To our customers,

Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April 1st, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)
Send any inquiries to http://www.renesas.com/inquiry.
Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.

2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.

4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information, and in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.

5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.

6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.

7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   “Specific”: Aircraft; aerospace equipment; subsurface repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.

8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.

9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
H8/300L

PWM as a DAC (DAC)

Introduction

Pulse Width Modulation (PWM) is a powerful technique for driving analog circuits with micro-controller’s digital outputs. It is popular in areas such as DC motor drive control and digital-to-analog conversion in bit stream DACs. This application note demonstrates ways to generate different voltage outputs using PWM.

1. **Overview**

Pulse Width Modulation (PWM) refers to a form of signal modulation where data is represented by the ratio of the on time to the total time (known as the duty cycle). PWM has the property where the instantaneous DC component is directly proportional to the duty cycle. It is primarily used for controlling digital encoded analog signal of varying amplitude.

![Figure 1: Duty Cycle and Frequency of PWM](image)

The relationship between the time-average voltage ($V_{avg}$) the high and low voltages of the square wave ($V_{hi}$ and $V_{lo}$) and the duty cycle (D) in percent is as follows:

$$V_{avg} = (V_{hi} - V_{lo}) \times D + V_{offset} \tag{1}$$

where $D = \frac{t_{ON}}{t_{W}}$ or $D = \frac{PWDR}{1023}$ (for 10-bit PWM) \tag{2}

If $V_{hi}$ is 5V, $V_{lo}$ is 0V (i.e. $V_{offset} = 0$) and D is 80%, $V_{avg}$ would be 4 V.

Another important parameter of PWM is the frequency. It is defined by number of pulse per second.

$$f = \frac{1}{t_{W}} \tag{3}$$

where $t_{W} = t_{ON} + t_{OFF} \tag{4}$

From equations [2] and [3], it can be proven that

$$F = \frac{D}{t_{ON}} \tag{4}$$
2. PWM Architecture

The H8/38024F series microcontroller has two on-chip 10-bit PWMs, designed as PWM1 and PWM2, with identical functions. It offers features including four conversion periods of 4096/Ω, 2048/Ω, 1024/Ω and 512/Ω, pulse division method for less ripple and module standby mode for power saving. There are 20 choices for input clock to the PWM.

PWDRUm and PWDRLm form a 10-bit write-only register, with the upper 2 bits assigned to PWDRUm and the lower 8 bits to PWDRLm. The value written to PWDRUm and PWDRLm gives the total high-level width of one PWM waveform cycle.

When 10-bit data is written to PWDRUm and PWDRLm, the register contents are latched in the PWM waveform generator, updating the PWM waveform generation data. The 10-bit data should always be written in the following sequences:

1. Write the lower 8 bits to PWDRLm
2. Write the upper 2 bits to PWDRUm for the same channel

PWDRUm and PWDRLm are write-only registers. If they are read, all bits are read as 1.

Upon reset, PWDRUm is initialized to H’FC.

</tr>
</tbody>
</table>
2.2 Basic Operation

To use the 10-bit PWM, set the registers in the following 3 steps:

1. **Select PWM channel**: Set PWM1 or PWM2 in PMR9 to 1 for PWM channel to be used, so that pin P90/PWM1 or P91/PWM2 is designated as the PWM output pin.

2. **Select Conversion Period**: Set bits PWCRm1 and PWCRm0 in the PWM control register (PWCRm) to select a conversion period.

3. **Set Pulse Width**: Set output waveform data in PWDRUm and PWDRLm. Data should be first written to PWDRLm and then to PWDRUm for the same channel.

One conversion period consists of 4 pulses, as shown in Fig. 2.2. The total of the high-level pulse widths during this period ($T_H$) corresponds to the data in PWDRUm and PWDRLm. The waveform will be changed at the next conversion period.

![PWM Output Waveform Diagram](image)

$$t_H = t_{H1} + t_{H2} + t_{H3} + t_{H4}$$

Where $t_H$ is the PWM input clock period: $1/\phi$, $2/\phi$, $4/\phi$ or $8/\phi$.

$$T_H = (\text{data value in PWDRUm and PWDRLm} + 4) \times t_\phi/2$$
3. Possible Settings

3.1 Conversion Period (Step 2)

Assuming 50% duty cycle,

![Diagram showing conversion period](image)

**Figure 4** Conversion Period

Based on a fixed crystal input clock ($O_{osc}$), with the fixed system clock divider (1/2) and system clock divider, the 4 possible input clock settings for PWM to set to the different conversion periods are $O$, $O/2$, $O/4$ and $O/8$.

The user can change the system clock divider with the 5 options: $O_{osc}/2$, $O_{osc}/16$, $O_{osc}/32$, $O_{osc}/64$ and $O_{osc}/128$, and thus with a total of $5 \times 4 = 20$ possible settings.

For instance, based on a 10 MHz main clock, the effective 10 choices of input clock to PWM are 5000, 2500, 1250, 625, 312.5, 156.25, 78.125, 39.0625, 19.53125 and 9.765625 kHz. The detailed calculations are listed in the Table 3.1.

Table 2 put clock selection to PWM
3.2 Duty Cycle (Step 3)

Assuming the conversion period is fixed, when the PWDRU_m and PWDRL_m are changed, the pulse width will be changed.

\[
\text{Duty Cycle} = \frac{t_{\text{ON}}}{t_{\text{W}}}
\]

Duty cycle = 33.33% [case (a)] and 83.33% [case (b)]
4. Theory of DAC

Depending on the application, the designer may want to fix the conversion period and vary the duty cycle or vice versa. For a more complex requirement, even both parameters may need to be changed to achieve the required output waveform.

The focus of this application is to generate a DC voltage with reasonable ripple after passing through a low-pass filter (a simple RC circuit). The PWM waveform will be charging through a capacitor when output at HI and discharging when output at LO.

For simplicity, the conversion period (step 2) is fixed at 512/Ø and vary the duty cycle (step 3) to achieve the DAC function.
5. Circuit Diagram

To achieve DAC, output of PWM2 is connected to pull-up register and RC low-pass filter. The pull register R2 is used to drive more current to the load. Adjust register R1 to eliminate loading effect. Output waveform is measured and 3-dB cut-off frequency is recorded. The capacitance C1 can then be determined by the equation below:

\[ f = \frac{1}{2\pi RC} \Rightarrow C = \frac{1}{2\pi f} \]

In this example, R1 = 1.2 M\(\Omega\) and C1 = 1010 pF,

\[ f = \frac{1}{2\pi * 1.2M * 1010p} = 131.32 Hz \]

The selection of R, C and conversion period is inter-related. If the conversion period is too short, or the capacitor value is too large, hence the analog value may not be achieved.

Since PWDR is a 10-bit counter (\(2^{10} = 1023\)), it allows 0 (min) equals to 0V (GND) and 1023 (max) equals to 5.0V (VCC). To achieve a specific voltage, \(V_x\)

\[ V_x = V_{ref} \times \frac{PWDR_{val}}{PWDR_{max}} \]

Note that the offset voltage is determined by the value of R1 and R2. Small resistance causes larger leakage current flow through R1 and C1. Large R1 may cause larger offset voltage. Without changing the cut-off frequency, it is better to change R2 value to control the amount of current and therefore the offset voltage.

Value of R1, R2 and C1 may change accordingly depends on circuit to be connected. For example, to drive a low impedance speaker, small R1 and R2 will be desirable for impedance matching purpose. Value of C1 will depend on the frequency bandwidth required and the noise consideration.
6. Further Measurement

Basic testing environment/conditions are:

1. ALE300L Emulator
2. \( V_{CC} = A_{VCC} = 3.3 \text{V} \)
3. \( R1 = 1.2 \text{ M}\Omega, R2 = 0.5 \text{k}\Omega \) and \( C1 = 1010 \text{ pF} \)  
   [5% tolerance for R1 & R2, 50V for C1]
4. No load
5. Voffset = 375 mV

Clock frequency, \( \Phi = 5 \text{MHz} \)
Clock Select: PWCRm1 = 1 and PWCRm0 = 1

Figure 8  Measurement at PWM data value of H’100

Figure 9  Measurement at PWM data value of H’300
From table 6.1, it shows that the maximum conversion error is about 5 to 10%.

Table 3   Comparison between the Measured Voltages and the Calculated Voltages
7. Program Overview

In this program, the main clock ($O_{osc}$) is set to 10 MHz by default, divided by 2 (for active mode)

$SYSCR1 = H'07$

During the initialization, P91 is configured as PWM2 output pin and the input clock to PWM2 is set at $O/8$. At $O = 5$ MHz, the conversion period, $4096/O = 0.8192$ ms.

$PMR9 = H'F2$
$PWCR2 = H'FF$

At the end of each conversion period, data point of equal spacing will be loaded into the PWDRL2 and PWDRU2 registers for 1024 cycles to form a up slope RAM, then subsequently another 1024 cycles for down slope RAM. This generates a triangular waveform continuously. To change the frequency of the triangular waveform, a simple way is to modify the delay loop preceding the writing to the PWM data register.
8. Program Flowchart

9. Software Listing

```c
#include <machine.h>
#include "iodefine.h"

/* Function define */

void init_PWM(unsigned char);
void storeCount(unsigned short);

/* RAM define */

unsigned char PWDR_L2, PWDR_U2;
int i=0, k=0, j=0;
unsigned int f=100;
```
#include <machine.h>
#include "iodefine.h"

void init_PWM(unsigned char);
void storeCount(unsigned short);

unsigned char PWDR_L2, PWDR_U2;
int i=0, k=0, j=0;
unsigned int f=100;
/**************************
/* Main Program          */
**************************/

void main ( void )
{
    init_PWM(3);                // select PWM2 to have (4096/5Mhz) conversion

    while (1)
    {
        for(i=0;i<1024;i++)       // increments
            {                     // For delay, f control frequency of wave
                storeCount(i);     // Write digital code into PWM registers
            }
        for(j=1023;j>=0;j--)      // decrements
            {                     // Write digital code into PWM registers
                storeCount(j);
            }
    }
}

void init_PWM(unsigned char selClk2)
{
    if (selClk2 <= 3)                // Check if valid, otherwise PWM2 is off
    {
        P_IO.PMR9.BIT.PWM2 = 1;       // Configure P91 as PWM2 output pin
        P_PWM2.PWCR2.BYTE = selClk2;   // Clock select for PWM2,write only
    }
}

void storeCount(unsigned short PWDRval_2)
{
    P_PWM2.PWDRL2.BYTE = (unsigned char)(PWDRval_2 & 0x00FF);   // Write lower 8bits of 10bits data
    P_PWM2.PWDRL2.BYTE = (unsigned char)((PWDRval_2 & 0x0300) >> 8); // Write upper 8bits of 10bits data
}

Keep safety first in your circuit designs!

1. Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.

2. Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.

3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.

The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.

Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (http://www.renesas.com).

4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.

5. Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

6. The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.

7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination. Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.

8. Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.
