Radiation Hardened Dual 36V Precision Single-Supply, Rail-to-Rail Output, Low-Power Operational Amplifiers

FN7957  
Rev 3.00  
May 19, 2016

The [ISL70218SEH](#), [ISL70218SRH](#) are dual, low-power precision amplifiers optimized for single-supply applications. These op amps feature a common-mode input voltage range extending to 0.5V below the V<sup>-</sup> rail, a rail-to-rail differential input voltage range, and rail-to-rail output voltage swing, which makes it ideal for single-supply applications where input operation at ground is important.

These op amps feature low-power, low-offset voltage and low-temperature drift, making it ideal for applications requiring both high DC accuracy and AC performance. They are designed to operate over a single supply range of 3V to 36V or a split supply voltage range of +1.8V/-1.2V to ±18V. The combination of precision and small footprint provides the user with outstanding value and flexibility relative to similar competitive parts.

Applications for these amplifiers include precision instrumentation, data acquisition and precision power supply controls.

ISL70218SEH, ISL70218SRH are available in a 10 lead hermetic ceramic flatpack and operate across the extended temperature range of -55 °C to +125 °C.

**Related Literature**

- [AN1653](#), “ISL70218SRH Evaluation Board User’s Guide”
- [AN1677](#), “Single Events Effects Testing of the ISL70218SRH, Dual 36V Rad Hard Low Power Operational Amplifiers”

**Features**

- DLA SMD# [5962-12222](#) (ISL70218SEH Only)
- Wide single and dual supply range . . . . . 3V to 42V, Abs. Max.
- Low current consumption . . . . . 850µA, typical
- Low input offset voltage. . . . . 40µV, typical
- Rail-to-rail output . . . . . <10mV
- Rail-to-rail input differential voltage range for comparator applications
- Operating temperature range. . . . . -55 °C to +125 °C
- Below-ground (V<sup>-</sup>) input capability to -0.5V
- Low noise voltage. . . . . 5.6nV/√Hz, typical
- Low noise current. . . . . 355fA/√Hz, typical
- Offset voltage temperature drift . . . . . 0.3µV/°C, typical
- No phase reversal
- Radiation tolerance
  - High dose rate (50-300rad(Si)/s) . . . . . 100krad(Si)
  - Low dose rate (0.01rad(Si)/s) . . . . . 100krad(Si)\*
  - SEB LET<sub>TH</sub> (V<sub>S</sub> = ±18V) . . . . . 86.4 MeV • cm<sup>2</sup>/mg
  - SEL Immune (SOI Process)

\* Product capability established by initial characterization. The EH version is acceptance tested on a wafer-by-wafer basis to 50krad(Si) at low dose rate.

**Applications**

- Precision instruments
- Active filter blocks
- Data acquisition
- Power supply control

### NOTES:

1. These Intersil Pb-free Hermetic packaged products employ 100% Au plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations.
2. Specifications for Rad Hard QML devices are controlled by the Defense Logistics Agency Land and Maritime (DLA). The SMD numbers listed in the "Ordering Information" table must be used when ordering.

## Absolute Maximum Ratings

Maximum Supply Voltage	42V
Maximum Supply Voltage (Note 5)	36V
Maximum Differential Input Current	20mA
Maximum Differential Input Voltage	$V^- - 0.5V$ to $V^+ + 0.5V$
Min/Max Input Voltage	$V^- - 0.5V$ to $V^+ + 0.5V$
Max/Min Input Current	$\pm 20mA$
Output Short-Circuit Duration (1 output at a time)	Indefinite
ESD Tolerance	
Human Body Model (Tested per MIL-PRF-883 3015.7)	2kV
Machine Model (Tested per JESD22-A115-A)	300V
Charged Device Model (Tested per CDM-22C10ID)	750V
Dielectrically Isolated PR40 Process	Latch-Up Free

## Thermal Information

Thermal Resistance (Typical)	$\theta_{JA}$ ( $^{\circ}C/W$ )	$\theta_{JC}$ ( $^{\circ}C/W$ )
10 Ld Flatpack Package (Notes 3, 4)	130	20
Storage Temperature Range	-65 $^{\circ}C$ to +150 $^{\circ}C$	

## Recommended Operating Conditions

Ambient Operating Temperature Range	-55 $^{\circ}C$ to +125 $^{\circ}C$
Maximum Operating Junction Temperature	+150 $^{\circ}C$
Supply Voltage	3V (+1.8V/-1.2V) to 30V ( $\pm 15V$ )

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

### NOTES:

- $\theta_{JA}$  is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief [TB379](#) for details.
- For  $\theta_{JC}$ , the "case temp" location is the center of the package underside.
- Tested in a heavy ion environment at LET = 86.4 MeV • cm<sup>2</sup>/mg at +125 $^{\circ}C$  (T<sub>C</sub>) for SEB. Please refer to [AN1677](#) for more information.

**Electrical Specifications**  $V_S \pm 15V$ ,  $V_{CM} = 0$ ,  $V_O = 0V$ ,  $R_L = \text{Open}$ ,  $T_A = +25^{\circ}C$ , unless otherwise noted. **Boldface limits apply across the operating temperature range, -55 $^{\circ}C$  to +125 $^{\circ}C$ .**

## Applications Information

### Functional Description

The ISL70218SEH, ISL70218SRH are dual, 3.2MHz, single or dual supply, rail-to-rail output amplifiers with a common-mode input voltage range extending to a range of 0.5V below the  $V^-$  rail. The input stage is optimized for precision sensing of ground-referenced signals in single-supply applications. The input stage is able to handle large input differential voltages without phase inversion, making this amplifier suitable for high-voltage comparator applications. The bipolar design features high open loop gain and excellent DC input and output temperature stability. This op amp features very low quiescent current of 850 $\mu$ A, and low temperature drift. The devices are fabricated in a new precision 40V complementary bipolar DI process and is immune from latch-up for up to a 36V supply range.

### Operating Voltage Range

The op amps are designed to operate over a single supply range of 3V to 36V or a split supply voltage range of +1.8V/-1.2V to  $\pm$ 18V. The device is fully characterized at 30V ( $\pm$ 15V). Both DC and AC performance remain virtually unchanged over the complete operating voltage range. Parameter variation with operating voltage is shown in the “Typical Performance Curves” beginning on [page 9](#).

The input common-mode voltage to the  $V^+$  rail ( $V^+ - 1.8V$  across the full temperature range) may limit amplifier operation when operating from split  $V^+$  and  $V^-$  supplies. [Figure 4](#) shows the common-mode input voltage range variation over temperature.

### Input Stage Performance

The ISL70218SEH, ISL70218SRH PNP input stage has a common-mode input range extending up to 0.5V below ground at +25 $^{\circ}$ C. Full amplifier performance is guaranteed for input voltage down to ground ( $V^-$ ) across the -55 $^{\circ}$ C to +125 $^{\circ}$ C temperature range. For common-mode voltages down to -0.5V below ground ( $V^-$ ), the amplifiers are fully functional, but performance degrades slightly over the full temperature range. This feature provides excellent CMRR, AC performance, and DC accuracy when amplifying low-level, ground-referenced signals.

The input stage has a maximum input differential voltage equal to a diode drop greater than the supply voltage and does not contain the back-to-back input protection diodes found on many similar amplifiers. This feature enables the device to function as a precision comparator by maintaining very high input impedance for high-voltage differential input comparator voltages. The high differential input impedance also enables the device to operate reliably in large signal pulse applications, without the need for anti-parallel clamp diodes required on MOSFET and most bipolar input stage op amps. Thus, input signal distortion caused by nonlinear clamps under high slew rate conditions is avoided.

In applications in which one or both amplifier input terminals are at risk of exposure to voltages beyond the supply rails, current-limiting resistors may be needed at each input terminal (see [Figure 49](#),  $R_{IN+}$ ,  $R_{IN-}$ ) to limit current through the power-supply ESD diodes to 20mA.

FIGURE 49. INPUT ESD DIODE CURRENT LIMITING

### Output Drive Capability

The bipolar rail-to-rail output stage features low saturation levels that enable an output voltage swing to less than 15mV when the total output load (including feedback resistance) is held below 50 $\mu$ A ([Figures 21](#) and [22](#)). With  $\pm$ 15V supplies, this can be achieved by using feedback resistor values >300k $\Omega$ .

The output stage is internally current limited. Output current limit over temperature is shown in [Figures 23](#) and [24](#). The amplifiers can withstand a short-circuit to either rail as long as the power dissipation limits are not exceeded. This applies to only one amplifier at a time for the dual op amp. Continuous operation under these conditions may degrade long-term reliability.

The amplifiers perform well when driving capacitive loads ([Figures 45](#) and [46](#)). The unity gain, voltage follower (buffer) configuration provides the highest bandwidth but is also the most sensitive to ringing produced by load capacitance found in BNC cables. Unity gain overshoot is limited to 35% at capacitance values to 0.33nF. At gains of 10 and higher, the device is capable of driving more than 10nF without significant overshoot.

### Output Phase Reversal

Output phase reversal is a change of polarity in the amplifier transfer function when the input voltage exceeds the supply voltage. The ISL70218SEH, ISL70218SRH are immune to output phase reversal out to 0.5V beyond the rail ( $V_{ABS\ MAX}$ ) limit (see [Figure 38](#) on [page 14](#)).

### Single Channel Usage

The ISL70218SEH, ISL70218SRH are dual op amps. If the application requires only one channel, the user must configure the unused channel to prevent it from oscillating. The unused channel oscillates if the input and output pins are floating. This results in higher-than-expected supply currents and possible noise injection into the channel being used. The proper way to prevent oscillation is to short the output to the inverting input, and ground the positive input ([Figure 50](#)).

FIGURE 50. PREVENTING OSCILLATIONS IN UNUSED CHANNELS

## Power Dissipation

It is possible to exceed the +150°C maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature ( $T_{JMAX}$ ) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using [Equation 1](#):

$$T_{JMAX} = T_{MAX} + \theta_{JA} \times PD_{MAXTOTAL} \quad (EQ. 1)$$

Where

- $PD_{MAXTOTAL}$  is the sum of the maximum power dissipation of each amplifier in the package ( $PD_{MAX}$ )
- $T_{MAX}$  = Maximum ambient temperature
- $\theta_{JA}$  = Thermal resistance of the package

$PD_{MAX}$  for each amplifier can be calculated using [Equation 2](#):

$$PD_{MAX} = V_S \times I_{qMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (EQ. 2)$$

Where

- $PD_{MAX}$  = Maximum power dissipation of one amplifier
- $V_S$  = Total supply voltage
- $I_{qMAX}$  = Maximum quiescent supply current of one amplifier
- $V_{OUTMAX}$  = Maximum output voltage swing of the application
- $R_L$  = Load resistance

## Package Characteristics

### Weight of Packaged Device

0.4029 grams (Typical)

### Lid Characteristics

Finish: Gold

Case Isolation to Any Lead:  $20 \times 10^9 \Omega$  (min)

## Die Characteristics

### Die Dimensions

$1565\mu\text{m} \times 2125\mu\text{m}$  (62 mils x 84 mils)

Thickness:  $355\mu\text{m} \pm 25\mu\text{m}$  (14 mils  $\pm 1$  mil)

### Interface Materials

#### GLASSIVATION

Type: Nitrox

Thickness:  $15\text{k}\text{\AA}$

## About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets. For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at [www.intersil.com](http://www.intersil.com).

You may report errors or suggestions for improving this datasheet by visiting [www.intersil.com/ask](http://www.intersil.com/ask).

Reliability reports are also available from our website at [www.intersil.com/support](http://www.intersil.com/support).

**NOTES:**

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab (dimension k) may be used to identify pin one.
2. If a pin one identification mark is used in addition to a tab, the limits of dimension k do not apply.
3. This dimension allows for off-center lid, meniscus, and glass overrun.
4. Dimensions b1 and c1 apply to lead base metal only. Dimension M applies to lead plating and finish thickness. The maximum limits of lead dimensions b and c or M shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
5. N is the maximum number of terminal positions.
6. Measure dimension S1 at all four corners.
7. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
8. Dimension Q shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension Q minimum shall be reduced by 0.0015 inch (0.038mm) maximum when solder dip lead finish is applied.
9. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
10. Controlling dimension: INCH.
