

1 Description

The 82P337xx are Synchronous Equipment Timing Source (SETS) for Synchronous Ethernet (SyncE) per ITU-T G.8264. These SETS generates ITU-T G.8262 compliant SyncE clocks, Telcordia GR-1244-CORE/GR-253-CORE, and ITU-T G.813 compliant SONET/SDH clocks.

2 Programming Information

2.1 Timing Commander

The user is urged to obtain from their local IDT FAE the Timing Commander/Evaluation Board Users Guide, a copy of the IDT Timing Commander software and the appropriate Personality file (.tcp extension) to model the specific SMU. An initial Settings file (.tcs extension), which contains all register values, can be generated by the IDT SMU Applications group and the IDT FAE with user input to define the application.

The Timing Commander Personality (.tcp extension) allows the majority of the register settings of the device to be established without the requirement of consulting the register map directly. It also demonstrates that the devices that contain an APLL3, the 82P33731, respond to two different I₂C addresses. The DPLL, APLL1 and APLL2 all respond to I₂C eight bit write addresses. The fourth write address is taken by APLL3. The 8-bit I₂C address is xxxx[a2][a1][a0]0, where xxxx defaults to 1010 (h'A); [a0] must be '0' to access APLL3 and '1' to access the rest of the chip. A2, A6, AA, AE are the four address for DPLLS, APLL1 & APLL2. For all other devices, there can be 8 I₂C addresses.

After the initial tcs file is generated, refinements to the register settings can be made on the evaluation board as the user becomes more familiar with the feature set of the part defined in the memory map. The evaluation board is also a useful debug tool to determine the expected behavior when register settings are changed.

2.2 Programming over the Slave Microprocessor Interface

The device supports I₂C, SPI and UART modes. An I₂C device driver is available and recommended to assist setting up the device.

These devices define the most significant four bits of the I₂C base address, I₂C_AD[6:3], as 0b1010. Of the remaining three bits, I₂C_AD[2:0], I₂C_AD[2:1] are defined by strapping pins on the part and are 0b00 by default. For 'x31 devices, I₂C_AD0 = 1 and is defined internal to the part; there is no I₂C_A0 strapping pin provided.

All register accesses are done as 8-bit bus cycles. The memory is structured as eight pages of 128 bytes each (with the exception of APLL3). The ten bit extended address, which locates any register in the memory map, requires that the three most significant bits to define the page be concatenated with the seven least significant bits of the offset address within the page. The 8 bit Slave address will then be the seven bit register offset address within the active page padded with a leading zero.

The three page bits are located in the single Page Register at the offset location set by the lower seven bits of 0x7F or equivalently at the extended address defined by the lower ten bits of 0x07F. This single page register can be accessed directly for reading or writing from any other page at offset address x7F, or equivalently, at the extended addresses x07F, x0FF, x17F, x1FF, x27F, x2FF, x37F and x3FF.

Said another way, the Page Register located in Page 0 is mapped into the offset address space of every other page at the offset address 0x7F. This means that regardless of the page currently selected, any bus transaction to offset address 0x7F always accesses the Page Register.

If access to a different page is required, a separate write to the Page Register is required. This makes the new page active and all subsequent reads and writes can be made anywhere within that page. It is recommended that the page pointer is set back to 0 once any contiguous set of transactions are completed.

After reset with no EEPROM load, all the registers are set to their default values. All DPLL and APLL3 registers are available to either read or write via the microprocessor slave interface. If the device is loaded from an EEPROM on the I2C Master bus, two things must be kept in mind. First, changes in the Page Register cannot be made by the EEPROM. The page register within each page then must mimic the required Page Register changes to step across the pages sequentially. That is, x07F = x01, x0FF = x02, x17F = x03, ..., x37F = x07. Second, APLL3 must still be programmed from the Slave bus because the SMU Master can only issue a single address on the master bus.

The access of the Multi-word Registers is different from that of the Single-worded Registers. Consider the register interrupt_mask_cfg[31:0] on page 0 and spanning offset addresses x0B, x0C, x0D and x0E. The write operation for Muti-word Registers follows a fixed sequence. The register x0B is configured first and the register x0E is configured last. The four registers are configured continuously and should not be interrupted by any operation. The mask configuration will take effect after all four registers are configured. During read operation, the x0B is read first and the register x0E is read last.

Certain bit locations within the device register map are designated as Reserved. To ensure proper and predictable operation, bits designated as Reserved must be left with their default values. If using EEPROM, the bits designated as Reserved must be set with their default values.

4 DPLL Register Descriptions

4.1 Global Control Registers

Identification Register

Register (Abbrev): id	Address: 0x00	Type: RO	Default Value: xxxx_0010				
7	6	5	4				
3	2	1	0				
dev_id[7:0]							
Bit	Name	Description				Def. Value	
7:0	dev_id[7:0]	Device identification.				xxxx_0010	

MPU Selection Configuration Register

Register (Abbrev): mpu_sel_cnfq	Address: 0x01	Type: RW	Default Value: 0000_0xxx	
7	6	5	4	
3	2	1	0	
reserved	reserved	sonet_sdh_cnfq	mpu_sel_cnfq[1:0]	
Bit	Name	Description		Def. Value
7	reserved (device) eeprom_rd_spd (EEPROM)	This bit selects the I2C EEPROM read speed. 0: 100 kbps 1: 400 kbps		0
6:3	reserved	reserved		000_0
2	sonet_sdh_cnfq	This bit selects the SDH or SONET network type. 0: SDH. The DPLL required clock is 2.048 MHz when the in{1:14}_freq bits are '0001'; the output from the 16E1/16T1 path is 16E1. 1: SONET. The DPLL required clock is 1.544 MHz when the in{1:14}_freq bits are '0001'; the output from the 16E1/16T1 path is 16T1.		Determined by SONET/SDH pin during reset or EEPROM
1:0	mpu_sel_cnfq[1:0]	00: I2C 01: SPI 10: UART 11: EEPROM boot mode (I2C EEPROM (16-bit))		Determined by MPU_MODE[1:0] pins during reset or EEPROM

XO Frequency Configuration Register

7	6	5	4	3	2	1	0
reserved				osci_edge	xo_freq_cfg[2:0]		
Bit	Name	Description				Def. Value	
7:4	reserved	reserved				0000	
3	osci_edge	This bit selects a better active edge of the master clock. 0: The rising edge 1: The falling edge				0	
2:0	xo_freq_cfg[2:0]	000: 10 MHz 001: 12.8 MHz 010: 13 MHz 011: 19.44 MHz 100: 20 MHz 101: 24.576 MHz 110: 25 MHz 111: 30.72 MHz				Determined by XO_FREQ[2:0] pins during reset or EEPROM	

Nominal Frequency Configuration Register [23:0]

7	6	5	4	3	2	1	0
nominal_freq_cfg[7:0]							
nominal_freq_cfg[15:8]							
nominal_freq_cfg[23:16]							
Bit	Name	Description				Def. Value	
7:0	nominal_freq_cfg[7:0]	nominal_freq_cfg[23:0] represent a 2's complement signed integer. The calibration value for the master clock in ppm is obtained by multiplying this register value by 0.0000884. The calibration range is within ±741 ppm.				0000_0000	
	nominal_freq_cfg[15:8]						
	nominal_freq_cfg[23:16]						

Interrupt Configuration Register

Register (Abbrev): interrupt_cfg Address: 0x06 Type: RW Default Value: 0000_0010

7	freq_mon_clk_sel	This bit selects the source of the clock to the frequency monitors, the AMI codecs, and the MPIF and CSRs. 0: Free-running clock that tracks crystal oscillator frequency 1: Clock that tracks output of dpll1				0																																										
6	in_noise_window	For 1 PPS, 2 kHz, 4kHz, and 8kHz input, this bit determines whether the input clock whose edge respect to the reference clock is outside ±5% is enabled to be selected for DPLL. 0: Disabled 1: Enabled				0																																										
5:4	reserved	reserved				00																																										
3:0	freq_mon_factor[3:0]	These bits determine the number of extra or missing edges by which a 16 second count of the number of input clock edges deviates from the nominal. The conversion of the count to ppm depends on the frequency of the clock. Shown is the conversion from count to ppm for a 19.44MHz clock. The count is multiplied by the accept/reject thresholds in the Hard Frequency Monitor Threshold Configuration Register and the Soft Frequency Monitor Threshold Configuration Register to convert to them to ppm.				1011

dpll1_bw_sw_time3_cnfq[7:0]							
Bit	Name		Description			Def. Value	
7:0	dpll1_bw_sw_time3_cnfq[7:0]		Third settling time for the DPLL when switching from a higher bandwidth to lower bandwidth. When switching to a DPLL loop bandwidth that is less than or equal to 2.9 MHz, the time in seconds it takes to transition to the new bandwidth is dictated by this register value. Time = register value * 4 seconds Note: The resolution here is different than the previous two registers, it is in steps of 4 seconds.			0100_0000

The output frequency of DPLL2 is established by the equation: $\text{fout_dpll2} = 1638.4 \text{ MHz} / \text{DivN}$ $\text{fout_dpll2} = 1638.4 \text{ MHz} / (\text{divn_int_cnfg} + (\text{divn_frac_cnfg} + \text{divn_num_cnfg}/\text{divn_den_cnfg})/2^{21})$ (The output frequency of DPLL2 set here must agree with the setting of dpll2_dpll_fbdv_cnfq.) Valid range of DivN is 16.384 (fout_dpll2 = 100 MHz) to 31.995 (fout_dpll2 = 51.208 MHz) Default: $\text{fout_dpll2} = 1638.4 \text{ MHz} / (x10 + (x155555 + x1000/x3000)/2^{21}) = 1638.4 \text{ MHz} / 16.666 = 98.304 \text{ MHz}$				01_0000

4:0	out1_ph1_cnfg[4:0]	This value represents the first stage phase adjustment for OUT01. The output phase of OUT01 will be moved in a POSITIVE direction in an amount calculated by this value times the phase 1 quanta. The phase 1 quanta is dependent on the configured output frequency passed to OUT01. The calculation is (1/FREQ). E.G.: If OUT01 is configured to use a frequency of 625 MHz from APLL1, the phase 1 quanta is (1/625) = 1.6ns. If this value were 10, the phase will be moved forward by 16ns (10*1.6).

			The phase 2 quanta is dependent on the configured output frequency passed to OUT01 and the divider specified in OUT01_DIV1_CNFG+1.. The calculation is (1/FREQ)(DIV1+1). E.G.: If OUT01 is configured to use a frequency of 625 MHz from APLL1 and OUT01_DIV_CNFG is set to 24, the phase 2 quanta is (1/625)/24 = 40ns. If this value were 5, the phase will be moved forward by 200ns (5*40).
