

Renesas Synergy™ Platform

CTSU Slider Example on DK-S124

Introduction

The Capacitive Touch Sensing Unit (CTSU) application note demonstrates the slider and button functionality on Renesas Synergy™ MCU Groups, and uses the DK-S124 v2.0, v3.0 and v3.1 as examples. It covers how to bring up the CTSU slider functionality using the CTSU framework on Synergy Software Platform (SSP) v1.6.0 or later.

Prerequisites

You should have some experience with either the Synergy e² studio or the IAR Embedded Workbench® for Renesas Synergy™ (IAR EW for Synergy), Integrated Solutions Development Environment (ISDE). The program may be compiled and run using either tool chain. You should also be familiar with the SSP and its concepts, such as frameworks, callback functions and APIs. For a conceptual overview, see SSP Architecture, in the *SSP User's Manual*.

Before you use this application note, you may want to build and run the Blinky project in your board's *Quick Start Guide*. By doing so, you will become familiar with building and running SSP applications while ensuring the debug connection to your board is functioning properly.

It should take about two hours to complete the topics below and bring up the sample project.

- SSP capacitive touch framework overview
- CTSU application configuration data overview
- Procedure to recreate the sample project:
 - Generating a new project with no RTOS included.
 - Creating the CTSU thread.
 - Creating the CTSU slider framework.
 - Creating the CTSU button framework.
 - Copying over the CTSU configuration files.
 - Creating the callback function.

Required Resources

To build and run the application, you will need:

- A Synergy DK-S124 v2.0 or later MCU kit
- SSP v1.6.0 or later
- e² studio v7.3.0 or later
- IAR EW for Synergy v8.23.3 with SSC v7.3.0 or later

You can download the required Renesas software from the Renesas Synergy Gallery (<https://www.renesas.com/us/en/products/synergy/software.html>).

1. CTSU Overview

The Capacitive Touch Sensing Unit (CTSU) measures the electrostatic capacitance of a touch sensor. Changes in electrostatic capacitance are determined by software that enables the CTSU to detect whether a finger is in contact with the touch sensor. Electrostatic capacitance is detected by self-capacitance and mutual capacitance methods. This application note uses the self-capacitance single-scan mode for the slider and button functionality.

The following table summarizes the CTSU specifications on DK-S124 Synergy MCU kit. For details, see the *S124 User's Manual*.

Table 1. CTSU Specification

Item		Description
Operating clock		PCLKB, PCLKB/2, or PCLKB/4
Pins	Electrostatic capacitance measurement	31 channels (TS00 to TS28, TS30, TS31)
	TSCAP	Low-pass filter (LPF) connection pin
Measurement modes	Self-capacitance single-scan mode	Electrostatic capacitance is measured on one channel using the self-capacitance method
	Self-capacitance multi-scan mode	Electrostatic capacitance is measured on multiple channels successively using the self-capacitance method
	Mutual capacitance full scan mode	Electrostatic capacitance is measured successively on multiple channels using the mutual capacitance method
Noise prevention		Synchronous noise prevention, high-pass noise prevention
Measurement start conditions		<ul style="list-style-type: none"> • Software trigger • External trigger (ELC_CTSU from the ELC).

The following diagram shows the CTSU block consists of a status control block, trigger control block, clock control block, channel control block, port control block, sensor drive pulse generator, measurement block, interrupt block, and I/O registers. With support from the SSP CTSU framework, you do not need to control the module at the level of these blocks and registers.

Figure 1. CTSU block diagram

The slider functionality commonly involves detecting the sliding motion and responding to the motion. In this application project, the example detects a user sliding a finger on the slider and responds by lighting up the three onboard LEDs. When you slide a finger from the tip (sharp end) of the slider to the end (wide end) of the slider, the three onboard LEDs light up from dim to bright. The button functionality involves detection of button press detection and response. The example project detects press on **button 1** and responds by toggling LED2 (orange) and detects press on **button 2** and responds by toggling LED3 (green).

A functioning project in archive format is attached with this application note. You can import the archive (CTSU_Slider_Button_Example.zip file), compile, download, and run to exercise the slider and button functionalities. In addition, this application note provides step by step instructions to use the SSP slider/button framework feature to recreate this application.

The following figure shows the CTSU component layout on the DK-S124 v3.0 Synergy MCU board. The v2.0 and v3.1 board has the same layout.

Figure 2. DK-S124 Capacitive Touch Components

2. Capacitive Touch SSP Framework Overview

The capacitive touch slider framework interprets the CTSU data for all the slider configurations initialized by the system. The capacitive touch slider framework registers a callback with the CTSU framework layer, that is called each time the processed data is available. The slider framework uses this data (raw values) to determine if a touch or release occurred and, if so, where it has occurred. If there is a state change, the framework calls the callback for each slider with the event and position, in the order as they are present in the slider configuration table. This application note uses only the single slider that is available on the DK-S124 Synergy MCU board.

2.1 Resources Used in the Capacitive Touch SSP Framework

Table 2. Resources used in CTSU framework interface

Resource	ISDE Tab	Selection
Framework CTSU Driver	Threads	Framework > Input > CTSU Framework on sf_touch_ctsu

SSP v1.6.0 or later supports S7G2, S3A7, S5D9, and S124 Synergy MCU boards. This application note focuses on the capacitive touch slider framework implemented on S124 with DK-S124 MCU kit. The following two tables list additional resources used by the slider framework.

Table 3. Additional resources used in CTSU slider framework interface

CTSU HAL Driver	Threads	—

2.2 Understanding the SSP Slider and Button Framework

The SSP CTSU slider framework generates the events after touch data processing. This application example creates a response when SF_TOUCH_CTSU_SLIDER_STATE_HELD is triggered. By looking at the reported position on the slider, you can create the desired response in the callback function when a sliding motion from the user is detected.

Table 5. CTSU slider states

Name	Description
SF_TOUCH_CTSU_SLIDER_STATE_NO_CHANGE	Slider is in the released state
SF_TOUCH_CTSU_SLIDER_STATE_INITIALIZED	Slider is in the pressed state
SF_TOUCH_CTSU_SLIDER_STATE_TOUCHED	Slider is pressed
SF_TOUCH_CTSU_SLIDER_STATE_RELEASED	Slider is released
SF_TOUCH_CTSU_SLIDER_STATE_CLOSED	Slider has been disabled and will no longer generate events
SF_TOUCH_CTSU_SLIDER_STATE_MULTI_TOUCH	More than one touch element is being touched
SF_TOUCH_CTSU_SLIDER_STATE_DISABLED	Slider is disabled from being updated
SF_TOUCH_CTSU_SLIDER_STATE_HELD	Slider is held (continued press)

The SSP CTSU button framework generates the events in the following table after the touch data processing.

Table 6 CTSU button states

Name	Description
TOUCH_BUTTON_STATE_RELEASED	Button is in the released state
TOUCH_BUTTON_STATE_PRESSED	Button is in the pressed state
TOUCH_BUTTON_STATE_LONG_HOLD	Button is pressed down for a long time (duration in <code>sf_touch_ctsu_button_config.h</code>)
TOUCH_BUTTON_STATE_STUCK	Button is pressed down for a short time (duration in <code>sf_touch_ctsu_button_config.h</code>)
TOUCH_BUTTON_STATE_INITIAL	Button has been initialized successfully
TOUCH_BUTTON_STATE_CLOSING	Button has been disabled and will no longer generate events
TOUCH_BUTTON_STATE_MULTI_TOUCH	More than one touch element is being touched
TOUCH_BUTTON_STATE_DISABLED	Button is disabled from being updated

2.3 CTSU Configuration Data

The sample project includes a set of CTSU configuration data under `\CTSUSliderButtonExample\src\captouch_configs\`. The CTSU configuration data is specific to DK-S124 hardware. Section 3.3 has step-by-step instructions on recreating the sample project. Step 7 in section 3.3 requires you to copy this `\captouch_config` folder to the new application you will be creating.

3. Building the CTSU Slider Application

This section provides details on generating a CTSU slider and button application with the e² studio ISDE and the SSP. With the slider/button framework support from the SSP package, your application only needs to handle the callbacks from CTSU events without requiring any low-level software to handle the CTSU registers and basic capacitive touch processing functions.

The next section describes the callback functions implemented in the sample project and can serve as a reference for your application. Section 3.2 details the sliding motion detection method used. You can use and adjust this method based on the requirements of your unique application. To illustrate the process of establishing a slider/button application, section 3.3 provides step-by-step instructions on recreating the sample project included. You can take similar steps to add the CTSU component to your existing application or use this sample project as a starting point for your application.

For details, see the sample project package `CTSUSliderButtonExample.zip`.

3.1 Handling the Slider and Button Callback

The example project implemented the slider and button callback functions in `ctsu_thread_entry.c` located in the sample project folder `\CTSUSliderButtonExample\src\` folder. The `ctsu_thread_entry.c` is generated by the Synergy configurator. Table 7 provides a summary of the functions implemented in the `ctsu_thread_entry.c`. These functions provide the functions you need to create with the SSP slider and button framework to establish a typical slider and button application.

Section 3.3 has a step-by-step instructions on recreating the sample project. You can copy the `ctsu_thread_entry.c` file to the new application and modify the response to the sliding motion and button press events as desired.

Table 7. Functions in ctsu_thread_entry.c

Functions	Description
g_button_framework_user_callback	Button touch callback function (defined with the Synergy configurator) implementation
g_slider_framework_user_callback	Slider touch callback function (defined with the Synergy configurator) implementation
CB_Self_Slider_0	Sub function called from g_slider_framework_user_callback Implements response to events listed in Table
CB_Self_Button_processing	Sub function called from g_button_framework_user_callback Activated when Button 1 is touched Implements response to events listed in Table
pwm_led_brightening	Subfunction called from ctsu_thread_entry Light up the LED from dim to bright.

The sliding motion detection is implemented in function `CB_Self_Slider_0`. This function is called from the `g_button_framework_user_callback`. It responds to the slider event described in Table 5.

In the handling of the `SF_TOUCH_CTSU_SLIDER_STATE_HELD` state, an algorithm has been implemented to detect the sliding motion, as explained in the following section. To perform sliding motion detection, the user application must perform a small amount of position data processing. For button press detection, no data processing needs to be done by the user. This application note does not detail button press detection.

3.2 Detection of User Sliding Motion

In the sample project, the following macro definitions, function definition, and variables are used in sliding motion detection.

Figure 9 shows the macro definitions are determined based on the **Update Hz** setting and how fast you want to guide the user's sliding motion across the slider. The slider position is reported as $100 \times$ number of sensors. In case of the DK-S124, the sensor numbering from left to right is 1, 2, 3, 4, and 5. The reported position then would be in the range of 0-500. The `STARTLIMIT` and `ENDLIMIT` are determined based on this calculation. The `DETECTIONTIME` is related to the **Update Hz** defined in the Synergy configurator for the CTSU sensing unit.

Section 3.3 has step-by-step instructions on recreating the sample project. **Update Hz** is set in step 3 of Figure 9. When **Update Hz** increases, the `DETECTIONTIME` should increase to allow a reasonable number of times for the detections of the sliding motion.

```
#define SIZEOFBUFFER    600 /* slider position temporary buffer size*/
#define DETECTIONTIME  8 /* after detection of 8 times of finger movement detected, a
sliding motion is identified */
#define STARTLIMIT     100 /* has to be less than this threshold to identify as a
starting point of a sliding motion */
#define ENDLIMIT       400 /* has to be greater than this threshold to identify an
ending point of a sliding motion */
```

```
void CB_Self_Slider_0(sf_touch_ctsu_slider_callback_args_t * p_args);
static uint32_t detect_count = 0; /* track the number of position movement detected */
volatile uint32_t result[SIZEOFBUFFER]; /* temporary storage for the slider position
*/
static uint32_t slider_data_index = 0; /* index into the result array */
int diff = 0; /* position difference between two neighboring slider position results
*/
```

The variables listed `detect_count`, `result`, `slider_data_index`, and `diff` are in the sliding motion detection algorithms. Figure 3 references these variables in a high-level flow listing the key actions in sliding motion detection.

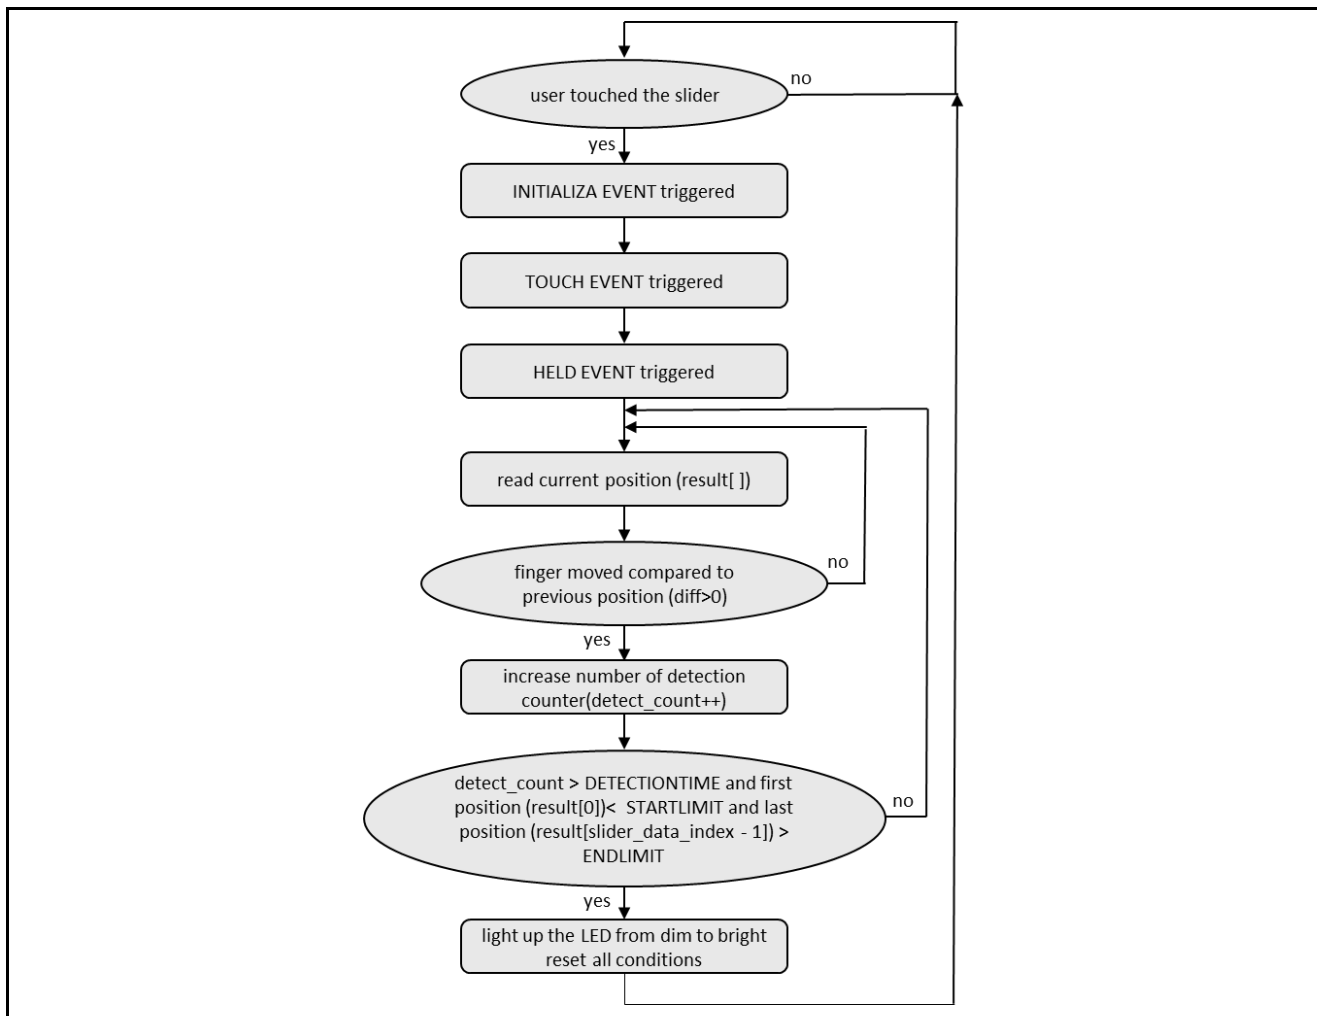

Figure 3. Sliding motion detection

3.3 Step-by-Step Procedure to Recreate the Sample Project

Use the following step-by-step instructions to establish the attached sample project. In each figure, follow the steps in order (1) -> (2) -> (3) -> (4)-> (5).

Note: Leave all the **Parameter Checking** properties as Default (BSP) at the development stage of the project. After the project is compiled and approved to be functioning, you can change the **Parameter Checking** to be **Disabled** to save some flash usage.

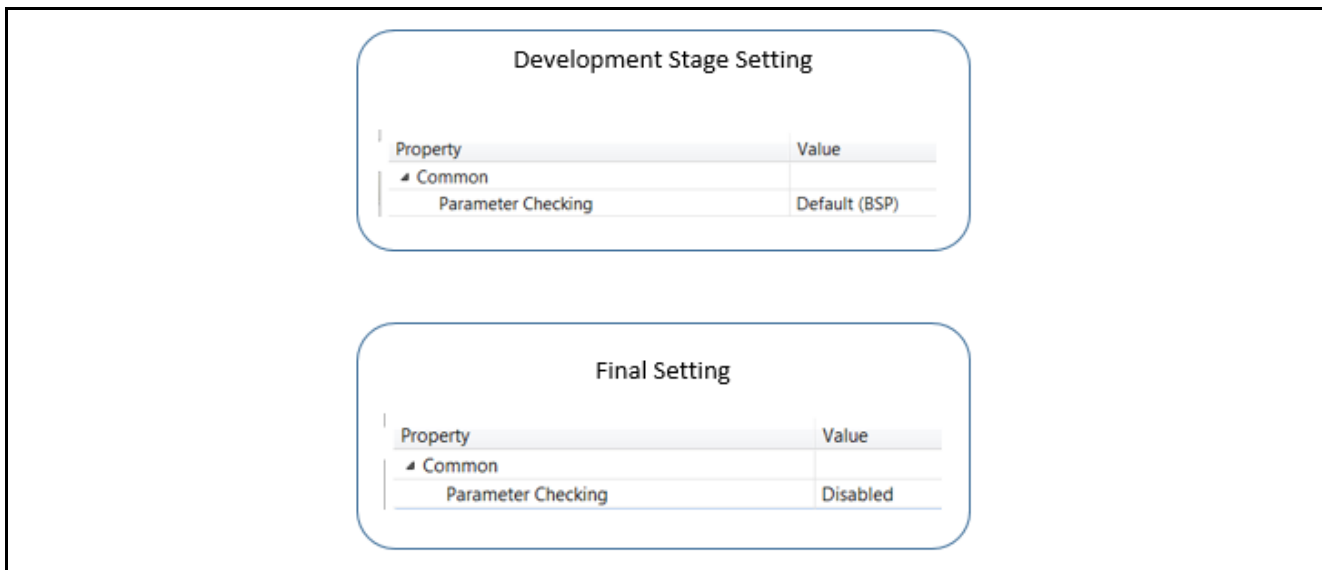

Figure 4. Parameter Checking Setting

Step 1: Establishing a new project with no RTOS included:

1. Create a new Synergy Project.
2. Select '**Renesas Synergy C Executable Project**'
3. Enter the project name and setup the Synergy license file.
See *Importing a Renesas Synergy Project* (r11an0023eu0121-synergy-ssp-import-guide.pdf) included with this application project to setup the Synergy license.

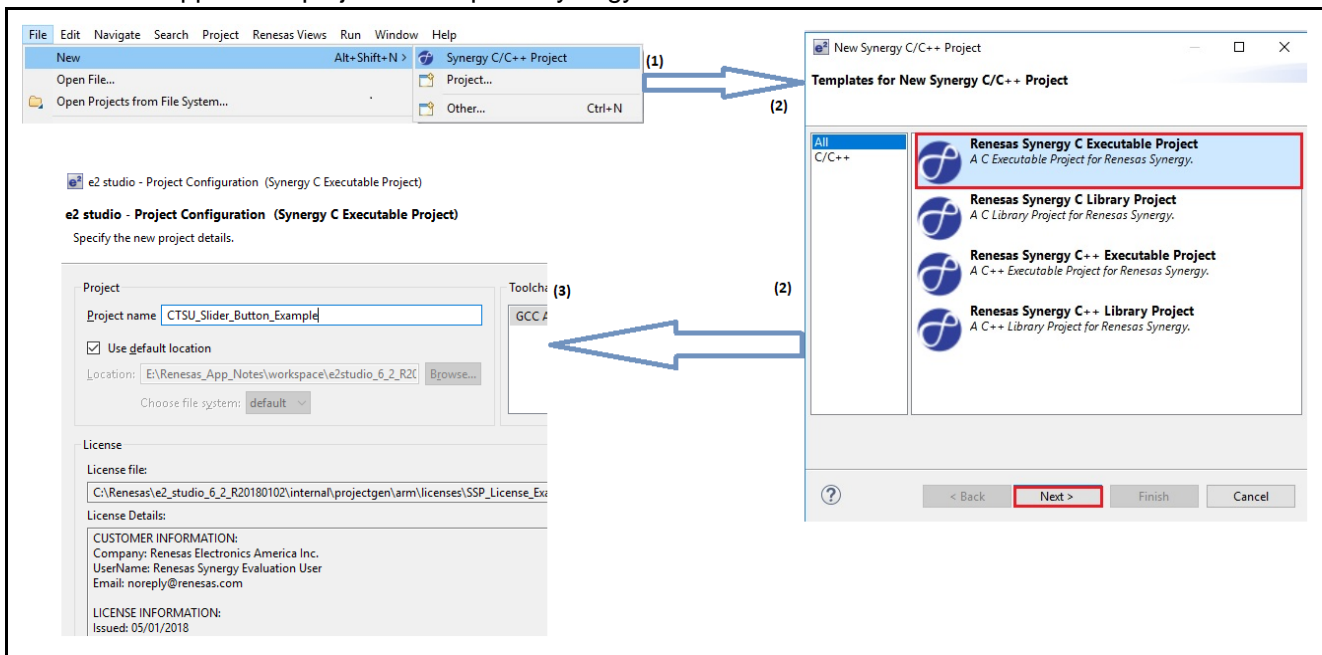

Figure 5. Generate a new project

4. Choose board **S124 DK**.
5. Choose **BSP**.

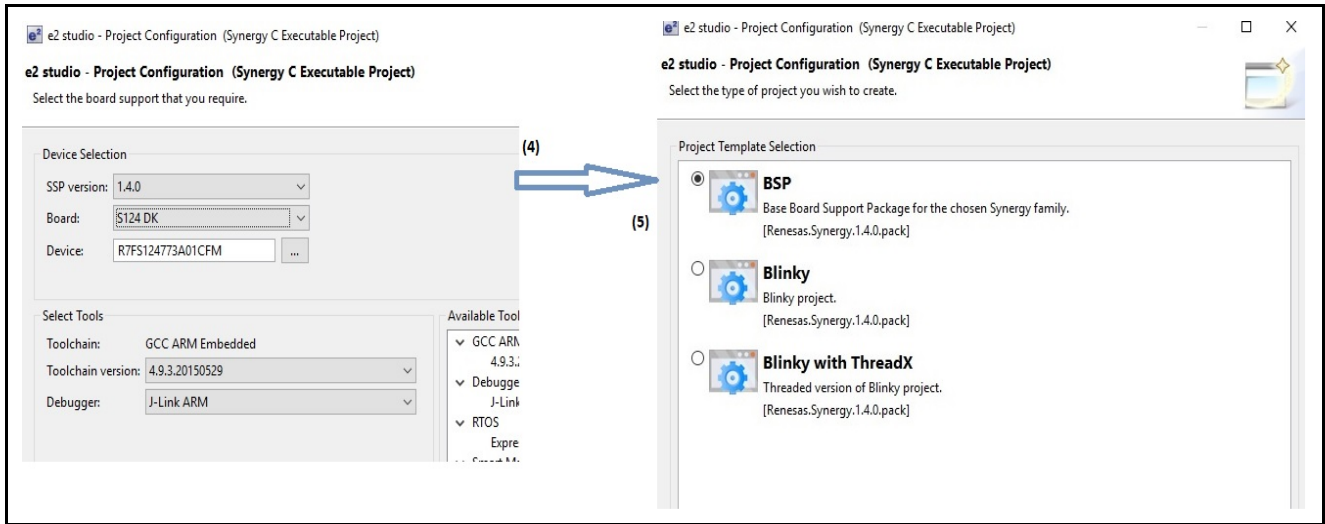

Figure 6. Choose the Board and BSP package

Step 2: Create the CTSU thread.

1. Updated the heap size (bytes) property from the default 0x1000 to 0x0.
2. Under the **Threads** tab, click the '+' sign to create a new thread.

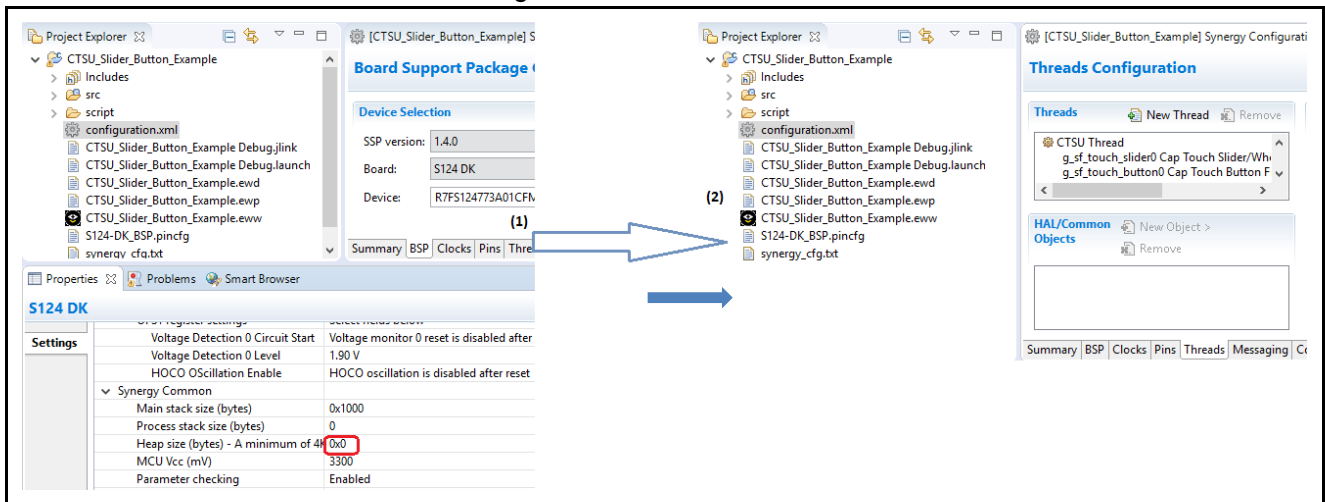

Figure 7. Generate CTSU Thread

3. Set the property of this new thread.

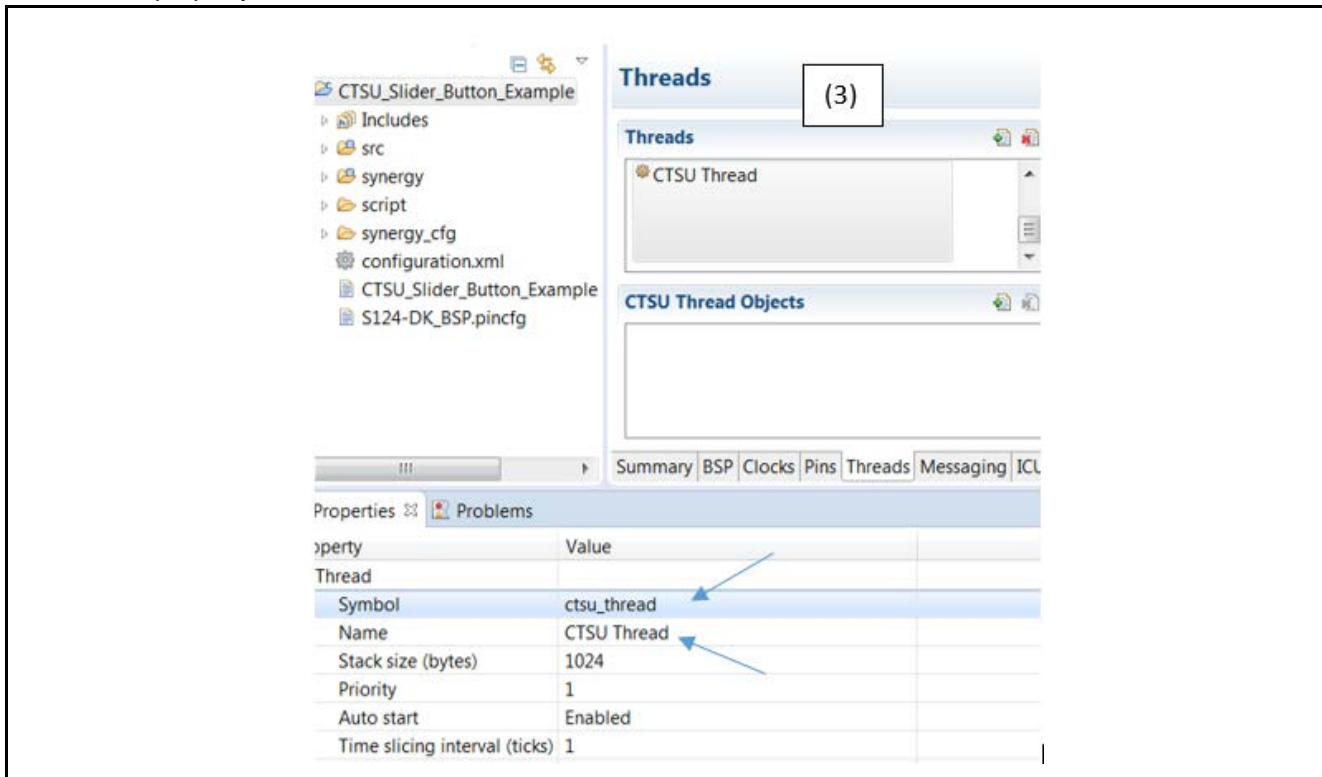

Figure 8. Configure CTSU Thread

Step 3: Create the CTSU slider framework.

1. Click the newly create thread **CTSU Thread**. In the **CTSU Thread Stacks** window, click the **New Stack** to add the **Cap Touch Slider/Wheel Framework on sf_touch_otsu_slider**.
2. Click on the box **g_sf_touch_otsu0 Cap Touch Framework on sf_touch_otsu** and configure the **Update Hz** to 20.

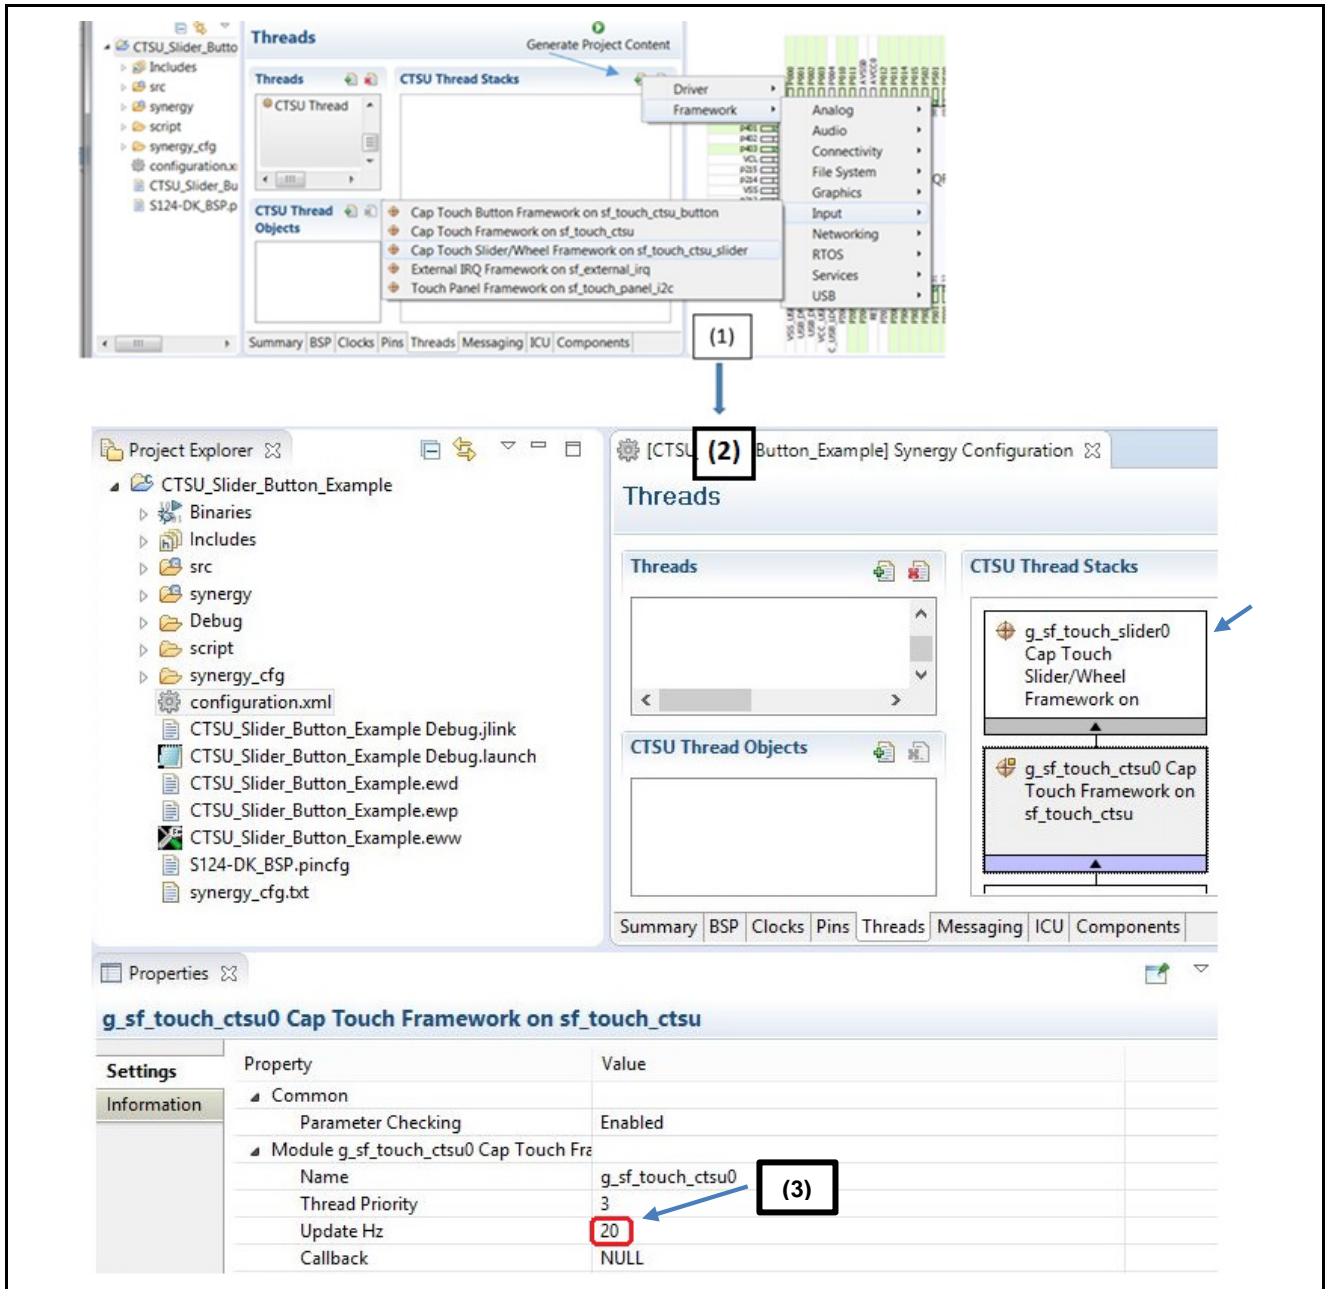

Figure 9. Generate CTSU Slider Framework

3. Click on the box with red text **g_ctsu0 CTSU Driver on r_ctsu**.
 Per the following figure, configure the properties as indicated in the screen shot.
 - **Max active channels** as '7'
 - Interrupt priority for **CTSU WRITE**, **CTSU READ**, and **CTSU END** as **Priority 1**
 - Module name as **g_ctsu**
 - **g_ctsu_config_self** as the CTSU configuration

Figure 10. Configure the CTSU Slider Driver

Step 4: Create the CTSU button framework as shown in the following figure.

1. In the **CTSU Thread Stacks** window, click the **New Stack** to add the **Cap Touch Button Framework on sf_touch_ctsu_button**.
2. Click on the box **g_sf_touch_button0 Cap Touch Button Framework on sf_touch_ctsu_button** and change the **Number of Buttons** to **2**.

Figure 11. Create CTSU Button Framework

3. Click on the pink box and choose **Use->g_sf_touch_ctsu0 Cap Touch Framework on sf_touch_ctsu.**

Figure 12. Configure the CTSU Button Framework

Step 5: The contents in the CTSU Thread Stacks panel should look like the following figure. No configuration is needed in this step.

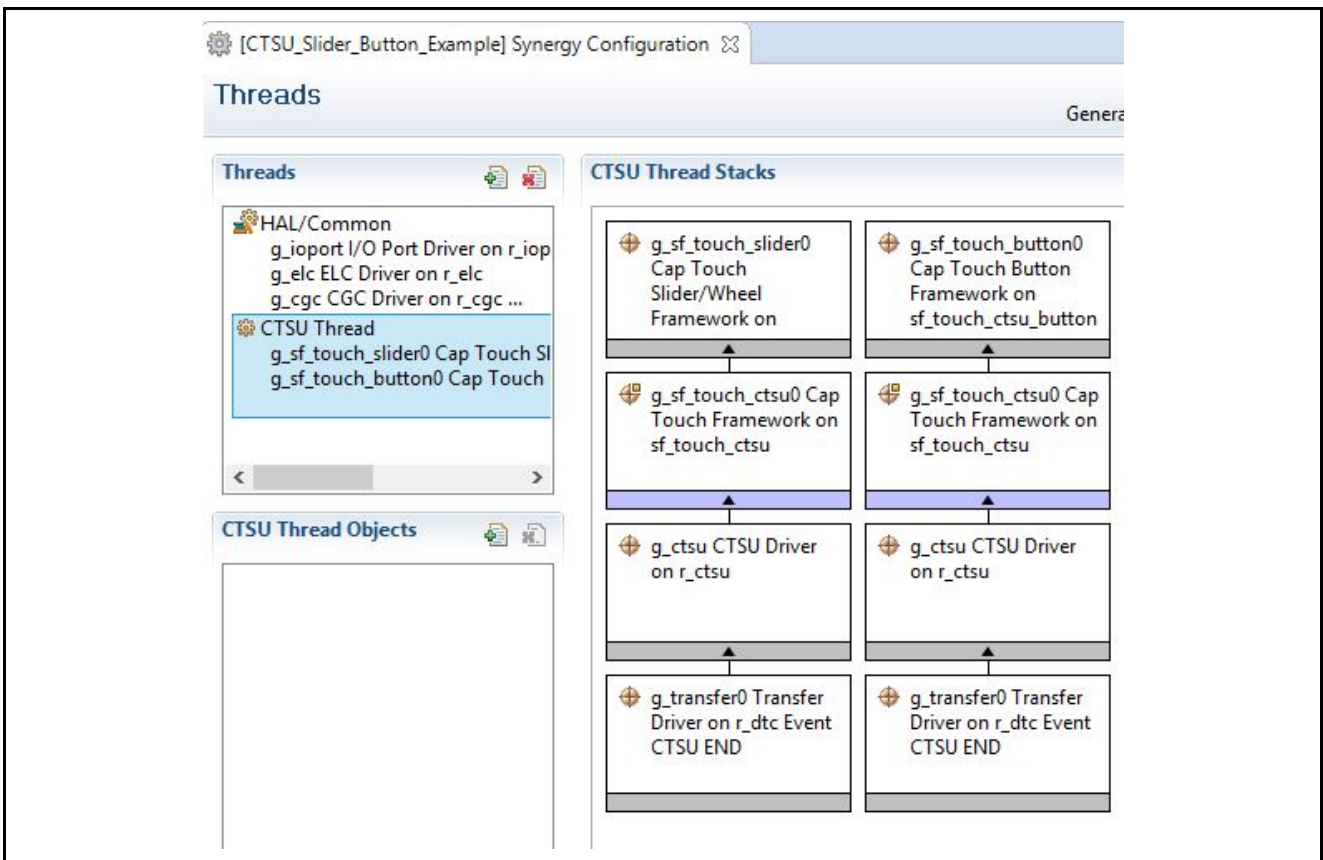

Figure 13. Overview of the CTSU Framework

Step 6: Copy the `captouch_configs` folder from the imported functioning sample project (under `\CTSUSlider_Button_Example\src\captouch_configs`) to your newly created project.

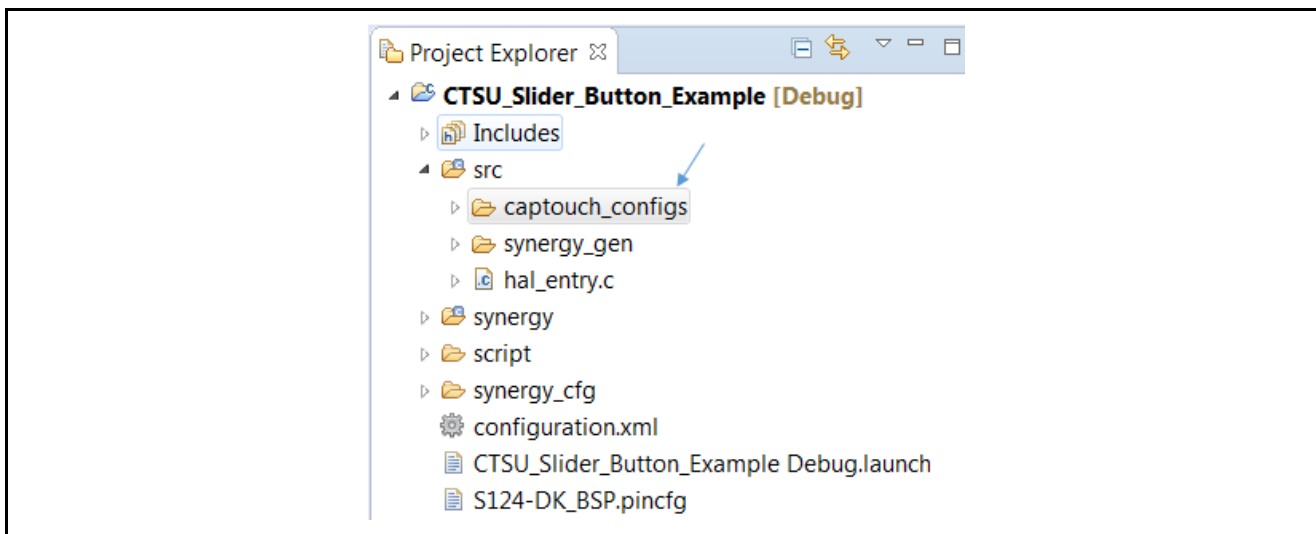

Figure 14. Copy over the CTSU configuration files

Step 7: Create the callback function.

In this step, you can copy over `cts_thread_entry.c` (under sample project `\CTSUSlider_Button_Example\src\`) to your newly created project.

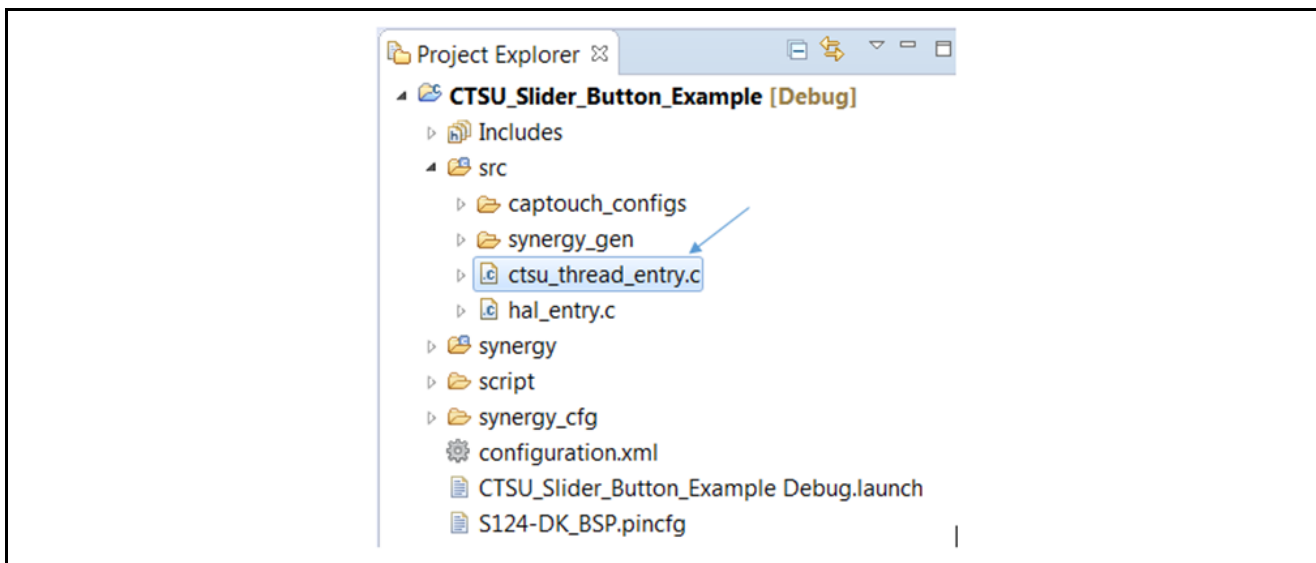

Figure 15. Copy over the example callback functions

Step 8: Exercise the project.

Click **Generate Project Content** from the Synergy configurator, and then compile the project. It should compile without any errors.

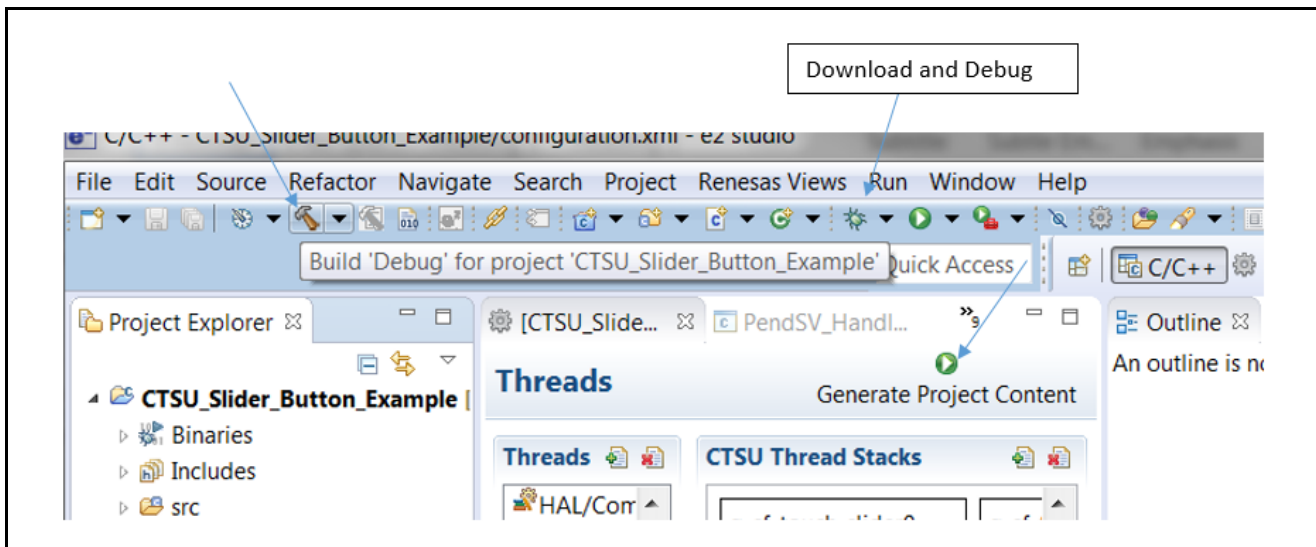

Figure 16. Generate Project Content and Build the Project

Download and run the project. You can slide your finger from the sharp end to the thick end and see the three LEDs light up from dim to bright upon reaching the thick end. With the sample application, LED2 (orange) toggles on a **button 1** press event and LED3 (green) toggles on a **button 2** press event.

Step 9: Update all **Parameter Checking** settings to **Disabled** as pointed out in Figure 4. Recompile and download to test the project.

4. Conclusion

With the support from the SSP CTSU framework and the e² studio configurator, building a slider application on the Synergy development kit is very easy. The SSP package has the build in CTSU data processing functionality and call back scheme to enable rapid slider and button application development.

Revision History

Rev.	Date	Description	
		Page	Summary
1.00	Aug 3, 2016	-	Initial version
1.10	Mar 27, 2017	-	Updated to SSP v1.2.0, added IAR support
1.11	Aug 19, 2017	-	Updated to SSP v1.3.0
1.12	Sep 27, 2017	1, 4	Required resources of SSP version changed
1.13	Jan 13, 2018	-	Updated for SSP v1.3.3
1.14	Mar 1, 2018	-	Updated for SSP v1.4.0
1.15	Mar 4, 2019	-	Updated for SSP v1.6.0

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
