

## Description

The 5X2503 MicroClock is a programmable clock generator and is intended for low-power, consumer, wearable and smart devices.

The 5X2503 device is a 3 PLL architecture design. Each PLL is individually programmable, allowing for up to 3 unique frequency outputs. The 5X2503 has built-in unique features such as Proactive Power Saving (PPS) to deliver better system-level power management.

An internal OTP memory allows the user to store the configuration in the device without programming after power up. It can then be reprogrammed again through the I<sup>2</sup>C interface.

The device has programmable VCO and PLL source selection allowing the user to do power-performance optimization based on the application requirements. A low-power 32.768kHz clock is supported with only less than 2μA current consumption for system RTC reference clock needs.

## Typical Applications

- SmartDevice, Handheld, Wearable applications
- Consumer application crystal replacement

## Features

- Configurable OE1 pin function as OE, PPS or DFC control function
- PPS: Proactive Power Saving features save power during the end device power-down mode
- DFC: Dynamic Frequency Control feature allows programming up to 4 difference frequencies that switch dynamically
- Integrated 26MHz crystal; no external input source requirement
- Spread spectrum clock support to lower system EMI
- I<sup>2</sup>C Interface

## Output Features

- 3 LVCMOS outputs, 1MHz–125MHz
- Low-power 32.768kHz clock supported
- Wireless clock crystal integration and fan-out directly

## Key Specifications

- 2μA operation for RTC clock 32.768kHz output
- 2.5 × 2.5 mm 12-DFN with crystal integration; small-form-factor package

## Device Feature and Function

### DFC – Dynamic Frequency Control

- OTP programmable–4 different feedback fractional dividers (4 VCO frequencies) that apply to PLL2.
- ORT (overshoot reduction) function will be applied automatically during the VCO frequency change.
- Smooth frequency incremental or decremental from current VCO to targeted VCO base on DFC hardware pins selection.

\* See OE Pin Function table.

## DFC Function Programming

- Register B63b3:2 selects DFC00–DFC11 configuration.
- Byte16–19 are the registers for PLL2 VCO setting, based on B63b3:2 configuration selection, the data write to B16–19 will be stored in selected configuration OTP memory.
- Refer to *DFC Function Priority* table. Select proper control pin(s) to activate DFC function.
- Note the DFC function can also be controlled by I<sup>2</sup>C access.

## PPS – Proactive Power Saving Function

PPS (Proactive Power Saving) is an IDT patented unique design for the clock generator that proactively detects end device power down state and then switches output clocks between normal operation clock frequency and low power mode 32kHz clock that only consumes < 5μA current. The system could save power when the device goes into power down or sleep mode. The PPS function diagram is shown as below.

Figure 3. PPS Function Block Diagram

Figure 4. PPS Assertion/Deassertion Timing Chart

### PPS Function Programming

Refer to the *OE Pin Function* table to have proper PPS function selected for OE pin(s). Note that the register default is set to Output Enable (OE) function for OE pins.

### Input Pin Function

The input pins in 5X2503 have multiple functions. The OE1 pin can be configured as output enable control (OE) or chip power-down control (PD#) or Proactive Power Saving function (PPS). Furthermore, the OE1 pin can be configured as single or Dynamic Frequency Control (DFC).

SCL/SDA are also multiple function pins. The two pins can be configured as output enable control (OE), or I<sup>2</sup>C interface or Dynamic Frequency Control (DFC) functions by programming and hardware pin latch.

## Spread Spectrum

The 5X2503 supports spread spectrum clocks from PLL1. PLL1 has built-in analog spread spectrum; PLL2 and PLL3 use seed clock from PLL1.

## ORT – VCO Overshoot Reduction Technology

The 5X2503 supports innovate the VCO overshoot reduction technology to prevent the output clock frequency spike when the device is change frequency on the fly or doing DFC (Dynamic Frequency Control) function.

The VCO frequency change are under control instead of free run to targeted frequency.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5X2503. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

## Marking Diagram

1. Line 1 is the truncated part number.
2. "000" denotes dash code.
3. "Y" is the last digit of the year the part was assembled.
4. "\*\*" denotes sequential lot number.

## Revision History

Revision Date	Description of Change
December 18, 2017	Corrected bit setting in Byte 24h, bit 2 from "1" to "0".
November 17, 2017	Updated register tables; Bytes 29, 30 and 32.
October 20, 2017	Initial release.
