Note on Using Flash Development Toolkit

When using Flash Development Toolkit, take note of the following problem:

- With executing script files

---

1. Product and Versions Concerned

Flash Development Toolkit
V.3.2 through V.3.07 Release 05; and V.4.00 Release 00 and later

2. Description

When you execute script files, application errors may arise.

3. Conditions

This problem arises if either of the following conditions is satisfied:
(1) By using one configuration file, two or more script files are executed, and the script files are different from each other in workspaces they use.
(2) In one script file, there are two or more "workspace" commands which load workspaces on Flash Development Toolkit.

Note that if this problem arises, exit Flash Development Toolkit once.

4. Workaround

To avoid this problem, create one configuration file for each workspace; then manage one script file by one configuration file.
Note, however, that create configuration files as follows:
(1) When typing the path name of a script file into Script file Settings in the Wait-For-Script Configuration dialog box, do not search for the script file by using the Wild Card button, but do by using the File button.
(2) Give different names to the Log and the Status files from each other by configuration file; then type these name into Log File Name and Status File Name in the Log and the Status File tab.
