

Description

The 5X1503 is a series of small form factor programmable clock generators intended for low-power, consumer, battery powered applications, wearable and smart devices.

The device is a 1 PLL + DCO architecture design with one embedded crystal. The device is OTP programmable, allowing for up to 3 unique frequency outputs. The 5X1503 has built-in unique features such as Proactive Power Saving (PPS) and a low power DCO to support system date/time keeping clock at 32.768kHz. Dynamic Frequency Control (DFC) supports dynamically changing between four different PLL frequencies via external requests with controlled frequency changes, reducing frequency overshoot and undershoot (ORT). The 5X1503S device can also support a spread clock for EMI reduction. For a description of terms and their functions, see [Glossary of Features](#).

An internal OTP memory allows the user to store up to four independent configurations that can be loaded on power-up without programming. It can then be reprogrammed again through the I²C interface.

The 5X1503 supports three LVCMOS type outputs. Two outputs have programmable amplitude. A low-power 32.768kHz clock is supported with only less than 1.5μA current consumption for system RTC reference clock needs.

5X1503 Base Number	Description	VCO Range (MHz)
5X1503	Standard, Integrated Crystal	50 – 130
5X1503L	Ultra Low-power, Integrated Crystal	50 – 130
5X1503S	Spread Clock, Integrated Crystal	500 – 1100

Typical Applications

- SmartDevice
- Handheld
- Wearable applications
- Portable Consumer applications

Features

- Proactive Power Saving (PPS) features save power during the end device power-down mode
- Dynamic Frequency Control (DFC) feature allows programming up to 4 difference frequencies that switch dynamically
- Programmable output clock amplitude (1V, 1.1V, 1.2V and 1.8V) to support low swing clock requirement
- Dedicated 32kHz output with 6 clock amplitude options (5X1503L)
- Integrated crystal; no external input source requirement
- Configurable through I2C or OTP programming
- Spread spectrum clock support (5X1503S)
- 1.8V operating supply voltage
- 2 × 2 mm 10-VFQFPN package

Output Features

- 3 LVCMOS outputs, 1MHz–100MHz or 32.768kHz
- Low-power 32.768kHz clock supported

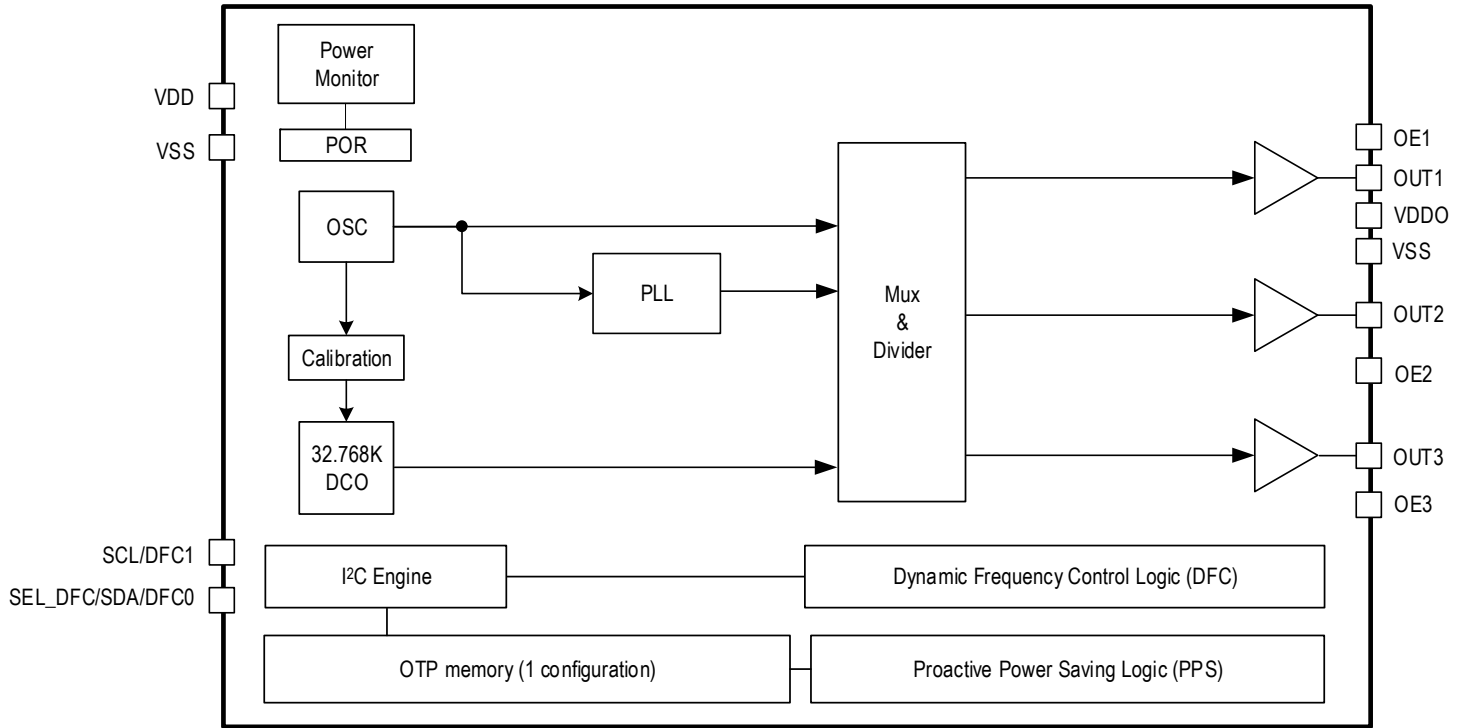

Key Specifications

- Output cycle-cycle jitter: 50ps (typ)
- Low power-on fully active mode: 2mA (typ)
- Low-power 32.768kHz < 1.0μA (5X1503L)

Pin Descriptions

Table 1. Pin Descriptions

Number	Name	Type	Description
1	SCL/DFC1	Input	I2C clock pin/dynamic frequency input pin.
2	SEL_DFC /SDA/DFC0	I/O	Functional selection pin/I2C data pin/dynamic frequency input pin. 0 = HW mode; 0 = I2C mode.
3	OE1	Input	OUT1 output enable pin. The pin can be configured to other functions (DFC and PPS).
4	OUT1	Output	Programmable LVCMOS clock output (32.768kHz only on 5X1503L).
5	VDD	Power	1.8V power supply for core, PLL, and 32kHz DCO.
6	VSS	GND	Connect to ground.
7	OUT3	Output	Programmable LVCMOS clock output.
8	VDDO	Power	1.8V power supply for I/O.
9	OE2	Input	OUT2 output enable pin. The pin can be configured to other functions (DFC and PPS).
10	OUT2	Output	Programmable LVCMOS clock output.

Device Feature and Function

DFC – Dynamic Frequency Control

- OTP programmable—4 different feedback fractional dividers (4 VCO frequencies) that apply to PLL.
- ORT (overshoot reduction) function will be applied automatically during the VCO frequency change.
- Smooth frequency incremental or decremental from current VCO to targeted VCO based on DFC hardware pins selection.

DFC Function Programming

- Register B0b1:0 – select DFC00–DFC11 configuration.
- Byte5–8 are the registers for PLL VCO setting. Based on B0b1:0 configuration selection, the data write to B5–8 will be stored in selected configuration OTP memory.
- Refer to [DFC Function Priority](#) table. Select proper control pin(s) to activate DFC function.
- Note the DFC function can also be controlled by I2C access.

PPS – Proactive Power Saving Function

PPS (Proactive Power Saving) is an IDT patented unique design for the clock generator that proactively detects end device power down state and then switches output clocks between normal operation clock frequency and low power mode 32kHz clock that only consumes < 1.5µA current. The system could save power when the device goes into power down or sleep mode. The PPS function diagram is shown as below.

Figure 3. PPS Function Block Diagram

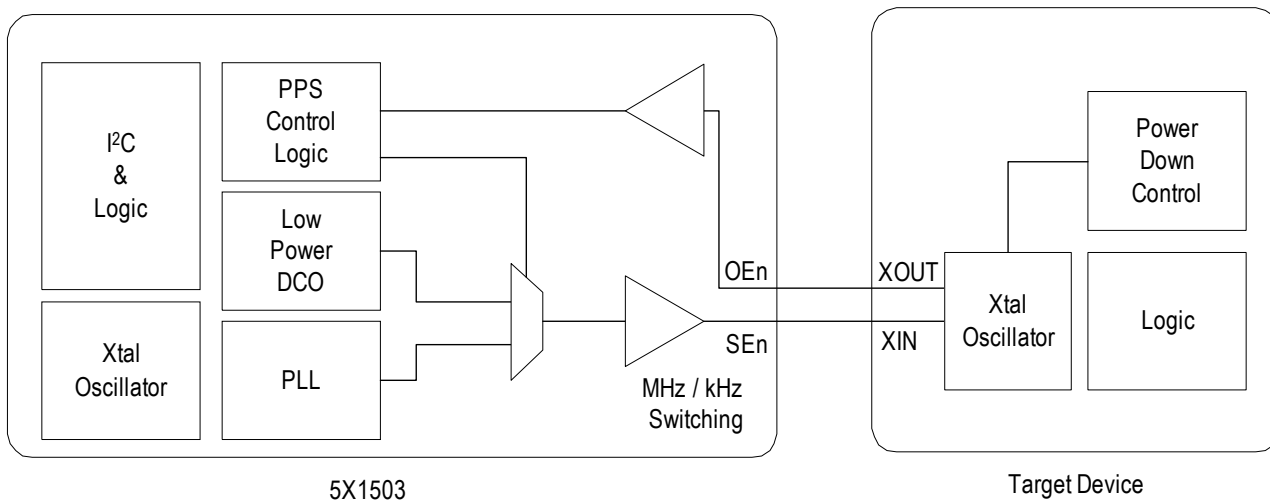

Figure 4. PPS Assertion/Deassertion Timing Chart

PPS Function Programming

- Refer to the [OE Pin Function](#) table to have proper PPS function selected for OE pin(s). Note that the register default is set to Output Enable (OE) function for OE pins.
- Have proper setup to Byte 16 for OE1–OE2 function selection. For PPS function, select 10 to control register bits.

Note: Config_SEL and DFC Control require the device to be in H/W mode with no I2C access

Table 5. OE Pin Function Summary

Pin	Function
OE1: OUT1	OE1 only control OUT1 enable/disable, other outputs are not affected by this pin status.
OE2: OUT2	OE2 only control OUT2 enable/disable, other outputs are not affected by this pin status.
OE1: PD#	OE1 control chip global power down (PD#) except 32.768kHz on OE1 (when 32K is enabled), When the PD# pin is active low, the chip goes to lowest power down mode and all outputs are disabled except 32kHz output and only keep 32k/Xtal calibration.
OE1: OUT1_PPS	Config OE1 as OUT1_PPS (Proactive Power Saving) function pin.
OE2: OUT2_PPS	Config OE2 as OUT2_PPS (Proactive Power Saving) function pin.
OE1:DFC0	Config OE1 as DFC0 control pin 0.
OE2:DFC1	Config OE2 as DFC1 control pin 1.

Spread Spectrum

Spread Spectrum

The 5X1503 supports spread spectrum clocks from PLL with digital spread spectrum.

Digital Spread Spectrum

Figure 5. Digital Spread Spectrum

Down spread or spread off

$$N = F_{vco}/F_{pfd}$$

N: include integer and fraction

Fvco: VCOs frequency

Fpfd: PLLs pfd frequency

Fss: spread modulation rate

SSamount: spread percentage

N will decrease to make the center frequency lower than spread off.

Example: 0.5% down spread at 32kHz modulation rate.

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5X1503. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Table 7. Absolute Maximum Ratings

How to Read

- Controller (host) will send a start bit
- Controller (host) sends the write address
- IDT clock will acknowledge
- Controller (host) sends the beginning byte location = N
- IDT clock will acknowledge
- Controller (host) will send a separate start bit
- Controller (host) sends the read address
- IDT clock will acknowledge
- IDT clock will send the data byte count = X
- IDT clock sends Byte N+X-1
- IDT clock sends Byte 0 through Byte X (if $X_{(H)}$ was written to Byte 8)
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Glossary of Features

Table 17. Glossary of Features

Term	Function Description	Apply to
DFC	Dynamic Frequency Control from selected PLL (TBD) to support two VCO frequencies—two different output frequencies by assigning H/W pin state changes (H-L or L-H). Needs to have frequency change Glitch-free function in order to not crash application system.	All
ORT	Overshoot Reduction Technology—when the PLL performs VCO frequency changes by DFC, or manually programming, the VCO changes frequencies smoothly to target frequency without overshoot or undershoot.	All
OE	Output Enable function. High active. Each output can be controlled by assigned OE pin and the dedicated OE pin can be OTP programmable as Global Power Down function (PD#) or Output enable (OE) or proactive power saving function (PPS).	All
PCT	Programmable Calibration Time, for 32K DCO, the programmable calibration time will help power saving or output accuracy adjustments.	All
Glitch-free	The output clock should not have short pulses that will kill the application system, the output frequency switch (based on DFC) should has glitch free function.	All
SS	Spread Spectrum Clock	5X1503S
PPS	Proactive Power Saving. Utilizes OE pin as monitor pin for end device X2 clock status. See PPS – Proactive Power Saving Function description for details.	All

Marking Diagrams

5X1503

- Line 1 is the truncated part number and indicates the following:
 - “D” denotes 5X1503; “xxx” denotes dash code.
 - “E” denotes 5X1503L; “xxx” denotes dash code.
 - “F” denotes 5X1503S; “xxx” denotes dash code.
- Line 2 indicates the following:
 - “YW” is the last digit of the year and work week the part was assembled.
 - “**” denotes sequential lot number.
