## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9DB433. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production. I<sub>REF</sub> = VDD/(3xR<sub>R</sub>). For R<sub>R</sub> = 475Ω (1%), I<sub>REF</sub> = 2.32mA.

I<sub>OH</sub> = 6 x I<sub>REF</sub> and V<sub>OH</sub> = 0.7V @ Z<sub>O</sub>=50Ω (100Ω differential impedance).

<sup>2</sup> Measured from differential waveform

<sup>3</sup> Slew rate is measured through the V<sub>swing</sub> voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

<sup>4</sup> Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

<sup>5</sup> V<sub>cross</sub> is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

<sup>6</sup> The total variation of all V<sub>cross</sub> measurements in any particular system. Note that this is a subset of V<sub>cross\_min/max</sub> (V<sub>cross</sub> absolute) allowed. The intent is to limit V<sub>cross</sub> induced modulation by setting V<sub>cross\_delta</sub> to be smaller than V<sub>cross</sub> absolute.

### PD#, Power Down

The PD# pin cleanly shuts off all clocks and places the device into a power saving mode. PD# must be asserted before shutting off the input clock or power to insure an orderly shutdown. PD is asynchronous active-low input for both powering down the device and powering up the device. When PD# is asserted, all clocks will be driven high, or tri-stated (depending on the PD# drive mode and Output control bits) before the PLL is shut down.

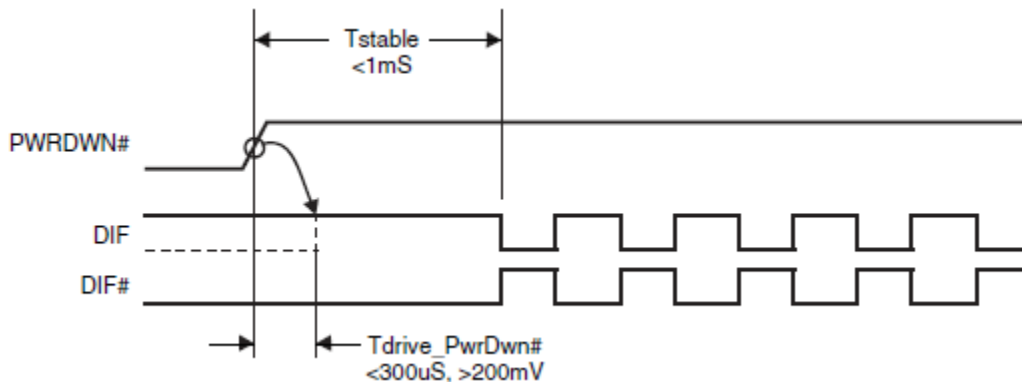

### PD# Assertion

When PD# is sampled low by two consecutive rising edges of DIF#, all DIF outputs must be held High, or tri-stated (depending on the PD# drive mode and Output control bits) on the next High-Low transition of the DIF# outputs. When the PD# drive mode bit is set to '0', all clock outputs will be held with DIF driven High with  $2 \times I_{REF}$  and DIF# tri-stated. If the PD# drive mode bit is set to '1', both DIF and DIF# are tri-stated.

### PD# De-assertion

Power-up latency is less than 1 ms. This is the time from de-assertion of the PD# pin, or VDD reaching 3.3V, or the time from valid SRC\_IN clocks until the time that stable clocks are output from the device (PLL Locked). If the PD# drive mode bit is set to '1', all the DIF outputs must be driven to a voltage of  $>200\text{mV}$  within  $300\mu\text{s}$  of PD# de-assertion.

## Revision History

Issue Date	Description	Page #
6/30/2010	Released to final	
5/9/2011	1. Update pin 1 pin-name and pin description from VDD to VDDR. This highlights that optimal performance is obtained by treating VDDR as in analog pin. This is a document update only, there is no silicon change.	Various
3/13/2012	1. Added additional line to PLL Bandwidth "-3dB point in High BW Mode" conditions for industrial mode (min1.5, typ 2.7, max 4.1 MHz) 2. Added additional line to Skew, Input to Output "Bypass Mode" conditions for industrial mode (min 2500, max 4900 ps)	6
7/5/2012	1. Changed references of PCIe Gen3 to PCIe Gen1,2,3	1
7/12/2012	1. Added missing typical values to DS.	Various
9/18/2012	Updated Byte 2, bits 1, 2, 5 and 6 per char review. Outputs can be programmed with Byte 2 to be Stoppable or Free-Run with DIF_Stop pin, not the OE pins.	Various
9/30/2013	Corrected typo in ordering information for 28-SSOP I-temp device.	15
8/14/2015	1. Corrected default value of Byte 2 to 00hex. Added note referring to 9DB434 if FFhex is the desired default.	11
6/7/2016	1. Corrected Idd values for 9DB433. 2. Updated typical values in electrical tables. 3. Updated clock input electrical table to latest format. 4. Updated SMBus operating frequency to 440KHz. 5. Corrected typo in Byte 0, bit 6 defaults to 0.	Various
5/25/2018	1. Updated the minimum input slew rate from 1 V/ns to 0.6V/ns.	6
