3. Description

Programming the flash ROM of any listed MCU via the CSI interface may lead to the following error message being displayed during execution of the programming command:

ERROR(E071): Program failed

This error only arises when the MCU in use has been programmed at least twice. This error does not arise when a new MCU is first programmed.

Note, however, that normal execution of the command with no error message arising means that the programming proceeded correctly.

4. Workaround

When programming the flash ROM of any applicable MCU, use the UART or CSI-HS interface.

Even when the CSI interface is used, the error may not arise if the setting for communication speed is low.

5. Schedule for Fixing the Problem

A new version with the problem corrected is planned.

If you need to take measures against this problem before the next release, please consult your local Renesas Electronics marketing office or distributor.
