### Description

CD4060BMS consists of an oscillator section and 14 ripple carry binary counter stages. The oscillator configuration allows design of either RC or crystal oscillator circuits. A RESET input is provided which resets the counter to the all O's state and disables the oscillator. A high level on the RESET line accomplishes the reset function. All counter stages are master slave flip-flops. The state of the counter is advanced one step in binary order on the negative transition of  $\phi I$  (and  $\phi_0$ ). All inputs and outputs are fully buffered. Schmitt trigger action on the input pulse line permits unlimited input pulse rise and fall times.

The CD4060BMS is supplied in these 16 lead outline packages:

Braze Seal DIP	H4W
Frit Seal DIP	H1F
Ceramic Flatpack	H6W
