Sample programs to use SRC FIT module for sampling rate conversion Using Firmware Integration Technology Modules

Introduction

This is document provided with two sets of sample program to show sampling rate conversion using SRC FIT module with Sampling Rate Converter (SRC) peripheral. Those are provided as e2studio C projects consisted of all needed software components. Those project shows how sampling rate conversion operation practically works on Renesas evaluation board.

In this document, firstly overview of sample program and secondly how to use the samples on e2studio are shown.

Target Device

• RX64M Group

1. Overview

The two sets of sample project provided with this document are made to show typical sampling rate conversion operations using SRC FIT module. The both projects change sampling rate from 8kHz to 44.1kHz. The difference between them is PCM data transfer from/to SRC peripheral. The one sample is using programmed input /output (PIO), the other one is using DMAC.

PCM data format

The input and output PCM data format is shown as follows.

- Input PCM data : 16 bit stereo, sampling frequency: 8kHz
- Output PCM data : 16 bit stereo, sampling frequency: 44.1kHz

Test wave

The test wave is contained in the both projects.

• Fs: 8kHz, Left channel: full scale, 500Hz sine wave, Right channel: full scale, 250Hz sine wave

1.1 Provided projects

This document and two sets of sample project are contained in the r01an2839ej0100_src_rx.zip file. Following is folder structure after decompress it.

r01an2839ej****_src_rx + r01an2839ej****_rx.pdf | \---workspace rx64m_example_src.zip rx64m_example_src_dma.zip

Those two .zip files are archived C project files of e2studio. Sampling rate conversion operation types and the corresponding C project archive files are shown in Table 1-1. Choose one among them, import and execute it on e2studio. Each projects' operation and audio signal flow by operation types are shown in Table 1-2.

Table 1-1 Operation type and corresponding C project file

Operation type	C project file
Sampling rate conversion with PIO	rx64m_example_src.zip
Sampling rate conversion with DMAC	rx64m_example_src_dma.zip

Table 1-2 Signal flow by operation types

Operation type	audio signal flow in RSKRX64M board
Sampling rate conversion with PIO	Writes PCM data contained in PCM write buffer to SRC's Input FIFO, and after sampling rate conversion read PCM data on Output FIFO and store it in PCM read buffer.
	RSKRX64M board RX64M PCM write buffer PIO transfer RX64M PCM read buffer PIO transfer

RX Family Sample programs to use SRC FIT module for sampling rate conversion Using Firmware Integration Technology Modules

Sampling rate conversion with DMAC	Using DMAC, writes PCM data contained in PCM write buffer to SRC's Input FIFO, and after sampling rate conversion read PCM data on Output FIFO and store it in PCM read buffer.
	RSKRX64M board RX64M PCM write buffer DMA transfer RX64M PCM read buffer DMA transfer

1.2 Hardware requirement

It shows signal connection between the RSKRX64M CPU board and external components. Refer to the document "RX64M Group Renesas Starter Kit+ User's Manual For e2 studio" and compose the target system.

Components of target system

• Target board : RSKRX64M CPU board

It is provided with Renesas Starter Kit+ for RX64M (RSK+RX64M). Product No: R0K50564MC010BR

• Target MCU : RX64M (R5F564MLCDFC)

1.3 Development tools requirement

- e2studio integrated development environment, version 3.1.2.10, from Renesas Electronics
- RX Family C/C++ compiler package, version 2.02.00, from Renesas Electronics
- E1 emulator from Renesas Electronics

2. Sample program

2.1 Software components

The sample programs consist of several software components as shown in Table 2-1. The main() executes system configuration and sampling rate conversion operation. It controls MCU peripherals indirectly using FIT modules. So look the source file with main() to understand sampling rate conversion operation using FIT modules' APIs. For detailed information about FIT modules, refer to corresponding application notes. (see 4. Reference Documents)

Operation type	Source file with main()	FIT modules
sampling rate conversion with PIO	r_main_src.c (Rev.1.00)	BSP FIT Module (Rev.2.80)
		SRC FIT Module (Rev.1.11)
Sampling rate conversion with DMAC	r_main_src_dma.c (Rev.1.00)	BSP FIT Module (Rev.2.80)
		SRC FIT Module (Rev.1.11)
		DMAC FIT Module (Rev.1.02)

 Table 2-1
 Software components by operation type

The both samples include PCM data table file "r_test_wave.h".

2.2 Sampling rate conversion using PIO

Figure 2-1 shows main elements for sampling rate conversion operation using PIO. As shown in it, there is just a main routine, no other routine like interrupt service. The main() executes system configuration and sampling rate conversion operation. It is a simple polling system accompanying with SRC peripheral's behavior.

Figure 2-1 Sampling rate conversion operation

Refer to Figure 2-1, operating steps for sampling rate conversion using PIO are described as follows.

- 1) Peripheral setting
 - main() configures SRC using SRC FIT module APIs.
- 2) PCM write and read buffer information setting main() sets PCM read and write buffer information. The information consists of the start address and the number of samples of PCM buffer. It is a unit of transfer, used for PCM data write and read operation described below.
- Sample rate conversion start main() specifies input and output sampling rate and enables SRC to start sampling rate conversion.

4) Sample rate conversion

main() executes following a) and c) repeatedly and asynchronously during sampling rate conversion.

- a) main() writes PCM data before conversion to SRC's Input FIFO.
- b) SRC starts conversion and output PCM data after conversion on its Output FIFO.
- c) main() reads the PCM data after conversion from the Output FIFO.

PCM data write operation

The above process a) is data transfer from the PCM write buffer to SRC's Input FIFO using R_SRC_Write(). The address of buffer and the number of samples are specified at the step 2). main() updates them every time after R_SRC_Write() call using its return value. The return value shows the number of samples successfully transferred.

PCM data read operation

The above process c) is data transfer from SRC's Output FIFO to the PCM read buffer using R_SRC_Read(). The address of buffer and the number of samples are specified at the step 2). main() updates them every time after R_SRC_Read() call. The return value shows the number of samples successfully transferred.

5) Finish conversion

When the specified number of samples (one block of PCM write buffer) is input, main() stops the process a), main() calls R_SRC_Stop() to request SRC to flush processing to finish conversion. Then main() continues the process b) until all PCM data after conversion is read and R_SRC_Read()'s return value shows the end of flush processing. Then all PCM data after sampling rate conversion is stored.

2.3 Sampling rate conversion using DMAC

Figure 2-2 shows main elements for sampling rate conversion operation using DMAC. As shown in it, there is just a main routine, no other routine like interrupt service. The main() executes system configuration and sampling rate conversion operation. It is a simple polling system accompanying with SRC's behavior.

Figure 2-2 Sampling rate conversion operation using DMAC

Refer to Figure 2-2, operating steps for sampling rate conversion using DMAC are described as follows.

- 1) Peripheral setting
- main() configures DMAC and SRC using DMAC and SSI FIT modules.
- 2) DMAC transfer information setting main() configures DMAC2 and DMAC3 for PCM data transfer using DMAC FIT module's APIs. The unit of transfer is a block of PCM buffer so main() sets the start address and the number of samples of PCM write and read buffer. And main() enables DMAC2 and 3 transfers at this step.
- Sample rate conversion start main() specifies input and output sampling rate and enables SRC to start sampling rate conversion.
- 4) Sample rate conversion

DMAC2 and DMAC3 start transfer activated by events occurred from SRC. Input FIFO empty event activates DMAC2 and Output FIFO full event activates DMAC3. The DMA transfers occur repeatedly and asynchronously during sampling rate conversion with occurrence of the events.

- a) DMAC2 transfers PCM data before conversion to SRC's Input FIFO.
- b) SRC starts conversion and output PCM data after conversion on its Output FIFO.
- c) DMAC3 transfers PCM data after conversion from SRC's Output FIFO.

PCM data write transfer by DMAC2

The above a) is data transfer from the PCM write buffer to SRC's Input FIFO using DMAC2. The address of buffer and the number of samples are specified at the step 2). When all PCM data is transferred, main() configures DMAC2 for the next transfer and enables it.

RX Family

PCM data read transfer by DMAC3

The above b) is data transfer from SRC's Output FIFO to the PCM read buffer using DMAC3. The address of buffer and the number of samples are specified at the step 2). When all PCM data is transferred, main() configures DMAC3 for the next transfer and enables it.

5) Finish conversion

When specified times of PCM write transfer by DMAC2 is completed (two units of DMA transfer in this sample program), main() stops the process a) and main() calls R_SRC_Stop() to request SRC to flush processing to finish conversion. Then main() continues the process b) until all PCM data after conversion is read. main() uses R_SRC_CheckFlush() to check the end of sampling rate conversion. When it shows Conversion End, main() stops DMAC3 transfer forcefully. Then all PCM data after sampling rate conversion is stored.

2.4 Required MCU resource

Table 2-2 shows MCU resources used for two sample programs.

MCU resources by sample programs		s by sample programs
	sampling rate conversion with PIO	Sampling rate conversion with DMAC
SRC	SRC	SRC
DMA activation source	-	SRC's Input FIFO empty (for DMAC2), SRC's Output FIFO full (for DMAC3)
DMAC	-	DMAC2, DMAC3

 Table 2-2
 Required MCU resource

2.5 PCM data buffer

PCM write buffer and PCM read buffer shown in Figure 2-1 and Figure 2-2 are containers for PCM data before and after sampling rate conversion. The buffers are uint16_t type of two-dimensional array. The array row shows buffer's number of blocks and the array column shows the number of samples per block. Table 2-3 shows the summary of PCM buffer size by conversion operation types.

- The number of blocks: see Table 2-3.
- The number of samples per block: 1024 x2.
- PCM data storing order: Left channel, Right channel, Left channel, Right channel,

Table 2-3PCM data buffer size

		sampling rate conversion with PIO	Sampling rate conversion with DMAC
PCM write buffer	blocks	1	2
	samples/block	1024 x2	1024 x2
PCM read buffer	blocks	6	12
	samples/block	1024 x2	1024 x2

3. Sample project execution

3.1 Hardware setup

Figure 3-1 shows operating environment. Refer to it, setup the environment keeping connecting order shown as follows.

- 1. Connect the E1 emulator to the RSKRX64M board of the target system with the user cable.
- 2. Connect the E1 emulator to the host PC with the USB cable.

Figure 3-1 Operating environment

3.2 Sample project execution using e2studio

3.2.1 Import sample project to e2stusio

In this part, the instruction to import the project "rx64m_example_src" is shown as an example.

- 1) Start e2studio
- 2) Workspace Launcher is displayed, Specify the folder to store the project (e.g. C:\workspace) in this dialog and click OK.

e ² Workspace Launcher		
Select a workspace		
e2 studio stores your projects in a folder called a workspace. Choose a workspace folder to use for this session.		
Workspace: C:¥WorkSpace¥	Browse	
Use this as the default and do not ask again		
	OK Cancel	

3) Click Cancel if Toolchain Registry is displayed.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

— The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

 The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

The reserved addresses are provided for the possible future expansion of functions. Do not
access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.
- 5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

 The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Notice

- Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
- 2. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
- Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
- 4. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from such alteration, modification, copy or otherwise misappropriation of Renesas Electronics product.
- Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; and safety equipment etc.

Renesas Electronics products are neither intended nor authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems, surgical implantations etc.), or may cause serious property damages (nuclear reactor control systems, military equipment etc.). You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application for which it is not intended. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for which the product is not intended by Renesas Electronics.

- 6. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
- 7. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or systems manufactured by you.
- 8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 9. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You should not use Renesas Electronics products or technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. When exporting the Renesas Electronics products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations.
- It is the responsibility of the buyer or distributor of Renesas Electronics products, who distributes, disposes of, or otherwise places the product with a third party, to notify such third party in advance of the contents and conditions set forth in this document, Renesas Electronics assumes no responsibility for any losses incurred by you or third parties as a result of unauthorized use of Renesas Electronics products.
- 11. This document may not be reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
