Last LBA of Storage Media	Arbitrary integer value (Default:0)	Specify the last LBA of storage media device (the number of sectors available in the media - 1). This parameter is only valid when the configuration "Mass Storage Class Parameter Setup" is "Auto".
Bytes Per Sector of Storage Media	Arbitrary integer value, which is multiple of 512 (Default: 512).	Specify the sector size of storage media. It can take multiple of 512 such as 512, 4K bytes. This parameter is only valid when the configuration "Mass Storage Class Parameter Setup" is "Auto".
Type of Storage Media	Arbitrary integer value (Default: 0).	Specify the type of storage media device. Typically, the value takes following values. Flash Drive (0), CD-ROM device (5) This parameter is only valid when the configuration "Mass Storage Class Parameter Setup" is "Auto".
Removable Flag of Storage Media	Arbitrary integer value (Default: 0x80).	Specify the Removable Flag value of Storage Media. This parameter is only valid when the configuration "Mass Storage Class Parameter Setup" is "Auto".
Media Read Function Callback	Arbitrary C symbol name (Default: ux_device_msc_media_read)	Specify the C symbol name of Media Read callback for the USBX Device Mass Storage Class. The function is to be called back from the Class library when read access to the USB storage device is requested from user application. Refer USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device Storage Class* for the function definition.

Configuration	Settings	Description
Media Write Function Callback	Arbitrary C symbol name (Default: ux_device_msc_media_write)	Specify the C symbol name of Media Write callback for the USBX Device Mass Storage Class. The function is to be called back from the Class library when write access to the USB storage device is requested from user application. Refer USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device Storage Class* for the function definition.
Media Status Function Callback	Arbitrary C symbol name (Default: ux_device_msc_media_status)	Specify the C symbol name of Media Status callback for the USBX Device Mass Storage Class. The function is to be called back from the Class library when status inquiry to the USB storage device is requested from user application. Refer USBX Stack User's Manual *Chapter 5: USBX Device Class ConsiderationsUSB Device Storage Class* for the function definition.
USBX Device Storage Instance_Activate Callback Function	Arbitrary symbol name (Default: "NULL")	Specify the name of instance_activate user callback function for the USBX Device Mass Storage Class module. Name must be a valid C symbol. See the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device Storage Class* for more information about the instance_activate callback function.
USBX Device Storage Instance_Deactivate Callback Function	Arbitrary symbol name (Default: "NULL")	Specify the name of instance_deactivate user callback function for the USBX Device Mass Storage Class module. Name must be a valid C symbol. Refer to the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device Storage Class* for more information about the instance_activate callback function

The USBX Device Class HID component has the configurations to setup USB Device HID Class shown in the table below. Parameters are available to configure through the Synergy Configuration tool.

USBX Device Class HID Configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_device_class_hid")	Specify the name of USBX Interface Descriptor for HID Class. It must be a valid C symbol.
USBX HID User Callback Function	Arbitrary symbol name (Default: "ux_hid_device_callback")	Specify the name of a user callback function to get an event from HID Class. Name must be a valid C symbol. Refer to the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device HID Class* for more information about the user callback function.
USBX Device HID Entry Function	Arbitrary symbol name (Default: "NULL")	Specify the name of user entry function for the USBX Device HID Class module. Name must be a valid C symbol. See the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device HID Class* for more information about the user entry function.
USBX Device HID instance_activate Function Callback	Arbitrary symbol name (Default: "NULL")	Specify the name of instance_activate user callback function for the USBX Device HID Class module. Name must be a valid C symbol. See the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device HID Class* for more information about the instance_activate callback function.
USBX Device HID instance_deactivate Function Callback	Arbitrary symbol name (Default: "NULL")	Specify the name of instance_deactivate user callback function for the USBX Device HID Class module. Name must be a valid C symbol. Refer to the USBX Stack User's Manual *Chapter 5: USBX Device Class Considerations USB Device HID Class* for more information about the instance_activate callback function

Configuration	Settings	Description
Multiple HID Report support	Enable or Disable (Default)	Set Enable to support multiple HID report. This configuration is used to indicate which data fields are represented in each report structure.

USB Device Descriptor Configuration

The USBX Device Configuration component has configurations shown in the table below to auto-generate the USB Device Descriptor and USB Configuration Descriptor. Refer to http://www.usb.org and download USB 2.0 Specification for more information about the specification of USB Device Descriptor and or Configuration Descriptor.

USBX Device Configuration

Configuration	Settings	Description
Vendor ID	16-bit arbitrary number (Default: 0x045B)	Specify Vendor ID assigned by USB-IF. This configuration is a part of the USB Device Descriptor (**idVendor**).
Product ID	16-bit arbitrary number (Default: 0x0000)	Specify Product ID assigned by manufacturer. This configuration is a part of the Device Descriptor (**idProduct**).
Device Release Number	16-bit arbitrary number (Default: 0x0000)	Specify Device Release Number in binary-coded decimal. This configuration is a part of the USB Device Descriptor (**bcdDevice**).
Index of Manufacturer String Descriptor	Arbitrary number from 0 to 255 (Default: 0x00)	Specify the Index of Manufacturer String Descriptor defined in the USBX String Framework. This configuration is a part of the USB Device Descriptor (**iManufacturer**). Set zero if String Descriptor is not used. See section USBX-String-Framework-Configuration for more information.
Index of Product String Descriptor	Arbitrary number from 0 to 255 (Default: 0x00)	Specify the Index of Product String Descriptor defined in the USBX String Framework. This configuration is a part of the USB Device Descriptor (**iProduct**). Set zero if String Descriptor is not used. See section "USBX String Framework Configuration" for more information.

Configuration	Settings	Description
Index of Serial Number String Descriptor	Arbitrary number from 0 to 255 (Default: 0x00)	Specify the Index of Serial Number String Descriptor defined in the USBX String Framework. This configuration is a part of the USB Device Descriptor (**iSerialNumber**). Set zero if the String Descriptor is not used. See section "USBX String Framework Configuration" for more information.
Class Code	Device(0x00), Communications(CDC) (0x02, Default), HID (0x03), Mass Storage (0x08), Miscellaneous (0xEF), Vendor Specific (0xFF)	Select the USB Device Class Code. This configuration is a part of the USB Configuration Descriptor (**bDeviceClass**).
Index of String Descriptor describing this configuration	Arbitrary number from 0 to 255 (Default: 0x00)	Specify the Index of String Descriptor describing this configuration. This configuration is a part of the USB Configuration Descriptor (**iConfiguration**). Set zero if String Descriptor is not used. See section "USBX String Framework Configuration" for more information.
Size of USB Descriptor in bytes for this configuration	0x00 (Default) or value to be set to wTotalLength (calculated by user)	Specify the size of USB Descriptor in bytes. Modify the value for Vendor-specific Class, otherwise you can set zero to calculate the size automatically in the auto-generated code from Synergy Configuration tool. This configuration is a part of the USB Configuration Descriptor (**wTotalLength**).
Number of Interfaces	0x00 (Default) or value to be set to bNumInterfaces (calculated by user).	Specify the Number of interfaces supported by this configuration. Modify the value for Vendor-specific Class, otherwise you can set zero to calculate the value automatically in the auto-generated code from Synergy Configuration tool. This configuration is a part of the USB Configuration Descriptor (**bNumInterfaces**).

Configuration	Settings	Description
Self-Powered	Enable (Default) or Disable	Enable this configuration if your USB Device is a self- powered device. This configuration is a part of the USB Configuration Descriptor (**bmAttributes** bit6)
Remote Wakeup	Enable or Disable (Default)	Enable this configuration if your USB Device supports remote wakeup. This configuration is a part of the USB Configuration Descriptor (**bmAttributes** bit5)
Maximum Power Consumption in 2mA units(0-250)	50 (Default), Integer value from 0 to 250.	Set the maximum power consumption of your device to indicate the amount of bus power required. This configuration is 2mA units, thus, the maximum 500 mA can be specified. This configuration is a part of the USB Configuration Descriptor (**bMaxPower**).
Supported Language Code	16-bit number assigned by Manufacturer (Default: 0x0409)	Specify the Language ID Code. For example, 0x0409 English - United States. This configuration is used for Language ID Framework code generation. See section "USBX Language Framework Configuration" for more information.
Name of USBX String Framework	Arbitrary C language symbol (Default : NULL)	Specify the name of user defined USBX String Framework. This must be a valid C symbol. Set NULL if the String Descriptor is not used. See section "USBX String Framework Configuration" for more information.
Total index number in USB String Descriptor in USBX String Framework	Arbitrary integer number (Default : 0)	Specify the total number of index for String Descriptor. See section "USBX String Framework Configuration" for more information.
Name of USB Language Descriptor	Arbitrary C language symbol (Default : NULL)	Specify the name of user defined USBX Language Framework. This must be a valid C symbol. If '0' is set to the property "Total Number of Language Support", this configuration is ignored. See section "USBX Language Framework Configuration" for more information.

Configuration	Settings	Description
Total Number of Language Support	Arbitrary integer number (Default : 0)	Specify the total number of languages to support. See section "USBX String Framework Configuration" for more information. If '0' is set here, US English (0x0409) is applied as the default language.

The USBX Interface Configuration CDC-ACM component has configurations shown in the table below to setup the USB Interface Descriptor for CDC-ACM. It can be configured through the Synergy Configuration tool. Refer to http://www.usb.org and download USB 2.0 Specification for more information about the specification of USB Interface Descriptor.

USBX Interface Descriptor for CDC-ACM

Configuration	Settings	Description
Name	Arbitrary symbol name(Default: "g_usb_interface_desc_cdcacm_0")	Specify the name of USBX Interface Descriptor for CDC-ACM. It must be a valid C symbol.
Interface Number of Communications Class interface	Arbitrary integer value from 0 to 255 (Default: 0x00)	Specify the index number of Communications Class interface. This configuration is a part of the USB Interface Descriptor (**bInterface**). The number must not be duplicated with the Interface Number of Data Class interface. Also must not be duplicated with any Interface Numbers if your USB device consists of a USB composite device.
Interrupt Transfer Endpoint to use for Communication Class.	End Point N, where N=1 to 9. (Default: End Point 3)	Specify the Endpoint Number of Interrupt Endpoint. It must not be duplicated with ones for the other Endpoints.
Polling period for Interrupt Endpoint (in mS/125us units for FS/HS)	Arbitrary integer value from 1 to 255 (Default: 0x0F)	Specify the Interval for polling Endpoint transfers. This configuration is valid for Interrupt Endpoint and ignored for Bulk Endpoints. Value is in frame counts (1ms units for FS mode and 125us units for HS mode).

Configuration	Settings	Description
Interface Number of Data Class interface	Arbitrary integer value from 0 to 255 (Default: 0x01)	Specify the index number of Data Class interface. This configuration is a part of the USB Interface Descriptor (**bInterface**). The number must not be duplicated with the Interface Number of Communications Class interface. Also must not be duplicated with any Interface Numbers if your USB device consists of a USB composite device.
Bulk In Transfer Endpoint to use for Data Class	End Point N, where N=1 to 9. (Default: End Point 1)	Specify the Endpoint Number of Bulk In Endpoint. It must not be duplicated with ones for the other Endpoints.
Bulk Out Transfer Endpoint to use for Data Class	End Point N, where N=1 to 9. (Default: End Point 2)	Specify the Endpoint Number of Bulk Out Endpoint. It must not be duplicated with ones for the other Endpoints.
Index of String Descriptor Describing Communications Class interface	Arbitrary integer number (Default : 0x00)	Specify the index number of String Descriptor Describing Communications Class interface. This configuration is a part of the USB Interface Descriptor (**iInterface**). Set '0' if do not have String information for the interface.
Index of String Descriptor Describing Data Class interface	Arbitrary integer number (Default : 0x00)	Specify the index number of String Descriptor Describing Data Class interface. This configuration is a part of the USB Interface Descriptor (**iInterface**). Set '0' if do not have String information for the interface.

The USBX Interface Configuration Mass Storage component has configurations shown in the table below to setup the USB Interface Descriptor for Mass Storage Class. Parameters are available to configure through the Synergy Configuration tool. Refer to http://www.usb.org and download USB 2.0 Specification for more information about the specification of USB Interface Descriptor.

USBX Interface Descriptor for Mass Storage Class

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_usb_interface_desciptor_storage0 ")	Specify the name of USBX Interface Descriptor for CDC-ACM. It must be a valid C symbol.

Configuration	Settings	Description
Interface Number of Bulk-Only Data Interface	Arbitrary integer value from 0 to 255 (Default: 0x00)	Specify the index number of Bulk-Only Data interface. This configuration is a part of the USB Interface Descriptor (**bInterface**). The number must not be duplicated with any other Interface Numbers if your USB device consists of a USB composite device.
Endpoint Number of Bulk-Out Transfer	End Point N, where N=1 to 9. (Default: End Point 1)	Specify the Endpoint Number of Bulk Out Endpoint. It must not be duplicated with ones for the other Endpoints.
Endpoint Number of Bulk-In transfer	End Point N, where N=1 to 9. (Default: End Point 2)	Specify the Endpoint Number of Bulk In Endpoint. It must not be duplicated with ones for the other Endpoints.

The USBX Interface Configuration HID component has configurations shown in the table below to setup the USB Interface Descriptor for HID Class. Parameters are available to configure through the Synergy Configuration tool. Refer to http://www.usb.org and download USB 2.0 Specification for more information about the specification of USB Interface Descriptor.

USBX Interface Descriptor for HID Class

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_usb_interface_desc_hid0")	Specify the name of USBX Interface Descriptor for CDC-ACM. It must be a valid C symbol.
Interface Number of HID Class Interface	Arbitrary integer value from 0 to 255 (Default: 0x00)	Specify the index number of HID Class interface. This configuration is a part of the USB Interface Descriptor (**bInterface**). The number must not be duplicated with any other Interface Numbers if your USB device consists of a USB composite device.
Protocol Code	0 (None), 1 (Keyboard, Default), 2 (Mouse)	Specify the HID protocol code from options. This configuration is a part of the USB Interface Descriptor. (**bInterfaceProtocol**). Available protocol codes are 0 (None), 1 (Keyboard, Default), 2 (Mouse).

Configuration	Settings	Description
Endpoint Number of Interrupt-In Transfer	End Point N, where N=1 to 9. (Default: End Point 1)	Specify the Endpoint Number of Interrupt-In Endpoint. It must not be duplicated with ones for the other Endpoints.
Maximum packet size in bytes for Interrupt in Endpoint	Arbitrary integer value from 1 to 1024 (Default: 0x08)	Specify the maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.
Interval for polling Interrupt-In Endpoint (in mS/125us units for FS/HS)	Arbitrary integer value from 1 to 255 (Default: 0x08)	Specify the Interval for polling Endpoint transfers. This configuration is valid for Interrupt-In Endpoint. Value is in frame counts (1ms units for FS mode and 125us units for HS mode).
Interrupt-Out Endpoint (Optional)	Enable or Disable (Default)	This configuration is reserved and currently not used.
Endpoint Number of Interrupt-Out transfer (Optional)	End Point N, where N=1 to 9. (Default: End Point 2)	This configuration is reserved and currently not used.
Maximum packet size in bytes for Interrupt-Out Endpoint (Optional)	Arbitrary integer value from 1 to 1024 (Default: 0x08)	This configuration is reserved and currently not used.
Interval for polling Interrupt-Out Endpoint for data transfers (in mS/125us units for FS/HS) (Optional)	Arbitrary integer value from 1 to 255 (Default: 0x08)	This configuration is reserved and currently not used.

The USBX String Framework is byte stream data to provide USB device information with human readable strings to the USB host device. Users need to define the byte stream data in their application code if required. It is optional and not mandatory to use. See the USBX Device Class User Guide, section *Definition of the Strings of the Device Framework* for more information about the USBX String Framework. Here is an example of USBX String Framework, which consists of three indexes String descriptors.

```
const UCHAR g_usb_string_framework[] =
{
    /* Index #1 (this example shows manufacturer information) */
    (uint8_t) (0x0409),     /* Byte0 Language Code, US English */
    (uint8_t) (0x0409 >> 8),    /* Byte1 Language Code */
    0x01,               /* Byte2 Index */
    7,              /* Byte3 Length */
    'R', 'E', 'N', 'E', 'S', 'A', 'S',

    /* Index #2 (this example shows product information) */
    (uint8_t) (0x0409),     /* Byte0 Language Code, US English */
    (uint8_t) (0x0409 >> 8),    /* Byte1 Language Code */
    0x02,               /* Byte2 Index */
```

```
    10,                 /* Byte3 Length */
    'C', 'O', 'M', ' ', 'D', 'E', 'V', 'I', 'C', 'E',

    /* Index #3 (this example shows Device Serial Number information) */
    (uint8_t) (0x0409),     /* Byte0 Language Code, US English */
    (uint8_t) (0x0409 >> 8),    /* Byte1 Language Code */
    0x03,               /* Byte2 Index */
    4,              /* Byte3 Length */
    '0', '1', '0', '0'
};
```

You can configure the properties of the USBX Device Configuration component as shown in the table below. Refer to for more information about each configuration in the table.

Example of the USBX String Framework Configuration

Configurations for String Descriptor on Synergy Configuration tool	Setting Example
Name of USB String Framework	g_usb_string_framework
Total index number of USB String Descriptor in USBX String Framework	3 (3 indexes)
Index of Manufacturer String Descriptor	1 (Index #1)
Index of Product String Descriptor	2 (Index #2)
Index of Serial Number String Descriptor	3 (Index #3)
Index of String Descriptor describing this configuration	0 (no string information)
Index of String Descriptor Describing Communications Class interface	0 (no string information)

The USBX Languages Framework is byte stream data to support multiple languages. You need to define the byte stream data in your application code if required. It is optional and not mandatory to use. See the USBX Device Class User Guide, section *Definition of the Languages Supported by the Device for each String* for more information. Below is an example of USBX Language Framework, which supports two Languages:

```
const UCHAR g_usb_language_framework[] =
{
    /* US English */
    (uint8_t) (0x0409),
    (uint8_t) (0x0409 >> 8),
    /* Japanese */
    (uint8_t) (0x0411),
    (uint8_t) (0x0411 >> 8),
```

```
};
```

You can configure the properties of USBX Device Configuration component as shown in the table below. See section "USBX Device Configuration for more information.

Example of the USBX Language Framework Configuration

Configurations for String Descriptor on Synergy Configuration tool	Setting Example
Name of USB Language Descriptor	g_usb_language_framework
Total Number of Language Support	2 (2 languages)

USB Host Classes Configuration

The USBX Host Configuration component has a configuration shown in the table below to auto-generate the USBX host stack initialization code.

USBX Host Configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_host_0")	Specify the name of USBX Host Configuration instance. It must be a valid C symbol.

The USBX Host Class CDC-ACM component has configurations to setup the USB Host Class CDC-ACM shown in the table below. It can be configured through the Synergy Configuration tool.

USBX Host Class CDC-ACM configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_host_class_cdc_acm0")	Specify the name of USBX Host CDC-ACM Class module instance. It must be a valid C symbol.

The USBX Host Class Mass Storage component has configurations to setup the USB Host Class Mass Storage shown in the table below. It can be configured through the Synergy Configuration tool.

USBX Host Class Mass Storage configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_host_class_storage0")	Specify the name of USBX Host Mass Storage Class module instance. It must be a valid C symbol.

The USBX Host Class HID component has configurations to setup the USB Host Class HID shown in the table below. It can be configured through the Synergy Configuration tool.

USBX Host Class HID configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_host_class_hid0")	Specify the name of USBX Host Mass HID module instance. It must be a valid C symbol.
HID Client – Keyboard Support	Enable(Default) / Disable	Set Enable to support USB keyboard devices. This configuration registers the USBX HID Keyboard Client.
HID Client – Mouse Support	Enable(Default) / Disable	Set Enable to support USB mouse devices. This configuration registers the USBX HID Mouse Client.
HID Client – Remote Control Support	Enable(Default) / Disable	Set Enable to support USB remote control devices. This configuration registers the USBX Remote Control Client.

The USBX Host Class Video component has configurations to setup the USB Host Class Video shown in the table below. It can be configured through the Synergy Configuration tool.

USBX Host Class Video configuration

Configuration	Settings	Description
Name	Arbitrary symbol name (Default: "g_ux_host_class_video0")	Specify the name of USBX Host Video Class module instance. It must be a valid C symbol.

USBX Port Driver Configuration

The information for the USBX Port Driver, see section "Express Logic USBX Driver Interface."

USBX Source Advanced Configurations

If the USBX Source components are added to Stack view in the Threads tab in the Synergy Configuration tool, the Properties window provides advanced configurations for the USBX source library. Highlight a configuration option to view a description of the option in the bottom left corner of the e^2 studio GUI. If the configuration option is empty, the default value is used. See the Configuration Options chapter of the *USBX User Guide* for more information.

USBX on ux Source Configurations

Configuration	Settings	Description
Maximum Classes	Not valid	UX_MAX_CLASSES This is not valid configuration so deprecated in future release.
Maximum Slave Classes	Not valid	UX_MAX_SLAVE_CLASSES This is not valid configuration so deprecated in future release.
Maximum Slave Interfaces	Value must be greater than 0 or empty (Default 4)	UX_MAX_SLAVE_INTERFACES When set, this value is the maximum number of interfaces in the device framework.
Maximum Host Controllers	Value must be greater than 0 or empty (Default 2)	UX_MAX_HCD When set, this value represents the number of different host controllers available in the system. For USB 1.1 support, this value will usually be 1. For USB 2.0 support, this value can be more than 1. This value represents the number of concurrent host controllers running at the same time. In Synergy implementation, the value can be set to 2 if running both USBHS and USBFS controllers for S7 or S5 parts.
Maximum Devices	Value must be greater than 0 or empty (Default 8)	UX_MAX_DEVICES When set, this value represents the maximum number of devices that can be attached to the USB. Note that this value represents the total number of devices regardless of the number of USB buses in the system.

Configuration	Settings	Description
Maximum Slave Logical Units	Value must be greater than 0 or empty (Default 2)	UX_MAX_SLAVE_LUN When set, this value represents the current number of SCSI logical units represented in the device storage class driver.
Maximum Host Logical Units	Value must be greater than 0 or empty (Default 16)	UX_MAX_HOST_LUN When set, this value represents the maximum number of SCSI logical units represented in the host storage class driver.
Slave Request Control Maximum Length	Value must be greater than 0 or empty (Default 256)	UX_SLAVE_REQUEST_CONTROL_MAX_LENGTH When set, this value represents the maximum number of bytes received on a control endpoint in the device stack. The default is 256 bytes but can be reduced in memory constraint environments.
Enforce Safe Alignment	Enabled/ Disabled(Default)	UX_ENFORCE_SAFE_ALIGNMENT When enabled, this value forces the memory allocation scheme to enforce alignment of memory with the UX_SAFE_ALIGN field.

USBX Device Class Mass Storage Source Configurations

Configuration	Settings	Description
Maximum number of SCSI logical units	Value must be greater than 0 or empty (Default 2)	UX_MAX_SLAVE_LUN This value represents the maximum number of SCSI logical units represented in the device storage class driver.

USBX Host Class Mass Storage Source Configurations

Configuration	Settings	Description
Use FileX stub	Enabled/Disable(Default)	UX_NO_FILEX Enable this option only in cases where FileX is not available to use.

Configuration	Settings	Description
Maximum number of SCSI logical units	Value must be greater than 0 or empty (Default 1)	UX_MAX_HOST_LUN The value represents the maximum number of SCSI logical units represented in the host storage class driver.
Maximum number of storage media instance	Value must be greater than 0 or empty (Default 1)	UX_HOST_CLASS_STORAGE_MAX_MEDIA The value represents the maximum number of storage media instances represented in the host storage class driver.
Storage memory size in bytes for FileX used for data transfer	Value must be greater than 512 or empty (Default 1024)	UX_HOST_CLASS_STORAGE_MEMORY_BUFFER_SIZE The value represents the block of memory in bytes for FileX to use when doing transfers. The value can be changed to save on memory space but should not be smaller than the media sector size. Because USB devices are SCSI devices and there is a great deal of overhead when doing read/writes, it is better to increase it for higher data throughput.
Maximum transfer size in bytes in one BOT data-transport phase	Value must be greater than 512 or empty (Default 1024)	UX_HOST_CLASS_STORAGE_MAX_TRANSFER_SIZEThe value represents maximum size of memory chunk in bytes to send in one data-transport phase in the Bulk-Only Transport protocol. Large size of data transfer request is split into smaller chunks specified by this configuration. It is better to increase it for higher data throughput.
Stack size for the Mass Storage Class internal thread	Value must be greater than 512 or empty (Default 1024)	UX_HOST_CLASS_STORAGE_THREAD_STACK_SIZEThe value represents the stack size in bytes for Mass Storage Class internal thread named ux_storage_thread.
Timeout in millisecond for a BOT transfer request	Value must be greater than 0 or empty (Default 100000)	UX_HOST_CLASS_STORAGE_TRANSFER_TIMEOUT_IN_MS The value represents timeout value in millisecond for a data transfer request in Bulk-Only Transport protocol.

Configuration	Settings	Description
Timeout in millisecond for the status from a command in the Control/Bulk/ Interrupt transport	Value must be greater than 0 or empty (Default 30000)	UX_HOST_CLASS_STORAGE_CBI _STATUS_TIMEOUT_IN_MS The value represents timeout value in millisecond for the status from a command, which is returned by the interrupt endpoint in the Control/Bulk/ Interrupt transport. The transport is mainly used by storage devices that have very slow read/write commands.
Show linkage warning	Enabled(Default)/Disabled	Notification message for users will be shown if "Enabled" option is selected. This is just to warn users possible linkage errors by multiple symbol definitions. Select "Disabled" stops the notification message.

USBX Host Class HID Source Configurations

Configuration	Settings	Description
HID Keyboard Thread Priority	Value must be greater than 0 or empty (Default 20)	UX_THREAD_PRIORITY_KEYBOA RD Define the priority of the HID keyboard thread.
Memory size for HID Report Decompression	Value must be greater than 0 or empty (Default 4096)	UX_HOST_CLASS_HID_DECOMPR ESSION_BUFFERDefine the memory size to build a decompressed report.
Number of Entries for HID Local Usage Item Table	Value must be greater than 0 or empty (Default 1024)	UX_HOST_CLASS_HID_USAGES Define the size of HID local usage item table. One item entry consumes 4bytes.
Show linkage warning	Enabled(Default)/Disabled	Notification message for users will be shown if "Enabled" option is selected. This is just to warn users possible linkage errors by multiple symbol definitions. Select "Disabled" stops the notification message.

No any special property is given for this module.

Device-Only Size Optimization

The Express Logic USBX module is built in device-only mode to reduce code size for Synergy S1 parts. The configuration (UX_SYSTEM_DEVICE_ONLY) is applied automatically if the S1 board is selected in the Synergy Configuration tool BSP tab. Note that following configurations are fixed in the device-only mode.

- UX_THREAD_STACK_SIZE=512
- UX_SLAVE_REQUEST_DATA_MAX_LENGTH=512

4.3.10.5 Express Logic USBX Auto-generated Code Procedures

NOTE: Code samples in this section are subject to change. No any warranty for contents and possible changes.

USBX Device Stack Auto-generated Code Procedures

The code sample below is pseudo code for USBX Device Classes. The function call sequence is auto-generated from the Synergy Configuration tool if one of the USBX Device Class component or multiple of them are added to the Synergy Configuration tool. Auto-generated code is emitted to common_data.c file and handles the feature listed below:

- Generate the USB Device Descriptor.
- Initialize the USBX software contexts in the memory pool.
- Initialize the USBX Device Stacks added in Synergy Configuration tool.
- Initialize Synergy USB controller(s) in device mode. The USBX Device stack supports Many-to-one topology between device classes and a device controller. For instance, Two USBX Device Classes, which consist of a USB composite device can use single USB controller.

  NOTE: The USBX Device stack does not support to use multiple USB controllers simultaneously. Either of USB controllers is used at once even if the Synergy part has multiple USB controllers (like S7G2 parts).

```
// Interrupt vector registering for USBHS or USBFS controller.
SSP_VECTOR_DEFINE_UNIT();

void g_common_init(void)
{
    // Initialize USBX Memory.
    ux_system_initialize ();

    // Initialize USBX Device stack.
    ux_device_stack_initialize ();

    // Register the Device CDC-ACM Class if the class is used.
    ux_device_stack_class_register();

    // Register the Device HID Class if the class is used.
    ux_device_stack_class_register();
```

```
    // Register the Device Mass Storage Class if the class is used.
    ux_device_stack_class_register();

    // Initialize the USB Device Controller. This function calls either of
    // _ux_dcd_synergy_initalize() or
    // _ux_dcd_synergy_initalize_transfer_support()
    ux_dcd_initialize ();
}
```

USBX Host Stack Auto-generated Code Procedures

The code sample below is pseudo code for USBX Host Classes. The function call sequence is auto-generated from the Synergy Configuration tool if one of USBX Host Class component or multiple of them are added to the Synergy Configuration tool. Auto-generated code is emitted to common_data.c file and handles the features listed below:

- Initialize the USBX software contexts in the memory pool.
- Initialize the USBX Host Stacks added in Synergy Configuration tool. Multi-instances of host class stacks are allowed to be built.
- Initialize the USBX HID Clients if the USBX Host HID Class is added in Synergy Configuration tool.
- Initialize Synergy USB controller(s) in host mode. The USBX Host stack supports Many-to-one or Many-to-many topology between host classes and host controllers. For instance, Two USBX Host Classes can use single USB controller, or Two USBX Host Classes can use different USB controllers individually if the Synergy part has multiple USB controllers (like S7G2 parts).
- Get a USBX Host Class container for user application.

```
// Interrupt vector registering for USBHS or USBFS controller.
SSP_VECTOR_DEFINE_UNIT();

void g_common_init(void)
{
    // Initialize FileX (ONLY for Mass Storage Class)
    fx_system_initialize ();

    // Initialize USBX Memory.
    ux_system_initialize ();

    // Initialize the USBX Host stack.
    ux_host_stack_initialize ();

    // Register the HUB Class if the class is used.
    ux_host_stack_class_register();

    // Register the Host CDC-ACM Class if the class is used.
    ux_host_stack_class_register();

    // Register the Host HID Class if the class is used.
    ux_host_stack_class_register();
```

```
    // Register the Host HID Clents if the HID clients are used.
    ux_host_class_hid_clients_register ();

    // Register the Host Mass Storage Class if the class is used.
    ux_host_stack_class_register();

    // Register and initialize the USB Host Controller.
    ux_host_stack_hcd_register ();

    // Get the USBX Host Class Container for registered classes.
    ux_host_stack_class_get ();
}
```

4.3.10.6 Express Logic USBX Application Code Examples

NOTE: Code samples in this section are subject to change. No any warranty for contents and possible changes.

USBX Device Stack User Code Sample

This section describes how user application code to be implemented in a user application thread followed to the auto-generated code, which is described in

Express Logic USBX Auto-generated Code Procedures. User application code for each USBX device class looks different so explained briefly in following sections with code samples.

The user application code follows to auto-generated code needs following processing briefly.

- Get a CDC-ACM instance through USBX CDC-ACM instance_activate Function Callback.
- Use the CDC-ACM instance and perform CDC-ACM communication with USB host device.

The code mock-up sample below shows an example of basic implementation of the USB CDC-ACM application with the USBX Device Class CDC-ACM.

```
// Precondition: The USBX Device Class CDC-ACM component is setup as below.
//   Refer to USBX Configuration Notes for more information.
// - "USBX CDC-ACM instance_activate Function Callback":
//               ux_cdc_device0_instance_activate
// - "USBX CDC-ACM instance_deactivate Function Callback":
//               ux_cdc_device0_instance_deactivate
//

// A pointer to store CDC-ACM device instance.
static UX_SLAVE_CLASS_CDC_ACM   * g_cdc;

// The USBX Device CDC-ACM instance_activate callback function.
void ux_cdc_device0_instance_activate (VOID * cdc_instance)
{
```

```
    /* Save the CDC instance.  */
    g_cdc = (UX_SLAVE_CLASS_CDC_ACM *) cdc_instance;
    tx_semaphore_put(&g_cdc_activate_semaphore0);
}

// The USBX Device CDC-ACM instance_deactivate callback function.
void ux_cdc_device0_instance_deactivate (VOID * cdc_instance)
{
    SSP_PARAMETER_NOT_USED(cdc_instance);
    g_cdc = UX_NULL;
}

// User application thread entry function.
void usb_thread_entry(void)
{
    // Wait until CDC-ACM device instance activated.
    tx_semaphore_get (&g_cdc_activate_semaphore0, TX_WAIT_FOREVER);

    while (1)
    {
        // Use the CDC-ACM instance obtained in instance_activate callback
        // and Perform communications with CDC class.
        // _ux_device_class_cdc_acm_read to read data from a USB Host.
        // _ux_device_class_cdc_acm_write to write data to a USB Host.
    }
}
```

The user application code follows to auto-generated code needs following processing briefly.

- Get the USB device handle by referencing ux_system_slave_device in the USBX System Device Data context named _ux_system_slave structure.
- Polls ux_slave_device_state member in the USB device handle until it changes to UX_DEVICE_CONFIGURED.
- Get a device interface.
- Get a HID instance from the interface.
- Use the HID instance and set HID Events to a USB host.

The code mock-up sample below shows an example of basic implementation of the USB HID application with the USBX Device Class HID.

```
// Precondition: The USBX Device Class HID component is setup as below.
//   See USBX Configuration Notes for the more information.
// - "USBX HID User Callback Function": ux_hid_device_callback
//

// The USBX Device HID User Callback function.
UINT ux_hid_device_callback (UX_SLAVE_CLASS_HID * hid,
                             UX_SLAVE_CLASS_HID_EVENT * hid_event)
{
```

```
    // Do an action against the HID event from a USB host.
    ....

    return UX_SUCCESS;
}

// User application thread entry function.
void usb_thread_entry(void)
{
    UX_SLAVE_DEVICE          * device;
    UX_SLAVE_INTERFACE       * interface;
    UX_SLAVE_CLASS_HID       * hid;
    UX_SLAVE_CLASS_HID_EVENT hid_event;

    // Clear hid_event with zero.
    // ....

    // Get the pointer to the device.
    device = &_ux_system_slave->ux_system_slave_device;

    while (1)
    {
        // Pole device->ux_slave_device_state until it is changed to
        // UX_DEVICE_CONFIGURED.
        // ....

        // Get a device interface. This is a simple case.
        interface = device->ux_slave_device_first_interface;

        // Get a HID instance from the interface.
        hid = interface->ux_slave_interface_class_instance;

        // We can move forward once a device is configured.
        while (1)
        {

            // Define a HID event in hid_event.
            // ....

            // Set the keyboard event to a USB host.
            _ux_device_class_hid_event_set(hid, &hid_event);

            // Do an action whatever you need...
            ....
        }
    }
}
```

The user application code for Device Mass Storage follows to auto-generated code does not need special application code in the user application thread. Everything should be handled in the media access function callback.

The code mock-up sample below shows an example of basic implementation of the USB RAM disk storage application with the USBX Device Class Mass Storage.

```
// Precondition: The USBX Device Mass Storage component is setup as below.
//   See USBX Configuration Notes for more information.
// - User Setup Callback              : Auto
// - Last LBA of Storage Media        : 31
// - Bytes Per Sector of Storage Media: 512
// - Type of Storage Media            : 0x80
// - Media Read Function Callback     : ux_device_msc_media_read
// - Media Write Function Callback    : ux_device_msc_media_write
// - Media Status Function Callback   : ux_device_msc_media_status
//   This setup matches to RAM Disk image "ramdisk" provided in
//   Application Note R30AN0242EUXXX available at https://www.renesas.com/

// RAM disk image.
extern UCHAR    ramdisk[];

// The USBX Device Mass Storage Media Status Function Callback.
UINT    ux_device_msc_media_status (VOID  * storage,
                                    ULONG lun,
                                    ULONG media_id,
                                    ULONG * media_status)
{
    // Do work
    // ....
    return (UX_SUCCESS);
}

// The USBX Device Mass Storage Media Read Function Callback.
UINT    ux_device_msc_media_read (VOID  * storage,
                                  ULONG lun,
                                  UCHAR * data_pointer,
                                  ULONG number_blocks,
                                  ULONG lba,
                                  ULONG * media_status)
{
    // Do work. Following is an example for 512B sector.
    memcpy(data_pointer, ramdisk + (512 * lba), 512 * number_blocks);
    return (UX_SUCCESS);
}

// The USBX Device Mass Storage Media Write Function Callback.
UINT    ux_device_msc_media_write (VOID  * storage,
                                   ULONG lun,
                                   UCHAR * data_pointer,
                                   ULONG number_blocks,
```

```
                                    ULONG lba,
                                    ULONG * media_status)
{
    // Do work. Following is an example for 512B sector.
    memcpy(ramdisk + (512 * lba), data_pointer, 512 * number_blocks);
    return (UX_SUCCESS);
}

// USB Thread entry function
void usb_thread_entry(void)
{
    // Do work if required.
}
```

USBX Host Stack User Code Sample

This section describes how user application code to be implemented in a user application thread followed to the auto-generated code, which is described in

Express Logic USBX Auto-generated Code Procedures. User application code for each USBX host class looks different so explained briefly in following sections with code samples.

The user application code follows to auto-generated code needs following processing briefly.

- Specify **User Callback Host Event Notification (Only valid for USB Host)** property of **USBX on ux** component to arbitrary function name ("NULL" by default).
- Use a CDC-ACM Class instance (UX_HOST_CLASS_CDC_ACM type) obtained in the User Callback Host Event Notification function in user application thread.

The code mock-up below briefly explains procedures required for USB communications with a USB CDC-ACM device.

```
static UX_HOST_CLASS_CDC_ACM * p_cdc_acm_class_instance = NULL;

UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class,
                                     VOID * instance)
{
  // Check if host_class is for CDC-ACM class.
  if (UX_SUCCESS ==
      _ux_utility_memory_compare (
          _ux_system_host_class_cdc_acm_name,
          host_class,
          _ux_utility_string_length_get(_ux_system_host_class_cdc_acm_name))
  ){
    // Check the event.
    if (UX_DEVICE_INSERTION == event)
    {
      p_cdc_acm_class_instance = (UX_HOST_CLASS_CDC_ACM *) instance;

      if (UX_HOST_CLASS_CDC_DATA_CLASS ==
          p_cdc_acm_class_instance->ux_host_class_cdc_acm_interface
                          ->ux_interface_descriptor.bInterfaceClass)
```

```
      {
        // Return successful completion.
        status = UX_SUCCESS;
      }
      else
      {
        // Check if the DATA class is on the second interface.
        p_cdc_acm_class_instance = p_cdc_acm_class_instance->
                                   ux_host_class_cdc_acm_next_instance;
        if (UX_NULL == p_cdc_acm_class_instance)
        {
          // We did not find a proper data interface.
          p_cdc_acm_class_instance = NULL;
          status = UX_HOST_CLASS_INSTANCE_UNKNOWN;
        }
        else
        {
          // Check this interface.
          if (UX_HOST_CLASS_CDC_DATA_CLASS ==
            p_cdc_acm_class_instance->ux_host_class_cdc_acm_interface
              ->ux_interface_descriptor.bInterfaceClass)
          {
            // Return successful completion.
            status = UX_SUCCESS;
          }
          else
          {
            // We did not find a proper data interface.
            p_cdc_acm_class_instance = NULL;
            status = UX_HOST_CLASS_INSTANCE_UNKNOWN;
          }
        }
      }
    }
  }
  else if (UX_DEVICE_REMOVAL == event)
  {
    p_cdc_acm_class_instance = NULL;
  }
  return status;
}
```

In user application thread entry function, use *p_cdc_acm_class_instance* obtained in the **User Callback Host Event Notification** required for USBX Host Class CDC_ACM APIs.

The user application code follows to auto-generated code needs following processing briefly.

- Specify **User Callback Host Event Notification (Only valid for USB Host)** property of **USBX on ux** component to arbitrary function name ("NULL" by default).

- Use a HID Class instance (UX_HOST_CLASS_HID type) obtained in the User Callback Host Event Notification function in user application thread.
- Get a HID Client instance (UX_HOST_CLASS_HID_CLIENT type) from the HID Class instance in user application thread.
- Get an instance of the HID Keyboard (UX_HOST_CLASS_HID_KEYBOARD type), Mouse (UX_HOST_CLASS_HID_MOUSE type), or Remote Control(UX_HOST_CLASS_HID_REMOTE_CONTROL type) and use it to get HID report in user application thread.

The code mock-up below briefly explains procedures required for USB communications with a USB device.

```
static UX_HOST_CLASS_HID * p_hid_class_instance;

UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class,
                                     VOID * instance)
{
    // Check if host_class is for HID class.
    if (UX_SUCCESS ==
        _ux_utility_memory_compare (
          _ux_system_host_class_hid_name,
          host_class,
          _ux_utility_string_length_get(_ux_system_host_class_hid_name))
    ){
        // Check the event.
        if (UX_DEVICE_INSERTION == event)
        {
            // Get a USB Host HID Class instance.
            p_hid_class_instance = (UX_HOST_CLASS_HID *) instance;

            // Notify the insertion of a USB HID device.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
        else if (UX_DEVICE_REMOVAL == event)
        {
            p_hid_class_instance = NULL;

            // Notify the removal of a USB HID device.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
    }
    return UX_SUCCESS;
}
```

In user application thread entry function, use *p_hid_class_instance* obtained in the **User Callback Host Event Notification** to get a USBX HID Client Instance.

- Use-case scenario 1:
  - Single USB Mass Storage media is already inserted/connected to the target board before the system boot up.
  - Single USB Mass Storage media is to be inserted before timeout happened.

– NetX/NetX Duo HTTP Server, FTP or TFTP, which require a pointer to the FileX Media Control block is used together.

In this use-case scenario, users can utilize the Auto Media Initialization feature to mount a USB Mass Storage media automatically in the auto-generated code. To enable the feature, set the following configuration properties of **FileX on USB Mass Storage** component.

- Set **Auto Media Initialization** property to "Enable" ("Disable" by default).
- Specify **Name** property ("fx_media0" by default).
- Specify **Name of FileX Media Control block initialization** ("fx_media_init_function0" by default).
- Specify **Timeout ticks for Media Initialization** ("1000" by default). (10 second if ThreadX timer is 10ms per count).
- Specify **User Callback Host Event Notification (Only valid for USB Host)** property of **USBX on ux** component to arbitrary function name ("NULL" by default).

In the Auto Media Initialization mode, user thread will be in suspension in the **FileX Media Control block initialization** function i.e. *fx_media_init_function0* presented in the auto-generated code, then the thread will be resumed when a pointer to the FileX Media Control block i.e. *fx_media0* is obtained. Users can utilize it to access to a USB Mass Storage media through FileX APIs in their application code.

After the USB Mass Storage media is removed, the FileX Media Control block is no longer valid so users need to obtain it again after another device insertion happened. Since **FileX Media Control block initialization** function i.e. *fx_media_init_function0* will not be called automatically at the device insertion second time or later, user application need to call the function to obtain a pointer to the FileX Media Control block by themselves. The function defined in the auto-generated code can be utilized in user application code as a user helper function.

To synchronize user application thread to the USB Mass Storage media insertion or removal timing, use **User Callback Host Event Notification**. Users need to define the callback function in their application code. Here is the mock-up sample of the function.

```
UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class,
                                     VOID * instance)
{
    // Check if host_class is for Mass Storage class.
    if (UX_SUCCESS ==
        _ux_utility_memory_compare (
          _ux_system_host_class_storage_name,
          host_class,
          _ux_utility_string_length_get(_ux_system_host_class_storage_name))
    ){
        // Check the event.
        if (UX_DEVICE_INSERTION == event)
        {
            // Notify the insertion of a USB Mass Storage media.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
        else if (UX_DEVICE_REMOVAL == event)
        {
            // Notify the removal of a USB Mass Storage media.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
    }
```

```
    return UX_SUCCESS;
}
```

NOTE: Auto Media Initialization feature for the USB Mass Storage media supports simple use-case to support single USB Mass Storage media but would not support multiple Mass Storage medias connected behind a USB HUB.

- Use-case scenario 2:
  - User thread cannot be suspended in the auto-generated code.
  - More complexed use-case than use-case scenario1 to use more than one USB flash drive.

In this use-case scenario, users need to disable Auto Media Initialization feature for the USB Mass Storage media and mount it in their application code on the fly when a device is inserted. Set the following configuration properties to support this use-case scenario.

1) Set **Auto Media Initialization** property of **FileX on USB Mass Storage** component to "Disable" ("Disable" by default).
2) Set **User Callback Host Event Notification (Only valid for USB Host)** property of **USBX on ux** component to arbitrary function name ("NULL" by default).

A FileX Media Control block is available to get in the **User Callback Host Event Notification** function. The code example below is the mock-up sample code.

```
UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class,
                                     VOID * instance)
{
    UX_HOST_CLASS_STORAGE_MEDIA * p_ux_host_class_storage_media;
    FX_MEDIA                    * p_fx_media;

    // Check if host_class is for Mass Storage class.
    if (UX_SUCCESS ==
        _ux_utility_memory_compare (
          _ux_system_host_class_storage_name,
          host_class,
          _ux_utility_string_length_get(_ux_system_host_class_storage_name))
    ){
        // Check if the event.
        if (UX_DEVICE_INSERTION == event)
        {
            // Get a pointer to the FX_MEDIA for a USB Mass Storage media.
            // p_fx_media can be used for the media access.
            ux_system_host_storage_fx_media_get (
                instance, &p_ux_host_class_storage_media, &p_fx_media);

            // You may want to get the drive volume serial ID to identify
            // the drive. Here is a hint to do that. Note that 'volume' below
            // is name of buffer to store the volume name of drive.
            // fx_media_volume_get (p_fx_media, volume, FX_BOOT_SECTOR);
```

```
            // Check p_fx_media->fx_media_memory_buffer byte 67-70.
            // The 4bytes show the volume serial ID of the drive
            // in case of FAT32 formatted drive.

            // Save the pointer to FX_MEDIA to use it later in user
            // application. The pointer to UX_HOST_CLASS_STORAGE_MEDIA
            // can be saved if required.

            // Notify the insertion of a USB Mass Storage media.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
        else if (UX_DEVICE_REMOVAL == event)
        {
            // Notify the removal of a USB Mass Storage media.
            tx_event_flags_set (&g_storage_event_flags, …);
        }
    }
    return UX_SUCCESS;
}
```

NOTE: The function named *ux_system_host_storage_fx_media_get* is a helper function defined in the auto-generated code to get a pointer to the FileX Media Control block.

Finally, in user application thread entry function, suspend the thread until the UX_DEVICE_INSERTION event is notified by the **User Callback Host Event Notification** function. When the event happened, user thread will be resumed and be able to access to a USB Mass Storage media using a pointer to the FileX Media Control block obtained in the **User Callback Host Event Notification** function.

The steps highlight key points for the USBX UVC configuration and how to write your application thread to control a UVC device

- Add "USBX Host Class Video" component in the Synergy Configurator.
- Select USBX Port HCD on sf_el_ux for USBHS, and configure "FIFO size for Bulk/Isochronous Pipes" property to "1024 bytes" (preferred) or higher value than that.
- Set the "Number of Isochronous Pipes Reserved" to 0, 1, or 2. Note that, PIPE1-PIPE5 in the Synergy USB controllers can be used for the Bulk transfer; PIPE1 and PIPE2 can be used for the Isochronous transfer, that means, PIPE1 and PIPE2 are shared for the Bulk and Isochronous transfers.
  - If "0" is specified, PIPE1 and PIPE2 are shared for the Bulk or Isochronous. If both PIPEs are used for Bulk, no any PIPE allocation would be made for the Isochronous transfer.
  - If "1" is specified, PIPE1 will be secured for the Isochronous transfer. Bulk PIPEs can be assigned to PIPE2-PIPE5. PIPE2 can be assigned for either of Isochronous or Bulk.
  - If "2" is specified, PIPE1 and PIPE2 will be secured for Isochronous. Bulk PIPEs can be assigned to PIPE3-PIPE5.
- Add application code in your application space. Briefly, you will need to implement:
  - USBX Host event notification callback function to get a UVC instance (The callback needs to be specified to "User Callback for Host Event Notification" property of "USBX on ux" component).

  - USBX UVC transfer request done callback. Typically, a semaphore should be put in the function to synchronize your application thread to the timing of video stream data reception.
  - USBX UVC API calls in your thread entry function
- Add application code in your thread entry function to control your UVC device. Briefly, what you will need are:
  - Wait until the USBX Host event notification callback function is called by USBX and you get an instance of UVC instance. When non-NULL value is obtained for your UVC instance, you can proceed following steps in your application thread.
  - Call ux_host_class_video_transfer_callback_set() to register your USBX UVC transfer request done callback function.
  - Call ux_host_class_video_frame_parameters_set() to set video parameters.
  - Call ux_host_class_video_start() to start the UVC device control. You may need to call ux_host_-class_video_ioctl() instead with UX_HOST_CLASS_VIDEO_IOCTL_CHANNEL_START if your UVC device has special interface configuration in the device descriptor (See section 4. Limitations for more detail).
  - Call ux_host_class_video_transfer_buffer_add() with specifying a user buffer to store video stream data. You will receive video stream data from your UVC device by this API call.
  - Suspend your application thread with a semaphore. The semaphore is to be set in the USBX UVC transfer request done callback function.
  - The USBX UVC transfer request done callback function is called when video stream data is received from a UVC device. Perform any required processing in the function and put the semaphore your application thread is suspending.
  - Your application thread is resumed. Process video stream data to retrieve actual portion of video stream. Video stream data you received contains UVC payload header + payload data. For more detail of the UVC sample isochronous transfer, refer to Video Class specification available from USB.org http://www.usb.org/developers/docs/devclass_docs/
  - Continue the procedure #5 to receive video stream data continuously. When stopping the video stream. Call ux_host_class_video_stop()

The code mock-up below briefly explains procedures required for USB communications with a USB CDC-ACM device.

```
static UX_HOST_CLASS_HID * video_host_class;
/* USBX Host event notification callback function */
UINT ux_host_usr_event_notification(ULONG event, UX_HOST_CLASS * host_class, VOI
D * instance)
{
    if (UX_SUCCESS
            == _ux_utility_memory_compare ("ux_host_class_video",
                                           _host_class,
                                           _ux_utility_string_length_get ((UCHAR
 *)"ux_host_class_video")))
    {
    /* Check if there is a device insertion. */
        if (UX_DEVICE_INSERTION == event)
        {
                video_host_class = instance;
```

```
                /* Set the event flag to let application know the device inserti
on. */
                tx_event_flags_set (&g_device_insert_eventflag, …);
        }
        else if(UX_DEVICE_REMOVAL == event)
        {
                video_host_class = NULL;

                /* Clear the event flag in case the camera was removed before th
e application could clear it. */
                tx_event_flags_set (&g_device_insert_eventflag, …);
        }
    }
    return UX_SUCCESS;
}
```

4.3.10.7 Express Logic USBX Special Linker Sections

The USBX Device Stack configuration uses the following special memory sections in the linker script files. The order of memory sections in the linker script needs to consist of the USB Device Descriptor byte stream, which is given to _ux_device_stack_initialize() function; because of this the linker script definitions must not be modified.

Memory section for the USBX Device Descriptor.

Memory section	USB Descriptor to be defined in the section
.usb_device_desc_fs*	The USB Device Descriptor for FS mode
.usb_config_desc_fs*	The USB Configuration Descriptor for FS mode
.usb_interface_desc_fs*	The USB Interface Descriptor for FS mode
.usb_device_desc_hs*	The USB Device Descriptor for HS mode
.usb_config_desc_hs*	The USB Configuration Descriptor for HS mode
.usb_interface_desc_hs*	The USB Interface Descriptor for HS mode

NOTE: Memory sections for HS mode only exists for Synergy Parts, which has the USBHS controller.

4.3.10.8 Express Logic USBX Memory Requirements

The USBX Device stack or USBX Host stack consumes RAM for the control block. The Synergy Configuration tool allocates memory to the USBX memory pool statically in the auto-generate code. The memory consumption is different for each class as shown in the table below. You need to set the appropriate memory size in bytes to the **USBX Pool Memory Size** property of the USBX on ux component in the Synergy Configuration tool in section "USBX on ux Configuration." If multiple classes are used, set total memory size to the property.

Memory (RAM) requirements for USBX memory pool.

USBX class	S1 parts	The other parts
USBX Device Mass Storage (ux_device_class_storage)	5.8KB	19KB
USBX Device CDC-ACM (ux_device_class_cdc_acm)	5.8KB	18KB
USBX Device HID (ux_device_class_hid)	5.8KB	12KB
USBX Host Mass Storage (ux_host_class_storage)	N/A	- Pre-built library: 42KB Source: 39KB + UX_HOST_CLASS_STORAGE_MEMORY_BUFFER_SIZE + UX_HOST_CLASS_STORAGE_THREAD_STACK_SIZE
USBX Host CDC-ACM (ux_host_class_cdc_acm)	N/A	29KB
USBX Host HID (ux_host_class_hid)	N/A	- HID Mouse: 38KB HID Keyboard: 46KB
USBX Host Video (ux_host_class_video)	N/A	- 35KB

NOTE: The information shown in the table above is valid if compiled with default USBX configurations.

NOTE: The memory size of USBX Classes in the table above are of the Pre-built libraries and following configuration was applied for the builds:

- UX_THREAD_STACK_SIZE: 512(bytes) for S1 parts; 2048(bytes) for the other parts

NOTE: The memory size of USBX Host Mass Storage is also shown with the case built with the Source module. It is because the size depends on the configuration UX_HOST_CLASS_STORAGE_MEMORY_BUFFER_SIZE, and would differ much from the Pre-build library's. Note that the size is with following configuration applied.

- UX_THREAD_STACK_SIZE: 2048(bytes)

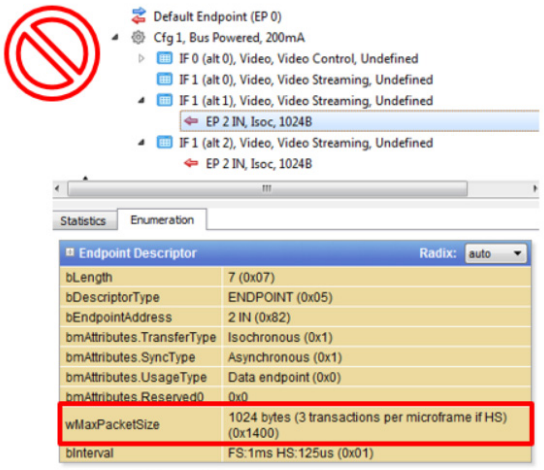
NOTE: The memory size of USBX Host HID shown in the table above is with following configurations (default setting) being made. The size can be reduced if Source module is used.

- UX_HOST_CLASS_HID_DECOMPRESSION_BUFFER: 4096(bytes).
- UX_HOST_CLASS_HID_USAGE: 1024(WORDs).

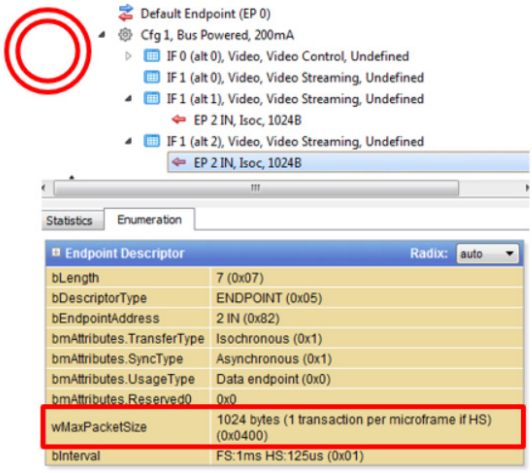
NOTE: The USBX Host Video memory pools size may differ for type of video device attached to the board

4.3.10.9 Express Logic USBX Limitations

- See the SSP Release Notes for known limitations.
- Support for the USB Device vender-specific class is not available.
- The module needs the interrupt of a USB Controller enabled. See section "Logic USBX Synergy Port Framework Limitations" for more information.
- USBX classes (ux_device_class_cdc_ecm, ux_device_class_rndis, ux_host_class_audio, ux_host_class_gser, ux_host_class_printer, ux_host_class_prolific, ux_host_class_swar) and USBX network driver (ux_network_driver) are experimental modules and not yet tested for Synergy parts in this version of SSP. It is not recommended to use them for product developments.
- To specify an Alt. setting in an interface in UVC(USB video class) device, you may need to use the USBX API ux_host_class_video_ioctl() instead of ux_host_class_video_start(), specifying UX_HOST_CLASS_VIDEO_IOCTL_CHANNEL_START for the argument "ioctl_function". You also need to specify the argument parameter with setting the member .ux_host_class_video_parameter_channel_bandwidth_selection to match to the wMaxPacketSize of an isochronous endpoint. For instance, if .ux_host_class_video_parameter_channel_bandwidth_selection is set to 1024 for a UVC device with the device descriptor shown in the figure below, the IF1 Alt.1 will not be selected since it requires high-bandwidth transfer. Instead, IF1 Alt.2 will be selected.



(this will not be selected)



(this will be selected)

Chapter 5 API Reference: Common

You can find error codes and version data structures that are common to the entire Synergy Software Package here.

5.1 Common Error Codes

All SSP code at every layer shares these common error codes.

5.1.1 User-defined enumerations

- ssp_err_t
- ssp_command_t

5.1.2 User-defined macros

- #define SSP_PARAMETER_NOT_USED

  Initial value: `(void) ((p))`

  This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.
- #define SSP_CPP_HEADER

  Initial value:

  Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.
- #define SSP_CPP_FOOTER

  Initial value:
- #define SSP_HEADER

  Initial value: `#define SSP_CPP_HEADER`

  SSP Header and Footer definitions
- #define SSP_FOOTER

  Initial value: `SSP_CPP_FOOTER`

5.1.3 API Data

5.1.3.1 ssp_err_t

`ssp_err_t`

Detailed description

Common error codes

Enumerated values

Name	Description
SSP_SUCCESS	
SSP_ERR_ASSERTION	A critical assertion has failed.
SSP_ERR_INVALID_POINTER	Pointer points to invalid memory location.
SSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
SSP_ERR_INVALID_CHANNEL	Selected channel does not exist.
SSP_ERR_INVALID_MODE	Unsupported or incorrect mode.
SSP_ERR_UNSUPPORTED	Selected mode not supported by this API.
SSP_ERR_NOT_OPEN	Requested channel is not configured or API not open.
SSP_ERR_IN_USE	Channel/peripheral is running/busy.
SSP_ERR_OUT_OF_MEMORY	Allocate more memory in the driver's cfg.h.
SSP_ERR_HW_LOCKED	Hardware is locked.
SSP_ERR_IRQ_BSP_DISABLED	IRQ not enabled in BSP.
SSP_ERR_OVERFLOW	Hardware overflow.
SSP_ERR_UNDERFLOW	Hardware underflow.
SSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
SSP_ERR_APPROXIMATION	Could not set value to exact result.
SSP_ERR_CLAMPED	Value had to be limited for some reason.
SSP_ERR_INVALID_RATE	Selected rate could not be met.
SSP_ERR_ABORTED	An operation was aborted.
SSP_ERR_NOT_ENABLED	Requested operation is not enabled.
SSP_ERR_TIMEOUT	Timeout error.

Name	Description
SSP_ERR_INVALID_BLOCKS	Invalid number of blocks supplied.
SSP_ERR_INVALID_ADDRESS	Invalid address supplied.
SSP_ERR_INVALID_SIZE	Invalid size/length supplied for operation.
SSP_ERR_WRITE_FAILED	Write operation failed.
SSP_ERR_ERASE_FAILED	Erase operation failed.
SSP_ERR_INVALID_CALL	Invalid function call is made.
SSP_ERR_INVALID_HW_CONDITION	Detected hardware is in invalid condition.
SSP_ERR_INVALID_FACTORY_FLASH	Factory flash is not available on this MCU.
SSP_ERR_INVALID_FMI_DATA	Linked FMI data table is not valid.
SSP_ERR_INVALID_STATE	API or command not valid in the current state.
SSP_ERR_INTERNAL	Internal error. Start of RTOS only error codes
SSP_ERR_WAIT_ABORTED	Wait.
SSP_ERR_FRAMING	Framing error occurs. Start of UART specific
SSP_ERR_BREAK_DETECT	Break signal detects.
SSP_ERR_PARITY	Parity error occurs.
SSP_ERR_RXBUF_OVERFLOW	Receive queue overflow.
SSP_ERR_QUEUE_UNAVAILABLE	Can't open s/w queue.
SSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular buffer.
SSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
SSP_ERR_TRANSFER_ABORTED	The data transfer was aborted. Start of SPI specific
SSP_ERR_MODE_FAULT	Mode fault error.
SSP_ERR_READ_OVERFLOW	Read overflow.
SSP_ERR_SPI_PARITY	Parity error.
SSP_ERR_OVERRUN	Overrun error.

Name	Description
SSP_ERR_CLOCK_INACTIVE	Inactive clock specified as system clock. Start of CGC Specific
SSP_ERR_CLOCK_ACTIVE	Active clock source cannot be modified without stopping first.
SSP_ERR_STABILIZED	Clock has stabilized after its been turned on/off.
SSP_ERR_NOT_STABILIZED	Clock has not stabilized after its been turned on/off.
SSP_ERR_MAIN_OSC_INACTIVE	PLL initialization attempted when main osc is turned off.
SSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop LOCO when Oscillation stop is enabled.
SSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detection status flag is set.
SSP_ERR_OSC_STOP_CLOCK_ACTIVE	Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active.
SSP_ERR_CLKOUT_EXCEEDED	Output on target output clock pin exceeds maximum supported limit.
SSP_ERR_USB_MODULE_ENABLED	USB clock configure request with USB Module enabled.
SSP_ERR_HARDWARE_TIMEOUT	A register read or write timed out.
SSP_ERR_PE_FAILURE	Unable to enter Programming mode. Start of FLASH Specific
SSP_ERR_CMD_LOCKED	Peripheral in command locked state.
SSP_ERR_FCLK	FCLK must be >= 4 MHz.
SSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate < reference clock rate. Start of CAC Specific
SSP_ERR_CLOCK_GENERATION	Clock cannot be specified as system clock. Start of GLCD Specific
SSP_ERR_INVALID_TIMING_SETTING	Invalid timing parameter.
SSP_ERR_INVALID_LAYER_SETTING	Invalid layer parameter.
SSP_ERR_INVALID_ALIGNMENT	Invalid memory alignment found.
SSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction parameter.

Name	Description
SSP_ERR_INVALID_LAYER_FORMAT	Invalid color format in layer.
SSP_ERR_INVALID_UPDATE_TIMING	Invalid timing for register update.
SSP_ERR_INVALID_CLUT_ACCESS	Invalid access to CLUT entry.
SSP_ERR_INVALID_FADE_SETTING	Invalid fade-in/fade-out setting.
SSP_ERR_JPEG_ERR	JPEG error. Start of JPEG Specific
SSP_ERR_JPEG_SOI_NOT_DETECTED	SOI not detected until EOI detected.
SSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED	SOF1 to SOFF detected.
SSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT	Unprovided pixel format detected.
SSP_ERR_JPEG_SOF_ACCURACY_ERROR	SOF accuracy error: other than 8 detected.
SSP_ERR_JPEG_DQT_ACCURACY_ERROR	DQT accuracy error: other than 0 detected.
SSP_ERR_JPEG_COMPONENT_ERROR1	Component error1: the number of SOF0 header components detected is other than 1,3,or 4.
SSP_ERR_JPEG_COMPONENT_ERROR2	Component error2: the number of components differs between SOF0 header and SOS.
SSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED	SOF0, DQT, and DHT not detected when SOS detected.
SSP_ERR_JPEG_SOS_NOT_DETECTED	SOS not detected: SOS not detected until EOI detected.
SSP_ERR_JPEG_EOI_NOT_DETECTED	EOI not detected (default)
SSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR	Restart interval data number error detected.
SSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size error detected.
SSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR	Last MCU data number error detected.
SSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR	Block data number error detected.
SSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	User provided buffer size not enough.
SSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	JPEG Image size is not aligned with MCU.
SSP_ERR_CALIBRATE_FAILED	Calibration failed. Start of touch panel framework specific

Name	Description
SSP_ERR_IP_HARDWARE_NOT_PRESENT	Requested IP does not exist on this device. Start of FMI specific
SSP_ERR_IP_UNIT_NOT_PRESENT	Requested unit does not exist on this device.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this device.
SSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool. Start of Message framework specific
SSP_ERR_ILLEGAL_BUFFER_ADDRESS	Buffer address is out of block memory pool.
SSP_ERR_INVALID_WORKBUFFER_SIZE	Work buffer size is invalid.
SSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
SSP_ERR_TOO_MANY_BUFFERS	Number of buffer is too many.
SSP_ERR_NO_SUBSCRIBER_FOUND	No message subscriber found.
SSP_ERR_MESSAGE_QUEUE_EMPTY	No message found in the message queue.
SSP_ERR_MESSAGE_QUEUE_FULL	No room for new message in the message queue.
SSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.
SSP_ERR_BUFFER_RELEASED	Buffer has been released.
SSP_ERR_D2D_ERROR_INIT	Dave/2d has an error in the initialization. Start of 2DG Driver specific
SSP_ERR_D2D_ERROR_DEINIT	Dave/2d has an error in the initialization.
SSP_ERR_D2D_ERROR_RENDERING	Dave/2d has an error in the rendering.
SSP_ERR_D2D_ERROR_SIZE	Dave/2d has an error in the rendering.
SSP_ERR_QUEUE_FULL	Queue is full, cannot queue another data. Start of BYTEQ library specific
SSP_ERR_QUEUE_EMPTY	Queue is empty, no data to dequeue.
SSP_ERR_CTSU_SC_OVERFLOW	Sensor count overflowed when performing CTSU scan. User must clear the CTSUSCOVF bit manually.
SSP_ERR_CTSU_RC_OVERFLOW	Reference count overflowed when performing CTSU scan. User must clear the CTSURCOVF bit manually.

Name	Description
SSP_ERR_CTSU_ICOMP	Abnormal TSCAP voltage. User must clear the CTSUICOMP bit manually.
SSP_ERR_CTSU_OFFSET_ADJUSTMENT_FAILED	Auto tuning algorithm failed.
SSP_ERR_CTSU_SAFETY_CHECK_FAILED	Safety check failed
SSP_ERR_CARD_INIT_FAILED	SD card or eMMC device failed to initialize. Start of SDMMC specific
SSP_ERR_CARD_NOT_INSERTED	SD card not installed.
SSP_ERR_SDHI_FAILED	SD peripheral failed to respond properly.
SSP_ERR_READ_FAILED	Data read failed.
SSP_ERR_CARD_NOT_READY	SD card was removed.
SSP_ERR_CARD_WRITE_PROTECTED	Media is write protected.
SSP_ERR_TRANSFER_BUSY	Transfer in progress.
SSP_ERR_MEDIA_FORMAT_FAILED	Media format failed. Start of FX_IO specific
SSP_ERR_MEDIA_OPEN_FAILED	Media open failed.
SSP_ERR_CAN_DATA_UNAVAILABLE	No data available. Start of CAN specific
SSP_ERR_CAN_MODE_SWITCH_FAILED	Switching operation modes failed.
SSP_ERR_CAN_INIT_FAILED	Hardware initialization failed.
SSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress.
SSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup as a receive mailbox.
SSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is setup as a transmit mailbox.
SSP_ERR_CAN_MESSAGE_LOST	Receive message has been overwritten or overrun.
SSP_ERR_WIFI_CONFIG_FAILED	WiFi module Configuration failed. Start of SF_WIFI Specific
SSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.
SSP_ERR_WIFI_TRANSMIT_FAILED	Transmission failed.
SSP_ERR_WIFI_INVALID_MODE	API called when provisioned in client mode.

Name	Description
SSP_ERR_WIFI_FAILED	WiFi Failed.
SSP_ERR_CELLULAR_CONFIG_FAILED	Cellular module Configuration failed. Start of SF_CELLULAR Specific
SSP_ERR_CELLULAR_INIT_FAILED	Cellular module initialization failed.
SSP_ERR_CELLULAR_TRANSMIT_FAILED	Transmission failed.
SSP_ERR_CELLULAR_FW_UPTODATE	Firmware is uptodate.
SSP_ERR_CELLULAR_FW_UPGRADE_FAILED	Firmware upgrade failed.
SSP_ERR_CELLULAR_FAILED	Cellular Failed.
SSP_ERR_CELLULAR_INVALID_STATE	API Called in invalid state.
SSP_ERR_BLE_FAILED	BLE operation failed. Start of SF_BLE specific
SSP_ERR_BLE_INIT_FAILED	BLE device initialization failed.
SSP_ERR_BLE_CONFIG_FAILED	BLE device configuration failed.
SSP_ERR_BLE_PRF_ALREADY_ENABLED	BLE device Profile already enabled.
SSP_ERR_BLE_PRF_NOT_ENABLED	BLE device not enabled.
SSP_ERR_CRYPTO_CONTINUE	Continue executing function. Start of Crypto specific (0x10000) Refer to sf_cryoto_err.h for Crypto error code.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Hardware resource busy */.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty */.
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid index */.
SSP_ERR_CRYPTO_SCE_RETRY	Retry.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verify is failed.
SSP_ERR_CRYPTO_SCE_ALREADY_OPEN	Crypto Module is already opened.
SSP_ERR_CRYPTO_NOT_OPEN	Hardware module is not initialized.
SSP_ERR_CRYPTO_UNKNOWN	Some unknown error occurred */.
SSP_ERR_CRYPTO_NULL_POINTER	Null pointer input as a parameter */.

Name	Description
SSP_ERR_CRYPTO_NOT_IMPLEMENTED	Algorithm/size not implemented */.
SSP_ERR_CRYPTO_RNG_INVALID_PARAM	An invalid parameter is specified */.
SSP_ERR_CRYPTO_RNG_FATAL_ERROR	A fatal error occurred */.
SSP_ERR_CRYPTO_INVALID_SIZE	Size specified is invalid */.
SSP_ERR_CRYPTO_INVALID_STATE	Function used in an valid state */.
SSP_ERR_CRYPTO_ALREADY_OPEN	control block is already opened */
SSP_ERR_CRYPTO_INSTALL_KEY_FAILED	Specified input key is invalid. */.
SSP_ERR_CRYPTO_AUTHENTICATION_FAILED	Authentication failed */.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common is not opened. Start of SF_CRYPTO specific
SSP_ERR_CRYPTO_HAL_ERROR	Cryoto HAL module returned an error.
SSP_ERR_CRYPTO_KEY_BUF_NOT_ENOUGH	Key buffer size is not enough to generate a key.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Attempt to write data larger than what the buffer can hold.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode.
SSP_ERR_MESSAGE_TOO_LONG	Message for RSA encryption is too long.
SSP_ERR_RSA_DECRYPTION_ERROR	RSA Decryption error.

5.1.3.2 ssp_command_t

`ssp_command_t`

Detailed description

ioctl commands.

Enumerated values

Name	Description
SSP_COMMAND_GET_SECTOR_COUNT	Get media sector count.
SSP_COMMAND_GET_SECTOR_SIZE	Get sector size.

Name	Description
SSP_COMMAND_GET_BLOCK_SIZE	Get erase block size.
SSP_COMMAND_CTRL_ERASE_SECTOR	Erase sectors.
SSP_COMMAND_GET_WRITE_PROTECTED	Get Write Protection status.
SSP_COMMAND_SET_BLOCK_SIZE	Set block size.

Chapter 6 API Reference: Framework Interfaces

6.1 API Reference: Framework Interfaces

The Framework Interface provides common APIs for functional Framework Layer applications. The Framework Interfaces can be implemented by one or more Framework Layer drivers.

- ADC Periodic Framework Interface
- Audio Framework Interface
- Audio Playback Framework Interface
- Audio Recording Framework Interface
- SF BLE Framework Interface
- SF BLE On-Board Profile Framework Interface
- SF BLE Alert Notification Profile Framework Interface
- SF BLE Battery Service Profile Framework Interface
- SF BLE Blood Pressure Profile Framework Interface
- SF BLE Current Time Service Profile Framework Interface
- SF BLE Find Me Profile Framework Interface
- SF BLE HID Over GATT Profile Framework Interface
- SF BLE Heart Rate Profile Framework Interface
- SF BLE Health Thermometer Profile Framework Interface
- SF BLE Immediate Alert Profile Framework Interface
- SF BLE Next DST Change Service Profile Framework Interface
- SF BLE Phone Alert Status Profile Framework Interface
- SF BLE Proximity Profile Framework Interface
- SF BLE Reference Time Update Service Profile Framework Interface
- SF BLE Scan Parameters Service Profile Framework Interface
- SF BLE Time Information Profile Framework Interface
- Block Media Framework Interface
- SF CELLULAR Framework Interface
- SF CELLULAR NSAL Framework Interface

6.2 ADC Periodic Framework Interface

RTOS-integrated ADC Periodic Framework Interface.

6.2.1 Summary

This is a ThreadX aware generic Periodic ADC sampling framework intended to be used to sample the ADC at periodic intervals, buffer the specified number of samples and then notify the application. The driver will use hardware triggers to allow for time-synchronous sampling. After initial configuration and the scan process is started, the framework uses a hardware timer to trigger an ADC scan in one-shot mode. Each scan can consist of one or more channels. When each scan is completed the ADC interrupt is intercepted by the DTC which moves the result of the scan into the user buffer. Each scan is defined as a sampling iteration and the number of samples generated for each scan will be equal to the number of channels if the channels are sequential eg: channels 1, 2, 3, 4. If the channels are not in sequence, eg: channels 1, 3, 4, 5, then the samples generated by each scan will also include data from the unused channels in between. Thus the second example here will result in 5 samples being stored to the user buffer each time even though only 4 channels have been configured for usage. The user specifies the total number of sample iterations that need to occur before being notified. When the specified number of sampling iterations have occurred and the data for each iteration has been stored into the user buffer, the user is notified via the callback function with an index for the valid data in the buffer and an event indicating that sampling for the specified number of iterations is complete. Unless the user stops the scan process using the stop API call, the scan will continue to be triggered by the timer and data will be written into the user buffer which is treated by the framework as a circular buffer. For this reason, the buffer length must be at least twice the total number of samples that will be generate after all the iterations are completed. In the second example, where there are 5 samples generated for each iteration, if the sample count is set to 3, this will result in 15 samples being available in the buffer before the callback is called. Thus in this example, the buffer length must be set to 30 or larger. The name and length of the buffer is specified via the framework configuration structure.

Implemented by: ADC Interface

ADC Periodic Framework Interface description: ADC Periodic Framework

6.2.2 Interface API

sf_adc_periodic_api_t

Function name	Description
.open	Acquires mutex, then initializes driver at the HAL layer
.start	Starts the scan.
.stop	Stops the hardware trigger (timer) from triggering any more ADC scans.
.close	Releases channel mutex and closes channel at HAL layer.
.versionGet	Gets version and stores it in provided pointer p_version.

6.2.6 Defines

- #define SF_ADC_PERIODIC_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_ADC_PERIODIC_API_VERSION_MINOR

  Initial value: `(3U)`

6.2.7 API Data

6.2.7.1 sf_adc_periodic_event_t

```
sf_adc_periodic_event_t
```

Detailed description

Options for the callback events.

Enumerated values

Name	Description
SF_ADC_PERIODIC_EVENT_NEW_DATA	New data is available in the buffer.

6.2.7.2 sf_adc_periodic_ctrl_t

```
typedef void sf_adc_periodic_ctrl_t
```

Detailed description

ADC periodic framework control block. Allocate an instance specific control block to pass into the ADC periodic framework API calls. Implemented as

- sf_adc_periodic_instance_ctrl_t

6.2.8 API Structures

6.2.8.1 sf_adc_periodic_callback_args_t

sf_adc_periodic_callback_args_t

Detailed description

ADC callback arguments definitions

Variables

- sf_adc_periodic_event_t event

  Periodic ADC callback event.

- uint32_t buffer_index

  Index to the buffer where the new data is stored.

- void const * p_context

  Placeholder for user data.

- adc_data_size_t * p_data_buffer

  Pointer to the buffer that will store the samples.

- uint32_t num_new_samples

  Number of new samples in the data buffer.

6.2.8.2 sf_adc_periodic_cfg_t

sf_adc_periodic_cfg_t

Detailed description

Configuration for RTOS integrated ADC driver

Variables

- adc_instance_t const *const p_lower_lvl_adc

  Pointer to the ADC instance.

- timer_instance_t const *const p_lower_lvl_timer

  Pointer to the Timer instance.

- transfer_instance_t const *const p_lower_lvl_transfer

  Pointer to the Transfer instance.

- adc_data_size_t * p_data_buffer

  Pointer to the buffer that will store the samples.
- uint32_t data_buffer_length

  Length of the data buffer that will store the samples.
- uint32_t sample_count

  Samples per channel to be buffered before notifying the app.
- elc_event_t scan_trigger

  The hardware trigger that starts the ADC scan.
- void(* p_callback)(sf_adc_periodic_callback_args_t *p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.
- void const * p_extend

  Extension parameter for hardware specific settings.

6.2.8.3 sf_adc_periodic_api_t

sf_adc_periodic_api_t

Detailed description

Framework Periodic ADC API structure. Implementations will use the following API.

6.2.8.4 open

```
ssp_err_t(* sf_adc_periodic_api_t::open) (sf_adc_periodic_ctrl_t *const p_ctrl,
sf_adc_periodic_cfg_t const *const p_cfg)
```

Detailed description

Acquires mutex, then initializes driver at the HAL layer

Table 1: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. Elements initialized here.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: sf_adc_periodic_ctrl_t*const p_ctrl

ADC periodic framework control block. Allocate an instance specific control block to pass into the ADC periodic framework API calls. Implemented assf_adc_periodic_instance_ctrl_t

Parameter p_cfg

Definition: sf_adc_periodic_cfg_t const *const p_cfg

Configuration for RTOS integrated ADC driver

- sf_adc_periodic_cfg_t::adc_instance_t

  Pointer to the ADC instance.
- sf_adc_periodic_cfg_t::timer_instance_t

  Pointer to the Timer instance.
- sf_adc_periodic_cfg_t::transfer_instance_t

  Pointer to the Transfer instance.
- sf_adc_periodic_cfg_t::p_data_buffer

  Pointer to the buffer that will store the samples.
- sf_adc_periodic_cfg_t::data_buffer_length

  Length of the data buffer that will store the samples.
- sf_adc_periodic_cfg_t::sample_count

  Samples per channel to be buffered before notifying the app.
- sf_adc_periodic_cfg_t::elc_event_t

  The hardware trigger that starts the ADC scan.
- sf_adc_periodic_cfg_t::p_callback

  Callback function.
- sf_adc_periodic_cfg_t::p_context

  Placeholder for user data.
- sf_adc_periodic_cfg_t::p_extend

  Extension parameter for hardware specific settings.

6.2.8.5 start

```
ssp_err_t(* sf_adc_periodic_api_t::start) (sf_adc_periodic_ctrl_t *const p_ctrl)
```

Detailed description

Starts the scan.

ATTENTION: The driver will enable the ADC to be triggered via timer event; there will be a time delay from the time this function is called to the time the hardware timer count expires and triggers the scan.

Table 2: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in SF_ADC_PERIODIC_Open.

Parameter p_ctrl

Definition: `sf_adc_periodic_ctrl_t*const p_ctrl`

ADC periodic framework control block. Allocate an instance specific control block to pass into the ADC periodic framework API calls. Implemented assf_adc_periodic_instance_ctrl_t

6.2.8.6 stop

```
ssp_err_t(* sf_adc_periodic_api_t::stop) (sf_adc_periodic_ctrl_t *const p_ctrl)
```

Detailed description

Stops the hardware trigger (timer) from triggering any more ADC scans.

Table 3: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in SF_ADC_PERIODIC_Open.

Parameter p_ctrl

Definition: `sf_adc_periodic_ctrl_t*const p_ctrl`

ADC periodic framework control block. Allocate an instance specific control block to pass into the ADC periodic framework API calls. Implemented assf_adc_periodic_instance_ctrl_t

6.2.8.7 close

```
ssp_err_t(* sf_adc_periodic_api_t::close) (sf_adc_periodic_ctrl_t *const p_ctrl)
```

Detailed description

Releases channel mutex and closes channel at HAL layer.

Table 4: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in SF_ADC_PERIODIC_Open.

Parameter p_ctrl

Definition: `sf_adc_periodic_ctrl_t*const p_ctrl`

ADC periodic framework control block. Allocate an instance specific control block to pass into the ADC periodic framework API calls. Implemented assf_adc_periodic_instance_ctrl_t

6.2.8.8 versionGet

```
ssp_err_t(* sf_adc_periodic_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 5: Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.2.8.9 sf_adc_periodic_instance_t

sf_adc_periodic_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_adc_periodic_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_adc_periodic_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_adc_periodic_api_t const * p_api

  Pointer to the API structure for this instance.

6.3 Audio Framework Interface

RTOS-integrated Audio Framework Interface.

6.3.1 Summary

The Audio Interface is a ThreadX-aware Audio Framework Interface. The Interface is implemented by the Audio Framework using the Timer driver, the Transfer driver, and a choice of the following drivers for playback: DAC, PWM (to be implemented), or I2S (to be implemented).

Interfaces used:

- Transfer Interface
- DAC Interface
- Timer Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Audio Framework Interface description: Audio Playback Framework

6.3.2 Interface API

sf_audio_playback_api_t

Function name	Description
.open	Configure the audio framework by creating a thread for audio playback and configuring HAL layer drivers used. This function must be called before any other audio functions.
.close	The close API handles cleans up internal driver data.
.start	Play audio. Currently only 16-bit mono PCM buffers are supported.
.pause	Pause audio playback. This stops the peripheral that triggers the DMA/DTC transfer and posts a flag to notify SF_AUDIO_PLAYBACK_Start() to pause any playback in progress.
.stop	Stop audio playback. Causes SF_AUDIO_PLAYBACK_Start() halt playback and return.
.resume	Resume audio playback. Posts a flag to notify SF_AUDIO_PLAYBACK_Start() to restart the peripheral that triggers the DMA/DTC transfer.

Function name	Description
.volumeSet	Set software volume control. Software volume control is applied globally to all streams on the hardware.
.versionGet	Store version information in provided pointer.

6.3.3 Data structures

- sf_audio_playback_data_t
- sf_audio_playback_common_cfg_t
- sf_audio_playback_cfg_t
- sf_audio_playback_instance_t

6.3.4 Enumerations

- sf_audio_playback_status_t

6.3.5 Typedefs

- sf_audio_playback_common_ctrl_t
- sf_audio_playback_ctrl_t

6.3.6 Defines

- #define SF_AUDIO_PLAYBACK_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_AUDIO_PLAYBACK_API_VERSION_MINOR

  Initial value: `(3U)`
- #define SF_AUDIO_PLAYBACK_MESSAGE_WORDS

  Initial value: `((sizeof(sf_message_payload_audio_t) + 3) / 4)`

  Audio playback message size in 4 byte words, rounded up.
- #define SF_AUDIO_PLAYBACK_MAX_VOLUME

  Initial value: `(255)`

  Macro defining the maximum volume.

6.3.7 API Data

6.3.7.1 sf_audio_playback_status_t

```
sf_audio_playback_status_t
```

Detailed description

Audio playback status.

Enumerated values

Name	Description
SF_AUDIO_PLAYBACK_STATUS_STOPPED	Stream is available to be used.
SF_AUDIO_PLAYBACK_STATUS_PAUSED	Stream is paused.
SF_AUDIO_PLAYBACK_STATUS_PLAYING	Stream is playing data.
SF_AUDIO_PLAYBACK_STATUS_WAITING	Stream is between packets, waiting for the next data message.

6.3.7.2 sf_audio_playback_common_ctrl_t

```
typedef void sf_audio_playback_common_ctrl_t
```

Detailed description

Audio playback common control block. Allocate an instance specific control block to pass to open in sf_audio_playback_cfg_t. Implemented as

- sf_audio_playback_common_instance_ctrl_t

6.3.7.3 sf_audio_playback_ctrl_t

```
typedef void sf_audio_playback_ctrl_t
```

Detailed description

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented as

- sf_audio_playback_instance_ctrl_t

6.3.8 API Structures

6.3.8.1 sf_audio_playback_data_t

sf_audio_playback_data_t

Detailed description

Audio data for playback.

Variables

- sf_message_header_t header

  Required common members of messaging framework payloads.

- sf_audio_playback_data_type_t type

  Data type. Must be uncompressed.

- uint32_t size_bytes

  Size of data in bytes.

- void const * p_data

  Pointer to data. Data start address must be 4-byte aligned.

- UINT loop_timeout

  ThreadX timeout, select TX_NO_WAIT to play the entire buffer once, TX_WAIT_FOREVER to loop until SF_AUDIO_PLAYBACK_Pause is called from another thread, or any timeout value from (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts to loop until the tick counts expire.

- bool stream_end

  This releases ownership of the stream and allows other threads to post data. Set to true if not more data will be sent as a part of this logical bitstream. Set to false if more packets are being prepared.

6.3.8.2 sf_audio_playback_common_cfg_t

sf_audio_playback_common_cfg_t

Detailed description

Common configuration for RTOS integrated audio framework. Shared by all streams.

Variables

- UINT priority

  Priority of the audio playback thread.

- sf_audio_playback_hw_instance_t const * p_lower_lvl_hw

  Hardware instance.

- sf_message_instance_t const * p_message

  Pointer to messaging framework instance used to post audio messages.

- TX_QUEUE * p_queue

  Pointer to the messaging framework queue specified for this audio stream. Must be subscribed to the SF_MESSAGE_EVENT_CLASS_AUDIO event class.

- void const * p_extend

  Implementation specific extension configuration.

6.3.8.3 sf_audio_playback_cfg_t

sf_audio_playback_cfg_t

Detailed description

Per stream configuration for RTOS integrated audio framework.

Variables

- void(* p_callback)(sf_message_callback_args_t *p_args)

  Callback called when playback of a buffer passed to sf_audio_playback_api_t::start is complete. Set to NULL for no callback.

- sf_audio_playback_common_ctrl_t * p_common_ctrl

  Pointer to the hardware control block used by this stream.

- sf_audio_playback_common_cfg_t const * p_common_cfg

  Pointer to common configurations shared by all streams using the same hardware.

- uint8_t class_instance

  Class instance used to identify the stream to the messaging framework.

6.3.8.4 sf_audio_playback_api_t

sf_audio_playback_api_t

Detailed description

Audio playback API structure. Audio playback implementations use the following API.

6.3.8.5 open

```
ssp_err_t(* sf_audio_playback_api_t::open) (sf_audio_playback_ctrl_t *const
p_ctrl, sf_audio_playback_cfg_t const *const p_cfg)
```

Brief description

Configure the audio framework by creating a thread for audio playback and configuring HAL layer drivers used. This function must be called before any other audio functions.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Open

Table 6: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a device structure allocated by user. The device control structure is initialized in this function.

Table 6: Parameters (Continued)

Name	Direction	Description
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

Parameter p_cfg

Definition: `sf_audio_playback_cfg_t const *const p_cfg`

Per stream configuration for RTOS integrated audio framework.

- `sf_audio_playback_cfg_t`::`p_callback`

  Callback called when playback of a buffer passed to sf_audio_playback_api_t::start is complete. Set to NULL for no callback.

- `sf_audio_playback_cfg_t`::`sf_audio_playback_common_ctrl_t`

  Pointer to the hardware control block used by this stream.

- `sf_audio_playback_cfg_t`::`sf_audio_playback_common_cfg_t`

  Pointer to common configurations shared by all streams using the same hardware.

- `sf_audio_playback_cfg_t`::`class_instance`

  Class instance used to identify the stream to the messaging framework.

6.3.8.6 close

```
ssp_err_t(* sf_audio_playback_api_t::close) (sf_audio_playback_ctrl_t *const p_ctrl)
```

Brief description

The close API handles cleans up internal driver data.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Close

Table 7: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for audio driver.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

6.3.8.7 start

```
ssp_err_t(* sf_audio_playback_api_t::start) (sf_audio_playback_ctrl_t *const
p_ctrl, sf_audio_playback_data_t *const p_data, UINT const timeout)
```

Brief description

Play audio. Currently only 16-bit mono PCM buffers are supported.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Start

NOTE: Call SF_MESSAGE_Open to configure the messaging framework control block and queues with the parameters specified in sf_audio_playback_cfg_t::p_message and sf_audio_playback_cfg_t::p_queue.

Table 8: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to device control block initialized in Open call for audio driver.
p_data	in	Pointer to data, description, timeout values, and synchronization options.

Table 8: Parameters (Continued)

Name	Direction	Description
timeout	in	ThreadX timeout, represents the maximum amount of time to wait to post to the audio queue. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout values from 0x00000001 through 0xFFFFFFFE in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

Parameter p_data

Definition: `sf_audio_playback_data_t*const p_data`

Audio data for playback.

- `sf_audio_playback_data_t::header`

  Required common members of messaging framework payloads.

- `sf_audio_playback_data_t::type`

  Data type. Must be uncompressed.

- `sf_audio_playback_data_t::size_bytes`

  Size of data in bytes.

- `sf_audio_playback_data_t::p_data`

  Pointer to data. Data start address must be 4-byte aligned.

- `sf_audio_playback_data_t::loop_timeout`

  ThreadX timeout, select TX_NO_WAIT to play the entire buffer once, TX_WAIT_FOREVER to loop until SF_AUDIO_PLAYBACK_Pause is called from another thread, or any timeout value from (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts to loop until the tick counts expire.

- `sf_audio_playback_data_t::stream_end`

  This releases ownership of the stream and allows other threads to post data. Set to true if not more data will be sent as a part of this logical bitstream. Set to false if more packets are being prepared.

Parameter timeout

`const`

6.3.8.8 pause

```
ssp_err_t(* sf_audio_playback_api_t::pause) (sf_audio_playback_ctrl_t *const
p_ctrl)
```

Brief description

Pause audio playback. This stops the peripheral that triggers the DMA/DTC transfer and posts a flag to notify SF_AUDIO_PLAYBACK_Start to pause any playback in progress.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Pause

NOTE: Call SF_AUDIO_PLAYBACK_Start before using this function. Calling SF_AUDIO_PLAYBACK_Pause before SF_AUDIO_PLAYBACK_Start has no effect and does not return an error code.

Table 9: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for audio driver.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

6.3.8.9 stop

```
ssp_err_t(* sf_audio_playback_api_t::stop) (sf_audio_playback_ctrl_t *const
p_ctrl)
```

Brief description

Stop audio playback. Causes SF_AUDIO_PLAYBACK_Start halt playback and return.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Stop

NOTE: Call SF_AUDIO_PLAYBACK_Start before using this function. Calling SF_AUDIO_PLAYBACK_Stop before SF_AUDIO_PLAYBACK_Start has no effect and does not return an error code.

Table 10: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for audio driver.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

6.3.8.10 resume

```
ssp_err_t(* sf_audio_playback_api_t::resume) (sf_audio_playback_ctrl_t *const p_ctrl)
```

Brief description

Resume audio playback. Posts a flag to notify SF_AUDIO_PLAYBACK_Start to restart the peripheral that triggers the DMA/DTC transfer.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_Resume

NOTE: Call SF_AUDIO_PLAYBACK_Pause before using this function. Calling SF_AUDIO_PLAYBACK_Resume before SF_AUDIO_PLAYBACK_Pause has no effect and does not return an error code.

Table 11: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for audio driver.

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

6.3.8.11 volumeSet

```
ssp_err_t(* sf_audio_playback_api_t::volumeSet) (sf_audio_playback_ctrl_t *const
p_ctrl, uint8_t const volume)
```

Brief description

Set software volume control. Software volume control is applied globally to all streams on the hardware.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_VolumeSet

ATTENTION: Software volume control reduces resolution and may require extra memory and processing bandwidth.

Table 12: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for audio driver.
volume	in	Volume level requested. Valid range is from 0 (muted, which will stop playback) to 255 (maximum volume, default on open).

Parameter p_ctrl

Definition: `sf_audio_playback_ctrl_t*const p_ctrl`

Audio playback framework control block. Allocate an instance specific control block to pass into the audio playback framework API calls. Implemented assf_audio_playback_instance_ctrl_t

Parameter volume

`uint8_t`

6.3.8.12 versionGet

```
ssp_err_t(* sf_audio_playback_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Store version information in provided pointer.

Detailed description

Implemented as

- SF_AUDIO_PLAYBACK_VersionGet

Table 13: Parameters

Name	Direction	Description
p_version	in	Pointer to device control block initialized in Open call for UART driver.

Parameter p_version

6.3.8.13 sf_audio_playback_instance_t

sf_audio_playback_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_audio_playback_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_audio_playback_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_audio_playback_api_t const * p_api

  Pointer to the API structure for this instance.

6.4 Audio Playback Framework Interface

RTOS-integrated Audio Playback Framework Interface.

6.4.1 Summary

Audio playback driver to play buffers of audio data.

Implemented by: DAC Audio Playback Framework

Audio Framework Interface description: Audio Playback Framework

6.4.2 Interface API

sf_audio_playback_hw_api_t

Function name	Description
.open	Open a device channel for read/write and control.
.start	Start audio playback hardware.
.stop	Stop audio playback hardware.
.play	Play audio buffer.
.dataTypeGet	Stores expected data type in provided pointer p_data_type.
.close	Close the audio driver.
.versionGet	Return the version of the driver.

6.4.3 Data structures

- sf_audio_playback_data_type_t
- sf_audio_playback_hw_callback_args_t
- sf_audio_playback_hw_cfg_t
- sf_audio_playback_hw_instance_t

6.4.4 Typedefs

- sf_audio_playback_hw_ctrl_t

6.4.5 Defines

- #define SF_AUDIO_PLAYBACK_HW_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define SF_AUDIO_PLAYBACK_HW_API_VERSION_MINOR
  Initial value: `(2U)`

6.4.6 API Data

6.4.6.1 sf_audio_playback_hw_ctrl_t

```
typedef void sf_audio_playback_hw_ctrl_t
```

Detailed description

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented as

- sf_audio_playback_hw_dac_instance_ctrl_t
- sf_audio_playback_hw_i2s_instance_ctrl_t

6.4.7 API Structures

6.4.7.1 sf_audio_playback_data_type_t

sf_audio_playback_data_type_t

Detailed description

Audio data type.

Variables

- uint8_t scale_bits_max

  Maximum data resolution in bits.

- bool is_signed

  Set to 1 for signed samples, or 0 for unsigned samples.

6.4.7.2 sf_audio_playback_hw_callback_args_t

sf_audio_playback_hw_callback_args_t

Detailed description

Callback function parameter data

Variables

- void * p_context

  Placeholder for user data. Set in sf_audio_playback_hw_api_t::open function in sf_audio_playback_hw_cfg_t.

6.4.7.3 sf_audio_playback_hw_cfg_t

sf_audio_playback_hw_cfg_t

Detailed description

Audio playback driver configuration.

Variables

- void(* p_callback)(sf_audio_playback_hw_callback_args_t *p_args)

  Callback called when play is complete. Set to NULL for no callback.
- void * p_context

  Placeholder for user data. Passed to the user callback in sf_audio_playback_hw_callback_args_t.
- void const * p_extend

  Hardware dependent configuration.

6.4.7.4 sf_audio_playback_hw_api_t

sf_audio_playback_hw_api_t

Detailed description

Audio playback API definition.

6.4.7.5 open

```
(* sf_audio_playback_hw_api_t::open) (sf_audio_playback_hw_ctrl_t *const p_ctrl,
sf_audio_playback_hw_cfg_t const *const p_cfg)
```

Detailed description

Open a device channel for read/write and control. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_Open

Table 14: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to memory allocated for control block.
p_cfg	in	Pointer to the hardware configurations.

Parameter p_ctrl

Definition: `sf_audio_playback_hw_ctrl_t*const p_ctrl`

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented
assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

Parameter p_cfg

Definition: `sf_audio_playback_hw_cfg_t const *const p_cfg`

Audio playback driver configuration.

- sf_audio_playback_hw_cfg_t::p_callback

  Callback called when play is complete. Set to NULL for no callback.

- sf_audio_playback_hw_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in sf_audio_playback_hw_callback_args_t.

- sf_audio_playback_hw_cfg_t::p_extend

  Hardware dependent configuration.

6.4.7.6 start

```
(* sf_audio_playback_hw_api_t::start) (sf_audio_playback_hw_ctrl_t *const p_ctrl)
```

Detailed description

Start audio playback hardware. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_Start

Table 15: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized in open.

Parameter p_ctrl

Definition: sf_audio_playback_hw_ctrl_t*const p_ctrl

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented
assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

6.4.7.7 stop

```
(* sf_audio_playback_hw_api_t::stop) (sf_audio_playback_hw_ctrl_t *const p_ctrl)
```

Detailed description

Stop audio playback hardware. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_Stop

Table 16: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized in open.

Parameter p_ctrl

Definition: `sf_audio_playback_hw_ctrl_t*const p_ctrl`

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

6.4.7.8 play

```
(* sf_audio_playback_hw_api_t::play) (sf_audio_playback_hw_ctrl_t *const p_ctrl,
int16_t const *const p_buffer, uint32_t length)
```

Detailed description

Play audio buffer. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_Play

Table 17: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized in open.
p_buffer	in	Pointer to buffer with PCM samples to play. Data must be scaled for audio playback hardware.
length	in	Length of data in p_buffer.

Parameter p_ctrl

Definition: `sf_audio_playback_hw_ctrl_t*const p_ctrl`

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

Parameter p_buffer

Parameter length

uint32_t

6.4.7.9 dataTypeGet

(* sf_audio_playback_hw_api_t::dataTypeGet) (sf_audio_playback_hw_ctrl_t *const p_ctrl, sf_audio_playback_data_type_t *const p_data_type)

Detailed description

Stores expected data type in provided pointer p_data_type. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_DataTypeGet

Table 18: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized in open.
p_data_type	out	Pointer to audio sample data type required by hardware.

Parameter p_ctrl

Definition: sf_audio_playback_hw_ctrl_t*const p_ctrl

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented
assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

Parameter p_data_type

Definition: sf_audio_playback_data_type_t*const p_data_type

Audio data type.

- sf_audio_playback_data_type_t::scale_bits_max

  Maximum data resolution in bits.

- sf_audio_playback_data_type_t::is_signed

  Set to 1 for signed samples, or 0 for unsigned samples.

6.4.7.10 close

(* sf_audio_playback_hw_api_t::close) (sf_audio_playback_hw_ctrl_t *const p_ctrl)

Detailed description

Close the audio driver. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_Close

Table 19: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized in open.

Parameter p_ctrl

Definition: `sf_audio_playback_hw_ctrl_t*const p_ctrl`

Audio playback hardware control block. Allocate an instance specific control block to pass into the audio playback hardware API calls. Implemented
assf_audio_playback_hw_dac_instance_ctrl_tsf_audio_playback_hw_i2s_instance_ctrl_t

6.4.7.11 versionGet

```
(* sf_audio_playback_hw_api_t::versionGet) ( *const p_version)
```

Detailed description

Return the version of the driver. Implemented as

- SF_AUDIO_PLAYBACK_HW_DAC_VersionGet

Table 20: Parameters

Name	Direction	Description
p_version	out	Pointer to variable that will be populated with version information.

Parameter p_version

6.4.7.12 sf_audio_playback_hw_instance_t

sf_audio_playback_hw_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_audio_playback_hw_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_audio_playback_hw_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_audio_playback_hw_api_t const * p_api

  Pointer to the API structure for this instance.

6.5 Audio Recording Framework Interface

RTOS-integrated Audio Recording Framework Interface.

6.5.1 Summary

The Audio Record Interface is a ThreadX-aware Interface for Audio Recording. The Interface is implemented by the ADC Audio Recording Framework using the ADC periodic Framework driver for recording. The interface is implemented by the I2S Audio Recording Framework using the I2S driver for recording.

Interfaces used:

- ADC Periodic Framework
- I2S Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

6.5.2 Interface API

sf_audio_record_api_t

Function name	Description
.open	Initializes audio recording framework.
.start	Starts audio recording.
.stop	Stops audio recording.

Function name	Description
.infoGet	Gets channel information(Mono/Stereo).
.close	Releases channel mutex and closes channel at HAL layer.
.versionGet	Gets version and stores it in provided pointer p_version.

6.5.3 Data structures

- sf_audio_record_info_t
- sf_audio_record_callback_args_t
- sf_audio_record_cfg_t
- sf_audio_record_instance_t

6.5.4 Enumerations

- sf_audio_record_channel_t
- sf_audio_record_data_size_t
- sf_audio_record_event_t

6.5.5 Typedefs

- sf_audio_record_ctrl_t

6.5.6 Defines

- #define SF_AUDIO_RECORD_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_AUDIO_RECORD_API_VERSION_MINOR

  Initial value: `(2U)`

6.5.7 API Data

6.5.7.1 sf_audio_record_channel_t

```
sf_audio_record_channel_t
```

Detailed description

Definition of audio recording mode.

Enumerated values

Name	Description
SF_AUDIO_RECORD_CHANNEL_MONO	Support Mono Channel.
SF_AUDIO_RECORD_CHANNEL_STEREO	Support Stereo Channel.

6.5.7.2 sf_audio_record_data_size_t

```
sf_audio_record_data_size_t
```

Detailed description

Definition of audio recording data sample size.

Enumerated values

Name	Description
SF_AUDIO_RECORD_DATA_SIZE_8BIT	data width in the sample is 8bit
SF_AUDIO_RECORD_DATA_SIZE_16BIT	data width in the sample is 16bit

6.5.7.3 sf_audio_record_event_t

```
sf_audio_record_event_t
```

Detailed description

Definition of events for audio recording.

Enumerated values

Name	Description
SF_AUDIO_RECORD_EVENT_NEW_DATA	New data is available in the buffer.

6.5.7.4 sf_audio_record_ctrl_t

```
typedef void sf_audio_record_ctrl_t
```

Detailed description

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented as

- sf_audio_record_adc_instance_ctrl_t
- sf_audio_record_i2s_instance_ctrl_t

6.5.8 API Structures

6.5.8.1 sf_audio_record_info_t

sf_audio_record_info_t

Detailed description
Variables

- sf_audio_record_channel_t channel_info

6.5.8.2 sf_audio_record_callback_args_t

sf_audio_record_callback_args_t

Detailed description
Variables

- sf_audio_record_event_t event

  Audio callback event.
- uint32_t buffer_index

  Index to the buffer where the new data is stored.
- void const * p_context

  Placeholder for user data.

6.5.8.3 sf_audio_record_cfg_t

sf_audio_record_cfg_t

Detailed description

Configuration for audio recording framework

Variables

- sf_audio_record_data_size_t capture_data_size

  Size of data in the sample 8 or 16 bit.
- uint32_t sampling_rate_hz

  Sampling rate for audio capture.
- void * p_capture_data_buffer

  Pointer to the buffer that will store the samples
- uint32_t capture_data_buffer_size

  total size of buffer configured by user to store samples

- uint32_t sample_count

  Samples per channel to be buffered before notifying the user via callback
- void(* p_callback)(sf_audio_record_callback_args_t *p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.
- void const * p_extend

  Extension parameter for hardware specific settings.

6.5.8.4 sf_audio_record_api_t

sf_audio_record_api_t

Detailed description

Framework Audio Recording API structure. Implementations will use the following API.

6.5.8.5 open

```
ssp_err_t(* sf_audio_record_api_t::open) (sf_audio_record_ctrl_t *const p_ctrl,
sf_audio_record_cfg_t const *const p_cfg)
```

Brief description

Initializes audio recording framework.

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_Open
- SF_AUDIO_RECORD_I2S_Open

Table 21: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. Elements initialized here.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_audio_record_ctrl_t*const p_ctrl`

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented assf_audio_record_adc_instance_ctrl_tsf_audio_record_i2s_instance_ctrl_t

Parameter p_cfg

Definition: sf_audio_record_cfg_t const *const p_cfg

Configuration for audio recording framework

- sf_audio_record_cfg_t::sf_audio_record_data_size_t

  Size of data in the sample 8 or 16 bit.

  Enumerated as:

  – SF_AUDIO_RECORD_DATA_SIZE_8BIT

  – SF_AUDIO_RECORD_DATA_SIZE_16BIT
- sf_audio_record_cfg_t::sampling_rate_hz

  Sampling rate for audio capture.
- sf_audio_record_cfg_t::p_capture_data_buffer

  Pointer to the buffer that will store the samples
- sf_audio_record_cfg_t::capture_data_buffer_size

  total size of buffer configured by user to store samples
- sf_audio_record_cfg_t::sample_count

  Samples per channel to be buffered before notifying the user via callback
- sf_audio_record_cfg_t::p_callback

  Callback function.
- sf_audio_record_cfg_t::p_context

  Placeholder for user data.
- sf_audio_record_cfg_t::p_extend

  Extension parameter for hardware specific settings.

6.5.8.6 start

```
ssp_err_t(* sf_audio_record_api_t::start) (sf_audio_record_ctrl_t *const p_ctrl)
```

Brief description

Starts audio recording.

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_Start
- SF_AUDIO_RECORD_I2S_Start

Table 22: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set

Parameter p_ctrl

Definition: `sf_audio_record_ctrl_t*const p_ctrl`

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented assf_audio_record_adc_instance_ctrl_tsf_audio_record_i2s_instance_ctrl_t

6.5.8.7 stop

```
ssp_err_t(* sf_audio_record_api_t::stop) (sf_audio_record_ctrl_t *const p_ctrl)
```

Brief description

Stops audio recording.

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_Stop
- SF_AUDIO_RECORD_I2S_Stop

Table 23: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block .

Parameter p_ctrl

Definition: `sf_audio_record_ctrl_t*const p_ctrl`

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented assf_audio_record_adc_instance_ctrl_tsf_audio_record_i2s_instance_ctrl_t

6.5.8.8 infoGet

```
ssp_err_t(* sf_audio_record_api_t::infoGet) (sf_audio_record_ctrl_t *const
p_ctrl, sf_audio_record_info_t *p_info)
```

Brief description

Gets channel information(Mono/Stereo).

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_InfoGet
- SF_AUDIO_RECORD_I2S_InfoGet

Table 24: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block .

Parameter p_ctrl

Definition: `sf_audio_record_ctrl_t*const p_ctrl`

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented assf_audio_record_adc_instance_ctrl_tsf_audio_record_i2s_instance_ctrl_t

6.5.8.9 close

```
ssp_err_t(* sf_audio_record_api_t::close) (sf_audio_record_ctrl_t *const p_ctrl)
```

Brief description

Releases channel mutex and closes channel at HAL layer.

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_Close
- SF_AUDIO_RECORD_I2S_Close

Table 25: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block .

Parameter p_ctrl

Definition: `sf_audio_record_ctrl_t*const p_ctrl`

Audio record framework control block. Allocate an instance specific control block to pass into the audio record framework API calls. Implemented assf_audio_record_adc_instance_ctrl_tsf_audio_record_i2s_instance_ctrl_t

6.5.8.10 versionGet

```
ssp_err_t(* sf_audio_record_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Implemented as

- SF_AUDIO_RECORD_ADC_VersionGet
- SF_AUDIO_RECORD_I2S_VersionGet

Table 26: Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.5.8.11 sf_audio_record_instance_t

sf_audio_record_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_audio_record_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_audio_record_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_audio_record_api_t const * p_api

  Pointer to the API structure for this instance.

6.6 BLE Framework API

6.6.1 SF BLE Framework Interface

RTOS-integrated SF BLE Framework Interface.

6.6.1.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Framework.

6.6.1.2 Interface API

sf_ble_api_t

Function name	Description
.open	Initializes the interface for data transfers. Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.
.close	De-initialize the interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.infoGet	Get BLE module information like chipset information and RSSI value.
.provisionGet	Reads the current BLE Provisioning information.
.provisionSet	Provisions the BLE Driver and set bonding and security modes as provisioned.
.scan	Scans for available BLE devices and return the list to the caller.
.advertisementStart	Make the device discoverable by broadcasting device information to remote devices.
.advertisementStop	Stop the device from being discoverable.
.whitelistAdd	Add specified devices to whitelist.
.whitelistDel	Remove specified devices from whitelist.
.bondingStart	Initiate bonding process with remote BLE device and exchange security keys if enabled.
.bondingResponse	Respond to the bonding request from the remote BLE device. Send bonding response on reception of bonding indication.
.startEncryption	Start encryption over a connection.
.connect	Connect to a remote BLE device.
.listen	Listen for connection request from remote device.
.authorization	Indicates that the specified remote device has been authorized by user.

Function name	Description
.disconnect	Terminate connection with remote BLE device.
.setTxPower	Sets the transmit power for the procedure specified by the connection handle.
.gattAddCustomProfiles	Add Custom Profile to GATT Database. This function is called with list of service and characteristics which is to be added to GATT database. Services and characteristics which were previously added will be removed and newly passed services and characteristics will be added.If services and characteristics were previously added and now those services and characteristics are to be removed and no new services and characteristics are to be added , then call this API with service and characteristics length as zero
.gattServiceDiscovery	Perform service discovery used by GATT client.Perform service discovery on remote GATT server and get results.
.gattCharDiscovery	Perform characteristics discovery used by GATT client.Perform characteristics discovery on remote GATT server and get results.
.gattCharDescDiscovery	Perform characteristics descriptor discovery used by GATT client.
.gattCharRead	Perform read characteristic used by GATT client.Read characteristic value from remote GATT server.
.gattCharWrite	Perform write characteristic used by GATT client.Write characteristic value on remote GATT server.
.gattCharExecuteWrite	Perform execute write on all pending write operations, used by GATT client.Execute or cancel all prepared writes of characteristics on remote GATT server.
.gattCharWriteLocal	Perform local characteristic write used by GATT server.Writes local characteristic value on GATT server.
.gattSendNotify	Send notification to GATT client, used by GATT server.
.gattSendIndicate	Send indication to GATT client, used by GATT server.Send indication to remote GATT client.
.gattWriteResponse	Send response to write operation received by GATT client, used by GATT server.Send response for write request received from remote GATT client.
.versionGet	Gets version and stores it in provided pointer p_version.

6.6.1.5 Typedefs

- sf_ble_callback_t
- sf_ble_conn_handle_t

6.6.1.6 Defines

- #define SF_BLE_API_VERSION_MAJOR

  Initial value: `(1U)`

  Major Version of the API defined in this file
- #define SF_BLE_API_VERSION_MINOR

  Initial value: `(2U)`

  Minor Version of the API defined in this file
- #define SF_BLE_MAX_BLE_ADV_DATA_LEN

  Initial value: `(100U)`

  BLE advertising data length.
- #define SF_BLE_MAX_NAME_LEN

  Initial value: `(66U)`

  Maximum length of name for BLE device.
- #define SF_BLE_MAX_GAP_NAME_LEN

  Initial value: `(23U)`

  Maximum length of GAP name.
- #define SF_BLE_ADDR_LEN

  Initial value: `(6U)`

  BLE address length.

- #define SF_BLE_SEC_KEY_LEN

  Initial value: `(0x10U)`

  BLE Security Key length.
- #define SF_BLE_128BITS_UUID_LENGTH

  Initial value: `(16U)`

  128 bit UUID length
- #define SF_BLE_RAND_NUM_LENGTH

  Initial value: `(8U)`

  Rand Number length.
- #define SF_BLE_TRUE

  Initial value: `(1U)`

  Boolean True Condition.
- #define SF_BLE_FALSE

  Initial value: `(0U)`

  Boolean False Condition.
- #define SF_BLE_MAX_MULTI_CHAR_READ_CNT

  Initial value: `(4U)`

  Maximum characteristics count for multiple read
- #define SF_BLE_MAX_CHAR_UUID_READ_CNT

  Initial value: `(10U)`

  Maximum characteristics count in result of characteristic read by UUID
- #define SF_BLE_GATT_LEN_UNDEF

  Initial value: `(0xFF)`

  Variable length characteristic value which can not be defined
- #define SF_BLE_ADV_DATA_LEN

  Initial value: `(0x1F)`

  BLE Advertising Data Length
- #define SF_BLE_GATT_PRI_SERVICE

  Initial value: `(0x2800U)`

  BLE GATT Service type Primary
- #define SF_BLE_GATT_INCLUDE_SERVICE

  Initial value: `(0x2802U)`

  BLE GATT Service type Included

- #define SF_BLE_GATT_CHAR_DECLARE

  Initial value: `(0x2803U)`

  BLE GATT Declare Characteristics
- #define SF_BLE_TX_POWER_CONNECTION_HANDLE

  Initial value: `(0xFFFFU)`

  BLE connection handle value when TX power is set

6.6.1.7 API Data

sf_ble_event_t

`sf_ble_event_t`

Detailed description

BLE events

Enumerated values

Name	Description
SF_BLE_EVENT_NONE	BLE user event none.
SF_BLE_EVENT_BONDING_INDICATION	BLE user event indicating reception of bonding request.
SF_BLE_EVENT_CONNECTION_COMP	BLE user event indicating connection completion.
SF_BLE_EVENT_DISCONNECT_COMP	BLE user event indicating disconnect.
SF_BLE_EVENT_SM_TK_REQ_IND	BLE user event indicating request for Temporary key.
SF_BLE_EVENT_SM_KEY_IND	BLE user event indicating received key from user.
SF_BLE_EVENT_SM_CHK_BD_ADDR_REQ	BLE user event indicating validation of remote address.
SF_BLE_EVENT_SM_ENC_START_IND	BLE user event indicating encryption started.
SF_BLE_EVENT_GATT_NOTIFICATION	BLE user event for Notification from peer.
SF_BLE_EVENT_GATT_INDICATION	BLE user event for Indication from peer.
SF_BLE_EVENT_GATT_WRITE_CMD_INDICATION	BLE user event for Write command from peer.
SF_BLE_EVENT_GATT_RESPONSE_TIMEOUT	BLE user event for GATT operation timeout.
SF_BLE_EVENT_GATT_ATTR_WRITE_REQ	BLE user event for Remote Write request on user Attributes.

Name	Description
SF_BLE_EVENT_GATT_ATTR_READ_REQ	BLE user event for Remote Read request on user Attributes.
SF_BLE_EVENT_GATT_ATTR_WRITE_COMPLETE	BLE user event Indicating Remote Write complete for user Attributes.
SF_BLE_EVENT_GATT_ATTR_WRITE_CCCD_REQ	BLE user event for Remote CCCD Write request on user Attributes.
SF_BLE_EVENT_GATT_ATTR_WRITE_CCCD_COMPLETE	BLE user event Indicating Remote CCCD Write complete for user Attributes.

sf_ble_gap_role_t

`sf_ble_gap_role_t`

Detailed description

GAP role

Enumerated values

Name	Description
SF_BLE_GAP_ROLE_MASTER	GAP role master/central.
SF_BLE_GAP_ROLE_SLAVE	GAP role slave/peripheral.
SF_BLE_GAP_ROLE_OBSERVER	GAP role Observer.
SF_BLE_GAP_ROLE_BROADCASTER	GAP role Broadcaster.

sf_ble_addr_type_t

`sf_ble_addr_type_t`

Detailed description

BLE address type

Enumerated values

Name	Description
SF_BLE_ADDR_TYPE_PUBLIC	BLE address type public.
SF_BLE_ADDR_TYPE_RANDOM	BLE address type random.

sf_ble_scan_mode_t

`sf_ble_scan_mode_t`

Detailed description

BLE scan mode

Enumerated values

Name	Description
SF_BLE_SCAN_MODE_PASSIVE	BLE scan mode passive.
SF_BLE_SCAN_MODE_ACTIVE	BLE scan mode active.

sf_ble_bonding_mode_t

`sf_ble_bonding_mode_t`

Detailed description

BLE bonding mode

Enumerated values

Name	Description
SF_BLE_BONDING_MODE_NONBONDABLE	BLE bonding not supported.
SF_BLE_BONDING_MODE_BONDABLE	BLE bonding supported.

sf_ble_sec_mode_t

`sf_ble_sec_mode_t`

Detailed description

BLE security mode

Enumerated values

Name	Description
SF_BLE_SEC_MODE1_LVL1_NO_SEC	BLE no security.
SF_BLE_SEC_MODE1_LVL2_NOAUTH_PAIR_ENC	BLE no authentication pairing encryption.
SF_BLE_SEC_MODE1_LVL3_AUTH_PAIR_ENC	Authenticated pairing with encryption.
SF_BLE_SEC_MODE1_LVL4_AUTHLE_PAIR_ENC	Authenticated LE Secure Connections pairing with encryption.

Name	Description
SF_BLE_SEC_MODE2_LVL1_NOAUTH_DATA_SIGNED	Unauthenticated pairing with data signing.
SF_BLE_SEC_MODE2_LVL2_AUTH_DATA_SIGNED	Authentication pairing with data signing.

sf_ble_disc_type_t

`sf_ble_disc_type_t`

Detailed description

BLE discovery type

Enumerated values

Name	Description
SF_BLE_DISC_TYPE_NON_DISCOVERABLE	BLE non-discoverable.
SF_BLE_DISC_TYPE_GENERAL_DISCOVERABLE	BLE discoverable.
SF_BLE_DISC_TYPE_LIMITED_DISCOVERABLE	BLE limited discoverable.

sf_ble_conn_type_t

`sf_ble_conn_type_t`

Detailed description

BLE connection type

Enumerated values

Name	Description
SF_BLE_CONN_TYPE_NON_CONNECTABLE	Connection type connection not allowed.
SF_BLE_CONN_TYPE_UNDIRECTED_CONNECTABLE	Connection type undirected.
SF_BLE_CONN_TYPE_DIRECTED_CONNECTABLE	Connection type directed.

sf_ble_adv_type_t

`sf_ble_adv_type_t`

Detailed description

BLE advertisement type

Enumerated values

Name	Description
SF_BLE_ADV_TYPE_CONN_UNDIR	Connectable Undirected advertising.
SF_BLE_ADV_TYPE_CONN_DIR_HIGH_DUTY	Connectable high duty cycle directed advertising.
SF_BLE_ADV_TYPE_DISC_UNDIR	Discoverable undirected advertising.
SF_BLE_ADV_TYPE_NONCONN_UNDIR	Non-connectable undirected advertising.
SF_BLE_ADV_TYPE_CONN_DIR_LOW_DUTY	Connectable low duty cycle directed advertising.

sf_ble_adv_filt_type_t

`sf_ble_adv_filt_type_t`

Detailed description

BLE advertisement filter type

Enumerated values

Name	Description
SF_BLE_ADV_FILT_TYPE_ALLOW_ALL	Filter type allow all.
SF_BLE_ADV_FILT_TYPE_ALLOW_SCAN_WLIST_CON_ANY	Filter type scan only whitelist entries, connect to any.
SF_BLE_ADV_FILT_TYPE_ALLOW_SCAN_ANY_CON_WLIST	Filter type scan any, connect to whitelist entries only.
SF_BLE_ADV_FILT_TYPE_ALLOW_WLIST_ONLY	Filter type allow whitelist only for both scan and connection.

sf_ble_duplicate_filter_t

`sf_ble_duplicate_filter_t`

Detailed description

BLE Duplicate Filter Configuration

Enumerated values

Name	Description
SF_BLE_DUPLICATE_FILTER_ENABLE	Enable Duplicate filter in Scan.

Name	Description
SF_BLE_DUPLICATE_FILTER_DISABLE	Disbale Duplicate filter in Scan.

sf_ble_init_filt_type_t

`sf_ble_init_filt_type_t`

Detailed description

BLE initial filter type

Enumerated values

Name	Description
SF_BLE_INIT_FILT_TYPE_IGNORE_WLIST	Ignore whitelist.
SF_BLE_INIT_FILT_TYPE_USE_WLIST	Use whitelist.

sf_ble_adv_chnl_map_t

`sf_ble_adv_chnl_map_t`

Detailed description

BLE advertisement channel map

Enumerated values

Name	Description
SF_BLE_ADV_CHNL_37	Enable channel 37 use.
SF_BLE_ADV_CHNL_38	Enable channel 38 use.
SF_BLE_ADV_CHNL_39	Enable channel 39 use.
SF_BLE_ADV_CHNL_ALL_CHANNELS	all channels(37, 38 and 39) enabled

sf_ble_iocap_t

`sf_ble_iocap_t`

Detailed description

BLE System IO Capabilities

Enumerated values

Name	Description
SF_BLE_IO_CAP_DISPLAY_ONLY	Display Only.
SF_BLE_IO_CAP_DISPLAY_YES_NO	Display Yes No.
SF_BLE_IO_CAP_KB_ONLY	Keyboard Only.
SF_BLE_IO_CAP_NO_INPUT_NO_OUTPUT	No Input No Output.
SF_BLE_IO_CAP_KB_DISPLAY	Keyboard Display.

sf_ble_auth_type_t

`sf_ble_auth_type_t`

Detailed description

BLE security authorization requirement

Enumerated values

Name	Description
SF_BLE_AUTH_TYPE_NONE	No Security.
SF_BLE_AUTH_TYPE_UNAUTHENTICATED_NO_MITM	No MITM.
SF_BLE_AUTH_TYPE_AUTHENTICATED_MITM	MITM Protected.

sf_ble_disconnect_reason_t

`sf_ble_disconnect_reason_t`

Detailed description

BLE security authorization requirement

Enumerated values

Name	Description
SF_BLE_DISCONNECT_REASON_LOCAL_HOST	Disconnected by local machine.
SF_BLE_DISCONNECT_REASON_REMOTE_USER	Disconnected by remote device.
SF_BLE_DISCONNECT_REASON_ERR	Error in Connection so disconnected.

sf_ble_key_dist_t

`sf_ble_key_dist_t`

Detailed description

BLE security key distribution type

Enumerated values

Name	Description
SF_BLE_KEY_DIST_NONE	No Keys to distribute.
SF_BLE_KEY_DIST_ENCKEY	Encryption key in distribution.
SF_BLE_KEY_DIST_IDKEY	IRK (ID key)in distribution.
SF_BLE_KEY_DIST_SIGNKEY	CSRK(Signature key) in distribution.

sf_ble_tx_pwr_state_t

`sf_ble_tx_pwr_state_t`

Detailed description

BLE Transmit power state

Enumerated values

Name	Description
SF_BLE_TX_PWR_STATE_NORMAL	Functionality disabled.
SF_BLE_TX_PWR_STATE_ADAPT_NEAR	RF low-power mode.
SF_BLE_TX_PWR_STATE_ADAPT_MIDDLE	RF normal mode.
SF_BLE_TX_PWR_STATE_ADAPT_FAR	RF high-performance mode.

sf_ble_char_property_t

`sf_ble_char_property_t`

Detailed description

Characteristic property

Enumerated values

Name	Description
SF_BLE_CHAR_PROPERTY_BCAST	Permits broadcasts of the Characteristic Value.
SF_BLE_CHAR_PROPERTY_RD	Permits reads of the Characteristic Value.
SF_BLE_CHAR_PROPERTY_WR_NO_RESP	Permits writes of the Characteristic Value without response.
SF_BLE_CHAR_PROPERTY_WR	Permits writes of the Characteristic Value with response.
SF_BLE_CHAR_PROPERTY_NTF	Permits notifications of the Characteristic Value without acknowledgment.
SF_BLE_CHAR_PROPERTY_IND	Permits indications of a Characteristic Value with acknowledgment.
SF_BLE_CHAR_PROPERTY_AUTH	Permits signed writes to the Characteristic Value.
SF_BLE_CHAR_PROPERTY_EXT_PROP	Additional characteristic properties.

sf_ble_service_discovery_t

`sf_ble_service_discovery_t`

Detailed description

Service discovery type

Enumerated values

Name	Description
SF_BLE_SERVICE_DISCOVERY_PRIMARY_ALL	Discover all primary services.
SF_BLE_SERVICE_DISCOVERY_PRIMARY_UUID	Discover primary service by UUID.
SF_BLE_SERVICE_DISCOVERY_INCLUDED	Discover includes services.

sf_ble_char_discovery_t

`sf_ble_char_discovery_t`

Detailed description

Characteristics discovery type

Enumerated values

Name	Description
SF_BLE_CHAR_DISCOVERY_ALL	Discover all characteristics.
SF_BLE_CHAR_DISCOVERY_UUID	Discover characteristics by UUID.

sf_ble_uuid_length_t

`sf_ble_uuid_length_t`

Detailed description

UUID length

Enumerated values

Name	Description
SF_BLE_UUID_LENGTH_16BITS	16 bit UUID
SF_BLE_UUID_LENGTH_32BITS	32 bit UUID
SF_BLE_UUID_LENGTH_128BITS	128 bit UUID

sf_ble_char_read_t

`sf_ble_char_read_t`

Detailed description

Characteristics read type

Enumerated values

Name	Description
SF_BLE_CHAR_READ_BY_HANDLE	Read single characteristic by handle.
SF_BLE_CHAR_READ_BY_UUID	Read single characteristic by UUID.
SF_BLE_CHAR_READ_LONG_BY_HANDLE	Read single long characteristic by handle.
SF_BLE_CHAR_DESC_READ_BY_HANDLE	Read single characteristic descriptor by handle.
SF_BLE_CHAR_DESC_READ_LONG_BY_HANDLE	Read single long characteristic descriptor by handle.
SF_BLE_CHAR_READ_MULTIPLE_BY_HANDLES	Read multiple characteristics by handles.

sf_ble_char_write_t

`sf_ble_char_write_t`

Detailed description

Characteristics write type

Enumerated values

Name	Description
SF_BLE_CHAR_WRITE_NO_RESPONSE	Write single characteristic with no response.
SF_BLE_CHAR_WRITE	Write single characteristic with response.
SF_BLE_CHAR_WRITE_LONG	Write single long characteristic with response.
SF_BLE_CHAR_DESC_WRITE	Write single characteristic descriptor with response.
SF_BLE_CHAR_DESC_WRITE_LONG	Write single long characteristic descriptor with response.

sf_ble_execute_write_t

`sf_ble_execute_write_t`

Detailed description

Characteristic execute write flag

Enumerated values

Name	Description
SF_BLE_EXECUTE_WRITE_FALSE	Execute write false i.e. cancel write operations.
SF_BLE_EXECUTE_WRITE_TRUE	Execute write true i.e. execute write operations.

sf_ble_write_response_t

`sf_ble_write_response_t`

Detailed description

Characteristic execute write flag

Enumerated values

Name	Description
SF_BLE_WRITE_RESPONSE_NOT_REQUIRED	Write response not required.

Name	Description
SF_BLE_WRITE_RESPONSE_REQUIRED	Write response required.

sf_ble_attribute_error_code_t

`sf_ble_attribute_error_code_t`

Detailed description

BLE Attribute write response code

Enumerated values

Name	Description
SF_BLE_ATTRIBUTE_ERR_SUCCESS	Success.
SF_BLE_ATTRIBUTE_ERR_INVALID_HANDLE	Invalid handle.
SF_BLE_ATTRIBUTE_ERR_WRITE_NOT_PERMITTED	Writing is not permitted.
SF_BLE_ATTRIBUTE_ERR_INSUFF_AUTHEN	Authentication required for the request.
SF_BLE_ATTRIBUTE_ERR_REQUEST_NOT_SUPPORTED	Unsupported request.
SF_BLE_ATTRIBUTE_ERR_INVALID_OFFSET	Invalid offset.
SF_BLE_ATTRIBUTE_ERR_INSUFF_AUTHOR	Authorization required for the request.
SF_BLE_ATTRIBUTE_ERR_ATTRIBUTE_NOT_FOUND	The attribute could not be found.
SF_BLE_ATTRIBUTE_ERR_ATTRIBUTE_NOT_LONG	The attribute is not long enough.
SF_BLE_ATTRIBUTE_ERR_INVALID_ATTRIBUTE_VAL_LEN	Invalid attribute value size.
SF_BLE_ATTRIBUTE_ERR_INSUFF_ENC	Encryption required for the request.
SF_BLE_ATTRIBUTE_ERR_OUT_OF_RANGE	Out of Range.

sf_ble_char_attr_permissions_t

`sf_ble_char_attr_permissions_t`

Detailed description

BLE GATT Attribute characteristics permission

Enumerated values

Name	Description
SF_BLE_ATT_PERMISSIONS_ALLACCESS	Full access.
SF_BLE_ATT_PERMISSIONS_READ_AUTHENTICATION	Read with authentication.
SF_BLE_ATT_PERMISSIONS_READ_ENCRYPTION	Read with encryption.
SF_BLE_ATT_PERMISSIONS_READ_AUTHORIZATION	Read with authorization.
SF_BLE_ATT_PERMISSIONS_READ_FORBIDDEN	Read forbidden.
SF_BLE_ATT_PERMISSIONS_WRITE_AUTHENTICATION	Write with authentication.
SF_BLE_ATT_PERMISSIONS_WRITE_ENCRYPTION	Write with encryption.
SF_BLE_ATT_PERMISSIONS_WRITE_AUTHORIZATION	Write with authorization.
SF_BLE_ATT_PERMISSIONS_WRITE_FORBIDDEN	Write forbidden.
SF_BLE_ATT_PERMISSIONS_NOACCESS	No access.

sf_ble_adv_event_type_t

`sf_ble_adv_event_type_t`

Detailed description

BLE advertising event type

Enumerated values

Name	Description
SF_BLE_ADV_EVENT_TYPE_CONN_UND_ADV	Connectable undirected advertising.
SF_BLE_ADV_EVENT_TYPE_CONN_DIR_ADV	Connectable directed advertising.
SF_BLE_ADV_EVENT_TYPE_SCANNABLE_UND_ADV	Scannable undirected advertising.
SF_BLE_ADV_EVENT_TYPE_NON_CONN_UND_ADV	Non connectable undirected advertising.
SF_BLE_ADV_EVENT_TYPE_SCAN_RESPONSE	Scan response.

sf_ble_callback_t

```
typedef void(* sf_ble_callback_t) (sf_ble_event_info_t *ev)
```

Detailed description

BLE Callback Type

sf_ble_conn_handle_t

```
typedef uint16_t sf_ble_conn_handle_t
```

Detailed description

BLE Connection Handle

6.6.1.8 API Structures

sf_ble_addr_t

sf_ble_addr_t

Detailed description

BLE address

Variables

- uint8_t addr[SF_BLE_ADDR_LEN]

  6-byte array address value

sf_ble_adv_data_t

sf_ble_adv_data_t

Detailed description

BLE Advertising data structure

Variables

- uint8_t data[SF_BLE_ADV_DATA_LEN]

  Advertising data bytes array.

- uint8_t adv_data_length

  Advertising data length.

sf_ble_event_info_t

sf_ble_event_info_t

Detailed description

BLE event info

Variables

- void * p_data

  Data for BLE event.

- uint16_t event

  Event type.

sf_ble_sec_info_t

sf_ble_sec_info_t

Detailed description

Security Related Configuration

Variables

- sf_ble_sec_mode_t sec_mode

  security mode

- uint8_t id_key[SF_BLE_SEC_KEY_LEN]

  GAP Identity Resolving Security key.

- uint8_t csrk_key[SF_BLE_SEC_KEY_LEN]

  GAP Connection Signature Resolving Security key.

- uint8_t ltk_key[SF_BLE_SEC_KEY_LEN]

  GAP Connection Long term Security key.

- uint8_t rand_num[SF_BLE_RAND_NUM_LENGTH]

  GAP Connection Random number for Long term Security key.

- uint16_t ediv

  GAP Connection Encrypted Diversifier for Long term Security key.

sf_ble_provisioning_t

sf_ble_provisioning_t

Detailed description

BLE provisioning information

Variables

- uint8_t gap_name[SF_BLE_MAX_GAP_NAME_LEN]

  GAP name.

- uint8_t bcast_mode

  broadcast mode

- sf_ble_bonding_mode_t bonding_mode

  bonding mode

- sf_ble_sec_info_t sec_info

  Security information.

- sf_ble_gap_role_t gap_role

  GAP role (master/slave)

- sf_ble_callback_t p_ble_callback

  GAP user event callback that runs in driver thread context. Application should make sure callback logic is as minimal as possible without any blocking calls

sf_ble_scan_info_t

sf_ble_scan_info_t

Detailed description

BLE scan information structure

Variables

- uint16_t total_scan_duration

  BLE total scan duration in milliseconds.

- sf_ble_scan_mode_t scan_mode

  BLE scan mode.

- sf_ble_disc_type_t discovery_type

  Specifies discovery type, Used only in active scan.

- sf_ble_addr_type_t address_type

  BLE address type.

- sf_ble_adv_filt_type_t filt_policy

  Scan Filter policy.

- sf_ble_duplicate_filter_t duplicate_filt

  Duplicate filter configuration.

sf_ble_bonding_start_t

sf_ble_bonding_start_t

Detailed description

BLE Bonding Start information

Variables

- sf_ble_iocap_t iocap

  IO capabilities.

- uint8_t key_size

  Encryption key size.

- sf_ble_key_dist_t ikey_dist

  Initiator key distribution.

- sf_ble_key_dist_t rkey_dist

  Responder key distribution.

sf_ble_bonding_response_t

sf_ble_bonding_response_t

Detailed description

Bonding Response Parameter

Variables

- uint8_t accept

  accept or reject bonding

- sf_ble_iocap_t io_cap

  IO capabilities.

- uint8_t max_key_size

  Max key size.

- sf_ble_key_dist_t ikeys

  Initiator key distribution.

- sf_ble_key_dist_t rkeys

  Responder key distribution.

sf_ble_sm_tk_info_t

sf_ble_sm_tk_info_t

Detailed description

Security structures BLE Temporary Key information

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.

- uint8_t disp_en

  Whether to enable display.

sf_ble_sm_tk_ind_t

sf_ble_sm_tk_ind_t

Detailed description

BLE Temporary Key indication

Variables

- sf_ble_sm_tk_info_t tk_info

  input parameter,information to app about temporary key request

- uint8_t tk_req_status

  output parameter: request status, application has to set this in callback event whether request is valid or not
- uint8_t tk_key[SF_BLE_SEC_KEY_LEN]

  application has to set this in callback event temporary key for encryption

sf_ble_addr_verify_ind_t

sf_ble_addr_verify_ind_t

Detailed description

BLE Bluetooth address verification indication

Variables

- uint8_t bd_addr[SF_BLE_ADDR_LEN]

  input parameter specifying bluetooth address of remote device
- sf_ble_addr_type_t addr_type

  input parameter specifying Address type of remote BLE device
- uint8_t accept_addr

  output parameter: application has to set this parameter in callback if it accepts this address

sf_ble_sm_key_ind_t

sf_ble_sm_key_ind_t

Detailed description

BLE Received Key information

Variables

- uint8_t conn_idx

  connection index
- sf_ble_key_dist_t key_code

  type of security key
- uint16_t ediv

  BLE Security EDIV.
- uint8_t rand_num[SF_BLE_RAND_NUM_LENGTH]

  Random number for security.
- uint8_t ltk_key[SF_BLE_SEC_KEY_LEN]

  BLE long term security key.

sf_ble_sm_enc_info_t

sf_ble_sm_enc_info_t

Detailed description

BLE Start Encryption information

Variables

- sf_ble_conn_handle_t conn_idx

  connection index
- uint16_t ediv

  BLE Security EDIV.
- uint8_t rand_num[SF_BLE_RAND_NUM_LENGTH]

  Random number for security.
- uint8_t ltk_key[SF_BLE_SEC_KEY_LEN]

  BLE long term security key.

sf_ble_sec_enc_start_ind_t

sf_ble_sec_enc_start_ind_t

Detailed description

Encryption Start Indication Event for user

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle of the remote device.
- uint8_t status

  Result of encryption start, 0 = SUCCESS else error.
- uint8_t key_size

  Key Size.
- sf_ble_auth_type_t auth_type

  Security properties.
- uint8_t bonding_status

  Bonding Status, 0 = Unbonded, 1 = Bonded.

sf_ble_scan_response_data_t

sf_ble_scan_response_data_t

Detailed description

Scan Response Data for advertising

Variables

- uint8_t scan_response_data[SF_BLE_ADV_DATA_LEN]

  Advertising data bytes array.

- uint8_t scan_response_data_length

  Advertising data length.

sf_ble_adv_info_t

sf_ble_adv_info_t

Detailed description

BLE advertisement information

Variables

- sf_ble_disc_type_t disc_mode

  Discovery mode.
- sf_ble_conn_type_t conn_mode

  Connection mode.
- sf_ble_adv_type_t adv_type

  Advertisement type.
- uint16_t adv_intv_min

  Minimum interval for advertising.
- uint16_t adv_intv_max

  Maximum interval for advertising.
- sf_ble_addr_type_t own_addr_type

  Own address type.
- sf_ble_addr_type_t direct_addr_type

  Direct connection address type.
- uint8_t direct_bd_addr[SF_BLE_ADDR_LEN]

  Direct connection BLE address.
- sf_ble_adv_chnl_map_t adv_chnl_map

  Advertising channel map.
- sf_ble_adv_filt_type_t adv_filt_policy

  Advertising filter policy.
- sf_ble_scan_response_data_t scan_response_data

  Scan Response information, will be advertised only for active scan.
- sf_ble_adv_data_t adv_data

  Advertising data.

sf_ble_scan_t

sf_ble_scan_t

Detailed description

BLE scan information

Variables

- sf_ble_addr_type_t addr_type

  Address type of remote BLE device.
- uint8_t bd_addr[SF_BLE_ADDR_LEN]

  Remote BLE address.
- uint16_t data_len

  Scan data length.
- uint8_t data[SF_BLE_MAX_BLE_ADV_DATA_LEN]

  Scan data.
- int16_t rssi

  RSSI value.
- sf_ble_adv_event_type_t event_type

  Advertising event type.

sf_ble_connection_t

sf_ble_connection_t

Detailed description

BLE connection information

Variables

- sf_ble_init_filt_type_t init_filt_type

  Connection filter type.
- sf_ble_addr_type_t addr_type

  BLE address type.
- uint8_t bd_addr[SF_BLE_ADDR_LEN]

  BLE address.

sf_ble_disconnect_t

sf_ble_disconnect_t

Detailed description

BLE Disconnect Event Information

Variables

- sf_ble_disconnect_reason_t reason

  Disconnection reason.

- uint8_t status

  Disconnect status if initiated by local host.
- sf_ble_conn_handle_t conhdl

  Connection handle of the remote device.

sf_ble_chipset_info_t

sf_ble_chipset_info_t

Detailed description

BLE chipset information

Variables

- uint32_t version

  chipset version
- uint8_t bd_addr[SF_BLE_ADDR_LEN]

  BLE address.

sf_ble_info_t

sf_ble_info_t

Detailed description

BLE module information

Variables

- sf_ble_chipset_info_t chipset

  Chipset information.
- uint16_t rssi

  RSSI value.

sf_ble_bonding_req_ind_t

sf_ble_bonding_req_ind_t

Detailed description

BLE bonding request indication information

Variables

- sf_ble_addr_t bd_addr

  BLE address.
- uint8_t index

  Connection index.
- uint8_t auth_req

  Authentication request type.

- uint8_t io_cap

  IO capability.
- uint8_t oob_data_flg

  Indicating if OOB data is present.
- uint8_t max_enc_size

  Maximum encryption key size.
- uint8_t ikey_dist

  Type of key distributed by the initiator.
- uint8_t rkey_dist

  Type of key distributed by the responder.

sf_ble_connect_info_t

sf_ble_connect_info_t

Detailed description

BLE connection information

Variables

- uint8_t status

  Confirmation status.
- uint8_t reserved

  Reserved.
- sf_ble_conn_handle_t conhdl

  Connection handle.
- uint8_t peer_addr_type

  Peer address type.
- sf_ble_addr_t peer_addr

  Peer BT address.
- uint8_t reserved2

  Reserved.
- uint16_t con_interval

  Connection interval.
- uint16_t con_latency

  Connection latency.
- uint16_t sup_to

  Link supervision time-out.

- uint8_t clk_accuracy

  Clock accuracy.
- uint8_t reserved3

  Reserved.

sf_ble_set_tx_pwr_info_t

sf_ble_set_tx_pwr_info_t

Detailed description

BLE set TX power information structure

Variables

- int8_t power_lvl

  TX power level in dBm.
- sf_ble_tx_pwr_state_t state

  Operating state to set the transmit power level.

sf_ble_uuid_t

sf_ble_uuid_t

Detailed description

Union holding either 16-bit/32-bit/128-bit UUID

Variables

- uint16_t uuid16

  16 bit UUID
- uint32_t uuid32

  32 bit UUID
- uint8_t uuid128[SF_BLE_128BITS_UUID_LENGTH]

  128 bit UUID
- union{} union{}

  See source code for definition of this member.
- sf_ble_uuid_length_t uuid_length

  Service UUID length.

sf_ble_svc_attribute_t

sf_ble_svc_attribute_t

Detailed description

BLE GATT Service Attributes

Variables

- uint16_t attr_handle

  Service Handle.
- uint16_t attr_type

  Attribute type such as SF_BLE_GATT_PRI_SERVICE, SF_BLE_GATT_INCLUDE_SERVICE.
- uint16_t parent_svc_handle

  parent_svc_handle is service handle of parent service which is already registered

  If service is included service,
- uint8_t * p_attr_value

  Service UUID Pointer.
- sf_ble_uuid_length_t attr_value_len

  UUID Length.

sf_ble_char_attribute_t

sf_ble_char_attribute_t

Detailed description

BLE GATT Characteristics Attributes

Variables

- sf_ble_svc_attribute_t * p_service

  Service to which this characteristics belongs.
- sf_ble_uuid_t attr_uuid

  UUID of characteristics value.
- uint16_t attr_declare_handle

  Characteristics handle.
- uint16_t attr_declare_type

  Characteristics declare type SF_BLE_GATT_CHAR_DECLARE.
- uint16_t attr_value_handle

  Characteristics value handle.
- sf_ble_char_attr_permissions_t attr_perm

  Characteristics permission.
- sf_ble_char_property_t attr_properties

  Characteristics properties.
- uint8_t * p_attr_value

  Characteristics value data.

- uint8_t attr_value_len

  Characteristics value data length.

sf_ble_gatt_attr_event_t

sf_ble_gatt_attr_event_t

Detailed description

BLE GATT Characteristics Remote Event data, passed in provision callback for GATT Custom profile

Variables

- uint16_t attr_handle

  Attribute handle for which event is generated.

- uint16_t offset

  The offset at which the client is willing to write.

- uint8_t const * p_value

  The value at which the client is willing to write.

- uint16_t length

  The amount of bytes that the client is willing to write as from this offset.

- ssp_err_t response

  User will update this variable, Pass SSP_SUCCESS if user accepts the remote request.

sf_ble_service_discovery_rsp_t

sf_ble_service_discovery_rsp_t

Detailed description

Service discovery result

Variables

- uint16_t service_handle

  Service handle.

- sf_ble_uuid_t uuid

  Service UUID.

- uint16_t start_handle

  Start handle of sub-attributes handle range.

- uint16_t end_handle

  End handle of sub-attributes handle range.

sf_ble_service_discovery_req_t

sf_ble_service_discovery_req_t

Detailed description

Service discovery request

Variables

- sf_ble_uuid_t uuid

  Service UUID.
- uint16_t start_handle

  Discovery start handle.
- uint16_t end_handle

  Discovery end handle.
- sf_ble_service_discovery_t discovery_type

  Service discovery type.

sf_ble_char_discovery_req_t

sf_ble_char_discovery_req_t

Detailed description

Characteristic discovery request

Variables

- sf_ble_uuid_t uuid

  Characteristic UUID.
- uint16_t start_handle

  Discovery start handle.
- uint16_t end_handle

  Discovery end handle.
- sf_ble_char_discovery_t discovery_type

  Characteristic discovery type.

sf_ble_char_discovery_rsp_t

sf_ble_char_discovery_rsp_t

Detailed description

Characteristic discovery result

Variables

- uint16_t char_handle

  Characteristic handle.
- sf_ble_uuid_t uuid

  Characteristic UUID.

- uint16_t value_handle

  Characteristic value handle.
- sf_ble_char_property_t property

  Characteristic property.

sf_ble_char_desc_discovery_rsp_t

sf_ble_char_desc_discovery_rsp_t

Detailed description

Characteristic descriptor discovery result

Variables

- uint16_t desc_handle

  Characteristic descriptor handle.
- sf_ble_uuid_t uuid

  Characteristic descriptor UUID.

sf_ble_char_multiple_read_req_t

sf_ble_char_multiple_read_req_t

Detailed description

Multiple Characteristic descriptor read request

Variables

- uint16_t handles[SF_BLE_MAX_MULTI_CHAR_READ_CNT]

  Characteristic handles for multiple read.
- uint8_t expected_result_size[SF_BLE_MAX_MULTI_CHAR_READ_CNT]

  Expected result length in bytes.

sf_ble_char_read_req_t

sf_ble_char_read_req_t

Detailed description

Read Characteristic request

Variables

- sf_ble_char_read_t char_read_type

  Characteristic read type.
- uint16_t handle

  Characteristic value or descriptor handle.
- sf_ble_uuid_t uuid

  Characteristic UUID.

- uint16_t offset

  Offset for long Characteristic value.
- sf_ble_char_multiple_read_req_t * p_mul_read_req

  Pointer to multiple read Characteristic request.
- uint16_t handles_cnt

  Characteristic handles count for multiple read.

sf_ble_char_multiple_read_rsp_t

sf_ble_char_multiple_read_rsp_t

Detailed description

Read multiple Characteristic response

Variables

- uint8_t * p_data[SF_BLE_MAX_MULTI_CHAR_READ_CNT]

  Pointer to Characteristic value.
- uint16_t data_len[SF_BLE_MAX_MULTI_CHAR_READ_CNT]

  Characteristic value length.

sf_ble_char_read_by_uuid_rsp_t

sf_ble_char_read_by_uuid_rsp_t

Detailed description

Read Characteristic by UUID response

Variables

- uint16_t handle[SF_BLE_MAX_CHAR_UUID_READ_CNT]

  Characteristic handles.
- uint8_t * p_data[SF_BLE_MAX_CHAR_UUID_READ_CNT]

  Pointer to Characteristic value.
- uint16_t data_len[SF_BLE_MAX_CHAR_UUID_READ_CNT]

  Characteristic value length.

sf_ble_char_read_by_handle_rsp_t

sf_ble_char_read_by_handle_rsp_t

Detailed description

Read Characteristic by handle response

Variables

- uint8_t * p_data

  Pointer to Characteristic value.

- uint16_t data_len

  Characteristic value length.

sf_ble_char_read_rsp_t

Detailed description

Read Characteristic response

Variables

p_char_read_by_handle_rsp

p_char_read_by_uuid_rsp

p_char_multiple_read_rsp

p_char_read_by_handle_rsp

`sf_ble_char_read_by_handle_rsp_t::p_char_read_by_handle_rsp`

Brief description

Response for read Characteristic by handle.

p_char_read_by_uuid_rsp

`sf_ble_char_read_by_uuid_rsp_t::p_char_read_by_uuid_rsp`

Brief description

Response for read Characteristic by UUID.

p_char_multiple_read_rsp

`sf_ble_char_multiple_read_rsp_t::p_char_multiple_read_rsp`

Brief description

Response for read multiple Characteristics.

sf_ble_char_write_req_t

sf_ble_char_write_req_t

Detailed description

Write Characteristic request

Variables

- sf_ble_char_write_t char_write_type

  Characteristic write type.

- uint16_t handle

  Characteristic value or descriptor handle.

- uint8_t * p_data

  Pointer to data.

- uint16_t offset

  Offset for long Characteristic value.
- uint16_t data_length

  Data length.
- sf_ble_execute_write_t auto_execute

  Automatic execute write flag.

sf_ble_gatt_notif_ind_event_data_t

sf_ble_gatt_notif_ind_event_data_t

Detailed description

Notification/Indication event data

Variables

- uint16_t handle

  Characteristic value or descriptor handle.
- uint8_t * p_data

  Pointer to data.
- uint16_t data_length

  Data length.

sf_ble_write_cmd_event_data_t

sf_ble_write_cmd_event_data_t

Detailed description

Write command event data

Variables

- uint16_t handle

  Characteristic value or descriptor handle.
- uint16_t offset

  Offset for long Characteristic value.
- sf_ble_write_response_t response_required

  Write response required or not.
- uint8_t * p_data

  Pointer to data.
- uint16_t data_length

  Data length.

sf_ble_ctrl_t

sf_ble_ctrl_t

Detailed description

BLE Framework control structure

Variables

- void * p_driver_handle

  Storage for information needed for each BLE device driver in the system.

sf_ble_cfg_t

sf_ble_cfg_t

Detailed description

BLE configuration information

Variables

- uint8_t bd_addr[SF_BLE_ADDR_LEN]

  BLE address.
- sf_ble_addr_type_t own_addr_type

  self address type
- uint8_t max_slaves

  Maximum slaves allowed to be connected.
- uint8_t update_bd_addr

  Set this to true to update bluetooth address during SF_BLE_Open.
- uint16_t scan_interval

  BLE scan interval for receiving advertisement.
- uint16_t scan_window

  Period of time during which advertising data is received at the scan interval.
- uint16_t disc_time

  Duration for which the device remain discoverable.
- uint16_t con_interval

  Interval for transmitting and receiving data periodically after connection establishment.
- uint16_t slave_latency

  Period of time during which data is transmitted and received at the connection interval.
- uint16_t sup_timeout

  Link loss time-out.
- void const * p_extend

  Instance specific configuration.

sf_ble_api_t

sf_ble_api_t

Detailed description

Framework API structure. Implementations will use the following API.

open

```
ssp_err_t(* sf_ble_api_t::open) (sf_ble_ctrl_t *const p_ctrl, const sf_ble_cfg_t *p_cfg)
```

Brief description

Initializes the interface for data transfers.

Detailed description

Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.

Table 27: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to user-provided storage for the control block.
p_cfg	in	Pointer to BLE configuration structure.

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_cfg

Definition: sf_ble_cfg_t sf_ble_cfg_t *p_cfg

BLE configuration information

- sf_ble_cfg_t::bd_addr

  BLE address.

- sf_ble_cfg_t::sf_ble_addr_type_t

  self address type

  Enumerated as:

  – SF_BLE_ADDR_TYPE_PUBLIC

  – SF_BLE_ADDR_TYPE_RANDOM

- sf_ble_cfg_t::max_slaves

  Maximum slaves allowed to be connected.

- sf_ble_cfg_t::update_bd_addr

  Set this to true to update bluetooth address during SF_BLE_Open.

- sf_ble_cfg_t::scan_interval

  BLE scan interval for receiving advertisement.

- sf_ble_cfg_t::scan_window

  Period of time during which advertising data is received at the scan interval.

- sf_ble_cfg_t::disc_time

  Duration for which the device remain discoverable.

- sf_ble_cfg_t::con_interval

  Interval for transmitting and receiving data periodically after connection establishment.

- sf_ble_cfg_t::slave_latency

  Period of time during which data is transmitted and received at the connection interval.

- sf_ble_cfg_t::sup_timeout

  Link loss time-out.

- sf_ble_cfg_t::p_extend

  Instance specific configuration.

close

```
ssp_err_t(* sf_ble_api_t::close) (sf_ble_ctrl_t *const p_ctrl)
```

Brief description

De-initialize the interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.

Detailed description

Table 28: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

infoGet

```
ssp_err_t(* sf_ble_api_t::infoGet) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_info_t *p_ble_info)
```

Brief description

Get BLE module information like chipset information and RSSI value.

Detailed description

Table 29: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle
p_ble_info	out	Pointer to module information

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter p_ble_info

Definition: `sf_ble_info_t*p_ble_info`

BLE module information

- `sf_ble_info_t::chipset`

  Chipset information.

- `sf_ble_info_t::rssi`

  RSSI value.

provisionGet

```
ssp_err_t(* sf_ble_api_t::provisionGet) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_provisioning_t *p_ble_provisioning)
```

Brief description

Reads the current BLE Provisioning information.

Detailed description

Table 30: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Table 30: Parameters (Continued)

Name	Direction	Description
p_ble_provisioning	out	current provisioning information

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_ble_provisioning

Definition: `sf_ble_provisioning_t*p_ble_provisioning`

BLE provisioning information

- `sf_ble_provisioning_t::gap_name`

  GAP name.

- `sf_ble_provisioning_t::bcast_mode`

  broadcast mode

- `sf_ble_provisioning_t::bonding_mode`

  bonding mode

- `sf_ble_provisioning_t::sec_info`

  Security information.

- `sf_ble_provisioning_t::gap_role`

  GAP role (master/slave)

- `sf_ble_provisioning_t::p_ble_callback`

  GAP user event callback that runs in driver thread context. Application should make sure callback logic is as minimal as possible without any blocking calls

provisionSet

```
ssp_err_t(* sf_ble_api_t::provisionSet) (sf_ble_ctrl_t *const p_ctrl, const
sf_ble_provisioning_t *p_ble_provisioning)
```

Brief description

Provisions the BLE Driver and set bonding and security modes as provisioned.

Detailed description

Table 31: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Table 31: Parameters (Continued)

Name	Direction	Description
p_ble_provisioning	in	Pointer to BLE provisioning structure

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_ble_provisioning

Definition: `sf_ble_provisioning_t`sf_ble_provisioning_t *p_ble_provisioning

BLE provisioning information

- `sf_ble_provisioning_t::gap_name`

  GAP name.

- `sf_ble_provisioning_t::bcast_mode`

  broadcast mode

- `sf_ble_provisioning_t::bonding_mode`

  bonding mode

- `sf_ble_provisioning_t::sec_info`

  Security information.

- `sf_ble_provisioning_t::gap_role`

  GAP role (master/slave)

- `sf_ble_provisioning_t::p_ble_callback`

  GAP user event callback that runs in driver thread context. Application should make sure callback logic is as minimal as possible without any blocking calls

scan

```
ssp_err_t(* sf_ble_api_t::scan) (sf_ble_ctrl_t *const p_ctrl, sf_ble_scan_t
*p_scan, uint8_t *p_cnt, sf_ble_scan_info_t *p_scan_info)
```

Brief description

Scans for available BLE devices and return the list to the caller.

Detailed description

Table 32: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Table 32: Parameters (Continued)

Name	Direction	Description
p_scan	out	Pointer to scan information structure
p_cnt	inout	Pointer to number of BLE devices scanned
p_scan_info	in	Pointer to scan information structure

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_scan

Definition: `sf_ble_scan_t*p_scan`

BLE scan information

- `sf_ble_scan_t::addr_type`
  Address type of remote BLE device.
- `sf_ble_scan_t::bd_addr`
  Remote BLE address.
- `sf_ble_scan_t::data_len`
  Scan data length.
- `sf_ble_scan_t::data`
  Scan data.
- `sf_ble_scan_t::rssi`
  RSSI value.
- `sf_ble_scan_t::event_type`
  Advertising event type.

Parameter p_cnt

`uint8_t`

Parameter p_scan_info

Definition: `sf_ble_scan_info_t*p_scan_info`

BLE scan information structure

- `sf_ble_scan_info_t::total_scan_duration`
  BLE total scan duration in milliseconds.
- `sf_ble_scan_info_t::scan_mode`
  BLE scan mode.

- sf_ble_scan_info_t::discovery_type

  Specifies discovery type, Used only in active scan.

- sf_ble_scan_info_t::address_type

  BLE address type.

- sf_ble_scan_info_t::filt_policy

  Scan Filter policy.

- sf_ble_scan_info_t::duplicate_filt

  Duplicate filter configuration.

advertisementStart

```
ssp_err_t(* sf_ble_api_t::advertisementStart) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_adv_info_t *const p_advt_info)
```

Brief description

Make the device discoverable by broadcasting device information to remote devices.

Detailed description

Table 33: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_advt_info	in	Pointer to advertisement information structure

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_advt_info

Definition: sf_ble_adv_info_t*const p_advt_info

BLE advertisement information

- sf_ble_adv_info_t::disc_mode

  Discovery mode.

- sf_ble_adv_info_t::conn_mode

  Connection mode.

- sf_ble_adv_info_t::adv_type

  Advertisement type.

- sf_ble_adv_info_t::adv_intv_min
  Minimum interval for advertising.
- sf_ble_adv_info_t::adv_intv_max
  Maximum interval for advertising.
- sf_ble_adv_info_t::own_addr_type
  Own address type.
- sf_ble_adv_info_t::direct_addr_type
  Direct connection address type.
- sf_ble_adv_info_t::direct_bd_addr
  Direct connection BLE address.
- sf_ble_adv_info_t::adv_chnl_map
  Advertising channel map.
- sf_ble_adv_info_t::adv_filt_policy
  Advertising filter policy.
- sf_ble_adv_info_t::scan_response_data
  Scan Response information, will be advertised only for active scan.
- sf_ble_adv_info_t::adv_data
  Advertising data.

advertisementStop

```
ssp_err_t(* sf_ble_api_t::advertisementStop) (sf_ble_ctrl_t *const p_ctrl)
```

Brief description

Stop the device from being discoverable.

Detailed description

Table 34: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

whitelistAdd

```
ssp_err_t(* sf_ble_api_t::whitelistAdd) (sf_ble_ctrl_t *const p_ctrl, const
uint8_t *p_bd_addr)
```

Brief description

Add specified devices to whitelist.

Detailed description

Table 35: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_bd_addr	in	Pointer to BLE address

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_bd_addr

`uint8_t`

whitelistDel

```
ssp_err_t(* sf_ble_api_t::whitelistDel) (sf_ble_ctrl_t *const p_ctrl, const
uint8_t *p_bd_addr)
```

Brief description

Remove specified devices from whitelist.

Detailed description

Table 36: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_bd_addr	in	Pointer to BLE address

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_bd_addr

uint8_t

bondingStart

```
ssp_err_t(* sf_ble_api_t::bondingStart) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, const uint8_t *p_bd_addr, sf_ble_bonding_start_t
*p_bonding_start)
```

Brief description

Initiate bonding process with remote BLE device and exchange security keys if enabled.

Detailed description

Table 37: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle.
p_bd_addr	in	Pointer to BLE address

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

Parameter p_bd_addr

uint8_t

bondingResponse

```
ssp_err_t(* sf_ble_api_t::bondingResponse) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, const uint8_t *p_bd_addr,
sf_ble_bonding_response_t *p_bonding_resp)
```

Brief description

Respond to the bonding request from the remote BLE device. Send bonding response on reception of bonding indication.

Detailed description

Table 38: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle
p_bd_addr	in	Pointer to BLE address
p_bonding_resp	in	Pointer to Bonding address

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter p_bd_addr

`uint8_t`

Parameter p_bonding_resp

Definition: `sf_ble_bonding_response_t*p_bonding_resp`

Bonding Response Parameter

- `sf_ble_bonding_response_t::accept`
  accept or reject bonding
- `sf_ble_bonding_response_t::io_cap`
  IO capabilities.
- `sf_ble_bonding_response_t::max_key_size`
  Max key size.
- `sf_ble_bonding_response_t::ikeys`
  Initiator key distribution.
- `sf_ble_bonding_response_t::rkeys`
  Responder key distribution.

startEncryption

```
ssp_err_t(* sf_ble_api_t::startEncryption) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_sm_enc_info_t const *p_enc_info)
```

Brief description

Start encryption over a connection.

Detailed description

Table 39: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_enc_info	in	information for starting encryption

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_enc_info

Definition: `sf_ble_sm_enc_info_tconst *p_enc_info`

BLE Start Encryption information

- `sf_ble_sm_enc_info_t::conn_idx`
  connection index
- `sf_ble_sm_enc_info_t::ediv`
  BLE Security EDIV.
- `sf_ble_sm_enc_info_t::rand_num`
  Random number for security.
- `sf_ble_sm_enc_info_t::ltk_key`
  BLE long term security key.

connect

```
ssp_err_t(* sf_ble_api_t::connect) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_connection_t const *const p_conn, sf_ble_conn_handle_t *p_handle)
```

Brief description

Connect to a remote BLE device.

Detailed description

Table 40: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Table 40: Parameters (Continued)

Name	Direction	Description
p_conn	in	Pointer to connection information
p_handle	out	Pointer to connection handle

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_conn

Definition: `sf_ble_connection_tconst *const p_conn`

BLE connection information

- `sf_ble_connection_t::init_filt_type`
  Connection filter type.
- `sf_ble_connection_t::addr_type`
  BLE address type.
- `sf_ble_connection_t::bd_addr`
  BLE address.

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

listen

```
ssp_err_t(* sf_ble_api_t::listen) (sf_ble_ctrl_t *const p_ctrl)
```

Brief description

Listen for connection request from remote device.

Detailed description

Table 41: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

authorization

```
ssp_err_t(* sf_ble_api_t::authorization) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle)
```

Brief description

Indicates that the specified remote device has been authorized by user.

Detailed description

Table 42: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle.

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

disconnect

```
ssp_err_t(* sf_ble_api_t::disconnect) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle)
```

Brief description

Terminate connection with remote BLE device.

Detailed description

Table 43: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

setTxPower

```
ssp_err_t(* sf_ble_api_t::setTxPower) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *const p_handle, sf_ble_set_tx_pwr_info_t *p_tx_power_info)
```

Brief description

Sets the transmit power for the procedure specified by the connection handle.

Detailed description

Table 44: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the BLE module.
p_handle	in	Pointer to connection handle. If transmit power is to be set before advertisement or connecting to remote device then pass connection handle as SF_BLE_TX_POWER_CONNECTION_HANDLE value else pass connection handle of remote device
p_tx_power_info	in	Pointer to TX power information

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*const p_handle

BLE Connection Handle

Parameter p_tx_power_info

Definition: sf_ble_set_tx_pwr_info_t*p_tx_power_info

BLE set TX power information structure

- sf_ble_set_tx_pwr_info_t::power_lvl

  TX power level in dBm.

- sf_ble_set_tx_pwr_info_t::state

  Operating state to set the transmit power level.

gattAddCustomProfiles

```
ssp_err_t(* sf_ble_api_t::gattAddCustomProfiles) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_svc_attribute_t *p_svc_attr, uint32_t svc_attr_len,
sf_ble_char_attribute_t *p_char_attr, uint32_t char_attr_len)
```

Brief description

Add Custom Profile to GATT Database.

Detailed description

This function is called with list of service and characteristics which is to be added to GATT database. Services and characteristics which were previously added will be removed and newly passed services and characteristics will be added.

If services and characteristics were previously added and now those services and characteristics are to be removed and no new services and characteristics are to be added , then call this API with service and characteristics length as zero

Table 45: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_svc_attr	in	List of Services to add
svc_attr_len	in	No of elements in services list
p_char_attr	in	List of Characteristics to add
char_attr_len	in	No of elements in Characteristics list

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_svc_attr

Definition: `sf_ble_svc_attribute_t*p_svc_attr`

BLE GATT Service Attributes

- `sf_ble_svc_attribute_t::attr_handle`

  Service Handle.
- `sf_ble_svc_attribute_t::attr_type`

  Attribute type such as SF_BLE_GATT_PRI_SERVICE, SF_BLE_GATT_INCLUDE_SERVICE.
- `sf_ble_svc_attribute_t::parent_svc_handle`

  parent_svc_handle is service handle of parent service which is already registered
- `sf_ble_svc_attribute_t::p_attr_value`

  Service UUID Pointer.

- sf_ble_svc_attribute_t::attr_value_len

  UUID Length.

Parameter svc_attr_len

uint32_t

Parameter p_char_attr

Definition: sf_ble_char_attribute_t*p_char_attr

BLE GATT Characteristics Attributes

- sf_ble_char_attribute_t::p_service

  Service to which this characteristics belongs.
- sf_ble_char_attribute_t::attr_uuid

  UUID of characteristics value.
- sf_ble_char_attribute_t::attr_declare_handle

  Characteristics handle.
- sf_ble_char_attribute_t::attr_declare_type

  Characteristics declare type SF_BLE_GATT_CHAR_DECLARE.
- sf_ble_char_attribute_t::attr_value_handle

  Characteristics value handle.
- sf_ble_char_attribute_t::attr_perm

  Characteristics permission.
- sf_ble_char_attribute_t::attr_properties

  Characteristics properties.
- sf_ble_char_attribute_t::p_attr_value

  Characteristics value data.
- sf_ble_char_attribute_t::attr_value_len

  Characteristics value data length.

Parameter char_attr_len

uint32_t

gattServiceDiscovery

```
ssp_err_t(* sf_ble_api_t::gattServiceDiscovery) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_service_discovery_req_t const *const
p_sf_ble_svc_dscv_req, sf_ble_service_discovery_rsp_t *const
p_sf_ble_svc_dscv_rsp, uint32_t *const p_rsp_cnt)
```

Brief description

Perform service discovery used by GATT client.Perform service discovery on remote GATT server and get results.

Detailed description

Table 46: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
p_sf_ble_svc_dscv_req	in	Pointer to service discovery request
p_sf_ble_svc_dscv_rsp	out	Pointer to service discovery response
p_rsp_cnt	inout	Input Size specifying maximum number of service discovery results which can be stored in response, output specifying number of service discovery results stored in response

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter p_sf_ble_svc_dscv_req

Definition: `sf_ble_service_discovery_req_tconst *const p_sf_ble_svc_dscv_req`

Service discovery request

- `sf_ble_service_discovery_req_t::uuid`
  Service UUID.
- `sf_ble_service_discovery_req_t::start_handle`
  Discovery start handle.
- `sf_ble_service_discovery_req_t::end_handle`
  Discovery end handle.
- `sf_ble_service_discovery_req_t::discovery_type`
  Service discovery type.

Parameter p_sf_ble_svc_dscv_rsp

Definition: `sf_ble_service_discovery_rsp_t*const p_sf_ble_svc_dscv_rsp`

Service discovery result

- sf_ble_service_discovery_rsp_t::service_handle

  Service handle.

- sf_ble_service_discovery_rsp_t::uuid

  Service UUID.

- sf_ble_service_discovery_rsp_t::start_handle

  Start handle of sub-attributes handle range.

- sf_ble_service_discovery_rsp_t::end_handle

  End handle of sub-attributes handle range.

Parameter p_rsp_cnt

uint32_t

gattCharDiscovery

```
ssp_err_t(* sf_ble_api_t::gattCharDiscovery) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_char_discovery_req_t const *const
p_sf_ble_char_dscv_req, sf_ble_char_discovery_rsp_t *const
p_sf_ble_char_dscv_rsp, uint32_t *const p_rsp_cnt)
```

Brief description

Perform characteristics discovery used by GATT client.Perform characteristics discovery on remote GATT server and get results.

Detailed description

Table 47: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
p_sf_ble_char_dscv_req	in	Pointer to characteristics discovery request
p_sf_ble_char_dscv_rsp	out	Pointer to characteristics discovery response
p_rsp_cnt	inout	Input Size specifying maximum number of characteristics discovery results which can be stored in response, output specifying number of characteristics discovery results stored in response

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

Parameter p_sf_ble_char_dscv_req

Definition: sf_ble_char_discovery_req_tconst *const p_sf_ble_char_dscv_req

Characteristic discovery request

- sf_ble_char_discovery_req_t::uuid

  Characteristic UUID.

- sf_ble_char_discovery_req_t::start_handle

  Discovery start handle.

- sf_ble_char_discovery_req_t::end_handle

  Discovery end handle.

- sf_ble_char_discovery_req_t::discovery_type

  Characteristic discovery type.

Parameter p_sf_ble_char_dscv_rsp

Definition: sf_ble_char_discovery_rsp_t*const p_sf_ble_char_dscv_rsp

Characteristic discovery result

- sf_ble_char_discovery_rsp_t::char_handle

  Characteristic handle.

- sf_ble_char_discovery_rsp_t::uuid

  Characteristic UUID.

- sf_ble_char_discovery_rsp_t::value_handle

  Characteristic value handle.

- sf_ble_char_discovery_rsp_t::property

  Characteristic property.

Parameter p_rsp_cnt

uint32_t

gattCharDescDiscovery

```
ssp_err_t(* sf_ble_api_t::gattCharDescDiscovery) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, uint16_t start_handle, uint16_t end_handle,
sf_ble_char_desc_discovery_rsp_t *const p_sf_ble_chardesc_dscv_rsp, uint32_t
*const p_rsp_cnt)
```

Brief description

Perform characteristics descriptor discovery used by GATT client.

Detailed description

Table 48: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
start_handle	in	Start handle from set of handle ranges to be used in discovery
end_handle	in	End handle from set of handle ranges to be used in discovery
p_sf_ble_chardesc_dscv_rsp	out	Pointer to characteristics descriptor discovery response
p_rsp_cnt	inout	Input Size specifying maximum number of characteristics descriptor discovery results which can be stored in response, output specifying number of characteristics descriptor discovery results stored in response

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter start_handle

`uint16_t`

Parameter end_handle

`uint16_t`

Parameter p_sf_ble_chardesc_dscv_rsp

Definition: `sf_ble_char_desc_discovery_rsp_t*const p_sf_ble_chardesc_dscv_rsp`

Characteristic descriptor discovery result

- `sf_ble_char_desc_discovery_rsp_t::desc_handle`
  Characteristic descriptor handle.
- `sf_ble_char_desc_discovery_rsp_t::uuid`
  Characteristic descriptor UUID.

Parameter p_rsp_cnt

`uint32_t`

gattCharRead

```
ssp_err_t(* sf_ble_api_t::gattCharRead) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_char_read_req_t const *const
p_char_read_req, sf_ble_char_read_rsp_t *const p_char_read_rsp)
```

Brief description

Perform read characteristic used by GATT client.Read characteristic value from remote GATT server.

Detailed description

Table 49: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
p_char_read_req	in	Pointer to characteristic read request
p_char_read_rsp	out	Pointer to characteristic read response

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter p_char_read_req

Definition: `sf_ble_char_read_req_tconst *const p_char_read_req`

Read Characteristic request

- `sf_ble_char_read_req_t::char_read_type`

  Characteristic read type.

- `sf_ble_char_read_req_t::handle`

  Characteristic value or descriptor handle.

- `sf_ble_char_read_req_t::uuid`

  Characteristic UUID.

- sf_ble_char_read_req_t::offset

  Offset for long Characteristic value.

- sf_ble_char_read_req_t::p_mul_read_req

  Pointer to multiple read Characteristic request.

- sf_ble_char_read_req_t::handles_cnt

  Characteristic handles count for multiple read.

Parameter p_char_read_rsp

Definition: sf_ble_char_read_rsp_t*const p_char_read_rsp

gattCharWrite

```
ssp_err_t(* sf_ble_api_t::gattCharWrite) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_char_write_req_t const *const
p_char_write_req)
```

Brief description

Perform write characteristic used by GATT client.Write characteristic value on remote GATT server.

Detailed description

Table 50: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
p_char_write_req	in	Pointer to characteristic write request

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

Parameter p_char_write_req

Definition: sf_ble_char_write_req_tconst *const p_char_write_req

Write Characteristic request

- sf_ble_char_write_req_t::char_write_type

  Characteristic write type.

- sf_ble_char_write_req_t::handle

  Characteristic value or descriptor handle.
- sf_ble_char_write_req_t::p_data

  Pointer to data.
- sf_ble_char_write_req_t::offset

  Offset for long Characteristic value.
- sf_ble_char_write_req_t::data_length

  Data length.
- sf_ble_char_write_req_t::auto_execute

  Automatic execute write flag.

gattCharExecuteWrite

```
ssp_err_t(* sf_ble_api_t::gattCharExecuteWrite) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, sf_ble_execute_write_t execute_flag)
```

Brief description

Perform execute write on all pending write operations, used by GATT client.Execute or cancel all prepared writes of characteristics on remote GATT server.

Detailed description

Table 51: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
execute_flag	in	Flag specifying whether to execute or cancel pending writes

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

Parameter execute_flag

Definition: sf_ble_execute_write_texecute_flag

Characteristic execute write flag

gattCharWriteLocal

```
ssp_err_t(* sf_ble_api_t::gattCharWriteLocal) (sf_ble_ctrl_t *const p_ctrl,
uint16_t char_handle, uint16_t data_length, uint8_t *const p_data)
```

Brief description

Perform local characteristic write used by GATT server.Writes local characteristic value on GATT server.

Detailed description

Table 52: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
char_handle	in	Characteristic handle
data_length	in	Length of data to write
p_data	in	Pointer to data

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter char_handle

uint16_t

Parameter data_length

uint16_t

Parameter p_data

uint8_t

gattSendNotify

```
ssp_err_t(* sf_ble_api_t::gattSendNotify) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, uint16_t char_handle)
```

Brief description

Send notification to GATT client, used by GATT server.

Detailed description

Table 53: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure

Table 53: Parameters (Continued)

Name	Direction	Description
p_handle	in	Connection handle
char_handle	in	Characteristic handle whose value will be notified

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter char_handle

`uint16_t`

gattSendIndicate

```
ssp_err_t(* sf_ble_api_t::gattSendIndicate) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, uint16_t char_handle)
```

Brief description

Send indication to GATT client, used by GATT server.Send indication to remote GATT client.

Detailed description

Table 54: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
char_handle	in	Characteristic handle whose value will be indicated

Parameter p_ctrl

Definition: `sf_ble_ctrl_t`

BLE Framework control structure

Parameter p_handle

Definition: `sf_ble_conn_handle_t*p_handle`

BLE Connection Handle

Parameter char_handle

uint16_t

gattWriteResponse

```
ssp_err_t(* sf_ble_api_t::gattWriteResponse) (sf_ble_ctrl_t *const p_ctrl,
sf_ble_conn_handle_t *p_handle, uint16_t handle, sf_ble_attribute_error_code_t
error_code)
```

Brief description

Send response to write operation received by GATT client, used by GATT server.Send response for write request received from remote GATT client.

Detailed description

Table 55: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure
p_handle	in	Connection handle
handle	in	Characteristic handle used for write operation
error_code	in	Characteristic write operation error code to be sent in response

Parameter p_ctrl

Definition: sf_ble_ctrl_t

BLE Framework control structure

Parameter p_handle

Definition: sf_ble_conn_handle_t*p_handle

BLE Connection Handle

Parameter handle

uint16_t

Parameter error_code

versionGet

```
ssp_err_t(* sf_ble_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Table 56: Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

sf_ble_instance_t

sf_ble_instance_t

Detailed description

BLE instance

Variables

- sf_ble_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_ble_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_ble_api_t const * p_api

  Pointer to the API structure for this instance.

6.6.2 SF BLE On-Board Profile Framework Interface

RTOS-integrated SF BLE On-Board Profile Framework Interface.

6.6.2.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE On-Board Profile Framework.

6.6.2.2 Interface API

sf_ble_onboard_profile_api_t

Function name	Description
.open	Initializes the interface for data transfers. Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.

Function name	Description
.close	De-initialize the interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.onbpEnable	Enable On-Board Profile Enables On-Board profile on given connection handle with specified security type. Registers user callback for the profile.
.onbpDisable	Disable On-Board Profile Disables On-Board profile on given connection handle and unregisters user callback.
.onbpServerWriteData	Update Server Local Database Update Local GATT database of Profile Server.
.onbpServerSendNotification	Send notification from Server Sends Notification which will be data specific to On-Board Profile to Client.
.onbpServerSendIndication	Send Indication from Server Sends Indication which contains profile specific data to client.
.onbpClientWriteCCCD	Writes CCCD configuration in Server This API writes CCCD configuration of Server and which enables or disables notification or indication from server.
.onbpClientWriteChar	Writes GATT characteristics with data passed Writes the GATT characteristics in the Server with the data passed.
.onbpClientReadChar	Reads GATT characteristics from Server Reads GATT characteristics from the Server for the profile specified.
.versionGet	Gets version and stores it in provided pointer p_version.

6.6.2.3 Data structures

- sf_ble_onboard_profile_cccd_changed_t
- sf_ble_attr_info_t
- sf_ble_long_attr_info_t

`sf_onbp_t`

Detailed description

BLE On-Board Profile types

Enumerated values

Name	Description
SF_ONBP_ANS_SERVER	Alert Notification Service Server.
SF_ONBP_ANS_CLIENT	Alert Notification Service Client.
SF_ONBP_BAS_SERVER	Battery Service Server.
SF_ONBP_BPS_SERVER	Blood Pressure Service Server.
SF_ONBP_BPS_CLIENT	Blood Pressure Service Client.

Name	Description
SF_ONBP_CTS_SERVER	Current Time Service Server.
SF_ONBP_DIS_SERVER	Device Information Service Server.
SF_ONBP_FMP_SERVER	Find Me Service Server.
SF_ONBP_FMP_CLIENT	Find Me Service Client.
SF_ONBP_HTP_SERVER	Health Thermometer Service Server.
SF_ONBP_HTP_CLIENT	Health Thermometer Service Client.
SF_ONBP_HRS_SERVER	Heart Rate Service Server.
SF_ONBP_HRS_CLIENT	Heart Rate Service Client.
SF_ONBP_HID_SERVER	HID Over GATT Service Server.
SF_ONBP_HID_BHOST_CLIENT	HID Over GATT Boot Host Service Client.
SF_ONBP_HID_RHOST_CLIENT	HID Over GATT Report Host Service Client.
SF_ONBP_IMA_SERVER	Immediate Alert Service Server.
SF_ONBP_LLS_SERVER	Link Loss Service Server.
SF_ONBP_LLS_CLIENT	Link Loss Service Client.
SF_ONBP_NDCS_SERVER	Next Daylight Savings Change Service Server.
SF_ONBP_PAPS_SERVER	Phone Alert Service Server.
SF_ONBP_PAPS_CLIENT	Phone Alert Service Client.
SF_ONBP_PXP_SERVER	Proximity Service Server.
SF_ONBP_PXP_CLIENT	Proximity Service Client.
SF_ONBP_RTUS_SERVER	Reference Time Update Service Server.
SF_ONBP_SCPS_SERVER	Scan Parameter Service Server.
SF_ONBP_SCPS_CLIENT	Scan Parameter Service Client.
SF_ONBP_TIP_SERVER	Time Information Service Server.
SF_ONBP_TIP_CLIENT	Time Information Service Client.

Name	Description
SF_ONBP_TXP_SERVER	Transmit Power Service Server.

sf_ble_prf_sec_t

`sf_ble_prf_sec_t`

Detailed description

BLE Profile Security type

Enumerated values

Name	Description
SF_BLE_PRF_SEC_NONE	No Security.
SF_BLE_PRF_SEC_UNAUTH	Unauthenticated Pairing.
SF_BLE_PRF_SEC_AUTH	Authenticated pairing.
SF_BLE_PRF_SEC_AUTZ	Requires Authorized.
SF_BLE_PRF_SEC_ENC	Encrypted communication.

sf_ble_onbp_char_t

`sf_ble_onbp_char_t`

Detailed description

On-Board Profile GATT Characteristics Code

Enumerated values

Name	Description
SF_BLE_ONBP_CHAR_HRP_HRCP	Heart Rate Control Point Characteristics (Property: Write), Refer sf_ble_prf_hrp_api_hrcp_t. Heart Rate Profile
SF_BLE_ONBP_CHAR_HRP_CCCD_NTF_HRMEAS	Heart Rate Measurement CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_hrp_api_hrmeas_t.
SF_BLE_ONBP_CHAR_HRP_BSL	Heart Rate Body Sensor Location Characteristics (Property: Read)
SF_BLE_ONBP_CHAR_ANP_SUP_NEW_ALERT	Supported New Alert Category Characteristics (Property: Read) Alert Notification Profile

Name	Description
SF_BLE_ONBP_CHAR_ANP_CCCD_NTF_NEW_ALERT	New Alert CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_anp_api_new_alert_ntf_t.
SF_BLE_ONBP_CHAR_ANP_SUP_UNREAD_ALERT	Supported Unread Alert Category Characteristics (Property: Read)
SF_BLE_ONBP_CHAR_ANP_CCCD_NTF_UNREAD_ALERT_STATUS	Unread Alert Status CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_anp_api_unread_alert_ntf_t.
SF_BLE_ONBP_CHAR_ANP_ALERT_NOTIFICATION_CTRL_POINT	Alert Notification Control Point (Property: Write), Refer sf_ble_anp_ancp_t.
SF_BLE_ONBP_CHAR_DIS_MANUF	Device Information Service Manufacturer Name String (Property: Read) Device Information Service Profile
SF_BLE_ONBP_CHAR_DIS_MODEL	Device Information Service Model Number String (Property: Read)
SF_BLE_ONBP_CHAR_DIS_SERNB	Device Information Service Serial number String (Property: Read)
SF_BLE_ONBP_CHAR_DIS_HWREV	Device Information Service HW Revision String (Property: Read)
SF_BLE_ONBP_CHAR_DIS_FWREV	Device Information Service Fw Revision String (Property: Read)
SF_BLE_ONBP_CHAR_DIS_SWREV	Device Information Service SW Revision String (Property: Read)
SF_BLE_ONBP_CHAR_DIS_SYSID	Device Information Service system ID (Property: Read)
SF_BLE_ONBP_CHAR_DIS_IEEE	Device Information Service IEEE Certification (Property: Read)
SF_BLE_ONBP_CHAR_DIS_PNPID	Device Information PNPID, Used in services like HOGP (Property: Read)
SF_BLE_ONBP_CHAR_IAS_ALERT_LEVEL	Alert Level (Property: Write), Refer sf_ble_prf_ias_alert_type_t. Immediate Alert Service Profile
SF_BLE_ONBP_CHAR_SCPS_CCCD_NTF_SCAN_REFRESH	Scan Refresh CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_prf_scps_scan_refresh_t. Scan Parameters Service Profile

Name	Description
SF_BLE_ONBP_CHAR_SCPS_SCAN_INTERVAL_WINDOW	Scan Interval Window (Property: Write), Refer sf_ble_prf_scps_scan_intv_t.
SF_BLE_ONBP_CHAR_CTS_CCCD_NTF_CURRENT_TIME	Current Time CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_cts_curr_time_ntf_t. Current Time Service Profile
SF_BLE_ONBP_CHAR_CTS_CCCD_NTF_CURRENT_TIME_VALUE	Used to read data for current time through read characteristics.
SF_BLE_ONBP_CHAR_CTS_LOCAL_TIME_INFORMATION	Local Time Information (Property: Read)
SF_BLE_ONBP_CHAR_CTS_REFERENCE_TIME_INFORMATION	Reference Time Information (Property: Read)
SF_BLE_ONBP_CHAR_NDCS_TIME_WITH_DST	Time with DST (Property: Read) Next DST Change Service Profile
SF_BLE_ONBP_CHAR_TIME_UPDATE_CONTROL_POINT	Time Update Control Point (Property: Write), Refer sf_ble_prf_rtus_time_updt_state_t. Reference Time Update Service Profile
SF_BLE_ONBP_CHAR_TIME_UPDATE_STATE	Time Update State (Property: Read)
SF_BLE_ONBP_CHAR_CCCD_NTF_CURRENT_TIME	Current Time CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_bas_battery_lvl_ntf_t. Time Information Service Profile
SF_BLE_ONBP_CHAR_CCCD_NTF_BATTERY_LEVEL	Battery Level (Property: NTF, Read, Write), Refer sf_ble_prf_bas_battery_lvl_t. Battery Service Profile
SF_BLE_ONBP_CHAR_PXPM_SET_ALERT	PXP Alert char. Alert Level Service Profile
SF_BLE_ONBP_CHAR_PXPM_GET_ALERT_LVL	PXP Get Alert Level.
SF_BLE_ONBP_CHAR_PXPM_GET_TX_POWER_LVL	PXP Get TX Power Level.
SF_BLE_ONBP_CHAR_HTP_TEMP_MEAS_IND	HTPC temp. measurement indication CCCD Characteristics (Property: IND, Read, Write), Refer. Health Thermometer Profile
SF_BLE_ONBP_CHAR_HTP_INTERM_TEMP_NTF	HTPC intermediate temp. notification CCCD Characteristics (Property: NTF, Read, Write), Refer.
SF_BLE_ONBP_CHAR_HTP_MEAS_INTV_IND	HTPC temp. measurement interval indication CCCD Characteristics (Property: IND, Read, Write), Refer.

Name	Description
SF_BLE_ONBP_CHAR_HTP_TEMP_TYPE	HTPC temp. temperature type(Property: Read)
SF_BLE_ONBP_CHAR_HTP_MEAS_INTV	HTPC temp. measurement interval.
SF_BLE_ONBP_CHAR_HTP_MEAS_INTV_RANGE	HTPC temp. measurement interval valid range.
SF_BLE_ONBP_CHAR_CCCD_NTF_REPORT_INPUT	Report Input CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_prf_hid_report_desc_t. HID Over GATT Service Profile
SF_BLE_ONBP_CHAR_CCCD_NTF_KB_INPUT_REPORT	Keyboard Input Report CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_prf_hid_report_desc_t.
SF_BLE_ONBP_CHAR_CCCD_NTF_KB_INPUT_REPORT_VALUE	Used to read Keyboard Input record value through read characteristics.
SF_BLE_ONBP_CHAR_CCCD_NTF_KB_OUTPUT_REPORT_VALUE	Used to read Keyboard Output record value through read characteristics.
SF_BLE_ONBP_CHAR_CCCD_NTF_MOUSE_INPUT_REPORT	Mouse Input Report CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_prf_hid_report_desc_t.
SF_BLE_ONBP_CHAR_CCCD_NTF_MOUSE_INPUT_REPORT_VALUE	Used to read Mouse Input record value through read characteristics.
SF_BLE_ONBP_CHAR_PROTOCOL_MODE	HID boot host protocol mode (Property: Read, Write), Refer sf_ble_prf_hid_protocol_mode_t.
SF_BLE_ONBP_CHAR_CONTROL_POINT	HID report host write control point (Property: Read, Write), Refer sf_ble_prf_hid_ctrl_point_val_t.
SF_BLE_ONBP_CHAR_BLP_CCCD_NTF_INTERM_CUFPRS	Read Cuff Pressure measurement CCCD Characteristics (Property: NTF, Read, Write), Refer sf_ble_blp_meas_info_t. Blood Pressure profile
SF_BLE_ONBP_CHAR_BLP_CCCD_IND_BLDPRS_MEAS	Blood Pressure Measurement CCCD Characteristics (Property: IND, Read, Write), Refer sf_ble_blp_meas_info_t.
SF_BLE_ONBP_CHAR_BLP_RD_BLS_BF	Read Blood Pressure Feature.
SF_BLE_ONBP_CHAR_CCCD_NTF_ALERT_STATUS	Alert Status (Property: NTF, Read, Write), Refer sf_ble_prf_alert_status. Phone Alert Status Service Profile
SF_BLE_ONBP_CHAR_CCCD_NTF_ALERT_STATUS_VALUE	Used to read Alert Status value through read characteristics.

Name	Description
SF_BLE_ONBP_CHAR_CCCD_NTF_RINGER_SETTING	Ringer Settings (Property: NTF, Read, Write), Refer sf_ble_prf_ringer_setting_t.
SF_BLE_ONBP_CHAR_CCCD_NTF_RINGER_SETTING_VALUE	Used to read Ringer Settings value through read characteristics.
SF_BLE_ONBP_CHAR_RINGER_CONTROL_POINT	PAPS Ringer control point write characteristics.

sf_onbp_t profile, sf_ble_onbp_char_t characteristics, const void *p_data)
```

Brief description

Update Server Local Database Update Local GATT database of Profile Server.

Detailed description

Table 61: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure for BLE
p_handle	in	Pointer to connection handle
profile	in	Profile type
characteristics	in	Profile characteristics
p_data	in	Pointer to data

Parameter p_ctrl

Definition: sf_ble_onboard_profile_ctrl_t

BLE On-Board Profile Framework control structure

Parameter p_handle
Parameter profile

Definition: sf_onbp_tprofile

BLE On-Board Profile types

Parameter characteristics

Definition: sf_ble_onbp_char_tcharacteristics

On-Board Profile GATT Characteristics Code

Parameter p_data

const

onbpServerSendNotification

```
ssp_err_t(* sf_ble_onboard_profile_api_t::onbpServerSendNotification)
(sf_ble_onboard_profile_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle,
sf_onbp_t profile, sf_ble_onbp_char_t characteristics, const void *p_data)
```

Brief description

Send notification from Server Sends Notification which will be data specific to On-Board Profile to Client.

Detailed description

Table 62: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure for BLE
p_handle	in	Pointer to connection handle
profile	in	Profile type
characteristics	in	Profile characteristics
p_data	in	Pointer to data

Parameter p_ctrl

Definition: `sf_ble_onboard_profile_ctrl_t`

BLE On-Board Profile Framework control structure

Parameter p_handle
Parameter profile

Definition: `sf_onbp_tprofile`

BLE On-Board Profile types

Parameter characteristics

Definition: `sf_ble_onbp_char_tcharacteristics`

On-Board Profile GATT Characteristics Code

Parameter p_data

`const`

onbpServerSendIndication

```
ssp_err_t(* sf_ble_onboard_profile_api_t::onbpServerSendIndication)
(sf_ble_onboard_profile_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle,
sf_onbp_t profile, sf_ble_onbp_char_t characteristics, const void *p_data)
```

Brief description

Send Indication from Server Sends Indication which contains profile specific data to client.

Detailed description

Table 63: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure for BLE

Table 63: Parameters (Continued)

Name	Direction	Description
p_handle	in	Pointer to connection handle
profile	in	Profile type
characteristics	in	Profile characteristics
p_data	in	Pointer to data

Parameter p_ctrl

Definition: `sf_ble_onboard_profile_ctrl_t`

BLE On-Board Profile Framework control structure

Parameter p_handle
Parameter profile

Definition: `sf_onbp_tprofile`

BLE On-Board Profile types

Parameter characteristics

Definition: `sf_ble_onbp_char_tcharacteristics`

On-Board Profile GATT Characteristics Code

Parameter p_data

`const`

onbpClientWriteCCCD

```
ssp_err_t(* sf_ble_onboard_profile_api_t::onbpClientWriteCCCD)

sf_onbp_t profile, sf_ble_onbp_char_t characteristics, const void *p_data)
```

Brief description

Writes GATT characteristics with data passed Writes the GATT characteristics in the Server with the data passed.

Detailed description

Table 65: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure for BLE
p_handle	in	Pointer to connection handle
profile	in	Profile type
characteristics	in	GATT characteristics code
p_data	in	Pointer to data

Parameter p_ctrl

Definition: sf_ble_onboard_profile_ctrl_t

BLE On-Board Profile Framework control structure

Parameter p_handle
Parameter profile

Definition: sf_onbp_tprofile

BLE On-Board Profile types

Parameter characteristics

Definition: sf_ble_onbp_char_tcharacteristics

On-Board Profile GATT Characteristics Code

Parameter p_data

const

onbpClientReadChar

```
ssp_err_t(* sf_ble_onboard_profile_api_t::onbpClientReadChar)
(sf_ble_onboard_profile_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle,
sf_onbp_t profile, sf_ble_onbp_char_t characteristics)
```

Brief description

Reads GATT characteristics from Server Reads GATT characteristics from the Server for the profile specified.

Detailed description

Table 66: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure for BLE
p_handle	in	Pointer to connection handle
profile	in	Profile type
characteristics	in	Profile characteristics

Parameter p_ctrl

Definition: sf_ble_onboard_profile_ctrl_t

BLE On-Board Profile Framework control structure

Parameter p_handle
Parameter profile

Definition: sf_onbp_tprofile

BLE On-Board Profile types

On-Board Profile GATT Characteristics Code

versionGet

```
ssp_err_t(* sf_ble_onboard_profile_api_t::versionGet) (ssp_version_t *const
p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Table 67: Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

sf_ble_onboard_profile_instance_t

sf_ble_onboard_profile_instance_t

Detailed description

Instance structure

Variables

- sf_ble_onboard_profile_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_ble_onboard_profile_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_ble_onboard_profile_api_t const * p_api

  Pointer to the API structure for this instance.

6.6.3 SF BLE Alert Notification Profile Framework Interface

RTOS-integrated SF BLE Alert Notification Profile Framework Interface.

6.6.3.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Alert Notification Profile Framework.

6.6.3.2 Interface API

sf_ble_anp_api_new_alert_t

Function name	Description
.category_id	Category ID.
.alert_num	Number of New Alert.
.text_size	Text Size.
.text	Actual Text.

sf_ble_anp_api_new_alert_ntf_t

Function name	Description
.conhdl	Connection handle.
.new_alert	New Alert data.

sf_ble_anp_api_unread_alert_t

Function name	Description
.category_id	Category ID.
.unread_count	Number of Unread Alert.

sf_ble_anp_api_unread_alert_ntf_t

Function name	Description
.conhdl	Connection handle.
.alert	Unread Alert data.

6.6.3.3 Data structures

- sf_ble_anp_ancp_t
- sf_ble_anp_ancp_change_t
- sf_ble_anp_api_new_alert_t
- sf_ble_anp_api_new_alert_ntf_t

- sf_ble_anp_api_unread_alert_t
- sf_ble_anp_api_unread_alert_ntf_t

6.6.3.4 Enumerations

- sf_ble_prf_anpc_event_t
- sf_ble_prf_anps_event_t
- sf_ble_prf_anp_category_id
- sf_ble_prf_anp_cmd_id_t

6.6.3.5 Defines

- #define SF_BLE_ANP_ALT_TEXT_MAX

  Initial value: `(18U)`

  Buffer size of data for Alert Notification

6.6.3.6 API Data

sf_ble_prf_anpc_event_t

`sf_ble_prf_anpc_event_t`

Detailed description

Profile Client user events

Enumerated values

Name	Description
SF_BLE_PRF_ANPC_EVENT_NONE	Event not supported.
SF_BLE_PRF_ANPC_EVENT_NEW_ALT_NTF	New Alert Data received event, Refer sf_ble_anp_api_new_alert_ntf_t.
SF_BLE_PRF_ANPC_EVENT_UNREAD_ALT_NTF	Unread Alert Data received event, Refer sf_ble_anp_api_unread_alert_ntf_t.
SF_BLE_PRF_ANPC_EVENT_READ_CHAR_RES	Read Char Complete Event.

sf_ble_prf_anps_event_t

`sf_ble_prf_anps_event_t`

Detailed description

Alert notification server profile user events

Enumerated values

Name	Description
SF_BLE_PRF_ANPS_EVENT_NONE	Event not supported.
SF_BLE_PRF_ANPS_EVENT_ALT_NF_CP_IND	Alert Notification Control Point Changed indication, Refer sf_ble_anp_ancp_change_t.
SF_BLE_PRF_ANPS_EVENT_CCCD_NTF_IND	CCCD Notification Setting change event.

sf_ble_prf_anp_category_id

`sf_ble_prf_anp_category_id`

Detailed description

Alert Notification Control Point Category ID

Enumerated values

Name	Description
SF_BLE_PRF_ANP_CATEGORY_ID_SIMPLE_ALERT	Simple Alert: General text alert or non-text alert.
SF_BLE_PRF_ANP_CATEGORY_ID_EMAIL	Email Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_NEWS	News feeds Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_CALL	Incoming Call Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_MISSED_CALL	Missed Call Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_SMS_MMS	SMS/MMS Message Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_VOICE_MAIL	Voice Mail Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_SCHEDULE	Alert occurred on calendar, planner.
SF_BLE_PRF_ANP_CATEGORY_ID_HIGH_PRIORITY_ALERT	High Prioritized Alert.
SF_BLE_PRF_ANP_CATEGORY_ID_INSTANT_MESSAGE	Incoming Instant Messages.
SF_BLE_PRF_ANP_CATEGORY_ID_ALL	All Supported Categories.

sf_ble_prf_anp_cmd_id_t

`sf_ble_prf_anp_cmd_id_t`

Detailed description

Alert Notification Control Point Command ID

Enumerated values

Name	Description
SF_BLE_PRF_ANP_CMD_ID_NEW_ALERT_ENABLE	Enable New Incoming Alert Notification.
SF_BLE_PRF_ANP_CMD_ID_UNREAD_ALERT_ENABLE	Enable Unread Category Status Notification.
SF_BLE_PRF_ANP_CMD_ID_NEW_ALERT_DISABLE	Disable New Incoming Alert Notification.
SF_BLE_PRF_ANP_CMD_ID_UNREAD_ALERT_DISABLE	Disable Unread Category Status Notification.
SF_BLE_PRF_ANP_CMD_ID_NEW_ALERT_NTF_REQ	Notify New Incoming Alert immediately.
SF_BLE_PRF_ANP_CMD_ID_UNREAD_ALERT_NTF_REQ	Notify Unread Category Status immediately.

6.6.3.7 API Structures

sf_ble_anp_ancp_t

sf_ble_anp_ancp_t

Detailed description

Write Characteristics data for Alert Notification Control Point

Variables

- sf_ble_prf_anp_cmd_id_t command_id

  Command type.

- sf_ble_prf_anp_category_id category_id

  Category on which to act.

sf_ble_anp_ancp_change_t

sf_ble_anp_ancp_change_t

Detailed description

Alert Notification Control Point Change Indication for Sensor

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.

- sf_ble_anp_ancp_t control_point_value

  Control point value.

sf_ble_anp_api_new_alert_t

sf_ble_anp_api_new_alert_t

Detailed description

Notification Data for New Alert, also used for sending notification from server

category_id

`sf_ble_prf_anp_category_id::category_id`

Brief description

Category ID.

alert_num

`uint8_t sf_ble_anp_api_new_alert_t::alert_num`

Brief description

Number of New Alert.

text_size

`uint8_t sf_ble_anp_api_new_alert_t::text_size`

Brief description

Text Size.

text

`uint8_t sf_ble_anp_api_new_alert_t::text[SF_BLE_ANP_ALT_TEXT_MAX]`

Brief description

Actual Text.

sf_ble_anp_api_new_alert_ntf_t

sf_ble_anp_api_new_alert_ntf_t

Detailed description

Notification Data received for New Alert

conhdl

`sf_ble_conn_handle_t::conhdl`

Brief description

Connection handle.

new_alert

`sf_ble_anp_api_new_alert_t::new_alert`

Brief description

New Alert data.

sf_ble_anp_api_unread_alert_t

sf_ble_anp_api_unread_alert_t

Detailed description

Notification Data for Unread Alert, also used for sending notification from server

category_id

`sf_ble_prf_anp_category_id::category_id`

Brief description

Category ID.

unread_count

`uint8_t sf_ble_anp_api_unread_alert_t::unread_count`

Brief description

Number of Unread Alert.

sf_ble_anp_api_unread_alert_ntf_t

sf_ble_anp_api_unread_alert_ntf_t

Detailed description

Notification Data received for Unread Alert

conhdl

`sf_ble_conn_handle_t::conhdl`

Brief description

Connection handle.

alert

`sf_ble_anp_api_unread_alert_t::alert`

Brief description

Unread Alert data.

6.6.4 SF BLE Battery Service Profile Framework Interface

RTOS-integrated SF BLE Battery Service Profile Framework Interface.

6.6.4.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Battery Service Profile Framework.

6.6.4.2 Data structures

- sf_ble_bas_battery_lvl_ntf_t

6.6.4.3 Variables

- sf_ble_prf_bas_battery_lvl_t

6.6.4.4 sf_ble_prf_bas_battery_lvl_t

```
SSP_HEADER typedef uint8_t sf_ble_prf_bas_battery_lvl_t
```

Detailed description

Battery Level

6.6.4.5 API Structures

sf_ble_bas_battery_lvl_ntf_t

sf_ble_bas_battery_lvl_ntf_t

Detailed description

Control Point Change Indication for Sensor

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.
- sf_ble_prf_bas_battery_lvl_t batt_lvl

  Battery Level.

6.6.5 SF BLE Blood Pressure Profile Framework Interface

RTOS-integrated SF BLE Blood Pressure Profile Framework Interface.

6.6.5.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Blood Pressure Profile Framework.

6.6.5.2 Data structures

- sf_ble_blp_meas_info_t
- sf_ble_blp_meas_recv_data_t

6.6.5.3 Enumerations

- sf_ble_prf_blpc_event_t
- sf_ble_prf_blps_event_t

6.6.5.4 API Data

sf_ble_prf_blpc_event_t

`sf_ble_prf_blpc_event_t`

Detailed description

Profile user client events

Enumerated values

Name	Description
SF_BLE_PRF_BLPC_EVENT_NONE	Event not supported.
SF_BLE_PRF_BLPC_EVENT_MEAS_NTF_IND	BLE user event indicating BLPC profile measurement notification.
SF_BLE_PRF_BLPC_EVENT_WRITE_CHAR_RES	BLE user event indicating BLPC profile read char response.
SF_BLE_PRF_BLPC_EVENT_READ_CHAR_RES	BLE user event indicating BLPC write char response.

sf_ble_prf_blps_event_t

`sf_ble_prf_blps_event_t`

Detailed description

Profile user server events

Enumerated values

Name	Description
SF_BLE_PRF_BLPS_EVENT_NONE	Event not supported.
SF_BLE_PRF_BLPS_EVENT_NTFIND_IND	BLE user event indicating notification indication.

6.6.5.5 API Structures

sf_ble_blp_meas_info_t

sf_ble_blp_meas_info_t

Detailed description

Blood Pressure Measurements Info

Variables

- uint8_t flag_stable_meas

  Stable or intermediary type of measurements. Set to 0 if intermediate measurement.
- uint8_t flags

  flags
- int16_t press_val1

  blood pressure value - Systolic or cuff pressure. Cuff pressure has to be filled here
- int16_t press_val2

  blood pressure value - Diastolic or subfield1
- int16_t press_val3

  blood pressure value - MAP or subfield2
- sf_ble_prf_cts_date_time_t stamp

  time stamp
- int16_t rate

  pulse rate
- uint8_t id

  user ID
- uint8_t reserved

  Reserved.
- uint16_t meas_sts

  measurement status

sf_ble_blp_meas_recv_data_t

sf_ble_blp_meas_recv_data_t

Detailed description

Blood Pressure Measurements Data Received from Server

Variables

- uint16_t conhdl

  Connection handle.
- sf_ble_onbp_char_t char_code

  Characteristic code.
- sf_ble_blp_meas_info_t meas_info

  BLP measurement data.

6.6.6 SF BLE Current Time Service Profile Framework Interface

RTOS-integrated SF BLE Current Time Service Profile Framework Interface.

6.6.6.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Current Time Service Profile Framework.

6.6.6.2 Data structures

- sf_ble_prf_cts_date_time_t
- sf_ble_prf_cts_curr_time_t
- sf_ble_cts_local_time_t
- sf_ble_cts_ref_time_t
- sf_ble_cts_curr_time_ntf_t

sf_ble_prf_cts_date_time_t

sf_ble_prf_cts_date_time_t

Detailed description

Current Time Service Date Time information

Variables

- uint16_t year

  Year value.
- uint8_t month

  Month value.
- uint8_t day

  Day value.
- uint8_t hour

  Hour value.
- uint8_t min

  Minute value.
- uint8_t sec

  Second value.
- uint8_t reserved

  Reserved.

sf_ble_prf_cts_curr_time_t

sf_ble_prf_cts_curr_time_t

Detailed description

Current time information with Date Time

Variables

- sf_ble_prf_cts_date_time_t stamp

  Date time info.
- uint8_t day_of_week

  Day of week.
- uint8_t fractions256

  Fraction value.
- uint8_t adjust_reason

  Adjust reason.
- uint8_t reserved

  Reserved.

sf_ble_cts_local_time_t

sf_ble_cts_local_time_t

Detailed description

Local Time Information structure

Variables

- int8_t time_zone

  Time Zone.
- uint8_t dst_offset

  DST Offset.

sf_ble_cts_ref_time_t

sf_ble_cts_ref_time_t

Detailed description

Reference Time Information structure

Variables

- uint8_t time_source

  Source of time.
- uint8_t accuracy

  Estimated accuracy of time compared to original time source.

- uint8_t days_since_update

  Days that passed since time was updated successfully from time source.
- uint8_t hours_since_update

  Time that passed since time was updated successfully from time source.

sf_ble_cts_curr_time_ntf_t

sf_ble_cts_curr_time_ntf_t

Detailed description

Notification Data of Current Time received from server

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.
- sf_ble_prf_cts_curr_time_t current_time

  heart rate measurement data

6.6.7 SF BLE Find Me Profile Framework Interface

RTOS-integrated SF BLE Find Me Profile Framework Interface.

6.6.7.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Find Me Profile Framework.

6.6.7.2 API Data

sf_ble_prf_fmpt_event_t

`sf_ble_prf_fmpt_event_t`

Detailed description

Profile Server user events

Enumerated values

Name	Description
SF_BLE_PRF_FMPT_EVENT_NONE	BLE event unsupported.
SF_BLE_PRF_FMPT_EVENT_ALERT_LVL_CHANGED	BLE user event Alert level changed from locator, Refer sf_ble_ias_alert_lvl_change_t.

6.6.8 SF BLE HID Over GATT Profile Framework Interface

RTOS-integrated SF BLE HID Over GATT Profile Framework Interface.

6.6.8.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE HID Over GATT Profile Framework.

6.6.8.2 Data structures

- sf_ble_prf_value_t
- sf_ble_prf_hid_report_desc_t
- sf_ble_prf_hid_report_ind_t

sf_ble_prf_dis_pnpid_t

Detailed description

Structure to set the current Device Information PnP Id characteristic value

Variables

- uint8_t vendorIdSource

  Vendor ID source.
- uint16_t vendorId

  Vendor ID.
- uint16_t productId

  Product ID.
- uint16_t productVersion

  Version of Product.

6.6.9 SF BLE Heart Rate Profile Framework Interface

RTOS-integrated SF BLE Heart Rate Profile Framework Interface.

6.6.9.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Heart Rate Profile Framework.

6.6.9.2 Interface API

sf_ble_hrp_api_hrmeas_t

Function name	Description
.flags	HRP bit Flags.
.rr_interval_num	number of RR Interval

Function name	Description
.heart_rate_measure	Heart Rate measurement value.
.energy_expended	Energy Expended in Kilo Joules from last time it was reset.
.rr_interval	RR interval(s)

sf_ble_hrp_api_meas_ntf_t

Function name	Description
.conhdl	Connection handle.
.measurements_info	heart rate measurement data

6.6.9.3 Data structures

- sf_ble_hrp_api_hrmeas_t
- sf_ble_hrp_api_meas_ntf_t
- sf_ble_hrp_cp_change_t

6.6.9.4 Enumerations

- sf_ble_prf_hrpc_event_t
- sf_ble_prf_hrps_event_t

6.6.9.5 Typedefs

- sf_ble_prf_hrp_api_hrcp_t

6.6.9.6 Defines

- #define SF_BLE_PRF_HRP_API_RR_INTERVAL_BUFF_LEN

  Initial value: `(0x9U)`

  Heart Rate RR Interval Buffer Length

6.6.9.7 API Data

sf_ble_prf_hrpc_event_t

`sf_ble_prf_hrpc_event_t`

Detailed description

Profile Client user events

Enumerated values

Name	Description
SF_BLE_PRF_HRPC_EVENT_NONE	Event not supported.
SF_BLE_PRF_HRPC_EVENT_MEAS_NTF	Heart Rate Measurement data received event, Refer sf_ble_hrp_api_meas_ntf_t.
SF_BLE_PRF_HRPC_EVENT_READ_CHAR_RES	Read Char Complete Event.

sf_ble_prf_hrps_event_t

`sf_ble_prf_hrps_event_t`

Detailed description

Profile Server user events

Enumerated values

Name	Description
SF_BLE_PRF_HRPS_EVENT_NONE	Event not supported.
SF_BLE_PRF_HRPS_EVENT_NTF_CHG_IND	CCCD Notification Setting Change Event.
SF_BLE_PRF_HRPS_EVENT_HRCP_CHG_IND	Heart Rate Control Point Changed Event, Refer sf_ble_hrp_cp_change_t.

sf_ble_prf_hrp_api_hrcp_t

`typedef uint16_t sf_ble_prf_hrp_api_hrcp_t`

Detailed description

Write Characteristics data for Heart Rate Control Point

6.6.9.8 API Structures

sf_ble_hrp_api_hrmeas_t

sf_ble_hrp_api_hrmeas_t

Detailed description

Notification Data for Heart Rate Measurement, also used for sending notification from server

flags

`uint8_t sf_ble_hrp_api_hrmeas_t::flags`

Brief description

HRP bit Flags.

rr_interval_num

`uint8_t sf_ble_hrp_api_hrmeas_t::rr_interval_num`

Brief description

number of RR Interval

heart_rate_measure

`uint16_t sf_ble_hrp_api_hrmeas_t::heart_rate_measure`

Brief description

Heart Rate measurement value.

energy_expended

`uint16_t sf_ble_hrp_api_hrmeas_t::energy_expended`

Brief description

Energy Expended in Kilo Joules from last time it was reset.

rr_interval

`uint16_t sf_ble_hrp_api_hrmeas_t::rr_interval[SF_BLE_PRF_HRP_API_RR_INTERVAL_BUFF_LEN]`

Brief description

RR interval(s)

sf_ble_hrp_api_meas_ntf_t

sf_ble_hrp_api_meas_ntf_t

Detailed description

Notification Data of Heart Rate measurement received from sensor

conhdl

`sf_ble_conn_handle_t::conhdl`

Brief description

Connection handle.

measurements_info

`sf_ble_hrp_api_hrmeas_t::measurements_info`

Brief description

heart rate measurement data

sf_ble_hrp_cp_change_t

sf_ble_hrp_cp_change_t

Detailed description

Control Point Change Indication for Sensor

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.
- sf_ble_prf_hrp_api_hrcp_t control_point_value

  Control point value.

6.6.10 SF BLE Health Thermometer Profile Framework Interface

RTOS-integrated SF BLE Health Thermometer Profile Framework Interface.

6.6.10.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Health Thermometer Profile Framework.

6.6.10.2 Data structures

- sf_ble_prf_htp_temp_info_t
- sf_ble_prf_htp_temp_info_ind_t
- st_sf_ble_prf_htp_meas_intv_val_t

6.6.10.3 Enumerations

- sf_ble_event_prf_htpt_t
- sf_ble_event_prf_htpc_t
- sf_ble_prf_htp_meas_state_t
- sf_ble_prf_htp_temp_type_t

6.6.10.4 API Data

sf_ble_event_prf_htpt_t

`sf_ble_event_prf_htpt_t`

Detailed description

HTP thermometer (server) user events

Enumerated values

Name	Description
SF_BLE_EVENT_PRF_HTPT_NONE	Event not supported.
SF_BLE_EVENT_PRF_HTPT_MEAS_INTV_CHG_IND	Thermometer measurement interval characteristic change indication.
SF_BLE_EVENT_PRF_HTPT_CFG_IND	BLE user event indicating HTPT profile CCCD change indication.

sf_ble_event_prf_htpc_t

`sf_ble_event_prf_htpc_t`

Detailed description

HTP Collector (client) user events

Enumerated values

Name	Description
SF_BLE_EVENT_PRF_HTPC_NONE	Event not supported.
SF_BLE_EVENT_PRF_HTPC_TEMP_IND	BLE user event indicating HTPC profile temperature value indication.
SF_BLE_EVENT_PRF_HTPC_MEAS_INTV_IND	BLE user event indicating HTPC profile measurement interval value indication.
SF_BLE_PRF_HTPC_EVENT_READ_CHAR_RES	BLE user event for read char response.

sf_ble_prf_htp_meas_state_t

`sf_ble_prf_htp_meas_state_t`

Detailed description

HTP Collector (client) user events

Enumerated values

Name	Description
SF_BLE_PRF_HTP_MEAS_STATE_IN_PROGRESS	Measurement in progress.
SF_BLE_PRF_HTP_MEAS_STATE_COMPLETE	Measurement is complete.

sf_ble_prf_htp_temp_type_t

`sf_ble_prf_htp_temp_type_t`

Detailed description

HTP Temperature Types

Enumerated values

Name	Description
SF_BLE_PRF_HTP_TYPE_ARMPIT	Temperature type Armpit.
SF_BLE_PRF_HTP_TYPE_BODY	Temperature type Body.
SF_BLE_PRF_HTP_TYPE_EAR	Temperature type Ear.
SF_BLE_PRF_HTP_TYPE_FINGER	Temperature type Finger.
SF_BLE_PRF_HTP_TYPE_GASTROINTESTINAL	Temperature type Gastrointestinal.
SF_BLE_PRF_HTP_TYPE_MOUTH	Temperature type Mouth.
SF_BLE_PRF_HTP_TYPE_RECTUM	Temperature type Rectum.
SF_BLE_PRF_HTP_TYPE_TOE	Temperature type Toe.
SF_BLE_PRF_HTP_TYPE_TYMPANUM	Temperature type Tympanum.

6.6.10.5 API Structures

sf_ble_prf_htp_temp_info_t

sf_ble_prf_htp_temp_info_t

Detailed description

Health Thermometer Info

Variables

- uint8_t flag_stable_meas

  Stable or intermediary type of temperature.
- uint8_t flags

  flags
- int32_t temp_val

  temp value
- sf_ble_prf_cts_date_time_t stamp

  time stamp

- sf_ble_prf_htp_temp_type_t type
  type
- uint8_t reserved
  Reserved.

sf_ble_prf_htp_temp_info_ind_t

sf_ble_prf_htp_temp_info_ind_t

Detailed description

Thermometer Information Indication

Variables

- uint16_t conhdl
  Connection handle.
- sf_ble_prf_htp_temp_info_t temp_info
  Thermometer info.

st_sf_ble_prf_htp_meas_intv_val_t

st_sf_ble_prf_htp_meas_intv_val_t

Detailed description

Measurement Interval value

Variables

- uint16_t conhdl
  Connection handle.
- uint16_t intv
  Interval value.

6.6.11 SF BLE Immediate Alert Profile Framework Interface

RTOS-integrated SF BLE Immediate Alert Profile Framework Interface.

6.6.11.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Immediate Alert Profile Framework.

6.6.11.2 Data structures

- sb_ble_prf_ias_set_alert_t
- sf_ble_prf_ias_alert_lvl_change_t

6.6.11.3 Enumerations

- sf_ble_prf_ias_alert_type_t
- sf_ble_prf_ias_svc_code_t

6.6.11.4 API Data

sf_ble_prf_ias_alert_type_t

`sf_ble_prf_ias_alert_type_t`

Detailed description

Alert Level Values

Enumerated values

Name	Description
SF_BLE_PRF_ALERT_TYPE_NONE	No Alert.
SF_BLE_PRF_ALERT_TYPE_MILD	Mild Alert.
SF_BLE_PRF_ALERT_TYPE_HIGH	High Alert.

sf_ble_prf_ias_svc_code_t

`sf_ble_prf_ias_svc_code_t`

Detailed description

SVC codes

Enumerated values

Name	Description
SF_BLE_SVC_SET_LK_LOSS_ALERT	Code for LLS Alert Level Char.
SF_BLE_SVC_SET_IMMDT_ALERT	Code for IAS Alert Level Char.

6.6.11.5 API Structures

sb_ble_prf_ias_set_alert_t

sb_ble_prf_ias_set_alert_t

Detailed description

Alert level and type

Variables

- sf_ble_prf_ias_svc_code_t svc_code

  SVC code.
- sf_ble_prf_ias_alert_type_t lvl

  Alert level.

sf_ble_prf_ias_alert_lvl_change_t

sf_ble_prf_ias_alert_lvl_change_t

Detailed description

Alert Level Change Indication for Server

Variables

- sf_ble_conn_handle_t conhdl

  Connection handle.
- sf_ble_prf_ias_alert_type_t alert_lvl

  Control point value.

6.6.12 SF BLE Next DST Change Service Profile Framework Interface

RTOS-integrated SF BLE Next DST Change Service Profile Framework Interface.

6.6.12.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Next DST Change Service Profile Framework.

6.6.12.2 Data structures

- sf_ble_prf_ndcs_time_dst_t

6.6.12.3 API Structures

sf_ble_prf_ndcs_time_dst_t

sf_ble_prf_ndcs_time_dst_t

Detailed description

Next Time with DST Information structure

Variables

- sf_ble_prf_cts_date_time_t stamp

  Current time stamp.
- uint8_t dst_offset

  DST Offset.

- uint8_t reserved

  Reserved.

6.6.13 SF BLE Phone Alert Status Profile Framework Interface

RTOS-integrated SF BLE Phone Alert Status Profile Framework Interface.

6.6.13.1 Summary

This SSP Interface provides access to the ThreadX-aware SF BLE Phone Alert Status Profile Framework.

6.6.13.2 Data structures

- sf_ble_prf_ringer_cp_change_t
- sf_ble_prf_ringer_setting_ntf_t
- sf_ble_prf_alert_status_ntf_t

6.6.13.3 Enumerations

- sf_ble_prf_papsc_event_t
- sf_ble_prf_papss_event_t
- sf_ble_prf_ringer_cp_t
- sf_ble_prf_ringer_setting_t
- sf_ble_prf_alert_setting_t

6.7 Block Media Framework Interface

RTOS-integrated File system Interface to access Synergy block media devices.

The interface provides an adaption layer from the FileX I/O to block media devices.

6.7.1 Summary

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

See also FileX Interface description: FileX Port Block Media Framework

6.7.2 Interface API

sf_block_media_api_t

Function name	Description
.open	Open a device channel for read/write and control.
.read	Read data from a media channel.
.write	Write data to a media channel.
.ioctl	Send control commands to and receives the status from the media port.
.close	Close the open media channel.
.versionGet	Return the version of the driver.

6.7.3 Data structures

- sf_block_media_cfg_t
- sf_block_media_instance_t

6.7.4 Typedefs

- sf_block_media_ctrl_t

6.7.5 Defines

- #define BLOCK_MEDIA_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define BLOCK_MEDIA_API_VERSION_MINOR

  Initial value: `(3U)`

6.7.6 API Data

6.7.6.1 sf_block_media_ctrl_t

```
typedef void sf_block_media_ctrl_t
```

Detailed description

Block media framework control block. Allocate an instance specific control block to pass into the block media framework API calls. Implemented as

- sf_block_media_sdmmc_instance_ctrl_t

- sf_block_media_ram_instance_ctrl_t
- sf_block_media_qspi_instance_ctrl_t

6.7.7 API Structures

6.7.7.1 sf_block_media_cfg_t

sf_block_media_cfg_t

Detailed description

Interface Configuration

Variables

- uint32_t block_size

  Block size in bytes.

Shared Interface definition for Block Media

6.7.7.3 open

```
(* sf_block_media_api_t::open) (sf_block_media_ctrl_t *p_ctrl,
sf_block_media_cfg_t const *const p_cfg)
```

Detailed description

Open a device channel for read/write and control. Implemented as

- SF_Block_Media_SDMMC_Open
- SF_BLOCK_MEDIA_RAM_Open
- SF_BLOCK_MEDIA_QSPI_Open

Table 68: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.

Parameter p_cfg

Definition: sf_block_media_cfg_t const *const p_cfg

Interface Configuration

- sf_block_media_cfg_t::block_size

  Block size in bytes.

- sf_block_media_cfg_t::p_extend

  Instance dependent configuration.

6.7.7.4 read

```
(* sf_block_media_api_t::read) (sf_block_media_ctrl_t *p_ctrl, uint8_t *const
p_dest, uint32_t const start_sector, uint32_t const sector_count)
```

Detailed description

Read data from a media channel. Implemented as

- SF_Block_Media_SDMMC_Read
- SF_BLOCK_MEDIA_RAM_Read
- SF_BLOCK_MEDIA_QSPI_Read

Table 69: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.
p_dest	in	Destination address to read data out.
start_sector	in	Beginning sector address to read.
sector_count	in	Number of sectors to read.

Parameter p_cfg
Parameter p_dest

uint8_t

Parameter start_sector

uint32_t

Parameter sector_count

uint32_t

6.7.7.5 write

```
(* sf_block_media_api_t::write) (sf_block_media_ctrl_t *p_ctrl, uint8_t const
*const p_src, uint32_t const start_sector, uint32_t const sector_count)
```

Detailed description

Write data to a media channel. Implemented as

- SF_Block_Media_SDMMC_Write
- SF_BLOCK_MEDIA_RAM_Write
- SF_BLOCK_MEDIA_QSPI_Write

Table 70: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.
p_src	in	Source address of data for writing.
start_sector	in	Beginning sector address to write to.
sector_count	in	Number of sectors to write.

Parameter p_cfg
Parameter p_src

`uint8_t`

Parameter start_sector

`uint32_t`

Parameter sector_count

`uint32_t`

6.7.7.6 ioctl

```
(* sf_block_media_api_t::ioctl) (sf_block_media_ctrl_t *p_ctrl, const command,
void *p_data)
```

Detailed description

Send control commands to and receives the status from the media port. Implemented as

- SF_Block_Media_SDMMC_Control
- SF_BLOCK_MEDIA_RAM_Control
- SF_BLOCK_MEDIA_QSPI_Control

Table 71: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.
command	in	Command to execute.
p_data	inout	Void pointer to data in or out.

Parameter p_cfg
Parameter command
Parameter p_data

`const`

6.7.7.7 close

```
(* sf_block_media_api_t::close) (sf_block_media_ctrl_t *p_ctrl)
```

Detailed description

Close the open media channel. Implemented as

- SF_Block_Media_SDMMC_Close
- SF_BLOCK_MEDIA_RAM_Close
- SF_BLOCK_MEDIA_QSPI_Close

Table 72: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.

Parameter p_cfg

6.7.7.8 versionGet

```
(* sf_block_media_api_t::versionGet) ( *const p_version)
```

Detailed description

Return the version of the driver. Implemented as

- SF_Block_Media_SDMMC_VersionGet
- SF_BLOCK_MEDIA_RAM_VersionGet
- SF_BLOCK_MEDIA_QSPI_VersionGet

Table 73: Parameters

Name	Direction	Description
p_cfg	in	Pointer to the media configuration structure for a channel.
p_version	out	Memory address to return version information to.

Parameter p_cfg
Parameter p_version

6.7.7.9 sf_block_media_instance_t

sf_block_media_instance_t

Detailed description

Interface Instance

Variables

- sf_block_media_ctrl_t * p_ctrl

  Block media pointer to device driver control structure.
- sf_block_media_cfg_t const * p_cfg

  Block media pointer to device driver configuration structure.
- sf_block_media_api_t const * p_api

  Block media pointer to device driver api structure.

6.8 SF CELLULAR Framework Interface

RTOS-integrated SF CELUULAR Framework Interface.

6.8.1 Summary

This SSP Interface provides access to the ThreadX-aware SF CELLULAR Framework.

6.8.2 Interface API

sf_cellular_api_t

Function name	Description
.open	Initializes and enables the Cellular module.
.close	Disables the Cellular module.
.provisioningGet	Pointer to function to Get the Cellular module provisioning information.
.provisioningSet	Pointer to function to Set the Cellular module's provisioning information.
.infoGet	Reads the Cellular module's information.
.statisticsGet	Returns statistics information of Cellular module.
.transmit	Passes packet buffer to PPP stack for transmission.
.versionGet	Gets version and stores it in provided pointer p_version.
.networkConnect	Initiates the Data connection.
.networkDisconnect	Terminates the Data connection.
.networkStatusGet	Get Network Status information.
.simPinSet	Set SIM Pin.
.simLock	Locks SIM.
.simUnlock	Unlocks SIM.
.simIDGet	Gets the SIM ID.
.fotaCheck	Checks for Available Firmware upgrade.
.fotaStart	Starts the Firmware upgrade.
.fotaStop	Stops the Firmware upgrade.
.reset	Reset cellular module. This reset() API will only work when module is opened.

6.8.3 Data structures

- sf_cellular_provisioning_t
- sf_cellular_ctrl_t

- sf_cellular_stats_t
- sf_cellular_info_t
- sf_cellular_network_status_t
- sf_cellular_callback_args_t
- sf_cellular_op_t
- sf_cellular_at_cmd_set_t
- sf_cellular_cfg_t
- sf_cellular_instance_t

6.8.4 Enumerations

- sf_cellular_op_select_mode_t
- sf_cellular_timezone_update_mode_t
- sf_cellular_event_t
- sf_cellular_reset_type_t
- sf_cellular_airplane_mode_t
- sf_cellular_pdp_type_t
- sf_cellular_op_name_format_t
- sf_cellular_auth_type_t
- sf_cellular_at_cmd_index_t

6.8.5 Defines

- #define SF_CELLULAR_API_VERSION_MAJOR

  Initial value: `(1U)`

  Major Version of the API defined in this file
- #define SF_CELLULAR_API_VERSION_MINOR

  Initial value: `(1U)`

  Minor Version of the API defined in this file
- #define SF_CELLULAR_MAX_OPERATOR_NAME_LEN

  Initial value: `(32U)`

  Maximum length for Operator name.
- #define SF_CELLULAR_MAX_PREFFERED_OPERATOR_COUNT

  Initial value: `(5U)`

  Maximum number of preferred operator.

- #define SF_CELLULAR_IMEI_LEN

  Initial value: `(16U)`

  Maximum length of IMEI number.
- #define SF_CELLULAR_FWVERSION_LEN

  Initial value: `(32U)`

  Maximum length of Firmware Version.
- #define SF_CELLULAR_MAX_STRING_LEN

  Initial value: `(32U)`

  Maximum string length.
- #define SF_CELLULAR_CHIPSET_LEN

  Initial value: `(16U)`

  Maximum length of Chipset info.
- #define SF_CELLULAR_MFG_NAME_LEN

  Initial value: `(16U)`

  Maximum length of manufacturer.
- #define SF_CELLULAR_CID_LEN

  Initial value: `(16U)`

  Maximum length of CID.
- #define SF_CELLULAR_IMSI_LEN

  Initial value: `(24U)`

  Maximum length of IMSI.
- #define SF_CELLULAR_IP_ADDR_LEN

  Initial value: `(128U)`

  Maximum lenfth of IP address.
- #define SF_CELLULAR_TRUE

  Initial value: `(1U)`

  Logical Value TRUE for Cellular
- #define SF_CELLULAR_FALSE

  Initial value: `(0U)`

  Logical Value FALSE for Cellular

6.8.6 API Data

6.8.6.1 sf_cellular_op_select_mode_t

`sf_cellular_op_select_mode_t`

Detailed description

Operator selection mode

Enumerated values

Name	Description
SF_CELLULAR_OP_SELECT_MODE_AUTO	Automatic Operator selection.
SF_CELLULAR_OP_SELECT_MODE_MANUAL	Manual Operator selection.
SF_CELLULAR_OP_SELECT_MODE_DEREGISTER	De-register from the network.
SF_CELLULAR_OP_SELECT_MODE_MANUAL_FALLBACK	Manual with fallback to automatic.

6.8.6.2 sf_cellular_timezone_update_mode_t

`sf_cellular_timezone_update_mode_t`

Detailed description

Timezone update mode

Enumerated values

Name	Description
SF_CELLULAR_TIMEZONE_UPDATE_AUTO_DISABLE	Disable automatic time zone update.
SF_CELLULAR_TIMEZONE_UPDATE_AUTO_ENABLE	Enable automatic time zone update.

6.8.6.3 sf_cellular_event_t

`sf_cellular_event_t`

Detailed description

Cellular Framework event codes

Enumerated values

Name	Description
SF_CELLULAR_EVENT_RX	Packet received event.
SF_CELLULAR_EVENT_PROVISIONSET	Provisioning Set event.

6.8.6.4 sf_cellular_reset_type_t

`sf_cellular_reset_type_t`

Detailed description

Cellular Module reset type

Enumerated values

Name	Description
SF_CELLULAR_RESET_TYPE_SOFT	Soft reset module using AT command.
SF_CELLULAR_RESET_TYPE_HARD	Hard reset module by toggling Reset Pin.

6.8.6.5 sf_cellular_airplane_mode_t

`sf_cellular_airplane_mode_t`

Detailed description

Airplane mode

Enumerated values

Name	Description
SF_CELLULAR_AIRPLANE_MODE_OFF	Airplane mode disabled.
SF_CELLULAR_AIRPLANE_MODE_ON	Airplane mode enabled.

6.8.6.6 sf_cellular_pdp_type_t

`sf_cellular_pdp_type_t`

Detailed description

PDP type

Enumerated values

Name	Description
SF_CELLULAR_PDP_TYPE_IP	Internet protocol.
SF_CELLULAR_PDP_TYPE_PPP	Point to point protocol.
SF_CELLULAR_PDP_TYPE_IPV6	Internet protocol, version 6.
SF_CELLULAR_PDP_TYPE_IPV4V6	Virtual introduced to handle dual stack UE capability.

6.8.6.7 sf_cellular_op_name_format_t

`sf_cellular_op_name_format_t`

Detailed description

Cellular operator name format

Enumerated values

Name	Description
SF_CELLULAR_OP_NAME_FORMAT_LONG	Long alphanumeric.
SF_CELLULAR_OP_NAME_FORMAT_SHORT	Short alphanumeric.
SF_CELLULAR_OP_NAME_FORMAT_NUMERIC	Numeric.

6.8.6.8 sf_cellular_auth_type_t

`sf_cellular_auth_type_t`

Detailed description

Cellular authentication type

Enumerated values

Name	Description
SF_CELLULAR_AUTH_TYPE_NONE	No authentication.
SF_CELLULAR_AUTH_TYPE_PAP	PAP.
SF_CELLULAR_AUTH_TYPE_CHAP	CHAP.

6.8.6.9 sf_cellular_at_cmd_index_t

`sf_cellular_at_cmd_index_t`

Detailed description

Enumeration for AT command index

Enumerated values

Name	Description
SF_CELLULAR_AT_CMD_INDEX_AT	Index for Command AT.
SF_CELLULAR_AT_CMD_INDEX_ATZ0	Index for Command ATZ0.
SF_CELLULAR_AT_CMD_INDEX_AT_CREG_SET_0	Index for Command to set AT+CREG.
SF_CELLULAR_AT_CMD_INDEX_AT_CMEE_SET_0	Index for Command to set AT+CMEE.
SF_CELLULAR_AT_CMD_INDEX_AT_ECHO	Index for Command ATE.
SF_CELLULAR_AT_CMD_INDEX_AT_SAVE	Index for Command AT&W.
SF_CELLULAR_AT_CMD_INDEX_AT_CREG	Index for Command AT+CREG.
SF_CELLULAR_AT_CMD_INDEX_AT_CPIN_STATUS_GET	Index for Command to get status of SIM lock.
SF_CELLULAR_AT_CMD_INDEX_AT_ENTER_CPIN	Index for Command to unlock SIM.
SF_CELLULAR_AT_CMD_INDEX_AT_CPIN_SET	Index for Command to set SIM PIN.
SF_CELLULAR_AT_CMD_INDEX_AT_CGDCONT_SET	Index for Command to set AT+CGDCOND.
SF_CELLULAR_AT_CMD_INDEX_AT_CPOL_SET	Index for Command to set AT+CPOL.
SF_CELLULAR_AT_CMD_INDEX_AT_COPS_AUTO_SET	Index for Command to set AUTO AT+COPS.
SF_CELLULAR_AT_CMD_INDEX_AT_COPS_MANUAL_SET	Index for Command to set Manual AT+COPS.
SF_CELLULAR_AT_CMD_INDEX_AT_AIRPLANE_OFF	Index for Command to set Airplane mode OFF.
SF_CELLULAR_AT_CMD_INDEX_AT_AIRPLANE_ON	Index for Command to set Airplane mode ON.
SF_CELLULAR_AT_CMD_INDEX_AT_CONTEXT_ACTIVE	Index for Command to activate context.

Name	Description
SF_CELLULAR_AT_CMD_INDEX_AT_CONTEXT_DEACTIVE	Index for Command to deactivate context.
SF_CELLULAR_AT_CMD_INDEX_AT_CGDATA_ACTIVE	Index for Command to activate Data mode.
SF_CELLULAR_AT_CMD_INDEX_AT_CGDATA_DEACTIVE	Index for Command to deactivate Data mode.
SF_CELLULAR_AT_CMD_INDEX_AT_CSQ_GET	Index for Command to get signal quality.
SF_CELLULAR_AT_CMD_INDEX_AT_VER_GET	Index for Command to get Modem stack Version.
SF_CELLULAR_AT_CMD_INDEX_AT_CHIPSET_GET	Index for Command to get chipset details.
SF_CELLULAR_AT_CMD_INDEX_AT_IMEI_GET	Index for Command to get IMEI number.
SF_CELLULAR_AT_CMD_INDEX_AT_MANF_NAME_GET	Index for Command to get manufacturer name.
SF_CELLULAR_AT_CMD_INDEX_AT_SIMID_GET	Index for Command to get SIM Card ID.
SF_CELLULAR_AT_CMD_INDEX_AT_NET_TYPE_STATUS_GET	Index for Command to get network type information.
SF_CELLULAR_AT_CMD_INDEX_AT_NET_STATUS_GET	Index for Command to get network status information.
SF_CELLULAR_AT_CMD_INDEX_AT_LOCK_SIM	Index for Command to lock SIM card.
SF_CELLULAR_AT_CMD_INDEX_AT_UNLOCK_SIM	Index for Command to unlock SIM card.
SF_CELLULAR_AT_CMD_INDEX_AT_ENTER_DATA_MODE	Index for Command to enter data mode.
SF_CELLULAR_AT_CMD_INDEX_AT_EXIT_DATA_MODE	Index for Command to exit data mode.
SF_CELLULAR_AT_CMD_INDEX_AT_USERNAME_SET	Index for Command to set username.
SF_CELLULAR_AT_CMD_INDEX_AT_PASSWORD_SET	Index for Command to set password.
SF_CELLULAR_AT_CMD_INDEX_AT_AUTH_TYPE_SET	Index for Command to set authorisation type.

Name	Description
SF_CELLULAR_AT_CMD_INDEX_AT_AUTO_TIME_UPDATE_ENABLE_SET	Index for Command to enable auto time update.
SF_CELLULAR_AT_CMD_INDEX_AT_AUTO_TIME_UPDATE_DISABLE_SET	Index for Command to disable auto time update.
SF_CELLULAR_AT_CMD_INDEX_AT_EMPTY_APN_SET	Index for Command to set empty APN.
SF_CELLULAR_AT_CMD_INDEX_AT_GET_IP_ADDR	Index for Command to get IP address.

6.8.7 API Structures

6.8.7.1 sf_cellular_provisioning_t

sf_cellular_provisioning_t

Detailed description

Cellular Provisioning information structure

Variables

- uint8_t apn[SF_CELLULAR_MAX_STRING_LEN]

  Access Point Name.
- sf_cellular_auth_type_t auth_type

  Authentication type: PAP/CHAP.
- uint8_t username[SF_CELLULAR_MAX_STRING_LEN]

  User name used for authentication.
- uint8_t password[SF_CELLULAR_MAX_STRING_LEN]

  Password used for authentication.
- sf_cellular_airplane_mode_t airplane_mode

  Airplane mode.
- uint8_t context_id

  Context ID to be used for connection.
- sf_cellular_pdp_type_t pdp_type

  PDP Type for Context.

6.8.7.2 sf_cellular_ctrl_t

sf_cellular_ctrl_t

Detailed description

Cellular Framework control structure

Variables

- void * p_driver_handle

  Stores information required by underlying Cellular device driver.

6.8.7.3 sf_cellular_stats_t

sf_cellular_stats_t

Detailed description

The statistic and error counters for this instance

Variables

- uint32_t rx_bytes

  Bytes received successfully.

- uint32_t tx_bytes

  Bytes transmitted successfully.

- uint32_t rx_err

  Bytes receive errors.

- uint32_t tx_err

  Bytes transmit errors.

6.8.7.4 sf_cellular_info_t

sf_cellular_info_t

Detailed description

Cellular Driver Information

Variables

- uint8_t mfg_name[SF_CELLULAR_MFG_NAME_LEN]

  Manufacturer name.

- uint8_t chipset[SF_CELLULAR_CHIPSET_LEN]

  Pointer to string showing Cellular chipset/driver information.

- uint8_t fw_version[SF_CELLULAR_FWVERSION_LEN]

  Cellular firmware version.

- uint8_t imei[SF_CELLULAR_IMEI_LEN]

  IMEI number.

- uint16_t rssi

  Received signal strength indication.
- uint16_t ber

  Bit rate error.
- uint8_t ip_addr[SF_CELLULAR_IP_ADDR_LEN]

  IP address.

6.8.7.5 sf_cellular_network_status_t

sf_cellular_network_status_t

Detailed description

Network Status information

Variables

- uint16_t country_code

  Country code.
- uint16_t operator_code

  Operator code.
- int16_t rssi

  RSSI.
- uint8_t cid[SF_CELLULAR_CID_LEN]

  Cell ID.
- uint8_t imsi[SF_CELLULAR_IMSI_LEN]

  IMSI.
- uint8_t op_name[SF_CELLULAR_MAX_OPERATOR_NAME_LEN]

  Operator name.
- uint8_t service_domain

  Service Domain.
- uint8_t active_band

  Active Band.

6.8.7.6 sf_cellular_callback_args_t

sf_cellular_callback_args_t

Detailed description

Callback structure for Cellular driver to get the data receive notification

Variables

- sf_cellular_event_t event

  Event Code.
- uint8_t * p_data

  Pointer to received data.
- uint32_t length

  Receive Data Length.
- void const * p_context

  Context Provided to user during callback.

6.8.7.7 sf_cellular_op_t

sf_cellular_op_t

Detailed description

Preferred operator selection structure

Variables

- sf_cellular_op_name_format_t op_name_format

  Cellular operator name format.
- uint8_t op_name[SF_CELLULAR_MAX_OPERATOR_NAME_LEN]

  Cellular operator name.

6.8.7.8 sf_cellular_at_cmd_set_t

sf_cellular_at_cmd_set_t

Detailed description

Structure defining AT commands parameters

Variables

- uint8_t * p_cmd

  AT Command.
- uint8_t * p_success_resp

  Success response string.
- uint16_t max_resp_length

  Maximum length of expected response.
- uint8_t retry

  Retry count.
- uint16_t retry_delay

  Delay between AT command retry.

6.8.7.9 sf_cellular_cfg_t

sf_cellular_cfg_t

Detailed description

Define the Cellular configuration parameters

Variables

- sf_cellular_op_select_mode_t op_select_mode

  Cellular Operator selection mode.

- sf_cellular_op_t op

  Cellular operator. Valid when operator selection mode is manual.

- uint16_t num_pref_ops

  Number of preferred operators in the pref_ops array.

- sf_cellular_op_t pref_ops[SF_CELLULAR_MAX_PREFFERED_OPERATOR_COUNT]

  Array of structures describing preferred operators.

- sf_cellular_timezone_update_mode_t tz_upd_mode

  TimeZone update mode policy.

- uint8_t * p_sim_pin

  SIM Pin.

- uint8_t * p_puk_pin

  PUK Pin.

- ssp_err_t(* p_prov_callback)(sf_cellular_callback_args_t *p_args)

  Pointer to provisioning callback function, used in NSAL

- void(* p_recv_callback)(sf_cellular_callback_args_t *p_args)

  This is the receive callback function used by NetX which will take a data packet from the Cellular module and hand it over to NetX for further processing.

- void const * p_context

  User defined context passed into callback function.

- void const * p_extend

  Instance specific configuration.

- sf_cellular_at_cmd_set_t const * p_cmd_set

  Instance specific command set.

6.8.7.10 sf_cellular_api_t

sf_cellular_api_t

Detailed description

Cellular Framework API structure.

6.8.7.11 open

```
ssp_err_t(* sf_cellular_api_t::open) (sf_cellular_ctrl_t *p_ctrl,
sf_cellular_cfg_t const *const p_cfg)
```

Brief description

Initializes and enables the Cellular module.

Detailed description

Table 74: Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to user-provided storage for the control block.
p_cfg	in	Pointer to Cellular configuration structure.

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_cfg

Definition: `sf_cellular_cfg_t const *const p_cfg`

Define the Cellular configuration parameters

- `sf_cellular_cfg_t`::`sf_cellular_op_select_mode_t`

  Cellular Operator selection mode.

  Enumerated as:

  – SF_CELLULAR_OP_SELECT_MODE_AUTO

  – SF_CELLULAR_OP_SELECT_MODE_MANUAL

  – SF_CELLULAR_OP_SELECT_MODE_DEREGISTER

  – SF_CELLULAR_OP_SELECT_MODE_MANUAL_FALLBACK

- `sf_cellular_cfg_t`::`sf_cellular_op_t`

  Cellular operator. Valid when operator selection mode is manual.

- `sf_cellular_cfg_t`::`num_pref_ops`

  Number of preferred operators in the pref_ops array.

- sf_cellular_cfg_t::sf_cellular_op_t

  Array of structures describing preferred operators.
- sf_cellular_cfg_t::sf_cellular_timezone_update_mode_t

  TimeZone update mode policy.

  Enumerated as:

  – SF_CELLULAR_TIMEZONE_UPDATE_AUTO_DISABLE

  – SF_CELLULAR_TIMEZONE_UPDATE_AUTO_ENABLE
- sf_cellular_cfg_t::p_sim_pin

  SIM Pin.
- sf_cellular_cfg_t::p_puk_pin

  PUK Pin.
- sf_cellular_cfg_t::ssp_err_t

  Pointer to provisioning callback function, used in NSAL
- sf_cellular_cfg_t::p_recv_callback

  This is the receive callback function used by NetX which will take a data packet from the Cellular module and hand it over to NetX for further processing.
- sf_cellular_cfg_t::p_context

  User defined context passed into callback function.
- sf_cellular_cfg_t::p_extend

  Instance specific configuration.
- sf_cellular_cfg_t::sf_cellular_at_cmd_set_t

  Instance specific command set.

6.8.7.12 close

```
ssp_err_t(* sf_cellular_api_t::close) (sf_cellular_ctrl_t *const p_ctrl)
```

Brief description

Disables the Cellular module.

Detailed description

Table 75: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module. .

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

6.8.7.13 provisioningGet

```
ssp_err_t(* sf_cellular_api_t::provisioningGet) (sf_cellular_ctrl_t *const
p_ctrl, sf_cellular_provisioning_t *const p_cellular_provisioning)
```

Brief description

Pointer to function to Get the Cellular module provisioning information.

Detailed description

Table 76: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_cellular_provisioning	out	Pointer to Cellular provisioning structure.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_cellular_provisioning

Definition: sf_cellular_provisioning_t*const p_cellular_provisioning

Cellular Provisioning information structure

- sf_cellular_provisioning_t::apn

  Access Point Name.
- sf_cellular_provisioning_t::auth_type

  Authentication type: PAP/CHAP.
- sf_cellular_provisioning_t::username

  User name used for authentication.
- sf_cellular_provisioning_t::password

  Password used for authentication.
- sf_cellular_provisioning_t::airplane_mode

  Airplane mode.

- sf_cellular_provisioning_t::context_id

  Context ID to be used for connection.

- sf_cellular_provisioning_t::pdp_type

  PDP Type for Context.

6.8.7.14 provisioningSet

```
ssp_err_t(* sf_cellular_api_t::provisioningSet) (sf_cellular_ctrl_t *const
p_ctrl, sf_cellular_provisioning_t const *const p_cellular_provisioning)
```

Brief description

Pointer to function to Set the Cellular module's provisioning information.

Detailed description

Table 77: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_cellular_provisioning	in	Pointer to Cellular provisioning structure.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_cellular_provisioning

Definition: sf_cellular_provisioning_tconst *const p_cellular_provisioning

Cellular Provisioning information structure

- sf_cellular_provisioning_t::apn

  Access Point Name.

- sf_cellular_provisioning_t::auth_type

  Authentication type: PAP/CHAP.

- sf_cellular_provisioning_t::username

  User name used for authentication.

- sf_cellular_provisioning_t::password

  Password used for authentication.

- sf_cellular_provisioning_t::airplane_mode

  Airplane mode.

- sf_cellular_provisioning_t::context_id

  Context ID to be used for connection.

- sf_cellular_provisioning_t::pdp_type

  PDP Type for Context.

6.8.7.15 infoGet

```
ssp_err_t(* sf_cellular_api_t::infoGet) (sf_cellular_ctrl_t *const p_ctrl,
sf_cellular_info_t *const p_cellular_info)
```

Brief description

Reads the Cellular module's information.

Detailed description

Table 78: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_cellular_info	out	Pointer to Cellular info structure.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_cellular_info

Definition: sf_cellular_info_t*const p_cellular_info

Cellular Driver Information

- sf_cellular_info_t::mfg_name

  Manufacturer name.

- sf_cellular_info_t::chipset

  Pointer to string showing Cellular chipset/driver information.

- sf_cellular_info_t::fw_version

  Cellular firmware version.

- sf_cellular_info_t::imei

  IMEI number.

- sf_cellular_info_t::rssi

  Received signal strength indication.

- sf_cellular_info_t::ber

  Bit rate error.

- sf_cellular_info_t::ip_addr

  IP address.

6.8.7.16 statisticsGet

```
ssp_err_t(* sf_cellular_api_t::statisticsGet) (sf_cellular_ctrl_t *const p_ctrl,
sf_cellular_stats_t *const p_cellular_device_stats)
```

Brief description

Returns statistics information of Cellular module.

Detailed description

Table 79: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_cellular_device_stats	out	Pointer to Cellular statistics information structure.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_cellular_device_stats

Definition: sf_cellular_stats_t*const p_cellular_device_stats

The statistic and error counters for this instance

- sf_cellular_stats_t::rx_bytes

  Bytes received successfully.

- sf_cellular_stats_t::tx_bytes

  Bytes transmitted successfully.

- sf_cellular_stats_t::rx_err

  Bytes receive errors.

- sf_cellular_stats_t::tx_err

  Bytes transmit errors.

6.8.7.17 transmit

```
ssp_err_t(* sf_cellular_api_t::transmit) (sf_cellular_ctrl_t *const p_ctrl,
uint8_t *const p_buf, uint32_t length)
```

Brief description

Passes packet buffer to PPP stack for transmission.

Detailed description

Table 80: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_buf	in	Pointer to packet buffer to transmit
length	in	Length of packet buffer

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_buf

`uint8_t`

Parameter length

`uint32_t`

6.8.7.18 versionGet

```
ssp_err_t(* sf_cellular_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Table 81: Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

6.8.7.19 networkConnect

```
ssp_err_t(* sf_cellular_api_t::networkConnect) (sf_cellular_ctrl_t *const p_ctrl)
```

Brief description

Initiates the Data connection.

Detailed description

Table 82: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

6.8.7.20 networkDisconnect

```
ssp_err_t(* sf_cellular_api_t::networkDisconnect) (sf_cellular_ctrl_t *const
p_ctrl)
```

Brief description

Terminates the Data connection.

Detailed description

Table 83: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

6.8.7.21 networkStatusGet

```
ssp_err_t(* sf_cellular_api_t::networkStatusGet) (sf_cellular_ctrl_t *const
p_ctrl, sf_cellular_network_status_t *p_network_status)
```

Brief description

Get Network Status information.

Detailed description

Table 84: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_network_status	out	Pointer to Network Status structure

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_network_status

Definition: `sf_cellular_network_status_t*p_network_status`

Network Status information

- `sf_cellular_network_status_t::country_code`
  Country code.
- `sf_cellular_network_status_t::operator_code`
  Operator code.
- `sf_cellular_network_status_t::rssi`
  RSSI.
- `sf_cellular_network_status_t::cid`
  Cell ID.
- `sf_cellular_network_status_t::imsi`
  IMSI.
- `sf_cellular_network_status_t::op_name`
  Operator name.
- `sf_cellular_network_status_t::service_domain`
  Service Domain.
- `sf_cellular_network_status_t::active_band`
  Active Band.

6.8.7.22 simPinSet

```
ssp_err_t(* sf_cellular_api_t::simPinSet) (sf_cellular_ctrl_t *const p_ctrl,
uint8_t *const p_old_pin, uint8_t *const p_new_pin)
```

Brief description

Set SIM Pin.

Detailed description

Table 85: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_old_pin	in	Pointer to char array containing current 4 digit pin.
p_new_pin	in	Pointer to char array containing new 4 digit pin.

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_old_pin

`uint8_t`

Parameter p_new_pin

`uint8_t`

6.8.7.23 simLock

```
ssp_err_t(* sf_cellular_api_t::simLock) (sf_cellular_ctrl_t *const p_ctrl,
uint8_t *const p_pin)
```

Brief description

Locks SIM.

Detailed description

Table 86: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_pin	in	PIN number to lock the SIM

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_pin

uint8_t

6.8.7.24 simUnlock

```
ssp_err_t(* sf_cellular_api_t::simUnlock) (sf_cellular_ctrl_t *const p_ctrl,
uint8_t *const p_pin)
```

Brief description

Unlocks SIM.

Detailed description

Table 87: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_pin	in	PIN number to unlock the SIM

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter p_pin

uint8_t

6.8.7.25 simIDGet

```
ssp_err_t(* sf_cellular_api_t::simIDGet) (sf_cellular_ctrl_t *const p_ctrl,
uint8_t *p_sim_id)
```

Brief description

Gets the SIM ID.

Detailed description

Table 88: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.

Table 88: Parameters (Continued)

Name	Direction	Description
p_sim_id	out	SIM ID

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_sim_id

`uint8_t`

6.8.7.26 fotaCheck

```
ssp_err_t(* sf_cellular_api_t::fotaCheck) (sf_cellular_ctrl_t *const p_ctrl, void *p_fotacheck)
```

Brief description

Checks for Available Firmware upgrade.

Detailed description

Table 89: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_fotacheck	in	Pointer to fota check specific data structure

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_fotacheck

`const`

6.8.7.27 fotaStart

```
ssp_err_t(* sf_cellular_api_t::fotaStart) (sf_cellular_ctrl_t *const p_ctrl, void *p_fotastart)
```

Brief description

Starts the Firmware upgrade.

Detailed description

Table 90: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_fotastart	in	Pointer to fota start specific data structure

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_fotastart

`const`

6.8.7.28 fotaStop

```
ssp_err_t(* sf_cellular_api_t::fotaStop) (sf_cellular_ctrl_t *const p_ctrl, void *p_fotastop)
```

Brief description

Stops the Firmware upgrade.

Detailed description

Table 91: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
p_fotastop	in	Pointer to fota stop specific data structure

Parameter p_ctrl

Definition: `sf_cellular_ctrl_t`

Cellular Framework control structure

Parameter p_fotastop

`const`

6.8.7.29 reset

```
ssp_err_t(* sf_cellular_api_t::reset) (sf_cellular_ctrl_t *const p_ctrl,
sf_cellular_reset_type_t reset_type)
```

Brief description

Reset cellular module. This reset API will only work when module is opened.

Detailed description

Table 92: Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Cellular module.
reset_type	in	Reset type

Parameter p_ctrl

Definition: sf_cellular_ctrl_t

Cellular Framework control structure

Parameter reset_type

6.8.7.30 sf_cellular_instance_t

sf_cellular_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_cellular_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_cellular_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_cellular_api_t const * p_api

  Pointer to the API structure for this instance.

6.9 SF CELLULAR NSAL Framework Interface

RTOS-integrated SF CELUULAR NSAL Framework Interface.

6.9.1 Summary

This SSP Interface provides access to the ThreadX-aware SF CELLULAR NSAL Framework.

6.9.2 Functions

- sf_cellular_deinit

6.9.3 Data structures

- sf_cellular_nsal_cfg_t

6.9.4 sf_cellular_deinit

```
ssp_err_t sf_cellular_deinit (  NX_IP_DRIVER * driver_req_ptr ,
 sf_cellular_instance_t  const * p_cellular_instance ,  sf_cellular_nsal_cfg_t
* p_cellular_nsal_cfg )
```

6.9.4.1 Brief description

De-initialize the Cellular NSAL, deletes PPP interface, disconnect the network and close cellular framework.

6.9.4.2 Detailed description

Function Prototypes

Table 93: Parameters

Name	Direction	Description
p_driver_req_ptr	in	Pointer to NetX IP driver
p_cellular_instance	in	Pointer to Cellular Framework instance
p_cellular_nsal_cfg	in	Pointer to Cellular NSAL configuration structure

Table 94: Return values

Name	Description
SSP_SUCCESS	Successful

Table 94: Return values (Continued)

Name	Description
SSP_ERR_CELLULAR_FAILED	Failed to de-init Cellular Framework
SSP_ERR_NOT_OPEN	Not opened

6.9.4.3 Function steps

- Disconnect Network
- Close Cellular Driver
- Return an error to NetX.

6.9.5 API Structures

6.9.5.1 sf_cellular_nsal_cfg_t

sf_cellular_nsal_cfg_t

Detailed description

Define the NSAL configuration parameters

Variables

- uint8_t * p_ppp_stack

  PPP Stack.
- uint32_t ppp_stack_size

  PPP Stack size.
- UINT priority

  PPP Thread Priority.
- NX_PPP * p_ppp

  NetX PPP Interface.
- NX_IP * p_ip

  NetX IP Interface.
- NX_PACKET_POOL * p_ppp_packet_pool

  NetX Packet pool for internal.
- void(* p_ppp_invalid_packet_cb)(NX_PACKET *p_packet_ptr)

  Callback handler for Invalid packet.

- void(* p_ppp_send_byte)(UCHAR byte)

  PPP Send byte callback function.
- void(* p_link_down_cb)(NX_PPP *p_ppp_ptr)

  PPP Link down notification callback.

  Link Notification callback function
- void(* p_link_up_cb)(NX_PPP *p_ppp_ptr)

  PPP Link up notification callback.
- sf_cellular_auth_type_t auth_type

  Authentication Type.
- UINT(* p_chap_get_challenge_cb)(CHAR *p_rand_value, CHAR *p_id, CHAR *p_name)

  Get challenge notification callback.

  CHAP Callback Function
- UINT(* p_chap_get_responder_cb)(CHAR *p_system, CHAR *p_name, CHAR *p_secret)

  Get Responder notification callback.
- UINT(* p_chap_get_verify_cb)(CHAR *p_system, CHAR *p_name, CHAR *p_secret)

  Get Chap verification callback.
- UINT(* p_pap_generate_login)(CHAR *p_name, CHAR *p_password)

  PAP Authentication generate login callback.

  PAP Callback Function
- UINT(* p_pap_verify_login)(CHAR *p_name, CHAR *p_password)

  PAP authentication verification callback.
- uint32_t local_ip

  Local IP Address.
- uint32_t peer_ip

  Peer IP Address.
- void const * p_extend

  Instance specific configuration.

6.10 SF CELLULAR Framework Common Code

SF_Cellular Framework API Common Code.

Cellular Framework header files Framework header files for this package HAL Layer communication interface header file

6.10.1 Functions

- SF_CELLULAR_COMMON_Open
- SF_CELLULAR_COMMON_Close
- SF_CELLULAR_COMMON_InfoGet
- SF_CELLULAR_COMMON_StatisticsGet
- SF_CELLULAR_COMMON_Transmit
- SF_CELLULAR_COMMON_ProvisioningGet
- SF_CELLULAR_COMMON_ProvisioningSet
- SF_CELLULAR_COMMON_NetworkConnect
- SF_CELLULAR_COMMON_NetworkConnectWithCGDATA
- SF_CELLULAR_COMMON_NetworkDisconnect
- SF_CELLULAR_COMMON_NetworkStatusGet
- SF_CELLULAR_COMMON_SimPinSet
- SF_CELLULAR_COMMON_SimLock
- SF_CELLULAR_COMMON_SimUnlock
- SF_CELLULAR_COMMON_SimIDGet
- SF_CELLULAR_COMMON_FotaCheck
- SF_CELLULAR_COMMON_FotaStart
- SF_CELLULAR_COMMON_FotaStop

6.10.2 SF_CELLULAR_COMMON_Open

```
ssp_err_t SF_CELLULAR_COMMON_Open ( sf_cellular_ctrl_t   * p_ctrl ,
 sf_cellular_cfg_t   const *const p_cfg )
```

6.10.2.1 Brief description

Initialize Cellular driver.

6.10.2.2 Detailed description

Implements open Initializes Cellular Driver and Configure the parameters as per the p_cfg Update global variables for future use.

Table 95: Parameters

Name	Direction	Description
p_ctrl	out	Cellular control block
p_cfg	in	Cellular configuration structure

Table 96: Return values

Name	Description
SSP_SUCCESS	Driver initialization successfully.
SSP_ERR_ALREADY_OPEN	Cellular Driver is already opened.
SSP_ERR_CELLULAR_CONFIG_FAILED	Cellular module Configuration failed
SSP_ERR_CELLULAR_INIT_FAILED	Cellular module initialization failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Driver initialization failed
SSP_ERR_IN_USE	Device already in used

6.10.2.3 Function steps

- Get Mutex Lock
- Set Cellular configuration

6.10.3 SF_CELLULAR_COMMON_Close

```
ssp_err_t SF_CELLULAR_COMMON_Close ( sf_cellular_ctrl_t  *const p_ctrl )
```

6.10.3.1 Brief description

Stop Cellular driver functionality.

6.10.3.2 Detailed description

Implements close This function deactivates the PDP context and Update global variables for future use

Table 97: Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block

Table 98: Return values

Name	Description
SSP_SUCCESS	Cellular Driver stop successfully.
SSP_ERR_NOT_OPEN	Device is not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Driver un-initialization failed
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.3.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.4 SF_CELLULAR_COMMON_InfoGet

```
ssp_err_t SF_CELLULAR_COMMON_InfoGet ( sf_cellular_ctrl_t  *const p_ctrl ,
 sf_cellular_info_t  *const p_cellular_info )
```

6.10.4.1 Brief description

Get Cellular module information.

6.10.4.2 Detailed description

Implements infoGet Get Cellular module information like chipset/driver information, RSSI, noise level, link quality

Table 99: Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_cellular_info	in	Cellular information structure

Table 100:Return values

Name	Description
SSP_SUCCESS	Successfully get the Cellular information
SSP_ERR_NOT_OPEN	Driver not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Failed reading Cellular information
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.4.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.5 SF_CELLULAR_COMMON_StatisticsGet

```
ssp_err_t SF_CELLULAR_COMMON_StatisticsGet ( sf_cellular_ctrl_t  *const p_ctrl ,
 sf_cellular_stats_t  *const p_cellular_device_stats )
```

6.10.5.1 Brief description

Get the interface statistics.

6.10.5.2 Detailed description

Implements statisticsGet Collect the statistics information of Cellular interface

Table 101:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_cellular_device_stats	in	Cellular statistic structure

Table 102:Return values

Name	Description
SSP_SUCCESS	Successfully get the Statistics information.
SSP_ERR_UNSUPPORTED	Functionality is not supported.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Failed Reading statistics information
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.5.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.6 SF_CELLULAR_COMMON_Transmit

```
ssp_err_t SF_CELLULAR_COMMON_Transmit ( sf_cellular_ctrl_t  *const p_ctrl ,
  uint8_t *const p_buf ,   uint32_t length )
```

6.10.6.1 Brief description

Passes packet buffer to PPP stack for transmission.

6.10.6.2 Detailed description

Implements transmit Send packet buffer to PPP stack

Table 103:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_buf	in	transmit byte buffer pointer
length	in	Length of data

Table 104:Return values

Name	Description
SSP_SUCCESS	Successfully send the packet buffer.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Transmitting Data failed
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.6.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.7 SF_CELLULAR_COMMON_ProvisioningGet

```
ssp_err_t SF_CELLULAR_COMMON_ProvisioningGet ( sf_cellular_ctrl_t
*const p_ctrl ,  sf_cellular_provisioning_t  *const p_cellular_provisioning )
```

6.10.7.1 Brief description

Reads the provisioning information.

6.10.7.2 Detailed description

Implements provisioningGet Reads Cellular's provisioning information

Table 105:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_cellular_provisioning	out	Cellular provisioning structure

Table 106:Return values

Name	Description
SSP_SUCCESS	Successfully read the provisioning information.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Reading provisioning information failed
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.7.3 Function steps

- Get cellular information
- Get Mutex Lock
- Copy provisioning info to driver structure

6.10.8 SF_CELLULAR_COMMON_ProvisioningSet

```
ssp_err_t SF_CELLULAR_COMMON_ProvisioningSet ( sf_cellular_ctrl_t
*const p_ctrl ,  sf_cellular_provisioning_t  const
*const p_cellular_provisioning )
```

6.10.8.1 Brief description

Sets the provisioning information.

6.10.8.2 Detailed description

Implements provisioningSet Sets Cellular's provisioning information

Table 107:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_cellular_provisioning	in	Cellular provisioning structure

Table 108:Return values

Name	Description
SSP_SUCCESS	Successfully set the provisioning information.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Provisioning configuration failed
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.8.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.9 SF_CELLULAR_COMMON_NetworkConnect

```
ssp_err_t SF_CELLULAR_COMMON_NetworkConnect ( sf_cellular_ctrl_t
*const p_ctrl )
```

6.10.9.1 Brief description

Establishes the Data connection.

6.10.9.2 Detailed description

Implements networkConnect Establishes the Network Connection

Table 109:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block

Table 110:Return values

Name	Description
SSP_SUCCESS	Successfully establishes the Network connection
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Failed to establish the Network Connection
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.9.3 Function steps

- Get cellular information
- Get Mutex Lock
- Enter Data Mode

6.10.10 SF_CELLULAR_COMMON_NetworkConnectWithCGDATA

```
ssp_err_t SF_CELLULAR_COMMON_NetworkConnectWithCGDATA ( sf_cellular_ctrl_t
*const p_ctrl )
```

6.10.10.1 Brief description

Establishes the Data connection using AT+CGDATA command. Limitation: This API activates only one PDP Context Id even though AT+CGDATA command actually supports activation of multiple Context Ids in single command.

6.10.10.2 Detailed description

Implements networkConnect Establishes the Network Connection

Table 111:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block

Table 112:Return values

Name	Description
SSP_SUCCESS	Successfully establishes the Network connection
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_CELLULAR_FAILED	Failed to establish the Network Connection
SSP_ERR_IN_USE	Device already in used
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.10.3 Function steps

- Get cellular information
- Get Mutex Lock
- Enter Data Mode

6.10.11 SF_CELLULAR_COMMON_NetworkDisconnect

```
ssp_err_t SF_CELLULAR_COMMON_NetworkDisconnect ( sf_cellular_ctrl_t
*const p_ctrl )
```

6.10.11.1 Brief description

Terminates the connection.

6.10.11.2 Detailed description

Implements networkDisconnect

Table 113:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block

Table 114:Return values

Name	Description
SSP_SUCCESS	Successfully disconnect the connection
SSP_ERR_NOT_OPEN	Cellular driver is not opened
SSP_ERR_CELLULAR_FAILED	Failed to terminate the network connection
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.11.3 Function steps

- Get cellular information
- Get Mutex Lock
- Exit Data Mode

6.10.12 SF_CELLULAR_COMMON_NetworkStatusGet

```
ssp_err_t SF_CELLULAR_COMMON_NetworkStatusGet ( sf_cellular_ctrl_t
*const p_ctrl ,  sf_cellular_network_status_t  * p_network_status )
```

6.10.12.1 Brief description

Get Network Status information.

6.10.12.2 Detailed description

Implements networkStatusGet

Table 115:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_network_status	out	Cellular network structure

Table 116:Return values

Name	Description
SSP_SUCCESS	Successfully read the Network status information
SSP_ERR_NOT_OPEN	Cellular driver is not opened
SSP_ERR_CELLULAR_FAILED	Failed reading Network Status information.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.12.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.13 SF_CELLULAR_COMMON_SimPinSet

```
ssp_err_t SF_CELLULAR_COMMON_SimPinSet ( sf_cellular_ctrl_t  *const p_ctrl ,
  uint8_t *const p_old_pin ,   uint8_t *const p_new_pin )
```

6.10.13.1 Brief description

Set the SIM PIN.

6.10.13.2 Detailed description

Implements sf_cellular_api_t::simSetPin

Table 117:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_old_pin	in	Old SIM Pin
p_new_pin	in	New SIM Pin

Table 118:Return values

Name	Description
SSP_SUCCESS	Successfully set SIM Pin
SSP_ERR_NOT_OPEN	Cellular driver is not opened
SSP_ERR_CELLULAR_FAILED	Failed to set the SIM Pin
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.13.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.14 SF_CELLULAR_COMMON_SimLock

```
ssp_err_t SF_CELLULAR_COMMON_SimLock ( sf_cellular_ctrl_t  *const p_ctrl ,
  uint8_t *const p_pin )
```

6.10.14.1 Brief description

Lock the SIM.

6.10.14.2 Detailed description

Implements simLock

Table 119:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_pin	in	SIM Pin

Table 120:Return values

Name	Description
SSP_SUCCESS	Successfully lock the SIM
SSP_ERR_NOT_OPEN	Cellular driver is not opened
SSP_ERR_CELLULAR_FAILED	Failed to Lock the SIM
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.14.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.15 SF_CELLULAR_COMMON_SimUnlock

```
ssp_err_t SF_CELLULAR_COMMON_SimUnlock ( sf_cellular_ctrl_t  *const p_ctrl ,
  uint8_t *const p_pin )
```

6.10.15.1 Brief description

Unlock the SIM.

6.10.15.2 Detailed description

Implements simUnlock

Table 121:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_pin	in	SIM Pin

Table 122:Return values

Name	Description
SSP_SUCCESS	Successfully unlock the SIM
SSP_ERR_NOT_OPEN	Cellular driver is not opened
SSP_ERR_CELLULAR_FAILED	Failed to unlock the SIM
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.15.3 Function steps

- Get cellular information
- Get Mutex Lock

6.10.16 SF_CELLULAR_COMMON_SimIDGet

```
ssp_err_t SF_CELLULAR_COMMON_SimIDGet ( sf_cellular_ctrl_t  *const p_ctrl ,
  uint8_t * p_sim_id )
```

6.10.16.1 Brief description

Get SIM ID.

6.10.16.2 Detailed description

Implements sf_cellular_api_t::simGetID Get SIM ID

Table 123:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_sim_id	out	SIM ID

Table 124:Return values

Name	Description
SSP_SUCCESS	Successfully get the SIM ID.
SSP_ERR_CELLULAR_FAILED	Failed to get the SIM ID
SSP_ERR_NOT_OPEN	Device is not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_CELLULAR_INVALID_STATE	Module in Data mode can't send AT command

6.10.16.3 Function steps

- Get cellular information

6.10.17 SF_CELLULAR_COMMON_FotaCheck

```
ssp_err_t SF_CELLULAR_COMMON_FotaCheck ( sf_cellular_ctrl_t  *const p_ctrl ,
  void * p_fotacheck )
```

6.10.17.1 Brief description

Checks for available firmware upgrade.

6.10.17.2 Detailed description

Implements fotaCheck Checks for available firmware upgrade.

Table 125:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_fotacheck	in	Fota check specific structure

Table 126:Return values

Name	Description
SSP_ERR_UNSUPPORTED	Functionality not supported

6.10.18 SF_CELLULAR_COMMON_FotaStart

```
ssp_err_t SF_CELLULAR_COMMON_FotaStart ( sf_cellular_ctrl_t  *const p_ctrl ,
  void * p_fotastart )
```

6.10.18.1 Brief description

Perform the firmware upgrade.

6.10.18.2 Detailed description

Implements fotaStart Perform the firmware upgrade.

Table 127:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_fotastart	in	Fota start specific structure

Table 128:Return values

Name	Description
SSP_ERR_UNSUPPORTED	Functionality not supported

6.10.19 SF_CELLULAR_COMMON_FotaStop

```
ssp_err_t SF_CELLULAR_COMMON_FotaStop ( sf_cellular_ctrl_t  *const p_ctrl ,
  void * p_fotastop )
```

6.10.19.1 Brief description

Stop firmware upgrade.

6.10.19.2 Detailed description

Implements fotaStop Stop firmware upgrade

Table 129:Parameters

Name	Direction	Description
p_ctrl	in	Cellular control block
p_fotastop	in	Fota stop specific structure

Table 130:Return values

Name	Description
SSP_ERR_UNSUPPORTED	Functionality not supported

6.11 Communications Framework Interface

RTOS-integrated communications Framework Interface.

Implemented by:

- UART Framework Instance - UART implementation
- USB Communication Framework - USBX CDC ACM device implementation
- Telnet Communication Framework - NetX telnet server implementation
- Telnet Communication Framework - NetX telnet server with shared IP Instance implementation

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

See also Framework Communications Interface description: Communications Framework

6.11.1 Interface API

sf_comms_api_t

Function name	Description
.open	Initialize communications driver.
.close	Clean up communications driver.
.read	Read data from communications driver. This call will return after the number of bytes requested is read or if a timeout occurs while waiting for access to the driver.
.write	Write data to communications driver. This call will return after all bytes are written or if a timeout occurs while waiting for access to the driver.
.lock	Lock the communications driver. Reserve exclusive access to the communications driver.
.unlock	Unlock the communications driver. Release exclusive access to the communications driver.
.versionGet	Store the driver version in the provided p_version.

6.11.2 Data structures

- sf_comms_cfg_t
- sf_comms_instance_t

6.11.3 Enumerations

- sf_comms_lock_t

6.11.4 Typedefs

- sf_comms_ctrl_t

6.11.5 Defines

- #define SF_COMMS_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_COMMS_API_VERSION_MINOR

  Initial value: `(5U)`

6.11.6 API Data

6.11.6.1 sf_comms_lock_t

```
sf_comms_lock_t
```

Detailed description

Communications locks

Enumerated values

Name	Description
SF_COMMS_LOCK_TX	Lock Transmit.
SF_COMMS_LOCK_RX	Lock Receive.
SF_COMMS_LOCK_ALL	Lock Transmit and Receive.

6.11.6.2 sf_comms_ctrl_t

```
typedef void sf_comms_ctrl_t
```

Detailed description

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented as

- sf_console_instance_ctrl_t

6.11.7 API Structures

6.11.7.1 sf_comms_cfg_t

sf_comms_cfg_t

Detailed description

Configuration for RTOS integrated communications driver

Variables

- void const * p_extend

  Pointer to lower level communications control structure.

6.11.7.2 sf_comms_api_t

sf_comms_api_t

Detailed description

Framework communications API structure. Implementations will use the following API.

6.11.7.3 open

```
ssp_err_t(* sf_comms_api_t::open) (sf_comms_ctrl_t *const p_ctrl, sf_comms_cfg_t
const *const p_cfg)
```

Detailed description

Initialize communications driver.

Table 131:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a control structure allocated by user. The control structure is initialized in this function.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_comms_ctrl_t*const p_ctrl`

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_cfg

Definition: `sf_comms_cfg_t const *const p_cfg`

Configuration for RTOS integrated communications driver

- sf_comms_cfg_t::p_extend

  Pointer to lower level communications control structure.

6.11.7.4 close

```
ssp_err_t(* sf_comms_api_t::close) (sf_comms_ctrl_t *const p_ctrl)
```

Detailed description

Clean up communications driver.

Table 132:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.

Parameter p_ctrl

Definition: sf_comms_ctrl_t*const p_ctrl

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

6.11.7.5 read

```
ssp_err_t(* sf_comms_api_t::read) (sf_comms_ctrl_t *const p_ctrl, uint8_t *const
p_dest, uint32_t const bytes, UINT const timeout)
```

Detailed description

Read data from communications driver. This call will return after the number of bytes requested is read or if a timeout occurs while waiting for access to the driver.

Table 133:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.
p_dest	in	Destination address to read data out
bytes	in	Read data length

Table 133:Parameters (Continued)

Name	Direction	Description
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_comms_ctrl_t*const p_ctrl`

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

Parameter timeout

`const`

6.11.7.6 write

```
ssp_err_t(* sf_comms_api_t::write) (sf_comms_ctrl_t *const p_ctrl, uint8_t const
*const p_src, uint32_t const bytes, UINT const timeout)
```

Detailed description

Write data to communications driver. This call will return after all bytes are written or if a timeout occurs while waiting for access to the driver.

Table 134:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.
p_src	in	Source address to read data out from
bytes	in	Write data length

Table 134:Parameters (Continued)

Name	Direction	Description
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_comms_ctrl_t*const p_ctrl`

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter bytes

`uint32_t`

Parameter timeout

`const`

6.11.7.7 lock

```
ssp_err_t(* sf_comms_api_t::lock) (sf_comms_ctrl_t *const p_ctrl, sf_comms_lock_t
lock_type, UINT timeout)
```

Detailed description

Lock the communications driver. Reserve exclusive access to the communications driver.

Table 135:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.
lock_type	in	Locking type, transmission channel or reception channel

Table 135:Parameters (Continued)

Name	Direction	Description
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_comms_ctrl_t*const p_ctrl`

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

Parameter lock_type

Definition: `sf_comms_lock_tlock_type`

Communications locks

Parameter timeout

`const`

6.11.7.8 unlock

```
ssp_err_t(* sf_comms_api_t::unlock) (sf_comms_ctrl_t *const p_ctrl,
sf_comms_lock_t lock_type)
```

Detailed description

Unlock the communications driver. Release exclusive access to the communications driver.

Table 136:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.
lock_type	in	Locking type, transmission channel or reception channel

Parameter p_ctrl

Definition: `sf_comms_ctrl_t*const p_ctrl`

Communications framework control block. Allocate an instance specific control block to pass into the communications framework API calls. Implemented assf_console_instance_ctrl_t

Parameter lock_type

Definition: sf_comms_lock_tlock_type

Communications locks

6.11.7.9 versionGet

```
ssp_err_t(* sf_comms_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Store the driver version in the provided p_version.

Table 137:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for communications driver.
p_version	in	Pointer to memory version to be stored.

Parameter p_ctrl

Parameter p_version

6.11.7.10 sf_comms_instance_t

sf_comms_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_comms_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_comms_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_comms_api_t const * p_api

  Pointer to the API structure for this instance.

6.12 Console Framework Interface

RTOS-integrated Console Framework Interface.

6.12.1 Summary

This module is a ThreadX-aware Console Framework.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

See also Console Interface description Console Framework

6.12.2 Interface API

sf_console_api_t

Function name	Description
.open	This function configures the console. This function must be called before any other console functions.
.close	The close API handles cleans up internal driver data.
.prompt	Prints prompt string from menu, waits for input, parses input based on menu, and calls callback function if a command is identified.
.parse	Looks for input string in menu, and calls callback function if found.
.read	Reads data into the destination byte by byte and echos input to the console. Backspace, delete, and left/right arrow keys supported. Read completes when a line ending CR, CR+LF, or CR+NULL is received, or when the input exceeds the number of bytes input. If the buffer overflows SF_CONSOLE_MAX_INPUT_LENGTH, read will return an error code.
.write	The write API gets mutex object and handles UART data transmission at UART HAL layer. gets event flag to synchronize to completion of data transfer.

Function name	Description
.argumentFind	Finds a command line argument in an input string and returns the index of the character immediately following the argument and any string numbers converted to integers.
.versionGet	Stores version information in provided pointer.

6.12.3 Data structures

- sf_console_callback_args_t
- sf_console_command_t
- sf_console_menu_t
- sf_console_cfg_t
- sf_console_instance_t

6.12.4 Typedefs

- sf_console_ctrl_t
- sf_console_cb_args_t

6.12.5 Defines

- #define SF_CONSOLE_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_CONSOLE_API_VERSION_MINOR

  Initial value: `(4U)`
- #define SF_CONSOLE_HELP_COMMAND

  Initial value: `((uint8_t *) "?")`

  Command to print each command and help in menu
- #define SF_CONSOLE_MENU_PREVIOUS_COMMAND

  Initial value: `((uint8_t *) "^")`

  Previous command

- #define SF_CONSOLE_ROOT_MENU_COMMAND

  Initial value: `((uint8_t *) "~")`

  Root menu command

- #define SF_CONSOLE_CALLBACK_NEXT_FUNCTION

  Initial value: `((void(*)(sf_console_callback_args_t * p_args)) 0x70000000)`

  Use this macro to access the next menu layer from this command.

6.12.6 API Data

6.12.6.1 sf_console_ctrl_t

```
typedef void sf_console_ctrl_t
```

Detailed description

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented as

- sf_console_instance_ctrl_t

6.12.6.2 sf_console_cb_args_t

```
typedef sf_console_callback_args_t sf_console_cb_args_t
```

Detailed description

DEPRECATED definition, please use sf_console_callback_args_t instead.

6.12.7 API Structures

6.12.7.1 sf_console_callback_args_t

sf_console_callback_args_t

Detailed description

Console callback arguments

Variables

- sf_console_ctrl_t * p_ctrl

  Pointer to console that received the command that caused this callback.

- uint8_t const * p_remaining_string

  String remaining after parsing command.

- uint8_t const * context

  Pointer to user provided data.

- uint32_t bytes

  The number of bytes remaining in the input string.

6.12.7.2 sf_console_command_t

sf_console_command_t

Detailed description

Console command structure, used to create a console menu with associated callbacks.

Variables

- uint8_t * command

  Command string.

- uint8_t * help

  Description of command.

- void(* callback)(sf_console_callback_args_t *p_args)

  Callback to call when command is selected.

- void const * context

  User provided context passed into callback.

6.12.7.3 sf_console_menu_t

sf_console_menu_t

Detailed description

Console menu structure.

Variables

- struct st_sf_console_menu const * menu_prev

  Previous menu.

- uint8_t const * menu_name

  Menu name, used as a prompt.

- uint32_t num_commands

  Number of commands in this menu.

- sf_console_command_t const * command_list

  Pointer to an array of commands of length num_commands.

6.12.7.4 sf_console_cfg_t

sf_console_cfg_t

Detailed description

Configuration for RTOS integrated console framework.

Variables

- sf_comms_instance_t const * p_comms

  Pointer to communications driver instance.

- sf_console_menu_t const * p_initial_menu

  First menu to print during Open.

- bool echo

  Whether to echo input commands to transmitter.

- bool autostart

  If true, prompt will occur with p_initial_menu after initialization.

6.12.7.5 sf_console_api_t

sf_console_api_t

Detailed description

Console framework API structure. Console implementations will use the following API.

6.12.7.6 open

```
(* sf_console_api_t::open) (sf_console_ctrl_t *const p_ctrl, sf_console_cfg_t
const *const p_cfg)
```

Brief description

This function configures the console. This function must be called before any other console functions.

Detailed description

Implemented as

- SF_CONSOLE_Open

Table 138:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a device structure allocated by user. The device control structure is initialized in this function.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: sf_console_ctrl_t*const p_ctrl

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_cfg

Definition: sf_console_cfg_t const *const p_cfg

Configuration for RTOS integrated console framework.

- sf_console_cfg_t::sf_comms_instance_t

  Pointer to communications driver instance.

- sf_console_cfg_t::sf_console_menu_t

  First menu to print during Open.

- sf_console_cfg_t::echo

  Whether to echo input commands to transmitter.

- sf_console_cfg_t::autostart

  If true, prompt will occur with p_initial_menu after initialization.

6.12.7.7 close

(* sf_console_api_t::close) (sf_console_ctrl_t *const p_ctrl)

Brief description

The close API handles cleans up internal driver data.

Detailed description

Implemented as

- SF_CONSOLE_Close

Table 139:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for UART driver.

Parameter p_ctrl

Definition: sf_console_ctrl_t*const p_ctrl

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

6.12.7.8 prompt

```
(* sf_console_api_t::prompt) (sf_console_ctrl_t *const p_ctrl, sf_console_menu_t
const *const p_menu, UINT const timeout)
```

Brief description

Prints prompt string from menu, waits for input, parses input based on menu, and calls callback function if a command is identified.

Detailed description

Implemented as

- SF_CONSOLE_Prompt

Table 140:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for UART driver.
p_menu	in	Set to NULL to stay on current menu maintained by the console framework. To change menus, pass a pointer to the new menu.
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_console_ctrl_t*const p_ctrl`

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_menu

Definition: `sf_console_menu_tconst *const p_menu`

Console menu structure.

- `sf_console_menu_t::menu_prev`

  Previous menu.

- `sf_console_menu_t::menu_name`

  Menu name, used as a prompt.

- sf_console_menu_t::num_commands

  Number of commands in this menu.

- sf_console_menu_t::command_list

  Pointer to an array of commands of length num_commands.

Parameter timeout

const

6.12.7.9 parse

```
(* sf_console_api_t::parse) (sf_console_ctrl_t *const p_ctrl, sf_console_menu_t
const *const p_cmd_list, uint8_t const *const p_input, uint32_t const bytes)
```

Brief description

Looks for input string in menu, and calls callback function if found.

Detailed description

Implemented as

- SF_CONSOLE_Parse

Table 141:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for UART driver.
p_cmd_list	in	Pointer to a menu of valid input commands for this prompt
p_input	in	Pointer to a null terminated string to search for in the command list
bytes	in	Length of the input string.

Parameter p_ctrl

Definition: sf_console_ctrl_t*const p_ctrl

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_cmd_list

Definition: sf_console_menu_tconst *const p_cmd_list

Console menu structure.

- sf_console_menu_t::menu_prev

  Previous menu.

- sf_console_menu_t::menu_name

  Menu name, used as a prompt.

- sf_console_menu_t::num_commands

  Number of commands in this menu.

- sf_console_menu_t::command_list

  Pointer to an array of commands of length num_commands.

Parameter p_input

`uint8_t`

Parameter bytes

`uint32_t`

6.12.7.10 read

```
(* sf_console_api_t::read) (sf_console_ctrl_t *const p_ctrl, uint8_t *const
p_dest, uint32_t const bytes, uint32_t const timeout)
```

Brief description

Reads data into the destination byte by byte and echos input to the console. Backspace, delete, and left/right arrow keys supported. Read completes when a line ending CR, CR+LF, or CR+NULL is received, or when the input exceeds the number of bytes input. If the buffer overflows SF_CONSOLE_MAX_INPUT_LENGTH, read will return an error code.

Detailed description

Implemented as

- SF_CONSOLE_Read

Table 142:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for UART driver.
p_dest	in	Destination address to read data out
bytes	in	Read data length

Table 142:Parameters (Continued)

Name	Direction	Description
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_console_ctrl_t*const p_ctrl`

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

Parameter timeout

`uint32_t`

6.12.7.11 write

```
(* sf_console_api_t::write) (sf_console_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const timeout)
```

Brief description

The write API gets mutex object and handles UART data transmission at UART HAL layer. gets event flag to synchronize to completion of data transfer.

Detailed description

Implemented as

- SF_CONSOLE_Write

Table 143:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for UART driver.

Table 143:Parameters (Continued)

Name	Direction	Description
p_src	in	Pointer to a NULL terminated string. Length must be less than SF_CONSOLE_MAX_WRITE_LENGTH.
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_console_ctrl_t*const p_ctrl`

Console framework control block. Allocate an instance specific control block to pass into the console framework API calls. Implemented assf_console_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter timeout

`uint32_t`

6.12.7.12 argumentFind

```
(* sf_console_api_t::argumentFind) (uint8_t const *const p_arg, uint8_t const
*const p_str, int32_t *const p_index, int32_t *const p_data)
```

Brief description

Finds a command line argument in an input string and returns the index of the character immediately following the argument and any string numbers converted to integers.

Detailed description

Implemented as

- SF_CONSOLE_ArgumentFind

Table 144:Parameters

Name	Direction	Description
p_arg	in	Pointer to argument to find.
p_src	in	Pointer to source string to find the argument in.

Table 144:Parameters (Continued)

Name	Direction	Description
p_index	out	Pointer to location to store index. Set to -1 if argument is not found in input string. Pass NULL if index is not requested.
p_data	out	Pointer to location to store data following the argument. Set to -1 if argument is not found in input string. Pass NULL if data is not requested.

Parameter p_arg

`uint8_t`

Parameter p_src
Parameter p_index
Parameter p_data

6.12.7.13 versionGet

```
(* sf_console_api_t::versionGet) ( *const p_version)
```

Brief description

Stores version information in provided pointer.

Detailed description

Implemented as

- SF_CONSOLE_VersionGet

Table 145:Parameters

Name	Direction	Description
p_version	out	Code and API version used stored here.

Parameter p_version

6.12.7.14 sf_console_instance_t

sf_console_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_console_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_console_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_console_api_t const * p_api

  Pointer to the API structure for this instance.

Name	Direction	Description
p_api_ctrl	inout	Pointer to a Crypto framework control block

Table 149:Return values

Name	Description
SSP_SUCCESS	Module was successfully closed.
SSP_ERR_NOT_OPEN	Module has not opened.
SSP_ERR_ASSERTION	NULL pointer is passed as an input parameter.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.

6.13.10 SF_CRYPTO_Lock

```
ssp_err_t SF_CRYPTO_Lock ( sf_crypto_ctrl_t  *const p_api_ctrl )
```

6.13.10.1 Brief description

Locks the module. This API is utilized for locking shared resources.

6.13.10.2 Detailed description

Table 150:Parameters

Name	Direction	Description
p_api_ctrl	inout	Pointer to a Crypto framework control block

Table 151:Return values

Name	Description
SSP_SUCCESS	Module resources are successfully locked.
SSP_ERR_TIMEOUT	Unable to get ownership of the mutex within the specified time.
SSP_ERR_INTERNAL	Thread suspension was aborted. Critical error.
SSP_ERR_ASSERTION	NULL pointer is passed.as an input parameter.
SSP_ERR_NOT_OPEN	The module is not yet opened.

6.13.10.3 Function steps

- Check if the module has been opened. If not, return error.

6.13.11 SF_CRYPTO_Unlock

```
ssp_err_t SF_CRYPTO_Unlock ( sf_crypto_ctrl_t  *const p_api_ctrl )
```

6.13.11.1 Brief description

Unlocks the module. This API is utilized for unlocking shared resources.

6.13.11.2 Detailed description

Table 152:Parameters

Name	Direction	Description
p_api_ctrl	inout	Pointer to a Crypto framework control block

Table 153:Return values

Name	Description
SSP_SUCCESS	Module resources are successfully unlocked.
SSP_ERR_ASSERTION	NULL pointer is passed as an input parameter.
SSP_ERR_INTERNAL	Mutex is not owned by a caller thread.
SSP_ERR_NOT_OPEN	The module is not yet opened.

6.13.12 SF_CRYPTO_StatusGet

```
ssp_err_t SF_CRYPTO_StatusGet ( sf_crypto_ctrl_t  *const p_api_ctrl ,
 sf_crypto_state_t  * p_status )
```

6.13.12.1 Brief description

Gets the Crypto Common Framework module status.

6.13.12.2 Detailed description

Table 154:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to a Crypto framework control block
p_status	out	Memory location to store module status.

Table 155:Return values

Name	Description
SSP_SUCCESS	Status returned successfully.
SSP_ERR_ASSERTION	The parameter p_status is NULL.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	This common module is not yet opened.

6.13.12.3 Function steps

- Check if the module has a valid / known status else return error.
- Other Crypto Framework modules will propogate this error to the caller. It will be helpful to explicitly indicate that the common module is not opened instead of the generic SSP_ERR_NOT_OPEN which may imply that the module from which the call is made is not open.

6.13.13 SF_CRYPTO_VersionGet

```
ssp_err_t SF_CRYPTO_VersionGet ( ssp_version_t  *const p_version )
```

6.13.13.1 Brief description

Gets the version of Crypto Common Framework module.

6.13.13.2 Detailed description

Table 156:Parameters

Name	Direction	Description
p_version	out	Pointer to the memory to store the version information.

Table 157:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

6.13.14 API Data

6.13.14.1 sf_crypto_key_type_t

`sf_crypto_key_type_t`

Detailed description

Supported key types

Enumerated values

Name	Description
SF_CRYPTO_KEY_TYPE_RSA_PLAIN_TEXT	RSA Key pair in standard format and plain text.
SF_CRYPTO_KEY_TYPE_RSA_CRT_PLAIN_TEXT	RSA Key pair in CRT format and plain text.
SF_CRYPTO_KEY_TYPE_RSA_WRAPPED	RSA Key pair public key in plain text and wrapped standard format private key.
SF_CRYPTO_KEY_TYPE_AES_WRAPPED	Wrapped AES key.
SF_CRYPTO_KEY_TYPE_AES_PLAIN_TEXT	AES Plain text key.
SF_CRYPTO_KEY_TYPE_ECC_PLAIN_TEXT	ECC Key pair in standard format and plain text.
SF_CRYPTO_KEY_TYPE_ECC_WRAPPED	ECC Key pair public key in plain text and wrapped standard format private key.
SF_CRYPTO_KEY_TYPE_ENCRYPTED_RSA_PRIVATE_KEY	RSA private key in encrypted format for installation.
SF_CRYPTO_KEY_TYPE_ENCRYPTED_AES_KEY	AES key in encrypted format for installation.
SF_CRYPTO_KEY_TYPE_ENCRYPTED_ECC_PRIVATE_KEY	ECC private key in encrypted format for installation.

6.13.14.2 sf_crypto_key_size_t

`sf_crypto_key_size_t`

Detailed description

Supported key sizes

Enumerated values

Name	Description
SF_CRYPTO_KEY_SIZE_RSA_1024	RSA 1024-bit key.
SF_CRYPTO_KEY_SIZE_RSA_2048	RSA 2048-bit key.
SF_CRYPTO_KEY_SIZE_AES_128	AES 128-bit key for CBC, CTR, ECB, GCM chaining modes.
SF_CRYPTO_KEY_SIZE_AES_XTS_128	AES 128-bit key for XTS chaining mode only.
SF_CRYPTO_KEY_SIZE_AES_192	AES 192-bit key for CBC, CTR, ECB, GCM chaining modes.
SF_CRYPTO_KEY_SIZE_AES_256	AES 256-bit key for CBC, CTR, ECB, GCM chaining modes.
SF_CRYPTO_KEY_SIZE_AES_XTS_256	AES 256-bit key for XTS chaining mode only.
SF_CRYPTO_KEY_SIZE_ECC_192	ECC 192-bit key.
SF_CRYPTO_KEY_SIZE_ECC_256	ECC 256-bit key.

6.13.14.3 sf_crypto_state_t

`sf_crypto_state_t`

Detailed description

State codes for the SSP Crypto Framework Common Module

Enumerated values

Name	Description
SF_CRYPTO_CLOSED	The module is closed.
SF_CRYPTO_OPENED	The module is opened.

6.13.14.4 sf_crypto_event_t

`sf_crypto_event_t`

Detailed description

Event code for the SSP Crypto Framework Common Module. This event code is all reserved for the future use.

Enumerated values

Name	Description
SF_CRYPTO_EVENT_PROCEDURE_DONE	Crypto hardware procedure done.
SF_CRYPTO_EVENT_ERROR	Error occurred.

6.13.14.5 sf_crypto_close_option_t

`sf_crypto_close_option_t`

Detailed description

SF_CRYPTO Close option. The module executes close operation if any SF_CRYPTO_XXX modules have already closed if SF_CRYPTO_CLOSE_OPTION_DEFAULT option is specified. The module performs close operation regardless of any SF_CRYPTO_XXX module status if SF_CRYPTO_CLOSE_OPTION_FORCE_CLOSE is specified.

Enumerated values

Name	Description
SF_CRYPTO_CLOSE_OPTION_DEFAULT	Close the module if no any SF_CRYPTO_XXX modules opened.
SF_CRYPTO_CLOSE_OPTION_FORCE_CLOSE	Close the module regardless of SF_CRYPTO_XXX modules status.

6.13.14.6 sf_crypto_cipher_state_t

`sf_crypto_cipher_state_t`

Detailed description

States the SSP Crypto Cipher Framework module can go through.

Enumerated values

Name	Description
SF_CRYPTO_CIPHER_STATE_CLOSED	The Cipher module is closed.
SF_CRYPTO_CIPHER_STATE_OPENED	The Cipher module is opened.
SF_CRYPTO_CIPHER_STATE_INITIALIZED	The cipher operation is initialized.
SF_CRYPTO_CIPHER_STATE_UPDATED	The cipher operation is updated.
SF_CRYPTO_CIPHER_STATE_FINALIZED	The cipher operation is finalized.

6.13.14.7 sf_crypto_ctrl_t

```
typedef void sf_crypto_ctrl_t
```

Detailed description

SSP Crypto Framework Common Module control block. Allocate an instance specific control block to pass into the SSP Crypto Framework Common Module API calls. Implemented as

- sf_crypto_instance_ctrl_t

6.13.15 Extensions

6.13.15.1 sf_crypto_data_handle_t

sf_crypto_data_handle_t

Detailed description

A structure to handle data among Crypto Framework modules

Variables

- uint8_t * p_data

  Pointer to data.

- uint32_t data_length

  The length of data pointed by p_data.

6.13.15.2 sf_crypto_callback_args_t

sf_crypto_callback_args_t

Detailed description

Callback arguments for the SSP Crypto Framework Common Module

Variables

- sf_crypto_event_t event

  Event code of the low level hardware.

- ssp_err_t error

  Error code if SF_CRYPTO_EVENT_ERROR.

6.13.15.3 sf_crypto_cfg_t

sf_crypto_cfg_t

Detailed description

Configuration structure for the SSP Crypto Framework Common Module

Variables

- uint32_t wait_option

  Wait option for RTOS service calls.
- crypto_instance_t * p_lower_lvl_crypto

  Pointer to a low-level Crypto engine HAL driver instance.
- void const * p_extend

  Extension parameter for hardware specific settings.
- void const * p_context

  Placeholder for user data.
- void * p_memory_pool

  Byte pool address.
- uint32_t memory_pool_size

  Byte pool size.
- sf_crypto_close_option_t close_option

  Close option.

6.13.15.4 sf_crypto_api_t

sf_crypto_api_t

Detailed description

Shared Interface definition for the SSP Crypto Framework Common Module

6.13.15.5 sf_crypto_instance_t

sf_crypto_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_crypto_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_crypto_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_crypto_api_t const * p_api

  Pointer to the API structure for this instance.

6.13.15.6 sf_crypto_instance_ctrl_t

sf_crypto_instance_ctrl_t

Detailed description

SSP Crypto Framework Common Module instance control block

Variables

- sf_crypto_state_t status

  Module status.

- TX_MUTEX mutex

  Mutex used in the Crypto Framework.

- TX_SEMAPHORE semaphore

  Semaphore used in the Crypto Framework (Reserve)

- TX_BYTE_POOL byte_pool

  Byte pool used in the Crypto Framework.

- uint32_t wait_option

  Wait time option used for RTOS service calls.

- uint32_t open_counter

  Counter to keep the number of SF_CRYPTO_XXX opened.

- void * p_lower_lvl_crypto

  Pointer to a low-level Crypto engine HAL driver instance.

- void(* p_callback)(*p_args)

  Pointer to callback function.

- void * p_context

  Pointer to a context.

- sf_crypto_close_option_t close_option

  Close option.

6.13.15.7 sf_crypto_cipher_instance_ctrl_t

sf_crypto_cipher_instance_ctrl_t

Detailed description

SSP Crypto Cipher Framework instance control block. DO NOT INITIALIZE. Initialization occurs when SF_CRYPTO_CIPHER_Open is called

Variables

- sf_crypto_key_type_t key_type

  Key type.

- sf_crypto_key_size_t key_size

  Key size.

- sf_crypto_cipher_mode_t cipher_chaining_mode
  Chaining mode specified for the cipher operation.
- sf_crypto_cipher_state_t status
  Module status.
- crypto_algorithm_type_t cipher_algorithm_type
  Cipher algorithm for the keys selected.
- sf_crypto_instance_ctrl_t * p_lower_lvl_fwk_common_ctrl
  Pointer to the Crypto Framework Common instance.
- sf_crypto_api_t * p_lower_lvl_fwk_common_api
  Pointer to the Crypto Framework Common API.
- sf_crypto_trng_instance_ctrl_t * p_lower_lvl_sf_crypto_trng_ctrl
  Pointer to the Crypto TRNG API.
- sf_crypto_trng_api_t * p_sf_crypto_trng_api
  Pointer to the Crypto TRNG API.
- void * p_hal_ctrl
  Pointer to HAL control structure for the Cipher operation.
- void * p_hal_api
  Pointer to HAL API structure for the cipher algorithm.
- void * p_cipher_context_buffer
  Cipher context buffer after DWORD alignment.

6.13.15.8 sf_crypto_key_instance_ctrl_t

sf_crypto_key_instance_ctrl_t

Detailed description

SSP Crypto Key Framework instance control block

Variables

- sf_crypto_key_state_t status
  Module status.
- sf_crypto_key_type_t key_type
  Key type.
- sf_crypto_key_size_t key_size
  Key size.
- sf_crypto_data_handle_t domain_params
  Domain parameters structure with pointer to data and length.

- sf_crypto_data_handle_t generator_point

  Generator Point structure with pointer to data and length.
- sf_crypto_instance_ctrl_t * p_fwk_common_ctrl

  Pointer to the Crypto Framework Common instance.
- sf_crypto_api_t * p_fwk_common_api

  Pointer to the Crypto Framework Common instance.
- void * p_hal_ctrl

  pointer to Crypto module control structure
- void * p_hal_api

  pointer to Crypto module API structure

6.14 SSP Crypto Cipher Framework Interface

Interface definition for Synergy Crypto Cipher Framework module.

Interface declaration for Synergy Crypto Key Framework module.

Interface declaration for Synergy Crypto Cipher Framework module for RSA.

Interface declaration for Synergy Crypto Cipher Framework module for AES.

6.14.1 Summary

This is a ThreadX aware Interface of SF_CRYPTO_CIPHER Framework module which provides encryption and decryption operations for AES and RSA algorithms.

SF_CRYPTO_CIPHER Framework Interface description: Crypto Framework

6.14.2 Functions

- sf_crypto_cipher_aes_hal_open
- sf_crypto_cipher_aes_hal_close
- sf_crypto_cipher_aes_interface_get

6.14.3 Typedefs

- sf_crypto_cipher_algorithm_init_params_t
- sf_crypto_cipher_ctrl_t

6.14.4 sf_crypto_cipher_aes_hal_open

```
ssp_err_t sf_crypto_cipher_aes_hal_open ( sf_crypto_cipher_instance_ctrl_t
* p_ctrl ,  sf_crypto_cipher_cfg_t  const *const p_cfg )
```

6.14.4.1 Brief description

Subroutine to open a Crypto AES HAL module. This function is called by SF_CRYPTO_CIPHER_Open.

6.14.4.2 Detailed description

Table 158:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used and set
p_cfg	in	Pointer to the cipher framework module configuration parameters. in the open() call.

Table 159:Return values

Name	Description
SSP_SUCCESS	AES HAL module is successfully opened.
SSP_ERR_OUT_OF_MEMORY	Failed to allocate memory to store AES HAL module control block.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
See	Common Error Codes or HAL driver for other possible return codes or causes. This function calls: open

6.14.4.3 Function steps

- Get a Crypto common control block and the interface.
- Allocate memory for a Crypto HAL control block in the byte pool.
- Get a AES interface instance.
- Set Crypto HAL API instance with the control common hardware api.
- Open the Crypto HAL AES module.

6.14.5 sf_crypto_cipher_aes_hal_close

```
ssp_err_t sf_crypto_cipher_aes_hal_close ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.5.1 Brief description

Subroutine to close a Crypto AES HAL module. This function is called by SF_CRYPTO_CIPHER_Close.

6.14.5.2 Detailed description

End of function sf_crypto_cipher_aes_hal_open

Table 160:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the cipher framework module control block used and set in the open() call.

Table 161:Return values

Name	Description
SSP_SUCCESS	AES HAL module is successfully closed.
See	Common Error Codes or HAL driver for other possible return codes or causes. This function calls: close

6.14.5.3 Function steps

- Release the control block memory back to byte pool

6.14.6 sf_crypto_cipher_aes_interface_get

```
 sf_crypto_cipher_aes_interface_get ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.6.1 Brief description

Subroutine to get a pointer to the AES HAL API instance.

6.14.6.2 Detailed description

End of function sf_crypto_cipher_aes_hal_close

Table 162:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Cipher framework control block, whose p_hal_api is filled with HAL AES interface. This will be NULL, for MCUs /feature/ configuration parameters not supported

6.14.6.3 Function steps

- Get a Crypto common control block and the HAL instance.
- Check the AES key type and size and get an appropriate API instance.
- Get the HAL API instance for a selected algorithm type.

6.14.7 sf_crypto_cipher_aes_fill_interface_key_type

```
sf_crypto_cipher_aes_fill_interface_key_type ( sf_crypto_cipher_instance_ctrl_t
 *const p_ctrl ,   crypto_interface_get_param_t * param )
```

6.14.7.1 Brief description

Subroutine to fill the key type parameter in the crypto_interface_get_param_t structure.

6.14.7.2 Detailed description

End of function sf_crypto_cipher_aes_interface_get

Table 163:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used and set in the open() call. *
param	in	Pointer to a crypto_interface_get_param_t structure to get the lower level interface.

6.14.8 sf_crypto_cipher_aes_fill_interface_key_size

```
sf_crypto_cipher_aes_fill_interface_key_size ( sf_crypto_cipher_instance_ctrl_t
 *const p_ctrl ,   crypto_interface_get_param_t * param )
```

6.14.8.1 Brief description

Subroutine to fill the key size parameter in the crypto_interface_get_param_t structure. This function is called by SF_CRYPTO_CIPHER_Open.

6.14.8.2 Detailed description

Table 164:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.
param	in	Pointer to a crypto_interface_get_param_t structure to get the lower level interface.

6.14.9 sf_crypto_cipher_aes_fill_interface_chaining_mode

```
 sf_crypto_cipher_aes_fill_interface_chaining_mode ( sf_crypto_cipher_instance_c
trl_t  *const p_ctrl ,   crypto_interface_get_param_t * param )
```

6.14.9.1 Brief description

Subroutine to fill the chaining mode parameter in the crypto_interface_get_param_t structure. This function is called by SF_CRYPTO_CIPHER_Open.

6.14.9.2 Detailed description

Table 165:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.

Table 165:Parameters (Continued)

Name	Direction	Description
param	in	Pointer to a crypto_interface_get_param_t structure to get the lower level interface.

6.14.10 sf_crypto_cipher_instance_aes_memory_allocate

```
ssp_err_t sf_crypto_cipher_instance_aes_memory_allocate ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.10.1 Brief description

Subroutine to allocate memory required for the context buffer for AES cipher operation. A contiguous block for the entire memory requirement for AES instance may not be available in the byte pool if it is fragmented. Hence memory is allocated in chunks to get the most out of the byte pool.

6.14.10.2 Detailed description

Table 166:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.

Table 167:Return values

Name	Description
SSP_SUCCESS	Memory allocation was successful.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error. *

6.14.10.3 Function steps

- Allocate memory for the AES context buffer. Extra 3 bytes are allocated to get the buffer WORD aligned
- Allocate memory for IV in the context buffer Extra 3 bytes are allocated to get the buffer WORD aligned
- Allocate memory for the key in the context buffer Extra 3 bytes are allocated to get the buffer WORD aligned
- Allocate memory for the partial block in the context buffer Extra 3 bytes are allocated to get the buffer WORD aligned.
- Allocate memory required for GCM related elements in the context buffer

6.14.11 sf_crypto_cipher_is_key_type_aes

```
sf_crypto_cipher_is_key_type_aes ( sf_crypto_key_type_t  key_type )
```

6.14.11.1 Brief description

Subroutine to check if the key type enum provided is a valid AES key type for cipher operation.

6.14.11.2 Detailed description

End of function sf_crypto_cipher_instance_aes_memory_allocate

Table 168:Parameters

Name	Direction	Description
key_type	in	The key type to be tested.

Table 169:Return values

Name	Description
true	The key is a valid AES key type.
false	The key is NOT a valid AES key type.

6.14.11.3 Function steps

- Check the key type and and determine the algorithm.

6.14.12 sf_crypto_cipher_aes_get_plain_text_key_size_bytes

```
ssp_err_t sf_crypto_cipher_aes_get_plain_text_key_size_bytes ( sf_crypto_key_size_t  key_size ,   uint32_t * key_size_bytes )
```

6.14.12.1 Brief description

Subroutine to get AES plain text key size in bytes given the key size enums.

6.14.12.2 Detailed description

End of function sf_crypto_cipher_is_key_type_aes

Table 170:Parameters

Name	Direction	Description
key_size	in	The key size enum to be used in calculating the key size in bytes.

Table 171:Return values

Name	Description
key_size_bytes	The AES key size in bytes. 0 if any of the inputs are invalid.

6.14.13 sf_crypto_cipher_aes_get_wrapped_key_size_bytes

```
ssp_err_t sf_crypto_cipher_aes_get_wrapped_key_size_bytes ( sf_crypto_key_size_t  key_size ,   uint32_t * key_size_bytes )
```

6.14.13.1 Brief description

Subroutine to get AES wrapped key size in bytes given the key size enums.

6.14.13.2 Detailed description

End of function sf_crypto_cipher_aes_get_plain_text_key_size_bytes

Table 172:Parameters

Name	Direction	Description
key_size	in	The key size enum to be used in calculating the key size in bytes.

Table 173:Return values

Name	Description
key_size_bytes	The AES key size in bytes. 0 if any of the inputs are invalid.

6.14.14 sf_crypto_cipher_aes_get_key_size_bytes

```
ssp_err_t sf_crypto_cipher_aes_get_key_size_bytes ( sf_crypto_key_type_t  key_ty
pe ,  sf_crypto_key_size_t  key_size ,   uint32_t * key_size_bytes )
```

6.14.14.1 Brief description

Subroutine to get AES key size in bytes given the key type and key size enums.

6.14.14.2 Detailed description

End of function sf_crypto_cipher_aes_get_wrapped_key_size_bytes

Table 174:Parameters

Name	Direction	Description
key_type	in	The key type enum to be used in calculating the key size in bytes.
key_size	in	The key size enum to be used in calculating the key size in bytes.

Table 175:Return values

Name	Description
key_size_bytes	The AES key size in bytes. 0 if any of the inputs are invalid.

6.14.15 sf_crypto_cipher_aes_validate_init_gcm_params

```
ssp_err_t sf_crypto_cipher_aes_validate_init_gcm_params ( sf_crypto_cipher_aes_init_params_t  * p_aes_params )
```

6.14.15.1 Brief description

Subroutine to validate the input parameters for the AES cipher Init operation.

6.14.15.2 Detailed description

End of function sf_crypto_cipher_aes_get_key_size_bytes

Table 176:Parameters

Name	Direction	Description
p_aes_params	in	Pointer to the AES algorithm specific parameter struct.

Table 177:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
SSP_ERR_INVALID_ARGUMENT	An input for the required cipher operation is invalid.

6.14.15.3 Function steps

- GCM supports 96-bit IV and 128-bit IV
- Tag is necessary for both encrypt and decrypt operations

6.14.16 sf_crypto_cipher_aes_validate_init_params_iv

```
ssp_err_t sf_crypto_cipher_aes_validate_init_params_iv ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_cipher_aes_init_params_t  * p_aes_params )
```

6.14.16.1 Brief description

Subroutine to validate the IV for the AES cipher Init operation for modes other than ECB and GCM.

6.14.16.2 Detailed description

Table 178:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_aes_params	in	Pointer to the algorithm specific parameters.

Table 179:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
SSP_ERR_INVALID_ARGUMENT	An input for the required cipher operation is invalid.

6.14.17 sf_crypto_cipher_aes_validate_init_padding_scheme

```
ssp_err_t sf_crypto_cipher_aes_validate_init_padding_scheme ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,
 sf_crypto_cipher_padding_scheme_t  padding_scheme )
```

6.14.17.1 Brief description

Subroutine to validate the padding scheme for AES cipher Init operation.

6.14.17.2 Detailed description

End of function sf_crypto_cipher_aes_validate_init_params_iv

Table 180:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
padding_scheme	in	The padding scheme to be used for the cipher operations.

Table 181:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
SSP_ERR_INVALID_ARGUMENT	An input for the required cipher operation is invalid.

6.14.17.3 Function steps

- Expect NO_PADDING for CTR and XTS - we expect multiple of block size For GCM it will be internally padded with 0, so user has to choose no padding.

6.14.18 sf_crypto_cipher_aes_validate_init_params

```
ssp_err_t sf_crypto_cipher_aes_validate_init_params ( sf_crypto_cipher_instance_
ctrl_t  *const p_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_aes_init_params_t  * p_aes_params )
```

6.14.18.1 Brief description

Subroutine to validate the input parameters for the AES cipher Init operation.

6.14.18.2 Detailed description

End of function sf_crypto_cipher_aes_validate_init_padding_scheme

Table 182:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
cipher_operation_mode	in	The cipher operation mode - encrypt / decrypt.
p_key	in	Pointer to the key to be used for the cipher operations.
p_aes_params	in	Pointer to the algorithm specific parameters.

Table 183:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
SSP_ERR_INVALID_ARGUMENT	An input for the required cipher operation is invalid.

6.14.18.3 Function steps

- Cipher operation mode is already validated before this function is called.
- Validate key length
- Validate padding scheme
- Validate algorithm specific parameters - IV for all modes except ECB and GCM ECB does not need IV and IV length for GCM will be tested in the next call to a GCM specific test.
- Validate parameters / lengths specific to GCM mode

6.14.19 sf_crypto_cipher_aes_init_gcm_params

```
ssp_err_t sf_crypto_cipher_aes_init_gcm_params ( sf_crypto_cipher_instance_ctrl_
t  *const p_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_algorithm_init_params_t  * p_algorithm_specific_params )
```

6.14.19.1 Brief description

Subroutine to init the AES GCM mode of operation with parameters from the AES cipherInit operation.

6.14.19.2 Detailed description

End of function sf_crypto_cipher_validate_aes_init_params

Table 184:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
cipher_operation_mode	in	The cipher operation mode - encrypt / decrypt.
p_key	in	Pointer to the key to be used for the cipher operations.
p_algorithm_specific_params	in	Pointer to the algorithm specific parameters.

Table 185:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes or HAL driver for other possible return codes or causes. This function calls: open

6.14.19.3 Function steps

- These unused common params are already handled in the calling routine
- Store the tag address supplied by the user, in the context buffer.
- For GCM, the work buffer in the HAL has to be initialized and that is done through the open call because there is no HW interaction and only the work buffer in the control block is cleaned up.

6.14.20 sf_crypto_cipher_aes_init

```
ssp_err_t sf_crypto_cipher_aes_init ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_algorithm_init_params_t  * p_algorithm_specific_params )
```

6.14.20.1 Brief description

Subroutine to initialize the AES cipher operation.

6.14.20.2 Detailed description

Table 186:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
cipher_operation_mode	in	The cipher operation mode - encrypt / decrypt.
p_key	in	Pointer to the key to be used for the cipher operations.
p_algorithm_specific_params	in	Pointer to the algorithm specific parameters.

Table 187:Return values

Name	Description
SSP_SUCCESS	All of the input parameters are validated successfully.
SSP_ERR_INVALID_ARGUMENT	An input for the required cipher operation is invalid.

6.14.20.3 Function steps

- All buffers within the context buffer are allocated at Open. Now just zeroise their contents.
- Copy the init parameters to the context buffer

6.14.21 sf_crypto_cipher_aes_check_fill_partial_block

```
sf_crypto_cipher_aes_check_fill_partial_block ( sf_crypto_cipher_instance_ctrl_
t  *const p_ctrl ,  uint32_t * fill_bytes ,  sf_crypto_data_handle_t  const
*const p_data_in )
```

6.14.21.1 Brief description

Subroutine to fill partial data block in the context buffer for the AES cipher operation. First checks if there is any data in the partial block. Only if there is any data, fills the partial block with the data from the input.

6.14.21.2 Detailed description

End of function sf_crypto_cipher_aes_init

Table 188:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
fill_bytes	inout	Pointer to the number of bytes required to fill the buffer. On output, contains the number of bytes used.
p_data_in	in	Pointer to input data output from the cipher operation.

6.14.21.3 Function steps

- Check if there is data in the partial block buffer. If so fill it from the input data
- Calculate the number of bytes to fill the partial block.
- Update the size of the data in the partial block.

6.14.22 sf_crypto_cipher_aes_fill_partial_block

```
sf_crypto_cipher_aes_fill_partial_block (  uint8_t * p_fill_buffer ,  uint32_t
* p_num_bytes_in_buffer ,  uint32_t * fill_bytes ,  sf_crypto_data_handle_t
const *const p_data_in )
```

6.14.22.1 Brief description

Subroutine to fill any AES partial block for the AES cipher operation. Fills the buffer only if there is any data present in the buffer.

6.14.22.2 Detailed description

Table 189:Parameters

Name	Direction	Description
p_fill_buffer	in	Pointer to the cbuffer to be filled.
p_num_bytes_in_buffer	inout	Pointer to the number of bytes already present in the buffer.
fill_bytes	inout	Pointer to the number of bytes required to fill the buffer.
p_data_in	in	Pointer to data handle of the input data from the user.

6.14.22.3 Function steps

- Calculate the number of bytes to fill the buffer.
- Update the size of the data in the partial block.

6.14.23 sf_crypto_cipher_aes_instance_gcm_memory_allocate

```
ssp_err_t sf_crypto_cipher_aes_instance_gcm_memory_allocate ( sf_crypto_cipher_i
nstance_ctrl_t  *const p_ctrl )
```

6.14.23.1 Brief description

Subroutine to allocate memory for GCM parameters in the context buffer.

6.14.23.2 Detailed description

Table 190:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 191:Return values

Name	Description
SSP_SUCCESS	Memory was alocated successfully.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.

6.14.23.3 Function steps

- Allocate memory for GCM tag in the context buffer. Extra 3 bytes are allocated to get the buffer WORD aligned
- Allocate memory for partial AAD in the context buffer. Extra 3 bytes are allocated to get the buffer WORD aligned
- Release the memory allocated for GCM Tag

6.14.24 sf_crypto_cipher_aes_update_helper_gcm_aad_update

```
ssp_err_t sf_crypto_cipher_aes_update_helper_gcm_aad_update ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.24.1 Brief description

Subroutine to update check and update AAD for cipher AES operation. If the mode is GCM and there is any partial AAD not processed yet, it will be processed.

6.14.24.2 Detailed description

Table 192:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 193:Return values

Name	Description
SSP_SUCCESS	AAD check / operation was completed successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.24.3 Function steps

- Now that all the data in the partial block is processed, clean it up and set the size to 0

6.14.25 sf_crypto_cipher_aes_update

```
ssp_err_t sf_crypto_cipher_aes_update ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.25.1 Brief description

Subroutine to update the cipher AES operation.

6.14.25.2 Detailed description

Table 194:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 195:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.25.3 Function steps

- If GCM check if there is any partial AAD remaining. This is to be processed only if the cipher is in initialized state. Once the update is done AAD calculations should not be done. if so call to update AAD
- Set the data out length before starting cipher operation.
- Update the number of bytes remaining in the input buffer to be processed.
- If data is block length, process it. That is encrypt / decrypt it.
- Check if the remaining input data is a multiple of block size
- Update the number of bytes written to the output buffer.
- Update the number of bytes remaining in the input buffer to be processed.
- If any bytes remain that is less than the block size, copy to the partial buffer
- Update the size of the data in the partial block

6.14.26 sf_crypto_cipher_aes_check_update_params

```
ssp_err_t sf_crypto_cipher_aes_check_update_params ( sf_crypto_cipher_instance_c
trl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.26.1 Brief description

Subroutine to check the parameters for the cipherUpdate operation.

6.14.26.2 Detailed description

End of function sf_crypto_cipher_aes_update

Table 196:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	in	Pointer to the data handle of the input data
p_data_out	in	Pointer to the data handle of the output data

Table 197:Return values

Name	Description
SSP_SUCCESS	Parameters were validated successfully.
SSP_ERR_INVALID_ARGUMENT	At least one of the buffer is set to NULL.
SSP_ERR_INVALID_SIZE	The output buffer sizes is invalid.

6.14.26.3 Function steps

- Check if the output buffer length is sufficient to hold the cipher text.
- validate the context buffer params too.

6.14.27 sf_crypto_cipher_aes_validate_update_params_context

```
ssp_err_t sf_crypto_cipher_aes_validate_update_params_context ( sf_crypto_cipher
_instance_ctrl_t  *const p_ctrl )
```

6.14.27.1 Brief description

Subroutine to validate the context buffer parameters for the cipherUpdate operation.

6.14.27.2 Detailed description

Table 198:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 199:Return values

Name	Description
SSP_SUCCESS	Parameters were validated successfully.
SSP_ERR_ASSERTION	At least one of the buffer is set to NULL.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.28 sf_crypto_cipher_aes_validate_aad_update_params_context

```
ssp_err_t sf_crypto_cipher_aes_validate_aad_update_params_context ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.28.1 Brief description

Subroutine to validate the context buffer parameters for the cipherAadUpdate operation.

6.14.28.2 Detailed description

End of function sf_crypto_cipher_aes_validate_update_params

Table 200:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 201:Return values

Name	Description
SSP_SUCCESS	Parameters were validated successfully.
SSP_ERR_ASSERTION	At least one of the buffer is set to NULL.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.29 sf_crypto_cipher_aes_aad_update

```
ssp_err_t sf_crypto_cipher_aes_aad_update ( sf_crypto_cipher_instance_ctrl_t
* p_ctrl ,  sf_crypto_data_handle_t  const *const p_aad )
```

6.14.29.1 Brief description

Subroutine to update the AAD for the cipher operation.

6.14.29.2 Detailed description

End of function sf_crypto_cipher_aes_validate_aad_update_params_context

Table 202:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_aad	in	Pointer to the input data structure - has the pointer to input AAD and the data length

Table 203:Return values

Name	Description
SSP_SUCCESS	AAD was updated successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.29.3 Function steps

- Check if there is data in the aad block buffer. If so first fill it from the input data
- Update the number of bytes remaining in the input buffer to be processed.
- If data is block length, encrypt it.
- Check if the input data is a multiple of block size
- Update the number of bytes remaining in the input buffer to be processed.
- If any bytes remain that is less than the block size, copy to the partial buffer
- Update the size of the data in the partial block

6.14.30 sf_crypto_cipher_aes_process_aad_partial_block

```
sf_crypto_cipher_aes_process_aad_partial_block ( sf_crypto_cipher_instance_ctrl
_t  *const p_ctrl )
```

6.14.30.1 Brief description

Subroutine to update the partial block of AAD for the cipher operation. Any partial data in the context buffer will be zero padded internally and updated.

6.14.30.2 Detailed description

End of function sf_crypto_cipher_aes_aad_update

Table 204:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 205:Return values

Name	Description
SSP_SUCCESS	AAD was updated successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.31 sf_crypto_cipher_aes_process_partial_block

```
ssp_err_t sf_crypto_cipher_aes_process_partial_block ( sf_crypto_cipher_instance
_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.31.1 Brief description

Subroutine to update the partial block of input data for the cipher operation. This calls the lower level HAL APIs to process the data.

6.14.31.2 Detailed description

End of function sf_crypto_cipher_process_aes_aad_partial_block

Table 206:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_out	in	Pointer to data handle of teh output data.

Table 207:Return values

Name	Description
SSP_SUCCESS	Data was processed successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.32 sf_crypto_cipher_aes_gcm_process_partial_block

```
 sf_crypto_cipher_aes_gcm_process_partial_block ( sf_crypto_cipher_instance_ctrl
_t  *const p_ctrl ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.32.1 Brief description

Subroutine to process the partial block of input data for the AES GCM cipher operation. This calls the lower level HAL APIs to process the data.

6.14.32.2 Detailed description

End of function sf_crypto_cipher_process_aes_partial_block

Table 208:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_out	in	Pointer to data handle of teh output data.

Table 209:Return values

Name	Description
SSP_SUCCESS	Data was processed successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.33 sf_crypto_cipher_aes_encrypt_final

```
ssp_err_t sf_crypto_cipher_aes_encrypt_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.33.1 Brief description

Subroutine to finalize the cipher encrypt operation.

6.14.33.2 Detailed description

End of function sf_crypto_cipher_aes_gcm_process_partial_block

Table 210:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 210:Parameters (Continued)

Name	Direction	Description
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 211:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid. •
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.33.3 Function steps

- Validate the input parameters
- Process the input data
- Handle padding for ECB, CBC modes
- Add padding and encrypt the last block.
- If there is a remaining partial block process it. For GCM zero padding is automatic
- Now that the possible AAD update and plain text encryption is done, get the GCM tag

6.14.34 sf_crypto_cipher_aes_decrypt_final_check_input_length

```
ssp_err_t sf_crypto_cipher_aes_decrypt_final_check_input_length ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in )
```

6.14.34.1 Brief description

Subroutine to check if the total data length to be decrypted is a multiple of the AES block size.

6.14.34.2 Detailed description

End of function sf_crypto_cipher_aes_encrypt_final

Table 212:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length

Table 213:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid.

6.14.34.3 Function steps

- If remaining length is not a multiple of block size, return error

6.14.35 sf_crypto_cipher_aes_decrypt_final

```
ssp_err_t sf_crypto_cipher_aes_decrypt_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.35.1 Brief description

Subroutine to finalize the cipher decrypt operation.

6.14.35.2 Detailed description

Table 214:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 215:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid. •
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.35.3 Function steps

- Validate the input parameters
- Process the input data
- If GCM check if there is any partial AAD remaining, if so call to update AAD
- If GCM set the tag
- For GCM compute and verify the tag - return error to indicate if the data is valid or not.

6.14.36 sf_crypto_cipher_aes_is_last_decrypt_block

```
 sf_crypto_cipher_aes_is_last_decrypt_block ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,   uint32_t remaining_length )
```

6.14.36.1 Brief description

Subroutine to check whether the the input is the last block for the cipher decrypt operation.

6.14.36.2 Detailed description

End of function sf_crypto_cipher_aes_decrypt_final

Table 216:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
remaining_length	in	Remaining bytes in the input data to be decrypted.

Table 217:Return values

Name	Description
true	Yes, it is the last block.
false	No, it is not the last block.

6.14.37 sf_crypto_cipher_aes_decrypt_last_block

```
ssp_err_t sf_crypto_cipher_aes_decrypt_last_block ( sf_crypto_cipher_instance_ct
rl_t  *const p_ctrl ,   uint8_t * p_input_data ,   uint8_t * p_output_buffer ,
  uint32_t * num_data_bytes )
```

6.14.37.1 Brief description

Subroutine to decrypt the last block of the input data for the cipher decrypt operation.

6.14.37.2 Detailed description

Table 218:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_input_data	in	Pointer to the the input data buffer.
p_output_buffer	inout	Pointer to the output data buffer.
num_data_bytes	inout	Length of the actual data (block minus the padding) is populated on successful output.

Table 219:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.37.3 Function steps

- Decrypt the last block into the buffer provided.
- Strip the padding bytes
- Pick the last byte which is the pad byte
- Check backwards to ensure the number of pad_bytes is the real padding

6.14.38 sf_crypto_cipher_aes_helper_decrypt_last_block

```
ssp_err_t sf_crypto_cipher_aes_helper_decrypt_last_block ( sf_crypto_cipher_inst
ance_ctrl_t  *const p_ctrl ,  uint32_t input_data_length ,  uint8_t
* p_input_data ,  sf_crypto_data_handle_t  *const p_data_out ,
  uint32_t data_out_offset )
```

6.14.38.1 Brief description

helper function to finalize the cipher decrypt operation. It decrypts the last block of data strips the padding bytes and writes the actual data to the output data buffer at the given offset. Also updates the data length on output.

6.14.38.2 Detailed description

End of function sf_crypto_cipher_aes_decrypt_last_block

Table 220:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module instance control block.
input_data_length	in	Length of the input data
p_input_data	in	Pointer to the input data buffer.
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length on input.
data_out_offset	in	Offset at which the data has to be output into p_data_out.p_data.

Table 221:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid. •
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.39 sf_crypto_cipher_is_last_block_with_padding

```
 sf_crypto_cipher_is_last_block_with_padding ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,   uint32_t remaining_input_length )
```

6.14.39.1 Brief description

helper function to finalize the cipher decrypt operation. This checks if it is the last block to be decrypted and if padding is enabled.

6.14.39.2 Detailed description

Table 222:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
remaining_input_length	in	The number of bytes remaining to be processed in the input data.

Table 223:Return values

Name	Description
padded_block	true if the remaining length is the last block and is padded false otherwise.

6.14.40 sf_crypto_cipher_aes_helper_decrypt_final

```
ssp_err_t sf_crypto_cipher_aes_helper_decrypt_final ( sf_crypto_cipher_instance_
ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.40.1 Brief description

helper function to finalize the cipher decrypt operation.

6.14.40.2 Detailed description

Table 224:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 225:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is invalid. •
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.40.3 Function steps

- This will be updated once the data is written to the buffer.
- Check if there is data in the partial block buffer. If so first fill it from the input data
- Update the number of bytes remaining in the input buffer to be processed.
- If data is block length within the partial block in the context buffer, then decrypt it.
- This is last block with padding buffered in the context buffer and we are done,so return
- update the number of bytes written to the output buffer.
- Now that all the data in the partial block is processed, clean it up and set the size to 0
- Check if there is remaining input data

- no more data to process, so return .
- This is last block with padding from the input data stream and we are done,so return
- There are multiple blocks to be decrypted but the last one is padded. So decrypt all but the last one.
- Process the input data stream with num blocks
- update the number of bytes written to the output buffer.
- Update the number of bytes remaining in the input buffer to be processed.
- This is last block with padding from the input data stream and we are done,so return

6.14.41 sf_crypto_cipher_aes_gcm_helper_decrypt_final

```
ssp_err_t sf_crypto_cipher_aes_gcm_helper_decrypt_final ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.41.1 Brief description

helper function to finalize the AES cipher decrypt operation for GCM .

6.14.41.2 Detailed description

End of function sf_crypto_cipher_aes_helper_decrypt_final

Table 226:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 227:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.

Table 227:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	Input data is invalid. •
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.41.3 Function steps

- This will be updated once the data is written to the buffer.
- Check if there is data in the partial block buffer. If so first fill it from the input data
- Update the number of bytes remaining in the input buffer to be processed.
- If there is a remaining partial block process it. For GCM zero padding is automatic
- update the number of bytes written to the output buffer.
- Now that all the data in the partial block is processed, clean it up and set the size to 0
- If remaining length is 0, we are done else we have more data to process
- update the number of bytes written to the output buffer.

6.14.42 sf_crypto_cipher_aes_handle_encrypt_padding

```
ssp_err_t sf_crypto_cipher_aes_handle_encrypt_padding ( sf_crypto_cipher_instanc
e_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.42.1 Brief description

Subroutine to handle the PKCS#7 padding scheme for the cipher encrypt operation.

6.14.42.2 Detailed description

End of function sf_crypto_cipher_aes_gcm_helper_decrypt_final

Table 228:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 228:Parameters (Continued)

Name	Direction	Description
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 229:Return values

Name	Description
SSP_SUCCESS	Cipher operation was finalized successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.42.3 Function steps

- Add PKCS#7 padding

6.14.43 sf_crypto_cipher_aes_get_gcm_tag

```
ssp_err_t sf_crypto_cipher_aes_get_gcm_tag ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.43.1 Brief description

Subroutine to get the GCM tag after the the cipher encrypt operation.

6.14.43.2 Detailed description

End of function sf_crypto_cipher_aes_handle_encrypt_padding

Table 230:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used

Table 231:Return values

Name	Description
SSP_SUCCESS	The GCM tag was created successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.44 sf_crypto_cipher_aes_set_gcm_tag

```
ssp_err_t sf_crypto_cipher_aes_set_gcm_tag ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.44.1 Brief description

Subroutine to set the GCM tag for the the cipher decrypt operation.

6.14.44.2 Detailed description

End of function sf_crypto_cipher_aes_get_gcm_tag

Table 232:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 233:Return values

Name	Description
SSP_SUCCESS	The GCM tag was created successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.45 sf_crypto_cipher_aes_compute_verify_gcm_tag

```
ssp_err_t sf_crypto_cipher_aes_compute_verify_gcm_tag ( sf_crypto_cipher_instanc
e_ctrl_t  *const p_ctrl )
```

6.14.45.1 Brief description

Subroutine to compute and verify the GCM tag for after the cipher decrypt operation.

6.14.45.2 Detailed description

End of function sf_crypto_cipher_aes_set_gcm_tag

Table 234:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.

Table 235:Return values

Name	Description
SSP_SUCCESS	The GCM tag was computed and verified successfully.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.46 sf_crypto_cipher_aes_helper_validate_final_params

```
ssp_err_t sf_crypto_cipher_aes_helper_validate_final_params ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in )
```

6.14.46.1 Brief description

Subroutine to validate the parameters for the AES cipher final operation. This function only checks if any input data is received for the final operation. *.

6.14.46.2 Detailed description

End of function sf_crypto_cipher_aes_compute_verify_gcm_tag

Table 236:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call. in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length

Table 237:Return values

Name	Description
SSP_SUCCESS	The parameters were verified successfully.
SSP_ERR_INVALID_ARGUMENT	No input data was provided either to the cipherUpdate() or the cipherFinal operation.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.46.3 Function steps

- GCM is the only mode that can take no input data but just create a tag For other modes: If no input data is provided in update operation and none in final, return error. If the status is SF_CRYPTO_CIPHER_STATE_INITIALIZED, it means this is a one shot final operation and no data was provided through the Update call.

6.14.47 sf_crypto_cipher_aes_validate_encrypt_final_out_buffer

```
ssp_err_t sf_crypto_cipher_aes_validate_encrypt_final_out_buffer ( sf_crypto_dat
a_handle_t  *const p_data_out ,   uint32_t required_length )
```

6.14.47.1 Detailed description

End of function sf_crypto_cipher_validate_aes_final_params

6.14.48 sf_crypto_cipher_aes_validate_encrypt_final_params

```
ssp_err_t sf_crypto_cipher_aes_validate_encrypt_final_params ( sf_crypto_cipher_
instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const
*const p_data_in ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.48.1 Brief description

Subroutine to validate the parameters for the final encrypt operation.

6.14.48.2 Detailed description

Table 238:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length

Table 239:Return values

Name	Description
SSP_SUCCESS	The parameters were verified successfully.
SSP_ERR_INVALID_ARGUMENT	Input data is not a multiple of block size.
SSP_ERR_INVALID_SIZE	Output data buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.48.3 Function steps

- GCM is the only mode that gets zero padded internally. Unless a padding scheme is selected, for rest of the modes the data has to be a multiple of the block size.
- Check if the output buffer is big enough
- If a padding scheme is selected and mode is not GCM, whether or not there are partial bytes remaining, padding will be applied.

6.14.49 sf_crypto_cipher_aes_validate_decrypt_final_params

```
ssp_err_t sf_crypto_cipher_aes_validate_decrypt_final_params ( sf_crypto_cipher_
instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const
*const p_data_in ,  sf_crypto_data_handle_t  *const p_data_out )
```

6.14.49.1 Brief description

Subroutine to validate the parameters for the final decrypt operation.

6.14.49.2 Detailed description

End of function sf_crypto_cipher_validate_aes_encrypt_final_params

Table 240:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length

Table 241:Return values

Name	Description
SSP_SUCCESS	The parameters were verified successfully.
SSP_ERR_INVALID_ARGUMENT	input data is not a multiple of block size.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.49.3 Function steps

- Except for GCM - For decryption, the data must be a multiple of block size

- Check if the output buffer is big enough. Note: If there is partial data in GCM, it will be zero padded internally for calculations but the data returned will be the same size as the input data.

6.14.50 sf_crypto_cipher_aes_hal_encrypt_decrypt

```
ssp_err_t sf_crypto_cipher_aes_hal_encrypt_decrypt ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,   uint32_t * p_key ,   uint32_t * p_iv ,
  uint32_t num_words ,   uint32_t * p_input ,   uint32_t * p_output )
```

6.14.50.1 Brief description

Subroutine calls the HAL encrypt / decrypt APIs as pointed to by the HAL interface in the control block. It is assumed that the control block is already populated with the interface for the HAL AES APIs. *.

6.14.50.2 Detailed description

End of function sf_crypto_cipher_validate_aes_decrypt_final_params

Table 242:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the Cipher framework module instance control block.
p_key	in	Pointer to the key to be used for the cipher operation.
p_iv	in	Pointer to the IV to be used for the cipher operation.
num_words	in	Number of words of input data for the cipher operation.
p_input	in	Pointer to the input data for the cipher operation.
p_output	in	Pointer to the IV to output data for the cipher operation.

Table 243:Return values

Name	Description
SSP_SUCCESS	The cipher update operation was successful.

Table 243:Return values (Continued)

Name	Description
SSP_ERR_UNSUPPORTED	The module does not support the algorithm bbased on the key type specified by the user.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.14.51 sf_crypto_cipher_aes_final

```
ssp_err_t sf_crypto_cipher_aes_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.51.1 Brief description

Sub-routine for Crypto Cipher Framework to call the appropriate routine for final encryption based on the algorithm for the cipherFinal operation. This function is called by SF_CRYPTO_CIPHER_CipherFinal.

6.14.51.2 Detailed description

End of function sf_crypto_cipher_aes_hal_encrypt_decrypt

Table 244:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the Cipher framework module instance control block.
p_data_in	in	Pointer to the input data buffer and the length of the input data.
p_data_out	inout	Pointer to the output data buffer and the buffer length on input. If data is output, the length of the data will be updated.

Table 245:Return values

Name	Description
SSP_SUCCESS	The cipher update operation was successful.

Table 245:Return values (Continued)

Name	Description
SSP_ERR_UNSUPPORTED	The module does not support the algorithm bbased on the key type specified by the user.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.14.51.3 Function steps

- Validate that there is some input data provided / processed before the finalizing operation Applies to both encrypt and decrypt operations. AES GCM is the only exception.

6.14.52 sf_crypto_cipher_aes_context_buffer_pointer_data_zeroise

```
 sf_crypto_cipher_aes_context_buffer_pointer_data_zeroise ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.52.1 Brief description

A subroutine to zeroise the memory pointed to by the fields within the context buffer. NOTE: the buffer sizes pointed to by the original allocation should NOT be cleared. Those sizes will be used when freeing up the memory.

6.14.52.2 Detailed description

End of function sf_crypto_cipher_aes_final

Table 246:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the Cipher framework module instance control block.

6.14.53 sf_crypto_cipher_instance_aes_memory_deallocate

```
ssp_err_t sf_crypto_cipher_instance_aes_memory_deallocate ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.53.1 Brief description

A subroutine to release the memory allocated for context buffer. All the data pointed to by the context buffer is first zeroised and freed. Next all elements of the context buffer are zeroised and pointers are set to NULL. Lastly the context buffer itself is freed.

6.14.53.2 Detailed description

End of function sf_crypto_cipher_aes_context_buffer_pointer_data_zeroise

Table 247:Parameters

Name	Direction	Description
p_ctrl	inout	The instance control block for the Cipher module.

Table 248:Return values

Name	Description
SSP_SUCCESS	The memory for this instance was freed successfully.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.

6.14.53.3 Function steps

- First zeroise the data pointed to from the context buffer and then release the memory resources used for this instance
- Release the memory allocated for Partial Block
- Release the memory allocated for Key
- Release the memory allocated for IV
- Release the memory allocated for AAD partial Block and tag
- Zeroise the context buffer and set all pointers to NULL
- Release the memory allocated for the context buffer.

6.14.54 sf_crypto_cipher_aes_zeroise_context_buffer

```
 sf_crypto_cipher_aes_zeroise_context_buffer ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.54.1 Brief description

A subroutine to init / reset the context buffer. All elements are zeroised and pointers are set to NULL.

6.14.54.2 Detailed description

End of function sf_crypto_cipher_instance_aes_memory_deallocate

Table 249:Parameters

Name	Direction	Description
p_ctrl	inout	The instance control block for the Cipher module.

6.14.55 sf_crypto_cipher_instance_aes_gcm_memory_release

```
ssp_err_t sf_crypto_cipher_instance_aes_gcm_memory_release ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.55.1 Brief description

A subroutine to free the memory allocated for the GCM data in the context buffer. All elements are zeroised and pointers are set to NULL.

6.14.55.2 Detailed description

End of function sf_crypto_cipher_aes_zeroise_context_buffer

Table 250:Parameters

Name	Direction	Description
p_ctrl	inout	The instance control block for the Cipher module.

Table 251:Return values

Name	Description
SSP_SUCCESS	The GCM data in the context buffer for this instance was freed successfully.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.

6.14.56 sf_crypto_cipher_initialize_aes_instance

```
ssp_err_t sf_crypto_cipher_initialize_aes_instance ( sf_crypto_cipher_instance_ctrl_t  * p_ctrl ,  sf_crypto_cipher_cfg_t  const *const p_cfg )
```

6.14.56.1 Brief description

Allocates memory for the instance and opens the underlying HAL instance.

6.14.56.2 Detailed description

End of function sf_crypto_cipher_instance_aes_gcm_memory_release

Table 252:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Cipher Framework instance control block structure.
p_cfg	in	Pointer to the configuration structure for Cipher module .

Table 253:Return values

Name	Description
SSP_SUCCESS	The module instantiated successfully.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes or HAL driver for other possible return codes or causes. This function calls: sf_crypto_cipher_instance_memory_allocate sf_crypto_cipher_hal_open

6.14.57 sf_crypto_cipher_deinitialize_aes_instance

```
ssp_err_t sf_crypto_cipher_deinitialize_aes_instance ( sf_crypto_cipher_instance
_ctrl_t  * p_ctrl )
```

6.14.57.1 Brief description

closes the underlying HAL instance and releases the memory for the instance.

6.14.57.2 Detailed description

End of function sf_crypto_cipher_initialize_aes_instance

Table 254:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Cipher Framework instance control block structure.

Table 255:Return values

Name	Description
SSP_SUCCESS	The module instantiated successfully.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes or HAL driver for other possible return codes or causes. This function calls: sf_crypto_cipher_instance_memory_allocate sf_crypto_cipher_hal_open

6.14.58 SF_CRYPTO_CIPHER_RSA_EB_SIZE_BYTES

```
SF_CRYPTO_CIPHER_RSA_EB_SIZE_BYTES (  uint32_t key_size_bits )
```

6.14.58.1 Brief description

Routine to calculate the Encryption block size based on the key size.

6.14.58.2 Detailed description

Table 256:Parameters

Name	Direction	Description
key_size_bits	in	key size in bits.

encryption block size in bytes

6.14.59 SF_CRYPTO_CIPHER_RSA_PKCS_1_5_EB_DATA_SIZE_BYTES

```
SF_CRYPTO_CIPHER_RSA_PKCS_1_5_EB_DATA_SIZE_BYTES (  uint32_t key_size_bits )
```

6.14.59.1 Brief description

Routine to calculate the Encryption block size based on the key size.

6.14.59.2 Detailed description

Table 257:Parameters

Name	Direction	Description
key_size_bits	in	key size in bits.

encryption block size in bytes for PKCS#1 v1.5 encoding

6.14.60 sf_crypto_cipher_rsa_hal_open

```
ssp_err_t sf_crypto_cipher_rsa_hal_open ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_cipher_cfg_t  const *const p_cfg )
```

6.14.60.1 Brief description

Subroutine to open a Crypto RSA HAL module. This function is called by SF_CRYPTO_CIPHER_Open.

6.14.60.2 Detailed description

Table 258:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block
p_cfg	inout	Pointer to a Crypto Key Framework module configuration structure

Table 259:Return values

Name	Description
SSP_SUCCESS	RSA HAL module is successfully opened.
SSP_ERR_OUT_OF_MEMORY	Failed to allocate memory to store RSA HAL module control block.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
Others	RSA HAL module returned an error. See Common Error Codes for other possible return codes.

6.14.60.3 Function steps

- Get a Crypto common control block and the interface.
- Allocate memory for a Crypto HAL control block from the byte pool.
- Set Crypto HAL API instance with the control common hardware api.
- Open the Crypto HAL RSA module.

6.14.61 sf_crypto_cipher_rsa_hal_close

```
ssp_err_t sf_crypto_cipher_rsa_hal_close ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.61.1 Brief description

Subroutine to close a Crypto RSA HAL module. This function is called by SF_CRYPTO_CIPHER_Close.

6.14.61.2 Detailed description

Table 260:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a Crypto Key Framework module control block

Table 261:Return values

Name	Description
SSP_SUCCESS	RSA HAL module is successfully closed.
Others	RSA HAL module returned an error. See Common Error Codes for other possible return codes.

6.14.61.3 Function steps

- Close the Crypto HAL driver.
- Release the control block memory back to byte pool

6.14.62 sf_crypto_cipher_rsa_interface_get

```
 sf_crypto_cipher_rsa_interface_get ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.62.1 Brief description

Subroutine to get a RSA HAL API instance. This function is called by sf_crypto_cipher_open_rsa().

6.14.62.2 Detailed description

Table 262:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Key framework control block, whose p_hal_api filled with HAL RSA interface. This indicates NULL, for not supported MCUs

6.14.62.3 Function steps

- Get a Crypto common control block and the HAL instance.
- Check the RSA key type.
- Check the RSA key type.
- Get the HAL API instance for a selected algorithm type.

6.14.63 sf_crypto_cipher_rsa_private_free_context_buffer_key

```
ssp_err_t sf_crypto_cipher_rsa_private_free_context_buffer_key ( sf_crypto_ciphe
r_instance_ctrl_t  *const p_ctrl )
```

6.14.63.1 Brief description

Subroutine to free memory allocated for the key in the context buffer for RSA cipher operation.

6.14.63.2 Detailed description

Table 263:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.

Table 264:Return values

Name	Description
SSP_SUCCESS	Memory allocation was successful.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error. *

6.14.63.3 Function steps

- Release the memory allocated for the RSA Context Buffer

6.14.64 sf_crypto_cipher_rsa_private_free_context_buffer

```
ssp_err_t sf_crypto_cipher_rsa_private_free_context_buffer ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.64.1 Brief description

Subroutine to free memory allocated for the context buffer for RSA cipher operation.

6.14.64.2 Detailed description

Table 265:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.

Table 266:Return values

Name	Description
SSP_SUCCESS	Memory allocation was successful.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error. *

6.14.64.3 Function steps

- Release the memory allocated for the RSA Context Buffer

6.14.65 sf_crypto_cipher_instance_rsa_memory_allocate

```
ssp_err_t sf_crypto_cipher_instance_rsa_memory_allocate ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl )
```

6.14.65.1 Brief description

Subroutine to allocate memory required for the context buffer for RSA cipher operation.

6.14.65.2 Detailed description

End of function sf_crypto_cipher_rsa_memory_free_context_buffer

Table 267:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a Crypto Key Framework module control block.

Table 268:Return values

Name	Description
SSP_SUCCESS	Memory allocation was successful.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
SSP_ERR_INTERNAL	An internal error occurred during processing.

6.14.65.3 Function steps

- Allocate memory for the RSA context buffer. Extra 3 bytes are allocated to get the buffer WORD aligned
- Zeroise the context buffer and set all pointers to NULL
- Allocate memory for key in the context buffer Extra 3bytes are allocated to get the buffer WORD aligned
- Allocate memory for partial block. Extra 3bytes are allocated to get the buffer WORD aligned.
- Not checking error here as we are already sending a mem alloc error. Free the memory for the key and then the context buffer itself.

6.14.66 sf_crypto_cipher_is_key_type_rsa

```
sf_crypto_cipher_is_key_type_rsa ( sf_crypto_key_type_t  key_type )
```

6.14.66.1 Brief description

Subroutine to check if key type is RSA.

6.14.66.2 Detailed description

Table 269:Parameters

Name	Direction	Description
key_type	in	Key type enum.

Table 270:Return values

Name	Description
SSP_SUCCESS	Memory allocation was successful.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SSP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error. *

6.14.66.3 Function steps

- Check the key type is valid for RSA operations.

6.14.67 sf_crypto_cipher_rsa_init

```
ssp_err_t sf_crypto_cipher_rsa_init ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_algorithm_init_params_t  * p_algorithm_specific_params )
```

6.14.67.1 Brief description

Routine to handle the cipherInit RSA operation.

6.14.67.2 Detailed description

Table 271:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
cipher_operation_mode	in	
p_key	in	
p_algorithm_specific_params	in	

Table 272:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.67.3 Function steps

- All buffers within the context buffer are allocated at Open. Now just zeroise their contents.
- Copy data into the control block / context buffer.

6.14.68 sf_crypto_cipher_rsa_update

```
ssp_err_t sf_crypto_cipher_rsa_update ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.68.1 Brief description

Subroutine to update the cipher RSA operation. This algorithm is only suitable for messages of limited length. The total number of input bytes processed during encryption may not be more than k-11, where k is the RSA key's modulus size in bytes. The encryption block(EB) during encryption with a Public key is built as follows: EB = 00 || 02 || PS || 00 || M :: M (input bytes) is the plaintext message :: PS is an octet string of length k-3-||M|| of pseudo random nonzero octets. The length of PS must be at least 8 octets. :: k is the RSA modulus size.

6.14.68.2 Detailed description

Table 273:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	in	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the buffer length on input. If data is filled the length is updated on output.

Table 274:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully. •
SSP_ERR_UNSUPPORTED	Unknown cipher operation mode was passed in.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.68.3 Function steps

- input parameters validation - done at the entry nothing to do here no output on update - so no checks for output buffer / length collect input up to the block size for encryption when no padding is selected. collect data up to block size -11 for encryption when padding is selected collect input up to the block size for decryption if it exceeds the above return error
- Copy the data into the partial block

6.14.69 sf_crypto_cipher_rsa_helper_pkcs_1_5_encode_block

```
ssp_err_t sf_crypto_cipher_rsa_helper_pkcs_1_5_encode_block ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in )
```

6.14.69.1 Brief description

Helper routine to encode the PKCS#1 v1.5 encoding.

6.14.69.2 Detailed description

Table 275:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length

Table 276:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_MESSAGE_TOO_LONG	The input data / message is too long for the given operation.
SSP_ERR_INTERNAL	An internal error occurred during processing.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.69.3 Function steps

- Copy any input data into the partial block.

6.14.70 sf_crypto_cipher_rsa_encrypt_final

```
ssp_err_t sf_crypto_cipher_rsa_encrypt_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.70.1 Brief description

Subroutine to finalize the cipher RSA encrypt operation.

6.14.70.2 Detailed description

Table 277:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 278:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_MESSAGE_TOO_LONG	The input data / message is too long for the given operation.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
SSP_ERR_UNSUPPORTED	Unknown padding scheme supplied.
SSP_ERR_INTERNAL	An internal error occurred during processing.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.70.3 Function steps

- At this point we have a block which has to be encrypted by the HAL API

6.14.71 sf_crypto_cipher_rsa_hal_encrypt_decrypt

```
ssp_err_t sf_crypto_cipher_rsa_hal_encrypt_decrypt ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,   uint32_t * p_key ,   uint32_t * p_domain ,
  uint32_t num_words ,   uint32_t * p_input ,   uint32_t * p_output )
```

6.14.71.1 Brief description

Subroutine to call the HAL RSA encrypt/decrypt API.

6.14.71.2 Detailed description

Table 279:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_key	in	Pointer to the ket used for the cipher operation.
p_domain	in	Pointer to the domain parameters for the cipher operation - NULL for RSA.
num_words	in	Number of words supplied as the input data.
p_input	in	Pointer to the input data for the cipher operation.
p_output	in	Pointer to the output data for the cipher operation.

Table 280:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.

Table 280:Return values (Continued)

Name	Description
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.72 sf_crypto_cipher_rsa_pkcs_1_5_encode_block

```
ssp_err_t sf_crypto_cipher_rsa_pkcs_1_5_encode_block ( sf_crypto_cipher_instance
_ctrl_t  *const p_ctrl )
```

6.14.72.1 Brief description

Subroutine to format the Encryption Block as per the PKCS#1 v1.5 for RSA encrypt operation. The partial data block in the context buffer will be formatted in place to avoid allocating extra memory from the byte pool or creating a block on the stack.

6.14.72.2 Detailed description

Table 281:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used

Table 282:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.72.3 Function steps

- message_end points to the last byte of the message to be encoded.
- Get the encryption block size.
- buffer_end points to the last byte of the EB to be encoded.

- move the data to the end of the buffer to format the Encryption Block EB in place in the context buffer EB = 00 || BT || PS || 00 || D
- Now get random numbers to fill the Padding String PS Also ensure that the random numbers so not contain any zeroes.

6.14.73 sf_crypto_cipher_rsa_decrypt_final

```
ssp_err_t sf_crypto_cipher_rsa_decrypt_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.73.1 Brief description

Subroutine to finalize the cipher RSA decrypt operation.

6.14.73.2 Detailed description

Table 283:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the cipher framework module control block used in the open() call.
p_data_in	inout	Pointer to the input data structure - has the pointer to input data and the data length
p_data_out	inout	Pointer to the output data structure - has the pointer to output data and the data length.

Table 284:Return values

Name	Description
SSP_SUCCESS	Cipher operation was updated successfully.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
SSP_ERR_INTERNAL	An internal error occurred during processing.
See	Common Error Codes or HAL driver for other possible return codes or causes.

6.14.73.3 Function steps

- Copy any input data into the partial block.
- At this point we have a block which has to be decrypted by the HAL API
- Before copying data into the output buffer ensure that the output buffer is of sufficient size.

6.14.74 sf_crypto_cipher_rsa_pkcs_1_5_decode_block

```
ssp_err_t sf_crypto_cipher_rsa_pkcs_1_5_decode_block ( sf_crypto_cipher_instance
_ctrl_t  *const p_ctrl )
```

6.14.74.1 Function steps

- Check if the Encoded Message format is correct
- check if the data separator is at least 8 octets away or the Padding string is at least eight octets long.

6.14.75 sf_crypto_cipher_rsa_validate_encrypt_final_out_params

```
ssp_err_t sf_crypto_cipher_rsa_validate_encrypt_final_out_params ( sf_crypto_cip
her_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t
*const p_data_out )
```

6.14.75.1 Brief description

Sub-routine for Crypto Cipher Framework to validate the output data bufferfor final RSA encryption.

6.14.75.2 Detailed description

Table 285:Return values

Name	Description
SSP_SUCCESS	Validation operation was successful.
SSP_ERR_INVALID_SIZE	The out buffer is inadequate to hold the output data.
SSP_ERR_INTERNAL	An internal error occurred during processing.

6.14.75.3 Function steps

- Get the encryption block size.
- If the output data buffer length is insufficient to hold the encryption data return error.

6.14.76 sf_crypto_cipher_rsa_final_input_buffer_check

```
ssp_err_t sf_crypto_cipher_rsa_final_input_buffer_check ( sf_crypto_cipher_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in )
```

6.14.76.1 Brief description

Sub-routine for Crypto Cipher Framework to call the appropriate routine for final encryption based on the algorithm for the cipherFinal operation. This function is called by SF_CRYPTO_CIPHER_CipherFinal.

6.14.76.2 Detailed description

Table 286:Return values

Name	Description
SSP_SUCCESS	The cipher update operation was successful.
SSP_ERR_INVALID_ARGUMENT	One or more input parameters are invalid.

6.14.76.3 Function steps

- If input data is NULL and no data has been buffered through an update operation, return error This applies to both encryption and decryption operations. Hence check at the top before branching.
- Check if input data length is non zero but buffer is NULL

6.14.77 sf_crypto_cipher_rsa_final

```
ssp_err_t sf_crypto_cipher_rsa_final ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.77.1 Brief description

Routine to process the final encryption / decryption operation for RSA. This function is called by SF_CRYPTO_CIPHER_CipherFinal.

6.14.77.2 Detailed description

End of function sf_crypto_cipher_rsa_final_input_buffer_check

Table 287:Return values

Name	Description
SSP_SUCCESS	The cipher update operation was successful.
SSP_ERR_UNSUPPORTED	The module does not support the algorithm bbased on the key type specified by the user.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.14.77.3 Function steps

- Clean up the data in the context buffer before exiting.

6.14.78 sf_crypto_cipher_rsa_context_buffer_pointer_data_zeroise

```
 sf_crypto_cipher_rsa_context_buffer_pointer_data_zeroise ( sf_crypto_cipher_ins
tance_ctrl_t  *const p_ctrl )
```

6.14.78.1 Detailed description

A subroutine to zeroise the memory pointed to by the fields within the context buffer. NOTE: the buffer sizes pointed to by the original allocation should NOT be cleared. That size will be used when freeing up the memory.

Table 288:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the Cipher framework module control block.

6.14.79 sf_crypto_cipher_instance_rsa_memory_deallocate

```
ssp_err_t sf_crypto_cipher_instance_rsa_memory_deallocate ( sf_crypto_cipher_ins
tance_ctrl_t  *const p_ctrl )
```

6.14.79.1 Detailed description

A subroutine to release the memory allocated for context buffer. All the data pointed to by the context buffer is first zeroised and freed. Next all elements of the context buffer are zeroised and pointers are set to NULL.

Table 289:Parameters

Name	Direction	Description
p_ctrl	inout	The control block for the Cipher module.

6.14.79.2 Function steps

- First zeroise the data pointed to from the context buffer and then release the memory resources used for this instance
- Release the memory allocated for Partial Block
- Release the memory allocated for Key
- Zeroise the context buffer and set all pointers to NULL
- Release the memory allocated for the context buffer

6.14.80 sf_crypto_cipher_rsa_zeroise_context_buffer

```
 sf_crypto_cipher_rsa_zeroise_context_buffer ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl )
```

6.14.80.1 Detailed description

A subroutine to init / reset the RSA context buffer. All elements are zeroised and pointers are set to NULL.

Table 290:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the Cipher control block structure passed in at open().

6.14.81 sf_crypto_cipher_get_rsa_pvt_key_size_bytes

```
ssp_err_t sf_crypto_cipher_get_rsa_pvt_key_size_bytes ( sf_crypto_key_type_t  ke
y_type ,  sf_crypto_key_size_t  key_size ,  uint32_t * key_size_bytes )
```

6.14.81.1 Detailed description

End of function sf_crypto_cipher_rsa_zeroise_context_buffer A subroutine to calculate the RSA key size in bytes.

Table 291:Parameters

Name	Direction	Description
key_type	in	The enum for key type.
key_size	in	The enum for key size.
key_size_bytes	inout	The size of the private key in bytes.

Table 292:Return values

Name	Description
SSP_SUCCESS	Key size in bytes returned successfully.
SSP_ERR_INTERNAL	Internal error occurred during processing.
SSP_ERR_INVALID_ARGUMENT	One of the input arguments is invalid.

6.14.82 sf_crypto_cipher_get_rsa_public_key_size_bytes

```
ssp_err_t sf_crypto_cipher_get_rsa_public_key_size_bytes ( sf_crypto_key_size_t
 key_size ,   uint32_t * key_size_bytes )
```

6.14.82.1 Detailed description

A subroutine to calculate the RSA Public key size in bytes.

Table 293:Parameters

Name	Direction	Description
key_size	in	enum for key size.
key_size_bytes	inout	key size in bytes filled on return.

Table 294:Return values

Name	Description
SSP_SUCCESS	Public key is computed and returned successfully.

Table 294:Return values (Continued)

Name	Description
SSP_ERR_INTERNAL	An error occurred during processing.

6.14.83 sf_crypto_cipher_get_rsa_modulus_size_bits

```
ssp_err_t sf_crypto_cipher_get_rsa_modulus_size_bits ( sf_crypto_key_size_t  key
_size ,   uint32_t * key_size_bits )
```

6.14.83.1 Detailed description

A subroutine to calculate the RSA modulus size in bits.

Table 295:Parameters

Name	Direction	Description
key_size	in	The key size of enum type sf_crypto_key_size_t
key_size_bits	inout	The RSA Modulus size in bits for the given RSA Key size.

Table 296:Return values

Name	Description
SSP_SUCCESS	The modulus size is returned successfully.
SSP_ERR_INVALID_ARGUMENT	The key_size input param is invalid.

6.14.84 sf_crypto_cipher_get_rsa_block_size_bytes

```
ssp_err_t sf_crypto_cipher_get_rsa_block_size_bytes ( sf_crypto_key_size_t  key_
size ,   uint32_t * block_size_bytes )
```

6.14.84.1 Detailed description

A subroutine to calculate the RSA encryption block size / modulus size in bytes. The block size is same as the size of the RSA modulus.

Table 297:Parameters

Name	Direction	Description
key_size	in	The key size of enum type sf_crypto_key_size_t

Table 298:Return values

Name	Description
block_size_bytes	The RSA Block size in bytes for the given RSA Key size.

6.14.85 sf_crypto_cipher_rsa_get_modulus_block_sizes

```
ssp_err_t sf_crypto_cipher_rsa_get_modulus_block_sizes ( sf_crypto_cipher_instan
ce_ctrl_t  *const p_ctrl ,   uint32_t * key_size_bits ,   uint32_t
* block_size_bytes )
```

6.14.86 sf_crypto_cipher_rsa_encrypt_update

```
ssp_err_t sf_crypto_cipher_rsa_encrypt_update ( sf_crypto_cipher_instance_ctrl_t
  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.86.1 Detailed description

A routine to handle the cipherUpdate - encrypt operation for RSA.

Input parameters validation - done at the entry nothing to do here No output on update - so no checks for output buffer / length Collect input up to the block size for encryption when no padding is selected. Collect data up to block size -11 for encryption when padding is selected if it exceeds the above return error

Table 299:Parameters

Name	Direction	Description
p_ctrl	inout	The control block for the Cipher module.
p_data_in	in	The pointer to the input data (structure with pointer to data and data length.)

Table 299:Parameters (Continued)

Name	Direction	Description
p_data_out	in	The pointer to the input data (structure with pointer to data and data length.)

Table 300:Return values

Name	Description
SSP_ERR_INTERNAL	Internal error occurred during processing.
SSP_SUCCESS	Update operation was completed successfully.

6.14.86.2 Function steps

- since no data is output, set output data length to 0.

6.14.87 sf_crypto_cipher_rsa_decrypt_update

```
ssp_err_t sf_crypto_cipher_rsa_decrypt_update ( sf_crypto_cipher_instance_ctrl_t
  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.87.1 Detailed description

End of function sf_crypto_cipher_rsa_encrypt_update A routine to handle the cipherUpdate - decrypt operation for RSA.

Input parameters validation - done at the entry nothing to do here No output on update - so no checks for output buffer / length collect input up to the block size for decryption. if it exceeds the above return error

Table 301:Parameters

Name	Direction	Description
p_ctrl	inout	The control block for the Cipher module.
p_data_in	in	The pointer to the input data (structure with pointer to data and data length).

Table 301:Parameters (Continued)

Name	Direction	Description
p_data_out	in	The pointer to the input data (structure with pointer to data and data length).

Table 302:Return values

Name	Description
SSP_SUCCESS	The validation of the init parameters for the RSA cipher operation was successful.
SSP_ERR_MESSAGE_TOO_LONG	The input data / message is too long for the given operation..
SSP_ERR_INVALID_CALL	This call is invalid and no operation can occur.

6.14.88 sf_crypto_cipher_rsa_init_validate_padding_scheme

```
ssp_err_t sf_crypto_cipher_rsa_init_validate_padding_scheme ( sf_crypto_cipher_padding_scheme_t  padding_scheme )
```

6.14.88.1 Detailed description

End of function sf_crypto_cipher_rsa_decrypt_update A subroutine to validate the parameters for the RSA padding scheme.

Table 303:Parameters

Name	Direction	Description
padding_scheme	in	Specifies RSA padding scheme

Table 304:Return values

Name	Description
SSP_SUCCESS	The validation of the init parameters for the RSA cipher operation was successful.
SSP_ERR_INVALID_ARGUMENT	At least one of the input parameters are invalid.

6.14.89 sf_crypto_cipher_rsa_init_validate

```
ssp_err_t sf_crypto_cipher_rsa_init_validate ( sf_crypto_cipher_instance_ctrl_t
*const p_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_rsa_init_params_t  * p_rsa_params )
```

6.14.89.1 Detailed description

End of function sf_crypto_cipher_rsa_init_validate_padding_scheme A subroutine to validate the parameters for the RSA cipherInit operation.

Table 305:Parameters

Name	Direction	Description
p_ctrl	inout	The control block for the Cipher module.
cipher_operation_mode	in	The operation mode of enum type sf_crypto_cipher_op_mode_t.
p_key	in	The key for the subsequent cipher operation.
p_rsa_params	in	The parameters specific to the RSA algorithm used for the Cipher operation.

Table 306:Return values

Name	Description
SSP_SUCCESS	The validation of the init parameters for the RSA cipher operation was successful.
SSP_ERR_INVALID_ARGUMENT	At least one of the input parameters are invalid.

6.14.89.2 Function steps

- Validate padding scheme
- Decryption is only supported with the private key.
- Encryption is only supported with the public key.
- Validate key length and buffer

6.14.90 sf_crypto_cipher_initialize_rsa_instance

```
ssp_err_t sf_crypto_cipher_initialize_rsa_instance ( sf_crypto_cipher_instance_ctrl_t  * p_ctrl ,  sf_crypto_cipher_cfg_t  const *const p_cfg )
```

6.14.90.1 Brief description

Allocates memory for the instance and opens the underlying HAL instance.

6.14.90.2 Detailed description

Table 307:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Cipher Framework instance control block structure.
p_cfg	in	Pointer to the configuration structure for Cipher module .

Table 308:Return values

Name	Description
SSP_SUCCESS	The module instantiated successfully.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes or HAL driver for other possible return codes or causes. This function calls: sf_crypto_cipher_instance_memory_allocate sf_crypto_cipher_hal_open

6.14.91 sf_crypto_cipher_deinitialize_rsa_instance

```
ssp_err_t sf_crypto_cipher_deinitialize_rsa_instance ( sf_crypto_cipher_instance_ctrl_t  * p_ctrl )
```

6.14.91.1 Brief description

closes the underlying HAL instance and releases the memory for the instance.

6.14.91.2 Detailed description

Table 309:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Cipher Framework instance control block structure.

Table 310:Return values

Name	Description
SSP_SUCCESS	The module instantiated successfully.
SSP_ERR_TIMEOUT	Was unable to allocate the memory within the specified time to wait.
SP_ERR_OUT_OF_MEMORY	Requested size is zero or larger than the pool.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes or HAL driver for other possible return codes or causes. This function calls: sf_crypto_cipher_instance_memory_allocate sf_crypto_cipher_hal_open

6.14.91.3 Function steps

- First close the Framework TRNG instance.
- Then close the HAL RSA instance.

6.14.92 SF_CRYPTO_CIPHER_Open

```
ssp_err_t SF_CRYPTO_CIPHER_Open ( sf_crypto_cipher_ctrl_t  *const p_api_ctrl ,
 sf_crypto_cipher_cfg_t  const *const p_cfg )
```

6.14.92.1 Brief description

SSP Crypto Cipher Framework Open operation.

6.14.92.2 Detailed description

The SF_CRYTO_CIPHER_Open function: Allocates memory required for the cipher operations based on the configuration parameters. Acquires lock for the shared crypto resources. Gets the interface to the HAL driver based on the config parameters. Calls the .open function of the HAL API. On successful open, the module status is updated as such. The shared resources are unlocked before exit.

Table 311:Return values

Name	Description
SSP_SUCCESS	The module was successfully opened.
SSP_ERR_ASSERTION	One or more input parameters maybe NULL.
SSP_ERR_INVALID_ARGUMENT	An invalid argument is used.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common Module has yet been opened.
SSP_ERR_ALREADY_OPEN	The module has been already opened.
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.
Others	Crypto HAL module returned an error or resource lock/unlock failed.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex or to create an internal thread. See Common Error Codes for other possible return codes.

6.14.92.3 Function steps

- Get a Crypto common control block and the interface.
- Get the pointers to TRNG control and API structures from the instance pointed to by the config structure.
- Check if the Crypto Framework has been opened. If not yet opened, return an error.
- Check if the Cipher module has been already opened. If opened, return an error.
- Validate the cfg parameters
- Fill the control block with the validated cfg parameters
- Determine and fill the algorithm type in the control block.

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during open. The HAL interfaceGet API is also called which does not access HW either. If HW will be accessed through the HAL driver, lock should be acquired.
- Allocate memory resources used by this framework instance and open HAL driver

6.14.93 SF_CRYPTO_CIPHER_Close

```
ssp_err_t SF_CRYPTO_CIPHER_Close ( sf_crypto_cipher_ctrl_t  *const p_api_ctrl )
```

6.14.93.1 Brief description

SSP Crypto Cipher Framework Close operation.

6.14.93.2 Detailed description

End of function SF_CRYPTO_CIPHER_Open

Table 312:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed.
SSP_ERR_ASSERTION	One or more input parameters maybe NULL.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.14.93.3 Function steps

- Get a Crypto common control block and the interface.
- Check if the Crypto Framework Cipher module has been opened. If not yet opened, return an error.
- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during close. If HW will be accessed through the HAL driver, lock should be acquired.
- Free the memory allocated for this instance and close the HAL driver.

6.14.94 SF_CRYPTO_CIPHER_VersionGet

```
ssp_err_t SF_CRYPTO_CIPHER_VersionGet ( ssp_version_t  *const p_version )
```

6.14.94.1 Brief description

Gets driver version based on compile time macros.

6.14.94.2 Detailed description

End of function SF_CRYPTO_CIPHER_Close

Table 313:Return values

Name	Description
SSP_SUCCESS	The version is returned successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

6.14.95 SF_CRYPTO_CIPHER_CipherInit

```
ssp_err_t SF_CRYPTO_CIPHER_CipherInit ( sf_crypto_cipher_ctrl_t
*const p_api_ctrl ,  sf_crypto_cipher_op_mode_t  cipher_operation_mode ,
 sf_crypto_data_handle_t  const *const p_key ,
 sf_crypto_cipher_algorithm_init_params_t  *const p_algorithm_specific_params )
```

6.14.95.1 Brief description

SSP Crypto Framework Cipher Init operation. The input parameters initialize the cipher operation. Some of the parameters are algorithm specific. The input parameters are validated and then copied into the context buffer. Refer to sf_crypto_cipher_aes_init_params_t or sf_crypto_cipher_rsa_init_params_t.

6.14.95.2 Detailed description

End of function SF_CRYPTO_KEY_VersionGet

Table 314:Return values

Name	Description
SSP_SUCCESS	The module is initialized for cipher operation successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
SSP_ERR_INVALID_ARGUMENT	One of the input parameters is invalid.

Table 314:Return values (Continued)

Name	Description
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.
Others	See Common Error Codes for other possible return codes.

6.14.95.3 Function steps

- Validate cipher operation mode
- Check if the module can transition to the initialized state.
- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during init. If HW will be accessed through the HAL driver, lock should be acquired.
- Do algorithm specific init
- Mark the module status as 'Initialized'.

6.14.96 SF_CRYPTO_CIPHER_CipherUpdate

```
ssp_err_t SF_CRYPTO_CIPHER_CipherUpdate ( sf_crypto_cipher_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.96.1 Brief description

SSP Crypto Cipher Framework - Encrypts / Decrypts the input data and writes the cipher-text or plain-text to the output buffer. Can be called multiple times for chunks of data.

6.14.96.2 Detailed description

End of function SF_CRYPTO_CIPHER_CipherInit

Table 315:Return values

Name	Description
SSP_SUCCESS	The function updated a cipher operation successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.

Table 315:Return values (Continued)

Name	Description
SSP_ERR_UNSUPPORTED	Key types / algorithms are not supported for the MCU part.
SSP_ERR_INVALID_CALL	Function call was made if the module state had not yet transitioned to SF_CRYPTO_CIPHER_STATE_INITIALIZED.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

NOTE:

NOTE: 1. This is a blocking call.

NOTE: 2. The input and output buffers have to be WORD aligned.

NOTE: 3. On encryption and decryption operations, block alignment considerations may require that the number of

NOTE: bytes written into output buffer be larger or smaller than input data length or even 0.

NOTE: 4. The output data area must not partially overlap the input data area such that the input data is modified before

NOTE: it is used else incorrect output may result.

NOTE: 5. If the length of input data is 0 this method does nothing.

NOTE: 6. For all Cipher operations cipherFinal() must be called to finalize the operation.

NOTE: 7. For RSA Operations, no data is output unless cipherFinal() is called.

6.14.96.3 Function steps

- If input data length is 0 - do nothing return success.
- The status will be set to 'updated' only when data is processed.
- Get a Crypto Framework common control block and the interface.
- Check if the Crypto Cipher Framework is in the correct state to transition to do the update operation. If module is not opened or initialized, return an error.
- Acquire the lock from the common module to access the Crypto HAL driver.
- If update processing has succeeded return the error from unlock.

6.14.97 SF_CRYPTO_CIPHER_CipherAadUpdate

```
ssp_err_t SF_CRYPTO_CIPHER_CipherAadUpdate ( sf_crypto_cipher_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  const *const p_aad )
```

6.14.97.1 Brief description

Updates Additional Authenticated Data. This is applicable only to AES GCM. Can be called multiple times for chunks of data.

6.14.97.2 Detailed description

End of function SF_CRYPTO_CIPHER_CipherUpdate

Table 316:Return values

Name	Description
SSP_SUCCESS	The function updated the AAD successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.

Table 316:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
SSP_ERR_UNSUPPORTED	Key types / algorithms are not supported for the MCU part.
SSP_ERR_INVALID_CALL	Function call was made if the module state had not yet transitioned to SF_CRYPTO_CIPHER_STATE_INITIALIZED.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

NOTE:

NOTE: 1. This is a blocking call.

NOTE: 2. This function has to be called before any call to cipherUpdate / cipherFinal is made.

NOTE: 3. The data buffer must be WORD aligned.

6.14.97.3 Function steps

- do nothing - similar to the cipherUpdate API
- Get a Crypto Framework common control block and the interface.
- Check if the Crypto Cipher Framework is in the correct state to execute this operation. If module is not opened or initialized, return an error.
- Acquire the lock from the common module to access the Crypto HAL driver.
- AAD is optional so no need to track if it is updated.
- Unlock the module.
- if update processing has succeeded return the error from unlock.

6.14.98 SF_CRYPTO_CIPHER_CipherFinal

```
ssp_err_t SF_CRYPTO_CIPHER_CipherFinal ( sf_crypto_cipher_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  const *const p_data_in ,
 sf_crypto_data_handle_t  *const p_data_out )
```

6.14.98.1 Brief description

SSP Crypto Cipher Framework - Generates encrypted / decrypted output from all/last input data. This function processes any remaining input data buffered by one or more calls to the cipherUpdate()API as well as input data supplied in the input parameter. This function must be invoked to complete a cipher operation.

6.14.98.2 Detailed description

End of function SF_CRYPTO_CIPHER_CipherAadUpdate

Table 317:Return values

Name	Description
SSP_SUCCESS	The module updated a message Digest successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
SSP_ERR_UNSUPPORTED	Key types / algorithms are not supported for the MCU part.
SSP_ERR_INVALID_CALL	Function call was made if the module state had not yet transitioned to SF_CRYPTO_CIPHER_STATE_INITIALIZED or SF_CRYPTO_CIPHER_STATE_UPDATED.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

NOTE:

NOTE: 1. This is a blocking call.

NOTE: 2. On encryption and decryption operations, block alignment considerations may require that the number of

NOTE: bytes written into output buffer be larger or smaller than input data length or even 0.

NOTE: 3. The output data area must not partially overlap the input data area such that the input data is modified before

NOTE: it is used else incorrect output may result.

NOTE: 4. Except for GCM, if the length of input data is 0 and no input was provided through update, an error is returned.

NOTE: 5. On decryption operations the padding bytes are not written to p_data_out.p_data.

NOTE: 6. The input and output buffers must be WORD aligned.

6.14.98.3 Function steps

- Get a Crypto Framework common control block and the interface.
- Check if the Crypto Cipher Framework is in the correct state to execute this operation. If module is not opened or initialized, return an error.
- Acquire the lock from the common module to access to Crypto HAL driver.
- Mark the module status as 'Finalized'.
- Unlock the module.
- if final processing has succeeded return the error from unlock.

6.14.99 API Data

6.14.99.1 sf_crypto_cipher_mode_t

`sf_crypto_cipher_mode_t`

Detailed description

AES modes for the SSP Crypto Cipher Framework

Enumerated values

Name	Description
SF_CRYPTO_CIPHER_MODE_ECB	Electronic Code Book chaining mode, default for RSA.
SF_CRYPTO_CIPHER_MODE_CBC	Cipher Block Chaining.
SF_CRYPTO_CIPHER_MODE_CTR	Counter Mode.
SF_CRYPTO_CIPHER_MODE_XTS	XEX-based tweaked-codebook mode with ciphertext stealing.
SF_CRYPTO_CIPHER_MODE_GCM	Galois Counter Mode.

6.14.99.2 sf_crypto_cipher_op_mode_t

`sf_crypto_cipher_op_mode_t`

Detailed description

Operating mode for Cipher APIs

Enumerated values

Name	Description
SF_CRYPTO_CIPHER_OP_MODE_ENCRYPT	The operating mode is set to encryption.
SF_CRYPTO_CIPHER_OP_MODE_DECRYPT	The operating mode is set to decryption.

6.14.99.3 sf_crypto_cipher_padding_scheme_t

`sf_crypto_cipher_padding_scheme_t`

Detailed description

Padding mode to be used for for Cipher operation - encrypting/ decrypting input data

Enumerated values

Name	Description
SF_CRYPTO_CIPHER_PADDING_SCHEME_NO_PADDING	No padding scheme.
SF_CRYPTO_CIPHER_PADDING_SCHEME_PKCS7	PKCS#7 padding scheme - applicable only for AES operations.
SF_CRYPTO_CIPHER_PADDING_SCHEME_PKCS1_1_5	PKCS#1 v1.5 padding scheme - applicable only for RSA operations.

6.14.99.4 sf_crypto_cipher_algorithm_init_params_t

```
typedef void sf_crypto_cipher_algorithm_init_params_t
```

Detailed description

Algorithm specific parameters. Allocate an algorithm specific block to pass into the cipherInit API call. Implemented as

- sf_crypto_cipher_aes_init_params_t for AES
- sf_crypto_cipher_rsa_init_params_t for RSA.

6.14.99.5 sf_crypto_cipher_ctrl_t

```
typedef void sf_crypto_cipher_ctrl_t
```

Detailed description

SSP Crypto Cipher framework control block. Allocate an instance specific control block to pass into the SSP Crypto framework Cipher API calls. Implemented as

- sf_crypto_cipher_instance_ctrl_t

6.14.100 Extensions

6.14.100.1 sf_crypto_cipher_aes_init_params_t

sf_crypto_cipher_aes_init_params_t

Detailed description

AES Algorithm specific parameters for cipher operations

Variables

- sf_crypto_cipher_padding_scheme_t padding_scheme
- sf_crypto_data_handle_t * p_iv

  pointer to IV for the AES operation.

- sf_crypto_data_handle_t * p_auth_tag

  Pointer to the GCM Authentication Tag. Only tag length of SF_CRYPTO_CIPHER_AES_GCM_TAG_LENGTH_16_BYTES is supported.

6.14.100.2 sf_crypto_cipher_rsa_init_params_t

sf_crypto_cipher_rsa_init_params_t

Detailed description

RSA Algorithm specific parameters for cipher operations

Variables

- sf_crypto_cipher_padding_scheme_t padding_scheme

6.14.100.3 sf_crypto_cipher_cfg_t

sf_crypto_cipher_cfg_t

Detailed description

Configuration structure for the SSP Crypto Cipher framework Cipher chaining mode for RSA operations is not applicable and can be set to ECB

Variables

- sf_crypto_key_type_t key_type

  Key type for cipher operation.

- sf_crypto_key_size_t key_size

  Key size for cipher operation.

- sf_crypto_cipher_mode_t cipher_chaining_mode

  Chaining mode specified for the cipher operation.

- sf_crypto_instance_t * p_lower_lvl_crypto_common

  Pointer to a Crypto Framework common instance.

- sf_crypto_trng_instance_t * p_lower_lvl_crypto_trng

  Pointer to a Crypto Framework TRNG instance.

- void const * p_extend

  Future extension for hardware specific settings.

6.14.100.4 sf_crypto_cipher_api_t

sf_crypto_cipher_api_t

Detailed description

Shared Interface definition for the SSP Crypto Cipher framework module

6.14.100.5 sf_crypto_cipher_instance_t

sf_crypto_cipher_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_crypto_cipher_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_crypto_cipher_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_crypto_cipher_api_t const * p_api

  Pointer to the API structure for this instance.

6.15 SSP Crypto HASH Framework Interface

Interface definition for Synergy Crypto HASH Framework module.

6.15.1 Summary

This is the Interface of SF_CRYPTO_HASH Framework module.
SF_CRYPTO_HASH Interface description:

6.15.2 Typedefs

- sf_crypto_hash_t
- sf_crypto_hash_ctrl_t

6.15.3 Defines

- #define SF_CRYPTO_HASH_API_VERSION_MAJOR

  Initial value: `(1U)`

  The API version of SSP Crypto HASH Framework
- #define SF_CRYPTO_HASH_API_VERSION_MINOR

  Initial value: `(2U)`

- #define SF_CRYPTO_HASH_MESSAGE_DIGEST_SIZE_MD5

  Initial value: `(16U)`

  Message Digest size for SHA1. Message Digest size for each HASH algorithm in bytes
- #define SF_CRYPTO_HASH_MESSAGE_DIGEST_SIZE_SHA1

  Initial value: `(20U)`

  Message Digest size for SHA1.
- #define SF_CRYPTO_HASH_MESSAGE_DIGEST_SIZE_SHA224

  Initial value: `(28U)`

  Message Digest size for SHA224.
- #define SF_CRYPTO_HASH_MESSAGE_DIGEST_SIZE_SHA256

  Initial value: `(32U)`

  Message Digest size for SHA256.

6.15.4 API Data

6.15.4.1 sf_crypto_hash_state_t

`sf_crypto_hash_state_t`

Detailed description

State codes for the SSP SSP Crypto HASH Framework

Enumerated values

Name	Description
SF_CRYPTO_HASH_CLOSED	The module is closed.
SF_CRYPTO_HASH_OPENED	The module is opened. The initial message digest is not yet generated.
SF_CRYPTO_HASH_DIGEST_INITIALIZED	Message digest is initialized.
SF_CRYPTO_HASH_DIGEST_UPDATED	Message digest is updated.

6.15.4.2 sf_crypto_hash_type_t

`sf_crypto_hash_type_t`

Detailed description

HASH algorithm types for the SSP SSP Crypto HASH Framework

Enumerated values

Name	Description
SF_CRYPTO_HASH_ALGORITHM_MD5	MD5 algorithm type.
SF_CRYPTO_HASH_ALGORITHM_SHA1	SHA-1 algorithm type.
SF_CRYPTO_HASH_ALGORITHM_SHA224	SHA-224 algorithm type.
SF_CRYPTO_HASH_ALGORITHM_SHA256	SHA-256 algorithm type.

6.15.4.3 sf_crypto_hash_t

```
typedef sf_crypto_data_handle_t sf_crypto_hash_t
```

6.15.4.4 sf_crypto_hash_ctrl_t

```
typedef void sf_crypto_hash_ctrl_t
```

Detailed description

SSP Crypto framework control block. Allocate an instance specific control block to pass into the SSP Crypto framework API calls. Implemented as

- sf_crypto_instance_ctrl_t

6.15.5 Extensions

6.15.5.1 sf_crypto_hash_context_t

sf_crypto_hash_context_t

Detailed description

HASH internal context structure for a message digest

Variables

- uint8_t * p_message_digest

  Intermediate digest stored buffer - WORD aligned.

- uint8_t * p_message_digest_org

  Originally allocated buffer - may not be WORD aligned.

- uint8_t * p_message_buffer

  Intermediate message data stored buffer - - WORD aligned.
- uint8_t * p_message_buffer_org

  IOriginally allocated buffer - may not be WORD aligned.
- uint64_t message_bytes

  Number of bytes from user data processed.
- uint32_t message_bytes_buffered

  Number of bytes buffered in the message data stored buffer.

6.15.5.2 sf_crypto_hash_callback_args_t

sf_crypto_hash_callback_args_t

Detailed description

Callback arguments for the SSP Crypto HASH framework

Variables

- ssp_err_t error

  Error code if SF_CRYPTO_EVENT_ERROR.

6.15.5.3 sf_crypto_hash_cfg_t

sf_crypto_hash_cfg_t

Detailed description

Configuration structure for the SSP SSP Crypto HASH framework

Variables

- sf_crypto_hash_type_t hash_type

  HASH algorithm type.
- sf_crypto_instance_t * p_lower_lvl_crypto_common

  Pointer to a Crypto Framework common instance.
- hash_instance_t * p_lower_lvl_instance

  pointer to HASH lower-level module instance
- void * p_extend

  Pointer to an optional configuration for Crypto HAL module.

6.15.5.4 sf_crypto_hash_api_t

sf_crypto_hash_api_t

Detailed description

Shared Interface definition for the SSP SSP Crypto framework

6.15.5.5 sf_crypto_hash_instance_t

sf_crypto_hash_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_crypto_hash_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_crypto_hash_cfg_t * p_cfg

  Pointer to the configuration structure for this instance.
- sf_crypto_hash_api_t const * p_api

  Pointer to the API structure for this instance.

6.16 SSP Crypto TRNG Framework Interface

Interface definition for Synergy Crypto TRNG Framework module.
Interface declaration for Synergy Crypto TRNG Framework module.

6.16.1 Summary

This is the Interface of SF_CRYPTO_TRNG Framework module.
SF_CRYPTO_TRNG Interface description: Crypto Framework

6.16.2 Summary

This is the Interface declarations of SF_CRYPTO_TRNG Framework module.
SF_CRYPTO_TRNG Interface declaration: Crypto Framework

6.16.3 Functions

- SF_CRYPTO_TRNG_Open
- SF_CRYPTO_TRNG_Close
- SF_CRYPTO_TRNG_RandomNumberGenerate
- SF_CRYPTO_TRNG_VersionGet

6.16.4 Variables

- sf_crypto_trng_version
- g_sf_crypto_trng_api

6.16.5 Typedefs

- sf_crypto_trng_ctrl_t

6.16.6 Defines

- #define SF_CRYPTO_TRNG_API_VERSION_MAJOR

  Initial value: `(1U)`

  The API version of SSP Crypto Framework
- #define SF_CRYPTO_TRNG_API_VERSION_MINOR

  Initial value: `(0U)`
- #define WORDS_IN_SINGLE_HW_PROC_CALL

  Initial value: `(4)`
- #define BYTES_IN_WORD

  Initial value: `(4)`
- #define BYTES_IN_SINGLE_HW_PROC_CALL

  Initial value: `((BYTES_IN_WORD) * (WORDS_IN_SINGLE_HW_PROC_CALL))`
- #define EXTRA_BUFFER_SIZE_WORDS

  Initial value: `((BYTES_IN_SINGLE_HW_PROC_CALL) / (BYTES_IN_WORD))`

6.16.7 SF_CRYPTO_TRNG_Open

```
ssp_err_t SF_CRYPTO_TRNG_Open ( sf_crypto_trng_ctrl_t  *const p_api_ctrl ,
 sf_crypto_trng_cfg_t  const *const p_cfg )
```

6.16.7.1 Brief description

SSP Crypto TRNG Framework Open operation.

6.16.7.2 Detailed description

Table 318:Return values

Name	Description
SSP_SUCCESS	The module was successfully opened
SSP_ERR_ASSERTION	One or more input parameters are NULL.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto framework common module has not been opened before calling this API.
SSP_ERR_ALREADY_OPEN	The module has already been opened.
Others	Crypto HAL module returned an error or resource lock/unlock failed. See Common Error Codes for other possible return codes.

6.16.7.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during open. In the future, if HW will be accessed through the HAL driver; lock should be acquired.

6.16.8 SF_CRYPTO_TRNG_Close

```
ssp_err_t SF_CRYPTO_TRNG_Close ( sf_crypto_trng_ctrl_t  *const p_api_ctrl )
```

6.16.8.1 Brief description

SSP Crypto TRNG Framework Close operation.

6.16.8.2 Detailed description

Table 319:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed

Table 319:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One or more input parameters are NULL.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Common module has not been opened.
SSP_ERR_NOT_OPEN	The module has not been opened before calling this API.
Others	Crypto HAL module returned an error or resource lock/unlock failed. See Common Error Codes for other possible return codes.

6.16.8.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during close. In the future, if HW will be accessed through the HAL driver; lock should be acquired.

6.16.9 SF_CRYPTO_TRNG_RandomNumberGenerate

```
ssp_err_t SF_CRYPTO_TRNG_RandomNumberGenerate ( sf_crypto_trng_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  *const p_random_number_buff )
```

6.16.9.1 Brief description

SSP Crypto TRNG Framework True Random Generation operation.

6.16.9.2 Detailed description

Table 320:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed.
SSP_ERR_NOT_OPEN	The module has not been opened before calling this API.
SSP_ERR_ASSERTION	One or more input parameters are NULL.
Others	Crypto HAL module returned an error or resource lock/unlock failed. See Common Error Codes for other possible return codes.

6.16.10 SF_CRYPTO_TRNG_VersionGet

```
ssp_err_t SF_CRYPTO_TRNG_VersionGet ( ssp_version_t  *const p_version )
```

6.16.10.1 Brief description

Sets TRNG Framework Code and API version based on compile time macros.

6.16.10.2 Detailed description

Table 321:Return values

Name	Description
SSP_SUCCESS	Successful close
SSP_ERR_ASSERTION	The parameter p_version is NULL.

6.16.11 g_sf_crypto_trng_api

```
sf_crypto_trng_api_t::g_sf_crypto_trng_api
```

  Pointer to the API structure for this instance.

6.17 SSP Crypto Key Framework Interface

Interface declaration for Synergy Crypto Key Framework module for AES.
Interface declaration for Synergy Crypto Key Framework module.
Interface declaration for Synergy Crypto Key Framework module for RSA.
Interface declaration for Synergy Crypto Key Framework module for ECC.

6.18 SSP Crypto Key Installation Framework Interface

Interface definition for Synergy Crypto Key Installation Framework module.

6.18.1 Functions

- SF_CRYPTO_KEY_INSTALLATION_Open
- SF_CRYPTO_KEY_INSTALLATION_Close
- SF_CRYPTO_KEY_INSTALLATION_KeyInstall
- SF_CRYPTO_KEY_INSTALLATION_VersionGet

6.18.2 Defines

- #define SF_CRYPTO_KEY_INSTALLATION_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  The API version of SSP Crypto Key Installation Framework

- #define SF_CRYPTO_KEY_INSTALLATION_CODE_VERSION_MINOR

  Initial value: `(0U)`

6.18.3 SF_CRYPTO_KEY_INSTALLATION_Open

```
ssp_err_t SF_CRYPTO_KEY_INSTALLATION_Open ( sf_crypto_key_installation_ctrl_t
*const p_api_ctrl , sf_crypto_key_installation_cfg_t const *const p_cfg )
```

6.18.3.1 Brief description

SSP Crypto Key Installation Framework Open operation.

6.18.3.2 Detailed description

Table 322:Return values

Name	Description
SSP_SUCCESS	The module was successfully opened.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common Module has yet been opened.
SSP_ERR_ALREADY_OPEN	The module has been already opened.
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.
Others	Crypto HAL module returned an error. See Common Error Codes for other possible return codes.

6.18.3.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during open. The HAL interfaceGet API is also called which does not access HW either. In the future, if HW will be accessed through the HAL driver; lock should be acquired.

6.18.4 SF_CRYPTO_KEY_INSTALLATION_Close

```
ssp_err_t SF_CRYPTO_KEY_INSTALLATION_Close ( sf_crypto_key_installation_ctrl_t
*const p_api_ctrl )
```

6.18.4.1 Brief description

SSP Crypto Key Installation Framework Close operation.

6.18.4.2 Detailed description

Table 323:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
Others	Crypto HAL module returned an error. See Common Error Codes for other possible return codes.

6.18.4.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during close. In the future, if HW will be accessed through the HAL driver; lock should be acquired.

6.18.5 SF_CRYPTO_KEY_INSTALLATION_KeyInstall

```
ssp_err_t SF_CRYPTO_KEY_INSTALLATION_KeyInstall (  sf_crypto_key_installation_ct
rl_t *const p_api_ctrl ,  sf_crypto_data_handle_t  *const p_user_key_input ,
 sf_crypto_data_handle_t  *const p_install_key_input ,  sf_crypto_data_handle_t
* p_key_data_out )
```

6.18.5.1 Brief description

SSP Crypto Framework Key Installation operation.

6.18.5.2 Detailed description

Table 324:Return values

Name	Description
SSP_SUCCESS	The module created a key successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.

Table 324:Return values (Continued)

Name	Description
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.18.6 SF_CRYPTO_KEY_INSTALLATION_VersionGet

```
ssp_err_t SF_CRYPTO_KEY_INSTALLATION_VersionGet ( ssp_version_t
*const p_version )
```

6.18.6.1 Brief description

Gets driver version based on compile time macros.

6.18.6.2 Detailed description

Table 325:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

6.18.7 Extensions

6.18.7.1 sf_crypto_key_installation_instance_ctrl_t

sf_crypto_key_installation_instance_ctrl_t

Detailed description

SSP Crypto Key Installation Framework instance control block

Variables

- sf_crypto_key_installation_state_t status

  Module status.
- sf_crypto_key_type_t key_type

  Type of key to be installed.
- sf_crypto_key_size_t key_size

  Size of key to be installed.

- sf_crypto_instance_ctrl_t * p_lower_lvl_common_ctrl

  Pointer to the Crypto Framework Common instance.
- sf_crypto_api_t * p_lower_lvl_common_api

  Pointer to the Crypto Framework Common instance.
- void * p_lower_lvl_instance

  Pointer to HAL KeyInstall Crypto module instance structure.

6.19 SSP Crypto Signature Framework Interface

Interface definition for Synergy Crypto Signature Framework module.
Common declaration for Synergy Crypto Signature Framework module.
Interface declaration for Synergy Crypto Signature Framework module.
Interface declaration for Synergy Crypto Signature Framework module - RSA specific.
SF_CRYPTO_SIGNATURE Interface description: Crypto Framework

6.19.1 Functions

- sf_crypto_signature_key_size_config_rsa
- sf_crypto_signature_open_rsa
- sf_crypto_signature_close_rsa
- sf_crypto_signature_context_init_rsa
- sf_crypto_signature_sign_update_rsa
- sf_crypto_signature_verify_update_rsa
- sf_crypto_signature_sign_final_rsa
- sf_crypto_signature_verify_final_rsa

- SF_CRYPTO_SIGNATURE_VerifyUpdate
- SF_CRYPTO_SIGNATURE_SignFinal
- SF_CRYPTO_SIGNATURE_VerifyFinal
- SF_CRYPTO_SIGNATURE_VersionGet
- sf_crypto_signature_validate_sign_operation_state_transition
- sf_crypto_signature_validate_verify_operation_state_transition

6.19.2 Defines

- #define SF_CRYPTO_SIGNATURE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  The API version of SSP Crypto Signature Framework
- #define SF_CRYPTO_SIGNATURE_CODE_VERSION_MINOR

  Initial value: `(0U)`

6.19.3 sf_crypto_signature_key_size_config_rsa

```
ssp_err_t sf_crypto_signature_key_size_config_rsa ( sf_crypto_signature_cfg_t
const *const p_cfg )
```

6.19.3.1 Brief description

Function for Crypto Signature Framework to check configuration params - Key size. This function is called by sf_crypto_signature_validate_config().

6.19.3.2 Detailed description

Table 326:Parameters

Name	Direction	Description
p_cfg	in	Pointer to sf_crypto_signature_cfg_t configuration structure.

Table 327:Return values

Name	Description
SSP_SUCCESS	Valid RSA Key size.
SSP_ERR_INVALID_ARGUMENT	Invalid RSA Key size.

6.19.4 sf_crypto_signature_open_rsa

```
ssp_err_t sf_crypto_signature_open_rsa ( sf_crypto_signature_instance_ctrl_t
*const p_ctrl ,  sf_crypto_signature_cfg_t  const *const p_cfg )
```

6.19.4.1 Brief description

Function for Crypto Signature Framework to open the RSA HAL driver. This function is called by sf_crypto_signature_hal_open().

6.19.4.2 Detailed description

Table 328:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.
p_cfg	in	Pointer to sf_crypto_signature_cfg_t configuration structure.

Table 329:Return values

Name	Description
SSP_SUCCESS	The module was successfully opened.
SSP_ERR_INTERNAL	Critical internal error.
Others	Crypto RSA module returned an error. See Common Error Codes for other possible return codes.

6.19.5 sf_crypto_signature_close_rsa

```
ssp_err_t sf_crypto_signature_close_rsa ( sf_crypto_signature_instance_ctrl_t
* p_ctrl )
```

6.19.5.1 Brief description

Function for Crypto Signature Framework to close the RSA HAL driver. This function is called by sf_crypto_signature_hal_close().

6.19.5.2 Detailed description

Table 330:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.

Table 331:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed.
SSP_ERR_INTERNAL	Critical internal error.
Others	Crypto RSA module returned an error. See Common Error Codes for other possible return codes.

6.19.6 sf_crypto_signature_context_init_rsa

```
ssp_err_t sf_crypto_signature_context_init_rsa ( sf_crypto_signature_instance_ctrl_t  *const p_ctrl ,   sf_crypto_signature_mode_t operation_mode ,
  sf_crypto_signature_algorithm_init_params_t
*const p_algorithm_specific_params ,  sf_crypto_data_handle_t  const
*const p_key )
```

6.19.6.1 Brief description

Function for Crypto Signature Framework to initialize the Signature framework module context. This function is called by sf_crypto_signature_hal_context_init().

6.19.6.2 Detailed description

Table 332:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.

Table 332:Parameters (Continued)

Name	Direction	Description
operation_mode	in	Perform Sign Or Verify operation.
p_algorithm_specific_params	in	Algorithm specific params.
p_key	in	Private key if sign operation is to be performed. Public key if verify operation is to be performed.

Table 333:Return values

Name	Description
SSP_SUCCESS	The module context was successfully initialized.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto RSA module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.7 sf_crypto_signature_sign_update_rsa

```
ssp_err_t sf_crypto_signature_sign_update_rsa ( sf_crypto_signature_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_message )
```

6.19.7.1 Brief description

Function for Crypto Signature Framework to perform sign update operation. This function is called by sf_crypto_signature_hal_sign_update().

6.19.7.2 Detailed description

Table 334:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.
p_message	in	Pointer to data handle containing update data and its length.

Table 335:Return values

Name	Description
SSP_SUCCESS	Sign update was performed successfully.
SSP_ERR_ASSERTION	Critical internal error.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto RSA module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.8 sf_crypto_signature_verify_update_rsa

```
ssp_err_t sf_crypto_signature_verify_update_rsa ( sf_crypto_signature_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_message )
```

6.19.8.1 Brief description

Function for Crypto Signature Framework to perform verify update operation. This function is called by sf_crypto_signature_hal_verify_update().

6.19.8.2 Detailed description

Table 336:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.
p_message	in	Pointer to data handle containing message in appropriate format and its length.

Table 337:Return values

Name	Description
SSP_SUCCESS	Verify update operation was performed successfully.
SSP_ERR_ASSERTION	Critical internal error.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto RSA module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.9 sf_crypto_signature_sign_final_rsa

```
ssp_err_t sf_crypto_signature_sign_final_rsa ( sf_crypto_signature_instance_ctrl
_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_message ,
 sf_crypto_data_handle_t  *const p_dest )
```

6.19.9.1 Brief description

Function for Crypto Signature Framework to perform sign final operation. This function is called by sf_crypto_signature_hal_sign_final().

6.19.9.2 Detailed description

Table 338:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.
p_message	in	Pointer to data handle containing last block of data and its length. If there is no more data to be passed this param can be set to NULL.
p_dest	inout	Pointer to data handle containing pointer to a buffer for storing signature. The data_length of this handle must be populated with the buffer length. Upon successful return this data_length will be updated with the number of bytes written to this buffer.

Table 339:Return values

Name	Description
SSP_SUCCESS	Sign Final operation was performed successfully.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_INVALID_SIZE	Not enough space to store signature.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
Others	Crypto RSA module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.10 sf_crypto_signature_verify_final_rsa

```
ssp_err_t sf_crypto_signature_verify_final_rsa ( sf_crypto_signature_instance_ctrl_t  *const p_ctrl ,  sf_crypto_data_handle_t  const *const p_signature ,
 sf_crypto_data_handle_t  const *const p_message )
```

6.19.10.1 Brief description

Function for Crypto Signature Framework to perform verify final operation. This function is called by sf_crypto_signature_hal_verify_final().

6.19.10.2 Detailed description

Table 340:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to Crypto Signature Framework instance control block structure.
p_signature	in	Pointer to data handle containing signature and its length.
p_message	in	Pointer to data handle containing message in appropriate format and its length.

Table 341:Return values

Name	Description
SSP_SUCCESS	Verify Final operation was performed successfully.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_INVALID_SIZE	Invalid signature length.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
Others	Crypto RSA module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.11 SF_CRYPTO_SIGNATURE_Open

```
ssp_err_t SF_CRYPTO_SIGNATURE_Open (  sf_crypto_signature_ctrl_t
*const p_api_ctrl ,  sf_crypto_signature_cfg_t  const *const p_cfg )
```

6.19.11.1 Brief description

SSP Crypto Signature Framework Open operation.

6.19.11.2 Detailed description

Table 342:Return values

Name	Description
SSP_SUCCESS	The module was successfully opened.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common Module has yet been opened.
SSP_ERR_ALREADY_OPEN	The module has been already opened.
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.19.11.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during open. The HAL interfaceGet API is also called which does not access HW either. If HW will be accessed through the HAL driver, lock should be acquired.

6.19.12 SF_CRYPTO_SIGNATURE_Close

```
ssp_err_t SF_CRYPTO_SIGNATURE_Close (  sf_crypto_signature_ctrl_t
*const p_api_ctrl )
```

6.19.12.1 Brief description

SSP Crypto Signature Framework Close operation.

6.19.12.2 Detailed description

Table 343:Return values

Name	Description
SSP_SUCCESS	The module was successfully closed.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. See Common Error Codes for other possible return codes.

6.19.12.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during close. If HW will be accessed through the HAL driver, lock should be acquired.

6.19.13 SF_CRYPTO_SIGNATURE_ContextInit

```
ssp_err_t SF_CRYPTO_SIGNATURE_ContextInit (  sf_crypto_signature_ctrl_t
*const p_api_ctrl ,   sf_crypto_signature_mode_t operation_mode ,
  sf_crypto_signature_algorithm_init_params_t
*const p_algorithm_specific_params ,  sf_crypto_data_handle_t  const
*const p_key )
```

6.19.13.1 Brief description

SSP Crypto Signature Framework Context Initialization operation.

6.19.13.2 Detailed description

Table 344:Return values

Name	Description
SSP_SUCCESS	The module context was successfully initialized.
SSP_ERR_ASSERTION	NULL is passed through the argument.

Table 344:Return values (Continued)

Name	Description
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.13.3 Function steps

- Note: sf_crypto.lock() is not called because the HAL driver does not access HW during init. If HW will be accessed through the HAL driver, lock should be acquired.

6.19.14 SF_CRYPTO_SIGNATURE_SignUpdate

```
ssp_err_t SF_CRYPTO_SIGNATURE_SignUpdate (  sf_crypto_signature_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  const *const p_message )
```

6.19.14.1 Brief description

SSP Crypto Signature Framework Signature Update operation.

6.19.14.2 Detailed description

Table 345:Return values

Name	Description
SSP_SUCCESS	Sign update was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.

Table 345:Return values (Continued)

Name	Description
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto HAL module returned an error or resource lock/unlock was failed. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.15 SF_CRYPTO_SIGNATURE_VerifyUpdate

```
ssp_err_t SF_CRYPTO_SIGNATURE_VerifyUpdate (  sf_crypto_signature_ctrl_t
*const p_api_ctrl ,  sf_crypto_data_handle_t  const *const p_message )
```

6.19.15.1 Brief description

SSP Crypto Signature Framework Signature-Verification Update operation.

6.19.15.2 Detailed description

Table 346:Return values

Name	Description
SSP_SUCCESS	Verify update operation was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.
Others	Crypto HAL module returned an error. resource lock/unlock was failed. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.16 SF_CRYPTO_SIGNATURE_SignFinal

```
ssp_err_t SF_CRYPTO_SIGNATURE_SignFinal ( sf_crypto_signature_ctrl_t
*const p_api_ctrl , sf_crypto_data_handle_t const *const p_message ,
 sf_crypto_data_handle_t *const p_dest )
```

6.19.16.1 Brief description

SSP Crypto Signature Framework Signature Final operation.

6.19.16.2 Detailed description

Table 347:Return values

Name	Description
SSP_SUCCESS	Sign Final operation was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_CRYPTO_INVALID_SIZE	Not enough space to store signature.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
Others	Crypto HAL module returned an error. Crypto Hash Framework module returned an error. See Common Error Codes for other possible return codes.

6.19.17 SF_CRYPTO_SIGNATURE_VerifyFinal

```
ssp_err_t SF_CRYPTO_SIGNATURE_VerifyFinal ( sf_crypto_signature_ctrl_t
*const p_api_ctrl , sf_crypto_data_handle_t const *const p_signature ,
 sf_crypto_data_handle_t const *const p_message )
```

SSP_SUCCESS	Valid call to the calling API.
SSP_ERR_INVALID_CALL	Invalid call to the calling API.

6.19.21 API Data

6.19.21.1 sf_crypto_signature_state_t

`sf_crypto_signature_state_t`

Detailed description

State codes for the SSP Crypto Signature framework module. Once the module is opened successfully, then the state is transition to OPENED state. After sign/verify operations, the Signature framework module must be closed with CLOSED state.

Enumerated values

Name	Description
SF_CRYPTO_SIGNATURE_CLOSED	The Signature module is closed.
SF_CRYPTO_SIGNATURE_OPENED	The Signature module is opened.

6.19.21.2 sf_crypto_signature_operation_state_t

`sf_crypto_signature_operation_state_t`

Detailed description

Internal state codes for the SSP Crypto Signature framework module.

Enumerated values

Name	Description
SF_CRYPTO_SIGNATURE_OPERATION_STATE_OPEN	Module opened to perform sign/verify operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_INITIALIZED	Context is initialized for Sign Operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_UPDATED	Sign operation is in progress.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_FINALIZED	Sign operation has been completed.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_INITIALIZED	Context is initialized for Verify Operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_UPDATED	Verify operation is in progress.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_FINALIZED	Verify operation has been completed.

6.19.22 Extensions

6.19.22.1 sf_crypto_signature_context_t

sf_crypto_signature_context_t

Detailed description

Internal SSP Crypto Signature framework module context.

Variables

- sf_crypto_signature_mode_t operation_mode

  Operating mode. (Sign / Verify operation)
- sf_crypto_signature_algorithm_init_params_t * p_aglorithm_specific_params

  Algorithm specific parameters. OR hold formatted input data.

- sf_crypto_data_handle_t buffer

  Internal buffer to format input data
- uint8_t * p_key_data

  Buffer to hold private key in case of Sign Operations. OR. Buffer to hold public key in case of Verify Operations.
- uint32_t key_data_length

  Length of key data.

6.19.22.2 sf_crypto_signature_instance_ctrl_t

sf_crypto_signature_instance_ctrl_t

Detailed description

SSP Crypto Signature Framework instance control block

Variables

- sf_crypto_signature_state_t status

  Module status.
- sf_crypto_key_type_t key_type

  Key type.
- sf_crypto_key_size_t key_size

  Key size.
- sf_crypto_signature_operation_state_t operation_state

  Internal Operation state.
- sf_crypto_signature_context_t operation_context

  Context for sign / verify operations.
- sf_crypto_instance_ctrl_t * p_lower_lvl_common_ctrl

  Pointer to the Crypto Framework Common instance
- sf_crypto_api_t * p_lower_lvl_common_api

  Pointer to the Crypto Framework API instance
- void * p_hal_ctrl

  pointer to Crypto module control structure
- void * p_hal_api

  pointer to Crypto module API structure
- sf_crypto_hash_instance_t * p_lower_lvl_sf_crypto_hash

  pointer to Crypto Framework Hash instance

6.19.22.3 sf_crypto_signature_api_t

Detailed description

Shared Interface definition for the SSP Crypto Signature framework

6.20 GUIX Interface

Interface definition for Adapting Express Logic GUIX for Synergy graphics drivers.

6.20.1 Summary

This is the Interface of SF_EL_GX Framework module which ties Synergy graphics device drivers to GUIX. The interface provides following driver adaptation for GUIX:

- DISPLAY driver for displaying image on LCD(e.g. GLCDC)
- Dave/2d driver for image rendering by 2DG engine
- JPEG driver for the image rendering by JPEG engine
- Software image rendering with no hardware acceleration

Implemented by: GUIX Synergy Port

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

GUIX Interface description: GUIX Port Framework

6.20.2 Interface API

sf_el_gx_api_t

Function name	Description
.open	Open SSP GUIX adaptation framework.
.close	Close SSP GUIX adaptation framework.
.versionGet	Get version.
.setup	Express Logic GUIX Driver setup entry.

Function name	Description
.canvasInit	Canvas initialization. Set the memory address of the initial canvas.

6.20.3 Data structures

- sf_el_gx_callback_args_t
- sf_el_gx_cfg_t
- sf_el_gx_instance_t

6.20.4 Enumerations

- sf_el_gx_state_t
- sf_el_gx_device_t
- sf_el_gx_event_t

6.20.5 Typedefs

- sf_el_gx_ctrl_t

6.20.6 Defines

- #define SF_EL_GX_API_VERSION_MAJOR

  Initial value: `(1U)`

  The API version of GUIX integrated driver framework
- #define SF_EL_GX_API_VERSION_MINOR

  Initial value: `(5U)`

6.20.7 API Data

6.20.7.1 sf_el_gx_state_t

`sf_el_gx_state_t`

Detailed description

State codes for the SSP GUIX adaptation framework

Enumerated values

Name	Description
SF_EL_GX_CLOSED	
SF_EL_GX_OPENED	
SF_EL_GX_CONFIGURED	

6.20.7.2 sf_el_gx_device_t

`sf_el_gx_device_t`

Detailed description

Low level device code for the GUIX

Enumerated values

Name	Description
SF_EL_GX_DEVICE_NONE	Non hardware.
SF_EL_GX_DEVICE_DISPLAY	Display device.
SF_EL_GX_DEVICE_DRW	2D Graphics Engine
SF_EL_GX_DEVICE_JPEG	JPEG Decoder.

6.20.7.3 sf_el_gx_event_t

`sf_el_gx_event_t`

Detailed description

Display event codes

Enumerated values

Name	Description
SF_EL_GX_EVENT_ERROR	Low level driver error occurs.
SF_EL_GX_EVENT_DISPLAY_VSYNC	Display interface VSYNC.
SF_EL_GX_EVENT_UNDERFLOW	Display interface underflow.

6.20.7.4 sf_el_gx_ctrl_t

```
typedef void sf_el_gx_ctrl_t
```

Detailed description

GUIX adaptation framework control block. Allocate an instance specific control block to pass into the GUIX adaptation framework API calls. Implemented as

- sf_el_gx_instance_ctrl_t

6.20.8 API Structures

6.20.8.1 sf_el_gx_callback_args_t

sf_el_gx_callback_args_t

Detailed description

Callback arguments for the SSP GUIX adaptation framework

Variables

- sf_el_gx_device_t device

  Device code.

- sf_el_gx_event_t event

  Event code of the low level hardware.

- uint32_t error

  Error code if SF_EL_GX_EVENT_ERROR.

6.20.8.2 sf_el_gx_cfg_t

sf_el_gx_cfg_t

Detailed description

Configuration structure for the SSP GUIX adaptation framework

Variables

- display_instance_t * p_display_instance

  Pointer to a display instance.

- display_runtime_cfg_t * p_display_runtime_cfg

  Pointer to a runtime display configuration.

- void * p_canvas

  Pointer to a canvas(reserved)

- void * p_framebuffer_a

  Pointer to a frame buffer(A)

- void * p_framebuffer_b

  Pointer to a frame buffer(B)
- void(* p_callback)(sf_el_gx_callback_args_t *p_args)

  Pointer to callback function.
- void * p_context

  Pointer to a context.
- void * p_jpegbuffer

  Pointer to a JPEG work buffer.
- uint32_t jpegbuffer_size

  Size of a JPEG work buffer.
- uint16_t rotation_angle

  Screen rotation angle(0/90/270)
- void * p_sf_jpeg_decode_instance

  Pointer to a JPEG framework instance.
- _Bool dave2d_buffer_cache_enabled

  D/AVE 2D buffer cache enabled/disabled.

Open SSP GUIX adaptation framework. Implemented as

- SF_EL_GX_Open

Table 354:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to SF_EL_GX control block structure. Must be declared by user. Value set here.

Table 354:Parameters (Continued)

Name	Direction	Description
p_cfg	in	Pointer to SF_EL_GX configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `sf_el_gx_ctrl_t*const p_ctrl`

GUIX adaptation framework control block. Allocate an instance specific control block to pass into the GUIX adaptation framework API calls. Implemented assf_el_gx_instance_ctrl_t

Parameter p_cfg

Definition: `sf_el_gx_cfg_t const *const p_cfg`

Configuration structure for the SSP GUIX adaptation framework

- `sf_el_gx_cfg_t`::`display_instance_t`

  Pointer to a display instance.

- `sf_el_gx_cfg_t`::`display_runtime_cfg_t`

  Pointer to a runtime display configuration.

- `sf_el_gx_cfg_t`::`p_canvas`

  Pointer to a canvas(reserved)

- `sf_el_gx_cfg_t`::`p_framebuffer_a`

  Pointer to a frame buffer(A)

- `sf_el_gx_cfg_t`::`p_framebuffer_b`

  Pointer to a frame buffer(B)

- `sf_el_gx_cfg_t`::`p_callback`

  Pointer to callback function.

- `sf_el_gx_cfg_t`::`p_context`

  Pointer to a context.

- `sf_el_gx_cfg_t`::`p_jpegbuffer`

  Pointer to a JPEG work buffer.

- `sf_el_gx_cfg_t`::`jpegbuffer_size`

  Size of a JPEG work buffer.

- `sf_el_gx_cfg_t`::`rotation_angle`

  Screen rotation angle(0/90/270)

- `sf_el_gx_cfg_t`::`p_sf_jpeg_decode_instance`

  Pointer to a JPEG framework instance.

- sf_el_gx_cfg_t::dave2d_buffer_cache_enabled

  D/AVE 2D buffer cache enabled/disabled.

6.20.8.5 close

```

  Pointer to the configuration structure for this instance.

- sf_el_gx_api_t const * p_api

  Pointer to the API structure for this instance.

6.21 External IRQ Framework Interface

RTOS-integrated External IRQ Framework Interface.

6.21.1 Summary

This module is a ThreadX-aware external IRQ Framework Interface for external inputs such as switches or other binary signals. The Interface is implemented by External IRQ Framework.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

External IRQ Framework Interface description: External IRQ Framework

6.21.2 Interface API

sf_external_irq_api_t

Function name	Description
.open	Acquire mutex, then handle driver initialization at the HAL layer.
.wait	Wait for the next external interrupt expiration, then return.
.versionGet	Get version and store it in provided pointer p_version.
.close	Release channel mutex and close channel at HAL layer.

6.21.3 Data structures

- sf_external_irq_cfg_t
- sf_external_irq_instance_t

6.21.4 Enumerations

- sf_external_irq_event_t

6.21.5 Typedefs

- sf_external_irq_ctrl_t

6.21.6 Defines

- #define SF_EXTERNAL_IRQ_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_EXTERNAL_IRQ_API_VERSION_MINOR

  Initial value: `(2U)`

6.21.7 API Data

6.21.7.1 sf_external_irq_event_t

```
sf_external_irq_event_t
```

Detailed description

Options for what should happen when the external interrupt expires.

Enumerated values

Name	Description
SF_EXTERNAL_IRQ_EVENT_NONE	Nothing happens during expiration. Can be used for data transfer.
SF_EXTERNAL_IRQ_EVENT_SEMAPHORE_PUT	Posts to internal semaphore. Select this if using SF_EXTERNAL_IRQ_Wait.

6.21.7.2 sf_external_irq_ctrl_t

```
typedef void sf_external_irq_ctrl_t
```

Detailed description

External interrupt control block. Allocate an instance specific control block to pass into the external interrupt framework API calls. Implemented as

- sf_external_irq_instance_ctrl_t

6.21.8 API Structures

6.21.8.1 sf_external_irq_cfg_t

sf_external_irq_cfg_t

Detailed description

Configuration for RTOS integrated external interrupt driver

Variables

- external_irq_instance_t const * p_lower_lvl_irq

  All info needed to work with lower layer

- sf_external_irq_event_t event

  Select what happens when the external IRQ is triggered.

6.21.8.2 sf_external_irq_api_t

sf_external_irq_api_t

Detailed description

External IRQ framework API structure. External IRQ implementations use the following API.

6.21.8.3 open

```
ssp_err_t(* sf_external_irq_api_t::open) (sf_external_irq_ctrl_t *const p_ctrl,
sf_external_irq_cfg_t const *const p_cfg)
```

Detailed description

Acquire mutex, then handle driver initialization at the HAL layer. Implemented as

- SF_EXTERNAL_IRQ_Open

Table 359:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. The device control structure is initialized in this function.

Table 359:Parameters (Continued)

Name	Direction	Description
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_external_irq_ctrl_t*const p_ctrl`

External interrupt control block. Allocate an instance specific control block to pass into the external interrupt framework API calls. Implemented assf_external_irq_instance_ctrl_t

Parameter p_cfg

Definition: `sf_external_irq_cfg_t const *const p_cfg`

Configuration for RTOS integrated external interrupt driver

- `sf_external_irq_cfg_t`::`external_irq_instance_t`

  All info needed to work with lower layer

- `sf_external_irq_cfg_t`::`sf_external_irq_event_t`

  Select what happens when the external IRQ is triggered.

  Enumerated as:

  – SF_EXTERNAL_IRQ_EVENT_NONE

  – SF_EXTERNAL_IRQ_EVENT_SEMAPHORE_PUT

6.21.8.4 wait

```
ssp_err_t(* sf_external_irq_api_t::wait) (sf_external_irq_ctrl_t *const p_ctrl,
ULONG const timeout)
```

Detailed description

Wait for the next external interrupt expiration, then return.

NOTE: Call SF_EXTERNAL_IRQ_Open to configure the external IRQ before using this function. During SF_EXTERNAL_IRQ_Open, set sf_external_irq_cfg_t::sf_external_irq_event_t to SF_EXTERNAL_IRQ_EVENT_SEMAPHORE_PUT.

Implemented as

- SF_EXTERNAL_IRQ_Wait

Table 360:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in SF_EXTERNAL_IRQ_Open.
timeout	in	ThreadX timeout. Select TX_NO_WAIT, a value in system clock counts between 1 and 0xFFFFFFFF, or TX_WAIT_FOREVER.

Parameter p_ctrl

Definition: `sf_external_irq_ctrl_t*const p_ctrl`

External interrupt control block. Allocate an instance specific control block to pass into the external interrupt framework API calls. Implemented assf_external_irq_instance_ctrl_t

Parameter timeout

`const`

6.21.8.5 versionGet

```
ssp_err_t(* sf_external_irq_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- SF_EXTERNAL_IRQ_VersionGet

Table 361:Parameters

Name	Direction	Description
p_version	out	Code and API version used stored here.

Parameter p_version

6.21.8.6 close

```
ssp_err_t(* sf_external_irq_api_t::close) (sf_external_irq_ctrl_t *const p_ctrl)
```

Detailed description

Release channel mutex and close channel at HAL layer. Implemented as

- SF_EXTERNAL_IRQ_Close

Table 362:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for this external interrupt.

Parameter p_ctrl

Definition: `sf_external_irq_ctrl_t*const p_ctrl`

External interrupt control block. Allocate an instance specific control block to pass into the external interrupt framework API calls. Implemented assf_external_irq_instance_ctrl_t

6.21.8.7 sf_external_irq_instance_t

sf_external_irq_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_external_irq_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

  Pointer to the configuration structure for this instance.

- sf_external_irq_api_t const * p_api

  Pointer to the API structure for this instance.

6.22 I2C Framework

RTOS-integrated I2C Framework Interface.

6.22.1 Summary

This is a ThreadX-aware I2C interface. It can be implemented by several hardware peripherals at the HAL layer through the I2C interface I2C Master Interface.

The connection to the HAL layer is established by passing in a driver structure in SF_I2C_Open.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers

- Using SSP Modules

SPI Framework Interface description: I2C Framework

6.22.2 Interface API

sf_i2c_api_t

Function name	Description
.open	Open a designated I2C device on a bus.
.read	Receive data from I2C device.
.write	Transmit data to I2C device.
.reset	Abort any in-progress transfer and force the I2C peripheral into a ready state. This function safely terminates any in-progress I2C transfer with the device. If a transfer is aborted, the user is be notified via callback with an abort event. Since the callback is optional, this function also returns a specific error code in this situation.
.close	Disable the I2C device designated by the control handle. Close the RTOS services used by the bus if no devices are connected to the bus.
.lock	Lock the bus for a device. Locking allows devices to reserve a bus to themselves for a given period of time (i.e. between lock and unlock). This allows devices to complete several reads and writes on the bus without interrupt, which is required in some instances.
.unlock	Unlock the bus from a particular device and make it available for other devices. This allows other devices to use bus for reads and writes on the bus.
.version	Get I2C framework version.

6.22.8 API Structures

6.22.8.1 sf_i2c_bus_t

sf_i2c_bus_t

Detailed description

Data structure defining a I2C bus.

Variables

- uint8_t channel

  Channel.
- TX_MUTEX * p_lock_mutex

  Lock mutex handle for this channel.
- TX_EVENT_FLAGS_GROUP * p_sync_eventflag

  Pointer to the event flag object for I2C data transfer.
- sf_i2c_ctrl_t ** pp_curr_ctrl

  Current device using the bus (by switching the address)
- uint8_t * p_bus_name

  User-supplied name to identify the bus. Useful for debugging.
- i2c_api_master_t const * p_lower_lvl_api

  Pointer to I2C HAL interface to be used in the framework.
- uint8_t device_count

  Number of devices on the bus; initialize to 0.
- sf_i2c_ctrl_t ** pp_curr_bus_ctrl

  Device configured on the bus (low level configuration)

6.22.8.2 sf_i2c_cfg_t

sf_i2c_cfg_t

Detailed description

Configuration for Framework I2C driver

Variables

- sf_i2c_bus_t * p_bus

  Bus used by the device.
- i2c_cfg_t const * p_lower_lvl_cfg

  Pointer to I2C HAL configuration.

```

Brief description

Open a designated I2C device on a bus.

Detailed description

Implemented as

- SF_I2C_Open

Table 363:Parameters

Name	Direction	Description
p_ctrl	out	Control handle for I2C framework driver context for a device (Value returns from this function). This value must be cleared by user.
p_cfg	in	I2C configuration includes I2C bus and low level configuration

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

Parameter p_cfg

Definition: `sf_i2c_cfg_t const *const p_cfg`

Configuration for Framework I2C driver

- `sf_i2c_cfg_t`::`sf_i2c_bus_t`

  Bus used by the device.

- `sf_i2c_cfg_t`::`i2c_cfg_t`

  Pointer to I2C HAL configuration.

6.22.8.5 read

```
ssp_err_t(* sf_i2c_api_t::read) (sf_i2c_ctrl_t *const p_ctrl, uint8_t *const
p_dest, uint32_t const bytes, bool const restart, uint32_t const timeout)
```

Brief description

Receive data from I2C device.

Detailed description

Implemented as

- SF_I2C_Read

Table 364:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to previously opened I2C SF control structure.
p_dest	in	Pointer to location to store read data.
bytes	in	Number of bytes to read.
restart	in	Indicates whether the restart condition should be issued after reading.
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

Parameter restart

`const`

Parameter timeout

`uint32_t`

6.22.8.6 write

```

p_src, uint32_t const bytes, bool const restart, uint32_t const timeout)
```

Brief description

Transmit data to I2C device.

Detailed description

Implemented as

- SF_I2C_Write

Table 365:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to previously opened I2C control structure.
p_src	in	Pointer to location to get write data.
bytes	in	Number of bytes to write.
restart	in	Indicates whether the restart condition should be issued after writing.
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter bytes

`uint32_t`

Parameter restart

`const`

Parameter timeout

`uint32_t`

6.22.8.7 reset

```
ssp_err_t(* sf_i2c_api_t::reset) (sf_i2c_ctrl_t *const p_ctrl, uint32_t const timeout)
```

Brief description

Abort any in-progress transfer and force the I2C peripheral into a ready state.

Detailed description

Implemented as

- SF_I2C_Reset

This function safely terminates any in-progress I2C transfer with the device. If a transfer is aborted, the user is be notified via callback with an abort event. Since the callback is optional, this function also returns a specific error code in this situation.

Table 366:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to device control block initialized in Open call for I2C driver.
timeout	in	ThreadX timeout. Options include TX_NO_WAIT (0x00000000), TX_WAIT_FOREVER (0xFFFFFFFF), and timeout value (0x00000001 through 0xFFFFFFFE) in ThreadX tick counts.

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

Parameter timeout

`uint32_t`

6.22.8.8 close

```
ssp_err_t(* sf_i2c_api_t::close) (sf_i2c_ctrl_t *const p_ctrl)
```

Brief description

Disable the I2C device designated by the control handle. Close the RTOS services used by the bus if no devices are connected to the bus.

Detailed description

Implemented as

- SF_I2C_Close

Table 367:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

6.22.8.9 lock

```
ssp_err_t(* sf_i2c_api_t::lock) (sf_i2c_ctrl_t *const p_ctrl)
```

Brief description

Lock the bus for a device. Locking allows devices to reserve a bus to themselves for a given period of time (i.e. between lock and unlock). This allows devices to complete several reads and writes on the bus without interrupt, which is required in some instances.

Detailed description

Implemented as

- SF_I2C_Lock

Table 368:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

6.22.8.10 unlock

```
ssp_err_t(* sf_i2c_api_t::unlock) (sf_i2c_ctrl_t *const p_ctrl)
```

Brief description

Unlock the bus from a particular device and make it available for other devices. This allows other devices to use bus for reads and writes on the bus.

Detailed description

Implemented as

- SF_I2C_Unlock

Table 369:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device

Parameter p_ctrl

Definition: `sf_i2c_ctrl_t*const p_ctrl`

I2C framework control block. Allocate an instance specific control block to pass into the I2C framework API calls. Implemented assf_i2c_instance_ctrl_t

6.22.8.11 version

```
ssp_err_t(* sf_i2c_api_t::version) (ssp_version_t *const p_version)
```

Brief description

Get I2C framework version.

Name	Direction	Description
p_ctrl	in	Handle for I2C framework control block for a device

Parameter p_ctrl

6.22.8.12 sf_i2c_instance_t

sf_i2c_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_i2c_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_i2c_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_i2c_api_t const * p_api

  Pointer to the API structure for this instance.

6.23 JPEG Decode Framework Interface

RTOS-integrated JPEG Decode Framework Interface.

6.23.1 Summary

This is a ThreadX aware generic JPEG decoding framework for run-time JPEG decode applications. It can be implemented by either hardware or software. For Synergy parts, the interface is implemented by the on-chip JPEG decoding engine. The connection to the HAL layer is established by passing in a driver structure in SF_JPEG_Decode_Open.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Framework JPEG Decode Interface description: JPEG Decode Framework

6.23.2 Interface API

sf_jpeg_decode_api_t

Function name	Description
.open	Acquire mutex, then handle driver initialization at the HAL layer. This function releases mutex before it returns to the caller.
.inputBufferSet	Feed data into JPEG codec module.
.outputBufferSet	Read processed data from JPEG codec module.
.linesDecodedGet	Obtain number of lines JPEG codec decoded.
.horizontalStrideSet	Configure the horizontal stride value.

Function name	Description
.imageSubsampleSet	Configure the horizontal and vertical subsample values. This allows an application to reduce the size of the decoded image.
.wait	Wait for current JPEG codec operation to finish
.statusGet	Obtain JPEG codec status
.imageSizeGet	Obtain the size of the image. This function is only useful for decoding a JPEG image.
.pixelFormatGet	Obtain the pixel format of the image. This function is only useful for decoding a JPEG image.
.close	Closes JPEG codec device. Un-finished codec operation is interrupted, and output data are discarded.
.versionGet	Gets version and stores it in provided pointer p_version.

```

Detailed description

Acquire mutex, then handle driver initialization at the HAL layer. This function releases mutex before it returns to the caller.

Table 371:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. Elements initialized here.

Table 371:Parameters (Continued)

Name	Direction	Description
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_cfg

Definition: `sf_jpeg_decode_cfg_t const *const p_cfg`

Configuration for RTOS integrated JPEG driver

- `sf_jpeg_decode_cfg_t`::`jpeg_decode_instance_t`

  Pointer to a driver structure that implements this interface. Pre-configured driver structures are located in r_jpeg_-decode.c and extern'ed in r_jpeg_decode.h.

6.23.7.4 inputBufferSet

```
(* sf_jpeg_decode_api_t::inputBufferSet) (sf_jpeg_decode_ctrl_t *const p_ctrl,
void *const p_buffer, uint32_t const buffer_size)
```

Detailed description

Feed data into JPEG codec module.

Table 372:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_buffer	in	Buffer contains data to be processed by the JPEG codec module. The buffer starting address must be 8-byte aligned
buffer_size	in	Size of the data buffer, must be multiple of 8 bytes

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_buffer

`const`

Parameter buffer_size

`uint32_t`

6.23.7.5 outputBufferSet

```
(* sf_jpeg_decode_api_t::outputBufferSet) (sf_jpeg_decode_ctrl_t *const p_ctrl,
void *p_buffer, uint32_t buffer_size)
```

Detailed description

Read processed data from JPEG codec module.

Table 373:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_buffer	in	User-supplied buffer space to hold output from JPEG codec module. The buffer starting address must be 8-byte aligned
buffer_size	in	Size of the output data buffer

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_buffer

`const`

Parameter buffer_size

`uint32_t`

6.23.7.6 linesDecodedGet

```
(* sf_jpeg_decode_api_t::linesDecodedGet) (sf_jpeg_decode_ctrl_t *const p_ctrl,
uint32_t *const p_lines)
```

Detailed description

Obtain number of lines JPEG codec decoded.

Table 374:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_lines	out	Number of lines decoded into the output buffer.

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_lines

`uint32_t`

6.23.7.7 horizontalStrideSet

```
(* sf_jpeg_decode_api_t::horizontalStrideSet) (sf_jpeg_decode_ctrl_t *const
p_ctrl, uint32_t horizontal_stride)
```

Detailed description

Configure the horizontal stride value.

Table 375:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
horizontal_stride	out	Set the horizontal stride value, in pixels

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter horizontal_stride

uint32_t

6.23.7.8 imageSubsampleSet

(* sf_jpeg_decode_api_t::imageSubsampleSet) (sf_jpeg_decode_ctrl_t *const p_ctrl, horizontal_subsample, vertical_subsample)

Detailed description

Configure the horizontal and vertical subsample values. This allows an application to reduce the size of the decoded image.

Table 376:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
horizontal_subsample	in	Set the horizontal subsample value
vertical_subsample	in	Set the vertical subsample value

Parameter p_ctrl

Definition: sf_jpeg_decode_ctrl_t*const p_ctrl

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter horizontal_subsample

Parameter vertical_subsample

6.23.7.9 wait

(* sf_jpeg_decode_api_t::wait) (sf_jpeg_decode_ctrl_t *const p_ctrl, *const p_status, uint32_t timeout)

Detailed description

Wait for current JPEG codec operation to finish

Table 377:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_status	out	Status of current JPEG codec module
timeout	out	Amount of time (in ThreadX ticks) to wait

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_status

Parameter timeout

`uint32_t`

6.23.7.10 statusGet

```
(* sf_jpeg_decode_api_t::statusGet) (sf_jpeg_decode_ctrl_t *const p_ctrl, *const
p_status)
```

Detailed description

Obtain JPEG codec status

Table 378:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_status	out	Status of current JPEG codec module

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_status

6.23.7.11 imageSizeGet

```
(* sf_jpeg_decode_api_t::imageSizeGet) (sf_jpeg_decode_ctrl_t *const p_ctrl,
uint16_t *p_horizontal_size, uint16_t *p_vertical_size)
```

Detailed description

Obtain the size of the image. This function is only useful for decoding a JPEG image.

Table 379:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_horizontal_size	out	Width of the image, in pixels
p_vertical_size	out	Height of the image, in pixels

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_horizontal_size

`uint16_t`

Parameter p_vertical_size

`uint16_t`

6.23.7.12 pixelFormatGet

```
(* sf_jpeg_decode_api_t::pixelFormatGet) (sf_jpeg_decode_ctrl_t *const p_ctrl,
*const p_color_space)
```

Detailed description

Obtain the pixel format of the image. This function is only useful for decoding a JPEG image.

Table 380:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block initialized in SF_JPEG_Decode_Open.
p_color_space	out	Color space of the image

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

Parameter p_color_space

6.23.7.13 close

```
(* sf_jpeg_decode_api_t::close) (sf_jpeg_decode_ctrl_t *const p_ctrl)
```

Detailed description

Closes JPEG codec device. Un-finished codec operation is interrupted, and output data are discarded.

Table 381:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block set in SF_JPEG_Decode_Open.

Parameter p_ctrl

Definition: `sf_jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode framework control block. Allocate an instance specific control block to pass into the JPEG decode framework API calls. Implemented assf_jpeg_decode_instance_ctrl_t

6.23.7.14 versionGet

```
(* sf_jpeg_decode_api_t::versionGet) ( *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 382:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.23.7.15 sf_jpeg_decode_instance_t

sf_jpeg_decode_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_jpeg_decode_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_jpeg_decode_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_jpeg_decode_api_t const * p_api

  Pointer to the API structure for this instance.

6.24 Messaging Framework Interface

RTOS-integrated Messaging Framework Interface.

6.24.1 Summary

This module is a ThreadX-aware Messaging Framework. This Interface is implemented by Messaging Framework.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Messaging Interface description: Messaging Framework

6.24.2 Interface API

sf_message_api_t

Function name	Description
.open	Initialize message framework. Initiate the messaging framework control block, configure the work memory corresponding to the configuration parameters.
.close	Finalize message framework.
.bufferAcquire	Acquire buffer for message passing from the block.
.bufferRelease	Release buffer obtained from SF_MESSAGE_BufferAcquire.
.post	Post message to the subscribers.
.pend	Pend message.
.versionGet	Get the version of the messaging framework.

6.24.3 Data structures

- sf_message_header_t
- sf_message_instance_range_t
- sf_message_subscriber_t
- sf_message_subscriber_list_t
- sf_message_callback_args_t
- sf_message_post_err_t
- sf_message_buffer_ctrl_t
- sf_message_cfg_t
- sf_message_acquire_cfg_t
- sf_message_post_cfg_t
- sf_message_instance_t

6.24.4 Enumerations

- sf_message_state_t
- sf_message_callback_event_t

- sf_message_priority_t
- sf_message_release_option_t

6.24.5 Typedefs

- sf_message_ctrl_t

6.24.6 Defines

- #define SF_MESSAGE_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_MESSAGE_API_VERSION_MINOR

  Initial value: `(2U)`

6.24.7 API Data

6.24.7.1 sf_message_state_t

`sf_message_state_t`

Detailed description

Messaging framework state

Enumerated values

Name	Description
SF_MESSAGE_STATE_CLOSED	Messaging framework is closed.
SF_MESSAGE_STATE_OPENED	Messaging framework is opened.

6.24.7.2 sf_message_callback_event_t

`sf_message_callback_event_t`

Detailed description

Messaging callback response

Enumerated values

Name	Description
SF_MESSAGE_CALLBACK_EVENT_ACK	ACK response.
SF_MESSAGE_CALLBACK_EVENT_NAK	NAK response.

6.24.7.3 sf_message_priority_t

`sf_message_priority_t`

Detailed description

Messaging framework state

Enumerated values

Name	Description
SF_MESSAGE_PRIORITY_NORMAL	Gives a message to be sent normal priority.
SF_MESSAGE_PRIORITY_HIGH	Gives a message to be sent higher priority than previous ones.

6.24.7.4 sf_message_release_option_t

`sf_message_release_option_t`

Detailed description

Messaging option

Enumerated values

Name	Description
SF_MESSAGE_RELEASE_OPTION_NONE	No option.
SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE	Buffer forced release option.
SF_MESSAGE_RELEASE_OPTION_ACK	ACK response (note if both ACK and NAK are set at same time, NAK.

Name	Description
SF_MESSAGE_RELEASE_OPTION_NAK	NAK response.

6.24.7.5 sf_message_ctrl_t

```
typedef void sf_message_ctrl_t
```

Detailed description

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented as

- sf_message_instance_ctrl_t

6.24.8 API Structures

6.24.8.1 sf_message_header_t

sf_message_header_t

Detailed description

Message header definition

Variables

- uint32_t event
- uint32_t class_code

  Event class code.
- uint32_t class_instance

  Event class instance number.
- uint32_t code

  Event code.
- struct{} event_b

  See source code for definition of this member.
- union{} union{}

  See source code for definition of this member.

6.24.8.2 sf_message_instance_range_t

sf_message_instance_range_t

Detailed description

Subscriber lists definitions

Variables

- uint8_t start

  Start of the event class instance range.

- uint8_t end

  End of the event class instance range.

6.24.8.3 sf_message_subscriber_t

sf_message_subscriber_t

Detailed description

Message subscriber

Variables

- TX_QUEUE * p_queue

  Pointer to the message queue for subscriber thread.

- sf_message_instance_range_t instance_range

  Range of the event class instance to receive message.

6.24.8.4 sf_message_subscriber_list_t

sf_message_subscriber_list_t

Detailed description

Message subscriber list

Variables

- sf_message_event_class_t event_class

  Event class code.

- uint16_t number_of_nodes

  Number of nodes in the subscriber group.

- sf_message_subscriber_t ** pp_subscriber_group

  Subscriber group for the event class.

6.24.8.5 sf_message_callback_args_t

sf_message_callback_args_t

Detailed description

Message framework callback parameters

Variables

- sf_message_callback_event_t event

  Event code.

- void const * p_context

  Context provided to user during callback.

6.24.8.6 sf_message_post_err_t

sf_message_post_err_t

Detailed description

Post error information structure

Variables

- TX_QUEUE * p_queue

  Queue.

6.24.8.7 sf_message_buffer_ctrl_t

sf_message_buffer_ctrl_t

Detailed description

Buffer control block structure

Variables

- void(* p_callback)(sf_message_callback_args_t *)

  Optional user callback function.

- void const * p_context

  Context provided to user during callback.

- sf_message_buffer_ctrl_t::st_buffer_ctrl_flagstruct flag_b

6.24.8.8 sf_message_buffer_ctrl_t::st_buffer_ctrl_flag

sf_message_buffer_ctrl_t::st_buffer_ctrl_flag

Brief description

< Flags

Detailed description

Variables

- uint32_t semaphore

  Counting semaphore to prevent a buffer from being released.
- uint32_t buffer_keep

  Buffer keep request.
- uint32_t nak_response

  NAK (ORed logic for multiple subscribers)
- uint32_t reserved

  Reserved bits.
- uint32_t in_use

  Buffer in-use.

6.24.8.9 sf_message_cfg_t

sf_message_cfg_t

Detailed description

Messaging framework configuration structure definition

Variables

- void * p_work_memory_start

  Start address of the memory area.
- uint32_t work_memory_size_bytes

  Size of working memory area in bytes.
- uint32_t buffer_size

  Bytes of the message block.
- sf_message_subscriber_list_t ** pp_subscriber_lists

  Pointer array to the subscriber lists.
- uint8_t * p_block_pool_name

  Pointer to the block pool name.

6.24.8.10 sf_message_acquire_cfg_t

sf_message_acquire_cfg_t

Detailed description

Messaging framework Post API function configuration structure definition

Variables

- bool buffer_keep

  Buffer keep option.

6.24.8.11 sf_message_post_cfg_t

sf_message_post_cfg_t

Detailed description

Messaging framework Acquire API function configuration structure definition

Variables

- sf_message_priority_t priority

  Message priority.

- void(* p_callback)(sf_message_callback_args_t *)

  User callback function.

- void const * p_context

  Context provided to user during callback.

6.24.8.12 sf_message_api_t

sf_message_api_t

Detailed description

Messaging Framework API structure. Implementations will use the following API.

6.24.8.13 open

```
ssp_err_t(* sf_message_api_t::open) (sf_message_ctrl_t *const p_ctrl,
sf_message_cfg_t const *const p_cfg)
```

Detailed description

Initialize message framework. Initiate the messaging framework control block, configure the work memory corresponding to the configuration parameters. Implemented as

- SF_MESSAGE_Open

Table 383:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the messaging control block
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `sf_message_ctrl_t*const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

Parameter p_cfg

Definition: `sf_message_cfg_t const *const p_cfg`

Messaging framework configuration structure definition

- `sf_message_cfg_t`::`p_work_memory_start`

  Start address of the memory area.

- `sf_message_cfg_t`::`work_memory_size_bytes`

  Size of working memory area in bytes.

- `sf_message_cfg_t`::`buffer_size`

  Bytes of the message block.

- `sf_message_cfg_t`::`sf_message_subscriber_list_t`

  Pointer array to the subscriber lists.

- `sf_message_cfg_t`::`p_block_pool_name`

  Pointer to the block pool name.

6.24.8.14 close

```
ssp_err_t(* sf_message_api_t::close) (sf_message_ctrl_t *const p_ctrl)
```

Detailed description

Finalize message framework. Implemented as

- SF_MESSAGE_Close

Table 384:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the messaging control block

Parameter p_ctrl

Definition: `sf_message_ctrl_t*const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

6.24.8.15 bufferAcquire

```
ssp_err_t(* sf_message_api_t::bufferAcquire) (sf_message_ctrl_t const *const
p_ctrl, sf_message_header_t **pp_buffer, sf_message_acquire_cfg_t const *const
p_acquire_cfg, uint32_t const wait_option)
```

Detailed description

Acquire buffer for message passing from the block. Implemented as

- SF_MESSAGE_BufferAcquire

Table 385:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the messaging control block
pp_buffer	inout	Pointer to the pointer to the allocated buffer memory
p_acquire_cfg	in	Pointer to the buffer acquisition configuration
wait_option	in	Wait option (TX_NO_WAIT, TX_WAIT_FOREVER or numerical values)

Parameter p_ctrl

Definition: `sf_message_ctrl_tconst *const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

Parameter pp_buffer

Definition: sf_message_header_t**pp_buffer

Message header definition

- sf_message_header_t::event
- sf_message_header_t::class_code

  Event class code.
- sf_message_header_t::class_instance

  Event class instance number.
- sf_message_header_t::code

  Event code.
- sf_message_header_t::event_b
- sf_message_header_t::struct{}

Parameter p_acquire_cfg

Definition: sf_message_acquire_cfg_t const *const p_acquire_cfg

Messaging framework Post API function configuration structure definition

- sf_message_acquire_cfg_t::buffer_keep

  Buffer keep option.

Parameter wait_option

uint32_t

6.24.8.16 bufferRelease

```
ssp_err_t(* sf_message_api_t::bufferRelease) (sf_message_ctrl_t *const p_ctrl,
sf_message_header_t *const p_buffer, sf_message_release_option_t const option)
```

Detailed description

Release buffer obtained from SF_MESSAGE_BufferAcquire. Implemented as

- SF_MESSAGE_BufferRelease

Table 386:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the messaging control block
p_buffer	in	Pointer to the buffer allocated by SF_MESSAGE_BufferAcquire
option	in	Buffer release option (SF_MESSAGE_RELEASE_OPTION_NONE, SF_MESSAGE_RELEASE_OPTION_ACK, SF_MESSAGE_RELEASE_OPTION_NAK, SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE)

Parameter p_ctrl

Definition: `sf_message_ctrl_t*const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

Parameter p_buffer

Definition: `sf_message_header_t*const p_buffer`

Message header definition

- `sf_message_header_t::event`
- `sf_message_header_t::class_code`

  Event class code.
- `sf_message_header_t::class_instance`

  Event class instance number.
- `sf_message_header_t::code`

  Event code.
- `sf_message_header_t::event_b`
- `sf_message_header_t::struct{}`

Parameter option

6.24.8.17 post

```
ssp_err_t(* sf_message_api_t::post) (sf_message_ctrl_t *const p_ctrl,
sf_message_header_t const *const p_buffer, sf_message_post_cfg_t const *const
p_post_cfg, sf_message_post_err_t *const p_post_err, uint32_t const wait_option)
```

Detailed description

Post message to the subscribers. Implemented as

- SF_MESSAGE_Post

Table 387:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the messaging control block
p_buffer	in	Pointer to the buffer allocated by SF_MESSAGE_BufferAcquire
p_post_cfg	in	Pointer to the message post configuration
wait_option	in	Wait option (TX_NO_WAIT, TX_WAIT_FOREVER or numerical values)

Parameter p_ctrl

Definition: `sf_message_ctrl_t*const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

Parameter p_buffer

Definition: `sf_message_header_tconst *const p_buffer`

Message header definition

- `sf_message_header_t::event`
- `sf_message_header_t::class_code`

  Event class code.
- `sf_message_header_t::class_instance`

  Event class instance number.

- sf_message_header_t::code

  Event code.

- sf_message_header_t::event_b

- sf_message_header_t::struct{}

Parameter p_post_cfg

Definition: sf_message_post_cfg_t const *const p_post_cfg

Messaging framework Acquire API function configuration structure definition

- sf_message_post_cfg_t::sf_message_priority_t

  Message priority.

  Enumerated as:

  – SF_MESSAGE_PRIORITY_NORMAL

  – SF_MESSAGE_PRIORITY_HIGH

- sf_message_post_cfg_t::p_callback

  User callback function.

- sf_message_post_cfg_t::p_context

  Context provided to user during callback.

Parameter wait_option

uint32_t

6.24.8.18 pend

```
ssp_err_t(* sf_message_api_t::pend) (sf_message_ctrl_t const *const p_ctrl,
TX_QUEUE const *const p_queue, sf_message_header_t **pp_buffer, uint32_t const
wait_option)
```

Detailed description

Pend message. Implemented as

- SF_MESSAGE_Pend

Table 388:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the messaging control block

Table 388:Parameters (Continued)

Name	Direction	Description
p_queue	in	Pointer to a threadX message queue object
pp_buffer	inout	Pointer to the pointer to the buffer where message is stored.
wait_option	in	Wait option (TX_NO_WAIT, TX_WAIT_FOREVER or numerical values)

Parameter p_ctrl

Definition: `sf_message_ctrl_tconst *const p_ctrl`

Message framework control block. Allocate an instance specific control block to pass into the message framework API calls. Implemented assf_message_instance_ctrl_t

Parameter p_queue

`const`

Parameter pp_buffer

Definition: `sf_message_header_t**pp_buffer`

Message header definition

- `sf_message_header_t::event`
- `sf_message_header_t::class_code`

  Event class code.
- `sf_message_header_t::class_instance`

  Event class instance number.
- `sf_message_header_t::code`

  Event code.
- `sf_message_header_t::event_b`
- `sf_message_header_t::struct{}`

Parameter wait_option

`uint32_t`

6.24.8.19 versionGet

```
ssp_err_t(* sf_message_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get the version of the messaging framework. Implemented as

- SF_MESSAGE_VersionGet

Table 389:Parameters

Name	Direction	Description
p_version	in	Pointer to the memory where to store the version number

Parameter p_version

6.24.8.20 sf_message_instance_t

sf_message_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_message_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_message_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_message_api_t const * p_api

  Pointer to the API structure for this instance.

6.25 Power Profiles Framework Interface

Power Profiles Framework Interface.

6.25.1 Summary

This framework allows an application to place itself in one of several available Low Power configurations. The application may make API calls that will place it into a low power sleep mode from which an external interrupt, or periodic RTC interrupt may awaken it.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Framework Power Profiles Interface description: Power Profiles Framework

6.25.2 Interface API

sf_power_profiles_api_t

Function name	Description
.open	Acquires mutex, then initialize the lower layer drivers at the HAL layer
.sleep	Places the MCU in Software Standby mode.
.close	Releases channel mutex and closes channel at HAL layer.
.versionGet	Gets version and stores it in provided pointer p_version.

6.25.3 Data structures

- sf_power_profiles_callback_args_t
- sf_power_profiles_ctrl_t
- sf_power_profiles_cfg_t
- sf_power_profiles_instance_t

6.25.4 Enumerations

- sf_power_profiles_mode_t
- sf_power_profiles_event_t

6.25.5 Defines

- #define SF_POWER_PROFILES_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_POWER_PROFILES_API_VERSION_MINOR

  Initial value: `(2U)`

6.25.6 API Data

6.25.6.1 sf_power_profiles_mode_t

`sf_power_profiles_mode_t`

Detailed description

Options for the callback events.

Enumerated values

Name	Description
SF_POWER_PROFILES_MODE_RUN	Normal startup mode (No sleep)
SF_POWER_PROFILES_MODE_RTC	Wakeup using RTC.
SF_POWER_PROFILES_MODE_EXTERNAL	Wakeup from an external source.

6.25.6.2 sf_power_profiles_event_t

`sf_power_profiles_event_t`

Detailed description

Options for the callback events.

Enumerated values

Name	Description
SF_POWER_PROFILES_EVENT_PRE_SLEEP	Callback just before entering sleep mode.
SF_POWER_PROFILES_EVENT_POST_SLEEP	Callback just after waking up.

6.25.7 API Structures

6.25.7.1 sf_power_profiles_callback_args_t

sf_power_profiles_callback_args_t

Detailed description

Power profiles callback arguments definitions

Variables

- sf_power_profiles_event_t event

  Power profiles callback event.

- void * p_context

  Placeholder for user data.

6.25.7.2 sf_power_profiles_ctrl_t

sf_power_profiles_ctrl_t

Detailed description

Channel control block. DO NOT INITIALIZE. Initialization occurs when SF_POWER_PROFILES_Open is called

Variables

- uint32_t open

  Used by driver to check if pointer to control block is valid.

- ioport_cfg_t const * p_wake_ioport_pin_tbl

  Pointer to ioport settings for wakeup.

- ioport_cfg_t const * p_sleep_ioport_pin_tbl

  Pointer to ioport settings for sleep.

- sf_power_profiles_mode_t operating_mode

  Power profile mode to use.

- lpm_api_t const * p_api_lpm

  Pointer to lower level Low Power driver function pointers.

- rtc_api_t const * p_api_rtc

  Pointer to lower level RTC driver function pointers.

- rtc_ctrl_t * p_ctrl_rtc

  Pointer to lower level RTC driver control block.

- void(* p_callback)(sf_power_profiles_callback_args_t *p_args)

  Callback function.

- void * p_context

  Placeholder for user data.

6.25.7.3 sf_power_profiles_cfg_t

sf_power_profiles_cfg_t

Detailed description

Configuration for RTOS integrated Power Profiles driver

Variables

- ioport_cfg_t const *const p_wake_ioport_pin_tbl

  Pointer to ioport settings for wakeup.

- ioport_cfg_t const *const p_sleep_ioport_pin_tbl

  Pointer to ioport settings for sleep.

- sf_power_profiles_mode_t operating_mode

  Power profile mode to use.

- bool retain_output_signals

  (Future implementation:) True (Default) ==> address bus and bus control signals retain the output state False ==> signals are set to high-impedance state

- lpm_instance_t const *const p_lower_lvl_lpm

  Pointer to the LPM instance.

- rtc_instance_t const *const p_lower_lvl_rtc

  Pointer to the RTC instance (if any)

- void(* p_callback)(sf_power_profiles_callback_args_t *p_args)

  Callback function.

- void * p_context

  Placeholder for user data.

6.25.7.4 sf_power_profiles_api_t

sf_power_profiles_api_t

Detailed description

Framework Power Profiles API structure. Implementations will use the following API.

6.25.7.5 open

```
ssp_err_t(* sf_power_profiles_api_t::open) (sf_power_profiles_ctrl_t *const
p_ctrl, sf_power_profiles_cfg_t const *const p_cfg)
```

Detailed description

Acquires mutex, then initialize the lower layer drivers at the HAL layer Implemented as

- SF_POWER_PROFILES_Open

Table 390:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. Elements initialized here.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_power_profiles_ctrl_t`

Channel control block. DO NOT INITIALIZE. Initialization occurs when SF_POWER_PROFILES_Open is called

Parameter p_cfg

Definition: `sf_power_profiles_cfg_t const *const p_cfg`

Configuration for RTOS integrated Power Profiles driver

- `sf_power_profiles_cfg_t`::`ioport_cfg_t`

  Pointer to ioport settings for wakeup.

- `sf_power_profiles_cfg_t`::`ioport_cfg_t`

  Pointer to ioport settings for sleep.

- `sf_power_profiles_cfg_t`::`sf_power_profiles_mode_t`

  Power profile mode to use.

  Enumerated as:

  – SF_POWER_PROFILES_MODE_RUN

  – SF_POWER_PROFILES_MODE_RTC

  – SF_POWER_PROFILES_MODE_EXTERNAL

- `sf_power_profiles_cfg_t`::`retain_output_signals`

  (Future implementation:) True (Default) ==> address bus and bus control signals retain the output state False ==> signals are set to high-impedance state

- `sf_power_profiles_cfg_t`::`lpm_instance_t`

  Pointer to the LPM instance.

- `sf_power_profiles_cfg_t`::`rtc_instance_t`

  Pointer to the RTC instance (if any)

- sf_power_profiles_cfg_t::p_callback

  Callback function.

- sf_power_profiles_cfg_t::p_context

  Placeholder for user data.

6.25.7.6 sleep

```
ssp_err_t(* sf_power_profiles_api_t::sleep) (sf_power_profiles_ctrl_t *const
p_ctrl)
```

Detailed description

Places the MCU in Software Standby mode. Implemented as

- SF_POWER_PROFILES_Sleep

NOTE: If the Power Profiles operating mode has been set to SF_POWER_PROFILES_MODE_RTC, then the MCU is configured to enter a low power mode that also allows the RTC and it's associated clock to run. It is up to the application to configure the RTC such that it interrupts at a specified interval.

Table 391:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in SF_POWER_PROFILES_Open.

Parameter p_ctrl

Definition: sf_power_profiles_ctrl_t

Channel control block. DO NOT INITIALIZE. Initialization occurs when SF_POWER_PROFILES_Open is called

6.25.7.7 close

```
ssp_err_t(* sf_power_profiles_api_t::close) (sf_power_profiles_ctrl_t *const
p_ctrl)
```

Detailed description

Releases channel mutex and closes channel at HAL layer. Implemented as

- SF_POWER_PROFILES_Close

Table 392:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in SF_POWER_PROFILES_Open.

Parameter p_ctrl

Definition: `sf_power_profiles_ctrl_t`

Channel control block. DO NOT INITIALIZE. Initialization occurs when SF_POWER_PROFILES_Open is called

6.25.7.8 versionGet

```
ssp_err_t(* sf_power_profiles_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 393:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.25.7.9 sf_power_profiles_instance_t

sf_power_profiles_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_power_profiles_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_power_profiles_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_power_profiles_api_t const * p_api

  Pointer to the API structure for this instance.

6.26 Power Profiles Framework Interface

Power Profiles Framework Interface.

6.26.1 Summary

This framework allows an application to apply power profiles at runtime. There are 2 types of profiles: Run and Low Power. Applying a Run profile will change things like the system clock and IOPORT settings. The MCU will continue to run during this process and will not be put into a low power mode. Applying a Low Power profile will put the MCU into a low power mode. Which low power mode is used is specified by the LPMv2 instance used. IOPORT settings can also be specified which will be applied before entering the low power mode and after waking up.

The Deep Software Standby low power mode, available on some MCUs, will reset the MCU when the woken up. In this case the callback will not be called and the IOPORT configuration will not be applied after waking up.

This framework can be used with, or without, an RTOS.

  Pointer to the configuration structure for this instance.
- sf_power_profiles_v2_api_t const * p_api

  Pointer to the API structure for this instance.

6.27 SF Socket WIFI Framework Interface

RTOS-integrated SF Socket WIFI Framework Interface.

6.27.1 Summary

This SSP Interface provides access OnChip stack BSD Socket API.

6.27.2 Functions

- socket
- close
- bind
- listen
- connect
- accept
- send
- recv
- sendto
- recvfrom
- setsockopt
- getsockopt
- select

6.27.3 Interface API

sf_socket_api_t

Function name	Description
.open	Pointer to function which initializes the network interface for data transfers. Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.
.close	Pointer to function which un-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.versionGet	Gets version and stores it in provided pointer p_version.

6.27.4 Data structures

- in_addr
- sockaddr
- sockaddr_in
- sf_socket_ctrl_t
- sf_socket_cfg_t
- sf_socket_instance_t

6.27.5 Typedefs

- socklen_t

6.27.6 Defines

- #define SF_SOCKET_WIFI_API_VER_MAJOR

  Initial value: `(1U)`

  Major Version of the API defined in this file
- #define SF_SOCKET_WIFI_API_VER_MINOR

  Initial value: `(0U)`

  Minor Version of the API defined in this file

6.27.7 socket

```
socket ( int domain , int type , int protocol )
```

6.27.7.1 Detailed description

API which creates socket

Table 399:Parameters

Name	Direction	Description
domain	in	Socket family
type	in	Socket type
protocol	in	Protocol type

6.27.8 close

```
close ( int socket_fd )
```

6.27.8.1 Detailed description

API which closes socket

Table 400:Parameters

Name	Direction	Description
socket_fd	in	Local socket

6.27.9 bind

```
bind ( int socket_fd , sockaddr const struct * p_local_sock_addr ,
socklen_t addrlen )
```

6.27.9.1 Detailed description

Bind socket to interface which is identified by IP address

Table 401:Parameters

Name	Direction	Description
socket_fd	in	Local socket
p_local_sock_addr	in	Pointer to local socket address
addrlen	in	Size of sock address structure

6.27.10 listen

```
listen (  int sockfd ,   int backlog )
```

6.27.10.1 Detailed description

Listen for tcp connection. Set socket in listen mode for tcp connection.

Table 402:Parameters

Name	Direction	Description
sockfd	in	Local socket
backlog	in	Max number of connection queue.

6.27.11 connect

```
connect (  int sockfd ,  sockaddr const struct * p_serv_addr ,
socklen_t  addrlen )
```

6.27.11.1 Detailed description

Establish TCP connection with remote socket

Table 403:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_serv_addr	in	Pointer to remote socket address

Table 403:Parameters (Continued)

Name	Direction	Description
addrlen	in	Size of sock address structure

6.27.12 accept

```
accept (  int sockfd ,  sockaddr struct * p_cliaddr ,  socklen_t  * p_addrlen )
```

6.27.12.1 Detailed description

Accept connection request from remote.

Table 404:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_cliaddr	out	Pointer to remote socket address which trying to connect
p_addrlen	out	Pointer to address length of client socket address

6.27.13 send

```
send (  int sockfd ,  const void * p_buf ,  size_t length ,  int flags )
```

6.27.13.1 Detailed description

Send data to remote socket.

Table 405:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	in	Pointer to data buffer
length	in	Data buffer length
flags	in	Socket flags

6.27.14 recv

```
recv ( int sockfd , void * p_buf , size_t length , int flags )
```

6.27.14.1 Detailed description

Receive data from remote socket.

Table 406:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	out	Pointer to data buffer where data will be received
length	in	Maximum length of data which can be received
flags	in	Socket flags

6.27.15 sendto

```
sendto ( int sockfd , const void * p_buf , size_t length , int flags ,
sockaddr const struct * p_dest_addr , socklen_t addrlen )
```

6.27.15.1 Detailed description

Send data to remote socket.

Table 407:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	in	Pointer to data buffer to sent
length	in	Data buffer length
flags	in	Socket flag
p_dest_addr	in	Pointer to remote socket address where to send data

Table 407:Parameters (Continued)

Name	Direction	Description
addrlen	in	Length of socket address structure

6.27.16 recvfrom

```
recvfrom (  int sockfd ,   void * p_buf ,   size_t length ,   int flags ,
sockaddr struct * p_src_addr ,  socklen_t  * p_addrlen )
```

6.27.16.1 Detailed description

Receive data from remote socket.

Table 408:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	out	Pointer to data buffer where data will be received
length	in	Maximum length of data which can be received
flags	in	Socket flag
p_src_addr	out	Pointer to remote socket address which has sent data
p_addrlen	out	Length of socket address structure

6.27.17 setsockopt

```
 setsockopt (  int sockfd ,   int level ,   int optname ,   const void
* p_optval ,  socklen_t  optlen )
```

6.27.17.1 Detailed description

Set Socket options.

Table 409:Parameters

Name	Direction	Description
sockfd	in	Local socket
level	in	Sockets API level
optname	in	Option to be set
p_optval	in	Option value to be set
optlen	in	Length of option value

6.27.18 getsockopt

```
getsockopt (  int sockfd ,   int level ,   int optname ,   void * p_optval ,
socklen_t  * p_optlen )
```

6.27.18.1 Detailed description

Get Socket options.

Table 410:Parameters

Name	Direction	Description
sockfd	in	Local socket
level	in	Sockets API level
optname	in	Option to be get
p_optval	out	Option value to be get
p_optlen	in	Length of option value

6.27.19 select

```
 select (  int nfds ,   fd_set * p_readfds ,   fd_set * p_writefds ,   fd_set
* p_exceptfds ,   struct timeval * p_timeout )
```

6.27.19.1 Detailed description

Wait on a given socket for specified amount of time. In case of any activity e.g. arrival of packet it comes out of wait.

Table 411:Parameters

Name	Direction	Description
nfds	in	Max fd
p_readfds	in	Pointer to fd_set to check whether data is available for read
p_writefds	in	Pointer to fd_set to check whether data is available for write
p_exceptfds	in	Pointer to fd_set to check whether exceptional condition occurred
p_timeout	in	Wait time in milliseconds

6.27.21.8 close

```
(* sf_socket_api_t::close) (sf_socket_ctrl_t *const p_ctrl)
```

Brief description

Pointer to function which un-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.

Detailed description

Table 413:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the control block

Parameter p_ctrl

Definition: `sf_socket_ctrl_t`

Socket Interface control structure

6.27.21.9 versionGet

```
(* sf_socket_api_t::versionGet) ( *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Table 414:Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

6.27.21.10 sf_socket_instance_t

sf_socket_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_socket_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_socket_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_socket_api_t const * p_api

  Pointer to the API structure for this instance.

6.28 SF Socket CELLULAR Framework Interface

RTOS-integrated SF Socket Cellular Framework Interface.

6.28.1 Summary

This SSP Interface provides access OnChip stack BSD Socket API.

6.28.2 Functions

- socket
- close
- bind
- listen
- connect
- accept
- send
- recv
- sendto
- recvfrom
- setsockopt
- getsockopt
- select

6.28.3 Interface API

sf_cellular_socket_api_t

Function name	Description
.open	Pointer to function which initializes the network interface for data transfers. Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.
.close	Pointer to function which un-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.versionGet	Gets version and stores it in provided pointer p_version.

6.28.4 Data structures

- in_addr
- sockaddr
- sockaddr_in
- sf_cellular_socket_ctrl_t

- sf_cellular_socket_cfg_t

  SF Cellular Socket APIs Minor Version

6.28.7 socket

```
socket (  int domain ,   int type ,   int protocol )
```

6.28.7.1 Detailed description

API which creates socket

Table 415:Parameters

Name	Direction	Description
domain	in	Socket family
type	in	Socket type
protocol	in	Protocol type

6.28.8 close

```
close (  int socket_fd )
```

6.28.8.1 Detailed description

API which closes socket

Table 416:Parameters

Name	Direction	Description
socket_fd	in	Local socket

6.28.9 bind

```
bind (  int socket_fd ,  sockaddr const struct * p_local_sock_addr ,
socklen_t  addrlen )
```

6.28.9.1 Detailed description

Bind socket to interface which is identified by IP address

Table 417:Parameters

Name	Direction	Description
socket_fd	in	Local socket
p_local_sock_addr	in	Pointer to local socket address
addrlen	in	Size of sock address structure

6.28.10 listen

```
listen (  int sockfd ,   int backlog )
```

6.28.10.1 Detailed description

Listen for tcp connection. Set socket in listen mode for tcp connection.

Table 418:Parameters

Name	Direction	Description
sockfd	in	Local socket
backlog	in	Max number of connection queue.

6.28.11 connect

```
connect ( int sockfd , sockaddr const struct * p_serv_addr ,
socklen_t addrlen )
```

6.28.11.1 Detailed description

Establish TCP connection with remote socket

Table 419:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_serv_addr	in	Pointer to remote socket address
addrlen	in	Size of sock address structure

6.28.12 accept

```
accept ( int sockfd , sockaddr struct * p_cliaddr , socklen_t * p_addrlen )
```

6.28.12.1 Detailed description

Accept connection request from remote.

Table 420:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_cliaddr	out	Pointer to remote socket address which trying to connect
p_addrlen	out	Pointer to address length of client socket address

6.28.13 send

```
send ( int sockfd , const void * p_buf , size_t length , int flags )
```

6.28.13.1 Detailed description

Send data to remote socket.

Table 421:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	in	Pointer to data buffer
length	in	Data buffer length
flags	in	Socket flags

6.28.14 recv

```
recv ( int sockfd , void * p_buf , size_t length , int flags )
```

6.28.14.1 Detailed description

Receive data from remote socket.

Table 422:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	out	Pointer to data buffer where data will be received
length	in	Maximum length of data which can be received
flags	in	Socket flags

6.28.15 sendto

```
sendto ( int sockfd , const void * p_buf , size_t length , int flags ,
sockaddr const struct * p_dest_addr , socklen_t addrlen )
```

6.28.15.1 Detailed description

Send data to remote socket.

Table 423:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	in	Pointer to data buffer to sent
length	in	Data buffer length
flags	in	Socket flag
p_dest_addr	in	Pointer to remote socket address where to send data
addrlen	in	Length of socket address structure

6.28.16 recvfrom

```
recvfrom (  int sockfd ,   void * p_buf ,   size_t length ,   int flags ,
sockaddr struct * p_src_addr ,  socklen_t  * p_addrlen )
```

6.28.16.1 Detailed description

Receive data from remote socket.

Table 424:Parameters

Name	Direction	Description
sockfd	in	Local socket
p_buf	out	Pointer to data buffer where data will be received
length	in	Maximum length of data which can be received
flags	in	Socket flag
p_src_addr	out	Pointer to remote socket address which has sent data

Table 424:Parameters (Continued)

Name	Direction	Description
p_addrlen	out	Length of socket address structure

6.28.17 setsockopt

```
 setsockopt (  int sockfd ,   int level ,   int optname ,   const void
* p_optval ,  socklen_t  optlen )
```

6.28.17.1 Detailed description

Set Socket options.

Table 425:Parameters

Name	Direction	Description
sockfd	in	Local socket
level	in	Sockets API level
optname	in	Option to be set
p_optval	in	Option value to be set
optlen	in	Length of option value

6.28.18 getsockopt

```
getsockopt (  int sockfd ,   int level ,   int optname ,   void * p_optval ,
socklen_t  * p_optlen )
```

6.28.18.1 Detailed description

Get Socket options.

Table 426:Parameters

Name	Direction	Description
sockfd	in	Local socket
level	in	Sockets API level

Table 426:Parameters (Continued)

Name	Direction	Description
optname	in	Option to be get
p_optval	out	Option value to be get
p_optlen	in	Length of option value

6.28.19 select

```
 select (  int nfds ,   fd_set * p_readfds ,   fd_set * p_writefds ,   fd_set
* p_exceptfds ,   struct timeval * p_timeout )
```

6.28.19.1 Detailed description

Wait on a given socket for specified amount of time. In case of any activity e.g. arrival of packet it comes out of wait.

Table 427:Parameters

Name	Direction	Description
nfds	in	Max fd
p_readfds	in	Pointer to fd_set to check whether data is available for read
p_writefds	in	Pointer to fd_set to check whether data is available for write
p_exceptfds	in	Pointer to fd_set to check whether exceptional condition occurred
p_timeout	in	Wait time in milliseconds

  Pointer to the API structure for this instance.

6.29 SPI Framework Interface

RTOS-integrated SPI Framework Interface.

6.29.1 Summary

This SSP Interface provides access to the ThreadX-aware SPI Framework. The Interface is implemented by the SPI Framework.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

SPI Framework Interface description: SPI Framework

6.29.2 Interface API

sf_spi_api_t

Function name	Description
.open	Open a designated SPI device on a bus.
.read	Receive data from SPI device.
.write	Transmit data to SPI device.
.writeRead	Simultaneously transmit data to an SPI device while receiving data from an SPI device (full duplex). The writeread API gets mutex object, handles SPI data transmission at SPI HAL layer and receive data from the SPI HAL layer. The API uses the event flag wait to synchronize to completion of data transfer .
.close	Disable the SPI device designated by the control handle and close the RTOS services used by the bus if no devices are connected to the bus. This function removes power to the SPI channel designated by the handle and disables the associated interrupts.
.lock	Lock the bus for a device. The locking allows devices to reserve a bus to themselves for a given period of time (i.e. between lock and unlock). This allows devices to complete several reads and writes on the bus without interrupt.
.unlock	Unlock the bus for a particular device and make the bus usable for other devices.
.version	Get the version information of the underlying driver.

sf_spi_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_spi_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_spi_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_spi_api_t const * p_api

  Pointer to the API structure for this instance.

6.30 Thread Monitor Framework Interface

RTOS-integrated Framework Interface for monitoring of threads.

Any misbehaving threads cause a reset of the device. Both the WDT and IWDT HAL modules are supported by this framework module.

6.30.1 Summary

This is a ThreadX aware Watchdog Timer Thread Monitor Framework for monitoring threads in an application in which threads are executing at an expected rate. Threads to be monitored register themselves through SF_THREAD_MONITOR_ThreadRegister and increment a count by calling

SF_THREAD_MONITOR_CountIncrement each time they execute. Each monitored thread also provides expected maximum and minimum count values for normal execution.

The Thread Monitor runs periodically and checks the count value of each monitored thread. If the count value falls outside of the expected range of values, the Watchdog Timer is allowed to reset the device. If all thread counts are within their expected ranges, then the Watchdog Timer is refreshed.

The WDT and IWDT modules are supported by the Thread Monitor.

The Framework Layer can be used to protect the entire software project. This is achieved through a high priority thread (Framework Layer) which runs periodically within the refresh permitted window of the Watchdog Timer selected (IWDT is safest as has its own clock source and is started automatically after reset). This thread monitors the state of every other thread in the system. If any of these threads are not running as expected, then the Watchdog Timer is not refreshed and is not allowed to reset the system. If the threads are running as expected, then the Watchdog Timer is refreshed.

Monitoring the other threads is achieved as follows: Each monitored thread increments a count variable each time it runs. The Thread Monitor thread checks the count variable of each thread to make sure it is within an expected range. If any of the variables are out of range a reset is allowed. Otherwise all variables are cleared to zero and the watchdog is refreshed. A profiling mode is used to establish the expected ranges.

This approach is described in the following article:

Jack Ganssle, "Great Watchdog Timers for Embedded Systems," www.ganssle.com/watchdogs.htm

This method requires the instrumenting of each thread to increment its count variable, but this is little overhead for the massive gain in protection.

Thread Monitor Interface description: Thread Monitor Framework

6.30.2 Interface API

sf_thread_monitor_api_t

Function name	Description
.open	Configures the WDT or IWDT module. From the configuration data the timeout period of the WDT/IWDT is determined and a thread created monitoring registered threads.
.close	Suspends the thread monitoring thread. Watchdog peripheral no longer refreshed.
.threadRegister	Registers a thread for monitoring.
.threadUnregister	Removes a thread from being monitored.

Function name	Description
.countIncrement	Safely increments a monitored thread's count value.
.versionGet	Get version and store it in provided pointer p_version.

6.30.3 Data structures

- sf_thread_monitor_cfg_t
- sf_thread_monitor_thread_counter_t
- sf_thread_monitor_counter_min_max_t
- sf_thread_monitor_instance_t

6.30.4 Typedefs

- sf_thread_monitor_ctrl_t

6.30.5 Defines

- #define THREAD_MONITOR_THREAD_STACK_SIZE

  Initial value:`400u`
- #define SF_THREAD_MONITOR_API_VERSION_MAJOR

  Initial value: `(1U)`

  Version of the API defined in this file
- #define SF_THREAD_MONITOR_API_VERSION_MINOR

  Initial value: `(3U)`

6.30.6 API Data

6.30.6.1 sf_thread_monitor_ctrl_t

```
typedef void sf_thread_monitor_ctrl_t
```

Detailed description

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented as

- sf_thread_monitor_instance_ctrl_t

6.30.7 API Structures

6.30.7.1 sf_thread_monitor_cfg_t

sf_thread_monitor_cfg_t

Detailed description

Configuration for RTOS Thread Monitor driver

Variables

- wdt_instance_t const * p_lower_lvl_wdt

  Pointer to lower level watchdog instance.

- bool profiling_mode_enabled

  Enables or disables profiling mode.

- UINT priority

  Priority of thread monitor thread.

6.30.7.2 sf_thread_monitor_thread_counter_t

sf_thread_monitor_thread_counter_t

Detailed description

Counter block for each monitored thread.

Variables

- uint32_t current_count

  Current count value for a thread.

- uint32_t minimum_count

  Minimum expected count value. If the current count is less than this value the watchdog will reset.

- uint32_t maximum_count

  Maximum expected count value. If the current count is more than this value the watchdog will reset

- bool active

  Indicates to the monitoring thread whether this count data is currently active. When a thread is registered this value will be set to false as the count is likely to be a partial count and so should not be monitored. This value will be set to true by the thread monitor thread when it clears all counts to zero.

- TX_THREAD * p_thread

  Pointer to thread for this counter data.

6.30.7.3 sf_thread_monitor_counter_min_max_t

sf_thread_monitor_counter_min_max_t

Detailed description

Counter block for each monitored thread.

Variables

- uint32_t minimum_count

  Minimum expected count value. If the current count is less than this value the watchdog will reset.

- uint32_t maximum_count

  Maximum expected count value. If the current count is more than this value the watchdog will reset

6.30.7.4 sf_thread_monitor_api_t

sf_thread_monitor_api_t

Detailed description

Thread monitor API structure. Thread Monitor implementations use the following API.

6.30.7.5 open

```
(* sf_thread_monitor_api_t::open) (sf_thread_monitor_ctrl_t *const p_ctrl,
sf_thread_monitor_cfg_t const *const p_cfg)
```

Brief description

Configures the WDT or IWDT module. From the configuration data the timeout period of the WDT/IWDT is determined and a thread created monitoring registered threads.

Detailed description

Implemented as

- SF_THREAD_MONITOR_Open

Table 439:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. Elements initialized here.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_thread_monitor_ctrl_t*const p_ctrl`

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented assf_thread_monitor_instance_ctrl_t

Parameter p_cfg

Definition: sf_thread_monitor_cfg_t const *const p_cfg

Configuration for RTOS Thread Monitor driver

- sf_thread_monitor_cfg_t::wdt_instance_t

  Pointer to lower level watchdog instance.

- sf_thread_monitor_cfg_t::profiling_mode_enabled

  Enables or disables profiling mode.

- sf_thread_monitor_cfg_t::priority

  Priority of thread monitor thread.

6.30.7.6 close

```
(* sf_thread_monitor_api_t::close) (sf_thread_monitor_ctrl_t *const p_ctrl)
```

Brief description

Suspends the thread monitoring thread. Watchdog peripheral no longer refreshed.

Detailed description

Implemented as

- SF_THREAD_MONITOR_Close

Table 440:Parameters

Name	Direction	Description
p_ctrl	inout	Control structure set in SF_THREAD_MONITOR_Open.

Parameter p_ctrl

Definition: sf_thread_monitor_ctrl_t*const p_ctrl

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented assf_thread_monitor_instance_ctrl_t

6.30.7.7 threadRegister

```
(* sf_thread_monitor_api_t::threadRegister) (sf_thread_monitor_ctrl_t *const
p_ctrl, sf_thread_monitor_counter_min_max_t const *p_counter_min_max)
```

Brief description

Registers a thread for monitoring.

Detailed description

Implemented as

- SF_THREAD_MONITOR_ThreadRegister

Table 441:Parameters

Name	Direction	Description
p_ctrl	inout	Control structure set in SF_THREAD_MONITOR_Open.
p_counter_min_max	in	Pointer to structure containing min and max values for thread to be registered values.

Parameter p_ctrl

Definition: `sf_thread_monitor_ctrl_t*const p_ctrl`

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented assf_thread_monitor_instance_ctrl_t

Parameter p_counter_min_max

Definition: `sf_thread_monitor_counter_min_max_tconst *p_counter_min_max`

Counter block for each monitored thread.

- `sf_thread_monitor_counter_min_max_t::minimum_count`

  Minimum expected count value. If the current count is less than this value the watchdog will reset.

- `sf_thread_monitor_counter_min_max_t::maximum_count`

  Maximum expected count value. If the current count is more than this value the watchdog will reset

6.30.7.8 threadUnregister

```
(* sf_thread_monitor_api_t::threadUnregister) (sf_thread_monitor_ctrl_t *const
p_ctrl)
```

Brief description

Removes a thread from being monitored.

Detailed description

Implemented as

- SF_THREAD_MONITOR_ThreadUnregister

Table 442:Parameters

Name	Direction	Description
p_ctrl	inout	Control structure set in SF_THREAD_MONITOR_Open.

Parameter p_ctrl

Definition: `sf_thread_monitor_ctrl_t*const p_ctrl`

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented assf_thread_monitor_instance_ctrl_t

6.30.7.9 countIncrement

```
(* sf_thread_monitor_api_t::countIncrement) (sf_thread_monitor_ctrl_t *const
p_ctrl)
```

Brief description

Safely increments a monitored thread's count value.

Detailed description

Implemented as

- SF_THREAD_MONITOR_CountIncrement

Table 443:Parameters

Name	Direction	Description
p_ctrl	inout	Control structure set in SF_THREAD_MONITOR_Open.

Parameter p_ctrl

Definition: `sf_thread_monitor_ctrl_t*const p_ctrl`

Thread monitor control block. Allocate an instance specific control block to pass into the thread monitor API calls. Implemented assf_thread_monitor_instance_ctrl_t

6.30.7.10 versionGet

```
(* sf_thread_monitor_api_t::versionGet) ( *const p_version)
```

Brief description

Get version and store it in provided pointer p_version.

Detailed description

Implemented as

- SF_THREAD_MONITOR_VersionGet

Table 444:Parameters

Name	Direction	Description
p_version	inout	Pointer to structure storing API and code versions.

Parameter p_version

6.30.7.11 sf_thread_monitor_instance_t

sf_thread_monitor_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_thread_monitor_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_thread_monitor_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_thread_monitor_api_t const * p_api

  Pointer to the API structure for this instance.

6.31 CTSU Framework Interface

RTOS-integrated CTSU Framework Interface.

6.31.1 Summary

This is a ThreadX-aware CTSU interface which is used to drive the CTSU HAL driver. It can be used to run the CTSU hardware, and read back the results of the scans.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CTSU Framework Interface description: Capacitive Touch Framework

6.31.2 Interface API

sf_touch_ctsu_api_t

Function name	Description
.open	Initialize the Touch CTSU Framework; configures the lower level hardware also and run scans at the configured Update Frequency.
.read	Read the results from the CTSU including raw data, binary data and other derived data according to the selected options.
.close	Close the Framework by ending any scans in progress and destroying internal threads.
.versionGet	Get version and store it in provided pointer p_version.

6.31.3 Data structures

- sf_touch_ctsu_callback_args_t
- sf_touch_ctsu_cfg_t
- sf_touch_ctsu_instance_t

6.31.4 Typedefs

- sf_touch_ctsu_ctrl_t

6.31.5 Defines

- #define SF_TOUCH_CTSU_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_TOUCH_CTSU_VERSION_MINOR

  Initial value: `(1U)`

6.31.6 API Data

6.31.6.1 sf_touch_ctsu_ctrl_t

```
typedef void sf_touch_ctsu_ctrl_t
```

Detailed description

Capacitive touch framework control block. Allocate an instance specific control block to pass into the capacitive touch framework API calls. Implemented as

- sf_touch_ctsu_instance_ctrl_t

6.31.7 API Structures

6.31.7.1 sf_touch_ctsu_callback_args_t

sf_touch_ctsu_callback_args_t

Detailed description

Callback argument structure

Variables

- void * p_context

6.31.7.2 sf_touch_ctsu_cfg_t

sf_touch_ctsu_cfg_t

Detailed description

Configuration for RTOS integrated CTSU Touch framework.

Variables

- UINT priority

  Priority of the touch panel thread.
- uint16_t update_hz

  The frequency to run the scans. This is set by the latest open() call.
- void(* p_callback)(sf_touch_ctsu_callback_args_t *p_args)

  Callback function;.
- void * p_context

  Arguments to the callback.
- ctsu_instance_t * p_ctsu_instance

  CTSU instance.

6.31.7.3 sf_touch_ctsu_api_t

sf_touch_ctsu_api_t

Detailed description

CTSU Framework API structure. Implementations will use the following API.

6.31.7.4 open

```
(* sf_touch_ctsu_api_t::open) (sf_touch_ctsu_ctrl_t *const p_ctrl,
sf_touch_ctsu_cfg_t const *const p_cfg)
```

Detailed description

Initialize the Touch CTSU Framework; configures the lower level hardware also and run scans at the configured Update Frequency. Implemented as

- SF_TOUCH_CTSU_Open

Table 445:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `sf_touch_ctsu_ctrl_t*const p_ctrl`

Capacitive touch framework control block. Allocate an instance specific control block to pass into the capacitive touch framework API calls. Implemented assf_touch_ctsu_instance_ctrl_t

Parameter p_cfg

Definition: `sf_touch_ctsu_cfg_t const *const p_cfg`

Configuration for RTOS integrated CTSU Touch framework.

- `sf_touch_ctsu_cfg_t`::`priority`

  Priority of the touch panel thread.

- `sf_touch_ctsu_cfg_t`::`update_hz`

  The frequency to run the scans. This is set by the latest open() call.

- `sf_touch_ctsu_cfg_t`::`p_callback`

  Callback function;.

- `sf_touch_ctsu_cfg_t`::`p_context`

  Arguments to the callback.

- `sf_touch_ctsu_cfg_t`::`ctsu_instance_t`

  CTSU instance.

6.31.7.5 read

```
(* sf_touch_ctsu_api_t::read) (sf_touch_ctsu_ctrl_t *const p_ctrl, void *p_dest,
opts, const *channels, const uint16_t count)
```

Detailed description

Read the results from the CTSU including raw data, binary data and other derived data according to the selected options. Implemented as

- SF_TOUCH_CTSU_Read

Table 446:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_dest	out	Pointer to the destination location for the read data
opts	in	Read options
channels	in	Specify the channel/channel pairs to read data for
channels	in	Specify the number of channel/channel pairs to read data for

Parameter p_ctrl

Definition: `sf_touch_ctsu_ctrl_t*const p_ctrl`

Capacitive touch framework control block. Allocate an instance specific control block to pass into the capacitive touch framework API calls. Implemented assf_touch_ctsu_instance_ctrl_t

Parameter p_dest

`const`

Parameter opts
Parameter channels
Parameter channels

6.31.7.6 close

```
(* sf_touch_ctsu_api_t::close) (sf_touch_ctsu_ctrl_t *const p_ctrl)
```

Detailed description

Close the Framework by ending any scans in progress and destroying internal threads. Implemented as

- SF_TOUCH_CTSU_Close

Table 447:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `sf_touch_ctsu_ctrl_t*const p_ctrl`

Capacitive touch framework control block. Allocate an instance specific control block to pass into the capacitive touch framework API calls. Implemented assf_touch_ctsu_instance_ctrl_t

6.31.7.7 versionGet

`(* sf_touch_ctsu_api_t::versionGet) ( *const p_version)`

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- SF_TOUCH_CTSU_VersionGet

Table 448:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.31.7.8 sf_touch_ctsu_instance_t

sf_touch_ctsu_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_touch_ctsu_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_touch_ctsu_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_touch_ctsu_api_t const * p_api

  Pointer to the API structure for this instance.

6.32 CTSU Button Framework Interface

RTOS-integrated CTSU Button Framework Interface.

This framework layer uses the CTSU Framework Layer to implement a button interface. Using this Button Framework the user can configure and use multiple buttons using the configuration structure generated from WorkBench. An action on each button (press, release etc) will result in a callback with an argument indicating the button id and event type.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CTSU Button Framework Interface description: Capacitive Touch Button Framework

6.32.1 Interface API

sf_touch_ctsu_button_api_t

Function name	Description
.open	Initialize the Touch CTSU Button Framework; configures the lower level hardware and registers callback functions for all the buttons.
.enable	Enable callback notification for a configured button.
.disable	Disable callback notification for a configured button.
.close	Close the Touch CTSU Button Framework; Closes the button framework and lower layers if no other modules are using it.
.versionGet	Get version and store it in provided pointer p_version.

6.32.5 Defines

- #define SF_TOUCH_CTSU_BUTTON_VERSION_MAJOR

  Initial value: `(1U)`

  Version Number of API.
- #define SF_TOUCH_CTSU_BUTTON_VERSION_MINOR

  Initial value: `(1U)`

6.32.6 API Data

6.32.6.1 sf_touch_button_state_t

`sf_touch_button_state_t`

Detailed description

Button States.

Enumerated values

Name	Description
TOUCH_BUTTON_STATE_RELEASED	Button is in the released state.
TOUCH_BUTTON_STATE_PRESSED	Button is in the pressed state.
TOUCH_BUTTON_STATE_LONG_HOLD	Button is pressed down for a long time (duration in sf_touch_ctsu_button_config.h)
TOUCH_BUTTON_STATE_SHORT_HOLD	Button is pressed down for a short time (duration in sf_touch_ctsu_button_config.h.
TOUCH_BUTTON_STATE_STUCK	Button is stuck.
TOUCH_BUTTON_STATE_INITIAL	Button has been initialized successfully.
TOUCH_BUTTON_STATE_CLOSING	Button has been disabled and will no longer generate events.
TOUCH_BUTTON_STATE_MULTI_TOUCH	More than one touch element is being touched.
TOUCH_BUTTON_STATE_DISABLED	Button is disabled from being updated.

6.32.6.2 sf_touch_ctsu_button_id

```
typedef uint32_t sf_touch_ctsu_button_id
```

Detailed description

Unique identifier used for each button

6.32.6.3 sf_touch_ctsu_button_ctrl_t

```
typedef void sf_touch_ctsu_button_ctrl_t
```

Detailed description

Capacitive touch button framework control block. Allocate an instance specific control block to pass into the capacitive touch button framework API calls. Implemented as

- sf_touch_ctsu_button_instance_ctrl_t

6.32.7 API Structures

6.32.7.1 sf_touch_ctsu_button_callback_args_t

sf_touch_ctsu_button_callback_args_t

Detailed description

Button callback arguments definitions

Variables

- sf_touch_ctsu_button_id id

  Unique id for button.

- sf_touch_button_state_t event

  Button callback event.

- void const * p_context

  Placeholder for user data.

6.32.7.2 sf_touch_ctsu_button_individual_t

sf_touch_ctsu_button_individual_t

Detailed description

Definition of a button and it's behavior in software.

Variables

- ctsu_channel_pair_t button_channel

  Define the channel/channel pairs which make up a button.
- uint8_t release_enable

  enable release events
- uint8_t press_enable

  enable press events
- uint8_t repeat_enable

  enable repeat events
- uint8_t shorthold_enable

  enable short hold events
- uint8_t longhold_enable

  enable long hold events
- uint8_t byte

  Byte representation of events enabled.
- union{} event_enable

  See source code for definition of this member.
- uint16_t debounce_threshold

  Number of consecutive times a button is determined as touched before state changes.
- sf_touch_ctsu_button_id id

  Unique id for button.

6.32.7.3 sf_touch_ctsu_button_cfg_t

sf_touch_ctsu_button_cfg_t

Detailed description

Button Configuration Structure

Variables

- sf_touch_ctsu_instance_t const *const p_lower_lvl_touch_framework

  Pointer to the Touch Framework instance.
- uint32_t button_count

  Number of buttons in configuration.
- sf_touch_ctsu_button_individual_t ** pp_button_cfgs

  Pointer to button configurations.

- void(* p_callback)(sf_touch_ctsu_button_callback_args_t *p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.
- void const * p_extend

  Extension parameter for instance specific settings.

6.32.7.4 sf_touch_ctsu_button_hdl

sf_touch_ctsu_button_hdl

Detailed description

Handle for each button

Variables

- sf_touch_ctsu_button_individual_t button_cfg

  Individual button configuration.
- sf_touch_button_state_t state

  Represents the current state of the button.
- int16_t offset

  Offset in the results array and bit offset in the binary.
- sf_touch_button_state_t prev_state

  Holds previous state of the button.
- uint32_t debounce_counter

  Debounce counter.
- uint32_t active_event_counter

  Amount of time for which button is spending between states.
- uint32_t press_down_counter

  Time for which button is held down.
- uint32_t open

  Indicate that button has been opened.

6.32.7.5 sf_touch_ctsu_button_api_t

sf_touch_ctsu_button_api_t

Detailed description

Touch CTSU Button Framework API structure. Implementations will use the following API.

6.32.7.6 open

```
ssp_err_t(* sf_touch_ctsu_button_api_t::open) (sf_touch_ctsu_button_ctrl_t *const p_ctrl, sf_touch_ctsu_button_cfg_t const *const p_cfg)
```

Detailed description

Initialize the Touch CTSU Button Framework; configures the lower level hardware and registers callback functions for all the buttons. Implemented as

- SF_TOUCH_CTSU_Button_Open

Table 449:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `sf_touch_ctsu_button_ctrl_t*const p_ctrl`

Capacitive touch button framework control block. Allocate an instance specific control block to pass into the capacitive touch button framework API calls. Implemented assf_touch_ctsu_button_instance_ctrl_t

Parameter p_cfg

Definition: `sf_touch_ctsu_button_cfg_t const *const p_cfg`

Button Configuration Structure

- `sf_touch_ctsu_button_cfg_t`::`sf_touch_ctsu_instance_t`

  Pointer to the Touch Framework instance.

- `sf_touch_ctsu_button_cfg_t`::`button_count`

  Number of buttons in configuration.

- `sf_touch_ctsu_button_cfg_t`::`sf_touch_ctsu_button_individual_t`

  Pointer to button configurations.

- `sf_touch_ctsu_button_cfg_t`::`p_callback`

  Callback function.

- `sf_touch_ctsu_button_cfg_t`::`p_context`

  Placeholder for user data.

- sf_touch_ctsu_button_cfg_t::p_extend

  Extension parameter for instance specific settings.

6.32.7.7 enable

```
ssp_err_t(* sf_touch_ctsu_button_api_t::enable) (sf_touch_ctsu_button_ctrl_t
*const p_ctrl, sf_touch_ctsu_button_id const button_id)
```

Detailed description

Enable callback notification for a configured button. Implemented as

- SF_TOUCH_CTSU_Button_Enable

Table 450:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
button_id	in	Unique identifier for a button

Parameter p_ctrl

Definition: `sf_touch_ctsu_button_ctrl_t*const p_ctrl`

Capacitive touch button framework control block. Allocate an instance specific control block to pass into the capacitive touch button framework API calls. Implemented assf_touch_ctsu_button_instance_ctrl_t

Parameter button_id

`const`

6.32.7.8 disable

```

Slider States

Enumerated values

Name	Description
SF_TOUCH_CTSU_SLIDER_STATE_NO_CHANGE	Slider is in the released state
SF_TOUCH_CTSU_SLIDER_STATE_INITIALIZED	Slider is in the pressed state
SF_TOUCH_CTSU_SLIDER_STATE_TOUCHED	Slider is pressed
SF_TOUCH_CTSU_SLIDER_STATE_RELEASED	Slider is released
SF_TOUCH_CTSU_SLIDER_STATE_CLOSED	Slider has been disabled and will no longer generate events.
SF_TOUCH_CTSU_SLIDER_STATE_MULTI_TOUCH	More than one touch element is being touched
SF_TOUCH_CTSU_SLIDER_STATE_DISABLED	Slider is disabled from being updated.
SF_TOUCH_CTSU_SLIDER_STATE_HELD	Slider is held. (Continued press)

6.33.6.2 sf_slider_type_t

`sf_slider_type_t`

Detailed description

Slider type definition

Enumerated values

Name	Description
SF_SLIDER_TYPE_LINEAR	The slider is of a linear type

Name	Description
SF_SLIDER_TYPE_CIRCULAR	The slider is of a circular type (wheel)

6.33.6.3 sf_touch_ctsu_slider_id_t

```
typedef uint32_t sf_touch_ctsu_slider_id_t
```

Detailed description

Unique identifier used for each slider

6.33.6.4 sf_touch_ctsu_slider_ctrl_t

```
typedef void sf_touch_ctsu_slider_ctrl_t
```

Detailed description

Capacitive touch slider framework control block. Allocate an instance specific control block to pass into the capacitive touch slider framework API calls. Implemented as

- sf_touch_ctsu_slider_instance_ctrl_t

6.33.7 API Structures

6.33.7.1 sf_touch_ctsu_slider_callback_args_t

sf_touch_ctsu_slider_callback_args_t

Detailed description

Slider callback arguments definitions

Variables

- sf_touch_ctsu_slider_id_t id

  Unique slider identifier.
- uint32_t event

  Slider callback event.
- uint32_t current_position

  Current slider position.
- void const * p_context

  Placeholder for user data.

6.33.7.2 sf_touch_ctsu_slider_cfg_t

sf_touch_ctsu_slider_cfg_t

Detailed description

Slider Configuration Structure

Variables

- sf_touch_ctsu_instance_t * p_lower_lvl_touch_framework

  Pointer to the Touch Framework instance

- uint32_t slider_count

  Number of sliders in configuration

- void(* p_callback)(sf_touch_ctsu_slider_callback_args_t *p_args)

  Callback function

- void const * p_context

  Placeholder for user data

- void const * p_extend

  Extension parameter for instance specific settings.

6.33.7.3 sf_touch_ctsu_slider_api_t

sf_touch_ctsu_slider_api_t

Detailed description

Touch CTSU Slider Framework API structure. Implementations will use the following API.

6.33.7.4 open

```
ssp_err_t(* sf_touch_ctsu_slider_api_t::open) (sf_touch_ctsu_slider_ctrl_t *const p_ctrl, sf_touch_ctsu_slider_cfg_t const *const p_cfg)
```

Detailed description

Initialize the Touch CTSU Slider Framework, configures the lower level hardware and registers callback functions for all the sliders. Implemented as

- SF_TOUCH_CTSU_Slider_Open

Table 454:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `sf_touch_ctsu_slider_ctrl_t*const p_ctrl`

Capacitive touch slider framework control block. Allocate an instance specific control block to pass into the capacitive touch slider framework API calls. Implemented assf_touch_ctsu_slider_instance_ctrl_t

Parameter p_cfg

Definition: sf_touch_ctsu_slider_cfg_t const *const p_cfg

Slider Configuration Structure

- sf_touch_ctsu_slider_cfg_t::sf_touch_ctsu_instance_t

  Pointer to the Touch Framework instance

- sf_touch_ctsu_slider_cfg_t::slider_count

  Number of sliders in configuration

- sf_touch_ctsu_slider_cfg_t::p_callback

  Callback function

- sf_touch_ctsu_slider_cfg_t::p_context

  Placeholder for user data

- sf_touch_ctsu_slider_cfg_t::p_extend

  Extension parameter for instance specific settings.

6.33.7.5 enable

```
ssp_err_t(* sf_touch_ctsu_slider_api_t::enable) (sf_touch_ctsu_slider_ctrl_t
*const p_ctrl, sf_touch_ctsu_slider_id_t const slider_id)
```

Detailed description

Enable callback notification for a configured slider. Implemented as

- SF_TOUCH_CTSU_Slider_Enable

Table 455:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
slider_id	in	Unique identifier for a slider

Parameter p_ctrl

Definition: sf_touch_ctsu_slider_ctrl_t*const p_ctrl

Capacitive touch slider framework control block. Allocate an instance specific control block to pass into the capacitive touch slider framework API calls. Implemented assf_touch_ctsu_slider_instance_ctrl_t

Parameter slider_id

6.33.7.6 disable

```
ssp_err_t(* sf_touch_ctsu_slider_api_t::disable) (sf_touch_ctsu_slider_ctrl_t
*const p_ctrl, sf_touch_ctsu_slider_id_t const slider_id)
```

Detailed description

Disable callback notification for a configured slider. Implemented as

- SF_TOUCH_CTSU_Slider_Disable

Table 456:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
slider_id	in	Unique identifier for a slider

Parameter p_ctrl

Definition: `sf_touch_ctsu_slider_ctrl_t*const p_ctrl`

Capacitive touch slider framework control block. Allocate an instance specific control block to pass into the capacitive touch slider framework API calls. Implemented assf_touch_ctsu_slider_instance_ctrl_t

Parameter slider_id

6.33.7.7 close

```
ssp_err_t(* sf_touch_ctsu_slider_api_t::close) (sf_touch_ctsu_slider_ctrl_t
*const p_ctrl)
```

Detailed description

Close the Touch CTSU Slider Framework; Closes the slider framework and lower layers if no other modules are using it. Implemented as

- SF_TOUCH_CTSU_Slider_Close

Table 457:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `sf_touch_ctsu_slider_ctrl_t*const p_ctrl`

Capacitive touch slider framework control block. Allocate an instance specific control block to pass into the capacitive touch slider framework API calls. Implemented assf_touch_ctsu_slider_instance_ctrl_t

6.33.7.8 versionGet

```
ssp_err_t(* sf_touch_ctsu_slider_api_t::versionGet) (ssp_version_t *const
p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- SF_TOUCH_CTSU_Slider_VersionGet

Table 458:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

6.33.7.9 sf_touch_ctsu_slider_instance_t

sf_touch_ctsu_slider_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_touch_ctsu_slider_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sf_touch_ctsu_slider_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sf_touch_ctsu_slider_api_t const * p_api

  Pointer to the API structure for this instance.

6.34 Touch Panel Framework Interface

RTOS-integrated Touch Panel Framework Interface.

6.34.1 Summary

This module is a ThreadX-aware Touch Panel Framework which scans for touch events and posts them to the Messaging Framework for distribution to touch event subscribers. This Interface is implemented by I2C Touch Panel Framework.

Interfaces used:

- External IRQ Framework Interface
- I2C Master Interface
- Messaging Framework Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Touch Panel Framework Interface description: Touch Panel Framework

6.34.2 Interface API

sf_touch_panel_api_t

Function name	Description
.open	Create required RTOS objects, call lower level module for hardware specific initialization, and create a thread to post touch data to a message queue.
.calibrate	Begin calibration routine based on provided expected coordinates. Returns SSP_SUCCESS only if the tolerance is longer than the distance from the expected touch point to the actual touch point (using the formula below): p_calibrate->tolerance_pixels ^ 2 > (p_calibrate->x - x_measured) ^ 2 + (p_calibrate->y - y_measured) ^ 2
.start	Start scanning for touch events.
.stop	Stop scanning for touch events.
.reset	Reset touch controller if reset pin is provided, and resets the I2C bus.
.close	Terminate touch thread and close channel at HAL layer.
.versionGet	Gets version and stores it in provided pointer p_version.

6.34.3 Data structures

- sf_touch_panel_payload_t
- sf_touch_panel_cfg_t
- sf_touch_panel_calibrate_t
- sf_touch_panel_instance_t

6.34.4 Enumerations

- sf_touch_panel_event_t

6.34.5 Typedefs

- sf_touch_panel_ctrl_t

6.34.6 Defines

- #define SF_TOUCH_PANEL_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_TOUCH_PANEL_API_VERSION_MINOR

  Initial value: `(2U)`
- #define SF_TOUCH_PANEL_MESSAGE_WORDS

  Initial value: `((sizeof(sf_touch_panel_payload_t) + 3) / 4)`

  Touch panel message size in 4 byte words, rounded up.
- #define SF_TOUCH_PANEL_MAX_MESSAGES

  Initial value: `(4)`

  Maximum number of messages in touch panel message queue.
- #define SF_TOUCH_BYTES_PER_WORD

  Initial value: `(4)`

  Macro defining the number of bytes per word.
- #define SF_TOUCH_PANEL_MESSAGE_MEM_BYTES

  Initial value: `(#define SF_TOUCH_PANEL_MESSAGE_WORDS * #define SF_TOUCH_BYTES_PER_WORD \ * #define SF_TOUCH_PANEL_MAX_MESSAGES)`

  Touch message queue memory size.

6.34.7 API Data

6.34.7.1 sf_touch_panel_event_t

`sf_touch_panel_event_t`

Detailed description

Touch event list.

Enumerated values

Name	Description
SF_TOUCH_PANEL_EVENT_INVALID	Invalid touch data.
SF_TOUCH_PANEL_EVENT_HOLD	Touch has not moved since last touch event.
SF_TOUCH_PANEL_EVENT_MOVE	Touch has moved since last touch event.
SF_TOUCH_PANEL_EVENT_DOWN	New touch event reported.
SF_TOUCH_PANEL_EVENT_UP	Touch released.
SF_TOUCH_PANEL_EVENT_NONE	No valid touch event happened.

6.34.7.2 sf_touch_panel_ctrl_t

```
typedef void sf_touch_panel_ctrl_t
```

Detailed description

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented as

- sf_touch_panel_i2c_instance_ctrl_t

6.34.8 API Structures

6.34.8.1 sf_touch_panel_payload_t

sf_touch_panel_payload_t

Detailed description

Touch data payload posted to the message queue.

Variables

- sf_message_header_t header

  Required header for messaging framework.
- int16_t x

  X coordinate.
- int16_t y

  Y coordinate.
- sf_touch_panel_event_t event_type

  Touch event type.

6.34.8.2 sf_touch_panel_cfg_t

sf_touch_panel_cfg_t

Detailed description

Configuration for RTOS integrated touch panel framework.

Variables

- uint16_t hsize_pixels

  Horizontal size of screen in pixels.

- uint16_t vsize_pixels

  Vertical size of screen in pixels.

- UINT priority

  Priority of the touch panel thread.

- sf_message_instance_t const * p_message

  Pointer to messaging framework control block.

- uint8_t event_class_instance

  Event class instance number for posting touch event class messages.

- uint16_t update_hz

  The frequency to report repeat (SF_TOUCH_PANEL_EVENT_DOWN or SF_TOUCH_PANEL_EVENT_HOLD) touch events in Hertz. This will be converted to RTOS ticks in the driver and rounded up to the nearest integer value of RTOS ticks.

- uint16_t rotation_angle

  Touch coordinate rotation angle(0/90/180/270)

- void const * p_extend

  Pointer to hardware specific extension. See sf_touch_panel_<instance>.h.

6.34.8.3 sf_touch_panel_calibrate_t

sf_touch_panel_calibrate_t

Detailed description

Calibration data passed to SF_TOUCH_PANEL_Calibrate.

Variables

- uint16_t x

  Expected x coordinate.

- uint16_t y

  Expected y coordinate.

- uint16_t tolerance_pixels

  Acceptable linear deviation from the expected coordinates in pixels.

- void const * p_extend

  Pointer to hardware specific extension. See sf_touch_panel_<instance>_cfg_t in sf_touch_panel_<instance>.h.

6.34.8.4 sf_touch_panel_api_t

sf_touch_panel_api_t

Detailed description

Touch panel API structure. Touch panel implementations use the following API.

6.34.8.5 open

```
ssp_err_t(* sf_touch_panel_api_t::open) (sf_touch_panel_ctrl_t *const p_ctrl,
sf_touch_panel_cfg_t const *const p_cfg)
```

Detailed description

Create required RTOS objects, call lower level module for hardware specific initialization, and create a thread to post touch data to a message queue. Implemented as

- SF_TOUCH_PANEL_I2C_Open

Table 459:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to a structure allocated by user. This control structure is initialized in this function.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `sf_touch_panel_ctrl_t*const p_ctrl`

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

Parameter p_cfg

Definition: `sf_touch_panel_cfg_t const *const p_cfg`

Configuration for RTOS integrated touch panel framework.

- `sf_touch_panel_cfg_t`::`hsize_pixels`

  Horizontal size of screen in pixels.

- sf_touch_panel_cfg_t::vsize_pixels

  Vertical size of screen in pixels.

- sf_touch_panel_cfg_t::priority

  Priority of the touch panel thread.

- sf_touch_panel_cfg_t::sf_message_instance_t

  Pointer to messaging framework control block.

- sf_touch_panel_cfg_t::event_class_instance

  Event class instance number for posting touch event class messages.

- sf_touch_panel_cfg_t::update_hz

  The frequency to report repeat (SF_TOUCH_PANEL_EVENT_DOWN or SF_TOUCH_PANEL_EVENT_HOLD) touch events in Hertz. This will be converted to RTOS ticks in the driver and rounded up to the nearest integer value of RTOS ticks.

- sf_touch_panel_cfg_t::rotation_angle

  Touch coordinate rotation angle(0/90/180/270)

- sf_touch_panel_cfg_t::p_extend

  Pointer to hardware specific extension. See sf_touch_panel_<instance>.h.

6.34.8.6 calibrate

```
ssp_err_t(* sf_touch_panel_api_t::calibrate) (sf_touch_panel_ctrl_t *const
p_ctrl, sf_touch_panel_calibrate_t const *const p_expected,
sf_touch_panel_payload_t const *const p_actual, ULONG timeout)
```

Detailed description

Begin calibration routine based on provided expected coordinates. Returns SSP_SUCCESS only if the tolerance is longer than the distance from the expected touch point to the actual touch point (using the formula below): p_calibrate->tolerance_pixels ^ 2 > (p_calibrate->x - x_measured) ^ 2 + (p_calibrate->y - y_measured) ^ 2 Implemented as

- SF_TOUCH_PANEL_I2C_Calibrate

Table 460:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in touch_panel_api_t::open.
p_expected	in	Expected coordinates and tolerance for passing.

Table 460:Parameters (Continued)

Name	Direction	Description
p_actual	in	Pointer to message payload received from SF_MESSAGE_EVENT_CLASS_TOUCH event class.
timeout	in	ThreadX timeout. Select TX_NO_WAIT, a value in system clock counts between 1 and 0xFFFFFFFF, or TX_WAIT_FOREVER.

Parameter p_ctrl

Definition: `sf_touch_panel_ctrl_t*const p_ctrl`

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

Parameter p_expected

Definition: `sf_touch_panel_calibrate_tconst *const p_expected`

Calibration data passed to SF_TOUCH_PANEL_Calibrate.

- `sf_touch_panel_calibrate_t::x`

  Expected x coordinate.

- `sf_touch_panel_calibrate_t::y`

  Expected y coordinate.

- `sf_touch_panel_calibrate_t::tolerance_pixels`

  Acceptable linear deviation from the expected coordinates in pixels.

- `sf_touch_panel_calibrate_t::p_extend`

  Pointer to hardware specific extension. See sf_touch_panel_<instance>_cfg_t in sf_touch_panel_<instance>.h.

Parameter p_actual

Definition: `sf_touch_panel_payload_tconst *const p_actual`

Touch data payload posted to the message queue.

- `sf_touch_panel_payload_t::header`

  Required header for messaging framework.

- `sf_touch_panel_payload_t::x`

  X coordinate.

- `sf_touch_panel_payload_t::y`

  Y coordinate.

- sf_touch_panel_payload_t::event_type

  Touch event type.

Parameter timeout

const

6.34.8.7 start

```
ssp_err_t(* sf_touch_panel_api_t::start) (sf_touch_panel_ctrl_t *const p_ctrl)
```

Brief description

Start scanning for touch events.

Detailed description

Implemented as

- SF_TOUCH_PANEL_I2C_Start

Table 461:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in touch_panel_api_t::open.

Parameter p_ctrl

Definition: sf_touch_panel_ctrl_t*const p_ctrl

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

6.34.8.8 stop

```
ssp_err_t(* sf_touch_panel_api_t::stop) (sf_touch_panel_ctrl_t *const p_ctrl)
```

Brief description

Stop scanning for touch events.

Detailed description

Implemented as

- SF_TOUCH_PANEL_I2C_Stop

Table 462:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in touch_panel_api_t::open.

Parameter p_ctrl

Definition: `sf_touch_panel_ctrl_t*const p_ctrl`

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

6.34.8.9 reset

```
ssp_err_t(* sf_touch_panel_api_t::reset) (sf_touch_panel_ctrl_t *const p_ctrl)
```

Brief description

Reset touch controller if reset pin is provided, and resets the I2C bus.

Detailed description

Implemented as

- SF_TOUCH_PANEL_I2C_Reset

NOTE: This does not include calibration. Use calibrate from the application after this function if calibration is required after reset.

Table 463:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in touch_panel_api_t::open.

Parameter p_ctrl

Definition: `sf_touch_panel_ctrl_t*const p_ctrl`

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

6.34.8.10 close

```
ssp_err_t(* sf_touch_panel_api_t::close) (sf_touch_panel_ctrl_t *const p_ctrl)
```

Brief description

Terminate touch thread and close channel at HAL layer.

Detailed description

Implemented as

- SF_TOUCH_PANEL_I2C_Close

Table 464:Parameters

Name	Direction	Description
p_ctrl	in	Handle set in touch_panel_api_t::open.

Parameter p_ctrl

Definition: `sf_touch_panel_ctrl_t*const p_ctrl`

Touch panel framework control block. Allocate an instance specific control block to pass into the touch panel framework API calls. Implemented assf_touch_panel_i2c_instance_ctrl_t

6.34.8.11 versionGet

```
ssp_err_t(* sf_touch_panel_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Implemented as

- SF_TOUCH_PANEL_I2C_VersionGet

Table 465:Parameters

Name	Direction	Description
p_version	out	Code and API version used stored here.

Parameter p_version

6.34.8.12 sf_touch_panel_instance_t

sf_touch_panel_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_touch_panel_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_touch_panel_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_touch_panel_api_t const * p_api

  Pointer to the API structure for this instance.

6.35 SF WIFI Framework Interface

RTOS-integrated SF WIFI Framework Interface.

6.35.1 Summary

This SSP Interface provides access to the ThreadX-aware SF WIFI Framework.

6.35.2 Interface API

sf_wifi_api_t

Function name	Description
.open	Initializes the network interface for data transfers. Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.
.close	De-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.multicastListAdd	Add the given MAC address to the multicast filter list.
.multicastListDelete	Delete the given MAC address from the multicast filter list.
.statisticsGet	Get the interface statistics.
.transmit	Transmit data packet.
.provisioningSet	Set WiFi module provisioning which will configure the module in AP or Client mode.
.provisioningGet	Get the provisioning information of WiFi module.

Function name	Description
.infoGet	Get WiFi module information.
.scan	Scan for WiFi SSIDs.
.ACLAdd	Adds a MAC address to the Access Control List. Valid in AP mode only.
.ACLDelete	Deletes a MAC address from Access Control List. Valid in AP mode only.
.macAddressGet	Get WiFi module MAC address.
.macAddressSet	Set WiFi module MAC address.
.versionGet	Gets version and stores it in provided pointer p_version.

6.35.6 API Data

6.35.6.1 sf_wifi_ip_addr_version_t

`sf_wifi_ip_addr_version_t`

Detailed description

IP address version

Enumerated values

Name	Description
SF_WIFI_IP_ADDR_VERSION_4	IPv4 address.
SF_WIFI_IP_ADDR_VERSION_6	IPv6 address.

6.35.6.2 sf_wifi_interface_mode_t

`sf_wifi_interface_mode_t`

Detailed description

WiFi Interface mode

Enumerated values

Name	Description
SF_WIFI_INTERFACE_MODE_AP	Access Point mode.
SF_WIFI_INTERFACE_MODE_CLIENT	Station Mode.

6.35.6.3 sf_wifi_wep_key_format_t

`sf_wifi_wep_key_format_t`

Detailed description

WiFi WEP Key Format

Enumerated values

Name	Description
SF_WIFI_WEP_KEY_FORMAT_ASCII	WEP Key in ASCII.
SF_WIFI_WEP_KEY_FORMAT_HEX	WEP Key in Hex.

6.35.6.4 sf_wifi_security_type_t

`sf_wifi_security_type_t`

Detailed description

WiFi Security type

Enumerated values

Name	Description
SF_WIFI_SECURITY_TYPE_OPEN	Open. No encryption used.
SF_WIFI_SECURITY_TYPE_WEP	128-bit WEP OPEN ASCII
SF_WIFI_SECURITY_TYPE_WPA	WiFi Protected Access.
SF_WIFI_SECURITY_TYPE_WPA2	WiFi Protected Access v2.

6.35.6.5 sf_wifi_encryption_type_t

`sf_wifi_encryption_type_t`

Detailed description

WiFi Encryption type

Enumerated values

Name	Description
SF_WIFI_ENCRYPTION_TYPE_AUTO	Automatic selection of encryption protocol.
SF_WIFI_ENCRYPTION_TYPE_TKIP	Temporal Key Integrity Protocol. Used by WPA.
SF_WIFI_ENCRYPTION_TYPE_CCMP	CTR mode with CBC-MAC Protocol. Used by WPA2.
SF_WIFI_ENCRYPTION_TYPE_WEP	WEP mode. Used by WEP.
SF_WIFI_ENCRYPTION_TYPE_NONE	No Encryption. Used by Open Security type.

6.35.6.6 sf_wifi_bss_type_t

`sf_wifi_bss_type_t`

Detailed description

WiFi BSS type

Enumerated values

Name	Description
SF_WIFI_BSS_TYPE_INFRASTRUCTURE	Infrastructure network.
SF_WIFI_BSS_TYPE_ADHOC	802.11 ad-hoc IBSS network
SF_WIFI_BSS_TYPE_ANY	Either infrastructure or ad-hoc network.
SF_WIFI_BSS_TYPE_UNKNOWN	BSS type is unknown.

6.35.6.7 sf_wifi_interface_hw_mode_t

`sf_wifi_interface_hw_mode_t`

Detailed description

WiFi Hardware mode

Enumerated values

Name	Description
SF_WIFI_INTERFACE_HW_MODE_11A	802.11a
SF_WIFI_INTERFACE_HW_MODE_11B	802.11b
SF_WIFI_INTERFACE_HW_MODE_11G	802.11g
SF_WIFI_INTERFACE_HW_MODE_11N	802.11n

6.35.6.8 sf_wifi_rts_t

`sf_wifi_rts_t`

Detailed description

WiFi RTS flag

Enumerated values

Name	Description
SF_WIFI_RTS_DISABLE	Disable RTS/CTS handshake.
SF_WIFI_RTS_ENABLE	Enable RTS/CTS handshake.

6.35.6.9 sf_wifi_preamble_t

`sf_wifi_preamble_t`

Detailed description

WiFi Preamble type

Enumerated values

Name	Description
SF_WIFI_PREAMBLE_SHORT	Use short preamble.
SF_WIFI_PREAMBLE_LONG	Use long preamble.

6.35.6.10 sf_wifi_wmm_t

`sf_wifi_wmm_t`

Detailed description

WiFi WMM flag

Enumerated values

Name	Description
SF_WIFI_WMM_DISABLE	Disable WMM.
SF_WIFI_WMM_ENABLE	Enable WMM.

6.35.6.11 sf_wifi_high_throughput_t

`sf_wifi_high_throughput_t`

Detailed description

WiFi High Throughput flag

Enumerated values

Name	Description
SF_WIFI_HIGH_THROUGHPUT_DISABLE	Disable high throughput mode.
SF_WIFI_HIGH_THROUGHPUT_ENABLE	Enable high throughput mode. Also requires WMM to be enabled.

6.35.6.12 sf_wifi_ssid_broadcast_t

`sf_wifi_ssid_broadcast_t`

Detailed description

WiFi SSID Broadcast flag

Enumerated values

Name	Description
SF_WIFI_SSID_BROADCAST_DISABLE	Disable SSID Broadcast.
SF_WIFI_SSID_BROADCAST_ENABLE	Enable SSID Broadcast.

6.35.6.13 sf_wifi_wds_t

`sf_wifi_wds_t`

Detailed description

WiFi WDS Flasg

Enumerated values

Name	Description
SF_WIFI_WDS_DISABLE	Disable WDS.
SF_WIFI_WDS_ENABLE	Enable WDS.

6.35.6.14 sf_wifi_mandatory_high_throughput_t

`sf_wifi_mandatory_high_throughput_t`

Detailed description

WiFi Mandatory High Throughput flag

Enumerated values

Name	Description
SF_WIFI_MANDATORY_HIGH_THROUGHPUT_DISABLE	Disable Mandatory HT requirement.
SF_WIFI_MANDATORY_HIGH_THROUGHPUT_ENABLE	Enable mandatory HT requirement.

6.35.6.15 sf_wifi_auto_negotiation_t

`sf_wifi_auto_negotiation_t`

Detailed description

WiFi Auto Negotiation flag

Enumerated values

Name	Description
SF_WIFI_AUTO_NEGOTIATION_DISABLE	Auto negotiation disable.
SF_WIFI_AUTO_NEGOTIATION_ENABLE	Auto negotiation enable.

6.35.6.16 sf_wifi_access_control_t

`sf_wifi_access_control_t`

Detailed description

WiFi Framework AccessContol mode

Enumerated values

Name	Description
SF_WIFI_ACCESS_CONTROL_DISABLE	Disable MAC address matching.
SF_WIFI_ACCESS_CONTROL_DENY	Deny association to stations on the MAC list.
SF_WIFI_ACCESS_CONTROL_ALLOW	Allow association to stations on the MAC list.

6.35.6.17 sf_wifi_event_t

`sf_wifi_event_t`

Detailed description

WiFi Framework event codes

Enumerated values

Name	Description
SF_WIFI_EVENT_RX	Packet received event.
SF_WIFI_EVENT_AP_CONNECT	Device Associated Successfully with AP.
SF_WIFI_EVENT_AP_DISCONNECT	Device Disconnected with AP.
SF_WIFI_EVENT_CLIENT_CONNECT	Client Associated Successfully with device AP.
SF_WIFI_EVENT_CLIENT_DISCONNECT	Client Disconnected from device AP.

6.35.7 API Structures

6.35.7.1 sf_wifi_ip_addr_t

sf_wifi_ip_addr_t

Detailed description

IP address information

Variables

- sf_wifi_ip_addr_version_t version

  IP Address Version : v4 or v6.
- uint32_t v4
- uint32_t v6[4]
- union{} addr

  IP address.

  See source code for definition of this member.

6.35.7.2 sf_wifi_info_t

sf_wifi_info_t

Detailed description

Configuration about underlying device driver.

Variables

- uint8_t * p_chipset

  Pointer to sting showing WiFi chipset/driver information.

- uint16_t rssi

  Received signal strength indication.
- uint16_t noise_level

  Signal to noise ratio.
- uint16_t link_quality

  Signal strength / quality.

6.35.7.3 sf_wifi_callback_args_t

sf_wifi_callback_args_t

Detailed description

WiFi framework callback parameter definition

Variables

- sf_wifi_event_t event

  Event code.
- uint8_t * p_data

  Packet data.
- uint32_t length

  Packet Data length.
- uint8_t mac_addr[SF_WIFI_MAC_ADDR_LENGTH]

  Client station MAC address.
- void const * p_context

  Context provided to user during callback.

6.35.7.4 sf_wifi_provisioning_t

sf_wifi_provisioning_t

Detailed description

WiFi Provisioning parameters

Variables

- sf_wifi_interface_mode_t mode

  Select AP or Client mode.
- uint8_t channel

  RF Channel number.
- uint8_t ssid[SF_WIFI_SSID_LENGTH+1]

  SSID.

- sf_wifi_security_type_t security

  Security type.
- sf_wifi_encryption_type_t encryption

  Encryption type.
- uint8_t key[SF_WIFI_SECURITY_KEY_LENGTH]

  Pre-shared key.
- void(* p_callback)(sf_wifi_callback_args_t *p_args)

  Pointer to Connection status notification callback function.

6.35.7.5 sf_wifi_cfg_t

sf_wifi_cfg_t

Detailed description

Define the WiFi configuration parameters

Variables

- uint8_t mac_addr[6]

  MAC address of WiFi Device.
- sf_wifi_interface_hw_mode_t hw_mode

  Modulation type: 11a/b/g/n.
- uint8_t tx_power

  Sets transmit power in dBm.
- sf_wifi_rts_t rts

  RTS/CTS handshake flag.
- uint16_t fragmentation

  Fragmentation threshold.
- uint8_t dtim

  Delivery traffic indication message interval.
- sf_wifi_high_throughput_t high_throughput

  High-throughput mode. Only valid for 802.11n.
- sf_wifi_preamble_t preamble

  Preamble type.
- sf_wifi_wmm_t wmm

  WiFi Multimedia Mode flag. If enabled, also requires.
- uint8_t max_stations

  Maximum permitted stations. Valid in AP mode only.

- sf_wifi_ssid_broadcast_t ssid_broadcast

  SSID broadcast flag. Valid in AP mode only.
- sf_wifi_access_control_t access_control

  Mode of access control MAC list.
- uint32_t beacon

  Beacon interval. Valid in AP mode only.
- uint32_t station_inactivity_timeout

  Station inactivity timeout value. Valid in AP mode only.
- sf_wifi_wds_t wds

  WDS flag. Valid in AP mode only.
- void * p_buffer_pool_rx

  Pointer to Network stack Rx buffer pool.
- sf_wifi_mandatory_high_throughput_t req_high_throughput

  Only allow HT mode. Valid in AP mode only.
- void(* p_callback)(sf_wifi_callback_args_t *p_args)

  Pointer to callback function.
- void const * p_context

  User defined context passed into callback function.
- void const * p_extend

  Instance specific configuration.

6.35.7.6 sf_wifi_stats_t

sf_wifi_stats_t

Detailed description

Define the statistic and error counters for this IP instance.

Variables

- uint32_t rx_pkts

  Packets received successfully.
- uint32_t tx_pkts

  Packets transmitted successfully.
- uint32_t tx_err

  Transmit errors.

6.35.7.7 sf_wifi_scan_t

sf_wifi_scan_t

Detailed description

Define the structure to store the SSID scan information

Variables

- sf_wifi_interface_hw_mode_t hw_mode

  Hardware mode 802.11a/b/g/n.

- uint8_t rssi

  Signal Strength.

- uint8_t ssid[SF_WIFI_SSID_LENGTH+1]

  SSID name.

- uint8_t bssid[SF_WIFI_MAC_ADDR_LENGTH]

  Basic Service Set Identification (i.e. MAC address of Access Point)

- uint8_t channel

  Radio channel that the AP beacon was received on.

- sf_wifi_security_type_t security

  Security type.

- sf_wifi_encryption_type_t encryption

  Encryption type.

- sf_wifi_bss_type_t bss_type

  Network type.

6.35.7.8 sf_wifi_ctrl_t

sf_wifi_ctrl_t

Detailed description

WiFi Framework control structure

Variables

- void * p_driver_handle

  Storage for information needed for each WiFi device driver in the system.

6.35.7.9 sf_wifi_api_t

sf_wifi_api_t

Detailed description

Framework API structure. Implementations will use the following API.

6.35.7.10 open

```
ssp_err_t(* sf_wifi_api_t::open) (sf_wifi_ctrl_t *p_ctrl, sf_wifi_cfg_t const
*const p_cfg)
```

Brief description

Initializes the network interface for data transfers.

Detailed description

Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.

Table 466:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to user-provided storage for the control block.
p_cfg	in	Pointer to WiFi configuration structure.

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_cfg

Definition: `sf_wifi_cfg_t const *const p_cfg`

Define the WiFi configuration parameters

- `sf_wifi_cfg_t`::`mac_addr`

  MAC address of WiFi Device.

- `sf_wifi_cfg_t`::`sf_wifi_interface_hw_mode_t`

  Modulation type: 11a/b/g/n.

  Enumerated as:

  – SF_WIFI_INTERFACE_HW_MODE_11A

  – SF_WIFI_INTERFACE_HW_MODE_11B

  – SF_WIFI_INTERFACE_HW_MODE_11G

  – SF_WIFI_INTERFACE_HW_MODE_11N

- `sf_wifi_cfg_t`::`tx_power`

  Sets transmit power in dBm.

- sf_wifi_cfg_t::sf_wifi_rts_t

  RTS/CTS handshake flag.

  Enumerated as:

  – SF_WIFI_RTS_DISABLE

  – SF_WIFI_RTS_ENABLE
- sf_wifi_cfg_t::fragmentation

  Fragmentation threshold.
- sf_wifi_cfg_t::dtim

  Delivery traffic indication message interval.
- sf_wifi_cfg_t::sf_wifi_high_throughput_t

  High-throughput mode. Only valid for 802.11n.

  Enumerated as:

  – SF_WIFI_HIGH_THROUGHPUT_DISABLE

  – SF_WIFI_HIGH_THROUGHPUT_ENABLE
- sf_wifi_cfg_t::sf_wifi_preamble_t

  Preamble type.

  Enumerated as:

  – SF_WIFI_PREAMBLE_SHORT

  – SF_WIFI_PREAMBLE_LONG
- sf_wifi_cfg_t::sf_wifi_wmm_t

  WiFi Multimedia Mode flag. If enabled, also requires.

  Enumerated as:

  – SF_WIFI_WMM_DISABLE

  – SF_WIFI_WMM_ENABLE
- sf_wifi_cfg_t::max_stations

  Maximum permitted stations. Valid in AP mode only.
- sf_wifi_cfg_t::sf_wifi_ssid_broadcast_t

  SSID broadcast flag. Valid in AP mode only.

  Enumerated as:

  – SF_WIFI_SSID_BROADCAST_DISABLE

  – SF_WIFI_SSID_BROADCAST_ENABLE

- sf_wifi_cfg_t::sf_wifi_access_control_t

  Mode of access control MAC list.

  Enumerated as:

  – SF_WIFI_ACCESS_CONTROL_DISABLE

  – SF_WIFI_ACCESS_CONTROL_DENY

  – SF_WIFI_ACCESS_CONTROL_ALLOW
- sf_wifi_cfg_t::beacon

  Beacon interval. Valid in AP mode only.
- sf_wifi_cfg_t::station_inactivity_timeout

  Station inactivity timeout value. Valid in AP mode only.
- sf_wifi_cfg_t::sf_wifi_wds_t

  WDS flag. Valid in AP mode only.

  Enumerated as:

  – SF_WIFI_WDS_DISABLE

  – SF_WIFI_WDS_ENABLE
- sf_wifi_cfg_t::p_buffer_pool_rx

  Pointer to Network stack Rx buffer pool.
- sf_wifi_cfg_t::sf_wifi_mandatory_high_throughput_t

  Only allow HT mode. Valid in AP mode only.

  Enumerated as:

  – SF_WIFI_MANDATORY_HIGH_THROUGHPUT_DISABLE

  – SF_WIFI_MANDATORY_HIGH_THROUGHPUT_ENABLE
- sf_wifi_cfg_t::p_callback

  Pointer to callback function.
- sf_wifi_cfg_t::p_context

  User defined context passed into callback function.
- sf_wifi_cfg_t::p_extend

  Instance specific configuration.

6.35.7.11 close

```
ssp_err_t(* sf_wifi_api_t::close) (sf_wifi_ctrl_t *const p_ctrl)
```

Brief description

De-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.

Detailed description

Table 467:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the control block for the WiFi module.

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

6.35.7.12 multicastListAdd

```
ssp_err_t(* sf_wifi_api_t::multicastListAdd) (sf_wifi_ctrl_t *const p_ctrl,
uint8_t const *const p_mac_addr)
```

Brief description

Add the given MAC address to the multicast filter list.

Detailed description

Table 468:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac_addr	in	Pointer to the Mac address.

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_mac_addr

`uint8_t`

6.35.7.13 multicastListDelete

```
ssp_err_t(* sf_wifi_api_t::multicastListDelete) (sf_wifi_ctrl_t *const p_ctrl,
uint8_t const *const p_mac_addr)
```

Detailed description

Delete the given MAC address from the multicast filter list.

Table 469:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac_addr	in	Pointer to the Mac address.

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_mac_addr

`uint8_t`

6.35.7.14 statisticsGet

```
ssp_err_t(* sf_wifi_api_t::statisticsGet) (sf_wifi_ctrl_t *const p_ctrl,
sf_wifi_stats_t *const p_wifi_device_stats)
```

Brief description

Get the interface statistics.

Detailed description

Table 470:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_wifi_device_stats	out	Pointer to the WiFi module data statistics.

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_wifi_device_stats

Definition: `sf_wifi_stats_t*const p_wifi_device_stats`

Define the statistic and error counters for this IP instance.

- sf_wifi_stats_t::rx_pkts

  Packets received successfully.

- sf_wifi_stats_t::tx_pkts

  Packets transmitted successfully.

- sf_wifi_stats_t::tx_err

  Transmit errors.

6.35.7.15 transmit

```
ssp_err_t(* sf_wifi_api_t::transmit) (sf_wifi_ctrl_t *const p_ctrl, uint8_t
*const p_buf, uint32_t length)
```

Brief description

Transmit data packet.

Detailed description

Table 471:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_buf	in	Pointer to transmit buffer
length	in	Transmit buffer length

Parameter p_ctrl

Definition: sf_wifi_ctrl_t

WiFi Framework control structure

Parameter p_buf

uint8_t

Parameter length

uint32_t

6.35.7.16 provisioningSet

```
ssp_err_t(* sf_wifi_api_t::provisioningSet) (sf_wifi_ctrl_t *const p_ctrl,
sf_wifi_provisioning_t const *const p_wifi_provisioning)
```

Brief description

Set WiFi module provisioning which will configure the module in AP or Client mode.

Detailed description

Table 472:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_wifi_provisioning	in	Pointer to WiFi provisioning structure

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_wifi_provisioning

Definition: `sf_wifi_provisioning_tconst *const p_wifi_provisioning`

WiFi Provisioning parameters

- `sf_wifi_provisioning_t::mode`

  Select AP or Client mode.

- `sf_wifi_provisioning_t::channel`

  RF Channel number.

- `sf_wifi_provisioning_t::ssid`

  SSID.

- `sf_wifi_provisioning_t::security`

  Security type.

- `sf_wifi_provisioning_t::encryption`

  Encryption type.

- `sf_wifi_provisioning_t::key`

  Pre-shared key.

- `sf_wifi_provisioning_t::p_callback`

  Pointer to Connection status notification callback function.

6.35.7.17 provisioningGet

```
ssp_err_t(* sf_wifi_api_t::provisioningGet) (sf_wifi_ctrl_t *const p_ctrl,
sf_wifi_provisioning_t *const p_wifi_provisioning)
```

Brief description

Get the provisioning information of WiFi module.

Detailed description

Table 473:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_wifi_provisioning	out	Pointer to WiFi provisioning structure

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_wifi_provisioning

Definition: `sf_wifi_provisioning_t*const p_wifi_provisioning`

WiFi Provisioning parameters

- `sf_wifi_provisioning_t::mode`

  Select AP or Client mode.

- `sf_wifi_provisioning_t::channel`

  RF Channel number.

- `sf_wifi_provisioning_t::ssid`

  SSID.

- `sf_wifi_provisioning_t::security`

  Security type.

- `sf_wifi_provisioning_t::encryption`

  Encryption type.

- `sf_wifi_provisioning_t::key`

  Pre-shared key.

- `sf_wifi_provisioning_t::p_callback`

  Pointer to Connection status notification callback function.

6.35.7.18 infoGet

```
ssp_err_t(* sf_wifi_api_t::infoGet) (sf_wifi_ctrl_t *const p_ctrl, sf_wifi_info_t
*const p_wifi_info)
```

Brief description

Get WiFi module information.

Detailed description

Table 474:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_wifi_info	out	Pointer to WiFi module information structure

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_wifi_info

Definition: `sf_wifi_info_t*const p_wifi_info`

Configuration about underlying device driver.

- `sf_wifi_info_t::p_chipset`

  Pointer to sting showing WiFi chipset/driver information.

- `sf_wifi_info_t::rssi`

  Received signal strength indication.

- `sf_wifi_info_t::noise_level`

  Signal to noise ratio.

- `sf_wifi_info_t::link_quality`

  Signal strength / quality.

6.35.7.19 scan

```
ssp_err_t(* sf_wifi_api_t::scan) (sf_wifi_ctrl_t *const p_ctrl, sf_wifi_scan_t
*const p_scan, uint8_t *const p_cnt)
```

Brief description

Scan for WiFi SSIDs.

Detailed description

Table 475:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.

Table 475:Parameters (Continued)

Name	Direction	Description
p_scan	out	Pointer to structure which will hold scan result. It is the responsibility of the caller to ensure that adequate space is available to hold scan results.
p_cnt	inout	Pointer to variable, specifying maximum number of SSID's to scan and will be updated to number of actual SSIDs scanned by device

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_scan

Definition: `sf_wifi_scan_t*const p_scan`

Define the structure to store the SSID scan information

- `sf_wifi_scan_t::hw_mode`

  Hardware mode 802.11a/b/g/n.

- `sf_wifi_scan_t::rssi`

  Signal Strength.

- `sf_wifi_scan_t::ssid`

  SSID name.

- `sf_wifi_scan_t::bssid`

  Basic Service Set Identification (i.e. MAC address of Access Point)

- `sf_wifi_scan_t::channel`

  Radio channel that the AP beacon was received on.

- `sf_wifi_scan_t::security`

  Security type.

- `sf_wifi_scan_t::encryption`

  Encryption type.

- `sf_wifi_scan_t::bss_type`

  Network type.

Parameter p_cnt

`uint8_t`

6.35.7.20 ACLAdd

```
ssp_err_t(* sf_wifi_api_t::ACLAdd) (sf_wifi_ctrl_t *const p_ctrl, uint8_t const *const p_mac)
```

Brief description

Adds a MAC address to the Access Control List. Valid in AP mode only.

Detailed description

Table 476:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac	in	Pointer to MAC address

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_mac

`uint8_t`

6.35.7.21 ACLDelete

```
ssp_err_t(* sf_wifi_api_t::ACLDelete) (sf_wifi_ctrl_t *const p_ctrl, uint8_t const *const p_mac)
```

Brief description

Deletes a MAC address from Access Control List. Valid in AP mode only.

Detailed description

Table 477:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac	in	Pointer to MAC address

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_mac

`uint8_t`

6.35.7.22 macAddressGet

```
ssp_err_t(* sf_wifi_api_t::macAddressGet) (sf_wifi_ctrl_t *const p_ctrl, uint8_t *const p_mac)
```

Brief description

Get WiFi module MAC address.

Detailed description

Table 478:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac	out	Pointer to MAC address

Parameter p_ctrl

Definition: `sf_wifi_ctrl_t`

WiFi Framework control structure

Parameter p_mac

`uint8_t`

6.35.7.23 macAddressSet

```
ssp_err_t(* sf_wifi_api_t::macAddressSet) (sf_wifi_ctrl_t *const p_ctrl, uint8_t const *const p_mac)
```

Brief description

Set WiFi module MAC address.

Detailed description

Table 479:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the WiFi module.
p_mac	in	Pointer to MAC address

Parameter p_ctrl

Definition: sf_wifi_ctrl_t

WiFi Framework control structure

Parameter p_mac

uint8_t

6.35.7.24 versionGet

```
ssp_err_t(* sf_wifi_api_t::versionGet) (ssp_version_t *const p_version)
```

Brief description

Gets version and stores it in provided pointer p_version.

Detailed description

Table 480:Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

6.35.7.25 sf_wifi_instance_t

sf_wifi_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sf_wifi_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_wifi_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_wifi_api_t const * p_api

  Pointer to the API structure for this instance.

6.36 SF WIFI NSAL Interface

RTOS-integrated SF WIFI NSAL Framework Interface.

6.36.1 Summary

This SSP Interface provides access to the ThreadX-aware SF WIFI NSAL Framework.

6.36.2 Data structures

- sf_wifi_nsal_cfg_t
- sf_wifi_nsal_callback_args_t

6.36.3 Enumerations

- sf_wifi_nsal_zero_copy_t

6.36.4 Defines

- #define SF_WIFI_NSAL_MAC_CHANGED

  Initial value: `(NX_LINK_USER_COMMAND + 1U)`

6.36.5 API Data

6.36.5.1 sf_wifi_nsal_zero_copy_t

`sf_wifi_nsal_zero_copy_t`

Detailed description

Zero Copy Configuration Enumeration

Enumerated values

Name	Description
SF_WIFI_NSAL_ZERO_COPY_DISABLE	Zero copy is disabled.
SF_WIFI_NSAL_ZERO_COPY_ENABLE	Zero copy is enabled.

6.36.6 API Structures

6.36.6.1 sf_wifi_nsal_cfg_t

sf_wifi_nsal_cfg_t

Detailed description

Define the NSAL configuration parameters

Variables

- sf_wifi_nsal_zero_copy_t tx_zero_copy

  Transmit path zero copy support.
- sf_wifi_nsal_zero_copy_t rx_zero_copy

  Receive path zero copy support.
- uint8_t * p_tx_packet_buffer

  Pointer to Tx buffer used to consolidate data from chained NetX packets.

6.36.6.2 sf_wifi_nsal_callback_args_t

sf_wifi_nsal_callback_args_t

Detailed description

Define the NSAL callback arguments

Variables

- NX_INTERFACE * p_interface

  Pointer to NetX interface.
- sf_wifi_nsal_cfg_t * p_wifi_nsal_cfg

  pointer to NSAL configuration

6.37 SF WIFI On-Chip Stack Interface

RTOS-integrated SF WIFI On-Chip Stack Interface.

6.37.1 Summary

This SSP Interface provides access to the ThreadX-aware SF WIFI Framework.

6.37.2 Interface API

sf_wifi_onchip_stack_api_t

Function name	Description
.open	Pointer to function which initializes the network interface for data transfers.Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.
.close	Pointer to function which un-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.
.ipAddressCfg	Configures IP address of the interface.
.dhcpServerStart	Starts DHCP server on the interface.
.dhcpServerStop	Stop DHCP server on the interface.
.versionGet	Gets version and stores it in provided pointer p_version.

6.37.3 Data structures

- sf_wifi_onchip_stack_ip_cfg_t
- sf_wifi_onchip_stack_cfg_t
- sf_wifi_onchip_stack_ctrl_t
- sf_wifi_onchip_stack_instance_t

6.37.4 Enumerations

- sf_wifi_onchip_stack_ip_addr_mode_t

6.37.5 Defines

- #define SF_WIFI_ONCHIP_STACK_API_VER_MAJOR

  Initial value: `(1U)`

  Major Version of the API defined in this file
- #define SF_WIFI_ONCHIP_STACK_API_VER_MINOR

  Initial value: `(0U)`

  Minor Version of the API defined in this file

6.37.6 API Data

6.37.6.1 sf_wifi_onchip_stack_ip_addr_mode_t

`sf_wifi_onchip_stack_ip_addr_mode_t`

Detailed description

IP addressing modes

Enumerated values

Name	Description
SF_WIFI_IP_ADDR_GET	Read the IP address assigned to interface.
SF_WIFI_IP_ADDR_STATIC	Statically configure the IP address.
SF_WIFI_IP_ADDR_DHCP	Get the IP address from DHCP server, dynamic assignment.

6.37.7 API Structures

6.37.7.1 sf_wifi_onchip_stack_ip_cfg_t

sf_wifi_onchip_stack_ip_cfg_t

Detailed description

Define IP Interface configuration information

Variables

- sf_wifi_onchip_stack_ip_addr_mode_t ip_addr_mode

  Addressing mode.
- sf_wifi_ip_addr_t ip_addr

  Interface IP address.
- sf_wifi_ip_addr_t netmask

  Interface netmask.
- sf_wifi_ip_addr_t gateway

  Interface Gateway.

6.37.7.2 sf_wifi_onchip_stack_cfg_t

sf_wifi_onchip_stack_cfg_t

Detailed description

Define the WiFi configuration parameters

Variables

- sf_wifi_instance_t const * p_lower_lvl_wifi

  Pointer to SF WiFi instance.

- void * p_extend

  Extended configuration.

6.37.7.3 sf_wifi_onchip_stack_ctrl_t

sf_wifi_onchip_stack_ctrl_t

Detailed description

WiFi Framework control structure

Variables

- sf_wifi_instance_t * p_lower_lvl_wifi

  Pointer to SF WiFi instance.

  Storage for information needed for each WiFi device driver in the system.

6.37.7.4 sf_wifi_onchip_stack_api_t

sf_wifi_onchip_stack_api_t

Detailed description

Framework API structure. Implementations will use the following API.

6.37.7.5 open

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::open) (sf_wifi_onchip_stack_ctrl_t
*p_ctrl, sf_wifi_onchip_stack_cfg_t const *const p_cfg)
```

Detailed description

Pointer to function which initializes the network interface for data transfers.

Initial driver configuration, enable the driver link, enable interrupts and make device ready for data transfer.

Table 481:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to user-provided storage for the control block.
p_cfg	in	Pointer to configuration structure.

Parameter p_ctrl

Definition: sf_wifi_onchip_stack_ctrl_t

WiFi Framework control structure

Parameter p_cfg

Definition: sf_wifi_onchip_stack_cfg_t const *const p_cfg

Define the WiFi configuration parameters

- sf_wifi_onchip_stack_cfg_t::sf_wifi_instance_t

  Pointer to SF WiFi instance.

- sf_wifi_onchip_stack_cfg_t::p_extend

  Extended configuration.

6.37.7.6 close

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::close) (sf_wifi_onchip_stack_ctrl_t
*const p_ctrl)
```

Detailed description

Pointer to function which un-initialize the network interface and may put it in low power mode or power it off. Close the driver, disable the driver link, disable interrupt.

Table 482:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the control block

Parameter p_ctrl

Definition: sf_wifi_onchip_stack_ctrl_t

WiFi Framework control structure

6.37.7.7 ipAddressCfg

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::ipAddressCfg)
(sf_wifi_onchip_stack_ctrl_t *const p_ctrl, sf_wifi_onchip_stack_ip_cfg_t *const
p_cfg)
```

Detailed description

Configures IP address of the interface.

Table 483:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block

Table 483:Parameters (Continued)

Name	Direction	Description
p_cfg	inout	Pointer to IP configuration structure.

Parameter p_ctrl

Definition: sf_wifi_onchip_stack_ctrl_t

WiFi Framework control structure

Parameter p_cfg

6.37.7.8 dhcpServerStart

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::dhcpServerStart)
(sf_wifi_onchip_stack_ctrl_t *const p_ctrl, sf_wifi_ip_addr_t const *const
p_start_ip, sf_wifi_ip_addr_t const *const p_end_ip)
```

Detailed description

Starts DHCP server on the interface.

Table 484:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block
p_start_ip	in	Pointer to start IP address
p_end_ip	in	Pointer to end IP address

Parameter p_ctrl

Definition: sf_wifi_onchip_stack_ctrl_t

WiFi Framework control structure

Parameter p_start_ip
Parameter p_end_ip

6.37.7.9 dhcpServerStop

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::dhcpServerStop)
(sf_wifi_onchip_stack_ctrl_t *const p_ctrl)
```

Detailed description

Stop DHCP server on the interface.

Table 485:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block

Parameter p_ctrl

Definition: sf_wifi_onchip_stack_ctrl_t

WiFi Framework control structure

6.37.7.10 versionGet

```
ssp_err_t(* sf_wifi_onchip_stack_api_t::versionGet) (ssp_version_t *const
p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 486:Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

6.37.7.11 sf_wifi_onchip_stack_instance_t

sf_wifi_onchip_stack_instance_t

Detailed description

SF WiFi On Chip Stack Instance structure

Variables

- sf_wifi_onchip_stack_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- sf_wifi_onchip_stack_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- sf_wifi_onchip_stack_api_t const * p_api

  Pointer to the API structure for this instance.

6.38 SF WIFI NSAL on NetX

NetX NSAL interface implementation header file.

6.38.1 Summary

This SSP Interface provides access to the ThreadX-aware SF WIFI NSAL NX Framework.

6.38.2 Functions

- nsal_netx_driver

6.38.3 nsal_netx_driver

```
 nsal_netx_driver (  NX_IP_DRIVER * driver ,  sf_wifi_instance_t  const
* p_wifi_instance ,  sf_wifi_nsal_cfg_t  * p_wifi_nsal_cfg )
```

6.38.3.1 Detailed description

NSAL NetX Driver Entry function

6.38.3.2 Function steps

- Check if the link is up

Chapter 7 API Reference: Framework

7.1 API Reference: Framework Layer

The framework layer provides RTOS aware drivers for functional use cases.

- ADC Periodic Framework
- Audio Framework
- DAC Audio Playback Framework
- I2S Audio Playback Framework
- ADC Audio Recording Framework
- I2S Audio Recording Framework
- QSPI Block Media Framework
- RAM Block Media Framework
- SDMMC Block Media Framework
- Cellular NSAL Implementation on NetX
- Telnet Communication Framework
- Console Framework
- FX_IO Framework
- GUIX Synergy Port
- Telnet Communication Framework
- USB Communication Framework
- USB Communication Framework V2
- External IRQ Framework
- I2C Framework
- JPEG Decode Framework
- Messaging Framework
- Power Profiles Framework
- Power Profiles V2 Framework
- SPI Framework
- Thread Monitor Framework
- CTSU Framework
- CTSU Button Framework
- CTSU Slider Framework

- I2C Touch Panel Framework
- UART Framework Instance
- NetX Synergy Port
- NetX Synergy Port PHY Driver
- Express Logic USBX Synergy Port Framework

7.2 ADC Periodic Framework

RTOS-integrated ADC Framework.

7.2.1 Functions

- SF_ADC_PERIODIC_Open
- SF_ADC_PERIODIC_Start
- SF_ADC_PERIODIC_Stop
- SF_ADC_PERIODIC_Close
- SF_ADC_PERIODIC_VersionGet

7.2.2 Defines

- #define SF_ADC_PERIODIC_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_ADC_PERIODIC_CODE_VERSION_MINOR

  Initial value: `(5U)`

7.2.3 SF_ADC_PERIODIC_Open

```
ssp_err_t SF_ADC_PERIODIC_Open ( sf_adc_periodic_ctrl_t  *const p_api_ctrl ,
 sf_adc_periodic_cfg_t  const *const p_cfg )
```

7.2.3.1 Brief description

Configures periodic ADC framework and optionally starts the timer.

7.2.3.2 Detailed description

The SF_ADC_PERIODIC_Open function acquires a mutex for the ADC Unit used, then calls the driver .open function in the p_api parameter. The mutex is released following the driver layer open function.

Table 487:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_api_ctrl or p_cfg. See HAL driver for other possible causes.
SSP_ERR_INVALID_ARGUMENT	An invalid argument is used
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex or to create an internal thread.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.2.3.3 Function steps

- Save driver structure pointer for use in other framework layer functions
- Create a mutex
- Get mutex before calling lower layer, which will access HW registers.
- Initialize the HAL layer
- Post the Mutex
- If any of the HAL layer initializations failed, then delete the mutex and exit the function with the error code
- Delete the mutex
- If there was a mutex error, return it
- Mark control block open so other tasks know it is valid

7.2.4 SF_ADC_PERIODIC_Start

```
ssp_err_t SF_ADC_PERIODIC_Start ( sf_adc_periodic_ctrl_t  *const p_api_ctrl )
```

7.2.4.1 Brief description

Gets mutex, starts the periodic ADC scan, and releases mutex.

7.2.4.2 Detailed description

ATTENTION: The driver will enable the ADC to be triggered via timer event; there will be a time delay from the time this function is called to the time the hardware timer count expires and triggers the scan.

Table 488:Return values

Name	Description
SSP_SUCCESS	ADC Periodic Scan started successfully.
SSP_ERR_ASSERTION	One or more pointers point to NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_ADC_PERIODIC_Open to configure.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex or to create an internal thread.
SSP_ERR_IN_USE	The module is currently busy performing another operation

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- scanStart
- start

7.2.4.3 Function steps

- Get mutex, start timer, then release mutex
- Enable the ADC to receive hardware triggers
- If the scan was successfully enabled in the ADC HAL,
- Start the timer to generate the ADC trigger events
- Return the mutex
- If there was a mutex error, return it

7.2.5 SF_ADC_PERIODIC_Stop

```
ssp_err_t SF_ADC_PERIODIC_Stop ( sf_adc_periodic_ctrl_t  *const p_api_ctrl )
```

7.2.5.1 Brief description

Gets mutex, stops the periodic ADC scan, and releases mutex.

7.2.5.2 Detailed description

Table 489:Return values

Name	Description
SSP_SUCCESS	Periodic ADC scan stopped successfully.
SSP_ERR_ASSERTION	One or more pointers point to NULL..
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_ADC_PERIODIC_Open to configure.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex or to create an internal thread.
SSP_ERR_IN_USE	The module is currently busy performing another operation

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- stop

7.2.5.3 Function steps

- Get mutex, stop timer, then release mutex
- If there was a mutex error, return it

7.2.6 SF_ADC_PERIODIC_Close

```
ssp_err_t SF_ADC_PERIODIC_Close ( sf_adc_periodic_ctrl_t  *const p_api_ctrl )
```

7.2.6.1 Brief description

The close function acquires the unit's mutex, closes all lower level drivers, releases and deletes the mutex.

7.2.6.2 Detailed description

Table 490:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	One or more pointers point to NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_ADC_PERIODIC_Open to configure.
SSP_ERR_IN_USE	The module is currently busy performing another operation
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex or to create an internal thread.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.2.6.3 Function steps

- Get mutex since this will access hardware registers
- Close the HAL layer modules
- Post the mutex
- If all the HAL layers closed successfully, then delete the mutex and mark module as un-initialized
- Delete RTOS services used
- Clear information from control block so other functions know this instance is closed
- If there was a mutex error, return it

7.2.7 SF_ADC_PERIODIC_VersionGet

```
ssp_err_t SF_ADC_PERIODIC_VersionGet ( ssp_version_t  *const p_version )
```

7.2.7.1 Brief description

Gets version and stores it in provided pointer p_version.

7.2.7.2 Detailed description

Table 491:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.2.8 Extensions

7.2.8.1 sf_adc_periodic_instance_ctrl_t

sf_adc_periodic_instance_ctrl_t

Detailed description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when SF_ADC_PERIODIC_Open is called

Variables

- uint32_t open

  Used by driver to check if pointer to control block is valid.
- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware registers.
- adc_instance_t const * p_lower_lvl_adc

  Pointer to the ADC instance.
- timer_instance_t const * p_lower_lvl_timer

  Pointer to the Timer instance.
- transfer_instance_t const * p_lower_lvl_transfer

  Pointer to the Transfer instance.
- void const *volatile p_src_transfer

  Source pointer for the low level transfer method.
- adc_data_size_t * p_data_buffer

  Pointer to the buffer that will store the samples.
- uint32_t data_buffer_length

  Length of the data buffer that will store the samples.
- uint32_t data_buffer_index

  Index of the data buffer where data is to be written to next.

- uint32_t sample_count

  Samples per channel to be buffered before notifying the app.
- uint32_t dtc_transfer_length

  Total Length of DTC transfer for requested number of samples.
- void(* p_callback)(*p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.

7.3 Audio Framework

RTOS-integrated Audio Framework.

7.3.1 Summary

This module is a ThreadX-aware Audio Framework. The module implements Audio Framework Interface.
Name of module used by error logger macro

7.3.2 Functions

- SF_AUDIO_PLAYBACK_Open
- SF_AUDIO_PLAYBACK_Close
- SF_AUDIO_PLAYBACK_Start
- SF_AUDIO_PLAYBACK_Pause
- SF_AUDIO_PLAYBACK_Stop
- SF_AUDIO_PLAYBACK_Resume
- SF_AUDIO_PLAYBACK_VolumeSet
- SF_AUDIO_PLAYBACK_VersionGet

7.3.3 Defines

- #define SF_AUDIO_PLAYBACK_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_AUDIO_PLAYBACK_CODE_VERSION_MINOR

  Initial value: `(6U)`

- #define SF_AUDIO_PLAYBACK_STACK_SIZE

  Initial value: (SF_AUDIO_PLAYBACK_CFG_THREAD_STACK_SIZE)

  Audio playback internal thread stack size. Varies by application, but rarely requires more than 256 bytes.

7.3.4 SF_AUDIO_PLAYBACK_Open

```
ssp_err_t SF_AUDIO_PLAYBACK_Open ( sf_audio_playback_ctrl_t  *const p_api_ctrl ,
 sf_audio_playback_cfg_t  const *const p_cfg )
```

7.3.4.1 Detailed description

Implements open.

Table 492:Return values

Name	Description
SSP_SUCCESS	Audio hardware successfully configured.
SSP_ERR_ASSERTION	A pointer is NULL or a parameter is invalid.
SSP_ERR_OUT_OF_MEMORY	The number of streams open at once is limited to SF_AUDIO_PLAYBACK_CFG_MAX_STREAMS. If this number is exceeded, an out of memory error occurs.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is not reentrant.

7.3.4.2 Function steps

- Open hardware if it is not already open.
- Create event flags to notify playback thread when playback of a buffer is complete.
- Store stream pointer in common control block.
- Initialize stream variables.
- Store queue pointers for audio data and clear stream owner pointers.
- Mark stream opened so it can be used by other API's.

7.3.5 SF_AUDIO_PLAYBACK_Close

```
ssp_err_t SF_AUDIO_PLAYBACK_Close ( sf_audio_playback_ctrl_t
*const p_api_ctrl )
```

7.3.5.1 Detailed description

Implements close.

Table 493:Return values

Name	Description
SSP_SUCCESS	Audio instance successfully closed
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is not reentrant.

7.3.5.2 Function steps

- Mark stream as unused in hardware control block and determine if all streams are closed.
- Mark hardware control block as unused so it can be reconfigured.
- Close lower level drivers
- Delete RTOS services used
- Mark control block as unused so it can be reconfigured.

7.3.6 SF_AUDIO_PLAYBACK_Start

```
ssp_err_t SF_AUDIO_PLAYBACK_Start ( sf_audio_playback_ctrl_t
*const p_api_ctrl ,  sf_audio_playback_data_t  *const p_data ,   UINT
const timeout )
```

7.3.6.1 Detailed description

Implements start.

Table 494:Return values

Name	Description
SSP_SUCCESS	Buffer successfully sent to audio playback thread
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

NOTE: This function is reentrant.

7.3.6.2 Function steps

- Ensure that audio data is only posted from the current stream owner.
- Store new stream owner if stream is unowned.
- Set message header to audio start event. Set instance to stream instance.
- Send message with audio data to audio thread.

7.3.7 SF_AUDIO_PLAYBACK_Pause

```
ssp_err_t SF_AUDIO_PLAYBACK_Pause ( sf_audio_playback_ctrl_t
*const p_api_ctrl )
```

7.3.7.1 Detailed description

Implements pause.

Table 495:Return values

Name	Description
SSP_SUCCESS	Audio playback pause message sent to audio playback thread for this stream.
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant.

7.3.8 SF_AUDIO_PLAYBACK_Stop

```
ssp_err_t SF_AUDIO_PLAYBACK_Stop ( sf_audio_playback_ctrl_t  *const p_api_ctrl )
```

7.3.8.1 Detailed description

Implements stop.

Table 496:Return values

Name	Description
SSP_SUCCESS	Audio playback stop message sent to audio playback thread for this stream.
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant.

7.3.9 SF_AUDIO_PLAYBACK_Resume

```
ssp_err_t SF_AUDIO_PLAYBACK_Resume ( sf_audio_playback_ctrl_t
*const p_api_ctrl )
```

7.3.9.1 Detailed description

Implements resume.

Table 497:Return values

Name	Description
SSP_SUCCESS	Audio playback resume message sent to audio playback thread for this stream.
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

NOTE: This function is reentrant.

7.3.10 SF_AUDIO_PLAYBACK_VolumeSet

```
ssp_err_t SF_AUDIO_PLAYBACK_VolumeSet ( sf_audio_playback_ctrl_t
*const p_api_ctrl ,   uint8_t const volume )
```

7.3.10.1 Detailed description

Implements volumeSet.

Table 498:Return values

Name	Description
SSP_SUCCESS	Audio playback software volume level updated (applies to all streams).
SSP_ERR_ASSERTION	p_ctrl is NULL
SSP_ERR_NOT_OPEN	The stream control block p_ctrl is not initialized.

7.3.10.2 Function steps

- Update volume in control block.

7.3.11 SF_AUDIO_PLAYBACK_VersionGet

```
ssp_err_t SF_AUDIO_PLAYBACK_VersionGet ( ssp_version_t  *const p_version )
```

7.3.11.1 Detailed description

Implements versionGet.

Table 499:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.3.12 Extensions

7.3.12.1 sf_audio_playback_common_instance_ctrl_t

sf_audio_playback_common_instance_ctrl_t

Detailed description

Audio common instance control block. DO NOT INITIALIZE. Initialization the first time open is called. Shared by all streams.

Variables

- uint32_t open

  Used to determine if driver is initialized.
- void const * p_next_buffer

  Pointer to next buffer (to be played when the current buffer completes).
- uint32_t next_length

  Length of next buffer (to be played when the current buffer completes).
- sf_message_instance_t const * p_message

  Pointer to message control block.
- TX_QUEUE * p_queue

  Queue subscribed to SF_MESSAGE_EVENT_CLASS_AUDIO events.
- sf_audio_playback_hw_instance_t const * p_lower_lvl_hw

  Hardware API's used.
- sf_audio_playback_instance_ctrl_t * p_stream[SF_AUDIO_PLAYBACK_CFG_MAX_STREAMS]

  Stream specific data.
- TX_THREAD thread

  Main audio thread.

- TX_EVENT_FLAGS_GROUP flags

  Event flags used to end wait in audio thread.
- sf_audio_playback_data_type_t data_type

  Sample format required by the hardware.
- uint8_t volume

  Volume from 0 (muted) to 255 (maximum, default on open).
- uint8_t buffer_index

  Which ping pong buffer to use.
- uint8_t stack[SF_AUDIO_PLAYBACK_STACK_SIZE]

  Stack for audio thread.
- int16_t samples[2][SF_AUDIO_PLAYBACK_CFG_BUFFER_SIZE_BYTES/sizeof(int16_t)]

  Ping pong buffers, used to store converted data during transfer.
- bool playing

  State of audio instance (currently playing if true)

7.3.12.2 st_sf_audio_playback_instance_ctrl

st_sf_audio_playback_instance_ctrl

Detailed description

Audio stream instance control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- uint32_t open

  Used to determine if driver is initialized.
- TX_THREAD * p_owner

  Pointer to thread that began the stream at this index. Used to ensure multiple threads don't interleave data on the same stream.
- void(* p_callback)(*p_args)

  Callback called when playback of a buffer passed to sf_audio_playback_api_t::start is complete.
- uint8_t class_instance

  Class instance used to identify the stream to the messaging framework.
- uint32_t samples_remaining

  Internal state of data samples remaining for this stream.
- uint32_t samples_total

  Total number of samples to play (independent of sample size like 8/12/16).

- uint32_t index

  Internal state of current data index for this stream.
- uint32_t end

  Used to track completion of looped playback.
- sf_audio_playback_data_t * p_data[2]

  Audio data read from queue.
- sf_audio_playback_status_t status

  Status of current stream.
- sf_audio_playback_common_instance_ctrl_t * p_common_ctrl

  Pointer to the hardware control block used by this stream.

7.4 DAC Audio Playback Framework

RTOS-integrated DAC implementation of Audio Playback Interface.

The Audio Playback Framework DAC implementation uses a timer to generate events at the sampling frequency, and uses these events to transfer PCM samples to the DAC.

7.4.1 Functions

- SF_AUDIO_PLAYBACK_HW_DAC_Open
- SF_AUDIO_PLAYBACK_HW_DAC_Start
- SF_AUDIO_PLAYBACK_HW_DAC_Stop
- SF_AUDIO_PLAYBACK_HW_DAC_Play
- SF_AUDIO_PLAYBACK_HW_DAC_DataTypeGet
- SF_AUDIO_PLAYBACK_HW_DAC_Close
- SF_AUDIO_PLAYBACK_HW_DAC_VersionGet
- sf_audio_playback_hw_callback_timer
- sf_audio_playback_hw_callback_common
- sf_audio_playback_hw_transfer_size_config

7.4.2 Variables

- g_sf_audio_playback_hw_on_sf_audio_playback_hw_dac

7.4.3 Defines

- #define SF_AUDIO_PLAYBACK_HW_DAC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_AUDIO_PLAYBACK_HW_DAC_CODE_VERSION_MINOR

  Initial value: `(6U)`

7.4.4 SF_AUDIO_PLAYBACK_HW_DAC_Open

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_Open ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl ,  sf_audio_playback_hw_cfg_t  const *const p_cfg )
```

7.4.4.1 Detailed description

Open the DAC audio driver, including the DAC HAL driver and helper timer and transfer HAL drivers.

Table 500:Return values

Name	Description
SSP_SUCCESS	Configuration of lower level drivers completed successfully.
SSP_ERR_ASSERTION	Null Pointer.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- open
- open
- open
- close
- close

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.4.4.2 Function steps

- Open Timer driver at selected frequency
- If DTC is selected, register the audio callback with the timer ISR. DTC calls activation source ISR when the transfer is complete.

- Open DAC module
- Open transfer module to transfer from buffer to DAC output register
- Configure transfer size of driver depending upon the underlying DAC resolution
- Open transfer driver
- Store driver data.
- Play linear ramp data to get DAC up to half the maximum output.

7.4.5 SF_AUDIO_PLAYBACK_HW_DAC_Start

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_Start ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl )
```

7.4.5.1 Detailed description

Start the DAC and timer HAL drivers.

Table 501:Return values

Name	Description
SSP_SUCCESS	Audio playback hardware started successfully.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- start
- start

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.4.5.2 Function steps

- Start DAC.
- Start timer.

7.4.6 SF_AUDIO_PLAYBACK_HW_DAC_Stop

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_Stop ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl )
```

7.4.6.1 Detailed description

Stop the DAC and timer HAL drivers.

Table 502:Return values

Name	Description
SSP_SUCCESS	Audio playback hardware stopped successfully.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- stop
- stop

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.4.6.2 Function steps

- Stop timer.
- Stop DAC.

7.4.7 SF_AUDIO_PLAYBACK_HW_DAC_Play

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_Play ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl ,   int16_t const *const p_buffer ,   uint32_t length )
```

7.4.7.1 Detailed description

Play a single audio buffer by input samples to the DAC at the sampling frequency configured by the timer.

Table 503:Return values

Name	Description
SSP_SUCCESS	Buffer playback began successfully.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_buffer is NULL or length is greater than 0x10000UL.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- reset

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.4.7.2 Function steps

- Reset transfer.

7.4.8 SF_AUDIO_PLAYBACK_HW_DAC_DataTypeGet

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_DataTypeGet ( sf_audio_playback_hw_ctrl_t
*const p_ctrl ,  sf_audio_playback_data_type_t  *const p_data_type )
```

7.4.8.1 Detailed description

Provides the expected data type in the pointer p_data_type.

Table 504:Return values

Name	Description
SSP_SUCCESS	Data type stored in p_data_type.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_data_type is NULL.

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.4.8.2 Function steps

- Store data type. The Synergy DAC supports only 12-bit unsigned data.

7.4.9 SF_AUDIO_PLAYBACK_HW_DAC_Close

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_Close ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl )
```

7.4.9.1 Detailed description

Close open audio driver.

Table 505:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- close
- close
- close

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.4.9.2 Function steps

- Close timer driver.
- Close DAC driver.
- Close transfer driver.

7.4.10 SF_AUDIO_PLAYBACK_HW_DAC_VersionGet

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_DAC_VersionGet ( ssp_version_t
*const p_version )
```

7.4.10.1 Detailed description

Stores the version of the firmware and API in provided pointer p_version.

Table 506:Return values

Name	Description
SSP_ERR_ASSERTION	The parameter p_version is NULL.
SSP_SUCCESS	Module version successfully stored in p_version.

NOTE: This function is reentrant.

7.4.11 sf_audio_playback_hw_callback_timer

```
sf_audio_playback_hw_callback_timer ( timer_callback_args_t  * p_args )
```

7.4.11.1 Detailed description

Callback function intercepted from timer driver.

Table 507:Parameters

Name	Direction	Description
p_args	in	Callback data can be used to identify what triggered the interrupt.

7.4.12 sf_audio_playback_hw_callback_common

```
sf_audio_playback_hw_callback_common (  void const * p_context )
```

7.4.12.1 Detailed description

Callback function intercepted from HAL layer.

Table 508:Parameters

Name	Direction	Description
p_context	in	Pointer to control block, used to identify what triggered the interrupt.

7.4.12.2 Function steps

- Recover context from ISR.
- Create callback arguments.
- Call user callback if not NULL.

7.4.13 sf_audio_playback_hw_transfer_size_config

```
 sf_audio_playback_hw_transfer_size_config ( transfer_cfg_t  const
* p_transfer ,  sf_audio_playback_hw_dac_cfg_t  const * p_cfg_extend )
```

7.4.13.1 Detailed description

Configures the transfer size of the transfer driver depending upon the underlying DAC resolution.

Table 509:Parameters

Name	Direction	Description
p_transfer	inout	Pointer to transfer driver configuration.
p_cfg_extend	inout	Pointer to hardware dependent configuration for DAC audio driver.

7.4.14 g_sf_audio_playback_hw_on_sf_audio_playback_hw_dac

sf_audio_playback_hw_api_t::g_sf_audio_playback_hw_on_sf_audio_playback_hw_dac

7.4.14.1 Detailed description

Function pointers for DAC implementation of audio playback API.

7.4.15 Extensions

7.4.15.1 sf_audio_playback_hw_dac_instance_ctrl_t

sf_audio_playback_hw_dac_instance_ctrl_t

Detailed description

Hardware dependent control block for DAC audio driver.

Variables

- void(* p_callback)(*p_args)

  Callback called when play is complete.
- void * p_context

  Placeholder for user data. Passed to the user callback in sf_audio_playback_hw_callback_args_t.
- dac_instance_t const * p_lower_lvl_dac

  DAC API used to access DAC hardware.

- timer_instance_t const * p_lower_lvl_timer

  Timer API used to generate sampling frequency.
- transfer_instance_t const * p_lower_lvl_transfer

  Transfer API used to transfer data each sampling frequency.

7.4.15.2 sf_audio_playback_hw_dac_cfg_t

sf_audio_playback_hw_dac_cfg_t

Detailed description

Hardware dependent configuration for DAC audio driver.

Variables

- dac_instance_t const * p_lower_lvl_dac

  DAC API used to access DAC hardware.
- timer_instance_t const * p_lower_lvl_timer

  Timer API used to generate sampling frequency.
- transfer_instance_t const * p_lower_lvl_transfer

  Transfer API used to transfer data each sampling frequency.

7.5 I2S Audio Playback Framework

RTOS-integrated I2S implementation of Audio Playback Interface.

The Audio Playback Framework I2S implementation uses the I2S interface for audio playback.

Name of module used by error logger macro

7.5.1 Functions

- SF_AUDIO_PLAYBACK_HW_I2S_Open
- SF_AUDIO_PLAYBACK_HW_I2S_Start
- SF_AUDIO_PLAYBACK_HW_I2S_Stop
- SF_AUDIO_PLAYBACK_HW_I2S_Play
- SF_AUDIO_PLAYBACK_HW_I2S_DataTypeGet
- SF_AUDIO_PLAYBACK_HW_I2S_Close
- SF_AUDIO_PLAYBACK_HW_I2S_VersionGet

7.5.2 Defines

- #define SF_AUDIO_PLAYBACK_HW_I2S_CODE_VERSION_MAJOR
  Initial value: `(1U)`
- #define SF_AUDIO_PLAYBACK_HW_I2S_CODE_VERSION_MINOR
  Initial value: `(5U)`

7.5.3 SF_AUDIO_PLAYBACK_HW_I2S_Open

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_Open ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl ,  sf_audio_playback_hw_cfg_t  const *const p_cfg )
```

7.5.3.1 Brief description

Open the I2S audio driver, including the I2S HAL driver and helper timer and transfer HAL drivers.

7.5.3.2 Detailed description

Table 510:Return values

Name	Description
SSP_SUCCESS	Configuration of lower level drivers completed successfully.
SSP_ERR_ASSERTION	One of the following parameter is null: p_ctrl or p_cfg or p_cfg_extend->p_lower_lvl_i2s or p_cfg_extend->p_lower_lvl_i2s->p_api.

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- open

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.5.3.3 Function steps

- Open I2S module
- Store driver data.

7.5.4 SF_AUDIO_PLAYBACK_HW_I2S_Start

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_Start ( sf_audio_playback_hw_ctrl_t
*const p_ctrl )
```

7.5.4.1 Brief description

Start the I2S and timer HAL drivers.

7.5.4.2 Detailed description

Table 511:Return values

Name	Description
SSP_SUCCESS	Audio playback hardware started successfully.

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.5.4.3 Function steps

- This API is not used - I2S is started when write is called from SF_AUDIO_PLAYBACK_HW_I2S_Play.

7.5.5 SF_AUDIO_PLAYBACK_HW_I2S_Stop

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_Stop ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl )
```

7.5.5.1 Brief description

Stop the I2S and timer HAL drivers.

7.5.5.2 Detailed description

Table 512:Return values

Name	Description
SSP_SUCCESS	Audio playback hardware stopped successfully.

Table 512:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- stop

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.5.5.3 Function steps

- Stop I2S.

7.5.6 SF_AUDIO_PLAYBACK_HW_I2S_Play

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_Play ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl ,   int16_t const *const p_buffer ,   uint32_t length )
```

7.5.6.1 Brief description

Play a single audio buffer by input samples to the I2S at the sampling frequency configured by the timer.

7.5.6.2 Detailed description

Table 513:Return values

Name	Description
SSP_SUCCESS	Buffer playback began successfully.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_buffer is NULL or length is less than 0x10000U.

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- write

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.5.6.3 Function steps

- Reset transfer.

7.5.7 SF_AUDIO_PLAYBACK_HW_I2S_DataTypeGet

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_DataTypeGet ( sf_audio_playback_hw_ctrl_t
*const p_ctrl ,  sf_audio_playback_data_type_t  *const p_data_type )
```

7.5.7.1 Brief description

Provides the expected data type in the pointer p_data_type.

7.5.7.2 Detailed description

Table 514:Return values

Name	Description
SSP_SUCCESS	Data type stored in p_data_type.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_data_type is NULL.

NOTE: This function is reentrant if the lower level driver functions are reentrant.

7.5.7.3 Function steps

- Store data type. The audio framework supports only 16-bit signed data.

7.5.8 SF_AUDIO_PLAYBACK_HW_I2S_Close

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_Close ( sf_audio_playback_hw_ctrl_t
*const p_api_ctrl )
```

7.5.8.1 Brief description

Close open audio driver.

7.5.8.2 Detailed description

Table 515:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- close

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.5.8.3 Function steps

- Close I2S driver.

7.5.9 SF_AUDIO_PLAYBACK_HW_I2S_VersionGet

```
ssp_err_t SF_AUDIO_PLAYBACK_HW_I2S_VersionGet ( ssp_version_t
*const p_version )
```

7.5.9.1 Brief description

Stores the version of the firmware and API in provided pointer p_version.

7.5.9.2 Detailed description

Table 516:Return values

Name	Description
SSP_ERR_ASSERTION	The parameter p_version is NULL.
SSP_SUCCESS	Module version successfully stored in p_version.

NOTE: This function is reentrant.

7.5.10 Extensions

7.5.10.1 sf_audio_playback_hw_i2s_instance_ctrl_t

sf_audio_playback_hw_i2s_instance_ctrl_t

Detailed description

Hardware dependent control block for I2S audio driver.

Variables

- void(* p_callback)(*p_args)

  Callback called when play is complete.
- void * p_context

  Placeholder for user data. Passed to the user callback in sf_audio_playback_hw_callback_args_t.
- i2s_instance_t const * p_lower_lvl_i2s

  I2S API used to access I2S hardware.

7.5.10.2 sf_audio_playback_hw_i2s_cfg_t

sf_audio_playback_hw_i2s_cfg_t

Detailed description

Hardware dependent configuration for I2S audio driver.

Variables

- i2s_instance_t const * p_lower_lvl_i2s

  I2S API used to access I2S hardware.

7.6 ADC Audio Recording Framework

RTOS-integrated ADC implementation of Audio Recording Interface.

The Audio Recording Framework implementation uses the ADC periodic interface for audio recording.

7.6.1 Functions

- SF_AUDIO_RECORD_ADC_Open
- SF_AUDIO_RECORD_ADC_Close
- SF_AUDIO_RECORD_ADC_Start

- SF_AUDIO_RECORD_ADC_Stop
- SF_AUDIO_RECORD_ADC_InfoGet
- SF_AUDIO_RECORD_ADC_VersionGet

7.6.2 Defines

- #define SF_AUDIO_RECORD_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_AUDIO_RECORD_CODE_VERSION_MINOR

  Initial value: `(3U)`

7.6.3 SF_AUDIO_RECORD_ADC_Open

```
ssp_err_t SF_AUDIO_RECORD_ADC_Open ( sf_audio_record_ctrl_t  *const p_api_ctrl ,
 sf_audio_record_cfg_t  const *const p_cfg )
```

7.6.3.1 Brief description

Configure the ADC with user configurations.

7.6.3.2 Detailed description

The SF_AUDIO_RECORD_ADC_Open will initialize the configurations for the underlying ADC periodic framework. Implements

- open.

Table 517:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL. Or any one of the following p_cfg parameter is NULL/zero. p_cfg->p_capture_data_buffer, p_cfg->sample_count, p_cfg->capture_data_buffer_size, p_cfg->p_callback, p_cfg->sampling_rate_hz. Or resolution or time period is not matching. for other possible causes.
SSP_ERR_IN_USE	The channel specified has already been opened.

See Common Error Codes or sf_adc_periodic for other possible return codes or causes. This function calls

- open

NOTE: This function is reentrant for any unit.

7.6.3.3 Function steps

- Initialize the ADC periodic framework
- Initialize the configuration parameters for ADC periodic configuration structure
- Configure the ADC resolution depending on the data width in cfg
- Call the underlying ADC periodic open

7.6.4 SF_AUDIO_RECORD_ADC_Close

```
ssp_err_t SF_AUDIO_RECORD_ADC_Close ( sf_audio_record_ctrl_t
*const p_api_ctrl )
```

7.6.4.1 Brief description

Call the ADC periodic framework Close.

7.6.4.2 Detailed description

Implements

- close.

Table 518:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized. Call SF_AUDIO_RECORD_ADC_Open to configure.

See Common Error Codes or sf_adc_periodic for other possible return codes or causes. This function calls

- close

7.6.4.3 Function steps

- Call the underlying ADC periodic close

7.6.5 SF_AUDIO_RECORD_ADC_Start

```
ssp_err_t SF_AUDIO_RECORD_ADC_Start ( sf_audio_record_ctrl_t
*const p_api_ctrl )
```

7.6.5.1 Brief description

Call the ADC periodic framework Start.

7.6.5.2 Detailed description

Implements

- start.

Table 519:Return values

Name	Description
SSP_SUCCESS	ADC Periodic Scan started successfully.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized. Call SF_AUDIO_RECORD_ADC_Open to configure.

See Common Error Codes or sf_adc_periodic for other possible return codes or causes. This function calls

- start

7.6.5.3 Function steps

- Call the underlying ADC periodic start

7.6.6 SF_AUDIO_RECORD_ADC_Stop

```
ssp_err_t SF_AUDIO_RECORD_ADC_Stop ( sf_audio_record_ctrl_t  *const p_api_ctrl )
```

7.6.6.1 Brief description

Call the ADC periodic framework Stop.

7.6.6.2 Detailed description

Implements

- stop.

Table 520:Return values

Name	Description
SSP_SUCCESS	Periodic ADC scan stopped successfully.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized. Call SF_AUDIO_RECORD_ADC_Open to configure.

See Common Error Codes or sf_adc_periodic for other possible return codes or causes. This function calls

- stop

7.6.6.3 Function steps

- Call the underlying ADC periodic start

7.6.7 SF_AUDIO_RECORD_ADC_InfoGet

```
ssp_err_t SF_AUDIO_RECORD_ADC_InfoGet ( sf_audio_record_ctrl_t
*const p_api_ctrl ,   sf_audio_record_info_t * p_info )
```

7.6.7.1 Brief description

Provide information about the channel supported by audio recording framework(MONO)

7.6.7.2 Detailed description

Implements

- infoGet.

Table 521:Return values

Name	Description
SSP_SUCCESS	InfoGet returns successfully.
SSP_ERR_ASSERTION	p_ctrl or p_info is null.

Table 521:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized. Call SF_AUDIO_RECORD_ADC_Open to configure.

See Common Error Codes or sf_adc_periodic for other possible return codes or causes.

7.6.8 SF_AUDIO_RECORD_ADC_VersionGet

```
ssp_err_t SF_AUDIO_RECORD_ADC_VersionGet ( ssp_version_t  *const p_version )
```

7.6.8.1 Brief description

Gets version and stores it in provided pointer p_version.

7.6.8.2 Detailed description

Implements

- versionGet.

Table 522:Return values

Name	Description
SSP_SUCCESS	VersionGet returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.6.9 Extensions

7.6.9.1 sf_audio_record_adc_instance_ctrl_t

sf_audio_record_adc_instance_ctrl_t

Detailed description

Control block for audio recording Initialization occurs when open is called

Variables

- uint32_t open

  Used by driver to check if pointer to control block is valid

- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware registers
- void * p_capture_data_buffer

  Pointer to the buffer that will store the samples
- uint32_t sample_count

  Samples per channel to be buffered before notifying the app
- void(* p_callback)(*p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.
- sf_adc_periodic_instance_t const * p_lower_lvl_adc_periodic

  Lower level ADC periodic instance.

7.6.9.2 sf_audio_record_adc_hw_cfg_t

sf_audio_record_adc_hw_cfg_t

Detailed description

Variables

- sf_adc_periodic_instance_t const * p_lower_lvl_adc_periodic

7.7 I2S Audio Recording Framework

I2S implementation of Audio Recording Interface.

The Audio Recording Framework implementation uses the I2S interface for audio recording.

7.7.1 Functions

- SF_AUDIO_RECORD_I2S_Open
- SF_AUDIO_RECORD_I2S_Start
- SF_AUDIO_RECORD_I2S_Stop
- SF_AUDIO_RECORD_I2S_InfoGet
- SF_AUDIO_RECORD_I2S_Close
- SF_AUDIO_RECORD_I2S_VersionGet

7.7.2 Defines

- #define SF_AUDIO_RECORD_I2S_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file

- #define SF_AUDIO_RECORD_I2S_CODE_VERSION_MINOR

  Initial value: `(0U)`

7.7.3 SF_AUDIO_RECORD_I2S_Open

```
ssp_err_t SF_AUDIO_RECORD_I2S_Open ( sf_audio_record_ctrl_t  *const p_api_ctrl ,
 sf_audio_record_cfg_t  const *const p_cfg )
```

7.7.3.1 Brief description

Configures the Audio record I2S framework and I2S HAL driver The SF_AUDIO_RECORD_I2S_Open function acquires a mutex for the I2S Unit used, then calls the driver open function. The mutex is released following the driver layer open function.

7.7.3.2 Detailed description

Implements

- open.

Table 523:Return values

Name	Description
SSP_SUCCESS	Configuration of lower level drivers completed successfully.
SSP_ERR_ASSERTION	One of the following parameter is null: p_ctrl or p_cfg or p_cfg_extend->p_lower_lvl_i2s or p_cfg_extend->p_lower_lvl_i2s->p_api.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex.

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- open

7.7.3.3 Function steps

- Open I2S module

- Create a mutex
- Get mutex before calling lower layer, which will access HW registers.
- Initialize the configuration parameters
- Post the Mutex
- If any of the HAL layer initializations failed, then delete the mutex and exit the function with the error code
- Delete the mutex
- If there was a mutex error, return it
- Mark control block open so other tasks know it is valid

7.7.4 SF_AUDIO_RECORD_I2S_Start

```
ssp_err_t SF_AUDIO_RECORD_I2S_Start ( sf_audio_record_ctrl_t
*const p_api_ctrl )
```

7.7.4.1 Brief description

Gets mutex, starts recording data into the buffer.

7.7.4.2 Detailed description

Implements

- start.

Table 524:Return values

Name	Description
SSP_SUCCESS	I2S record started successfully.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex.
SSP_ERR_IN_USE	The module is currently busy performing another operation

See Common Error Codes and lower level driver function for other possible return codes. This function calls:

- read

7.7.4.3 Function steps

- Get mutex, start i2s
- Call the underlying I2S driver read
- If any of the HAL layer initializations failed, then delete the mutex and exit the function with the error code
- Return the mutex
- If there was a mutex error, return it

7.7.5 SF_AUDIO_RECORD_I2S_Stop

```
ssp_err_t SF_AUDIO_RECORD_I2S_Stop ( sf_audio_record_ctrl_t  *const p_api_ctrl )
```

7.7.5.1 Brief description

Stops the audio recording and releases mutex.

7.7.5.2 Detailed description

Implements

- stop.

Table 525:Return values

Name	Description
SSP_SUCCESS	I2S Record stopped successfully.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use a mutex.

See Common Error Codes for other possible return codes or causes. This function calls: stop

7.7.5.3 Function steps

- Return the mutex
- If there was a mutex error, return it

7.7.6 SF_AUDIO_RECORD_I2S_InfoGet

```
ssp_err_t SF_AUDIO_RECORD_I2S_InfoGet ( sf_audio_record_ctrl_t
*const p_api_ctrl ,   sf_audio_record_info_t * p_info )
```

7.7.6.1 Brief description

Provide information about the channel supported by audio recording framework(stereo)

7.7.6.2 Detailed description

Implements

- infoGet.

Table 526:Return values

Name	Description
SSP_SUCCESS	InfoGet returns successfully.
SSP_ERR_ASSERTION	p_ctrl or p_info is null.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized.

See Common Error Codes for other possible return codes or causes.

7.7.7 SF_AUDIO_RECORD_I2S_Close

```
ssp_err_t SF_AUDIO_RECORD_I2S_Close ( sf_audio_record_ctrl_t
*const p_api_ctrl )
```

7.7.7.1 Brief description

Closes I2S driver, releases and deletes the mutex.

7.7.7.2 Detailed description

Implements

- close.

Table 527:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Control block p_ctrl is not initialized.

See Common Error Codes and lower level driver function for other possible return codes or causes. This function calls

- close

7.7.7.3 Function steps

- Call the underlying I2S close
- Post the mutex
- If all the HAL layers closed successfully, then delete the mutex and mark module as un-initialized
- Clear information from control block so other functions know this instance is closed

7.7.8 SF_AUDIO_RECORD_I2S_VersionGet

```
ssp_err_t SF_AUDIO_RECORD_I2S_VersionGet ( ssp_version_t  *const p_version )
```

7.7.8.1 Brief description

Gets version and stores it in provided pointer p_version.

7.7.8.2 Detailed description

Implements

- versionGet.

Table 528:Return values

Name	Description
SSP_SUCCESS	VersionGet returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.7.9 Extensions

7.7.9.1 sf_audio_record_i2s_instance_ctrl_t

sf_audio_record_i2s_instance_ctrl_t

Detailed description

Control block for audio recording Initialization occurs when open is called

Variables

- uint32_t open

  Used by driver to check if pointer to control.
- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware registers.
- void * p_capture_data_buffer

  Pointer to the buffer record buffer */.
- uint32_t capture_data_size

  capture data type
- uint32_t data_size

  Number of bytes captured for each iteration.
- uint32_t buffer_size

  size of the current record buffer */
- uint32_t current_buffer_index

  Index into current buffer */.
- void(* p_callback)(*p_args)

  Callback function.
- void const * p_context

  Placeholder for user data.
- i2s_instance_t const * p_lower_lvl_i2s

  Lower level I2S instance.

7.7.9.2 sf_audio_record_i2s_hw_cfg_t

sf_audio_record_i2s_hw_cfg_t

Detailed description

Variables

- i2s_instance_t const * p_lower_lvl_i2s

7.8 QSPI Block Media Framework

RTOS-integrated Block Media framework for QSPI driver.

7.8.1 Functions

- sf_block_media_qspi_initialize
- sf_block_media_qspi_erase
- sf_block_media_qspi_program
- SF_BLOCK_MEDIA_QSPI_Open
- SF_BLOCK_MEDIA_QSPI_Read
- SF_BLOCK_MEDIA_QSPI_Write
- SF_BLOCK_MEDIA_QSPI_Control
- SF_BLOCK_MEDIA_QSPI_Close
- SF_BLOCK_MEDIA_QSPI_VersionGet

7.8.2 Variables

- g_block_media_qspi_version
- g_sf_block_media_on_sf_block_media_qspi

7.8.3 Defines

- #define SF_BLOCK_MEDIA_QSPI_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_BLOCK_MEDIA_QSPI_CODE_VERSION_MINOR

  Initial value: `(0U)`
- #define SF_QSPI_OPEN

  Initial value: `(0x51535049U)`

  "QSPI" in ASCII, used to identify general SF_BLOCK_MEDIA_QSPI control block
- #define QSPI_FLASH_BASE_ADDRESS

  Initial value:`BSP_PRV_QSPI_DEVICE_PHYSICAL_ADDRESS`
- #define IN_PROGRESS

  Initial value:`true`

- #define SF_BLOCK_MEDIA_QSPI_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &g_module_name[0], &g_block_media_qspi_version)`

  Macro for error logger.

7.8.4 sf_block_media_qspi_initialize

```
ssp_err_t sf_block_media_qspi_initialize ( sf_block_media_qspi_instance_ctrl_t *const p_ctrl , sf_block_media_cfg_t const *const p_cfg )
```

7.8.4.1 Brief description

Acquires mutex, then handles driver initialization at the HAL layer. This function releases the mutex before returns to the caller.

7.8.4.2 Detailed description

Table 529:Return values

Name	Description
SSP_SUCCESS	Block Media driver for QSPI is successfully opened.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- open

7.8.4.3 Function steps

- Calling low level driver

7.8.5 sf_block_media_qspi_erase

```
ssp_err_t sf_block_media_qspi_erase ( sf_block_media_qspi_instance_ctrl_t * p_ctrl , uint8_t * p_device_address , uint32_t const block_count )
```

7.8.5.1 Brief description

This is the subroutine for the SF_BLOCK_MEDIA_QSPI_Write API.

7.8.5.2 Detailed description

Table 530:Return values

Name	Description
SSP_SUCCESS	No parameter error found

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- erase

7.8.5.3 Function steps

- Erase the block before writing
- Wait until operation is in progress
- Calculate next sub-sector address

7.8.6 sf_block_media_qspi_program

```
ssp_err_t sf_block_media_qspi_program ( sf_block_media_qspi_instance_ctrl_t
* p_ctrl ,   uint8_t * p_device_address ,   uint8_t * p_buffer ,
 qspi_info_t  qspi_info ,   uint32_t const block_count )
```

7.8.6.1 Brief description

This is the subroutine for the SF_BLOCK_MEDIA_QSPI_Write API.

7.8.6.2 Detailed description

Table 531:Return values

Name	Description
SSP_SUCCESS	No parameter error found

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- pageProgram

7.8.6.3 Function steps

- Write data into the block media QSPI flash

7.8.7 SF_BLOCK_MEDIA_QSPI_Open

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_Open ( sf_block_media_ctrl_t  *const p_api_ctrl ,
 sf_block_media_cfg_t  const *const p_cfg )
```

7.8.7.1 Brief description

Open Block Media QSPI flash device for read/write and control. Parameter checking and Acquires mutex, then handles driver initialization at the HAL QSPI layer and marking the open flag in control block.

7.8.7.2 Detailed description

Name of module used by error logger macro

Table 532:Return values

Name	Description
SSP_SUCCESS	Block media for QSPI framework is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_api_ctrl, p_cfg or configuration for qspi.
SSP_ERR_IN_USE	The channel specified has already been opened. or the mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- open

7.8.7.3 Function steps

- On success populate the control structure
- Selecting smallest block erasable by underlying QSPI flash

7.8.8 SF_BLOCK_MEDIA_QSPI_Read

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_Read ( sf_block_media_ctrl_t  *const p_api_ctrl ,
  uint8_t *const p_dest ,   uint32_t const start_block ,   uint32_t
const block_count )
```

7.8.8.1 Brief description

Read requested data from Block Media QSPI Flash through QSPI channel.

7.8.8.2 Detailed description

Table 533:Return values

Name	Description
SSP_SUCCESS	QSPI data read successfully.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_api_ctrl or p_dest.
SSP_ERR_NOT_OPEN	Block media QSPI Framework module is not yet initialized.
SSP_ERR_IN_USE	The channel specified has already been opened. or the mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- read

7.8.8.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Read data from block media QSPI flash
- Release mutex

7.8.9 SF_BLOCK_MEDIA_QSPI_Write

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_Write ( sf_block_media_ctrl_t  *const p_api_ctrl ,
  uint8_t const *const p_src ,   uint32_t const start_block ,   uint32_t
const block_count )
```

7.8.9.1 Brief description

Program requested data content to the Block Media QSPI flash memory.

7.8.9.2 Detailed description

Table 534:Return values

Name	Description
SSP_SUCCESS	Flash write finished successfully.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_api_ctrl or p_src.
SSP_ERR_NOT_OPEN	Block media QSPI Framework module is not yet initialized.
SSP_ERR_IN_USE	The channel specified has already been opened. or the mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- pageProgram

7.8.9.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Get the information of Flash
- Calculate the address of flash
- Calculate the number of iteration required to complete write operation
- Write data into the block media QSPI flash
- Release mutex

7.8.10 SF_BLOCK_MEDIA_QSPI_Control

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_Control ( sf_block_media_ctrl_t
*const p_api_ctrl ,  ssp_command_t  const command ,   void * p_data )
```

7.8.10.1 Brief description

Send control commands to and receive status of flash.

7.8.10.2 Detailed description

Table 535:Return values

Name	Description
SSP_SUCCESS	Command executed successfully.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_api_ctrl.
SSP_ERR_NOT_OPEN	Block media QSPI Framework module is not yet initialized.
SSP_ERR_UNSUPPORTED	Command not support.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- infoGet

7.8.10.3 Function steps

- Get the information of Flash

7.8.11 SF_BLOCK_MEDIA_QSPI_Close

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_Close ( sf_block_media_ctrl_t  *const p_api_ctrl )
```

7.8.11.1 Brief description

Close functionality will delete the resources which is initialized in open call.

7.8.11.2 Detailed description

Table 536:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	Parameters may be null: p_api_ctrl.
SSP_ERR_NOT_OPEN	Block media QSPI Framework module is not yet initialized.

Table 536:Return values (Continued)

Name	Description
SSP_ERR_IN_USE	The channel specified has already been opened. or the mutex may be unavailable for the the device. See HAL driver for other possible causes.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- close

7.8.11.3 Function steps

- Delete RTOS services allocated during the open call.

7.8.12 SF_BLOCK_MEDIA_QSPI_VersionGet

```
ssp_err_t SF_BLOCK_MEDIA_QSPI_VersionGet ( ssp_version_t  *const p_version )
```

7.8.12.1 Brief description

Get the firmware and API version of Block Media QSPI Framework.

7.8.12.2 Detailed description

Table 537:Return values

Name	Description
SSP_SUCCESS	Function executed successfully.
SSP_ERR_ASSERTION	Null Pointer.

NOTE: This function is reentrant.

7.8.13 g_block_media_qspi_version

```
ssp_version_t::g_block_media_qspi_version
```

7.8.13.1 Detailed description

Version data structure used by error logger macro.

7.8.14 g_sf_block_media_on_sf_block_media_qspi

sf_block_media_api_t::g_sf_block_media_on_sf_block_media_qspi

7.8.14.1 Detailed description

Block Media QSPI function pointers

7.8.14.2 Initialized as

```
g_sf_block_media_on_sf_block_media_qspi=
{
        .open       = SF_BLOCK_MEDIA_QSPI_Open,
        .read       = SF_BLOCK_MEDIA_QSPI_Read,
        .write      = SF_BLOCK_MEDIA_QSPI_Write,
        .ioctl      = SF_BLOCK_MEDIA_QSPI_Control,
        .close      = SF_BLOCK_MEDIA_QSPI_Close,
        .versionGet = SF_BLOCK_MEDIA_QSPI_VersionGet
}
```

7.8.15 Extensions

7.8.15.1 sf_block_media_on_qspi_cfg_t

sf_block_media_on_qspi_cfg_t

Detailed description

Variables

- qspi_instance_t const *const p_lower_lvl_qspi

  Pointer to QSPI instance structure.

7.8.15.2 sf_block_media_qspi_instance_ctrl_t

sf_block_media_qspi_instance_ctrl_t

Detailed description

QSPI block media instance control block.

Variables

- uint32_t open

  Used to determine if framework is initialized.

- uint32_t block_size

  Block size in bytes.
- qspi_instance_t * p_lower_lvl_qspi

  Pointer to QSPI instance structure.
- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware registers.

7.9 RAM Block Media Framework

RTOS-integrated Block Media framework for RAM.

7.9.1 Functions

- SF_BLOCK_MEDIA_RAM_Open
- SF_BLOCK_MEDIA_RAM_Read
- SF_BLOCK_MEDIA_RAM_Write
- SF_BLOCK_MEDIA_RAM_Control
- SF_BLOCK_MEDIA_RAM_Close
- SF_BLOCK_MEDIA_RAM_VersionGet

7.9.2 Defines

- #define SF_BLOCK_MEDIA_RAM_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_BLOCK_MEDIA_RAM_CODE_VERSION_MINOR

  Initial value: `(0U)`

7.9.3 SF_BLOCK_MEDIA_RAM_Open

```
ssp_err_t SF_BLOCK_MEDIA_RAM_Open ( sf_block_media_ctrl_t  *const p_api_ctrl ,
 sf_block_media_cfg_t  const *const p_cfg )
```

7.9.3.1 Brief description

Open device for read/write and control.

7.9.3.2 Detailed description

Table 538:Return values

Name	Description
SSP_SUCCESS	RAM buffer is available and is now open for read, write, and control access.
SSP_ERR_ASSERTION	p_api_ctrl, p_cfg, p_cfg->p_extend, or p_block_media_cfg->p_ram_buffer is NULL.
SSP_ERR_IN_USE	Framework is already open by someone else

7.9.3.3 Function steps

- Check if Framework is already in USE
- Copy the block size and RAM buffer memory address to control structure for further operation
- Mark device as a open

7.9.4 SF_BLOCK_MEDIA_RAM_Read

```
ssp_err_t SF_BLOCK_MEDIA_RAM_Read ( sf_block_media_ctrl_t  *const p_api_ctrl ,
  uint8_t *const p_dest ,   uint32_t const start_block ,   uint32_t
const block_count )
```

7.9.4.1 Brief description

Read data from RAM buffer.

7.9.4.2 Detailed description

Table 539:Return values

Name	Description
SSP_SUCCESS	Data read successfully.
SSP_ERR_ASSERTION	p_api_ctrl, p_dest or internal control block element is NULL.
SSP_ERR_NOT_OPEN	The Framework is not opened.
SSP_ERR_INVALID_BLOCKS	Invalid block passed to API

7.9.4.3 Function steps

- Check if Framework is NOT open
- Copy the content of p_ram_buffer into destination

7.9.5 SF_BLOCK_MEDIA_RAM_Write

```
ssp_err_t SF_BLOCK_MEDIA_RAM_Write ( sf_block_media_ctrl_t  *const p_api_ctrl ,
  uint8_t const *const p_src ,   uint32_t const start_block ,   uint32_t
const block_count )
```

7.9.5.1 Brief description

Write data to RAM buffer.

7.9.5.2 Detailed description

Table 540:Return values

Name	Description
SSP_SUCCESS	Data write successfully.
SSP_ERR_ASSERTION	p_api_ctrl, p_src or internal control block element is NULL.
SSP_ERR_NOT_OPEN	Framework is not opened.
SSP_ERR_INVALID_BLOCKS	Invalid block passed to API

7.9.5.3 Function steps

- Check if Framework is NOT open
- Copy the content of source into p_ram_buffer

7.9.6 SF_BLOCK_MEDIA_RAM_Control

```
ssp_err_t SF_BLOCK_MEDIA_RAM_Control ( sf_block_media_ctrl_t
*const p_api_ctrl ,  ssp_command_t  const command ,   void * p_data )
```

7.9.6.1 Brief description

Send control commands to and receive status of RAM buffer.

7.9.6.2 Detailed description

Table 541:Return values

Name	Description
SSP_SUCCESS	Command executed successfully.
SSP_ERR_ASSERTION	p_api_ctrl or p_data is NULL.
SSP_ERR_NOT_OPEN	Framework is not opened.
SSP_ERR_UNSUPPORTED	Command not supported.

7.9.6.3 Function steps

- Check if Framework is NOT open

7.9.7 SF_BLOCK_MEDIA_RAM_Close

```
ssp_err_t SF_BLOCK_MEDIA_RAM_Close ( sf_block_media_ctrl_t  *const p_api_ctrl )
```

7.9.7.1 Brief description

Close the Framework.

7.9.7.2 Detailed description

Table 542:Return values

Name	Description
SSP_SUCCESS	RAM buffer is available and is now open for read, write, and control access.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Framework is not opened.

7.9.7.3 Function steps

- Check if Framework is NOT open
- Mark Framework as close

7.9.8 SF_BLOCK_MEDIA_RAM_VersionGet

```
ssp_err_t SF_BLOCK_MEDIA_RAM_VersionGet ( ssp_version_t  *const p_version )
```

7.9.8.1 Brief description

Get version of Block Media RAM framework.

7.9.8.2 Detailed description

Return the version of the firmware and API.

Table 543:Return values

Name	Description
SSP_ERR_ASSERTION	p_version is NULL.
SSP_SUCCESS	version read successfully.

NOTE: This function is reentrant.

7.9.9 Extensions

7.9.9.1 sf_block_media_on_ram_cfg_t

sf_block_media_on_ram_cfg_t

Detailed description
Variables

- uint8_t * p_ram_buffer

  Pointer to RAM buffer address.
- uint32_t ram_buffer_size

  Size of RAM buffer.

7.9.9.2 sf_block_media_ram_instance_ctrl_t

sf_block_media_ram_instance_ctrl_t

Detailed description

RAM block media instance control block.

Variables

- uint8_t * p_ram_buffer

  pointer to RAM buffer address
- uint32_t block_size

  Block size in bytes.
- uint32_t open

  Used to determine if framework is initialized.
- uint32_t ram_buffer_size

  Size of RAM buffer.

7.10 SDMMC Block Media Framework

RTOS-integrated Block Media framework for SDMMC driver.

7.10.1 Functions

- SF_Block_Media_SDMMC_Open
- SF_Block_Media_SDMMC_Read
- SF_Block_Media_SDMMC_Write
- SF_Block_Media_SDMMC_Control
- SF_Block_Media_SDMMC_Close
- SF_Block_Media_SDMMC_VersionGet
- sf_block_media_sdmmc_callback

7.10.2 Defines

- #define BLOCK_MEDIA_SDMMC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define BLOCK_MEDIA_SDMMC_CODE_VERSION_MINOR

  Initial value: `(5U)`

7.10.3 SF_Block_Media_SDMMC_Open

```
ssp_err_t SF_Block_Media_SDMMC_Open ( sf_block_media_ctrl_t  *const p_api_ctrl ,
 sf_block_media_cfg_t  const *const p_cfg )
```

7.10.3.1 Brief description

Open device for read/write and control.

7.10.3.2 Detailed description

Open an SD or MMC device port for read/write and control. This function initializes the SDMMC driver and hardware the first time it is called out of reset.

Table 544:Return values

Name	Description
SSP_SUCCESS	Port is available and is now open for read, write, and control access.
SSP_ERR_ASSERTION	p_ctrl, p_cfg, p_block_media_cfg or p_sdmmc is NULL.
SSP_ERR_INTERNAL	OS service call fails.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- open

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.10.3.3 Function steps

- Create SDMMC event flag and put it into context
- Mark the stream as open by initializing "BMSO" in its ASCII equivalent.
- Cleanup before logging the error

7.10.4 SF_Block_Media_SDMMC_Read

```
ssp_err_t SF_Block_Media_SDMMC_Read ( sf_block_media_ctrl_t  *const p_api_ctrl ,
  uint8_t *const p_dest ,   uint32_t const start_block ,   uint32_t
const block_count )
```

7.10.4.1 Brief description

Read data from SD/MMC.

7.10.4.2 Detailed description

Read data from an SD or MMC device port.

Table 545:Return values

Name	Description
SSP_SUCCESS	Data read successfully.
SSP_ERR_ASSERTION	p_ctrl, p_sdmmc or p_dest is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	OS service call fails.
SSP_ERR_READ_FAILED	Data read failed.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- read

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.10.4.3 Function steps

- Wait until read operation is completed. Event is signaled in event flag object.

7.10.5 SF_Block_Media_SDMMC_Write

```
ssp_err_t SF_Block_Media_SDMMC_Write ( sf_block_media_ctrl_t
*const p_api_ctrl ,   uint8_t const *const p_src ,   uint32_t const start_block ,
  uint32_t const block_count )
```

7.10.5.1 Brief description

Write data to SDMMC channel.

7.10.5.2 Detailed description

Table 546:Return values

Name	Description
SSP_SUCCESS	Card write finished successfully.
SSP_ERR_ASSERTION	p_ctrl, p_sdmmc or p_src is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	OS service call fails.
SSP_ERR_WRITE_FAILED	Data write failed.
SSP_ERR_WRITE_PROTECTED	SD or MMC card is Write Protected.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- write

NOTE: This function is reentrant for different channels.

7.10.5.3 Function steps

- Wait until write operation is completed. Event is signaled in event flag object.

7.10.6 SF_Block_Media_SDMMC_Control

```
ssp_err_t SF_Block_Media_SDMMC_Control ( sf_block_media_ctrl_t
*const p_api_ctrl ,  ssp_command_t  const command ,   void * p_data )
```

7.10.6.1 Brief description

Send control commands to and receive status of SD/MMC port.

7.10.6.2 Detailed description

Send control commands to the SD/MMC port and receive the status of the SD/MMC port.

Table 547:Return values

Name	Description
SSP_SUCCESS	Command executed successfully.
SSP_ERR_ASSERTION	p_ctrl or p_sdmmc or p_data is Null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SF_INFO_NOT_AVAILABLE	Information not available possibly because card has been removed or is defective.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- control

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.10.7 SF_Block_Media_SDMMC_Close

```
ssp_err_t SF_Block_Media_SDMMC_Close ( sf_block_media_ctrl_t
*const p_api_ctrl )
```

7.10.7.1 Brief description

Close open device port.

7.10.7.2 Detailed description

Close an open SD/MMC device port.

Table 548:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl or p_sdmmc is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	OS service call fails.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- close

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

7.10.7.3 Function steps

- Mark control block as unused so it can be reconfigured.

7.10.8 SF_Block_Media_SDMMC_VersionGet

```
ssp_err_t SF_Block_Media_SDMMC_VersionGet ( ssp_version_t  *const p_version )
```

7.10.8.1 Brief description

Get version of Block Media SD/MMC driver.

7.10.8.2 Detailed description

Return the version of the firmware and API.

Table 549:Return values

Name	Description
SSP_ERR_ASSERTION	p_version is Pointer.
SSP_SUCCESS	version read successfully.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant.

7.10.9 sf_block_media_sdmmc_callback

```
sf_block_media_sdmmc_callback ( sdmmc_callback_args_t  * pcb_arg )
```

7.10.9.1 Detailed description

SDMMC SSP framework level callback

Table 550:Parameters

Name	Direction	Description
pcb_arg	in	Pointer to callback parameters

Table 551:Return values

Name	Description
void	

7.10.9.2 Function steps

- Transfer complete event occurs wake up the suspended thread.

7.10.10 Extensions

7.10.10.1 sf_block_media_on_sdmmc_cfg_t

sf_block_media_on_sdmmc_cfg_t

Detailed description

Variables

- sdmmc_instance_t const *const p_lower_lvl_sdmmc

  Pointer to SDMMC instance structure.

7.10.10.2 sf_block_media_sdmmc_instance_ctrl_t

sf_block_media_sdmmc_instance_ctrl_t

Detailed description

SDMMC block media instance control block.

Variables

- uint32_t block_size

  Block size in bytes.

- sdmmc_instance_t * p_lower_lvl_sdmmc

  Pointer to SDMMC instance structure.
- TX_EVENT_FLAGS_GROUP eventflag

  Pointer to the event flag object for SDMMC data transfer.
- uint32_t open

  Used to determine if framework is initialized.

7.11 Cellular NSAL Implementation on NetX

Cellular NetX NSAL interface implementation header file.

7.11.1 Functions

- sf_cellular_nsal_netx_driver
- sf_cellular_nsal_ppp_send_byte
- sf_cellular_nsal_invalid_packet_handler

7.11.2 Defines

- #define SF_CELR_NSALNX_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file Major Version of code that implements the API defined in this file
- #define SF_CELR_NSALNX_CODE_VERSION_MINOR

  Initial value: `(1U)`

  Minor Version of code that implements the API defined in this file

7.11.3 sf_cellular_nsal_netx_driver

```
 sf_cellular_nsal_netx_driver (  NX_IP_DRIVER * driver_req_ptr ,
 sf_cellular_instance_t  const * p_cellular_instance ,  sf_cellular_nsal_cfg_t
* p_cellular_nsal_cfg )
```

7.11.3.1 Brief description

NetX IP Driver entry function.

7.11.3.2 Detailed description

Table 552:Parameters

Name	Direction	Description
driver_req_ptr	in	Pointer to NetX IP Driver
p_cellular_instance	in	Pointer to cellular framework instance
p_cellular_nsal_cfg	in	Pointer to cellular nsal configuration structure

NetX IP Driver entry function.

Table 553:Parameters

Name	Direction	Description
driver_req_ptr	in	NetX Driver Pointer
p_cellular_instance	in	Cellular Framework Instance
p_cellular_nsal_cfg	in	Cellular NSAL configuration

Table 554:Return values

Name	Description
void	

7.11.4 sf_cellular_nsal_ppp_send_byte

```
 sf_cellular_nsal_ppp_send_byte (  UCHAR byte ,  sf_cellular_instance_t  const
* p_celr_instance )
```

7.11.4.1 Brief description

PPP Send Byte Callback function call from PPP Stack.

7.11.4.2 Detailed description

NSAL PPP Send bytes callback API

Table 555:Parameters

Name	Direction	Description
byte	in	Byte to send
p_celr_instance	in	Pointer to cellular framework instance
byte	in	Byte to be send
p_celr_instance	in	Cellular instance pointer

7.11.4.3 Function steps

- Transmit byte

7.11.5 sf_cellular_nsal_invalid_packet_handler

```
sf_cellular_nsal_invalid_packet_handler (  NX_PACKET * p_packet_ptr ,
sf_cellular_instance_t  const * p_celr_instance )
```

7.11.5.1 Brief description

Cellular framework nsal invalid callback handler.

7.11.5.2 Detailed description

Table 556:Parameters

Name	Direction	Description
p_packet_ptr	in	Pointer to NetX Packet
p_celr_instance	in	Pointer to cellular framework instance

Cellular framework nsal invalid callback handler.

Table 557:Parameters

Name	Direction	Description
p_packet_ptr	in	Pointer to invalid PPP Packet received
p_celr_instance	in	Cellular instance pointer

7.11.5.3 Function steps

- variable to get Memory compare result
- Check whether packet contains "NO CARRIER" string, we are ignoring first and last 2 bytes of packet which are Carriage Return and Line Feed.
- check whether no carrier string present
- Disconnect Network
- Soft reset the module
- Provision the Module using callback
- Reestablish data connection
- Restart PPP
- Release the packet

7.12 Telnet Communication Framework

RTOS-integrated Communications Framework NetX telnet server implementation.

7.12.1 Functions

- SF_COMMS_TELNET_Open
- SF_COMMS_TELNET_Close
- SF_COMMS_TELNET_Read
- SF_COMMS_TELNET_Write
- SF_COMMS_TELNET_Lock
- SF_COMMS_TELNET_Unlock
- SF_COMMS_TELNET_VersionGet

7.12.2 Defines

- #define SF_COMMS_TELNET_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_COMMS_TELNET_CODE_VERSION_MINOR

  Initial value: `(1U)`
- #define SF_COMMS_TELNET_INTERNAL_TIMEOUT

  Initial value: `(10)`
- #define SF_COMMS_TELNET_MAX_CONNECTION

  Initial value: `(4U)`
- #define SF_COMMS_TELNET_PACKET_SIZE_BYTES

  Initial value: `(1536U + 32U)`
- #define SF_COMMS_TELNET_PACKETS_IN_POOL_MEMORY

  Initial value: `(50U)`
- #define SF_COMMS_TELNET_PACKET_POOL_MEMORY_SIZE_BYTES

  Initial value: `((SF_COMMS_TELNET_PACKET_SIZE_BYTES + (uint32_t) sizeof(NX_PACKET)) * SF_COMMS_TELNET_PACKETS_IN_POOL_MEMORY)`
- #define SF_COMMS_TELNET_QUEUE_MEMORY_SIZE_BYTES

  Initial value: `(SF_COMMS_TELNET_PACKETS_IN_POOL_MEMORY * 4U )`
- #define SF_COMMS_TELNET_OPEN

  Initial value: `(0x434D544EU)`

  "CMTN" in ASCII, used to identify general timer handle

7.12.3 SF_COMMS_TELNET_Open

```
ssp_err_t SF_COMMS_TELNET_Open ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_cfg_t  const *const p_cfg )
```

7.12.3.1 Brief description

Initializes the Telnet server and other operating system resources.

7.12.3.2 Detailed description

Table 558:Return values

Name	Description
SSP_SUCCESS	comms Telnet instance opened successfully.
SSP_ERR_IN_USE	comms Telnet maximum connection limit reached.
SSP_ERR_ALREADY_OPEN	comms Telnet instance already open.
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL. • Pointer p_cfg is NULL • Pointer p_cfg->p_extend is NULL • Pointer p_cfg_extend->p_telnet_server is NULL • Pointer p_cfg_extend->p_telnet_server is NULL • Telnet server field nx_telnet_server_id indicate this instance is not created already thus invlaid instance of Telnet server.
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.12.3.3 Function steps

- Initialize and start Telnet server and ThreadX resources for this connection
- Mark this connection initialized.

7.12.4 SF_COMMS_TELNET_Close

```
ssp_err_t SF_COMMS_TELNET_Close ( sf_comms_ctrl_t  *const p_api_ctrl )
```

7.12.4.1 Brief description

Disconnect Telnet server and clean up resources.

7.12.4.2 Detailed description

Table 559:Return values

Name	Description
SSP_SUCCESS	Connection successfully closed
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL • p_ctrl->p_telnet_server is NULL • Telnet server field nx_telnet_server_id indicate this instance is not created already thus invlaid instance of Telnet server.
SSP_ERR_NOT_OPEN	Connection is not open

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.12.4.3 Function steps

- Check if connection is open
- Update connection record.
- Return connection not open if no record found
- Stop and release Telnet server and ThreadX resources for this connection
- Mark this connection uninitialized.

7.12.5 SF_COMMS_TELNET_Read

```
ssp_err_t SF_COMMS_TELNET_Read ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   UINT const timeout )
```

7.12.5.1 Brief description

Read data from the Telnet comms connection.

7.12.5.2 Detailed description

Table 560:Return values

Name	Description
SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL • Pointer p_dest is NULL • Invalid read length i.e. bytes value is zero
SSP_ERR_NOT_OPEN	Connection is not open
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Receive mutex get' timed out • 'Queue receive' timed out

Table 560:Return values (Continued)

Name	Description
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This API is reentrant.

7.12.5.3 Function steps

- Check if connection is open
- Check and wait for client to be connected with timeout.
- Get read lock.
- Get data from read queue.
- Release read lock.

7.12.6 SF_COMMS_TELNET_Write

```
ssp_err_t SF_COMMS_TELNET_Write ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
const *const p_src ,   uint32_t const bytes ,   UINT const timeout )
```

7.12.6.1 Brief description

Write data to the Telnet comms connection.

7.12.6.2 Detailed description

Table 561:Return values

Name	Description
SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL. • Pointer p_src is NULL. • Invalid write length i.e. bytes value is zero.
SSP_ERR_NOT_OPEN	Connection is not open
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Transmit mutex get' timed out
SSP_ERR_OUT_OF_MEMORY	Couldn't allocate pool memory for Telnet server
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.12.6.3 Function steps

- Check if connection is open
- Check and wait for client to be connected with timeout.
- Get write lock.
- Send data to the connected client.
- Release write lock.

7.12.7 SF_COMMS_TELNET_Lock

```
ssp_err_t SF_COMMS_TELNET_Lock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type ,   UINT timeout )
```

7.12.7.1 Brief description

Acquire lock type for the Telnet comms instance.

7.12.7.2 Detailed description

Table 562:Return values

Name	Description
SSP_SUCCESS	Acquired requested lock on given connection.
SSP_ERR_ASSERTION	Pointer p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Connection is not open.
SSP_ERR_TIMEOUT	Acquiring requested lock timed-out.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.12.7.3 Function steps

- Check if connection is open
- Get both lock if requested
- Else get the lock type requested

7.12.8 SF_COMMS_TELNET_Unlock

```
ssp_err_t SF_COMMS_TELNET_Unlock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type )
```

7.12.8.1 Brief description

Release lock type for the Telnet comms instance.

7.12.8.2 Detailed description

Table 563:Return values

Name	Description
SSP_SUCCESS	Released requested lock on given connection..
SSP_ERR_ASSERTION	Pointer p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Connection is not open.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.12.8.3 Function steps

- Check if connection is open

- Release Lock(s) on this connection.

7.12.9 SF_COMMS_TELNET_VersionGet

```
ssp_err_t SF_COMMS_TELNET_VersionGet ( ssp_version_t  *const p_version )
```

7.12.9.1 Brief description

Get driver version.

7.12.9.2 Detailed description

Table 564:Return values

Name	Description
SSP_SUCCESS	Operation successful
SSP_ERR_ASSERTION	p_version pointer is NULL

NOTE: - This function is reentrant.

7.12.10 Extensions

- NX_TELNET_SERVER * p_telnet_server
- CHAR * p_telnet_server_name
- NX_IP * p_ip
- VOID * p_stack
- ULONG stack_size

7.13 Console Framework

RTOS-integrated Console Framework.

This is a ThreadX aware console framework implemented using the SSP communications framework.

7.13.1 Functions

- SF_CONSOLE_Open
- SF_CONSOLE_Close
- SF_CONSOLE_Parse
- SF_CONSOLE_Prompt
- SF_CONSOLE_Read
- SF_CONSOLE_Write
- SF_CONSOLE_ArgumentFind
- SF_CONSOLE_CallbackNextMenu
- SF_CONSOLE_VersionGet

7.13.2 Defines

- #define SF_CONSOLE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_CONSOLE_CODE_VERSION_MINOR

  Initial value: `(6U)`

7.13.3 SF_CONSOLE_Open

```
ssp_err_t SF_CONSOLE_Open ( sf_console_ctrl_t  *const p_api_ctrl ,
 sf_console_cfg_t  const *const p_cfg )
```

7.13.3.1 Detailed description

Table 565:Return values

Name	Description
SSP_SUCCESS	Console channel is successfully opened

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.3.2 Function steps

- Open UART driver
- Store echo configuration and initial menu in control block
- Prompt for input autostart is true

7.13.4 SF_CONSOLE_Close

```
ssp_err_t SF_CONSOLE_Close ( sf_console_ctrl_t  *const p_api_ctrl )
```

7.13.4.1 Detailed description

Table 566:Return values

Name	Description
SSP_SUCCESS	Console successfully closed

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.4.2 Function steps

- Close UART driver

7.13.5 SF_CONSOLE_Parse

```
ssp_err_t SF_CONSOLE_Parse ( sf_console_ctrl_t  *const p_api_ctrl ,
 sf_console_menu_t  const *const p_menu ,   uint8_t const *const p_input ,
  uint32_t const bytes )
```

7.13.5.1 Detailed description

Table 567:Return values

Name	Description
SSP_SUCCESS	Data parsed successfully, command found and callback called.
SSP_ERR_UNSUPPORTED	Command not found in the current menu.
SSP_ERR_ASSERTION	One or more input parameter pointers are invalid.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.5.2 Function steps

- Print help menu if help command is entered
- Go back one menu if previous menu command is entered.
- Go back to root menu if root menu command is entered.
- Look for matching commands, call callback if command found.

7.13.6 SF_CONSOLE_Prompt

```
ssp_err_t SF_CONSOLE_Prompt ( sf_console_ctrl_t  *const p_api_ctrl ,
 sf_console_menu_t  const *const p_menu ,   UINT const timeout )
```

7.13.6.1 Detailed description

Table 568:Return values

Name	Description
SSP_SUCCESS	Received valid command and called callback
SSP_ERR_ASSERTION	p_ctrl is NULL

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.6.2 Function steps

- Update stored current menu pointer if a new pointer is specified.
- Print menu name followed by ">" to prompt for user input.
- Lock the console UART framework to reserve exclusive access until the command completes.
  NOTE: Transmission is only locked while the menu name is printed and while the input command is non-zero in length. This allow debug messages to print from other threads while echo is off or no input command has been entered.

  Wait for input
- Parse input and call associated user callback.
- Command is complete, so unlock comms reception.

7.13.7 SF_CONSOLE_Read

```
ssp_err_t SF_CONSOLE_Read ( sf_console_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   uint32_t const timeout )
```

7.13.7.1 Detailed description

Table 569:Return values

Name	Description
SSP_SUCCESS	Data read completed successfully

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.7.2 Function steps

- Lock the communications framework reception until carriage return is received.
- Read one byte at a time, checking for carriage returns, backspace, delete, and escape codes.
- Unlock the communications framework reception

7.13.8 SF_CONSOLE_Write

```
ssp_err_t SF_CONSOLE_Write ( sf_console_ctrl_t  *const p_api_ctrl ,   uint8_t
const *const p_src ,   uint32_t const timeout )
```

7.13.8.1 Detailed description

Table 570:Return values

Name	Description
SSP_SUCCESS	Data write completed successfully

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.8.2 Function steps

- Write null terminated string. Calculate the length. If it isn't longer than the maximum, write the entire string to the console.

7.13.9 SF_CONSOLE_ArgumentFind

```
ssp_err_t SF_CONSOLE_ArgumentFind ( uint8_t const *const p_arg , uint8_t const
*const p_str , int32_t *const p_index , int32_t *const p_data )
```

7.13.9.1 Detailed description

Table 571:Return values

Name	Description
SSP_SUCCESS	Argument found successfully
SSP_ERR_ASSERTION	p_arg or p_str is NULL

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any channel.

7.13.9.2 Function steps

- Search for first letter match at beginning of word.
- If the input string matches the input argument, store the index of the character following the argument in p_index and the data at that index in p_data. Then return.

7.13.10 SF_CONSOLE_CallbackNextMenu

```
SF_CONSOLE_CallbackNextMenu ( sf_console_callback_args_t * p_args )
```

7.13.10.1 Detailed description

Callback provided to continue parsing the next menu down.

Table 572:Parameters

Name	Direction	Description
p_args	in	Pointer to callback arguments to use in the next menu.

7.13.10.2 Function steps

- Next level menu is passed in as the user context parameter
- Update current menu.
- Check to see if the next menu command was input in the remaining string.

7.13.11 SF_CONSOLE_VersionGet

```
ssp_err_t SF_CONSOLE_VersionGet ( ssp_version_t  *const p_version )
```

7.13.11.1 Detailed description

Console version get function.

Table 573:Parameters

Name	Direction	Description
p_version	in	Version information stored here.

Table 574:Return values

Name	Description
SSP_SUCCESS	Version stored in provided pointer.
SSP_ERR_ASSERTION	p_version was null.

7.13.11.2 Function steps

- Set version pointer

7.13.12 Extensions

7.13.12.1 sf_console_instance_ctrl_t

sf_console_instance_ctrl_t

Detailed description

Console instance control block. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- sf_console_menu_t const * p_current_menu

  Current menu is stored here.
- sf_comms_instance_t const * p_comms

  Pointer to communications driver instance.
- uint8_t new_line

  Whether to echo input commands to transmitter.
- bool echo

  Whether to echo input commands to transmitter.
- uint8_t input[SF_CONSOLE_MAX_INPUT_LENGTH]

  Input buffer used to store user input.

7.14 FX_IO Framework

FileX adaptation layer for block media device drivers.

SF_EL_FX FileX I/O is a single entry function which adapts FileX to Renesas Synergy block media device drivers.

7.14.1 Summary

SF_EL_FX Has no API file.

7.14.2 Functions

- SF_EL_FX_BlockDriver
- check_partition_offset
- check_fat_boot_record

7.14.3 Defines

- #define SF_EL_FX_API_VERSION_MAJOR

  Initial value: `(1)`

  Version of the API defined in this file
- #define SF_EL_FX_API_VERSION_MINOR

  Initial value: `(0)`
- #define SF_EL_FX_CODE_VERSION_MAJOR

  Initial value: `(1U)`

- #define SF_EL_FX_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_EL_FX_55AA_SIGNATURE_OFFSET

  Initial value: `(0x1FEU)`

  SSP FileX Support.
- #define SF_EL_FX_JUMP_INST_OFFSET

  Initial value: `(0U)`
- #define SF_EL_FX_FAT16_SECTORS_PER_FAT

  Initial value: `(0x16U)`
- #define SF_EL_FX_FAT32_SECTORS_PER_FAT

  Initial value: `(0x24U)`
- #define SF_EL_FX_FAT16_SECTOR_COUNT

  Initial value: `(0x13U)`
- #define SF_EL_FX_FAT32_SECTOR_COUNT

  Initial value: `(0x20U)`
- #define SF_EL_FX_PARTITION0_OFFSET

  Initial value: `(0x1C6U)`
- #define SF_EL_FX_PARTITION0_TYPE_OFFSET

  Initial value: `(0x1C2U)`

7.14.4 SF_EL_FX_BlockDriver

```
SF_EL_FX_BlockDriver (  FX_MEDIA * media_ptr )
```

7.14.4.1 Brief description

Access Block Media device functions open, close, read, write and control.

7.14.4.2 Detailed description

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. The SF_EL_FX_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the Synergy Block Media Interface.

Table 575:Parameters

Name	Direction	Description
p_fx_media	inout	FileX media control block. All information about each open media device are maintained in by the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Table 576:Return values

Name	Description
noneUses	block media driver for accesses.

7.14.4.3 Function steps

- Initialize FileX I/O status to error. It will change to FX_SUCCESS unless an operation fails.
- Process the driver request specified in the media control block.
- FileX reads one or more sectors into memory by issuing a read request to the I/O driver.
- FileX writes one or more sectors to the physical media by issuing a write request to the I/O driver.

- FileX flushes all sectors currently in the driver's sector cache to the physical media by issuing a flush request to the I/O driver. Synergy drivers do not currently cache sectors.
- Command not currently supported in available Synergy modules. Return driver success.
- FileX informs the driver to abort all further physical I/O activity with the physical media by issuing an abort request to the I/O driver. The driver should not perform any I/O again until it is re-initialized.
- Close/un-initialize device.
- Although the actual driver initialization processing is application specific, it usually consists of data structure initialization and possibly some preliminary hardware initialization. This request is the first made by FileX and is done from within the fx_media_open service. If media write protection is detected, the driver fx_media_driver_write_protect member of FX_MEDIA should be set to FX_TRUE.
- Open the block media.
- Get write protection status.
- Close the block media.
- FileX uses the uninit command to close the media.
- Close/un-initialize device.
- Instead of using a standard read request, FileX makes a specific request to read the media's boot sector.
- Read the boot record and return to the caller.
- Open the block media.
- Use already allocated buffer
- Read the first non hidden sector.
- Check the partition offset to determine if the current sector is the boot record or partition table.
- Read the sector at the offset indicated in the partition table.
- Check the partition offset to confirm it is the boot record.
- check_partition_offset failed or the current buffer is not the boot sector
- Instead of using a standard write request, FileX makes a specific request to write the media's boot sector.
- Open driver.
- Write the boot record and return to the caller.
- Invalid driver request.
- Successful driver request.

7.14.5 check_partition_offset

```
ssp_err_t check_partition_offset (  uint8_t * p_sector ,   uint32_t
* p_partition_offset )
```

7.14.5.1 Brief description

Checks if the sector passed is a valid boot record or master boot record. If not valid boot record returns the offset to the partitions boot record.

7.14.5.2 Detailed description

(end addtogroup SF_EL_FX)

Table 577:Parameters

Name	Direction	Description
p_sector	in	Pointer to sector.
p_partition_offset	out	Sector number of found partition table. 0 if boot sector.

Table 578:Return values

Name	Description
SSP_SUCCESS	Found boot record or partition offset.
SSP_ERR_MEDIA_OPEN_FAILED	Not a valid boot record or partition table.

7.14.5.3 Function steps

- Check for FAT boot record.
- Check for master boot record.
- Read the offset to partition 0.
- Check for partition type is set and the offset is not zero and boot record signature for valid MBR then report the partition offset.

7.14.6 check_fat_boot_record

```
ssp_err_t check_fat_boot_record (  uint8_t * p_sector ,   uint32_t
* p_partition_offset )
```

7.14.6.1 Brief description

Checks if the sector passed is a valid boot record. If not returns error.

7.14.6.2 Detailed description

Table 579:Parameters

Name	Direction	Description
p_sector	in	Pointer to sector
p_partition_offset	out	Sector number of found partition table. 0 if boot sector.

Table 580:Return values

Name	Description
SSP_SUCCESS	Found boot record or partition offset
SSP_ERR_MEDIA_OPEN_FAILED	Not a valid boot record or partition table

7.14.6.3 Function steps

- Check for a valid jump instruction.
- Check for a non zero sectors per FAT.
- Check for a non zero sector count.
- Check for jump instruction and sectors per fat and sector count are not 0 which indicate FAT Boot record.
- Get sector size.
- Check the sector size value.
- Check Boot record signature to make sure the buffer is valid then return valid boot record.

7.14.7 Extensions

7.14.7.1 sf_el_fx_t

sf_el_fx_t

Detailed description

Block Media Control Block Type

Variables

- sf_block_media_instance_t * p_lower_lvl_block_media

  Lower level block media pointer.
- void * p_extend

7.15 GUIX Synergy Port

GUIX adaptation layer.

7.15.1 Functions

- SF_EL_GX_Open
- SF_EL_GX_Close
- SF_EL_GX_VersionGet
- SF_EL_GX_Setup
- SF_EL_GX_CanvasInit

7.15.2 SF_EL_GX_Open

```
ssp_err_t SF_EL_GX_Open ( sf_el_gx_ctrl_t  *const p_api_ctrl ,  sf_el_gx_cfg_t
const *const p_cfg )
```

7.15.2.1 Brief description

GUIX adaptation framework driver for Synergy, open function to configure the framework module. The function initialize RTOS resources used by the module, initialize the control block based on user configuration, and transition the module state to SF_EL_GX_OPENED. This function calls following functions:

7.15.2.2 Detailed description

- sf_el_gx_open_param_check() Check configuration parameters if parameter check is enabled.
- tx_mutex_create() Creates the mutex for lock the driver during the context update.
- tx_mutex_delete() Deletes the mutex if kernel service calls failed in the process.
- tx_semaphore_create() Creates the semaphore for rendering and displaying synchronization.

Table 581:Return values

Name	Description
SSP_SUCCESS	Opened the module successfully.
SSP_ERR_ASSERTION	NULL pointer error happened.
SSP_ERR_IN_USE	SF_EL_GX is in-use.
SSP_ERR_INTERNAL	Error happened in kernel service calls.
SSP_ERR_INVALID_ARGUMENT	An invalid argument was passed to the driver.

NOTE: This function does not initialize the display or rendering hardware but setup function will do.

NOTE: This function registers a user callback function but it is optional. Set NULL to p_cfg::p_callback if user callback is not required.

NOTE: The configuration for the frame buffer B (p_cfg::p_framebuffer_b) is optional. Set NULL to p_framebuffer_b in case of a single-buffered system.

7.15.2.3 Function steps

- Creates global mutex for SF_EL_GX
- Locks the SF_EL_GX instance until driver setup is done by SF_EL_GX_Setup.
- Creates a semaphore for frame buffer flip
- Initializes the SF_EL_GX control block
- Saves the control block to the global pointer inside the module temporarily. Stored data will be used in sf_el_gx_driver_setup() which will be invoked by GUIX. This pointer will be valid at last but be protected until SF_EL_GX_Setup is done.
- Changes the driver state

7.15.3 SF_EL_GX_Close

```
ssp_err_t SF_EL_GX_Close ( sf_el_gx_ctrl_t  *const p_api_ctrl )
```

7.15.3.1 Brief description

GUIX adaptation framework for Synergy, Close function. This function calls following functions:

7.15.3.2 Detailed description

- tx_mutex_get() Gets the mutex to lock the driver while device access.
- tx_mutex_put() Puts the mutex to unlock the driver while device access.
- tx_mutex_delete() Deletes the mutex if kernel service calls failed in the process.
- tx_semaphore_delete() Deletes the semaphore for rendering and displaying synchronization.
- sf_el_gx_d2_close() Finalizes 2D Drawing Engine hardware.
- sf_el_gx_display_close() Finalizes display hardware.

Table 582:Return values

Name	Description
SSP_SUCCESS	Closed the module successfully.
SSP_ERR_ASSERTION	NULL pointer error happens.
SSP_ERR_NOT_OPEN	SF_EL_GX is not opened.
SSP_ERR_INTERNAL	Error happened in kernel service calls.
SSP_ERR_TIMEOUT	Error occurred in display driver.
SSP_ERR_D2D_ERROR_DEINIT	Error occurred in D/AVE 2D driver.

NOTE: This function is re-entrant.

7.15.3.3 Function steps

- Locks the driver to update the context.
- Finalizes display hardware
- Changes the driver state
- Deletes a semaphore for frame buffer flip
- Unlocks the SF_EL_GX instance
- Deletes driver global mutex

- Clears the temporary storage for the pointer to a control block. This procedure has done in SF_EL_GX_Setup in the expected function call sequence, but clear it here as well in case SF_EL_GX_Setup being not called.

7.15.4 SF_EL_GX_VersionGet

```
ssp_err_t SF_EL_GX_VersionGet ( ssp_version_t  * p_version )
```

7.15.4.1 Brief description

GUIX adaptation framework for Synergy, Version get function.

7.15.4.2 Detailed description

Table 583:Parameters

Name	Direction	Description
p_version	inout	The version number.

Table 584:Return values

Name	Description
SSP_SUCCESS	Successfully returned the module version.
SSP_ERR_ASSERTION	NULL pointer is passed to function.

NOTE: This function is re-entrant.

7.15.5 SF_EL_GX_Setup

```
SF_EL_GX_Setup (  GX_DISPLAY * p_display )
```

7.15.5.1 Brief description

GUIX adaptation framework for Synergy, Setup GUIX low level device drivers for Display and D/AVE 2D interface. This function has to be passed to the GUIX Studio display driver setup function gx_studio_display_configure() to let GUIX call this function and configure the GUIX low level device driver(s). This function calls following functions:

7.15.5.2 Detailed description

- tx_mutex_put() Puts the driver global mutex when the low level driver setup is done
- tx_mutex_delete() Deletes the mutex if kernel service calls failed in the process
- _gx_synergy_display_driver_565rgb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is RGB565 format
- _gx_synergy_display_driver_24xrgb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is RGB888, unpacked format
- _gx_display_driver_32argb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is ARGB8888, unpacked format
- sf_el_gx_driver_setup() Setups low level device drivers and overrides the GUIX default callback functions with hardware accelerated functions.

Table 585:Return values

Name	Description
GX_SUCCESS	Device driver setup is successfully done.
GX_FAILURE	Device driver setup failed.

NOTE: Make sure SF_EL_GX_Open has been called when this function is called back by GUIX. The behavior is not defined if this function were not invoked by GUIX.

7.15.5.3 Function steps

- Copies the GX_DISPLAY context for later use.
- Setups GUIX low level device drivers
- Changes the driver state
- Clears the temporary storage for the pointer to a control block.
- Unlocks the SF_EL_GX instance since driver setup is done

7.15.6 SF_EL_GX_CanvasInit

```
ssp_err_t SF_EL_GX_CanvasInit ( sf_el_gx_ctrl_t  *const p_api_ctrl ,
  GX_WINDOW_ROOT * p_window_root )
```

7.15.6.1 Brief description

GUIX adaptation framework for Synergy, Canvas initialization, setup the memory address of first canvas to be rendered.

7.15.6.2 Detailed description

Table 586:Return values

Name	Description
SSP_SUCCESS	Memory address is successfully configured to a canvas.
SSP_ERR_ASSERTION	Invalid control block (NULL pointer) or window root (NULL pointer) passed to driver.
SSP_ERR_INVALID_CALL	Function call was made when the driver is not in SF_EL_GX_CONFIGURED state.
SSP_ERR_INTERNAL	Mutex operation had an error.

7.15.6.3 Function steps

- Locks the driver to update the context.
- Lets GUIX know the first canvas
- Unlocks the driver.

7.15.7 Extensions

7.15.7.1 sf_el_gx_instance_ctrl_t

sf_el_gx_instance_ctrl_t

Detailed description

GUIX adaptation layer for SSP. Instance control block for the SSP GUIX adaptation framework

Variables

- GX_DISPLAY * p_display

  Pointer to the GUIX display context.
- display_instance_t * p_display_instance

  Pointer to a display instance.
- display_runtime_cfg_t * p_display_runtime_cfg

  Pointer to a runtime display configuration.
- void * p_canvas

  Pointer to a canvas(reserved)

- void * p_framebuffer_read

  Pointer to a frame buffer (for displaying)
- void * p_framebuffer_write

  Pointer to a frame buffer (for rendering)
- void(* p_callback)(*p_args)

  Pointer to callback function.
- void * p_context

  Pointer to a context.
- TX_SEMAPHORE semaphore

  Semaphore for the frame buffer flip sync.
- bool rendering_enable

  Sync flag between Rendering and displaying.
- bool display_list_flushed

  Flag to show the display list is flushed.
- sf_el_gx_state_t state

  State of this module.
- void * p_jpegbuffer

  Pointer to a JPEG work buffer.
- uint32_t jpegbuffer_size

  Size of a JPEG work buffer.
- uint16_t rotation_angle

  Screen rotation angle(0/90/270)
- void * p_sf_jpeg_decode_instance

  Pointer to a JPEG framework instance.
- _Bool dave2d_buffer_cache_enabled

  D/AVE 2D buffer cache enabled/disabled.

7.16 Telnet Communication Framework

RTOS-integrated Communications Framework NetX telnet server implementation.

7.16.1 Functions

- SF_EL_NX_COMMS_Open

- SF_EL_NX_COMMS_Close
- SF_EL_NX_COMMS_Read
- SF_EL_NX_COMMS_Write
- SF_EL_NX_COMMS_Lock
- SF_EL_NX_COMMS_Unlock
- SF_EL_NX_COMMS_VersionGet
- netx_resource_setup
- netx_resource_release
- tx_resource_setup
- tx_resource_release
- receive_data
- telnet_new_connection
- telnet_connection_end
- telnet_receive_data
- sf_el_nx_comms_error

7.16.2 Variables

- gp_ctrls
- gp_ctrls_logical

7.16.3 Defines

- #define SF_EL_NX_COMMS_CODE_VERSION_MAJOR
  Initial value: `(1U)`
- #define SF_EL_NX_COMMS_CODE_VERSION_MINOR
  Initial value: `(5U)`
- #define SF_EL_NX_COMMS_PACKET_POOL_MEMORY_SIZE_BYTES
  Initial value: `((1536U + 32U + (uint32_t) sizeof(NX_PACKET)) * 50U)`
- #define SF_EL_NX_COMMS_IP_MEMORY_SIZE_BYTES
  Initial value: `(2048U)`
- #define SF_EL_NX_COMMS_ARP_MEMORY_SIZE_BYTES
  Initial value: `(1024U)`
- #define SF_EL_NX_COMMS_TELNET_SERVER_MEMORY_SIZE_BYTES
  Initial value: `(2048U)`

- #define SF_EL_NX_COMMS_QUEUE_MEMORY_SIZE_BYTES

  Initial value: `(20U)`
- #define OPEN

  Initial value: `(0x4E58434DU)`

  0x4E58434DU is "NXCM" in ASCII, used to identify NetX comms handle

7.16.4 SF_EL_NX_COMMS_Open

```
ssp_err_t SF_EL_NX_COMMS_Open ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_cfg_t  const *const p_cfg )
```

7.16.4.1 Detailed description

Initializes the Telnet server.

Table 587:Return values

Name	Description
SSP_SUCCESS	Channel opened successfully
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL. • Pointer p_cfg is NULL • Pointer p_cfg->p_extend is NULL
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.16.4.2 Function steps

- Initialize and start NetX and NetX application resources
- Initialize and start ThreadX resources
- Mark control block open.

7.16.5 SF_EL_NX_COMMS_Close

```
ssp_err_t SF_EL_NX_COMMS_Close ( sf_comms_ctrl_t  *const p_api_ctrl )
```

7.16.5.1 Detailed description

Disconnect Telnet server and clean up variables.

Table 588:Return values

Name	Description
SSP_SUCCESS	Channel successfully closed
SSP_ERR_ASSERTION	Pointer p_api_ctrl is NULL
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.16.5.2 Function steps

- Stop and release NetX resources
- Release ThreadX resources
- Mark control block closed.

7.16.6 SF_EL_NX_COMMS_Read

```
ssp_err_t SF_EL_NX_COMMS_Read ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   UINT const timeout )
```

7.16.6.1 Detailed description

Read data from the Telnet server.

Table 589:Return values

Name	Description
SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL • Pointer p_dest is NULL • Invalid read length i.e. bytes value is zero
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Receive mutex get' timed out • 'Queue receive' timed out
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This API is reentrant.

7.16.6.2 Function steps

- Wait for a client to be connected.
- Get mutex.
- Receive data.
- Release mutex.

7.16.7 SF_EL_NX_COMMS_Write

```
ssp_err_t SF_EL_NX_COMMS_Write ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
const *const p_src ,   uint32_t const bytes ,   UINT const timeout )
```

7.16.7.1 Detailed description

Write data to the Telnet server.

Table 590:Return values

Name	Description
SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL. • Pointer p_src is NULL. • Invalid write length i.e. bytes value is zero.

Table 590:Return values (Continued)

Name	Description
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Transmit mutex get' timed out
SSP_ERR_OUT_OF_MEMORY	Couldn't allocate pool memory for Telnet server
SSP_ERR_INTERNAL	An internal ThreadX Or NetX error has occurred. This is typically a failure to create/use thread mutex or failure create/enable an internal thread/feature for NetX service.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

NOTE: - This function is reentrant.

7.16.7.2 Function steps

- Get Transmit mutex.
- Allocate a packet for data.
- Build the message.
- Send the packet to the client.
- Release Transmit mutex.

7.16.8 SF_EL_NX_COMMS_Lock

```
ssp_err_t SF_EL_NX_COMMS_Lock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type ,   UINT timeout )
```

7.16.8.1 Detailed description

Table 591:Return values

Name	Description
SSP_SUCCESS	Locking NX_COMMS resource successful.
SSP_ERR_ASSERTION	Pointer p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel is not open.
SSP_ERR_TIMEOUT	Mutex not available in timeout.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.16.8.2 Function steps

- Get transmit mutex if transmit or all mutexes are requested.
- Get receive mutex if receive or all mutexes are requested.

7.16.9 SF_EL_NX_COMMS_Unlock

```
ssp_err_t SF_EL_NX_COMMS_Unlock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type )
```

7.16.9.1 Detailed description

Table 592:Return values

Name	Description
SSP_SUCCESS	Unlocking NX_COMMS resource successful.
SSP_ERR_ASSERTION	Pointer p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel is not open.

NOTE: - For Telnet server specific API details, refer Telnet server user manual.

NOTE: - For NetX specific API details, refer NetX user manual.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.16.9.2 Function steps

- Release transmit mutex if transmit or all mutexes are released.
- Release receive mutex if receive or all mutexes are released.

7.16.10 SF_EL_NX_COMMS_VersionGet

```
ssp_err_t SF_EL_NX_COMMS_VersionGet ( ssp_version_t  *const p_version )
```

7.16.10.1 Detailed description

Get driver version

Table 593:Return values

Name	Description
SSP_SUCCESS	Operation successful

Table 593:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	p_version pointer is NULL

NOTE: - This function is reentrant.

7.16.11 netx_resource_setup

```
ssp_err_t netx_resource_setup ( sf_el_nx_comms_instance_ctrl_t  * p_ctrl ,
 sf_el_nx_comms_on_comms_cfg_t  * p_cfg_extend )
```

7.16.11.1 Brief description

This is a helper routine called by open API to initialize NetX and NetX application resources.

7.16.11.2 Detailed description

Table 594:Parameters

Name	Direction	Description
p_ctrl	in	- Pointer to a control structure allocated by user.
p_cfg_extend	in	- Pointer to lower level communications control structure

7.16.11.3 Function steps

- Initialize the NetX system.
- Create a packet pool.
- Create an IP instance.
- Enable ARP and supply ARP cache memory for the IP Instance.
- Enable TCP traffic.
- Enable ICMP.
- Create the NetX TELNET Server.
- Start the TELNET Server.

7.16.12 netx_resource_release

```
ssp_err_t netx_resource_release ( sf_el_nx_comms_instance_ctrl_t  * p_ctrl )
```

7.16.12.1 Brief description

This is a helper routine called by close API to release NetX and NetX application resources.

7.16.12.2 Detailed description

Table 595:Parameters

Name	Direction	Description
p_ctrl	in	- Pointer to a control structure allocated by user.

7.16.12.3 Function steps

- Initiate server disconnection.
- Delete Telnet server instance.
- Delete IP instance.

7.16.13 tx_resource_setup

```
ssp_err_t tx_resource_setup ( sf_el_nx_comms_instance_ctrl_t  * p_ctrl )
```

7.16.13.1 Brief description

This is a helper routine called by open API to initialize ThreadX resources.

7.16.13.2 Detailed description

Table 596:Parameters

Name	Direction	Description
p_ctrl	in	- Pointer to a control structure allocated by user.

7.16.13.3 Function steps

- Create the transmit mutex.
- Create the receive mutex.

7.16.14 tx_resource_release

```
ssp_err_t tx_resource_release ( sf_el_nx_comms_instance_ctrl_t  * p_ctrl )
```

7.16.14.1 Brief description

This is a helper routine called by Close API to release ThreadX resources.

7.16.14.2 Detailed description

Table 597:Parameters

Name	Direction	Description
p_ctrl	in	- Pointer to a control structure allocated by user.

7.16.14.3 Function steps

- Delete transmit mutex.
- Delete receive mutex.
- Delete event flags group.
- Delete queue instance.

7.16.15 receive_data

```
ssp_err_t receive_data ( sf_el_nx_comms_instance_ctrl_t  * p_ctrl ,   uint8_t
*const p_dest ,   uint32_t bytes ,   UINT const timeout )
```

7.16.15.1 Brief description

Called by the NetX Telnet Server on new Telnet client connection request.

7.16.15.2 Detailed description

Table 598:Parameters

Name	Direction	Description
p_ctrl	in	- Pointer to a control structure allocated by user.
p_dest	in	- Destination
bytes	in	- Size of data
timeout	in	- Timeout period

7.16.16 telnet_new_connection

```
telnet_new_connection (  NX_TELNET_SERVER * server_ptr ,
 UINT logical_connection )
```

7.16.16.1 Brief description

Called by the NetX Telnet Server on new Telnet client connection request.

7.16.16.2 Detailed description

Table 599:Parameters

Name	Direction	Description
server_ptr		- Telnet server instance pointer
logical_connection		- Logical connection for this request

7.16.16.3 Function steps

- Find which control block belongs to this server.
- Set event flag to show connection is complete.

7.16.17 telnet_connection_end

```
telnet_connection_end (  NX_TELNET_SERVER * server_ptr ,
 UINT logical_connection )
```

7.16.17.1 Brief description

Called by the NetX Telnet Server on telnet client disconnect.

7.16.17.2 Detailed description

Table 600:Parameters

Name	Direction	Description
server_ptr		- Telnet server instance pointer
logical_connection		- Logical connection for this request

7.16.17.3 Function steps

- Clear event flag.

7.16.18 telnet_receive_data

```
telnet_receive_data (  NX_TELNET_SERVER * server_ptr ,
 UINT logical_connection ,   NX_PACKET * packet_ptr )
```

7.16.18.1 Brief description

Called by the NetX Telnet Server on data receive from Telnet client.

7.16.18.2 Detailed description

Table 601:Parameters

Name	Direction	Description
server_ptr		- Telnet server instance pointer
logical_connection		- Logical connection for this request
packet_ptr		- received packet pointer

7.16.18.3 Function steps

- Send packet to read function.

7.16.19 sf_el_nx_comms_error

```
ssp_err_t sf_el_nx_comms_error ( UINT status , ssp_err_t err )
```

7.16.19.1 Brief description

Helper function log an error when callers return type is void to avoid compiler warnings.

7.16.19.2 Detailed description

Table 602:Parameters

Name	Direction	Description
status		- Actual returned status value
err		- Error type to log and return on error

7.16.20 Extensions

7.16.20.1 sf_el_nx_comms_instance_ctrl_t

sf_el_nx_comms_instance_ctrl_t

Detailed description

NetX Telnet server communications instance control structure. DO NOT INITIALIZE. Initialization occurs when open is called

7.17.3 usbhs_usb_int_resume_isr

```
usbhs_usb_int_resume_isr ( void )
```

7.17.3.1 Brief description

This function calls the host interrupt handler or the device interrupt handler.

7.17.4 usbfs_int_isr

```
usbfs_int_isr ( void )
```

7.17.4.1 Brief description

All the USBFS interrupts are handled by this ISR.

7.17.5 usbfs_resume_isr

```
usbfs_resume_isr ( void )
```

7.17.5.1 Brief description

VBINT(VBUS interrupt), RESM(Resume interrupt) OVRCR(Over current input), BCHG(Change interrupt), and PDDETINT0(Bus change interrupt) fire this ISR. This is only used for canceling following standby modes.

7.17.5.2 Detailed description

- Canceling the software standby mode
- Canceling deep standby mode

7.17.6 ux_dcd_synergy_buffer_empty_interrupt

```
ux_dcd_synergy_buffer_empty_interrupt (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   ULONG flag )
```

7.17.6.1 Brief description

This function processes the BEMP interrupt for the specific endpoint.

7.17.6.2 Detailed description

Table 603:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to physical Endpoint(ED) control block
flag	in	Flag to enable or disable the buffer empty interrupt.

7.17.7 ux_dcd_synergy_buffer_notready_interrupt

```
ux_dcd_synergy_buffer_notready_interrupt (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   ULONG flag )
```

7.17.7.1 Brief description

This function processes the NRDY(Not Ready) interrupt for the specific endpoint.

7.17.7.2 Detailed description

Table 604:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to physical Endpoint(ED) control block

Table 604:Parameters (Continued)

Name	Direction	Description
flag	in	Flag for DCD synergy enable or disable.

7.17.8 ux_dcd_synergy_buffer_read

```
ux_dcd_synergy_buffer_read (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.8.1 Brief description

This function reads from a specified pipe into a buffer.

7.17.8.2 Detailed description

Table 605:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block

Table 606:Return values

Name	Description
UX_SUCCESS	Read a data from buffer successfully.
UX_ERROR	Unable to read a data from buffer.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_fifo_read

7.17.9 ux_dcd_synergy_buffer_ready_interrupt

```
ux_dcd_synergy_buffer_ready_interrupt (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   ULONG flag )
```

7.17.9.1 Brief description

This function enable or disable the BRDY(Ready) interrupt for the pipe.

7.17.9.2 Detailed description

Table 607:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block
flag	in	Check whether DCD synergy is enable or disable.

7.17.10 ux_dcd_synergy_buffer_write

```
ux_dcd_synergy_buffer_write (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.10.1 Brief description

This function writes a data from input buffer to the specified PIPE.

7.17.10.2 Detailed description

Table 608:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block

Table 609:Return values

Name	Description
UX_SUCCESS	Write a data to FIFO(D0, D1 and C) successfully.

Table 609:Return values (Continued)

Name	Description
UX_ERROR	Unable to write a data to FIFO(D0, D1 and C).

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_fifod_write
- ux_dcd_synergy_fifoc_write

7.17.11 ux_dcd_synergy_current_endpoint_change

```
ux_dcd_synergy_current_endpoint_change (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   ULONG direction )
```

7.17.11.1 Brief description

This function configures the FIFO as per the request specified in endpoint descriptor.

7.17.11.2 Detailed description

Table 610:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block
direction	in	Endpoint direction

7.17.12 ux_dcd_synergy_data_buffer_size

```
ux_dcd_synergy_data_buffer_size (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.12.1 Brief description

This function returns the size of the data buffer and selects the specified pipe.

7.17.12.2 Detailed description

Table 611:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block

Table 612:Return values

Name	Description
buffer_size	Maximum packet size.

7.17.13 ux_dcd_synergy_endpoint_create

```
ux_dcd_synergy_endpoint_create (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_ENDPOINT * endpoint )
```

7.17.13.1 Brief description

This function creates a physical endpoint.

7.17.13.2 Detailed description

Table 613:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
endpoint	in	Pointer to a Device Controller Endpoint structure.

Table 614:Return values

Name	Description
UX_SUCCESS	Endpoint is created successfully.
UX_ERROR	Buffer is not free or endpoint creation is unsuccessful.
UX_NO_ED_AVAILABLE	Endpoint is already in use.

7.17.14 ux_dcd_synergy_endpoint_destroy

```
ux_dcd_synergy_endpoint_destroy (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_ENDPOINT * endpoint )
```

7.17.14.1 Brief description

This function will destroy a physical endpoint.

7.17.14.2 Detailed description

Table 615:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
endpoint	in	Pointer to a Device Controller Endpoint structure.

Table 616:Return values

Name	Description
UX_SUCCESS	Endpoint is destroyed successfully.

7.17.15 ux_dcd_synergy_endpoint_nak_set

```
ux_dcd_synergy_endpoint_nak_set (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.15.1 Brief description

This function sets a NAK(Not Acknowledged) to an endpoint.

7.17.15.2 Detailed description

Table 617:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block

7.17.16 ux_dcd_synergy_endpoint_reset

```
ux_dcd_synergy_endpoint_reset (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_ENDPOINT * endpoint )
```

7.17.16.1 Brief description

This function will reset a physical endpoint.

7.17.16.2 Detailed description

Table 618:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
endpoint	in	Pointer to a Device Controller Endpoint structure.

Table 619:Return values

Name	Description
UX_SUCCESS	Endpoint is reset successfully.
UX_NO_ED_AVAILABLE	Device Controller Endpoint structure pointer is NULL

7.17.17 ux_dcd_synergy_endpoint_stall

```
ux_dcd_synergy_endpoint_stall (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_ENDPOINT * endpoint )
```

7.17.17.1 Brief description

This function will stall a physical endpoint.

7.17.17.2 Detailed description

Table 620:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
endpoint	in	Pointer to a Device Controller Endpoint structure.

Table 621:Return values

Name	Description
UX_SUCCESS	Endpoint is stalled successfully.
UX_NO_ED_AVAILABLE	Device Controller Endpoint control pointer is Null.

7.17.18 ux_dcd_synergy_endpoint_status

```
ux_dcd_synergy_endpoint_status (  UX_DCD_SYNERGY * dcd_synergy ,
 ULONG endpoint_index )
```

7.17.18.1 Brief description

This function will retrieve the status of the endpoint.

7.17.18.2 Detailed description

Table 622:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
endpoint_index	in	Endpoint number who's status is to be known.

Table 623:Return values

Name	Description
UX_ERROR	Endpoint already in use.
UX_FALSE	Endpoint is stalled.
UX_TRUE	Endpoint is not stalled.

7.17.19 ux_dcd_synergy_fifo_port_change

```
ux_dcd_synergy_fifo_port_change (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   ULONG direction )
```

7.17.19.1 Brief description

This function configures the FIFO port.

7.17.19.2 Detailed description

Table 624:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to a DCD control block
ed	in	Pointer to a physical Endpoint(ED) control block
direction	in	Direction to switch

Table 625:Return values

Name	Description
UX_ERROR	Unable to change fifo port.

synergy_register Current endpoint index(pipe)

7.17.20 ux_dcd_synergy_fifo_read

```
 ux_dcd_synergy_fifo_read (  UX_DCD_SYNERGY * dcd_synergy ,   UX_DCD_SYNERGY_ED
* ed )
```

7.17.20.1 Brief description

This function reads from the hardware FIFO C, D0 or D1 and stores in the destination buffer.

7.17.20.2 Detailed description

Table 626:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
ed	inout	: Pointer to a physical Endpoint(ED) control block

Table 627:Return values

Name	Description
UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_READ_OVER	FIFO read overflow.
UX_SYNERGY_DCD_FIFO_READ_SHORT	Short packet is received.
UX_SYNERGY_DCD_FIFO_READING	Continue reading FIFO.

7.17.21 ux_dcd_synergy_fifo_read_dma

```
ux_dcd_synergy_fifo_read_dma (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   UINT dma_bytes_to_transfer )
```

7.17.21.1 Brief description

This function reads the data from HW D0/ D1 FIFO using DMA.

7.17.21.2 Detailed description

Table 628:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
ed	inout	: Pointer to a physical Endpoint(ED) control block
dma_bytes_to_transfer	inout	: No of bytes to be transferred using DMA

Table 629:Return values

Name	Description
UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_READ_OVER	FIFO read overflow.
UX_SYNERGY_DCD_FIFO_READ_SHORT	Short packet is received.
UX_SYNERGY_DCD_FIFO_READING	Continue reading FIFO.

7.17.22 ux_dcd_synergy_read_dma_configure

```
ux_dcd_synergy_read_dma_configure (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   ULONG fifo_sel ,
 ULONG ep_buff_size )
```

7.17.22.1 Brief description

USBX DCD DMA read setup function. Call a subroutine for selected USB controller hardware.

7.17.22.2 Detailed description

Table 630:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
fifo_sel	in	FIFO select register

7.17.23 ux_dcd_synergy_read_dma_set_16bit

```
ux_dcd_synergy_read_dma_set_16bit (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   ULONG fifo_sel ,
 ULONG ep_buff_size )
```

7.17.23.1 Brief description

USBX DCD DMA read setup function for USB hardwares with 16-bit FIFO.

7.17.23.2 Detailed description

Table 631:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
fifo_sel	in	FIFO select register

7.17.24 ux_dcd_synergy_fifo_dma_start_read

```
 ux_dcd_synergy_fifo_dma_start_read (  UX_DCD_SYNERGY * dcd_synergy ,   UCHAR
* p_payload_buffer ,   VOID * p_fifo ,   VOID * p_fifo_ctrl ,   VOID
* p_fifo_sel )
```

7.17.24.1 Brief description

USBX DCD FIFO read - DMA start function.

7.17.24.2 Detailed description

Table 632:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload_buffer	inout	Pointer to a payload buffer
p_fifo	in	FIFO register address

7.17.25 ux_dcd_synergy_fifo_read_software_copy

```
ux_dcd_synergy_fifo_read_software_copy (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   VOID * p_fifo ,
 ULONG fifo_sel )
```

7.17.25.1 Brief description

USBX DCD FIFO read by software copy. Call a subroutine for selected USB controller hardware.

7.17.25.2 Detailed description

Table 633:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address
fifo_sel	in	FIFO select register

7.17.26 ux_dcd_synergy_fifo_read_software_copy_16bit

```
ux_dcd_synergy_fifo_read_software_copy_16bit (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   VOID * p_fifo ,
 ULONG fifo_sel )
```

7.17.26.1 Brief description

USBX DCD FIFO read - Software copy for USB hardwares with 16-bit FIFO.

7.17.26.2 Detailed description

Table 634:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address
fifo_sel	in	FIFO select register

7.17.27 ux_dcd_synergy_fifo_read_last_bytes

```
 ux_dcd_synergy_fifo_read_last_bytes (  UX_DCD_SYNERGY_PAYLOAD_TRANSFER
* p_payload ,   VOID * p_fifo )
```

7.17.27.1 Brief description

USBX DCD FIFO read - Copy last bytes from FIFO by software if the rest bytes are less than FIFO access width.

7.17.27.2 Detailed description

Table 635:Parameters

Name	Direction	Description
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address

7.17.28 ux_dcd_synergy_fifoc_write

```
ux_dcd_synergy_fifoc_write (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.28.1 Brief description

This function writes a data from a buffer into USB FIFO using CPU.

7.17.28.2 Detailed description

Table 636:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
ed	inout	: Pointer to a physical Endpoint(ED) control block

Table 637:Return values

Name	Description
UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_WRITE_END	Status for fifo write ends.
UX_SYNERGY_DCD_FIFO_WRITE_SHORT	Status for fifo short packet.
UX_SYNERGY_DCD_FIFO_WRITING	Status for fifo multiple writes.

7.17.29 ux_dcd_synergy_fifo_write_software_copy

```
ux_dcd_synergy_fifo_write_software_copy (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   VOID * p_fifo ,
 ULONG fifo_sel )
```

7.17.29.1 Brief description

USBX DCD FIFO write by software copy. Call a subroutine for selected USB controller hardware.

7.17.29.2 Detailed description

Table 638:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address
fifo_sel	in	FIFO select register

7.17.30 ux_dcd_synergy_fifo_write_software_copy_16bit

```
ux_dcd_synergy_fifo_write_software_copy_16bit (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   VOID * p_fifo ,
 ULONG fifo_sel )
```

7.17.30.1 Brief description

USBX DCD FIFO write - Software copy for USB hardwares with 16-bit FIFO.

7.17.30.2 Detailed description

Table 639:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address
fifo_sel	in	FIFO select register

7.17.31 ux_dcd_synergy_fifo_write_last_bytes

```
 ux_dcd_synergy_fifo_write_last_bytes (  UX_DCD_SYNERGY_PAYLOAD_TRANSFER
* p_payload ,   VOID * p_fifo ,   ULONG usb_base )
```

7.17.31.1 Brief description

USBX DCD FIFO write - Copy last bytes to FIFO by software if the rest bytes are less than FIFO access width.

7.17.31.2 Detailed description

Table 640:Parameters

Name	Direction	Description
p_payload	inout	Pointer to a payload transfer structure
p_fifo	in	FIFO register address
usb_base	in	USB controller hardware base address

7.17.32 ux_dcd_synergy_fifod_write

```
ux_dcd_synergy_fifod_write (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed )
```

7.17.32.1 Brief description

This function writes a buffer to FIFOD0 or FIFOD1.

7.17.32.2 Detailed description

Table 641:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
ed	inout	: Pointer to a physical Endpoint(ED) control block

Table 642:Return values

Name	Description
UX_ERROR	FIFO is not accessible.

Table 642:Return values (Continued)

Name	Description
UX_SYNERGY_DCD_FIFO_WRITE_END	Write ends of FIFO.
UX_SYNERGY_DCD_FIFO_WRITE_SHORT	Write short packet.
UX_SYNERGY_DCD_FIFO_WRITING	Continue multiple write to FIFO.

7.17.33 ux_dcd_synergy_fifod_write_dma

```
ux_dcd_synergy_fifod_write_dma (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_ED * ed ,   UINT dma_bytes_to_transfer )
```

7.17.33.1 Brief description

This function writes a buffer to FIFOD0 or FIFOD1 using DMA.

7.17.33.2 Detailed description

Table 643:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
ed	inout	: Pointer to a physical Endpoint(ED) control block
dma_bytes_to_transfer	inout	: No of bytes to be transferred using DMA

Table 644:Return values

Name	Description
UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_WRITE_END	Write ends of FIFO.
UX_SYNERGY_DCD_FIFO_WRITE_SHORT	Write short packet.
UX_SYNERGY_DCD_FIFO_WRITING	Continue multiple write to FIFO.

7.17.34 ux_dcd_synergy_write_dma_configure

```
ux_dcd_synergy_write_dma_configure (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   ULONG fifo_sel ,
 ULONG endpoint_size )
```

7.17.34.1 Brief description

USBX DCD DMA write setup function. Call a subroutine for selected USB controller hardware.

7.17.34.2 Detailed description

Table 645:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload	inout	Pointer to a payload transfer structure
fifo_sel	in	FIFO select register
endpoint_size	in	Endpoint size

7.17.35 ux_dcd_synergy_write_dma_set_16bit

```
ux_dcd_synergy_write_dma_set_16bit (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_DCD_SYNERGY_PAYLOAD_TRANSFER * p_payload ,   ULONG fifo_sel ,
 ULONG endpoint_size )
```

7.17.35.1 Brief description

USBX DCD DMA write setup function for USB hardwares with 16-bit FIFO.

7.17.35.2 Detailed description

Table 646:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block

Table 646:Parameters (Continued)

Name	Direction	Description
p_payload	inout	Pointer to a payload transfer structure
fifo_sel	in	FIFO select register
endpoint_size	in	Endpoint size

7.17.36 ux_dcd_synergy_fifo_dma_start_write

```
 ux_dcd_synergy_fifo_dma_start_write (  UX_DCD_SYNERGY * dcd_synergy ,   UCHAR
* p_payload_buffer ,   VOID * p_fifo_add ,   VOID * p_fifo_ctrl ,   VOID
* p_fifo_sel )
```

7.17.36.1 Brief description

USBX DCD DMA FIFO write - DMA start function.

7.17.36.2 Detailed description

Table 647:Parameters

Name	Direction	Description
dcd_synergy	in	Pointer to the DCD control block
p_payload_buffer	inout	Pointer to a payload buffer
p_fifo_add	in	FIFO register address
p_fifo_ctrl	in	FIFO register control
p_fifo_sel	in	FIFO register select

7.17.37 ux_dcd_synergy_frame_number_get

```
 ux_dcd_synergy_frame_number_get (  UX_DCD_SYNERGY * dcd_synergy ,   ULONG
* frame_number )
```

7.17.37.1 Brief description

This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes.

7.17.37.2 Detailed description

Table 648:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
frame_number	inout	: Pointer to a frame number in use

Table 649:Return values

Name	Description
UX_SUCCESS	In use frame number is returned successfully.

7.17.38 ux_dcd_synergy_function

```
 ux_dcd_synergy_function (  UX_SLAVE_DCD * dcd ,   UINT function ,   VOID
* parameter )
```

7.17.38.1 Brief description

This function act as interface between upper layer USBX device stack and synergy controller.

7.17.38.2 Detailed description

Table 650:Parameters

Name	Direction	Description
dcd	inout	: Pointer to a USBX control block.
function	inout	: Function requested to be despatched.
parameter	inout	: Pointer to requested function parameters.

Table 651:Return values

Name	Description
UX_CONTROLLER_UNKNOWN	Desired controller is not specified.
UX_FUNCTION_NOT_SUPPORTED	DCD function is not supported by the controller.
UX_SUCCESS	DCD function despatched successfully.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_frame_number_get
- ux_dcd_synergy_transfer_request
- ux_dcd_synergy_endpoint_create
- ux_dcd_synergy_endpoint_destroy
- ux_dcd_synergy_endpoint_reset
- ux_dcd_synergy_endpoint_stall
- ux_dcd_synergy_endpoint_status

7.17.39 ux_dcd_synergy_initialize

```
ux_dcd_synergy_initialize (  ULONG dcd_io )
```

7.17.39.1 Brief description

This function initializes the USB slave controller for Renesas Synergy MCUs.

7.17.39.2 Detailed description

Table 652:Parameters

Name	Direction	Description
dcd_io	inout	: Address of DCD

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_initialize_common()

7.17.40 ux_dcd_synergy_initialize_transfer_support

```
ux_dcd_synergy_initialize_transfer_support (  ULONG dcd_io ,
 UX_DCD_SYNERGY_TRANSFER * p_transfer_instance )
```

7.17.40.1 Brief description

The function initializes the USB slave controller of the Renesas Synergy MCUs with associated DMA transfer modules.

7.17.40.2 Detailed description

Table 653:Parameters

Name	Direction	Description
dcd_io	in	Address of the USB controller.
p_transfer_instance	in	Pointer to Synergy Transfer module instances.

Table 654:Return values

Name	Description
UX_SUCCESS	Completed the USB controller initialization successfully.
UX_CONTROLLER_INIT_FAILED	Failed to initialize the USB controller.
UX_MEMORY_INSUFFICIENT	Memory was not allocated properly for the Synergy DCD instance.

7.17.41 ux_dcd_synergy_initialize_common

```
ux_dcd_synergy_initialize_common (  ULONG dcd_io )
```

7.17.41.1 Brief description

USBX DCD first half common part of the USB controller initialization.

7.17.41.2 Detailed description

Table 655:Parameters

Name	Direction	Description
dcd_io	in	Address of the USB controller.

Table 656:Return values

Name	Description
UX_SUCCESS	Completed the USB controller initialization successfully.
UX_CONTROLLER_INIT_FAILED	Failed to initialize the USB controller.
UX_MEMORY_INSUFFICIENT	Memory was not allocated properly for the Synergy DCD instance.

7.17.42 ux_dcd_synergy_initialize_common_complete

```
ux_dcd_synergy_initialize_common_complete (  void  )
```

7.17.42.1 Brief description

USBX DCD bottom-half common part of the USB controller initialization.

7.17.43 ux_dcd_dma_complete_tx

```
ux_dcd_dma_complete_tx ( transfer_callback_args_t  * p_args )
```

7.17.43.1 Brief description

USBX DCD DMA write callback function.

7.17.43.2 Detailed description

Table 657:Parameters

Name	Direction	Description
p_args	in	Pointer to the argument of a Transfer module callback function.

7.17.44 ux_dcd_dma_complete_rx

```
ux_dcd_dma_complete_rx ( transfer_callback_args_t  * p_args )
```

7.17.44.1 Brief description

USBX DCD DMA read callback function.

7.17.44.2 Detailed description

Table 658:Parameters

Name	Direction	Description
p_args	in	Pointer to the argument of a Transfer module callback function.

7.17.45 ux_dcd_synergy_initialize_complete

```
ux_dcd_synergy_initialize_complete (  VOID  )
```

7.17.45.1 Brief description

This function completes the initialization of the USB slave controller for the Renesas Synergy MCUs.

7.17.45.2 Detailed description

Table 659:Return values

Name	Description
UX_SUCCESS	USB slave is initialized successfully.

7.17.46 ux_dcd_synergy_interrupt_handler

```
ux_dcd_synergy_interrupt_handler (  VOID  )
```

7.17.46.1 Brief description

This function is the interrupt handler for the synergy controller. The controller will trigger an interrupt when something happens on an endpoint whose mask has been set in the interrupt enable register.

7.17.47 ux_dcd_synergy_register_clear

```
ux_dcd_synergy_register_clear (  UX_DCD_SYNERGY * dcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.47.1 Brief description

This function clears a bit in a register of the synergy.

7.17.47.2 Detailed description

Table 660:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
synergy_register	inout	: Register to clear
value	inout	: Value to clear

7.17.48 ux_dcd_synergy_register_read

```
ux_dcd_synergy_register_read (  UX_DCD_SYNERGY * dcd_synergy ,
 ULONG synergy_register )
```

7.17.48.1 Brief description

This function reads a synergy USB register.

7.17.48.2 Detailed description

Table 661:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
synergy_register	inout	: Register to read

Table 662:Return values

Name	Description
dcd_reg	Value read from USB register.

7.17.49 ux_dcd_synergy_register_set

```
ux_dcd_synergy_register_set (  UX_DCD_SYNERGY * dcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.49.1 Brief description

This function set a bit in synergy USB register.

7.17.49.2 Detailed description

Table 663:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
synergy_register	inout	: Register to set
value	inout	: Value to set

7.17.50 ux_dcd_synergy_register_write

```
ux_dcd_synergy_register_write (  UX_DCD_SYNERGY * dcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.50.1 Brief description

This function writes a bit in synergy USB register.

7.17.50.2 Detailed description

Table 664:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
synergy_register	inout	: Register to write
value	inout	: Value to write

7.17.51 ux_dcd_synergy_transfer_callback

```
ux_dcd_synergy_transfer_callback (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_TRANSFER * transfer_request ,   ULONG interrupt_status ,
 ULONG ctsq_mask )
```

7.17.51.1 Brief description

This function is invoked under ISR when an event happens on a specific endpoint.

7.17.51.2 Detailed description

Table 665:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
transfer_request	inout	: Pointer to USBX Device Transfer Request structure
interrupt_status	inout	: Check if we have SETUP condition or BRDY or BEMP interrupt.
ctsq_mask	inout	: Mask to isolate the CTSQ field.

Table 666:Return values

Name	Description
UX_SUCCESS	Function is invoked under ISR successfully.

7.17.52 ux_dcd_synergy_transfer_request

```
ux_dcd_synergy_transfer_request (  UX_DCD_SYNERGY * dcd_synergy ,
 UX_SLAVE_TRANSFER * transfer_request )
```

7.17.52.1 Brief description

This function will initiate a transfer to a specific endpoint. If the endpoint is IN, the endpoint register will be set to accept the request. If the endpoint is IN, the endpoint FIFO will be filled with the buffer and the endpoint register set.

7.17.52.2 Detailed description

Table 667:Parameters

Name	Direction	Description
dcd_synergy	inout	: Pointer to a DCD control block
transfer_request	inout	: Pointer to transfer request

Table 668:Return values

Name	Description
UX_SUCCESS	Transfer to a specific endpoint is initiated successfully.
ux_slave_transfer_request_completion_code	Pointer to structure UX_SLAVE_TRANSFER(transfer request completion code).
UX_TRANSFER_ERROR	Transfer is completed with error.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_buffer_write

7.17.53 ux_hcd_synergy_asynch_queue_process

```
ux_hcd_synergy_asynch_queue_process (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.53.1 Brief description

This function process the asynchronous transactions. The function will identify the USB interrupts occurred associated with an endpoint and will process the interrupts.

7.17.53.2 Detailed description

Table 669:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

7.17.54 ux_hcd_synergy_asynch_queue_process_bemp

```
ux_hcd_synergy_asynch_queue_process_bemp (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.54.1 Brief description

This function process the BEMP(Buffer Empty) interrupt that occurred on a specific ED.

7.17.54.2 Detailed description

Table 670:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.55 ux_hcd_synergy_asynch_queue_process_brdy

```
ux_hcd_synergy_asynch_queue_process_brdy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.55.1 Brief description

This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED.

7.17.55.2 Detailed description

Table 671:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.56 ux_hcd_synergy_asynch_queue_process_nrdy

```
ux_hcd_synergy_asynch_queue_process_nrdy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.56.1 Brief description

This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED.

7.17.56.2 Detailed description

Table 672:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- UX_TRANSFER::ux_transfer_request_completion_function

7.17.57 ux_hcd_synergy_asynch_queue_process_sign

```
ux_hcd_synergy_asynch_queue_process_sign (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.57.1 Brief description

This function process the Setup transaction Error Interrupt.

7.17.57.2 Detailed description

Table 673:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.58 ux_hcd_synergy_asynch_schedule

```
ux_hcd_synergy_asynch_schedule (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.58.1 Brief description

This function schedules new transfers from the control or bulk lists.

7.17.58.2 Detailed description

Table 674:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

7.17.59 ux_hcd_synergy_asynchronous_endpoint_create

```
ux_hcd_synergy_asynchronous_endpoint_create (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.59.1 Brief description

This function will create an asynchronous endpoint. The control and bulk endpoints fall into this category.

7.17.59.2 Detailed description

Table 675:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to endpoint

Table 676:Return values

Name	Description
UX_NO_ED_AVAILABLE	ED for new endpoint not available.
UX_NO_TD_AVAILABLE	Dummy TD not available for terminating the ED transfer chain.
UX_SUCCESS	Asynchronous endpoint created successfully.

7.17.60 ux_hcd_synergy_asynchronous_endpoint_destroy

```
ux_hcd_synergy_asynchronous_endpoint_destroy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.60.1 Brief description

This function will destroy an asynchronous endpoint. The control and bulk endpoints fall into this category.

7.17.60.2 Detailed description

Table 677:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to endpoint

Table 678:Return values

Name	Description
UX_ENDPOINT_HANDLE_UNKNOWN	Physical endpoint has not been initialized properly.
UX_SUCCESS	Asynchronous endpoint destroyed successfully.

7.17.61 ux_hcd_synergy_buffer_empty_interrupt

```
ux_hcd_synergy_buffer_empty_interrupt (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed ,   ULONG flag )
```

7.17.61.1 Brief description

This function enable or disable the BEMP(Buffer Empty) interrupt for the pipe.

7.17.61.2 Detailed description

Table 679:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to physical Endpoint(ED) control block
flag	in	: Check whether DCD synergy is enable or disable.

7.17.62 ux_hcd_synergy_buffer_notready_interrupt

```
ux_hcd_synergy_buffer_notready_interrupt (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed ,   ULONG flag )
```

7.17.62.1 Brief description

This function enable or disable the NRDY(Not Ready) interrupt for the pipe.

7.17.62.2 Detailed description

Table 680:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to physical Endpoint(ED) control block
flag	in	: Check whether DCD synergy is enable or disable.

7.17.63 ux_hcd_synergy_buffer_read

```
ux_hcd_synergy_buffer_read ( UX_HCD_SYNERGY * hcd_synergy , UX_SYNERGY_ED
* ed )
```

7.17.63.1 Brief description

This function reads from a specified pipe into a buffer.

7.17.63.2 Detailed description

Table 681:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to a physical Endpoint(ED) control block

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_fifo_read

7.17.64 ux_hcd_synergy_buffer_ready_interrupt

```
ux_hcd_synergy_buffer_ready_interrupt ( UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed , ULONG flag )
```

7.17.64.1 Brief description

This function enable or disable the BRDY(Ready) interrupt for the pipe.

7.17.64.2 Detailed description

Table 682:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to physical Endpoint(ED) control block
flag	in	: Check whether DCD synergy is enable or disable.

7.17.65 ux_hcd_synergy_buffer_write

```
 ux_hcd_synergy_buffer_write (  UX_HCD_SYNERGY * hcd_synergy ,   UX_SYNERGY_ED
* ed )
```

7.17.65.1 Brief description

This function writes data to the selected FIFO of the endpoint.

7.17.65.2 Detailed description

Table 683:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	in	: Pointer to a physical Endpoint(ED) control block

Table 684:Return values

Name	Description
UX_SUCCESS	Buffer written to the specified PIPE successfully.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_fifod_write
- ux_hcd_synergy_fifoc_write

7.17.66 ux_hcd_synergy_bulk_endpoint_create

```
ux_hcd_synergy_bulk_endpoint_create (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.66.1 Brief description

This function will create a bulk endpoint.

7.17.66.2 Detailed description

Table 685:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to a USBX Endpoint Container structure

Table 686:Return values

Name	Description
UX_ERROR	PIPE is not available for bulk endpoint creation .
UX_SUCCESS	Bulk endpoints created successfully.
UX_NO_ED_AVAILABLE	ED for bulk endpoint is not available.
UX_NO_TD_AVAILABLE	Dummy TD for for terminating the ED transfer chain is not available.

7.17.67 ux_hcd_synergy_bulk_int_td_add

```
ux_hcd_synergy_bulk_int_td_add (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.67.1 Brief description

This function adds a transfer descriptor to an Bulk or INT ED.

7.17.67.2 Detailed description

Table 687:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to a Synergy ED structure

Table 688:Return values

Name	Description
UX_SUCCESS	Transfer descriptor added successfully.

7.17.68 ux_hcd_synergy_control_endpoint_create

```
ux_hcd_synergy_control_endpoint_create (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.68.1 Brief description

This function will create a control endpoint.

7.17.68.2 Detailed description

Table 689:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to an Endpoint control block

Table 690:Return values

Name	Description
UX_SUCCESS	Control endpoint created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED for control endpoint.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for control endpoint.

7.17.69 ux_hcd_synergy_control_td_add

```
ux_hcd_synergy_control_td_add ( UX_HCD_SYNERGY * hcd_synergy , UX_SYNERGY_ED
* ed )
```

7.17.69.1 Brief description

This function adds a transfer descriptor to an ED.

7.17.69.2 Detailed description

Table 691:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to Synergy ED structure

Table 692:Return values

Name	Description
UX_SUCCESS	Transfer descriptor added to an ED successfully.

7.17.70 ux_hcd_synergy_controller_disable

```
ux_hcd_synergy_controller_disable ( UX_HCD_SYNERGY * hcd_synergy )
```

7.17.70.1 Brief description

This function will disable the Synergy controller. The controller will release all its resources (memory, IO ...). After this, the controller will not send SOF any longer. All transactions should have been completed, all classes should have been closed.

7.17.70.2 Detailed description

Table 693:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 694:Return values

Name	Description
UX_SUCCESS	Synergy controller disabled successfully.

7.17.71 ux_hcd_synergy_current_endpoint_change

```
ux_hcd_synergy_current_endpoint_change (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed ,   ULONG direction )
```

7.17.71.1 Brief description

This function change the endpoint in the FIFO.

7.17.71.2 Detailed description

Table 695:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to Synergy ED structure
direction	in	: Direction to transfer

7.17.72 ux_hcd_synergy_data_buffer_size

```
ux_hcd_synergy_data_buffer_size (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.72.1 Brief description

This function returns the size of the buffer data.

7.17.72.2 Detailed description

Table 696:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to Synergy ED structure

Table 697:Return values

Name	Description
buffer_size	buffer size

7.17.73 ux_hcd_synergy_ed_obtain

```
ux_hcd_synergy_ed_obtain (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.73.1 Brief description

This function obtains a free ED from the ED list.

7.17.73.2 Detailed description

Table 698:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 699:Return values

Name	Description
UX_NULL	No available ED in the ED list.

ed Endpoint descriptor pointer address.

7.17.74 ux_hcd_synergy_ed_td_clean

```
ux_hcd_synergy_ed_td_clean (  UX_SYNERGY_ED * ed )
```

7.17.74.1 Brief description

This function process cleans the ED of all tds except the last dummy TD.

7.17.74.2 Detailed description

Table 700:Parameters

Name	Direction	Description
ed	inout	: Pointer to Synergy ED structure

7.17.75 ux_hcd_synergy_endpoint_nak_set

```
ux_hcd_synergy_endpoint_nak_set (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.75.1 Brief description

This function sets a NAK(Not Acknowledged) to an endpoint.

7.17.75.2 Detailed description

Table 701:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block

Table 701:Parameters (Continued)

Name	Direction	Description
ed	in	: Pointer to Synergy ED structure

7.17.76 ux_hcd_synergy_endpoint_reset

```
ux_hcd_synergy_endpoint_reset ( UX_HCD_SYNERGY * hcd_synergy , UX_ENDPOINT
* endpoint )
```

7.17.76.1 Brief description

This function will reset an endpoint.

7.17.76.2 Detailed description

Table 702:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
endpoint	inout	: Pointer to an Endpoint control block

Table 703:Return values

Name	Description
UX_SUCCESS	Endpoint reset successfully.

7.17.77 ux_hcd_synergy_entry

```
ux_hcd_synergy_entry ( UX_HCD * hcd , UINT function , VOID * parameter )
```

7.17.77.1 Brief description

This function is the entry function to the USB driver from the USB stack.

7.17.77.2 Detailed description

Table 704:Parameters

Name	Direction	Description
hcd	in	: Pointer to USBX Host Controller structure.
function	in	: Function for driver to perform
parameter	in	: Pointer to function parameter(s)

Table 705:Return values

Name	Description
UX_SUCCESS	HCD function is dispatched successfully.
UX_CONTROLLER_UNKNOWN	Synergy controller is not known.
UX_FUNCTION_NOT_SUPPORTED	Function not supported.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_controller_disable
- ux_hcd_synergy_port_status_get
- ux_hcd_synergy_port_enable
- ux_hcd_synergy_port_disable
- ux_hcd_synergy_power_on_port
- ux_hcd_synergy_power_down_port
- ux_hcd_synergy_port_suspend
- ux_hcd_synergy_port_resume
- ux_hcd_synergy_port_reset
- ux_hcd_synergy_frame_number_get
- ux_hcd_synergy_request_transfer
- ux_hcd_synergy_transfer_abort
- ux_hcd_synergy_control_endpoint_create
- ux_hcd_synergy_bulk_endpoint_create
- ux_hcd_synergy_interrupt_endpoint_create

- ux_hcd_synergy_isochronous_endpoint_create
- ux_hcd_synergy_asynchronous_endpoint_destroy
- ux_hcd_synergy_periodic_endpoint_destroy
- ux_hcd_synergy_endpoint_reset

7.17.78 ux_hcd_synergy_fifo_port_change

```
ux_hcd_synergy_fifo_port_change (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed ,   ULONG direction )
```

7.17.78.1 Brief description

This function change the port of the FIFO.

7.17.78.2 Detailed description

Table 706:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
ed	in	: Pointer to Synergy ED structure
direction	in	: Direction to transfer

Table 707:Return values

Name	Description
synergy_register	Content of FIFO control register.
UX_ERROR	Port not changed successfully or unable to access FIFO.

7.17.79 ux_hcd_synergy_fifo_read

```
 ux_hcd_synergy_fifo_read (  UX_HCD_SYNERGY * hcd_synergy ,   UX_SYNERGY_ED
* ed )
```

7.17.79.1 Brief description

This function read data from the FIFO configured for the PIPE(FIFO C, D0 or D1).

7.17.79.2 Detailed description

Table 708:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	in	: Pointer to Synergy ED structure

Table 709:Return values

Name	Description
UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_READ_OVER	Status set to read overflow.
UX_SYNERGY_HC_FIFO_READ_SHORT	Short packet to read.
UX_SYNERGY_HC_FIFO_READING	Continue reading buffer.

7.17.80 ux_hcd_synergy_fifo_read_software_copy

```
ux_hcd_synergy_fifo_read_software_copy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,   UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.80.1 Brief description

USBX HCD CPU FIFO read by software copy. Call a suitable subroutine for selected USB controller hardware.

7.17.80.2 Detailed description

Table 710:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload	in	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.81 ux_hcd_synergy_fifo_read_software_copy_16bit

```
ux_hcd_synergy_fifo_read_software_copy_16bit (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,   UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.81.1 Brief description

USBX HCD CPU FIFO read - Software copy with 16-bit FIFO access.

7.17.81.2 Detailed description

Table 711:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.82 ux_hcd_synergy_fifo_read_software_copy_8bit

```
ux_hcd_synergy_fifo_read_software_copy_8bit (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,   UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.82.1 Brief description

USBX HCD CPU FIFO read - Software copy with 8-bit FIFO access.

7.17.82.2 Detailed description

Table 712:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.83 ux_hcd_synergy_fifo_read_dma_start

```
ux_hcd_synergy_fifo_read_dma_start (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,   UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.83.1 Brief description

USBX HCD DMA read setup function.

7.17.83.2 Detailed description

Table 713:Parameters

Name	Direction	Description
hcd_synergy	inout	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.84 ux_hcd_synergy_fifo_read_dma_set_16bit_or_8bit

```
 ux_hcd_synergy_fifo_read_dma_set_16bit_or_8bit (  UX_HCD_SYNERGY
* hcd_synergy ,   UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,
  UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.84.1 Brief description

USBX HCD DMA FIFO read - DMA transfer with 16 or 8 bit FIFO access.

7.17.84.2 Detailed description

Table 714:Parameters

Name	Direction	Description
hcd_synergy	inout	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.85 ux_hcd_synergy_fifoc_write

```
ux_hcd_synergy_fifoc_write (  UX_HCD_SYNERGY * hcd_synergy ,   UX_SYNERGY_ED
* ed )
```

7.17.85.1 Brief description

This function writes a buffer to FIFOC.

7.17.85.2 Detailed description

Table 715:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to Synergy ED structure

Table 716:Return values

Name	Description
UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_WRITE_END	Writing at ends.
UX_SYNERGY_HC_FIFO_WRITE_SHORT	Writing short data.
UX_SYNERGY_HC_FIFO_WRITING	Doing multiple writes.

7.17.86 ux_hcd_synergy_fifo_write_software_copy

```
ux_hcd_synergy_fifo_write_software_copy (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG payload_length ,   UCHAR * payload_buffer ,   VOID * fifo_addr ,
 ULONG fifo_sel )
```

7.17.86.1 Brief description

USBX HCD CPU FIFO write by software copy. Call a suitable subroutine for selected USB controller hardware.

7.17.86.2 Detailed description

Table 717:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload_length	in	Payload length
payload_buffer	in	Payload buffer address
fifo_addr	in	FIFO register address
fifo_sel	in	FIFO select register

7.17.87 ux_hcd_synergy_fifo_write_software_copy_16bit

```
ux_hcd_synergy_fifo_write_software_copy_16bit (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG payload_length ,   UCHAR * payload_buffer ,   VOID * fifo_addr ,
 ULONG fifo_sel )
```

7.17.87.1 Brief description

USBX HCD CPU FIFO write - Software copy with 16-bit FIFO access.

7.17.87.2 Detailed description

Table 718:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload_length	inout	Payload length
payload_buffer	inout	Payload buffer address
fifo_addr	inout	FIFO register address
fifo_sel	in	FIFO select register

7.17.88 ux_hcd_synergy_fifo_write_software_copy_8bit

```
ux_hcd_synergy_fifo_write_software_copy_8bit (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG payload_length ,   UCHAR * payload_buffer ,   VOID * fifo_addr ,
 ULONG fifo_sel )
```

7.17.88.1 Brief description

USBX HCD CPU FIFO write - Software copy with 8-bit FIFO access.

7.17.88.2 Detailed description

Table 719:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block
payload_length	inout	Payload length
payload_buffer	inout	Payload buffer address
fifo_addr	inout	FIFO register address
fifo_sel	in	FIFO select register

7.17.89 ux_hcd_synergy_fifo_write_software_copy_remaining_bytes

```
 ux_hcd_synergy_fifo_write_software_copy_remaining_bytes (  UX_HCD_SYNERGY
* hcd_synergy ,   ULONG payload_length ,   UCHAR * payload_buffer ,   VOID
* fifo_addr )
```

7.17.89.1 Brief description

USBX HCD CPU FIFO write - Copy remaining bytes to FIFO by software if the rest bytes are less than FIFO access width.

7.17.89.2 Detailed description

Table 720:Parameters

Name	Direction	Description
hcd_synergy	in	Pointer to the HCD control block

Table 720:Parameters (Continued)

Name	Direction	Description
payload_length	inout	Payload length
payload_buffer	inout	Payload buffer address
fifo_addr	inout	FIFO register address

7.17.90 ux_hcd_synergy_fifod_write

```
ux_hcd_synergy_fifod_write (  UX_HCD_SYNERGY * hcd_synergy ,   UX_SYNERGY_ED
* ed )
```

7.17.90.1 Brief description

This function writes a buffer data to FIFOD0 or FIFOD1.

7.17.90.2 Detailed description

Table 721:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to Synergy ED structure

Table 722:Return values

Name	Description
UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_WRITE_END	Writing at ends.
UX_SYNERGY_HC_FIFO_WRITE_SHORT	Writing short data.
UX_SYNERGY_HC_FIFO_WRITING	Doing multiple writes.

7.17.91 ux_hcd_synergy_fifod_write_dma_start

```
ux_hcd_synergy_fifod_write_dma_start (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,   UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.91.1 Brief description

USBX HCD DMA write setup function. Call a suitable subroutine for selected USB controller hardware.

7.17.91.2 Detailed description

Table 723:Parameters

Name	Direction	Description
hcd_synergy	inout	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	in	Pointer to the fifo block

7.17.92 ux_hcd_synergy_fifod_write_dma_set_16bit_or_8bit

```
 ux_hcd_synergy_fifod_write_dma_set_16bit_or_8bit (  UX_HCD_SYNERGY
* hcd_synergy ,   UX_HCD_SYNERGY_PAYLOAD_TRANSFER * payload ,
  UX_HCD_SYNERGY_FIFO * fifo )
```

7.17.92.1 Brief description

USBX HCD DMA FIFO write - DMA transfer with 16 or 8 bit FIFO access.

7.17.92.2 Detailed description

Table 724:Parameters

Name	Direction	Description
hcd_synergy	inout	Pointer to the HCD control block
payload	inout	Pointer to the Payload block
fifo	inout	Pointer to the fifo block

7.17.93 ux_hcd_synergy_frame_number_get

```
 ux_hcd_synergy_frame_number_get (  UX_HCD_SYNERGY * hcd_synergy ,   ULONG
* frame_number )
```

7.17.93.1 Brief description

This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes and for timing.

7.17.93.2 Detailed description

Table 725:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
frame_number	inout	: Frame number to set

Table 726:Return values

Name	Description
UX_SUCCESS	Frame number returned successfully.

7.17.94 ux_hcd_synergy_frame_number_set

```
ux_hcd_synergy_frame_number_set (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG frame_number )
```

7.17.94.1 Brief description

This function will set the current frame number to the one specified. This function is mostly used for isochronous purpos.es.

7.17.94.2 Detailed description

Table 727:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
frame_number	inout	: Frame number to set

7.17.95 ux_hcd_synergy_initialize

```
ux_hcd_synergy_initialize ( UX_HCD * hcd )
```

7.17.95.1 Brief description

This function initializes the Synergy controller.

7.17.95.2 Detailed description

Table 728:Parameters

Name	Direction	Description
hcd	inout	: Pointer to USBX host controller structure.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_initialize_common()

7.17.96 ux_hcd_synergy_initialize_common

```
ux_hcd_synergy_initialize_common ( UX_HCD * hcd )
```

7.17.96.1 Brief description

This function Initialize USB peripheral.

7.17.96.2 Detailed description

Table 729:Parameters

Name	Direction	Description
hcd	inout	: Pointer to USBX host controller structure.

Table 730:Return values

Name	Description
UX_SUCCESS	Initialize hcd transfer support successfully.
UX_CONTROLLER_INIT_FAILED	Failed in Transfer module setup, or Unsupported USB controller was specified.
UX_MEMORY_INSUFFICIENT	Failed in allocation memory.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_periodic_tree_create

7.17.97 ux_hcd_synergy_initialize_transfer_support

```
 ux_hcd_synergy_initialize_transfer_support (  UX_HCD * hcd ,   const
UX_HCD_SYNERGY_TRANSFER * p_transfer_instance )
```

7.17.97.1 Brief description

USBX HCD Transfer Support with DMA support.

7.17.97.2 Detailed description

Table 731:Parameters

Name	Direction	Description
hcd	inout	Pointer to the USBX HCD control block.
p_transfer_instance	in	Pointer to Transfer module instances.

Table 732:Return values

Name	Description
UX_SUCCESS	Initialize hcd transfer support successfully.
UX_CONTROLLER_INIT_FAILED	Failed in Transfer module setup, or Unsupported USB controller was specified.
UX_SEMAPHORE_ERROR	Failed in creating a semaphore used for DMA transfer.
UX_MEMORY_INSUFFICIENT	Failed in allocation memory.

7.17.98 ux_hcd_synergy_initialize_common_complete

```
ux_hcd_synergy_initialize_common_complete (  UX_HCD * hcd )
```

7.17.98.1 Brief description

USBX HCD final procedure for the initialization.

7.17.98.2 Detailed description

Table 733:Parameters

Name	Direction	Description
hcd	in	Pointer to the USBX HCD control block.

7.17.99 ux_hcd_dma_complete_tx

```
ux_hcd_dma_complete_tx ( transfer_callback_args_t  * p_args )
```

7.17.99.1 Brief description

USBX HCD DMA write callback function.

7.17.99.2 Detailed description

Table 734:Parameters

Name	Direction	Description
p_args	in	Pointer to the argument of a Transfer module callback function.

7.17.100 ux_hcd_dma_complete_rx

```
ux_hcd_dma_complete_rx ( transfer_callback_args_t  * p_args )
```

7.17.100.1 Brief description

USBX HCD DMA read callback function.

7.17.100.2 Detailed description

Table 735:Parameters

Name	Direction	Description
p_args	in	Pointer to the argument of a Transfer module callback function.

7.17.101 ux_hcd_synergy_interrupt_endpoint_create

```
ux_hcd_synergy_interrupt_endpoint_create (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.101.1 Brief description

This function will create an interrupt endpoint. The interrupt endpoint has an interval of operation from 1 to 255. The Synergy has no hardware scheduler but we still build an interrupt tree similar to the OHCI controller.

7.17.101.2 Detailed description

This routine will match the best interval for the Synergy hardware. It will also determine the best node to hook the endpoint based on the load that already exists on the horizontal ED chain.

The tricky part is to understand how the interrupt matrix is constructed. We have used eds with the skip bit on to build a frame of anchor eds. Each ED creates a node for an appropriate combination of interval frequency in the list.

After obtaining a pointer to the list with the lowest traffic, we traverse the list from the highest interval until we reach the interval required. At that node, we anchor our real ED to the node and link the ED that was attached to the node to our ED.

Table 736:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to an Endpoint control block

Table 737:Return values

Name	Description
UX_SUCCESS	Interrupt endpoint created successfully.
UX_ERROR	Available pipe is not found for interrupt endpoint.
UX_NO_ED_AVAILABLE	Failed to obtain an ED for new endpoint.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for terminating the ED transfer chain.

7.17.102 ux_hcd_synergy_interrupt_handler

```
ux_hcd_synergy_interrupt_handler (  UINT hcd_index )
```

7.17.102.1 Brief description

This function is the interrupt handler for the Synergy USB HS controller. Normally an interrupt occurs from the controller when there is either a EOF signal and there has been transfers within the frame or when there is a change on one of the downstream ports.

7.17.102.2 Detailed description

All we need to do in the ISR is scan the controllers to find out which one has issued a IRQ. If there is work to do for this controller we need to wake up the corresponding thread to take care of the job.

Table 738:Parameters

Name	Direction	Description
hcd_index	in	: HCD number

7.17.103 ux_hcd_synergy_iso_queue_process

```
ux_hcd_synergy_iso_queue_process (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.103.1 Brief description

This function process the isochronous transactions that happened in the last frame.

7.17.103.2 Detailed description

Table 739:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block

7.17.104 ux_hcd_synergy_iso_queue_process_bemp

```
ux_hcd_synergy_iso_queue_process_bemp (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.104.1 Brief description

This function process the BEMP(Buffer Empty) Interrupt that occurred on a specific ED used for Isochronous transfer.

7.17.104.2 Detailed description

Table 740:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.105 ux_hcd_synergy_iso_queue_bemp_transfer_end_check

```
 ux_hcd_synergy_iso_queue_bemp_transfer_end_check (  UX_TRANSFER
* transfer_request ,   ULONG actual_length ,   ULONG max_packet_size )
```

7.17.105.1 Brief description

This is the subroutine of ux_hcd_synergy_iso_queue_process_bemp to check a transfer request is completed or not. The function identify the completion by checking following conditions.

7.17.105.2 Detailed description

- PID was set to STALL.
- Actual transferred data length matches to the requested length.
- ZLP was sent.
- Short packet was sent.

Table 741:Parameters

Name	Direction	Description
transfer_request	in	: Pointer to a Transfer Request
actual_length	in	: Data length transmitted
max_packet_size	in	: Max packet size of PIPE used for a data transfer.

7.17.106 ux_hcd_synergy_iso_queue_process_brdy

```
ux_hcd_synergy_iso_queue_process_brdy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.106.1 Brief description

This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED used for isochronous transfer.

7.17.106.2 Detailed description

Table 742:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.107 ux_hcd_synergy_iso_queue_brdy_out_transaction

```
ux_hcd_synergy_iso_queue_brdy_out_transaction (  UX_SYNERGY_ED * ed )
```

7.17.107.1 Brief description

This is the subroutine of ux_hcd_synergy_iso_queue_process_brdy to perform BRDY interrupt processing for OUT direction PIPE used for isochrnous transfer.

7.17.107.2 Detailed description

Table 743:Parameters

Name	Direction	Description
ed	inout	: Pointer to an Endpoint control block

7.17.108 ux_hcd_synergy_iso_queue_brdy_in_transaction

```
ux_hcd_synergy_iso_queue_brdy_in_transaction (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.108.1 Brief description

This is the subroutine of ux_hcd_synergy_iso_queue_process_brdy to perform BRDY interrupt processing for IN direction PIPE used for isochrnous transfer.

7.17.108.2 Detailed description

Table 744:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.109 ux_hcd_synergy_iso_queue_process_nrdy

```
ux_hcd_synergy_iso_queue_process_nrdy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_SYNERGY_ED * ed )
```

7.17.109.1 Brief description

This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED used for Isochronous transfer.

7.17.109.2 Detailed description

Table 745:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
ed	inout	: Pointer to an Endpoint control block

7.17.110 ux_hcd_synergy_iso_schedule

```
ux_hcd_synergy_iso_schedule (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.110.1 Brief description

This function schedules new transfers from isochronous list.

7.17.110.2 Detailed description

Table 746:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block

7.17.111 ux_hcd_synergy_isochronous_endpoint_create

```
ux_hcd_synergy_isochronous_endpoint_create (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.111.1 Brief description

This function creates an isochronous endpoint.

7.17.111.2 Detailed description

Table 747:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to an Endpoint control block

Table 748:Return values

Name	Description
UX_SUCCESS	Isochronous endpoint is created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED terminating the ED transfer chain.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for new endpoint.

7.17.112 ux_hcd_synergy_isochronous_td_obtain

```
ux_hcd_synergy_isochronous_td_obtain (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.112.1 Brief description

This function obtains a free TD from the isochronous TD list.

7.17.112.2 Detailed description

Table 749:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 750:Return values

Name	Description
td	Pointer to Synergy ISO Trasfer Descriptor.

Table 750:Return values (Continued)

Name	Description
UX_NULL	TD not available in the TD list.

7.17.113 ux_hcd_synergy_least_traffic_list_get

```
ux_hcd_synergy_least_traffic_list_get (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.113.1 Brief description

This function return a pointer to the first ED in the periodic tree that has the least traffic registered.

7.17.113.2 Detailed description

Table 751:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 752:Return values

Name	Description
min_bandwidth_ed	End descriptor interrupt Number(ed)

7.17.114 ux_hcd_synergy_periodic_endpoint_destroy

```
ux_hcd_synergy_periodic_endpoint_destroy (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_ENDPOINT * endpoint )
```

7.17.114.1 Brief description

This function will destroy an isochronous endpoint.

7.17.114.2 Detailed description

Table 753:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
endpoint	inout	: Pointer to an Endpoint control block

Table 754:Return values

Name	Description
UX_SUCCESS	Isochronous endpoint is destroyed successfully.
UX_ENDPOINT_HANDLE_UNKNOWN	Physical endpoint has not been initialized properly.

7.17.115 ux_hcd_synergy_periodic_schedule

```
ux_hcd_synergy_periodic_schedule (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.115.1 Brief description

This function schedules new transfers from the periodic interrupt list.

7.17.115.2 Detailed description

Table 755:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

7.17.116 ux_hcd_synergy_periodic_tree_create

```
ux_hcd_synergy_periodic_tree_create (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.116.1 Brief description

This function creates the periodic static tree for the interrupt and isochronous eds.

7.17.116.2 Detailed description

Table 756:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 757:Return values

Name	Description
UX_SUCCESS	Periodic tree created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED.

7.17.117 ux_hcd_synergy_port_disable

```
ux_hcd_synergy_port_disable (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.117.1 Brief description

This function will disable a specific port attached to the root HUB.

7.17.117.2 Detailed description

Table 758:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 759:Return values

Name	Description
UX_SUCCESS	Port disabled successfully.

Table 759:Return values (Continued)

Name	Description
UX_PORT_INDEX_UNKNOWN	Invalid port .

7.17.118 ux_hcd_synergy_port_enable

```
ux_hcd_synergy_port_enable (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.118.1 Brief description

This function will enable a specific port attached to the root HUB.

7.17.118.2 Detailed description

Table 760:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
port_index	in	: Port Index

Table 761:Return values

Name	Description
UX_SUCCESS	Port enabled successfully.
UX_PORT_INDEX_UNKNOWN	Invalid port.
UX_NO_DEVICE_CONNECTED	Device not connected properly.

7.17.119 ux_hcd_synergy_port_reset

```
ux_hcd_synergy_port_reset (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.119.1 Brief description

This function will reset a specific port attached to the root HUB.

7.17.119.2 Detailed description

Table 762:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 763:Return values

Name	Description
UX_SUCCESS	Port reset successfully.
UX_PORT_INDEX_UNKNOWN	Invalid port.
UX_NO_DEVICE_CONNECTED	Device not connected properly.

7.17.120 ux_hcd_synergy_port_resume

```
ux_hcd_synergy_port_resume (  UX_HCD_SYNERGY * hcd_synergy ,
 UINT port_index )
```

7.17.120.1 Brief description

This function will resume a specific port attached to the root HUB. Present, this function is not supported for resume port.

7.17.120.2 Detailed description

Table 764:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 765:Return values

Name	Description
UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

7.17.121 ux_hcd_synergy_port_status_get

```
ux_hcd_synergy_port_status_get (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.121.1 Brief description

This function will return the status for each port attached to the root HUB.

7.17.121.2 Detailed description

Table 766:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
port_index	in	: Port Index

Table 767:Return values

Name	Description
UX_PORT_INDEX_UNKNOWN	Invalid port.
port_status	Synergy Port status

7.17.122 ux_hcd_synergy_port_suspend

```
ux_hcd_synergy_port_suspend (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.122.1 Brief description

This function will suspend a specific port attached to the root HUB. Present, this function is does not supported.

7.17.122.2 Detailed description

Table 768:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 769:Return values

Name	Description
UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

7.17.123 ux_hcd_synergy_power_down_port

```
ux_hcd_synergy_power_down_port (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.123.1 Brief description

This function will power down a specific port attached to the root HUB. Present, this function is does not supported.

7.17.123.2 Detailed description

Table 770:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 771:Return values

Name	Description
UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

7.17.124 ux_hcd_synergy_power_on_port

```
ux_hcd_synergy_power_on_port (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG port_index )
```

7.17.124.1 Brief description

This function will power a specific port attached to the root HUB. Present, this function is does not supported.

7.17.124.2 Detailed description

Table 772:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
port_index	in	: Port Index

Table 773:Return values

Name	Description
UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

7.17.125 ux_hcd_synergy_power_root_hubs

```
ux_hcd_synergy_power_root_hubs (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.125.1 Brief description

This function will power the root HUB. Present, this function is does not supported.

7.17.125.2 Detailed description

Table 774:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block

7.17.126 ux_hcd_synergy_register_clear

```
ux_hcd_synergy_register_clear (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.126.1 Brief description

This function clears flags in a synergy USB register.

7.17.126.2 Detailed description

Table 775:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
synergy_register	in	: Register to write
value	in	: Value to clear

7.17.127 ux_hcd_synergy_register_read

```
ux_hcd_synergy_register_read (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG synergy_register )
```

7.17.127.1 Brief description

This function reads a data from synergy USB register.

7.17.127.2 Detailed description

Table 776:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
synergy_register	in	: Register to read

Table 777:Return values

Name	Description
hcd_reg	Value read from the specified register(ULONG value).

7.17.128 ux_hcd_synergy_register_set

```
ux_hcd_synergy_register_set (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.128.1 Brief description

This function sets flags in a synergy USB register.

7.17.128.2 Detailed description

Table 778:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
synergy_register	in	: Register to read
value	in	: Value to be set

7.17.129 ux_hcd_synergy_register_write

```
ux_hcd_synergy_register_write (  UX_HCD_SYNERGY * hcd_synergy ,
 ULONG synergy_register ,   USHORT value )
```

7.17.129.1 Brief description

This function writes a data to a Synergy USB register.

7.17.129.2 Detailed description

Table 779:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block
synergy_register	in	: Register to write
value	in	: Value to write

7.17.130 ux_hcd_synergy_regular_td_obtain

```
ux_hcd_synergy_regular_td_obtain (  UX_HCD_SYNERGY * hcd_synergy )
```

7.17.130.1 Brief description

This function obtains a free TD from the regular TD list.

7.17.130.2 Detailed description

Table 780:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 781:Return values

Name	Description
td	A pointer to Synergy TD.
UX_NULL	Null pointer.

7.17.131 ux_hcd_synergy_request_bulk_transfer

```
ux_hcd_synergy_request_bulk_transfer (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_TRANSFER * transfer_request )
```

7.17.131.1 Brief description

This function performs a bulk transfer request. A bulk transfer can be larger than the size of the Synergy buffer so it may be required to chain multiple tds to accommodate this transfer request. A bulk transfer is non blocking, so we return before the transfer request is completed.

7.17.131.2 Detailed description

Table 782:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
transfer_request	inout	: Pointer to transfer request

Table 783:Return values

Name	Description
UX_SUCCESS	Bulk transfer happened successfully.
UX_NO_TD_AVAILABLE	Unavailable New TD.

7.17.132 ux_hcd_synergy_request_control_transfer

```
ux_hcd_synergy_request_control_transfer (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_TRANSFER * transfer_request )
```

7.17.132.1 Brief description

This function performs a control transfer from a transfer request. The USB control transfer is in 3 phases (setup, data, status). This function will chain all phases of the control sequence before setting the Synergy endpoint as a candidate for transfer.

7.17.132.2 Detailed description

Table 784:Parameters

Name	Direction	Description
hcd_synergy	inout	: Pointer to a HCD control block

Table 784:Parameters (Continued)

Name	Direction	Description
transfer_request	inout	: Pointer to transfer request

Table 785:Return values

Name	Description
UX_MEMORY_INSUFFICIENT	Insufficient memory to build the SETUP request.
UX_NO_TD_AVAILABLE	Unavailable New TD.
ux_transfer_request_completion_code	Pointer to USBX transfer request structure(request completion code).

7.17.133 ux_hcd_synergy_request_interrupt_transfer

```
ux_hcd_synergy_request_interrupt_transfer (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_TRANSFER * transfer_request )
```

7.17.133.1 Brief description

This function performs an interrupt transfer request. An interrupt transfer can only be as large as the MaxpacketField in the endpoint descriptor. This was verified at the USB layer and does not need to be reverified here.

7.17.133.2 Detailed description

Table 786:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
transfer_request	inout	: Pointer to transfer request

Table 787:Return values

Name	Description
UX_SUCCESS	Interrupt transfer request processed successfully.

Table 787:Return values (Continued)

Name	Description
UX_NO_TD_AVAILABLE	Unavailable new TD.

7.17.134 ux_hcd_synergy_request_isochronous_transfer

```
ux_hcd_synergy_request_isochronous_transfer (  UX_HCD_SYNERGY * hcd_synergy ,
 UX_TRANSFER * transfer_request )
```

7.17.134.1 Brief description

This function performs an isochronous transfer request.

7.17.134.2 Detailed description

Table 788:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
transfer_request	inout	: Pointer to transfer request

Table 789:Return values

Name	Description
UX_SUCCESS	Isochronous transfer request processed successfully.
UX_NO_TD_AVAILABLE	Unavailable new TD.

7.17.135 ux_hcd_synergy_request_transfer

```
 ux_hcd_synergy_request_transfer (  UX_HCD_SYNERGY * hcd_synergy ,   UX_TRANSFER
* transfer_request )
```

7.17.135.1 Brief description

This function is the handler for all the transactions on the USB. The transfer request passed as parameter contains the endpoint and the device descriptors in addition to the type of transaction de be executed. This function routes the transfer request to according to the type of transfer to be executed.

7.17.135.2 Detailed description

Table 790:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
transfer_request	inout	: Pointer to transfer request

Table 791:Return values

Name	Description
UX_ERROR	Error while Isolating the endpoint type and routing the transfer request.
UX_NO_DEVICE_CONNECTED	No device attached.

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_request_control_transfer
- ux_hcd_synergy_request_bulk_transfer
- ux_hcd_synergy_request_interrupt_transfer
- ux_hcd_synergy_request_isochronous_transfer

7.17.136 ux_hcd_synergy_td_add

```
ux_hcd_synergy_td_add (  UX_HCD_SYNERGY * hcd_synergy ,   UX_SYNERGY_ED * ed )
```

7.17.136.1 Brief description

This function add new TD for control, Bulk or Interrupt endpoint.

7.17.136.2 Detailed description

Table 792:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block

Table 792:Parameters (Continued)

Name	Direction	Description
ed	in	: Pointer to Synergy ED structure

Table 793:Return values

Name	Description
UX_SUCCESS	Transfer done successfully.

7.17.137 ux_hcd_synergy_transfer_abort

```
ux_hcd_synergy_transfer_abort ( UX_HCD_SYNERGY * hcd_synergy , UX_TRANSFER
* transfer_request )
```

7.17.137.1 Brief description

This function will abort transactions attached to a transfer request.

7.17.137.2 Detailed description

Table 794:Parameters

Name	Direction	Description
hcd_synergy	in	: Pointer to a HCD control block
transfer_request	inout	: Pointer to transfer request

Table 795:Return values

Name	Description
UX_SUCCESS	Transactions attached to transfer request are aborted successfully.
UX_ENDPOINT_HANDLE_UNKNOWN	Endpoint is not initialized properly.

7.17.138 Extensions

7.18 USB Communication Framework

RTOS-integrated USBX CDC ACM device implementation.

7.18.1 Functions

- SF_EL_UX_COMMS_Open
- SF_EL_UX_COMMS_Close
- SF_EL_UX_COMMS_Read
- SF_EL_UX_COMMS_Write
- SF_EL_UX_COMMS_Lock
- SF_EL_UX_COMMS_Unlock
- SF_EL_UX_COMMS_VersionGet
- ux_cdc_instance_activate
- ux_cdc_instance_deactivate
- sf_el_ux_comms_read_leftover

7.18.2 Defines

- #define SF_EL_UX_COMMS_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_EL_UX_COMMS_CODE_VERSION_MINOR

  Initial value: `(6U)`

7.18.3 SF_EL_UX_COMMS_Open

```
ssp_err_t SF_EL_UX_COMMS_Open ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_cfg_t  const *const p_cfg )
```

7.18.3.1 Brief description

Initializes a USB channel for CDC ACM mode.

7.18.3.2 Detailed description

Table 796:Return values

Name	Description
SSP_SUCCESS	Channel opened successfully
SSP_ERR_ASSERTION	Pointer to sf_el_ux_comms control block is NULL
SSP_ERR_INTERNAL	USBX initialize call returned an error.

NOTE: This function is reentrant.

Table 797:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to control structure block.
p_cfg	in	Pointer to configuration structure block. This parameter is not used in the framework hence the NULL parameter check not implemented.

Table 798:Return values

Name	Description
SSP_SUCCESS	Channel opened successfully
SSP_ERR_ASSERTION	p_api_ctrl pointer parameter to control block is NULL
SSP_ERR_TIMEOUT	Mutex not available in timeout.
SSP_ERR_IN_USE	Channel/peripheral is running/busy.

NOTE: This function is reentrant.

7.18.3.3 Function steps

- Create the mutexes.
- Mark control block open by intializing it to "UXCM" in its ASCII equivalent .
- Suspend here until a USBX CDC instance is created by the USBX CDC for this module.
- Create the mutexes.
- Mark control block open.

7.18.4 SF_EL_UX_COMMS_Close

```
ssp_err_t SF_EL_UX_COMMS_Close ( sf_comms_ctrl_t  *const p_api_ctrl )
```

7.18.4.1 Brief description

Releases all the ThreadX Resources.

7.18.4.2 Detailed description

Finalize CDC ACM operation for a USB channel. and clear SCI device control block members.

Table 799:Return values

Name	Description
SSP_SUCCESS	Channel successfully closed
SSP_ERR_ASSERTION	Pointer to control block is NULL
SSP_ERR_INTERNAL	Deletion of mutex failed

NOTE: This function is reentrant.

Table 800:Return values

Name	Description
SSP_SUCCESS	Channel successfully closed
SSP_ERR_ASSERTION	Pointer to control block is NULL
SSP_ERR_INTERNAL	Deletion of mutex failed

NOTE: This function is reentrant. No actual USB COM port close operation being held.

7.18.4.3 Function steps

- Delete transmit mutex.
- Delete receive mutex.
- Delete transmit mutex.
- Delete receive mutex.

7.18.5 SF_EL_UX_COMMS_Read

```
ssp_err_t SF_EL_UX_COMMS_Read ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   UINT const timeout )
```

7.18.5.1 Brief description

Read data from the USBX CDC ACM driver.

7.18.5.2 Detailed description

Read data from the USBX CDC-ACM driver.

Table 801:Return values

Name	Description
SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_TIMEOUT	Wait for the USBX instance to be created until the timeout occurs.
SSP_ERR_INTERNAL	USB device not enumerated or USBX read call returned an error.

NOTE: This API is reentrant.

Table 802:Return values

Name	Description
SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_INTERNAL	USB device not enumerated or USBX read call returned an error.
SSP_ERR_ASSERTION	Either of pointer type argument is NULL.
SSP_ERR_NOT_OPEN	Module is not opened.

NOTE: This API is reentrant.

7.18.5.3 Function steps

- Read data leftover from the last packet.
- Read from the CDC class.
- Buffer overflow occurred.
- Check if module has been opened.
- Check for the USB to be plugged in.
- If there is data leftover from the last packet, use it.
- Read from the CDC class.
- Buffer overflow occurred.

7.18.6 SF_EL_UX_COMMS_Write

```
ssp_err_t SF_EL_UX_COMMS_Write ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
const *const p_src ,   uint32_t const bytes ,   UINT const timeout )
```

7.18.6.1 Brief description

Write data to the USBX CDC ACM driver.

7.18.6.2 Detailed description

Write data to the USBX CDC-ACM framework.

Table 803:Return values

Name	Description
SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_TIMEOUT	Wait for the USBX instance to be created until the timeout occurs.
SSP_ERR_ASSERTION	Pointer to sf_el_ux_comms control block is NULL.
SSP_ERR_INTERNAL	USB device not enumerated or USBX write call returned an error.

NOTE: This function is reentrant.

Table 804:Return values

Name	Description
SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	Pointer to control block is NULL
SSP_ERR_NOT_OPEN	Module is not opened.
SSP_ERR_INTERNAL	USB device not enumerated or USBX write call returned an error.

NOTE: This function is reentrant.

7.18.6.3 Function steps

- Wait for the USB to be plugged in.
- Check if module has been opened.
- Check for the USB to be plugged in.

7.18.7 SF_EL_UX_COMMS_Lock

```
ssp_err_t SF_EL_UX_COMMS_Lock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type ,   UINT timeout )
```

7.18.7.1 Brief description

Locks the communication to a thread by acquiring a mutex before the timeout occurs.

7.18.7.2 Detailed description

Lock the USB COM resource.

Table 805:Return values

Name	Description
SSP_SUCCESS	Locking sf_el_ux_comms resource successful.
SSP_ERR_ASSERTION	Pointer to sf_el_ux_comms control block is NULL.
SSP_ERR_TIMEOUT	Mutex not available in timeout.
SSP_ERR_NOT_OPEN	The framework is not opened. Open the framework first before calling this API.
SSP_SUCCESS	Locking a USB COM resource successful.
SSP_ERR_ASSERTION	Pointer to control block is NULL.
SSP_ERR_NOT_OPEN	Module is not opened.
SSP_ERR_TIMEOUT	Mutex not available in timeout.

7.18.8 SF_EL_UX_COMMS_Unlock

```
ssp_err_t SF_EL_UX_COMMS_Unlock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type )
```

7.18.8.1 Brief description

Unlocks the communication to a thread by releasing the mutex for write or read or both.

7.18.8.2 Detailed description

Unlock the USB COM resource.

Table 806:Return values

Name	Description
SSP_SUCCESS	Unlocks the sf_el_ux_comms communication resource successful.
SSP_ERR_ASSERTION	Pointer to sf_el_ux_comms control block is NULL.
SSP_ERR_NOT_OPEN	The framework is not opened. Open the framework first before calling this API.
SSP_SUCCESS	Unlocking a USB COM resource successful.
SSP_ERR_ASSERTION	Pointer to control block is NULL.
SSP_ERR_NOT_OPEN	Module is not opened.
SSP_ERR_TIMEOUT	An internal ThreadX error has occurred. This is typically a failure to use a mutex.

7.18.9 SF_EL_UX_COMMS_VersionGet

```
ssp_err_t SF_EL_UX_COMMS_VersionGet ( ssp_version_t  *const p_version )
```

7.18.9.1 Brief description

Get driver version.

7.18.9.2 Detailed description

Get driver version

Table 807:Parameters

Name	Direction	Description
p_version	out	Version will be stored here.

Table 808:Return values

Name	Description
SSP_SUCCESS	Version stored in provided pointer.
SSP_ERR_ASSERTION	p_version was null.

NOTE: This function is reentrant.

Table 809:Parameters

Name	Direction	Description
p_version	out	Version will be stored here.

NOTE: This function is reentrant.

7.18.10 ux_cdc_instance_activate

```
ux_cdc_instance_activate (  VOID * cdc_instance )
```

7.18.11 ux_cdc_instance_deactivate

```
ux_cdc_instance_deactivate (  VOID * cdc_instance )
```

7.18.12 sf_el_ux_comms_read_leftover

```
ssp_err_t sf_el_ux_comms_read_leftover ( sf_el_ux_comms_instance_ctrl_t
* p_ux_comms_ctrl ,   uint8_t *const p_destination ,   uint32_t
* p_remaining_bytes ,   UINT time )
```

7.18.12.1 Brief description

Subroutine for SF_EL_UX_COMMS_Read API which will be called to read the leftover data from last packet.

7.18.12.2 Detailed description

Table 810:Parameters

Name	Direction	Description
p_ux_comms_ctrl	in	Pointer to the sf_el_ux_comms control block.
p_destination	out	Pointer to the destination buffer.
p_remaining_bytes	inout	Pointer to remaining bytes.
time	in	User specified timeout value.

Table 811:Return values

Name	Description
SSP_ERR_TIMEOUT	Wait for the USBX instance to be created until the timeout occurs.
SSP_SUCCESS	Read the leftover data from previous packet successful.

7.18.12.3 Function steps

- Wait for the USB to be plugged in.
- If there is data leftover from the last packet, use it.

7.18.13 Extensions

7.18.13.1 sf_el_ux_comms_instance_ctrl_t

sf_el_ux_comms_instance_ctrl_t

Detailed description

USBX CDC ACM device communications instance control structure. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t open
- TX_MUTEX mutex[2]

- UX_SLAVE_CLASS_CDC_ACM * p_cdc
- uint32_t leftover_length
- uint32_t index
- uint8_t memory[SF_EL_UX_COMMS_CFG_USB_MEMORY_SIZE_BYTES]
- uint8_t rx_memory[SF_EL_UX_COMMS_CFG_BUFFER_MAX_LENGTH]
- TX_SEMAPHORE semaphore

7.18.14 Modules

- Build Time Configurations

7.18.14.1 Build Time Configurations

Defines

- #define SF_EL_UX_COMMS_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking
- #define SF_EL_UX_COMMS_CFG_USB_MEMORY_SIZE_BYTES

  Initial value: `(65536)`

  Specify the size of memory to allocate for USBX. Size of 65536 is recommended for device applications.
- #define SF_EL_UX_COMMS_CFG_BUFFER_MAX_LENGTH

  Initial value: `(128)`

  Specify the size of memory to allocate for a read input buffer.

7.19 USB Communication Framework V2

RTOS-integrated USBX CDC ACM device implementation.

7.19.1 Defines

- #define SF_EL_UX_COMMS_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_EL_UX_COMMS_CODE_VERSION_MINOR

  Initial value: `(5U)`

7.19.2 Extensions

7.19.2.1 sf_el_ux_comms_instance_ctrl_t

sf_el_ux_comms_instance_ctrl_t

Detailed description

USBX CDC ACM device communications instance control structure. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t open
- TX_MUTEX mutex[2]
- UX_SLAVE_CLASS_CDC_ACM * p_cdc
- uint32_t leftover_length
- uint32_t index
- uint8_t memory[SF_EL_UX_COMMS_CFG_USB_MEMORY_SIZE_BYTES]
- uint8_t rx_memory[SF_EL_UX_COMMS_CFG_BUFFER_MAX_LENGTH]
- TX_SEMAPHORE semaphore

7.20 External IRQ Framework

RTOS-integrated external IRQ Framework.

7.20.1 Summary

This module is a ThreadX-aware external IRQ Framework for external inputs such as switches or other binary signals.

7.20.2 Functions

- SF_EXTERNAL_IRQ_Open
- SF_EXTERNAL_IRQ_Wait
- SF_EXTERNAL_IRQ_VersionGet
- SF_EXTERNAL_IRQ_Close

7.20.3 Defines

- #define SF_EXTERNAL_IRQ_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_EXTERNAL_IRQ_CODE_VERSION_MINOR

  Initial value: `(5U)`

7.20.4 SF_EXTERNAL_IRQ_Open

```
ssp_err_t SF_EXTERNAL_IRQ_Open ( sf_external_irq_ctrl_t  *const p_api_ctrl ,
 sf_external_irq_cfg_t  const *const p_cfg )
```

7.20.4.1 Brief description

Configure external IRQ and optionally enable external IRQ callbacks. Implements open.

7.20.4.2 Detailed description

The SF_EXTERNAL_IRQ_Open function acquires a mutex for the external IRQ channel used, then calls the HAL driver open function. After successful initialization, the external IRQ is ready for use.

Table 812:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and external interrupt has started.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg, p_api, or p_api->open. See HAL driver for other possible causes.
SSP_ERR_IN_USE	This channel is already open.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- open

NOTE: This function is reentrant for any channel.

7.20.4.3 Function steps

- Save driver structure for use in other framework layer functions
- Create semaphore for use with wait function
- Get mutex before calling lower layer, which will access HW registers.
- Prepare configuration for lower layer
- Open lower layer
- Post the mutex
- If low level initialization failed, delete the mutex and exit the function with the error code
- Delete RTOS services used and log the error
- log the error and return the error
- If there was any mutex error, return it
- Mark control block open so other tasks know it is valid

7.20.5 SF_EXTERNAL_IRQ_Wait

```
ssp_err_t SF_EXTERNAL_IRQ_Wait ( sf_external_irq_ctrl_t  *const p_api_ctrl ,
  ULONG const timeout )
```

7.20.5.1 Brief description

Get mutex, wait for external interrupt to expire, and release mutex. Implements wait.

7.20.5.2 Detailed description

Table 813:Return values

Name	Description
SSP_SUCCESS	External interrupt stopped successfully.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_EXTERNAL_IRQ_Open to configure.
SSP_ERR_TIMEOUT	Time out happens while waiting a semaphore.
SSP_ERR_WAIT_ABORTED	Suspension was aborted by another thread.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.20.5.3 Function steps

- Wait for semaphore post from ISR

7.20.6 SF_EXTERNAL_IRQ_VersionGet

```
ssp_err_t SF_EXTERNAL_IRQ_VersionGet ( ssp_version_t  *const p_version )
```

7.20.6.1 Brief description

Get version and store it in provided pointer p_version. Implements versionGet.

7.20.6.2 Detailed description

Table 814:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.20.7 SF_EXTERNAL_IRQ_Close

```
ssp_err_t SF_EXTERNAL_IRQ_Close ( sf_external_irq_ctrl_t  *const p_api_ctrl )
```

7.20.7.1 Brief description

Release channel mutex and close channel at HAL layer. Implements close.

7.20.7.2 Detailed description

Table 815:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_IN_USE	This channel is already open.

Table 815:Return values (Continued)

Name	Description
SSP_ERR_UNSUPPORTED	Unsupported operation.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- close

7.20.7.3 Function steps

- Get mutex since this will access hardware registers
- Close channel in HAL layer
- Post the mutex
- Clear information from control block so other functions know this block is closed
- Clear information from control block so other functions know this instance is closed
- Delete RTOS services used

7.20.8 Extensions

7.20.8.1 sf_external_irq_instance_ctrl_t

sf_external_irq_instance_ctrl_t

Detailed description

Instance control block. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t open

  Used by driver to check if control block is valid.
- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware registers.
- TX_SEMAPHORE semaphore

  Semaphore used for SF_EXTERNAL_IRQ_Wait.
- external_irq_instance_t const * p_lower_lvl_irq

  Pointer to lower level driver instance.
- bool callback_used

  Used by driver to check if wait can be used.

7.21 I2C Framework

RTOS-integrated I2C Framework.

SSP I2C framework driver API .

7.21.1 Summary

This is a ThreadX-aware I2C driver API. The API implements the I2C Framework interface and can access several hardware peripherals at the HAL layer. The connection to the HAL layer is established by passing in a driver structure in SF_I2C_Open.

7.21.2 Interface Used

I2C Framework

7.21.3 Functions

- sf_i2c_callback
- sf_i2c_common_start
- sf_i2c_common_wait
- sf_i2c_common_finish
- sf_i2c_check_lower_lvl_driver_parameters
- sf_i2c_check_common_parameters
- sf_i2c_reconfigure_device
- SF_I2C_Open
- SF_I2C_Read
- SF_I2C_Write
- SF_I2C_Reset
- SF_I2C_Close
- SF_I2C_Lock
- SF_I2C_Unlock
- SF_I2C_VersionGet

7.21.4 Variables

- g_sf_i2c_version
- g_sf_i2c_on_sf_i2c

7.21.5 Defines

- #define SF_I2C_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_I2C_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_I2C_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((expression), (error), &g_module_name[0], &g_sf_i2c_version)`

7.21.6 sf_i2c_callback

```
sf_i2c_callback ( i2c_callback_args_t  * parg )
```

7.21.6.1 Brief description

I2C SSP framework level callback.

7.21.6.2 Detailed description

Table 816:Parameters

Name	Direction	Description
p_args	in	Pointer to callback parameters

Table 817:Return values

Name	Description
void	

7.21.7 sf_i2c_common_start

```
ssp_err_t sf_i2c_common_start ( sf_i2c_instance_ctrl_t  *const p_ctrl ,
  uint32_t const timeout )
```

7.21.7.1 Brief description

Common I2C transfer start function. Used in all framework read write calls. This function checks is there any need for reconfiguration and gets the mutex and reconfigures if required.

7.21.7.2 Detailed description

(end addtogroup SF_I2C)

Table 818:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device.
timeout	in	ThreadX timeout.

Table 819:Return values

Name	Description
SSP_SUCCESS	Transfer started successfully.
SSP_ERR_INTERNAL	Internal error occurred.

NOTE: This function is reentrant for any device.

7.21.7.3 Function steps

- Reconfigure the device address, if necessary

7.21.8 sf_i2c_common_wait

```
ssp_err_t sf_i2c_common_wait ( sf_i2c_instance_ctrl_t  *const p_ctrl ,
 i2c_event_t  event ,   uint32_t const timeout )
```

7.21.8.1 Brief description

Common I2C wait. Waits for an operation to finish.

7.21.8.2 Detailed description

Table 820:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device
event	in	Event
timeout	in	ThreadX timeout

Table 821:Return values

Name	Description
SSP_SUCCESS	Data transmitted successfully.
SSP_ERR_TRANSFER_ABORTED	Transfer aborted.
SSP_ERR_INTERNAL	Internal error occurred.

NOTE: This function is reentrant for any device.

7.21.9 sf_i2c_common_finish

```
ssp_err_t sf_i2c_common_finish ( sf_i2c_instance_ctrl_t  *const p_ctrl )
```

7.21.9.1 Brief description

Common I2C finish. Release mutex if the bus is not locked and restart not issued..

7.21.9.2 Detailed description

Table 822:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework driver context for a device

Table 823:Return values

Name	Description
SSP_SUCCESS	Transfer finished successfully.
SSP_ERR_INTERNAL	Internal error occurred.

NOTE: This function is reentrant for any device.

7.21.10 sf_i2c_check_lower_lvl_driver_parameters

```
sf_i2c_check_lower_lvl_driver_parameters ( sf_i2c_cfg_t  const *const p_cfg )
```

7.21.10.1 Brief description

Checks whether lower level I2C module and bus are configured.

7.21.10.2 Detailed description

Table 824:Parameters

Name	Direction	Description
p_cfg	in	Pointer to I2C framework Configuration Structure

Table 825:Return values

Name	Description
true	Lower level I2C driver, and I2C bus are configured.
false	Lower level I2C driver, and I2C bus are not configured.

7.21.11 sf_i2c_check_common_parameters

```
 sf_i2c_check_common_parameters ( sf_i2c_ctrl_t  *const p_ctrl ,   uint32_t
const bytes )
```

7.21.11.1 Brief description

Check if I2C framework control block address and number of bytes are not NULL.

7.21.11.2 Detailed description

Table 826:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to I2C framework control block
bytes	in	Number of bytes of data to be transferred

Table 827:Return values

Name	Description
true	I2C framework control block address, number of bytes are not NULL.
false	I2C framework control block address, number of bytes are NULL.

7.21.12 sf_i2c_reconfigure_device

```
ssp_err_t sf_i2c_reconfigure_device ( sf_i2c_instance_ctrl_t  *const p_ctrl )
```

7.21.12.1 Brief description

Assign a slave address of new device to current device on the bus.

7.21.12.2 Detailed description

Table 828:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for I2C framework context for a device

Table 829:Return values

Name	Description
SSP_SUCCESS	New device slave address assigned to current device

See Common Error Codes and lower level drivers for other possible return codes. These driver functions are:

- slaveAddressSet

7.21.12.3 Function steps

- Reconfigure the device by changing the slave address.
- Change the slave address and addressing mode.
- Assign this device to current.

7.21.13 SF_I2C_Open

```
ssp_err_t SF_I2C_Open ( sf_i2c_ctrl_t  *const p_api_ctrl ,  sf_i2c_cfg_t  const
*const p_cfg )
```

7.21.13.1 Brief description

Initialize a I2C bus and open low level I2C driver.

7.21.13.2 Detailed description

Table 830:Return values

Name	Description
SSP_SUCCESS	I2C device is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_cfg, Pointer to Open, Close, Read, Write, or reset API interfaces,p_cfg->p_bus.
SSP_ERR_INTERNAL	Internal error occurred.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is

- open

NOTE: This function is reentrant for any channel.

NOTE: Control handle must be cleared by caller before calling this function.

7.21.13.3 Function steps

- Copy bus to control
- Initialize bus lock to false
- Set framework level callback function.
- Save context for use in ISRs.
- Create mutex for this bus.
- Create Event flag.
- Open low level.
- Save device configuration for reconfiguration.
- Set device state as Opened.
- Initialize restarted flag to false.
- Increment device count.

7.21.14 SF_I2C_Read

```
ssp_err_t SF_I2C_Read ( sf_i2c_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   bool const restart ,   uint32_t
const timeout )
```

7.21.14.1 Brief description

Start the transfer process and receive data from I2C device.

7.21.14.2 Detailed description

Table 831:Return values

Name	Description
SSP_SUCCESS	Data received successfully.
SSP_ERR_NOT_OPEN	Device instance not opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_dest, bytes, timeout.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- read

7.21.14.3 Function steps

- Check whether device is opened or not.
- Start transfer process - check lock, check reconfiguration, get Mutex.
- Get the low level control in use.
- Perform read.
- Wait for callback to set event flag.
- Finish transfer.
- Finish transfer.

7.21.15 SF_I2C_Write

```
ssp_err_t SF_I2C_Write ( sf_i2c_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_src ,   uint32_t const bytes ,   bool const restart ,   uint32_t
const timeout )
```

7.21.15.1 Brief description

Start the transfer process and send data on I2C bus.

7.21.15.2 Detailed description

Table 832:Return values

Name	Description
SSP_SUCCESS	Data written successfully.
SSP_ERR_NOT_OPEN	Device instance not opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_src, bytes.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- write

7.21.15.3 Function steps

- Check whether device is opened or not.
- Start transfer process - check lock, check reconfiguration, get Mutex.
- Get the low level control in use.
- Wait for callback to set event flag.

7.21.16 SF_I2C_Reset

```
ssp_err_t SF_I2C_Reset ( sf_i2c_ctrl_t  *const p_api_ctrl ,   uint32_t
const timeout )
```

7.21.16.1 Brief description

Abort any in-progress transfer.

7.21.16.2 Detailed description

Table 833:Return values

Name	Description
SSP_SUCCESS	Channel was reseted without issue.
SSP_ERR_NOT_OPEN	Device was not even opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_INTERNAL	Internal error occurred.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- reset

7.21.16.3 Function steps

- Check whether device is opened or not.
- Get the low level control in use.
- Get mutex since this will access hardware registers.

7.21.17 SF_I2C_Close

```
ssp_err_t SF_I2C_Close ( sf_i2c_ctrl_t  *const p_api_ctrl )
```

7.21.17.1 Brief description

Close the I2C device designated by the control handle and close the RTOS services used by the bus if no device is connected to the bus.

7.21.17.2 Detailed description

Table 834:Return values

Name	Description
SSP_SUCCESS	Device is successfully closed.
SSP_ERR_IN_USE	In-use error.

Table 834:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Device was not even opened.*
SSP_ERR_INTERNAL	Internal error occurred.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- close

NOTE: This function is reentrant for any device.

7.21.17.3 Function steps

- Check whether device is opened or not.
- See if the device need to close through close. close only if this is the current device, else it might have closed during reconfiguration, or not opened through the open().
- Get mutex since this will access hardware registers.
- Close low level driver.
- Release mutex.
- Decrement device count.
- Check whether any device is still using the bus.
- Delete RTOS services used by bus.
- Set device to closed state.

7.21.18 SF_I2C_Lock

```
ssp_err_t SF_I2C_Lock ( sf_i2c_ctrl_t  *const p_api_ctrl )
```

7.21.18.1 Brief description

Lock the bus for a device. Once bus is locked by a device it can not be used by other devices.

7.21.18.2 Detailed description

Table 835:Return values

Name	Description
SSP_SUCCESS	I2C channel is successfully locked.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

NOTE: This function is reentrant for any device.

7.21.18.3 Function steps

- Check whether device is opened or not.
- Check whether lock is already taken.
- Get the mutex for this device.
- Reconfigure the device address, if necessary
- Set lock flag.

7.21.19 SF_I2C_Unlock

```
ssp_err_t SF_I2C_Unlock ( sf_i2c_ctrl_t  *const p_api_ctrl )
```

7.21.19.1 Brief description

Unlock the locked bus and make the bus usable for other devices.

7.21.19.2 Detailed description

Table 836:Return values

Name	Description
SSP_SUCCESS	I2C bus is successfully unlocked.

Table 836:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

NOTE: This function is reentrant for any device.

7.21.19.3 Function steps

- Check whether device is opened or not.
- Clear lock flag.
- Release the mutex so that others can use the bus.

7.21.20 SF_I2C_VersionGet

```
ssp_err_t SF_I2C_VersionGet ( ssp_version_t  *const p_version )
```

7.21.20.1 Brief description

Get the version information of the framework.

7.21.20.2 Detailed description

Table 837:Return values

Name	Description
SSP_SUCCESS	Got version number successfully.
SSP_ERR_ASSERTION	Following parameters is NULL: p_version.

7.21.20.3 Function steps

- Checks error. Further parameter checking can be done at the driver layer.

7.21.21 g_sf_i2c_version

ssp_version_t::g_sf_i2c_version

7.21.21.1 Detailed description

Version data structure used by error logger macro.

7.21.21.2 Initialized as

```
g_sf_i2c_version=
{
.api_version_minor  = SF_I2C_API_VERSION_MINOR,
    .api_version_major  = #define  SF_I2C_API_VERSION_MAJOR,
.code_version_minor = SF_I2C_CODE_VERSION_MINOR,
    .code_version_major = SF_I2C_CODE_VERSION_MAJOR,
}
```

7.21.22 g_sf_i2c_on_sf_i2c

sf_i2c_api_t::g_sf_i2c_on_sf_i2c

7.21.22.1 Initialized as

```
g_sf_i2c_on_sf_i2c=
{
    .open    = SF_I2C_Open,
    .read    = SF_I2C_Read,
    .write   = SF_I2C_Write,
    .reset   = SF_I2C_Reset,
    .close   = SF_I2C_Close,
    .lock    = SF_I2C_Lock,
    .unlock  = SF_I2C_Unlock,
    .version = SF_I2C_VersionGet
}
```

7.21.23 Extensions

7.21.23.1 sf_i2c_instance_ctrl_t

sf_i2c_instance_ctrl_t

Detailed description

I2C instance control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- sf_i2c_bus_t * p_bus

  Bus using this device. Copy from configuration structure.
- i2c_master_instance_t const * p_lower_lvl_i2c

  I2C instance.
- i2c_cfg_t lower_lvl_cfg

  Used to reconfigure I2C driver.
- i2c_ctrl_t * p_lower_lvl_ctrl

  I2C peripheral control block.
- sf_i2c_dev_state_t dev_state

  Device status.
- bool locked

  Lock and unlock bus for a device.
- bool restarted

  Indicates whether device issued a restart.

7.22 JPEG Decode Framework

RTOS-integrated JPEG Framework.

7.22.1 Functions

- sf_jpeg_initialize
- sf_jpeg_callback_function
- SF_JPEG_Decode_Open
- SF_JPEG_Decode_InputBufferSet
- SF_JPEG_Decode_LinesDecodedGet
- SF_JPEG_Decode_HorizontalStrideSet
- SF_JPEG_Decode_ImageSubsampleSet
- SF_JPEG_Decode_OutputBufferSet
- SF_JPEG_Decode_Wait
- SF_JPEG_Decode_StatusGet
- SF_JPEG_Decode_PixelFormatGet
- SF_JPEG_Decode_ImageSizeGet
- SF_JPEG_Decode_Close

- SF_JPEG_Decode_VersionGet

7.22.2 Variables

- s_sf_jpeg_version
- p_event_flag
- g_sf_jpeg_decode_on_sf_jpeg_decode

7.22.3 Defines

- #define SF_JPEG_DECODE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_JPEG_DECODE_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_JPEG_DECODE_OPEN

  Initial value: `(0x4A504547U)`

  "JPEG" in ASCII, used to identify general JPEG control block
- #define SF_JPEG_ERROR_RETURN

  Initial value:
  ```
  #define  SSP_ERROR_RETURN((a), (err), &g_module_name[0], &s_sf_jpeg_version)
  ```

  Macro for error logger.
- #define JPEG_ALL_EVENTS

  Initial value: `((ULONG) 0xFFFFFFFF)`

7.22.4 sf_jpeg_initialize

```
ssp_err_t sf_jpeg_initialize ( sf_jpeg_decode_instance_ctrl_t  *const p_ctrl ,
 sf_jpeg_decode_cfg_t  const *const p_cfg )
```

7.22.4.1 Brief description

Acquires mutex, then handles driver initialization at the HAL layer. This function releases the mutex before returns to the caller.

7.22.4.2 Detailed description

Table 838:Return values

Name	Description
SSP_SUCCESS	JPEG Decode driver is successfully opened.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- open

7.22.5 sf_jpeg_callback_function

```
sf_jpeg_callback_function ( jpeg_decode_callback_args_t  * p_args )
```

7.22.6 SF_JPEG_Decode_Open

```
ssp_err_t SF_JPEG_Decode_Open ( sf_jpeg_decode_ctrl_t  *const p_api_ctrl ,
 sf_jpeg_decode_cfg_t  const *const p_cfg )
```

7.22.6.1 Brief description

Parameter checking and initialize JPEG decode with sf_jpeg_initialize helper function and marking the open flag in control block.

7.22.6.2 Detailed description

Table 839:Return values

Name	Description
SSP_SUCCESS	JPEG Decode framework is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_ctrl or p_cfg.
SSP_ERR_ALREADY_OPEN	JPEG Decode framework is already open.

Table 839:Return values (Continued)

Name	Description
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.22.7 SF_JPEG_Decode_InputBufferSet

```
ssp_err_t SF_JPEG_Decode_InputBufferSet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,   void *const p_buffer ,   uint32_t const buffer_size )
```

7.22.7.1 Brief description

Configures JPEG coded input data.

7.22.7.2 Detailed description

This API configures the decode input buffer address register. After the input buffer address is set, the driver checks whether the output buffer address is set, and verifies that the output buffer size is large enough to hold at least eight output lines of data. If both the input buffer and output buffer are set properly, the driver automatically starts the decode process.

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 840:Return values

Name	Description
SSP_SUCCESS	Decode input buffer is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- inputBufferSet

7.22.7.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Call the HAL driver layer inputBufferSet routine.
- Release mutex

7.22.8 SF_JPEG_Decode_LinesDecodedGet

```
ssp_err_t SF_JPEG_Decode_LinesDecodedGet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,   uint32_t *const p_lines )
```

7.22.8.1 Brief description

Obtain number of lines decoded by the codec.

7.22.8.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 841:Return values

Name	Description
SSP_SUCCESS	Lines decoded value is successfully obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- linesDecodedGet

7.22.8.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.9 SF_JPEG_Decode_HorizontalStrideSet

```
ssp_err_t SF_JPEG_Decode_HorizontalStrideSet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,   uint32_t horizontal_stride )
```

7.22.9.1 Brief description

Configure the horizontal stride value.

7.22.9.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 842:Return values

Name	Description
SSP_SUCCESS	Horizontal Stride value is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- horizontalStrideSet

7.22.9.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.10 SF_JPEG_Decode_ImageSubsampleSet

```
ssp_err_t SF_JPEG_Decode_ImageSubsampleSet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,  jpeg_decode_subsample_t  horizontal_subsample ,
 jpeg_decode_subsample_t  vertical_subsample )
```

7.22.10.1 Brief description

Configure the horizontal and vertical subsample values. This allows an application to reduce the size of the decoded image at runtime.

7.22.10.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 843:Return values

Name	Description
SSP_SUCCESS	Image subsample values are successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- imageSubsampleSet

7.22.10.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.11 SF_JPEG_Decode_OutputBufferSet

```
ssp_err_t SF_JPEG_Decode_OutputBufferSet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,   void * p_buffer ,   uint32_t buffer_size )
```

7.22.11.1 Brief description

Configure the decode output buffer.

7.22.11.2 Detailed description

This API configures the decode output buffer address register. After the output buffer address is set, the driver computers the number of output lines the buffer is able to hold. The hardware requires the number out output lines to decode at a time is multiple of eight. If both the input buffer and output buffer are set properly, the driver automatically starts the decode process.

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 844:Return values

Name	Description
SSP_SUCCESS	Output buffer is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- outputBufferSet

7.22.11.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.12 SF_JPEG_Decode_Wait

```
ssp_err_t SF_JPEG_Decode_Wait ( sf_jpeg_decode_ctrl_t  *const p_api_ctrl ,
 jpeg_decode_status_t  *const p_status ,   uint32_t timeout )
```

7.22.12.1 Brief description

Wait for current JPEG codec operation to finish.

7.22.12.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 845:Return values

Name	Description
SSP_SUCCESS	The wait function returns successfully.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_TIMEOUT	The wait operation timed out, the underlying driver did not response in time.
SSP_ERR_WAIT_ABORTED	System internal error occurred.

7.22.12.3 Function steps

- Obtain mutex before making HAL-level driver call.

7.22.13 SF_JPEG_Decode_StatusGet

```
ssp_err_t SF_JPEG_Decode_StatusGet ( sf_jpeg_decode_ctrl_t  *const p_api_ctrl ,
 jpeg_decode_status_t  *const p_status )
```

7.22.13.1 Brief description

Obtain JPEG codec status. This function can be used to poll the device instead of using SF_JPEG_Decode_Wait to block on JPEG operations.

7.22.13.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 846:Return values

Name	Description
SSP_SUCCESS	The JPEG status information is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- statusGet

7.22.13.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.14 SF_JPEG_Decode_PixelFormatGet

```
ssp_err_t SF_JPEG_Decode_PixelFormatGet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,  jpeg_decode_color_space_t  *const p_color_space )
```

7.22.14.1 Brief description

Obtain the format of the image. This function is only useful for decoding a JPEG image.

7.22.14.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 847:Return values

Name	Description
SSP_SUCCESS	The JPEG image size is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- pixelFormatGet

7.22.14.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.15 SF_JPEG_Decode_ImageSizeGet

```
ssp_err_t SF_JPEG_Decode_ImageSizeGet ( sf_jpeg_decode_ctrl_t
*const p_api_ctrl ,   uint16_t * p_horizontal_size ,   uint16_t
* p_vertical_size )
```

7.22.15.1 Brief description

Obtain the size of the image. This function is only useful for decoding a JPEG image.

7.22.15.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the JPEG codec block before using this function.

Table 848:Return values

Name	Description
SSP_SUCCESS	The JPEG image size is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- imageSizeGet

7.22.15.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex

7.22.16 SF_JPEG_Decode_Close

```
ssp_err_t SF_JPEG_Decode_Close ( sf_jpeg_decode_ctrl_t  *const p_api_ctrl )
```

7.22.16.1 Brief description

Close JPEG codec device. Un-finished codec operation is interrupted, and output data are discarded.

7.22.16.2 Detailed description

NOTE: Call SF_JPEG_Decode_Open to configure the timer before using this function.

Table 849:Return values

Name	Description
SSP_SUCCESS	The JPEG decode device is successfully closed.

Table 849:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- close

7.22.16.3 Function steps

- Obtain mutex before making HAL-level driver call.
- Release mutex
- Clear information from control block so other functions know this block is closed
- Delete RTOS services allocated during the open call.

7.22.17 SF_JPEG_Decode_VersionGet

```
ssp_err_t SF_JPEG_Decode_VersionGet ( ssp_version_t  *const p_version )
```

7.22.17.1 Brief description

Get version and store it in provided pointer p_version.

7.22.17.2 Detailed description

Table 850:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version is null.

7.22.18 g_sf_jpeg_decode_on_sf_jpeg_decode

sf_jpeg_decode_api_t::g_sf_jpeg_decode_on_sf_jpeg_decode

7.22.18.1 Initialized as

```
g_sf_jpeg_decode_on_sf_jpeg_decode=
{
    .open                   = SF_JPEG_Decode_Open,
    .inputBufferSet         = SF_JPEG_Decode_InputBufferSet,
    .outputBufferSet        = SF_JPEG_Decode_OutputBufferSet,
    .linesDecodedGet        = SF_JPEG_Decode_LinesDecodedGet,
    .horizontalStrideSet    = SF_JPEG_Decode_HorizontalStrideSet,
    .imageSubsampleSet      = SF_JPEG_Decode_ImageSubsampleSet,
    .wait                   = SF_JPEG_Decode_Wait,
    .statusGet              = SF_JPEG_Decode_StatusGet,
    .imageSizeGet           = SF_JPEG_Decode_ImageSizeGet,
    .pixelFormatGet         = SF_JPEG_Decode_PixelFormatGet,
    .close                  = SF_JPEG_Decode_Close,
    .versionGet             = SF_JPEG_Decode_VersionGet
}
```

7.22.19 Extensions

7.22.19.1 sf_jpeg_decode_instance_ctrl_t

sf_jpeg_decode_instance_ctrl_t

Detailed description

JPEG framework instance control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- uint32_t open

  Indicate whether the driver is open.

- uint32_t state

  Used by driver to check if pointer to control block is valid.

- TX_MUTEX mutex

  Mutex used to protect access to lower level driver hardware.

- TX_EVENT_FLAGS_GROUP events

  Event flags used by the HAL driver to notify the framework driver of.

- jpeg_decode_instance_t const * p_lower_lvl_jpeg_decode

  Pointer to lower level instance.

7.23 Messaging Framework

RTOS-integrated Messaging Framework implementation.

7.23.1 Functions

- SF_MESSAGE_Open
- SF_MESSAGE_Close
- SF_MESSAGE_BufferAcquire
- SF_MESSAGE_BufferRelease
- SF_MESSAGE_Post
- SF_MESSAGE_Pend
- SF_MESSAGE_VersionGet

7.23.2 Defines

- #define SF_MESSAGE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_MESSAGE_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_MESSAGE_QUEUE_MESSAGE_WORDS

  Initial value: `(1)`

  The size of a message queue in words

7.23.3 SF_MESSAGE_Open

```
ssp_err_t SF_MESSAGE_Open ( sf_message_ctrl_t  *const p_api_ctrl ,
 sf_message_cfg_t  const *const p_cfg )
```

7.23.3.1 Brief description

Initialize message framework. This function initiates the messaging framework control block, configures the work memory corresponding to the configuration parameters.

7.23.3.2 Detailed description

Table 851:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	p_ctrl, p_cfg or p_cfg->p_work_memory_start is NULL.
SSP_ERR_INTERNAL	OS service call fails.
SSP_ERR_IN_USE	The Messaging Framework is in use.
SSP_ERR_INVALID_WORKBUFFER_SIZE	Invalid work buffer size.
SSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
SSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.

NOTE: This API function is allowed to be called once per instance. The behavior if called twice is undefined.

NOTE: This API function only allows to be called from thread context.

7.23.3.3 Function steps

- Creates the memory pools in the work memory area
- Registers subscriber lists
- Changes the messaging framework status from CLOSED to OPENED

7.23.4 SF_MESSAGE_Close

```
ssp_err_t SF_MESSAGE_Close ( sf_message_ctrl_t  *const p_api_ctrl )
```

7.23.4.1 Brief description

Closes message framework.

7.23.4.2 Detailed description

Table 852:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.
SSP_ERR_INTERNAL	OS service call fails

NOTE: This API function only allows to be called from thread context.

7.23.4.3 Function steps

- Finds subscribers and flushes their queues
- Deletes memory pools allocated in the work memory

7.23.5 SF_MESSAGE_BufferAcquire

```
ssp_err_t SF_MESSAGE_BufferAcquire ( sf_message_ctrl_t  const
*const p_api_ctrl ,  sf_message_header_t  ** pp_buffer ,
 sf_message_acquire_cfg_t  const *const p_acquire_cfg ,   uint32_t
const wait_option )
```

7.23.5.1 Brief description

Acquire buffer for message passing from the block.

7.23.5.2 Detailed description

Table 853:Return values

Name	Description
SSP_SUCCESS	Buffer acquisition was successful.

Table 853:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	p_ctrl, p_acquire_cfg or pp_buffer is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool.
SSP_ERR_TIMEOUT	OS service call returns timeout.
SSP_ERR_INTERNAL	OS service call fails.

NOTE: This API function allows to be called from not only thread but also ISR.

7.23.5.3 Function steps

- Allocates buffer in the block memory pool.
- Clears buffer control block
- Sets the buffer in-use flag
- Sets the address of the allocated buffer to 'pp_buffer'
- Clears the event class and event code in the buffer. This is because the initial value in the buffer control block is unknown and it would not be safe.
- Sets the 'buffer_keep' flag in the buffer control block if SF_MESSAGE_ACQUIRE_OPTION_KEEP is set to the 'option' argument

7.23.6 SF_MESSAGE_BufferRelease

```
ssp_err_t SF_MESSAGE_BufferRelease ( sf_message_ctrl_t  *const p_api_ctrl ,
 sf_message_header_t  *const p_buffer ,  sf_message_release_option_t
const option )
```

7.23.6.1 Brief description

Release buffer obtained by SF_MESSAGE_BufferAcquire.

7.23.6.2 Detailed description

Table 854:Return values

Name	Description
SSP_SUCCESS	Buffer release was successful.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_ASSERTION	p_ctrl or p_buffer is NULL.
SSP_ERR_ILLEGAL_BUFFER_ADDRESS	If buffer address is not aligned or p_buffer is not in the block pool range.
SSP_ERR_BUFFER_RELEASED	Buffer has been released.

NOTE: This API function allows to be called from thread but also from ISR.

7.23.6.3 Function steps

- Calculates the address of the buffer control block
- Release buffer in the condition below. (1) The counting semaphore is zero and the buffer keep option is not specified. (2) 'option' is set to SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE.
- Clears the flags in the buffer control block.
- Set back the backed up interrupt mask level.
- Invokes an user callback function if it is registered in the condition below. (1) The counting semaphore is zero. (2) 'option' is set to SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE.
- Sets SF_MESSAGE_CALLBACK_EVENT_NAK if any subscribers for the message have responded NAK
- Sets SF_MESSAGE_CALLBACK_EVENT_ACK if all subscribers for the message have responded ACK
- Sets the pointer to the context to kept in the buffer control block
- Invokes the registered user callback function.

7.23.7 SF_MESSAGE_Post

```
ssp_err_t SF_MESSAGE_Post ( sf_message_ctrl_t  *const p_api_ctrl ,
 sf_message_header_t  const *const p_buffer ,  sf_message_post_cfg_t  const
*const p_post_cfg ,  sf_message_post_err_t  *const p_post_err ,   uint32_t
const wait_option )
```

7.23.7.1 Brief description

Post a message to the subscribers.

7.23.7.2 Detailed description

Table 855:Return values

Name	Description
SSP_SUCCESS	Message posting was successful.
SSP_ERR_ASSERTION	p_ctrl or p_buffer is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_NO_SUBSCRIBER_FOUND	No subscriber found.
SSP_ERR_BUFFER_RELEASED	Buffer has been released.
SSP_ERR_MESSAGE_QUEUE_FULL	Queue is full (Timeout occurs before sending a message if timeout option is specified)
SSP_ERR_ILLEGAL_BUFFER_ADDRESS	If buffer address is not aligned or p_buffer is not in the block pool range.
SSP_ERR_INTERNAL	OS service call fails

NOTE: This API function allows to be called from not only thread but also ISR(if wait_option is TX_NO_WAIT).

NOTE: Another buffer writing to the buffer before the message read by message consumers results data overwriting.

7.23.7.3 Function steps

- Checks the number of the subscribers of specified event class
- Calculates the address of the buffer control block
- Counts up the counting semaphore in the buffer control block
- Registers user callback function and context passed from user

7.23.8 SF_MESSAGE_Pend

```
ssp_err_t SF_MESSAGE_Pend ( sf_message_ctrl_t  const *const p_api_ctrl ,
  TX_QUEUE const *const p_queue ,  sf_message_header_t  ** pp_buffer ,  uint32_t
const wait_option )
```

7.23.8.1 Brief description

Pend on a message.

7.23.8.2 Detailed description

Table 856:Return values

Name	Description
SSP_SUCCESS	Message pending was successful.
SSP_ERR_ASSERTION	p_ctrl, pp_buffer or p_queue is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_MESSAGE_QUEUE_EMPTY	Queue is empty.
SSP_ERR_TIMEOUT	OS service call returns timeout.
SSP_ERR_INTERNAL	OS service call fails.

NOTE: This API function allows to be called from not only thread but also ISR(if wait_option is TX_NO_WAIT).

7.23.8.3 Function steps

- Receiving message here. Receiving data is not message itself but the pointer to the buffer
- If there is no data in the message queue and TX_NO_WAIT is specified to wait_option, return immediately with SSP_ERR_MESSAGE_QUEUE_EMPTY error code

7.23.9 SF_MESSAGE_VersionGet

```
ssp_err_t SF_MESSAGE_VersionGet ( ssp_version_t  *const p_version )
```

7.23.9.1 Brief description

Get the version of the messaging framework. Stores version information in provided pointer.

7.23.9.2 Detailed description

Table 857:Return values

Name	Description
SSP_SUCCESS	Got version number successfully.
SSP_ERR_ASSERTION	p_version is NULL.

7.23.10 Extensions

7.23.10.1 sf_message_instance_ctrl_t

sf_message_instance_ctrl_t

Detailed description

Messaging framework instance control block structure

Variables

- TX_BLOCK_POOL block_pool

  Pointer to the memory block pool control.
- sf_message_subscriber_list_t ** pp_subscriber_lists

  Pointer array to the subscriber lists.
- uint32_t buffer_size

  Bytes of the message buffer.
- uint32_t number_of_buffers

  The number of allocated buffers.
- uint16_t number_of_subscriber_groups

  The number of subscriber groups.
- sf_message_state_t state

  Status of the message framework.

7.24 Power Profiles Framework

Power Profiles Framework.

7.24.1 Functions

- SF_POWER_PROFILES_Open
- SF_POWER_PROFILES_Sleep
- SF_POWER_PROFILES_Close
- SF_POWER_PROFILES_VersionGet

7.24.2 Defines

- #define SF_POWER_PROFILES_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_POWER_PROFILES_CODE_VERSION_MINOR

  Initial value: `(4U)`

7.24.3 SF_POWER_PROFILES_Open

```
ssp_err_t SF_POWER_PROFILES_Open ( sf_power_profiles_ctrl_t  *const p_ctrl ,
 sf_power_profiles_cfg_t  const *const p_cfg )
```

7.24.3.1 Brief description

Configures the Power Profiles framework and opens any required HAL layer drivers that will be used.

7.24.3.2 Detailed description

The SF_POWER_PROFILES_Open function acquires a mutex for the Power Profile module, it then calls the open/init functions for the necessary lower level drivers (RTC, LPM) and finally calls the driver .open function for the Power Profiles module. The mutex is released following the driver layer open functions.

Table 858:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.

Table 858:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_IN_USE	The mutex may be unavailable for the unit requested. See HAL driver for other possible causes.
SSP_ERR_INVALID_HW_CONDITION	Incompatible system clock configuration.
SSP_ERR_INTERNAL	Creation of mutex failed

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.24.3.3 Function steps

- Save driver structure pointer for use in other framework layer functions
- Keep the control pointer that is associated with the already open RTC module
- Keep the pointer to the callback function
- Keep the pointer to the sleep and awake ioport tables
- Make a local copy of the LPM configuration structure to modify it
- Initialize the LPM HAL driver
- Mark driver as open by initializing it to "PPMG" in its ASCII equivalent

7.24.4 SF_POWER_PROFILES_Sleep

```
ssp_err_t SF_POWER_PROFILES_Sleep ( sf_power_profiles_ctrl_t  *const p_ctrl )
```

7.24.4.1 Brief description

Places the MCU in Software Standby mode.

7.24.4.2 Detailed description

Table 859:Return values

Name	Description
SSP_SUCCESS	Entered Sleep and then Awoke, or called with mode == SF_POWER_PROFILES_MODE_RUN.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_POWER_PROFILES_Open to configure.
SSP_ERR_UNSUPPORTED	This function is not supported by the HAL driver (p_ctrl->p_api->start is NULL).

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.24.4.3 Function steps

- PREPARE FOR SLEEP MODE
- Set the ioport pins per the supplied sleep configuration
- Check to see if LOCO and/or Subclk are currently running
- Get the current WUPEN bits for restore later
- Get some info about the RTC
- Set the WUPEN bits such the RTC Periodic and Alarm are capable of interrupting and waking them MCU
- Stop the LOCO
- Stop the Sub-Clock
- Set the WUPEN bits such the RTC Periodic and Alarm are capable of interrupting and waking them MCU
- These clocks are allowed to be on during Software Standby mode. If the user is not using RTC mode then we will turn these off.
- Stop the LOCO
- Stop the Sub-Clock
- S7G2

- Some peripherals can be set to run even in Software Standby mode. To insure lowest power usage we will turn those off before going to sleep, if they are on and restore them on Wakeup These include: SCI0 (MSTPCRB b31) IIC0 (MSTPCRB b09)
- MSTPCRB 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 1 1
- Above are our desired bit settings for MSTPCRB, our MSTBCRB mask is therefore 0x7FFFFDFF
- D/A Convertor 0 (MSTPCRD b20), AGT1 (MSTPCRD b1) AGT0 (MSTPCRD b3) Comparator-OC5 (MSTPCRD b23) Comparator-OC4 (MSTPCRD b24) Comparator-OC3 (MSTPCRD b25) Comparator-OC2 (MSTPCRD b26) Comparator-OC1 (MSTPCRD b27) Comparator-OC0 (MSTPCRD b28)
- MSTPCRD 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 1 1 1 0 0 0 0 0 1 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 1 1
- Above are our desired bit settings for MSTPCRD, our MSTBCRD mask is therefore 0xE06FFFF3
- S3A7
- Some peripherals can be set to run even in Software Standby mode. To insure lowest power usage we will turn those off before going to sleep, if they are on and restore them on Wakeup These include: SCI0 (MSTPCRB b31) IIC0 (MSTPCRB b09)
- MSTPCRB 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 1 1
- Above are our desired bit settings for MSTPCRB, our MSTBCRB mask is therefore 0x7FFFFDFF
- D/A Convertor 0 (MSTPCRD b20), AGT1 (MSTPCRD b2) AGT0 (MSTPCRD b3) Comparator-OC0 (MSTPCRD b28) Low Power Comparator (MSTPCRD b29)
- MSTPCRD 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 1 1 0 0 1 1 1 1 1 1 1 0 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 0 0 1 1
- Above are our desired bit settings for MSTPCRD, our MSTBCRD mask is therefore 0xCFEFFFF3
- < Disable the LCD
- issue the Pre-Sleep Callback
- Populate the callback argument fields
- Call the user callback
- Setup to enter the low power mode
- ENTER STANDBY MODE
- AWAKE
- Restore any clocks we stopped
- Restore the original mstp mode
- < Reenable the LCD
- Set the ioport pins per the supplied wake configuration
- issue the Post-Sleep Callback
- Populate the callback argument fields
- Call the user callback

- Restore the WUPEN contents to what they were before we entered Software Standby mode

7.24.5 SF_POWER_PROFILES_Close

```
ssp_err_t SF_POWER_PROFILES_Close ( sf_power_profiles_ctrl_t  *const p_ctrl )
```

7.24.5.1 Brief description

The close function acquires the unit's mutex, calls the driver close function, and releases the mutex.

7.24.5.2 Detailed description

Table 860:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_POWER_PROFILES_Open to configure.
SSP_ERR_UNSUPPORTED	This function is not supported by the HAL driver (p_ctrl->p_api->close is NULL).
SSP_ERR_INTERNAL	Deletion of mutex failed.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: - For ThreadX specific API details, refer ThreadX user manual.

7.24.5.3 Function steps

- Clear information from control block so other functions know this block is closed

7.24.6 SF_POWER_PROFILES_VersionGet

```
ssp_err_t SF_POWER_PROFILES_VersionGet ( ssp_version_t  *const p_version )
```

7.24.6.1 Brief description

Gets version and stores it in provided pointer p_version.

7.24.6.2 Detailed description

Table 861:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.25 Power Profiles V2 Framework

Power Profiles Framework.

7.25.1 Functions

- SF_POWER_PROFILES_V2_Open
- SF_POWER_PROFILES_V2_RunApply
- SF_POWER_PROFILES_V2_LowPowerApply
- SF_POWER_PROFILES_V2_Close
- SF_POWER_PROFILES_V2_VersionGet
- clock_config_apply
- low_power_config_apply
- ioport_cfg_apply
- pre_low_power_callback_handle
- post_low_power_callback_handle

7.25.2 Defines

- #define SF_POWER_PROFILES_V2_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file

- #define SF_POWER_PROFILES_V2_CODE_VERSION_MINOR

  Initial value: (0U)

7.25.3 SF_POWER_PROFILES_V2_Open

```
ssp_err_t SF_POWER_PROFILES_V2_Open ( sf_power_profiles_v2_ctrl_t
*const p_ctrl ,  sf_power_profiles_v2_cfg_t  const *const p_cfg )
```

7.25.3.1 Brief description

Configures the Power Profiles framework and opens any required HAL layer drivers that will be used.

7.25.3.2 Detailed description

The SF_POWER_PROFILES_V2_Open function initializes the critical data structures and variables.

Table 862:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_IN_USE	Power profiles framework is already open.
SSP_ERR_INTERNAL	Unable to obtain mutex. Unable to release mutex.
See	Common Error Codes for other possible return codes or causes.

7.25.4 SF_POWER_PROFILES_V2_RunApply

```
ssp_err_t SF_POWER_PROFILES_V2_RunApply ( sf_power_profiles_v2_ctrl_t
*const p_ctrl ,  sf_power_profiles_v2_run_cfg_t  const *const p_cfg )
```

7.25.4.1 Brief description

Applies a Run profile.

7.25.4.2 Detailed description

The SF_POWER_PROFILES_V2_RunApply function will:

- Apply an IO port configuration, if supplied

- Apply a clock configuration

Table 863:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_INVALID_ARGUMENT	Clock configuration is invalid.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.
SSP_ERR_INVALID_HW_CONDITION	Incompatible system clock configuration.
See	Common Error Codes, r_ioport, or r_cgc driver for other possible return codes or causes.

7.25.5 SF_POWER_PROFILES_V2_LowPowerApply

```
ssp_err_t SF_POWER_PROFILES_V2_LowPowerApply ( sf_power_profiles_v2_ctrl_t
*const p_ctrl ,  sf_power_profiles_v2_low_power_cfg_t  const *const p_cfg )
```

7.25.5.1 Brief description

Applies a Low Power profile.

7.25.5.2 Detailed description

The SF_POWER_PROFILES_V2_LowPowerApply function will:

- Apply a LPMv2 configuration to prepare for low power
- Apply an IO port configuration to prepare for low power, if supplied
- Notify application that low power is about to be entered
- Enter low power mode
- When low power mode is exited, apply an IO port configuration for wake up, if supplied
- Notify application that wake up has occurred

Table 864:Return values

Name	Description
SSP_SUCCESS	Entered and exited low power mode successfully.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.
SSP_ERR_UNSUPPORTED	This function is not supported by one of the HAL drivers, r_lpmv2, r_ioport.
SSP_ERR_INVALID_MODE	r_lpmv2 mode is not LPMV2_LOW_POWER_MODE_SLEEP but r_lmv2 p_extend is NULL.
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.
See	Common Error Codes, r_ioport, or r_lpmv2 drivers for other possible return codes or causes.

7.25.6 SF_POWER_PROFILES_V2_Close

```
ssp_err_t SF_POWER_PROFILES_V2_Close ( sf_power_profiles_v2_ctrl_t
*const p_ctrl )
```

7.25.6.1 Brief description

Closes the framework.

7.25.6.2 Detailed description

Table 865:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.

Table 865:Return values (Continued)

Name	Description
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.

7.25.7 SF_POWER_PROFILES_V2_VersionGet

```
ssp_err_t SF_POWER_PROFILES_V2_VersionGet ( ssp_version_t  *const p_version )
```

7.25.7.1 Brief description

Gets version and stores it in provided pointer p_version.

7.25.7.2 Detailed description

Table 866:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.25.8 clock_config_apply

```
ssp_err_t clock_config_apply ( cgc_clocks_cfg_t  const *const p_clock_cfg )
```

7.25.8.1 Brief description

Internal function that checks and applies the clock configuration.

7.25.8.2 Detailed description

Table 867:Return values

Name	Description
SSP_SUCCESS	Clock configuration applied successfully.

Table 867:Return values (Continued)

Name	Description
See	Common Error Codes or r_cgc driver for other possible return codes or causes.

7.25.9 low_power_config_apply

```
ssp_err_t low_power_config_apply ( sf_power_profiles_v2_ctrl_t  *const p_ctrl ,
 sf_power_profiles_v2_low_power_cfg_t  const *const p_cfg )
```

7.25.9.1 Brief description

Apply the low power configuration using the lpm driver. Internal function, do not use directly. Returns mutex if an error occurs.

7.25.9.2 Detailed description

Table 868:Parameters

Name	Direction	Description
p_ctrl	in	PPM V2 control structure
p_cfg	in	PPM V2 config structure

Table 869:Return values

Name	Description
SSP_SUCCESS	LPM configuration was successful.
See	Common Error Codes or r_lpmv2 driver for other possible return codes or causes.

7.25.10 ioport_cfg_apply

```
ssp_err_t ioport_cfg_apply ( sf_power_profiles_v2_ctrl_t  *const p_ctrl ,
 ioport_cfg_t  const * p_ioport_pin_tbl )
```

7.25.10.1 Brief description

Apply the IO Port configuration using the ioport driver. Internal function, do not use directly. Returns mutex if an error occurs.

7.25.10.2 Detailed description

Table 870:Parameters

Name	Direction	Description
p_ctrl	in	PPM V2 control structure
p_ioport_pin_tbl	in	Pointer to ioport settings

Table 871:Return values

Name	Description
SSP_SUCCESS	IO Port configuration was successful.
See	Common Error Codes or r_ioport driver for other possible return codes or causes.

7.25.11 pre_low_power_callback_handle

```
 pre_low_power_callback_handle ( sf_power_profiles_v2_low_power_cfg_t  const
*const p_cfg )
```

7.25.11.1 Brief description

Notify application using pre-low power callback. Internal function, do not use directly.

7.25.11.2 Detailed description

Table 872:Parameters

Name	Direction	Description
p_cfg	in	PPM V2 config structure

Table 873:Return values

Name	Description
none	

7.25.12 post_low_power_callback_handle

```
 post_low_power_callback_handle ( sf_power_profiles_v2_low_power_cfg_t  const
*const p_cfg )
```

7.25.12.1 Brief description

Notify application using post-low power callback. Internal function, do not use directly.

7.25.12.2 Detailed description

Table 874:Parameters

Name	Direction	Description
p_cfg	in	PPM V2 config structure

Table 875:Return values

Name	Description
none	

7.26 SPI Framework

RTOS-integrated SPI Framework.

7.26.1 Functions

- sf_spi_callback
- sf_spi_common_start
- sf_spi_common_wait

- sf_spi_common_finish
- sf_spi_bus_device_check
- sf_spi_chipselect_assert
- sf_spi_chipselect_deassert
- sf_spi_check_lower_lvl_driver_parameters
- sf_spi_reconfigure_device
- sf_spi_check_common_parameters
- SF_SPI_Open
- SF_SPI_Read
- SF_SPI_Write
- SF_SPI_WriteRead
- SF_SPI_Close
- SF_SPI_Lock
- SF_SPI_Unlock
- SF_SPI_VersionGet

7.26.2 Variables

- g_sf_spi_version
- g_sf_spi_on_sf_spi

7.26.3 Defines

- #define SF_SPI_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_SPI_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_SPI_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((expression), (error), &g_module_name[0], &g_sf_spi_version)`

7.26.4 sf_spi_callback

```
sf_spi_callback ( spi_callback_args_t * parg )
```

7.26.4.1 Brief description

SPI SSP framework level callback.

7.26.4.2 Detailed description

Table 876:Parameters

Name	Direction	Description
pcb_arg	in	Pointer to callback parameters

Table 877:Return values

Name	Description
void	

7.26.4.3 Function steps

- Event occurs wake up the suspended thread.
- < Points location for event flag for reception
- Set flag to trigger waiting thread.

7.26.5 sf_spi_common_start

```
ssp_err_t sf_spi_common_start ( sf_spi_instance_ctrl_t  *const p_ctrl ,
  uint32_t const timeout )
```

7.26.5.1 Brief description

Common SPI transfer start function. Used in all framework read write calls. This function checks whether there is any need for reconfiguration and if yes then it checks whether device is supported by the bus. If bus supports the device it acquires the mutex, reconfigures the bus and then enables the slave.

7.26.5.2 Detailed description

Table 878:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for SPI framework driver context for a device
timeout	in	ThreadX timeout

Table 879:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully closed
SSP_ERR_INTERNAL	Internal error

See Common Error Codes and lower level driver function for other possible return codes. These driver functions are:

- close
- open

NOTE: This function is reentrant for any device.

7.26.5.3 Function steps

- See if SPI bus needs to be reconfigured.
- Different device is using bus than last time. Check that bus supports device.
- Get mutex for this bus.
- Need to reconfigure.
- Enable slave.

7.26.6 sf_spi_common_wait

```
ssp_err_t sf_spi_common_wait ( sf_spi_instance_ctrl_t  *const p_ctrl ,
  uint32_t const timeout )
```

7.26.6.1 Brief description

Common SPI wait. Waits for an operation to finish.

7.26.6.2 Detailed description

Table 880:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for SPI framework driver context for a device
timeout	in	ThreadX timeout.

Table 881:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully closed.
SSP_ERR_INTERNAL	Internal error occurs.
SSP_ERR_TRANSFER_ABORTED	The data transfer was aborted.
SSP_ERR_UNDERFLOW	Read underflow occurs.
SSP_ERR_MODE_FAULT	Mode fault error occurs.
SSP_ERR_READ_OVERFLOW	Read overflow occurs.
SSP_ERR_PARITY	Parity error occurs.
SSP_ERR_OVERRUN	Overrun error occurs.

NOTE: This function is reentrant for any device.

7.26.7 sf_spi_common_finish

```
ssp_err_t sf_spi_common_finish ( sf_spi_instance_ctrl_t  *const p_ctrl )
```

7.26.7.1 Brief description

Common SPI finish. Release mutex and deassert chip select.

7.26.7.2 Detailed description

Table 882:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for SPI framework driver context for a device

Table 883:Return values

Name	Description
SSP_SUCCESS	Chip select deactivated and mutex released.
SSP_ERR_INTERNAL	Internal error.

NOTE: This function is reentrant for any device.

7.26.8 sf_spi_bus_device_check

```
ssp_err_t sf_spi_bus_device_check ( sf_spi_instance_ctrl_t  *const p_ctrl )
```

7.26.8.1 Brief description

SPI device check, checks device compatibility on the bus.

7.26.8.2 Detailed description

Table 884:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for SPI framework driver context for a device

Table 885:Return values

Name	Description
SSP_SUCCESS	Selected device supported by the SPI bus
SSP_ERR_UNSUPPORTED	Selected device not supported by the SPI bus

NOTE: This function is reentrant for any device.

7.26.9 sf_spi_chipselect_assert

```
sf_spi_chipselect_assert ( ioport_port_pin_t  chip_select ,
ioport_level_t  active_level )
```

7.26.9.1 Brief description

SPI SSP framework level chip select utility function.

7.26.9.2 Detailed description

Table 886:Parameters

Name	Direction	Description
chip_select	in	Chip select pin
active_level	in	Active high or active low

Table 887:Return values

Name	Description
void	

7.26.10 sf_spi_chipselect_deassert

```
sf_spi_chipselect_deassert ( ioport_port_pin_t  chip_select ,
ioport_level_t  active_level )
```

7.26.10.1 Brief description

SPI SSP framework level chip select utility function.

7.26.10.2 Detailed description

Table 888:Parameters

Name	Direction	Description
chip_select	in	Chip select pin
active_level	in	Active high or active low

Table 889:Return values

Name	Description
void	

7.26.11 sf_spi_check_lower_lvl_driver_parameters

```
sf_spi_check_lower_lvl_driver_parameters ( sf_spi_cfg_t  const *const p_cfg )
```

7.26.11.1 Brief description

Checks whether lower level SPI module and bus are defined.

7.26.11.2 Detailed description

Table 890:Parameters

Name	Direction	Description
p_cfg	in	Pointer to SPI framework Configuration Structure

Table 891:Return values

Name	Description
true	Lower level SPI driver, and SPI bus are configured
false	Lower level SPI driver, and SPI bus are not configured

7.26.12 sf_spi_reconfigure_device

```
ssp_err_t sf_spi_reconfigure_device ( sf_spi_instance_ctrl_t  *const p_ctrl )
```

7.26.12.1 Brief description

Assign a new device address to current device.

7.26.12.2 Detailed description

Table 892:Parameters

Name	Direction	Description
p_ctrl	in	Control handle for SPI framework context for a device

Table 893:Return values

Name	Description
SSP_SUCCESS	New device address assigned to current device

See Common Error Codes and lower level drivers for other possible return codes. These driver functions are:

- close
- open

7.26.12.3 Function steps

- < Get the current device.
- Close the device currently using the bus.
- Assign bus for the new device to use.

- Assign this device to current.

7.26.13 sf_spi_check_common_parameters

```
 sf_spi_check_common_parameters ( sf_spi_ctrl_t  *const p_ctrl ,   uint32_t
const length ,   uint32_t const timeout )
```

7.26.13.1 Brief description

Checks if SPI framework control block address, length and timeout are NULL.

7.26.13.2 Detailed description

Table 894:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to SPI framework control block
length	in	Number of bytes of data to be transferred
timeout	in	Timeout in ThreadX tick counts

Table 895:Return values

Name	Description
true	SPI framework control block address, length and timeout are not NULL.
false	SPI framework control block address, length and timeout are NULL.

7.26.14 SF_SPI_Open

```
ssp_err_t SF_SPI_Open ( sf_spi_ctrl_t  *const p_api_ctrl ,  sf_spi_cfg_t  const
*const p_cfg )
```

7.26.14.1 Brief description

Initialize a SPI bus and open low level SPI driver.

7.26.14.2 Detailed description

Table 896:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_cfg, Pointer to Open, Close, Read, Write, or Writeread API interfaces, p_cfg->p_bus or p_cfg->p_lower_lvl_cfg.
SSP_ERR_INTERNAL	Internal error occurred.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is

- open

NOTE: This function is reentrant for any channel.

NOTE: Control block must be cleared by caller before calling this function.

7.26.14.3 Function steps

- Copy bus to control
- Copy chip_select to control
- Copy chip_select level to control
- Initialize bus lock to false
- Set framework level callback function.
- Save context for use in ISRs.
- Use bus channel in device open.
- Open only for the first device on the bus. If the device requires a bus reconfiguration then that will happen when a later read/write occurs.
- Create mutex for this bus.
- Create Event flag.
- Open the low level SPI module.
- Assign last used device ctrl on this bus.

- Save device configuration for reconfiguration.
- Set device state as Opened.
- Increment device count.
- Initialize chip select.

7.26.15 SF_SPI_Read

```
ssp_err_t SF_SPI_Read ( sf_spi_ctrl_t  *const p_api_ctrl ,  void *const p_dest ,
  uint32_t const length ,  spi_bit_width_t  const bit_width ,  uint32_t
const timeout )
```

7.26.15.1 Brief description

Starts the transfer process and receives data from SPI device.

7.26.15.2 Detailed description

Table 897:Return values

Name	Description
SSP_SUCCESS	Data read completed successfully.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_dest, length, timeout.
SSP_ERR_NOT_OPEN	Device not opened.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- read

7.26.15.3 Function steps

- Check whether device is open.
- Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.
- Perform write read.
- Finish transfer.

7.26.16 SF_SPI_Write

```
ssp_err_t SF_SPI_Write ( sf_spi_ctrl_t  *const p_api_ctrl ,  void *const p_src ,
  uint32_t const length ,  spi_bit_width_t  const bit_width ,  uint32_t
const timeout )
```

7.26.16.1 Brief description

Starts the transfer process and writes data to SPI device.

7.26.16.2 Detailed description

Table 898:Return values

Name	Description
SSP_SUCCESS	Data write completed successfully.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_api_ctrl, p_src, length, timeout.
SSP_ERR_NOT_OPEN	Device not opened.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- write

7.26.16.3 Function steps

- Check that device is open.
- Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.
- Perform write read.
- Finish transfer.

7.26.17 SF_SPI_WriteRead

```
ssp_err_t SF_SPI_WriteRead ( sf_spi_ctrl_t  *const p_api_ctrl ,  void
*const p_src ,  void *const p_dest ,  uint32_t const length ,  spi_bit_width_t
const bit_width ,  uint32_t const timeout )
```

7.26.17.1 Brief description

Simultaneously transmit data to SPI device while receiving data from SPI device(full duplex).

7.26.17.2 Detailed description

Table 899:Return values

Name	Description
SSP_SUCCESS	Data write completed successfully.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_api_ctrl, p_src, p_dest, length, timeout.
SSP_ERR_NOT_OPEN	Device not opened.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- writeRead

7.26.17.3 Function steps

- Check whether device is open.
- Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.
- Perform write read.
- Finish transfer.

7.26.18 SF_SPI_Close

```
ssp_err_t SF_SPI_Close ( sf_spi_ctrl_t  *const p_api_ctrl )
```

7.26.18.1 Brief description

Disable the SPI device designated by the control handle and close the RTOS services used by the bus if no devices are connected to the bus.

7.26.18.2 Detailed description

Table 900:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.

Table 900:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_INTERNAL	Internal error occurred.

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- close

NOTE: This function is reentrant for any device.

7.26.18.3 Function steps

- Check whether device is open.
- Check whether the device must be closed through close. Close only if this is the current device. Otherwise the device might have been closed during reconfiguration or might not have been opened through open().
- Get mutex since this will access hardware registers.
- Close low level driver.
- Release mutex.
- Decrement device count.
- < Check is there any device still using the bus.
- Delete RTOS services used by bus.
- Set device to closed state

7.26.19 SF_SPI_Lock

```
ssp_err_t SF_SPI_Lock ( sf_spi_ctrl_t  *const p_api_ctrl )
```

7.26.19.1 Brief description

Lock the bus for a device.

7.26.19.2 Detailed description

Table 901:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.

NOTE: This function is reentrant for any device.

7.26.19.3 Function steps

- Check whether device is open.
- Check whether device is already locked.
- Get the mutex for this device.
- Set lock flag.
- Enable slave.

7.26.20 SF_SPI_Unlock

```
ssp_err_t SF_SPI_Unlock ( sf_spi_ctrl_t  *const p_api_ctrl )
```

7.26.20.1 Brief description

Unlock the bus for a particular device and make the bus usable for other devices.

7.26.20.2 Detailed description

Table 902:Return values

Name	Description
SSP_SUCCESS	SPI channel is successfully closed.

Table 902:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.

NOTE: This function is reentrant for any device.

7.26.20.3 Function steps

- Check whether device is open.
- Clear lock flag.
- Release the mutex so that others can use the bus.
- Disable slave.

7.26.21 SF_SPI_VersionGet

```
ssp_err_t SF_SPI_VersionGet ( ssp_version_t  *const p_version )
```

7.26.21.1 Brief description

Get the version information of the framework.

7.26.21.2 Detailed description

Table 903:Return values

Name	Description
SSP_ERR_ASSERTION	p_version is NULL.
SSP_SUCCESS	Successful return.

7.26.21.3 Function steps

- Checks error. Further parameter checking can be done at the driver layer.

7.26.22 g_sf_spi_version

ssp_version_t::g_sf_spi_version

7.26.22.1 Detailed description

Version data structure used by error logger macro.

7.26.23 g_sf_spi_on_sf_spi

sf_spi_api_t::g_sf_spi_on_sf_spi

7.26.23.1 Initialized as

```
g_sf_spi_on_sf_spi=
{
    .open      = SF_SPI_Open,
    .read      = SF_SPI_Read,
    .write     = SF_SPI_Write,
    .writeRead = SF_SPI_WriteRead,
    .close     = SF_SPI_Close,
    .lock      = SF_SPI_Lock,
    .unlock    = SF_SPI_Unlock,
    .version   = SF_SPI_VersionGet
}
```

7.26.24 Extensions

7.26.24.1 sf_spi_instance_ctrl_t

sf_spi_instance_ctrl_t

Detailed description

SPI device context. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- sf_spi_bus_t * p_bus

  Bus using this device (copy from cfg)
- ioport_port_pin_t chip_select

  Chip select for this device (copy from cfg)
- ioport_level_t chip_select_level_active

  Polarity of CS, active High or Low (copy from cfg)

- spi_cfg_t lower_lvl_cfg

  SPI peripheral configuration, use for bus reconfiguration.
- spi_ctrl_t * p_lower_lvl_ctrl

  SPI peripheral control block.
- sf_spi_dev_state_t dev_state

  Device status.
- bool locked

  Lock and unlock bus for a device.

7.27 Thread Monitor Framework

Framework module providing monitoring of threads.

Any misbehaving threads result in the device being reset. Both the WDT and IWDT HAL modules are supported by this framework module.

7.27.1 Interface Used

WDT Interface

7.27.2 Functions

- SF_THREAD_MONITOR_Thread
- SF_THREAD_MONITOR_Open
- SF_THREAD_MONITOR_Close
- SF_THREAD_MONITOR_ThreadRegister
- SF_THREAD_MONITOR_ThreadUnregister
- SF_THREAD_MONITOR_CountIncrement
- SF_THREAD_MONITOR_VersionGet

7.27.3 Defines

- #define SF_THREAD_MONITOR_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_THREAD_MONITOR_CODE_VERSION_MINOR

  Initial value: `(5U)`

7.27.4 SF_THREAD_MONITOR_Thread

```
SF_THREAD_MONITOR_Thread (  ULONG thread_input )
```

7.27.4.1 Brief description

The SF_THREAD_MONITOR_thread() is the main thread monitor thread which runs periodically.

7.27.4.2 Detailed description

The period is determined from the timeout period of the Watchdog hardware. This thread's period should be half of that of the watchdog hardware so the watchdog is refreshed at 50% of the count value.

Table 904:Parameters

Name	Direction	Description
thread_input	in	This is the address of the control block for the thread monitor module. This allows this thread to be created multiple times with the data used and hardware interfaced with governed by the control structure.

As this is a ThreadX thread this function does not return.

NOTE: This function is not reentrant.

NOTE: If there are no threads registered to be monitored the monitoring thread will refresh/tickle/kick the watchdog and so prevent the watchdog from reseting the device.

7.27.5 SF_THREAD_MONITOR_Open

```
ssp_err_t SF_THREAD_MONITOR_Open ( sf_thread_monitor_ctrl_t  *const p_api_ctrl ,
 sf_thread_monitor_cfg_t  const *const p_cfg )
```

7.27.5.1 Brief description

Calls the driver .open function in the p_lower_lvl_wdt parameter.

7.27.5.2 Detailed description

After successively opening and configuring the HAL driver, the SF_THREAD_MONITOR_Open function starts the thread monitoring thread. This thread is responsible for checking thread execution through thread count variables and for refreshing the implemented watchdog timer peripheral.

Table 905:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and watchdog monitoring thread has started.
SSP_ERR_ASSERTION	p_ctrl, p_cfg, p_cfg->p_lower_lvl_wdt pointers and/or p_cfg->p_lower_lvl_wdt are NULL.
SSP_ERR_IN_USE	Thread monitor has already been opened.
SSP_ERR_INVALID_MODE	Low level watchdog peripheral returned an error when opened.
SSP_ERR_UNSUPPORTED	Data structure could not be allocated.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options is invalid for the low level driver.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: This function is not reentrant.

NOTE: If there are no threads registered to be monitored the monitoring thread refreshes the watchdog and prevents the watchdog from reseting the device.

NOTE: The Thread Monitor can be closed with SF_THREAD_MONITOR_Close and then SF_THREAD_MONITOR_Open can be called again. However, if the underlying watchdog timer hardware such as WDT or IWDT cannot be closed or stopped then there are likely to be undesirable results.

7.27.6 SF_THREAD_MONITOR_Close

```
ssp_err_t SF_THREAD_MONITOR_Close ( sf_thread_monitor_ctrl_t
*const p_api_ctrl )
```

7.27.6.1 Brief description

Stop the thread monitoring thread. All threads are unregistered and no longer monitored.

7.27.6.2 Detailed description

Table 906:Return values

Name	Description
SSP_SUCCESS	Close was successful and watchdog monitoring thread has stopped.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: This function is not reentrant.

NOTE: This function DOES NOT stop the watchdog timer (e.g. WDT or IWDT). It does however stop the thread which refreshes the these timers. To prevent the hardware watchdog from reseting the device the watchdog must be refreshed elsewhere.

NOTE: The Thread Monitor can be closed with SF_THREAD_MONITOR_Close. However, if the underlying watchdog timer hardware such as WDT or IWDT cannot be closed or stopped then there are likely to be undesirable results.

7.27.7 SF_THREAD_MONITOR_ThreadRegister

```
ssp_err_t SF_THREAD_MONITOR_ThreadRegister ( sf_thread_monitor_ctrl_t
*const p_api_ctrl ,  sf_thread_monitor_counter_min_max_t  const
* p_counter_min_max )
```

7.27.7.1 Brief description

Register a thread to be monitored by the watchdog monitoring thread.

7.27.7.2 Detailed description

This thread must supply the minimum and maximum expected values for the thread. The mininimum and maximum values can be determined by using monitoring mode.

Table 907:Return values

Name	Description
SSP_SUCCESS	Thread successfully registered.
SSP_ERR_ASSERTION	p_ctrl or p_counter_min_max pointers are NULL.
SSP_ERR_INSUFFICIENT_SPACE	Not enough entries in the threads to be monitored array to add this thread. Increase the value of THREAD_MONITOR_CFG_MAX_NUMBER_OF_THREADS in sf_thread_moinitor_cfg.h
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: This function is reentrant.

7.27.8 SF_THREAD_MONITOR_ThreadUnregister

```
ssp_err_t SF_THREAD_MONITOR_ThreadUnregister ( sf_thread_monitor_ctrl_t
*const p_api_ctrl )
```

7.27.8.1 Brief description

Remove a thread from being monitored by the Watchdog monitoring thread.

7.27.8.2 Detailed description

Table 908:Return values

Name	Description
SSP_SUCCESS	Thread successfully unregistered.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: This function is reentrant.

7.27.9 SF_THREAD_MONITOR_CountIncrement

```
ssp_err_t SF_THREAD_MONITOR_CountIncrement ( sf_thread_monitor_ctrl_t
*const p_api_ctrl )
```

7.27.9.1 Brief description

Safely increment the counter of a thread. A mutex is used to ensure this increment occurs without corruption.

7.27.9.2 Detailed description

Table 909:Return values

Name	Description
SSP_SUCCESS	Thread counter successfully incremented.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_INSUFFICIENT_SPACE	Not enough entries in the threads to be monitored array to add this thread.

Table 909:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or HAL driver for other possible return codes or causes.

NOTE: This function is reentrant.

7.27.10 SF_THREAD_MONITOR_VersionGet

```
ssp_err_t SF_THREAD_MONITOR_VersionGet ( ssp_version_t  *const p_version )
```

7.27.10.1 Brief description

Get version and store it in provided pointer p_version. Implements versionGet.

7.27.10.2 Detailed description

Table 910:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.27.11 Extensions

7.27.11.1 sf_thread_monitor_instance_ctrl_t

sf_thread_monitor_instance_ctrl_t

Detailed description

Thread monitor control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- uint32_t open

  Used by driver to check if the control structure is valid
- wdt_instance_t const * p_lower_lvl_wdt

  Pointer to interface structure for the watchdog peripheral
- uint32_t timeout_period_msec

  Time in milliseconds of the watchdog timeout period. Used to calculate the period of the monitoring thread.
- uint32_t timeout_period_watchdog_clocks

  Maximum count value of the watchdog. Used to synchronise to the count.
- bool profiling_mode_enabled

  Used by the driver to check if profiling mode is enabled.
- TX_MUTEX mutex

  Mutex to protect access to the thread counters.
- uint32_t profiling_mode_check

  Value used to verify profiling mode is enabled when prfiling_mode_enabled == true.
- sf_thread_monitor_thread_counter_t thread_counters[THREAD_MONITOR_CFG_MAX_NUMBER_OF_THREADS]

  Data storage for the thread counter information.
- TX_THREAD thread

  Thread monitor thread.
- void const * p_extend

  Extended configuration data.
- uint8_t stack[THREAD_MONITOR_THREAD_STACK_SIZE]

  Stack for thread monitor thread.

7.28 CTSU Framework

RTOS-integrated CTSU Framework.

7.28.1 Functions

- SF_TOUCH_CTSU_Open
- SF_TOUCH_CTSU_Read
- SF_TOUCH_CTSU_Close
- SF_TOUCH_CTSU_VersionGet

7.28.2 Defines

- #define SF_TOUCH_CTSU_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_TOUCH_CTSU_CODE_VERSION_MINOR

  Initial value: `(3U)`

7.28.3 SF_TOUCH_CTSU_Open

```
ssp_err_t SF_TOUCH_CTSU_Open ( sf_touch_ctsu_ctrl_t  *const p_api_ctrl ,
 sf_touch_ctsu_cfg_t  const *const p_cfg )
```

7.28.3.1 Brief description

Configures Touch CTSU framework.

7.28.3.2 Detailed description

The SF_TOUCH_CTSU_Open function checks to see if it was already initialized and if not, then initializes the CTSU HAL layer, saves the callback for the calling layer, and creates the internal thread. If the framework was already initialized by the same widget layer, then it will return an error. If the calling widget is a first time caller, then the callback and context are stored internally.

Table 911:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_IN_USE	The framework has already been initialized by this particular widget.
SSP_ERR_INTERNAL	The hardware initialization or thread/semaphore failed.
SSP_ERR_INVALID_ARGUMENT	An input parameter was outside the supported bounds.

NOTE: Refer to the lower level driver for additional return value descriptions.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.28.3.3 Function steps

- Initialize the elements to NULL if this is the first time the framework is being opened
- If the framework has already been opened by at least one widget layer; this is verified by checking to see if the callback from the widget layer is the same as any of the already stored ones
- Check if the table already contains the callback and the passed callback is not NULL. If true, then the same widget layer is calling the initialization function again in error. If the passed callback is NULL, this means that the widget layer does not want a callback.
- Save the widget callback and context into the framework callback array
- Verify there was room to store the callback and/or context
- If the framework has not been opened by at least one widget layer then initialize the lower layer and create the internal thread
- Create semaphore to control access to the lower level driver
- Delete the semaphore_ctsu_scan_complete semaphore
- Return error
- Assign the instance for the lower level into the control structure
- Create a local version of the CTSU HAL driver so that we can modify the HAL callback to use the callback defined in this file.
- Change the callback function to private function in this file.
- Open the CTSU for operation
- Save configuration and lower level API info
- Close the lower level driver to clean up hardware locks and memory
- Clear the callback
- Clear the callback
- Delete the semaphores
- Return the error
- Create internal CTSU thread to drive scans.
- Delete the semaphore
- If this framework has already been initialized by a previous call, then update the p_ctrl for the current calling layer
- Save the locally saved pointer to the lower level control to the current calling frameworks lower level control so that the current framework can close the lower level
- Save the callback index
- Mark control block open so other tasks know it is valid
- Mark the local flag as initialized

7.28.4 SF_TOUCH_CTSU_Read

```
ssp_err_t SF_TOUCH_CTSU_Read ( sf_touch_ctsu_ctrl_t  *const p_api_ctrl ,  void
* p_dest ,  ctsu_read_t  read_options ,  ctsu_channel_pair_t const * channels ,
  const uint16_t count )
```

7.28.4.1 Brief description

Reads data from Touch CTSU framework.

7.28.4.2 Detailed description

The SF_TOUCH_CTSU_Read function allows the user to read back data from the lower level layer. Access to the lower level data is controlled via semaphore to prevent data reading when a scan or processing is ongoing.

Table 912:Return values

Name	Description
SSP_SUCCESS	Read completed successfully.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Open to configure.
SSP_ERR_UNSUPPORTED	This function is not supported by the HAL driver (p_ctrl->p_lower_lvl_api->read is NULL).

See Common Error Codes or HAL driver for other possible return codes or causes.

7.28.4.3 Function steps

- Hold the TX status
- Wait for a scan to complete if the CTSU is scanning.
- Read the data from the lower layer driver
- Return the semaphore
- Read the converted data from the lower layer driver. Reading this data does not require a semaphore since this data is not actively updated by an ongoing scan.
- If there is a ThreadX error, return it, else return the lower level driver return code

7.28.5 SF_TOUCH_CTSU_Close

```
ssp_err_t SF_TOUCH_CTSU_Close ( sf_touch_ctsu_ctrl_t  *const p_api_ctrl )
```

7.28.5.1 Brief description

The close function checks to see if there are any other registered callbacks for other widgets. If there are then this function simply sets the callback for this widget to NULL and returns. If there are no other registered callbacks then this function terminates the internal scanning thread and calls the lower level close function.

7.28.5.2 Detailed description

Table 913:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Open to configure.
SSP_ERR_INTERNAL	ThreadX call failed.
SSP_ERR_UNSUPPORTED	This function is not supported by the HAL driver (p_ctrl->p_lower_lvl_api->close is NULL).

See Common Error Codes or HAL driver for other possible return codes or causes.

7.28.5.3 Function steps

- Hold the status
- Set the callback for this widget to NULL
- Clear information from control block so other functions know this block is closed
- Check if the table contains any non-NULL callbacks which would indicate that some other widget layer is also using this framework. If no non-NULL callbacks are in the table then the internal thread can be terminated and the HAL closed
- Return success
- Grab the semaphore first before deleting the Thread. May be unnecessary depending on TX Implementation
- Terminate the internal scanning thread first
- Delete the internal scanning thread once it has been terminated
- Close the lower layer driver
- Delete the semaphore
- Clear the local flag to indicate that the framework module is closed
- If there is a ThreadX error, return it, else return the lower level driver return code

7.28.6 SF_TOUCH_CTSU_VersionGet

```
ssp_err_t SF_TOUCH_CTSU_VersionGet ( ssp_version_t  *const p_version )
```

7.28.6.1 Brief description

Gets version and stores it in provided pointer p_version.

7.28.6.2 Detailed description

Table 914:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.28.7 Extensions

7.28.7.1 sf_touch_ctsu_instance_ctrl_t

sf_touch_ctsu_instance_ctrl_t

Detailed description

Instance control block. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t open

  Used by driver to check if control block is valid.
- uint16_t update_hz

  The frequency to run the scans at.
- ctsu_instance_t * p_lower_lvl_instance

  Pointer to CTSU instance.
- uint32_t cb_index

  Indicates the index in callback registry table.

7.29 CTSU Button Framework

RTOS-integrated CTSU Button Framework.

7.29.1 Functions

- SF_TOUCH_CTSU_Button_Open
- SF_TOUCH_CTSU_Button_Close
- SF_TOUCH_CTSU_Button_Enable
- SF_TOUCH_CTSU_Button_Disable
- SF_TOUCH_CTSU_Button_VersionGet

7.29.2 Defines

- #define SF_TOUCH_CTSU_BUTTON_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_TOUCH_CTSU_BUTTON_CODE_VERSION_MINOR

  Initial value: `(2U)`
- #define SF_TOUCH_CTSU_BUTTON_MAX_CHANNELS

  Initial value:`CTSU_MAX_CHANNELS`

  Maximum supported button channel
- #define SF_TOUCH_CTSU_BUTTON_BIT_MASK_ARRAY_SIZE

  Initial value:`6`

7.29.3 SF_TOUCH_CTSU_Button_Open

```
ssp_err_t SF_TOUCH_CTSU_Button_Open ( sf_touch_ctsu_button_ctrl_t
*const p_api_ctrl ,  sf_touch_ctsu_button_cfg_t  const *const p_cfg )
```

7.29.3.1 Brief description

Configures Touch CTSU Button framework.

7.29.3.2 Detailed description

The SF_TOUCH_CTSU_Button_Open function initializes all the buttons in the configuration structure and also initializes the lower level framework module.

Table 915:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.

Table 915:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See lower driver for other possible causes.
SSP_ERR_IN_USE	The framework has already been initialized by this particular widget.

See HAL driver for other possible return codes or causes.

7.29.4 SF_TOUCH_CTSU_Button_Close

```
ssp_err_t SF_TOUCH_CTSU_Button_Close ( sf_touch_ctsu_button_ctrl_t
* p_api_ctrl )
```

7.29.4.1 Brief description

Closes the Touch CTSU Button framework.

7.29.4.2 Detailed description

The SF_TOUCH_CTSU_Button_Close closes the button framework.

Table 916:Return values

Name	Description
SSP_SUCCESS	Close was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Button_Open to configure.
SSP_ERR_INTERNAL	The hardware initialization or thread/mutex/semaphore failed.

See HAL driver for other possible return codes or causes.

7.29.4.3 Function steps

- Close the lower level module

- Mark the module as uninitialized

7.29.5 SF_TOUCH_CTSU_Button_Enable

```
ssp_err_t SF_TOUCH_CTSU_Button_Enable ( sf_touch_ctsu_button_ctrl_t
* p_api_ctrl ,  sf_touch_ctsu_button_id  id )
```

7.29.5.1 Brief description

Enables events for a specific button.

7.29.5.2 Detailed description

The SF_TOUCH_CTSU_Button_Enable function resets a buttons state and enables events to be generated from actions on that button.

Table 917:Return values

Name	Description
SSP_SUCCESS	Button Enable was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Button_Open to configure.
SSP_ERR_INTERNAL	The hardware initialization or thread/mutex/semaphore failed.

See HAL driver for other possible return codes or causes.

7.29.5.3 Function steps

- Iterate through the list of button identifiers to find the button and then enable the button

7.29.6 SF_TOUCH_CTSU_Button_Disable

```
ssp_err_t SF_TOUCH_CTSU_Button_Disable ( sf_touch_ctsu_button_ctrl_t
* p_api_ctrl ,  sf_touch_ctsu_button_id  id )
```

7.29.6.1 Brief description

Disables a specific button.

7.29.6.2 Detailed description

The SF_TOUCH_CTSU_Button_Disable function disables events from a particular button.

Table 918:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Button_Open to configure.

See HAL driver for other possible return codes or causes.

7.29.6.3 Function steps

- Iterate through the list of button identifiers to find the button and then disable the button

7.29.7 SF_TOUCH_CTSU_Button_VersionGet

```
ssp_err_t SF_TOUCH_CTSU_Button_VersionGet ( ssp_version_t  *const p_version )
```

7.29.7.1 Brief description

Gets version and stores it in provided pointer p_version.

7.29.7.2 Detailed description

Table 919:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.29.8 Extensions

7.29.8.1 sf_touch_ctsu_button_instance_ctrl_t

sf_touch_ctsu_button_instance_ctrl_t

Detailed description

Control structure for this Interface

Variables

- uint32_t opened

  Save the initialization state.
- sf_touch_ctsu_button_hdl * p_button_hdl

  Pointer to the button handle.
- uint32_t button_count

  Button Count.
- sf_touch_ctsu_instance_t const * p_lower_lvl_ctsu

  Pointer to the lower level instance.
- void const * p_context

  Placeholder for user data.
- void(* p_callback)(*p_args)

  Callback function.

7.30 CTSU Slider Framework

RTOS-integrated CTSU Slider Framework.

7.30.1 Functions

- SF_TOUCH_CTSU_Slider_VersionGet
- SF_TOUCH_CTSU_Slider_Open
- SF_TOUCH_CTSU_Slider_Close
- SF_TOUCH_CTSU_Slider_Enable
- SF_TOUCH_CTSU_Slider_Disable

7.30.2 Defines

- #define SF_TOUCH_CTSU_SLIDER_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_TOUCH_CTSU_SLIDER_CODE_VERSION_MINOR

  Initial value: `(3U)`
- #define SF_TOUCH_CTSU_SLIDER_MAX_CHANNELS

  Initial value:`CTSU_MAX_CHANNELS`

  Maximum supported CTSU channels
- #define SF_TOUCH_CTSU_SLIDER_MAX_CHANNELS_PER_SLIDER

  Initial value:`10`

  Maximum supported channels per slider based on Workbench6 as of February 2016
- #define SF_TOUCH_CTSU_SLIDER_BIT_MASK_ARRAY_SIZE

  Initial value:`6`

7.30.3 SF_TOUCH_CTSU_Slider_VersionGet

```
ssp_err_t SF_TOUCH_CTSU_Slider_VersionGet ( ssp_version_t  *const p_version )
```

7.30.3.1 Brief description

Gets version and stores it in provided pointer p_version.

7.30.3.2 Detailed description

Table 920:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.30.4 SF_TOUCH_CTSU_Slider_Open

```
ssp_err_t SF_TOUCH_CTSU_Slider_Open ( sf_touch_ctsu_slider_ctrl_t
*const p_api_ctrl ,  sf_touch_ctsu_slider_cfg_t  const *const p_cfg )
```

7.30.4.1 Brief description

Configures Touch CTSU Slider framework.

7.30.4.2 Detailed description

The SF_TOUCH_CTSU_Slider_Open function initializes all the sliders/wheels in the configuration structure and initializes the lower level framework module.

Table 921:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See lower driver for other possible causes.
SSP_ERR_IN_USE	The framework has already been initialized by this particular widget.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.30.4.3 Function steps

- Discover active channels

7.30.5 SF_TOUCH_CTSU_Slider_Close

```
ssp_err_t SF_TOUCH_CTSU_Slider_Close ( sf_touch_ctsu_slider_ctrl_t
*const p_api_ctrl )
```

7.30.5.1 Brief description

Closes the Touch CTSU Slider framework.

7.30.5.2 Detailed description

The SF_TOUCH_CTSU_Slider_Close

Table 922:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See lower driver for other possible causes.
SSP_ERR_NOT_OPEN	The framework has not been initialized by this particular widget.
SSP_ERR_UNSUPPORTED	p_ctrl->p_lower_lvl_ctsu->p_api or p_ctrl->p_lower_lvl_ctsu->p_api->close was NULL

See Common Error Codes or HAL driver for other possible return codes or causes.

7.30.5.3 Function steps

- Close the lower level module
- Mark the module as uninitialized

7.30.6 SF_TOUCH_CTSU_Slider_Enable

```
ssp_err_t SF_TOUCH_CTSU_Slider_Enable ( sf_touch_ctsu_slider_ctrl_t
*const p_api_ctrl ,  sf_touch_ctsu_slider_id_t  id )
```

7.30.6.1 Brief description

The SF_TOUCH_CTSU_Slider_Enable.

7.30.6.2 Detailed description

Table 923:Return values

Name	Description
SSP_SUCCESS	Enable was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See lower driver for other possible causes.

Table 923:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	The framework has not been initialized by this particular widget.
SSP_ERR_INVALID_ARGUMENT	Invalid slider identifier.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.30.6.3 Function steps

- Iterate through the list of slider identifiers to find the slider and then enable the slider

7.30.7 SF_TOUCH_CTSU_Slider_Disable

```
ssp_err_t SF_TOUCH_CTSU_Slider_Disable ( sf_touch_ctsu_slider_ctrl_t
*const p_api_ctrl ,  sf_touch_ctsu_slider_id_t  id )
```

7.30.7.1 Brief description

The SF_TOUCH_CTSU_Slider_Disable.

7.30.7.2 Detailed description

Table 924:Return values

Name	Description
SSP_SUCCESS	Disable was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See lower driver for other possible causes.
SSP_ERR_NOT_OPEN	The framework has not been initialized by this particular widget.
SSP_ERR_IN_USE	The framework has already been initialized by this particular widget.

See Common Error Codes or HAL driver for other possible return codes or causes.

7.30.7.3 Function steps

- Iterate through the list of slider identifiers to find the slider and then disable the slider

7.30.8 Extensions

7.30.8.1 sf_touch_ctsu_slider_instance_ctrl_t

sf_touch_ctsu_slider_instance_ctrl_t

Detailed description

Instance control structure for this module

Variables

- uint32_t opened

  Save the initialization state of the framework.
- uint32_t slider_count

  Slider Count.
- sf_touch_ctsu_instance_t const * p_lower_lvl_ctsu

  Pointer to the lower level instance.
- void const * p_context

  Placeholder for user data.
- void(* p_callback)(*p_args)

  Function to call when an event occurs

7.30.8.2 sf_slider_on_ctsu_cfg_t

sf_slider_on_ctsu_cfg_t

Detailed description

Individual slider structure to be populated by Workbench

Variables

- sf_slider_type_tconst type

  Linear or circular (wheel)
- uint32_t num_slider_channels
- ctsu_channel_pair_t const * p_slider_channels

  Define the channel/channel pairs which make up a slider.
- int32_t const * p_normalization

- int32_t * p_channel_average
- uint32_t * p_offset
- uint16_t *const p_slider_scount
- uint16_t *const p_slider_baseline
- int32_t *const p_slider_delta
- sf_touch_ctsu_slider_id_t id

  Unique identifier for slider
- int32_t max_slider_value

  Maximum slider value, must be greater than 0; Minimum is always 0
- const uint16_t slider_norm_max

  Individual slider settings that can be modified by the user. Should be the same as in st_sf_touch_ctsu_slider_h-dlTOUCH_SLIDER_CFG_NORM_MAX
- const int32_t slider_threshold

  Touch threshold. Ensure that value is greater than 0
- const int32_t channel_average_weight

  Weight of running average of counts for each channel
- const int32_t prev_sum_weight

  Weight of running average of previous sum in position calculation, must be greater than 0
- const int32_t cutoff

  Defines how far below prev_sum running average to get before "SF_TOUCH_SLIDER_STATE_RELEASED" detected

7.30.8.3 st_sf_touch_ctsu_slider_hdl

st_sf_touch_ctsu_slider_hdl

Detailed description

Handle for each slider

Needed for forward reference to sf_touch_ctsu_slider_hdl_t

Variables

- uint32_t open

  Indicate that slider has been opened
- sf_touch_ctsu_slider_id_t id

  Unique identifier for slider.
- sf_touch_ctsu_slider_state_t state

  Represents the current state of the slider.

- sf_slider_type_t type

  Linear or circular (wheel)
- uint32_t num_slider_channels
- ctsu_channel_pair_t const * p_slider_channels

  Define the channel/channel pairs which make up a slider.
- int32_t const * p_normalization
- int32_t * p_channel_average
- uint32_t * p_offset
- uint16_t * p_slider_scount
- uint16_t * p_slider_baseline
- int32_t * p_slider_delta
- uint32_t position

  Calculated position.
- int32_t prev_sum

  Used to store the running average of previous sum in position calculation
- int32_t max_slider_value

  Maximum slider value, must be greater than 0; Minimum is always 0
- ssp_err_t(* p_update)(*const hdl, const *const p_lower_lvl_touch_framework, uint32_t *p_pos, *const p_state)

  Function to calculate position of touch.
- uint64_t bit_mask[SF_TOUCH_CTSU_SLIDER_BIT_MASK_ARRAY_SIZE]

  Bit mask to be used in update function
- uint16_t slider_norm_max

  Individual slider settings that can be modified by the user. Should be the same as in sf_slider_on_ctsu_cfg_t-TOUCH_SLIDER_CFG_NORM_MAX
- int32_t slider_threshold

  Touch threshold. Ensure that value is greater than 0
- int32_t channel_average_weight

  Weight of running average of counts for each channel
- int32_t prev_sum_weight

  Weight of running average of previous sum in position calculation, must be greater than 0
- int32_t cutoff

  Defines how far below prev_sum running average to get before "SF_TOUCH_SLIDER_STATE_RELEASED" detected

7.31 I2C Touch Panel Framework

RTOS-integrated touch panel Framework implementation for external I2C touch chips.

7.31.1 Summary

This is a ThreadX touch panel framework implemented for external I2C touch controllers with IRQ pins used to notify the application when new data is available.

7.31.2 Functions

- SF_TOUCH_PANEL_I2C_Open
- SF_TOUCH_PANEL_I2C_Calibrate
- SF_TOUCH_PANEL_I2C_Start
- SF_TOUCH_PANEL_I2C_Stop
- SF_TOUCH_PANEL_I2C_Reset
- SF_TOUCH_PANEL_I2C_Close
- SF_TOUCH_PANEL_I2C_VersionGet

7.31.3 Defines

- #define SF_TOUCH_PANEL_I2C_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define SF_TOUCH_PANEL_I2C_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define SF_TOUCH_PANEL_I2C_RESET_PIN_UNUSED

  Initial value: `(0xFFFF)`
- #define SF_TOUCH_PANEL_I2C_STACK_SIZE

  Initial value: `(1024)`

  Stack size for I2C touch panel thread.

7.31.4 SF_TOUCH_PANEL_I2C_Open

```
ssp_err_t SF_TOUCH_PANEL_I2C_Open ( sf_touch_panel_ctrl_t  *const p_api_ctrl ,
 sf_touch_panel_cfg_t  const *const p_cfg )
```

7.31.4.1 Brief description

Implements open.

7.31.4.2 Detailed description

Table 925:Return values

Name	Description
SSP_SUCCESS	Touch panel thread created and lower level drivers opened successfully.
SSP_ERR_ASSERTION	A pointer parameter was NULL, or a lower level driver reported this error.
SSP_ERR_INTERNAL	The touch panel thread or event flags could not be created, or a lower level driver reported this error.
SSP_ERR_IN_USE	Mutex was not available, or a lower level driver reported this error.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- open
- reset
- open

NOTE: This function is reentrant for any panel.

7.31.4.3 Function steps

- Store API's.
- Store user configurations in control block.
- Initialize previous event.
- Get mutex before calling lower layer, which will access HW registers.
- Open the lower level I2C driver.
- Reset the touch chip.
- Open the lower level external IRQ driver.
- Return mutex
- Create event flags for internal communication.
- Create main touch panel thread.
- Mark control block open so other tasks know it is valid

7.31.5 SF_TOUCH_PANEL_I2C_Calibrate

```
ssp_err_t SF_TOUCH_PANEL_I2C_Calibrate ( sf_touch_panel_ctrl_t
*const p_api_ctrl ,  sf_touch_panel_calibrate_t  const *const p_expected ,
 sf_touch_panel_payload_t  const *const p_actual ,   ULONG timeout )
```

7.31.5.1 Brief description

Implements calibrate.

7.31.5.2 Detailed description

Table 926:Return values

Name	Description
SSP_SUCCESS	Touch panel calibrated successfully.
SSP_ERR_ASSERTION	A pointer parameter was NULL, or a lower level driver reported this error.
SSP_ERR_CALIBRATE_FAILED	Actual touch value was not in expected range.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_I2C_Open.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any panel.

7.31.5.3 Function steps

- Timeout not used in this implementation.
- Determine if touch message data matches expected value.

7.31.6 SF_TOUCH_PANEL_I2C_Start

```
ssp_err_t SF_TOUCH_PANEL_I2C_Start ( sf_touch_panel_ctrl_t  *const p_api_ctrl )
```

7.31.6.1 Brief description

Implements start.

7.31.6.2 Detailed description

Table 927:Return values

Name	Description
SSP_SUCCESS	Touch panel start flag posted to touch thread.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_I2C_Open.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any panel.

7.31.6.3 Function steps

- Set start flag.

7.31.7 SF_TOUCH_PANEL_I2C_Stop

```
ssp_err_t SF_TOUCH_PANEL_I2C_Stop ( sf_touch_panel_ctrl_t  *const p_api_ctrl )
```

7.31.7.1 Brief description

Implements stop.

7.31.7.2 Detailed description

Table 928:Return values

Name	Description
SSP_SUCCESS	Touch panel will not respond to touch events.
SSP_ERR_ASSERTION	Parameter p_ctrl was NULL, or a lower level driver reported this error.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_I2C_Open.

Table 928:Return values (Continued)

Name	Description
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

See Common Error Codes or lower level drivers for other possible return codes.

NOTE: This function is reentrant for any panel.

7.31.7.3 Function steps

- Set stop flag.

7.31.8 SF_TOUCH_PANEL_I2C_Reset

```
ssp_err_t SF_TOUCH_PANEL_I2C_Reset ( sf_touch_panel_ctrl_t  *const p_api_ctrl )
```

7.31.8.1 Brief description

Implements reset.

7.31.8.2 Detailed description

Table 929:Return values

Name	Description
SSP_SUCCESS	Touch panel and lower level I2C driver were reset successfully.
SSP_ERR_ASSERTION	Parameter p_ctrl was NULL, or a lower level driver reported this error.
SSP_ERR_IN_USE	Mutex was not available, or a lower level driver reported this error.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Use Open API to configure.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- reset

NOTE: This function is reentrant for any panel.

7.31.8.3 Function steps

- Obtain mutex since this accesses shared resources.
- Call hardware specific reset function.
- Release mutex.

7.31.9 SF_TOUCH_PANEL_I2C_Close

```
ssp_err_t SF_TOUCH_PANEL_I2C_Close ( sf_touch_panel_ctrl_t  *const p_api_ctrl )
```

7.31.9.1 Brief description

Implements close.

7.31.9.2 Detailed description

Table 930:Return values

Name	Description
SSP_SUCCESS	Touch panel instance successfully closed.
SSP_ERR_ASSERTION	Parameter p_ctrl was NULL, or a lower level driver reported this error.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_I2C_Open.

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- close
- close
- bufferRelease

NOTE: This function is reentrant.

7.31.9.3 Function steps

- Close the lower level external IRQ driver.
- Close the lower level I2C driver.
- If I2C Abort returned from previous close, one more try to close I2C driver.
- Suspend internal thread.
- If a messaging framework buffer is taken but a touch message is not yet posted to the subscribers, release it.
- Delete RTOS services used
- Mark control block close

7.31.10 SF_TOUCH_PANEL_I2C_VersionGet

```
ssp_err_t SF_TOUCH_PANEL_I2C_VersionGet ( ssp_version_t  *const p_version )
```

7.31.10.1 Brief description

Implements versionGet.

7.31.10.2 Detailed description

Table 931:Return values

Name	Description
SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

7.31.11 Extensions

7.31.11.1 sf_touch_panel_i2c_chip_t

sf_touch_panel_i2c_chip_t

Detailed description

Chip definition.

Variables

- ssp_err_t(* payloadGet)(*const p_ctrl, *const p_payload)

  Reads the touch chip and fills in the touch payload data. p_ctrlPointer to a structure allocated by user. This control structure is initialized in this function. p_payloadPointer to the payload to data structure. Touch data provided should be processed to logical pixel values.

- ssp_err_t(* reset)(*const p_ctrl)

  Resets the touch chip. p_ctrlPointer to a structure allocated by user. This control structure is initialized in this function.

7.31.11.2 sf_touch_panel_i2c_instance_ctrl_t

sf_touch_panel_i2c_instance_ctrl_t

Detailed description

Instance control block. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t open

  Used by driver to check if control block is valid.

- uint16_t hsize_pixels

  Horizontal size of screen in pixels.

- uint16_t vsize_pixels

  Vertical size of screen in pixels.

- sf_message_instance_t const * p_message

  Pointer to messaging framework control block.

- uint8_t event_class_instance

  Event class instance number for posting touch event class messages.

- sf_touch_panel_payload_t * p_payload

  Pointer to buffer used to store payload.

- sf_touch_panel_payload_t last_payload

  Stores most recent payload put on queue for comparison.

- TX_MUTEX mutex

  Mutex used to protect access to shared resources.

- TX_EVENT_FLAGS_GROUP flags

  Event flags for internal communication.

- TX_THREAD thread

  Main touch panel thread.

- ioport_port_pin_t pin

  Reset pin.

- i2c_master_instance_t const * p_lower_lvl_i2c

  Lower level I2C.

- sf_external_irq_instance_t const * p_lower_lvl_irq

  Lower level external IRQ.

- uint8_t stack[SF_TOUCH_PANEL_I2C_STACK_SIZE]

  Stack for touch panel thread.

- sf_touch_panel_i2c_chip_t const * p_chip

  Chip specific functions and definitions.

- uint16_t update_hz

  The frequency to report repeat (SF_TOUCH_PANEL_EVENT_DOWN or SF_TOUCH_PANEL_EVENT_HOLD) touch events in Hertz. This will be converted to RTOS ticks in the driver and rounded up to the nearest integer value of RTOS ticks.

- uint16_t rotation_angle

  Touch coordinate rotation angle(0/90/180/270)

7.31.11.3 sf_touch_panel_i2c_cfg_t

sf_touch_panel_i2c_cfg_t

Detailed description

Configuration for RTOS touch panel driver.

Variables

- i2c_master_instance_t const * p_lower_lvl_i2c

  Pointer to lower level I2C.

- sf_external_irq_instance_t const * p_lower_lvl_irq

  Pointer to lower level external IRQ.

- ioport_port_pin_t pin

  Port pin connected to reset line on touch controller chip. Set to SF_TOUCH_PANEL_I2C_RESET_PIN_UNUSED if unused.

- sf_touch_panel_i2c_chip_t const *const p_chip

  Selected touch controller chip.

7.32 UART Framework Instance

RTOS-integrated Communications Framework UART implementation.

7.32.1 Functions

- SF_UART_COMMS_Open

- SF_UART_COMMS_Close
- SF_UART_COMMS_Read
- SF_UART_COMMS_Write
- SF_UART_COMMS_Lock
- SF_UART_COMMS_Unlock
- SF_UART_COMMS_VersionGet

7.32.2 Defines

- #define SF_UART_COMMS_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define SF_UART_COMMS_CODE_VERSION_MINOR

  Initial value: `(7U)`

7.32.3 SF_UART_COMMS_Open

```
ssp_err_t SF_UART_COMMS_Open ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_cfg_t  const *const p_cfg )
```

7.32.3.1 Brief description

Open the UART for communication.

7.32.3.2 Detailed description

Table 932:Parameters

Name	Direction	Description
p_api_ctrl	inout	Pointer to the UART control block
p_cfg	in	Pointer to the configuration structure

Table 933:Return values

Name	Description
SSP_SUCCESS	Channel opened successfully.

Table 933:Return values (Continued)

Name	Description
SSP_ERR_IN_USE	Channel already in use.
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL. • Pointer p_cfg is NULL • Pointer p_cfg->p_extend is NULL • Pointer p_cfg_extend->p_lower_lvl_uart is NULL • Pointer p_cfg_extend->p_lower_lvl_uart->p_api->open is NULL • Pointer p_cfg_extend->p_lower_lvl_uart->p_cfg is NULL
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

See Common Error Codes or functions called by this function for other possible codes. This function calls:

- open

NOTE: This function is reentrant for any channel. Handle must be cleared by caller before calling this function.

7.32.3.3 Function steps

- Checks error. Further parameter checking can be done at the driver layer.
- Initialize and start ThreadX resources
- Calls open function of UART HAL driver

7.32.4 SF_UART_COMMS_Close

```
ssp_err_t SF_UART_COMMS_Close ( sf_comms_ctrl_t  *const p_api_ctrl )
```

7.32.4.1 Brief description

Close the UART Channel and clean up the resources.

7.32.4.2 Detailed description

Table 934:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to the UART control block

Table 935:Return values

Name	Description
SSP_SUCCESS	UART channel is successfully closed.
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL. • Pointer p_ctrl->p_lower_lvl_uart is NULL • Pointer p_ctrl->p_lower_lvl_uart->p_api is NULL • Pointer p_ctrl->p_lower_lvl_uart->p_api->close is NULL
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to delete thread mutex , event flags or queue.

See Common Error Codes or functions called by this function for other possible codes. This function calls:

- close

NOTE: This function is reentrant for any channel.

7.32.4.3 Function steps

- Checks error. Further parameter checking can be done at the driver layer.
- Calls close function of UART HAL driver
- Release ThreadX resources

7.32.5 SF_UART_COMMS_Read

```
ssp_err_t SF_UART_COMMS_Read ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_dest ,   uint32_t const bytes ,   UINT const timeout )
```

7.32.5.1 Brief description

Read user specified number of bytes into destination buffer pointer.

7.32.5.2 Detailed description

Table 936:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to the UART control block
bytes	in	No.of bytes to be read
timeout	in	timeout for read
p_dest	out	Destination buffer

Table 937:Return values

Name	Description
SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_HW_LOCKED	Channel is locked.
SSP_ERR_ASSERTION	Pointer to UART control block/pointer to destination address is NULL.
SSP_ERR_INVALID_MODE	Channel is used for non-UART mode.
SSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
SSP_ERR_OVERFLOW	Hardware overflow.
SSP_ERR_FRAMING	Framing error.
SSP_ERR_PARITY	Parity error.

Table 937:Return values (Continued)

Name	Description
SSP_ERR_BREAK_DETECT	Break signal detected.
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Receive mutex get' timed out
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- read
- communicationAbort

7.32.5.3 Function steps

- Locks the UART reception hardware resource
- Unlock the UART reception hardware resource

7.32.6 SF_UART_COMMS_Write

```
ssp_err_t SF_UART_COMMS_Write ( sf_comms_ctrl_t  *const p_api_ctrl ,   uint8_t
const *const p_src ,   uint32_t const bytes ,   UINT const timeout )
```

7.32.6.1 Brief description

Write user specified number of bytes from the source buffer.

7.32.6.2 Detailed description

Table 938:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to the UART control block
bytes	in	Number of bytes to to be written.

Table 938:Parameters (Continued)

Name	Direction	Description
timeout	in	Timeout for write. This timeout must be long enough for the write to complete. A timeout of 0 or TX_NO_WAIT results in a return value of SSP_ERR_TIMEOUT.
p_src	out	Source buffer

Table 939:Return values

Name	Description
SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL. Pointer to source buffer is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_INVALID_MODE	Channel is used for non-UART mode or illegal mode is set in handle.
SSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular buffer.
SSP_ERR_HW_LOCKED	Could not lock hardware.
SSP_ERR_TIMEOUT	'Transmit mutex get' timed out
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- write
- communicationAbort

7.32.6.3 Function steps

- Locks the UART transmission hardware resource
- Clear the event flag.
- Calls write function of UART HAL driver

- Wait until write operation is completed. Event is signaled in event flag object
- Calls communicationAbort function of UART HAL driver to abort write operation.
- Unlock the UART transmission hardware resource

7.32.7 SF_UART_COMMS_Lock

```
ssp_err_t SF_UART_COMMS_Lock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type ,   UINT timeout )
```

7.32.7.1 Brief description

Lock the UART resource.

7.32.7.2 Detailed description

Table 940:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to the UART control block
lock_type	in	Type of Lock.
timeout	in	timeout for lock.

Table 941:Return values

Name	Description
SSP_SUCCESS	Locking UART resource successful.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_TIMEOUT	Timeout Error. 'Receive mutex get' timed out 'Transmit mutex get' timed out

7.32.8 SF_UART_COMMS_Unlock

```
ssp_err_t SF_UART_COMMS_Unlock ( sf_comms_ctrl_t  *const p_api_ctrl ,
 sf_comms_lock_t  lock_type )
```

7.32.8.1 Brief description

UnLock the UART resource.

7.32.8.2 Detailed description

Table 942:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to the UART control block
lock_type	in	Type of Lock.

Table 943:Return values

Name	Description
SSP_SUCCESS	Unlocking UART resource successful.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_TIMEOUT	Timeout Error. 'Receive mutex put' timed out 'Transmit mutex put' timed out

7.32.9 SF_UART_COMMS_VersionGet

```
ssp_err_t SF_UART_COMMS_VersionGet ( ssp_version_t  *const p_version )
```

7.32.9.1 Detailed description

Table 944:Return values

Name	Description
SSP_SUCCESS	Version number obtained successfully.
SSP_ERR_ASSERTION	

7.32.10 API Data

7.32.10.1 sf_uart_comms_state_t

sf_uart_comms_state_t

Detailed description

Framework UART state

Enumerated values

Name	Description
SF_UART_COMMS_STATE_CLOSED	UART port is closed.
SF_UART_COMMS_STATE_OPENED	UART port is opened.
SF_UART_COMMS_STATE_READING	UART port is on data reception.
SF_UART_COMMS_STATE_WRITING	UART port is on data transmission.

7.32.11 Extensions

7.32.11.1 sf_uart_comms_instance_ctrl_t

sf_uart_comms_instance_ctrl_t

Detailed description

UART communications instance control structure. DO NOT INITIALIZE. Initialization occurs when open is called

Variables

- uint32_t state

  UART status.
- uart_instance_t const * p_lower_lvl_uart

  Pointer to UART interface (copied from cfg)
- TX_MUTEX mutex[2]

  Pointer to the mutex object for UART resource mutual exclusion.
- TX_EVENT_FLAGS_GROUP eventflag[2]

  Pointer to the event flag object for UART data transfer.
- TX_QUEUE queue

  Queue for reading.

- uint32_t queue_mem[SF_UART_COMMS_CFG_QUEUE_SIZE_WORDS]
  Queue memory.

7.32.11.2 sf_uart_comms_cfg_t

sf_uart_comms_cfg_t

Detailed description

Configuration for RTOS integrated UART driver

Variables

- uart_instance_t const * p_lower_lvl_uart
  Pointer to UART Driver instance

7.33 NetX Synergy Port

Name of module used by error logger macro

7.33.1 Functions

- edmac_eint_isr
- nx_ms_to_ticks
- nx_synergy_ethernet_init
- nx_driver_timer_handler
- nx_driver_event_handler
- enet_hw_enable_interrupt
- nx_ether_custom_packet_send
- nx_ether_driver
- nx_ether_interrupt
- nx_ether_send
- nx_ether_write
- nx_storage_init
- nx_tx_interrupt
- nx_rx_interrupt
- nx_receive
- nx_driver_deferred_processing
- nx_ethernet_version_get

7.33.2 edmac_eint_isr

```
edmac_eint_isr (  void  )
```

7.33.2.1 Brief description

edmac_eint_isr

7.33.2.2 Detailed description

This is the Ethernet interrupt service routine. It clears the interrupt flag and calls nx_ether_interrupt to process the interrupt.

7.33.2.3 Function steps

- Save context if RTOS is used
- Process the interrupt.
- Clear pending interrupt flag to make sure it doesn't fire again after exiting.
- Restore context if RTOS is used

7.33.3 nx_ms_to_ticks

```
nx_ms_to_ticks (  ULONG time_ms )
```

7.33.4 nx_synergy_ethernet_init

```
nx_synergy_ethernet_init ( NX_REC * nx_rec_ptr ,  nx_cfg_t  * sf_el_nx_cfg_ptr )
```

7.33.4.1 Brief description

nx_synergy_ethernet_init

7.33.4.2 Detailed description

This function initializes the specified Ethernet port.

Table 945:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure

Table 945:Parameters (Continued)

Name	Direction	Description
sf_el_nx_cfg_ptr	in	: Pointer to NetX configuration structure

Table 946:Return values

Name	Description
SSP_SUCCESS	: Call successful.
NX_NOT_SUCCESSFUL	: Call not successful.

7.33.4.3 Function steps

- Configure the Ethernet interrupt.
- Enable clock
- Reset PHY
- Initialize & reset EDMAC and ETHERC
- Wait at least 64 cycles of PCLKA to reset the EDMAC and ETHERC. PCLKA must be at least 12.5 MHz to use Ethernet, so wait at least 5.12 us.
- Set ETHERC default modes 100 Mbps, Full duplex
- Set to little Endian.
- Initialize controller
- Set up descriptor addresses
- Configure FIFO
- Enable EDMAC receive
- Enable receive, transmit, ECI interrupts.
- Initialize PHY.
- Start PHY auto negotiation
- Create a timer to poll for completion of autonegotiation.

7.33.5 nx_driver_timer_handler

```
nx_driver_timer_handler (  ULONG data )
```

7.33.5.1 Brief description

nx_driver_timer_handler

7.33.5.2 Detailed description

This function is called from the timer expiration event. On every time event, this routine register a deferred event in IP helper thread

Table 947:Parameters

Name	Direction	Description
data	in	: Data.

7.33.5.3 Function steps

- Mark the polling flag.
- Call NetX to register a deferred event.

7.33.6 nx_driver_event_handler

```
nx_driver_event_handler ( NX_REC  * nx_rec_ptr )
```

7.33.6.1 Brief description

nx_driver_event_handler

7.33.6.2 Detailed description

This function is called from the IP thread deferred event. On every deferred event, this routine checks for Phy link status and handles link up/down and link change. During initialization this routine is responsible for checking for autonegotiation.

Table 948:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure.

7.33.6.3 Function steps

- Determine previous link status.
- Save link status and changed polling interval.

- Check PHY link status.
- Save link status and changed polling interval.

7.33.7 enet_hw_enable_interrupt

```
enet_hw_enable_interrupt ( NX_REC  * nx_rec_ptr )
```

7.33.7.1 Brief description

enet_hw_enable_interrupt

7.33.7.2 Detailed description

This function enables interrupts for the given Ethernet port.

Table 949:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure.

NOTE: The pointer parameter passed to this function is already validated at the higher level.

7.33.7.3 Function steps

- Enable interrupts at the NVIC.
- Enable interrupts at the Ethernet controller

7.33.8 nx_ether_custom_packet_send

```
ssp_err_t nx_ether_custom_packet_send (  NX_PACKET_POOL * pool_ptr ,  NX_REC
* nx_record_ptr ,   UCHAR * data ,   UINT length ,   USHORT ether_type ,
 nx_mac_address_t  dest_mac_address )
```

7.33.8.1 Brief description

nx_ether_custom_packet_send

7.33.8.2 Detailed description

Ethernet driver routine to send a user data in raw Ethernet packet frame from a Source HW address to destination HW address with the requested EtherType through a Ethernet channel

Table 950:Parameters

Name	Direction	Description
pool_ptr	in	: Pointer to packet pool to use
nx_record_ptr	in	: Pointer to Ethernet record structure
data	in	: Pointer to data to be send
length	in	: length of data to send
ether_type	in	: Type of Ethernet packet
dest_mac_address	in	: Destination hardware address to send the user data

Table 951:Return values

Name	Description
SSP_SUCCESS	: Call successful
SSP_ERR_ASSERTION	: - A parameter pointers point to NULL • Invalid Ethernet record structure pointer • Invalid data length
SSP_ERR_OUT_OF_MEMORY	: No memory is free to allocate the packet in the pool buffer
SSP_ERR_NOT_OPEN	: Link not enabled
SSP_ERR_INTERNAL	: - Maximum transmit queue depth has been reached • No packet is available to append the data

7.33.8.3 Function steps

- Free the packet that we will not send.
- Setup the prepend pointer in order to build the Ethernet frame. Backup another 2 bytes to get 32-bit word alignment.
- Build the actual Ethernet frame.

- Build the sender's MAC access.
- Set the Ethernet frame type.
- Endian swapping if necessary.
- Put the frame on the wire.

7.33.9 nx_ether_driver

```
ssp_err_t nx_ether_driver (  NX_IP_DRIVER * driver_req_ptr ,  NX_REC
* nx_rec_ptr ,  nx_cfg_y  * sf_el_nx_cfg_ptr )
```

7.33.9.1 Brief description

nx_ether_driver

7.33.9.2 Detailed description

Ethernet driver function for Renesas Synergy.

Table 952:Parameters

Name	Direction	Description
driver_req_ptr	in	: Pointer to driver request structure
nx_rec_ptr	in	: Pointer to Ethernet record structure
sf_el_nx_cfg_ptr	in	: sf_el_nx configuration structure pointer. This is similar to SSP configuration structure

Table 953:Return values

Name	Description
SSP_SUCCESS	: Call successful.
SSP_ERR_ASSERTION	: One or more pointers point to NULL.

See NX user manual for all possible return values.

7.33.9.3 Function steps

- Perform parameter checking

- Setup the IP pointer from the driver request.
- Default to successful return.
- Extract driver command.
- Process the driver request.
- Save the callback record pointer in the record structure.
- Record the interface structure in the driver record.
- This command is used in multi homed devices - return NX_SUCCESS by default.
- Process driver initialization.
- Initialize BDs.
- Record the interface structure in the driver record.
- Update associated channel information in driver record
- Configure mac address.
- Get MAC address from user.
- Initialize the ETHERC and E-DMAC hardware.
- Setup the link maximum IP layer transfer unit.
- See if we can honor the NX_LINK_ENABLE request. NX_ALREADY_ENABLED: Device has already been enabled
- Enable the interrupts, at the interrupt controller and Ethernet controller.
- Make sure we are in the right state to do the NX_LINK_DISABLE.
- Disable receive and transmit.
- Clear link enabled flag.
- Clear the enabled flag since there is no-one else.
- Free the packet that we will not send.
- Process driver send packet. Place the Ethernet frame at the front of the packet.
- Adjust packet length.
- Setup the prepend pointer in order to build the Ethernet frame. Backup another 2 bytes to get 32-bit word alignment.
- Build the actual Ethernet frame.
- Use MAC broadcast for this frame.
- Build the sender's MAC access.
- Set the Ethernet frame type.
- Endian swapping if necessary.
- Put the frame on the wire.
- Enable multicast.
- The device automatically receives multicast packets. Nothing needs to be done.
- Process driver deferred requests. Process a device driver function on behalf of the IP thread.

- Return the unhandled command status.
- Return NULL in the supplied return pointer.

7.33.10 nx_ether_interrupt

```
nx_ether_interrupt ( NX_REC  * nx_rec_ptr )
```

7.33.10.1 Brief description

nx_ether_interrupt

7.33.10.2 Detailed description

This function is the main Renesas Ethernet interrupt handler.

Table 954:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure

7.33.10.3 Function steps

- Read EDMAC and EtherC status register.
- Clear all interrupts.
- Frame transmit completed interrupt The MAC sets Transmit Complete flag only if all frames are transmitted. This creates a delay in processing transmitted frames. The work around: this driver process transmitted packets when frame receive interrupt occurs. This way the transmitted packets can be released before processing received packets, reducing the delay.
- Frame received.
- Special case for ECI interrupt + link change.
- To report link status changes to the application, add a semaphore put or event flag set to the statement below.
- Link present.

7.33.11 nx_ether_send

```
nx_ether_send (  NX_PACKET * packet ,  NX_REC  * nx_rec_ptr )
```

7.33.11.1 Brief description

nx_ether_send

7.33.11.2 Detailed description

This function decides whether to queue or send the packet

Table 955:Parameters

Name	Direction	Description
packet	in	: Pointer to the data packet
nx_rec_ptr	in	: Pointer to Ethernet record structure

NX_SUCCESS : Success NX_TX_QUEUE_DEPTH : Queue depth NX_NOT_ENABLED : Link is not enabled See NX user manual for all possible return values

7.33.11.3 Function steps

- Check if the link is enabled.
- Call write function to send the packet, then check the result.
- Transmit failed, drop the packet.

7.33.12 nx_ether_write

```
nx_ether_write (  NX_PACKET * pkt ,  NX_REC  * nx_rec_ptr )
```

7.33.12.1 Brief description

nx_ether_write

7.33.12.2 Detailed description

This function writes the data to the TX FIFO buffer descriptor. This function can only be called when there is no active transmission.

Table 956:Parameters

Name	Direction	Description
packet	in	: Pointer to the data packet
nx_rec_ptr	in	: Pointer to Ethernet record structure

NX_SUCCESS : Success NX_NO_MORE_ENTRIES : No more entries(BD's) allowed See NX user manual for all possible return values

NOTE: The pointer parameters passed to this function are already validated at higher level.

7.33.12.3 Function steps

- Check if the BD is free.
- Set up a transfer descriptor for each NX_PACKET in the packet chain.
- Special case: alignment requirement to 5 bits for data 16 bytes or less. To accommodate this special case, NX_PACKETs need to be minimum 32+16 in size.
- Check alignment for packets 16 bytes or less.
- Loop from back to front to copy data in the NX_PACKET.
- Set new prepend and append pointers.
- Set up the transmit BD.
- This was the last packet in the chain. Store the original packet pointer in the last BD.
- Get next NetX packet in the chain.
- Move to next BD.
- Disable interrupts.
- Restore interrupts.
- Set active flag to indicate BDs are ready.
- Set active flag in reverse order, move to previous BD.
- Set active flag.
- If the transmission is suspended, resume transmission.
- Start transmission.

7.33.13 nx_storage_init

```
nx_storage_init (  NX_IP * ip_ptr ,  NX_REC  * nx_rec_ptr )
```

7.33.13.1 Brief description

nx_storage_init

7.33.13.2 Detailed description

This function initializes byte pool, packet pool, list of descriptors and Tx & Rx FIFO.

Table 957:Parameters

Name	Direction	Description
ip_ptr	in	: Pointer to the data packet
nx_rec_ptr	in	: Pointer to Ethernet record structure

NX_SUCCESS : Successful send NX_NO_PACKET : No packet available NX_WAIT_ABORTED : Requested suspension was aborted by a call to tx_thread_wait_abort. See NX user manual for all possible return values

NOTE: The pointer parameters passed to this function are already validated at higher level.

NOTE: The number of receive buffer descriptors NUM_RX_DESC is a user configurable value which is present in sf_el_nx_cfg header file and it defaults to 8.

7.33.13.3 Function steps

- All memory is assumed to be allocated at link time in the .bss section to avoid memory allocation errors at runtime.
- 16 byte alignment for BDs.
- Initialize receive buffer descriptors.
- Allocate packets from the pool to be used for reception.
- Check if the allocation was successful.
- Release allocated packets.
- Set buffer length, payload address (32byte align), initial status.
- Length has to be multiple of 32.
- Set DL bit in last descriptor.

7.33.14 nx_tx_interrupt

```
nx_tx_interrupt ( NX_REC  * nx_rec_ptr )
```

7.33.14.1 Brief description

nx_tx_interrupt

7.33.14.2 Detailed description

This function handles the Tx done interrupt.

Table 958:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure

NOTE: The pointer parameter passed to this function is already validated at the higher level.

7.33.14.3 Function steps

- Loop through buffers in use.
- Check if the BD is in non active state.
- Check if this is the last BD in a chain.
- Release packet transmitted.
- Move to next BD.

7.33.15 nx_rx_interrupt

```
nx_rx_interrupt ( NX_REC  * nx_rec_ptr )
```

7.33.15.1 Brief description

nx_rx_interrupt

7.33.15.2 Detailed description

This function handles the receive interrupt.

Table 959:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure

NOTE: The pointer parameter passed to this function is already validated at the higher level.

7.33.15.3 Function steps

- Do for every complete frame in the receive buffer.
- Each frame consists of 1 or more BDs.
- The driver should be able to process at least 1 completed frame when it gets here.
- Get the number of BDs in this receive chain: Last BD has FRAME_POSITION_END set, BDs preceding should have DESCRIPTOR_FLAG_ACTIVE bit cleared. The value of FRAME_POSITION_END is 0x10000000U The value of TX/RX DESCRIPTOR_FLAG_ACTIVE is 0x80000000U
- This frame has a BD that is still active and is not fully received, break out here.
- Move to next BD.
- Get first packet from first BD.
- Store the total frame length from the last BD + the padding in the NetX packet.
- Get the last packet in the chain, we need this to build NetX packet chain.
- For each packet in the chain, except the last one:
- Adjust the append pointer according to the size in BD.
- Update remaining_bytes.
- Chain packet (set _next pointer).
- Set nx_packet_last pointer to point to last packet in chain.
- Insert a new NetX packet into the BD.
- Set buffer length and address and align the address to 32 bytes boundary.
- Make the size to be multiple of 32.
- Check if we had some successful allocation.
- Release the packet.
- Set the BDs to active.
- Set buffer length and address. Align to 32 byte address
- Make the size to be multiple of 32.
- Check if we had allocation failures.
- Advance the index for next reception.
- Last BD or packet.
- Set append pointer for the last packet.
- Clear _next pointer.
- Insert a new NetX packet into the BD.
- Send the packet up the stack.

- Allocation failed. Assign last packet to the BD.
- Prepare the BD for receiving data.
- Set buffer length and address align to 32 byte address.
- Make the size to be multiple of 32.
- advance the index for next reception
- If reception is in suspended state, resume it.
- Resume reception.

7.33.16 nx_receive

```
nx_receive ( NX_REC  * nx_rec_ptr ,   NX_PACKET * packet_ptr )
```

7.33.16.1 Brief description

nx_receive

7.33.16.2 Detailed description

nx_rx_interrupt() This function processing incoming packets. This routine would be called from the receive packet ISR.

Table 960:Parameters

Name	Direction	Description
nx_rec_ptr	in	: Pointer to Ethernet record structure
packet_ptr	in	: Packet pointer

NOTE: The pointer parameters passed to this function are already validated at higher level.

7.33.16.3 Function steps

- Pickup the packet header to determine where the packet needs to be sent.
- Clean off the Ethernet header.
- Adjust the packet length.
- Route the incoming packet according to its Ethernet type.
- Call the callback for unsupported packet type, if defined.
- If Ethernet header id invalid, release the packet.

7.33.17 nx_driver_deferred_processing

```
 nx_driver_deferred_processing (  NX_IP_DRIVER * driver_req_ptr ,  NX_REC
* nx_rec_ptr )
```

7.33.17.1 Brief description

nx_driver_deferred_processing

7.33.17.2 Detailed description

This function processing the deferred action within the context of the IP thread.

Table 961:Parameters

Name	Direction	Description
driver_req_ptr	in	: Driver command from the IP thread
nx_rec_ptr	in	: Pointer to Ethernet record structure

7.33.17.3 Function steps

- Check if we need to poll PHY status.
- If so, clear the polling flag.
- Mark request as successful.

7.33.18 nx_ethernet_version_get

```
ssp_err_t nx_ethernet_version_get ( ssp_version_t  *const p_version )
```

7.33.18.1 Brief description

Retrieve the API version number.

7.33.18.2 Detailed description

Table 962:Return values

Name	Description
SSP_SUCCESS	Successful return.

Table 962:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The parameter p_version is NULL.

7.33.18.3 Function steps

- Return the version number

7.34 NetX Synergy Port PHY Driver

7.34.1 Functions

- Phy_Init
- Phy_Start_Autonegotiate
- Phy_Get_Autonegotiate
- Phy_GetLinkStatus

7.34.2 Phy_Init

```
Phy_Init (  uint32_t channel )
```

7.34.2.1 Brief description

Phy_Init - Initialize Ethernet PHY device.

7.34.2.2 Detailed description

Table 963:Parameters

Name	Direction	Description
channel	in	Ethernet channel number

Table 964:Return values

Name	Description
R_PHY_OK	PHY device is initialized successfully
R_PHY_ERROR	PHY device is not initialized successfully

NOTE: Refer HW manual for valid channels for a target MCU

7.34.2.3 Function steps

- Resets PHY device
- Waits the reset completion, PHY_CONTROL_RESET bit is self-cleared after 1 is written to it.
- Sets Duplex Mode as Full-duplex

7.34.3 Phy_Start_Autonegotiate

```
Phy_Start_Autonegotiate (  uint32_t channel ,   uint8_t pause )
```

7.34.3.1 Brief description

Sets Auto-Negotiation advertisement and starts auto-negotiation.

7.34.3.2 Detailed description

Table 965:Parameters

Name	Direction	Description
channel	in	Ethernet channel number
pause	in	Using state of pause frames

Table 966:Return values

Name	Description
void	

7.34.4 Phy_Get_Autonegotiate

```
Phy_Get_Autonegotiate (  uint32_t channel ,   uint16_t * p_line_speed_duplex ,
 uint16_t * p_local_pause ,   uint16_t * p_partner_pause )
```

7.34.4.1 Brief description

Gets capabilities of an Ethernet PHY device.

7.34.4.2 Detailed description

Table 967:Parameters

Name	Direction	Description
channel	in	Ethernet channel number
p_line_speed_duplex	in	A pointer to the location of both the line speed and the duplex
p_local_pause	in	A pointer to the location to store the local pause bits
p_partner_pause	in	A pointer to the location to store the partner pause bits

Table 968:Return values

Name	Description
R_PHY_OK	Got information successfully
R_PHY_ERROR	PHY device is yet to be initialized

NOTE: The value returned to local_pause and patner_pause is used as it is as an argument of ether_pause_resolution function.

NOTE: Validating parameters is not required by this function as it by design is only called by sf_el_nx framework with valid parameters.

7.34.4.3 Function steps

- Reads the status register. Because reading the first time shows the previous state, the Link status bit should be read twice.
- Checks the link status
- Check the auto-negotiation status
- Gets local pause capability

7.34.5 Phy_GetLinkStatus

```
Phy_GetLinkStatus (  uint32_t channel )
```

7.34.5.1 Brief description

Phy_GetLinkStatus - Returns the status of the physical link.

7.34.5.2 Detailed description

Table 969:Parameters

Name	Direction	Description
channel	in	Ethernet channel number

Table 970:Return values

Name	Description
R_PHY_OK	PHY device is initialized successfully
R_PHY_ERROR	PHY device is not initialized successfully

7.35 TES D/AVE 2D Port Driver

7.35.1 Functions

7.35.2 d1_opendevice

```
d1_opendevice (  d1_long_t flags )
```

7.35.2.1 Brief description

Creates a device handle to access hardware. This function initializes the D1 device handle, supply module clock to D/AVE 2D hardware and enables the D/AVE 2D interrupt. It is called by the D/AVE 2D driver function d2_inithw() to initialize the D/AVE 2D hardware.

7.35.2.2 Detailed description

Table 971:Parameters

Name	Direction	Description
flags	in	Reserved. Not used in this function.

Table 972:Return values

Name	Description
Non-NULL	The function returns the pointer to a d1_device object if the D1 device handle was successfully initialized.
NULL	The function returns NULL if failed to create the display list synchronization semaphore.

7.35.2.3 Function steps

- Get new device handle.
- Initialize device data.
- Access to FMI through the productFeatureGet interface and get the D/AVE 2D hardware information.
- Initialize the D/AVE 2D hardware bass address in the device context.
- Supply clock to the D/AVE 2D hardware.
- Create the semaphore to notify the completion of display list execution.
- Enable the D/AVE 2D interrupt if semaphore creation was successful.
- If failed to enable the D/AVE 2D interrupt, set NULL to handle.
- If failed to create the semaphore, set NULL to handle.
- Returns the pointer to the d1_device object.

7.35.3 d1_closedevice

```
d1_closedevice (  d1_device * handle )
```

7.35.3.1 Brief description

Close a device handle. It is called by the D/AVE 2D driver function d2_deinithw to de-initialize the D/AVE 2D hardware. Disables the D/AVE 2D interrupt and stop the module clock supply.

7.35.3.2 Detailed description

Table 973:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.

Table 974:Return values

Name	Description
0	The function returns 0 if error occurred, NULL is passed to the argument handle, or failed to release the semaphore.
1	The function returns 1 if successfully device handle was closed.

7.35.3.3 Function steps

- Disable the D/AVE 2D interrupt.
- Stop clock supply to the D/AVE 2D hardware.
- Delete used semaphore

7.35.4 d1_setregister

```
d1_setregister (  d1_device * handle ,   d1_int_t deviceid ,   d1_int_t index ,
 d1_long_t value )
```

7.35.4.1 Brief description

Write data to the D/AVE 2D hardware register.

7.35.4.2 Detailed description

Table 975:Parameters

Name	Direction	Description
handle	in	Pointer to a device handle.

Table 975:Parameters (Continued)

Name	Direction	Description
deviceid	in	D1_DAVE2D(Rendering core) or D1_DLISTINDIRECT(Lists of dlist support). The others are ignored.
index	in	Register index (word offset from the D/AVE 2D base address).
value	in	32-bit value to write.

7.35.4.3 Function steps

- Write data to specified D/AVE 2D register.

7.35.5 d1_getregister

```
d1_getregister (  d1_device * handle ,   d1_int_t deviceid ,   d1_int_t index )
```

7.35.5.1 Brief description

Read data from hardware register. Reading a register from an invalid or unsupported device ID will always return 0.

7.35.5.2 Detailed description

Table 976:Parameters

Name	Direction	Description
handle	in	Pointer to a device handle.
deviceid	in	D1_DAVE2D(Rendering core) or D1_DLISTINDIRECT(Lists of dlist support). The others are ignored.
index	in	Register index (starts with 0).

Table 977:Return values

Name	Description
Value	The function returns 32-bit value of the register.

7.35.6 d1_devicesupported

```
d1_devicesupported (  d1_device * handle ,   d1_int_t deviceid )
```

7.35.6.1 Brief description

Check if the specified device ID is valid for the D/AVE 2D implemented for Synergy. Use this function to verify that a specific hardware interface is available on the current host system.

7.35.6.2 Detailed description

Table 978:Parameters

Name	Direction	Description
handle	in	Pointer to a device handle.
deviceid	in	D1_DAVE2D(Rendering core). The others are ignored.

Table 979:Return values

Name	Description
0	The function returns 0 if specified device ID not supported.
1	The function returns 1 if specified device ID supported.

7.35.7 d1_queryirq

```
d1_queryirq (  d1_device * handle ,   d1_int_t irqmask ,   d1_int_t timeout )
```

7.35.7.1 Brief description

Wait for next IRQ being happened.

7.35.7.2 Detailed description

Table 980:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object (Not used).
irqmask	in	Interrupt ID (Not used. Synergy only uses Display list IRQ).
timeout	in	Timeout value.

Table 981:Return values

Name	Description
0	Always return 0.

7.35.7.3 Function steps

- Wait for dlist processing to complete.

7.35.8 d1_allocmem

```
d1_allocmem (  d1_uint_t size )
```

7.35.8.1 Brief description

Allocates memory in the driver heap.

7.35.8.2 Detailed description

Table 982:Parameters

Name	Direction	Description
size	in	Size of the memory to be allocated.

Table 983:Return values

Name	Description
Non-NULL	The function returns the pointer to memory chunk if memory allocation was successful.
NULL	The function returns NULL if memory allocation was failed.

7.35.8.3 Function steps

- Create a byte memory pool in the driver heap if this function call is the first time.
- Allocate memory from a byte memory pool.

7.35.9 d1_freemem

```
d1_freemem (  void * ptr )
```

7.35.9.1 Brief description

Free the specified memory area in the driver heap.

7.35.9.2 Detailed description

Table 984:Parameters

Name	Direction	Description
ptr	in	Pointer to the memory area to be freed.

7.35.9.3 Function steps

- Free specified memory allocated by d1_allocmem.

7.35.10 d1_memsize

```
d1_memsize (  void * ptr )
```

7.35.10.1 Brief description

This function intends to return the size of the given memory block but we don't return valid value. This function returns always 1.

7.35.10.2 Detailed description

Table 985:Parameters

Name	Direction	Description
ptr	in	Pointer to a memory block in Heap.

Table 986:Return values

Name	Description
1	The function always return 1.

7.35.10.3 Function steps

- Always return 1.

7.35.11 d1_allocvidmem

```
d1_allocvidmem (  d1_device * handle ,   d1_int_t memtype ,   d1_uint_t size )
```

7.35.11.1 Brief description

Allocate video memory. Synergy does not use the virtual memory space so this function exactly works same as d1_allocmem.

7.35.11.2 Detailed description

Table 987:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
memtype	in	Type of memory.

Table 987:Parameters (Continued)

Name	Direction	Description
size	in	Number of bytes.

Table 988:Return values

Name	Description
Non-NULL	The function returns the pointer to memory chunk if memory allocation was successful.
NULL	The function returns Null if memory allocation was failed.

7.35.12 d1_freevidmem

```
d1_freevidmem (  d1_device * handle ,   d1_int_t memtype ,   void * ptr )
```

7.35.12.1 Brief description

Free video memory. Synergy does not use the virtual memory space so this function exactly works same as d1_freemem.

7.35.12.2 Detailed description

Table 989:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
memtype	in	Type of memory.
ptr	in	Address returned by d1_allocvidmem.

7.35.13 d1_queryvidmem

```
d1_queryvidmem (  d1_device * handle ,   d1_int_t memtype ,   d1_int_t query )
```

7.35.13.1 Brief description

Get current memory status. This function does not do anything special.

7.35.13.2 Detailed description

Table 990:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
memtype	in	Type of memory.
query	in	Type of requested information.

Table 991:Return values

Name	Description
0	The function always return 0.

7.35.14 d1_queryarchitecture

```
d1_queryarchitecture (  d1_device * handle )
```

7.35.14.1 Brief description

Return hints about systems memory architecture.

7.35.14.2 Detailed description

Table 992:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.

Table 993:Return values

Name	Description
d1_ma_unified	The function always return d1_ma_unified (Unified memory architecture).

7.35.15 d1_mapvidmem

```
d1_mapvidmem (  d1_device * handle ,   void * ptr ,   d1_int_t flags )
```

7.35.15.1 Brief description

Map video memory for direct CPU access. Synergy does not use the virtual memory space so this function does not do anything special.

7.35.15.2 Detailed description

Table 994:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
ptr	in	Video memory address returned by d1_allocvidmem.
flags	in	Memory mapping flags.

Table 995:Return values

Name	Description
ptr	The function just returns ptr back since no mapping required for Synergy.

7.35.16 d1_unmapvidmem

```
d1_unmapvidmem (  d1_device * handle ,   void * ptr )
```

7.35.16.1 Brief description

Release memory mapping. Synergy does not use the virtual memory space so this function does not do anything special.

7.35.16.2 Detailed description

Table 996:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
ptr	in	Mapped video memory address returned by d1_mapvidmem.

Table 997:Return values

Name	Description
1	The function always return 1.

7.35.17 d1_maptovidmem

```
d1_maptovidmem (  d1_device * handle ,   void * ptr )
```

7.35.17.1 Brief description

Map CPU accessible address of a video memory block back to video memory address. Synergy does not use the virtual memory space so this function does not do anything special.

7.35.17.2 Detailed description

Table 998:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
ptr	in	CPU accessible address pointing to a video memory block originally allocated using d1_allocvidmem.

Table 999:Return values

Name	Description
ptr	The function just returns ptr back since no mapping required for Synergy.

7.35.18 d1_mapfromvidmem

```
d1_mapfromvidmem (  d1_device * handle ,   void * ptr )
```

7.35.18.1 Brief description

Map already allocated video memory address to an address for direct CPU access.

7.35.18.2 Detailed description

Table 1000:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
ptr	in	Video memory address returned by d1_allocvidmem.

Table 1001:Return values

Name	Description
ptr	The function just returns ptr back since no mapping required for Synergy.

7.35.19 d1_copytovidmem

```
d1_copytovidmem (  d1_device * handle ,   void * dst ,   const void * src ,
 d1_uint_t size ,   d1_int_t flags )
```

7.35.19.1 Brief description

Copy data to video memory. Destination (video) memory area has to be allocated by d1_allocvidmem.

7.35.19.2 Detailed description

Table 1002:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
dst	in	pointer into video memory (destination).
src	in	Pointer into system memory (source).
size	in	Number of bytes to copy.
flags	in	Bitfield containing additional information on data to be copied.

Table 1003:Return values

Name	Description
1	The function always return 1.

7.35.19.3 Function steps

- Simply use C standard memcpy.

7.35.20 d1_copyfromvidmem

```
d1_copyfromvidmem (  d1_device * handle ,   void * dst ,   const void * src ,
 d1_uint_t size ,   d1_int_t flags )
```

7.35.20.1 Brief description

Copy data from video memory. Source (video) memory area has to be allocated by d1_allocvidmem.

7.35.20.2 Detailed description

Table 1004:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
dst	in	pointer into system memory (destination).
src	in	Pointer into video memory (source).
size	in	Number of bytes to copy.
flags	in	Reserved for future use.

Table 1005:Return values

Name	Description
1	The function always return 1.

7.35.20.3 Function steps

- Simply use C standard memcpy.

7.35.21 d1_cacheflush

```
d1_cacheflush (  d1_device * handle ,   d1_int_t memtype )
```

7.35.21.1 Brief description

Flush CPU data caches. Synergy does not have a cache memory so does not do anything special.

7.35.21.2 Detailed description

Table 1006:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.

Table 1006:Parameters (Continued)

Name	Direction	Description
memtype	in	Memory pools to flush (can be ored together).

Table 1007:Return values

Name	Description
1	The function always return 1.

7.35.22 d1_cacheblockflush

```
d1_cacheblockflush ( d1_device * handle , d1_int_t memtype , const void
* ptr , d1_uint_t size )
```

7.35.22.1 Brief description

Flush part of CPU data caches. Synergy does not have a cache memory so does not do anything special.

7.35.22.2 Detailed description

Table 1008:Parameters

Name	Direction	Description
handle	in	Pointer to the d1_device object.
memtype	in	Memory pools to flush (can be ored together).
ptr	in	Start address of memory to be flushed.
size	in	Size of memory to be flushed.

Table 1009:Return values

Name	Description
1	The function always return 1.

Chapter 8 API Reference: HAL Driver Interfaces

8.1 API Reference: HAL Interfaces

The HAL Interfaces offer common APIs for functional use cases. They can be implemented by one or more HAL layer drivers. Framework Layer drivers connect to these HAL drivers through the Interface Layer.

- ADC Interface
- AES Interface
- ARC4 Interface
- CAC Interface
- CAN Interface
- CGC Interface
- COMPARATOR Interface
- CRC Interface
- CTSU Interface
- DAC Interface
- Display Interface
- DOC Interface
- ELC Interface
- External IRQ Interface
- Flash Interface
- FMI Interface
- HASH Algorithm Interface
- I2C Master Interface
- I2S Interface
- Input Capture Interface
- I/O Port Interface
- JPEG Decode Interface
- JPEG Encode Interface
- Key Matrix Interface
- Low Power Modes Interface

- Low Power Modes V2 Interface
- Low Voltage Detection Interface
- OPAMP Interface
- PDC Interface
- Quad SPI Flash Interface
- RTC Interface
- SD/MMC Interface
- SLCDC Interface
- SPI Interface
- Timer Interface
- Transfer Interface
- Random number generation
- UART Interface
- WDT Interface

8.2 ADC Interface

Interface for A/D Converters.

8.2.1 Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

Implemented by: ADC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

ADC Interface description: ADC Driver

8.2.2 Interface API

adc_api_t

Function name	Description
.open	Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.
.scanCfg	Configure the scan including the channels, groups and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.
.scanStart	Start the scan (in case of a software trigger), or enable the hardware trigger.
.scanStop	Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.
.scanStatusGet	Check scan status.
.read	Read ADC conversion result.
.read32	Read ADC conversion result into a 32-bit word.
.sampleStateCountSet	Set the sample state count for the specified channel. Not supported for all implementations. See implementation for details.
.calibrate	Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details.
.offsetSet	Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.
.close	Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.
.infoGet	Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.
.versionGet	Retrieve the API version.

8.2.3 Data structures

- adc_sample_state_t
- adc_callback_args_t
- adc_info_t
- adc_channel_cfg_t
- adc_cfg_t
- adc_instance_t

8.2.4 Enumerations

- adc_mode_t
- adc_resolution_t
- adc_alignment_t
- adc_add_t
- adc_clear_t
- adc_trigger_t
- adc_sample_state_reg_t
- adc_cb_event_t
- adc_group_a_t
- adc_register_t

8.2.5 Typedefs

- adc_data_size_t
- adc_ctrl_t

8.2.6 Defines

- #define ADC_API_VERSION_MAJOR

  Initial value: `(1U)`

  Includes board and MCU related header files. Version Number of API.
- #define ADC_API_VERSION_MINOR

  Initial value: `(6U)`

8.2.7 API Data

8.2.7.1 adc_mode_t

adc_mode_t

Detailed description

ADC operation mode definitions

Enumerated values

Name	Description
ADC_MODE_SINGLE_SCAN	Single scan - one or more channels.
ADC_MODE_GROUP_SCAN	Two trigger sources to trigger scan for two groups which contain one or more channels.
ADC_MODE_CONTINUOUS_SCAN	Continuous scan - one or more channels.

8.2.7.2 adc_resolution_t

adc_resolution_t

Detailed description

ADC data resolution definitions

Enumerated values

Name	Description
ADC_RESOLUTION_12_BIT	12 bit resolution
ADC_RESOLUTION_10_BIT	10 bit resolution
ADC_RESOLUTION_8_BIT	8 bit resolution
ADC_RESOLUTION_14_BIT	14 bit resolution
ADC_RESOLUTION_16_BIT	16 bit resolution
ADC_RESOLUTION_24_BIT	24 bit resolution

8.2.7.3 adc_alignment_t

adc_alignment_t

Detailed description

ADC data alignment definitions

Enumerated values

Name	Description
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

8.2.7.4 adc_add_t

`adc_add_t`

Detailed description

ADC data sample addition and averaging options

Enumerated values

Name	Description
ADC_ADD_OFF	Addition turned off for channels/sensors.
ADC_ADD_TWO	Add two samples.
ADC_ADD_THREE	Add three samples.
ADC_ADD_FOUR	Add four samples.
ADC_ADD_SIXTEEN	Add sixteen samples.
ADC_ADD_AVERAGE_TWO	Average two samples.
ADC_ADD_AVERAGE_FOUR	Average four samples.
ADC_ADD_AVERAGE_SIXTEEN	Add sixteen samples.

8.2.7.5 adc_clear_t

`adc_clear_t`

Detailed description

ADC clear after read definitions

Enumerated values

Name	Description
ADC_CLEAR_AFTER_READ_OFF	Clear after read off.
ADC_CLEAR_AFTER_READ_ON	Clear after read on.

8.2.7.6 adc_trigger_t

`adc_trigger_t`

Detailed description

ADC trigger mode definitions

Enumerated values

Name	Description
ADC_TRIGGER_ASYNC_EXT_TRG0	External asynchronous trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.

8.2.7.7 adc_sample_state_reg_t

`adc_sample_state_reg_t`

Detailed description

ADC sample state registers

Enumerated values

Name	Description
ADC_SAMPLE_STATE_CHANNEL_0	Sample state register channel 0.
ADC_SAMPLE_STATE_CHANNEL_1	Sample state register channel 1.
ADC_SAMPLE_STATE_CHANNEL_2	Sample state register channel 2.
ADC_SAMPLE_STATE_CHANNEL_3	Sample state register channel 3.
ADC_SAMPLE_STATE_CHANNEL_4	Sample state register channel 4.
ADC_SAMPLE_STATE_CHANNEL_5	Sample state register channel 5.

Name	Description
ADC_SAMPLE_STATE_CHANNEL_6	Sample state register channel 6.
ADC_SAMPLE_STATE_CHANNEL_7	Sample state register channel 7.
ADC_SAMPLE_STATE_CHANNEL_8	Sample state register channel 8.
ADC_SAMPLE_STATE_CHANNEL_9	Sample state register channel 9.
ADC_SAMPLE_STATE_CHANNEL_10	Sample state register channel 10.
ADC_SAMPLE_STATE_CHANNEL_11	Sample state register channel 11.
ADC_SAMPLE_STATE_CHANNEL_12	Sample state register channel 12.
ADC_SAMPLE_STATE_CHANNEL_13	Sample state register channel 13.
ADC_SAMPLE_STATE_CHANNEL_14	Sample state register channel 14.
ADC_SAMPLE_STATE_CHANNEL_15	Sample state register channel 15.
ADC_SAMPLE_STATE_CHANNEL_16_TO_21	Sample state register channel 16 to 21 for unit 0 on S7G2.
ADC_SAMPLE_STATE_CHANNEL_16_TO_20	Sample state register channel 16 to 20 for unit 1 on S7G2.
ADC_SAMPLE_STATE_CHANNEL_16_TO_27	Sample state register channel 16 to 27 for unit 0 on S3A7.
ADC_SAMPLE_STATE_TEMPERATURE	Sample state register channel temperature.
ADC_SAMPLE_STATE_VOLTAGE	Sample state register channel voltage.

8.2.7.8 adc_cb_event_t

`adc_cb_event_t`

Detailed description

ADC callback event definitions

Enumerated values

Name	Description
ADC_EVENT_SCAN_COMPLETE	Normal/Group A scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_B	Group B scan complete.
ADC_EVENT_CALIBRATION_COMPLETE	Calibration complete.

Name	Description
ADC_EVENT_CONVERSION_COMPLETE	Conversion complete.

8.2.7.9 adc_group_a_t

`adc_group_a_t`

Detailed description

ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode.

Enumerated values

Name	Description
ADC_GROUP_A_PRIORITY_OFF	Group A ignored and does not interrupt ongoing group B scan.
ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER	Group A interrupts Group B(single scan) which restarts at next Group B trigger.
ADC_GROUP_A_GROUP_B_RESTART_SCAN	Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete.
ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN	Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger.

8.2.7.10 adc_register_t

`adc_register_t`

Detailed description

ADC registers used for the Read() argument

Enumerated values

Name	Description
ADC_REG_CHANNEL_0	ADC channel 0.
ADC_REG_CHANNEL_1	ADC channel 1.
ADC_REG_CHANNEL_2	ADC channel 2.
ADC_REG_CHANNEL_3	ADC channel 3.

Name	Description
ADC_REG_CHANNEL_4	ADC channel 4.
ADC_REG_CHANNEL_5	ADC channel 5.
ADC_REG_CHANNEL_6	ADC channel 6.
ADC_REG_CHANNEL_7	ADC channel 7.
ADC_REG_CHANNEL_8	ADC channel 8.
ADC_REG_CHANNEL_9	ADC channel 9.
ADC_REG_CHANNEL_10	ADC channel 10.
ADC_REG_CHANNEL_11	ADC channel 11.
ADC_REG_CHANNEL_12	ADC channel 12.
ADC_REG_CHANNEL_13	ADC channel 13.
ADC_REG_CHANNEL_14	ADC channel 14.
ADC_REG_CHANNEL_15	ADC channel 15.
ADC_REG_CHANNEL_16	ADC channel 16.
ADC_REG_CHANNEL_17	ADC channel 17.
ADC_REG_CHANNEL_18	ADC channel 18.
ADC_REG_CHANNEL_19	ADC channel 19.
ADC_REG_CHANNEL_20	ADC channel 20.
ADC_REG_CHANNEL_21	ADC channel 21.
ADC_REG_CHANNEL_22	ADC channel 22.
ADC_REG_CHANNEL_23	ADC channel 23.
ADC_REG_CHANNEL_24	ADC channel 24.
ADC_REG_CHANNEL_25	ADC channel 25.
ADC_REG_CHANNEL_26	ADC channel 26.
ADC_REG_CHANNEL_27	ADC channel 27.

Name	Description
ADC_REG_TEMPERATURE	ADC channel temperature.
ADC_REG_VOLT	ADC channel volt.

8.2.7.11 adc_data_size_t

```
typedef uint16_t adc_data_size_t
```

8.2.7.12 adc_ctrl_t

```
typedef void adc_ctrl_t
```

Detailed description

ADC control block. Allocate using driver instance control structure from driver instance header file.

8.2.8 API Structures

8.2.8.1 adc_sample_state_t

adc_sample_state_t

Detailed description

ADC sample state configuration

Variables

- adc_sample_state_reg_t reg_id

  Sample state register ID.

- uint8_t num_states

  Number of sampling states for conversion. Ch16-20/21 use the same value.

8.2.8.2 adc_callback_args_t

adc_callback_args_t

Detailed description

ADC callback arguments definitions

Variables

- uint16_t unit

  ADC device in use.

- adc_cb_event_t event

  ADC callback event.

- void const * p_context

  Placeholder for user data.

- adc_register_t channel

  Channel of conversion result. Only valid for ADC_EVENT_CONVERSION_COMPLETE.

8.2.8.3 adc_info_t

adc_info_t

Detailed description

ADC Information Structure for Transfer Interface

Variables

- __I uint16_t * p_address

  The address to start reading the data from.

- uint32_t length

  The total number of transfers to read.

- transfer_size_t transfer_size

  The size of each transfer.

- elc_peripheral_t elc_peripheral

  Name of the peripheral in the ELC list.

- elc_event_t elc_event

  Name of the ELC event for the peripheral.

- uint32_t calibration_data

  Temperature sensor calibration data (0xFFFFFFFF if unsupported). Refer to hardware manual for steps on using slope with calibration data to determine temperature

- int16_t slope_microvolts

  Temperature sensor slope in microvolts/°C.

- bool calibration_ongoing

  Calibration is in progress.

8.2.8.4 adc_channel_cfg_t

adc_channel_cfg_t

Detailed description

ADC channel(s) configuration

Variables

- uint32_t scan_mask

  Channels/bits: bit 0 is ch0; bit 15 is ch15. Use #define ADC_MASK_xxx from r_adc.h.
- uint32_t scan_mask_group_b

  Valid for group modes. Use #define ADC_MASK_xxx from r_adc.h.
- adc_group_a_t priority_group_a

  Valid for group modes.
- uint32_t add_mask

  Valid if add enabled in Open(). Use #define ADC_MASK_xxx from r_adc.h.
- uint8_t sample_hold_mask

  Channels/bits 0-2. Use #define ADC_MASK_xxx from r_adc.h.
- uint8_t sample_hold_states

  Number of states to be used for sample and hold. Affects channels 0-2.

8.2.8.5 adc_cfg_t

adc_cfg_t

Detailed description

ADC general configuration

Variables

- uint16_t unit

  ADC Unit to be used.
- adc_mode_t mode

  ADC operation mode.
- adc_resolution_t resolution

  ADC resolution 8, 10, or 12-bit.
- adc_alignment_t alignment

  Specify left or right alignment; ignored if addition used.
- adc_add_t add_average_count

  Add or average samples.
- adc_clear_t clearing

  Clear after read.
- adc_trigger_t trigger

  Default and Group A trigger source.
- adc_trigger_t trigger_group_b

  Group B trigger source; valid only for group mode.

- uint8_t scan_end_ipl

  Scan end interrupt priority.
- uint8_t scan_end_b_ipl

  Scan end group B interrupt priority.
- bool calib_adc_skip

  Option to perform calibration when channels are configured.
- void(* p_callback)(adc_callback_args_t *p_args)

  Callback function; set to NULL for none.
- void const * p_context

  Placeholder for user data. Passed to the user callback in adc_api_t::adc_callback_args_t.
- void const * p_extend

  Extension parameter for hardware specific settings.

8.2.8.6 adc_api_t

adc_api_t

Detailed description

ADC functions implemented at the HAL layer will follow this API.

8.2.8.7 open

```
ssp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const
p_cfg)
```

Detailed description

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors. Implemented as

- R_ADC_Open
- R_SDADC_Open

NOTE: Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

Table 1010:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Table 1010:Parameters (Continued)

Name	Direction	Description
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter p_cfg

Definition: `adc_cfg_t const *const p_cfg`

ADC general configuration

- `adc_cfg_t`::`unit`

  ADC Unit to be used.

- `adc_cfg_t`::`adc_mode_t`

  ADC operation mode.

  Enumerated as:

  – ADC_MODE_SINGLE_SCAN

  – ADC_MODE_GROUP_SCAN

  – ADC_MODE_CONTINUOUS_SCAN

- `adc_cfg_t`::`adc_resolution_t`

  ADC resolution 8, 10, or 12-bit.

  Enumerated as:

  – ADC_RESOLUTION_12_BIT

  – ADC_RESOLUTION_10_BIT

  – ADC_RESOLUTION_8_BIT

  – ADC_RESOLUTION_14_BIT

  – ADC_RESOLUTION_16_BIT

  – ADC_RESOLUTION_24_BIT

- `adc_cfg_t`::`adc_alignment_t`

  Specify left or right alignment; ignored if addition used.

  Enumerated as:

  – ADC_ALIGNMENT_RIGHT

  – ADC_ALIGNMENT_LEFT

- adc_cfg_t::adc_add_t

  Add or average samples.

  Enumerated as:

  – ADC_ADD_OFF
  – ADC_ADD_TWO
  – ADC_ADD_THREE
  – ADC_ADD_FOUR
  – ADC_ADD_SIXTEEN
  – ADC_ADD_AVERAGE_TWO
  – ADC_ADD_AVERAGE_FOUR
  – ADC_ADD_AVERAGE_SIXTEEN

- adc_cfg_t::adc_clear_t

  Clear after read.

  Enumerated as:

  – ADC_CLEAR_AFTER_READ_OFF
  – ADC_CLEAR_AFTER_READ_ON

- adc_cfg_t::adc_trigger_t

  Default and Group A trigger source.

  Enumerated as:

  – ADC_TRIGGER_ASYNC_EXT_TRG0
  – ADC_TRIGGER_SYNC_ELC
  – ADC_TRIGGER_SOFTWARE

- adc_cfg_t::adc_trigger_t

  Group B trigger source; valid only for group mode.

  Enumerated as:

  – ADC_TRIGGER_ASYNC_EXT_TRG0
  – ADC_TRIGGER_SYNC_ELC
  – ADC_TRIGGER_SOFTWARE

- adc_cfg_t::scan_end_ipl

  Scan end interrupt priority.

- adc_cfg_t::scan_end_b_ipl

  Scan end group B interrupt priority.

- adc_cfg_t::calib_adc_skip

  Option to perform calibration when channels are configured.

- adc_cfg_t::p_callback

  Callback function; set to NULL for none.

- adc_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in adc_api_t::adc_callback_args_t.

- adc_cfg_t::p_extend

  Extension parameter for hardware specific settings.

8.2.8.8 scanCfg

```
ssp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, adc_channel_cfg_t
const *const p_channel_cfg)
```

Detailed description

Configure the scan including the channels, groups and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details. Implemented as

- R_ADC_ScanConfigure
- R_SDADC_ScanConfigure

Table 1011:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_channel_cfg	in	Pointer to scan configuration structure

Parameter p_ctrl

Definition: adc_ctrl_t*const p_ctrl

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter p_channel_cfg

Definition: adc_channel_cfg_t const *const p_channel_cfg

ADC channel(s) configuration

- adc_channel_cfg_t::scan_mask

  Channels/bits: bit 0 is ch0; bit 15 is ch15. Use #define ADC_MASK_xxx from r_adc.h.

- adc_channel_cfg_t::scan_mask_group_b

  Valid for group modes. Use #define ADC_MASK_xxx from r_adc.h.
- adc_channel_cfg_t::adc_group_a_t

  Valid for group modes.

  Enumerated as:

  – ADC_GROUP_A_PRIORITY_OFF

  – ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER

  – ADC_GROUP_A_GROUP_B_RESTART_SCAN

  – ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN
- adc_channel_cfg_t::add_mask

  Valid if add enabled in Open(). Use #define ADC_MASK_xxx from r_adc.h.
- adc_channel_cfg_t::sample_hold_mask

  Channels/bits 0-2. Use #define ADC_MASK_xxx from r_adc.h.
- adc_channel_cfg_t::sample_hold_states

  Number of states to be used for sample and hold. Affects channels 0-2.

8.2.8.9 scanStart

```
ssp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)
```

Detailed description

Start the scan (in case of a software trigger), or enable the hardware trigger. Implemented as

- R_ADC_ScanStart
- R_SDADC_ScanStart

Table 1012:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: adc_ctrl_t*const p_ctrl

ADC control block. Allocate using driver instance control structure from driver instance header file.

8.2.8.10 scanStop

```
ssp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)
```

Detailed description

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger. Implemented as

- R_ADC_ScanStop
- R_SDADC_ScanStop

Table 1013:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

8.2.8.11 scanStatusGet

```
ssp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl)
```

Detailed description

Check scan status. Implemented as

- R_ADC_CheckScanDone
- R_SDADC_CheckScanDone

Table 1014:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

8.2.8.12 read

```
ssp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_register_t const
reg_id, uint16_t *const p_data)
```

Detailed description

Read ADC conversion result. Implemented as

- R_ADC_Read

- R_SDADC_Read

Table 1015:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
reg_id	in	ADC channel to read (see enumeration adc_register_t)
p_data	in	Pointer to variable to load value into.

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter reg_id

Definition: `adc_register_tconst reg_id`

ADC registers used for the Read() argument

Parameter p_data

`uint16_t`

8.2.8.13 read32

```
ssp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_register_t const
reg_id, uint32_t *const p_data)
```

Detailed description

Read ADC conversion result into a 32-bit word. Implemented as

- R_SDADC_Read32

Table 1016:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
reg_id	in	ADC channel to read (see enumeration adc_register_t)
p_data	in	Pointer to variable to load value into.

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter reg_id

Definition: adc_register_tconst reg_id

ADC registers used for the Read() argument

Parameter p_data

uint32_t

8.2.8.14 sampleStateCountSet

```
ssp_err_t(* adc_api_t::sampleStateCountSet) (adc_ctrl_t *const p_ctrl,
adc_sample_state_t *p_sample)
```

Detailed description

Set the sample state count for the specified channel. Not supported for all implementations. See implementation for details. Implemented as

- R_ADC_SetSampleStateCount

Table 1017:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_sample	in	Pointer to the ADC channels and corresponding sample states to be set

Parameter p_ctrl

Definition: adc_ctrl_t*const p_ctrl

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter p_sample

Definition: adc_sample_state_t*p_sample

ADC sample state configuration

- adc_sample_state_t::reg_id

  Sample state register ID.

- adc_sample_state_t::num_states

  Number of sampling states for conversion. Ch16-20/21 use the same value.

8.2.8.15 calibrate

```
ssp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void *const p_extend)
```

Detailed description

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details. Implemented as

- R_SDADC_Calibrate

Table 1018:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_extend	in	Pointer to implementation specific arguments

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter p_extend

`const`

8.2.8.16 offsetSet

```
ssp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_register_t const reg_id, int32_t const offset)
```

Detailed description

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details. Implemented as

- R_SDADC_OffsetSet

Table 1019:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
reg_id	in	ADC channel to read (see enumeration adc_register_t)
offset	in	See implementation for details.

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter reg_id

Definition: adc_register_tconst reg_id

ADC registers used for the Read() argument

Parameter offset

8.2.8.17 close

```
ssp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)
```

Detailed description

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit. Implemented as

- R_ADC_Close
- R_SDADC_Close

Table 1020:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: adc_ctrl_t*const p_ctrl

ADC control block. Allocate using driver instance control structure from driver instance header file.

8.2.8.18 infoGet

```
ssp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const
p_adc_info)
```

Detailed description

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data. Implemented as

- R_ADC_InfoGet
- R_SDADC_InfoGet

Table 1021:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_adc_info	out	Pointer to ADC information structure

Parameter p_ctrl

Definition: `adc_ctrl_t*const p_ctrl`

ADC control block. Allocate using driver instance control structure from driver instance header file.

Parameter p_adc_info

Definition: `adc_info_t*const p_adc_info`

ADC Information Structure for Transfer Interface

- `adc_info_t::p_address`

  The address to start reading the data from.

- `adc_info_t::length`

  The total number of transfers to read.

- `adc_info_t::transfer_size`

  The size of each transfer.

- `adc_info_t::elc_peripheral`

  Name of the peripheral in the ELC list.

- `adc_info_t::elc_event`

  Name of the ELC event for the peripheral.

- `adc_info_t::calibration_data`

  Temperature sensor calibration data (0xFFFFFFFF if unsupported). Refer to hardware manual for steps on using slope with calibration data to determine temperature

- `adc_info_t::slope_microvolts`

  Temperature sensor slope in microvolts/°C.

- `adc_info_t::calibration_ongoing`

  Calibration is in progress.

8.2.8.19 versionGet

```
ssp_err_t(* adc_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Retrieve the API version. Implemented as

- R_ADC_VersionGet
- R_SDADC_VersionGet

NOTE: This function retrieves the API version.

Table 1022:Parameters

Name	Direction	Description
p_version	in	Pointer to version structure

Parameter p_version

8.2.8.20 adc_instance_t

adc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- adc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- adc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- adc_channel_cfg_t const * p_channel_cfg

  Pointer to the channel configuration structure for this instance.
- adc_api_t const * p_api

  Pointer to the API structure for this instance.

8.3 AES Interface

AES encryption and decryption APIs.

8.3.1 Interface API

aes_api_t

Function name	Description
.open	AES module open function. Must be called before performing any encrypt/decrypt operations.
.createKey	Generate an AES key for encrypt / decrypt operations.

Function name	Description
.encrypt	AES encryption. Encrypt input data with ECB mode using a 128-bit AES key
.addAdditionalAuthenticationData	Add additional authentication data (called before starting an encryption or decryption operation)
.encryptFinal	AES final encryption using the chaining mode and padding mode specified in the aes.open() function call.
.decrypt	AES Decryption. Decrypt input data with ECB mode using a 128-bit AES key
.setGcmTag	set parameter specific to the mode
.getGcmTag	Get authentication tag data.
.close	Close the AES module.
.zeroPaddingEncrypt	AES zero padding encryption using the chaining mode and padding mode specified. Implementation for GCM mode only API usage -.
.zeroPaddingDecrypt	AES zero padding decryption using the chaining mode and padding mode specified. Implementation for GCM mode only API usage -.
.versionGet	Gets version and stores it in provided pointer p_version.

8.3.2 Data structures

- aes_ctrl_t

8.3.4 Defines

- #define AES_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define AES_API_VERSION_MINOR

  Initial value: `(0U)`
- #define DRV_AES_CONTEXT_BUFFER_SIZE

  Initial value: `(64)`

- #define AES_XTS_128_WRAPPPED_SECRET_KEY_SIZE_BYTES

  Initial value: `(52)`

  Return Wrapped AES-XTS secret key size in bytes for a 128-bit AES XTS Mode Key
- #define AES_XTS_256_WRAPPPED_SECRET_KEY_SIZE_BYTES

  Initial value: `(84)`

  Return AES-XTS secret key size in bytes for a 256-bit AES XTS Mode Key
- #define AES128_WRAPPPED_SECRET_KEY_SIZE_BYTES

  Initial value: `(36)`

  Return Wrapped AES secret key size in bytes for a 128-bit AES Key
- #define AES192_WRAPPPED_SECRET_KEY_SIZE_BYTES

  Initial value: `(52)`

  Return Wrapped AES secret key size in bytes for a 192-bit AES Key
- #define AES256_WRAPPPED_SECRET_KEY_SIZE_BYTES

  Initial value: `(52)`

  Return Wrapped AES secret key size in bytes for a 256-bit AES Key
- #define AES128_SECRET_KEY_SIZE_BYTES

  Initial value: `(16)`

  Return AES secret key size in bytes for a 128-bit AES Key
- #define AES192_SECRET_KEY_SIZE_BYTES

  Initial value: `(24)`

  Return AES secret key size in bytes for a 192-bit AES Key
- #define AES256_SECRET_KEY_SIZE_BYTES

  Initial value: `(32)`

  Return AES secret key size in bytes for a 256-bit AES Key

AES Interface control structure

Variables

- crypto_ctrl_t * p_crypto_ctrl

  pointer to crypto engine control structure
- crypto_api_t const * p_crypto_api

  pointer to crypto engine API
- uint32_t work_buffer[DRV_AES_CONTEXT_BUFFER_SIZE]

  Examples: AES-GCM mode uses this for storing authentication tag etc.

  used for storing context/state of the Cipher

8.3.34.2 aes_cfg_t

aes_cfg_t

Detailed description

AES Interface configuration structure. User must fill in these values before invoking the open() function

Variables

- crypto_api_t const * p_crypto_api

  pointer to crypto engine api

8.3.34.3 aes_api_t

aes_api_t

Detailed description

AES_Interface SCE functions implemented at the HAL layer will follow this API.

8.3.34.4 open

```
uint32_t(* aes_api_t::open) (aes_ctrl_t *const p_ctrl, aes_cfg_t const *const
p_cfg)
```

Detailed description

AES module open function. Must be called before performing any encrypt/decrypt operations.

Table 1023:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to control structure for the AES interface. Must be declared by user. Elements are set here.
p_cfg	in	pointer to control structure for the AES configuration. All elemenets of this structure must be set by user.

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

Parameter p_cfg

Definition: `aes_cfg_t const *const p_cfg`

AES Interface configuration structure. User must fill in these values before invoking the open() function

- `aes_cfg_t`::`p_crypto_api`

  pointer to crypto engine api

8.3.34.5 createKey

```
uint32_t(* aes_api_t::createKey) (aes_ctrl_t *const p_ctrl, uint32_t num_words,
uint32_t *p_key)
```

Brief description

Generate an AES key for encrypt / decrypt operations.

Detailed description

Table 1024:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to control structure for the AES interface.
num_words	in	number of words in buffer p_key
p_key	out	pointer to key buffer. Generated key will be stored at this location.

Parameter p_ctrl

Definition: aes_ctrl_t

AES Interface control structure

Parameter num_words

uint32_t

Parameter p_key

uint32_t

8.3.34.6 encrypt

```
uint32_t(* aes_api_t::encrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key,
uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)
```

Brief description

AES encryption.

Detailed description

Encrypt input data with ECB mode using a 128-bit AES key

Table 1025:Parameters

Name	Direction	Description
*p_key	in	pointer to the AES plain-text key
*p_iv	in	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
num_words	in	data buffer size in words. Each word is 4-bytes. multiples of 4
*p_source	in	input data buffer
*p_dest	out	output data buffer

Parameter *p_key

uint32_t

Parameter *p_iv

uint32_t

Parameter num_words

uint32_t

Parameter *p_source

uint32_t

Parameter *p_dest

uint32_t

8.3.34.7 addAdditionalAuthenticationData

```
uint32_t(* aes_api_t::addAdditionalAuthenticationData) (aes_ctrl_t *const p_ctrl,
const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source)
```

Brief description

Add additional authentication data (called before starting an encryption or decryption operation)

Detailed description

Table 1026:Parameters

Name	Direction	Description
*p_key	in	pointer to the AES plain-text key
*p_iv	in	unused for ECB mode
num_words	in	data buffer size in words. Each word is 4-bytes. multiples of 4
*p_source	in	input data buffer

Parameter *p_key

uint32_t

Parameter *p_iv

uint32_t

Parameter num_words

uint32_t

Parameter *p_source

uint32_t

8.3.34.8 encryptFinal

```
uint32_t(* aes_api_t::encryptFinal) (aes_ctrl_t *const p_ctrl, const uint32_t
*p_key, uint32_t *p_iv, uint32_t input_num_words, uint32_t *p_source, uint32_t
output_num_words, uint32_t *p_dest)
```

Brief description

AES final encryption using the chaining mode and padding mode specified in the aes.open() function call.

8.3.34.9 decrypt

```
uint32_t(* aes_api_t::decrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key,
uint32_t *p_iv, uint32_t imaxcnt, uint32_t *p_source, uint32_t *p_dest)
```

Brief description

AES Decryption.

Detailed description

Decrypt input data with ECB mode using a 128-bit AES key

Table 1027:Parameters

Name	Direction	Description
*p_key	in	128-bit plain key
*p_iv	in	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
num_words	in	Size in words of p_source and p_dest data buffers. Each word is 4-bytes. Must be multiples of 4 words.
*p_source	in	input data buffer
*p_dest	out	output data buffer

Parameter *p_key

`uint32_t`

Parameter *p_iv

`uint32_t`

Parameter num_words
Parameter *p_source

`uint32_t`

Parameter *p_dest

`uint32_t`

8.3.34.10 setGcmTag

```
uint32_t(* aes_api_t::setGcmTag) (aes_ctrl_t *const p_ctrl, uint32_t num_words,
uint32_t *p_source)
```

Brief description

set parameter specific to the mode

Detailed description

Table 1028:Parameters

Name	Direction	Description
p_ctrl	in	pointer to the control structure
num_words	in	number of words in p_source buffer. This must be atleast 4 words
p_source	in	pointer to authentication tag data buffer, must be of size 4 words.

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

Parameter num_words

`uint32_t`

Parameter p_source

`uint32_t`

8.3.34.11 getGcmTag

```
uint32_t(* aes_api_t::getGcmTag) (aes_ctrl_t *const p_ctrl, uint32_t num_words,
uint32_t *p_dest)
```

Brief description

Get authentication tag data.

Detailed description

Table 1029:Parameters

Name	Direction	Description
p_ctrl	in	pointer to the control structure
num_words	in	number of words in p_dest buffer. This must be atleast 4 words
p_dest	in	pointer to data buffer, must be of size 4 words.

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

Parameter num_words

`uint32_t`

Parameter p_dest

`uint32_t`

8.3.34.12 close

```
uint32_t(* aes_api_t::close) (aes_ctrl_t *const p_ctrl)
```

Detailed description

Close the AES module.

Table 1030:Parameters

Name	Direction	Description
p_ctrl	in	pointer to the control structure

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

8.3.34.13 zeroPaddingEncrypt

```
uint32_t(* aes_api_t::zeroPaddingEncrypt) (aes_ctrl_t *const p_ctrl, const
uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t
*p_dest)
```

Brief description

AES zero padding encryption using the chaining mode and padding mode specified. Implementation for GCM mode only API usage -.

Detailed description

1) Provide any Add Authentication Data (AAD): set p_dest = NULL
2) Encryption: set p_source to input data and p_dest will return encrypted data
3) Get/Compute Tag: set p_source = NULL

Table 1031:Parameters

Name	Direction	Description
p_ctrl	in	pointer to the control structure

Table 1031:Parameters (Continued)

Name	Direction	Description
*p_key	in	pointer to the AES plain-text key, the buffer size should be equal to the keylength
*p_iv	in	the buffer size must be 16 bytes
num_bytes	in	data buffer size in bytes.
*p_source	in	input data buffer, computes tag when set to NULL.
*p_dest	out	output data buffer, adds authentication data when set to NULL.

NOTE: this function is not thread safe.

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

Parameter *p_key

`uint32_t`

Parameter *p_iv

`uint32_t`

Parameter num_bytes

`uint32_t`

Parameter *p_source

`uint32_t`

Parameter *p_dest

`uint32_t`

8.3.34.14 zeroPaddingDecrypt

```
uint32_t(* aes_api_t::zeroPaddingDecrypt) (aes_ctrl_t *const p_ctrl, const
uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t
*p_dest)
```

Brief description

AES zero padding decryption using the chaining mode and padding mode specified. Implementation for GCM mode only API usage -.

Detailed description

1) Set expected tag value using the setGcmTag function
2) Provide any Add Authentication Data (AAD), invoke this API using p_dest = NULL
1) Decryption: set p_source to input encrypted data, decrypted data will be returned in p_dest
2) Verify the tag, invoke this API using p_source = NULL and p_dest = NULL, the return value indicates authentication tag verification status.

Table 1032:Parameters

Name	Direction	Description
p_ctrl	in	pointer to the control structure
*p_key	in	pointer to the AES plain-text key, the buffer size should be equal to the keylength
*p_iv	in	the buffer size must be 16 bytes
num_bytes	in	data buffer size in bytes.
*p_source	in	input data buffer, computes tag when set to NULL.
*p_dest	out	output data buffer, adds authentication data when set to NULL.

NOTE: this function is not thread safe.

Parameter p_ctrl

Definition: `aes_ctrl_t`

AES Interface control structure

Parameter *p_key

`uint32_t`

Parameter *p_iv

`uint32_t`

Parameter num_bytes

`uint32_t`

Parameter *p_source

`uint32_t`

Parameter *p_dest

`uint32_t`

8.3.34.15 versionGet

```
uint32_t(* aes_api_t::versionGet) ( *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 1033:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.3.34.16 aes_instance_t

aes_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- aes_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- aes_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- aes_api_t const * p_api

  Pointer to the API structure for this instance.

8.4 ARC4 Interface

ARC4 encryption and decryption APIs.

8.4.1 Interface API

arc4_api_t

Function name	Description
.open	ARC4 module open function. Must be called before performing any encrypt/decrypt operations. Initializes the context for the encrypt or decrypt operations using the chosen Cipher interface.
.keySet	ARC4 module key set function. Resets the state of the ARC4 encryption block.
.arc4Process	Encrypt or decrypt source data p_source of length num_bytes and write the results to destination buffer p_dest
.close	Close the ARC4 module.
.versionGet	Gets version and stores it in provided pointer p_version.

8.4.2 Data structures

- arc4_ctrl_t
- arc4_cfg_t
- arc4_instance_t

8.4.3 Variables

- g_sce_crypto_api
- g_arc4_on_sce

8.4.4 Defines

- #define ARC4_API_VERSION_MAJOR

  Initial value: (01)

  Register definitions, common services and error codes.
- #define ARC4_API_VERSION_MINOR

  Initial value: (00)

- #define DRV_ARC4_CONTEXT_BUFFER_SIZE

  Initial value: (66)

8.4.5 g_sce_crypto_api

const g_sce_crypto_api

8.4.6 g_arc4_on_sce

arc4_api_t::g_arc4_on_sce

8.4.6.1 Detailed description

ARC4 interface is only available on S7G2, S5D9 and S5D5.

SCE/ARC4 implementation of ARC4 API.

8.4.7 API Structures

8.4.7.1 arc4_ctrl_t

arc4_ctrl_t

Detailed description

ARC4 Interface control structure

Variables

- crypto_ctrl_t * p_crypto_ctrl

  pointer to crypto engine control structure

- crypto_api_t const * p_crypto_api

  pointer to crypto engine API

- uint32_t state

  used to identify state of the ARC4 control block

- uint32_t work_buffer[DRV_ARC4_CONTEXT_BUFFER_SIZE]

- bsp_lock_t open

  indicates whether driver is opened with this control block

  used for storing context of the cipher < ARC4 uses this for storing the sbox results for the next encrypt/ decrypt operations

8.4.7.2 arc4_cfg_t

arc4_cfg_t

Detailed description

ARC4 Interface configuration structure. User must fill in these values before invoking the open() function

Variables

- crypto_api_t const * p_crypto_api

  pointer to crypto engine api

- uint32_t length

  Length of p_key in bytes.

- uint8_t const * p_key

  ARC4 key to use for encrypt or decrypto operations.

8.4.7.3 arc4_api_t

arc4_api_t

Detailed description

ARC4_Interface SCE functions implemented at the HAL layer will follow this API.

8.4.7.4 open

```
uint32_t(* arc4_api_t::open) (arc4_ctrl_t *const p_ctrl, arc4_cfg_t const *const p_cfg)
```

Detailed description

ARC4 module open function. Must be called before performing any encrypt/decrypt operations. Initializes the context for the encrypt or decrypt operations using the chosen Cipher interface.

Table 1034:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to control structure for the ARC4 interface. Must be declared by user. Elements are set here.
p_cfg	in	pointer to control structure for the ARC4 configuration. All elemenets of this structure must be set by user.

Parameter p_ctrl

Definition: `arc4_ctrl_t`

ARC4 Interface control structure

Parameter p_cfg

Definition: `arc4_cfg_t const *const p_cfg`

ARC4 Interface configuration structure. User must fill in these values before invoking the open() function

- arc4_cfg_t::p_crypto_api

  pointer to crypto engine api

- arc4_cfg_t::length

  Length of p_key in bytes.

- arc4_cfg_t::p_key

  ARC4 key to use for encrypt or decrypto operations.

8.4.7.5 keySet

```
uint32_t(* arc4_api_t::keySet) (arc4_ctrl_t *const p_ctrl, uint32_t length,
uint8_t const *p_key)
```

Detailed description

ARC4 module key set function. Resets the state of the ARC4 encryption block.

Table 1035:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to control structure for the ARC4 interface.
length	in	length of the p_key key material in bytes
p_key	in	pointer to the key material to use for encryption operations.

Parameter p_ctrl

Definition: arc4_ctrl_t

ARC4 Interface control structure

Parameter length

uint32_t

Parameter p_key

uint8_t

8.4.7.6 arc4Process

```
uint32_t(* arc4_api_t::arc4Process) (arc4_ctrl_t *const p_ctrl, uint32_t
num_bytes, uint8_t *p_source, uint8_t *p_dest)
```

Brief description

Encrypt or decrypt source data p_source of length num_bytes and write the results to destination buffer p_dest

Detailed description

Table 1036:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to control structure for ARC4 interface.
num_bytes	in	number of bytes to encrypt or decrypt, the value must be a multiple of 16
p_source	in	pointer to source data buffer
p_dest	out	pointer to destination data buffer

Parameter p_ctrl

Definition: `arc4_ctrl_t`

ARC4 Interface control structure

Parameter num_bytes

`uint32_t`

Parameter p_source

`uint8_t`

Parameter p_dest

`uint8_t`

8.4.7.7 close

```
uint32_t(* arc4_api_t::close) (arc4_ctrl_t *const p_ctrl)
```

Detailed description

Close the ARC4 module.

Table 1037:Parameters

Name	Direction	Description
p_ctrl	inout	pointer to the control structure

Parameter p_ctrl

Definition: `arc4_ctrl_t`

ARC4 Interface control structure

8.4.7.8 versionGet

```
uint32_t(* arc4_api_t::versionGet) ( *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 1038:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.4.7.9 arc4_instance_t

arc4_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- arc4_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- arc4_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- arc4_api_t const * p_api

  Pointer to the API structure for this instance.

8.5 CAC Interface

Interface for clock frequency accuracy measurements.

Register definitions, common services and error codes.

8.5.1 Summary

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of pulses of the clock (system clock) to be measured.

Related SSP architecture topics:

- SSP Interfaces

- SSP Predefined Layers
- Using SSP Modules

CAC Interface description: CAC Driver

8.5.2 Interface API

cac_api_t

Function name	Description
.open	Open function for CAC device.
.read	Read function for CAC peripheral.
.close	Close function for CAC device.
.stopMeasurement	End a measurement for the CAC peripheral.
.startMeasurement	Begin a measurement for the CAC peripheral.
.reset	Reset function for CAC device.
.versionGet	Get the CAC API and code version information.

8.5.3 Data structures

- cac_ref_clock_config_t
- cac_meas_clock_config_t
- cac_callback_args_t
- cac_cfg_t
- cac_instance_t

8.5.4 Enumerations

- cac_event_t
- cac_clock_type_t
- cac_clock_source_t
- cac_ref_divider_t
- cac_ref_digfilter_t
- cac_ref_edge_t

- cac_meas_divider_t

8.5.5 Typedefs

- cac_ctrl_t

8.5.6 Defines

- #define CAC_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define CAC_API_VERSION_MINOR
  Initial value: `(2U)`

8.5.7 API Data

8.5.7.1 cac_event_t

`cac_event_t`

Detailed description

Event types returned by the ISR callback when used in CAC interrupt mode

Enumerated values

Name	Description
CAC_EVENT_FREQUENCY_ERROR	Frequency error.
CAC_EVENT_MEASUREMENT_COMPLETE	Measurement complete.
CAC_EVENT_COUNTER_OVERFLOW	Counter overflow.

8.5.7.2 cac_clock_type_t

`cac_clock_type_t`

Detailed description

Enumeration of the two possible clocks.

Enumerated values

Name	Description
CAC_CLOCK_MEASURED	Measurement clock.
CAC_CLOCK_REFERENCE	Reference clock.

8.5.7.3 cac_clock_source_t

`cac_clock_source_t`

Detailed description

Enumeration of the possible clock sources for both the reference and measurement clocks.

Enumerated values

Name	Description
CAC_CLOCK_SOURCE_MAIN_OSC	Main clock oscillator.
CAC_CLOCK_SOURCE_SUBCLOCK	Sub-clock.
CAC_CLOCK_SOURCE_HOCO	HOCO (High speed on chip oscillator)
CAC_CLOCK_SOURCE_MOCO	MOCO (Middle speed on chip oscillator)
CAC_CLOCK_SOURCE_LOCO	LOCO (Middle speed on chip oscillator)
CAC_CLOCK_SOURCE_PCLKB	PCLKB (Peripheral Clock B)
CAC_CLOCK_SOURCE_IWDT	IWDT- Dedicated on-chip oscillator.
CAC_CLOCK_SOURCE_MEAS_MAX	Maximum measured clock.
CAC_CLOCK_SOURCE_EXTERNAL	Externally supplied measurement clock on CACREF pin.
CAC_CLOCK_SOURCE_REF_MAX	Maximum reference clock.

8.5.7.4 cac_ref_divider_t

`cac_ref_divider_t`

Detailed description

Enumeration of available dividers for the reference clock.

Enumerated values

Name	Description
CAC_REF_DIV_32	Reference clock divided by 32.
CAC_REF_DIV_128	Reference clock divided by 128.
CAC_REF_DIV_1024	Reference clock divided by 1024.
CAC_REF_DIV_8192	Reference clock divided by 8192.

8.5.7.5 cac_ref_digfilter_t

`cac_ref_digfilter_t`

Detailed description

Enumeration of available digital filter settings for an external reference clock.

Enumerated values

Name	Description
CAC_REF_DIGITAL_FILTER_OFF	No digital filter on the CACREF pin for reference clock.
CAC_REF_DIGITAL_FILTER_1	Sampling clock for digital filter = measuring frequency.
CAC_REF_DIGITAL_FILTER_4	Sampling clock for digital filter = measuring frequency/4.
CAC_REF_DIGITAL_FILTER_16	Sampling clock for digital filter = measuring frequency/16.

8.5.7.6 cac_ref_edge_t

`cac_ref_edge_t`

Detailed description

Enumeration of available edge detect settings for the reference clock.

Enumerated values

Name	Description
CAC_REF_EDGE_RISE	Rising edge detect for the Reference clock.
CAC_REF_EDGE_FALL	Falling edge detect for the Reference clock.

Name	Description
CAC_REF_EDGE_BOTH	Both Rising and Falling edges detect for the Reference clock.

8.5.7.7 cac_meas_divider_t

```
cac_meas_divider_t
```

Detailed description

Enumeration of available dividers for the measurement clock

Enumerated values

Name	Description
CAC_MEAS_DIV_1	Measurement clock divided by 1.
CAC_MEAS_DIV_4	Measurement clock divided by 4.
CAC_MEAS_DIV_8	Measurement clock divided by 8.
CAC_MEAS_DIV_32	Measurement clock divided by 32.

8.5.7.8 cac_ctrl_t

```
typedef void cac_ctrl_t
```

Detailed description

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented as

- cac_instance_ctrl_t

8.5.8 API Structures

8.5.8.1 cac_ref_clock_config_t

cac_ref_clock_config_t

Detailed description

Structure defining the settings that apply to reference clock configuration.

Variables

- cac_ref_divider_t divider

  Divider specification for the Reference clock.

- cac_clock_source_t clock

  Clock source for the Reference clock.
- cac_ref_digfilter_t digfilter

  Digital filter selection for the CACREF ext clock.
- cac_ref_edge_t edge

  Edge detection for the Reference clock.

8.5.8.2 cac_meas_clock_config_t

cac_meas_clock_config_t

Detailed description

Structure defining the settings that apply to measurement clock configuration.

Variables

- cac_meas_divider_t divider

  Divider specification for the Measurement clock.
- cac_clock_source_t clock

  Clock source for the Measurement clock.

8.5.8.3 cac_callback_args_t

cac_callback_args_t

Detailed description

Callback function parameter data

Variables

- cac_event_t event

  The event can be used to identify what caused the callback (cac ready or error).
- void const * p_context

  Placeholder for user data. Set in cac_api_t::open function in cac_cfg_t.

8.5.8.4 cac_cfg_t

cac_cfg_t

Detailed description

CAC Configuration

Variables

- cac_ref_clock_config_t cac_ref_clock

  reference clock specific settings

- cac_meas_clock_config_t cac_meas_clock
  measurement clock specific settings
- uint16_t cac_upper_limit
  the upper limit counter threshold
- uint16_t cac_lower_limit
  the lower limit counter threshold
- bool mei_interrupt_enabled
  True if Measurement Complete interrupt is enabled.
- bool ovf_interrupt_enabled
  True if Overflow interrupt is enabled.
- bool ferr_interrupt_enabled
  True if Frequency Error interrupt is enabled.
- bool continuous_mode
  True if measurement continuously restarts after completing.
- uint8_t frequency_error_ipl
  Frequency error interrupt priority.
- uint8_t measurement_end_ipl
  Measurement end interrupt priority.
- uint8_t overflow_ipl
  Overflow interrupt priority.
- void(* p_callback)(cac_callback_args_t *p_args)
  Callback provided when a CAC interrupt ISR occurs.
- void const * p_extend
  CAC hardware dependent configuration */.
- void const * p_context
  Placeholder for user data. Passed to user callback in cac_callback_args_t.

8.5.8.5 cac_api_t

cac_api_t

Detailed description

CAC functions implemented at the HAL layer API

8.5.8.6 open

```
ssp_err_t(* cac_api_t::open) (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)
```

Detailed description

Open function for CAC device.

Table 1039:Parameters

Name	Direction	Description
p_ctrl	out	Pointer to CAC device control. Must be declared by user. Value set here.
cac_cfg_t	in	Pointer to CAC configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `cac_ctrl_t*const p_ctrl`

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

Parameter cac_cfg_t

Definition: `cac_cfg_t const *const p_cfg`

CAC Configuration

- `cac_cfg_t::cac_ref_clock_config_t`

  reference clock specific settings
- `cac_cfg_t::cac_meas_clock_config_t`

  measurement clock specific settings
- `cac_cfg_t::cac_upper_limit`

  the upper limit counter threshold
- `cac_cfg_t::cac_lower_limit`

  the lower limit counter threshold
- `cac_cfg_t::mei_interrupt_enabled`

  True if Measurement Complete interrupt is enabled.
- `cac_cfg_t::ovf_interrupt_enabled`

  True if Overflow interrupt is enabled.
- `cac_cfg_t::ferr_interrupt_enabled`

  True if Frequency Error interrupt is enabled.

- cac_cfg_t::continuous_mode

  True if measurement continuously restarts after completing.

- cac_cfg_t::frequency_error_ipl

  Frequency error interrupt priority.

- cac_cfg_t::measurement_end_ipl

  Measurement end interrupt priority.

- cac_cfg_t::overflow_ipl

  Overflow interrupt priority.

- cac_cfg_t::p_callback

  Callback provided when a CAC interrupt ISR occurs.

- cac_cfg_t::p_extend

  CAC hardware dependent configuration */.

- cac_cfg_t::p_context

  Placeholder for user data. Passed to user callback in cac_callback_args_t.

8.5.8.7 read

```
ssp_err_t(* cac_api_t::read) (cac_ctrl_t *const p_ctrl, uint8_t *const p_status,
uint16_t *const p_counter)
```

Detailed description

Read function for CAC peripheral.

Table 1040:Parameters

Name	Direction	Description
p_ctrl	in	Control for the CAC device context.
p_status	in	Pointer to variable in which to store the current CASTR register contents.
p_counter	in	Pointer to variable in which to store the current CACNTBR register contents.

Parameter p_ctrl

Definition: cac_ctrl_t*const p_ctrl

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

Parameter p_status

uint8_t

Parameter p_counter

uint16_t

8.5.8.8 close

```
ssp_err_t(* cac_api_t::close) (cac_ctrl_t *const p_ctrl)
```

Detailed description

Close function for CAC device.

Table 1041:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CAC device control.

Parameter p_ctrl

Definition: cac_ctrl_t*const p_ctrl

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

8.5.8.9 stopMeasurement

```
ssp_err_t(* cac_api_t::stopMeasurement) (cac_ctrl_t *const p_ctrl)
```

Detailed description

End a measurement for the CAC peripheral.

Table 1042:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CAC device control.

Parameter p_ctrl

Definition: cac_ctrl_t*const p_ctrl

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

8.5.8.10 startMeasurement

```
ssp_err_t(* cac_api_t::startMeasurement) (cac_ctrl_t *const p_ctrl)
```

Detailed description

Begin a measurement for the CAC peripheral.

Table 1043:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CAC device control.

Parameter p_ctrl

Definition: `cac_ctrl_t*const p_ctrl`

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

8.5.8.11 reset

```
ssp_err_t(* cac_api_t::reset) (cac_ctrl_t *const p_ctrl)
```

Detailed description

Reset function for CAC device.

Table 1044:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CAC device control.

Parameter p_ctrl

Definition: `cac_ctrl_t*const p_ctrl`

CAC control block. Allocate an instance specific control block to pass into the CAC API calls. Implemented ascac_instance_ctrl_t

8.5.8.12 versionGet

```
ssp_err_t(* cac_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get the CAC API and code version information.

Table 1045:Parameters

Name	Direction	Description
p_version	out	is value returned.

Parameter p_version

8.5.8.13 cac_instance_t

cac_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- cac_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- cac_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- cac_api_t const * p_api

  Pointer to the API structure for this instance.

8.6 CAN Interface

Interface for CAN peripheral.

8.6.1 Summary

The CAN interface provides common APIs for CAN HAL drivers. CAN interface supports following features.

- Full-duplex CAN communication
- Generic CAN parameter setting
- Interrupt driven transmit/receive processing
- Callback function support with returning event code
- Hardware resource locking during a transaction

8.6.2 Interface API

can_api_t

Function name	Description
.open	Open function for CAN device
.read	Read function for CAN device, non-Blocking.
.write	Write function for CAN device

Function name	Description
.close	Close function for CAN device
.control	Control function for CAN device
.infoGet	Get CAN channel info.
.versionGet	Version get function for CAN device

8.6.3 Data structures

- can_status_t
- can_error_t
- can_info_t
- can_callback_args_t
- can_bit_timing_cfg_t
- can_frame_t
- can_mailbox_t
- can_cfg_t
- can_instance_t

8.6.4 Enumerations

- can_event_t
- can_mode_t
- can_id_mode_t
- can_frame_type_t
- can_message_mode_t
- can_clock_source_t
- can_time_segment1_t
- can_time_segment2_t
- can_sync_jump_width_t
- can_mailbox_send_receive_t
- can_command_t

8.6.5 Typedefs

- can_id_t
- can_ctrl_t

8.6.6 Defines

- #define CAN_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define CAN_API_VERSION_MINOR

  Initial value: `(2U)`

8.6.7 API Data

8.6.7.1 can_event_t

`can_event_t`

Detailed description

CAN event codes

Enumerated values

Name	Description
CAN_EVENT_RX_COMPLETE	Receive complete event.
CAN_EVENT_TX_COMPLETE	Transmit complete event.
CAN_EVENT_ERR_BUS_OFF	Bus Off event.
CAN_EVENT_BUS_RECOVERY	Bus Off Recovery event.
CAN_EVENT_ERR_PASSIVE	Error Passive event.
CAN_EVENT_ERR_WARNING	Error Warning event.
CAN_EVENT_MAILBOX_OVERWRITE_OVERRUN	DEPRECATED, Mailbox has been overrun. This event is not used when the mailbox is overwritten.
CAN_EVENT_MAILBOX_OVERRUN	Mailbox has been overrun.

8.6.7.2 can_mode_t

`can_mode_t`

Detailed description

CAN Operation modes

Enumerated values

Name	Description
CAN_MODE_NORMAL	CAN Normal Mode.
CAN_MODE_HALT	CAN Halt Mode.
CAN_MODE_SLEEP	CAN SLEEP Mode.
CAN_MODE_EXIT_SLEEP	CAN Exit SLEEP Mode.
CAN_MODE_RESET	CAN Reset Mode.
CAN_MODE_LISTEN	CAN Listen Mode.
CAN_MODE_LOOPBACK_INTERNAL	CAN Internal Loopback Mode.
CAN_MODE_LOOPBACK_EXTERNAL	CAN External Loopback Mode.

8.6.7.3 can_id_mode_t

`can_id_mode_t`

Detailed description

CAN ID modes

Enumerated values

Name	Description
CAN_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_ID_MODE_EXTENDED	Extended IDs of 29 bits used.

8.6.7.4 can_frame_type_t

`can_frame_type_t`

Detailed description

CAN frame types

Enumerated values

Name	Description
CAN_FRAME_TYPE_DATA	Data frame type.
CAN_FRAME_TYPE_REMOTE	Remote frame type.

8.6.7.5 can_message_mode_t

`can_message_mode_t`

Detailed description

CAN Message Modes

Enumerated values

Name	Description
CAN_MESSAGE_MODE_OVERWRITE	Receive data will be overwritten if not read before the next frame.
CAN_MESSAGE_MODE_OVERRUN	Receive data will be retained until it is read.

8.6.7.6 can_clock_source_t

`can_clock_source_t`

Detailed description

CAN Source Clock

Enumerated values

Name	Description
CAN_CLOCK_SOURCE_PCLKB	PCLB is the source of the CAN Clock.
CAN_CLOCK_SOURCE_CANMCLK	CANMCLK is the source of the CAN Clock.

8.6.7.7 can_time_segment1_t

`can_time_segment1_t`

Detailed description

CAN Time Segment 1 Time Quanta

Enumerated values

Name	Description
CAN_TIME_SEGMENT1_TQ4	Time Segment 1 setting for 4 Time Quanta.
CAN_TIME_SEGMENT1_TQ5	Time Segment 1 setting for 5 Time Quanta.
CAN_TIME_SEGMENT1_TQ6	Time Segment 1 setting for 6 Time Quanta.
CAN_TIME_SEGMENT1_TQ7	Time Segment 1 setting for 7 Time Quanta.
CAN_TIME_SEGMENT1_TQ8	Time Segment 1 setting for 8 Time Quanta.
CAN_TIME_SEGMENT1_TQ9	Time Segment 1 setting for 9 Time Quanta.
CAN_TIME_SEGMENT1_TQ10	Time Segment 1 setting for 10 Time Quanta.
CAN_TIME_SEGMENT1_TQ11	Time Segment 1 setting for 11 Time Quanta.
CAN_TIME_SEGMENT1_TQ12	Time Segment 1 setting for 12 Time Quanta.
CAN_TIME_SEGMENT1_TQ13	Time Segment 1 setting for 13 Time Quanta.
CAN_TIME_SEGMENT1_TQ14	Time Segment 1 setting for 14 Time Quanta.
CAN_TIME_SEGMENT1_TQ15	Time Segment 1 setting for 15 Time Quanta.
CAN_TIME_SEGMENT1_TQ16	Time Segment 1 setting for 16 Time Quanta.

8.6.7.8 can_time_segment2_t

```
can_time_segment2_t
```

Detailed description

CAN Time Segment 2 Time Quanta

Enumerated values

Name	Description
CAN_TIME_SEGMENT2_TQ2	Time Segment 2 setting for 2 Time Quanta.
CAN_TIME_SEGMENT2_TQ3	Time Segment 2 setting for 3 Time Quanta.
CAN_TIME_SEGMENT2_TQ4	Time Segment 2 setting for 4 Time Quanta.

Name	Description
CAN_TIME_SEGMENT2_TQ5	Time Segment 2 setting for 5 Time Quanta.
CAN_TIME_SEGMENT2_TQ6	Time Segment 2 setting for 6 Time Quanta.
CAN_TIME_SEGMENT2_TQ7	Time Segment 2 setting for 7 Time Quanta.
CAN_TIME_SEGMENT2_TQ8	Time Segment 2 setting for 8 Time Quanta.

8.6.7.9 can_sync_jump_width_t

`can_sync_jump_width_t`

Detailed description

CAN Synchronization Jump Width Time Quanta

Enumerated values

Name	Description
CAN_SYNC_JUMP_WIDTH_TQ1	Synchronization Jump Width setting for 1 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ2	Synchronization Jump Width setting for 2 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ3	Synchronization Jump Width setting for 3 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ4	Synchronization Jump Width setting for 4 Time Quanta.

8.6.7.10 can_mailbox_send_receive_t

`can_mailbox_send_receive_t`

Detailed description

CAN Mailbox type

Enumerated values

Name	Description
CAN_MAILBOX_RECEIVE	Mailbox is for receiving.
CAN_MAILBOX_TRANSMIT	Mailbox is for sending.

8.6.7.11 can_command_t

```
can_command_t
```

Detailed description

CAN control commands.

Enumerated values

Name	Description
CAN_COMMAND_MODE_SWITCH	Switch CAN operating mode..

8.6.7.12 can_id_t

```
typedef uint32_t can_id_t
```

Detailed description

CAN Id

8.6.7.13 can_ctrl_t

```
typedef void can_ctrl_t
```

Detailed description

CAN control block. Allocate an instance specific control block to pass into the CAN API calls. Implemented as

- can_instance_ctrl_t

8.6.8 API Structures

8.6.8.1 can_status_t

Detailed description

CAN Status

Variables

status

status_b

8.6.8.2 status

```
uint32_t can_status_t::status
```

8.6.8.3 status_b

```
struct can_status_t::st_status_b can_status_t::status_b
```

8.6.8.4 can_error_t

Detailed description

CAN Error Code

Variables

error

error_b

8.6.8.5 error

```
uint32_t can_error_t::error
```

8.6.8.6 error_b

```
struct can_error_t::st_error_b can_error_t::error_b
```

8.6.8.7 can_info_t

can_info_t

Detailed description

Variables

- can_mode_t operation_mode

  Can operation mode.
- can_status_t status

  CAN status.
- uint32_t bit_rate

  CAN bit rate.
- uint8_t error_count_transmit

  Transmit error count.
- uint8_t error_count_receive

  Receive error count.
- can_error_t error_code

  Error code, cleared after reading.

8.6.8.8 can_callback_args_t

can_callback_args_t

Detailed description

CAN callback parameter definition

Variables

- uint32_t channel

  Device channel number.

- can_event_t event

  Event code.

- uint32_t mailbox

  Mailbox number of interrupt source.

- void const * p_context

  Context provided to user during callback.

8.6.8.9 can_bit_timing_cfg_t

can_bit_timing_cfg_t

Detailed description

CAN bit rate configuration.

Variables

- uint32_t baud_rate_prescaler

  Baud rate prescaler. Valid values: 1 - 1024.

- can_time_segment1_t time_segment_1

  Time segment 1 control.

- can_time_segment2_t time_segment_2

  Time segment 2 control.

- can_sync_jump_width_t synchronization_jump_width

  Synchronization jump width.

8.6.8.10 can_frame_t

can_frame_t

Detailed description

CAN data Frame

Variables

- can_id_t id

  CAN id.
- uint8_t data_length_code

  CAN Data Length code, number of bytes in the message.
- uint8_t data[8]

  CAN data, up to 8 bytes.
- can_frame_type_t type

  Frame type, data or remote frame.

8.6.8.11 can_mailbox_t

can_mailbox_t

Detailed description

CAN Mailbox

Variables

- can_id_t mailbox_id

  Mailbox ID.
- can_mailbox_send_receive_t mailbox_type

  Receive or Transmit mailbox type.
- can_frame_type_t frame_type

  Frame type for receive mailbox.

8.6.8.12 can_cfg_t

can_cfg_t

Detailed description

CAN Configuration

Variables

- uint32_t channel

  CAN channel.
- can_bit_timing_cfg_t * p_bit_timing

  CAN bit timing.
- can_id_mode_t id_mode

  Standard or Extended ID mode.
- uint32_t mailbox_count

  Number of mailboxes.

- can_mailbox_t * p_mailbox

  Pointer to mailboxes.
- can_message_mode_t message_mode

  Overwrite message or overrun.
- void(* p_callback)(can_callback_args_t *p_args)

  Pointer to callback function.
- void const * p_context

  User defined callback context.
- void const * p_extend

  CAN hardware dependent configuration.
- uint8_t error_ipl

  Error interrupt priority.
- uint8_t mailbox_rx_ipl

  Receive interrupt priority.
- uint8_t mailbox_tx_ipl

  Transmit interrupt priority.

8.6.8.13 can_api_t

can_api_t

Detailed description

Shared Interface definition for CAN

8.6.8.14 open

```
ssp_err_t(* can_api_t::open) (can_ctrl_t *const p_ctrl, can_cfg_t const *const
p_cfg)
```

Detailed description

Open function for CAN device Implemented as

- R_CAN_Open

Table 1046:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to the CAN control block Must be declared by user. Value set here.

Table 1046:Parameters (Continued)

Name	Direction	Description
can_cfg_t	in	Pointer to CAN configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `can_ctrl_t*const p_ctrl`

CAN control block. Allocate an instance specific control block to pass into the CAN API calls. Implemented ascan_instance_ctrl_t

Parameter can_cfg_t

Definition: `can_cfg_t const *const p_cfg`

CAN Configuration

- `can_cfg_t`::`channel`

  CAN channel.

- `can_cfg_t`::`can_bit_timing_cfg_t`

  CAN bit timing.

- `can_cfg_t`::`can_id_mode_t`

  Standard or Extended ID mode.

  Enumerated as:

  – CAN_ID_MODE_STANDARD

  – CAN_ID_MODE_EXTENDED

- `can_cfg_t`::`mailbox_count`

  Number of mailboxes.

- `can_cfg_t`::`can_mailbox_t`

  Pointer to mailboxes.

- `can_cfg_t`::`can_message_mode_t`

  Overwrite message or overrun.

  Enumerated as:

  – CAN_MESSAGE_MODE_OVERWRITE

  – CAN_MESSAGE_MODE_OVERRUN

- `can_cfg_t`::`p_callback`

  Pointer to callback function.

- can_cfg_t::p_context

  User defined callback context.

- can_cfg_t::p_extend

  CAN hardware dependent configuration.

- can_cfg_t::error_ipl

  Error interrupt priority.

- can_cfg_t::mailbox_rx_ipl

  Receive interrupt priority.

- can_cfg_t::mailbox_tx_ipl

  Transmit interrupt priority.

8.6.8.15 read

```
ssp_err_t(* can_api_t::read) (can_ctrl_t *const p_ctrl, uint32_t mailbox,
can_frame_t *const p_frame)
```

Detailed description

Read function for CAN device, non-Blocking. Implemented as

- R_CAN_Read

Table 1047:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the CAN control block for the channel.
mailbox	in	Mailbox to read from.
p_frame	out	Pointer for frame of CAN ID, DLC, data and frame type.

Parameter p_ctrl

Definition: can_ctrl_t*const p_ctrl

CAN control block. Allocate an instance specific control block to pass into the CAN API calls. Implemented ascan_instance_ctrl_t

Parameter mailbox

uint32_t

Parameter p_frame

Definition: can_frame_t*const p_frame

CAN data Frame

- can_frame_t::id

  CAN id.

- can_frame_t::data_length_code

  CAN Data Length code, number of bytes in the message.

- can_frame_t::data

  CAN data, up to 8 bytes.

- can_frame_t::type

  Frame type, data or remote frame.

8.6.8.16 write

```
ssp_err_t(* can_api_t::write) (can_ctrl_t *const p_ctrl, uint32_t mailbox,
can_frame_t *const p_frame)

Name	Direction	Description
p_data	in	Command data.

Parameter p_ctrl

Definition: `can_ctrl_t*const p_ctrl`

CAN control block. Allocate an instance specific control block to pass into the CAN API calls. Implemented ascan_instance_ctrl_t

Parameter command
Parameter p_data

`const`

8.6.8.19 infoGet

```
ssp_err_t(* can_api_t::infoGet) (can_ctrl_t *const p_ctrl, can_info_t *const
p_info)
```

Detailed description

Get CAN channel info. Implemented as

- R_CAN_InfoGet

Table 1051:Parameters

Name	Direction	Description
p_ctrl	in	Handle for channel (pointer to channel control block)
p_info	out	Memory address to return channel specific data to.

Parameter p_ctrl

Definition: `can_ctrl_t*const p_ctrl`

CAN control block. Allocate an instance specific control block to pass into the CAN API calls. Implemented ascan_instance_ctrl_t

Parameter p_info

Definition: `can_info_t*const p_info`

- `can_info_t::operation_mode`

  Can operation mode.

- `can_info_t::status`

  CAN status.

- can_info_t::bit_rate

  CAN bit rate.
- can_info_t::error_count_transmit

  Transmit error count.
- can_info_t::error_count_receive

  Receive error count.
- can_info_t::error_code

  Error code, cleared after reading.

8.6.8.20 versionGet

```
ssp_err_t(* can_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Version get function for CAN device Implemented as

Name	Direction	Description
p_version	in	Pointer to the memory to store the version information

Parameter p_version

8.6.8.21 can_instance_t

can_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- can_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- can_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- can_api_t const * p_api

  Pointer to the API structure for this instance.

8.7 CGC Interface

Interface for clock generation.

8.7.1 Summary

The CGC interface provides the ability to configure and use all of the CGC module's capabilities. Among the capabilities is the selection of several clock sources to use as the system clock source. Additionally, the system clocks can be divided down to provide a wide range of frequencies for various system and peripheral needs.

Clock stability can be checked and clocks may also be stopped to save power when not needed. The API has a function to return the frequency of the system and system peripheral clocks at run time. There is also a feature to detect when the main oscillator has stopped, with the option of calling a user provided callback function.

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CGC Interface description: CGC Driver

8.7.2 Interface API

cgc_api_t

Function name	Description
.init	Initial configuration
.clocksCfg	Configure all system clocks.
.clockStart	Start a clock.
.clockStop	Stop a clock.
.systemClockSet	Set the system clock.
.systemClockGet	Get the system clock information.
.systemClockFreqGet	Return the frequency of the selected clock.
.clockCheck	Check the stability of the selected clock.
.oscStopDetect	Configure the Main Oscillator stop detection.
.oscStopStatusClear	Clear the oscillator stop detection flag.

Function name	Description
.busClockOutCfg	Configure the bus clock output secondary divider. The primary divider is set using the bsp clock configuration and the systemClockSet function (S7G2 and S3A7 only).
.busClockOutEnable	Enable the bus clock output (S7G2 and S3A7 only).
.busClockOutDisable	Disable the bus clock output (S7G2 and S3A7 only).
.clockOutCfg	Configure clockOut.
.clockOutEnable	Enable clock output on the CLKOUT pin. The source of the clock is controlled by clockOutCfg.
.clockOutDisable	Disable clock output on the CLKOUT pin. The source of the clock is controlled by clockOutCfg.
.lcdClockCfg	Configure the segment LCD Clock (S3A7 and S124 only).
.lcdClockEnable	Enable the LCD clock (S3A7 and S124 only).
.lcdClockDisable	Disables the LCD clock (S3A7 and S124 only).
.sdadcClockCfg	Configure the 24-bit Sigma-Delta A/D Converter Clock (S1JA only).
.sdadcClockEnable	Enable the SDADC clock (S1JA only).
.sdadcClockDisable	Disables the SDADC clock (S1JA only).
.sdramClockOutEnable	Enables the SDRAM clock output (S7G2 only).
.sdramClockOutDisable	Disables the SDRAM clock (S7G2 only).
.usbClockCfg	Configures the USB clock (S7G2 only).
.systickUpdate	Update the Systick timer.
.versionGet	Gets the CGC driver version.

8.7.6 API Data

8.7.6.1 cgc_event_t

`cgc_event_t`

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
CGC_EVENT_OSC_STOP_DETECT	Oscillator stop detection has caused the event.

8.7.6.2 cgc_clock_t

```
cgc_clock_t
```

Detailed description

System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider

Enumerated values

Name	Description
CGC_CLOCK_HOCO	The high speed on chip oscillator.
CGC_CLOCK_MOCO	The middle speed on chip oscillator.
CGC_CLOCK_LOCO	The low speed on chip oscillator.
CGC_CLOCK_MAIN_OSC	The main oscillator.
CGC_CLOCK_SUBCLOCK	The subclock oscillator.
CGC_CLOCK_PLL	The PLL oscillator.

8.7.6.3 cgc_pll_div_t

```
cgc_pll_div_t
```

Detailed description

PLL divider values

Enumerated values

Name	Description
CGC_PLL_DIV_1	PLL divider of 1.
CGC_PLL_DIV_2	PLL divider of 2.
CGC_PLL_DIV_3	PLL divider of 3 (S7G2 only).
CGC_PLL_DIV_4	PLL divider of 4 (S3A7 only).

8.7.6.4 cgc_sys_clock_div_t

`cgc_sys_clock_div_t`

Detailed description

System clock divider values - The individually selectable divider of each of the system clocks, ICLK, BCLK, FCLK, PCLKS A-D

Enumerated values

Name	Description
CGC_SYS_CLOCK_DIV_1	System clock divided by 1.
CGC_SYS_CLOCK_DIV_2	System clock divided by 2.
CGC_SYS_CLOCK_DIV_4	System clock divided by 4.
CGC_SYS_CLOCK_DIV_8	System clock divided by 8.
CGC_SYS_CLOCK_DIV_16	System clock divided by 16.
CGC_SYS_CLOCK_DIV_32	System clock divided by 32.
CGC_SYS_CLOCK_DIV_64	System clock divided by 64.

8.7.6.5 cgc_system_clocks_t

`cgc_system_clocks_t`

Detailed description

System clock identifiers - Used as an input parameter to the systemClockFreqGet function.

Enumerated values

Name	Description
CGC_SYSTEM_CLOCKS_PCLKA	PCLKA - Peripheral module clock A.
CGC_SYSTEM_CLOCKS_PCLKB	PCLKB - Peripheral module clock B.
CGC_SYSTEM_CLOCKS_PCLKC	PCLKC - Peripheral module clock C.
CGC_SYSTEM_CLOCKS_PCLKD	PCLKD - Peripheral module clock D.
CGC_SYSTEM_CLOCKS_BCLK	BCLK - External bus Clock.

Name	Description
CGC_SYSTEM_CLOCKS_FCLK	FCLK - FlashIF clock.
CGC_SYSTEM_CLOCKS_ICLK	ICLK - System clock.

8.7.6.6 cgc_clockout_dividers_t

`cgc_clockout_dividers_t`

Detailed description

Divider values for the CLKOUT output.

Enumerated values

Name	Description
CGC_CLOCKOUT_DIV_1	Clockout source is divided by 1.
CGC_CLOCKOUT_DIV_2	Clockout source is divided by 2.
CGC_CLOCKOUT_DIV_4	Clockout source is divided by 4.
CGC_CLOCKOUT_DIV_8	Clockout source is divided by 8.
CGC_CLOCKOUT_DIV_16	Clockout source is divided by 16.
CGC_CLOCKOUT_DIV_32	Clockout source is divided by 32.
CGC_CLOCKOUT_DIV_64	Clockout source is divided by 64.
CGC_CLOCKOUT_DIV_128	Clockout source is divided by 128.

8.7.6.7 cgc_bclockout_dividers_t

`cgc_bclockout_dividers_t`

Detailed description

Divider values for the external bus clock output.

Enumerated values

Name	Description
CGC_BCLOCKOUT_DIV_1	External bus clock source is divided by 1.
CGC_BCLOCKOUT_DIV_2	External bus clock source is divided by 2.

8.7.6.8 cgc_usb_clock_div_t

`cgc_usb_clock_div_t`

Detailed description

USB clock divider values

Enumerated values

Name	Description
CGC_USB_CLOCK_DIV_3	Divide USB source clock by 3.
CGC_USB_CLOCK_DIV_4	Divide USB source clock by 4.
CGC_USB_CLOCK_DIV_5	Divide USB source clock by 5.

8.7.6.9 cgc_systick_period_units_t

`cgc_systick_period_units_t`

Detailed description

Available period units for R_CGC_SystickUpdate

Enumerated values

Name	Description
CGC_SYSTICK_PERIOD_UNITS_MILLISECONDS	Requested period in milliseconds.
CGC_SYSTICK_PERIOD_UNITS_MICROSECONDS	Requested period in microseconds.

8.7.6.10 cgc_clock_change_t

`cgc_clock_change_t`

Detailed description

Clock options

Enumerated values

Name	Description
CGC_CLOCK_CHANGE_NONE	No change to the clock.
CGC_CLOCK_CHANGE_STOP	Stop the clock.
CGC_CLOCK_CHANGE_START	Start the clock.

8.7.7 API Structures

8.7.7.1 cgc_callback_args_t

cgc_callback_args_t

Detailed description

Callback function parameter data

Variables

- cgc_event_t event

  The event can be used to identify what caused the callback.
- void const * p_context

  Placeholder for user data.

8.7.7.2 cgc_clock_cfg_t

cgc_clock_cfg_t

Detailed description

Clock configuration structure - Used as an input parameter to the clockStart function for the PLL clock.

Variables

- cgc_clock_t source_clock

  PLL source clock (S7G2 only).

- cgc_pll_div_t divider

  PLL divider.
- float multiplier

  PLL multiplier.

8.7.7.3 cgc_system_clock_cfg_t

cgc_system_clock_cfg_t

Detailed description

Clock configuration structure - Used as an input parameter to the systemClockSet and systemClockGet functions.

Variables

- cgc_sys_clock_div_t pclka_div

  Divider value for PCLKA.
- cgc_sys_clock_div_t pclkb_div

  Divider value for PCLKB.
- cgc_sys_clock_div_t pclkc_div

  Divider value for PCLKC.
- cgc_sys_clock_div_t pclkd_div

  Divider value for PCLKD.
- cgc_sys_clock_div_t bclk_div

  Divider value for BCLK.
- cgc_sys_clock_div_t fclk_div

  Divider value for FCLK.
- cgc_sys_clock_div_t iclk_div

  Divider value for ICLK.

8.7.7.4 cgc_clocks_cfg_t

cgc_clocks_cfg_t

Detailed description

Clock configuration

Variables

- cgc_clock_t system_clock

  System clock source enumeration.

- cgc_clock_cfg_t pll_cfg
  PLL configuration structure.
- cgc_system_clock_cfg_t sys_cfg
  Clock dividers structure.
- cgc_clock_change_t loco_state
  State of LOCO.
- cgc_clock_change_t moco_state
  State of MOCO.
- cgc_clock_change_t hoco_state
  State of HOCO.
- cgc_clock_change_t subosc_state
  State of Sub-oscillator.
- cgc_clock_change_t mainosc_state
  State of Main oscillator.
- cgc_clock_change_t pll_state
  State of PLL.

8.7.7.5 cgc_api_t

cgc_api_t

Detailed description

CGC functions implemented at the HAL layer follow this API.

8.7.7.6 init

```
ssp_err_t(* cgc_api_t::init) (void)
```

Detailed description

Initial configuration Implemented as

- R_CGC_Init

NOTE: The BSP module calls this function at startup. No further initialization is necessary.

8.7.7.7 clocksCfg

```
ssp_err_t(* cgc_api_t::clocksCfg) (cgc_clocks_cfg_t const *const p_clock_cfg)
```

Detailed description

Configure all system clocks. Implemented as

- R_CGC_ClocksCfg

NOTE: The BSP module calls this function at startup, but it can also be called from the application to change clocks at runtime.

8.7.7.8 clockStart

```
ssp_err_t(* cgc_api_t::clockStart) (cgc_clock_t clock_source, cgc_clock_cfg_t
*p_clock_cfg)
```

Detailed description

Start a clock. Implemented as

- R_CGC_ClockStart

NOTE: Clock to be started must not be running prior to calling this function or an error will be returned.

Table 1053:Parameters

Name	Direction	Description
clock_source	in	Clock source to initialize.
p_clock_cfg	in	Pointer to a structure that contains the dividers or multipliers to be used when configuring the PLL.

Parameter clock_source

Definition: `cgc_clock_tclock_source`

System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider

Parameter p_clock_cfg

Definition: `cgc_clock_cfg_t *p_clock_cfg`

Clock configuration structure - Used as an input parameter to the clockStart function for the PLL clock.

- `cgc_clock_cfg_t`::`cgc_clock_t`

  PLL source clock (S7G2 only).

  Enumerated as:

  - CGC_CLOCK_HOCO
  - CGC_CLOCK_MOCO
  - CGC_CLOCK_LOCO
  - CGC_CLOCK_MAIN_OSC
  - CGC_CLOCK_SUBCLOCK
  - CGC_CLOCK_PLL
- cgc_clock_cfg_t::cgc_pll_div_t

  PLL divider.

  Enumerated as:

  - CGC_PLL_DIV_1
  - CGC_PLL_DIV_2
  - CGC_PLL_DIV_3
  - CGC_PLL_DIV_4
- cgc_clock_cfg_t::multiplier

  PLL multiplier.

8.7.7.9 clockStop

```
ssp_err_t(* cgc_api_t::clockStop) (cgc_clock_t clock_source)
```

Detailed description

Stop a clock. Implemented as

- R_CGC_ClockStop

NOTE: Clock to be stopped must not be stopped prior to calling this function or an error will be returned.

Table 1054:Parameters

Name	Direction	Description
clock_source	in	The clock source to stop.

Parameter clock_source

Definition: cgc_clock_tclock_source

System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider

8.7.7.10 systemClockSet

```
ssp_err_t(* cgc_api_t::systemClockSet) (cgc_clock_t clock_source,
cgc_system_clock_cfg_t const *const p_clock_cfg)
```

Detailed description

Set the system clock. Implemented as

- R_CGC_SystemClockSet

NOTE: The clock to be set as the system clock must be running prior to calling this function.

Table 1055:Parameters

Name	Direction	Description
clock_source	in	Clock source to set as system clock
p_clock_cfg	in	Pointer to the clock dividers configuration passed by the caller.

Parameter clock_source

Definition: `cgc_clock_t`clock_source

System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider

Parameter p_clock_cfg

Definition: `cgc_system_clock_cfg_t const *const p_clock_cfg`

Clock configuration structure - Used as an input parameter to the systemClockSet and systemClockGet functions.

- `cgc_system_clock_cfg_t`::`cgc_sys_clock_div_t`

  Divider value for PCLKA.

  Enumerated as:

  – CGC_SYS_CLOCK_DIV_1

  – CGC_SYS_CLOCK_DIV_2

  – CGC_SYS_CLOCK_DIV_4

  – CGC_SYS_CLOCK_DIV_8

- CGC_SYS_CLOCK_DIV_16
- CGC_SYS_CLOCK_DIV_32
- CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for PCLKB.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8
  - CGC_SYS_CLOCK_DIV_16
  - CGC_SYS_CLOCK_DIV_32
  - CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for PCLKC.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8
  - CGC_SYS_CLOCK_DIV_16
  - CGC_SYS_CLOCK_DIV_32
  - CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for PCLKD.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8

- CGC_SYS_CLOCK_DIV_16
- CGC_SYS_CLOCK_DIV_32
- CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for BCLK.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8
  - CGC_SYS_CLOCK_DIV_16
  - CGC_SYS_CLOCK_DIV_32
  - CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for FCLK.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8
  - CGC_SYS_CLOCK_DIV_16
  - CGC_SYS_CLOCK_DIV_32
  - CGC_SYS_CLOCK_DIV_64

- cgc_system_clock_cfg_t::cgc_sys_clock_div_t

  Divider value for ICLK.

  Enumerated as:

  - CGC_SYS_CLOCK_DIV_1
  - CGC_SYS_CLOCK_DIV_2
  - CGC_SYS_CLOCK_DIV_4
  - CGC_SYS_CLOCK_DIV_8

- CGC_SYS_CLOCK_DIV_16
- CGC_SYS_CLOCK_DIV_32
- CGC_SYS_CLOCK_DIV_64

8.7.7.11 systemClockGet

```
ssp_err_t(* cgc_api_t::systemClockGet) (cgc_clock_t *p_clock_source,
cgc_system_clock_cfg_t *p_set_clock_cfg)
```

Detailed description

Get the system clock information. Implemented as

- R_CGC_SystemClockGet

Table 1056:Parameters

Name	Direction	Description
clock_source	out	Returns the current system clock.
p_clock_cfg	out	Returns the current system clock dividers.

Parameter clock_source

Parameter p_clock_cfg

8.7.7.12 systemClockFreqGet

```
ssp_err_t(* cgc_api_t::systemClockFreqGet) (cgc_system_clocks_t clock, uint32_t
*p_freq_hz)
```

Detailed description

Return the frequency of the selected clock. Implemented as

- R_CGC_SystemClockFreqGet

Table 1057:Parameters

Name	Direction	Description
clock	in	Specifies the internal clock whose frequency is returned.

Table 1057:Parameters (Continued)

Name	Direction	Description
p_freq_hz	out	Returns the frequency in Hz referenced by this pointer.

Parameter clock

Definition: `cgc_system_clocks_tclock`

System clock identifiers - Used as an input parameter to the cgc_api_t::systemClockFreqGet function.

Parameter p_freq_hz

`uint32_t`

8.7.7.13 clockCheck

```
ssp_err_t(* cgc_api_t::clockCheck) (cgc_clock_t clock_source)
```

Detailed description

Check the stability of the selected clock. Implemented as

- R_CGC_ClockCheck

Table 1058:Parameters

Name	Direction	Description
clock_source	in	Which clock source to check for stability.

Parameter clock_source

Definition: `cgc_clock_tclock_source`

System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider

8.7.7.14 oscStopDetect

```
ssp_err_t(* cgc_api_t::oscStopDetect) (void(*p_callback)(cgc_callback_args_t
*p_args), bool enable)
```

Detailed description

Configure the Main Oscillator stop detection. Implemented as

- R_CGC_OscStopDetect

Table 1059:Parameters

Name	Direction	Description
p_callback	in	Callback function that will be called by the NMI interrupt when an oscillation stop is detected. If the second argument is "false", then this argument can be NULL.
enable	in	Enable/disable Oscillation Stop Detection.

Parameter p_callback

Parameter enable

`const`

8.7.7.15 oscStopStatusClear

```
ssp_err_t(* cgc_api_t::oscStopStatusClear) (void)
```

Detailed description

Clear the oscillator stop detection flag. Implemented as

- R_CGC_OscStopStatusClear

8.7.7.16 busClockOutCfg

```
ssp_err_t(* cgc_api_t::busClockOutCfg) (cgc_bclockout_dividers_t divider)
```

Detailed description

Configure the bus clock output secondary divider. The primary divider is set using the bsp clock configuration and the systemClockSet function (S7G2 and S3A7 only).

Implemented as

- R_CGC_BusClockOutCfg

Table 1060:Parameters

Name	Direction	Description
divider	in	The divider of 1 or 2 of the clock source.

Parameter divider

Definition: cgc_bclockout_dividers_tdivider

Divider values for the external bus clock output.

8.7.7.17 busClockOutEnable

```
ssp_err_t(* cgc_api_t::busClockOutEnable) (void)
```

Detailed description

Enable the bus clock output (S7G2 and S3A7 only). Implemented as

- R_CGC_BusClockOutEnable

8.7.7.18 busClockOutDisable

```
ssp_err_t(* cgc_api_t::busClockOutDisable) (void)
```

Detailed description

Disable the bus clock output (S7G2 and S3A7 only). Implemented as

- R_CGC_BusClockOutDisable

8.7.7.19 clockOutCfg

```
ssp_err_t(* cgc_api_t::clockOutCfg) (cgc_clock_t clock, cgc_clockout_dividers_t
divider)
```

Detailed description

Configure clockOut. Implemented as

- R_CGC_ClockOutCfg

Table 1061:Parameters

Name	Direction	Description
clock	in	Clock source.
divider	in	Divider of between 1 and 128 of the clock source.

Parameter clock

Parameter divider

Definition: cgc_clockout_dividers_tdivider

Divider values for the CLKOUT output.

8.7.7.20 clockOutEnable

```
ssp_err_t(* cgc_api_t::clockOutEnable) (void)
```

Detailed description

Enable clock output on the CLKOUT pin. The source of the clock is controlled by clockOutCfg. Implemented as

- R_CGC_ClockOutEnable

8.7.7.21 clockOutDisable

```
ssp_err_t(* cgc_api_t::clockOutDisable) (void)
```

Detailed description

Disable clock output on the CLKOUT pin. The source of the clock is controlled by clockOutCfg. Implemented as

- R_CGC_ClockOutDisable

8.7.7.22 lcdClockCfg

```
ssp_err_t(* cgc_api_t::lcdClockCfg) (cgc_clock_t clock)
```

Detailed description

Configure the segment LCD Clock (S3A7 and S124 only). Implemented as

- R_CGC_LCDClockCfg

Table 1062:Parameters

Name	Direction	Description
clock	in	Segment LCD clock source.

Parameter clock

8.7.7.23 lcdClockEnable

```
ssp_err_t(* cgc_api_t::lcdClockEnable) (void)
```

Detailed description

Enable the LCD clock (S3A7 and S124 only). Implemented as

- R_CGC_LCDClockEnable

8.7.7.24 lcdClockDisable

```
ssp_err_t(* cgc_api_t::lcdClockDisable) (void)
```

Detailed description

Disables the LCD clock (S3A7 and S124 only). Implemented as

- R_CGC_LCDClockDisable

8.7.7.25 sdadcClockCfg

```
ssp_err_t(* cgc_api_t::sdadcClockCfg) (cgc_clock_t clock)
```

Detailed description

Configure the 24-bit Sigma-Delta A/D Converter Clock (S1JA only). Implemented as

- R_CGC_SDADCClockCfg

Table 1063:Parameters

Name	Direction	Description
clock	in	SDADC clock source.

Parameter clock

8.7.7.26 sdadcClockEnable

```
ssp_err_t(* cgc_api_t::sdadcClockEnable) (void)
```

Detailed description

Enable the SDADC clock (S1JA only). Implemented as

- R_CGC_SDADCClockEnable

8.7.7.27 sdadcClockDisable

```
ssp_err_t(* cgc_api_t::sdadcClockDisable) (void)
```

Detailed description

Disables the SDADC clock (S1JA only). Implemented as

- R_CGC_SDADCClockDisable

8.7.7.28 sdramClockOutEnable

```
ssp_err_t(* cgc_api_t::sdramClockOutEnable) (void)
```

Detailed description

Enables the SDRAM clock output (S7G2 only). Implemented as

- R_CGC_SDRAMClockOutEnable

8.7.7.29 sdramClockOutDisable

```
ssp_err_t(* cgc_api_t::sdramClockOutDisable) (void)
```

Detailed description

Disables the SDRAM clock (S7G2 only). Implemented as

- R_CGC_SDRAMClockOutDisable

8.7.7.30 usbClockCfg

```
ssp_err_t(* cgc_api_t::usbClockCfg) (cgc_usb_clock_div_t divider)
```

Detailed description

Configures the USB clock (S7G2 only). Implemented as

- R_CGC_USBClockCfg

Table 1064:Parameters

Name	Direction	Description
divider	in	The divider of 3, 4 or 5, of the clock source.

Parameter divider

Definition: `cgc_usb_clock_div_t`divider

USB clock divider values

8.7.7.31 systickUpdate

```
ssp_err_t(* cgc_api_t::systickUpdate) (uint32_t period_count,
cgc_systick_period_units_t units)
```

Detailed description

Update the Systick timer. Implemented as

- R_CGC_SystickUpdate

Table 1065:Parameters

Name	Direction	Description
period_count	in	The duration for the systick period.
units	in	The units for the provided period.

Parameter period_count

`uint32_t`

Parameter units

8.7.7.32 versionGet

```
ssp_err_t(* cgc_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Gets the CGC driver version. Implemented as

- R_CGC_VersionGet

Table 1066:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.7.7.33 cgc_instance_t

cgc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- cgc_clock_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- cgc_api_t const * p_api

  Pointer to the API structure for this instance.

8.8 COMPARATOR Interface

Interface for Comparators.

8.8.1 Summary

The comparator interface provides standard comparator functionality, including generating an event when the comparator result changes.

Implemented by: High-Speed Analog ComparatorLow Power Analog Comparator

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

8.8.2 Interface API

comparator_api_t

Function name	Description
.open	Initialize the comparator.
.outputEnable	Start the comparator.
.infoGet	Provide information such as the recommended minimum stabilization wait time.
.statusGet	Provide current comparator status.
.close	Stop the comparator.
.versionGet	Retrieve the API version.

8.8.3 Data structures

- comparator_info_t
- comparator_status_t

- comparator_callback_args_t
- comparator_cfg_t
- comparator_instance_t

8.8.4 Enumerations

- comparator_mode_t
- comparator_trigger_t
- comparator_polarity_invert_t
- comparator_pin_output_t
- comparator_filter_t
- comparator_state_t

8.8.5 Typedefs

- comparator_ctrl_t

8.8.6 Defines

- #define COMPARATOR_API_VERSION_MAJOR

  Initial value: `(1U)`

  Includes board and MCU related header files. Version Number of API.
- #define COMPARATOR_API_VERSION_MINOR

  Initial value: `(0U)`

8.8.7 API Data

8.8.7.1 comparator_mode_t

`comparator_mode_t`

Detailed description

Select whether to invert the polarity of the comparator output.

Enumerated values

Name	Description
COMPARATOR_MODE_NORMAL	Normal mode.

Name	Description
COMPARATOR_MODE_WINDOW	Window mode, not supported by all implementations.

8.8.7.2 comparator_trigger_t

`comparator_trigger_t`

Detailed description

Trigger type: rising edge, falling edge, both edges, low level.

Enumerated values

Name	Description
COMPARATOR_TRIGGER_RISING	Rising edge trigger.
COMPARATOR_TRIGGER_FALLING	Falling edge trigger.
COMPARATOR_TRIGGER_BOTH_EDGE	Both edges trigger.

8.8.7.3 comparator_polarity_invert_t

`comparator_polarity_invert_t`

Detailed description

Select whether to invert the polarity of the comparator output.

Enumerated values

Name	Description
COMPARATOR_POLARITY_INVERT_OFF	Do not invert polarity.
COMPARATOR_POLARITY_INVERT_ON	Invert polarity.

8.8.7.4 comparator_pin_output_t

`comparator_pin_output_t`

Detailed description

Select whether to include the comparator output on the output pin.

Enumerated values

Name	Description
COMPARATOR_PIN_OUTPUT_OFF	Do not include comparator output on output pin.
COMPARATOR_PIN_OUTPUT_ON	Include comparator output on output pin.

8.8.7.5 comparator_filter_t

`comparator_filter_t`

Detailed description

Comparator digital filtering sample clock divisor settings.

Enumerated values

Name	Description
COMPARATOR_FILTER_OFF	Disable debounce filter.
COMPARATOR_FILTER_1	Filter using PCLK divided by 1, not supported by all implementations.
COMPARATOR_FILTER_8	Filter using PCLK divided by 8.
COMPARATOR_FILTER_16	Filter using PCLK divided by 16, not supported by all implementations.
COMPARATOR_FILTER_32	Filter using PCLK divided by 32.

8.8.7.6 comparator_state_t

`comparator_state_t`

Detailed description

Current comparator state.

Enumerated values

Name	Description
COMPARATOR_STATE_OUTPUT_DISABLED	comparator_api_t::outputEnable() has not been called
COMPARATOR_STATE_OUTPUT_LOW	VCMP < VREF if polarity is not inverted, VCMP > VREF if inverted.

Name	Description
COMPARATOR_STATE_OUTPUT_HIGH	VCMP > VREF if polarity is not inverted, VCMP < VREF if inverted.

8.8.7.7 comparator_ctrl_t

```
typedef void comparator_ctrl_t
```

Detailed description

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented as

- acmphs_instance_ctrl_t
- acmplp_instance_ctrl_t

8.8.8 API Structures

8.8.8.1 comparator_info_t

comparator_info_t

Detailed description

Comparator information.

Variables

- uint32_t min_stabilization_wait_us

  Minimum stabilization wait time in microseconds.

8.8.8.2 comparator_status_t

comparator_status_t

Detailed description

Comparator status.

Variables

- comparator_state_t state

  Current comparator state.

8.8.8.3 comparator_callback_args_t

comparator_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Placeholder for user data. Set in comparator_api_t::open function in comparator_cfg_t.
- uint32_t channel

  The physical hardware channel that caused the interrupt.

8.8.8.4 comparator_cfg_t

comparator_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- uint8_t channel

  Hardware channel used.
- uint8_t irq_ipl

  Interrupt priority.
- comparator_mode_t mode

  Normal or window mode.
- comparator_trigger_t trigger

  Trigger setting.
- comparator_filter_t filter

  Digital filter clock divisor setting.
- comparator_polarity_invert_t invert

  Whether to invert output.
- comparator_pin_output_t pin_output

  Whether to include output on output pin.
- void(* p_callback)(comparator_callback_args_t *p_args)

  Callback called when comparator event occurs.
- void const * p_context

  Placeholder for user data. Passed to the user callback in comparator_callback_args_t.
- void const * p_extend

  Comparator hardware dependent configuration.

8.8.8.5 comparator_api_t

comparator_api_t

Detailed description

Comparator functions implemented at the HAL layer will follow this API.

8.8.8.6 open

```
ssp_err_t(* comparator_api_t::open) (comparator_ctrl_t *const p_ctrl,
comparator_cfg_t const *const p_cfg)
```

Detailed description

Initialize the comparator. Implemented as

- R_ACMPHS_Open
- R_ACMPLP_Open

Table 1067:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_cfg	in	Pointer to configuration

Parameter p_ctrl

Definition: `comparator_ctrl_t*const p_ctrl`

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented asacmphs_instance_ctrl_tacmplp_instance_ctrl_t

Parameter p_cfg

Definition: `comparator_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `comparator_cfg_t`::`channel`

  Hardware channel used.

- `comparator_cfg_t`::`irq_ipl`

  Interrupt priority.

- `comparator_cfg_t`::`comparator_mode_t`

  Normal or window mode.

  Enumerated as:

  – COMPARATOR_MODE_NORMAL

  – COMPARATOR_MODE_WINDOW

- comparator_cfg_t::comparator_trigger_t

  Trigger setting.

  Enumerated as:

  – COMPARATOR_TRIGGER_RISING

  – COMPARATOR_TRIGGER_FALLING

  – COMPARATOR_TRIGGER_BOTH_EDGE

- comparator_cfg_t::comparator_filter_t

  Digital filter clock divisor setting.

  Enumerated as:

  – COMPARATOR_FILTER_OFF

  – COMPARATOR_FILTER_1

  – COMPARATOR_FILTER_8

  – COMPARATOR_FILTER_16

  – COMPARATOR_FILTER_32

- comparator_cfg_t::comparator_polarity_invert_t

  Whether to invert output.

  Enumerated as:

  – COMPARATOR_POLARITY_INVERT_OFF

  – COMPARATOR_POLARITY_INVERT_ON

- comparator_cfg_t::comparator_pin_output_t

  Whether to include output on output pin.

  Enumerated as:

  – COMPARATOR_PIN_OUTPUT_OFF

  – COMPARATOR_PIN_OUTPUT_ON

- comparator_cfg_t::p_callback

  Callback called when comparator event occurs.

- comparator_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in comparator_callback_args_t.

- comparator_cfg_t::p_extend

  Comparator hardware dependent configuration.

8.8.8.7 outputEnable

```
ssp_err_t(* comparator_api_t::outputEnable) (comparator_ctrl_t *const p_ctrl)
```

Detailed description

Start the comparator. Implemented as

- R_ACMPHS_OutputEnable
- R_ACMPLP_OutputEnable

Table 1068:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block

Parameter p_ctrl

Definition: `comparator_ctrl_t*const p_ctrl`

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented asacmphs_instance_ctrl_tacmplp_instance_ctrl_t

8.8.8.8 infoGet

```
ssp_err_t(* comparator_api_t::infoGet) (comparator_ctrl_t *const p_ctrl,
comparator_info_t *const p_info)
```

Detailed description

Provide information such as the recommended minimum stabilization wait time. Implemented as

- R_ACMPHS_InfoGet
- R_ACMPLP_InfoGet

Table 1069:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_info	out	Comparator information stored here

Parameter p_ctrl

Definition: `comparator_ctrl_t*const p_ctrl`

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented asacmphs_instance_ctrl_tacmplp_instance_ctrl_t

Parameter p_info

Definition: `comparator_info_t*const p_info`

Comparator information.

- comparator_info_t::min_stabilization_wait_us

  Minimum stabilization wait time in microseconds.

8.8.8.9 statusGet

```
ssp_err_t(* comparator_api_t::statusGet) (comparator_ctrl_t *const p_ctrl,
comparator_status_t *const p_status)
```

Detailed description

Provide current comparator status. Implemented as

- R_ACMPHS_StatusGet
- R_ACMPLP_StatusGet

Table 1070:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_status	out	Status stored here

Parameter p_ctrl

Definition: comparator_ctrl_t*const p_ctrl

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented asacmphs_instance_ctrl_tacmplp_instance_ctrl_t

Parameter p_status

Definition: comparator_status_t*const p_status

Comparator status.

- comparator_status_t::state

  Current comparator state.

8.8.8.10 close

```
ssp_err_t(* comparator_api_t::close) (comparator_ctrl_t *const p_ctrl)
```

Detailed description

Stop the comparator. Implemented as

- R_ACMPHS_Close
- R_ACMPLP_Close

Table 1071:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block

Parameter p_ctrl

Definition: `comparator_ctrl_t*const p_ctrl`

Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. Implemented asacmphs_instance_ctrl_tacmplp_instance_ctrl_t

8.8.8.11 versionGet

```
ssp_err_t(* comparator_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Retrieve the API version. Implemented as

- R_ACMPHS_VersionGet
- R_ACMPLP_VersionGet

NOTE: This function retrieves the API version.

Table 1072:Parameters

Name	Direction	Description
p_version	in	Pointer to version structure

Parameter p_version

8.8.8.12 comparator_instance_t

comparator_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- comparator_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- comparator_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- comparator_api_t const * p_api

  Pointer to the API structure for this instance.

8.9 CRC Interface

Interface for cyclic redundancy checking.

8.9.1 Summary

The CRC (Cyclic Redundancy Check) calculator generates CRC codes using five different polynomials including 8 bit, 16 bit, and 32 bit variations. Calculation can be performed by sending data to the block using the CPU or by snooping on read or write activity on one of 10 SCI channels.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CRC Interface description: CRC Driver

8.9.2 Interface API

crc_api_t

Function name	Description
.open	Open the CRC driver module.
.close	Close the CRC module driver
.crcResultGet	Return the current calculated value.
.snoopEnable	Enable snooping.
.snoopDisable	Disable snooping.
.snoopCfg	Configure the snoop channel and direction.
.calculate	Perform a CRC calculation on a block of data.

Function name	Description
.versionGet	Get the driver version based on compile time macros.

8.9.3 Data structures

- crc_cfg_t
- crc_snoop_cfg_t
- crc_instance_t

8.9.4 Enumerations

- crc_polynomial_t
- crc_bit_order_t
- crc_snoop_direction_t

8.9.5 Typedefs

- crc_ctrl_t

8.9.6 Defines

- #define CRC_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define CRC_API_VERSION_MINOR
  Initial value: `(2U)`

8.9.7 API Data

8.9.7.1 crc_polynomial_t

`crc_polynomial_t`

Detailed description

CRC Generating Polynomial Switching (GPS).

Enumerated values

Name	Description
CRC_POLYNOMIAL_CRC_8	8-bit CRC-8 (X8 + X2 + X + 1)
CRC_POLYNOMIAL_CRC_16	16-bit CRC-16 (X16 + X15 + X2 + 1)
CRC_POLYNOMIAL_CRC_CCITT	16-bit CRC-CCITT (X16 + X12 + X5 + 1)
CRC_POLYNOMIAL_CRC_32	32-bit CRC-32 (X32 + X26 + X23 + X22 + X16 + X12 + X11 + X10 + X8 + X7 + X5 + X4 + X2 + X + 1)
CRC_POLYNOMIAL_CRC_32C	32-bit CRC-32C (X32 + X28 + X27 + X26 + X25 + X23 + X22 + X20 + X19 + X18 + X14 + X13 + X11 + X10 + X9 + X8 + X6 + 1)

8.9.7.2 crc_bit_order_t

`crc_bit_order_t`

Detailed description

CRC Calculation Switching (LMS)

Enumerated values

Name	Description
CRC_BIT_ORDER_LMS_LSB	Generates CRC for LSB first communication.
CRC_BIT_ORDER_LMS_MSB	Generates CRC for MSB first communication.

8.9.7.3 crc_snoop_direction_t

`crc_snoop_direction_t`

Detailed description

Snoop-On-Write/Read Switch (CRCSWR)

Enumerated values

Name	Description
CRC_SNOOP_DIRECTION_RECEIVE	Snoop-on-read.
CRC_SNOOP_DIRECTION_TRANSMIT	Snoop-on-write.

8.9.7.4 crc_ctrl_t

```
typedef void crc_ctrl_t
```

Detailed description

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented as

- crc_instance_ctrl_t

8.9.8 API Structures

8.9.8.1 crc_cfg_t

crc_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- crc_polynomial_t polynomial

  CRC Generating Polynomial Switching. (GPS)
- crc_bit_order_t bit_order

  CRC Calculation Switching (LMS)
- void const * p_extend

  CRC Hardware Dependent Configuration.

8.9.8.2 crc_snoop_cfg_t

crc_snoop_cfg_t

Detailed description

Snoop configuration

Variables

- uint32_t snoop_channel

  Register Snoop Address (CRCSA)
- crc_snoop_direction_t snoop_direction

  Snoop-On-Write/Read Switch (CRCSWR)

8.9.8.3 crc_api_t

crc_api_t

Detailed description

CRC driver structure. General CRC functions implemented at the HAL layer will follow this API.

8.9.8.4 open

```
ssp_err_t(* crc_api_t::open) (crc_ctrl_t *const p_ctrl, crc_cfg_t const *const
p_cfg)
```

Detailed description

Open the CRC driver module. Implemented as

- R_CRC_Open

Table 1073:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CRC device handle.
p_cfg	in	Pointer to a configuration structure.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter p_cfg

Definition: `crc_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `crc_cfg_t::crc_polynomial_t`

  CRC Generating Polynomial Switching. (GPS)

  Enumerated as:

  – CRC_POLYNOMIAL_CRC_8

  – CRC_POLYNOMIAL_CRC_16

  – CRC_POLYNOMIAL_CRC_CCITT

  – CRC_POLYNOMIAL_CRC_32

  – CRC_POLYNOMIAL_CRC_32C

- `crc_cfg_t::crc_bit_order_t`

  CRC Calculation Switching (LMS)

  Enumerated as:

  – CRC_BIT_ORDER_LMS_LSB

  – CRC_BIT_ORDER_LMS_MSB

- crc_cfg_t::p_extend

  CRC Hardware Dependent Configuration.

8.9.8.5 close

```
ssp_err_t(* crc_api_t::close) (crc_ctrl_t *const p_ctrl)
```

Detailed description

Close the CRC module driver Implemented as

- R_CRC_Close

Table 1074:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to crc device handle

Table 1075:Return values

Name	Description
SSP_SUCCESS	Configuration was successful.

Parameter p_ctrl

Definition: crc_ctrl_t*const p_ctrl

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter SSP_SUCCESS

8.9.8.6 crcResultGet

```
ssp_err_t(* crc_api_t::crcResultGet) (crc_ctrl_t *const p_ctrl, uint32_t
*crc_result)
```

Detailed description

Return the current calculated value. Implemented as

- R_CRC_CalculatedValueGet

Table 1076:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CRC device handle.
crc_result	out	The calculated value from the last CRC calculation.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter crc_result

`uint32_t`

8.9.8.7 snoopEnable

```
ssp_err_t(* crc_api_t::snoopEnable) (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)
```

Detailed description

Enable snooping. Implemented as

- R_CRC_SnoopEnable

Table 1077:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to CRC device handle.
crc_seed	in	CRC seed.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter crc_seed

`uint32_t`

8.9.8.8 snoopDisable

```
ssp_err_t(* crc_api_t::snoopDisable) (crc_ctrl_t *const p_ctrl)
```

Detailed description

Disable snooping. Implemented as

- R_CRC_SnoopDisable

Table 1078:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to crc device handle.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

8.9.8.9 snoopCfg

```
ssp_err_t(* crc_api_t::snoopCfg) (crc_ctrl_t *const p_ctrl, crc_snoop_cfg_t
*const p_snoop_cfg)
```

Detailed description

Configure the snoop channel and direction. Implemented as

- R_CRC_SnoopCfg

Table 1079:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to crc device handle.
p_snoopCfg	in	Snoop configuration.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter p_snoopCfg

8.9.8.10 calculate

```
ssp_err_t(* crc_api_t::calculate) (crc_ctrl_t *const p_ctrl, void
*p_input_buffer, uint32_t num_bytes, uint32_t crc_seed, uint32_t *p_crc_result)
```

Detailed description

Perform a CRC calculation on a block of data. Implemented as

- R_CRC_Calculate

Table 1080:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to crc device handle.
input_buffer	in	A pointer to an array of data values.
num_bytes	in	The number of bytes (not elements) in the array.
crc_seed	in	The seeded value for crc calculations.
crc_result	out	The calculated value of the CRC calculation.

Parameter p_ctrl

Definition: `crc_ctrl_t*const p_ctrl`

CRC control block. Allocate an instance specific control block to pass into the CRC API calls. Implemented ascrc_instance_ctrl_t

Parameter input_buffer
Parameter num_bytes

`uint32_t`

Parameter crc_seed

`uint32_t`

Parameter crc_result

8.9.8.11 versionGet

```
ssp_err_t(* crc_api_t::versionGet) (ssp_version_t *version)
```

Detailed description

Get the driver version based on compile time macros. Implemented as

- R_CRC_VersionGet

8.9.8.12 crc_instance_t

crc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- crc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- crc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- crc_api_t const * p_api

  Pointer to the API structure for this instance.

8.10 CTSU Interface

Interface for Capacitive Touch Controllers.

8.10.1 Summary

The CTSU interface provides the functionality necessary to open, close, run and control the CTSU depending upon the configuration passed as arguments.

Implemented by: CTSU

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CTSU Interface description: CTSU Driver

8.10.2 Interface API

ctsu_api_t

Function name	Description
.open	Initialize the CTSU; enable power and clock and set the register configuration.
.close	Close the CTSU by ending any scan in progress, disabling interrupts, and removing power to the peripheral and saving configurations according to options.
.scan	Start off a single CTSU scan.

Function name	Description
.update	Update the CTSU internal data including the touch decision and other derived data according to the results of the scan.
.read	Read the results from the CTSU including raw data, binary data and other derived data according to the selected options.
.versionGet	Retrieve the API version.

8.10.3 Data structures

- ctsu_callback_args_t
- ctsu_channel_pair_t
- ctsu_channel_setting_t
- ctsu_channel_data_self_t
- ctsu_channel_data_mutual_t
- ctsu_hw_cfg_t
- ctsu_functions_t
- ctsu_cfg_t
- ctsu_instance_t

8.10.4 Enumerations

- ctsu_event_t
- ctsu_read_t
- ctsu_process_option_t
- ctsu_close_option_t
- ctsu_action_t

8.10.5 Typedefs

- ctsu_ctrl_t

8.10.6 Defines

- #define CTSU_API_VERSION_MAJOR

  Initial value: `(1U)`

  Includes board and MCU related header files. Version of the API defined in this file
- #define CTSU_API_VERSION_MINOR

  Initial value: `(2U)`

8.10.7 API Data

8.10.7.1 ctsu_event_t

`ctsu_event_t`

Detailed description

CTSU callback event definitions

Enumerated values

Name	Description
CTSU_EVENT_SCAN_COMPLETE	Scan cycle is complete. This callback is occurring from an ISR.
CTSU_EVENT_PARAMETERS_UPDATED	All derived parameters from raw CTSU data are updated. Callback is not from ISR.

8.10.7.2 ctsu_read_t

`ctsu_read_t`

Detailed description

Different options with which a user can query the results of a CTSU scan. User cannot logic 'or' these together.

Enumerated values

Name	Description
CTSU_READ_BINARY_DATA_ALL	Read binary string of touch determination.
CTSU_READ_BINARY_DATA_SEL	Read binary string of touch determination for selected channels only.
CTSU_READ_RAW_SENSOR_OUTPUT_ALL	Read raw CTSU output for all active channels.

Name	Description
CTSU_READ_RAW_SENSOR_OUTPUT_SEL	Read raw CTSU output for selected channels.
CTSU_READ_FILTERED_SENSOR_VALUES_ALL	Read scount values output from filter for all active channels.
CTSU_READ_FILTERED_SENSOR_VALUES_SEL	Read scount values output from filter for all active channels.
CTSU_READ_DELTA_COUNT_ALL	Write out the difference between sensor and baseline count to p_dest array for all active sensors.
CTSU_READ_DELTA_COUNT_SEL	Write out the difference between sensor and baseline count to p_dest array for selected channels.
CTSU_READ_BASELINE_COUNT_ALL	Read the current sensor baseline used to determine if a channel is being touched for all active channels.
CTSU_READ_BASELINE_COUNT_SEL	Read the current sensor baseline used to determine if a channel is being touched for selected channels.
CTSU_READ_FILTERED_REF_ICO_VALUES_ALL	Read the rcount values output from filter for all active channels.
CTSU_READ_FILTERED_REF_ICO_VALUES_SEL	Read the rcount values output from filter for selected channels only.

8.10.7.3 ctsu_process_option_t

`ctsu_process_option_t`

Detailed description

Different options that can be provided to the Process function.

Enumerated values

Name	Description
CTSU_PROCESS_OPTION_DEFAULT_SETTING	Recommended option for most use cases.
CTSU_PROCESS_OPTION_AUTO_SCAN	Automatically start a scan after all internal variables have been updated.
CTSU_PROCESS_OPTION_ENABLE_DRIFT_COMP	Perform drift compensation and start a new scan when internal variables are updated.
CTSU_PROCESS_OPTION_ENABLE_AUTO_CALIB	Perform auto-calibration and start a new scan when internal variables are updated.

Name	Description
CTSU_PROCESS_OPTION_NONE	Skip all optional actions.

8.10.7.4 ctsu_close_option_t

`ctsu_close_option_t`

Detailed description

Options which can be passed to the Close function. User can logically 'OR' these together.

Enumerated values

Name	Description
CTSU_CLOSE_OPTION_SUSPEND	Suspend the CTSU by setting the CTSUSNZ bit.
CTSU_CLOSE_OPTION_SAVE_CONFIG	Save the configuration in the second argument provided to the close function.
CTSU_CLOSE_OPTION_RESET_SFRS	Bring the SFRs back to their P-O-RS values.
CTSU_CLOSE_OPTION_POWER_DOWN	Disable clock supply to the CTSU and set it into low power mode.

8.10.7.5 ctsu_action_t

`ctsu_action_t`

Detailed description

State of the Process/Update CTSU sensor data function

Enumerated values

Name	Description
CTSU_ACTION_START_NEW_SCAN	Start new scan.
CTSU_ACTION_WAITING_FOR_SCAN_COMPLETE	Wait for scan complete.
CTSU_ACTION_CHECK_FOR_ERRORS	Check for errors.
CTSU_ACTION_FILTER_DATA	Filter data.
CTSU_ACTION_UPDATE_TOUCH_INFO	Update touch info.
CTSU_ACTION_UPDATE_BUTTONS	Update buttons.

Name	Description
CTSU_ACTION_UPDATE_SLIDERS	Update sliders.
CTSU_ACTION_RUN_DRIFT_COMP	Run drift compensation.
CTSU_ACTION_RUN_AUTO_TUNE	Run auto tuning.
CTSU_ACTION_RESTART_STATE_MACHINE	Restart state machine.

8.10.7.6 ctsu_ctrl_t

```
typedef void ctsu_ctrl_t
```

Detailed description

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented as

- ctsu_instance_ctrl_t

8.10.8 API Structures

8.10.8.1 ctsu_callback_args_t

ctsu_callback_args_t

Detailed description

CTSU callback arguments definitions

Variables

- ctsu_event_t event

  CTSU callback event.

- void const * p_context

  Placeholder for user data.

8.10.8.2 ctsu_channel_pair_t

ctsu_channel_pair_t

Detailed description

Structure storing information about a touch sensor element

Variables

- int8_t rx

  Denotes the primary channel.

- int8_t tx

  Denotes the secondary channel (used only for mutual capacitance mode)

8.10.8.3 ctsu_channel_setting_t

ctsu_channel_setting_t

Detailed description

Structure to be holding values to be written to the SFRs in the WR ISR

Variables

- uint16_t ctsussc

  Holds value for the CTSUSSC register.

- uint16_t ctsuso0

  Holds value for the CTSUSO0 register.

- uint16_t ctsuso1

  Holds value for the CTSUSO1 register.

8.10.8.4 ctsu_channel_data_self_t

ctsu_channel_data_self_t

Detailed description

Immediate raw data readings from the CTSU registers CTSUSC(sensor count) and CTSURC(Reference count) in self-capacitance mode.

Variables

- uint16_t sensor_count

  Raw sensor count.

- uint16_t reference_count

  Raw reference count.

8.10.8.5 ctsu_channel_data_mutual_t

ctsu_channel_data_mutual_t

Detailed description

Immediate raw data readings from the CTSU registers CTSUSC(sensor count) and CTSURC(Reference count) in mutual-capacitance mode.

Variables

- uint16_t sen_cnt_1

  Raw Sensor count primary reading.

- uint16_t ref_cnt_1

  Raw reference ICO count primary reading.

- uint16_t sen_cnt_2

  Raw sensor ICO count secondary reading.

- uint16_t ref_cnt_2

  Raw reference ICO count secondary reading.

8.10.8.6 ctsu_hw_cfg_t

ctsu_hw_cfg_t

Detailed description

Structure defining a hardware configuration to be passed to the Open function

Variables

- R_CTSU_Type ctsu_settings

  User defined SFR settings for CR0, CR1, SDPRS, SST, CHACn, CHTRCn, DCLKC.

- ctsu_channel_setting_t * write_settings

  User defined initial settings for thresholds for each active channel . Threshold is difference between runtime baseline and filtered output of sensor count.

  User defined settings for SSC, SO0, SO1 for each active channel.

- uint16_t * threshold
- uint16_t * hysteresis

  User defined settings for tolerance in count values.

- uint16_t * baseline

  A baseline of the expected count for each active channel when not touched.

- void * raw_result

  A pointer to a buffer which will hold raw results of CTSU measurement.

- void * filter_output

  A pointer to a buffer which will hold output after filtering raw results.

- void * binary_result

  A pointer to a location where binary data can be stored.

- ctsu_channel_pair_t * excluded

  A pointer to an array which contains a list of channel pairs which need to be ignored in ascending order of rx and then tx.

- int8_t num_excluded

  Number of elements in the array excluded.

- const uint16_t * series_resistance

  Resistance of the channel (to determine RC constant when tuning).

8.10.8.7 ctsu_functions_t

ctsu_functions_t

Detailed description

User defined functions that can be used to override the default processing functions used internally by the driver. For advanced usage only.

Variables

- int32_t(* preFilter)(void *p_args)

  Used for calculating raw data SNR before data gets filtered.

- int32_t(* filter)(volatile uint16_t *output, volatile uint16_t *input)

  Weighted averaging using CTSU_CFG_FILTER_DEPTH.

- int32_t(* postFilter)(void *p_args)

  Processing the filter results.

- int32_t(* ctsuDecode)(void *p_args)

  Algorithm to decide if channel is touched or not.

- int32_t(* otDriftComp)(void *p_args)

  Algorithm to perform manipulations to baseline, envelope, and thresholds on initialization.

- int32_t(* rtDriftComp)(void *p_args)

  Algorithm to perform run time manipulations to baseline, envelope, and thresholds.

- int32_t(* otAutoTune)(void *p_args)

  Function called once on initialization of system.

- int32_t(* rtAutoTune)(void *p_args)

  Function called to auto tune sensor when system is running.

8.10.8.8 ctsu_cfg_t

ctsu_cfg_t

Detailed description

Structure defining a configuration structure for the CTSU driver

Variables

- transfer_instance_t const *const p_lower_lvl_transfer_read

  Pointer to the Transfer instance to read results.

- transfer_instance_t const *const p_lower_lvl_transfer_write

  Pointer to the Transfer instance to write cfg.
- ctsu_hw_cfg_t * p_ctsu_hw_cfg

  Pointer to a CTSU configuration.
- ctsu_functions_t * p_ctsu_functions

  Pointer to a place holder for custom data functions.
- void(* p_callback)(ctsu_callback_args_t *p_args)

  Callback to the function to use when scan is complete.
- void * p_context

  Pointer to data that should be passed to update_complete notification.
- ctsu_process_option_t ctsu_soft_option

  Software options to use when performing Open and Process.
- ctsu_close_option_t ctsu_close_option

  Software options to use when closing touch operation.
- uint8_t write_ipl

  Write interrupt priority.
- uint8_t read_ipl

  Read interrupt priority.
- uint8_t end_ipl

  End interrupt priority.

8.10.8.9 ctsu_api_t

ctsu_api_t

Detailed description

CTSU HAL driver API structure. Functions implemented at the HAL layer will follow this API.

8.10.8.10 open

```
ssp_err_t(* ctsu_api_t::open) (ctsu_ctrl_t *p_ctrl, ctsu_cfg_t *p_cfg)
```

Detailed description

Initialize the CTSU; enable power and clock and set the register configuration. Implemented as

- R_CTSU_Open

Table 1081:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_cfg	in	Pointer to configuration structure

Parameter p_ctrl

Definition: `ctsu_ctrl_t*p_ctrl`

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented asctsu_instance_ctrl_t

Parameter p_cfg

Definition: `ctsu_cfg_t *p_cfg`

Structure defining a configuration structure for the CTSU driver

- `ctsu_cfg_t`::`transfer_instance_t`

  Pointer to the Transfer instance to read results.

- `ctsu_cfg_t`::`transfer_instance_t`

  Pointer to the Transfer instance to write cfg.

- `ctsu_cfg_t`::`ctsu_hw_cfg_t`

  Pointer to a CTSU configuration.

- `ctsu_cfg_t`::`ctsu_functions_t`

  Pointer to a place holder for custom data functions.

- `ctsu_cfg_t`::`p_callback`

  Callback to the function to use when scan is complete.

- `ctsu_cfg_t`::`p_context`

  Pointer to data that should be passed to update_complete notification.

- `ctsu_cfg_t`::`ctsu_process_option_t`

  Software options to use when performing Open and Process.

  Enumerated as:

  – CTSU_PROCESS_OPTION_DEFAULT_SETTING

  – CTSU_PROCESS_OPTION_AUTO_SCAN

  – CTSU_PROCESS_OPTION_ENABLE_DRIFT_COMP

  – CTSU_PROCESS_OPTION_ENABLE_AUTO_CALIB

  – CTSU_PROCESS_OPTION_NONE

- ctsu_cfg_t::ctsu_close_option_t

  Software options to use when closing touch operation.

  Enumerated as:

  – CTSU_CLOSE_OPTION_SUSPEND

  – CTSU_CLOSE_OPTION_SAVE_CONFIG

  – CTSU_CLOSE_OPTION_RESET_SFRS

  – CTSU_CLOSE_OPTION_POWER_DOWN

- ctsu_cfg_t::write_ipl

  Write interrupt priority.

- ctsu_cfg_t::read_ipl

  Read interrupt priority.

- ctsu_cfg_t::end_ipl

  End interrupt priority.

8.10.8.11 close

```
ssp_err_t(* ctsu_api_t::close) (ctsu_ctrl_t *p_ctrl, ctsu_close_option_t opts)
```

Detailed description

Close the CTSU by ending any scan in progress, disabling interrupts, and removing power to the peripheral and saving configurations according to options. Implemented as

- R_CTSU_Close

Table 1082:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
opts	in	Closing options

Parameter p_ctrl

Definition: ctsu_ctrl_t*p_ctrl

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented asctsu_instance_ctrl_t

Parameter opts

Definition: ctsu_close_option_topts

Options which can be passed to the Close function. User can logically 'OR' these together.

8.10.8.12 scan

```
ssp_err_t(* ctsu_api_t::scan) (ctsu_ctrl_t *p_ctrl)
```

Detailed description

Start off a single CTSU scan. Implemented as

- R_CTSU_Start_Scan

Table 1083:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `ctsu_ctrl_t*p_ctrl`

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented asctsu_instance_ctrl_t

8.10.8.13 update

```
ssp_err_t(* ctsu_api_t::update) (ctsu_ctrl_t *p_ctrl)
```

Detailed description

Update the CTSU internal data including the touch decision and other derived data according to the results of the scan. Implemented as

- R_CTSU_Update_Parameters

Table 1084:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure

Parameter p_ctrl

Definition: `ctsu_ctrl_t*p_ctrl`

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented asctsu_instance_ctrl_t

8.10.8.14 read

```
ssp_err_t(* ctsu_api_t::read) (ctsu_ctrl_t *p_ctrl, void *p_dest, ctsu_read_t
opts, const ctsu_channel_pair_t *channels, const uint16_t count)
```

Detailed description

Read the results from the CTSU including raw data, binary data and other derived data according to the selected options. Implemented as

- R_CTSU_Read_Results

Table 1085:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_dest	out	Pointer to the destination location for the read data
opts	in	Read options, use only one option per call to read, do not logically OR values
channels	in	Specify the channel/channel pairs to read data for
count	in	Specify the number of channel/channel pairs to read data for

Parameter p_ctrl

Definition: `ctsu_ctrl_t*p_ctrl`

CTSU control block. Allocate an instance specific control block to pass into the CTSU API calls. Implemented asctsu_instance_ctrl_t

Parameter p_dest

`const`

Parameter opts

Definition: `ctsu_read_topts`

Different options with which a user can query the results of a CTSU scan. User cannot logic 'or' these together.

Parameter channels

Definition: `ctsu_channel_pair_tctsu_channel_pair_t *channels`

Structure storing information about a touch sensor element

- `ctsu_channel_pair_t::rx`

  Denotes the primary channel.

- `ctsu_channel_pair_t::tx`

  Denotes the secondary channel (used only for mutual capacitance mode)

Parameter count

`uint16_t`

8.10.8.15 versionGet

```
ssp_err_t(* ctsu_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Retrieve the API version. Implemented as

- R_CTSU_VersionGet()

NOTE: This function retrieves the API version.

Table 1086:Parameters

Name	Direction	Description
p_version	in	Pointer to version structure

Parameter p_version

8.10.8.16 ctsu_instance_t

ctsu_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- ctsu_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- ctsu_cfg_t * p_cfg

  Pointer to the configuration structure for this instance.
- ctsu_api_t const * p_api

  Pointer to the API structure for this instance.

8.11 Display Interface

Interface for LCD panel displays.

8.11.1 Summary

The display interface provides standard display functionality:

- Signal timing configuration for LCD panels with RGB interface.
- Dot clock source selection (internal or external) and frequency divider.
- Blending of multiple graphics layers on the background screen.
- Color correction (brightness/configuration/gamma correction).
- Interrupts and callback function.

Implemented by: GLCDC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Display Interface description: GLCDC Display Driver

8.11.2 Interface API

display_api_t

Function name	Description
.open	Open display device.
.close	Close display device.
.start	Display start.
.stop	Display stop.
.layerChange	Change layer parameters at runtime.
.correction	Color correction.
.clut	Set CLUT for display device.
.statusGet	Get status for display device.
.versionGet	Get version.

8.11.3 Data structures

- display_timing_t
- display_color_t
- display_coordinate_t

- display_brightness_t
- display_contrast_t
- display_correction_t
- gamma_correction_t
- display_gamma_correction_t

8.11.5 Typedefs

- display_ctrl_t

8.11.6 Defines

- #define DISPLAY_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define DISPLAY_API_VERSION_MINOR

  Initial value: `(2U)`
- #define DISPLAY_GAMMA_CURVE_ELEMENT_NUM

  Initial value: `(16)`

8.11.7 API Data

8.11.7.1 display_frame_layer_t

`display_frame_layer_t`

Detailed description

Display frame number

Enumerated values

Name	Description
DISPLAY_FRAME_LAYER_1	Frame layer 1.
DISPLAY_FRAME_LAYER_2	Frame layer 2.

8.11.7.2 display_state_t

`display_state_t`

Detailed description

Display interface operation state

Enumerated values

Name	Description
DISPLAY_STATE_CLOSED	Display closed.
DISPLAY_STATE_OPENED	Display opened.
DISPLAY_STATE_DISPLAYING	Displaying.

8.11.7.3 display_event_t

`display_event_t`

Detailed description

Display event codes

Enumerated values

Name	Description
DISPLAY_EVENT_GR1_UNDERFLOW	Graphics frame1 underflow occurs.
DISPLAY_EVENT_GR2_UNDERFLOW	Graphics frame2 underflow occurs.
DISPLAY_EVENT_LINE_DETECTION	Designated line is processed.

8.11.7.4 display_in_format_t

`display_in_format_t`

Detailed description

Input format setting

Enumerated values

Name	Description
DISPLAY_IN_FORMAT_32BITS_ARGB8888	ARGB8888, 32 bits.
DISPLAY_IN_FORMAT_32BITS_RGB888	RGB888, 32 bits.
DISPLAY_IN_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB1555	ARGB1555, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB4444	ARGB4444, 16 bits.
DISPLAY_IN_FORMAT_CLUT8	CLUT8.
DISPLAY_IN_FORMAT_CLUT4	CLUT4.
DISPLAY_IN_FORMAT_CLUT1	CLUT1.

8.11.7.5 display_out_format_t

`display_out_format_t`

Detailed description

Output format setting

Enumerated values

Name	Description
DISPLAY_OUT_FORMAT_24BITS_RGB888	RGB888, 24 bits.
DISPLAY_OUT_FORMAT_18BITS_RGB666	RGB666, 18 bits.
DISPLAY_OUT_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_OUT_FORMAT_8BITS_SERIAL	SERIAL, 8 bits.

8.11.7.6 display_endian_t

`display_endian_t`

Detailed description

Data endian select

Enumerated values

Name	Description
DISPLAY_ENDIAN_LITTLE	Little-endian.
DISPLAY_ENDIAN_BIG	Big-endian.

8.11.7.7 display_color_order_t

`display_color_order_t`

Detailed description

RGB color order select

Enumerated values

Name	Description
DISPLAY_COLOR_ORDER_RGB	Color order RGB.
DISPLAY_COLOR_ORDER_BGR	Color order BGR.

8.11.7.8 display_signal_polarity_t

`display_signal_polarity_t`

Detailed description

Polarity of a signal select

Enumerated values

Name	Description
DISPLAY_SIGNAL_POLARITY_LOACTIVE	Low active signal.
DISPLAY_SIGNAL_POLARITY_HIACTIVE	High active signal.

8.11.7.9 display_sync_edge_t

`display_sync_edge_t`

Detailed description

Signal synchronization edge select

Enumerated values

Name	Description
DISPLAY_SIGNAL_SYNC_EDGE_RISING	Signal is synchronized to rising edge.
DISPLAY_SIGNAL_SYNC_EDGE_FALLING	Signal is synchronized to falling edge.

8.11.7.10 display_fade_control_t

`display_fade_control_t`

Detailed description

Fading control

Enumerated values

Name	Description
DISPLAY_FADE_CONTROL_NONE	Applying no fading control.
DISPLAY_FADE_CONTROL_FADEIN	Applying fade-in control.
DISPLAY_FADE_CONTROL_FADEOUT	Applying fade-out control.

8.11.7.11 display_fade_status_t

`display_fade_status_t`

Detailed description

Fading status

Enumerated values

Name	Description
DISPLAY_FADE_STATUS_NOT_UNDERWAY	Fade-in/fade-out is not in progress.
DISPLAY_FADE_STATUS_FADING_UNDERWAY	Fade-in or fade-out is in progress.
DISPLAY_FADE_STATUS_UNCERTAIN	Fade-in/fade-out status is uncertain just before hardware working.

8.11.7.12 display_ctrl_t

`typedef void display_ctrl_t`

Detailed description

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented as

- glcd_instance_ctrl_tDisplay control block

8.11.8 API Structures

8.11.8.1 display_timing_t

display_timing_t

Detailed description

Display signal timing setting

Variables

- uint16_t total_cyc

  Total cycles in one line or total lines in one frame.
- uint16_t display_cyc

  Active video cycles or lines.
- uint16_t back_porch

  Back poach cycles or lines.
- uint16_t sync_width

  Sync signal asserting width.

- display_signal_polarity_t sync_polarity

  Sync signal polarity.

8.11.8.2 display_color_t

display_color_t

Detailed description

RGB Color setting

Variables

- uint32_t argb
- uint8_t b

  blue
- uint8_t g

  green
- uint8_t r

  red
- uint8_t a

  a
- struct{} byte

  See source code for definition of this member.
- union{} union{}

  See source code for definition of this member.

8.11.8.3 display_coordinate_t

display_coordinate_t

Detailed description

Contrast (gain) correction setting

Variables

- int16_t x

  Coordinate X, this allows to set signed value.
- int16_t y

  Coordinate Y, this allows to set signed value.

8.11.8.4 display_brightness_t

display_brightness_t

Detailed description

Brightness (DC) correction setting

Variables

- bool enable

  Brightness Correction On/Off.

- uint16_t r

  Brightness (DC) adjustment for R channel.

- uint16_t g

  Brightness (DC) adjustment for G channel.

- uint16_t b

  Brightness (DC) adjustment for B channel.

8.11.8.5 display_contrast_t

display_contrast_t

Detailed description

Contrast (gain) correction setting

Variables

- bool enable

  Contrast Correction On/Off.

- uint8_t r

  Contrast (gain) adjustment for R channel.

- uint8_t g

  Contrast (gain) adjustment for G channel.

- uint8_t b

  Contrast (gain) adjustment for B channel.

8.11.8.6 display_correction_t

display_correction_t

Detailed description

Color correction setting

Variables

- display_brightness_t brightness

  Brightness.

- display_contrast_t contrast

  Contrast.

8.11.8.7 gamma_correction_t

gamma_correction_t

Detailed description

Gamma correction setting for each color

Variables

- bool enable

  Gamma Correction On/Off.

- uint16_t gain[DISPLAY_GAMMA_CURVE_ELEMENT_NUM]

  Gain adjustment.

- uint16_t threshold[DISPLAY_GAMMA_CURVE_ELEMENT_NUM]

  Start threshold.

8.11.8.8 display_gamma_correction_t

display_gamma_correction_t

Detailed description

Gamma correction setting

Variables

- gamma_correction_t r

  Gamma correction for R channel.

- gamma_correction_t g

  Gamma correction for G channel.

- gamma_correction_t b

  Gamma correction for B channel.

8.11.8.9 display_clut_t

display_clut_t

Detailed description

CLUT setting

Variables

- uint32_t color_num

  The number of colors in CLUT.

- const uint32_t * p_clut

  Address of the area storing the CLUT data (in ARGB8888 format)

8.11.8.10 display_input_cfg_t

display_input_cfg_t

Detailed description

Graphics plane input configuration structure

Variables

- uint32_t * p_base

  Base address to the frame buffer.
- uint16_t hsize

  Horizontal pixel size in a line.
- uint16_t vsize

  Vertical pixel size in a frame.
- uint32_t hstride

  Memory stride (bytes) in a line.
- display_in_format_t format

  Input format setting.
- bool line_descending_enable

  Line descending enable.
- bool lines_repeat_enable

  Line repeat enable.
- uint16_t lines_repeat_times

  Expected number of line repeating.

8.11.8.11 display_output_cfg_t

display_output_cfg_t

Detailed description

Display output configuration structure

Variables

- display_timing_t htiming

  Horizontal display cycle setting.
- display_timing_t vtiming

  Vertical display cycle setting.

- display_out_format_t format

  Output format setting.
- display_endian_t endian

  Bit order of output data.
- display_color_order_t color_order

  Color order in pixel.
- display_signal_polarity_t data_enable_polarity

  Data Enable signal polarity.
- display_sync_edge_t sync_edge

  Signal sync edge selection.
- display_color_t bg_color

  Background color.
- display_brightness_t brightness

  Brightness setting.
- display_contrast_t contrast

  Contrast setting.
- display_gamma_correction_t * p_gamma_correction

  Pointer to gamma correction setting.
- bool dithering_on

  Dithering on/off.

8.11.8.12 display_layer_t

display_layer_t

Detailed description

Graphics layer blend setup parameter structure

Variables

- display_coordinate_t coordinate

  Blending location (starting point of image)
- display_color_t bg_color

  Color outside region.
- display_fade_control_t fade_control

  Layer fade-in/out control on/off.
- uint8_t fade_speed

  Layer fade-in/out frame rate.

8.11.8.13 display_callback_args_t

display_callback_args_t

Detailed description

Display callback parameter definition

Variables

- display_event_t event

  Event code.

- void const * p_context

  Context provided to user during callback.

8.11.8.14 display_cfg_t

display_cfg_t

Detailed description

Display main configuration structure

Variables

- display_input_cfg_t input[DISPLAY_FRAME_LAYER_2+1]

  Graphics input frame setting.

  Generic configuration for display devices

- display_output_cfg_t output

  Graphics output frame setting.

- display_layer_t layer[DISPLAY_FRAME_LAYER_2+1]

  Graphics layer blend setting.

- uint8_t line_detect_ipl

  Line detect interrupt priority.

- uint8_t underflow_1_ipl

  Underflow 1 interrupt priority.

- uint8_t underflow_2_ipl

  Underflow 1 interrupt priority.

- void(* p_callback)(display_callback_args_t *p_args)

  Pointer to callback function.

  Configuration for display event processing

- void const * p_context

  User defined context passed into callback function.

- void const * p_extend

  Display hardware dependent configuration.

  Pointer to display peripheral specific configuration

8.11.8.15 display_runtime_cfg_t

display_runtime_cfg_t

Detailed description

Display main configuration structure

Variables

- display_input_cfg_t input

  Graphics input frame setting.

  Generic configuration for display devices

- display_layer_t layer

  Graphics layer alpha blending setting.

8.11.8.16 display_clut_cfg_t

display_clut_cfg_t

Detailed description

Display CLUT configuration structure

Variables

- uint32_t * p_base

  Pointer to CLUT source data.

- uint16_t start

  Beginning of CLUT entry to be updated.

- uint16_t size

  Size of CLUT entry to be updated.

8.11.8.17 display_status_t

display_status_t

Detailed description

Display Status

Variables

- display_state_t state

  Status of GLCD module.

- display_fade_status_t fade_status[DISPLAY_FRAME_LAYER_2+1]

  Status of fade-in/fade-out status.

8.11.8.18 display_api_t

display_api_t

Detailed description

Shared Interface definition for display peripheral

8.11.8.19 open

```
ssp_err_t(* display_api_t::open) (display_ctrl_t *const p_ctrl, display_cfg_t
const *const p_cfg)
```

Detailed description

Open display device. Implemented as

- R_GLCD_Open

Table 1087:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to display interface control block. Must be declared by user. Value set here.
p_cfg	in	Pointer to display configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `display_ctrl_t*const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

Parameter p_cfg

Definition: `display_cfg_t const *const p_cfg`

Display main configuration structure

- display_cfg_t::display_input_cfg_t

  Graphics input frame setting.

  Generic configuration for display devices

- display_cfg_t::display_output_cfg_t

  Graphics output frame setting.

- display_cfg_t::display_layer_t

  Graphics layer blend setting.
- display_cfg_t::line_detect_ipl

  Line detect interrupt priority.
- display_cfg_t::underflow_1_ipl

  Underflow 1 interrupt priority.
- display_cfg_t::underflow_2_ipl

  Underflow 1 interrupt priority.
- display_cfg_t::p_callback

  Pointer to callback function.

  Configuration for display event processing
- display_cfg_t::p_context

  User defined context passed into callback function.
- display_cfg_t::p_extend

  Display hardware dependent configuration.

  Pointer to display peripheral specific configuration

8.11.8.20 close

```
ssp_err_t(* display_api_t::close) (display_ctrl_t *const p_ctrl)
```

Detailed description

Close display device. Implemented as

- R_GLCD_Close

Table 1088:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: display_ctrl_t*const p_ctrl

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

8.11.8.21 start

```
ssp_err_t(* display_api_t::start) (display_ctrl_t *const p_ctrl)
```

Detailed description

Display start. Implemented as

- R_GLCD_Start

Table 1089:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `display_ctrl_t*const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

8.11.8.22 stop

```
ssp_err_t(* display_api_t::stop) (display_ctrl_t *const p_ctrl)
```

Detailed description

Display stop. Implemented as

- R_GLCD_Stop

Table 1090:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `display_ctrl_t*const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

8.11.8.23 layerChange

```
ssp_err_t(* display_api_t::layerChange) (display_ctrl_t const *const p_ctrl,
display_runtime_cfg_t const *const p_cfg, display_frame_layer_t frame)
```

Detailed description

Change layer parameters at runtime. Implemented as

- R_GLCD_LayerChange

Table 1091:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.
p_cfg	in	Pointer to run-time layer configuration structure.
frame	in	Number of graphic frames.

Parameter p_ctrl

Definition: `display_ctrl_tconst *const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

Parameter p_cfg

Definition: `display_runtime_cfg_t const *const p_cfg`

Display main configuration structure

- `display_runtime_cfg_t`::`display_input_cfg_t`

  Graphics input frame setting.

  Generic configuration for display devices

- `display_runtime_cfg_t`::`display_layer_t`

  Graphics layer alpha blending setting.

Parameter frame

8.11.8.24 correction

```
ssp_err_t(* display_api_t::correction) (display_ctrl_t const *const p_ctrl,
display_correction_t const *const p_param)
```

Detailed description

Color correction. Implemented as

- R_GLCD_ColorCorrection

Table 1092:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.
param	in	Pointer to color correction configuration structure.

Parameter p_ctrl

Definition: `display_ctrl_tconst *const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

Parameter param

8.11.8.25 clut

```
ssp_err_t(* display_api_t::clut) (display_ctrl_t const *const p_ctrl,
display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t frame)
```

Detailed description

Set CLUT for display device. Implemented as

- R_GLCD_ClutUpdate

Table 1093:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.
p_clut_cfg	in	Pointer to CLUT configuration structure.
frame	in	Number of frame buffer corresponding to the CLUT.

Parameter p_ctrl

Definition: `display_ctrl_tconst *const p_ctrl`

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

Parameter p_clut_cfg

Definition: `display_clut_cfg_t const *const p_clut_cfg`

Display CLUT configuration structure

- display_clut_cfg_t::p_base

  Pointer to CLUT source data.

- display_clut_cfg_t::start

  Beginning of CLUT entry to be updated.

- display_clut_cfg_t::size

  Size of CLUT entry to be updated.

Parameter frame

8.11.8.26 statusGet

```
ssp_err_t(* display_api_t::statusGet) (display_ctrl_t const *const p_ctrl,
display_status_t *const p_status)
```

Detailed description

Get status for display device. Implemented as

- R_GLCD_StatusGet

Table 1094:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.
status	in	Pointer to display interface status structure.

Parameter p_ctrl

Definition: display_ctrl_tconst *const p_ctrl

Display control block. Allocate an instance specific control block to pass into the display API calls. Implemented asglcd_instance_ctrl_tDisplay control block

Parameter status

8.11.8.27 versionGet

```
ssp_err_t(* display_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version. Implemented as

- R_GLCD_VersionGet

Table 1095:Parameters

Name	Direction	Description
p_version	in	Pointer to the memory to store the version information.

Parameter p_version

8.11.8.28 display_instance_t

display_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- display_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- display_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- display_api_t const * p_api

  Pointer to the API structure for this instance.

8.12 Digital-to-Analog Converter

8.12.1 DAC Interface

Interface for D/A converters.

8.12.1.1 Summary

The DAC interface provides standard Digital/Analog Converter functionality. A DAC application writes digital sample data to the device and generates analog output on the DAC output pin.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

DAC Interface description: DAC Driver

8.12.1.2 Interface API

dac_api_t

Function name	Description
.open	Initial configuration.
.close	Close the D/A Converter.
.write	Write sample value to the D/A Converter.
.start	Start the D/A Converter if it has not been started yet.
.stop	Stop the D/A Converter if the converter is running.
.versionGet	Get version and store it in provided pointer p_version.
.infoGet	Get information about DAC Resolution and store it in provided pointer p_info.

8.12.1.3 Data structures

- dac_info_t
- dac_cfg_t
- dac_instance_t

8.12.1.4 Enumerations

- dac_data_format_t

8.12.1.5 Typedefs

- dac_size_t
- dac_ctrl_t

8.12.1.6 Defines

- #define DAC_API_VERSION_MAJOR

  Initial value: `(1U)`

- #define DAC_API_VERSION_MINOR

  Initial value: (2U)

8.12.1.7 API Data

dac_data_format_t

dac_data_format_t

Detailed description

DAC Open API AD/DA data format settings.

Enumerated values

Name	Description
DAC_DATA_FORMAT_FLUSH_RIGHT	LSB of data is flush to the right leaving the top 4 bits unused.
DAC_DATA_FORMAT_FLUSH_LEFT	MSB of data is flush to the left leaving the bottom 4 bits unused.

dac_size_t

typedef uint16_t dac_size_t

Detailed description

Data type to store DAC output value.

dac_ctrl_t

typedef void dac_ctrl_t

Detailed description

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented as

- dac_instance_ctrl_t

8.12.1.8 API Structures

dac_info_t

dac_info_t

Detailed description

DAC information structure to store various information for a DAC

Variables

- uint8_t bit_width

  Resolution of the DAC.

dac_cfg_t

dac_cfg_t

Detailed description

DAC Open API configuration parameter

Variables

- uint8_t channel

  ID associated with this DAC channel.

- bool ad_da_synchronized

  AD/DA synchronization.

- dac_data_format_t data_format

  Data format.

- bool output_amplifier_enabled

  Output amplifier enable.

- void const * p_extend

dac_api_t

dac_api_t

Detailed description

DAC driver structure. General DAC functions implemented at the HAL layer follow this API.

open

```
ssp_err_t(* dac_api_t::open) (dac_ctrl_t *p_ctrl, dac_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_DAC_Open
- R_DAC8_Open

Table 1096:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: dac_ctrl_t*p_ctrl

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

Parameter p_cfg

Definition: dac_cfg_t const *const p_cfg

DAC Open API configuration parameter

- dac_cfg_t::channel

  ID associated with this DAC channel.

- dac_cfg_t::ad_da_synchronized

  AD/DA synchronization.

- dac_cfg_t::dac_data_format_t

  Data format.

  Enumerated as:

  – DAC_DATA_FORMAT_FLUSH_RIGHT

  – DAC_DATA_FORMAT_FLUSH_LEFT

- dac_cfg_t::output_amplifier_enabled

  Output amplifier enable.

- dac_cfg_t::p_extend

close

ssp_err_t(* dac_api_t::close) (dac_ctrl_t *p_ctrl)

Detailed description

Close the D/A Converter. Implemented as

- R_DAC_Close
- R_DAC8_Close

Table 1097:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: dac_ctrl_t*p_ctrl

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

write

```
ssp_err_t(* dac_api_t::write) (dac_ctrl_t *p_ctrl, dac_size_t value)
```

Detailed description

Write sample value to the D/A Converter. Implemented as

- R_DAC_Write
- R_DAC8_Write

Table 1098:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
value	in	Sample value to be written to the D/A Converter.

Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

Parameter value

Definition: `dac_size_tvalue`

Data type to store DAC output value.

start

```
ssp_err_t(* dac_api_t::start) (dac_ctrl_t *p_ctrl)
```

Detailed description

Start the D/A Converter if it has not been started yet. Implemented as

- R_DAC_Start
- R_DAC8_Start

Table 1099:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

stop

```
ssp_err_t(* dac_api_t::stop) (dac_ctrl_t *p_ctrl)
```

Detailed description

Stop the D/A Converter if the converter is running. Implemented as

- R_DAC_Stop
- R_DAC8_Stop

Table 1100:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

versionGet

```
ssp_err_t(* dac_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_DAC_VersionGet
- R_DAC8_VersionGet

Table 1101:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

infoGet

```
ssp_err_t(* dac_api_t::infoGet) (dac_info_t *const p_info)
```

Detailed description

Get information about DAC Resolution and store it in provided pointer p_info. Implemented as

- R_DAC_InfoGet
- R_DAC8_InfoGet

Table 1102:Parameters

Name	Direction	Description
p_info	out	Collection of information for this DAC.

Parameter p_info

Definition: `dac_info_t*const p_info`

DAC information structure to store various information for a DAC

- `dac_info_t::bit_width`
  Resolution of the DAC.

dac_instance_t

dac_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- dac_ctrl_t * p_ctrl
  Pointer to the control structure for this instance.
- dac_cfg_t const * p_cfg
  Pointer to the configuration structure for this instance.
- dac_api_t const * p_api
  Pointer to the API structure for this instance.

8.12.2 dac_api_t

dac_api_t

8.12.2.1 Detailed description

DAC driver structure. General DAC functions implemented at the HAL layer follow this API.

8.12.3 open

```
ssp_err_t(* dac_api_t::open) (dac_ctrl_t *p_ctrl, dac_cfg_t const *const p_cfg)
```

8.12.3.1 Detailed description

Initial configuration. Implemented as

- R_DAC_Open
- R_DAC8_Open

Table 1103:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

8.12.3.2 Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

8.12.3.3 Parameter p_cfg

Definition: `dac_cfg_t const *const p_cfg`

DAC Open API configuration parameter

- `dac_cfg_t`::`channel`

  ID associated with this DAC channel.

- `dac_cfg_t`::`ad_da_synchronized`

  AD/DA synchronization.

- `dac_cfg_t`::`dac_data_format_t`

  Data format.

  Enumerated as:

  – DAC_DATA_FORMAT_FLUSH_RIGHT

  – DAC_DATA_FORMAT_FLUSH_LEFT

- `dac_cfg_t`::`output_amplifier_enabled`

  Output amplifier enable.

- `dac_cfg_t`::`p_extend`

8.12.4 close

```
ssp_err_t(* dac_api_t::close) (dac_ctrl_t *p_ctrl)
```

8.12.4.1 Detailed description

Close the D/A Converter. Implemented as

- R_DAC_Close
- R_DAC8_Close

Table 1104:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

8.12.4.2 Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

8.12.5 write

```
ssp_err_t(* dac_api_t::write) (dac_ctrl_t *p_ctrl, dac_size_t value)
```

8.12.5.1 Detailed description

Write sample value to the D/A Converter. Implemented as

- R_DAC_Write
- R_DAC8_Write

Table 1105:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
value	in	Sample value to be written to the D/A Converter.

8.12.5.2 Parameter p_ctrl

Definition: dac_ctrl_t*p_ctrl

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

8.12.5.3 Parameter value

Definition: dac_size_tvalue

Data type to store DAC output value.

8.12.6 start

```
ssp_err_t(* dac_api_t::start) (dac_ctrl_t *p_ctrl)
```

8.12.6.1 Detailed description

Start the D/A Converter if it has not been started yet. Implemented as

- R_DAC_Start
- R_DAC8_Start

Table 1106:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

8.12.6.2 Parameter p_ctrl

Definition: dac_ctrl_t*p_ctrl

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

8.12.7 stop

```
ssp_err_t(* dac_api_t::stop) (dac_ctrl_t *p_ctrl)
```

8.12.7.1 Detailed description

Stop the D/A Converter if the converter is running. Implemented as

- R_DAC_Stop

- R_DAC8_Stop

Table 1107:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

8.12.7.2 Parameter p_ctrl

Definition: `dac_ctrl_t*p_ctrl`

DAC control block. Allocate an instance specific control block to pass into the DAC API calls. Implemented asdac_instance_ctrl_t

8.12.8 versionGet

```
ssp_err_t(* dac_api_t::versionGet) (ssp_version_t *p_version)
```

8.12.8.1 Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_DAC_VersionGet
- R_DAC8_VersionGet

Table 1108:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

8.12.8.2 Parameter p_version

8.12.9 infoGet

```
ssp_err_t(* dac_api_t::infoGet) (dac_info_t *const p_info)
```

8.12.9.1 Detailed description

Get information about DAC Resolution and store it in provided pointer p_info. Implemented as

- R_DAC_InfoGet

- R_DAC8_InfoGet

Table 1109:Parameters

Name	Direction	Description
p_info	out	Collection of information for this DAC.

8.12.9.2 Parameter p_info

Definition: `dac_info_t*const p_info`

DAC information structure to store various information for a DAC

- `dac_info_t::bit_width`
  Resolution of the DAC.

8.12.10 dac_cfg_t

dac_cfg_t

8.12.10.1 Detailed description

DAC Open API configuration parameter

8.12.10.2 Variables

- uint8_t channel
  ID associated with this DAC channel.
- bool ad_da_synchronized
  AD/DA synchronization.
- dac_data_format_t data_format
  Data format.
- bool output_amplifier_enabled
  Output amplifier enable.
- void const * p_extend

8.13 DOC Interface

Interface for the Data Operation Circuit.

Defines the API and data structures for the DOC implementation of the Data Operation Circuit (DOC) interface.

8.13.1 Summary

This module implements the DOC_API using the Data Operation Circuit (DOC).

Implemented by: DOC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

DOC Interface description: Data Operation Circuit Driver

8.13.2 Interface API

doc_api_t

Function name	Description
.open	Initial configuration.
.close	Allow the driver to be reconfigured. Will reduce power consumption.
.statusGet	Get the DOC status and stores it in the provided pointer p_status.
.statusClear	Clear DOPCF status flag.
.write	Write to the DODIR and DODSR registers.
.inputRegisterWrite	Write to the DODIR register.
.versionGet	Get version and stores it in provided pointer p_version.

8.13.3 Data structures

- doc_callback_args_t
- doc_data_t
- doc_cfg_t
- doc_instance_t

8.13.4 Enumerations

- doc_event_t
- doc_status_t

8.13.5 Typedefs

- doc_size_t
- doc_ctrl_t

8.13.6 Defines

- #define DOC_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define DOC_API_VERSION_MINOR

  Initial value: `(2U)`

8.13.7 API Data

8.13.7.1 doc_event_t

`doc_event_t`

Detailed description

Event that can trigger a callback function.

Enumerated values

Name	Description
DOC_EVENT_COMPARISON_MISMATCH	Comparison of data has resulted in a mismatch.
DOC_EVENT_ADDITION	Addition of data has resulted in a value greater than H'FFFF.
DOC_EVENT_SUBTRACTION	Subtraction of data has resulted in a value less than H'0000.
DOC_EVENT_COMPARISON_MATCH	Comparison of data has resulted in a match.

8.13.7.2 doc_status_t

```
doc_status_t
```

Detailed description

Status of the data comparison operation.

Enumerated values

Name	Description
DOC_STATUS_CONDITION_FALSE	Data comparison condition NOT met (match or mismatch), addition result NOT > H'FFFF, subtraction result NOT < H'0000.
DOC_STATUS_CONDITION_TRUE	Data comparison condition met (match or mismatch), addition result > H'FFFF, subtraction result < H'0000.

8.13.7.3 doc_size_t

```
typedef uint16_t doc_size_t
```

Detailed description

Size of the comparison data supported by the Data Operation Circuit (DOC)

8.13.7.4 doc_ctrl_t

```
typedef void doc_ctrl_t
```

Detailed description

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented as

- doc_instance_ctrl_t

8.13.8 API Structures

8.13.8.1 doc_callback_args_t

doc_callback_args_t

Detailed description

Callback function parameter data.

Variables

- doc_event_t event

  The event is used to identify what caused the callback.

- void const * p_context

  Placeholder for user data. Set in doc_api_t::open function in doc_cfg_t.

8.13.8.2 doc_data_t

doc_data_t

Detailed description

Data to be written to DOC register for comparison/addition/subtraction.

Variables

- doc_size_t dodir

  Value to be written to the DOC DODIR.

- doc_size_t dodsr

  Value to be written to the DOC DODSR.

8.13.8.3 doc_cfg_t

doc_cfg_t

Detailed description

User configuration structure, used in the open function.

Variables

- doc_event_t event

  Select enumerated value from doc_event_t.

- uint8_t irq_ipl

  DOC interrupt priority.

- void(* p_callback)(doc_callback_args_t *p_args)

  Callback provided when a DOC ISR occurs.

- void const * p_context

  Placeholder for user data. Passed to the user callback in doc_callback_args_t.

8.13.8.4 doc_api_t

doc_api_t

Detailed description

Data Operation Circuit (DOC) API structure. DOC functions implemented at the HAL layer will follow this API.

8.13.8.5 open

```
ssp_err_t(* doc_api_t::open) (doc_ctrl_t *const p_ctrl, doc_cfg_t const *const
p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_DOC_Open

NOTE: Peripheral clocks should be configured prior to calling this function.

Table 1110:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `doc_ctrl_t*const p_ctrl`

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

Parameter p_cfg

Definition: `doc_cfg_t const *const p_cfg`

User configuration structure, used in the open function.

- `doc_cfg_t::doc_event_t`

  Select enumerated value from doc_event_t.

  Enumerated as:

  – DOC_EVENT_COMPARISON_MISMATCH

  – DOC_EVENT_ADDITION

  – DOC_EVENT_SUBTRACTION

– DOC_EVENT_COMPARISON_MATCH

- doc_cfg_t::irq_ipl

  DOC interrupt priority.

- doc_cfg_t::p_callback

  Callback provided when a DOC ISR occurs.

- doc_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in doc_callback_args_t.

8.13.8.6 close

```
ssp_err_t(* doc_api_t::close) (doc_ctrl_t *const p_ctrl)
```

Detailed description

Allow the driver to be reconfigured. Will reduce power consumption. Implemented as

- R_DOC_Close

Table 1111:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.

Parameter p_ctrl

Definition: doc_ctrl_t*const p_ctrl

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

8.13.8.7 statusGet

```
ssp_err_t(* doc_api_t::statusGet) (doc_ctrl_t *const p_ctrl, doc_status_t
*p_status)
```

Detailed description

Get the DOC status and stores it in the provided pointer p_status. Implemented as

- R_DOC_StatusGet

NOTE: Call open to configure the DOC before using this function.

Table 1112:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_status	out	Indicates the status of the comparison/addition/subtraction operation. Result will be one of doc_status_t.

Parameter p_ctrl

Definition: `doc_ctrl_t*const p_ctrl`

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

Parameter p_status

Definition: `doc_status_t*p_status`

Status of the data comparison operation.

8.13.8.8 statusClear

```
ssp_err_t(* doc_api_t::statusClear) (doc_ctrl_t *const p_ctrl)
```

Detailed description

Clear DOPCF status flag. Implemented as

- R_DOC_StatusClear

NOTE: Call open to configure the DOC before using this function.

Table 1113:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.

Parameter p_ctrl

Definition: `doc_ctrl_t*const p_ctrl`

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

8.13.8.9 write

```
ssp_err_t(* doc_api_t::write) (doc_ctrl_t *const p_ctrl, doc_data_t *const p_data)
```

Detailed description

Write to the DODIR and DODSR registers. Implemented as

- R_DOC_Write

NOTE: Call open to configure the DOC before using this function.

Table 1114:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_data	in	Pointer to data to be written to DOC DODIR and DODSR registers.

Parameter p_ctrl

Definition: `doc_ctrl_t*const p_ctrl`

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

Parameter p_data

Definition: `doc_data_t*const p_data`

Data to be written to DOC register for comparison/addition/subtraction.

- `doc_data_t::dodir`

  Value to be written to the DOC DODIR.

- `doc_data_t::dodsr`

  Value to be written to the DOC DODSR.

8.13.8.10 inputRegisterWrite

```
ssp_err_t(* doc_api_t::inputRegisterWrite) (doc_ctrl_t *const p_ctrl, doc_size_t
data)
```

Detailed description

Write to the DODIR register. Implemented as

- R_DOC_InputRegisterWrite

NOTE: Call open to configure the DOC before using this function.

Table 1115:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
data	in	Data to be written to DOC DODIR register.

Parameter p_ctrl

Definition: `doc_ctrl_t*const p_ctrl`

DOC control block. Allocate an instance specific control block to pass into the DOC API calls. Implemented asdoc_instance_ctrl_t

Parameter data

Definition: `doc_size_tdata`

Size of the comparison data supported by the Data Operation Circuit (DOC)

8.13.8.11 versionGet

```
ssp_err_t(* doc_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and stores it in provided pointer p_version. Implemented as

- R_DOC_VersionGet

Table 1116:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.13.8.12 doc_instance_t

doc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- doc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- doc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- doc_api_t const * p_api

  Pointer to the API structure for this instance.

8.14 ELC Interface

Interface for the Event Link Controller.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Event Link Controller Interface description: ELC Driver

Related SSP architecture topics:

- What is an SSP Interface? SSP Interfaces
- What is a SSP Layer? SSP Predefined Layers
- How to use SSP Interfaces and Modules? Using SSP Modules

Event Link Controller Interface description: ELC Driver

8.14.1 Interface API

elc_api_t

Function name	Description
.init	Initialize all links in the Event Link Controller.
.softwareEventGenerate	Generate a software event in the Event Link Controller.
.linkSet	Create a single event link.

Function name	Description
.linkBreak	Break an event link.
.enable	Enable the operation of the Event Link Controller.
.disable	Disable the operation of the Event Link Controller.
.versionGet	Get the driver version based on compile time macros.

8.14.2 Data structures

- elc_link_t
- elc_cfg_t
- elc_instance_t

8.14.3 Enumerations

- elc_software_event_t

8.14.4 Defines

- #define ELC_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define ELC_API_VERSION_MINOR
  Initial value: `(2U)`

8.14.5 API Data

8.14.5.1 elc_software_event_t

`elc_software_event_t`

Detailed description

Software event number

Enumerated values

Name	Description
ELC_SOFTWARE_EVENT_0	Software event 0.

Name	Description
ELC_SOFTWARE_EVENT_1	Software event 1.

8.14.6 API Structures

8.14.6.1 elc_link_t

elc_link_t

Detailed description

Individual event link. The actual peripheral definitions can be found in the MCU specific (ie. /mcu/S124/bsp_elc.h) bsp_elc.h files.

Variables

- elc_peripheral_t peripheral

  Peripheral to receive the signal.

- elc_event_t event

  Signal that gets sent to the Peripheral.

8.14.6.2 elc_cfg_t

elc_cfg_t

Detailed description

Main configuration structure for the Event Link Controller

Variables

- bool autostart

  Start operation and enable interrupts during open().

- uint32_t link_count

  Number of event links.

- elc_link_t const * link_list

  Event links.

8.14.6.3 elc_api_t

elc_api_t

Detailed description

ELC driver structure. General ELC functions implemented at the HAL layer follow this API.

8.14.6.4 init

```
ssp_err_t(* elc_api_t::init) (elc_cfg_t const *const p_cfg)
```

Detailed description

Initialize all links in the Event Link Controller. Implemented as

- R_ELC_Init

Table 1117:Parameters

Name	Direction	Description
p_cfg	in	Pointer to configuration structure.

Parameter p_cfg

Definition: `elc_cfg_t const *const p_cfg`

Main configuration structure for the Event Link Controller

- `elc_cfg_t::autostart`

  Start operation and enable interrupts during open().

- `elc_cfg_t::link_count`

  Number of event links.

- `elc_cfg_t::elc_link_t`

  Event links.

8.14.6.5 softwareEventGenerate

```
ssp_err_t(* elc_api_t::softwareEventGenerate) (elc_software_event_t event_num)
```

Detailed description

Generate a software event in the Event Link Controller. Implemented as

- R_ELC_SoftwareEventGenerate

Table 1118:Parameters

Name	Direction	Description
eventNum	in	Software event number to be generated.

Parameter eventNum

8.14.6.6 linkSet

```
ssp_err_t(* elc_api_t::linkSet) (elc_peripheral_t peripheral, elc_event_t signal)
```

Detailed description

Create a single event link. Implemented as

- R_ELC_LinkSet

Table 1119:Parameters

Name	Direction	Description
peripheral	in	The peripheral block that will receive the event signal.
signal	in	The event signal.

Parameter peripheral
Parameter signal

8.14.6.7 linkBreak

```
ssp_err_t(* elc_api_t::linkBreak) (elc_peripheral_t peripheral)
```

Detailed description

Break an event link. Implemented as

- R_ELC_LinkBreak

Table 1120:Parameters

Name	Direction	Description
peripheral	in	The peripheral that should no longer be linked.

Parameter peripheral

8.14.6.8 enable

```
ssp_err_t(* elc_api_t::enable) (void)
```

Detailed description

Enable the operation of the Event Link Controller. Implemented as

- R_ELC_Enable

8.14.6.9 disable

```
ssp_err_t(* elc_api_t::disable) (void)
```

Detailed description

Disable the operation of the Event Link Controller. Implemented as

- R_ELC_Disable

8.14.6.10 versionGet

```
ssp_err_t(* elc_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get the driver version based on compile time macros. Implemented as

- R_ELC_VersionGet

Table 1121:Parameters

Name	Direction	Description
p_version	out	is value returned.

Parameter p_version

8.14.6.11 elc_instance_t

elc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- elc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- elc_api_t const * p_api

  Pointer to the API structure for this instance.

8.15 External IRQ Interface

Interface for detecting external interrupts.

8.15.1 Summary

The external IRQ interface supports external inputs, for example input from pins or capacitive touch buttons. When an input trigger is detected, a user provided callback function will be called.

Implemented by: ICU

Related interfaces: Key Matrix Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

External IRQ Interface description: External IRQ Driver

8.15.2 Interface API

external_irq_api_t

Function name	Description
.open	Initial configuration.
.enable	Enable callback when external IRQ occurs.
.disable	Disable callback when external IRQ occurs.
.triggerSet	Set trigger.
.filterEnable	Enables noise filter.
.filterDisable	Disable noise filter.
.close	Allow driver to be reconfigured. May reduce power consumption.
.versionGet	Get version and store it in provided pointer p_version.

8.15.3 Data structures

- external_irq_callback_args_t
- external_irq_cfg_t
- external_irq_instance_t

8.15.4 Enumerations

- external_irq_trigger_t
- external_irq_pclk_div_t

8.15.5 Typedefs

- external_irq_ctrl_t

8.15.6 Defines

- #define EXTERNAL_IRQ_API_VERSION_MAJOR

  Initial value: `(1U)`

  EXTERNAL IRQ API version number (Major)
- #define EXTERNAL_IRQ_API_VERSION_MINOR

  Initial value: `(2U)`

  EXTERNAL IRQ API version number (Minor)

8.15.7 API Data

8.15.7.1 external_irq_trigger_t

`external_irq_trigger_t`

Detailed description

Trigger type: rising edge, falling edge, both edges, low level.

Enumerated values

Name	Description
EXTERNAL_IRQ_TRIG_FALLING	Falling edge trigger.
EXTERNAL_IRQ_TRIG_RISING	Rising edge trigger.
EXTERNAL_IRQ_TRIG_BOTH_EDGE	Both edges trigger.
EXTERNAL_IRQ_TRIG_LEVEL_LOW	Low level trigger.

8.15.7.2 external_irq_pclk_div_t

`external_irq_pclk_div_t`

Detailed description

External IRQ input pin digital filtering sample clock divisor settings.

Enumerated values

Name	Description
EXTERNAL_IRQ_PCLK_DIV_BY_1	Filter using PCLK divided by 1.
EXTERNAL_IRQ_PCLK_DIV_BY_8	Filter using PCLK divided by 8.
EXTERNAL_IRQ_PCLK_DIV_BY_32	Filter using PCLK divided by 32.
EXTERNAL_IRQ_PCLK_DIV_BY_64	Filter using PCLK divided by 64.

8.15.7.3 external_irq_ctrl_t

```
typedef void external_irq_ctrl_t
```

Detailed description

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented as

- icu_instance_ctrl_t

8.15.8 API Structures

8.15.8.1 external_irq_callback_args_t

external_irq_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Placeholder for user data. Set in external_irq_api_t::open function in external_irq_cfg_t.

- uint32_t channel

  The physical hardware channel that caused the interrupt.

8.15.8.2 external_irq_cfg_t

external_irq_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- uint8_t channel

  Hardware channel used.
- uint8_t irq_ipl

  Interrupt priority.
- external_irq_trigger_t trigger

  Trigger setting.
- external_irq_pclk_div_t pclk_div

  Digital filter clock divisor setting.
- bool autostart

  Start operation and enable interrupts during open().
- bool filter_enable

  Digital filter enable/disable setting.
- void(* p_callback)(external_irq_callback_args_t *p_args)

  Callback provided external input trigger occurs.
- void const * p_context

  Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.
- void const * p_extend

  External IRQ hardware dependent configuration.

8.15.8.3 external_irq_api_t

external_irq_api_t

Detailed description

External interrupt driver structure. External interrupt functions implemented at the HAL layer will follow this API.

8.15.8.4 open

```
ssp_err_t(* external_irq_api_t::open) (external_irq_ctrl_t *const p_ctrl,
external_irq_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_ICU_ExternalIrqOpen

Table 1122:Parameters

Name	Direction	Description
p_ctrl	out	Pointer to control block. Must be declared by user. Value set here.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

Parameter p_cfg

Definition: `external_irq_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `external_irq_cfg_t`::`channel`

  Hardware channel used.

- `external_irq_cfg_t`::`irq_ipl`

  Interrupt priority.

- `external_irq_cfg_t`::`external_irq_trigger_t`

  Trigger setting.

  Enumerated as:

  – EXTERNAL_IRQ_TRIG_FALLING

  – EXTERNAL_IRQ_TRIG_RISING

  – EXTERNAL_IRQ_TRIG_BOTH_EDGE

  – EXTERNAL_IRQ_TRIG_LEVEL_LOW

- `external_irq_cfg_t`::`external_irq_pclk_div_t`

  Digital filter clock divisor setting.

  Enumerated as:

  – EXTERNAL_IRQ_PCLK_DIV_BY_1

  – EXTERNAL_IRQ_PCLK_DIV_BY_8

  – EXTERNAL_IRQ_PCLK_DIV_BY_32

  – EXTERNAL_IRQ_PCLK_DIV_BY_64

- external_irq_cfg_t::autostart

  Start operation and enable interrupts during open().

- external_irq_cfg_t::filter_enable

  Digital filter enable/disable setting.

- external_irq_cfg_t::p_callback

  Callback provided external input trigger occurs.

- external_irq_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.

- external_irq_cfg_t::p_extend

  External IRQ hardware dependent configuration.

8.15.8.5 enable

```
ssp_err_t(* external_irq_api_t::enable) (external_irq_ctrl_t *const p_ctrl)
```

Detailed description

Enable callback when external IRQ occurs. Implemented as

- R_ICU_ExternalIrqEnable

Table 1123:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.

Parameter p_ctrl

Definition: external_irq_ctrl_t*const p_ctrl

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

8.15.8.6 disable

```
ssp_err_t(* external_irq_api_t::disable) (external_irq_ctrl_t *const p_ctrl)
```

Detailed description

Disable callback when external IRQ occurs. Implemented as

- R_ICU_ExternalIrqDisable

Table 1124:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

8.15.8.7 triggerSet

```
ssp_err_t(* external_irq_api_t::triggerSet) (external_irq_ctrl_t *const p_ctrl,
external_irq_trigger_t const trigger)
```

Detailed description

Set trigger. Implemented as

- R_ICU_ExternalIrqTriggerSet

Table 1125:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.
trigger	in	Trigger type

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

Parameter trigger

8.15.8.8 filterEnable

```
ssp_err_t(* external_irq_api_t::filterEnable) (external_irq_ctrl_t *const p_ctrl)
```

Detailed description

Enables noise filter. Implemented as

- R_ICU_ExternalIrqFilterEnable

Table 1126:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

8.15.8.9 filterDisable

```
ssp_err_t(* external_irq_api_t::filterDisable) (external_irq_ctrl_t *const
p_ctrl)
```

Detailed description

Disable noise filter. Implemented as

- R_ICU_ExternalIrqFilterDisable

Table 1127:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

8.15.8.10 close

```
ssp_err_t(* external_irq_api_t::close) (external_irq_ctrl_t *const p_ctrl)
```

Detailed description

Allow driver to be reconfigured. May reduce power consumption. Implemented as

- R_ICU_ExternalIrqClose

Table 1128:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in Open call for this external interrupt.

Parameter p_ctrl

Definition: `external_irq_ctrl_t*const p_ctrl`

External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. Implemented asicu_instance_ctrl_t

8.15.8.11 versionGet

```
ssp_err_t(* external_irq_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_ICU_ExternalIrqVersionGet

Table 1129:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.15.8.12 external_irq_instance_t

external_irq_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- external_irq_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- external_irq_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- external_irq_api_t const * p_api

  Pointer to the API structure for this instance.

8.16 Flash Interface

Interface for the flash controller.

8.16.1 Summary

The Flash interface provides the functionality necessary to read, write, erase and blank check the Flash memory. Additionally functions are provided to configure the access window and swap areas of the flash memory.

Implemented by:

- High-performance Flash
- Low Power Flash

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Flash Interface description: Flash Driver

8.16.2 Interface API

flash_api_t

Function name	Description
.open	Open FLASH device.
.write	Write FLASH device.
.read	Read FLASH device.
.erase	Erase FLASH device.
.blankCheck	Blank check FLASH device.
.infoGet	Close FLASH device.
.close	Close FLASH device.
.statusGet	Get Status for FLASH device.
.accessWindowSet	Set Access Window for FLASH device.

Function name	Description
.accessWindowClear	Clear any existing Code Flash access window for FLASH device.
.reset	Reset function for FLASH device.
.updateFlashClockFreq	Update Flash clock frequency (FCLK) and recalculate timeout values
.startupAreaSelect	Select which block - Default (Block 0) or Alternate (Block 1) is used as the start-up area block. swap_type | is_temporary | Operation FLASH_STARTUP_AREA_BLOCK0: false On next reset Startup area will be Block 0.FLASH_STARTUP_AREA_BLOCK0 | false | On next reset Startup area will be Block 0. Block 0.FLASH_STARTUP_AREA_BLOCK1: false On next reset Startup area will be Block 1.FLASH_STARTUP_AREA_BLOCK1 | true | Startup area is immediately, but temporarily switched to Block 1. Block 1.FLASH_STARTUP_AREA_BTFLG | true | Startup area is immediately, but temporarily switched to... taken.the Block determined by the Configuration BTFLG.
.versionGet	Get Flash driver version.

8.16.3 Data structures

- flash_ctrl_t

8.16.6 Defines

- #define FLASH_API_VERSION_MAJOR

  Initial value: `(1U)`

  FLASH HAL API version number (Major)
- #define FLASH_API_VERSION_MINOR

  Initial value: `(2U)`

  FLASH HAL API version number (Minor)

8.16.7 API Data

8.16.7.1 flash_result_t

`flash_result_t`

Detailed description

Result type for certain operations

Enumerated values

Name	Description
FLASH_RESULT_BLANK	Return status for Blank Check Function.
FLASH_RESULT_NOT_BLANK	Return status for Blank Check Function.
FLASH_RESULT_BGO_ACTIVE	Flash is configured for BGO mode. Result is returned in callback.

8.16.7.2 flash_startup_area_swap_t

`flash_startup_area_swap_t`

Detailed description

Parameter for specifying the startup area swap being requested by startupAreaSelect()

Enumerated values

Name	Description
FLASH_STARTUP_AREA_BLOCK1	Startup area will be set to Block 1.
FLASH_STARTUP_AREA_BLOCK0	Startup area will be set to Block 0.
FLASH_STARTUP_AREA_BTFLG	Startup area will be set based on the value of the BTFLG.

8.16.7.3 flash_event_t

```
flash_event_t
```

Detailed description

Event types returned by the ISR callback when used in Data Flash BGO mode

Enumerated values

Name	Description
FLASH_EVENT_ERASE_COMPLETE	Erase operation successfully completed.
FLASH_EVENT_WRITE_COMPLETE	Write operation successfully completed.
FLASH_EVENT_BLANK	Blank check operation successfully completed. Specified area is blank.
FLASH_EVENT_NOT_BLANK	Blank check operation successfully completed. Specified area is NOT blank.
FLASH_EVENT_ERR_DF_ACCESS	Data Flash operation failed. Can occur when writing an unerased section.
FLASH_EVENT_ERR_CF_ACCESS	Code Flash operation failed. Can occur when writing an unerased section.
FLASH_EVENT_ERR_CMD_LOCKED	Operation failed, FCU is in Locked state (often result of an illegal command)
FLASH_EVENT_ERR_FAILURE	Erase or Program Operation failed.

8.16.7.4 flash_ctrl_t

```
typedef void flash_ctrl_t
```

Detailed description

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented as

- flash_lp_instance_ctrl_t
- flash_hp_instance_ctrl_t

8.16.8 API Structures

8.16.8.1 flash_fmi_block_info_t

flash_fmi_block_info_t

Detailed description

Flash block details stored in factory flash.

Variables

- uint32_t block_section_st_addr

  starting address for this block section (blocks of this size)
- uint32_t block_section_end_addr

  ending address for this block section (blocks of this size)
- uint32_t block_size

  Flash erase block size.
- uint32_t block_size_write

  Flash write block size.

8.16.8.2 flash_fmi_regions_t

flash_fmi_regions_t

Detailed description

Flash block details

Variables

- uint32_t num_regions

  Length of block info array.
- flash_fmi_block_info_t const * p_block_array

  Block info array base address.

8.16.8.3 flash_info_t

flash_info_t

Detailed description

Information about the flash blocks

Variables

- flash_fmi_regions_t code_flash

  Information about the code flash regions.
- flash_fmi_regions_t data_flash

  Information about the code flash regions.

8.16.8.4 flash_callback_args_t

flash_callback_args_t

Detailed description

Callback function parameter data

Variables

- flash_event_t event

  Event can be used to identify what caused the callback (flash ready or error).
- void const * p_context

  Placeholder for user data. Set in flash_api_t::open function in::flash_cfg_t.

8.16.8.5 flash_cfg_t

flash_cfg_t

Detailed description

FLASH Configuration

Variables

- bool data_flash_bgo

  True if BGO (Background Operation) is enabled for Data Flash.
- void(* p_callback)(flash_callback_args_t *p_args)

  Callback provided when a Flash interrupt ISR occurs.
- void const * p_extend

  FLASH hardware dependent configuration.
- void const * p_context

  Placeholder for user data. Passed to user callback in flash_callback_args_t.
- uint8_t irq_ipl

  Flash ready interrupt priority.
- uint8_t err_irq_ipl

  Flash error interrupt priority (unused in r_flash_lp)

8.16.8.6 flash_api_t

flash_api_t

Detailed description

Shared Interface definition for FLASH

8.16.8.7 open

```
ssp_err_t(* flash_api_t::open) (flash_ctrl_t *const p_ctrl, flash_cfg_t const
*const p_cfg)
```

Detailed description

Open FLASH device. Implemented as

- R_FLASH_LP_Open
- R_FLASH_HP_Open

Table 1130:Parameters

Name	Direction	Description
p_ctrl	out	Pointer to FLASH device control. Must be declared by user. Value set here.
flash_cfg_t	in	Pointer to FLASH configuration structure. All elements of this structure must be set by the user.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter flash_cfg_t

Definition: `flash_cfg_t const *const p_cfg`

FLASH Configuration

- `flash_cfg_t`::`data_flash_bgo`

  True if BGO (Background Operation) is enabled for Data Flash.

- `flash_cfg_t`::`p_callback`

  Callback provided when a Flash interrupt ISR occurs.

- `flash_cfg_t`::`p_extend`

  FLASH hardware dependent configuration.

- flash_cfg_t::p_context

  Placeholder for user data. Passed to user callback in flash_callback_args_t.

- flash_cfg_t::irq_ipl

  Flash ready interrupt priority.

- flash_cfg_t::err_irq_ipl

  Flash error interrupt priority (unused in r_flash_lp)

8.16.8.8 write

```
ssp_err_t(* flash_api_t::write) (flash_ctrl_t *const p_ctrl, uint32_t const
src_address, uint32_t const flash_address, uint32_t const num_bytes)
```

Detailed description

Write FLASH device. Implemented as

- R_FLASH_LP_Write
- R_FLASH_HP_Write

Table 1131:Parameters

Name	Direction	Description
p_ctrl	in	Control for the FLASH device context.
src_address	in	Address of the buffer containing the data to write to Flash.
flash_address	in	Code Flash or Data Flash address to write. The address must be on a programming line boundary.
num_bytes	in	The number of bytes to write. This number must be a multiple of the programming size. For Code Flash this is FLASH_MIN_PGM_SIZE_CF. For Data Flash this is FLASH_MIN_PGM_SIZE_DF.

ATTENTION: Specifying a number that is not a multiple of the programming size will result in SF_FLASH_ERR_-BYTES being returned and no data written.

Parameter p_ctrl

Definition: flash_ctrl_t*const p_ctrl

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter src_address

`uint32_t`

Parameter flash_address

`uint32_t`

Parameter num_bytes

`uint32_t`

8.16.8.9 read

```
ssp_err_t(* flash_api_t::read) (flash_ctrl_t *const p_ctrl, uint8_t *const
p_dest_address, uint32_t const flash_address, uint32_t const num_bytes)
```

Detailed description

Read FLASH device. Implemented as

- R_FLASH_LP_Read
- R_FLASH_HP_Read

Table 1132:Parameters

Name	Direction	Description
p_ctrl	in	Control for the FLASH device context.
p_dest_address	in	Pointer to caller's destination buffer used to hold the data read from Flash.
flash_address	in	Code Flash or Data Flash starting address to read from.
num_bytes	in	The number of bytes to read.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter p_dest_address

`uint8_t`

Parameter flash_address

`uint32_t`

Parameter num_bytes

uint32_t

8.16.8.10 erase

```
ssp_err_t(* flash_api_t::erase) (flash_ctrl_t *const p_ctrl, uint32_t const
address, uint32_t const num_blocks)
```

Detailed description

Erase FLASH device. Implemented asR_FLASH_LP_EraseR_FLASH_HP_Erase

Table 1133:Parameters

Name	Direction	Description
p_ctrl	in	Control for the FLASH device.
address	in	The block containing this address is the first block erased.
num_blocks	in	Specifies the number of blocks to be erased, the starting block determined by the block_erase_address.

Parameter p_ctrl

Definition: flash_ctrl_t*const p_ctrl

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter address

uint32_t

Parameter num_blocks

uint32_t

8.16.8.11 blankCheck

```
ssp_err_t(* flash_api_t::blankCheck) (flash_ctrl_t *const p_ctrl, uint32_t const
address, uint32_t const num_bytes, flash_result_t *const p_blank_check_result)
```

Detailed description

Blank check FLASH device. Implemented as

- R_FLASH_LP_BlankCheck
- R_FLASH_HP_BlankCheck

Table 1134:Parameters

Name	Direction	Description
p_ctrl	in	Control for the FLASH device context.
address	in	The starting address of the Flash area to blank check.
num_bytes	in	Specifies the number of bytes that need to be checked. See the specific handler for details.
p_blank_check_result	out	Pointer that will be populated by the API with the results of the blank check operation in non-BGO (blocking) mode. In this case the blank check operation completes here and the result is returned. In Data Flash BGO mode the blank check operation is only started here and the result obtained later when the supplied callback routine is called. In this case FLASH_RESULT_BGO_ACTIVE will be returned in p_blank_check_result.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter address

`uint32_t`

Parameter num_bytes

`uint32_t`

Parameter p_blank_check_result

Definition: `flash_result_t*const p_blank_check_result`

Result type for certain operations

8.16.8.12 infoGet

```
ssp_err_t(* flash_api_t::infoGet) (flash_ctrl_t *const p_ctrl, flash_info_t
*const p_info)
```

Detailed description

Close FLASH device. Implemented as

- R_FLASH_LP_InfoGet
- R_FLASH_HP_InfoGet

Table 1135:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.
p_info	out	Pointer to FLASH info structure.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter p_info

Definition: `flash_info_t*const p_info`

Information about the flash blocks

- `flash_info_t::code_flash`

  Information about the code flash regions.

- `flash_info_t::data_flash`

  Information about the code flash regions.

8.16.8.13 close

```
ssp_err_t(* flash_api_t::close) (flash_ctrl_t *const p_ctrl)
```

Detailed description

Close FLASH device. Implemented as

- R_FLASH_LP_Close
- R_FLASH_HP_Close

Table 1136:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

8.16.8.14 statusGet

```
ssp_err_t(* flash_api_t::statusGet) (flash_ctrl_t *const p_ctrl)
```

Detailed description

Get Status for FLASH device. Implemented as

- R_FLASH_LP_StatusGet
- R_FLASH_HP_StatusGet

Table 1137:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

8.16.8.15 accessWindowSet

```
ssp_err_t(* flash_api_t::accessWindowSet) (flash_ctrl_t *const p_ctrl, uint32_t
const start_addr, uint32_t const end_addr)
```

Detailed description

Set Access Window for FLASH device. Implemented as

- R_FLASH_LP_AccessWindowSet
- R_FLASH_HP_AccessWindowSet

Table 1138:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.
start_addr	in	Determines the Starting block for the Code Flash access window.
end_addr	in	Determines the Ending block for the Code Flash access window.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter start_addr

`uint32_t`

Parameter end_addr

`uint32_t`

8.16.8.16 accessWindowClear

```
ssp_err_t(* flash_api_t::accessWindowClear) (flash_ctrl_t *const p_ctrl)
```

Detailed description

Clear any existing Code Flash access window for FLASH device. Implemented as

- R_FLASH_LP_AccessWindowClear
- R_FLASH_HP_AccessWindowClear

Table 1139:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.
start_addr	in	Determines the Starting block for the Code Flash access window.
end_addr	in	Determines the Ending block for the Code Flash access window.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter start_addr
Parameter end_addr

8.16.8.17 reset

```
ssp_err_t(* flash_api_t::reset) (flash_ctrl_t *const p_ctrl)
```

Detailed description

Reset function for FLASH device. Implemented as

- R_FLASH_LP_Reset

- R_FLASH_HP_Reset

Table 1140:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

8.16.8.18 updateFlashClockFreq

```
ssp_err_t(* flash_api_t::updateFlashClockFreq) (flash_ctrl_t *const p_ctrl)
```

Detailed description

Update Flash clock frequency (FCLK) and recalculate timeout values Implemented as

- R_FLASH_LP_UpdateFlashClockFreq
- R_FLASH_HP_UpdateFlashClockFreq

Table 1141:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

8.16.8.19 startupAreaSelect

```
ssp_err_t(* flash_api_t::startupAreaSelect) (flash_ctrl_t *const p_ctrl,
flash_startup_area_swap_t swap_type, bool is_temporary)
```

Detailed description

Select which block - Default (Block 0) or Alternate (Block 1) is used as the start-up area block. Implemented as

- R_FLASH_LP_StartUpAreaSelect
- R_FLASH_HP_StartUpAreaSelect

Table 1142:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to FLASH device control.
swap_type	in	FLASH_STARTUP_AREA_BLOCK0, FLASH_STARTUP_AREA_BLOCK1 or FLASH_STARTUP_AREA_BTFLG.
is_temporary	in	True or false. See table below.

swap_type | is_temporary | Operation FLASH_STARTUP_AREA_BLOCK0: false On next reset Startup area will be Block 0.

FLASH_STARTUP_AREA_BLOCK0 | false | On next reset Startup area will be Block 0. Block 0.

FLASH_STARTUP_AREA_BLOCK1: false On next reset Startup area will be Block 1.

FLASH_STARTUP_AREA_BLOCK1 | true | Startup area is immediately, but temporarily switched to Block 1. Block 1.

FLASH_STARTUP_AREA_BTFLG | true | Startup area is immediately, but temporarily switched to... taken.

the Block determined by the Configuration BTFLG.

Parameter p_ctrl

Definition: `flash_ctrl_t*const p_ctrl`

Flash control block. Allocate an instance specific control block to pass into the flash API calls. Implemented asflash_lp_instance_ctrl_tflash_hp_instance_ctrl_t

Parameter swap_type

Definition: `flash_startup_area_swap_tswap_type`

Parameter for specifying the startup area swap being requested by startupAreaSelect()

Parameter is_temporary

`const`

8.16.8.20 versionGet

```
ssp_err_t(* flash_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get Flash driver version. Implemented as

- R_FLASH_LP_VersionGet
- R_FLASH_HP_VersionGet

Table 1143:Parameters

Name	Direction	Description
p_version	out	Returns version.

Parameter p_version

8.16.8.21 flash_instance_t

flash_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- flash_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- flash_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- flash_api_t const * p_api

  Pointer to the API structure for this instance.

8.17 FMI Interface

Interface for reading on-chip factory information.

8.17.1 Summary

The FMI (Factory MCU Information) module provides a function for reading the Product Information record.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

FMI Interface description: FMI Driver

8.17.2 Interface API

fmi_api_t

Function name	Description
.init	Initialize the FMI base pointer.
.productInfoGet	Get product information record address into caller's pointer.
.uniqueIdGet	Copy unique ID into p_unique_id.
.productFeatureGet	Get feature information and store it in p_info.
.eventInfoGet	Get event information and store it in p_info.
.versionGet	Get the driver version based on compile time macros.

8.17.3 Data structures

- fmi_header_t
- fmi_product_info_t
- fmi_unique_id_t
- fmi_feature_info_t
- fmi_event_info_t
- fmi_instance_t

8.17.4 Defines

- #define FMI_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define FMI_API_VERSION_MINOR

  Initial value: `(3U)`

8.17.5 API Structures

8.17.5.1 fmi_header_t

fmi_header_t

Detailed description
Variables

- uint32_t contents
- uint32_t variant
- uint32_t count
- uint32_t minor
- uint32_t major

8.17.5.2 fmi_product_info_t

fmi_product_info_t

Detailed description
Variables

- fmi_header_t header
- uint8_t unique_id[16]

  DEPRECATED, use uniqueIdGet instead.
- uint8_t product_name[16]
- uint8_t product_marking[16]
- uint32_t mask_revision
- uint32_t pin_count
- uint32_t pkg_type
- uint32_t temp_range
- uint32_t quality_code

8.17.5.6 fmi_api_t

fmi_api_t

Detailed description

fmi driver structure. General fmi functions implemented at the HAL layer will follow this API.

8.17.5.7 init

```
(* fmi_api_t::init) (void)
```

Detailed description

Initialize the FMI base pointer. Implemented as

- R_FMI_Init()

8.17.5.8 productInfoGet

```
(* fmi_api_t::productInfoGet) (fmi_product_info_t **pp_product_info)
```

Detailed description

Get product information record address into caller's pointer.

ATTENTION: fmi_product_info_t::unique_id is deprecated and will not contain a unique ID if the factory MCU information is linked in by the application code. Use uniqueIdGet for the unique ID.

Table 1144:Parameters

Name	Direction	Description
pp_product_info	inout	Pointer to store pointer to product info.

Implemented as

- R_FMI_ProductInfoGet()

Parameter pp_product_info

Definition: `fmi_product_info_t**pp_product_info`

- `fmi_product_info_t::header`
- `fmi_product_info_t::unique_id`

  DEPRECATED, use uniqueIdGet instead.
- `fmi_product_info_t::product_name`
- `fmi_product_info_t::product_marking`
- `fmi_product_info_t::mask_revision`
- `fmi_product_info_t::pin_count`

- fmi_product_info_t::struct{}
- fmi_product_info_t::max_freq
- fmi_product_info_t::reserved1
- fmi_product_info_t::struct{}

8.17.5.9 uniqueIdGet

```
(* fmi_api_t::uniqueIdGet) (fmi_unique_id_t *p_unique_id)
```

Detailed description

Copy unique ID into p_unique_id.

Table 1145:Parameters

Name	Direction	Description
p_unique_id	out	Pointer to unique ID.

Implemented as

- R_FMI_UniqueIdGet()

Parameter p_unique_id

Definition: fmi_unique_id_t*p_unique_id

- fmi_unique_id_t::unique_id

8.17.5.10 productFeatureGet

```
(* fmi_api_t::productFeatureGet) ( const *const p_feature, fmi_feature_info_t
*const p_info)
```

Detailed description

Get feature information and store it in p_info.

Table 1146:Parameters

Name	Direction	Description
p_feature	in	Definition of SSP feature.
p_info	out	Feature specific information.

Implemented as

- R_FMI_ProductFeatureGet()

Parameter p_feature
Parameter p_info

Definition: fmi_feature_info_t*const p_info

- fmi_feature_info_t::ptr
- fmi_feature_info_t::channel_count
- fmi_feature_info_t::variant_data
- fmi_feature_info_t::extended_data_count
- fmi_feature_info_t::version_major
- fmi_feature_info_t::version_minor
- fmi_feature_info_t::struct{}
- fmi_feature_info_t::ptr_extended_data

8.17.5.11 eventInfoGet

```
(* fmi_api_t::eventInfoGet) ( const *const p_feature, signal, fmi_event_info_t
*const p_info)
```

Detailed description

Get event information and store it in p_info.

Table 1147:Parameters

Name	Direction	Description
p_feature	in	Definition of SSP feature.
signal	in	Feature signal ID.
p_info	out	Event information for feature signal.

Implemented as

- R_FMI_EventInfoGet()

Parameter p_feature
Parameter signal
Parameter p_info

Definition: `fmi_event_info_t*const p_info`

- `fmi_event_info_t::irq`
- `fmi_event_info_t::event`

8.17.5.12 versionGet

```
(* fmi_api_t::versionGet) ( *const p_version)
```

Detailed description

Get the driver version based on compile time macros. Implemented as

- R_FMI_VersionGet()

8.17.5.13 fmi_instance_t

fmi_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- fmi_api_t const * p_api

  Pointer to the API structure for this instance.

8.18 HASH Algorithm Interface

HASH_Interface Hash algorithm APIs.

8.18.1 Interface API

hash_api_t

Function name	Description
.open	HASH_Interface: Initial configuration
.updateHash	update hash for the words from source buffer .This function will be deprecated. The function hashUpdate should be used instead.
.hashUpdate	update hash for the words from source buffer .
.close	
.versionGet	Gets version and stores it in provided pointer p_version.

8.18.2 Data structures

- hash_cfg_t
- hash_ctrl_t
- hash_instance_t

8.18.3 Variables

- g_md5_hash_on_sce
- g_sha1_hash_on_sce
- g_sha256_hash_on_sce

8.18.4 Defines

- #define HASH_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define HASH_API_VERSION_MINOR

  Initial value: `(0U)`
- #define HASH_MESSAGE_BLOCK_SIZE_WORDS

  Initial value: `(16U)`
- #define HASH_MESSAGE_BLOCK_SIZE_BYTES

  Initial value: `((HASH_MESSAGE_BLOCK_SIZE_WORDS) * 4)`
- #define HASH_MAX_DIGEST_SIZE_WORDS

  Initial value: `(8)`
- #define HASH_MAX_DIGEST_SIZE_BYTES

  Initial value: `((HASH_DIGEST_SIZE_WORDS) * 4)`

8.18.5 g_md5_hash_on_sce

`hash_api_t::g_md5_hash_on_sce`

8.18.5.1 Detailed description

HASH interface is only available on S7G2, S5D9 and S5D5.
MD5 implementation of HASH API.

8.18.6 g_sha1_hash_on_sce

`hash_api_t::g_sha1_hash_on_sce`

8.18.6.1 Detailed description

SHA1 implementation of HASH API.

8.18.7 g_sha256_hash_on_sce

`hash_api_t::g_sha256_hash_on_sce`

8.18.7.1 Detailed description

SHA256 implementation of HASH API.

8.18.8 API Structures

8.18.8.1 hash_cfg_t

hash_cfg_t

Detailed description

HASH_Interface configuration structure

Variables

- crypto_ctrl_t * p_crypto_ctrl
  pointer to crypto engine control structure
- crypto_api_t const * p_crypto_api
  pointer to crypto engine API structure

8.18.8.2 hash_ctrl_t

hash_ctrl_t

Detailed description

HASH_Interface control structure

Variables

- uint32_t msgbuf[HASH_MESSAGE_BLOCK_SIZE_WORDS]
  message buffer to be hashed
- uint32_t hash[HASH_MAX_DIGEST_SIZE_WORDS]
  current hash value
- uint64_t length
  64-bit message length (number of bits)

8.18.8.3 hash_api_t

hash_api_t

Detailed description

HASH_Interface SCE functions implemented at the HAL layer will follow this API.

8.18.8.4 open

```
uint32_t(* hash_api_t::open) (hash_ctrl_t *const p_ctrl, hash_cfg_t const *const p_cfg)
```

Detailed description

HASH_Interface: Initial configuration

NOTE: HASH_Interface: Peripheral clocks and any required output pins should be configured prior to calling this function.

Table 1148:Parameters

Name	Direction	Description
HASH_Interface	inout	p_ctrl Pointer to control structure. Must be declared by user. Elements set here.
HASH_Interface	in	p_cfg Pointer to configuration structure. All elements of this structure must be set by user.

Parameter HASH_Interface
Parameter HASH_Interface

8.18.8.5 updateHash

```
uint32_t(* hash_api_t::updateHash) (const uint32_t *p_source, uint32_t num_words, uint32_t *p_dest)
```

Detailed description

update hash for the num_words words from source buffer p_source.

Table 1149:Parameters

Name	Direction	Description
p_source	in	pointer to input message buffer. size must be a multiple of 64-bytes
num_words	in	number of words to be hashed from the buffer p_source
p_dest	inout	pointer to the message digest. on input contains initialization value.

This function will be deprecated. The function hashUpdate should be used instead.

Parameter p_source

`uint32_t`

Parameter num_words

`uint32_t`

Parameter p_dest

`uint32_t`

8.18.8.6 hashUpdate

```
uint32_t(* hash_api_t::hashUpdate) (hash_ctrl_t *const p_ctrl, const uint32_t
*p_source, uint32_t num_words, uint32_t *p_dest)
```

Detailed description

update hash for the num_words words from source buffer p_source.

Table 1150:Parameters

Name	Direction	Description
p_ctrl	in	pointer to hash_ctrl_t control structure.
p_source	in	pointer to input message buffer. size must be a multiple of 64-bytes
num_words	in	number of words to be hashed from the buffer p_source
p_dest	inout	pointer to the message digest. on input contains initialization value.

Parameter p_ctrl

Definition: `hash_ctrl_t`

HASH_Interface control structure

Parameter p_source

`uint32_t`

Parameter num_words

`uint32_t`

Parameter p_dest

`uint32_t`

8.18.8.7 close

```
uint32_t(* hash_api_t::close) (hash_ctrl_t *const p_ctrl)
```

8.18.8.8 versionGet

```
uint32_t(* hash_api_t::versionGet) ( *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version.

Table 1151:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.18.8.9 hash_instance_t

hash_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- hash_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- hash_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- hash_api_t const * p_api

  Pointer to the API structure for this instance.

8.19 I2C Master Interface

Interface for I2C communication.

8.19.1 Summary

The I2C master interface provides a common API for I2C HAL drivers. The I2C master interface supports:

- Interrupt driven transmit/receive processing

- Callback function support which can return an event code

Implemented by:

- Simple I2C on SCI
- IIC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

I2C Interface description: I2C Master Driver and I2C Slave Driver

8.19.2 Interface API

i2c_api_master_t

Function name	Description
.open	Opens the I2C driver and initializes the hardware.
.close	Closes the driver and releases the I2C device.
.read	Performs a read operation on an I2C device.
.write	Performs a write operation on an I2C device.
.reset	Performs a reset of the peripheral.
.slaveAddressSet	Sets address of the slave device without reconfiguring the bus.
.versionGet	Gets version information and stores it in the provided version struct.

i2c_api_slave_t

Function name	Description
.open	Opens the I2C driver and initializes the hardware.
.close	Closes the driver and releases the I2C device.
.masterWriteSlaveRead	Performs a read operation on an I2C device.

Function name	Description
.masterReadSlaveWrite	Performs a write operation on an I2C device.
.versionGet	Gets version information and stores it in the provided version struct.

  Initial value: `(4U)`

8.19.7 API Data

8.19.7.1 i2c_rate_t

```
i2c_rate_t
```

Detailed description

Communication speed options

Enumerated values

Name	Description
I2C_RATE_STANDARD	100 kHz
I2C_RATE_FAST	400 kHz
I2C_RATE_FASTPLUS	1 MHz

8.19.7.2 i2c_addr_mode_t

`i2c_addr_mode_t`

Detailed description

Addressing mode options

Enumerated values

Name	Description
I2C_ADDR_MODE_7BIT	Use 7-bit addressing mode.
I2C_ADDR_MODE_10BIT	Use 10-bit addressing mode.

8.19.7.3 i2c_event_t

`i2c_event_t`

Detailed description

Callback events

Enumerated values

Name	Description
I2C_EVENT_ABORTED	A transfer was aborted.
I2C_EVENT_RX_COMPLETE	A receive operation was completed successfully.

Name	Description
I2C_EVENT_TX_COMPLETE	A transmit operation was completed successfully.

8.19.7.4 i2c_ctrl_t

```
typedef void i2c_ctrl_t
```

Detailed description

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented as

- sci_i2c_instance_ctrl_t
- riic_instance_ctrl_t

8.19.8 API Structures

8.19.8.1 i2c_callback_args_t

i2c_callback_args_t

Detailed description

I2C callback parameter definition

Variables

- void const *const p_context

  Pointer to user-provided context.
- uint32_t const bytes

  Number of received/transmitted bytes in buff.
- i2c_event_t const event

  Event code.

8.19.8.2 i2c_cfg_t

i2c_cfg_t

Detailed description

I2C configuration block

Variables

- uint8_t channel

  Identifier recognizable by implementation.

  Generic configuration
- i2c_rate_t rate

  Device's maximum clock rate from enum i2c_rate_t.
- uint16_t slave

  The address of the slave device.
- i2c_addr_mode_t addr_mode

  Indicates how slave fields should be interpreted.
- uint16_t sda_delay

  The SDA output delay.
- uint8_t rxi_ipl

  Receive interrupt priority.
- uint8_t txi_ipl

  Transmit interrupt priority.
- uint8_t tei_ipl

  Transmit end interrupt priority.
- uint8_t eri_ipl

  Error interrupt priority.
- transfer_instance_t const * p_transfer_tx

  DTC instance for I2C transmit.Set to NULL if unused.

  DTC/DMA support
- transfer_instance_t const * p_transfer_rx

  DTC instance for I2C receive. Set to NULL if unused.
- void(* p_callback)(i2c_callback_args_t *p_args)

  Pointer to callback function.

  Parameters to control software behavior
- void const * p_context

  Pointer to the user-provided context.
- void const * p_extend

  Any configuration data needed by the hardware.

  Implementation-specific configuration

8.19.8.3 i2c_api_master_t

i2c_api_master_t

Detailed description

Interface definition for I2C access as master

8.19.8.4 open

```
ssp_err_t(* i2c_api_master_t::open) (i2c_ctrl_t *const p_ctrl, i2c_cfg_t const
*const p_cfg)
```

Detailed description

Opens the I2C driver and initializes the hardware. Implemented as

- R_RIIC_MasterOpen
- R_SCI_SIIC_MasterOpen

Table 1152:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements are set here.
p_cfg	in	Pointer to configuration structure.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_cfg

Definition: `i2c_cfg_t const *const p_cfg`

I2C configuration block

- `i2c_cfg_t`::channel

  Identifier recognizable by implementation.

  Generic configuration

- `i2c_cfg_t`::`i2c_rate_t`

  Device's maximum clock rate from enum i2c_rate_t.

  Enumerated as:

  - I2C_RATE_STANDARD
  - I2C_RATE_FAST
  - I2C_RATE_FASTPLUS
- i2c_cfg_t::slave

  The address of the slave device.
- i2c_cfg_t::i2c_addr_mode_t

  Indicates how slave fields should be interpreted.

  Enumerated as:
  - I2C_ADDR_MODE_7BIT
  - I2C_ADDR_MODE_10BIT
- i2c_cfg_t::sda_delay

  The SDA output delay.
- i2c_cfg_t::rxi_ipl

  Receive interrupt priority.
- i2c_cfg_t::txi_ipl

  Transmit interrupt priority.
- i2c_cfg_t::tei_ipl

  Transmit end interrupt priority.
- i2c_cfg_t::eri_ipl

  Error interrupt priority.
- i2c_cfg_t::transfer_instance_t

  DTC instance for I2C transmit.Set to NULL if unused.

  DTC/DMA support
- i2c_cfg_t::transfer_instance_t

  DTC instance for I2C receive. Set to NULL if unused.
- i2c_cfg_t::p_callback

  Pointer to callback function.

  Parameters to control software behavior
- i2c_cfg_t::p_context

  Pointer to the user-provided context.
- i2c_cfg_t::p_extend

  Any configuration data needed by the hardware.

  Implementation-specific configuration

8.19.8.5 close

```
ssp_err_t(* i2c_api_master_t::close) (i2c_ctrl_t *const p_ctrl)
```

Detailed description

Closes the driver and releases the I2C device. Implemented as

- R_RIIC_MasterClose
- R_SCI_SIIC_MasterClose

Table 1153:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

8.19.8.6 read

```
ssp_err_t(* i2c_api_master_t::read) (i2c_ctrl_t *const p_ctrl, uint8_t *const
p_dest, uint32_t const bytes, bool const restart)
```

Detailed description

Performs a read operation on an I2C device. Implemented as

- R_RIIC_MasterRead
- R_SCI_SIIC_MasterRead

Table 1154:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.
p_dest	in	Pointer to the location to store read data.
bytes	in	Number of bytes to read.

Table 1154:Parameters (Continued)

Name	Direction	Description
restart	in	Specify if the restart condition should be issued after reading.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

Parameter restart

`const`

8.19.8.7 write

```
ssp_err_t(* i2c_api_master_t::write) (i2c_ctrl_t *const p_ctrl, uint8_t *const
p_src, uint32_t const bytes, bool const restart)
```

Detailed description

Performs a write operation on an I2C device. Implemented as

- R_RIIC_MasterWrite
- R_SCI_SIIC_MasterWrite

Table 1155:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.
p_src	in	Pointer to the location to get write data from.
bytes	in	Number of bytes to write.
restart	in	Specify if the restart condition should be issued after writing.

Parameter p_ctrl

Definition: i2c_ctrl_t*const p_ctrl

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_src

uint8_t

Parameter bytes

uint32_t

Parameter restart

const

8.19.8.8 reset

```
ssp_err_t(* i2c_api_master_t::reset) (i2c_ctrl_t *const p_ctrl)
```

Detailed description

Performs a reset of the peripheral. Implemented as

- R_RIIC_MasterReset
- R_SCI_SIIC_MasterReset

Table 1156:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.

Parameter p_ctrl

Definition: i2c_ctrl_t*const p_ctrl

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

8.19.8.9 slaveAddressSet

```
ssp_err_t(* i2c_api_master_t::slaveAddressSet) (i2c_ctrl_t *const p_ctrl,
uint16_t const slave, i2c_addr_mode_t const addr_mode)
```

Detailed description

Sets address of the slave device without reconfiguring the bus. Implemented as

- R_RIIC_MasterSlaveAddressSet

- R_SCI_SIIC_MasterSlaveAddressSet

Table 1157:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.
slave_address	in	Address of the slave device.
address_mode	in	Addressing mode.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter slave_address

Parameter address_mode

8.19.8.10 versionGet

```
ssp_err_t(* i2c_api_master_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets version information and stores it in the provided version struct. Implemented as

- R_RIIC_MasterVersionGet
- R_SCI_SIIC_MasterVersionGet

Table 1158:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.19.8.11 i2c_api_slave_t

i2c_api_slave_t

Detailed description

Interface definition for I2C access as slave

8.19.8.12 open

```
ssp_err_t(* i2c_api_slave_t::open) (i2c_ctrl_t *const p_ctrl, i2c_cfg_t const
*const p_cfg)
```

Detailed description

Opens the I2C driver and initializes the hardware. Implemented as

- R_RIIC_SlaveOpen

Table 1159:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements are set here.
p_cfg	in	Pointer to configuration structure.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_cfg

Definition: `i2c_cfg_t const *const p_cfg`

I2C configuration block

- `i2c_cfg_t`::`channel`

  Identifier recognizable by implementation.

  Generic configuration

- `i2c_cfg_t`::`i2c_rate_t`

  Device's maximum clock rate from enum i2c_rate_t.

  Enumerated as:

  – I2C_RATE_STANDARD

  – I2C_RATE_FAST

  – I2C_RATE_FASTPLUS

- i2c_cfg_t::slave

  The address of the slave device.
- i2c_cfg_t::i2c_addr_mode_t

  Indicates how slave fields should be interpreted.

  Enumerated as:

  – I2C_ADDR_MODE_7BIT

  – I2C_ADDR_MODE_10BIT
- i2c_cfg_t::sda_delay

  The SDA output delay.
- i2c_cfg_t::rxi_ipl

  Receive interrupt priority.
- i2c_cfg_t::txi_ipl

  Transmit interrupt priority.
- i2c_cfg_t::tei_ipl

  Transmit end interrupt priority.
- i2c_cfg_t::eri_ipl

  Error interrupt priority.
- i2c_cfg_t::transfer_instance_t

  DTC instance for I2C transmit.Set to NULL if unused.

  DTC/DMA support
- i2c_cfg_t::transfer_instance_t

  DTC instance for I2C receive. Set to NULL if unused.
- i2c_cfg_t::p_callback

  Pointer to callback function.

  Parameters to control software behavior
- i2c_cfg_t::p_context

  Pointer to the user-provided context.
- i2c_cfg_t::p_extend

  Any configuration data needed by the hardware.

  Implementation-specific configuration

8.19.8.13 close

```
ssp_err_t(* i2c_api_slave_t::close) (i2c_ctrl_t *const p_ctrl)
```

Detailed description

Closes the driver and releases the I2C device. Implemented as

- R_RIIC_SlaveClose

Table 1160:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

8.19.8.14 masterWriteSlaveRead

```
ssp_err_t(* i2c_api_slave_t::masterWriteSlaveRead) (i2c_ctrl_t *const p_ctrl,
uint8_t *const p_dest, uint32_t const bytes)
```

Detailed description

Performs a read operation on an I2C device. Implemented as

- R_RIIC_MasterWriteSlaveRead

Table 1161:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.
p_dest	in	Pointer to the location to store read data.
bytes	in	Number of bytes to read.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

8.19.8.15 masterReadSlaveWrite

```
ssp_err_t(* i2c_api_slave_t::masterReadSlaveWrite) (i2c_ctrl_t *const p_ctrl,
uint8_t *const p_src, uint32_t const bytes)
```

Detailed description

Performs a write operation on an I2C device. Implemented as

- R_RIIC_MasterReadSlaveWrite

Table 1162:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block set in open call.
p_src	in	Pointer to the location to get write data from.
bytes	in	Number of bytes to write.

Parameter p_ctrl

Definition: `i2c_ctrl_t*const p_ctrl`

I2C control block. Allocate an instance specific control block to pass into the I2C API calls. Implemented assci_i2c_instance_ctrl_triic_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter bytes

`uint32_t`

8.19.8.16 versionGet

```
ssp_err_t(* i2c_api_slave_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets version information and stores it in the provided version struct. Implemented as

- R_RIIC_SlaveVersionGet

Table 1163:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.19.8.17 i2c_master_instance_t

i2c_master_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- i2c_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- i2c_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- i2c_api_master_t const * p_api

  Pointer to the API structure for this instance.

8.19.8.18 i2c_slave_instance_t

i2c_slave_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- i2c_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- i2c_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- i2c_api_slave_t const * p_api

  Pointer to the API structure for this instance.

8.20 I2S Interface

The I2S (Inter-IC Sound) interface provides APIs and definitions for I2S audio communication.

8.20.1 Summary

The I2S (Inter-IC Sound) interface provides APIs and definitions for I2S audio communication.

8.20.2 Known Implementations

SSI

8.20.3 Related modules

See also: I2S Audio Playback Framework

8.20.4 Interface API

i2s_api_t

Function name	Description
.open	Initial configuration.
.stop	Stop communication. Transmission is stopped when callback is called with I2S_EVENT_IDLE. Reception is stopped when callback is called with I2S_EVENT_RX_EMPTY.
.mute	Enable or disable mute.
.write	Write I2S data. All transmit data is queued when callback is called with I2S_EVENT_TX_EMPTY. Transmission is complete when callback is called with I2S_EVENT_IDLE.
.read	Read I2S data. Reception is complete when callback is called with I2S_EVENT_RX_EMPTY.
.writeRead	Simultaneously write and read I2S data. Transmission and reception are complete when callback is called with I2S_EVENT_IDLE.
.infoGet	Get instance specific information and store it in provided pointer p_info.

Function name	Description
.close	Allows driver to be reconfigured and may reduce power consumption.
.versionGet	Get version and store it in provided pointer p_version.

8.20.5 Data structures

- i2s_callback_args_t
- i2s_info_t
- i2s_cfg_t
- i2s_instance_t

8.20.6 Enumerations

- i2s_pcm_width_t
- i2s_word_length_t
- i2s_event_t
- i2s_dir_t
- i2s_mute_t
- i2s_ws_continue_t
- i2s_status_t

8.20.7 Typedefs

- i2s_ctrl_t

8.20.8 Defines

- #define I2S_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define I2S_API_VERSION_MINOR

  Initial value: `(2U)`

8.20.9 API Data

8.20.9.1 i2s_pcm_width_t

`i2s_pcm_width_t`

Detailed description

Audio PCM width

Enumerated values

Name	Description
I2S_PCM_WIDTH_8_BITS	Using 8-bit PCM.
I2S_PCM_WIDTH_16_BITS	Using 16-bit PCM.
I2S_PCM_WIDTH_18_BITS	Using 18-bit PCM.
I2S_PCM_WIDTH_20_BITS	Using 20-bit PCM.
I2S_PCM_WIDTH_22_BITS	Using 22-bit PCM.
I2S_PCM_WIDTH_24_BITS	Using 24-bit PCM.

8.20.9.2 i2s_word_length_t

`i2s_word_length_t`

Detailed description

Audio system word length.

Enumerated values

Name	Description
I2S_WORD_LENGTH_8_BITS	Using 8-bit system word length.
I2S_WORD_LENGTH_16_BITS	Using 16-bit system word length.
I2S_WORD_LENGTH_24_BITS	Using 24-bit system word length.
I2S_WORD_LENGTH_32_BITS	Using 32-bit system word length.

8.20.9.3 i2s_event_t

`i2s_event_t`

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
I2S_EVENT_IDLE	Communication is idle.
I2S_EVENT_TX_EMPTY	Transmit buffer is below FIFO trigger level.
I2S_EVENT_RX_FULL	Receive buffer is above FIFO trigger level.

8.20.9.4 i2s_dir_t

`i2s_dir_t`

Detailed description

I2S communication direction

Enumerated values

Name	Description
I2S_DIR_TX	Transmit direction only.
I2S_DIR_RX	Receive direction only.
I2S_DIR_TX_RX	Transmit and receive direction.

8.20.9.5 i2s_mute_t

`i2s_mute_t`

Detailed description

Mute audio samples.

Enumerated values

Name	Description
I2S_MUTE_ON	Enable mute.
I2S_MUTE_OFF	Disable mute.

8.20.9.6 i2s_ws_continue_t

`i2s_ws_continue_t`

Detailed description

Whether to continue WS (word select line) transmission during idle state.

Enumerated values

Name	Description
I2S_WS_CONTINUE_ON	Enable WS continue mode.
I2S_WS_CONTINUE_OFF	Disable WS continue mode.

8.20.9.7 i2s_status_t

`i2s_status_t`

Detailed description

Possible status values returned by infoGet.

Enumerated values

Name	Description
I2S_STATUS_IN_USE	I2S is in use.
I2S_STATUS_STOPPED	I2S is stopped.

8.20.9.8 i2s_ctrl_t

`typedef void i2s_ctrl_t`

Detailed description

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented as

- ssi_instance_ctrl_t

8.20.10 API Structures

8.20.10.1 i2s_callback_args_t

i2s_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Placeholder for user data. Set in i2s_api_t::open function in i2s_cfg_t.

- i2s_event_t event

  The event can be used to identify what caused the callback (overflow or error).

8.20.10.2 i2s_info_t

i2s_info_t

Detailed description

Timer information structure to store various information for an I2S instance.

Variables

- i2s_status_t status
- uint32_t sampling_freq_hz

  Sampling frequency in Hertz.

8.20.10.3 i2s_cfg_t

i2s_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- uint8_t channel

  Select a channel corresponding to the channel number of the hardware.

- i2s_pcm_width_t pcm_width

  Audio PCM data width.

- i2s_word_length_t word_length

  Audio word length, bits must be >= i2s_cfg_t::pcm_width bits.

- i2s_ws_continue_t ws_continue

  Whether to continue WS transmission during idle state.

- uint32_t sampling_freq_hz

  Sampling frequency in Hertz.

- uint32_t audio_clk_freq_hz

  Audio clock frequency in Hertz. Must be a multiple between 1 and 128 of (16 * i2s_cfg_t::sampling_freq_hz * (i2s_cfg_t::word_length <enum_value> + 1)

- timer_instance_t const * p_timer

  To generate audio clock with GPT, link a timer instance here. Set to NULL if unused.
- transfer_instance_t const * p_transfer_tx

  To use DTC during write, link a DTC instance here. Set to NULL if unused.
- transfer_instance_t const * p_transfer_rx

  To use DTC during read, link a DTC instance here. Set to NULL if unused.
- void(* p_callback)(i2s_callback_args_t *p_args)

  Callback provided when an I2S ISR occurs. Set to NULL for no CPU interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user callback in i2s_callback_args_t.
- void const * p_extend

  Extension parameter for hardware specific settings.
- uint8_t rxi_ipl

  Receive interrupt priority.
- uint8_t txi_ipl

  Transmit interrupt priority.
- uint8_t idle_err_ipl

  Idle/Error interrupt priority.

8.20.10.4 i2s_api_t

i2s_api_t

Detailed description

I2S functions implemented at the HAL layer will follow this API.

8.20.10.5 open

```
ssp_err_t(* i2s_api_t::open) (i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const
p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_SSI_Open

NOTE: Peripheral clocks and any required output pins should be configured prior to calling this function.

NOTE: To reconfigure after calling this function, call close first.

Table 1164:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter p_cfg

Definition: `i2s_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `i2s_cfg_t`::`channel`

  Select a channel corresponding to the channel number of the hardware.

- `i2s_cfg_t`::`i2s_pcm_width_t`

  Audio PCM data width.

  Enumerated as:

  – I2S_PCM_WIDTH_8_BITS

  – I2S_PCM_WIDTH_16_BITS

  – I2S_PCM_WIDTH_18_BITS

  – I2S_PCM_WIDTH_20_BITS

  – I2S_PCM_WIDTH_22_BITS

  – I2S_PCM_WIDTH_24_BITS

- `i2s_cfg_t`::`i2s_word_length_t`

  Audio word length, bits must be >= i2s_cfg_t::pcm_width bits.

  Enumerated as:

  – I2S_WORD_LENGTH_8_BITS

  - I2S_WORD_LENGTH_16_BITS
  - I2S_WORD_LENGTH_24_BITS
  - I2S_WORD_LENGTH_32_BITS
- i2s_cfg_t::i2s_ws_continue_t

  Whether to continue WS transmission during idle state.

  Enumerated as:

  - I2S_WS_CONTINUE_ON
  - I2S_WS_CONTINUE_OFF
- i2s_cfg_t::sampling_freq_hz

  Sampling frequency in Hertz.
- i2s_cfg_t::audio_clk_freq_hz

  Audio clock frequency in Hertz. Must be a multiple between 1 and 128 of (16 * i2s_cfg_t::sampling_freq_hz * (i2s_cfg_t::word_length <enum_value> + 1)
- i2s_cfg_t::timer_instance_t

  To generate audio clock with GPT, link a timer instance here. Set to NULL if unused.
- i2s_cfg_t::transfer_instance_t

  To use DTC during write, link a DTC instance here. Set to NULL if unused.
- i2s_cfg_t::transfer_instance_t

  To use DTC during read, link a DTC instance here. Set to NULL if unused.
- i2s_cfg_t::p_callback

  Callback provided when an I2S ISR occurs. Set to NULL for no CPU interrupt.
- i2s_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in i2s_callback_args_t.
- i2s_cfg_t::p_extend

  Extension parameter for hardware specific settings.
- i2s_cfg_t::rxi_ipl

  Receive interrupt priority.
- i2s_cfg_t::txi_ipl

  Transmit interrupt priority.
- i2s_cfg_t::idle_err_ipl

  Idle/Error interrupt priority.

8.20.10.6 stop

```
ssp_err_t(* i2s_api_t::stop) (i2s_ctrl_t *const p_ctrl, i2s_dir_t const dir)
```

Detailed description

Stop communication. Transmission is stopped when callback is called with I2S_EVENT_IDLE. Reception is stopped when callback is called with I2S_EVENT_RX_EMPTY. Implemented as

- R_SSI_Stop

Table 1165:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
dir	in	Direction of communication to stop.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter dir

8.20.10.7 mute

```
ssp_err_t(* i2s_api_t::mute) (i2s_ctrl_t *const p_ctrl, i2s_mute_t const
mute_enable)
```

Detailed description

Enable or disable mute. Implemented as

- R_SSI_Mute

Table 1166:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
mute_enable	in	Whether to enable or disable mute.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter mute_enable

Definition: `i2s_mute_tconst mute_enable`

Mute audio samples.

8.20.10.8 write

```
ssp_err_t(* i2s_api_t::write) (i2s_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint16_t const bytes)
```

Detailed description

Write I2S data. All transmit data is queued when callback is called with I2S_EVENT_TX_EMPTY. Transmission is complete when callback is called with I2S_EVENT_IDLE. Implemented as

- R_SSI_Write

Table 1167:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
p_src	in	Buffer of PCM samples. Must be 4 byte aligned.
bytes	in	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter bytes

`uint16_t`

8.20.10.9 read

```
ssp_err_t(* i2s_api_t::read) (i2s_ctrl_t *const p_ctrl, uint8_t *const p_dest,
uint16_t const bytes)
```

Detailed description

Read I2S data. Reception is complete when callback is called with I2S_EVENT_RX_EMPTY. Implemented as

- R_SSI_Read

Table 1168:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
p_dest	in	Buffer to store PCM samples. Must be 4 byte aligned.
bytes	in	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, receive will stop at the multiple of 8 below requested bytes.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint16_t`

8.20.10.10 writeRead

```
ssp_err_t(* i2s_api_t::writeRead) (i2s_ctrl_t *const p_ctrl, uint8_t const *const
p_src, uint8_t *const p_dest, uint16_t const bytes)
```

Detailed description

Simultaneously write and read I2S data. Transmission and reception are complete when callback is called with I2S_EVENT_IDLE. Implemented as

- R_SSI_WriteRead

Table 1169:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
p_src	in	Buffer of PCM samples. Must be 4 byte aligned.
p_dest	in	Buffer to store PCM samples. Must be 4 byte aligned.
bytes	in	Number of bytes in the buffers. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8, and receive will stop at the multiple of 8 below requested bytes.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter p_dest

`uint8_t`

Parameter bytes

`uint16_t`

8.20.10.11 infoGet

```
ssp_err_t(* i2s_api_t::infoGet) (i2s_ctrl_t *const p_ctrl, i2s_info_t *const
p_info)
```

Detailed description

Get instance specific information and store it in provided pointer p_info. Implemented as

- R_SSI_InfoGet

Table 1170:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.
p_info	out	Collection of information for this instance.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

Parameter p_info

Definition: `i2s_info_t*const p_info`

Timer information structure to store various information for an I2S instance.

- `i2s_info_t::status`
- `i2s_info_t::sampling_freq_hz`

  Sampling frequency in Hertz.

8.20.10.12 close

```
ssp_err_t(* i2s_api_t::close) (i2s_ctrl_t *const p_ctrl)
```

Detailed description

Allows driver to be reconfigured and may reduce power consumption. Implemented as

- R_SSI_Close

Table 1171:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this instance.

Parameter p_ctrl

Definition: `i2s_ctrl_t*const p_ctrl`

I2S control block. Allocate an instance specific control block to pass into the I2S API calls. Implemented asssi_instance_ctrl_t

8.20.10.13 versionGet

```
ssp_err_t(* i2s_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_SSI_VersionGet

Table 1172:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.20.10.14 i2s_instance_t

i2s_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- i2s_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- i2s_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- i2s_api_t const * p_api

  Pointer to the API structure for this instance.

8.21 I/O Port Interface

Interface for accessing I/O ports and configuring I/O functionality.

The IOPort shared interface provides the ability to access the IOPorts of a device at both bit and port level. Port and pin direction can be changed.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

IOPORT Interface description: I/O Port Driver

8.21.1 Interface API

ioport_api_t

Function name	Description
.init	Initialize internal driver data and initial pin configurations. Called during startup. Do not call this API during runtime. Use pinsCfg for runtime reconfiguration of multiple pins.
.pinsCfg	Configure multiple pins.
.pinCfg	Configure settings for an individual pin.
.pinDirectionSet	Set the pin direction of a pin.
.pinEventInputRead	Read the event input data of the specified pin and return the level.
.pinEventOutputWrite	Write pin event data.
.pinEthernetModeCfg	Configure the PHY mode of the Ethernet channels.
.pinRead	Read level of a pin.
.pinWrite	Write specified level to a pin.
.portDirectionSet	Set the direction of one or more pins on a port.
.portEventInputRead	Read captured event data for a port.
.portEventOutputWrite	Write event output data for a port.
.portRead	Read states of pins on the specified port.
.portWrite	Write to multiple pins on a port.
.versionGet	Return the version of the IOPort driver.

8.21.2 Data structures

- ioport_pin_cfg_t
- ioport_cfg_t
- ioport_instance_t

8.21.3 Enumerations

- ioport_level_t
- ioport_direction_t
- ioport_port_t
- ioport_port_pin_t
- ioport_peripheral_t
- ioport_ethernet_channel_t
- ioport_ethernet_mode_t
- ioport_cfg_options_t

8.21.4 Typedefs

- ioport_size_t

8.21.5 Defines

- #define IOPORT_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define IOPORT_API_VERSION_MINOR
  Initial value: `(2U)`
- #define IOPORT_PRV_PFS_PSEL_OFFSET
  Initial value: `(24)`

8.21.6 API Data

8.21.6.1 ioport_level_t

`ioport_level_t`

Detailed description

Levels that can be set and read for individual pins

Enumerated values

Name	Description
IOPORT_LEVEL_LOW	Low.
IOPORT_LEVEL_HIGH	High.

8.21.6.2 ioport_direction_t

`ioport_direction_t`

Detailed description

Direction of individual pins

Enumerated values

Name	Description
IOPORT_DIRECTION_INPUT	Input.
IOPORT_DIRECTION_OUTPUT	Output.

8.21.6.3 ioport_port_t

`ioport_port_t`

Detailed description

Superset list of all possible IO ports.

Enumerated values

Name	Description
IOPORT_PORT_00	IO port 0.
IOPORT_PORT_01	IO port 1.
IOPORT_PORT_02	IO port 2.
IOPORT_PORT_03	IO port 3.
IOPORT_PORT_04	IO port 4.
IOPORT_PORT_05	IO port 5.
IOPORT_PORT_06	IO port 6.
IOPORT_PORT_07	IO port 7.
IOPORT_PORT_08	IO port 8.
IOPORT_PORT_09	IO port 9.
IOPORT_PORT_10	IO port 10.

Name	Description
IOPORT_PORT_11	IO port 11.

8.21.6.4 ioport_port_pin_t

```
ioport_port_pin_t
```

Detailed description

Superset list of all possible IO port pins.

Enumerated values

Name	Description
IOPORT_PORT_00_PIN_00	IO port 0 pin 0.
IOPORT_PORT_00_PIN_01	IO port 0 pin 1.
IOPORT_PORT_00_PIN_02	IO port 0 pin 2.
IOPORT_PORT_00_PIN_03	IO port 0 pin 3.
IOPORT_PORT_00_PIN_04	IO port 0 pin 4.
IOPORT_PORT_00_PIN_05	IO port 0 pin 5.
IOPORT_PORT_00_PIN_06	IO port 0 pin 6.
IOPORT_PORT_00_PIN_07	IO port 0 pin 7.
IOPORT_PORT_00_PIN_08	IO port 0 pin 8.
IOPORT_PORT_00_PIN_09	IO port 0 pin 9.
IOPORT_PORT_00_PIN_10	IO port 0 pin 10.
IOPORT_PORT_00_PIN_11	IO port 0 pin 11.
IOPORT_PORT_00_PIN_12	IO port 0 pin 12.
IOPORT_PORT_00_PIN_13	IO port 0 pin 13.
IOPORT_PORT_00_PIN_14	IO port 0 pin 14.
IOPORT_PORT_00_PIN_15	IO port 0 pin 15.
IOPORT_PORT_01_PIN_00	IO port 1 pin 0.

Name	Description
IOPORT_PORT_01_PIN_01	IO port 1 pin 1.
IOPORT_PORT_01_PIN_02	IO port 1 pin 2.
IOPORT_PORT_01_PIN_03	IO port 1 pin 3.
IOPORT_PORT_01_PIN_04	IO port 1 pin 4.
IOPORT_PORT_01_PIN_05	IO port 1 pin 5.
IOPORT_PORT_01_PIN_06	IO port 1 pin 6.
IOPORT_PORT_01_PIN_07	IO port 1 pin 7.
IOPORT_PORT_01_PIN_08	IO port 1 pin 8.
IOPORT_PORT_01_PIN_09	IO port 1 pin 9.
IOPORT_PORT_01_PIN_10	IO port 1 pin 10.
IOPORT_PORT_01_PIN_11	IO port 1 pin 11.
IOPORT_PORT_01_PIN_12	IO port 1 pin 12.
IOPORT_PORT_01_PIN_13	IO port 1 pin 13.
IOPORT_PORT_01_PIN_14	IO port 1 pin 14.
IOPORT_PORT_01_PIN_15	IO port 1 pin 15.
IOPORT_PORT_02_PIN_00	IO port 2 pin 0.
IOPORT_PORT_02_PIN_01	IO port 2 pin 1.
IOPORT_PORT_02_PIN_02	IO port 2 pin 2.
IOPORT_PORT_02_PIN_03	IO port 2 pin 3.
IOPORT_PORT_02_PIN_04	IO port 2 pin 4.
IOPORT_PORT_02_PIN_05	IO port 2 pin 5.
IOPORT_PORT_02_PIN_06	IO port 2 pin 6.
IOPORT_PORT_02_PIN_07	IO port 2 pin 7.
IOPORT_PORT_02_PIN_08	IO port 2 pin 8.

Name	Description
IOPORT_PORT_02_PIN_09	IO port 2 pin 9.
IOPORT_PORT_02_PIN_10	IO port 2 pin 10.
IOPORT_PORT_02_PIN_11	IO port 2 pin 11.
IOPORT_PORT_02_PIN_12	IO port 2 pin 12.
IOPORT_PORT_02_PIN_13	IO port 2 pin 13.
IOPORT_PORT_02_PIN_14	IO port 2 pin 14.
IOPORT_PORT_02_PIN_15	IO port 2 pin 15.
IOPORT_PORT_03_PIN_00	IO port 3 pin 0.
IOPORT_PORT_03_PIN_01	IO port 3 pin 1.
IOPORT_PORT_03_PIN_02	IO port 3 pin 2.
IOPORT_PORT_03_PIN_03	IO port 3 pin 3.
IOPORT_PORT_03_PIN_04	IO port 3 pin 4.
IOPORT_PORT_03_PIN_05	IO port 3 pin 5.
IOPORT_PORT_03_PIN_06	IO port 3 pin 6.
IOPORT_PORT_03_PIN_07	IO port 3 pin 7.
IOPORT_PORT_03_PIN_08	IO port 3 pin 8.
IOPORT_PORT_03_PIN_09	IO port 3 pin 9.
IOPORT_PORT_03_PIN_10	IO port 3 pin 10.
IOPORT_PORT_03_PIN_11	IO port 3 pin 11.
IOPORT_PORT_03_PIN_12	IO port 3 pin 12.
IOPORT_PORT_03_PIN_13	IO port 3 pin 13.
IOPORT_PORT_03_PIN_14	IO port 3 pin 14.
IOPORT_PORT_03_PIN_15	IO port 3 pin 15.
IOPORT_PORT_04_PIN_00	IO port 4 pin 0.

Name	Description
IOPORT_PORT_04_PIN_01	IO port 4 pin 1.
IOPORT_PORT_04_PIN_02	IO port 4 pin 2.
IOPORT_PORT_04_PIN_03	IO port 4 pin 3.
IOPORT_PORT_04_PIN_04	IO port 4 pin 4.
IOPORT_PORT_04_PIN_05	IO port 4 pin 5.
IOPORT_PORT_04_PIN_06	IO port 4 pin 6.
IOPORT_PORT_04_PIN_07	IO port 4 pin 7.
IOPORT_PORT_04_PIN_08	IO port 4 pin 8.
IOPORT_PORT_04_PIN_09	IO port 4 pin 9.
IOPORT_PORT_04_PIN_10	IO port 4 pin 10.
IOPORT_PORT_04_PIN_11	IO port 4 pin 11.
IOPORT_PORT_04_PIN_12	IO port 4 pin 12.
IOPORT_PORT_04_PIN_13	IO port 4 pin 13.
IOPORT_PORT_04_PIN_14	IO port 4 pin 14.
IOPORT_PORT_04_PIN_15	IO port 4 pin 15.
IOPORT_PORT_05_PIN_00	IO port 5 pin 0.
IOPORT_PORT_05_PIN_01	IO port 5 pin 1.
IOPORT_PORT_05_PIN_02	IO port 5 pin 2.
IOPORT_PORT_05_PIN_03	IO port 5 pin 3.
IOPORT_PORT_05_PIN_04	IO port 5 pin 4.
IOPORT_PORT_05_PIN_05	IO port 5 pin 5.
IOPORT_PORT_05_PIN_06	IO port 5 pin 6.
IOPORT_PORT_05_PIN_07	IO port 5 pin 7.
IOPORT_PORT_05_PIN_08	IO port 5 pin 8.

Name	Description
IOPORT_PORT_05_PIN_09	IO port 5 pin 9.
IOPORT_PORT_05_PIN_10	IO port 5 pin 10.
IOPORT_PORT_05_PIN_11	IO port 5 pin 11.
IOPORT_PORT_05_PIN_12	IO port 5 pin 12.
IOPORT_PORT_05_PIN_13	IO port 5 pin 13.
IOPORT_PORT_05_PIN_14	IO port 5 pin 14.
IOPORT_PORT_05_PIN_15	IO port 5 pin 15.
IOPORT_PORT_06_PIN_00	IO port 6 pin 0.
IOPORT_PORT_06_PIN_01	IO port 6 pin 1.
IOPORT_PORT_06_PIN_02	IO port 6 pin 2.
IOPORT_PORT_06_PIN_03	IO port 6 pin 3.
IOPORT_PORT_06_PIN_04	IO port 6 pin 4.
IOPORT_PORT_06_PIN_05	IO port 6 pin 5.
IOPORT_PORT_06_PIN_06	IO port 6 pin 6.
IOPORT_PORT_06_PIN_07	IO port 6 pin 7.
IOPORT_PORT_06_PIN_08	IO port 6 pin 8.
IOPORT_PORT_06_PIN_09	IO port 6 pin 9.
IOPORT_PORT_06_PIN_10	IO port 6 pin 10.
IOPORT_PORT_06_PIN_11	IO port 6 pin 11.
IOPORT_PORT_06_PIN_12	IO port 6 pin 12.
IOPORT_PORT_06_PIN_13	IO port 6 pin 13.
IOPORT_PORT_06_PIN_14	IO port 6 pin 14.
IOPORT_PORT_06_PIN_15	IO port 6 pin 15.
IOPORT_PORT_07_PIN_00	IO port 7 pin 0.

Name	Description
IOPORT_PORT_07_PIN_01	IO port 7 pin 1.
IOPORT_PORT_07_PIN_02	IO port 7 pin 2.
IOPORT_PORT_07_PIN_03	IO port 7 pin 3.
IOPORT_PORT_07_PIN_04	IO port 7 pin 4.
IOPORT_PORT_07_PIN_05	IO port 7 pin 5.
IOPORT_PORT_07_PIN_06	IO port 7 pin 6.
IOPORT_PORT_07_PIN_07	IO port 7 pin 7.
IOPORT_PORT_07_PIN_08	IO port 7 pin 8.
IOPORT_PORT_07_PIN_09	IO port 7 pin 9.
IOPORT_PORT_07_PIN_10	IO port 7 pin 10.
IOPORT_PORT_07_PIN_11	IO port 7 pin 11.
IOPORT_PORT_07_PIN_12	IO port 7 pin 12.
IOPORT_PORT_07_PIN_13	IO port 7 pin 13.
IOPORT_PORT_07_PIN_14	IO port 7 pin 14.
IOPORT_PORT_07_PIN_15	IO port 7 pin 15.
IOPORT_PORT_08_PIN_00	IO port 8 pin 0.
IOPORT_PORT_08_PIN_01	IO port 8 pin 1.
IOPORT_PORT_08_PIN_02	IO port 8 pin 2.
IOPORT_PORT_08_PIN_03	IO port 8 pin 3.
IOPORT_PORT_08_PIN_04	IO port 8 pin 4.
IOPORT_PORT_08_PIN_05	IO port 8 pin 5.
IOPORT_PORT_08_PIN_06	IO port 8 pin 6.
IOPORT_PORT_08_PIN_07	IO port 8 pin 7.
IOPORT_PORT_08_PIN_08	IO port 8 pin 8.

Name	Description
IOPORT_PORT_08_PIN_09	IO port 8 pin 9.
IOPORT_PORT_08_PIN_10	IO port 8 pin 10.
IOPORT_PORT_08_PIN_11	IO port 8 pin 11.
IOPORT_PORT_08_PIN_12	IO port 8 pin 12.
IOPORT_PORT_08_PIN_13	IO port 8 pin 13.
IOPORT_PORT_08_PIN_14	IO port 8 pin 14.
IOPORT_PORT_08_PIN_15	IO port 8 pin 15.
IOPORT_PORT_09_PIN_00	IO port 9 pin 0.
IOPORT_PORT_09_PIN_01	IO port 9 pin 1.
IOPORT_PORT_09_PIN_02	IO port 9 pin 2.
IOPORT_PORT_09_PIN_03	IO port 9 pin 3.
IOPORT_PORT_09_PIN_04	IO port 9 pin 4.
IOPORT_PORT_09_PIN_05	IO port 9 pin 5.
IOPORT_PORT_09_PIN_06	IO port 9 pin 6.
IOPORT_PORT_09_PIN_07	IO port 9 pin 7.
IOPORT_PORT_09_PIN_08	IO port 9 pin 8.
IOPORT_PORT_09_PIN_09	IO port 9 pin 9.
IOPORT_PORT_09_PIN_10	IO port 9 pin 10.
IOPORT_PORT_09_PIN_11	IO port 9 pin 11.
IOPORT_PORT_09_PIN_12	IO port 9 pin 12.
IOPORT_PORT_09_PIN_13	IO port 9 pin 13.
IOPORT_PORT_09_PIN_14	IO port 9 pin 14.
IOPORT_PORT_09_PIN_15	IO port 9 pin 15.
IOPORT_PORT_10_PIN_00	IO port 10 pin 0.

Name	Description
IOPORT_PORT_10_PIN_01	IO port 10 pin 1.
IOPORT_PORT_10_PIN_02	IO port 10 pin 2.
IOPORT_PORT_10_PIN_03	IO port 10 pin 3.
IOPORT_PORT_10_PIN_04	IO port 10 pin 4.
IOPORT_PORT_10_PIN_05	IO port 10 pin 5.
IOPORT_PORT_10_PIN_06	IO port 10 pin 6.
IOPORT_PORT_10_PIN_07	IO port 10 pin 7.
IOPORT_PORT_10_PIN_08	IO port 10 pin 8.
IOPORT_PORT_10_PIN_09	IO port 10 pin 9.
IOPORT_PORT_10_PIN_10	IO port 10 pin 10.
IOPORT_PORT_10_PIN_11	IO port 10 pin 11.
IOPORT_PORT_10_PIN_12	IO port 10 pin 12.
IOPORT_PORT_10_PIN_13	IO port 10 pin 13.
IOPORT_PORT_10_PIN_14	IO port 10 pin 14.
IOPORT_PORT_10_PIN_15	IO port 10 pin 15.
IOPORT_PORT_11_PIN_00	IO port 11 pin 0.
IOPORT_PORT_11_PIN_01	IO port 11 pin 1.
IOPORT_PORT_11_PIN_02	IO port 11 pin 2.
IOPORT_PORT_11_PIN_03	IO port 11 pin 3.
IOPORT_PORT_11_PIN_04	IO port 11 pin 4.
IOPORT_PORT_11_PIN_05	IO port 11 pin 5.
IOPORT_PORT_11_PIN_06	IO port 11 pin 6.
IOPORT_PORT_11_PIN_07	IO port 11 pin 7.
IOPORT_PORT_11_PIN_08	IO port 11 pin 8.

Name	Description
IOPORT_PORT_11_PIN_09	IO port 11 pin 9.
IOPORT_PORT_11_PIN_10	IO port 11 pin 10.
IOPORT_PORT_11_PIN_11	IO port 11 pin 11.
IOPORT_PORT_11_PIN_12	IO port 11 pin 12.
IOPORT_PORT_11_PIN_13	IO port 11 pin 13.
IOPORT_PORT_11_PIN_14	IO port 11 pin 14.
IOPORT_PORT_11_PIN_15	IO port 11 pin 15.

8.21.6.5 ioport_peripheral_t

`ioport_peripheral_t`

Detailed description

Superset of all peripheral functions.

Enumerated values

Name	Description
IOPORT_PERIPHERAL_IO	Pin will functions as an IO pin.
IOPORT_PERIPHERAL_DEBUG	Pin will function as a DEBUG pin.
IOPORT_PERIPHERAL_AGT	Pin will function as an AGT.
IOPORT_PERIPHERAL_GPT0	Pin will function as a GPT.
IOPORT_PERIPHERAL_GPT1	Pin will function as a GPT.
IOPORT_PERIPHERAL_SCI0_2_4_6_8	Pin will function as an SCI.
IOPORT_PERIPHERAL_SCI1_3_5_7_9	Pin will function as an SCI.
IOPORT_PERIPHERAL_RSPI	Pin will function as a RSPI.
IOPORT_PERIPHERAL_RIIC	Pin will function as a RIIC.
IOPORT_PERIPHERAL_KEY	Pin will function as a KEY.
IOPORT_PERIPHERAL_CLKOUT_COMP_RTC	Pin will function as a.

Name	Description
IOPORT_PERIPHERAL_CAC_AD	Pin will function as a CAC/ADC.
IOPORT_PERIPHERAL_BUS	Pin will function as a BUS.
IOPORT_PERIPHERAL_CTSU	Pin will function as a CTSU.
IOPORT_PERIPHERAL_LCDC	Pin will function as a segment LCD.
IOPORT_PERIPHERAL_DALI	Pin will function as a DALI.
IOPORT_PERIPHERAL_CAN	Pin will function as a CAN.
IOPORT_PERIPHERAL_QSPI	Pin will function as a QSPI.
IOPORT_PERIPHERAL_SSI	Pin will function as an SSI.
IOPORT_PERIPHERAL_USB_FS	Pin will function as a USB.
IOPORT_PERIPHERAL_USB_HS	Pin will function as a USB.
IOPORT_PERIPHERAL_SDHI_MMC	Pin will function as an SD/MMC.
IOPORT_PERIPHERAL_ETHER_MII	Pin will function as an Ethernet.
IOPORT_PERIPHERAL_ETHER_RMII	Pin will function as an Ethernet.
IOPORT_PERIPHERAL_PDC	Pin will function as a PDC.
IOPORT_PERIPHERAL_LCD_GRAPHICS	Pin will function as a graphics.
IOPORT_PERIPHERAL_TRACE	Pin will function as a debug trace.
IOPORT_PERIPHERAL_END	Marks end of enum - used by.

8.21.6.6 ioport_ethernet_channel_t

`ioport_ethernet_channel_t`

Detailed description

Superset of Ethernet channels.

Enumerated values

Name	Description
IOPORT_ETHERNET_CHANNEL_0	Used to select Ethernet channel 0.

Name	Description
IOPORT_ETHERNET_CHANNEL_1	Used to select Ethernet channel 1.
IOPORT_ETHERNET_CHANNEL_END	Marks end of enum - used by parameter checking.

8.21.6.7 ioport_ethernet_mode_t

`ioport_ethernet_mode_t`

Detailed description

Superset of Ethernet PHY modes.

Enumerated values

Name	Description
IOPORT_ETHERNET_MODE_MII	Ethernet PHY mode set to MII.
IOPORT_ETHERNET_MODE_RMII	Ethernet PHY mode set to RMII.
IOPORT_ETHERNET_MODE_END	Marks end of enum - used by parameter checking.

8.21.6.8 ioport_cfg_options_t

`ioport_cfg_options_t`

Detailed description

Options to configure pin functions

Enumerated values

Name	Description
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.

Name	Description
IOPORT_CFG_PMOS_ENABLE	Enables the pin's PMOS open-drain ouput.
IOPORT_CFG_DRIVE_MID	Sets pin drive output to medium.
IOPORT_CFG_DRIVE_MID_IIC	Sets pin to drive output needed for IIC on a 20mA port.
IOPORT_CFG_DRIVE_HIGH	Sets pin drive output to high.
IOPORT_CFG_EVENT_RISING_EDGE	Sets pin event trigger to rising edge.
IOPORT_CFG_EVENT_FALLING_EDGE	Sets pin event trigger to falling edge.
IOPORT_CFG_EVENT_BOTH_EDGES	Sets pin event trigger to both edges.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.

8.21.6.9 ioport_size_t

```
typedef uint16_t ioport_size_t
```

Brief description

IO port size on this device.

Detailed description

IO port type used with ports

8.21.7 API Structures

8.21.7.1 ioport_pin_cfg_t

ioport_pin_cfg_t

Detailed description

Pin identifier and pin PFS pin configuration value

Variables

- uint32_t pin_cfg

  Pin PFS configuration - Use ioport_cfg_options_t parameters to configure.

- ioport_port_pin_t pin

  Pin identifier.

8.21.7.2 ioport_cfg_t

ioport_cfg_t

Detailed description

Multiple pin configuration data for loading into PFS registers by R_IOPORT_Init

Variables

- uint16_t number_of_pins

  Number of pins for which there is configuration data.

- ioport_pin_cfg_t const * p_pin_cfg_data

  Pin configuration data.

8.21.7.3 ioport_api_t

ioport_api_t

Detailed description

IOPort driver structure. IOPort functions implemented at the HAL layer will follow this API.

8.21.7.4 init

```
ssp_err_t(* ioport_api_t::init) (const ioport_cfg_t *p_cfg)
```

Detailed description

Initialize internal driver data and initial pin configurations. Called during startup. Do not call this API during runtime. Use pinsCfg for runtime reconfiguration of multiple pins. Implemented as

- R_IOPORT_Init

Table 1173:Parameters

Name	Direction	Description
p_cfg	in	Pointer to pin configuration data array.

Parameter p_cfg

Definition: `ioport_cfg_t ioport_cfg_t *p_cfg`

Multiple pin configuration data for loading into PFS registers by R_IOPORT_Init

- `ioport_cfg_t`::number_of_pins

  Number of pins for which there is configuration data.

- `ioport_cfg_t`::`ioport_pin_cfg_t`

  Pin configuration data.

8.21.7.5 pinsCfg

```
ssp_err_t(* ioport_api_t::pinsCfg) (const ioport_cfg_t *p_cfg)
```

Detailed description

Configure multiple pins. Implemented as

- R_IOPORT_PinsCfg

Table 1174:Parameters

Name	Direction	Description
p_cfg	in	Pointer to pin configuration data array.

Parameter p_cfg

Definition: `ioport_cfg_t ioport_cfg_t *p_cfg`

Multiple pin configuration data for loading into PFS registers by R_IOPORT_Init

- `ioport_cfg_t`::`number_of_pins`

  Number of pins for which there is configuration data.

- `ioport_cfg_t`::`ioport_pin_cfg_t`

  Pin configuration data.

8.21.7.6 pinCfg

```
ssp_err_t(* ioport_api_t::pinCfg) (ioport_port_pin_t pin, uint32_t cfg)
```

Detailed description

Configure settings for an individual pin. Implemented as

- R_IOPORT_PinCfg

Table 1175:Parameters

Name	Direction	Description
pin	in	Pin to be read.
cfg	in	Configuration options for the pin.

Parameter pin
Parameter cfg

`uint32_t`

8.21.7.7 pinDirectionSet

```
ssp_err_t(* ioport_api_t::pinDirectionSet) (ioport_port_pin_t pin,
ioport_direction_t direction)
```

Detailed description

Set the pin direction of a pin. Implemented as

- R_IOPORT_PinDirectionSet

Table 1176:Parameters

Name	Direction	Description
pin	in	Pin being configured.
direction	in	Direction to set pin to which is a member of ioport_direction_t.

Parameter pin
Parameter direction

8.21.7.8 pinEventInputRead

```
ssp_err_t(* ioport_api_t::pinEventInputRead) (ioport_port_pin_t pin,
ioport_level_t *p_pin_event)
```

Detailed description

Read the event input data of the specified pin and return the level. Implemented as

- R_IOPORT_PinEventInputRead

Table 1177:Parameters

Name	Direction	Description
pin	in	Pin to be read.
p_pin_event	in	Pointer to return the event data.

Parameter pin
Parameter p_pin_event

Definition: `ioport_level_t*p_pin_event`

Levels that can be set and read for individual pins

8.21.7.9 pinEventOutputWrite

```
ssp_err_t(* ioport_api_t::pinEventOutputWrite) (ioport_port_pin_t pin,
ioport_level_t pin_value)
```

Detailed description

Write pin event data. Implemented as

- R_IOPORT_PinEventOutputWrite

Table 1178:Parameters

Name	Direction	Description
pin	in	Pin event data is to be written to.
pin_value	in	Level to be written to pin output event.

Parameter pin
Parameter pin_value

Definition: `ioport_level_tpin_value`

Levels that can be set and read for individual pins

8.21.7.10 pinEthernetModeCfg

```
ssp_err_t(* ioport_api_t::pinEthernetModeCfg) (ioport_ethernet_channel_t channel,
ioport_ethernet_mode_t mode)
```

Detailed description

Configure the PHY mode of the Ethernet channels. Implemented as

- R_IOPORT_EthernetModeCfg

Table 1179:Parameters

Name	Direction	Description
channel	in	Channel configuration will be set for.
mode	in	PHY mode to set the channel to.

Parameter channel
Parameter mode

8.21.7.11 pinRead

```
ssp_err_t(* ioport_api_t::pinRead) (ioport_port_pin_t pin, ioport_level_t
*p_pin_value)
```

Detailed description

Read level of a pin. Implemented as

- R_IOPORT_PinRead

Table 1180:Parameters

Name	Direction	Description
pin	in	Pin to be read.
p_pin_value	in	Pointer to return the pin level.

Parameter pin
Parameter p_pin_value

Definition: `ioport_level_t*p_pin_value`

Levels that can be set and read for individual pins

8.21.7.12 pinWrite

```
ssp_err_t(* ioport_api_t::pinWrite) (ioport_port_pin_t pin, ioport_level_t level)
```

Detailed description

Write specified level to a pin. Implemented as

- R_IOPORT_PinWrite

Table 1181:Parameters

Name	Direction	Description
pin	in	Pin to be written to.
level	in	State to be written to the pin.

Parameter pin
Parameter level

8.21.7.13 portDirectionSet

```
ssp_err_t(* ioport_api_t::portDirectionSet) (ioport_port_t port, ioport_size_t
direction_values, ioport_size_t mask)
```

Detailed description

Set the direction of one or more pins on a port. Implemented as

- R_IOPORT_PortDirectionSet

Table 1182:Parameters

Name	Direction	Description
port	in	Port being configured.
direction_values	in	Value controlling direction of pins on port (1 - output, 0 - input).
mask	in	Mask controlling which pins on the port are to be configured.

Parameter port
Parameter direction_values

Definition: `ioport_size_tdirection_values`

IO port type used with ports

Parameter mask

Definition: `ioport_size_tmask`

IO port type used with ports

8.21.7.14 portEventInputRead

```
ssp_err_t(* ioport_api_t::portEventInputRead) (ioport_port_t port, ioport_size_t
*p_event_data)
```

Detailed description

Read captured event data for a port. Implemented as

- R_IOPORT_PortEventInputRead

Table 1183:Parameters

Name	Direction	Description
port	in	Port to be read.
p_event_data	in	Pointer to return the event data.

Parameter port
Parameter p_event_data

Definition: `ioport_size_t*p_event_data`

IO port type used with ports

8.21.7.15 portEventOutputWrite

```
ssp_err_t(* ioport_api_t::portEventOutputWrite) (ioport_port_t port,
ioport_size_t event_data, ioport_size_t mask_value)
```

Detailed description

Write event output data for a port. Implemented as

- R_IOPORT_PortEventOutputWrite

Table 1184:Parameters

Name	Direction	Description
port	in	Port event data will be written to.
event_data	in	Data to be written as event data to specified port.
mask_value	in	Each bit set to 1 in the mask corresponds to that bit's value in event data. being written to port.

Parameter port
Parameter event_data

Definition: ioport_size_tevent_data

IO port type used with ports

Parameter mask_value

Definition: ioport_size_tmask_value

IO port type used with ports

8.21.7.16 portRead

```
ssp_err_t(* ioport_api_t::portRead) (ioport_port_t port, ioport_size_t
*p_port_value)
```

Detailed description

Read states of pins on the specified port. Implemented as

- R_IOPORT_PortRead

Table 1185:Parameters

Name	Direction	Description
port	in	Port to be read.

Table 1185:Parameters (Continued)

Name	Direction	Description
p_port_value	in	Pointer to return the port value.

Parameter port
Parameter p_port_value

Definition: `ioport_size_t*p_port_value`

IO port type used with ports

8.21.7.17 portWrite

```
ssp_err_t(* ioport_api_t::portWrite) (ioport_port_t port, ioport_size_t value,
ioport_size_t mask)
```

Detailed description

Write to multiple pins on a port. Implemented as

- R_IOPORT_PortWrite

Table 1186:Parameters

Name	Direction	Description
port	in	Port to be written to.
value	in	Value to be written to the port.
mask	in	Mask controlling which pins on the port are written to.

Parameter port
Parameter value

Definition: `ioport_size_tvalue`

IO port type used with ports

Parameter mask

Definition: `ioport_size_tmask`

IO port type used with ports

8.21.7.18 versionGet

```
ssp_err_t(* ioport_api_t::versionGet) (ssp_version_t *p_data)
```

Detailed description

Return the version of the IOPort driver. Implemented as

- R_IOPORT_VersionGet

Table 1187:Parameters

Name	Direction	Description
p_data	out	Memory address to return version information to.

Parameter p_data

Definition: `ssp_version_t *p_data`

- `ssp_version_t::version_id`
  Version id
- `ssp_version_t::code_version_minor`
  Code minor version.
- `ssp_version_t::code_version_major`
  Code major version.
- `ssp_version_t::api_version_minor`
  API minor version.
- `ssp_version_t::api_version_major`
  API major version.
- `ssp_version_tstruct{}`
  Code version parameters

8.21.7.19 ioport_instance_t

ioport_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- ioport_cfg_t const * p_cfg
  Pointer to the configuration structure for this instance.
- ioport_api_t const * p_api
  Pointer to the API structure for this instance.

8.22 Input Capture Interface

Interface for sampling input signals for pulse width.

8.22.1 Summary

The input capture interface provides for sampling of input signals to determine the width of a pulse (from one edge to the opposite edge). An interrupt can be triggered after each measurement is captured.

Implemented by: GPT Input Capture

See also: Timer Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

8.22.2 Interface API

input_capture_api_t

Function name	Description
.open	Initial configuration.
.disable	Disables input capture measurement.
.enable	Enables input capture measurement.
.infoGet	Gets the status (running or not) of the measurement counter.
.lastCaptureGet	Gets the last captured timer/counter value
.close	Close the input capture operation. Allows driver to be reconfigured, and may reduce power consumption.
.versionGet	Gets the version of this API and stores it in structure pointed to by p_version.

8.22.3 Data structures

- input_capture_callback_args_t
- input_capture_capture_t

- input_capture_info_t
- input_capture_cfg_t
- input_capture_instance_t

8.22.4 Enumerations

- input_capture_mode_t
- input_capture_signal_edge_t
- input_capture_signal_level_t
- input_capture_repetition_t
- input_capture_event_t
- input_capture_status_t
- input_capture_variant_t

8.22.5 Typedefs

- input_capture_ctrl_t

8.22.6 Defines

- #define INPUT_CAPTURE_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define INPUT_CAPTURE_API_VERSION_MINOR

  Initial value: `(4U)`
- #define info_capture_info_t

  Initial value:`input_capture_info_t`

  Mapping of deprecated info_capture_info_t.

8.22.7 API Data

8.22.7.1 input_capture_mode_t

`input_capture_mode_t`

Detailed description

Input capture operational modes

Enumerated values

Name	Description
INPUT_CAPTURE_MODE_PULSE_WIDTH	Measure a signal pulse width.
INPUT_CAPTURE_MODE_PERIOD	Measure a signal Cycle period.

8.22.7.2 input_capture_signal_edge_t

`input_capture_signal_edge_t`

Detailed description

Input capture signal edge trigger

Enumerated values

Name	Description
INPUT_CAPTURE_SIGNAL_EDGE_RISING	The capture begins at the rising edge.
INPUT_CAPTURE_SIGNAL_EDGE_FALLING	The capture begins at the falling edge.

8.22.7.3 input_capture_signal_level_t

`input_capture_signal_level_t`

Detailed description

Input capture signal level, primarily used for the enable signal

Enumerated values

Name	Description
INPUT_CAPTURE_SIGNAL_LEVEL_NONE	Use this if signal_level is not applicable to a particular measurement.
INPUT_CAPTURE_SIGNAL_LEVEL_LOW	The capture is enabled at the low level.
INPUT_CAPTURE_SIGNAL_LEVEL_HIGH	The capture is enabled at the high level.

8.22.7.4 input_capture_repetition_t

`input_capture_repetition_t`

Detailed description

Specifies either a one-time or continuous measurements

Enumerated values

Name	Description
INPUT_CAPTURE_REPETITION_PERIODIC	Capture continuous measurements, until explicitly stopped or disabled.
INPUT_CAPTURE_REPETITION_ONE_SHOT	Capture a single measurement, then interrupts are disabled.

8.22.7.5 input_capture_event_t

`input_capture_event_t`

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
INPUT_CAPTURE_EVENT_MEASUREMENT	A capture measurement has been captured.
INPUT_CAPTURE_EVENT_OVERFLOW	A capture measurement overflowed the counter.

8.22.7.6 input_capture_status_t

`input_capture_status_t`

Detailed description

Input capture status.

Enumerated values

Name	Description
INPUT_CAPTURE_STATUS_IDLE	The input capture timer is idle.
INPUT_CAPTURE_STATUS_CAPTURING	A capture measurement is in progress.

8.22.7.7 input_capture_variant_t

`input_capture_variant_t`

Detailed description

Input capture timer variant types.

Enumerated values

Name	Description
INPUT_CAPTURE_VARIANT_32_BIT	32-bit timer
INPUT_CAPTURE_VARIANT_16_BIT	16-bit timer

8.22.7.8 input_capture_ctrl_t

```
typedef void input_capture_ctrl_t
```

Detailed description

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented as

- gpt_input_capture_instance_ctrl_t

8.22.8 API Structures

8.22.8.1 input_capture_callback_args_t

input_capture_callback_args_t

Detailed description

Callback function parameter data

Variables

- uint8_t channel

  The channel being used.
- input_capture_event_t event

  The event that caused the interrupt and callback.
- uint32_t counter

  The value of the timer captured at the time of interrupt.
- uint32_t overflows

  The number of counter overflows that occurred during this measurement.
- void const * p_context

  Placeholder for user data, set in input_capture_cfg_t::p_context.

8.22.8.2 input_capture_capture_t

input_capture_capture_t

Detailed description

Capture data

Variables

- uint32_t counter

  The value of the timer captured at the time of interrupt.

- uint32_t overflows

  The number of counter overflows that occurred during this measurement.

8.22.8.3 input_capture_info_t

input_capture_info_t

Detailed description

Driver information

Variables

- input_capture_status_t status

  Whether or not a capture is in progress.

- input_capture_variant_t variant

  Whether timer is 16 or 32 bits.

8.22.8.4 input_capture_cfg_t

input_capture_cfg_t

Detailed description

User configuration structure, passed to open function

Variables

- uint8_t channel

  The channel in use.

- uint8_t capture_irq_ipl

  Capture interrupt priority.

- uint8_t overflow_irq_ipl

  Overflow interrupt priority.

- input_capture_mode_t mode

  The mode of measurement to be performed.

- input_capture_signal_edge_t edge

  The triggering edge to start a measurement (rise or fall).

- input_capture_repetition_t repetition

  One-shot or periodic measurement.
- bool autostart

  Specifies whether interrupts are enabled or not after open.
- void const * p_extend

  REQUIRED. Pointer to peripheral-specific extension parameters. See gpt_input_capture_extend_t for GPT.
- void(* p_callback)(input_capture_callback_args_t *p_args)

  Pointer to user's callback function, or NULL if no interrupt desired.
- void const * p_context

  Pointer to user's context data, to be passed to the callback.

8.22.8.5 input_capture_api_t

input_capture_api_t

Detailed description

Input capture API structure. Functions implemented at the HAL layer will implement this API.

8.22.8.6 open

```
ssp_err_t(* input_capture_api_t::open) (input_capture_ctrl_t *const p_ctrl,
input_capture_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_GPT_InputCaptureOpen

NOTE: To reconfigure after calling this function, call close first.

Table 1188:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block: memory allocated by caller, contents filled in by open.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: input_capture_ctrl_t*const p_ctrl

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

Parameter p_cfg

Definition: input_capture_cfg_t const *const p_cfg

User configuration structure, passed to open function

- input_capture_cfg_t::channel

  The channel in use.

- input_capture_cfg_t::capture_irq_ipl

  Capture interrupt priority.

- input_capture_cfg_t::overflow_irq_ipl

  Overflow interrupt priority.

- input_capture_cfg_t::input_capture_mode_t

  The mode of measurement to be performed.

  Enumerated as:

  – INPUT_CAPTURE_MODE_PULSE_WIDTH

  – INPUT_CAPTURE_MODE_PERIOD

- input_capture_cfg_t::input_capture_signal_edge_t

  The triggering edge to start a measurement (rise or fall).

  Enumerated as:

  – INPUT_CAPTURE_SIGNAL_EDGE_RISING

  – INPUT_CAPTURE_SIGNAL_EDGE_FALLING

- input_capture_cfg_t::input_capture_repetition_t

  One-shot or periodic measurement.

  Enumerated as:

  – INPUT_CAPTURE_REPETITION_PERIODIC

  – INPUT_CAPTURE_REPETITION_ONE_SHOT

- input_capture_cfg_t::autostart

  Specifies whether interrupts are enabled or not after open.

- input_capture_cfg_t::p_extend

  REQUIRED. Pointer to peripheral-specific extension parameters. See gpt_input_capture_extend_t for GPT.

- input_capture_cfg_t::p_callback

  Pointer to user's callback function, or NULL if no interrupt desired.

- input_capture_cfg_t::p_context

  Pointer to user's context data, to be passed to the callback.

8.22.8.7 disable

```
ssp_err_t(* input_capture_api_t::disable) (input_capture_ctrl_t const *const
p_ctrl)
```

Detailed description

Disables input capture measurement. Implemented as

- R_GPT_InputCaptureDisable

Table 1189:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized by open call.

Parameter p_ctrl

Definition: input_capture_ctrl_tconst *const p_ctrl

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

8.22.8.8 enable

```
ssp_err_t(* input_capture_api_t::enable) (input_capture_ctrl_t const *const
p_ctrl)
```

Detailed description

Enables input capture measurement. Implemented as

- R_GPT_InputCaptureEnable

Table 1190:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized by open call.

NOTE: Interrupts may already be enabled if specified by input_capture_cfg_t::irq_enable.

Parameter p_ctrl

Definition: input_capture_ctrl_tconst *const p_ctrl

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

8.22.8.9 infoGet

```
ssp_err_t(* input_capture_api_t::infoGet) (input_capture_ctrl_t const *const
p_ctrl, input_capture_info_t *const p_info)
```

Detailed description

Gets the status (running or not) of the measurement counter. Implemented as

- R_GPT_InputCaptureInfoGet

Table 1191:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized by open call.
p_info	out	Pointer to returned status. Result will be one of input_capture_status_t.

Parameter p_ctrl

Definition: input_capture_ctrl_tconst *const p_ctrl

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

Parameter p_info

Definition: input_capture_info_t*const p_info

Driver information

- input_capture_info_t::status

  Whether or not a capture is in progress.

- input_capture_info_t::variant

  Whether timer is 16 or 32 bits.

8.22.8.10 lastCaptureGet

```
ssp_err_t(* input_capture_api_t::lastCaptureGet) (input_capture_ctrl_t const
*const p_ctrl, input_capture_capture_t *const p_counter)
```

Detailed description

Gets the last captured timer/counter value Implemented as

- R_GPT_InputCaptureLastCaptureGet

Table 1192:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized by open call.
p_counter	out	Pointer to location to store last captured counter value.

Parameter p_ctrl

Definition: `input_capture_ctrl_tconst *const p_ctrl`

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

Parameter p_counter

Definition: `input_capture_capture_t*const p_counter`

Capture data

- `input_capture_capture_t::counter`

  The value of the timer captured at the time of interrupt.

- `input_capture_capture_t::overflows`

  The number of counter overflows that occurred during this measurement.

8.22.8.11 close

```
ssp_err_t(* input_capture_api_t::close) (input_capture_ctrl_t *const p_ctrl)
```

Detailed description

Close the input capture operation. Allows driver to be reconfigured, and may reduce power consumption. Implemented as

- R_GPT_InputCaptureClose

Table 1193:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block initialized by open call.

Parameter p_ctrl

Definition: `input_capture_ctrl_t*const p_ctrl`

Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. Implemented asgpt_input_capture_instance_ctrl_t

8.22.8.12 versionGet

```
ssp_err_t(* input_capture_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets the version of this API and stores it in structure pointed to by p_version. Implemented as

- R_GPT_InputCaptureVersionGet

Table 1194:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.22.8.13 input_capture_instance_t

input_capture_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- input_capture_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- input_capture_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- input_capture_api_t const * p_api

  Pointer to the API structure for this instance.

8.23 JPEG Decode Interface

Interface for JPEG decode functions.

8.23.1 Summary

The JPEG DECODE interface provides JPEG decoder functionality. It allows application to convert a JPEG image into bitmap data suitable for display frame buffer.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

JPEG DECODE Interface description: JPEG Decode Driver

8.23.2 Interface API

jpeg_decode_api_t

Function name	Description
.open	Initial configuration
.outputBufferSet	Assign output buffer to JPEG codec for storing output data.
.horizontalStrideSet	Configure the horizontal stride value.
.imageSubsampleSet	Configure the horizontal and vertical subsample settings.
.inputBufferSet	Assign input data buffer to JPEG codec.
.linesDecodedGet	Return the number of lines decoded into the output buffer.
.imageSizeGet	Retrieve image size during decoding operation.
.statusGet	Retrieve current status of the JPEG codec module.
.close	Cancel an outstanding operation.
.versionGet	Get version and store it in provided pointer p_version.
.pixelFormatGet	Get the input pixel format.

8.23.3 Data structures

- jpeg_decode_callback_args_t
- jpeg_decode_cfg_t
- jpeg_decode_instance_t

8.23.4 Enumerations

- jpeg_decode_color_space_t

8.23.5 Typedefs

- jpeg_decode_ctrl_t

8.23.6 Defines

- #define JPEG_DECODE_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes. Configuration for this module
- #define JPEG_DECODE_API_VERSION_MINOR

  Initial value: `(3U)`

8.23.7 API Data

8.23.7.1 jpeg_decode_color_space_t

`jpeg_decode_color_space_t`

Detailed description

Image color space definitions

Enumerated values

Name	Description
JPEG_DECODE_COLOR_SPACE_YCBCR444	Color Space YCbCr 444.
JPEG_DECODE_COLOR_SPACE_YCBCR422	Color Space YCbCr 422.
JPEG_DECODE_COLOR_SPACE_YCBCR420	Color Space YCbCr 420.

Name	Description
JPEG_DECODE_COLOR_SPACE_YCBCR411	Color Space YCbCr 411.

8.23.7.2 jpeg_decode_data_format_t

`jpeg_decode_data_format_t`

Detailed description

Multi-byte Data Format

Enumerated values

Name	Description
JPEG_DECODE_DATA_FORMAT_NORMAL	(1)(2)(3)(4)(5)(6)(7)(8) Normal byte order
JPEG_DECODE_DATA_FORMAT_BYTE_SWAP	(2)(1)(4)(3)(6)(5)(8)(7) Byte Swap
JPEG_DECODE_DATA_FORMAT_WORD_SWAP	(3)(4)(1)(2)(7)(8)(5)(6) Word Swap
JPEG_DECODE_DATA_FORMAT_WORD_BYTE_SWAP	(4)(3)(2)(1)(8)(7)(6)(5) Word-Byte Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_SWAP	(5)(6)(7)(8)(1)(2)(3)(4) Longword Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_BYTE_SWAP	(6)(5)(8)(7)(2)(1)(4)(3) Longword Byte Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_SWAP	(7)(8)(5)(6)(3)(4)(1)(2) Longword Word Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP	(8)(7)(6)(5)(4)(3)(2)(1) Longword Word Byte Swap
JPEG_DECODE_DATA_FORMAT_MAX	

8.23.7.3 jpeg_decode_pixel_format_t

`jpeg_decode_pixel_format_t`

Detailed description

Pixel Data Format

Enumerated values

Name	Description
JPEG_DECODE_PIXEL_FORMAT_ARGB8888	Pixel Data ARGB8888 format.
JPEG_DECODE_PIXEL_FORMAT_RGB565	Pixel Data RGB565 format.

8.23.7.4 jpeg_decode_status_t

`jpeg_decode_status_t`

Detailed description

JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status

Enumerated values

Name	Description
JPEG_DECODE_STATUS_FREE	JPEG codec module is not yet open.
JPEG_DECODE_STATUS_IDLE	JPEG Codec module is open, and is not operational.
JPEG_DECODE_STATUS_RUNNING	JPEG Codec is running.
JPEG_DECODE_STATUS_DONE	JPEG Codec has successfully finished the operation.
JPEG_DECODE_STATUS_INPUT_PAUSE	JPEG Codec paused waiting for more input data.
JPEG_DECODE_STATUS_OUTPUT_PAUSE	JPEG Codec paused after decoded the number of lines specified by user.
JPEG_DECODE_STATUS_IMAGE_SIZE_READY	JPEG decoding operation obtained image size, and paused.
JPEG_DECODE_STATUS_ERROR	JPEG Codec module encountered an error.
JPEG_DECODE_STATUS_HEADER_PROCESSING	JPEG Codec module is reading the JPEG header information.

8.23.7.5 jpeg_decode_subsample_t

`jpeg_decode_subsample_t`

Detailed description

Data type for horizontal and vertical subsample settings. This setting applies only to the decoding operation.

Enumerated values

Name	Description
JPEG_DECODE_OUTPUT_NO_SUBSAMPLE	No subsample. The image is decoded with no reduction in size.
JPEG_DECODE_OUTPUT_SUBSAMPLE_HALF	The output image size is reduced by half.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_QUARTER	The output image size is reduced to one-quarter.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_EIGHTH	The output image size is reduced to one-eighth.

8.23.7.6 jpeg_decode_count_enable_t

`jpeg_decode_count_enable_t`

Detailed description

Data type for decoding count mode enable.

Enumerated values

Name	Description
JPEG_DECODE_COUNT_DISABLE	Count mode disable.
JPEG_DECODE_COUNT_ENABLE	Count mode enable.

8.23.7.7 jpeg_decode_resume_mode_t

`jpeg_decode_resume_mode_t`

Detailed description

Data type for decoding count mode enable.

Enumerated values

Name	Description
JPEG_DECODE_COUNT_MODE_ADDRESS_CONTINUE	The data buffer address will not be initialized when resuming image data lines.
JPEG_DECODE_COUNT_MODE_ADDRESS_REINITIALIZE	The data buffer address will be initialized when resuming image data lines.

8.23.7.8 jpeg_decode_ctrl_t

```
typedef void jpeg_decode_ctrl_t
```

Detailed description

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented as

- jpeg_decode_instance_ctrl_t

8.23.8 API Structures

8.23.8.1 jpeg_decode_callback_args_t

jpeg_decode_callback_args_t

Detailed description

Callback status structure

Variables

- jpeg_decode_status_t status

  JPEG status.
- void const * p_context

  Pointer to user-provided context.

8.23.8.2 jpeg_decode_cfg_t

jpeg_decode_cfg_t

Detailed description

User configuration structure, used in open function.

Variables

- jpeg_decode_color_space_t color_space

  Color space.
- jpeg_decode_data_format_t input_data_format

  Input data stream byte order.
- jpeg_decode_data_format_t output_data_format

  Output data stream byte order.
- jpeg_decode_pixel_format_t pixel_format

  Pixel format.
- uint8_t alpha_value

  Alpha value to be applied to decoded pixel data. Only valid for ARGB888 format.

- uint8_t jdti_ipl

  Data transfer interrupt priority.
- uint8_t jedi_ipl

  Decompression interrupt priority.
- void(* p_callback)(jpeg_decode_callback_args_t *p_args)

  User-supplied callback functions.
- void const * p_context

  Placeholder for user data. Passed to user callback in jpeg_decode_callback_args_t.

8.23.8.3 jpeg_decode_api_t

jpeg_decode_api_t

Detailed description

JPEG functions implemented at the HAL layer will follow this API.

8.23.8.4 open

```
ssp_err_t(* jpeg_decode_api_t::open) (jpeg_decode_ctrl_t *const p_ctrl,
jpeg_decode_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration Implemented as

- R_JPEG_Decode_Open

NOTE: none

Table 1195:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_cfg

Definition: `jpeg_decode_cfg_t const *const p_cfg`

User configuration structure, used in open function.

- `jpeg_decode_cfg_t`::`jpeg_decode_color_space_t`

  Color space.

  Enumerated as:

  – JPEG_DECODE_COLOR_SPACE_YCBCR444

  – JPEG_DECODE_COLOR_SPACE_YCBCR422

  – JPEG_DECODE_COLOR_SPACE_YCBCR420

  – JPEG_DECODE_COLOR_SPACE_YCBCR411

- `jpeg_decode_cfg_t`::`jpeg_decode_data_format_t`

  Input data stream byte order.

  Enumerated as:

  – JPEG_DECODE_DATA_FORMAT_NORMAL

  – JPEG_DECODE_DATA_FORMAT_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_WORD_SWAP

  – JPEG_DECODE_DATA_FORMAT_WORD_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_LONGWORD_SWAP

  – JPEG_DECODE_DATA_FORMAT_LONGWORD_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_SWAP

  – JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_MAX

- `jpeg_decode_cfg_t`::`jpeg_decode_data_format_t`

  Output data stream byte order.

  Enumerated as:

  – JPEG_DECODE_DATA_FORMAT_NORMAL

  – JPEG_DECODE_DATA_FORMAT_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_WORD_SWAP

  – JPEG_DECODE_DATA_FORMAT_WORD_BYTE_SWAP

  – JPEG_DECODE_DATA_FORMAT_LONGWORD_SWAP

  - JPEG_DECODE_DATA_FORMAT_LONGWORD_BYTE_SWAP
  - JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_SWAP
  - JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP
  - JPEG_DECODE_DATA_FORMAT_MAX
- jpeg_decode_cfg_t::jpeg_decode_pixel_format_t

  Pixel format.

  Enumerated as:

  - JPEG_DECODE_PIXEL_FORMAT_ARGB8888
  - JPEG_DECODE_PIXEL_FORMAT_RGB565
- jpeg_decode_cfg_t::alpha_value

  Alpha value to be applied to decoded pixel data. Only valid for ARGB888 format.
- jpeg_decode_cfg_t::jdti_ipl

  Data transfer interrupt priority.
- jpeg_decode_cfg_t::jedi_ipl

  Decompression interrupt priority.
- jpeg_decode_cfg_t::p_callback

  User-supplied callback functions.
- jpeg_decode_cfg_t::p_context

  Placeholder for user data. Passed to user callback in jpeg_decode_callback_args_t.

8.23.8.5 outputBufferSet

```
ssp_err_t(* jpeg_decode_api_t::outputBufferSet) (jpeg_decode_ctrl_t *const
p_ctrl, void *p_buffer, uint32_t buffer_size)
```

Detailed description

Assign output buffer to JPEG codec for storing output data. Implemented as

- R_JPEG_Decode_OutputBufferSet

NOTE: The JPEG codec module must have been opened properly.

NOTE: The buffer starting address must be 8-byte aligned. For the decoding process, the HLD driver automatically computes the number of lines of the image to decoded so the output data fits into the given space. If the supplied output buffer is not able to hold the entire frame, the application should call the Output Full Callback function so it can be notified when additional buffer space is needed.

Table 1196:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_buffer	in	Pointer to the output buffer space
buffer_size	in	Size of the output buffer

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_buffer

`const`

Parameter buffer_size

`uint32_t`

8.23.8.6 horizontalStrideSet

```
ssp_err_t(* jpeg_decode_api_t::horizontalStrideSet) (jpeg_decode_ctrl_t *const
p_ctrl, uint32_t horizontal_stride)
```

Detailed description

Configure the horizontal stride value. Implemented as

- R_JPEG_Decode_HorizontalStrideSet

NOTE: The JPEG codec module must have been opened properly.

Table 1197:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
horizontal_stride	in	Horizontal stride value to be used for the decoded image data.

Table 1197:Parameters (Continued)

Name	Direction	Description
buffer_size	in	Size of the output buffer

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter horizontal_stride

`uint32_t`

Parameter buffer_size

8.23.8.7 imageSubsampleSet

```
ssp_err_t(* jpeg_decode_api_t::imageSubsampleSet) (jpeg_decode_ctrl_t *const
p_ctrl, jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t
vertical_subsample)
```

Detailed description

Configure the horizontal and vertical subsample settings. Implemented as

- R_JPEG_Decode_ImageSubsampleSet

NOTE: The JPEG codec module must have been opened properly.

Table 1198:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
horizontal_subsample	in	Horizontal subsample value
vertical_subsample	in	Vertical subsample value

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter horizontal_subsample

Definition: `jpeg_decode_subsample_thorizontal_subsample`

Data type for horizontal and vertical subsample settings. This setting applies only to the decoding operation.

Parameter vertical_subsample

Definition: `jpeg_decode_subsample_tvertical_subsample`

Data type for horizontal and vertical subsample settings. This setting applies only to the decoding operation.

8.23.8.8 inputBufferSet

```
ssp_err_t(* jpeg_decode_api_t::inputBufferSet) (jpeg_decode_ctrl_t *const p_ctrl,
void *p_buffer, uint32_t buffer_size)
```

Detailed description

Assign input data buffer to JPEG codec. Implemented as

- R_JPEG_Decode_InputBufferSet

NOTE: the JPEG codec module must have been opened properly.

NOTE: The buffer starting address must be 8-byte aligned.

Table 1199:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_buffer	in	Pointer to the input buffer space
buffer_size	in	Size of the input buffer

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_buffer

`const`

Parameter buffer_size

`uint32_t`

8.23.8.9 linesDecodedGet

```
ssp_err_t(* jpeg_decode_api_t::linesDecodedGet) (jpeg_decode_ctrl_t *const
p_ctrl, uint32_t *const p_lines)
```

Detailed description

Return the number of lines decoded into the output buffer. Implemented as

- R_JPEG_Decode_LinesDecodedGet

NOTE: the JPEG codec module must have been opened properly.

Table 1200:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_lines	out	Number of lines decoded

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_lines

`uint32_t`

8.23.8.10 imageSizeGet

```
ssp_err_t(* jpeg_decode_api_t::imageSizeGet) (jpeg_decode_ctrl_t *const p_ctrl,
uint16_t *p_horizontal_size, uint16_t *p_vertical_size)
```

Detailed description

Retrieve image size during decoding operation. Implemented as

- R_JPEG_Decode_ImageSizeGet

NOTE: the JPEG codec module must have been opened properly.

NOTE: If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Table 1201:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_horizontal_size	out	Image horizontal size, in number of pixels.
p_vertical_size	out	Image vertical size, in number of pixels.

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_horizontal_size

`uint16_t`

Parameter p_vertical_size

`uint16_t`

8.23.8.11 statusGet

```
ssp_err_t(* jpeg_decode_api_t::statusGet) (jpeg_decode_ctrl_t *const p_ctrl,
jpeg_decode_status_t *const p_status)
```

Detailed description

Retrieve current status of the JPEG codec module. Implemented as

- R_JPEG_Decode_StatusGet

NOTE: the JPEG codec module must have been opened properly.

Table 1202:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_status	out	JPEG module status

Parameter p_ctrl

Definition: jpeg_decode_ctrl_t*const p_ctrl

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_status

Definition: jpeg_decode_status_t*const p_status

JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status

8.23.8.12 close

```
ssp_err_t(* jpeg_decode_api_t::close) (jpeg_decode_ctrl_t *const p_ctrl)
```

Detailed description

Cancel an outstanding operation. Implemented as

- R_JPEG_Decode_Close

NOTE: the JPEG codec module must have been opened properly.

NOTE: If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Table 1203:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in jpeg_decode_api_t::Open call.

Parameter p_ctrl

Definition: jpeg_decode_ctrl_t*const p_ctrl

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

8.23.8.13 versionGet

```
ssp_err_t(* jpeg_decode_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_JPEG_Decode_VersionGet

Table 1204:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.23.8.14 pixelFormatGet

```
ssp_err_t(* jpeg_decode_api_t::pixelFormatGet) (jpeg_decode_ctrl_t *const p_ctrl,
jpeg_decode_color_space_t *const p_color_space)
```

Detailed description

Get the input pixel format. Implemented as

- R_JPEG_Decode_PixelFormatGet

NOTE: the JPEG codec module must have been opened properly.

Table 1205:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_color_space	out	JPEG input format.

Parameter p_ctrl

Definition: `jpeg_decode_ctrl_t*const p_ctrl`

JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. Implemented asjpeg_decode_instance_ctrl_t

Parameter p_color_space

Definition: `jpeg_decode_color_space_t*const p_color_space`

Image color space definitions

8.23.8.15 jpeg_decode_instance_t

jpeg_decode_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- jpeg_decode_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- jpeg_decode_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- jpeg_decode_api_t const * p_api

  Pointer to the API structure for this instance.

8.24 JPEG Encode Interface

Interface for JPEG encode functions.

8.24.1 Summary

The JPEG ENCODE interface provides JPEG encoder functionality. It allows application to convert a JPEG image into bitmap data suitable for display frame buffer.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

JPEG ENCODE Interface description: JPEG Decode Driver

8.24.2 Interface API

jpeg_encode_api_t

Function name	Description
.open	Initial configuration
.imageParameterSet	Set image parameters to JPEG Codec
.outputBufferSet	Assign output buffer to JPEG codec for storing output data.
.inputBufferSet	Assign input data buffer to JPEG codec.
.statusGet	Retrieve current status of the JPEG codec module.

Function name	Description
.close	Cancel an outstanding operation.
.versionGet	Get version and store it in provided pointer p_version.

8.24.3 Data structures

- jpeg_encode_raw_image_parameters
- jpeg_encode_callback_args_t
- jpeg_encode_cfg_t
- jpeg_encode_instance_t

8.24.4 Enumerations

- jpeg_encode_data_format_t
- jpeg_encode_status_t
- jpeg_encode_count_t
- jpeg_encode_resume_mode_t

8.24.5 Typedefs

- jpeg_encode_ctrl_t

8.24.6 Defines

- #define JPEG_ENCODE_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define JPEG_ENCODE_API_VERSION_MINOR

  Initial value: `(0U)`

8.24.7 API Data

8.24.7.1 jpeg_encode_data_format_t

`jpeg_encode_data_format_t`

Detailed description

Multi-byte Data Format

Enumerated values

Name	Description
JPEG_ENCODE_DATA_FORMAT_NORMAL	(1)(2)(3)(4)(5)(6)(7)(8) Normal byte order
JPEG_ENCODE_DATA_FORMAT_BYTE_SWAP	(2)(1)(4)(3)(6)(5)(8)(7) Byte Swap
JPEG_ENCODE_DATA_FORMAT_WORD_SWAP	(3)(4)(1)(2)(7)(8)(5)(6) Word Swap
JPEG_ENCODE_DATA_FORMAT_WORD_BYTE_SWAP	(4)(3)(2)(1)(8)(7)(6)(5) Word-Byte Swap
JPEG_ENCODE_DATA_FORMAT_LONGWORD_SWAP	(5)(6)(7)(8)(1)(2)(3)(4) Longword Swap
JPEG_ENCODE_DATA_FORMAT_LONGWORD_BYTE_SWAP	(6)(5)(8)(7)(2)(1)(4)(3) Longword Byte Swap
JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_SWAP	(7)(8)(5)(6)(3)(4)(1)(2) Longword Word Swap
JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP	(8)(7)(6)(5)(4)(3)(2)(1) Longword Word Byte Swap
JPEG_ENCODE_DATA_FORMAT_MAX	

8.24.7.2 jpeg_encode_status_t

```
jpeg_encode_status_t
```

Detailed description

JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status

Enumerated values

Name	Description
JPEG_ENCODE_STATUS_FREE	JPEG codec module is not yet open.
JPEG_ENCODE_STATUS_IDLE	JPEG Codec module is open, and is not operational.
JPEG_ENCODE_STATUS_RUNNING	JPEG Codec is running.
JPEG_ENCODE_STATUS_DONE	JPEG Codec has successfully finished the operation.

Name	Description
JPEG_ENCODE_STATUS_INPUT_PAUSE	JPEG Codec paused waiting for more input data.

8.24.7.3 jpeg_encode_count_t

```
jpeg_encode_count_t
```

Detailed description

Data type for encoding count mode enable.

Enumerated values

Name	Description
JPEG_ENCODE_COUNT_DISABLE	Count mode disable.
JPEG_ENCODE_COUNT_ENABLE	Count mode enable.

8.24.7.4 jpeg_encode_resume_mode_t

```
jpeg_encode_resume_mode_t
```

Detailed description

Data type for encoding resume mode

Enumerated values

Name	Description
JPEG_ENCODE_COUNT_MODE_ADDRESS_CONTINUE	The data buffer address will not be initialized when resuming image data lines.
JPEG_ENCODE_COUNT_MODE_ADDRESS_REINITIALIZE	The data buffer address will be initialized when resuming image data lines.

8.24.7.5 jpeg_encode_ctrl_t

```
typedef void jpeg_encode_ctrl_t
```

Detailed description

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented as

- jpeg_encode_instance_ctrl_t

8.24.8 API Structures

8.24.8.1 jpeg_encode_raw_image_parameters

jpeg_encode_raw_image_parameters

Detailed description

Image parameter structure

Variables

- uint16_t horizontal_stride

  Horizontal stride.

- uint16_t horizontal_resolution

  Horizontal Resolution in pixel.

- uint16_t vertical_resolution

  Vertical Resolution in pixel.

8.24.8.2 jpeg_encode_callback_args_t

jpeg_encode_callback_args_t

Detailed description

Callback status structure

Variables

- jpeg_encode_status_t status

  JPEG status.

- uint32_t image_size

  JPEG image size.

- void const * p_context

  Pointer to user-provided context.

8.24.8.3 jpeg_encode_cfg_t

jpeg_encode_cfg_t

Detailed description

User configuration structure, used in open function.

Variables

- jpeg_encode_data_format_t input_data_format

  Input data stream byte order.

- jpeg_encode_data_format_t output_data_format

  Output data stream byte order.
- uint16_t dri_marker

  DRI Marker setting 0 :- No DRI and RST marker.
- uint8_t jdti_ipl

  Data transfer interrupt priority.
- uint8_t jedi_ipl

  Decompression interrupt priority.
- uint8_t quality_factor

  JPEG image quality.
- uint16_t vertical_resolution

  vertical resolution of input image
- uint16_t horizontal_resolution

  horizontal resolution of input image
- uint8_t const * p_quant_luma_table

  Luma table.
- uint8_t const * p_quant_croma_table

  croma table
- uint8_t const * p_huffman_luma_ac_table

  Huffman AC table for luma.
- uint8_t const * p_huffman_luma_dc_table

  Huffman DC table for luma.
- uint8_t const * p_huffman_croma_ac_table

  Huffman AC table for croma.
- uint8_t const * p_huffman_croma_dc_table

  Huffman DC table for croma.
- void(* p_callback)(jpeg_encode_callback_args_t *p_args)

  User-supplied callback functions.
- void const * p_context

  Placeholder for user data. Passed to user callback in jpeg_encode_callback_args_t.

8.24.8.4 jpeg_encode_api_t

jpeg_encode_api_t

Detailed description

JPEG functions implemented at the HAL layer will follow this API.

8.24.8.5 open

```
ssp_err_t(* jpeg_encode_api_t::open) (jpeg_encode_ctrl_t *const p_ctrl,
jpeg_encode_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration Implemented as

- R_JPEG_Encode_Open

NOTE: none

Table 1206:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `jpeg_encode_ctrl_t*const p_ctrl`

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

Parameter p_cfg

Definition: `jpeg_encode_cfg_t const *const p_cfg`

User configuration structure, used in open function.

- `jpeg_encode_cfg_t`::`jpeg_encode_data_format_t`

  Input data stream byte order.

  Enumerated as:

  – JPEG_ENCODE_DATA_FORMAT_NORMAL

  – JPEG_ENCODE_DATA_FORMAT_BYTE_SWAP

  – JPEG_ENCODE_DATA_FORMAT_WORD_SWAP

  – JPEG_ENCODE_DATA_FORMAT_WORD_BYTE_SWAP

  – JPEG_ENCODE_DATA_FORMAT_LONGWORD_SWAP

  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_MAX
- jpeg_encode_cfg_t::jpeg_encode_data_format_t

  Output data stream byte order.

  Enumerated as:
  - JPEG_ENCODE_DATA_FORMAT_NORMAL
  - JPEG_ENCODE_DATA_FORMAT_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_WORD_SWAP
  - JPEG_ENCODE_DATA_FORMAT_WORD_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_SWAP
  - JPEG_ENCODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP
  - JPEG_ENCODE_DATA_FORMAT_MAX
- jpeg_encode_cfg_t::dri_marker

  DRI Marker setting 0 :- No DRI and RST marker.
- jpeg_encode_cfg_t::jdti_ipl

  Data transfer interrupt priority.
- jpeg_encode_cfg_t::jedi_ipl

  Decompression interrupt priority.
- jpeg_encode_cfg_t::quality_factor

  JPEG image quality.
- jpeg_encode_cfg_t::vertical_resolution

  vertical resolution of input image
- jpeg_encode_cfg_t::horizontal_resolution

  horizontal resolution of input image
- jpeg_encode_cfg_t::p_quant_luma_table

  Luma table.
- jpeg_encode_cfg_t::p_quant_croma_table

  croma table

- jpeg_encode_cfg_t::p_huffman_luma_ac_table

  Huffman AC table for luma.
- jpeg_encode_cfg_t::p_huffman_luma_dc_table

  Huffman DC table for luma.
- jpeg_encode_cfg_t::p_huffman_croma_ac_table

  Huffman AC table for croma.
- jpeg_encode_cfg_t::p_huffman_croma_dc_table

  Huffman DC table for croma.
- jpeg_encode_cfg_t::p_callback

  User-supplied callback functions.
- jpeg_encode_cfg_t::p_context

  Placeholder for user data. Passed to user callback in jpeg_encode_callback_args_t.

8.24.8.6 imageParameterSet

```
ssp_err_t(* jpeg_encode_api_t::imageParameterSet) (jpeg_encode_ctrl_t *const
p_ctrl, jpeg_encode_raw_image_parameters *p_raw_image_parameters)
```

Detailed description

Set image parameters to JPEG Codec Implemented as

- R_JPEG_Encode_ImageParameterSet

NOTE: The JPEG codec module must have been opened properly.

Table 1207:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to control block. Must be declared by user. Elements set here.
p_raw_image_parameters	in	Pointer to the RAW image parameters

Parameter p_ctrl

Definition: jpeg_encode_ctrl_t*const p_ctrl

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

Parameter p_raw_image_parameters

```
const
```

8.24.8.7 outputBufferSet

```
ssp_err_t(* jpeg_encode_api_t::outputBufferSet) (jpeg_encode_ctrl_t *const
p_ctrl, void *p_buffer)
```

Detailed description

Assign output buffer to JPEG codec for storing output data. Implemented as

- R_JPEG_Encode_OutputBufferSet

NOTE: The JPEG codec module must have been opened properly.

NOTE: The buffer starting address must be 8-byte aligned.

Table 1208:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_buffer	in	Pointer to the output buffer space

Parameter p_ctrl

Definition: `jpeg_encode_ctrl_t*const p_ctrl`

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

Parameter p_buffer

```
const
```

8.24.8.8 inputBufferSet

```
ssp_err_t(* jpeg_encode_api_t::inputBufferSet) (jpeg_encode_ctrl_t *const p_ctrl,
void *p_buffer, uint32_t buffer_size)
```

Detailed description

Assign input data buffer to JPEG codec. Implemented as

- R_JPEG_Encode_InputBufferSet

NOTE: the JPEG codec module must have been opened properly, output buffer and image parameter must be set prior to

call this function.

NOTE: The buffer starting address must be 8-byte aligned.

Table 1209:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_buffer	in	Pointer to the input buffer space
buffer_size	in	Size of the input buffer

Parameter p_ctrl

Definition: `jpeg_encode_ctrl_t*const p_ctrl`

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

Parameter p_buffer

`const`

Parameter buffer_size

`uint32_t`

8.24.8.9 statusGet

```
ssp_err_t(* jpeg_encode_api_t::statusGet) (jpeg_encode_ctrl_t *const p_ctrl,
volatile jpeg_encode_status_t *p_status)
```

Detailed description

Retrieve current status of the JPEG codec module. Implemented as

- R_JPEG_Encode_StatusGet

NOTE: the JPEG codec module must have been opened properly.

Table 1210:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call.
p_status	out	JPEG module status

Parameter p_ctrl

Definition: `jpeg_encode_ctrl_t*const p_ctrl`

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

Parameter p_status

Definition: `jpeg_encode_status_tjpeg_encode_status_t *p_status`

JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status

8.24.8.10 close

```
ssp_err_t(* jpeg_encode_api_t::close) (jpeg_encode_ctrl_t *const p_ctrl)
```

Detailed description

Cancel an outstanding operation. Implemented as

- R_JPEG_Encode_Close

NOTE: the JPEG codec module must have been opened properly.

Table 1211:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in jpeg_encode_api_t::Open call.

Parameter p_ctrl

Definition: `jpeg_encode_ctrl_t*const p_ctrl`

JPEG encode control block. Allocate an instance specific control block to pass into the JPEG encode API calls. Implemented asjpeg_encode_instance_ctrl_t

8.24.8.11 versionGet

```
ssp_err_t(* jpeg_encode_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_JPEG_Encode_VersionGet

Table 1212:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.24.8.12 jpeg_encode_instance_t

jpeg_encode_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- jpeg_encode_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- jpeg_encode_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- jpeg_encode_api_t const * p_api

  Pointer to the API structure for this instance.

8.25 Key Matrix Interface

Interface for key matrix functions.

8.25.1 Summary

The KEYMATRIX interface provides standard KeyMatrix functionality including event generation on a rising or falling edge for one or more channels at the same time. The generated event indicates all channels that are active in that instant via a bit mask. This allows the interface to be used with a matrix configuration or a one-to-one hardware implementation that is triggered on either a rising or a falling edge.

Key Matrix Interface description: Key Matrix Driver

8.25.2 Interface API

keymatrix_api_t

Function name	Description
.open	Initial configuration.
.enable	Enable Key interrupt
.disable	Disable Key interrupt.
.triggerSet	Set trigger for Key interrupt.
.close	Allow driver to be reconfigured. May reduce power consumption.
.versionGet	Get version and store it in provided pointer p_version.

8.25.3 Data structures

- keymatrix_callback_args_t
- keymatrix_cfg_t
- keymatrix_instance_t

8.25.4 Enumerations

- keymatrix_trigger_t

8.25.5 Typedefs

- keymatrix_channels_t
- keymatrix_ctrl_t

8.25.6 Defines

- #define KEYMATRIX_API_VERSION_MAJOR

  Initial value: `(1U)`

  KEY MATRIX API version number (Major)
- #define KEYMATRIX_API_VERSION_MINOR

  Initial value: `(1U)`

  KEY MATRIX API version number (Minor)

8.25.7 API Data

8.25.7.1 keymatrix_trigger_t

```
keymatrix_trigger_t
```

Detailed description

Trigger type: rising edge, falling edge

Enumerated values

Name	Description
KEYMATRIX_TRIG_FALLING	Falling edge trigger.
KEYMATRIX_TRIG_RISING	Rising edge trigger.

8.25.7.2 keymatrix_channels_t

```
typedef uint32_t keymatrix_channels_t
```

Detailed description

Channel definition. This is a bit mask with each bit from 0-7 representing channels 0-7 respectively.

8.25.7.3 keymatrix_ctrl_t

```
typedef void keymatrix_ctrl_t
```

Detailed description

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented as

- kint_instance_ctrl_t

8.25.8 API Structures

8.25.8.1 keymatrix_callback_args_t

keymatrix_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Holder for user data. Set in keymatrix_api_t::open function in keymatrix_cfg_t.

- keymatrix_channels_t channels

  Bit vector representing the physical hardware channel(s) that caused the interrupt. The bit vector is used for compatibility with matrix designs where more than one input will be active at once. Not all HAL drivers support matrix mode. See r_kint.h for details.

8.25.8.2 keymatrix_cfg_t

keymatrix_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- keymatrix_channels_t channels

  Key Input channel(s). Bit mask of channels to open.

- keymatrix_trigger_t trigger

  Key Input trigger setting.

- bool autostart

  Start operation and enable interrupts during open().

- void(* p_callback)(keymatrix_callback_args_t *p_args)

  Callback for key interrupt ISR.

- void const * p_context

  Holder for user data. Passed to callback in keymatrix_user_cb_data_t.

- void const * p_extend

  Extension parameter for hardware specific settings.

- uint8_t irq_ipl

  Interrupt priority level.

8.25.8.3 keymatrix_api_t

keymatrix_api_t

Detailed description

Key Matrix driver structure. Key Matrix functions implemented at the HAL layer will use this API.

8.25.8.4 open

```
ssp_err_t(* keymatrix_api_t::open) (keymatrix_ctrl_t *const p_ctrl,
keymatrix_cfg_t const *const p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_KINT_KEYMATRIX_Open

Table 1213:Parameters

Name	Direction	Description
p_ctrl	out	Pointer to control block. Must be declared by user. Value set in this function.
p_cfg	in	Pointer to configuration structure. All elements of the structure must be set by user.

Parameter p_ctrl

Definition: `keymatrix_ctrl_t*const p_ctrl`

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented askint_instance_ctrl_t

Parameter p_cfg

Definition: `keymatrix_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `keymatrix_cfg_t`::`keymatrix_channels_t`

  Key Input channel(s). Bit mask of channels to open.

- `keymatrix_cfg_t`::`keymatrix_trigger_t`

  Key Input trigger setting.

  Enumerated as:

  – KEYMATRIX_TRIG_FALLING

– KEYMATRIX_TRIG_RISING

- keymatrix_cfg_t::autostart

  Start operation and enable interrupts during open().

- keymatrix_cfg_t::p_callback

  Callback for key interrupt ISR.

- keymatrix_cfg_t::p_context

  Holder for user data. Passed to callback in keymatrix_user_cb_data_t.

- keymatrix_cfg_t::p_extend

  Extension parameter for hardware specific settings.

- keymatrix_cfg_t::irq_ipl

  Interrupt priority level.

8.25.8.5 enable

```
ssp_err_t(* keymatrix_api_t::enable) (keymatrix_ctrl_t *const p_ctrl)
```

Detailed description

Enable Key interrupt Implemented as

- R_KINT_KEYMATRIX_Enable

Table 1214:Parameters

Name	Direction	Description
p_ctrl	in	Control block pointer set in Open call for this Key interrupt.

Parameter p_ctrl

Definition: keymatrix_ctrl_t*const p_ctrl

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented askint_instance_ctrl_t

8.25.8.6 disable

```
ssp_err_t(* keymatrix_api_t::disable) (keymatrix_ctrl_t *const p_ctrl)
```

Detailed description

Disable Key interrupt. Implemented as

- R_KINT_KEYMATRIX_Disable

Table 1215:Parameters

Name	Direction	Description
p_ctrl	in	Control block pointer set in Open call for this Key interrupt.

Parameter p_ctrl

Definition: `keymatrix_ctrl_t*const p_ctrl`

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented askint_instance_ctrl_t

8.25.8.7 triggerSet

```
ssp_err_t(* keymatrix_api_t::triggerSet) (keymatrix_ctrl_t *const p_ctrl,
keymatrix_trigger_t const trigger)
```

Detailed description

Set trigger for Key interrupt. Implemented as

- R_KINT_KEYMATRIX_TriggerSet

Table 1216:Parameters

Name	Direction	Description
p_ctrl	in	Control block pointer set in Open call for this Key interrupt.
trigger	in	Trigger source for key interrupt; defined in enumeration of keymatrix_trigger_t.

Parameter p_ctrl

Definition: `keymatrix_ctrl_t*const p_ctrl`

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented askint_instance_ctrl_t

Parameter trigger

8.25.8.8 close

```
ssp_err_t(* keymatrix_api_t::close) (keymatrix_ctrl_t *const p_ctrl)
```

Detailed description

Allow driver to be reconfigured. May reduce power consumption. Implemented as

- R_KINT_KEYMATRIX_Close

Table 1217:Parameters

Name	Direction	Description
p_ctrl	in	Control block pointer set in Open call for this Key interrupt.

Parameter p_ctrl

Definition: `keymatrix_ctrl_t*const p_ctrl`

Key matrix control block. Allocate an instance specific control block to pass into the key matrix API calls. Implemented askint_instance_ctrl_t

8.25.8.9 versionGet

```
ssp_err_t(* keymatrix_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_KINT_VersionGet

Table 1218:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.25.8.10 keymatrix_instance_t

keymatrix_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- keymatrix_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- keymatrix_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- keymatrix_api_t const * p_api

  Pointer to the API structure for this instance.

8.26 Low Power Modes Interface

Interface for accessing low power modes.

8.26.1 Summary

This section defines the API for the LPM (Low Power Mode) Driver. The LPM Driver provides several functions for controlling power consumption including stopping modules, selecting the operating mode, configuring low power modes, and transitioning to low power modes. The LPM driver supports configuration of MCU operating modes and mcu low power modes using the LPM hardware peripheral. The LPM driver supports operating modes low-voltage, low-speed, middle-speed, high-speed, and suboscillator mode. The LPM driver supports low power modes deep standby, standby, sleep, and snooze. The LPM driver supports reducing power consumption when in deep standby mode via internal power supply control and reseting the states of IO ports. The LPM driver supports disabling and enabling of the MCU's other hardware peripherals.
NOTE: Not all operating modes are available on all MCUs. Not all low power modes are available on all MCUs.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

LPM Interface description: Low Power Modes Driver

8.26.2 Interface API

lpm_api_t

Function name	Description
.init	Open the LPM driver module Initialized the LPM block according to the passed in config structure
.mstpcrSet	Set the value of all the Module Stop Control Registers
.mstpcrGet	Get the values of all the Module Stop Control Registers
.moduleStop	Stop a module

Function name	Description
.moduleStart	Run a module
.operatingPowerModeSet	Set the operating power mode
.snoozeEnable	Configure and enable snooze mode
.snoozeDisable	Disable snooze mode
.lowPowerCfg	Configure a low power mode
.wupenSet	Set the value of the Wake Up Interrupt Enable Register WUPEN
.wupenGet	Get the value of the Wake Up Interrupt Enable Register WUPEN
.deepStandbyCancelRequestEnable	Enable a Deep Standby Cancel Request
.deepStandbyCancelRequestDisable	Disable a Deep Standby Cancel Request
.lowPowerModeEnter	Enter low power mode (sleep/standby/deep standby) using WFI macro. Function will return after waking from low power mode.
.versionGet	Get the driver version based on compile time macros.

8.26.3 Data structures

- lpm_cfg_t
- lpm_instance_t

8.26.4 Enumerations

- lpm_cancel_request_edge_t
- lpm_deep_standby_t
- lpm_low_power_mode_t
- lpm_output_port_enable_t
- lpm_dpsby_t
- lpm_io_port_t
- lpm_power_supply_t
- lpm_power_save_memory_t
- lpm_code_flash_t

- lpm_snooze_request_t
- lpm_snooze_end_t
- lpm_snooze_rxd0_t
- lpm_snooze_dtc_t
- lpm_operating_power_t
- lpm_subosc_t
- lpm_mstp_t

8.26.5 Defines

- #define LPM_API_VERSION_MAJOR

  Initial value: `(2U)`

  Register definitions, common services and error codes.
- #define LPM_API_VERSION_MINOR

  Initial value: `(3U)`

8.26.6 API Data

8.26.6.1 lpm_cancel_request_edge_t

`lpm_cancel_request_edge_t`

Detailed description

Deep Standby Interrupt Edge

Enumerated values

Name	Description
LPM_CANCEL_REQUEST_EDGE_FALLING	A cancel request is generated at a falling edge.
LPM_CANCEL_REQUEST_EDGE_RISING	A cancel request is generated at a rising edge.

8.26.6.2 lpm_deep_standby_t

`lpm_deep_standby_t`

Detailed description

Deep Standby pins and signals

Enumerated values

Name	Description
LPM_DEEP_STANDBY_IRQ0_DS	IRQ0-DS Pin.
LPM_DEEP_STANDBY_IRQ1_DS	IRQ1-DS Pin.
LPM_DEEP_STANDBY_IRQ2_DS	IRQ2-DS Pin.
LPM_DEEP_STANDBY_IRQ3_DS	IRQ3-DS Pin.
LPM_DEEP_STANDBY_IRQ4_DS	IRQ4-DS Pin.
LPM_DEEP_STANDBY_IRQ5_DS	IRQ5-DS Pin.
LPM_DEEP_STANDBY_IRQ6_DS	IRQ6-DS Pin.
LPM_DEEP_STANDBY_IRQ7_DS	IRQ7-DS Pin.
LPM_DEEP_STANDBY_IRQ8_DS	IRQ8-DS Pin.
LPM_DEEP_STANDBY_IRQ9_DS	IRQ9-DS Pin.
LPM_DEEP_STANDBY_IRQ10_DS	IRQ10-DS Pin.
LPM_DEEP_STANDBY_IRQ11_DS	IRQ11-DS Pin.
LPM_DEEP_STANDBY_IRQ12_DS	IRQ12-DS Pin.
LPM_DEEP_STANDBY_IRQ13_DS	IRQ13-DS Pin.
LPM_DEEP_STANDBY_IRQ14_DS	IRQ14-DS Pin.
LPM_DEEP_STANDBY_IRQ15_DS	IRQ15-DS Pin.
LPM_DEEP_STANDBY_LVD1	LVD1.
LPM_DEEP_STANDBY_LVD2	LVD2.
LPM_DEEP_STANDBY_RTC_INTERVAL	RTC Interval Interrupt.
LPM_DEEP_STANDBY_RTC_ALARM	RTC Alarm Interrupt.
LPM_DEEP_STANDBY_NMI	NMI Pin.
LPM_DEEP_STANDBY_USBFS	USBFS Suspend/Resume.
LPM_DEEP_STANDBY_USBHS	USBHS Suspend/Resume.

Name	Description
LPM_DEEP_STANDBY_AGT1	AGT1 Underflow.

8.26.6.3 lpm_low_power_mode_t

`lpm_low_power_mode_t`

Detailed description

Low power modes

Enumerated values

Name	Description
LPM_LOW_POWER_MODE_SLEEP	Sleep mode (ARM Cortex sleep mode)
LPM_LOW_POWER_MODE_STANDBY	Software Standby mode.
LPM_LOW_POWER_MODE_DEEP	Deep Software Standby mode.

8.26.6.4 lpm_output_port_enable_t

`lpm_output_port_enable_t`

Detailed description

Output port enable

Enumerated values

Name	Description
LPM_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPM_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

8.26.6.5 lpm_dpsby_t

`lpm_dpsby_t`

Detailed description

Select between Software Standby and Deep Software Standby

Enumerated values

Name	Description
LPM_DPSBY_SOFTWARE_STANDBY	Sleep mode (SBYCR.SSBY = 0) / Software Standby mode (SBYCR.SSBY = 1)
LPM_DPSBY_DEEP_SOFTWARE_STANDBY	Sleep mode (SBYCR.SSBY = 0) / Deep Software Standby mode (SBYCR.SSBY = 1)

8.26.6.6 lpm_io_port_t

`lpm_io_port_t`

Detailed description

I/O port state after Deep Software Standby mode

Enumerated values

Name	Description
LPM_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state.
LPM_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode

8.26.6.7 lpm_power_supply_t

`lpm_power_supply_t`

Detailed description

Power supply control

Enumerated values

Name	Description
LPM_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode

Name	Description
LPM_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode
LPM_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled

8.26.6.8 lpm_power_save_memory_t

`lpm_power_save_memory_t`

Detailed description

Power save memory control

Enumerated values

Name	Description
LPM_POWER_SAVE_MEMORY_ALL_RAM	All RAM on in Software Standby mode.
LPM_POWER_SAVE_MEMORY_48KB	48KB RAM (2000 0000h to 2000 BFFFh) on in Software Standby mode

8.26.6.9 lpm_code_flash_t

`lpm_code_flash_t`

Detailed description

Code flash operation mode

Enumerated values

Name	Description
LPM_CODE_FLASH_OPERATES	Code flash memory operates.
LPM_CODE_FLASH_STOPS	Code flash memory stops.

8.26.6.10 lpm_snooze_request_t

`lpm_snooze_request_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPM_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPM_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPM_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPM_SNOOZE_REQUEST_KR	Enable KR snooze request.
LPM_SNOOZE_REQUEST_COMPARATOR_OC0	Enable Comparator-OC0 snooze request.
LPM_SNOOZE_REQUEST_COMPARATOR_LP	Enable Comparator-LP snooze request.
LPM_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.

Name	Description
LPM_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPM_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPM_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPM_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.

8.26.6.11 lpm_snooze_end_t

`lpm_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPM_SNOOZE_END_VIA_WUPEN	Transition from Snooze to Normal mode directly.
LPM_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPM_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPM_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPM_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPM_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC hannel 0 compare mismatch.
LPM_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPM_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.
LPM_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address unmatch.

8.26.6.12 lpm_snooze_rxd0_t

`lpm_snooze_rxd0_t`

Detailed description

RXD0 Snooze Request Enable

Enumerated values

Name	Description
LPM_SNOOZE_RXD0_FALLING_EDGE_IGNORE	Ignore RXD0 falling edge in Software Standby mode.
LPM_SNOOZE_RXD0_FALLING_EDGE_DETECT	Detect RXD0 falling edge in Software Standby mode as a request to transit to Snooze mode. Do not set to 1 other than in asynchronous mode.

8.26.6.13 lpm_snooze_dtc_t

`lpm_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPM_SNOOZE_DTC_DISABLE	Disable DTC operation.
LPM_SNOOZE_DTC_ENABLE	Enable DTC operation.

8.26.6.14 lpm_operating_power_t

`lpm_operating_power_t`

Detailed description

Operating power mode

Enumerated values

Name	Description
LPM_OPERATING_POWER_HIGH_SPEED_MODE	High speed mode.
LPM_OPERATING_POWER_MIDDLE_SPEED_MODE	Middle speed mode.
LPM_OPERATING_POWER_LOW_VOLTAGE_MODE	Low voltage mode.
LPM_OPERATING_POWER_LOW_SPEED_MODE	Low speed mode.

8.26.6.15 lpm_subosc_t

`lpm_subosc_t`

Detailed description

Subosc speed mode select

Enumerated values

Name	Description
LPM_SUBOSC_OTHER	Other than Subosc-speed mode.
LPM_SUBOSC_SELECT	Subosc-speed mode.

8.26.6.16 lpm_mstp_t

`lpm_mstp_t`

Detailed description

Module stop bits

Enumerated values

Name	Description
LPM_MSTP_RAM0	RAM0.
LPM_MSTP_RAM1	RAM1.
LPM_MSTP_HSRAM	HSRAM.
LPM_MSTP_ECCRAM	ECCRAM.
LPM_MSTP_STANDBYRAM	STANDBYRAM.
LPM_MSTP_DMAC_DTC	DMAC_DTC.
LPM_MSTP_RCAN1	RCAN1.
LPM_MSTP_RCAN0	RCAN0.
LPM_MSTP_IRDA	IRDA.
LPM_MSTP_QSPI	QSPI.
LPM_MSTP_I2C2	I2C2.
LPM_MSTP_I2C1	I2C1.
LPM_MSTP_I2C0	I2C0.

Name	Description
LPM_MSTP_USBFS	USBFS.
LPM_MSTP_USBHS	USBHS.
LPM_MSTP_EPTPC_PTPEDMAC	EPTPC_PTPEDMAC.
LPM_MSTP_ETHERC1_EDMAC1	ETHERC1_EDMAC1.
LPM_MSTP_ETHERC0_EDMAC0	ETHERC0_EDMAC0.
LPM_MSTP_RSPI1	RSPI1.
LPM_MSTP_RSPI0	RSPI0.
LPM_MSTP_SCI9	SCI9.
LPM_MSTP_SCI8	SCI8.
LPM_MSTP_SCI7	SCI7.
LPM_MSTP_SCI6	SCI6.
LPM_MSTP_SCI5	SCI5.
LPM_MSTP_SCI4	SCI4.
LPM_MSTP_SCI3	SCI3.
LPM_MSTP_SCI2	SCI2.
LPM_MSTP_SCI1	SCI1.
LPM_MSTP_SCI0	SCI0.
LPM_MSTP_CAC	CAC.
LPM_MSTP_CRC	CRC.
LPM_MSTP_PDC	PDC.
LPM_MSTP_CTSU	CTSU.
LPM_MSTP_GLCDC	GLCDC.
LPM_MSTP_JPEG	JPEG.
LPM_MSTP_2GD	2GD

Name	Description
LPM_MSTP_SSI1	SSI1.
LPM_MSTP_SSI0	SSI0.
LPM_MSTP_SRC	SRC.
LPM_MSTP_SDH_MMC1	SDH_MMC1.
LPM_MSTP_SDH_MMC0	SDH_MMC0.
LPM_MSTP_DOC	DOC.
LPM_MSTP_ELC	ELC.
LPM_MSTP_TSIP	TSIP.
LPM_MSTP_AGT1	AGT1.
LPM_MSTP_AGT0	AGT0.
LPM_MSTP_GPT_CH7_0	GPT_CH7_0.
LPM_MSTP_GPT_CH13_8	GPT_CH13_8.
LPM_MSTP_PGI	PGI.
LPM_MSTP_S12AD_UNIT1	S12AD_UNIT1.
LPM_MSTP_S12AD_UNIT0	S12AD_UNIT0.
LPM_MSTP_D_A0	D_A0.
LPM_MSTP_TEMP_SENSE	TEMP_SENSE.
LPM_MSTP_COMP_OC5	COMP_OC5.
LPM_MSTP_COMP_OC4	COMP_OC4.
LPM_MSTP_COMP_OC3	COMP_OC3.
LPM_MSTP_COMP_OC2	COMP_OC2.
LPM_MSTP_COMP_OC1	COMP_OC1.
LPM_MSTP_COMP_OC0	COMP_OC0.
LPM_MSTP_COMP_LP	COMP_LP.

Name	Description
LPM_MSTP_COMP_RD	COMP_RD.
LPM_MSTP_COMP_OPAMP	COMP_OPAMP.

8.26.7 API Structures

8.26.7.1 lpm_cfg_t

lpm_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- lpm_operating_power_t operating_power

  Operating power mode.
- lpm_subosc_t sub_oscillator

  Sub oscillator.
- lpm_code_flash_t code_flash

  Enable the code flash.

8.26.7.2 lpm_api_t

lpm_api_t

Detailed description

lpm driver structure. General lpm functions implemented at the HAL layer will follow this API.

8.26.7.3 init

```
ssp_err_t(* lpm_api_t::init) (lpm_cfg_t const *const p_cfg)
```

Detailed description

Open the LPM driver module Initialized the LPM block according to the passed in config structure

Table 1219:Parameters

Name	Direction	Description
p_cfg	in	Pointer to a configuration structure

Parameter p_cfg

Definition: lpm_cfg_t const *const p_cfg

User configuration structure, used in open function

- lpm_cfg_t::lpm_operating_power_t

  Operating power mode.

  Enumerated as:

  – LPM_OPERATING_POWER_HIGH_SPEED_MODE

  – LPM_OPERATING_POWER_MIDDLE_SPEED_MODE

  – LPM_OPERATING_POWER_LOW_VOLTAGE_MODE

  – LPM_OPERATING_POWER_LOW_SPEED_MODE

- lpm_cfg_t::lpm_subosc_t

  Sub oscillator.

  Enumerated as:

  – LPM_SUBOSC_OTHER

  – LPM_SUBOSC_SELECT

- lpm_cfg_t::lpm_code_flash_t

  Enable the code flash.

  Enumerated as:

  – LPM_CODE_FLASH_OPERATES

  – LPM_CODE_FLASH_STOPS

8.26.7.4 mstpcrSet

```
ssp_err_t(* lpm_api_t::mstpcrSet) (uint32_t mstpcra_value, uint32_t
mstpcrb_value, uint32_t mstpcrc_value, uint32_t mstpcrd_value)
```

Detailed description

Set the value of all the Module Stop Control Registers

Table 1220:Parameters

Name	Direction	Description
mstpcra_value	in	The value for MSTPCRA
mstpcrb_value	in	The value for MSTPCRB
mstpcrc_value	in	The value for MSTPCRC

Table 1220:Parameters (Continued)

Name	Direction	Description
mstpcrd_value	in	The value for MSTPCRD

Parameter mstpcra_value

`uint32_t`

Parameter mstpcrb_value

`uint32_t`

Parameter mstpcrc_value

`uint32_t`

  Pointer to the configuration structure for this instance.

- lpm_api_t const * p_api

  Pointer to the API structure for this instance.

8.27 Low Power Modes V2 Interface

Interface for accessing low power modes.

8.27.1 Summary

This section defines the API for the LPMV2 (Low Power Mode) Driver. The LPMV2 Driver provides functions for controlling power consumption by configuring and transitioning to a low power mode. The LPMV2 driver supports configuration of MCU low power modes using the LPMV2 hardware peripheral. The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCUs.

Related SSP architecture topics:

Variables

- lpmv2_cfg_t const *const p_cfg

  Pointer to the configuration structure for this instance.

- lpmv2_api_t const *const p_api

  Pointer to the API structure for this instance.

8.28 Low Voltage Detection Interface

This section defines the API for the LVD (Low Voltage Detection) Driver.

The LVD driver provides functions for configuring the LVD hardware peripheral.

The process of configuring and enabling a Low Voltage Detection monitor has very specific timing constraints and register write ordering. Because of these constraints, the entire process of configuring and enabling a voltage monitor is most effectively performed by a single function. The API function configure performs configuration and enables the monitor in order to properly enforce the timing and register write ordering constraints.

The LVD driver configures all of the settings of the available configurable LVD monitors.

The settings include:

- voltage_threshold: Determines the voltage detection threshold (i.e. 2.99 Volts).
- sample_clock_divisor: Determines the sample clock rate of the digital filter, based on division of the LOCO clock. Also disables or enables the digital filter if available on the MCU.
- detection_response: Determines which event will occur, reset, interrupt, non-maskable interrupt, or no response, when the voltage threshold is crossed
- voltage_slope: Choose either rising or falling voltage as the trigger for a voltage detection interrupt.
- negation_delay: Determine whether timing of the negation of the voltage event is based upon the reset event or based on the voltage event itself.
- p_callback: Address of user defined function to be called when the voltage event interrupt occurs.

NOTE: Low Voltage Monitor 0 (LVD0) is not configurable at runtime but can be configured by changing the OFS1 register value on the BSP Properties tab of the Synergy Project Configurator in the e^2 studio ISDE.

NOTE: Digital filter is not to be used with standby modes. If software standby or deep standby mode is to be used, the digital filter should be disabled.

For details about the implementation of the driver functions see section LVD.

8.28.1 Interface API

lvd_api_t

Function name	Description
.open	Initializes a low voltage detection driver according to the passed in configuration structure. Enables an LVD peripheral based on configuration structure.

Function name	Description
.statusGet	Get the current state of the monitor, (threshold crossing detected, voltage currently within range) Can be used to poll the state of the LVD monitor at any time. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.
.statusClear	Clears the latched status of the monitor. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.
.close	Disables the LVD peripheral. Closes the driver instance.
.versionGet	Returns the LVD driver version based on compile time macros.

8.28.2 Data structures

- lvd_status_t
- lvd_callback_args_t
- lvd_cfg_t
- lvd_instance_t

8.28.3 Enumerations

8.28.5 Defines

- #define LVD_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.

- #define LVD_API_VERSION_MINOR

  Initial value: `(1U)`

8.28.6 API Data

8.28.6.1 lvd_threshold_t

`lvd_threshold_t`

Detailed description

Voltage detection level The thresholds supported by each MCU is in the MCU User's Manual as well as in the r_lvd module description on the threads tab of the Synergy project.

Enumerated values

Name	Description
LVD_THRESHOLD_MONITOR_1_LEVEL_0	4.29V (Vdet1_0)
LVD_THRESHOLD_MONITOR_1_LEVEL_1	4.14V (Vdet1_1)
LVD_THRESHOLD_MONITOR_1_LEVEL_2	4.02V (Vdet1_2)
LVD_THRESHOLD_MONITOR_1_LEVEL_3	3.84V (Vdet1_3)
LVD_THRESHOLD_MONITOR_1_LEVEL_4	3.10V (Vdet1_4)
LVD_THRESHOLD_MONITOR_1_LEVEL_5	3.00V (Vdet1_5)
LVD_THRESHOLD_MONITOR_1_LEVEL_6	2.90V (Vdet1_6)
LVD_THRESHOLD_MONITOR_1_LEVEL_7	2.79V (Vdet1_7)
LVD_THRESHOLD_MONITOR_1_LEVEL_8	2.68V (Vdet1_8)
LVD_THRESHOLD_MONITOR_1_LEVEL_9	2.58V (Vdet1_9)
LVD_THRESHOLD_MONITOR_1_LEVEL_A	2.48V (Vdet1_A)
LVD_THRESHOLD_MONITOR_1_LEVEL_B	2.20V (Vdet1_B)
LVD_THRESHOLD_MONITOR_1_LEVEL_C	1.96V (Vdet1_C)
LVD_THRESHOLD_MONITOR_1_LEVEL_D	1.86V (Vdet1_D)
LVD_THRESHOLD_MONITOR_1_LEVEL_E	1.75V (Vdet1_E)
LVD_THRESHOLD_MONITOR_1_LEVEL_F	1.65V (Vdet1_F)

Name	Description
LVD_THRESHOLD_MONITOR_1_LEVEL_11	2.99V (Vdet1_11)
LVD_THRESHOLD_MONITOR_1_LEVEL_12	2.92V (Vdet1_12)
LVD_THRESHOLD_MONITOR_1_LEVEL_13	2.85V (Vdet1_13)
LVD_THRESHOLD_MONITOR_2_LEVEL_0	4.29V (Vdet2_0)
LVD_THRESHOLD_MONITOR_2_LEVEL_1	4.14V (Vdet2_1)
LVD_THRESHOLD_MONITOR_2_LEVEL_2	4.02V (Vdet2_2)
LVD_THRESHOLD_MONITOR_2_LEVEL_3	3.84V (Vdet2_3)
LVD_THRESHOLD_MONITOR_2_LEVEL_5	2.99V (Vdet2_5)
LVD_THRESHOLD_MONITOR_2_LEVEL_6	2.92V (Vdet2_6)
LVD_THRESHOLD_MONITOR_2_LEVEL_7	2.85V (Vdet2_7)

8.28.6.2 lvd_response_t

`lvd_response_t`

Detailed description

Response types to a threshold crossing event, interrupt, reset, NMI...

Enumerated values

Name	Description
LVD_RESPONSE_NMI	Non-maskable interrupt.
LVD_RESPONSE_INTERRUPT	Maskable interrupt.
LVD_RESPONSE_RESET	Reset.
LVD_RESPONSE_NONE	No response, status must be requested via statusGet function.

8.28.6.3 lvd_voltage_slope_t

`lvd_voltage_slope_t`

Detailed description

Voltage slope, rising, falling, or both

Enumerated values

Name	Description
LVD_VOLTAGE_SLOPE_RISING	When VCC >= Vdet2 (rise) is detected.
LVD_VOLTAGE_SLOPE_FALLING	When VCC < Vdet2 (drop) is detected.
LVD_VOLTAGE_SLOPE_BOTH	When drop and rise are detected.

8.28.6.4 lvd_threshold_crossing_t

```
lvd_threshold_crossing_t
```

Detailed description

Threshold crossing detection (latched)

Enumerated values

Name	Description
LVD_THRESHOLD_CROSSING_NOT_DETECTED	Threshold crossing has not been detected.
LVD_THRESHOLD_CROSSING_DETECTED	Threshold crossing has been detected.

8.28.6.5 lvd_current_state_t

```
lvd_current_state_t
```

Detailed description

Instantaneous status of VCC (above or below threshold)

Enumerated values

Name	Description
LVD_CURRENT_STATE_BELOW_THRESHOLD	VCC < threshold.
LVD_CURRENT_STATE_ABOVE_THRESHOLD	VCC >= threshold or monitor is disabled.

8.28.6.6 lvd_ctrl_t

```
typedef void lvd_ctrl_t
```

Detailed description

LVD control block. Allocate an instance specific control block to pass into the LVD API calls. Implemented as

- lvd_instance_ctrl_t

8.28.7 API Structures

8.28.7.1 lvd_status_t

lvd_status_t

Detailed description

Voltage monitor status structure, used with statusGet function and p_callback to provide current state of the monitor, (threshold crossing detected, vcc currently within range).

Variables

- lvd_threshold_crossing_t crossing_detected

  Threshold crossing detection (latched)

- lvd_current_state_t current_state

  Instantaneous status of monitored voltage (above or below threshold)

8.28.7.2 lvd_callback_args_t

lvd_callback_args_t

Detailed description

LVD callback parameter definition

Variables

- uint32_t monitor_number

  Monitor number.

- lvd_status_t status

  Status of monitor.

- void const * p_context

  Placeholder for user data.

8.28.7.3 lvd_cfg_t

lvd_cfg_t

Detailed description

LVD configuration structure

Variables

- const uint32_t monitor_number

  Monitor number, 1, 2, ...

- lvd_threshold_t voltage_threshold

  Threshold for out of range voltage detection
- lvd_response_t detection_response

  Response on detecting a threshold crossing
- lvd_voltage_slope_t voltage_slope

  Rising or falling voltage is to be detected
- uint8_t monitor_ipl

  Interrupt priority level.
- void(* p_callback)(lvd_callback_args_t *p_args)

  User function to be called from interrupt
- void const * p_context

  Placeholder for user data. Passed to the user callback in
- void const * p_extend

  Extension parameter for hardware specific settings

8.28.7.4 lvd_api_t

lvd_api_t

Detailed description

LVD driver API structure. LVD driver functions implemented at the HAL layer will adhere to this API.

8.28.7.5 open

```
ssp_err_t(* lvd_api_t::open) (lvd_ctrl_t *const p_ctrl, lvd_cfg_t const *const
p_cfg)
```

Detailed description

Initializes a low voltage detection driver according to the passed in configuration structure. Enables an LVD peripheral based on configuration structure. Implemented as

- R_LVD_Open

Table 1235:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to monitor control structure for the driver instance
p_cfg	in	Pointer to the configuration structure for the driver instance

Parameter p_ctrl

Definition: `lvd_ctrl_t*const p_ctrl`

LVD control block. Allocate an instance specific control block to pass into the LVD API calls. Implemented aslvd_instance_ctrl_t

Parameter p_cfg

Definition: `lvd_cfg_t const *const p_cfg`

LVD configuration structure

- `lvd_cfg_t`::`monitor_number`

  Monitor number, 1, 2, ...

- `lvd_cfg_t`::`lvd_threshold_t`

  Threshold for out of range voltage detection

  Enumerated as:

  – LVD_THRESHOLD_MONITOR_1_LEVEL_0
  – LVD_THRESHOLD_MONITOR_1_LEVEL_1
  – LVD_THRESHOLD_MONITOR_1_LEVEL_2
  – LVD_THRESHOLD_MONITOR_1_LEVEL_3

  Response on detecting a threshold crossing

  Enumerated as:
  - LVD_RESPONSE_NMI
  - LVD_RESPONSE_INTERRUPT
  - LVD_RESPONSE_RESET
  - LVD_RESPONSE_NONE
- lvd_cfg_t::lvd_voltage_slope_t

  Rising or falling voltage is to be detected

  Enumerated as:
  - LVD_VOLTAGE_SLOPE_RISING
  - LVD_VOLTAGE_SLOPE_FALLING
  - LVD_VOLTAGE_SLOPE_BOTH
- lvd_cfg_t::monitor_ipl

  Interrupt priority level.
- lvd_cfg_t::p_callback

  User function to be called from interrupt
- lvd_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in
- lvd_cfg_t::p_extend

  Extension parameter for hardware specific settings

8.28.7.6 statusGet

```
ssp_err_t(* lvd_api_t::statusGet) (lvd_ctrl_t *const p_ctrl, lvd_status_t
*p_lvd_status)
```

Detailed description

Get the current state of the monitor, (threshold crossing detected, voltage currently within range) Can be used to poll the state of the LVD monitor at any time. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE. Implemented as

- R_LVD_StatusGet

Table 1236:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control structure for the driver instance
p_lvd_status	inout	Pointer to an lvd_status_t instance

Parameter p_ctrl

Definition: `lvd_ctrl_t*const p_ctrl`

LVD control block. Allocate an instance specific control block to pass into the LVD API calls. Implemented aslvd_instance_ctrl_t

Parameter p_lvd_status

Definition: `lvd_status_t*p_lvd_status`

Voltage monitor status structure, used with statusGet function and p_callback to provide current state of the monitor, (threshold crossing detected, vcc currently within range).

- `lvd_status_t::crossing_detected`

  Threshold crossing detection (latched)

- `lvd_status_t::current_state`

  Instantaneous status of monitored voltage (above or below threshold)

8.28.7.7 statusClear

```
ssp_err_t(* lvd_api_t::statusClear) (lvd_ctrl_t *const p_ctrl)
```

Detailed description

Clears the latched status of the monitor. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE. Implemented as

- R_LVD_StatusClear

Table 1237:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control structure for the driver instance

Parameter p_ctrl

lvd_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- lvd_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- lvd_cfg_t const * p_cfg

  Pointer to the configuration structure for this interface instance.
- lvd_api_t const * p_api

  Pointer to the API structure for this interface instance.

8.29 OPAMP Interface

Interface for Operational Amplifiers.

8.29.1 Summary

The OPAMP interface provides standard operational amplifier functionality, including starting and stopping the amplifier.

Implemented by: Operational Amplifier (OPAMP)

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

OPAMP Interface description: OPAMP Driver

8.29.2 Interface API

opamp_api_t

Function name	Description
.open	Initialize the operational amplifier.
.start	Start the op-amp(s).
.stop	Stop the op-amp(s).
.trim	Trim the op-amp(s). Not supported on all MCUs. See implementation for procedure details.
.infoGet	Provide information such as the recommended minimum stabilization wait time.
.statusGet	Provide status of each op-amp channel.
.close	Close the specified OPAMP unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.
.versionGet	Retrieve the API version.

8.29.3 Data structures

- opamp_trim_args_t
- opamp_info_t
- opamp_status_t
- opamp_cfg_t
- opamp_instance_t

8.29.4 Enumerations

- opamp_trim_cmd_t
- opamp_trim_input_t

8.29.5 Typedefs

- opamp_ctrl_t

8.29.6 Defines

- #define OPAMP_API_VERSION_MAJOR

  Initial value: `(1U)`

  Includes board and MCU related header files. Version Number of API.

- #define OPAMP_API_VERSION_MINOR

  Initial value: `(0U)`

8.29.7 API Data

8.29.7.1 opamp_trim_cmd_t

`opamp_trim_cmd_t`

Detailed description

Trim command.

Enumerated values

Name	Description
OPAMP_TRIM_CMD_START	Initialize trim state machine.
OPAMP_TRIM_CMD_NEXT_STEP	Move to next step in state machine.
OPAMP_TRIM_CMD_CLEAR_BIT	Clear trim bit.

8.29.7.2 opamp_trim_input_t

`opamp_trim_input_t`

Detailed description

Trim input.

Enumerated values

Name	Description
OPAMP_TRIM_INPUT_PCH	Trim non-inverting (+) input.
OPAMP_TRIM_INPUT_NCH	Trim inverting (-) input.

8.29.7.3 opamp_ctrl_t

```
typedef void opamp_ctrl_t
```

Detailed description

OPAMP control block. Allocate using driver instance control structure from driver instance header file.

8.29.8 API Structures

8.29.8.1 opamp_trim_args_t

opamp_trim_args_t

Detailed description

OPAMP trim arguments.

Variables

- uint8_t channel

  Channel.

- opamp_trim_input_t input

  Which input of the channel above.

8.29.8.2 opamp_info_t

opamp_info_t

Detailed description

OPAMP information.

Variables

- uint32_t min_stabilization_wait_us

  Minimum stabilization wait time in microseconds.

8.29.8.3 opamp_status_t

opamp_status_t

Detailed description

OPAMP status.

Variables

- uint32_t operating_channel_mask

  Bitmask of channels currently operating.

8.29.8.4 opamp_cfg_t

opamp_cfg_t

Detailed description

OPAMP general configuration.

Variables

- void const * p_extend

  Extension parameter for hardware specific settings.

8.29.8.5 opamp_api_t

opamp_api_t

Detailed description

OPAMP functions implemented at the HAL layer will follow this API.

8.29.8.6 open

```
ssp_err_t(* opamp_api_t::open) (opamp_ctrl_t *const p_ctrl, opamp_cfg_t const
*const p_cfg)
```

Detailed description

Initialize the operational amplifier. Implemented as

- R_OPAMP_Open

Table 1240:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_cfg	in	Pointer to configuration

Parameter p_ctrl
Parameter p_cfg

8.29.8.7 start

```
ssp_err_t(* opamp_api_t::start) (opamp_ctrl_t *const p_ctrl, uint32_t const
channel_mask)
```

Detailed description

Start the op-amp(s). Implemented as

- R_OPAMP_Start

Table 1241:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
channel_mask	in	Bitmask of channels to start

Parameter p_ctrl
Parameter channel_mask

`uint32_t`

8.29.8.8 stop

```
ssp_err_t(* opamp_api_t::stop) (opamp_ctrl_t *const p_ctrl, uint32_t const
channel_mask)
```

Detailed description

Stop the op-amp(s). Implemented as

- R_OPAMP_Stop

Table 1242:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
channel_mask	in	Bitmask of channels to stop

Parameter p_ctrl
Parameter channel_mask

`uint32_t`

8.29.8.9 trim

```
ssp_err_t(* opamp_api_t::trim) (opamp_ctrl_t *const p_ctrl, opamp_trim_cmd_t
const cmd, opamp_trim_args_t const *const p_args)
```

Detailed description

Trim the op-amp(s). Not supported on all MCUs. See implementation for procedure details. Implemented as

- R_OPAMP_Trim

Table 1243:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
cmd	in	Trim command
p_args	in	Pointer to arguments for the command

Parameter p_ctrl
Parameter cmd
Parameter p_args

Definition: `opamp_trim_args_tconst *const p_args`

OPAMP trim arguments.

- `opamp_trim_args_t::channel`

  Channel.

- `opamp_trim_args_t::input`

  Which input of the channel above.

8.29.8.10 infoGet

```
ssp_err_t(* opamp_api_t::infoGet) (opamp_ctrl_t *const p_ctrl, opamp_info_t
*const p_info)
```

Detailed description

Provide information such as the recommended minimum stabilization wait time. Implemented as

- R_OPAMP_InfoGet

Table 1244:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_info	out	OPAMP information stored here

Parameter p_ctrl
Parameter p_info

8.29.8.11 statusGet

```
ssp_err_t(* opamp_api_t::statusGet) (opamp_ctrl_t *const p_ctrl, opamp_status_t
*const p_status)
```

Detailed description

Provide status of each op-amp channel. Implemented as

- R_OPAMP_StatusGet

Table 1245:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block
p_status	out	Status stored here

Parameter p_ctrl
Parameter p_status

8.29.8.12 close

```
ssp_err_t(* opamp_api_t::close) (opamp_ctrl_t *const p_ctrl)
```

Detailed description

Close the specified OPAMP unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit. Implemented as

- R_OPAMP_Close

Table 1246:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to instance control block

Parameter p_ctrl

8.29.8.13 versionGet

```
ssp_err_t(* opamp_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Retrieve the API version. Implemented as

- R_OPAMP_VersionGet

NOTE: This function retrieves the API version.

Table 1247:Parameters

Name	Direction	Description
p_version	in	Pointer to version structure

Parameter p_version

8.29.8.14 opamp_instance_t

opamp_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- opamp_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- opamp_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- opamp_api_t const * p_api

  Pointer to the API structure for this instance.

8.30 PDC Interface

Interface for PDC functions.

8.30.1 Summary

The PDC interface provides the functionality for capturing an image from a camera. When a capture is complete a transfer complete interrupt is triggered.

8.30.2 Known Implementations

PDCRelated SSP architecture topics:

- What is an SSP Interface? SSP Interfaces
- What is a SSP Layer? SSP Predefined Layers

- How to use SSP Interfaces and Modules? Using SSP Modules

8.30.3 Interface API

pdc_api_t

Function name	Description
.open	Initial configuration.
.close	Closes the driver and allows reconfiguration. May reduce power consumption.
.captureStart	Start a capture.
.stateGet	Get the state of the VSYNC and HSYNC pins.
.versionGet	Return the version of the driver.

8.30.4 Data structures

- pdc_state_t
- pdc_callback_args_t
- pdc_cfg_t
- pdc_instance_t

8.30.5 Enumerations

- pdc_clock_division_t
- pdc_endian_t
- pdc_hsync_polarity_t
- pdc_vsync_polarity_t
- pdc_event_t
- pdc_vsync_state_t
- pdc_hsync_state_t

8.30.6 Typedefs

- pdc_ctrl_t

8.30.7 Defines

- #define PDC_API_VERSION_MAJOR

  Initial value: `(1U)`

  Register definitions, common services and error codes.
- #define PDC_API_VERSION_MINOR

  Initial value: `(2U)`

8.30.8 API Data

8.30.8.1 pdc_clock_division_t

`pdc_clock_division_t`

Detailed description

Clock divider applied to PDC clock to provide PCKO output frequency

Enumerated values

Name	Description
PDC_CLOCK_DIVISION_2	CLK / 2.
PDC_CLOCK_DIVISION_4	CLK / 4.
PDC_CLOCK_DIVISION_6	CLK / 6.
PDC_CLOCK_DIVISION_8	CLK / 8.
PDC_CLOCK_DIVISION_10	CLK / 10.
PDC_CLOCK_DIVISION_12	CLK / 12.
PDC_CLOCK_DIVISION_14	CLK / 14.
PDC_CLOCK_DIVISION_16	CLK / 16.

8.30.8.2 pdc_endian_t

`pdc_endian_t`

Detailed description

Endian of captured data

Enumerated values

Name	Description
PDC_ENDIAN_LITTLE	Data is in little endian format.
PDC_ENDIAN_BIG	Data is in big endian format.

8.30.8.3 pdc_hsync_polarity_t

`pdc_hsync_polarity_t`

Detailed description

Polarity of input HSYNC signal

Enumerated values

Name	Description
PDC_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
PDC_HSYNC_POLARITY_LOW	HSYNC signal is active low.

8.30.8.4 pdc_vsync_polarity_t

`pdc_vsync_polarity_t`

Detailed description

Polarity of input VSYNC signal

Enumerated values

Name	Description
PDC_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
PDC_VSYNC_POLARITY_LOW	VSYNC signal is active low.

8.30.8.5 pdc_event_t

`pdc_event_t`

Detailed description

PDC events

Enumerated values

Name	Description
PDC_EVENT_TRANSFER_COMPLETE	Complete frame transferred by DMAC/DTC.
PDC_EVENT_RX_DATA_READY	Receive data ready interrupt.
PDC_EVENT_FRAME_END	Frame end interrupt.
PDC_EVENT_ERR_OVERRUN	Overrun interrupt.
PDC_EVENT_ERR_UNDERRUN	Underrun interrupt.
PDC_EVENT_ERR_V_SET	Vertical line setting error interrupt.
PDC_EVENT_ERR_H_SET	Horizontal byte number setting error interrupt.

8.30.8.6 pdc_vsync_state_t

`pdc_vsync_state_t`

Detailed description

VSYNC signal state

Enumerated values

Name	Description
PDC_VSYNC_STATE_LOW	VSYNC signal is low.
PDC_VSYNC_STATE_HIGH	VSYNC signal is high.

8.30.8.7 pdc_hsync_state_t

`pdc_hsync_state_t`

Detailed description

HSYNC signal state

Enumerated values

Name	Description
PDC_HSYNC_STATE_LOW	HSYNC signal is low.
PDC_HSYNC_STATE_HIGH	HSYNC signal is high.

8.30.8.8 pdc_ctrl_t

```
typedef void pdc_ctrl_t
```

Detailed description

PDC control block. Allocate an instance specific control block to pass into the PDC API calls. Implemented as

- pdc_instance_ctrl_t

8.30.9 API Structures

8.30.9.1 pdc_state_t

pdc_state_t

Detailed description

PDC VSYNC/HSYNC state

Variables

- pdc_vsync_state_t vsync

  VSYNC signal state.
- pdc_hsync_state_t hsync

  HSYNC signal state.

8.30.9.2 pdc_callback_args_t

pdc_callback_args_t

Detailed description

Callback function parameter data

Variables

- pdc_event_t event

  Event causing the callback.
- uint8_t * p_buffer

  Pointer to buffer containing the captured data.
- void const * p_context

  Placeholder for user data. Set in pdc_api_t::open function in pdc_cfg_t.

8.30.9.3 pdc_cfg_t

pdc_cfg_t

Detailed description

PDC configuration parameters.

Variables

- uint16_t x_capture_start_pixel

  Horizontal position to start capture.
- uint16_t x_capture_pixels

  Number of horizontal pixels to capture.
- uint16_t y_capture_start_pixel

  Vertical position to start capture.
- uint16_t y_capture_pixels

  Number of vertical lines/pixels to capture.
- pdc_clock_division_t clock_division

  Clock divider.
- pdc_endian_t endian

  Endian of capture data.
- pdc_hsync_polarity_t hsync_polarity

  Polarity of HSYNC input.
- pdc_vsync_polarity_t vsync_polarity

  Polarity of VSYNC input.
- uint8_t * p_buffer

  Pointer to buffer to write image into.
- uint8_t bytes_per_pixel

  Number of bytes per pixel.
- uint8_t frame_end_ipl

  Frame end interrupt priority.
- uint8_t irq_ipl

  PDC interrupt priority.
- transfer_instance_t const *const p_lower_lvl_transfer

  Pointer to the transfer instance the PDC should use.
- void(* p_callback)(pdc_callback_args_t *p_args)

  Callback provided when a PDC transfer ISR occurs.
- void const * p_context

  Placeholder for user data. Passed to the user callback in pdc_callback_args_t.
- void const * p_extend

8.30.9.4 pdc_api_t

pdc_api_t

Detailed description

PDC functions implemented at the HAL layer will follow this API.

8.30.9.5 open

```
ssp_err_t(* pdc_api_t::open) (pdc_ctrl_t *const p_ctrl, pdc_cfg_t const *const
p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_PDC_Open

NOTE: To reconfigure after calling this function, call close first.

Table 1248:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_cfg	in	Pointer to pin configuration structure.

Parameter p_ctrl

Definition: `pdc_ctrl_t*const p_ctrl`

PDC control block. Allocate an instance specific control block to pass into the PDC API calls. Implemented aspdc_instance_ctrl_t

Parameter p_cfg

Definition: `pdc_cfg_t const *const p_cfg`

PDC configuration parameters.

- `pdc_cfg_t::x_capture_start_pixel`

  Horizontal position to start capture.

- `pdc_cfg_t::x_capture_pixels`

  Number of horizontal pixels to capture.

- `pdc_cfg_t::y_capture_start_pixel`

  Vertical position to start capture.

- pdc_cfg_t::y_capture_pixels

  Number of vertical lines/pixels to capture.
- pdc_cfg_t::pdc_clock_division_t

  Clock divider.

  Enumerated as:

  – PDC_CLOCK_DIVISION_2

  – PDC_CLOCK_DIVISION_4

  – PDC_CLOCK_DIVISION_6

  – PDC_CLOCK_DIVISION_8

  – PDC_CLOCK_DIVISION_10

  – PDC_CLOCK_DIVISION_12

  – PDC_CLOCK_DIVISION_14

  – PDC_CLOCK_DIVISION_16
- pdc_cfg_t::pdc_endian_t

  Endian of capture data.

  Enumerated as:

  – PDC_ENDIAN_LITTLE

  – PDC_ENDIAN_BIG
- pdc_cfg_t::pdc_hsync_polarity_t

  Polarity of HSYNC input.

  Enumerated as:

  – PDC_HSYNC_POLARITY_HIGH

  – PDC_HSYNC_POLARITY_LOW
- pdc_cfg_t::pdc_vsync_polarity_t

  Polarity of VSYNC input.

  Enumerated as:

  – PDC_VSYNC_POLARITY_HIGH

  – PDC_VSYNC_POLARITY_LOW
- pdc_cfg_t::p_buffer

  Pointer to buffer to write image into.

- pdc_cfg_t::bytes_per_pixel

  Number of bytes per pixel.
- pdc_cfg_t::frame_end_ipl

  Frame end interrupt priority.
- pdc_cfg_t::irq_ipl

  PDC interrupt priority.
- pdc_cfg_t::transfer_instance_t

  Pointer to the transfer instance the PDC should use.
- pdc_cfg_t::p_callback

  Callback provided when a PDC transfer ISR occurs.
- pdc_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in pdc_callback_args_t.
- pdc_cfg_t::p_extend

8.30.9.6 close

```
ssp_err_t(* pdc_api_t::close) (pdc_ctrl_t *const p_ctrl)
```

Detailed description

Closes the driver and allows reconfiguration. May reduce power consumption. Implemented as

- R_PDC_Close

Table 1249:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.

Parameter p_ctrl

Definition: pdc_ctrl_t*const p_ctrl

PDC control block. Allocate an instance specific control block to pass into the PDC API calls. Implemented aspdc_instance_ctrl_t

8.30.9.7 captureStart

```
ssp_err_t(* pdc_api_t::captureStart) (pdc_ctrl_t *const p_ctrl, uint8_t *const
p_buffer)
```

Detailed description

Start a capture. Implemented as

- R_PDC_CaptureStart

Table 1250:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_buffer	in	Pointer to store captured image data.

Parameter p_ctrl

Definition: `pdc_ctrl_t*const p_ctrl`

PDC control block. Allocate an instance specific control block to pass into the PDC API calls. Implemented aspdc_instance_ctrl_t

Parameter p_buffer

`uint8_t`

8.30.9.8 stateGet

```
ssp_err_t(* pdc_api_t::stateGet) (pdc_ctrl_t *const p_ctrl, pdc_state_t *p_state)
```

Detailed description

Get the state of the VSYNC and HSYNC pins. Implemented as

- R_PDC_StateGet

Table 1251:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_state	in	Pointer to store state data.

Parameter p_ctrl

Definition: `pdc_ctrl_t*const p_ctrl`

PDC control block. Allocate an instance specific control block to pass into the PDC API calls. Implemented aspdc_instance_ctrl_t

Parameter p_state

Definition: `pdc_state_t*p_state`

PDC VSYNC/HSYNC state

- `pdc_state_t::vsync`

  VSYNC signal state.

- pdc_state_t::hsync

  HSYNC signal state.

8.30.9.9 versionGet

```
ssp_err_t(* pdc_api_t::versionGet) (ssp_version_t *const p_data)
```

Detailed description

Return the version of the driver. Implemented as

- R_PDC_VersionGet

Table 1252:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_data	out	Memory address to return version information to.

Parameter p_ctrl
Parameter p_data

Definition: ssp_version_t *const p_data

- ssp_version_t::version_id

  Version id

- ssp_version_t::code_version_minor

  Code minor version.

- ssp_version_t::code_version_major

  Code major version.

- ssp_version_t::api_version_minor

  API minor version.

- ssp_version_t::api_version_major

  API major version.

- ssp_version_tstruct{}

  Code version parameters

8.30.9.10 pdc_instance_t

pdc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- pdc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- pdc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- pdc_api_t const * p_api

  Pointer to the API structure for this instance.

8.31 Quad SPI Flash Interface

Interface for accessing external SPI flash devices.

8.31.1 Summary

The QSPI module provides an interface that writes and erases sectors in quad SPI flash devices connected to the QSPI interface.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

QSPI Interface description: QSPI Driver

8.31.2 Interface API

qspi_api_t

Function name	Description
.open	Open the QSPI driver module.
.close	Close the QSPI driver module.
.read	Read a block of data from the flash.
.pageProgram	Program a page of data to the flash.
.erase	Erase a certain number of bytes of the flash.

Function name	Description
.infoGet	Get information about this specific QSPI flash.
.sectorErase	Erase a sector of the flash.
.statusGet	Get the write or erase status of the flash.
.bankSelect	Select the bank to access.
.versionGet	Get the driver version based on compile time macros.

8.31.3 Data structures

- qspi_cfg_t
- qspi_info_t
- qspi_instance_t

8.31.4 Typedefs

- qspi_ctrl_t

8.31.5 Defines

- #define QSPI_API_VERSION_MAJOR
  Initial value: `(1U)`
- #define QSPI_API_VERSION_MINOR
  Initial value: `(2U)`

8.31.6 API Data

8.31.6.1 qspi_ctrl_t

```
typedef void qspi_ctrl_t
```

Detailed description

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented as

- qspi_instance_ctrl_t

8.31.7 API Structures

8.31.7.1 qspi_cfg_t

qspi_cfg_t

Detailed description

User configuration structure used by the open function

Variables

- void * p_extend

  place holder for future development

8.31.7.2 qspi_info_t

qspi_info_t

Detailed description

QSPI information structure to store information specific to the currently used QSPI.

Variables

- uint32_t total_size_bytes

  Size of this QSPI in bytes.
- uint32_t min_program_size_bytes

  Minimum program size in bytes.
- uint32_t * p_erase_sizes_bytes

  Array of available erase sizes. Each entry is in bytes.
- uint8_t num_erase_sizes

  Number of available erase sizes.

8.31.7.3 qspi_api_t

qspi_api_t

Detailed description

QSPI functions implemented at the HAL layer follow this API.

8.31.7.4 open

```
(* qspi_api_t::open) (qspi_ctrl_t *p_ctrl, qspi_cfg_t const *const p_cfg)
```

Detailed description

Open the QSPI driver module. Implemented as

- R_QSPI_Open

Table 1253:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle
p_cfg	in	Pointer to a configuration structure

Parameter p_ctrl

Definition: `qspi_ctrl_t*p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_cfg

Definition: `qspi_cfg_t const *const p_cfg`

User configuration structure used by the open function

- `qspi_cfg_t`::`p_extend`

  place holder for future development

8.31.7.5 close

```
(* qspi_api_t::close) (qspi_ctrl_t *p_ctrl)
```

Detailed description

Close the QSPI driver module. Implemented as

- R_QSPI_Close

Table 1254:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle

Parameter p_ctrl

Definition: `qspi_ctrl_t*p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

8.31.7.6 read

```
(* qspi_api_t::read) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint8_t
*p_memory_address, uint32_t byte_count)
```

Detailed description

Read a block of data from the flash. Implemented as

- R_QSPI_Read

Table 1255:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle
p_device_address	in	The location in the flash device address space to read
p_memory_address	in	The memory address of a buffer to place the read data in
byte_count	in	The number of bytes to read

Parameter p_ctrl

Definition: qspi_ctrl_t*p_ctrl

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_device_address

uint8_t

Parameter p_memory_address

uint8_t

Parameter byte_count

uint32_t

8.31.7.7 pageProgram

```
(* qspi_api_t::pageProgram) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address,
uint8_t *p_memory_address, uint32_t byte_count)
```

Detailed description

Program a page of data to the flash. Implemented as

- R_QSPI_PageProgram

Table 1256:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle
p_device_address	in	The location in the flash device address space to write the data to
p_memory_address	in	The memory address of the data to write to the flash device
byte_count	in	The number of bytes to write

Parameter p_ctrl

Definition: `qspi_ctrl_t*p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_device_address

`uint8_t`

Parameter p_memory_address

`uint8_t`

Parameter byte_count

`uint32_t`

8.31.7.8 erase

```
(* qspi_api_t::erase) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint32_t byte_count)
```

Detailed description

Erase a certain number of bytes of the flash. Implemented as

- R_QSPI_Erase

Table 1257:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle

Table 1257:Parameters (Continued)

Name	Direction	Description
p_device_address	in	The location in the flash device address space to start the erase from
byte_count	in	The number of bytes to erase

Parameter p_ctrl

Definition: `qspi_ctrl_t*p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_device_address

`uint8_t`

Parameter byte_count

`uint32_t`

8.31.7.9 infoGet

```
(* qspi_api_t::infoGet) (qspi_ctrl_t *const p_ctrl, qspi_info_t *const p_info)
```

Detailed description

Get information about this specific QSPI flash. Implemented as

- R_QSPI_InfoGet

Table 1258:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
p_info	out	Collection of information for this QSPI.

Parameter p_ctrl

Definition: `qspi_ctrl_t*const p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_info

Definition: qspi_info_t*const p_info

QSPI information structure to store information specific to the currently used QSPI.

- qspi_info_t::total_size_bytes

  Size of this QSPI in bytes.

- qspi_info_t::min_program_size_bytes

  Minimum program size in bytes.

- qspi_info_t::p_erase_sizes_bytes

  Array of available erase sizes. Each entry is in bytes.

- qspi_info_t::num_erase_sizes

  Number of available erase sizes.

8.31.7.10 sectorErase

```
(* qspi_api_t::sectorErase) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address)
```

Detailed description

Erase a sector of the flash. Implemented as

- R_QSPI_SectorErase

Table 1259:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle
p_device_address	in	The location in the flash device address space to start the erase from

Parameter p_ctrl

Definition: qspi_ctrl_t*p_ctrl

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_device_address

uint8_t

8.31.7.11 statusGet

```
(* qspi_api_t::statusGet) (qspi_ctrl_t *p_ctrl, bool *p_write_in_progress)
```

Detailed description

Get the write or erase status of the flash. Implemented as

- R_QSPI_StatusGet

Table 1260:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to a driver handle
p_write_in_progress	in	The write or erase status - TRUE = write/erase in progress

Parameter p_ctrl

Definition: `qspi_ctrl_t*p_ctrl`

QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. Implemented asqspi_instance_ctrl_t

Parameter p_write_in_progress

`const`

8.31.7.12 bankSelect

```
(* qspi_api_t::bankSelect) (uint32_t bank)
```

Detailed description

Select the bank to access. Implemented as

- R_QSPI_BankSelect

Table 1261:Parameters

Name	Direction	Description
bank	in	The bank number

Parameter bank

`uint32_t`

8.31.7.13 versionGet

```
(* qspi_api_t::versionGet) ( *const p_version)
```

Detailed description

Get the driver version based on compile time macros. Implemented as

- R_QSPI_VersionGet

Table 1262:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.31.7.14 qspi_instance_t

qspi_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- qspi_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- qspi_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- qspi_api_t const * p_api

  Pointer to the API structure for this instance.

8.32 RTC Interface

Interface for accessing the Realtime Clock.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

RTC description: RTC Driver

8.32.1 Interface API

rtc_api_t

Function name	Description
.open	Open the RTC driver.
.close	Close the RTC driver.
.configure	Configure the RTC driver.
.calendarTimeSet	Set the calendar time.
.calendarTimeGet	Get the calendar time.
.calendarAlarmSet	Set the calendar alarm time.
.calendarAlarmGet	Get the calendar alarm time.
.calendarCounterStart	Start the calendar counter.
.calendarCounterStop	Stop the calendar counter.
.irqEnable	Enable the alarm irq.
.irqDisable	Disable the alarm irq.
.periodicIrqRateSet	Set the periodic irq rate
.infoGet	Return the currently configure clock source for the RTC
.errorAdjustmentModeSet	Set time error adjustment mode.
.errorAdjustmentSet	Set time error adjustment.
.versionGet	Gets version and stores it in provided pointer p_version.

8.32.2 Data structures

- rtc_callback_args_t
- rtc_error_adjustment_cfg_t
- rtc_error_adjustment_mode_cfg_t
- rtc_alarm_time_t
- rtc_info_t

- rtc_cfg_t
- rtc_instance_t

8.32.3 Enumerations

- rtc_event_t
- rtc_clock_source_t
- rtc_status_t
- rtc_error_adjustment_t
- rtc_error_adjustment_mode_t
- rtc_error_adjustment_period_t
- rtc_periodic_irq_select_t

8.32.4 Typedefs

- rtc_time_t
- rtc_ctrl_t

8.32.5 Defines

- #define RTC_API_VERSION_MAJOR

  Initial value: `(1U)`

  Use of time structure, tm
- #define RTC_API_VERSION_MINOR

  Initial value: `(4U)`

8.32.6 API Data

8.32.6.1 rtc_event_t

`rtc_event_t`

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
RTC_EVENT_ALARM_IRQ	Real Time Clock ALARM IRQ.
RTC_EVENT_PERIODIC_IRQ	Real Time Clock PERIODIC IRQ.
RTC_EVENT_CARRY_IRQ	Real Time Clock CARRY IRQ.

8.32.6.2 rtc_clock_source_t

`rtc_clock_source_t`

Detailed description

Clock source for the RTC block

Enumerated values

Name	Description
RTC_CLOCK_SOURCE_SUBCLK	Sub-clock oscillator.
RTC_CLOCK_SOURCE_LOCO	Low power On Chip Oscillator.

8.32.6.3 rtc_status_t

`rtc_status_t`

Detailed description

RTC run state

Enumerated values

Name	Description
RTC_STATUS_STOPPED	RTC counter is stopped.
RTC_STATUS_RUNNING	RTC counter is running.

8.32.6.4 rtc_error_adjustment_t

`rtc_error_adjustment_t`

Detailed description

Time error adjustment settings

Enumerated values

Name	Description
RTC_ERROR_ADJUSTMENT_NONE	Adjustment is not performed.
RTC_ERROR_ADJUSTMENT_ADD_PRESCALER	Adjustment is performed by the addition to the prescaler.
RTC_ERROR_ADJUSTMENT_SUBTRACT_PRESCALER	Adjustment is performed by the subtraction from the prescaler.

8.32.6.5 rtc_error_adjustment_mode_t

`rtc_error_adjustment_mode_t`

Detailed description

Time error adjustment mode settings

Enumerated values

Name	Description
RTC_ERROR_ADJUSTMENT_MODE_MANUAL	Adjustment mode is set to manual.
RTC_ERROR_ADJUSTMENT_MODE_AUTOMATIC	Adjustment mode is set to automatic.

8.32.6.6 rtc_error_adjustment_period_t

`rtc_error_adjustment_period_t`

Detailed description

Time error adjustment period settings

Enumerated values

Name	Description
RTC_ERROR_ADJUSTMENT_PERIOD_1_MINUTE	Adjustment period is set to every one minute.
RTC_ERROR_ADJUSTMENT_PERIOD_10_SECOND	Adjustment period is set to every ten second.
RTC_ERROR_ADJUSTMENT_PERIOD_NONE	Adjustment period not supported in manual mode.

8.32.6.7 rtc_periodic_irq_select_t

`rtc_periodic_irq_select_t`

Detailed description

Periodic Interrupt select

Enumerated values

Name	Description
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_256_SECOND	A periodic irq is generated every 1/256 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_128_SECOND	A periodic irq is generated every 1/128 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_64_SECOND	A periodic irq is generated every 1/64 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_32_SECOND	A periodic irq is generated every 1/32 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_16_SECOND	A periodic irq is generated every 1/16 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_8_SECOND	A periodic irq is generated every 1/8 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_4_SECOND	A periodic irq is generated every 1/4 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND	A periodic irq is generated every 1/2 second.
RTC_PERIODIC_IRQ_SELECT_1_SECOND	A periodic irq is generated every 1 second.
RTC_PERIODIC_IRQ_SELECT_2_SECONDS	A periodic irq is generated every 2 seconds.

8.32.6.8 rtc_time_t

```
typedef struct tm rtc_time_t
```

Detailed description

Date and time structure defined in C standard library <time.h>

8.32.6.9 rtc_ctrl_t

```
typedef void rtc_ctrl_t
```

Detailed description

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented as

- rtc_instance_ctrl_t

8.32.7 API Structures

8.32.7.1 rtc_callback_args_t

rtc_callback_args_t

Detailed description

Callback function parameter data

Variables

- rtc_event_t event

  The event can be used to identify what caused the callback (compare match or error).

- void const * p_context

  Placeholder for user data. Set in r_timer_t::open function in timer_cfg_t.

8.32.7.2 rtc_error_adjustment_cfg_t

rtc_error_adjustment_cfg_t

Detailed description

Time error adjustment value configuration

Variables

- rtc_error_adjustment_t adjustment_type

  Time error adjustment type setting.

- uint8_t adjustment_value

  Time error adjustment value.

8.32.7.3 rtc_error_adjustment_mode_cfg_t

rtc_error_adjustment_mode_cfg_t

Detailed description

Time error adjustment mode and period configuration

Variables

- rtc_error_adjustment_mode_t adjustment_mode

  Time error adjustment mode setting.

- rtc_error_adjustment_period_t adjustment_period

  Time error adjustment period setting.

8.32.7.4 rtc_alarm_time_t

rtc_alarm_time_t

Detailed description

Alarm time setting structure

Variables

- rtc_time_t time

  Time structure.
- bool sec_match

  Enable the alarm based on a match of the seconds field.
- bool min_match

  Enable the alarm based on a match of the minutes field.
- bool hour_match

  Enable the alarm based on a match of the hours field.
- bool mday_match

  Enable the alarm based on a match of the days field.
- bool mon_match

  Enable the alarm based on a match of the months field.
- bool year_match

  Enable the alarm based on a match of the years field.
- bool dayofweek_match

  Enable the alarm based on a match of the dayofweek field.

8.32.7.5 rtc_info_t

rtc_info_t

Detailed description

RTC Information Structure for information returned by infoGet()

Variables

- rtc_clock_source_t clock_source

  Clock source for the RTC block.
- rtc_status_t status

  RTC run status.

8.32.7.6 rtc_cfg_t

rtc_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- rtc_clock_source_t clock_source

  Clock source for the RTC block.
- bool hw_cfg

  Initialize RTC in Open()
- uint32_t error_adjustment_value

  Value of the prescaler for error adjustment.
- rtc_error_adjustment_t error_adjustment_type

  How the prescaler value is applied.
- uint8_t alarm_ipl

  Alarm interrupt priority.
- uint8_t periodic_ipl

  Periodic interrupt priority.
- uint8_t carry_ipl

  Carry interrupt priority.
- void(* p_callback)(rtc_callback_args_t *p_args)

  Called from the ISR.
- void const * p_context

  Passed to the callback.
- void const * p_extend

  RTC hardware dependant configuration.

8.32.7.7 rtc_api_t

rtc_api_t

Detailed description

RTC driver structure. General RTC functions implemented at the HAL layer follow this API.

8.32.7.8 open

```
ssp_err_t(* rtc_api_t::open) (rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const
p_cfg)
```

Detailed description

Open the RTC driver. Implemented as

- R_RTC_Open

Table 1263:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
p_cfg	in	Pointer to the configuration structure

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_cfg

Definition: `rtc_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `rtc_cfg_t`::`rtc_clock_source_t`

  Clock source for the RTC block.

  Enumerated as:

  – RTC_CLOCK_SOURCE_SUBCLK

  – RTC_CLOCK_SOURCE_LOCO

- `rtc_cfg_t`::`hw_cfg`

  Initialize RTC in Open()

- `rtc_cfg_t`::`error_adjustment_value`

  Value of the prescaler for error adjustment.

- `rtc_cfg_t`::`rtc_error_adjustment_t`

  How the prescaler value is applied.

  Enumerated as:

  – RTC_ERROR_ADJUSTMENT_NONE

  – RTC_ERROR_ADJUSTMENT_ADD_PRESCALER

  – RTC_ERROR_ADJUSTMENT_SUBTRACT_PRESCALER

- `rtc_cfg_t`::`alarm_ipl`

  Alarm interrupt priority.

- `rtc_cfg_t`::`periodic_ipl`

  Periodic interrupt priority.

- rtc_cfg_t::carry_ipl

  Carry interrupt priority.
- rtc_cfg_t::p_callback

  Called from the ISR.
- rtc_cfg_t::p_context

  Passed to the callback.
- rtc_cfg_t::p_extend

  RTC hardware dependant configuration.

8.32.7.9 close

```
ssp_err_t(* rtc_api_t::close) (rtc_ctrl_t *const p_ctrl)
```

Detailed description

Close the RTC driver. Implemented as

- R_RTC_Close

Table 1264:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle.

Parameter p_ctrl

Definition: rtc_ctrl_t*const p_ctrl

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

8.32.7.10 configure

```
ssp_err_t(* rtc_api_t::configure) (rtc_ctrl_t *const p_ctrl, void *const p_extend)
```

Detailed description

Configure the RTC driver. Implemented as

- R_RTC_Configure

Table 1265:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle.

Table 1265:Parameters (Continued)

Name	Direction	Description
p_extend	in	Currently not implemented, pass NULL.

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_extend

`const`

8.32.7.11 calendarTimeSet

```
ssp_err_t(* rtc_api_t::calendarTimeSet) (rtc_ctrl_t *const p_ctrl, rtc_time_t
*p_time, bool clock_start)
```

Detailed description

Set the calendar time. Implemented as

- R_RTC_CalendarTimeSet

Table 1266:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
p_time	in	Pointer to a time structure that contains the time to set
clock_start	in	Flag that starts the clock right after it is set

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_time

Definition: `rtc_time_t*p_time`

Date and time structure defined in C standard library <time.h>

Parameter clock_start

`const`

8.32.7.12 calendarTimeGet

```
ssp_err_t(* rtc_api_t::calendarTimeGet) (rtc_ctrl_t *const p_ctrl, rtc_time_t
*p_time)
```

Detailed description

Get the calendar time. Implemented as

- R_RTC_CalendarTimeGet

Table 1267:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
p_time	out	Pointer to a time structure that contains the time to get

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_time

Definition: `rtc_time_t*p_time`

Date and time structure defined in C standard library <time.h>

8.32.7.13 calendarAlarmSet

```
ssp_err_t(* rtc_api_t::calendarAlarmSet) (rtc_ctrl_t *const p_ctrl,
rtc_alarm_time_t *p_alarm, bool irq_enable_flag)
```

Detailed description

Set the calendar alarm time. Implemented as

- R_RTC_CalendarAlarmSet

Table 1268:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
p_alarm	in	Pointer to an alarm structure that contains the alarm time to set
irq_enable_flag	in	Enable the ALARM irq if set

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_alarm

Definition: `rtc_alarm_time_t*p_alarm`

Alarm time setting structure

- `rtc_alarm_time_t::time`

  Time structure.

- `rtc_alarm_time_t::sec_match`

  Enable the alarm based on a match of the seconds field.

- `rtc_alarm_time_t::min_match`

  Enable the alarm based on a match of the minutes field.

- `rtc_alarm_time_t::hour_match`

  Enable the alarm based on a match of the hours field.

- `rtc_alarm_time_t::mday_match`

  Enable the alarm based on a match of the days field.

- `rtc_alarm_time_t::mon_match`

  Enable the alarm based on a match of the months field.

- `rtc_alarm_time_t::year_match`

  Enable the alarm based on a match of the years field.

- `rtc_alarm_time_t::dayofweek_match`

  Enable the alarm based on a match of the dayofweek field.

Parameter irq_enable_flag

`const`

8.32.7.14 calendarAlarmGet

```
ssp_err_t(* rtc_api_t::calendarAlarmGet) (rtc_ctrl_t *const p_ctrl,
rtc_alarm_time_t *p_alarm)
```

Detailed description

Get the calendar alarm time. Implemented as

- R_RTC_CalendarAlarmGet

Table 1269:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
p_alarm	out	Pointer to an alarm structure to fill up with the alarm time

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_alarm

Definition: `rtc_alarm_time_t*p_alarm`

Alarm time setting structure

- `rtc_alarm_time_t::time`

  Time structure.

- `rtc_alarm_time_t::sec_match`

  Enable the alarm based on a match of the seconds field.

- `rtc_alarm_time_t::min_match`

  Enable the alarm based on a match of the minutes field.

- `rtc_alarm_time_t::hour_match`

  Enable the alarm based on a match of the hours field.

- `rtc_alarm_time_t::mday_match`

  Enable the alarm based on a match of the days field.

- `rtc_alarm_time_t::mon_match`

  Enable the alarm based on a match of the months field.

- `rtc_alarm_time_t::year_match`

  Enable the alarm based on a match of the years field.

- `rtc_alarm_time_t::dayofweek_match`

  Enable the alarm based on a match of the dayofweek field.

8.32.7.15 calendarCounterStart

```
ssp_err_t(* rtc_api_t::calendarCounterStart) (rtc_ctrl_t *const p_ctrl)
```

Detailed description

Start the calendar counter. Implemented as

- R_RTC_CalendarCounterStart

Table 1270:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

8.32.7.16 calendarCounterStop

```
ssp_err_t(* rtc_api_t::calendarCounterStop) (rtc_ctrl_t *const p_ctrl)
```

Detailed description

Stop the calendar counter. Implemented as

- R_RTC_CalendarCounterStop

Table 1271:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

8.32.7.17 irqEnable

```
ssp_err_t(* rtc_api_t::irqEnable) (rtc_ctrl_t *const p_ctrl, rtc_event_t irq)
```

Detailed description

Enable the alarm irq. Implemented as

- R_RTC_IrqEnable

Table 1272:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

8.32.7.18 irqDisable

```
ssp_err_t(* rtc_api_t::irqDisable) (rtc_ctrl_t *const p_ctrl, rtc_event_t irq)
```

Detailed description

Disable the alarm irq. Implemented as

- R_RTC_IrqDisable

Table 1273:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

8.32.7.19 periodicIrqRateSet

```
ssp_err_t(* rtc_api_t::periodicIrqRateSet) (rtc_ctrl_t *const p_ctrl,
rtc_periodic_irq_select_t rate)
```

Detailed description

Set the periodic irq rate Implemented as

- R_RTC_PeriodicIrqRateSet

Table 1274:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to RTC device handle
rate	in	Rate of periodic interrupts

Parameter p_ctrl

Definition: `rtc_ctrl_t*const p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter rate

Definition: `rtc_periodic_irq_select_trate`

Periodic Interrupt select

8.32.7.20 infoGet

```
ssp_err_t(* rtc_api_t::infoGet) (rtc_ctrl_t *p_ctrl, rtc_info_t *p_rtc_info)
```

Detailed description

Return the currently configure clock source for the RTC

Implemented as

- R_RTC_InfoGet

Table 1275:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_rtc_info	out	Pointer to RTC information structure

Parameter p_ctrl

Definition: `rtc_ctrl_t*p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_rtc_info

Definition: `rtc_info_t*p_rtc_info`

RTC Information Structure for information returned by infoGet()

- rtc_info_t::clock_source

  Clock source for the RTC block.

- rtc_info_t::status

  RTC run status.

8.32.7.21 errorAdjustmentModeSet

```
ssp_err_t(* rtc_api_t::errorAdjustmentModeSet) (rtc_ctrl_t *p_ctrl,
rtc_error_adjustment_mode_cfg_t *p_error_adjustment_mode)
```

Detailed description

Set time error adjustment mode.

Implemented as

- R_RTC_ErrorAdjustmentModeSet

Table 1276:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_error_adjustment_mode	in	Pointer to error adjustment mode configuration structure

Parameter p_ctrl

Definition: rtc_ctrl_t*p_ctrl

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_error_adjustment_mode

Definition: rtc_error_adjustment_mode_cfg_t *p_error_adjustment_mode

Time error adjustment mode and period configuration

- rtc_error_adjustment_mode_cfg_t::rtc_error_adjustment_mode_t

  Time error adjustment mode setting.

  Enumerated as:

  – RTC_ERROR_ADJUSTMENT_MODE_MANUAL

  – RTC_ERROR_ADJUSTMENT_MODE_AUTOMATIC

- rtc_error_adjustment_mode_cfg_t::rtc_error_adjustment_period_t

  Time error adjustment period setting.

  Enumerated as:

– RTC_ERROR_ADJUSTMENT_PERIOD_1_MINUTE

– RTC_ERROR_ADJUSTMENT_PERIOD_10_SECOND

– RTC_ERROR_ADJUSTMENT_PERIOD_NONE

8.32.7.22 errorAdjustmentSet

```
ssp_err_t(* rtc_api_t::errorAdjustmentSet) (rtc_ctrl_t *p_ctrl,
rtc_error_adjustment_cfg_t *p_error_adjustment_config)
```

Detailed description

Set time error adjustment.

Implemented as

- R_RTC_ErrorAdjustmentSet

Table 1277:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control handle structure
p_error_adjustment_config	in	Pointer to error adjustment structure

Parameter p_ctrl

Definition: `rtc_ctrl_t*p_ctrl`

RTC control block. Allocate an instance specific control block to pass into the RTC API calls. Implemented asrtc_instance_ctrl_t

Parameter p_error_adjustment_config

Definition: `rtc_error_adjustment_cfg_t *p_error_adjustment_config`

Time error adjustment value configuration

- `rtc_error_adjustment_cfg_t`::`rtc_error_adjustment_t`

  Time error adjustment type setting.

  Enumerated as:

  – RTC_ERROR_ADJUSTMENT_NONE

  – RTC_ERROR_ADJUSTMENT_ADD_PRESCALER

  – RTC_ERROR_ADJUSTMENT_SUBTRACT_PRESCALER

- `rtc_error_adjustment_cfg_t`::`adjustment_value`

  Time error adjustment value.

8.32.7.23 versionGet

```
ssp_err_t(* rtc_api_t::versionGet) (ssp_version_t *version)
```

Detailed description

Gets version and stores it in provided pointer p_version. Implemented as

- R_RTC_VersionGet

Table 1278:Parameters

Name	Direction	Description
p_version	out	Code and API version used

Parameter p_version

8.32.7.24 rtc_instance_t

rtc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- rtc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- rtc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- rtc_api_t const * p_api

  Pointer to the API structure for this instance.

8.33 SD/MMC Interface

Interface for accessing SD, eMMC, and SDIO devices.

8.33.1 Summary

The r_sdmmc interface provides standard SD and eMMC media functionality. A complete file system can be implemented with FileX, sf_el_fx, sf_block_media_sdmmc and r_sdmmc modules. This driver also supports SDIO. The SD/MMC interface is implemented by:

- SDMMC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

SD/MMC description: SD/MMC Driver and SDIO Driver

8.33.2 Interface API

sdmmc_api_t

Function name	Description
.open	Open an SD/MMC device. If the device is a card, the card must be plugged in prior to calling this API. This API blocks until the device initialization procedure is complete.
.close	Close open SD/MMC device.
.read	Read data from an SD/MMC channel. This API is not supported for SDIO devices.
.write	Write data to SD/MMC channel. This API is not supported for SDIO devices.
.control	The Control function sends control commands to and receives info from the SD/MMC port.
.readIo	Read one byte of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.
.writeIo	Write one byte of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.
.readIoExt	Read multiple bytes or blocks of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.
.writeIoExt	Write multiple bytes or blocks of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.
.ioIntEnable	Enables SDIO interrupt for SD/MMC instance. This API is not supported for SD or eMMC memory devices.
.versionGet	Returns the version of the SD/MMC driver.
.infoGet	Get SD/MMC device info.

Function name	Description
.erase	Erase SD/MMC sectors. The sector size for erase is fixed at 512 bytes. This API is not supported for SDIO devices.

8.33.3 Data structures

- sdmmc_hw_t
- sdmmc_info_t
- sdmmc_callback_args_t
- sdmmc_cfg_t
- sdmmc_instance_t

8.33.4 Enumerations

- sdmmc_ready_status_t
- sdmmc_card_type_t
- sdmmc_media_type_t
- sdmmc_bus_width_t
- sdmmc_io_transfer_mode_t
- sdmmc_io_address_mode_t
- sdmmc_io_write_mode_t
- sdmmc_event_t

8.33.5 Typedefs

- sdmmc_ctrl_t

8.33.6 Defines

- #define SDMMC_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define SDMMC_API_VERSION_MINOR

  Initial value: `(2U)`
- #define SDMMC_MAX_BLOCK_SIZE

  Initial value: `(512U)`

8.33.7 API Data

8.33.7.1 sdmmc_ready_status_t

`sdmmc_ready_status_t`

Detailed description

SD/MMC status

Enumerated values

Name	Description
SDMMC_STATUS_CARD_NOT_READY	SD card or eMMC device has not been initialized.
SDMMC_STATUS_CARD_READY	SD card or eMMC device has been initialized and is ready to access.

8.33.7.2 sdmmc_card_type_t

`sdmmc_card_type_t`

Detailed description

SD/MMC media uses SD protocol or MMC protocol.

Enumerated values

Name	Description
SDMMC_CARD_TYPE_MMC	The media is an eMMC device.
SDMMC_CARD_TYPE_SD	The media is an SD card.

8.33.7.3 sdmmc_media_type_t

`sdmmc_media_type_t`

Detailed description

SD/MMC media is embedded or it can be inserted and removed.

Enumerated values

Name	Description
SDMMC_MEDIA_TYPE_EMBEDDED	The media is an embedded card, or eMMC device.

Name	Description
SDMMC_MEDIA_TYPE_CARD	The media is an pluggable card.

8.33.7.4 sdmmc_bus_width_t

`sdmmc_bus_width_t`

Detailed description

SD/MMC data bus is 1, 4 or 8 bits wide.

Enumerated values

Name	Description
SDMMC_BUS_WIDTH_1_BIT	Data bus is 1 bit wide.
SDMMC_BUS_WIDTH_4_BITS	Data bus is 4 bits wide.
SDMMC_BUS_WIDTH_8_BITS	Data bus is 8 bits wide.

8.33.7.5 sdmmc_io_transfer_mode_t

`sdmmc_io_transfer_mode_t`

Enumerated values

Name	Description
SDMMC_IO_MODE_TRANSFER_BYTE	
SDMMC_IO_MODE_TRANSFER_BLOCK	

8.33.7.6 sdmmc_io_address_mode_t

`sdmmc_io_address_mode_t`

Enumerated values

Name	Description
SDMMC_IO_ADDRESS_MODE_FIXED	
SDMMC_IO_ADDRESS_MODE_INCREMENT	

8.33.7.7 sdmmc_io_write_mode_t

```
sdmmc_io_write_mode_t
```

Enumerated values

Name	Description
SDMMC_IO_WRITE_MODE_NO_READ	
SDMMC_IO_WRITE_READ_AFTER_WRITE	

8.33.7.8 sdmmc_event_t

```
sdmmc_event_t
```

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
SDMMC_EVENT_CARD_REMOVED	Card removed event.
SDMMC_EVENT_CARD_INSERTED	Card inserted event.
SDMMC_EVENT_ACCESS	Access event.
SDMMC_EVENT_SDIO	IO event.
SDMMC_EVENT_TRANSFER_COMPLETE	Read or write complete.
SDMMC_EVENT_TRANSFER_ERROR	Read or write failed.
SDMMC_EVENT_NONE	No event.

8.33.7.9 sdmmc_ctrl_t

```
typedef void sdmmc_ctrl_t
```

Detailed description

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented as

- sdmmc_instance_ctrl_t

8.33.8 API Structures

8.33.8.1 sdmmc_hw_t

sdmmc_hw_t

Detailed description

Channel, media type, bus width defined by the hardware.

Variables

- uint8_t channel

  Channel of SD/MMC host interface.

- sdmmc_media_type_t media_type

  Embedded or pluggable card.

- sdmmc_bus_width_t bus_width

  Device bus width is 1, 4 or 8 bits wide.

8.33.8.2 sdmmc_info_t

sdmmc_info_t

Detailed description

Status and other information obtained from the media device.

Variables

- sdmmc_card_type_t card_type

  SD or eMMC.

- bool ready

  False if card was removed (only applies if MCU supports card detection and SDnCD pin is connected).True otherwise.If ready is false, the driver must be closed, then reopened with a card inserted.

- bool hc

  true = Card is High Capacity card

- bool sdio

  true = SDIO present

- bool write_protected

  true = Card is write protected

- bool transfer_in_progress

  true = Card is busy

- uint8_t csd_version

  CSD version.

- uint8_t device_type

  Speed and data rate (eMMC)
- sdmmc_bus_width_t bus_width

  Current media bus width.
- uint8_t hs_timing

  High Speed status.
- uint32_t sdhi_rca

  Relative Card Address.
- uint32_t max_clock_rate

  Maximum clock rate for media card.
- uint32_t clock_rate

  Current clock rate.
- uint32_t sector_size

  Sector size.
- uint32_t sector_count

  Sector count.
- uint32_t erase_sector_count

  Minimum erasable unit (in 512 byte sectors)

8.33.8.3 sdmmc_callback_args_t

sdmmc_callback_args_t

Detailed description

Callback function parameter data

Variables

- sdmmc_event_t event

  The event can be used to identify what caused the callback.
- void const * p_context

  Placeholder for user data.

8.33.8.4 sdmmc_cfg_t

sdmmc_cfg_t

Detailed description

SD/MMC Configuration

Variables

- sdmmc_hw_t hw

  Channel, media type, bus width defined by the hardware.
- transfer_instance_t const * p_lower_lvl_transfer

  Transfer instance used to move data with DMA or DTC.
- void(* p_callback)(sdmmc_callback_args_t *p_args)

  Pointer to callback function.
- void const * p_context

  User defined context passed into callback function.
- void const * p_extend

  SD/MMC hardware dependent configuration.
- uint8_t access_ipl

  Access interrupt priority.
- uint8_t sdio_ipl

  SDIO interrupt priority.
- uint8_t card_ipl

  Card interrupt priority.
- uint8_t dma_req_ipl

  DMA request interrupt priority.

8.33.8.5 sdmmc_api_t

sdmmc_api_t

Detailed description

SD/MMC functions implemented at the HAL layer API.

8.33.8.6 open

```
ssp_err_t(* sdmmc_api_t::open) (sdmmc_ctrl_t *const p_ctrl, sdmmc_cfg_t const
*const p_cfg)
```

Detailed description

Open an SD/MMC device. If the device is a card, the card must be plugged in prior to calling this API. This API blocks until the device initialization procedure is complete.

Implemented asR_SDMMC_Open

Table 1279:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to SD/MMC instance control block.
p_cfg	in	Pointer to SD/MMC instance configuration structure.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_cfg

Definition: `sdmmc_cfg_t const *const p_cfg`

SD/MMC Configuration

- `sdmmc_cfg_t`::`sdmmc_hw_t`

  Channel, media type, bus width defined by the hardware.

- `sdmmc_cfg_t`::`transfer_instance_t`

  Transfer instance used to move data with DMA or DTC.

- `sdmmc_cfg_t`::`p_callback`

  Pointer to callback function.

- `sdmmc_cfg_t`::`p_context`

  User defined context passed into callback function.

- `sdmmc_cfg_t`::`p_extend`

  SD/MMC hardware dependent configuration.

- `sdmmc_cfg_t`::`access_ipl`

  Access interrupt priority.

- `sdmmc_cfg_t`::`sdio_ipl`

  SDIO interrupt priority.

- `sdmmc_cfg_t`::`card_ipl`

  Card interrupt priority.

- `sdmmc_cfg_t`::`dma_req_ipl`

  DMA request interrupt priority.

8.33.8.7 close

```
ssp_err_t(* sdmmc_api_t::close) (sdmmc_ctrl_t *const p_ctrl)
```

Detailed description

Close open SD/MMC device.

Implemented asR_SDMMC_Close

Table 1280:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

8.33.8.8 read

```
ssp_err_t(* sdmmc_api_t::read) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const p_dest,
uint32_t const start_sector, uint32_t const sector_count)
```

Detailed description

Read data from an SD/MMC channel. This API is not supported for SDIO devices.

Implemented asR_SDMMC_Read

Table 1281:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_dest	out	Pointer to data buffer to read data to.
start_sector	in	First sector address to read.
sector_count	in	Number of sectors to read. All sectors must be in the range of sector_count.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter start_sector

`uint32_t`

Parameter sector_count

`uint32_t`

8.33.8.9 write

```
ssp_err_t(* sdmmc_api_t::write) (sdmmc_ctrl_t *const p_ctrl, uint8_t const *const p_source, uint32_t const start_sector, uint32_t const sector_count)
```

Detailed description

Write data to SD/MMC channel. This API is not supported for SDIO devices.

Implemented asR_SDMMC_Write

Table 1282:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_source	in	Pointer to data buffer to write data from.
start_sector	in	First sector address to write to.
sector_count	in	Number of sectors to write. All sectors must be in the range of sector_count.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_source

`uint8_t`

Parameter start_sector

`uint32_t`

Parameter sector_count

`uint32_t`

8.33.8.10 control

```
ssp_err_t(* sdmmc_api_t::control) (sdmmc_ctrl_t *const p_ctrl, ssp_command_t
const command, void *p_data)
```

Detailed description

The Control function sends control commands to and receives info from the SD/MMC port.

Implemented asR_SDMMC_Control

Table 1283:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
command	in	Command to execute. The list of supported commands is below.
p_data	inout	Pointer to data in or out. For each command, this data should be cast as follows: • SSP_COMMAND_GET_SECTOR_COUNT : [out] (uint32_t *) p_data • SSP_COMMAND_GET_SECTOR_SIZE : [out] (uint32_t *) p_data • SSP_COMMAND_GET_WRITE_PROTECTED : [out] (bool *) p_data • SSP_COMMAND_SET_BLOCK_SIZE : [in] (uint32_t *) p_data

Parameter p_ctrl

Definition: sdmmc_ctrl_t*const p_ctrl

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter command
Parameter p_data

```
const
```

8.33.8.11 readIo

```
ssp_err_t(* sdmmc_api_t::readIo) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const
p_data, uint32_t const function, uint32_t const address)
```

Detailed description

Read one byte of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented asR_SDMMC_ReadIo

Table 1284:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_data	out	Pointer to location to store data byte.
function	in	SDIO Function Number.
address	in	SDIO register address.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_data

`uint8_t`

Parameter function

`uint32_t`

Parameter address

`uint32_t`

8.33.8.12 writeIo

```
ssp_err_t(* sdmmc_api_t::writeIo) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const
p_data, uint32_t const function, uint32_t const address, sdmmc_io_write_mode_t
const read_after_write)
```

Detailed description

Write one byte of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented asR_SDMMC_WriteIo

Table 1285:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.

Table 1285:Parameters (Continued)

Name	Direction	Description
p_data	inout	Pointer to data byte to write. Read data is also provided here if read_after_write is true.
function	in	SDIO Function Number.
address	in	SDIO register address.
read_after_write	in	Set to true for reading after writing.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_data

`uint8_t`

Parameter function

`uint32_t`

Parameter address

`uint32_t`

Parameter read_after_write

Definition: `sdmmc_io_write_mode_tconst read_after_write`

8.33.8.13 readIoExt

```
ssp_err_t(* sdmmc_api_t::readIoExt) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const
p_dest, uint32_t const function, uint32_t const address, uint32_t *const count,
sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t address_mode)
```

Detailed description

Read multiple bytes or blocks of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented asR_SDMMC_ReadIoExt

Table 1286:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_dest	out	Pointer to data buffer to read data to.
function	in	SDIO Function Number.
address	in	SDIO register address.
count	in	Number of bytes or blocks to read, maximum 512 bytes or 511 blocks.
transfer_mode	in	Byte mode = 0, Block mode = 1.
address_mode	in	0 = fixed address, 1 = Incrementing address.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter function

`uint32_t`

Parameter address

`uint32_t`

Parameter count

`uint32_t`

Parameter transfer_mode
Parameter address_mode

8.33.8.14 writeIoExt

```
ssp_err_t(* sdmmc_api_t::writeIoExt) (sdmmc_ctrl_t *const p_ctrl, uint8_t const
*const p_source, uint32_t const function, uint32_t const address, uint32_t const
count, sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t
address_mode)
```

Detailed description

Write multiple bytes or blocks of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented asR_SDMMC_WriteIoExt

Table 1287:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_source	in	Pointer to data buffer to write data from.
function_number	in	SDIO Function Number.
address	in	SDIO register address.
count	in	Number of bytes or blocks to write, maximum 512 bytes or 511 blocks.
transfer_mode	in	Byte mode = 0, Block mode = 1.
address_mode	in	0 = fixed address, 1 = Incrementing address.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_source

`uint8_t`

Parameter function_number
Parameter address

`uint32_t`

Parameter count

`uint32_t`

Parameter transfer_mode
Parameter address_mode

8.33.8.15 IoIntEnable

```
ssp_err_t(* sdmmc_api_t::IoIntEnable) (sdmmc_ctrl_t *const p_ctrl, bool enable)
```

Detailed description

Enables SDIO interrupt for SD/MMC instance. This API is not supported for SD or eMMC memory devices.

Implemented asR_SDMMC_IoIntEnable

Table 1288:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
enable	in	Interrupt enable = true, interrupt disable = false.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter enable

`const`

8.33.8.16 versionGet

```
ssp_err_t(* sdmmc_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Returns the version of the SD/MMC driver.

Implemented asR_SDMMC_VersionGet

Table 1289:Parameters

Name	Direction	Description
p_version	out	Pointer to return version information to.

Parameter p_version

8.33.8.17 infoGet

```
ssp_err_t(* sdmmc_api_t::infoGet) (sdmmc_ctrl_t *const p_ctrl, sdmmc_info_t
*const p_info)
```

Detailed description

Get SD/MMC device info.

Implemented asR_SDMMC_InfoGet

Table 1290:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
p_info	out	Pointer to return device information to.

Parameter p_ctrl

Definition: `sdmmc_ctrl_t*const p_ctrl`

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter p_info

Definition: `sdmmc_info_t*const p_info`

Status and other information obtained from the media device.

- `sdmmc_info_t::card_type`

  SD or eMMC.

- `sdmmc_info_t::ready`

  False if card was removed (only applies if MCU supports card detection and SDnCD pin is connected). True otherwise. If ready is false, the driver must be closed, then reopened with a card inserted.

- `sdmmc_info_t::hc`

  true = Card is High Capacity card

- `sdmmc_info_t::sdio`

  true = SDIO present

- `sdmmc_info_t::write_protected`

  true = Card is write protected

- `sdmmc_info_t::transfer_in_progress`

  true = Card is busy

- `sdmmc_info_t::csd_version`

  CSD version.

- `sdmmc_info_t::device_type`

  Speed and data rate (eMMC)

- `sdmmc_info_t::bus_width`

  Current media bus width.

- sdmmc_info_t::hs_timing

  High Speed status.
- sdmmc_info_t::sdhi_rca

  Relative Card Address.
- sdmmc_info_t::max_clock_rate

  Maximum clock rate for media card.
- sdmmc_info_t::clock_rate

  Current clock rate.
- sdmmc_info_t::sector_size

  Sector size.
- sdmmc_info_t::sector_count

  Sector count.
- sdmmc_info_t::erase_sector_count

  Minimum erasable unit (in 512 byte sectors)

8.33.8.18 erase

```
ssp_err_t(* sdmmc_api_t::erase) (sdmmc_ctrl_t *const p_ctrl, uint32_t const start_sector, uint32_t const sector_count)
```

Detailed description

Erase SD/MMC sectors. The sector size for erase is fixed at 512 bytes. This API is not supported for SDIO devices.

Implemented asR_SDMMC_Erase

Table 1291:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to an open SD/MMC instance control block.
start_sector	in	First sector to erase. Must be a multiple of erase_sector_count.
sector_count	in	Number of sectors to erase. Must be a multiple of erase_sector_count. All sectors must be in the range of sector_count.

Parameter p_ctrl

Definition: sdmmc_ctrl_t*const p_ctrl

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls. Implemented assdmmc_instance_ctrl_t

Parameter start_sector

`uint32_t`

Parameter sector_count

`uint32_t`

8.33.8.19 sdmmc_instance_t

sdmmc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- sdmmc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- sdmmc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- sdmmc_api_t const * p_api

  Pointer to the API structure for this instance.

8.34 SLCDC Interface

Interface for Segment LCD controllers.

8.34.1 Summary

This driver uses the Segment LCD controller (SLCDC) to display data on a Segment LCD.

Implemented by: SLCDC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

SLCDC Interface description: Segment LCD Driver

8.34.2 Interface API

slcdc_api_t

Function name	Description
.open	Open SLCD device.
.write	Write data to SLCD segment. Specifies the initial display data. Except for 8-time slice, store values in the lower 4 bits when writing to the A-pattern area, and in the upper 4 bits when writing to the B-pattern area. The display data is stored in the display data register.
.modify	Rewrite data in the SLCD segment. Rewrites the LCD display data in 1-bit units. If a bit is not specified for rewriting, the value stored in the bit is held as it is. Specifies the data to rewrite
.start	Enable display on the SLCD. Displays the specified data on the LCD. Before that data should be written to the segments.
.stop	Disable display on the SLCD. Stops displaying data on the SLCD.
.contrastIncrease	Increase the display contrast. Increase by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator
.contrastDecrease	Decrease the display contrast. Decrease by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator
.setdisplayArea	Set LCD display area. This function sets a specified display area, A-pattern or B-pattern. This function can be used to set blink on where A-pattern and B-pattern area data will be alternately displayed.When using blinking, the RTC is required to operate before this function is executed. To configure the RTC, follow the steps below. 1) Open RTC 2) Set Periodic interrupt request, 1/2 second 3) Start RTC counter 4) Enable IRQ, RTC_EVENT_PERIODIC_IRQ Refer to the User's Manual: Hardware for the detailed procedure.
.close	Close display device.
.versionGet	Get version.

8.34.7 API Data

8.34.7.1 slcdc_display_state_t

`slcdc_display_state_t`

Detailed description

Display interface operation state

Enumerated values

Name	Description
SLCDC_DISPLAY_STATE_CLOSED	Display closed.
SLCDC_DISPLAY_STATE_OPENED	Display opened.

8.34.7.2 slcdc_bias_method_t

`slcdc_bias_method_t`

Detailed description

LCD display bias method.

Enumerated values

Name	Description
SLCDC_BIAS_2	1/2 bias method
SLCDC_BIAS_3	1/3 bias method
SLCDC_BIAS_4	1/4 bias method

8.34.7.3 slcdc_time_slice_t

`slcdc_time_slice_t`

Detailed description

Time slice of LCD display.

Enumerated values

Name	Description
SLCDC_STATIC	Static.
SLCDC_SLICE_2	2-time slice
SLCDC_SLICE_3	3-time slice
SLCDC_SLICE_4	4-time slice
SLCDC_SLICE_8	8-time slice

8.34.7.4 slcdc_wave_form_t

`slcdc_wave_form_t`

Detailed description

LCD display waveform select.

Enumerated values

Name	Description
SLCDC_WAVE_A	Waveform A.
SLCDC_WAVE_B	Waveform B.

8.34.7.5 slcdc_drive_volt_gen_t

`slcdc_drive_volt_gen_t`

Detailed description

LCD Drive Voltage Generator Select.

Enumerated values

Name	Description
SLCDC_VOLT_EXTERNAL	External resistance division method.
SLCDC_VOLT_INTERNAL	Internal voltage boosting method.
SLCDC_VOLT_CAPACITOR	Capacitor split method.

8.34.7.6 slcdc_display_area_control_blink_t

`slcdc_display_area_control_blink_t`

Detailed description

Display Data Area Control

Enumerated values

Name	Description
SLCDC_NOT_BLINKING	Alternately displaying A-pattern and B-pattern area data.
SLCDC_BLINKING	Displaying an A-pattern or B-pattern area data.

8.34.7.7 slcdc_display_area_t

`slcdc_display_area_t`

Detailed description

Display Area data

Enumerated values

Name	Description
SLCDC_DISP_A	Displaying an A-pattern area data.
SLCDC_DISP_B	Displaying an B-pattern area data.
SLCDC_DISP_BLINK	

8.34.7.8 slcdc_display_on_off_t

`slcdc_display_on_off_t`

Detailed description

LCD Display Enable/Disable

Enumerated values

Name	Description
SLCDC_DISP_OFF	Display off.
SLCDC_DISP_ON	Display on.

8.34.7.9 slcdc_display_enable_disable_t

`slcdc_display_enable_disable_t`

Detailed description

LCD Display output enable

Enumerated values

Name	Description
SLCDC_DISP_DISABLE	Output ground level to segment/common pin.
SLCDC_DISP_ENABLE	Output enable.

8.34.7.10 slcdc_display_clock_t

`slcdc_display_clock_t`

Detailed description

LCD Display clock selection

Enumerated values

Name	Description
SLCDC_CLOCK_LOCO	Display clock source LOCO.
SLCDC_CLOCK_SOSC	Display clock source SOSC.
SLCDC_CLOCK_MOSC	Display clock source MOSC.
SLCDC_CLOCK_HOCO	Display clock source HOCO.

8.34.7.11 slcdc_clk_div_t

`slcdc_clk_div_t`

Detailed description

LCD clock settings

Enumerated values

Name	Description
SLCDC_CLK_DIVISOR_LOCO_4	LOCO Clock/4.
SLCDC_CLK_DIVISOR_LOCO_8	LOCO Clock/8.
SLCDC_CLK_DIVISOR_LOCO_16	LOCO Clock/16.
SLCDC_CLK_DIVISOR_LOCO_32	LOCO Clock/32.
SLCDC_CLK_DIVISOR_LOCO_64	LOCO Clock/64.
SLCDC_CLK_DIVISOR_LOCO_128	LOCO Clock/128.
SLCDC_CLK_DIVISOR_LOCO_256	LOCO Clock/256.
SLCDC_CLK_DIVISOR_LOCO_512	LOCO Clock/512.
SLCDC_CLK_DIVISOR_LOCO_1024	LOCO Clock/1024.
SLCDC_CLK_DIVISOR_HOCO_256	HOCO Clock/256.
SLCDC_CLK_DIVISOR_HOCO_512	HOCO Clock/512.
SLCDC_CLK_DIVISOR_HOCO_1024	HOCO Clock/1024.
SLCDC_CLK_DIVISOR_HOCO_2048	HOCO Clock/2048.
SLCDC_CLK_DIVISOR_HOCO_4096	HOCO Clock/4096.
SLCDC_CLK_DIVISOR_HOCO_8192	HOCO Clock/8192.
SLCDC_CLK_DIVISOR_HOCO_16384	HOCO Clock/16384.
SLCDC_CLK_DIVISOR_HOCO_32768	HOCO Clock/32768.
SLCDC_CLK_DIVISOR_HOCO_65536	HOCO Clock/65536.
SLCDC_CLK_DIVISOR_HOCO_131072	HOCO Clock/131072.
SLCDC_CLK_DIVISOR_HOCO_262144	HOCO Clock/262144.

Name	Description
SLCDC_CLK_DIVISOR_HOCO_524288	HOCO Clock/524288.

8.34.7.12 slcdc_size_t

```
typedef uint8_t slcdc_size_t
```

Detailed description

Size definition for slcdc

8.34.7.13 slcdc_ctrl_t

```
typedef void slcdc_ctrl_t
```

Detailed description

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented as

- slcdc_instance_ctrl_tSLCDC control block

8.34.8 API Structures

8.34.8.1 slcdc_cfg_t

slcdc_cfg_t

Detailed description

SLCDC configuration block

Variables

- slcdc_display_clock_t slcdc_clock
  LCD clock source (LCDSCKSEL)
- slcdc_clk_div_t slcdc_clock_setting
  LCD clock setting (LCDC0)
- slcdc_bias_method_t bias_method
  LCD display bias method select (LBAS bit).
- slcdc_time_slice_t time_slice
  Time slice of LCD display select (LDTY bit)
- slcdc_wave_form_t wave_form
  LCD display waveform select (LWAVE bit).
- slcdc_drive_volt_gen_t drive_volt_gen
  LCD Drive Voltage Generator Select (MDSTET bit).

8.34.8.2 slcdc_api_t

slcdc_api_t

Detailed description

SLCDC functions implemented at the HAL layer will follow this API.

8.34.8.3 open

```
ssp_err_t(* slcdc_api_t::open) (slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const
*const p_cfg)
```

Detailed description

Open SLCD device. Implemented as

- R_SLCDC_Open

Table 1292:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to display interface control block. Must be declared by user. Value set here.
p_cfg	in	Pointer to display configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

Parameter p_cfg

Definition: `slcdc_cfg_t const *const p_cfg`

SLCDC configuration block

- `slcdc_cfg_t`::`slcdc_display_clock_t`

  LCD clock source (LCDSCKSEL)

  Enumerated as:

  – SLCDC_CLOCK_LOCO

  – SLCDC_CLOCK_SOSC

  – SLCDC_CLOCK_MOSC

  – SLCDC_CLOCK_HOCO

- slcdc_cfg_t::slcdc_clk_div_t

  LCD clock setting (LCDC0)

  Enumerated as:

  – SLCDC_CLK_DIVISOR_LOCO_4
  – SLCDC_CLK_DIVISOR_LOCO_8
  – SLCDC_CLK_DIVISOR_LOCO_16
  – SLCDC_CLK_DIVISOR_LOCO_32
  – SLCDC_CLK_DIVISOR_LOCO_64
  – SLCDC_CLK_DIVISOR_LOCO_128
  – SLCDC_CLK_DIVISOR_LOCO_256
  – SLCDC_CLK_DIVISOR_LOCO_512
  – SLCDC_CLK_DIVISOR_LOCO_1024
  – SLCDC_CLK_DIVISOR_HOCO_256
  – SLCDC_CLK_DIVISOR_HOCO_512
  – SLCDC_CLK_DIVISOR_HOCO_1024
  – SLCDC_CLK_DIVISOR_HOCO_2048
  – SLCDC_CLK_DIVISOR_HOCO_4096
  – SLCDC_CLK_DIVISOR_HOCO_8192
  – SLCDC_CLK_DIVISOR_HOCO_16384
  – SLCDC_CLK_DIVISOR_HOCO_32768
  – SLCDC_CLK_DIVISOR_HOCO_65536
  – SLCDC_CLK_DIVISOR_HOCO_131072
  – SLCDC_CLK_DIVISOR_HOCO_262144
  – SLCDC_CLK_DIVISOR_HOCO_524288

- slcdc_cfg_t::slcdc_bias_method_t

  LCD display bias method select (LBAS bit).

  Enumerated as:

  – SLCDC_BIAS_2
  – SLCDC_BIAS_3
  – SLCDC_BIAS_4

- slcdc_cfg_t::slcdc_time_slice_t

  Time slice of LCD display select (LDTY bit)

  Enumerated as:

  – SLCDC_STATIC

  – SLCDC_SLICE_2

  – SLCDC_SLICE_3

  – SLCDC_SLICE_4

  – SLCDC_SLICE_8

- slcdc_cfg_t::slcdc_wave_form_t

  LCD display waveform select (LWAVE bit).

  Enumerated as:

  – SLCDC_WAVE_A

  – SLCDC_WAVE_B

- slcdc_cfg_t::slcdc_drive_volt_gen_t

  LCD Drive Voltage Generator Select (MDSTET bit).

  Enumerated as:

  – SLCDC_VOLT_EXTERNAL

  – SLCDC_VOLT_INTERNAL

  – SLCDC_VOLT_CAPACITOR

8.34.8.4 write

```
ssp_err_t(* slcdc_api_t::write) (slcdc_ctrl_t *const p_ctrl, slcdc_size_t const
start_segment, slcdc_size_t const *const p_data, slcdc_size_t const segment_count)
```

Detailed description

Write data to SLCD segment. Specifies the initial display data. Except for 8-time slice, store values in the lower 4 bits when writing to the A-pattern area, and in the upper 4 bits when writing to the B-pattern area. The display data is stored in the display data register. Implemented as

- R_SLCDC_Write

Table 1293:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Table 1293:Parameters (Continued)

Name	Direction	Description
start_segment	in	Specify the start segment number to be written.
p_data	in	pointer to the display data to be written to the specified segments
segment_count	in	Number of segments to be written

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

Parameter start_segment

Definition: `slcdc_size_tconst start_segment`

Size definition for slcdc

Parameter p_data

Definition: `slcdc_size_tconst *const p_data`

Size definition for slcdc

Parameter segment_count

Definition: `slcdc_size_tconst segment_count`

Size definition for slcdc

8.34.8.5 modify

```
ssp_err_t(* slcdc_api_t::modify) (slcdc_ctrl_t *const p_ctrl, slcdc_size_t const
segment, slcdc_size_t const data_mask, slcdc_size_t const data)
```

Detailed description

Rewrite data in the SLCD segment. Rewrites the LCD display data in 1-bit units. If a bit is not specified for rewriting, the value stored in the bit is held as it is. Specifies the data to rewrite Implemented as

- R_SLCDC_Modify

Table 1294:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.
seg	in	Specify the segment to be written.

Table 1294:Parameters (Continued)

Name	Direction	Description
data_mask	in	Mask the data being displayed. Set 0 to the bit to be rewritten and set 1 to the other bits. Multiple bits can be rewritten. Setting value of data_mask, Bit 3 - 0xf7 Bit 2 - 0xfb Bit 1 - 0xfd Bit 0 - 0xfe
data	in	Specify display data to rewrite to the specified segment.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

Parameter seg

Definition: `slcdc_size_tconst segment`

Size definition for slcdc

Parameter data_mask

Definition: `slcdc_size_tconst data_mask`

Size definition for slcdc

Parameter data

Definition: `slcdc_size_tconst data`

Size definition for slcdc

8.34.8.6 start

```
ssp_err_t(* slcdc_api_t::start) (slcdc_ctrl_t *const p_ctrl)
```

Detailed description

Enable display on the SLCD. Displays the specified data on the LCD. Before that data should be written to the segments. Implemented as

- R_SLCDC_Start

Table 1295:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

8.34.8.7 stop

```
ssp_err_t(* slcdc_api_t::stop) (slcdc_ctrl_t *const p_ctrl)
```

Detailed description

Disable display on the SLCD. Stops displaying data on the SLCD. Implemented as

- R_SLCDC_Stop

Table 1296:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

8.34.8.8 contrastIncrease

```
ssp_err_t(* slcdc_api_t::contrastIncrease) (slcdc_ctrl_t *const p_ctrl)
```

Detailed description

Increase the display contrast. Increase by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator Implemented as

- R_SLCDC_ContrastIncrease

Table 1297:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

8.34.8.9 contrastDecrease

```
ssp_err_t(* slcdc_api_t::contrastDecrease) (slcdc_ctrl_t *const p_ctrl)
```

Detailed description

Decrease the display contrast. Decrease by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator Implemented as

- R_SLCDC_ContrastDecrease

Table 1298:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

8.34.8.10 setdisplayArea

```
ssp_err_t(* slcdc_api_t::setdisplayArea) (slcdc_ctrl_t *const p_ctrl,
slcdc_display_area_t const display_area)
```

Detailed description

Set LCD display area. This function sets a specified display area, A-pattern or B-pattern. This function can be used to set blink on where A-pattern and B-pattern area data will be alternately displayed.

When using blinking, the RTC is required to operate before this function is executed. To configure the RTC, follow the steps below. 1) Open RTC 2) Set Periodic interrupt request, 1/2 second 3) Start RTC counter 4) Enable IRQ, RTC_EVENT_PERIODIC_IRQ Refer to the User's Manual: Hardware for the detailed procedure.

Implemented as

- R_SLCDC_SetdisplayArea()

Table 1299:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Table 1299:Parameters (Continued)

Name	Direction	Description
display_area	in	Display area to be used, A-pattern or B-pattern area.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

Parameter display_area

8.34.8.11 close

```
ssp_err_t(* slcdc_api_t::close) (slcdc_ctrl_t *const p_ctrl)
```

Detailed description

Close display device. Implemented as

- R_SLCDC_Close

Table 1300:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to display interface control block.

Parameter p_ctrl

Definition: `slcdc_ctrl_t*const p_ctrl`

SLCDC control block. Allocate an instance specific control block to pass into the SLCDC API calls. Implemented asslcdc_instance_ctrl_tSLCDC control block

8.34.8.12 versionGet

```
ssp_err_t(* slcdc_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version. Implemented as

- R_SLCDC_VersionGet

Table 1301:Parameters

Name	Direction	Description
p_version	in	Pointer to the memory to store the version information.

Parameter p_version

8.34.8.13 slcdc_instance_t

slcdc_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- slcdc_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- slcdc_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- slcdc_api_t const * p_api

  Pointer to the API structure for this instance.

8.35 SPI Interface

Interface for SPI communications.

8.35.1 Summary

The SPI Interface provides access to the SPI bus API. The Interface implements the Simple SPI on SCI HAL layer driver module.

Implemented by:

- SPI
- Simple SPI on SCI

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

SPI Interface description: SPI Driver

8.35.2 Interface API

spi_api_t

Function name	Description
.open	Initialize a channel for SPI communication mode.
.read	Receive data from an SPI device.
.write	Transmit data to an SPI device.
.writeRead	Simultaneously transmit data to an SPI device while receiving data from a SPI device (full duplex).
.close	Remove power to the SPI channel designated by the handle and disable the associated interrupts.
.versionGet	Get the version information of the underlying driver.

8.35.3 Data structures

- spi_callback_args_t
- spi_cfg_t
- spi_instance_t

8.35.4 Enumerations

- spi_bit_width_t
- spi_mode_t
- spi_clk_phase_t
- spi_clk_polarity_t
- spi_mode_fault_t
- spi_bit_order_t
- spi_event_t
- spi_operation_t

8.35.5 Typedefs

- spi_ctrl_t

8.35.6 Defines

- #define SPI_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define SPI_API_VERSION_MINOR

  Initial value: `(4U)`

8.35.7 API Data

8.35.7.1 spi_bit_width_t

`spi_bit_width_t`

Detailed description

Data bit width

Enumerated values

Name	Description
SPI_BIT_WIDTH_8_BITS	Data bit width is 8 bits byte.
SPI_BIT_WIDTH_16_BITS	Data bit width is 16 bits word.
SPI_BIT_WIDTH_32_BITS	Data bit width is 32 bits long word.

8.35.7.2 spi_mode_t

`spi_mode_t`

Detailed description

Master or slave operating mode

Enumerated values

Name	Description
SPI_MODE_MASTER	Channel operates as SPI master.
SPI_MODE_SLAVE	Channel operates as SPI slave.

8.35.7.3 spi_clk_phase_t

`spi_clk_phase_t`

Detailed description

Clock phase

Enumerated values

Name	Description
SPI_CLK_PHASE_EDGE_ODD	0: Data sampling on odd edge, data variation on even edge
SPI_CLK_PHASE_EDGE_EVEN	1: Data variation on odd edge, data sampling on even edge

8.35.7.4 spi_clk_polarity_t

`spi_clk_polarity_t`

Detailed description

Clock polarity

Enumerated values

Name	Description
SPI_CLK_POLARITY_LOW	0: Clock polarity is low when idle
SPI_CLK_POLARITY_HIGH	1: Clock polarity is high when idle

8.35.7.5 spi_mode_fault_t

`spi_mode_fault_t`

Detailed description

Mode fault error flag. This error occurs when the device is setup as a master, but the SSLA line does not seem to be controlled by the master. This usually happens when the connecting device is also acting as master. A similar situation can also happen when configured as a slave.

Enumerated values

Name	Description
SPI_MODE_FAULT_ERROR_ENABLE	Mode fault error flag on.

Name	Description
SPI_MODE_FAULT_ERROR_DISABLE	Mode fault error flag off.

8.35.7.6 spi_bit_order_t

`spi_bit_order_t`

Detailed description

Bit-order

Enumerated values

Name	Description
SPI_BIT_ORDER_MSB_FIRST	Send MSB first in transmission.
SPI_BIT_ORDER_LSB_FIRST	Send LSB first in transmission.

8.35.7.7 spi_event_t

`spi_event_t`

Detailed description

SPI events

Enumerated values

Name	Description
SPI_EVENT_TRANSFER_COMPLETE	The data transfer was completed.
SPI_EVENT_TRANSFER_ABORTED	The data transfer was aborted.
SPI_EVENT_ERR_MODE_FAULT	Mode fault error.
SPI_EVENT_ERR_READ_OVERFLOW	Read overflow error.
SPI_EVENT_ERR_PARITY	Parity error.
SPI_EVENT_ERR_OVERRUN	Overrun error.
SPI_EVENT_ERR_FRAMING	Framing error.
SPI_EVENT_ERR_MODE_UNDERRUN	Underrun error.

8.35.7.8 spi_operation_t

```
spi_operation_t
```

Detailed description

Used by control block only.

Enumerated values

Name	Description
SPI_OPERATION_DO_TX	perform SPI transmission operation
SPI_OPERATION_DO_RX	perform SPI reception operation
SPI_OPERATION_DO_TX_RX	perform SPI Transmission and reception operation

8.35.7.9 spi_ctrl_t

```
typedef void spi_ctrl_t
```

Detailed description

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented as

- sci_spi_instance_ctrl_t
- rspi_instance_ctrl_t

8.35.8 API Structures

8.35.8.1 spi_callback_args_t

spi_callback_args_t

Detailed description

Common callback parameter definition

Variables

- uint32_t channel

  Device channel number.

- spi_event_t event

  Event code.

- void const * p_context

  Context provided to user during callback.

8.35.8.2 spi_cfg_t

spi_cfg_t

Detailed description

SPI interface configuration

Variables

- uint8_t channel

  Channel number to be used.
- uint8_t rxi_ipl

  Receive interrupt priority.
- uint8_t txi_ipl

  Transmit interrupt priority.
- uint8_t tei_ipl

  Transmit end interrupt priority.
- uint8_t eri_ipl

  Error interrupt priority.
- spi_mode_t operating_mode

  Select master or slave operating mode.
- spi_clk_phase_t clk_phase

  Data sampling on odd or even clock edge.
- spi_clk_polarity_t clk_polarity

  Clock level when idle.
- spi_mode_fault_t mode_fault

  Mode fault error (master/slave conflict) flag.
- spi_bit_order_t bit_order

  Select to transmit MSB/LSB first.
- uint32_t bitrate

  Bits Per Second.
- transfer_instance_t const * p_transfer_tx

  To use SPI DTC/DMA write transfer, link a DTC/DMA instance here. Set to NULL if unused.
- transfer_instance_t const * p_transfer_rx

  To use SPI DTC/DMA read transfer, link a DTC/DMA instance here. Set to NULL if unused.
- void(* p_callback)(spi_callback_args_t *p_args)

  Pointer to user callback function.

- void const * p_context

  User defined context passed to callback function.

- void const * p_extend

  Extended SPI hardware dependent configuration.

8.35.8.3 spi_api_t

spi_api_t

Detailed description

Shared Interface definition for SPI

8.35.8.4 open

```
ssp_err_t(* spi_api_t::open) (spi_ctrl_t *p_ctrl, spi_cfg_t const *const p_cfg)
```

Detailed description

Initialize a channel for SPI communication mode. Implemented as

- R_RSPI_Open
- R_SCI_SPI_Open

Table 1302:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to user-provided storage for the control block.
p_cfg	in	Pointer to SPI configuration structure.

Parameter p_ctrl

Definition: `spi_ctrl_t*p_ctrl`

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented assci_spi_instance_ctrl_trspi_instance_ctrl_t

Parameter p_cfg

Definition: `spi_cfg_t const *const p_cfg`

SPI interface configuration

- `spi_cfg_t::channel`

  Channel number to be used.

- `spi_cfg_t::rxi_ipl`

  Receive interrupt priority.

- spi_cfg_t::txi_ipl

  Transmit interrupt priority.

- spi_cfg_t::tei_ipl

  Transmit end interrupt priority.

- spi_cfg_t::eri_ipl

  Error interrupt priority.

- spi_cfg_t::spi_mode_t

  Select master or slave operating mode.

  Enumerated as:

  – SPI_MODE_MASTER

  – SPI_MODE_SLAVE

- spi_cfg_t::spi_clk_phase_t

  Data sampling on odd or even clock edge.

  Enumerated as:

  – SPI_CLK_PHASE_EDGE_ODD

  – SPI_CLK_PHASE_EDGE_EVEN

- spi_cfg_t::spi_clk_polarity_t

  Clock level when idle.

  Enumerated as:

  – SPI_CLK_POLARITY_LOW

  – SPI_CLK_POLARITY_HIGH

- spi_cfg_t::spi_mode_fault_t

  Mode fault error (master/slave conflict) flag.

  Enumerated as:

  – SPI_MODE_FAULT_ERROR_ENABLE

  – SPI_MODE_FAULT_ERROR_DISABLE

- spi_cfg_t::spi_bit_order_t

  Select to transmit MSB/LSB first.

  Enumerated as:

  – SPI_BIT_ORDER_MSB_FIRST

  – SPI_BIT_ORDER_LSB_FIRST

- spi_cfg_t::bitrate

  Bits Per Second.

- spi_cfg_t::transfer_instance_t

  To use SPI DTC/DMA write transfer, link a DTC/DMA instance here. Set to NULL if unused.

- spi_cfg_t::transfer_instance_t

  To use SPI DTC/DMA read transfer, link a DTC/DMA instance here. Set to NULL if unused.

- spi_cfg_t::p_callback

  Pointer to user callback function.

- spi_cfg_t::p_context

  User defined context passed to callback function.

- spi_cfg_t::p_extend

  Extended SPI hardware dependent configuration.

8.35.8.5 read

```
ssp_err_t(* spi_api_t::read) (spi_ctrl_t *const p_ctrl, void const *p_dest,
uint32_t const length, spi_bit_width_t const bit_width)
```

Detailed description

Receive data from an SPI device. Implemented as

- R_RSPI_Read
- R_SCI_SPI_Read

Table 1303:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the channel.
length	in	Number of units of data to be transferred (unit size specified by the bit_width).
bit_width	in	Data bit width to be transferred.
p_dest	out	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count.

Parameter p_ctrl

Definition: `spi_ctrl_t*const p_ctrl`

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented assci_spi_instance_ctrl_trspi_instance_ctrl_t

Parameter length

`uint32_t`

Parameter bit_width

Parameter p_dest

`const`

8.35.8.6 write

```
ssp_err_t(* spi_api_t::write) (spi_ctrl_t *const p_ctrl, void const *p_src,
uint32_t const length, spi_bit_width_t const bit_width)
```

Detailed description

Transmit data to an SPI device. Implemented as

- R_RSPI_Write
- R_SCI_SPI_Write

Table 1304:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the channel.
p_src	in	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
length	in	Number of units of data to be transferred (unit size specified by the bit_width).
bit_width	in	Data bit width to be transferred.

Parameter p_ctrl

Definition: `spi_ctrl_t*const p_ctrl`

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented assci_spi_instance_ctrl_trspi_instance_ctrl_t

Parameter p_src

`const`

Parameter length

uint32_t

Parameter bit_width

8.35.8.7 writeRead

```
ssp_err_t(* spi_api_t::writeRead) (spi_ctrl_t *const p_ctrl, void const *p_src,
void const *p_dest, uint32_t const length, spi_bit_width_t const bit_width)
```

Detailed description

Simultaneously transmit data to an SPI device while receiving data from a SPI device (full duplex). Implemented as

- R_RSPI_WriteRead
- R_SCI_SPI_WriteRead

Table 1305:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the channel.
p_src	in	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
p_dest	out	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count. The argument must not be NULL.
length	in	Number of units of data to be transferred (unit size specified by the bit_width).
bit_width	in	Data bit width to be transferred.

Parameter p_ctrl

Definition: spi_ctrl_t*const p_ctrl

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented assci_spi_instance_ctrl_trspi_instance_ctrl_t

Parameter p_src

const

Parameter p_dest

`const`

Parameter length

`uint32_t`

Parameter bit_width

8.35.8.8 close

```
ssp_err_t(* spi_api_t::close) (spi_ctrl_t *const p_ctrl)
```

Detailed description

Remove power to the SPI channel designated by the handle and disable the associated interrupts. Implemented as

- R_RSPI_Close
- R_SCI_SPI_Close

Table 1306:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the channel.

Parameter p_ctrl

Definition: `spi_ctrl_t*const p_ctrl`

SPI control block. Allocate an instance specific control block to pass into the SPI API calls. Implemented assci_spi_instance_ctrl_trspi_instance_ctrl_t

8.35.8.9 versionGet

```
ssp_err_t(* spi_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get the version information of the underlying driver. Implemented as

- R_RSPI_VersionGet
- R_SCI_SPI_VersionGet

Table 1307:Parameters

Name	Direction	Description
p_version	out	pointer to memory location to return version number

Parameter p_version

8.35.8.10 spi_instance_t

spi_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- spi_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- spi_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- spi_api_t const * p_api

  Pointer to the API structure for this instance.

8.36 Timer Interface

Interface for timer functions.

8.36.1 Summary

The general timer interface provides standard timer functionality including periodic mode, one-shot mode, and free-running timer mode. After each timer cycle (overflow or underflow), an interrupt can be triggered.

If an instance supports output compare mode, it is provided in the extension configuration timer_on_<instance>_cfg_t defined in r_<instance>.h.

Implemented by:

- GPT
- AGT

- Using SSP Modules

Timer Interface description: Timer Driver

8.36.2 Interface API

timer_api_t

Function name	Description
.open	Initial configuration.
.stop	Stop the counter.
.start	Start the counter.
.reset	Reset the counter to the initial value.
.counterGet	Get current counter value and store it in provided pointer p_value.
.periodSet	Set the time until the timer expires.
.dutyCycleSet	Sets the time until the duty cycle expires.
.infoGet	Get the time until the timer expires in clock counts and store it in provided pointer p_period_counts.
.close	Allows driver to be reconfigured and may reduce power consumption.
.versionGet	Get version and store it in provided pointer p_version.

8.36.3 Data structures

- timer_callback_args_t
- timer_info_t
- timer_cfg_t
- timer_instance_t

8.36.4 Enumerations

- timer_event_t
- timer_variant_t
- timer_status_t
- timer_mode_t
- timer_unit_t
- timer_pwm_unit_t
- timer_direction_t

8.36.5 Typedefs

- timer_size_t
- timer_ctrl_t
- timer_period_t

8.36.6 Defines

- #define TIMER_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define TIMER_API_VERSION_MINOR

  Initial value: `(2U)`

8.36.7 API Data

8.36.7.1 timer_event_t

`timer_event_t`

Detailed description

Events that can trigger a callback function

Enumerated values

Name	Description
TIMER_EVENT_EXPIRED	Requested timer delay has expired or timer has wrapped around.

8.36.7.2 timer_variant_t

`timer_variant_t`

Detailed description

Timer variant types.

Enumerated values

Name	Description
TIMER_VARIANT_32_BIT	32-bit timer
TIMER_VARIANT_16_BIT	16-bit timer

8.36.7.3 timer_status_t

`timer_status_t`

Detailed description

Possible status values returned by infoGet.

Enumerated values

Name	Description
TIMER_STATUS_COUNTING	Timer is running.
TIMER_STATUS_STOPPED	Timer is stopped.

8.36.7.4 timer_mode_t

`timer_mode_t`

Detailed description

Timer operational modes

Enumerated values

Name	Description
TIMER_MODE_PERIODIC	Timer will restart after delay periods.
TIMER_MODE_ONE_SHOT	Timer will stop after delay periods.
TIMER_MODE_PWM	Timer generate PWM output.

8.36.7.5 timer_unit_t

```
timer_unit_t
```

Detailed description

Units of timer period value.

Enumerated values

Name	Description
TIMER_UNIT_PERIOD_RAW_COUNTS	Period in clock counts.
TIMER_UNIT_PERIOD_NSEC	Period in nanoseconds.
TIMER_UNIT_PERIOD_USEC	Period in microseconds.
TIMER_UNIT_PERIOD_MSEC	Period in milliseconds.
TIMER_UNIT_PERIOD_SEC	Period in seconds.
TIMER_UNIT_FREQUENCY_HZ	Frequency in Hz.
TIMER_UNIT_FREQUENCY_KHZ	Frequency in kHz.

8.36.7.6 timer_pwm_unit_t

```
timer_pwm_unit_t
```

Detailed description

Units of timer duty cycle value.

Enumerated values

Name	Description
TIMER_PWM_UNIT_RAW_COUNTS	Period in clock counts.
TIMER_PWM_UNIT_PERCENT	Percent unit used for duty cycle.
TIMER_PWM_UNIT_PERCENT_X_1000	Percent multiplied by 1000 for extra resolution.

8.36.7.7 timer_direction_t

```
timer_direction_t
```

Detailed description

Direction of timer count

Enumerated values

Name	Description
TIMER_DIRECTION_DOWN	Timer count goes up.
TIMER_DIRECTION_UP	Timer count goes down.

8.36.7.8 timer_size_t

```
typedef uint32_t timer_size_t
```

Detailed description

Largest supported timer size. Currently up to 32-bit timers are supported. If a 16-bit timer is used, only the bottom 16 bits of any timer_size_t parameter can be used. Passing in values larger than 16 bits would result in an error.

8.36.7.9 timer_ctrl_t

```
typedef void timer_ctrl_t
```

Detailed description

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented as

- gpt_instance_ctrl_t
- agt_instance_ctrl_t

8.36.7.10 timer_period_t

```
typedef timer_size_t timer_period_t
```

Detailed description

DEPRECATED: Recommend using timer_size_t for period.

8.36.8 API Structures

8.36.8.1 timer_callback_args_t

timer_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Placeholder for user data. Set in timer_api_t::open function in timer_cfg_t.

- timer_event_t event

  The event can be used to identify what caused the callback (overflow or error).

8.36.8.2 timer_info_t

timer_info_t

Detailed description

Timer information structure to store various information for a timer resource

Variables

- timer_direction_t count_direction

  Clock counting direction of the timer resource.

- uint32_t clock_frequency

  Clock frequency of the timer resource.

- timer_size_t period_counts

  Time in clock counts until timer will expire.

- timer_status_t status
- elc_event_t elc_event

  ELC event associated with the count operation of the timer resource.

8.36.8.3 timer_cfg_t

timer_cfg_t

Detailed description

User configuration structure, used in open function

Variables

- timer_mode_t mode

  Select enumerated value from timer_mode_t.

- uint32_t period

  Defines when the timer should expire. For a free running counter, set to TIMER_MAX_CLOCK with unit TIMER_UNIT_PERIOD_RAW_COUNTS
- timer_unit_t unit

  Units of timer_cfg_t::period.
- timer_size_t duty_cycle

  Duty cycle in units timer_cfg_t::duty_cycle_unit.
- timer_pwm_unit_t duty_cycle_unit

  Units of timer_cfg_t::duty_cycle.
- uint8_t channel

  Select a channel corresponding to the channel number of the hardware.
- uint8_t irq_ipl

  Timer interrupt priority.
- bool autostart

  Whether to start during Open call or not. True: Start during open. False: Don't start during open.
- void(* p_callback)(timer_callback_args_t *p_args)

  Callback provided when a timer ISR occurs. Set to NULL for no CPU interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user callback in timer_callback_args_t.
- void const * p_extend

  Extension parameter for hardware specific settings.

8.36.8.4 timer_api_t

timer_api_t

Detailed description

Timer API structure. General timer functions implemented at the HAL layer follow this API.

8.36.8.5 open

```
ssp_err_t(* timer_api_t::open) (timer_ctrl_t *const p_ctrl, timer_cfg_t const
*const p_cfg)
```

Detailed description

Initial configuration. Implemented as

- R_GPT_TimerOpen
- R_AGT_TimerOpen

NOTE: To reconfigure after calling this function, call close first.

Table 1308:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

Parameter p_cfg

Definition: `timer_cfg_t const *const p_cfg`

User configuration structure, used in open function

- `timer_cfg_t`::`timer_mode_t`

  Select enumerated value from timer_mode_t.

  Enumerated as:

  – TIMER_MODE_PERIODIC

  – TIMER_MODE_ONE_SHOT

  – TIMER_MODE_PWM

- `timer_cfg_t`::`period`

  Defines when the timer should expire. For a free running counter, set to TIMER_MAX_CLOCK with unit TIMER_UNIT_PERIOD_RAW_COUNTS

- `timer_cfg_t`::`timer_unit_t`

  Units of timer_cfg_t::period.

  Enumerated as:

  – TIMER_UNIT_PERIOD_RAW_COUNTS

  – TIMER_UNIT_PERIOD_NSEC

  – TIMER_UNIT_PERIOD_USEC

  - TIMER_UNIT_PERIOD_MSEC
  - TIMER_UNIT_PERIOD_SEC
  - TIMER_UNIT_FREQUENCY_HZ
  - TIMER_UNIT_FREQUENCY_KHZ
- timer_cfg_t::timer_size_t

  Duty cycle in units timer_cfg_t::duty_cycle_unit.
- timer_cfg_t::timer_pwm_unit_t

  Units of timer_cfg_t::duty_cycle.

  Enumerated as:
  - TIMER_PWM_UNIT_RAW_COUNTS
  - TIMER_PWM_UNIT_PERCENT
  - TIMER_PWM_UNIT_PERCENT_X_1000
- timer_cfg_t::channel

  Select a channel corresponding to the channel number of the hardware.
- timer_cfg_t::irq_ipl

  Timer interrupt priority.
- timer_cfg_t::autostart

  Whether to start during Open call or not. True: Start during open. False: Don't start during open.
- timer_cfg_t::p_callback

  Callback provided when a timer ISR occurs. Set to NULL for no CPU interrupt.
- timer_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in timer_callback_args_t.
- timer_cfg_t::p_extend

  Extension parameter for hardware specific settings.

8.36.8.6 stop

```
ssp_err_t(* timer_api_t::stop) (timer_ctrl_t *const p_ctrl)
```

Detailed description

Stop the counter. Implemented as

- R_GPT_Stop
- R_AGT_Stop

Table 1309:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

8.36.8.7 start

```
ssp_err_t(* timer_api_t::start) (timer_ctrl_t *const p_ctrl)
```

Detailed description

Start the counter. Implemented as

- R_GPT_Start
- R_AGT_Start

NOTE: The counter can also be started in the open function if autostart is true.

Table 1310:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

8.36.8.8 reset

```
ssp_err_t(* timer_api_t::reset) (timer_ctrl_t *const p_ctrl)
```

Detailed description

Reset the counter to the initial value. Implemented as

- R_GPT_Reset
- R_AGT_Reset

Table 1311:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

8.36.8.9 counterGet

```
ssp_err_t(* timer_api_t::counterGet) (timer_ctrl_t *const p_ctrl, timer_size_t
*const p_value)
```

Detailed description

Get current counter value and store it in provided pointer p_value. Implemented as

- R_GPT_CounterGet
- R_AGT_CounterGet

Table 1312:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
p_value	out	Pointer to store current counter value.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

Parameter p_value

Definition: `timer_size_t*const p_value`

Largest supported timer size. Currently up to 32-bit timers are supported. If a 16-bit timer is used, only the bottom 16 bits of any timer_size_t parameter can be used. Passing in values larger than 16 bits would result in an error.

8.36.8.10 periodSet

```
ssp_err_t(* timer_api_t::periodSet) (timer_ctrl_t *const p_ctrl, timer_size_t
const period, timer_unit_t const unit)
```

Detailed description

Set the time until the timer expires. Implemented as

- R_GPT_PeriodSet
- R_AGT_PeriodSet

NOTE: Timer expiration may or may not generate a CPU interrupt based on how the timer is configured in open.

Table 1313:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
period	in	Time until timer should expire.
unit	in	Units of period parameter.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

Parameter period

Definition: `timer_size_tconst period`

Largest supported timer size. Currently up to 32-bit timers are supported. If a 16-bit timer is used, only the bottom 16 bits of any timer_size_t parameter can be used. Passing in values larger than 16 bits would result in an error.

Parameter unit

8.36.8.11 dutyCycleSet

```
ssp_err_t(* timer_api_t::dutyCycleSet) (timer_ctrl_t *const p_ctrl, timer_size_t
const duty_cycle, timer_pwm_unit_t const duty_cycle_unit, uint8_t const pin)
```

Detailed description

Sets the time until the duty cycle expires.

Table 1314:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
duty_cycle	in	Time until duty cycle should expire.
duty_cycle_unit	in	Units of duty_cycle parameter.
pin	in	Which output pin to update. Enter the pin number or if pins are identified by letters, enter 0 for A, 1 for B, 2 for C, etc.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

Parameter duty_cycle

Definition: `timer_size_tconst duty_cycle`

Largest supported timer size. Currently up to 32-bit timers are supported. If a 16-bit timer is used, only the bottom 16 bits of any timer_size_t parameter can be used. Passing in values larger than 16 bits would result in an error.

Parameter duty_cycle_unit

Definition: `timer_pwm_unit_tconst duty_cycle_unit`

Units of timer duty cycle value.

Parameter pin

`uint8_t`

8.36.8.12 infoGet

```
ssp_err_t(* timer_api_t::infoGet) (timer_ctrl_t *const p_ctrl, timer_info_t
*const p_info)
```

Detailed description

Get the time until the timer expires in clock counts and store it in provided pointer p_period_counts. Implemented as

- R_GPT_InfoGet
- R_AGT_InfoGet

Table 1315:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.
p_info	out	Collection of information for this timer.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

Parameter p_info

Definition: `timer_info_t*const p_info`

Timer information structure to store various information for a timer resource

- `timer_info_t::count_direction`

  Clock counting direction of the timer resource.
- `timer_info_t::clock_frequency`

  Clock frequency of the timer resource.
- `timer_info_t::period_counts`

  Time in clock counts until timer will expire.
- `timer_info_t::status`
- `timer_info_t::elc_event`

  ELC event associated with the count operation of the timer resource.

8.36.8.13 close

```
ssp_err_t(* timer_api_t::close) (timer_ctrl_t *const p_ctrl)
```

Detailed description

Allows driver to be reconfigured and may reduce power consumption. Implemented as

- R_GPT_Close
- R_AGT_Close

Table 1316:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this timer.

Parameter p_ctrl

Definition: `timer_ctrl_t*const p_ctrl`

Timer control block. Allocate an instance specific control block to pass into the timer API calls. Implemented asgpt_instance_ctrl_tagt_instance_ctrl_t

8.36.8.14 versionGet

```
ssp_err_t(* timer_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Get version and store it in provided pointer p_version. Implemented as

- R_GPT_VersionGet
- R_AGT_VersionGet

Table 1317:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.36.8.15 timer_instance_t

timer_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- timer_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- timer_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- timer_api_t const * p_api

  Pointer to the API structure for this instance.

8.37 Transfer Interface

Interface for data transfer functions.

8.37.1 Summary

The transfer interface supports background data transfer (no CPU intervention).

The transfer interface can be implemented by:

- DTC
- DMAC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Transfer Interface description: Transfer Driver

8.37.2 Interface API

transfer_api_t

Function name	Description
.open	Initial configuration. Enables the transfer if auto_enable is true and p_src, p_dest, and length are valid. Transfers can also be enabled using enable or reset.

Function name	Description
.reset	Reset source address pointer, destination address pointer, and/or length, keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid.
.enable	Enable transfer. Transfers occur after the activation source event (or when start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as activation source).
.disable	Disable transfer. Transfers do not occur after the transfer_info_t::activation source event (or when start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source).
.start	Start transfer in software.
.stop	Stop transfer in software. The transfer will stop after completion of the current transfer.
.infoGet	Provides information about this transfer.
.close	Releases hardware lock. This allows a transfer to be reconfigured using open.
.versionGet	Gets version and stores it in provided pointer p_version.
.blockReset	Reset source address pointer, destination address pointer, and/or length, for block transfer keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid.

8.37.3 Data structures

- transfer_properties_t
- transfer_info_t

  Initial value: `(1U)`
- #define TRANSFER_API_VERSION_MINOR

  Initial value: `(2U)`

8.37.7 API Data

8.37.7.1 transfer_mode_t

`transfer_mode_t`

Detailed description

Transfer mode describes what will happen when a transfer request occurs.

Enumerated values

Name	Description
TRANSFER_MODE_NORMAL	In normal mode, each transfer request causes a transfer of transfer_size_t from the source pointer to the destination pointer. The transfer length is decremented and the source and address pointers are updated according to transfer_addr_mode_t. After the transfer length reaches 0, transfer requests will not cause any further transfers.

Name	Description
TRANSFER_MODE_REPEAT	Repeat mode is like normal mode, except that when the transfer length reaches 0, the pointer to the repeat area and the transfer length will be reset to their initial values. If DMAC is used, the transfer repeats only transfer_info_t::num_blocks times. After the transfer repeats transfer_info_t::num_blocks times, transfer requests will not cause any further transfers. If DTC is used, the transfer repeats continuously (no limit to the number of repeat transfers).
TRANSFER_MODE_BLOCK	In block mode, each transfer request causes transfer_info_t::length transfers of transfer_size_t. After each individual transfer, the source and destination pointers are updated according to transfer_addr_mode_t. After the block transfer is complete, transfer_info_t::num_blocks is decremented. After the transfer_info_t::num_blocks reaches 0, transfer requests will not cause any further transfers.

8.37.7.2 transfer_size_t

`transfer_size_t`

Detailed description

Transfer size specifies the size of each individual transfer. Total transfer length = transfer_size_t * transfer_length_t

Enumerated values

Name	Description
TRANSFER_SIZE_1_BYTE	Each transfer transfers an 8-bit value.
TRANSFER_SIZE_2_BYTE	Address pointer is incremented after each transfer.
TRANSFER_SIZE_4_BYTE	Address pointer is incremented after each transfer.

8.37.7.3 transfer_addr_mode_t

`transfer_addr_mode_t`

Detailed description

Address mode specifies whether to modify (increment or decrement) pointer after each transfer.

Enumerated values

Name	Description
TRANSFER_ADDR_MODE_FIXED	Address pointer remains fixed after each transfer.
TRANSFER_ADDR_MODE_INCREMENTED	Address pointer is incremented by associated transfer_size_t after each transfer.
TRANSFER_ADDR_MODE_DECREMENTED	Address pointer is decremented by associated transfer_size_t after each transfer.

8.37.7.4 transfer_repeat_area_t

`transfer_repeat_area_t`

Detailed description

Repeat area options (source or destination). In TRANSFER_MODE_REPEAT, the selected pointer returns to its original value after length transfers. In TRANSFER_MODE_BLOCK, the selected pointer returns to its original value after each transfer.

Enumerated values

Name	Description
TRANSFER_REPEAT_AREA_DESTINATION	Destination area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK.
TRANSFER_REPEAT_AREA_SOURCE	Source area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK.

8.37.7.5 transfer_chain_mode_t

`transfer_chain_mode_t`

Detailed description

Chain transfer mode options.
NOTE: Only applies for DTC.

Enumerated values

Name	Description
TRANSFER_CHAIN_MODE_DISABLED	Chain mode not used.

Name	Description
TRANSFER_CHAIN_MODE_EACH	Switch to next transfer after a single transfer from this transfer_info_t.
TRANSFER_CHAIN_MODE_END	Complete the entire transfer defined in this transfer_info_t before chaining to next transfer.

8.37.7.6 transfer_irq_t

`transfer_irq_t`

Detailed description

Interrupt options.

Enumerated values

Name	Description
TRANSFER_IRQ_END	Interrupt occurs only after last transfer. If this transfer is chained to a subsequent transfer, the interrupt will occur only after subsequent chained transfer(s) are complete. DTC triggers the interrupt of the activation source. Choosing TRANSFER_IRQ_END with DTC will prevent activation source interrupts until the transfer is complete.
TRANSFER_IRQ_EACH	Interrupt occurs after each transfer. Not available in all HAL drivers. See HAL driver for details. This will prevent chained transfers that would have happened after this one until the next activation source.

8.37.7.7 transfer_start_mode_t

`transfer_start_mode_t`

Detailed description

Select whether to start single or repeated transfer with software start.

Enumerated values

Name	Description
TRANSFER_START_MODE_SINGLE	Software start triggers single transfer.
TRANSFER_START_MODE_REPEAT	Software start transfer continues until transfer is complete.

8.37.7.8 transfer_ctrl_t

```
typedef void transfer_ctrl_t
```

Detailed description

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented as

- dtc_instance_ctrl_t
- dmac_instance_ctrl_t

8.37.8 API Structures

8.37.8.1 transfer_properties_t

transfer_properties_t

Detailed description

Driver specific information.

Variables

- uint32_t transfer_length_max

  Maximum number of transfers.

- uint16_t transfer_length_remaining

  Number of transfers remaining.

- bool in_progress

  Whether or not this transfer is in progress.

8.37.8.2 transfer_info_t

transfer_info_t

Detailed description

This structure specifies the properties of the transfer.
ATTENTION: When using DTC, this structure corresponds to the descriptor block registers required by the DTC. The following components may be modified by the driver: p_src, p_dest, num_blocks, and length.

ATTENTION: When using DTC, do NOT reuse this structure to configure multiple transfers. Each transfer must have a unique .

ATTENTION: When using DTC, this structure must not be allocated in a temporary location. Any instance of this structure must remain in scope until the transfer it is used for is closed.

NOTE: When using DTC, consider placing instances of this structure in a protected section of memory.

Variables

- uint32_t __pad0__
- uint32_t __pad1__
- transfer_addr_mode_t dest_addr_mode

  Select what happens to destination pointer after each transfer.
- transfer_repeat_area_t repeat_area

  Select to repeat source or destination area, unused in TRANSFER_MODE_NORMAL.
- transfer_irq_t irq

  Select if interrupts should occur after each individual transfer or after the completion of all planned transfers.
- transfer_chain_mode_t chain_mode

  Select when the chain transfer ends.
- uint32_t __pad2__
- transfer_addr_mode_t src_addr_mode

  Select what happens to source pointer after each transfer.
- transfer_size_t size

  Select number of bytes to transfer at once. transfer_info_t::length.
- transfer_mode_t mode

  Select mode from transfer_mode_t.
- void const *volatile p_src

  Source pointer.
- void *volatile p_dest

  Destination pointer.
- uint16_t num_blocks

  Number of blocks to transfer when using TRANSFER_MODE_BLOCK (both DTC an DMAC) and TRANSFER_MODE_REPEAT (DMAC only), unused in other modes.
- uint16_t length

  Length of each transfer. Range limited for TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT, see HAL driver for details.

8.37.8.3 transfer_callback_args_t

transfer_callback_args_t

Detailed description

Callback function parameter data.

Variables

- void const * p_context

  Placeholder for user data. Set in r_transfer_t::open function in transfer_cfg_t.

8.37.8.4 transfer_cfg_t

transfer_cfg_t

Detailed description

Driver configuration set in open. All elements except p_extend are required and must be initialized.

Variables

- transfer_info_t * p_info

  Pointer to transfer configuration options. If using chain transfer (DTC only), this can be a pointer to an array of chained transfers that will be completed in order.

- elc_event_t activation_source

  Select which event will trigger the transfer. Select ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 for software activation. When using DTC, these events may only be used once each. DMAC uses internal software start when either of these events are selected.

- bool auto_enable

  Select whether the transfer should be enabled after open.

- uint8_t irq_ipl

  Interrupt priority level. Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

- void(* p_callback)(transfer_callback_args_t *p_args)

  Callback for transfer end interrupt. Set to NULL for no CPU interrupt. Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

- void const * p_context

  Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

- void const * p_extend

  Extension parameter for hardware specific settings.

8.37.8.5 transfer_api_t

transfer_api_t

Detailed description

Transfer functions implemented at the HAL layer will follow this API.

8.37.8.6 open

```
ssp_err_t(* transfer_api_t::open) (transfer_ctrl_t *const p_ctrl, transfer_cfg_t
const *const p_cfg)
```

Detailed description

Initial configuration. Enables the transfer if auto_enable is true and p_src, p_dest, and length are valid. Transfers can also be enabled using enable or reset. Implemented as

- R_DTC_Open
- R_DMAC_Open

Table 1318:Parameters

Name	Direction	Description
p_ctrl	inout	Pointer to control block. Must be declared by user. Elements set here.
p_cfg	in	Pointer to configuration structure. All elements of this structure must be set by user.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

Parameter p_cfg

Definition: `transfer_cfg_t const *const p_cfg`

Driver configuration set in open. All elements except p_extend are required and must be initialized.

- `transfer_cfg_t`::`transfer_info_t`

  Pointer to transfer configuration options. If using chain transfer (DTC only), this can be a pointer to an array of chained transfers that will be completed in order.

- `transfer_cfg_t`::`elc_event_t`

  Select which event will trigger the transfer. Select ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 for software activation. When using DTC, these events may only be used once each. DMAC uses internal software start when either of these events are selected.

- `transfer_cfg_t`::`auto_enable`

  Select whether the transfer should be enabled after open.

- `transfer_cfg_t`::`irq_ipl`

  Interrupt priority level. Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

- `transfer_cfg_t`::`p_callback`

  Callback for transfer end interrupt. Set to NULL for no CPU interrupt. Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

- transfer_cfg_t::p_context

  Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

- transfer_cfg_t::p_extend

  Extension parameter for hardware specific settings.

8.37.8.7 reset

```
ssp_err_t(* transfer_api_t::reset) (transfer_ctrl_t *const p_ctrl, void const
*p_src, void *p_dest, uint16_t const num_transfers)
```

Detailed description

Reset source address pointer, destination address pointer, and/or length, keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid. Implemented as

- R_DTC_Reset
- R_DMAC_Reset

Table 1319:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.
p_src	in	Pointer to source. Set to NULL if source pointer should not change.
p_dest	in	Pointer to destination. Set to NULL if destination pointer should not change.
num_transfers	in	Transfer length in normal mode or number of blocks in block mode. In DMAC only, resets number of repeats (initially stored in num_blocks) in repeat mode. Not used in repeat mode for DTC.

Parameter p_ctrl

Definition: transfer_ctrl_t*const p_ctrl

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

Parameter p_src

const

Parameter p_dest

const

Parameter num_transfers

`uint16_t`

8.37.8.8 enable

```
ssp_err_t(* transfer_api_t::enable) (transfer_ctrl_t *const p_ctrl)
```

Detailed description

Enable transfer. Transfers occur after the activation source event (or when start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as activation source). Implemented as

- R_DMAC_Enable
- R_DTC_Enable

Table 1320:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

8.37.8.9 disable

```
ssp_err_t(* transfer_api_t::disable) (transfer_ctrl_t *const p_ctrl)
```

Detailed description

Disable transfer. Transfers do not occur after the transfer_info_t::activation source event (or when start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source).

NOTE: If a transfer is in progress, it will be completed. Subsequent transfer requests do not cause a transfer.

Implemented as

- R_DMAC_Disable
- R_DTC_Disable

Table 1321:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

8.37.8.10 start

```
ssp_err_t(* transfer_api_t::start) (transfer_ctrl_t *const p_ctrl,
transfer_start_mode_t mode)
```

Detailed description

Start transfer in software.

ATTENTION: Only works if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFT-WARE_EVENT_0 is chosen as transfer_info_t::activation_source.

NOTE: DTC only supports TRANSFER_START_MODE_SINGLE. DTC does not support TRANSFER_START_-MODE_REPEAT.

Implemented as

- R_DMAC_Start
- R_DTC_Start

Table 1322:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.
mode	in	Select mode from transfer_start_mode_t.

Parameter p_ctrl

Definition: transfer_ctrl_t*const p_ctrl

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

Parameter mode

8.37.8.11 stop

```
ssp_err_t(* transfer_api_t::stop) (transfer_ctrl_t *const p_ctrl)
```

Detailed description

Stop transfer in software. The transfer will stop after completion of the current transfer.

NOTE: Not supported for DTC.

NOTE: Only applies for transfers started with TRANSFER_START_MODE_REPEAT.

ATTENTION: Only works if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source.

Implemented as

- R_DMAC_Stop

Table 1323:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.

Parameter p_ctrl

Definition: transfer_ctrl_t*const p_ctrl

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

8.37.8.12 infoGet

```
ssp_err_t(* transfer_api_t::infoGet) (transfer_ctrl_t *const p_ctrl,
transfer_properties_t *const p_info)
```

Detailed description

Provides information about this transfer. Implemented as

- R_DTC_InfoGet
- R_DMAC_InfoGet

Table 1324:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.
p_info	out	Driver specific information.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

Parameter p_info

Definition: `transfer_properties_t*const p_info`

Driver specific information.

- `transfer_properties_t::transfer_length_max`

  Maximum number of transfers.

- `transfer_properties_t::transfer_length_remaining`

  Number of transfers remaining.

- `transfer_properties_t::in_progress`

  Whether or not this transfer is in progress.

8.37.8.13 close

```
ssp_err_t(* transfer_api_t::close) (transfer_ctrl_t *const p_ctrl)
```

Detailed description

Releases hardware lock. This allows a transfer to be reconfigured using open. Implemented as

- R_DTC_Close
- R_DMAC_Close

Table 1325:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

8.37.8.14 versionGet

```
ssp_err_t(* transfer_api_t::versionGet) (ssp_version_t *const p_version)
```

Detailed description

Gets version and stores it in provided pointer p_version. Implemented as

- R_DTC_VersionGet
- R_DMAC_VersionGet

Table 1326:Parameters

Name	Direction	Description
p_version	out	Code and API version used.

Parameter p_version

8.37.8.15 blockReset

```
ssp_err_t(* transfer_api_t::blockReset) (transfer_ctrl_t *const p_ctrl, void
const *p_src, void *p_dest, uint16_t const length, transfer_size_t size, uint16_t
const num_transfers)
```

Detailed description

Reset source address pointer, destination address pointer, and/or length, for block transfer keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid. Implemented as

- R_DMAC_BlockReset
- R_DTC_BlockReset

Table 1327:Parameters

Name	Direction	Description
p_ctrl	in	Control block set in open call for this transfer.
p_src	in	Pointer to source. Set to NULL if source pointer should not change.
p_dest	in	Pointer to destination. Set to NULL if destination pointer should not change.
length	in	Transfer length in block mode.In DMAC only.
size	in	Transfer size in block mode. In DMAC only.
num_transfers	in	number of blocks in block mode. In DMAC only.

Parameter p_ctrl

Definition: `transfer_ctrl_t*const p_ctrl`

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls. Implemented asdtc_instance_ctrl_tdmac_instance_ctrl_t

Parameter p_src

`const`

Parameter p_dest

`const`

Parameter length

`uint16_t`

Parameter size
Parameter num_transfers

`uint16_t`

8.37.8.16 transfer_instance_t

transfer_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- transfer_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.
- transfer_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.
- transfer_api_t const * p_api

  Pointer to the API structure for this instance.

8.38 Random number generation

RNG_Interface Random number generation.

8.38.1 Interface API

trng_api_t

Function name	Description
.open	Open the TRNG driver for reading random data from the hardware TRNG module
.read	Generate of random number words and store them in buffer
.close	Close the TRNG interface driver
.versionGet	Gets version and stores it in provided pointer p_version.

8.38.2 Data structures

- trng_ctrl_t
- trng_cfg_t
- trng_instance_t

8.38.3 Defines

- #define TRNG_API_VERSION_MAJOR

  Initial value: `(01)`

  Register definitions, common services and error codes.

- #define TRNG_API_VERSION_MINOR

  Initial value: `(00)`
- #define TRNG_REGISTER_SIZE_WORDS

  Initial value: `(4)`
- #define TRNG_REGISTER_SIZE_BYTES

  Initial value: `((TRNG_REGISTER_SIZE_WORDS) * 4)`

8.38.4 API Structures

8.38.4.1 trng_ctrl_t

trng_ctrl_t

Detailed description

TRNG_Interface control structure.

Variables

- uint32_t nattempts

  number of retries
- crypto_ctrl_t * p_crypto_ctrl

  pointer to crypto control structure
- crypto_api_t const * p_crypto_api

  pointer to crypto-engine API
- uint32_t prevbuf[TRNG_REGISTER_SIZE_WORDS]

  previous random data
- uint32_t currbuf[TRNG_REGISTER_SIZE_WORDS]

  current random data

8.38.4.2 trng_cfg_t

trng_cfg_t

Detailed description

TRNG interface configuration parameters

Variables

- crypto_api_t const * p_crypto_api

  pointer to crypto API
- uint32_t nattempts

  number of retries when a continuous test failure occurs

8.38.4.8 trng_instance_t

trng_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- trng_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- trng_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- trng_api_t const * p_api

  Pointer to the API structure for this instance.

8.39 UART Interface

Interface for UART communications.

8.39.1 Summary

The UART interface provides common APIs for UART HAL drivers. The UART interface supports the following features:

- Full-duplex UART communication
- Generic UART parameter setting
- Interrupt driven transmit/receive processing
- Callback function with returned event code
- Runtime baud-rate change
- Hardware resource locking during a transaction
- CTS/RTS hardware flow control support (with an associated IOPORT pin)

- Circular buffer support
- Runtime Transmit/Receive circular buffer flushing

Implemented by:

- UART on SCI

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

UART Interface description: UART Driver

8.39.2 Interface API

uart_api_t

Function name	Description
.open	Open UART device.
.read	Read from UART device. If a transfer instance is used for reception, the received bytes are stored directly in the read input buffer. When a transfer is complete, the callback is called with event UART_EVENT_RX_COMPLETE. Bytes received outside an active transfer are received in the callback function with event UART_EVENT_RX_CHAR. The maximum transfer size is reported by infoGet.
.write	Write to UART device. The write buffer is used until write is complete. Do not overwrite write buffer contents until the write is finished. When the write is complete (all bytes are fully transmitted on the wire), the callback called with event UART_EVENT_TX_COMPLETE. The maximum transfer size is reported by infoGet.
.baudSet	Change baud rate.
.infoGet	Get the driver specific information.
.close	Close UART device.
.versionGet	Get version.
.communicationAbort	Abort ongoing transfer.

8.39.3 Data structures

8.39.7 API Data

8.39.7.1 uart_event_t

`uart_event_t`

Detailed description

UART Event codes

Enumerated values

Name	Description
UART_EVENT_RX_COMPLETE	Receive complete event.

Name	Description
UART_EVENT_TX_COMPLETE	Transmit complete event.
UART_EVENT_ERR_PARITY	Parity error event.
UART_EVENT_ERR_FRAMING	Mode fault error event.
UART_EVENT_BREAK_DETECT	Break detect error event.
UART_EVENT_ERR_OVERFLOW	FIFO Overflow error event.
UART_EVENT_ERR_RXBUF_OVERFLOW	DEPRECATED: Receive buffer overflow error event.
UART_EVENT_RX_CHAR	Character received.
UART_EVENT_TX_DATA_EMPTY	Last byte is transmitting, ready for more data.

8.39.7.2 uart_data_bits_t

`uart_data_bits_t`

Detailed description

UART Data bit length definition

Enumerated values

Name	Description
UART_DATA_BITS_8	Data bits 8-bit.
UART_DATA_BITS_7	Data bits 7-bit.
UART_DATA_BITS_9	Data bits 9-bit.

8.39.7.3 uart_parity_t

`uart_parity_t`

Detailed description

UART Parity definition

Enumerated values

Name	Description
UART_PARITY_OFF	No parity.

Name	Description
UART_PARITY_EVEN	Even parity.
UART_PARITY_ODD	Odd parity.

8.39.7.4 uart_stop_bits_t

```
uart_stop_bits_t
```

Detailed description

UART Stop bits definition

Enumerated values

Name	Description
UART_STOP_BITS_1	Stop bit 1-bit.
UART_STOP_BITS_2	Stop bits 2-bit.

8.39.7.5 uart_dir_t

```
uart_dir_t
```

Detailed description

UART transaction definition

Enumerated values

Name	Description
UART_DIR_RX_TX	Both RX and TX.
UART_DIR_RX	Only RX.
UART_DIR_TX	Only TX.

8.39.7.6 uart_ctrl_t

```
typedef void uart_ctrl_t
```

Detailed description

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented as

- sci_uart_instance_ctrl_t

8.39.8 API Structures

8.39.8.1 uart_info_t

uart_info_t

Detailed description

UART driver specific information

Variables

- uint32_t write_bytes_max

  Maximum bytes that can be written at this time. Only applies if uart_cfg_t::p_transfer_tx is not NULL.

- uint32_t read_bytes_max

  Maximum bytes that are available to read at one time. Only applies if uart_cfg_t::p_transfer_rx is not NULL.

8.39.8.2 uart_callback_args_t

uart_callback_args_t

Detailed description

UART Callback parameter definition

Variables

- uint32_t channel

  Device channel number.

- uart_event_t event

  Event code.

- uint32_t data

  Contains the next character received for the events UART_EVENT_RX_CHAR, UART_EVENT_ERR_PARITY, UART_EVENT_ERR_FRAMING, or UART_EVENT_ERR_OVERFLOW. Otherwise unused.

- void const * p_context

  Context provided to user during callback.

8.39.8.3 uart_cfg_t

uart_cfg_t

Detailed description

UART Configuration

Variables

- uint8_t channel

  Select a channel corresponding to the channel number of the hardware.

- uint32_t baud_rate

  Baud rate, i.e. 9600, 19200, 115200.

- uart_data_bits_t data_bits

  Data bit length (8 or 7 or 9)

- uart_parity_t parity

  Parity type (none or odd or even)

- uart_stop_bits_t stop_bits

  Stop bit length (1 or 2)

- bool ctsrts_en

  CTS/RTS hardware flow control enable.

- uint8_t rxi_ipl

  Receive interrupt priority.

- uint8_t txi_ipl

  Transmit interrupt priority.

- uint8_t tei_ipl

  Transmit end interrupt priority.

- uint8_t eri_ipl

  Error interrupt priority.

- transfer_instance_t const * p_transfer_rx

  Optional transfer instance used to receive multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the read API is limited to one byte at a time.

- transfer_instance_t const * p_transfer_tx

  Optional transfer instance used to send multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the write APIs is limited to one byte at a time.

- void(* p_callback)(uart_callback_args_t *p_args)

  Pointer to callback function.

- void const * p_context

  User defined context passed into callback function.

- void const * p_extend

  UART hardware dependent configuration.

Definition: `uart_cfg_t const *const p_cfg`

UART Configuration

- `uart_cfg_t`::channel

  Select a channel corresponding to the channel number of the hardware.

- `uart_cfg_t`::baud_rate

  Baud rate, i.e. 9600, 19200, 115200.

- `uart_cfg_t`::`uart_data_bits_t`

  Data bit length (8 or 7 or 9)

  Enumerated as:

  – UART_DATA_BITS_8

  – UART_DATA_BITS_7

  – UART_DATA_BITS_9

- uart_cfg_t::uart_parity_t

  Parity type (none or odd or even)

  Enumerated as:

  – UART_PARITY_OFF

  – UART_PARITY_EVEN

  – UART_PARITY_ODD

- uart_cfg_t::uart_stop_bits_t

  Stop bit length (1 or 2)

  Enumerated as:

  – UART_STOP_BITS_1

  – UART_STOP_BITS_2

- uart_cfg_t::ctsrts_en

  CTS/RTS hardware flow control enable.

- uart_cfg_t::rxi_ipl

  Receive interrupt priority.

- uart_cfg_t::txi_ipl

  Transmit interrupt priority.

- uart_cfg_t::tei_ipl

  Transmit end interrupt priority.

- uart_cfg_t::eri_ipl

  Error interrupt priority.

- uart_cfg_t::transfer_instance_t

  Optional transfer instance used to receive multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the read API is limited to one byte at a time.

- uart_cfg_t::transfer_instance_t

  Optional transfer instance used to send multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the write APIs is limited to one byte at a time.

- uart_cfg_t::p_callback

  Pointer to callback function.

- uart_cfg_t::p_context

  User defined context passed into callback function.

- uart_cfg_t::p_extend

  UART hardware dependent configuration.

8.39.8.6 read

```
ssp_err_t(* uart_api_t::read) (uart_ctrl_t *const p_ctrl, uint8_t const *const
p_dest, uint32_t const bytes)
```

Detailed description

Read from UART device. If a transfer instance is used for reception, the received bytes are stored directly in the read input buffer. When a transfer is complete, the callback is called with event UART_EVENT_RX_COMPLETE. Bytes received outside an active transfer are received in the callback function with event UART_EVENT_RX_CHAR. The maximum transfer size is reported by infoGet. Implemented as

- R_SCI_UartRead

Table 1333:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block for the channel.
p_dest	in	Destination address to read data from.
bytes	in	Read data length. Only applicable if p_transfer_rx is not NULL. Otherwise all read bytes will be provided through the callback set in p_callback.

Parameter p_ctrl

Definition: `uart_ctrl_t*const p_ctrl`

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

Parameter p_dest

`uint8_t`

Parameter bytes

`uint32_t`

8.39.8.7 write

```
ssp_err_t(* uart_api_t::write) (uart_ctrl_t *const p_ctrl, uint8_t const *const
p_src, uint32_t const bytes)
```

Detailed description

Write to UART device. The write buffer is used until write is complete. Do not overwrite write buffer contents until the write is finished. When the write is complete (all bytes are fully transmitted on the wire), the callback called with event UART_EVENT_TX_COMPLETE. The maximum transfer size is reported by infoGet. Implemented as

- R_SCI_UartWrite

Table 1334:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block.
p_src	in	Source address to write data to.
bytes	in	Write data length.

Parameter p_ctrl

Definition: `uart_ctrl_t*const p_ctrl`

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

Parameter p_src

`uint8_t`

Parameter bytes

`uint32_t`

8.39.8.8 baudSet

```
ssp_err_t(* uart_api_t::baudSet) (uart_ctrl_t *const p_ctrl, uint32_t const
baudrate)
```

Detailed description

Change baud rate.

ATTENTION: Calling this API aborts any in-progress transmission and disables reception until the new baud settings have been applied.

Implemented as

- R_SCI_UartBaudSet

Table 1335:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block.
baudrate	in	Baud rate in bps.

Parameter p_ctrl

Definition: uart_ctrl_t*const p_ctrl

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

Parameter baudrate

uint32_t

8.39.8.9 infoGet

```
ssp_err_t(* uart_api_t::infoGet) (uart_ctrl_t *const p_ctrl, uart_info_t *const p_info)
```

Detailed description

Get the driver specific information. Implemented as

- R_SCI_UartInfoGet

Table 1336:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block.
baudrate	in	Baud rate in bps.

Parameter p_ctrl

Definition: uart_ctrl_t*const p_ctrl

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

Parameter baudrate

8.39.8.10 close

```
ssp_err_t(* uart_api_t::close) (uart_ctrl_t *const p_ctrl)
```

Detailed description

Close UART device. Implemented as

- R_SCI_UartClose

Table 1337:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block.

Parameter p_ctrl

Definition: uart_ctrl_t*const p_ctrl

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

8.39.8.11 versionGet

```
ssp_err_t(* uart_api_t::versionGet) (ssp_version_t *p_version)
```

Detailed description

Get version. Implemented as

- R_SCI_UartVersionGet

Table 1338:Parameters

Name	Direction	Description
p_version	in	Pointer to the memory to store the version information.

Parameter p_version

8.39.8.12 communicationAbort

```
ssp_err_t(* uart_api_t::communicationAbort) (uart_ctrl_t *const p_ctrl,
uart_dir_t communication_to_abort)
```

Detailed description

Abort ongoing transfer. Implemented as

- R_SCI_UartAbort

Table 1339:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the UART control block.
communication_to_abort	in	Type of abort request.

Parameter p_ctrl

Definition: uart_ctrl_t*const p_ctrl

UART control block. Allocate an instance specific control block to pass into the UART API calls. Implemented assci_uart_instance_ctrl_t

Parameter communication_to_abort

Definition: uart_dir_tcommunication_to_abort

UART transaction definition

8.39.8.13 uart_instance_t

uart_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- uart_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- uart_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- uart_api_t const * p_api

  Pointer to the API structure for this instance.

8.40 WDT Interface

Interface for watch dog timer functions.

8.40.1 Summary

The WDT interface for the Watchdog Timer (WDT) peripheral provides watchdog functionality including resetting the device or generating an interrupt.

See Also and Thread Monitor Framework Interface

The watchdog timer interface can be implemented by:

- WDT
- IWDT

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

WDT Interface description: Watchdog Driver

8.40.2 Interface API

wdt_api_t

Function name	Description
.cfgGet	Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback.
.open	Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback.
.refresh	Refresh the watchdog timer.
.statusGet	Read the status of the WDT.
.statusClear	Clear the status flags of the WDT.
.counterGet	Read the current WDT counter value.
.timeoutGet	Read the watchdog timeout values.
.versionGet	Return the version of the IOPort driver.

8.40.3 Data structures

- wdt_callback_args_t
- wdt_timeout_values_t
- wdt_cfg_t
- wdt_instance_t

8.40.4 Enumerations

- wdt_timeout_t
- wdt_clock_division_t
- wdt_window_start_t
- wdt_window_end_t
- wdt_reset_control_t
- wdt_stop_control_t
- wdt_status_t
- wdt_start_mode_t

8.40.5 Typedefs

- wdt_ctrl_t

8.40.6 Defines

- #define WDT_API_VERSION_MAJOR

  Initial value: `(1U)`
- #define WDT_API_VERSION_MINOR

  Initial value: `(2U)`

8.40.7 API Data

8.40.7.1 wdt_timeout_t

`wdt_timeout_t`

Detailed description

WDT time-out periods.

Enumerated values

Name	Description
WDT_TIMEOUT_128	128 clock cycles
WDT_TIMEOUT_512	512 clock cycles
WDT_TIMEOUT_1024	1024 clock cycles
WDT_TIMEOUT_2048	2048 clock cycles
WDT_TIMEOUT_4096	4096 clock cycles
WDT_TIMEOUT_8192	8192 clock cycles
WDT_TIMEOUT_16384	16384 clock cycles

8.40.7.2 wdt_clock_division_t

`wdt_clock_division_t`

Detailed description

WDT clock division ratio.

Enumerated values

Name	Description
WDT_CLOCK_DIVISION_1	CLK/1.
WDT_CLOCK_DIVISION_4	CLK/4.
WDT_CLOCK_DIVISION_16	CLK/16.
WDT_CLOCK_DIVISION_32	CLK/32.
WDT_CLOCK_DIVISION_64	CLK/64.
WDT_CLOCK_DIVISION_128	CLK/128.
WDT_CLOCK_DIVISION_256	CLK/256.
WDT_CLOCK_DIVISION_512	CLK/512.
WDT_CLOCK_DIVISION_2048	CLK/2048.
WDT_CLOCK_DIVISION_8192	CLK/8192.

8.40.7.3 wdt_window_start_t

`wdt_window_start_t`

Detailed description

WDT refresh permitted period window start position.

Enumerated values

Name	Description
WDT_WINDOW_START_25	Start position = 25%.
WDT_WINDOW_START_50	Start position = 50%.
WDT_WINDOW_START_75	Start position = 75%.
WDT_WINDOW_START_100	Start position = 100%.

8.40.7.4 wdt_window_end_t

`wdt_window_end_t`

Detailed description

WDT refresh permitted period window end position.

Enumerated values

Name	Description
WDT_WINDOW_END_75	End position = 75%.
WDT_WINDOW_END_50	End position = 50%.
WDT_WINDOW_END_25	End position = 25%.
WDT_WINDOW_END_0	End position = 0%.

8.40.7.5 wdt_reset_control_t

`wdt_reset_control_t`

Detailed description

WDT Counter underflow and refresh error control.

Enumerated values

Name	Description
WDT_RESET_CONTROL_NMI	NMI request when counter underflows.
WDT_RESET_CONTROL_RESET	Reset request when counter underflows.

8.40.7.6 wdt_stop_control_t

`wdt_stop_control_t`

Detailed description

WDT Counter operation in sleep mode.

Enumerated values

Name	Description
WDT_STOP_CONTROL_DISABLE	Count will not stop when device enters sleep mode.
WDT_STOP_CONTROL_ENABLE	Count will automatically stop when device enters sleep mode.

8.40.7.7 wdt_status_t

```
wdt_status_t
```

Detailed description

WDT status

Enumerated values

Name	Description
WDT_STATUS_NO_ERROR	No status flags set.
WDT_STATUS_UNDERFLOW_ERROR	Underflow flag set.
WDT_STATUS_REFRESH_ERROR	Refresh error flag set. Refresh outside of permitted.
WDT_STATUS_UNDERFLOW_AND_REFRESH_ERRO R	Underflow and refresh error flags set.

8.40.7.8 wdt_start_mode_t

```
wdt_start_mode_t
```

Detailed description

WDT start mode. Used to check the WDT is configured correctly.

Enumerated values

Name	Description
WDT_START_MODE_REGISTER	WDT is to be configured using the WDT registers.
WDT_START_MODE_AUTO	WDT is to be configured using OFS0 hardware register.
WDT_START_MODE_DISABLED	WDT is disabled.

8.40.7.9 wdt_ctrl_t

```
typedef void wdt_ctrl_t
```

Detailed description

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented as

- wdt_instance_ctrl_t
- iwdt_instance_ctrl_t

8.40.8 API Structures

8.40.8.1 wdt_callback_args_t

wdt_callback_args_t

Detailed description

Callback function parameter data

Variables

- void const * p_context

  Placeholder for user data. Set in wdt_api_t::open function in wdt_cfg_t.

8.40.8.2 wdt_timeout_values_t

wdt_timeout_values_t

Detailed description

WDT timeout data. Used to return frequency of WDT clock and timeout period

Variables

- uint32_t clock_frequency_hz

  Frequency of watchdog clock after divider.

- uint32_t timeout_clocks

  Timeout period in units of watchdog clock ticks.

8.40.8.3 wdt_cfg_t

wdt_cfg_t

Detailed description

WDT configuration parameters.

Variables

- wdt_start_mode_t start_mode

  The expected start mode for the WDT.

- bool autostart

  When true the WDT is started as part of its configuration (register start mode). If false the WDT needs to be started manually by calling the refresh API.

- wdt_timeout_t timeout

  Timeout period.

- wdt_clock_division_t clock_division

  Clock divider.

- wdt_window_start_t window_start

  Refresh permitted window start position.
- wdt_window_end_t window_end

  Refresh permitted window end position.
- wdt_reset_control_t reset_control

  Select NMI or reset generated on underflow.
- wdt_stop_control_t stop_control

  Select whether counter operates in sleep mode.
- void(* p_callback)(wdt_callback_args_t *p_args)

  Callback provided when a WDT NMI ISR occurs.
- void const * p_context

  Placeholder for user data. Passed to the user callback in wdt_callback_args_t.
- void const * p_extend

  Placeholder for user extension.

8.40.8.4 wdt_api_t

wdt_api_t

Detailed description

WDT functions implemented at the HAL layer will follow this API.

8.40.8.5 cfgGet

```
ssp_err_t(* wdt_api_t::cfgGet) (wdt_ctrl_t *const p_ctrl, wdt_cfg_t *const p_cfg)
```

Detailed description

Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback. Implemented as

- R_WDT_CfgGet
- R_IWDT_CfgGet

Table 1340:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_cfg	out	Pointer to pin configuration structure for reading WDT configuration.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter p_cfg

Definition: `wdt_cfg_t *const p_cfg`

WDT configuration parameters.

- `wdt_cfg_t`::`wdt_start_mode_t`

  The expected start mode for the WDT.

  Enumerated as:

  – WDT_START_MODE_REGISTER

  – WDT_START_MODE_AUTO

  – WDT_START_MODE_DISABLED

- `wdt_cfg_t`::`autostart`

  When true the WDT is started as part of its configuration (register start mode). If false the WDT needs to be started manually by calling the refresh API.

- `wdt_cfg_t`::`wdt_timeout_t`

  Timeout period.

  Enumerated as:

  – WDT_TIMEOUT_128

  – WDT_TIMEOUT_512

  – WDT_TIMEOUT_1024

  – WDT_TIMEOUT_2048

  – WDT_TIMEOUT_4096

  – WDT_TIMEOUT_8192

  – WDT_TIMEOUT_16384

- `wdt_cfg_t`::`wdt_clock_division_t`

  Clock divider.

  Enumerated as:

  – WDT_CLOCK_DIVISION_1

  – WDT_CLOCK_DIVISION_4

  – WDT_CLOCK_DIVISION_16

  – WDT_CLOCK_DIVISION_32

  - WDT_CLOCK_DIVISION_64
  - WDT_CLOCK_DIVISION_128
  - WDT_CLOCK_DIVISION_256
  - WDT_CLOCK_DIVISION_512
  - WDT_CLOCK_DIVISION_2048
  - WDT_CLOCK_DIVISION_8192
- wdt_cfg_t::wdt_window_start_t

  Refresh permitted window start position.

  Enumerated as:
  - WDT_WINDOW_START_25
  - WDT_WINDOW_START_50
  - WDT_WINDOW_START_75
  - WDT_WINDOW_START_100
- wdt_cfg_t::wdt_window_end_t

  Refresh permitted window end position.

  Enumerated as:
  - WDT_WINDOW_END_75
  - WDT_WINDOW_END_50
  - WDT_WINDOW_END_25
  - WDT_WINDOW_END_0
- wdt_cfg_t::wdt_reset_control_t

  Select NMI or reset generated on underflow.

  Enumerated as:
  - WDT_RESET_CONTROL_NMI
  - WDT_RESET_CONTROL_RESET
- wdt_cfg_t::wdt_stop_control_t

  Select whether counter operates in sleep mode.

  Enumerated as:
  - WDT_STOP_CONTROL_DISABLE
  - WDT_STOP_CONTROL_ENABLE

- wdt_cfg_t::p_callback

  Callback provided when a WDT NMI ISR occurs.

- wdt_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in wdt_callback_args_t.

- wdt_cfg_t::p_extend

  Placeholder for user extension.

8.40.8.6 open

```
ssp_err_t(* wdt_api_t::open) (wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg)
```

Detailed description

Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback. Implemented as

- R_WDT_Open
- R_IWDT_Open

Table 1341:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_cfg	in	Pointer to pin configuration structure.

Parameter p_ctrl

Definition: wdt_ctrl_t*const p_ctrl

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter p_cfg

Definition: wdt_cfg_t const *const p_cfg

WDT configuration parameters.

- wdt_cfg_t::wdt_start_mode_t

  The expected start mode for the WDT.

  Enumerated as:

  – WDT_START_MODE_REGISTER

  – WDT_START_MODE_AUTO

  – WDT_START_MODE_DISABLED

- wdt_cfg_t::autostart

  When true the WDT is started as part of its configuration (register start mode). If false the WDT needs to be started manually by calling the refresh API.

- wdt_cfg_t::wdt_timeout_t

  Timeout period.

  Enumerated as:

  – WDT_TIMEOUT_128
  – WDT_TIMEOUT_512
  – WDT_TIMEOUT_1024
  – WDT_TIMEOUT_2048
  – WDT_TIMEOUT_4096
  – WDT_TIMEOUT_8192
  – WDT_TIMEOUT_16384

- wdt_cfg_t::wdt_clock_division_t

  Clock divider.

  Enumerated as:

  – WDT_CLOCK_DIVISION_1
  – WDT_CLOCK_DIVISION_4
  – WDT_CLOCK_DIVISION_16
  – WDT_CLOCK_DIVISION_32
  – WDT_CLOCK_DIVISION_64
  – WDT_CLOCK_DIVISION_128
  – WDT_CLOCK_DIVISION_256
  – WDT_CLOCK_DIVISION_512
  – WDT_CLOCK_DIVISION_2048
  – WDT_CLOCK_DIVISION_8192

- wdt_cfg_t::wdt_window_start_t

  Refresh permitted window start position.

  Enumerated as:

  – WDT_WINDOW_START_25
  – WDT_WINDOW_START_50

  - WDT_WINDOW_START_75
  - WDT_WINDOW_START_100
- wdt_cfg_t::wdt_window_end_t

  Refresh permitted window end position.

  Enumerated as:
  - WDT_WINDOW_END_75
  - WDT_WINDOW_END_50
  - WDT_WINDOW_END_25
  - WDT_WINDOW_END_0
- wdt_cfg_t::wdt_reset_control_t

  Select NMI or reset generated on underflow.

  Enumerated as:
  - WDT_RESET_CONTROL_NMI
  - WDT_RESET_CONTROL_RESET
- wdt_cfg_t::wdt_stop_control_t

  Select whether counter operates in sleep mode.

  Enumerated as:
  - WDT_STOP_CONTROL_DISABLE
  - WDT_STOP_CONTROL_ENABLE
- wdt_cfg_t::p_callback

  Callback provided when a WDT NMI ISR occurs.
- wdt_cfg_t::p_context

  Placeholder for user data. Passed to the user callback in wdt_callback_args_t.
- wdt_cfg_t::p_extend

  Placeholder for user extension.

8.40.8.7 refresh

```
ssp_err_t(* wdt_api_t::refresh) (wdt_ctrl_t *const p_ctrl)
```

Detailed description

Refresh the watchdog timer. Implemented as

- R_WDT_Refresh
- R_IWDT_Refresh

NOTE: If the WDT is in auto-start mode ensure the OFS0 register is configured before using this function.

ATTENTION: Calling this function in register-start mode before calling R_WDT_Open will start the WDT in it's default state and further changes to the configuration will not be possible.

Table 1342:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

8.40.8.8 statusGet

```
ssp_err_t(* wdt_api_t::statusGet) (wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status)
```

Detailed description

Read the status of the WDT. Implemented as

- R_WDT_StatusGet
- R_IWDT_StatusGet

Table 1343:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_status	out	Pointer to variable to return status information through.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter p_status

Definition: `wdt_status_t*const p_status`

WDT status

8.40.8.9 statusClear

```
ssp_err_t(* wdt_api_t::statusClear) (wdt_ctrl_t *const p_ctrl, const wdt_status_t status)
```

Detailed description

Clear the status flags of the WDT. Implemented as

- R_WDT_StatusClear
- R_IWDT_StatusClear

Table 1344:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
status	in	Status condition(s) to clear.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter status

8.40.8.10 counterGet

```
ssp_err_t(* wdt_api_t::counterGet) (wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)
```

Detailed description

Read the current WDT counter value. Implemented as

- R_WDT_CounterGet
- R_IWDT_CounterGet

Table 1345:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.

Table 1345:Parameters (Continued)

Name	Direction	Description
p_count	out	Pointer to variable to return current WDT counter value.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter p_count

`uint32_t`

8.40.8.11 timeoutGet

```
ssp_err_t(* wdt_api_t::timeoutGet) (wdt_ctrl_t *const p_ctrl,
wdt_timeout_values_t *const p_timeout)
```

Detailed description

Read the watchdog timeout values. Implemented as

- R_WDT_TimeoutGet
- R_IWDT_TimeoutGet

Table 1346:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_timeout	out	Pointer to structure to return timeout values.

Parameter p_ctrl

Definition: `wdt_ctrl_t*const p_ctrl`

WDT control block. Allocate an instance specific control block to pass into the WDT API calls. Implemented aswdt_instance_ctrl_tiwdt_instance_ctrl_t

Parameter p_timeout

Definition: `wdt_timeout_values_t*const p_timeout`

WDT timeout data. Used to return frequency of WDT clock and timeout period

- `wdt_timeout_values_t::clock_frequency_hz`

  Frequency of watchdog clock after divider.

- wdt_timeout_values_t::timeout_clocks

  Timeout period in units of watchdog clock ticks.

8.40.8.12 versionGet

```
ssp_err_t(* wdt_api_t::versionGet) (ssp_version_t *const p_data)
```

Detailed description

Return the version of the IOPort driver. Implemented as

- R_WDT_VersionGet
- R_IWDT_VersionGet

Table 1347:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to control structure.
p_data	out	Memory address to return version information to.

Parameter p_ctrl
Parameter p_data

Definition: ssp_version_t *const p_data

- ssp_version_t::version_id

  Version id

- ssp_version_t::code_version_minor

  Code minor version.

- ssp_version_t::code_version_major

  Code major version.

- ssp_version_t::api_version_minor

  API minor version.

- ssp_version_t::api_version_major

  API major version.

- ssp_version_tstruct{}

  Code version parameters

8.40.8.13 wdt_instance_t

wdt_instance_t

Detailed description

This structure encompasses everything that is needed to use an instance of this interface.

Variables

- wdt_ctrl_t * p_ctrl

  Pointer to the control structure for this instance.

- wdt_cfg_t const * p_cfg

  Pointer to the configuration structure for this instance.

- wdt_api_t const * p_api

  Pointer to the API structure for this instance.

Chapter 9 API Reference: HAL Drivers

9.1 API Reference: HAL Layer

The hardware abstraction layer provides drivers for Renesas peripherals. HAL drivers typically implement Interfaces and provide additional hardware specific APIs.

9.2 High-Speed Analog Comparator

Driver for the High-Speed Analog Comparator.

9.2.1 Summary

Extends COMPARATOR Interface.

This module implements the COMPARATOR Interface using the high-speed analog comparator.

9.2.2 Functions

- R_ACMPHS_Open
- R_ACMPHS_InfoGet
- R_ACMPHS_OutputEnable
- R_ACMPHS_StatusGet
- R_ACMPHS_Close
- R_ACMPHS_VersionGet

9.2.3 Defines

- #define ACMPHS_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define ACMPHS_CODE_VERSION_MINOR

  Initial value: `(0U)`

9.2.4 R_ACMPHS_Open

```
ssp_err_t R_ACMPHS_Open ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_cfg_t  const *const p_cfg )
```

9.2.4.1 Detailed description

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. outputEnable should be called after the output has stabilized. Implements open.

Comparator inputs must be configured in the application code prior to calling this function.

Table 1348:Return values

Name	Description
SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	An input pointer is NULL
SSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.

Table 1348:Return values (Continued)

Name	Description
SSP_ERR_IN_USE	The control block is already open or the hardware lock is taken.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.2.4.2 Function steps

- Verify the control block has not already been initialized.
- Configure interrupt priority. The interrupt is disabled until outputEnable is called.
- Enable clocks to the ACMPHS hardware.
- Set registers controlled by this driver to their default values.
- Configure the output polarity.
- Configure the trigger edge.
- Configure the hardware debounce filter.
- Enable the comparator.

9.2.5 R_ACMPHS_InfoGet

```
ssp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_info_t  *const p_info )
```

9.2.5.1 Detailed description

Provides the minimum stabilization wait time in microseconds. Implements infoGet.

Table 1349:Return values

Name	Description
SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.2.5.2 Function steps

- Perform parameter checking
- Get the base stabilization time.
- Add 4 filter clocks if the filter is enabled.

9.2.6 R_ACMPHS_OutputEnable

```
ssp_err_t R_ACMPHS_OutputEnable ( comparator_ctrl_t  *const p_api_ctrl )
```

9.2.6.1 Detailed description

Enables the comparator output, which can be polled using statusGet. Also enables pin output and interrupts as configured during open. Implements outputEnable.

Table 1350:Return values

Name	Description
SSP_SUCCESS	Comparator output is enabled.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.2.6.2 Function steps

- Enable the ACMPHS output.
- Set the VCOUT output setting for this channel (enabled or disabled).
- Enable interrupts for this channel.

9.2.7 R_ACMPHS_StatusGet

```
ssp_err_t R_ACMPHS_StatusGet ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_status_t  *const p_status )
```

9.2.7.1 Detailed description

Provides the operating status of the comparator. Implements statusGet.

Table 1351:Return values

Name	Description
SSP_SUCCESS	Operating status of the comparator is provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_TIMEOUT	The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts.

9.2.7.2 Function steps

- Read the operating status of the comparator.

9.2.8 R_ACMPHS_Close

```
ssp_err_t R_ACMPHS_Close ( comparator_ctrl_t  * p_api_ctrl )
```

9.2.8.1 Detailed description

Stops the comparator. Implements close.

Table 1352:Return values

Name	Description
SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.2.8.2 Function steps

- Perform parameter checking
- Mark driver as closed
- Disable interrupts.
- Stop the comparator and disable output to VCOUT.
- Enter the module-stop state.

- Release the hardware lock

9.2.9 R_ACMPHS_VersionGet

```
ssp_err_t R_ACMPHS_VersionGet ( ssp_version_t  *const p_version )
```

9.2.9.1 Detailed description

Gets the API and code version. Implements versionGet.

Table 1353:Return values

Name	Description
SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.2.9.2 Function steps

- Return the version number

9.2.10 Extensions

9.2.10.1 acmphs_instance_ctrl_t

acmphs_instance_ctrl_t

Detailed description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs in open.

Variables

- uint32_t open
- R_ACMPHS0_Type * p_reg
- comparator_pin_output_t pin_output
- void(* p_callback)(*p_args)
- void const * p_context
- IRQn_Type irq
- uint8_t channel

9.3 Low Power Analog Comparator

Driver for the Low Power Analog Comparator.

9.3.1 Summary

Extends COMPARATOR Interface.

This module implements the COMPARATOR Interface using the low power analog comparator.

9.3.2 Functions

- R_ACMPLP_Open
- R_ACMPLP_InfoGet
- R_ACMPLP_OutputEnable
- R_ACMPLP_StatusGet
- R_ACMPLP_Close
- R_ACMPLP_VersionGet

9.3.3 Defines

- #define ACMPLP_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define ACMPLP_CODE_VERSION_MINOR

  Initial value: `(0U)`

9.3.4 R_ACMPLP_Open

```
ssp_err_t R_ACMPLP_Open ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_cfg_t  const *const p_cfg )
```

9.3.4.1 Detailed description

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. outputEnable should be called after the output has stabilized. Implements open.

Comparator inputs must be configured in the application code prior to calling this function.

Table 1354:Return values

Name	Description
SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	An input pointer is NULL
SSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
SSP_ERR_IN_USE	The control block is already open or the hardware lock is taken.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.3.4.2 Function steps

- Verify the control block has not already been initialized.
- Configure interrupt priority. The interrupt is disabled until outputEnable is called.
- Enable clocks to the ACMPLP hardware.
- Set registers controlled by this channel to their default values.
- Set the mode.
- Configure the output polarity.
- Configure the trigger edge.
- Configure the hardware debounce filter.
- Enable the comparator.

9.3.5 R_ACMPLP_InfoGet

```
ssp_err_t R_ACMPLP_InfoGet ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_info_t  *const p_info )
```

9.3.5.1 Detailed description

Provides the minimum stabilization wait time in microseconds. Implements infoGet.

Table 1355:Return values

Name	Description
SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.3.5.2 Function steps

- Perform parameter checking

9.3.6 R_ACMPLP_OutputEnable

```
ssp_err_t R_ACMPLP_OutputEnable ( comparator_ctrl_t  *const p_api_ctrl )
```

9.3.6.1 Detailed description

Enables the comparator output, which can be polled using statusGet. Also enables pin output and interrupts as configured during open. Implements outputEnable.

Table 1356:Return values

Name	Description
SSP_SUCCESS	Comparator output is enabled.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.3.6.2 Function steps

- Set the VCOUT output setting for this channel (enabled or disabled).
- Enable interrupts for this channel.

9.3.7 R_ACMPLP_StatusGet

```
ssp_err_t R_ACMPLP_StatusGet ( comparator_ctrl_t  *const p_api_ctrl ,
 comparator_status_t  *const p_status )
```

9.3.7.1 Detailed description

Provides the operating status of the comparator. Implements statusGet.

Table 1357:Return values

Name	Description
SSP_SUCCESS	Operating status of the comparator is provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.3.7.2 Function steps

- Read the operating status of the comparator.

9.3.8 R_ACMPLP_Close

```
ssp_err_t R_ACMPLP_Close ( comparator_ctrl_t  * p_api_ctrl )
```

9.3.8.1 Detailed description

Stops the comparator. Implements close.

Table 1358:Return values

Name	Description
SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.3.8.2 Function steps

- Perform parameter checking
- Mark driver as closed
- Disable interrupts.
- Stop the comparator and disable output to VCOUT.

- Enter the module-stop state.
- Release the hardware lock

9.3.9 R_ACMPLP_VersionGet

```
ssp_err_t R_ACMPLP_VersionGet ( ssp_version_t  *const p_version )
```

9.3.9.1 Detailed description

Gets the API and code version. Implements versionGet.

Table 1359:Return values

Name	Description
SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.3.9.2 Function steps

- Return the version number

9.3.10 Extensions

9.3.10.1 acmplp_instance_ctrl_t

acmplp_instance_ctrl_t

Detailed description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs in open.

Variables

- uint32_t open
- R_ACMPLP_Type * p_reg
- comparator_pin_output_t pin_output
- void(* p_callback)(*p_args)
- void const * p_context
- IRQn_Type irq
- uint8_t channel
- uint8_t output_enabled

- comparator_polarity_invert_t invert

9.4 ADC

Driver for the 14-Bit A/D Converter (ADC14) and 12-bit A/D Converter (ADC12).

This module supports the ADC14 and ADC12 peripherals. It implements the following interfaces:

- ADC Interface

9.4.1 Functions

- R_ADC_Open
- R_ADC_SetSampleStateCount
- R_ADC_ScanConfigure
- R_ADC_InfoGet
- R_ADC_ScanStart
- R_ADC_ScanStop
- R_ADC_CheckScanDone
- R_ADC_Read
- R_ADC_Read32
- R_ADC_Close
- R_ADC_VersionGet
- R_ADC_Calibrate
- R_ADC_OffsetSet

9.4.2 Defines

- #define ADC_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define ADC_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define ADC_SAMPLE_STATE_COUNT_MIN

  Initial value: `(7U)`

  Typical values that can be used to modify the sample states. The minimum sample state count value is either 6 or 7 depending on the clock ratios. It is fixed to 7 based on the fact that at the lowest ADC conversion clock supported

(1 MHz) this extra state will lead to at worst a "1 microsecond" increase in conversion time. At 60 MHz the extra sample state will add 16.7 ns to the conversion time.

- #define ADC_SAMPLE_STATE_COUNT_MAX

  Initial value: `(255U)`

- #define ADC_SAMPLE_STATE_HOLD_COUNT_MIN

  Initial value: `(4U)`

  Typical values that can be used for the sample and hold counts for the channels 0-2 Minimum sample and hold states

- #define ADC_SAMPLE_STATE_HOLD_COUNT_DEFAULT

  Initial value: `(24U)`

  Default sample and hold states

- #define ADC_MASK_CHANNEL_0

  Initial value: `(1U<<0U)`

  For ADC Scan configuration adc_channel_cfg_t::scan_mask, scan_mask_group_b, add_mask and sample_hold_mask Use bitwise OR to combine these masks for desired channels and sensors.

- #define ADC_MASK_CHANNEL_1

  Initial value: `(1U<<1U)`

- #define ADC_MASK_CHANNEL_2

  Initial value: `(1U<<2U)`

- #define ADC_MASK_CHANNEL_3

  Initial value: `(1U<<3U)`

- #define ADC_MASK_CHANNEL_4

  Initial value: `(1U<<4U)`

- #define ADC_MASK_CHANNEL_5

  Initial value: `(1U<<5U)`

- #define ADC_MASK_CHANNEL_6

  Initial value: `(1U<<6U)`

- #define ADC_MASK_CHANNEL_7

  Initial value: `(1U<<7U)`

- #define ADC_MASK_CHANNEL_8

  Initial value: `(1U<<8U)`

- #define ADC_MASK_CHANNEL_9

  Initial value: `(1U<<9U)`

- #define ADC_MASK_CHANNEL_10
  Initial value: `(1U<<10U)`
- #define ADC_MASK_CHANNEL_11
  Initial value: `(1U<<11U)`
- #define ADC_MASK_CHANNEL_12
  Initial value: `(1U<<12U)`
- #define ADC_MASK_CHANNEL_13
  Initial value: `(1U<<13U)`
- #define ADC_MASK_CHANNEL_14
  Initial value: `(1U<<14U)`
- #define ADC_MASK_CHANNEL_15
  Initial value: `(1U<<15U)`
- #define ADC_MASK_CHANNEL_16
  Initial value: `(1U<<16U)`
- #define ADC_MASK_CHANNEL_17
  Initial value: `(1U<<17U)`
- #define ADC_MASK_CHANNEL_18
  Initial value: `(1U<<18U)`
- #define ADC_MASK_CHANNEL_19
  Initial value: `(1U<<19U)`
- #define ADC_MASK_CHANNEL_20
  Initial value: `(1U<<20U)`
- #define ADC_MASK_CHANNEL_21
  Initial value: `(1U<<21U)`
- #define ADC_MASK_CHANNEL_22
  Initial value: `(1U<<22U)`
- #define ADC_MASK_CHANNEL_23
  Initial value: `(1U<<23U)`
- #define ADC_MASK_CHANNEL_24
  Initial value: `(1U<<24U)`
- #define ADC_MASK_CHANNEL_25
  Initial value: `(1U<<25U)`
- #define ADC_MASK_CHANNEL_26
  Initial value: `(1U<<26U)`

- #define ADC_MASK_CHANNEL_27

  Initial value: `(1U<<27U)`
- #define ADC_MASK_TEMPERATURE

  Initial value: `(1U<<28UL)`
- #define ADC_MASK_VOLT

  Initial value: `(1U<<29UL)`
- #define ADC_MASK_SENSORS

  Initial value: `(ADC_MASK_TEMPERATURE | ADC_MASK_VOLT)`
- #define ADC_MASK_GROUP_B_OFF

  Initial value: `(0UL)`
- #define ADC_MASK_ADD_OFF

  Initial value: `(0UL)`
- #define ADC_MASK_SAMPLE_HOLD_OFF

  Initial value: `(0U)`
- #define ADC_SAMPLE_HOLD_CHANNELS

  Initial value: `(0x07U)`

  Sample and hold Channel mask. Sample and hold is only available for channel 0,1,2

9.4.3 R_ADC_Open

```
ssp_err_t R_ADC_Open ( adc_ctrl_t  * p_api_ctrl ,  adc_cfg_t  const
*const p_cfg )
```

9.4.3.1 Brief description

The Open function applies power to the A/D peripheral, sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt priority is non-zero in BSP_IRQ_Cfg.h, the function takes a callback function pointer for notifying the user at interrupt level whenever a scan has completed. On MCUs where calibration is possible, this function will only return after calibration is completed if enabled in the user configuration. The calibration times vary depending on PCLKB and ADCLK.

9.4.3.2 Detailed description

Table 1360:Return values

Name	Description
SSP_SUCCESS	Call successful.

Table 1360:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_cfg is NULL.
SSP_ERR_INVALID_ARGUMENT	Mode or element of p_cfg structure has invalid value or is illegal based on mode.
SSP_ERR_IN_USE	Calibration timed out.

9.4.3.3 Function steps

- Perform parameter checking
- Verify this unit has not already been initialized
- Set all p_ctrl fields prior to using it in any functions
- Save callback function pointer
- Store the Unit number into the control structure
- Store the user context into the control structure
- Store the mode into the control structure
- Store the alignment into the control structure
- Save the regular mode/Group A trigger in the internal control block
- Save the context
- Confirm the requested unit exists on this MCU and record available channels.
- Lock specified ADC channel
- Retrieve temperature sensor information into control block
- Set ADC and Temperature sensors to a stop state
- Initialize the hardware based on the configuration
- Set ADC and Temperature sensors to a stop state
- Set unused registers to known state (Disable ADC PGA on MCUs that have it)
- Invalid scan mask (initialized for later).
- Mark driver as opened by initializing it to "RADC" in its ASCII equivalent for this unit.
- Return the error code

9.4.4 R_ADC_SetSampleStateCount

```
ssp_err_t R_ADC_SetSampleStateCount ( adc_ctrl_t  * p_api_ctrl ,
 adc_sample_state_t  * p_sample )
```

9.4.4.1 Brief description

Set the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of Reset.

9.4.4.2 Detailed description

Table 1361:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_sample is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

9.4.4.3 Function steps

- Perform parameter checking
- Set the sample state count for the specified register
- Return the error code

9.4.5 R_ADC_ScanConfigure

```
ssp_err_t R_ADC_ScanConfigure ( adc_ctrl_t  * p_api_ctrl ,  adc_channel_cfg_t
const *const p_channel_cfg )
```

9.4.5.1 Brief description

Configure the ADC scan parameters. Channel specific settings are set in this function.

9.4.5.2 Detailed description

Table 1362:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_channel_cfg is NULL.

Table 1362:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

NOTE: If the Group Mode Priority configuration is set to ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN, then since Group B will be scanning continuously, Group B Interrupts are disabled and the application will not receive a call-back for Group B scan completion even if a callback is provided. The application will still receive a callback for Group A scan completion if a callback is provided.

NOTE: If the ADC conversion clock is faster than 50 MHz, the Temperature and Voltage sensor will not be accurate across the operating temperature range, so an error is returned.

9.4.5.3 Function steps

- Perform parameter checking
- Configure the hardware based on the configuration
- Save the scan mask locally; this is required for the infoGet function
- Return the error code

9.4.6 R_ADC_InfoGet

```
ssp_err_t R_ADC_InfoGet ( adc_ctrl_t  * p_api_ctrl ,  adc_info_t  * p_adc_info )
```

9.4.6.1 Brief description

This function returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned. This function retrieves the temperature sensor slope. It also returns the calibration data for the sensor if available on this MCU otherwise an invalid calibration data of 0xFFFFFFFF will be returned.

9.4.6.2 Detailed description

Table 1363:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- eventInfoGet

NOTE: : Currently this function call does not support Group Mode operation.

9.4.6.3 Function steps

- Perform parameter checking
- Get a pointer to the base register for the current unit
- Retrieve the scan mask of active channels from the control structure
- If at least one channel is configured, determine the highest and lowest configured channels
- Determine the lowest channel that is configured
- Determine the highest channel that is configured
- Set the mask count so that we start with the highest bit of the 32 bit mask
- Initialize the mask result
- Determine the size of data that must be read to read all the channels between and including the highest and lowest channels.
- If no channels are configured, set the return length 0
- Specify the peripheral name in the ELC list
- Set Temp Sensor calibration data to invalid value
- If calibration register is available, retrieve it from the MCU
- Provide the previously retrieved slope information

9.4.7 R_ADC_ScanStart

```
ssp_err_t R_ADC_ScanStart ( adc_ctrl_t  * p_api_ctrl )
```

9.4.7.1 Brief description

This function starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the Open() call. If the Unit was configured for hardware triggering, then this function simply allows the trigger signal (hardware or software) to get to the ADC Unit. The function is not able to control the generation of the trigger itself. If the Unit was configured for software triggering, then this function starts the software triggered scan.

9.4.7.2 Detailed description

Table 1364:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_IN_USE	Running scan is still in progress

9.4.7.3 Function steps

- Perform parameter checking
- If the the normal/GroupA trigger is not set to software, then that the Unit is configured for hardware triggering
- Otherwise, enable software triggering
- Check to see if there is an ongoing scan else start the scan
- Return the error code

9.4.8 R_ADC_ScanStop

```
ssp_err_t R_ADC_ScanStop ( adc_ctrl_t  * p_api_ctrl )
```

9.4.8.1 Brief description

This function stops the software scan or disables the Unit from being triggered by the hardware trigger (internal or external) based on what type of trigger the unit was configured for in the Open() function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

9.4.8.2 Detailed description

Table 1365:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.

NOTE: Stopping a software scan results in immediate stoppage of the scan irrespective of current state of of the scan. Stopping the hardware scan results in disabling the trigger to prevent future scans from starting but does not affect the current scan.

9.4.8.3 Function steps

- Perform parameter checking
- If the trigger is not software scan, then disallow hardware triggering
- Otherwise, disable software triggering
- Return the error code

9.4.9 R_ADC_CheckScanDone

```
ssp_err_t R_ADC_CheckScanDone ( adc_ctrl_t  * p_api_ctrl )
```

9.4.9.1 Brief description

This function returns the status of any scan process that was started. On supported MCUs, the status of the ADC calibration is returned.

9.4.9.2 Detailed description

Table 1366:Return values

Name	Description
SSP_SUCCESS	Successful; the scan is complete.

Table 1366:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_IN_USE	Running scan or calibration is still in progress.

NOTE: If the peripheral was configured in single scan mode, then the return value of this function is an indication of the scan status. However, if the peripheral was configured in group mode, then the return value of this function could be an indication of either the group A or group B scan state. This is because the ADST bit is set when a scan is ongoing and cleared when the scan is done. This function should normally only be used when using software trigger in single scan mode.

9.4.9.3 Function steps

- Perform parameter checking
- Read status of ADC calibration and return busy status if calibration is ongoing
- Read the status of the ADST bit
- Return the error code

9.4.10 R_ADC_Read

```
ssp_err_t R_ADC_Read ( adc_ctrl_t * p_api_ctrl , adc_register_t const reg_id ,
  adc_data_size_t *const p_data )
```

9.4.10.1 Brief description

This function reads conversion results from a single channel or sensor register.

9.4.10.2 Detailed description

Table 1367:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.

Table 1367:Return values (Continued)

Name	Description
SSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

9.4.10.3 Function steps

- Perform parameter checking
- Get pointer to appropriate base address. This is repeated here in case parameter checking is disabled.
- Read the data from the requested ADC conversion register and return it
- Return the error code

9.4.11 R_ADC_Read32

```
ssp_err_t R_ADC_Read32 ( adc_ctrl_t  * p_api_ctrl ,  adc_register_t
const reg_id ,   uint32_t *const p_data )
```

9.4.11.1 Brief description

This function reads conversion results from a single channel or sensor register into a 32-bit result.

9.4.11.2 Detailed description

Table 1368:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

9.4.11.3 Function steps

- Read the 16-bit result.
- Left shift the result into the upper 16 bits if the unit is configured for left alignment.

9.4.12 R_ADC_Close

```
ssp_err_t R_ADC_Close ( adc_ctrl_t  * p_api_ctrl )
```

9.4.12.1 Brief description

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

9.4.12.2 Detailed description

Table 1369:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.

9.4.12.3 Function steps

- Perform parameter checking
- Mark driver as closed
- Perform hardware stop for the specific unit
- Release the lock
- Return the error code

9.4.13 R_ADC_VersionGet

```
ssp_err_t R_ADC_VersionGet ( ssp_version_t  *const p_version )
```

9.4.13.1 Brief description

Retrieve the API version number.

9.4.13.2 Detailed description

Table 1370:Return values

Name	Description
SSP_SUCCESS	Successful return.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.4.13.3 Function steps

- Return the version number

9.4.14 R_ADC_Calibrate

```
ssp_err_t R_ADC_Calibrate ( adc_ctrl_t  *const p_api_ctrl ,   void
*const p_extend )
```

9.4.14.1 Brief description

This function initiates calibration of the ADC on supported MCUs. Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. If ADC interrupts are enabled, a notification is provided via callback when calibration is complete. Otherwise, if the ADC interrupts are disabled then no notification will be provided and the application must check calibration status using infoGet() to determine if the calibration is complete before using the ADC API. Interrupts are enabled in scanStatusGet.

9.4.14.2 Detailed description

Table 1371:Parameters

Name	Direction	Description
p_api_ctrl	in	Pointer to control handle structure
p_extend	in	Unused argument. Pass NULL.

Table 1372:Return values

Name	Description
SSP_SUCCESS	Calibration successfully initiated.

Table 1372:Return values (Continued)

Name	Description
SSP_ERR_INVALID_HW_CONDITION	Hardware is in invalid state to perform calibration due to ongoing scan or scan trigger is enabled.
SSP_ERR_UNSUPPORTED	Calibration not supported on this MCU.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_extend is NULL.

9.4.14.3 Function steps

- Perform parameter checking
- ADC Calibration can only happen if there is no ongoing scan and if the scan trigger is disabled
- Set the normal mode interrupt request to occur when calibration is complete
- Initiate calibration
- Return the unsupported error.

9.4.15 R_ADC_OffsetSet

```
ssp_err_t R_ADC_OffsetSet ( adc_ctrl_t  *const p_api_ctrl ,  adc_register_t
const reg_id ,   int32_t offset )
```

9.4.15.1 Detailed description

offsetSet is not supported on the ADC.

9.4.15.2 Function steps

- Return the unsupported error.

9.4.16 Extensions

9.4.16.1 adc_instance_ctrl_t

adc_instance_ctrl_t

Detailed description

ADC instance control block. DO NOT INITIALIZE. Initialized in open.

Variables

- uint16_t unit

  ADC Unit in use.

- int16_t slope_microvolts

  Temperature sensor slope in microvolts/°C.
- adc_mode_t mode

  operational mode
- adc_alignment_t alignment

  alignment
- uint8_t max_resolution

  ADC max resolution: 8, 10, 12, or 14-bit.
- uint8_t pga_available

  PGA available or not on MCU.
- uint8_t tsn_ctrl_available

  Availability of TSN control register.
- uint8_t tsn_calib_available

  Availability of TSn calibration register.
- uint8_t adc_calib_available

  Availability of ADC calibration feature.
- R_TSN_Control_Type * p_tsn_ctrl_regs

  Pointer to temperature control register.
- R_TSN_Calibration_Type * p_tsn_calib_regs

  Pointer to temperature calibration register.
- void const * p_context

  Placeholder for user data.
- void * p_reg

  Base register for this unit.
- void(* callback)(*p_args)

  User callback pointer.
- adc_trigger_t trigger

  Trigger defined for normal mode.
- uint32_t opened

  Boolean to verify that the Unit has been initialized.
- uint32_t scan_mask

  Scan mask used for Normal scan.
- IRQn_Type scan_end_irq

  Scan end IRQ number.

- IRQn_Type scan_end_b_irq

  Scan end group B IRQ number.

9.5 AGT

Driver for the Asynchronous General Purpose Timer (AGT).

9.5.1 Summary

Extends Timer Interface.

HAL High-Level Driver for accessing and configuring AGT timer modes.

The AGT timer functions are used by the Timer to provide timer services.

9.5.2 Functions

- R_AGT_TimerOpen
- R_AGT_Close
- R_AGT_CounterGet
- R_AGT_PeriodSet
- R_AGT_DutyCycleSet
- R_AGT_Reset
- R_AGT_Start
- R_AGT_InfoGet
- R_AGT_Stop
- R_AGT_VersionGet

9.5.3 R_AGT_TimerOpen

```
ssp_err_t R_AGT_TimerOpen ( timer_ctrl_t  *const p_api_ctrl ,  timer_cfg_t  const
*const p_cfg )
```

9.5.3.1 Brief description

Open the AGT channel as a timer, handles required initialization described in hardware manual. Implements open.

9.5.3.2 Detailed description

The Timer Open function configures a single AGT channel for timer mode with parameters specified in the timer Configuration structure. It also sets up the control block for use with subsequent AGT Timer APIs.

This function must be called once prior to calling any other AGT API functions. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional timer_on_agt_cfg_t extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

The clock divider is selected based on the source clock frequency and the timer period supplied by the caller.

Table 1373:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and timer has started.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, p_ctrl, or the configuration channel ID exceeds AGT_MAX_CH, or the configuration mode is invalid.
SSP_ERR_IN_USE	The channel specified has already been opened.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the BSP.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet
- systemClockFreqGet

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.5.3.3 Function steps

- Verify channel is not already used
- Power on the AGT channel.
- Wait for counter to stop.
- Clear AGTO output
- Clear TEDGSEL bit to normal output.
- Set the AGT mode based on agt_mode value.
- Make sure period is valid, then set period
- Start the timer if requested by user

- All done.

9.5.4 R_AGT_Close

```
ssp_err_t R_AGT_Close ( timer_ctrl_t  *const p_api_ctrl )
```

9.5.4.1 Detailed description

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements close.

Table 1374:Return values

Name	Description
SSP_SUCCESS	The AGT Timer channel is successfully closed.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The AGT channel is not opened.

9.5.4.2 Function steps

- Cleanup the device: Stop counter, disable interrupts, and power down if no other channels are in use.
- Clear the TOE (output enable) bit
- Clear the TEDGSEL bit
- Unlock channel

9.5.5 R_AGT_CounterGet

```
ssp_err_t R_AGT_CounterGet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
*const p_value )
```

9.5.5.1 Detailed description

Retrieve and store counter value in provided p_value pointer. Implements counterGet.

Table 1375:Return values

Name	Description
SSP_SUCCESS	Counter value read, p_value is valid.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null

Table 1375:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	The channel is not opened.

9.5.5.2 Function steps

- Read counter value

9.5.6 R_AGT_PeriodSet

```
ssp_err_t R_AGT_PeriodSet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
const period ,  timer_unit_t  const unit )
```

9.5.6.1 Detailed description

Sets period value provided. Implements periodSet.

Table 1376:Return values

Name	Description
SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARG	One of the following is invalid: • p_period->unit: must be one of the options from timer_size_t::unit • p_period->value: must result in a period supported by the clock source specified during the Open call.
SSP_ERR_NOT_OPEN	The channel is not opened.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- systemClockFreqGet

9.5.6.2 Function steps

- Make sure period is valid, then set period

9.5.7 R_AGT_DutyCycleSet

```
ssp_err_t R_AGT_DutyCycleSet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
const duty_cycle ,  timer_pwm_unit_t  const unit ,   uint8_t const pin )
```

9.5.7.1 Detailed description

Setting duty cycle is not supported by this driver. Implements dutyCycleSet.

Table 1377:Return values

Name	Description
SSP_SUCCESS	Once duty cycle set successfully.
SSP_ERR_INVALID_ARGUMENT	If any of the argument is invalid
SSP_ERR_NOT_OPEN	The channel is not opened.

9.5.7.2 Function steps

- Set duty cycle.

9.5.8 R_AGT_Reset

```
ssp_err_t R_AGT_Reset ( timer_ctrl_t  *const p_api_ctrl )
```

9.5.8.1 Detailed description

Resets the counter value to the period that was originally set. Implements reset.

Table 1378:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.5.8.2 Function steps

- Save running status for restart, if already running.

- Reset the counter to the period originally sent in.
- Restart the AGT channel if it was running.

9.5.9 R_AGT_Start

```
ssp_err_t R_AGT_Start ( timer_ctrl_t  *const p_api_ctrl )
```

9.5.9.1 Detailed description

Starts timer. Implements start.

Table 1379:Return values

Name	Description
SSP_SUCCESS	Timer successfully started.
SSP_ERR_ASSERTION	The p_ctrl parameter is null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.5.9.2 Function steps

- Start timer

9.5.10 R_AGT_InfoGet

```
ssp_err_t R_AGT_InfoGet ( timer_ctrl_t  *const p_api_ctrl ,  timer_info_t
*const p_info )
```

9.5.10.1 Brief description

Get timer information and store it in provided pointer p_info. Implements infoGet.

9.5.10.2 Detailed description

Table 1380:Return values

Name	Description
SSP_SUCCESS	Period, status, count direction, frequency value written to caller's structure successfully.

Table 1380:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The p_ctrl or p_period_counts parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INVALID_HW_CONDITION	Invalid hardware setting is detected.

9.5.10.3 Function steps

- Get and store period
- Get and store clock frequency
- AGT supports only counting down direction

9.5.11 R_AGT_Stop

```
ssp_err_t R_AGT_Stop ( timer_ctrl_t  *const p_api_ctrl )
```

9.5.11.1 Detailed description

Stops the AGT channel specified by the handle (control block). This API implements stop. This API does not reset the channel or power it down.

Table 1381:Return values

Name	Description
SSP_SUCCESS	Timer successfully stopped.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.5.12 R_AGT_VersionGet

```
ssp_err_t R_AGT_VersionGet ( ssp_version_t  *const p_version )
```

9.5.12.1 Detailed description

Sets driver version based on compile time macros. Implements versionGet.

Table 1382:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.5.13 API Data

9.5.13.1 agt_count_source_t

agt_count_source_t

Detailed description

Count source

Enumerated values

Name	Description
AGT_CLOCK_PCLKB	Counter clock source is PCLKB when AGT_CLOCK_PCLKB, AGT_CLOCK_PCLKB_DIV_2, or AGT_CLOCK_PCLKB_DIV_8 is selected. The PCLKB divisor is selected automatically at runtime to the optimal value of PCLKB/1, PCLKB/2, or PCLKB/8. If the timer_cfg_t::unit is TIMER_UNIT_PERIOD_RAW_COUNTS, the timer_cfg_t::period should be the desired value in PCLKB counts, even if the value would exceed 16 bits. For example, if a period of 0x30000 counts is requested, a divisor of PCLKB/8 is be selected and the counter underflows after 0x6000 counts.
AGT_CLOCK_PCLKB_DIV_8	Superseded: See AGT_CLOCK_PCLKB.
AGT_CLOCK_PCLKB_DIV_2	Superseded: See AGT_CLOCK_PCLKB.
AGT_CLOCK_LOCO	Divided clock LOCO specified y bits CKS[2:0] in the AGTMR2 register.
AGT_CLOCK_AGT0_UNDERFLOW	Underflow event signal from AGT0.
AGT_CLOCK_FSUB	Divided clock fSUB specified by bits CKS[2:0] in the AGTMR2 register.

9.5.14 Extensions

9.5.14.1 agt_instance_ctrl_t

agt_instance_ctrl_t

Detailed description

Channel control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- void(* p_callback)(*p_args)

  Callback provided when a timer ISR occurs. NULL indicates no CPU interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user callback in timer_callback_args_t.
- void * p_reg

  Base register for this channel.
- uint32_t open

  Whether or not channel is open.
- uint16_t period

  Current timer period (counts)
- uint8_t channel

  Channel number.
- IRQn_Type irq

  Counter overflow IRQ number.
- timer_mode_t mode

  Timer mode.

9.5.14.2 timer_on_agt_cfg_t

timer_on_agt_cfg_t

Detailed description

Optional AGT extension data structure.

Variables

- agt_count_source_t count_source

  AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_-CLOCK_FSUB.
- bool agto_output_enabled

  AGTO pin is enabled for output compare (true, false)

- bool agtio_output_enabled

  AGTIO pin is enabled for output compare (true, false)
- bool output_inverted

  Output inverted (true, false)
- bool agtoa_output_enable

  Enable comparator A output pin (true, false)
- bool agtob_output_enable

  Enable comparator B output pin (true, false)

9.6 CAC

Driver for the Clock Frequency Accuracy Measurement Circuit (CAC).

9.6.1 Summary

This module supports the CAC peripheral.

9.6.2 Functions

- R_CAC_Open
- R_CAC_Close
- R_CAC_StopMeasurement
- R_CAC_StartMeasurement
- R_CAC_Reset
- R_CAC_Read
- R_CAC_VersionGet
- cac_setup
- cac_disable_nvic_interrupts
- cac_fmi_setup
- cac_setup_vectors
- cac_irq_cfg
- cac_enable_interrupts
- cac_frequency_error_isr
- cac_overflow_isr
- cac_measurement_end_isr

9.6.3 Defines

- #define CAC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define CAC_CODE_VERSION_MINOR

  Initial value: `(7U)`

9.6.4 R_CAC_Open

```
ssp_err_t R_CAC_Open ( cac_ctrl_t  *const p_api_ctrl ,  cac_cfg_t  const
*const p_cfg )
```

9.6.4.1 Brief description

Initialize the CAC peripheral.

9.6.4.2 Detailed description

The Open function applies power to the CAC peripheral, checks/sets the interrupt priority, and configures the CAC based on the provided user configuration settings. If a user defined callback function has been provided in the configuration, then the CAC interrupt(s) will be enabled and the user callback function called accordingly. Implements r_cac_t::open.

Table 1383:Return values

Name	Description
SSP_SUCCESS	CAC is available and available for measurement(s).
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options are invalid.
SSP_ERR_HW_LOCKED	Hardware lock for CAC peripheral is already taken.
SSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate smaller than reference clock rate.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

NOTE: There is only a single CAC peripheral. It is not reentrant.

9.6.4.3 Function steps

- g_cac_version is accessed by the ASSERT macro only and so compiler toolchain can issue a warning that they are not accessed. The code below eliminates this warning and also ensures these data structures are not optimised away.
- Eliminate warning if parameter checking is disabled.
- Take the hardware lock for the CAC.
- Setup the interrupt vectors and priorities
- Return the hardware lock for the CAC.
- Apply power to the peripheral
- Configure the CAC per the configuration.
- Store the callback and context information
- Mark driver as open by initializing it to "CAC" - its ASCII equivalent.

9.6.5 R_CAC_Close

```
ssp_err_t R_CAC_Close ( cac_ctrl_t  *const p_api_ctrl )
```

9.6.5.1 Brief description

Release any resources that were allocated by the Open() or any subsequent CAC operations. Implements r_cac_t::close.

9.6.5.2 Detailed description

Table 1384:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open has not been successfully called.

9.6.5.3 Function steps

- Eliminate warning if parameter checking is disabled.
- < Disable interrupts in the peripheral and NVIC
- Disable interrupts in NVIC.
- Disable the CAC ints.
- Stop measuring.

- Power down peripheral.
- Return the hardware lock for the CAC.

9.6.6 R_CAC_StopMeasurement

```
ssp_err_t R_CAC_StopMeasurement ( cac_ctrl_t  *const p_api_ctrl )
```

9.6.6.1 Brief description

Stop the CAC measurement process. Implements r_cac_t::stopMeasurement.

9.6.6.2 Detailed description

Table 1385:Return values

Name	Description
SSP_SUCCESS	CAC measuring has been stoped.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open has not been successfully called.

9.6.6.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Stop measuring.

9.6.7 R_CAC_StartMeasurement

```
ssp_err_t R_CAC_StartMeasurement ( cac_ctrl_t  *const p_api_ctrl )
```

9.6.7.1 Brief description

Start the CAC measurement process. Implements r_cac_t::startMeasurement.

9.6.7.2 Detailed description

Table 1386:Return values

Name	Description
SSP_SUCCESS	CAC measurement started.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open has not been successfully called.
SSP_ERR_CLOCK_INACTIVE	Either the provided Measurement or Reference clock is not running

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- clockCheck

9.6.7.3 Function steps

- Eliminate warnings if parameter checking is disabled.
- Start measuring.

9.6.8 R_CAC_Reset

```
ssp_err_t R_CAC_Reset ( cac_ctrl_t  *const p_api_ctrl )
```

9.6.8.1 Brief description

Resets the Overflow, Measurement End and Frequency Error interrupt flags. This will clear any of the CASTR status bits that have been set, but only if the CFME bit is off (Not measuring). Implements r_cac_t::reset.

9.6.8.2 Detailed description

Table 1387:Return values

Name	Description
SSP_SUCCESS	CAC reset completed.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open has not been successfully called.

9.6.8.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Reset the CAC.

9.6.9 R_CAC_Read

```
ssp_err_t R_CAC_Read ( cac_ctrl_t  *const p_api_ctrl ,   uint8_t
*const p_status ,   uint16_t *const p_counter )
```

9.6.9.1 Brief description

Read and return the CAC status and counter registers. Implements r_cac_t::read.

9.6.9.2 Detailed description

Table 1388:Return values

Name	Description
SSP_SUCCESS	CAC read successful.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open has not been successfully called.

9.6.9.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.6.10 R_CAC_VersionGet

```
ssp_err_t R_CAC_VersionGet ( ssp_version_t  *const p_version )
```

9.6.10.1 Brief description

Get the API and code version information.

9.6.10.2 Detailed description

Table 1389:Return values

Name	Description
SSP_SUCCESS	Version info returned.

NOTE: This function is reentrant.

9.6.11 cac_setup

```
cac_setup ( cac_instance_ctrl_t  *const p_ctrl ,  cac_cfg_t  const
*const p_cfg )
```

9.6.11.1 Detailed description

Configure the CAC per the user's configuration

Table 1390:Parameters

Name	Direction	Description
p_ctrl	in	- CAC instance control block
p_cfg	in	- pointer to the CAC configuration settings.

9.6.11.2 Function steps

- Disable interrupt in ICU

9.6.12 cac_disable_nvic_interrupts

```
cac_disable_nvic_interrupts ( cac_instance_ctrl_t  *const p_ctrl )
```

9.6.12.1 Detailed description

Disable the CAC interrupts in the NVIC

Table 1391:Parameters

Name	Direction	Description
p_ctrl	in	- CAC instance control block

None

9.6.13 cac_fmi_setup

```
ssp_err_t cac_fmi_setup ( cac_instance_ctrl_t  *const p_ctrl ,  ssp_feature_t
* p_ssp )
```

9.6.13.1 Brief description

This function gets the interrupt vector indexes from the FMI for the CAC interrupts.

9.6.13.2 Detailed description

Table 1392:Parameters

Name	Direction	Description
p_ctrl	in	- CAC instance control block
p_ssp	in	- pointer to ssp feature information

Table 1393:Return values

Name	Description
SSP_SUCCESS	FMI based setup success.
SSP_ERR_ASSERTION	Problem getting FMI information.

9.6.14 cac_setup_vectors

```
ssp_err_t cac_setup_vectors ( cac_instance_ctrl_t  *const p_ctrl ,  cac_cfg_t
const *const p_cfg )
```

9.6.14.1 Brief description

This function verfies that there is a callback function specified if one or more interrupts are enabled and sets the vector table entries and priority for enabled CAC interrupts.

9.6.14.2 Detailed description

Table 1394:Parameters

Name	Direction	Description
p_ctrl	in	- CAC instance control block
p_cfg	in	- pointer to the CAC configuration settings.

Table 1395:Return values

Name	Description
SSP_SUCCESS	Enabled vectors and priorities configured.
SSP_ERR_INVALID_POINTER	Interrupt specified with NULL callback.

9.6.15 cac_irq_cfg

```
 cac_irq_cfg ( cac_instance_ctrl_t  *const p_ctrl ,   bool state ,  cac_cfg_t
const *const p_cfg )
```

9.6.15.1 Brief description

This function enables or disables the CAC interrupts. There are 3 possible CAC interrupts, each of which the user may choose to enable or disable. These are the Frequency Error interrupt, the Measurement Complete interrupt and the Overflow interrupt. If the caller has provided a callback function as part of the provided p_cfg pointer, then that function will be called as a result of the interrupt.

9.6.15.2 Detailed description

Table 1396:Parameters

Name	Direction	Description
p_ctrl	in	CAC instance control block

Table 1396:Parameters (Continued)

Name	Direction	Description
state	in	true ==> enable interrupts, false ==> disable interrupts.
p_cfg	in	Pointer to the CAC configuration structure.

9.6.15.3 Function steps

- Regardless of whether we will enable or disable, Clear the Interrupt Request bits
- Enable the Interrupts if requested
- Assign the callback
- Disable interrupt in NVIC
- < Disable interrupts in the peripheral

9.6.16 cac_enable_interrupts

```
 cac_enable_interrupts ( cac_instance_ctrl_t  *const p_ctrl ,  cac_cfg_t  const
*const p_cfg )
```

9.6.16.1 Brief description

This function enables the CAC interrupts enabled in the supplied configuration.

9.6.16.2 Detailed description

Table 1397:Parameters

Name	Direction	Description
p_ctrl	in	CAC instance control block
p_cfg	in	Pointer to the CAC configuration structure.

9.6.16.3 Function steps

- < Disable interrupts in the peripheral
- Enable/Disable CAC interrupts as requested by the user.

9.6.17 cac_frequency_error_isr

```
cac_frequency_error_isr ( void )
```

9.6.17.1 Brief description

CAC Frequency error interrupt routine.

9.6.17.2 Detailed description

This function implements the CAC Frequency error isr. The function clears the interrupt request source on entry populates the callback structure with the relevant event, and providing a callback routine has been provided, calls the callback function with the event.

Table 1398:Return values

Name	Description
none	

9.6.17.3 Function steps

- The CAC interrupts are level based which means the bits in the peripheral must be cleared before clearing the IR bit in the IELSRn register.
- Clear the interrupt condition in the CAC peripheral
- Clear the IR bit in the IELSRn register
- Set data to identify callback to user, then call user callback.

9.6.18 cac_overflow_isr

```
cac_overflow_isr ( void )
```

9.6.18.1 Brief description

CAC Overflow interrupt routine.

9.6.18.2 Detailed description

This function implements the CAC overflow isr. The function clears the interrupt request source on entry populates the callback structure with the relevant event, and providing a callback routine has been provided, calls the callback function with the event.

Table 1399:Return values

Name	Description
none	

9.6.18.3 Function steps

- The CAC interrupts are level based which means the bits in the peripheral must be cleared before clearing the IR bit in the IELSRn register.
- Clear the interrupt condition in the CAC peripheral
- Clear the IR bit in the IELSRn register
- Set data to identify callback to user, then call user callback.

9.6.19 cac_measurement_end_isr

```
cac_measurement_end_isr (  void  )
```

9.6.19.1 Brief description

CAC Measurement Complete interrupt routine.

9.6.19.2 Detailed description

This function implements the CAC measurement complete isr. The function clears the interrupt request source populates the callback structure with the relevant event, and providing a callback routine has been provided, calls the callback function with the event.

Table 1400:Return values

Name	Description
none	

9.6.19.3 Function steps

- The CAC interrupts are level based which means the bits in the peripheral must be cleared before clearing the IR bit in the IELSRn register.
- Clear the interrupt condition in the CAC peripheral
- Clear the IR bit in the IELSRn register

- Set data to identify callback to user, then call user callback.

9.6.20 Extensions

9.6.20.1 cac_instance_ctrl_t

cac_instance_ctrl_t

Detailed description

CAC instance control block. DO NOT INITIALIZE.

Variables

- void * p_reg

  Pointer to register base address.
- void(* p_callback)(*cb_data)

  Called from the ISR.
- void const * p_context

  Passed to the callback.
- IRQn_Type frequency_error_irq

  Frequency error IRQ number.
- IRQn_Type measurement_end_irq

  Measurement end IRQ number.
- IRQn_Type overflow_irq

  Overflow IRQ number.
- uint32_t cac_api_open

  Set to "CAC" once API has been successfully opened.
- bool cac_continous_mode

  Set as a result of the Open() call.
- bsp_lock_t cac_lock

  CAC commands software lock.
- cac_clock_source_t measurement_clock

  Clock specified in Open() as the measurement clock.
- cac_clock_source_t reference_clock

  Clock specified in Open() as the reference clock.
- void const * p_extend

9.7 CAN

Driver for CAN, Controller Area Network.

This module supports the Controller Area Network peripheral. It implements the following interfaces:

- CAN Interface

9.7.1 Functions

- R_CAN_Open
- R_CAN_Close
- R_CAN_Read
- R_CAN_Write
- R_CAN_Control
- R_CAN_InfoGet
- R_CAN_VersionGet

9.7.2 Defines

- #define CAN_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define CAN_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.7.3 R_CAN_Open

```
ssp_err_t R_CAN_Open ( can_ctrl_t  *const p_ctrl ,  can_cfg_t  const
*const p_cfg )
```

9.7.3.1 Brief description

Open and configure the CAN channel for operation. Implements open

9.7.3.2 Detailed description

Table 1401:Return values

Name	Description
SSP_SUCCESS	Channel opened successfully
SSP_ERR_INVALID_ARGUMENT	Invalid channel passed as argument.
SSP_ERR_HW_LOCKED	Lock already owned by another user.
SSP_ERR_CAN_MODE_SWITCH_FAILED	Channel failed to switch modes.
SSP_ERR_CAN_INIT_FAILED	Channel failed to initialize.
SSP_ERR_ASSERTION	Null pointer presented.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet
- clockCheck

9.7.3.3 Function steps

- Check for valid parameters.
- Make sure the feature exists on this MCU.
- Return if failed to get feature information.
- Try to get channel lock.
- Return if channel is already open so return error
- Enter module start state.
- Disable interrupts while initializing
- Initialize and configure CAN module to run.
- Set channel, callback function, context, id mode, mailbox count, message mode, op mode and opened status.
- If successful, Lookup and store IRQ numbers. Enable interrupts.
- If successful, Mark the control block as open
- If the device failed to initialize, disable interrupts, stop and unlock the hardware and mark the control block as closed.
- Process errors before returning.
- Log error or assertion.

9.7.4 R_CAN_Close

```
ssp_err_t R_CAN_Close ( can_ctrl_t  *const p_ctrl )
```

9.7.4.1 Brief description

Close the CAN channel. Implements close

9.7.4.2 Detailed description

End of function R_CAN_Open

Table 1402:Return values

Name	Description
SSP_SUCCESS	Channel closed successfully.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_ASSERTION	Null pointer presented.

9.7.4.3 Function steps

- Mark the channel not open so other APIs cannot use it.
- Disable transmit, receive and error interrupts
- Enable module stop for the CAN channel
- Unlock the CAN channel

9.7.5 R_CAN_Read

```
ssp_err_t R_CAN_Read ( can_ctrl_t  *const p_ctrl ,   uint32_t mailbox ,
 can_frame_t  *const p_frame )
```

9.7.5.1 Brief description

Read data from the CAN channel. Return up to eight bytes read from the channel mailbox. Implements read

9.7.5.2 Detailed description

Table 1403:Return values

Name	Description
SSP_SUCCESS	Data successfully read.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_DATA_UNAVAILABLE	No data available.
SSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is not setup for receive.
SSP_ERR_ASSERTION	Null pointer presented.

9.7.5.3 Function steps

- Check for receive data
- Get frame data.
- Check for other mailboxes in an overrun state.
- Check for other mailboxes with received messages pending.

9.7.6 R_CAN_Write

```
ssp_err_t R_CAN_Write ( can_ctrl_t  *const p_ctrl ,   uint32_t mailbox ,
 can_frame_t  *const p_frame )
```

9.7.6.1 Brief description

Write data to the CAN channel. Write up to eight bytes to the channel mailbox. Implements write

9.7.6.2 Detailed description

Table 1404:Return values

Name	Description
SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.

Table 1404:Return values (Continued)

Name	Description
SSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup for receive and cannot send.
SSP_ERR_INVALID_ARGUMENT	Data length or frame type invalid.
SSP_ERR_ASSERTION	Null pointer presented

9.7.6.3 Function steps

- Check transmit ready flag.
- Transmit ready flag is not set, return error/status.
- Transmit ready flag set, so clear it.
- Send transmit frame.

9.7.7 R_CAN_Control

```
ssp_err_t R_CAN_Control ( can_ctrl_t  *const p_ctrl ,  can_command_t
const command ,   void * p_data )
```

9.7.7.1 Brief description

CAN Control is used to control extended features. Implements control

9.7.7.2 Detailed description

Table 1405:Return values

Name	Description
SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_INVALID_ARGUMENT	Invalid command.
SSP_ERR_ASSERTION	Null pointer presented
SSP_ERR_CAN_MODE_SWITCH_FAILED	Switching modes failed.

9.7.7.3 Function steps

- Verify command is CAN_COMMAND_MODE_SWITCH
- Change operating mode. Returns false if invalid mode or mode switch failed.
- Save mode for diagnostic purposes.

9.7.8 R_CAN_InfoGet

```
ssp_err_t R_CAN_InfoGet ( can_ctrl_t  *const p_ctrl ,   can_info_t
*const p_info )
```

9.7.8.1 Brief description

Get CAN state and status information for the channel. Implements infoGet

9.7.8.2 Detailed description

Table 1406:Return values

Name	Description
SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_DATA_UNAVAILABLE	Channel failed to return info.
SSP_ERR_ASSERTION	Null pointer presented

9.7.8.3 Function steps

- Get status for channel.
- Error encountered when retrieving info.
- Save the operation mode

9.7.9 R_CAN_VersionGet

```
ssp_err_t R_CAN_VersionGet ( ssp_version_t  *const p_version )
```

9.7.9.1 Brief description

Get CAN module code and API versions. Implements versionGet

9.7.9.2 Detailed description

Table 1407:Return values

Name	Description
SSP_SUCCESS	Operation succeeded.
SSP_ERR_ASSERTION	Null pointer presented note This function is reentrant.

9.7.9.3 Function steps

- Return module version information.

9.7.10 Extensions

9.7.10.1 can_instance_ctrl_t

can_instance_ctrl_t

Detailed description

CAN Instance Control Block

Variables

- uint32_t channel

  Channel number.

  Parameters to control CAN peripheral device
- uint32_t open

  Open status of channel.
- can_mode_t operation_mode

  Can operation mode.
- can_id_mode_t id_mode

  Standard or Extended ID mode.
- uint32_t mailbox_count

  Number of mailboxes.
- can_mailbox_t * p_mailbox

  Pointer to mailboxes.

- can_message_mode_t message_mode

  Overwrite message or overrun.
- can_clock_source_t clock_source

  Clock source. CANMCLK or PCLKB.
- void(* p_callback)(*p_args)

  Pointer to callback function.

  Parameters to process CAN Event
- void const * p_context

  Pointer to the higher level device context.
- void * p_reg

  Pointer to register base address.
- IRQn_Type error_irq

  Error IRQ number.
- IRQn_Type mailbox_rx_irq

  Receive mailbox IRQ number.
- IRQn_Type mailbox_tx_irq

  Transmit mailbox IRQ number.

9.7.10.2 can_extended_cfg_t

can_extended_cfg_t

Detailed description

CAN clock configuration and mailbox mask to be pointed to by p_extend.

Variables

- can_clock_source_t clock_source

  Source of the CAN clock.
- uint32_t * p_mailbox_mask

  Mailbox mask, one for every 4 mailboxes.

9.8 CGC

Driver for the Clock Generation Circuit.

Clock Generation Circuit API.

This module supports the Clock Generation Circuit. It implements the following interfaces:

- CGC Interface

9.8.1 Functions

- R_CGC_Init
- R_CGC_ClocksCfg
- R_CGC_ClockStart
- R_CGC_ClockStop
- R_CGC_SystemClockSet
- R_CGC_SystemClockGet
- R_CGC_SystemClockFreqGet
- R_CGC_ClockCheck
- R_CGC_OscStopDetect
- R_CGC_OscStopStatusClear
- R_CGC_BusClockOutCfg
- R_CGC_BusClockOutEnable
- R_CGC_BusClockOutDisable
- R_CGC_ClockOutCfg
- R_CGC_ClockOutEnable
- R_CGC_ClockOutDisable
- R_CGC_LCDClockCfg
- R_CGC_LCDClockEnable
- R_CGC_LCDClockDisable
- R_CGC_SDADCClockCfg
- R_CGC_SDADCClockEnable
- R_CGC_SDADCClockDisable
- R_CGC_SDRAMClockOutEnable
- R_CGC_SDRAMClockOutDisable
- R_CGC_USBClockCfg
- R_CGC_SystickUpdate
- R_CGC_VersionGet
- r_cgc_stabilization_wait
- r_cgc_clock_start_stop

9.8.2 Defines

- #define CGC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define CGC_CODE_VERSION_MINOR

  Initial value: `(9U)`

9.8.3 R_CGC_Init

```
ssp_err_t R_CGC_Init (  void  )
```

9.8.3.1 Brief description

Initialize the CGC API.

9.8.3.2 Detailed description

Configures the following for the clock generator module

- If CGC_CFG_SUBCLOCK_AT_RESET_ENABLE is set to true:
  - SubClock drive capacity (Compile time configurable: CGC_CFG_SUBCLOCK_DRIVE)
  - Initial setting for the SubClock

THIS FUNCTION MUST BE EXECUTED ONCE AT STARTUP BEFORE ANY OF THE OTHER CGC FUNCTIONS CAN BE USED OR THE CLOCK SOURCE IS CHANGED FROM THE MOCO.

Table 1408:Return values

Name	Description
SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

9.8.3.3 Function steps

- SubClock will stop only if configurable setting is Enabled

9.8.4 R_CGC_ClocksCfg

```
ssp_err_t R_CGC_ClocksCfg ( cgc_clocks_cfg_t  const *const p_clock_cfg )
```

9.8.4.1 Brief description

Reconfigure all main system clocks.

9.8.4.2 Detailed description

Table 1409:Return values

Name	Description
SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_MAIN_OSC_INACTIVE	PLL Initialization attempted with Main OCO turned off/unstable.
SSP_ERR_CLOCK_ACTIVE	Active clock source specified for modification. This applies specifically to the PLL dividers/multipliers which cannot be modified if the PLL is active. It has to be stopped first before modification.
SSP_ERR_NOT_STABILIZED	The Clock source is not stabilized after being turned off.
SSP_ERR_CLKOUT_EXCEEDED	The main oscillator can be only 8 or 16 MHz.
SSP_ERR_ASSERTION	A NULL is passed for configuration data when PLL is the clock_source.
SSP_ERR_INVALID_MODE	Attempt to start a clock in a restricted operating power control mode.

9.8.5 R_CGC_ClockStart

```
ssp_err_t R_CGC_ClockStart ( cgc_clock_t  clock_source ,  cgc_clock_cfg_t
* p_clock_cfg )
```

9.8.5.1 Brief description

Start the specified clock if it is not currently active.

9.8.5.2 Detailed description

Configures the following when starting the Main Clock Oscillator:

- MainClock drive capacity (Configured based on external clock frequency)
- MainClock stabilization wait time (Compile time configurable: CGC_CFG_MAIN_OSC_WAIT)

- To update the subclock driven capacity, stop the subclock first before calling this function.

Table 1410:Return values

Name	Description
SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_MAIN_OSC_INACTIVE	PLL Initialization attempted with Main OCO turned off/unstable.
SSP_ERR_CLOCK_ACTIVE	Active clock source specified for modification. This applies specifically to the PLL dividers/multipliers which cannot be modified if the PLL is active. It has to be stopped first before modification.
SSP_ERR_NOT_STABILIZED	The Clock source is not stabilized after being turned off.
SSP_ERR_CLKOUT_EXCEEDED	The main oscillator can be only 8 or 16 MHz.
SSP_ERR_ASSERTION	A NULL is passed for configuration data when PLL is the clock_source.
SSP_ERR_INVALID_MODE	Attempt to start a clock in a restricted operating power control mode.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

9.8.5.3 Function steps

- See if we need to switch to Middle or High Speed mode before starting the PLL.

9.8.6 R_CGC_ClockStop

```
ssp_err_t R_CGC_ClockStop ( cgc_clock_t  clock_source )
```

9.8.6.1 Brief description

Stop the specified clock if it is active and not configured as the system clock.

9.8.6.2 Detailed description

Table 1411:Return values

Name	Description
SSP_SUCCESS	Clock stopped successfully.
SSP_ERR_CLOCK_ACTIVE	Current System clock source specified for stopping. This is not allowed.
SSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop MOCO when Oscillation stop is enabled.
SSP_ERR_NOT_STABILIZED	Clock not stabilized after starting. A finite stabilization time after starting the clock has to elapse before it can be stopped.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

9.8.7 R_CGC_SystemClockSet

```
ssp_err_t R_CGC_SystemClockSet ( cgc_clock_t  clock_source ,
 cgc_system_clock_cfg_t  const *const p_clock_cfg )
```

9.8.7.1 Brief description

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD and FCLK.

9.8.7.2 Detailed description

THIS FUNCTION DOES NOT CHECK TO SEE IF THE OPERATING MODE SUPPORTS THE SPECIFIED CLOCK SOURCE AND DIVIDER VALUES. SETTING A CLOCK SOURCE AND DVIDER OUTSIDE THE RANGE SUPPORTED BY THE CURRENT OPERATING MODE WILL RESULT IN UNDEFINED OPERATION.

IF THE LOCO MOCO OR SUBCLOCK ARE CHOSEN AS THE SYSTEM CLOCK, THIS FUNCTION WILL SET THOSE AS THE SYSTEM CLOCK WITHOUT CHECKING FOR STABILIZATION. IT IS UP TO THE USER TO ENSURE THAT LOCO, MOCO OR SUBCLOCK ARE STABLE BEFORE USING THEM AS THE SYSTEM CLOCK.

Additionally this function sets the RAM and ROM wait states for the MCU. For the S7 MCU the ROMWT register controls ROM wait states. For the S3 MCU the MEMWAIT register controls ROM wait states.

Table 1412:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
SSP_ERR_ASSERTION	The p_clock_cfg parameter is NULL.
SSP_ERR_NOT_STABILIZED	The clock source has not stabilized
SSP_ERR_INVALID_ARGUMENT	Invalid argument used. ICLK is not set as the fastest clock.
SSP_ERR_INVALID_MODE	Peripheral divisions are not valid in sub-osc mode
SSP_ERR_INVALID_MODE	Oscillator stop detect not allowed in sub-osc mode

9.8.7.3 Function steps

- In order to correctly set the ROM and RAM wait state registers we need to know the current (S3A7 only) and requested iclk frequencies.

9.8.8 R_CGC_SystemClockGet

```
ssp_err_t R_CGC_SystemClockGet ( cgc_clock_t  * clock_source ,
 cgc_system_clock_cfg_t  * p_set_clock_cfg )
```

9.8.8.1 Brief description

Return the current system clock source and configuration.

9.8.8.2 Detailed description

Table 1413:Return values

Name	Description
SSP_SUCCESS	Parameters returned successfully.
SSP_ERR_ASSERTION	A NULL is passed for configuration data.
SSP_ERR_ASSERTION	A NULL is passed for clock source.

9.8.9 R_CGC_SystemClockFreqGet

```
ssp_err_t R_CGC_SystemClockFreqGet ( cgc_system_clocks_t  clock ,  uint32_t
* p_freq_hz )
```

9.8.9.1 Brief description

Return the requested internal clock frequency in Hz.

9.8.9.2 Detailed description

Table 1414:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid clock specified.
SSP_ERR_ASSERTION	A NULL is passed for frequency data.

9.8.10 R_CGC_ClockCheck

```
ssp_err_t R_CGC_ClockCheck ( cgc_clock_t  clock_source )
```

9.8.10.1 Brief description

Check the specified clock for stability.

9.8.10.2 Detailed description

Table 1415:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_NOT_STABILIZED	Clock not stabilized.
SSP_ERR_CLOCK_ACTIVE	Clock active but not able to check for stability.
SSP_ERR_CLOCK_INACTIVE	Clock not turned on.
SSP_ERR_INVALID_ARGUMENT	Illegal parameter passed.

Table 1415:Return values (Continued)

Name	Description
SSP_ERR_STABILIZED	Clock stabilized.

9.8.11 R_CGC_OscStopDetect

```
ssp_err_t R_CGC_OscStopDetect ( cgc_callback_args_t void(*)(
*p_args) p_callback ,   bool enable )
```

9.8.11.1 Brief description

Enable or disable the oscillation stop detection for the main clock. The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

9.8.11.2 Detailed description

Table 1416:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.
SSP_ERR_ASSERTION	Null pointer passed for callback function when the second argument is "true".
SSP_ERR_ASSERTION	Cannot enable oscillator stop detect in sub-osc speed mode
SSP_ERR_ASSERTION	Invalid peripheral clock divisions for oscillator stop detect

9.8.12 R_CGC_OscStopStatusClear

```
ssp_err_t R_CGC_OscStopStatusClear (  void  )
```

9.8.12.1 Brief description

Clear the Oscillation Stop Detection Status register.

9.8.12.2 Detailed description

This register is not cleared automatically if the stopped clock is restarted. This function blocks for about 3 ICLK cycles until the status register is cleared.

Table 1417:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.

9.8.13 R_CGC_BusClockOutCfg

```
ssp_err_t R_CGC_BusClockOutCfg ( cgc_bclockout_dividers_t  divider )
```

9.8.13.1 Brief description

Configure the secondary dividers for BCLKOUT. The primary divider is set using the bsp clock configuration and the R_CGC_SystemClockSet function.

9.8.13.2 Detailed description

Table 1418:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.14 R_CGC_BusClockOutEnable

```
ssp_err_t R_CGC_BusClockOutEnable (  void  )
```

9.8.14.1 Brief description

Enable the BCLKOUT output.

9.8.14.2 Detailed description

Table 1419:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.15 R_CGC_BusClockOutDisable

```
ssp_err_t R_CGC_BusClockOutDisable (  void  )
```

9.8.15.1 Brief description

Disable the BCLKOUT output.

9.8.15.2 Detailed description

Table 1420:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.16 R_CGC_ClockOutCfg

```
ssp_err_t R_CGC_ClockOutCfg ( cgc_clock_t  clock ,
 cgc_clockout_dividers_t  divider )
```

9.8.16.1 Brief description

Configure the dividers for CLKOUT.

9.8.16.2 Detailed description

Table 1421:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.17 R_CGC_ClockOutEnable

```
ssp_err_t R_CGC_ClockOutEnable ( void )
```

9.8.17.1 Brief description

Enable the CLKOUT output.

9.8.17.2 Detailed description

Table 1422:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.18 R_CGC_ClockOutDisable

```
ssp_err_t R_CGC_ClockOutDisable ( void )
```

9.8.18.1 Brief description

Disable the CLKOUT output.

9.8.18.2 Detailed description

Table 1423:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.19 R_CGC_LCDClockCfg

```
ssp_err_t R_CGC_LCDClockCfg ( cgc_clock_t clock )
```

9.8.19.1 Brief description

Configure the source for the segment LCDCLK.

9.8.19.2 Detailed description

Table 1424:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.

9.8.20 R_CGC_LCDClockEnable

```
ssp_err_t R_CGC_LCDClockEnable (  void  )
```

9.8.20.1 Brief description

Enable the segment LCDCLK output.

9.8.20.2 Detailed description

Table 1425:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.

9.8.21 R_CGC_LCDClockDisable

```
ssp_err_t R_CGC_LCDClockDisable (  void  )
```

9.8.21.1 Brief description

Disable the segment LCDCLK output.

9.8.21.2 Detailed description

Table 1426:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.

9.8.22 R_CGC_SDADCClockCfg

```
ssp_err_t R_CGC_SDADCClockCfg ( cgc_clock_t  clock )
```

9.8.22.1 Brief description

Configure the source for the SDADCCLK.

9.8.22.2 Detailed description

Table 1427:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.23 R_CGC_SDADCClockEnable

```
ssp_err_t R_CGC_SDADCClockEnable (  void  )
```

9.8.23.1 Brief description

Enable the SDADCCLK output.

9.8.23.2 Detailed description

Table 1428:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.24 R_CGC_SDADCClockDisable

```
ssp_err_t R_CGC_SDADCClockDisable ( void )
```

9.8.24.1 Brief description

Disable the SDADCCLK output.

9.8.24.2 Detailed description

Table 1429:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.25 R_CGC_SDRAMClockOutEnable

```
ssp_err_t R_CGC_SDRAMClockOutEnable ( void )
```

9.8.25.1 Brief description

Enable the SDCLK output.

9.8.25.2 Detailed description

Table 1430:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.26 R_CGC_SDRAMClockOutDisable

```
ssp_err_t R_CGC_SDRAMClockOutDisable ( void )
```

9.8.26.1 Brief description

Disable the SDCLK output.

9.8.26.2 Detailed description

Table 1431:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.

9.8.27 R_CGC_USBClockCfg

```
ssp_err_t R_CGC_USBClockCfg ( cgc_usb_clock_div_t  divider )
```

9.8.27.1 Brief description

Configure the dividers for UCLK.

9.8.27.2 Detailed description

Table 1432:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid divider specified.

9.8.28 R_CGC_SystickUpdate

```
ssp_err_t R_CGC_SystickUpdate (  uint32_t period_count ,
 cgc_systick_period_units_t  units )
```

9.8.28.1 Brief description

Re-Configure the systick based on the provided period and current system clock frequency.

9.8.28.2 Detailed description

Table 1433:Parameters

Name	Direction	Description
period_count	in	The duration for the systick period.
units	in	The units for the provided period.

Table 1434:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid period specified.
SSP_ERR_ABORTED	Attempt to update systick timer failed.

9.8.29 R_CGC_VersionGet

```
ssp_err_t R_CGC_VersionGet ( ssp_version_t  *const p_version )
```

9.8.29.1 Brief description

Return the driver version.

9.8.29.2 Detailed description

Table 1435:Return values

Name	Description
SSP_SUCCESS	Operation performed successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL..

9.8.30 r_cgc_stabilization_wait

```
ssp_err_t r_cgc_stabilization_wait ( cgc_clock_t  clock )
```

9.8.31 r_cgc_clock_start_stop

```
ssp_err_t r_cgc_clock_start_stop ( cgc_clock_change_t  clock_state ,
 cgc_clock_t  clock_to_change )
```

9.9 CRC

Driver for the CRC Calculator (CRC).

This module supports the CRC Calculator (CRC). It implements the following interface:

- CRC Interface

9.9.1 Functions

- calculate_polynomial
- R_CRC_Open
- R_CRC_Close
- R_CRC_CalculatedValueGet
- R_CRC_SnoopEnable
- R_CRC_SnoopDisable
- R_CRC_SnoopCfg
- R_CRC_Calculate
- R_CRC_VersionGet

9.9.2 Variables

- s_crc_version
- g_crc_on_crc

9.9.3 Defines

- #define CRC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define CRC_CODE_VERSION_MINOR

  Initial value: `(4U)`

- #define CRC_SNOOP_MAX_CHANNEL

  Initial value: `(10UL)`

  Maximum number of channels supported by CRC

- #define CRC_OPEN

  Initial value: `(0x00435243ULL)`

  "CRC" in ASCII, used to determine if channel is open.

- #define CRC_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &g_module_name[0], &s_crc_version)`

  Macro for error logger.

9.9.4 calculate_polynomial

```
ssp_err_t calculate_polynomial ( crc_ctrl_t *const p_api_ctrl , void
* inputBuffer , uint32_t length , uint32_t crc_seed , uint32_t
* calculatedValue )
```

9.9.4.1 Brief description

Perform a CRC calculation on a block of 8-bit data.

9.9.4.2 Detailed description

(end defgroup CRC) Implements calculate

This function performs a CRC calculation on an array of 8-bit/32-bit(for 32-bit polynomial) values and returns an 8-bit32-bit(for 32-bit polynomial) calculated value.

Table 1436:Return values

Name	Description
SSP_SUCCESS	Calculation successful.

9.9.5 R_CRC_Open

```
ssp_err_t R_CRC_Open ( crc_ctrl_t *const p_api_ctrl , crc_cfg_t const
*const p_cfg )
```

9.9.5.1 Brief description

Open the CRC driver module.

9.9.5.2 Detailed description

Implements open

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Table 1437:Return values

Name	Description
SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.9.5.3 Function steps

- Mark driver as initialized by setting the open value to the ASCII equivalent of "CRC"

9.9.6 R_CRC_Close

```
ssp_err_t R_CRC_Close ( crc_ctrl_t  *const p_api_ctrl )
```

9.9.6.1 Brief description

Close the CRC module driver.

9.9.6.2 Detailed description

Implements close

Table 1438:Return values

Name	Description
SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

9.9.7 R_CRC_CalculatedValueGet

```
ssp_err_t R_CRC_CalculatedValueGet ( crc_ctrl_t  *const p_api_ctrl ,   uint32_t
* calculatedValue )
```

9.9.7.1 Brief description

Return the current calculated value.

9.9.7.2 Detailed description

Implements crcResultGet

CRC calculation operates on a running value. This function returns the current calculated value.

Table 1439:Return values

Name	Description
SSP_SUCCESS	Return of calculated value successful.
SSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

9.9.8 R_CRC_SnoopEnable

```
ssp_err_t R_CRC_SnoopEnable ( crc_ctrl_t  *const p_api_ctrl ,
  uint32_t crc_seed )
```

9.9.8.1 Brief description

Enable snooping.

9.9.8.2 Detailed description

Implements snoopEnable

Table 1440:Return values

Name	Description
SSP_SUCCESS	Snoop enabled.
SSP_ERR_ASSERTION	Either p_ctrl or crc_seed is NULL.

Table 1440:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	The driver is not opened.

9.9.9 R_CRC_SnoopDisable

```
ssp_err_t R_CRC_SnoopDisable ( crc_ctrl_t  *const p_api_ctrl )
```

9.9.9.1 Brief description

Disable snooping.

9.9.9.2 Detailed description

Implements snoopDisable

Table 1441:Return values

Name	Description
SSP_SUCCESS	Snoop disabled.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

9.9.10 R_CRC_SnoopCfg

```
ssp_err_t R_CRC_SnoopCfg ( crc_ctrl_t  *const p_api_ctrl ,  crc_snoop_cfg_t
*const p_snoop_cfg )
```

9.9.10.1 Brief description

Configure the snoop channel and direction.

9.9.10.2 Detailed description

Implements snoopCfg

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Table 1442:Return values

Name	Description
SSP_SUCCESS	Snoop configured successfully.
SSP_ERR_ASSERTION	- This is due to below conditions • Either p_ctrl or p_snoop_cfg is NULL • snoop_channel is greater than or equal to CRC_SNOOP_MAX_CHANNEL.
SSP_ERR_NOT_OPEN	The driver is not opened.

9.9.11 R_CRC_Calculate

```
ssp_err_t R_CRC_Calculate ( crc_ctrl_t  *const p_api_ctrl ,   void
* inputBuffer ,   uint32_t length ,   uint32_t crc_seed ,   uint32_t
* calculatedValue )
```

9.9.11.1 Brief description

Perform a CRC calculation on a block of 8-bit/32-bit(for 32-bit polynomial) data.

9.9.11.2 Detailed description

Implements calculate

This function performs a CRC calculation on an array of 8-bit/32-bit(for 32-bit polynomial) values and returns an 8-bit/32-bit(for 32-bit polynomial) calculated value

Table 1443:Return values

Name	Description
SSP_SUCCESS	Calculation successful.
SSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
SSP_ERR_INVALID_ARGUMENT	length value is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.
SSP_ERR_IN_USE	CRC peripheral is currently in use by another instance of the driver.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.9.11.3 Function steps

- Lock the peripheral during calculation

9.9.12 R_CRC_VersionGet

```
ssp_err_t R_CRC_VersionGet ( ssp_version_t  *const p_version )
```

9.9.12.1 Brief description

Get the driver version based on compile time macros.

9.9.12.2 Detailed description

Implements versionGet

Table 1444:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

9.9.13 g_crc_on_crc

```
crc_api_t::g_crc_on_crc
```

9.9.13.1 Detailed description

Name of module used by error logger macro Filled in Interface API structure for this Instance.

9.9.13.2 Initialized as

```
g_crc_on_crc=
{
    .open           = R_CRC_Open,
    .close          = R_CRC_Close,
    .crcResultGet   = R_CRC_CalculatedValueGet,
    .snoopEnable    = R_CRC_SnoopEnable,
    .snoopDisable   = R_CRC_SnoopDisable,
```

```
    .snoopCfg       = R_CRC_SnoopCfg,
    .calculate      = R_CRC_Calculate,
    .versionGet     = R_CRC_VersionGet
}
```

9.9.14 Extensions

9.9.14.1 crc_instance_ctrl_t

crc_instance_ctrl_t

Detailed description

Driver instance control structure.

Variables

- R_CRC_Type * p_reg

  Pointer to register base address.

- uint32_t open

  Whether or not channel is open.

- crc_polynomial_t polynomial

  CRC Generating Polynomial Switching (GPS).

- crc_bit_order_t bit_order

  CRC Calculation Switching (LMS).

9.10 CTSU

Driver for the Capacitive Touch Sensing Unit (CTSU).

Driver for operating the CTSU. Provides functions to start up the CTSU and maintain necessary parameters to determine if a channel is being touched or not.

It implements the following interface:

- CTSU Interface defined in r_ctsu_api.h

9.10.1 Functions

- R_CTSU_VersionGet
- R_CTSU_Open
- R_CTSU_Start_Scan
- R_CTSU_Update_Parameters
- R_CTSU_Process

- R_CTSU_Read_Results
- R_CTSU_Control
- R_CTSU_Close

9.10.2 Defines

- #define CTSU_CODE_VERSION_MAJOR
  Initial value: `(1U)`
- #define CTSU_CODE_VERSION_MINOR
  Initial value: `(3U)`
- #define CTSU_MAX_CHANNELS
  Initial value: `(36)`

9.10.3 R_CTSU_VersionGet

```
ssp_err_t R_CTSU_VersionGet ( ssp_version_t  *const p_version )
```

9.10.4 R_CTSU_Open

```
ssp_err_t R_CTSU_Open ( ctsu_ctrl_t  * p_api_ctrl ,  ctsu_cfg_t  * p_cfg )
```

9.10.4.1 Brief description

Initializes the CTSU, initializes software driver parameters for touch determination, with initial auto-tuning(optional) and baseline initialization(optional).

9.10.4.2 Detailed description

Table 1445:Return values

Name	Description
SSP_SUCCESS	No errors. CTSU succesfully initialized.
SSP_ERR_HW_LOCKED	CTSU driver already in use
SSP_ERR_ASSERTION	Invalid mode of operation (SELF or MUTUAL capacitance), invalid soft option, or invalid close option
SSP_ERR_INVALID_POINTER	NULL pointer passed as an argument for a required parameter -OR- Memory allocation failed.

Table 1445:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	Illegal parameter was found.
SSP_ERR_CTSU_OFFSET_ADJUSTMENT_FAILED	Initial auto tuning failed because either the filter depth is too large, or the tuning is not valid for either the board or the current conditions.

NOTE: Data processing functions should be used by advanced users only. Beginners should provide a dummy argument (except NULL). Members inside should be kept NULL.

NOTE: If CFG_AUTO_TUNE is enabled, then the user must ensure that global interrupt operation is enabled before Open gets invoked.

9.10.4.3 Function steps

- Perform quick checks
- Set the valid channel mask based on variant data.
- Cannot reconfigure CTSU. You should unload active configuration by calling Close before proceeding.
- Power ON the CTSU
- Blind copy the configuration settings to initialize CTSU
- Discover excluded channels
- The number of active channels must be greater than the number of excluded channels
- Variables to be used in the loop below
- Initialize buffers used
- Populate primary buffers
- Select operation functions
- Enable interrupt operation
- Perform optional actions
- Indicate that R_Touch is ready
- Save which CTSU configuration has been opened
- Save the CTSU options used during open
- Save the CTSU options to use when updating parameters
- Save the notification function argument to be passed

9.10.5 R_CTSU_Start_Scan

```
ssp_err_t R_CTSU_Start_Scan ( ctsu_ctrl_t  * p_api_ctrl )
```

9.10.5.1 Brief description

Starts off a CTSU hardware scan. The rate at which this function is called is essentially the scan rate.

9.10.5.2 Detailed description

Table 1446:Return values

Name	Description
SSP_SUCCESS	No errors. CTSU scan successfully initialized.
SSP_ERR_IN_USE	A scan is ongoing

9.10.5.3 Function steps

- CTSU h/w is ready to start a new scan.
- Start a new scan.
- Hardware is busy

9.10.6 R_CTSU_Update_Parameters

```
ssp_err_t R_CTSU_Update_Parameters ( ctsu_ctrl_t  * p_api_ctrl )
```

9.10.6.1 Brief description

Function that must be called after each scan is complete to process the results of the scanned data.

9.10.6.2 Detailed description

It performs the following tasks:

```
             0. Checks for any errors in CTSU operation.
             1. Runs a filter on the raw values output by the CTSU.
             2. Determines if a channel is being touched or not and updates the
binary and difference between
                 sensor_baseline and the current sensor value.
          3. When the update is complete, the user specified callback is called
from this function with
               the CTSU_EVENT_PARAMETERS_UPDATED event.
```

```
            4. (Optional) Performs auto-tuning if (a single/all) channels are not
being touched.
             5. (Optional) Performs drift compensation if (a single/all channels)
are not being touched.
                     Drift compensation := move sensor baseline after N readings.
```

Table 1447:Return values

Name	Description
SSP_SUCCESS	No errors.
SSP_ERR_INVALID_POINTER	NULL pointer passed as an argument for a required parameter. -OR- Memory allocation failed.
SSP_ERR_INVALID_ARGUMENT	Illegal parameter was found.
SSP_ERR_CTSU_OFFSET_ADJUSTMENT_FAILED	Auto tuning failed because CTSU encountered a ICOMP error or Check the configuration parameters for each channel by locating the point of failure.

9.10.6.3 Function steps

- Check for CTSU error conditions
- Update each channel measured
- Initialize variables for loop below
- Channel is to be excluded. Bypass calculations.
- Check which channels are being touched.
- Initialize variables for loop below
- Channel is to be excluded. Bypass calculations.
- Do the callback to provide a notification
- Perform drift compensation

9.10.7 R_CTSU_Process

```
ssp_err_t R_CTSU_Process ( ctsu_ctrl_t  * p_api_ctrl ,
 ctsu_process_option_t  opts )
```

9.10.7.1 Brief description

Function that the user must call from the main loop. This function is deprecated by the R_CTSU_Update_Parameters function and is not exposed to the user in the interface API.

9.10.7.2 Detailed description

It performs the following tasks:

```
             0. Checks for any errors in CTSU operation.
             1. Runs a filter on the raw values output by the CTSU.
             2. Determines if a channel is being touched or not and updates the
binary and difference between
                  sensor_baseline and the current sensor value.
           3. (Optional) Performs auto-tuning if (a single/all) channels are not
being touched.
            4. (Optional) Performs drift compensation if (a single/all channels)
are not being touched.
                     Drift compensation := move sensor baseline after N readings.
             5. (Optional) Starts off a new scan.
```

Table 1448:Return values

Name	Description
SSP_SUCCESS	No errors.
SSP_ERR_INVALID_POINTER	NULL pointer passed as an argument for a required parameter. -OR- Memory allocation failed.
SSP_ERR_INVALID_ARGUMENT	Illegal parameter was found.
SSP_ERR_CTSU_OFFSET_ADJUSTMENT_FAILED	Auto tuning failed because CTSU encountered a ICOMP error or Check the configuration parameters for each channel by locating the point of failure.

9.10.7.3 Function steps

- Check for CTSU error conditions
- Update each channel measured
- Initialize variables for loop below
- Initialize variables for loop below
- Check which channels are being touched.
- Update buttons
- Update Slider
- Perform drift compensation
- CTSU is ready to run
- Start a new scan.

- Save a copy of the state machine

9.10.8 R_CTSU_Read_Results

```
ssp_err_t R_CTSU_Read_Results ( ctsu_ctrl_t  * p_api_ctrl ,   void * p_dest ,
 ctsu_read_t  opts ,  ctsu_channel_pair_t const * channels ,   const
uint16_t count )
```

9.10.8.1 Brief description

Function to allow the user to read the results after executing a scan.

9.10.8.2 Detailed description

Table 1449:Return values

Name	Description
SSP_SUCCESS	No errors.
CTSU_ERR_INVALID_CMD	Command option provided is invalid.
SSP_ERR_INVALID_POINTER	NULL pointer passed as an argument for a required parameter. -OR- Memory allocation failed.
SSP_ERR_INVALID_ARGUMENT	Illegal parameter was found.
SSP_ERR_CTSU_OFFSET_ADJUSTMENT_FAILED	Auto tuning failed because CTSU encountered a ICOMP error. Check the configuration parameters for each channel by locating the point of failure.

9.10.8.3 Function steps

- Get results for the requested options
- Assemble arr[3] and arr[2] as the high and low byte
- Assemble arr[3] and arr[2] as the high and low byte
- Assemble arr[3] and arr[2] as the high and low byte
- Assemble arr[3] and arr[2] as the high and low byte
- Assemble arr[3] and arr[2] as the high and low byte
- Assemble arr[3] and arr[2] as the high and low byte

9.10.9 R_CTSU_Control

```
ssp_err_t R_CTSU_Control (  ctsu_cmd_t cmd ,   void * p_data )
```

9.10.9.1 Brief description

Allows the user to query manipulate R_Touch layer, and CTSU operation. This function is not exposed for usage in the interface API.

9.10.9.2 Detailed description

Table 1450:Return values

Name	Description
SSP_SUCCESS	No errors.
CTSU_ERR_INVALID_CMD	Command option provided is invalid.
SSP_ERR_IN_USE	CTSU Scan is ongoing.

9.10.9.3 Function steps

- Execute the control request

9.10.10 R_CTSU_Close

```
ssp_err_t R_CTSU_Close ( ctsu_ctrl_t  * p_api_ctrl ,
 ctsu_close_option_t  opts )
```

9.10.10.1 Brief description

Function used to close the CTSU driver, stop clocking of the CTSU peripheral, reset all internal structures and close the DTC Transfer instances. The function can also optionally save the configuration for a rapid wake-up on re-opening.

9.10.10.2 Detailed description

Table 1451:Return values

Name	Description
SSP_SUCCESS	No errors.

9.10.11 Extensions

9.10.11.1 ctsu_instance_ctrl_t

ctsu_instance_ctrl_t

Detailed description

Instance control structure

Variables

- transfer_api_t const * p_api_transfer

  Pointer to lower level Transfer driver function pointers.
- transfer_ctrl_t * p_lowerl_lvl_transfer_read_ctrl

  Pointer to the Transfer Read control.
- transfer_ctrl_t * p_lowerl_lvl_transfer_write_ctrl

  Pointer to the Transfer Write control.
- bool ctsu_opened

  Store initialization state.
- uint8_t ctsu_unit

  CTSU Unit in use.
- ctsu_hw_cfg_t * p_ctsu_hw_cfg

  Pointer to a CTSU configuration.
- ctsu_process_option_t ctsu_open_option

  Software options to use when performing Open and Process.
- ctsu_process_option_t ctsu_update_option

  Software options to use when performing parameter Update process.
- ctsu_close_option_t ctsu_close_option

  Software options to use when closing touch operation.
- ctsu_action_t ctsu_process_state

  Variable to observe CTSU processing state machine operation.
- void(* p_callback)(*p_args)

  Callback to the function to use when updating dependent parameters is complete.
- void * p_context

  Pointer to data that should be passed to update_complete notification.
- R_CTSU_Type * p_reg

  Pointer to base register address.

9.11 DAC

Driver for the 12-Bit D/C Converter (DAC12).

9.11.1 Summary

This module implements the following interface: DAC Interface.

Name of module used by error logger macro

9.11.2 Functions

- R_DAC_Open
- R_DAC_Close
- R_DAC_Write
- R_DAC_Start
- R_DAC_Stop
- R_DAC_VersionGet
- R_DAC_InfoGet

9.11.3 Defines

- #define DAC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define DAC_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.11.4 R_DAC_Open

```
ssp_err_t R_DAC_Open ( dac_ctrl_t  * p_api_ctrl ,  dac_cfg_t  const
*const p_cfg )
```

9.11.4.1 Brief description

Perform required initialization described in hardware manual. Implements open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

9.11.4.2 Detailed description

Table 1452:Return values

Name	Description
SSP_SUCCESS	The channel was successfully opened.
SSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_api_ctrl or p_cfg Channel ID requested in p_cfg may not available on the device selected in r_bsp_config.h data_format value in p_cfg is out of range. ad_da_synchronized value in p_cfg is out of range.
SSP_ERR_IN_USE	DAC resource is locked.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.11.4.3 Function steps

- Validate the input parameter.
- Make sure the peripheral exists.
- Lock the DAC Hardware Resource.
- Power on the DAC device.
- Stop the channel.
- Configure data format: left or right justified.
- Configure D/A-A/D Synchronous Start Control Register(DAADSCR).
- Set output amplifier configuration for the channel.
- Set the reference voltage.
- Initialize the channel state information.
- All done. Return.

9.11.5 R_DAC_Close

```
ssp_err_t R_DAC_Close ( dac_ctrl_t  * p_api_ctrl )
```

9.11.5.1 Brief description

Stop the D/A conversion, stop output, and close the DAC channel.

9.11.5.2 Detailed description

Table 1453:Return values

Name	Description
SSP_SUCCESS	The channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.11.5.3 Function steps

- Validate that the channel is opened.
- Stop the channel
- Update the channel state information.
- Unlock the DAC Hardware Resource
- Power down the DAC device.
- Unlock the DAC Hardware Resource

9.11.6 R_DAC_Write

```
ssp_err_t R_DAC_Write ( dac_ctrl_t  * p_api_ctrl ,  dac_size_t  value )
```

9.11.6.1 Brief description

Write data to the D/A converter and enable the output if it has not been enabled.

9.11.6.2 Detailed description

Table 1454:Return values

Name	Description
SSP_SUCCESS	Data is successfully written to the D/A Converter.

Table 1454:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

NOTE: Write function automatically starts the D/A conversion after data is successfully written to the channel.

9.11.6.3 Function steps

- Validate that the channel is opened.
- Write the value to D/A converter.
- Start the converter if it has been idle.
- Start the channel

9.11.7 R_DAC_Start

```
ssp_err_t R_DAC_Start ( dac_ctrl_t  * p_api_ctrl )
```

9.11.7.1 Brief description

Start the D/A conversion output if it has not been started.

9.11.7.2 Detailed description

Table 1455:Return values

Name	Description
SSP_SUCCESS	The channel is started successfully.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.11.7.3 Function steps

- Validate that the channel is opened.

- Enable the output.
- Update the internal state.

9.11.8 R_DAC_Stop

```
ssp_err_t R_DAC_Stop ( dac_ctrl_t  * p_api_ctrl )
```

9.11.8.1 Brief description

Stop the D/A conversion and disable the output signal.

9.11.8.2 Detailed description

Table 1456:Return values

Name	Description
SSP_SUCCESS	The control is successfully stopped.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.11.8.3 Function steps

- Validate that the channel is opened.
- Disable the output.
- Mark the internal state.

9.11.9 R_DAC_VersionGet

```
ssp_err_t R_DAC_VersionGet ( ssp_version_t  * p_version )
```

9.11.9.1 Brief description

Get version and store it in provided pointer p_version.

9.11.9.2 Detailed description

Table 1457:Return values

Name	Description
SSP_SUCCESS	Successfully retrieved version information.
SSP_ERR_ASSERTION	p_version is NULL.

9.11.10 R_DAC_InfoGet

```
ssp_err_t R_DAC_InfoGet ( dac_info_t  *const p_info )
```

9.11.10.1 Brief description

Get information about DAC Resolution and store it in provided pointer p_info.

9.11.10.2 Detailed description

Table 1458:Return values

Name	Description
SSP_SUCCESS	Value of DAC resolution written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_info parameter was null.

9.11.11 Extensions

9.11.11.1 dac_instance_ctrl_t

dac_instance_ctrl_t

Detailed description

DAC instance control block. DO NOT INITIALIZE.

Variables

- void * p_reg

  Pointer to DAC base register.

- uint8_t channel

  ID associated with this DAC channel.
- uint8_t channel_started

  DAC operation on channel started.
- uint8_t channel_opened

  DAC channel open.

9.12 DAC

Driver for the 8-Bit D/C Converter (DAC8).

9.12.1 Summary

This module implements the following interface: DAC Interface.

Name of module used by error logger macro

9.12.2 Functions

- R_DAC8_Open
- R_DAC8_Close
- R_DAC8_Write
- R_DAC8_Start
- R_DAC8_Stop
- R_DAC8_VersionGet
- R_DAC8_InfoGet

9.12.3 Defines

- #define DAC8_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define DAC8_CODE_VERSION_MINOR

  Initial value: `(3U)`

9.12.4 R_DAC8_Open

```
ssp_err_t R_DAC8_Open ( dac_ctrl_t  * p_api_ctrl ,  dac_cfg_t  const
*const p_cfg )
```

9.12.4.1 Brief description

Perform required initialization described in hardware manual. Implements open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

9.12.4.2 Detailed description

Table 1459:Return values

Name	Description
SSP_SUCCESS	The channel was successfully opened.
SSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_api_ctrl or p_cfg
SSP_ERR_IN_USE	DAC8 resource is locked.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was requested.
SSP_ERR_UNSUPPORTED	Output amplifier is not supported. Real time mode is not supported. Charge pump is not supported. A/D - D/A synchronization is not supported.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.12.4.3 Function steps

- Validate the input parameter.
- Make sure the peripheral exists.
- Lock the DAC Hardware Resource.
- Power on the DAC device.
- Stop the channel.
- Set defaults.
- Configure the charge pump.
- Configure the DAC mode.

- Configure DA/AD mode.
- Initialize the channel state information.
- All done. Return.

9.12.5 R_DAC8_Close

```
ssp_err_t R_DAC8_Close ( dac_ctrl_t  * p_api_ctrl )
```

9.12.5.1 Brief description

Stop the D/A conversion, stop output, and close the DAC channel.

9.12.5.2 Detailed description

Table 1460:Return values

Name	Description
SSP_SUCCESS	The channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.12.5.3 Function steps

- Stop the channel
- Update the channel state information.
- Unlock the DAC Hardware Resource
- Unlock the DAC Hardware Resource

9.12.6 R_DAC8_Write

```
ssp_err_t R_DAC8_Write ( dac_ctrl_t  * p_api_ctrl ,  dac_size_t  value )
```

9.12.6.1 Brief description

Write data to the D/A converter and enable the output if it has not been enabled.

9.12.6.2 Detailed description

Table 1461:Return values

Name	Description
SSP_SUCCESS	Data is successfully written to the D/A Converter.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

NOTE: Write function automatically starts the D/A conversion after data is successfully written to the channel.

9.12.6.3 Function steps

- Handle data format.
- Convert to 8 bits.
- Write the value to D/A converter.
- Start the converter if it has been idle.
- Start the channel

9.12.7 R_DAC8_Start

```
ssp_err_t R_DAC8_Start ( dac_ctrl_t  * p_api_ctrl )
```

9.12.7.1 Brief description

Start the D/A conversion output.

9.12.7.2 Detailed description

Table 1462:Return values

Name	Description
SSP_SUCCESS	The channel is started successfully.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.

Table 1462:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.12.7.3 Function steps

- Enable the output.
- Update the internal state.

9.12.8 R_DAC8_Stop

```
ssp_err_t R_DAC8_Stop ( dac_ctrl_t  * p_api_ctrl )
```

9.12.8.1 Brief description

Stop the D/A conversion and disable the output signal.

9.12.8.2 Detailed description

Table 1463:Return values

Name	Description
SSP_SUCCESS	The control is successfully stopped.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

9.12.8.3 Function steps

- Disable the output.
- Mark the internal state.

9.12.9 R_DAC8_VersionGet

```
ssp_err_t R_DAC8_VersionGet ( ssp_version_t  * p_version )
```

9.12.9.1 Brief description

Get version and store it in provided pointer p_version.

9.12.9.2 Detailed description

Table 1464:Return values

Name	Description
SSP_SUCCESS	Successfully retrieved version information.
SSP_ERR_ASSERTION	p_version is NULL.

9.12.10 R_DAC8_InfoGet

```
ssp_err_t R_DAC8_InfoGet ( dac_info_t  *const p_info )
```

9.12.10.1 Brief description

Get information about DAC Resolution and store it in provided pointer p_info.

9.12.10.2 Detailed description

Table 1465:Return values

Name	Description
SSP_SUCCESS	Value of DAC resolution written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_info parameter was null.

9.12.11 API Data

9.12.11.1 dac8_mode_t

`dac8_mode_t`

Detailed description

DAC8 mode

Enumerated values

Name	Description
DAC8_MODE_NORMAL	DAC Normal mode.
DAC8_MODE_REAL_TIME	DAC Real-time (event link) mode.

9.12.12 Extensions

9.12.12.1 dac8_instance_ctrl_t

dac8_instance_ctrl_t

Detailed description

DAC8 instance control block. DO NOT INITIALIZE.

Variables

- void * p_reg

  Pointer to DAC base register.
- uint8_t channel

  ID associated with this DAC channel.
- uint8_t channel_started

  DAC operation on channel started.
- uint32_t channel_opened

  DAC channel open.
- dac_data_format_t data_format

  DAC data format.

9.12.12.2 dac8_extended_cfg_t

dac8_extended_cfg_t

Detailed description

DAC8 extended configuration

Variables

- bool enable_charge_pump

  Enable DAC charge pump.
- dac8_mode_t dac_mode

  DAC mode.

9.13 DMAC

DMA Controller (DMAC).

9.13.1 Summary

Extends the Transfer Interface.

The Direct Memory Access (DMA) Controller allows data transfers to occur in place of or in addition to any interrupt. It also supports data transfers using software start.

NOTE: The transfer length is limited to 1024 (10 bits) in TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT.

NOTE: This driver supports only TRANSFER_IRQ_END from transfer_irq_t.

9.13.2 Functions

- R_DMAC_Open
- R_DMAC_Reset
- R_DMAC_Start
- R_DMAC_Stop
- R_DMAC_Enable
- R_DMAC_Disable
- R_DMAC_InfoGet
- R_DMAC_Close
- R_DMAC_VersionGet
- R_DMAC_BlockReset

9.13.3 Defines

- #define DMAC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define DMAC_CODE_VERSION_MINOR

  Initial value: `(4U)`
- #define DMAC_REPEAT_BLOCK_MAX_LENGTH

  Initial value: `(0x400)`

  Length limited to 1024 transfers for repeat and block mode

- #define DMAC_NORMAL_MAX_LENGTH

  Initial value: (0xFFFF)

  Length limited to 65535 transfers for normal mode

9.13.4 R_DMAC_Open

```
ssp_err_t R_DMAC_Open ( transfer_ctrl_t  *const p_api_ctrl ,  transfer_cfg_t
const *const p_cfg )
```

9.13.4.1 Brief description

Initialize transfer and enables transfer in ICU. Implements open.

9.13.4.2 Detailed description

Table 1466:Return values

Name	Description
SSP_SUCCESS	Successful open. Transfer is configured and will start when trigger occurs.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_ENABLED	Auto-enable was requested, but enable failed.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
SSP_ERR_IN_USE	The BSP hardware lock for the DMAC is not available.

See Common Error Codes for other possible return codes.This function calls

- productFeatureGet
- eventInfoGet

9.13.4.3 Function steps

- Acquire BSP hardware lock for channel used.
- Configure the DMAC according to the flowchart "Activating the DMAC" in chapter 16.3.7 of hardware manual NoSecurity_r01uh0488ej0040_sc32.pdf.
- Configure DMA transfer and sources
-

  NOTE: Transfer escape interrupts not supported.

Update internal variables.

- Mark driver as open by initializing "DMAC" in its ASCII equivalent.
- If auto_enable is true, enable transfer and ELC events if software start is used.

9.13.5 R_DMAC_Reset

```
ssp_err_t R_DMAC_Reset ( transfer_ctrl_t  *const p_api_ctrl ,   void const
*volatile p_src ,   void *volatile p_dest ,   uint16_t const num_transfers )
```

9.13.5.1 Brief description

Reset transfer source, destination, and number of transfers.

9.13.5.2 Detailed description

Table 1467:Return values

Name	Description
SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_ENABLED	DMAC is not enabled. A valid source and destination must be provided in either open() or reset().
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.

9.13.5.3 Function steps

- Enables transfers on this activation source.

9.13.6 R_DMAC_Start

```
ssp_err_t R_DMAC_Start ( transfer_ctrl_t  *const p_api_ctrl ,
 transfer_start_mode_t  mode )
```

9.13.6.1 Brief description

Start transfer. Implements start.

9.13.6.2 Detailed description

Table 1468:Return values

Name	Description
SSP_SUCCESS	Transfer started written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

9.13.6.3 Function steps

- Set autoclear bit and software start bit.

9.13.7 R_DMAC_Stop

```
ssp_err_t R_DMAC_Stop ( transfer_ctrl_t  *const p_api_ctrl )
```

9.13.7.1 Brief description

Stop transfer. Implements stop.

9.13.7.2 Detailed description

Table 1469:Return values

Name	Description
SSP_SUCCESS	Transfer stopped written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

9.13.7.3 Function steps

- Reset auto clear bit and clear software transfer request.

9.13.8 R_DMAC_Enable

```
ssp_err_t R_DMAC_Enable ( transfer_ctrl_t  *const p_api_ctrl )
```

9.13.8.1 Brief description

Enable transfer. Implements enable.

9.13.8.2 Detailed description

Table 1470:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

9.13.8.3 Function steps

- Enable transfer.

9.13.9 R_DMAC_Disable

```
ssp_err_t R_DMAC_Disable ( transfer_ctrl_t  *const p_api_ctrl )
```

9.13.9.1 Brief description

Disable transfer. Implements disable.

9.13.9.2 Detailed description

Table 1471:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.

Table 1471:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

9.13.9.3 Function steps

- Disable transfer.

9.13.10 R_DMAC_InfoGet

```
ssp_err_t R_DMAC_InfoGet ( transfer_ctrl_t  *const p_api_ctrl ,
 transfer_properties_t  *const p_info )
```

9.13.10.1 Brief description

Set driver specific information in provided pointer. Implements infoGet.

9.13.10.2 Detailed description

Table 1472:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_ASSERTION	An input parameter is invalid.

9.13.10.3 Function steps

- If a transfer is active, store it in p_in_progress.
- Store maximum transfer length.
- Store remaining transfer length.

9.13.11 R_DMAC_Close

```
ssp_err_t R_DMAC_Close ( transfer_ctrl_t  *const p_api_ctrl )
```

9.13.11.1 Brief description

Disable transfer and clean up internal data. Implements close.

9.13.11.2 Detailed description

Table 1473:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.

9.13.11.3 Function steps

- Disable DMAC transfers, disable DMAC interrupts, and remove DMAC trigger from ICU register.
- Clear ID so control block can be reused.
- Release BSP hardware lock on this channel

9.13.12 R_DMAC_VersionGet

```
ssp_err_t R_DMAC_VersionGet ( ssp_version_t  *const p_version )
```

9.13.12.1 Brief description

Set driver version based on compile time macros.

9.13.12.2 Detailed description

Table 1474:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.

9.13.13 R_DMAC_BlockReset

```
ssp_err_t R_DMAC_BlockReset ( transfer_ctrl_t  *const p_api_ctrl ,   void const
*volatile p_src ,   void *volatile p_dest ,   uint16_t const length ,
 transfer_size_t  size ,   uint16_t const num_transfers )
```

9.13.13.1 Brief description

Reset transfer source, destination, length and number of transfers for block transfer.

9.13.13.2 Detailed description

Table 1475:Return values

Name	Description
SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.
SSP_ERR_NOT_ENABLED	DMAC is not enabled. A valid source and destination must be provided in either open() or blockReset().

9.13.13.3 Function steps

- Enables transfers on this activation source.

9.13.14 Extensions

9.13.14.1 dmac_instance_ctrl_t

dmac_instance_ctrl_t

Detailed description

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in open.

Variables

- uint32_t id

  Driver ID.

- elc_event_t trigger

  Transfer activation event. Matches event returned by transfer_api_t::infoGet.

- IRQn_Type irq

  Transfer activation IRQ.
- uint8_t channel

  Channel number.
- void(* p_callback)(*cb_data)

  Callback for transfer end interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.
- void * p_reg

  Pointer to base register.

9.13.14.2 transfer_on_dmac_cfg_t

transfer_on_dmac_cfg_t

Detailed description

DMAC transfer configuration extension. This extension is required.

Variables

- uint8_t channel

  Channel number, does not apply to all HAL drivers.

9.14 DOC

Driver for the Data Operation Circuit (DOC).

9.14.1 Summary

This module implements the DOC Interface using the Data Operation Circuit (DOC).

9.14.2 Functions

- R_DOC_Open
- R_DOC_Close
- R_DOC_StatusGet
- R_DOC_StatusClear
- R_DOC_Write

- R_DOC_InputRegisterWrite
- R_DOC_VersionGet

9.14.3 Defines

- #define DOC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define DOC_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.14.4 R_DOC_Open

```
ssp_err_t R_DOC_Open ( doc_ctrl_t  *const p_api_ctrl ,  doc_cfg_t  const
*const p_cfg )
```

9.14.4.1 Brief description

Configure the Data Operation Circuit (DOC) in comparison, addition or subtraction mode. Implements open.

9.14.4.2 Detailed description

If callback is not NULL in the configuration structure the DOC IRQ will be enabled.

Table 1476:Return values

Name	Description
SSP_SUCCESS	DOC successfully configured.
SSP_ERR_IN_USE	Module already open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.
SSP_ERR_INVALID_ARGUMENT	ISR is not enabled. Enable the ISR in bsp_irq_cfg.h.
SSP_ERR_HW_LOCKED	DOC resource is locked.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

NOTE: This function is reentrant.

9.14.4.3 Function steps

- Make sure the DOC exists on this part.
- Lock the DOC Hardware Resource
- Configure the DOC via DOCR register.
- If callback parameter is not NULL configure the IRQ
- Mark driver as open by initializing it to "DOCO" in its ASCII equivalent.

9.14.5 R_DOC_Close

```
ssp_err_t R_DOC_Close ( doc_ctrl_t  *const p_api_ctrl )
```

9.14.5.1 Brief description

Close the module driver. Enable module stop mode. Implements close.

9.14.5.2 Detailed description

To close the DOC it must have been opened via the open API. When opened a control structure of type doc_ctrl_t is passed to the open API. The same control structure must be passed to the close API.

Table 1477:Return values

Name	Description
SSP_SUCCESS	Module successfully closed.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- eventInfoGet

NOTE: This function is reentrant.

NOTE: This function will disable the DOC interrupt in the NVIC.

9.14.5.3 Function steps

- Disable the IRQ in the NVIC in case it has been left enabled.
- Clear DOPCF in DOCR
- Mark driver as closed.
- Unlock the DOC Hardware Resource

9.14.6 R_DOC_StatusGet

```
ssp_err_t R_DOC_StatusGet ( doc_ctrl_t  *const p_api_ctrl ,  doc_status_t
* p_status )
```

9.14.6.1 Brief description

Return the comparison/addition/subtraction status. Implements statusGet.

9.14.6.2 Detailed description

The status is read from the Data Operation Circuit Flag (DOPCF).

Table 1478:Return values

Name	Description
SSP_SUCCESS	Status successfully read.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.

NOTE: This function is reentrant.

9.14.7 R_DOC_StatusClear

```
ssp_err_t R_DOC_StatusClear ( doc_ctrl_t  *const p_api_ctrl )
```

9.14.7.1 Brief description

Clear the DOPCF status flag at the hardware layer. This flag indicates the result of a DOC operation. Implements statusClear.

9.14.7.2 Detailed description

Table 1479:Return values

Name	Description
SSP_SUCCESS	Interrupt successfully cleared.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

NOTE: This function is reentrant.

9.14.8 R_DOC_Write

```
ssp_err_t R_DOC_Write ( doc_ctrl_t  *const p_api_ctrl ,  doc_data_t
*const p_data )
```

9.14.8.1 Brief description

Write to the DODIR and DODSR registers. Implements write,.

9.14.8.2 Detailed description

In comparison mode the 16-bit reference data is written to the DODSR register and the data for the comparison written to the DODIR. In addition mode the initial data is written to the DODSR and the data to be added to the DODIR. In subtraction mode the initial data is written to the DODSR and the data to be subtracted to the DODIR.

When changing both the DODSR and DODIR the DODSR should be updated first.

Table 1480:Return values

Name	Description
SSP_SUCCESS	Values successfully written to the registers.
SSP_ERR_NOT_OPEN	Driver not open.

Table 1480:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One or more pointers point to NULL.

NOTE: This function is reentrant.

9.14.9 R_DOC_InputRegisterWrite

```
ssp_err_t R_DOC_InputRegisterWrite ( doc_ctrl_t  *const p_api_ctrl ,
 doc_size_t  data )
```

9.14.9.1 Brief description

Write to the DODIR register. Implements inputRegisterWrite,.

9.14.9.2 Detailed description

Writes to the DODIR register only.

Table 1481:Return values

Name	Description
SSP_SUCCESS	Value successfully written to the DODIR register.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.

NOTE: This function is reentrant.

9.14.10 R_DOC_VersionGet

```
ssp_err_t R_DOC_VersionGet ( ssp_version_t  *const p_version )
```

9.14.10.1 Brief description

Return DOC HAL driver version. Implements versionGet.

9.14.10.2 Detailed description

Table 1482:Return values

Name	Description
SSP_SUCCESS	Version information successfully read.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

NOTE: This function is reentrant.

9.14.11 Extensions

9.14.11.1 doc_instance_ctrl_t

doc_instance_ctrl_t

Detailed description

DOC instance control block. Do not initialize. Initialization occurs when the open function is called.

Variables

- uint32_t open

  Used by driver to check if the control structure is valid.
- void(* p_callback)(*p_args)

  Callback provided when a DOC ISR occurs. NULL indicates no CPU interrupt.
- doc_event_t event

  The event DOC is configured for. Passed in ISR callback.
- void const * p_context

  Placeholder for user data. Passed to the user callback in doc_callback_args_t.
- void * p_reg

  Base register.

9.15 DTC

Driver for the Data Transfer Controller (DTC).

9.15.1 Summary

Extends Transfer Interface.

The Data Transfer Controller allows data transfers to occur in place of or in addition to any interrupt. It does not support data transfers using software start.

NOTE: The transfer length is limited to 256 (8 bits) in TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT.

9.15.2 Functions

- R_DTC_Open
- R_DTC_Reset
- R_DTC_Start
- R_DTC_Stop
- R_DTC_Enable
- R_DTC_Disable
- R_DTC_InfoGet
- R_DTC_Close
- R_DTC_VersionGet
- R_DTC_BlockReset

9.15.3 Defines

- #define DTC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define DTC_CODE_VERSION_MINOR

  Initial value: `(8U)`
- #define DTC_REPEAT_BLOCK_MAX_LENGTH

  Initial value: `(0x100)`

  Length limited to 256 transfers for repeat and block mode

- #define DTC_NORMAL_MAX_LENGTH

  Initial value: (0x10000)

  Length limited to 65536 transfers for normal mode

9.15.4 R_DTC_Open

```
ssp_err_t R_DTC_Open ( transfer_ctrl_t  *const p_api_ctrl ,  transfer_cfg_t
const *const p_cfg )
```

9.15.4.1 Brief description

Set transfer data in the vector table and enable transfer in ICU. Implements open.

9.15.4.2 Detailed description

Table 1483:Return values

Name	Description
SSP_SUCCESS	Successful open. Transfer is configured and will start when trigger occurs.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_IN_USE	The BSP hardware lock for the DTC is not available, or the index for this IRQ in the DTC vector table is already configured.
SSP_ERR_HW_LOCKED	DTC hardware resource is locked.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
SSP_ERR_NOT_ENABLED	Auto-enable was requested, but enable failed due to an invalid input parameter.

9.15.4.3 Function steps

- Make sure the activation source is mapped in the ICU.
- Make sure the activation source is not already being used by the DTC.
- Configure the DTC transfer. See the hardware manual for details.
- Update internal variables.
- Mark driver as open by initializing it to "DTC" in its ASCII equivalent.

- If auto_enable is true, enable transfer and ELC events if software start is used.
- Enable read skip after all settings are complete.

9.15.5 R_DTC_Reset

```
ssp_err_t R_DTC_Reset ( transfer_ctrl_t  *const p_api_ctrl ,   void const
*volatile p_src ,   void *volatile p_dest ,   uint16_t const num_transfers )
```

9.15.5.1 Brief description

Reset transfer source, destination, and number of transfers. Implements reset.

9.15.5.2 Detailed description

Table 1484:Return values

Name	Description
SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_NOT_ENABLED	Transfer length must not be 0 for repeat and block mode, or enable failed due to an invalid input parameter: • Transfer source must not be NULL. • Transfer destination must not be NULL.

9.15.5.3 Function steps

- Disable transfers on this activation source.
- Disable read skip prior to modifying settings. It will be enabled later.
- Reset transfer based on input parameters.
- Enables transfers on this activation source.
- Enable read skip after all settings are complete.

9.15.6 R_DTC_Start

```
ssp_err_t R_DTC_Start ( transfer_ctrl_t  *const p_api_ctrl ,
 transfer_start_mode_t  mode )
```

9.15.6.1 Brief description

Start transfer. Implements start.

9.15.6.2 Detailed description

Table 1485:Return values

Name	Description
SSP_SUCCESS	Transfer started successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	One of the following is invalid: • Handle was not configured for software activation. • Mode not set to TRANSFER_START_MODE_SINGLE. • DTC_SOFTWARE_START_ENABLE set to 0 (disabled) in ssp_cfg/driver/r_dtc_cfg.h.

9.15.7 R_DTC_Stop

```
ssp_err_t R_DTC_Stop ( transfer_ctrl_t  *const p_ctrl )
```

9.15.7.1 Brief description

Placeholder for unsupported stop function. Implements stop.

9.15.7.2 Detailed description

Table 1486:Return values

Name	Description
SSP_ERR_UNSUPPORTED	DTC software start is not supported.

9.15.8 R_DTC_Enable

```
ssp_err_t R_DTC_Enable ( transfer_ctrl_t  *const p_api_ctrl )
```

9.15.8.1 Brief description

Enable transfer and ELC events if they are used for software start. Implements enable.

9.15.8.2 Detailed description

Table 1487:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the p_ctrl is not enabled in the BSP.

9.15.8.3 Function steps

- Enable transfer.

9.15.9 R_DTC_Disable

```
ssp_err_t R_DTC_Disable ( transfer_ctrl_t  *const p_api_ctrl )
```

9.15.9.1 Brief description

Disable transfer. Implements disable.

9.15.9.2 Detailed description

Table 1488:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.

Table 1488:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

9.15.9.3 Function steps

- Disable transfer.

9.15.10 R_DTC_InfoGet

```
ssp_err_t R_DTC_InfoGet ( transfer_ctrl_t  *const p_api_ctrl ,
 transfer_properties_t  *const p_info )
```

9.15.10.1 Brief description

Set driver specific information. Implements infoGet.

9.15.10.2 Detailed description

Table 1489:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

9.15.10.3 Function steps

- If a transfer is active, store it in p_in_progress.
- Transfer information for the activation source is taken from DTC vector table.
- Mask out the high byte in case of repeat transfer.
- Store maximum transfer length.

9.15.11 R_DTC_Close

```
ssp_err_t R_DTC_Close ( transfer_ctrl_t  *const p_api_ctrl )
```

9.15.11.1 Brief description

Disables transfer in the ICU, then clears transfer data from the DTC vector table. Implements close.

9.15.11.2 Detailed description

Table 1490:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the p_ctrl is not enabled in the BSP.

9.15.11.3 Function steps

- Clear DTC enable bit in ICU.
- Clear pointer in vector table.

9.15.12 R_DTC_VersionGet

```
ssp_err_t R_DTC_VersionGet ( ssp_version_t  *const p_version )
```

9.15.12.1 Brief description

Set driver version based on compile time macros. Implements versionGet.

9.15.12.2 Detailed description

Table 1491:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.

9.15.13 R_DTC_BlockReset

```
ssp_err_t R_DTC_BlockReset ( transfer_ctrl_t  *const p_api_ctrl ,   void const
*volatile p_src ,   void *volatile p_dest ,   uint16_t const length ,
 transfer_size_t  size ,   uint16_t const num_transfers )
```

9.15.13.1 Brief description

BlockReset transfer source, destination, length and number of transfers. Implements blockReset.

9.15.13.2 Detailed description

Table 1492:Return values

Name	Description
SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	If mode is other than Block Transfer Mode.
SSP_ERR_NOT_ENABLED	Enable failed due to an invalid input parameter: • Transfer source must not be NULL. • Transfer destination must not be NULL.

9.15.13.3 Function steps

- Disable transfers on this activation source.
- Disable read skip prior to modifying settings. It will be enabled later.

- Reset transfer based on input parameters.
- Enables transfers on this activation source.
- Enable read skip after all settings are complete.

9.15.14 Extensions

9.15.14.1 dtc_instance_ctrl_t

dtc_instance_ctrl_t

Detailed description

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in open.

Variables

- uint32_t id

  Driver ID.
- elc_event_t trigger

  Transfer activation event. Matches event returned by transfer_api_t::infoGet.
- IRQn_Type irq

  Transfer activation IRQ, does not apply to all HAL drivers.
- void(* p_callback)(*cb_data)

  Callback for transfer end interrupt used for ELC software trigger.
- void const * p_context

  Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

9.15.14.2 dtc_reg_t

dtc_reg_t

Detailed description

DTC Registers. Same as transfer_info_t, but uses register names. Provided as service to typecast transfer_info_t.

Variables

- uint32_t __pad0__
- uint8_t MRB

  Mode Register B
- uint8_t __pad0__
- uint8_t DM

  Transfer Destination Address mode.

- uint8_t DTS

  DTC Transfer Mode Select.
- uint8_t DISEL

  DTC Interrupt Select.
- uint8_t CHNS

  DTC Chain Transfer Select.
- uint8_t CHNE

  DTC CHain Transfer Enable.
- struct{} MRB_b

  MRB bits */

  See source code for definition of this member.
- uint8_t MRA

  Mode Register A
- uint8_t SM

  Transfer Source Address mode.
- uint8_t SZ

  DTC Data Transfer Size.
- uint8_t MD

  DTC Transfer Mode Select.
- struct{} MRA_b

  MRA bits */

  See source code for definition of this member.
- struct{} struct{}

  Mode registers */

  See source code for definition of this member.
- void *volatile SAR

  Source address register.
- void *volatile DAR

  Destination address register
- uint16_t CRB

  Transfer count register B
- uint16_t CRA

  Transfer count register A

- uint8_t CRAL

  Transfer counter A lower register.
- uint8_t CRAH

  Transfer counter B upper register.
- struct{} CRA_b

  bits */

  See source code for definition of this member.
- struct{} struct{}

  Transfer count registers */

  See source code for definition of this member.

9.16 ELC

Driver for the Event Link Controller (ELC).

This module supports the Event Link Controller (ELC). It implements the following interface: ELC Interface

9.16.1 Functions

- R_ELC_Init
- R_ELC_SoftwareEventGenerate
- R_ELC_LinkSet
- R_ELC_LinkBreak
- R_ELC_Enable
- R_ELC_Disable
- R_ELC_VersionGet

9.16.2 Defines

- #define ELC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define ELC_CODE_VERSION_MINOR

  Initial value: `(3U)`

9.16.3 R_ELC_Init

```
ssp_err_t R_ELC_Init ( elc_cfg_t  const *const p_cfg )
```

9.16.3.1 Brief description

Initialize all the links in the Event Link Controller.

9.16.3.2 Detailed description

Implements init

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set an individual link use R_ELC_LinkSet

Table 1493:Return values

Name	Description
SSP_SUCCESS	Initialization was successful
SSP_ERR_ASSERTION	p_config was NULL

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.16.3.3 Function steps

- Power on ELC
- Enable the operation of the Event Link Controller

9.16.4 R_ELC_SoftwareEventGenerate

```
ssp_err_t R_ELC_SoftwareEventGenerate ( elc_software_event_t  event_number )
```

9.16.4.1 Brief description

Generate a software event in the Event Link Controller.

9.16.4.2 Detailed description

Implements softwareEventGenerate

Table 1494:Return values

Name	Description
SSP_SUCCESS	Initialization was successful
SSP_ERR_ASSERTION	Invalid event number

9.16.5 R_ELC_LinkSet

```
ssp_err_t R_ELC_LinkSet ( elc_peripheral_t  peripheral ,  elc_event_t  signal )
```

9.16.5.1 Brief description

Create a single event link.

9.16.5.2 Detailed description

Implements linkSet

Table 1495:Return values

Name	Description
SSP_SUCCESS	Initialization was successful

9.16.6 R_ELC_LinkBreak

```
ssp_err_t R_ELC_LinkBreak ( elc_peripheral_t  peripheral )
```

9.16.6.1 Brief description

Break an event link.

9.16.6.2 Detailed description

Implements linkBreak

Table 1496:Return values

Name	Description
SSP_SUCCESS	Event link broken

9.16.7 R_ELC_Enable

```
ssp_err_t R_ELC_Enable ( void )
```

9.16.7.1 Brief description

Enable the operation of the Event Link Controller.

9.16.7.2 Detailed description

Implements enable

Table 1497:Return values

Name	Description
SSP_SUCCESS	ELC enabled.

9.16.8 R_ELC_Disable

```
ssp_err_t R_ELC_Disable ( void )
```

9.16.8.1 Brief description

Disable the operation of the Event Link Controller.

9.16.8.2 Detailed description

Implements disable

Table 1498:Return values

Name	Description
SSP_SUCCESS	ELC disabled.

9.16.9 R_ELC_VersionGet

```
ssp_err_t R_ELC_VersionGet ( ssp_version_t  *const p_version )
```

9.16.9.1 Brief description

Get the driver version based on compile time macros.

9.16.9.2 Detailed description

Implements versionGet

Table 1499:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

9.17 Low Power Flash

Driver for the Low power Flash Memory (S3A7 and S124).

This module supports the Flash interface for the Low-power FLASH peripheral.

9.17.1 Functions

- R_FLASH_LP_Open
- R_FLASH_LP_Write
- R_FLASH_LP_Read
- R_FLASH_LP_Erase
- R_FLASH_LP_BlankCheck
- R_FLASH_LP_StatusGet
- R_FLASH_LP_AccessWindowSet
- R_FLASH_LP_AccessWindowClear
- R_FLASH_LP_Reset
- R_FLASH_LP_StartUpAreaSelect
- R_FLASH_LP_UpdateFlashClockFreq
- R_FLASH_LP_InfoGet

- R_FLASH_LP_Close
- R_FLASH_LP_VersionGet

9.17.2 Defines

- #define FLASH_LP_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define FLASH_LP_CODE_VERSION_MINOR

  Initial value: `(8U)`
- #define PLACE_IN_RAM_SECTION

  Initial value:

9.17.3 R_FLASH_LP_Open

```
ssp_err_t R_FLASH_LP_Open ( flash_ctrl_t *const p_api_ctrl , flash_cfg_t const
*const p_cfg )
```

9.17.3.1 Brief description

Initialize the Low Power flash peripheral. Implements open.

9.17.3.2 Detailed description

The Open function initializes the Flash. It first copies the FCU firmware to FCURAM and sets the FCU Clock based on the current FCLK frequency. In addition, if Code Flash programming is enabled, the API code responsible for Code Flash programming will be copied to RAM.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations. Subsequent to successfully completing this call p_ctrl->opened will be true.

NOTE: Providing a callback function in the supplied p_cfg->callback field, automatically configures the Flash for Data Flash to operate in non-blocking (BGO) mode.

Subsequent to a successful Open(), the Flash is ready to process additional Flash commands.

Table 1500:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and timer has started.
SSP_FLASH_ERR_FAILURE	Failed to successfully enter Programming/Erase mode.

Table 1500:Return values (Continued)

Name	Description
SSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg or problem getting FMI info.
SSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
SSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
SSP_ERR_IN_USE	Flash Open() has already been called.
SSP_ERR_HW_LOCKED	Flash module unable to get the Hardware lock for the Flash LP Periperhal.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

9.17.3.3 Function steps

- g_flash_lp_version is accessed by the ASSERT macro only, and so compiler toolchain can issue a warning that it is not accessed. The code below eliminates this warning and also ensures data structures are not optimized away.
- Insure API has not been opened
- While the Flash API is in use we will disable the FLash Cache.
- Allow Initialization if not initialized or if no operation is ongoing and re-initialization is desired
- Check that API is not already Open
- Set the parameters struct based on the user supplied settings
- Setup the Flash interrupt callback based on the caller's info. If the Flash interrupt is not enabled in the BSP then this will return SSP_ERR_IRQ_BSP_DISABLED
- Make sure Flash interrupts are disabled, they are only used in BGO mode
- Save callback function pointer

9.17.4 R_FLASH_LP_Write

```
ssp_err_t R_FLASH_LP_Write ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const src_address ,   uint32_t flash_address ,   uint32_t const num_bytes )
```

9.17.4.1 Brief description

Write to the specified Code or Data Flash memory area. Implements write.

9.17.4.2 Detailed description

The minimum/maximum number of bytes, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Table 1501:Return values

Name	Description
SSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
SSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
SSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
SSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
SSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
SSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to write CF was requested.

9.17.4.3 Function steps

- Get the block information for this address

9.17.5 R_FLASH_LP_Read

```
ssp_err_t R_FLASH_LP_Read ( flash_ctrl_t  *const p_api_ctrl ,   uint8_t
* p_dest_address ,   uint32_t const flash_address ,   uint32_t const num_bytes )
```

9.17.5.1 Brief description

Read the requested number of bytes from the supplied Data or Code Flash address. Implements read.

9.17.5.2 Detailed description

The minimum/maximum number of blocks, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

NOTE: This function is provided simply for the purposes of maintaining a complete interface. It is possible (and recommended), to read Flash memory directly.

Table 1502:Return values

Name	Description
SSP_SUCCESS	Operation successful.
SSP_ERR_INVALID_ADDRESS	Invalid Flash address was supplied.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_dest_address
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.5.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.17.6 R_FLASH_LP_Erase

```
ssp_err_t R_FLASH_LP_Erase ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const address ,   uint32_t const num_blocks )
```

9.17.6.1 Brief description

Erase the specified Code or Data Flash blocks. Implements erase.

9.17.6.2 Detailed description

The minimum/maximum number of blocks, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Table 1503:Return values

Name	Description
SSP_SUCCESS	Successful open.
SSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
SSP_ERR_INVALID_ADDRESS	Invalid address specified
SSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to erase CF was requested.

9.17.6.3 Function steps

- Get the block information for this address
- Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE
- Still good to go?
- Is this a request to Erase Code Flash?
- This is a request to erase Data Flash
- Erase the Blocks, give this function the details about this block
- If in non-BGO mode, the current operation is complete. Exit PE mode and return status

9.17.7 R_FLASH_LP_BlankCheck

```
ssp_err_t R_FLASH_LP_BlankCheck ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const address ,   uint32_t num_bytes ,  flash_result_t  * p_blank_check_result )
```

9.17.7.1 Brief description

Perform a blank check on the specified address area. Implements blankCheck.

9.17.7.2 Detailed description

The minimum/maximum number of bytes, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information. The number of bytes for Data Flash blank checking must be between (1 and FLASH_DATA_BLANK_CHECK_MAX). The number of bytes for Code Flash blank checking must be between (1 and FLASH_CODE_BLANK_CHECK_MAX).

Table 1504:Return values

Name	Description
SSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
SSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
SSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to Blank Check CF was requested.

9.17.7.3 Function steps

- Get the block information for this address
- Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE
- SSP_ERR_IN_USE would indicate that a BGO operation is underway, so don't reset in that case

9.17.8 R_FLASH_LP_StatusGet

```
ssp_err_t R_FLASH_LP_StatusGet ( flash_ctrl_t  *const p_api_ctrl )
```

9.17.8.1 Brief description

Query the FLASH for its status. Implements statusGet.

9.17.8.2 Detailed description

Table 1505:Return values

Name	Description
SSP_SUCCESS	Flash is ready and available to accept commands.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.8.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Return flash status

9.17.9 R_FLASH_LP_AccessWindowSet

```
ssp_err_t R_FLASH_LP_AccessWindowSet ( flash_ctrl_t  *const p_api_ctrl ,
  uint32_t const start_addr ,   uint32_t const end_addr )
```

9.17.9.1 Brief description

Configure an access window for the Code Flash memory. Implements accessWindowSet.

9.17.9.2 Detailed description

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block > last block inclusive. Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address. NOTE: If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear.

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Table 1506:Return values

Name	Description
SSP_SUCCESS	Access window successfully configured.
SSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.9.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Remove warnings generated when Code Flash code is not compiled in.
- < For consistency with _LP API we return error if Code Flash not enabled

9.17.10 R_FLASH_LP_AccessWindowClear

```
ssp_err_t R_FLASH_LP_AccessWindowClear ( flash_ctrl_t  *const p_api_ctrl )
```

9.17.10.1 Brief description

Remove any access window that is configured in the Code Flash. Implements accessWindowClear. On successful return from this call all Code Flash is writable.

9.17.10.2 Detailed description

Table 1507:Return values

Name	Description
SSP_SUCCESS	Access window successfully removed.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

Table 1507:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.10.3 Function steps

- Eliminate warning if parameter checking is disabled.
- < Return error if Code Flash not enabled

9.17.11 R_FLASH_LP_Reset

```
ssp_err_t R_FLASH_LP_Reset ( flash_ctrl_t  *const p_api_ctrl )
```

9.17.11.1 Brief description

Reset the FLASH peripheral. Implements reset.

9.17.11.2 Detailed description

No attempt is made to grab the Flash software lock before executing the reset since the assumption is that a reset will terminate any existing operation.

Table 1508:Return values

Name	Description
SSP_SUCCESS	Flash circuit successfully reset.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.12 R_FLASH_LP_StartUpAreaSelect

```
ssp_err_t R_FLASH_LP_StartUpAreaSelect ( flash_ctrl_t  *const p_api_ctrl ,
 flash_startup_area_swap_t  swap_type ,   bool is_temporary )
```

9.17.12.1 Brief description

Select which block is used as the startup area block. Implements startupAreaSelect.

9.17.12.2 Detailed description

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Table 1509:Return values

Name	Description
SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.12.3 Function steps

- This is already the normal reset behavior. There's nothing to do
- Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE
- Success?
- Return to read mode
- If there is an error, then reset the Flash. This will clear error flags and exit the P/E mode

9.17.13 R_FLASH_LP_UpdateFlashClockFreq

```
ssp_err_t R_FLASH_LP_UpdateFlashClockFreq ( flash_ctrl_t  *const p_api_ctrl )
```

9.17.13.1 Brief description

Indicate to the already open Flash API that the FCLK has changed. Implements r_flash_t::updateFlashClockFreq.

9.17.13.2 Detailed description

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro. This function uses R_CGC_SystemClockFreqGet to get the current FCLK frequency.

Table 1510:Return values

Name	Description
SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.17.13.3 Function steps

- Grab the current flash state
- API already in this state
- < Check FCLK, calculate timeout values

9.17.14 R_FLASH_LP_InfoGet

```
ssp_err_t R_FLASH_LP_InfoGet ( flash_ctrl_t  *const p_api_ctrl ,  flash_info_t
*const p_info )
```

9.17.14.1 Brief description

Returns the information about the flash regions. Implements infoGet.

9.17.14.2 Detailed description

Table 1511:Return values

Name	Description
SSP_SUCCESS	Successful retrieved the request information.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

9.17.15 R_FLASH_LP_Close

```
ssp_err_t R_FLASH_LP_Close ( flash_ctrl_t  *const p_api_ctrl )
```

9.17.15.1 Brief description

Release any resources that were allocated by the Flash API. Implements close.

9.17.15.2 Detailed description

Table 1512:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

9.17.15.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Return the hardware lock for the Flash
- Restore the FLash Cache state to what it was before we opened the Flash API.
- API is now closed
- Release the lock

9.17.16 R_FLASH_LP_VersionGet

```
ssp_err_t R_FLASH_LP_VersionGet ( ssp_version_t  *const p_version )
```

9.17.16.1 Brief description

Get FLASH HAL driver version.

9.17.16.2 Detailed description

Table 1513:Return values

Name	Description
SSP_SUCCESS	- operation performed successfully

NOTE: This function is reentrant.

9.17.17 Extensions

9.17.17.1 flash_lp_instance_ctrl_t

flash_lp_instance_ctrl_t

Detailed description

Flash instance control block. DO NOT INITIALIZE.

Variables

- uint32_t opened

  To check whether api has been opened or not.
- void * p_reg

  Base address of flash registers.
- void(* p_callback)(*p_args)
- bsp_cache_state_t cache_state

  Used to disable and then restore Flash Cache while API is open.
- IRQn_Type irq

  Flash ready interrupt number.

9.18 High-performance Flash

Driver for the High-performance Flash Memory (S7G2 and S5D9).

This module supports the Flash interface for the High Performance FLASH peripheral.

9.18.1 Functions

- R_FLASH_HP_Open
- R_FLASH_HP_Write
- R_FLASH_HP_Read
- R_FLASH_HP_Erase
- R_FLASH_HP_BlankCheck
- R_FLASH_HP_StatusGet
- R_FLASH_HP_AccessWindowSet
- R_FLASH_HP_AccessWindowClear
- R_FLASH_HP_Reset
- R_FLASH_HP_StartUpAreaSelect

- R_FLASH_HP_UpdateFlashClockFreq
- R_FLASH_HP_InfoGet
- R_FLASH_HP_Close
- R_FLASH_HP_VersionGet
- flash_lock_state
- flash_ReleaseState
- setup_for_pe_mode
- flash_get_block_info
- flash_setup
- flash_open_setup
- flash_write_initiate
- flash_operation_complete
- flash_blank_check_address_checking
- flash_blank_check_setup
- flash_blank_check_initiate
- flash_fmi_setup

9.18.2 Defines

- #define FLASH_HP_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define FLASH_HP_CODE_VERSION_MINOR

  Initial value: `(5U)`
- #define PLACE_IN_RAM_SECTION

  Initial value:

  S5D9 and S5D5 MCUs uses RV40F Phase 2 Flash technology. This macro will eventually be migrated to bsp_feature.h.

9.18.3 R_FLASH_HP_Open

```
ssp_err_t R_FLASH_HP_Open ( flash_ctrl_t *const p_api_ctrl , flash_cfg_t const
*const p_cfg )
```

9.18.3.1 Brief description

Initializes the flash peripheral. Implements open.

9.18.3.2 Detailed description

The Open function initializes the Flash. It first copies the FCU firmware to FCURAM and sets the FCU Clock based on the current FCLK frequency. In addition, if Code Flash programming is enabled, the API code responsible for Code Flash programming will be copied to RAM.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready and Error interrupts will be configured to call the users callback routine with an Event type describing the source of the interrupt.

NOTE: Providing a callback function in the supplied p_cfg->callback field, automatically configures the Flash for Data Flash to operate in non-blocking (BGO) mode.

Subsequent to a successful Open(), the Flash is ready to process additional Flash commands.

Table 1514:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and timer has started.
SSP_FLASH_ERR_FAILURE	Failed to successfully enter Programming/Erase mode.
SSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg or problem getting FMI info.
SSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
SSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
SSP_ERR_HW_LOCKED	FLASH peripheral has already been initialized and is in use.

9.18.3.3 Function steps

- g_flash_hp_version is accessed by the ASSERT macro only, and so compiler toolchain can issue a warning that it is not accessed. The code below eliminates this warning and also ensures data structures are not optimized away.
- While the Flash API is in use we will disable the FLash Cache.
- Allow Initialization if not initialized or if no operation is ongoing and re-initialization is desired
- Check that API is not already Open
- Set the parameters struct based on the user supplied settings
- Setup the Flash interrupt callback based on the caller's info. If both Flash interrupts are not enabled in the BSP then this will return SSP_ERR_IRQ_BSP_DISABLED
- Make sure Flash interrupts are disabled, they are only used in BGO mode

- Save callback function pointer

9.18.4 R_FLASH_HP_Write

```
ssp_err_t R_FLASH_HP_Write ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const src_address ,   uint32_t flash_address ,   uint32_t const num_bytes )
```

9.18.4.1 Brief description

Writes to the specified Code or Data Flash memory area. Implements write.

9.18.4.2 Detailed description

Table 1515:Return values

Name	Description
SSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
SSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
SSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
SSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
SSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
SSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to write CF was requested.

9.18.5 R_FLASH_HP_Read

```
ssp_err_t R_FLASH_HP_Read ( flash_ctrl_t  *const p_api_ctrl ,   uint8_t
* p_dest_address ,   uint32_t const flash_address ,   uint32_t const num_bytes )
```

9.18.5.1 Brief description

Reads the requested number of bytes from the supplied Data or Code Flash memory address. Implements read.

9.18.5.2 Detailed description

NOTE: This function is provided simply for the purposes of maintaining a complete interface. It is possible (and recommended), to read Flash memory directly.

Table 1516:Return values

Name	Description
SSP_SUCCESS	Operation successful.
SSP_ERR_INVALID_ADDRESS	Invalid Flash address was supplied.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_dest_address

9.18.5.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.18.6 R_FLASH_HP_Erase

```
ssp_err_t R_FLASH_HP_Erase ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const address ,   uint32_t const num_blocks )
```

9.18.6.1 Brief description

Erases the specified Code or Data Flash blocks. Implements erase by the block_erase_address.

9.18.6.2 Detailed description

Table 1517:Return values

Name	Description
SSP_SUCCESS	Successful open.
SSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
SSP_ERR_INVALID_ADDRESS	Invalid address specified
SSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to erase CF was requested.

9.18.6.3 Function steps

- Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE

9.18.7 R_FLASH_HP_BlankCheck

```
ssp_err_t R_FLASH_HP_BlankCheck ( flash_ctrl_t  *const p_api_ctrl ,   uint32_t
const address ,   uint32_t num_bytes ,  flash_result_t  * p_blank_check_result )
```

9.18.7.1 Brief description

Performs a blank check on the specified address area. Implements blankCheck.

9.18.7.2 Detailed description

Table 1518:Return values

Name	Description
SSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
SSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
SSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
SSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

9.18.8 R_FLASH_HP_StatusGet

```
ssp_err_t R_FLASH_HP_StatusGet ( flash_ctrl_t  *const p_api_ctrl )
```

9.18.8.1 Brief description

Query the FLASH peripheral for its status. Implements statusGet.

9.18.8.2 Detailed description

Table 1519:Return values

Name	Description
SSP_SUCCESS	FLASH peripheral is ready to use.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

9.18.8.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.18.9 R_FLASH_HP_AccessWindowSet

```
ssp_err_t R_FLASH_HP_AccessWindowSet ( flash_ctrl_t  *const p_api_ctrl ,
  uint32_t const start_addr ,   uint32_t const end_addr )
```

9.18.9.1 Brief description

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block > last block inclusive. Anything outside this range of Code Flash is then write protected.

9.18.9.2 Detailed description

NOTE: If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear.

Implements accessWindowSet.

Table 1520:Return values

Name	Description
SSP_SUCCESS	Access window successfully configured.
SSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.18.9.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Remove warnings generated when Code Flash code is not compiled in.
- < For consistency with _LP API we return error if Code Flash not enabled

9.18.10 R_FLASH_HP_AccessWindowClear

```
ssp_err_t R_FLASH_HP_AccessWindowClear ( flash_ctrl_t  *const p_api_ctrl )
```

9.18.10.1 Brief description

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements accessWindowClear.

9.18.10.2 Detailed description

Table 1521:Return values

Name	Description
SSP_SUCCESS	Access window successfully removed.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.18.10.3 Function steps

- Eliminate warning if parameter checking is disabled.
- < For consistency with _LP API we return error if Code Flash not enabled

9.18.11 R_FLASH_HP_Reset

```
ssp_err_t R_FLASH_HP_Reset ( flash_ctrl_t  *const p_api_ctrl )
```

9.18.11.1 Brief description

Resets the FLASH peripheral. Implements reset. No attempt is made to grab the Flash software lock before executing the reset since the assumption is that a reset will terminate any existing operation.

9.18.11.2 Detailed description

Table 1522:Return values

Name	Description
SSP_SUCCESS	Flash circuit successfully reset.

Table 1522:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

9.18.11.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.18.12 R_FLASH_HP_StartUpAreaSelect

```
ssp_err_t R_FLASH_HP_StartUpAreaSelect ( flash_ctrl_t  *const p_api_ctrl ,
 flash_startup_area_swap_t  swap_type ,   bool is_temporary )
```

9.18.12.1 Brief description

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements startupAreaSelect.

9.18.12.2 Detailed description

Table 1523:Return values

Name	Description
SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

9.18.12.3 Function steps

- Eliminate warning if parameter checking is disabled.
- This is already the normal reset behavior. There's nothing to do
- Update Flash state and set the P/E mode. 'Standard' Flash requires that Configuration commands be issued while in Data Flash P/E mode. PHASE 2 Flash requires that Configuration commands be issued while in Code Flash P/E mode.

9.18.13 R_FLASH_HP_UpdateFlashClockFreq

```
ssp_err_t R_FLASH_HP_UpdateFlashClockFreq ( flash_ctrl_t  *const p_api_ctrl )
```

9.18.13.1 Brief description

Indicate to the already open Flash API, that the FCLK has changed since the Open(). This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro. This function uses R_CGC_SystemClockFreqGet to get the current FCLK frequency. Implements updateFlashClockFreq.

9.18.13.2 Detailed description

Table 1524:Return values

Name	Description
SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

9.18.13.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Grab the current flash state
- API already in this state
- < Check FCLK, calculate timeout values

9.18.14 R_FLASH_HP_InfoGet

```
ssp_err_t R_FLASH_HP_InfoGet ( flash_ctrl_t  *const p_api_ctrl ,  flash_info_t
*const p_info )
```

9.18.14.1 Brief description

Returns the information about the flash regions. Implements infoGet.

9.18.14.2 Detailed description

Table 1525:Return values

Name	Description
SSP_SUCCESS	Successful retrieved the request information.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

9.18.14.3 Function steps

- Eliminate warning if parameter checking is disabled.

9.18.15 R_FLASH_HP_Close

```
ssp_err_t R_FLASH_HP_Close ( flash_ctrl_t  *const p_api_ctrl )
```

9.18.15.1 Brief description

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements close.

9.18.15.2 Detailed description

Table 1526:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

9.18.15.3 Function steps

- Eliminate warning if parameter checking is disabled.
- Return the hardware lock for the Flash
- Restore the FLash Cache state to what it was before we opened the Flash API.
- Release the lock
- Close the API

9.18.16 R_FLASH_HP_VersionGet

```
ssp_err_t R_FLASH_HP_VersionGet ( ssp_version_t  *const p_version )
```

9.18.16.1 Brief description

This function gets FLASH HAL driver version.

9.18.16.2 Detailed description

Table 1527:Return values

Name	Description
SSP_SUCCESS	- operation performed successfully

NOTE: This function is reentrant.

9.18.17 flash_lock_state

```
ssp_err_t flash_lock_state (  flash_states_t new_state )
```

9.18.17.1 Brief description

This function attempts to change the flash state to the new requested state. This can only happen if we are able to take the FLASH lock. If the lock is currently in use then we will return FLASH_ERR_BUSY, otherwise we will take the lock and change the state.

9.18.17.2 Detailed description

Internal functions.

Table 1528:Parameters

Name	Direction	Description
new_state	in	Which state to attempt to transition to.

Table 1529:Return values

Name	Description
SSP_SUCCESS	Successful.
SSP_ERR_IN_USE	Flash is busy with another operation.

9.18.18 flash_ReleaseState

```
flash_ReleaseState (  void  )
```

9.18.18.1 Brief description

This function releases the flash state so another flash operation can take place. This function is called by both the HLD and LLD layers (interrupt routines).

9.18.18.2 Detailed description

Table 1530:Return values

Name	Description
None	

9.18.19 setup_for_pe_mode

```
ssp_err_t setup_for_pe_mode ( flash_hp_instance_ctrl_t  *const p_ctrl ,
  flash_type_t flash_type ,   flash_states_t flash_state )
```

9.18.19.1 Brief description

This function places the flash in the requested Code or Data P/E mode.

9.18.19.2 Detailed description

Table 1531:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the Flash control block.

Table 1531:Parameters (Continued)

Name	Direction	Description
flash_type	in	FLASH_TYPE_CODE_FLASH or FLASH_TYPE_DATA_FLASH.
flash_state	in	Desired Flash state to transition into (ie FLASH_STATE_WRITING).

Table 1532:Return values

Name	Description
SSP_SUCCESS	Successful.
SSP_ERR_IN_USE	Flash is busy with another operation.

9.18.20 flash_get_block_info

```
flash_get_block_info (  uint32_t addr ,   flash_block_info_t * p_block_info )
```

9.18.20.1 Brief description

This function takes the supplied address and fills in the supplied block info structure with the respective details about the block in which it resides.

9.18.20.2 Detailed description

Table 1533:Return values

Name	Description
false	Supplied address is valid flash address on this MCU.
true	Supplied address is valid and p_block_info contains the details on this addresses block

9.18.20.3 Function steps

- Determine if this is a Code or Data Flash address, or something else (invalid)
- Is this address within this section of blocks?
- Make sure we know the end of the Code or Data Flash memory space.

- add in # of blocks in this section

9.18.21 flash_setup

```
ssp_err_t flash_setup (  R_FACI_Type * p_faci_reg )
```

9.18.21.1 Brief description

This function verifies that FCLK falls within the allowable range and calculates the timeout values based on the current FCLK frequency.

9.18.21.2 Detailed description

Table 1534:Return values

Name	Description
SSP_SUCCESS	Setup complete
SSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.

9.18.21.3 Function steps

- We need clock frequencies to calculate the worst case timeout values.
- FCLK must be a minimum of 4 MHz for Flash operations

9.18.22 flash_open_setup

```
ssp_err_t flash_open_setup ( flash_hp_instance_ctrl_t  *const p_ctrl ,
  ssp_feature_t * p_ssp )
```

9.18.22.1 Brief description

This function does the completion setup for the R_FLASH_HP_Open function.

9.18.22.2 Function steps

- Check FCLK, calculate timeout values
- If we failed to successfully open then return the hardware lock
- API is now open

9.18.23 flash_write_initiate

```
ssp_err_t flash_write_initiate ( flash_hp_instance_ctrl_t  *const p_ctrl ,
  uint32_t const * src_start_address ,   uint32_t * dest_start_address ,
  uint32_t num_bytes )
```

9.18.23.1 Brief description

This function initiates the write sequence for the R_FLASH_HP_Write function.

9.18.23.2 Function steps

- Update Flash state and enter the respective Code or Data Flash P/E mode

9.18.24 flash_operation_complete

```
flash_operation_complete ( flash_hp_instance_ctrl_t  *const p_ctrl ,
ssp_err_t  err )
```

9.18.24.1 Brief description

This function performs the final cleanup for the erase, write and blankcheck functions.

9.18.24.2 Function steps

- SSP_ERR_IN_USE will be returned if we are in the process of executing a BGO operation. In this case we do not want to take any action as that will terminate the in process operation

9.18.25 flash_blank_check_address_checking

```
ssp_err_t flash_blank_check_address_checking (  uint32_t const address ,
  uint32_t num_bytes )
```

9.18.25.1 Brief description

This function performs the address checking required by the R_FLASH_HP_BlankCheck function.

9.18.25.2 Detailed description

Table 1535:Return values

Name	Description
SSP_SUCCESS	Parameter checking completed without error.

Table 1535:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
SSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.

9.18.25.3 Function steps

- Is this a request to Blank Check Data Flash?. If so, num_bytes must be a multiple of the programming size

9.18.26 flash_blank_check_setup

```
ssp_err_t flash_blank_check_setup ( flash_ctrl_t  *const p_api_ctrl ,   uint8_t
* p_address ,   uint32_t num_bytes ,  flash_result_t  * p_blank_check_result )
```

9.18.26.1 Brief description

This function performs the setup phase required by the R_FLASH_HP_BlankCheck function.

9.18.26.2 Detailed description

Table 1536:Return values

Name	Description
SSP_SUCCESS	Setup completed completed without error.
SSP_ERR_PE_FAILURE	Failed to enter P/E mode

9.18.26.3 Function steps

- Blank checking for Code Flash does not require any FCU operations. The specified address area Can simply be checked for non 0xFF.
- Assume blank until we know otherwise

9.18.27 flash_blank_check_initiate

```
ssp_err_t flash_blank_check_initiate ( flash_hp_instance_ctrl_t  *const p_ctrl ,
  uint32_t const address ,   uint32_t num_bytes ,  flash_result_t
* p_blank_check_result )
```

9.18.27.1 Brief description

This function performs the Blank check phase required by the R_FLASH_HP_BlankCheck function.

9.18.27.2 Detailed description

Table 1537:Return values

Name	Description
SSP_SUCCESS	Setup completed completed without error.
SSP_ERR_PE_FAILURE	Failed to enter P/E mode

9.18.28 flash_fmi_setup

```
ssp_err_t flash_fmi_setup ( flash_hp_instance_ctrl_t  *const p_ctrl ,
 flash_cfg_t  const *const p_cfg ,   ssp_feature_t * p_ssp )
```

9.18.28.1 Brief description

This function initializes data required by the Flash based on information read from the FMI.

9.18.28.2 Detailed description

Table 1538:Return values

Name	Description
SSP_SUCCESS	FMI based setup success.
SSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
SSP_ERR_ASSERTION	Problem getting FMI information.
SSP_ERR_HW_LOCKED	FLASH peripheral has already been initialized and is in use.

9.18.29 Extensions

9.18.29.1 flash_hp_instance_ctrl_t

flash_hp_instance_ctrl_t

Detailed description

Flash HP instance control block. DO NOT INITIALIZE.

Variables

- uint32_t opened

  To check whether api has been opened or not.
- R_FACI_Type * p_reg

  Base address of flash registers.
- void(* p_callback)(*p_args)
- bsp_cache_state_t cache_state

  User Callback function.

  Used to disable and then restore Flash Cache while API is open.
- IRQn_Type irq

  Flash ready interrupt number.
- IRQn_Type err_irq

  Flash error interrupt number.

9.19 FMI

Driver for accessing Factory MCU Information (FMI).
Read Factory MCU Information flash memory.

9.19.1 Functions

- R_FMI_Init
- R_FMI_ProductInfoGet
- R_FMI_UniqueIdGet
- R_FMI_FeatureGet
- R_FMI_EventInfoGet
- R_FMI_VersionGet

9.19.2 Variables

- g_fmi_on_fmi

9.19.3 Defines

- #define FMI_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define FMI_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.19.4 R_FMI_Init

```
ssp_err_t R_FMI_Init ( void )
```

9.19.4.1 Detailed description

Initializes factory flash base pointer. Implements init.

Table 1539:Return values

Name	Description
SSP_SUCCESS	Factory flash initialization successful.
SSP_ERR_INVALID_FMI_DATA	The FMI data table provided is not valid, or at least one field in the part number is not compatible with the FMI data table provided.

9.19.4.2 Function steps

- Verify the provided MCU information data table is valid. This table is required to use the SSP. If the data in this table is not valid, log an unrecoverable error.
- Check to see if the factory flash is valid.
- The upper 16 bits of the base address of the factory flash must be 0x0100.
- If the factory flash is valid, store the base address for later and compare the part number to the part number mask match.

9.19.5 R_FMI_ProductInfoGet

```
ssp_err_t R_FMI_ProductInfoGet ( fmi_product_info_t ** pp_product_info )
```

9.19.5.1 Detailed description

Get pointer to Factory MCU Information product information record. Implements productInfoGet.

Table 1540:Return values

Name	Description
SSP_SUCCESS	Caller's pointer set to Product Information Record.
SSP_ERR_ASSERTION	Caller's pointer is NULL.

9.19.5.2 Function steps

- Use the factory flash if it is valid. Otherwise use the SSP MCU information.

9.19.6 R_FMI_UniqueIdGet

```
ssp_err_t R_FMI_UniqueIdGet (  fmi_unique_id_t * p_unique_id )
```

9.19.6.1 Detailed description

Get unique ID for this device. Implements uniqueIdGet.

Table 1541:Return values

Name	Description
SSP_SUCCESS	Unique ID stored in p_unique_id
SSP_ERR_ASSERTION	p_unique_id was NULL
SSP_ERR_INVALID_FACTORY_FLASH	Factory flash is not valid

9.19.6.2 Function steps

- If the factory flash is not valid, return an error.
- Store unique ID in p_unique_id.

9.19.7 R_FMI_FeatureGet

```
ssp_err_t R_FMI_FeatureGet (  ssp_feature_t const *const p_feature ,
  fmi_feature_info_t *const p_info )
```

9.19.7.1 Detailed description

Get feature information for the requested feature. Implements productFeatureGet.

Table 1542:Return values

Name	Description
SSP_SUCCESS	Feature information stored in p_info
SSP_ERR_ASSERTION	p_feature was NULL or p_info was NULL
SSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU
SSP_ERR_IP_UNIT_NOT_PRESENT	Requested unit does not exist on this MCU
SSP_ERR_INTERNAL	Requested feature is in a format not supported at this time

9.19.7.2 Function steps

- Get the factory flash base address for this IP.
- Find the factory flash base address for this unit.
- Populate the feature information.

9.19.8 R_FMI_EventInfoGet

```
ssp_err_t R_FMI_EventInfoGet (  ssp_feature_t const *const p_feature ,
  ssp_signal_t signal ,   fmi_event_info_t *const p_info )
```

9.19.8.1 Brief description

Get event information for the requested feature and signal. Implements eventInfoGet.

9.19.8.2 Detailed description

Table 1543:Return values

Name	Description
SSP_SUCCESS	Event information stored in p_info
SSP_ERR_ASSERTION	p_feature was NULL or p_info was NULL

Table 1543:Return values (Continued)

Name	Description
SSP_ERR_IRQ_BSP_DISABLED	Event information could not be found. p_info::irq is set to SSP_INVALID_VECTOR and p_info::event is set to 0xFF.

NOTE: The ssp_signal_t enums and ssp_ip_t are collectively defined for different modules. When used with the FMI API, the signal and IP should correspond as follows:

1) IP name (ssp_ip_t enum : SSP_IP_<peripheral>)
2) Signal name (ssp_signal_t enum: SSP_SIGNAL_<peripheral>_ <signal>), where <peripheral> is the same as the one used in IP name above.

9.19.9 R_FMI_VersionGet

```
ssp_err_t R_FMI_VersionGet ( ssp_version_t  *const p_version )
```

9.19.9.1 Detailed description

Get the driver version based on compile time macros. Implements versionGet.

Table 1544:Return values

Name	Description
SSP_SUCCESS	Caller's structure written.
SSP_ERR_ASSERTION	Caller's pointer is NULL.

9.19.10 g_fmi_on_fmi

```
fmi_api_t::g_fmi_on_fmi
```

9.20 GLCDC

Driver for the Graphics LCD Controller (GLCDC).

9.20.1 Summary

Implements Display Interface. This module supports the Graphics LCD Controller (GLCDC). It implements the display interface and drives LCD panels connected to the GLCDC pins.

9.20.2 Functions

- r_glcd_sync_signal_set
- r_glcd_background_screen_set
- r_glcd_graphics_layer_set
- r_glcd_output_block_set
- r_glcd_gamma_correction
- r_glcd_hsync_set
- r_glcd_vsync_set
- r_glcd_data_enable_set
- r_glcd_clock_set
- r_glcd_brightness_correction
- r_glcd_contrast_correction
- r_glcd_get_bit_size
- r_glcd_graphics_plane_format_set
- r_glcd_interrupt_enable
- r_glcd_output_data_order_set
- r_glcd_pixel_size_recalculate
- glcdc_line_detect_isr
- glcdc_underflow_1_isr
- glcdc_underflow_2_isr
- R_GLCD_Open
- R_GLCD_Close
- R_GLCD_Start
- R_GLCD_Stop
- R_GLCD_LayerChange
- R_GLCD_ColorCorrection
- R_GLCD_ClutUpdate
- R_GLCD_StatusGet
- R_GLCD_VersionGet

9.20.3 Variables

- module_version
- g_display_on_glcd
- default_glcd_cfg
- ctrl_blk

9.20.4 Defines

- #define GLCD_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &g_module_name[0], &module_version)`

- #define GLCD_ADDRESS_ALIGNMENT_64B

  Initial value: `(64U)`

  The macro to use for 64-byte alignment checking, calculation

- #define OFFSET_MARGIN_MINUS_64PIX

  Initial value: `(64U)`

  This enables the GLCD to locate the foreground/background layer image, at the physical start of the left side of the display, if the offset of layer start position is a negative value, compared to the active video area. Shifting the base address of the layer image can be used in this operation, but it must be aligned to 64 byte boundary, so that the layer position adjustment can be made.

9.20.5 r_glcd_sync_signal_set

```
r_glcd_sync_signal_set ( R_GLCDC_Type * p_glcd_reg , display_cfg_t const *const p_cfg )
```

9.20.5.1 Brief description

Subroutine to configure the sync signal setting (TCON block setting)

9.20.5.2 Detailed description

Table 1545:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for display interface

Table 1545:Parameters (Continued)

Name	Direction	Description
p_glcd_reg	in	Pointer to GLCD registers

Table 1546:Return values

Name	Description
void	

9.20.5.3 Function steps

- Applied default configuration if GLCD HAL configuration is NULL

9.20.6 r_glcd_background_screen_set

```
r_glcd_background_screen_set (  R_GLCDC_Type * p_glcd_reg ,  display_cfg_t
const *const p_cfg )
```

9.20.6.1 Brief description

Subroutine to configure the background screen setting.

9.20.6.2 Detailed description

- Panel timing setting
- Color setting for the background screen

Table 1547:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for display interface
p_glcd_reg	in	Pointer to GLCD registers

Table 1548:Return values

Name	Description
void	

9.20.6.3 Function steps

- Set number of total cycle for a line including Sync & Back poach, Front poach
- Set the start position of Background screen
- Set the width of Background screen
- Set the Background color

9.20.7 r_glcd_graphics_layer_set

```
 r_glcd_graphics_layer_set (  R_GLCDC_Type * p_glcd_reg ,  display_input_cfg_t
const *const p_input ,  display_layer_t  const *const p_layer ,
 display_frame_layer_t  const frame )
```

9.20.7.1 Brief description

Subroutine to configure the graphics layer register settings which includes...

9.20.7.2 Detailed description

- Blend setting of foreground or background plane on background plane
- Rectangle area blending settings

Table 1549:Parameters

Name	Direction	Description
p_input	in	The input frame buffer configuration
p_layer	in	The layer configuration
frame	in	The number of input frame buffer
p_glcd_reg	in	Pointer to GLCD registers

Table 1550:Return values

Name	Description
void	

NOTE: This function does not perform parameter check and it would be expected to be done in the caller function.

9.20.7.3 Function steps

- If the base address is NULL, just set the later transparent and disable read memory access
- Set the base address of graphics plane
- Set the background color on graphics plane
- Set the number of data transfer times per line, 64 bytes are transferred in each transfer
- If line number descending mode is enable, change its sign
- Set the line offset address for accessing the graphics data on graphics plane
- When line repeating mode, always read data on same line(s)
- Set the line offset address for accessing the graphics data
- Set the line offset address for accessing the graphics data on graphics plane
- Set the frame number of the graphics plane
- Set the frame offset for accessing the graphics data on the graphics plane
- Set the start position of the graphics layers
- Set the start position of the rectangle area in the graphics layers
- Set the width of the graphics layers
- Set the alpha blending condition

9.20.8 r_glcd_output_block_set

```
 r_glcd_output_block_set (  R_GLCDC_Type * p_glcd_reg ,  display_cfg_t  const
*const p_cfg )
```

9.20.8.1 Brief description

Subroutine to configure the output control block register settings which includes...

9.20.8.2 Detailed description

- Bit endian / color order setting
- Output color setting
- Color correction setting

Table 1551:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for display interface
p_glcd_reg	in	Pointer to GLCD registers

Table 1552:Return values

Name	Description
void	

9.20.8.3 Function steps

- Applied default configuration if the GLCD HAL configuration is NULL
- selects the output format
- In case of serial RGB, set as RGB888 format
- sets the pixel clock (the GLCD internal signal) frequency in case that the output format is 8-bit serial RGB
- sets the Brightness/contrast and Gamma Correction processing order
- Set the dithering mode

9.20.9 r_glcd_gamma_correction

```
 r_glcd_gamma_correction (  R_GLCDC_Type * p_glcd_reg ,  display_cfg_t  const
*const p_cfg )
```

9.20.9.1 Brief description

Subroutine to configure the gamma correction register setting.

9.20.9.2 Detailed description

Table 1553:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for the display interface
p_glcd_reg	in	Pointer to GLCD registers

Table 1554:Return values

Name	Description
void	

9.20.10 r_glcd_hsync_set

```
r_glcd_hsync_set (  R_GLCDC_Type * p_glcd_reg ,  glcd_tcon_pin_t  tcon ,
display_timing_t  const * timing )
```

9.20.10.1 Brief description

Subroutine to configure the horizontal signal setting.

9.20.10.2 Detailed description

Table 1555:Parameters

Name	Direction	Description
p_glcd_reg	in	Pointer to GLCD registers
tcon	in	TCON pin select(GLCD_TCON_PIN_0|GLCD_TCON_PIN_1|GLCD_TCON_PIN_2|GLCD_TCON_PIN_3)
timing	in	Hsync signal timing

Table 1556:Return values

Name	Description
void	

9.20.11 r_glcd_vsync_set

```
r_glcd_vsync_set (  R_GLCDC_Type * p_glcd_reg ,  glcd_tcon_pin_t  tcon ,
display_timing_t  const *const timing )
```

9.20.11.1 Brief description

Subroutine to configure the vertical signal setting.

9.20.11.2 Detailed description

Table 1557:Parameters

Name	Direction	Description
p_glcd_reg	in	Pointer to GLCD registers
tcon	in	TCON pin select(GLCD_TCON_PIN_0|GLCD_TCON_PIN_1|GLCD_TCON_PIN_2|GLCD_TCON_PIN_3)
timing	in	Vsync signal timing

Table 1558:Return values

Name	Description
void	

9.20.12 r_glcd_data_enable_set

```
 r_glcd_data_enable_set (  R_GLCDC_Type * p_glcd_reg ,  glcd_tcon_pin_t
const tcon ,  display_timing_t  const *const vtiming ,  display_timing_t  const
*const htiming ,  display_signal_polarity_t  const polarity )
```

9.20.12.1 Brief description

Subroutine to configure the data enable(DE) signal setting.

9.20.12.2 Detailed description

Table 1559:Parameters

Name	Direction	Description
p_glcd_reg	in	Pointer to GLCD registers
tcon	in	TCON pin select(GLCD_TCON_PIN_0|GLCD_TCON_PIN_1|GLCD_TCON_PIN_2|GLCD_TCON_PIN_3)
vtiming	in	DE signal vertical timing
htiming	in	DE signal horizontal timing
polarity	in	DE signal porarity(DISPLAY_SIGNAL_POLARITY_LOACTIVE|DISPLAY_SIGNAL_POLARITY_HIACTIVE)

Table 1560:Return values

Name	Description
void	

9.20.13 r_glcd_clock_set

```
 r_glcd_clock_set (  R_GLCDC_Type * p_glcd_reg ,  display_cfg_t  const
*const p_cfg )
```

9.20.13.1 Brief description

Subroutine to configure dot clock setting.

9.20.13.2 Detailed description

Table 1561:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for display interface
p_glcd_reg	in	Pointer to GLCD registers

Table 1562:Return values

Name	Description
void	

9.20.13.3 Function steps

- Selects input source for dot clock
- Sets division ratio
- Selects pixel clock output

9.20.14 r_glcd_brightness_correction

```
 r_glcd_brightness_correction (  R_GLCDC_Type * p_glcd_reg ,
 glcd_instance_ctrl_t  const *const p_ctrl ,  display_brightness_t  const
*const p_brightness )
```

9.20.14.1 Brief description

Subroutine to configure the brightness register settings. Pixel color output comes to be the value shown below processed by the brightness control block.

9.20.14.2 Detailed description

- Gout = Gin + p_cfg->output.brightness.g - 512 (output.brightness.g must be 10 bits value; up to 512)
- Bout = Bin + p_cfg->output.brightness.b - 512 (output.brightness.b must be 10 bits value; up to 512)
- Rout = Rin + p_cfg->output.brightness.r - 512 (output.brightness.r must be 10 bits value; up to 512)

Table 1563:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for Display Interface
p_brightness	in	Pointer to brightness configuration structure
p_glcd_reg	in	Pointer to GLCD registers

Table 1564:Return values

Name	Description
void	

9.20.14.3 Function steps

- Sets brightness correction register for each color in a pixel.
- If brightness setting in configuration is 'off', apply default value

9.20.15 r_glcd_contrast_correction

```
 r_glcd_contrast_correction (  R_GLCDC_Type * p_glcd_reg ,
 glcd_instance_ctrl_t  const *const p_ctrl ,  display_contrast_t  const
*const p_contrast )
```

9.20.15.1 Brief description

Subroutine to configure the contrast register settings. Pixel color output becomes the value shown below, processed by the contrast control block. Contrast can be changed between x0.000 to x1.992 (0x0:x0.000 / 0x80:x1.000 / 0xFF:x1.992).

9.20.15.2 Detailed description

- Gout = (Gin + p_contrast->g)/128
- Bout = (Bin + p_contrast->b)/128
- Rout = (Rin + p_contrast->r)/128

Table 1565:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block for the Display Interface
p_contrast	in	Pointer to the contrast configuration structure
p_glcd_reg	in	Pointer to GLCD registers

Table 1566:Return values

Name	Description
void	

9.20.15.3 Function steps

- Sets the contrast correction register for each color in a pixel.
- If the contrast setting in the configuration is set to 'off', apply default value

9.20.16 r_glcd_get_bit_size

```
r_glcd_get_bit_size ( display_in_format_t  const format )
```

9.20.16.1 Brief description

Subroutine to get the bit size of the specified format.

9.20.16.2 Detailed description

Table 1567:Parameters

Name	Direction	Description
format	in	Color format (specify display_in_format_t type enumeration value)

Table 1568:Return values

Name	Description
Bit	size

9.20.16.3 Function steps

- Get bit size and set color format
- < ARGB8888, 32bits
- < RGB888, 32bits
- < RGB565, 16bits
- < ARGB1555, 16bits
- < ARGB4444, 16bits
- < CLUT8
- < CLUT4
- < CLUT1

9.20.17 r_glcd_graphics_plane_format_set

```
r_glcd_graphics_plane_format_set (  R_GLCDC_Type * p_glcd_reg ,
display_in_format_t  const format ,  display_frame_layer_t  const frame )
```

9.20.17.1 Brief description

Subroutine to set the color format of graphics plane to the GLCD register.

9.20.17.2 Detailed description

Table 1569:Parameters

Name	Direction	Description
format	in	Color format (specify display_in_format_t type enumeration value)
frame	in	The number of input frame buffer
p_glcd_reg	in	Pointer to GLCD registers

Table 1570:Return values

Name	Description
void	

9.20.17.3 Function steps

- < ARGB8888, 32bits
- < RGB888, 32bits
- < RGB565, 16bits
- < ARGB1555, 16bits
- < ARGB4444, 16bits
- < CLUT8
- < CLUT4
- < CLUT1

9.20.18 r_glcd_interrupt_enable

```
 r_glcd_interrupt_enable (  R_GLCDC_Type * p_glcd_reg ,   IRQn_Type
* line_detect_irq ,   IRQn_Type * underflow_1_irq ,   IRQn_Type
* underflow_2_irq )
```

9.20.18.1 Brief description

Enable the glcd interrupt.

9.20.18.2 Detailed description

Table 1571:Parameters

Name	Direction	Description
p_glcd_reg	in	Pointer to GLCD registers
line_detect_irq	in	Pointer to IRQ
underflow_1_irq	in	Pointer to IRQ
underflow_2_irq	in	Pointer to IRQ

Table 1572:Return values

Name	Description
void	

9.20.18.3 Function steps

- Enable the GLCD interrupts

9.20.19 r_glcd_output_data_order_set

```
r_glcd_output_data_order_set (  R_GLCDC_Type * p_glcd_reg ,  display_cfg_t
const *const p_cfg )
```

9.20.19.1 Brief description

Configure endianness for output data and output byte order swapping.

9.20.19.2 Detailed description

Table 1573:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for the display interface
p_glcd_reg	in	Pointer to GLCD registers

Table 1574:Return values

Name	Description
void	

9.20.19.3 Function steps

- selects big or little endian for output data
- selects the output byte order swapping

9.20.20 r_glcd_pixel_size_recalculate

```
 r_glcd_pixel_size_recalculate ( display_input_cfg_t  const *const p_input ,
 display_layer_t  const *const p_layer ,   recalculated_param_t
* p_recalculated ,   uint16_t * bit_size )
```

9.20.20.1 Brief description

Calculate the pixels to be displayed on window based on the offset of the graphic layer.

9.20.20.2 Detailed description

Table 1575:Parameters

Name	Direction	Description
p_input	in	The input frame buffer configuration
p_layer	in	The layer configuration
p_recalculated	inout	Pointer to store recalculated parameter
bit_size	in	Pointer to bit size of the color format

Table 1576:Return values

Name	Description
void	

9.20.20.3 Function steps

- If the offset of the graphics layer is greater than or equal to zero and it is less than or equal to the size of the display window, calculate actual pixel size to display.
- Calculate actual pixel size, the pixels to be displayed is less than the display window size
- Actual pixel size to display is same as the display window size
- If the offset of the graphics layer is less than zero, calculate the actual pixel size to display.
- If coordinate.x is a minus value, the layer image position can be adjusted not only by adjusting the horizontal offset but also by changing the base address of layer image. Since the base address has to be aligned to 64 bytes, we need to adjust the horizontal offset, which is the cycles from the 'internal zero' to the start cycle of active video region to achieve 1 pixel unit offset. We need to adjust the size of image to display as well.
- Base address must be aligned to a 64-bit address

- If graphics layer offset is beyond the display window size, set the pixel size to display to zero

9.20.21 glcdc_line_detect_isr

```
glcdc_line_detect_isr ( void )
```

9.20.21.1 Brief description

The line detection interrupt service routine. This ISR is called when the number of the display line reaches the designated number of lines. If a callback function is registered in R_GLCD_Open, it is called from this ISR and the DISPLAY_EVENT_LINE_DETECTION event code is set as its argument.

9.20.21.2 Detailed description

Table 1577:Return values

Name	Description
none	

9.20.21.3 Function steps

- Call back callback function if it is registered
- Clear interrupt flag in the register of the GLCD module
- Clear interrupt flag in the register of the NVIC module

9.20.22 glcdc_underflow_1_isr

```
glcdc_underflow_1_isr ( void )
```

9.20.22.1 Brief description

The graphics plane 1 underflow detection interrupt service routine. This ISR is called when the underflow occurs in the graphics plane 1 control block. If a callback function is registered in R_GLCD_Open, it is called back from this ISR and the DISPLAY_EVENT_GR1_UNDERFLOW event code is set as its argument.

9.20.22.2 Detailed description

Table 1578:Return values

Name	Description
none	

9.20.22.3 Function steps

- Call back callback function if it is registered
- Clear interrupt flag in the register of the GLCD module
- Clear interrupt flag in the register of the NVIC module

9.20.23 glcdc_underflow_2_isr

```
glcdc_underflow_2_isr (  void  )
```

9.20.23.1 Brief description

The graphics plane 2 underflow detection interrupt service routine. This ISR is called when the underflow occurs in the graphics plane 2 control block. If a callback function is registered in R_GLCD_Open, it is called from this ISR and the DISPLAY_EVENT_GR2_UNDERFLOW event code is set as its argument.

9.20.23.2 Detailed description

Table 1579:Return values

Name	Description
none	

9.20.23.3 Function steps

- Call the callback function if it is registered
- Clear interrupt flag in the register of the GLCD module
- Clear interrupt flag in the register of the NVIC module

9.20.24 R_GLCD_Open

```
ssp_err_t R_GLCD_Open ( display_ctrl_t *const p_api_ctrl , display_cfg_t const
*const p_cfg )
```

9.20.24.1 Brief description

Open GLCDC module.

9.20.24.2 Detailed description

Implements

- open.

Table 1580:Return values

Name	Description
SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
SSP_ERR_HW_LOCKED	GLCDC resource is locked.
SSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock source.
SSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
SSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
SSP_ERR_INVALID_LAYER_FORMAT	Invalid format is specified.
SSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found.

NOTE: PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

9.20.24.3 Function steps

- Lock the GLCD resource

- Supply the peripheral clock to the GLCD module
- Release GLCD from a SW reset status.
- Set the dot clock frequency
- Set the panel signal timing
- Configure the background screen
- Store back poach position to the control block (needed to define the layer blending position later)
- Configure the graphics plane layers
- Configure the output control block
- Configure the color correction setting (brightness, brightness and gamma correction)
- Change GLCD driver state
- Save callback function
- Save user defined context
- Save the display interface context into GLCD HAL control block
- Set the line number which is suppose to happen the line detect interrupt

9.20.25 R_GLCD_Close

```
ssp_err_t R_GLCD_Close ( display_ctrl_t  *const p_api_ctrl )
```

9.20.25.1 Brief description

Close GLCDC module.

9.20.25.2 Detailed description

Implements

- close.

Table 1581:Return values

Name	Description
SSP_SUCCESS	Device was closed successfully.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to DISPLAY_STATE_CLOSED.

Table 1581:Return values (Continued)

Name	Description
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCD is updating register values internally.

NOTE: This API can be called when the driver is not in DISPLAY_STATE_CLOSED state. It returns an error if the register update operation for the background screen generation block is being held.

9.20.25.3 Function steps

- Disable the GLCD interrupts
- Reset the GLCD hardware
- Halt the peripheral clock to the GLCD module
- Unlock the GLCD resource

9.20.26 R_GLCD_Start

```
ssp_err_t R_GLCD_Start ( display_ctrl_t  *const p_api_ctrl )
```

9.20.26.1 Brief description

Start GLCDC module.

9.20.26.2 Detailed description

Implements

- start.

Table 1582:Return values

Name	Description
SSP_SUCCESS	Device was started successfully.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_OPENED.

NOTE: This API can be called when the driver is not in DISPLAY_STATE_OPENED status.

9.20.26.3 Function steps

- Start to output the vertical and horizontal synchronization signals and screen data.

9.20.27 R_GLCD_Stop

```
ssp_err_t R_GLCD_Stop ( display_ctrl_t  *const p_api_ctrl )
```

9.20.27.1 Brief description

Stop GLCDC module.

9.20.27.2 Detailed description

Implements

- stop.

Table 1583:Return values

Name	Description
SSP_SUCCESS	Device was stopped successfully
SSP_ERR_ASSERTION	Pointer to the control block is NULL
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCD is updating register values internally.

NOTE: This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

9.20.27.3 Function steps

- Stop outputting the vertical and horizontal synchronization signals and screen data.

9.20.28 R_GLCD_LayerChange

```
ssp_err_t R_GLCD_LayerChange ( display_ctrl_t  const *const p_api_ctrl ,
 display_runtime_cfg_t  const *const p_cfg ,  display_frame_layer_t  frame )
```

9.20.28.1 Brief description

Change layer parameters of GLCDC module at runtime.

9.20.28.2 Detailed description

Implements

- layerChange.

Table 1584:Return values

Name	Description
SSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_ARGUMENT	An invalid parameter is found in the argument.
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCD is updating register values internally.

NOTE: This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

9.20.28.3 Function steps

- Configure the graphics plane layers

- Reflect the graphics module register value to the GLCD internal operations (at the timing of the next Vsync assertion)

9.20.29 R_GLCD_ColorCorrection

```
ssp_err_t R_GLCD_ColorCorrection ( display_ctrl_t  const *const p_api_ctrl ,
 display_correction_t  const *const p_correction )
```

9.20.29.1 Brief description

Perform color correction by GLCDC module.

9.20.29.2 Detailed description

Implements

- correction.

Table 1585:Return values

Name	Description
SSP_SUCCESS	Color correction by GLCDC module was performed successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.

NOTE: This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

9.20.29.3 Function steps

- Configure the brightness and contrast correction register setting.
- Update the Output block register setting.

9.20.30 R_GLCD_ClutUpdate

```
ssp_err_t R_GLCD_ClutUpdate ( display_ctrl_t  const *const p_api_ctrl ,
 display_clut_cfg_t  const *const p_clut_cfg ,  display_frame_layer_t  frame )
```

9.20.30.1 Brief description

Update Color Look Up Table of GLCDC module.

9.20.30.2 Detailed description

Implements

- clut.

Table 1586:Return values

Name	Description
SSP_SUCCESS	CLUT updated successfully.
SSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
SSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

NOTE: This API can be called any time.

9.20.30.3 Function steps

- Check the CLUT table current used
- Copy the new CLUT data on the source memory to the CLUT SRAM in the GLCD module
- Make the GLCD module read the new CLUT table data from the next frame

9.20.31 R_GLCD_StatusGet

```
ssp_err_t R_GLCD_StatusGet ( display_ctrl_t  const *const p_api_ctrl ,
 display_status_t  *const p_status )
```

9.20.31.1 Brief description

Get status of GLCDC module.

9.20.31.2 Detailed description

Implements

- statusGet.

Table 1587:Return values

Name	Description
SSP_SUCCESS	Got status successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

NOTE: The GLCD hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_UNCERTAIN, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

9.20.31.3 Function steps

- Return the GLCD HAL driver state
- Return the fading status for the layers

9.20.32 R_GLCD_VersionGet

```
ssp_err_t R_GLCD_VersionGet ( ssp_version_t  * p_version )
```

9.20.32.1 Brief description

Get version of R_GLCDC module.

9.20.32.2 Detailed description

Implements

- versionGet.

Table 1588:Return values

Name	Description
p_version.	The version number.

NOTE: This function is re-entrant.

9.20.33 g_display_on_glcd

`display_api_t::g_display_on_glcd`

9.20.33.1 Detailed description

GLCD HAL module API function pointer list

9.20.33.2 Initialized as

```
g_display_on_glcd=
{
    .open        = R_GLCD_Open,
    .close       = R_GLCD_Close,
    .start       = R_GLCD_Start,
    .stop        = R_GLCD_Stop,
    .layerChange = R_GLCD_LayerChange,
    .clut        = R_GLCD_ClutUpdate,
    .correction  = R_GLCD_ColorCorrection,
    .statusGet   = R_GLCD_StatusGet,
    .versionGet  = R_GLCD_VersionGet
}
```

9.20.34 API Data

9.20.34.1 glcd_clk_src_t

`glcd_clk_src_t`

Detailed description

Clock source select

Enumerated values

Name	Description
GLCD_CLK_SRC_INTERNAL	Internal.
GLCD_CLK_SRC_EXTERNAL	External.

9.20.34.2 glcd_panel_clk_div_t

`glcd_panel_clk_div_t`

Detailed description

Clock frequency division ratio

Enumerated values

Name	Description
GLCD_PANEL_CLK_DIVISOR_1	Division Ratio 1/1.
GLCD_PANEL_CLK_DIVISOR_2	Division Ratio 1/2.
GLCD_PANEL_CLK_DIVISOR_3	Division Ratio 1/3.
GLCD_PANEL_CLK_DIVISOR_4	Division Ratio 1/4.
GLCD_PANEL_CLK_DIVISOR_5	Division Ratio 1/5.
GLCD_PANEL_CLK_DIVISOR_6	Division Ratio 1/6.
GLCD_PANEL_CLK_DIVISOR_7	Division Ratio 1/7.
GLCD_PANEL_CLK_DIVISOR_8	Division Ratio 1/8.
GLCD_PANEL_CLK_DIVISOR_9	Division Ratio 1/9.
GLCD_PANEL_CLK_DIVISOR_12	Division Ratio 1/12.
GLCD_PANEL_CLK_DIVISOR_16	Division Ratio 1/16.
GLCD_PANEL_CLK_DIVISOR_24	Division Ratio 1/24.
GLCD_PANEL_CLK_DIVISOR_32	Division Ratio 1/32.

9.20.34.3 glcd_tcon_pin_t

`glcd_tcon_pin_t`

Detailed description

LCD TCON output pin select

Enumerated values

Name	Description
GLCD_TCON_PIN_NONE	No output.
GLCD_TCON_PIN_0	LCD_TCON0.
GLCD_TCON_PIN_1	LCD_TCON1.
GLCD_TCON_PIN_2	LCD_TCON2.
GLCD_TCON_PIN_3	LCD_TCON3.
GLCD_TCON_PIN_NUM	

9.20.34.4 glcd_bus_arbitration_t

`glcd_bus_arbitration_t`

Detailed description

Bus Arbitration setting

Enumerated values

Name	Description
GLCD_BUS_ARBITRATION_ROUNDROBIN	Round robin.
GLCD_BUS_ARBITRATION_FIX_PRIORITY	Fixed.

9.20.34.5 glcd_correction_proc_order_t

`glcd_correction_proc_order_t`

Detailed description

Correction circuit sequence control

Enumerated values

Name	Description
GLCD_CORRECTION_PROC_ORDER_BRIGHTNESS_CONTRAST2GAMMA	Brightness -> contrast -> gamma correction.
GLCD_CORRECTION_PROC_ORDER_GAMMA2BRIGHTNESS_CONTRAST	Gamma correction -> brightness -> contrast.

9.20.34.6 glcd_tcon_signal_select_t

`glcd_tcon_signal_select_t`

Detailed description

Timing signals for driving the LCD panel

Enumerated values

Name	Description
GLCD_TCON_SIGNAL_SELECT_STVA_VS	STVA/VS.
GLCD_TCON_SIGNAL_SELECT_STVB_VE	STVB/VE.
GLCD_TCON_SIGNAL_SELECT_STHA_HS	STH/SP/HS.
GLCD_TCON_SIGNAL_SELECT_STHB_HE	STB/LP/HE.
GLCD_TCON_SIGNAL_SELECT_DE	DE.

9.20.34.7 glcd_clut_plane_t

`glcd_clut_plane_t`

Detailed description

Clock phase adjustment for serial RGB output

Enumerated values

Name	Description
GLCD_CLUT_PLANE_0	GLCD CLUT plane 0.
GLCD_CLUT_PLANE_1	GLCD CLUT plane 1.

9.20.34.8 glcd_dithering_mode_t

`glcd_dithering_mode_t`

Detailed description

Dithering mode

Enumerated values

Name	Description
GLCD_DITHERING_MODE_TRUNCATE	No dithering (truncate)
GLCD_DITHERING_MODE_ROUND_OFF	Dithering with round off.
GLCD_DITHERING_MODE_2X2PATTERN	Dithering with 2x2 pattern.
GLCD_DITHERING_MODE_SETTING_MAX	

9.20.34.9 glcd_dithering_pattern_t

`glcd_dithering_pattern_t`

Detailed description

Dithering mode

Enumerated values

Name	Description
GLCD_DITHERING_PATTERN_00	2x2 pattern '00'
GLCD_DITHERING_PATTERN_01	2x2 pattern '01'
GLCD_DITHERING_PATTERN_10	2x2 pattern '10'
GLCD_DITHERING_PATTERN_11	2x2 pattern '11'

9.20.34.10 glcd_input_interface_format_t

`glcd_input_interface_format_t`

Detailed description

Output interface format

Enumerated values

Name	Description
GLCD_INPUT_INTERFACE_FORMAT_RGB565	Input interface format RGB565.
GLCD_INPUT_INTERFACE_FORMAT_RGB888	Input interface format RGB888.
GLCD_INPUT_INTERFACE_FORMAT_ARGB1555	Input interface format ARGB1555.
GLCD_INPUT_INTERFACE_FORMAT_ARGB4444	Input interface format ARGB4444.
GLCD_INPUT_INTERFACE_FORMAT_ARGB8888	Input interface format ARGB8888.
GLCD_INPUT_INTERFACE_FORMAT_CLUT8	Input interface format CLUT8.
GLCD_INPUT_INTERFACE_FORMAT_CLUT4	Input interface format CLUT4.
GLCD_INPUT_INTERFACE_FORMAT_CLUT1	Input interface format CLUT1.

9.20.34.11 glcd_output_interface_format_t

`glcd_output_interface_format_t`

Detailed description

Output interface format

Enumerated values

Name	Description
GLCD_OUTPUT_INTERFACE_FORMAT_RGB888	Output interface format RGB888.
GLCD_OUTPUT_INTERFACE_FORMAT_RGB666	Output interface format RGB666.
GLCD_OUTPUT_INTERFACE_FORMAT_RGB565	Output interface format RGB565.
GLCD_OUTPUT_INTERFACE_FORMAT_SERIAL_RGB	Output interface format Serial RGB.

9.20.34.12 glcd_dithering_output_format_t

`glcd_dithering_output_format_t`

Detailed description

Dithering output format

Enumerated values

Name	Description
GLCD_DITHERING_OUTPUT_FORMAT_RGB888	Dithering output format RGB888.
GLCD_DITHERING_OUTPUT_FORMAT_RGB666	Dithering output format RGB666.
GLCD_DITHERING_OUTPUT_FORMAT_RGB565	Dithering output format RGB565.

9.20.34.13 display_plane_blend_t

`display_plane_blend_t`

Detailed description

RGB color order select

Enumerated values

Name	Description
DISPLAY_PLANE_BLEND_TRANSPARENT	Current graphics layer is transparent and the lower layer is.
DISPLAY_PLANE_BLEND_NON_TRANSPARENT	Current graphics layer is displayed.
DISPLAY_PLANE_BLEND_ON_LOWER_LAYER	Current graphics layer is blended with the lower layer.

9.20.34.14 glcd_fading_control_initial_alpha_t

`glcd_fading_control_initial_alpha_t`

Detailed description

RGB color order select

Enumerated values

Name	Description
GLCD_FADING_CONTROL_INITIAL_ALPHA_MIN	Initial alpha value setting for a graphics plane is zero.
GLCD_FADING_CONTROL_INITIAL_ALPHA_MAX	Initial alpha value setting for a graphics plane is maximum.

9.20.35 Extensions

9.20.35.1 glcd_instance_ctrl_t

glcd_instance_ctrl_t

Detailed description

Display control block. DO NOT INITIALIZE.

Variables

- display_state_t state

  Status of GLCD module.
- void(* p_callback)(*p_args)

  Pointer to callback function.
- void const * p_context

  Pointer to the higher level device context.
- R_GLCDC_Type * p_reg

  Base register address.

9.20.35.2 glcd_cfg_t

glcd_cfg_t

Detailed description

GLCD hardware specific configuration

Variables

- glcd_tcon_pin_t tcon_hsync

  GLCD TCON output pin select.
- glcd_tcon_pin_t tcon_vsync

  GLCD TCON output pin select.
- glcd_tcon_pin_t tcon_de

  GLCD TCON output pin select.
- glcd_correction_proc_order_t correction_proc_order

  Correction control route select.
- glcd_clk_src_t clksrc

  Clock Source selection.
- glcd_panel_clk_div_t clock_div_ratio

  Clock divide ratio for dot clock.

- glcd_dithering_mode_t dithering_mode

  Dithering mode.
- glcd_dithering_pattern_t dithering_pattern_A

  Dithering pattern A.
- glcd_dithering_pattern_t dithering_pattern_B

  Dithering pattern B.
- glcd_dithering_pattern_t dithering_pattern_C

  Dithering pattern C.
- glcd_dithering_pattern_t dithering_pattern_D

  Dithering pattern D.

9.20.35.3 glcd_ctrl_t

glcd_ctrl_t

Detailed description

GLCD hardware specific control block

Variables

- display_coordinate_t back_porch

  Zero coordinate for graphics plane(Bach porch End)
- uint16_t hsize

  Horizontal pixel size in a line.
- uint16_t vsize

  Vertical pixel size in a frame.
- bsp_lock_t resource_lock

  Resource lock.
- void * p_context

  Pointer to the function level device context (e.g. display_ctrl_t type data)

9.20.35.4 tcon_func_t

tcon_func_t

Detailed description

Function pointers to control TCON pin settings

Variables

- void(* tcon_select)(R_GLCDC_Type *p_glcd_reg,)
- void(* invert)(R_GLCDC_Type *p_glcd_reg)

9.20.35.5 recalculated_param_t

recalculated_param_t

Detailed description

The structure for the layer parameter recalculation

Variables

- uint16_t hpix_size
- uint16_t vpix_size
- int16_t hpix_offset
- int16_t vpix_offset
- uint32_t hread_size
- uint32_t base_address

9.21 GPT

Driver for the General PWM Timer (GPT).

9.21.1 Summary

Extends Timer Interface.

This module implements the Timer Interface using the General PWM Timer (GPT) peripherals GPT32EH, GPT32E, GPT32. It also provides an output compare extension to output the timer signal to the GTIOC pin.

9.21.2 Functions

- R_GPT_TimerOpen
- R_GPT_Stop
- R_GPT_Start
- R_GPT_CounterGet
- R_GPT_Reset
- R_GPT_PeriodSet
- R_GPT_DutyCycleSet
- R_GPT_InfoGet
- R_GPT_Close
- R_GPT_VersionGet

9.21.3 Defines

- #define GPT_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define GPT_CODE_VERSION_MINOR

  Initial value: `(7U)`

9.21.4 R_GPT_TimerOpen

```
ssp_err_t R_GPT_TimerOpen ( timer_ctrl_t *const p_api_ctrl , timer_cfg_t const
*const p_cfg )
```

9.21.4.1 Brief description

Powers on GPT, handles required initialization described in hardware manual. Implements open.

9.21.4.2 Detailed description

The Open function configures a single GPT channel, starts the channel, and provides a handle for use with the GPT API Control and Close functions. This function must be called once prior to calling any other GPT API functions. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a timer_on_gpt_cfg_t extension parameter.

Table 1589:Return values

Name	Description
SSP_SUCCESS	Initialization was successful and timer has started.
SSP_ERR_ASSERTION	One of the following parameters is incorrect. Either • p_cfg is NULL, OR • p_ctrl is NULL, OR

Table 1589:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	One of the following parameters is invalid: • p_cfg->period: must be in the following range: – Lower bound: (1 / (PCLK frequency) – Upper bound: (0xFFFFFFFF * 1024 / (PCLK frequency)) • p_cfg->p_callback not NULL, but ISR is not enabled. ISR must be enabled to use callback function. Enable channel's overflow ISR in bsp_irq_cfg.h.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.
SSP_ERR_IRQ_BSP_DISABLED	- p_cfg->mode is TIMER_MODE_ONE_SHOT, but ISR is not enabled. ISR must be enabled to use one-shot mode.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	- The channel requested in the p_cfg parameter is not available on this device.

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.21.4.3 Function steps

- Calculate period and store internal variables
- Calculate duty cycle
- Verify channel is not already used
- Power on GPT before setting any hardware registers. Make sure the counter is stopped before setting mode register, PCLK divisor register, and counter register.

9.21.5 R_GPT_Stop

```
ssp_err_t R_GPT_Stop ( timer_ctrl_t  *const p_api_ctrl )
```

9.21.5.1 Brief description

Stops timer. Implements stop.

9.21.5.2 Detailed description

Table 1590:Return values

Name	Description
SSP_SUCCESS	Timer successfully stopped.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.5.3 Function steps

- Stop timer

9.21.6 R_GPT_Start

```
ssp_err_t R_GPT_Start ( timer_ctrl_t  *const p_api_ctrl )
```

9.21.6.1 Brief description

Starts timer. Implements start.

9.21.6.2 Detailed description

Table 1591:Return values

Name	Description
SSP_SUCCESS	Timer successfully started.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.6.3 Function steps

- Start timer

9.21.7 R_GPT_CounterGet

```
ssp_err_t R_GPT_CounterGet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
*const p_value )
```

9.21.7.1 Brief description

Sets counter value in provided p_value pointer. Implements counterGet.

9.21.7.2 Detailed description

Table 1592:Return values

Name	Description
SSP_SUCCESS	Counter value read, p_value is valid.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.7.3 Function steps

- Read counter value

9.21.8 R_GPT_Reset

```
ssp_err_t R_GPT_Reset ( timer_ctrl_t  *const p_api_ctrl )
```

9.21.8.1 Brief description

Resets the counter value to 0. Implements reset.

9.21.8.2 Detailed description

Table 1593:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.

Table 1593:Return values (Continued)

Name	Description
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.8.3 Function steps

- Write the counter value

9.21.9 R_GPT_PeriodSet

```
ssp_err_t R_GPT_PeriodSet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
const period ,  timer_unit_t  const unit )
```

9.21.9.1 Brief description

Sets period value provided. Implements periodSet.

9.21.9.2 Detailed description

Table 1594:Return values

Name	Description
SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARGUMENT	One of the following is invalid: • p_period->unit: must be one of the options from timer_unit_t • p_period->value: must result in a period in the following range: – Lower bound: (1 / (PCLK frequency)) – Upper bound: (0xFFFFFFFF * 1024 / (PCLK frequency))
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.9.3 Function steps

- Delay must be converted to PCLK counts before it can be set in registers

- Make sure period is valid.
- Store current status, then stop timer before setting divisor register
- Reset counter in case new cycle is less than current count value, then restore state (counting or stopped).

9.21.10 R_GPT_DutyCycleSet

```
ssp_err_t R_GPT_DutyCycleSet ( timer_ctrl_t  *const p_api_ctrl ,  timer_size_t
const duty_cycle ,  timer_pwm_unit_t  const unit ,   uint8_t const pin )
```

9.21.10.1 Brief description

Sets status in provided p_status pointer. Implements pwm_api_t::dutyCycleSet.

9.21.10.2 Detailed description

Table 1595:Return values

Name	Description
SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.10.3 Function steps

- Converted duty cycle to PCLK counts before it can be set in registers
- Set duty cycle.

9.21.11 R_GPT_InfoGet

```
ssp_err_t R_GPT_InfoGet ( timer_ctrl_t  *const p_api_ctrl ,  timer_info_t
*const p_info )
```

9.21.11.1 Brief description

Get timer information and store it in provided pointer p_info. Implements infoGet.

9.21.11.2 Detailed description

Table 1596:Return values

Name	Description
SSP_SUCCESS	Period, count direction, frequency, and status value written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_info parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.11.3 Function steps

- Get and store period
- Get and store clock frequency
- Get and store clock counting direction

9.21.12 R_GPT_Close

```
ssp_err_t R_GPT_Close ( timer_ctrl_t  *const p_api_ctrl )
```

9.21.12.1 Brief description

Stops counter, disables interrupts, disables output pins, and clears internal driver data.

9.21.12.2 Detailed description

Table 1597:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.21.12.3 Function steps

- Cleanup. Disable interrupts, stop counter, and disable output.

- Unlock channel
- Clear stored internal driver data

9.21.13 R_GPT_VersionGet

```
ssp_err_t R_GPT_VersionGet ( ssp_version_t  *const p_version )
```

9.21.13.1 Brief description

Sets driver version based on compile time macros.

9.21.13.2 Detailed description

Table 1598:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.21.14 API Data

9.21.14.1 gpt_pin_level_t

`gpt_pin_level_t`

Detailed description

Level of GPT pin

Enumerated values

Name	Description
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.
GPT_PIN_LEVEL_RETAINED	Pin level retained.

9.21.14.2 gpt_trigger_t

`gpt_trigger_t`

Detailed description

Sources can be used to start the timer, stop the timer, count up, or count down.

Enumerated values

Name	Description
GPT_TRIGGER_NONE	No action performed.
GPT_TRIGGER_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_TRIGGER_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_TRIGGER_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_TRIGGER_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.
GPT_TRIGGER_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_TRIGGER_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_TRIGGER_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_TRIGGER_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_TRIGGER_SOURCE_REGISTER_ENABLE	Enables settings in the Source Select Register.

9.21.14.3 gpt_output_t

```
gpt_output_t
```

Detailed description

Output level used when selecting what happens at compare match or cycle end.

Enumerated values

Name	Description
GPT_OUTPUT_RETAINED	Output retained.

Name	Description
GPT_OUTPUT_LOW	Output low.
GPT_OUTPUT_HIGH	Output high.
GPT_OUTPUT_TOGGLED	Output toggled.

9.21.15 Extensions

9.21.15.1 gpt_instance_ctrl_t

gpt_instance_ctrl_t

Detailed description

Channel control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- void(* p_callback)(*p_args)

  Callback provided when a timer ISR occurs. NULL indicates no CPU interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user callback in timer_callback_args_t.
- void * p_reg

  Base register for this channel.
- uint32_t open

  Whether or not channel is open.
- uint8_t channel

  Channel number.
- bool one_shot

  Whether or not timer is in one shot mode.
- IRQn_Type irq

  Counter overflow IRQ number.
- timer_variant_t variant

  Timer variant.

9.21.15.2 gpt_output_pin_t

gpt_output_pin_t

Detailed description

Configurations for output pins.

Variables

- bool output_enabled

  Set to true to enable output, false to disable output.

- gpt_pin_level_t stop_level

  Select a stop level from gpt_pin_level_t.

9.21.15.3 timer_on_gpt_cfg_t

timer_on_gpt_cfg_t

Detailed description

GPT extension configures the output pins for GPT.

Variables

- gpt_output_pin_t gtioca

  Configuration for GPT I/O pin A.

- gpt_output_pin_t gtiocb

  Configuration for GPT I/O pin B.

9.22 GPT Input Capture

Driver for the General PWM Timer (GPT) with Input Capture.

9.22.1 Summary

Extends Input Capture Interface.

This module implements the Input Capture Interface for the General PWM Timer (GPT) peripherals GPT32EH, GPT32E, GPT32.

9.22.2 Functions

- R_GPT_InputCaptureOpen
- R_GPT_InputCaptureClose
- R_GPT_InputCaptureVersionGet
- R_GPT_InputCaptureDisable
- R_GPT_InputCaptureEnable
- R_GPT_InputCaptureInfoGet
- R_GPT_InputCaptureLastCaptureGet

9.22.3 Defines

- #define GPT_INPUT_CAPTURE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Includes
- #define GPT_INPUT_CAPTURE_CODE_VERSION_MINOR

  Initial value: `(7U)`
- #define GPT_INPUT_CAPTURE_MAX_COUNT

  Initial value: `(0xFFFFFFFFUL)`

  Maximum value of GPT counter.

9.22.4 R_GPT_InputCaptureOpen

```
ssp_err_t R_GPT_InputCaptureOpen ( input_capture_ctrl_t  *const p_api_ctrl ,
 input_capture_cfg_t  const *const p_cfg )
```

9.22.4.1 Brief description

Open a GPT Timer for Input Capture. Implements open.

9.22.4.2 Detailed description

The Open function configures a single GPT channel for input capture and provides a handle for use with the other Input Capture API functions. This function must be called once prior to calling any other Input Capture API function. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

Table 1599:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the parameters is NULL: p_cfg, p_ctrl, p_extend. Or the channel requested in the p_cfg parameter may not be available on the device selected in r_bsp_cfg.h. Or p_cfg->mode is invalid.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.22.4.3 Function steps

- Verify channel is not already used

9.22.5 R_GPT_InputCaptureClose

```
ssp_err_t R_GPT_InputCaptureClose ( input_capture_ctrl_t  *const p_api_ctrl )
```

9.22.5.1 Brief description

Close a GPT Timer Channel for Input Capture. Implements close.

9.22.5.2 Detailed description

Clears Timer settings, disables interrupts, and clears internal driver data.

Table 1600:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.22.5.3 Function steps

- Cleanup. Disable interrupts and stop measurements.
- Unlock channel
- Clear stored internal driver data

9.22.6 R_GPT_InputCaptureVersionGet

```
ssp_err_t R_GPT_InputCaptureVersionGet ( ssp_version_t  *const p_version )
```

9.22.6.1 Brief description

Gets driver version based on compile time macros. Implements versionGet.

9.22.6.2 Detailed description

Table 1601:Return values

Name	Description
SSP_SUCCESS	Success.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.22.7 R_GPT_InputCaptureDisable

```
ssp_err_t R_GPT_InputCaptureDisable ( input_capture_ctrl_t  const
*const p_api_ctrl )
```

9.22.7.1 Brief description

Disables GPT Input Capture RegA interrupt for specified channel at NVIC. Implements disable.

9.22.7.2 Detailed description

Table 1602:Return values

Name	Description
SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.22.7.3 Function steps

- Disable interrupts
- Clearing the input capture source select registers.

9.22.8 R_GPT_InputCaptureEnable

```
ssp_err_t R_GPT_InputCaptureEnable ( input_capture_ctrl_t  const
*const p_api_ctrl )
```

9.22.8.1 Brief description

Enables GPT Input Capture RegA interrupt for specified channel at NVIC. Implements enable.

9.22.8.2 Detailed description

Table 1603:Return values

Name	Description
SSP_SUCCESS	Interrupt enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.22.8.3 Function steps

- Configuring the input capture source select registers.
- Enabling the overflow and capture registers.

9.22.9 R_GPT_InputCaptureInfoGet

```
ssp_err_t R_GPT_InputCaptureInfoGet ( input_capture_ctrl_t  const
*const p_api_ctrl ,  input_capture_info_t  *const p_info )
```

9.22.9.1 Brief description

Gets status into provided p_info pointer. Implements infoGet.

9.22.9.2 Detailed description

Table 1604:Return values

Name	Description
SSP_SUCCESS	Success.

Table 1604:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.22.10 R_GPT_InputCaptureLastCaptureGet

```
ssp_err_t R_GPT_InputCaptureLastCaptureGet ( input_capture_ctrl_t  const
*const p_api_ctrl ,  input_capture_capture_t  *const p_capture )
```

9.22.10.1 Brief description

Update the last captured value and overflow count, in provided p_capture pointer. Implements lastCaptureGet.

9.22.10.2 Detailed description

Table 1605:Return values

Name	Description
SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.22.10.3 Function steps

- Set capture value

9.22.11 API Data

9.22.11.1 gpt_input_capture_signal_t

`gpt_input_capture_signal_t`

Detailed description

Input capture signal selection

Enumerated values

Name	Description
GPT_INPUT_CAPTURE_SIGNAL_PIN_GTIOCA	GTIOCxA pin, where x is channel number.
GPT_INPUT_CAPTURE_SIGNAL_PIN_GTIOCB	GTIOCxB pin, where x is channel number.

9.22.11.2 gpt_input_capture_signal_filter_t

`gpt_input_capture_signal_filter_t`

Detailed description

Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.

Enumerated values

Name	Description
GPT_INPUT_CAPTURE_SIGNAL_FILTER_NONE	NONE - no filtering.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_1	PCLK/1 - fast sampling.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_4	PCLK/4.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_16	PCLK/16.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_64	PCLK/64 - slow sampling.

9.22.11.3 gpt_input_capture_clock_divider_t

`gpt_input_capture_clock_divider_t`

Detailed description

Input capture PCLK divider. Used to scale the timer counter.

Enumerated values

Name	Description
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_1	/ 1
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_4	/ 4
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_16	/ 16

Name	Description
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_64	/ 64
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_256	/ 256
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_1024	/ 1024

9.22.12 Extensions

9.22.12.1 gpt_input_capture_extend_t

gpt_input_capture_extend_t

Brief description

Extension configuration struct for TU Input Capture.

Detailed description

Pointed to by p_extend

Variables

- gpt_input_capture_signal_t signal

  One of gpt_input_capture_signal_t.
- gpt_input_capture_signal_filter_t signal_filter

  One of gpt_input_capture_signal_filter_t.
- gpt_input_capture_clock_divider_t clock_divider

  One of gpt_input_capture_clock_divider_t.
- input_capture_signal_level_t enable_level

  The unused GTIOCx pin can be used as an enable signal to enable captures. If the Input Capture Signal Pin is GTIOCA, then the enable pin is GTIOCB. The enable level is set here if used.
- gpt_input_capture_signal_filter_t enable_filter

  One of gpt_input_capture_signal_filter_t.

9.22.12.2 gpt_input_capture_instance_ctrl_t

gpt_input_capture_instance_ctrl_t

Detailed description

Channel control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- uint32_t open

  Whether or not channel is open.

- uint8_t channel

  The channel in use.
- input_capture_mode_t mode

  The mode of measurement being performed.
- input_capture_repetition_t repetition

  One-shot or periodic measurement.
- uint32_t capture_count

  The value of the timer captured at the time of interrupt.
- uint32_t overflows_last

  Overflow count that occurred during last measurement.
- uint32_t overflows_current

  Running count of overflows in current measurement.
- void(* p_callback)(*p_args)

  Pointer to user callback.
- void const * p_context

  Pointer to user's context data, to be passed to the callback function.
- void * p_reg

  GPT base register for this channel.
- IRQn_Type capture_irq

  Capture IRQ number.
- IRQn_Type overflow_irq

  Overflow IRQ number.
- input_capture_variant_t variant

  Timer variant.
- uint32_t start_bitmask

  Start and Clear bitmask for input capture.
- uint32_t stop_bitmask

  Stop and capture bitmask for input capture.

9.23 ICU

Driver for the Interrupt Controller Unit (ICU) External pin interrupts function.

9.23.1 Summary

Extends External IRQ Interface.

This module implements the External IRQ Interface using the external input pins in the Interrupt Controller Unit (ICU).

9.23.2 Functions

- R_ICU_ExternalIrqOpen
- R_ICU_ExternalIrqEnable
- R_ICU_ExternalIrqDisable
- R_ICU_ExternalIrqTriggerSet
- R_ICU_ExternalIrqFilterEnable
- R_ICU_ExternalIrqFilterDisable
- R_ICU_ExternalIrqVersionGet
- R_ICU_ExternalIrqClose

9.23.3 Defines

- #define ICU_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define ICU_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.23.4 R_ICU_ExternalIrqOpen

```
ssp_err_t R_ICU_ExternalIrqOpen ( external_irq_ctrl_t  *const p_api_ctrl ,
 external_irq_cfg_t  const *const p_cfg )
```

9.23.4.1 Brief description

Configure an external input pin for use with the button interface. Implements open.

9.23.4.2 Detailed description

The Open function is responsible for preparing an external input pin for operation. After completion of the Open function the external input pin shall be enabled and ready to service interrupts. This function must be called once prior to calling any other external input pin API functions. Once successfully completed, the status of the selected external input pin will be set to "open". After that this function should not be called again for the same external input pin without first performing a "close" by calling R_ICU_ExternalIrqClose.

Table 1606:Return values

Name	Description
SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	One of the following is invalid: • p_ctrl or p_cfg is NULL • The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
SSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. Enable channel's overflow ISR in bsp_irq_cfg.h.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this device.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

NOTE: This function is reentrant for different channels. It is not reentrant for the same channel.

9.23.5 R_ICU_ExternalIrqEnable

```
ssp_err_t R_ICU_ExternalIrqEnable ( external_irq_ctrl_t  *const p_api_ctrl )
```

9.23.5.1 Brief description

Enable external interrupt for specified channel at NVIC. Implements enable.

9.23.5.2 Detailed description

Table 1607:Return values

Name	Description
SSP_SUCCESS	Interrupt Enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	Requested IRQ is not defined in this system

9.23.6 R_ICU_ExternalIrqDisable

```
ssp_err_t R_ICU_ExternalIrqDisable ( external_irq_ctrl_t  *const p_api_ctrl )
```

9.23.6.1 Brief description

Disable external interrupt for specified channel at NVIC. Implements disable.

9.23.6.2 Detailed description

Table 1608:Return values

Name	Description
SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	Requested IRQ is not defined in this system

9.23.7 R_ICU_ExternalIrqTriggerSet

```
ssp_err_t R_ICU_ExternalIrqTriggerSet ( external_irq_ctrl_t  *const p_api_ctrl ,
 external_irq_trigger_t  hw_trigger )
```

9.23.7.1 Brief description

Set trigger value provided. Implements triggerSet.

9.23.7.2 Detailed description

Table 1609:Return values

Name	Description
SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_period parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.23.8 R_ICU_ExternalIrqFilterEnable

```
ssp_err_t R_ICU_ExternalIrqFilterEnable ( external_irq_ctrl_t
*const p_api_ctrl )
```

9.23.8.1 Brief description

Enable external interrupt digital filter for specified channel. Implements filterEnable.

9.23.8.2 Detailed description

Table 1610:Return values

Name	Description
SSP_SUCCESS	External interrupt digital filter enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.23.9 R_ICU_ExternalIrqFilterDisable

```
ssp_err_t R_ICU_ExternalIrqFilterDisable ( external_irq_ctrl_t
*const p_api_ctrl )
```

9.23.9.1 Brief description

Enable external interrupt digital filter for specified channel. Implements filterDisable.

9.23.9.2 Detailed description

Table 1611:Return values

Name	Description
SSP_SUCCESS	External interrupt digital filter disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.23.10 R_ICU_ExternalIrqVersionGet

```
ssp_err_t R_ICU_ExternalIrqVersionGet ( ssp_version_t  *const p_version )
```

9.23.10.1 Brief description

Set driver version based on compile time macros. Implements versionGet.

9.23.10.2 Detailed description

Table 1612:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.23.11 R_ICU_ExternalIrqClose

```
ssp_err_t R_ICU_ExternalIrqClose ( external_irq_ctrl_t  *const p_api_ctrl )
```

9.23.11.1 Brief description

Disable external interrupt. Implements close.

9.23.11.2 Detailed description

Table 1613:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.23.11.3 Function steps

- Cleanup. Disable interrupt
- Release BSP hardware lock

9.23.12 Extensions

9.23.12.1 icu_instance_ctrl_t

icu_instance_ctrl_t

Detailed description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs in open.

Variables

- uint32_t open

  Used to determine if channel control block is in use.
- R_ICU_Type * p_reg

  Pointer to register base address.
- void(* p_callback)(*p_args)

  Callback provided when a external IRQ ISR occurs. Set to NULL for no CPU interrupt.
- void const * p_context

  Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.
- IRQn_Type irq

  NVIC interrupt number.
- uint8_t channel

  Channel.

9.24 IOPORT

Driver for the I/O Ports.

The IOPort HAL drivers provide the ability to access the I/O Ports of a device at both bit and port level. Port and pin direction can be changed. In addition a number of configuration APIs are provided to change the functionality of individual pins.

9.24.1 Functions

- R_IOPORT_Init
- R_IOPORT_PinsCfg
- R_IOPORT_PinCfg
- R_IOPORT_PinRead
- R_IOPORT_PortRead
- R_IOPORT_PortWrite
- R_IOPORT_PinWrite
- R_IOPORT_PortDirectionSet
- R_IOPORT_PinDirectionSet
- R_IOPORT_PortEventInputRead
- R_IOPORT_PinEventInputRead
- R_IOPORT_PortEventOutputWrite
- R_IOPORT_PinEventOutputWrite
- R_IOPORT_VersionGet
- R_IOPORT_EthernetModeCfg

9.24.2 Defines

- #define IOPORT_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define IOPORT_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.24.3 R_IOPORT_Init

```
ssp_err_t R_IOPORT_Init ( ioport_cfg_t const * p_cfg )
```

9.24.3.1 Brief description

Initializes internal driver data, then calls R_IOPORT_PinsCfg to configure pins.

9.24.3.2 Detailed description

Table 1614:Return values

Name	Description
SSP_SUCCESS	Pin configuration data written to PFS register(s)
SSP_ERR_ASSERTION	NULL pointer

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.24.4 R_IOPORT_PinsCfg

```
ssp_err_t R_IOPORT_PinsCfg ( ioport_cfg_t const * p_cfg )
```

9.24.4.1 Brief description

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements pinsCfg.

9.24.4.2 Detailed description

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the ISDE pin configurator or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and test.*

Table 1615:Return values

Name	Description
SSP_SUCCESS	Pin configuration data written to PFS register(s)
SSP_ERR_ASSERTION	NULL pointer

9.24.5 R_IOPORT_PinCfg

```
ssp_err_t R_IOPORT_PinCfg ( ioport_port_pin_t  pin ,   uint32_t cfg )
```

9.24.5.1 Brief description

Configures the settings of a pin. Implements pinCfg.

9.24.5.2 Detailed description

Table 1616:Return values

Name	Description
SSP_SUCCESS	Pin configured.
SSP_ERR_INVALID_ARGUMENT	Invalid pin

NOTE: This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

9.24.6 R_IOPORT_PinRead

```
ssp_err_t R_IOPORT_PinRead ( ioport_port_pin_t  pin ,  ioport_level_t
* p_pin_value )
```

9.24.6.1 Brief description

Reads the level on a pin. Implements pinRead.

9.24.6.2 Detailed description

Table 1617:Return values

Name	Description
SSP_SUCCESS	Pin read.
SSP_ERR_INVALID_ARGUMENT	Invalid argument
SSP_ERR_ASSERTION	NULL pointer

NOTE: This function is re-entrant for different pins.

9.24.7 R_IOPORT_PortRead

```
ssp_err_t R_IOPORT_PortRead ( ioport_port_t  port ,  ioport_size_t
* p_port_value )
```

9.24.7.1 Brief description

Reads the value on an IO port. Implements portRead.

9.24.7.2 Detailed description

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. *

Table 1618:Return values

Name	Description
SSP_SUCCESS	Port read.
SSP_ERR_INVALID_ARGUMENT	Port not valid.
SSP_ERR_ASSERTION	NULL pointer

NOTE: This function is re-entrant for different ports.

9.24.8 R_IOPORT_PortWrite

```
ssp_err_t R_IOPORT_PortWrite ( ioport_port_t  port ,  ioport_size_t  value ,
 ioport_size_t  mask )
```

9.24.8.1 Brief description

Writes to multiple pins on a port. Implements portWrite.

9.24.8.2 Detailed description

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. e.g. value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Table 1619:Return values

Name	Description
SSP_SUCCESS	Port written to.
SSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid.

NOTE: This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

9.24.8.3 Function steps

- High bits
- Low bits

9.24.9 R_IOPORT_PinWrite

```
ssp_err_t R_IOPORT_PinWrite ( ioport_port_pin_t  pin ,  ioport_level_t  level )
```

9.24.9.1 Brief description

Sets a pin's output either high or low. Implements pinWrite.

9.24.9.2 Detailed description

Table 1620:Return values

Name	Description
SSP_SUCCESS	Pin written to.
SSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid.

NOTE: This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

9.24.10 R_IOPORT_PortDirectionSet

```
ssp_err_t R_IOPORT_PortDirectionSet ( ioport_port_t  port ,
 ioport_size_t  direction_values ,  ioport_size_t  mask )
```

9.24.10.1 Brief description

Sets the direction of individual pins on a port. Implements portDirectionSet.

9.24.10.2 Detailed description

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Table 1621:Return values

Name	Description
SSP_SUCCESS	Port direction updated.
SSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid.

NOTE: This function is re-entrant for different ports.

9.24.10.3 Function steps

- High bits
- Low bits
- New value to write to port direction register

9.24.11 R_IOPORT_PinDirectionSet

```
ssp_err_t R_IOPORT_PinDirectionSet ( ioport_port_pin_t  pin ,
 ioport_direction_t  direction )
```

9.24.11.1 Brief description

Sets the direction of an individual pin on a port. Implements pinDirectionSet.

9.24.11.2 Detailed description

Table 1622:Return values

Name	Description
SSP_SUCCESS	Pin direction updated.
SSP_ERR_INVALID_ARGUMENT	The pin and/or direction not valid.

NOTE: This function is re-entrant for different pins.

9.24.12 R_IOPORT_PortEventInputRead

```
ssp_err_t R_IOPORT_PortEventInputRead ( ioport_port_t  port ,  ioport_size_t
* p_event_data )
```

9.24.12.1 Brief description

Reads the value of the event input data. Implements portEventInputRead.

9.24.12.2 Detailed description

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Table 1623:Return values

Name	Description
SSP_SUCCESS	Port read.
SSP_ERR_INVALID_ARGUMENT	Port not valid.
SSP_ERR_ASSERTION	NULL pointer

NOTE: This function is re-entrant for different ports.

9.24.13 R_IOPORT_PinEventInputRead

```
ssp_err_t R_IOPORT_PinEventInputRead ( ioport_port_pin_t  pin ,  ioport_level_t
* p_pin_event )
```

9.24.13.1 Brief description

Reads the value of the event input data of a specific pin. Implements pinEventInputRead.

9.24.13.2 Detailed description

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Table 1624:Return values

Name	Description
SSP_SUCCESS	Pin read.
SSP_ERR_INVALID_ARGUMENT	Pin not valid.
SSP_ERR_ASSERTION	NULL pointer

NOTE: This function is re-entrant.

9.24.14 R_IOPORT_PortEventOutputWrite

```
ssp_err_t R_IOPORT_PortEventOutputWrite ( ioport_port_t  port ,
 ioport_size_t  event_data ,  ioport_size_t  mask_value )
```

9.24.14.1 Brief description

This function writes the set and reset event output data for a port. Implements portEventOutputWrite.

9.24.14.2 Detailed description

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Table 1625:Return values

Name	Description
SSP_SUCCESS	Port event data written.
SSP_ERR_INVALID_ARGUMENT	Port and/or mask not valid. •

NOTE: This function is re-entrant for different ports.

9.24.15 R_IOPORT_PinEventOutputWrite

```
ssp_err_t R_IOPORT_PinEventOutputWrite ( ioport_port_pin_t  pin ,
 ioport_level_t  pin_value )
```

9.24.15.1 Brief description

This function writes the event output data value to a pin. Implements pinEventOutputWrite.

9.24.15.2 Detailed description

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Table 1626:Return values

Name	Description
SSP_SUCCESS	Pin event data written.
SSP_ERR_INVALID_ARGUMENT	Pin or value not valid.

NOTE: This function is re-entrant for different ports.

9.24.16 R_IOPORT_VersionGet

```
ssp_err_t R_IOPORT_VersionGet ( ssp_version_t  * p_data )
```

9.24.16.1 Brief description

Returns IOPort HAL driver version. Implements versionGet.

9.24.16.2 Detailed description

Table 1627:Return values

Name	Description
SSP_SUCCESS	Version information read.
SSP_ERR_ASSERTION	The parameter p_data is NULL.

NOTE: This function is reentrant.

9.24.17 R_IOPORT_EthernetModeCfg

```
ssp_err_t R_IOPORT_EthernetModeCfg ( ioport_ethernet_channel_t  channel ,
 ioport_ethernet_mode_t  mode )
```

9.24.17.1 Brief description

Configures Ethernet channel PHY mode. Implements ioport_api_t::ethModeCfg.

9.24.17.2 Detailed description

Table 1628:Return values

Name	Description
SSP_SUCCESS	Ethernet PHY mode set.

Table 1628:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	Channel or mode not valid.
SSP_ERR_UNSUPPORTED	Ethernet configuration not supported on this device.

NOTE: This function is not re-entrant.

9.25 IWDT

Driver for the Independent Watchdog Timer (IWDT).

9.25.1 Summary

This module supports the Independent Watchdog Timer (IWDT). It implements the WDT Interface. Extends WDT_API HAL layer drivers for interfacing with the Independent Watchdog Timer (IWDT) peripheral.

The IWDT HAL APIs provide the ability to refresh the independent watchdog, read the timer value and read and clear status flags. When used in NMI output mode the callback to be called by the NMI ISR can be registered.

9.25.2 Functions

- R_IWDT_Open
- R_IWDT_CfgGet
- R_IWDT_Refresh
- R_IWDT_StatusGet
- R_IWDT_StatusClear
- R_IWDT_CounterGet
- R_IWDT_TimeoutGet
- R_IWDT_VersionGet

9.25.3 Defines

- #define IWDT_CODE_VERSION_MAJOR

  Initial value: `(1U)`

- #define IWDT_CODE_VERSION_MINOR

  Initial value: (4U)

9.25.4 R_IWDT_Open

```
ssp_err_t R_IWDT_Open ( wdt_ctrl_t  *const p_api_ctrl ,  wdt_cfg_t  const
*const p_cfg )
```

9.25.4.1 Brief description

Register the IWDT NMI callback.

9.25.4.2 Detailed description

Table 1629:Return values

Name	Description
SSP_SUCCESS	IWDT NMI callback successfully configured.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_MODE	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
SSP_ERR_HW_LOCKED	IWDT module has already been called.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

NOTE: This function is not reentrant.

9.25.4.3 Function steps

- g_iwdt_version is accessed by the ASSERT macro only and so compiler toolchain can issue a warning that it is not accessed. The code below eliminates this warning and also ensures these data structures are not optimized away.
- Eliminate toolchain warning when NMI output is not being used.
- Lock the IWDT Hardware Resource
- Initialize global pointer to WDT for NMI callback use.
- Check for NMI output mode

- NMI output mode
- Enable the IWDT underflow/refresh error interrupt (will generate an NMI).

9.25.5 R_IWDT_CfgGet

```
ssp_err_t R_IWDT_CfgGet ( wdt_ctrl_t  *const p_api_ctrl ,  wdt_cfg_t
*const p_cfg )
```

9.25.5.1 Brief description

Read the configuration of the IWDT. Implements cfgGet.

9.25.5.2 Detailed description

Table 1630:Return values

Name	Description
SSP_SUCCESS	IWDT configuration successfully read.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options is invalid.

NOTE: This function is reentrant.

9.25.5.3 Function steps

- Get timeout value from OFS0 register.

9.25.6 R_IWDT_Refresh

```
ssp_err_t R_IWDT_Refresh ( wdt_ctrl_t  *const p_api_ctrl )
```

9.25.6.1 Brief description

Refresh the Independent Watchdog Timer. Implements refresh.

9.25.6.2 Detailed description

Table 1631:Return values

Name	Description
SSP_SUCCESS	IWDT successfully refreshed.

NOTE: This function is reentrant. This function only returns SSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

9.25.7 R_IWDT_StatusGet

```
ssp_err_t R_IWDT_StatusGet ( wdt_ctrl_t  *const p_api_ctrl ,  wdt_status_t
*const p_status )
```

9.25.7.1 Brief description

Read the IWDT status flags.

9.25.7.2 Detailed description

Indicates both status and error conditions.

Table 1632:Return values

Name	Description
SSP_SUCCESS	IWDT status successfully read.
SSP_ERR_ASSERTION	Null pointer as a parameter.

NOTE: This function is reentrant. When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags can be read after reset to establish if the IWDT caused the reset. Reading the status and error flags in NMI output mode indicates whether the IWDT generated the NMI interrupt.

9.25.8 R_IWDT_StatusClear

```
ssp_err_t R_IWDT_StatusClear ( wdt_ctrl_t  *const p_api_ctrl ,
 wdt_status_t const  status )
```

9.25.8.1 Brief description

Clear the IWDT status and error flags. Implements statusClear.

9.25.8.2 Detailed description

Table 1633:Return values

Name	Description
SSP_SUCCESS	IWDT flag(s) successfully cleared.
SSP_ERR_ASSERTION	Null pointer as a parameter.

NOTE: This function is reentrant.

9.25.8.3 Function steps

- Write zero to clear flags

9.25.9 R_IWDT_CounterGet

```
ssp_err_t R_IWDT_CounterGet ( wdt_ctrl_t  *const p_api_ctrl ,   uint32_t
*const p_count )
```

9.25.9.1 Brief description

Read the current count value of the IWDT. Implements counterGet.

9.25.9.2 Detailed description

Table 1634:Return values

Name	Description
SSP_SUCCESS	IWDT current count successfully read.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.

NOTE: This function is reentrant.

9.25.10 R_IWDT_TimeoutGet

```
ssp_err_t R_IWDT_TimeoutGet ( wdt_ctrl_t  *const p_api_ctrl ,
 wdt_timeout_values_t  *const p_timeout )
```

9.25.10.1 Brief description

Read timeout information for the watchdog timer. Implements timeoutGet.

9.25.10.2 Detailed description

Table 1635:Return values

Name	Description
SSP_SUCCESS	WDT successfully refreshed.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_ABORTED	Invalid clock divider for this watchdog

NOTE: This function is reentrant. This function must not be called before calling R_WDT_Open.

9.25.11 R_IWDT_VersionGet

```
ssp_err_t R_IWDT_VersionGet ( ssp_version_t  *const p_data )
```

9.25.11.1 Brief description

Return IWDT HAL driver version. Implements versionGet.

9.25.11.2 Detailed description

Table 1636:Return values

Name	Description
SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.

NOTE: This function is reentrant.

9.25.12 Extensions

9.25.12.1 iwdt_instance_ctrl_t

iwdt_instance_ctrl_t

Detailed description

WDT control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- bool wdt_open

  Indicates whether the open() API has been successfully called.
- void const * p_context

  Placeholder for user data. Passed to the user callback in wdt_callback_args_t.
- R_IWDT_Type * p_reg

  Pointer to register base address.
- void(* p_callback)(*p_args)

  Callback provided when a WDT NMI ISR occurs.

9.26 JPEG Decode

Driver for the JPEG Decoder.

9.26.1 Functions

- R_JPEG_Decode_Open
- R_JPEG_Decode_OutputBufferSet
- R_JPEG_Decode_LinesDecodedGet
- R_JPEG_Decode_InputBufferSet
- R_JPEG_Decode_ImageSubsampleSet
- R_JPEG_Decode_HorizontalStrideSet
- R_JPEG_Decode_Close
- R_JPEG_Decode_ImageSizeGet
- R_JPEG_Decode_StatusGet
- R_JPEG_Decode_PixelFormatGet
- R_JPEG_Decode_VersionGet

9.26.2 Defines

- #define JPEG_DECODE_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define JPEG_DECODE_CODE_VERSION_MINOR

  Initial value: `(6U)`

9.26.3 R_JPEG_Decode_Open

```
ssp_err_t R_JPEG_Decode_Open ( jpeg_decode_ctrl_t  *const p_api_ctrl ,
 jpeg_decode_cfg_t  const *const p_cfg )
```

9.26.3.1 Brief description

Initialize the JPEG Codec module. This function configures the JPEG Codec for decoding operation, sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support image size read operation and callback functions.

9.26.3.2 Detailed description

Table 1637:Return values

Name	Description
SSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
SSP_ERR_IN_USE	JPEG Codec is already in use.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_HW_LOCKED	JPEG Codec resource is locked.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

9.26.3.3 Function steps

- Verify JPEG Codec is not already used.
- Update the common control parameter with the control and JEDI and JDTI callback handler for JPEG decode, the handlers will be called from r_jpeg_common, which implements JPEG JDTI and JEDI ISR for r_jpeg_decode and r_jpeg_encode driver.
- Record the configuration settings.
- Initialize horizontal stride value.
- Initialize output buffer size.
- Initialize total_lines_decoded
- Initialize horizontal sub-sample setting.
- Provide power to the JPEG module.
- Perform bus reset
- Reset the destination buffer address.
- Reset the source buffer address.
- Reset the horizontal stride.
- Configure the JPEG module for decode operation.
- Set image format for the decoded image.
- If the output pixel format is ARGB8888, also configure the alpha value.
- Set the alpha value for the decoded image.

- Set the output data format.
- The following interrupts are enabled: Interrupt on all errors Interrupt on Image Size
- Record user supplied callback routine.
- Set the driver status.
- All done. Return success.

9.26.4 R_JPEG_Decode_OutputBufferSet

```
ssp_err_t R_JPEG_Decode_OutputBufferSet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
  void * p_output_buffer ,   uint32_t output_buffer_size )
```

9.26.4.1 Brief description

Assign output buffer to the JPEG Codec for storing output data.

9.26.4.2 Detailed description

NOTE: The number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least eight lines of decoded image data.

Table 1638:Return values

Name	Description
SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size

9.26.4.3 Function steps

- Set the decoding destination address.

- Record the size of the output buffer.
- If the image size is not ready yet, the driver does not know the input pixel format. Without that information, the driver is unable to compute the number of lines of image to decode. In this case, the driver would record the output buffer size. Once all the information is ready, the driver would attempt to start the decoding process.
- For a given buffer size, compute number of lines to decode if the image size acquisition is known.
- If the driver status is IMAGE_SIZE_READY with no other flags, that means the driver just received IMAGE_SIZE. It has not started the decoding process yet.
- If Input buffer is set, output buffer is set, and horizontal stride is set, the driver is able to determine the number of lines to decode, and start the decoding operation.
- If the current status is OUTPUT_PAUSE, the driver needs to resume the operation.

9.26.5 R_JPEG_Decode_LinesDecodedGet

```
ssp_err_t R_JPEG_Decode_LinesDecodedGet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
  uint32_t * p_lines )
```

9.26.5.1 Brief description

Returns the number of lines decoded into the output buffer.

9.26.5.2 Detailed description

NOTE: Use this function to retrieve number of image lines written to the output buffer after JPEG decoded a partial image. Combined with the horizontal stride settings and the output pixel format, the application can compute the amount of data to read from the output buffer.

Table 1639:Return values

Name	Description
SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_NOT_OPEN	JPEG not opened.

9.26.6 R_JPEG_Decode_InputBufferSet

```
ssp_err_t R_JPEG_Decode_InputBufferSet ( jpeg_decode_ctrl_t  *const p_api_ctrl ,
  void * p_data_buffer ,   uint32_t data_buffer_size )
```

9.26.6.1 Brief description

Assign input data buffer to JPEG codec for processing.

9.26.6.2 Detailed description

NOTE: After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so JPEG decoding can resume.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

Table 1640:Return values

Name	Description
SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.

9.26.6.3 Function steps

- Configure the input buffer address.
- If the system is idle, start the JPEG engine. This allows the system to obtain image information (image size and input pixel format). This information is needed to drive the decode process later on.
- Based on buffer size, detect the in count mode setting. The driver is able to read input data in chunks. However the size of each chunk is limited to BUFFER_MAX_SIZE. Therefore, if the input data size is larger than BUFFER_MAX_SIZE, the driver assumes the entire input data is present, and can be decoded without additional input data. Otherwise, the driver enables input stream feature. This works even if the entire input size is smaller than BUFFER_MAX_SIZE.

9.26.7 R_JPEG_Decode_ImageSubsampleSet

```
ssp_err_t R_JPEG_Decode_ImageSubsampleSet ( jpeg_decode_ctrl_t
*const p_api_ctrl ,  jpeg_decode_subsample_t  horizontal_subsample ,
 jpeg_decode_subsample_t  vertical_subsample )
```

9.26.7.1 Brief description

Configure horizontal and vertical subsample.

9.26.7.2 Detailed description

NOTE: Use for scaling the decoded image.

Table 1641:Return values

Name	Description
SSP_SUCCESS	Horizontal Stride value is properly configured.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_ARGUMENT	Sub-sample setting is invalid.
SSP_ERR_NOT_OPEN	JPEG not opened.

9.26.7.3 Function steps

- Update horizontal sub-sample setting.

9.26.8 R_JPEG_Decode_HorizontalStrideSet

```
ssp_err_t R_JPEG_Decode_HorizontalStrideSet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
  uint32_t horizontal_stride )
```

9.26.8.1 Brief description

Configure horizontal stride setting.

9.26.8.2 Detailed description

NOTE: Use when the horizontal stride needs to match the image width and the image size is unknown when opening the JPEG driver. (If the image size is known prior to the open call, pass the horizontal stride value in the jpef_cfg_t structure.) After the image size becomes available, use this function to update the horizontal stride value. If the driver must decode one line at a time, the horizontal stride can be set to zero.

Table 1642:Return values

Name	Description
SSP_SUCCESS	Horizontal Stride value is properly configured.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.

9.26.8.3 Function steps

- Record the horizontal stride value in the control block
- Set the horizontal stride.
- If the parameters all are set, resume the core to decode.
- For the given buffer size, compute number of lines to decode.

9.26.9 R_JPEG_Decode_Close

```
ssp_err_t R_JPEG_Decode_Close ( jpeg_decode_ctrl_t  * p_api_ctrl )
```

9.26.9.1 Brief description

Cancel an outstanding JPEG codec operation and close the device.

9.26.9.2 Detailed description

Table 1643:Return values

Name	Description
SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG not opened.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- eventInfoGet

9.26.9.3 Function steps

- Clear JPEG JINTE0 interrupt and JINTE1 interrupt.
- Disable JEDI and JDTI at NVIC
- Power off the JPEG codec.
- Reset the jpeg status flag in the driver.
- Unlock module at BSP level.

9.26.10 R_JPEG_Decode_ImageSizeGet

```
ssp_err_t R_JPEG_Decode_ImageSizeGet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
  uint16_t * p_horizontal_size ,   uint16_t * p_vertical_size )
```

9.26.10.1 Brief description

Obtain the size of the image. This operation is valid during JPEG decoding operation.

9.26.10.2 Detailed description

Table 1644:Return values

Name	Description
SSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by p_horizontal_size and p_vertical_size.

Table 1644:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_IMAGE_SIZE_UNKNOWN	The image size is unknown. More input data may be needed.
SSP_ERR_INVALID_MODE	JPEG Codec module is not decoding.
SSP_ERR_NOT_OPEN	JPEG is not opened.

9.26.11 R_JPEG_Decode_StatusGet

```
ssp_err_t R_JPEG_Decode_StatusGet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
 jpeg_decode_status_t  * p_status )
```

9.26.11.1 Brief description

Get the status of the JPEG codec. This function can also be used to poll the device.

9.26.11.2 Detailed description

Table 1645:Return values

Name	Description
SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG is not opened.

9.26.11.3 Function steps

- HW does not report error. Return internal status information.

9.26.12 R_JPEG_Decode_PixelFormatGet

```
ssp_err_t R_JPEG_Decode_PixelFormatGet ( jpeg_decode_ctrl_t  * p_api_ctrl ,
 jpeg_decode_color_space_t  * p_color_space )
```

9.26.12.1 Brief description

Get the input pixel format.

9.26.12.2 Detailed description

Table 1646:Return values

Name	Description
SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG is not opened.

9.26.12.3 Function steps

- HW does not report error. Return internal status information.

9.26.13 R_JPEG_Decode_VersionGet

```
ssp_err_t R_JPEG_Decode_VersionGet ( ssp_version_t  * p_version )
```

9.26.13.1 Brief description

Get version of the display interface and GLCD HAL code.

9.26.13.2 Detailed description

Table 1647:Return values

Name	Description
SSP_SUCCESS	Version number
SSP_ERR_ASSERTION	The parameter p_version is NULL.

NOTE: This function is reentrant.

9.26.14 Extensions

9.26.14.1 jpeg_decode_instance_ctrl_t

jpeg_decode_instance_ctrl_t

Detailed description

JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called.

Variables

- jpeg_decode_status_t status
  JPEG Codec module status.
- ssp_err_t error_code
  JPEG Codec error code (if any).
- void(* p_callback)(*p_args)
  User-supplied callback functions.
- void const * p_extend
  JPEG Codec hardware dependent configuration */.
- void const * p_context
  Placeholder for user data. Passed to user callback in jpeg_decode_callback_args_t.
- R_JPEG_Type * p_reg
  Pointer to register base address.
- jpeg_decode_pixel_format_t pixel_format
  Pixel format.
- uint32_t horizontal_stride
  Horizontal Stride settings.
- uint32_t outbuffer_size
  out buffer size
- uint16_t total_lines_decoded
  Track the number of lines decoded so far.
- jpeg_decode_subsample_t horizontal_subsample
  Horizontal sub-sample setting.

9.27 JPEG Encode

Driver for the JPEG Encoder.

9.27.1 Functions

- R_JPEG_Encode_Open
- R_JPEG_Encode_OutputBufferSet
- R_JPEG_Encode_InputBufferSet
- R_JPEG_Encode_ImageParameterSet
- R_JPEG_Encode_StatusGet
- R_JPEG_Encode_Close
- R_JPEG_Encode_VersionGet

9.27.2 Defines

- #define JPEG_ENCODE_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Configuration for this module
- #define JPEG_ENCODE_CODE_VERSION_MINOR

  Initial value: `(0U)`

9.27.3 R_JPEG_Encode_Open

```
ssp_err_t R_JPEG_Encode_Open ( jpeg_encode_ctrl_t  *const p_api_ctrl ,
 jpeg_encode_cfg_t  const *const p_cfg )
```

9.27.3.1 Brief description

Initialize the JPEG Codec module. This function configures the JPEG Codec for encoding operation, sets up the registers for data format, pixel format, vertical and horizontal resolution stride based on user-supplied configuration parameters.

9.27.3.2 Detailed description

Table 1648:Return values

Name	Description
SSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
SSP_ERR_IN_USE	JPEG Codec is already in use.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.

Table 1648:Return values (Continued)

Name	Description
SSP_ERR_HW_LOCKED	JPEG Codec resource is locked.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter is passed.
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

9.27.3.3 Function steps

- Verify JPEG Codec is not already used.
- Update the common control parameter with the control and JDEI and JDTI callback handler for JPEG encode, the handlers will be called from r_jpeg_common, which implements JPEG JDTI and JDEI ISR for r_jpeg_decode and r_jpeg_encode driver.
- Get the JDTI event information from FMI
- Get the vector table information of JDTI event
- Record the JPEG Encoder ctrl and internal ISR callback handler to JDTI event vector table
- Get the JEDI event information from FMI
- Get the vector table information of JEDI event
- Record the JPEG Encoder ctrl and internal ISR callback handler to JEDI event vector table
- Provide power to the JPEG module.
- Perform bus reset
- Reset the destination buffer address.
- Reset the source buffer address.
- Set the horizontal stride.
- Set the image horizontal and vertical size.
- Configure the JPEG module for encode operation.
- Set the output data format.
- Set input pixel format for JPEG Encoder NOTE : only ycbcr422 is valid for encoder
- Quantization table setting NOTE: Table 0(zero) is used for Luminance and Table 1(one) is used for Chrominance - Cr and Cb component
- Upload Luminance and Chrominance table to JPEG Codec
- Huffman table setting

- Upload the Huffman table to JPEG Codec
- Reset Marker setting
- Record image parameters to ctrl
- Set the driver status.
- Record the user context information
- Record user supplied callback routine.
- Enabled JPEG Compression data transfer complete interrupt and Count mode Interrupt
- Enable the JDTI and JDEI interrupts
- All done. Return success.

9.27.4 R_JPEG_Encode_OutputBufferSet

```
ssp_err_t R_JPEG_Encode_OutputBufferSet ( jpeg_encode_ctrl_t  * p_api_ctrl ,
  void * p_output_buffer )
```

9.27.4.1 Brief description

Assign output buffer to the JPEG Codec for storing output data.

9.27.4.2 Detailed description

NOTE: Buffer size should be sufficient to hold the encoded jpeg image.

Table 1649:Return values

Name	Description
SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made, Codec output buffer address is attempted to changed during codec operation

9.27.4.3 Function steps

- Output buffer cannot be change during codec operation
- Set the encoding destination address.

9.27.5 R_JPEG_Encode_InputBufferSet

```
ssp_err_t R_JPEG_Encode_InputBufferSet ( jpeg_encode_ctrl_t  *const p_api_ctrl ,
  void * p_data_buffer ,   uint32_t data_buffer_size )
```

9.27.5.1 Brief description

Assign input data buffer to JPEG codec for processing.

9.27.5.2 Detailed description

NOTE: 1.After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so JPEG encoding can resume. 2.Image size should be greater or equal to minimum coded unit (MCU) for YCbCr422 (only supported color space) the MCU is 8 lines by 16 pixel (where 1 pixel = 2 bytes) hence size can not be less than 8x16x2 = 256

The JPEG encoding operation automatically starts after setting the input buffer.

Table 1650:Return values

Name	Description
SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the p_data_buffer is NULL.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address or image line to encode or size of buffer is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made, set output buffer first
SSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size is not supported by JPEG Codec

9.27.5.3 Function steps

- Validate the the size : JPEG Codec can process minimum up to 8 lines by 16 pixel for YCbCr422 meaning 8x16x2 = 256

- Calculate the number of lines to be encode
- JPEG Codec required Lines to be byte aligned
- Check, If output image buffer is set or not
- Configure the input buffer address.
- if JPEG is just opened or completed one image, make DONE and IDLE status flag zero to encode next image
- Remove the Done and IDLE status flag
- Set the driver status to JPEG_ENCODE_STATUS_RUNNING.
- Start the encoder
- JPEG is PAUSE for next chunk of image
- Clear internal status information.
- Set RUNNING status
- Resume the count mode
- JPEG is running Notify the user, return error

9.27.6 R_JPEG_Encode_ImageParameterSet

```
ssp_err_t R_JPEG_Encode_ImageParameterSet ( jpeg_encode_ctrl_t
*const p_api_ctrl ,  jpeg_encode_raw_image_parameters  * p_image_parameters )
```

9.27.6.1 Brief description

Setup the image parameters to JPEG Codec device.

9.27.6.2 Detailed description

NOTE: Image parameters needs to be set before the setting the input buffer.DO NOT call this function during the JPEG Codec operation.

Table 1651:Return values

Name	Description
SSP_SUCCESS	Image parameter is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL,
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.

Table 1651:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	Horizontal and Vertical resolution is invalid or zero.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made.

9.27.6.3 Function steps

- Do not change the JPEG Codec image setting while JPEG Codec is in progress
- Record the horizontal stride and vertical size value in the control block
- Set the horizontal stride.
- Set the image horizontal and vertical size.

9.27.7 R_JPEG_Encode_StatusGet

```
ssp_err_t R_JPEG_Encode_StatusGet ( jpeg_encode_ctrl_t  * p_api_ctrl ,
 jpeg_encode_status_t volatile * p_status )
```

9.27.7.1 Brief description

Get the status of the JPEG codec. This function can also be used to poll the device.

9.27.7.2 Detailed description

Table 1652:Return values

Name	Description
SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

9.27.7.3 Function steps

- HW does not report error. Return internal status information.

9.27.8 R_JPEG_Encode_Close

```
ssp_err_t R_JPEG_Encode_Close ( jpeg_encode_ctrl_t  * p_api_ctrl )
```

9.27.8.1 Brief description

Cancel an outstanding JPEG codec operation and close the device.

9.27.8.2 Detailed description

Table 1653:Return values

Name	Description
SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG not opened.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- eventInfoGet

9.27.8.3 Function steps

- Clear JPEG JINTE0 interrupt and JINTE1 interrupt.
- Disable JEDI and JDTI at NVIC
- Power off the JPEG codec.
- Reset the jpeg status flag in the driver.
- Unlock module at BSP level.

9.27.9 R_JPEG_Encode_VersionGet

```
ssp_err_t R_JPEG_Encode_VersionGet ( ssp_version_t  * p_version )
```

9.27.9.1 Brief description

Get version of the display interface and GLCD HAL code.

9.27.9.2 Detailed description

Table 1654:Return values

Name	Description
SSP_SUCCESS	Version number
SSP_ERR_ASSERTION	The parameter p_version is NULL.

NOTE: This function is reentrant.

9.27.10 Extensions

9.27.10.1 jpeg_encode_instance_ctrl_t

jpeg_encode_instance_ctrl_t

Detailed description

JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called.

Variables

- jpeg_encode_status_t status

  JPEG Codec module status.
- void(* p_callback)(*p_args)

  User-supplied callback functions.
- void const * p_extend

  JPEG Codec hardware dependent configuration */.
- void const * p_context

  Placeholder for user data. Passed to user callback in jpeg_encode_callback_args_t.
- R_JPEG_Type * p_reg

  Pointer to register base address.
- uint32_t horizontal_stride

  Horizontal Stride settings (Line offset).
- uint32_t output_buffer_size

  out buffer size

- uint16_t lines_to_encoded

  Number of lines to encode.

- uint16_t vertical_resolution

  vertical size

9.28 Key Interrupts

Driver for the Key Interrupt Function.

The Key input driver can be used for one to eight channels or in a matrix format. This module implements the following interface: Key Matrix Interface.

9.28.1 Functions

- R_KINT_KEYMATRIX_Open
- R_KINT_KEYMATRIX_Close
- R_KINT_KEYMATRIX_Enable
- R_KINT_KEYMATRIX_Disable
- R_KINT_KEYMATRIX_TriggerSet
- R_KINT_VersionGet

9.28.2 Defines

- #define KINT_CODE_VERSION_MAJOR

  Initial value: `(1U)`

- #define KINT_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.28.3 R_KINT_KEYMATRIX_Open

```
ssp_err_t R_KINT_KEYMATRIX_Open ( keymatrix_ctrl_t  *const p_api_ctrl ,
 keymatrix_cfg_t  const *const p_cfg )
```

9.28.3.1 Brief description

Power on KINT, handle required initialization described in hardware manual. Implements open.

9.28.3.2 Detailed description

The Open function configures all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. This function must be called at least once prior to calling any other KINT API functions. After the peripheral is initialized, the Open function should not be called again without first calling the Close function.

Table 1655:Return values

Name	Description
SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback.
SSP_ERR_INVALID_ARGUMENT	One of the following may be invalid: • p_cfg->channel: must be between 0 and KINT_MAX_NUM_CHANNELS • p_cfg->trigger not a valid value.
SSP_ERR_HW_LOCKED	The API has already been opened. It must be closed before it can be opened again.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

NOTE: This function is not reentrant.

9.28.3.3 Function steps

- Check to see that the arguments passed are not null pointers
- Grab the hardware lock. If successful this indicates that the open was not previously called.
- Disable interrupts in the KINT peripheral
- Clear any pending interrupt requests in the KINT peripheral
- Clear the Interrupt Request in the ICU
- Configure the trigger edge. The trigger edge can be modified in the TriggerSet function later if desired
- KEYMATRIX_TRIG_RISING condition
- Configure the usage of key interrupt flags
- Store the callback and context information

- If interrupts are to be enabled now, set it up for the selected channels. The channels can be changed later in the enable function but to modify the callback and context, the API has to be closed and reopened with the new callback and context.
  NOTE: The KINT hardware only supports a single interrupt for all channels

  Enable interrupt for the selected channels after casting since KRM is an 8 bit register
- Enable interrupt
- Store number of channels for use to the control block to use it later
- Mark KINT as initialized

9.28.4 R_KINT_KEYMATRIX_Close

```
ssp_err_t R_KINT_KEYMATRIX_Close ( keymatrix_ctrl_t  *const p_api_ctrl )
```

9.28.4.1 Brief description

Disable KINT. Implements close.

9.28.4.2 Detailed description

End of function R_KINT_KEYMATRIX_Open The Close function disables the interrupts in the peripheral and the NVIC and clears any pending interrupt requests. It also releases the hardware lock on the API.

Table 1656:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

9.28.4.3 Function steps

- Disable interrupt in ICU
- Disable interrupts in the KINT peripheral
- Clear any pending interrupt requests in the KINT peripheral
- Clear the Interrupt Request bit
- Clear stored internal driver data
- Mark KINT as un-initialized
- Release the lock

9.28.5 R_KINT_KEYMATRIX_Enable

```
ssp_err_t R_KINT_KEYMATRIX_Enable ( keymatrix_ctrl_t  *const p_api_ctrl )
```

9.28.5.1 Brief description

Enable external irq for all the specified channel by R_KINT_KEYMATRIX_Open. Implements enable.

9.28.5.2 Detailed description

This function enables interrupts for the KINT peripheral both at the interrupt level and in the NVIC after clearing any pending requests in the KINT and ICU peripheral. All the channels specified by R_KINT_KEYMATRIX_Open are enabled.

Table 1657:Return values

Name	Description
SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The peripheral is not opened.

9.28.5.3 Function steps

- Clear any pending interrupt requests in the KINT peripheral
- Clear the Interrupt Request Flag in the ICU
- Enable interrupt for the selected channels after casting since KRM is an 8 bit register
- Enable interrupt

9.28.6 R_KINT_KEYMATRIX_Disable

```
ssp_err_t R_KINT_KEYMATRIX_Disable ( keymatrix_ctrl_t  *const p_api_ctrl )
```

9.28.6.1 Brief description

Disable external irq for all the specified channel by R_KINT_KEYMATRIX_Open. Implements disable.

9.28.6.2 Detailed description

This function disables interrupts for the KINT peripheral both at the interrupt level and in the NVIC. All the channels specified by R_KINT_KEYMATRIX_Open are disabled.

Table 1658:Return values

Name	Description
SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

9.28.6.3 Function steps

- Disable interrupts in the KINT peripheral
- Clear any pending interrupt requests in the KINT peripheral
- Disable interrupt in the ICU

9.28.7 R_KINT_KEYMATRIX_TriggerSet

```
ssp_err_t R_KINT_KEYMATRIX_TriggerSet ( keymatrix_ctrl_t  *const p_api_ctrl ,
 keymatrix_trigger_t  hw_trigger )
```

9.28.7.1 Brief description

Set trigger edge (falling or rising) provided. Implements triggerSet.

9.28.7.2 Detailed description

This function changes trigger sense at run-time. The change is applied to all the channels specified by R_KINT_KEYMATRIX_Open.

Table 1659:Return values

Name	Description
SSP_SUCCESS	Trigger value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARGUMENT	Trigger input invalid. hw_trigger must be one of the options from button_trigger_t.
SSP_ERR_NOT_OPEN	The channel is not opened.

NOTE: This function expects to be called when the driver is disabled (the driver state before R_KINT_KEYMATRIX-_Enable is called if the driver is opened in the non-auto start mode, or after R_KINT_KEYMATRIX_Disable is called if the driver is opened in the auto start mode). The driver does not restrict to call this API when the driver is enabled but users need to make sure the edge detection sense is instantly changed by this API call.

9.28.7.3 Function steps

- Configure the trigger edge
- KEYMATRIX_TRIG_RISING condition
- Configure the usage of key interrupt flags

9.28.8 R_KINT_VersionGet

```
ssp_err_t R_KINT_VersionGet ( ssp_version_t  *const p_version )
```

9.28.8.1 Brief description

Set driver version based on compile time macros.

9.28.8.2 Detailed description

Table 1660:Return values

Name	Description
SSP_SUCCESS	Successful return.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.28.9 Extensions

9.28.9.1 kint_instance_ctrl_t

kint_instance_ctrl_t

Detailed description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when open is called.

Variables

- R_KINT_Type * p_reg

  Pointer to register base address.

- keymatrix_channels_t channels

  Channel bitmask.

- IRQn_Type irq

  Interrupt priority number.

9.29 LPM

Driver for Low Power Modes.

The LPM (Low Power Mode) Driver provides several functions for controlling power consumption including stopping modules, selecting the operating mode, configuring low power modes, and transitioning to low power modes. The LPM driver supports configuration of MCU operating modes and MCU low power modes using the LPM hardware peripheral. The LPM driver supports operating modes low-voltage, low-speed, middle-speed, high-speed, and suboscillator mode.

The LPM driver supports low power modes deep standby, standby, sleep, and snooze. The LPM driver supports reducing power consumption when in deep standby mode via internal power supply control and reseting the states of IO ports. The LPM driver supports disabling and enabling of the MCU's other hardware peripherals.

NOTE: Not all operating modes are available on all MCU's. Not all low power modes are available on all MCU's.

9.29.1 Functions

- R_LPM_Init
- R_LPM_MSTPCRSet
- R_LPM_MSTPCRGet
- R_LPM_ModuleStop
- R_LPM_ModuleStart
- R_LPM_OperatingPowerModeSet
- R_LPM_SnoozeEnable
- R_LPM_SnoozeDisable
- R_LPM_LowPowerConfigure
- R_LPM_WUPENSet
- R_LPM_WUPENGet
- R_LPM_DeepStandbyCancelRequestEnable
- R_LPM_DeepStandbyCancelRequestDisable
- R_LPM_LowPowerModeEnter

- R_LPM_VersionGet

9.29.2 Defines

- #define LPM_CODE_VERSION_MAJOR
  Initial value: `(2U)`
- #define LPM_CODE_VERSION_MINOR
  Initial value: `(6U)`

9.29.3 R_LPM_Init

```
ssp_err_t R_LPM_Init ( lpm_cfg_t  const *const p_cfg )
```

9.29.3.1 Brief description

Initialize the mcu operating power mode.

9.29.3.2 Detailed description

Initialize the mcu operating power mode according to the passed in config structure.

Table 1661:Return values

Name	Description
SSP_SUCCESS	Configuration was successful
SSP_ERR_ASSERTION	p_cfg was NULL

9.29.4 R_LPM_MSTPCRSet

```
ssp_err_t R_LPM_MSTPCRSet (  uint32_t mstpcra_value ,   uint32_t mstpcrb_value ,
  uint32_t mstpcrc_value ,   uint32_t mstpcrd_value )
```

9.29.4.1 Brief description

Set the value of all the Module Stop Control Registers.

9.29.4.2 Detailed description

Table 1662:Return values

Name	Description
SSP_SUCCESS	Value was successfully set

9.29.5 R_LPM_MSTPCRGet

```
ssp_err_t R_LPM_MSTPCRGet ( uint32_t * mstpcra_value , uint32_t
* mstpcrb_value , uint32_t * mstpcrc_value , uint32_t * mstpcrd_value )
```

9.29.5.1 Brief description

Get the values of all the Module Stop Control Registers.

9.29.5.2 Detailed description

Table 1663:Return values

Name	Description
SSP_SUCCESS	Value was successfully retrieved
SSP_ERR_ASSERTION	One of the passed in pointers was NULL

9.29.6 R_LPM_ModuleStop

```
ssp_err_t R_LPM_ModuleStop ( lpm_mstp_t module )
```

9.29.6.1 Brief description

Stop a module.

9.29.6.2 Detailed description

Stop a module from running by setting the corresponding bit in the module stop register.

Table 1664:Return values

Name	Description
SSP_SUCCESS	Configuration was successful
SSP_ERR_ASSERTION	Module stop bit not available on this MCU.

9.29.7 R_LPM_ModuleStart

```
ssp_err_t R_LPM_ModuleStart ( lpm_mstp_t  module )
```

9.29.7.1 Brief description

Run a module.

9.29.7.2 Detailed description

Start a module running by clearing the corresponding bit in the module stop register.

Table 1665:Return values

Name	Description
SSP_SUCCESS	Configuration was successful
SSP_ERR_ASSERTION	Module stop bit not available on this MCU.

9.29.8 R_LPM_OperatingPowerModeSet

```
ssp_err_t R_LPM_OperatingPowerModeSet ( lpm_operating_power_t  power_mode ,
 lpm_subosc_t  subosc )
```

9.29.8.1 Brief description

Set the operating power mode.

9.29.8.2 Detailed description

Table 1666:Return values

Name	Description
SSP_SUCCESS	Operating power mode successfully set
SSP_ERR_ASSERTION	Operating power control mode not available on this MCU.

9.29.9 R_LPM_SnoozeEnable

```
ssp_err_t R_LPM_SnoozeEnable ( lpm_snooze_rxd0_t  rdx0_mode ,
 lpm_snooze_dtc_t  dtc_mode ,  lpm_snooze_request_t  requests ,
 lpm_snooze_end_t  triggers )
```

9.29.9.1 Brief description

Configure and enable snooze mode.

9.29.9.2 Detailed description

NOTE: this function must be called before entering Software Standby mode, otherwise snooze mode will not be entered

Table 1667:Return values

Name	Description
SSP_SUCCESS	Snooze mode successfully enabled
SSP_ERR_ASSERTION	One or more snooze settings are not available on this MCU.

9.29.10 R_LPM_SnoozeDisable

```
ssp_err_t R_LPM_SnoozeDisable (  void  )
```

9.29.10.1 Brief description

Disable snooze mode.

9.29.10.2 Detailed description

Table 1668:Return values

Name	Description
SSP_SUCCESS	Snooze mode successfully disabled

9.29.11 R_LPM_LowPowerConfigure

```
ssp_err_t R_LPM_LowPowerConfigure ( lpm_low_power_mode_t  power_mode ,
 lpm_output_port_enable_t  output_port_enable ,
 lpm_power_supply_t  power_supply ,  lpm_io_port_t  io_port_state )
```

9.29.11.1 Brief description

Configure a low power mode.

9.29.11.2 Detailed description

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Table 1669:Return values

Name	Description
SSP_SUCCESS	Sleep mode entered successfully
SSP_ERR_ASSERTION	Low power mode are not available on this MCU.
SSP_ERR_ASSERTION	Invalid deep standby power supply configuration.

9.29.12 R_LPM_WUPENSet

```
ssp_err_t R_LPM_WUPENSet (  uint32_t wupen_value )
```

9.29.12.1 Brief description

Set the value of the Wake Up Interrupt Enable Register WUPEN.

9.29.12.2 Detailed description

Table 1670:Return values

Name	Description
SSP_SUCCESS	Value was successfully set

9.29.13 R_LPM_WUPENGet

```
ssp_err_t R_LPM_WUPENGet (  uint32_t * wupen_value )
```

Table 1675:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

9.30 LPMV2 S124

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCU's.

9.30.1 Functions

- R_LPMV2_VersionGet
- R_LPMV2_Init
- R_LPMV2_LowPowerConfigure
- R_LPMV2_LowPowerModeEnter

9.30.2 Typedefs

- lpmv2_snooze_end_bits_t
- lpmv2_standby_wake_source_bits_t

9.30.3 Defines

- #define LPMV2_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define LPMV2_CODE_VERSION_MINOR

  Initial value: `(3U)`
- #define LPMV2_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &(g_lpmv2_module_name[0]), &g_lpmv2_version)`

9.30.4 User-defined macros

- #define LPMV2_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking

9.30.5 R_LPMV2_VersionGet

```
ssp_err_t R_LPMV2_VersionGet ( ssp_version_t  *const p_version )
```

9.30.5.1 Brief description

Get the driver version based on compile time macros.

9.30.5.2 Detailed description

Table 1676:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

9.30.6 R_LPMV2_Init

```
ssp_err_t R_LPMV2_Init (  void  )
```

9.30.6.1 Brief description

Perform any necessary initialization.

9.30.6.2 Detailed description

Table 1677:Return values

Name	Description
SSP_SUCCESS	LPMV2 Software lock initialized

9.30.7 R_LPMV2_LowPowerConfigure

```
ssp_err_t R_LPMV2_LowPowerConfigure ( lpmv2_cfg_t  const *const p_cfg )
```

9.30.7.1 Brief description

Configure a low power mode.

9.30.7.2 Detailed description

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Table 1678:Return values

Name	Description
SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

9.30.8 R_LPMV2_LowPowerModeEnter

```
ssp_err_t R_LPMV2_LowPowerModeEnter ( void )
```

9.30.8.1 Brief description

Enter low power mode (sleep/standby/deep standby) using WFI macro.

9.30.8.2 Detailed description

Function will return after waking from low power mode.

Table 1679:Return values

Name	Description
SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

9.30.9 API Data

9.30.9.1 lpmv2_snooze_request_t

```
lpmv2_snooze_request_t
```

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.30.9.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

9.30.9.3 lpmv2_snooze_dtc_t

`lpmv2_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation

9.30.9.4 lpmv2_standby_wake_source_t

`lpmv2_standby_wake_source_t`

Detailed description

Wake from standby mode sources, does not apply to sleep or deep standby modes

Enumerated values

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0.
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1.
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2.
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3.
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4.
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5.
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6.
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7.
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt.
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.30.9.5 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.30.9.6 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

S3A7 specific configuration structure

S5D5 specific configuration structure

S5D9 specific configuration structure

S7G2 specific configuration structure

Variables

- lpmv2_standby_wake_source_bits_t standby_wake_sources
  Bitwise list of sources to wake from standby
- lpmv2_snooze_request_t snooze_request_source
  Snooze request source
- lpmv2_snooze_end_bits_t snooze_end_sources
  Bitwise list of snooze end sources
- lpmv2_snooze_dtc_t dtc_state_in_snooze
  State of DTC in snooze mode, enabled or disabled
- lpmv2_output_port_enable_t output_port_enable
  Output port enabled/disabled in standby and deep standby
- lpmv2_io_port_t io_port_state
  IO port state in deep standby (maintained or reset)
- lpmv2_power_supply_t power_supply_state
  Internal power supply state in standby and deep standby (deepcut)
- lpmv2_deep_standby_cancel_source_bits_t deep_standby_cancel_source
  Sources that can trigger exit from deep standby
- lpmv2_deep_standby_cancel_edge_bits_t deep_standby_cancel_edge
  Signal edges for the sources that can trigger exit from deep standby

9.31 LPMV2 S128

Driver for Low Power Modes.
The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCU's.

9.31.1 Typedefs

- lpmv2_snooze_end_bits_t
- lpmv2_standby_wake_source_bits_t

9.31.2 Defines

- #define LPMV2_CODE_VERSION_MAJOR

  Initial value: `(1U)`

- #define LPMV2_CODE_VERSION_MINOR

  Initial value: `(3U)`

- #define LPMV2_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &(g_lpmv2_module_name[0]), &g_lpmv2_version)`

9.31.3 User-defined macros

- #define LPMV2_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking

9.31.4 API Data

9.31.4.1 lpmv2_snooze_request_t

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.31.4.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

9.32.4.8 lpmv2_snooze_dtc_t

`lpmv2_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation

9.32.4.9 lpmv2_standby_wake_source_t

`lpmv2_standby_wake_source_t`

Detailed description

Wake from standby mode sources, does not apply to sleep or deep standby modes

Enumerated values

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0.
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1.
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2.
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3.
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4.
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5.
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6.
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7.
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt.
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.32.4.10 lpmv2_output_port_enable_t

`lpmv2_output_port_enable_t`

Detailed description

Output port enable

Enumerated values

Name	Description
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

9.32.4.11 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.32.4.12 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

9.32.4.13 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.32.4.14 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.33.3.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.

Name	Description
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

9.35.8 R_LPMV2_LowPowerModeEnter

```
ssp_err_t R_LPMV2_LowPowerModeEnter (  void  )
```

9.35.8.1 Brief description

Enter low power mode (sleep/standby/deep standby) using WFI macro.

9.35.8.2 Detailed description

Function will return after waking from low power mode.

Table 1683:Return values

Name	Description
SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

9.35.9 API Data

9.35.9.1 lpmv2_snooze_request_t

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.35.9.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.

Name	Description
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

9.35.9.3 lpmv2_snooze_dtc_t

`lpmv2_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation

9.35.9.4 lpmv2_standby_wake_source_t

`lpmv2_standby_wake_source_t`

Detailed description

Wake from standby mode sources, does not apply to sleep or deep standby modes

Enumerated values

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1.
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2.
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3.
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4.
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5.
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6.
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7.
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt.
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.35.9.5 lpmv2_output_port_enable_t

```
lpmv2_output_port_enable_t
```

Detailed description

Output port enable

Enumerated values

Name	Description
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

9.35.9.6 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.35.9.7 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

Variables

- lpmv2_standby_wake_source_bits_t standby_wake_sources
  Bitwise list of sources to wake from standby
- lpmv2_snooze_request_t snooze_request_source
  Snooze request source
- lpmv2_snooze_end_bits_t snooze_end_sources
  Bitwise list of snooze end sources
- lpmv2_snooze_dtc_t dtc_state_in_snooze
  State of DTC in snooze mode, enabled or disabled
- lpmv2_output_port_enable_t output_port_enable
  Output port enabled/disabled in standby and deep standby
- lpmv2_io_port_t io_port_state
  IO port state in deep standby (maintained or reset)
- lpmv2_power_supply_t power_supply_state
  Internal power supply state in standby and deep standby (deepcut)
- lpmv2_deep_standby_cancel_source_bits_t deep_standby_cancel_source
  Sources that can trigger exit from deep standby
- lpmv2_deep_standby_cancel_edge_bits_t deep_standby_cancel_edge
  Signal edges for the sources that can trigger exit from deep standby

9.36 LPMV2 S5D4

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCU's.

9.36.1 Typedefs

- lpmv2_snooze_end_bits_t
- lpmv2_standby_wake_source_bits_t
- lpmv2_deep_standby_cancel_edge_bits_t
- lpmv2_deep_standby_cancel_source_bits_t

9.36.2 Defines

- #define LPMV2_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define LPMV2_CODE_VERSION_MINOR

  Initial value: `(3U)`
- #define LPMV2_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &(g_lpmv2_module_name[0]), &g_lpmv2_version)`

9.36.3 User-defined macros

- #define LPMV2_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking

9.36.4 API Data

9.36.4.1 lpmv2_snooze_request_t

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.36.4.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.36.4.5 lpmv2_io_port_t

`lpmv2_io_port_t`

Detailed description

I/O port state after Deep Software Standby mode

Enumerated values

Name	Description
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state

Name	Description
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode

9.36.4.6 lpmv2_power_supply_t

`lpmv2_power_supply_t`

Detailed description

Power supply control

Enumerated values

Name	Description
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled

9.36.4.7 lpmv2_deep_standby_cancel_edge_t

`lpmv2_deep_standby_cancel_edge_t`

Detailed description

Deep Standby Interrupt Edge

Enumerated values

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge.

9.37 LPMV2 S5D9

Driver for Low Power Modes.
The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCU's.

9.37.1 Typedefs

- lpmv2_snooze_end_bits_t
- lpmv2_standby_wake_source_bits_t
- lpmv2_deep_standby_cancel_edge_bits_t

- lpmv2_deep_standby_cancel_source_bits_t

9.37.2 Defines

- #define LPMV2_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define LPMV2_CODE_VERSION_MINOR

  Initial value: `(3U)`
- #define LPMV2_ERROR_RETURN

  Initial value:`#define SSP_ERROR_RETURN((a), (err), &(g_lpmv2_module_name[0]), &g_lpmv2_version)`

9.37.3 User-defined macros

- #define LPMV2_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking

9.37.4 API Data

9.37.4.1 lpmv2_snooze_request_t

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.37.4.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

9.37.4.3 lpmv2_snooze_dtc_t

`lpmv2_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation

9.37.4.4 lpmv2_standby_wake_source_t

`lpmv2_standby_wake_source_t`

Detailed description

Wake from standby mode sources, does not apply to sleep or deep standby modes

Enumerated values

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0.
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1.
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2.
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3.
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4.
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5.
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6.
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7.
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt.
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.37.4.5 lpmv2_io_port_t

`lpmv2_io_port_t`

Detailed description

I/O port state after Deep Software Standby mode

Enumerated values

Name	Description
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode

9.37.4.6 lpmv2_power_supply_t

`lpmv2_power_supply_t`

Detailed description

Power supply control

Enumerated values

Name	Description
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled

9.37.4.7 lpmv2_deep_standby_cancel_edge_t

`lpmv2_deep_standby_cancel_edge_t`

Detailed description

Deep Standby Interrupt Edge

Enumerated values

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_RISING	IRQ4-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_FALLING	IRQ4-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_RISING	IRQ5-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_FALLING	IRQ5-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_RISING	IRQ6-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_FALLING	IRQ6-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_RISING	IRQ7-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_FALLING	IRQ7-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_RISING	IRQ8-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_FALLING	IRQ8-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_RISING	IRQ9-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_RISING	LVD1 Rising Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_RISING	IRQ15-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge.

9.37.4.8 lpmv2_deep_standby_cancel_source_t

`lpmv2_deep_standby_cancel_source_t`

Detailed description

Deep Standby cancel sources

Enumerated values

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7	IRQ7.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8	IRQ8.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15.

9.37.4.9 lpmv2_output_port_enable_t

```
lpmv2_output_port_enable_t
```

Detailed description

Output port enable

Enumerated values

Name	Description
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

9.37.4.10 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.37.4.11 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

9.37.4.12 lpmv2_deep_standby_cancel_edge_bits_t

```
typedef uint32_t lpmv2_deep_standby_cancel_edge_bits_t
```

9.37.4.13 lpmv2_deep_standby_cancel_source_bits_t

```
typedef uint32_t lpmv2_deep_standby_cancel_source_bits_t
```

9.37.5 Extensions

9.37.5.1 lpmv2_mcu_cfg_t

lpmv2_mcu_cfg_t

Detailed description

S124 specific configuration structure

S128 specific configuration structure

S3A3 specific configuration structure

S3A6 specific configuration structure

S3A7 specific configuration structure

S5D5 specific configuration structure

S5D9 specific configuration structure

S7G2 specific configuration structure

Variables

- lpmv2_standby_wake_source_bits_t standby_wake_sources
  Bitwise list of sources to wake from standby
- lpmv2_snooze_request_t snooze_request_source
  Snooze request source
- lpmv2_snooze_end_bits_t snooze_end_sources
  Bitwise list of snooze end sources
- lpmv2_snooze_dtc_t dtc_state_in_snooze
  State of DTC in snooze mode, enabled or disabled
- lpmv2_output_port_enable_t output_port_enable
  Output port enabled/disabled in standby and deep standby
- lpmv2_io_port_t io_port_state
  IO port state in deep standby (maintained or reset)
- lpmv2_power_supply_t power_supply_state
  Internal power supply state in standby and deep standby (deepcut)

- lpmv2_deep_standby_cancel_source_bits_t deep_standby_cancel_source
  Sources that can trigger exit from deep standby
- lpmv2_deep_standby_cancel_edge_bits_t deep_standby_cancel_edge
  Signal edges for the sources that can trigger exit from deep standby

9.38 LPMV2 S7G2

Driver for Low Power Modes.
The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

NOTE: Not all low power modes are available on all MCU's.

9.38.1 Functions

- R_LPMV2_VersionGet
- R_LPMV2_Init
- R_LPMV2_LowPowerConfigure
- R_LPMV2_LowPowerModeEnter

9.38.2 Typedefs

- lpmv2_snooze_end_bits_t
- lpmv2_standby_wake_source_bits_t
- lpmv2_deep_standby_cancel_edge_bits_t
- lpmv2_deep_standby_cancel_source_bits_t

9.38.3 Defines

- #define LPMV2_CODE_VERSION_MAJOR
  Initial value: `(1U)`
- #define LPMV2_CODE_VERSION_MINOR
  Initial value: `(3U)`
- #define LPMV2_ERROR_RETURN
  Initial value:
```
#define SSP_ERROR_RETURN((a), (err), &(g_lpmv2_module_name[0]), &g_lpmv2_version)
```

9.38.4 User-defined macros

- #define LPMV2_CFG_PARAM_CHECKING_ENABLE

  Initial value: `(BSP_CFG_PARAM_CHECKING_ENABLE)`

  Specify whether to include code for API parameter checking. Valid settings include:BSP_CFG_PARAM_-CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h1 : Includes parameter checking0 : Compiles out parameter checking

9.38.5 R_LPMV2_VersionGet

```
ssp_err_t R_LPMV2_VersionGet ( ssp_version_t  *const p_version )
```

9.38.5.1 Brief description

Get the driver version based on compile time macros.

9.38.5.2 Detailed description

Table 1684:Return values

Name	Description
SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

9.38.6 R_LPMV2_Init

```
ssp_err_t R_LPMV2_Init (  void  )
```

9.38.6.1 Brief description

Perform any necessary initialization.

9.38.6.2 Detailed description

Table 1685:Return values

Name	Description
SSP_SUCCESS	LPMV2 Software lock initialized

9.38.7 R_LPMV2_LowPowerConfigure

```
ssp_err_t R_LPMV2_LowPowerConfigure ( lpmv2_cfg_t  const *const p_cfg )
```

9.38.7.1 Brief description

Configure a low power mode.

9.38.7.2 Detailed description

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Table 1686:Return values

Name	Description
SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

9.38.8 R_LPMV2_LowPowerModeEnter

```
ssp_err_t R_LPMV2_LowPowerModeEnter (  void  )
```

9.38.8.1 Brief description

Enter low power mode (sleep/standby/deep standby) using WFI macro.

9.38.8.2 Detailed description

Function will return after waking from low power mode.

Table 1687:Return values

Name	Description
SSP_SUCCESS	Successful.

Table 1687:Return values (Continued)

Name	Description
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

9.38.9 API Data

9.38.9.1 lpmv2_snooze_request_t

`lpmv2_snooze_request_t`

Detailed description

Snooze request sources

Enumerated values

Name	Description
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request.
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request.
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request.
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request.
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request.
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request.

Name	Description
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request.
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request.
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request.
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request.
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request.

9.38.9.2 lpmv2_snooze_end_t

`lpmv2_snooze_end_t`

Detailed description

Snooze end control

Enumerated values

Name	Description
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly.
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion.
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion.
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match.
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch.

Name	Description
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch.
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match.
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch.

9.38.9.3 lpmv2_snooze_dtc_t

`lpmv2_snooze_dtc_t`

Detailed description

DTC Enable in Snooze Mode

Enumerated values

Name	Description
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation

9.38.9.4 lpmv2_standby_wake_source_t

`lpmv2_standby_wake_source_t`

Detailed description

Wake from standby mode sources, does not apply to sleep or deep standby modes

Enumerated values

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0.
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1.
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2.
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3.
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4.
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5.
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6.

Name	Description
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7.
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt.
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt.
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt.
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8.
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9.
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10.
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11.
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12.
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13.
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14.
LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15.
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt.
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt.
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt.

9.38.9.5 lpmv2_io_port_t

`lpmv2_io_port_t`

Detailed description

I/O port state after Deep Software Standby mode

Enumerated values

Name	Description
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode

9.38.9.6 lpmv2_power_supply_t

`lpmv2_power_supply_t`

Detailed description

Power supply control

Enumerated values

Name	Description
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled

9.38.9.7 lpmv2_deep_standby_cancel_edge_t

`lpmv2_deep_standby_cancel_edge_t`

Detailed description

Deep Standby Interrupt Edge

Enumerated values

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_RISING	IRQ4-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_FALLING	IRQ4-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_RISING	IRQ5-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_FALLING	IRQ5-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_RISING	IRQ6-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_FALLING	IRQ6-DS Pin Falling Edge.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_RISING	IRQ7-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_FALLING	IRQ7-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_RISING	IRQ8-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_FALLING	IRQ8-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_RISING	IRQ9-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_RISING	LVD1 Rising Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_RISING	IRQ15-DS Pin Rising Edge.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge.

9.38.9.8 lpmv2_deep_standby_cancel_source_t

`lpmv2_deep_standby_cancel_source_t`

Detailed description

Deep Standby cancel sources

Enumerated values

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4.

Name	Description
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7	IRQ7.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8	IRQ8.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume.
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15.

9.38.9.9 lpmv2_output_port_enable_t

`lpmv2_output_port_enable_t`

Detailed description

Output port enable

Enumerated values

Name	Description
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

9.38.9.10 lpmv2_snooze_end_bits_t

```
typedef uint8_t lpmv2_snooze_end_bits_t
```

9.38.9.11 lpmv2_standby_wake_source_bits_t

```
typedef uint32_t lpmv2_standby_wake_source_bits_t
```

9.38.9.12 lpmv2_deep_standby_cancel_edge_bits_t

```
typedef uint32_t lpmv2_deep_standby_cancel_edge_bits_t
```

9.38.9.13 lpmv2_deep_standby_cancel_source_bits_t

```
typedef uint32_t lpmv2_deep_standby_cancel_source_bits_t
```

9.38.10 Extensions

9.38.10.1 lpmv2_mcu_cfg_t

lpmv2_mcu_cfg_t

Detailed description

S124 specific configuration structure

S128 specific configuration structure

S3A3 specific configuration structure

S3A6 specific configuration structure

S3A7 specific configuration structure

S5D5 specific configuration structure

S5D9 specific configuration structure

S7G2 specific configuration structure

Variables

- lpmv2_standby_wake_source_bits_t standby_wake_sources
  Bitwise list of sources to wake from standby
- lpmv2_snooze_request_t snooze_request_source
  Snooze request source
- lpmv2_snooze_end_bits_t snooze_end_sources
  Bitwise list of snooze end sources
- lpmv2_snooze_dtc_t dtc_state_in_snooze
  State of DTC in snooze mode, enabled or disabled
- lpmv2_output_port_enable_t output_port_enable
  Output port enabled/disabled in standby and deep standby
- lpmv2_io_port_t io_port_state
  IO port state in deep standby (maintained or reset)
- lpmv2_power_supply_t power_supply_state
  Internal power supply state in standby and deep standby (deepcut)
- lpmv2_deep_standby_cancel_source_bits_t deep_standby_cancel_source
  Sources that can trigger exit from deep standby
- lpmv2_deep_standby_cancel_edge_bits_t deep_standby_cancel_edge
  Signal edges for the sources that can trigger exit from deep standby

9.39 LVD

Driver for Low Voltage Detection.
Implementation of the LVD API.For a detailed description see the Low Voltage Detection Interface.

9.39.1 Functions

- R_LVD_Open
- R_LVD_Close
- R_LVD_StatusGet
- R_LVD_StatusClear
- R_LVD_VersionGet
- lvd_common_isr_handler

- lvd_lvd_isr
- lvd_nmi_handler
- detection_response_configure
- detection_response_check
- negation_delay_check
- interrupt_type_configure
- lvd_open_parameter_check

9.39.2 Defines

- #define LVD_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define LVD_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.39.3 R_LVD_Open

```
ssp_err_t R_LVD_Open ( lvd_ctrl_t  *const p_api_ctrl ,  lvd_cfg_t  const
*const p_cfg )
```

9.39.3.1 Brief description

Initializes a low voltage detection driver according to the passed in configuration structure. Enables an LVD peripheral based on configuration structure.

9.39.3.2 Detailed description

Implements

- open.

NOTE: Digital filter is not to be used with standby modes

Table 1688:Return values

Name	Description
SSP_SUCCESS	Successful

Table 1688:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One or more pointers passed as function argument point to NULL.
SSP_ERR_ASSERTION	Requested configuration of a voltage monitor was invalid.
SSP_ERR_ASSERTION	Invalid detection response.
SSP_ERR_ASSERTION	Invalid voltage threshold.
SSP_ERR_ASSERTION	Invalid monitor number.
SSP_ERR_ASSERTION	Invalid sample clock configuration.
SSP_ERR_IN_USE	Unable to acquire the hardware lock.
SSP_ERR_INVALID_MODE	MOCO must be running for LVD_NEGATION_DELAY_FROM_RESET negation delay option

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet
- eventInfoGet

9.39.3.3 Function steps

- Select the detection voltage by setting the LVDLVLR.LVDnLVL[m:0] bits.
- Enable voltage detection LVCMPCR.LVDnE = 1
- Enable output of the results of comparison by voltage monitor LVDnCR0.CMPE = 1
- Mark driver as opened by initializing it to "LVD" in its ASCII equivalent.

9.39.4 R_LVD_Close

```
ssp_err_t R_LVD_Close ( lvd_ctrl_t  *const p_api_ctrl )
```

9.39.4.1 Brief description

Disables the LVD peripheral. Closes the driver instance.

9.39.4.2 Detailed description

Implements

- close.

Table 1689:Return values

Name	Description
SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	Pointers passed as function argument point to NULL.
SSP_ERR_ASSERTION	Invalid monitor number

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- eventInfoGet

9.39.4.3 Function steps

- Disable voltage monitor comparison result output
- Disable reset/interrupt event
- Clear low voltage detection flag LVDnSR.DET = 0
- Disable digital filtering
- Disable voltage monitor

9.39.5 R_LVD_StatusGet

```
ssp_err_t R_LVD_StatusGet ( lvd_ctrl_t  *const p_api_ctrl ,  lvd_status_t
* p_lvd_status )
```

9.39.5.1 Brief description

Get the current state of the monitor, (threshold crossing detected, voltage currently within range)

9.39.5.2 Detailed description

Implements

- statusGet.

Table 1690:Return values

Name	Description
SSP_SUCCESS	Successful

Table 1690:Return values (Continued)

Name	Description
SSP_ERR_ASSERTION	One or more pointers passed as function argument point to NULL, invalid LVD monitor number
SSP_ERR_NOT_OPEN	Driver is not open, status will not be valid

9.39.6 R_LVD_StatusClear

```
ssp_err_t R_LVD_StatusClear ( lvd_ctrl_t  *const p_api_ctrl )
```

9.39.6.1 Brief description

Clears the latched status of the monitor.

9.39.6.2 Detailed description

Implements

- statusClear.

Table 1691:Return values

Name	Description
SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	Pointers passed as function argument point to NULL, invalid LVD monitor number
SSP_ERR_NOT_OPEN	Driver is not open, status will not be valid

9.39.7 R_LVD_VersionGet

```
ssp_err_t R_LVD_VersionGet ( ssp_version_t  *const p_version )
```

9.39.7.1 Brief description

Returns the LVD driver version based on compile time macros.

9.39.7.2 Detailed description

Implements

- versionGet.

Table 1692:Return values

Name	Description
SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	p_version was NULL

9.39.8 lvd_common_isr_handler

```
lvd_common_isr_handler ( lvd_instance_ctrl_t  * p_ctrl ,
 uint32_t monitor_number )
```

9.39.8.1 Brief description

Common code needed for all LVD ISRs.

9.39.8.2 Detailed description

Table 1693:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block structure for the driver instance
monitor_number	in	Identifier for the monitor which generated the interrupt

NOTE: Do not call this function directly. To be used internally by LVD driver.

9.39.8.3 Function steps

- If a callback is specified, call it

9.39.9 lvd_lvd_isr

```
lvd_lvd_isr (  void  )
```

9.39.9.1 Brief description

ISR for LVD.

9.39.9.2 Detailed description

NOTE: Do not call this function directly. To be used internally by LVD driver.

9.39.9.3 Function steps

- Save context if RTOS is used
- Clear the Interrupt Request
- Restore context if RTOS is used

9.39.10 lvd_nmi_handler

```
lvd_nmi_handler (  bsp_grp_irq_t irq )
```

9.39.10.1 Brief description

NMI ISR handler for LVD 1 and 2.

9.39.10.2 Detailed description

Table 1694:Parameters

Name	Direction	Description
irq	in	BSP group IRQ identifier

NOTE: Do not call this function directly. To be used internally by LVD driver.

9.39.10.3 Function steps

- Save context if RTOS is used
- Restore context if RTOS is used

9.39.11 detection_response_configure

```
 detection_response_configure ( lvd_instance_ctrl_t  * p_ctrl ,  lvd_cfg_t  const
*const p_cfg ,   IRQn_Type irq )
```

9.39.11.1 Brief description

Configure LVD monitor detection response. Internal function, do not use directly.

9.39.11.2 Detailed description

Table 1695:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block structure for the driver instance
p_cfg	in	Pointer to the configuration structure for the driver instance
irq	in	IRQ associated with the monitor

NOTE: Do not call this function directly. To be used internally by LVD driver.

9.39.12 detection_response_check

```
ssp_err_t detection_response_check ( lvd_cfg_t  const *const p_cfg )
```

9.39.12.1 Brief description

Verify the detection response. Internal function, do not use directly.

9.39.12.2 Detailed description

Table 1696:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for the driver instance

Table 1697:Return values

Name	Description
SSP_SUCCESS	detection response configuration is valid
SSP_ERR_ASSERTION	detection response configuration is invalid

9.39.13 negation_delay_check

```
ssp_err_t negation_delay_check ( lvd_cfg_t  const *const p_cfg )
```

9.39.13.1 Brief description

Verify the LVD signal negation delay. Internal function, do not use directly.

9.39.13.2 Detailed description

Table 1698:Parameters

Name	Direction	Description
p_cfg	in	Pointer to the configuration structure for the driver instance

Table 1699:Return values

Name	Description
SSP_SUCCESS	signal negation delay is valid
SSP_ERR_ASSERTION	signal negation delay is invalid

9.39.14 interrupt_type_configure

```
 interrupt_type_configure ( lvd_instance_ctrl_t  * p_ctrl ,  lvd_cfg_t  const
*const p_cfg )
```

9.39.14.1 Brief description

Configure the interrupt response type. Internal function, do not use directly.

9.39.14.2 Detailed description

Table 1700:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block structure for the driver instance
p_cfg	in	Pointer to the configuration structure for the driver instance

Table 1701:Return values

Name	Description
none	

9.39.15 lvd_open_parameter_check

```
ssp_err_t lvd_open_parameter_check ( lvd_instance_ctrl_t  * p_ctrl ,  lvd_cfg_t
const *const p_cfg )
```

9.39.15.1 Brief description

Helper function to do parameter checking for the Open function for LVD module.

9.39.15.2 Detailed description

Table 1702:Parameters

Name	Direction	Description
p_ctrl	in	Pointer to the control block structure for the driver instance
p_cfg	in	Pointer to the configuration structure for the driver instance

Table 1703:Return values

Name	Description
SSP_SUCCESS	If all parameter checks are success
SSP_ERR_ASSERTION	If any of the parameter checks fails
SSP_ERR_INVALID_MODE	If the attempted mode is invalid for this configuration

9.39.16 API Data

9.39.16.1 lvd_sample_clock_t

`lvd_sample_clock_t`

Detailed description

Sample clock divider, use LVD_SAMPLE_CLOCK_DISABLED to disable digital filtering

Enumerated values

Name	Description
LVD_SAMPLE_CLOCK_LOCO_DIV_2	Digital filter sample clock is LOCO divided by 2.
LVD_SAMPLE_CLOCK_LOCO_DIV_4	Digital filter sample clock is LOCO divided by 4.
LVD_SAMPLE_CLOCK_LOCO_DIV_8	Digital filter sample clock is LOCO divided by 8.
LVD_SAMPLE_CLOCK_LOCO_DIV_16	Digital filter sample clock is LOCO divided by 16.
LVD_SAMPLE_CLOCK_DISABLED	Digital filter is disabled.

9.39.16.2 lvd_negation_delay_t

`lvd_negation_delay_t`

Detailed description

Negation of LVD signal follows reset or voltage in range

Enumerated values

Name	Description
LVD_NEGATION_DELAY_FROM_VOLTAGE	Negation follows a stabilization time (tLVDn) after VCC > Vdet1 is detected. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE
LVD_NEGATION_DELAY_FROM_RESET	Negation follows a stabilization time (tLVDn) after assertion of the LVDn reset. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE

9.39.17 Extensions

9.39.17.1 lvd_instance_ctrl_t

lvd_instance_ctrl_t

Detailed description

LVD instance control structure

Variables

- uint32_t monitor_number

  Monitor number, 1, 2, ...
- R_SYSTEM_Type * p_reg

  Pointer to LVD register base address.
- void(* p_callback)(*p_args)
- lvd_callback_args_t lvd_callback_args
- uint32_t opened

9.39.17.2 lvd_extend_t

lvd_extend_t

Detailed description

Hardware extend structure

Variables

- lvd_negation_delay_t negation_delay

  Negation of LVD signal follows reset or voltage in range
- lvd_sample_clock_t sample_clock_divisor

  Sample clock divider, use LVD_SAMPLE_CLOCK_DISABLED to disable digital filtering

9.40 Operational Amplifier (OPAMP)

Driver for the Operational Amplifier (OPAMP).

This module supports the OPAMP peripheral. It implements the following interfaces:

- OPAMP Interface

9.40.1 Functions

- R_OPAMP_Open
- R_OPAMP_InfoGet
- R_OPAMP_Start
- R_OPAMP_Stop
- R_OPAMP_StatusGet
- R_OPAMP_Trim
- R_OPAMP_Close
- R_OPAMP_VersionGet

9.40.2 Defines

- #define OPAMP_CODE_VERSION_MAJOR

  Initial value: `(1U)`

  Version of code that implements the API defined in this file
- #define OPAMP_CODE_VERSION_MINOR

  Initial value: `(0U)`
- #define OPAMP_MASK_CHANNEL_0

  Initial value: `(1U << 0)`
- #define OPAMP_MASK_CHANNEL_1

  Initial value: `(1U << 1)`

- #define OPAMP_MASK_CHANNEL_2

  Initial value: `(1U << 2)`
- #define OPAMP_MASK_CHANNEL_3

  Initial value: `(1U << 3)`

9.40.3 R_OPAMP_Open

```
ssp_err_t R_OPAMP_Open ( opamp_ctrl_t  *const p_api_ctrl ,  opamp_cfg_t  const
*const p_cfg )
```

9.40.3.1 Detailed description

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements open.

The op-amp is not operational until the start is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until start and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after open and before start.

Table 1704:Return values

Name	Description
SSP_SUCCESS	Configuration successful.
SSP_ERR_ASSERTION	An input pointer is NULL.
SSP_ERR_INVALID_ARGUMENT	An input argument is invalid.
SSP_ERR_IN_USE	Control block is already opened.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- productFeatureGet

9.40.3.2 Function steps

- Verify the control block has not already been initialized.
- Confirm the OPAMP exists on this MCU.
- Lock the OPAMP
- Initialize the hardware based on the configuration.
- Stop operation of all op-amps.
- Initialize trim registers to factory trim values.

9.40.4 R_OPAMP_InfoGet

```
ssp_err_t R_OPAMP_InfoGet ( opamp_ctrl_t  *const p_api_ctrl ,  opamp_info_t
*const p_info )
```

9.40.4.1 Detailed description

Provides the minimum stabilization wait time in microseconds. Implements infoGet.

Table 1705:Return values

Name	Description
SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.40.4.2 Function steps

- Perform parameter checking

9.40.5 R_OPAMP_Start

```
ssp_err_t R_OPAMP_Start ( opamp_ctrl_t  *const p_api_ctrl ,   uint32_t
const channel_mask )
```

9.40.5.1 Detailed description

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements start.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after open and before start.

Table 1706:Return values

Name	Description
SSP_SUCCESS	Op-amp started or hardware triggers enabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Table 1706:Return values (Continued)

Name	Description
SSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

9.40.5.2 Function steps

- Enable AGT start and ADC conversion end triggers or start the op-amp channel(s).
- Return the error code

9.40.6 R_OPAMP_Stop

```
ssp_err_t R_OPAMP_Stop ( opamp_ctrl_t  *const p_api_ctrl ,   uint32_t
const channel_mask )
```

9.40.6.1 Detailed description

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements stop.

Table 1707:Return values

Name	Description
SSP_SUCCESS	Op-amp stopped or hardware triggers disabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

9.40.6.2 Function steps

- Disable AGT start and ADC conversion end triggers and stop the op-amp channel(s).
- Return the error code

9.40.7 R_OPAMP_StatusGet

```
ssp_err_t R_OPAMP_StatusGet ( opamp_ctrl_t  *const p_api_ctrl ,  opamp_status_t
*const p_status )
```

9.40.7.1 Detailed description

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements statusGet.

Table 1708:Return values

Name	Description
SSP_SUCCESS	Operating status of each op-amp provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.40.7.2 Function steps

- Read the operating status of the op-amps.

9.40.8 R_OPAMP_Trim

```
ssp_err_t R_OPAMP_Trim ( opamp_ctrl_t  *const p_api_ctrl ,  opamp_trim_cmd_t
const cmd ,  opamp_trim_args_t  const *const p_args )
```

9.40.8.1 Detailed description

On MCUs that support trimming, the op-amp trim register is set to the factory default after open(). This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling trim() with command OPAMP_TRIM_CMD_START again.

Implements trim.

The trim procedure works as follows: Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.

Connect a fixed voltage to the Pch (+) input.

Connect the Nch (-) input to the op-amp output to create a voltage follower.

Ensure the op-amp is operating and stabilized.

Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.

Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure). Iterate over the following loop 5 times:

Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.

Measure the op-amp output using the SAR ADC (referred to as B in the next step).

If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure). Iterate over the following loop 5 times:
Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
Measure the op-amp output using the SAR ADC (referred to as B in the next step).
If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Table 1709:Return values

Name	Description
SSP_SUCCESS	Conversion result in p_data.
SSP_ERR_UNSUPPORTED	Trimming is not supported on this MCU.
SSP_ERR_INVALID_STATE	The command is not valid in the current state of the trim state machine.
SSP_ERR_INVALID_ARGUMENT	The requested channel is not operating or the trim procedure is not in progress for this channel/input combination.
SSP_ERR_INVALID_MODE	Trim is not allowed in low power mode.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.40.8.2 Function steps

- Initialize the trim register to 0 during OPAMP_TRIM_CMD_START.
- Set the next trim bit during OPAMP_TRIM_CMD_NEXT_STEP.
- Clear the current trim bit during OPAMP_TRIM_CMD_CLEAR_BIT.

9.40.9 R_OPAMP_Close

```
ssp_err_t R_OPAMP_Close ( opamp_ctrl_t  *const p_api_ctrl )
```

9.40.9.1 Detailed description

Stops the op-amps. Implements close.

Table 1710:Return values

Name	Description
SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

9.40.9.2 Function steps

- Perform parameter checking
- Set all OPAMP units and the reference current generator to be stopped.
- Mark driver as closed
- Enter the module-stop state.
- Release the hardware lock
- Return the error code

9.40.10 R_OPAMP_VersionGet

```
ssp_err_t R_OPAMP_VersionGet ( ssp_version_t  *const p_version )
```

9.40.10.1 Detailed description

Gets the API and code version. Implements versionGet.

Table 1711:Return values

Name	Description
SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

9.40.10.2 Function steps

- Return the version number

9.40.11 API Data

9.40.11.1 opamp_trigger_t

`opamp_trigger_t`

Detailed description

Start and stop trigger for the op-amp.

Enumerated values

Name	Description
OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP	Start and stop with APIs.
OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP	Start by AGT compare match and stop with API.
OPAMP_TRIGGER_AGT_START_ADC_STOP	Start by AGT compare match and stop after ADC conversion.

9.40.11.2 opamp_agt_link_t

`opamp_agt_link_t`

Detailed description

Which AGT timer starts the op-amp. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. If OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP is selected for a channel, then no AGT compare match event will start that op-amp channel.

Enumerated values

Name	Description
OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPAMP_1_3	OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPAMP_2_3	OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3	All OPAMP channels are started by AGT1 compare match.

9.40.11.3 opamp_mode_t

opamp_mode_t

Detailed description

Op-amp mode.

Enumerated values

Name	Description
OPAMP_MODE_LOW_POWER	Low power mode.
OPAMP_MODE_MIDDLE_SPEED	Middle speed mode (not supported on all MCUs)
OPAMP_MODE_HIGH_SPEED	High speed mode.

9.40.11.4 opamp_priv_trim_state_t

opamp_priv_trim_state_t

Enumerated values

Name	Description
OPAMP_PRIV_TRIM_STATE_INVALID	
OPAMP_PRIV_TRIM_STATE_END	
OPAMP_PRIV_TRIM_STATE_BIT_0	
OPAMP_PRIV_TRIM_STATE_BIT_1	
OPAMP_PRIV_TRIM_STATE_BIT_2	
OPAMP_PRIV_TRIM_STATE_BIT_3	
OPAMP_PRIV_TRIM_STATE_BIT_4	
OPAMP_PRIV_TRIM_STATE_BEGIN	

9.40.12 Extensions

9.40.12.1 opamp_on_opamp_cfg_t

opamp_on_opamp_cfg_t

Detailed description

OPAMP configuration extension. This extension is required and must be provided in p_extend.

Variables

- opamp_agt_link_t agt_link

  Configure which AGT links are paired to which channel. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel.

- opamp_mode_t mode

  Low power, middle speed, or high speed mode.

- opamp_trigger_t trigger_channel_0

  Start and stop triggers for channel 0.

- opamp_trigger_t trigger_channel_1

  Start and stop triggers for channel 1.

- opamp_trigger_t trigger_channel_2

  Start and stop triggers for channel 2.

- opamp_trigger_t trigger_channel_3

  Start and stop triggers for channel 3.

9.40.12.2 opamp_instance_ctrl_t

opamp_instance_ctrl_t

Detailed description

OPAMP instance control block. DO NOT INITIALIZE. Initialized in open.

Variables

- R_OPAMP_Type * p_reg
- uint32_t opened
- uint8_t trim_capable
- uint8_t switches
- uint32_t valid_opamps
- opamp_priv_trim_state_t trim_state
- uint8_t trim_channel
- opamp_trim_input_t trim_input

9.41 PDC

Driver for the Parallel Data Capture Unit (PDC).

9.41.1 Summary

extends PDC Interface The PDC interface allows the capturing of an image from a camera module.

9.41.2 Functions

- R_PDC_Open
- R_PDC_Close
- R_PDC_CaptureStart
- R_PDC_StateGet
- R_PDC_VersionGet

9.41.3 Defines

- #define PDC_CODE_VERSION_MAJOR

  Initial value: `(1U)`
- #define PDC_CODE_VERSION_MINOR

  Initial value: `(4U)`

9.41.4 R_PDC_Open

```
ssp_err_t R_PDC_Open ( pdc_ctrl_t  *const p_api_ctrl ,  pdc_cfg_t  const
*const p_cfg )
```

9.41.4.1 Brief description

Powers on PDC, handles required initialization described in the hardware manual. Implements open.

9.41.4.2 Detailed description
