

## General Description

The 830154I-08 is an LVCMOS, over-voltage tolerant clock fanout buffer targeted for clock generation in high-performance telecommunication, networking and computing applications. The device is optimized for low-skew clock distribution in low-voltage applications. The input over-voltage tolerance enables using this device in mixed-mode voltage applications. An output enable pin controls whether the outputs are in the active or high impedance state. Guaranteed output skew characteristics make the 830154I-08 ideal for those applications demanding well defined performance and repeatability. The 830154I-08 is packaged in a small 8-TSSOP and in an 8-SOIC package.

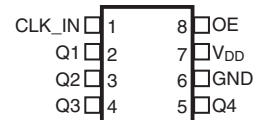

## Features

- Low-skew 1:4 fanout buffer
- Supports 3.3V, 2.5V, 1.8V and 1.5V power supplies
- LVCMOS input and output levels
- 3.6V Over-voltage tolerance at the clock and control inputs
- Supports clock frequencies up to 160MHz
- LVCMOS compatible control input for output disable
- Output disabled to a high-impedance state
- -40°C to 85°C ambient operating temperature
- Available in lead-free RoHS 6 packages (8-TSSOP, 8-SOIC)

R <sub>PULLDOWN</sub>	Input Pulldown Resistor			51		kΩ
R <sub>OUT</sub>	Output Impedance	V <sub>DD</sub> = 3.3V ± 5%		9		Ω
		V <sub>DD</sub> = 2.5V ± 5%		10		Ω
		V <sub>DD</sub> = 1.8V ± 0.15V		12		Ω
		V <sub>DD</sub> = 1.5 ± 0.1V		15		Ω

## Function Table

**Table 3. OE Configuration Table**

Input	Operation
OE	
0	Q[4:1] disabled (high-impedance)
1 (default)	Q[4:1] enabled

NOTE: OE is an asynchronous control.

## Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Item	Rating
Supply Voltage, $V_{DD}$	4.6V
Inputs, $V_I$	3.6V
Outputs, $V_O$	-0.5V to $V_{DD} + 0.5V$
Package Thermal Impedance, $\theta_{JA}$ 8 Lead TSSOP 8 Lead SOIC	121.5°C/W (0 mps) 103°C/W (0 mps)
Storage Temperature, $T_{STG}$	-65°C to 150°C

## DC Electrical Characteristics

## Additive Phase Jitter (1.5V Output)

The spectral purity in a band at a specific offset from the fundamental compared to the power of the fundamental is called the ***dBc Phase Noise***. This value is normally expressed using a Phase noise plot and is most often the specified plot in many applications. Phase noise is defined as the ratio of the noise power present in a 1Hz band at a specified offset from the fundamental frequency to the power value of the fundamental. This ratio is expressed in decibels (dBm) or a ratio of the power in the 1Hz band to the power in the

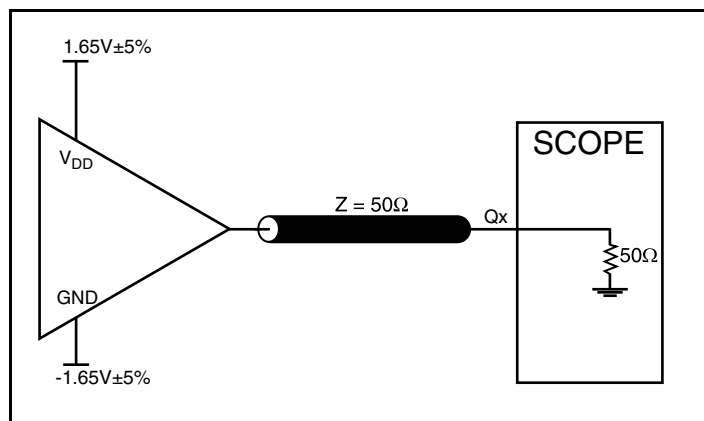

fundamental. When the required offset is specified, the phase noise is called a ***dBc*** value, which simply means dBm at a specified offset from the fundamental. By investigating jitter in the frequency domain, we get a better understanding of its effects on the desired application over the entire time record of the signal. It is mathematically possible to calculate an expected bit error rate given a phase noise plot.

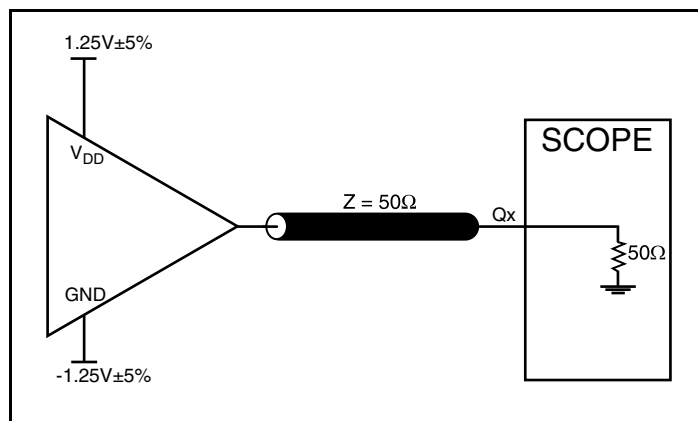

As with most timing specifications, phase noise measurements has issues relating to the limitations of the equipment. Often the noise floor of the equipment is higher than the noise floor of the device. This is illustrated above. The device meets the noise floor of what is shown, but can actually be lower. The phase noise is dependent on the input source and measurement equipment.

The source generator "IFR2042 10kHz – 56.4GHz Low Noise Signal Generator as external input to an Agilent 8133A 3GHz Pulse Generator".

## Applications Information

### Recommendations for Unused Output Pins

#### Outputs:

##### LVC MOS Outputs

All unused LVC MOS outputs can be left floating. There should be no trace attached.

## Power Considerations

This section provides information on power dissipation and junction temperature for the 830154I-08. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 830154I-08 is the sum of the core power plus the power dissipation in the load(s). The following is the power dissipation for  $V_{DD} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

$$\text{Power (core)}_{MAX} = V_{DD\_MAX} * I_{DD\_MAX} = 3.465V * 1mA = \mathbf{3.465mW}$$

#### Total Static Power:

$$= \text{Power (core)}_{MAX} = \mathbf{3.465mW}$$

#### Dynamic Power Dissipation at $F_{OUT\_MAX}$ (160MHz)

$$\text{Total Power (160MHz)} = [(C_{PD} * N) * \text{Frequency} * (V_{DDO})^2] = [(14pF * 4) * 160MHz * (3.465V)^2] = \mathbf{107.6mW}$$

**N = number of outputs**

#### Total Power

$$\begin{aligned} &= \text{Static Power} + \text{Dynamic Power Dissipation} \\ &= 3.465mW + 107.6mW \\ &= \mathbf{111.065mW} \end{aligned}$$

### 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature,  $T_j$ , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

$$\text{The equation for } T_j \text{ is as follows: } T_j = \theta_{JA} * Pd_{total} + T_A$$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd_{total}$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 121.5°C/W per Table 6A below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.111W * 121.5^\circ\text{C/W} = 98.5^\circ\text{C}. \text{ This is below the limit of } 125^\circ\text{C}.$$

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

**Table 6A. Thermal Resistance  $\theta_{JA}$  for 8 Lead TSSOP, Forced Convection**

$\theta_{JA}$ by Velocity			
Meters per Second	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	121.5°C/W	117.3°C/W	115.3°C/W
