RX Family

Simple Flash API for RX

Introduction
RX Family MCUs are provided with flash memory for code storage (ROM) and flash memory for data storage (data flash). Both of these areas of flash memory can be programmed by user programs.

This application note presents an application programming interface (API) that can be utilized by developers to implement programming of flash memory for code storage (ROM) and flash memory for data storage (data flash) in user programs they create. This document describes how to use the API functions and how to import a project into a user application.

Target Devices
- RX610 Group
- RX621 Group, RX62N Group, RX62T Group, and RX62G Group
- RX630 Group, RX631 Group, RX63N Group, and RX63T Group
- RX210 Group, RX21A Group, and RX220 Group

Revision History........................................................................................................................... 50
1. Overview

In order to program the flash memory it is necessary to control the MCU’s on-chip flash control unit (FCU) and execute a complex procedure. The API presented in this application note enables the user to program the flash memory without needing to worry about the complex procedure.

1.1 Supported Functionality

The API supports the following functionality.

- Programming the ROM and data flash
- API operating modes (blocking mode and non-blocking mode)
- Programming of ROM from ROM, and data flash from data flash
- Protection by means of lock bit

1.2 Programming Flash Memory

As shown in Figure 1.1 (left figure), the necessary code for programming the flash memory is located in the ROM. By running the code from the ROM, it is possible to program the target area in the flash memory (the data flash in this example), as shown in Figure 1.1 (right figure).
1.3 API Operating Modes (Blocking Mode and Non-Blocking Mode)
The API has two operating modes: blocking mode and non-blocking mode. In blocking mode, after an API function is called, it does not return until processing of flash memory programming is complete. In non-blocking mode, after an API function is called, it returns before processing of flash memory programming finishes. For details of the API operating modes, refer to 2.6, Blocking Mode and Non-Blocking Mode.

1.4 Access Restrictions during API Execution
The FCU has a read mode for running programs and reading data, and a program/erase mode (P/E mode) for programming the flash memory. With the exception of a few API functions, the FCU transitions to P/E mode when an API function is run and programs the flash memory. While the FCU is in P/E mode, the types of read access to the flash memory listed in the table below are restricted. If the programming target area is read while in P/E mode, the read value is undefined.

<table>
<thead>
<tr>
<th>Programming Target Area (in P/E Mode)</th>
<th>Read Access Area</th>
<th>ROM</th>
<th>Data Flash</th>
<th>RAM</th>
<th>External Memory</th>

<td>✓</td>
</tr>
<tr>
<td>Data flash</td>
<td>✓</td>
<td>✗</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

O: Access allowed.
X: Access prohibited.

For this reason, it is not possible to program the same area of the flash memory where the code necessary for programming is located, as shown in Figure 1.2.

Figure 1.2 Programming Same Area of Flash Memory where Code Necessary for Programming Is Located

In order to program the ROM, it is necessary to run the program from an area other than the ROM, in other words from the RAM area (including external RAM). This also applies to the data that is programmed.
1.5 API Execution Area and Necessary Operations

In order to program the flash memory, it is necessary to run the API functions from an area other than the programming target area.

The default settings of the API assign the API functions to ROM areas (section P and section C), but it may be necessary to change the area from which the API functions run according to the API mode or programming target area. It may also be necessary to change the locations of associated links and interrupt vector tables, as well as preparing callback functions.

Table 1.2 Accommodating the API Mode

<table>
<thead>
<tr>
<th>Programming Target Area</th>

<td></td>
</tr>
</tbody>
</table>

For information on running programs from the RAM, refer to 2.8, Running API Code from RAM. For information on moving interrupt vector tables, refer to 2.7, Interrupt Vector Tables and Interrupt Handlers.

In addition, it is necessary to prepare callback functions when using API functions in non-blocking mode. For information on preparing callback functions, refer to 2.6.2, Non-Blocking Mode.
2. API Information

2.1 Toolchain
The operation of the API has been confirmed with the following toolchain.
C/C++ Compiler Package for RX Family (CC-RX) V3.04.00

2.2 Header Files
To use the API with a user program, include the file r_flash_api_rx_if.h. In addition, in order to use the API you will need to make settings in r_flash_api_rx_config.h to match the user program.
2.3 Configuration

Settings for the API are made in `r_flash_api_rx_config.h`. Table 2.1 lists the configuration options in `r_flash_api_rx_config.h`.

Table 2.1 Configuration Items (`r_flash_api_rx_config.h`)

<table>
<thead>

</tr>
<tr>
<td><code>FLASH_API_RX_CFG_FLASH_READY_IPL</code></td>
<td>Specifies the priority level of the flash ready interrupt. This setting takes effect when programming in non-blocking mode is enabled.</td>
</tr>
<tr>
<td><code>FLASH_API_RX_CFG_IGNORE_LOCK_BITS</code></td>
<td>The lock bit protection functionality is disabled when this option is defined. When it is undefined, lock bit protection is enabled and attempts to program or erase blocks for which the lock bit is set fail.</td>
</tr>
<tr>
<td><code>FLASH_API_RX_CFG_COPY_CODE_BY_API</code></td>
<td>The <code>R_FlashCodeCopy</code> function is enabled when this option is defined. When copying API functions located in the ROM section (PFRAM) to the RAM section (RPFRAM) by editing <code>dbsct.c</code>, without using the <code>R_FlashCodeCopy</code> function, leave this definition undefined (disabled).</td>
</tr>
</tbody>
</table>
2.4 Return Values

The return values of the API functions are listed below. These are defined in r_flash_api_rx_if.h. Some return values can have the same value, but no API function can have the same value defined for more than one return value at the same time.

```c
/**** Function Return Values ****/
/* Operation was successful */
#define FLASH_SUCCESS           (0x00)
/* Flash area checked was blank, making this 0x00 as well to keep existing code checking compatibility */
#define FLASH_BLANK             (0x00)
/* The address that was supplied was not on aligned correctly for ROM or DF */
#define FLASH_ERROR_ALIGNED     (0x01)
/* Flash area checked was not blank, making this 0x01 as well to keep existing code checking compatibility */
#define FLASH_NOT_BLANK         (0x01)
/* The number of bytes supplied to write was incorrect */
#define FLASH_ERROR_BYTES       (0x02)
/* The address provided is not a valid ROM or DF address */
#define FLASH_ERROR_ADDRESS     (0x03)
/* Writes cannot cross the 1MB boundary on some parts */
#define FLASH_ERROR_BOUNDARY    (0x04)
/* Flash is busy with another operation */
#define FLASH_BUSY              (0x05)
/* Operation failed */
#define FLASH_FAILURE           (0x06)
/* Lock bit was set for the block in question */
#define FLASH_LOCK_BIT_SET      (0x07)
/* Lock bit was not set for the block in question */
#define FLASH_LOCK_BIT_NOT_SET  (0x08)
/* 'Address + number of bytes' for this operation went past the end of this memory area. */
#define FLASH_ERROR_OVERFLOW   (0x09)
```
2.5 Blocking Mode and Non-Blocking Mode

2.5.1 Blocking Mode
In blocking mode, after an API function is called, it does not return until processing of flash memory programming is complete. To run API functions in blocking mode, disable the following macro definitions in the configuration options.

- `FLASH_API_RX_CFG_DATA_FLASH_BGO`
- `FLASH_API_RX_CFG_ROM_BGO`

2.5.2 Non-Blocking Mode
In non-blocking mode, after an API function is called, it returns before processing of flash memory programming finishes. When flash memory programming finishes, a flash ready interrupt (FRDYI) is generated and a callback function is run from the interrupt handler routine.

To run API functions in non-blocking mode, enable the following macro definitions in the configuration options. Operation in non-blocking mode only occurs for processing with these macro definitions enabled.

- `FLASH_API_RX_CFG_DATA_FLASH_BGO`
- `FLASH_API_RX_CFG_ROM_BGO`

Only the following API functions operate in non-blocking mode. For all other API functions no flash ready interrupt (FRDYI) is generated and no callback function is run. (Operation is in blocking mode.)

- `R_FlashErase function`
- `R_FlashEraseRange function`
- `R_FlashWrite function`
- `R_FlashDataAreaBlankCheck function`

The following callback functions are run according to the API function. These callback functions must be prepared by the user, and they cannot be omitted.

- `void FlashEraseDone(void)`
  — This callback function is run when erasing of the ROM or data flash by the `R_FlashErase` function or `R_FlashEraseRange` function finishes.
- `void FlashWriteDone(void)`
  — This callback function is run when programming of the ROM or data flash by the `R_FlashWrite` function finishes.
- `void FlashBlankCheckDone(uint8_t result)`
  — This callback function is run when blank checking of the data flash by the `R_FlashDataAreaBlankCheck` function finishes. The result of the blank check is stored in the argument `result`. If the data flash is blank, the value stored is `FLASH_BLANK`, and if the data flash is not blank, the value stored is `FLASH_NOT_BLANK`.
- `void FlashError(void)`
  — This callback function is run when erasing, programming, or blank checking fails. Command lock or any applicable error status is canceled by the time the callback function runs, so the user does not need to run any processing targeting the FCU. You should implement whatever processing is appropriate for the user system.
2.6 Interrupt Vector Tables and Interrupt Handlers

Due to the restrictions on read access described in 1.4, Access Restrictions during API Execution, it is not possible to read correct data from the ROM after the FCU switches to P/E mode in order to program the flash memory. This restriction applies to everything stored in the ROM, including variable vector tables (interrupt vector tables), fixed vector tables, and interrupt handler code.

To enable interrupt handlers to run while in P/E mode, it is necessary to copy the interrupt vector tables and interrupt handler code to a RAM area (including external) in the same manner as the API functions and to make appropriate changes to the interrupt table register (INTB) values. Since it is not possible to change the location of fixed vector tables, care must be taken to ensure that no exception handling involving such tables occurs while in P/E mode.

The example below shows the method of copying an interrupt vector table to the RAM and changing the value of the interrupt table register (INTB). This is only an example, and you will need to study the appropriate method to use to match the user system.

```c
/* RAM area where vector table is stored */
static uint32_t ram_vector_table[256];

/* Pointer for accessing interrupt vector table */
uint32_t *pvect_table;

/* Variable for loop */
uint16_t i;

/* == Relocation of interrupt vector table in RAM == */
pvect_table = (uint32_t *)__sectop("C$VECT");

for( i=0 ; i < 256 ; i++ )
{   
    ram_vect_table[i] = pvect_table[i]; /* Copy address of FRDYI interrupt function */
}

set_intb((void *)ram_vect_table);
```
2.7 Running API Code from RAM

To run API code from the RAM, first prepare sections for storing the API code in both RAM (RPFRAM) and ROM (PFRAM), and then, after a reset, copy the code, including the API functions, from the ROM section (PFRAM) to the RAM section (RPFRAM).

Follow the steps below to make the necessary settings.

1) Configuration option setting
   Enable the following definition:
   `#define FLASH_API_RX_CFG_ENABLE_ROM_PROGRAMMING`
(2) Adding sections

Add the RPFRAM section in the RAM area and the PFRAM section in the ROM area.

Select **Linker → Section** and click ... to open the Section Viewer window. Add the PFRAM and RPFRAM sections as shown in the figure below.
— CS+
Select CC-RX (Build Tool) → Link Option → Section → Section start address and click ... to open the Section Settings window. Add the PFRAM and RPFRAM sections as shown in the figure below.

(3) Mapping from ROM to RAM
To create a linker map from the ROM section (PFRAM) to the RAM section (RPFRAM), add the following item under ROM to RAM mapped section.
— e2 studio
Select Linker → Section → Symbol file and click the Add button under ROM to RAM mapped section to open the window shown below. Add PFRAM=RPFRAM as shown in the figure below.
Select **CC-RX(Build Tool)** → **Link Option** → **Section** → **ROM to RAM mapped section** and click ... to open the window shown below. Add **PFRAM=RPFRAM** as shown in the figure below.

(4) Transferring program code from ROM to RAM after reset

Transfer the program code from the ROM section (PFRAM) to the RAM section (RPFRAM). Either of the following two methods can be used to copy the program code to the RAM section (RPFRAM).

1. **Editing the dbsct.c file**
   The dbsct.c file specifies the areas to be initialized after a reset. Add code to transfer the program code from the PFRAM section to the RPFRAM section as shown in red text below.

   ```c
   -- FILE [dbsct.c] --
   #pragma section $DSEC
   static const struct {
       _UBYTE *rom_s; /* Initial address on ROM of initialization data section */
       _UBYTE *rom_e; /* Final address on ROM of initialization data section */
       _UBYTE *ram_s; /* Initial address on RAM of initialization data section */
   }   DTBL[] = {
       { __sectop("D"), __secend("D"), __sectop("R") },
       { __sectop("PFRAM"), __secend("PFRAM"), __sectop("RPFRAM") }
   };
   ```

2. **Running the R_FlashCodeCopy function**
   The purpose of the R_FlashCodeCopy function is to transfer the program code to the RAM section (RPFRAM). Call this function from the user program before calling any other API functions. It is necessary to define **FLASH_API_RX_CFG_COPY_CODE_BY_API** in r_flash_api_rx_config.h in order to use the R_FlashCodeCopy function.
2.8 Programing from ROM to ROM or from Data Flash to Data Flash

This functionality is implemented in software. It is not built into the FCU.

In the default configuration option settings FLASH_API_RX_CFG_FLASH_TO_FLASH is left undefined, so it is not possible to specify an address in the write destination area as the write source address (buffer_addr) specified by the second argument of the R_FlashWrite function.

However, enabling the FLASH_API_RX_CFG_FLASH_TO_FLASH definition in the configuration options makes it possible to specify an address in the write destination area as the write source address (buffer_addr). For example, you can specify an address in the ROM when the write destination area is the ROM, and you can specify an address in the data flash when the write destination area is the data flash. For details of the R_FlashWrite function, refer to 3.4, R_FlashWrite.

When the R_FlashWrite function is run, this functionality stores in the RAM the data to be written before the transition to P/E mode, and uses the data stored in the RAM to program the flash memory after the transition to P/E mode. Therefore, enabling the FLASH_API_RX_CFG_FLASH_TO_FLASH definition causes the data to be written to be maintained in the RAM buffer set aside for storing programming data. The size of the RAM buffer should be equivalent to the maximum amount of data that will be programmed to the ROM on the particular device.

![Figure 2.2 Example of Programming from ROM to ROM](image_url)
2.9 Usage Precautions

2.9.1 Operating Frequency when Running API Functions
When running API functions, set the operating frequency within the range shown in Table 2.2. Set the configuration option FLASH_API_RX_CFG_FCLK_HZ to the same value as the operating frequency.

Table 2.2 Operating Frequency

<table>
<thead>
<tr>
<th>Device</th>
<th>FCU Clock Source</th>
<th>Frequency Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX610 Group</td>
<td>Peripheral module clock (PCLK)</td>
<td>8 MHz to PCLK max. frequency</td>
</tr>
<tr>
<td>RX62x Group</td>
<td></td>
<td></td>
</tr>
<tr>
<td>RX63x Group</td>
<td>FlashIF clock (FCLK)</td>
<td>4 MHz to FCLK max. frequency</td>
</tr>
<tr>
<td>RX2x Group</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

2.9.2 Accessing Data Flash after Reset
Accessing the data flash (reading, programming, or erasing) is prohibited in the initial state after a reset. To access the data flash, it is first necessary to enable access by running the R_FlashDataAreaAccess function. For details, refer to 3.5, R_FlashDataAreaAccess.

2.9.3 Flash Memory Value after Erase
After erasure, the values of the ROM and data flash differ. The read value of the ROM after erasure is FFh, but that of the data flash is undefined. To determine whether or not the data flash is blank, run the R_FlashDataAreaBlankCheck function.

2.9.4 Block Address Constants
The API makes use of constant array g_flash_BlockAddresses[] containing const type data. This array defines the start addresses of the blocks in the flash memory. Note that addresses in the ROM are defined as P/E mode addresses and cannot be used for read accesses. Also, the array is stored in a ROM area (section C) by default. Note that the array will be deleted if the ROM is erased. The array is defined in the header file for the specific device (r_flash_api_rxXXX.h), stored in r_flash_api_rxtargets.

```c
/* Data Structure */
const uint32_t g_flash_BlockAddresses[86] = {
  0x00FFF000, /* EB00 */
  0x00FFE000, /* EB01 */
  0x00FFD000, /* EB02 */
  0x00FFC000, /* EB03 */
  ...
};
```
### 2.9.5 Programming across Boundaries in ROM Area

Some RX Family products have multiple ROM areas. For example, RX63N Group products with 2 MB of ROM have four ROM areas (areas 0, 1, 2, and 3). The programming that can be performed by an API function each time it is run is limited to a single area and cannot cross a boundary between ROM areas. To program data across ROM area boundaries, divide the data to be written into segments and program each one separately.

Refer to Table 2.3 for the ROM areas of each product.

#### Table 2.3 ROM Area Boundaries

### 2.10 Memory Usage

The amount of ROM and RAM used differs according to the which configuration options are enabled. For example, when ROM programming (FLASH_API_RX_CFG_ENABLE_ROM_PROGRAMMING) is enabled, areas for storing program code are necessary in both the RAM and ROM since API functions for programming the ROM are run from the RAM.

Table 2.4 lists several configuration patterns, and Table 2.5 lists the memory usage for each configuration pattern.

2.11 Importing API Functions into a User Project

Follow the steps below to import the API functions into your user project.

1. Copy the entire contents of the `r_flash_api_rx` directory in the source directory to the user project.
2. Add the file `r_flash_api_rx\src\r_flash_api_rx.c` as a build target.
3. Add the `r_flash_api_rx` directory to the include path.
4. Add the `r_flash_api_rx\src` directory to the include path.
5. In the `r_flash_api_rx\src\targets` directory, delete the directories with names matching products that will not be used on the user system.
6. Copy `r_flash_api_rx_config_reference.h` from the `ref` directory to the user project directory, and rename the file as `r_flash_api_rx_config.h`.
7. Add the directory containing the file `r_flash_api_rx_config.h` to the include path.
8. Configure `r_flash_api_rx_config.h` to match the user system.
9. Add lines to the file `r_flash_api_rx_if.h` to include the source files used by the API functions.

Note: Deleting the `r_flash_api_rx\ref` directory from the user project will have no effect on the build process.

To program the ROM, proceed with the steps listed in 2.8, Running API Code from RAM.
3. API Functions

3.1 Overview

Table 3.1 is an overview of the API functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R_FlashErase</td>

<td>Sets the lock bit for the target block in the ROM, prohibiting erasing and programming.</td>
</tr>
<tr>
<td>R_FlashReadLockBit</td>
<td>Reads the status of the lock bit for the target block in the ROM.</td>
</tr>
<tr>
<td>R_FlashSetLockBitProtection</td>
<td>Enable or disable the lock bit protection functionality.</td>
</tr>
<tr>
<td>R_FlashGetStatus</td>
<td>Returns the API processing status.</td>
</tr>
<tr>
<td>R_FlashCodeCopy</td>
<td>Copies the API code from the ROM section (PFRAM) to the RAM section (RPFRAM).</td>
</tr>
</tbody>
</table>
### 3.2 R_FlashErase

Erases the target block in the flash memory.

#### Format

```c
uint8_t R_FlashErase(uint32_t block);
```

#### Parameters

- **block**: Specifies the block number to be erased. Block numbers are defined in the `r_flash_api_rxXXX.h` file corresponding to the device, located in `r_flash_api_rx/src/targets`. For example, on the RX610 the block at address 0xFFFFE000 is referenced as block 0 in the user's manual and would be specified by this parameter as `BLOCK_0`.

#### Return Values

- **FLASH_SUCCESS**: Normal end (In non-blocking mode, this indicates that processing of the flash memory started normally.)
- **FLASH_FAILURE**: Abnormal end (Processing attempted on a ROM area for which the lock bit is set or a data flash area for which the access is prohibited; or processing timeout.)
- **FLASH_BUSY**: Other processing of the flash memory is currently in progress.
- **FLASH_ERROR_ADDRESS**: Invalid block number

#### Description

Erases the block specified by the argument. Block sizes differ according to the device group as well as the flash memory area on the device. In addition, the data flash on some devices has very small block sizes defined, so the function erases multiple blocks at once. For details of the block structure, refer to the user's manual of the specific device.

Table 3.2 lists the erase size for each device.

#### Table 3.2 Erase Size

<table>
<thead>
<tr>
<th>Device</th>
<th>ROM</th>
<th>Data Flash</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX610 Group</td>
<td>128 KB, 64 KB, 8 KB</td>
<td>8 KB</td>
</tr>
<tr>
<td>RX62x Group</td>
<td>16 KB, 4 KB</td>
<td>2 KB</td>
</tr>
<tr>
<td>RX630, RX63N, RX631 Group</td>
<td>64 KB, 32 KB, 16 KB, 4 KB</td>
<td>2 KB (32 bytes × 64 blocks)</td>
</tr>
<tr>
<td>RX63T Group</td>
<td>16 KB, 4 KB</td>
<td>2 KB (32 bytes × 64 blocks)</td>
</tr>
<tr>
<td>RX2x Group</td>
<td>2 KB</td>
<td>2 KB (128 bytes × 16 blocks)</td>
</tr>
</tbody>
</table>

#### Reentrant

No.
Example

```c
uint32_t loop;
uint8_t ret;

/* Specify the erase block */
ret = R_FlashErase(BLOCK_0);

/* Check for errors. */
if (FLASH_SUCCESS != ret)
{
    . . .
}

/* Erase multiple blocks (erase block 0 to block "NUM_BLOCKS_TO_ERASE") */
for (loop = 0; loop < NUM_BLOCKS_TO_ERASE; loop++)
{
    /* Erase block */
    ret = R_FlashErase(loop);

    /* Check for errors. */
    if (FLASH_SUCCESS != ret)
    {
        . . .
    }
}
```

Special Notes
To erase a block in the data flash, first run the R_FlashDataAreaAccess function to enable access to the data flash.
3.3 R_FlashEraseRange (Not supported on RX610 Group and RX62x Group.)

Erases the blocks within the target range of the data flash.

Format

```
uint8_t R_FlashEraseRange(uint32_t start_addr, uint32_t bytes);
```

Parameters

- `start_addr`: Specifies the block start address of the target range to be erased. The address must be in alignment with the block size. Refer to Table 3.3 for the method of calculating block sizes and addresses on each device.
- `bytes`: Specifies the number of bytes to be erased. This value must be a multiple of the data flash block size. For example, on the RX630, valid setting values are 32, 64, 96, and so on because the data flash block size is 32 bytes.

Return Values

- `FLASH_SUCCESS`: Normal end (In non-blocking mode, this indicates that processing of the flash memory started normally.)
- `FLASH_FAILURE`: Abnormal end (Processing attempted on a data flash area for which the access is prohibited; or processing timeout.)
- `FLASH_BUSY`: Other processing of the flash memory is currently in progress.
- `FLASH_ERROR_BYTES`: Byte count is not a multiple of the block size.
- `FLASH_ERROR_ADDRESS`: Invalid address
- `FLASH_ERROR_ALIGNED`: Block start address not specified.
- `FLASH_ERROR_OVERFLOW`: Erase range exceeds data flash area.

Description

Erases blocks within the specified range (start_addr to (start_addr + bytes)).

Table 3.3 Data Flash Block Sizes

<table>
<thead>
<tr>
<th>Device</th>
<th>Block Size</th>
<th>Method of Calculating Block N Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX63x Group</td>
<td>32 bytes (32 bytes \times 1,024 blocks = 32 KB)</td>
<td>(N \times 32 + \text{start address of data flash area (0010 0000h)})</td>
</tr>
<tr>
<td>RX2x Group</td>
<td>128 bytes (128 bytes \times 64 blocks = 8 KB)</td>
<td>(N \times 128 + \text{start address of data flash area (0010 0000h)})</td>
</tr>
</tbody>
</table>

Reentrant

No.
Example

```c
uint8_t ret;

/* Erase 64 bytes. */
ret = R_FlashEraseRange(address, 64);

/* Check for errors. */
if (FLASH_SUCCESS != ret)
{
   ... 
}
```

Special Notes

- This function is not supported on the RX610 Group and RX62x Group. Use the R_FlashErase function to perform erasures instead.
- This function can only be used to erase the data flash.
- To use this function, first run the R_FlashDataAreaAccess function to enable access to the data flash.
3.4  R_FlashWrite
Programs data to the flash memory.

Format

```c
uint8_t R_FlashWrite(uint32_t   flash_addr,
                      uint32_t   buffer_addr,
                      uint16_t   bytes);
```

Parameters

- **flash_addr**: Specifies the write destination address. The address must be aligned with the minimum write size.
- **buffer_addr**: Specifies the write source address.
- **bytes**: Specifies the byte count of the data to be written. This value must be a multiple of the minimum write size. Refer to Table 3.4 for the minimum write size on each device.

Return Values

- **FLASH_SUCCESS**: Normal end (In non-blocking mode, this indicates that processing of the flash memory started normally.)
- **FLASH_FAILURE**: Abnormal end (Processing attempted on an area that was not blank or a ROM area for which the lock bit is set or data flash area for which the access is prohibited; or processing timeout.)
- **FLASH_BUSY**: Other processing of the flash memory is currently in progress.
- **FLASH_ERRORAligned**: Address is not aligned with minimum write size.
- **FLASH_ERROR_BYTES**: Byte count is not a multiple of the minimum write size.
- **FLASH_ERROR_ADDRESS**: Invalid address
- **FLASH_ERROR_BOUNDARY**: Writes are not allowed to cross boundaries between ROM areas.
- **FLASH_ERROR_OVERFLOW**: Write range exceeds ROM or data flash area.

Description

Programs data to the flash memory. The write address must be aligned with the minimum write size. Also, the byte count must be a multiple of the minimum write size. The minimum write size differs according to the device, as shown in the table below.

<table>
<thead>
<tr>
<th>Device</th>
<th>ROM</th>
<th>Data Flash</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX610 Group and RX62x Group</td>
<td>256 bytes</td>
<td>8 bytes, 128 bytes</td>
</tr>
<tr>
<td>RX63x Group</td>
<td>128 bytes</td>
<td>8 bytes</td>
</tr>
<tr>
<td>RX210 Group</td>
<td>2 bytes, 8 bytes, 128 bytes</td>
<td>2 bytes, 8 bytes</td>
</tr>
</tbody>
</table>

Some RX Family products have multiple ROM areas. The programming that can be performed by the R_FlashWrite function each time it is run cannot cross a boundary between ROM areas. To program data across ROM area boundaries, divide the data to be written into segments and run the R_FlashWrite function for each one separately. For details on ROM areas, refer to 2.10.5, Programming across Boundaries in ROM Area.

In addition, enabling the FLASH_API_RX_CFG_FLASH_TO_FLASH definition in r_flash_api_rx_config.h makes it possible to specify a write source address in the same area as the write destination address. For example, you can specify an address in the ROM when the write destination area is the ROM, and you can
specify an address in the data flash when the write destination area is the data flash. For details, refer to 2.9, Programing from ROM to ROM or from Data Flash to Data Flash.

**Reentrant**
No.

**Example**

```c
uint8_t ret;
uint8_t write_buffer[PROGRAM_SIZE] = "Hello World...";

/* Write data to internal memory. */
ret = R_FlashWrite(address, (uint32_t)write_buffer, PROGRAM_SIZE);

/* Check for errors. */
if (FLASH_SUCCESS != ret)
{
    . . .
}
```

**Special Notes**
To program the data flash, first run the R_FlashDataAreaAccess function to enable access to the data flash.
3.5 R_FlashDataAreaAccess
Enables or disables access to the data flash (reading, programming, and erasing). After a reset, run the R_FlashDataAreaAccess function to enable access to the data flash (reading, programming, and erasing).

Format

```c
void R_FlashDataAreaAccess(uint16_t read_en_mask,
                           uint16_t write_en_mask);
```

Parameters

- **read_en_mask** Enables or disables read access for the blocks corresponding to the various bits. Setting a bit to 1 enables read access to the corresponding block, and clearing a bit to 0 disables read access to the corresponding block. Table 3.5 lists the blocks corresponding to the various bits.

- **write_en_mask** Enables or disables write or erase access for the blocks corresponding to the various bits. Setting a bit to 1 enables write or erase access to the corresponding block, and clearing a bit to 0 disables write or erase access to the corresponding block. Table 3.5 lists the blocks corresponding to the various bits.

Return Values

None.
Description
Enables or disables access to the data flash. Before accessing the data flash, run the `R_FlashDataAreaAccess` function to enable access to the data flash.

Table 3.5 lists the blocks corresponding to the various bits. A dash (—) indicates that the bit setting has no effect.

</tr>
<tr>
<td>RX21A</td>
<td></td>
<td></td>
<td>— — — — — — — — — — — — — —</td>
</tr>
</tbody>
</table>

Reentrant
No.

Example
/* Enable reading, writing, and erasing of all data flash blocks. */
R_FlashDataAreaAccess(0xFFFF, 0xFFFF);
3.6 R_FlashDataAreaBlankCheck

Performs a blank check on the data flash.

**Format**

```c
uint8_t R_FlashDataAreaBlankCheck(uint32_t address,
                                  uint8_t size);
```

**Parameters**

- **address**: Specifies the address or block number to undergo a blank check. When specifying an address, the value should align with the blank check size specified by size. When specifying a block number, use the value defined in the `r_flash_api_rxXXX.h` file corresponding to the device, located in `r_flash_api_rx/src/targets`.
- **size**: Specifies the size of the blank check. The following two values may be specified.
  - BLANK_CHECK_SMALLEST: Minimum blank check size
  - BLANK_CHECK_ENTIRE_BLOCK: Multiple-block size

**Return Values**

- **FLASH_BLANK**: (In blocking mode)
  - The data flash area is blank.
  - (In non-blocking mode with size set to BLANK_CHECK_SMALLEST)
    - The data flash area is blank.
  - (In non-blocking mode with size set to BLANK_CHECK_ENTIRE_BLOCK)
    - Blank check processing started normally.

- **FLASH_NOT_BLANK**: The data flash area is not blank.

- **FLASH_FAILURE**: Abnormal end (Normally not returned.)

- **FLASH_BUSY**: Other processing of the flash memory is currently in progress.

- **FLASH_ERROR_ADDRESS**: Invalid address

- **FLASH_ERROR_BYTES**: Invalid size

- **FLASH_ERRORAligned**: Address is not aligned with blank check size.
  - (Applies only when size = BLANK_CHECK_SMALLEST.)

**Description**

Performs a blank check on the data flash. The `R_FlashDataAreaBlankCheck` function can be used on the data flash only. The blank check size can be specified as BLANK_CHECK_SMALLEST (minimum blank check size) or BLANK_CHECK_ENTIRE_BLOCK (multiple-block size). As shown in Table 3.6, the blank check sizes differ by device.

**Table 3.6 Blank Check Sizes**

<table>
<thead>
<tr>
<th>Device</th>
<th>Blank Check Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX610</td>
<td>BLANK_CHECK_SMALLEST: 8 bytes</td>
</tr>
<tr>
<td></td>
<td>BLANK_CHECK_ENTIRE_BLOCK: 1 block (8 KB)</td>
</tr>
<tr>
<td>RX62x</td>
<td>BLANK_CHECK_SMALLEST: 8 bytes</td>
</tr>
<tr>
<td></td>
<td>BLANK_CHECK_ENTIRE_BLOCK: 1 block (2 KB)</td>
</tr>
<tr>
<td>RX63x</td>
<td>BLANK_CHECK_SMALLEST: 2 bytes</td>
</tr>
<tr>
<td></td>
<td>BLANK_CHECK_ENTIRE_BLOCK: 64 blocks (2 KB)</td>
</tr>
<tr>
<td>RX210</td>
<td>BLANK_CHECK_SMALLEST: 2 bytes</td>
</tr>
<tr>
<td></td>
<td>BLANK_CHECK_ENTIRE_BLOCK: 16 blocks (2 KB)</td>
</tr>
</tbody>
</table>
Example

```c
uint8_t ret;
/* Blank check a small data flash address. Blocking mode operation Only */
ret = R_FlashDataAreaBlankCheck(address, BLANK_CHECK_SMALLEST);

/* Check result. */
if (FLASH_NOT_BLANK == ret)
{
    /* Block is not blank. */
    . . .
}
else if (FLASH_BLANK == ret)
{
    /* Block is blank. */
    . . .
}
/* Blank check an entire data flash block. */
ret = R_FlashDataAreaBlankCheck(BLOCK_DB0, BLANK_CHECK_ENTIRE_BLOCK);

/* Check result. */
if (FLASH_NOT_BLANK == ret)
{
    /* Block is not blank. */
    . . .
}
else if (FLASH_BLANK == ret)
{
    /* Block is blank. */
    . . .
}
```

Special Notes
When the second argument (size) is set to BLANK_CHECK_SMALLEST (minimum blank check size), the blank check is performed in blocking mode even if non-blocking mode is enabled because the processing completes more quickly than writing or erasure. When it is set to BLANK_CHECK_ENTIRE_BLOCK (multiple block size), the enabled API operating mode is used.
3.7 R_FlashProgramLockBit

Sets the lock bit for the target block in the ROM, prohibiting erasing and programming.

**Format**

```c
uint8_t R_FlashProgramLockBit(uint32_t block);
```

**Parameters**

- `block` Specifies the block number for which the lock bit is set. Block numbers are defined in the `r_flash_api_rxXXX.h` file corresponding to the device, located in `r_flash_api_rx/src/targets`. For example, on the RX610 the block at address 0xFFFFE000 is referenced as block 0 in the user's manual and would be specified by this parameter as BLOCK_0.

**Return Values**

- `FLASH_SUCCESS`: Normal end
- `FLASH_FAILURE`: Abnormal end
  - (Processing attempted on area for which lock bit is already set.)
- `FLASH_BUSY`: Other processing of the flash memory is currently in progress.
- `FLASH_ERROR_ADDRESS`: Invalid block number

**Description**

Sets the lock bit for the specified block.

**Reentrant**

- No.

**Example**

```c
uint8_t ret;

/* Enable lock bit protection (this is default out of reset) */
ret = R_FlashSetLockBitProtection(true);

/* Check for errors. */
if (FLASH_SUCCESS != ret)
{
    . . .
}

/* Program lock bits */
ret = R_FlashProgramLockBit(flash_block);

/* Check for errors. */
if (FLASH_SUCCESS != ret)
{
    . . .
}
```
Special Notes

• If a block is erased while the lock bit protection functionality is disabled, the lock bit corresponding to that block is cleared.

• To use the R_FlashProgramLockBit function, disable the FLASH_API_RX_CFG_IGNORE_LOCK_BITS definition in r_flash_api_rx_config.h.
3.8 R_FlashReadLockBit
Reads the status of the lock bit for the target block in the ROM.

Format
uint8_t R_FlashReadLockBit(uint32_t block);

Parameters
block Specifies the block number for which the lock bit status is read.

Return Values
FLASH_LOCK_BIT_SET: The lock bit has been set.
FLASH_LOCK_BIT_NOT_SET: The lock bit has been cleared.
FLASH_FAILURE: Abnormal end (Normally not returned.)
FLASH_BUSY: Other processing of the flash memory is currently in progress.
FLASH_ERROR_ADDRESS: Invalid block number

Description
Reads the status of the lock bit for the specified block. The return value is determined by the read result. A return value of FLASH_LOCK_BIT_SET (0x07) indicates that the lock bit of the target block has been set. A return value of FLASH_LOCK_BIT_NOT_SET (0x08) indicates that the lock bit of the target block has been cleared.

Reentrant
No.

Example
uint8_t ret;

/* Program lock bits */
ret = R_FlashReadLockBit(flash_block);

/* Check result. */
if (FLASH_LOCK_BIT_SET == ret)
{
    /* Lock bit is set for this block. */
    . . .
}
else if (FLASH_LOCK_BIT_NOT_SET == ret)
{
    /* Lock bit was not set for this block. */
    . . .
}

Special Notes
- If a block is erased while the lock bit protection functionality is disabled, the lock bit corresponding to that block is cleared.
- To use the R_FlashProgramLockBit function, disable the FLASH_API_RX_CFG_IGNORE_LOCK_BITS definition in r_flash_api_rx_config.h.
3.9  \texttt{R\_FlashSetLockBitProtection}

Enable or disable the lock bit protection functionality.

**Format**

\begin{verbatim}
uint8_t R_FlashSetLockBitProtection(uint32_t lock_bit);
\end{verbatim}

**Parameters**

\begin{itemize}
  \item lock\_bit Specifies whether lock bit protection functionality is enabled or disabled. A value of true or 1 or greater enables lock bit protection, and a value of false or 0 disables it.
\end{itemize}

**Return Values**

- FLASH\_SUCCESS: Normal end
- FLASH\_BUSY: Other processing of the flash memory is currently in progress.

**Description**

Enable or disable the lock bit protection functionality. When lock bit protection is enabled, it is not possible to write to or erase blocks for which the lock bit is set. When lock bit protection is disabled, it is possible to write to or erase all blocks, regardless of whether or not their lock bits are set.

**Reentrant**

No.

**Example**

\begin{verbatim}
uint8_t ret;

/* Enable lock bit protection (this is default out of reset) */
ret = R_FlashSetLockBitProtection(true);

/* Check for errors. */
if (FLASH\_SUCCESS != ret)
{
  . . .
}
\end{verbatim}

**Special Notes**

- If a block is erased while the lock bit protection functionality is disabled, the lock bit corresponding to that block is cleared.
- To use the \texttt{R\_FlashProgramLockBit} function, disable the FLASH\_API\_RX\_CFG\_IGNORE\_LOCK\_BITS definition in \texttt{r\_flash\_api\_rx\_config.h}.
3.10  R_FlashGetStatus
Returns the API processing status.

Format
uint8_t R_FlashGetStatus(void);

Parameters
None.

Return Values
FLASH_SUCCESS: API functions can be run.
FLASH_BUSY: Other processing of the flash memory is currently in progress.

Description
This function can be used to check the API processing status in non-blocking mode.

Reentrant
Yes.

Example
uint8_t ret;
/* Blank check an entire data flash block. */
ret = R_FlashDataAreaBlankCheck(address, BLANK_CHECK_ENTIRE_BLOCK);

while( R_FlashGetStatus() == FLASH_BUSY )
{
    /* Wait for previous operation to finish. You could also stall this task
    and do some real work. */
}

Special Notes
None.
3.11 R_FlashCodeCopy
Copies the API code from the ROM section (PFRAM) to the RAM section (RPFRAM).

Format

```c
void R_FlashCodeCopy(void);
```

Parameters
None.

Return Values
None.

Description
Running the R_FlashCodeCopy function copies the API code from the ROM section (PFRAM) to the RAM section (RPFRAM).

Reentrant
Yes.

Example

```c
/* Transfer Flash API code to RAM so that we can program/erase ROM. */
R_FlashCodeCopy();

/* Flash API can now program/erase ROM. */
```

Special Notes
- It is not necessary to run the R_FlashCodeCopy function if you instead copy the code by editing dbsct.c.
- To use the R_FlashCodeCopy function, enable the `FLASH_API_RX_CFG_COPY_CODE_BY_API` definition in `r_flash_api_rx_config.h`. 
3.12 R_FlashGetVersion
Returns the version number of the API.

Format
uint32_t R_FlashGetVersion(void);

Parameters
None.

Return Values
API version number

Description
The API version number is reported as a return value. The upper 2 bytes of the return value represent the major version number, and the lower 2 bytes represent the minor version number. For example, version 4.25 is represented as a return code of 0x00040019.

Reentrant
Yes.

Example
uint32_t cur_version;

/* Get version of installed Flash API. */
cur_version = R_FlashGetVersion();

/* Check to make sure version is new enough for this application’s use. */
if (MIN_VERSION > cur_version)
{
    /* This Flash API version is not new enough and does not have XXX feature that is needed by this application. Alert user. */
    ....
}

Special Notes
R_FlashGetVersion function is defined as an inline function in the r_flash_api_rx.c file.
4. Reference Information

4.1 Emulator Debugging Settings

If you use the default debugging settings in the integrated development environment (e2 studio or CS+), you will not be able to use the memory monitoring function to check the contents of the flash memory programmed by the API. It will be possible to program the flash memory, but the monitored values will not be updated by downloaded values.

If you want to be able to confirm the programmed data, change the debugger tool settings in the debugging configuration as shown below.

e2 studio

1. In Project Explorer, click the project to be debugged.
2. Click Run → Debug Configurations... to open the Debug Configurations window.
3. In the Debug Configurations window, open the Renesas GDB Hardware Debugging debugging configuration display, then click the debugging configuration of the debugging target.
4. Switch to the Debugger tab, click the Debug Tool Settings subtab of the Debugger tab, and enter the following settings.
   — System
   • Debug the program re-writing the on-chip PROGRAM ROM : Yes
   • Debug the program re-writing the on-chip DATA FLASH : Yes
Select RX E2 Lite(Debug Tool) → Debug Tool Settings → System, and enter the following settings.

- Debug the program re-writing the on-chip PROGRAM ROM : Yes
- Debug the program re-writing the on-chip DATA FLASH : Yes
4.2 Using Flash Programmer to Read Programmed Data

In order to use Renesas Flash Programmer (RFP) to read the contents of flash memory programmed by a user program, you must set an ID code when you download the user program. The ID code is a security function built into RX Family devices. Note that if a connection is established without first setting an ID code, RFP will erase the entire flash memory area. For details of the ID code function, refer to the user’s manual of the specific device.
5. Sample Project

5.1 Overview

A sample project for each target device is provided as an accompaniment to this application note. The sample project is provided in e² studio project format, and it can be imported using e² studio or CS+ and used to confirm the operation of the API.

5.2 Operation Confirmation Environment

The operation of the sample project has been confirmed on the following environment.

Table 5.1 Operation Confirmation Environment

Figure 5.1 Sample Program Processing Overview (with ROM Programming Enabled)
5.4 Operating Clock Settings for Sample Project

The sample projects for some devices make use of code described in the associated “Initial Setting” application note to make operating clock settings. The operating clock settings used are the default settings listed in the “Initial Setting” application note. Refer to section 6, Reference Documents, for a listing of “Initial Setting” application notes.

The HardwareSetup function of generate/hwsetup.c performs operating clock settings in each sample project.
5.5 Importing a Project

The sample programs are distributed in e² studio project format. This section shows how to import a project into e² studio or CS+. After importing the sample project, make sure to confirm build and debugger setting.

5.5.1 Importing a Project into e² studio

To use sample programs in e² studio, follow the steps below to import them into e² studio. In projects managed by e² studio, do not use space codes, multibyte characters, and symbols such as "$", "#", "%" in folder names or paths to them.

(Note that depending on the version of e² studio you are using, the interface may appear somewhat different from the screenshots below.)

![Figure 5.2 Importing a Project into e² studio](image-url)
5.5.2 Importing a Project into CS+

To use sample programs in CS+, follow the steps below to import them into CS+. In projects managed by CS+, do not use space codes, multibyte characters, and symbols such as "$", "#", "%" in folder names or paths to them.

(Note that depending on the version of CS+ you are using, the interface may appear somewhat different from the screenshots below.)

Start the CS+, and select [Open Existing MCU Simulator / e² studio / CubeSuite / High-performance Embedded Workshop / PM+ Project].

Select [Empty Application (CC-RX)] in [Kind of project], and specify the project name and place, and select whether to backup.

<td>Mar. 5, 2010</td>
<td>Fixes based on recommendations from RTE.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>1.40</td>
<td>May 26, 2010</td>
<td>Revised to include support for the RX62x Group.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>1.41</td>
<td>Jun. 11, 2010</td>
<td>Fixed typographical errors, etc.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>1.43</td>
<td>Feb. 18, 2011</td>
<td>Blank check function parameter description updated.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.00</td>
<td>Apr. 27, 2011</td>
<td>Background operation (BGO), flash to flash transfer, and lock bit protection functionality added.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.10</td>
<td>Jul. 11, 2011</td>
<td>Support for RX630, RX631, and RX63N devices added. DATA_FLASH_OPERATION_PIPL and ROM_OPERATION_PIPL definitions deleted, and section added explaining why this was done. Added R_FlashEraseRange() function to API. Section on ROM area boundaries (previously Section 3.4) rewritten to apply to RX610 and RX63x devices.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.20</td>
<td>Mar. 27, 2012</td>
<td>Moved document over to new template. Restructured existing data and added new information about using r_bsp package. Added R_FlashCodeCopy() function to the API.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.30</td>
<td>Sep. 12, 2012</td>
<td>Added R_FlashGetVersion() function to the API. Removed config macro for not using r_bsp because the code has been modified to recognize this automatically. Added “Configure for Only Data Flash Use,” “Erase Entire User Application Area,” “Reading from Data Flash After Reset,” “Checking if a Data Flash Location is Blank (Erased),” and “Putting Flash API in User Boot Area” sections. Added blank check size table in R_FlashDataAreaBlankCheck section.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.40</td>
<td>Jul. 1, 2013</td>
<td>Added support for RX210, RX62G, and RX63T devices. Since RX200 Series devices are now supported, changed name from “Simple Flash API for RX600” to “Simple Flash API for RX.” Added “Checking if a Data Flash Location is Blank (Erased)” section, and added note on first page about where to find information about why erased data flash locations are not read as 0xFF. Added list of API functions to beginning of API Functions section. Added Demo Projects section.</td>
<td>---</td>
<td></td>
</tr>
<tr>
<td>2.50</td>
<td>Mar. 6, 2015</td>
<td>Added support for RX21A and RX220. For all instructions that referenced HEW, the equivalent steps are now provided for e² studio. Added “Execute from Data Flash” subsection. Added “Access Rules” subsection. Added “Related Documents” to cover page. Added “Memory Requirements” subsection. Removed “Bootloader Implementations” section. Revised “R_FlashDataAreaBlankCheck” subsection with use of new BLANK_CHECK_SMALLEST macro. Use of BLANK_CHECK_2_BYTE and BLANK_CHECK_8_BYTE is to be discontinued. Removed “Demo” section.</td>
<td>---</td>

</tbody>
</table>
**General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products**

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. **Precaution against Electrostatic Discharge (ESD)**
   
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. **Processing at power-on**
   
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. **Input of signal during power-off state**
   
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. **Handling of unused pins**
   
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. **Clock signals**
   
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. **Voltage application waveform at input pin**
   
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between $V_{IL}$ (Max.) and $V_{IH}$ (Min.).

7. **Prohibition of access to reserved addresses**
   
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. **Differences between products**
   
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.
Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.

5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

   - **“Standard”**: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

   - **“High Quality”**: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space systems; underwater repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.

8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.

9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation, other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for validating the safety of the final products or systems manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

13. This document shall not be reproduced, reprinted or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
