RL78/L13

Integrate External EEPROM IC Functionality into MCU by Using Data Flash Memory (EEPROM Emulation Library) CC-RL

Introduction

Self-programming is a function that the microcontroller to rewrite the internal flash memory by itself. RL78/L13 is equipped with the data flash memory which is suitable for data storage. Rewriting of data flash memory can be realized by the Flash Data Library (FDL) and the EEPROM Emulation Library (EEL) from Renesas Electronics Corp. This application note explains how to hold non-volatile data simply by data flash memory and the EEL without using external EEPROM IC. It also explains how to save data to data flash memory quickly after detecting low voltage to prepare for power interruption. User can integrate the function of external EEPROM IC into microcontroller by applying this application note.

Correspondence between Compiler and EEL

This application note has a sample code (excluding the EEL). In order to operate this sample code, it is required to download and link EEL to the project. Refer to “6.9 How to import EEL” for details on method of linking EEL to the project. EEL has a Renesas CC-RL version and a IAR version. However, the version of EEL supported by each sales company (each area) is different. Confirm the supported version by selecting the area on the Renesas Electronics Website (http://www.renesas.com). Please check the manual of the EEL, and the release note (or README.txt on the download source page) before using the EEL.

<table>
<thead>

</thead>
</table>

Target Device

RL78/L13

EEL used in this application note supports other devices of RL78.
- RL78/D1A, RL78/F12, RL78/F13, RL78/F14, RL78/G13, RL78/G14, RL78/G1A, RL78/G1E, RL78/I1A, RL78/L1C

Confirm by the latest user’s manual of the EEL about the supported device of EEL. When applying the sample program covered in this application note to another RL78 microcontroller, conduct an extensive evaluation of the modified program.

1. **Overview**

There are three types of Self Programming Library: the Flash Self Programming library (FSL), the FDL, and the EEL shown in .

As libraries using data flash memory, the outline of the EEL is indicated in **1.1 Outline of the EEL** and the outline of FDL is indicated in **1.2 Outline of the FDL**. This application note explains the EEL which is indicated with the bold font in .

### Table 1.1 List of Self Programming Library

</tr>
<tr>
<td>EEL</td>
<td>Data flash memory</td>
<td>Uses data flash library just like EEPROM to rewrite and read data.</td>
</tr>
</tbody>
</table>

**1.1 Outline of the EEL**

The EEL is a software library to store the data in internal data flash memory of the RL78 microcontroller in the same way as EEPROM. In order to rewrite data flash memory with the EEL, the corresponding functions of EEL initialization and other purpose, would be called from the user-created program.

The EEL allows the user to assign a 1-byte identifier (data ID: 1 to 64) to each block of data and to perform read or write operations in units of 1 to 255 bytes for each ID that is assigned (a maximum of 64 data items can be assigned to an ID).

**1.2 Outline of the FDL**

The FDL is a software library to perform operations to the data flash memory with the firmware installed on the RL78 microcontroller. In order to rewrite data flash memory with the FDL, the corresponding functions of FDL initialization and other purpose, would be called from the user-created program.

The fundamental usage of the FDL is to write data byte by byte to the data flash memory’s address, which has not been written( in the blank state). However, it cannot overwrite the same address. In order to overwrite the same address, data erasing per block is required in advance.
1.3 Proper Use of the FDL and the EEL

There are some differences such as rewriting method, resources required, execution time, data management mechanism and so on between using the FDL and the EEL. Main features of the FDL and the EEL are shown in Table 1.2.

Since FDL is only a fundamental access function to data flash memory, it can be customized to manage data flexibly according to the user-created program. On the other hand, EEL has the feature that development load is low because the mechanism of data management was decided in advance by the EEL.

Select the FDL or the EEL according to the requirements for application.

<table>
<thead>
<tr>
<th>Feature</th>
<th>FDL</th>
<th>EEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rewriting method</td>
<td>Depends on user-created program.</td>
<td>Writes after changing address.</td>
</tr>
<tr>
<td>Resources required</td>
<td>Small</td>
<td>Large</td>
</tr>
<tr>
<td>Data size</td>
<td>Up to 1024 bytes</td>
<td>Up to 255 bytes</td>
</tr>
<tr>
<td>Execution time</td>
<td>Short</td>
<td>Long</td>
</tr>
<tr>
<td>Data management mechanism</td>
<td>None (User manage data by address)</td>
<td>Managed (By data number)</td>
</tr>
</tbody>
</table>

Caution: The feature of the FDL is dependent on the upper-class layer, the application (the specification of data management).

(1) Rewriting Method

Writing is permitted only when the target write address of data flash memory is in the blank state. It is necessary to erase data in units of one block in advance in order to overwrite the same address. FDL itself does not have a mechanism in which data can be managed. It is necessary to consider how to manage data in the application layer (by user). On the other hand, EEL has a mechanism to manage data, and writes data with keeping changing the variable which contains an address that marks the memory in the blank state in data flash memory. Since data can be written in until the block for writing is filled with data, it is suitable for mass data storage and frequent data writing.
(2) Resources required
Software resources required by the FDL and the EEL are shown in . The Self-RAM, stack, and data buffer have to use RAM. Since the EEL uses the FDL, the amount of the EEL ROM resources is larger than the FDL ROM resources.

<table>
<thead>
<tr>
<th>Item</th>
<th>FDL</th>
<th>EEL</th>
</tr>
</thead>
<tbody>
<tr>
<td>Self-RAM</td>
<td>0 to 1024</td>
<td>0 to 1024</td>
</tr>
<tr>
<td>Stack</td>
<td>MAX 46</td>
<td>MAX 80</td>
</tr>
<tr>
<td>Data buffer</td>
<td>1 to 1024</td>
<td>1 to 255</td>
</tr>
<tr>
<td>Library size</td>
<td>ROM : MAX 177</td>
<td>ROM : MAX 3400</td>
</tr>
</tbody>
</table>

Note 1: An area used as the working area by the EEL is called self-RAM. The self-RAM requires no user setting because it is an area that is not mapped and automatically used at execution of the EEL (previous data is discarded).

Note 2: A RAM space required in order to input the data read and written is called a data buffer. Required size changes by the reading and writing unit. When performing 1 byte of reading and writing, a needed data buffer is 1 byte.

Note 3: The resources given in this table are according to FDL RL78 Type04 Ver1.05 and EEL RL78 Pack02 Ver1.01. The library may change by upgrade etc. Confirm the manual of each library for the latest resource information.

(3) Data Size
The FDL is able to read and write data up to 1024 bytes (1 block of a data flash memory). The EEL is able to read and write data up to 255 bytes. The FDL has an advantage when saving big data. The data buffer of expresses the size of the data which can be read and written at a time.
(4) Execution Time
The execution time of the library function of FDL and EEL is shown in Table 1.4. The FDL without data management mechanism can read and write data at high speed.

Table 1.4 The Execution Time of the Library Function of FDL/EEL

<table>
<thead>
<tr>
<th>Processing</th>
<th>FDL (255 bytes)</th>
<th>EEL (255 bytes)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FDL : PFDL_Execute(Write)</td>
<td>519.7[μs]</td>
<td>11399.7[μs]</td>
</tr>
<tr>
<td>EEL : EEL_Execute(Write)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Read</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FDL : PFDL_Execute(Read)</td>
<td>167.7[μs]</td>
<td>179.7[μs]</td>
</tr>
<tr>
<td>EEL : EEL_Execute(Read)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Verify</td>
<td></td>
<td></td>
</tr>
<tr>
<td>FDL : PFDL_Execute(IVerify)</td>
<td>959.7[μs]</td>
<td>3919.7[μs]</td>
</tr>
<tr>
<td>EEL : EEL_Execute(Verify)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Remark. The execution time described in this application note is the actual measured value calculated on operating FDL RL78 Type04 Ver1.05 or EEL RL78 Pack02 Ver1.01 on the integrated development environment CS+. The value would be different according to the individual specificities of the device and the execution condition.

(5) Data Management Mechanism
The FDL uses address to access data flash memory. Since the address in which the newest data is stored is changed, it needs to manage the address. On the other hand, EEL manages data by data ID. Therefore, it is not necessary to manage the address in which the newest data is stored when using the EEL.
1.4 Benefits and Caution Points When EEPROM IC is Replaced

This section explains benefits when replacing the function of EEPROM IC with data flash memory by using EEL, and the difference from EEPROM IC.

1.4.1 Benefits from Replacing EEPROM IC

The benefits of replacing from EEPROM IC are shown below.

- Since external EEPROM IC becomes unnecessary, parts cost reduction and small footprint are realizable.
- Since it is the operation completed inside device, it is not necessary to perform serial communication. The serial communication pins of microcontroller can be used by other functions. In addition, the value which was written can be confirmed directly with a debugger at the time of the software development.
- Since serial communication is unnecessary, processing time can be reduced. (However, it is dependent on data structure.) In EEPROM IC, the serial communication time + the write completion time (several milliseconds) are taken for the processing time.
- Since data is managed by data ID, it is not necessary to care about address.

1.4.2 Difference from EEPROM IC

The difference with the case where EEPROM IC is used is shown below.

- Since it is emulation, the size of the flash memory which can be used by user decreases. Refer to “2.4 Number of stored user data items and total user data size” for how to calculate the space available to the user.
- The program which communicates with EEPROM IC is not required. Instead, a program just like the FDL or the EEL is necessary.
- The maximum number of data items is 64 and the maximum size of one data item is 255 byte. Refer to the user’s manual of the EEL for more information about the number of data items.
2. Specifications

In this application, LED0 or LED1 blinks 10 times by a keypress. The data used for LED blinking is saved to data flash memory when the supply voltage becomes too low. The saved data is read when system restarts, and the interrupted blinking processing is continued.

When reset is ended, the system reads the blinking state data (target LED for blinking, and the remaining times of LED blinking) by EEL from data flash memory where the data has been saved.

Next, after completing 10 times blinking at intervals of 500 ms according to the blinking state data, the LED stops blinking and the system becomes the waiting state for keypress.

If the key is pressed in a state in which no LED is blinking, the LED that had not been blinking just before will start to blink. The keypress becomes invalid while LED is blinking.

The fall of power supply voltage is detected by LVD function. If the fall of power supply voltage is detected, the LED blinking state data (target LED for blinking, and the remaining times of LED blinking) is saved to data flash memory by the EEL, LED3 which shows the completion of data saving will be lit up, and then the mode moves to the STOP mode.

Moreover, if an error occurs when accessing data flash memory with EEL functions, LED0 and LED1 will be lit up and the mode shifts into the STOP mode.

The structure of the data to be saved is shown in Figure 2.1. Higher 4 bits of this one byte user data indicates target LED for blinking and lower 4 bits indicate the remaining times of LED blinking. The example data in Figure 2.1 shows that the rest of the LED1's blinking times is 5.

![Figure 2.1 Stored Data](image)

Table 2.1 shows the required peripheral functions and their uses. Figure 2.2 shows overall picture of application. Figure 2.3 shows operation outline.

<table>
<thead>

</tr>
</tbody>
</table>
It is necessary to set data flash memory to the state that accessing data flash memory is permitted, or to secure the resource used by FDL/EEL by performing Init/Open of FDL/EEL, in order to access data flash memory from user application. The reading and writing to data flash memory are enabled by performing Startup of EEL after the Init/Open processing.

- Data flash memory ← Data of the target LED for blinking, Data of the remaining times of LED blinking
- Only the LED which shows the blinking completion is on

---

**Figure 2.3 Operation Outline**
2.1 Shortening of the Write Time of EEL

In order to access data flash memory from user application using the EEL, it is necessary to set data flash memory to the state that accessing the data flash memory is permitted, or to secure the resource used by FDL/EEL. Therefore, the EEL realizes the above-mentioned processes by calling some library functions. Required processes are as follows.

- **FDL_Init function**: Initialization of RAM used by FDL.
- **FDL_Open function**: Set data flash memory to the state that accessing the data flash memory is permitted.
- **EEL_Init function**: Initialization of RAM used by EEL.
- **EEL_Open function**: Set data flash memory to the state that can be managed.
- **EEL_Execute function (STARTUP command)**: Changing into the state in which EEPROM emulation execution is possible.

However, if the above-mentioned preparation processings are performed at a low voltage, it may become power disconnect during the data saving processing. Therefore, in this application note, in order to shorten the data saving time, the data saving processing done by EEL is divided into two phases which are executed separately, the preparation phase and the saving phase. **Figure 2.4** shows the data saving processing when it is performed by a batch processing. **Figure 2.5** shows the data saving processing when it is performed by a two-step processing. The saving phase takes 991[µs] in the case of batch processing, and takes 683[µs] in the case of two-step processing.

Remark. The measurements described in this application note are the actual measured value calculated by using EEL RL78 Pack02 Ver1.01 on the integrated development environment CS+.
Power Supply Voltage ($V_{DD}$)

$V_{LSH}$

$V_{LSDL}$

**Figure 2.5 Data Saving Processing (by a two-step processing)**
2.2 EEL Architecture

The operation principle of the EEL is explained. The EEL manages data in the data area and manages data ID in the reference area. These areas are configured in the same block and managed by each block. The next block will be used if unused area of the block currently used is run out. This chapter explains how to use the data flash memory in the EEL.

2.2.1 EEL Pool

The EEL pool is a user-defined data flash area that is accessible by the EEL. The user-created program can access the data flash only by using this EEL pool in the data flash via the EEL. The EEL pool size must be specified with the number of blocks in the data flash of the target device. For the procedure to specify the number of blocks, see Section 2.3 EEL Initial Values to be set by User.

The EEL pool is divided into 1024-byte blocks. Each block has a state which indicates the current usage of the block.

<table>
<thead>
<tr>
<th>State</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>Only a single EEL block is active at a time to store defined data. The active block circulates in data flash blocks allocated in the EEL pool.</td>
</tr>
<tr>
<td>Invalid</td>
<td>No data is stored in invalid blocks. EEL blocks are marked as invalid by the EEL or become invalid in the case of erasure blocks.</td>
</tr>
</tbody>
</table>

Figure 2.6 shows an exemplary pool configuration for a device with 4 KB data flash.

When no writable area is remaining in the active block (block 1 in the example) and data can no longer be stored (failure in write command), a new active block is selected in a cyclic manner and the current valid data set is copied to this new active block. This process is referred to as refresh. After the EEL_CMD_REFRESH command is executed, the previous active block becomes invalid and only a single active block exists.
The overall life cycle of a block in the EEL pool is shown in **Figure 2.7**. The EEL block switches between active and invalid state.

![Figure 2.7 Life Cycle of an EEL Block](image-url)
2.2.2 EEL Block

Figure 2.8 EEL Block Structure (Example of RL78/L13 (R5F10WMG)) shows detailed block structure used by the EEL. The EEL block is divided into three utilized areas: the block header, the reference area and the data area.
Table 2.1 Components of EEL Block

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block header</td>
<td>The block header contains all block status information needed for the block management within the EEL-pool. It has a fixed size of 8 bytes.</td>
</tr>
<tr>
<td>Reference area</td>
<td>The reference area contains reference data which are required for the management of data. When data is written, this area extends in the address increment direction.</td>
</tr>
<tr>
<td>Data area</td>
<td>The data area contains user data. When data is written, this area extends in the address decrement direction.</td>
</tr>
</tbody>
</table>

Between reference area and data area, there is an unused area. With each EEL data update (i.e. the data is written), this area is reduced successively. However, at least two bytes of space is always required in between reference area and data area for management and separation of these areas. This is indicated by the separator in Figure 2.8.
2.3 EEL Initial Values to be Set by User

As the initial values for the EEL, be sure to set the items indicated below. In addition, before executing the EEL, be sure to execute the high-speed on-chip oscillator. The high-speed on-chip oscillator must also be activated when using the external clock. Parentheses indicated on the right-hand side of each setup are connected with the numbers in the following page. Setup of each item has been tailored to this application.

Setup of each item has been tailored to this application.

<FDL user include file (fdl_descriptor.h)> Note 1, 2

```
#define FDL_SYSTEM_FREQUENCY 24000000  // (1) Operation frequency
#define FDL_WIDE_VOLTAGE_MODE     // (2) Voltage mode
#define FDL_POOL_BLOCKS          // (3) FDL pool size
#define EEL_POOL_BLOCKS          // (4) EEL pool size
```

<EEJ user include file (eel_descriptor.h)> Note 1, 2

```
#define EEL_VER_NO 1  // (5) Number of stored data items
```

<EEJ user include file (eel_user_types.h)> Note 1, 2

```
typedef eel_u08 type_A;  // (6) Data size
```

<EEJ user-created program file (eel_descriptor.c)> Note 1, 2

```
__far const eel_u08 eel_descriptor[EEL_VAR_NO+2] =
{
    (eel_u08)(EEL_VAR_NO), /* variable count */
    (eel_u08)(sizeof(type_A)), /* id = 1 */
    (eel_u08) (0x00), /* zero terminator */
};  // (7) Data size of the data ID
```

Note 1: The macros and macro names that are being used have common parameters with the EEL, so changes should be made to numerical values only.

Note 2: After initializing the EEPROM emulation blocks (after executing the EEL_CMD_FORMAT command), do not change the values. If the values are changed, reinitialize the EEL blocks (by executing the EEL_CMD_FORMAT command).
(1) Operation frequency
   This sets an operation frequency which is used in RL78 microcontrollers. Note1
   The setting value is set to the FDL_Init frequency parameter by the following expressions.
   In this application note, since the operation frequency of CPU is 24 MHz, it is set to 24.
   
   Note1: This setting is a value required to control data flash memory. This setting does not change the
   operation frequency of RL78 microcontrollers. In addition, this operation frequency is not the
   frequency of the high-speed on-chip oscillator.

(2) Voltage mode
   This sets the voltage mode of data flash memory. Note 2
   FDL_WIDE_VOLTAGE_MODE is not defined: Full-speed mode
   FDL_WIDE_VOLTAGE_MODE is defined: Wide voltage mode
   This application note does not define FDL_WIDE_VOLTAGE_MODE because it is operated in full
   speed mode.
   
   Note 2: For details of the voltage mode, see the corresponding RL78 microcontrollers user’s manual.

(3) FDL pool size Note 3
   Specify 0.
   
   Note 3: A user defined data flash area which is accessible by the FDL.

(4) EEL pool size Note 4
   The number of blocks in the data flash memory of the target device must be specified as the number of
   blocks in the EEL pool.
   
   Note 4: Specify 3 (3 blocks) or a greater value (recommended).

(5) Number of stored data items
   Specify the number of data items to be used in the EEPROM emulation. A value of 1 to 64 can be set.
   In this application note, since one kind of data is managed, the number of stored data items is set to 1.

(6) Data size registration
   The data size of every data ID is registered into an EEL descriptor table.
   There are 8 standarized sizes: type_A, type_B, type_C, type_D, type_E, type_F, type_X, and type_Z. It
   is necessary to change size according to the size of the user data.
   In this application note, since one data type of 1-byte (LED blinking state) is managed, type_A which is
   1-byte long, is used for data ID1.
(7) Data size of data ID
A table to define the data size of each data ID is provided below. This is called an EEL descriptor table. The EEL can only add identifiers while the program is running. Data to be written must be registered in the EEL descriptor table in advance like the processing described in (6).

### EEL Descriptor Table

<th>EEL_VAR_NO</th>
<th>Byte size of data ID1 (type_A)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td></td>
</tr>
</tbody>
</table>

- **EEL_VAR_NO**
  User-specified number of data items used in the EEL

- **Byte size of Data IDx**
  User-specified size of user data (in bytes)

- **Termination area (0x00)**
  Specify 0 as the termination information.
2.4 Number of Stored User Data Items and Total User Data Size

The total size of user data that can be used in the EEPROM emulation is limited. If refresh processing is taken into consideration, it is need to place all of the user data and an unused area which is big enough for one or more data in one block.

The number of stored data items that can be used differs depending on the size of user data that is actually stored.

The following shows the calculation method of the size which can actually be used in the writing of user data, and the maximum number of times one block can be written with user data.

[Maximum usable size of one block that can be used to write the user data]

Size of one block of data flash memory: 1024 bytes
Size required for EEPROM emulation block management: 8 bytes
Free space necessary as termination information (separator): 2 bytes

Maximum usable size of one block = 1024 bytes - 8 bytes - 2 bytes = 1014 bytes

[Calculating the size for writing each user data item]

Size of each written user data item = data size + reference data size (2 bytes)
Since the size of the data written in in this application note is 1 byte, the size of user data will be 3 bytes.

[Number of times one block can be written]

Because the maximum usable size of one block is 1014 bytes and the user data size is 3 bytes:

Number of times one block can be written = 1014 / 3 = 338 times

It is necessary to perform refresh processing for every 338 times writing in this application note. Refresh processing is performed within preparation processing (Refer to 2.1 Shortening of the Write Time of EEL). At the time of doing refresh processing, preparation processing time is longer for 6.74[ms] in comparison with usual time.
2.5 Notes for Using EEL

Notes when using EEL are shown below.

- The data flash memory cannot be read during data flash memory operation by the EEL.
- The watchdog timer does not stop during the execution of the EEL.
- The EEL does not support multitask execution. Do not execute the EEL functions during interrupt processing.
- Before starting the EEPROM emulation, be sure to start up the high-speed on-chip oscillator first. The high-speed on-chip oscillator must also be activated when using the external clock.
- In address above 0xFFE20 (0xFE20), do not place data buffer (argument) or stack which is used by EEL functions and FDL functions.
- To use the data flash memory for EEPROM emulation, it is necessary to execute the EEL_CMD_FORMAT command upon first starting up to initialize the data flash memory and make it usable as EEPROM emulation blocks.
- It is recommended to use at least three blocks of the data flash memory in order to use the EEL.
- The EEL does not support multitask execution. When executing an EEL function on the OS, do not execute in from two or more tasks.
- About an operation frequency of RL78 microcontrollers and an operation frequency value set by the initializing function (FDL_Init), be aware of the following points:
  - When using a frequency lower than 4 MHz as an operation frequency of RL78 microcontrollers, only 1 MHz, 2 MHz and 3 MHz can be used (frequencies other than integer values like a 1.5 MHz cannot be used). Also, set an integer value 1, 2, or 3 to the operation frequency value set by the initializing function.
  - When using a frequency of 4 MHz or higher Note as an operation frequency of RL78 microcontrollers, a certain frequency can be used as an operation frequency of RL78 microcontrollers.
  - This operation frequency is not the frequency of the high-speed on-chip oscillator.

Note: For a maximum frequency, see the target RL78 microcontroller user’s manual.
3. **Operation Check Conditions**

The sample code described in this application note has been checked under the conditions listed in the table below.

5. Description of the Hardware

5.1 Hardware Configuration Example

Figure 5.1 shows an example of the hardware connection.

Cautions: 1. The purpose of this circuit is only to provide the connection outline and the circuit is simplified accordingly. When designing and implementing an actual circuit, provide proper pin treatment and make sure that the hardware’s electrical specifications are met (connect the input-only ports separately to \( V_{DD} \) or \( V_{SS} \) via a resistor).

2. \( V_{DD} \) must be held at not lower than the reset release voltage (\( V_{LVDH} \)) that is specified as LVD.

6. Description of Software

6.1 Operation Outline

In this application, LED0 or LED1 blinks 10 times by a keypress. The data used for LED blinking is saved to data flash memory when the supply voltage becomes too low. The saved data is read when system restarts, and the interrupted blinking processing is continued.

When reset is ended, the system reads the blinking state data (target LED for blinking, and the remaining times of LED blinking) by EEL from data flash memory where the data has been saved.

Next, after completing 10 times blinking at intervals of 500 ms according to the blinking state data, the LED stops blinking and the system becomes the waiting state for keypress.

If the key is pressed in a state in which no LED is blinking, the LED that had not been blinking just before will start to blink. The keypress becomes invalid while LED is blinking.

The fall of power supply voltage is detected by LVD function. If the fall of power supply voltage is detected, the LED blinking state data (target LED for blinking, and the remaining times of LED blinking) is saved to data flash memory by the EEL. LED3 which shows the completion of data saving will be lit up, and then the mode moves to the STOP mode.

Moreover, if an error occurs when accessing data flash memory with an EEL function, LED0 and LED1 will be lit up and the mode shifts into the STOP mode.

1. Sets the input and output ports.
   - LED lighting control (for LED0, LED1, LED3): Configure P05, P45, and P41 as the output ports. (LED0, LED1, and LED3 are off.)
   - Keypress: Configure P137/INTP0 for detecting INTP0 falling edges. (Interrupt servicing disabled)

2. Start EEPROM emulation by doing the RAM initialization processing of FDL/EEL and the preparation processing. Specifically, functions are called in following order.
   - FDL_Init, FDL_Open, EEL_Init, EEL_Open, EEL_Execute(Startup)

3. LED blinking state (Data ID: 1) is read and then the target LED will blink at intervals of 500 ms according to this LED blinking state.
   - Higher 4 bits of the read data show the target LED for blinking (0000B: LED0, 0001B: LED1). And lower 4 bits show the data (Range: 0000B - 1010B) of remaining times of LED blinking.
   - The target LED for blinking to is set as LED0 and the data of remaining times of LED blinking is set as 0, when data does not exist.
   - Blinking according to the read data is started.
   - EEL_Execute (Read) function is used for reading of data.

4. Ensure the space for data writing via evaluating the free space in a block before writing the data.
   - If free space is lower than 3 bytes (smaller than the size of user data), perform refresh processing to secure a space in another block and move the latest data.
   - If free space is 3 bytes or more, refresh processing is not performed.

5. A push on a switch will blink LED 10 times.
   - Interrupt processing is started upon detection of a P137/INTP0 falling edge. Chattering is detected and, if the on state of the input lasts about 10 ms, it is recognized as a valid keypress and the LED blinking is started.
   - Target LED for blinking is changed at every keypress.
   - The next keypress can’t be accepted during the period from pressing key to the end of the LED blinking.

6. When a LVD interrupt occurs, the remaining times of LED blinking and the number of the target LED for blinking will be saved to data flash memory. The LED3 turns on to show completion of data saving. Then FDL/EEL will be stopped and system will go into STOP mode. Specifically, after functions are called in following order, STOP command is executed.
   - EEL_Execute(Write), EEL_Execute(Shutdown), EEL_Close, FDL_Close

7. If an error occurs when accessing data flash memory by the EEL, it will go to the stop mode after stopping FDL/EEL and turning on both LED0 and LED1.
Specifically, after functions are called in following order, STOP command is executed.
EEL_Execute(Shutdown), EEL_Close, FDL_Close
8. If reset occurs, it will return to 1.
Figure 6.1 shows the timing chart.

Remark 1. Preparation Processing: It is prepared to write data to flash memory by using EEL for saving data. The saved data is read and the LED blinking is started. The free space of a block is checked. If there is no space for writing, it will refresh.

Remark 2. Normal processing: Waiting for keypress. If a key is pressed, the target LED will blink 10 times and then waits for keypress again. The target LED for blinking changes to another by keypress.

Remark 3. Data saving: Data of the remaining times of LED blinking and targeted LED for blinking is saved into data flash memory. It turns LED off and turns LED3 on which shows the completion of data saving. It invalidates INTP0 interruption and goes into STOP mode.
(1) Release from the reset state
   After reset is ended the CPU starts running, initialization of RAM used by FDL/EEL and the LED blinking
data reading are performed. Then LED linking is started according to the read data.

(2) Keypress of SW1
   The count of the interval timer for chattering evasion is started.

(3) Detection of keypress
   It will be regarded as a valid keypress if the detection performed 10 ms after the previous keypress shows
   that SW1 is still being pressed. The interval timer of 500 ms is started, and LED goes to blink.

(4) Low voltage detection
   LED blinking data (the remaining times of LED blinking, the target LED for blinking) will be written in data
   flash memory (Data ID: 1), and the blinking LED will be off. Moreover, after turning on LED (LED3) which
   shows the completion of data saving, It invalidates INTP0 interruption (operation of SW1 is ignored), and
   goes into STOP mode. In the example of Figure 6.1, LED blinking data is set to 03H (the rest of the
   LED0's blinking times is 3).

(5) Reset occurring
   If voltage becomes below 2.75V (VLVDL falling edge), reset by LVD will occur.

(6) Data saving
   LED corresponding to the data saving blinks when the reset is ended. In the example of Figure 6.1, LED0
   blinks 3 times.
### 6.2 File Configuration

The files used for the sample code is shown in Table 6.1. Files that are automatically generated by the integrated development environment are excluded.

**Table 6.1 List of Additional Functions and Files**

<table>

### 6.7 Function Specifications

This section describes the specifications for the functions that are used in the sample code. Each function has included `r_cg_macrodriver.h` header.

#### R_Systeminit

**Synopsis**  
Initialization of peripheral functions

**Header**  
None

**Declaration**  
`void R_Systeminit(void)`

**Explanation**  
Initializes peripheral functions used in this application note.

**Arguments**  
None

**Return value**  
None

#### R_PORT_Create

**Synopsis**  
Initialization of ports

**Header**  
`r_cg_port.h`

**Declaration**  
`void R_PORT_Create(void)`

**Explanation**  
Initializes ports.

**Arguments**  
None

**Return value**  
None

#### R_CGC_Create

**Synopsis**  
Initialization of CPU clock

**Header**  
`r_cg_cgc.h`

**Declaration**  
`void R_CGC_Create(void)`

**Explanation**  
Initializes the CPU clock.

**Arguments**  
None

**Return value**  
None

#### R_TAU0_Create

**Synopsis**  
Initialization of TAU0

**Header**  
`r_cg_timer.h`

**Declaration**  
`void R_TAU0_Create(void)`

**Explanation**  
Initializes TAU0 in order to use TAU00 and TAU01 as interval timers.

**Arguments**  
None

**Return value**  
None
**R_INTC_Create**

**Synopsis**
Initialization of INTP

**Header**
r_cg_intc.h

**Declaration**
void R_INTC_Create(void)

**Explanation**
Initializes INTP.

**Arguments**
None

**Return value**
None

---

**R_LVD_Create**

**Synopsis**
Initialization of LVD

**Header**
r_cg_lvd.h

**Declaration**
void R_LVD_Create(void)

**Explanation**
Initializes LVD.

**Arguments**
None

**Return value**
None

---

**main**

**Synopsis**
Main Processing

**Header**
r_cg_tau.h
r_cg_intc.h
r_eel_function.h
r_cg_userdefine.h

**Declaration**
void main(void)

**Explanation**
Main processing is performed.

**Arguments**
None

**Return value**
None

---

**R_MAIN_UserInit**

**Synopsis**
Initialization of the Main Processing

**Header**
r_lvd.h
r_eel_function.h

**Declaration**
void R_MAIN_UserInit(void)

**Explanation**
Initializes the main function.

**Arguments**
None

**Return value**
None

---

**R_EEL_Initialize**

**Synopsis**
Initialization of EEL

**Header**
r_eel_function.h
r_cg_userdefine.h

**Declaration**
uint8_t R_EEL_Initialize(void)

**Explanation**
Performs the preparation processing like initialization of RAM before starting EEPROM emulation.

**Arguments**
None

**Return value**
- Normal response: RET_OK
- Abnormal termination: RET_NG_DEVICE
**R_EEL_ReadData**

**Synopsis**
Read by EEL

**Header**
r_eel_function.h  
r_cg_userdefine.h

**Declaration**
uint8_t R_EEL_ReadData(uint8_t id, uint8_t* pdata)

**Explanation**
Reads data from data flash memory.

**Arguments**
- **id**
  Data ID to be read
- **pdata**
  The pointer of the buffer where the read data is stored.

**Return value**
- Normal response: RET_OK
- Abnormal termination: RET_NG_DEVICE
- No data: RET_NG_NODATA

**R_EEL_CheckDataRange**

**Synopsis**
Valid range check of LED blinking data

**Header**
r_eel_function.h

**Declaration**
uint8_t R_EEL_CheckDataRange(uint8_t data)

**Explanation**
Checks whether LED blinking data is in the valid range.

**Arguments**
- **data**
  Object data of the check

**Return value**
- Within the range: RET_OK
- Outside of the range: RET_NG_RANGE

**R_EEL_CheckStatus**

**Synopsis**
EEL Function Status Check

**Header**
r_eel_function.h  
r_cg_userdefine.h

**Declaration**
uint8_t R_EEL_CheckStatus(eel_request_t* request_pstr)

**Explanation**
Checks the execution status of EEL. It is called immediately after performing EEL_Execute.

**Arguments**
- **request_pstr**
  The argument when EEL_Execute is executed.

**Return value**
- Normal response: RET_OK
- Abnormal termination: RET_NG_DEVICE
- No data: RET_NG_NODATA

**R_TAU0_Channel1_Start**

**Synopsis**
Enabling TAU01

**Header**
r_cg_timer.h

**Declaration**
void R_TAU0_Channel1_Start(void)

**Explanation**
Starts the count of TAU01.

**Arguments**
None

**Return value**
None
### r_tau0_channel1_interrupt

**Synopsis**
TAU01 interrupt handler

**Header**
r_cg_timer.h
r_eel_function.h

**Declaration**
__interrupt static void r_tau0_channel1_interrupt(void)

**Explanation**
Switches LED between ON/OFF and decrements the remaining times of LED blinking
Target LED for blinking is switches to another LED when blinking is completed.

**Arguments**
None

**Return value**
None

---

### R_TAU0_Channel1_Stop

**Synopsis**
Disabling TAU01

**Header**
r_cg_timer.h

**Declaration**
void R_TAU0_Channel1_Stop(void)

**Explanation**
Stops the count of TAU01.

**Arguments**
None

**Return value**
None

---

### R_INTC0_Start

**Synopsis**
Enabling INTP0

**Header**
r_cg_intp.h

**Declaration**
void R_INTC0_Start(void)

**Explanation**
Enables INTP0 interruption.

**Arguments**
None

**Return value**
None

---

### r_intc0_interrupt

**Synopsis**
INTP0 interrupt handler

**Header**
r_cg_intp.h
r_cg_timer.h

**Declaration**
__interrupt static void r_intc0_interrupt(void)

**Explanation**
Starts the operation of TAU00.

**Arguments**
None

**Return value**
None

---

### R_TAU0_Channel0_Start

**Synopsis**
Enabling TAU00

**Header**
r_cg_timer.h

**Declaration**
void R_TAU0_Channel0_Start(void)

**Explanation**
Starts the count of TAU00.

**Arguments**
None

**Return value**
None
r_tau0_channel0_interrupt

Synopsis: TAU00 interrupt handler
Header:  
  r_cg_timer.h
  r_eel_function.h
Declaration:  
  __interrupt static void r_tau0_channel0_interrupt(void)
Explanation: Checks the state of SW1 and starts to blink LED.
Arguments: None
Return value: None

R_EEL_WriteData

Synopsis: Write by EEL
Header:  
  r_eel_function.h
  r_cg_userdefine.h
Declaration:  
  uint8_t R_EEL_WriteData(uint8_t id, uint8_t* pdata)
Explanation: Writes data to the data flash memory.
Arguments:  
  uint8_t id  
  Data ID to be written
  uint8_t* pdata  
  The pointer of the buffer where the data is written.
Return value:  
  • Normal response: RET_OK
  • Abnormal termination: RET_NG_DEVICE

R_TAU0_Channel0_Stop

Synopsis: Disabling TAU00
Header:  
  r_cg_timer.h
Declaration:  
  void R_TAU0_Channel0_Stop(void)
Explanation: Stops the count of TAU00.
Arguments: None
Return value: None

R_INTC0_Stop

Synopsis: Disabling INTP0
Header:  
  r_cg_intp.h
Declaration:  
  void R_INTC0_Stop(void)
Explanation: Disables INTP0 interruption.
Arguments: None
Return value: None

R_LVD_InterruptMode_Start

Synopsis: Enabling LVD interruption
Header:  
  r_cg_lvd.h
Declaration:  
  void R_LVD_InterruptMode_Start(void)
Explanation: Enables LVD interruption.
Arguments: None
Return value: None
**r_lvd_interrupt**

**Synopsis**
LVD interrupt handler

**Header**
r_cg_lvd.h
r_eel_function.h

**Declaration**
__interrupt static void r_lvd_interrupt(void)

**Explanation**
Sets the low voltage detection flag

**Arguments**
None

**Return value**
None

---

**FDL_Init**

**Synopsis**
Initialization of FDL

**Header**
fdl.h

**Declaration**
fdl_status_t __far FDL_Init(const __far descriptor_t* descriptor_pstr)

**Explanation**
Initializes FDL.
(This is a FDL library function.)

**Arguments**
const __far descriptor_t* descriptor_pstr
   It is a pointer to the descriptor table.

**Return value**
- Normal termination: FDL_OK
- Initialization error: FDL_ERR_CONFIGURATION

---

**FDL_Open**

**Synopsis**
FDL set up

**Header**
fdl.h

**Declaration**
void __far FDL_Open(void)

**Explanation**
Sets up FDL.
(This is a FDL library function.)

**Arguments**
None

**Return value**
None

---

**FDL_Close**

**Synopsis**
Stop FDL

**Header**
fdl.h

**Declaration**
void __far FDL_Close(void)

**Explanation**
Stops FDL.
(This is a FDL library function.)

**Arguments**
None

**Return value**
None
EEL_Init

Synopsis
Initialization of RAM used by EEL

Header
eel.h

Declaration
eel_status_t __far EEL_Init(void)

Explanation
Initializes RAM which is used for EEPROM emulation.
(This is an EEL library function.)

Arguments
None

Return value
Normal termination: EEL_OK
Initialization error: EEL_ERR_CONFIGURATION

EEL_Open

Synopsis
EEL set up

Header
eel.h

Declaration
void __far EEL_Open(void)

Explanation
Changes into the state where EEPROM emulation can be performed.
(This is an EEL library function.)

Arguments
None

Return value
None

EEL_Close

Synopsis
Stop EEL

Header
eel.h

Declaration
void __far EEL_Close(void)

Explanation
This function makes the EEPROM emulation unexecutable.
(This is an EEL library function.)

Arguments
None

Return value
None

EEL_Execute

Synopsis
Execution of the data flash operation by each command

Header
eel.h

Declaration
void __far EEL_Execute(__near eel_request_t* request_pstr)

Explanation
Each type of processing for performing EEPROM emulation operations is specified
for this function as an argument in the command format, and the processing is
executed.
(This is an EEL library function.)

Arguments
__near eel_request_t* request_pstr
It is a pointer to the request structure.

Return value
None
### EEL_Handler

**Synopsis**  
Controls the EEL while it is running  

**Header**  
eel.h  

**Declaration**  
void __far EEL_Handler(void)

**Explanation**  
This function continues executing the EEPROM emulation processing specified for the EEL_Execute function.  
(This is an EEL library function.)

**Arguments**  
None

**Return value**  
None

### EEL_GetSpace

**Synopsis**  
Checks free space in the EEL block  

**Header**  
eel.h  

**Declaration**  
eel_status_t __far EEL_GetSpace(__near eel_u16* space_pu16)

**Explanation**  
This obtains the free EEL block space.  
(This is an EEL library function.)

**Arguments**  
__near eel_u16* space_pu16  
The address at which the free space information of the current active block is input.

**Return value**  
Normal termination: EEL_OK  
EEL_Init has not been executed: EEL_ERR_INITIALIZATION  
The EEL_CMD_STARTUP command has not finished normally: EEL_ERR_ACCESS_LOCKED  
A command is being executed: EEL_ERR_REJECTED
6.8 Flowcharts

6.8.1 Overall Flowchart

Figure 6.2 shows the overall flow of the sample program described in this application note.

```
Start
  | Initialization function
  | hdwinit()
  | The option bytes are referenced before the initialization function is called.
  | main()
  | End
```

**Figure 6.2 Overall Flowchart**

6.8.2 Initialization of Peripheral Functions

Figure 6.3 shows the initialization of peripheral function.

```
R_Systeminit
  | Disable redirection of peripheral I/O
  | PIOR register ← 00H
  | Initialize ports
  | R_PORT_Create()
  | Initialize CPU clock
  | R_CGC_Create()
  | Initialize TAU0
  | R_TAU0_Create()
  | Initialize INTP
  | R_INTC_Create()
  | Initialize LVD
  | R_LVD_Create()
  | Disable flash memory CRC control
  | CRC0CTL register ← 00H
  | Disable illegal memory access detection control
  | IAWCTL register ← 00H
  | Read out Pmn register value when port mode output
  | PMS register ← 00H
  | return
```

**Figure 6.3 Initialization of Peripheral Functions**
6.8.3 Initialization of Ports

Figure 6.4 shows the initialization of ports.

```
| R_PORT_Create | PFSEG0 register ← 00H |
| Use P50-P53 as ports |
| Use P54-P57 and P70-P73 as ports |
| Use P74-P77 and P30-P33 as ports |
| Use P34-P37, P45-P475, P130 and P22-23 as ports |
| Use P24-P27 and P10-P13 as ports |
| Use P14-P17 and P00-P03 as ports |
| Use P04-P07 as ports |
| Enable the digital input of P125-P127 |
| Set up P05 for high level |
| Set up P41 & P45 for high level |
| Set up P05 for output mode |
| Set up P41 & P45 for output mode |
| Set up P15 for high level Note 1 |
| Set up P15 for output mode Note 1 |
| Set up unused port Note 2 |
| return |
```

Figure 6.4 Initialization of ports

Note 1: This is a setup which makes unused LED switch off.
Note 2: Refer to “RL78/L13 User’s Manual: Hardware” for the setup of the unused ports.
Caution: Provide proper treatment for unused pins so that their electrical specifications are observed. Connect each of any unused input-only ports to VDD or VSS via a separate resistor.
### 6.8.4 Initialization of CPU Clock

Figure 6.5 shows the initialization of CPU clock.

**R_CGC_Create**

- Set up unused X1 oscillator circuit and unused XT1 oscillator circuit
- Stop high-speed system clock
- Set up main system clock
- Stop subsystem clock
- Real time clock and operation clock of interval timer
- Set up CPU/peripheral hardware clock
- High-speed on-chip oscillator circuit operation

**CMC register**
- $MSTOP$ bit $← 1$: Stop X1 oscillator circuit.
- $MCM0$ bit $← 0$: Set up high-speed on-chip oscillation clock
- $XTSTOP$ bit $← 1$: Stop XT1 oscillator circuit.
- $OSMC$ register $← 10H$: Supply permission of subsystem clock to peripheral functions.
- $WUTMCK0$ bit $← 1$: Low-speed on-chip oscillator clock
- $CSS$ bit $← 0$: Set up the main system clock

**CKC register**
- $EXCLK$ bit $← 0$: Operation mode of high-speed system clock pin: Input port mode
- $EXCLKS$ bit $← 0$: Operation mode of sub-system clock pin: Input port mode
- $AMPHS1-AMPHS0$ bit $← 00B$: Oscillation mode of XT1 oscillator circuit: Low power oscillation

**Figure 6.5 Initialization of CPU Clock**
6.8.5 Initialization of TAU0

Figure 6.6 and Figure 6.7 show the initialization of TAU0.

![Diagram of TAU0 Initialization]

- **R_TAU0Create**
  - Supply permission of clock to TAU0
  - Set up timer clock selection register 0
  - Stop TAU0 count
  - Disable TAU0 interrupt
  - Disable TAU01 interrupt
  - Disable TAU01 higher 8 bits interrupt
  - Set up TAU0 operation mode
  - Set TAU0 counter value
  - Disable TAU0 output

- **Figure 6.6 Initialization of TAU0 (1/2)**

- **R_TAU0_Create**
  - Set up timer clock selection register 0
  - Stop TAU0 count
  - Disable TAU0 interrupt
  - Disable TAU01 interrupt
  - Disable TAU01 higher 8 bits interrupt
  - Set up TAU0 operation mode
  - Set TAU0 counter value
  - Disable TAU0 output
Set up TAU01 operation mode

- TMR01 register 8001H
  - CKS011-CKS010 bit = 01B
  - CCS01 bit = 0
  - SPLIT01 bit = 0
  - STS012-STS010 bit = 000B
  - MD013-MD011 bit = 000B
  - MD01 bit = 1

- Operation clock: Operation clock (CK01) which is set by timer clock selection register 0 (TPS0)
- Count clock: Operation clock which are specified by CKS011 and CKS010 bit.
- Operate as 16-bit timer
- Start trigger set up: Only software trigger start is valid. (Other trigger sources are unselected.)
- Operation mode: Interval timer mode
- Timer interrupt is generated at the time of a count start.

Set up TAU01 counter value

- TDR01 register B71AH
  - measure for 500 ms (1/93750Hz × 46875 = 500ms)

Disable TAU01 output

- TOM0 register
  - TOM01 bit 0
- TOL0 register
  - TOL01 bit 0
- TO0 register
  - TO01 bit 0
- TOE0 register
  - TOE01 bit 0

Set up unused timer

return

Figure 6.7 Initialization of TAU0 (2/2)
6.8.6 Initialization of INTP

Figure 6.8 shows the initialization of INTP.

```
R_INTC_Create

Disable INTP0 interrupt
Clear interrupt request flag of INTP0
Set interrupt priority level of INTP0 to 3
The enable edge of INTP0 pin is set as a falling edge.
Set up unused INTP

return
```

Figure 6.8 Initialization of INTP

6.8.7 Initialization of LVD

Figure 6.9 shows the initialization of LVD.

```
R_LVD_Create

Disable LVD interrupt
Clear interrupt request flag of LVD
Set interrupt priority level of LVD to 0

return
```

Figure 6.9 Initialization of LVD
6.8.8 Main Processing

Figure 6.10 and Figure 6.11 show the main processing.

```plaintext
main

Initialization of the main processing
R_MAIN_UserInit()

Initialization of EEL
R_EEL_Initialize()

ret ← Completion of initialization / Access error

Is initialization completed?
No (Access error)
Yes

Read by EEL
R_EEL_ReadData()

Is there read data?
No (No data / Access error)
Yes

Valid range check of LED blink data
R_EEL_CheckDataRange()

Is data in the valid range?
No (Out of the range)
Yes

Store the LED blink data

Clear the LED blinking data

Set the return value to the normal response

ret ← RET_OK

Is LED blink data set completed?
No (Access error)
Yes

Obtain the free EEL block space
EEL_GetSpace()

space ← Free space
ret ← EEL_OK / EEL_ERR_INITIALIZATION / EEL_ERR_ACCESS_LOCKED / EEL_ERR_REJECTED

Obtain the free space successfully?
No (It is not EEL_OK)
Yes

Free space is 3 bytes or more?
No (The space is less than 3 bytes.)
Yes

Set the return value to the normal response
ret ← RET_OK

Set arguments
request_pstr.command_enu ← EEL_CMD_REFRESH

Refresh processing of EEL block
EEL_Execute(Refresh)

EEL function status check
R_EEL_CheckStatus()

ret ← Normal termination / Access error

Figure 6.10 Main Processing (1/2)
```
Does the supply voltage become too low?

Yes

Disable maskable interrupt
IE ← 0

Prepare the data to be saved
led_data ← Higher 4 bits: g_blink_led
Lower 4 bits: g_blink_num

EEL write
R_EEL_WriteData()

Turn off LED0 and LED1
Turn on LED3

Set arguments
request_pstr.command_enu ← EEL_CMD_SHUTDOWN

Shutdown EEL
EEL_Execute(Shutdown)

Stop EEL
EEL_Close()

Stop FDL
FDL_Close()

Disable TAU0
R_TAU0_Channel0_Stop()

Disable TAU01
R_TAU0_Channel1_Stop()

Disable INTP0
R_INTC0_Stop()

Shift to STOP mode

No (Access error)

Disabling INTP0
R_INTC0_Stop()

Does the supply voltage become too low?

No (g_lvd_flag = UNDETECT_LOW_VOLTAGE)

INTP0 interruption is started and LED starts to blink when SW1 was pressed.

LVD interrupt is started and DETECT_LOW_VOLTAGE is set to g_lvd_flag when the supply voltage becomes equal to or lower than VLVDH.

Figure 6.11 Main Processing (2/2)
6.8.9 Initialization of the Main Processing

Figure 6.12 shows the initialization of the main processing.

```
R_MAIN_UserInit
   Enable maskable interrupt
      IE ← 1
   Set target LED for blinking to LED0
      g_blink_led ← BLINK_LED0
   Set 0 to the remaining times of LED blinking
      g_blink_num ← 0
   Clear low voltage detection flag
      g_lvd_flag ← UNDETECT_LOW_VOLTAGE
   Enable LVD interruption
      R_LVD_Interrupt
         Mode_Start()
   return
```

Figure 6.12 Initialization of the Main Processing
### 6.8.10 Initialization of EEL

Figure 6.13 shows the initialization of EEL.

![Diagram of Initialization of EEL](image)

**Figure 6.13 Initialization of EEL**
6.8.11 Read Processing by EEL

Figure 6.14 shows how to read data by EEL.

```c
R_EEL_ReadData()

Set up arguments

Read by EEL
EEL_Execute(Read)

EEL function status check
R_EEL_CheckStatus()

return(ret)
```

6.8.12 Valid Range Check of LED blinking Data

Figure 6.15 shows the valid range check of LED blinking data.

```c
R_EEL_CheckDataRange()

Argument uint8_t data : Data to be checked

Extraction of data

Led (local variable) ← Higher 4 bits of data to be checked
Num (local variable) ← Lower 4 bits of data to be checked

Is LED data within the valid range?

Yes

Set "normal response" to the return value.

ret ← RET_OK

return(ret)

No (blinking LED number or the remaining times of LED blinking is out of the range.)

Set "out of the valid range" to the return value.

ret ← RET_NG_RANGE
```

Figure 6.15 Valid Range Check of LED Blinking Data
6.8.13 EEL Function Status Check

Figure 6.16 shows the EEL function status check.

```
R_EEL_CheckStatus
Argument request_pstr : argument of EEL_Execute function

"Pending" is set to the return value.
ret ← STATUS_PENDING

EEL status check
EEL_Handler()

Function processing finish?
Yes

Status
Identify by request_pstr.status_enu.

EEL_OK
Format successful?
Yes

Set up arguments
request_pstr.command_enu ← EEL_CMD_STARTUP
EEL_Execute(Startup)

Set "normal response" to the return value.
ret ← RET_OK

No (The status is BUSY.)

EEL_ERR_NO_INSTANCE

Set "No-write-data error" to the return value
ret ← RET_NG_NODATA

EEL_ERR_POOL_FULL
EEL_ERR_VERIFY

Set up arguments
request_pstr.command_enu ← EEL_CMD_REFRESH

Refresh processing of EEL
EEL_Execute(Refresh)

EEL_ERR_POOL_INCONSISTENT
EEL_ERR_POOL_EXHAUSTED

Is the command FORMAT or WRITE?
Yes

default

Is the command FORMAT or WRITE?
No (The command is other than FORMAT or WRITE.)

Set up arguments
request_pstr.command_enu ← EEL_CMD_FORMAT

EEL Execute(Format)

Set "Abnormal termination" to the return value.
ret ← RET_NG_DEVICE

Formatting of EEL block

No (ret = STATUS_PENDING)

return(ret)
```

6.9 How to Import EEL into the Software Project

How to import EEL files used by this application into the software project is indicated below.

6.9.1 CS+ Version

(1) The following files are copied to the root directory of a project.
   - fdl.h
   - fdl_types.h
   - fdl.lib
   - eel.h
   - eel_types.h
   - eel.lib

(2) Right-clicks “File” at the project tree of CS+ and select the file copied according to the extension (.h, .lib, dr) by clicking “Add” and “Add an existing file”.

Caution
Please do not import the file in the directory smprl78 included in EEL. Be sure to use the file included in the sample code. (e.g. eel_descriptor.c)
When the file has been overwritten, correct according to “0 EEL Initial Values to be Set by User”.

6.9.2 e2studio Version

(1) The following files are copied to src directory.
   - fdl.h
   - fdl_types.h
   - fdl.lib
   - eel.h
   - eel_types.h
   - eel.lib

(2) Select “Update” by right-click project name at project explorer of e2studio.

Caution
Please do not import the file in the directory smp included in FDL/EEL. Be sure to use the file included in the sample code. (e.g. eel_descriptor.c)
When the file has been overwritten, correct according to “0 EEL Initial Values to be Set by User”.

6.9.3 IAR Version

(1) Copy the installed EEL folder to the root directory of the project.

(2) Select "C/C++ Compiler" > "Preprocessor" from the IAR Project Options.

(3) Specify the folders copied to the root directory up to subfolders in the "Additional include directories" field.

   (Example. $PROJ_DIR\EEL\IAR_210\EEL\lib)
   (Example. $PROJ_DIR\EEL\IAR_210\FDL\lib)

(4) “https://github.com/IARSystems/ewrl78-linker-config-flashlibs”

   Download the linker script for IAR from the GitHub page above.

(5) Copy the following folder in the download to the user function folder.
   - trio_lnkR5F100xE.icf
   - common.icf
   - self_ram.icf
(6) Rename the copied "trio_lnkR5F100xE.icf" to "trio_lvkR5F10WMG.icf" and modify the code as follows

```c
#define symbol_FLASH_END = 0x1FFFF;
#define symbol_RAM_START = 0xFDF00;
```

(7) Modify the copied "common.icf" as follows

```c
#define region OCD_ROM_RAM_AREA = msm:[from(_FLASH_END & 0x1FE00) size 0x200
```

(8) From IAR Project Options, check "Linker" -> "Config" -> "Override Default".

(9) Specify the modified "trio_lvkR5F10WMG.icf".

(10) In the "Configuration file symbol definitions," enter the corresponding EEL and FDL symbols from the "RAM reservation symbols" table at the bottom of the GitHub page.

(Example. __RESRVE_T02_EEL=1)
(Example. __RESRVE_T02_FDL=1)

(11) Add FDL and EEL libraries to "Linker" -> "Library" -> "Additional Libraries" from the IAR Project Options.

(Example. $PROJ_DIR$\EEL\IAR_210\EEL\lib\eel.a)
(Example. $PROJ_DIR$\EEL\IAR_210\FDL\lib\fdl.a)

Note: Directories included in FDL/EEL must be modified according to "2.3EEL Initial Values to be Set by User".
6.10 Modification of the Sample Code

When re-execute code generation, correction of files and projects may be needed as follows.

Target IDE: CS+ version, e2studio version
File name: r_cg_main.c
Fix location: R_MAIN_UserInit();.
   Delete R_MAIN_UserInit(); above the Start user code generated in the main function.

```c
void main(void)
{
    R_MAIN_UserInit();
    /* Start user code. Do not edit comment generated here */
}
```

```c
void main(void)
{
    /* Start user code. Do not edit comment generated here */
```
7. **Sample Code**

The sample code is available on the Renesas Electronics Website.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.).

7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims including patents, copyrights, or other intellectual property rights of third parties, and any and all liability for any losses or damages incurred by you or any third parties arising from the use of Renesas Electronics products, whether in whole or in part, and any and all liability for any losses or damages incurred by you or third parties arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.

5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. "High Quality": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics data sheet or other Renesas Electronics documentation, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implants; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics documentation.

8. Renesas Electronics products shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.

9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics documentation, Renesas Electronics products are not subject to radiation-resistant design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
