RX Family
USB Peripheral Mass Storage Class Driver (PMSC)

Introduction
This application note describes the USB peripheral mass storage class driver (PMSC). This driver operates in combination with the USB Basic Peripheral Driver (USB-BASIC-F/W). It is referred to below as the PMSC.

Target Device
RX62N/RX621 Group
RX63N/RX631 Group
RX630 Group
RX63T Group

When using this application note with other Renesas MCUs, careful evaluation is recommended after making modifications to comply with the alternate MCU.

1. Overview

PMSC, when used in combination with the USB-BASIC-F/W, operates as a USB peripheral mass storage class driver (PMSC). The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol. When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

This module supports the following functions.

- Storage command control using the BOT protocol
- Response to mass storage device class requests from a USB host

1.1 Please be sure to read

Please refer to the document (Document number: R01AN0512) for USB Basic Host and Peripheral Driver Application Note when creating an application program using this driver.

This document is located in the "reference_documents" folder within this package.

1.2 Note

This driver is not guaranteed to provide USB communication operation. The customer should verify operation when utilizing it in a system and confirm the ability to connect to a variety of different types of devices.

1.3 Limitations

PMSC is subject to the following limitations.

1. This driver return the value (0:zero) to the mass storage command (GetMaxLun) which is sent from USB Host.
2. The sector size which this driver supports is only 512 bytes.
3. This driver does not support DMA/DTC transfer.

1.4 Note

1. This driver is not guaranteed to provide USB communication operation. The customer should verify operation when utilizing it in a system and confirm the ability to connect to a variety of different types of devices.
2. Please be sure to use the documentation (r01an0514ji0232_usb.pdf, r01an0512ji0232_usb.pdf) under the "reference_documents" folder when using RX62N/RX621/RX63T/RX630.
3. You need to create the media driver function to control the media which is used as the storage area.
4. This driver uses the following area as the storage media area.

<table>
<thead>
<tr>
<th>MCU</th>
<th>Storage Media Area</th>
<th>File System</th>
</tr>
</thead>
<tbody>
<tr>
<td>RX62N</td>
<td>SDRAM on RSK</td>
<td>FAT16</td>
</tr>
<tr>

<td>RX63T</td>
<td>Internal RAM</td>
<td>FAT12</td>
</tr>
<tr>
<td>RX630</td>
<td>Internal RAM</td>
<td>FAT12</td>
</tr>
</tbody>
</table>

Note:

When the following all conditions are satisfied, be sure to do the eject processing by " Safely Remove Hardware and Eject Media" display on Windows® task bar before plugging out MSC device.

(1). The storage media is formatted as FAT12.
(2). MSC Host is Windows® 8.1 or Windows® 10.

2. Software Configuration

PMSC comprises two layers: PMSCD and PMSDD.

PMSCD comprises three layers: PCD API (PCI), PMSDD API (DDI), and BOT protocol control and data sends and receives (PMSCF).

PMSCD uses the BOT protocol to communicate with the host via PCD.

PMSDD analyzes and executes storage commands received from PMSCD. PMSDD accesses media data via the media driver.

Figure 2-1 shows the configuration of the modules.

![Software Configuration Diagram](image)

**Table 2-1 Module Function Overview**

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
</table>
| PMSDD  | Mass Storage Device Driver  
|        | • Processes storage commands from the PMSCD  
|        | • Accesses media via the media driver  |
| DDI    | PMSDD-PMSCD interface function |
| PMSCF  | Mass Storage Class Driver  
|        | • Controls BOT protocol data and responds to class requests.  
|        | • Analyzes CBWs and transmits/receives data.  
|        | • Generates CSWs together with the PMSDD/PCD.  |
| PCI    | PMSCD – PCD interface function |
| PCD    | USB Peripheral H/W Control driver |
3. API Information

This Driver API follows the Renesas API naming standards.

3.1 Hardware Requirements

This driver requires your MCU support the following features:

- USB

3.2 Operating Confirmation Environment

The following shows the operating confirmation environment of this driver.

<table>
<thead>
<tr>
<th>Table 3-1 Operation Confirmation Environment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item</td>
</tr>
<tr>
<td>C compiler</td>
</tr>
<tr>

</tbody>
</table>

3.3 Usage of Interrupt Vector

The following shows the interrupt vector which this driver uses.

<table>
<thead>
<tr>
<th>Table 3-2 List of Usage Interrupt Vectors</th>
</tr>
</thead>
<tbody>
<tr>
<td>Device</td>
</tr>
<tr>
<td>RX63N/RX631</td>
</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

3.4 Header Files

All API calls and their supporting interface definitions are located in `r_usb_basic_if.h` and `r_usb_pmsc_if.h`.

3.5 Integer Types

This project uses ANSI C99 “Exact width integer types” in order to make the code clearer and more portable. These types are defined in `stdint.h`.

3.6 Compile Setting

For compile settings, refer to chapter 7, Configuration (`r_usb_pmsc_config.h`) in this document and chapter "Configuration" in the document (Document number: R01AN0512) for USB Basic Host and Peripheral Driver Application Note.
### 3.7 ROM/RAM size

The follows show ROM/RAM size of this driver.

<table>
<thead>
<tr>
<th></th>
<th>Checks arguments</th>
<th>Does not check arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ROM size</td>
<td>20.1K bytes (Note 3)</td>
<td>19.6K bytes (Note 4)</td>
</tr>
<tr>
<td>RAM size</td>
<td>13.4K bytes</td>
<td>13.4K bytes</td>
</tr>
</tbody>
</table>

**Note:**
1. ROM/RAM size for USB Basic Driver is included in the above size.
2. The default option is specified in the compiler optimization option.
3. The ROM size of “Checks arguments” is the value when `USB_CFG_ENABLE` is specified to `USB_CFG_PARAM_CHECKING` definition in `r_usb_basic_config.h` file.
4. The ROM size of “Does not check arguments” is the value when `USB_CFG_DISABLE` is specified to `USB_CFG_PARAM_CHECKING` definition in `r_usb_basic_config.h` file.
5. The RAM size is the value when 8 (numeric value) is specified to `USB_CFG_PMSC_TRANS_COUNT` definition in `r_usb_pmsc_config.h` file.

### 3.8 Argument

For the structure used in the argument of API function, refer to chapter "Structures" in the document (Document number: R01AN0512) for USB Basic Host and Peripheral Driver Application Note.
4. Class Driver Overview

4.1 Class Request

The following lists the class requests supported by this driver.

<table>
<thead>
<tr>
<th>Request</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bulk-Only Mass Storage Reset</td>
<td>0xFF</td>
<td>Resets the connection interface to the mass storage device.</td>
</tr>
<tr>
<td>Get Max Lun</td>
<td>0xFE</td>
<td>Reports the logical numbers supported by the device.</td>
</tr>
</tbody>
</table>

4.2 Storage Commands

The following lists the storage commands supported by this driver. This driver send the STALL or FAIL error (CSW) to USB HOST when receiving other than the following command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEST_UNIT_READY</td>
<td>0x00</td>
<td>Checks the state of the peripheral device.</td>
</tr>
<tr>
<td>REQUESTSENSE</td>
<td>0x03</td>
<td>Gets the error information of the previous storage command execution result.</td>
</tr>
<tr>
<td>INQUIRY</td>
<td>0x12</td>
<td>Gets the parameter information of the logical unit.</td>
</tr>
<tr>
<td>READ_FORMAT_CAPACITY</td>
<td>0x23</td>
<td>Gets the formattable capacity.</td>
</tr>
<tr>
<td>READ_CAPACITY</td>
<td>0x25</td>
<td>Gets the capacity information of the logical unit.</td>
</tr>
<tr>
<td>READ10</td>
<td>0x28</td>
<td>Reads data.</td>
</tr>
<tr>
<td>WRITE10</td>
<td>0x2A</td>
<td>Writes data.</td>
</tr>
<tr>
<td>MODE SENSE10</td>
<td>0x5A</td>
<td>Gets the parameters of the logical unit.</td>
</tr>
</tbody>
</table>
5. Peripheral Device Class Driver (PDCD)

5.1 Basic Functions

The functions of PDCD are to:
1. Supporting SFF-8070i (ATAPI)
2. Respond to mass storage class requests from USB host.
3. Respond to USB host storage commands which are encapsulated in the BOT protocol (Bulk Only Transport), see below.

5.2 BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that, encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a “Command Block Wrapper” (CBW) and a “Command Status Wrapper” (CSW). The following shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

![BOT protocol Overview](image-url)

Figure 5-1 BOT protocol Overview
Command and status flow between USB host and peripheral.
6. API Functions

For API used in the application program, refer to chapter "API Functions" in the document (Document number: R01AN0512) for *USB Basic Host and Peripheral Driver Application Note*. 
7. Configuration (r_usb_pmsc_config.h)

Please set the following according to your system.

Note:

Be sure to set r_usb_basic_config.h file as well. For r_usb_basic_config.h file, refer to chapter "Configuration" in the document (Document number: R01AN0512) for USB Basic Host and Peripheral Driver Application Note.

1. Setting pipe to be used

Set the pipe number (PIPE1 to PIPE5) to use for Bulk IN/OUT transfer. Do not set the same pipe number for the definitions of USB_CFG_PMSC_BULK_IN and USB_CFG_PMSC_BULK_OUT.

```
#define USB_CFG_PMSC_BULK_IN Pipe number (USB_PIPE1 to USB_PIPE5)
#define USB_CFG_PMSC_BULK_OUT Pipe number (USB_PIPE1 to USB_PIPE5)
```

2. Setting the response data for Inquiry command

This driver sends the data specified in the following definitions to the USB Host as the response data of Inquiry command.

(1). Setting Vendor Information

Specify the vendor information which is response data of Inquiry command. Be sure to enclose data of 8 bytes with double quotation marks.

```
#define USB_CFG_PMSC_VENDOR Vendor Information
e.g.)
#define USB_CFG_PMSC_VENDOR "Renesas"
```

(2). Setting Product Information

Specify the product information which is response data of Inquiry command. Be sure to enclose data of 16 bytes with double quotation marks.

```
#define USB_CFG_PMSC_PRODUCT Product Information
e.g.)
#define USB_CFG_PMSC_PRODUCT "Mass Storage"
```

(3). Setting Product Revision Level

Specify the product revision level which is response data of Inquiry command. Be sure to enclose data of 4 bytes with double quotation marks.

```
#define USB_CFG_PMSC_REVISION Product Information
e.g.)
#define USB_CFG_PMSC_REVISION "1.00"
```

3. Setting the number of transfer sector

Specify the maximum sector size to request to PCD (Peripheral Control Driver) at one data transfer. This driver specifies the value of "1 sector (512) × USB_CFG_PMSC_TRANS_COUNT" bytes to PCD as the transfer size. By increasing this value, the number of data transfer requests to the PCD decreases, so the transfer speed performance may be improved. However, note that "1 sector (512) × USB_CFG_PMSC_TRANS_COUNT" bytes of RAM will be consumed.

```
#define USB_CFG_PMSC_TRANS_COUNT Number of transfer sectors (1 to 255)
e.g.)
#define USB_CFG_PMSC_TRANS_COUNT 4
```
8. Media Driver Interface

PMSC uses a common media driver API function to access to the media drivers with different specifications.

8.1 Overview of Media Driver API Functions

Media driver API functions are called by the PMSC and the API functions call the media driver function implemented by the user. This chapter explains the prototype of the media driver API function and the processing necessary for implementing each function.

Table 8-1 shows the list of the media driver API functions.

<table>
<thead>
<tr>
<th>Media Driver API</th>
<th>Processing Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>R_USB_media_initialize</td>
<td>Initializes the media driver.</td>
</tr>
<tr>
<td>R_USB_media_open</td>
<td>Opens the media driver.</td>
</tr>
<tr>
<td>R_USB_media_close</td>
<td>Closes the media driver.</td>
</tr>
<tr>
<td>R_USB_media_read</td>
<td>Reads from the media.</td>
</tr>
<tr>
<td>R_USB_media_write</td>
<td>Writes to the media.</td>
</tr>
<tr>
<td>R_USB_media_ioctl</td>
<td>Processing the control instructions specific to the media device.</td>
</tr>
</tbody>
</table>
8.1.1  R_USB_media_initialize

Register the media driver function to the media driver

Format

    bool R_USB_media_initialize(media_driver_t * p_media_driver);

Arguments

    p_media_driver  Point to the structure area for the media driver

Return Value

    TRUE          Successfully completed
    FALSE         Error generated

Description

This API registers the media driver function implemented by the user to the media driver. Be sure to call this API at the initialization processing etc in the user application program.

Note

1. The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.
2. For how to register of the media driver function implemented by the user, refer to the chapter 8.3, Registration of the storage media driver.
3. This API does not do the media device initialization processing and does not do the starting operation processing of the media device. These processing is done by R_USB_media_open function.
4. PMSC does not support the function to register the multiple type media driver function.

Example

    if (!R_USB_media_initialize(&g_ram_mediadriver))
    {
        /* Handle the error */
    }
    result = R_USB_media_open();
    if (USB_MEDIA_RET_OK != result)
    {
        /* Process the error */
    }
8.1.2 R_USB_media_open

Initialize the media driver and the media device

Format

```
usb_media_ret_t R_USB_media_open(void);
```

Arguments

--

Return Value

- `USB_MEDIA_RET_OK` Successfully completed
- `USB_MEDIA_RET_PARAERR` Parameter error
- `USB_MEDIA_RET_DEV_OPEN` The device was already opened
- `USB_MEDIA_RET_NOTRDY` The device is not responding or not present
- `USB_MEDIA_RET_OP_FAIL` Any other failure

Description

This API initializes the media device and the media driver and make the media device and the media driver the ready status. Be sure to call this API at the initialization processing etc in the user application program.

Note

1. `R_USB_media_initialize` function has to be called before calling this API.
2. The number of calls this API is only once unless `R_USB_media_close` is called. After calling `R_USB_media_close` function, this API can be called again to return the device to the initial state.
3. The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.

Example

```
if (!R_USB_media_initialize(&g_ram_mediatedriver))
{
    /* Handle the error */
}

result = R_USB_media_open();
if (USB_MEDIA_RET_OK != result)
{
    /* Process the error */
}
```
8.1.3  R_USB_media_close

Release the resource for the media driver and return the media device to the non active state.

Format

    usb_media_ret_t    R_USB_media_close(void);

Arguments

    --

Return Value

    USB_MEDIA_RET_OK        Successfully completed
    USB_MEDIA_RET_PARAERR   Parameter error
    USB_MEDIA_RET_OP_FAIL   Any other failure

Description

This API releases the resource for the media driver and return the media device to the non active state.

Note

1.  _R_USB_media_initialize_ function has to be called before calling this API.
2.  The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.

Example

    result = R_USB_media_close();
    if (USB_MEDIA_RET_OK != result)
        { /* Process the error */
        }
### 8.1.4 R_USB_media_read

Read the data blocks from the media device

**Format**

```c
usb_media_ret_t R_USB_media_read(uint8_t *p_buf, uint32_t lba, uint8_t count);
```

**Argument**

- **p_buf**: Pointer to the area to store the read data from the media device
- **lba**: Read start logical block address
- **count**: Number of read block (Number of sector)

**Return Value**

- **USB_MEDIA_RET_OK**: Successfully completed
- **USB_MEDIA_RET_PARAERR**: Parameter error
- **USB_MEDIA_RET_NOTRDY**: The device is not ready state
- **USB_MEDIA_RET_OP_FAIL**: Any other failure

**Description**

This API reads the data blocks from the media device. (Read the data blocks for the number of blocks specified by the third argument (`count`) from the LBA (Logical Block Address) specified by the second argument.) The read data is stored in the specified area by the first argument (`p_buf`).

**Note**

1. The `R_USB_media_initialize` function has to be called before calling this API.
2. The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.

**Example**

```c
cresult = R_USB_media_read(&buffer, lba, 1);
if (USB_MEDIA_RET_OK != result)
{
    /* Process the error */
}
```
8.1.5 R_USB_media_write

Write the data block to the media device

Format

\[
\text{usb_media_ret_t R_USB_media_write(uint8_t *p_buf, uint32_t lba, uint8_t count);}
\]

Arguments

- `p_buf`: Pointer to the area where data to be written to the media device is stored
- `lba`: Write start logical block address
- `count`: Number of write blocks (Number of sector)

Return Value

- `USB_MEDIA_RET_OK`: Successfully completed
- `USB_MEDIA_RET_PARAERR`: Parameter error
- `USB_MEDIA_RET_NOTRDY`: The device is not ready state
- `USB_MEDIA_RET_OP_FAIL`: Any other failure

Description

This API writes the data blocks to the media device. (Write the data blocks for the number of blocks specified by the third argument (`count`) to the LBA (Logical Block Address) specified by the second argument.) Store the write data in the area specified by the first argument (`p_buf`).

Note

1. `R_USB_media_initialize` function has to be called before calling this API.
2. The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.

Example

```c
result = R_USB_media_write(&buffer, lba, 1);
if (MEDIA_RET_OK != result)
{
    /* Process the error */
}
```
8.1.6  R_USB_media_ioctl

Get the information of the media driver etc

Format

```c
    usb_media_ret_t   R_USB_media_ioctl(iocctl_cmd_t command, void *p_data);
```

Arguments

- `command` - Command code
- `p_data` - Pointer to the area to store the media information

Return Value

- `USB_MEDIA_RET_OK` - Successfully completed
- `USB_MEDIA_RET_PARAERR` - Parameter error
- `USB_MEDIA_RET_NOTRDY` - The device is not ready state
- `USB_MEDIA_RET_OP_FAIL` - Any other failure

Description

This API gets the return information from the media driver by specifying the media driver specific command. PMSC uses the following commands as the command code to the media driver.

- `MEDIA_IOCTL_GET_NUM_BLOCKS` - Number of block for the media area
- `MEDIA_IOCTL_GET_BLOCK_SIZE` - 1 block size

Note

1. `R_USB_media_initialize` function has to be called before calling this API.
2. The user can redefine the command code specified in the argument(command) newly.
3. The user needs to implement the media driver function based on the contents described in the above "Arguments", "Return Value" and "Description" etc.

Example

```c
    uint32_t num_blocks;
    uint32_t block_size;
    uint64_t capacity;

    result = R_USB_media_ioctl(MEDIA_IOCTL_GET_NUM_BLOCKS, (void *)&num_blocks);
    result = R_USB_media_ioctl(MEDIA_IOCTL_GET_BLOCK_SIZE, (void *)&block_size);
    capacity = (uint64_t)block_size * (uint64_t)num_blocks;
```
8.2 Structure / Enum type definition

The following shows the structure and enum type used by the media driver API. These are defined in `r_usb_media_driver_if.h` file.

8.2.1 usb_media_driver_t (Structure)

`usb_media_driver_t` is the structure to hold the pointer to the media driver function implemented by the user. The following shows `usb_media_driver_t` structure.

```c
typedef struct media_driver_t {
    usb_media_open_t pf_media_open; /* Pointer to the open function */
    usb_media_close_t pf_media_close; /* Pointer to the close function */
    usb_media_read_t pf_media_read; /* Pointer to the read function */
    usb_media_write_t pf_media_write; /* Pointer to the write function */
    usb_media_ioctl_t pf_media_ioctl; /* Pointer to the control function */
} usb_media_driver_t
```

8.2.2 usb_media_ret_t (Enum)

The return value is defined in `usb_media_ret_t` (Enum).

```c
typedef enum {
    USB_MEDIA_RET_OK = 0, /* Successfully Completed */
    USB_MEDIA_RET_NOTRDY, /* The device is not ready state */
    USB_MEDIA_RET_PARERR, /* Parameter error */
    USB_MEDIA_RET_OP_FAIL, /* Any other failure */
    USB_MEDIA_RET_DEV_OPEN, /* The device was already opened */
} usb_media_ret_t
```

8.2.3 ioctl_cmd_t (Enum)

The command code specified in the argument of the `R_USB_media_ioctl` function is defined in `ioctl_cmd_t` (Enum).

```c
typedef enum {
    USB_MEDIA_IOCTL_GET_NUM_BLOCKS, /* Get the number of the logical block */
    USB_MEDIA_IOCTL_GET_BLOCK_SIZE, /* Get the logical block size */
} ioctl_cmd_t
```

Note:

Please add the command code in the `ioctl_cmd_t` when adding the user own command code.

8.3 Registration of the storage media driver

To change the PMSC’s storage media from RAM to something else, such as flash memory, the user has to implement media driver functions to handle reading from and writing to the new storage media and register them to the media driver API functions.

The example below shows the procedure for changing from RAM media to serial SPI flash.

1. Creating Media Driver Functions

Assume that the following functions are implemented by the user as media driver functions for serial SPI flash.

```c
1. usb_media_ret_t  spi_flash_open (void)
2. usb_media_ret_t  spi_flash_close (void)
3. usb_media_ret_t  spi_flash_read(uint8_t *p_buf,uint32_t lba,uint8_t count)
4. usb_media_ret_t  spi_flash_write(uint8_t *p_buf,uint32_t lba,uint8_t count)
```
5. \texttt{usb_media_ret_t \ spi_flash_ioctl(ioctl_cmd_t \ ioctl_cmd,void * \ ioctl_data)}

2. **Registering the Media Driver Functions with the Media API**

   (1). Define the structure \texttt{usb_media_driver_t} for the serial SPI flash. As the members of this structure, specify pointers to the relevant media driver functions.

   \begin{verbatim}
   struct media_driver_t g_spi_flash_media_driver =
   {
     &spi_flash_open,
     &spi_flash_close,
     &spi_flash_read,
     &spi_flash_write,
     &spi_flash_ioctl
   };
   \end{verbatim}

   (2). In the application program, specify the pointer to \texttt{usb_media_driver_t} structure to the argument in \texttt{R_USB_media_initialize} function (API), and perform initialization processing.

   \begin{verbatim}
   == Application Program ==
   R_USB_media_initialize(& g_spi_flash_media_driver);
   \end{verbatim}

   The serial SPI flash function is registered as the media driver function called by the media driver by doing the above order.
8.4 Implementation of the storage media driver
The user needs to implement the media driver function for controlling the storage media to be used.
The implemented media driver function is called from PMSC via the API described in chapter 8.1, Overview of Media Driver API Functions from PMSC.

Note:
For the necessary processing to implement the media driver function, refer to each API specification described in chapter 8.1, Overview of Media Driver API Functions.

8.5 Prototype Declaration of Media Driver function
The following shows the prototype declaration of the media driver function.

1. `usb_media_ret_t (*media_open_t) (uint8_t);` /* Open function type */
2. `usb_media_ret_t (*media_close_t)(uint8_t);` /* Close function type */
3. `usb_media_ret_t (*media_read_t)(uint8_t, uint8_t*, uint32_t, uint8_t);` /* Read function type */
4. `usb_media_ret_t (*media_write_t)(uint8_t, uint8_t*, uint32_t, uint8_t);` /* Write function type */
5. `usb_media_ret_t (*media_ioctl_t)(uint8_t, ioctl_cmd_t, void *);` /* Control function type */
9. Sample Application

9.1 Application Specification

The PMSC sample application (APL) runs on the RSK. When the RSK is connected to the host PC it is recognized as a removable disk, and data transfers, such as reading and writing files, can be performed.

Figure 9-1 shows an example PMSC operating environment, and Figure 9-2 shows a PMSC operation example.
9.1.1 Media Area on Removable Disk

The APL uses the SDRAM or Internal RAM area on the RSK as the media area of a removable disk.

![PMSC Operation Example](image)

Figure 9-2 PMSC Operation Example
9.2 Application Processing

The application comprises two parts: initial settings and main loop.

Initial setting : Makes MCU pin settings, initializes the USB controller, and initializes the USB driver.

Main loop : Calls R_USB_GetEvent function in the loop. If a Suspend request is received from the USB host or the USB host is detached while the loop is being processed, the APL transitions the MSC device (RSK) to low-power mode. For details of low-power mode, see 9.3, MCU Low power consumption processing.

PMSC controls processing by a mass storage class driver (MSCD) and mass storage device driver (MSDD) in response to requests from the USB host (PC). Therefore, the PMSC APL does not perform any processing on data transferred from the host. Aside from initialization processing, the only thing performed within the loop is calling the R_USB_GetEvent function. The APL does not write files to or read files from the PMSC storage area; this processing is all performed by the PMSC USB driver.

Note:

1. For a list of the storage commands supported by the PMSC, see 4.2, Storage Commands.
2. Make sure to call the R_USB_GetEvent function from within the application program loop processing.

An overview of the processing performed by the APL is shown below:

![APL Processing Overview Diagram]

Figure 9-3 APL Processing Overview
9.3 MCU Low power consumption processing

MCU low-power processing occurs when the conditions in Table 9-1 are met, causing a transition to low-power mode. Note that this processing is enabled by setting the USE_LPW definition in the r_usb_pmsc_apl_config.h file to USE_LPW.

<table>
<thead>
<tr>
<th>Transition Condition</th>
<th>Transition Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>VBUS</td>
<td>Software standby mode</td>
</tr>
<tr>
<td>OFF</td>
<td>Suspend Configured</td>
</tr>
<tr>
<td>ON</td>
<td>Sleep mode</td>
</tr>
<tr>
<td>ON</td>
<td>Normal mode (program running)</td>
</tr>
</tbody>
</table>

(1). When the MSC device (RSK) detaches from the USB host (VBUS OFF), the APL performs processing to transition the MCU to software standby mode. Recovery from software standby mode occurs when the MSC device (RSK) attaches to the USB host.

(2). When a suspend signal sent by the USB host is received while the MSC device (RSK) is connected to the USB host, the APL performs processing to transition the MCU to sleep mode. Note that recovery from sleep mode occurs when a resume signal is received from the USB host.

![Flowchart of MCU Low Power Consumption Processing](image_url)

Figure 9-4 Flowchart of MCU Low Power Consumption Processing
9.4 Configuration File for the application program (r_usb_pmsc_apl_config.h)

Make settings for the definitions listed below.

1. **USE_USBIP Definition**
   Specify the module number of the USB module you are using. Specify one of the following settings for the USE_USBIP definition.
   
   ```
   #define USE_USBIP 0  // Specify USB_IP0.
   #define USE_USBIP 1  // Specify USB_IP1.
   ```

   **[Note]**
   Specify `USE_USBIP0` when using RX63T or RX630.

2. **USB_SUPPORT_SPEED Definition**
   Specify the USB operation speed (Full-speed) which MSC device (RSK) supports.
   
   ```
   #define USB_SUPPORT_SPEED FULL_SPEED  // Full-Speed setting
   ```

3. **Low-Power Function Definition**
   Specify whether or not the low-power function will be used. If the low-power function will be used, specify `USB_APL_DISABLE` to `USB_SUPPORT_LPW` definition.
   
   ```
   #define USB_SUPPORT_LPW 0  USB_APL_DISABLE  // No use the low-power function
   #define USB_SUPPORT_LPW 1  USB_APL_ENABLE   // Use the low-power function
   ```

4. **Note**
   The above configuration settings apply to the application program. USB driver configuration settings are required in addition to the above settings. For information on USB driver configuration settings, refer to *USB Basic Host and Peripheral Driver Application Note* (Document number: R01AN0512EJ).

9.5 **Descriptor**

The PMSC’s descriptor information is contained in `r_usb_pmsc_descriptor.c`. Also, please be sure to use your vendor ID.
10. Setup

10.1 Hardware

10.1.1 Example Operating Environment

Figure 10-1 shows an example operating environment for the PMSC. Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

![Diagram of Example Operating Environment]

**Figure 10-1 Example Operating Environment**

Note:

1. PC environment setting

   No special settings are required on the USB host PC so long as it is running Microsoft Windows 7 or later.
10.1.2 RSK Setting

It is necessary to set RSK to operate in the host mode. Please refer to the following.

<table>
<thead>
<tr>
<th>RSK</th>
<th>Jumper Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSK+RX63N</td>
<td>J3: Shorted Pin1-2</td>
</tr>
<tr>
<td></td>
<td>J4: Shorted Pin1-2</td>
</tr>
<tr>
<td></td>
<td>J18: Shorted Pin2-3</td>
</tr>
</tbody>
</table>

Note:
For the detail of RSK setting, refer to the user's manual of RSK.
10.2 Software

(1). Setup e² studio

a) Start e² studio

b) If you start up e² studio at first, the following dialog is displayed. Specify the folder to store the project in this dialog.

![Select a directory as workspace](image)

(2). Import the project to the workspace

a) Select [File] > [Import]

b) Select [General] => [Existing Projects into Workspace]
c) Select the root directory of the project, that is, the folder containing the "cproject" file.

![Import Projects Dialog](image)

- Click "Finish".
  
  You have now imported the project into the workspace. Note that you can import other projects into the same workspace.

(3). Generate the binary target program by clicking the "Build" button.

(4). Connect the target board to the debug tool and download the executable. The target is run by clicking the "Run" button.
11. Creating an Application

Refer to the chapter “Creating an Application Program” in the document (Document number: R01AN0512) for USB Basic Host and Peripheral Driver Application Note.

Note:

Be sure to call \texttt{R\_USB\_media\_initialize} function (API) and \texttt{R\_USB\_media\_open} function (API) at the initialize processing etc in the user application program.
12. Using the e² studio project with CS+

The PMSC contains a project only for e² studio. When you use the PMSC with CS+, import the project to CS+ by following procedures.

Note:

Uncheck the checkbox Backup the project composition files after conversion in Project Convert Settings window.

![Using the e² studio project with CS+](image)

**Figure 12-1 Using the e² studio project with CS+**

Launch CS+ and click “Start”.
Select [Open Existing e²studio/CS/High-performance Embedded Workshop/PM+ project] in Start menu.

Select the used project

- e.g. Sample

The project name depends on the AN.

Select the file with the extension [.rcpc] and click Open button.

Select the device used in the project.

Select Project type, and specify the project name and its location.
Click OK button if they are OK.

# General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Handling of Unused Pins</td>
<td>Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.</td>
</tr>
<tr>
<td></td>
<td>The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.</td>
</tr>
<tr>
<td>2. Processing at Power-on</td>
<td>The state of the product is undefined at the moment when power is supplied.</td>
</tr>
<tr>
<td></td>
<td>The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.</td>
</tr>
<tr>
<td></td>
<td>In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.</td>
</tr>
<tr>
<td></td>
<td>In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.</td>
</tr>
<tr>
<td>3. Prohibition of Access to Reserved Addresses</td>
<td>Access to reserved addresses is prohibited.</td>
</tr>
<tr>
<td></td>
<td>The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.</td>
</tr>
<tr>
<td>4. Clock Signals</td>
<td>After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.</td>
</tr>
<tr>
<td></td>
<td>When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.</td>
</tr>
<tr>
<td>5. Differences between Products</td>
<td>Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.</td>
</tr>
<tr>
<td></td>
<td>The characteristics of Microprocessing unit or Microcontroller unit products in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.</td>
</tr>

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

5. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality.” The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.

- “Standard”: Computers, office equipment, communications equipment, test and measurement equipment, audio and visual equipment, home electronic appliances, machine tools, personal electronic equipment, industrial robots, etc.
- “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implants; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics documentation.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Silicon Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified conditions.

7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations.

9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
