## Old Company Name in Catalogs and Other Documents

---

On April 1<sup>st</sup>, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: <http://www.renesas.com>

Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (<http://www.renesas.com>)

Send any inquiries to <http://www.renesas.com/inquiry>.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
  - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
  - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
  - “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

# Application Note

## 78K0S/Kx1+

### Sample Program (16-bit Timer/Event Counter 00)

### Pulse Width Measurement

This document describes an operation overview of the sample program and how to use it, as well as how to set and use the pulse width measurement function of 16-bit timer/event counter 00. In the sample program, the pulse width of the signal input from the TI000 pin is measured by using the pulse width measurement function of 16-bit timer/event counter 00.

Date Published September 2008 NS

• **The information in this document is current as of July, 2008. The information is subject to change without notice. For actual design-in, refer to the latest publications of NEC Electronics data sheets or data books, etc., for the most up-to-date specifications of NEC Electronics products. Not all products and/or types are available in every country. Please check with an NEC Electronics sales representative for availability and additional information.**

• No part of this document may be copied or reproduced in any form or by any means without the prior written consent of NEC Electronics. NEC Electronics assumes no responsibility for any errors that may appear in this document.

• NEC Electronics does not assume any liability for infringement of patents, copyrights or other intellectual property rights of third parties by or arising from the use of NEC Electronics products listed in this document or any other liability arising from the use of such products. No license, express, implied or otherwise, is granted under any patents, copyrights or other intellectual property rights of NEC Electronics or others.

• Descriptions of circuits, software and other related information in this document are provided for illustrative purposes in semiconductor product operation and application examples. The incorporation of these circuits, software and information in the design of a customer's equipment shall be done under the full responsibility of the customer. NEC Electronics assumes no responsibility for any losses incurred by customers or third parties arising from the use of these circuits, software and information.

• While NEC Electronics endeavors to enhance the quality, reliability and safety of NEC Electronics products, customers agree and acknowledge that the possibility of defects thereof cannot be eliminated entirely. To minimize risks of damage to property or injury (including death) to persons arising from defects in NEC Electronics products, customers must incorporate sufficient safety measures in their design, such as redundancy, fire-containment and anti-failure features.

• NEC Electronics products are classified into the following three quality grades: "Standard", "Special" and "Specific".

The "Specific" quality grade applies only to NEC Electronics products developed based on a customer-designated "quality assurance program" for a specific application. The recommended applications of an NEC Electronics product depend on its quality grade, as indicated below. Customers must check the quality grade of each NEC Electronics product before using it in a particular application.

"Standard": Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment and industrial robots.

"Special": Transportation equipment (automobiles, trains, ships, etc.), traffic control systems, anti-disaster systems, anti-crime systems, safety equipment and medical equipment (not specifically designed for life support).

"Specific": Aircraft, aerospace equipment, submersible repeaters, nuclear reactor control systems, life support systems and medical equipment for life support, etc.

The quality grade of NEC Electronics products is "Standard" unless otherwise expressly specified in NEC Electronics data sheets or data books, etc. If customers wish to use NEC Electronics products in applications not intended by NEC Electronics, they must contact an NEC Electronics sales representative in advance to determine NEC Electronics' willingness to support a given application.

(Note)

(1) "NEC Electronics" as used in this statement means NEC Electronics Corporation and also includes its majority-owned subsidiaries.

(2) "NEC Electronics products" means any product developed or manufactured by or for NEC Electronics (as defined above).

## CHAPTER 1 OVERVIEW

An example of using the pulse width measurement function of 16-bit timer/event counter 00 is presented in this sample program. The pulse width of the signal input from the TI000 pin is measured eight times.

### 1.1 Main Contents of the Initial Settings

The main contents of the initial settings are as follows.

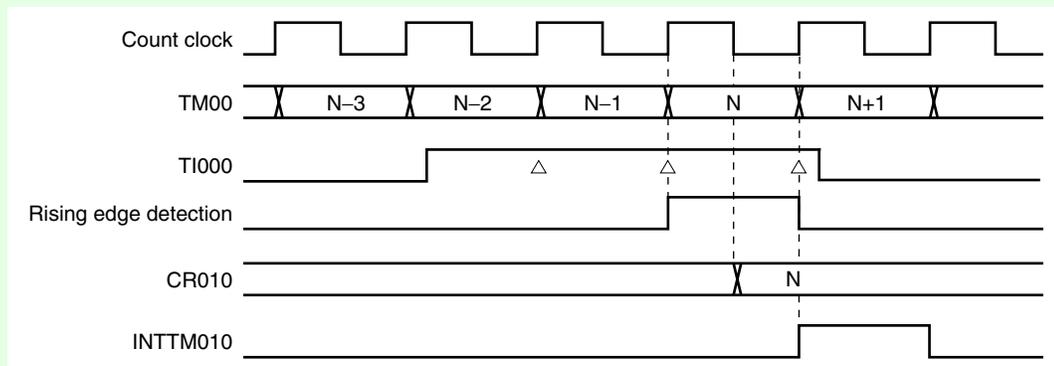

- Selecting the high-speed internal oscillator as the system clock source<sup>Note</sup>
- Stopping watchdog timer operation
- Setting  $V_{LVI}$  (low-voltage detection voltage) to  $4.3\text{ V} \pm 0.2\text{ V}$
- Generating an internal reset (LVI reset) signal when it is detected that  $V_{DD}$  is less than  $V_{LVI}$ , after  $V_{DD}$  (power supply voltage) becomes greater than or equal to  $V_{LVI}$
- Setting the CPU clock frequency to 8 MHz
- Setting the I/O ports
- Setting 16-bit timer/event counter 00
  - Setting the operation modes of CR000 and CR010 as a compare register and a capture register, respectively
  - Setting “FFFFH” to CR000
  - Setting the valid edge of the TI000 pin to both the falling and rising edges and setting the count clock to  $f_{XP}/2^2$  (2 MHz)
  - Setting the operation mode to clear & start upon detection of the valid edge of the TI000 pin
- Enabling INTTM000 and INTTM010 interrupts

**Note** This is set by using the option byte.

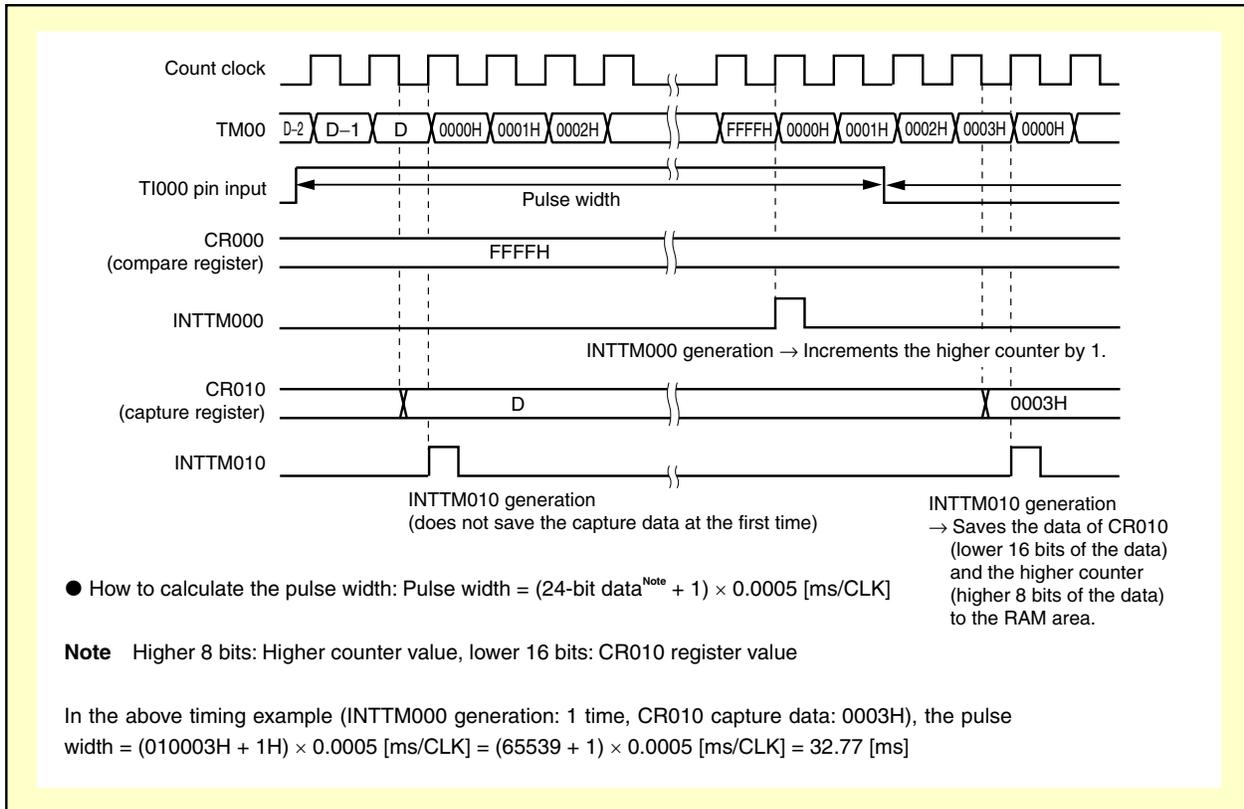

#### [Column] Capture operation timing

With 16-bit timer/event counter 00, capture operation is performed for the first time when the valid level of the TI000 pin or TI010 pin is detected twice, in order to eliminate the noise with a short pulse width. An input pulse that is longer than two count clock cycles is therefore required. The following diagram shows an operation example in which CR010 is captured when the rising edge is specified.

## 1.2 Contents Following the Main Loop

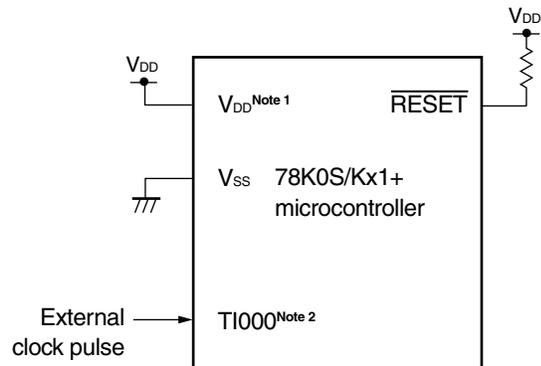

The pulse width of the signal input from the T1000 pin is measured eight times by using the generation of 16-bit timer/event counter 00 interrupts (INTTM000 and INTTM010), after completion of the initial settings.

**Caution** For cautions when using the device, refer to the user's manual of each product ([78K0S/KU1+](#), [78K0S/KY1+](#), [78K0S/KA1+](#), [78K0S/KB1+](#)).

## CHAPTER 2 CIRCUIT DIAGRAM

This chapter describes a circuit diagram to be used in this sample program.

**Notes** 1. Use this in a voltage range of  $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}$ .

2. TI000/INTP0/P30: 78K0S/KA1+ and 78K0S/KB1+ microcontrollers  
TI000/ANI0/TOH1/P20: 78K0S/KY1+ and 78K0S/KU1+ microcontrollers

- Cautions**
1. Connect the  $AV_{REF}$  pin directly to  $V_{DD}$  (only for the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers).
  2. Connect the  $AV_{SS}$  pin directly to GND (only for the 78K0S/KB1+ microcontroller).
  3. Leave all unused pins open (unconnected), except for the pins shown in the circuit diagram and the  $AV_{REF}$  and  $AV_{SS}$  pins.

## CHAPTER 3 SOFTWARE

This chapter describes the file configuration of the compressed file to be downloaded, internal peripheral functions of the microcontroller to be used, and initial settings and operation overview of the sample program, and shows a flow chart.

### 3.1 File Configuration

The following table shows the file configuration of the compressed file to be downloaded.

File Name	Description	Compressed (*.zip) File Included	
			
main.asm (Assembly language version) ----- main.c (C language version)	Source file for hardware initialization processing and main processing of microcontroller	● Note	● Note
op.asm	Assembler source file for setting the option byte (sets the system clock source)	●	●
tm00cap.prw	Work space file for integrated development environment PM+		●
tm00cap.prj	Project file for integrated development environment PM+		●

**Note** “main.asm” is included with the assembly language version, and “main.c” with the C language version.

**Remark**  : Only the source file is included.

 : The files to be used with integrated development environment PM+ are included.

### 3.2 Internal Peripheral Functions to Be Used

The following internal peripheral functions of the microcontroller are used in this sample program.

- Pulse width measurement function: 16-bit timer/event counter 00
- $V_{DD} < V_{LVI}$  detection: Low-voltage detector (LVI)
- External pulse input: TI000<sup>Note</sup>

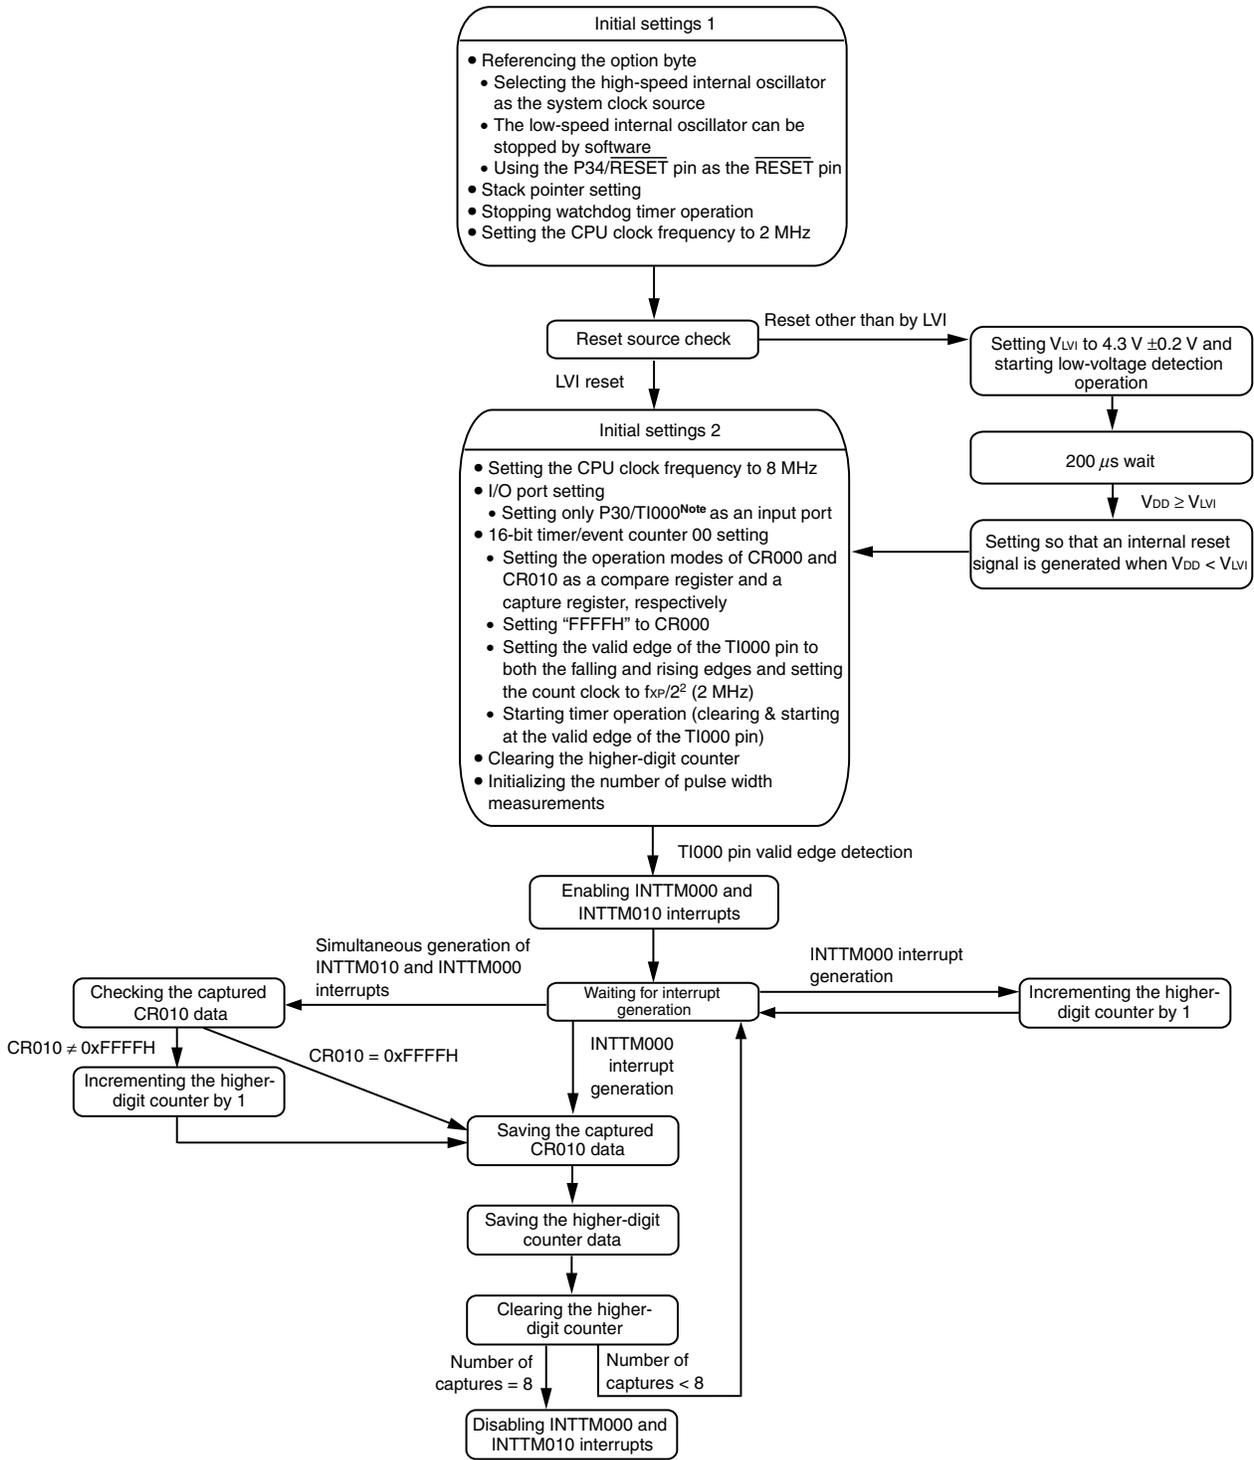

**Note** TI000/INTP0/P30: 78K0S/KA1+ and 78K0S/KB1+ microcontrollers  
TI000/ANI0/TOH1/P20: 78K0S/KY1+ and 78K0S/KU1+ microcontrollers

### 3.3 Initial Settings and Operation Overview

In this sample program, initial settings including the setting of the low-voltage detection function, selection of the clock frequency, setting of the I/O ports, setting of 16-bit timer/event counter 00 (pulse width measurement function), and setting of interrupts are performed.

The pulse width of the signal input from the TI000 pin is measured eight times by using the generation of 16-bit timer/event counter 00 interrupts (INTTM000 and INTTM010), after completion of the initial settings.

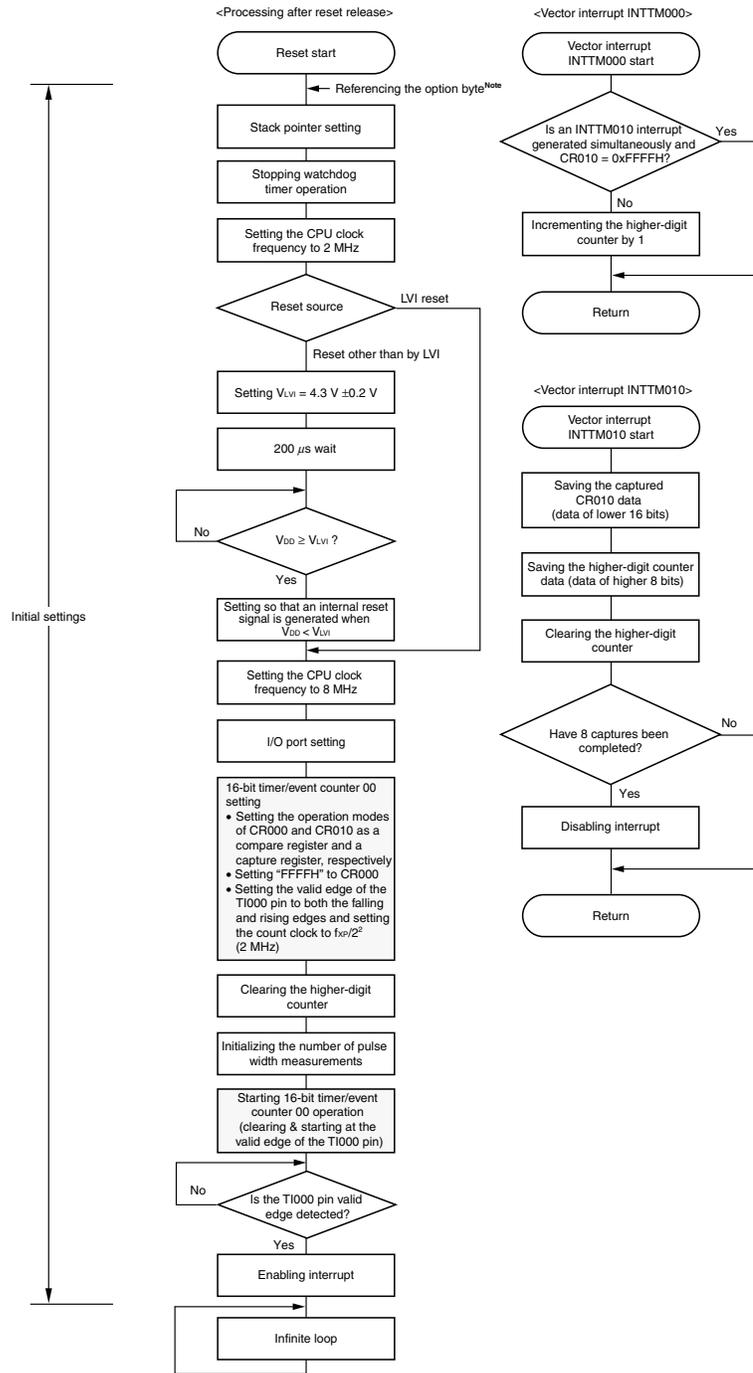

The details are described in the status transition diagram shown below.

**Note** TI000/P30: 78K0S/KA1+ and 78K0S/KB1+ microcontrollers  
 TI000/P20: 78K0S/KY1+ and 78K0S/KU1+ microcontrollers

### 3.4 Flow Charts

The flow charts for the sample program are shown below.

**Note** Referencing the option byte is automatically performed by the microcontroller after reset release. In this sample program, the following contents are set by referencing the option byte.

- Using the high-speed internal oscillation clock (8 MHz (TYP.)) as the system clock source
- The low-speed internal oscillator can be stopped by using software
- Using the P34/RESET pin as the RESET pin

## CHAPTER 4 SETTING METHODS

This chapter describes the pulse width measurement function of 16-bit timer/event counter 00.

For other initial settings, refer to the [78K0S/Kx1+ Sample Program \(Initial Settings\) LED Lighting Switch Control Application Note](#). For interrupt, refer to the [78K0S/Kx1+ Sample Program \(Interrupt\) External Interrupt Generated by Switch Input Application Note](#). For low-voltage detection (LVI), refer to the [78K0S/Kx1+ Sample Program \(Low-Voltage Detection\) Reset Generation During Detection at Less than 2.7 V Application Note](#).

For how to set registers, refer to the user's manual of each product ([78K0S/KU1+](#), [78K0S/KY1+](#), [78K0S/KA1+](#), [78K0S/KB1+](#)).

For assembler instructions, refer to the [78K/0S Series Instructions User's Manual](#).

### 4.1 Setting the Pulse Width Measurement Function of 16-bit Timer/Event Counter 00

The following seven types of registers are set when using the pulse width measurement function of 16-bit timer/event counter 00.

- Capture/compare control register 00 (CRC00)
- Prescaler mode register 00 (PRM00)
- 16-bit timer mode control register 00 (TMC00)
- 16-bit timer capture/compare register 000 (CR000)
- 16-bit timer capture/compare register 010 (CR010)
- Port mode register x (PMx)<sup>Note</sup>
- Port mode control register x (PMCx)<sup>Note</sup>

**Note** Set as follows, because the pulse width measurement function uses only the TI000 pin or the TI000 pin and TI010 pin as the timer input.

- TI000 pin

	PMx Register	PMCx Register
78K0S/KA1+ and 78K0S/KB1+ microcontrollers	PM30 = 1	Setting not required
78K0S/KY1+ and 78K0S/KU1+ microcontrollers	PM20 = 1	PMC20 = 0

- TI010 pin

	PMx Register	PMCx Register
78K0S/KA1+ and 78K0S/KB1+ microcontrollers	PM31 = 1	Setting not required
78K0S/KY1+ and 78K0S/KU1+ microcontrollers	PM21 = 1	PMC21 = 0

<Example of the basic operation setting procedure when using 16-bit timer/event counter 00 for pulse width measurement>

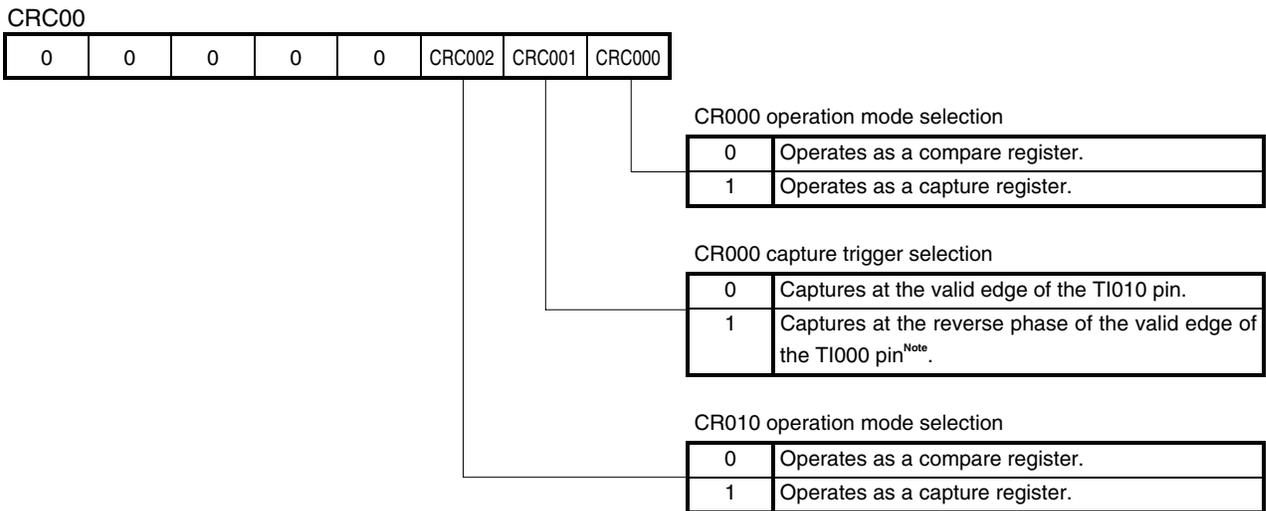

- <1> Setting the CRC00 register
- <2> Setting the count clock using the PRM00 register
- <3> Setting the TMC00 register: starting operation

**Caution** Steps <1> and <2> may be performed randomly.

**(1) Setting the CRC00 register**

This register controls the operation of the CR000 and CR010 registers.

**Figure 4-1. Format of Capture/Compare Control Register 00 (CRC00)**

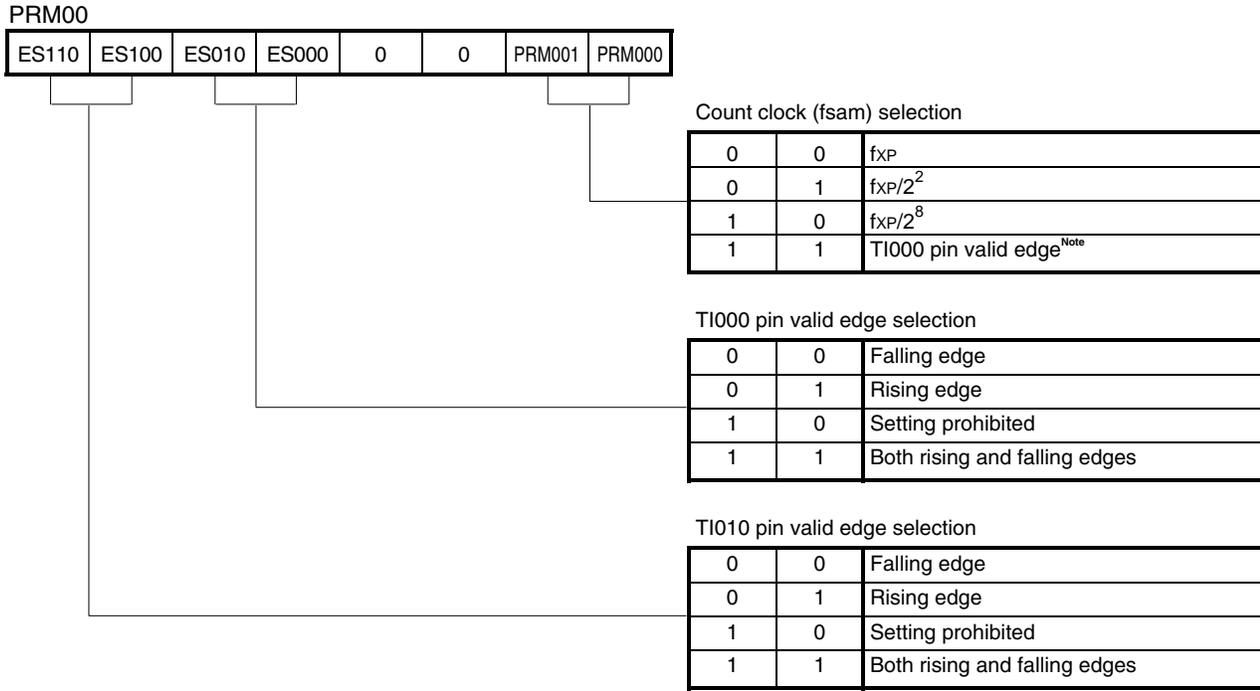

**Note** If CRC000 is 1, when both the falling and rising edges are selected as the valid edge of the TI000 pin, the CR000 register cannot perform capture operation.

- Cautions**
1. The timer operation must be stopped before setting the CRC00 register.
  2. Do not specify the CR000 register as a capture register when the clear & start mode has been selected upon a match between TM00 and CR000 by using the TMC00 register.
  3. The capture trigger requires a pulse that is longer than 2 cycles of the count clock selected by using prescaler mode register 00 (PRM00) for surely performing capture.

(2) Setting the PRM00 register

This register is used to set the count clock of the TM00 counter and the valid edges of the TI000 and TI010 inputs.

Figure 4-2. Format of Prescaler Mode Register 00 (PRM00)

**Note** The external clock requires a pulse longer than two cycles of the internal clock ( $f_{XP}$ ).

**Remark**  $f_{XP}$ : Oscillation frequency of the clock supplied to peripheral hardware

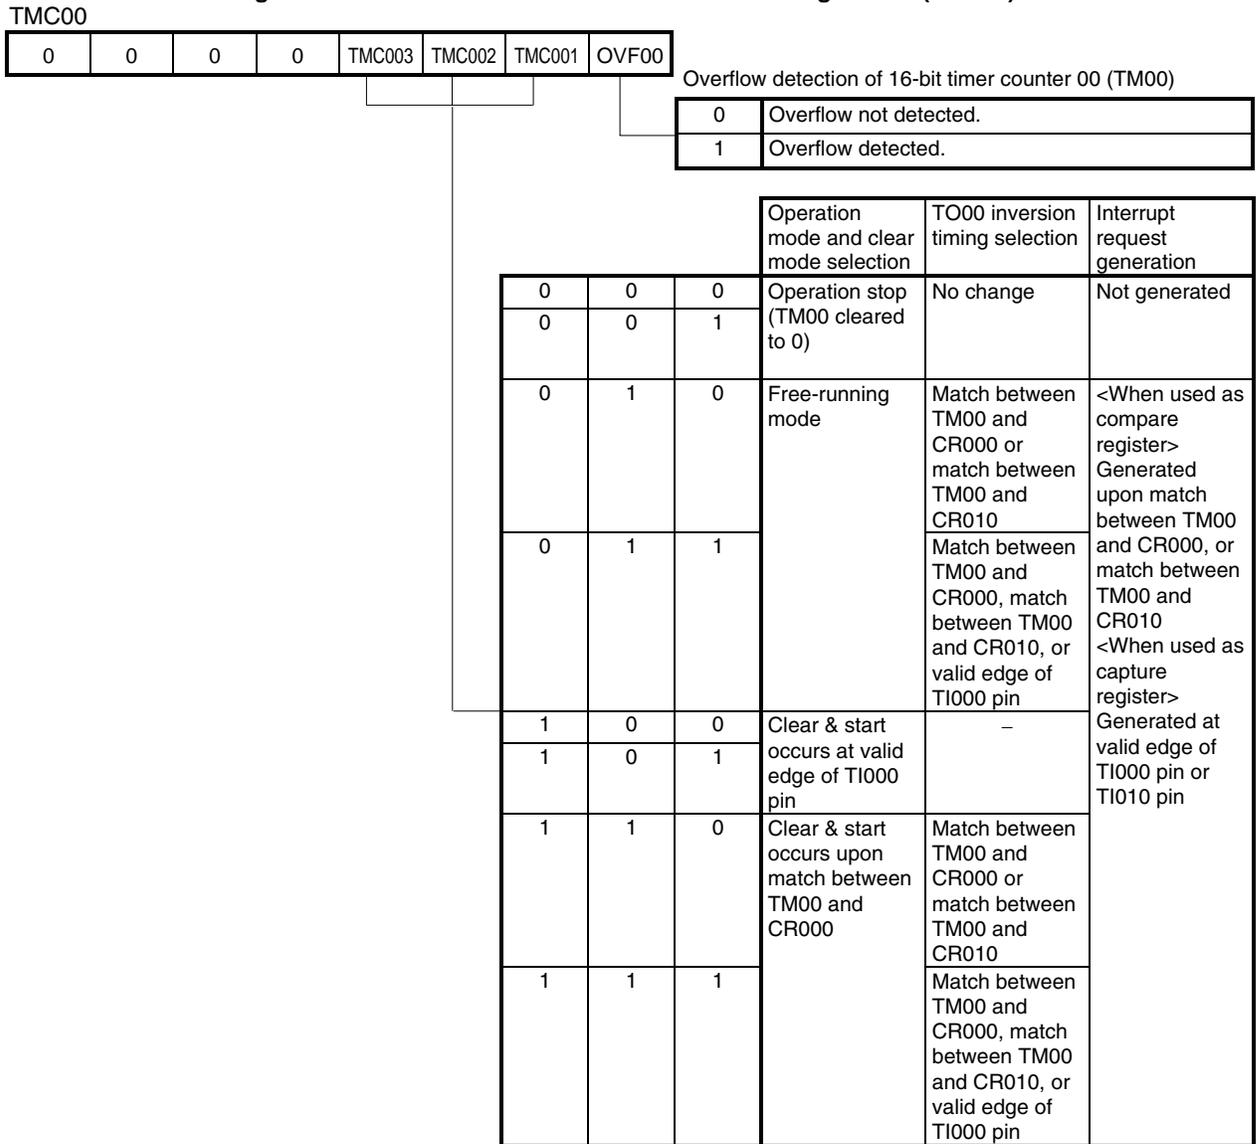

- Cautions**
- Always set data to the PRM00 register after stopping timer operation.
  - When setting the valid edge of the TI000 pin as the count clock, do not set the clear & start mode with the valid edge of the TI000 pin and the TI000 pin as the capture trigger.
  - In the following cases, note with caution that the valid edge of the TI0n0 pin ( $n = 0, 1$ ) is detected.
    - <1> A high level is input to the TI0n0 pin and the TM00 operation is enabled immediately after a system reset.
      - If the rising edge or both the rising and falling edges are specified as the valid edge of the TI0n0 pin, a rising edge is detected immediately after the TM00 operation is enabled.
    - <2> The TM00 operation is stopped while the TI0n0 pin is at high level and it is then enabled after a low level is input to the TI0n0 pin.
      - If the falling edge or both the rising and falling edges are specified as the valid edge of the TI0n0 pin, a falling edge is detected immediately after the TM00 operation is enabled.
    - <3> The TM00 operation is stopped while the TI0n0 pin is at low level and it is then enabled after a high level is input to the TI0n0 pin.
      - If the rising edge or both the rising and falling edges are specified as the valid edge of the TI0n0 pin, a rising edge is detected immediately after the TM00 operation is enabled.

- Cautions 4.** To use the valid edge of TI000 as the capture trigger, it is sampled with the count clock that is selected with prescaler mode register 00 (PRM00) to eliminate noise. The capture operation is not performed until the valid edge is sampled and the valid level is detected twice, thus eliminating noise with a short pulse width.
- 5.** When the TI010/TO00/Pxx pin is used as the input pin (TI010) of the valid edge, it cannot be used as a timer output pin (TO00). When it is used as a timer output pin (TO00), it cannot be used as the input pin (TI010) of the valid edge.

**(3) Setting the TMC00 register**

This register sets the 16-bit timer/event counter 00 operation mode, TM00 counter clear mode, and output timing, and detects overflows.

**Figure 4-3. Format of 16-bit Timer Mode Control Register 00 (TMC00)**

- Cautions**
1. The operation of the TM00 counter starts when values other than 0 and 0 (operation stop mode) are set to TMC002 and TMC003, respectively. To stop the operation, set TMC002 and TMC003 to 0 and 0, respectively.
  2. Write to the bits other than the OVF00 flag after stopping the timer operation.
  3. When the timer is stopped, timer counts and timer interrupts do not occur, even if a signal is input to the TI000/TI010 pin.
  4. Except when the valid edge of the TI000 pin is selected as the count clock, stop the timer operation before setting to the STOP mode or system clock stop mode; otherwise the timer may malfunction when the system clock starts.
  5. Set the valid edge of the TI000 pin with bits 4 and 5 of the PRM00 register after stopping the timer operation.
  6. If the clear & start mode is set upon a match between TM00 and CR000 or at the valid edge of the TI000 pin, or the free-running mode is selected, when the set value of the CR000 register is FFFFH and the TM00 counter value changes from FFFFH to 0000H, the OVF00 flag is set to 1.
  7. Even if the OVF00 flag is cleared before the next count clock is counted (before the TM00 counter becomes 0001H) after the TM00 counter overflows, it is re-set and clearing is disabled.
  8. Capture operation is performed at the fall of the count clock. An interrupt request (INTTM0n0: n = 0, 1), however, occurs at the rise of the next count clock.

#### (4) Setting the CR000 register

This register has the functions of both a capture register and a compare register.

**Figure 4-4. Format of 16-bit Timer Capture/Compare Register 000 (CR000)**

- When using CR000 as a compare register  
The value set to CR000 is constantly compared with the 16-bit timer counter 00 (TM00) count value, and an interrupt request (INTTM000) is generated if they match.
- When using CR000 as a capture register  
The valid edges of the TI000 pin or TI010 pin can be selected as the capture trigger. The valid edges of the TI000 and TI010 pins are set by using the [PRM00 register](#).

- Cautions**
1. Set a value other than 0000H to the CR000 register in the clear & start mode entered on a match between TM00 and CR000. When 0000H is set to CR000 in the free-running mode or the clear & start mode entered by the valid edge of the TI000 pin, an interrupt request (INTTM000) is generated when 0000H turns to 0001H, after an overflow (FFFFH) occurs.
  2. If the new CR000 register value is less than the TM00 counter value, the TM00 counter continues counting, overflows, and then starts counting from 0 again. If the new CR000 register value is less than the old value, therefore, the timer must be reset and restarted after the value of the CR000 register is changed.
  3. The value of the CR000 register after the TM00 counter has been stopped is not guaranteed.
  4. Capture operation may not be performed for the CR000 register set to the compare mode, even if a capture trigger is input.

- Cautions 5.** When CR000 is used as the capture register, if the register read period and capture trigger input conflict, the capture trigger input takes precedence and the CR000 read data becomes undefined. If the timer count stop and capture trigger input conflict, the capture data becomes undefined.
- 6.** Changing the CR000 register setting during TM00 counter operation may cause a malfunction.

#### (5) Setting the CR010 register

This register has the functions of both a capture register and a compare register.

**Figure 4-5. Format of 16-bit Timer Capture/Compare Register 010 (CR010)**

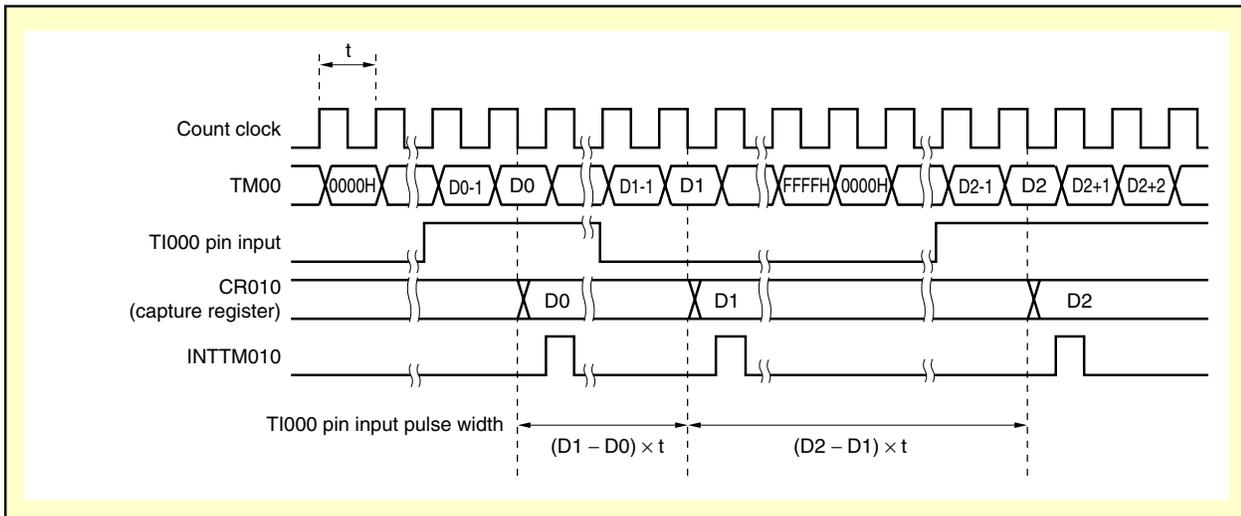

- When using CR010 as a compare register  
The value set to CR010 is constantly compared with the 16-bit timer counter 00 (TM00) count value, and an interrupt request (INTTM010) is generated if they match.
  - When using CR010 as a capture register  
The valid edge of the TI000 pin can be selected as the capture trigger. The valid edge of the TI000 pin is set by using the [PRM00 register](#).
- Cautions 1.** When 0000H is set to CR010 in the free-running mode or the clear & start mode entered by the valid edge of the TI000 pin, an interrupt request (INTTM010) is generated when 0000H turns to 0001H, after an overflow (FFFFH) occurs.
- 2.** If the new CR010 register value is less than the TM00 counter value, the TM00 counter continues counting, overflows, and then starts counting from 0 again. If the new CR010 register value is less than the old value, therefore, the timer must be reset and restarted after the value of the CR010 register is changed.
- 3.** The value of the CR010 register after the TM00 counter has been stopped is not guaranteed.
- 4.** Capture operation may not be performed for the CR010 register set to the compare mode, even if a capture trigger is input.
- 5.** When CR010 is used as the capture register, if the register read period and capture trigger input conflict, the capture trigger input takes precedence and the CR010 read data becomes undefined. If the timer count stop and capture trigger input conflict, the capture data becomes undefined.
- 6.** Changing the CR010 register setting during TM00 counter operation may cause a malfunction.

**[Example 1]** Measuring the pulse width with the input signal of the TI000 pin (using the CR010 register as a capture register, free-running mode)

The pulse width of the signal input to the TI000 pin is measured when the TM00 counter is operated in the free-running mode. The TM00 counter count value is captured to the CR010 register when the valid edge of the TI000 pin is detected.

**Caution** The pulse width that can be measured in this operation example is up to one timer counter cycle.

**Figure 4-6. Timing Example When Measuring the Pulse Width with the Input Signal of the TI000 Pin (Free-Running Mode, Both-Edge Specification)**

**(1) Register settings**

<1> CRC00

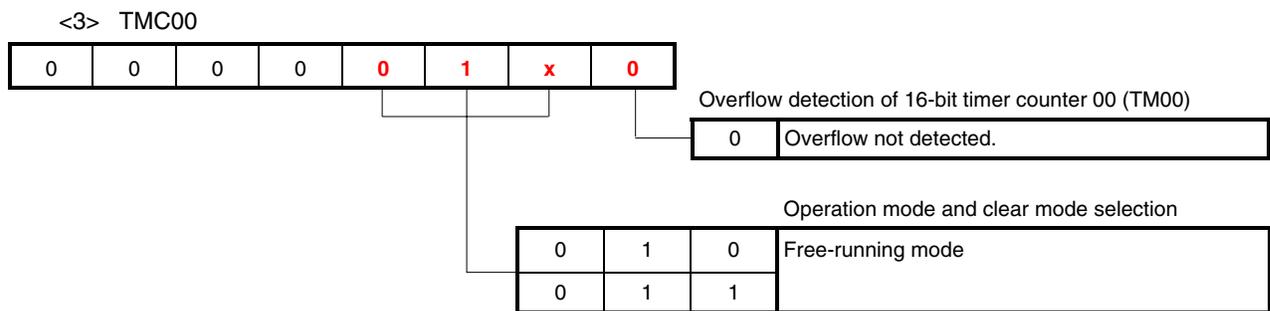

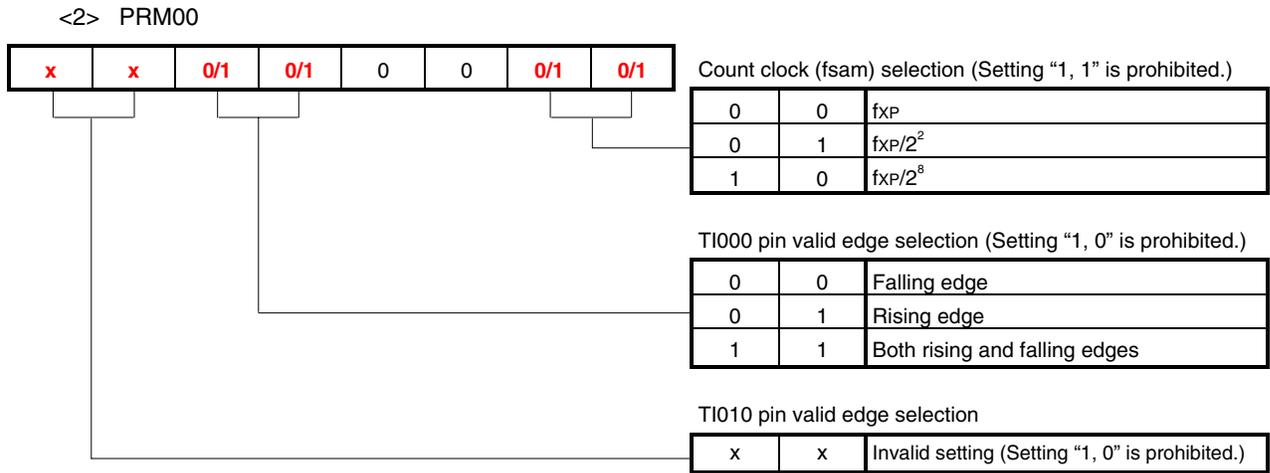

- CR000 operation mode selection  

0	Operates as a compare register.
---	---------------------------------
- CR000 capture trigger selection  

x	Invalid setting
---	-----------------
- CR010 operation mode selection  

1	Operates as a capture register.
---	---------------------------------

<4> PMx, PMCx

	PMx Register	PMCx Register
78K0S/KA1+ and 78K0S/KB1+ microcontrollers	PM30 = 1	Setting not required
78K0S/KY1+ and 78K0S/KU1+ microcontrollers	PM20 = 1	PMC20 = 0

(2) Sample program

In the example below, "x" in (1) **Register settings** is set to "0". Furthermore, the valid edge of the TI000 pin is set to both edges and the count clock is set to  $f_{XP}$  (system clock frequency).

<1> Assembly language (when using the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers)

```
SET1    PM3.0
MOV     CRC00, #00000100B
MOV     PRM00, #00110000B

TMC00 = 0b00000100;
```

**[Example 2]** Measuring the pulse width with the input signals of the TI000 pin and TI010 pin (using the CR000 register and CR010 register as capture registers, free-running mode)

The pulse widths of the two signals input to the TI000 pin and TI010 pin are measured simultaneously when the TM00 counter is operated in the free-running mode. The TM00 counter count value is captured to the CR010 register when the valid edge of the TI000 pin is detected and the TM00 counter count value is captured to the CR000 register when the valid edge of the TI010 pin is detected.

**Caution** The pulse width that can be measured in this operation example is up to one timer counter cycle.

**Figure 4-7. Timing Example When Measuring the Pulse Width with the Input Signals of the TI000 Pin and TI010 Pin (Free-Running Mode, Both-Edge Specification)**

1	1	Both rising and falling edges

TI010 pin valid edge selection (Setting "1, 0" is prohibited.)

0	0	Falling edge
0	1	Rising edge
1	1	Both rising and falling edges

<4> PMx, PMCx

	PMx Register	PMCx Register
78K0S/KA1+ and 78K0S/KB1+ microcontrollers	PM30 = 1, PM31 = 1	Setting not required
78K0S/KY1+ and 78K0S/KU1+ microcontrollers	PM20 = 1, PM21 = 1	PMC20 = 0, PMC21 = 0

(2) Sample program

In the example below, “x” in (1) **Register settings** is set to “0”. Furthermore, the valid edges of the TI000 pin and TI010 pin are set to both edges and the count clock is set to  $f_{XP}$  (system clock frequency).

<1> Assembly language (when using the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers)

```
SET1  PM3.0
SET1  PM3.1
MOV   CRC00, #00000101B
MOV   PRM00, #11110000B
MOV   TMC00, #00000100B
```

<2> C language (when using the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers)

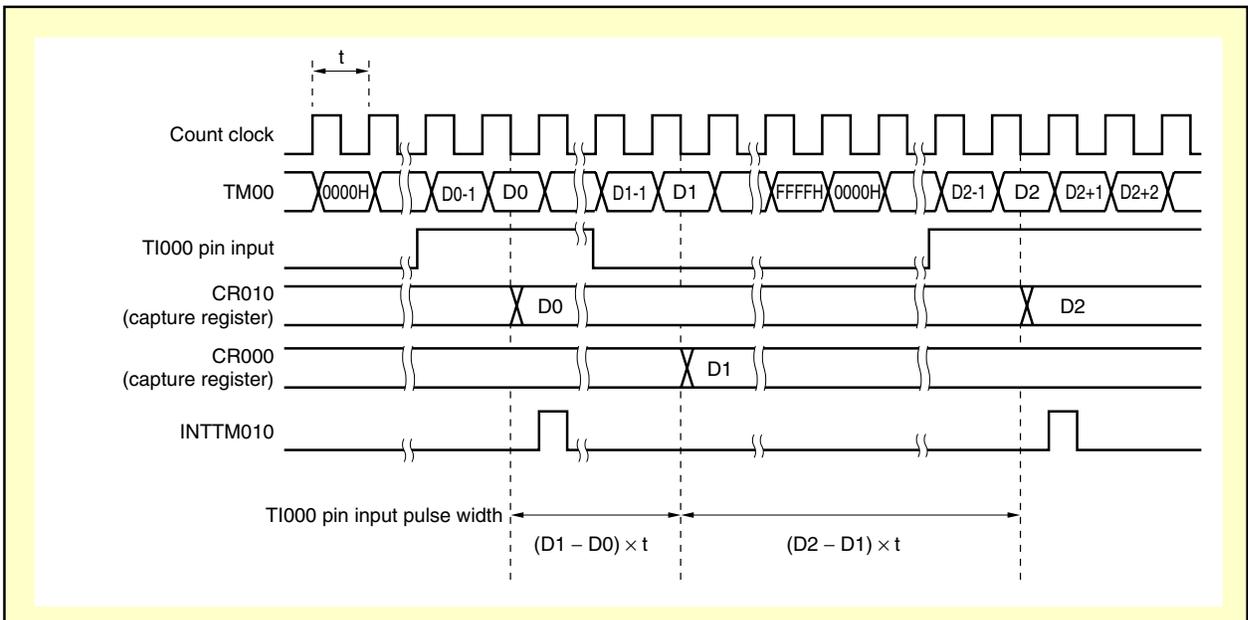

```
PM3.0 = 1;
PM3.1 = 1;
CRC00 = 0b00000101;
PRM00 = 0b11110000;
TMC00 = 0b00000100;
```

**[Example 3]** Measuring the pulse width with the input signal of the TI000 pin (using the CR000 register and CR010 register as capture registers, free-running mode)

The pulse width of the signal input to the TI000 pin is measured when the TM00 counter is operated in the free-running mode. The TM00 counter count value is captured to the CR010 register when the valid edge of the TI000 pin is detected and the TM00 counter count value is captured to the CR000 register by the phase reverse to that when the valid edge of the TI000 pin is detected. Set the valid edge detection of the TI000 pin as the rising edge or falling edge.

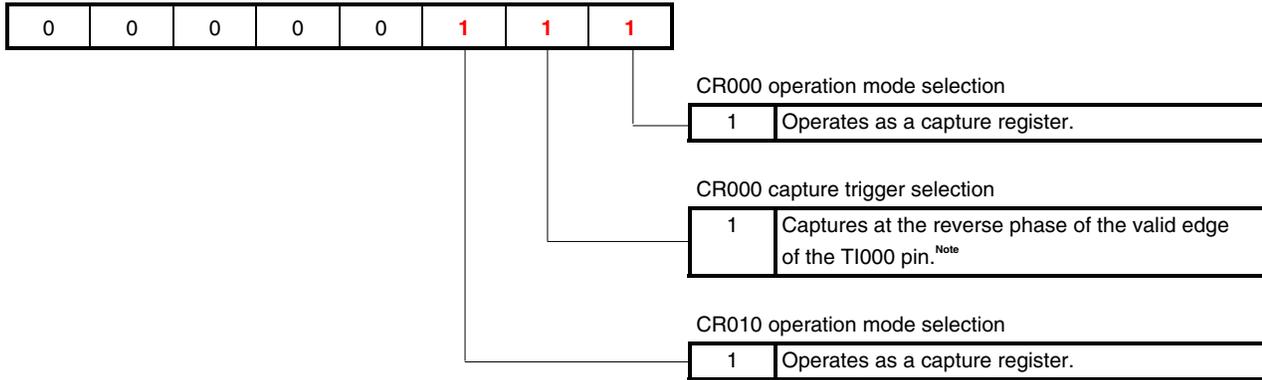

**Caution** The pulse width that can be measured in this operation example is up to one timer counter cycle.

**Figure 4-8. Timing Example When Measuring the Pulse Width with the Input Signal of the TI000 Pin (Free-Running Mode, Rising-Edge Specification)**

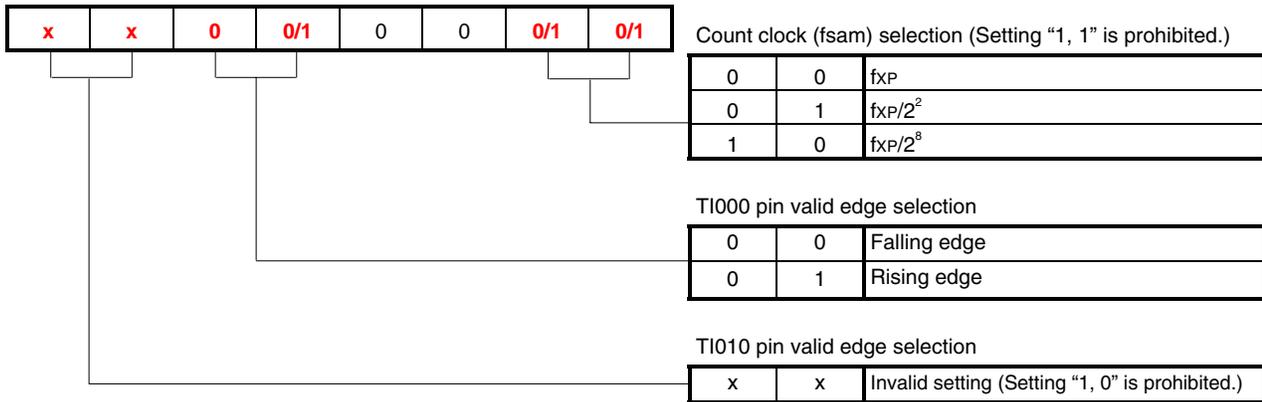

(1) Register settings

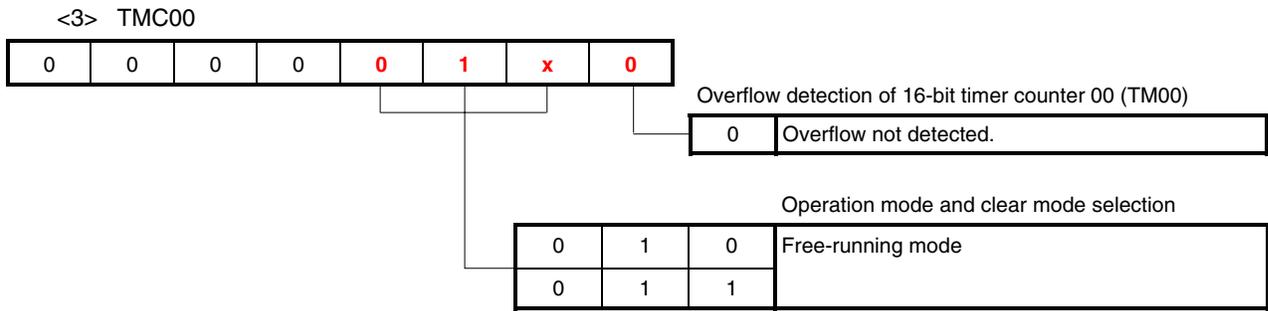

<1> CRC00

**Note** If CRC000 is 1, when both the falling and rising edges are selected as the valid edge of the TI000 pin, the CR000 register cannot perform capture operation. If CRC001 is 1, capture to the CR000 register by the valid edge of the TI010 pin cannot be performed; however, the TI010 pin can be used as an external interrupt, because INTTM000 is generated.

<2> PRM00

<4> PMx, PMCx

	PMx Register	PMCx Register
78K0S/KA1+ and 78K0S/KB1+ microcontrollers	PM30 = 1	Setting not required
78K0S/KY1+ and 78K0S/KU1+ microcontrollers	PM20 = 1	PMC20 = 0

(2) Sample program

In the example below, “x” in (1) **Register settings** is set to “0”. Furthermore, the valid edge of the TI000 pin is set to rising edge and the count clock is set to  $f_{XP}$  (system clock frequency).

<1> Assembly language (when using the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers)

```
SET1    PM3.0
MOV     CRC00, #00000111B
MOV     PRM00, #00010000B
MOV     TMC00, #00000100B
```

<2> C language (when using the 78K0S/KA1+ and 78K0S/KB1+ microcontrollers)

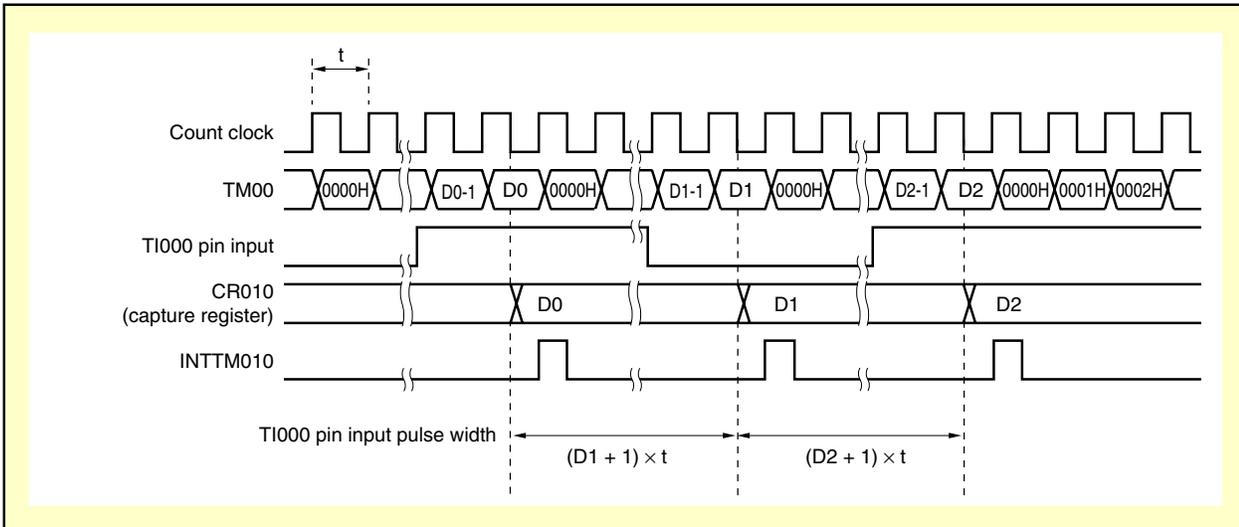

```
PM3.0 = 1;
CRC00 = 0b00000111;
PRM00 = 0b00010000;
TMC00 = 0b00000100;
```

**[Example 4]** Measuring the pulse width with the input signal of the TI000 pin (using the CR000 register as a capture register, clear & start mode entered by inputting the valid edge of the TI000 pin)

The pulse width of the signal input to the TI000 pin is measured when the TM00 counter is operated in the clear & start mode entered by inputting the valid edge of the TI000 pin. The TM00 counter is cleared, counting is restarted, and the pulse width of the signal input to the TI000 pin is measured after the TM00 counter count value is captured to the CR010 register by detecting the valid edge of the TI000 pin.

**Caution** The pulse width that can be measured in this operation example is up to one timer counter cycle.

**Figure 4-9. Timing Example When Measuring the Pulse Width with the Input Signal of the TI000 Pin (Clear & Start Mode Entered by TI000 Pin Valid Edge Input, Both-Edge Specification)**

TMC00 = 0b00001000;
```

**[Example 5]** Measuring with the input signal of the TI000 pin the width of a pulse that is longer than a TM00 counter cycle (using the CR010 register as a capture register and the CR000 register as a compare register, clear & start mode entered by inputting the valid edge of the TI000 pin)  
(Same contents as in this sample program source)

The pulse width of the signal input to the TI000 pin is measured when the TM00 counter is operated in the clear & start mode entered by inputting the valid edge of the TI000 pin.  
The values of the CR000 register and TM00 counter match when the operation mode of the CR000 register is set as a compare register and CR000 is set to FFFFH, and an INTTM000 interrupt is generated when the TM00 counter changes from FFFFH to 0000H. The width of a pulse that is longer than a TM00 counter cycle can be measured by using this interrupt as an overflow interrupt and counting up the higher digits when an INTTM000 interrupt is generated.  
The TM00 counter is cleared, counting is restarted, and the pulse width of the signal input to the TI000 pin is measured after the TM00 counter count value is captured to the CR010 register by detecting the valid edge of the TI000 pin.

    g_unHighLength[8 - g_ucTimes] = g_ucHighCount; /* Read the higher digits */
    .
    .
    .
    return;
}

```

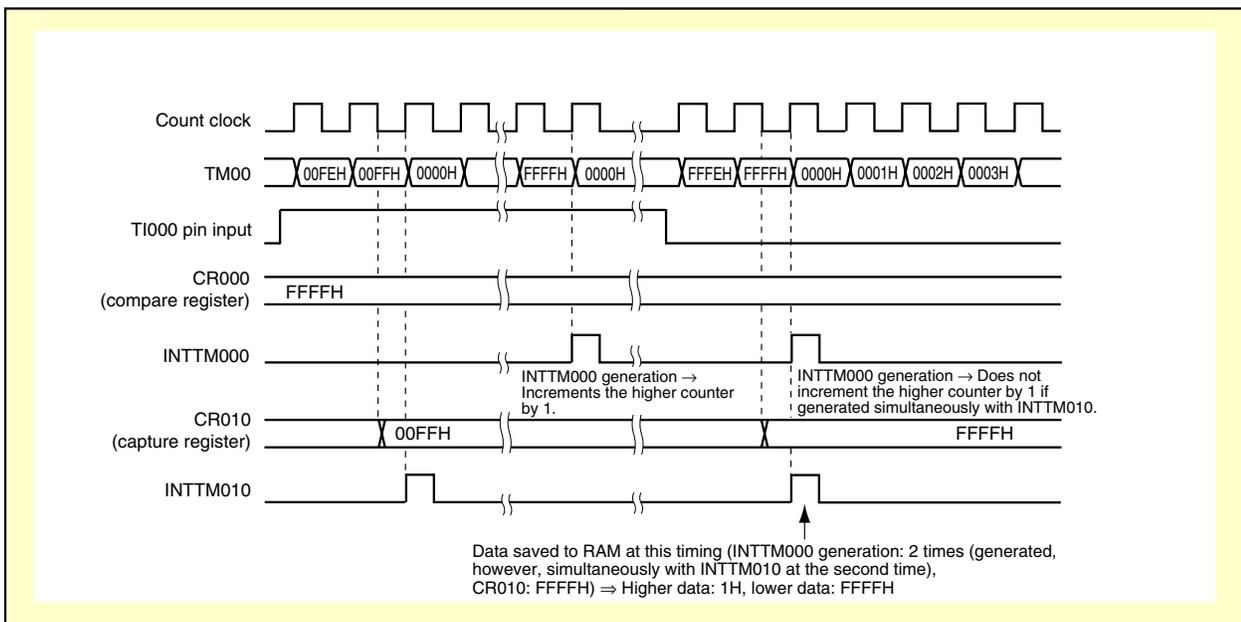

#### 4.2 Timing When Generation of INTTM000 and INTTM010 Interrupts Conflict (When Measuring the Width of a Pulse that is Longer than a TM00 Counter Cycle)

The operation modes of the CR010 and CR000 registers are set as a capture register and as a compare register, respectively, and the CR000 register is set to FFFFH in this sample program. The clear & start mode entered by the valid edge of the TI000 pin is set (see [Example 5] above).

The values of the CR000 register and TM00 counter match due to these settings and an INTTM000 interrupt is generated when the TM00 counter changes from FFFFH to 0000H. The width of a pulse that is longer than a TM00 counter cycle can be measured by using this interrupt as an overflow interrupt and counting up the higher digits when an INTTM000 interrupt is generated.

When an INTTM000 interrupt is generated simultaneously with an INTTM010 interrupt, INTTM000 interrupt servicing takes precedence. At this time, The CR010 register capture data becomes FFFFH and the higher digits need not to be counted up. The higher digits, therefore, are not counted up, and the higher digit data and CR010 register capture data (FFFFH) are saved to the RAM area when an INTTM000 interrupt is generated simultaneously with an INTTM010 interrupt.

**Figure 4-11. Timing Example When INTTM000 and INTTM010 Interrupts Conflict (Clear & Start Mode Entered by TI000 Pin Valid Edge Input, Both-Edge Specification)**

## CHAPTER 5 OPERATION CHECK USING THE DEVICE

This chapter describes the flow from building to the operation check using the device, using the downloaded sample program.

<R>

### 5.1 Building the Sample Program

This section describes how to build sample programs, using the sample program (source program + project file) downloaded by clicking the  icon. See the [78K0S/Kx1+ Sample Program Startup Guide Application Note](#) for how to build other downloaded programs.

For the details of how to operate PM+, refer to the [PM+ Project Manager User's Manual](#).

#### [Column] Build errors

Change the compiler option setting according to the following procedure when the error message “A006 File not found ‘C:\NECTOOLS32\LIB78K0S\s0sl.rel’” or “\*\*\* ERROR F206 Segment ‘@@DATA’ can’t allocate to memory - ignored.” is displayed, when building with PM+.

<1> Select [Compiler Options] from the [Tool] menu.

<2> The [Compiler Options] dialog box will be displayed. Select the [Startup Routine] tab.

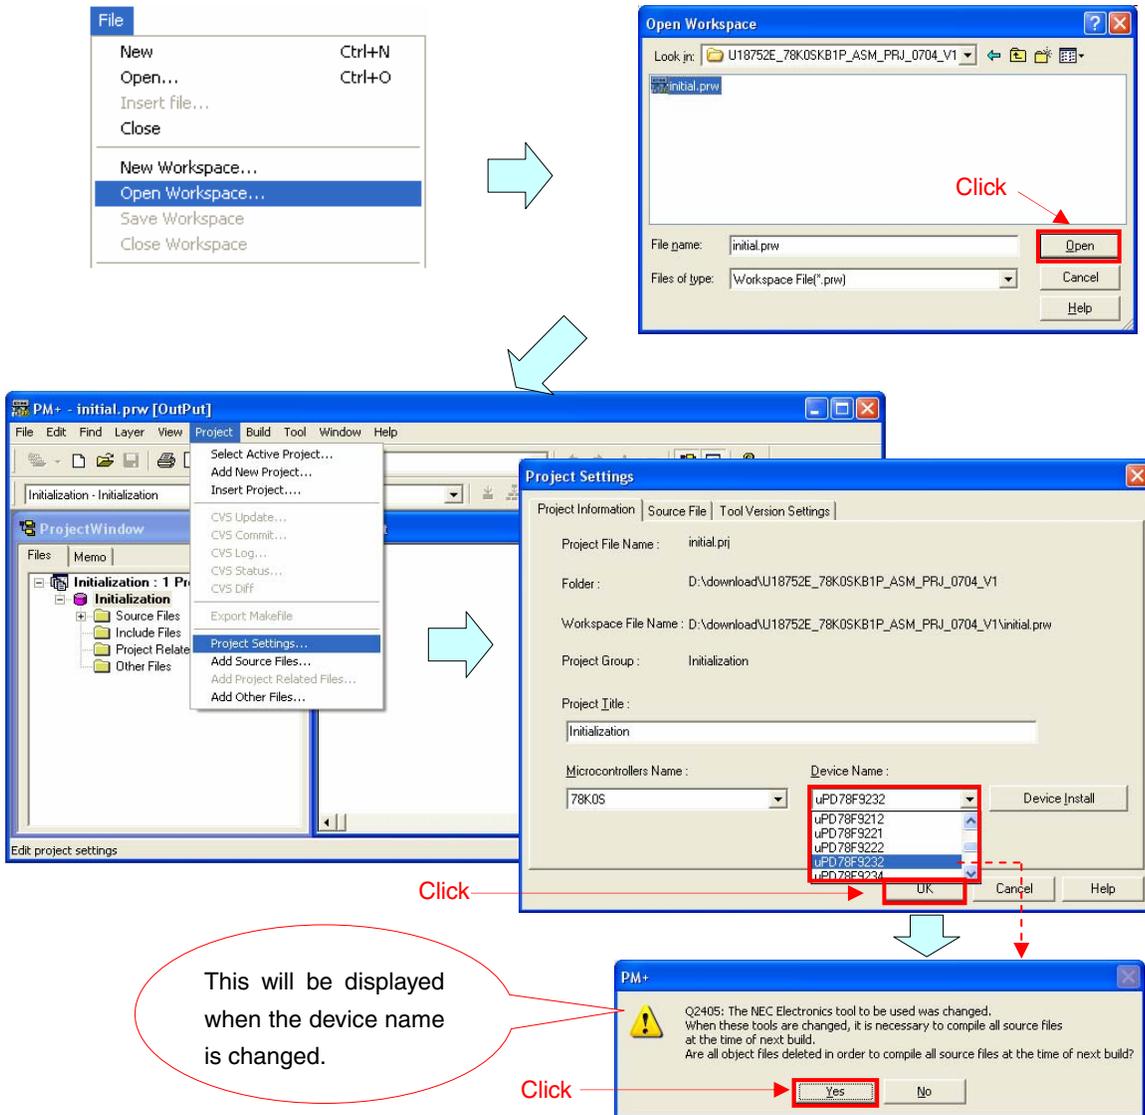

<3> Uncheck the [Using Fixed Area of Standard Library] check box. (Leave the other check boxes as they are.)

A RAM area of 118 bytes that has been secured as a fixed standard library area will be enabled for use when the [Using Fixed Area of Standard Library] check box is unchecked; however, the standard libraries (such as the getchar function and malloc function) will be disabled for use.

The [Using Fixed Area of Standard Library] check box is unchecked by default when the file that has been downloaded by clicking the  icon is used in this sample program.

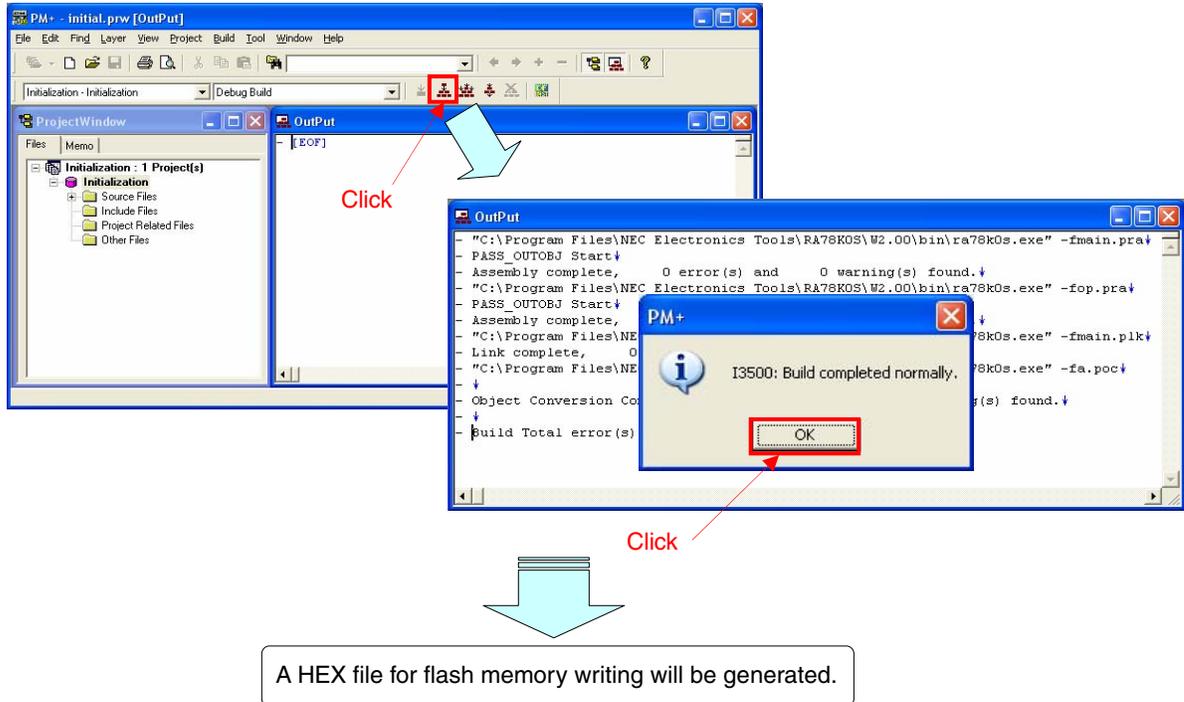

- (1) Start PM+.
- (2) Select "tm00cap.prw" by clicking [Open Workspace] from the [File] menu and click [Open]. A workspace into which the source file will be automatically read will be created.
- (3) Select [Project Settings] from the [Project] menu. When the [Project Settings] window opens, select the name of the device to be used (the device with the largest ROM or RAM size will be selected by default), and click [OK].

**Remark** Screenshots of the Sample Program (Initial Settings) LED Lighting Switch Control are shown below.

- (4) Click  ([Build] button). When the source files are built normally, the message "I3500: Build completed normally." will be displayed.
- (5) Click the [OK] button in the message dialog box. A HEX file for flash memory writing will be created.

**Remark** Screenshots of the Sample Program (Initial Settings) LED Lighting Switch Control are shown below.

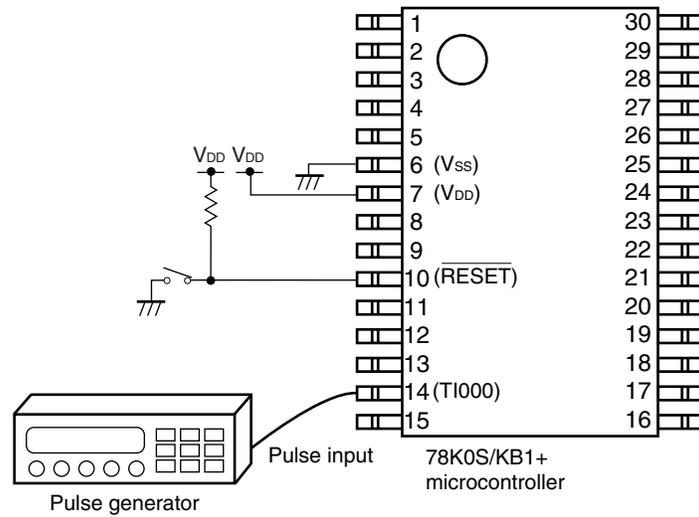

## 5.2 Operation with the Device

This section describes an example of an operation check using the device.

The HEX file generated by executing build can be written to the flash memory of the device.

For how to write to the flash memory of the device, refer to the **Flash Programming Manual (Basic) MINICUBE2 version** of each product ([78K0S/KU1+](#), [78K0S/KY1+](#), [78K0S/KA1+](#), [78K0S/KB1+](#)).

An example of how to connect the device and peripheral hardware (pulse generator) to be used is shown below.

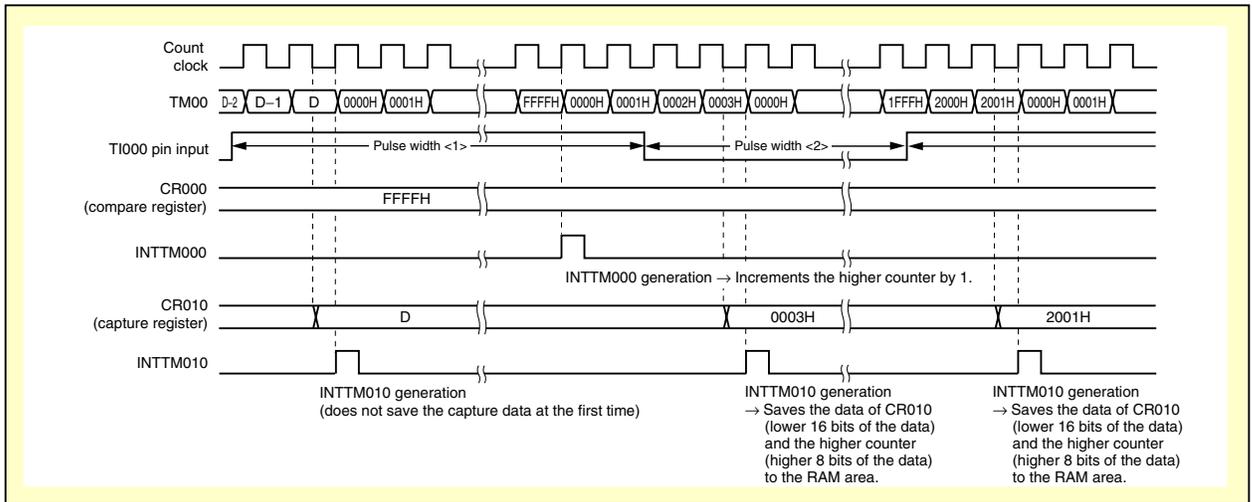

An operation example of the device that wrote this sample program is shown below.

**(1) Operation during detection of the first valid edge**

When a pulse is input to the TI000 pin, the first valid edge acts as a trigger and pulse width measurement is started.

**(2) Operation during detection of the second and following valid edges**

The high-level pulse width and low-level pulse width are captured alternately and the captured data is stored in the RAM, because the valid edge of the TI000 pin is detected both on the falling and rising edges.

<Expression for calculating the pulse width of this sample program>

$$\text{Pulse width} = (24\text{-bit data}^{\text{Note}} + 1) \times 0.0005 \text{ [ms/CLK]}$$

**Note** Higher 8 bits: Higher counter value, lower 16 bits: CR010 register value

Pulse width <1> and pulse width <2> in the above-mentioned operation example are as follows.

- Pulse width <1> (INTTM000 generation: 1 time, CR010 capture data: 0003H)  
 $= (010003\text{H} + 1\text{H}) \times 0.0005 \text{ [ms/CLK]} = (65539 + 1) \times 0.0005 \text{ [ms/CLK]} = 32.77 \text{ [ms]}$
- Pulse width <2> (INTTM000 generation: 0 times, CR010 capture data: 2001H)  
 $= (002001\text{H} + 1\text{H}) \times 0.0005 \text{ [ms/CLK]} = (8193 + 1) \times 0.0005 \text{ [ms/CLK]} = 4.097 \text{ [ms]}$

**(3) Operation following the eighth pulse width measurement**

When eight pulse width values have been stored to the RAM, no further pulse width measurements will be performed.

## APPENDIX A PROGRAM LIST

As a program list example, the 78K0S/KB1+ microcontroller source program is shown below.

### ● main.asm (Assembly language version)

```

;*****
;
;   NEC Electronics      78K0S/KB1+
;
;*****
;   78K0S/KB1+  Sample program
;*****
;   16-bit timer 00 (pulse width measurement)
;*****
;<<History>>
;   2007.7.--  Release
;*****
;
;<<Overview>>
;
;This sample program presents an example of using the pulse width measurement
;function of 16-bit timer 00. The timer count value when the count clock is
;set to fxp/4 (= 2 MHz) and both the rising and falling edges of the signal
;input to the TI000 pin are detected is captured to the CRC010 register.
;The width or interval of the pulse input to the TI000 pin can be known from
;the captured value. The width or interval of a pulse whose length is at
;least the timer cycle can be measured by setting the CR000 register to
;0xFFFF and generating an overflow interrupt.
;
;
; <Principal setting contents>
;
; - Stop the watchdog timer operation
; - Set the low-voltage detection voltage (VLVI) to 4.3 V +-0.2 V
; - Generate an internal reset signal (low-voltage detector) when VDD <
VLVI after VDD >= VLVI
; - Set the CPU clock to 8 MHz
; - Set the clock supplied to the peripheral hardware to 8 MHz
; - Use the DE and HL registers for interrupt servicing (similarly as a
global variable)
;
;
; <16-bit timer 00 settings>
; - Operation mode: Clear & start the timer count at the valid edge of the
TI000 pin
; - Use CR000 as an overflow compare register

```

```

; - Use CR010 as a capture register
; - Capture the pulse width by detecting both edges of the TI000 pin
; - Count clock = fclk/4
; - Not performing timer output
;
;
; <Calculating the pulse width>
;
; The length of the data to be captured is 24 bits, which is a combination
; of the 16-bit data of the CR010 register and higher 8-bit data.
; They are each saved to the RAM area, as shown in the table below.
;
; The pulse width is calculated from the 24-bit data, as shown below.
;
; 24-bit data x 0.0005 [ms/clock] = pulse width [ms]
;
; # Here, 1 [clock] is the timer 00 count clock (2 MHz).
;
; +-----+
; | Address | Data Length | Data Type |
; +-----+
; | LOWLENGTH | 16 bits | Pulse width lower data (1st time) |
; | LOWLENGTH + 2 | 16 bits | Pulse width lower data (2nd time) |
; | LOWLENGTH + 4 | 16 bits | Pulse width lower data (3rd time) |
; | LOWLENGTH + 6 | 16 bits | Pulse width lower data (4th time) |
; | LOWLENGTH + 8 | 16 bits | Pulse width lower data (5th time) |
; | LOWLENGTH +10 | 16 bits | Pulse width lower data (6th time) |
; | LOWLENGTH +12 | 16 bits | Pulse width lower data (7th time) |
; | LOWLENGTH +14 | 16 bits | Pulse width lower data (8th time) |
; +-----+
; | HIGHLENGTH | 8 bits | Pulse width higher data (1st time) |
; | HIGHLENGTH +1 | 8 bits | Pulse width higher data (2nd time) |
; | HIGHLENGTH +2 | 8 bits | Pulse width higher data (3rd time) |
; | HIGHLENGTH +3 | 8 bits | Pulse width higher data (4th time) |
; | HIGHLENGTH +4 | 8 bits | Pulse width higher data (5th time) |
; | HIGHLENGTH +5 | 8 bits | Pulse width higher data (6th time) |
; | HIGHLENGTH +6 | 8 bits | Pulse width higher data (7th time) |
; | HIGHLENGTH +7 | 8 bits | Pulse width higher data (8th time) |

*****
    16-bit timer 00 (pulse width measurement)
*****
<<History>>
    2007.7.-- Release
*****

```

<<Overview>>

This sample program presents an example of using the pulse width measurement function of 16-bit timer 00. The timer count value when the count clock is set to  $f_{xp}/4$  (= 2 MHz) and both the rising and falling edges of the signal input to the TI000 pin are detected is captured to the CRC010 register. The width or interval of the pulse input to the TI000 pin can be known from the captured value. The width or interval of a pulse whose length is at least the timer cycle can be measured by setting the CR000 register to 0xFFFF and generating an overflow interrupt.

<Principal setting contents>

- Declare a function run by an interrupt: INTTM000 -> fn\_inttm000()
- Declare a function run by an interrupt: INTTM010 -> fn\_inttm010()
- Stop the watchdog timer operation
- Set the low-voltage detection voltage (VLVI) to 4.3 V +-0.2 V
- Generate an internal reset signal (low-voltage detector) when VDD < VLVI after VDD >= VLVI
- Set the CPU clock to 8 MHz
- Set the clock supplied to the peripheral hardware to 8 MHz

<16-bit timer 00 settings>

- Operation mode: Clear & start the timer count at the valid edge of the TI000 pin
- Use CR000 as an overflow compare register
- Use CR010 as a capture register
- Capture the pulse width by detecting both edges of the TI000 pin
- Count clock =  $f_{xp}/4$
- Not performing timer output

<Calculating the pulse width>

The length of the data to be captured is 24 bits, which is a combination of the 16-bit data of the CR010 register and higher 8-bit data. They are each saved to the RAM area, as shown in the table below.

The pulse width is calculated from the 24-bit data, as shown below.

$$24\text{-bit data} \times 0.0005 \text{ [ms/clock]} = \text{pulse width [ms]}$$

# Here, 1 [clk] is the timer 00 count clock (2 MHz).

Variable Name	Data Length	Data Type
g_unLowLength[0]	16 bits	Pulse width lower data (1st time)
g_unLowLength[1]	16 bits	Pulse width lower data (2nd time)
g_unLowLength[2]	16 bits	Pulse width lower data (3rd time)
g_unLowLength[3]	16 bits	Pulse width lower data (4th time)
g_unLowLength[4]	16 bits	Pulse width lower data (5th time)
g_unLowLength[5]	16 bits	Pulse width lower data (6th time)
g_unLowLength[6]	16 bits	Pulse width lower data (7th time)
g_unLowLength[7]	16 bits	Pulse width lower data (8th time)
g_unHighLength[0]	8 bits	Pulse width higher data (1st time)
g_unHighLength[1]	8 bits	Pulse width higher data (2nd time)
g_unHighLength[2]	8 bits	Pulse width higher data (3rd time)
g_unHighLength[3]	8 bits	Pulse width higher data (4th time)
g_unHighLength[4]	8 bits	Pulse width higher data (5th time)
g_unHighLength[5]	8 bits	Pulse width higher data (6th time)
g_unHighLength[6]	8 bits	Pulse width higher data (7th time)
g_unHighLength[7]	8 bits	Pulse width higher data (8th time)

## APPENDIX B REVISION HISTORY

The mark "<R>" shows major revised points. The revised points can be easily searched by copying an "<R>" in the PDF file and specifying it in the "Find what." field.

Edition	Date Published	Page	Revision
1st edition	November 2007	–	–
2nd edition	September 2008	pp.33 to 35	Modification of 5.1 Building the Sample Program
		p.38	CHAPTER 6 RELATED DOCUMENTS • Addition of Flash Programming Manual (Basic) MINICUBE2 version
