

## GENERAL DESCRIPTION

The 8731-01 is a low voltage, low skew, 1-to-11 Differential-to-3.3V LVPECL Clock Multiplier/Zero Delay Buffer. With output frequencies up to 700MHz the 8731-01 is targeted at high performance clock applications. Along with a fully integrated PLL the 8731-01 contains frequency configurable, differential outputs and external feedback inputs for multiplying clock frequencies and regenerating clocks with "zero delay". Frequency multiplication is achieved by utilizing the separate feedback and clock output dividers. The value of the multiplier is determined by the ratio of the feedback divider, M, to the output divider,N. For multiplier values greater than 1, M must be greater than N. For multiplier values less than 1,M must be less than N. The zero delay mode is achieved with M and N at equal values. The divide values of the clock and feedback outputs are controlled by the DIV\_SEL0:2 and FB\_SEL0:1 inputs, respectively. The 8731-01 accepts any differential signal and translates it to differential 3.3V LVPECL output levels.

## FEATURES

- Eleven differential 3.3V LVPECL outputs
- Differential reference clock input pair
- REF\_CLK, nREF\_CLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, SSTL, HCSL
- Maximum output frequency: 700MHz
- Maximum reference clock input frequency: 200MHz
- VCO range: 250MHz - 700MHz
- Accepts any single-ended input signal with a resistor bias on nCLK input
- External feedback for zero delay capability
- Output skew: 70ps (maximum)
- Cycle-to-cycle jitter: 65ps (maximum)
- Full 3.3V operating supply
- 0°C to 70°C ambient operating temperature
- Available in lead-free RoHS compliant package

**TABLE 1. PIN DESCRIPTIONS**

| Number                      | Name   | Type   |          | Description  |
|-----------------------------|--|--------|----------|--|
| 1                           | MR   | Input  | Pulldown | Active High Master Reset. When logic HIGH, the internal dividers are reset causing the true outputs, Q <sub>x</sub> , to go low and the inverted outputs nQ <sub>x</sub> to go high. When logic LOW, the internal dividers and the outputs are enabled. LVCMOS / LVTTL interface levels. |
| 2, 10,<br>26, 36,<br>38, 48 | V <sub>CCO</sub>   | Power  |          | Output supply pins.  |
| 3, 4,<br>5, 6               | Q <sub>8</sub> , nQ <sub>8</sub> ,<br>Q <sub>9</sub> , nQ <sub>9</sub> | Output |          | Differential output pairs.   |
| 7, 14, 20,<br>31, 43        | V <sub>EE</sub>  | Power  |          | Negative supply pins.  |
| 8,<br>9                     | Q10/FB_OUT,<br>nQ10/nFB_OUT  | Output |          | Differential clock outputs.  |
| 11, 12                      | FB_IN, nFB_IN  | Input  | Pulldown | Feedback input to phase detector for generating clocks with "zero delay".  |
| 15                          | V <sub>CC</sub>  | Power  |          | Core supply pin.   |
| 16                          | FB_SEL0  | Input  | Pulldown | Determines output divider for Q10/FB outputs (see Table 3). LVCMOS / LVTTL interface levels.   |
| 17                          | FB_SEL1  | Input  | Pulldown | Determines output divider for Q10/FB outputs (see Table 3). LVCMOS / LVTTL interface levels.   |
| 18                          | nREF_CLK   | Input  | Pullup   | Inverting differential clock input.  |
| 19                          | REF_CLK  | Input  | Pulldown | Non-inverting differential clock input.  |
| 21                          | V <sub>CCA</sub>   | Power  |          | Analog supply pin.   |
| 22                          | DIV_SEL0,  | Input  | Pulldown | Determines output divider values in Table 3. LVCMOS / LVTTL interface levels.  |
| 23                          | DIV_SEL1   | Input  | Pulldown | Determines output divider values in Table 3. LVCMOS / LVTTL interface levels.  |
| 24                          | DIV_SEL2   | Input  | Pulldown | Determines output divider values in Table 3. LVCMOS / LVTTL interface levels.  |
| 13, 25                      | nc   | Unused |          | No connect.  |
| 27, 28<br>29, 30            | Q <sub>0</sub> , nQ <sub>0</sub> ,<br>Q <sub>1</sub> , nQ <sub>1</sub> | Output |          | Differential output pairs.   |
| 32, 33,<br>34, 35           | Q <sub>2</sub> , nQ <sub>2</sub> ,<br>Q <sub>3</sub> , nQ <sub>3</sub> | Output |          | Differential output pairs.   |
| 37                          | PLL_SEL  | Input  | Pullup   | Selects between the PLL and reference clock as the input to the dividers. When LOW, selects reference clock. When HIGH, selects PLL. LVCMOS / LVTTL interface levels.  |
| 39, 40,<br>41, 42           | Q <sub>4</sub> , nQ <sub>4</sub> ,<br>Q <sub>5</sub> , nQ <sub>5</sub> | Output |          | Differential output pairs.   |
| 44, 45,<br>46, 47           | Q <sub>6</sub> , nQ <sub>6</sub> ,<br>Q <sub>7</sub> , nQ <sub>7</sub> | Output |          | Differential output pairs.   |

NOTE: and refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

NOTE 1: VCO frequency range is 250MHz to 700MHz.

NOTE 2: The maximum input frequency that the phase defector can accept is 200MHz.

**ABSOLUTE MAXIMUM RATINGS**

|  |                          |
|--|--------------------------|
| Supply Voltage, $V_{CC}$                 | 4.6V                     |
| Inputs, $V_I$                            | -0.5V to $V_{CC} + 0.5V$ |
| Outputs, $I_O$                           |                          |
| Continuous Current                       | 50mA                     |
| Surge Current                            | 100mA                    |
| Package Thermal Impedance, $\theta_{JA}$ | 47.9°C/W (0 lfpm)        |
| Storage Temperature, $T_{STG}$           | -65°C to 150°C           |

NOTE: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

All parameters measured at  $f_{MAX}$  unless noted otherwise.

NOTE 1: Measured from the differential input crossing point to the differential output crossing point.

NOTE 2: Defined as the time difference between the input reference clock and the average feedback input signal when the PLL is locked and the input reference frequency is stable.

NOTE 3: Defined as skew between outputs at the same supply voltages and with equal load conditions.

Measured at the output differential cross points.

NOTE 4: This parameter is defined in accordance with JEDEC Standard 65.

## APPLICATION INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The 8731-01 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$ ,  $V_{CCA}$ , and  $V_{CCO}$  should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a  $10\Omega$  resistor along with a  $10\mu F$  and a  $.01\mu F$  bypass capacitor should be connected to each  $V_{CCA}$  pin.

FIGURE 1. POWER SUPPLY FILTERING

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LEVELS

*Figure 2* shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{CC}/2$  is generated by the bias resistors  $R1$ ,  $R2$  and  $C1$ . This bias circuit should be located as close as possible to the input pin. The ratio

of  $R1$  and  $R2$  might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only 2.5V and  $V_{CC} = 3.3V$ ,  $V_{REF}$  should be 1.25V and  $R2/R1 = 0.609$ .

FIGURE 2. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

## DIFFERENTIAL CLOCK INPUT INTERFACE

The REF\_CLK /nREF\_CLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals.

Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 3A to 3D show interface examples for the REF\_CLK/nREF\_CLK input driven by the most common driver types. The input interfaces suggested here are examples

only. Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in Figure 3A, the input termination applies for LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

## RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

### INPUTS:

#### LVC MOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A 1k $\Omega$  resistor can be used.

### OUTPUTS:

#### LVPECL OUTPUT

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## TERMINATION FOR LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

FOUT and nFOUT are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to

drive 50 $\Omega$  transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 4A and 4B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

## SCHEMATIC EXAMPLE

Figure 5 shows an application schematic example of the 8731-01. This schematic provides examples of input and output handling. The input can accept various types of differential signal. This example shows the 8731-01 input driven by a 3.3V LVPECL driver. Additional examples for the input driven by other types of drivers are shown in the application section of

this data sheet. The 8731-01 outputs are LVPECL driver. In this example, we assume the traces are long transmission line and the receiver is high input impedance without built-in matched load. An example of 3.3V LVPECL termination is shown in this schematic. Additional termination approaches are shown in the LVPECL Termination Application Note.

FIGURE 5. APPLICATION SCHEMATIC EXAMPLE

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 8731-01. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 8731-01 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 195mA = 675.67\text{mW}$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $11 * 30\text{mW} = 330\text{mW}$

**Total Power<sub>MAX</sub>** (3.465V, with all outputs switching) =  $675.67\text{mW} + 330\text{mW} = 1005.67\text{mW}$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for the devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * P_{d\_total} + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$P_{d\_total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming a moderate air flow of 200 linear feet per minute and a multi-layer board, the appropriate value is 42.1°C/W per Table 7 below.

Therefore,  $T_j$  for an ambient temperature of 70°C with all outputs switching is:

$70^\circ\text{C} + 1.006\text{W} * 42.1^\circ\text{C/W} = 112.4^\circ\text{C}$ . This is below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 7. THERMAL RESISTANCE  $\theta_{JA}$  FOR 48-PIN LQFP, FORCED CONVECTION**

| <b><math>\theta_{JA}</math> by Velocity (Linear Feet per Minute)</b>  |          |            |            |
|---|----------|------------|------------|
|   | <b>0</b> | <b>200</b> | <b>500</b> |
| Single-Layer PCB, JEDEC Standard Test Boards  | 67.8°C/W | 55.9°C/W   | 50.1°C/W   |
| Multi-Layer PCB, JEDEC Standard Test Boards   | 47.9°C/W | 42.1°C/W   | 39.4°C/W   |
| <b>NOTE:</b> Most modern PCB designs use multi-layered boards. The data in the second row pertains to most designs. |          |            |            |

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 6*.

To calculate worst case power dissipation into the load, use the following equations which assume a  $50\Omega$  load, and a termination voltage of  $V_{CCO} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CCO\_MAX} - 0.9V$

$$(V_{CCO\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CCO\_MAX} - 1.7V$

$$(V_{CCO\_MAX} - V_{OL\_MAX}) = 1.7V$$

$Pd_H$  is power dissipation when the output drives high.

$Pd_L$  is the power dissipation when the output drives low.

$$Pd_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC} - V_{OH\_MAX}))/R_L] * (V_{CC} - V_{OH\_MAX}) = [(2V - 0.9V)/50\Omega] * 0.9V = 19.8mW$$

$$Pd_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC} - V_{OL\_MAX}))/R_L] * (V_{CC} - V_{OL\_MAX}) = [(2V - 1.7V)/50\Omega] * 1.7V = 10.2mW$$

$$\text{Total Power Dissipation per output pair} = Pd_H + Pd_L = 30mW$$
