Notes: 1. Transition is measured ±200mV from steady voltage with output load (B). This parameter is sampled and not 100% tested.

2. If the CS# or LB# or UB# low transition occurs simultaneously with the WE# low transition or after the WE# transition, output remains a high impedance state.

3. WE# and/or CS# must be high during address transition time.

4. If CS#, OE#, LB# and UB# are low during this period, I/O pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.

5. t_{AS} is measured from the latest address transition to the latest of CS#, WE#, LB# or UB# going low.

6. t_{WR} is measured from the earliest of CS#, WE#, LB# or UB# going high to the first address transition.

7. A write occurs during the overlap of a low CS#, a low WE# and a low LB# or a low UB# (t_{WP}). A write begins at the latest transition among CS# going low, WE# going low and LB# going low or UB# going low. A write ends at the earliest transition among CS# going high, WE# going high and LB# going high or UB# going high.

8. t_{CW} is measured from the later of CS# going low to the end of write.
