFrCTLO - Accumulation Counter Control Register 0

ASFrCTL0 is a 32-bit readable/writable register that sets count-up conditions for ASFrCNT. ASFrCTL0 is initialized to $00000000_{\mathrm{H}}$ at a reset.

This register must not be modified during operation (while $\mathrm{ASFrST}=1$ ).

Table 34.109 ASFrCTLO Register Contents

| Bit Position | Bit Name | Function |

| 3 to 0 | ASFrCTAG[3:0] | Accumulation Count-Up TAG |
|  |  | When an ASF entry request of TAG for DFE that matches ASFrCTAG is accepted, ASFrCNT starts to count-up. |

## (4) ASFrCTL1 - Accumulation Counter Control Register 1

ASFrCTL1 is an 8-bit readable/writable register that enables (starts) or disables (stops) counting up by ASFrCNT. ASFrCTL1 is initialized to $00_{\mathrm{H}}$ at a reset.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

|  |  | $0:$ The accumulation counter and all intermediate buffers are cleared to 0. |
|  |  | 1: Counting up and accumulation processing by the accumulation counter are enabled. |
|  |  | When an ASF entry request of TAG for DFE that matches ASFrCTAG is accepted with |
|  |  | ASFrST set to 1, ASFrCNT starts counting up. |

## (5) ASFrCNT - Accumulation Count Reading Register

ASFrCNT is an 16 -bit read-only register that indicates the count value of the accumulation counter. ASFrCNT is initialized to $0000_{\mathrm{H}}$ at a reset. When ASFrCTL0.ASFrRTD $=0$, the current summation count can be read. When ASFrCTLD.ASFrRTD $=1$, this register value is not guaranteed. This register is updated when the input value dftag[3:0] matches the set ASFrCTL0.ASFrCTAG[3:0] value at the rising edge of ASF entry request (asreq).

|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 0 | ASFrCNT[8:0] | Accumulation Counter |
|  |  | Case of ASFrCTLO.ASFrRTD=0 |
|  |  | When ASFrST is set to 1 , ASFrCNT counts up each time an ASF entry request of TAG for DFE that matches ASFrCTAG is accepted. |
|  |  | When ASFrST is set to 0 , ASFrCNT is cleared to 0 . |
|  |  | -When ASFrACSL $=000_{\mathrm{B}}$ (4 accumulation times) The counter counts up to 3 and then returns to 0 . |
|  |  | -When ASFrACSL $=001_{\mathrm{B}}$ (8 accumulation times) <br> The counter counts up to 7 and then returns to 0 . |
|  |  | -When ASFrACSL $=010_{\mathrm{B}}$ (16 accumulation times) The counter counts up to 15 and then returns to 0 . |
|  |  | -When ASFrACSL $=011_{\mathrm{B}}$ ( 32 accumulation times) The counter counts up to 31 and then returns to 0 . |
|  |  | -When ASFrACSL = 100 ( 64 accumulation times) <br> The counter counts up to 63 and then returns to 0 . |
|  |  | -When ASFrACSL $=101_{\mathrm{B}}$ (128 accumulation times) The counter counts up to 127 and then returns to 0 . |
|  |  | -When ASFrACSL $=110_{\mathrm{B}}$ (256 accumulation times) <br> The counter counts up to 255 and then returns to 0 . |
|  |  | -When ASFrACSL = 111 $1_{\mathrm{B}}$ ( 512 accumulation times) <br> The counter counts up to 511 and then returns to 0 . |
|  |  | When ASFrCTLO.ASFrRTD=1 |
|  |  | The read value of this register cannot be guaranteed. |

## (6) ASFrRTDRi - Accumulation Data/Accumulation Counter Intermediate Reading Register i

ASFrRTDRi is a 32-bit read-only register that stores an accumulation data and accumulation counter value.
When ASFrCTL0.ASFrRTD $=0$, the read value of this register cannot be guaranteed.
When ASFrCTL0.ASFrRTD $=1$, current accumulation data and current accumulation cycles can be read from this register.This register is updated at the timing of an ASF entry request (asreq).

ASFrRTDRi of the accumulation channel (for example, when dftag $=1_{\mathrm{H}}$, then it is ASFrRTDR01) indicated by TAG data (dftag [3:0]) is updated. For details, see Section 34.8.3.1, Example of Accumulation Processing

## Operation.

The data format of an accumulation-data/accumulation-counter-intermediate-reading-register-i (ASFrRTDRi) is according to Figure 34.46 and Section 34.8.2.2(5), ASFrCNT - Accumulation Count Reading Register.

When an accumulation counter start is cleared to 0 , this register is cleared to 0 .

| Value after reset: $\quad 00000000_{H}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Table 34.112 ASFrRTDRi Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 11 | ASFrRTDRi [20:0] | Accumulation Data Intermediate Value |
|  |  | When ASFrCTLO.ASFrRTD=0 |
|  |  | The read value of this register cannot be guaranteed. |
|  |  | When ASFrCTLO.ASFrRTD=1 |
|  |  | Accumulation data value during the accumulation process. |
| 10 to 9 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 8 to 0 | ASFrRTCNTi[8:0] | Accumulation Counter Intermediate Value |
|  |  | When ASFrCTL0.ASFrRTD=0 |
|  |  | The read value of this register cannot be guaranteed. |
|  |  | When ASFrCTLO.ASFrRTD=1 |
|  |  | Accumulation counter value during the accumulation process. |

## CAUTION

ASF is equipped with only 1 accumulation counter.
Therefore, when DFTAG value for more than one ADCHnVCRj.DFTAG[3:0] of ADCHn value overlaps, a mismatch occurs between accumulation-data-intermediate-value and accumulation-counter-intermediate-value in specific accumulation channel.

ADCHnVCRj.DFTAG [3:0] has to be set as an unique value so that the accumulation channel for the requested entry doesn't overlap when more than one accumulation channel is requested for entry.

When an accumulation channel is terminated independently, a value of this register of terminated channel in period of "from terminated time to the first generating time of accumulation end interrupt after restarting" cannot be guaranteed.

### 34.8.3 Operation

The ADC summation function (ASF) accumulates the results of ADCHn conversions from the ADCHn , stores the accumulation value in a register, and generates an interrupt request each time accumulation for the specified number of cycles is completed.

The ASF allows accumulation for up to 16 channels. The number of accumulation cycles is selectable from 4, 8, 16, 32, $64,128,256$ and 512 . However, the number of accumulation cycles is common for all channels (it cannot be set individually for each channel). Furthermore, interrupt timing offset is enabled by register setting.

After ASFrST is set to 1 to enable accumulation processing, the ADCHn conversion result is added to the accumulation channel that is the same as the TAG value for DFE each time an ASF entry request from the ADCHn is set to a high level.

The accumulation counter (ASFrCNT[8:0]) counts up when TAG for DFE that matches ASFrCTAG[3:0] is input and an ASF entry request is set to a high level. When ASFrCTAG[3:0] matches the TAG for DFE and the accumulation count reaches number of accumulation cycles specified by ASFrACSL[2:0]-1, the accumulation counter returns to 0 at the next ASF entry request.

When ASF1nCTL0.ASFrRTD $=0$, and $\left\{0000_{\mathrm{B}}, \mathrm{ASFrCMPi}[4: 0]\right\}$ matches with ASFrCNT[8:0], the accumulation data (ASFrDRi[31:0]) is updated and an accumulation end interrupt ASIi is generated.

When ASF1nCTL0.ASFrRTD $=1$, accumulation data (ASFrDRi[31:0]) is updated when ASFrRTCNTi[8:0] returns to 0 irrespective of the value of ASFrCMPi[4:0], and accumulation end interrupt (ASIi) is generated at the same time.

When ASF1nCTL0.ASFrRTD = 1, accumulation-data-intermediate-value and accumulation-count-intermediate-values can be read from ASFrRTDRi.

ASFrRTDRi of the accumulation channel (for example, when dftag $=1_{H}$, then it is ASFrRTDR01) indicated by TAG data ( $\mathrm{dftag}[3: 0]$ ) is updated at the time that ASF entry request (asreq) is requested.

## [Operating Example]

(1) The following registers must be set when state of ASFrCTL1.ASFrST $=0$.

ASFrCTLO.ASFrACSL[2:0] $=000_{\mathrm{B}}$, ASFrCTL0.ASFrCTAG[3:0] $=1_{\mathrm{H}}$, ASFrCMP00.ASFrCHE $0=1$, ASFrCMP01.ASFrCHE $1=1$, ASFrCMP00.ASI00IE $=1$, ASFrCMP01.ASI01IE $=1$, ASFrCTL0.ASFrRTD $=0 / 1$, ASFrCMP00.ASFrCMP00[4:0] $=00_{\mathrm{H}}$, ASFrCMP01.ASFrCMP01[4:0] $=01_{\mathrm{H}}$. (There are no regulations for the order in which these registers should set.)
(2) Set ASFrCTL1.ASFrST to 1 to enable (start) the accumulation processing operation.
(3) 1. When ASFrCTLO.ASFrRTD $=0$, after any accumulation end interrupt ASIi (except for the first one) is generated, $\operatorname{ASFrDR} 00 . \operatorname{ASFrDR} 00[20: 0]$ is read and accumulated value of $\mathrm{A} / \mathrm{D}$ conversion result is acquired.
See note below for instructions on how to handle the first accumulation end interrupt.
2. When ASFrCTL0.ASFrRTD $=1$, accumulation-data-intermediate-value and accumulation-count-intermediate-value can be read from accumulation-data/accumulation-counter-intermediate-read-register (ASF1nRTDRi).
(4) After the required accumulation value of the ADCHn conversion results is obtained, set ASFrCTL1.ASFrST to 0 to stop the accumulation processing.

## CAUTION

Ignore the first accumulation end interrupt (ASII) (or discard the ASFrDRi[20:0] read value).
Because the first accumulation count after accumulation start is undefined.

### 34.8.3.1 Example of Accumulation Processing Operation

## (1) Operation start

When 1 is written to ASFrST of accumulation counter control register 1 (ASFrCTL1), accumulation processing is started.

## - When ASFrRTD = 0:

Figure 34.47 shows an example of accumulation processing operation for two channels when the number of accumulation cycles is set to $4\left(\operatorname{ASFrACSL}[2: 0]=000_{\mathrm{B}}, \operatorname{ASFrCTAG}[3: 0]=1_{\mathrm{H}}, \operatorname{ASFrCMP} 00[4: 0]=00_{\mathrm{H}}\right.$, ASFrCMP01[4:0] $=02_{\mathrm{H}}$ ).

In this example, data (dfdata[15:0]) of dftag[3:0] $=0_{\mathrm{H}}$ is always 10 , data (dfdata[15:0]) of $\mathrm{dftag}[3: 0]=1_{\mathrm{H}}$ is always 20 for convenience.
(1) The counts up operation of ASFrCNT is started (is permitted) by ASFrST=1.
(2) When the Accumulation Counter (ASFrCNT[8:0]) matches the Accumulation Compare Match ( $\left\{0000_{\mathrm{B}}\right.$, ASFrCMP00[4:0]\}), the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASIO0) is generated at the same time (the first time). Refer to 'CAUTION' of Section 34.8.3, Operation.
(3) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1 , the Accumulation Counter (ASFrCNT[8:0]) perform counts up.
(4) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1 and defined Accumulation Cycles (ASFrACSL[2:0]-1) is 3, the Accumulation Counter (ASFrCNT[8:0]) returns to 0 .
(5) When the Accumulation Counter (ASFrCNT[8:0]) matches the Accumulation Compare Match ( $\left\{0000_{\mathrm{B}}\right.$, ASFrCMP00[4:0]\}), the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASI00) is generated at the same time (the second time).

Figure 34.47 Timing of Accumulation Processing Start Operation Example (When ASFrRTD $=0$ )

## - When ASFrRTD=1:

Figure 34.48 shows an example of accumulation processing operation for two channels when the number of accumulation cycles is set to $4\left(\operatorname{ASFrACSL}[2: 0]=000_{\mathrm{B}}, \operatorname{ASFrCTAG}[3: 0]=1_{\mathrm{H}}, \operatorname{ASFrCMP} 00[4: 0]=00_{\mathrm{H}}\right.$, ASFrCMP01[4:0] = $01_{\mathrm{H}}$ ).

In this example, data (dfdata[15:0]) of dftag[3:0] $=0_{\mathrm{H}}$ is always 10 , data (dfdata[15:0]) of dftag[3:0] $=1_{\mathrm{H}}$ is always 20 for convenience.
(1) The counts up operation of ASFrCNT is started (is permitted) by ASFrST=1.
(2) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1, ASF transfers from nonoperating state to operating state.
(3) When dftag[3:0] matches 0 H and the ASF entry request (asreq) is 1 , the intermediate buffer (ASF1nRTDR00[20:0]) is updated and the intermediate accumulation counter (ASFrRTCNT00[8:0]) perform counts up ( +1 ).
(4) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1, the Accumulation Counter (ASFrCNT[8:0]) perform counts up.
(5) When the intermediate accumulation counter (ASFrRTCNT00[8:0]) returns to 0, the Accumulation Data (ASFrDR00[31:0]) is updated. The accumulation end interrupt (ASI00) is generated at the same time.
(6) When ASFrCTAG[3:0] matches dftag[3:0] and the ASF entry request (asreq) is 1 and defined Accumulation Cycles (ASFrACSL[2:0]-1) is 3, the Accumulation Counter (ASFrCNT[8:0]) returns to 0.

Figure 34.48 Timing of Accumulation Processing Start Operation Example (When ASFrRTD $=1$ )

## (2) Operation Stop and Restart

Figure 34.49 shows an example of accumulation processing stop and restart operation.
When ASFrST is set to 0 , the accumulation counter ASFrCNT[8:0] and intermediate buffer i are cleared to 0 .
When ASFrST is set to 1 , accumulation processing is started again.

Figure 34.49 Timing of Accumulation Processing Stop and Restart Operation Example

## (3) Channel Stop

Figure 34.50 shows an example of accumulation processing stop and restart operation for an accumulation channel.
When ASFrCHEi is set to 0 , intermediate buffer i is cleared to 0 .
When ASFrCHEi is set to 1 , accumulation processing is started again.
When ASFrCHEi is set to 0 , ignore the first accumulation end interrupt (ASIi) (or discard the ASFrDRi[20:0] read value) because the first accumulation count after accumulation start is undefined.

When ASFrRTD=1, value of accumulation-data/accumulation-counter-intermediate-reading-register (ASFrRTDRi) cannot be guaranteed until the first accumulation end interrupt (ASIi) generated.

Figure 34.50 Timing of Accumulation Processing Stop Operation Example using ASFrCHEi

## (4) Accumulation End Interrupt Request Function

The ASF can output a accumulation end interrupt request (ASIi). An accumulation end interrupt request is output in 1 register access clock period.

When ASFrCMPi.ASIIIE is set, a accumulation end interrupt request (ASIi) is output.
For details, see Figure 34.47 and Figure 34.48.

If the accumulation channel i enable bit (ASFrCHEi) or the accumulation counter start bit (ASFrST) is cleared to 0 immediately before the summation ends, the processing ends but a summation end interrupt may be output.
If the accumulation end interrupt enable bit (ASIiIE) is cleared to 0 immediately before the accumulation ends, an accumulation end interrupt may be output.

### 34.9 ADC VMON Secondary Error Generator (AVSEG)

### 34.9.1 Overview

### 34.9.1.1 Function Overview

AVSEG is equivalent to the function which notify an upper error pulse (secondary HDET) and a lower error pulse (Secondary LDET) of each power supply (VCC, EVCC and VDD) to ECM in the secondary power supply voltage monitor.

- Upper Error Pulse Control and Lower Error Pulse Control

This function generates an error signal from ADCH 0 to ECM if an upper or lower bound is exceeded.

- Noise Filter

The upper and lower error pulses are generated by signals passed through a filter to reduce noise.

## CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

### 34.9.1.2 Block Diagram

Figure 34.51 illustrates the AVSEG block diagram.

Figure 34.51 AVSEG Block Diagram

Table 34.114 AVSEGVCCCHSCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 7 to 0 | AVSEGVCCCHS | Input Channel Selector |
|  |  | These bits select the channel used for generating error of VCC in the secondary power supply voltage monitor. |
|  |  | $00_{\mathrm{H}}$ : Selects ADCH0 virtual channel 0 |
|  |  | : |
|  |  | 27\%: Selects ADCH0 virtual channel 39 |
|  |  | $28_{H}$ to $\mathrm{FF}_{\mathrm{H}}$ : Reserved |

## (2) AVSEGVCCCNTCR — Filter Counter Control Register VCC

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Table 34.115 AVSEGVCCCNTCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 28 | AVSEGVCCENB | Filter Enable |
|  |  | This bit enable AVSEG for VCC |
|  |  | 0 : Disabled |
|  |  | 1: Enables the filter. |
|  |  | When set to disabled all AVSEG for VCC functions are disabled. |
| 27 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 11 to 8 | AVSEGVCCNRMCNT | Recovery Counter Settings |
|  |  | These bits control the number of counts until the signal is considered recovered. |
|  |  | Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. |
|  |  | The counter value is reset when one of the following values is written to AVSEGVCCNRMCNT. |
|  |  | $1_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 1 count. |
|  |  | $\mathrm{F}_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 15 consecutive counts. |
| 7 to 4 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |

Table 34.115 AVSEGVCCCNTCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 3 to 0 | AVSEGVCCERRCNT | Error Counter Control |
|  |  | These bits control the number of counts until the signal is considered out of bounds. |
|  | The signal is considered out of bounds once the set number of consecutive error pulses are |  |
| detected. |  |  |
|  | The counter value is reset when one of the following values is written to |  |
|  | AVSEGVCCERRCNT. |  |
|  |  |  |
|  |  |  |
|  |  |  |
|  |  | $\mathrm{F}_{\mathrm{H}}:$ Out of bounds when the signal violates the boundaries for 1 count. |

## CAUTION

Setting AVSEGVCCNRMCNT and AVSEGVCCERRCNT to $\mathrm{O}_{\mathrm{H}}$ is prohibited.

## (3) AVSEGEVCCCHSCR — Input Channel Selector Register EVCC

This register selects the input channel.

## (4) AVSEGEVCCCNTCR — Filter Counter Control Register EVCC

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Table 34.117 AVSEGEVCCCNTCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 28 | AVSEGEVCCENB | Filter Enable |
|  |  | This bit enable AVSEG for EVCC |
|  |  | 0 : Disabled |
|  |  | 1: Enables the filter. |
|  |  | When set to disabled all AVSEG for EVCC functions are disabled. |
| 27 to 12 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 11 to 8 | AVSEGEVCCNRMC NT | Recovery Counter Settings |
|  |  | These bits control the number of counts until the signal is considered recovered. |
|  |  | Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. |
|  |  | The counter value is reset when one of the following values is written to AVSEGEVCCNRMCNT. |
|  |  | $1_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 1 count. |
|  |  | $\mathrm{F}_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 15 consecutive counts. |
| 7 to 4 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |

Table 34.117 AVSEGEVCCCNTCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 to 0 | AVSEGEVCCERRCN | Error Counter Control |
|  | T | These bits control the number of counts until the signal is considered out of bounds. |
|  |  | The signal is considered out of bounds once the set number of consecutive error pulses are detected. |
|  |  | The counter value is reset when one of the following values is written to AVSEGEVCCERRCNT. |
|  |  | $1_{\text {H: }}$ : Out of bounds when the signal violates the boundaries for 1 count. |
|  |  | $\mathrm{F}_{\mathrm{H}}$ : Out of bounds when the signal violates the boundaries for 15 consecutive counts. |
| CAUTION |  |  |

Setting AVSEGEVCCNRMCNT and AVSEGEVCCERRCNT to $\mathrm{OH}_{\mathrm{H}}$ is prohibited.

## (5) AVSEGVDDCHSCR — Input Channel Selector Register VDD

This register selects the input channel.

Value after reset: $00000000_{\mathrm{H}}$

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 8 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 7 to 0 | AVSEGVDDCHS | Input Channel Selector |
|  |  | These bits select the channel used for generating error of VDD in the secondary power supply voltage monitor |
|  |  | $00_{\mathrm{H}}$ : Selects ADCH0 virtual channel 0 |
|  |  | : |
|  |  | 27\%: Selects ADCH0 virtual channel 39 |
|  |  | $28_{H}$ to $\mathrm{FF}_{H}$ : Reserved |

## (6) AVSEGVDDCNTCR — Filter Counter Control Register VDD

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Table 34.119 AVSEGVDDCNTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 28 | AVSEGVDDENB | Filter Enable <br> This bit enable AVSEG for VDD <br> 0 : Disabled <br> 1: Enables the filter. <br> When set to disabled all AVSEG for VDD functions are disabled. |
| 27 to 12 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 11 to 8 | AVSEGVDDNRMCNT | Recovery Counter Settings <br> These bits control the number of counts until the signal is considered recovered. <br> Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. <br> The counter value is reset when one of the following values is written to AVSEGVDDNRMCNT. <br> $1_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 1 count. <br> $\mathrm{F}_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 15 consecutive counts. |
| 7 to 4 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 3 to 0 | AVSEGVDDERRCNT | Error Counter Control <br> These bits control the number of counts until the signal is considered out of bounds. <br> The signal is considered out of bounds once the set number of consecutive error pulses are detected. <br> The counter value is reset when one of the following values is written to AVSEGVDDERRCNT. <br> $1_{\mathrm{H}}$ : Out of bounds when the signal violates the boundaries for 1 count. <br> $\mathrm{F}_{\mathrm{H}}$ : Out of bounds when the signal violates the boundaries for 15 consecutive counts. |

## CAUTION

Setting AVSEGVDDNRMCNT and AVSEGVDDERRCNT to $\mathrm{O}_{\mathrm{H}}$ is prohibited.

### 34.9.3 Operation

### 34.9.3.1 Noise Count Method

The AVSEG noise count methods are shown below. Noise is filtered and reduced by counting the number of times the ADC boundary values are exceeded using the input error pulses.

## CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

Example for the upper error pulse AVSEG for VCC:
Method 1:
AVSEGVCCCNTCR.AVSEGVCCERMCNT $=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and AVSEGVCCCNTCR.AVSEGVCCNRMCNT $=1_{\mathrm{H}}$.

Figure 34.52 Noise Count (1)

Method 2:
AVSEGVCCCNTCR.AVSEGVCCERMCNT $=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and AVSEGVCCCNTCR.AVSEGVCCNRMCNT $=2_{\mathrm{H}}$.

<AVSEGVCCERRCNT= $\mathbf{2}_{\mathrm{H}}$ and AVSEGVCCNRMCNT= $\mathbf{2}_{\mathrm{H}}$ >

<AVSEGVCCERRCNT= ${ }_{H}$ and AVSEGVCCNRMCNT $=\mathbf{2}_{\boldsymbol{H}}$ >

Figure 34.53 Noise Count (2)

Method 3:
AVSEGVCCCNTCR.AVSEGVCCERRCNT $=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and AVSEGVCCCNTCR.AVSEGVCCNRMCNT $=3_{\mathrm{H}}$.

Figure 34.54 Noise Count (3)

### 34.9.3.2 Upper/Lower Error Pulse Output

The AVSEG upper/lower error pulse output signals are shown below. All output signals are generated by signals that have passed through the filter function to reduce noise.

Figure 34.55 Upper/Lower Error Pulse Output

### 34.9.4 Use Method

(1) Startup Procedure Example
(a) ADC Settings (For details, refer to Section 34, Analog to Digital Converter (ADCH))

Set the virtual channel registers and virtual channel upper/lower limit table registers so that comparisons are made between the limit registers and the input voltage during conversion.
(b) ECM Settings

Refer to Section 39, Error Control Module (ECM).
(c) AVSEG Settings

Set the Input Channel Selector Register of respective voltage (AVSEGVCCCHSCR, AVSEGEVCCCHSCR and AVSEGVDDCHSCR).

Set the Filter Counter Control Register of respective voltage (AVSEGVCCCNTCR, AVSEGEVCCCNTCR and AVSEGVDDCNTCR).
(d) Begin AD Conversion

Begin AD conversion after setting up AVSEG. If the AVSEG Filter Counter Control Register is modified, the error counter and recovery counter will be set with the written values, and all outputs change will be masked.
(2) Stop Procedure Example
(a) End A/D Conversion

Stop the ADCHO.
(b) AVSEG Setting

Set the filter counter enable bit, AVSEGVCCCNTCR. AVSEGVCCENB, AVSEGEVCCCNTCR. AVSEGEVCCENB and AVSEGVDDCNTCR. AVSEGVDDENB to 0.

This will prevent any and all pulse signals from being output from AVSEG.

NOTE
The internal filter counters will be reset to the written values during the AVSEGVCCCNTCR, AVSEGEVCCCNTCR and AVSEGVDDCNTCR write procedure.

## (3) Usage Notes

(a) The input of both upper and lower error pulses into the same module at the same time is prohibited.
(b) Setting AVSEGVCCNRMCNT, AVSEGVCCERRCNT, AVSEGEVCCNRMCNT, AVSEGEVCCERRCNT, AVSEGVDDNRMCNT and AVSEGVDDERRCNT to $0_{H}$ is prohibited.

### 34.10 ADC Boundary Flag Generator (ABFG)

### 34.10.1 Overview

### 34.10.1.1 Function Overview

ABFG has the following functions.

- Boundary Flag Control

This function generates a boundary flag by using virtual channel conversion end pulse signals with their respective upper-limit/lower-limit error pulse signals provided by the SAR-ADC, Delta-Sigma ADC and Cyclic ADC converters.

- Boundary Pulse Control

This function generates an interrupt request and/or DMAC request that indicates the current state of the boundary flag.

- Noise Filter

The boundary flag, and boundary pulse are generated by signals passed through a filter to reduce noise.

## CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

### 34.10.1.2 Block Diagram

Figure $\mathbf{3 4 . 5 6}$ illustrates the ABFG block diagram.

Figure 34.56 ABFG Block Diagram

Figure 34.57 illustrates the ABFG block diagram.

Table 34.121 ABFGBFGCRw Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 26 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 25, 24 | ABFGwBTGC | Boundary Flag Toggle Control |
|  |  | These bits control the boundary flag toggle method. |
|  |  | $00_{\mathrm{B}}$ : Flag is set to High when violating the upper boundary, and is set to Low when violating the lower boundary. |
|  |  | $01_{\mathrm{B}}$ : Flag is set to Low when violating the upper boundary, and is set to High when violating the lower boundary. |
|  |  | $10_{\mathrm{B}}$ : Flag is set to Low when within the upper and lower boundaries, and is set to High when violating either boundary. |
|  |  | $11_{\mathrm{B}}$ : Flag is set to High when within the upper and lower boundaries, and is set to Low when violating either boundary. |
| 23 to 18 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 17 to 16 | ABFGwBPGC | Boundary Flag Pulse Generation Control |
|  |  | These bits control the method used in generating the boundary flag pulse. |
|  |  | $00_{\mathrm{B}}$ : No pulse is generated. |
|  |  | $01_{B}$ : A boundary flag pulse is generated on the rising edge of the boundary flag. |
|  |  | $10_{\mathrm{B}}$ : A boundary flag pulse is generated on the falling edge of the boundary flag. |
|  |  | $11_{B}$ : A boundary flag pulse is generated on both rising and falling edges of the boundary flag. |
| 15 to 8 | - | Reserved |
|  |  | These bits are always read as 0 . The write value should always be 0 . |
| 7 to 0 | ABFGwCHS | Input Channel Selector |
|  |  | These bits select the channel used in generating the boundary flag. |
|  |  | Refer to Table 34.122 to Table 34.129. |

## (2) ABFGCNTCRw - Filter Counter Control Register w

This register controls the filter counter. The noise filtering interval is controlled by using an error counter and a recovery counter. The internal down counter is reset with the written values when this register is modified.

Table 34.130 ABFGCNTCRw Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 29 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 28 | ABFGwENB | Filter Enable <br> This bit enable boundary flag w functions. <br> 0: Disabled <br> 1: Enables the filter <br> When set to disabled, all boundary flag w functions are disabled. |
| 27 to 12 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 11 to 8 | ABFGwNRMCNT | Recovery Counter Settings <br> These bits control the number of counts until the signal is considered recovered. <br> Once the signal is considered out of bounds, it will not be recovered until the set number of consecutive non-error pulses are detected. <br> The counter value is reset when one of the following values is written to ABFGwNRMCNT. <br> $1_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 1 count. <br> $\mathrm{F}_{\mathrm{H}}$ : Recovery after the signal is within the boundaries for 15 consecutive counts. |
| 7 to 4 | - | Reserved <br> These bits are always read as 0 . The write value should always be 0 . |
| 3 to 0 | ABFGwERRCNT | Error Counter Control <br> These bits control the number of counts until the signal is considered out of bounds. <br> The signal is considered out of bounds once the set number of consecutive error pulses are detected. <br> The counter value is reset when one of the following values is written to ABFGwERRCNT. $1_{\mathrm{H}}$ : Out of bounds when the signal violates the boundaries for 1 count. <br> $\mathrm{F}_{\mathrm{H}}$ : Out of bounds when the signal violates the boundaries for 15 consecutive counts. |

## CAUTION

Setting ABFGwNRMCNT and ABFGwERRCNT to $\mathrm{O}_{\mathrm{H}}$ is prohibited.

## (3) ABFGBFSRw - Boundary Flag Status Register w

This register shows the status of the boundary flag.

Value after reset: $\quad 00000000_{\mathrm{H}}$

Table 34.131 ABFGBFSRw Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 1 | - | Reserved |
|  |  | These bits are always read as 0. The write value should always be 0. |
| 0 | ABFGwBFS | Boundary Flag Status <br>  |
|  | This bit shows the status of the boundary flag. |  |
|  | It is possible to set the boundary flag directly by writing to this register. |  |

## CAUTION

Writing to this register while ABFGCNTCRw.ABFGwENB is 1 is prohibited.

### 34.10.3 Operation

### 34.10.3.1 Noise Count Method

The boundary flag noise count methods are shown below. Noise is filtered and reduced by counting the number of times the ADC boundary values are exceeded using the input error pulses.

## CAUTION

The input of both upper and lower pulses into the same module at the same time is prohibited.

Example for the upper boundary error.
Method 1:
$\operatorname{ABFGCNTCRw} \cdot \mathrm{ABFGwERRCNT}=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and $\mathrm{ABFGCNTCRw} \cdot \mathrm{ABFGwNRMCNT}=1_{\mathrm{H}}$.

Figure 34.58 Noise Count (1)

Method 2:
$\operatorname{ABFGCNTCRw} \cdot \mathrm{ABFGwERRCNT}=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and $\mathrm{ABFGCNTCRw} \cdot \mathrm{ABFGwNRMCNT}=2_{\mathrm{H}}$.

Figure 34.59 Noise Count (2)

Method 3:
$\operatorname{ABFGCNTCRw} \cdot \mathrm{ABFGwERRCNT}=1_{\mathrm{H}}$ to $3_{\mathrm{H}}$ and $\mathrm{ABFGCNTCRw} \cdot \mathrm{ABFGwNRMCNT}=3_{\mathrm{H}}$.

Figure 34.60 Noise Count (3)

### 34.10.3.2 Boundary Flag Output, Boundary Flag Pulse Output

The ABFG boundary flag output, boundary flag pulse output signals are shown below. All output signals are generated by signals that have passed through the filter function to reduce noise. The boundary flag can be generated using 4 different methods. The boundary flag pulse is generated by detecting the rising and/or falling edges of the boundary flag with 4 modes of output.

Figure 34.61 Boundary Flag Output, Boundary Flag Pulse Output

### 34.10.4 Use Method

(1) Starting Procedure Example
(a) ADC Settings (For details, refer to Section 34, Analog to Digital Converter (ADCH), Section 35, Delta-Sigma Analog to Digital Converter (DSADC) and Section 36, Cyclic Analog to Digital Converter (CADC))

Set the virtual channel registers and virtual channel upper/lower limit table registers so that comparisons are made between the limit registers and the input voltage during conversion.
(b) ATU, GTM, INTC, DMAC Settings

Refer to Section 30, ATU-V, Section 31, Generic Timer Module (GTM), Section 6, Interrupts, Section 7, sDMA Controller (sDMAC), Section 8, DTS Controller.

## (c) ABFG Settings

Set the boundary flag control register with the input channel, pulse generation and toggle methods (ABFGBFGCRw).
Set the boundary flag status (ABFGBFSRw) (optional).
Set the filter counter value (ABFGCNTCRw).
(d) Begin AD Conversion

Begin AD conversion after setting up ABFG. If the ABFG Filter Counter Control Register is modified, the error counter and recovery counter will be set with the written values, and all outputs change will be masked.
(2) Stop Procedure Example
(a) End A/D Conversion

Stop the ADCH, DSADC and CADC.
For details, refer to Section 34, Analog to Digital Converter (ADCH), Section 35, Delta-Sigma Analog to Digital Converter (DSADC) and Section 36, Cyclic Analog to Digital Converter (CADC).
(b) ABFG Setting

Set the filter counter enable bit, ABFGCNTCRw.ABFGwENB to 0 .
This will prevent any and all pulse signals from being output from ABFG, and the boundary flag signal will hold its level until ABFGBFSRw register is changed or ABFG is turned back on.

NOTE
The internal filter counters will be reset to the written values during the ABFGNTCRw write procedure.
(3) Usage Notes
(a) The input of both upper and lower error pulses into the same module at the same time is prohibited.
(b) Setting ABFGwNRMCNT and ABFGwERRCNTto $0_{H}$ is prohibited.
(c) Writing to ABFGBFSRw while ABFGCNTCRw.ENB is 1 is prohibited.

### 34.11 ADC Interrupt Router (AIR)

The AIR is a function that selects signals from all A/D related resources, and outputs interrupt requests and DMA requests.

### 34.11.1 Overview

### 34.11.1.1 Function Overview

- AIR selects interrupt requests from resource $0(\mathrm{ADCH}, \mathrm{DSADC}$ and CADC$)$ and resource $1(\mathrm{ABFG})$.
- AIR selects DMA requests from resource 0 ( $\mathrm{ADCH}, \mathrm{DSADC}$ and CADC$)$ and resource 1 (ABFG)

### 34.11.1.2 Block Diagram

Figure 34.62 illustrates the AIR block diagram.

Figure 34.62 AIR Block Diagram

### 34.11.2 Registers

### 34.11.2.1 List of Registers

Table 34.132 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| AIR | Interrupt Request Select Register 0 | AIR_ISELR0 | <AIR_base> + 00 ${ }_{\text {H }}$ | $\begin{aligned} & 8,16, \\ & 32 \end{aligned}$ | - |
| AIR | Interrupt Request Select Register 1 | AIR_ISELR1 | <AIR_base> + 04 H | $\begin{aligned} & 8,16, \\ & 32 \end{aligned}$ | - |
| AIR | DMA Request Select Register 0 | AIR_DSELR0 | <AIR_base> + 08 ${ }_{\text {H }}$ | $\begin{aligned} & 8,16 \\ & 32 \end{aligned}$ | - |
| AIR | DMA Request Select Register 1 | AIR_DSELR1 | <AIR_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | $\begin{aligned} & 8,16 \\ & 32 \end{aligned}$ | - |

### 34.11.2.2 AIR Specific Registers

## (1) AIR_ISELRO - Interrupt Request Select Register 0

This register selects interrupt request resources.

Table 34.133 AIR_ISELRO Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ISEL[31:0] | Interrupt Request Select |
|  |  | These bits select from resource 0 and resource 1. |
|  |  | For resource 0 and resource 1, refer to Table 34.135 to Table 34.139. |

## (2) AIR_ISELR1 - Interrupt Request Select Register 1

This register selects interrupt request resources.

Table 34.134 AIR_ISELR1 Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 0 | ISEL[63:32] | Interrupt Request Select |
|  |  | These bits select from resource 0 and resource 1. |
|  |  | For resource 0 and resource 1, refer to Table 34.135 to Table 34.139. |

Table 34.135 Interrupt Request Select (1)

| Interrupt Signal | Outline |  |  |  |

## Section 35 Delta-Sigma Analog to Digital Converter (DSADC)

This section contains a description of the Delta Sigma A/D Converter (DSADC).
The first part of this section describes all of the products, such as the number of units, and register base addresses. The remainder of the section describes the functions and registers of the DSADC.

### 35.1 Features

### 35.1.1 Number of Units

This microcontroller has following number of DSADC units.
Table $35.1 \quad$ Number of Units (For RH850/E2x-FCC1, E2M)

| Product Name | RH850/E2x-FCC1, E2M |  |  |
| :--- | :--- | :--- | :---: |
|  | 292 Pins | 373 Pins |  |
|  | 1 | 1 |  |
| Number of DSADC Channel Units | 6 | 6 |  |
| Name of DSADC Units | DSADC |  |  |
|  |  | DSADCn $(\mathrm{n}=00,10,11,12,13,20)$ |  |

A DSADCn unit has the same number of physical channels as the number of A/D input pins. The numbers of channels on individual products are listed below.

Table 35.2 Unit Configurations and Physical Channels (For RH850/E2x-FCC1, E2M)

| Unit Name (Number of Channels) <br> DSADCn | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
| DSADC00 | 8 | 8 |
| DSADC10 | 4 | 4 |
| DSADC20 | 2 | 2 |
| DSADC12 | 4 | 4 |
| DSADC13 | 4 | 4 |
| DSADC11 | 4 | 4 |

Table 35.3 Unit Configurations and Virtual Channels (For RH850/E2x-FCC1, E2M)

| Unit Name (Number of Channels) <br> DSADCn | RH850/E2x-FCC1, E2M |  |
| :--- | :--- | :--- |
|  | 292 Pins | 373 Pins |
| DSADC00 | 8 | 8 |
| DSADC10 | 4 | 4 |
| DSADC20 | 2 | 2 |
| DSADC12 | 4 | 4 |
| DSADC13 | 4 | 4 |
| DSADC11 | 4 | 4 |

Table $35.4 \quad$ Indices

| Index | Description |
| :--- | :--- |
| n | Throughout this section, the individual DSADC units are identified by the index " n " <br> $(\mathrm{n}=00,10,20,12,13,11) ;$ <br> For example, DSADCnCCR indicates the channel control register. |
| x | Throughout this section, the individual analog input attributes at differential input are identified by the index " x " ( $\mathrm{x}=$ <br> $\mathrm{P}, \mathrm{N}$ ); for example, DSANnOx. |
| j | Number of the virtual channel |

### 35.1.2 Register Base Addresses

The DSADC and DSADCn base addresses are listed in the following table.
The DSADC and DSADCn register addresses are given as offsets from the base address.
Table 35.5 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <DSADC_base> | FFF3 $0000_{\mathrm{H}}$ | Peripheral Group 7 |
| <DSADC00_base> | FFF3 $1000_{\mathrm{H}}$ | Peripheral Group 7 |
| <DSADC10_base> | FFF3 $2000_{\mathrm{H}}$ | Peripheral Group 7 |
| <DSADC20_base> | FFF3 $3000_{\mathrm{H}}$ | Peripheral Group 7 |
| <DSADC12_base> | FFF3 $4000_{\mathrm{H}}$ | Peripheral Group 7 |
| <DSADC13_base> | FFF5 $0000_{\mathrm{H}}$ | Peripheral Group 8 |
| <DSADC11_base> | FFF5 $1000_{\mathrm{H}}$ | Peripheral Group 8 |

### 35.1.3 Clock Supply

The DSADC and DSADCn clock supplies are shown in the following table.
Table 35.6 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| DSADC | ADCLK | CLK_HSB |
|  | Register access clock | CLK_LSB |
| DSADCn | ADCLK | CLK_HSB |
|  | Register access clock | CLK_LSB |

### 35.1.4 Interrupt Requests

The DSADCn interrupt requests are listed in the following table.
Table 35.7 Interrupt Requests

| Interrupt <br> Symbol Name | Unit Interrupt <br> Signal | Outline | Interrupt <br> Number | sDMAC <br> Trigger <br> Number | DTS Trigger <br> Number | Other Trigger <br> Signals |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| DSADCn | DSADEn | A/D error interrupt <br> Upper limit/lower limit error interrupt | $* 1$ | - | - | - |
| $* 1$ | DSADIn | A/D conversion end interrupt | - | $* 1$ | $* 1$ | - |
|  |  |  |  |  |  |  |

Note 1. DSADEn and DSADIn are chosen by the AIR (ADC Interrupt Router), and those are forwarded to the INTC and DMAC. For Interrupt Number and DMA Trigger Number, see Section 34, Analog to Digital Converter (ADCH).

### 35.1.5 Reset Source

The DSADC and DSADCn reset sources are listed in the following table. The DSADC and DSADCn are initialized by the following reset sources.

Table 35.8 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up Reset | System Reset 1 | System Reset $2$ | Application Reset | Module Reset | JTAG Reset |
| DSADC | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| DSADCn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 35.1.6 External Input/Output Signals

The External Input/Output signals of the DSADCn are listed below.
Table 35.9 DSADC External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| DSADCn Common |  |  |
| ADSVCC | Power supply pin for the analog part | ADSVCC |
| ADSVSS | Ground pin for the analog part | ADSVSS |
| ADSVREFH | Upper reference voltage pin for the analog part | ADSVREFH |
| ADSVREFL | Lower reference voltage pin for the analog part | ADSVREFL |
| ADSVCL | Delta sigma ADC external capacitor pin | ADSVCL |

Table 35.10 DSADCn $(\mathrm{n}=00)$ External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| DSANn0P | Analog input pin (for single-ended/differential P) | DSANn0P |
| DSANn0N | Analog input pin (for single-ended/differential N) | DSANn0N |
| DSANn1P | Analog input pin (for single-ended/differential P) | DSANn1P |
| DSANn1N | Analog input pin (for single-ended/differential N) | DSANn1N |
| DSANn2P | Analog input pin (for single-ended/differential P) | DSANn2P |
| DSANn2N | Analog input pin (for single-ended/differential N) | DSANn2N |
| DSANn3P | Analog input pin (for single-ended/differential P) | DSANn3P |
| DSANn3N | Analog input pin (for single-ended/differential N) | DSANn3N |
| DSADTRGn | External trigger pin | DSADTRGn |
| DSADENDn | A/D conversion timing monitor pin | DSADENDn |

Table 35.11 DSADCn ( $n=10,11,12,13$ ) External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| DSANn0P | Analog input pin (for single-ended/differential P) | DSANn0P |
| DSANn0N | Analog input pin (for single-ended/differential N) | DSANn0N |
| DSANn1P | Analog input pin (for single-ended/differential P) | DSANn1P |
| DSANn1N | Analog input pin (for single-ended/differential ) | DSANn1N |
| DSADTRGn | External trigger pin | DSADTRGn |
| DSADENDn | A/D conversion timing monitor pin | DSADENDn |

Table 35.12 DSADCn $(\mathrm{n}=20)$ External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| DSANn0P | Analog input pin (for single-ended/differential P) | DSANn0P |
| DSANn0N | Analog input pin (for single-ended/differential N) | DSANn0N |
| DSADTRGn | External trigger pin | DSADTRGn |
| DSADENDn | A/D conversion timing monitor pin | DSADENDn |

### 35.2 Overview

### 35.2.1 Function Overview

The following describes the features (provides a functional overview) of the DSADC.

- A/D conversion method: Delta sigma modulation method
- Configuration of analog input pins

6 modules, 26 analog input pins in total
DSADC00: 8 single-ended inputs (4 differential inputs)
DSADC1y ( $\mathrm{y}=0$ to 3 ): 4 single-ended inputs ( 2 differential inputs)
DSADC20: 2 single-ended inputs ( 1 differential input)

## NOTES

1. One differential input can be used as two single-ended inputs.
2. All analog inputs are multiplexed with ADCH analog inputs.

- Input type: Single-ended input and differential input

Single-ended input or differential input can be selected for each DSADCn.
In single-ended mode:
The A/D conversion value format of unsigned 16-bit resolution is generated when ADSVREFL is chosen as the common mode voltage.
Range of the A/D conversion value: $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$
The A/D conversion value format of signed 15-bit resolution (15-bit value preceded by the sign bit) is generated when ADSVREFH/2 is chosen as the common mode voltage.
Range of the A/D conversion value: $\mathrm{C}_{0} 00_{\mathrm{H}}$ to $3 \mathrm{FFF}_{\mathrm{H}}$ (When gain is $\times 1$ ), $8000_{\mathrm{H}}$ to $7 \mathrm{FFF}_{\mathrm{H}}$ (When gain is $\times 2$, $\times 4$, or $\times 8$ )

In differential mode:
The A/D conversion value format of signed 15 -bit resolution (15-bit value preceded by the sign bit) is generated. Range of the $\mathrm{A} / \mathrm{D}$ conversion value: $8000_{\mathrm{H}}$ to $7 \mathrm{FFF}_{\mathrm{H}}$

- Input gain function (PGA): $\times 1, \times 2, \times 4$, or $\times 8$ can be selected by each virtual channel using PGA (programmable gain amplifier) in each DSADCn.
- Sampling rate (Fs): $100 \mathrm{ksps}, 200 \mathrm{ksps}, 400 \mathrm{ksps}$, 800 ksps and 1600 ksps (Fos (Over sampling rate) is 8 Msps )
- Pass band: $30 \mathrm{kHz}, 60 \mathrm{kHz}, 90 \mathrm{kHz}, 100 \mathrm{kHz}$ and 200 kHz
- Virtual channels

## See Section 35.1.1, Number of Units.

- Calibration function

It is possible to achieve highly accurate $A / D$ conversions by using the calibration function in spite of the use environment.

- Data register

A data register corresponding to each DSADCn is contained in the data supplementary information register j (DSADCnDIRj per virtual channel) or the unit data supplementary information register (DSADCnUDIR). The latest data can be read from DSADCnUDIR, even if not reading virtual channel pointer.

- $\mathrm{A} / \mathrm{D}$ conversion start trigger

Each DSADCn can start an A/D conversion by software, each timer trigger, or an external trigger (DSADTRGn).

- A/D conversion end trigger

Each DSADCn can terminate A/D conversion by software, by each timer trigger, or by an external trigger (DSADTRGn).

- Entry to the digital filter engine and the Generic Timer Module

A/D converted values can be entered directly into the Digital Filter Engine (DFE), or Generic Timer Module (GTM). Each DSADCn can select from DFE0 and DFE1 as an entry target.
Whether to enable or disable DFE entry and the TAG to determine the channels for entry can be set for each virtual channel.
For details of the DFE, see Section 37, Digital Filter Engine (DFE).
For details of the GTM, see Section 31, Generic Timer Module (GTM).

- Timestamp function

The lapsed time from the result output is stored in the timestamp register at the rise time of the read-gate (DSADRGTn) from the timer (ATU, GTM) as timestamp information. This function allows measurement of the time difference between the DSADRGTn and input sampling time.

For details of the ATU, see Section 30, ATU-V.
For details of the GTM, see Section 31, Generic Timer Module (GTM).

- DMA transfer based on A/D conversion end timing

Each time an A/D conversion ends, each DSADCn outputs a DMA request on completion of the $A / D$ conversion (DSADIn), which can generate DMA request sources (DSADIn) to the DMAC or activate the DMAC.

The output of the DSADIn is capable of beginning limited by the read-gate from a timer (ATU, GTM).

- Boundary flag output function

It is possible to output a boundary flag generating signal (DSADUEn, DSADLEn and DSADCnVCIj) to the ABFG (ADC Boundary Flag Generator). For details of the ABFG, see Section 34, Analog to Digital Converter (ADCH).

- AD error interrupt request and AD parity error notification

Each DSADC can generate an AD error interrupt request (DSADEn) to the INTC and an AD parity error notification (DSADPEn) to the ECM (Error Control Module).

- Settable analog conversion voltage range

An analog conversion voltage range can be set using the ADSVREFH pin and the ADSVREFL pin. When performing an A/D conversion by using a single-ended input, either ADSVREFL or ADSVREFH/2 can be selected as the common voltage.

- A/D conversion monitor output

A/D conversion timing can be output to the $\mathrm{A} / \mathrm{D}$ conversion monitor output pin (DSADENDn).

- A wide range of safety functions

A variety of safety functions are provided, including AD self-diagnosis, pin-level self-diagnosis, wiring-break detection, self-diagnosis of wiring-break detection, normality check for analog selection, upper-limit/lower-limit check for data registers, data register parity check for data registers, overwrite check for data registers, and read and clear function for data registers.

### 35.2.2 Block Diagram

The block diagram of the DSADC is shown in Figure 35.1.

Figure $35.1 \quad$ Block Diagram of DSADC

### 35.3 Registers

### 35.3.1 List of Registers

The DSADC registers are listed in following table.
For details about <DSADC_base> and <DSADCn_base>, see Section 35.1.2, Register Base Address.
Table 35.13 List of Registers (1/2)

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| DSADC | AD Synchronization Start Control Register | DSADCSYNSTCR | <DSADC_base> + 00 ${ }_{\text {H }}$ | 8 | - |
| DSADC | AD Global Control Register | DSADCADGCR | <DSADC_base> + 04 ${ }_{\text {H }}$ | 8 | - |
| DSADC | Pin Level Self-Diagnosis Control Register | DSADCTDCR | <DSADC_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
| DSADCn | Virtual Channel Register 0*1 | DSADCnVCR0 | <DSADCn_base> + $00{ }_{\text {H }}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 1*1 | DSADCnVCR1 | <DSADCn_base> + $04_{\text {H }}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 2*1 | DSADCnVCR2 | <DSADCn_base> + $08{ }_{\text {H }}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 3*1 | DSADCnVCR3 | <DSADCn_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 4*1 | DSADCnVCR4 | <DSADCn_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 5*1 | DSADCnVCR5 | <DSADCn_base> + $14_{\mathrm{H}}$ | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 6*1 | DSADCnVCR6 | <DSADCn_base> + 18H | 8, 16, 32 | - |
| DSADCn | Virtual Channel Register 7*1 | DSADCnVCR7 | <DSADCn_base> + $1 \mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| DSADCn | Data Supplementary Information Register 0 *1 | DSADCnDIR0 | <DSADCn_base> + 20 ${ }_{\text {H }}$ | 16*3, 32 | - |
| DSADCn | Data Supplementary Information Register $1^{* 1}$ | DSADCnDIR1 | <DSADCn_base> + 24 ${ }_{\text {H }}$ | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register $2^{* 1}$ | DSADCnDIR2 | <DSADCn_base> + 28 ${ }_{\text {H }}$ | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register $3^{\star 1}$ | DSADCnDIR3 | <DSADCn_base> + 2 $\mathrm{C}_{\mathrm{H}}$ | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register $4^{* 1}$ | DSADCnDIR4 | <DSADCn_base> + 30 H | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register 5*1 | DSADCnDIR5 | <DSADCn_base> + $34_{\text {H }}$ | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register 6*1 | DSADCnDIR6 | <DSADCn_base> + 38 ${ }_{\text {H }}$ | $16^{* 3}, 32$ | - |
| DSADCn | Data Supplementary Information Register 7*1 | DSADCnDIR7 | <DSADCn_base> + 3C ${ }_{\text {H }}$ | 16*3, 32 | - |

| DSADCn | Upper-Limit/Lower-Limit Table Register 1*2 | DSADCnULTBR1 | <DSADCn_base> + 84 ${ }_{\text {H }}$ | 16, 32 | - |
| DSADCn | Upper-Limit/Lower-Limit Table Register $2^{* 2}$ | DSADCnULTBR2 | <DSADCn_base> + 88 ${ }_{\text {H }}$ | 16, 32 | - |
| DSADCn | Upper-Limit/Lower-Limit Table Register 3*2 | DSADCnULTBR3 | <DSADCn_base> + 8C H | 16, 32 | - |

Note 1. For $\mathrm{n}=00$ : "Virtual Channel Register" and "Data Supplementary Information Register" numbers are from 0 to 7.
For $n=10 / 12 / 13 / 11$ : "Virtual Channel Register" and "Data Supplementary Information Register" numbers are from 0 to 3.
For $n=20$ : "Virtual Channel Register" and "Data Supplementary Information Register" numbers are from 0 to 1.
Note 2. For $\mathrm{n}=00$ : "Upper-Limit/Lower-Limit Table Register" numbers are from 0 to 3.
For $n=10 / 12 / 13 / 11$ : "Upper-Limit/Lower-Limit Table Register" numbers are from 0 to 1 .
For $\mathrm{n}=20$ : "Upper-Limit/Lower-Limit Table Register" number is 0 .
Note 3. When reading DSADCnDIRj in 16-bit units, see Section 35.5.2, DSADCnDIRj — Data Supplementary Information Register $\mathbf{j}$.

### 35.4 Delta-Sigma ADC Common Registers

This section describes the registers shared by all Delta-Sigma ADCs (DSADCn).

### 35.4.1 DSADCSYNSTCR — AD Synchronization Start Control Register

DSADCSYNSTCR is an 8-bit write-only register to control the simultaneous start of each Delta-Sigma ADC. This register is always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADSTART |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 35.14 DSADCSYNSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  | When read, the value after reset is returned. When writing, write the value after reset. |  |
| 0 | ADSTART | A/D Conversion Start of Each Delta-Sigma ADC |
|  | When ADSTART is set to 1 with ADSTTE $=1$. |  |
|  | All DSADCn in which ADSTARTE is set to 1 are activated simultaneously. |  |
|  | However, DSADCB and DSADCA operate with a shift of half oversampling rate cycles. |  |
|  | When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] |  |
|  | value is $0_{H}$, the ongoing A/D conversion stops and A/D conversion of the virtual channel 0 |  |
| starts. |  |  |
|  | When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] |  |
|  | value is not $0_{H}$, the ongoing A/D conversion stops and A/D conversion of the next virtual |  |
| channel starts. |  |  |
|  | When 1 is written to this bit in DSADCnADTCR.ADSTTE $=0$, it is ignored and A/D conversion |  |
|  | does not start. |  |
|  | Writing 0 to this bit is ignored. |  |
|  | Note: $\quad$ DSADCA is DSADC00, DSADC20 and DSADC13. |  |
|  |  |  |

## NOTE

We recommend that ADSTART be written with STTRGE and ENDTRGE for all Delta-Sigma ADCs set to 0 and not used with external triggers.

### 35.4.2 DSADCADGCR — AD Global Control Register

DSADCADGCR is an 8-bit read/write register to fully control the AD.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | ODDE | ODE | - | - | - | UNSND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R/W |

Table 35.15 DSADCADGCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | ODDE | Wiring-break Detection Function Self-Diagnosis Enable |
|  |  | 0 : Self-diagnosis of the wiring-break detection function is disabled. |
|  |  | 1: Self-diagnosis of the wiring-break detection function is enabled. |
|  |  | When ODDE is set to 1 , wiring-break detection function self-diagnosis and pin level selfdiagnosis are enabled. When doing pin level self-diagnosis, set ODDE to 1 before setting TDE to 1. |
|  |  | If TDE is set to 1 with ODDE $=0$, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device. |
| 4 | ODE | Wiring-break Detection Enable |
|  |  | 0 : Wiring-break detection is disabled. |
|  |  | 1: Wiring-break detection is enabled. |
|  |  | When ODE is set to 1, wiring-break detection is enabled for all analog pins. |
|  |  | Setting this bit in 1 simultaneously with pin level self-diagnosis (TDE=1) is prohibited. |
|  |  | When setting DSADCADGCR.ODE as 1, if DSADCnVCRj.CNVCLS[1:0] value is set to anything but $0_{H}, A / D$ conversion is prohibited. |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | UNSND | Unsigned Conversion Result Output Enable |
|  |  | When this bit is set to 1 , the A/D conversion result (when ADSVREFL is selected for the single-ended common voltage) can be output as an unsigned value. |
|  |  | 0 : The A/D conversion result is output as a signed value. |
|  |  | 1: When single-ended common voltage = ADSVREFL, the A/D conversion result is output as an unsigned value.*1 Otherwise, it is output as a signed value. |
|  |  | For differences in data format due to UNSND setting, see the description on the Section 35.5.2, DSADCnDIRj — Data Supplementary Information Register j format. |

Note 1. When the calculation result after correction is a negative value, an $A / D$ conversion result of 0 is output.
NOTE
To prevent a malfunction, set DSADCADGCR when ADACT and CLBACT of all Delta-Sigma ADCs $=0$ (before starting an A/D conversion) and STTRGE of all Delta-Sigma ADCs $=0$.

### 35.4.3 DSADCTDCR — Pin Level Self-Diagnosis Control Register

DSADCTDCR is an 8-bit read/write register to control pin level self-diagnosis.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | TDE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 35.16 DSADCTDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | TDE | Pin Level Self-Diagnosis Enable |
|  |  | 0 : Pin level self-diagnosis is disabled. |
|  |  | 1: Pin level self-diagnosis is enabled. |
|  |  | When TDE is set to 1, all analog pins are disconnected from the analog I/O buffer. |
|  |  | When TDE is set to 0 , all analog pins are connected to the analog I/O buffer. |
|  |  | When TDE = 1, analog pin DSANn0x to DSANn3x is fixed to the level specified by DSADCnTDLVR.AN0xLV to DSADCnTDLVR.AN3xLV. |
|  |  | By performing an $A / D$ conversion in this state and checking the $A / D$ converted value, the path between the analog pin and the Delta-Sigma ADC can be diagnosed. |
|  |  | Do not set this bit as 1 simultaneously with ODE = 1 (wiring-break detection enable) and CNVCLS $=3_{H}$ (A/D self-diagnosis). |
|  |  | When doing pin level self-diagnosis, set ODDE to 1 before setting TDE to 1. |
|  |  | If TDE is set to 1 with ODDE $=0$, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device. |

To prevent a malfunction, set DSADCTDCR when ADACT and CLBACT of all delta-sigma ADCs $=0$ (before starting A/D conversion) and STTRGE of all delta-sigma ADCs $=0$.

### 35.5 Delta-Sigma ADC Unit-Specific Registers

This section describes registers provided for each Delta-Sigma ADC unit.

### 35.5.1 DSADCnVCRj — Virtual Channel Register j

DSADCnVCRj is a 32-bit read/write register to control virtual channels.

Table 35.17 DSADCnVCRj Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 29, 28 | GAIN[1:0] | Gain |
|  |  | These bits specify the input gain. |
|  |  | $0_{H}: \times 1$ |
|  |  | $1_{\mathrm{H}}: \times 2$ |
|  |  | $2_{\mathrm{H}}$ : $\times 4$ (When high resolution mode is set, this setting is prohibited.) |
|  |  | $3_{H}: \times 8$ (When high resolution mode is set, this setting is prohibited.) |
| 27 | VCULME | Virtual Channel Upper-Limit Excess Notification Enable |
|  |  | 0 : An A/D conversion greater than the result upper-limit of the virtual channel is not notified. |
|  |  | 1: An A/D conversion greater than the result upper-limit of the virtual channel is notified. |
| 26 | VCLLME | Virtual Channel Lower-Limit Excess Notification Enable |
|  |  | 0 : An A/D conversion less than the result lower-limit of virtual channel is not notified. |
|  |  | 1: An A/D conversion less than the result lower-limit of virtual channel is notified. |
| 25, 24 | VCULLMTBS [1:0] | Virtual Channel Upper-Limit/Lower-Limit Table Register Select |
|  |  | These bits select the upper-limit/lower-limit table register to be compared. |
|  |  | $0_{H}$ : Upper-limit/lower-limit values are checked by DSADCnULTBRO. [Initial value] |
|  |  | $1_{\mathrm{H}}$ : Upper-limit/lower-limit values are checked by DSADCnULTBR1. |
|  |  | $2_{\text {н: }}$ : Upper-limit/lower-limit values are checked by DSADCnULTBR2. |
|  |  | $3_{\mathrm{H}}$ : Upper-limit/lower-limit values are checked by DSADCnULTBR3. |
|  |  | When the A/D converted value is stored in the DR, upper-limit/lower-limit values are checked by using the upper-limit value/lower-limit value table. |

Table 35.17 DSADCnVCRj Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 23 | ORT | Delta-Sigma ADC Post-Filter 2nd Stage Output Rate Select <br> This bit is invalid when TPVSL[2:0] $=0_{H}$ (2nd stage not used). <br> 0 : The 2 nd stage output rate is set to $1 / 2$. <br> 1: The 2nd stage output rate is set to $1 / 4$. <br> The output rate (entire filter type) is determined in combination with the DSDFTYP set value. <br> Specifications of the settable filter type are provided in Table 35.36. <br> Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 35.36 is prohibited. |
| 22 to 20 | TPVSL[2:0] | Use of the Delta-Sigma ADC Post-Filter 2nd Stage and the TAP Coefficient Select These bits are valid when DSDFTYP $=0_{H}$. See Table 35.18 Coefficients. <br> $0_{H}$ : The 2nd stage of the post-filter in the delta-sigma ADC is not used. (Fs = 400ksps) <br> $1_{\mathrm{H}}$ : The 2 nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 1 is applied. <br> $2_{\mathrm{H}}$ : The 2 nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 2 is applied. <br> $3_{H}$ : The 2 nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 3 is applied. <br> $4_{\mathrm{H}}$ : The 2 nd stage of the post-filter in the delta-sigma ADC is used, and coefficient 4 is applied. <br> 5 to $7_{\mathrm{H}}$ : Setting prohibited <br> Specifications of settable filter type are provided in Table 35.36. <br> Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 35.36 is prohibited. |
| 19, 18 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 17, 16 | DSDFTYP[1:0] | Delta-Sigma ADC Post-Filter Type <br> These bits specify the type of the post-filter in the delta-sigma ADC. <br> $0_{H}$ : The filter type depends on the ORT and TPVSL settings. (See Table 35.36.) Set ORT and TPVSL. <br> $1_{\mathrm{H}}$ : Fs = 1.6 Msps (2nd stage not used, small group delay) <br> 2H: $\mathrm{Fs}=800 \mathrm{ksps}$ (2nd stage not used, large group delay) <br> $3_{\mathrm{H}}$ : Setting prohibited <br> Specifications of settable filter type are provided in Table 35.36. <br> Setting to any combination of ORT, TPVSL, and DSDFTYP other than the settings shown in Table 35.36 is prohibited. |
| 15 | ADIE | Conversion End Interrupt Enable <br> 0 : DSADIn is not output by writing to DSADCnDIRj. <br> 1: DSADIn is output by writing to DSADCnDIRj. |
| 14 | ULEIE | Upper-Limit/Lower-Limit Error Interrupt Enable <br> 0 : DSADEn is not output at an upper-limit or lower-limit error of DSADCnDIRj. <br> 1: DSADEn is output at an upper-limit or lower-limit error of DSADCnDIRj. |
| 13 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | DFENT | DFE Entry <br> 0 : Entry is not performed. <br> 1: Entry is performed. <br> This bit selects whether to perform entry to the DFEO or DFE1 (Digital Filter Engine). |

Table 35.17 DSADCnVCRj Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | DFTAG[3:0] | DFE-TAG |
|  |  | These bits are used to perform entry to a channel of the DFE for which the TAG identical to the setting of DFTAG[3:0] is set. If the TAG matches the setting of DFTAG[3:0] for multiple channels, entry to multiple channels is performed. |
| 7,6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5, 4 | CNVCLS[1:0] | Conversion Type |
|  |  | $\mathrm{OH}_{\text {H: }}$ S Single-ended input, common voltage $=$ ADSVREFL |
|  |  | $1_{\mathrm{H}}$ : Single-ended input, common voltage $=$ ADSVREFH/2 |
|  |  | $2_{\text {H: }}$ Differential input |
|  |  | $3_{\text {H: }}$ Self-diagnosis |
| 3 to 0 | GCTRL[3:0] | General Control |
|  |  | These bits set the A/D conversion for each conversion mode. |
|  |  | Single-ended input ( $\mathrm{CNVCLS}=0_{\mathrm{H}}, 1_{\mathrm{H}}$ ) |
|  |  | Analog input channels are selected by the GCTRL[3:0] bits. |
|  |  | ОН: DSANnOP |
|  |  | $1_{\text {H: }}$ DSANNON |
|  |  | 2н: DSANn1P |
|  |  | 3H: DSANn1N |
|  |  | 4H: DSANn2P |
|  |  | 5H: DSANn2N |
|  |  | 6н: DSANn3P |
|  |  | 7н: DSANn3N |
|  |  | Setting of unsupported channels is prohibited. |
|  |  | Differential input ( $\mathrm{CNVCLS}=2_{\mathrm{H}}$ ) |
|  |  | Analog input channels are selected by the GCTRL[3:0] bits. |
|  |  | ОH: DSANnOP/DSANnON |
|  |  | $1_{\text {H: }}$ : Setting prohibited |
|  |  | 2н: DSANn1P/DSANn1N |
|  |  | 3H: Setting prohibited |
|  |  | 4H: DSANn2P/DSANn2N |
|  |  | 5H: Setting prohibited |
|  |  | 6н: DSANn3P/DSANn3N |
|  |  | $7_{\text {H: }}$ : Setting prohibited |
|  |  | Setting of unsupported channels is prohibited. |
|  |  | Self-diagnosis (CNVCLS[1:0] $=3_{\mathrm{H}}$ ) |
|  |  | Self-diagnosis level is selected by the GCTRL[3:0] bits. |
|  |  | 7н: ADSVREFH $\times 1$ |
|  |  | 4H: ADSVREFH $\times 1 / 2$ |
|  |  | OH: ADSVREFH $\times 0$ |
|  |  | CH: - ADSVREFH $\times 1 / 2$ |
|  |  | 8\%: - ADSVREFH $\times 1$ |
|  |  | Other than the above: Setting prohibited |
|  |  | NOTE: Setting of self-diagnosis level does not correspond to gain $\times 8$. Set gain $\times 4$ as selfdiagnosis in the high impedance mode when using gain of more than $\times 4$ in the high impedance mode. And always set gain $\times 1$ or $\times 2$ in the high resolution mode. |

NOTE
To prevent a malfunction, set DSADCnVCRj when ADACT $=0$ and CLBACT $=0$ (before starting A/D conversion) and STTRGE $=0$. When rewriting this register after A/D conversion stop, change the setting after it is confirmed that ADACT was cleared by reading ADSR.

Table 35.18 Coefficients of Post-Filter 2nd Stage in Delta-Sigma ADC

| No. | Coefficient 1 $\left(\text { TPVSL }=1_{\mathrm{H}}\right)$ | Coefficient 2 $\left(\text { TPVSL }=2_{\mathrm{H}}\right)$ | Coefficient 3 $\left(\text { TPVSL }=3_{H}\right)$ | Coefficient 4 $\left(\text { TPVSL }=4_{H}\right)$ |

### 35.5.2 DSADCnDIRj — Data Supplementary Information Register j

DSADCnDIRj is a 32-bit read-only register to store $\mathrm{A} / \mathrm{D}$ converted values and their supplementary information. This register is cleared to $00000000_{\mathrm{H}}$ by reading this register when RDCLRE is set to 1 . Additionally, DSADCnUDIR is also cleared to $00000000_{\mathrm{H}}$ by reading this register which is mirrored to DSADCnUDIR when DSADCnRDCLRE is set to 1 . The WFLG bit is cleared by reading this register regardless of the RDCLRE value.

When reading the DSADCnDIRj in 16-bit units, disable Read-and-Clear-Enable ( $\operatorname{DSADCnSFTCR} . \operatorname{RDCLRE}=0$ ) and disable the overwriting function $\left({ }^{* 1}\right)$.

Note 1. The expected value comparison of the WFLG bit of DSADCnDIRj and Overwrite-Error of the Error-Register is not put into effect, and the Overwrite-Error-Interrupt-Enable (OWEIE) of the Safety-Control-Register (DSADCnSFTCR) is 0 (prohibited).

Table 35.19 DSADCnDIRj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | IDEF | ID Error |
|  |  | 0 : An error is present. |
|  |  | 1: No error is present. |
| 25 | WFLG | Write Flag |
|  |  | Setting condition |
|  |  | Storing an A/D converted value in DSADCnDIRj |
|  |  | Clearing condition |
|  |  | Reading DSADCnDIRj |
| 24 | PRTY | Parity |
|  |  | This bit indicates the even parity bit of DR and IDEF. |
| 23 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | DR[15:0] | These bits are used to store the A/D converted value. |
|  |  | For the data format, see "Bits 15 to 0 DR Data Register Data Format". |

The setting timing of IDEF, WFLG and PRTY is simultaneous with the timing at which the A/D conversion result is stored up in a data register (DR).

When update (setting) and reading (clearance) of IDEF, WFLG and PRTY are in contention, update (setting) is given priority.

## Bits 15 to 0 DR Data Register Data Format

The A/D converted value is stored in the DR. The data format of the DR is shown below. The format of the data to be transferred to the DFE (Digital Filter Engine) or the GTM (Generic Timer Module) is in the signed fixed-point format regardless of the UNSND setting.

Signed Fixed-Point Format

| DFMT[3:0] | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{O}_{\mathrm{H}}$ | S |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| $1_{\mathrm{H}}$ | S |  |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 |
| 2 H | S |  |  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 |
| 3 H | S |  |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 |
| $4{ }_{\text {H }}$ | S |  |  |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 |
| $5_{\text {H }}$ | S |  |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 |
| $6_{\text {H }}$ | S |  |  |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 0 |
| 7 H | S |  |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $8{ }_{\text {H }}$ | S |  |  |  |  |  |  |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Unsigned Fixed-Point Format
(UNSND = 1 and CNVCLS[1:0] = $0_{\mathrm{H}}$ )

Sign bit
: Always 0

Figure 35.2 DR (Data Register) Data Format 1

Figure 35.3 DR (Data Register) Data Format 2

### 35.5.3 DSADCnADSTCR — AD Start Control Register

DSADCnADSTCR is an 8-bit write-only register to control the Delta-Sigma ADC start. This register is always read as 0.

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 35.20 DSADCnADSTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADST | A/D Conversion Start |
|  |  | A/D conversion start condition with ADST |
|  |  | Writing 1 to ADST |
|  |  | When 1 is written to this bit with $A / D$ conversion operating, the ongoing $A / D$ conversion stops and $A / D$ conversion of the next virtual channel starts. |
|  |  | When 1 is written to this bit with A/D conversion operating, if the DSADCnUCR.VCEP[2:0] value is $0_{H}$, the ongoing A/D conversion stops and A/D conversion of the virtual channel 0 starts. |
|  |  | Writing 0 to this bit is ignored. |
| NOTE |  |  |

We recommend that a value be written to the ADST bit when STTRGE $=0$ and ENDTRGE $=0$. When the external trigger and write to ADST occur at the same time, the count value of the channel sometimes does not match the number of inputs of the trigger.

To prevent a malfunction, the ADST bit must be set after confirmation of calibration completion following the A/D conversion flow in Figure 35.4.

### 35.5.4 DSADCnADENDCR — AD Stop Control Register

DSADCnADENDCR is an 8-bit write-only register to control the Delta-Sigma ADC stop. This register is always read as 0 .

$$
\text { Value after reset: } \quad 00_{H}
$$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | ADEND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 35.21 DSADCnADENDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | ADEND | A/D Conversion End |
|  |  | A/D conversion stop condition with ADEND |
|  |  | Writing 1 to this bit stops A/D conversion when A/D conversion is operating. |
|  |  | When A/D conversion is stopped with VPRSTE $=0$, the virtual channel is incremented. |
|  |  | When A/D conversion is stopped with VPRSTE $=1$, the virtual channel is cleared to 0 . |
|  |  | Writing 1 to this bit is ignored when $A / D$ conversion is stopped. |
|  |  | Writing 0 to this bit is ignored. |
|  |  | NOTE: When changing the other register setting after an A/D conversion is stopped, please be sure to confirm that ADACT is 0 . |

## NOTE

We recommend that a value be written to the ADEND bit when STTRGE $=0$ and ENDTRGE $=0$.

### 35.5.5 DSADCnCLBSTCR - Calibration Start Control Register

DSADCnCLBSTCR is an 8-bit write-only register to control calibration start. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

Table 35.22 DSADCnCLBSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLBST | Calibration Start |
|  |  | Calibration start condition with CLBST |
|  | Writing 1 to this bit starts calibration when calibration and A/D conversion are stopped. |  |
|  |  | Writing 1 to this bit is ignored when calibration or A/D conversion is operating. |

### 35.5.6 DSADCnCLBEDCR — Calibration Stop Control Register

DSADCnCLBEDCR is an 8-bit write-only register to control calibration stop. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 5 |  | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CLBEND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 35.23 DSADCnCLBEDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CLBEND | Calibration Stop |
|  | Calibration stop condition with CLBEND |  |
|  | Writing 1 to this bit stops calibration when calibration is operating. |  |
|  |  | Writing 1 to this bit is ignored when calibration is stopped. |

CAUTION: If calibration is suspended by CLBEND before calibration is completed, the correction value before calibration is performed is retained. Writing 0 to this bit is ignored.

## NOTE

To prevent a malfunction, $A / D$ conversion must be restarted from the initialization process following the $A / D$ conversion flow in Figure $\mathbf{3 5 . 4}$ after writing 1 to the CLBEND bit in during calibration.

Setting of ADST or CLBST must not be done before at least 6 register access cycles after confirmation of calibration stop.

### 35.5.7 DSADCnADTCR — AD Conversion Trigger Control Register

DSADCnADTCR is an 8-bit read/write register to control the Delta-Sigma ADC.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | ADSTTE | - | - | - | - | ENDTRGE | StTRGE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R | R | R | R | R/W | R/W |

Table 35.24 DSADCnADTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 6 | ADSTTE | A/D Synchronization Start Enable |
|  |  | 0 : ADSTART is disabled. |
|  |  | 1: ADSTART is enabled. |
| 5 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | ENDTRGE | A/D Conversion End Trigger Enable |
|  |  | 0 : A/D conversion end trigger $n$ is disabled. |
|  |  | 1: A/D conversion end trigger $n$ is enabled. |
|  |  | The trigger selection function is used to set the trigger source selection for $A / D$ conversion end trigger n . |
|  |  | For details, see Section 33, Peripheral Interconnection (PIC). |
| 0 | STTRGE | A/D Conversion Start Trigger Enable |
|  |  | $0: A / D$ conversion start trigger n is disabled. |
|  |  | 1: A/D conversion start trigger $n$ is enabled. |
|  |  | The trigger selection function is used to set the trigger source selection for $A / D$ conversion start trigger n . |
|  |  | For details, see Section 33, Peripheral Interconnection (PIC). |
| NOTE |  |  |
| Enable the module standby function when ENDTRGE $=0$ and STTRGE $=0$. For details, see Section 35.7.2, Module Standby Function. |  |  |

### 35.5.8 DSADCnUCR — Unit Control Register

DSADCnUCR is a 32 -bit read/write register to control the Delta-Sigma AD units.

Table 35.25 DSADCnUCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | VPRSTE | Virtual Channel Pointer Reset Enable |
|  |  | 0 : The virtual channel pointer is incremented at the end of the $A / D$ conversion by the $A / D$ conversion end trigger $n$ or ADEND. |
|  |  | 1: The virtual channel pointer is set as 0 at the end of the $A / D$ conversion by the $A / D$ conversion end trigger n or ADEND. |
| 28 | RDMA | Read Gate DMA Mode |
|  |  | This bit selects a DMA transfer request output condition. |
|  |  | 0: A DMA transfer request is output for all A/D conversion results. |
|  |  | 1: A DMA transfer request is output for the A/D conversion result for which DSADRGTn is being asserted. |
| 27 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | RESO0 | High Resolution Mode |
|  |  | 0: High resolution mode |
|  |  | 1: High impedance mode |
|  |  | Be sure to perform calibration after high resolution mode is changed. |
| 25 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 24 | DFES | DFE Channel Select |
|  |  | This bit sets the DFE channel to be assigned to DSADCn. Entry to the DFE is performed for each VCR register. |
|  |  | 0 : DFE0 is selected. |
|  |  | 1: DFE1 is selected. |
| 23 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 35.25 DSADCnUCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | DFMT[3:0] | Data Format |
|  |  | These bits specify the lower bits to be zero-masked (rounded in the $-\infty$ direction). |
|  |  | $0_{H}$ : Not masked |
|  |  | $1_{\mathrm{H}}$ : Lower 1 bit masked |
|  |  | $2_{\text {H: }}$ : Lower 2 bits masked |
|  |  | $3_{\mathrm{H}}$ : Lower 3 bits masked |
|  |  | $4_{\mathrm{H}}$ : Lower 4 bits masked |
|  |  | $5_{\text {H: }}$ L Lower 5 bits masked |
|  |  | $6_{H}$ : Lower 6 bits masked |
|  |  | $7_{\mathrm{H}}$ : Lower 7 bits masked |
|  |  | 8н: Lower 8 bits masked |
|  |  | Others: Setting prohibited |
|  |  | The setting of these bits depends on the format of the data for DR, DFE, and GTM. |
|  |  | For details about the data format, see Section 35.5.2, DSADCnDIRj — Data Supplementary Information Register j. |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | VCEP[2:0] | End Virtual Channel Pointer |
|  |  | These bits set the end virtual channel number. |
| NOTE |  |  |

To prevent a malfunction, set DSADCnUCRn when ADACT $=0$ and CLBACT $=0$ (before starting A/D conversion) and STTRGE $=0$.

### 35.5.9 DSADCnVCPTRR — Virtual Channel Pointer Control Register

DSADCnVCPTRR is an 8-bit read/write register to monitor the number of the virtual channel for which A/D conversion is in progress.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | VCPTR[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 35.26 DSADCnVCPTRR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | VCPTR[2:0] | A/D Conversion Ongoing Virtual Channel Number |
|  |  | These bits output the number of virtual channels for which A/D conversion is in progress. |
|  |  | If a value is written to these bits while A/D conversion is not ongoing, the virtual channel number is updated and A/D conversion starts for the channel written at the next conversion start. |
|  |  | Writing to these bits during A/D conversion is prohibited. When any value is written to these bits with A/D conversion operating, the A/D conversion of the next start channel cannot be guaranteed. |
|  |  | The number of the channel for which the next A/D conversion is processed is retained while conversion is stopped or calibration is processed. |
|  |  | A setting exceeding the end pointer is prohibited. |
|  |  | When changing a channel by the external trigger or ADST, it is necessary to wait up to 20 register access cycles until the change is reflected to VCPTR. |

## NOTE

To prevent a malfunction, set DSADCnVCPTRR when ADACT $=0$ and CLBACT $=0$ (before starting A/D conversion) and ADSTTE $=0$ and STTRGE $=0$ and ENDTRGE $=0$. When writing during external trigger use, be sure to stop A/D conversion. When writing to VCPTR, set ADSTTE, STTRGE and ENDTRGE as 0 , and confirm ADACT $=0$, or write ADEND $=1$ to ensure that $A / D$ conversion stops.

### 35.5.10 DSADCnADSR - AD Conversion Status Register

DSADCnADSR is an 8-bit read-only register that indicates the delta-sigma ADC status.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | CLBACT | ADACT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 35.27 DSADCnADSR Register Contents
\(\left.\begin{array}{lll}\hline Bit Position \& Bit Name \& Function <br>
\hline 7 to 2 \& Reserved <br>

\& When read, the value after reset is returned. When writing, write the value after reset.\end{array}\right]\)|  | Calibration Status |
| :--- | :--- |
| 0 | 0: Calibration is not in progress. |
| 1: Calibration is in progress. |  |

### 35.5.11 DSADCnUDPTRR — Unit Data Pointer Register

DSADCnUDPTRR is an 8-bit read-only register that indicates the virtual channel number of DSADCnUDIR.

Value after reset: $\quad 00_{H}$

Table 35.28 DSADCnUDPTRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | UDPTR | Unit Data Pointer <br> These bits indicate the virtual channel number in which the latest A/D conversion result is <br> stored. |

### 35.5.12 DSADCnUDIR — Unit Data Supplementary Information Register

DSADCnUDIR is a 32-bit read-only register to output all A/D conversion results of DSADCn units regardless of the selection of the virtual channel. The bit besides CHNUM[2:0] and UPRTY of this register is a mirror register of DSADCnDIRj specified by UDPTR[3:0]. When DSADCnUDIR is read, the WFLG of the actual DSADCnDIRj is cleared at the same time, and DR[15:0], PRTY and IDEF in DSADCnDIRj as well as CHNUM[2:0] and UPRTY in this register are also cleared when RDCLRE is set to 1 .

Table 35.29 DSADCnUDIR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 29 | CHNUM[2:0] | Virtual Channel Number <br> Virtual channel number of UDR[15:0] |
| 28,27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | UIDEF | ID Error |
|  |  | 0: An error is present. |
|  |  | 1: No error is present. |

### 35.5.13 DSADCnTSVAL — Timestamp Register

DSADCnTSVAL is a 32-bit read-only register to output timestamp data. When DSADRGTn from ATU or GTM is rising edge, the timestamp value and $A / D$ conversion result can be captured in this register.

Table 35.30 DSADCnTSVAL Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 23 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 22 to 16 | TSVAL[6:0] | Timestamp Data at the DSADRGTn Rising edge |
|  |  | The lapsed time (oversampling cycles) after the previous conversion ended can be monitored. |
|  |  | A value of $7 \mathrm{~F}_{H}$ is output during A/D conversion stop or the first A/D conversion. |
| 15 to 0 | TSDR[15:0] | Timestamp Data Output |
|  |  | The A/D conversion result when reading the timestamp can be monitored. |
|  |  | It is the signed fixed point format. It does not correspond to DFMT. |

### 35.5.14 DSADCnSFTCR — Safety Control Register

DSADCnSFTCR is an 8-bit read/write register for safety control.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | RDCLRE | - | - | - | - | OWEIE | PEIE | IDEIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R/W | R/W | R/W |

Table 35.31 DSADCnSFTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | RDCLRE | Read and Clear Enable |
|  |  | 0: DSADCnDIRj (DSADCnUDIR) is not cleared by reading DSADCnDIRj (DSADCnUDIR). <br> 1: DSADCnDIRj (DSADCnUDIR) is cleared by reading DSADCnDIRj (DSADCnUDIR). |
|  |  | The WFLG of DSADCnDIRj (DSADCnUDIR) is cleared by reading DSADCnDIRj (DSADCnUDIR) regardless of the RDCLRE value. |
|  |  | When DSADCnUDIR is read after RDCLRE has been set to 1, DSADCnDIRj which corresponds with DSADCnUDPTR is also cleared at the same time. |
|  |  | When DSADCnDIRj which corresponds with DSADCnUDPTR is read, DSADCnUDIR is also cleared at the same time. |
| 6 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | OWEIE | Overwrite Error Interrupt Enable |
|  |  | 0 : Disabled |
|  |  | 1: Enabled |
|  |  | When using DMA transfer with read-gate, if read-gate is in the inactive state, a DMA request is not output, but, on the other hand, an overwrite error occurs. |
|  |  | Therefore, the overwrite Error Interrupt and DMA transfer by the DSADIn with read-gate cannot be used at the same time. |
| 1 | PEIE | Parity Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 0 | IDEIE | ID Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| NOTE |  |  |

To prevent a malfunction, set DSADCnSFTCR when ADACT $=0$ (before starting A/D conversion) and STTRGE $=0$.

### 35.5.15 DSADCnECR — Error Clear Register

DSADCnECR is an 8 -bit write-only register to control error clear. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | ULEC | LLEC | OWEC | PEC | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | W | W | W | W | R |

Table 35.32 DSADCnECR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 5 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | ULEC | Upper-Limit Error Clear |
|  |  | 0: Does not clear the upper-limit error. |
|  |  | 1: Clears the upper-limit error. |
| 3 | LLEC | Lower-Limit Error Clear |
|  |  | 0 : Does not clear the lower-limit error. |
|  |  | 1: Clears the lower-limit error. |
| 2 | OWEC | Overwrite Error Clear |
|  |  | 0 : Does not clear the overwrite error. |
|  |  | 1: Clears the overwrite error. |
| 1 | PEC | Parity Error Clear |
|  |  | 0: Does not clear the parity error. |
|  |  | 1: Clears the parity error. |
| 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 35.5.16 DSADCnER — Error Register

DSADCnER is a 32-bit read-only register that indicates errors.

| Value after reset: $00000000_{\mathrm{H}}$ |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|  | ULE | LLE | - | - | - | ULECAP[2:0] |  |  | OWE | - | - | - | - | OWECAP[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | PE | - | - | - | - | PECAP[2:0] |  |  | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

Table 35.33 DSADCnER Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 | ULE $^{(*)}$ | Upper-Limit Error |
|  | 0: No upper-limit error is present. |  |
|  | 1: An upper-limit error is present. |  |
|  | Setting condition |  |
| The A/D converted value exceeds the specified upper-limit table range. |  |  |
|  | Clearing condition |  |
|  | Writing 1 to ULEC in DSADCnECR. |  |

When LLE is set to 1 , ULE is not set to 1 even if an upper-limit error occurred.

| When LLE is set to 1, ULE is not set to 1 even if an upper-limit error occurred. |
| :--- |
| 30 LLE ${ }^{(*)}$ |
| 0: No lower-limit error is present. |
| 1: A lower-limit error is present. |
| Setting condition |
| The A/D converted value exceeds the specified lower-limit table range. |
| Clearing condition |
| Writing 1 to ULEC in DSADCnECR. |

|  | When ULE is set to 1, LLE is not set to 1 even if a lower-limit error occurred. |
| :--- | :--- | :--- |
| 29 to 27 | Reserved |
| 26 to 24 | When read, the value after reset is returned. When writing, write the value after reset. |
|  | Upper-Limit/Lower-Limit Error Capture <br> These bits show the virtual channel number in which an upper-limit or lower-limit error <br> occurred. <br> When writing 1 to ULEC, these bits are cleared to $0_{H}$. |

Table 35.33 DSADCnER Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 23 | OWE | Overwrite Error <br> 0 : No overwrite error is present. <br> 1: An overwrite error is present. <br> Setting condition <br> Writing an A/D converted value to DSADCnDIRj.DR occurs when WFLG $=1$. <br> Even if DSADCnUDIR.UDR is overwritten when DSADCnUDIR.UWFLG = 1 , <br> this bit is not set to 1 if DSADCnDIRj.DR is not overwritten. <br> Clearing condition <br> Writing 1 to OWEC in DSADCnECR. |
| 22 to 19 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 18 to 16 | OWECAP[2:0] | Overwrite Error Capture <br> These bits show the virtual channel number in which an overwrite error occurred. When writing 1 to OWEC, these bits are cleared to $0_{H}$. |
| 15 | PE | Parity Error <br> 0 : No parity error is present. <br> 1: A parity error is present. <br> Setting condition <br> A parity error is detected. <br> Clearing condition <br> Writing 1 to PEC in DSADCnECR. |
| 14 to 11 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 8 | PECAP[2:0] | Parity Error Capture <br> These bits show the virtual channel number in which a parity error occurred. <br> When writing 1 to PEC, these bits are cleared to $0_{\mathrm{H}}$. <br> When a parity error is indicated by DSADCnUDIR, the number of DSADCnUDIR.CHNUM[2:0] is shown. |
| 7 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

The ULE and OWE bits are updated when an A/D converted value is written to the DIR. The PE bit is updated when the DIR is read.

When an AD error interrupt request is generated, read the error register and check for the " 1 " bits in the interrupt exception handler, and then clear them to 0 by using the corresponding clear bits in the ECR.

When an error bit is not cleared and an error occurs during the next $A / D$ conversion, the following operation takes place and the error cannot be detected or identified.

1. When the same error (error bit $=1$ ) occurs:

No AD error interrupt request is made.
The relevant error bit in the ER remains 1.
${ }^{(*)}$ ULE and LLE are handled as the same error.
2. When a different error (error bit $=0$ ) occurs:

An AD error interrupt request is made.
The error bit that was generated in the previous A/D conversion remains 1 and the relevant error bit in the ER is set to 1 .
${ }^{(*)}$ ULE and LLE are handled as the same error.

### 35.5.17 DSADCnTDLVR — Pin Level Self-Diagnosis Level Register

DSADCnTDLVR is an 8-bit read/write register to specify pin level self-diagnosis levels. Write to this register, when the DSADCTDCR.TDE bit is in the state of 0 .

Value after reset: $\quad 00_{H}$

| Bit | $7 \quad 6$ |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AN3NLV | AN3PLV | AN2NLV | AN2PLV | AN1NLV | AN1PLV | ANONLV | ANOPLV |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Table 35.34 DSADCnTDLVR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | AN3NLV | Pin Level Self-Diagnosis Level of DSANn3N <br> 0 : DSANn3N is discharged (ADSVSS). <br> 1: DSANn3N is charged (ADSVCC). |
| 6 | AN3PLV | Pin Level Self-Diagnosis Level of DSANn3P <br> 0 : DSANn3P is discharged (ADSVSS). <br> 1: DSANn3P is charged (ADSVCC). |
| 5 | AN2NLV | Pin Level Self-Diagnosis Level of DSANn2N <br> 0 : DSANn2N is discharged (ADSVSS). <br> 1: DSANn2N is charged (ADSVCC). |
| 4 | AN2PLV | Pin Level Self-Diagnosis Level of DSANn2P <br> 0: DSANn2P is discharged (ADSVSS). <br> 1: DSANn2P is charged (ADSVCC). |
| 3 | AN1NLV | Pin Level Self-Diagnosis Level of DSANn1N <br> 0 : DSANn1N is discharged (ADSVSS). <br> 1: DSANn1N is charged (ADSVCC). |
| 2 | AN1PLV | Pin Level Self-Diagnosis Level of DSANn1P <br> 0 : DSANn1P is discharged (ADSVSS). <br> 1: DSANn1P is charged (ADSVCC). |
| 1 | ANONLV | Pin Level Self-Diagnosis Level of DSANnON <br> 0 : DSANnON is discharged (ADSVSS). <br> 1: DSANnON is charged (ADSVCC). |
| 0 | ANOPLV | Pin Level Self-Diagnosis Level of DSANnOP <br> 0 : DSANnOP is discharged (ADSVSS). <br> 1: DSANnOP is charged (ADSVCC). |
| NOTE |  |  |

To prevent a malfunction, set DSADCnTDLVR when ADACT $=0$ (before starting A/D conversion) and STTRGE $=0$.

### 35.5.18 DSADCnULTBR0/1/2/3 — Upper-Limit/Lower-Limit Table Register 0/1/2/3

DSADCnULTBR0 to DSADCnULTBR3 are 32-bit read/write registers to set the upper-limit and lower-limit values of the A/D converted values.

Table 35.35 DSADCnULTBR0/1/2/3 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | ULMTB[15:0] | Upper-Limit Table |
|  |  | These bits specify the upper-limit value of the A/D converted value. When the following condition is met, the ULE (upper-limit error) is set to 1. |
|  |  | ULMTB[15:0] < A/D converted value |
|  |  | The ULMTB[15:0] format is the same as the DR format. |
|  |  | For the unsigned format, it is compared with the A/D converted value as unsigned. |
|  |  | The A/D converted values are compared by using the values before they are masked by DFMT[3:0]. |
| 15 to 0 | LLMTB[15:0] | Lower-Limit Table |
|  |  | These bits specify the lower-limit value of the A/D converted value. When the following condition is met, the LLE (lower-limit error) is set to 1 |
|  |  | LLMTB[15:0] > A/D converted value |
|  |  | The LLMTB[15:0] format is the same as the DR format. |
|  |  | For the unsigned format, it is compared with the A/D converted value as unsigned. |
|  |  | The A/D converted values are compared by using the values before they are masked by DFMT[3:0]. |

To prevent a malfunction, set DSADCnULTBR0 to DSADCnULTBR3 when ADACT $=0$ (before starting A/D conversion) and STTRGE $=0$.

### 35.6 Operation

### 35.6.1 A/D Conversion Flow

The delta-sigma ADC starts $\mathrm{A} / \mathrm{D}$ conversion by setting the registers shown in Figure 35.4.

Note 1. Set this just before the start of analog to digital conversion (after setting of all other registers).
When using hardware triggers, set pin functions by using the PFC/trigger selection function and then set DSADCnADTCR.

Figure 35.4 A/D Conversion Flow

### 35.6.2 Filter Type Setting

Filter types vary with the combinations of the values set in DSADCnADGCR, DSADCnUCR, and DSADCnVCRj. Set the filter types according to the purpose, as shown below.

Table 35.36 Register Set Values for Each Filter Type

|  | 2nd <br> Stage <br> Used <br> Case 1 <br> (F1a) | 2nd <br> Stage <br> Used <br> Case 2 <br> (F1b) | 2nd <br> Stage <br> Used <br> Case 3 <br> (F2) | 2nd <br> Stage <br> Used <br> Case 4 <br> (F3a) | 2nd <br> Stage <br> Used <br> Case 5 <br> (F3b) | 2nd <br> Stage <br> Used <br> Case 6 <br> (F4) | (Fase 7 <br> (F5) | (F7) |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Register setting

| DSADCnVCRj.DSDFTYP | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $1_{H}$ | $2_{H}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| DSADCnVCRj.ORT | $1_{H}$ | $0_{H}$ | $0_{H}$ | $1_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ |
| DSADCnVCRj.TPVSL <br> $[2: 0]$ | $1_{H}$ | $1_{H}$ | $2_{H}$ | $3_{H}$ | $3_{H}$ | $4_{H}$ | $0_{H}$ | $0_{H}$ | $0_{H}$ |

Note 1. Software delay excluded

### 35.6.3 A/D Conversion Time

After the ADST bit in DSADCnADSTCR is set to 1 and the A/D conversion start delay time (tD) and the internal stabilization time (tW) have passed, the delta-sigma ADC starts $\mathrm{A} / \mathrm{D}$ conversion processing.

Figure 35.5 shows the $\mathrm{A} / \mathrm{D}$ conversion start timing and end timing. Figure $\mathbf{3 5 . 6}$ shows the $\mathrm{A} / \mathrm{D}$ conversion restart timing. Figure 35.7 shows the time budget of $A / D$ conversion processing. The $A / D$ conversion processing time (ADST setting during $\mathrm{A} / \mathrm{D}$ conversion stop) (tAD) includes the $\mathrm{A} / \mathrm{D}$ conversion start delay time (tD), the internal stabilization time ( tW ), and the delta-sigma ADC post-filter processing delay time ( tDF ). The A/D conversion processing time (second time and later) ( tAD ) is the sampling cycle ( tS ). $\mathrm{A} / \mathrm{D}$ conversion processing time (ADST setting during $\mathrm{A} / \mathrm{D}$ conversion operating) (tAD) includes the $\mathrm{A} / \mathrm{D}$ conversion restart delay time ( tR ), the internal stabilization time (tW), and the delta-sigma ADC post-filter processing delay time (tDF). Table 35.37 shows the $\mathrm{A} / \mathrm{D}$ conversion processing time.

The $\mathrm{A} / \mathrm{D}$ conversion processing time ( tAD ) is calculated by the following formula.
$A / D$ conversion processing time (ADST setting during $A / D$ conversion stop): $t A D=t D+t W+t D F$
$A / D$ conversion processing time (ADST setting during A/D conversion operating): $t A D=t R+t W+t D F$
$A / D$ conversion processing time (From the second time for both cases): $t A D=t S$

Table 35.37 A/D Conversion Time (When Register Access Clock $=40 \mathrm{MHz}$, ADCLK $=80 \mathrm{MHz}$, Unit: Register Access Clock)

| Item | 2nd <br> Stage <br> Used <br> Case 1 <br> (F1a) | 2nd Stage Used Case 2 (F1b) | 2nd <br> Stage <br> Used <br> Case 3 <br> (F2) | 2nd Stage Used Case 4 (F3a) | 2nd Stage Used Case 5 (F3b) | 2nd <br> Stage <br> Used <br> Case 6 (F4) | Case 7 (F5) | (F7) | (F6) |

| tAD (ADST setting during A/D conversion operating) | $\begin{aligned} & \hline 2612.5^{\star 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & \hline 2612.5^{\star 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & 2612.5^{* 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & 2612.5^{\star 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & \hline 2612.5^{\star 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & 2612.5^{\star 1} \\ & \text { to } 2820^{* 1} \end{aligned}$ | $\begin{aligned} & 400.5^{* 1} \text { to } \\ & 608^{* 1} \end{aligned}$ | $\begin{aligned} & 197.5^{* 1} \text { to } \\ & 255^{* 1} \end{aligned}$ | $\begin{aligned} & 350.5^{* 1} \text { to } \\ & 458^{\star 1} \end{aligned}$ |
| tR | $33.5 * 1$ to $241^{* 1}$ |  |  |  |  |  |  | $\begin{aligned} & 33.5^{\star 1} \text { to } \\ & 91^{\star 1} \end{aligned}$ | $\begin{aligned} & 33.5^{* 1} \text { to } \\ & 141^{* 1} \end{aligned}$ |
| tAD (From the second time for both cases) | 400 | 200 | 200 | 400 | 200 | 200 | 100 | 25 | 50 |
| tS | 400 | 200 | 200 | 400 | 200 | 200 | 100 | 25 | 50 |

Note 1. DSADCA* ${ }^{* 2}$ is added 2.5 states (half period of over sampling clock).
Note 2. DSADCA is DSADC00, DSADC20 and DSADC13.
DSADCB is DSADC10, DSADC12 and DSADC11.

Figure 35.5 A/D Conversion Start and End (when ADST Is Set during Conversion Stop)

Figure 35.6 A/D Conversion Stop and Restart (when ADST Is Set during Conversion)

Figure 35.7 Budget of A/D Conversion Processing

### 35.6.4 Starting an A/D Conversion by an External Trigger

A/D conversion of the DSADCn can be started by DSADTRGn input. To start a DSADCn by DSADTRGn, input a high level to DSADTRGn, and then set STTRGE in DSADCnADTCR to 1 . When a low level is input to the DSADTRGn in this state, the DSADCn detects a falling edge and sets ADACT to 1 .

Figure 35.8 shows the external trigger input timing. ADACT is set to 1 in 3 to 4 states of ADCLK and 2 to 3 states of the register access clock after the falling edge of DSADTRGn.

The timing after ADACT is set to 1 until DSADCn is started is the same as the case where ADST is set to 1 by the software. For the pin function settings, see Section 2, Pin Function. For selecting the A/D conversion start trigger n source, see Section 33, Peripheral Interconnection (PIC).

Figure $35.8 \quad$ External Trigger Input Timing

### 35.6.5 Terminating an A/D Conversion by an External Trigger

The DSADCn can be terminated by the DSADTRGn input. To terminate the DSADCn by the DSADTRGn, set the pin functions by using the PFC (pin function controller) and select an A/D conversion end trigger $n$ source by using the trigger selection function. Input a high level to DSADTRGn and then set ENDTRGE in DSADCnADTCR to 1. When a low level is input to DSADTRGn in this state, the DSADCn detects a falling edge and clears ADACT to 0 to terminate the DSADCn

ADACT is cleared to 0 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the falling edge of DSADTRGn.

For the pin function settings, see Section 2, Pin Function. For selecting the A/D conversion end trigger n source, see Section 33, Peripheral Interconnection (PIC).

To terminate an A/D conversion by an external trigger, input an external trigger when $\mathrm{ADACT}=1$. If an external trigger is input when $\mathrm{ADACT}=0$, this input is ignored.

### 35.6.6 Starting an A/D Conversion by a Timer Trigger

The DSADCn can be started by an arbitrary timer trigger. To start the DSADCn by using a timer trigger, select a timer trigger as an A/D conversion start trigger $n$ source by using the trigger selection function. Set STTRGE in DSADCnADTCR to 1 .

When the selected timer trigger is input in this state, ADACT is set to 1 . The period after ADACT is set to 1 until the DSADCn is started is the same as the case where ADST is set to 1 by the software.

For selecting the A/D conversion start trigger n source, see Section 33, Peripheral Interconnection (PIC).
To stop the DSADCn, write 1 to ADEND in DSADCnADENDCR.

### 35.6.7 Terminating an A/D Conversion by a Timer Trigger

The DSADCn can be terminated by an arbitrary timer trigger. To terminate the DSADCn by using a timer trigger, select a timer trigger as an A/D conversion end trigger $n$ source by using the trigger selection function. Set ENDTRGE in DSADCnADTCR to 1 .

When the selected timer trigger is input in this state, ADACT is cleared to 0 to terminate the DSADCn.
For selecting the A/D conversion end trigger $n$ source, see Section 33, Peripheral Interconnection (PIC).
To terminate an $\mathrm{A} / \mathrm{D}$ conversion by a timer trigger, input a timer trigger when $\mathrm{ADACT}=1$. If a timer trigger is input when $\mathrm{ADACT}=0$, the timer trigger is ignored.

### 35.6.8 Switching Virtual Channels via Start and End Triggers

When the VCEP[2:0] bits are set as a channel besides 0 in DSADCnUCR, they are incremented $(+)$ at each input of an external trigger (start trigger or stop trigger) or a software trigger (start trigger or stop trigger) during A/D conversion. Virtual channels can be sequentially switched from DSADCnVCR0 to DSADCnVCRj ( $\mathrm{j}=\mathrm{VCEP}[2: 0]$ set value) for A/D conversion by inputting a trigger continuously at more than 1 cycle (ADCLK) intervals from the external timer. The channel switching is not performed normally by inputting a start trigger or a stop trigger continuously at less than 1 cycle (ADCLK) intervals. When VPRSTE is set to 1 , virtual channels always return to DSADCnVCR0 at a stop trigger. By using this operation, an $\mathrm{A} / \mathrm{D}$ conversion can also be started from any DSADCnVCRj by continuously generating a start trigger after a stop trigger. If a trigger is input during an A/D conversion of the channel set by VCEP[2:0], the channel returns to DSADCnVCR0 again and then an A/D conversion is performed. Figure $\mathbf{3 5 . 9}$ to Figure $\mathbf{3 5 . 1 1}$ show examples of virtual channel switching made by start triggers and end triggers.

Figure 35.9 Switching Virtual Channels by a Start Trigger

Figure 35.10 Switching Virtual Channels by an End Trigger (VPRSTE = 0)

Figure 35.11 Switching Virtual Channels by an End Trigger (VPRSTE = 1)

### 35.6.9 Calculating Correction Values by Using Calibration

Accurate $\mathrm{A} / \mathrm{D}$ conversions can be performed by calculating an offset correction value and a gain error correction value under current operating conditions by using calibration. In calibration, the reference voltage is $\mathrm{A} / \mathrm{D}$ converted in selfdiagnosis mode and the best correction values are determined from errors included in the conversion result. Calibration operation starts by writing 1 to CLBST.

### 35.6.9.1 Calibration Time

Table 35.38 Calibration Time (When Register Access Clock $=40 \mathrm{MHz}$, ADCLK $=80 \mathrm{MHz}$, Unit: Register Access
Clock)

| Conversion Mode | Calibration Time |
| :--- | :--- |
| High Resolution Mode | 34907.5 to 35017.5 |
| High Impedance Mode | 69827.5 to 70047.5 |

### 35.6.10 A/D Conversion Result Error Correction Processing

The post-filter 2nd stage in the Delta-Sigma ADC has the gain error. The gain error specified in Electrical Characteristic are the gain error of A/D conversion result corrected by software processing or by DFE. Correction formula and correction coefficient are shown the following.

Table 35.39 Correction Formula and Correction Coefficient for the Post-Filter 2nd Stage

| Filter type | Correction Coefficient |
| :--- | :--- |
| F1a, F1b | $4076 / 4096$ |
| F2 | $4119 / 4096$ |
| F3a, F3b | $4073 / 4096$ |
| F4 | $4089 / 4096$ |
| 2nd stage not used <br> (F5, F6, F7) | $4096 / 4096$ |

Correction formula
Corrected $A / D$ conversion result $=A / D$ conversion result $\times$ Correction coefficient

### 35.6.11 A/D Conversion Monitoring Function Using Monitor Pins

The A/D conversion of the DSADCn can be monitored by the DSADENDn. The DSADENDn pins directly output ADACT of DSADCn. CLBACT is not output. For the pin settings, see Section 2, Pin Function.

Figure $\mathbf{3 5 . 1 2}$ shows an example of $\mathrm{A} / \mathrm{D}$ conversion monitor pin output.

Figure 35.12 Example of A/D Conversion Monitor Pin Output

### 35.6.12 DMA Request Source

The Delta-Sigma ADC generates DMA request sources (DSADIn) to activate the DMAC (without generating an interrupt to the INTC). When the ADIE in DSADCnVCRj is set to 1 , the DSADIn is output at the end of an A/D conversion. When the ADIE in DSADCnADTCR is cleared to 0 , the DSADIn output is disabled even at the end of an A/D conversion.

For DMAC settings, see Section 7, sDMA Controller (sDMAC) and Section 8, DTS Controller.

Figure 35.13 Example of DMA Request Source

### 35.6.13 AD Error Interrupt Request and AD Parity Error Interrupt Request

The Delta-Sigma ADC can generate an AD error interrupt request (DSADEn) to the INTC and an AD parity error interrupt request (DSADPEn) to the ECM (Error Control Module). Any of the error sources for which ULEIE in DSADCnVCRj or IDEIE or OWEIE in DSADCnSFTCR is set to 1 are output as DSADEn. Error sources DSADEn for which ULEIE in DSADCnVCRj or IDEIE or OWEIE in DSADCnSFTCR are set to 0 can be disabled. When PEIE in DSADCnSFTCR is set to 1 , DSADPEn is enabled. When PEIE is set to 0 , DSADPEn is disabled.

Table 35.40 Correspondence between Interrupt Sources and Interrupt Signals

| Status | Interrupt Signal | Interrupt Enable |
| :--- | :--- | :--- |
| LLE | DSADEn | DSADCnVCRj.ULEIE and DSADCnVCRj.VCLLME |
| ULE |  | DSADCnVCRj.ULEIE and DSADCnVCRj.VCULME |
| IDE |  | IDEIE |
|  |  | OWEIE |
| OWE |  | PEIE |

Figure 35.14 Example of an AD Error Interrupt and an AD Parity Error Interrupt

### 35.6.13.1 Upper-Limit/Lower-Limit Errors

These errors indicate that the $\mathrm{A} / \mathrm{D}$ conversion result has exceeded the set value.
When the comparison result between the $\mathrm{A} / \mathrm{D}$ conversion result and the upper-limit/lower-limit table register value (ULTBR0 to ULTBR3.ULMTB[15:0], LLMTB[15:0]) by setting VCULME and VCLLME of DSADCnVCRj is as follows, it is determined as an error.

A/D conversion result > ULMTB[15:0] (When upper-limit table is effective: DSADCnVCRj.VCULME $=1$ )
A/D conversion result $<$ LLMTB [15:0] (When lower-limit table is effective: $\operatorname{DSADCnVCRj}$. VCLLME $=1$ )
Detection of these errors is made each time an $\mathrm{A} / \mathrm{D}$ conversion result is stored.

### 35.6.13.2 Overwrite Error

This error indicates that a new $\mathrm{A} / \mathrm{D}$ conversion result has been overwritten to the data register before the data supplementary information register j ( DSADCnDIRj ) is read.

When the write flag (DSADCnDIRj.WFLG) in the data supplementary information register j is 1 and a new $\mathrm{A} / \mathrm{D}$ conversion result is stored in the relevant data supplementary information register j (DSADCnDIRj), an overwrite error is detected.

### 35.6.13.3 ID Error

This error indicates that the physical channel set by the virtual channel register j ( DSADCnVCRj ) is different from the physical channel in which the A/D conversion was actually performed. In other words, this error indicates the occurrence of a malfunction of the analog switch in the I/O buffer.

The ID error detection result is stored in the ID Error bit in the data supplementary information register j (DSADCnDIRj) corresponding to the virtual channel (DSADCnVCRj) in which an ID error was detected.

The level of the feedback signal from the I/O buffer is checked.
The general control bit (DSADCnVCRj.GCTRL[3:0]) value in the virtual channel register j is compared with the I/O buffer number that is actually activated. If these values do not match, an ID error is detected.

Because the I/O buffer is controlled in a one-hot manner, this error is detected also when the feedback signal is not a one-hot signal.

Either of the following are detected.
(1) Whether the specified physical channel number does not match the activated I/O buffer number
(2) Whether differential inputs of two channels or more or single-ended input I/O buffers are simultaneously activated during an $\mathrm{A} / \mathrm{D}$ conversion (one-hot error)

### 35.6.14 Boundary Flag Generating Signal Output Function

The boundary flag is a level signal that shows whether the input voltage is within the specified voltage range
The Delta-Sigma ADC outputs upper-limit/lower-limit error pulse signals (DSADUEn, DSADLEn) and a virtual channel conversion end pulse signal (DSADCnDSADVCIj) as boundary flag generating signals.

When A/D conversion in a virtual channel that corresponds has ended, a virtual channel conversion end pulse (DSADCnDSADVCIj) is always output in spite of setting for ADIE in DSADCnVCRj.

When setting VCULME in DSADCnVCRj as 1, if upper limit error has been detected, the upper limit error pulse (DSADUEn) is output.

When setting VCLLME in DSADCnVCRj as 1, if lower limit error was detected, the lower limit error pulse (DSADLEn) is output.

A boundary flag is generated by ABFG (ADC Boundary Flag Generator). When using the boundary flag, set VCULME and VCLLME in DSADCnVCRj to 1. For ABFG, see Section 34, Analog to Digital Converter (ADCH)

On the other hand, after every unit is merged ${ }^{* 1}$, a virtual channel conversion end pulse ( DSADCnDSADVCIj )*2 is output to the $\mathrm{GTM}^{* 3}$ as a conversion end pulse (DSADCnDSADCEP).

Note 1. The merging method is OR.
Note 2. DSADCnDSADVClj is output irrespective of the settings for VCULME and VCLLME in DSADCnVCRj.
Note 3. DSADCnDSADCEP is chosen by the PIC (Peripheral Interconnection), and those are forwarded to the GTM. For details, see Section 33, Peripheral Interconnection (PIC).

### 35.6.15 Timestamp Function

The lapsed time from the last results output is stored in the DSADCnTSVAL register at the rising edge timing of the DSADRGTn from timer (ATU, GTM) as timestamp information. This function allows measurement of the time difference between the DSADRGTn and the input sampling time. When RDMA in DSADCnUCR is set to 1 , the DSADIn is output only while the DSADRGTn is asserted.

The DSADIn output is valid only when DSADRGTn from a timer (ATU, GTM) is asserted.
To continuously toggle DSADRGTn while inputting the operation clock, maintain a pulse width (the Low width and the High width) as wide as at least 2 PCLK clocks (register access clock).

Maintain the rising edge interval of DSADRGTn more than 10 clocks (register access clock).
When the rising edge interval of DSADRGTn is below 10 clocks (register access clock), the second and the following time stamp updates at the rising edge timing of DSADRGTn is waited until the former time stamp updating is complete. Therefore, DMAC cannot read updated time stamp values sometimes.

Figure $\mathbf{3 5 . 1 5}$ shows the operation of the timestamp function.

Figure 35.15 Example of the Timestamp Function Operation (RDMA $=1$ )

Figure 35.16 DMA Request by DSADRGTn from the ATU

Figure 35.17
DMA Request by DSADRGTn from the GTM

### 35.6.16 Wiring-Break Detection Function

The wiring-break detection function is used to detect wiring-breaks of DSANn0P/DSANn0N to DSANn3P/DSANn3N.
If a wiring-break is present, the conversion results attenuates to approximately 0 V , and an abnormal value is detected in the conversion results by repeating the $\mathrm{A} / \mathrm{D}$ conversion several times.

This can be determined as detection of wiring-break.
It is not possible to use the wiring-break detection function simultaneously with normal A/D conversion.
Use a wiring-break detection function before normal $\mathrm{A} / \mathrm{D}$ conversion is started or between normal $\mathrm{A} / \mathrm{D}$ conversions.

## [Feature]

(1) Users can select desired physical channels for which wiring-break is to be detected by setting virtual channels.

## [Recommended flow]

(1) Make settings according to the initial settings (Figure 35.4).
(2) Set CNVCLS[1:0] in the virtual channel register j ( DSADCnVCRj ) to $0_{\mathrm{H}}$ and set GCTRL[3:0] to select the desired channels.
(3) Set ODE in the AD control register (DSADCADGCR) to 1.
(4) Set ADST in the AD start control register (DSADCnADSTCR) to 1 , and then perform A/D conversion.
(5) When the read $\mathrm{A} / \mathrm{D}$ conversion results are attenuated to approximately 0 V after repeating $\mathrm{A} / \mathrm{D}$ conversion several times, judge that wiring-break occurred.
(6) Repeat steps (4) to (5) for all channels which have DSADCnVCRj set.

### 35.6.17 Self-Diagnosis

### 35.6.17.1 Self-Diagnosis of Wiring-Break Detection Function

The self-diagnosis function of the wiring-break detection function is used to check that the wiring-break detection function is working normally.

Enable the I/O buffer self-diagnosis and wiring detection of DSANn0P/DSANn0N to DSANn3P/DSANn3N by setting A/D control register (DSADCADGCR), and then perform A/D conversion.

The conversion results attenuates to approximately 0 V , and an abnormal value is detected in the conversion results by repeating the A/D conversion several times.

This means that the wiring-break detection function is normally processed.

## [Feature]

(1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.

## [Recommended flow]

(1) Make settings according to the initial settings (Figure 35.4).
(2) Set CNVCLS[1:0] in the virtual channel register $\mathrm{j}(\mathrm{DSADCnVCRj})$ to $0_{\mathrm{H}}$ and set GCTRL[3:0] to select the desired channels.
(3) Set both ODE and ODDE in the A/D control register (DSADCADGCR) to 1.
(4) Set ADST in the A/D start control register (DSADCnADSTCR) to 1 , and then perform the $\mathrm{A} / \mathrm{D}$ conversion.
(5) When the read $\mathrm{A} / \mathrm{D}$ conversion results are attenuated to approximately 0 V after repeating $\mathrm{A} / \mathrm{D}$ conversion several times, judge that self-diagnosis of wiring-break detection function is working normally.
(6) Repeat steps (4) to (5) for all channels which DSADCnVCRj is set.

### 35.6.17.2 A/D Self-Diagnosis Function

A/D self-diagnosis is used to check that the $\mathrm{A} / \mathrm{D}$ conversion works normally.
If the expectation value does not match the $A / D$ conversion results, there is a possibility that the $A / D$ converter is broken.

The voltage value is set by setting CNVCLS[1:0] of virtual channel register j to $3_{\mathrm{H}}$ and selecting from GCTRL [3:0].
It is possible that $\mathrm{A} / \mathrm{D}$ conversion for ADSVREFH $\times 1, \operatorname{ADSVREFH} \times 1 / 2,-\operatorname{ADSVREFH} \times 1 / 2,-\operatorname{ADSVREFH} \times 1$ or ADSVREFH $\times 0$ is performed.

When using A/D self-diagnosis, set gain $\times 1$ or gain $\times 2$ for high accuracy mode, and set gain $\times 1$, gain $\times 2$ or gain $\times 4$ for high impedance mode.

Settings other than above are prohibited.

## [Setting]

(1) Make settings according to the initial settings (Figure 35.4).
(2) Set CNVCLS[1:0] in the virtual channel register j (DSADCnVCRj) to $3_{\mathrm{H}}$ and set GCTRL[3:0] to select the desired A/D self-diagnosis voltage level.
(3) Make other appropriate settings (Figure 35.4).
(4) Set ADST in the A/D start control register (DSADCnADSTCR) to 1 , and then perform the $\mathrm{A} / \mathrm{D}$ conversion.

### 35.6.17.3 Pin Level Self-Diagnosis Function

Pin level self-diagnosis is the function to diagnose abnormal analog input by applying different voltages and performing A/D conversion for each physical channel.

When using pin level self-diagnosis, set gain $\times 1$.
Settings other than above are prohibited.

## [Analog Input Process]

I/O Buffer to A/D Converter

## [Setting]

Make the settings for A/D control register (DSADCADGCR), virtual channel register j ( DSADCnVCRj ), pin level selfdiagnosis control register (DSADCTDCR) and pin level self-diagnosis level register (DSADCnTDLVR) according to the initial settings.
(1) DSADCADGCR

| ODDE | ODE |
| :--- | :--- |
| 1 | 0 |

(2) DSADCTDCR

```
TDE
```

    1
    (3) DSADCnVCRj

| VCR Number | CNVCLS[1:0] | GCTRL[3:0] |
| :--- | :--- | :--- |
| N | $0_{\mathrm{H}}, 1_{\mathrm{H}}, 2_{\mathrm{H}}$ | Physical Channel Number |

(4) DSADCnTDLVR

| ANOPLV/ANONLV |  |
| :--- | :--- |
| AN1PLV/AN1NLV |  |
| AN2PLV/AN2NLV | Injecting Voltage of <br> AN3PLVIAN3NLV |
| 0 | ADSVSS |
| 1 | ADSVCC |

Perform A/D conversion according to the $\mathrm{A} / \mathrm{D}$ conversion flow.
NOTE
Set ODDE of the A/D control register (DSADCADGCR) to 1 before setting TDE of the pin level self-diagnosis control register (DSADCTDCR) to 1 .
Do not use the pin level self-diagnosis function and wiring-break detection function at the same time.

### 35.6.18 DFE Control

Entry to the DFE or GTM is enabled by setting the DFENT bit in the DSADCnVCRj register to 1. This A/D has two DFE channels and uses one of them. A DFE channel to use can be selected for each A/D unit according to the settings of the DFES bit in the DSADCnUCR register.

### 35.7 Usage Notes

### 35.7.1 Notes on Using Analog Input Pins

Do not perform an $\mathrm{A} / \mathrm{D}$ conversion on the value of the same analog pin simultaneously by the Delta-Sigma ADC and the SAR-ADC. Also, do not allow the Delta-Sigma ADC to perform an A/D conversion on the value of an analog pin currently selected for digital input. This may degrade A/D accuracy.

When the Delta-Sigma ADC is used with a single-ended input, and only the analog input pins on the P side (or N side) of a differential input are used, the analog input pins on the N side (or P side) can be used for other ADC inputs.

### 35.7.2 Module Standby Function

The Delta-Sigma ADC has a module standby function.
Module standby stops the clock supply to DSADC00 and DSADC10 by setting MSR_DAD.MS_DAD00_10. Module standby stops the clock supply to DSADC20 and DSADC12 by setting MSR_DAD.MS_DAD20_12. Module standby stops the clock supply to DSADC13 and DSADC11 by setting MSR_DAD.MS_DAD13_11. Module standby stops clock supply to DSADC (common). For the clock supply stop condition for the DSADC (common), see Table 35.41.

Table 35.41 Clock Supply Stop Condition of DSADC (common) by Module Standby

|  | MSR_DAD. | MSR_DAD. | MSR_DAD. | MSR_CAD. |
| :--- | :--- | :--- | :--- | :--- |
| States | MS_DAD00_10 | MS_DAD20_12 | MS_DAD13_11 | MS_CAD |
| Clock Supply | 0 | 0 or 1 | 0 or 1 | 0 or 1 |
| Clock Supply | 1 | 0 | 0 or 1 | 0 or 1 |
| Clock Supply | 1 | 1 | 0 | 0 or 1 |
| Clock Supply | 1 | 1 | 1 | 0 |
| Clock Supply Stop | 1 | 1 | 1 | 1 |

To prevent a malfunction, do not set the module standby mode during an $\mathrm{A} / \mathrm{D}$ conversion, calibration or while an $\mathrm{A} / \mathrm{D}$ conversion start/end trigger is enabled. Before setting the module standby mode, set the related channels as follows. Also, set module standby mode after maintainings the following state during 10 states of the register access clock:

- DSADCnADSR.ADACT $=0$, and
- DSADCnADSR.CLBACT $=0$, and
- DSADCnADTCR.ENDTRGE $=0$, and
- DSADCnADTCR.STTRGE $=0$

## Section 36 Cyclic Analog to Digital Converter (CADC)

This section contains a description of the Cyclic A/D Converter (CADC).
The first part of this section describes all of the features specific to this product, such as the number of units and register base addresses. The remainder of the section describes the functions and registers of the CADC.

### 36.1 Features

### 36.1.1 Number of Units and Channels

This microcontroller has the following number of CADC units.
Table $36.1 \quad$ Number of Units

| Product Name | RH850/E2x-FCC1, E2M |  |
| :--- | :---: | :---: |
|  | 292 Pins | 373 Pins |
|  | 1 | 1 |
| Number of CADC Channel Units | 1 |  |
| Name of CADC Units | CADC |  |
|  |  | CADCn $(\mathrm{n}=00)$ |

A CADCn unit has the same number of physical channels as the number of $A / D$ input pins. The numbers of channels of individual products are listed below.

Table 36.2 Unit Configurations and Physical Channels

| Unit Name (Number of Channels) <br> CADCn | RH850/E2x-FCC1, E2M |  |
| :--- | :---: | :---: |
|  | 292 Pins | 373 Pins |
| CADC00 | 8 | 8 |

Table 36.3 Unit Configurations and Virtual Channels

| Unit Name (Number of Channels) <br> CADCn | RH850/E2x-FCC1, E2M |  |
| :--- | :---: | :---: |
|  | 292 Pins | 373 Pins |
| CADC00 | 8 | 8 |

Table $36.4 \quad$ Indices

| Index | Description |
| :---: | :---: |
| n | Throughout this section, the individual CADC units are identified by the index " n " ( $\mathrm{n}=00$ ); <br> For example, CADCnCCR indicates the channel control register. |
| X | Throughout this section, the individual analog input attribute at differential input are identified by the index " $x$ " ( $x=$ P, N); for example, CANnx. |
| j | The number of a virtual channel. |

### 36.1.2 Register Base Addresses

The CADC and CADCn base addresses are listed in the following table.
The CADC and CADCn register addresses are given as offsets from the base address in general.
Table 36.5 Register Base Addresses

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <CADC_base> | FFF4 $0000_{\mathrm{H}}$ | Peripheral Group 7 |
| <CADCn_base> | FFF4 $1000_{\mathrm{H}}$ | Peripheral Group 7 |

### 36.1.3 Clock Supply

The CADC and CADCn clock supplies are shown in the following table.
Table 36.6 Clock Supply

| Unit Name | Clock for the Unit | Supply Clock Name |
| :--- | :--- | :--- |
| CADC | ADCLK | CLK_HSB |
|  | Register access clock, PCLK | CLK_LSB |
| CADCn | ADCLK | CLK_HSB |
|  | Register access clock, PCLK | CLK_LSB |

### 36.1.4 Interrupt Requests

The CADCn interrupt requests are listed in the following table.
Table 36.7 Interrupt Requests

|  |  |  | DMA Trigger Number <br> (DMA or DTS) | Other Trigger Signals |
| :--- | :--- | :--- | :--- | :--- |
| CADCn Interrupt Signal | Outline | Interrupt Number |  |  |

Note 1. CADEn and CADIn are chosen by the AIR (ADC Interrupt Router), and those are forwarded to the INTC and DMAC.

For Interrupt Number and DMA Trigger Numbers, see Section 34, Analog to Digital Converter (ADCH).

### 36.1.5 Reset Sources

The CADC and CADCn reset sources are listed in the following table. The CADC and CADCn are initialized by these reset sources.

Table 36.8 Reset Sources

|  |  | Reset Condition |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Unit Name | Register Name | Power Up <br> Reset | System Reset 1 | System Reset 2 | Application Reset | Module Reset | JTAG Reset |
| CADC | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |
| CADCn | All registers | $\checkmark$ | $\checkmark$ | $\checkmark$ | $\checkmark$ | - | - |

### 36.1.6 External Input/Output Signals

The External Input/Output signals of the CADCn are listed below.
Table 36.9 CADC External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| CADCn Common |  | Power supply pin for the analog part |
| ADSVCC | Ground pin for the analog part | ADSVCC |
| ADSVSS | Upper reference voltage pin for the analog part | ADSVSS |
| ADSVREFH | Lower reference voltage pin for the analog part | ADSVREFH |
| ADSVREFL |  | ADSVREFL |

Table 36.10 CADC00 External Input/Output Signals

| Unit Signal Name | Outline | Alternative Port Pin Signal |
| :--- | :--- | :--- |
| CAN000P | Analog input pin (for single-ended/differential P) | CANO00P |
| CAN000N | Analog input pin (for single-ended/differential N ) | CAN000N |
| CAN001P | Analog input pin (for single-ended/differential P ) | CAN001P |
| CAN001N | Analog input pin (for single-ended/differential ) | CAN001N |
| CAN002P | Analog input pin (for single-ended/differential P) | CAN002P |
| CAN002N | Analog input pin (for single-ended/differential N ) | CAN002N |
| CAN003P | Analog input pin (for single-ended/differential P) | CAN003P |
| CAN003N | Analog input pin (for single-ended/differential N) | CAN003N |
| CADTRG00 | External trigger pin | CADTRG00 |
| CADEND00 | A/D conversion timing monitor pin | CADEND00 |

### 36.2 Overview

### 36.2.1 Function Overview

The following describes features (functional overview) of the CADC.

- A/D conversion method: Cyclic method
- Configuration of analog input channels 1 module, 8 analog input channels in total.

CADC00: 8 single-ended inputs (4 differential inputs).
NOTES

1. One differential input can be used as two single-ended inputs.
2. All analog inputs are multiplexed with ADCH analog inputs.

- Input type: Single-ended input and differential input

Single-ended input or differential input can be selected for each virtual channels.
In single-ended mode:
The A/D conversion value format of unsigned 16-bit resolution is generated when ADSVREFL is chosen as the common mode voltage.
Range of the $\mathrm{A} / \mathrm{D}$ conversion value: $0000_{\mathrm{H}}$ to $\mathrm{FFFF}_{\mathrm{H}}$
The A/D conversion value format of signed 15 -bit resolution (15-bit value preceded by the sign bit) is generated when ADSVREFH/2 is chosen as the common mode voltage.
Range of the $\mathrm{A} / \mathrm{D}$ conversion value: $\mathrm{C} 000_{\mathrm{H}}$ to $3 \mathrm{FFF}_{\mathrm{H}}$
In differential mode:
The A/D conversion value format of signed 15 -bit resolution (15-bit value preceded by the sign bit) is generated. Range of the $\mathrm{A} / \mathrm{D}$ conversion value: $8000_{\mathrm{H}}$ to $7 \mathrm{FFF}_{\mathrm{H}}$

- Input gain function (PGA): $\times 1$ only.

Sampling rate: 1 Msps (Fos (Over sampling rate) is 2Msps)

- Pass band: 500 kHz
- Virtual channels

## See Section 36.1.1, Number of Units and Channels.

- Calibration function

The CADC has a calibration function, and the execution of the calibration routine realize a high accuracy A/D conversion.

- Data register

A data register is contained in the data supplementary information register j .

- $\mathrm{A} / \mathrm{D}$ conversion start trigger

Each CADC can start an A/D conversion with software, each timer trigger, or an external trigger (CADTRGn).

- A/D conversion end trigger

Each CADC can terminate an A/D conversion with software, each timer trigger, or an external trigger (CADTRGn).

- Entry to the digital filter engine, and the Generic Timer Module

A/D converted values can be entered directly into the digital filter engine (DFE), or Generic Timer Module (GTM).

Whether to enable or disable DFE entry and a TAG to determine channels for entry can be set for each virtual channel.
For details of DFE, see Section 37, Digital Filter Engine (DFE).
For details of GTM, see Section 31, Generic Timer Module (GTM).

- DMA transfer based on A/D conversion end timing

Each time an A/D conversion ends, each CADC outputs a DMA request on completion of an A/D conversion (CADIn), which can generate DMA request sources (CADIn) to the DMAC or activate the DMAC.

The output of the CADIn is capable of being limited by a read-gate (CADRGTn) from a timer (ATU GTM).
For details of the ATU, see Section 30, ATU-V.
For details of the GTM, see Section 31, Generic Timer Module (GTM).

- Boundary flag output function

It is possible to output a boundary flag generating signal (CADUEn, CADLEn and CADCnVCIj) to the ABFG (ADC Boundary Flag Generator).
For details of the ABFG, see Section 34, Analog to Digital Converter (ADCH).

- AD error interrupt request and AD parity error notification

Each CADC can generate an AD error interrupt request (CADEn) to the INTC and an AD parity error notification (CADPEn) to the ECM (error control module).

- Settable analog conversion voltage range

An analog conversion voltage range can be set using the ADSVREFH pin and the ADSVREFL pin. When performing an $\mathrm{A} / \mathrm{D}$ conversion by using the single-ended input, either ADSVREFL or ADSVREFH/2 is selectable as a common voltage.

- A/D conversion monitor output
$\mathrm{A} / \mathrm{D}$ conversion timing can be output to the $\mathrm{A} / \mathrm{D}$ conversion monitor output pin (CADENDn).
- A wide range of safety functions

A variety of safety functions are provided, including self-diagnosis, pin-level self-diagnosis, wiring-break detection, normality check for analog selection, upper-limit/lower-limit check for data registers, data register parity check for data registers, overwrite check for data registers, and read and clear function for data registers.

### 36.2.2 Block Diagram

The block diagram of the CADC is shown in Figure 36.1.

Figure $36.1 \quad$ Block Diagram of CADC

### 36.3 Registers

### 36.3.1 List of Registers

The CADC registers are listed in the following table.
For detail about $<$ CADC_base $>$ and $<$ CADCn_base $>$, see Section 36.1.2, Register Base Address.
Table 36.11 List of Registers

| Module Name | Register Name | Symbol | Address | Access | Access Protection |
| :---: | :---: | :---: | :---: | :---: | :---: |
| CADC | AD Control Register | CADCADGCR | <CADC_base> + 04 ${ }_{\text {H }}$ | 8 | - |
| CADC | Pin Level Self-Diagnosis Control Register | CADCTDCR | <CADC_base> + $0 \mathrm{C}_{\mathrm{H}}$ | 8 | - |
| CADCn | Virtual Channel Register 0 | CADCnVCR0 | <CADCn_base> + $00{ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 1 | CADCnVCR1 | <CADCn_base> + 04 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 2 | CADCnVCR2 | <CADCn_base> + 08 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 3 | CADCnVCR3 | <CADCn_base> + 0 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 4 | CADCnVCR4 | <CADCn_base> + 10 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 5 | CADCnVCR5 | <CADCn_base> + 14 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 6 | CADCnVCR6 | <CADCn_base> + 18 ${ }_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Register 7 | CADCnVCR7 | <CADCn_base> + 1 $\mathrm{C}_{\mathrm{H}}$ | 8, 16, 32 | - |
| CADCn | Data Supplementary Information Register 0 | CADCnDIR0 | <CADCn_base> + $20_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 1 | CADCnDIR1 | <CADCn_base> + $24_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 2 | CADCnDIR2 | <CADCn_base> + $28{ }_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 3 | CADCnDIR3 | <CADCn_base> + $2 \mathrm{C}_{\mathrm{H}}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 4 | CADCnDIR4 | <CADCn_base> + $30_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 5 | CADCnDIR5 | <CADCn_base> + $34_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 6 | CADCnDIR6 | <CADCn_base> + $38{ }_{\text {H }}$ | 16*1, 32 | - |
| CADCn | Data Supplementary Information Register 7 | CADCnDIR7 | <CADCn_base> + 3 $\mathrm{C}_{\mathrm{H}}$ | 16**, 32 | - |
| CADCn | AD Start Control Register | CADCnADSTCR | <CADCn_base> + 40 ${ }_{\text {H }}$ | 8 | - |
| CADCn | AD Stop Control Register | CADCnADENDCR | <CADCn_base> + 44 ${ }_{\text {H }}$ | 8 | - |
| CADCn | Calibration Start Control Register | CADCnCLBSTCR | <CADCn_base> + 48 ${ }_{\text {H }}$ | 8 | - |
| CADCn | Calibration Stop Control Register | CADCnCLBEDCR | <CADCn_base> + 4 $\mathrm{C}_{\mathrm{H}}$ | 8 | - |
| CADCn | AD Conversion Trigger Control Register | CADCnADTCR | <CADCn_base> + 50 ${ }_{\text {H }}$ | 8 | - |
| CADCn | Unit Control Register | CADCnUCR | <CADCn_base> + $54_{\text {H }}$ | 8, 16, 32 | - |
| CADCn | Virtual Channel Pointer Register | CADCnVCPTRR | <CADCn_base> + 58 ${ }_{\text {H }}$ | 8 | - |
| CADCn | AD Conversion Status Register | CADCnADSR | <CADCn_base> + 60 ${ }_{\text {H }}$ | 8 | - |
| CADCn | Unit Data Pointer Register | CADCnUDPTRR | <CADCn_base> + 64 ${ }_{\text {H }}$ | 8 | - |
| CADCn | Unit Data Supplementary Information Register | CADCnUDIR | <CADCn_base> + 68 ${ }_{\text {H }}$ | 32 | - |

| CADCn | Upper-Limit/Lower-Limit Table Register 1 | CADCnULTBR1 | <CADCn_base> + $84_{\text {H }}$ | 16, 32 | - |
| CADCn | Upper-Limit/Lower-Limit Table Register 2 | CADCnULTBR2 | <CADCn_base> + 88 ${ }_{\text {H }}$ | 16, 32 | - |
| CADCn | Upper-Limit/Lower-Limit Table Register 3 | CADCnULTBR3 | <CADCn_base> + 8C ${ }_{\mathrm{H}}$ | 16, 32 | - |

Note 1. When reading CADCnDIRj in 16-bit units, see Section 36.5.2, CADCnDIRj — Data Supplementary Information Register j.

### 36.4 Cyclic ADC Common Registers

This section describes the registers shared by all of the Cyclic ADC units.

### 36.4.1 CADCADGCR — AD Control Register

CADCADGCR is an 8 -bit read/write register to totally control $\mathrm{A} / \mathrm{D}$ conversion.

## Value after reset: $\quad 00_{\mathrm{H}}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | CADCODDE | CADCODE | - | - | - | CADCUNSND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R/W |

Table 36.12 CADCADGCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7, 6 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 5 | CADCODDE | Wiring-break Detection Function Self-Diagnosis Enable |
|  |  | 0 : Self-diagnosis of the wiring-break detection function is disabled. |
|  |  | 1: Self-diagnosis of the wiring-break detection function is enabled. |
|  |  | When CADCODDE is set to 1 , wiring-break detection function self-diagnosis and pin level selfdiagnosis are enabled. When doing pin level self-diagnosis, set CADCODDE to 1 before setting CADCTDE to 1. |
|  |  | If CADCTDE is set to 1 with CADDCODDE $=0$, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device. |
| 4 | CADCODE | Wiring-break Detection Enable |
|  |  | 0 : Wiring-break detection is disabled. |
|  |  | 1: Wiring-break detection is enabled. |
|  |  | When CADCODE is set to 1, wiring-break detection is enabled for all analog pins. |
|  |  | Setting this bit in 1 simultaneously with pin level self-diagnosis (CADCTDE=1) is prohibited. |
|  |  | When setting CADCADGCR.CADCODE as 1 , if CADCnVCRj.CADCnCNVCLS[1:0] value is set to anything but $0_{\mathrm{H}}, \mathrm{A} / \mathrm{D}$ conversion is prohibited. |
| 3 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCUNSND | Unsigned Conversion Result Output Enable |
|  |  | When unsigned output is enabled in this register, the A/D conversion result (when ADSVREFL is selected for the single-ended common voltage) can be output as an unsigned value. |
|  |  | 0 : A/D conversion result is output as a signed value. |
|  |  | 1: When the single-ended common voltage = ADSVREFL, A/D conversion result is output as an unsigned value.*1 |
|  |  | For details about the difference in the data format for this bit, see Section 36.5.2, CADCnDIRj - Data Supplementary Information Register j. |

Note 1. When the calculation result after correction is a negative value, an $A / D$ conversion result of 0 is output.
NOTE
To prevent a malfunction, set CADCADGCR when CADCnADACT and CADCnCLBACT of the Cyclic ADC $=0$ (before starting A/D conversion) and CADCnSTTRGE of all Cyclic ADCs $=0$.

### 36.4.2 CADCTDCR — Pin Level Self-Diagnosis Control Register

CADCTDCR is an 8-bit read/write register to control pin level self-diagnosis.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CADCTDE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

Table 36.13 CADCTDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCTDE | Pin Level Self-Diagnosis Enable |
|  |  | 0 : Pin level self-diagnosis is disabled. |
|  |  | 1: Pin level self-diagnosis is enabled. |
|  |  | When CADCTDE is set to 1, all analog pins are disconnected from the analog I/O buffer. |
|  |  | When CADCTDE is set to 0 , all analog pins are connected to the analog I/O buffer. |
|  |  | When CADCTDE $=1$, analog pins CANn0x to CANn3x are fixed to the level specified by CADCnTDLVR.AN0xLV to CADCnTDLVR.AN3xLV. By performing A/D conversion in this state and checking the A/D converted value, the path between the analog pins and Cyclic ADC can be diagnosed. |
|  |  | Do not set this bit as 1 simultaneously with CADCODE $=1$ (wiring-break detection enable) and CADCCNVCLS $=3_{\mathrm{H}}$ (A/D self-diagnosis). |
|  |  | When doing pin level self-diagnosis, set CADCODDE to 1 before setting CADCTDE to 1. |
|  |  | If CADCTDE is set to 1 with CADCODDE $=0$, the self-diagnosis pin level voltage is output to the chip pin, which might affect the external circuit of the connected device. |
| NOTE |  |  |
| To prevent a malfunction, set CADCTDCR when CADCnADACT and CADCnCLBACT of the Cyclic ADC $=0$ (before starting A/D conversion) and CADCnSTTRGE of all Cyclic ADCs $=0$. |  |  |

### 36.5 Cyclic ADC Unit-Specific Registers

This section describes the registers provided to control each individual Cyclic ADC unit controller.

### 36.5.1 CADCnVCRj — Virtual Channel Register j

CADCnVCRj is a 32-bit read/write register to control virtual channels.

Table 36.14 CADCnVCRj Register Contents (1/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 28 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 27 | CADCnVCULME | Virtual Channel Upper-Limit Excess Notification Enable |
|  |  | 0 : If the $A / D$ conversion result is greater than the upper limit of the virtual channel, it is not notified. |
|  |  | 1: If the $A / D$ conversion result is greater than the upper limit of the virtual channel, it is notified. |
| 26 | CADCnVCLLME | Virtual Channel Lower-Limit Excess Notification Enable |
|  |  | 0 : If the $A / D$ conversion result is less than lower limit of the virtual channel, it is not notified. <br> 1: If the $A / D$ conversion result is less than lower limit of the virtual channel, it is notified. |

Table 36.14 CADCnVCRj Register Contents (2/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 25, 24 | CADCnVCULLMTBS [1:0] | Virtual Channel Upper-Limit/Lower-Limit Table Register Select <br> These bits select the upper-limit/lower-limit table register to be compared. <br> $0_{H}$ : Upper-limit/lower-limit values are checked by CADCnULTBRO. [Initial value] <br> $1_{\mathrm{H}}$ : Upper-limit/lower-limit values are checked by CADCnULTBR1. <br> 2н: Upper-limit/lower-limit values are checked by CADCnULTBR2. <br> $3_{\mathrm{H}}$ : Upper-limit/lower-limit values are checked by CADCnULTBR3. <br> When the A/D converted value is stored in the CADCnDR, upper-limit/lower-limit values are checked by using the upper-limit value/lower-limit value table. |
| 23 to 16 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 15 | CADCnADIE | Conversion End Interrupt Enable <br> 0 : CADCIn is not output when the CADCnDIRj conversion result is output. <br> 1: CADCIn is output when the CADCnDIRj conversion result is output. |
| 14 | CADCnULEIE | Upper-Limit/Lower-Limit Error Interrupt Enable <br> 0 : CADCEn is not output upon an upper-limit or lower-limit error of CADCnDIRj. <br> 1: CADCEn is output upon an upper-limit or lower-limit error of CADCnDIRj. |
| 13 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 12 | CADCnDFENT | DFE Entry <br> 0 : Entry is not performed. <br> 1: Entry is performed. <br> This bit selects whether or not to perform entry to the DFE (digital filter engine). |
| 11 to 8 | CADCnDFTAG[3:0] | DFE-TAG <br> These bits are used to perform entry to a channel of the DFE for which the TAG is identical to the setting of CADCnDFTAG[3:0]. If the TAG matches the setting of CADCnDFTAG[3:0] for multiple channels, entry to multiple DFE channels is performed. |
| 7, 6 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 5, 4 | CADCnCNVCLS[1:0] | Conversion Type <br> $\mathrm{O}_{\mathrm{H}}$ : Single-ended input, common voltage = ADSVREFL <br> $1_{\mathrm{H}}$ : Single-ended input, common voltage = ADSVREFH/2 <br> $2_{\mathrm{H}}$ : Differential input <br> $3_{\mathrm{H}}$ : Self-diagnosis |

Table 36.14 CADCnVCRj Register Contents (3/3)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 3 to 0 | CADCnGCTRL[3:0] | General Control |
|  |  | These bits set the A/D conversion in each conversion mode. |
|  |  | Single-ended input (CADCnCNVCLS $=0_{\mathrm{H}}, 1_{\mathrm{H}}$ ) |
|  |  | Analog input channels are selected by the CADCnGCTRL[3:0] bits. |
|  |  | $0_{H}$ : CANnOP |
|  |  | $1_{\mathrm{H}}$ : CANnON |
|  |  | 2н: CANn1P |
|  |  | $3_{H}$ : CANn1N |
|  |  | 4H: CANn2P |
|  |  | $5_{\text {H: }}$ : CANn2N |
|  |  | 6н: CANn3P |
|  |  | 7\%: CANn3N |
|  |  | Other than the above: Setting prohibited. |
|  |  | Differential input (CADCnCNVCLS $=2 \mathrm{H}$ ) |
|  |  | Analog input channels are selected by the CADCnGCTRL[3:0] bits. |
|  |  | $0_{\mathrm{H}}$ : CANnOP/CANnON |
|  |  | $1_{\mathrm{H}}$ : Setting prohibited |
|  |  | $2_{\text {H: }}$ : CANn1P/CANn1N |
|  |  | $3_{H}$ : Setting prohibited |
|  |  | 4н: CANn2P/CANn2N |
|  |  | $5_{H}$ : Setting prohibited |
|  |  | $6_{\mathrm{H}}$ : CANn3P/CANn3N |
|  |  | $7_{\mathrm{H}}$ : Setting prohibited |
|  |  | Other than the above: Setting prohibited. |
|  |  | For self-diagnosis (CADCnCNVCLS[1:0] = $3_{H}$ ), a self-diagnosis level is selected by the CADCnGCTRL[3:0] bits. |
|  |  | $7_{\text {H }}$ : ADSVREFH $\times 1$ |
|  |  | 4н: ADSVREFH $\times 1 / 2$ |
|  |  | $0_{H}$ : ADSVREFH $\times 0$ |
|  |  | $\mathrm{C}_{\mathrm{H}}$ : - ADSVREFH $\times 1 / 2$ |
|  |  | $8_{\mathrm{H}}$ : - ADSVREFH $\times 1$ Other than the above: Setting prohibited |

## NOTE

To prevent a malfunction, set CADCnVCRj when CADCnADACT and CADCnCLBACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$. When rewriting this register after A/D conversion stop, change the setting after clearing of CADCnADACT is confirmed by reading CADCnADSR.

### 36.5.2 CADCnDIRj — Data Supplementary Information Register j

CADCnDIRj is a 32-bit read-only register to store $\mathrm{A} / \mathrm{D}$ converted values and their supplementary information. This register is cleared to $00000000_{\mathrm{H}}$ by reading this register when CADCnRDCLRE is set to 1 . Additionally, CADCnUDIR is also cleared to $00000000_{\mathrm{H}}$ by reading this register, which is mirrored to CADCnUDIR when CADCnRDCLRE is set to 1 . The CADCnWFLG bit is cleared by reading this register regardless of the CADCnRDCLRE value.

When reading the CADCnDIRj in16-bit units, invalidate Read-and-Clear-Enable (CADCnSFTCR.CADCnRDCLRE $=$ 0 ) and invalidate the overwriting function*1.

Note 1. The expected value comparison of the CADCnWFLG of CADCnDIRj and Overwrite-Error of the Error-Register is not put into effect, and Overwrite-Error-Interrupt-Enable (CADCnOWEIE) of the Safety-Control-Register (CADCnSFTCR) is 0 (prohibited).

Table 36.15 CADCnDIRj Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 27 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | CADCnIDEF | ID Error |
|  |  | 0 : An error has occurred. |
|  |  | 1: No error has occurred. |
| 25 | CADCnWFLG | Write Flag |
|  |  | Setting condition |
|  |  | Storing an A/D converted value in CADCnDIRj |
|  |  | Clearing condition |
|  |  | Reading CADCnDIRj |
| 24 | CADCnPRTY | Parity |
|  |  | This bit indicates the even parity bit of CADCnDR and CADCnIDEF. |
| 23 to 16 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 15 to 0 | CADCnDR[15:0] | These bits are used to store the A/D converted value. |
|  |  | For the data format, see "Bits 15 to 0 DR Data Register Data Format". |

The setting timing of CADCnIDEF, CADCmWFLG and CADCnPRTY are same timing to set the data register to the $\mathrm{A} / \mathrm{D}$ conversion result (CADCnDR).

If setting and clearing of CADCnIDEF, CADCmWFLG and CADCnPRTY are conflicted, the setting is high priority.

## Bits 15 to 0 DR Data Register Data Format

The A/D converted value is stored in the CADCnDR. The data format of the CADCnDR is shown below. The format of data to be transferred to the DFE (digital filter engine) or the GTM (Generic Timer Module) is in the signed fixed-point format regardless of the UNSND setting.

Signed Fixed-Point Format
(UNSND $=0$ or UNSND $=1$ and CNVCLS[1:0] $\neq 0_{H}$ )

Unsigned Fixed-Point Format
(UNSND = 1 and CNVCLS[1:0] = $0_{H}$ )

| S | : Sign bit |
| :--- | :--- |
| 0 | : Always 0 |

Figure 36.2 DR (Data Register) Data Format 1

| CNVCLS [1:0] | Differential input (2H) |  |

Figure 36.3 DR (Data Register) Data Format 2

### 36.5.3 CADCnADSTCR — AD Start Control Register

CADCnADSTCR is an 8-bit write-only register to control Cyclic ADC start. This register is always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 5 |  | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CADCnADST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.16 CADCnADSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCnADST | A/D Conversion Start |
|  |  | Writing 1 to Conversion start condition with CADCnADST |
|  |  | When 1 is written to this bit while an A/D conversion is already in progress, if the |
|  | CADCnVCEP[2:0] value in CADCnUCR is not $0_{H}$, the ongoing A/D conversion stops and A/D |  |
|  | conversion of the next virtual channel starts. Writing 1 to this bit while ADACT = 1 and |  |
|  | CADCnVCEP[2:0] in CADCnUCR is $0_{H}$ suspends the A/D conversion and repeats the A/D |  |
|  | conversion of virtual channel 0. |  |
|  | When 1 is written to this bit while calibration is in progress, calibration stops and A/D |  |
|  | conversion of the next virtual channel that is indicated by the CADCnVCPTR bit starts. |  |
|  | Writing 0 to this bit is ignored. |  |

## NOTE

It is recommended that a value be written to the CADCnADST bit when CADCnSTTRGE $=0$ and CADCnENDTRGE $=0$. When the external trigger and to write to CADCnADST occurred at the same time, count value of channel isn't sometimes matched with the number of inputs of the trigger.

### 36.5.4 CADCnADENDCR — AD Stop Control Register

CADCnADENDCR is an 8-bit write-only register to control Cyclic ADC stop. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 5 |  | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CADCnADEND |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.17 CADCnADENDCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCnADEND | A/D Conversion End |
|  |  | A/D conversion stop condition with CADCnADEND |
|  |  | Writing 1 to CADCnADEND stops an active A/D conversion. |
|  |  | When A/D conversion is stopped with CADCnVPRSTE $=0$, the virtual channel is incremented. |
|  |  | When A/D conversion is stopped with CADCnVPRSTE $=1$, the virtual channel is cleared to 0 . |
|  |  | Writing 1 to this bit when CADCnADACT $=0$ is ignored. |
|  |  | Writing 0 to this bit is ignored. |
|  |  |  |
|  |  | NOTE: When changing the other register setting after an $A / D$ conversion is stopped, please be sure to confirm that CADCnADACT is 0 . |
| NOTE |  |  |
| It is recommended that a value be written to the CADCnADEND bit when CADCnSTTRGE $=0$ and $C A D C n E N D T R G E=$ 0. |  |  |

### 36.5.5 CADCnCLBSTCR — Calibration Start Control Register

CADCnCLBSTCR is an 8-bit write-only register to control calibration start. This register is always read as 0 .

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 5 |  | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | - | CADCnCLBST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | W |

Table 36.18 CADOnCLBSTCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCnCLBST | Calibration Start |
|  | Calibration start condition with CADCnCLBST |  |
|  | Writing 1 to CADCnCLBST when both calibration and A/D conversion are stopped starts A/D |  |
|  | calibration. |  |
|  | Writing 1 to this bit when calibration is active or A/D conversion is active is ignored. |  |

### 36.5.6 CADCnCLBEDCR — Calibration Stop Control Register

CADCnCLBENDCR is an 8-bit write-only register to control calibration stop. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

Table 36.19 CADCnCLBEDCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 1 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 0 | CADCnCLBEND | Calibration Stop |
|  | Calibration stop condition with CADCnCLBEND |  |
|  | Writing 1 to CADCnCLBEND when calibration is active, stops A/D calibration. |  |
|  | Writing 1 to this bit when calibration is stopped is ignored. |  |
|  | If calibration is terminated by CADCnCLBEND before calibration is completed, the correction |  |
|  | value present before calibration is started is retained. |  |
|  | Writing 0 to this bit is ignored. |  |

### 36.5.7 CADCnADTCR — AD Conversion Trigger Control Register

CADCnADTCR is an 8-bit read/write register to control the Cyclic ADC.

```
Value after reset: }00\mp@subsup{O}{H}{
```

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | CADCn ENDTRGE | CADCnSTTRGE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W |

Table 36.20 CADCnADTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 2 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 1 | CADCnENDTRGE | AD End Trigger Enable |
|  |  | $0: A D$ end trigger $n$ is disabled. |
|  |  | $1: A D$ end trigger $n$ is enabled. |
|  |  | The trigger selection function is used to set the trigger source selection for AD end trigger n . |
|  |  | For details, see Section 33, Peripheral Interconnection (PIC). |
| 0 | CADCnSTTRGE | AD Start Trigger Enable |
|  |  | 0 : AD start trigger $n$ is disabled. |
|  |  | 1: AD start trigger $n$ is enabled. |
|  |  | The trigger selection function is used to set the trigger source selection for AD start trigger n . |
|  |  | For details, see Section 33, Peripheral Interconnection (PIC). |
| NOTE |  |  |

Enable the module standby function when CADCnENDTRGE $=0$ and CADCnSTTRGE $=0$. For details, see Section 36.7.2, Module Standby Function.

### 36.5.8 CADCnUCR — Unit Control Register

CADCnUCR is a 32-bit read/write register to control the cyclic AD units.

Value after reset: $\quad 00000000_{\mathrm{H}}$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | $\begin{gathered} \hline \text { CADCn } \\ \text { VP } \\ \text { RSTE } \end{gathered}$ | CADCn RDMA | - | - | - | - | - | - | - | - | - | - | - | - |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R | R | R | R | R | R | R | R | R |
| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  | - | - | - | - | CADCnDFMT[3:0] |  |  |  | - | - | - | - | - | CADCnVCEP[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 36.21 CADCnUCR Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31, 30 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 29 | CADCnVPRSTE | Virtual Channel Pointer Reset Enable |
|  |  | 0 : The virtual channel pointer is incremented at the end of an A/D conversion by AD end trigger $n$ or CADCnADEND. |
|  |  | 1: The virtual channel pointer is cleared to 0 at the end of an $A / D$ conversion by $A D$ end trigger n or CADCnADEND. |
| 28 | CADCnRDMA | Read Gate DMA Mode |
|  |  | This bit selects the DMA transfer request output condition. |
|  |  | 0 : A DMA transfer request is output for all A/D conversion results. |
|  |  | 1: A DMA transfer request is output for the A/D conversion result only when CADRGTn is being asserted. |
| 27 to 12 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

Table 36.21 CADCnUCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 11 to 8 | CADCnDFMT[3:0] | Data Format |
|  |  | These bits specify the lower bits to be zero-masked (rounded in the $-\infty$ direction). |
|  |  | $\mathrm{O}_{\mathrm{H}}$ : Not masked |
|  |  | $1_{\mathrm{H}}$ : Lower 1 bit masked |
|  |  | 2н: Lower 2 bits masked |
|  |  | $3_{\text {H: }}$ : Lower 3 bits masked |
|  |  | $4_{\text {H: }}$ : Lower 4 bits masked |
|  |  | $5_{\text {H: }}$ Lower 5 bits masked |
|  |  | $6_{\text {н: }}$ : Lower 6 bits masked |
|  |  | 7н: Lower 7 bits masked |
|  |  | 8\%: Lower 8 bits masked |
|  |  | Others: Setting prohibited |
|  |  | The setting of these bits is the format of the data for the CADCnDR, DFE and GTM. |
|  |  | For details of data format, see Section 36.5.2, CADCnDIRj — Data Supplementary Information Register j. |
| 7 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CADCnVCEP[2:0] | End Virtual Channel Pointer |
|  |  | These bits set the end virtual channel number. |
| NOTE |  |  |

To prevent a malfunction, set CADCnUCR when CADCnADACT $=0$ and CADCnCLBACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$.

### 36.5.9 CADCnVCPTRR — Virtual Channel Pointer Register

CADCnVCPTRR is an 8-bit read/write register to monitor the number of the virtual channels in which A/D conversion is in progress.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | CADCnVCPTR[2:0] |  |  |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W |

Table 36.22 CADCnVCPTRR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CADCnVCPTR[2:0] | A/D Conversion Ongoing Virtual Channel Number <br> These bits output the number of virtual channels in which the A/D conversion is in progress. If a value is written to these bits while $A / D$ conversion is not ongoing, the virtual channel number is updated and $A / D$ conversion starts for the channel written at the next conversion start. <br> Writing to these bits during A/D conversion is prohibited. <br> The channel number for which A/D conversion is to be made next is retained during conversion stop or during calibration. <br> A setting exceeding the end pointer is prohibited. <br> When the virtual channel is switched by external trigger or CADCnADST setting, 20 register access cycles are required to update CADCnVCPTR register. |
| NOTE |  |  |
| To prevent a malfunction, set CADCnVCPTRR when CADCnADACT $=0, C A D C n C L B A C T=0$ (before starting A/D conversion) and CADCnSTTRGE, CADCnENDTRGE $=0$. When writing to CADCnVCPTR with external trigger use, it is necessary to stop A/D conversion at the exact timing. When writing to CADCnVCPTR, set CADCnSTTRGE and CADCnENDTRGE as 0 , and confirm CADCnADACT $=0$, or write CADCnADEND $=1$ to ensure that A/D conversion stops. |  |  |

### 36.5.10 CADCnADSR - AD Conversion Status Register

CADCnADSR is an 8-bit read-only register that indicates the Cyclic ADC status.

Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | - | CADCnCLBACT | CADCnADACT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 36.23 CADCnADSR Register Contents
\(\left.\begin{array}{lll}\hline Bit Position \& Bit Name \& Function <br>
\hline 7 to 2 \& Reserved <br>

When read, the value after reset is returned. When writing, write the value after reset.\end{array}\right]\)|  | Calibration Status |
| :--- | :--- |
| 0: Calibration is not ongoing. |  |
| 1 | 1: Calibration is in progress. |

### 36.5.11 CADCnUDPTRR — Unit Data Pointer Register

CADCnUDPTRR is an 8-bit read-only register that indicates the virtual channel number of CADCnUDIR.

## Value after reset: $\quad 00_{H}$

Table 36.24 CADCnUDPTRR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 3 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 2 to 0 | CADCnUDPTR[2:0] | Unit Data Pointer <br> These bits indicate the virtual channel number in which the latest A/D conversion result is <br> stored. |

### 36.5.12 CADCnUDIR — Unit Data Supplementary Information Register

CADCnUDIR is a 32-bit read-only register to output all $\mathrm{A} / \mathrm{D}$ conversion results of CADCn units regardless of the selection of the virtual channel. Except for CADCnCHNUM[2:0] and CADCnUPRTY, this register is a mirror register of CADCnDIRj specified by CADCnUDPTR[3:0]. When CADCnUDIR is read, CADCnWFLG of the actual CADCnDIRj is cleared at the same time. When CADCnRDCLRE is set to 1 , the CADCnDR[15:0], CADCnPRTY, and CADCnIDEF bits in CADCnDIRj register are cleared in addition to the CADCnCHNUM[2:0] and CADCnUPRTY bits in this register.

Table 36.25 CADCnUDIR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 29 | CADCnCHNUM[2:0] | Virtual Channel Number <br> These bits indicate the virtual channel number of CADCnUDR[15:0]. |
| 28,27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 26 | CADCnUIDEF | ID Error |
|  |  | 0: An error is present. |
|  |  | 1: No error is present. |

### 36.5.13 CADCnSMPCR — Sampling Rate Control Register

CADCnSMPCR is a 32-bit read/write register to set the sampling rate.

Value after reset: $00010707_{\mathrm{H}}$

Table 36.26 CADCnSMPCR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 31 to 17 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 16 | CADCnODAV | Output Data Averaging |
|  |  | 0: Data is output without averaging (oversampling rate $=1$ ) |
|  |  | 1: Data is output with averaging (oversampling rate $=2$ ) |
| 15 to 0 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| NOTE |  |  |

To prevent a malfunction, set CADCnSMPCR when CADCnADACT and CADCnCLBACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$.

### 36.5.14 CADCnSFTCR — Safety Control Register

CADCnSFTCR is an 8-bit read/write register for safety control.

Value after reset: $\quad 00_{H}$

| Bi | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CADCnRDCLRE | - | - | - | - | CADCnOWEIE | CADCnPEIE | CADCnIDEIE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R/W | R/W | R/W |

Table 36.27 CADCnSFTCR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | CADCnRDCLRE | Read and Clear Enable |
|  |  | 0 : CADCnDIRj (CADCnUDIR) is not cleared by reading CADCnDIRj (CADCnUDIR). |
|  |  | 1: CADCnDIRj (CADCnUDIR) is cleared by reading CADCnDIRj (CADCnUDIR). |
|  |  | The WFLG of CADCnDIRj (CADCnUDIR) is cleared by reading CADCnDIRj (CADCnUDIR) regardless of the RDCLRE value. |
|  |  | When CADCnUDIR is read after CADCnRDCLRE has been set to 1 , CADCnDIRj which corresponds with CADCnUDPTR is also cleared at the same time. |
|  |  | When CADCnDIRj which corresponds with CADCnUDPTR is read, CADCnUDIR is also cleared at the same time. |
| 6 to 3 | - | Reserved |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |
| 2 | CADCnOWEIE | Overwrite Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
|  |  | The Overwrite Error Interrupt and DMA transfer using CADIn with read-gate cannot be used at the same time. |
|  |  | Because overwrite errors occur in spite of using read gate function, using read gate function and overwrite error function at the same time is prohibited. |
| 1 | CADCnPEIE | Parity Error Interrupt Enable |
|  |  | 0: Disabled |
|  |  | 1: Enabled |
| 0 | CADCnIDEIE | ID Error Interrupt Enable |
|  |  | 0 : Disabled |
|  |  | 1: Enabled |
| NOTE |  |  |

To prevent a malfunction, set CADCnSFTCR when CADCnADACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$.

### 36.5.15 CADCnECR - Error Clear Register

CADCnECR is an 8-bit write-only register to control error clear. This register is always read as 0 .

## Value after reset: $\quad 00_{H}$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| ---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | CADCnULEC | CADCnLLEC | CADCnOWEC | CADCnPEC | - |

Table 36.28 CADCnECR Register Contents

| Bit Position | Bit Name | Function |
| :--- | :--- | :--- |
| 7 to 5 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 4 | CADCnULEC | Upper-Limit Error Clear |
|  | 0: Does not clear the upper-limit error. |  |
|  | 1: Clears the upper-limit error. |  |
| 3 | CADCnLLEC | Lower-Limit Error Clear |
|  |  | 0: Does not clear the lower-limit error. |
|  | 1: Clears the lower-limit error. |  |
| 2 | CADCnOWEC | Overwrite Error Clear |
|  | 0: Does not clear the overwrite error. |  |
|  |  | 1: Clears the overwrite error. |
| 1 | Parity Error Clear |  |
|  | 0: Does not clear the parity error. |  |
|  |  | 1: Clears the parity error. |
| 0 | Reserved |  |
|  |  | When read, the value after reset is returned. When writing, write the value after reset. |

### 36.5.16 CADCnER — Error Register

CADCnER is a 32-bit read-only register that indicates errors.

Table 36.29 CADCnER Register Contents (1/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 | CADCnULE | Upper-Limit Error <br> 0 : No upper-limit error is present. <br> 1: An upper-limit error is present. <br> Setting condition <br> The A/D converted value exceeds the specified upper-limit table range. <br> Clearing condition <br> Writing 1 to CADCnULEC <br> When CADCnLLE is set already, CADCnULE is not set. |
| 30 | CADCnLLE | Lower-Limit Error <br> 0 : No lower-limit error is present. <br> 1: A lower-limit error is present. <br> Setting condition <br> The A/D converted value exceeds the specified lower-limit table range. <br> Clearing condition <br> Writing 1 to CADCnLLEC <br> When CADCnULE was set already, CADCnLLE is not set. |
| 29 to 27 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 26 to 24 | CADCnULECAP[2:0] | Upper-Limit/Lower-Limit Error Capture <br> These bits show the virtual channel number in which an upper-limit or lower-limit error occurred. <br> When writing 1 to CADCnULEC, these bits are cleared to $0_{H}$. |
| 23 | CADCnOWE | Overwrite Error <br> 0 : No overwrite error is present. <br> 1: An overwrite error is present. <br> Setting condition <br> Writing the A/D converted value to CADCnDIRj.DR when CADCnWFLG $=1$ <br> Even if CADCnUDIR.CADCnUDR is overwritten when CADCnUDIR.CADCnUWFLG $=1$, this bit is not set to 1 if CADCnDIRj.CADCnDR is not overwritten. <br> Clearing condition <br> Writing 1 to CADCnOWEC |
| 22 to 19 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |

Table 36.29 CADCnER Register Contents (2/2)

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 18 to 16 | CADCnOWECAP[2:0] | Overwrite Error Capture <br> These bits show the virtual channel number in which an overwrite error occurred. When writing 1 to CADCnOWEC, these bits are cleared to $0_{\mathrm{H}}$. |
| 15 | CADCnPE | Parity Error <br> 0 : No parity error is present. <br> 1: A parity error is present. Setting condition <br> A parity error is detected. <br> Clearing condition <br> Writing 1 to CADCnPEC |
| 14 to 11 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| 10 to 8 | CADCnPECAP[2:0] | Parity Error Capture <br> These bits show the virtual channel number in which a parity error occurred. When writing 1 to CADCnPEC, these bits are cleared to $0_{H}$. <br> When a parity error occurred in CADCnUDIR, these bits indicate the number of CADCnCHNUM. |
| 7 to 0 | - | Reserved <br> When read, the value after reset is returned. When writing, write the value after reset. |
| NOTE |  |  |

The CADCnULE and CADCnOWE bits are updated when an A/D converted value is written to the CADCnDIR.
The CADCnPE bit is updated when the CADCnDIR is read.
When an AD error interrupt request is generated, read the CADCnER and check for the "1" bits in the interrupt exception handling, and then clear them to 0 by using the corresponding clear bits in the CADCnECR.

When an error bit is not cleared and an error occurs during the next $A / D$ conversion, the following operation takes place and the error cannot be detected or identified.
(1) When the same error (error bit = 1 ) occurs:

No $A D$ error interrupt request is made.
The relevant error bit in the CADCnER remains 1.
CADCnULE and CADCnLLE are treated as the same error.
(2) When a different error (error bit $=0$ ) occurs:

An AD error interrupt request is made.
The error bit that was generated in the previous A/D conversion remains 1 and the relevant error bit in the CADCnER is set to 1 .

CADCnULE and CADCnLLE are treated as the same error.

### 36.5.17 CADCnTDLVR — Pin Level Self-Diagnosis Level Register

CADCnTDLVR is a 8 -bit readable/writable register to specify pin level self-diagnosis levels.

## Value after reset: $\quad 00_{H}$

Table 36.30 CADCnTDLVR Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 7 | CADCnAN3NLV | Pin Level Self-Diagnosis Level of CANn3N <br> 0 : CANn3N is discharged (ADSVSS). <br> 1: CANn3N is charged (ADSVCC). |
| 6 | CADCnAN3PLV | Pin Level Self-Diagnosis Level of CANn3P <br> 0 : CANn3P is discharged (ADSVSS). <br> 1: CANn3P is charged (ADSVCC). |
| 5 | CADCnAN2NLV | Pin Level Self-Diagnosis Level of CANn2N <br> 0 : CANn2N is discharged (ADSVSS). <br> 1: CANn2N is charged (ADSVCC). |
| 4 | CADCnAN2PLV | Pin Level Self-Diagnosis Level of CANn2P <br> 0 : CANn2P is discharged (ADSVSS). <br> 1: CANn2P is charged (ADSVCC). |
| 3 | CADCnAN1NLV | Pin Level Self-Diagnosis Level of CANn1N <br> $0:$ CANn1N is discharged (ADSVSS). <br> 1: CANn1N is charged (ADSVCC). |
| 2 | CADCnAN1PLV | Pin Level Self-Diagnosis Level of CANn1P <br> $0:$ CANn1P is discharged (ADSVSS). <br> 1: CANn1P is charged (ADSVCC). |
| 1 | CADCnANONLV | Pin Level Self-Diagnosis Level of CANnON <br> 0 : CANnON is discharged (ADSVSS). <br> 1: CANnON is charged (ADSVCC). |
| 0 | CADCnANOPLV | Pin Level Self-Diagnosis Level of CANnOP <br> 0 : CANnOP is discharged (ADSVSS). <br> 1: CANnOP is charged (ADSVCC). |
| NOTE |  |  |

To prevent a malfunction, set CADCnTDLVR when CADCnADACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$.

### 36.5.18 CADCnULTBR0/1/2/3 — Upper-Limit/Lower-Limit Table Register 0/1/2/3

CADCnULTBR0 to CADCnULTBR3 are 32-bit readable/writable registers to set upper-limit and lower-limit values of $\mathrm{A} / \mathrm{D}$ converted values.

Table 36.31 CADCnULTBR0/1/2/3 Register Contents

| Bit Position | Bit Name | Function |
| :---: | :---: | :---: |
| 31 to 16 | CADCnULMTB[15:0] | Upper-Limit Table |
|  |  | These bits specify the upper-limit value of the A/D converted value. When the following condition is met, CADCnULE (upper-limit error) is set to 1. |
|  |  | ULMTB[15:0] < A/D converted value |
|  |  | The ULMTB[15:0] format is the same as the DR format. For unsigned format, the value is compared as unsigned. A/D converted values are compared by using the values before they are masked by DFMT[3:0]. |
| 15 to 0 | CADCnLLMTB[15:0] | Lower-Limit Table |
|  |  | These bits specify the lower-limit value of the A/D converted value. When the following condition is met, CADCnLLE (lower-limit error) is set to 1 |
|  |  | LLMTB[15:0] > A/D converted value |
|  |  | The LLMTB[15:0] format is the same as the DR format. For unsigned format, the value is compared as unsigned. A/D converted values are compared by using the values before they are masked by DFMT[3:0]. |
| NOTE |  |  |

To prevent a malfunction, set CADCnULTBR0/1/2/3 when CADCnADACT $=0$ (before starting A/D conversion) and CADCnSTTRGE $=0$.

### 36.6 Operation

### 36.6.1 A/D Conversion Flow

The Cyclic ADC starts A/D conversion by setting the registers shown in Figure 36.4.

Note 1. When using hardware triggers, set pin functions by using the PFC/trigger selection function and then set CADCnADTCR.

Figure 36.4 A/D Conversion Flow

### 36.6.2 A/D Conversion time

The Cyclic ADC starts A/D conversion processing immediately after the ADST bit in ADSTCR is set to 1 .
Figure 36.5 shows the $\mathrm{A} / \mathrm{D}$ conversion start timing and end timing. Figure 36.6 and Figure $\mathbf{3 6 . 7}$ show the budget of A/D conversion processing. The first $A / D$ processing time ( $\mathrm{t} A \mathrm{D}$ ) includes the $\mathrm{A} / \mathrm{D}$ conversion start delay time (tD), the internal stabilization time ( tW ), and the result calculation processing delay time ( tDF ). Subsequent $\mathrm{A} / \mathrm{D}$ conversion processing time ( tAD ) is the sampling period (tS). Table $\mathbf{3 6 . 3 2}$ shows $\mathrm{A} / \mathrm{D}$ conversion processing time.
$\mathrm{A} / \mathrm{D}$ conversion processing time ( tAD ) is calculated by the following formula.
First $A / D$ processing time $t A D=t D+t W+t D F$
Subsequent $A / D$ processing time $t A D=t S$
Table 36.32 Conversion Time (When Register Access Clock $=40 \mathrm{MHz}$, ADCLK $=80 \mathrm{MHz}$, Unit: Register Access
Clocks)

| Item | Without averaging | With averaging |
| :--- | :--- | :--- |
| tAD | 907 | 927 |
|  | to913 | to 933 |
| tD | 18 to 22 | 18 to 22 |
| tW | 840.5 to 842.5 | 840.5 to 842.5 |
| tDF | 48.5 | 68.5 |
| tS | 20 | 40 |

Note: PCLK means register access clock. CYCLK80M means ADCLK.
CYCLK16M is the $1 / 5$ frequency divided clock of ADCLK.

Figure 36.5 A/D Conversion Start and End

Figure 36.6 Budget of A/D Conversion Processing (CADCnODAV =0)

Figure 36.7 Budget of A/D Conversion Processing (CADCnODAV =1)

### 36.6.3 Starting an A/D Conversion by External Triggers

A CADCn A/D conversion can be started by a CADTRGn input. To start a CADCn by a CADTRGn, input a high level to CADTRGn, and then set CADCnSTTRGE in CADCnADTCR to 1 . When a low level is input to CADTRGn in this state, the CADCn detects a pulse falling edge and sets CADCnADACT to 1 .

Figure 36.8 shows the external trigger input timing. CADCnADACT is set to 1 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the CADTRGn falling edge is sampled.

The timing after CADCnADACT is set to 1 until CADCn is started is the same as when the CADCnADST is set to 1 by the software. For pin functions, see Section 2, Pin Function. For selecting the AD start trigger n source, see Section 33, Peripheral Interconnection (PIC).

Figure 36.8 External Trigger Input Timing

### 36.6.4 Terminating an A/D Conversion via an External Trigger

A CADCn conversion can be terminated via a CADTRGn input. To terminate a CADCn conversion via a CADTRGn, set pin functions by using the PFC (pin function controller) and select the AD end trigger n source by using the trigger selection function. Input a high level to CADTRGn, and then set CADCnENDTRGE in CADCnADTCR to 1 . When a low level is input to CADTRGn in this state, CADCn detects a pulse falling edge and clears CADCnADACT to 0 to terminate the CADCn conversion.

CADCnADACT is cleared to 0 in 3 to 4 states of the ADCLK and 2 to 3 states of the register access clock after the CADTRGn falling edge is sampled.

For pin functions setting, see Section 2, Pin Function. For selecting AD end trigger n source, see Section 33, Peripheral Interconnection (PIC).

To terminate $\mathrm{A} / \mathrm{D}$ conversion via an external trigger, input an external trigger when $\mathrm{CADCnADACT}=1$. If an external trigger is input when CADCnADACT $=0$, the external trigger is ignored.

### 36.6.5 Starting an A/D Conversion via a Timer Trigger

A CADCn conversion can be started via an arbitrary timer trigger. To start a CADCn conversion via a timer trigger, select a timer trigger as an AD start trigger n source by using the trigger selection function. Set CADCnSTTRGE in CADCnADTCR to 1 .

When the selected timer trigger is input in this state, CADCnADACT is set to 1 . The timing after CADCnADACT is set to 1 until the CADCn conversion is started is the same as the case where CADCnADST is set to 1 by the software.

For selecting the AD start trigger n source, see Section 33, Peripheral Interconnection (PIC).
To stop CADCn conversion, write 1 to CADCnADEND.

### 36.6.6 Terminating an A/D Conversion via a Timer Trigger

A CADCn conversion can be terminated via an arbitrary timer trigger. To terminate a CADCn conversion via a timer trigger, select a timer trigger as an $A D$ end trigger $n$ source by using the trigger selection function. Set CADCnENDTRGE in CADCnADTCR to 1.

When the selected timer trigger is input in this state, CADCnADACT is cleared to 0 to terminate CADCn.
For selecting the AD end trigger n source, see Section 33, Peripheral Interconnection (PIC).
To terminate $\mathrm{A} / \mathrm{D}$ conversion via a timer trigger, input a timer trigger when $\mathrm{CADCnADACT}=1$. If a timer trigger is input when $\mathrm{CADCnADACT}=0$, the timer trigger is ignored.

### 36.6.7 Switching Virtual Channels via Start and End Triggers

When the CADCnVCEP[2:0] bits in the CADCnUCR register are set to a channel other than 0 , they are incremented $(+)$ at each input of an external trigger (start trigger or stop trigger) or a software trigger (start trigger or stop trigger) during A/D conversion. Virtual channels can be sequentially switched from CADCnVCR0 to CADCnVCRj ( $\mathrm{j}=$ CADCnVCEP[2:0] set value) for A/D conversion by inputting a trigger continuously at constant intervals over ADCLK x 1 cycle from the external timer. In addition, when start or end pulse inputting interval is less than ADCLK x 1 cycle, switching virtual channels cannot operate correctly. When CADCnVPRSTE is set to 1 , virtual channels always return to CADCnVCR0 at a stop trigger. By using this operation, an A/D conversion can also be started from any CADCnVCRj by continuously generating a start trigger after a stop trigger. If a trigger is input during $\mathrm{A} / \mathrm{D}$ conversion of the channel set by CADCnVCEP[2:0], the channel returns to CADCnVCR0 again, and then $\mathrm{A} / \mathrm{D}$ conversion is performed.

Figure 36.9 to Figure 36.11 show examples of normal virtual channel switching made by a start trigger and an end trigger.

Figure 36.9 Switching Virtual Channels via a Start Trigger

Figure 36.10 Switching Virtual Channels via an End Trigger (VPRSTE =0)

Figure 36.11 Switching Virtual Channels via an End Trigger (VPRSTE = 1)

### 36.6.8 A/D Conversion Monitoring Function Using Monitor Pins

A/D conversion of the CADCn can be monitored by the CADENDn. CADENDn pins directly output CADCnADACT of unit n. For the pin settings, see Section 2, Pin Function.

Figure $\mathbf{3 6 . 1 2}$ shows an example of $\mathrm{A} / \mathrm{D}$ conversion monitor pin output.

Figure 36.12 Example of A/D Conversion Monitor Pin Output

### 36.6.9 DMA Request Sources

The Cyclic ADC generates DMA request sources (CADIn) to activate the DMAC (without generating an interrupt to the INTC). When the CADCnADIE in CADCnVCRj is set to 1 , the CADIn is output at the end of the $A / D$ conversion. When the CADCnADIE in CADCnVCRj is cleared to 0 , the CADIn output is disabled even at the end of the $\mathrm{A} / \mathrm{D}$ conversion.

For the DMAC settings, see Section 7, sDMA Controller (sDMAC).

Figure 36.13 Example of DMA Request Source

### 36.6.10 AD Error Interrupt Request and AD Parity Error Interrupt Request

The Cyclic ADC can generate an AD error interrupt request (CADEn) to the INTC and an AD parity error interrupt request (CADPEn) to the ECM (error control module). If CADCnULEIE in CADCnVCRj, or CADCnIDEIE or CADCnOWEIE in CADCnSFTCR, is set to 1 , that can be an error source, CADEn. If CADCnULEIE in CADCnVCRj, or CADCnIDEIE or CADCnOWEIE in CADCnSFTCR, is set to 0 , that cannot be an error source, CADEn. When CADCnPEIE in CADCnSFTCR is set to 1 , CADPEn is enabled. When CADCnPEIE is set to 0 , CADPEn is disabled.

Table 36.33 Correspondence between Interrupt Sources and Interrupt Signals

| Status | Interrupt Signal | Interrupt Enable |  |
| :--- | :--- | :--- | :---: |
| CADCnLLE | CADEn | CADCnVCRj.CADCnULEIE and CADCnVCRj.CADCnVCLLME |  |
| CADCnULE |  | CADCnVCRj.CADCnULEIE and CADCnVCRj.CADCnVCULME <br> CADCnIDE |  |
| CADCnIDEIE |  |  |  |
| CADCnOWE |  | CADCnOWEIE |  |

Figure 36.14 Example of AD Error Interrupt and AD Parity Error Interrupt

## Upper-limit/lower-limit errors

These errors indicate that the $\mathrm{A} / \mathrm{D}$ conversion results exceeded the set value.
When the comparison result between the $\mathrm{A} / \mathrm{D}$ conversion result and the upper-limit/lower-limit table register value (CADCnULTBR0 to CADCnULTBR3.CADCnULMTB[15:0], CADCnLLMTB[15:0]) by CADCnVCULME and CADCnVCLLME is as follows, it is determined to be an error.
$\mathrm{A} / \mathrm{D}$ conversion result $>$ CADCnULMTB[15:0] (When upper-limit table is enabled: $\mathrm{CADCnVCULME}=1$ )
A/D conversion result < CADCnLLMTB[15:0] (When lower-limit table is enabled: CADCnVCLLME $=1$ )
Detection of these errors is made each time the $\mathrm{A} / \mathrm{D}$ conversion result is stored.

## Overwrite error

This error indicates that a new $\mathrm{A} / \mathrm{D}$ conversion result was overwritten to the data register before the data supplementary information register j (CADCnDIRj) was read.

When the write flag (CADCnDIRj.CADCnWFLG) in the data supplementary information register j is 1 and a new $\mathrm{A} / \mathrm{D}$ conversion result is stored in the relevant data supplementary information register j ( CADCnDIRj ), an overwrite error is detected.

## ID error

This error indicates that the physical channel set by the virtual channel register $\mathrm{j}(\mathrm{CADCnVCRj})$ is different from the physical channel upon which $\mathrm{A} / \mathrm{D}$ conversion was actually performed, that is, this error indicates the occurrence of a malfunction of the analog switch in the I/O buffer.

The ID error detection result is stored in the ID Error bit in the data supplementary information register j (CADCnDIRj) corresponding to the virtual channel (CADCnVCRj) in which an ID error was detected.

The level of the feedback signal from the I/O buffer is checked.
The general control bit (CADCnVCRj.CADCnGCTRL[3:0]) value in the virtual channel register j is compared with the I/O buffer number that is actually activated. If these values do not match, an ID error is detected.

Because the I/O buffer is controlled in a one-hot manner, this error is detected also when the feedback signal is not a one-hot signal.

Either of the following are detected:
(1) Whether the specified physical channel number does not match the activated I/O buffer number
(2) Whether differential inputs of two or more channels or single-ended input I/O buffers are simultaneously activated during $\mathrm{A} / \mathrm{D}$ conversion (one-hot error)

### 36.6.11 Boundary Flag Output Function

The boundary flag is a level signal that shows whether the input voltage is within the specified voltage range.
The Cyclic ADC outputs upper-limit/lower-limit error pulse signals (CADUEn, CADLEn) and a virtual channel conversion end pulse signal (CADCnVCIj) as boundary flag generating signals. A virtual channel conversion end pulse signal (CADCnVCIj) is always output in spite of CADCnADIE setting when corresponding virtual channel conversion is finished. CADUEn is output when an upper limit error is detected while CADCnVCULME is set to 1 . CADLEn is output when a lower limit error is detected while CADCnVCLLME is set to 1 . A boundary flag is generated by the ABFG (ADC Boundary Flag Generator). When using the boundary flag, set VCULME and VCLLME in CADCnVCRj to 1. For the ABFG, see Section 34, Analog to Digital Converter (ADCH).

And after being merged ${ }^{* 1}$, a virtual channel conversion end pulse ( CADCnVCIj$)^{* 2}$ is output to the GTM as a conversion end pulse (CADCnCADCEP)*3.

Note 1. The merging method is OR.
Note 2. CADCnVClj is output irrespective of the setting for VCULME and VCLLME in CADCnVCRj.
Note 3. CADCnCADCEP is chosen by the PIC (Peripheral Interconnection), and those are forwarded to the GTM. For details, see Section 33, Peripheral Interconnection (PIC).

### 36.6.12 Read Gate Function

When CADCnUCR.RDMA is set to 1 , CADIn is output only while CADRGTn is asserted.
Figure 36.15 shows a schematic of the DMA request circuit having a read gate from the ATU.
Figure $\mathbf{3 6 . 1 6}$ shows a schematic of the DMA request circuit having a read gate from the GTM.

Figure 36.15 DMA Request by CADRGTn from the ATU

Figure 36.16 DMA Request by CADRGTn from the GTM

### 36.6.13 Wiring-break Detection Function

The wiring-break detection function is a function that can detect the wiring-breaks for the CAN000P-
CAN003P/CAN000N-CAN003N. When A/D conversion is repeated, the conversion result attenuates to approximately 0 V and the abnormal value is detected, which means a wiring-break is detected.

This can be determined as detection of wiring-break.
It is not possible to use the wiring-break detection function simultaneously with normal $\mathrm{A} / \mathrm{D}$ conversion.
Use a wiring-break detection function before normal $\mathrm{A} / \mathrm{D}$ conversion is started or between normal $\mathrm{A} / \mathrm{D}$ conversions.

## [Feature]

1) Users can select desired physical channels for which wiring-break is to be detected by setting virtual channels.

## [Recommended flow]

1) Make settings according to the initial value (see Figure 36.4)
2) Set the CADCnVCRj register for $\operatorname{CADCnCNVCLS}[1: 0]=0_{\mathrm{H}}$ and for arbitrary physical channel by CADCnGCTRL[3:0].
3) Set the CADCODE bit to 1 .
4) Execute the $\mathrm{A} / \mathrm{D}$ conversion with the CADCnADST bit setting.
5) After repeating the $A / D$ conversion, read the results of the $A / D$ conversion value. When the value attenuates to approximately 0 V , it is detected as a wiring-break.
6) Repeat steps 4) and 5) until the conversion is finished for all the channels.

### 36.6.14 Self-Diagnosis Function

There are three self-diagnosis functions for CADC.

### 36.6.14.1 Self-Diagnosis of Wiring-break Detection Function

The self-diagnosis function of wiring-break detection function is used to check that the wiring-break detection function is working normally.

Enable the wiring-break detection function and I/O buffer self-diagnosis of CAN000P-CAN003P/CAN000N-
CAN003N input by CADCADGCR setting, then perform A/D conversion. When A/D conversion is repeated and the $\mathrm{A} / \mathrm{D}$ conversion result attenuates to approximately 0 V , wiring-break detection works correctly.

## [Feature]

1) Users can select desired physical channels for which self-diagnosis of wiring-break detection function is performed by setting virtual channels.

## [Recommended flow]

1) Make settings according to the initial value (see Figure 36.4)
2) Set the CADCnVCRj register for $\mathrm{CADCnCNVCLS}[1: 0]=0_{\mathrm{H}}$ and for arbitrary physical channel by CADCnGCTRL[3:0].
3) Set CADCODE and CADCODDE bit to 1 .
4) Execute the $\mathrm{A} / \mathrm{D}$ conversion with the CADCnADST bit setting.
5) After repeating the $A / D$ conversion, read the result of $A / D$ conversion value. When the value attenuates to approximately 0 V , it is detected as a wiring break.
6) Repeat steps 4) and 5) until the conversion is finished for all the channels.

### 36.6.14.2 A/D Converter Self-Diagnosis Function

AD self-diagnosis can check that $\mathrm{A} / \mathrm{D}$ conversion is working normally. When the $\mathrm{A} / \mathrm{D}$ conversion result differs from the expecting result, $\mathrm{A} / \mathrm{D}$ converter have some potential of failure. The voltage value is set by setting CNVCLS[1:0] of virtual channel register j to $3_{\mathrm{H}}$ and selecting from GCTRL[3:0]. It is possible that $\mathrm{A} / \mathrm{D}$ conversion of ADSVREFH x 1 , ADSVREFH x $1 / 2$, - ADSVREFH x $1 / 2,-$ ADSVREFH x 1 or ADSVREFH x 0 is performed.

## [Setting]

1) Make settings according to the initial value (see Figure 36.4)
2) Set CADCnCNVCLS[1:0] in the virtual channel register $\mathrm{j}(\mathrm{CADCnVCRj})$ to $3_{\mathrm{H}}$ and set $\mathrm{CADCnGCTRL}[3: 0]$ to select desired AD self-diagnosis voltage level.
3) According to the initial setting flow (see Figure 36.4), make the other needed setting for $\mathrm{A} / \mathrm{D}$ conversion.
4) Execute the $\mathrm{A} / \mathrm{D}$ conversion with the CADCnADST bit setting.

### 36.6.14.3 Pin Level Self-Diagnosis Function

Pin level self-diagnosis can check the analog input path with an A/D conversion by inputting the different voltage levels of each physical channel. When the $A / D$ conversion result is not static, $A / D$ converter have some potential of failure.

## [Analog Input Process]

I/O Buffer to A/D Converter

## [Setting]

Make the settings for $A / D$ control register (CADCADGCR), virtual channel register j (CADCnVCRj), pin level selfdiagnosis control register (CADCTDCR) and pin level self-diagnosis level register (CADCnTDLVR) according to the initial settings.
(1) CADCADGCR

> CADCODDE CADCODE

10
(2) CADCTDCR

CADCTDE
1
(3) CADCnVCRj

| VCR Number | CADCnCNVCLS[1:0] | CADCnGCTRL[3:0] |
| :--- | :--- | :--- |
| N | $0_{\mathrm{H}}, 1_{\mathrm{H}}, 2_{\mathrm{H}}$ | Physical Channel Number |

(4) CADCnTDLVR

| ANOPLV/ANONLV |  |
| :--- | :--- |
| AN1PLV/AN1NLV |  |
| AN2PLV/AN2NLV | Injecting Voltage of |
| AN3PLV/AN3NLV | ADSVsical Channel |
| 0 | ADSVCC |
| 1 |  |

Execute the A/D conversion with the A/D conversion flow.
Note 1: Set CADCODDE bit to 1 before setting the CADCTDE bit to 1 .
Note 2: When CADCTDE $=1$, do not set CADCODE bit to 1 .

### 36.6.15 DFE Control

Entry to DFE or GTM is enabled by setting the CADCnDFENT bit in the CADCnVCRj register to 1 .
For allocation of each CADCn and each channel of DFE, see Section 37, Digital Filter Engine (DFE).
For allocation of each CADCn and each channel of GTM, see Section 31, Generic Timer Module (GTM).

### 36.7 Usage Notes

### 36.7.1 Notes on Using Analog Input Pins

Do not perform an $\mathrm{A} / \mathrm{D}$ conversion on the value of the same analog pin simultaneously with the Cyclic ADC and SARADC. Also, do not allow the Cyclic ADC to perform A/D conversion on the value of an analog pin currently selected for digital input. This may diminish A/D accuracy.

When the Cyclic ADC is used with a single-ended input, and only the analog input pins on the P side (or N side) of a differential input are used, the analog input pins on the N side (or P side) can be used for other ADC inputs.

### 36.7.2 Module Standby Function

The Cyclic ADC has a module standby function.
Module standby stops the clock supply to CADC00 by setting MSRCAD.MS_CAD.
Module standby stops the clock supply to CADC (common). For the clock supply stop condition of the CADC (common), see Table 36.34.

Table 36.34 Clock Supply Stop Condition of CADC (common) by Module Standby

|  | MSR_DAD. | MSR_DAD. | MSR_DAD. | MSR_CAD. |
| :--- | :--- | :--- | :--- | :--- |
| States | MS_DAD00_10 | MS_DAD20_12 | MS_DAD13_11 | MS_CAD |
| Clock Supply | 0 | 0 or 1 | 0 or 1 | 0 or 1 |
| Clock Supply | 1 | 0 | 0 or 1 | 0 or 1 |
| Clock Supply | 1 | 1 | 0 | 0 or 1 |
| Clock Supply | 1 | 1 | 1 | 0 |
| Clock Supply Stop | 1 | 1 | 1 | 1 |

To prevent a malfunction, do not set module standby mode during A/D conversion or during calibration or while A/D conversion start/end trigger is enabled. Before setting module standby mode, set the related channels as follows, and wait for 10 states of the register access clock.

- CADCnADSR.CADCnADACT $=0$
- CADCnADSR.CADCnCLBACT $=0$
- CADCnADTCR.CADCnENDTRGE $=0$
- CADCnADTCR.CADCnSTTRGE $=0$

## Section 37 Digital Filter Engine (DFE)

This section contains a description of the Digital Filter Engine (DFE) and DFE FIFO.
The first part in this section describes the features specific to this product, including register base addresses and input/output signals. The subsequent sections describe the functions and registers of DFE and DFE FIFO.

### 37.1 Features

### 37.1.1 Units and Channels

This microcontroller has following number of units and channels for the Digital Filter Engine (DFE) and DFE FIFO.
Table $37.1 \quad$ Number of Units for DFE

| Product Name | RH850/E2x-FCC1 |  |
| :---: | :---: | :---: |
|  | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Unit Name | DFEj ( $\mathrm{j}=0,1$ ) | DFEj ( $\mathrm{j}=0,1$ ) |
|  |  | 0/E2M |
| Product Name | 373 Pins | 292 Pins |
| Number of Units | 2 | 2 |
| Unit Name | DFEj (j = 0,1) | DFEj ( $\mathrm{l}=0,1$ ) |

Table 37.2 Number of Units for DFE FIFO

| Product Name | RH850/E2x-FCC1 |  |
| :---: | :---: | :---: |
|  | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Unit Name | DFE FIFO | DFE FIFO |
|  |  | 0/E2M |
| Product Name | 373 Pins | 292 Pins |
| Number of Units | 1 | 1 |
| Unit Name | DFE FIFO | DFE FIFO |

Table 37.3 Number of Channels

| DFEj | Number of Channels |
| :--- | :--- |
| DFE0 | 12 |
| DFE1 | 4 |

Table $37.4 \quad$ Index

| Index | Description |
| :--- | :--- |
| j | The individual DFE units are identified by the index " j " $(\mathrm{j}=0,1)$. |

### 37.1.2 Register Base Address

The DFE and DFE FIFO base addresses are listed in the following table.
The DFE and DFE FIFO register addresses are given as offsets from the base address.
Table 37.5 Register Base Address

| Base Address Name | Base Address | Bus Group |
| :--- | :--- | :--- |
| <DFE0_base> | FFBF $0000_{\mathrm{H}}$ | Peripheral Group 5 |
| <DFE1_base> | FFBF $4000_{\mathrm{H}}$ | Peripheral Group 5 |
| <DFE_FIFO_base> | FFBF $8000_{\mathrm{H}}$ | Peripheral Group 5 |

### 37.1.3 Clock Supply

The DFE and DFE FIFO clock supplies are shown in the following table.
Table 37.6 Clock Supply
