1. Overview

This application note explains the speed control algorithm in the sensorless vector control software for permanent magnetic synchronous motor (PMSM) using Renesas Electronics Corporation’s microcontroller.

2. PMSM Fundamental Equation

2.1 PMSM Model in Three-Phase (U, V, W) Coordinate

Voltage equation of the permanent magnet synchronous motor having sinusoidal magnetic flux distribution (Figure 2-1) can be expressed as follows.

\[
\begin{bmatrix}
v_u \\
v_v \\
v_w \\
\end{bmatrix} = R_a \begin{bmatrix}
i_u \\
i_v \\
i_w \\
\end{bmatrix} + p \begin{bmatrix}
\phi_u \\
\phi_v \\
\phi_w \\
\end{bmatrix}
\]

\[
\begin{bmatrix}
\phi_u \\
\phi_v \\
\phi_w \\
\end{bmatrix} = \begin{bmatrix}
L_u & M_{uw} & M_{wu} \\
M_{uv} & L_v & M_{vw} \\
M_{wu} & M_{vw} & L_w \\
\end{bmatrix} \begin{bmatrix}
i_u \\
i_v \\
i_w \\
\end{bmatrix} + \psi \begin{bmatrix}
cos\theta \\
cos(\theta - 2\pi/3) \\
cos(\theta + 2\pi/3) \\
\end{bmatrix}
\]

- \(v_u, v_v, v_w\): Stator phase voltage
- \(i_u, i_v, i_w\): Stator phase current
- \(\phi_u, \phi_v, \phi_w\): Stator phase interlinkage flux
- \(R_a\): Stator phase resistance
- \(p\): Differential operator
- \(L_u, L_v, L_w\): Stator phase self-inductance
- \(M_{uw}, M_{uv}, M_{wu}\): Mutual inductance
- \(\psi\): Maximum flux linkage due to permanent magnet
- \(\theta\): Rotor electrical angle from phase U

Figure 2-1 Conceptual Diagram of Three-Phase Permanent Magnet Synchronous Motor
2.2 PMSM Model in Direct-Quadrature (d, q) Coordinate

Vector control is a method to control the motor on the two-phase (d, q) coordinate system instead of the three-phase (u,v,w) coordinate system.

The d-axis is set in the direction of the magnetic flux (N pole) of the permanent magnet and the q-axis is set in the direction which progresses by 90 degrees (electrical) in the forward direction of the angle $\theta$ from the d-axis.

![Figure 2-2 Conceptual Diagram of the Two-Phase Direct Current Motor](image)

The coordinate transformation is performed by the following transformation matrix.

$$ C = \sqrt{\frac{2}{3}} \begin{bmatrix} \cos \theta & \cos(\theta - 2\pi/3) & \cos(\theta + 2\pi/3) \\ -\sin \theta & -\sin(\theta - 2\pi/3) & -\sin(\theta + 2\pi/3) \end{bmatrix} $$

$$ \begin{bmatrix} v_d \\ v_q \end{bmatrix} = C \begin{bmatrix} v_u \\ v_v \\ v_w \end{bmatrix} $$

The voltage equation in the two-phase (d, q) coordinate system is obtained as follows.

$$ \begin{bmatrix} v_d \\ v_q \end{bmatrix} = \begin{bmatrix} R_a + pL_d \\ \omega L_d \\ -\omega L_q \\ R_a + pL_q \end{bmatrix} \begin{bmatrix} i_d \\ i_q \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \end{bmatrix} $$

$v_d, v_q$: d-axis and q-axis voltage
$i_d, i_q$: d-axis and q-axis current
$R_a$: Stator phase resistance
$\omega$: Angular speed
$L_d, L_q$: d-axis and q-axis inductance
$L_a, L_q$: d-axis and q-axis inductance
$i_a$: Stator phase current
$\psi_a$: Flux linkage due to permanent magnet
$\psi = \frac{3}{\sqrt{2}} \psi_a$
Based on this, it can be considered that alternate current flowing in the stationary three-phase stator is equivalent to direct current flowing in the two-phase stator rotating synchronously with the permanent magnet operating as a rotor.

The generated torque can be written as follows from the exterior product of the electric current vector and armature inter-linkage magnetic flux. The first term on the right side of this formula is called magnet torque and the second term on the right side of this formula is called reluctance torque.

\[
T = P_n(\psi_A i_q + (L_d - L_q)i_d i_q)
\]

\( T \) : Motor torque \quad P_n : Number of pole pairs

The PMSM which has no difference between the d-axis and q-axis inductances is defined as non-salient PMSM. In this case, as the reluctance torque is 0, the total torque is proportional to the q-axis current. Due to this, the q-axis current is called torque current. In two-phase (d, q) phase coordinate, the d-axis flux is sum of permanent magnet flux and flux generated by d-axis current. Since the equivalent rotating stator flux (in three-phase (u, v, w) coordinate system) is controlled by d-axis current, the d-axis current is called as excitation current.
3. Control System Design

3.1 Vector Control System and the Controller

Speed control block diagram of the vector control is shown below.

As shown in Figure 3-1, this system consists of the speed control system and the current control system. These systems use general PI controller. PI controller gains of each system must be designed properly to realize required control characteristics.

In decoupling control block, \( v_d^{**} \), \( v_q^{**} \) (as the following equations) are calculated and then added to voltage command value. This realizes the high response of speed control system and enables to control the d-axis and q-axis independently.

\[
\begin{align*}
   v_d^{**} &= -\omega L_q i_q \\
   v_q^{**} &= \omega (L_d i_d + \psi_a)
\end{align*}
\]
3.2 Current Control System

3.2.1 Design of Current Control System

The current control system is modeled by using the electrical characteristics of the motor. The stator coil can be represented by a resistance $R$ and an inductance $L$. The stator model of the motor is expressed by the transfer function of the typical RL series circuit $\frac{1}{R+Ls}$.

The current control system model can be represented by a feedback control system using PI control. (Figure 3-2)

![Figure 3-2 Current Control System Model](image)

Based on this model, PI gains of the current control system are designed as the following method.

First, the closed-loop transfer function of this system is obtained as follows.

$$G(s) = \frac{Y(s)}{X(s)} = \frac{\frac{K_a}{K_b} \left( 1 + \frac{S}{a} \right)}{s^2 + \frac{1}{K_b} \left( 1 + \frac{K_a}{a} \right) s + \frac{K_a}{K_b}}$$

$$K_i = K_p a, \quad K_a = \frac{K_p a}{R}, \quad K_b = \frac{L}{R}$$

The general equation of second-order lag system with zero point can be expressed as follows.

$$\frac{\omega_n^2}{s^2 + 2\zeta \omega_n s + \omega_n^2 \left( 1 + \frac{s}{\omega_z} \right)}$$
By comparing coefficients of two equations above, the following equations are obtained.

\[
\frac{\omega_n^2 \left( 1 + \frac{S}{\omega_z} \right)}{s^2 + 2\zeta \omega_n s + \omega_n^2} \Leftrightarrow \frac{K_a}{K_b} \cdot \left( 1 + \frac{S}{a} \right) \Rightarrow \frac{1}{s^2 + \frac{1}{K_b} \left( 1 + \frac{K_a}{a} \right) s + \frac{K_a}{K_b}}
\]

\[
\omega_n^2 = \frac{K_a}{K_b}, \quad 2\zeta \omega_n = \frac{1}{K_b} \left( 1 + \frac{K_a}{a} \right), \quad \omega_z = a
\]

From above equations, natural frequency \( \omega_n \), damping ratio \( \zeta \), zero-point frequency \( \omega_z \) are written as follows.

\[
\omega_n = \sqrt{\frac{K_a}{K_b}}, \quad \zeta = \frac{1}{2K_b} \sqrt{\frac{K_a}{K_b}} \left( 1 + \frac{K_a}{a} \right), \quad \omega_z = a = \frac{\omega_n^2 L}{2\zeta \omega_n L - R}
\]

Current PI control gains \( (K_{p,\text{current}}, K_{i,\text{current}}) \) are written as the following equations.

\[
K_{p,\text{current}} = 2\zeta_{CG} \omega_{CG} L - R, \quad K_{i,\text{current}} = K_{p,\text{current}} a = \omega_{CG}^2 L
\]

- \( \omega_{CG} \): Desired natural frequency of current control system
- \( \zeta_{CG} \): Desired damping ratio of current control system

Therefore, PI control gains of the current control system can be designed by \( \omega_{CG} \) and \( \zeta_{CG} \).
3.3 Speed Control System

3.3.1 Design of Speed Control System

The speed control system is modeled by using the mechanical characteristics of the motor. The mechanical system torque equation is written as follows.

\[ T = J \dot{\omega}_{mech} \]

\( J \): Inertia of rotor, \( \omega_{mech} \): Speed (Mechanical)

In consideration of only magnet torque, the electrical system torque equation is written as follows.

\[ T = P_n \psi_a i_q \]

By using the mechanical and electrical torque equation, the speed (mechanical) is written as follows.

\[ \omega_{mech} = \frac{P_n \psi_a}{sJ} i_q \]

The speed in the control software is treated as the electrical speed. Thereby, the number of pole pairs \( P_n \) is multiplied to both sides of this equation.

\[ \omega_{elec} = \frac{P_n^2 \psi_a}{sJ} i_q \]

\( \omega_{elec} \): Speed (Electrical)

The speed control system model can be represented by a feedback control system using PI control. (Figure 3-3)

**Figure 3-3 Speed Control System Model**
Based on this model, PI gains of the speed control system are designed as the following method.

First, the closed-loop transfer function of this system is obtained as follows.

\[
G(s) = \frac{Y(s)}{X(s)} = \frac{K_b \left(1 + \frac{s}{a}\right)}{s^2 + K_b s + K_b a}
\]

\[
K_b = \frac{K_p \rho_n^2 \psi_a}{J}, \quad K_i = K_p a
\]

The general equation of second-order lag system with zero point can be expressed as follows.

\[
\frac{\omega_n^2}{s^2 + 2\zeta \omega_n s + \omega_n^2 \left(1 + \frac{s}{\omega_z}\right)}
\]

Similar to the current control system, by comparing coefficients of two equations above, the following equations are obtained.

\[
\omega_n^2 = aK_b = \frac{K_p a \rho_n^2 \psi_a}{J}, \quad 2\zeta \omega_n = K_b = \frac{K_p \rho_n^2 \psi_a}{J}, \quad \omega_z = a
\]

From above equations, natural frequency \(\omega_n\), damping ratio \(\zeta\), zero-point frequency \(\omega_z\) are written as follows.

\[
\omega_n = \sqrt{\frac{K_p a \rho_n^2 \psi_a}{J}}, \quad \zeta = \frac{1}{2} \sqrt{\frac{K_p \rho_n^2 \psi_a}{aJ}}, \quad \omega_z = a = \frac{\omega_n}{2\zeta}
\]

Speed PI control gains \((K_{p\_speed}, K_{i\_speed})\) are written as the following equations.

\[
K_{p\_speed} = \frac{2\zeta_{SG} \omega_{SG} J}{\rho_n^2 \psi_a}, \quad K_{i\_speed} = K_{p\_speed} a = \frac{\omega_{SG}^2 J}{\rho_n^2 \psi_a}
\]

\(\omega_{SG}\): Desired natural frequency of speed control system
\(\zeta_{SG}\): Desired damping ratio of speed control system

Therefore, PI control gains of the speed control system can be designed by \(\omega_{SG}\) and \(\zeta_{SG}\).
4. Sensorless Vector Control

4.1 Position/Speed Estimation Method Based on The BEMF Observer

When the position sensors are not used, in other words, in the case of the sensorless vector control, it is necessary to estimate the position by some methods. These days, the demand for sensorless motor control has increased and several methods are provided for estimating the position. This part introduces the sensorless vector control, which is using the BEMF observer.

![Figure 4-1 BEMF on The Estimated dq Axis](image)

According to Figure 4-1, the voltage equation on the estimated dq axis is written as follows.

\[
v_d^* = (R + sL_d)i_d - \omega^*L_qi_q + e_d
\]

\[
v_q^* = (R + sL_q)i_q + \omega^*L_d i_d + e_q
\]

Furthermore, by considering \(-\omega^*L_qi_q + e_d\) and \(\omega^*L_d i_d + e_q\) as the voltage disturbance, they are written as \(-d_d, -d_q\) respectively.

\[
v_d^* = (R + sL_d)i_d - d_d
\]

\[
v_q^* = (R + sL_q)i_q - d_q
\]

d-axis voltage equation is rewritten as follows.

\[si_d = \frac{v_d^*}{L_d} - \frac{R}{L_d}i_d + \frac{d_d}{L_d}\]
According to the above equation, state equation is written as follows. The state variables are the d-axis current and the voltage disturbance.

\[
\dot{s}i_d = -\frac{R}{L_d}i_d + \frac{d}{L_d} + \frac{v_d^*}{L_d}
\]

\[
sd = sd_d
\]

If the estimated \(i_d\) is \(\hat{i}_d\) and the estimated \(d\) is \(\hat{d}\), the estimated state equation is written as follows. \(K_{Ed1}\) and \(K_{Ed2}\) are estimation gains.

\[
\dot{s}\hat{i}_d = -\frac{R}{L_d}\hat{i}_d + \frac{\hat{d}}{L_d} + \frac{v_d^*}{L_d} + K_{Ed1}(i_d - \hat{i}_d)
\]

\[
\dot{s}\hat{d} = K_{Ed2}(i_d - \hat{i}_d)
\]

According to the above equations, \(\hat{i}_d\) and \(\hat{d}\) are written as follows.

\[
\hat{i}_d = \frac{K_{Ed2}}{s^2 + \left(\frac{R}{L_d} + K_{Ed1}\right)s + \frac{K_{Ed2}}{L_d}} \left\{ \left(1 + \frac{K_{Ed1}}{K_{Ed2}}\right) \frac{i_d}{L_d}s + \frac{s}{K_{Ed2}}v_d^* \right\}
\]

\[
\hat{d} = \hat{d}_d = \frac{K_{Ed2}}{s^2 + \left(\frac{R}{L_d} + K_{Ed1}\right)s + \frac{K_{Ed2}}{L_d}} \left\{ (L_d s + R)i_d - v_d^* \right\}
\]

As shown in the above equations, \(\hat{i}_d\) and \(\hat{d}_d\) are the 2\textsuperscript{nd} order lag system with input \(i_d\) and \(v_d^*\).

Natural frequency \(\omega_n\), damping ratio \(\zeta\) are written as follows.

\[
\omega_n = \sqrt{\frac{K_{Ed2}}{L_d}}
\]

\[
\zeta = \frac{R}{L_d} + \frac{K_{Ed1}}{2\sqrt{\frac{K_{Ed2}}{L_d}}}
\]
The characteristic of the estimation system is designed by $\omega_n$ and $\zeta$.

The estimation gains are written as follows.

\[
K_{Ed1} = 2\zeta_E \omega_E - \frac{R}{L_d} \\
K_{Ed2} = \omega_E^2 L_d
\]

$\omega_E$: Desired natural frequency of BEMF estimation system  
$\zeta_E$: Desired damping ratio of BEMF estimation system

Furthermore, the estimated state equation is rewritten as follows.

\[
\hat{i}_d = \frac{1}{s} \left\{ -\frac{R}{L_d} \hat{i}_d + \frac{\hat{d}_d}{L_d} + \frac{v_{d}^*}{L_d} + K_{Ed1}(i_d - \hat{i}_d) \right\} \\
\hat{d}_d = \frac{1}{s} \{K_{Ed2}(i_d - \hat{i}_d)\}
\]

According to the above equations, the block diagram of the BEMF observer on d-axis can be drew as shown in Figure 4-2.

![Figure 4-2 Block Diagram of the BEMF Observer on d-Axis](image)
The same calculation can be also realized on q-axis. 

\( i_q \) and \( d \) are written as follows.

\[
\hat{i}_q = \frac{K_{Eq2}}{L_q} \left\{ \left( 1 + \frac{K_{Eq1}}{K_{Eq2}} L_q S \right) i_q + \frac{S}{K_{Eq2}} v_q^* \right\}
\]

\[
\hat{d} = \hat{d}_q = \frac{K_{Eq2}}{L_q} \left\{ \left( L_q S + R \right) i_q - v_q^* \right\}
\]

As shown in the above equations, \( \hat{i}_q \) and \( \hat{d}_q \) are the 2nd order lag system with input \( i_q \) and \( v_q^* \).

Natural frequency \( \omega_n \), damping ratio \( \zeta \) are written as follows.

\[
\omega_n = \sqrt{\frac{K_{Eq2}}{L_q}}
\]

\[
\zeta = \frac{K_{Eq1}}{2 \sqrt{\frac{K_{Eq2}}{L_q}}}
\]

The characteristic of the estimation system is designed by \( \omega_n \) and \( \zeta \). The estimation gains are written as follows.

\[
K_{Eq1} = 2\zeta_{EG} \omega_{EG} - \frac{R}{L_q}
\]

\[
K_{Eq2} = \omega_{EG}^2 L_q
\]

\( \omega_{EG} \): Desired natural frequency of BEMF estimation system

\( \zeta_{EG} \): Desired damping ratio of BEMF estimation system
Furthermore, the estimated state equation is rewritten as follows.

\[
\hat{i}_q = \frac{1}{s} \left\{ -\frac{R}{L_q} \hat{i}_q + \frac{\vec{d}_q}{L_q} + \frac{v^*_q}{L_q} + K_{Eq1}(i_q - \hat{i}_q) \right\}
\]

\[
\vec{d}_q = \frac{1}{s} \{ K_{Eq2}(i_q - \hat{i}_q) \}
\]

According to the above equations, the block diagram of the BEMF observer on q-axis is shown in Figure 4-3.

![Figure 4-3 Block Diagram of the BEMF Observer on q-Axis](image)

Next, BEMF is calculated from the estimated voltage disturbance \( \vec{d}_q \), \( \vec{d}_q \) as follows.

\[
e_d = -\vec{d}_d + \omega^*L_d i_q
\]

\[
e_q = -\vec{d}_q - \omega^*L_d i_d
\]

\[
\Delta \theta = \arctan \left( \frac{e_d}{e_q} \right)
\]

As shown in the above equations, the phase error between the real axis and the estimated axis are calculated.
Finally, $\Delta \theta$ is used to estimate rotor position by the method shown in Figure 4-4.

![Figure 4-4 Block Diagram of the Position Estimation System](image)

According to the above block diagram, the closed-loop transfer function of this system is

$$\frac{\theta_{est}(s)}{\theta(s)} = \frac{K_I \left( s \frac{K_P}{K_I} + 1 \right)}{s^2 + K_P s + K_I}$$

This system is a 2nd order lag system. The natural frequency $\omega_n$, damping ratio $\zeta$ are written as follows.

$$\omega_n = \sqrt{K_I}$$
$$\zeta = \frac{K_P}{2\sqrt{K_I}}$$

The control gains of this system ($K_{P\_phase\_error}$: $K_{I\_phase\_error}$) are written as follows.

$$K_{P\_phase\_error} = 2\zeta\Delta \theta \omega_{\Delta \theta}$$
$$K_{I\_phase\_error} = \omega_{\Delta \theta}^2$$

$\omega_{\Delta \theta}$: Desired natural frequency of position estimation system
$\zeta_{\Delta \theta}$: Desired damping ratio of position estimation system

As above, the rotor position/speed estimation is completed.
4.2 Open-Loop Control

In the conventional sensorless vector control, the position/speed estimation error in low-speed region is not negligible. Accordingly, in the low-speed region, the motor runs with open-loop control. In this case, motor speed vibrates with natural frequency (depends on current and motor parameters). Figure 4-5 shows the block diagram of the open-loop damping control. This reduces vibration of the motor and realizes stable motor speed.

![Block Diagram of the Open-Loop Damping Control](image)

Figure 4-5 Block Diagram of the Open-Loop Damping Control

When the motor speed reaches the region that position/speed estimation error is negligible, the control mode is shifted from open-loop control to sensorless control (closed loop control). But in the open-loop control, especially when the load is heavy, the phase error is large. In this case, shock in current and speed is caused at the control transition timing. Therefore, we use the phase error $\Delta\theta$ to calculate the torque current required to set the phase error to 0 at the control transition, and implement the processing to reflect the calculated torque current to the q-axis current reference (Sensorless transition control) as shown in Figure 4-6. This makes it possible to reduce shock in current and speed at the control transition.

![Sequence of Sensorless Transition Control](image)

Figure 4-6 Sequence of Sensorless Transition Control
4.3 Flux-weakening Control

BEMF of a PMSM is proportional to the magnetic flux of the rotor and the rotation speed. Then, when the rotation speed increases and BEMF is equal to the power supply voltage, that is, when the voltage saturates, no more current can be passed to the motor, and the rotation speed saturates. It is difficult to achieve both high torque and high speed rotation of a PMSM. For example, a PMSM equipped with a strong magnet increases the torque, but BEMF also increases. In this case, high-speed rotation cannot be realized. Flux-weakening control is a technique to solve this problem.

In the flux-weakening control, applying negative d-axis current prevents voltage saturation due to the BEMF. This achieves high-speed rotation and improves torque output in the high-speed region.

In the software implementation, the d-axis current is determined according to the following formula.

\[
I_d = -\psi_a + \frac{\sqrt{(V_{om} / \omega)}^2 - (L_q I_q)^2}{L_d}
\]

\[
V_{om} = V_{amax} - I_a R
\]

- \(V_{om}\): Limit of BEMF [V]
- \(V_{amax}\): Maximum value of magnitude of voltage vector [V]
- \(I_a\): Magnitude of current vector [A]
4.4 Voltage Error Compensation
The 3-phase inverter has deadtime to prevent short circuit between upper and lower arm of switching devices. Therefore, the voltage reference and the voltage applied the motor have error. This error causes degradation of control accuracy. The voltage error compensation is implemented to reduce this error.

The voltage error depends on the current (direction and magnitude), the deadtime and the switching device characteristic. The voltage error dependence on phase current is shown in Figure 4-7. The voltage error compensation can be realized by adding the voltage, opposite to the voltage error, to the voltage reference.

![Figure 4-7 Current Dependence of Voltage Error (Example)](image)

4.5 Pulse Width Modulation (PWM)
As a general implementation of the vector control for PMSMs, phase voltage references are generated as sine wave. However, when sin wave voltage reference is used as modulation wave for PWM generation, voltage utilization factor is limited by 86.7 [%]. To increase the voltage utilization factor, the modified three-phase voltage reference is used as modulation wave. The modified three-phase voltage reference \( (V'_u, V'_v, V'_w) \) is calculated by subtracting average value of maximum and minimum from three-phase voltage \( (V_u, V_v, V_w) \). Then, without changing line-to-line voltage, the maximum amplitude of the modulation wave becomes \( \sqrt{3}/2 \) times, and as a result the voltage efficiency rate becomes 100[%].

\[
\begin{pmatrix}
V'_u \\
V'_v \\
V'_w
\end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}
\]

\[\Delta V = -\frac{V_{max} + V_{min}}{2} \]

\[V_{max} = \max\{V_u, V_v, V_w\} \quad V_{min} = \min\{V_u, V_v, V_w\}\]

\(V_u, V_v, V_w\): U, V, W phase voltage reference
\(V'_u, V'_v, V'_w\): U, V, W phase voltage reference for PWM generation (Modulation wave)
4.6 Block Diagram of Sensorless Vector Control

Figure 4-8 shows block diagram sensorless vector control using BEMF observer when open-loop control is in use.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins
   Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.
   - The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on
   The state of the product is undefined at the moment when power is supplied.
   - The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
     In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
     In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses
   Access to reserved addresses is prohibited.
   - The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals
   After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.
   - When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products
   Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.
   - The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise.
     When changing to a product with a different part number, implement a system-evaluation test for the given product.
Notice

1. Descriptions of circuits, software, and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No licenses, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. “You” shall not alter, modify, copy, reverse engineer any Renesas product, whether, in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   1. “Standard” : Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   2. “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.), Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.

7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to, redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
