RL78/G14, R8C/36M Group
Migration Guide from R8C to RL78: Reset Function

Introduction

This document describes how to migrate the reset function of the R8C/36M Group to the reset function of the RL78/G14 (a 64-pin product is taken as an example in this document).

Target Device

RL78/G14, R8C/36M Group

When using this application note with other Renesas MCUs, careful evaluation is recommended after making modifications to comply with the alternate MCU.

1. Migration Method from R8C Family to RL78 Family

The following sections describe how to implement the reset function of the R8C/36M by using the reset function of the RL78/G14.

Table 1.1 shows the reset function of the R8C/36M group, and Table 1.2 shows the reset function of the RL78/G14.

<table>
<thead>
<tr>
<th>Reset Function in R8C/36M</th>
<th>Source</th>

</tr>
<tr>
<td>Software reset</td>
<td>Write 1 to PM03 bit in PM0 register</td>
<td>Internal reset by execution of illegal instruction (instruction code FFH)</td>
</tr>
</tbody>
</table>

The R8C/36M group has five types of reset functions and the RL78/G14 has seven types of reset functions.

Table 1.3 shows the correspondence between the R8C/36M group reset functions and RL78/G14 reset functions.

<table>
<thead>
<tr>
<th>R8C/36M Group</th>

<tr>
<td>Software reset</td>
<td>—</td>
</tr>
</tbody>
</table>

Note 1: Reset is not generated by execution of an illegal instruction during emulation with the in-circuit emulator or on-chip debug emulator.
2. Differences between RL78/G14 and R8C/36M Group

2.1 Differences in Reset Function

Table 2.1 shows the differences between the R8C/36M group reset functions and RL78/G14 reset functions.

Refer to the relevant user’s manual of the product for the differences between each MCU’s reset function specifications, SFR (special function register) state after reset, and electric characteristics.

<table>
<thead>
<tr>
<th>Item</th>
<th>R8C/36M Group</th>
<th>RL78/G14</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU clock after reset release</td>
<td>Low-speed on-chip oscillator (undivided clock)</td>
<td>High-speed on-chip oscillator (clock selected with the option bytes)</td>
</tr>
<tr>
<td>Program counter (PC) value after reset release</td>
<td>Reset vector Value at (addresses 0FFFEh to 0FFFFh)</td>
<td>Reset vector table Value at (addresses 00000H and 00001H)</td>
</tr>
<tr>
<td>RAM value after reset release</td>
<td>Undefined</td>
<td>Undefined</td>
</tr>
<tr>
<td>Protect state after reset release (Note 1)</td>
<td>Protection of the important registers by using the PRCR register: Enabled</td>
<td>SFR guard function: Disabled (protection canceled)</td>
</tr>
<tr>
<td>Clock supply to peripheral hardware after reset release (Note 2)</td>
<td>Enabled</td>
<td>Disabled</td>
</tr>
</tbody>
</table>

Note 1. The logic (setting values) for the bits to enable/disable the protect functions of the R8C/36M is reverse to that of the RL78/G14. Be sure to set the appropriate values; otherwise, the registers are not protected correctly.

Note 2. The logic (setting values) for the bits to enable/disable the clock supply to the peripheral hardware of the R8C/36M is reverse to that of the RL78/G14. Be sure to set the appropriate values; otherwise, the peripheral hardware will not operate.
2.1.1 Migration from Hardware reset

To provide the RL78/G14 with the equivalent operation to the hardware reset of the R8C/36M, execute “external reset input via the RESET pin (input a low level to the RESET pin).”

Table 2.2 shows the reset via the RESET pin of the R8C/36M group and RL78/G14.

<table>
<thead>
<tr>
<th>Item</th>

<th>(1) Input a high level to the RESET pin.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(2) Increase the supply voltage until it meets the recommended operating conditions. (Note 1)</td>
</tr>
<tr>
<td></td>
<td>(3) Wait for the time for internal power supply stabilization during power-on (td(P-R)) or more to allow the internal power supply to stabilize. (Note 2)</td>
</tr>
<tr>
<td></td>
<td>(4) Wait for 10 μs.</td>
</tr>
<tr>
<td></td>
<td>(5) Input a high level to the RESET pin.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>(1) Input a low level to the RESET pin.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(2) Turn power on and continue to input a low level for 10 μs or more within the operating voltage range shown in the AC Characteristics section. (Note 3)</td>
</tr>
<tr>
<td></td>
<td>(3) Input a high level to the RESET pin.</td>
</tr>
</tbody>
</table>

Note 1. For the recommended operating conditions, refer to the Electrical Characteristics chapter of the R8C/36M Group User’s Manual.

Note 2. For the time for internal power supply stabilization during power-on (td(P-R)), refer to the Power Supply Circuit Timing Characteristics table in the R8C/36M Group User’s Manual.

Note 3. For the operating voltage range, refer to the Electrical Specifications chapter of the RL78/G14 User’s Manual.

2.1.2 Migration from Power-on reset

To provide the RL78/G14 with the equivalent operation to the power-on reset of the R8C/36M, execute "internal reset by comparison of supply voltage and detection voltage of the power-on-reset (POR) circuit.” When using POR, the voltage detection circuit (LVD) (voltage monitor 0 circuit of the R8C/36M group) needs to be used together. For LVD operation mode setting, set the LVIMDS1 and LVIMDS0 bits to 11b (reset mode) at addresses 000C1H/010C1H in the option bytes.

For details, refer to the following application note.

Note The voltage detection level for "internal reset by comparison of supply voltage and detection voltage of the power-on-reset (POR) circuit” of the RL78/G14 is different from that of the power-on reset function of the R8C/36M. For the RL78/G14, the voltage detection level same as the detection level for the R8C/36M cannot be set; therefore, set the appropriate LVD voltage detection level for the system used, and fully evaluate the operation.
2.1.3 Migration from Voltage monitor 0 reset
For details on how to provide the RL78/G14 with the equivalent operation to the voltage monitor 0 reset of the R8C/36M, refer to the shown chapter of the following application note.

- APPLICATION NOTE RL78/G14, R8C/36M Group
  Migration Guide from R8C to RL78: Power-on Reset and Voltage Detector (R01AN1352)
  Reset Mode section

2.1.4 Migration from Watchdog timer reset
For details on how to provide the RL78/G14 with the equivalent operation to the watchdog timer reset of the R8C/36M, refer to the following application note.

- APPLICATION NOTE RL78/G14, R8C/36M Group
  Migration Guide from R8C to RL78: Watchdog Timer CC-RL (R01AN3060)

2.1.5 Migration from Software reset
The RL78/G14 is not provided with the function equivalent to the software reset (PM03 bit in the PM0 register) of the R8C/36M group. The following methods can be used to reset the RL78/G14 at a desired timing.

An internal reset is generated by execution of an illegal instruction (instruction code FFH). (Notes 1 and 2)
When the watchdog timer is used, an internal reset is generated by executing the refresh process at the value other than the refresh code (by writing data other than ACH to the WDTE register).

Note 1. Reset is not generated by execution of an illegal instruction during emulation with the in-circuit emulator or on-chip debug emulator.

Note 2. The reset control flag register (RESF) can indicate the reset source (an internal reset by execution of an illegal instruction). However, it is impossible to distinguish the intentionally generated internal reset from the internal reset caused by an abnormality. Be sure to confirm that this does not have an adverse effect on the system.
### 2.2 Register Compatibility

Table 2.3 compares the registers for the reset functions of the R8C/36M group to the corresponding registers of the RL78/G14.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins
   Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.
   — The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on
   The state of the product is undefined at the moment when power is supplied.
   — The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
     In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
     In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses
   Access to reserved addresses is prohibited.
   — The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals
   After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.
   — When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products
   Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.
   — The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.
Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality.” The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   - “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   - “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; underwater repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.) and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.

7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, sale, use or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products and technologies.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
