ISL72027SEH

3.3V Radiation Tolerant CAN Transceiver, with Listen Mode and Split Termination Output

FN8763
Rev 3.00
August 16, 2016

The Intersil ISL72027SEH is a 3.3V radiation tolerant CAN transceiver that is compatible with the ISO11898-2 standard for applications calling for Controller Area Network (CAN) serial communication in satellites and aerospace communications and telemetry data processing in harsh industrial environments.

The transceiver can transmit and receive at bus speeds up to 5Mbps. It can drive a 40m cable at 1Mbps per the ISO11898-2 specification. The device is designed to operate over a common-mode range of -7V to +12V with a maximum of 120 nodes. The device has three discrete selectable driver rise/fall time options, a listen mode feature and a split termination output.

Receiver (Rx) inputs feature a “full fail-safe” design, which ensures a logic high Rx output if the Rx inputs are floating, shorted, or terminated but undriven.

The ISL72027SEH is available in an 8 Ld hermetic ceramic flatpack and die form that operate across the temperature range of the -55°C to +125°C. The logic inputs are tolerant with 5V systems.

Other CAN transceivers available are the ISL72026SEH and ISL72028SEH. For a list of differences see Table 1 on page 2.

Features

- DLA SMD 5962-15228
- ESD Protection on all pins. . . . . 4kV HBM
- Compatible with ISO11898-2
- Operating supply range . . . . . 3.0V to 3.6V
- Bus pin fault protection to ±20V
- Undervoltage lockout
- Cold spare: powered down devices/nodes will not affect active devices operating in parallel
- Three selectable driver rise and fall times
- Glitch free bus I/O during power-up and power-down
- Full fail-safe (open, short, terminated/undriven) receiver
- Hi Z input allows for 120 nodes on the bus
- High data rates. . . . . up to 5Mbps
- Quiescent supply current . . . . . 7mA (max)
- Listen mode supply current . . . . . 2mA (max)
- -7V to +12V common-mode input voltage range
- 5V tolerant logic inputs
- Thermal shutdown
- Acceptance tested to 75krad(Si) (LDR) wafer-by-wafer
- Radiation tolerance
  - SEL/B immune to LET 60MeV • cm^2/mg
  - Low dose rate (0.01rad(Si)/s) . . . . . 75krad(Si)

Applications

- Satellites and aerospace communications
- Telemetry data processing
- High-end industrial environments
- Harsh environments

NOTES:

1. Specifications for Radiation Tolerant QML devices are controlled by the Defense Logistics Agency Land and Maritime (DLA). The SMD numbers listed in the Ordering Information must be used when ordering.
2. These Intersil Pb-free Hermetic packaged products employ 100% Au plate - e4 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations.

Pin Descriptions

PIN NUMBER	PIN NAME	FUNCTION
1	D	CAN driver digital input. The bus states are LOW = dominant and HIGH = recessive. Internally tied HIGH.
2	GND	Ground connection.
3	VCC	System power supply input (3.0V to 3.6V). The typical voltage for the device is 3.3V.
4	R	CAN data receiver output. The bus states are LOW = dominant and HIGH = recessive.
8	RS	A resistor to GND from this pin controls the rise and fall time of the CAN output waveform. Drive RS HIGH to put into listen mode.
7	CANL	CAN bus line for low level output.
6	CANH	CAN bus line for high level output.
5	VREF	VCC/2 reference output for split mode termination.

Recommended Operating Conditions

Temperature Range . . . . . -55°C to +125°C
V_{CC} Supply Voltage . . . . . 3V to 3.6V
Voltage on CAN I/O. . . . . -7V to 12V
V_{IH} D Logic Pin . . . . . 2V to 5.5V
V_{IL} D Logic Pin . . . . . 0V to 0.8V
IOH Driver (CANH - CANL = 1.5V, V_{CC} = 3.3V) . . . . . - 40mA
IOH Receiver (V_{OH} = 2.4V) . . . . . -4mA
IOL Driver (CANH - CANL = 1.5V, V_{CC} = 3.3V) . . . . . +40mA
IOL Receiver (V_{OL} = 0.4V) . . . . . +4mA

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

3. θ_{JA} is measured with the component mounted on a high effective thermal conductivity test board (two buried 1oz copper planes) with "direct attach" features package base mounted to PCB thermal land with a 10 mil gap fill material having a k of 1W/m-K. See Tech Brief TB379.
4. For θ_{JC}, the "case temp" location is the center of the package underside.

Electrical Specifications

Test Conditions: V_{CC} = 3V to 3.6V; Typicals are at T_A = +25°C (Note 7); unless otherwise specified (Note 5). **Boldface limits apply across the operating temperature range, -55°C to +125°C or across a total Ionizing dose of 75krad(Si) at +25°C with exposure at a low dose rate of <10mrad(Si)/s.**

Functional Description

Overview

The Intersil ISL72027SEH is a 3.3V radiation tolerant CAN transceiver that is compatible with the ISO11898-2 standard for use in CAN (Controller Area Network) serial communication systems.

The device performs transmit and receive functions between the CAN controller and the CAN differential bus. It can transmit and receive at bus speeds of up to 5Mbps. It is designed to operate over a common-mode range of -7V to +12V with a maximum of 120 nodes. The device is capable of withstanding ±20V on the CANH and CANL bus pins outside of ion beam and ±16V under ion beam.

Slope Adjustment

The output driver rise and fall time has three distinct selections that may be chosen by using a resistor from the RS pin to GND. Connecting the RS pin directly to GND results in output switching times that are the fastest, limited only by the drive capability of the output stage. RS = 10kΩ provides for a typical slew rate of 8V/µs and RS = 50kΩ provides for a typical slew rate of 4V/µs.

Putting a high logic level to the RS pin places the device in a low current listen mode. The protocol controller uses this mode to switch between low power listen mode and a normal transmit mode.

Cable Length

The device can work per ISO11898 specification with a 40m cable and stub length of 0.3m and 60 nodes at 1Mbps. This is greater than the ISO requirement of 30 nodes. The cable type specified is a twisted pair (shielded or unshielded) with a characteristic impedance of 120Ω. Resistors equal to this are to be terminated at both ends of the cable. Stubs should be kept as short as possible to prevent reflections.

Cold Spare

High reliability system designers implementing data communications have to be sensitive to the potential for single point failures. To mitigate the risk of a failure they will use redundant bus transceivers in parallel. Space systems call for high reliability in data communications that are resistant to single point failures. This is achieved by using a redundant bus transceiver in parallel. In this arrangement, both active and quiescent devices can be present simultaneously on the bus. The quiescent devices are powered down for cold spare and do not affect the communication of the other active nodes.

To achieve this, a powered down transceiver (V_{CC} < 200mV) has a resistance between the VREF pin or the CANH pin or CANL pin and the V_{CC} supply rail of >480kΩ (max) with a typical resistance >2MΩ. The resistance between CANH and CANL of a powered down transceiver has a typical resistance of 80kΩ.

Listen Mode

When a high level is applied to the RS pin, the device enters a low power listen mode. The driver of the transceiver is switched off to conserve power while the receiver remains active. In listen mode the transceiver draws 2mA (max) of current.

A low level on the RS pin brings the device back to normal operation.

Using 3.3V Devices in 5V Systems

Looking at the differential voltage of both the 3.3V and 5V devices, the differential voltage is the same, the recessive common-mode output is the same. The dominant common-mode output voltage is slightly lower than the 5V counterparts. The receiver specs are also the same. Though the electrical parameters appear compatible, it is advised that necessary system testing be performed to verify interchangeable operation.

Split Mode Termination

The VREF pin provides a $V_{CC}/2$ output voltage for split mode termination. The VREF pin has the same ESD protection, short-circuit protection, and common-mode operating range as the bus pins.

The split mode termination technique is shown in Figure 19.

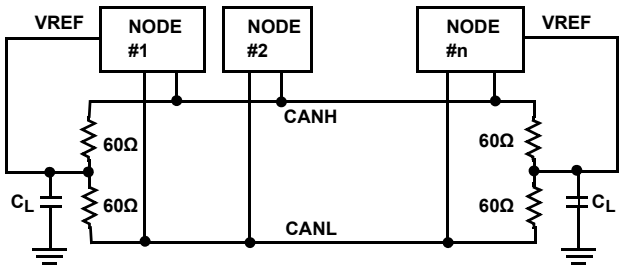

FIGURE 19. SPLIT TERMINATION

It is used to stabilize the bus voltage at $V_{CC}/2$ and prevent it from drifting to a high common-mode voltage during periods of inactivity. The technique improves the electromagnetic compatibility of a network. The split mode termination is put at each end of the bus.

The C_L capacitor between the two 60Ω resistors filters unwanted high frequency noise to ground. The resistors should have a tolerance of 1% or better and the two resistors should be carefully matched to provide the most effective EMI immunity. A typical value of C_L for a high speed CAN network is 4.7nF, which generates a 3dB point at 1.1Mbps. The capacitance value used is dependent on the signaling rate of the network.

Typical Performance Curves

V_{CC} = 3.3V, C_L = 15pF, T_A = +25°C; unless otherwise specified.

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to the web to make sure that you have the latest revision.

DATE	REVISION	CHANGE
August 16, 2016	FN8763.3	“Absolute Maximum Ratings” on page 5 changed voltage value in VCC to GND With/Without Ion Beam From: -0.3V to 4.5V To: -0.3V to 5.5V.
April 29, 2016	FN8763.2	- Updated title. - Updated the test condition for Output Rise Time on page 7. - Changed maximum data rate from 1Mbps to 5Mbps in the following locations: - Second paragraph and “Features” section on page 1. - In “Overview” on page 11.
November 9, 2015	FN8763.1	Absolute Maximum Ratings table on page 5: changed the value for “CANH, CANL, VREF Under Ion Beam” from ±16V to ±18V.
October 26, 2015	FN8763.0	Initial Release

About Intersil

Intersil Corporation is a leading provider of innovative power management and precision analog solutions. The company's products address some of the largest markets within the industrial and infrastructure, mobile computing and high-end consumer markets.

For the most updated datasheet, application notes, related documentation and related parts, please see the respective product information page found at www.intersil.com.

You may report errors or suggestions for improving this datasheet by visiting www.intersil.com/ask.

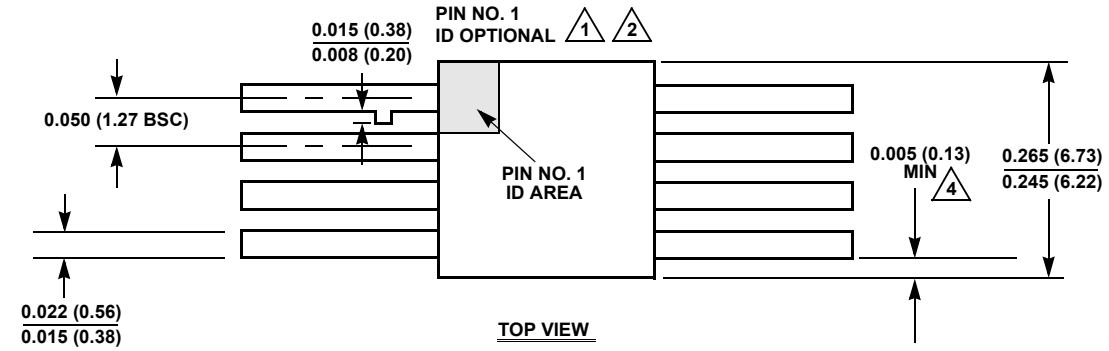
Reliability reports are also available from our website at www.intersil.com/support.

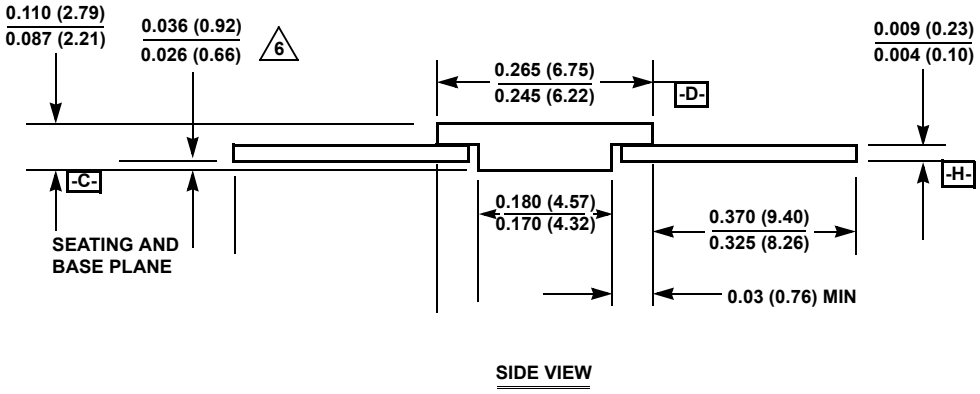
Package Outline Drawing

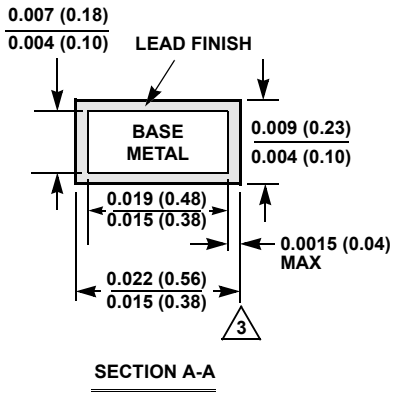
K8.A

8 LEAD CERAMIC METAL SEAL FLATPACK PACKAGE

Rev 4, 12/14







NOTES:

1. Index area: A notch or a pin one identification mark shall be located adjacent to pin one and shall be located within the shaded area shown. The manufacturer's identification shall not be used as a pin one identification mark. Alternately, a tab may be used to identify pin one.
2. If a pin one identification mark is used in addition to or instead of a tab, the limits of the tab dimension do not apply.
3. The maximum limits of lead dimensions (section A-A) shall be measured at the centroid of the finished lead surfaces, when solder dip or tin plate lead finish is applied.
4. Measure dimension at all four corners.
5. For bottom-brazed lead packages, no organic or polymeric materials shall be molded to the bottom of the package to cover the leads.
6. Dimension shall be measured at the point of exit (beyond the meniscus) of the lead from the body. Dimension minimum shall be reduced by 0.0015 inch (0.038mm) maximum when solder dip lead finish is applied.
7. Dimensioning and tolerancing per ANSI Y14.5M - 1982.
8. Controlling dimension: INCH.
