LOW EMI CLOCK GENERATOR

MK5812

Description

The MK5812 device generates a low EMI output clock from a clock or crystal input. The device is designed to dither a high emissions clock to lower EMI in consumer applications. Using IDT's proprietary mix of analog and digital Phase-Locked Loop (PLL) technology, the device spreads the frequency spectrum of the output and reduces the frequency amplitude peaks by several dB. The MK5812 offers both centered and down spread from a high-speed clock input. The multiplier is a fixed 2x.

For different multiplier configurations, use the MK5811 (1x) or MK5814 (4x).

IDT offers many other clocks for computers and computer peripherals. Consult IDT when you need to remove crystals and oscillators from your board.

Features

- Packaged in 8-pin SOIC
- Provides a spread spectrum output clock
- Supports flat panel controllers
- Accepts a clock or crystal input (provides same frequency dithered output)
- Input frequency range of 4 to 32 MHz
- Output frequency range of 8 to 64 MHz
- 2X frequency multiplication
- Center and down spread
- Peak reduction by 8 dB to 16 dB typical on 3rd through 19th odd harmonics
- Low EMI feature can be disabled
- Includes power down
- Operating voltage of 3.3 V
- Advanced, low-power CMOS process

Pin Descriptions

Pin Number	Pin Name	Pin Type	Pin Description
1	X1/ICLK	Input	Connect to 4-32 MHz crystal or clock.
2	GND	Power	Connect to ground.
3	S1	Input	Function select 1 input. Selects spread amount and direction per table above. (default-internal mid-level).
4	S0	Input	Function select 0 input. Selects spread amount and direction per table above. (default-internal mid-level).
5	SSCLK	Output	Clock output with Spread spectrum
6	FRSEL	Input	Function select for input frequency range. Default to mid level “M”.
7	VDD	Power	Connect to +3.3 V.
8	X2	XO	Crystal connection to 4-32 MHz crystal. Leave unconnected for clock

External Components

The MK5812 requires a minimum number of external components for proper operation.

Decoupling Capacitor

A decoupling capacitor of 0.01µF must be connected between VDD and GND on pins 7 and 2. Connect the capacitor as close to these pins as possible. For optimum device performance, mount the decoupling capacitor on the component side of the PCB. Avoid the use of vias in the decoupling circuit.

Series Termination Resistor

Use series termination when the PCB trace between the clock output and the load is over 1 inch. To series terminate a 50Ω trace (a commonly used trace impedance), place a 33Ω resistor in series with the clock line. Place the resistor as close to the clock output pin as possible. The nominal impedance of the clock output is 20Ω

Tri-level Select Pin Operation

The S1 and S0 select pins are tri-level, meaning that they have three separate states to make the selections shown in the table on page 2. To select the M (mid) level, the connection to these pins must be eliminated by either floating them originally, or tri-stating the GPIO pins which drive the select pins.

PCB Layout Recommendations

For optimum device performance and lowest output phase noise, observe the following guidelines:

1) Mount the 0.01µF decoupling capacitor on the component side of the board as close to the VDD pin as possible. No vias should be used between the decoupling capacitor and VDD pin. The PCB trace to the VDD pin and the PCB trace to the ground via should be kept as short as possible.

2) To minimize EMI, place the 33Ω series-termination resistor (if needed) close to the clock output.

3) An optimum layout is one with all components on the same side of the board, thus minimizing vias through other signal layers. Other signal traces should be routed away from the MK5812 device. This includes signal traces located underneath the device, or on layers adjacent to the ground plane layer used by the device.

Crystal Information

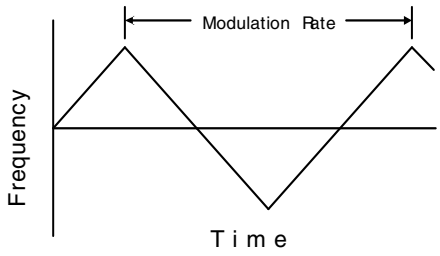
The crystal used should be a fundamental mode (do not use third overtone), parallel resonant crystal. To optimize the initial accuracy, connect crystal capacitors from pins X1 to ground and X2 to ground. The value of these capacitors is given by the following equation:

$$\text{Crystal caps (pF)} = (C_L - 6) \times 2$$

In the equation, C_L is the crystal load capacitance. For example, a crystal with a 16 pF load capacitance uses two 20 pF [(16-6) x 2] capacitors.

Spread Spectrum Profile

The MK5812 is a low EMI clock generator using a optimized frequency slew rate algorithm to facilitate down stream tracking of zero delay buffers and other PLL devices.



Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the MK5812. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device, at these or any other conditions, above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.
