

**HIGH-SPEED 3.3V 64K x 36  
SYNCHRONOUS  
BANK-SWITCHABLE  
DUAL-PORT STATIC RAM  
WITH 3.3V OR 2.5V INTERFACE**

**IDT70V7589S**

**Features:**

- ◆ 64K x 36 Synchronous Bank-Switchable Dual-ported SRAM Architecture
  - 64 independent 1K x 36 banks
  - 2 megabits of memory on chip
- ◆ Bank access controlled via bank address pins
- ◆ High-speed data access
  - Commercial: 3.4ns (200MHz)/3.6ns (166MHz)/4.2ns (133MHz) (max.)
  - Industrial: 3.6ns (166MHz)/4.2ns (133MHz) (max.)
- ◆ Selectable Pipelined or Flow-Through output mode
- ◆ Counter enable and repeat features
- ◆ Dual chip enables allow for depth expansion without additional logic
- ◆ Full synchronous operation on both ports
  - 5ns cycle time, 200MHz operation (14Gbps bandwidth)
  - Fast 3.4ns clock to data out

- 1.5ns setup to clock and 0.5ns hold on all control, data, and address inputs @ 200MHz
- Data input, address, byte enable and control registers
- Self-timed write allows fast cycle time
- ◆ Separate byte controls for multiplexed bus and bus matching compatibility
- ◆ LVTTTL-compatible, 3.3V (±150mV) power supply for core
- ◆ LVTTTL compatible, selectable 3.3V (±150mV) or 2.5V (±100mV) power supply for I/Os and control signals on each port
- ◆ Industrial temperature range (-40°C to +85°C) is available at 166MHz and 133MHz
- ◆ Available in a 208-pin Plastic Quad Flatpack (PQFP), 208-pin fine pitch Ball Grid Array (fpBGA), and 256-pin Ball Grid Array (BGA)
- ◆ Supports JTAG features compliant with IEEE 1149.1

**NOTE:**

1. The Bank-Switchable dual-port uses a true SRAM core instead of the traditional dual-port SRAM core. As a result, it has unique operating characteristics. Please refer to the functional description on page 19 for details.

## Description:

The IDT70V7589 is a high-speed 64Kx36 (2Mbit) synchronous Bank-Switchable Dual-Ported SRAM organized into 64 independent 1Kx36 banks. The device has two independent ports with separate control, address, and I/O pins for each port, allowing each port to access any 1Kx36 memory block not already accessed by the other port. Accesses by the ports into specific banks are controlled via the bank address pins under the user's direct control.

Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times. With an input data

register, the IDT70V7589 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by CE0 and CE1, permits the on-chip circuitry of each port to enter a very low standby power mode. The dual chip enables also facilitate depth expansion.

The 70V7589 can support an operating voltage of either 3.3V or 2.5V on one or both ports, controllable by the OPT pins. The power supply for the core of the device (VDD) remains at 3.3V. Please refer also to the functional description on page 19.

### NOTES:

- $V_{DD}$ ,  $OPT_x$ , and  $V_{DDQX}$  must be set to appropriate operating levels prior to applying inputs on the I/Os and controls for that port.
- $OPT_x$  selects the operating voltage levels for the I/Os and controls on that port. If  $OPT_x$  is set to VIH (3.3V), then that port's I/Os and controls will operate at 3.3V levels and  $V_{DDQX}$  must be supplied at 3.3V. If  $OPT_x$  is set to VIL (0V), then that port's I/Os and address controls will operate at 2.5V levels and  $V_{DDQX}$  must be supplied at 2.5V. The  $OPT$  pins are independent of one another—both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.
- When  $\overline{REPEAT}_x$  is asserted, the counter will reset to the last valid address loaded via  $\overline{ADS}_x$ .
- Accesses by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory with the shared array that is not currently being accessed by the opposite port (i.e.,  $BA_{0L}$  -  $BA_{5L} \neq BA_{0R}$  -  $BA_{5R}$ ). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the ports within that bank may be corrupted (in the case that either or both ports are writing) or may result in invalid output (in the case that both ports are trying to read).

## NOTES:

5627 tbl 03

- "H" = V<sub>IH</sub>, "L" = V<sub>IL</sub>, "X" = Don't Care.
- Read and write operations are controlled by the appropriate setting of R/ $\overline{W}$ ,  $\overline{CE}_0$ , CE<sub>1</sub>,  $\overline{BE}_n$  and  $\overline{OE}$ .
- Outputs configured in flow-through output mode: if outputs are in pipelined mode the data out will be delayed by one cycle.
- $\overline{ADS}$  and  $\overline{REPEAT}$  are independent of all other memory control signals including  $\overline{CE}_0$ , CE<sub>1</sub> and  $\overline{BE}_n$ .
- The address counter advances if  $\overline{CNTEN} = V_{IL}$  on the rising edge of CLK, regardless of all other memory control signals including  $\overline{CE}_0$ , CE<sub>1</sub>,  $\overline{BE}_n$ .
- When  $\overline{REPEAT}$  is asserted, the counter will reset to the last valid address loaded via  $\overline{ADS}$ . This value is not set at power-up: a known location should be loaded via  $\overline{ADS}$  during initialization if desired. Any subsequent  $\overline{ADS}$  access during operations will update the  $\overline{REPEAT}$  address location.
- The counter includes bank address and internal address. The counter will advance across bank boundaries. For example, if the counter is in Bank 0, at address FFFh, and is advanced one location, it will move to address 0h in Bank 1. By the same token, the counter at FFFh in Bank 63 will advance to 0h in Bank 0. Refer to Timing Waveform of Counter Repeat, page 18. Care should be taken during operation to avoid having both counters point to the same bank (i.e., ensure BA<sub>0L</sub> - BA<sub>5L</sub> ≠ BA<sub>0R</sub> - BA<sub>5R</sub>), as this condition will invalidate the access for both ports. Please refer to the functional description on page 19 for details.

### NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>DD</sub> + 150mV for more than 25% of the cycle time or 4ns maximum, and is limited to  $\leq$  20mA for the period of V<sub>TERM</sub>  $\geq$  V<sub>DD</sub> + 150mV.

### NOTES:

5627 tbl 11

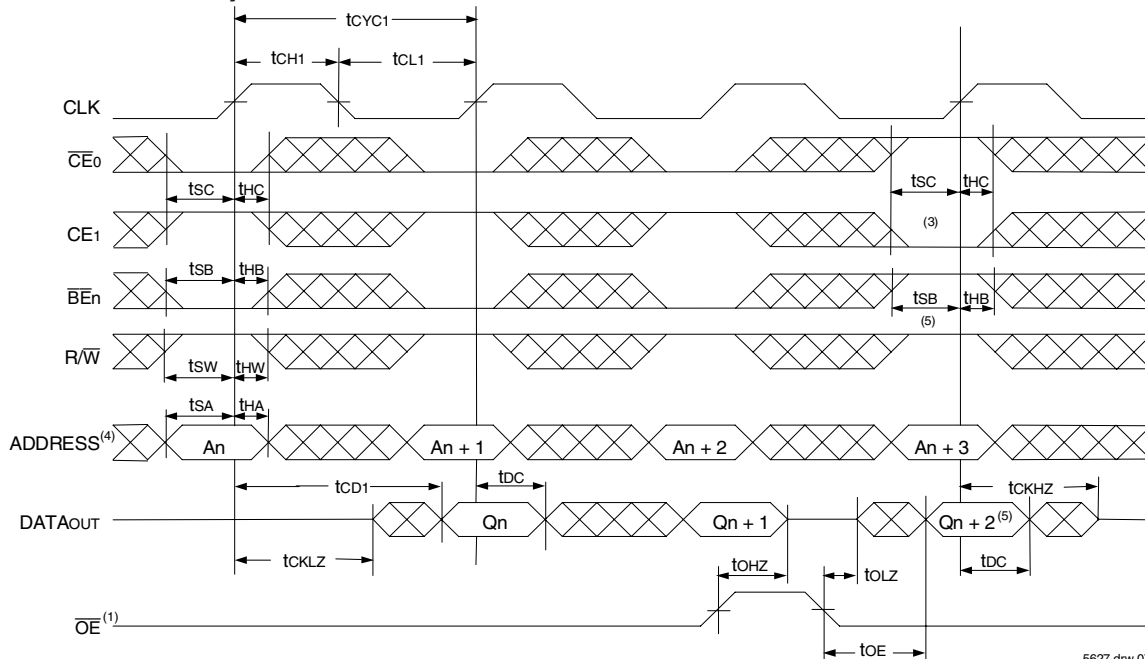

- The Pipelined output parameters (t<sub>CYC2</sub>, t<sub>CD2</sub>) apply to either or both left and right ports when  $\overline{FT}/PIPE_x = V_{IH}$ . Flow-through parameters (t<sub>CYC1</sub>, t<sub>CD1</sub>) apply when  $\overline{FT}/PIPE_x = V_{IL}$  for that port.
- All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ) and  $\overline{FT}/PIPE$ .  $\overline{FT}/PIPE$  should be treated as a DC signal, i.e. steady state during operation.
- These values are valid for either level of  $V_{DD0}$  (3.3V/2.5V). See page 5 for details on selecting the desired operating voltage levels for each port.
- 166MHz Industrial Temperature not available in BF-208 package.

5627 drw 07

### NOTES:

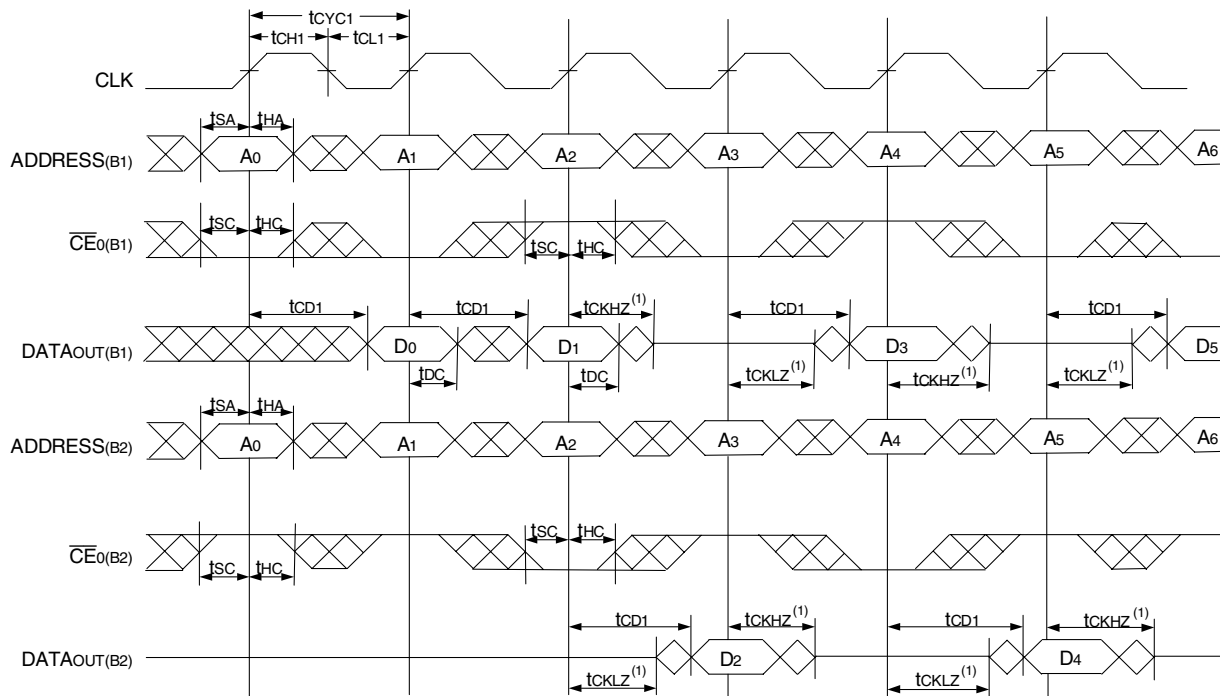

1.  $\overline{OE}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
2.  $\overline{ADS} = V_{IL}$ ,  $\overline{CNTEN}$  and  $\overline{REPEAT} = V_{IH}$ .
3. The output is disabled (High-Impedance state) by  $\overline{CE}_0 = V_{IH}$ ,  $CE_1 = V_{IL}$ ,  $\overline{BE}_n = V_{IH}$  following the next rising edge of the clock. Refer to Truth Table 1.
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. If  $\overline{BE}_n$  was HIGH, then the appropriate Byte of DATAout for  $Q_n + 2$  would be disabled (High-Impedance state).
6. "x" denotes Left or Right port. The diagram is with respect to that port.

### NOTES:

- $\overline{CE}_0$ ,  $\overline{BE}_n$ , and  $R/\overline{W}$  =  $V_{IL}$ ;  $\overline{CE}_1$  and  $\overline{REPEAT}$  =  $V_{IH}$ .
- $\overline{CE}_0$ ,  $\overline{BE}_n$  =  $V_{IL}$ ;  $\overline{CE}_1$  =  $V_{IH}$ .
- The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .
- No dead cycle exists during  $\overline{REPEAT}$  operation. A READ or WRITE cycle may be coincidental with the counter  $\overline{REPEAT}$  cycle: Address loaded by last valid  $\overline{ADS}$  load will be accessed. For more information on  $\overline{REPEAT}$  function refer to Truth Table II.
- $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An + 1'. The transition shown indicates the time required for the counter to advance. The 'An + 1' Address is written to during this cycle.
- The counter includes bank address and internal address. The counter will advance across bank boundaries. For example, if the counter is in Bank 0, at address FFFh, and is advanced one location, it will move to address 0h in Bank 1. By the same token, the counter at FFFh in Bank 63 will advance to 0h in Bank 0.
- For Pipelined Mode user should add 1 cycle latency for outputs as per timing waveform of read cycle for pipelined operations.

## Functional Description

The IDT70V7589 is a high-speed 64Kx36 (2 Mbit) synchronous Bank-Switchable Dual-Ported SRAM organized into 64 independent 1Kx36 banks. Based on a standard SRAM core instead of a traditional true dual-port memory core, this bank-switchable device offers the benefits of increased density and lower cost-per-bit while retaining many of the features of true dual-ports. These features include simultaneous, random access to the shared array, separate clocks per port, 166 MHz operating speed, full-boundary counters, and pinouts compatible with the IDT70V3599 (128Kx36) dual-port family.

The two ports are permitted independent, simultaneous access into separate banks within the shared array. Access by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory with the shared array that is not currently being accessed by the opposite port (i.e., BA0L - BA5L ≠ BA0R - BA5R). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the ports within that bank may be corrupted (in the case that either or both ports are writing) or may result in invalid output (in the case that both ports are trying to read).

The IDT70V7589 provides a true synchronous Dual-Port Static RAM

interface. Registered inputs provide minimal setup and hold times on address, data and all critical control inputs.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

A HIGH on  $\overline{CE}_0$  or a LOW on CE1 for one clock cycle will power down the internal circuitry on each port (individually controlled) to reduce static power consumption. Dual chip enables allow easier banking of multiple IDT70V7589S for depth expansion configurations. Two cycles are required with  $\overline{CE}_0$  LOW and CE1 HIGH to read valid data on the outputs.

## Depth and Width Expansion

The IDT70V7589 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V7589 can also be used in applications requiring expanded width, as indicated in Figure 4. Through combining the control signals, the devices can be grouped as necessary to accommodate applications needing 72-bits or wider.

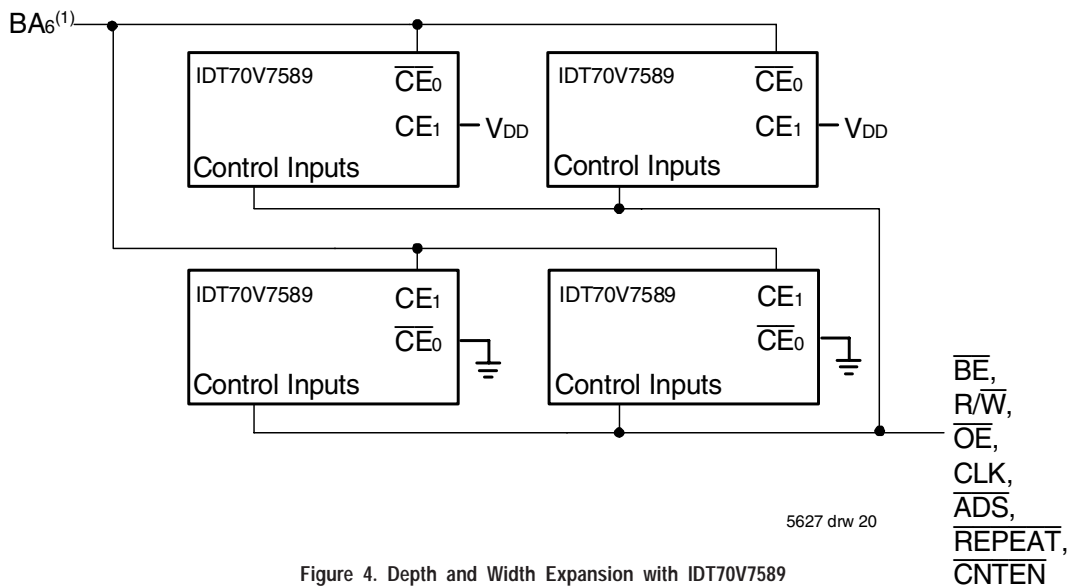

Figure 4. Depth and Width Expansion with IDT70V7589

**NOTE:**

1. In the case of depth expansion, the additional address pin logically serves as an extension of the bank address. Accesses by the ports into specific banks are controlled by the bank address pins under the user's direct control: each port can access any bank of memory within the shared array that is not currently being accessed by the opposite port (i.e., BA0L - BA6L ≠ BA0R - BA6R). In the event that both ports try to access the same bank at the same time, neither access will be valid, and data at the two specific addresses targeted by the parts within that bank may be corrupted (in the case that either or both parts are writing) or may result in invalid output (in the case that both ports are trying to read).

### NOTES:

1. Guaranteed by design.
2. 30pF loading on external output signals.
3. Refer to AC Electrical Test Conditions stated earlier in this document.
4. JTAG operations occur at one speed (10MHz). The base device may run at any speed specified in this datasheet.

## Identification Register Definitions

Instruction Field	Value	Description
Revision Number (31:28)	0x0	Reserved for version number
IDT Device ID (27:12)	0x320	Defines IDT part number
IDT JEDEC ID (11:1)	0x33	Allows unique identification of device vendor as IDT
ID Register Indicator Bit (Bit 0)	1	Indicates the presence of an ID register

5627 tbl 13

## Scan Register Sizes

Register Name	Bit Size
Instruction (IR)	4
Bypass (BYR)	1
Identification (IDR)	32
Boundary Scan (BSR)	Note (3)

## System Interface Parameters

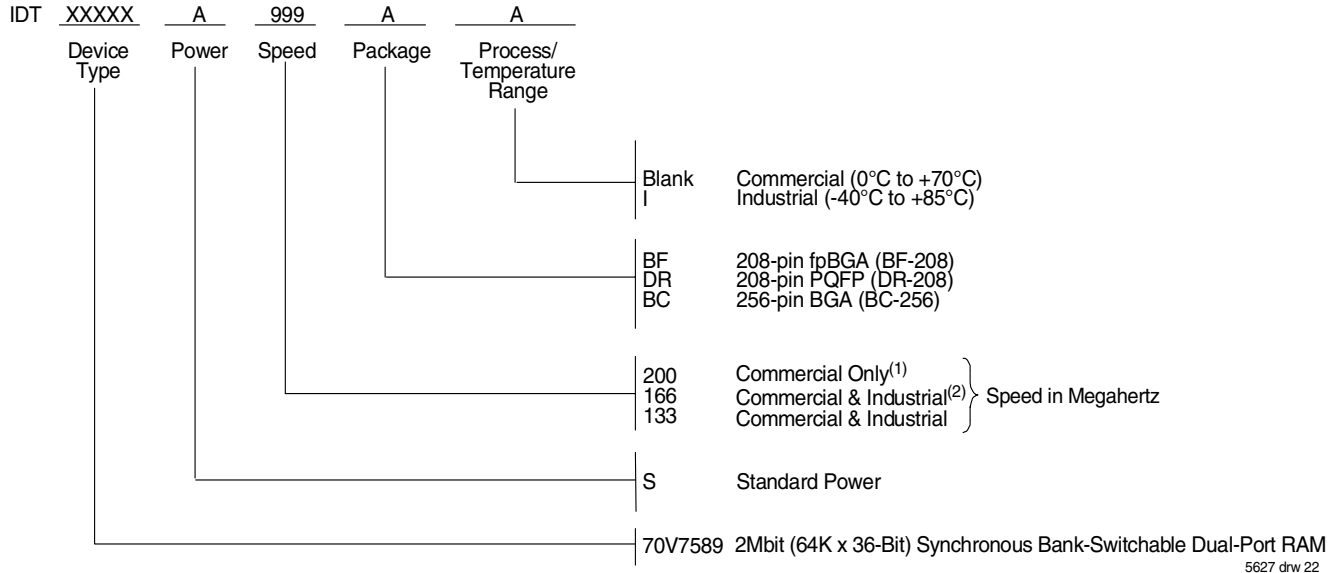

Instruction	Code	Description
EXTEST	0000	Forces contents of the boundary scan cells onto the device outputs <sup>(1)</sup> . Places the boundary scan register (BSR) between TDI and TDO.
BYPASS	1111	Places the bypass register (BYR) between TDI and TDO.
IDCODE	0010	Loads the ID register (IDR) with the vendor ID code and places the register between TDI and TDO.
HIGHZ	0100	Places the bypass register (BYR) between TDI and TDO. Forces all device output drivers to a High-Z state.
CLAMP	0011	Uses BYR. Forces contents of the boundary scan cells onto the device outputs. Places the bypass register (BYR) between TDI and TDO.
SAMPLE/PRELOAD	0001	Places the boundary scan register (BSR) between TDI and TDO. SAMPLE allows data from device inputs <sup>(2)</sup> and outputs <sup>(1)</sup> to be captured in the boundary scan cells and shifted serially through TDO. PRELOAD allows data to be input serially into the boundary scan cells via the TDI.
RESERVED	All other codes	Several combinations are reserved. Do not use codes other than those identified above.

### NOTES:

1. Device outputs = All device outputs except TDO.
2. Device inputs = All device inputs except TDI, TMS, TRST, and TCK.
3. The Boundary Scan Descriptive Language (BSDL) file for this device is available on the IDT website ([www.idt.com](http://www.idt.com)), or by contacting your local IDT sales representative.

## Ordering Information

5627 drw 22

### NOTES:

1. Available in BC-256 package only.
2. Industrial Temperature at 166Mhz not available in BF-208 package.

## Datasheet Document History:

1/5/00:	Initial Public Offering
10/19/01:	Page 2, 3 & 4 Added date revision for pin configurations Page 9 Changed I <sub>SB3</sub> values for commercial and industrial DC Electrical Characteristics Page 11 Changed t <sub>OE</sub> value in AC Electrical Characteristics, please refer to Errata #SMEN-01-05 Page 20 Increased t <sub>CD</sub> from 20ns to 25ns, please refer to Errata #SMEN-01-04 Page 1 & 22 Replaced ™ logo with ® logo
03/18/02:	Page 1, 9, 11 & 22 Added 200MHz specification Page 9 Tightened power numbers in DC Electrical Characteristics Page 14 Changed waveforms to show INVALID operation if t <sub>CO</sub> < minimum specified Page 1 - 22 Removed "Preliminary" status
12/4/02:	Page 9, 11 & 22 Designated 200Mhz speed grade available in BC-256 package only
01/16/04:	Page 11 Added byte enable setup time and byte enable hold time parameters and values to all speed grades in the AC Electrical Characteristics Table
