Introduction

This application note explains how to use the instructions specific to the RX Family DSP functions. Coding examples of a multiple precision multiplication program using the DSP function specific instructions are also introduced.

1. General

Multiple precision arithmetic refers to numerical computations on numbers of a precision higher than that which can be handled directly with the hardware instructions of a computer. The range of numbers that can be handled directly by a 32-bit microcomputer such as the RX family is limited to from 0 to \(2^{32} - 4294967295\) (assuming that the numbers are unsigned integers). A program that carries out multiple precision arithmetic is required to make calculations beyond such hardware limitations. Generally, multiple precision arithmetic is used in applications in which the precision provided by hardware-implemented fixed-precision arithmetic would be inadequate or any overflows of computation results would bring about some problems. A typical application of multiple precision arithmetic is public key encryption. The public key encryption algorithm entails integer computations with a great number of digits.

This application note describes a multiple precision multiplication program as an application example of the multiply-accumulate instruction of the RX family CPU core (hereafter referred to as the RX). In addition to the multiplication program, the note also illustrates multiple precision arithmetic programs for addition, subtraction, and division. These programs may be combined and used as a four-function multiple precision arithmetic program.

For details on the RX's multiply-accumulate instructions, refer to RX Family User's Manual; Software (REJ09B0435). Reference should also be made to the document listed below for details on the multiple precision arithmetic algorithm.

2. Data Representation Multiple precision Numbers

Numbers of which precision exceeds the limits of values that a computer hardware can handle directly are called multiple precision numbers. This chapter describes the data representation of multiple precision numbers that are subject to multiple precision arithmetic.

The multiple precision numbers are assumed to be unsigned integers. The RX has a 16 bits \(\times 16\) bits multiply-accumulate instruction. To take advantage of this multiply-accumulate instruction to implement a multiplication program for multiple precision numbers, a multiple precision number is assumed to be represented by an array of 16-bit unsigned integers in this application note.

A 16-bit unsigned integer representation can represent \(2^{16}\) numbers. By regarding each element of the array as a digit in a notation system of base \(2^{16}\), an array of 16-bit unsigned integers with a length of \(N\) can be used to represent an integer of \(N\) digits in a notation system of base \(2^{16}\). In addition, it is predefined that the elements of the array for a number of \(N\) digits are arranged in the ascending order toward the uppermost digit, with the element with a subscript of 0 being designated as the lowermost digit.

This is illustrated in figure 1.

![Figure 1](image)

Array of 16-bit unsigned integers (length \(N\))

The numerical value stored in the multiple precision number \(a[N]\) can be represented by the following expression:

\[
a[N - 1] \times 2^{16(N-1)} + \ldots + a[2] \times 2^{32} + a[1] \times 2^{16} + a[0]
\]

An example of a C program fragment for a multiple precision number that corresponds to figure 1 is given below. In this program, the number of digits \(N\) is set to 32 and unsigned integers with a maximum of \(2^{512} - 1\) of magnitude are assumed to be handled.
```c
#include <stdint.h>
#define N       32      /* Length of multiple precision number (for an array of 16-bit unsigned integers) */
uint16_t a[N];
```

For example, 12345678901234567890 in decimal notation can be represented as a C language array with initial values as shown below. Note that the elements of the array for which no initial value is specified (upper digits) are all assumed to have a value of 0.

```c
uint16_t num[N] = { 0x0ad2, 0xeb1f, 0xa98c, 0xab54 };`
/*
    Multiplies 16-bit unsigned integers.
    Returns a 32-bit unsigned integer as the results.
*/
#define inline_asm

static uint32_t mul16(uint16_t a, uint16_t b) {
    push.l  r6
    mov.l   r1,r3
    and     #7fffh,r3

3.2 Multiplication of Multiple precision Numbers on Paper

This section explains the multiplication of multiple precision numbers on paper. Considering multiple precision numbers as 16-bit unsigned integers of N digits, add together the results of multiplying each digit of the multiplicand by each digit of the multiplier (32-bit unsigned integers) sequentially at their required digit position. Figure 3 shows an example of on-paper multiplication of 4-digit multiple precision numbers.
### 3.3 Multiplication Programs

Given below is a sample program for the function `long_mul` that performs on-paper multiplications on multiple precision numbers. This function performs a multiplication on the multiple precision numbers `a` and `b` and places the results in `a`.

```c
/*
   Multiplies multiple precision numbers.
   The results are placed in a.
*/
void long_mul(uint16_t *a, uint16_t *b)
{
    int i, j;
    uint32_t x;
    uint16_t res[N];

    memset(res, 0, sizeof res);
    for (i = 0; i < N; i++) {
        if (a[i] != 0) {
            for (j = 0; j < N; j++) {
                if (b[j] != 0 && i + j < N) {
                    x = mul16(a[i], b[j]);
                    add16(res, i + j, (x & 0xffff));
                    add16(res, i + j + 1, (x >> 16));
                }
            }
        }
    }
    memcpy(a, res, sizeof res);
}
```

The function `long_mul` initially resets the variable `res` for storing the results, then sequentially performs multiplications over the digits of multiplicand `a` and multiplier `b`, one digit at a time, and adds the intermediate results to the variable `res`. The function, however, skips any computation on the digit whose value is 0 or if the results will not fit in `N` digits. Finally, the function copies the results from the variable `res` to `a`.

Given below is a sample program for the auxiliary function `add16` which is called by the function `long_mul`. This function adds the 16-bit unsigned integer `b` to the `i`th digit of multiple precision number `a`.

```c
/*
   Adds 16-bit unsigned integer b to ith digit of multiple precision number a
*/
static void add16(uint16_t *a, int i, uint16_t b)
{
    uint32_t c;

    for (c = b ; c > 0 && i < N; i++) {
        c += a[i];
        a[i] = c;  // Only lower 16 bits of c are transferred.
        c >>= 16;  // Upper 16 bits of c hold the value of the carry.
    }
}
```
4. Four Arithmetic Operations on Multiple precision Numbers

This chapter introduces sample arithmetic operation programs that perform three of the four arithmetic operations on multiple precision numbers; except the multiplication which is discussed in the preceding chapter.

- Addition
- Subtraction
- Division

4.1 Addition Program

This section explains a sample program for the addition function long_add for multiple precision numbers. This function places the results of adding multiple precision number b to multiple precision number a in a. This function is coded in assembly language. Accordingly, the #pragma inline_asm declaration is used.

```c
/*
   Adds together multiple precision numbers.
   Results are placed in a.
*/
#pragma inline_asm long_add
void long_add(uint16_t *a, uint16_t *b)
{
    mov.l   #0,r4
    mov.l   #N,r5
    ?:       
        movu.w [r1],r3
        add     r3,r4
        movu.w [r2+],r3
        add     r3,r4
        mov.w   r4,[r1+]
        shlr    #16,r4
        sub     #1,r5
        bnz     ?-
}
```

4.2 Subtraction Program

This section explains a sample program for the subtraction function long_sub for multiple precision numbers. This function places the results of subtracting multiple precision number b from multiple precision number a in a. However, the inequality \( a \geq b \) must be observed. This function is coded in assembly language. Accordingly, the \#pragma inline_asm declaration is used.

```c
/*
   Subtraction on multiple precision numbers (a >= b must be observed)
   Results are placed in a.
*/
#pragma inline_asm long_sub
void long_sub(uint16_t *a, uint16_t *b)
{
    mov.l   #0,r4
    mov.l   #N,r5
    ?:        
        movu.w  [r1],r3
        add     r3,r4
        movu.w  [r2+],r3
        sub     r3,r4
        mov.w   r4,[r1+]
        shar    #16,r4
        sub     #1,r5
        bnz     ?-    
}
```

Shown below is another sample program for the comparison function long_cmp for multiple precision numbers which is used to carry out the operation that is performed in conjunction with a subtraction. This function compares two multiple precision number a and b and returns 0 if \( a = b \), -1 if \( a < b \), and 1 if \( a > b \).

```c
/*
   Compares between multiple precision numbers
   Returns 1 if a > b, 0 if a == b, and -1 if a < b.
*/
int long_cmp(uint16_t *a, uint16_t *b)
{
    int32_t c;
    for (i = N - 1; i >= 0; i--) {
        c = (int32_t)a[i] - (int32_t)b[i];
        if (c < 0) {
            return -1;
        }
        if (c > 0) {
            return 1;
        }
    }
    return 0;
}
4.3 Division Program

This section contains a sample program for the division function `long_div` for multiple precision numbers. This function divides the value of multiple precision number \( a \) by multiple precision number \( b \) and places the quotient in \( q \) and the remainder in \( r \). However, the inequality \( b > 0 \) must be observed.

```c
static uint32_t guess(uint16_t *a, uint16_t *b, int c, int d);
/*
 * Performs division on multiple precision numbers (inequality b > 0 must be observed).
 * Places the quotient in q and the remainder in r.
 */
void long_div(uint16_t *a, uint16_t *b, uint16_t *q, uint16_t *r) {
    int i, m, n, shift;
    uint32_t u, quot;
    uint16_t c[N], d[N], e[N];

    #define ZERO(x)         memset(x, 0, sizeof(uint16_t) * N)
    #define COPY(x, y)      memcpy(x, y, sizeof(uint16_t) * N)

    /* initialize */
    ZERO(e);
    ZERO(q);
    COPY(r, a);
    n = llen(b) - 1;
    if (long_cmp(a, b) < 0 || n < 0) {
        return;
    }
    /* normalize */
    for (shift = 0, u = b[n]; (u & 0x8000) == 0; u <<= 1) {
        shift++;
    }
    lshl(r, shift);
    lshl(b, shift);
    /* loop */
    while (long_cmp(r, b) >= 0) {
        m = llen(r) - 1;
        if (r[m] >= b[n]) {
            ZERO(c);
            for (i = 0; i <= n; i++) { c[m - n + i] = b[i]; }
            if (long_cmp(r, c) >= 0) {
                q[m - n] = 1;
                long_sub(r, c);
                continue;
            }
        }
        quot = guess(r, b, m, n);
        ZERO(c);
        for (i = 0; i <= n; i++) { c[m - n - 1 + i] = b[i]; }
        COPY(d, c);
        e[0] = quot;
        long_mul(c, e);
        while (long_cmp(r, c) < 0) {
            long_sub(c, d);
            quot--;
        }
        q[m - n - 1] = quot;
    }
}
```

This program initializes the dividend and divisor, normalizes them, and then iterates through the division process. It uses a helper function `guess` to estimate the quotient at each step and updates the quotient and remainder accordingly.
long_sub(r, c);
*/ unnormalize */
lshr(r, shift);
lshr(b, shift);
#undef ZERO
#undef COPY
}
#pragma inline_asm guess
static uint32_t guess(uint16_t *a, uint16_t *b, int c, int d)
{
    shll #01h,r3,r5
    add r1,r5
    movu.w [r5],r1
    sub #02h,r5
    shll #10h,r1
    add [r5].uw,r1
    movu.w [r4,r2],r5
    divu r5,r1
    cmp #0ffffh,r1
    bleu ?+
    mov.l #0ffffh,r1
    ?:
}

The above division program uses the following three auxiliary functions in addition to the already-discussed multiplication, subtraction, and comparison functions:

- Bit-shift multiple precision number left (lshl)
- Bit-shift multiple precision number right (lshr)
- Get number of digits of multiple precision number (llen)

Firstly, a sample program for the left shift function lshl for multiple precision numbers is shown below. This function shifts multiple precision number a n bits to the left. The inequality 0 ≤ n ≤ 15 must be observed.

/* Shifts multiple precision number a n bits to the left. 0 <= n <= 15 must be observed. */
static void lshl(uint16_t *a, int n)
{
    int i;
    uint32_t c = 0;
    uint32_t t;
    
    if (n == 0) {
        return;
    }
    for (i = 0; i < N; i++) {
        t = (uint32_t)a[i];
        t <<= n;
        t |= c;
        a[i] = t;
        c = (t >> 16);
    }
}
Given below is a sample program for the right shift function `lshr` for multiple precision numbers. This function shifts multiple precision number `a` `n` bits to the right. The inequality $0 \leq n \leq 15$ must be observed.

```c
/*
 * Shifts multiple precision number `a` `n` bits to the right.
 * $0 \leq n \leq 15$ must be observed.
 */
static void lshr(uint16_t *a, int n)
{
    int i;
    uint16_t c = 0;
    uint16_t t;

    if (n == 0) {
        return;
    }
    for (i = N - 1; i >= 0; i--)
    {
        t = a[i];
        a[i] = (c | (t >> n));
        c = (t << (16 - n));
    }
}
```

Finally, a sample program for the function `llen` for getting the length of multiple precision numbers is shown below. This function returns the number of digits of multiple precision number `a`. The function returns 0 if `a = 0`.

```c
/*
 * Returns number of digits of a multiple precision number.
 * A 0 is returned if `a == 0`.
 */
static int llen(uint16_t *a)
{
    int i;

    for (i = N - 1; i >= 0; i--)
    {
        if (a[i] != 0) {
            return i + 1;
        }
    }
    return 0;
}
```
5. Sample Program

Given below is an example of a simple multiple precision arithmetic program that finds the factorial of 35.

```c
void main(void)
{
    int i;
    uint16_t a[N];
    uint16_t b[N];
    uint16_t c[N];

    memset(a, 0, sizeof a);
    memset(b, 0, sizeof b);
    memset(c, 0, sizeof b);
    a[0] = 1;
    b[0] = 2;
    c[0] = 1;
    for (i = 0; i < 35 - 1; i++) {
        long_mul(a, b);
        long_add(b, c);
    }
    /* a <- 35! = 10333147966386144929666651337523200000000 */
}
```

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins
   Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.
   - The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on
   The state of the product is undefined at the moment when power is supplied.
   - The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
   In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
   In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses
   Access to reserved addresses is prohibited.
   - The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals
   After applying a reset, only release the reset line after the operating clock signal has become stable.
   When switching the clock signal during program execution, wait until the target clock signal has stabilized.
   - When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal.
   Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products
   Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.
   - The characteristics of an MPU or MCU in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.
Notice

- All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
- Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
- Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any damages incurred by you or third parties arising from the use of these circuits, software, or information.
- When specifying the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
- Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages whatsoever by you resulting from errors in or omissions from the information included herein.
- Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the products quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.

9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation design resistance. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries. Please also take note of the following:

- Renesas Electronics products listed herein may not be used for any application beyond such specified ranges.
- Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- Renesas Electronics assumes no liability whatsoever for any damages whatsoever by you resulting from errors in or omissions from the information included herein.
- Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation design resistance. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) "Renesas Electronics product" means any product developed or manufactured by or for Renesas Electronics.
