What are the Advantages of Packaging a Proximity Sensor with an Ambient Light Sensor?

AN1682
Rev 0.00
Oct 8, 2012

Consumer devices like cell phones are using more and more sensors to save power and enhance our interaction with them. Some of the latest devices have more than 10 sensors. It is a natural question for cell phone manufacturers to ask if any of these sensors can be co-packaged to save power, space and cost. There are many good reasons for co-packaging a Proximity Sensor with an Ambient Light Sensor. After clarifying their roles, their operations and some simple differences, these reasons will be discussed.

An ambient light sensor acts like an eye for a system that measures the surrounding light. If the device is indoors, it is the light in a room. If the device is outside, it could be bright from sunlight or less in the shade. The measurement of this amount of light is made by a light emitting diode (LED) and quantified to enable a system to adjust its own display. If the surrounding light is bright, the backlight of the display is run at full power. If the area is darker, the backlight is reduced, saving power. Incidentally, this is also pleasing to the user. Have you ever tried looking directly into a bright light in a dark room? Eyes can tire quite quickly for this overstimulation, so the dimming function provided by the ambient light sensor is a welcome addition. The challenge is that silicon diodes naturally react to a wide spectrum of wavelengths. An ambient light sensor must be designed to mimic the human eye. This filtering is one of the quality measurements of the sensor, especially since the majority of light sources have energy in the infrared wavelengths (think about which light sources also give off heat). To demonstrate this filtering, see the plot in Figure 1. The ISL29028A from Intersil provides the best match of filtering in its ambient light sensor compared to the response of the human eye.

A proximity sensor measures an infrared signal. Instead of the signal coming from the surrounding area, the proximity sensor drives an external infrared LED. The signal from this LED is directed out above the proximity sensor. If something enters the path of the infrared emission, some will be reflected back toward the sensor. There is another LED within the proximity sensor ready to pick up this reflected light. This allows a system to react to someone or something coming close. A great example of this is on many cell phones. The user doesn't want their cheek to be "pressing buttons" or hanging up on a call while they have the phone up to their ear. It would be convenient if the phone could turn off the touch screen whenever the phone is brought up to a user's ear. This is exactly what the proximity sensor allows the phone to do.

These two separate systems are now being offered in one package. Are semiconductor companies overexcited by their drive to integrate more features and systems, or are there real advantages in co-packaging the proximity sensor with the ambient light sensor?

While it is true that they are two separate systems, they are both optical systems utilizing a sensing LED. They collect information from the outside world, quantify it and provide it to the system. Currently, the system predominantly uses the information to adjust the backlight of the display. The information could just as easily be used to control more system features in the future.

Of course, it is convenient to save space, to share supplies, and to combine power supply bypassing. The size of the solution is a critical parameter in many systems, especially portable ones. The co-packaging of the proximity sensor and ambient light sensor is an enabling step in the development of more compact, yet feature enhanced, cell phones.

The next reason is slightly more subtle: Location. Both the proximity sensor and ambient light sensor need access to the outside world for proper function, so their placement within a system is strongly related to their sensitivity and their correct operation. In some cases where an ambient light sensor is packaged alone, it has been placed deeper within a system-behind a speaker screen or further down a printed circuit board from a nearby external access point. This practice has pushed ambient light sensors to be more and more sensitive to this indirect light. Light intensity is measured in lux. While sunlight exceeds 100,000 lux, these ambient light sensors can detect 0.001 lux! That's a tiny fraction of a candle's light. For a practical array of the lux levels of various light sources, see Table 1.

A final and compelling reason to house the proximity sensor and ambient light sensor in the same package is that it enables quick and undisturbed communication between the two. Remember in the beginning during the explanation of the operation of the ambient light sensor that we explained how its sensor must mimic the human eye? The human eye does not see infrared light, so the ambient light sensor is specifically designed to remove as much energy in the infrared wavelengths as possible. Remember also that the proximity sensor operates precisely within the infrared spectrum. Whenever the proximity sensor is attempting the make a measurement, it is simultaneously sending out infrared light in the hope of bouncing off of a nearby object. This infrared energy could easily swamp the ambient light sensor's input and cause false positive measurements (where the ambient light sensor measures more light energy than is actually in the surrounding area). It is for this reason that it is vital to coordinate the operation of the ambient light sensor with the proximity sensor. While this could be accomplished with a microcontroller, it is easier and a much smaller footprint to have this coordination within a single package. That one package houses both the ambient light sensor and the proximity sensor.

Locating the ambient light sensor and proximity sensor in the same package provides a number of advantages. They both enable power savings through the dimming or shutdown of the backlight and interface with the same system blocks. Co-packaging saves space and reduces complexity. Both sensors need access to the outside of the system and would likely be located in similar places. And since interference from the proximity sensor system can disturb the ambient light sensor, coordination between these two features is paramount. It is for all of these reasons that there is a huge

advantage in co-packaging the proximity sensor and ambient light sensor.

TABLE 1. TABLE OF LUX VALUES

Direct Sunlight	100,000 to 130,000 Lux
Full Daylight	10,000 to 20,000 Lux
Cloudy Day	1,000 Lux
Office Lights	300-500 Lux
Candlelight/dark 10-15 Lux	10-15 Lux

NOTE: “Lux” - Measure of light density within the visible spectrum.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
