

The Freescale Semiconductor, Inc. MPC9448 is a 3.3 V or 2.5 V compatible, 1:12 clock fanout buffer targeted for high performance clock tree applications. With output frequencies up to 350 MHz and output skews less than 150 ps, the device meets the needs of most demanding clock applications.

### Features

- 12 LVC MOS compatible clock outputs
- Selectable LVC MOS and differential LVPECL compatible clock inputs
- Maximum clock frequency of 350 MHz
- Maximum clock skew of 150 ps
- Synchronous output stop in logic low state eliminates output runt pulses
- High-impedance output control
- 3.3 V or 2.5 V power supply
- Drives up to 24 series terminated clock lines
- Ambient temperature range -40°C to +85°C
- 32-Lead LQFP packaging, Pb-free
- Supports clock distribution in networking, telecommunication and computing applications
- Pin and function compatible to MPC948
- For drop in replacement part use [83948AYI-147](#)

### Functional Description

The MPC9448 is specifically designed to distribute LVC MOS compatible clock signals up to a frequency of 350 MHz. Each output provides a precise copy of the input signal with a near zero skew. The outputs buffers support driving of 50 Ω terminated transmission lines on the incident edge. Each output is capable of driving either one parallel terminated or two series terminated transmission lines.

Two selectable, independent clock inputs are available, providing support of LVC MOS and differential LVPECL clock distribution systems. The MPC9448 CLK\_STOP control is synchronous to the falling edge of the input clock. It allows the start and stop of the output clock signal only in a logic low state, thus eliminating potential output runt pulses. Applying the OE control will force the outputs into high-impedance mode.

All inputs have an internal pull-up or pull-down resistor preventing unused and open inputs from floating. The device supports a 2.5 V or 3.3 V power supply and an ambient temperature range of -40°C to +85°C. The MPC9448 is pin and function compatible but performance-enhanced to the MPC948.

Table 1. Function Table

Control	Default	0	1
CLK_SEL	1	PECL differential input selected	CCLK input selected
OE	1	Outputs disabled (high-impedance state) <sup>(1)</sup>	Outputs enabled
CLK_STOP	1	Outputs synchronously stopped in logic low state	Outputs active

1. OE = 0 will high-impedance tristate all outputs independent on CLK\_STOP.

Table 2. Pin Configurations

Pin	I/O	Type	Function
PCLK, PCLK̄	Input	LVPECL	Clock signal input
CCLK	Input	LVCMS	Alternative clock signal input
CLK_SEL	Input	LVCMS	Clock input select
CLK_STOP	Input	LVCMS	Clock output enable/disable
OE	Input	LVCMS	Output enable/disable (high-impedance tristate)
Q0-11	Output	LVCMS	Clock outputs
GND	Supply	Ground	Negative power supply (GND)
VCC	Supply	VCC	Positive power supply for I/O and core. All VCC pins must be connected to the positive power supply for correct operation

**Table 3. Absolute Maximum Ratings<sup>(1)</sup>**

Symbol	Characteristics	Min	Max	Unit
$V_{CC}$	Supply Voltage	-0.3	3.9	V
$V_{IN}$	DC Input Voltage	-0.3	$V_{CC} + 0.3$	V
$V_{OUT}$	DC Output Voltage	-0.3	$V_{CC} + 0.3$	V
$I_{IN}$	DC Input Current		$\pm 20$	mA
$I_{OUT}$	DC Output Current		$\pm 50$	mA
$T_{Stor}$	Storage temperature	-65	125	°C

1. Absolute maximum continuous ratings are those maximum values beyond which damage to the device may occur. Exposure to these conditions or conditions beyond those indicated may adversely affect device reliability. Functional operation at absolute-maximum-rated conditions is not implied.

**Table 4. General Specifications**

Symbol	Characteristics	Min	Typ	Max	Unit	Condition
$V_{TT}$	Output Termination Voltage		$V_{CC} \div 2$		V	
MM	ESD Protection (Machine model)	200			V	
HBM	ESD Protection (Human body model)	2000			V

$Z_{OUT}$	Output Impedance		17		$\Omega$	
$I_{CCQ}^{(4)}$	Maximum Quiescent Supply Current			2.0	mA	All $V_{CC}$ Pins

- $V_{CMR}$  (DC) is the crosspoint of the differential input signal. Functional operation is obtained when the crosspoint is within the  $V_{CMR}$  range and the input swing lies within the  $V_{PP}$  (DC) specification.
- Input pull-up / pull-down resistors influence input current.
- The MPC9448 is capable of driving 50  $\Omega$  transmission lines on the incident edge. Each output drives one 50  $\Omega$  parallel terminated transmission line to a termination voltage of  $V_{TT}$ . Alternatively, the device drives up to two 50  $\Omega$  series terminated transmission lines (for  $V_{CC} = 3.3$  V) or one 50  $\Omega$  series terminated transmission line (for  $V_{CC} = 2.5$  V).
- $I_{CCQ}$  is the DC current consumption of the device with all outputs open and the input in its default state or open.

**Table 6. AC Characteristics** ( $V_{CC} = 3.3 \text{ V} \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )<sup>(1)</sup>

Symbol	Characteristics		Min	Typ	Max	Unit	Condition

1. AC characteristics apply for parallel output termination of  $50 \Omega$  to  $V_{TT}$ .
2.  $V_{CMR}$  (AC) is the crosspoint of the differential input signal. Normal AC operation is obtained when the crosspoint is within the  $V_{CMR}$  range and the input swing lies within the  $V_{PP}$  (AC) specification. Violation of  $V_{CMR}$  or  $V_{PP}$  impacts  $t_{PLH/HL}$  and  $t_{SK(PP)}$ .
3. Violation of the 1.0 ns maximum input rise and fall time limit will affect the device propagation delay, device-to-device skew, reference input pulse width, output duty cycle and maximum frequency specifications.
4. Output pulse skew is the absolute difference of the propagation delay times:  $|t_{pLH} - t_{pHL}|$ .

**Table 7. DC Characteristics** ( $V_{CC} = 2.5 \text{ V} \pm 5\%$ ,  $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ )

Symbol	Characteristics		Min	Typ	Max	Unit	Condition

$t_r, t_f$	Output Rise/Fall Time		0.1		1.0	ns	0.6 to 1.8 V

1. AC characteristics apply for parallel output termination of  $50 \Omega$  to  $V_{TT}$ .
2.  $V_{CMR}$  (AC) is the crosspoint of the differential input signal. Normal AC operation is obtained when the crosspoint is within the  $V_{CMR}$  range and the input swing lies within the  $V_{PP}$  (AC) specification. Violation of  $V_{CMR}$  or  $V_{PP}$  impacts  $t_{PLH/HL}$  and  $t_{SK(PP)}$ .
3. Violation of the 1.0 ns maximum input rise and fall time limit will affect the device propagation delay, device-to-device skew, reference input pulse width, output duty cycle and maximum frequency specifications.
4. Output pulse skew is the absolute difference of the propagation delay times:  $| t_{PLH} - t_{PHL} |$ .

## APPLICATION INFORMATION

Figure 3. Output Clock Stop (CLK\_STOP) Timing Diagram

#### Driving Transmission Lines

The MPC9448 clock driver was designed to drive high-speed signals in a terminated transmission line environment. To provide the optimum flexibility to the user, the output drivers were designed to exhibit the lowest impedance possible. With an output impedance of  $17\Omega$  ( $V_{CC} = 3.3\text{ V}$ ), the outputs can drive either parallel or series terminated transmission lines. For more information on transmission lines, the reader is referred to Freescale application note AN1091. In most high performance clock networks, point-to-point distribution of signals is the method of choice. In a point-to-point scheme, either series terminated or parallel terminated transmission lines can be used. The parallel technique terminates the signal at the end of the line with a  $50\Omega$  resistance to  $V_{CC}/2$ .

Figure 4. Single versus Dual Transmission Lines

This technique draws a fairly high level of DC current, and thus, only a single terminated line can be driven by each output of the MPC9448 clock driver. For the series terminated case, however, there is no DC current draw; thus, the outputs can drive multiple series terminated lines. Figure 4 illustrates an output driving a single series terminated line versus two series terminated lines in parallel. When taken to its extreme, the fanout of the MPC9448 clock driver is effectively doubled due to its capability to drive multiple lines at  $V_{CC} = 3.3\text{ V}$ .

Figure 5. Single versus Dual Line Termination Waveforms

The waveform plots in Figure 5 show the simulation results of an output driving a single line versus two lines. In both cases, the drive capability of the MPC9448 output buffer is more than sufficient to drive  $50\Omega$  transmission lines on the incident edge. Note from the delay measurements in the simulations, a delta of only 43 ps exists between the two differently loaded outputs. This suggests that the dual line driving need not be used exclusively to maintain the tight output-to-output skew of the MPC9448. The output waveform in Figure 5 shows a step in the waveform. This step is caused by the impedance mismatch seen looking into the driver. The parallel combination of the  $33\Omega$  series resistor plus the output impedance does not match the parallel combination of the line impedances. The voltage wave launched down the two lines will equal:

$$\begin{aligned}
 V_L &= V_S (Z_0 \div (R_S + R_0 + Z_0)) \\
 Z_0 &= 50\Omega \parallel 50\Omega \\
 R_S &= 33\Omega \parallel 33\Omega \\
 R_0 &= 17\Omega \\
 V_L &= 3.0 (25 \div (16.5 + 17 + 25)) \\
 &= 1.28\text{ V}
 \end{aligned}$$

At the load end, the voltage will double, due to the near unity reflection coefficient, to  $2.5\text{ V}$ . It will then increment towards the quiescent  $3.0\text{ V}$  in steps separated by one round trip delay (in this case  $4.0\text{ ns}$ ).

Since this step is well above the threshold region, it will not cause any false clock triggering; however, designers may be uncomfortable with unwanted reflections on the line. To better match the impedances when driving multiple lines, the situation in Figure 6 should be used. In this case, the series terminating resistors are reduced such that when the parallel combination is added to the output buffer impedance, the line impedance is perfectly matched.

Figure 6. Optimized Dual Line Termination

#### Power Consumption of the MPC9448 and Thermal Management

The MPC9448 AC specification is guaranteed for the entire operating frequency range up to 350 MHz. The MPC9448 power consumption, and the associated long-term reliability, may decrease the maximum frequency limit, depending on operating conditions such as clock frequency, supply voltage, output loading, ambient temperature, vertical convection and thermal conductivity of package and board. This section describes the impact of these parameters on the junction temperature and gives a guideline to estimate the MPC9448 die junction temperature and the associated device reliability. For a complete analysis of power consumption as a function of operating conditions and associated long term device reliability, please refer to the Freescale application note AN1545. According the AN1545, the long-term device reliability is a function of the die junction temperature:

Table 9. Die Junction Temperature and MTBF

Junction Temperature (°C)	MTBF (Years)
100	20.4
110	9.1
120	4.2
130	2.0

Increased power consumption will increase the die junction temperature and impact the device reliability (MTBF). According to the system-defined tolerable MTBF, the die junction temperature of the MPC9448 needs to be controlled, and the thermal impedance of the board/package should be optimized. The power dissipated in the MPC9448 is represented in equation 1.

Where  $I_{CCQ}$  is the static current consumption of the MPC9448,  $C_{PD}$  is the power dissipation capacitance per output.  $(M)\Sigma C_L$  represents the external capacitive output load, and  $N$  is the number of active outputs ( $N$  is always 12 in case of the MPC9448). The MPC9448 supports driving transmission lines to maintain high signal integrity and tight timing parameters. Any transmission line will hide the lumped capacitive load at the end of the board trace, therefore,  $\Sigma C_L$  is zero for controlled transmission line systems and can be eliminated from equation 1. Using parallel termination output, termination results in equation 2 for power dissipation.

In equation 2,  $P$  stands for the number of outputs with a parallel or thevenin termination.  $V_{OL}$ ,  $I_{OL}$ ,  $V_{OH}$  and  $I_{OH}$  are a function of the output termination technique, and  $DC_Q$  is the clock signal duty cycle. If transmission lines are used,  $\Sigma C_L$  is zero in equation 2 and can be eliminated. In general, the use of controlled transmission line techniques eliminates the impact of the lumped capacitive loads at the end lines and greatly reduces the power dissipation of the device. Equation 3 describes the die junction temperature  $T_J$  as a function of the power consumption.

Where  $R_{thja}$  is the thermal impedance of the package (junction to ambient), and  $T_A$  is the ambient temperature. According to Figure 9, the junction temperature can be used to estimate the long-term device reliability. Further, combining equation 1 and equation 2 results in a maximum operating frequency for the MPC9448 in a series terminated transmission line system, equation 4.

$$P_{TOT} = [I_{CCQ} + V_{CC} \cdot f_{CLOCK} \cdot (N \cdot C_{PD} + \sum_M C_L)] \cdot V_{CC} \quad \text{Equation 1}$$

$$P_{TOT} = V_{CC} \cdot [I_{CCQ} + V_{CC} \cdot f_{CLOCK} \cdot (N \cdot C_{PD} + \sum_M C_L)] + \sum_P [DC_Q \cdot I_{OH} \cdot (V_{CC} - V_{OH}) + (1 - DC_Q) \cdot I_{OL} \cdot V_{OL}] \quad \text{Equation 2}$$

$$T_J = T_A + P_{TOT} \cdot R_{thja} \quad \text{Equation 3}$$

$$f_{CLOCK,MAX} = \frac{1}{C_{PD} \cdot N \cdot V_{CC}^2} \cdot \left[ \frac{T_{j,MAX} - T_A}{R_{thja}} - (I_{CCQ} \cdot V_{CC}) \right] \quad \text{Equation 4}$$

$T_{J,MAX}$  should be selected according to the MTBF system requirements, and Figure 9  $R_{thja}$  can be derived from Figure 10. The  $R_{thja}$  represent data based on 1S2P boards. Using 2S2P boards will result in a lower thermal impedance than indicated below.

**Table 10. Thermal Package Impedance of the 32Id LQFP**

Convection, lFPM	$R_{thja}$ (1P2S board), °C/W	$R_{thja}$ (2P2S board), °C/W
Still air	86	61
100 lFpm	76	56
200 lFpm	71	54
300 lFpm	68	53
400 lFpm	66	52
500 lFpm	60	49

If the calculated maximum frequency is below 350 MHz, it becomes the upper clock speed limit for the given application conditions. The following eight derating charts describe the safe frequency operation range for the MPC9448. The charts were calculated for a maximum tolerable die junction temperature of 110°C (120°C), corresponding to an estimated MTBF of 9.1 years (4 years), a supply voltage of 3.3 V and series terminated transmission line or capacitive loading. Depending on a given set of these operating conditions and the available device convection, a decision on the maximum operating frequency can be made.

## PACKAGE DIMENSIONS

NOTES:

1. DIMENSIONS ARE IN MILLIMETERS.
2. INTERPRET DIMENSIONS AND TOLERANCES PER ASME Y14.5M, 1994.
3. DATUMS A, B, AND D TO BE DETERMINED AT DATUM PLANE H.
4. DIMENSIONS D AND E TO BE DETERMINED AT SEATING PLANE C.
5. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08-mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD OR PROTRUSION: 0.07-mm.
6. DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25-mm PER SIDE. D1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH.
7. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
8. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.1-mm AND 0.25-mm FROM THE LEAD TIP.
