2.5V Synchronous ZBT™ SRAMs
2.5V I/O, Burst Counter
Flow-Through Outputs

IDT71T75702
OBSOLETE PART

Features

- **512K x 36, 1M x 18 memory configurations**
- **Supports high performance system speed - 100 MHz (7.5 ns Clock-to-Data Access)**
- **ZBT™ Feature - No dead cycles between write and read cycles**
- **Internally synchronized output buffer enable eliminates the need to control $\overline{OE}$**
- **Single R/$\overline{W}$ (READ/WRITE) control pin**
- **4-word burst capability (Interleaved or linear)**
- **Individual byte write ($\overline{BW_1}$ - $\overline{BW_4}$) control (May tie active)**
- **Three chip enables for simple depth expansion**
- **2.5V power supply (±5%)**
- **2.5V (±5%) I/O Supply (V_{DDQ})**
- **Power down controlled by ZZ input**
- **Boundary Scan JTAG Interface (IEEE 1149.1 Compliant)**
- **Packaged in a JEDEC standard 100-pin plastic thin quad flatpack (TQFP), 119 ball grid array (BGA)**

Description

The IDT71T75702/902 are 2.5V high-speed 18,874,368-bit (18 Megabit) synchronous SRAMs organized as 512K x 36 /1M x 18. They are designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Thus they have been given the name ZBT™, or Zero Bus Turnaround.

Address and control signals are applied to the SRAM during one clock cycle, and on the next clock cycle the associated data cycle occurs, be it read or write.

The IDT71T75702/902 contain address, data-in and control signal registers. The outputs are flow-through (no output data register). Output enable is the only asynchronous signal and can be used to disable the outputs at any given time.

A Clock Enable ($\overline{CEN}$) pin allows operation of the IDT71T75702/902 to be suspended as long as necessary. All synchronous inputs are ignored when $\overline{CEN}$ is high and the internal device registers will hold their previous values.

There are three chip enable pins ($\overline{CE_1}$, CE_2, $\overline{CE_2}$) that allow the user to deselect the device when desired. If any one of these three is not asserted when ADV/$\overline{LD}$ is low, no new memory operation can be initiated. However, any pending data transfers (reads or writes) will be completed. The data bus will tri-state one cycle after the chip is deselected or a write is initiated.

The IDT71T75702/902 have an on-chip burst counter. In the burst mode, the IDT71T75702/902 can provide four cycles of data for a single address presented to the SRAM. The order of the burst sequence is defined by the $\overline{LBO}$ input pin. The $\overline{LBO}$ pin selects between linear and interleaved burst sequence. The ADV/$\overline{LD}$ signal is used to load a new external address (ADV/$\overline{LD}$ = LOW) or increment the internal burst counter (ADV/$\overline{LD}$ = HIGH).

The IDT71T75702/902 SRAMs utilize IDT's high-performance CMOS process, and are packaged in a JEDEC Standard 14mm x 20mm 100-pin plastic thin quad flatpack (TQFP) as well as a 119 ball grid array (BGA).

Pin Definitions(1)

Symbol	Pin Function	I/O	Active	Description
A_0-A_{19}	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK, ADV/$\overline{LD}$ low, $\overline{CEN}$ low, and true chip enables.
ADV/$\overline{LD}$	Advance / Load	I	N/A	ADV/$\overline{LD}$ is a synchronous input that is used to load the internal registers with new address and control when it is sampled low at the rising edge of clock with the chip selected. When ADV/$\overline{LD}$ is low with the chip deselected, any burst in progress is terminated. When ADV/$\overline{LD}$ is sampled high then the internal burst counter is advanced for any burst that was in progress. The external addresses are ignored when ADV/$\overline{LD}$ is sampled high.
R/$\overline{W}$	Read / Write	I	N/A	R/$\overline{W}$ signal is a synchronous input that identifies whether the current load cycle initiated is a Read or Write access to the memory array. The data bus activity for the current cycle takes place one clock cycle later.
$\overline{CEN}$	Clock Enable	I	LOW	Synchronous Clock Enable Input. When $\overline{CEN}$ is sampled high, all other synchronous inputs, including clock are ignored and outputs remain unchanged. The effect of $\overline{CEN}$ sampled high on the device outputs is as if the low to high clock transition did not occur. For normal operation, $\overline{CEN}$ must be sampled low at rising edge of clock.
$\overline{BW_1}$-$\overline{BW_4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. Each 9-bit byte has its own active low byte write enable. On load write cycles (When R/$\overline{W}$ and ADV/$\overline{LD}$ are sampled low) the appropriate byte write signal ($\overline{BW_1}$-$\overline{BW_4}$) must be valid. The byte write signal must also be valid on each cycle of a burst write. Byte Write signals are ignored when R/$\overline{W}$ is sampled high. The appropriate byte(s) of data are written into the device one cycle later. $\overline{BW_1}$-$\overline{BW_4}$ can all be tied low if always doing write to the entire 36-bit word.
$\overline{CE_1}$, $\overline{CE_2}$	Chip Enables	I	LOW	Synchronous active low chip enable. $\overline{CE_1}$ and $\overline{CE_2}$ are used with CE_2 to enable the IDT71T75702/902 ($\overline{CE_1}$ or $\overline{CE_2}$ sampled high or CE_2 sampled low) and ADV/$\overline{LD}$ low at the rising edge of clock, initiates a deselect cycle. The ZBT™ has a one cycle deselect, i.e., the data bus will tri-state one clock cycle after deselect is initiated.
CE_2	Chip Enable	I	HIGH	Synchronous active high chip enable. CE_2 is used with $\overline{CE_1}$ and $\overline{CE_2}$ to enable the chip. CE_2 has inverted polarity but otherwise identical to $\overline{CE_1}$ and $\overline{CE_2}$.
CLK	Clock	I	N/A	This is the clock input to the IDT71T75702/902. Except for $\overline{OE}$, all timing references for the device are made with respect to the rising edge of CLK.
I/O_0-I/O_{31} I/O_{P1}-I/O_{P4}	Data Input/Output	I/O	N/A	Data input/output (I/O) pins. The data input path is registered, triggered by the rising edge of CLK. The data output path is flow-through (no output register).
$\overline{LBO}$	Linear Burst Order	I	LOW	Burst order selection input. When $\overline{LBO}$ is high the Interleaved burst sequence is selected. When $\overline{LBO}$ is low the Linear burst sequence is selected. $\overline{LBO}$ is a static input, and it must not change during device operation.
$\overline{OE}$	Output Enable	I	LOW	Asynchronous output enable. $\overline{OE}$ must be low to read data from the IDT71T75702/902. When $\overline{OE}$ is HIGH the I/O pins are in a high-impedance state. $\overline{OE}$ does not need to be actively controlled for read and write cycles. In normal operation, $\overline{OE}$ can be tied low.
TMS	Test Mode Select	I	N/A	Gives input command for TAP controller; sampled on rising edge of TCK. This pin has an internal pullup.
TDI	Test Data Input	I	N/A	Serial input of registers placed between TDI and TDO. Sampled on rising edge of TCK. This pin has an internal pullup.
TCK	Test Clock	I	N/A	Clock input of TAP controller. Each TAP event is clocked. Test inputs are captured on rising edge of TCK, while test outputs are driven from falling edge of TCK. This pin has an internal pullup.
TDO	Test Data Output	O	N/A	Serial output of registers placed between TDI and TDO. This output is active depending on the state of the TAP controller.
$\overline{TRST}$	JTAG Reset (Optional)	I	LOW	Optional asynchronous JTAG reset. Can be used to reset the TAP controller, but not required. JTAG reset occurs automatically at power up and also resets using TMS and TCK per IEEE 1149.1. If not used $\overline{TRST}$ can be left floating. This pin has an internal pullup. Only available in BGA package.
ZZ	Sleep Mode	I	HIGH	Synchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the IDT71T75702/902 to its lowest power consumption level. Data retention is guaranteed in Sleep Mode. This pin has an internal pulldown.
V_{DD}	Power Supply	N/A	N/A	2.5V core power supply.
V_{DDQ}	Power Supply	N/A	N/A	2.5V I/O Supply.
V_{SS}	Ground	N/A	N/A	Ground.

NOTE:

NOTES:
1. Pins 14 and 66 do not have to be connected directly to VSS as long as the input voltage is ≤ VIL.
2. Pin 16 does not have to be connected directly to VDD as long as the input voltage is ≥ VIH.
3. Pins 38, 39 and 43 will be pulled internally to VDD if not actively driven. To disable the TAP controller without interfering with normal operation, several settings are possible. Pins 38, 39 and 43 could be tied to VDD or VSS and pin 42 should be left unconnected. Or all JTAG inputs (TMS, TDI and TCK) pins 38, 39 and 43 could be left unconnected "NC" and the JTAG circuit will remain disabled from power up.
4. Pin 43 is reserved for the 36M address. JTAG is not offered in the 100-pin TQFP package for the 36M ZBT device.

NOTES:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{DD} terminals only.
3. V_{DDQ} terminals only.
4. Input terminals only.
5. I/O terminals only.
6. This is a steady-state DC parameter that applies after the power supply has reached its nominal operating value. Power sequencing is not necessary; however, the voltage on any input or I/O pin cannot exceed V_{DDQ} during power supply ramp up.
7. During production testing, the case temperature equals T_A.

5319 tbl 08

NOTES:
1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. When ADV/$\overline{LD}$ signal is sampled high, the internal burst counter is incremented. The R/$\overline{W}$ signal is ignored when the counter is advanced. Therefore the nature of the burst cycle (Read or Write) is determined by the status of the R/$\overline{W}$ signal when the first address is loaded at the beginning of the burst cycle.
3. Deselect cycle is initiated when either ($\overline{CE_1}$, or $\overline{CE_2}$ is sampled high or CE_2 is sampled low) and ADV/$\overline{LD}$ is sampled low at rising edge of clock. The data bus will tri-state one cycle after deselect is initiated.
4. When $\overline{CEN}$ is sampled high at the rising edge of clock, that clock edge is blocked from propogating through the part. The state of all the internal registers and the I/Os remains unchanged.
5. To select the chip requires $\overline{CE_1}$ = L, $\overline{CE_2}$ = L and CE_2 = H on these chip enable pins. The chip is deselected if any one of the chip enables is false.
6. Device Outputs are ensured to be in High-Z during device power-up.
7. Q - data read from the device, D - data written to the device.

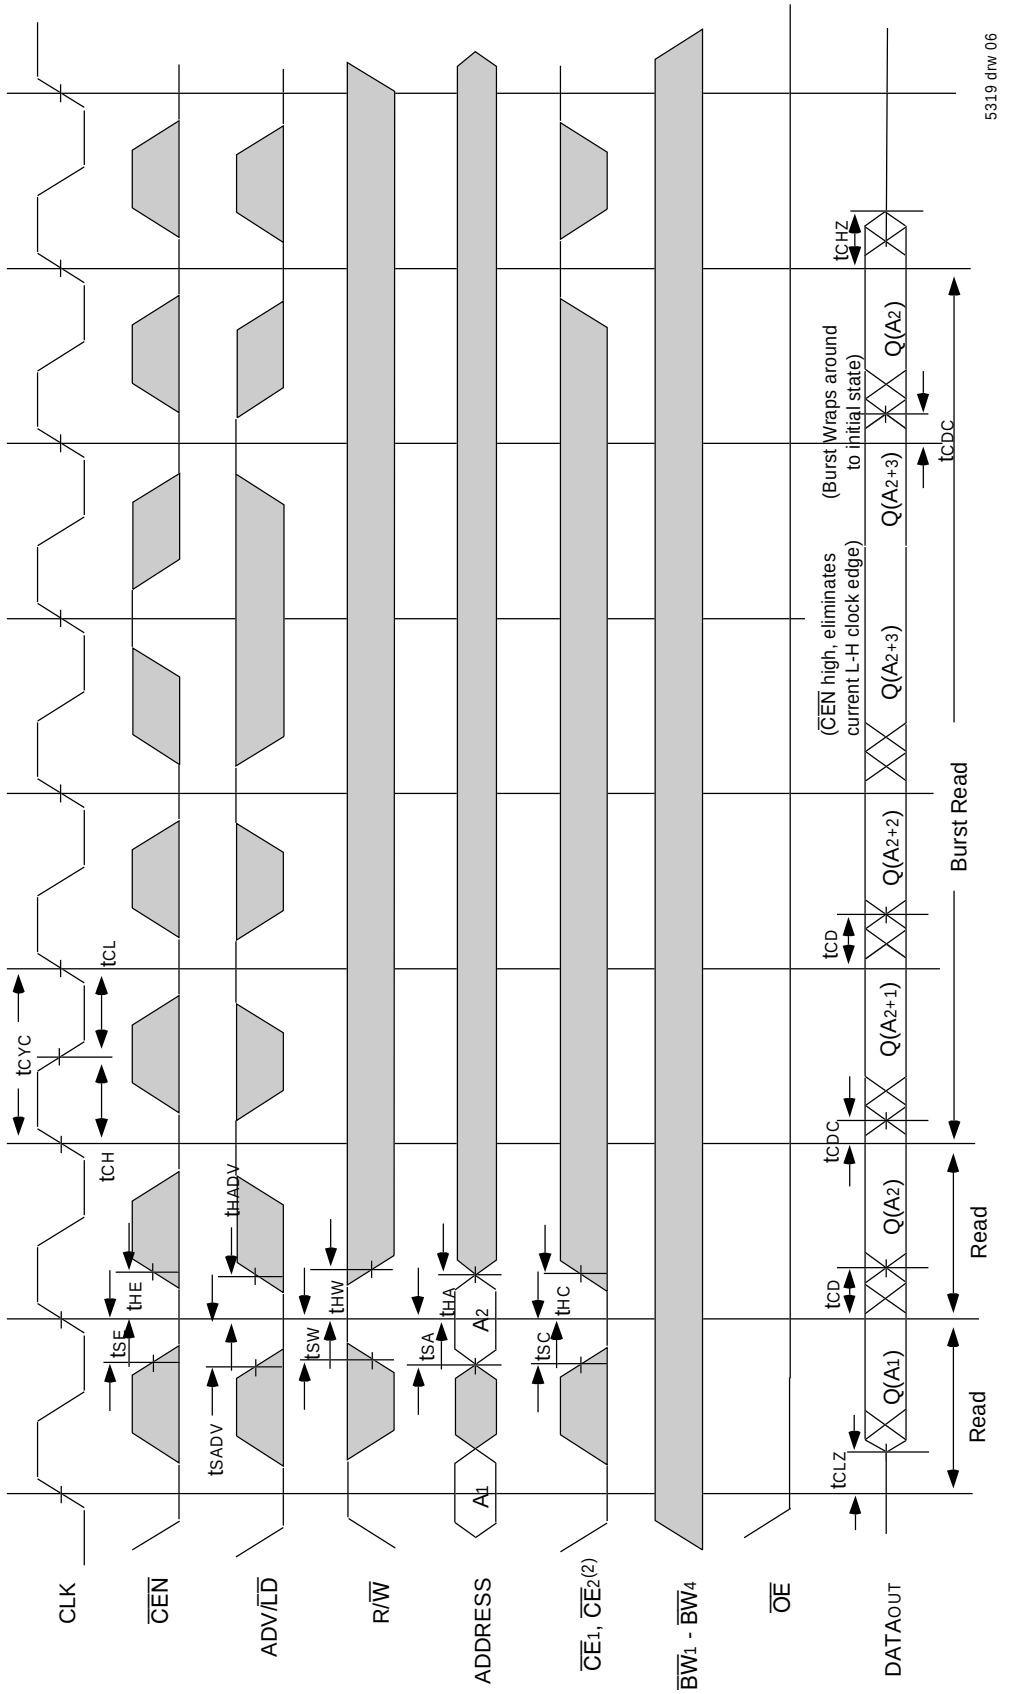
5319 tbl 24

NOTES:

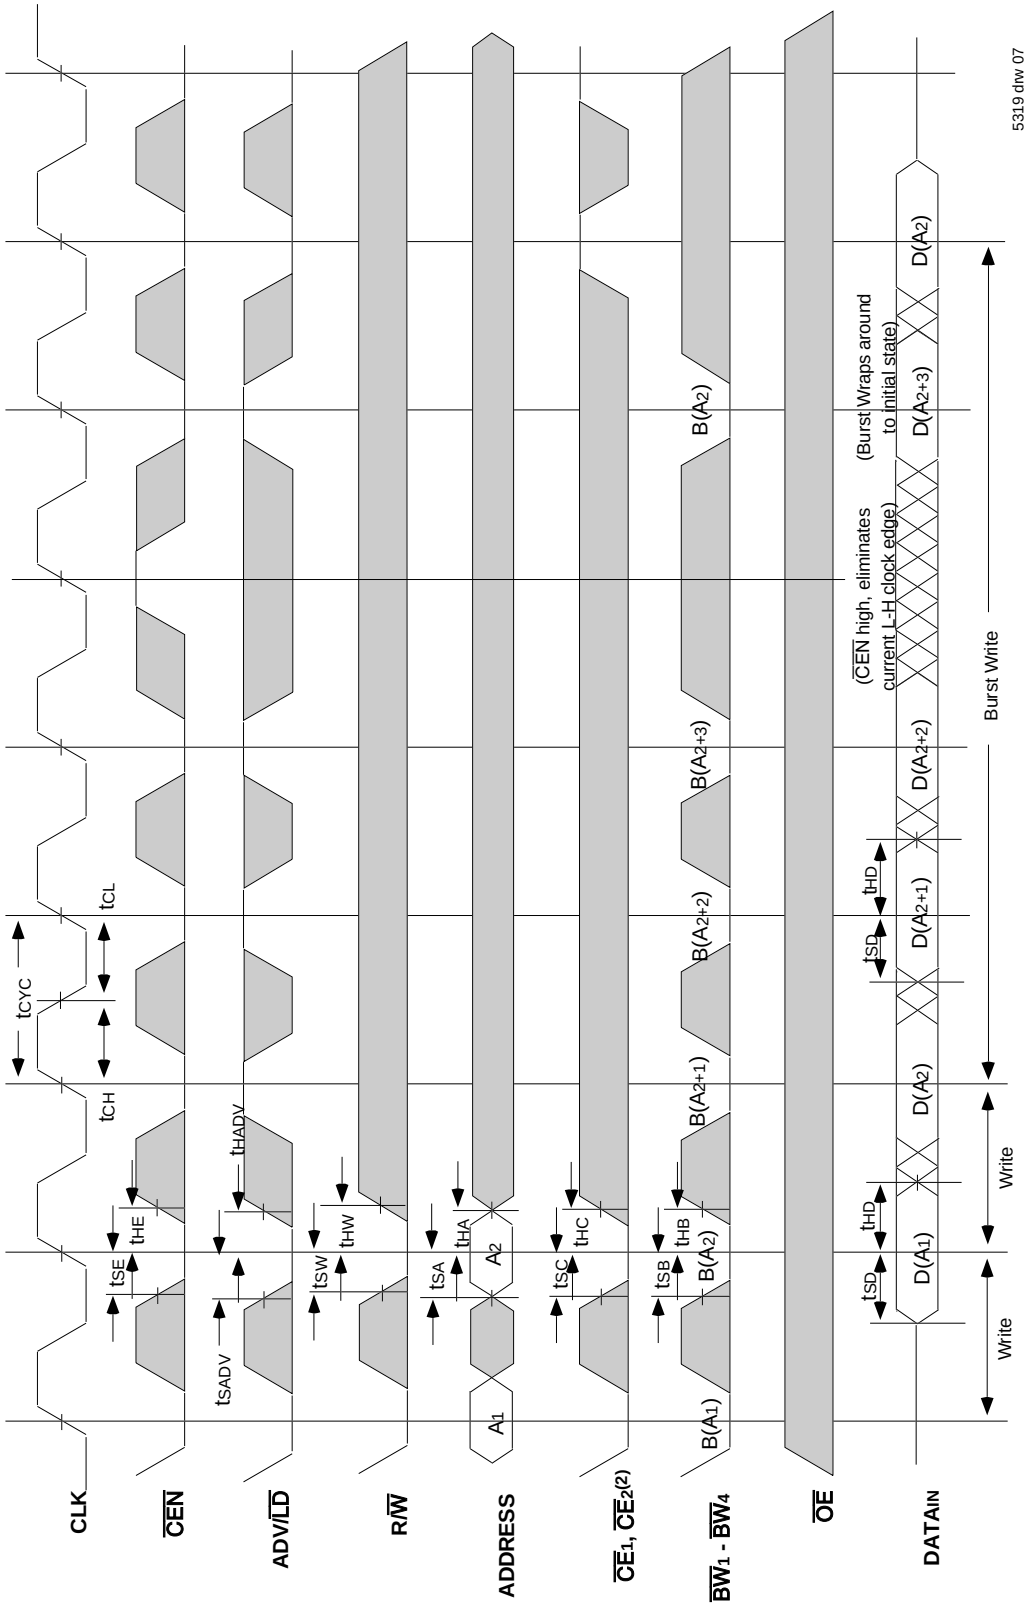
1. Measured as HIGH above 0.6V_{DDQ} and LOW below 0.4V_{DDQ}.
2. Transition is measured ±200mV from steady-state.
3. These parameters are guaranteed with the AC load (Figure 1) by device characterization. They are not production tested.
4. To avoid bus contention, the output buffers are designed such that t_{CHZ} (device turn-off) is about 1ns faster than t_{CLZ} (device turn-on) at a given temperature and voltage. The specs as shown do not imply bus contention because t_{CLZ} is a Min. parameter that is worse case at totally different test conditions (0 deg. C, 2.625V) than t_{CHZ}, which is a Max. parameter (worse case at 70 deg. C, 2.375V).

Timing Waveform of Read Cycle(1,2,3,4)



NOTES:
1. Q (A1) represents the first output from the external address A1. Q (A2) represents the first output from the external address A2; Q (A2+1) represents the next output data in the burst sequence of the base address A2, etc. where address bits A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. CE2 timing transitions are identical but inverted to the CE1 and CE2 signals. For example, when CE1 and CE2 are LOW on this waveform, CE2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/LD LOW.
4. R/W is don't care when the SRAM is bursting (ADV/LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/W signal when new address and control are loaded into the SRAM.

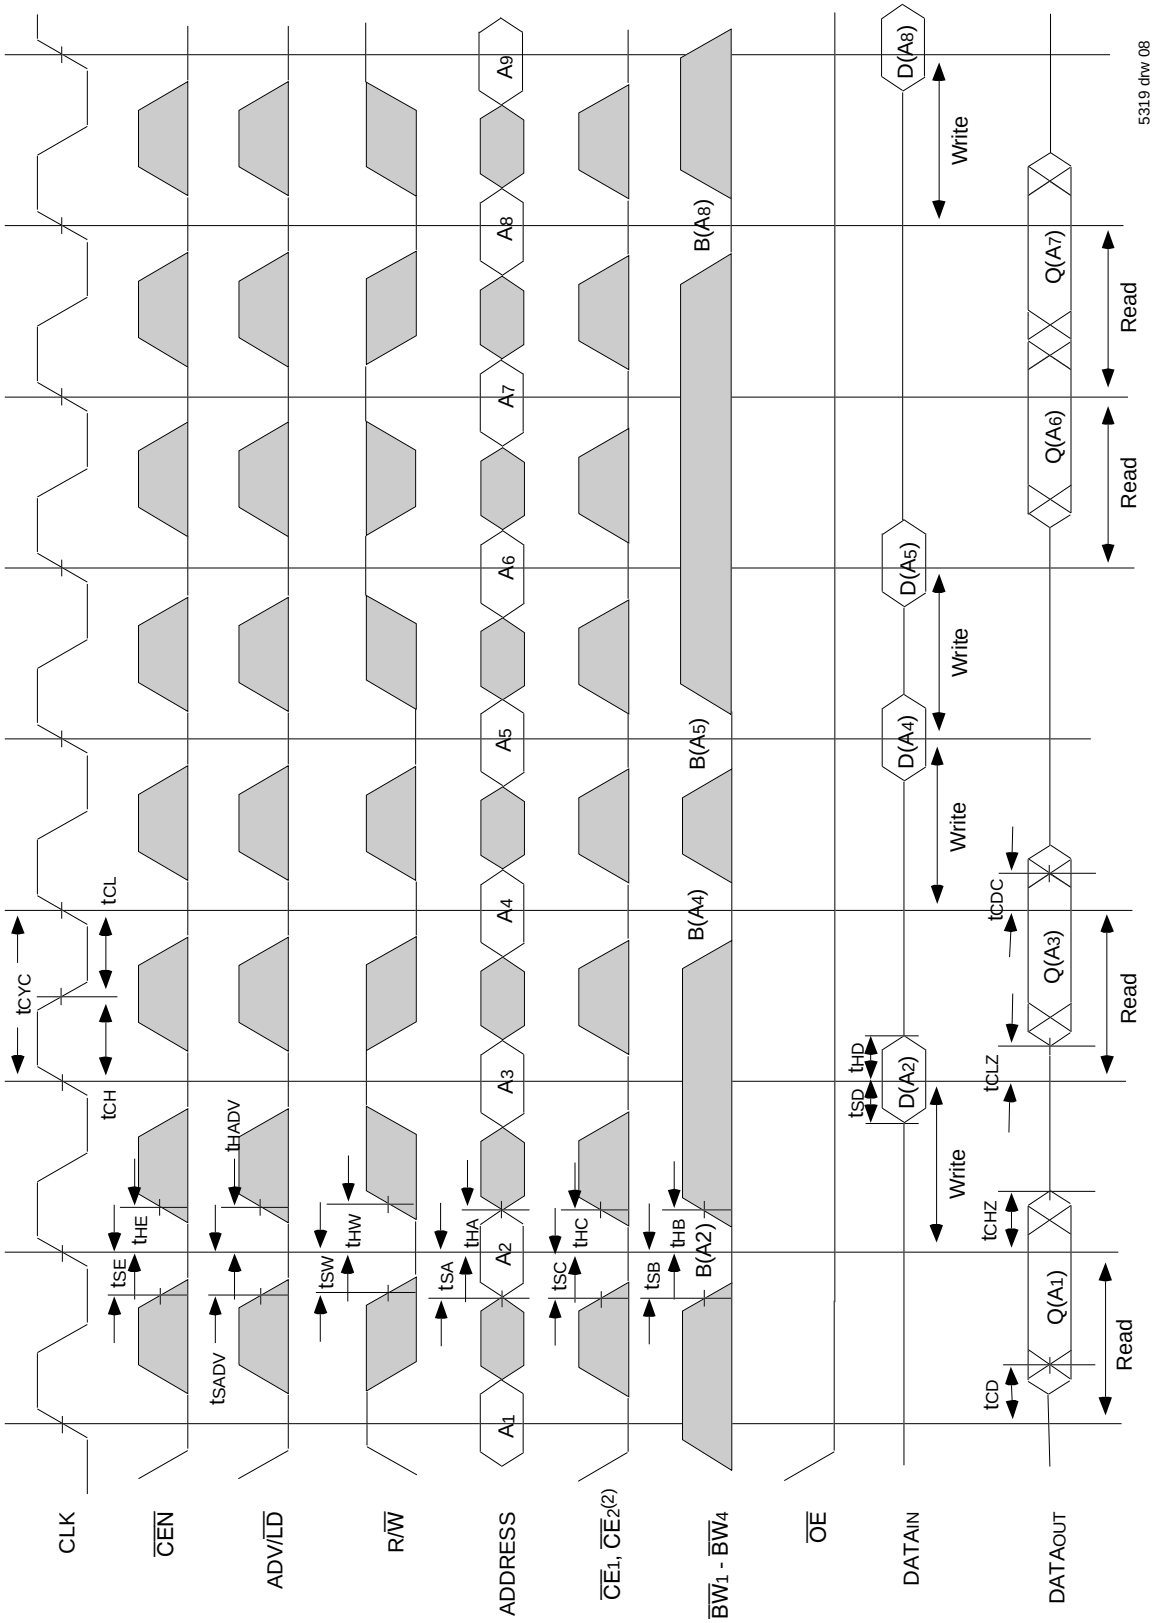
Timing Waveform of Write Cycles(1,2,3,4,5)



NOTES:

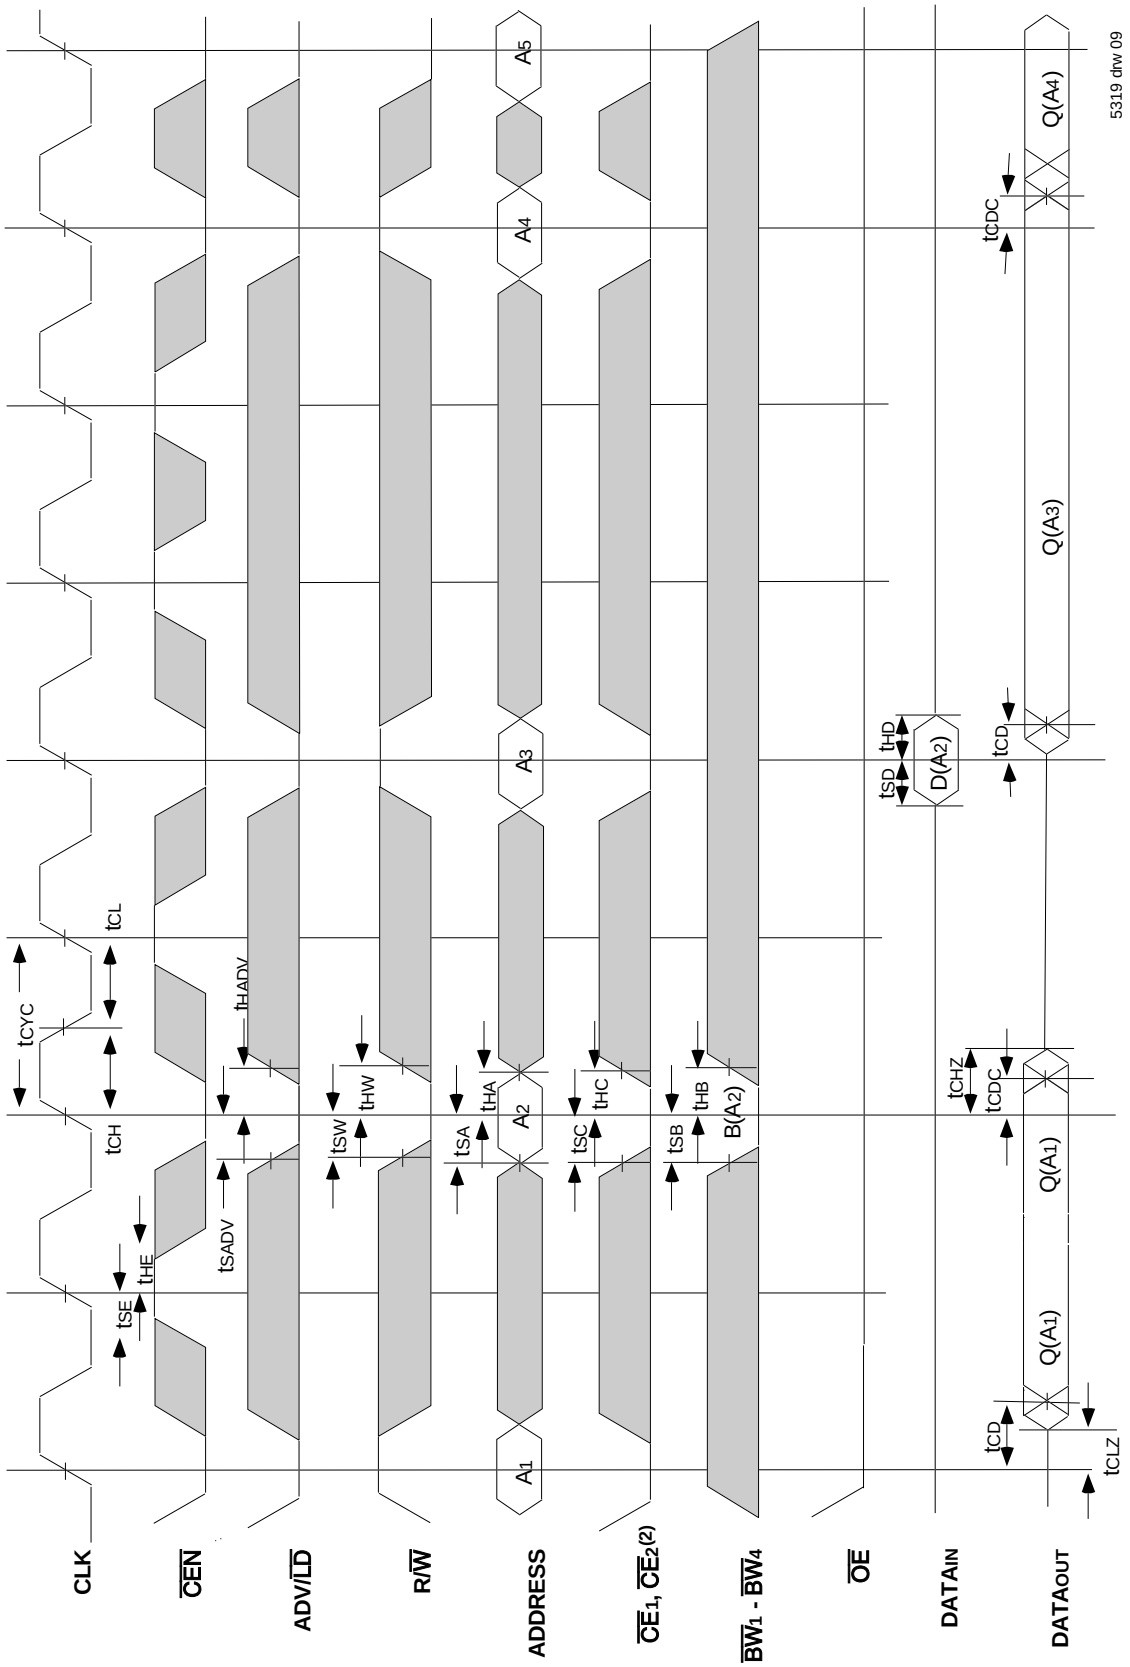
1. D (A_1) represents the first input to the external address A_1. D (A_2) represents the first input to the external address A_2; D (A_{2+1}) represents the next input data in the burst sequence of the base address A_2, etc. where address bits A_0 and A_1 are advancing for the four word burst in the sequence defined by the state of the $\overline{LBO}$ input.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE_2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/$\overline{LD}$ LOW.
4. R/$\overline{W}$ is don't care when the SRAM is bursting (ADV/$\overline{LD}$ sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/$\overline{W}$ signal when new address and control are loaded into the SRAM.
5. Individual Byte Write signals ($\overline{BWx}$) must be valid on all write and burst-write cycles. A write cycle is initiated when R/$\overline{W}$ signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

Timing Waveform of Combined Read and Write Cycles(1,2,3)



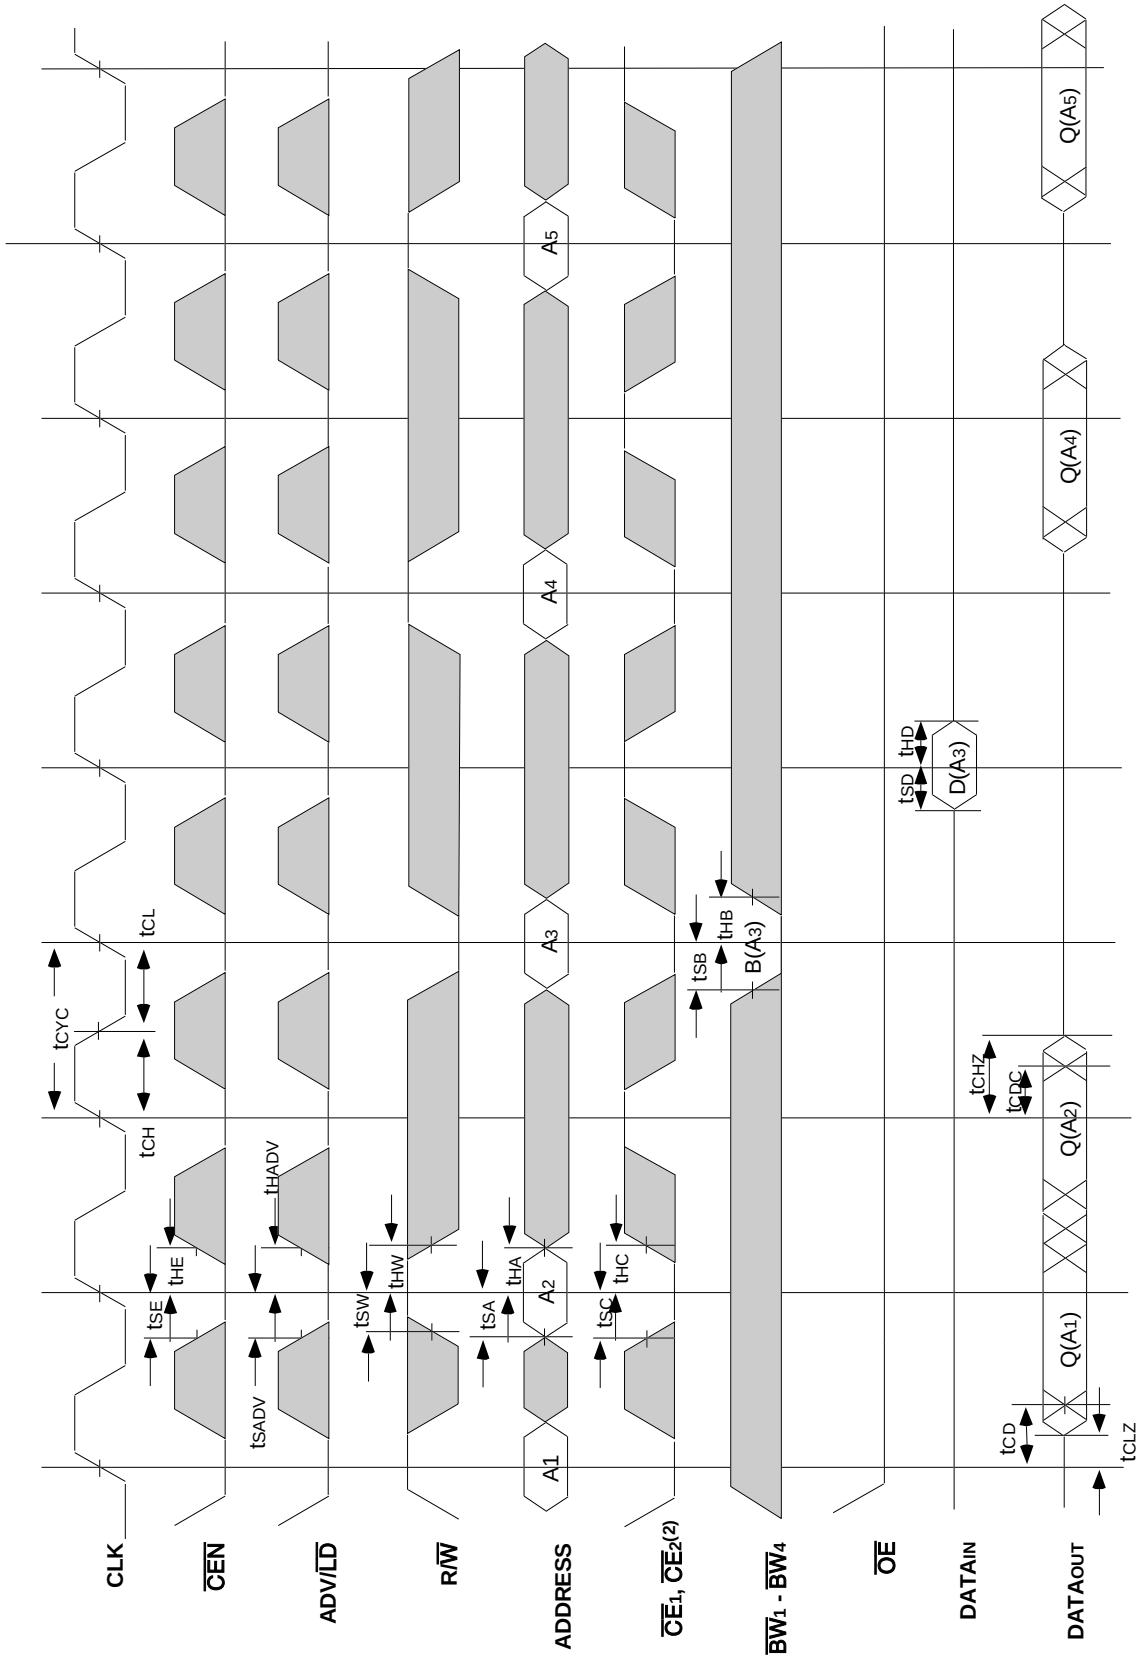
NOTES:
1. Q (A_1) represents the first output from the external address A_1. D (A_2) represents the input data to the SRAM corresponding to address A_2.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE_2 is HIGH.
3. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when R/$\overline{W}$ signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

Timing Waveform of $\overline{CEN}$ Operation(1,2,3,4)



NOTES:
1. Q (A_1) represents the first output from the external address A_1. D (A_2) represents the input data to the SRAM corresponding to address A_2.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE_2 is HIGH.
3. $\overline{CEN}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propogating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when $R/\overline{W}$ signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

Timing Waveform of $\overline{CS}$ Operation(1,2,3,4)



NOTES:

1. Q (A1) represents the first output from the external address A1. D (A3) represents the input data to the SRAM corresponding to address A3 etc.
2. CE2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE2 is HIGH.
3. When either one of the Chip enables ($\overline{CE}_1$, CE2, $\overline{CE}_2$) is sampled inactive at the rising clock edge, a deselect cycle is initiated. The data-bus tri-states one cycle after the initiation of the deselect cycle. This allows for any pending data transfers (reads or writes) to be completed.
4. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when R/$\overline{W}$ signal is sampled LOW. The byte write information comes in one cycle before the actual data is presented to the SRAM.

NOTES:
1. Device inputs = All device inputs except TDI, TMS and $\overline{\text{TRST}}$.
2. Device outputs = All device outputs except TDO.
3. During power up, $\overline{\text{TRST}}$ could be driven low or not be used since the JTAG circuit resets automatically. $\overline{\text{TRST}}$ is an optional JTAG reset.

Instruction Field	Value	Description
Revision Number (31:28)	0x2	Reserved for version number.
IDT Device ID (27:12)	0x221, 0x223	Defines IDT part number 71T75702 and 71T75902, respectively.
IDT JEDEC ID (11:1)	0x33	Allows unique identification of device vendor as IDT.
ID Register Indicator Bit (Bit 0)	1	Indicates the presence of an ID register.

I5319 tbl 02

Available JTAG Instructions

Instruction	Description	OPCODE
EXTEST	Forces contents of the boundary scan cells onto the device outputs[1]. Places the boundary scan register (BSR) between TDI and TDO.	0000
SAMPLE/PRELOAD	Places the boundary scan register (BSR) between TDI and TDO. SAMPLE allows data from device inputs[2] and outputs[1] to be captured in the boundary scan cells and shifted serially through TDO. PRELOAD allows data to be input serially into the boundary scan cells via the TDI.	0001
DEVICE_ID	Loads the JTAG ID register (JIDR) with the vendor ID code and places the register between TDI and TDO.	0010
HIGHZ	Places the bypass register (BYR) between TDI and TDO. Forces all device output drivers to a High-Z state.	0011
RESERVED	Several combinations are reserved. Do not use codes other than those identified for EXTEST, SAMPLE/PRELOAD, DEVICE_ID, HIGHZ, CLAMP, VALIDATE and BYPASS instructions.	0100
RESERVED		0101
RESERVED		0110
RESERVED		0111
CLAMP	Uses BYR. Forces contents of the boundary scan cells onto the device outputs. Places the bypass register (BYR) between TDI and TDO.	1000
RESERVED	Same as above.	1001
RESERVED		1010
RESERVED		1011
RESERVED		1100
VALIDATE	Automatically loaded into the instruction register whenever the TAP controller passes through the CAPTURE-IR state. The lower two bits '01' are mandated by the IEEE std. 1149.1 specification.	1101
RESERVED	Same as above.	1110
BYPASS	The BYPASS instruction is used to truncate the boundary scan register as a single bit in length.	1111

NOTES:

1 ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M–1982

2 TOP PACKAGE MAY BE SMALLER THAN BOTTOM PACKAGE BY .15 mm

3 DATUMS A–B AND –D– TO BE DETERMINED AT DATUM PLANE –H–

4 DIMENSIONS D AND E ARE TO BE DETERMINED AT SEATING PLANE –C–

5 DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS .25 mm PER SIDE. D1 AND E1 ARE MAXIMUM BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH

6 DETAILS OF PIN 1 IDENTIFIER IS OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED

7 DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION IS .08 mm IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

8 EXACT SHAPE OF EACH CORNER IS OPTIONAL

9 THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN .10 AND .25 mm FROM THE LEAD TIP

10 ALL DIMENSIONS ARE IN MILLIMETERS

11 THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO–136, VARIATION DJ AND BX

NOTES:

1. ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M-1982
2. SEATING PLANE AND PRIMARY DATUM -C- ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS
3. "MD" IS THE BALL MATRIX SIZE IN THE "D" DIRECTION
   "ME" IS THE BALL MATRIX SIZE IN THE "E" DIRECTION
   "N" IS THE MAXIMUM ALLOWABLE NUMBER OF SOLDER BALLS
4. PACKAGE MAY EXTEND TO EDGE PERIPHERY AND MAY CONSIST OF MOLDING COMPOUND, EPOXY, METAL, CERAMIC OR OTHER MATERIAL
5. DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM -C-
6. "A1" ID CORNER MUST BE IDENTIFIED. IDENTIFICATION MAY BE BY MEANS OF CHAMFER, METALLIZED OR INK MARK, INDENTATION OR OTHER FEATURE OF THE PACKAGE BODY. MARK MUST BE VISIBLE FROM TOP SURFACE
7. ACTUAL SHAPE OF THIS FEATURE IS OPTIONAL
8. ALL DIMENSIONS ARE IN MILLIMETERS
9. THIS DRAWING CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MS-028, VARIATION AA

Datasheet Document History

Rev	Date	Pages	Description
0	05/25/00		Created Advance Information Datasheet
1	08/24/01	p. 1, 25	Removed reference of BQ165 package
		p. 8	Removed page of the 165 BGA pin configuration
		p. 24	Removed page of the 165 BGA package diagram outline
2	10/16/01	p. 7	Corrected 3.3V to 2.5V in Note 3
3	12/21/01	p. 5-7	Added clarification to JTAG pins, allow for NC. Added 36M address pin locations
4	05/29/02	p. 21	Corrected 100-pin TQFP package drawing
5	06/07/02	p. 1-4,7,14,21,22	Added complete JTAG functionality.
		p. 2,14	Added notes for ZZ pin internal pulldown and ZZ leakage current.
		p. 14	Updated ISB3 power supply current from 40 to 60mA for all speeds.
6	11/19/02	p.1-26	Changed datasheet from Advanced information to final release.
7	05/23/03	p.5,6,14,15,25	Added I-temp to the datasheet.
		p.6	Updated 165 BGA table.
8	02/29/04	p.1	Updated logo with new design.
		p.5,6	Clarified ambient and case operating temperatures. Updated recommended operating temperature and supply voltage table and removed note 1.
		p.7	Updated I/O pin number order for the 119 BGA.
9	02/20/09	p.25	Removed "IDT" from orderable parts number
10	07/28/08:		PDN SR-08-03R2 issued. See IDT.com for PDN specifics
