3.3 V/2.5 V 1:15 PECL/LVCMOS Clock Fanout Buffer

MPC9449

PRODUCT DISCONTINUATION NOTICE - LAST TIME BUY EXPIRES SEPTEMBER 7, 2016

DATASHEET

The MPC9449 is a 3.3 V or 2.5 V compatible, 1:15 clock fanout buffer targeted for high performance clock tree applications. With output frequencies up to 200 MHz and output skews less than 200 ps the device meets the needs of the most demanding clock applications.

3.5 V/2.5 V 1:15
PECL/LVCMOS
CLOCK FANOUT BUFFER

AE SUFFIX
52-LEAD LQFP PACKAGE
Pb-FREE PACKAGE
CASE 848D-03

Features

- 15 LVCMOS compatible clock outputs
- Two selectable LVCMOS and one differential LVPECL compatible clock inputs
- Selectable output frequency divider (divide-by-one and divide-by-two)
- Maximum clock frequency of 200 MHz
- Maximum clock skew of 200 ps
- High-impedance output control
- 3.3 V or 2.5 V power supply
- Drives up to 30 series terminated clock lines
- Ambient temperature range –40°C to +85°C
- 52-lead LQFP packaging, Pb-free
- Supports clock distribution in networking, telecommunication and computing applications
- Pin and function compatible to MPC949
- For functional replacement use 8T49N285A

Functional Description

The MPC9449 is specifically designed to distribute LVCMOS compatible clock signals up to a frequency of 200 MHz. The device has 15 identical outputs, organized in four output banks. Each output bank provides a retimed or frequency divided copy of the input signal with a near zero skew. The output buffer supports driving of 50 Ω terminated transmission lines on the incident edge: each output is capable of driving either one parallel terminated or two series terminated transmission lines.

Two selectable LVCMOS compatible clock inputs are available. This feature supports redundant differential clock sources. In addition, the MPC9449 accepts one differential PECL clock signal. The DSELx pins choose between division of the input reference frequency by one or two. The frequency divider can be set individually for each of the four output banks. Applying the OE control will force the outputs into high-impedance mode.

All inputs have an internal pull-up or pull-down resistor preventing unused and open inputs from floating. The device supports a 2.5 V or 3.3 V power supply and an ambient temperature range of –40°C to +85°C. The MPC9449 is pin and function compatible but performance-enhanced to the MPC949. The device is packaged in a 52-lead LQFP package.

1. AC characteristics apply for parallel output termination of 50 Ω to V_{TT}.
2. V_{CMR} (AC) is the crosspoint of the differential input signal. Normal AC operation is obtained when the crosspoint is within the V_{CMR} range and the input swing lies within the V_{PP} (AC) specification. Violation of V_{CMR} or V_{PP} impacts propagation delay.
3. An input rise/fall time greater than that specified may be used, but AC characteristics are not guaranteed under such a condition.

APPLICATIONS INFORMATION

Driving Transmission Lines

The MPC9449 clock driver was designed to drive high speed signals in a terminated transmission line environment. To provide the optimum flexibility to the user the output drivers were designed to exhibit the lowest impedance possible. With an output impedance of less than 20 Ω the drivers can drive either parallel or series terminated transmission lines. For more information on transmission lines the reader is referred to Freescale Semiconductor application note AN1091. In most high performance clock networks point-to-point distribution of signals is the method of choice. In a point-to-point scheme either series terminated or parallel terminated transmission lines can be used. The parallel technique terminates the signal at the end of the line with a 50 Ω resistance to V_{CC}÷2.

This technique draws a fairly high level of DC current and thus only a single terminated line can be driven by each output of the MPC9449 clock driver. For the series terminated case however there is no DC current draw, thus the outputs can drive multiple series terminated lines. Figure 3 illustrates an output driving a single series terminated line versus two series terminated lines in parallel. When taken to its extreme the fanout of the MPC9449 clock driver is effectively doubled due to its capability to drive multiple lines.

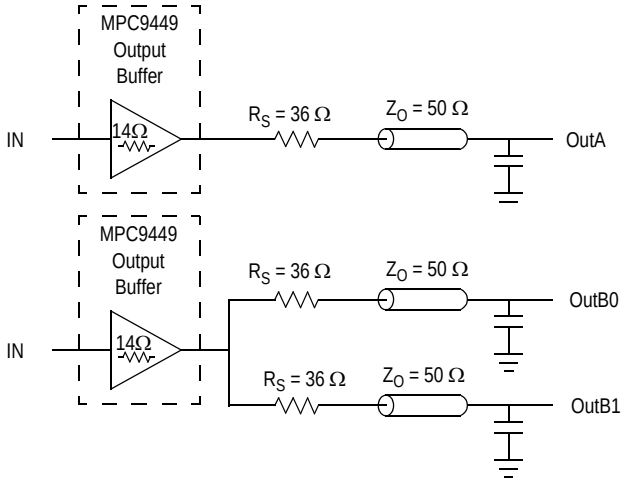

Figure 3. Single versus Dual Transmission Lines

The waveform plots in Figure 4 show the simulation results of an output driving a single line versus two lines. In both cases the drive capability of the MPC9449 output buffer is more than sufficient to drive 50 Ω transmission lines on the incident edge. Note from the delay measurements in the simulations a delta of only 43 ps exists between the two differently loaded outputs. This suggests that the dual line driving need not be used exclusively to maintain the tight output-to-output skew of the MPC9449. The output waveform in Figure 4 shows a step in the waveform, this step is caused by the impedance mismatch seen looking into the driver. The parallel combination of the 36 Ω series resistor plus the output impedance does not match the parallel combination of the line impedances. The voltage wave launched down the two lines will equal:

$$V_L = V_S (Z_0 \div (R_S + R_0 + Z_0))$$
$$Z_0 = 50\ \Omega \parallel 50\ \Omega$$
$$R_S = 36\ \Omega \parallel 36\ \Omega$$
$$R_0 = 14\ \Omega$$
$$V_L = 3.0\ (25 \div (18 + 17 + 25)$$
$$= 1.31\ V$$

At the load end the voltage will double, due to the near unity reflection coefficient, to 2.6 V. It will then increment towards the quiescent 3.0 V in steps separated by one round trip delay (in this case 4.0 ns).

1. Final skew data pending specification.

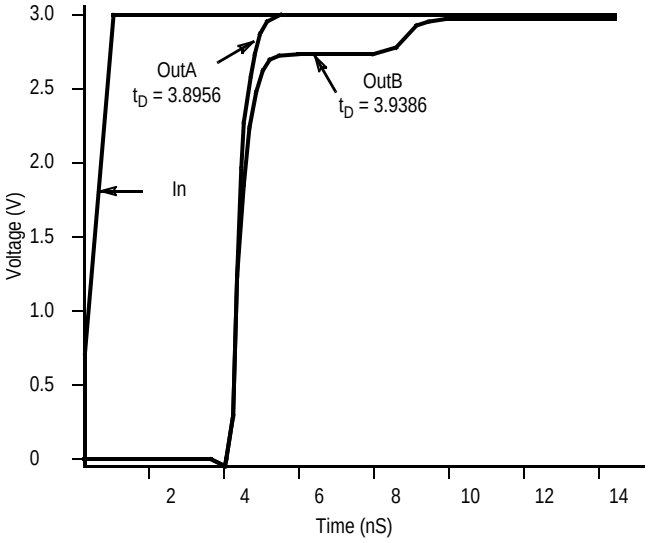

Figure 4. Single versus Dual Waveforms

Since this step is well above the threshold region it will not cause any false clock triggering, however designers may be uncomfortable with unwanted reflections on the line. To better match the impedances when driving multiple lines the situation in Figure 5 should be used. In this case the series terminating resistors are reduced such that when the parallel combination is added to the output buffer impedance the line impedance is perfectly matched.
