Renesas RA Family

Injecting and Updating Secure User Keys

Introduction

Cryptography is important because it provides the tools to implement solutions for authenticity, confidentiality, and integrity, which are vital aspects of any security solution. In modern cryptographic systems, the security of the system no longer depends on the secrecy of the algorithm used but rather on the secrecy of the keys.

Renesas MCU security revolves around integrated security engines. The most advanced security engine used in the Renesas RA Family is the SCE9 Secure Crypto Engine. The SCE9 can operate in two different modes, called Compatibility Mode and Protected Mode. The application note Renesas SCE Operational Modes (R11AN0498) explains the definition of the two modes and their use cases. In Compatibility Mode, SCE9 can inject secure keys as well as plaintext keys. In Protected Mode, SCE9 can inject only secure keys.

Other available security engines used in RA Family MCUs are the SCE7, SCE5, and SCE5_B. These Secure Crypto Engines can only operate in Compatibility Mode and can inject secure keys as well as plaintext keys.

This application project demonstrates SCE9 Protected Mode and SCE7 Compatibility Mode secure key injection. Compatibility Mode secure key injection for SCE5 and SCE5_B uses identical APIs to SCE7 secure key injection.

This release contains AES-256 and ECC public key injection and update examples on an RA6M4 with the SCE9 in Protected Mode, and an AES-128 secure key injection and update example on an RA6M3 with the SCE7 (Compatibility Mode). Example keys are provided with the projects. This application note describes how to modify the projects to use custom keys.

Required Resources

Development tools and software

- e² studio IDE v2022_07 or greater
- Renesas Flexible Software Package (FSP) v4.0.0 or later
- SEGGER J-Link® USB driver and RTT Viewer
- Renesas Flash Programmer (RFP) v3.09 or later
- Renesas Security Key Management Tool v1.0.2 or later

The FSP, J-Link USB drivers, and e² studio are bundled in a downloadable platform installer available on the FSP webpage at renesas.com/ra/fsp. SEGGER RTT Viewer is available for download free-of-charge from https://www.segger.com/products/debug-probes/j-link/tools/rtt-viewer/. RFP is available for download from https://www.renesas.com/software-tool/renesas-flash-programmer-programming-gui. The free-of-charge edition can be used for the functionality required by this Application Project. The Security Key Management Tool can be downloaded at https://www.renesas.com/software-tool/security-key-management-tool.

Hardware

- EK-RA6M4, Evaluation Kit for RA6M4 MCU Group (http://www.renesas.com/ra/ek-ra6m4)
- EK-RA6M3, Evaluation Kit for RA6M3 MCU Group (http://www.renesas.com/ra/ek-ra6m3)
- Workstation running Windows® 10
- One USB device cable (type-A male to micro-B male)

Prerequisites and Intended Audience

This application note assumes you have some experience with the Renesas e² studio IDE and Arm®-TrustZone®-technology based development models with e² studio. In addition, the application note assumes that you have some knowledge of RA Family MCU security features. See chapter 49, Security Features in the Renesas RA6M4 Group MCU User’s Manual: Hardware for background knowledge preparation for the cryptographic key injection. The intended audience are product developers, product manufacturers, product support, or end users who are involved with any stage of injecting or updating secure keys with Renesas RA Family MCUs.

1. SCE Wrapped Key Creates Root of Trust

1.1 Introduction to Root of Trust

Roots of trust are highly reliable hardware, firmware, and software components that perform specific, critical security functions (https://csrc.nist.gov/projects/hardware-roots-of-trust). In an IoT system, a root of trust typically consists of identity and cryptographic keys rooted in the hardware of a device. It establishes a unique, immutable, and unclonable identity to authorize a device to exist in the IoT network.

Secure boot is part of the services provided in the Root of Trust in many security systems. Authentication of the application uses Public Key Encryption. The associated keys are part of the Root of Trust of the system. Device Identity, which consists of Device Private Key and Device Certificate, is part of the Root of Trust for many IoT devices.

From the above Root of Trust discussion, we can see that leakage of cryptographic keys can bring the secure system into a risky state. Protection of the Root of Trust involves limiting key accessibility to within the cryptographic boundary only, with keys that are securely stored and preferably unclonable. The Root of Trust should be locked from read and write access by unauthorized parties.

The Renesas user key management system can provide all the above desired protection.

1.2 Introduction to Secure Crypto Engine and Associated Keys

The Secure Crypto Engine (SCE) is an isolated subsystem within the MCU. The security engine contains hardware accelerators for symmetric and asymmetric cryptographic algorithms, as well as various hashes and message authentication codes. It also contains a True Random Number Generator (TRNG), providing an entropy source for the cryptographic operations. The Secure Crypto Engine is protected by an Access Management Circuit, which can shut down the security engine in the event of an illegal external access attempt. Figure 1 shows the conceptual diagram of the SCE. Refer to Table 1 for exactly what cryptographic operations are supported by each type of SCE.

![Figure 1. Secure Crypto Engine](image)

The Hardware Root Key (HRK) is not a single key that is physically stored. It is represented in this presentation as such for simplifying the description of the concepts. The SCE contains internal RAM for operations that deal with sensitive material such as plaintext keys. This RAM is not accessible outside the SCE.

The SCE has its own dedicated internal RAM, enabling all crypto operations to be physically isolated within the Secure Crypto Engine. This, combined with advanced key handling capability, means that it is possible to implement applications where there is no plaintext key exposure on any CPU-accessible bus.

Secure key storage and usage is accomplished by storing application keys in wrapped format, encrypted by the MCU’s Hardware Unique Key and tagged with a Message Authentication Code. Since wrapped keys can
only be unwrapped by the Secure Crypto Engine within the specific MCU that wrapped them, the wrapping mechanism provides unclonable secure storage of application keys. The RA Family also provides a secure key injection mechanism in order to securely provision your devices.

The Secure Crypto Engine is packed full of cryptography features that you can leverage in your higher-level solutions, giving you the option to use hardware acceleration for reducing both execution time and power consumption. All of the security engines offer AES, TRNG, and secure key storage and usage. The SCE7 and SCE9 expand this by offering both RSA and ECC for PKI solutions. The full complement of SCE9 Protected Mode crypto algorithms plus a selection of SCE7 crypto algorithms are NIST CAVP certified. There are four different versions of Secure Crypto Engines for Renesas RA MCUs. Table 1 summarizes the different SCEs and their associated cryptographic functionalities.

The features of the various Security Engines are as follows:

- SCE5 provides hardware-accelerated symmetric encryption for confidentiality. The updated SCE5_B uses enhanced secure key handling leveraging an injected MCU-unique HUK.
- SCE7 adds asymmetric encryption and advanced hash functions for integrity and authentication.
- SCE9 expands upon the SCE7 by leveraging an injected MCU-unique HUK for secure key handling and increasing RSA support up to RSA-4K.

The MCU-unique Hardware Unique Key (HUK) is a 256-bit random key for SCE9 and a 128-bit random key for SCE5_B, that is injected in the Renesas factory. This key is stored in wrapped format using an MCU-unique key wrapping mechanism.

The MCU-unique Hardware Key (HUK) for SCE5 and SCE7 is a derived MCU unique key which serves the same purpose as the HUK for SCE9 and SCE5_B in terms of user key wrapping. The derived HUK for SCE7 and SCE5 is never stored and is accessible only by the SCE, and not by application code.

Since for all the SCEs, the HUK is in a wrapped format unique to the MCU, even if an attacker were able to extract the stored key, another MCU will not be able to use it.
All SCEs can inject a Key Update Key (KUK), which can be used to securely update the user keys when a device is deployed in the field. The KUKs are injected during end-product manufacturing via the MCU’s programming interface or using FSP Crypto Driver. To update keys in a device that is deployed in the field, the new key must be wrapped with one of the previously injected KUKs. In addition to replacing keys that have been compromised, many security policies require key rotation or key update (re-keying) on a regular basis. It is recommended to consider injecting multiple KUKs.

1.3 Renesas Secure Key Injection Advantages

Secure key injection and update, combined with the security engine’s support of wrapped keys, address many vulnerabilities associated with using plaintext keys:

- Plaintext keys are never stored in code flash. In the event of a program memory breach, the sensitive key material is protected.
- Plaintext keys are never stored in RAM. In the event of malicious code executing on the system, the sensitive key material is still protected.
- Keys can be securely stored in code flash, data flash, or even copied into external memory, enabling unlimited secure key storage.

In addition, Renesas key wrapping techniques protect against device cloning, as discussed below.

1.3.1 Advantages of Key Wrapping over Key Encryption

It is important to understand the difference between wrapping and encrypting for secure asset storage.

When data is encrypted and sent to another recipient, if that recipient has the same key, they can decrypt the data. This results in a confidential exchange of information. However, what if there was a problem with the transmission of the encrypted data? If the recipient unknowingly receives corrupted information, the decryption algorithm will generate garbage data, with no indication that the original data has been corrupted.

Wrapping solves this problem by appending a Message Authentication Code to the encrypted output for integrity checking.
1.3.2 Advantages of Key Wrapping using MCU HUK

Using the MCU Hardware Unique Key (HUK) to wrap the stored keys adds another protection feature – clone protection. If the wrapped key is transmitted or copied to another MCU, that MCU’s HUK will not be able to either unwrap or use the copied key. Even if the entire MCU contents are copied onto another device, the keys cannot be used or exposed.

1.4 Renesas RA MCU Factory Boot Firmware Limitations for SCE9

Secure key injection via the serial programming interface is not supported for RSA 3K, RSA 4K, ECC secp256k1, and Key-Update Keys on some older versions of the Renesas RA MCUs due to factory Boot Firmware limitations. The user needs to use a Renesas Flash Programmer (RFP) to read out the Boot Firmware version and confirm the support for the Secure Key Injection of the above-mentioned keys. Refer to the RFP user’s manual Flow of Operations section to access the Bootloader Firmware version by using the Read Device Information menu.

- V1.2.04 – WS1: secure user key inject command is not supported
- V1.3.10 – WS2: user key inject command is not supported
- V1.5.22 – CS: user key inject command is supported, but it does not support RSA 3K, RSA 4K, secp256k1, or KUK
- V1.6.25 and above – MP: no limitations

The part information silkscreened on the device can also be checked, though it is recommended that the boot firmware version be confirmed as described above. Boot firmware limitations exist for the following MCUs:

- RA4M2 - All WS and ES devices
- RA4M3 - All WS, ES and CS devices (date code 014AZ00)
- RA6M4 - All WS, ES and CS devices (date code 014AZ00). MP device with date codes 028AZ00, 031AZ00
- RA6M5 - All WS and ES devices

Please note that some EK-RA6M4 and EK-RA4M3 Evaluation Kits may contain affected silicon. The following list shows the affected kit serial numbers. Note that all early adopter kits with WS or ES silicon are also affected.

- EK-RA4M3 – Serial numbers 219243 – 219542
- EK-RA6M4 – Serial numbers 215938 – 216237 and 218497 - 218996

If your application requires secure key injection of RSA 3K, RSA 4K, ECC secp256k1, or Key-Update Keys and your evaluation kit does not support it, please contact your local Renesas Sales representative.
2. Wrapped Key Injection Use Cases and Injection Procedure Overview

This section provides an overview of the wrapped key injection use cases and the general steps for injection procedure of each use case. A step-by-step walk through of the wrapped key injection procedures is provided in later sections.

2.1 Wrapped Key Types

Table 2 summarizes the key types that can be directly injected into Renesas RA Family MCUs with the SCE9 Secure Crypto Engine. Injected keys are stored wrapped by the MCU's HUK.

Table 2. Supported Key Types for SCE9

See Table 1 to understand the types of keys supported for other Secure Crypto Engines based on the supported crypto algorithms and Device Lifecycle Management capability.

2.2 General Steps for Secure Key Injection and Update

Secure Key Injection for SCE9 Protected Mode and SCE5_B is performed via the serial programming interface, demonstrated here with the Renesas Flash Programmer (RFP). Secure Key Injection for SCE9 Compatibility Mode, SCE7, and SCE5 is performed through the FSP. Key preparation steps where key material is exposed in plaintext must be performed in a secure environment.

2.2.1 Key Injection

There are three high-level steps for key injection. Section 3 guides the user to establish the PGP encrypted communication channel between the user and Renesas DLM Server. Sections 4, 5, and 5.2 provides the step-by-step walkthroughs of how to perform the three high-level steps for the secure key injection.

1. The first step in the secure key injection process is to use the Renesas Device Lifecycle Management (DLM) service to wrap an arbitrary User Factory Programming Key (UFPK) (in green) using the Renesas Hardware Root Key (HRK) (in blue). The UFPK is a 256-bit value selected by the user. The same UFPK can be used to inject any number of keys.

Figure 4. Wrapping the UFPK using DLM Server
2. Next, the user key (in yellow) must be wrapped with the UFPK.

![Figure 5. Wrap the User Key with the UFPK](image)

3. Finally, the user key is injected by providing the wrapped UFPK (W-UFPK) and the wrapped user key to the secure key injection mechanism of the security engine.

![Figure 6. Inject User Key over the Serial Programming Interface](image)

### 2.2.2 Key Update

Since injecting new keys in the field is usually done to replace older keys (key rotation or re-keying), this process is referred to as “key update”. To enable secure key update in the field, one or more Key-Update Keys (KUK) must be injected during production provisioning, as described above.

KUKs, like other cryptographic keys, can be stored in either code flash or data flash (if available on the MCU). Since the KUK is the only mechanism by which new keys can be injected/wrapped, it is highly recommended that multiple KUKs be injected during production provisioning. This enables the KUK to be rotated or revoked to adhere to an infrastructure security policy or to respond to a key exposure security breach.

For MCUs that support secure key injection over the programmer interface, additional KUKs CANNOT be injected after the programming interface is disabled. Once a product is in the field with its programming interface disabled, new keys can ONLY be injected via a pre-existing KUK.

The KUKs may be stored in any code or data flash location during production. This location will be passed to the key update API for the injection of the new user key. A user can inject multiple KUKs and provide a scheme to rotate the keys based on timed schedule or key leakage event. We recommend that users disable the programming interface prior to deploying to the field for security considerations.

There are two high-level steps for key update. Note that the KUK must already reside on the MCU.

1. Use the KUK (in grey) to wrap the new user key (in yellow).

![Figure 7. Wrap the New User Key with a KUK](image)
2. Use the FSP and the previously injected KUK to inject the new user key. The new user key is wrapped by the MCU HUK (in black). Note that the APIs for the two modes are provided by different FSP modules.

2.3 Important Preparations for Using the Example Projects

The example projects in this application project demonstrate the secure key injection and update capabilities of Renesas RA Family MCUs using sample keys. Sections 3, 4, and 5 describe the steps needed to replace these sample keys with custom keys.

The following graphic shows the flow of this preparation work plus the example project for SCE9 (RA6M4 example). The block outlined in red is the scope of the functionality of the example project.
The following graphic shows the flow of this preparation work plus the example project for SCE7 (RA6M3 example). The block outlined in red is the scope of the functionality of the example project.

### 2.4 Tools Used in the Secure Key Injection and Update

There are three tools used in the secure key injection and update besides e² studio, which is used as the software project development environment. Refer to the corresponding section mentioned below for details on obtaining, setting up, and using these tools.

- **Gpg4win**
  This tool is used in section 3 to establish a PGP encrypted communication channel between user and the Renesas Key Wrap server. Using this tool, the user can generate a user PGP key pair, perform key exchange with the Renesas DLM server, and assist the reception of the W-UFPK.

- **Renesas Security Key Management Tool (SKMT)**
  This tool is used in section 4 and section 5 to generate the following three key files:
  - User key: to be injected to MCU via RFP or FSP API
  - Key update key: to be injected to MCU via RFP or FSP API
  - New user key wrapped using the KUK: to be updated by an FSP API

- **Renesas Flash Programmer (RFP)**
  This tool is used in section 5.2 to inject the User key and KUK when using SCE9 Protected Mode.
3. Using the Renesas Key Wrap Service

The Renesas Key Wrap Service must be used to obtain a wrapped UFPK (W-UFPK) for the specific MCU Group and security engine operational mode. All key material exchange is performed with PGP encryption. This section explains the steps to establish this PGP-encrypted communication channel between the user and the Renesas Key Wrap Server. This is a one-time process and does not need to be repeated for different MCUs.

3.1 Create PGP Key Pair

If you already have a PGP key pair, that key can be used for the key exchange process. Otherwise, the instructions below describe one method for creating a PGP key pair.

The PGP software demonstrated here is GPG4Win, which can be downloaded from this URL: http://www.gpg4win.org/

The screen shots included in this application note are based on gpgwin-4.0.0.exe. There may be minor graphic interface updates with later versions. However, the functionality used in this application note should persist.

Download and install Kleopatra:

![Download and Install Kleopatra](image)

Launch Kleopatra and create a PGP Key Pair.

1. Click File > New Key Pair
2. Choose Create a personal OpenPGP key pair.

![Create a Personal OpenPGP Key Pair](image)
3. Provide a **Name** and **Email**. Note that even though these are marked as optional, at least one entity must be provided to move to the next stage. Check Protect the generated key with a passphrase.

![Image of Enter Details dialog box](image)

**Figure 13. Provide Name and Email**

4. Click **Advanced Settings** and select **RSA** as the key type.

![Image of Advanced Settings dialog box](image)

**Figure 14. Select RSA Encryption**
5. Click **Create** and provide a passphrase twice to protect the private key. Then click **OK**. **Be sure to save your passphrase.**

![Figure 15. Define a Passphrase](image)

6. The PGP key pair should be created successfully. Click **Finish**.

![Figure 16. PGP Key Pair Created](image)

7. A new item will be created in Kleopatra. Right-click on the keypair just created and select **Export**.

![Figure 17. Export the User PGP Public Key](image)
8. Save the public key to a file with an *.asc extension. In this example, this file is renamed to `customer_public.asc`. Click **Save**.

![Figure 18. Save the PGP public key to a folder](image)

### 3.2 Registration with DLM Server

The first time you use the Renesas Key Wrap service, you will have to register with the Renesas DLM Server.

1. Open the URL [https://dlm.renesas.com/keywrap](https://dlm.renesas.com/keywrap) in a browser and click **New registration**.

![Figure 19. Start Registration with Renesas DLM Server](image)

2. Follow the prompt to provide a **valid** email address and click **Send mail**.

![Figure 20. Register User Email Address](image)
After clicking **Send mail**, the following screen will appear. Click **Return**.

![Figure 21. Acknowledge Email Transmission](image)

3. You should receive an email similar to the one shown below. Click on the URL provided to confirm your registration.

![Figure 22. Registration Confirmation Email](image)

4. Follow the prompts to provide your name and company name and create a password. Click the **Next (confirmation)** button. Note that the password must consist of 8 to 32 alphanumeric characters and may include the symbols "!" and "@".

![Figure 23. Confirm Registration](image)
After the confirmation screen is displayed, click on the **Register** button to complete the user registration.

### Figure 24. Finish the Registration

#### 3.3 Exchange User and Renesas PGP Public Keys

If you have not already exchanged PGP keys with the Renesas DLM server, follow the steps below.

1. After successfully registering the user information, the following screen will open. Click the **Start service** button to start using the key encryption system.

#### Figure 25. Start DLM Key Wrapping Service

2. When the agreement warning shows up, scroll down to the bottom of the **Trusted Secure IP Key Wrap Agreement** and click **I agree**. You will then be logged into the DLM server. Note that the Agreement will come up every time you log into the DLM server.

--- CAUTION!!---

--- PLEASE READ THE FOLLOWING BEFORE USING THE SERVICE ---

This Trusted Secure IP Key Wrap Service Agreement (this "Agreement") is between you and Renesas Electronics Corporation. Please carefully note that this Agreement is legally valid agreement relating to Trusted Secure IP key encryption (the "Service").

**Article 15 (ENTIRE AGREEMENT)**

This Agreement sets forth the entire agreement of the parties with respect to the subject matter hereof and supersedes any prior or contemporaneous agreements, written or oral, concerning the subject matter hereof. Any change, modification or amendment of the terms of this Agreement shall not be effective unless reduced to writing and authorized by both parties.

---

#### Figure 26. Agreement for Using the Renesas DLM Server
3. When you log into the DLM system, the window below appears. Click **PGP key exchange**.

![Figure 27. Start PGP Key Exchange](image)

4. Click **Reference** and select the public key generated earlier (**customer_public.asc**). Notice that the fingerprint of the Renesas PGP public key is displayed. This will be used to certify the Renesas public key after you receive it.

![Figure 28. Browse the Customer PGP Public Key](image)

5. Click **PGP key exchange**.

![Figure 29. Exchange Keys](image)
6. Once the PGP public key is submitted, click **Return**.

![Figure 30. Wait for Renesas’s PGP Public Key](image)

7. You will receive an email from Renesas at the email address registered with the DLM server with the contents as shown below if the key exchange is successful. It typically takes about one to two minutes to receive this email.

Note that a PGP public key can be registered any number of times. The latest PGP public key that has been registered successfully is used for encryption. All previously registered PGP public keys are discarded.

![Figure 31. Receive the Renesas PGP Public Key](image)

8. Go back to the Kleopatra application and import the Renesas PGP Public key to Kleopatra as shown below.

![Figure 32. Import Renesas Public Key](image)
9. After **Open** is clicked, a new item is added in Kleopatra as **not certified**.

![Figure 33. Renesas Public Key is Imported](image)

10. Confirm that the Fingerprint displayed is same as what is shown on the screen represented in Figure 29. Click **Certify**.

![Figure 34. Confirm the Fingerprint and Certify the Renesas Public Key](image)

11. Click **Certify** again from following screen.

![Figure 35. Certify the Certificate](image)
12. Provide the passphrase to unlock the secure key.

![Figure 36. Provide the Passphrase](image)

13. The following item will pop up upon successful certification. Click **OK**.

![Figure 37. Successful Certification](image)

4. **Wrapping the User Factory Programming Key Using the Renesas Key Wrap Service**

If you do not already have a W-UFPK for your target MCU Group, follow the steps below to wrap a UFPK with the Renesas Hardware Root Key as described by Figure 4.

4.1 **Renesas Security Key Management Tool**

The Renesas Security Key Management Tool (SKMT) performs several functions during the secure key injection process. Open the following link to access the latest SKMT:

https://www.renesas.com/software-tool/security-key-management-tool

From the above link, find the **Downloads** area and download the latest Security Key Management Tool installer. This tool supports Windows and Linux. The screen shots in this document came from the Windows environment.

![Figure 38. Download the Security Key Management Tool for Windows or Linux](image)

Once the installer executable is downloaded, right-click on the installer, and select **Run as administrator** to install this tool. Follow the prompt to select the **Setup Language**, currently both English and Japanese are supported. Next, select the installation folder. By default, it will be installed into \C:\Renesas\SecurityKeyManagementTool\. If a previous version is installed, the old version will be overwritten.
The User’s Manual of this tool is located in the \DOC folder. We recommend that you read through the user’s manual before proceeding to the following section.

The SKMT provides two interfaces to users, a Command Line Interface (CLI) and a Graphic User Interface (GUI). The CLI interface is typically used for production support and the GUI interface is primarily intended for development usage. This application note will explain how to use both interfaces to perform key injection and update.

4.2 Creating the User Factory Programming Key using SKMT GUI Interface

Define a UFPK and convert it to a binary format that is compatible with the Renesas Key Wrap Service. This can be done using the Renesas Security Key Management Tool (SKMT).

The same UFPK can be used for all RA Family MCUs. However, the corresponding W-UFPK may be different, depending on the specific MCU Group. Therefore, these examples will use different UFPKs. To use the GUI interface to prepare the UFPK for secure key injection for SCE9 Protected Mode, follow section 4.2.2. To use the GUI interface to prepare the UFPK for secure key injection for SCE7 Compatibility Mode, follow section 0. To use the CLI interface to prepare the UFPK for secure key injection, follow section 4.3.

4.2.1 Launching the GUI Interface

Double-click SecurityKeyManagementTool.exe to launch the GUI interface.

![Figure 39. Launch SKMT GUI Interface](image)
4.2.2 Creating the UFPK for SCE9 Protected Mode

To use the example projects for RA6M4, in the **Overview** window, select **RA Family, SCE9 Protected Mode**.

![Security Key Management Tool](Image)

*Figure 40. Select RA Family, SCE9 Protected Mode*
Next, navigate to the **Generate UFPK** page.

- For the **User Factory Programming Key**, select **Generate random value**.
- Click the **Browse** button to select a folder to store the key, and name the resulting file `ufpk.key`.
- Click **Generate UFPK key file**. The `ufpk.key` file will be generated. This operation is demonstrated in Figure 41.

---

**Figure 41. Generate Random Value for the UFPK using GUI for SCE9**
It is also possible to specify a specific UFPK. The following is an example of using the same UFPK used in the example project:

```
000102030405060708090A0B0C0D0E0F000102030405060708090A0b0c0d0e0f
```

Note that the 32-byte UFPK must be provided in big-endian format.

![Generate Fixed UFPK using GUI for SCE9](image)

**Figure 42. Generate Fixed UFPK using GUI for SCE9**
4.2.3 Creating the UFPK for SCE7 Compatibility Mode

To use the example projects for RA6M3, select **RA Family, SCE7 Compatibility Mode** as the MCU family and security engine.

![Security Key Management Tool](image)

**Figure 43. Select RA Family, SCE7 Compatibility Mode**
Next, navigate to the **Generate UFPK** page.

- For the **User Factory Programming Key**, select **Generate random value**.
- Click the **Browse** button to select a folder to store the key, and name the resulting file `ufpk.key`.
- Click **Generate UFPK key file**. The `ufpk.key` file will be generated.

It is also possible to specify a specific UFPK. The following is an example of using the same UFPK used in the example project:

```
2222222222222222222222222222222211111111111111111111111111111111
```

Note that the 32-byte UFPK must be provided in big-endian format.

![Generate Fixed UFPK using GUI for SCE7](image-url)

**Figure 44 Generate Fixed UFPK using GUI for SCE7**
4.3 Using the CLI Interface for SCE9 Protected Mode

Open a Command Prompt window and navigate to the folder where skmt.exe resides, typically under \Renesas\Security Key Management Tool\CLI\.

Use the following command to generate a random UFPK and place it in a key file (ufpk.key). If desired, a complete file name with path may be specified. Refer to the Security Key Management Tool user’s manual to understand the usage of /genufpk option.

```
skmt.exe /genufpk /output "C:\User_key_injection_protected_mode\keys\ufpk.key"
```

This command will generate a random 256-bit UFPK as shown below.

```
UFPK: E8AB23E99AD42823DA4215549A41496720F7243680A4715F4B944ACC94B691
Output File: C:\User_key_injection_protected_mode\keys\ufpk.key
```

Figure 45. Create a Random UFPK Using SKMT CLI

It is also possible to specify a specific UFPK, as shown by the following command:

```
skmt.exe /genufpk /ufpk "000102030405060708090A0B0C0D0E0F000102030405060708090a0b0c0d0e0f" /output "C:\User_key_injection_protected_mode\keys\ufpk.key"
```

```
UFPK: 000102030405060708090A0B0C0D0E0F000102030405060708090a0b0c0d0e0f
Output File: C:\User_key_injection_protected_mode\keys\ufpk.key
```

Figure 46. Create a Fixed UFPK Using SKMT CLI

4.4 Wrapping the UFPK

The next step is to obtain a W-UFPK from the Renesas Key Wrap Service based on the selected UFPK. Note that if the UFPK is changed, a new W-UFPK must be obtained.

1. Encrypt the UFPK with the Renesas public key. This key was imported earlier to Kleopatra. Using Kleopatra, select Sign/Encrypt… and select the desired ufpk.key file. Then click Open.

```
Figure 47. Encrypt the UFPK File for PGP Transfer
```
2. When asked which entity this file is to be encrypted for, (optionally) uncheck *Encrypt for me* and check *Sign as*, *Encrypt for others*, and *Encrypt / Sign each file separately*.

Figure 48. Select PGP Encryption Options
3. Click the **Open Selection Dialog** (the ![image](image) icon). This will open a **Certificate Selection** dialog box. Take care to keep UFPK and W-UFPK key files separate for different MCU Groups.

![Figure 49. Open the Selection Dialog](image)

4. In this window, select **keywrap** to select the Renesas public key, then click **OK**

![Figure 50. Select the Renesas PGP public key](image)
5. Ensure that the correct destination folder for the encrypted key is selected under **Output**. Finally, click **Sign/Encrypt**.

![Figure 51. Encrypt UFPK using Renesas PGP Public Key](image)
6. If you do not check **Encrypt for me**, you will get an **Encrypt-To-Self Warning** that you cannot decrypt the data. Click **Continue**.

![Image](image1.png)

**Figure 52. Start the UFPK Encryption process**

7. Provide your private key passphrase, then click **OK**.

![Image](image2.png)

**Figure 53. Provide Passphrase**

8. The UFPK encrypted with the Renesas public key will be generated, with `.gpg` added to the extension of the key. In this case, the file `ufpk.key.gpg` is generated. Click **Finish**.

![Image](image3.png)

**Figure 54. Provide User Passphrase**
9. Now we can send the UFPK that has been encrypted with Renesas Public Key to the Renesas DLM Server for wrapping. Return to the DLM Server web page:

- To create a W-UFPK for the RA6M4 example project, select the Renesas RA Family and click Protected Mode RA6M4/RA6M5 Encryption of customer’s data.

- To create a W-UFPK for the RA6M3 example project, select the Renesas RA Family and click Compatibility Mode RA6M1/RA6M2/RA6M3/RA6T1 Encryption of customer’s data.

10. Click Encryption service for products at the next screen.
11. Click **Reference**, select the `ufpk.key.gpg` created previously, and click **Open**. Note that in the DLM server description, **Key2** refers to the UFPK.

![Figure 59. Select the PGP-Encrypted UFPK file](image)

12. Click **Settle**. The following message will be printed. Then click **Return to menu**. You can now log out of the Renesas Key Wrap Service.

![Figure 60. Return to the DLM Server Main Menu](image)
13. The wrapped UFPK Key (W-UFPK) encrypted with your PGP public key should arrive in your email typically in about 1-2 minutes. Save the attached file.

![Figure 61. Receiving the W-UFPK via Email](image)

14. With the Kleopatra program, click Decrypt/Verify, select the W-UFPK file, and click Open.

![Figure 62. Decrypt the W-UFPK](image)
15. Follow the prompt to provide your PGP private key passphrase, click **OK**. The decrypted W-UFPK is generated in the folder specified.

![Decrypting the Encrypted W-UFPK](image)

**Figure 63. Decrypting the Encrypted W-UFPK**

16. Click **Save All** to save the decrypted W-UFPK key file `ufpk.key_enc.key` to the same folder as the UFPK key file. Both key files are required to generate key injection bundles.

5. **Secure Key Injection for SCE9 Protected Mode**

5.1 **Wrap Keys with the UFPK**

This section walks the user through the wrapping process required for secure key injection and update. The SKMT tool is used to perform this key wrapping process.

Step-by-step instructions for generating the three types of keys are provided, using both the CLI and GUI interfaces of the SKMT.

- **User Key** wrapping with the UFPK for secure key injection of the user key
- **Key-Update Key** wrapping with the UFPK for secure key injection of the KUK
- **User Key** wrapping with the KUK for secure key update of the user key

This application project provides examples for user key wrapping of both AES-256 and ECC secp256r1 public keys.

5.1.1 **Using the SKMT GUI Interface**

To prepare a Protected Mode user key to inject using RFP, we need the UFPK, W-UFPK, and the user key as input to the SKMT GUI interface.

Launch the SKMT GUI and select **RA Family, SCE9 Protected Mode** on the **Overview** tab. On the **Wrap Key** tab, open the submenu **Key Type**. This page can be used to choose which key type to prepare.

5.1.1.1 **Wrap an Initial AES-256 Key with the UFPK**

A NIST CAVP test vector is used for this purpose.

[https://csrc.nist.gov/Projects/Cryptographic-Algorithm-Validation-Program/Block-Ciphers](https://csrc.nist.gov/Projects/Cryptographic-Algorithm-Validation-Program/Block-Ciphers)

![NIST AES 256 Test Vector](image)

**Figure 64. NIST AES 256 Test Vector**
In the **Key Type** area, choose **Key Type** and specify **AES** with **256 bits**.

![Figure 65. Choose AES 256 bits as the Key Type](image)

Navigate to the **Key Data** page and input the **Raw** key data as shown below based on the NIST vector shown in Figure 64. The key data is duplicated here to easily copy and paste to the GUI interface.

KEY = `8000000000000000000000000000000000000000000000000000000000000000`

![Figure 66. Set up the Key Data](image)

Under the **Wrapping Key** section, click the corresponding **Browse** buttons to select the **UFPK** and **W-UFPK** key pair created in section 4.2 and 4.4. For the **IV**, select **Generate random value**. In the **Output** option, select **RFP**; then click the **Browse** button, choose the output folder, and name the output file.
Figure 67. Generate the AES 256 RFP Injection Key File

Now click Generate File. The AES256.rkey file will be generated.

The plaintext AES-256 key and UFPK are NOT contained in the *.rkey file, enabling confidential transfer of the key injection file contents.

5.1.1.2 Wrap an Initial ECC Public Key with the UFPK

A set of NIST test vectors are used in this application project.

https://csrc.nist.gov/Projects/Cryptographic-Algorithm-Validation-Program/Component-Testing

Figure 68. NIST ECC secp256r1 Test Vector
Launch the SKMT GUI and select **RA Family, SCE9 Protected Mode** on the **Overview** tab. On the **Wrap Key** tab, select the **Key Type** as **ECC** and **secp256r1, public** as shown in Figure 69.

![Figure 69. Choose secp256r1 Public Key](image)

Next, configure the **Key Data**. Under the **Key Data** area, select **Raw** and provide the **Qx** and **Qy** as shown below. The key data is duplicated here to easily copy and paste to the GUI interface.

- \(Q_x = 1ccbe91c075fc7f4f033bfa248db8fcccc3565de94bbfb12f3c59ff46c271bf83\)
- \(Q_y = ce4014c68811f9a21a1fdb2c0e6113e06db7ca93b7404e78dc7ccd5ca89a4ca9\)

![Figure 70. Provide the ECC Public Key data](image)
Next, under the **Wrapping Key** section, click the corresponding **Browse** buttons to select the **UFPK** and **W-UFPK** key pair created in section 4.2 and 4.4. For the **IV**, select **Generate random value**. For the **Output** option, select **RFP**; then click the **Browse** button, choose the output folder, and name the output file.

![Figure 71. Generate the ECC Public Key RFP Injection Key File using GUI](image)

The plaintext KUK and UFPK are NOT contained in the *.rkey file, enabling confidential transfer of the key injection file contents.
5.1.1.3 **Wrap a Key-Update Key with the UFPK**

The SKMT can be used to generate a sample KUK. To generate the KUK key file, navigate to the Generate KUK tab and use: `000102030405060708090a0b0c0d0e0f000102030405060708090a0b0c0d0e0f`.

Click the Browse button to select the folder and file name for the generated key file, here specified as `kuk_for_new_key.key`. Next, click Generate KUK key file, and the `kuk_for_new_key.key` file will be generated in the selected folder.

![Diagram showing steps to generate KUK file](image)

**Figure 72. Generate the KUK File used to Encrypt the User Key for SCE9**
Next, we will wrap the KUK so it can be injected to the MCU. Navigate to the **Wrap Key** page and choose **KUK** from the **Key Type** area.

![Figure 73. Choose KUK to Wrap](image1)

Navigate to the **Key Data** page, select the **File** option, and browse to the `kuk_for_new_key.key` key file generated in Figure 72.

![Figure 74. Provide the KUK .key File](image2)
Next, under the **Wrapping Key** section, click the corresponding **Browse** buttons to select the **UFPK** and **W-UFPK** key pair created in section 4.2 and 4.4. For the **IV**, select **Generate random value**. For the **Output** option, select **RFP**; then click the **Browse** button, choose the output folder, and name the output file.

Now click the **Generate File** button. The **KUK.rkey** file will be generated.

![Figure 75. Generate the Key-Update Key Injection File using GUI for SCE9](image)

### 5.1.1.4 Wrap a New AES-256 User Key with the KUK

In the section, we will use the **kuk_for_new_key.key** generated in Figure 72 to wrap a new AES-256 key. We will use a second NIST test vector to demonstrate secure key update using the KUK.

![Figure 76. NIST Test Vector as New AES-256 Key Test Data](image)

Navigate to the SKMT **Wrap Key** tab. In the **Key Type** area, select **AES-256** with **256 bits**.

![Figure 77. Choose AES 256bit New User Key](image)
In the **Key Data** area, provide the key data from the NIST vector based on Figure 76. The key data is duplicated here to copy and paste into the GUI interface.

```
KEY = c000000000000000000000000000000000000000000000000000000000000000
```

![Figure 78. Provide the New AES 256-bit Key Data](image)

In the **Wrapping Key** area, select KUK as the wrapping key and click **Browse** to locate the `kuk_for_new_key.key` file generated in Figure 72. For the **IV**, choose **Generate random value**. For the **Output** option, choose **C Source** and name the output file as `new_aes_key.c`. Name the **Key name** property as **NEW_AES256**. This name will be used in the source files for key-specific definitions.

Finally, click **Generate file**. Both the `new_aes_key.c` and the `new_aes_key.h` files will be generated.

![Figure 79. Generate KUK-Wrapped AES-256 Key](image)
5.1.1.5 Wrap a New ECC Public Key with the KUK

In the section, we will use the `kuk_for_new_key.key` generated in Figure 72 to wrap a new ECC public key.

To demonstrate updating the ECC public key, another NIST ECC secp256r1 test vector is used in this application project.

![Figure 80. New Set of NIST ECC Test Vectors]

Follow the procedure below to wrap the new ECC public key using the KUK file generated in Figure 72.

From the SKMT GUI, make sure RA Family, SCE9 Protected Mode is selected from the Overview page. Next, navigate to Wrap Key page. Select the Key Type as secp256r1, public as shown in Figure 69.

Under the Key Data area, select Raw and provide Qx and Qy as shown below. The key data is duplicated here so user can copy and paste to the GUI interface.

Qx = e266ddfdcc12668db30d4ca3e8f77494322c416044f2d2b8c10bf3d4012aeffa8a
Qy = bfa86404a2e9ffe67d47c587ef7a97a7f456b863b4d02cfc6928973ab5b1cb39

![Figure 81. Provide the New ECC Public Key Data]
Next, under the **Wrapping Key** section, click the corresponding **Browse** button to select the KUK generated in section 5.1.2. For the **IV**, select **Generate random value**. In the **Output** option, choose **C Source** and name the output as `new_ecc_public_key.c`. Set the **Key name** to `NEW_ECC_PUB`.

Finally, click **Generate file**. Both the `new_ecc_public_key.c` and the `new_ecc_public_key.h` files will be generated.

![Generate KUK-Wrapped ECC Public Key](image)

**Figure 82. Generate KUK-Wrapped ECC Public Key**

### 5.1.2 Using the SKMT CLI Interface

This section describes how to perform the actions described above using the SKMT CLI interface. These examples use SCE9 Protected mode, but SCE7 support is fundamentally the same.

The `/genkey` command of the Security Key Management Tool command line tool `skmt.exe` will be used to prepare keys for secure injection and update. These are the options for this command:

- **/keytype** – This input can take either ASCII or a one-byte hexadecimal input parameter indicating the key type.
- **/ufpk** – The User Factory Programming Key.
- **/wufpk** – The Renesas HRK-wrapped UFPK.
- **/kuk** – The Key-Update Key for secure key update.
- **/mcu** – The target MCU and security engine.
- **/output** – The output of the command.

Refer to the Security Key Management Tool user’s manual for more information about these commands, including the valid values for each parameter.

This application project uses an AES-256 key and an ECC secp256r1 public key to illustrate the secure key injection and update processes.

For these examples, we will use the UFPK and W-UPFK created earlier.
5.1.2.1 Wrap an Initial AES-256 Key with the UFPK

In the Command Prompt window opened earlier (section 4.3), use the following command to create the AES-256 key injection file (AES256_CLI.rkey). Refer to the Security Key Management Tool user manual for more information on how to construct the command.

```
Skmt.exe /genkey /ufpk
file="C:\User_key_injection_protected_mode\keysGui\ufpk.key" /wufpk
file="C:\User_key_injection_protected_mode\keysGui\ufpk.key_enc.key" /mcu
"RA-SCE9" /keytype "AES-256" /key
"8000000000000000000000000000000000000000000000000000000000000000" /filetype
"rfp" /output "C:\User_key_injection_protected_mode\keysGui\AES256_CLI.rkey"
```

Note that in this example:
- We are using 8000000000000000000000000000000000000000000000000000000000000000 from the NIST vector in Figure 64 as the AES-256 plaintext user key.
- We have specified the key type “AES-256”.
- “RA-SCE9” is used for the /mcu option.
- We are using a randomly generated IV. The IV changes each time this command is executed.
- In this example, we have specified the complete file path for the key file AES256_CLI.rkey.

Output File: C:\User_key_injection_protected_mode\keysGui\AES256_CLI.rkey
UFPK: 000102030405060708090A0B0C0D0E0F000102030405060708090A0B0C0D0E0F
W-UFPK: 000000006FEE15036A3B4E726FOB3F9EE1F74B7076EE15036A3B4E726FOB3F9EE1F74B70
IV: 0B730F4F7194A9CB67E2B8A1B0D2A370
Encrypted key:
1D6612FF7F2768BBE6B05410151C43E740368DFB0688FB7A52D35E2B86A9963C14F3FE16A4529AAC7E8B0650EB72

Figure 83. Create the AES-256 User Key Injection File

The generated key file AES256_CLI.rkey now contains the encrypted user key along with the W-UFPK. The plaintext AES-256 key and UFPK are NOT contained in the *.rkey file, enabling confidential transfer of the key injection file contents.

5.1.2.2 Wrap an Initial ECC Public Key with the UFPK

In this section, we will use the ECC key pair in Figure 68 as example of preparing an ECC public key for secure key injection.

In the Command Prompt window opened earlier (section 4.3), use the following command to create the ECC public key injection file (ECC_Public_Key_CLI.rkey). Refer to the Security Key Management Tool user manual for more information on how to construct the command.

```
Skmt.exe /genkey /ufpk
file="C:\User_key_injection_protected_mode\keysGui\ufpk.key" /wufpk
file="C:\User_key_injection_protected_mode\keysGui\ufpk.key_enc.key" /mcu
"RA-SCE9" /keytype "secp256r1-public" /key
"1ccbe91c075fc7f4f033bfa248db8fccccd3565f9e4bbbf12f359ff46c271bf83
cesq9a21affdb2c0e6113d6db7ca93b7404e78dc7c5ca89a4ca9" /filetype
"rfp" /output
"C:\User_key_injection_protected_mode\keysGui\ECC_Public_Key_CLI.rkey"
```

Note that in this example:
- 1ccbe91c075fc7ff4f033bfa248db8fccccd3565f9e4bbbf12f359ff46c271bf83
cesq9a21affdb2c0e6113d6db7ca93b7404e78dc7c5ca89a4ca9 is the NIST ECC public key from Figure 68.
- We have specified the key type “secp256r1-public”.
- “RA-SCE9” is used for the /mcu option.
- We are using a randomly generated IV. The IV is updated in each encryption instance.
- The command option /output defines the locations and name of the output file.
### Output File: C:\User_key_injection_protected_mode\keys_gui\ECC_Public_Keys_CLI.rkey

**UFPK:** 000102030405060708090A0B0C0D0E0F000102030405060708090A0B0C0D0E0F

**W-UFPK:** 1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF

**IV:** 0273B727750F33491F2B569B092535

**Encrypted key:**

1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF

---

**Figure 84. Create the ECC Public Key Injection File Using CLI**

### 5.1.2.3 Create and Wrap a Key-Update Key with the UFPK

We can use the SKMT to create a key file for a KUK. This is done with the following command:

```
skmt.exe /genkuk /kuk
"000102030405060708090A0B0C0D0E0F000102030405060708090A0b0c0d0e0f" /output
"C:\User_key_injection_protected_mode\keys_gui\kuk_for_new_key_cli.key"
```

Note that in this example:
- We have specified the complete file path for the key file.
- We need to use the same Key-Update Key as used in section 5.1.2.3.

---

**KUK:** 000102030405060708090A0B0C0D0E0F000102030405060708090A0B0C0D0E0F

**Output File:** C:\User_key_injection_protected_mode\keys_gui\kuk_for_new_key_cli.key

---

**Figure 85. Create the KUK Key File**

The generated key file `kuk_for_new_key_cli.key` now contains the KUK. Retain this key file to use for wrapping new user keys for secure key update.

To enable secure key update, we must first securely inject the KUK. Use the SKMT to wrap the KUK with the UFPK and create a key injection file for use with RFP with the following command:

```
skmt.exe /genkey /ufpk
file="C:\User_key_injection_protected_mode\keys_gui\ufpk.key" /wufpk
file="C:\User_key_injection_protected_mode\keys_gui\ufpk.key_enc.key" /mcu
"RA-SCE9" /keytype "key-update-key" /key
file="C:\User_key_injection_protected_mode\keys_gui\kuk_for_new_key_cli.key"
/filetype "rfp" /output
"C:\User_key_injection_protected_mode\keys_gui\KUK_CLI.rkey"
```

Note that in this example:
- We are using the KUK key file created above.
- We have specified key type “key-update-key”.
- We are using a randomly generated IV. The IV changes each time this command is executed.
- We have specified complete file path for the key file (KUK_CLI.rkey).

---

**Output File:** C:\User_key_injection_protected_mode\keys_gui\KUK_CLI.rkey

**UFPK:** 000102030405060708090A0B0C0D0E0F000102030405060708090A0B0C0D0E0F

**W-UFPK:** 1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF

**IV:** 1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF

**Encrypted key:**

1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF1234567890ABCDEF

---

**Figure 86. Create the Key-Update Key Injection File Using CLI**

The generated key file `KUK_CLI.rkey` now contains the wrapped KUK along with the W-UFPK. The plaintext KUK and UFPK are NOT contained in the *.rkey file, enabling confidential transfer of the key injection file contents.
Wrap a New AES-256 Key With the KUK

The user can use the following command to wrap the new AES key defined in Figure 76 using the KUK. This is done with the following command.

```
C:\Renesas\SecurityKeyMangementTool\cli>skmt.exe /genkey /kuk
file="C:\Secure_Key_Injection\keys_gui\kuk_for_new_key_cli.key" /mcu "RA-SCE9" /keytype "AES-256" /key
"c000000000000000000000000000000000000000000000000000000000000000" /filetype "csource" /keyname "NEW_AES256" /output
"C:\User_key_injection_protected_mode\keys_gui\new_aes_key_cli.c"
```

Note that in this example:
- We are using `c000000000000000000000000000000000000000000000000000000000000000` as the new AES-256 plaintext key.
- We are using a randomly generated IV. The IV changes each time this command is executed.
- We use the `/keyname` to create an identifiable key structure name that is unique in the software project. This resolves confusions when more than one set of new user keys are to be generated. If this option is not provided, a key structure name of `encrypted_user_key_data` is generated for the key structure.
- The generated `new_aes_key_cli.c` and `new_aes_key_cli.h` files include the output information in a data structure. The user can directly include these two files in the application project. This is demonstrated in the example project included.

```
Output File: C:\User_key_injection_protected_mode\keys_gui\new_aes_key_cli.h
Output File: C:\User_key_injection_protected_mode\keys_gui\new_aes_key_cli.c
KUK: 000102030405060708090A0B0C0D0E0F000102030405060708090A0B0C0D0E0F
IV: 3C841F6EAE05B7625098E70C542C1
Encrypted key: 03FE218ADC0A3DA5634833AB7F4D64CF8BF2CAC73C18E56C28DF04ADAD52536EED8DF4050312B8D0F935B087ECA0
```

Figure 87. Encrypt the New User Key with the KUK

5.1.2.4 Wrap a New ECC Public Key With the KUK

Use the following command to wrap the new ECC public key shown in Figure 80.

```
skmt.exe /genkey /kuk
file="C:\\Secure_Key_Injection\\keys_gui\\kuk_for_new_key.key" /mcu "RA-SCE9"
/keytype "secp256r1-public" /key
e266ddfde12668db30d4ca3e8f774943c2416044f2d2b10bf3d4012e7e2aa8a86404a2e9f6e6d79c587ef79a7f456b863b4d02cfc6928973ab5b1cb39" /filetype "csource"
/keyname "NEW_ECC_PUB" /output
"C:\\Secure_Key_Injection\\keys_gui\\new_ecc_public_key_cli.c"
```

Note that in this example:
- `e266ddfde12668db30d4ca3e8f774943c2416044f2d2b10bf3d4012e7e2aa8a86404a2e9f6e6d79c587ef79a7f456b863b4d02cfc6928973ab5b1cb39` is the ECC public key from the NIST test vector shown in Figure 80.
- The key type “secp256r1-public” is one of the available options specified in the Security Key Management Tool user's manual.
- "RA-SCE9" is used for the `/mcu` option.
- We are using a randomly generated IV. The IV changes each time this command is executed.
- The command option `/output` defines the locations and name of the output file.
- We use the `/keyname` to create an identifiable key structure name that is unique in the software project. This resolves confusions when more than one set of new user keys are to be generated. If this option is not provided, a key structure name of `encrypted_user_key_data` is generated for the key structure.
- The generated `new_ecc_public_key_cli.c` and `new_ecc_public_key_cli.h` files include the output information in a data structure. The user can directly include these two files in the application project. This is demonstrated in the example project included.

```
Note: In this example:
- We are using `c000000000000000000000000000000000000000000000000000000000000000` as the new AES-256 plaintext key.
- We are using a randomly generated IV. The IV changes each time this command is executed.
- We use the `/keyname` to create an identifiable key structure name that is unique in the software project. This resolves confusions when more than one set of new user keys are to be generated. If this option is not provided, a key structure name of `encrypted_user_key_data` is generated for the key structure.
- The generated `new_aes_key_cli.c` and `new_aes_key_cli.h` files include the output information in a data structure. The user can directly include these two files in the application project. This is demonstrated in the example project included.
```
5.2 Secure Key Injection via Serial Programming Interface

Follow this section to inject the AES-256 key, the ECC public key, and the Key-Update Key (KUK) that were prepared in section 5.1.1 or section 5.1.2. This capability is supported by RA Family MCUs that incorporate the SCE9 (Protected Mode) or SCE5_B security engine.

5.2.1 Setting up the Hardware

Set up the EK-RA6M4 evaluation board as follows.

- Set the jumpers to their default settings. Refer to the EK-RA6M4 User’s Manual for details.
- Connect the EK-RA6M4 J10 connector to the development PC using a USB micro-B cable to provide power and a debug connection using the on-board debugger.

Erase the entire MCU flash and ensure that the MCU is in the SSD Device Lifecycle State. This can be done using the Renesas Flash Programmer, as shown here.

1. Unzip rfp_project.zip
2. Launch the Renesas Flash Programmer GUI executable
3. Select File > Open Project and select ra6m4_secure_key_inject.rpj.
4. Select Device Information > Initialize Device.

Figure 89. Open RFP Project and Initialize the Device

Upon successful initialization, the following message will be printed.

Figure 90. RA6M4 Initialization

Unless there are permanently locked flash blocks, the entire flash will be erased and the RA6M4 will be set to SSD state through the above steps.
5.2.2 Inject the Initial User Key and Key-Update Key

After initializing the RA6M4, power-cycle the board and follow the steps below to inject the AES-256 key, the ECC public key, and the Key-Update Key. This section uses the set of injection keys generated from the GUI interface.

To simplify duplicating this example, the .rkey files that match the example project are included in the rfp_resources.zip file. If the user has used the NIST vectors included in this application project for verification purpose, they can use the included .rkey files for system verification. The screen captures included in this section use these files for demonstration purpose. If different keys are used, then the corresponding .rkey files must be updated to match those keys.

- Navigate to the User Keys tab and check Write User Keys.

![Figure 91. Select Write User Keys](image)

- Click and browse to the .rkey file containing the AES256 key, which for this example is \rfp_resources\user_keys\AES256.rkey (Figure 67). Set the Address property to a data flash or code flash address applicable for your specific application. In this example, the AES key will be injected to the first block of Data Flash at 0x08000000.

![Figure 92. Configure the AES-256 User Key Selection and Injection Address](image)

- Click Add Key. The selected AES key will be added for injection.

![Figure 93. AES-256 User Key is Configured for Injection](image)
• Click ‐ and browse to the ECC_Public_Key.rkey (Figure 71). Set the Address property to a data flash or code flash address applicable for your specific application. In this example, the ECC public key will be injected to the third block of Data Flash at 0x08000080.

![Figure 94. Configure the ECC Public Key Selection and Injection Address](image)

• Click Add Key. The selected ECC public key will be added for injection.

![Figure 95. ECC Public Key is Configured for Injection](image)

• Click ‐ and browse to the KUK.rkey (Figure 75) or KUK_CLI.rkey (Figure 86) file generated in Figure 86. Set the Address property to a data flash or code flash address applicable for your specific application. In this example, the Key-Update Key will be injected at code flash address 0x40000.

![Figure 96. Configure the Key-Update Key Selection and Injection Address](image)

• Click Add Key. The selected Key-Update Key will be added for injection.

![Figure 97. Key Update Key is Configured for Injection](image)
- Browse to the **Operation Settings** tab and note that **Erase**, **Program**, **Verify**, and **Erase Before Program** are selected.

![Figure 98. Select to Perform Flash Erase, Program, and Verify](image)

- Browse to the **Block Settings** tab and note that the entire flash region is selected for Erase.

![Figure 99. Entire Flash Region is Selected for Erase](image)

- Browse to the **Operation** tab. Click **Start** to inject the AES-256, the ECC public key, and the Key-Update Key. The injection should succeed with a similar output message as shown below at the selected flash addresses.

![Figure 100. Secure Keys Successfully Injected](image)
In this example code, no application is programmed since we are interested only in the key injection. In a production flow, it is possible to program the application and user keys together. This operation can also be performed using the command line function of RFP.

6. Secure Key Injection Preparation for SCE7 Compatibility Mode using SKMT GUI Interface

This section shows how to generate the `.c` and `.h` files which can be used in an application project that uses the FSP APIs to inject keys for use with the PSA Crypto APIs using the security engine in Compatibility Mode. This key injection method must be used for both user keys and Key-Update Keys.

6.1 Wrap an Initial AES-128 User Key Using the UFPK

A NIST CAVP test vector is used for demonstration.

https://csrc.nist.gov/Projects/Cryptographic-Algorithm-Validation-Program/Block-Ciphers

```
KEY = e00000000000000000000000000000000
IV = 00000000000000000000000000000000
PLAINTEXT = 00000000000000000000000000000000
CIPHERTEXT = 72a1da770f5d7ac4c9ef94d822affd97
```

**Figure 101. NIST AES-128 Test Vector**

Using the SKMT GUI interface, on the **Overview** tab, select **RA Family, SCE7 Compatibility Mode**. On the **Wrap Key** tab, in the **Key Type** area, choose **AES** and **128 bits**.

**Figure 102. Choose AES-128 bits as the Key Type**

Select the **Key Data** tab and input the **Raw** Key Data as shown below based on the NIST vector as shown in Figure 101.

**Figure 103. Set up the Initial AES-128 Key Data**
Under the **Wrapping Key** section, click the corresponding **Browse** buttons to select the **UFPK** and **W-UFPK** key pair. Choose **Generate random value** option for the **IV** data. For the **Output** option, select **C Source**; then click the **Browse** button, choose the output folder and file name, and name the key. This name will be reflected in the definitions generated for the C source files.

Now click the **Generate File** button. The source files to inject the AES key will be generated.

![Figure 104. Generate the Initial AES-128 Encrypted Key File](image)

Note that the generated `new_aes_128.c` and `new_aes_128.h` are used in the RA6M3 secure key injection example project.
6.2 Wrap a Key-Update Key with the UFPK

To wrap a KUK with the UFPK, we will first generate a KUK .key file. To generate the KUK .key file, navigate to the Generate KUK tab and input the KUK data. We will use this value for our sample key:

$$\text{KUK} = \text{fffffffeeeeddcccccbbbbbbaaaa0000099999999}$$

Click the Browse button to select the folder and file name for the generated key file, shown here as key_update_key.key. Next, click Generate KUK key file to generate the file as specified.

![Image of Security Key Management Tool](image)

Figure 105. Generate the KUK File used to Inject New User Key for SCE7

We will now create files for securely injecting the KUK. Select the Wrap Key tab. In the Key Type area, choose KUK. In the Key Data area, select File and specify the key_update_key.key file created above.

Under the Wrapping Key section, click the corresponding Browse buttons to select the UFPK and W-UFPK key pair. Use a random IV for the encryption portion of the wrapping mechanism. For the Output option, select C Source; then click the Browse button, choose the output folder and file name. Next, name the key as KUK. This name will be used in the key-specific definitions in the C source files.

Now click the Generate File button. The source files to inject the KUK will be generated.
Figure 106. Generate the Key-Update Key Injection File using GUI

Note that the generated `key_update_key.c` and `key_update_key.h` are used in the RA6M3 secure key injection example project.
6.3 Wrap a New AES-128 User Key with KUK

We will use a second NIST test vector to demonstrate AES key update using the KUK.

<table>
<thead>
<tr>
<th>KEY</th>
<th>IV</th>
<th>PLAINTEXT</th>
<th>CIPHERTEXT</th>
</tr>
</thead>
<tbody>
<tr>
<td>80000000000000000000000000000000</td>
<td>00000000000000000000000000000000</td>
<td>00000000000000000000000000000000</td>
<td>0edd33d3c621e546455bd8ba1418bec8</td>
</tr>
</tbody>
</table>

**Figure 107. Second NIST AES-128 Test Vector**

Navigate to the SKMT Wrap Key page, in the Key Type area, and select AES with 128 bits.

**Figure 108. New AES-128 Key**

In the Key Data area, provide the key data from the second NIST test vector.

**Figure 109. New AES128 Key**

In the Wrapping Key area, select KUK as the wrapping key and click the corresponding Browse button to select the key_update_key.key file generated above. For the IV, choose Generate random value. In the Output section, select C Source; then click the Browse button, choose the output folder and file name, and name the key. This name will be reflected in the definitions generated in the C source files.

Then click Generate file. The new_aes_key.c and the new_aes_key.h files will be both generated. These two files are used in the RA6M3 example project.
To exercise the example projects as is, user can follow below steps:

- Inject the included example RFP injection keys (AES256.rkey, KUK.rkey, and ECC_Public_Key.rkey which are included in rfp_resource.zip) by following section 5.2.2.
- A set of new user keys (AES256 as well as ECC Public Key) generated using the example KUK is already provisioned in the example projects. User can then directly proceed to exercise the example project.
- Please do not use the example keys for production support.

To use the example projects with customized keys, user can follow below steps:

- To test customized RFP injection keys and new user update keys (generated by following section 5.1.1 or 5.1.2 rather than using the ones included in rfp_resources.zip), user needs to follow section 5.2.2 to inject the keys to the MCU. User also needs to generate customized new user key files (new_aes_key.c/.h and new_ecc_public_key.c/.h) with the same key name to replace
the corresponding files used in the example project. Once the example projects are updated, user can proceed to running the example projects to verify the operations.

- To test new user key update procedure only, user can use the included RFP KUK.rkey file to generate new source files to replace the corresponding files in the example project. Once the example projects are updated, user can then proceed to the verification of the operations.

7.1 Example Project Overview

This pair of TrustZone-based secure and non-secure example projects provides the following functions:

**Secure project (secure_key_inject_update_ra6m4_s):**

- Uses the injected AES-256 key to perform cryptographic operation using AES256-CBC.
- Uses the injected Key-Update Key (KUK) to inject the new AES-256 key and store this new AES-256 key to data flash.
- Uses the new AES-256 to perform cryptographic operation using AES256-CBC.
- Uses the injected ECC public key to verify the NIST test signature shown in Figure 68.
- Uses the injected Key-Update Key (KUK) to inject the new wrapped ECC public key and store this new ECC public key to data flash.
- Uses the new ECC public key to verify the NIST test signature shown in Figure 80.

**Non-secure project (secure_key_inject_update_ra6m4_ns):**

- Establishes an RTT Viewer interface to allow users to select the intended Secure Crypto Engine and flash operation.
- Calls the non-secure callable APIs provided from the secure project based on user selection from the RTT Viewer interface.
- Prints the user operation results on the RTT Viewer.

---

**Figure 111. Software Block Diagram**
The FSP modules used in this pair of example projects are:

- **r_sce_protected**: This module is used in the secure region and provides services to the non-secure region via non-secure callable APIs.
- **r_flash_hp**: This module is used in the secure region and provides services to the non-secure region via non-secure callable APIs.

For more information on designing applications with TrustZone support, refer to the application project *Renesas RA Family MCU Security Design with TrustZone – IP Protection*.

### 7.2 Using the RFP Injected Keys

#### 7.2.1 Formatting the Injected Keys

The keys that are injected into the MCU flash using RFP cannot be used directly by the FSP Crypto APIs. A minor formatting change is required.

#### 7.2.1.1 Formatting the Injected AES Key

The following code snippet reads the AES-256 key from flash. The destination buffer can then be used for cryptographic operations. Replace the macro `DIRECT_AES_KEY_ADDRESS` with the actual injection address.

```c
static sce_aes_wrapped_key_t injected_key;
injected_key.type = SCE_KEY_INDEX_TYPE_AES256;
memcpy(injected_key.value, (uint32_t *)DIRECT_AES_KEY_ADDRESS,
      HW_SCE_AES256_KEY_INDEX_WORD_SIZE*4);
```

#### 7.2.1.2 Formatting the Injected ECC Public Key

The following code snippet reads the ECC public key from flash. The destination buffer can then be used for cryptographic operations. Replace the macro `DIRECT_ECC_PUB_KEY_ADDRESS` with the actual injection address.

```c
static sce_ecc_public_wrapped_key_t ecc_public_key_injected;
ecc_public_key_injected.type = SCE_KEY_INDEX_TYPE_ECC_P256_PUBLIC;
wrapped_ecc_public_key_size = sizeof(ecc_public_key_injected.value);
memcpy((uint8_t *)(&(ecc_public_key_injected.value)), (uint8_t *)DIRECT_ECC_PUB_KEY_ADDRESS,
      wrapped_ecc_public_key_size);
```

#### 7.2.1.3 Formatting the Injected KUK

The following code snippet reads the injected KUK from the flash. The destination buffer can then be used for secure key update. Replace the macro `KUK_ADDRESS` with the actual injection address.

```c
static sce_key_update_key_t kuk_key;
kuk_key.type = SCE_KEY_INDEX_TYPE_UPDATE_KEY_RING;
memcpy(kuk_key.value, (uint32_t *)KUK_ADDRESS,HW_SCE_UPDATE_KEY_RING_INDEX_WORD_SIZE*4);
```

#### 7.2.1.4 Formatting an Injected RSA Public Key

This application project does not include an example usage for RSA secure key injection and update, but the principles are identical. The following code snippet can be used to format an injected RSA public key. Replace the macro `RSA_2048_PUB_KEY_ADDRESS` with the actual injection address.

```c
static sce_rsa2048_public_wrapped_key_t injected_rsa_public_key;
injected_rsa_public_key.type = SCE_KEY_INDEX_TYPE_RSA2048_PUBLIC;
uint32_t wrapped_rsa_2048_public_key_size = sizeof(injected_rsa_public_key.value);
memcpy((uint8_t *)(&(injected_rsa_public_key.value)), (uint32_t *)RSA_2048_PUB_KEY_ADDRESS,
      wrapped_rsa_2048_public_key_size);
```
7.2.2 Verifying the Injected Key and the Updated Key

To verify the AES injection, provide the plaintext message and the expected cipher text for the injected AES key and the updated AES key to the software project. For example, based on the NIST vectors presented in Figure 64 and Figure 76, use the data below in `aes_crypto_operations.c`:

```c
#define BLOCK 16
/* NIST vector plaintext message*/
static uint8_t plain_text[BLOCK] = {
    0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00
};

/* NIST vector initialization vector for the directly injected AES key and the AES key update*/
static uint8_t iv[BLOCK] = {
    0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00
};

/* NIST cipher to match directly injected AES key*/
static uint8_t cipher_expected[BLOCK] = {
    0xe3, 0x5a, 0x6d, 0xcb, 0x19, 0xb2, 0x01, 0xa0, 0x1e, 0xbc, 0xfa, 0x8a, 0xa2, 0x2b, 0x57, 0x59
};

/* NIST cipher to match new AES key */
static uint8_t cipher_expected_new[BLOCK] = {
    0xb2, 0x91, 0x69, 0xcb, 0xb2, 0x01, 0xa0, 0x1e, 0xbc, 0xfa, 0x8a, 0xa2, 0x2b, 0x57, 0x59
};

To verify the ECC public key injection, the expected signature using the ECC private key which matches the injected ECC public key (see Figure 68) is provided in the array `ECC_SECP256R1ExpectedSignature` in `ecc_crypto_operation.c`.

```c
/* This is an externally generated NIST test signature using the private key */
uint8_t ECC_SECP256R1ExpectedSignature[] = {
    0xf3, 0xac, 0x80, 0x61, 0xb5, 0x14, 0x79, 0x5b, 0x88, 0x43, 0xe3, 0xd6, 0x62, 0x95, 0x27, 0xed,
    0x2a, 0xfd, 0x6b, 0x1f, 0x6a, 0x55, 0x5a, 0x7a, 0xca, 0xbb, 0x5e, 0x6f, 0x79, 0xc8, 0xc2, 0xac,
    0x8b, 0xf7, 0x78, 0x19, 0xca, 0x05, 0x6a, 0xb2, 0x78, 0x6c, 0x76, 0x26, 0xb2, 0xf7, 0x37, 0x1c,
    0xef, 0x97, 0xb2, 0x18, 0xe9, 0x6f, 0x17, 0x5a, 0x3c, 0xc0, 0xda, 0x2a, 0xc0, 0x05, 0x89, 0x03
};
```

**Figure 112. Provision the ECC_SECP256R1ExpectedSignature Array**

Similarly, the expected signature using the ECC private key which matches the updated ECC public key (see Figure 80) is provided in the array `ECC_SECP256R1ExpectedSignature_New` in `ecc_crypto_operation.c`.

```c
/* This is an externally generated signature using the private key */
uint8_t ECC_SECP256R1ExpectedSignature_New[] = {
    0x97, 0x6d, 0x3a, 0x4e, 0x9d, 0x23, 0x32, 0x6d, 0xc0, 0x6a, 0xa9, 0xfa, 0x56, 0x2b, 0x7c, 0xe,
    0x53, 0xf4, 0x28, 0x64, 0xf5, 0x08, 0x48, 0x3a, 0x64, 0x73, 0xb6, 0xa1, 0x10, 0x79, 0xb2, 0xdb,
    0x1b, 0x76, 0x6e, 0x9c, 0xe, 0x71, 0xb9, 0x6c, 0xb1, 0x9d, 0xb4, 0x6e, 0x0a, 0xf4, 0x62, 0x0c,
    0x4c, 0xfa, 0x65, 0x2a, 0xe5, 0x00, 0x7d, 0x45, 0x55, 0xb8, 0xe, 0xef, 0x3, 0x6e, 0x19, 0x32
};
```

**Figure 113. Provision the ECC_SECP256R1ExpectedSignature_New Array**

There is no action needed from the user if the same sets of keys and plaintext messages are used. If new sets of keys and messages are used, the user needs to update the project with the new credentials for the above items.
7.3 FSP Crypto Module Support for User Key Update

This section introduces the FSP Crypto APIs for SCE Protected Mode that are used for secure user key update. For a complete description of all FSP Crypto APIs, refer to the FSP User’s Manual.

To use keys that have been injected via the secure key injection process using the serial interface, the application must refer to those keys at the address where they were injected. If you inject keys at addresses other than those demonstrated above, be sure to change your application code to reflect those addresses. See instructions in section 7.4.

To perform secure AES key update, use the following API to MCU-uniquely wrap a new AES key using a previously injected Key-Update Key:

```c
fsp_err_t R_SCE_AES256_EncryptedKeyWrap (  
  uint8_t *initial_vector,  
  uint8_t *encrypted_key,  
  sce_key_update_key_t *key_update_key,  
  sce_aes_wrapped_key_t *wrapped_key )
```

The API parameters are:
- `[in] initial_vector`: Pointer to a buffer that holds the initialization vector that was used to wrap the new key. This must be the IV that was used during the key wrap process shown in section 5.1.1.4 or section 5.1.2.4. This value will be included in the generated `new_aes_key.c` and `new_aes_key.h`.
- `[in] encrypted_key`: Pointer to a buffer that holds the new key, wrapped by the KUK. In this example, it is the KUK-wrapped AES-256 key that was output during the key wrap process shown in section 5.1.1.4 or section 5.1.2.4. This value will be included in the generated `new_aes_key.c` and `new_aes_key.h`.
- `[in] key_update_key`: Pointer to the Key-Update Key that was previously injected on the MCU. This address must match the address used when injecting the KUK in section 5.2.2. The user needs to update the macro definition `KUK_ADDRESS` defined in `flash_storage.h` to match the injection address.
- `[in, out] wrapped_key`: This is the SRAM buffer to store the wrapped new user key. For security considerations, it is recommended to erase this buffer right after the wrapped key is saved to flash. In this application project, the newly generated wrapped key is stored to data flash and used in the example project.

To perform secure ECC public key update, use the following API to MCU-uniquely wrap a new ECC public key using a previously injected Key-Update Key:

```c
fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (  
  uint8_t *initial_vector,  
  uint8_t *encrypted_key,  
  sce_key_update_key_t *key_update_key,  
  sce_ecc_public_wrapped_key_t *wrapped_key )
```

The API parameters are:
- `[in] initial_vector`: Pointer to a buffer that holds the initialization vector that was used to wrap the new key. This must be the IV that was used during the key wrap process shown in section 5.1.1.5 or section 5.1.2.5. This value will be included in the generated `new_ecc_public_key.c` and `new_ecc_public_key.h`.
- `[in] encrypted_key`: Pointer to a buffer that holds the new key, wrapped by the HUK. In this example, it is the KUK-wrapped ECC private key that was output during the key wrap process shown in section 5.1.1.5 or section 5.1.2.5. This value will be included in the generated `new_ecc_public_key.c` and `new_ecc_public_key.h`.
- `[in] key_update_key`: Pointer to the Key-Update Key that was previously injected on the MCU. This address must match the address used when injecting the KUK in section 5.2.2. The user needs to update the macro definition `KUK_ADDRESS` defined in `flash_storage.h` to match the injection address.
- `[in, out] wrapped_key`: This is the SRAM buffer to store the wrapped new user key. For security considerations, it is recommended to erase this buffer right after the wrapped key is saved to flash. In this application project, the newly generated wrapped key is stored to data flash and used in the example project.
7.3.1 Save the New Wrapped Key to Data Flash

Once a new key is wrapped, the user needs to use the flash driver `r_flash_hp` to manually store it to the data flash.

```c
sce_aes_wrapped_key_t wrapped_new_user_key;
error = R_SCE_AES256_EncryptedKeyWrap(
    iv_encrypt_new_key, encrypted_new_key, &kuk_key, &wrapped_new_user_key);
```

Refer to function `store_new_aes_key_to_data_flash()` and function `store_new_ecc_pub_key_to_data_flash()` for the operations of storing the new wrapped keys to data flash.

7.4 Import and Compile the Example Project

Follow the steps below to exercise the example project. Note that there are sections of the code that must be updated using the secure key injection results generated above prior to compiling and running the project. Note that if the user has used the NIST vectors included in this application project for verification purposes, steps 4 to 5 can be skipped.

1. Launch e² studio and import `secure_key_inject_update_ra6m3.zip` file to a workspace.
2. Open `crypto_operations.c` in the secure project `secure_key_inject_update_ek_ra6m4_s`, under the folder `\secure_key_inject_update_s\src`.
3. At the bottom of `flash_storage.h`, find the macro definitions `DIRECT_AES_KEY_ADDRESS`, `DIRECT_ECC_PUB_KEY_ADDRESS`, and `KUK_ADDRESS` based on Figure 97.
4. Replace `new_aes_key.h` and `new_aes_key.c` with the new sets of files generated in section 5.1.1.4 or section 5.1.2.4 located in folder `\secure_key_inject_update_ek_ra6m4_s\src`.
5. Replace `new_ecc_public_key.c` and `new_ecc_public_key.h` generated in section 5.1.1.5 or section 5.1.2.5 located in folder `\secure_key_inject_update_ek_ra6m4_s\src`.
6. If different file names are used, update the `#include` definition in `aes_crypto_operations.c` on this line to reflect the new file name.

```
#include "crypto_operations.h"
#include "hal_data.h"
#include "r_sce.h"
#include "flash_storage.h"
#include "new_aes_key.h"
```

Figure 114. Include the Generated Header File for AES operation

7. If different file names are used, update the `#include` definition in `ecc_crypto_operations.c` on this line to reflect the new file name.

```
#include <crypto_operations.h>
#include "hal_data.h"
#include "r_sce.h"
#include "flash_storage.h"
#include "new_ecc_public_key.h"
```

Figure 115. Include the Generated Header File for ECC operation

8. Next, double-click `configuration.xml` from the secure project. Once the configurator is opened, click `Generate Project Content` and then compile the secure project.
9. Expand the non-secure project and double-click the `configuration.xml` file. Once the configurator is opened, click `Generate Project Content` and compile the non-secure project.
7.5 Running the Example Project

Once the source code compilation is successful, follow the steps below to exercise the example projects:

1. Choose to debug from the non-secure application. Right-click on secure_key_inject_update_ra6m4_ns and select Debug As > Renesas GDB Hardware Debugging.

2. Execution will halt at the secure project reset handler.

3. Click Resume twice to run the project.

4. Open the J-Link RTT Viewer with the settings shown below.

5. Click OK. The following menu should be printed.

a. Input 1 to confirm that the cipher text for the first AES key is successfully decrypted by the injected AES-256 key.
b. Input 2 to perform a key update to wrap the new AES-256 key and save the new key to data flash. Note that the SCE handles the wrapping of the new key internally, without exposing the plaintext key. It is not possible to extract the plaintext key. The wrapped AES key in SRAM is deleted after storing to data flash. Note that if menu option ‘1’ is rerun after menu item ‘2’ is run, it will fail because the new AES key will not generate the same cipher text as the original key.

Figure 120. Update the AES Key and Store to Data Flash

c. Input 3 to confirm that the cipher text for the second AES key is successfully decrypted by the updated AES-256 key.

Figure 121. Crypto Operation with the New AES Key

d. Input 4 to confirm that the signature generated using the first ECC private key is successfully verified by the injected ECC public key.

Figure 122. Crypto Operation with Injected ECC Public Key

e. Input 5 to perform a key update to wrap the new ECC public key and save the new key to data flash. Note that the SCE handles the wrapping of the new key internally, without exposing the plaintext key. It is not possible to extract the plaintext key. The wrapped ECC public key in SRAM is deleted after storing to data flash. Note that if menu option ‘4’ is rerun after menu item ‘5’ is run, it will fail because the new ECC public key cannot verify a signature that was generated by the first key’s private key.

Figure 123. Update the ECC Public Key and Store to Data Flash

f. Input 6 to confirm that the signature generated using the second ECC private key is successfully verified by the updated ECC public key.

Figure 124. Crypto Operation with the New ECC Public Key

Successful operations of the above menu items conclude the demonstration of the secure key injection and update in this application project.
8. Example Project for RA6M3 (SCE7 Compatibility Mode)

This section introduces SCE7 Compatibility Mode with an example of AES-128 user key injection and update.

8.1 Overview

This example project demonstrates the following functionalities of the compatibility mode of SCE7:

- AES-128 key injection using the files generated in section 6.1.
- Verifying the injected AES-128 key using PSA Crypto APIs and a NIST AES test vector.
- Key-Update Key injection using the files generated in section 6.2.
- AES key update using the files generated in section 6.3.
- Verifying the updated AES-128 key using PSA Crypto APIs and a NIST AES test vector.

8.2 Using the SKMT Generated Files

The source files generated from Figure 104, Figure 106, Figure 110 are included in the example project. These files provide the UFPK-wrapped and KUK-wrapped keys used to demonstrate the functionality described above.

![Figure 125. RA6M3 Example Project Source Code](image)

8.3 SCE7 Compatibility Mode Key Injection APIs

This demonstration uses the APIs in the Key Injection module (`r_sce_key_injection`) to perform key injection. Refer to the FSP User Manual for the complete list of key injection APIs and their parameters.

8.4 Import and Compile the Example Project

Note that if AES keys other than the NIST vectors are used, then those new source files need to replace the existing files in the example project prior to compiling and running the example project. If the NIST vectors included in this application project are being used for verification purposes, steps 2 to 5 can be skipped.

1. Launch e² studio and import `secure_key_inject_update_ra6m3.zip` file to a workspace.
2. Replace `initial_aes_128.h` and `initial_aes_128.c` with the new set of files generated in Figure 104.
3. Replace `key_update_key.c` and `key_update_key.h` with the new set of files generated in Figure 106.
4. Replace `new_aes_128.h` and `new_aes_128.c` with the new sets of files generated in Figure 110.
5. If different file names are used, update the `#include` definition in `hal_entry.c` on this line to reflect the new file name.

![Image of #include definitions]

Figure 126. Include the Generated Header File for AES operation

6. Next, double-click `configuration.xml`. Once the configurator is opened, click Generate Project Content and then compile the secure project.

8.5 Running the Example Project

Follow the steps below to exercise the example projects:

1. Right-click on `secure_key_injection_update_ra6m3` and select Debug As > Renesas GDB Hardware Debugging.
2. Execution will halt at the reset handler.

![Image of reset handler]

Figure 127. Running to the Project Reset Handler

3. Click Resume twice to run the project.
4. Open the J-Link RTT Viewer with the settings shown below.

![Image of RTT viewer settings]

Figure 128. RTT Viewer Setting
5. Click **OK**. The following execution result should be printed. User can step into the code to understand the code execution flow.

![Execution Result - Secure Key Injection and Update Example Project RA6M3](image)

**Figure 129. Execution Result - Secure Key Injection and Update Example Project RA6M3**

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part, Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.

7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
