

### General Description

The 8T33FS6222 is a bipolar monolithic differential clock fanout buffer. Designed for most demanding clock distribution systems, the 8T33FS6222 supports various applications that require the distribution of precisely aligned differential clock signals. Using SiGe technology and a fully differential architecture, the device offers very low skew outputs and superior digital signal characteristics. Target applications for this clock driver is high performance clock distribution in computing, networking and telecommunication systems.

### Functional Description

The 8T33FS6222 is designed for low skew clock distribution systems and supports clock frequencies up to 2GHz. The CLK0 and CLK1 inputs can be driven by PECL compatible signals. Each of the four output banks of two, three, four and six differential clock output pairs can be independently configured to distribute the input frequency or 2 of the input frequency. The FSELA, FSELB, FSELC, FSELD, and CLK\_SEL are asynchronous control inputs. Any changes of the control inputs require a MR pulse for resynchronization of the 2 outputs. For the functionality of the MR control input, see [Figure 4.Functional Diagram](#).

In order to meet the tight skew specification of the device, both outputs of a differential output pair should be terminated, even if only one output is used. In the case where not all ten outputs are used, the output pairs on the same package side as the parts being used on that side should be terminated.

The 8T33FS6222 can be operated from a single 3.3V or 2.5V supply.

### Features

- Fifteen differential PECL outputs (four output banks)
- Two selectable differential PECL inputs
- Selectable  $\div 1$  or  $\div 2$  frequency divider
- Supports DC to 2GHz input frequency
- Single 3.3V or 2.5V supply
- Standard 52-Lead TQFP package with exposed pad for enhanced thermal characteristics
- Supports industrial temperature range
- Lead-free RoHS 6 packaging

## Pin Description and Characteristics

Table 1. Pin Description Table

Number	Name	Type		Description
1	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
2	MR	Input		Reset.
3	FSELA	Input		Selection output frequency divider for Bank A.
4	FSELB	Input		Selection output frequency divider for Bank B.
5	CLK0	Input	PECL	Differential reference clock signal input.
6	nCLK0	Input	PECL	Differential reference clock signal input.
7	CLK_SEL	Input		Clock reference select input.
8	CLK1	Input	PECL	Alternative differential reference clock signal input.
9	nCLK1	Input	PECL	Alternative differential reference clock signal input.
10	V <sub>BB</sub>	Output		Reference voltage output for single ended PECL operation.
11	FSELC	Input		Selection output frequency divider for Bank C.
12	FSELD	Input		Selection output frequency divider for Bank D.
13	V <sub>EE</sub> <sup>1</sup>	Power		Negative power supply.
14	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
15	nQD5	Output	PECL	Bank D differential output.
16	QD5	Output	PECL	Bank D differential output.
17	nQD4	Output	PECL	Bank D differential output.
18	QD4	Output	PECL	Bank D differential output.
19	nQD3	Output	PECL	Bank D differential output.
20	QD3	Output	PECL	Bank D differential output.
21	nQD2	Output	PECL	Bank D differential output.
22	QD2	Output	PECL	Bank D differential output.
23	nQD1	Output	PECL	Bank D differential output.
24	QD1	Output	PECL	Bank D differential output.
25	nQD0	Output	PECL	Bank D differential output.
26	QD0	Output	PECL	Bank D differential output.
27	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
28	NC	Unused		No internal connection.
29	NC	Unused		No internal connection.
30	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
31	nQC3	Output	PECL	Bank C differential output.
32	QC3	Output	PECL	Bank C differential output.

**Table 1. Pin Description Table**

Number	Name	Type		Description
33	nQC2	Output	PECL	Bank C differential output.
34	QC2	Output	PECL	Bank C differential output.
35	nQC1	Output	PECL	Bank C differential output.
36	QC1	Output	PECL	Bank C differential output.
37	nQC0	Output	PECL	Bank C differential output.
38	QC0	Output	PECL	Bank C differential output.
39	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
40	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
41	nQB2	Output	PECL	Bank B differential output.
42	QB2	Output	PECL	Bank B differential output.
43	nQB1	Output	PECL	Bank B differential output.
44	QB1	Output	PECL	Bank B differential output.
45	nQB0	Output	PECL	Bank B differential output.
46	QB0	Output	PECL	Bank B differential output.
47	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
48	nQA1	Output	PECL	Bank A differential output.
49	QA1	Output	PECL	Bank A differential output.
50	nQA0	Output	PECL	Bank A differential output.
51	QA0			Bank A differential output.
52	V <sub>CC</sub>	Power		Power supply. All V <sub>CC</sub> pins must be connected to the positive power supply for correct DC and AC operation.
ePAD	V <sub>EE_EP</sub>	Power		Exposed pad of package. Connect to ground.

NOTE 1. In PECL mode (positive power supply mode), V<sub>EE</sub> is connected to GND (0V) and V<sub>CC</sub> is either +3.3 V or +2.5 V. The input and output levels are referenced to the most positive supply (V<sub>CC</sub>).

MR (asynchronous)	Active	Reset. Qx = L and nQx = H

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of the product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability

**Table 3. Absolute Maximum Ratings**

Symbol	Characteristics		Min	Max	Unit
$V_{CC}$	Supply Voltage		-0.3	3.6	V
$V_{IN}$	DC Input Voltage		-0.3	$V_{CC} + 0.3$	V
$V_{OUT}$	DC Output Voltage		-0.3	$V_{CC} + 0.3$	V

HBM	ESD Human Body Model <sup>1</sup>			2000	V
CDM	ESD Charged Device Model <sup>1</sup>			500	V

NOTE 1. According to JEDEC/JS-001-2012/JESD22-C101E.

## DC Electrical Characteristics

**Table 4. PECL DC Characteristics,  $V_{CC} = 2.5V \pm 5\%$  or  $V_{CC} = 3.3V \pm 5\%$ ,  $V_{EE} = GND$ ,  $T_A = -40^\circ C$  to  $+85^\circ C$**

Symbol	Characteristics	Condition	Min	Typ	Max	Unit
Clock Input Pair CLK0, nCLK0, CLK1, nCLK1 (PECL differential signals)						
$V_{PP}$	Differential Input Voltage <sup>1</sup>	Differential operation	0.2		1.3	V
$V_{CMR}$	Differential Cross Point Voltage <sup>2</sup>	Differential operation	1.0		$V_{CC} - V_{PP}/2$	V
$I_{IN}$	Input Current <sup>1</sup>	$V_{IN} = V_{IL}$ or $V_{IN} = V_{IH}$			$\pm 150$	$\mu A$
Clock Inputs MR, CLK_SEL, FSELA, FSELB, FSELC, FSELD						
$V_{IH}$	Input Voltage High		$V_{CC} - 1.165$		$V_{CC}$	V
$V_{IL}$	Input Voltage Low		$V_{EE}$		$V_{CC} - 1.475$	V
$I_{IN}$	Input Current <sup>3</sup>	$V_{IN} = V_{IL}$ or $V_{IN} = V_{IH}$			$\pm 150$	$\mu A$
PECL Clock Outputs (QA[0:1], nQA[0:1], QB[0:2], nQB[0:2], QC[0:3], nQC[0:3], QD[0:5], nQD[0:5])						
$V_{OH}$	Output High Voltage	$I_{OH} = -30mA$ <sup>4</sup>	$V_{CC} - 1.1$		$V_{CC} - 0.7$	V
$V_{OL}$	Output Low Voltage	$I_{OL} = -5mA$ <sup>4</sup>	$V_{CC} - 1.9$		$V_{CC} - 1.4$	V
Supply Current and $V_{BB}$						
$I_{EE}$ <sup>5</sup>	Maximum Quiescent Supply Current without Output Termination Current	$V_{EE}$ pins			145	mA
$V_{BB}$	Output Reference Voltage	$I_{BB} = 0.4mA$	$V_{CC} - 1.38$		$V_{CC} - 1.2$	V

NOTE 1.  $V_{PP}$  (DC) is the minimum differential input voltage swing required to maintain device functionality.  $V_{IL}$  should not be less than -0.3V.  $V_{IH}$  should not be greater than  $V_{CC}$ .

NOTE 2.  $V_{CMR}$  (DC) is the crosspoint of the differential input signal. Functional operation is obtained when the crosspoint is within the  $V_{CMR}$  (DC) range and the input swing lies within the  $V_{PP}$  (DC) specification.

NOTE 3. Input have internal pullup/pulldown resistors which affect the input current.

NOTE 4. Equivalent to a termination of  $50\Omega$  to  $V_{TT}$ .

NOTE 5.  $I_{CC}$  calculation:  $I_{CC} = (\text{number of differential output used}) \times (I_{OH} + I_{OL}) + I_{EE}$   
 $I_{CC} = (\text{number of differential output used}) \times (V_{OH} - V_{TT})/R_{load} + (V_{OL} - V_{TT})/R_{load} + I_{EE}$ .

## AC Electrical Characteristics

**Table 5. AC Characteristics**, PECL:  $V_{CC} = 3.3V \pm 5\%$  or  $V_{CC} = 2.5V \pm 5\%$ ,  $V_{EE} = GND$ ,  $T_A = -40^\circ C$  to  $+85^\circ C$ <sup>1 2</sup>

odc	Output Duty Cycle	$f_{REF} < 0.1GHz$	$DC_{REF} = 50\%$	48	52	%
		$f_{REF} < 1.0GHz$	$DC_{REF} = 50\%$	45	55	%
		$f_{REF} < 2.0GHz$	$DC_{REF} = 50\%$	40	60	%
$t_r, t_f$	Output Rise/Fall Time	20% to 80%			300	ps

NOTE 1. Electrical parameters are guaranteed over the specified ambient operating temperature range, which is established when the device is mounted in a test socket with maintained transverse airflow greater than 500 lfm. The device will meet specifications after thermal equilibrium has been reached under these conditions.

NOTE 2. AC characteristics apply for parallel output termination of  $50\Omega$  to  $V_{TT}$ .

## Additive Phase Jitter

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the **dBc Phase Noise**. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio

of the power in the 1Hz band to the power in the fundamental. When the required offset is specified, the phase noise is called a **dBc** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

As with most timing specifications, phase noise measurements have issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The device meets the noise floor of what is

shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

Measured using a Wenzel, 156.25MHz Oscillator as the input source.

## Applications Information

### Wiring the Differential Input to Accept Single-Ended Levels

Figure 3 shows how a differential input can be wired to accept single ended levels. The reference voltage  $V_1 = V_{CC}/2$  is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the  $V_1$  in the center of the input voltage swing. For example, if the input clock swing is 2.5V and  $V_{CC} = 3.3V$ , R1 and R2 value should be adjusted to set  $V_1$  at 1.25V. The values below are for when both the single ended swing and  $V_{CC}$  are at the same voltage. This configuration requires that the sum of the output impedance of the driver ( $R_o$ ) and the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission

line impedance. For most 50Ω applications, R3 and R4 can be 100Ω. The values of the resistors can be increased to reduce the loading for slower and weaker LVCMOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVCMOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however  $V_{IL}$  cannot be less than -0.3V and  $V_{IH}$  cannot be more than  $V_{CC} + 0.3V$ . Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

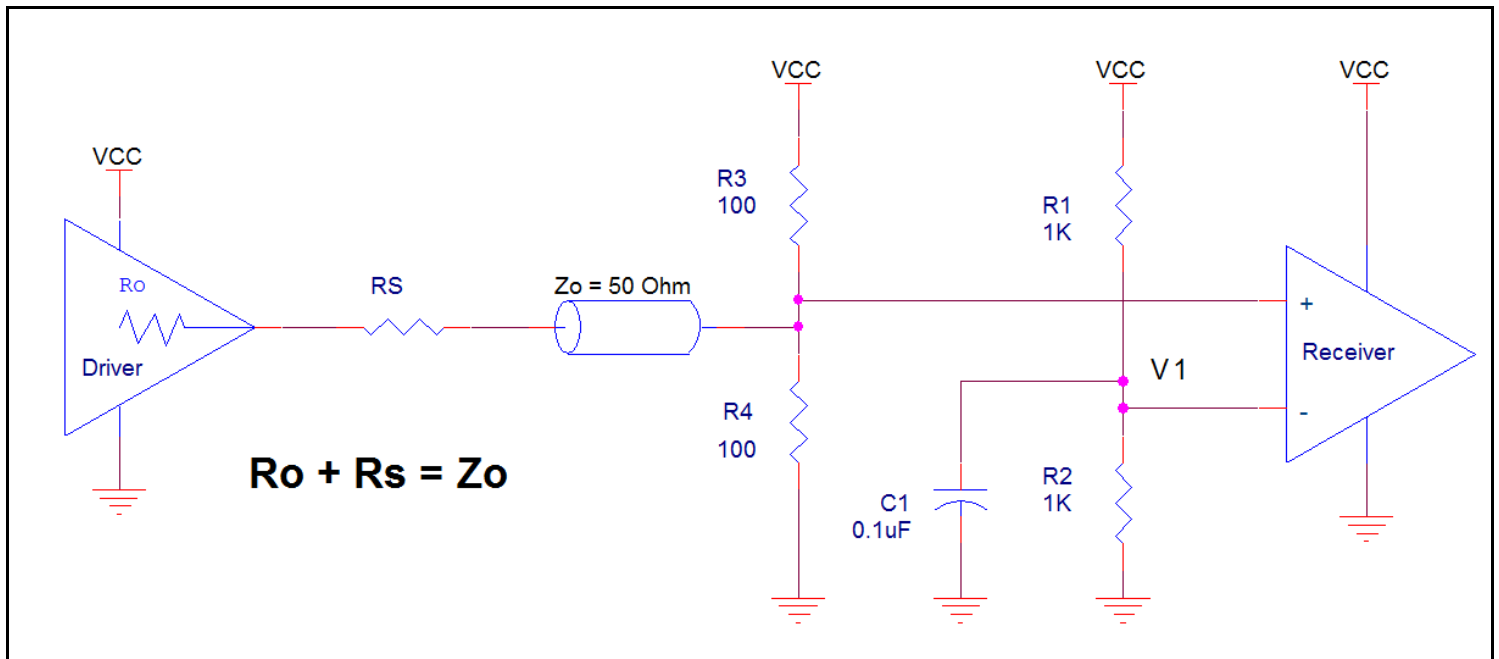

Figure 3. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

### Recommendations for Unused Input and Output Pins

#### Inputs:

##### CLKx/nCLKx Inputs

For applications not requiring the use of a differential input, both the CLKx and nCLKx pins can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from CLKx to ground. For applications

#### Outputs:

##### LVPECL Outputs

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## Applications Information

### Asynchronous Reset Functional Diagram

Figure 4. Functional Diagram

### Maintaining Lowest Device Skew

The 8T33FS6222 guarantees low output-to-output bank skew of 130ps and a part-to-part skew of max. 300ps. To ensure low skew clock signals in the application, both outputs of any differential output pair need to be terminated identically, even if only one output is used. When fewer than all nine output pairs are used, identical termination of all output pairs within the output bank is recommended. This will reduce the device power consumption while maintaining minimum output skew.

### Power Supply Bypassing

The 8T33FS6222 is a mixed analog/digital product. The differential architecture of the 8T33FS6222 supports low noise signal operation at high frequencies. In order to maintain its superior signal quality, all  $V_{CC}$  pins should be bypassed by high-frequency ceramic capacitors connected to GND. If the spectral frequencies of the internally generated switching noise on the supply pins cross the series resonant point of an individual bypass capacitor, its overall impedance begins to look inductive and thus increases with increasing frequency. The parallel capacitor combination shown ensures that a low impedance path to ground exists for frequencies well above the noise bandwidth.

Figure 5.  $V_{CC}$  Power Supply Bypass

## EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 6*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as "heat pipes". The number of vias (i.e. "heat pipes") are application

specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, refer to the Application Note on the *Surface Mount Assembly* of Amkor's Thermally/Electrically Enhance Lead frame Base Package, Amkor Technology.

### 3.3V LVPECL Clock Input Interface

The CLK /nCLK accepts LVPECL, LVDS, CML and other differential signals. Both differential outputs must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 7A to 7E show interface examples for the CLK/nCLK input driven by the most common driver types. The input

interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

## Termination for 3.3V LVPECL Outputs

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are a low impedance follower output that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion.

*Figures 9A and 9B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

Figure 9A. 3.3V LVPECL Output Termination

Figure 9B. 3.3V LVPECL Output Termination

## Termination for 2.5V LVPECL Outputs

Figure 10A and Figure 10B show examples of termination for 2.5V LVPECL driver. These terminations are equivalent to terminating  $50\Omega$  to  $V_{CC} - 2V$ . For  $V_{CC} = 2.5V$ , the  $V_{CC} - 2V$  is very close to ground

level. The R3 in Figure 10B can be eliminated and the termination is shown in Figure 10C.

## Power Considerations

This section provides information on power dissipation and junction temperature for the 8T33FS6222. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 8T33FS6222 is the sum of the core power plus the power dissipated due to the load. The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

NOTE: Please refer to Section 3 for details on calculating power dissipated in the load.

- The maximum current at 85C is:  $I_{EE\_max} = 145mA$
  - Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 145mA = 502.4mW$
  - Power (outputs)<sub>MAX</sub> = **35mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $15 * 35mW = 525mW$
- Total Power<sub>MAX</sub>** (3.465V, with all outputs switching) =  $502.4mW + 525mW = 1027mW$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 26.84°C/W per Table 6 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 1.027W * 26.84^\circ C/W = 112.5^\circ C. \text{ This is within the limit of } 125^\circ C.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 6. Thermal Resistance  $\theta_{JA}$  for 52-Lead TQFP, Forced Convection**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2
Multi-Layer PCB, JEDEC Standard Test Boards	26.84°C/W	22.08°C/W	20.54°C/W

### 3. Calculations and Equations.

The purpose of this section is to calculate the power dissipation for the LVPECL output pairs.

LVPECL output driver circuit and termination are shown in *Figure 11*.

**Figure 11. LVPECL Driver Circuit and Termination**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CC} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CC\_MAX} - 0.7V$   
( $V_{CC\_MAX} - V_{OH\_MAX}$ ) = **0.7V**
- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CC\_MAX} - 1.4V$   
( $V_{CC\_MAX} - V_{OL\_MAX}$ ) = **1.4V**

$Pd\_H$  is power dissipation when the output drives high.

$Pd\_L$  is the power dissipation when the output drives low.

$$Pd\_H = [(V_{OH\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OH\_MAX}) = [(2V - 0.7V)/50\Omega] * 0.7V = \mathbf{18.2mW}$$

$$Pd\_L = [(V_{OL\_MAX} - (V_{CC\_MAX} - 2V))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CC\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CC\_MAX} - V_{OL\_MAX}) = [(2V - 1.4V)/50\Omega] * 1.4V = \mathbf{16.8mW}$$

$$\text{Total Power Dissipation per output pair} = Pd\_H + Pd\_L = \mathbf{35mW}$$

## IMPORTANT NOTICE AND DISCLAIMER

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES ("RENESAS") PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD-PARTY INTELLECTUAL PROPERTY RIGHTS.

These resources are intended for developers who are designing with Renesas products. You are solely responsible for (1) selecting the appropriate products for your application, (2) designing, validating, and testing your application, and (3) ensuring your application meets applicable standards, and any other safety, security, or other requirements. These resources are subject to change without notice. Renesas grants you permission to use these resources only to develop an application that uses Renesas products. Other reproduction or use of these resources is strictly prohibited. No license is granted to any other Renesas intellectual property or to any third-party intellectual property. Renesas disclaims responsibility for, and you will fully indemnify Renesas and its representatives against, any claims, damages, costs, losses, or liabilities arising from your use of these resources. Renesas' products are provided only subject to Renesas' Terms and Conditions of Sale or other applicable terms agreed to in writing. No use of any Renesas resources expands or otherwise alters any applicable warranties or warranty disclaimers for these products.
