User's Manual: Hardware

32-bit MCU

Renesas Advanced (RA) Family

Renesas RA6 Series

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (<http://www.renesas.com>).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

| Component | Document Type | Description |
|-------------------------|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Microcontrollers | Data sheet | Features, overview, and electrical characteristics of the MCU |
| | User's Manual: Hardware | MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions |
| | Application Notes | Technical notes, board design guidelines, and software migration information |
| | Technical Update (TU) | Preliminary reports on product specifications such as restriction and errata |
| Software | User's Manual: Software | API reference and programming information |
| | Application Notes | Project files, guidelines for software programming, and application examples to develop embedded software applications |
| Tools & Kits, Solutions | User's Manual: Development Tools | User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE) |
| | User's Manual: Software | |
| | Quick Start Guide | |
| | Application Notes | Project files, guidelines for software programming, and application examples to develop embedded software applications |

4. Numbering Notation

The following numbering notation is used throughout this manual:

| Example | Description |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 011b | Binary number. For example, the binary equivalent of the number 3 is 011b. |
| 0x1F | Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h". |
| 1234 | Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix. |

5. Typographic Notation

The following typographic notation is used throughout this manual:

| Example | Description |
|-------------|------------------------------------------------------------------------------------------------------|
| AAA.BBB.CCC | Periods separated a function module symbol (AAA), register symbol (BBB), and bit field symbol (CCC). |
| AAA.BBB | A period separated a function module symbol (AAA) and register symbol (BBB). |
| BBB.DDD | A period separated a register symbol (BBB) and bit field symbol (DDD). |
| EEE[3:0] | Numbers in brackets expresses a bit number. For example, EEE[3:0] occupies bits 3 to 0. |

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

| Symbol | Name | Description |
|--------|--------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| b | Binary Digit | Single 0 or 1 |
| B | Byte | This unit is generally used for memory specification of the MCU and address space. |
| k | kilo- | $1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual. |
| K | Kilo- | $1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual. |

7. Special Terms

The following terms have special meanings.

| Term | Description |
|------|---------------------------------------------------------------------------------|
| NC | Not connected pin. This pin should be left floating unless specified otherwise. |
| Hi-Z | High impedance. |
| x | Don't care or undefined. |

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XX.X.X {register/name} : {register/description}

(1) Function module symbol, register symbol, and address assignment

Function module symbol, {peripheral/name}, register symbol, {register/name}, and address assignment of this register are generally expressed. Base Address and Offset Address mean {register/name} : {register/description} of {peripheral/name} is assigned to address {peripheral/baseAddress} + {register/addressOffset}.

(2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

0: Indicates that the value is 0 after a reset.

1: Indicates that the value is 1 after a reset.

x: Indicates that the value is undefined after a reset.

(4) Symbol

{field/name} indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field, {field/description}, and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

R/W: The bit field is readable and writable.

R: The bit field is readable only. Writing to this bit field has no effect.

W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

| Abbreviation | Description |
|--------------|---------------------------------------------|
| AES | Advanced Encryption Standard |
| AHB | Advanced High-performance Bus |
| AHB-AP | AHB Access Port |
| APB | Advanced Peripheral Bus |
| ARC | Alleged RC |
| ATB | Advanced Trace Bus |
| BCD | Binary Coded Decimal |
| BSDL | Boundary Scan Description Language |
| DES | Data Encryption Standard |
| DSA | Digital Signature Algorithm |
| ETB | Embedded Trace Buffer |
| ETM | Embedded Trace Macrocell |
| FLL | Frequency Locked Loop |
| FPU | Floating Point Unit |
| HMI | Human Machine Interface |
| IrDA | Infrared Data Association |
| LSB | Least Significant Bit |
| MSB | Most Significant Bit |
| NVIC | Nested Vector Interrupt Controller |
| PC | Program Counter |
| PFS | Port Function Select |
| PLL | Phase Locked Loop |
| POR | Power-on reset |
| PWM | Pulse Width Modulation |
| RSA | Rivest Shamir Adleman |
| SHA | Secure Hash Algorithm |
| S/H | Sample and Hold |
| SP | Stack Pointer |
| SWD | Serial Wire Debug |
| SW-DP | Serial Wire-Debug Port |
| TRNG | True Random Number Generator |
| UART | Universal Asynchronous Receiver/Transmitter |
| VCO | Voltage Controlled Oscillator |

|------------|---------------------------------------------------------------------------|-------------|
| 27.2.1 | List of Registers | 988 |
| 27.2.2 | BCTL : Bus Control Register | 990 |
| 27.2.3 | RSTCTL : Reset Control Register | 990 |
| 27.2.4 | PRSST : Present State Register | 991 |
| 27.2.5 | BFCTL : Bus Function Control Register | 993 |
| 27.2.6 | SVCTL : Slave Control Register | 995 |
| 27.2.7 | REFCKCTL : Reference Clock Control Register | 996 |
| 27.2.8 | STDBR : Standard Bit Rate Register | 997 |
| 27.2.9 | EXTBR : Extended Bit Rate Register | 998 |
| 27.2.10 | BFRECDT : Bus Free Condition Detection Time Register | 999 |
| 27.2.11 | OUTCTL : Output Control Register | 999 |
| 27.2.12 | INCTL : Input Control Register | 1001 |
| 27.2.13 | TMOCTL : Timeout Control Register | 1002 |
| 27.2.14 | WUCTL : Wake Up Unit Control Register | 1003 |
| 27.2.15 | ACKCTL : Acknowledge Control Register | 1004 |
| 27.2.16 | SCSTRCTL : SCL Stretch Control Register | 1005 |
| 27.2.17 | CNDCTL : Condition Control Register | 1006 |
| 27.2.18 | NTDTBP0/NTDTBP0_BY : Normal Transfer Data Buffer Port Register 0 | 1007 |
| 27.2.19 | BST : Bus Status Register | 1008 |
| 27.2.20 | BSTE : Bus Status Enable Register | 1011 |
| 27.2.21 | BIE : Bus Interrupt Enable Register | 1012 |
| 27.2.22 | BSTFC : Bus Status Force Register | 1013 |
| 27.2.23 | NTST : Normal Transfer Status Register | 1014 |
| 27.2.24 | NTSTE : Normal Transfer Status Enable Register | 1015 |
| 27.2.25 | NTIE : Normal Transfer Interrupt Enable Register | 1016 |
| 27.2.26 | NTSTFC : Normal Transfer Status Force Register | 1016 |
| 27.2.27 | BCST : Bus Condition Status Register | 1017 |
| 27.2.28 | SVST : Slave Status Register | 1018 |
| 27.2.29 | WUST : Wake Up Unit Operating Status Register | 1021 |
| 27.2.30 | SDATBASy : Slave Device Address Table Basic Register y (y = 0 to 2) | 1021 |
| 27.2.31 | SVDVADy : Slave Device Address Register y (y = 0 to 2) | 1022 |
| 27.2.32 | BITCNT : Bit Count Register | 1023 |
| 27.2.33 | PRSTDBG : Present State Debug Register | 1024 |
| 27.3 | Operation | 1024 |
| 27.3.1 | Details of Function | 1024 |
| 27.3.2 | Operation | 1066 |
| 27.4 | Interrupt Sources | 1072 |
| 27.4.1 | Overview | 1072 |
| 27.4.2 | Buffer Operation for Buffer Full/Empty Interrupts | 1073 |
| 27.5 | Event Link Output | 1073 |
| 27.5.1 | Interrupt Handling and Event Linking | 1073 |

| 28.1 | Overview | 1078 |
| 28.1.1 | CANFD Module | 1078 |

| | | |
|---------|-----------------------------------------------------------------------------------|------|
| 28.1.2 | Clock restriction..... | 1080 |
| 28.2 | Register Descriptions | 1080 |
| 28.2.1 | Register Table | 1080 |
| 28.2.2 | Legend | 1081 |
| 28.2.3 | CFDC0NCFG : Channel 0 Nominal Bitrate Configuration Register | 1084 |
| 28.2.4 | CFDC0CTR : Channel 0 Control Register | 1085 |
| 28.2.5 | CFDC0STS : Channel 0 Status Register | 1089 |
| 28.2.6 | CFDC0ERFL : Channel 0 Error Flag Register | 1092 |
| 28.2.7 | CFDC0DCFG : Channel 0 Data Bitrate Configuration Register | 1097 |
| 28.2.8 | CFDC0FDCFG : Channel 0 CANFD Configuration Register | 1099 |
| 28.2.9 | CFDC0FDCTR : Channel 0 CANFD Control Register | 1101 |
| 28.2.10 | CFDC0FDSTS : Channel 0 CANFD Status Register | 1102 |
| 28.2.11 | CFDC0FDCRC : Channel 0 CANFD CRC Register..... | 1104 |
| 28.2.12 | CFDGCFG : Global Configuration Register | 1105 |
| 28.2.13 | CFDGCTR : Global Control Register | 1107 |
| 28.2.14 | CFDGSTS : Global Status Register | 1108 |
| 28.2.15 | CFDGERFL : Global Error Flag Register | 1109 |
| 28.2.16 | CFDGTINTSTS : Global TX Interrupt Status Register | 1111 |
| 28.2.17 | CFDGTSC : Global Timestamp Counter Register..... | 1112 |
| 28.2.18 | CFDGALECTR : Global Acceptance Filter List Entry Control Register | 1113 |
| 28.2.19 | CFDGAFLCFG : Global Acceptance Filter List Configuration Register | 1113 |
| 28.2.20 | CFDGAFLIDr : Global Acceptance Filter List ID Registers (r = 1 to 16) | 1114 |
| 28.2.21 | CFDGAFLMr : Global Acceptance Filter List Mask Registers (r = 1 to 16)..... | 1115 |
| 28.2.22 | CFDGAFLP0r : Global Acceptance Filter List Pointer 0 Registers (r = 1 to 16)..... | 1116 |
| 28.2.23 | CFDGAFLP1r : Global Acceptance Filter List Pointer 1 Registers (r = 1 to 16)..... | 1118 |
| 28.2.24 | CFDRMNB : RX Message Buffer Number Register | 1119 |
| 28.2.25 | CFDRMND : RX Message Buffer New Data Register | 1120 |
| 28.2.26 | CFDRFCCa : RX FIFO Configuration/Control Registers a (a = 0 to 1) | 1120 |
| 28.2.27 | CFDRFSTSa : RX FIFO Status Registers a (a = 0 to 1) | 1122 |
| 28.2.28 | CFDRFPCTRa : RX FIFO Pointer Control Registers a (a = 0 to 1) | 1124 |
| 28.2.29 | CFDCFCC : Common FIFO Configuration/Control Register..... | 1124 |
| 28.2.30 | CFDCFSTS : Common FIFO Status Register..... | 1127 |
| 28.2.31 | CFDCFPCTR : Common FIFO Pointer Control Register | 1129 |
| 28.2.32 | CFDFESTS : FIFO Empty Status Register | 1130 |
| 28.2.33 | CFDFFSTS : FIFO Full Status Register | 1131 |
| 28.2.34 | CFDFMSTS : FIFO Message Lost Status Register | 1131 |
| 28.2.35 | CFDRFISTS : RX FIFO Interrupt Flag Status Register..... | 1132 |
| 28.2.36 | CFDCDTCT : DMA Transfer Control Register | 1133 |
| 28.2.37 | CFDCDTSTS : DMA Transfer Status Register..... | 1133 |
| 28.2.38 | CFDTMCi : TX Message Buffer Control Registers i (i = 0 to 3)..... | 1134 |
| 28.2.39 | CFDTMSTSj : TX Message Buffer Status Registers j (j = 0 to 3)..... | 1136 |
| 28.2.40 | CFDTMTRSTS : TX Message Buffer Transmission Request Status Register | 1137 |
| 28.2.41 | CFDTMTARSTS : TX Message Buffer Transmission Abort Request Status Register | 1137 |
| 28.2.42 | CFDTMTCSTS : TX Message Buffer Transmission Completion Status Register | 1138 |
| 28.2.43 | CFDTMTASTS : TX Message Buffer Transmission Abort Status Register | 1139 |
| 28.2.44 | CFDTMIEC : TX Message Buffer Interrupt Enable Configuration Register..... | 1139 |
| 28.2.45 | CFDTXQCC : TX Queue Configuration/Control Register | 1140 |

| | | |
|---------|------------------------------------------------------------------------------|------|
| 28.2.46 | CFDTXQSTS : TX Queue Status Register | 1141 |
| 28.2.47 | CFDTXQPCTR : TX Queue Pointer Control Register | 1142 |
| 28.2.48 | CFDTHLCC : TX History List Configuration/Control Register | 1143 |
| 28.2.49 | CFDTHLSTS : TX History List Status Register | 1144 |
| 28.2.50 | CFDTHLACC0 : TX History List Access Register 0 | 1145 |
| 28.2.51 | CFDTHLACC1 : TX History List Access Register 1 | 1146 |
| 28.2.52 | CFDTHLPCTR : TX History List Pointer Control Register | 1147 |
| 28.2.53 | CFDGRSTC : Global SW reset Register..... | 1147 |
| 28.2.54 | CFDGTSTCFG : Global Test Configuration Register | 1148 |
| 28.2.55 | CFDGTSTCTR : Global Test Control Register..... | 1148 |
| 28.2.56 | CFDGFDCFG : Global FD Configuration Register..... | 1149 |
| 28.2.57 | CFDGLOCKK : Global Lock Key Register | 1150 |
| 28.2.58 | CFDRPGACk : RAM Test Page Access Registers k (k = 0 to 63)..... | 1150 |
| 28.2.59 | CFDGAFLIGNENT : Global AFL Ignore Entry Register | 1151 |
| 28.2.60 | CFDGAFLIGNCTR : Global AFL Ignore Control Register | 1151 |
| 28.2.61 | CFDRMIEC : RX Message Buffer Interrupt Enable Configuration Register..... | 1152 |
| 28.2.62 | Message Buffer Component Structure | 1152 |
| 28.3 | Modes of Operation | 1172 |
| 28.3.1 | Overview | 1172 |
| 28.3.2 | Global Modes | 1172 |
| 28.3.3 | Channel Modes | 1181 |
| 28.3.4 | Global Mode and Channel Mode Transition Interactions | 1186 |
| 28.4 | Initialization..... | 1188 |
| 28.4.1 | Initialization of CAN Clock, Bit Timing and Baud Rate | 1188 |
| 28.4.2 | CAN Module Configuration after Hardware Reset | 1195 |
| 28.5 | Acceptance Filtering Function using Global Acceptance Filter List (AFL)..... | 1196 |
| 28.5.1 | Overview | 1196 |
| 28.5.2 | Allocation of AFL Entries | 1198 |
| 28.5.3 | AFL Entry Description | 1198 |
| 28.5.4 | Entering Entries in the AFL | 1200 |
| 28.5.5 | Loopback Modes..... | 1203 |
| 28.5.6 | IDE Masking | 1203 |
| 28.5.7 | Updating AFL Entry during Communication..... | 1204 |
| 28.6 | FIFO Buffers and Normal Message Buffer Configuration | 1206 |
| 28.6.1 | Normal RX Message Buffers..... | 1207 |
| 28.6.2 | FIFO Buffers..... | 1207 |
| 28.7 | Interrupts and DMA | 1212 |
| 28.7.1 | Interrupts | 1212 |
| 28.7.2 | DMA Transfer | 1215 |
| 28.8 | Reception and Transmission | 1218 |
| 28.8.1 | Reception | 1218 |
| 28.8.2 | Transmission | 1224 |
| 28.9 | Test Mode | 1238 |
| 28.9.1 | Channel Specific Test Modes | 1239 |
| 28.9.2 | Global Test Modes | 1241 |
| 28.10 | RAM Area Configuration..... | 1245 |
| 28.10.1 | Examples | 1247 |

| | | |
|------------|----------------------------------------------------------------|-------------|
| 28.10.2 | OTB Area | 1248 |
| 28.10.3 | RAM Initialization Cycle | 1248 |
| 29. | CANFD ECC (CNECC) | 1249 |
| 29.1 | Overview..... | 1249 |
| 29.2 | Register Descriptions | 1249 |
| 29.2.1 | EC710CTL : ECC Control Register..... | 1249 |
| 29.2.2 | EC710TMC : ECC Test Mode Control Register | 1252 |
| 29.2.3 | EC710TED : ECC Test Substitute Data Register | 1253 |
| 29.2.4 | EC710EAD0 : ECC Error Address Register..... | 1253 |
| 29.3 | Operation..... | 1254 |
| 29.3.1 | ECC Function Setting..... | 1254 |
| 29.3.2 | ECC Decoder Testing..... | 1255 |
| 29.4 | Interrupts..... | 1255 |
| 30. | Serial Peripheral Interface (SPI) | 1257 |
| 30.1 | Overview..... | 1257 |
| 30.2 | Register Descriptions | 1260 |
| 30.2.1 | SPDR : SPI Data Register | 1260 |
| 30.2.2 | SPDECR : SPI Delay Control Register | 1262 |
| 30.2.3 | SPCR : SPI Control Register | 1264 |
| 30.2.4 | SPCR2 : SPI Control Register 2 | 1268 |
| 30.2.5 | SPCR3 : SPI Control Register 3 | 1270 |
| 30.2.6 | SPCMDm : SPI Command Register (m = 0 to 7)..... | 1272 |
| 30.2.7 | SPDCR : SPI Data Control Register | 1275 |
| 30.2.8 | SPDCR2 : SPI Data Control Register 2 | 1276 |
| 30.2.9 | SPSR : SPI Status Register | 1277 |
| 30.2.10 | SPTFSR : SPI Transfer FIFO Status Register | 1283 |
| 30.2.11 | SPRFSR : SPI Receive FIFO Status Register | 1284 |
| 30.2.12 | SPPSR : SPI Polling Register | 1284 |
| 30.2.13 | SPSRC : SPI Status Clear Register..... | 1285 |
| 30.2.14 | SPFCR : SPI FIFO Clear Register | 1285 |
| 30.3 | Operation..... | 1286 |
| 30.3.1 | Overview of SPI Operation..... | 1286 |
| 30.3.2 | Controlling the SPI Pins | 1287 |
| 30.3.3 | SPI System Configuration Examples | 1288 |
| 30.3.4 | Data Formats | 1294 |
| 30.3.5 | Transfer Formats..... | 1307 |
| 30.3.6 | Communication Operating Mode | 1309 |
| 30.3.7 | Transmit Buffer Empty and Receive Buffer Full Interrupts | 1312 |
| 30.3.8 | Idle Interrupt..... | 1313 |
| 30.3.9 | Communication End Interrupt | 1315 |
| 30.3.10 | Error Detection | 1324 |
| 30.3.11 | Initializing the SPI..... | 1331 |
| 30.3.12 | SPI Operation..... | 1331 |
| 30.3.13 | Clock Synchronous Operation | 1351 |
| 30.3.14 | Loopback Mode..... | 1357 |
| 30.3.15 | Self-Diagnosis of Parity Bit Function..... | 1358 |

| | | |
|------------|------------------------------------------------------------------------------------------------------|-------------|
| 30.3.16 | Interrupt Sources..... | 1359 |
| 30.4 | Event Link Controller Event Output | 1360 |
| 30.4.1 | Receive Buffer Full Event Output..... | 1360 |
| 30.4.2 | Transmit Buffer Empty Event Output..... | 1360 |
| 30.4.3 | Mode-Fault, Underrun, Overrun, Parity Error, or received data ready Event Output | 1361 |
| 30.4.4 | SPI Idle Event Output..... | 1361 |
| 30.4.5 | Communication End Event Output..... | 1362 |
| 30.4.6 | Synchronization bypass function..... | 1364 |
| 30.5 | Usage Notes..... | 1364 |
| 30.5.1 | Settings for the Module-Stop State | 1364 |
| 30.5.2 | Constraint on Low-Power Functions | 1364 |
| 30.5.3 | Constraints on Starting Transfer | 1364 |
| 30.5.4 | Constraints on Mode-Fault, Underrun, Overrun, Parity Error, or Receive Data Ready Event Output | 1364 |
| 30.5.5 | Constraints on the SPSR.SPRF and SPSR.SPTEF Flags | 1365 |
| 31. | Cyclic Redundancy Check (CRC) | 1366 |
| 31.1 | Overview..... | 1366 |
| 31.2 | Register Descriptions | 1367 |
| 31.2.1 | CRCCR0 : CRC Control Register 0 | 1367 |
| 31.2.2 | CRCCR1 : CRC Control Register 1 | 1367 |
| 31.2.3 | CRCDIR/CRCDIR_BY : CRC Data Input Register..... | 1368 |
| 31.2.4 | CRCDOR/CRCDOR_HA/CRCDOR_BY : CRC Data Output Register | 1368 |
| 31.2.5 | CRCSAR : Snoop Address Register..... | 1369 |
| 31.3 | Operation..... | 1369 |
| 31.3.1 | Basic Operation..... | 1369 |
| 31.3.2 | CRC Snoop Function | 1372 |
| 31.4 | Usage Notes..... | 1373 |
| 31.4.1 | Settings for the Module-Stop State | 1373 |
| 31.4.2 | Note on Transmission | 1373 |
| 32. | Trigonometric Function Unit (TFU) | 1375 |
| 32.1 | Overview..... | 1375 |
| 32.1.1 | Precautions on Use of the Trigonometric Function Unit..... | 1376 |
| 32.2 | Register Descriptions | 1376 |
| 32.2.1 | TRGSTS : Trigonometric Status Register | 1376 |
| 32.2.2 | SCDT0 : Sine Cosine Data Register 0 | 1377 |
| 32.2.3 | SCDT1 : Sine Cosine Data Register 1 | 1378 |
| 32.2.4 | ATDT0 : Arctangent Data Register 0..... | 1378 |
| 32.2.5 | ATDT1 : Arctangent Data Register 1..... | 1379 |
| 32.3 | Operation..... | 1379 |
| 32.3.1 | Arithmetic Processing | 1379 |
| 32.3.2 | Input and Output Value Formats | 1379 |
| 32.3.3 | Relationship Between Input and Output Values for Sincos Operation | 1380 |
| 32.3.4 | Relationship Between Input and Output Values for Atan Operation | 1380 |
| 32.3.5 | Relationship Between Input and Output Values for hypot_k Operation | 1381 |
| 32.3.6 | Procedure for Trigonometric Function Operation | 1381 |
| 33. | IIR Filter Accelerator (IIRFA)..... | 1384 |

| | | |
|------------|-------------------------------------------------|-------------|
| 33.1 | Overview..... | 1384 |
| 33.2 | Register Descriptions | 1385 |
| 33.2.1 | Register List | 1385 |
| 33.3 | Operation..... | 1397 |
| 33.3.1 | Overview | 1397 |
| 33.3.2 | Channel Processing Operation | 1399 |
| 33.3.3 | Operation When an Operation Error Occurs | 1400 |
| 33.3.4 | Operation on ECC Error Detection..... | 1401 |
| 33.3.5 | Operating Procedure..... | 1402 |
| 33.4 | Interrupt Sources | 1406 |
| 34. | Boundary Scan | 1407 |
| 34.1 | Overview..... | 1407 |
| 34.2 | Register Descriptions | 1407 |
| 34.2.1 | JTIR : Instruction Register..... | 1408 |
| 34.2.2 | JTIDR : ID Code Register | 1408 |
| 34.2.3 | JTBPR : Bypass Register..... | 1409 |
| 34.2.4 | JTBSR : Boundary Scan Register | 1409 |
| 34.3 | Operation..... | 1409 |
| 34.3.1 | TAP Controller | 1409 |
| 34.3.2 | Commands | 1410 |
| 34.4 | Usage Notes..... | 1411 |
| 35. | Secure Cryptographic Engine (SCE5) | 1413 |
| 35.1 | Overview..... | 1413 |
| 35.2 | Operation..... | 1414 |
| 35.2.1 | Encryption Engine | 1414 |
| 35.2.2 | Encryption and Decryption | 1415 |
| 35.3 | Usage Notes..... | 1416 |
| 35.3.1 | Software Standby Mode..... | 1416 |
| 35.3.2 | Module-Stop Function Setting | 1416 |
| 36. | A/D Converter | 1417 |
| 36.1 | Overview..... | 1417 |
| 36.2 | Register Descriptions | 1426 |
| 36.2.1 | System | 1426 |
| 36.2.2 | Scan Group | 1431 |
| 36.2.3 | Virtual Channel..... | 1439 |
| 36.2.4 | A/D Conversion Configuration..... | 1444 |
| 36.2.5 | S&H, PGA and Others | 1449 |
| 36.2.6 | Digital Filter | 1455 |
| 36.2.7 | Self-calibration | 1456 |
| 36.2.8 | Limiter Clip Function | 1458 |
| 36.2.9 | Compare Match Function..... | 1462 |
| 36.2.10 | Start and Stop Control of A/D Conversion | 1469 |
| 36.2.11 | Status Registers..... | 1472 |
| 36.2.12 | FIFO | 1480 |
| 36.2.13 | Data Register | 1487 |
| 36.3 | Operation..... | 1489 |

| | | |
|---------|----------------------------------------------------------------|------|
| 36.3.1 | A/D Conversion Clock | 1489 |
| 36.3.2 | A/D Converter Operation Mode | 1489 |
| 36.3.3 | Single-ended Input and Differential Input | 1490 |
| 36.3.4 | Analog Channel | 1491 |
| 36.3.5 | Virtual Channel | 1491 |
| 36.3.6 | Scan Group | 1492 |
| 36.3.7 | Scanning Operation | 1493 |
| 36.3.8 | Self-calibration | 1501 |
| 36.3.9 | Analog Input Channel | 1504 |
| 36.3.10 | Extended Analog Function | 1505 |
| 36.3.11 | Self-diagnosis Function | 1505 |
| 36.3.12 | Internal Reference Voltage | 1507 |
| 36.3.13 | Temperature Sensor | 1507 |
| 36.3.14 | D/A Converter | 1507 |
| 36.3.15 | Programmable Gain Amplifier | 1507 |
| 36.3.16 | Channel-dedicated Sample-and-hold Circuit | 1510 |
| 36.3.17 | Disconnection Detection Assist Function | 1523 |
| 36.3.18 | Group Priority Operation | 1525 |
| 36.3.19 | Synchronous Operation | 1532 |
| 36.4 | A/D Conversion Data | 1535 |
| 36.4.1 | Internal Data Processing Flow | 1535 |
| 36.4.2 | Digital Filter Function | 1537 |
| 36.4.3 | Calibration and Adjustment | 1538 |
| 36.4.4 | A/D-converted Value Addition/Averaging Function | 1541 |
| 36.4.5 | Limiter Clip Function | 1542 |
| 36.4.6 | Data Formatting process | 1543 |
| 36.4.7 | Data Format | 1543 |

High-performance 240 MHz Arm Cortex-M33 core, up to 512 KB code flash memory with background operation, 16 KB Data flash memory, and 64 KB SRAM with ECC. Integrated A/D converter with channel-dedicated sample-and-hold circuit for simultaneous sampling and single-end/pseudo-differential input supportive amplifier. Integrated General PWM Timer with 200 MHz operation and high resolution. Integrated Secure Cryptographic Engine with cryptography accelerators and key management support in concert with Arm TrustZone for integrated secure element functionality.

Features

■ Arm® Cortex®-M33 Core

- Armv8-M architecture with the main extension
- Maximum operating frequency: 240 MHz
- Arm Memory Protection Unit (Arm MPU)
 - Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
 - Embeds two SysTick timers: Secure and Non-secure instance
 - Driven by LOCO or system clock
- CoreSight™ ETM-M33

■ Memory

- Up to 512-KB code flash memory
- 16-KB data flash memory (125,000 program/erase (P/E) cycles)
- 64-KB SRAM

■ Connectivity

- Serial Communications Interface (SCI) × 6
 - Asynchronous interfaces
 - 8-bit clock synchronous interface
 - Smart card interface
 - Simple IIC
 - Simple SPI
 - Simple LIN
 - Manchester coding
- I²C bus interface (IIC) × 2
 - Transfer at up to 3.2 Mbps (high speed mode)
- Serial Peripheral Interface (SPI) × 2
- CAN with Flexible Data-rate (CANFD)

■ Analog

- A/D Converter (ADC) × 2
 - Up to 16-bit resolution
 - Up to 6.25 Msps
 - Channel-dedicated sample-and-hold circuit × 6
 - Programmable Gain Amplifier (PGA) × 4
- High-Speed Analog Comparator (ACMPHS) × 4
- 12-bit D/A Converter (DAC12) × 4
- Temperature Sensor (TSN)

■ Timers

- General PWM Timer 32-bit (GPT32) with High Resolution × 4
 - 156 ps resolution in 200 MHz
- General PWM Timer 32-bit (GPT32) × 6
- Low Power Asynchronous General Purpose Timer (AGT) × 2

■ Security and Encryption

- Secure Cryptographic Engine (SCE5)
 - Symmetric algorithms: AES
 - Hash-value generation: GHASH
 - 128-bit unique ID
- Arm® TrustZone®
 - Up to three regions for the code flash
 - Up to two regions for the data flash
 - Up to three regions for the SRAM
 - Individual secure or non-secure security attribution for each peripheral
- Device lifecycle management

■ System and Power Management

- Low power modes
- Event Link Controller (ELC)
- Data Transfer Controller (DTC)
- DMA Controller (DMAC) × 8
- Power-on reset
- Low Voltage Detection (LVD) with voltage settings
- Watchdog Timer (WDT)
- Independent Watchdog Timer (IWDT)

- Key Interrupt Function (KINT)

■ Data Processing Accelerator

- Trigonometric Function Unit (TFU)
- IIR Filter Accelerator (IIRFA)

■ Multiple Clock Sources

- Main clock oscillator (MOSC) (8 to 24 MHz)
- High-speed on-chip oscillator (HOCO) (16/18/20 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- IWDT-dedicated on-chip oscillator (15 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- PLL/PLL2
- Clock out support

■ General-Purpose I/O Ports

- 5-V tolerance, open drain, input pull-up, switchable driving ability

■ Operating Voltage

- VCC: 2.7 to 3.6 V

■ Operating Temperature and Packages

- Ta = -40°C to +105°C
 - 100-pin LQFP (14 mm × 14 mm, 0.5 mm pitch)
 - 64-pin LQFP (10 mm × 10 mm, 0.5 mm pitch)
 - 48-pin LQFP (7 mm × 7 mm, 0.5 mm pitch)
 - 64-pin QFN (8 mm × 8 mm, 0.4 mm pitch)
 - 48-pin QFN (7 mm × 7 mm, 0.5 mm pitch)

1. Overview

The MCU integrates multiple series of software-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm Cortex®-M33 core running up to 240 MHz with the following features:

- Up to 512 KB code flash memory
- 64 KB SRAM
- General PWM Timer (GPT) - Enhanced High Resolution
- Analog peripherals
- Security and safety features

1.1 Function Outline

Table 1.1 Arm core

Table 1.2 Memory

| Feature | Functional description |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------|
| Code flash memory | Maximum 512 KB of code flash memory. See section 43, Flash Memory . |
| Data flash memory | 16 KB of data flash memory. See section 43, Flash Memory . |
| Option-setting memory | The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory . |
| SRAM | On-chip high-speed SRAM with Error Correction Code (ECC). See section 41, SRAM . |

Table 1.3 System (1 of 2)

| Feature | Functional description |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operating modes | Two operating modes: <ul style="list-style-type: none"> • Single-chip mode • SCI boot mode See section 3, Operating Modes . |
| Resets | The MCU provides 14 resets. See section 5, Resets . |
| Low Voltage Detection (LVD) | The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds. See section 7, Low Voltage Detection (LVD) . |

Table 1.3 System (2 of 2)

| Feature | Functional description |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clocks | <ul style="list-style-type: none"> • Main clock oscillator (MOSC) • High-speed on-chip oscillator (HOCO) • Middle-speed on-chip oscillator (MOCO) • Low-speed on-chip oscillator (LOCO) • IWDG-dedicated on-chip oscillator • PLL/PLL2 • Clock out support See section 8, Clock Generation Circuit . |
| Clock Frequency Accuracy Measurement Circuit (CAC) | <p>The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.</p> See section 9, Clock Frequency Accuracy Measurement Circuit (CAC) . |
| Interrupt Controller Unit (ICU) | <p>The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.</p> See section 12, Interrupt Controller Unit (ICU) . |
| Key Interrupt Function (KINT) | <p>The key interrupt function (KINT) generates the key interrupt by detecting rising or falling edge on the key interrupt input pins.</p> See section 19, Key Interrupt Function (KINT) . |
| Low power modes | <p>Power consumption can be reduced in multiple ways, including setting clock dividers, stopping modules, selecting power control mode in normal operation, and transitioning to low power modes.</p> See section 10, Low Power Modes . |
| Register write protection | <p>The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).</p> See section 11, Register Write Protection . |
| Memory Protection Unit (MPU) | <p>The MCU has one Memory Protection Unit (MPU).</p> See section 14, Memory Protection Unit (MPU) . |

Table 1.4 Event link

| Feature | Functional description |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Event Link Controller (ELC) | <p>The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.</p> See section 17, Event Link Controller (ELC) . |

Table 1.5 Direct memory access

| Feature | Functional description |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Data Transfer Controller (DTC) | <p>A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.</p> See section 16, Data Transfer Controller (DTC) . |
| DMA Controller (DMAC) | <p>The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.</p> See section 15, DMA Controller (DMAC) . |

Table 1.6 Timers (1 of 2)

| Feature | Functional description |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General PWM Timer (GPT) | <p>The General PWM Timer (GPT) is a 32-bit timer with $GPT32 \times 10$ channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.</p> See section 21, General PWM Timer (GPT) . |

Table 1.6 Timers (2 of 2)

| Feature | Functional description |
|----------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PWM Delay Generation Circuit (PDG) | The PWM Delay Generation circuit (PDG) has 4 channels delay circuits that can connect to the GPT. The PDG can control the rise and fall edge timing with which the PWM output for the GPT320 through the GPT323. See section 22, PWM Delay Generation Circuit (PDG) . |
| Port Output Enable for GPT (POEG) | The POEG issues requests to stop output from output pins of the general PWM timer (GPT). Select the method of detection for stopping the output from the list below. See section 20, Port Output Enable for GPT (POEG) . |
| Low power Asynchronous General Purpose Timer (AGT) | The low power Asynchronous General Purpose Timer (AGT) is a 32-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See section 23, Low Power Asynchronous General Purpose Timer (AGTW) . |
| Watchdog Timer (WDT) | The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See section 24, Watchdog Timer (WDT) . |
| Independent Watchdog Timer (IWDT) | The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers. See section 25, Independent Watchdog Timer (IWDT) . |

Table 1.7 Communication interfaces

| Feature | Functional description |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serial Communications Interface (SCI) | The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces: <ul style="list-style-type: none"> Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) 8-bit clock synchronous interface Simple IIC (master-only) Simple SPI Simple LIN Smart card interface Manchester interface The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0 to 4, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. See section 26, Serial Communications Interface (SCI) . |
| I ² C bus interface (IIC) | The I ² C bus interface (IIC) has 2 channels. The IIC module conform with and provide a subset of the NXP I ² C (Inter-Integrated Circuit) bus interface functions. See section 27, I²C Bus Interface (IIC) . |
| Serial Peripheral Interface (SPI) | The Serial Peripheral Interface (SPI) has 2 channels. The SPI provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. See section 30, Serial Peripheral Interface (SPI) . |
| CAN with Flexible Data-rate (CANFD) | The CAN with Flexible Data-rate (CANFD) module can handle classical CAN frames and CAN-FD frames complied with ISO 11898-1 standard. The module supports 4 transmit buffers and 32 receive buffer. See section 28, CAN with Flexible Data-rate (CANFD) . |

Table 1.8 Analog

| Feature | Functional description |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A/D Converter (ADC) | <p>The A/D Converter (ADC) has two units of noise-shaping SAR-type A/D converter.</p> <ul style="list-style-type: none"> Hybrid architecture that combines the features of the successive approximation register-type and the delta-sigma modulation-type. Up to 16-bit resolution Up to 6.25 Msps Up to 29 analog input channels Support single-ended input or differential inputs Built-in channel-dedicated sample-and-hold circuit (SH) Built-in Programmable Gain Amplifier (PGA) Temperature sensor output and internal reference voltage, and D/A converters output are selectable for conversion. <p>See section 36, A/D Converter.</p> |
| 12-bit D/A Converter (DAC12) | <p>A 12-bit D/A converter (DAC12) is provided.</p> <p>See section 37, 12-Bit D/A Converter (DAC12).</p> |
| High-Speed Analog Comparator (ACMPHS) | <p>The High-Speed Analog Comparator (ACMPHS) compares a test voltage with a reference voltage and provides a digital output based on the conversion result. Both the test and reference voltages can be provided to the comparator from internal sources such as the DAC12 output and an internal PGA output, and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion.</p> <p>See section 39, High-Speed Analog Comparator (ACMPHS).</p> |
| Temperature Sensor (TSN) | <p>The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC for conversion and can be further used by the end application.</p> <p>See section 38, Temperature Sensor (TSN).</p> |

Table 1.9 Data processing

| Feature | Functional description |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cyclic Redundancy Check (CRC) | <p>The Cyclic Redundancy Check (CRC) generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. The snoop function allows to monitor the access to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer.</p> <p>See section 31, Cyclic Redundancy Check (CRC).</p> |
| Data Operation Circuit (DOC) | <p>The data operation circuit (DOC) is used to compare, add, and subtract 16 or 32-bit data. An interrupt can be generated when the following conditions apply.</p> <ul style="list-style-type: none"> When the 16 or 32-bit compared values match the detection condition When the result of 16 or 32-bit data addition overflows When the result of 16 or 32-bit data subtraction underflows <p>See section 40, Data Operation Circuit (DOC).</p> |

Note: The product name differs depending on the memory size and whether CAN-FD is supported. See [section 1.3. Part Numbering](#).

Note 1. Available pins depend on the Pin count. For details, see [section 1.7. Pin Lists](#).

Note 2. Fm+ and Hs-mode are only available for IIC channel IIC0.

Note 3. Shared terminal for UNIT0 and UNIT1.

1.5 Pin Functions

Table 1.14 Pin functions (1 of 3)

| Function | Signal | I/O | Description |
|------------------------|------------------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Power supply | VCC | Input | Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1-μF capacitor. The capacitor should be placed close to the pin. |
| | VCL | I/O | Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin. |
| | VSS | Input | Ground pin. Connect it to the system power supply (0 V). |
| Clock | EXTAL | Input | Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin. |
| | XTAL | Output | |
| | CLKOUT | Output | Clock output pin |
| Operating mode control | MD | Input | Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state. |
| System control | RES | Input | Reset signal input pin. The MCU enters the reset state when this signal goes low. |
| CAC | CACREF | Input | Measurement reference clock input pin |
| On-chip emulator | TMS | Input | On-chip emulator or boundary scan pins |
| | TDI | Input | |
| | TCK | Input | |
| | TDO | Output | |
| | TCLK | Output | Output clock for synchronization with the trace data |
| | TDATA0 to TDATA3 | Output | Trace data output |
| | SWO | Output | Serial wire trace output pin |
| | SWDIO | I/O | Serial wire debug data input/output pin |
| | SWCLK | Input | Serial wire clock pin |
| Interrupt | NMI | Input | Non-maskable interrupt request pin |
| | IRQn | Input | Maskable interrupt request pins |
| | IRQn-DS | Input | Maskable interrupt request pins that can also be used in Deep Software Standby mode |
| KINT | KR00 to KR07 | Input | Key interrupt input pins |

Table 1.14 Pin functions (2 of 3)

| Function | Signal | I/O | Description |
|----------|----------------------------------------------------|--------|-----------------------------------------------------------------------------------------------------------------------------------|
| GPT | GTETRG, GTETRGA, GTETRGB, GTETRG, GTETRGC, GTETRGD | Input | External trigger input pins |
| | GTIOcNA, GTIOcNB | I/O | Input capture, output compare, or PWM output pins |
| | GTADSM0, GTADSM1 | Output | A/D conversion start request monitoring output pins |
| | GTCPP00 to GTCPP04, GTCPP07 | Output | Toggle output synchronized with PWM period |
| | GTIU | Input | Hall sensor input pin U |
| | GTIV | Input | Hall sensor input pin V |
| | GTIW | Input | Hall sensor input pin W |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive U phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative U phase) |
| | GTOVUP | Output | 3-phase PWM output for BLDC motor control (positive V phase) |
| | GTOVLO | Output | 3-phase PWM output for BLDC motor control (negative V phase) |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive W phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative W phase) |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (negative W phase) |
| AGT | AGTEEn | Input | External event input enable signals |
| | AGTIOn | I/O | External event input and pulse output pins |
| | AGTOAn | Output | Pulse output pins |
| | AGTOAn | Output | Output compare match A output pins |
| | AGTOBn | Output | Output compare match B output pins |
| SCI | SCKn | I/O | Input/output pins for the clock (clock synchronous mode) |
| | RXDn | Input | Input pins for received data (asynchronous mode/clock synchronous mode) |
| | TXDn | Output | Output pins for transmitted data (asynchronous mode/clock synchronous mode) |
| | CTS _n _RTS _n | I/O | Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low. |
| | CTS _n | Input | Input for the start of transmission. |
| | DEn | Output | Output pins for Driver Enable signal |
| | SCLn | I/O | Input/output pins for the IIC clock (simple IIC mode) |
| | SDAn | I/O | Input/output pins for the IIC data (simple IIC mode) |
| | SCKn | I/O | Input/output pins for the clock (simple SPI mode) |
| | MISO _n | I/O | Input/output pins for slave transmission of data (simple SPI mode) |
| | MOSI _n | I/O | Input/output pins for master transmission of data (simple SPI mode) |
| | SSn | Input | Chip-select input pins (simple SPI mode), active-low |
| IIC | SCLn | I/O | Input/output pins for the clock |
| | SDAn | I/O | Input/output pins for data |
| SPI | RSPCKA, RSPCKB | I/O | Clock input/output pin |
| | MOSIA, MOSIB | I/O | Input or output pins for data output from the master |
| | MISOA, MISOB | I/O | Input or output pins for data output from the slave |
| | SSLA0, SSLB0 | I/O | Input or output pin for slave selection |
| | SSLA1 to SSLA3, SSLB1 to SSLB3 | Output | Output pins for slave selection |

Table 1.14 Pin functions (3 of 3)

| Function | Signal | I/O | Description |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| CANFD | CRX0 | Input | Receive data |
| | CTX0 | Output | Transmit data |
| Analog power supply | AVCC0 | Input | Analog voltage supply pin. This is used as the analog power supply for the respective modules. Supply this pin with the same voltage as the VCC pin. |
| | AVSS0 | Input | Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin. |
| | VREFH0 | Input | Analog reference voltage supply pin for the ADC. Connect this pin to AVCC0 when not using the ADC. |
| | VREFL0 | Input | Analog reference ground pin for the ADC. Connect this pin to AVSS0 when not using the ADC. |
| ADC | AN000 to AN028 | Input | Input pins for the analog signals to be processed by the A/D converter. |
| | PGAIN0 to PGAIN3 | Input | Pseudo-differential input pins of programmable gain amplifier (Signal source side) |
| | PGAVSS0 to PGAVSS3 | Input | Pseudo-differential input pins of programmable gain amplifier (reference ground side) |
| | PGAOUT0 to PGAOUT3 | Output | Monitor output pins of programmable gain amplifier |
| | ADTRGm | Input | Input pins for the external trigger signals that start the A/D conversion, active-low. |
| DAC12 | DAn | Output | Output pins for the analog signals processed by the D/A converter. |
| ACMPHS | VCOUT | Output | Comparator output pin (OR output of all units) |
| | CMPOUTm | Output | Comparator output pin (m:unit number) |
| | CMPOUT012 | Output | Comparator output pin (OR output of units 0, 1 and 2) |
| | IVREF0, IVREF1 | Input | Reference voltage input pins for comparator |
| | IVCMPm0, IVCMPm2, IVCMPm3 | Input | Analog voltage input pins for comparator (m:unit number) |
| I/O ports | P201, P212, P213, PA08 to PA15, PB03 to PB10, PB12 to PB15, PC06 to PC12, PC14, PC15, PD00 to PD15, PE00 to PE06, PE08 to PE15 | I/O | General-purpose input/output pins |
| | P000, P001, P002, PA00 to PA07, PB00 to PB02, PC00 to PC05, PC13 | Input | General-purpose input pins |

The following figures show the pin assignments from the top view.

Note: Several pin names have the added suffix of _A, _B, _C, _D, _E and _F. The suffix can be ignored when assigning functionality.

2. CPU

The MCU is based on the Arm[®] Cortex[®]-M33 core.

2.1 Overview

2.1.1 CPU

- Arm Cortex-M33
 - Revision: r0p4-00rel1
 - Armv8-M architecture profile
 - Single Precision Floating-Point Unit compliant with the ANSI/IEEE Std 754-2008
- SAU (Security Attribution Unit): 0 region
- IDAU (Implementation Defined Attribution Unit): 8 regions
 - Code flash (secure/non-secure callable/non-secure)
 - Data Flash (secure/non-secure)
 - SRAM0 (secure/non-secure callable/non-secure)
- Memory Protection Unit (MPU)
 - Armv8 Protected Memory System Architecture (PMSAv8)
 - Secure MPU (MPU_S): 8 regions
 - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
 - Two SysTick timers: Secure and Non-secure instance
 - Driven by SysTick timer clock (SYSTICCLK) or system clock (ICLK)

See reference 1. and reference 2. in [section 2.14. References](#) for details.

2.1.2 Debug

- Arm[®] CoreSight[™] ETM-M33
 - Revision: r0p2-00rel0
 - ARM ETM Architecture version 4.2
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace Unit (DWT)
 - 4 comparators for watchpoints and triggers
- Breakpoint Unit (BPU)
 - Breakpoint function is available.
 - 8 instruction comparators
 - 0 literal comparators
- Time Stamp Generator (TSG)
 - Time stamp for ETM and ITM
 - Driven by CPU clock
- Debug Register Module (DBGREG)
 - Reset control
 - Halt control
- Debug Access Port (DAP)

- JTAG Debug Port (JTAG-DP)
- Serial Wire Debug Port (SW-DP)
- Cortex-M33 Trace Port Interface Unit (TPIU)
 - 4 bits TPIU formatter output
 - Serial Wire Output
- Cross Trigger Interface (CTI)
- Embedded Trace Buffer (ETB)
 - CoreSight Trace Memory Controller with ETB configuration
 - Buffer size: 2 KB

See reference 1. and reference 2. in [section 2.14. References](#) for details.

2.1.3 Operating Frequency

The operating frequencies for the MCU are as follows:

- CPU: maximum 240 MHz
- 4-bit TPIU trace interface: maximum 60 MHz
- Serial Wire Output (SWO) trace interface: maximum 60 MHz
- Joint Test Action Group (JTAG) interface: maximum 25 MHz
- Serial Wire Debug (SWD) interface: maximum 25 MHz

2.1.4 Block Diagram

[Figure 2.1](#) shows a block diagram of the Cortex-M33 core.

Table 2.1 shows the implementation options of the MCU.

| Option | Implementation |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| SAU | Not included |
| IDAU | Included, 8 regions |
| MPU | Included, 8 regions for Secure and 8 regions for Non-secure |
| BPU | Included |
| Cross Trigger Interface (CTI) | Included |
| DWT | Included |
| Number of Wakeup Interrupt Controllers (WIC) | Not included ICU can wake up CPU instead of WIC. See section 12, Interrupt Controller Unit (ICU) for details. |
| TPIU | Included <ul style="list-style-type: none"> 4 bits TPIU formatter output Serial Wire Output |
| FPU | Included |
| DSP | Included |

Table 2.1 Implementation options (2 of 2)

| Option | Implementation |
|-----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Embedded Trace Macrocell (ETM) | Included |
| Sleep mode power saving | Sleep mode and other low power modes are supported. For more details, see section 10, Low Power Modes . Note: SCB.SCR.SLEEPDEEP is ignored. |
| Interrupts | 96 |
| Priority bits | 4 bits (16 levels) |
| Endianness | Little-endian |
| Memory features | Cacheable attribute is utilized in the MCU. See section 13, Buses for the detail. |
| SysTick | Included |
| SYST_CALIB register (0x4000_0147) | <div> <div> Bit [31] = 0 Bit [30] = 1 Bits [29:24] = 0x00 Bits [23:0] = 0x000147 </div> <div> Reference clock provided TENMS value is inexact Reserved TENMS: $(32768 \times 10 \text{ ms}) - 1/32.768 \text{ kHz}$ = 326.66 decimal = 327 with skew = 0x000147 </div> </div> |
| Event input/output | Not implemented |
| Global exclusive monitor | Not implemented |
| System reset request output | The SYSRESETREQ bit in Application Interrupt and Reset Control Register causes a CPU reset |

2.3 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. [Table 2.2](#) shows the MCU pins for the function. These pins are multiplexed with other functions.

Table 2.2 Trace function pins

| Name | I/O | Function | When not in use |
|---------|--------|--------------------------------------------------|-----------------|
| TCLK | Output | Trace clock | Open |
| TDATA0 | Output | Trace data output 0 | Open |
| TDATA1 | Output | Trace data output 1 | Open |
| TDATA2 | Output | Trace data output 2 | Open |
| TDATA3 | Output | Trace data output 3 | Open |
| TDO/SWO | Output | Serial wire output multiplexed with JTAG TDO pin | Open |

2.4 JTAG/SWD Interface

[Table 2.3](#) shows the JTAG/SWD pins.

Table 2.3 JTAG/SWD pins

| Name | I/O | Function | When not in use |
|-----------|--------|--------------------------------------------------|-----------------|
| TDI | Input | JTAG TDI pin | Pull-up |
| TDO/SWO | Output | JTAG TDO pin multiplexed with serial wire output | Open |
| TCK/SWCLK | Input | JTAG clock pin Serial wire clock pin | Pull-up |
| TMS/SWDIO | I/O | JTAG TMS pin Serial wire data I/O pin | Pull-up |

2.5 Security Attribution for Memory

In this MCU, SAU is not implemented and IDAU performs region definition for memory. IDAU divides the memory into 8 different areas as shown in [Figure 2.2](#).

The code flash, the data flash, and the SRAM are divided into Secure (S), Non-secure (NS) and Non-secure callable (NSC) regions. These memory security attributions are set into the nonvolatile memory by the serial programming command when the device lifecycle is in SSD state. These memory security attributions are loaded into the IDAU and the memory controller before application execution. These memory security attributions cannot be updated by application but can read through the dedicated registers.

Note: When configuring, the memory regions should satisfy the setting condition of minimum address unit shown in [Table 2.4](#).

Figure 2.2 Memory partitioning

Table 2.4 S/NS and S/NSC boundary list

| Boundary | Code flash | Data flash | SRAM |
|----------|------------|------------|------|
| S/NS | 32 KB | 1 KB | 8 KB |
| S/NSC | 1 KB | — | 1 KB |

Each region has its dedicated ID as follows. For more details, see [section 2.14. References](#).

| IREGION (IDAU region number) | Description |
|------------------------------|--------------------------------|
| 0x0D | Non-secure SRAM |
| 0x0E | Non-secure callable SRAM |
| 0x0F | Secure SRAM |
| 0x09 | Non-secure data flash |
| 0x0B | Secure data flash |
| 0x05 | Non-secure code flash |
| 0x06 | Non-secure callable code flash |
| 0x07 | Secure code flash |

2.6 Debug Function

2.6.1 Debugger connectivity

In this MCU, debug function is considered in three levels, DBG0, DBG1, DBG2. At DBG0, no debug function is available. DBG1 level is defined as non-secure debug in ARMv-8 and the debugger can only access defined non-secure debug accessible regions. DBG2 level is defined as secure debug in ARMv-8 and at this level, nonsecure and secure debug function is enabled and can be accessible from the debugger.

Debug level is determined by the Device Lifecycle Management (DLM) state of the product.

See [Figure 2.1](#) for debugger accessible regions.

[Table 2.5](#) shows the CPU debug function and conditions.

Table 2.5 CPU debug function and conditions

| Condition | | | Permitted debug function |
|---------------|-----------|-------------|---------------------------------------------|
| OCD connect*1 | DLM State | Debug level | Description |
| Connected | CM | DBG2 | All debug functions are available |
| Connected | SSD | DBG2 | All debug functions are available |
| Connected | NSECSD | DBG1 | Only Non-secure debug function is available |
| Connected | DPL | DBG0 | Debugger connection is not available |
| Connected | LCK_DBG | DBG0 | Debugger connection is not available |
| Connected | LCK_BOOT | DBG0 | Debugger connection is not available |
| Connected | RMA_REQ | DBG0 | Debugger connection is not available |
| Connected | RMA_ACK | DBG2 | All debug functions are available |

Note 1. OCD connect is determined by the CDBGWPUPREQ bit output in the SWJ-DP register. The bit can only be written by the OCD. However, the level of the bit can be confirmed by reading the DBGSTR.CDBGWPUPREQ bit.

2.6.2 Emulator Connection

Renesas provides the emulator which supports both debugging using SWD or JTAG communication and serial programming using SCI communication. This emulator makes it easy to switch between debug-ging and serial programming.

[Table 2.6](#) shows the pinout of 10 pin or 20 pin socket pinouts when using this emulator. The pinout of SWD and JTAG is ARM standard, and MD, TXD, RXD pins are added for the serial programming using SCI communication.

The serial programming interface must be used to program the TrustZone IDAU boundary register settings.

It is recommended to connect PA14/SWCLK/TCK and P201/MD pins using wired OR circuit on the board to use both debugging and serial programming.

Table 2.6 Pin assign for emulator

| Pin No. | SWD | JTAG | Serial Programming using SCI |
|------------------|-------------------------------------|-----------------------------------|------------------------------|
| 1 | VCC | VCC | VCC |
| 2 | PA13/SWDIO | PA13/TMS | NC |
| 4 | PA14/SWCLK Wired OR with P201/MD | PA14/TCK Wired OR with P201/MD | P201/MD |
| 6 | PB03/SWO/TXD9 | PB03/SWO/TXD9 | PB03/TXD9 |
| 8 | PA15/RXD9 | PA15/TDI/RXD9 | PA15/RXD9 |
| 9 | GNDdetect | GNDdetect | GNDdetect |
| 10 | nRESET | nRESET | nRESET |
| 12 | PE02/TCLK | PE02/TCLK | NC |
| 14 | PE03/TDATA[0] | PE03/TDATA[0] | NC |
| 16 | PE04/TDATA[1] | PE04/TDATA[1] | NC |
| 18 | PE05/TDATA[2] | PE05/TDATA[2] | NC |
| 20 | PE06/TDATA[3] | PE06/TDATA[3] | NC |
| 3, 5, 15, 17, 19 | GND | GND | GND |
| 7 | NC | NC | NC |
| 11, 13 | NC | NC | NC |

2.6.3 Self-Hosted Debug Function

As described in [section 2.7.6. CPUDSAR : CPU Debug Security Attribution Register](#), at the initial setting access from the CPU in non-secure state to CoreSight debug components is protected, that is, the non-secure access to CoreSight debug components from the self-hosted debugger is not allowed when the debug level is DBG2 at the initial setting. Therefore, the CPUDSAR.CPUDSA0 must be set to 1 to enable the self-hosted debug for CPU in non-secure state.

Note: There is no restriction for the self-hosted debug function while the CPU is in the secure state.

2.6.4 Effect of Debug Function

The debug function effects inside and outside of CPU.

2.6.4.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Software Standby, Snooze or Deep Software Standby mode. However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components. To request low power mode cancellation, the OCD can set the DBIRQ bit in the MCUCTRL register. For details, see [section 2.7.5.2. MCUCTRL : MCU Control Register](#).

2.6.4.2 Reset

In OCD mode, some resets depend on the CPU status and the DBGSTOPCR register setting.

Table 2.7 Reset or interrupt and mode setting

| Reset or interrupt name | Control in On-Chip Debug (OCD) mode | |
|--------------------------------------------|-------------------------------------|------------------------------|
| | OCD break mode | OCD run mode |
| RES pin reset | Same as user mode | |
| Power-on reset | Same as user mode | |
| Independent watchdog timer reset/interrupt | Does not occur*1 | Depends on DBGSTOPCR setting |
| Watchdog timer reset/interrupt | Does not occur*1 | Depends on DBGSTOPCR setting |
| Voltage monitor 0 reset | Depends on DBGSTOPCR setting | |
| Voltage monitor 1 reset/interrupt | Depends on DBGSTOPCR setting | |
| Voltage monitor 2 reset/interrupt | Depends on DBGSTOPCR setting | |
| SRAM parity error reset/interrupt | Depends on DBGSTOPCR setting | |
| SRAM ECC error reset/interrupt | Depends on DBGSTOPCR setting | |
| Cache parity error reset/interrupt | Depends on DBGSTOPCR setting | |
| Bus master MPU error reset/interrupt | Same as user mode | |
| Deep software standby reset | Same as user mode | |
| Software reset | Same as user mode | |

Note: In OCD break mode, the CPU is halted. In OCD run mode, the CPU is in OCD mode and the CPU is not halted.

Note 1. The IWDG and WDT always stop in this mode.

2.7 Programmers Model

2.7.1 Address Spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has a dedicated address space (OCD address space) and is connected to the OCDREG registers.

[Figure 2.3](#) shows a block diagram of the AP connection and address spaces.

Figure 2.3 JTAG/SWD authentication block diagram

For debugging purposes, there are two register modules, DBGREG and OCDREG. DBGREG is located in the system address space and can be accessed from the OCD emulator, the CPU, and other bus masters in the MCU. OCDREG is located in the OCD address space and can only be accessed from the OCD tool. The CPU and other bus masters cannot access OCDREG.

2.7.2 Peripheral Address Map

In system address space, the Cortex-M33 core has a Private Peripheral Bus (PPB) which can be accessed only from CPU and OCD emulator. The PPB is expanded from the original implementation of the Cortex-M33 core for this MCU. [Table 2.8](#) shows the address map of the MCU.

Table 2.8 Peripheral address map

| Component name | Start address | End address | Note |
|----------------------|---------------|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| ITM | 0xE000_0000 | 0xE000_0FFF | See reference 2. in section 2.14. References |
| DWT | 0xE000_1000 | 0xE000_1FFF | See reference 2. in section 2.14. References |
| BPU | 0xE000_2000 | 0xE000_2FFF | See reference 2. in section 2.14. References |
| Secure SCS/SCS | 0xE000_E000 | 0xE000_EFFF | See reference 1. in section 2.14. References |
| Non-Secure SCS | 0xE002_E000 | 0xE002_EFFF | See reference 2. in section 2.14. References |
| TPIU*1 | 0xE004_0000 | 0xE004_0FFF | See reference 3. in section 2.14. References |
| ETM | 0xE004_1000 | 0xE004_1FFF | See reference 1. in section 2.14. References |
| CTI1 | 0xE004_2000 | 0xE004_2FFF | See reference 2. in section 2.14. References |
| CTI0 | 0xE004_4000 | 0xE004_4FFF | See reference 4. in section 2.14. References |
| ATB Funnel | 0xE004_7000 | 0xE004_7FFF | See section 2.9. CoreSight ATB Funnel and reference 4. in section 2.14. References |
| ETB | 0xE004_8000 | 0xE004_8FFF | See reference 4. in section 2.14. References |
| Time Stamp Generator | 0xE004_9000 | 0xE004_9FFF | See section 2.11. CoreSight Time Stamp Generator and reference 4. in section 2.14. References |
| System ROM Table | 0xE00F_E000 | 0xE00F_EFFF | See reference 3. in section 2.14. References |
| Processor ROM Table | 0xE00F_F000 | 0xE00F_FFFF | See reference 2. in section 2.14. References |

Note 1. TPIU registers should not be accessed without connection of OCD emulator to avoid stopping bus access.

2.7.3 CoreSight ROM Table

The MCU contains two CoreSight ROM Tables, the processor and system ROM Tables. The Processor ROM Table contains entries which hold a list of debug components inside the processor. The System ROM Table contains entries of Processor ROM Table and others debug components outside the processor.

2.7.3.1 ROM entries

ROM entries hold a list of components in the system. OCD emulator can use the ROM entries to determine which components are implemented in a system.

[Table 2.9](#) and [Table 2.10](#) show the System ROM entries and Processor ROM entries. See reference 5. in [section 2.14. References](#) for details.

Table 2.9 System ROM entries

| # | Address | Access size | R/W | Value | Target module pointer |
|---|-------------|-------------|-----|-------------|-----------------------|
| 0 | 0xE00F_E000 | 32 bits | R | 0xFFFF46003 | CTI0 |
| 1 | 0xE00F_E004 | 32 bits | R | 0xFFFF49003 | Funnel |
| 2 | 0xE00F_E008 | 32 bits | R | 0xFFFF4A003 | ETB |
| 3 | 0xE00F_E00C | 32 bits | R | 0xFFFF4B003 | TSG |
| 4 | 0xE00F_E010 | 32 bits | R | 0xFFFF42003 | TPIU |
| 5 | 0xE00F_E014 | 32 bits | R | 0x00001003 | Processor ROM table |
| 6 | 0xE00F_E018 | 32 bits | R | 0x00000000 | End of entries |

Table 2.10 Processor ROM Entries

| # | Address | Access size | R/W | Value | Target module pointer |
|---|-------------|-------------|-----|-------------|-----------------------|
| 0 | 0xE00F_F000 | 32 bits | R | 0xFFFF0F003 | SCS |
| 1 | 0xE00F_F004 | 32 bits | R | 0xFFFF02003 | DWT |
| 2 | 0xE00F_F008 | 32 bits | R | 0xFFFF03003 | BPU |
| 3 | 0xE00F_F00C | 32 bits | R | 0xFFFF01003 | ITM |
| 4 | 0xE00F_F014 | 32 bits | R | 0xFFFF42003 | ETM |
| 5 | 0xE00F_F018 | 32 bits | R | 0xFFFF43003 | CTI1 |
| 6 | 0xE00F_F020 | 32 bits | R | 0x00000000 | End of entries |

2.7.3.2 CoreSight component registers

The CoreSight ROM Table lists the CoreSight component registers defined in the Arm CoreSight architecture.

[Table 2.11](#) shows the registers. See reference 5. in [section 2.14. References](#) for details of each register.

Table 2.11 CoreSight component registers in the CoreSight ROM Table

| Name | Address | Access size | R/W | Initial value |
|------|-------------|-------------|-----|---------------|
| PID4 | 0xE00F_EFD0 | 32 bits | R | 0x00000004 |
| PID5 | 0xE00F_EFD4 | 32 bits | R | 0x00000000 |
| PID6 | 0xE00F_EFD8 | 32 bits | R | 0x00000000 |
| PID7 | 0xE00F_EFDC | 32 bits | R | 0x00000000 |
| PID0 | 0xE00F_EFE0 | 32 bits | R | 0x0000003E |
| PID1 | 0xE00F_EFE4 | 32 bits | R | 0x00000030 |
| PID2 | 0xE00F_EFE8 | 32 bits | R | 0x0000000A |
| PID3 | 0xE00F_EFEC | 32 bits | R | 0x00000000 |
| CID0 | 0xE00F_EFF0 | 32 bits | R | 0x0000000D |
| CID1 | 0xE00F_EFF4 | 32 bits | R | 0x00000010 |
| CID2 | 0xE00F_EFF8 | 32 bits | R | 0x00000005 |
| CID3 | 0xE00F_EFFC | 32 bits | R | 0x000000B1 |

2.7.4 DBGREG Module

The DBGREG module controls the debug functionalities and is implemented as a CoreSight-compliant component.

Table 2.12 shows the DBGREG registers other than the CoreSight component registers.

Table 2.12 Non-CoreSight DBGREG registers

| Name | | DAP port | Address | Access size | R/W |
|-----------------------------|-----------|----------|-------------|-------------|-----|
| Debug Status Register | DBGSTR | Port 0 | 0x4001_B000 | 32 bits | R |
| Debug Stop Control Register | DBGSTOPCR | Port 0 | 0x4001_B010 | 32 bits | R/W |

2.7.4.1 DBGSTR : Debug Status Register

Base address: DBG = 0x4001_B000

Offset address: 0x00

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----------------------|----------------------|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | CDBG PWRU PACK | CDBG PWRU PREQ | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------------|--------------------------------------------------------------------------------------------------------------------------|-----|
| 27:0 | — | These bits are read as 0. | R |
| 28 | CDBGPWRUPREQ | Debug power-up request 0: OCD is not requesting debug power up 1: OCD is requesting debug power up | R |
| 29 | CDBGPWRUPACK | Debug power-up acknowledge 0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged | R |
| 31:30 | — | These bits are read as 0. | R |

The DBGSTR register is a status register which indicates the state of the debug power-up request to the MCU from the emulator.

2.7.4.2 DBGSTOPCR : Debug Stop Control Register

Base address: DBG = 0x4001_B000

Offset address: 0x10

| | | | | | | | | | | | | | | | | |
|--------------------|----------------------|----|----|----|----|----|---------------------------|----------------------|----|----|----|----|----|----------------------|----------------------|--------------------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | DBGS TOP_ CPER | — | — | — | — | — | DBGS TOP_ RECC R | DBGS TOP_ RPER | — | — | — | — | — | DBGS TOP_L VD2 | DBGS TOP_L VD1 | DBGS TOP_L VD0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DBGS TOP_ WDT | DBGS TOP_ I WDT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DBGSTOP_IWDT | Mask bit for IWDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value. 0: Enable IWDT reset/interrupt 1: Mask IWDT reset/interrupt and stop IWDT counter | R/W |
| 1 | DBGSTOP_WDT | Mask bit for WDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT counter is stopped, regardless of this bit value. 0: Enable WDT reset/interrupt 1: Mask WDT reset/interrupt and stop WDT counter | R/W |
| 15:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | DBGSTOP_LVD0 | Mask bit for LVD0 reset 0: Enable LVD0 reset 1: Mask LVD0 reset | R/W |
| 17 | DBGSTOP_LVD1 | Mask bit for LVD1 reset/interrupt 0: Enable LVD1 reset/interrupt 1: Mask LVD1 reset/interrupt | R/W |
| 18 | DBGSTOP_LVD2 | Mask bit for LVD2 reset/interrupt 0: Enable LVD2 reset/interrupt 1: Mask LVD2 reset/interrupt | R/W |
| 23:19 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | DBGSTOP_RPER | Mask bit for SRAM parity error reset/interrupt 0: Enable SRAM parity error reset/interrupt 1: Mask SRAM parity error reset/interrupt | R/W |
| 25 | DBGSTOP_RECCR | Mask bit for SRAM ECC error reset/interrupt 0: Enable SRAM ECC error reset/interrupt 1: Mask SRAM ECC error reset/interrupt | R/W |
| 30:26 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31 | DBGSTOP_CPER | Mask bit for Cache SRAM parity error reset/interrupt 0: Enable Cache SRAM parity error reset/interrupt 1: Mask Cache SRAM parity error reset/interrupt | R/W |

The Debug Stop Control Register (DBGSTOPCR) controls the functional stop in OCD mode. All bits in the register are regarded as 0 when the MCU is not in OCD mode.

2.7.4.3 DBGREG CoreSight component registers

The DBGREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.13 shows the registers. See reference 4. in [section 2.14. References](#) for details of each register.

Table 2.13 DBGREG CoreSight component registers (1 of 2)

| Name | Address | Access size | R/W | Initial value |
|-------|-------------|-------------|-----|---------------|
| PIDR4 | 0x4001_BFD0 | 32 bits | R | 0x00000004 |
| PIDR5 | 0x4001_BFD4 | 32 bits | R | 0x00000000 |
| PIDR6 | 0x4001_BFD8 | 32 bits | R | 0x00000000 |
| PIDR7 | 0x4001_BFDC | 32 bits | R | 0x00000000 |
| PIDR0 | 0x4001_BFE0 | 32 bits | R | 0x00000005 |
| PIDR1 | 0x4001_BFE4 | 32 bits | R | 0x00000030 |
| PIDR2 | 0x4001_BFE8 | 32 bits | R | 0x0000000A |
| PIDR3 | 0x4001_BFEC | 32 bits | R | 0x00000000 |
| CIDR0 | 0x4001_BFF0 | 32 bits | R | 0x0000000D |
| CIDR1 | 0x4001_BFF4 | 32 bits | R | 0x000000F0 |

Table 2.13 DBGREG CoreSight component registers (2 of 2)

| Name | Address | Access size | R/W | Initial value |
|-------|-------------|-------------|-----|---------------|
| CIDR2 | 0x4001_BFF8 | 32 bits | R | 0x00000005 |
| CIDR3 | 0x4001_BFFC | 32 bits | R | 0x000000B1 |

2.7.5 OCDREG Module

The OCDREG module are only accessible by the On-Chip Debug (OCD) emulator. OCDREG is implemented as a CoreSight-compliant component.

Table 2.14 lists the OCDREG registers.

Table 2.14 OCDREG registers

| Name | | DAP port | Address | Access size | R/W |
|----------------------|---------|----------|-------------|-------------|-----|
| MCU Status Register | MCUSTAT | Port 1 | 0x8000_0400 | 32 bits | R |
| MCU Control Register | MCUCTRL | Port 1 | 0x8000_0410 | 32 bits | R/W |

Note: OCDREG is located in the dedicated OCD address space. This address map is independent from the system address map.

2.7.5.1 MCUSTAT : MCU Status Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x400

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|-------------------|-------------------|-------------------|----|----|----|----|----|----|----|----|--------------------|-------------------|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | SECD BG | DBGF UNCEN | BOOT MD | — | — | — | — | — | — | — | — | CPUS TOPC LK | CPUS LEEP | — |
| Value after reset: | 0 | 0 | 1/0 ^{*1} | 1/0 ^{*1} | 1/0 ^{*1} | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1/0 ^{*1} | 1/0 ^{*1} | 0 |

| Bit | Symbol | Function | R/W |
|------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | — | These bits are read as 0. | R |
| 1 | CPUSLEEP | Sleep mode status This bit is unpredictable when the MCU is in Software Standby mode, Snooze mode, or Deep Software Standby mode. 0: CPU is not in Sleep mode 1: CPU in Sleep mode | R |
| 2 | CPUSTOPCLK | CPU clock status This bit is unpredictable when the MCU is in Deep Software Standby mode. 0: CPU clock is not stopped. 1: CPU clock is stopped. | R |
| 7:3 | — | These bits are read as 0. | R |
| 8 | — | These bits are read as 1. | R |
| 10:9 | — | These bits are read as 0. | R |
| 11 | BOOTMD | Boot mode status 0: Device is not in Boot mode 1: Device is in Boot mode | R |
| 12 | DBGFUNCEN | Debugger status 0: Debugger connection is not available 1: Debugger function is enabled | R |

| Bit | Symbol | Function | R/W |
|-------|--------|-----------------------------------------------------------------------------------------|-----|
| 13 | SECDBG | Secure Debug status 0: Secure Debug is not available 1: Secure Debug is available | R |
| 31:14 | — | These bits are read as 0. | R |

Note 1. Depends on the MCU status.

2.7.5.2 MCUCTRL : MCU Control Register

Base address: CPU_OCD = 0x8000_0000

Offset address: 0x410

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CPUW AIT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|-------|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | DBIRQ | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | DBIRQ ^{*2} | Debug Interrupt Request Writing 1 to the bit wakes up the MCU from low power mode. The condition can be cleared by writing 0 to the DBIRQ bit. 0: Debug interrupt not requested 1: Debug interrupt requested | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | CPUWAIT ^{*2} | CPU Wait Setting Write 1 to assert CPUWAIT, write 0 to deassert CPUWAIT ^{*1} . 0: Clear CPUWAIT to low 1: Set CPUWAIT to high | R/W |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. CPUWAIT is used to prevent the processor from executing code immediately after reset.

Note 2. Access (R/W) to bit is valid only when Debug Level is DBG1 or DBG2.

2.7.5.3 OCDREG CoreSight component registers

The OCDREG module provides the CoreSight component registers defined in the Arm CoreSight architecture.

Table 2.15 shows the registers. See reference 4. in [section 2.14. References](#) for details of each register.

Table 2.15 OCDREG CoreSight component registers (1 of 2)

| Name | Address | Access size | R/W | Initial value |
|-------|-------------|-------------|-----|---------------|
| PIDR4 | 0x8000_0FD0 | 32 bits | R | 0x00000004 |
| PIDR5 | 0x8000_0FD4 | 32 bits | R | 0x00000000 |
| PIDR6 | 0x8000_0FD8 | 32 bits | R | 0x00000000 |
| PIDR7 | 0x8000_0FDC | 32 bits | R | 0x00000000 |
| PIDR0 | 0x8000_0FE0 | 32 bits | R | 0x00000004 |
| PIDR1 | 0x8000_0FE4 | 32 bits | R | 0x00000030 |
| PIDR2 | 0x8000_0FE8 | 32 bits | R | 0x0000000A |
| PIDR3 | 0x8000_0FEC | 32 bits | R | 0x00000000 |

Table 2.15 OCDREG CoreSight component registers (2 of 2)

| Name | Address | Access size | R/W | Initial value |
|-------|-------------|-------------|-----|---------------|
| CIDR0 | 0x8000_0FF0 | 32 bits | R | 0x0000000D |
| CIDR1 | 0x8000_0FF4 | 32 bits | R | 0x000000F0 |
| CIDR2 | 0x8000_0FF8 | 32 bits | R | 0x00000005 |
| CIDR3 | 0x8000_0FFC | 32 bits | R | 0x000000B1 |

2.7.6 CPUDSAR : CPU Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x1B0

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CPUD SA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|------|---------|----------------------------------------------------------------|-----|
| 0 | CPUDSA0 | CPU Debug Security Attribution 0 0: Secure 1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only secure access can write to this register. Both secure access and non-secure read access are allowed. Non-secure write access is denied, and no TrustZone access error is generated.

Note: This register is write-protected by PRCR register.

When Debug level of the MCU is DBG2, by guarding entire EPPB bus, the non-secure access from CPU to debug related components is completely controlled by the current value of the CPUDSA0 bit. Since this bit is modifiable only when CPU is in secure state, user must be aware of the CPUDSAR register before using CoreSight debug components.

CPUDSA0 bit (CPU Debug Security Attribution 0)

Security attributes of register for accessing the debug component of the CPU.

0: Debug component can only be accessed with secure access.

1: There is no restriction on accessing the debug component.

2.7.7 Processing on Error response generated by CPU access

In addition to the specific-error detection specification of the Arm Cortex-M33 processor, this MCU also provides additional error information which is described in [section 13, Buses](#).

This section describes how to handle the additional error information with no conflict to that of the Arm Cortex-M33 processor.

[Table 2.16](#) shows error detection modules, which are also described in [section 13, Buses](#). These error detection modules not only provide error information on the bus module, but also notify the processor to trigger the exception handler.

Table 2.16 Error detection modules (1 of 2)

| | NMI/RESET request | Interrupt | Bus error status register | Error address register Error RW register |
|-----------|-------------------|-----------------------------|---------------------------|---------------------------------------------|
| Slave TZF | NMISR.TZFST | Bus Fault*1 (Hard Fault) | BUS.BUSnERRSTAT.STERRSTAT | BUS.BTZFnERRADD BUS.BTZFnERRRW |

Table 2.16 Error detection modules (2 of 2)

| | NMI/RESET request | Interrupt | Bus error status register | Error address register Error RW register |
|------------------------------|-------------------|-----------------------------------------|---------------------------|---------------------------------------------|
| Slave bus error | — | Bus Fault* ¹ (Hard Fault) | BUS.BUSnERRSTAT.SLERRSTAT | BUS.BUSnERRADD BUS.BUSnERRRW |
| Illegal address access error | — | Bus Fault* ¹ (Hard Fault) | BUS.BUSnERRSTAT.ILERRSTAT | BUS.BUSnERRADD BUS.BUSnERRRW |

Note 1. A Bus Fault can be treated as HardFault. For details, see *ARM® Cortex®-M33 Device Generic User Guide* in the [section 2.14. References](#).

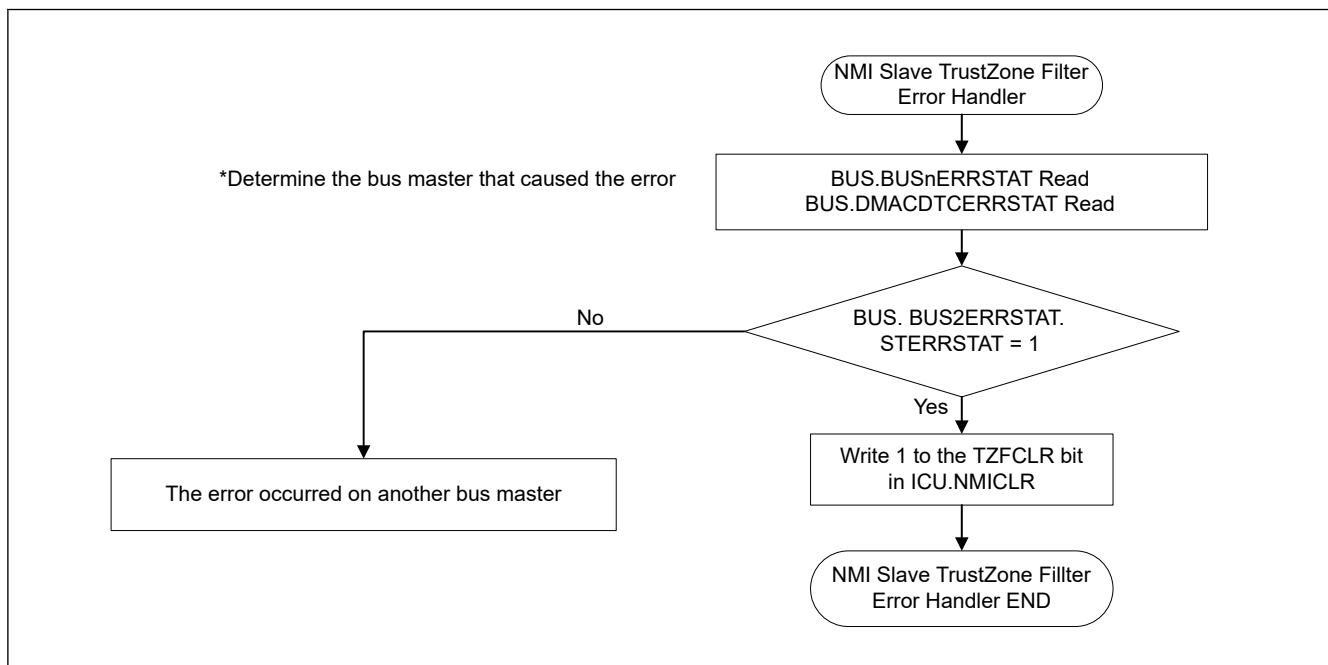

To prevent unexpected operation, when handling the exception, additional operation should be added into exception routing. BusFault when occurred by error detected as shown in [Table 2.16](#):

- See [section 13, Buses](#) for the error information in the corresponding register
- Clear the data in cache for the error address
- Clear the Error Status register in the bus module
- Service exception handling with Arm-guided operation

For a Bus Fault that is not detected in the Renesas-specific error detection module (occurred inside the Arm Cortex-M33 core), see the *ARM® Cortex®-M33 Device Generic User Guide* to handle this case.

In the system bus specification, there is a specific case for Slave TrustZone Filter, that is, if an error is selected to generate an NMI, then before the processor handles the Bus Fault exception, NMI with higher priority takes the exception first. Therefore, use the BusFault handler and not NMI handler to handle this error. In other words, the NMI status should be cleared but the error status bit should not be cleared to ensure that BusFault captures all the error information.

[Figure 2.4](#) and [Figure 2.5](#) show the recommended flows for NMI handler and BusFault handler for the errors described in [Table 2.16](#).

**Figure 2.4 NMI handling flowchart**

Figure 2.5 BusFault interrupt handling flowchart

2.8 CoreSight Cross Trigger Interface (CTI)

As shown in [Figure 2.6](#), the input and output of a Cross Trigger Interface (CTI) interact with each other through four CTM channels. Input of a CTI can be used to trigger the output of another CTI using the four CTM channels.

Figure 2.6 CTI System

Debug Interrupt Request (DBGIRQ) is controlled by MCUCTRL register in OCDREG module.

Table 2.17 CTI Trigger signals

| Number of CTI channel | CTITRIGIN | | CTITRIGOUT | |
|-----------------------|-----------|-------------------------|------------|--------------------------------|
| CTI0 (Debug common) | 0 | ACQCOMP | 0 | — |
| | 1 | FULL | 1 | — |
| | 2 | DBIRQ | 2 | ETB FLUSHIN |
| | 3 | — | 3 | ETB TRIGIN |
| | 4 | — | 4 | — |
| | 5 | — | 5 | — |
| | 6 | — | 6 | — |
| | 7 | — | 7 | — |
| CTI1 (CPU) | 0 | Processor Halted | 0 | Processor debug request |
| | 1 | DWT Comparator Output 0 | 1 | Processor Restart |
| | 2 | DWT Comparator Output 1 | 2 | CTIIRQ[0] (Connected to IRQ96) |
| | 3 | DWT Comparator Output 2 | 3 | CTIIRQ[1] (Connected to IRQ97) |
| | 4 | ETM Event Output 0 | 4 | ETM Event Input 0 |
| | 5 | ETM Event Output 1 | 5 | ETM Event Input 1 |
| | 6 | — | 6 | ETM Event Input 2 |
| | 7 | — | 7 | ETM Event Input 3 |

2.9 CoreSight ATB Funnel

There is one CoreSight ATB funnel in the MCU. The funnel has two ATB slaves and one ATB master, and it selects the debug trace source from ETM and ITM to ETB. [Figure 2.7](#) shows the CoreSight ATB connection in the MCU.

Figure 2.7 CoreSight ATB connection

Table 2.18 shows the ATB slave connection for the funnel.

Table 2.18 ATB slave connection

| ATB slave number | Connected trace source |
|------------------|------------------------|
| #0 | ITM |
| #1 | ETM |

See reference 4. in [section 2.14. References](#) for details of the ATB and funnel.

2.10 Break Point Unit

The MCU has Break Point Unit. See BreakPoint unit chapter of reference 1. in [section 2.14. References](#) for details about register description of this module.

2.11 CoreSight Time Stamp Generator

A CoreSight Time Stamp Generator provides a CPU clock-based timestamp to ITM and ETM. The timestamp is generated by a 64-bit counter. See reference 4. in [section 2.14. References](#) for details.

2.12 SysTick Timer

The MCU has SysTick timer that provides two 24-bit down counters, non-secure and secure counters. The timer can select SysTick timer clock (SYSTICCLK) or System clock (ICLK).

See [section 8, Clock Generation Circuit](#) and reference 1. in [section 2.14. References](#) for details.

Note: SysTick timer counter operation is enabled by signal synchronized with CPU clock. Therefore, the counter might not operate correctly if the CPU clock is slower than the SysTick timer clock. In other words, clock setting must satisfy the following: CPU clock \geq SysTick timer clock (LOCO: 32.768 kHz).

2.13 OCD Emulator Connection

In this product, the MCU confirms the access permission for Non-secure debug and Non-secure chip resources by checking Debug level is DBG1 or higher. For full access permission for debug and chip resources, Secure debug level DBG2 is required.

[Figure 2.8](#) shows a block diagram of SWD authentication mechanism.

Figure 2.8 SWD Authentication mechanism block diagram

Three levels of debug capability are available, DBG0, DBG1, and DBG2, which correspond to the Device Level Management (DLM) states. When debug level is DBG0, access to debug components and system bus from OCD emulator is not permitted. When debug level is DBG1 or DBG2, the corresponding non-secure or secure debug components and system bus can be accessed from the OCD emulator. See [Table 2.5](#) for more information about debug levels.

2.13.1 DBGEN

After the OCD emulator gets access permission, the OCD emulator must set the DBGEN bit in the System Control OCD Control Register (SYOCD CR). In addition, the OCD emulator must clear the DBGEN bit before disconnecting it. See [section 10, Low Power Modes](#) for details.

2.13.2 Restrictions on Connecting an OCD emulator

This section describes the restrictions on emulator access.

2.13.2.1 Starting connection while in low power mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal or Sleep mode. If the MCU is in Software Standby, Snooze, or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.13.2.2 Changing low power mode while in OCD mode

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Software Standby, Snooze or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from the OCD emulator in these modes. [Table 2.19](#) shows the restrictions.

Table 2.19 Restrictions by mode (1 of 2)

| Active mode | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|-------------|-------------------------------|-----------------------|------------------------------|--------------------------|
| Normal | Yes | Yes | Yes | Yes |

Table 2.19 Restrictions by mode (2 of 2)

| Active mode | Start OCD emulator connection | Change low power mode | Access AHB-AP and system bus | Access APB-AP and OCDREG |
|-----------------------|-------------------------------|-----------------------|------------------------------|--------------------------|
| Sleep | Yes | Yes | Yes | Yes |
| Software Standby | No | Yes | No | Yes |
| Snooze | No | Yes | No | Yes |
| Deep Software Standby | No | Yes | No | Yes |

If system bus access is required in Software Standby, Snooze, or Deep Software Standby mode, set the MCUCTRL.DBIRQ bit in OCDREG to wake up the MCU from the low power modes. Simultaneously, by asserting the MCUCTRL.DBIRQ bit in OCDREG, the OCD emulator can wake up the MCU without starting CPU execution by using a CPU break.

2.13.2.3 Connecting sequence and JTAG/SWD authentication

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.
In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set MCUCTRL.CPUWAIT = 1.
5. Confirm the debug capability of device by reading MCUSTAT:
 - If Debug function is prohibited, this device is not able to debug.
 - If Debug function is enabled and secure debug is not available, only non-secure debug is available.
 - If Debug function is enabled and secure debug is available, full debug functions are available.

If Debug function is available, set debug-related register then clear MCUCTRL.CPUWAIT = 0.

6. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
7. Set SYOCD CR.DBGEN to 1.
8. Start accessing the CPU debug resources using the AHB-AP.

Note: Debug level is determined by the current DLM state of product.

2.13.3 Restrictions on Disconnecting OCD Emulator

After disconnecting the OCD emulator, a device cannot fully transfer to Software Standby mode. In this case, power consumption was not reduced as expected, because some low-consumption features did not work.

3. Operating Modes

3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin. For details, see [section 3.2. Details of Operating Modes](#). Operation starts with the on-chip flash memory enabled, regardless of the mode in which operation started.

Table 3.1 Selection of operating modes by the mode-setting pin

| Mode-setting pin (MD) | Operating mode | On-chip Flash |
|-----------------------|------------------|---------------|
| 1 | Single-chip mode | Enable |
| 0 | SCI boot mode | Enable |

3.2 Details of Operating Modes

3.2.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs.

When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

3.2.2 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see [section 43, Flash Memory](#). The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

3.3 Operating Modes Transitions

3.3.1 Operating Mode Transitions as Determined by the Mode-Setting Pin

Figure 3.1 shows operating mode transitions determined by the MD pin settings.

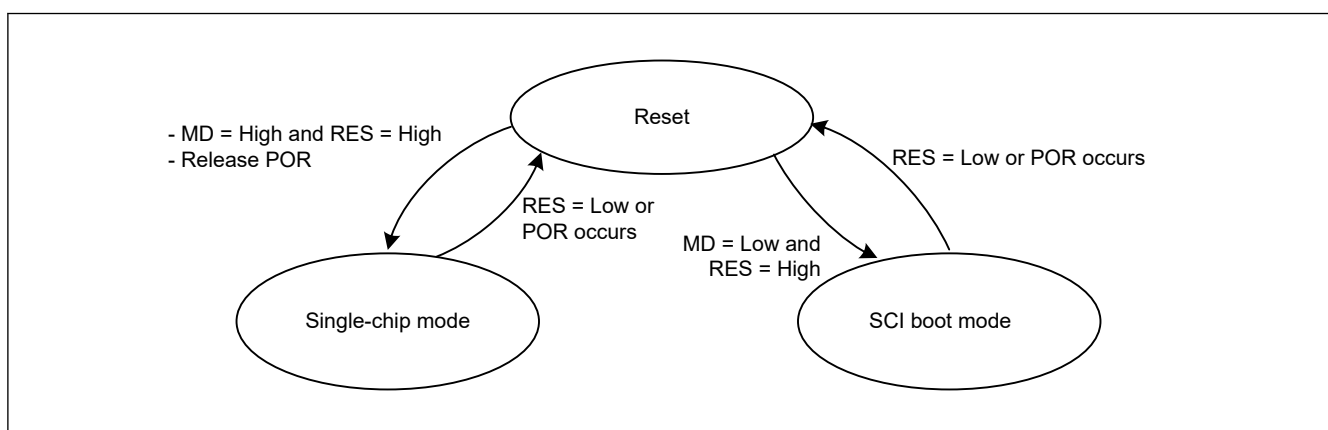

Figure 3.1 Mode-setting pin level and operating mode

4. Address Space

4.1 Address Space

The MCU supports a 4-GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. Figure 4.1 shows the memory map.

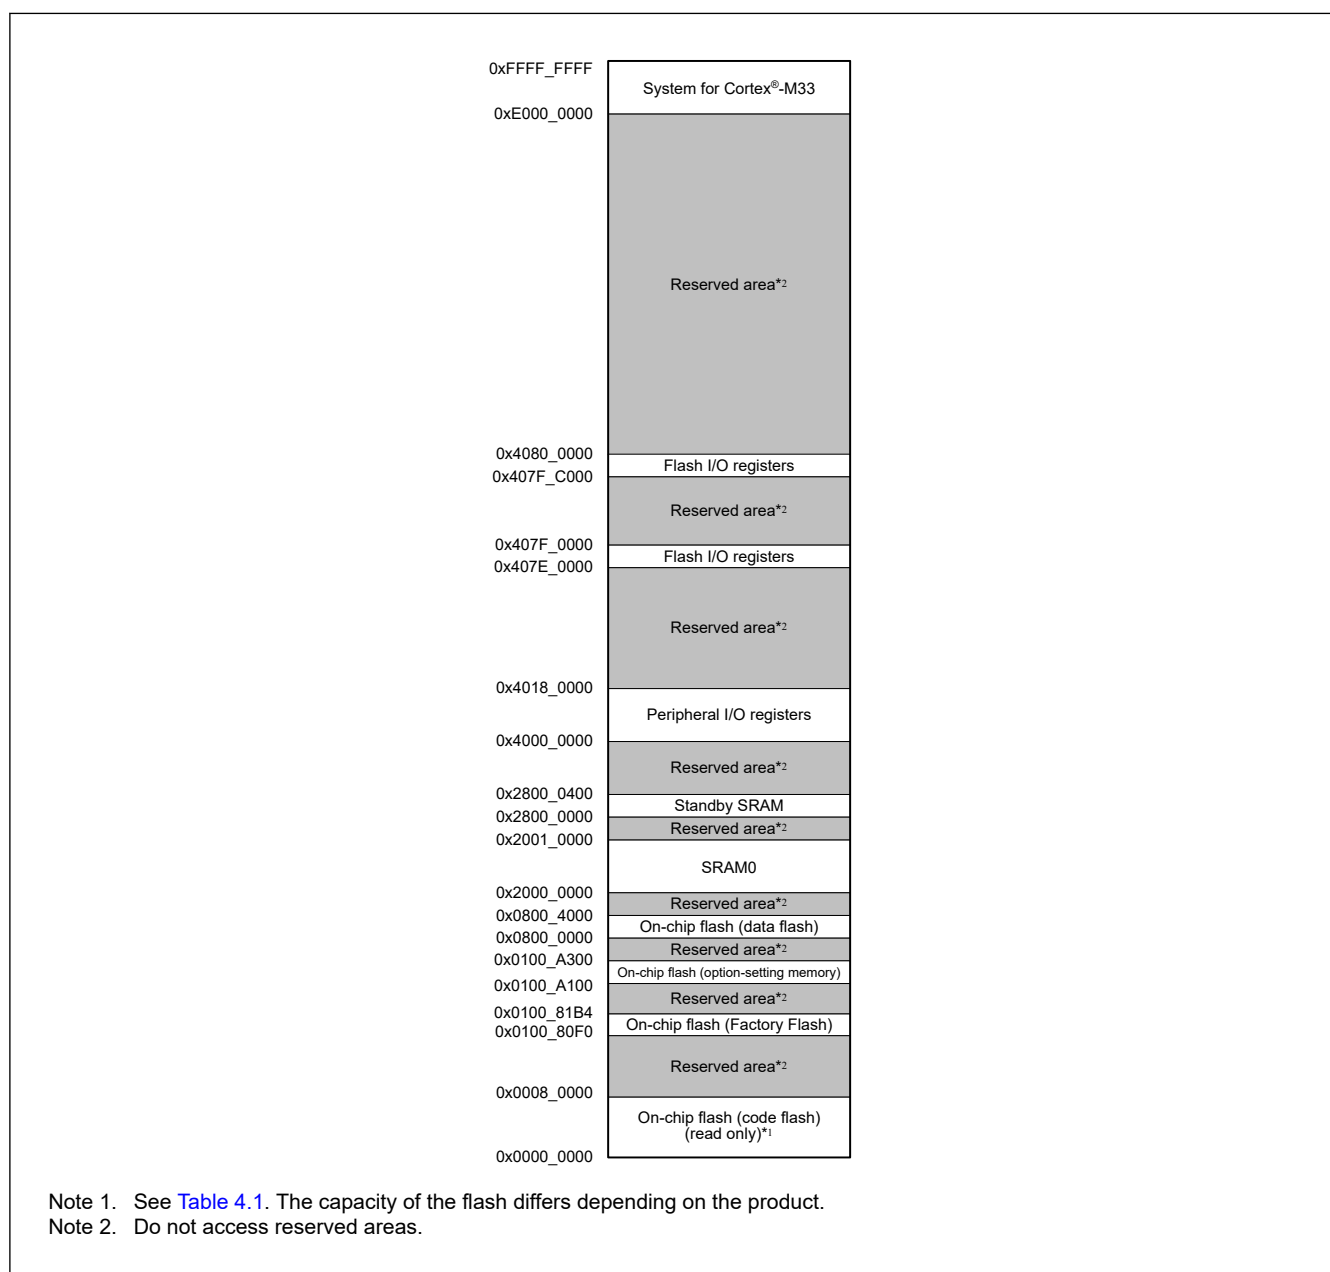

Figure 4.1 Memory map

Table 4.1 Capacity of the code flash memory, data flash memory, and SRAM0

| Code flash memory | | Data flash memory | | SRAM0 | |
|-------------------|---------------------------|-------------------|---------------------------|----------|---------------------------|
| Capacity | Address | Capacity | Address | Capacity | Address |
| 512 KB | 0x0000_0000 - 0x0007_FFFF | 16 KB | 0x0800_0000 - 0x0800_3FFF | 64 KB | 0x2000_0000 - 0x2000_FFFF |
| 256 KB | 0x0000_0000 - 0x0003_FFFF | | | | |

5. Resets

5.1 Overview

The MCU provides 14 resets.

[Table 5.1](#) lists the reset names and sources.

Table 5.1 Reset names and sources

| Reset name | Source |
|----------------------------------|-----------------------------------------------------------------|
| RES pin reset | Voltage input to the RES pin is driven low |
| Power-on reset | VCC rise (voltage detection V_{POR})* ¹ |
| Independent watchdog timer reset | IWDT underflow or refresh error |
| Watchdog timer reset | WDT underflow or refresh error |
| Voltage monitor 0 reset | VCC fall (voltage detection V_{det0})* ¹ |
| Voltage monitor 1 reset | VCC fall (voltage detection V_{det1})* ¹ |
| Voltage monitor 2 reset | VCC fall (voltage detection V_{det2})* ¹ |
| SRAM parity error reset | SRAM parity error detection |
| SRAM ECC error reset | SRAM ECC error detection |
| Bus master MPU error reset | Bus master MPU error detection |
| TrustZone error reset | TrustZone error detection |
| Cache Parity error reset | Cache Parity error detection |
| Deep software standby reset | Deep software standby mode is canceled by an interrupt |
| Software reset | Register setting (use the software reset bit AIRCR.SYSRESETREQ) |

Note 1. For details on the voltages to be monitored (V_{POR} , V_{det0} , V_{det1} , and V_{det2}), see [section 7, Low Voltage Detection \(LVD\)](#) and [section 46, Electrical Characteristics](#).

The internal state and pins are initialized by a reset. [Table 5.2](#) and [Table 5.3](#) list the targets initialized by resets.

Table 5.2 Reset detect flags initialized by each reset source (1 of 4)

| Flag to be initialized | Reset source | | | | | | | |

| Registers other than those shown, CPU, and internal state | | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ | ✓ |

Note: ✓ : Initialized
 — : Not initialized

Note 1. Depends on the setting of DPSBYCR.IOKEEP.

Note 2. Some control bits are not initialized by all types of resets. For details on the target bits, see [section 13, Buses](#)

Note 3. Reset does not occur while the debugger is connected (DBGSTR.CDBGPWRUPREQ = 1) even if On-chip debugger is disabled (SYOCD CR.DBGEN = 0).

Note 4. Reset does not occur while On-chip debugger is enabled (SYOCD CR.DBGEN = 1).

[Table 5.4](#) shows the states of LOCO when a reset occurs.

Table 5.4 States of LOCO when a reset occurs

| | | Reset source | |
|------|------------------------|-----------------------------------------------------------------------|---------------------------------------------------------|
| | | POR, LVD0, LVD1, LVD2, Deep Software Standby (DEEPCUT[0] = 1) | Other |
| LOCO | Enable or disable | Initialized to enable | |
| | Oscillation accuracy*1 | Initialized to accuracy before trimming by power-on (accuracy: ± 10%) | Continue with the accuracy that was trimmed by LOCOUTCR |

Note 1. The LOCO User Trimming Control Register (LOCOUTCR) is reset by POR, LVD0, LVD1, LVD2, and Deep Software Standby (DEEPCUT[0] = 1) resets, returning the LOCO to the default oscillation accuracy. To restore the pre-reset LOCO oscillation accuracy, reload the required trimming value into LOCOUTCR after any of these resets.

When a reset is released, reset exception handling starts.

[Table 5.5](#) lists the pin related to the reset function.

Table 5.5 Pin related to reset

| Pin name | I/O | Function |
|----------|-------|-----------|
| RES | Input | Reset pin |

5.2 Register Descriptions

5.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C4

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|---------|---------|---------|

| 0 | NONSEC0 | Non-secure Attribute bit 0 Target register: Reset Status Register 0 0: Secure 1: Non-secure | R/W |
| 1 | NONSEC1 | Non-secure Attribute bit 1 Target register: Reset Status Register 1 0: Secure 1: Non-secure | R/W |
| 2 | NONSEC2 | Non-secure Attribute bit 2 Target register: Reset Status Register 2 0: Secure 1: Non-secure | R/W |
| 31:3 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

5.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x410

| | | | | | | | | |
|--------------------|-------------|---|---|---|------------|------------|------------|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DPSR STF | — | — | — | LVD2R F | LVD1R F | LVD0R F | PORF |
| Value after reset: | x*1 | 0 | 0 | 0 | x*1 | x*1 | x*1 | x*1 |

| Bit | Symbol | Function | R/W |
|-----|---------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 0 | PORF | Power-On Reset Detect Flag 0: Power-on reset not detected 1: Power-on reset detected | R/W ² |
| 1 | LVD0RF | Voltage Monitor 0 Reset Detect Flag 0: Voltage monitor 0 reset not detected 1: Voltage monitor 0 reset detected | R/W ² |
| 2 | LVD1RF | Voltage Monitor 1 Reset Detect Flag 0: Voltage monitor 1 reset not detected 1: Voltage monitor 1 reset detected | R/W ² |
| 3 | LVD2RF | Voltage Monitor 2 Reset Detect Flag 0: Voltage monitor 2 reset not detected 1: Voltage monitor 2 reset detected | R/W ² |
| 6:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | DPSRSTF | Deep Software Standby Reset Detect Flag 0: Deep software standby mode cancellation not requested by an interrupt. 1: Deep software standby mode cancellation requested by an interrupt. | R/W ² |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. The register is cleared when a reset source listed in [Table 5.2](#) occurs or when 0 is written to clear a flag. Bits other than the flag that is cleared should be set to 1.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When PORF is read as 1 and then 0 is written to PORF

LVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The LVD0RF flag indicates that the VCC voltage fell below V_{det0} .

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD0RF is read as 1 and then 0 is written to LVD0RF.

LVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The LVD1RF flag indicates that the VCC voltage fell below V_{det1} .

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD1RF is read as 1 and then 0 is written to LVD1RF

LVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The LVD2RF flag indicates that the VCC voltage fell below V_{det2} .

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When LVD2RF is read as 1 and then 0 is written to LVD2RF

DPSRSTF flag (Deep Software Standby Reset Detect Flag)

The DPSRSTF flag indicates that Deep Software Standby mode has been canceled by an external or internal interrupt and that an internal reset (Deep Software Standby reset) occurred when the exception from Deep Software Standby Mode occur.

[Setting condition]

- When Deep Software Standby mode is cancelled by an external or an internal interrupt. For details, see [section 10, Low Power Modes](#).

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs.
- When DPSRSTF is read as 1 and then 0 is written to DPSRSTF

5.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0C0

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|----|-----------|----|------------|----|-----------|-----------|---|---|---|---|---|------|-----------|------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CPER F | — | TZER F | — | BUSM RF | — | REER F | RPER F | — | — | — | — | — | SWRF | WDTR F | IWDT RF |
| Value after reset: | x*1 | 0 | x*1 | 0 | x*1 | 0 | x*1 | x*1 | 0 | 0 | 0 | 0 | 0 | x*1 | x*1 | x*1 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 0 | IWDRF | Independent Watchdog Timer Reset Detect Flag 0: Independent watchdog timer reset not detected 1: Independent watchdog timer reset detected | R/W ² |
| 1 | WDTRF | Watchdog Timer Reset Detect Flag 0: Watchdog timer reset not detected 1: Watchdog timer reset detected | R/W ² |
| 2 | SWRF | Software Reset Detect Flag 0: Software reset not detected 1: Software reset detected | R/W ² |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | RPERF | SRAM Parity Error Reset Detect Flag 0: SRAM parity error reset not detected 1: SRAM parity error reset detected | R/W ² |
| 9 | REERF | SRAM ECC Error Reset Detect Flag 0: SRAM ECC error reset not detected 1: SRAM ECC error reset detected | R/W ² |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMRF | Bus Master MPU Error Reset Detect Flag 0: Bus master MPU error reset not detected 1: Bus master MPU error reset detected | R/W ² |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------|------------------|
| 13 | TZERF | TrustZone Error Reset Detect Flag 0: TrustZone error reset not detected. 1: TrustZone error reset detected. | R/W ² |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPERF | Cache Parity Error Reset Detect Flag 0: Cache Parity error reset not detected. 1: Cache Parity error reset detected. | R/W ² |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an independent watchdog timer reset occurs.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to IWDTRF.

WDTRF flag (Watchdog Timer Reset Detect Flag)

The WDTRF flag indicates that a watchdog timer reset occurs.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to WDTRF.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a software reset occurs.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to SWRF.

RPERF flag (SRAM Parity Error Reset Detect Flag)

The RPERF flag indicates that an SRAM parity error reset occurs.

[Setting condition]

- When an SRAM parity error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read as 1 and then 0 is written to RPERF.

REERF flag (SRAM ECC Error Reset Detect Flag)

The REERF flag indicates that an SRAM ECC error reset occurs.

[Setting condition]

- When an SRAM ECC error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read as 1 and then 0 is written to REERF.

BUSMRF flag (Bus Master MPU Error Reset Detect Flag)

The BUSMRF flag indicates that a bus master MPU error reset occurs.

[Setting condition]

- When a bus master MPU error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read and then 0 is written to BUSMRF.

TZERF flag (TrustZone Error Reset Detect Flag)

The TZERF flag indicates that a TrustZone error reset has occurred.

[Setting condition]

- When a TrustZone error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read then and 0 is written to TZERF.

CPERF flag (Cache Parity Error Reset Detect Flag)

The CPERF flag indicates that a Cache Parity error reset has occurred.

[Setting condition]

- When a Cache Parity error reset occurs.

[Clearing conditions]

- When a reset listed in [Table 5.2](#) occurs
- When 1 is read then and 0 is written to CPERF.

5.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x411

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-----------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | CWSF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x ^{*1} |

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------|-------------------|
| 0 | CWSF | Cold/Warm Start Determination Flag 0: Cold start 1: Warm start | R/W ^{*2} |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------|-----|
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The value after reset depends on the reset source.

Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. The determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start). CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software.

[Clearing condition]

- When a reset listed in [Table 5.2](#) occurs.

5.3 Operation

5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (t_{RESWT}) elapses. The CPU then starts the reset exception handling.

For details, see [section 46, Electrical Characteristics](#).

5.3.2 Power-On Reset

The power-on reset (POR) is an internal reset generated by the power-on reset circuit. A power-on reset is generated under the following conditions.

1. If the RES pin is in a high level state when power is supplied
2. If the RES pin is in a high level state when VCC is below V_{POR}

After VCC exceeds V_{POR} and the specified power-on reset time (t_{POR}) elapses, the CPU starts the reset exception handling. The power-on reset time is a stabilization period of the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset. When VCC falls below V_{POR} , a power-on reset state is occurred.

[Figure 5.1](#) shows example of operations during a power-on reset.

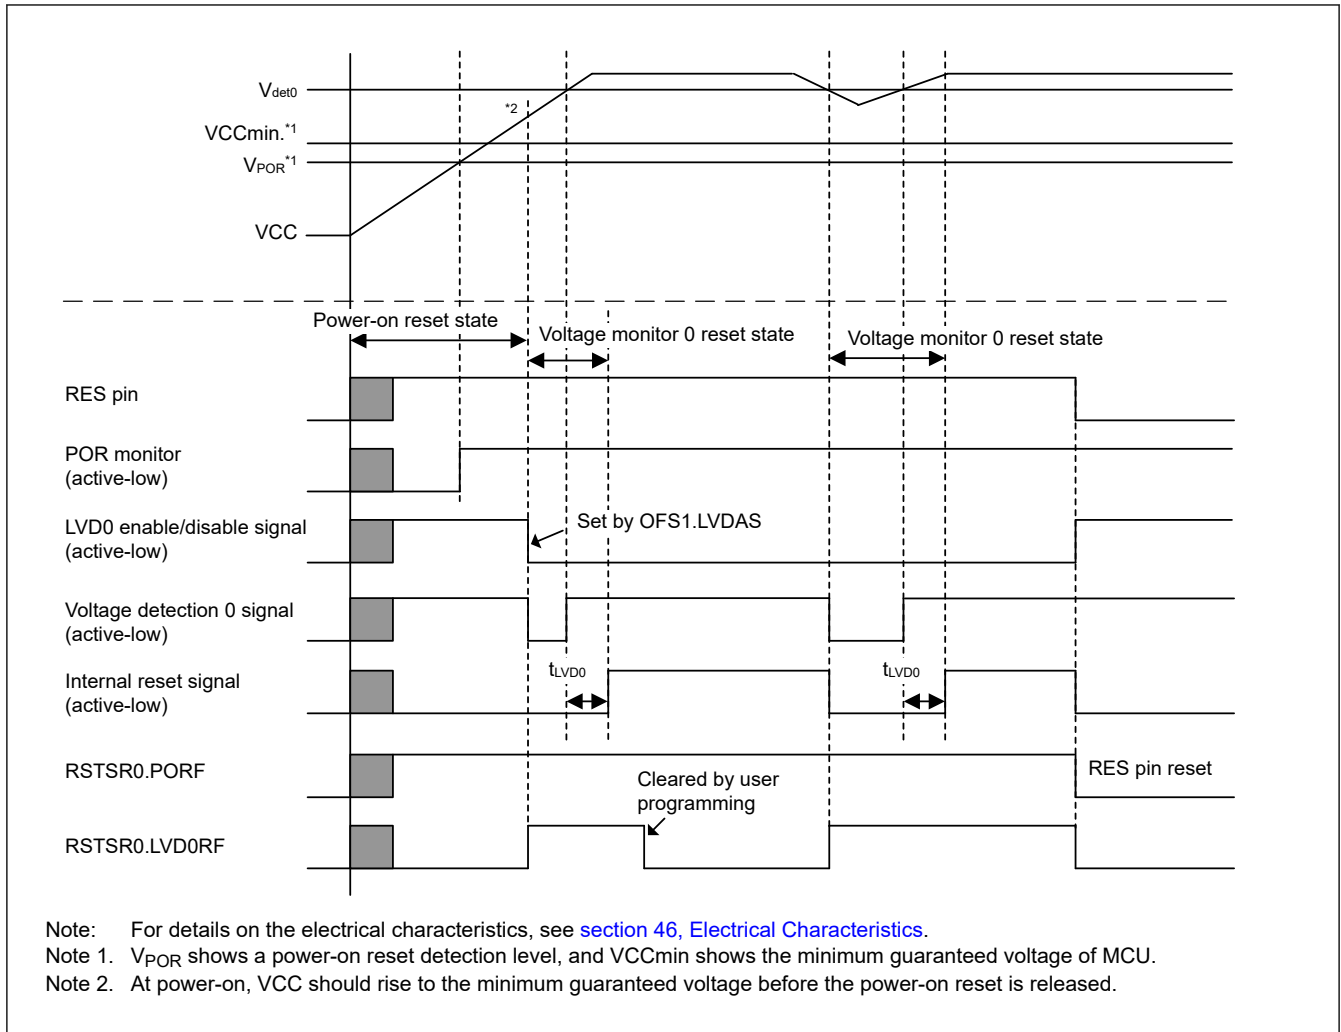

Figure 5.1 Example of operations during a power-on reset

5.3.3 Voltage Monitor Reset

The voltage monitor i ($i = 0, 1, 2$) reset is an internal reset generated by the voltage monitor i circuit. If the Voltage Detection 0 Circuit Start (LVDAS) bit in the Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below V_{det0} , the RSTSR0.LVD0RF flag becomes 1 and the voltage detection circuit generates voltage monitor 0 reset. Clear the OFS1.LVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds V_{det0} and the voltage monitor 0 reset time (t_{LVD0}) elapses, the internal reset is canceled and the CPU starts the reset exception handling.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (LVD1CR0), the RSTSR0.LVD1RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 1 reset if VCC falls to or below V_{det1} .

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (LVD2CR0), the RSTSR0.LVD2RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 2 reset if VCC falls to or below V_{det2} .

Similarly, timing for release from the voltage monitor 1 reset state is selectable with the Voltage Monitor 1 Reset Negate Select bit (RN) in the LVD1CR0. When the LVD1CR0.RN bit is 0 and VCC falls to or below V_{det1} , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time (t_{LVD1}) elapses after VCC rises above V_{det1} . When the LVD1CR0.RN bit is 1 and VCC falls to or below V_{det1} , the CPU is released from the internal reset state and starts reset exception handling when the LVD1 reset time (t_{LVD1}) elapses.

Likewise, timing for release from the voltage monitor 2 reset state is selectable by setting the Voltage Monitor 2 Reset Negate Select bit (RN) in the LDV2CR0 register.

Detection levels V_{det1} and V_{det2} can be changed in the Voltage Monitoring Comparator Control Register (LVD1CMPCR/LVD2CMPCR).

Figure 5.2 shows example of operations during voltage monitor 1 and 2 resets. For details on the voltage monitor 1 reset and voltage monitor 2 reset, see [section 7, Low Voltage Detection \(LVD\)](#).

Figure 5.2 Example of operations during voltage monitor 1 and voltage monitor 2 resets

5.3.4 Deep Software Standby Reset

This is an internal reset generated when Deep Software Standby mode is canceled by an interrupt.

When a Deep Software Standby mode cancellation source is generated, a Deep Software Standby reset is generated. The Deep Software Standby reset is canceled after t_{DSBY} (return time after Deep Software Standby mode cancellation) has elapsed. At the same time, Deep Software Standby mode is also canceled.

When t_{DSBYWT} (wait time after Deep Software Standby mode cancellation) has elapsed after Deep Software Standby mode has been canceled, the internal reset is canceled and the CPU starts the reset exception handling.

For details of the Deep Software Standby reset, see [section 10, Low Power Modes](#).

5.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDG). Output of the reset from the IWDG can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

5.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, a watchdog timer reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see [section 24, Watchdog Timer \(WDT\)](#).

5.3.7 Software Reset

The software reset is an internal reset generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (t_{RESW2}) elapses after the software reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the SYSRESETREQ bit, see the *ARM® Cortex®-M33 Technical Reference Manual*.

5.3.8 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

[Figure 5.3](#) shows an example of cold/warm start determination operation.

Figure 5.3 Example of cold/warm start determination operation

5.3.9 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.4 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after it is read as 1.

Figure 5.4 Example of reset generation source determination flow

6. Option-Setting Memory

6.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area of the flash memory.

[Figure 6.1](#) shows the option-setting memory area. The option-setting memory area has secure region. [Table 6.1](#) shows the programming condition of the option-setting memory area.

Figure 6.1 Option-setting memory area

Table 6.1 The programming condition of the option-setting memory area

| | Self programming | Serial programming | Programming by the on-chip debugger |
|---------------|-------------------------------------------------------------|--------------------------------------------------------------------------|-------------------------------------------------------------------|
| Secure region | Programming commands issued by secure access. | Programming commands issued when the device life cycle is SSD. | Programming commands issued when the debug level is DBG2. |
| Other region | Programming commands issued by secure or non-secure access. | Programming commands issued when the device life cycle is SSD or NSECSD. | Programming commands issued when the debug level is DBG2 or DBG1. |

6.2 Register Descriptions

6.2.1 OFS0 : Option Function Select Register 0

Address: 0x0100_A100

| | | | | | | | | | | | | | | | | |
|---------------|----|--------------|----|--------------------|--------------|--------------|-------------|----|----|--------------|----|----|------------|----|----|----|

| 31 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524288 IWDT clock cycles.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering Sleep mode, Snooze mode, or Software Standby mode.

For details, see [section 25, Independent Watchdog Timer \(IWDT\)](#).

WDTSTRT bit (WDT Start Mode Select)

The WDTSTRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDTTOPS[1:0] bits (WDT Timeout Period Select)

The WDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDTCKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDTCKS[3:0] and WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTCKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDTTOPS[1:0] bits setting, the WDT counting period can be set from 4096 to 134217728 PCLKB cycles.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDRPES[1:0] bits (WDT Window End Position Select)

The WDRPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDRPSS[1:0] and WDRPES[1:0] bits vary with the setting of the WDTTOPS[1:0] bits.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTRPSS[1:0] bits (WDT Window Start Position Select)

The WDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTRSTIRQS bit (WDT Reset Interrupt Request Select)

The WDTRSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

WDTSTPCTL bit (WDT Stop Control)

The WDTSTPCTL bit specifies whether to stop counting when entering Sleep mode.

For details, see [section 24, Watchdog Timer \(WDT\)](#).

6.2.2 SAS : Startup Area Setting Register

Address: 0x0100_A134

| 1:0 | VDSEL[1:0] | Voltage Detection 0 Level Select 0 0: Setting prohibited 0 1: Select 2.94 V 1 0: Select 2.87 V 1 1: Select 2.80 V | R |
| 2 | LVDAS | Voltage Detection 0 Circuit Start 0: Enable voltage monitor 0 reset after a reset 1: Disable voltage monitor 0 reset after a reset | R |
| 7:3 | — | When read, these bits return the written value. The write value should be 1. | R |
| 8 | HOCOEN | HOCO Oscillation Enable 0: Enable HOCO oscillation after a reset 1: Disable HOCO oscillation after a reset | R |
| 10:9 | HOCOFREQ[1:0] | HOCO Frequency Setting 0 0 0: 16 MHz 0 1: 18 MHz 1 0: 20 MHz 1 1: Setting prohibited | R |
| 15:11 | — | When read, these bits return the written value. The write value should be 1. | R |
| 19:16 | PGADEN[3:0] | PGAn pseudo-differential input Enable (n = 0 to 3) If not set, the pseudo-differential input of PGAn is enabled. Set this bit to 0 when pseudo-differential input to the PGAs is not to be used. 0: After reset, PGAn pseudo-differential input disabled (single-ended input) 1: After reset, PGAn pseudo-differential input enabled | R |
| 31:20 | — | When read, these bits return the written value. The write value should be 1. | R |

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program OFS1_SEC and OFS1_SEL registers. OFS1_SEC register is for secure developer, and OFS1 register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in OFS1_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

VDSEL[1:0] bits (Voltage Detection 0 Level Select)

The VDSEL[1:0] bits select the voltage detection level of the voltage detection 0 circuit.

LVDAS bits (Voltage Detection 0 Circuit Start)

The LVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, you must set the OFS1.HOCOFRQ0 bit*1 to an optimum value.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore the HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits when OFS1.HOCOEN = 1.

HOCOFRQ0[1:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[1:0] bits specify the HOCO frequency after a reset as 16, 18, or 20 MHz.

PGADEN[3:0] bits (PGAn pseudo-differential input Enable)

This bit selects whether the pseudo-differential input on the PGAn pin is enabled or disabled (single-ended input) after a reset.

6.2.4 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register

address:

BPS: 0x0100_A1C0
BPS_SEC: 0x0100_A240
BPS_SEL: 0x0100_A2C0

Bit position: 31

0

Bit field:

| |
|--|
| |
|--|

Value after reset:

User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program BPS_SEC and BPS_SEL registers. BPS_SEC register is for secure developer, and BPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#).

The BPS and BPS_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. [Figure 6.2](#) shows the code flash block structure of each product. [Figure 6.3](#) shows the relationship between the bit of register and the block number. Unused bits are reserved and should be set to 1.

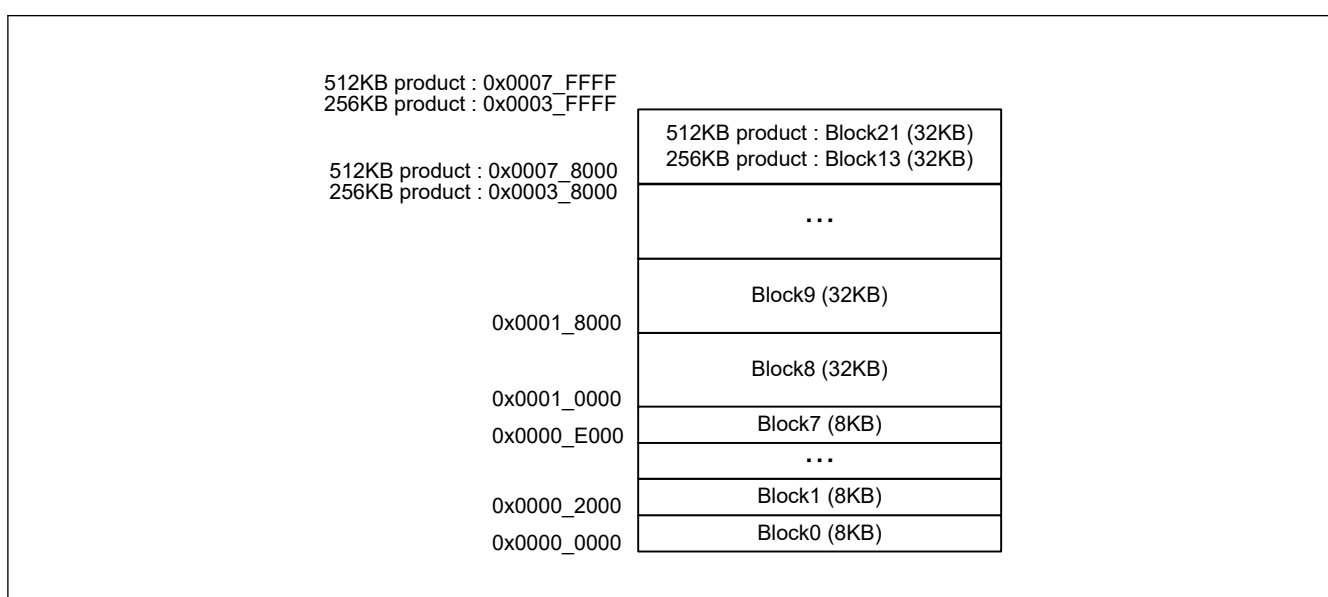

Figure 6.2 Code Flash block structure

| Register | Address | +31 | +30 | +29 | +28 | +27 | +26 | +25 | +24 | +23 | +22 | +21 | +20 | +19 | +18 | +17 | +16 | +15 | +14 | +13 | +12 | +11 | +10 | +9 | +8 | +7 | +6 | +5 | +4 | +3 | +2 | +1 | +0 |
|----------|-------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|----|----|----|----|----|----|----|----|----|----|
| BPS_SEL | 0x0100_A2C0 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ⋮ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BPS_SEC | 0x0100_A240 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| | ⋮ | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| BPS | 0x0100_A1C0 | | | | | | | | | | | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

Figure 6.3 The relationship between the bit of register and the block number

6.2.5 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x0100_A1E0
PBPS_SEC: 0x0100_A260

Bit position: 31

0

Bit field:

Value after reset:

User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Only secure developer can program PBPS_SEC register. PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see [section 6.3.3. Security attribution of option-setting memory](#). The security attribution register is same BPS_SEL register between the block protection and permanent block protection.

The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be set to 0 when corresponding bit of BPS and BPS_SEC is set to 0. When the bit of this register is set to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1.

[Table 6.2](#) shows the relationship between the bit of applied PBPS and bit of applied BPS.

The relationship between the bit of this register and the block number is same as BPS and BPS_SEC registers ([section 6.2.4. BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register](#)). Unused bits are reserved and should be set to 1.

Table 6.2 The relationship between the bit of PBPS, PBPS_SEC and bit of BPS, BPS_SEC

| The bit of applied PBPS | The bit of applied BPS | Content |
|-------------------------|------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| 1 | 1 | Programming and erasure to the corresponding block is valid. |
| 1 | 0 | Programming and erasure to the corresponding block is invalid. This protection can be canceled by FBPROT0 or FBPROT1 registers. |
| 0 | 1 | Cannot set this condition |
| 0 | 0 | Programming and erasure to the corresponding block is invalid permanently |

6.3 Setting Option-Setting Memory

6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in [Figure 6.1](#). The allocated data is used by tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The option-setting memory does not support background operations (BGO). When writing the option-setting memory, jump to SRAM after copying writing software to SRAM.

For details of the configuration setting command, see [section 43, Flash Memory](#).

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in [section 6.3.1. Allocation of Data in Option-Setting Memory](#), from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in [section 6.3.1. Allocation of Data in Option-Setting Memory](#).

6.3.3 Security attribution of option-setting memory

Some functionality has 3 registers for non-secure (FUNC NAME), and secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only secure developer can set the registers for secure and security attribution. As shown in [Figure 6.4](#), when the bit of security attribution register is set to 0, the corresponding bit of secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of non-secure register is applied.

For example, if the secure developer wants to configure LVD of OFS1 as secure, HOCO and PGA of OFS1 as non-secure, the secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF8

By this setting, LVDAS and VDSEL[1:0] values of OFS1_SEC and HOCOFRQ0[1:0], HOCOEN and PGADEN[3:0] values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 1.

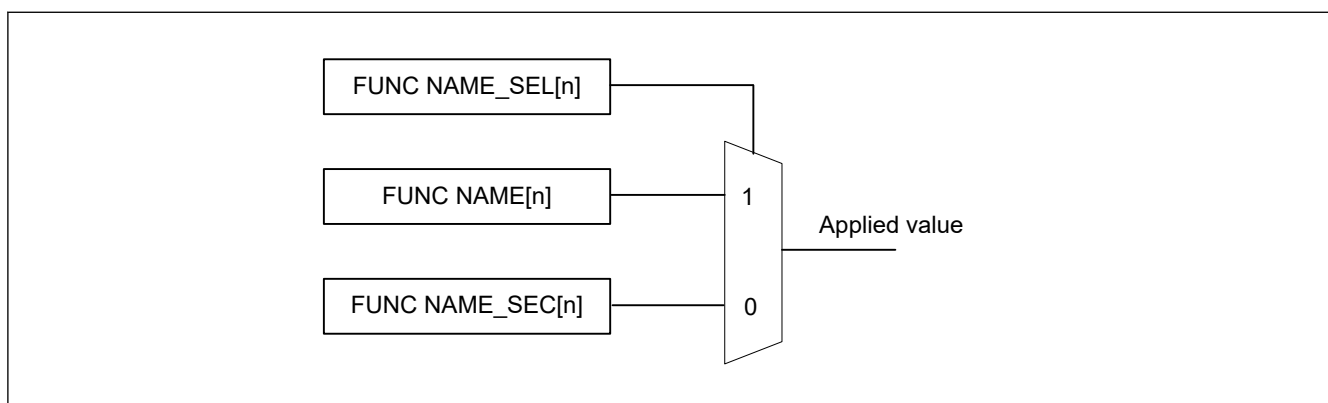

Figure 6.4 Selection of applied value

6.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS, and PBPS_SEC registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

In case the programming using the serial programming mode in customer's factory, be careful that the block protection for secure user is applied after MCU is reset. Because initial value of the security attribution registers of block protection (BPS_SEL) is 1 (non-secure), the block protection setting for secure developer (BPS_SEC/PBPS_SEC) is not applied until MCU is reset even if the corresponding bit of BPS_SEL is programmed to 0 (secure).

6.4 Usage Notes

6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

7. Low Voltage Detection (LVD)

7.1 Overview

The Low Voltage Detection (LVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The LVD module consists of three separate voltage level detectors (LVD0, LVD1, LVD2). LVD0, LVD1, and LVD2 measure the voltage level input to the VCC pin. LVD registers allow your application to configure detection of VCC changes at various voltage thresholds.

Voltage monitor registers are used to configure the LVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the LVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor 1 interrupt and reset circuit, and Figure 7.3 shows a block diagram of the voltage monitor 2 interrupt and reset circuit.

Table 7.1 LVD specifications

| Parameter | | Voltage monitor 0 | Voltage monitor 1 | Voltage monitor 2 |
|--------------------------------|--------------------------------------|-----------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Means for setting up operation | | OFS1 register | Registers | Registers |
| Target for monitoring | | VCC pin input voltage | VCC pin input voltage | VCC pin input voltage |
| Monitored voltage | | V _{det0} | V _{det1} | V _{det2} |

| Bit | Symbol | Function | R/W |
|------|---------|-------------------------------------------------------------------------------------------------|-----|
| 0 | NONSEC0 | Non-secure Attribute bit 0 Target register: registers for LVD1 0: Secure 1: Non-secure | R/W |
| 1 | NONSEC1 | Non-secure Attribute bit 1 Target register: registers for LVD2 0: Secure 1: Non-secure | R/W |
| 31:2 | — | These bits are read as 1. The write value must be 1 when it is possible to write. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

The LVDSAR register controls the secure attribute of LVD registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of LVD1CMPCR, LVD1CR0, LVD1CR1, LVD1SR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of LVD2CMPCR, LVD2CR0, LVD2CR1, LVD2SR.

7.2.2 LVD1CMPCR : Voltage Monitoring 1 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x417

| | | | | | | | | |
|--------------------|-------|---|---|--------------|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | LVD1E | — | — | LVD1LVL[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 4:0 | LVD1LVL[4:0] | Voltage Detection 1 Level Select (Standard voltage during drop in voltage) 0x11: 2.99 V (Vdet1_1) 0x12: 2.92 V (Vdet1_2) 0x13: 2.85 V (Vdet1_3) Others: Setting prohibited | R/W |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------|-----|
| 7 | LVD1E | Voltage Detection 1 Enable 0: Voltage detection 1 circuit disabled 1: Voltage detection 1 circuit enabled | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The LVD1CMPCR.LVD1LVL can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD1CMPCR.LVD1LVL and LVD1CMPCR.LVD1E at the same time.

LVD1E bit (Voltage Detection 1 Enable)

When using voltage detection 1 interrupt/reset or the LVD1SR.MON bit, set the LVD1E bit to 1. The voltage detection 1 circuit starts once $t_{d(E-A)}$ passes after the LVD1E bit value is changed from 0 to 1. When using the voltage detection 1 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

7.2.3 LVD2CMPCR : Voltage Monitoring 2 Comparator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x418

| | | | | | | | | |
|--------------------|-------|---|---|---|---|--------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | LVD2E | — | — | — | — | LVD2LVL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | LVD2LVL[2:0] | Voltage Detection 2 Level Select (Standard voltage during drop in voltage) 1 0 1: 2.99 V (Vdet2_1) 1 1 0: 2.92 V (Vdet2_2) 1 1 1: 2.85 V (Vdet2_3) Others: Setting prohibited | R/W |
| 6:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | LVD2E | Voltage Detection 2 Enable 0: Voltage detection 2 circuit disabled 1: Voltage detection 2 circuit enabled | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The LVD2CMPCR.LVD2LVL can be changed only if the LVD1CMPCR.LVD1E and LVD2CMPCR.LVD2E bits are both 0. The voltage detection circuits 1 and 2 should not be set at the same voltage detection level.

Do not change LVD2CMPCR.LVD2LVL and LVD2CMPCR.LVD2E at the same time.

LVD2E bit (Voltage Detection 2 Enable)

When using voltage detection 2 interrupt/reset or the LVD2SR.MON bit, set the LVD2E bit to 1. The voltage detection 2 circuit starts once $t_{d(E-A)}$ passes after the LVD2E bit value is changed from 0 to 1. When using the voltage detection 2 circuit in Deep Software Standby mode, do not set the DPSBYCR.DEEPCUT[1:0] bits to 11b.

7.2.4 LVD1CR0 : Voltage Monitor 1 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41A

| | | | | | | | | |
|--------------------|----|----|------------|---|------|-------|-----|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | RN | RI | FSAMP[1:0] | — | CMPE | DFDIS | RIE | |
| Value after reset: | 1 | 0 | 0 | 0 | x | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|-----|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | RIE | Voltage Monitor 1 Interrupt/Reset Enable 0: Disable 1: Enable | R/W |
| 1 | DFDIS | Voltage monitor 1 Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter | R/W |
| 2 | CMPE | Voltage Monitor 1 Circuit Comparison Result Output Enable 0: Disable voltage monitor 1 circuit comparison result output 1: Enable voltage monitor 1 circuit comparison result output | R/W |
| 3 | — | The read value is undefined. The write value should be 1. | R/W |
| 5:4 | FSAMP[1:0] | Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency | R/W |
| 6 | RI | Voltage Monitor 1 Circuit Mode Select 0: Generate voltage monitor 1 interrupt on V_{det1} crossing 1: Enable voltage monitor 1 reset when the voltage falls to and below V_{det1} | R/W |
| 7 | RN | Voltage Monitor 1 Reset Negate Select 0: Negate after a stabilization time (t_{LVD1}) when $VCC > V_{det1}$ is detected 1: Negate after a stabilization time (t_{LVD1}) on assertion of the LVD1 reset | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor 1 Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor 1 interrupt/reset. Ensure that neither a voltage monitor 1 interrupt nor a voltage monitor 1 reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor 1 Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0 (enabled). Set this bit to 1 (disabled) when using the voltage monitor 1 circuit in Software Standby mode or in Deep Software Standby mode.

CMPE bit (Voltage Monitor 1 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 1 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 1 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 1 circuit, disable the voltage detection 1 circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the LVD1CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD1CR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 1 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 1 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 1 interrupt selected).

RN bit (Voltage Monitor 1 Reset Negate Select)

If the RN bit is set to 1 (negation follows a stabilization time on assertion of the LVD1 reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). In addition, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows stabilization time when $V_{CC} > V_{det1}$ is detected). Do not set the RN bit to 1 when this is the case.

7.2.5 LVD2CR0 : Voltage Monitor 2 Circuit Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x41B

| | | | | | | | | |
|--------------------|----|----|------------|---|------|-------|-----|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | RN | RI | FSAMP[1:0] | — | CMPE | DFDIS | RIE | |
| Value after reset: | 1 | 0 | 0 | 0 | x | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|-----|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | RIE | Voltage Monitor 2 Interrupt/Reset Enable 0: Disable 1: Enable | R/W |
| 1 | DFDIS | Voltage monitor 2 Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter | R/W |
| 2 | CMPE | Voltage Monitor 2 Circuit Comparison Result Output Enable 0: Disable voltage monitor 2 circuit comparison result output 1: Enable voltage monitor 2 circuit comparison result output | R/W |
| 3 | — | The read value is undefined. The write value should be 1. | R/W |
| 5:4 | FSAMP[1:0] | Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency | R/W |
| 6 | RI | Voltage Monitor 2 Circuit Mode Select 0: Generate voltage monitor 2 interrupt on V_{det2} crossing 1: Enable voltage monitor 2 reset when the voltage falls to and below V_{det2} | R/W |
| 7 | RN | Voltage Monitor 2 Reset Negate Select 0: Negate after a stabilization time (t_{LVD2}) when $V_{CC} > V_{det2}$ is detected 1: Negate after a stabilization time (t_{LVD2}) on assertion of the LVD2 reset | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor 2 Interrupt/Reset Enable)

The RIE bit enables or disables the voltage monitor 2 interrupt/reset. Ensure that neither a voltage monitor 2 interrupt nor a voltage monitor 2 reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor 2 Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) when this bit is 0 (digital filter enabled). Set this bit to 1 (digital filter disabled) when using the voltage monitor 2 circuit in Software Standby mode or in Deep Software Standby mode.

CMPE bit (Voltage Monitor 2 Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor 2 circuit comparison result output. Set the CMPE bit to 1 after the voltage detection 2 circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection 2 circuit, disable the voltage detection 2 circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the LVD2CR0.DFDIS bit is 1 (digital filter circuit disabled). Do not rewrite these bits if the LVD2CR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor 2 Circuit Mode Select)

When the RI bit is 1 (voltage monitor 2 reset selected), transition to Deep Software Standby mode cannot be made. In this case, transition to Software Standby mode is made. To enter Deep Software Standby mode, set the RI bit to 0 (voltage monitor 2 interrupt selected).

RN bit (Voltage Monitor 2 Reset Negate Select)

If the RN bit is set to 1 (negating LVD2 reset in a specified time after its assertion), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Additionally, for a transition to Software Standby or Deep Software Standby mode, the only possible value for the RN bit is 0 (negation follows a stabilization time when $VCC > V_{det2}$ is detected). Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the LVD2 reset signal) when this is the case.

7.2.6 LVD1CR1 : Voltage Monitor 1 Circuit Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E0

| | | | | | | | | |
|--------------------|---|---|---|---|---|--------|-------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | IRQSEL | IDTSEL[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | IDTSEL[1:0] | Voltage Monitor 1 Interrupt Generation Condition Select 0 0: When $VCC \geq V_{det1}$ (rise) is detected 0 1: When $VCC < V_{det1}$ (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited | R/W |
| 2 | IRQSEL | Voltage Monitor 1 Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt*1 | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD1EN bit value in the ICU from the reset state.

7.2.7 LVD1SR : Voltage Monitor 1 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E1

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|-----|-----|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | MON | DET |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------|-------------------|
| 0 | DET | Voltage Monitor 1 Voltage Variation Detection Flag 0: Not detected 1: V_{det1} crossing is detected | R/W ^{*1} |
| 1 | MON | Voltage Monitor 1 Signal Monitor Flag 0: $VCC < V_{det1}$ 1: $VCC \geq V_{det1}$ or MON is disabled | R |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 1 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

When detecting V_{det1} , set the DET flag to 0 after setting LVD1CR0.RIE is 0 (disabled). When setting LVD1CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the LVD1CMPCR.LVD1E bit is 1 (voltage detection 1 circuit enabled) and the LVD1CR0.CMPE bit is 1 (voltage monitor 1 circuit comparison result output enabled).

7.2.8 LVD2CR1 : Voltage Monitor 2 Circuit Control Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x0E2

| | | | | | | | | |
|--------------------|---|---|---|---|---|--------|-------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | IRQSEL | IDTSEL[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | IDTSEL[1:0] | Voltage Monitor 2 Interrupt Generation Condition Select 0 0: When $VCC \geq V_{det2}$ (rise) is detected 0 1: When $VCC < V_{det2}$ (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited | R/W |
| 2 | IRQSEL | Voltage Monitor 2 Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt ^{*1} | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.

Note 1. When enabling maskable interrupts, do not change the NMIER.LVD2EN bit value in the ICU from the reset state.

7.2.9 LVD2SR : Voltage Monitor 2 Circuit Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0E3

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|-----|-----|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | MON | DET |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------|-------------------|
| 0 | DET | Voltage Monitor 2 Voltage Variation Detection Flag 0: Not detected 1: V_{det2} crossing is detected | R/W ^{*1} |
| 1 | MON | Voltage Monitor 2 Signal Monitor Flag 0: $VCC < V_{det2}$ 1: $VCC \geq V_{det2}$ or MON is disabled | R |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor 2 Voltage Variation Detection Flag)

The DET flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

When detecting V_{det2} , set the DET flag to 0 after setting LVD2CR0.RIE is 0 (disabled). When setting LVD2CR0.RIE bit to 1 (enabled) after setting it to 0, wait for 2 or more PCLKB cycles which have elapsed.

MON flag (Voltage Monitor 2 Signal Monitor Flag)

The MON flag is enabled when the LVD2CMPCR.LVD2E bit is 1 (voltage detection 2 circuit enabled) and the LVD2CR0.CMPE bit is 1 (voltage monitor 2 circuit comparison result output enabled).

7.3 VCC Input Voltage Monitor

7.3.1 Monitoring V_{det0}

The comparison results from voltage monitor 0 are not available for reading.

7.3.2 Monitoring V_{det1}

Table 7.2 shows the procedures to set up monitoring against V_{det1} . After the settings are complete, the comparison results from voltage monitor 1 can be monitored with the LVD1SR.MON flag.

Table 7.2 Procedures to set up monitoring against V_{det1}

| Step | Monitoring the comparison results from voltage monitor 1 | |
|--------------------------------------------|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Setting up the voltage detection 1 circuit | 1 | Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR.LVD1LVL[4:0] bits. |
| | 2 | Select the detection voltage in the LVD1CMPCR.LVD1LVL[4:0] bits. |
| | 3 | Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit. |
| | 4 | Wait for at least $t_{d(E-A)}$ for the LVD1 operation stabilization time after LVD1 is enabled.*1 |
| Setting the digital filter*2 | 5 | Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits. |
| | 6 | Set LVD1CR0.DFDIS = 0 to enable the digital filter. |
| | 7 | Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n . |
| Enabling output | 8 | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1. |

Note 1. Steps 5 to 7 can be performed during the wait time of step 4. For details of $t_{d(E-A)}$, see [section 46, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

7.3.3 Monitoring V_{det2}

[Table 7.3](#) shows the procedures to set up monitoring against V_{det2} . After the settings are complete, the comparison results from voltage monitor 2 can be monitored in the LVD2SR.MON flag.

Table 7.3 Procedures to set up monitoring against V_{det2}

| Step | Monitoring the results of comparison by voltage monitor 2 | |
|--------------------------------------------|-----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Setting up the voltage detection 2 circuit | 1 | Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR.LVD2LVL[2:0] bits. |
| | 2 | Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits. |
| | 3 | Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit. |
| | 4 | Wait for at least $t_{d(E-A)}$ for the LVD2 operation stabilization time after LVD2 is enabled.*1 |
| Setting the digital filter*2 | 5 | Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits. |
| | 6 | Set LVD2CR0.DFDIS = 0 to enable the digital filter. |
| | 7 | Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n . |
| Enabling output | 8 | Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2. |

Note 1. Steps 5 to 7 can be performed during the wait time of step 4. For details of $t_{d(E-A)}$, see [section 46, Electrical Characteristics](#).

Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

7.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1.LVDAS bit to 0 to enable the voltage monitor 0 reset after a reset. However, at boot mode, the reset from voltage monitor 0 is disabled regardless of the value of the OFS1.LVDAS bit.

[Figure 7.4](#) shows an example of operations for a voltage monitor 0 reset.

Note: For details of the electrical characteristics, see [section 46, Electrical Characteristics](#).

Note 1. V_{POR} indicates the detection level for a power-on reset and V_{det0} indicates the detection level for a voltage monitor 0 reset.

Note 2. t_{POR} : the period until the power-on reset is released.

t_{LVD0} : the period until the LVD0 reset is released.

Note 3. At power-on, the POR reset is released after VCC has reached the minimum guaranteed voltage.

Figure 7.4 Example of voltage monitor 0 reset operation

7.5 Interrupt and Reset from Voltage Monitor 1

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 1 circuit.

[Table 7.4](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring occurs. [Table 7.5](#) shows the procedures for setting bits related to the voltage monitor 1 interrupt/reset so that voltage monitoring stops. [Figure 7.5](#) shows an example of operations for a voltage monitor 1 interrupt. For the operation of the voltage monitor 1 reset, see [Figure 5.2](#) in [section 5, Resets](#).

When using the voltage monitor 1 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit using the procedures in this section.

(1) Setting in Software Standby mode

- Disable the digital filter ($LVD1CR0.DFDIS = 1$).
- When $VCC > V_{det1}$ is detected, negate the voltage monitor 1 reset signal ($LVD1CR0.RN = 0$) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter ($LVD1CR0.DFDIS = 1$).

- Enable the voltage monitor 1 interrupt (LVD1CR0.RI = 0). If the voltage monitor 1 reset is enabled (LVD1CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 1 circuit stops. To use the voltage monitor 1 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 7.4 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring occurs

| Step | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output) | | Voltage monitor 1 reset |
|-----------------------------------------------------|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Setting up the voltage detection 1 circuit | 1 | Set LVD1CMPCR.LVD1E = 0 to disable voltage detection 1 before writing to the LVD1CMPCR register. | |
| | 2 | Select the detection voltage in the LVD1CMPCR.LVD1LVL[4:0] bits. | |
| | 3 | Set LVD1CMPCR.LVD1E = 1 to enable the voltage detection 1 circuit. | |
| | 4 | Wait for at least $t_{d(E-A)}$ for the LVD1 operation stabilization time after LVD1 is enabled.* ¹ | |
| Setting the digital filter* ³ | 5 | Select the sampling clock for the digital filter in the LVD1CR0.FSAMP[1:0] bits. | |
| | 6 | Set LVD1CR0.DFDIS = 0 to enable the digital filter. | |
| | 7 | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .* ⁴ | |
| Setting up the voltage monitor 1 interrupt or reset | 8 | Set LVD1CR0.RI = 0 to select the voltage monitor 1 interrupt. | <ul style="list-style-type: none"> • Set LVD1CR0.RI = 1 to select the voltage monitor 1 reset. • Select the type of reset negation in the LVD1CR0.RN bit. |
| | 9 | <ul style="list-style-type: none"> • Select the interrupt request condition in the LVD1CR1.IDTSEL[1:0] bits. • Select the interrupt type in the LVD1CR1.IRQSEL bit. | — |
| Enabling output | 10 | Set LVD1SR.DET = 0. | |
| | 11 | Set LVD1CR0.RIE = 1 to enable the voltage monitor 1 interrupt or reset.* ² | |
| | 12 | Set LVD1CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 1. | |

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on $t_{d(E-A)}$, see [section 46, Electrical Characteristics](#).

Note 2. Step 11 is not required if only the ELC event signal is to be output.

Note 3. Steps 5 to 7 are not required if the digital filter is not in use.

Note 4. Steps 8 to 11 can be performed during the wait time of step 7.

Table 7.5 Procedures for setting bits related to voltage monitor 1 interrupt and voltage monitor 1 reset so that voltage monitoring stops

| Step | Voltage monitor 1 interrupt (voltage monitor 1 ELC event output), voltage monitor 1 reset | |
|------------------------------------------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Stopping the enabling output | 1 | Set LVD1CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 1. |
| | 2 | Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8,$ or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .* ² |
| | 3 | Set LVD1CR0.RIE = 0 to disable the voltage monitor 1 interrupt or reset.* ¹ |
| Stopping the digital filter | 4 | Set LVD1CR0.DFDIS = 1 to disable the digital filter.* ² * ³ |
| Stopping the voltage detection 1 circuit | 5 | Set LVD1CMPCR.LVD1E = 0 to disable the voltage detection 1 circuit. |

Note 1. Step 3 is not required if only the ELC event signal is to be output.

Note 2. Steps 2 and 4 are not required if the digital filter is not in use.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 1 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 1 circuit is not required if the settings for the circuit do not change.
- Setting the digital filter is not required if the settings for the circuit do not change.

- Setting the voltage monitor 1 interrupt or reset is not required if the settings for the voltage monitor 1 interrupt or voltage monitor 1 reset do not change.

Figure 7.5 shows an example of the voltage monitor 1 interrupt operation.

Figure 7.5 Example of voltage monitor 1 interrupt operation

7.6 Interrupt and Reset from Voltage Monitor 2

An interrupt or reset can be generated in response to the comparison results from the voltage monitor 2 circuit.

Table 7.6 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring occurs. Table 7.7 shows the procedures for setting bits related to the voltage monitor 2 interrupt/reset so that voltage monitoring stops. Figure 7.6 shows an example of operations for a voltage monitor 2 interrupt. For the operation of the voltage monitor 2 reset, see Figure 5.2 in section 5, Resets.

When using the voltage monitor 2 circuit in Software Standby mode or Deep Software Standby mode, set up the circuit with the following procedures.

(1) Setting in Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1).
- When $V_{CC} > V_{det2}$ is detected, negate the voltage monitor 2 reset signal (LVD2CR0.RN = 0) following a LVD2 stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (LVD2CR0.DFDIS = 1).
- Enable the voltage monitor 2 interrupt (LVD2CR0.RI = 0). If the voltage monitor 2 reset is enabled (LVD2CR0.RI = 1), a transition to Deep Software Standby mode is not possible, and the operation transitions to Software Standby mode instead.
- When the DPSBYCR.DEEPCUT[1:0] bits are 11b, the voltage monitor 2 circuit stops. To use the voltage monitor 2 circuit in Deep Software Standby mode, set the DPSBYCR.DEEPCUT[1:0] bits to a value other than 11b.

Table 7.6 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring occurs

| Step | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output) | | Voltage monitor 2 reset |
|-----------------------------------------------------|------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Setting up the voltage detection 2 circuit | 1 | Set LVD2CMPCR.LVD2E = 0 to disable voltage detection 2 before writing to the LVD2CMPCR register. | |
| | 2 | Select the detection voltage in the LVD2CMPCR.LVD2LVL[2:0] bits. | |
| | 3 | Set LVD2CMPCR.LVD2E = 1 to enable the voltage detection 2 circuit. | |
| | 4 | Wait for at least $t_{d(E-A)}$ for the LVD2 operation stabilization time after LVD2 is enabled.*1 | |
| Setting the digital filter*3 | 5 | Select the sampling clock for the digital filter in the LVD2CR0.FSAMP[1:0] bits. | |
| | 6 | Set LVD2CR0.DFDIS = 0 to enable the digital filter. | |
| | 7 | Wait for at least $2n + 3$ LOCO cycles, where $n = 2, 4, 8$, or 16 , and the sampling clock for the digital filter is the LOCO frequency-divided by n .*4 | |
| Setting up the voltage monitor 2 interrupt or reset | 8 | Set LVD2CR0.RI = 0 to select the voltage monitor 2 interrupt. | <ul style="list-style-type: none"> • Set LVD2CR0.RI = 1 to select the voltage monitor 2 reset. • Select the type of reset negation in the LVD2CR0.RN bit. |
| | 9 | <ul style="list-style-type: none"> • Select the interrupt request condition in the LVD2CR1.IDTSEL[1:0] bits. • Select the interrupt type in the LVD2CR1.IRQSEL bit. | — |
| Enabling output | 10 | Set LVD2SR.DET = 0. | |
| | 11 | Set LVD2CR0.RIE = 1 to enable the voltage monitor 2 interrupt or reset.*2 | |
| | 12 | Set LVD2CR0.CMPE = 1 to enable output of the comparison results from voltage monitor 2. | |

Note 1. Steps 5 to 11 can be performed during the wait time in step 4. For details on $t_{d(E-A)}$, see section 46, Electrical Characteristics.

Note 2. Step 11 is not required if only the ELC event signal is to be output.

Note 3. Steps 5 to 7 are not required if the digital filter is not in use.

Note 4. Steps 8 to 11 can be performed during the wait time of step 7.

Table 7.7 Procedures for setting bits related to voltage monitor 2 interrupt and voltage monitor 2 reset so that voltage monitoring stops

| Step | Voltage monitor 2 interrupt (voltage monitor 2 ELC event output), voltage monitor 2 reset | |
|------------------------------------------|-------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Settings to stop enabling output | 1 | Set LVD2CR0.CMPE = 0 to disable output of the comparison results from voltage monitor 2. |
| | 2 | Wait for at least $2n + 3$ cycles of the LOCO, where $n = 2, 4, 8, \text{ or } 16$, and the sampling clock for the digital filter is the LOCO frequency-divided by n . ^{*2} |
| | 3 | Set LVD2CR0.RIE = 0 to disable the voltage monitor 2 interrupt or reset. ^{*1} |
| Stopping the digital filter | 4 | Set LVD2CR0.DFDIS = 1 to disable the digital filter. ^{*2 *3} |
| Stopping the voltage detection 2 circuit | 5 | Set LVD2CMPCR.LVD2E = 0 to disable the voltage detection 2 circuit. |

Note 1. Step 3 is not required if only the ELC event signal is to be output.

Note 2. Steps 2 and 4 are not required if the digital filter is not in use.

Note 3. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least 2 LOCO clock cycles before re-enabling it.

If the voltage monitor 2 interrupt or reset setting is to be made again after it is used and stopped once, you can omit the following steps in the procedures for stopping and setting, depending on the conditions:

- Setting the voltage detection 2 is not required if the settings for the circuit do not change.
- Setting the digital filter is not required if the settings for the circuit do not change.
- Setting the voltage monitor 2 interrupt or reset is not required if the settings for the voltage monitor 2 interrupt or voltage monitor 2 reset do not change.

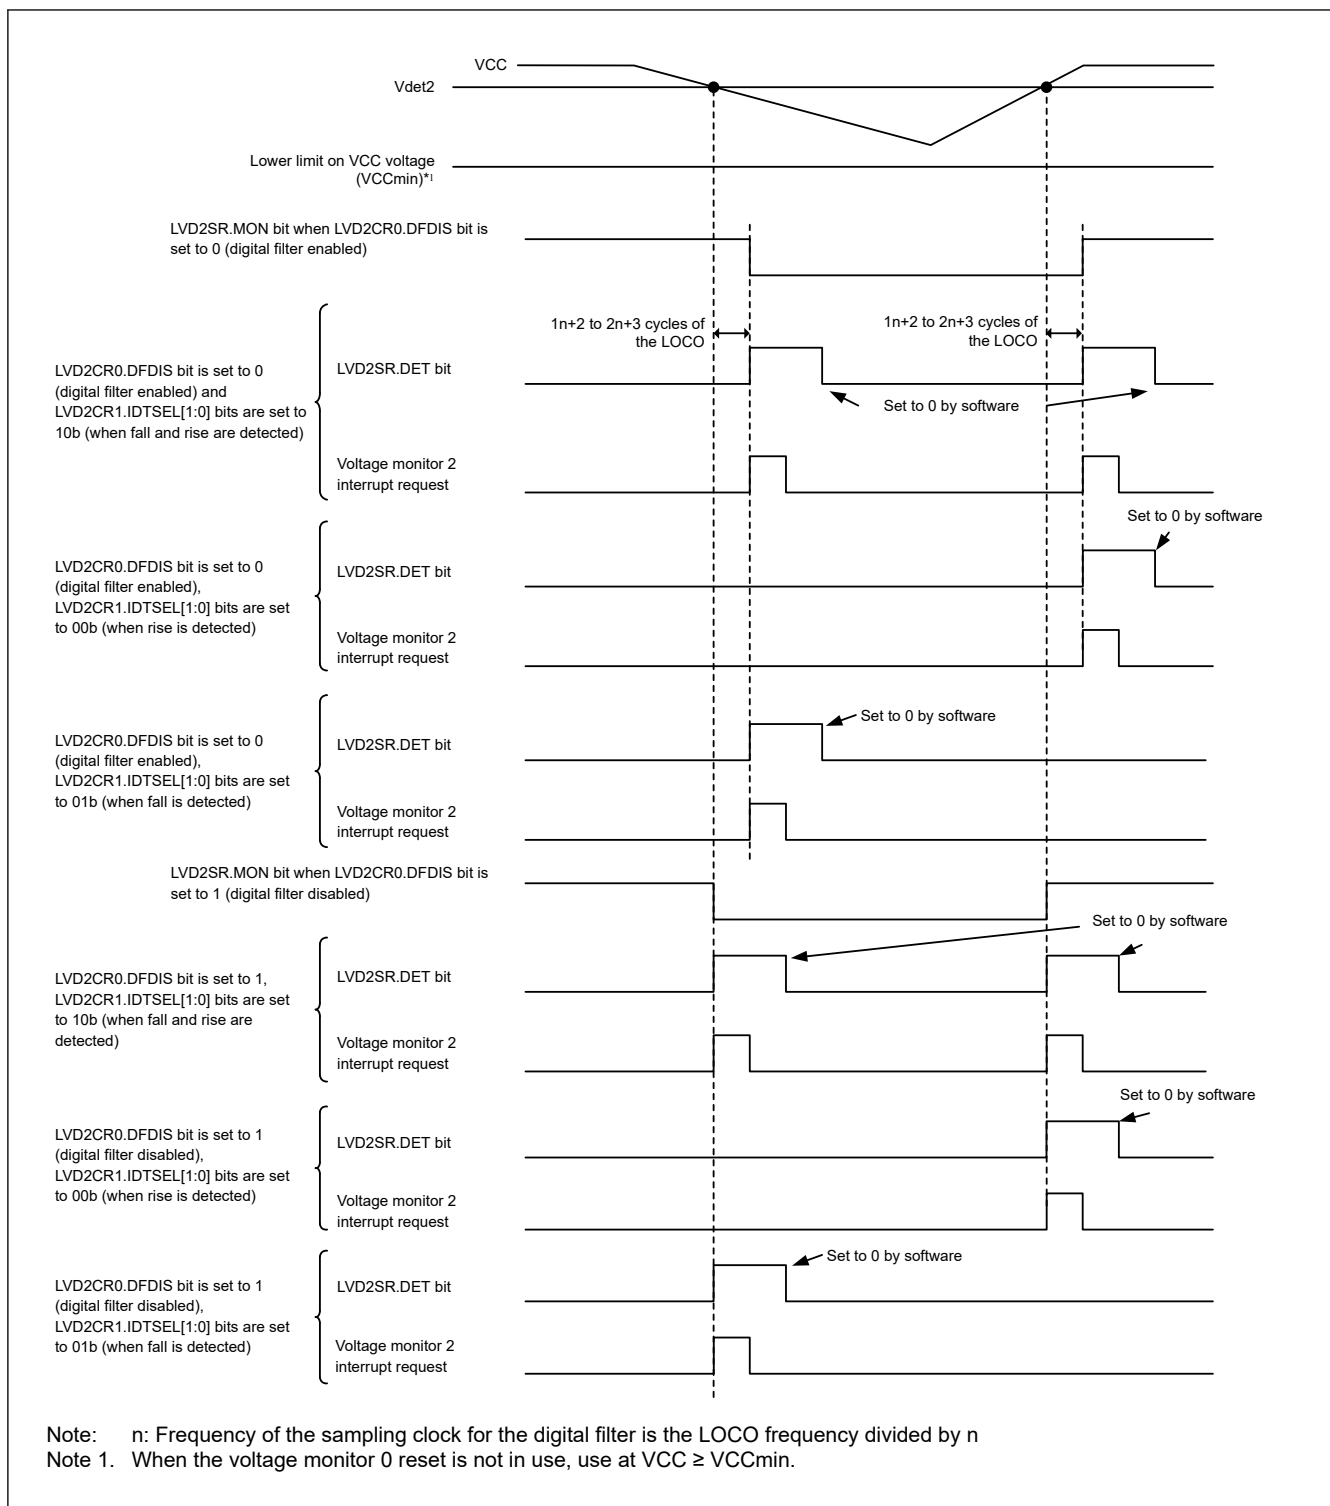

Figure 7.6 Example of voltage monitor 2 interrupt operation

7.7 Event Link Controller (ELC) Output

The LVD can output the event signals to the Event Link Controller (ELC).

(1) V_{det1} Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the V_{det1} voltage while both the voltage detection 1 circuit and the voltage monitor 1 circuit comparison result output are enabled.

(2) V_{det2} Crossing Detection Event

The LVD outputs the event signal when it detects that the voltage has passed the V_{det2} voltage while both the voltage detection 2 circuit and the voltage monitor 2 circuit comparison result output are enabled.

When enabling the event link output function of the LVD, you must enable the LVD before enabling the LVD event link function of the ELC. To stop the event link output function of the LVD, you must stop the LVD before disabling the LVD event link function of the ELC.

7.7.1 Interrupt Handling and Event Linking

The LVD provides bits to separately enable or disable the voltage monitor 1 and 2 interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

In contrast, as soon as an interrupt source is generated, an event link signal is output as the event signal to the other module through the ELC, regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor 1 and 2 interrupts in Software Standby and Deep Software Standby modes. The event signals for the ELC in Software Standby and Deep Software Standby modes are output as follows:

- When a V_{det1} or V_{det2} passage events is detected in Software Standby mode, event signals are not generated for the ELC because the clock is not supplied in Software Standby mode. Because the V_{det1} and V_{det2} passage detection flags are saved, when the clock supply resumes after returning from Software Standby mode, the event signals for the ELC are output based on the state of the V_{det1} and V_{det2} detection flags.
- When a V_{det1} or V_{det2} passage events are detected in Deep Software Standby mode, event signals are not generated for the ELC.

8. Clock Generation Circuit

8.1 Overview

The MCU provides a clock generation circuit. [Table 8.1](#) and [Table 8.2](#) list the clock generation circuit specifications. [Figure 8.1](#) show a block diagram, and [Table 8.3](#) lists the I/O pins.

Table 8.1 Clock generation circuit specifications for the clock sources

| Clock source | Description | Specification |
|----------------------------------------------|------------------------------------------|--------------------------------------|
| Main clock oscillator (MOSC) | Resonator frequency | 8 MHz to 24 MHz |
| | External clock input frequency | Up to 24 MHz |
| | External resonator or additional circuit | ceramic resonator, crystal |
| | Connection pins | EXTAL, XTAL |
| | Drive capability switching | Available |
| | Oscillation stop detection function | Available |
| PLL circuit | Input clock source | MOSC, HOCO |
| | Input pulse frequency division ratio | Selectable from 1, 2, and 3 |
| | Input frequency | 8 MHz to 24 MHz |
| | Frequency multiplication ratio | Selectable from 10 to 30 (0.5 steps) |
| | Output pulse frequency division ratio | Unavailable |
| | PLL Output frequency | 120 MHz to 240 MHz |
| PLL2 circuit | Input clock source | MOSC, HOCO |
| | Input pulse frequency division ratio | Selectable from 1, 2, and 3 |
| | Input frequency | 8 MHz to 24 MHz |
| | Frequency multiplication ratio | Selectable from 10 to 30 (0.5 steps) |
| | Output pulse frequency division ratio | Unavailable |
| | PLL Output frequency | 120 MHz to 240 MHz |
| | PLL2-LDO stop function | Unavailable |
| High-speed on-chip oscillator (HOCO) | Oscillation frequency | 16/18/20 MHz |
| | FLL function | Unavailable |
| | User trimming | Available |
| Middle-speed on-chip oscillator (MOCO) | Oscillation frequency | 8 MHz |
| | User trimming | Available |
| Low-speed on-chip oscillator (LOCO) | Oscillation frequency | 32.768 kHz |
| | User trimming | Available |
| IWDt-dedicated on-chip oscillator (IWDtLOCO) | Oscillation frequency | 15 kHz |
| | User trimming | Unavailable |
| External clock input for JTAG (TCK) | Input clock frequency | Up to 25 MHz |
| External clock input for SWD (SWCLK) | Input clock frequency | Up to 25 MHz |

Table 8.2 Clock generation circuit specifications for the internal clocks (1 of 2)

| Item | Clock source | Clock supply | Specification |
|---------------------|-------------------------|---------------------------------------------------|----------------------------------------------------|
| System clock (ICLK) | MOSC/HOCO/MOCO/LOCO/PLL | CPU, DTC, DMAC, Flash, RAM, I/O ports, TFU, IIRFA | Up to 240 MHz Division ratios: 1/2/4/8/16/32/64 |

Table 8.2 Clock generation circuit specifications for the internal clocks (2 of 2)

| Item | Clock source | Clock supply | Specification |
|--------------------------------------------------------------|------------------------------|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Peripheral module clock A (PCLKA) | MOSC/HOCO/MOCO/LOCO/PLL | Peripheral modules (SCI, CANFD-RAM, CNECC, SPI, CRC, DOC, ADC, DAC12, SCE5, GPT bus clock, PDG, IIC) | Up to 120 MHz Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock B (PCLKB) | MOSC/HOCO/MOCO/LOCO/PLL | Peripheral modules (CAC, ELC, POEG, WDT, IWD, AGT, CANFD, TSN, Standby SRAM, KINT ACMPHS) | Up to 60 MHz Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock C (PCLKC) | MOSC/HOCO/MOCO/LOCO/PLL | Peripheral module (ADC) | Up to 60 MHz Division ratio: 1/2/4/8/16/32/64 |
| Peripheral module clock D (PCLKD) | MOSC/HOCO/MOCO/LOCO/PLL | Peripheral module (GPT) | Up to 120 MHz Division ratio: 1/2/4/8/16/32/64 |
| FlashIF clock (FCLK) | MOSC/HOCO/MOCO/LOCO/PLL | FlashIF | 4 MHz to 60 MHz (P/E) Up to 60 MHz (read) Division ratio: 1/2/4/8/16/32/64 |
| CANFD clock (CANFDCLK) | PLL/PLL2 | CANFD | Up to 40 MHz Division ratio: 1/2/4/6/8 |
| CAN clock (CANMCLK) | MOSC | CANFD | 8 MHz to 24 MHz |
| Peripheral module asynchronous clock for GPT (GPTCLK) | MOSC/HOCO/MOCO/LOCO/PLL/PLL2 | GPT | Up to 200 MHz Division ratio: 1/2/4/6/8 |
| Peripheral module asynchronous clock for IIC (IICCLK) | MOSC/HOCO/MOCO/LOCO/PLL/PLL2 | IIC | Up to 200 MHz Division ratio: 1/2/4/6/8 |
| Peripheral module asynchronous clock for SCI/SPI (SCISPICLK) | MOSC/HOCO/MOCO/LOCO/PLL/PLL2 | SCI, SPI | Up to 120 MHz Division ratio: 1/2/4/6/8 |
| AGT clock (AGTLCLK) | LOCO | AGT | 32.768 kHz |
| CAC Main clock (CACMCLK) | MOSC | CAC | Up to 24 MHz |
| CAC LOCO clock (CACLCLK) | LOCO | CAC | 32.768 kHz |
| CAC MOCO clock (CACMOCLK) | MOCO | CAC | 8 MHz |
| CAC HOCO clock (CACHCLK) | HOCO | CAC | 16/18/20 MHz |
| CAC IWDTLCO clock (CACILCLK) | IWDTLCO | CAC | 15 kHz |
| IWD clock (IWDCLK) | IWDTLCO | IWD | 15 kHz |
| SysTick timer clock (SYSTICKCLK) | LOCO | SysTick timer | 32.768 kHz |
| JTAG clock (JTAGTCK) | TCK | JTAG | Up to 25 MHz |
| Serial wire clock (SWCLK) | SWCLK | OCD | Up to 25 MHz |
| Trace clock (TRCLK) | MOSC/HOCO/MOCO/LOCO/PLL | CPU-OCD | Up to 120 MHz Division ratio: 1/2/4 |
| TCLK pin output (TCLK) | 1/2 TRCLK | TCLK pin | Up to 60 MHz |
| Clock/buzzer output (CLKOUT) | MOSC/LOCO/MOCO/HOCO | CLKOUT pin | Up to 24 MHz Division ratios: 1/2/4/8/16/32/64/128 |

Note: Restrictions on setting clock frequency: $ICLK \geq PCLKA \geq PCLKB$, $PCLKD \geq PCLKA \geq PCLKB$, $GPTCLK \geq PCLKA$
 $ICLK \geq FCLK$

Restrictions on clock frequency ratio: (N: integer, and up to 64)

$ICLK:FCLK = N:1$, $ICLK:PCLKA = N:1$, $ICLK:PCLKB = N:1$, $ICLK:PCLKC = N:1$ or $1:N$, $ICLK:PCLKD = N:1$ or $1:N$, $ICLK:TRCLK = N:1$ or $1:N$

If the CANFD is used, clock frequency ratio is constrained to be $PCLKA:PCLKB = 2:1$.

Note: Restrictions on the minimum FCLK frequency 4MHz when P/E.

- Note: The multiplication of PLL and PLL2 should be set to be within the output frequency range of PLL and PLL2, taking the frequency of HOCO into consideration. The division of PLL and PLL2 input also should be set to be within the input frequency range of PLL and PLL2, taking the frequency of HOCO into consideration.
- Note: Clocks have a permissible frequency range (See [Table 8.2](#)).
Flash memory also have a permissible operating frequency range in each wait cycle setting. (See [section 43, Flash Memory](#))
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency. (See [section 46, Electrical Characteristics](#)).

Figure 8.1 Clock generation circuit block diagram

Table 8.3 lists the input/output pins of the clock generation circuit.

Table 8.3 Input/Output Pins of Clock Generation Circuit

| Pin name | I/O | Description |
|-----------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| XTAL | Output | These pins are used to connect a ceramic resonator or crystal resonator. The XTAL pin can also be used to input an external clock. For details, see section 8.3.2. External Clock Input . |
| EXTAL | Input | |
| TCK/SWCLK | Input | This pin is used to input the clock for the JTAG/SWD |
| CLKOUT | Output | This pin is used to output the CLKOUT/BUZZER clock |

8.2 Register Descriptions

8.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000

| 31:21 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECSD (DLMMON.DLMMON[3:0] = 0011b). See [section 45.6.1. Restrictions on setting the security attribution](#) for the details.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

NONSEC00 bit (Non-secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKSCR.

NONSEC02 bit (Non-secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, HOCOCR2, HOCOUTCR.

NONSEC03 bit (Non-secure Attribute bit 03)

This bit controls the security attribute of MOCOCR, MOCOUTCR.

NONSEC04 bit (Non-secure Attribute bit 04)

This bit controls the security attribute of LOCOCR, LOCOUTCR.

NONSEC05 bit (Non-secure Attribute bit 05)

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR.

NONSEC06 bit (Non-secure Attribute bit 06)

This bit controls the security attribute of OSTDCR, OSTDSR.

NONSEC08 bit (Non-secure Attribute bit 08)

This bit controls the security attribute of PLLCCR, PLLCR.

NONSEC09 bit (Non-secure Attribute bit 09)

This bit controls the security attribute of PLL2CCR, PLL2CR.

NONSEC11 bit (Non-secure Attribute bit 11)

This bit controls the security attribute of CKOCR.

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of SCISPICKDIVCR, SCISPICKCR.

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of CANFDCKDIVCR, CANFDCKCR.

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of GPTCKDIVCR, GPTCKCR.

NONSEC20 bit (Non-secure Attribute bit 20)

This bit controls the security attribute of IICCKDIVCR, IICCKCR.

8.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x020

| 27 | — | This bit is read as 0. The write value should be 0. | R/W |
| 30:28 | FCK[2:0] ^{*1} | FlashIF Clock (FCLK) Select 0 0 0: × 1/1 0 0 1: × 1/2 0 1 0: × 1/4 0 1 1: × 1/8 1 0 0: × 1/16 1 0 1: × 1/32 1 1 0: × 1/64 Others: Setting prohibited. | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. The following relation is required between the frequencies of the system clock (ICLK) and the FlashIF clock (FCLK).

$$\text{ICLK:FCLK} = N:1 \text{ (N: integer)}$$

Note 2. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB)

$$\text{ICLK:PCLKA} = N:1, \text{ ICLK:PCLKB} = N:1 \text{ (N: integer)}$$

Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD):

$$\text{ICLK:PCLKC, PCLKD} = N:1 \text{ or } 1:N \text{ (N: integer)}$$

Note 4. The frequency of the system clock (ICLK) is limited to the flash wait cycle register (FLWT). See [section 43, Flash Memory](#).

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD), FlashIF clock (FCLK).

When the PLL is selected as the clock source, you must enter the following modules in module-stop state before changing the value of this register: ADC, SCE5.

In addition, when changing any value in SCKDIVCR from a lower division ratio to a higher division ratio, wait at least 750 ns before the changing the value and change as follows according to the ICLK frequency before the change.

- When the ICLK frequency before change is more than 120 MHz:
At first, wait 5 μ s after setting ICLK frequency division ratio to 1/2, then wait 5 μ s after setting SCKDIVCR.
- When the ICLK frequency before change is 120 MHz or less:
Wait 5 μ s after setting SCKDIVCR.

When changing any value from a higher division ratio to a lower division ratio, change as follows according to the changed ICLK frequency, before starting the subsequent processing.

- When the ICLK frequency after change is more than 120 MHz:
At first, wait 1 μ s after setting ICLK frequency division ratio to 1/2, then wait 1 μ s after setting SCKDIVCR.
- When the ICLK frequency after change is 120 MHz or less:
Wait 1 μ s after setting SCKDIVCR.

The recommended method to measure the wait time is through software.

Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

Figure 8.2 Example flow for changing the value of SCKDIVCR

8.2.3 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x026

| | | | | | | | | |
|--------------------|---|---|---|---|---|------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | CKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | CKSEL[2:0] | Clock Source Select 0 0 0: HOCO 0 0 1: MOCO 0 1 0: LOCO 0 1 1: Main clock oscillator (MOSC) 1 0 0: Setting prohibited 1 0 1: PLL 1 1 0: Setting prohibited 1 1 1: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The SCKSCR register selects the clock source for the system clock.

When changing the value of SCKSCR to either select or deselect the PLL, set the following modules to the module-stop state before changing the SCKSCR value: ADC, SCE5.

In addition, when changing the value of SCKSCR from the PLL to a different clock source, wait at least 750 ns before the changing the value and change as follows according to the ICLK frequency before the change.

- When the ICLK frequency before change is more than 120 MHz:
At first, wait 5 μ s after setting ICLK frequency division ratio to 1/2, then wait 5 μ s after setting SCKSCR.
- When the ICLK frequency before change is 120 MHz or less:
Wait 5 μ s after setting SCKSCR.

When changing the value from a non-PLL clock source to the PLL, change as follows according to the changed ICLK frequency, before starting the subsequent processing.

- When the ICLK frequency after change is more than 120 MHz:
At first, wait 1 μ s after setting ICLK frequency division ratio to 1/2, then wait 1 μ s after setting SCKSCR.
- When the ICLK frequency after change is 120 MHz or less:
Wait 1 μ s after setting SCKSCR.

The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

Figure 8.3 Example flow for changing the value of SCKSCR

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

The bits select from one of the following sources:

- Low-speed on-chip oscillator (LOCO)
- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- PLL

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see [section 10, Low Power Modes](#).

8.2.4 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x028

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|-------------|----|----|----|---|---|---|---|----------|---|---|-------------|---|---|

| 15:14 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PLIDIV[1:0] should be set so that the frequency of PLL input signal is within the range of [section 8.1. Overview](#).

Note 2. PLLMUL[5:0] should be set so that the frequency of PLL output signal is within the range of [section 8.1. Overview](#).

The PLLCCR register sets the operation of the PLL circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL operates).

PLIDIV[1:0] bits (PLL Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL clock source.

PLSRCSEL bit (PLL Clock Source Select)

This bit selects the clock source for the PLL.

PLLMUL[5:0] bits (PLL Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL circuit.

8.2.5 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x02A

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | PLLST P |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------|-----|
| 0 | PLLSTP | PLL Stop Control 0: PLL is operating 1: PLL is stopped. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL circuit.

PLLSTP bit (PLL Stop Control)

This bit runs or stops the PLL circuit.

If the main clock oscillator is to be selected as the clock source for the PLL by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL, only use the PLL clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL operation. A fixed time is also required for oscillation to stop after stopping the PLL operation. Additionally, apply the following limitations when starting and stopping the PLL operation by the PLLSTP bit:

- After stopping the PLL, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL.
- Confirm that the PLL is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL.
- Regardless of whether the PLL clock is selected as the system clock, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL.

- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

8.2.6 PLL2CCR : PLL2 Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x048

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|--------------|----|----|----|---|---|---|---|---------------|---|---|--------------|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | PLL2MUL[5:0] | | | | | — | — | — | PL2SR CSEL | — | — | PL2IDIV[1:0] | | |
| Value after reset: | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | PL2IDIV[1:0] ^{*1} | PLL2 Input Frequency Division Ratio Select 0 0: /1 (value after reset) 0 1: /2 1 0: /3 Others: Setting prohibited. | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | PL2SRCSEL | PLL2 Clock Source Select 0: Main clock oscillator 1: HOCO | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 13:8 | PLL2MUL[5:0] ^{*2} | PLL2 Frequency Multiplication Factor Select 0x13: × 10.0 (value after reset) 0x14: × 10.5 0x15: × 11.0 ⋮ 0x1C: × 14.5 0x1D: × 15.0 0x1E: × 15.5 ⋮ 0x3A: × 29.5 0x3B: × 30.0 Others: Setting prohibited. | R/W |
| 15:14 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note 1. PL2IDIV[1:0] should be set so that the frequency of PLL2 input signal is within the range of [section 8.1. Overview](#).

Note 2. PLL2MUL[5:0] should be set so that the frequency of PLL2 output signal is within the range of [section 8.1. Overview](#).

The PLL2CCR register sets the operation of the PLL2 circuit.

Writing to the PLL2CCR register is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

PL2IDIV[1:0] bits (PLL2 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL2 clock source.

PLL2SRCSEL bit (PLL2 Clock Source Select)

This bit selects the clock source for the PLL2.

PLL2MUL[5:0] bits (PLL2 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL2 circuit.

8.2.7 PLL2CR : PLL2 Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x04A

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | PLL2S TP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------|-----|
| 0 | PLL2STP | PLL2 Stop Control 0: PLL2 is operating 1: PLL2 is stopped. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLL2CR register controls the operation of the PLL2 circuit.

PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PLL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.
- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

8.2.8 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x032

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | MOSTP |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------|-----|
| 0 | MOSTP | Main Clock Oscillator Stop 0: Operate the main clock oscillator*1 1: Stop the main clock oscillator | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby after operating the main clock oscillator or Deep Software Standby mode.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL is operating)
- PLL2CCR.PL2SRCSEL = 0 (PLL2 source clock = MOSC) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.9 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x490

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | LCST P |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------|-----|
| 0 | LCSTP | LOCO Stop 0: Operate the LOCO clock 1: Stop the LOCO clock | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

After setting the LCSTP bit to 0 to start the LOCO clock, only use the clock after the LOCO clock-oscillation stabilization wait time (t_{LOCOWT}) elapses. A fixed stabilization wait time is required after setting the LOCO clock to start operation. A fixed wait time is also required after setting the LOCO clock to stop.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, allow a stop interval of at least 5 LOCO clock cycles before restarting it
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Regardless of whether the LOCO is selected as the system clock, confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the LOCO clock, wait for at least 3 LOCO cycles before executing the WFI instruction.

Writing 1 to LCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 010b (system clock source = LOCO).

Because the LOCO clock measures the wait time for other oscillators, it continues to oscillate while measuring this time, regardless of the setting in LOCOCR.LCSTP. As a result, the LOCO clock might be unintentionally supplied even when the LCSTP is set to stop.

8.2.10 HOCOCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x036

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | HCST P |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0/1*1 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------|-----|
| 0 | HCSTP | HOCO Stop 0: Operate the HOCO clock *2 *3 1: Stop the HOCO clock | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The HCSTP bit value after a reset is 0 when the OFS1.HOCOEN bit is 0. It is 1 when the OFS1.HOCOEN bit is 1.

Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1.HOCOFREQ[1:0] bit to an optimum value.

Note 3. The value of OFS1.HOCOFREQ[1:0] bits is automatically transferred to HOCOCR2.HCFREQ[1:0] bits after reset, therefore HOCO frequency can also be specified by HOCOCR2.HCFREQ[1:0] bits.

The HOCOCR register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock, confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO).
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL)
- PLLCCR.PLSRCSEL = 1 (PLL source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL is operating)
- PLL2CCR.PL2SRCSEL = 1 (PLL2 source clock = HOCO) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.11 HOCOCR2 : High-Speed On-Chip Oscillator Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x037

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|-------------|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | HCFREQ[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0/1*1 | 0/1*1 |

| Bit | Symbol | Function | R/W |
|-----|-------------|--------------------------------------------------------------------------------------------------|-----|
| 1:0 | HCFRQ0[1:0] | HOCO Frequency Setting 0 0 0: 16 MHz 0 1: 18 MHz 1 0: 20 MHz 1 1: Setting prohibited | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Value after reset of the HCFRQ0[1:0] bits depend on OFS1.HOCOFRQ0[1:0] bits.

The HOCOCR2 register controls the HOCO clock. Writing to the HOCOCR2 is prohibited when the HOCOCR.HCSTP bit is 0 (the HOCO operates).

8.2.12 MOCOCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x038

| | | | | | | | | |
|---------------|---|---|---|---|---|---|---|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | MCSTP |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------|-----|
| 0 | MCSTP | MOCO Stop 0: MOCO clock is operating 1: MOCO clock is stopped | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MOCOCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

The MCSTP bit starts or stops the MOCO clock.

After setting MCSTP to 0, use the MOCO clock only after the MOCO clock oscillation stabilization time (t_{MOCOWT}) elapses. A fixed stabilization wait time is required after setting the MOCO clock to start operation. A fixed wait time is also required for oscillation to stop after setting the MOCO clock to stop operation.

The following restrictions apply when starting and stopping the oscillator:

- After stopping the MOCO clock, allow a stop interval of at least 5 MOCO clock cycles before restarting it
- Confirm that MOCO clock oscillation is stable before stopping the MOCO clock
- Regardless of whether the MOCO clock is selected as the system clock, confirm that MOCO clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the MOCO clock, wait for at least 3 MOCO clock cycles before executing the WFI instruction.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).

Writing 1 to the MCSTP bit (stopping the MOCO) is prohibited if oscillation stop detection is enabled in the Oscillation Stop Detection Control Register (OSTDCR.OSTDE).

8.2.13 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03C

| | | | | | | | | |
|--------------------|---|--------|-------|---|--------|---|---|-------------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | PLL2SF | PLLSF | — | MOSCSF | — | — | HOCOSF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0/1 ^{*1} |

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | HOCOSF | HOCO Clock Oscillation Stabilization Flag 0: The HOCO clock is stopped or is not yet stable 1: The HOCO clock is stable, so is available for use as the system clock | R |
| 2:1 | — | These bits are read as 0. | R |
| 3 | MOSCSF | Main Clock Oscillation Stabilization Flag 0: The main clock oscillator is stopped (MOSTP = 1) or is not yet stable ^{*2} 1: The main clock oscillator is stable, so is available for use as the system clock | R |
| 4 | — | This bit is read as 0. | R |
| 5 | PLLSF | PLL Clock Oscillation Stabilization Flag 0: The PLL clock is stopped, or oscillation of the PLL clock is not stable yet 1: The PLL clock is stable, so is available for use as the system clock | R |
| 6 | PLL2SF | PLL2 Clock Oscillation Stabilization Flag 0: The PLL2 clock is stopped, or oscillation of the PLL2 clock is not stable yet 1: The PLL2 clock is stable | R |
| 7 | — | These bits are read as 0. | R |

Note 1. The value after reset depends on the OFS1.HOCOEN setting.

When OFS1.HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.

When OFS1.HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.

Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags to indicate the operating status of the counters in the oscillation stabilization wait circuits for the individual oscillators. After oscillation starts, these counters measure the wait time until each oscillator output clock is supplied to the internal circuits. An overflow of a counter indicates that the clock supply is stable and available for the associated circuit.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1.HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- When the HOCO clock is stopped and the HOCOCR.HCSTP bit is set to 0, and then the HOCO oscillation stabilization time is counted by the LOCO clock and supply of the HOCO clock within the MCU is started. For the HOCO oscillation stabilization time, see [section 46, Electrical Characteristics](#).

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the operating state of the counter that measures the wait time of the PLL.

[Setting condition]

- When the PLL is stopped and the PLLCR.PLLSTP bit is set to 0, and then the PLL oscillation stabilization time is counted by the LOCO clock and supply of the PLL clock within the MCU is started. If oscillation by the PLL clock source is not stable when the PLLCR.PLLSTP bit is set to 0, counting of the LOCO cycles continues even after the PLL clock source oscillation is stabilized. For the PLL oscillation stabilization time, see [section 46, Electrical Characteristics](#).

[Clearing condition]

- When the PLL is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

The PLL2SF flag indicates the operating state of the counter that measures the wait time of the PLL2.

[Setting condition]

- When the PLL2 is stopped and the PLL2CR.PLL2STP bit is set to 0, and then the PLL2 oscillation stabilization time is counted by the LOCO clock and supply of the PLL2 clock within the MCU is started. If oscillation by the PLL2 clock source is not stable when the PLL2CR.PLL2STP bit is set to 0, counting of the LOCO cycles continues even after the PLL2 clock source oscillation is stabilized. For the PLL2 oscillation stabilization time, see [section 46, Electrical Characteristics](#).

[Clearing condition]

- When the PLL2 is operating and then is deactivated because the PLL2CR.PLL2STP bit is set to 1.

8.2.14 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040

| | | | | | | | | |
|--------------------|-----------|---|---|---|---|---|---|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | OSTD E | — | — | — | — | — | — | OSTDI E |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | OSTDIE | Oscillation Stop Detection Interrupt Enable 0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG) | R/W |
| 6:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | OSTDE | Oscillation Stop Detection Function Enable 0: Disable oscillation stop detection function 1: Enable oscillation stop detection function | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The OSTDCR register controls the oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The OSTDE bit must be set to 0 before transitioning to Software Standby or Deep Software Standby mode. To transition to Software Standby or Deep Software Standby mode, first set the OSTDE bit to 0, then execute the WFI instruction.

The following restrictions apply when using the oscillation stop detection function:

In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, PCLKA, PCLKB, PCLKC, and PCLKD is prohibited.

8.2.15 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000

Offset address: 0x041

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | OSTD F |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------------|-------------------|
| 0 | OSTDF | Oscillation Stop Detection Flag 0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected | R/W ^{*1} |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock is MOSC) nor 101b (system clock is PLL) and PLLCCR.PLSRCSEL bit is not 0 (PLL source clock is MOSC).

8.2.16 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A2

| | | | | | | | | |
|--------------------|---|---|---|---|-----------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | MSTS[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | MSTS[3:0] | Main Clock Oscillator Wait Time Setting 0x0: Wait time = 3 cycles (11.4 μ s) 0x1: Wait time = 35 cycles (133.5 μ s) 0x2: Wait time = 67 cycles (255.6 μ s) 0x3: Wait time = 131 cycles (499.7 μ s) 0x4: Wait time = 259 cycles (988.0 μ s) 0x5: Wait time = 547 cycles (2086.6 μ s) 0x6: Wait time = 1059 cycles (4039.8 μ s) 0x7: Wait time = 2147 cycles (8190.2 μ s) 0x8: Wait time = 4291 cycles (16368.9 μ s) 0x9: Wait time = 8163 cycles (31139.4 μ s) Others: Setting prohibited | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (μ s) = $1/(f_{\text{LOCO}}[\text{MHz}] \times 8) = 1/(0.032768 \times 8) = 3.81$ (μ s)

(min.) The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

8.2.17 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x413

| | | | | | | | | |
|--------------------|---|-------|------------|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | MOSEL | MODRV[1:0] | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|------------|--------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5:4 | MODRV[1:0] | Main Clock Oscillator Drive Capability 0 Switching 0 0: 20 MHz to 24 MHz 0 1: 16 MHz to 20 MHz 1 0: 8 MHz to 16 MHz 1 1: 8 MHz | R/W |
| 6 | MOSEL | Main Clock Oscillator Switching 0: Resonator 1: External clock input | R/W |
| 7 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.

Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MODRV[1:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV[1:0] bit switches the drive capability of the main clock oscillator.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

8.2.18 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03E

| | | | | | | | | |
|--------------------|-------|-------------|---|---|---|---|-------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CKOEN | CKODIV[2:0] | — | — | — | — | CKOSEL[2:0] | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | CKOSEL[2:0] | Clock Out Source Select 0 0 0: HOCO (value after reset) 0 0 1: MOCO 0 1 0: LOCO 0 1 1: MOSC 1 0 0: Setting prohibited 1 0 1: Setting prohibited Others: Setting prohibited | R/W |

| Bit | Symbol | Function | R/W |
|-----|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6:4 | CKODIV[2:0] | Clock Output Frequency Division Ratio 0 0 0: $\times 1/1$ 0 0 1: $\times 1/2$ 0 1 0: $\times 1/4$ 0 1 1: $\times 1/8$ 1 0 0: $\times 1/16$ 1 0 1: $\times 1/32$ 1 1 0: $\times 1/64$ 1 1 1: $\times 1/128$ | R/W |
| 7 | CKOEN | Clock Out Enable 0: Disable clock out 1: Enable clock out | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

8.2.19 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x492

Bit position: 7 6 5 4 3 2 1 0

Bit field:

LOCOUTRM[7:0]

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|---------------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | LOCOUTRM[7:0] | LOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed

- Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The LOCOUTCR register is added to the original LOCO trimming data.

MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range. When LOCOUTCR is modified, the frequency stabilization time corresponds to the frequency stabilization time at the start of MCU operation.

8.2.20 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x061

| Bit | Symbol | Function | R/W |
|-----|---------------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | MOCOUTRM[7:0] | MOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOUTCR register is added to the original MOCO trimming data.

MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range. When MOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

8.2.21 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x062

| Bit | Symbol | Function | R/W |
|-----|---------------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | HOCOUTRM[7:0] | HOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127 | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The HOCOUTCR register is added to the original HOCO trimming data.

MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range. When HOCOUTCR is modified, the frequency stabilization wait time corresponds to the frequency stabilization wait time at the start of the MCU operation.

8.2.22 SCISPICKDIVCR : SCI SPI Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x06D

| | | | | | | | | |
|---------------|---|---|---|---|---|------------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | SCISPICKDIV[2:0] | | |

Value after reset: 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | SCISPICKDIV[2:0] | SCI SPI Clock (SCISPICK) Division Select 0 0 0: /1 (value after reset) 0 0 1: /2 0 1 0: /4 0 1 1: /6 1 0 0: /8 Others: Setting prohibited. | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SCISPICKDIVCR controls the SCI SPI clock (SCISPICK).

SCISPICKDIV[2:0] bits (SCI SPI Clock (SCISPICK) Division Select)

These bits select the frequency of the SCI SPI clock (SCISPICK) and must be modified when SCISPICKCR.SCISPICKSRDY = 1.

When switching the division ratio setting from n ($n \neq 1$), set all of MSTPCRB.MSTPB $_i$ = 1 ($i = 18, 19, 22, 27, 28, 29, 30, 31$) before setting SCISPICKCR.SCISPICKSREQ = 1.

8.2.23 CANFDCKDIVCR : CANFD Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x06E

| | | | | | | | | |
|--------------------|---|---|---|---|---|-----------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | CANFDCKDIV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | CANFDCKDIV[2:0] | CANFD clock (CANFDCLK) Division Select 0 0 0: /1 (value after reset) 0 0 1: /2 0 1 0: /4 0 1 1: /6 1 0 0: /8 Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CANFDCKDIVCR controls the CANFD clock (CANFDCLK).

CANFDCKDIV[2:0] bit (CANFD clock (CANFDCLK) Division Select)

These bits select the frequency of the CANFD clock (CANFDCLK).

These bits must change when CANFDCKCR.CANFDCKSRDY = 1.

When switching the division ratio setting from n ($n \neq 1$), set MSTPCRC.MSTPC27 = 1 before setting CANFDCKCR.CANFDCKSREQ = 1.

8.2.24 GPTCKDIVCR : GPT Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x06F

| | | | | | | | | |
|--------------------|---|---|---|---|---|---------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | GPTCKDIV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | GPTCKDIV[2:0] | GPT clock (GPTCLK) Division Select 0 0 0: /1 (value after reset) 0 0 1: /2 0 1 0: /4 0 1 1: /6 1 0 0: /8 Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

GPTCKDIVCR controls the GPT clock (GPTCLK).

GPTCKDIV[2:0] bit (GPT clock (GPTCLK) Division Select)

These bits select the frequency of the GPT clock (GPTCLK).

These bits must change when GPTCKCR.GPTCKRSRDY = 1.

When switching the division ratio setting from n ($n \neq 1$), set MSTPCRE.MSTPE31 = 1 before setting GPTCKCR.GPTCKSREQ = 1.

8.2.25 IICCKDIVCR : IIC Clock Division Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x070

| | | | | | | | | |
|--------------------|---|---|---|---|---|---------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | IICCKDIV[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | IICCKDIV[2:0] | IIC clock (IICCLK) Division Select 0 0 0: /1 (value after reset) 0 0 1: /2 0 1 0: /4 0 1 1: /6 1 0 0: /8 Others: Setting prohibited | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

IICCKDIVCR controls the IIC clock (IICCLK).

IICCKDIV[2:0] bit (IIC clock (IICCLK) Division Select)

These bits select the frequency of the IIC clock (IICCLK).

These bits must change when IICCKCR.IICCKSRDY = 1.

When switching the division ratio setting from n ($n \neq 1$), set all of MSTPCRB.MSTPB_i = 1 ($i = 8, 9$) before setting IICCKCR.IICCKSREQ = 1.

8.2.26 SCISPICKCR : SCI SPI Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x075

| | | | | | | | | |
|--------------------|--------------|--------------|---|---|---|------------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SCISPICKSRDY | SCISPICKSREQ | — | — | — | SCISPICKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | SCISPICKSEL[2:0] | SCI SPI Clock (SCISPICKLK) Source Select 0 0 0: HOCO 0 0 1: MOCO (value after reset) 0 1 0: LOCO 0 1 1: Main clock oscillator 1 0 1: PLL 1 1 0: PLL2 Others: Setting prohibited. | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | SCISPICKSREQ | SCI SPI Clock (SCISPICKLK) Switching Request 0: No request 1: Request switching. | R/W |
| 7 | SCISPICKSRDY | SCI SPI Clock (SCISPICKLK) Switching Ready state flag 0: Switching not possible 1: Switching possible. | R |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SCISPICKCR register controls the SCI SPI clock (SCISPICKLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output.

To change the set value of SCISPICKDIVCR.SCISPICKDIV[2:0] and SCISPICKSEL[2:0], use the following procedure:

1. Write 1 to all of MSTPCRB.MSTPBi (i = 18, 19, 22, 27, 28, 29, 30, 31) (only when switching the division ratio setting from n (n ≠ 1)).
2. Wait for two SCISPICKLK (only when switching the division ratio setting from n (n ≠ 1)).
3. Write 1 to SCISPICKSREQ.
4. Poll until SCISPICKSRDY is read as 1. While SCISPICKSRDY = 1, no clock is output to SCISPICKLK.
5. Write to SCISPICKDIVCR.SCISPICKDIV[2:0] and SCISPICKSEL[2:0].
6. Write 0 to SCISPICKSREQ.
7. Poll until SCISPICKSRDY is read as 0.
8. When SCISPICKSRDY becomes 0, SCISPICKLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when SCISPICKSREQ = 1 and SCISPICKSRDY = 0, or when SCISPICKSREQ = 0 and SCISPICKSRDY = 1.

SCISPICKSEL[2:0] bits (SCI SPI Clock (SCISPICKLK) Source Select)

These bits select the clock source of the SCI SPI clock (SCISPICKLK) and must be modified when SCISPICKCR.SCISPICKSRDY = 1.

SCISPICKSREQ bit (SCI SPI Clock (SCISPICKL) Switching Request)

This bit selects the SCISPICKL switching request.

SCISPICKSRDY flag (SCI SPI Clock (SCISPICKL) Switching Ready state flag)

This flag indicates the state of switching ready for the SCISPICKL. When SCISPICKSRDY = 1, no clock is output to SCISPICKL.

8.2.27 CANFDCKCR : CANFD Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x076

| | | | | | | | | |
|--------------------|-------------|-------------|---|---|---|-----------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CANFDCKSRDY | CANFDCKSREQ | — | — | — | CANFDCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|-----------------|-------------------------------------------------------------------------------------------------------|-----|
| 2:0 | CANFDCKSEL[2:0] | CANFD clock (CANFDCLK) Source Select 1 0 1: PLL 1 1 0: PLL2 Others: Setting prohibited | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | CANFDCKSREQ | CANFD clock (CANFDCLK) Switching Request 0: No request 1: Request switching | R/W |
| 7 | CANFDCKSRDY | CANFD clock (CANFDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch | R |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The CANFDCKCR register controls the CANFD clock (CANFDCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[2:0], use the following procedure:

- Write 1 to MSTPCRC.MSTPC27 (only when switching the division ratio setting from n ($n \neq 1$)).
- Wait for two CANFDCLK (only when switching the division ratio setting from n ($n \neq 1$)).
- Write 1 to CANFDCKSREQ.
- Poll until CANFDCKSRDY is read as 1. While CANFDCKSRDY = 1, no clock is output to CANFDCLK.
- Write to CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[2:0].
- Write 0 to CANFDCKSREQ.
- Poll until CANFDCKSRDY is read as 0.
- When CANFDCKSRDY becomes 0, CANFDCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when CANFDCKSREQ = 1 and CANFDCKSRDY = 0, or when CANFDCKSREQ = 0 and CANFDCKSRDY = 1.

CANFDCKSEL[2:0] bits (CANFD clock (CANFDCLK) Source Select)

These bits select the clock source of the CANFD clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

CANFDCKSREQ bit (CANFD clock (CANFDCLK) Switching Request)

This bit selects the CANFDCLK switching request.

CANFDCKSRDY flag (CANFD clock (CANFDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the CANFDCLK. When CANFDCKSRDY = 1, no clock is output to CANFDCLK.

8.2.28 GPTCKCR : GPT Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x077

| | | | | | | | | |
|--------------------|-------------------|-------------------|---|---|---|---------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | GPTC KSRD Y | GPTC KSRE Q | — | — | — | GPTCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | GPTCKSEL[2:0] | GPT clock (GPTCLK) Source Select 0 0 0: HOCO 0 0 1: MOCO (value after reset) 0 1 0: LOCO 0 1 1: Main clock oscillator 1 0 1: PLL 1 1 0: PLL2 Others: Setting prohibited | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | GPTCKSREQ | GPT clock (GPTCLK) Switching Request 0: No request 1: Request switching | R/W |
| 7 | GPTCKSRDY | GPT clock (GPTCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch | R |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The GPTCKCR register controls the GPT clock (GPTCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of GPTCKDIVCR.GPTCKDIV[2:0] and GPTCKSEL[2:0], use the following procedure:

1. Write 1 to MSTPCRE.MSTPE31 (only when switching the division ratio setting from n ($n \neq 1$)).
2. Wait for two GPTCLK (only when switching the division ratio setting from n ($n \neq 1$)). Write 1 to GPTCKSREQ.
3. Write 1 to GPTCKSREQ.

4. Poll until GPTCKSRDY is read as 1. While GPTCKSRDY = 1, no clock is output to GPTCLK.
5. Write to GPTCKDIVCR.GPTCKDIV[2:0] and GPTCKSEL[2:0].
6. Write 0 to GPTCKSREQ.
7. Poll until GPTCKSRDY is read as 0.
8. When GPTCKSRDY becomes 0, GPTCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when GPTCKSREQ = 1 and GPTCKSRDY = 0, or when GPTCKSREQ = 0 and GPTCKSRDY = 1.

GPTCKSEL[2:0] bits (GPT clock (GPTCLK) Source Select)

These bits select the clock source of the GPT clock (GPTCLK) and must be modified when GPTCKCR.GPTCKSRDY = 1.

GPTCKSREQ bit (GPT clock (GPTCLK) Switching Request)

This bit selects the GPTCLK switching request.

GPTCKSRDY flag (GPT clock (GPTCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the GPTCLK. When GPTCKSRDY = 1, no clock is output to GPTCLK.

8.2.29 IICCKCR : IIC Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x078

| | | | | | | | | |
|--------------------|-----------|-----------|---|---|---|---------------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | IICCKSRDY | IICCKSREQ | — | — | — | IICCKSEL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | IICCKSEL[2:0] | IIC clock (IICCLK) Source Select 0 0 0: HOCO 0 0 1: MOCO (value after reset) 0 1 0: LOCO 0 1 1: Main clock oscillator 1 0 1: PLL 1 1 0: PLL2 Others: Setting prohibited | R/W |
| 5:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | IICCKSREQ | IIC clock (IICCLK) Switching Request 0: No request 1: Request switching | R/W |
| 7 | IICCKSRDY | IIC clock (IICCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch | R |

Note: If the security attribution is configured as secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The IICCKCR register controls the IIC clock (IICCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of IICCKDIVCR.IICCKDIV[2:0] and IICCKSEL[2:0], use the following procedure:

1. Write 1 to all of MSTPCRB.MSTPBi (i = 8, 9) (only when switching the division ratio setting from n (n ≠ 1)).
2. Wait for two IICCLK (only when switching the division ratio setting from n (n ≠ 1)).
3. Write 1 to IICCKSREQ.
4. Poll until IICCKSRDY is read as 1. While IICCKSRDY = 1, no clock is output to IICCLK.
5. Write to IICCKDIVCR.IICCKDIV[2:0] and IICCKSEL[2:0].
6. Write 0 to IICCKSREQ.
7. Poll until IICCKSRDY is read as 0.
8. When IICCKSRDY becomes 0, IICCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when IICCKSREQ = 1 and IICCKSRDY = 0, or when IICCKSREQ = 0 and IICCKSRDY = 1.

IICCKSEL[2:0] bits (IIC clock (IICCLK) Source Select)

These bits select the clock source of the IIC clock (IICCLK) and must be modified when IICCKCR.IICCKSRDY = 1.

IICCKSREQ bit (IIC clock (IICCLK) Switching Request)

This bit selects the IICCLK switching request.

IICCKSRDY flag (IIC clock (IICCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the IICCLK. When IICCKSRDY = 1, no clock is output to IICCLK.

8.2.30 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x03F

| | | | | | | | | |
|--------------------|------------|---|---|---|-----------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | TRCK EN | — | — | — | TRCK[3:0] | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|-----------|---------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | TRCK[3:0] | Trace Clock operating frequency select 0x0: /1 0x1: /2 (value after reset) 0x2: /4 Others: Setting prohibited | R/W |
| 6:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | TRCKEN | Trace Clock operating Enable 0: Stop 1: Operation enable | R/W |

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Trace Clock Control Register controls switching the trace clock.

TRCKCR can be written only when the debugger is connected (DBGSTR.CDBGPWRUPREQ = 1).

Change the TRCLK frequency in the state of TRCKEN = 0.

Factor of the initialization of TRCKCR register is all resets.

8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.3.1 Connecting a Crystal Resonator

Figure 8.4 shows an example of connecting a crystal resonator. A damping resistor (R_d) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (R_f), insert an R_f between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

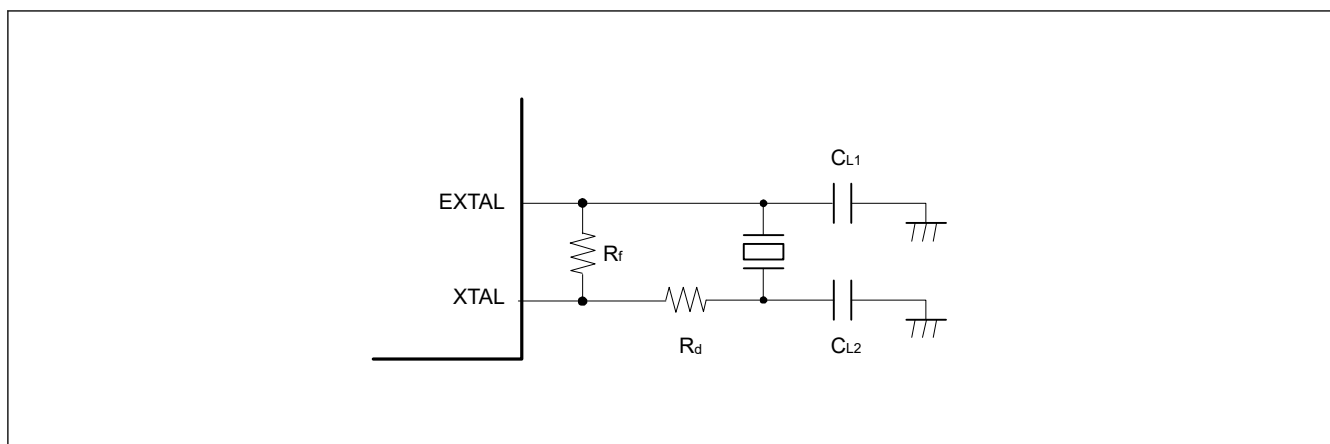

Figure 8.4 Example of crystal resonator connection

Figure 8.5 shows an equivalent circuit of the crystal resonator.

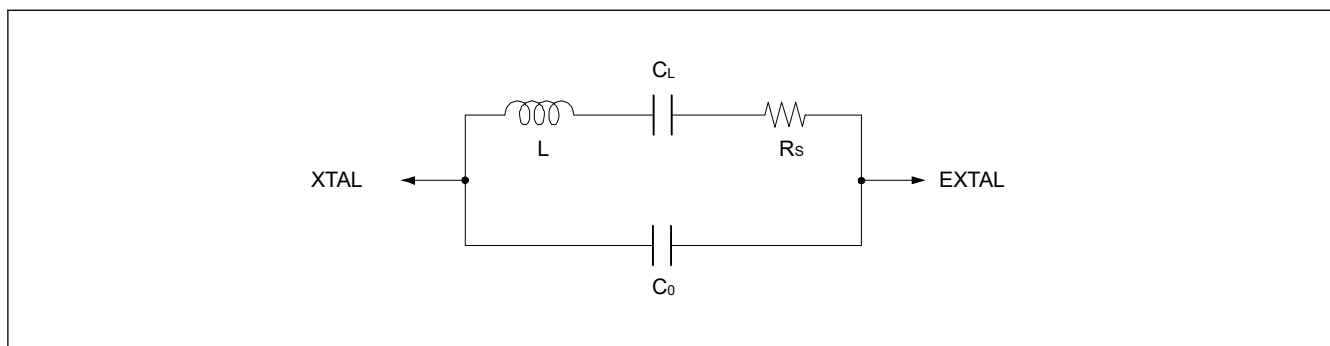

Figure 8.5 Equivalent circuit of the crystal resonator

8.3.2 External Clock Input

Figure 8.6 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

Figure 8.6 Equivalent circuit for external clock

8.3.3 Notes on External Clock Input

The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.

8.4 Oscillation Stop Detection Function

8.4.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL), PLL clock remains the system clock source. However, the frequency becomes a free-running oscillation frequency.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to a high-impedance state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See [section 46, Electrical Characteristics](#).

Switching between the main clock oscillator and the MOCO clock or between the PLL clock and PLL free-running clock is controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
 - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
 - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.
- When PLLCCR.PLSRCSEL = 0 (PLL source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL):
 - When OSTDF changes 0 to 1, the clock source switches to the PLL free-running oscillation clock.
 - When OSTDF changes 1 to 0, the clock source switches back to PLL.

To switch the clock source to the main clock or PLL clock again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock or PLL clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the CKSEL[2:0] bits to the main clock or PLL clock after the specified oscillation stabilization time elapses.

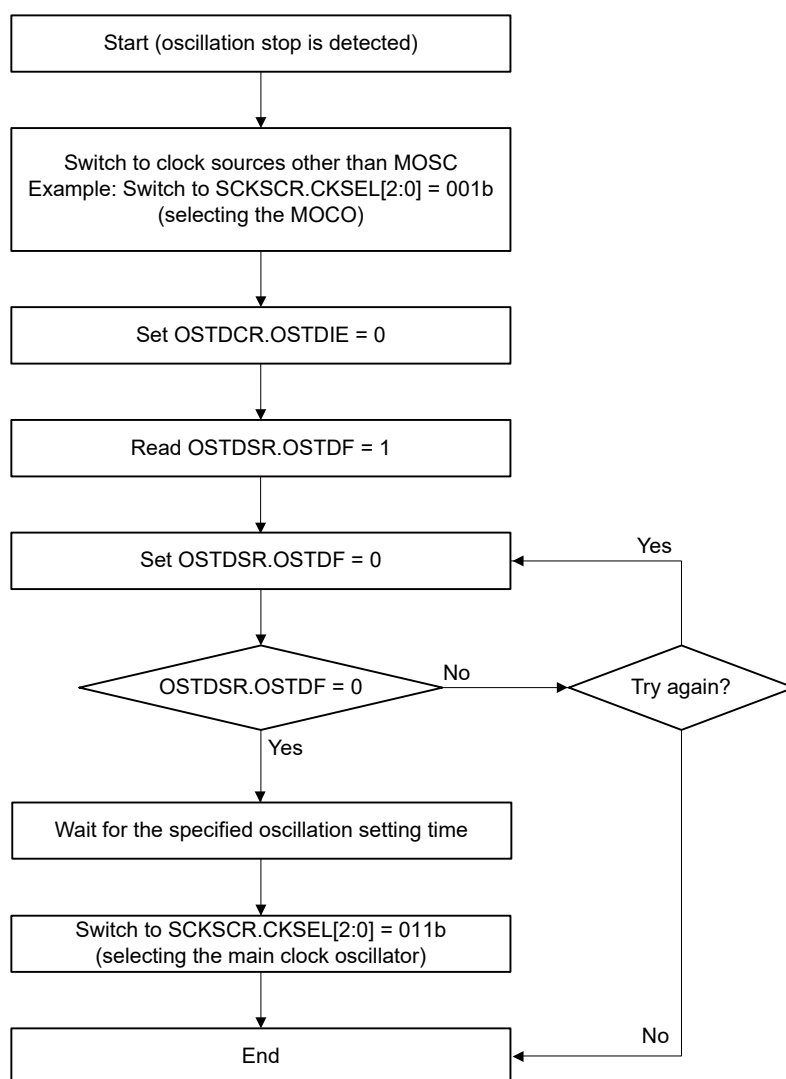

After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause. Therefore, the oscillation stop detection function must be disabled before the main clock oscillator is stopped by software or a transition is made to Software Standby or Deep Software Standby mode.

The oscillation stop detection function switches all clocks that can be selected as the MOSC clock except CLKOUT to the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL).

The system clock (ICK) frequency during the MOCO (when system clock is MOSC) or PLL free-running (when system clock is PLL) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (SCKDIVCR.ICK[2:0])

Example of returning when CKSEL[2:0] = 011b (selecting the main clock oscillator) after an oscillation stop is detected

Note: On return from the oscillation-stopped state, the factor responsible for stopping the main clock oscillation circuit must be removed from the system to allow oscillation to resume.

Figure 8.7 Flow of recovery on detection of oscillator stop

8.4.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

8.5 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

8.6 Internal Clock

Clock sources for the internal clock signals include:

- Main clock
- HOCO clock
- MOCO clock
- LOCO clock
- PLL clock
- PLL2 clock
- IWDT-dedicated clock
- JTAG clock

The following internal clocks are produced from these sources.

- Operating clock of the CPU, DMAC, DTC, Flash, I/O ports, TFU, IIRFA and RAM: System clock (ICLK)
- Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD)
- Operating clock of the FlashIF: FlashIF clock (FCLK)
- Operating clock for the GPT : GPT clock (GPTCLK)
- Operating clock for the SCI and SPI: SCI SPI clock (SCISPICK)
- Operating clock for the CANFD: CANFD clock (CANFDCLK)
- Operating clock for the CANFD: CAN clock (CANMCLK)
- Operating clocks for the IIC: IIC clock (IICCLK)
- Operating clocks for the CAC: CAC clock (CACCLK)
- Operating clock for the IWDT: IWDT-dedicated clock (IWDTCLK)
- Operating clock for the AGT: AGT-dedicated LOCO clock (AGTLCLK)
- Operating clock for the SysTick Timer: SysTick Timer-dedicated clock (SYSTICCLK)
- Clock for external pin output: Clock/Buzzer output clock (CLKOUT)
- Operating clock for the JTAG: JTAG clock (JTAGTCK)

For details on the registers used to set the frequencies of the internal clocks, see [section 8.6.1. System Clock \(ICLK\)](#) to [section 8.6.14. JTAG Clock \(JTAGTCK\)](#)

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

8.6.1 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the CPU, DMAC, DTC, Flash, I/O ports, TFU, IIRFA and SRAM.

The ICLK frequency is specified by the ICK[2:0] bits in SCKDIVCR, the CKSEL[2:0] bits in SCKSCR, the PLLMUL[5:0], and PLIDIV[1:0] bits in PLLCCR, and the HOCOFRQ0[1:0] bits in OFS1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore the HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 8.8 and Figure 8.9.

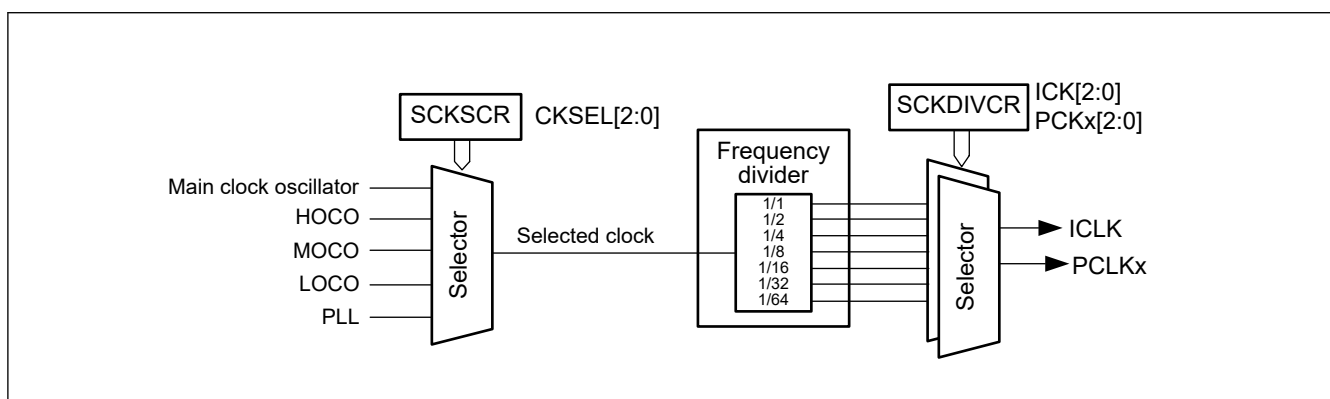

Figure 8.8 Block diagram of clock source selector

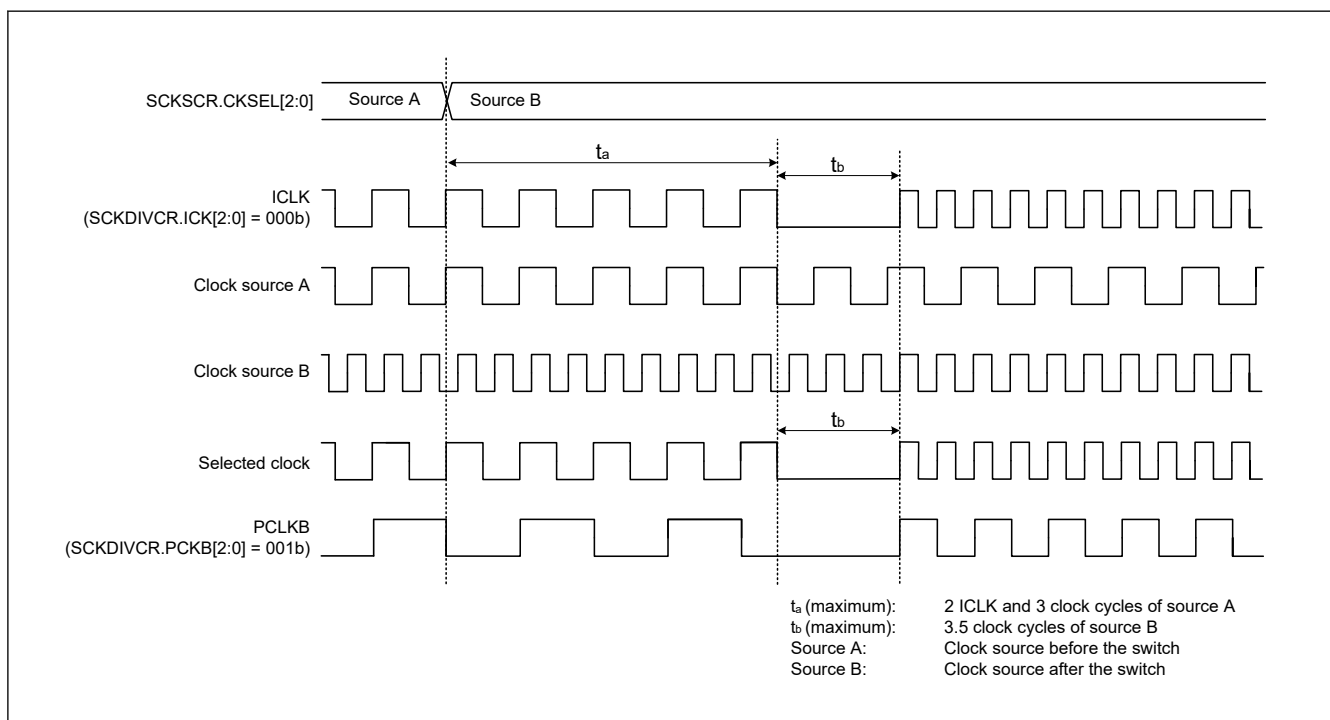

Figure 8.9 Timing of clock source switching

8.6.2 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD)

The peripheral module clocks (PCLKA, PCLKB, PCLKC and PCLKD) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[2:0], PCKB[2:0], PCKC[2:0] and PCKD[2:0] bits in SCKDIVCR

- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[1:0] bits in OFS1^{*1}.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore the HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See [Figure 8.8](#) and [Figure 8.9](#).

8.6.3 FlashIF Clock (FCLK)

The flash interface clock (FCLK) is the operating clock for the flash memory interface. In addition to reading from the data flash, FCLK is used for the programming and erasure of the code flash and data flash.

The FCLK frequency is specified in the following bits:

- FCK[2:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- HOCOFRQ0[1:0] bits in OFS1^{*1}.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore the HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

8.6.4 GPT Clock (GPTCLK)

The GPT clock (GPTCLK) is the operating clock for the GPT module.

The GPTCLK frequency is specified in the following bits:

- GPTCKSEL[2:0] bits in GPTCKCR
- GPTCKDIV[2:0] bits in GPTCKDIVCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- PLL2MUL[5:0] and PL2IDIV[1:0] bits in PLL2CCR
- HOCOFRQ0[1:0] bits in OFS1.

8.6.5 SCI SPI clock (SCISPICLK)

The SCI SPI clock (SCISPICLK) is the operating clock for the SCI and SPI module.

The SCISPICLK frequency is specified in the following bits:

- SCISPICKSEL[2:0] bits in SCISPICKCR
- SCISPICKDIV[2:0] bits in SCISPICKDIVCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- PLL2MUL[5:0] and PL2IDIV[1:0] bits in PLL2CCR
- HOCOFRQ0[1:0] bits in OFS1.

8.6.6 CAN Clock (CANMCLK)

The CAN clock (CANMCLK) is the operating clock for the CANFD module. CANMCLK is generated by the main clock oscillator.

8.6.7 CANFD Clock (CANFDCLK)

The CANFD clock (CANFDCLK) is the operating clock for the CANFD module.

The CANFDCLK frequency is specified in the following bits:

- CANFDCKSEL[2:0] bits in CANFDCKCR
- CANFDCKDIV[2:0] bits in CANFDCKDIVCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- PLL2MUL[5:0] bits and PL2IDIV[1:0] bits in PLL2CCR.

8.6.8 CAC Clock (CACCLK)

The CAC clock, CACCLK, is the operating clock for the CAC. CACCLK is generated by the following oscillators:

- Main clock oscillator
- High-speed clock oscillator (HOCO)
- Middle-speed clock oscillator (MOCO)
- Low-speed on-chip oscillator (LOCO)
- IWDt-dedicated on-chip oscillator. (IWDTLOCO)

8.6.9 IIC clock (IICCLK)

The IIC clock (IICCLK) is the operating clock for the IIC module.

The IICCLK frequency is specified in the following bits:

- IICCKSEL[2:0] bits in IICCKCR
- IICCKDIV[2:0] bits in IICCKDIVCR
- PLLMUL[5:0] and PLIDIV[1:0] bits in PLLCCR
- PLL2MUL[5:0] and PL2IDIV[1:0] bits in PLL2CCR
- HOCOFRQ0[1:0] bits in OFS1.

8.6.10 IWDt-Dedicated Clock (IWDTCCLK)

The IWDt-dedicated clock (IWDTCCLK) is the operating clock for the IWDt. IWDTCCLK is internally generated by the IWDt-dedicated on-chip oscillator.

8.6.11 AGT-Dedicated LOCO Clock (AGTLCLK)

The AGT-dedicated LOCO clock (AGTLCLK) is the operating clock for the AGT. AGTLCLK is generated by the LOCO clock.

8.6.12 SysTick Timer-Dedicated Clock (SYSTICCLK)

The SysTick timer-dedicated clock, SYSTICCLK, is the operating clock for the SysTick timer. SYSTICCLK is generated by the LOCO clock.

8.6.13 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFRQ0[1:0] bits in OFS1^{*1}.

Note 1. OFS1 is for non-secure developers and OFS1_SEC is for secure developers. The applied setting value is determined by OFS1_SEL. The value of OFS1.HOCOFRQ0[1:0] bits is automatically transferred to HOCOCR2.HCFRQ0[1:0] bits after reset, therefore the HOCO frequency can also be specified by HOCOCR2.HCFRQ0[1:0] bits.

8.6.14 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

8.7 Usage Notes

8.7.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR register:

- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, and PCLKD)
- FlashIF clock (FCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See [section 46, Electrical Characteristics](#).
- The system clock, peripheral module clock must be set according to [Table 8.2](#).

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

8.7.2 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in [Figure 8.10](#) to prevent electromagnetic induction from interfering with correct oscillation. [Figure 8.10](#) shows the case which the main clock oscillator is used.

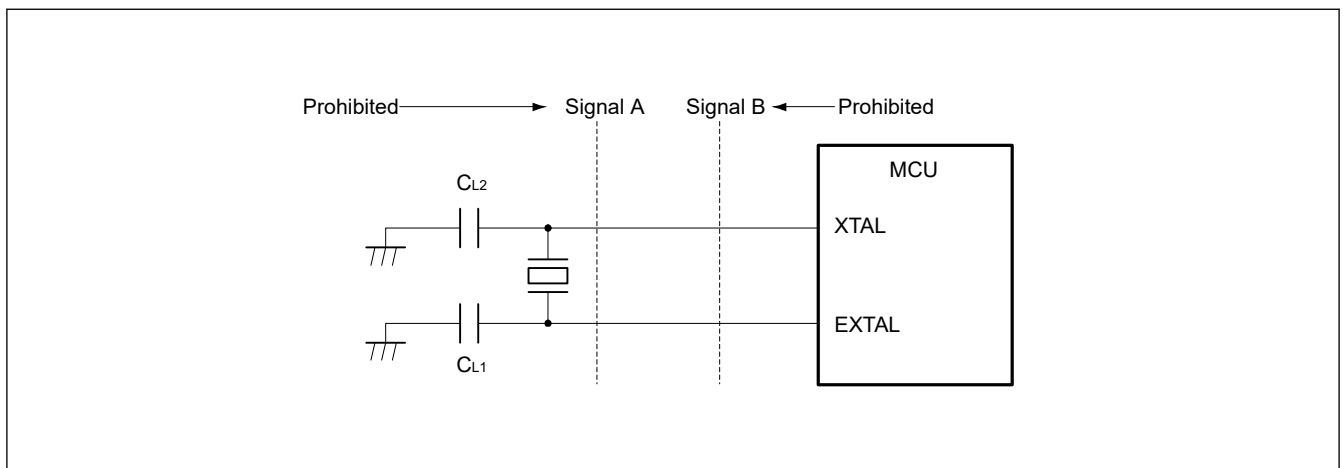

Figure 8.10 Signal routing in board design for oscillation circuit

8.7.3 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

9. Clock Frequency Accuracy Measurement Circuit (CAC)

9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

[Table 9.1](#) lists the CAC specifications, [Figure 9.1](#) shows the CAC block diagram, and [Table 9.2](#) lists the CAC I/O pin.

Table 9.1 CAC specifications

| Parameter | Specifications |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Measurement target clocks | Frequency can be measured for: <ul style="list-style-type: none"> • Main clock oscillator • HOCO clock • MOCO clock • LOCO clock • Peripheral module clock B (PCLKB) • IWDT-dedicated clock |
| Measurement reference clocks | Frequency can be referenced to: <ul style="list-style-type: none"> • External clock input to the CACREF pin • Main clock oscillator • HOCO clock • MOCO clock • LOCO clock • Peripheral module clock B (PCLKB) • IWDT-dedicated clock |
| Selectable function | Digital filter |
| Interrupt sources | <ul style="list-style-type: none"> • Measurement end • Frequency error • Overflow |
| Module-stop function | Module-stop state can be set to reduce power consumption |
| TrustZone Filter | Security attribution can be set |

| Function | Pin name | I/O | Description |
|----------|----------|-------|---------------------------------------|
| CAC | CACREF | Input | Measurement reference clock input pin |

9.2 Register Descriptions

9.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4008_3600

Offset address: 0x00

| | | | | | | | | |
|---------------|---|---|---|---|---|---|---|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | CFME |

Value after reset: 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------|-----|
| 0 | CFME | Clock Frequency Measurement Enable 0: Disable 1: Enable | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. Changes made to this bit are not immediately reflected to the internal circuit. Read the bit to confirm that the change has been reflected.

9.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4008_3600

Offset address: 0x01

| | | | | | | | | |
|--------------------|------------|---|-----------|---|-----------|---|-------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | EDGES[1:0] | | TCSS[1:0] | | FMCS[2:0] | | CACR EFE | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | CACREFE | CACREF Pin Input Enable 0: Disable 1: Enable | R/W |
| 3:1 | FMCS[2:0] | Measurement Target Clock Select 0 0 0: Main clock oscillator 0 0 1: Setting prohibited 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: IWDG-dedicated clock 1 1 1: Setting prohibited | R/W |
| 5:4 | TCSS[1:0] | Timer Count Clock Source Select 0 0: No division 0 1: × 1/4 clock 1 0: × 1/8 clock 1 1: × 1/32 clock | R/W |
| 7:6 | EDGES[1:0] | Valid Edge Select 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited | R/W |

Note: Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

9.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4008_3600

Offset address: 0x02

| | | | | | | | | |
|--------------------|----------|---|-----------|---|-----------|---|-----|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DFS[1:0] | | RCDS[1:0] | | RSCS[2:0] | | RPS | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | RPS | Reference Signal Select 0: CACREF pin input 1: Internal clock (internally generated signal) | R/W |
| 3:1 | RSCS[2:0] | Measurement Reference Clock Select 0 0 0: Main clock oscillator 0 0 1: Setting prohibited 0 1 0: HOCO clock 0 1 1: MOCO clock 1 0 0: LOCO clock 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: IWDG-dedicated clock 1 1 1: Setting prohibited | R/W |
| 5:4 | RCDS[1:0] | Measurement Reference Clock Frequency Division Ratio Select 0 0: $\times 1/32$ clock 0 1: $\times 1/128$ clock 1 0: $\times 1/1024$ clock 1 1: $\times 1/8192$ clock | R/W |
| 7:6 | DFS[1:0] | Digital Filter Select 0 0: Disable digital filtering 0 1: Use sampling clock for the digital filter as the frequency measuring clock 1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4 1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16. | R/W |

Note: Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

9.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4008_3600

Offset address: 0x03

| | | | | | | | | |
|---------------|---|------------|-------------|-------------|---|-------|------------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | OVFF CL | MEND FCL | FERR FCL | — | OVFIE | MEND IE | FERR IE |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------|-----|
| 0 | FERRIE | Frequency Error Interrupt Request Enable 0: Disable 1: Enable | R/W |
| 1 | MENDIE | Measurement End Interrupt Request Enable 0: Disable 1: Enable | R/W |

| Bit | Symbol | Function | R/W |
|-----|---------|-------------------------------------------------------------------|-----|
| 2 | OVFIE | Overflow Interrupt Request Enable 0: Disable 1: Enable | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | FERRFCL | FERRF Clear 0: No effect 1: The CASTR.FERRF flag is cleared | W |
| 5 | MENDFCL | MENDF Clear 0: No effect 1: The CASTR.MENDF flag is cleared | W |
| 6 | OVFFCL | OVFF Clear 0: No effect 1: The CASTR.OVFF flag is cleared. | W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

9.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4008_3600

Offset address: 0x04

| | | | | | | | | |
|---------------|---|---|---|---|---|------|-----------|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | OVFF | MEND F | FERR F |

Value after reset: 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | FERRF | Frequency Error Flag 0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error). | R |
| 1 | MENDF | Measurement End Flag 0: Measurement is in progress 1: Measurement ended | R |
| 2 | OVFF | Overflow Flag 0: Counter has not overflowed 1: Counter overflowed | R |
| 7:3 | — | These bits are read as 0. | R |

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

9.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x06

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | n/a | <p>The Upper Value of the Allowable Range</p> <p>The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.</p> <p>The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.</p> | R/W |

9.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4008_3600

Offset address: 0x08

Bit position: 15 0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | n/a | <p>The Lower Value of the Allowable Range</p> <p>The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0.</p> <p>The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.</p> | R/W |

9.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4008_3600

Offset address: 0x0A

Bit position: 15 0

Bit field: 

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | n/a | <p>The Measurement Result</p> <p>The CACNTBR register is a 16-bit read-only register that stores the measurement result.</p> | R |

9.3 Operation

9.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. [Figure 9.2](#) shows an operating example of the CAC.

Figure 9.2 CAC operating example

The events in Figure 9.2 are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both $CACNTBR \leq CAULVR$ and $CACNTBR \geq CALLVR$ are true, only the MENDF flag in CACSTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR > CAULVR$, the FERRF flag in CACSTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CACSTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If $CACNTBR < CALLVR$, the FERRF flag in CACSTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CACSTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

Counter value error = (1 cycle of the count source clock) / (1 cycle of the sampling clock)

9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. [Table 9.3](#) provides information on the CAC interrupt requests.

Table 9.3 CAC interrupt requests

| Interrupt request | Interrupt enable bit | Status flag | Interrupt sources |
|---------------------------|----------------------|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Frequency error interrupt | CAICR.FERRIE | CASTR.FERRF | The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR |
| Measurement end interrupt | CAICR.MENDIE | CASTR.MENDF | <ul style="list-style-type: none"> • Valid edge is input from the CACREF pin or internal clock • Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit |
| Overflow interrupt | CAICR.OVFIE | CASTR.OVFF | Counter overflows |

9.5 Usage Notes

9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

10. Low Power Modes

10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, stopping modules, selecting power control mode in Normal mode, and transitioning to low power modes.

[Table 10.1](#) lists the specifications of the low power mode functions. [Table 10.2](#) lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DTC, DMAC and SRAM operate.

Table 10.1 Specifications of the low power mode functions

| Item | Specification |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reducing power consumption by switching clock signals | The frequency division ratio can be selected independently for the system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD), and flash interface clock (FCLK). *1 |
| Module stop | Functions can be stopped independently for each peripheral module |
| Low-power modes | <ul style="list-style-type: none"> Sleep mode Software Standby mode Snooze mode Deep Software Standby mode |
| Power control modes | <ul style="list-style-type: none"> Power consumption can be reduced in Normal and Sleep modes by selecting an appropriate operating power control mode according to the operating frequency. Two operating power control modes are available: High-speed mode Low-speed mode |
| TrustZone Filter | Security attribution can be set for each registers |

Note 1. For details, see [section 8, Clock Generation Circuit](#)

Table 10.2 Operating conditions of each low power mode (1 of 3)

| Item | Sleep mode | Software Standby mode | Snooze mode | Deep Software Standby mode |
|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transition condition | When [Condition 1] or [Condition 2] while SBYCR.SSBY = 0 [Condition 1] <ul style="list-style-type: none"> WFI instruction A valid interrupt request *14 cannot be accepted to CPU. Table 10.2 Operating conditions of each low power mode (3 of 3)

| Item | Sleep mode | Software Standby mode | Snooze mode | Deep Software Standby mode |
|------------------------------------------|------------|-----------------------|----------------------|----------------------------|
| NMI, IRQn-DS (n = 0 to 15) pin interrupt | Selectable | Selectable | Selectable | Selectable |
| Key Interrupt Function (KINT) | Selectable | Selectable | Selectable | Stop (Undefined) |
| Low voltage detection (LVD) | Selectable | Selectable | Selectable | Selectable* ¹⁰ |
| Power-on reset circuit | Operating | Operating | Operating | Operating* ¹¹ |
| Other peripheral modules | Selectable | Stop (Retained) | Operation prohibited | Stop (Undefined) |
| I/O Ports | Operating | Retained | Operating | Retained |

Note: Selectable means that operating or not operating can be selected by the control registers.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Operation prohibited means that the function must be stopped before entering Software Standby mode.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

All modules whose module-stop bits are 0 start as soon as PCLKs are supplied after entering Snooze mode. In order to avoid increase in power consumption in Snooze mode, module-stop bit of modules which are unnecessary in Snooze mode must be set to 1 before entering Software Standby mode.

Note 1. In IWDt-dedicated on-chip oscillator and IWDt, operating or stopping is selected by setting the IWDt Stop Control bit (IWDtSTPCTL) in Option Function Select register 0 (OFS0) in IWDt auto start mode. In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Power consumption can be reduced in Normal and Sleep modes by selecting an appropriate operating power control mode according to the operating frequency.

Note 2. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO).

Note 3. IIC0 wakeup interrupt is available.

Note 4. When using SCI0 in Snooze mode, MOSCCR.MOSTP and PLLCR.PLLSTP and PLL2CR.PLL2STP bits must be 1.

Note 5. Serial communication modes of SCI0 is only in asynchronous mode.

Note 6. Event lists the restrictions described in [section 10.10.12. ELC Events in Snooze Mode](#).

Note 7. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, the oscillator status is the same as before entering Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, the oscillator stops when the MCU enters Deep Software Standby mode.

Note 8. If the DPSBYCR.DEEPCUT[1:0] bits are 00b, data in the Standby SRAM is retained in Deep Software Standby mode. When the DPSBYCR.DEEPCUT[1:0] bits are not 00b, data in the Standby SRAM is undefined in Deep Software Standby mode.

Note 9. Only VCOU function is permitted. The VCOU pin operates when ACMPHS uses no digital filter. For details on digital filter, see [section 39, High-Speed Analog Comparator \(ACMPHS\)](#).

Note 10. When using LVD in Deep Software Standby mode, DPSBYCR.DEEPCUT[1:0] bits must be 00b or 01b before entering Deep Software Standby mode.

Note 11. When the MCU enters Deep Software Standby mode with the DPSBYCR.DEEPCUT[1:0] bits set to 11b, the LVD circuit stops and the low-power function of the power-on reset circuit is enabled.

Note 12. AGT0 operation is possible when 100b (AGTLCLK) is selected by the AGT0.AGTMR1.TCK[2:0] bits. AGT1 operation is possible when 100b (AGTLCLK) or 101 (Underflow event signal from AGT0) is selected by the AGT1.AGTMR1.TCK[2:0] bits.

Note 13. When using the Programmable Gain Amplifiers, MSTPD16 must be set to 0. For details, see [section 36.3.15. Programmable Gain Amplifier](#).

Note 14. Valid interrupt requests are any interrupt/exception that are not masked by the priority level of current exception and the priority level set by BASEPRI. In addition, if the interrupt request is based on IELSRn, the interrupt must be enabled by NVIC_ISERn.

Table 10.3 Interrupt Source for canceling Snooze, Software Standby and Deep Software Standby Modes (1 of 2)

| Interrupt source | Name | Software Standby Mode | Snooze Mode | Deep Software Standby Mode |
|------------------|----------------------------|-----------------------|-------------------|----------------------------|
| NMI | | Yes | Yes | Yes |
| Port | PORT_IRQn (n = 0 to 15) | Yes | Yes | Yes* ³ |
| LVD | LVD_LVD1 | Yes | Yes | Yes |
| | LVD_LVD2 | Yes | Yes | Yes |
| IWDt | IWDt_NMIUNDF | Yes | Yes | No |
| KINT | KEY_INTKR | Yes | Yes | No |
| AGT1 | AGT1_AGTI | Yes | Yes* ² | No |
| | AGT1_AGTCAI | Yes | Yes | No |
| | AGT1_AGTCMBI | Yes | Yes | No |

Table 10.3 Interrupt Source for canceling Snooze, Software Standby and Deep Software Standby Modes (2 of 2)

| Interrupt source | Name | Software Standby Mode | Snooze Mode | Deep Software Standby Mode |
|------------------|--------------|-----------------------|----------------------------------|----------------------------|
| IIC0 | IIC0_WU | Yes | Yes | No |
| SCI0 | SCI0_AM | No | Yes with SELSR0 ^{*1} | No |
| DTC | DTC_COMPLETE | No | Yes with SELSR0 ^{*1 *2} | No |
| DOC | DOC_DOPCI | No | Yes with SELSR0 ^{*1} | No |

Note 1. To use the interrupt request as a trigger for exiting the Snooze mode, the request must be selected in SELSR0. See [section 12, Interrupt Controller Unit \(ICU\)](#) for the setting of SELSR0. When a trigger selected in SELSR0 occurs after executing WFI instruction and during the transition from Normal mode to Software Standby mode, the request might or might not be accepted, depending on the timing of the occurrence.

Note 2. The event which is enabled by the SNZEDCR0 must not be used.

Note 3. IRQn-DS pin interrupt is available. IRQn pin interrupt is not available.

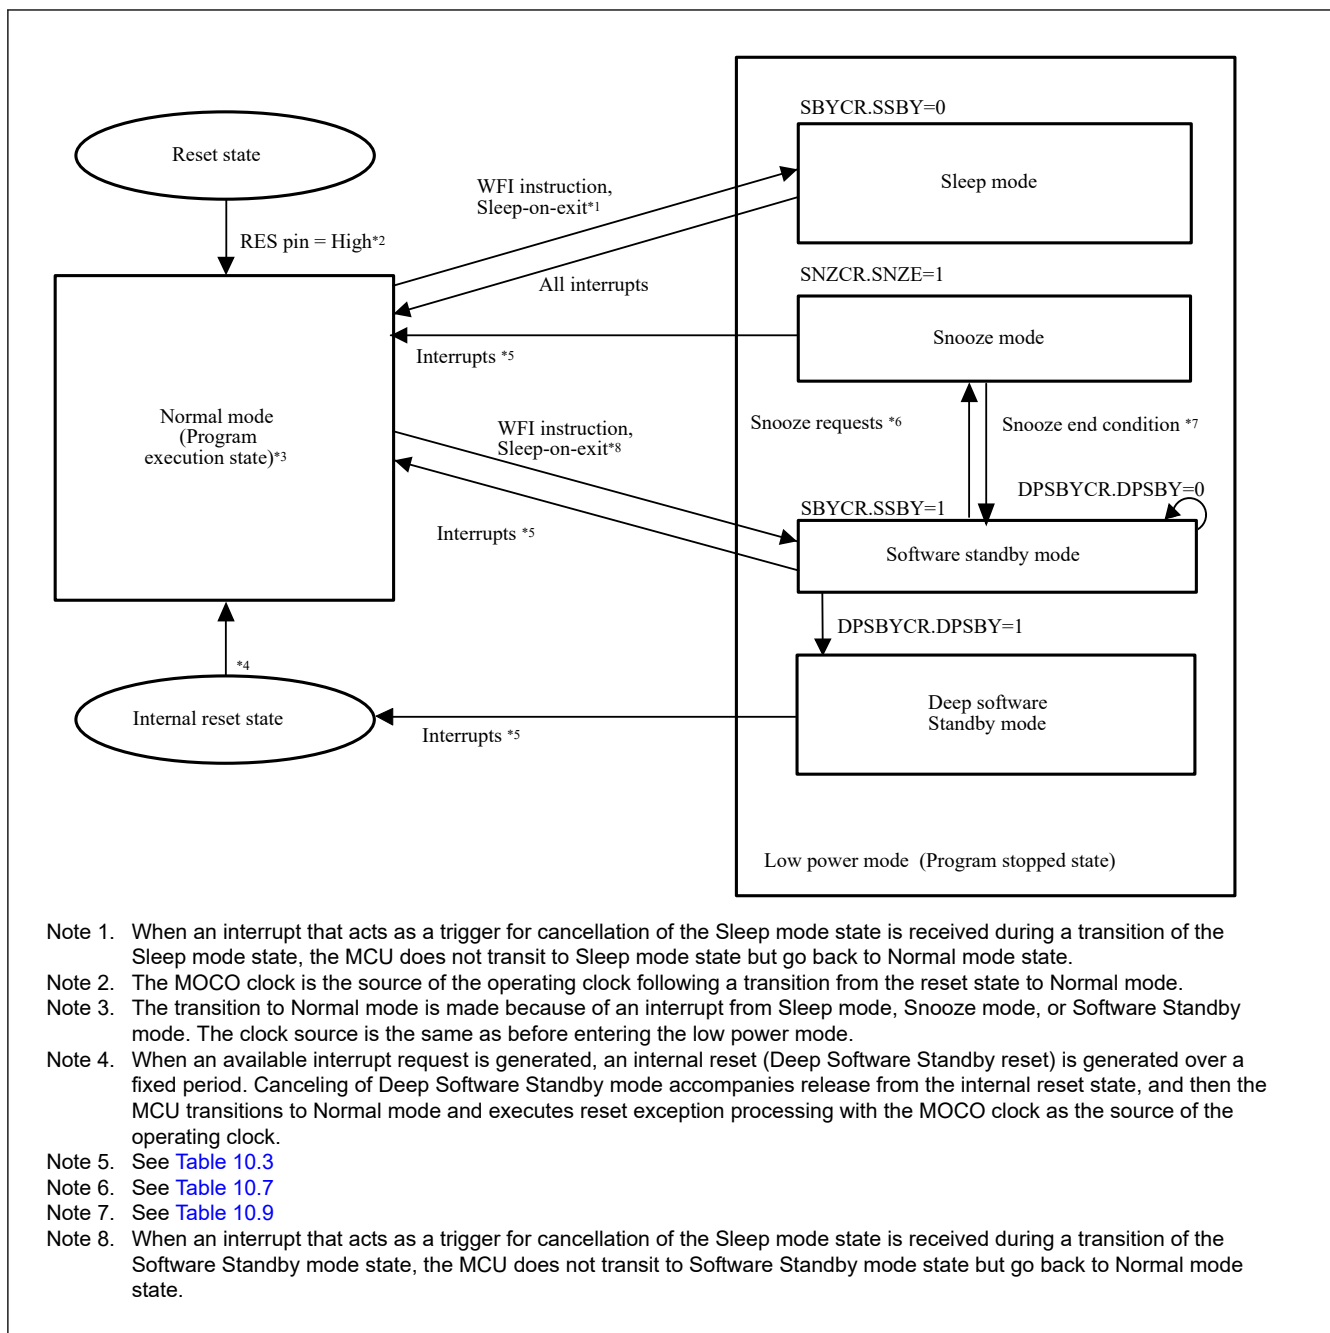

Figure 10.1 Mode Transitions

10.2 Register Descriptions

10.2.1 LPMSAR : Low Power Mode Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3C8

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---------|---------|----|----|----|---------|----|---------|----|---------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | NONSEC9 | NONSEC8 | — | — | — | NONSEC4 | — | NONSEC2 | — | NONSEC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|-----------------------|---------------------------------------------------------------------------------------------------------|-----|
| 0 | NONSEC0 ^{*1} | Non-secure Attribute bit 0 Target register: OPCCR 0: Secure 1: Non-secure | R/W |
| 1 | — | This bit is read as 1. The write value should be 1. | R/W |
| 2 | NONSEC2 | Non-secure Attribute bit 2 Target register: SBYCR 0: Secure 1: Non-secure | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | NONSEC4 | Non-secure Attribute bit 4 Target register: SNZCR, SNZEDCR0, SNZREQCR0 0: Secure 1: Non-secure | R/W |
| 7:5 | — | These bits are read as 1. The write value should be 1. | R/W |
| 8 | NONSEC8 | Non-secure Attribute bit 8 Target register: DPSBYCR 0: Secure 1: Non-secure | R/W |
| 9 | NONSEC9 | Non-secure Attribute bit 9 Target register: DPSWCR 0: Secure 1: Non-secure | R/W |
| 31:10 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. It is recommended that these bits are configured as Non-secure when the device life cycle is NSECSD (DLMMON.DLMMON[3:0] = 0011b). See [section 45.6.1. Restrictions on setting the security attribution](#) for details.

The LPMSAR register controls the secure attribute of Low Power Mode registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of OPCCR.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of SBYCR.

NONSEC4 bit (Non-secure Attribute bit 4)

This bit controls the security attribute of SNZCR, SNZEDCR0, SNZREQCR0

NONSEC8 bit (Non-secure Attribute bit 8)

This bit controls the security attribute of DPSBYCR.

NONSEC9 bit (Non-secure Attribute bit 9)

This bit controls the security attribute of DPSWCR.

10.2.2 DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3E0

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----------|----------|----------|----------|----------|---------|---------|---------|---------|---------|----------|---------|---------|----------|----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | DPFS A20 | — | — | DPFS A17 | DPFS A16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DPFS A15 | DPFS A14 | DPFS A13 | DPFS A12 | DPFS A11 | DPFS A10 | DPFS A9 | DPFS A8 | DPFS A7 | DPFS A6 | DPFS A5 | DPFS A4 | DPFS A3 | DPFS A2 | DPFS A1 | DPFS A0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | DPFSA0 to DPFSA7 | Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 0 to 7) 0: Secure 1: Non-secure | R/W |
| 15:8 | DPFSA8 to DPFSA15 | Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15) Target register: DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 8 to 15) 0: Secure 1: Non-secure | R/W |
| 16 | DPFSA16 | Deep Software Standby Interrupt Factor Security Attribute bit 16 Target register: DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 Target factor : LVD1 0: Secure 1: Non-secure | R/W |
| 17 | DPFSA17 | Deep Software Standby Interrupt Factor Security Attribute bit 17 Target register: DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1 Target factor : LVD2 0: Secure 1: Non-secure | R/W |
| 19:18 | — | These bits are read as 1. The write value should be 1. | R/W |
| 20 | DPFSA20 | Deep Software Standby Interrupt Factor Security Attribute bit 20 Target register: DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4 Target factor : NMI Pin 0: Secure 1: Non-secure | R/W |
| 31:21 | — | These bits are read as 1. The write value should be 1. | R/W |

The DPFSAR register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7))

This bit controls the security attribute of DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 0 to 7).

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15))

This bit controls the security attribute of DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 8 to 15)

DPFSA16 bit (Deep Software Standby Interrupt Factor Security Attribute bit 16)

This bit controls the security attribute of DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 .

Target factor is LVD1.

DPFSA17 bits (Deep Software Standby Interrupt Factor Security Attribute bit 17)

This bit controls the security attribute of DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1.

Target factor is LVD2.

DPFSA20 bit (Deep Software Standby Interrupt Factor Security Attribute bit 20)

This bit controls the security attribute of DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4.

Target factor is NMI Pin.

10.2.3 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x00C

| | | | | | | | | | | | | | | | | |
|--------------------|------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SSBY | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------|-----|
| 14:0 | — | These bits are read as reset value. The write value should be reset value | R/W |
| 15 | SSBY | Software Standby Mode Select 0: Sleep mode 1: Software Standby mode. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

SSBY bit (Software Standby Mode Select)

The SSBY bit specifies the transition destination after a WFI instruction is executed.

When the SSBY bit is set to 1, the MCU enters Software Standby mode after execution of a WFI instruction. When the MCU returns to Normal mode from Software Standby mode by an interrupt, the SSBY bit remains 1. The SSBY bit can be cleared by writing 0 to it.

While the OSTDCR.OSTDE bit is 1, setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

While the FENTRYR.FENTRYC bit is 1 setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

While the FENTRYR.FENTRYD bit is 1 setting of the SSBY bit is ignored. Even if SSBY bit is 1, the MCU enters Sleep mode on execution of a WFI instruction.

10.2.4 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4008_4000

Offset address: 0x000

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|---------|----------|----|----|----|----|----|---------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | MSTP A22 | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | MSTP A7 | — | — | — | — | — | — | MSTP A0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |

| Bit | Symbol | Function | R/W |
|-------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | MSTPA0 | SRAM0 Module Stop Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 6:1 | — | These bits are read as 1. The write value should be 1. | R/W |
| 7 | MSTPA7 | Standby SRAM Module Stop Target module: Standby SRAM 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 21:8 | — | These bits are read as 1. The write value should be 1. | R/W |
| 22 | MSTPA22 | DMA Controller/Data Transfer Controller Module Stop*1 Target module: DTC, DMAC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 31:23 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.

10.2.5 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4008_4000

Offset address: 0x004

| | | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------|-----|
| 7:0 | — | This bit is read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|-------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8 | MSTPB8 | I ² C Bus Interface 1 Module Stop* ¹ Target module: IIC1 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 9 | MSTPB9 | I ² C Bus Interface 0 Module Stop* ¹ Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 17:10 | — | These bits are read as 1. The write value should be 1. | R/W |
| 18 | MSTPB18 | Serial Peripheral Interface 1 Module Stop* ² Target module: SPI1 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 19 | MSTPB19 | Serial Peripheral Interface 0 Module Stop* ² Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 21:20 | — | These bits are read as 1. The write value should be 1. | R/W |
| 22 | MSTPB22 | Serial Communication Interface 9 Module Stop* ² Target module: SCI9 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 26:23 | — | These bits are read as 1. The write value should be 1. | R/W |
| 27 | MSTPB27 | Serial Communication Interface 4 Module Stop* ² Target module: SCI4 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 28 | MSTPB28 | Serial Communication Interface 3 Module Stop* ² Target module: SCI3 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 29 | MSTPB29 | Serial Communication Interface 2 Module Stop* ² Target module: SCI2 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 30 | MSTPB30 | Serial Communication Interface 1 Module Stop* ² Target module: SCI1 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 31 | MSTPB31 | Serial Communication Interface 0 Module Stop* ² Target module: SCI0 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The MSTPB_i bit should be written after the IICCLK is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of IICCLK following the change of MSTPB_i (i = 8, 9).

Note 2. The MSTPB_i bit should be written after the SCISPICLK is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of SCISPICLK following the change of MSTPB_i (i = 18, 19, 22, and 27 to 31).

10.2.6 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4008_4000

Offset address: 0x008

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----------|----|----|----|----|----|----------|----------|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | MSTP C31 | — | — | — | MSTP C27 | — | — | — | — | — | MSTP C21 | MSTP C20 | — | — | — | — |

| Bit | Symbol | Function | R/W |
|-------|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | MSTPC0 | Clock Frequency Accuracy Measurement Circuit Module Stop* ¹ Target module: CAC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 1 | MSTPC1 | Cyclic Redundancy Check Module Stop Target module: CRC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 12:2 | — | These bits are read as 1. The write value should be 1. | R/W |
| 13 | MSTPC13 | Data Operation Circuit Module Stop Target module: DOC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 14 | MSTPC14 | Event Link Controller Module Stop Target module: ELC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 19:15 | — | These bits are read as 1. The write value should be 1. | R/W |
| 20 | MSTPC20 | Trigonometric Function Unit Module Stop Target module: TFU 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 21 | MSTPC21 | IIR Filter Accelerator Module Stop Target module: IIRFA 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 26:22 | — | These bits are read as 1. The write value should be 1. | R/W |
| 27 | MSTPC27 | CANFD Module Stop* ² Target module: CANFD 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 30:28 | — | These bits are read as 1. The write value should be 1. | R/W |
| 31 | MSTPC31 | Secure Cryptographic Engine Module Stop Target module: SCE5 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

- Note 1. The MSTPC0 bit should be written after the CAC clock (CACMCLK/CACLCLK/CACMOCLK/CACHCLK/CACILCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CACMCLK/CACLCLK/CACMOCLK/CACHCLK/CACILCLK following the change of MSTPC0.
- Note 2. The MSTPC27 bit should be written after the CANFD clock (CANFDCLK) is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of CANFDCLK following the change of MSTPC27.

10.2.7 MSTPCRD : Module Stop Control Register D

| 14 | MSTPD14 | Port Output Enable for GPT Group A Module Stop Target module: POEGGA 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 15 | — | This bit is read as 1. The write value should be 1. | R/W |
| 16 | MSTPD16 | A/D Converter Module Stop Target module: ADC 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 18:17 | — | These bits are read as 1. The write value should be 1. | R/W |
| 19 | MSTPD19 | 12-bit D/A Converter 1 Module Stop Target module: DAC121 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |

| Bit | Symbol | Function | R/W |
|-------|---------|-------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 20 | MSTPD20 | 12-bit D/A Converter 0 Module Stop Target module: DAC120 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 21 | — | This bit is read as 1. The write value should be 1. | R/W |
| 22 | MSTPD22 | Temperature Sensor Module Stop Target module: TSN 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 24:23 | — | These bits are read as 1. The write value should be 1. | R/W |
| 25 | MSTPD25 | High-Speed Analog Comparator 3 Module Stop Target module: ACMPHS3 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 26 | MSTPD26 | High-Speed Analog Comparator 2 Module Stop Target module: ACMPHS2 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 27 | MSTPD27 | High-Speed Analog Comparator 1 Module Stop Target module: ACMPHS1 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 28 | MSTPD28 | High-Speed Analog Comparator 0 Module Stop Target module: ACMPHS0 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 31:29 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. When the count source is LOCO, AGT1 counting does not stop even if MSTPD2 is set to 1. If the count source is LOCO, this bit must be set to 1 except when accessing the AGT1 registers.

Note 2. When the count source is LOCO, AGT0 counting does not stop even if MSTPD3 is set to 1. If the count source is LOCO, this bit must be set to 1 except when accessing the AGT0 registers.

10.2.8 MSTPCRE : Module Stop Control Register E

Base address: MSTP = 0x4008_4000

Offset address: 0x010

| | | | | | | | | | | | | | | | | |
|--------------------|-------------|----|----|----|----|----|----|----|----|----|----|------------|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | MSTP E31 | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | MSTP E4 | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------|-----|
| 3:0 | — | These bits are read as 1. The write value should be 1. | R/W |

| Bit | Symbol | Function | R/W |
|------|---------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 4 | MSTPE4 | Key Interrupt Function Module Stop Target module: KINT 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |
| 30:5 | — | These bits are read as 1. The write value should be 1. | R/W |
| 31 | MSTPE31 | General PWM Timer and PWM Delay Generation Circuit Module Stop*1 Target module: GPT, PDG 0: Cancel the module-stop state 1: Enter the module-stop state | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. The MSTPE31 bit should be written after the GPTCLK is stable. To enter Software Standby mode, the WFI instruction should be executed after 2 or more cycles of GPTCLK following the change of MSTPE31.

10.2.9 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x0A0

| | | | | | | | | |
|---------------|---|---|---|-------------|---|---|-----------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | OPCM TSF | — | — | OPCM[1:0] | |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|-----------|------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | OPCM[1:0] | Operating Power Control Mode Select 0 0: High-speed mode 0 1: Setting prohibited 1 0: Setting prohibited 1 1: Low-speed mode | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | OPCMTSF | Operating Power Control Mode Transition Status Flag 0: Transition completed 1: During transition | R |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Sleep modes by specifying a lower operating frequency. For the procedure to change the operating power control modes, see [section 10.5. Function for Lower Operating Power Consumption](#).

When transitioning from Software Standby mode to Normal or Snooze mode, the settings in the OPCCR.OPCM[1:0] bits are as follows, regardless of their settings before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)

If Software Standby mode is canceled before the transition to Software Standby completes, the OPCCR.OPCM[1:0] bits retain their settings from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Sleep modes. [Table 10.4](#) shows the relationship between the operating power control modes and the OPCM[1:0] settings.

OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Table 10.4 Operating power control mode

| Operating power control mode | OPCM[1:0] bits | Power consumption |
|------------------------------|----------------|-------------------|
| High-speed mode | 00b | High |
| Low-speed mode | 11b | Low |

For details about the operating frequency range, see [section 46, Electrical Characteristics](#).

Each operating power control mode is described below.

- High-speed mode
After a reset cancellation, the MCU is activated in this mode.
- Low-speed mode
The following constraints apply in low-speed mode:
 - Programming and erasure operations for the flash memory are prohibited
 - Using the PLL or PLL2 is prohibited. See [section 10.10.1. Register Access](#)

In this mode, lower power consumption is possible than in High-speed mode when the same operation is performed under the same conditions, such as operating frequency.

10.2.10 SNZCR : Snooze Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x092

| | | | | | | | | |
|---------------|------|---|---|---|---|---|-----------|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SNZE | — | — | — | — | — | SNZD TCEN | RXDR EQEN |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|----------|--------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | RXDREQEN | RXD0 Snooze Request Enable 0: Ignore RXD0 falling edge in Software Standby mode 1: Detect RXD0 falling edge in Software Standby mode | R/W |
| 1 | SNZDTCEN | DTC Enable in Snooze mode 0: Disable DTC operation 1: Enable DTC operation | R/W |
| 6:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SNZE | Snooze mode Enable 0: Disable Snooze mode 1: Enable Snooze mode | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

RXDREQEN bit (RXD0 Snooze Request Enable)

The RXDREQEN bit specifies whether to detect a falling edge of the RXD0 pin in Software Standby mode. This bit can be used only when SCI0 is operating in asynchronous mode. To detect a falling edge of the RXD0 pin, set this bit before entering Software Standby mode. When this bit is set to 1, a falling edge of the RXD0 pin in Software Standby mode causes the MCU to enter Snooze mode.

SNZDTCEN bit (DTC Enable in Snooze mode)

The SNZDTCEN bit specifies whether to use the DTC and SRAM in Snooze mode. To use the DTC and SRAM in Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, the DTC can be activated by setting IELSRn register.

SNZE bit (Snooze mode Enable)

The SNZE bit specifies whether to enable a transition from Software Standby mode to Snooze mode. To use Snooze mode, set this bit to 1 before entering Software Standby mode. When this bit is set to 1, a trigger as shown in [Table 10.7](#) in Software Standby mode causes the MCU to enter Snooze mode. After the MCU transitions from Software Standby mode or Snooze mode to Normal mode, set 0 to the SNZE bit once then set it before re-entering Software Standby mode. For details, see [section 10.8. Snooze Mode](#).

10.2.11 SNZEDCR0 : Snooze End Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x094

| | | | | | | | | |
|--------------------|-----------|---|---|---|---|----------|---------|----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SCI0UMTED | — | — | — | — | DTCNZRED | DTCZRED | AGTUNFED |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------|---------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | AGTUNFED | AGT1 Underflow Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request | R/W |
| 1 | DTCZRED | Last DTC Transmission Completion Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request | R/W |
| 2 | DTCNZRED | Not Last DTC Transmission Completion Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request | R/W |
| 6:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SCI0UMTED | SCI0 Address Mismatch Snooze End Enable 0: Disable the snooze end request 1: Enable the snooze end request | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZEDCR0 register controls the condition of switching from Snooze mode to Software Standby mode. In order to use a trigger shown in [Table 10.8](#) as a condition to switch from Snooze mode to Software Standby mode, the corresponding bit in the SNZEDCR0 register must be set to 1.

The event that is used to return from snooze mode to normal mode as shown in [Table 10.3](#) must not be enabled in the SNZEDCR0 register.

AGTUNFED bit (AGT1 Underflow Snooze End Enable)

The AGTUNFED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an AGT1 underflow. For details on the trigger conditions, see [section 23, Low Power Asynchronous General Purpose Timer \(AGTW\)](#).

DTCZRED bit (Last DTC Transmission Completion Snooze End Enable)

The DTCZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of the last DTC transmission, that is, when CRA or CRB registers in the DTC is 0. For details on the trigger conditions, see [section 16, Data Transfer Controller \(DTC\)](#).

DTCNZRED bit (Not Last DTC Transmission Completion Snooze End Enable)

The DTCNZRED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on completion of each DTC transmission, that is, when CRA or CRB registers in the DTC is not 0. For details on the trigger conditions, see [section 16, Data Transfer Controller \(DTC\)](#).

SCI0UMTED bit (SCI0 Address Mismatch Snooze End Enable)

The SCI0UMTED bit specifies whether to enable a transition from Snooze mode to Software Standby mode on an SCI0 event when an address received in Software Standby mode does not match the expected data. For details on the trigger conditions, see [section 26, Serial Communications Interface \(SCI\)](#). Only set this bit to 1 when SCI0 operates in asynchronous mode.

10.2.12 SNZREQCR0 : Snooze Request Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x098

| | | | | | | | | | | | | | | | | |
|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|--------------------|-------------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Symbol | Function | R/W |
|-----|-----------|-------------------------------------------------------------------------------------------------|-----|
| 0 | SNZREQEN0 | Enable IRQ0 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 1 | SNZREQEN1 | Enable IRQ1 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 2 | SNZREQEN2 | Enable IRQ2 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 3 | SNZREQEN3 | Enable IRQ3 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 4 | SNZREQEN4 | Enable IRQ4 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 5 | SNZREQEN5 | Enable IRQ5 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |

| Bit | Symbol | Function | R/W |
|-------|------------|-------------------------------------------------------------------------------------------------------------|-----|
| 6 | SNZREQEN6 | Enable IRQ6 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 7 | SNZREQEN7 | Enable IRQ7 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 8 | SNZREQEN8 | Enable IRQ8 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 9 | SNZREQEN9 | Enable IRQ9 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 10 | SNZREQEN10 | Enable IRQ10 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 11 | SNZREQEN11 | Enable IRQ11 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 12 | SNZREQEN12 | Enable IRQ12 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 13 | SNZREQEN13 | Enable IRQ13 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 14 | SNZREQEN14 | Enable IRQ14 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 15 | SNZREQEN15 | Enable IRQ15 pin snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 16 | — | This bit is read as 0. The write value should be 0. | R/W |
| 17 | SNZREQEN17 | Enable Key Interrupt snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 27:18 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | SNZREQEN28 | Enable AGT1 underflow snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 29 | SNZREQEN29 | Enable AGT1 compare match A snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 30 | SNZREQEN30 | Enable AGT1 compare match B snooze request 0: Disable the snooze request 1: Enable the snooze request | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SNZREQCR0 register controls which trigger causes the MCU to switch from Software Standby mode to Snooze mode. If a trigger is selected as a request to cancel Software Standby mode by setting the WUPENn register, see [section 12, Interrupt Controller Unit \(ICU\)](#), the MCU enters Normal mode when the trigger is generated while the associated bit of the SNZREQCR0 is 1. The setting of the WUPENn register always has higher priority than the setting of the SNZREQCR0 register. For details, see [section 10.8. Snooze Mode](#) and [section 12, Interrupt Controller Unit \(ICU\)](#).

10.2.13 DPSBYCR : Deep Software Standby Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x400

| | | | | | | | | |
|--------------------|-----------|------------|---|---|---|---|--------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DPSB Y | IOKEE P | — | — | — | — | DEEPCUT[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | DEEPCUT[1:0] | Power-Supply Control 0 0: Power to the standby RAM and Low-speed on-chip oscillator is supplied in Deep Software Standby mode. 0 1: Power to the standby RAM and Low-speed on-chip oscillator is not supplied in Deep Software Standby mode. 1 0: Setting prohibited 1 1: Power to the standby RAM and Low-speed on-chip oscillator is not supplied in Deep Software Standby mode. In addition, LVD is disabled and the low power function in a power-on reset circuit is enabled. | R/W |
| 5:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | IOKEEP | I/O Port Retention 0: When the Deep Software Standby mode is canceled, the I/O ports are in the reset state. 1: When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode. | R/W |
| 7 | DPSBY | Deep Software Standby 0: Sleep mode (SBYCR.SSBY=0) / Software Standby mode (SBYCR.SSBY=1) 1: Sleep mode (SBYCR.SSBY=0) / Deep Software Standby mode (SBYCR.SSBY=1) | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

DEEPCUT[1:0] bit (Power-Supply Control)

The DEEPCUT[1:0] bits control the internal power supply to the standby RAM and Low-speed on-chip oscillator in Deep Software Standby mode. In addition, these bits control the state of LVD and power-on reset circuit in Deep Software Standby mode.

When an LVD interrupt is used in Deep Software Standby mode, the DEEPCUT[1:0] bits must be set to 00b or 01b.

For lower power consumption, set the DEEPCUT[1:0] bits to 11b so that the LVD is stopped and the low power consumption function of the power-on reset circuit is enabled.

Regardless of the DEEPCUT[1:0] bit setting, during Deep Software Standby mode, internal power supply to SRAM other than standby SRAM is stopped.

When a Deep Software Standby mode is used, set DPSWCR.WTSTS bits depending on the value of DEEPCUT[1] before entering Deep Software Standby mode.

IOKEEP bit (I/O Port Retention)

In Deep Software Standby mode, I/O ports keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports or not when the Deep Software Standby mode is canceled.

DPSBY bit (Deep Software Standby)

The DPSBY bit controls transitions to Deep Software Standby mode.

When the WFI instruction is executed while SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both 1, the MCU enters Deep Software Standby mode through Software Standby mode.

The DPSBY bit remains 1 when Deep Software Standby mode is canceled by certain pins which are sources of external pin interrupts (NMI, IRQn-DS (n = 0 to 15)) or a peripheral interrupt (voltage monitor 1, or voltage monitor 2). Write 0 to this bit to clear it.

The DPSBY bit setting is invalid when OFS0.IWDTSTPCTL bit is 0 (counting continues) regardless of the setting in OFS0.IWDTSTRT bit. In that case, even when SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

The setting of the DPSBY bit is invalid when voltage monitor 1 reset is enabled (LVD1CR0.RI = 1) or when a voltage monitor 2 reset is enabled (LVD2CR0.RI = 1). In this case, even when the SBYCR.SSBY bit is 1 and the DPSBY bit is 1, the transition after the execution of a WFI instruction is to Software Standby mode.

10.2.14 DPSWCR : Deep Software Standby Wait Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x401

| | | | | | | | | |
|--------------------|---|---|------------|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | WTSTS[5:0] | | | | | |
| Value after reset: | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 1 |

| Bit | Symbol | Function | R/W |
|-----|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 5:0 | WTSTS[5:0] | Deep Software Wait Standby Time Setting Bit 0x0E: Wait cycle for fast recovery 0x19: Wait cycle for slow recovery Others: Setting prohibited | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSWCR register sets the wait stabilization time when a Deep Software Standby mode is canceled by certain pins that are the sources of external pin interrupts or a peripheral interrupt.

During a wait stabilization period set in this register, a Deep Software Standby reset occurs, and the MCU is initialized.

The DPSWCR register is not initialized with the internal reset signal by the cancellation of the Deep Software Standby mode. For details, see [section 5, Resets](#).

When a Deep Software Standby mode is used, set DPSWCR.WTSTS bits according to the value of DPSBYCR.DEEPCUT[1] before entering Deep Software Standby mode.

When DPSBYCR.DEEPCUT[1]=0, you can set DPSWCR.WTSTS to the wait cycle for fast recovery.

When DPSBYCR.DEEPCUT[1]=1, you must set DPSWCR.WTSTS to the wait cycle for slow recovery.

10.2.15 DPSIER0 : Deep Software Standby Interrupt Enable Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x402

| | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ7 E | DIRQ6 E | DIRQ5 E | DIRQ4 E | DIRQ3 E | DIRQ2 E | DIRQ1 E | DIRQ0 E |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ0E | IRQ0-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 1 | DIRQ1E | IRQ1-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 2 | DIRQ2E | IRQ2-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 3 | DIRQ3E | IRQ3-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 4 | DIRQ4E | IRQ4-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 5 | DIRQ5E | IRQ5-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 6 | DIRQ6E | IRQ6-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 7 | DIRQ7E | IRQ7-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER0 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER0 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR0 being set to 1. Therefore, DPSIFR0 should be cleared to 0 before entering Deep Software Standby mode.

10.2.16 DPSIER1 : Deep Software Standby Interrupt Enable Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x403

| | | | | | | | | |
|--------------------|-------------|-------------|-------------|-------------|-------------|-------------|------------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ1 5E | DIRQ1 4E | DIRQ1 3E | DIRQ1 2E | DIRQ1 1E | DIRQ1 0E | DIRQ9 E | DIRQ8 E |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ8E | IRQ8-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 1 | DIRQ9E | IRQ9-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 2 | DIRQ10E | IRQ10-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 3 | DIRQ11E | IRQ11-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 4 | DIRQ12E | IRQ12-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 5 | DIRQ13E | IRQ13-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 6 | DIRQ14E | IRQ14-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 7 | DIRQ15E | IRQ15-DS Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER1 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER1 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR1 being set to 1. Therefore, DPSIFR1 should be cleared to 0 before entering Deep Software Standby mode.

10.2.17 DPSIER2 : Deep Software Standby Interrupt Enable Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x404

| | | | | | | | | |
|---------------|---|---|---|-----------|---|---|-------------|-------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | DNMI E | — | — | DLVD2 IE | DLVD1 IE |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DLVD1IE | LVD1 Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 1 | DLVD2IE | LVD2 Deep Software Standby Cancel Signal Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------|-------------------|
| 4 | DNMIE | NMI Pin Enable 0: Cancelling Deep Software Standby mode is disabled 1: Cancelling Deep Software Standby mode is enabled | R/W ^{*1} |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. 1 can be written only once. Once 1 is written to this bit, subsequent write accesses are disabled.

DPSIER2 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

After the setting of DPSIER2 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR2 being set to 1. Therefore, DPSIFR2 should be cleared to 0 before entering Deep Software Standby mode.

10.2.18 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x406

| | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ7 F | DIRQ6 F | DIRQ5 F | DIRQ4 F | DIRQ3 F | DIRQ2 F | DIRQ1 F | DIRQ0 F |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ0F | IRQ0-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 1 | DIRQ1F | IRQ1-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 2 | DIRQ2F | IRQ2-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 3 | DIRQ3F | IRQ3-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 4 | DIRQ4F | IRQ4-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 5 | DIRQ5F | IRQ5-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 6 | DIRQ6F | IRQ6-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 7 | DIRQ7F | IRQ7-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0. For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.19 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x407

| | | | | | | | | |
|--------------------|-------------|-------------|-------------|-------------|-------------|-------------|------------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ1 5F | DIRQ1 4F | DIRQ1 3F | DIRQ1 2F | DIRQ1 1F | DIRQ1 0F | DIRQ9 F | DIRQ8 F |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|--------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ8F | IRQ8-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 1 | DIRQ9F | IRQ9-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 2 | DIRQ10F | IRQ10-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 3 | DIRQ11F | IRQ11-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 4 | DIRQ12F | IRQ12-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 5 | DIRQ13F | IRQ13-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 6 | DIRQ14F | IRQ14-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 7 | DIRQ15F | IRQ15-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 8 to 15)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR1 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.20 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x408

| | | | | | | | | |
|---------------|---|---|---|-------|---|---|----------|----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | DNMIF | — | — | DLVD2 IF | DLVD1 IF |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|---------|---------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DLVD1IF | LVD1 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 1 | DLVD2IF | LVD2 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | DNMIF | NMI Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Writing 0 clears the flag. Writing 1 is ignored.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Each flag is set to 1 when a cancel request specified by DPSIEGR2 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER2 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR2 is cleared to 0x00.

To clear DPSIFR2 to 0x00 after modifying DPSIER2, wait for at least 6 PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2.

DPSIFR2 is not initialized by the internal reset signal used as Deep Software Standby mode Cancelling source. For details, see [section 5, Resets](#).

DLVDmIF flag (LVDm Deep Software Standby Cancel Flag) (m = 1 to 2)

The DLVDmIF flag indicates that a cancel request by the voltage monitor m signal has been generated.

[Setting condition]

A cancel request is generated by the voltage monitor m signal that is selected in DPSIEGR2.

[Clearing condition]

Writing 0 to each flag after 1 is read.

DNMIF flag (NMI Pin Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the NMI pin has been generated.

[Setting condition]

A cancel request by the NMI pin specified by DPSIEGR2 is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.21 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0x40A

| | | | | | | | | |
|--------------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ7 EG | DIRQ6 EG | DIRQ5 EG | DIRQ4 EG | DIRQ3 EG | DIRQ2 EG | DIRQ1 EG | DIRQ0 EG |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ0EG | IRQ0-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 1 | DIRQ1EG | IRQ1-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 2 | DIRQ2EG | IRQ2-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 3 | DIRQ3EG | IRQ3-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 4 | DIRQ4EG | IRQ4-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 5 | DIRQ5EG | IRQ5-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 6 | DIRQ6EG | IRQ6-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7 | DIRQ7EG | IRQ7-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR0 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.22 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1

Base address: SYSC = 0x4001_E000

Offset address: 0x40B

| | | | | | | | | |
|--------------------|----------|----------|----------|----------|----------|----------|---------|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DIRQ15EG | DIRQ14EG | DIRQ13EG | DIRQ12EG | DIRQ11EG | DIRQ10EG | DIRQ9EG | DIRQ8EG |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|----------|---------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DIRQ8EG | IRQ8-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 1 | DIRQ9EG | IRQ9-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 2 | DIRQ10EG | IRQ10-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 3 | DIRQ11EG | IRQ11-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 4 | DIRQ12EG | IRQ12-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 5 | DIRQ13EG | IRQ13-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 6 | DIRQ14EG | IRQ14-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |
| 7 | DIRQ15EG | IRQ15-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR1 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.23 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0x40C

| | | | | | | | | |
|--------------------|---|---|---|------------|---|---|-------------|-------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | DNMI EG | — | — | DLVD2 EG | DLVD1 EG |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DLVD1EG | LVD1 Edge Select 0: A cancel request is generated when $V_{CC} < V_{det1}$ (fall) is detected 1: A cancel request is generated when $V_{CC} \geq V_{det1}$ (rise) is detected | R/W |
| 1 | DLVD2EG | LVD2 Edge Select 0: A cancel request is generated when $V_{CC} < V_{det2}$ (fall) is detected 1: A cancel request is generated when $V_{CC} \geq V_{det2}$ (rise) is detected | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | DNMIEG | NMI Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR2 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see [section 5, Resets](#).

10.2.24 SYOCDCCR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000

Offset address: 0x040E

| | | | | | | | | |
|--------------------|-----------|---|---|---|---|---|---|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DBG EN | — | — | — | — | — | — | DOCD F |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | x |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------|------------------|
| 0 | DOCDF | Deep Software Standby OCD flag 0: DBIRQ is not generated 1: DBIRQ is generated | R/W ¹ |
| 6:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | DBGEN | Debugger Enable bit Set to 1 first in on-chip debug mode. 0: On-chip debugger is disabled 1: On-chip debugger is enabled | R/W |

Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

Note 1. Writing 0 clears the flag. Writing 1 is ignored

This register is not controlled by any security attribute register (e.g. LPMSAR, DPFSAR).

SYOCDCCR can be written when DBGSTR.CDBGPWRUPREQ = 1 (the debugger is connected).

SYOCDCCR is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode.

DOCDF flag (Deep Software Standby OCD flag)

DOCDF flag indicates that a cancel request of Deep Software Standby mode by the MCUCTRL.DBIRQ bit has been generated. DOCDF flag is set to 1 when a cancel request is generated. This flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode). Therefore, a transition to Deep Software Standby mode must be made after DOCDF flag is cleared to 0.

[Setting condition]

- A cancel request by the MCUCTRL.DBIRQ is generated

[Clearing condition]

- Writing 0 to the flag after reading the bit as 1
- When DBGEN bit is 0

DBGEN bit (Debugger Enable bit)

The DBGEN bit enables the on-chip debug mode. This bit must be set to 1 first in the on-chip debugger mode.

[Setting condition]

- Writing 1 to the bit when the debugger is connected.

[Clearing condition]

- Power-on reset is generated
- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see [section 2.13.2. Restrictions on Connecting an OCD emulator](#).

10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR register is set.

For information on module and clock associations, see [section 8.2.2. SCKDIVCR : System Clock Division Control Register](#).

10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit ($m = A$ to E , $i = 31$ to 0) in MSTPCRn ($n = A$ to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

When the PLL is selected as the clock source, MSTPmi bits must be changed only one bit at a time. In this case, wait at least 250 ns after changing each MSTPmi bit before starting subsequent processing if you change any of the following bits:

MSTPD16 (ADC), MSTPC31 (SCE5).

The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode, Sleep mode, and Snooze mode.

10.5.1 Setting Operating Power Control Mode

Ensure the operating condition such as the frequency range is always within the specified range before and after switching the operating power control modes.

This section provides example procedures for switching operating power control modes.

Table 10.5 Available oscillators in each mode

| Mode | Oscillator | | | | | |
|------------|------------|-------------------------------|---------------------------------|------------------------------|-----------------------|-----------------------------------|
| | PLL, PLL2 | High-speed on-chip oscillator | Middle-speed on-chip oscillator | Low-speed on-chip oscillator | Main clock oscillator | IWDT-dedicated on-chip oscillator |
| High-speed | Available | Available | Available | Available | Available | Available |
| Low-speed | N/A | Available | Available | Available | Available | Available |

(1) Switching from a higher power mode to a lower power mode

Example 1: From High-speed mode to Low-speed mode:

(Operation begins in High-speed mode)

1. Change the oscillator to what is used in Low-speed mode. Set the frequency of each clock lower than or equal to the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that OPCCR.OPCMTSF flag is 0 (indicates transition completed).

(Operation is now in Low-speed mode)

(2) Switching from a lower power mode to a higher power mode

Example 1: From Low-speed mode to High-speed mode

(Operation begins in Low-speed mode)

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any required oscillator in High-speed mode.
5. Set the frequency of each clock lower than or equal to the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

10.6 Sleep Mode

10.6.1 Transitioning to Sleep Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 0, the MCU enters Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in Sleep mode cause the MCU to cancel Sleep mode. All interrupt sources are available. If using an interrupt to cancel Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

Counting by IWDT stops when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Sleep mode, Software Standby mode, or Snooze mode).

Counting by IWDT continues when the MCU enters Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Sleep mode, Software Standby mode, or Snooze mode).

Counting by WDT stops when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in Sleep mode). Similarly, counting by WDT stops when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSLTPR.SLCSTP bit is 1 (WDT stops in Sleep mode).

Counting by WDT continues when the MCU enters Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in Sleep mode). Similarly, counting by WDT continues when the MCU enters Sleep mode while the WDT is in register start mode and the WDTCSNPR.SLCSTP bit is 0 (WDT does not stop in Sleep mode).

10.6.2 Canceling Sleep Mode

Sleep mode is canceled by:

- An interrupt
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- An SRAM parity error reset
- An SRAM ECC error reset
- A bus master MPU error reset
- A TrustZone error reset
- A reset caused by an IWDTC or a WDT underflow

The operations are as follows:

1. Canceling by an interrupt
When an interrupt request is generated, Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset
When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in [section 46, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDTC reset
 - Sleep mode is canceled by an internal reset generated by an IWDTC underflow and the MCU starts the reset exception handling. However, IWDTC stops in Sleep mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
 - OFS0.IWDTCSTRT = 0 and OFS0.IWDTCSTPCTL = 1.
4. Canceling by WDT reset
Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in Sleep mode even when counting in Normal mode and an internal reset for canceling Sleep mode is not generated in the following conditions:
 - OFS0.WDTCSTRT = 0 (auto start mode) and OFS0.WDTCSTPCTL = 1
 - OFS0.WDTCSTRT = 1 (register start mode) and WDTCSNPR.SLCSTP = 1.
5. Canceling by other resets available in Sleep mode
Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see [section 12, Interrupt Controller Unit \(ICU\)](#).

10.7 Software Standby Mode

10.7.1 Transitioning to Software Standby Mode

When a WFI instruction is executed while SBYCR.SSBY bit is 1 and DPSBYCR.DPSBY bit is 0, the MCU enters Software Standby mode. In this mode, the CPU, most of the on-chip peripheral functions and the oscillators stop. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained. Software Standby mode allows significant reduction in power consumption because most of the oscillators stop in this mode. [Table 10.2](#) shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to cancel Software Standby mode. See [Table 10.3](#) for available interrupt sources and [section 12.2.17. WUPEN0 : Wake Up Interrupt Enable Register 0](#) for information on waking up the MCU from

Software Standby mode. If using an interrupt to cancel an interrupt, you must set the associated IELSRn register before executing a WFI instruction. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction except when using DTC in Snooze mode. If DTC is required in Snooze mode, set DTCST.DTCST bit to 1 before executing a WFI instruction.

Counting by the IWDG stops if the MCU enters Software Standby mode while the IWDG is in auto start mode and the OFS0.IWDGSTOPCTL bit is 1 (IWDG stops in Sleep, Software Standby or Snooze mode).

Counting by the IWDG continues if the MCU enters Software Standby mode while the IWDG is in auto start mode and the OFS0.IWDGSTOPCTL bit is 0 (IWDG does not stop in Sleep, Software Standby or Snooze mode).

WDG stops counting when the MCU enters Software Standby mode because the PCLKB stops.

Do not enter Software Standby mode while OSTDCR.OSTDE = 1 (oscillation stop detection function is enabled). To enter Software Standby mode, execute a WFI instruction after disabling the oscillation stop detection function (OSTDCR.OSTDE = 0). In case of executing WFI instruction while OSTDCR.OSTDE = 1, the MCU enters Sleep mode even if SBYCR.SSBY = 1.

Do not enter Software Standby mode while the flash memory is programming or erasing. To enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

When the PLL is selected as the clock source, set the following modules to the module-stop state before executing a WFI instruction:

ADC, SCE5.

In this case, wait for least 750 ns and if the ICLK frequency before executing the WFI instruction exceeds 120 MHz, it is necessary to set the ICLK frequency division ratio to 1/2 and wait 5 μ s. The recommended method to measure the wait time is through software. Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

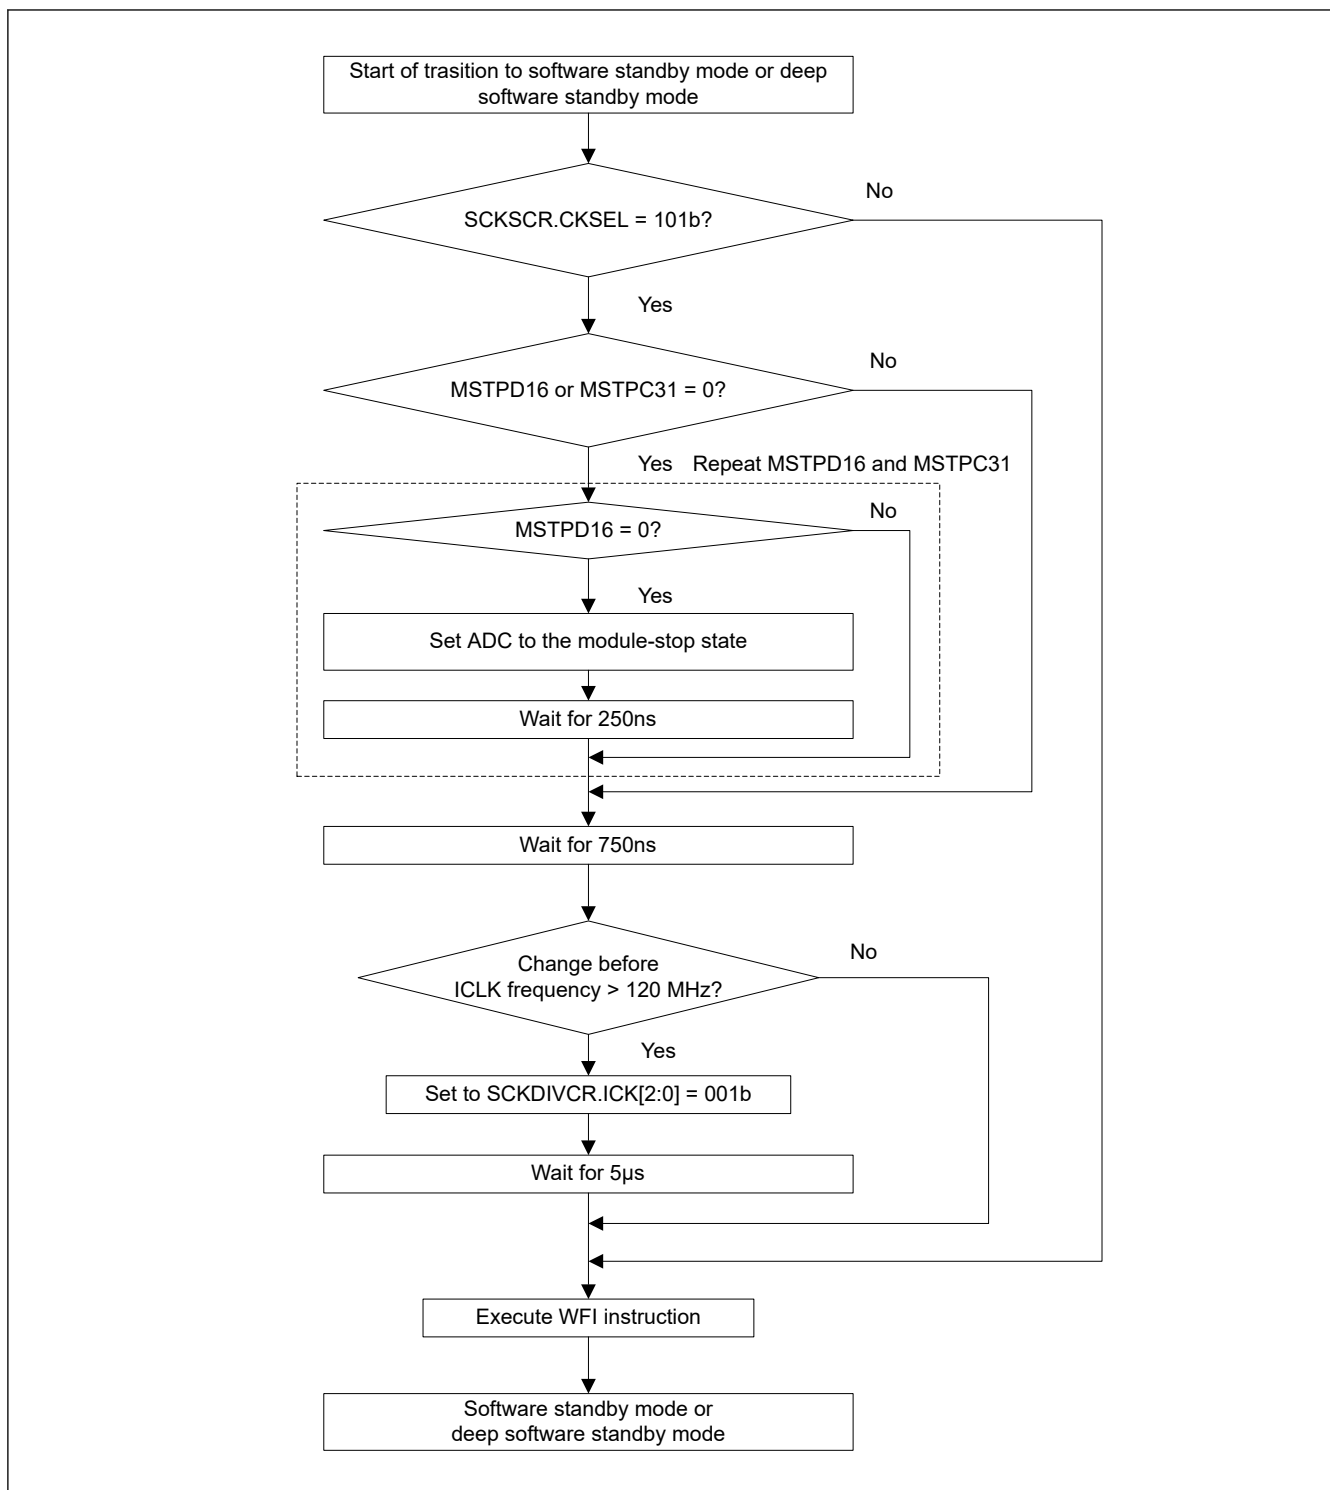

Figure 10.2 Example flow for transition to software standby mode or Deep Software Standby mode

Table 10.6 shows the setting of the related control bits and the modes to enter after executing WFI instruction.

Table 10.6 Bit settings that affect modes when executing a WFI instruction (1 of 2)

| | | SBYCR.SSBY and PSBYCR.DPSBY bit settings | | | |
|--------------|---|------------------------------------------|------------------------|------------------------|------------------------|
| | | SSBY = 0, DPSBY = 0 | SSBY = 0, DPSBY = 1 | SSBY = 1, DPSBY = 0 | SSBY = 1, DPSBY = 1 |
| OSTDCR.OSTDE | 0 | Sleep | Sleep | Software Standby | Deep Software Standby |
| | 1 | | | Sleep | Sleep |

Table 10.6 Bit settings that affect modes when executing a WFI instruction (2 of 2)

| | | SBYCR.SSBY and PSBYCR.DPSBY bit settings | | | |
|------------------------------------|---|------------------------------------------|------------------------|------------------------|------------------------|
| | | SSBY = 0, DPSBY = 0 | SSBY = 0, DPSBY = 1 | SSBY = 1, DPSBY = 0 | SSBY = 1, DPSBY = 1 |
| FENTRYR.FENTRYC FENTRYR.FENTRYD | 0 | Sleep | Sleep | Software Standby | Deep Software Standby |
| | 1 | | | Sleep | Sleep |
| OFS0.IWDTSTPCTL | 0 | Sleep | Sleep | Software Standby | Software Standby |
| | 1 | | | | Deep Software Standby |
| LVD1CR0.RI | 0 | Sleep | Sleep | Software Standby | Deep Software Standby |
| | 1 | | | | Software Standby |
| LVD2CR0.RI | 0 | Sleep | Sleep | Software Standby | Deep Software Standby |
| | 1 | | | | Software Standby |

10.7.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in [Table 10.3](#)
- A RES pin reset
- A power-on reset
- A voltage monitor reset
- A reset caused by an IWDG underflow.

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See [section 12.2.17. WUPEN0 : Wake Up Interrupt Enable Register 0](#) for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt

When an available interrupt request (see [Table 10.3](#)) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.

When the PLL is selected as the clock source, you must insert a wait time of at least 250 ns at the beginning of the interrupt handling. The recommended method to measure the wait time is through software.

Be sure to consider the worst-case conditions to ensure that the required wait time elapses.

Figure 10.3 Example flow for canceling software standby mode

2. Canceling by a RES pin reset
When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in [section 46, Electrical Characteristics](#). When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset
Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
4. Canceling by a voltage monitor reset
Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.
5. Canceling by IWDG reset
Software Standby mode is canceled by an internal reset generated by an IWDG underflow and the MCU starts the reset exception handling. However, IWDG stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:
 - OFS0.IWDGSTRT = 0 and OFS0.IWDGSTPCTL = 1.

10.7.3 Example of Software Standby Mode Application

Figure 10.4 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge) in Normal mode, and the IRQCRi.IRQMD[1:0] bits are set to 01b (rising edge). After that, the SBYCR.SSBY bit is set to 1 and a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#). The oscillation stabilization time in [Figure 10.4](#) is specified in [section 46, Electrical Characteristics](#).

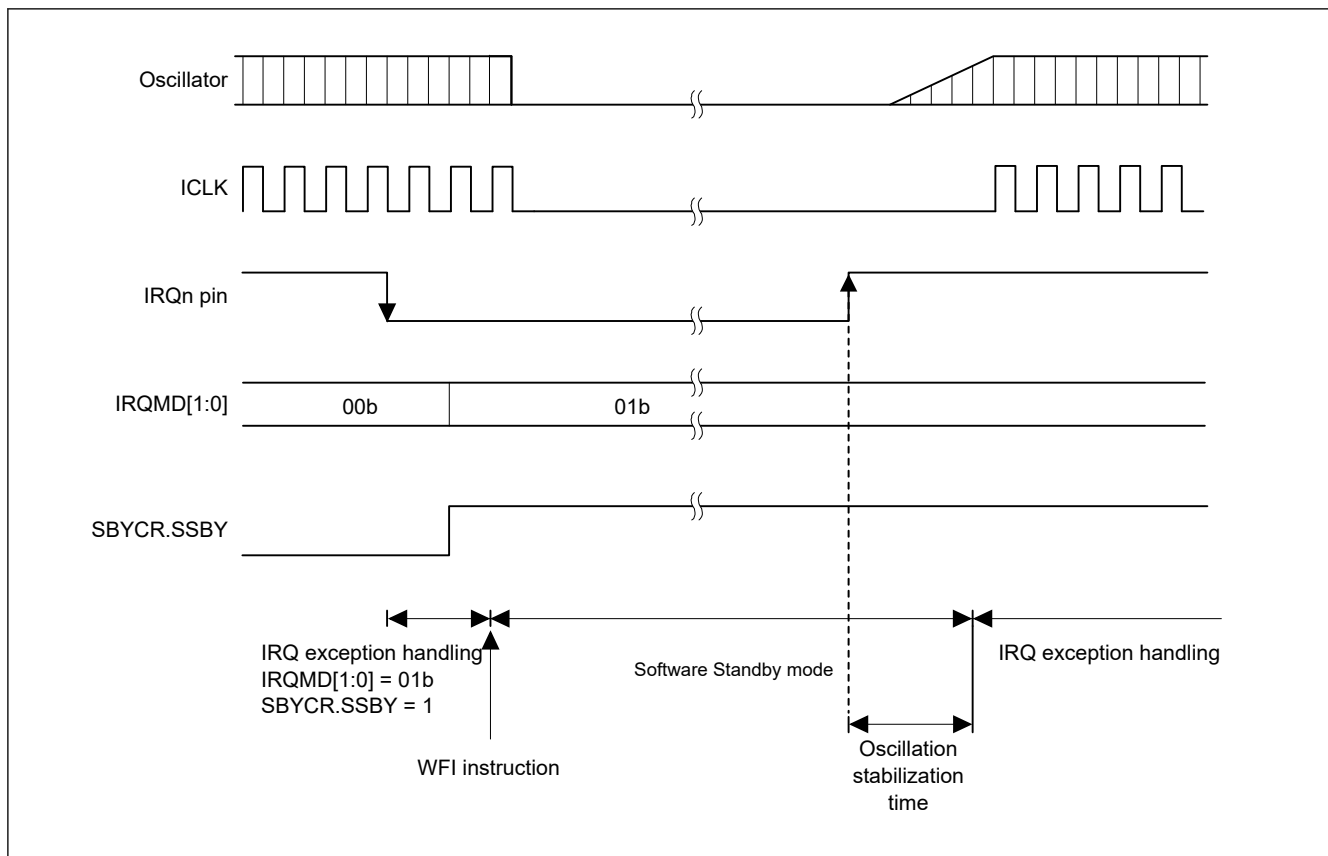

Figure 10.4 Example of Software Standby mode application

10.8 Snooze Mode

10.8.1 Transition to Snooze Mode

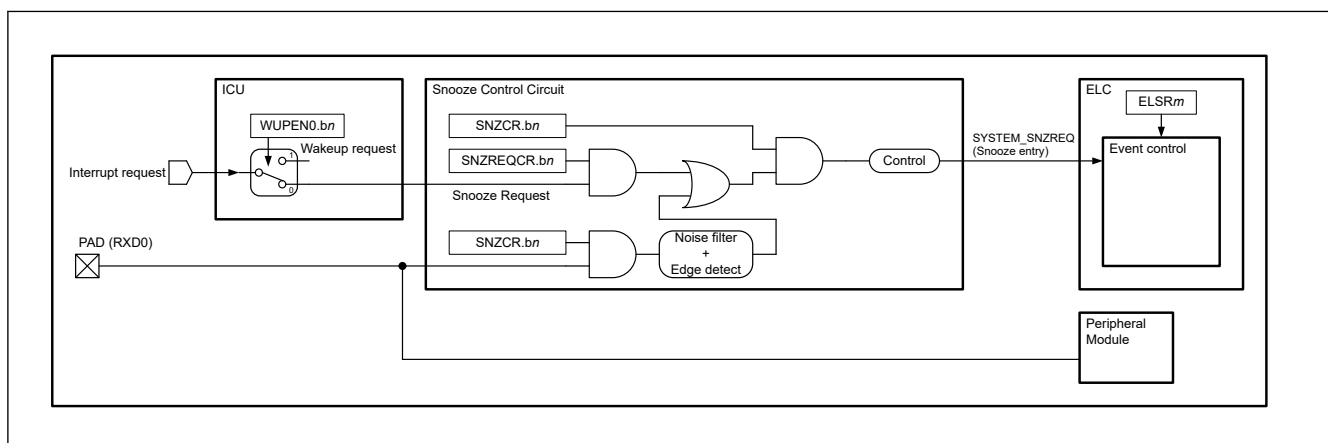

Figure 10.5 Snooze mode entry configuration

When the snooze control circuit accepts an available snooze request in Software Standby mode, the MCU transfers to Snooze mode. In this mode, some peripheral modules operate without waking the CPU. The peripheral modules that can

operate in Snooze mode are shown in [Table 10.2](#). Also, DTC operation in Snooze mode can be selected by the setting of SNZCR.SNZDTCEN bit.

[Table 10.7](#) shows the Snooze requests that switch the MCU from Software Standby mode to Snooze mode. To use the listed Snooze requests as a trigger to switch to Snooze mode, the corresponding SNZREQENn bit of the SNZREQCR0 register or RXDREQEN bit of SNZCR register must be set before entering Software Standby mode.

Table 10.7 Available snooze requests to switch to Snooze mode

| Snooze request | Control Register | |
|-------------------------|------------------|-------------------------|
| | Register | Bit*1 |
| PORT_IRQn (n = 0 to 15) | SNZREQCR0 | SNZREQENn (n = 0 to 15) |
| KEY_INTKR | SNZREQCR0 | SNZREQEN17 |
| AGT1_AGTI | SNZREQCR0 | SNZREQEN28 |
| AGT1_AGTCAI | SNZREQCR0 | SNZREQEN29 |
| AGT1_AGTICMBI | SNZREQCR0 | SNZREQEN30 |
| RXD0 falling edge | SNZCR | RXDREQEN*2 |

Note 1. Do not enable multiple snooze requests at the same time.

Note 2. Do not set the RXDREQEN bit to 1 except in asynchronous mode.

Clear the DMAST.DMST and DTCST.DTCST bits to 0 before executing a WFI instruction, except when using the DTC in Snooze mode. If the DTC is required in Snooze mode, set the DTCST.DTCST bit to 1 before executing a WFI instruction.

10.8.2 Canceling Snooze Mode

Snooze mode is canceled by an interrupt request that is available in Software Standby mode or a reset. [Table 10.3](#) shows the requests that can be used to exit each mode. After canceling the Snooze mode, the MCU enters Normal mode and proceeds with exception processing for the given interrupt or reset. The action triggered by the interrupt requests, selected in SELSR0, cancels Snooze mode. Interrupt canceling Snooze mode must be selected in IELSRn to link to the NVIC for the corresponding interrupt handling. See [section 12, Interrupt Controller Unit \(ICU\)](#) for information on SELSR0 and IELSRn registers.

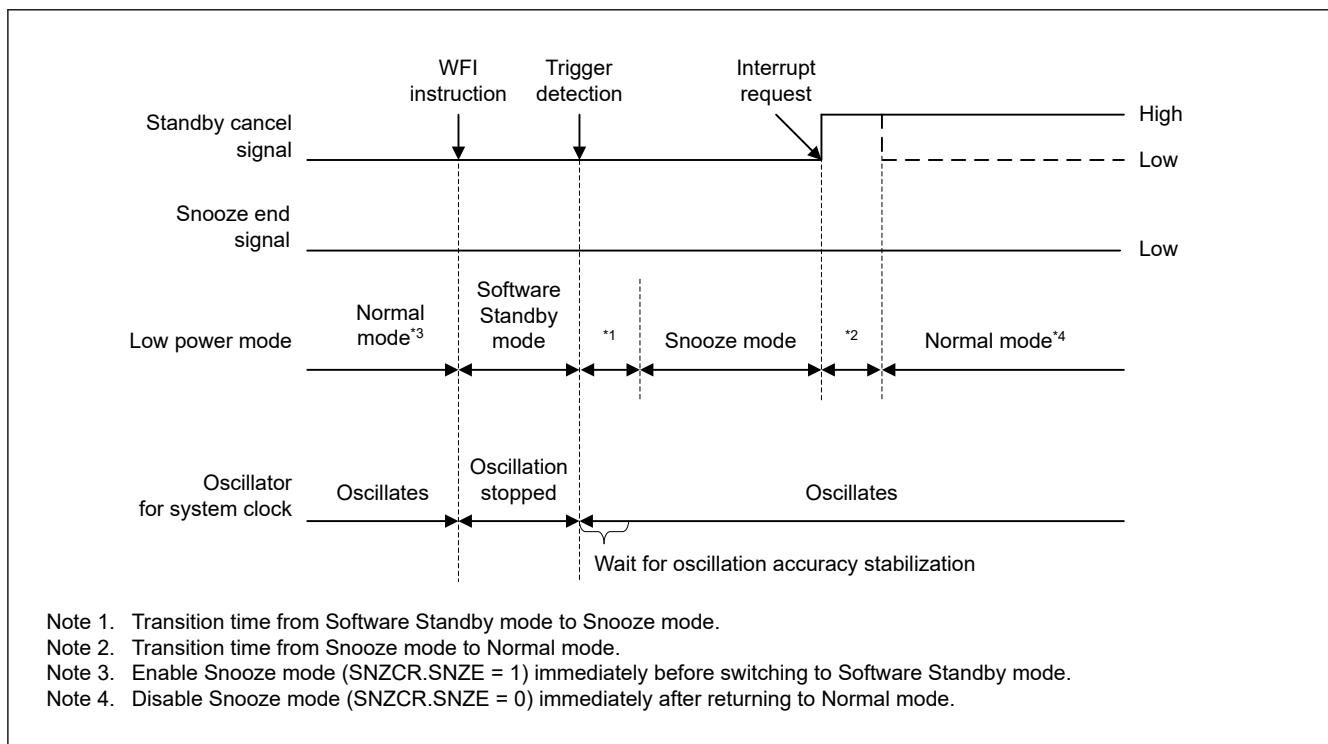

Figure 10.6 Canceling of Snooze mode when an interrupt request signal is generated

10.8.3 Returning from Snooze Mode to Software Standby Mode

Table 10.8 shows the snooze end request that can be used as triggers to return to Software Standby mode. The snooze end requests are available only in Snooze mode. If the requests are generated when the MCU is not in Snooze mode, they are ignored. When multiple requests are selected, each of the requests invokes transition to Software Standby mode from Snooze mode.

Table 10.9 shows the snooze end conditions that consist of the snooze end requests and the conditions of the peripheral modules. The SCI0 and DTC modules can keep the MCU in Snooze mode until they complete the operation. However, an AGTn (n = 1) underflow as a trigger to return to Software Standby mode cancels Snooze mode without waiting for the completion of SCI0 operation.

Figure 10.7 shows the timing diagram for the transition from Snooze mode to Software Standby mode. This mode transition occurs according to which snooze end requests are set in the SNZEDCR0 register. A snooze request is cleared automatically after returning to Software Standby mode.

Table 10.8 Available snooze end requests (triggers to return to Software Standby mode)

| Peripheral Module | Snooze end request | Enable/Disable Control | |
|-------------------|-----------------------------------------------------|------------------------|-----------|
| | | Register | Bit |
| AGT1 | AGT1 underflow (AGT1_AGTI) | SNZEDCR0 | AGTUNFED |
| DTC | Last DTC transmission completion (DTC_COMPLETE) | SNZEDCR0 | DTCZRED |
| DTC | Not Last DTC Transmission Completion (DTC_TRANSFER) | SNZEDCR0 | DTCNZRED |
| SCI0 | SCI0 address mismatch (SCI0_DCUF) | SNZEDCR0 | SCI0UMTED |

Table 10.9 Snooze end conditions

| Operating module when a snooze end request occurs | Snooze end request | |
|---------------------------------------------------|---------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| | AGT1 underflow | Other than AGT1 underflow |
| DTC | The MCU transitions to the Software Standby mode after DTC complete operation. | The MCU transitions to the Software Standby mode after DTC and SCI0 complete the operation. |
| SCI0 | The MCU transitions to the Software Standby mode immediately after the snooze end request is generated. | |
| Other than specified | The MCU transitions to the Software Standby mode immediately after a snooze end request is generated. | |

Note: If the DTC is used to activate the SCI, the MCU transitions to Software Standby mode immediately after a snooze end request is generated.

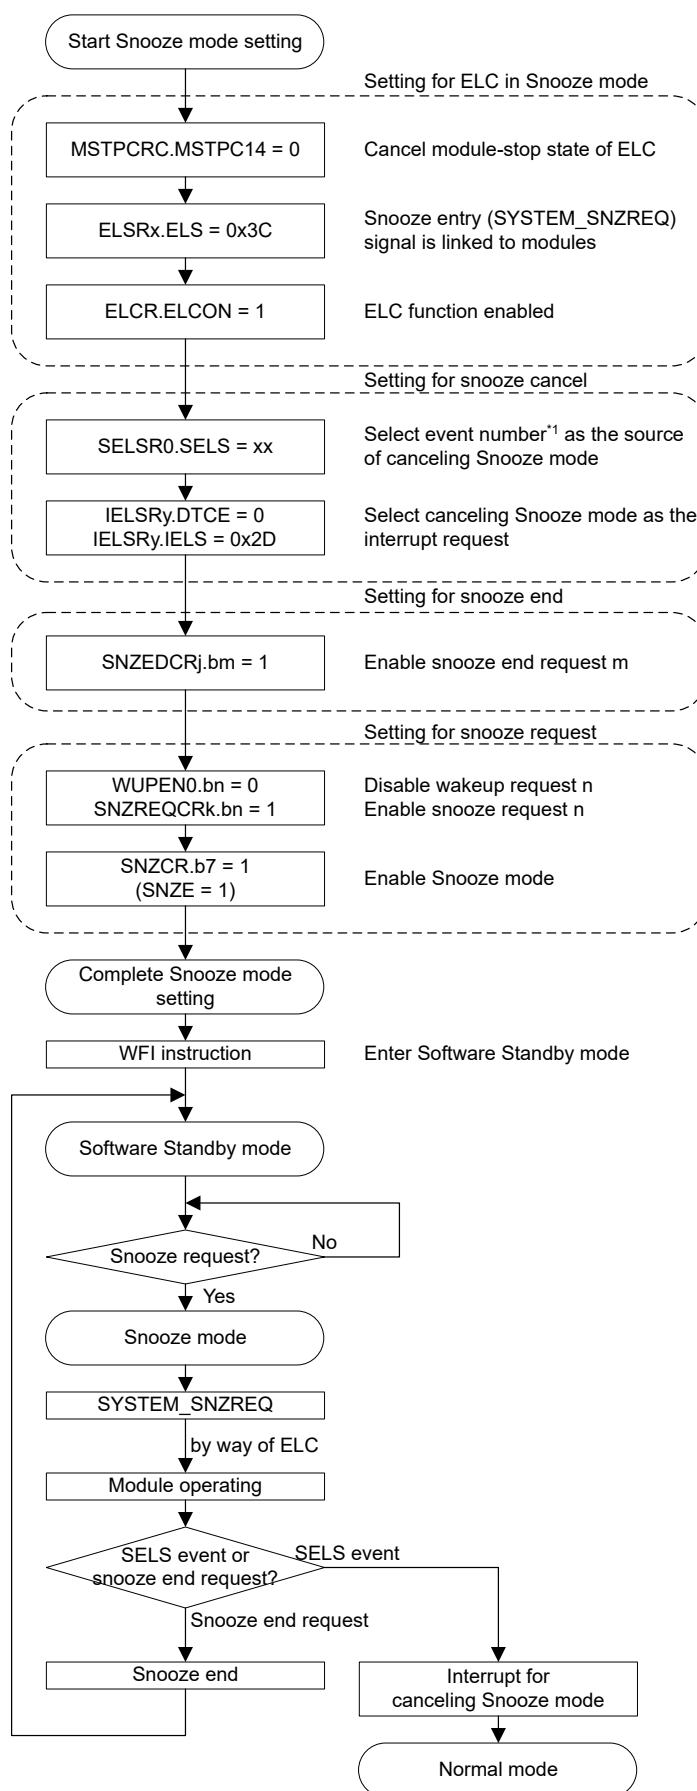

Figure 10.7 Canceling of Snooze mode when an interrupt request signal is not generated

10.8.4 Snooze Operation Example

Figure 10.8 shows an example setting for using ELC in Snooze mode.

Note 1. See [Table 12.4](#)

Figure 10.8 Setting example of using ELC in Snooze mode

The MCU can transmit and receive data in SCI0 asynchronous mode without CPU intervention. When using the SCI0 in Snooze mode, use either High-speed mode or Low-speed mode.

[Table 10.10](#) shows the maximum transfer rate of SCI0 in Snooze mode.

Table 10.10 HOCO: $\pm 1.4\%$ ($T_a = -20^\circ\text{C}$ to 105°C) (Unit: bps)

| Maximum division ratio of ICLK, PCLKA, PCLKB, PCLKC, PCLKD, FCLK, and TRCLK | HOCO frequency | | | | | |
|-----------------------------------------------------------------------------|-----------------------|--------|--------|-------------------|--------|--------|
| | LOCO is not operating | | | LOCO is operating | | |
| | 16 MHz | 18 MHz | 20 MHz | 16 MHz | 18 MHz | 20 MHz |
| 1 | 2400 | | | 4800 | | |
| 2 | | | | | | |
| 4 | | | | | | |
| 8 | | | | | | |
| 16 | | | | | | |
| 32 | 1200 | | | 2400 | | |
| 64 | | | | | | |

When using SCI0 in Snooze mode, use the following setting: BGDM = 0, ABCS = 0, ABCSE = 0. See [section 26, Serial Communications Interface \(SCI\)](#) for information on these bits.

[Figure 10.9](#) shows a setting example for using SCI0 in Snooze mode entry.

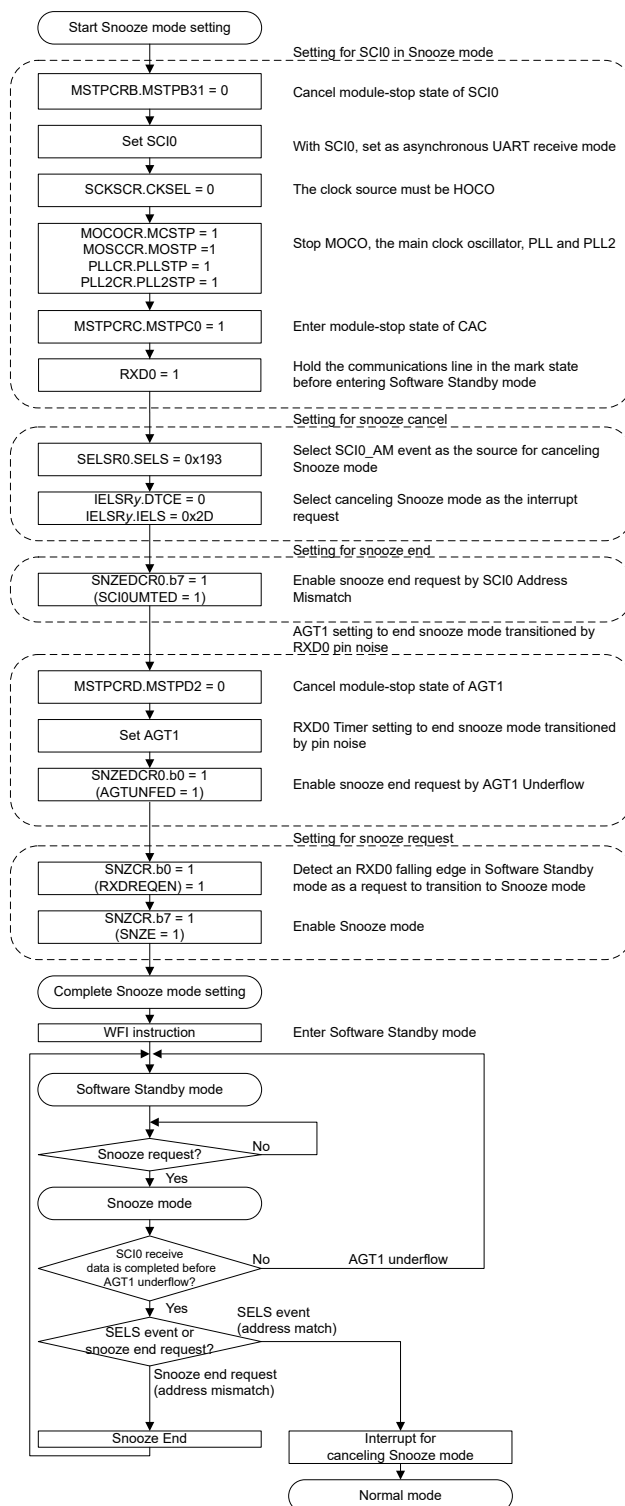

Figure 10.9 Setting example of using SCI0 in Snooze mode entry

10.9 Deep Software Standby Mode

10.9.1 Transitioning to Deep Software Standby Mode

When a WFI instruction is executed with the SBYCR.SSBY and DPSBYCR.DPSBY bits set to 1, the MCU enters Deep Software Standby mode. See [Table 10.6](#) for the setting of the related control bits. In this mode, the CPU, on-chip peripheral functions, SRAM (except for standby RAM), and all oscillators (except for Low-speed on-chip oscillator) are stopped. Also because the internal power supply to these modules is stopped, power consumption is remarkably reduced. The contents of all CPU registers and internal peripheral modules become undefined.

Data in the standby SRAM are preserved if the setting of the DEEPCUT[1:0] bits are 00b. If the setting of the DEEPCUT[1:0] bits are 01b, the internal power supply to the standby SRAM is cut off, reducing power consumption. Data in the standby SRAM becomes undefined at this time. If the setting of the DEEPCUT[1:0] bits are 11b, the internal power supply to the standby SRAM is cut off, the LVD is stopped, and the low-power-consumption function of the power-on reset circuit is enabled, so power consumption is further reduced. For details, see [section 46, Electrical Characteristics](#).

When the MCU enters Deep Software Standby mode while the IWDTC is in auto start mode and the OFS0.IWDTCSTPCTL bit is 1, power supply to the IWDTC-dedicated clock and the IWDTC is cut off, and counting by the IWDTC stops.

When OFS0.IWDTCSTPCTL bit is 0, the MCU enters Software Standby mode instead of Deep Software Standby mode, regardless of the setting of OFS0.IWDTCSTRT bit or DPSBYCR.DPSBY bit. If OFS0.IWDTCSTPCTL bit is 0 while OFS0.IWDTCSTRT bit is 0 (auto start mode), IWDTC-dedicated clock and IWDTC continues the operation.

When LVD1CR0.RI = 1 (voltage monitor 1 reset selected) or LVD2CR0.RI = 1 (voltage monitor 2 reset selected), the MCU enters Software Standby mode instead of Deep Software Standby mode. The I/O port states are the same as in Software Standby mode.

When the PLL is selected as the clock source, set the following modules to the module-stop state before executing a WFI instruction:

ADC, SCE5.

In this case, wait for least 750 ns and if the ICLK frequency before executing the WFI instruction exceeds 120 MHz, it is necessary to set the ICLK frequency division ratio to 1/2 and wait 5 μ s. Measurement of the waiting time, it is recommended the measurement by the software. If you use the timer, regardless of the use conditions, ensure that the waiting time has elapsed.

See [Figure 10.2](#) for Example flow for transition to software standby mode or Deep Software Standby mode.

Note: Conditions on the DTC, DMAC, and IWDTC for transitioning to Software Standby mode should be met before the WFI instruction is executed. For details, see [section 10.7. Software Standby Mode](#).

10.9.2 Cancelling Deep Software Standby Mode

Deep Software Standby mode is canceled by:

- An interrupt shown in [Table 10.3](#)
- A RES pin reset
- A power-on reset
- A voltage monitor 0 reset.

(1) Cancelling by an interrupt

Cancelling by interrupts is controlled by DPSIERn (n = 0 to 2) and DPSIFRn (n = 0 to 2). When a Deep Software Standby Cancelling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 2). The interrupts for which an edge can be selected are the NMI, IRQn-DS (n = 0 to 15), voltage monitor 1, and voltage monitor 2 interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and an internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is supplied to the entire MCU and Deep Software Standby reset is canceled. The MCU starts reset exception handling.

When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

(2) Cancelling by RES pin reset

When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Keep the RES pin low for the time specified in [section 46, Electrical Characteristics](#). When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.

(3) Cancelling by a power-on reset

Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

(4) Cancelling by a voltage monitor 0 reset

Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.

10.9.3 Pin States when Deep Software Standby mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states from Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, and reset exception handling starts immediately. The DPSBYCR.IOKEEP bit setting determines whether to initialize the I/O ports or to retain the I/O ports states for Software Standby mode. The following is the state of the I/O ports for each bit setting:

- When the DPSBYCR.IOKEEP bit = 0
I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1
Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, the I/O ports retain their states from Software Standby mode regardless of the MCU internal state. The I/O ports states remain unchanged from Software Standby mode even when settings are made to the I/O ports or peripheral modules. The retained I/O ports states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state. The DPSBYCR.IOKEEP bit is not initialized by any internal reset generated when Deep Software Standby mode is canceled.

10.9.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

[Figure 10.10](#) shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn-DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge). After the DPSIEGRy.DIRQnEG (y = 0 or 1, n = 0 to 15) bit is set to 1 (rising edge) and the SBYCR.SSBY bit and DPSBYCR.DPSBY bit are both set to 1, the WFI instruction is executed. As a result, the MCU transitions to Deep Software Standby mode. Deep Software Standby mode is then canceled on the rising edge of the IRQn-DS pin.

Figure 10.10 Example of Deep Software Standby Mode Application

10.9.5 Usage Flow for Deep Software Standby Mode

Figure 10.11 shows an example flow for using Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made.

For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings are made.

Figure 10.11 Example flow for using Deep Software Standby mode

10.10 Usage Notes

10.10.1 Register Access

(1) Invalid register write accesses during specific modes or transitions

Do not write to registers under any of the conditions listed in this section.

[Registers]

- All registers with a peripheral name of SYSTEM.

[Conditions]

- OPCCR.OPCMTSF = 1 (during transition of the operating power control mode)
- During the time period from executing a WFI instruction to returning to Normal mode
- FENTRYR.FENTRYC = 1 or FENTRYR.FENTRYD = 1 (flash P/E mode, data flash P/E mode)

(2) Valid setting for the clock-related registers

Table 10.11 and Table 10.12 show the valid settings of the clock-related registers in each operating power control mode. Do not write any value other than the valid setting. Each register has certain prohibited settings under conditions other than those related to the operating power control modes. See section 8, [Clock Generation Circuit](#) for another condition of each register.

Table 10.11 Valid settings for the clock-related registers (1)

| Mode | Valid settings | | | | | | | |
|------------|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|---------------------------|---------------------------|------------------------------|------------------------------|------------------------------|------------------------------|
| | SCKSCR. CKSEL[2:0] CKOCR. CKOSEL[2:0] | SCKDIVCR. FCK[2:0] ICK[2:0] | PLLCR. PLLSTP | PLL2CR. PLL2STP | HOCOCR. HCSTP | MOCOCR. MCSTP | LOCOCR. LCSTP | MOSCCR. MOSTP |
| High-speed | 000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) 101b (PLL) *1 | 000b (1/1) 001b (1/2) 010b (1/4) 011b (1/8) 100b (1/16) 101b (1/32) 110b (1/64) | 0 (operating) 1 (stop) | 0 (operating) 1 (stop) | 0 (operating) 1 (stopped) | 0 (operating) 1 (stopped) | 0 (operating) 1 (stopped) | 0 (operating) 1 (stopped) |
| Low-speed | 000b (HOCO) 001b (MOCO) 010b (LOCO) 011b (Main clock) | | 1 (stop) | 1 (stop) | | | | |

Note 1. SCKSCR.CKSEL[2:0] only

Table 10.12 Valid settings for the clock-related registers (2)

| Operating oscillator | Valid settings |
|-----------------------------------|-----------------|
| | OPCCR.OPCM[1:0] |
| PLL, PLL2 | 00b |
| High-speed on-chip oscillator | 00b, 11b |
| Middle-speed on-chip oscillator | |
| Main clock oscillator | |
| Low-speed on-chip oscillator | |
| IWDT-dedicated on-chip oscillator | |

(3) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA, MSTPCRB, MSTPCRC, MSTPCRD, MSTPCRE

(4) Invalid register write accesses in Snooze mode

Do not write to registers listed in this section in Snooze mode. They must be set before entering Software Standby mode.

[Registers]

- SNZCR, SNZEDCR0, SNZREQCR0.

(5) Invalid write access when PRCR.PRC1 is 0

Do not write to registers listed in this section when the PRCR.PRC1 bit is 0.

[Registers]

- SBYCR, SNZCR, SNZEDCR0, SNZREQCR0, OPCCR, DPSBYCR, DPSWCR, DPSIERn, DPSIFRn, DPSIEGRn, SYOCDRCR

(6) Invalid write access when when PRCR.PRC4 bit is 0

Do not write to registers listed in this section when the PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR, DPFSAR

10.10.2 I/O Port pin states

The I/O port pin states in Software Standby mode, Deep Software Standby and Snooze mode, unless modifying in Snooze mode, are the same before entering the modes. Therefore, power consumption is not reduced while the output signals are held high.

10.10.3 Module-Stop State of DTC, DMAC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see [section 15, DMA Controller \(DMAC\)](#) and [section 16, Data Transfer Controller \(DTC\)](#).

10.10.4 Internal Interrupt Sources

Interrupts do not operate in the module-stop state. If setting the module-stop bit while an interrupt request is generated, a CPU interrupt source or a DTC or DMAC startup source cannot be cleared. Always disable the associated interrupts before setting the module-stop bits.

10.10.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIERy.DIRQnE (y = 0 or 1, n = 0 to 15) bit to 1 enables the associated input buffer of the IRQn-DS (n = 0 to 15) pins. Although inputs to these pins are sent to the DPSIFRy.DIRQnF (y = 0 or 1, n = 0 to 15) bits, they are not sent to the interrupt controller (ICU), peripheral modules, and I/O ports.

10.10.6 Transitioning to Low Power Modes

Because the MCU does not support wakeup by events, do not enter the low power modes such as Sleep mode, Software Standby mode or Deep Software Standby Mode by executing a WFE instruction. Also, do not set the SLEEPDEEP bit of the System Control Register in the Cortex-M33 core because the MCU does not support low power modes by SLEEPDEEP.

10.10.7 Timing of WFI Instruction

It is possible for the WFI instruction to be executed before I/O register write is completed, in which case operation might not be as intended. This can happen if the WFI is placed immediately after a write to an I/O register. To avoid this problem, read back the register that was written to confirm that the write completed.

10.10.8 Writing to the WDT/IWDT Registers by DTC or DMAC in Sleep Mode or Snooze Mode

Do not write to the WDT or IWDT registers by the DTC or DMAC while WDT or IWDT is stopped after entering Sleep mode or Snooze mode.

10.10.9 Oscillators in Snooze Mode

Oscillators that stop on entering Software Standby mode automatically restart when a trigger for switching to Snooze mode is generated. The MCU does not enter Snooze mode until all the oscillators stabilize. If in Snooze mode, you must disable oscillators that are not required in Snooze mode before entering Software Standby mode. Otherwise, the transition from Software Standby mode to Snooze mode takes longer.

10.10.10 Snooze Mode Entry by RXD0 Falling Edge

When the SNZCR.RXDREQEN bit is 1, the falling edge of RXD0 pin is used to switch MCU from Software Standby mode to Snooze mode when using UART of SCIO in Snooze mode. In this case an interrupt such as SCIO_AM or an address mismatch event is used as the source for canceling Snooze mode. However noise on the RXD0 pin might cause the MCU to transfer from Software Standby mode to Snooze mode unexpectedly. In this case if the MCU does not receive RXD0 data after the noise, an interrupt such as SCIO_AM, or an address mismatch event is not generated and the MCU stays in Snooze mode. This can be avoided by using AGTn (n = 1) underflow interrupt to return to Software Standby mode or Normal mode unless otherwise UART receive data is completed before AGTn (n = 1) underflow. However, do not use the AGTn (n = 1) underflow as a source to return to Software Standby mode during an UART communication. This causes the UART to stop the operation in a half-finished state.

10.10.11 Using UART of SCI0 in Snooze Mode

When using UART in Snooze mode, ensure that the snooze request (RXD0 falling edge) does not conflict with the wakeup requests set by the WUPEN0 register, otherwise UART cannot be guaranteed.

When using UART in Snooze mode, the following conditions must be satisfied:

- The clock source must be HOCO
- MOCO, PLL, PLL2, and the main clock oscillator must be stopped before entering Software Standby mode
- The RXD0 pin must be kept high before entering Software Standby mode
- A transition to Software Standby mode must not occur during an SCI0 communication
- The MSTPCRC.MSTPC0 bit must be 1 before entering Software Standby mode.

10.10.12 ELC Events in Snooze Mode

This section lists available ELC events in Snooze mode. Do not use any other events. If starting peripheral modules for the first time after entering Snooze mode, the Event Link Setting Register (ELSRn) must set a Snooze mode entry event (SYSTEM_SNZREQ) as the trigger.

- Snooze mode entry (SYSTEM_SNZREQ)
- DTC transfer end (DTC_DTCEND)
- Data operation circuit interrupt (DOC_DOPCI).

10.10.13 Module-Stop Bit Write Timing

It is possible that access to I/O register may be executed before the corresponding module-stop bit write completed. In this case, access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module-stop bit that was written to confirm that the write completed.

10.10.14 Sleep-on-exit Function

There are 2 ways to transition to low power modes. One is WFI instruction and the other is Sleep-on-exit. When Sleep-on-exit is used for transition to low power modes, WFI instruction comments written in User's Manual Hardware is applicable to Sleep-on-exit.

10.10.15 Interruption During the Transition to Low Power Modes

If the software meets the applicable condition listed in [section 10.10.15.1. Applicable Condition and Notes](#), you may not be able to enter the intended low power mode and transit to unintended states described in [section 10.10.15.1. Applicable Condition and Notes](#).

If the unintended states described in [section 10.10.15.1. Applicable Condition and Notes](#) cannot be tolerated, use [section 10.10.15.2. Workaround](#).

10.10.15.1 Applicable Condition and Notes

(1) Applicable Condition

Transition to Software Standby mode is started by a trigger (WFI instruction or SLEEPONEXIT) with SBYCR.SSBY = 1 set to use Software Standby, Snooze, or Deep Software Standby mode.

During the specified interval (ICLK 2 cycle) of transitioning to Software Standby mode, one of the following interrupt requests that is not an interrupt source to return from Software Standby mode is accepted by CPU.

1. SysTick interrupt (all of the following are applicable)
 - Exception number 15 of Interrupt vector table
 - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI) (BASEPRI = 0 or BASEPRI > SHPR3.PRI_15)
2. Maskable interrupt requests that are not interrupt source to return from Software Standby mode (all of the following are applicable)

- By WUPEN in exception numbers 16 to 111 in the interrupt vector table those not permitted to return from Software Standby mode
 - Interrupt requests are enabled by Interrupt Set-Enable Register (NVIC_ISERn)
 - Interrupt requests are not masked by Base Priority Mask Register (BASEPRI)
(BASEPRI = 0 or BASEPRI > NVIC_IPRn.PRI_N)
3. Non-maskable interrupt request triggered by the following sources
- SRAM parity error
 - SRAM ECC failure
 - MPU bus master error
 - MPU bus slave error
 - TrustZone filtering error

(2) Notes

If the above conditions are met, the MCU will transit to following unintended states. These unintended states can be resolved by a reset or returning to Normal mode with an interrupt request of an interrupt source to return from Software Standby mode.

1. When transitioning to Software Standby mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 0, SNZCR.SNZE = 0)
Only CPU clock is stopped, and the remaining clocks continue to operate as they were prior to transitioning Software Standby mode.
 - As before the transition to Software Standby mode is started, depending on the setting, timer or other peripherals continue to operate, and an interrupt request related to the peripheral is generated.
 - Because the IWDG and WDG clock-stop function is disabled, a reset or an interrupt for the IWDG and WDG is generated depending on the settings before starting the transition to Software Standby mode.
 - Interrupt requests are held in IR flag (IELSRn, DELSRn).
2. When transitioning to Snooze mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 0, SNZCR.SNZE = 1)
The transition to Snooze mode is not possible, and the states shown in “1) When transitioning to Software Standby mode” is continued.
To return to Normal mode by an interrupt source (SELSR0) from Snooze mode depends on whether the interrupt request (SELSR0) to returning from Snooze mode can be generated while DTC operation is disabled.
If DTC operation is disabled (SNZCR.SNZDTCEN = 0) in Snooze mode, Normal mode can be returned because an interrupt source for the interrupt source (SELSR0) to return from Snooze mode can be generated.
If DTC operation is enabled (SNZCR.SNZDTCEN = 1) in Snooze mode, the Normal mode cannot be returned because an interrupt request for the interrupt source (SELSR0) to return from Snooze mode cannot be generated.
3. When transitioning to Deep Software Standby mode (SBYCR.SSBY = 1, DPSBYCR.DPSBY = 1)
The transition to Deep Software Standby mode is not possible, and the state shown in “1. When transitioning to Software Standby mode” is continued.
As for the interrupt source (DPSIERn) settings to returning from Deep Software Standby mode, these interrupt requests can return to Normal mode only when the interrupt source (WUPEN) to return from Software Standby mode is set.

10.10.15.2 Workaround

(1) Workaround

To avoid the unintended states described above, apply the following before the terms for transition to Software Standby mode, Snooze mode, or Deep Software Standby mode are met: (For the setting procedure, see "Setting Procedure for Transition to Software Standby, Snooze, or Deep Software Standby Mode")

1. Disable SysTick interrupt requests.
Exception number 15 of Interrupt vector table
2. Disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode.
Exception number 16 to 111 of Interrupt vector table that WUPEN does not allow to return from Software Standby mode.

3. Stop access from the bus master other than the CPU so that the non-maskable interrupt is not triggered by the following sources.

SRAM parity error

SRAM ECC failure

MPU bus master error

MPU bus slave error

TrustZone filtering error

(2) Setting Procedure for Transition to Software Standby, Snooze, or Deep Software Standby Mode

This section describes procedures for avoiding unintended states.

The handling of interrupt requests after returning from Software Standby or Snooze mode varies depending on the method used to disable the maskable interrupt request. Either one or the other should be applied.

- Procedure A: Disable maskable interrupt request acceptance.
Any interrupt request that occurs while interrupt request acceptance is disabled is discarded.

Table 10.13 Before transitioning to Software Standby, Snooze, or Deep Software Standby mode

| Step | Description |
|------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Stop the bus access from the bus master other than CPU.* ¹ |
| 2 | Disable the SysTick interrupt request.* ² |
| 3 | Clear IELSRn in ICU to disable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 4 | Read IELSRn in ICU to confirm that IELSRn in ICU has been cleared. |
| 5 | Transition to Software Standby mode (WFI instruction, SLEEPONEXIT). |

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.

Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

Table 10.14 After returning from Software Standby or Snooze mode

| Step | Description |
|------|--------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Enable the SysTick interrupt request. |
| 2 | Set IELSRn in ICU to enable acceptance of maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 3 | Enable bus access from bus masters other than CPU. |

- Procedure B: Disable the maskable interrupt request
The interrupt request generated while the interrupt request is disabled is retained in IELSRn.IR flag. Therefore, after returning from Software Standby or Snooze mode and enabling the maskable interrupt, it is possible to process the interrupt.

Table 10.15 Before transitioning to Software Standby, Snooze, or Deep Software Standby mode

| Step | Description |
|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Stop the bus access from the bus master other than CPU.* ¹ |
| 2 | Disable the SysTick interrupt request.* ² |
| 3 | Write 1 to the corresponding bit in NVIC_ICERn in CPU to disable maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 4 | Execute Data Synchronization Barrier (DSB) instruction. |
| 5 | Transition Software Standby mode (WFI instruction, SLEEPONEXIT) |

Note 1. SRAM parity error interrupt, SRAM ECC error interrupt, MPU bus master error interrupt, MPU bus slave error interrupt, or TrustZone filter error interrupt is enabled as a non-maskable interrupt.

Note 2. Disabling a SysTick interrupt request may cause SysTick interrupt request to be delayed by one cycle of SysTick timer without generating the latest SysTick interrupt request.

Table 10.16 After returning from Software Standby or Snooze mode

| Step | Description |
|------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Enable the SysTick interrupt request. |
| 2 | Write 1 to the corresponding bit in NVIC_ISERn in CPU to enable maskable interrupt requests that are not interrupt sources to return from Software Standby mode. |
| 3 | Enable bus access from bus masters other than CPU. |

11. Register Write Protection

11.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR).

Table 11.1 lists the association between the bits in the PRCR register and the registers to be protected.

Table 11.1 Association between the bits in the PRCR register and registers to be protected

| PRCR bit | Register to be protected |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PRC0 | <ul style="list-style-type: none"> Registers related to the clock generation circuit: SCKDIVCR, SCKSCR, PLLCCR, PLLCR, MOSCCR, HOCOCR, HOCOCR2, MOCOCR, CKOCR, TRCKCR, OSTDCR, OSTDSR, PLL2CCR, PLL2CR, MOCOUTCR, HOCOUTCR, SCISPICKDIVCR, CANFDCKDIVCR, GPTCKDIVCR, IICCKDIVCR, SCISPICKCR, CANFDCKCR, GPTCKCR, IICCKCR, MOSCWTCR, MOMCR, LOCOCR, LOCOUTCR |
| PRC1 | <ul style="list-style-type: none"> Registers related to the low power modes: SBYCR, SNZCR, SNZEDCR0, SNZREQCR0, OPCCR, DPSBYCR, DPSWCR, DPSIER0-2, DPSIFR0-2, DPSIEGR0-2, SYOCDCR |

| PRC4 | <ul style="list-style-type: none"> Registers related to the security function: CGFSAR, RSTSAR, LPMSAR, LVDSAR, DPFSAR, CSAR, SRAMSAR, STBRAMSAR, DTCSAR, DMACSAR, ICUSARx, BUSSARx, MMPUSARx, TZFSAR, CPUDSAR, FSAR, PSARx, MSSAR, PmSAR, ELCSARx |

11.2 Register Descriptions

11.2.1 PRCR : Protect Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3FE

| | | | | | | | | | | | | | | | | |
|--------------------|------------|----|----|----|----|----|---|---|---|---|---|------|------|---|------|------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | PRKEY[7:0] | | | | | | | | — | — | — | PRC4 | PRC3 | — | PRC1 | PRC0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PRC0 | Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes | R/W |
| 1 | PRC1 | Enable writing to the registers related to the low power modes 0: Disable writes 1: Enable writes | R/W |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | PRC3 | Enable writing to the registers related to the LVD 0: Disable writes 1: Enable writes | R/W |
| 4 | PRC4 | Enables writing to the registers related to the security function 0: Disable writes 1: Enable writes | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | PRKEY[7:0] | PRC Key Code These bits control the write access to the PRCR register. To modify the PRCR register, write 0xA5 to the upper 8 bits and the target value to the lower 8 bits as a 16-bit unit. | W |

PRCn bits (Protect bit n) (n = 0, 1, 3, 4)

The PRCn bits enable or disable writing to the protected registers listed in [Table 11.1](#). Setting the PRCn bits to 1 or 0 enables or disables writing, respectively.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR after PRC4 change, and then write access the PRC4-controlled register.

12. Interrupt Controller Unit (ICU)

12.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

[Table 12.1](#) lists the ICU specifications, [Figure 12.1](#) shows a block diagram, and [Table 12.2](#) lists the I/O pins.

Table 12.1 ICU specifications

| Item | | Description |
|---------------------------------------|----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Maskable interrupts | Peripheral function interrupts | <ul style="list-style-type: none"> Interrupts from peripheral modules Number of sources: 265 (select factor within event list numbers 17 to 511) |
| | External pin interrupts | <ul style="list-style-type: none"> Interrupt detection on low level^{*4}, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source Digital filter function supported 16 sources, with interrupts from IRQi (i = 0 to 15) pins. |
| | Interrupt requests to CPU (NVIC) | <ul style="list-style-type: none"> 96 interrupt requests are output to NVIC. |
| | DMAC control | <ul style="list-style-type: none"> The DMAC can be activated using interrupt sources^{*1} The target interrupt source can be selected individually for every DMAC channels. |
| | DTC control | <ul style="list-style-type: none"> The DTC can be activated using interrupt sources^{*1} The method for selecting an interrupt source is the same as that of the interrupt request to NVIC. |
| Non-maskable interrupts ^{*2} | NMI pin interrupt | <ul style="list-style-type: none"> Interrupt from the NMI pin Interrupt detection on falling edge or rising edge Digital filter function supported |
| | WDT underflow/refresh error ^{*3} | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
| | IWDT underflow/refresh error ^{*3} | Interrupt on an underflow of the down-counter or occurrence of a refresh error |
| | Low voltage detection 1 ^{*3} | Voltage monitor 1 interrupt of the voltage monitor 1 circuit (LVD_LVD1) |
| | Low voltage detection 2 ^{*3} | Voltage monitor 2 interrupt of the voltage monitor 2 circuit (LVD_LVD2) |
| | RPEST ^{*5} | Interrupt on SRAM parity error |
| | RECCST ^{*5} | Interrupt on SRAM ECC error |
| | TZFST ^{*5} | Interrupt on TrustZone Filter error |
| | CPEST ^{*5} | Interrupt on Cache RAM Parity error |
| | Oscillation stop detection interrupt ^{*3} | Interrupt on detecting that the main oscillation has stopped |
| | Bus master MPU error ^{*5} | Interrupt on bus master MPU error |
| Low power modes | | <ul style="list-style-type: none"> Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source Software Standby mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the WUPEN0 register. Snooze mode: return is initiated by non-maskable interrupts. Interrupt can be selected in the SELSR0 and WUPEN0 registers. <p>See section 12.2.16. SELSR0 : SYS Event Link Setting Register and section 12.2.17. WUPEN0 : Wake Up Interrupt Enable Register 0.</p> |
| TrustZone Filter | | Available |

Note 1. For the DMAC and DTC activation sources, see [Table 12.4](#).

Note 2. Non-maskable interrupts can be enabled only once after a reset release.

Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the LVD1CR1.IRQSEL and LVD2CR1.IRQSEL bits to 1.

Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.

Note 5. These non-maskable interrupt sources cannot be recovered if the request source clock is stopped during low power mode.

Figure 12.1 shows the ICU block diagram.

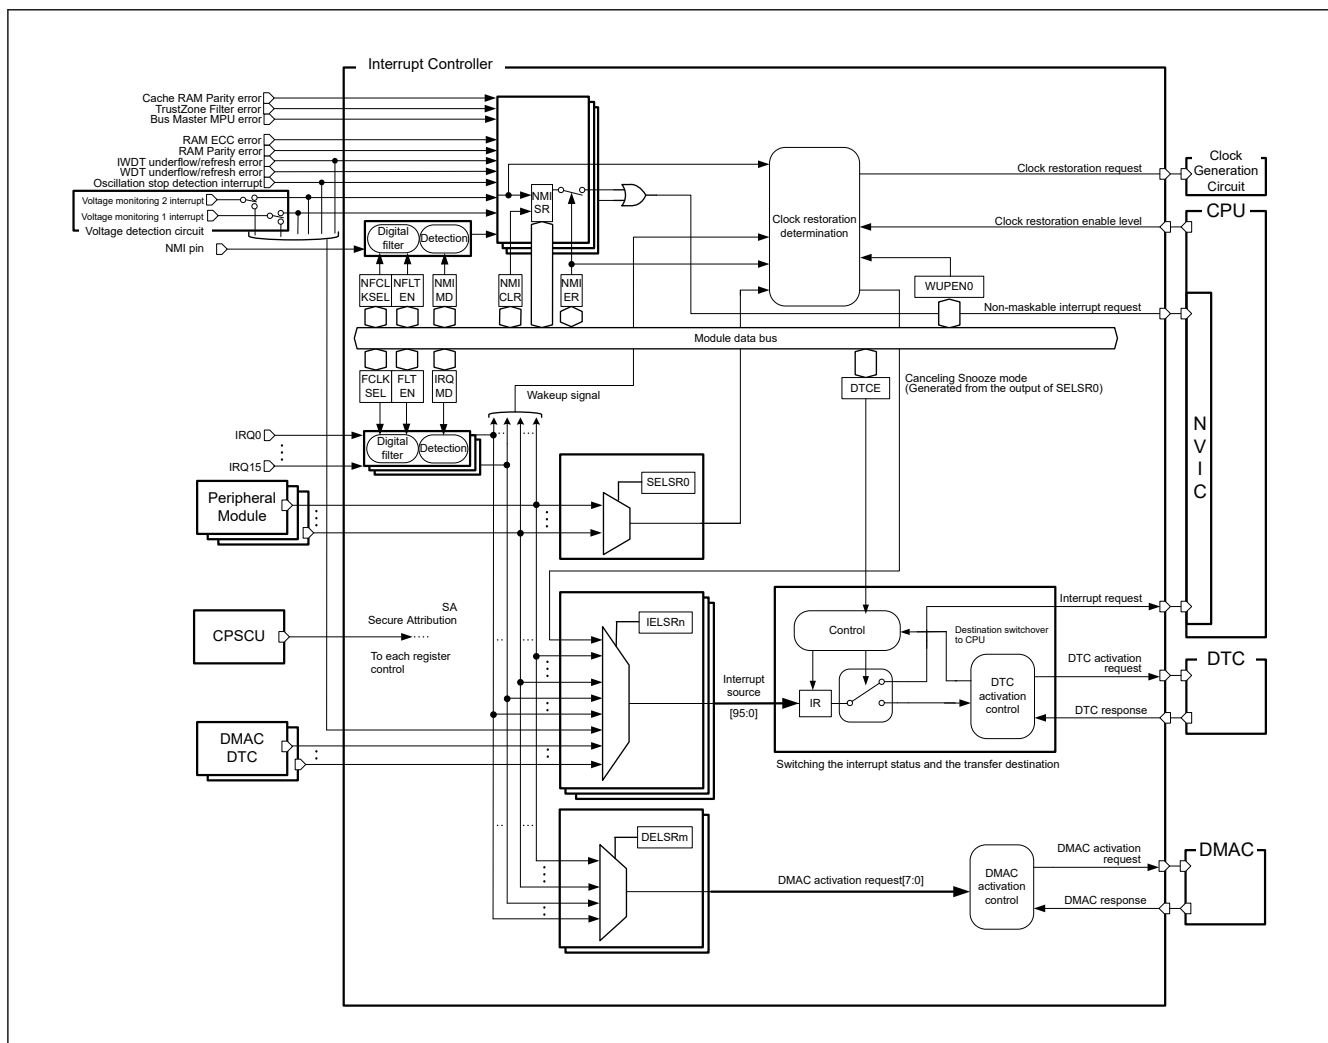

Figure 12.1 ICU block diagram

Table 12.2 lists the ICU input/output pins.

Table 12.2 ICU I/O pins

| Pin name | I/O | Description |
|--------------------|-------|------------------------------------|
| NMI | Input | Non-maskable interrupt request pin |
| IRQi (i = 0 to 15) | Input | External interrupt request pins |

12.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information about these registers, see ARM Limited., ARM® Cortex®-M33 Processor Technical Reference Manual (ARM 100230).

12.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x40

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SAIRQ CR15 | SAIRQ CR14 | SAIRQ CR13 | SAIRQ CR12 | SAIRQ CR11 | SAIRQ CR10 | SAIRQ CR9 | SAIRQ CR8 | SAIRQ CR7 | SAIRQ CR6 | SAIRQ CR5 | SAIRQ CR4 | SAIRQ CR3 | SAIRQ CR2 | SAIRQ CR1 | SAIRQ CR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|----------------------|----------------------------------------------------------------------------------------|-----|
| 15:0 | SAIRQCR15 to SAIQCR0 | Security attributes of registers for the IRQCRn register 0: Secure 1: Non-secure | R/W |
| 31:16 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIRQCRn bits (Security attributes of registers for the IRQCRn register)

The target registers are as follows:

- IRQCR0 to IRQCR15 registers
- WUPEN0.IRQWUPEN[15:0] bits

12.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000

Offset address: 0x44

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SANMI |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|--------|------------------------------------------------------------------------------------------|-----|
| 0 | SANMI | Security attributes of registers for nonmaskable interrupt 0: Secure 1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SANMI bit (Security attributes of registers for nonmaskable interrupt)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- NMIER

- NMICLR
- NMICR

The value of AIRCR.BFHFNMINS bit [13] in Application Interrupt and Reset Control Register of ARM CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and the SANMI bits are different. AIRCR.BFHFNMINS is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-Secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

12.2.3 ICUSARC : Interrupt Controller Unit Security Attribution Register C

Base address: CPSCU = 0x4000_8000

Offset address: 0x48

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | SADM AC7 | SADM AC6 | SADM AC5 | SADM AC4 | SADM AC3 | SADM AC2 | SADM AC1 | SADM AC0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|-----------------------|---------------------------------------------------------------------------------|-----|
| 7:0 | SADMAC7 to SADMAC0 | Security attributes of registers for DMAC channel 0: Secure 1: Non-secure | R/W |
| 31:8 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SADMACn bits (Security attributes of registers for DMAC channel)

Security attributes of registers for DMAC channel. This register is referred to as the security attribute of the ICU and DMAC registers.

The controlled ICU register is:

- DELSRn

The controlled DMAC registers are:

- DMACn.DMSAR
- DMACn.DMSRR
- DMACn.DMDAR
- DMACn.DMDRR
- DMACn.DMCRA
- DMACn.DMCRB
- DMACn.DMTMD
- DMACn.DMINT
- DMACn.DMAMD
- DMACn.DMOFR

- DMACn.DMCNT
- DMACn.DMREQ
- DMACn.DMSTS
- DMACn.DMSBS
- DMACn.DMDBS

For details on DMAC registers, see [section 15, DMA Controller \(DMAC\)](#).

12.2.4 ICUSARD : Interrupt Controller Unit Security Attribution Register D

Base address: CPSCU = 0x4000_8000

Offset address: 0x4C

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | SASELSR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|----------|---------------------------------------------------------------------------|-----|
| 0 | SASELSR0 | Security attributes of registers for SELSR0 0: Secure 1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

12.2.5 ICUSARE : Interrupt Controller Unit Security Attribution Register E

Base address: CPSCU = 0x4000_8000

Offset address: 0x50

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|-------------|-------------|-------------|----|----|----|----|----|----|----|----|-----------|-----------|----------|-----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | SAIIC0WUP | SAAGT1CBWUP | SAAGT1CAWUP | SAAGT1UDWUP | — | — | — | — | — | — | — | — | SALVD2WUP | SALVD1WUP | SAKEYWUP | SAIWDTWUP |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|-----------|-------------------------------------------------------------------------------|-----|
| 15:0 | — | These bits are read as 1. The write value should be 1. | R/W |
| 16 | SAIWDTWUP | Security attributes of registers for WUPEN0.b16 0: Secure 1: Non-secure | R/W |
| 17 | SAKEYWUP | Security attributes of registers for WUPEN0.b17 0: Secure 1: Non-secure | R/W |

| Bit | Symbol | Function | R/W |
|-------|-------------|-------------------------------------------------------------------------------|-----|
| 18 | SALVD1WUP | Security attributes of registers for WUPEN0.b18 0: Secure 1: Non-secure | R/W |
| 19 | SALVD2WUP | Security attributes of registers for WUPEN0.b19 0: Secure 1: Non-secure | R/W |
| 27:20 | — | These bits are read as 1. The write value should be 1. | R/W |
| 28 | SAAGT1UDWUP | Security attributes of registers for WUPEN0.b28 0: Secure 1: Non-secure | R/W |
| 29 | SAAGT1CAWUP | Security attributes of registers for WUPEN0.b29 0: Secure 1: Non-secure | R/W |
| 30 | SAAGT1CBWUP | Security attributes of registers for WUPEN0.b30 0: Secure 1: Non-secure | R/W |
| 31 | SAIC0WUP | Security attributes of registers for WUPEN0.b31 0: Secure 1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

12.2.6 ICUSARG : Interrupt Controller Unit Security Attribution Register G

Base address: CPSCU = 0x4000_8000

Offset address: 0x70

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | SAIEL SR31 | SAIEL SR30 | SAIEL SR29 | SAIEL SR28 | SAIEL SR27 | SAIEL SR26 | SAIEL SR25 | SAIEL SR24 | SAIEL SR23 | SAIEL SR22 | SAIEL SR21 | SAIEL SR20 | SAIEL SR19 | SAIEL SR18 | SAIEL SR17 | SAIEL SR16 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SAIEL SR15 | SAIEL SR14 | SAIEL SR13 | SAIEL SR12 | SAIEL SR11 | SAIEL SR10 | SAIEL SR9 | SAIEL SR8 | SAIEL SR7 | SAIEL SR6 | SAIEL SR5 | SAIEL SR4 | SAIEL SR3 | SAIEL SR2 | SAIEL SR1 | SAIEL SR0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|-----------------------|--------------------------------------------------------------------------------------|-----|
| 31:0 | SAIELSR31 to SAIELSR0 | Security attributes of registers for IELSR31 to IELSR0 0: Secure 1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 0 to 31). NVIC internal registers are in NVIC_ITNS0[31:0]. The initial values of NVIC_ITNS0 and ICUSARG are different. NVIC_ITNS0 is secure and ICUSARG is non-secure. Polarity has the same meaning so program these to match.

12.2.7 ICUSARH : Interrupt Controller Unit Security Attribution Register H

Base address: CPSCU = 0x4000_8000

Offset address: 0x74

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|

|------|------------------------|---------------------------------------------------------------------------------------|-----|
| 31:0 | SAIELSR63 to SAIELSR32 | Security attributes of registers for IELSR63 to IELSR32 0: Secure 1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR63 to IELSR32)

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of IELSEn (n = 32 to 63). NVIC internal registers are in NVIC_ITNS1[31:0]. The initial values of NVIC_ITNS1 and ICUSARH are different. NVIC_ITNS1 is secure and ICUSARH is non-secure. Polarity has the same meaning so program these to match.

12.2.8 ICUSARI : Interrupt Controller Unit Security Attribution Register I

Base address: CPSCU = 0x4000_8000

Offset address: 0x78

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | SAIEL SR95 | SAIEL SR94 | SAIEL SR93 | SAIEL SR92 | SAIEL SR91 | SAIEL SR90 | SAIEL SR89 | SAIEL SR88 | SAIEL SR87 | SAIEL SR86 | SAIEL SR85 | SAIEL SR84 | SAIEL SR83 | SAIEL SR82 | SAIEL SR81 | SAIEL SR80 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SAIEL SR79 | SAIEL SR78 | SAIEL SR77 | SAIEL SR76 | SAIEL SR75 | SAIEL SR74 | SAIEL SR73 | SAIEL SR72 | SAIEL SR71 | SAIEL SR70 | SAIEL SR69 | SAIEL SR68 | SAIEL SR67 | SAIEL SR66 | SAIEL SR65 | SAIEL SR64 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|------------------------|---------------------------------------------------------------------------------------|-----|
| 31:0 | SAIELSR95 to SAIELSR64 | Security attributes of registers for IELSR95 to IELSR64 0: Secure 1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

SAIELSRn bits (Security attributes of registers for IELSR95 to IELSR64)

The Secure Attribute managed within the ARM CPU NVIC must match the security attribution of IELSEn (n = 64 to 95). NVIC internal registers are in NVIC_ITNS2[31:0]. The initial values of NVIC_ITNS2 and ICUSARI are different. NVIC_ITNS2 is secure and ICUSARI is non-secure. Polarity has the same meaning so program these to match.

12.2.9 IRQCRi : IRQ Control Register i (i = 0 to 15)

Base address: ICU = 0x4000_6000

Offset address: 0x000 + 0x1 × i

| | | | | | | | | |
|--------------------|-------|---|--------------|---|---|---|------------|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | FLTEN | — | FCLKSEL[1:0] | — | — | — | IRQMD[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------------|-------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | IRQMD[1:0] | IRQi Detection Sense Select 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5:4 | FCLKSEL[1:0] | IRQi Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64 | R/W |
| 6 | — | This bit is read as 0. The write value should be 0. | R/W |
| 7 | FLTEN | IRQi Digital Filter Enable 0: Digital filter is disabled 1: Digital filter is enabled. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).
The register value should be changed only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:
Change the IRQCRi register value before setting the target DELSRn register (n = 0 to 7).
The register value should be changed only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:
Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 15). The register value should be changed when the target WUPEN0.IRQWUPEN[n] is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see [section 12.5.6. External Pin Interrupts](#).

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 12.5.5. Digital Filter](#).

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 12.5.5. Digital Filter](#).

12.2.10 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_6000

Offset address: 0x140

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|----|-------|----|------------|----|------------|-----------|-------|-----------|---|---|------------|------------|-------|------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CPES T | — | TZFST | — | BUSM ST | — | RECC ST | RPES T | NMIST | OSTS T | — | — | LVD2S T | LVD1S T | WDTST | IWDT ST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | IWDTST | IWDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 1 | WDTST | WDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 2 | LVD1ST | Voltage Monitor 1 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 3 | LVD2ST | Voltage Monitor 2 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 5:4 | — | These bits are read as 0. | R |
| 6 | OSTST | Main Clock Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for main clock oscillation stop 1: Interrupt requested for main clock oscillation stop | R |
| 7 | NMIST | NMI Pin Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 8 | RPEST | SRAM Parity Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 9 | RECCST | SRAM ECC Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 10 | — | This bit is read as 0. | R |
| 11 | BUSMST | Bus Master MPU Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 12 | — | This bit is read as 0. | R |
| 13 | TZFST | TrustZone Filter Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |
| 14 | — | This bit is read as 0. | R |
| 15 | CPEST | Cache RAM Parity Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested | R |

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

LVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The LVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.LVD1CLR bit.

[Setting condition]

When the voltage monitor 1 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD1CLR bit.

LVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The LVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.LVD2CLR bit.

[Setting condition]

When the voltage monitor 2 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.LVD2CLR bit.

OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main clock oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When the main clock oscillation stop detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMISTCLR bit.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMICLR bit.

RPEST flag (SRAM Parity Error Interrupt Status Flag)

The RPEST flag indicates an SRAM parity error interrupt request.

[Setting condition]

When an interrupt is generated in response to an SRAM parity error.

[Clearing condition]

When 1 is written to the NMICLR.RPECLR bit.

RECCST flag (SRAM ECC Error Interrupt Status Flag)

The RECCST flag indicates an SRAM ECC error interrupt request.

[Setting condition]

When an interrupt is generated in response to an SRAM ECC error.

[Clearing condition]

When 1 is written to the NMICLR.RECCCLR bit.

BUSMST flag (Bus Master MPU Error Interrupt Status Flag)

The BUSMST flag indicates a bus master error interrupt request.

[Setting condition]

When an interrupt is generated in response to a bus master error.

[Clearing condition]

When 1 is written to the NMICLR.BUSMCLR bit.

TZFST flag (TrustZone Filter Error Interrupt Status Flag)

This flag indicates the TrustZone Filter error interrupt request.

[Setting condition]

When an interrupt is generated in response to a TrustZone Filter error

[Clearing condition]

When 1 is written to the NMICLR.TZFCLR bit

CPEST flag (Cache RAM Parity Error Interrupt Status Flag)

This flag indicates the Cache RAM Parity error interrupt request.

[Setting condition]

When an interrupt is generated in response to an Cache RAM Parity error

[Clearing condition]

When 1 is written to the NMICLR.CPECLR bit

12.2.11 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_6000

Offset address: 0x120

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|----|-----------|----|------------|----|------------|-----------|-----------|-----------|---|---|------------|------------|-----------|------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CPEE N | — | TZFE N | — | BUSM EN | — | RECC EN | RPEE N | NMIE N | OSTE N | — | — | LVD2E N | LVD1E N | WDTE N | IWDT EN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------|----------------------|
| 0 | IWDTEN | IWDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled. | R/W ^{*1} *2 |
| 1 | WDTEN | WDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} *2 |
| 2 | LVD1EN | Voltage monitor 1 Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} *2 |
| 3 | LVD2EN | Voltage monitor 2 Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} *2 |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | OSTEN | Main Clock Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} *2 |
| 7 | NMIEN | NMI Pin Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |
| 8 | RPEEN | SRAM Parity Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |
| 9 | RECCEN | SRAM ECC Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMEN | Bus Master MPU Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13 | TZFEN | TrustZone Filter Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPEEN | Cache RAM Parity Error Interrupt Enable 0: Disabled 1: Enabled | R/W ^{*1} |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.

Note 2. Do not write 1 to this bit when the source is used as an event signal.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as an NMI trigger.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as an NMI trigger.

LVD1EN bit (Voltage monitor 1 Interrupt Enable)

The LVD1EN bit enables voltage monitor 1 interrupt as an NMI trigger.

LVD2EN bit (Voltage monitor 2 Interrupt Enable)

The LVD2EN bit enables voltage monitor 2 interrupt as an NMI trigger.

OSTEN bit (Main Clock Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as an NMI trigger.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as an NMI trigger.

RPEEN bit (SRAM Parity Error Interrupt Enable)

The RPEEN bit enables SRAM parity error interrupt as an NMI trigger.

RECCEN bit (SRAM ECC Error Interrupt Enable)

The RECCEN bit enables SRAM ECC error interrupt as an NMI trigger.

BUSMEN bit (Bus Master MPU Error Interrupt Enable)

The BUSMEN bit enables bus master error interrupt as an NMI trigger.

TZFEN bit (TrustZone Filter Error Interrupt Enable)

TZFEN bit enables the TrustZone Filter error interrupt as an NMI trigger.

CPEEN bit (Cache RAM Parity Error Interrupt Enable)

CPEEN bit enables the Cache RAM Parity error interrupt as an NMI trigger.

12.2.12 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_6000

Offset address: 0x130

| | | | | | | | | | | | | | | | | |
|--------------------|------------|----|------------|----|-------------|----|-------------|------------|------------|------------|---|---|-------------|-------------|------------|-------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CPEC LR | — | TZFCL R | — | BUSM CLR | — | RECC CLR | RPEC LR | NMICL R | OSTC LR | — | — | LVD2C LR | LVD1C LR | WDTC LR | IWDT CLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------------------------------------------------|-------------------|
| 0 | IWDTCLR | IWDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IWDTST flag | R/W ^{*1} |
| 1 | WDTCCLR | WDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.WDTST flag | R/W ^{*1} |
| 2 | LVD1CLR | Voltage Monitor 1 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LVD1ST flag | R/W ^{*1} |
| 3 | LVD2CLR | Voltage Monitor 2 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LVD2ST flag. | R/W ^{*1} |
| 5:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | OSTCLR | Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag | R/W ^{*1} |
| 7 | NMICLR | NMI Pin Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.NMIST flag | R/W ^{*1} |
| 8 | RPECLR | SRAM Parity Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.RPEST flag | R/W ^{*1} |

| Bit | Symbol | Function | R/W |
|-----|---------|------------------------------------------------------------------------------------------------------|-------------------|
| 9 | RECCCLR | SRAM ECC Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.RECCST flag | R/W ^{*1} |
| 10 | — | This bit is read as 0. The write value should be 0. | R/W |
| 11 | BUSMCLR | Bus Master MPU Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.BUSMST flag | R/W ^{*1} |
| 12 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13 | TZFCLR | TrustZone Filter Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.TZFCLR flag | R/W ^{*1} |
| 14 | — | This bit is read as 0. The write value should be 0. | R/W |
| 15 | CPECLR | Cache RAM Parity Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.CPECLR flag | R/W ^{*1} |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only write 1 to this bit.

IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

LVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)

Writing 1 to the LVD1CLR bit clears the NMISR.LVD1ST flag. This bit is read as 0.

LVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)

Writing 1 to the LVD2CLR bit clears the NMISR.LVD2ST flag. This bit is read as 0.

OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Pin Interrupt Status Flag Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

RPECLR bit (SRAM Parity Error Interrupt Status Flag Clear)

Writing 1 to the RPECLR bit clears the NMISR.RPEST flag. This bit is read as 0.

RECCCLR bit (SRAM ECC Error Interrupt Status Flag Clear)

Writing 1 to the RECCCLR bit clears the NMISR.RECCST flag. This bit is read as 0.

BUSMCLR bit (Bus Master MPU Error Interrupt Status Flag Clear)

Writing 1 to the BUSMCLR bit clears the NMISR.BUSMST flag. This bit is read as 0.

TZFCLR bit (TrustZone Filter Error Interrupt Status Flag Clear)

Writing 1 to the TZFCLR bit clears the NMISR.TZFST flag. This bit is read as 0.

CPECLR bit (Cache RAM Parity Error Interrupt Status Flag Clear)

Writing 1 to the CPECLR bit clears the NMISR.CPEST flag. This bit is read as 0.

12.2.13 NMICR : NMI Pin Interrupt Control Register

Base address: ICU = 0x4000_6000

Offset address: 0x100

| | | | | | | | | |
|--------------------|--------|---|---------------|---|---|---|---|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | NFLTEN | — | NFCLKSEL[1:0] | — | — | — | — | NMIMD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------------|----------------------------------------------------------------------------------------------------------|-----|
| 0 | NMIMD | NMI Detection Set 0: Falling edge 1: Rising edge | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 5:4 | NFCLKSEL[1:0] | NMI Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64 | R/W |
| 6 | — | This bit is read as 0. The write value should be 0. | R/W |
| 7 | NFLTEN | NMI Digital Filter Enable 0: Disabled. 1: Enabled. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see [section 12.5.5. Digital Filter](#).

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see [section 12.5.5. Digital Filter](#).

12.2.14 IELSRn : ICU Event Link Setting Register n (n = 0 to 95)

Base address: ICU = 0x4000_6000

Offset address: 0x300 + 0x4 × n

| 8:0 | IELS[8:0] | ICU Event Link Select 0x00: Disable interrupts to the associated NVIC or DTC module Others: Event signal number to be linked. For details, see section 12.3.2. Event Number . | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | IR | Interrupt Status Flag 0: No interrupt request generated. 1: An interrupt request is generated. | R/W ^{*1} |
| 23:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | DTCE | DTC Activation Enable 0: DTC activation is disabled. 1: DTC activation is enabled. | R/W |
| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: This register requires halfword or word access.

Note 1. Writing 1 to the IR flag is prohibited.

The IELSRn register selects the IRQi source used by the NVIC. For details, see [Table 12.3](#). IELSRn corresponds to the NVIC IRQ input source number, where n = 0 to 95.

IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see [Table 12.3](#) and [Table 12.4](#).

IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- In the case of DTC.DISEL = 0. At the time other than the final transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.
- In the case of DTC.DISEL = 1. For DTC transfers during DTCE = 1, the hardware does not clear the IR flag. Should be cleared by the CPU writing 0.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

In the case of level detection, clear of the IR flag should follow the steps below.

1. Negate the input interrupt signal.
2. Read access the peripheral once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a wakeup request. However, interrupt requests are not issued automatically. See [section 16, Data Transfer Controller \(DTC\)](#) for how to set the interrupt when a DTC error occurs.

12.2.15 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7)

Base address: ICU = 0x4000_6000

Offset address: 0x280 + 0x4 × n

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|-----------|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | IR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | DELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 8:0 | DELS[8:0] | DMAC Event Link Select 0x00: Disable interrupts to the associated DMAC module. Others: Event signal number to be linked. For details, see Table 12.4 . | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | IR | DMAC Activation Request Status Flag 0: No DMAC activation request occurred. 1: DMAC activation request occurred. | R/W ¹ |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Writing 1 to the IR flag is prohibited.

DELS[8:0] bit (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the associated DMAC module. Do not set the same event number in multiple DELSRn registers.

IR flag (DMAC Activation Request Status Flag)

The IR flag is the status flag of a DMAC activation request. This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

The flag is set to 1 when a DMAC activation request is generated from the associated peripheral module or IRQi pin.

[Clearing conditions]

- When 0 is written to the IR flag.
- At the start of a DMA transfer after the DMAC activation request is issued.

Note: The IR flag is automatically cleared after completion of a DMA transfer. Therefore, do not write 0 unless an abort occurs. When 0 is written, DMA transfer operation cannot be guaranteed.

Note: Error during DMAC transfer

If an error response occurs during a DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSRn (n = 0 to 7). DELSRn that is not the target channel is not cleared.

12.2.16 SELSR0 : SYS Event Link Setting Register

Base address: ICU = 0x4000_6000

Offset address: 0x200

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|-----------|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | SELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8:0 | SELS[8:0] | SYS Event Link Select 0x00: Disable event output to the associated low-power mode module Others: Event signal number to be linked. For details, see Table 12.4 . | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The SELSR0 register selects the events that wake up the CPU from Snooze mode. You can use only the events listed in [Table 12.4](#) checked as “Canceling Snooze mode”. When ICU_SNZCANCEL is selected in the IELSRn.IELS[8:0] bits, an interrupt is generated that cancels snooze mode.

Caution: For security attribution added to parts related to a series of actions, make sure to match all security attribution so that security holes cannot be created.

About security attribution to be matched

- Event source to be set to SELSR0.
- SELSR0
- IELSRn (n = 0 to 95) to receive event No. 45 (ICU_SNZCANCEL).
- NVIC internal registers in the CPU of the interrupt specified in the previous item.
- Interrupt Handler.

12.2.17 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_6000

Offset address: 0x1A0

| | | | | | | | | | | | | | | | | |
|--------------------|----------------|-------------|-------------|-------------|----|----|----|----|----|----|----|----|-----------|-----------|----------|-----------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | IIC0WUPEN | AGT1CBWUPEN | AGT1CAWUPEN | AGT1UDWUPEN | — | — | — | — | — | — | — | — | LVD2WUPEN | LVD1WUPEN | KEYWUPEN | IWDTWUPEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | IRQWUPEN[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | IRQWUPEN[15:0] | IRQn Interrupt Software Standby/Snooze Mode Returns Enable bit (n = 0 to 15) 0: Software Standby/Snooze Mode returns by IRQn interrupt is disabled 1: Software Standby/Snooze Mode returns by IRQn interrupt is enabled*1 | R/W |
| 16 | IWDTWUPEN | IWDT Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by IWDT interrupt is disabled 1: Software Standby/Snooze Mode returns by IWDT interrupt is enabled | R/W |
| 17 | KEYWUPEN | Key interrupt S/W standby returns enable bit 0: S/W standby returns by KEY interrupt is disabled 1: S/W standby returns by KEY interrupt is enabled | R/W |
| 18 | LVD1WUPEN | LVD1 Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by LVD1 interrupt is disabled 1: Software Standby/Snooze Mode returns by LVD1 interrupt is enabled | R/W |
| 19 | LVD2WUPEN | LVD2 Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by LVD2 interrupt is disabled 1: Software Standby/Snooze Mode returns by LVD2 interrupt is enabled | R/W |
| 27:20 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | AGT1UDWUPEN | AGT1 Underflow Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by AGT1 underflow interrupt is disabled 1: Software Standby/Snooze Mode returns by AGT1 underflow interrupt is enabled | R/W |
| 29 | AGT1CAWUPEN | AGT1 Compare Match A Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by AGT1 compare match A interrupt is disabled 1: Software Standby/Snooze Mode returns by AGT1 compare match A interrupt is enabled | R/W |
| 30 | AGT1CBWUPEN | AGT1 Compare Match B Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by AGT1 compare match B interrupt is disabled 1: Software Standby/Snooze Mode returns by AGT1 compare match B interrupt is enabled | R/W |
| 31 | IIC0WUPEN | IIC0 Address Match Interrupt Software Standby/Snooze Mode Returns Enable bit 0: Software Standby/Snooze Mode returns by IIC0 address match interrupt is disabled 1: Software Standby/Snooze Mode returns by IIC0 address match interrupt is enabled | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Description is a description of each bit.

The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

12.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see [section 12.9. Reference](#).

12.3.1 Interrupt Vector Table

[Table 12.3](#) describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

Table 12.3 Interrupt vector table (1 of 3)

| Exception number | IRQ number | Vector offset | Source | Description |
|------------------|------------|---------------|-------------|------------------------------------------------------|
| 0 | — | 0x000 | Arm | Initial stack pointer |
| 1 | — | 0x004 | Arm | Initial program counter (reset vector) |
| 2 | — | 0x008 | Arm | Non-Maskable Interrupt (NMI) |
| 3 | — | 0x00C | Arm | Hard Fault |
| 4 | — | 0x010 | Arm | MemManage fault |
| 5 | — | 0x014 | Arm | BusFault |
| 6 | — | 0x018 | Arm | UsageFault |
| 7 | — | 0x01C | Arm | SecureFault |
| 8 | — | 0x020 | Arm | Reserved |
| 9 | — | 0x024 | Arm | Reserved |
| 10 | — | 0x028 | Arm | Reserved |
| 11 | — | 0x02C | Arm | Supervisor Call (SVCall) |
| 12 | — | 0x030 | Arm | DebugMonitor |
| 13 | — | 0x034 | Arm | Reserved |
| 14 | — | 0x038 | Arm | Pendable request for system service (PendableSrvReq) |

| 108 | 92 | 0x1B0 | ICU.IELSR92 | Event selected in the ICU.IELSR92 register |
| 109 | 93 | 0x1B4 | ICU.IELSR93 | Event selected in the ICU.IELSR93 register |
| 110 | 94 | 0x1B8 | ICU.IELSR94 | Event selected in the ICU.IELSR94 register |
| 111 | 95 | 0x1BC | ICU.IELSR95 | Event selected in the ICU.IELSR95 register |

12.3.2 Event Number

The following table lists heading details for [Table 12.4](#), which describes each event number.

| Heading | Description |
|---------------------------------|---------------------------------------------------------------------------------------------|
| Interrupt request source | Name of the source generating the interrupt request |
| Name | Name of the interrupt |
| Connect to NVIC | "✓" indicates the interrupt can be used as a CPU interrupt |
| Invoke DTC | "✓" indicates the interrupt can be used to request DTC activation |
| Invoke DMAC | "✓" indicates the interrupt can be used to request DMAC activation |
| Canceling Snooze | "✓" indicates the interrupt can be used to request a return from Snooze mode |
| Canceling Software Standby | "✓" indicates the interrupt can be used to request a return from Software Standby mode |
| Canceling Deep Software Standby | "✓" indicates the interrupt can be used to request a return from Deep Software Standby mode |

Table 12.4 Event table (9 of 9)

| Event number | Interrupt request source | Name | IELSRn | | DELSRn | Canceling Snooze | Canceling Software Standby | Canceling Deep Software Standby |
|--------------|--------------------------|-----------|-----------------|------------|-------------|------------------|----------------------------|---------------------------------|
| | | | Connect to NVIC | Invoke DTC | Invoke DMAC | | | |
| 0x1DB | DOC | DOC_DOPCI | ✓ | — | — | ✓*1 | — | — |

Note 1. Using SELSR0.

Note 2. Only supported when KRCTL.KRMD = 1.

Note 3. Only the first edge detection is valid.

Note 4. Only interrupts after DTC transfer are supported.

12.4 Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation, or DMAC activation.

12.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS[8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see [Table 12.3](#) and [Table 12.4](#). Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

**Figure 12.2** Interrupt path of the ICU and CPU (NVIC)

12.5 Interrupt setting procedure

12.5.1 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DEELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN0 register setting).

12.5.2 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as DMAC activation (DELSRn.DEELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN0 register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

12.5.3 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DEELS[8:0]), snooze mode cancellation (SELSR0.SELS[8:0]), software standby mode cancellation (WUPEN0 register setting).
4. Poll the interrupt Set-Pending register (NVIC_ISPR).

12.5.4 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in [Table 12.3](#), [Table 12.4](#).

The interrupt output destination, CPU, DMAC, or DTC can be independently selected for each interrupt source.

Use an interrupt request destination setting that is indicated by a “✓” in the event list (see [section 12.3.2. Event Number](#)).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

12.5.4.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 0.

12.5.4.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

[Table 12.5](#) shows operation when the DTC is the interrupt request destination.

Table 12.5 Operation when DTC becomes interrupt request destination

| Interrupt request destination | DISEL* ¹ | Remaining transfer operations | Operation per request | IR* ² | Interrupt request destination after transfer |
|-------------------------------|---------------------|-------------------------------|------------------------------|---------------------------------------------------------------------------|------------------------------------------------|
| DTC* ³ | 1 | ≠ 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | DTC |
| | | = 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | CPU (IELSRn.DTCE bit is automatically cleared) |
| | 0 | ≠ 0 | DTC transfer | Cleared at the start of DTC data transfer after reading DTC transfer data | DTC |
| | | = 0 | DTC transfer → CPU interrupt | Cleared on interrupt acceptance by the CPU | CPU (IELSRn.DTCE bit is automatically cleared) |

Note 1. DTC.MRB.DISEL bit controls the interrupt generates timing from DTC to CPU.

Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.

Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See [Table 16.2](#) in [section 16, Data Transfer Controller \(DTC\)](#).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

Note: DTC transfer error in snooze mode

When an error occurs in DTC transfer in Snooze mode, ICU issues a Wake Up request. However, interrupt requests are not issued automatically. See [section 16, Data Transfer Controller \(DTC\)](#) chapter for information on how to set the interrupt when a DTC error occurs.

12.5.4.3 DMAC Activation

Events specified in the DELSRn registers are output to the DMAC.

To set the interrupt source for DMAC, use the following procedure:

1. Set the DELSRn.DELS[8:0] bits to the event to activate the DMAC.
2. When using interrupts to CPU, set the IELSRn.IELS bit to factor of DMAC interrupt and IELSRn.DTCE bit to 0.
3. Set the activation source for the target DMAC channel (DMACm.DMTMD.DCTG[1:0]) to 01b (interrupt module detection).
4. Set the DMAC transfer enable bit for the target DMAC channel (DMACm.DMCNT.DTE) to 1.
5. Set the DMAC operation enable bit (DMAST.DMST) to 1.

Figure 12.3 DMAC request trigger and interrupt path

Note: Error during DMAC transfer

If an error response occurs during DMAC transfer, the DMAC notifies the ICU that an error has occurred.

The ICU clears all bits of the target channel of DELSR_n ($n = 0$ to 7). DELSR_n that is not the target channel is not cleared.

12.5.5 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQ_i, ($i = 0$ to 15) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

To use the digital filter for an IRQ_i pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCR_i.FCLKSEL[1:0] bits ($i = 0$ to 15).
2. Set the IRQCR_i.FLTEN bit ($i = 0$ to 15) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 12.4 shows an example of digital filter operation.

Figure 12.4 Digital filter operation example

Before entering Software Standby mode, disable the digital filters by clearing the IRQCRi.FLTEN and NMICR.NFLTEN bits. The ICU clock stops in Software Standby mode.

On exiting Software Standby mode, the circuit detects the edge by comparing the state before standby to the state after standby release. If the input changes during Software Standby mode, an incorrect edge might be detected. The digital filters can be enabled again after exiting Software Standby mode.

12.5.6 External Pin Interrupts

To use external pin interrupts:

1. Configure I/O ports settings.
2. Clear the IRQCRi.FLTEN bit (i = 0 to 15) to 0 (digital filter disabled).
3. Set the IRQMD[1:0] bits of the given IRQCRi register (i = 0 to 15) to select the senses of detection.
4. Set the FCLKSEL[1:0] bits, and the FLTEN bit of the IRQCRi register.
5. Select the IRQ pin as follows:
 - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 0.
 - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS[8:0] bits and the IELSRn.DTCE bit to 1.
 - If the IRQ pin is to be used for DMAC activation, set the DELSRn.DELS[8:0] bits.

12.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- SRAM parity error interrupt
- SRAM ECC error interrupt

- Bus master MPU error interrupt
- TrustZone filter error interrupt
- Cache RAM parity error interrupt.

Non-maskable interrupts can only be used with the CPU, not to activate the DTC or DMAC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIE bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

The secure attribution managed within the Application Interrupt and Reset Control Register (AIRCR) of the Arm CPU must match the security attribution of NMI.

The NMI secure of the CPU is changed by AIRCR.BFHFNMINS. It is managed by software developers who manage Secure program.

12.6.1 Correspondence to TrustZone-M by NMI

The NMI security is set by AIRCR.BFHFNMINS.

Although there is only one NMI as a CPU, multiple factors can be set.

This section describes the procedure for mixing secure and non-secure factors of NMI.

When mixing secure and non-secure, NMI related registers in the CPU should be set to Secure.

NMI-related registers:

- NMIER
- NMICLR
- NMICR

Figure 12.5 shows the flow.

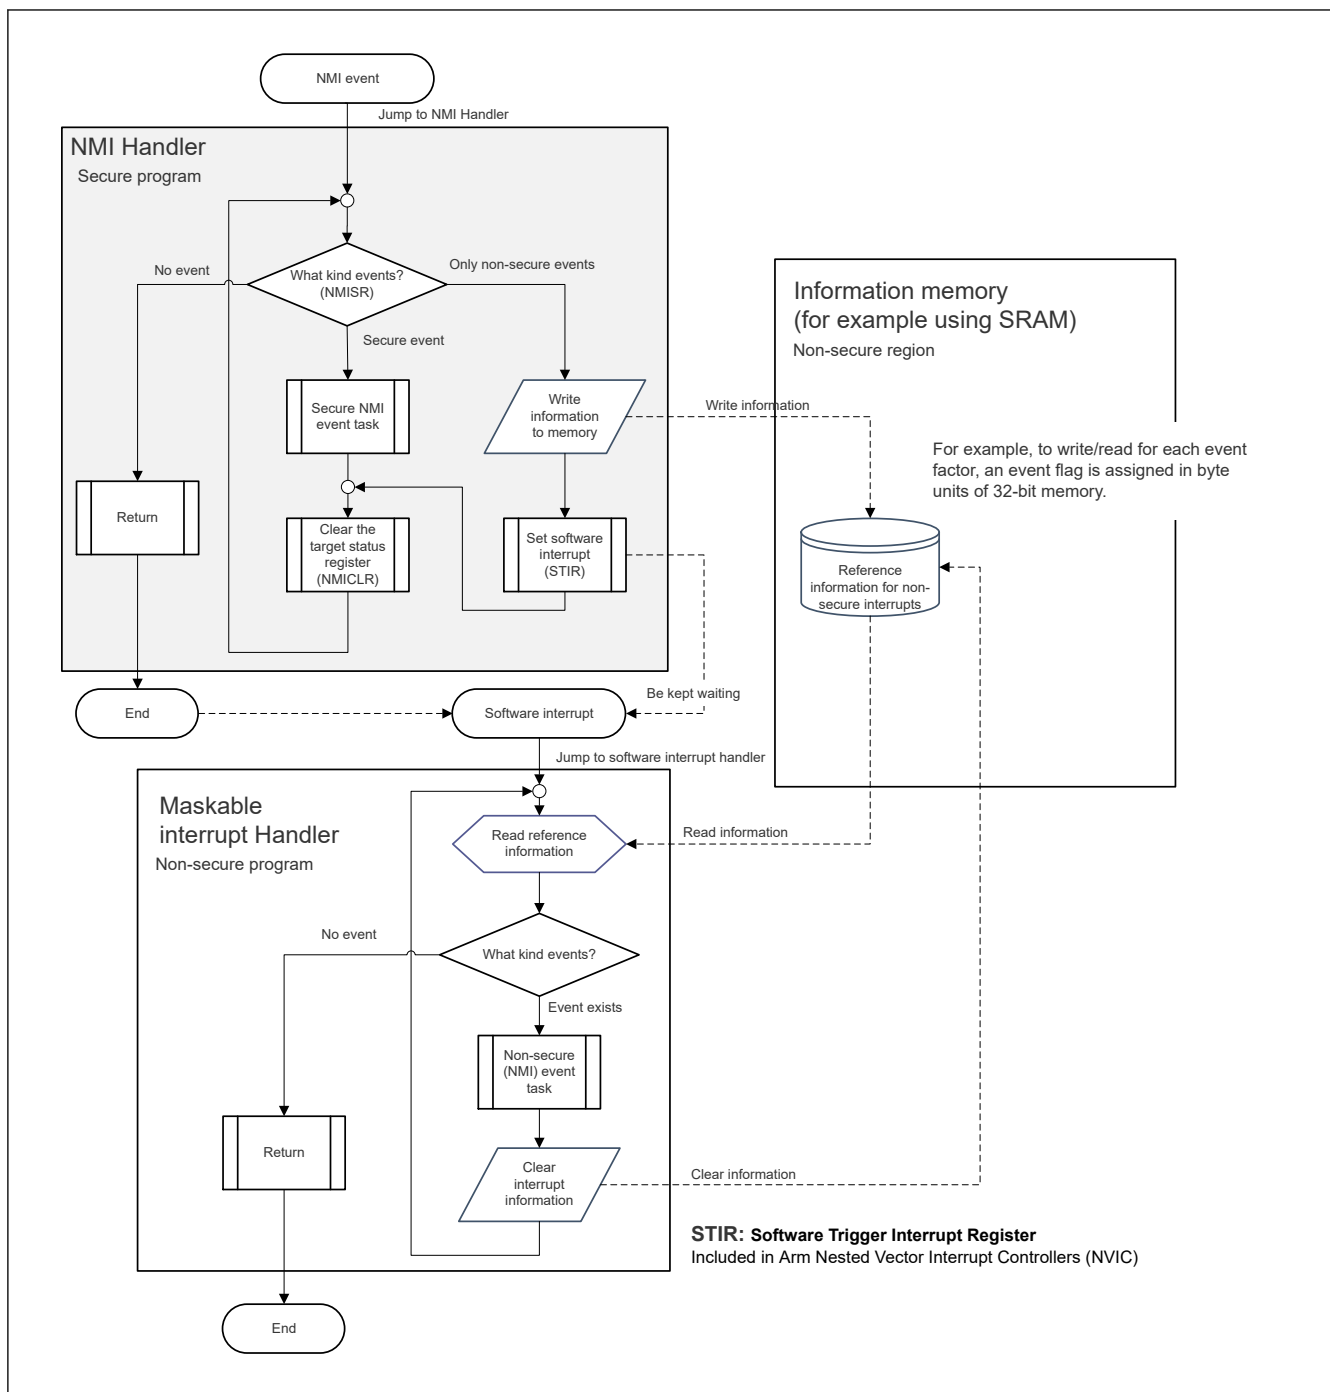

Figure 12.5 Correspondence to TrustZone-M by NMI

See the Arm documentation for details on how to move between secure and non-secure programs.

12.7 Return from Low Power Modes

Table 12.4 lists the interrupt sources that can be used to exit Sleep, Snooze, or Software Standby mode. For more information, see [section 10, Low Power Modes](#).

12.7.1 Return from Sleep Mode

To return from Sleep mode in response to an interrupt:

non-maskable interrupt

- Use the NMIER register to enable the target interrupt request.

maskable interrupt

- Select the CPU as the interrupt request destination.
- Enable the interrupt in the NVIC.

12.7.2 Return from Software Standby Mode

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see [Table 12.4](#).

To return from Software Standby mode:

1. Select the interrupt source that enables return from Software Standby:
 - For non-maskable interrupts, use the NMIER register to enable the target interrupt request
 - For maskable interrupts, use the WUPEN0 register to enable the target interrupt request.
2. Select the CPU as the interrupt request destination
3. Enable the interrupt in the NVIC.

Interrupt requests through the IRQn pins that do not satisfy these conditions are not detected while the clock is stopped in Software Standby mode.

Similarly, request for a non-maskable interrupt from a request source whose clock is stopped in Software Standby mode cannot be detected.

Transition to/from Software Standby mode

1. Before Software Standby mode is entered, disable the digital filter for the interrupt source as a return target (IRQCRi.FLTEN = 0, NMICR.NFLTEN = 0).
2. To use the digital filter again after returning from Software Standby mode, enable the digital filter (IRQCRi.FLTEN = 1, NMICR.NFLTEN = 1).

12.7.3 Return from Snooze Mode

The ICU can return to Normal mode from Snooze mode using the interrupts provided for this mode.

To return to Normal mode from Snooze mode:

1. Set the number of the required interrupt request in SELSR0.SELS[8:0]
2. Set the value 0x02D (ICU_SNZCANCEL) in IELSRn.IELS[8:0] (n = 0 to 95).
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the non-maskable that do not satisfy the above conditions are not detected while the clock is stopped in snooze mode.

Note: In Snooze mode, a clock is supplied to the ICU. If an event selected in IELSRn is detected, the CPU acknowledges the interrupt after returning to Normal mode from Software Standby mode. If an event selected in DELSRn is detected, the DMAC can acknowledge the interrupt after returning to Normal mode from Software Standby mode.

12.8 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

13. Buses

13.1 Overview

The buses consists of 32 bits AHB bus matrix. [Table 13.1](#) lists the bus masters and bus slaves and [Figure 13.1](#) shows the bus configuration.

Table 13.1 Bus Specifications

| Classification | Bus Master/Slave name | Bus I/F Max Freq | Sync Clock | Specifications |
|----------------|-------------------------|------------------|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bus Masters | Code bus (Cortex-M33) | 240 MHz | ICLK | Connected to the CPU Instruction Cache for instructions and operands |
| | System bus (Cortex-M33) | 240 MHz | ICLK | Connected to the CPU Data Cache for system |
| | DMAC / DTC | 240 MHz | ICLK | Connected to the DMAC/DTC |
| Bus Slaves | FHBIU | 240 MHz | ICLK | Connected to Code Flash memory and Configuration area |
| | FLBIU | 60 MHz | FCLK | Connected to Data Flash memory, FACI |
| | S0BIU | 240 MHz | ICLK | Connected to SRAM0 (Standby RAM) |
| | PSBIU | 240 MHz | ICLK | <ul style="list-style-type: none"> Connected to peripheral system modules (DTC, DMAC, ICU, Flash, MPU, SRAM, Debug/Trace module, System controller and BUS controller) Connected to peripheral modules (IIRFA, TFU, and IO ports) |
| | PLBIU | 60 MHz | PCLKB | Connected to peripheral modules (CAC, ELC, POEG, WDT, IWDI, AGT, CANFD, TSN, ACPHPS, and KINT) |
| | PHBIU | 120 MHz | PCLKA | Connected to peripheral modules (GPT, SCI, SPI, CRC, DOC, ADC, DAC12, CNECC, IIC, SCE5, and PDG) |

Note: FHBIU: Flash High speed Bus Interface Unit.
 FLBIU: Flash Low speed Bus Interface Unit.
 S0BIU: SRAM0 Bus Interface Unit.
 PSBIU: Peripheral System Bus Interface Unit.
 PLBIU: Peripheral Low speed Bus Interface Unit.
 PHBIU: Peripheral High speed Bus Interface Unit.

Figure 13.1 Bus Connection

13.2 Description of Buses

13.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected for each master. For details, see [section 13.3.3. BUSSCNT<slave> : Slave Bus Control Register \(<slave> = FHBIU, FLBIU, S0BIU\)](#), [section 13.3.4. BUSSCNT<slave> : Slave Bus Control Register \(<slave> = PSBIU, PLBIU, PHBIU\)](#).

13.2.2 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave modules. For example, if the CPU is fetching an instruction from Code Flash and an operand from SRAM0, the DMAC can handle transfer between a peripheral module at the same time.

[Figure 13.2](#) shows an example of parallel operations. In this example, the CPU uses code bus and system bus for simultaneous access to FHBIU and S0BIU, respectively. Furthermore, the DMAC/DTC simultaneously accesses the peripheral bus during access to FHBIU and S0BIU by the CPU.

Figure 13.2 Example of Parallel Operations

13.2.3 Restrictions

(1) Restriction on Endian

Memory space must be little-endian in order to execute Cortex code.

(2) Bufferable write access

When CPU perform Bufferable Write access to PLBIU or PHBIU, if an STZF error occurs then the error response is invalidated. So there is no error flag will be set and no NMI / RESET request is generated.

When CPU perform Bufferable Write access to PHBIU, if a Slave BUS error occurs then the error response will become invalid and the error flag will not be set.

If error response is required, set the bus master to non-bufferable access.

(3) Access to reserved area of FLBIU and S0BIU

Access to the reserved area of FLBIU and S0BIU is prohibited. Operation is not guaranteed if accessed.

(4) Clock setting

The clock division ratio prohibits setting changes during slave bus access to FLBIU, PLBIU, and PHBIU.

13.3 Register Descriptions

13.3.1 BUSSARA : BUS Security Attribution Register A

Base address: CPSCU = 0x4000_8000

Offset address: 0x0100

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15:2 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: • BUSSCNT<slave> : <slave> is bus interface unit name for Slave

- The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.

ARBS[1:0] bits (Arbitration Select for two masters)

The ARBS bits sets the arbitration method of each master.

13.3.4 BUSSCNT<slave> : Slave Bus Control Register (<slave> = PSBIU, PLBIU, PHBIU)

Base address: BUS = 0x4000_3000

Offset address: 0x1120 (BUSSCNTPSBIU)
0x1130 (BUSSCNTPLBIU)
0x1134 (BUSSCNTPHBIU)

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ARBS |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | ARBS | Arbitration Select for two masters Specify the priority between bus master. > : Fixed Priority ↔: Round-Robin 0: DMAC/DTC > CPU 1: DMAC/DTC ↔ CPU | R/W |
| 15:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: • BUSSCNT<slave> : <slave> is bus interface unit name for Slave

- The change is prohibited from initial value (0) to reserved bit. Operation when changing is not guaranteed.

ARBS bit (Arbitration Select for two masters)

The ARBS bits sets the arbitration method of each master.

13.3.5 BUSnERRADD : BUS Error Address Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1800 + 0x10 × (n - 1)

| Bit | Symbol | Function | R/W |
|------|-------------|----------------------------------------------------------------------------------|-----|
| 31:0 | BERAD[31:0] | Bus Error Address When a bus error occurs, these bits store the error address | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 14, Memory Protection Unit \(MPU\)](#) and [section 45.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BUS1ERRADD : Code bus

BUS2ERRADD : System bus

BUS3ERRADD : DMAC/DTC

BERAD[31:0] bits (Bus Error Address)

The BERAD[31:0] bits indicate the address when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 13.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 13.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BERAD[31:0] bits store the address of the bus error access.

BERAD[31:0] bits are only valid when ILERRSTAT, MMERRSTAT, and SLERRSTAT in BUSnERRSTAT (n = 1 to 3) are set to 1.

13.3.6 BUSnERRRW : BUS Error Read Write Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1804 + 0x10 × (n - 1)

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------|-----|
| 0 | RWSTAT | Error Access Read/Write Status The status at the time of the error 0: Read access 1: Write access | R |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU related reset, see [section 5, Resets](#) and [section 14, Memory Protection Unit \(MPU\)](#).

The following bus errors correspond to the master bus:

BUS1ERRRW : Code bus

BUS2ERRRW : System bus

BUS3ERRRW : DMAC/DTC

RWSTAT bit (Error Access Read/Write Status)

The RWSTAT bit indicates the access status, (write access or read access) when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 13.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 13.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the RWSTAT bits store the read/write status of the bus error access.

RWSTAT bit is only valid when ILERRSTAT, MMERRSTAT, and SLERRSTAT in BUSnERRSTAT (n = 1 to 3) are set to 1.

13.3.7 BTZFnERRADD : BUS TZF Error Address Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: $0x1900 + 0x10 \times (n - 1)$

Bit position: 31

0

Bit field:

BTZFERAD[31:0]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|----------------|---------------------------------------------------------------------------------------------------|-----|
| 31:0 | BTZFERAD[31:0] | Bus TrustZone Filter Error Address When a bus error occurs, these bits store the error address | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 14, Memory Protection Unit \(MPU\)](#) and [section 45.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BTZF1ERRADD : Code bus

BTZF2ERRADD : System bus

BTZF3ERRADD : DMAC/DTC

See [Figure 13.1](#) for connection of each BUS.

BTZFERAD[31:0] bits (Bus TrustZone Filter Error Address)

The BTZFERAD[31:0] bits indicate the address, when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 13.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 13.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the BTZFERAD[31:0] bits store the address of the bus error access.

BTZFERAD[31:0] bits are only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

13.3.8 BTZFnERRRW : BUS TZF Error Read Write Register (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: $0x1904 + 0x10 \times (n - 1)$

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | TRWSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|-----------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | TRWSTAT | TrustZone filter error access Read/Write Status The status at the time of the error 0: Read access 1: Write access | R |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 14, Memory Protection Unit \(MPU\)](#) and [section 45.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BTZF1ERRRW : Code bus

BTZF2ERRRW : System bus

BTZF3ERRRW : DMAC/DTC

See [Figure 13.1](#) for connection of each BUS.

TRWSTAT bit (TrustZone filter error access Read/Write Status)

The TRWSTAT bit indicates the access status, (write access or read access), when an error occurs on the associated bus. For detail of error that occurs by bus, see [section 13.3.9. BUSnERRSTAT : BUS Error Status Register n \(n = 1 to 3\)](#) and [section 13.4. Bus Error Monitoring Section](#).

When an error occurs on the bus, the corresponding bit of STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1, at the same time, the TRWSTAT bits store the read/write status of the bus error access. The TRWSTAT bit is only valid when STERRSTAT in BUSnERRSTAT (n = 1 to 3) is set to 1.

13.3.9 BUSnERRSTAT : BUS Error Status Register n (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: $0x1A00 + 0x10 \times (n - 1)$

| | | | | | | | | |
|--------------------|---|---|---|-----------|-----------|---|-----------|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | ILERRSTAT | MMERRSTAT | — | STERRSTAT | SLERRSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------|----------------------------------------------------------------------------------|-----|
| 0 | SLERRSTAT | Slave bus Error Status 0: No error occurred 1: Error occurred | R |
| 1 | STERRSTAT | Slave TrustZone filter Error Status 0: No error occurred 1: Error occurred | R |
| 2 | — | This bit is read as 0. | R |

| Bit | Symbol | Function | R/W |
|-----|-----------|----------------------------------------------------------------------------------|-----|
| 3 | MMERRSTAT | Master MPU Error Status 0: No error occurred 1: Error occurred | R |
| 4 | ILERRSTAT | Illegal address access Error Status 0: No error occurred 1: Error occurred | R |
| 7:5 | — | These bits are read as 0. | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 14, Memory Protection Unit \(MPU\)](#) and [section 45.2. Arm TrustZone Security](#).

The following bus errors correspond to the master bus:

BUS1ERRSTAT : Code bus

BUS2ERRSTAT : System bus

BUS3ERRSTAT : DMAC/DTC

See [Figure 13.1](#) for connection of each BUS

When an illegal access error, master MPU error, and slave bus error all occurred at the same time, the STAT bit is only valid in the following order of priority. The left side has higher priority.

Master MPU Error > Illegal access error, slave bus error

Note: Illegal access error and slave bus error do not occur at the same time.

If one of ILERRSTAT, MMERRSTAT or SLERRSTAT is set, these bits are not renewed until it is cleared.

SLERRSTAT bit (Slave bus Error Status)

When slave error occurs by bus, BUSnERRSTAT.SLERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.SLERRCLR (n = 1 to 3) to 1. Slave error is an error that occurs on a slave such as a timeout. For detail of slave error that occurs by bus, see [section 13.4. Bus Error Monitoring Section](#).

STERRSTAT bit (Slave TrustZone filter Error Status)

When slave TrustZone filter error occurs by bus, BUSnERRSTAT.STERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.STERRCLR (n = 1 to 3) to 1. The STERRSTAT bit is not set when the debugger accesses the security area. For detail of slave TrustZone filter error that occurs by bus, see [section 45, Security Features](#).

MMERRSTAT bit (Master MPU Error Status)

When master MPU error occurs by bus, BUSnERRSTAT.MMERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.MMERRCLR (n = 1 to 3) to 1. For detail of master MPU error that occurs by bus, see [section 14, Memory Protection Unit \(MPU\)](#).

Note: At master MPU error is occur in DMAC or DTC access, if error address value is not as master MPU area, Illegal address access error or slave error is occurring before DMAC or DTC access. Decide the what error was happened by referring the error address value.

ILERRSTAT bit (Illegal address access Error Status)

When illegal address access error occurs by bus, BUSnERRSTAT.ILERRSTAT (n = 1 to 3) is set to 1. Clear condition is reset or set BUSnERRCLR.ILERRCLR (n = 1 to 3) to 1. For detail of illegal address access error that occurs by bus, see [section 13.4. Bus Error Monitoring Section](#).

13.3.10 DMACDTCERRSTAT : DMAC/DTC Error Status Register

Base address: BUS = 0x4000_3000

Offset address: 0x1A24

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | MTERRSTAT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------|-----------------------------------------------------------------------------------|-----|
| 0 | MTERRSTAT | Master TrustZone Filter Error Status 0: No error occurred 1: Error occurred | R |
| 7:1 | — | These bits are read as 0. | R |

This register is cleared by reset other than MPU- and TZF-related resets which are Bus Master MPU Error Reset and TrustZone Filter Error Reset.

For detail of MPU- and TZF-related resets, see [section 5, Resets](#), [section 14, Memory Protection Unit \(MPU\)](#) and [section 45.2. Arm TrustZone Security](#).

MTERRSTAT bit (Master TrustZone Filter Error Status)

When a master TrustZone filter error occurs by DMAC or DTC, DMACDTCERRSTAT.MTERRSTAT is set to 1. Clear condition is reset or set DMACDTCERRCLR.MTERRCLR to 1.

For detail of master TrustZone filter error that occurs by DMAC or DTC, see [section 15, DMA Controller \(DMAC\)](#) and [section 16, Data Transfer Controller \(DTC\)](#)

13.3.11 BUSnERRCLR : BUS Error Clear Register n (n = 1 to 3)

Base address: BUS = 0x4000_3000

Offset address: 0x1A08 + 0x10 × (n - 1)

| | | | | | | | | |
|--------------------|---|---|---|----------|----------|---|----------|----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | ILERRCLR | MMERRCLR | — | STERRCLR | SLERRCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|----------|-------------------------------------------------------------------------------------------------------------------|------------------|
| 0 | SLERRCLR | Slave bus Error Clear Writing 1 to the SLERRCLR bit clears the BUSnERRSTAT.SLERRSTAT (n = 1 to 3) | R/W ¹ |
| 1 | STERRCLR | Slave TrustZone filter Error Clear Writing 1 to the STERRCLR bit clears the BUSnERRSTAT.STERRSTAT (n = 1 to 3) | R/W ¹ |
| 2 | — | This bit is read as 0. The write value should be 0. | R/W |
| 3 | MMERRCLR | Master MPU Error Clear Writing 1 to the MMERRCLR bit clears the BUSnERRSTAT.MMERRSTAT (n = 1 to 3) | R/W ¹ |
| 4 | ILERRCLR | Illegal Address Access Error Clear Writing 1 to the ILERRCLR bit clears the BUSnERRSTAT.ILERRSTAT (n = 1 to 3) | R/W ¹ |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

The following bus errors correspond to the master bus:

BUS1ERRCLR : Code bus

BUS2ERRCLR : System bus

BUS3ERRCLR : DMAC/DTC

When writing 1 to BUSnERRCLR (n = 1 to 3), stop the bus access that causes an error in the corresponding bus master.

13.3.12 DMACDTCERRCLR : DMAC/DTC Error Clear Register

Base address: BUS = 0x4000_3000

Offset address: 0x1A2C

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|--------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | MTER RCLR |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|----------|--------------------------------------------------------------------------------------------------------|-------------------|
| 0 | MTERRCLR | Master TrustZone filter Error Clear Writing 1 to this bit clears the DMACDTCERRSTAT.MTERRSTAT flag. | R/W ^{*1} |
| 7:1 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

When writing 1 to DMACDTCERRCLR, stop the bus access that causes an error in DMAC/DTC.

13.4 Bus Error Monitoring Section

The bus error monitoring system monitors each individual area, and when an error is detected, an error is returned to the requesting master IP using the AHB-Lite error response protocol.

13.4.1 Bus Error Types

The following types of errors can occur on each bus:

- Illegal address access
- Bus master MPU error
- TrustZone Filter error
- Bus error transmitted from each slave IP

Table 13.2 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see [section 14, Memory Protection Unit \(MPU\)](#).

13.4.2 Operations When a Bus Error Occurs

When a bus error occurs, operation is not guaranteed and the error is returned to the requesting master IP.

Figure 13.3 shows operation from each error detection to user notification on the bus.

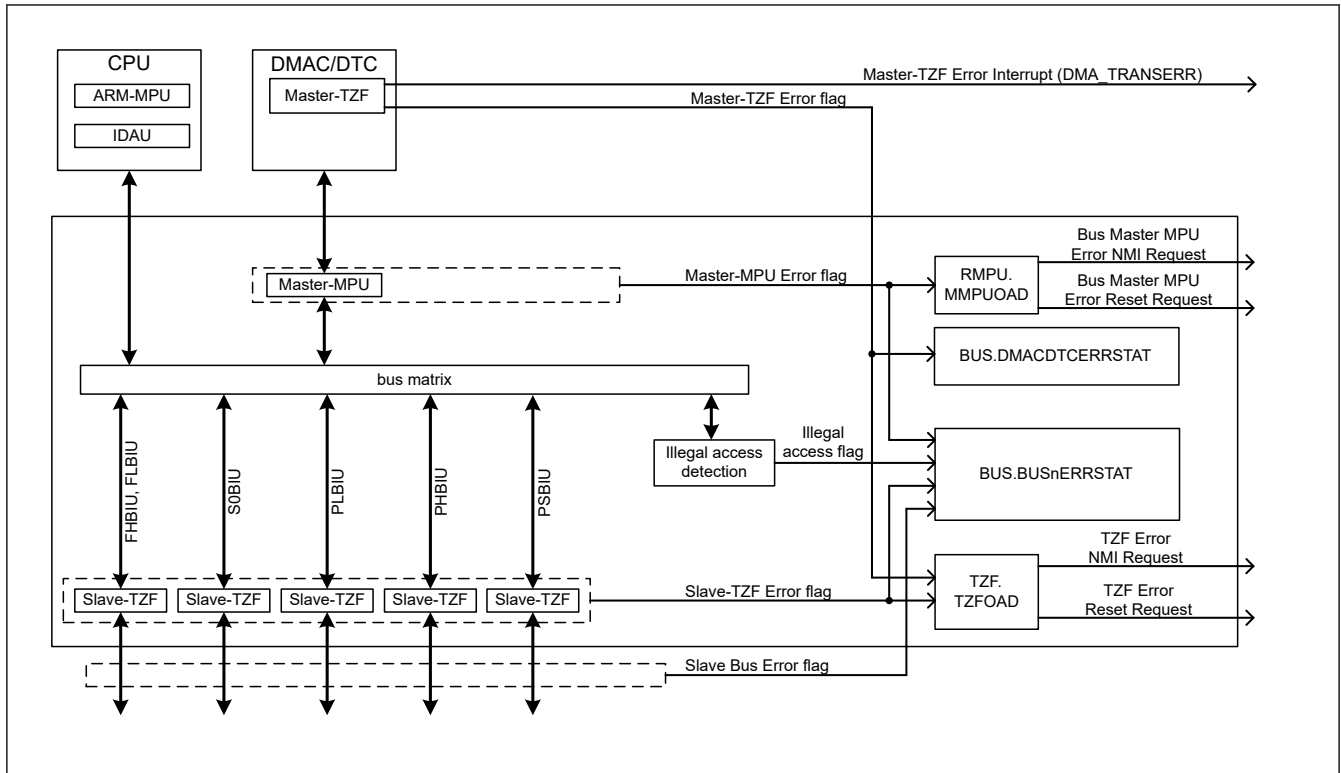

Figure 13.3 The operation from each error detection to user notification on the bus

(1) Bus Master MPU Error

The bus master of DMAC/DTC has a master MPU for access control of the set address area. The CPU does not have a master MPU because it has an Arm MPU. When a bus master MPU error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD ($n = 3$).
2. Store the read/write information of the error in BUSnERRRW ($n = 3$).
3. Set 1 to MMERRSTAT bit of BUSnERRSTAT ($n = 3$).

An NMI request or a reset request is generated according to the MMPUOAD.OAD setting (see [section 14, Memory Protection Unit \(MPU\)](#)). Since BUSnERRADD ($n = 3$), BUSnERRRW ($n = 3$), and BUSnERRSTAT ($n = 3$) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR ($n = 3$), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first bus master MPU error after a reset or clearing of BUSnERRSTAT.MMERRSTAT ($n = 3$) bit by BUSnERRCLR ($n = 3$).

(2) Illegal Access Error

[section 13.4.3. Conditions Leading to Illegal Address Access Errors](#), describes illegal access errors. When an illegal access error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD ($n = 1$ to 3).
2. Store the read/write information of the error in BUSnERRRW ($n = 1$ to 3).
3. Set 1 to ILERRSTAT bit of BUSnERRSTAT ($n = 1$ to 3).

NMI request and reset request are not generated. Since BUSnERRADD ($n = 1$ to 3), BUSnERRRW ($n = 1$ to 3), BUSnERRSTAT ($n = 1$ to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR ($n = 1$ to 3), they can be confirmed in the Bus Fault handler or the interrupt handler.

(3) Master-TZF Error

As described in [section 45, Security Features](#), DMAC/DTC has Master-TZF errors. When a Master-TZF error is detected, 1 is set to MTERRSTAT bit of DMACDTCERRSTAT, and because the DMAC/DTC does not perform bus access, no bus error information is stored in BTZF3ERRADD and BTZF3ERRRW.

An NMI request or reset request is generated according to the setting of TZFOAD.OAD. See [section 15, DMA Controller \(DMAC\)](#), [section 16, Data Transfer Controller \(DTC\)](#) for details on Master-TZF errors. Because DMACDTCERRSTAT is held until reset other than MPU- and TZF-related resets or cleared by DMACDTCERRCLR, they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Master-TZF error after reset or clearing of the DMACDTCERRSTAT.MTERRSTAT bit by DMACDTCERRCLR.

(4) Slave-TZF Error

As described in [section 45, Security Features](#), FHBIU (code flash), FLBIU (data flash), S0BIU (SRAM), PSBIU, PHBIU and PLBIU have Slave-TZF errors. See [section 45.2.3, Peripheral Security Attribution](#) for TZF error occurrence of each peripheral module. When a Slave-TZF error is detected, perform the following steps:

1. Store the address of the error in BTZFnERRADD (n = 1 to 3).
2. Store the read/write information of the error in BTZFnERRRW (n = 1 to 3).
3. Set 1 to STERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

NMI request or reset request is generated according to the setting in TZFOAD.OAD. Since BTZFnERRADD (n = 1 to 3), BTZFnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the NMI handler or after reset.

An NMI request is generated only on the first Slave-TZF error after a reset or clearing of the BUSnERRSTAT.STERRSTAT (n = 1 to 3) bit by BUSnERRCLR (n = 1 to 3).

(5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the master. At the same time, perform the following steps:

1. Store the address of the error in BUSnERRADD (n = 1 to 3)
2. Store the read/write information of the error in BUSnERRRW (n = 1 to 3)
3. Set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 3).

An NMI request and reset request are not generated. Since BUSnERRADD (n = 1 to 3), BUSnERRRW (n = 1 to 3), and BUSnERRSTAT (n = 1 to 3) are held until reset other than MPU- and TZF-related resets or cleared by BUSnERRCLR (n = 1 to 3), they can be verified in the Bus Fault handler or interrupt handler.

13.4.3 Conditions Leading to Illegal Address Access Errors

[Table 13.2](#) lists the address spaces for each bus that trigger illegal address access errors.

Table 13.2 Conditions leading to illegal address access errors (1 of 2)

| Address | Slave bus | Master bus | | |
|----------------------------|-----------|------------|--------|-----|
| | | CPU | | DMA |
| | | Code | System | |
| 0x0000_0000 to 0x01FF_FFFF | FHBIU | — | | — |
| 0x0200_0000 to 0x07FF_FFFF | Reserved | E | | E |
| 0x0800_0000 to 0x0803_FFFF | FLBIU | — | | — |
| 0x0804_0000 to 0x0FFF_FFFF | Reserved | E | | E |
| 0x1000_0000 to 0x100F_FFFF | Reserved | — | | E |
| 0x1010_0000 to 0x1FFF_FFFF | Reserved | E | | E |

Table 13.2 Conditions leading to illegal address access errors (2 of 2)

| Address | Slave bus | Master bus | | |
|----------------------------|------------------------|------------|--------|-----|
| | | CPU | | DMA |
| | | Code | System | |
| 0x2000_0000 to 0x2800_FFFF | S0BIU | | — | — |
| 0x2801_0000 to 0x3FFF_FFFF | Reserved | | E | E |
| 0x4000_0000 to 0x4007_FFFF | PSBIU | | — | — |
| 0x4008_0000 to 0x400F_FFFF | PLBIU | | — | — |
| 0x4010_0000 to 0x4017_FFFF | PHBIU | | — | — |
| 0x4018_0000 to 0x407D_FFFF | Reserved | | E | E |
| 0x407E_0000 to 0x407F_FFFF | FLBIU | | — | — |
| 0x4080_0000 to 0x5FFF_FFFF | Reserved | | E | E |
| 0x6000_0000 to 0xDFFF_FFFF | Reserved | | E | E |
| 0xE000_0000 to 0xFFFF_FFFF | System for Cortex®-M33 | | | E |

Note: "E" : A bus error occurs.

"—" : Transfer does not occur.

"—" : A bus error has not occurred. Even if there has reserved area, a bus error has not occurred.

Do not access reserved area in FLBIU and S0BIU. If accessed, a slave TZF error might occur.

13.4.4 Time-out

For some peripheral modules, a timeout error occurs with the module-stop function. When there is no response from the slave for a certain period of time, a timeout error is detected. A timeout error is returned to the requesting master IP using the AHB-Lite error response protocol.

13.6 Cache

13.6.1 Overview

There are two types of caches:

- C-cache on code bus
- S-cache on system bus.

Table 13.3 lists the specifications of the cache, Figure 13.4 shows a block diagram of the cache, and Figure 13.5 shows the cache structure.

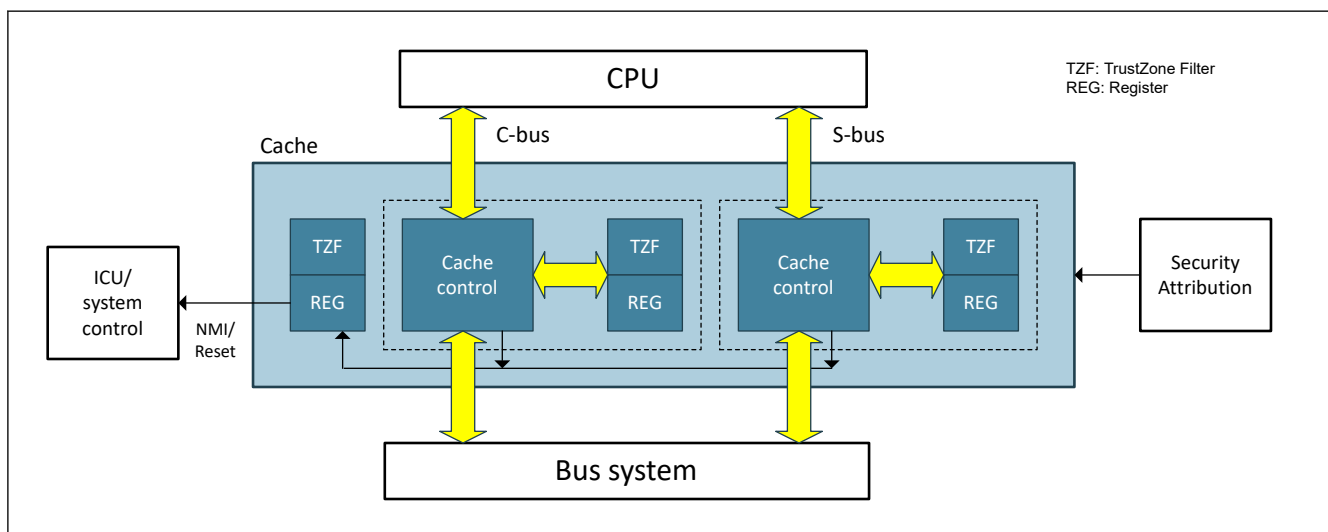

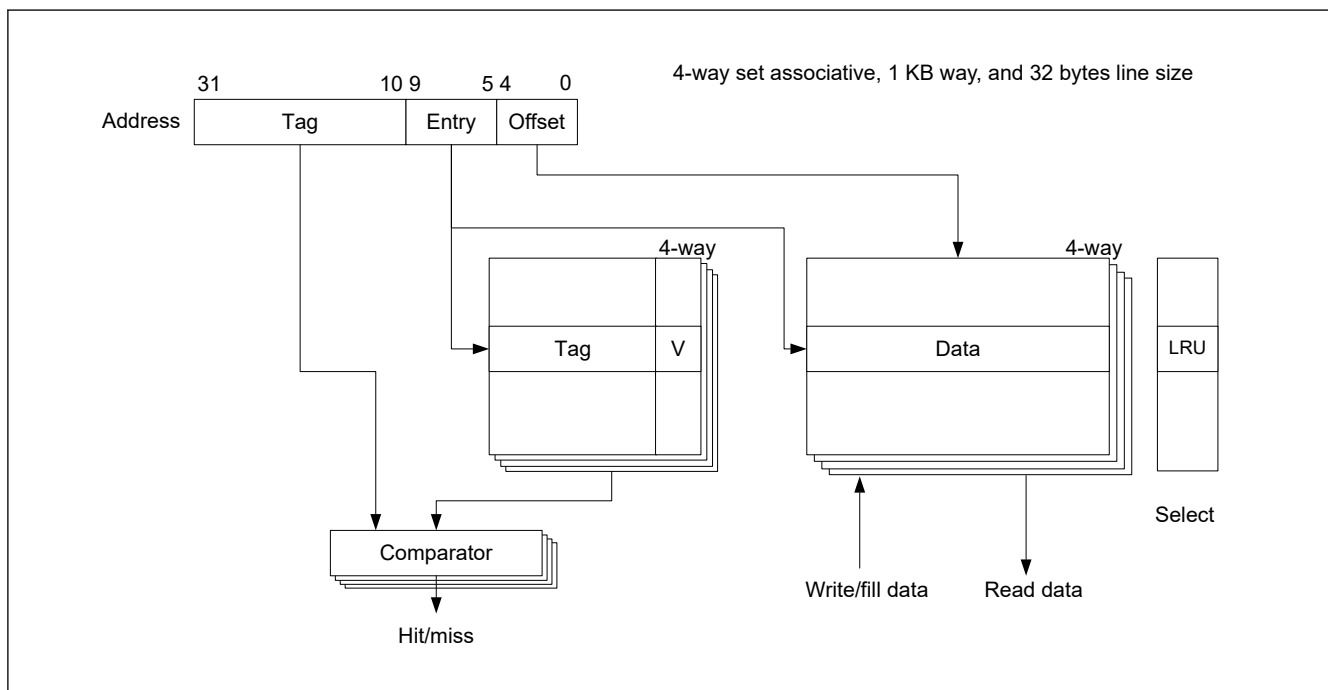

Table 13.3 Cache specifications (1 of 2)

| Parameter | C-cache | S-cache |
|-----------------|-----------------------|-----------------------|
| Capacity | 4 KB | 4 KB |
| Way | 4-way set associative | 4-way set associative |

13.6.2 Register Description

13.6.2.1 CSAR : Cache Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x000

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|----------|----------|----------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | CACHEESA | CACHELSA | CACHEESA |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|----------|---------------------------------------------------------------------------------------------|-----|
| 0 | CACHESA | Security Attributes of Registers for Cache Control 0: Secure 1: Non-secure | R/W |
| 1 | CACHELSA | Security Attributes of Registers for Cache Line Configuration 0: Secure 1: Non-secure | R/W |
| 2 | CACHEESA | Security Attributes of Registers for Cache Error 0: Secure 1: Non-secure | R/W |
| 31:3 | — | These bits are read as 1. | R |

Note: Only secure access can write to this register. Both secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note: When CACHESA = 0 (secure), cache maintenance operation cannot be performed after updated the program. Therefore, when debugging, software breakpoints cannot be used for the cache target area.

CACHESA bit (Security Attributes of Registers for Cache Control)

The CACHESA bit indicates the security attributes of registers for cache control. The target registers are:

- CCACTL
- CCAFCT
- SCACTL
- SCAFCT.

CACHELSA bit (Security Attributes of Registers for Cache Line Configuration)

The CACHELSA bit indicates the security attributes of registers for cache line configuration. The target registers are:

- CCALCF
- SCALCF.

CACHEESA bit (Security Attributes of Registers for Cache Error)

The CACHEESA bit indicates the security attributes of registers for cache error.

- CAPOAD
- CAPRCR.

The CS[1:0] bits control the cache line size of S-cache. This bit can be written when the SCACTL.ENS bit is 0. Otherwise, this bit cannot be written.

This bit can be written when the CACTL.ENS bit is 0. Otherwise, this bit cannot be written.

Base address: CACHE = 0x4000_7000
Offset address: 0x200

Bit position: 31

0

Bit field:

[illegible][illegible]

| Bit | Symbol | Function | R/W |
|------|--------|-------------------------------------------------------------------------------------------------------------|-----|
| 0 | OAD | Operation after Detection Select the operation after detection: 0: Non-maskable interrupt 1: Reset | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The OAD bit generates either a reset or a non-maskable interrupt when parity error is detected.

The protection register (CAPRCR) protects this register against writes. Modify the valid bit in the protection register (CAPRCR) to enable before writing to this bit. Do not write to CAPOAD while access to cache is in progress.

Base address: CACHE = 0x4000_7000
Offset address: 0x204

Bit position:

31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16

Bit field:

[illegible]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

Bit position:

15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

Bit field:

[illegible]

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|---------|--------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PRCR | Register Write Control Set the register write control: 0: Disable writes to protected registers 1: Enable writes to protected registers | R/W |
| 7:1 | KW[6:0] | Write key code These bits enable or disable writes to the PRCR bit. | R/W |

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------|-----|
| 31:8 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

PRCR bit (Register Write Control)

The PRCR bit controls the write mode of the CAPOAD register. When this bit is set to 1, writing to the CAPOAD register is enabled. When writing to this bit, write 0x78 to the KW[6:0] bits simultaneously.

KW[6:0] bits (Write key code)

The KW[6:0] bits enable or disable writes to the PRCR bit. When writing to the PRCR bit, write 0x78 to the KW[6:0] bits simultaneously. When a value other than 0x78 is written to KW[6:0] bits, the PRCR bit is not updated. The KW[6:0] bits are always read as 0x00.

13.6.3 Operation

13.6.3.1 S-Cache

Figure 13.6 shows the access flow from CPU to S-cache.

Figure 13.6 Access flow from CPU to S-cache

The cache function works when cache is enabled (CACTL.ENS = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

Read miss

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

Read hit

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

Write miss

The cache processes only a write cycle to memory. No affect to cache data.

Write hit

The cache processes both a write cycle to cache data and a write cycle to memory.

13.6.3.2 C-Cache

Figure 13.7 shows the access flow from CPU to C-cache.

Figure 13.7 Access flow from CPU to C-cache

The cache function works when cache is enabled (CACTL.ENC = 1) and cacheable access is from CPU. The cache checks the address of CPU access request and request in cache tag, then determines whether the CPU access is a hit or a miss-hit.

Read miss

The cache reads one cache line data from memory and stores it into the cache data. The cache then returns the required data to CPU.

Read hit

The cache reads required data from the cache data and returns it to CPU. Access cycle then determines it is a hit because of the 0 wait cycle.

Because C-cache does not function in the ROM area of C-cache, therefore it operates in read-only access.

13.6.3.3 Cache Flush

The Valid bit is cleared with the CAFCT register. However, tag and cache data are not affected by the CAFCT register.

The valid bit is also cleared when CACTL is set from 0 to 1.

Note: After changing the cacheable attribute by the Arm MPU, clear the valid bit using the CAFCT register.

13.6.3.4 LRU and Replace

The cache uses LRU (Least Recently Used) mechanism as the cache replacement algorithm. If a CPU access is determined as a hit or a miss-hit, the cache replaces cache data that is not the last restored. Additionally, the cache is tagged as the latest data in LRU of the cache data. Therefore even when the cache line in cache ways are full, the cache can replace cache data using LRU which shows older data.

The algorithm for a 4-way Full-LRU shows the order each way, for example way 0 to way 3.

13.6.3.5 Parity Check

The cache has a parity check function for cache RAM that is stored as cache fill data. The cache has 4-bit parities for 32-bit data, that is when data is read, a parity bit is added to every 8-bit data of 32-bit data width. When the cache reads data with a hit status, it checks for parity errors. When a parity error occurs, a parity error notification is generated.

The cache reads 32-bit data even when the CPU requests a byte read or half-word read.

Note: A parity error might occur even though it is caused by a non validated-data byte of which the CPU does not request.

Parity error notification can be specified as a non-maskable interrupt or a reset request in the CAPOAD register. However, if the debug mode requests to suppress the parity error notification, then notification is not generated.

When a parity error occurs, the cache does not perform a cache flush and does not respond to the CPU with a bus error.

Parity errors often occur due to noise. To confirm whether the cause of the parity error is noise or corruption, see the flows for cache parity check in [Figure 13.8](#) and [Figure 13.9](#).

Figure 13.8 Flow of cache parity check when parity reset is enabled

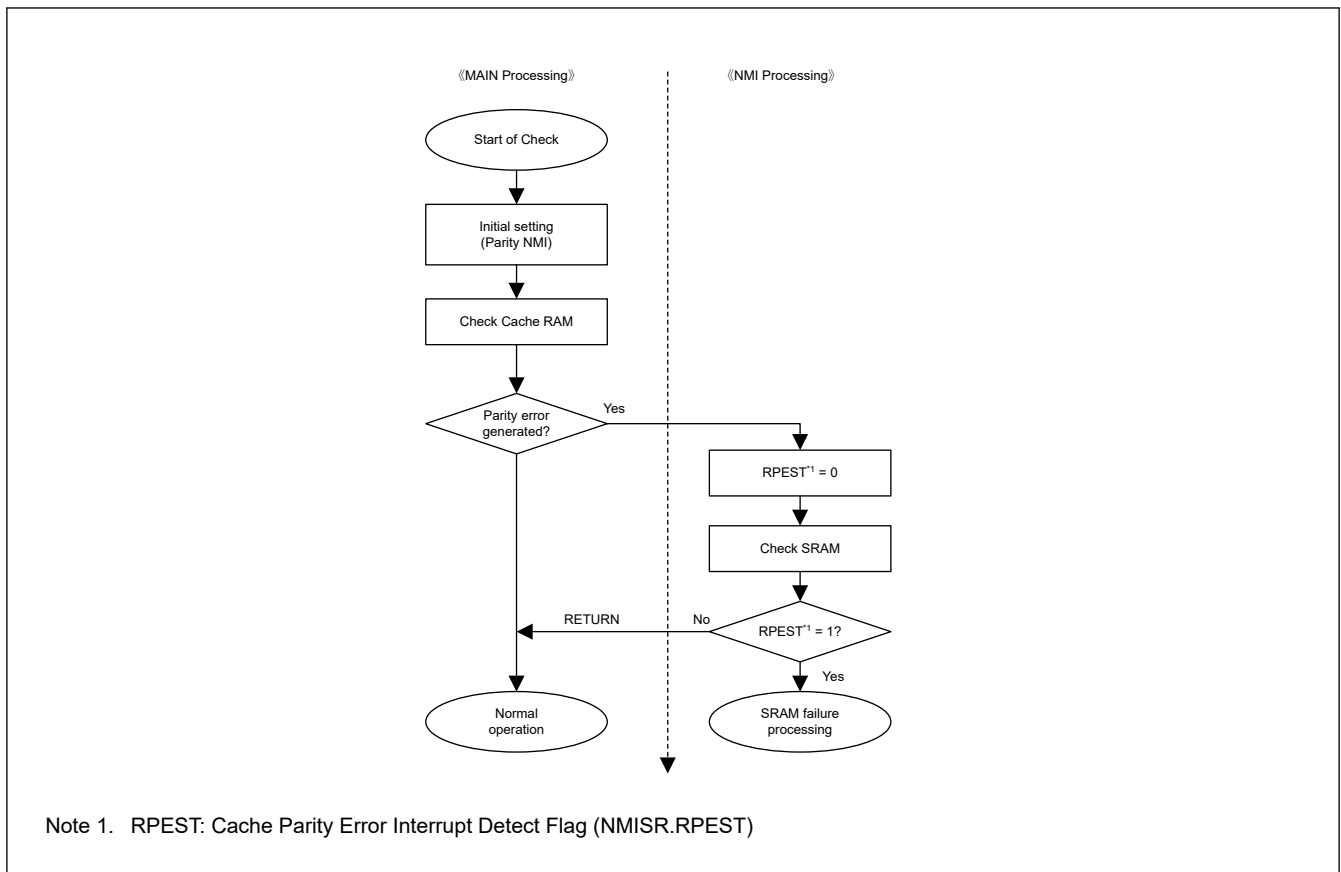

Figure 13.9 Flow of cache parity check when parity interrupt is enabled

13.6.3.5.1 Cache RAM Check

Parity error of cache RAM occurs at a read access by CPU with a cache status of read-hit. With a read-hit status, some conditions are required before performing a cache RAM check. For S-cache check, execute the check program in flash memory. For C-cache check, execute the check program in SRAM.

(1) Cache RAM check flow

1. Flush all valid bits in cache to clear the cache enable bit.
2. Reserve a 4-KB work memory such as SRAM for S-cache. Because each cache in the MCU is a 4-way set associative with 1 KB RAM per way, a total of 4 KB is required for S-cache. The target address should not be used as reserved area.
3. Set the cache enable to 1.
4. Read data from the target word address of 4 KB using the CPU. The status of cache should be a read-miss with the result stored as cache fill data.
5. Read data in another cache way whose address is calculated by adding the address in step 4. with 1 KB address. The status of cache should be a read-miss with the result stored as cache fill data in another way.
6. Read data in another cache way whose address is calculated by adding the address in step 5. with 1 KB address. The status of cache should be a read-miss with the result stored as cache fill data in another way.
7. Read data in another cache way whose address is calculated by adding the address in step 6. with 1 KB address. The status of cache should be a read-miss with the result stored as cache fill data in another way. Cache RAM check for a write/read-hit status is now complete.
8. Write test data to the target word address in steps 4., 5., 6., and 7.. The status of cache in steps 4., 5., 6., and 7. should be a write-hit with the results written to the cache RAM.
9. Read from the target word address in steps 4., 5., 6., and 7. again. The status of cache in steps 4., 5., 6., and 7. should be a read-hit. Parity check for a word data is now complete.
10. Go to step 1. to continue parity check for different target addresses.

13.6.3.6 Bus Error

The association from a bus slave to a bus error is described in the sections that follow.

In cache off

The cache returns a bus error to the CPU.

For non-cacheable access

The cache returns a bus error to the CPU.

During read accesses for cache fill

For the first data that corresponds to a CPU access request, the cache returns a bus error to the CPU. For other read data while filling the cache line, the cache cannot return a bus error to the CPU except for read data with early forwarding. The cache enable bit clears the cache line if the cache accepts a bus error response from the slave.

For write-hit status

The cache cannot return a bus error to the CPU because the cache enable bit does not clear the cache line.

For write-miss status

The cache cannot return a bus error to the CPU.

13.6.3.7 Early Forwarding Function

While filling data in the cache, if the address of the CPU read request and the address of the cache fill request are the same, the cache returns the data to CPU. [Table 13.4](#) shows an example.

Table 13.4 Example of early forwarding

| Operation | Access sequence | | | | | | | | |
|-----------------------------|-----------------|-------------|-------------|------|-------------|------|------|------|-------------|
| Address of CPU read request | 0x04 | 0x08 | 0x0C | 0x14 | → | 0x10 | → | → | → |
| Address of cache fill | 0x04 | 0x08 | 0x0C | 0x10 | 0x14 | 0x18 | 0x1C | 0x00 | — |
| CPU access status | Read (0x04) | Read (0x08) | Read (0x0C) | — | Read (0x14) | — | — | — | Read (0x10) |

When the CPU requests read accesses and the addresses are 0x04, 0x08, 0x0C, 0x14 and 0x10 sequentially, the first read access to address 0x04 is of a miss-hit status and the cache starts to fill data into cache. The early forwarding function allows a return of read data to CPU when accesses are to addresses 0x08, 0x0C and 0x14 while the cache is filling the cache line. On the other hand, access to address 0x10 must wait for the completion of filling the cache line. The cache then returns data for address 0x10 when it finished filling the cache line.

13.6.4 Usage Notes**13.6.4.1 Cache Line Configuration Register**

Writes to the Cache Line Configuration Register are allowed when the status is cache off (CACTL.ENS = 0 for S-cache, CACTL.ENC = 0 for C-cache).

13.6.4.2 Coherency

The coherency between the cache and the internal SRAM must be guaranteed by software.

When allocating shared memory between the CPU and a bus master such as DMAC in the cache support area, invalidate the cache data as necessary.

13.6.4.3 Cacheability

When the cache is enabled, the cacheability attribute is determined from the default system address map of the Cortex-M or by using an Arm MPU that excludes 0x2800_0000 to 0x2FFF_FFFF area which is always treated as non-cacheable regardless of the default system address map or Arm MPU setting.

When using the default system address map, the cacheable attribution is determined as follows:

- 0x0000_0000 to 0x27FF_FFFF : Cacheable
- 0x2800_0000 to 0x2FFF_FFFF : Non-cacheable

- 0x3000_0000 to 0x3FFF_FFFF : Cacheable
- 0x4000_0000 to 0x5FFF_FFFF : Non-cacheable
- 0x6000_0000 to 0x9FFF_FFFF : Cacheable
- 0xA000_0000 to 0xFFFF_FFFF : Non-cacheable

When not using the default system address map, MAIR_ATTR used for each MPU region determines the cacheable attribution as follows:

- MAIR_ATTR[7:4] = 0000b : Non-cacheable (device memory)
- MAIR_ATTR[7:4] = 0100b : Non-cacheable (normal memory)
- MAIR_ATTR[7:4] = 1010b : Cacheable
- Other settings are not supported in the MCU.

Note: In case of accessing the following areas, the area must be set to non-cacheable:

- Peripheral I/O register area (0x4000_0000 to 0x5FFF_FFFF)

See the ARM Limited, *ARM v8-M Architecture Reference Manual*.

14. Memory Protection Unit (MPU)

14.1 Overview

The MCU has one Memory Protection Unit (MPU).

[Table 14.1](#) lists the MPU specifications, and [Table 14.2](#) shows the behavior on detection of each MPU error.

Table 14.1 MPU specifications

| Classification | Module/Function | Specifications |
|-----------------------|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Illegal memory access | Arm® Cortex®-M33 CPU | <ul style="list-style-type: none"> Arm CPU has a default memory map. If the CPU makes an illegal access, an exception interrupt occurs The MPU can change a default memory map. |
| Memory protection | Arm MPU | Memory protection function for the CPU: <ul style="list-style-type: none"> (8+8) region MPU with sub regions and background region for secure and Non-secure. |
| | Bus master MPU | Memory protection function for each bus master except for the CPU: <ul style="list-style-type: none"> DMAC/DTC: 8 regions |

Table 14.2 Behavior on MPU error detection

| MPU type | Notification type | Error Response by HRESP signal of AHB I/F | Bus Access on error detection | Storing of error access information |
|----------------|--------------------------------------------------------------------------------------------------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| Arm MPU | <ul style="list-style-type: none"> Hard fault | Not supported | <ul style="list-style-type: none"> Does not correctly write access Does not correctly read access | Stored in the Cortex-M33 processor |
| Bus Master MPU | <ul style="list-style-type: none"> Reset or Non-maskable interrupts Hard fault | Supported | <ul style="list-style-type: none"> Write access ignore Read access is read as 0 | Stored |

For information on error access for the Arm MPU, see [section 14.4. References](#). For information on error access for other MPUs, see [section 13.3. Register Descriptions](#) and [section 13.4. Bus Error Monitoring Section](#) in [section 13, Buses](#).

14.2 Arm MPU

The Arm MPU monitors the addresses accessed by the CPU across the entire address space (0x0000_0000 to 0xFFFF_FFFF) and provides support for:

- (8 + 8) protected regions
- When memory regions overlap, the processor generates a fault if a core access hits the overlapping regions
- Setting access permissions to protected region (Read, Write, Execution)
- Export of memory attributes to the system.

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see [section 14.4. References](#).

14.3 Bus Master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000_0000 to 0xFFFF_FFFF). Access-control information can be set up to 8 regions in DMAC/DTC and monitor for access to each region is in accord with this information.

If access to a protected region is detected, the bus master MPU generates an internal reset or a non-maskable interrupt. For information on error access, see [section 13.3. Register Descriptions](#) and [section 13.4. Bus Error Monitoring Section](#) in [section 13, Buses](#).

The access control information for each area consists of protected/not-protected to read or write.

[Table 14.3](#) lists the specifications of the bus master MPU.

Table 14.3 Bus master MPU specifications

| Parameter | Description |
|-----------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| Protected master groups | <ul style="list-style-type: none"> DMAC, DTC |

| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | MMPU ASA7 | MMPU ASA6 | MMPU ASA5 | MMPU ASA4 | MMPU ASA3 | MMPU ASA2 | MMPU ASA1 | MMPU ASA0 |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|----------|-----------------------------------------------------------------------|-----------------|
| 7:0 | MMPUASAn | MMPUA Security Attribution (n = 0 to 7) 0: Secure 1: Non-secure | R/W |
| 31:8 | — | These bits are read as 1. | R ^{*1} |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note 1. This bit is read only.

MMPUASAn bits (MMPUA Security Attribution (n = 0 to 7))

The MMPUASAn bits specify the security attributes of registers for the Bus Master MPU Region Setting register. The target registers are:

- MMPUSDMAcN (n = 0 to 7)
- MMPUEDMAcN (n = 0 to 7)
- MMPUACDMAcN (n = 0 to 7)

Base address: CPSCU = 0x4000_8000
Offset address: 0x134

| Bit | Symbol | Function | R/W |
|------|----------|----------------------------------------------------------|-----|
| 0 | MMPUBSA0 | MMPUB Security Attribution 0: Secure 1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R*1 |

Note 1. This bit is read-only.

The MMPUBSA0 bit specifies the security attributes of registers for the Bus Master MPU Region Setting register, Protect register, and OAD register. The target registers are:

- The Secure user provides a Secure API to Non-secure user for the modification of the MMPURPTDMAC value when MMPUBSA0 bit is set to 0 (Secure).

Base address: RMPU = 0x4000_0000
Offset address: $0x0204 + 0x010 \times n$

| Bit | Symbol | Function | R/W |
|------|-------------|---------------------------------------------------------------------------------------------------|-----|
| 4:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31:5 | MMPUS[31:5] | Region start address register Address where the region starts, for use in region determination | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MMPUSDMACn (n = 0 to 7) register specifies the start address where the region starts.

This register requires word access. Byte access and half word access is prohibited. When byte access and half word access is executed, operation is not guaranteed.

Regions set by MMPUSDMACn (n = 0 to 7), MMPUEDMACn (n = 0 to 7) and MMPUACDMACn (n = 0 to 7) registers, can be set for a secure access or a Non-secure access with the MMPUSARA register. If the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 1, only Non-secure access is permitted for that region. On the other hand, if the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 0, only secure access is permitted for that region.

14.3.1.4 MMPUEDMACn : MMPU End Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000

Offset address: $0x0208 + 0x010 \times n$

Bit position: 31 5 0

| | | | | | | |
|------------|-------------|---|---|---|---|---|
| Bit field: | MMPUE[31:5] | — | — | — | — | — |
|------------|-------------|---|---|---|---|---|

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x x 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|------|-------------|----------------------------------------------------------------------------------------------|-----|
| 4:0 | — | These bits are read as 1. The write value should be 1. | R/W |
| 31:5 | MMPUE[31:5] | Region end address register Address where the region end, for use in region determination | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The MMPUEDMAC (n = 0 to 7) register specifies the end address where the region ends.

This register requires word access. Byte access and half word access is prohibited. When byte access and half word access is executed, operation is not guaranteed.

14.3.1.5 MMPUACDMACn : MMPU Access Control Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000

Offset address: $0x0200 + 0x010 \times n$

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | WP | RP | ENAB LE |
|------------|---|---|---|---|---|---|---|---|---|---|---|---|---|----|----|------------|

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------------------|-----|
| 0 | ENABLE | Region enable 0: DMAC Region n unit is disabled 1: DMAC Region n unit is enabled | R/W |
| 1 | RP | Read protection 0: Read permission 1: Read protection | R/W |
| 2 | WP | Write protection 0: Write permission 1: Write protection | R/W |
| 15:3 | — | These bits are read as 0. The write value should be 0. | R/W |

- Note: If the security attribution is configured as Secure:
- Secure access and Non-secure read access are allowed
 - Non-secure write access is ignored, and TrustZone access error is not generated.
- If the security attribution is configured as Non-secure:
- Secure and Non-secure access are allowed.

Region n unit sets the ENABLE bit, the RP bit, and the WP bit each.

ENABLE bit (Region enable)

The ENABLE bit controls the enable or disable of DMAC/DTC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit control access permission for read and write protection to MMPUSDMACn (n = 0 to 7) and MMPUEDMACn (n = 0 to 7).

When the ENABLE bit is set to 0, access to DMAC region n (n = 0 to 7) is the outside region.

RP bit (Read protection)

The RP bit enables or disables read protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection of DMAC/DTC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

Table 14.4 Function of Region Control Circuit for DMAC

| MMPUACDMACn (n = 0 to 7) | | | Access | Region | Output of DMAC Region n unit (n = 0 to 7) |
|--------------------------|----|----|--------|---------|-------------------------------------------|
| ENABLE | RP | WP | | | |
| 0 | — | — | Read | — | Outside region |
| | | | Write | | Outside region |
| 1 | 0 | 0 | Read | Inside | Permitted region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Permitted region |
| | | | | Outside | Outside region |
| | 0 | 1 | Read | Inside | Permitted region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Protection region |
| | | | | Outside | Outside region |
| | 1 | 0 | Read | Inside | Protection region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Permitted region |
| | | | | Outside | Outside region |
| | 1 | 1 | Read | Inside | Protection region |
| | | | | Outside | Outside region |
| | | | Write | Inside | Protection region |
| | | | | Outside | Outside region |

Note: Each regions of DMAC / DTC are set for secure access and Non-secure access by MMPUSARA register. In this case, Non-secure regions in secure access and secure regions in Non-secure access are outside regions.

Table 14.5 Function of Master Control Circuit for DMAC

| MMPUENDMAC | Output of DMAC Region 0 unit | Output of DMAC Region 1 unit | Output of DMAC Region 2-7 unit | Function of DMAC |
|-------------|------------------------------|------------------------------|--------------------------------|------------------|
| ENABLE | | | | |
| 1 | Protected region | Don't care | Don't care | Generate error |
| | Don't care | Protected region | Don't care | Generate error |
| | Don't care | Don't care | Protected region | Generate error |
| | Outside region | Outside region | Outside region | Generate error |
| Other cases | | | | No error |

A master MPU error occurs on the following conditions:

1. MMPUENDMAC.ENABLE = 1, and output of one or more Region n unit is protected region.
2. MMPUENDMAC.ENABLE = 1, and output of all Region n unit are outside region.

Other cases are handled as permitted region.

14.3.1.6 MMPUENDMAC : MPU Enable Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0100

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|--------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | ENABLE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|------------------------------------------------------------------------------------------------------------------|-----|
| 0 | ENABLE | Bus Master MPU of DMAC enable 0: Bus Master MPU of DMAC is disabled. 1: Bus Master MPU of DMAC is enabled. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code These bits enable or disable writes to the ENABLE bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

ENABLE bit (Bus Master MPU of DMAC enable)

The ENABLE bit controls enable or disable of the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDMACn (n = 0 to 7) is valid. When the ENABLE bit is set to 0, MMPUACDMACn (n = 0 to 7) is invalid for all regions. The bus master MPU function sets the ENABLE bit of each master group. When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the ENABLE bit. When writing to the ENABLE bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

14.3.1.7 MMPUENPTDMAC : MMPU Enable Protect Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0104

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PROTECT | Protection of register 0: MMPUENDMAC register writes are possible. 1: MMPUENDMAC register writes are protected. Read is possible. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the MMPUENDMAC register.

When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] at the same time. When values other than 0xA5 are written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

14.3.1.8 MMPURPTDMAC : MMPU Regions Protect Register for DMAC

Base address: RMPU = 0x4000_0000

Offset address: 0x0108

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PROTECT | Protection of register 0: Bus Master MPU register for DMAC writing is possible. 1: Bus Master MPU register for DMAC writing is protected. Read is possible. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of Non-secure program
- MMPUEDMACn (n = 0 to 7) of Non-secure program
- MMPUACDMACn (n = 0 to 7) of Non-secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits always read as 0x00.

14.3.1.9 MMPURPTDMAC_SEC : MPU Regions Protect register for DMAC Secure

Base address: RMPU = 0x4000_0000

Offset address: 0x010C

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PROTECT | Protection of register 0: Bus master MPU register for DMAC secure writes are possible. 1: Bus master MPU register for DMAC secure writes are protected. Read is possible. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC_SEC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of Secure program
- MMPUEDMACn (n = 0 to 7) of Secure program
- MMPUACDMACn (n = 0 to 7) of Secure program

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the PROTECT bit is not updated.

The KEY[7:0] bits are always read as 0x00.

14.3.1.10 MMPUOAD : MMPU Operation After Detection Register

Base address: RMPU = 0x4000_0000

Offset address: 0x0000

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|-----|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | OAD |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|--------------------------------------------------------------------|-----|
| 0 | OAD | Operation after detection 0: Non-maskable interrupt 1: Reset | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key Code This bit enables or disables writes to the OAD bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

OAD bit (Operation after detection)

The OAD bit is specified to generate either reset or non-maskable interrupt when the access to the protect region is detected by the BUS Master MPU.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated.

The KEY[7:0] bits always read as 0x00.

14.3.1.11 MMPUOADPT : MMPU Operation After Detection Protect Register

Base address: RMPU = 0x4000_0000

Offset address: 0x0004

| | | | | | | | | | | | | | | | | |
|--------------------|----------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KEY[7:0] | | | | | | | | — | — | — | — | — | — | — | PROTECT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|-----------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PROTECT | Protection of register 0: MMPUOAD register writes are possible. 1: MMPUOAD register writes are protected. Read is possible. | R/W |

| Bit | Symbol | Function | R/W |
|------|----------|---------------------------------------------------------------------|-----|
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | KEY[7:0] | Key code These bits enable or disable writes to the PROTECT bit. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note: It is necessary to write by half word access.

Byte write access is prohibited. When byte write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPUOADPT.PROTECT controls the following register:

- MMPUOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

14.3.2 Operation

14.3.2.1 Memory protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If access to a protected region is detected, the bus master MPU generates a memory protection error.

Bus Master MPU can be set for up to 8 protection regions. It is protection region when set up of permission region and protection region overlaps. It is protection region when set up of two protection region overlaps.

Bus Master MPU has master groups of DMAC/DTC.

Memory protection checks the address of the bus which the master group unified. Therefore, all the access of a master group is detected by memory protection.

The region setting registers of the Bus Master MPU for DMAC/DTC can be set for secure access and Non-secure access using the MMPUSARA register. Make secure access and Non-secure access settings the same for each DMAC/DTC channel and the corresponding region setting registers of the Bus Master MPU.

Bus Master MPU is permission of all regions after reset. All region is protected by setting MMPUENDMAC.ENABLE = 1.

Each region sets up a permission region on the protection region. If access to the protected region is detected, Bus Master MPU will generate an error.

Figure 14.1 shows the use case of a bus master MPU.

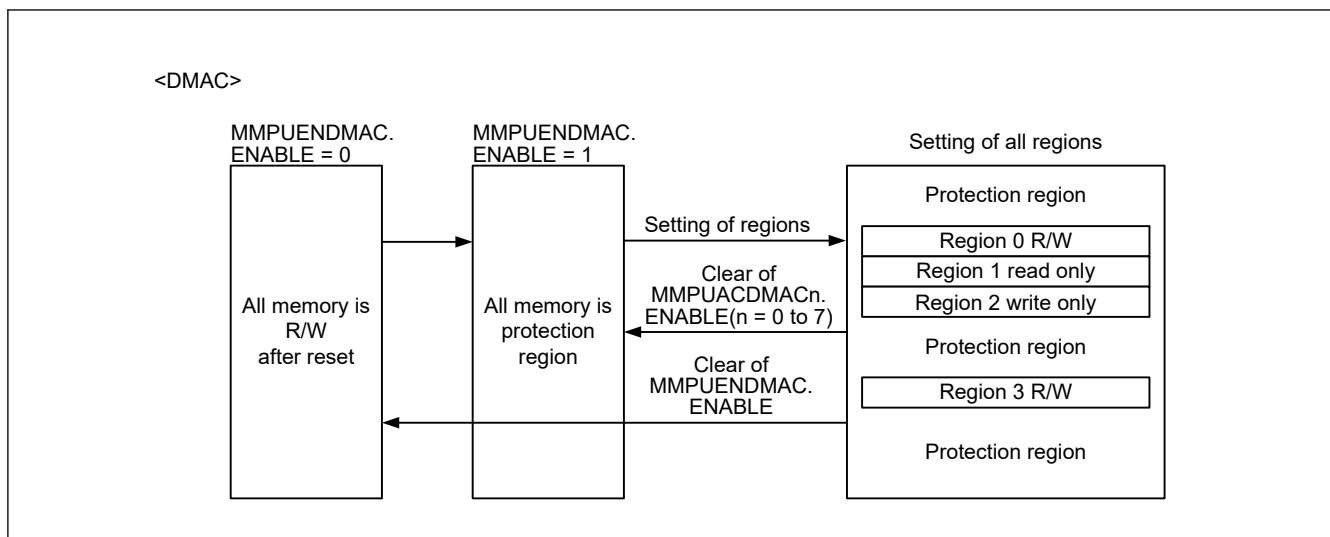

Figure 14.1 Use case of bus master MPU

Figure 14.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

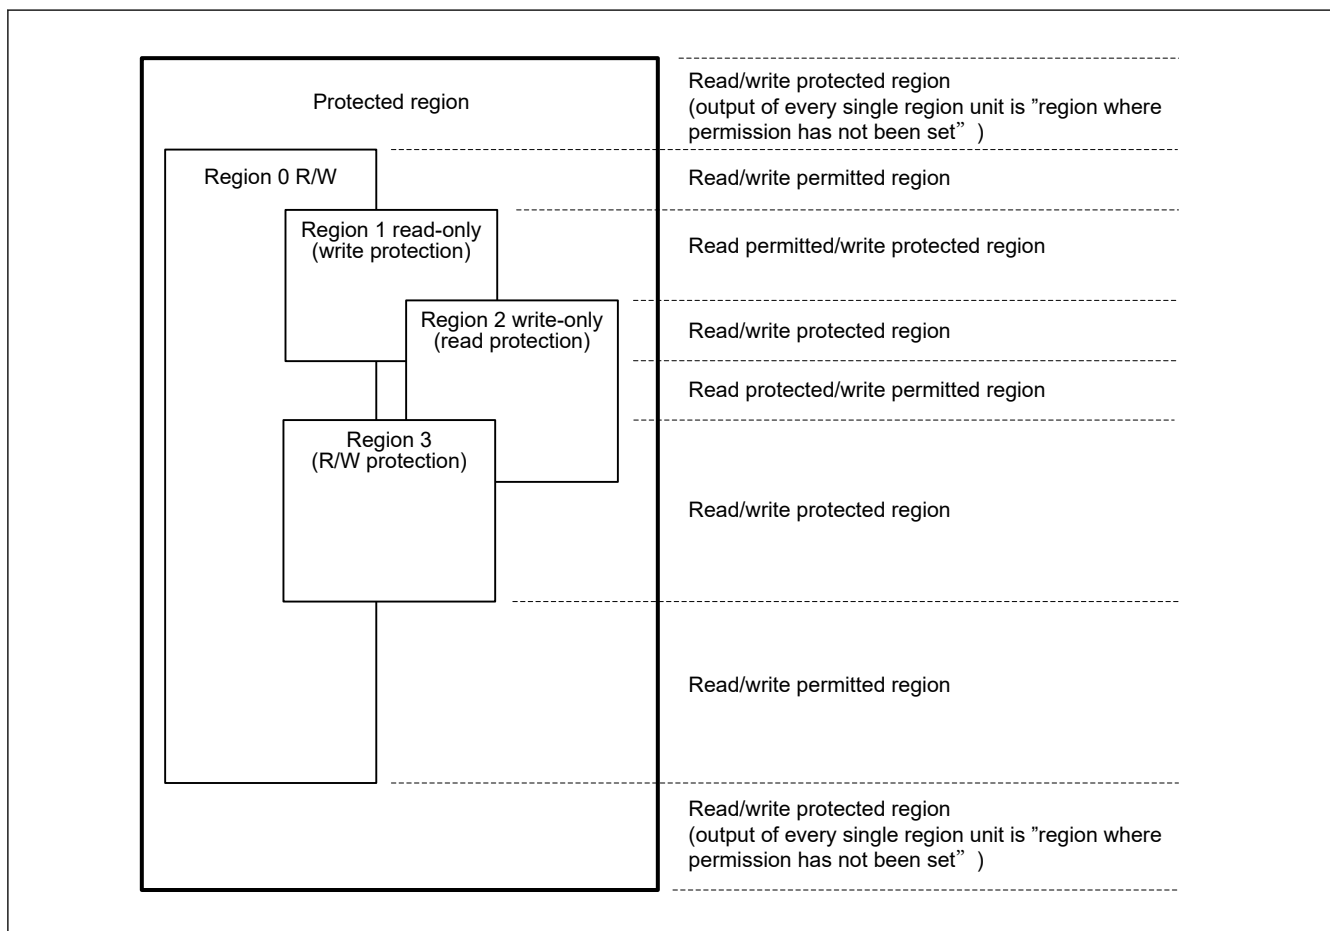

Figure 14.2 Access permission or protection by overlap of the bus master MPU regions

Figure 14.3 shows the register setting flow after reset. During this register setting, stop all bus masters except the CPU.

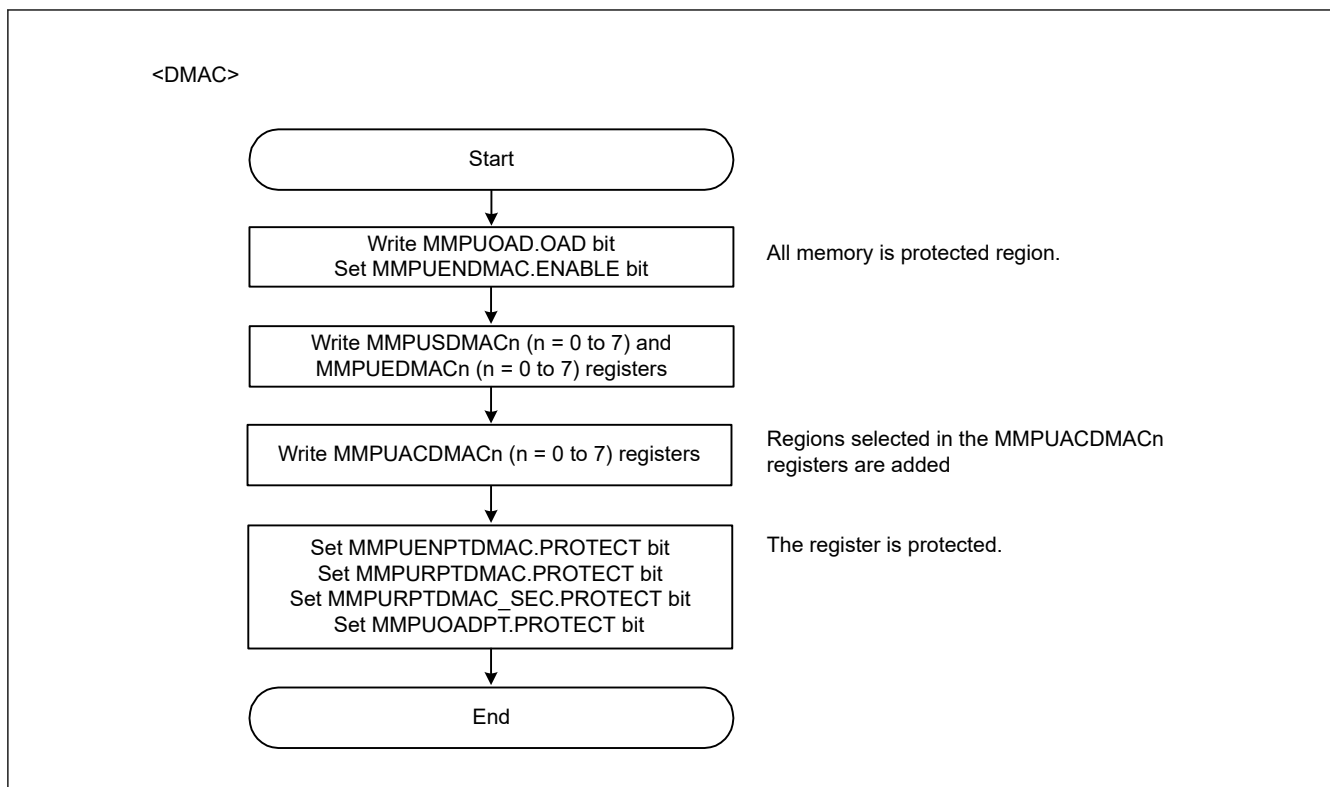

Figure 14.3 Register setting flow of bus master MPU after reset

Figure 14.4 shows the register setting flow for adding regions. During this register setting, stop all masters except the CPU.

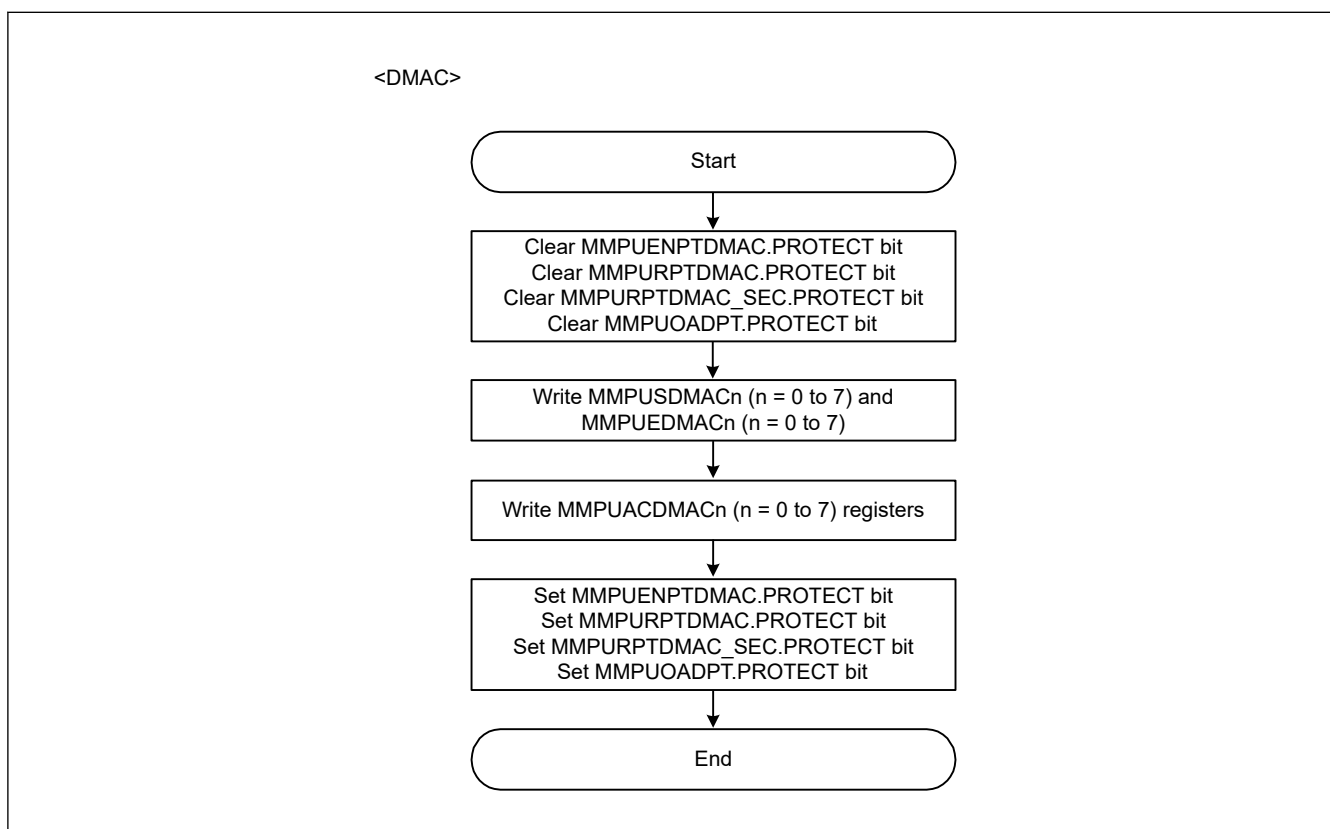

Figure 14.4 Register setting flow for region addition

14.3.2.2 Protecting the registers

Registers related to the Bus Master MPU can be protected with the PROTECT bit in the MMPUENPTDMAC, MMPURPTDMAC, MMPURPTDMAC_SEC, and MMPUOADPT registers.

Table 14.6 PROTECT bit and Protected target registers

| PROTECT bit | Protect target registers |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MMPUENPTDMAC.PROTECT | MMPUENDMAC |
| MMPURPTDMAC.PROTECT | The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7) |
| MMPURPTDMAC_SEC.PROTECT | The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7) |
| MMPUOADPT.PROTECT | MMPUOAD |

14.3.2.3 Memory protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the OAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSMST. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#). The reset status is indicated in SYSTEM.RSTSR1.BUSMRF. For details, see [section 5, Resets](#).

15. DMA Controller (DMAC)

15.1 Overview

The MCU includes an 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 15.1 lists the DMAC specifications, and Figure 15.1 shows a block diagram of the DMAC.

Table 15.1 DMAC specifications (1 of 2)

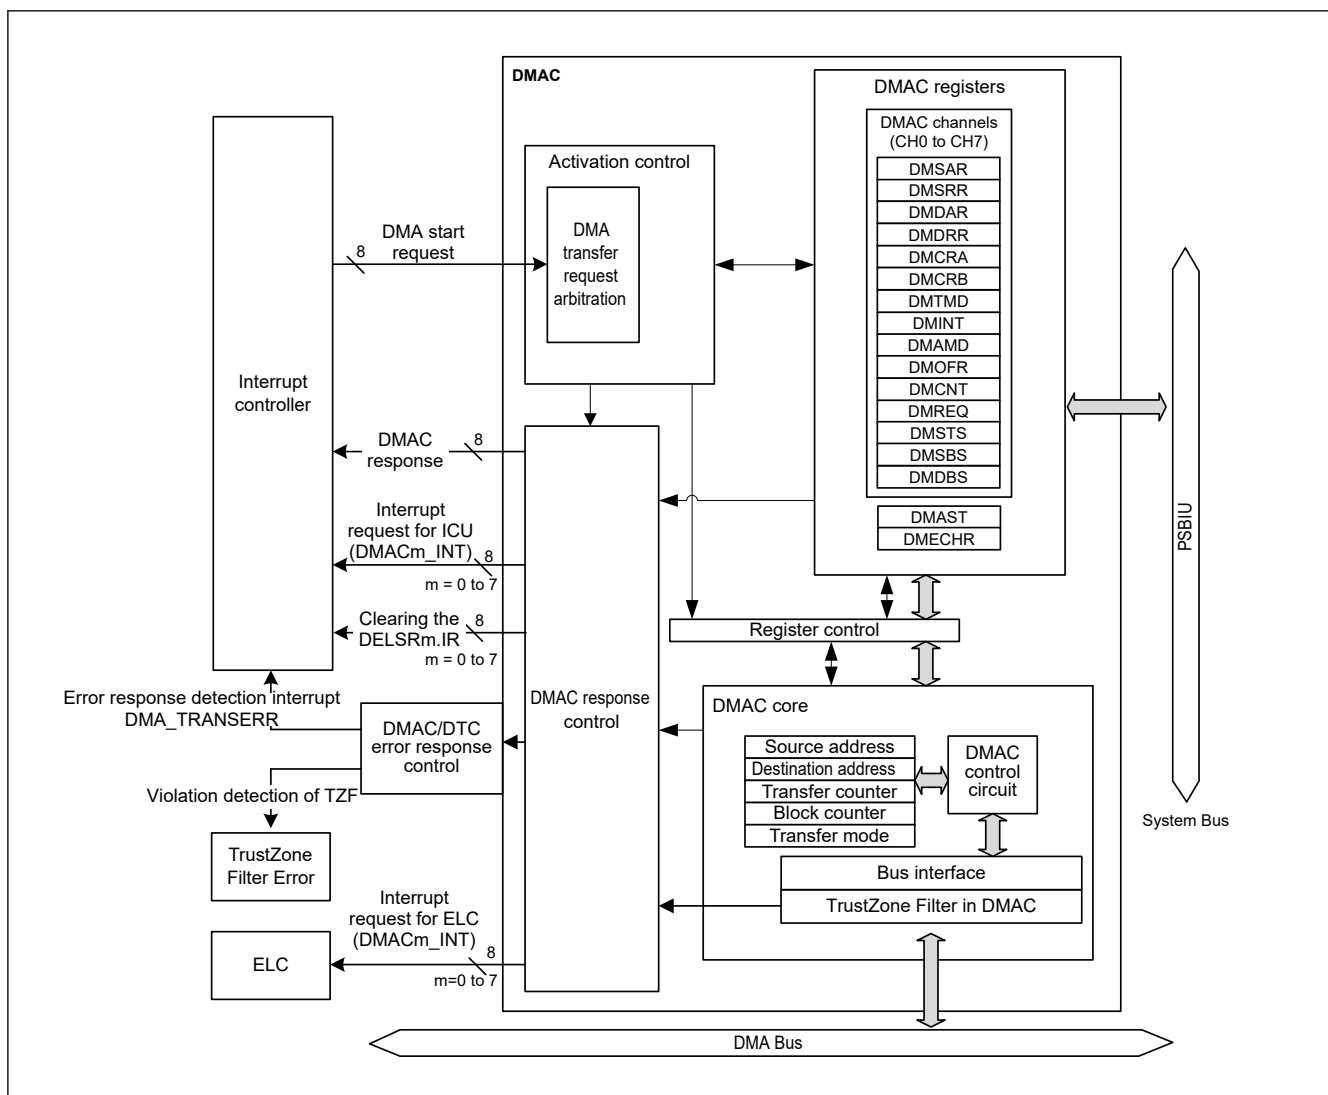

| Item | | Description |
|-----------------------------------|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of channels | | 8 channels (DMACn (n = 0 to 7)) |
| Transfer space | | 4 GB (0x00000000 to 0xFFFFFFFF excluding reserved areas) |
| Maximum transfer volume | | 64 M data (Maximum number of transfers in block transfer mode: 1,024 data/block × 65,536 blocks) |
| DMAC activation source | | Selectable for each channel: <ul style="list-style-type: none"> • Software trigger • Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1 |
| Channel priority | | Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest) |
| Transfer data | Single data | Bit length: 8, 16, 32 bits |
| | Block size | Number of data: 1 to 1,024 |
| Transfer mode | Normal transfer mode | <ul style="list-style-type: none"> • One data transfer by one DMA transfer request • Free-running function (setting in which total number of data transfers is not specified) settable |
| | Repeat transfer mode | <ul style="list-style-type: none"> • One data transfer by one DMA transfer request • Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. • Maximum settable repeat size: 1,024 • Selectable free-running function |
| | Repeat-block transfer mode | <ul style="list-style-type: none"> • One block data transfer by one DMA transfer request • Maximum settable block size: 1,024 • Block transfer can be repeated • Maximum settable repeat size: 64K • Selectable free-running function |
| | Block transfer mode | <ul style="list-style-type: none"> • One block data transfer by one DMA transfer request • Maximum settable block size: 1,024 data • Selectable free-running function |
| Selective functions | Extended repeat area function | <ul style="list-style-type: none"> • Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed. • Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination. |
| Processing on DMAC transfer error | | <ul style="list-style-type: none"> • When a DMAC transfer error occurs, the transfer on the channel that caused the error is stopped. • A request to clear the register for activation request of DMAC error channel is sent to ICU. |
| Interrupt (DMACn_INT) | Transfer end interrupt | Generated on completion of transferring data volume specified by the transfer counter. |
| | Transfer escape end interrupt | <ul style="list-style-type: none"> • Generated when the repeat size of data transfer is completed. • Generated when the source address extended repeat area overflows. • Generated when the destination address extended repeat area overflows. |
| Interrupt (DMA_TRANSE RR) | Error response detection interrupt | Generated when the DMAC transfer error occurs. |
| Event link activation (DMACn_INT) | | An event link request is generated after each data transfer (for block transfer, after each block is transferred). |

Table 15.1 DMAC specifications (2 of 2)

| Item | Description |
|--------------------------------------|----------------------------------------------------------------------------------------------------|
| Master TrustZone Filter | TrustZone violation area of Flash and SRAM is detected before a non-secure channel access the bus. |
| Power consumption reduction function | Module-stop state can be set. |
| TrustZone Filter | Security attribution can be set for each channels |

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC

Note 1. For details on DMAC activation sources, see [Table 12.4](#) in [section 12, Interrupt Controller Unit \(ICU\)](#).

| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|---------|----------------------------------------------------------|-----|
| 0 | DMASTSA | DMAST Security Attribution 0: Secure 1: Non-secure | R/W |
| 31:1 | — | These bits are read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

For DMAC, security attribution is set for each channel. However, this register only sets the DMAST register security attribute. The security attribution setting of each channel is described in the [section 12.2.3. ICUSARC : Interrupt Controller Unit Security Attribution Register C](#).

DMASTSA bit (DMAST Security Attribution)

Security attributes of registers for DMAST. Do not write to DMASTSA bit while DMA transfer is enabled or a bus master is writing to the DMA registers.

15.2.2 DMSAR : DMA Source Address Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x00

| | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|--------------------|----|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 31 | 0 | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Bit field: | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | Specifies the transfer source start address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set DMSAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

15.2.3 DMSRR : DMA Source Reload Address Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x20$

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|---------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | Specifies the transfer source reload address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set DMSRR while DMAC activation is disabled ($\text{DMAST.DMST} = 0$) or DMA transfer is disabled ($\text{DMCNT.DTE} = 0$).

DMSRR is the initial value of DMSAR. In repeat-block transfer mode, DMSAR reloads the value of DMSRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode, and block transfer mode DMSRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

15.2.4 DMDAR : DMA Destination Address Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x04$

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|-------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | Specifies the transfer destination start address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set DMDAR while DMAC activation is disabled ($\text{DMAST.DMST} = 0$) or DMA transfer is disabled ($\text{DMCNT.DTE} = 0$).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

15.2.5 DMDRR : DMA Destination Reload Address Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x24$

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | Specifies the transfer destination reload address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 Gbytes). | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0). DMDRR is the initial value of DMDAR. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

15.2.6 DMCRA : DMA Transfer Count Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: 0x08

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|----|----|----|----|----|-------------|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | DMCRAH[9:0] | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DMCRAL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------------|------------------------------------------------------------------------------|-----|
| 15:0 | DMCRAL[15:0] | Lower bits of transfer count Specifies the number of transfer operations. | R/W |
| 25:16 | DMCRAH[9:0] | Upper bits of transfer count Specifies the number of transfer operations. | R/W |
| 31:26 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

(1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

(2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

15.2.7 DMCRB : DMA Block Transfer Count Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: 0x0C

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | DMCRBH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DMCRBL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------------|-------------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | DMCRBL[15:0] | Functions as a number of block, repeat or repeat-block transfer counter. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536) | R/W |
| 31:16 | DMCRBH[15:0] | Specifies the number of block, repeat or repeat-block transfer operations. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536) | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMCRBH and DMCRL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRL functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL reloads the value of DMCRBH automatically.

15.2.8 DMTMD : DMA Transfer Mode Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: 0x10

| | | | | | | | | | | | | | | | | |
|--------------------|---------|----|----------|----|----|-----|---------|---|---|---|---|---|---|---|-----------|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | MD[1:0] | | DTS[1:0] | | — | TKP | SZ[1:0] | | — | — | — | — | — | — | DCTG[1:0] | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | DCTG[1:0] | Transfer Request Source Select 0 0: Software request 0 1: Hardware request*1 1 0: Setting prohibited 1 1: Setting prohibited | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 9:8 | SZ[1:0] | Transfer Data Size Select 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: Setting prohibited | R/W |
| 10 | TKP | Transfer Keeping 0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running). | R/W |
| 11 | — | This bit is read as 0. The write value should be 0. | R/W |
| 13:12 | DTS[1:0] | Repeat Area Select 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited. | R/W |
| 15:14 | MD[1:0] | Transfer Mode Select 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. To select the DMAC activation source, use the DELSRn registers of the ICU. For details on DMAC activation sources, see [Table 12.4](#) in [section 12, Interrupt Controller Unit \(ICU\)](#).

DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

15.2.9 DMINT : DMA Interrupt Setting Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x13$

| | | | | | | | | |
|--------------------|---|---|---|------|------|-------|-------|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | DTIE | ESIE | RPTIE | SARIE | DARIE |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DARIE | Destination Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the destination address. 1: Enables an interrupt request for an extended repeat area overflow on the destination address. | R/W |
| 1 | SARIE | Source Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the source address. 1: Enables an interrupt request for an extended repeat area overflow on the source address. | R/W |
| 2 | RPTIE | Repeat Size End Interrupt Enable 0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request. | R/W |
| 3 | ESIE | Transfer Escape End Interrupt Enable 0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request. | R/W |
| 4 | DTIE | Transfer End Interrupt Enable 0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request. | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

15.2.10 DMAMD : DMA Address Mode Register

Base address: DMACn = 0x4000_5000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x14

| | | | | | | | | | | | | | | | | |
|--------------------|---------|----|------|-----------|----|----|---|---------|---|------|-----------|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SM[1:0] | | SADR | SARA[4:0] | | | | DM[1:0] | | DADR | DARA[4:0] | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 4:0 | DARA[4:0] | Destination Address Extended Repeat Area Specifies the extended repeat area on the destination address. For details on the settings, see Table 15.2 . | R/W |
| 5 | DADR | Destination Address Update Select After Reload 0: Only reloading. 1: Add index after reloading. | R/W |
| 7:6 | DM[1:0] | Destination Address Update Mode 0 0: Destination address is fixed. 0 1: Offset addition. 1 0: Destination address is incremented. 1 1: Destination address is decremented. | R/W |
| 12:8 | SARA[4:0] | Source Address Extended Repeat Area Specifies the extended repeat area on the source address. For details on the settings, see Table 15.2 . | R/W |

| Bit | Symbol | Function | R/W |
|-------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 13 | SADR | Source Address Update Select After Reload 0: Only reloading. 1: Add index after reloading. | R/W |
| 15:14 | SM[1:0] | Source Address Update Mode 0 0: Source address is fixed. 0 1: Offset addition. 1 0: Source address is incremented. 1 1: Source address is decremented. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. [Table 15.2](#) lists the settings and the corresponding extended repeat areas.

DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in [Table 15.13](#).

In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. [Table 15.2](#) lists the settings and the corresponding extended repeat areas.

SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value $((\text{DMSBSH} - \text{DMSBSL}) \times \text{DataSize})$ is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in [Table 15.12](#).

In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 15.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)

| SARA[4:0] or DARA[4:0] settings | Extended repeat area |
|---------------------------------|----------------------------------------------------------------------------------|
| 00000b | Not specified |
| 00001b | 2 bytes specified as extended repeat area by the lower 1 bit of the address |
| 00010b | 4 bytes specified as extended repeat area by the lower 2 bits of the address |
| 00011b | 8 bytes specified as extended repeat area by the lower 3 bits of the address |
| 00100b | 16 bytes specified as extended repeat area by the lower 4 bits of the address |
| 00101b | 32 bytes specified as extended repeat area by the lower 5 bits of the address |
| 00110b | 64 bytes specified as extended repeat area by the lower 6 bits of the address |
| 00111b | 128 bytes specified as extended repeat area by the lower 7 bits of the address |
| 01000b | 256 bytes specified as extended repeat area by the lower 8 bits of the address |
| 01001b | 512 bytes specified as extended repeat area by the lower 9 bits of the address |
| 01010b | 1 Kbyte specified as extended repeat area by the lower 10 bits of the address |
| 01011b | 2 Kbytes specified as extended repeat area by the lower 11 bits of the address |
| 01100b | 4 Kbytes specified as extended repeat area by the lower 12 bits of the address |
| 01101b | 8 Kbytes specified as extended repeat area by the lower 13 bits of the address |
| 01110b | 16 Kbytes specified as extended repeat area by the lower 14 bits of the address |
| 01111b | 32 Kbytes specified as extended repeat area by the lower 15 bits of the address |
| 10000b | 64 Kbytes specified as extended repeat area by the lower 16 bits of the address |
| 10001b | 128 Kbytes specified as extended repeat area by the lower 17 bits of the address |
| 10010b | 256 Kbytes specified as extended repeat area by the lower 18 bits of the address |
| 10011b | 512 Kbytes specified as extended repeat area by the lower 19 bits of the address |
| 10100b | 1 Mbyte specified as extended repeat area by the lower 20 bits of the address |
| 10101b | 2 Mbytes specified as extended repeat area by the lower 21 bits of the address |
| 10110b | 4 Mbytes specified as extended repeat area by the lower 22 bits of the address |
| 10111b | 8 Mbytes specified as extended repeat area by the lower 23 bits of the address |
| 11000b | 16 Mbytes specified as extended repeat area by the lower 24 bits of the address |
| 11001b | 32 Mbytes specified as extended repeat area by the lower 25 bits of the address |

Table 15.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)

| SARA[4:0] or DARA[4:0] settings | Extended repeat area |
|---------------------------------|----------------------------------------------------------------------------------|
| 11010b | 64 Mbytes specified as extended repeat area by the lower 26 bits of the address |
| 11011b | 128 Mbytes specified as extended repeat area by the lower 27 bits of the address |
| 11100b to 11111b | Setting prohibited. |

15.2.11 DMOFR : DMA Offset Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x18$

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | Specifies the offset when offset addition is selected as the address update mode for transfer source or destination. 0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes) 0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte) | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

15.2.12 DMCNT : DMA Transfer Enable Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x1C$

Bit position: 7 6 5 4 3 2 1 0

Bit field:

| | | | | | | | |
|---|---|---|---|---|---|---|-----|
| — | — | — | — | — | — | — | DTE |
|---|---|---|---|---|---|---|-----|

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------|-----|
| 0 | DTE | DMA Transfer Enable 0: Disables DMA transfer. 1: Enables DMA transfer. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped by the access error occurs. See [section 15.5. Processing on DMA Transfer Error](#).

15.2.13 DMREQ : DMA Software Start Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x1D$

| | | | | | | | | |
|--------------------|---|---|---|------|---|---|---|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | CLRS | — | — | — | SWREQ |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | SWREQ | DMA Software Start 0: DMA transfer is not requested. 1: DMA transfer is requested. | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | CLRS | DMA Software Start Bit Auto Clear Select 0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software. | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

15.2.14 DMSTS : DMA Status Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: $0x1E$

| | | | | | | | | |
|--------------------|-----|---|---|------|---|---|---|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | ACT | — | — | DTIF | — | — | — | ESIF |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| 0 | ESIF | Transfer Escape End Interrupt Flag 0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated. | R/W ^{*1} |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | DTIF | Transfer End Interrupt Flag 0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated. | R/W ^{*1} |
| 6:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | ACT | DMAC Active Flag 0: DMAC is in the idle state. 1: DMAC is operating. | R |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Note 1. Only 0 can be written to clear the flag.

ESIF flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

DTIF flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRL reloading DMCRLH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRL reloading DMCRLH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

15.2.15 DMSBS : DMA Source Buffer Size Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: 0x28

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | DMSBSH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DMSBSL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | DMSBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode See Table 15.3 for available settings. | R/W |
| 31:16 | DMSBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode See Table 15.3 for available settings. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. [Table 15.3](#) shows

the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 15.3 Available setting for DMSBS register in repeat-block transfer mode

| Source address update mode (DMAMD.SM) | Transfer data size (DMTMD.SZ) | Available setting for DMSBSH and DMSBSL bits |
|---------------------------------------------------------|-------------------------------|----------------------------------------------------|
| Source address is fixed (SM = 00b) | Don't care | 0x0000 (DMSBS is not used) |
| Offset addition (SM = 01b) | 8 bits (SZ = 00b) | 0x0001 to 0xFFFF (1 to 65535) |
| | 16 bits (SZ = 01b) | 0x0001 to 0x7FFF (1 to 32767) |
| | 32 bits (SZ = 10b) | 0x0001 to 0x3FFF (1 to 16383) |
| Source address is incremented or decremented (SM = 1xb) | Don't care | 0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

15.2.16 DMDBS : DMA Destination Buffer Size Register

Base address: $\text{DMACn} = 0x4000_5000 + 0x0040 \times n$ ($n = 0$ to 7)

Offset address: 0x2C

| | | | | | | | | | | | | | | | | |
|--------------------|--------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | DMDBSH[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | DMDBSL[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------------|-----------------------------------------------------------------------------------------------------------------------------|-----|
| 15:0 | DMDBSL[15:0] | Functions as data transfer counter in repeat-block transfer mode. See Table 15.4 for available settings. | R/W |
| 31:16 | DMDBSH[15:0] | Specifies the repeat-area size in repeat-block transfer mode. See Table 15.4 for available settings. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

Set the same value for DMDBSH and DMDBSL in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH specifies buffer size and DMDBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH and DMDBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL reloads value of DMDBSH. When address update mode is fixed address, this register is ignored. [Table 15.4](#) shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 15.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)

| Destination address update mode (DMAMD.DM) | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits |
|--------------------------------------------|-------------------------------|----------------------------------------------|
| Destination address is fixed (DM = 00b) | Don't care | 0x0000 (DMDBS is not used) |

Table 15.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)

| Destination address update mode (DMAMD.DM) | Transfer data size (DMTMD.SZ) | Available setting for DMDBSH and DMDBSL bits |
|--------------------------------------------------------------|-------------------------------|----------------------------------------------------|
| Offset addition (DM = 01b) | 8 bits (SZ = 00b) | 0x0001 to 0xFFFF (1 to 65535) |
| | 16 bits (SZ = 01b) | 0x0001 to 0x7FFF (1 to 32767) |
| | 32 bits (SZ = 10b) | 0x0001 to 0x3FFF (1 to 16383) |
| Destination address is incremented or decremented (DM = 1xb) | Don't care | 0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535) |

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

15.2.17 DMAST : DMA Module Activation Register

Base address: DMA = 0x4000_5200

Offset address: 0x00

| | | | | | | | | |
|--------------------|---|---|---|---|---|---|---|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | DMST |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------------|-----|
| 0 | DMST | DMAC Operation Enable 0: DMAC activation is disabled. 1: DMAC activation is enabled. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

15.2.18 DMECHR : DMAC Error Channel Register

Base address: DMA = 0x4000_5200

Offset address: 0x40

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----------|----|----|----|----|----|----|----|--------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DMESTA |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | DMECHSAM | — | — | — | — | — | — | — | DMECH |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 2:0 | DMECH | DMAC Error channel Indicates the channel number causing the error 0 0 0: Error occurred on Channel 0 0 0 1: Error occurred on Channel 1 0 1 0: Error occurred on Channel 2 ⋮ 1 1 1: Error occurred on Channel 7 | R |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R |
| 8 | DMECHSAM | DMAC Error channel Security Attribution Monitor Indicates the security attribution of a channel causing the error 0: Secure channel 1: Non-secure channel | R |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R |
| 16 | DMESTA | DMAC Error Status 0: No DMA transfer error occurred 1: DMA transfer error occurred | R/W ¹ |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R |

Note 1. Writing to DMESTA depends on the value of DMECHSAM

DMECH[2:0] bits (DMAC Error channel)

When a transfer error due to DMA transfer occurs, the DMECH[2:0] bits store the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMECHSAM bit (DMAC Error channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, the DMECHSAM bit indicates the security attribution of the violating DMAC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMESTA bit (DMAC Error Status)

The DMESTA bit indicates whether or not a DMA transfer error occurred.

DMECH, DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. DMECHSAM = 0, it cannot be cleared in the non-secure state.

15.3 Operation

15.3.1 Transfer Mode

15.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 15.5 summarizes the register update operation in normal transfer mode, and Figure 15.2 shows the operation in normal transfer mode.

Table 15.5 Register update operation in normal transfer mode

| Register | Function | Update operation after completion of a transfer by one transfer request |
|----------|------------------------------|-------------------------------------------------------------------------|
| DMSAR | Transfer source address | Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | Increment/decrement/fixed/offset addition |
| DMCRAL | Transfer count | Decrement by one/not updated (in free running function) |
| DMCRAH | — | Not updated (Not used in normal transfer mode) |
| DMCRB | — | Not updated (Not used in normal transfer mode) |

Figure 15.2 Operation in normal transfer mode

15.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRAL register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 15.6 summarizes the register update operation in repeat transfer mode, and Figure 15.3 shows the operation in repeat transfer mode.

Table 15.6 Register update operation in repeat transfer mode (1 of 2)

| Register | Function | Update operation after completion of a transfer by one transfer request | |
|----------|------------------------------|-------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | When DMCRAL register is not 1 | When DMCRAL register is 1 (Transfer of the last data in repeat size) |
| DMSAR | Transfer source address | Increment/decrement/fixed/offset addition | <ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition DMTMD.DTS[1:0] = 01b Initial value of DMSAR DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | Increment/decrement/fixed/offset addition | <ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Initial value of DMDAR DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMCRAH | Repeat size | Not updated | Not updated |
| DMCRAL | Transfer count | Decrement by one | DMCRAH |

Table 15.6 Register update operation in repeat transfer mode (2 of 2)

| Register | Function | Update operation after completion of a transfer by one transfer request | |
|----------|--------------------------------------|-------------------------------------------------------------------------|-------------------------------------------------------------------------|
| | | When DMCRAL register is not 1 | When DMCRAL register is 1 (Transfer of the last data in repeat size) |
| DMCRBH | Number of repeat transfer operations | Not updated | Not updated |
| DMCRBL | Count of repeat transfer operations | Not updated | Decrement by one |

**Figure 15.3 Operation in repeat transfer mode**

15.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 15.7 summarizes the register update operation in block transfer mode, and Figure 15.4 shows the operation in block transfer mode.

Table 15.7 Register update operation in block transfer mode

| Register | Function | Update operation after completion of single-block transfer by one transfer request |
|----------|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMSAR | Transfer source address | <ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition DMTMD.DTS[1:0] = 01b Initial value of DMSAR DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMDAR | Transfer destination address | <ul style="list-style-type: none"> DMTMD.DTS[1:0] = 00b Initial value of DMDAR DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition |
| DMCRAH | Block size | Not updated |
| DMCRAL | Transfer count | DMCRAH |
| DMCRBH | Number of block transfer operations | Not updated |
| DMCRBL | Count of block transfer operations | Decrement by one |

**Figure 15.4 Operation in block transfer mode**

15.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 15.5 shows an example of adding a repeat function to the transfer destination.

Figure 15.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

15.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 15.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

Figure 15.7 Example of extended repeat area operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 15.8 shows an example when the extended repeat area function is used in block transfer mode.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b), block transfer mode with block size 5 is set (DMCRA = 0x0005_0005), and transfer source address is not specified as a block area. Data size is eight bits (DMTMD.SZ[1:0] bits = 00b).

Figure 15.8 Example of extended repeat area function in block transfer mode

15.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

15.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see [section 15.3.1.1. Normal Transfer Mode](#).

15.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

[Figure 15.9](#) show an example of block transfer operation without free-running function.

Figure 15.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0

Figure 15.10 show an example of block transfer operation with free-running function.

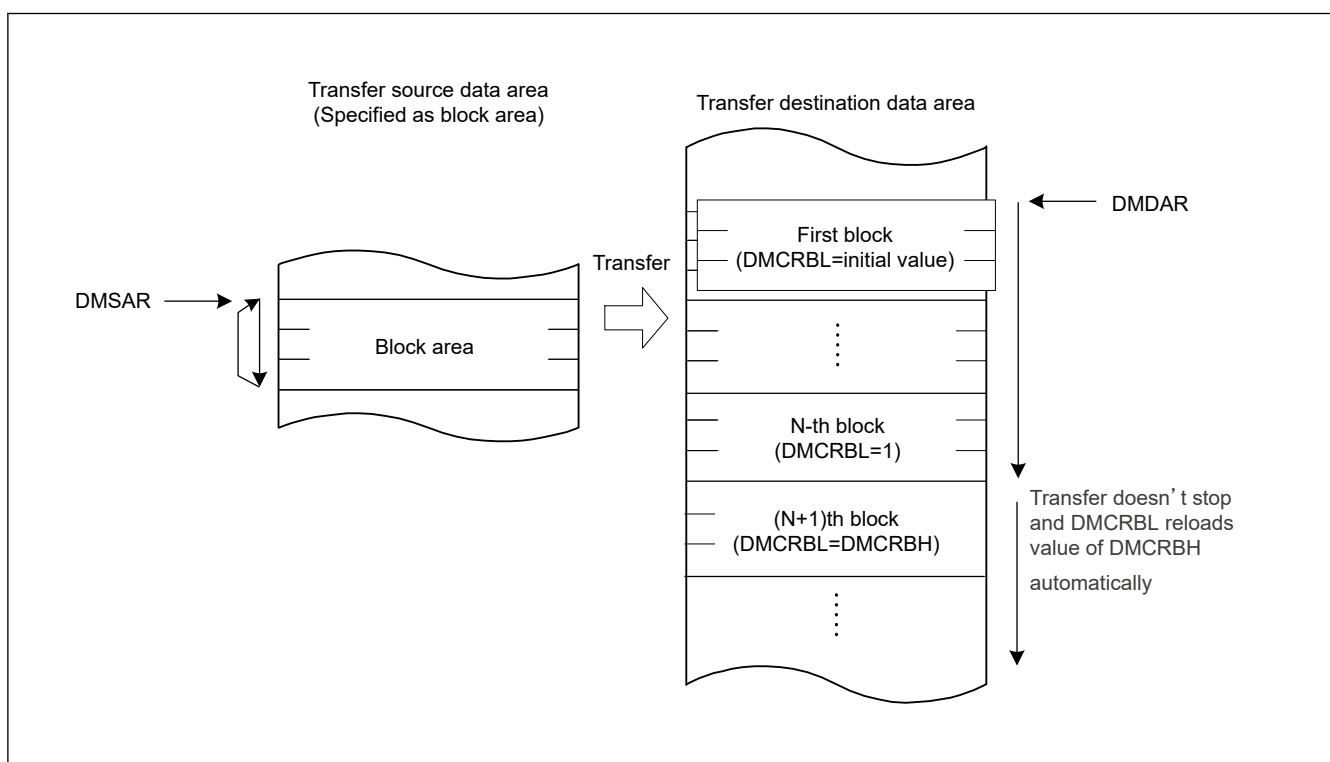

Figure 15.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1

15.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information [section 15.3.1.4. Repeat-Block Transfer Mode](#)

Table 15.14 shows the address update method in each address update mode.

Table 15.14 Address update method in each address update mode

| Address update mode | Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes | Address update method (for different SZ[1:0] settings in DMTMD) | | |
|---------------------|----------------------------------------------------------------------|--------------------------------------------------------------------|---------------|---------------|
| | | SZ[1:0] = 00b | SZ[1:0] = 01b | SZ[1:0] = 10b |
| Address fixed | 00b | Fixed | | |
| Offset addition | 01b | +DMOFR*1 | | |
| Increment | 10b | +1 | +2 | +4 |
| Decrement | 11b | -1 | -2 | -4 |

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:

two's complement of a negative offset value = $\sim(\text{offset}) + 1$ (\sim = bit inversion)

15.3.4.1 Basic Transfer Using Offset Addition

Figure 15.11 shows an example of address updating using offset addition.

Figure 15.11 Example of address updating by offset addition

Figure 15.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

15.3.4.2 Example of XY Conversion Using Offset Addition

Figure 15.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

Figure 15.12 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.
- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5 (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 15.13 shows a flowchart of the XY conversion.

Figure 15.13 XY conversion flowchart using offset addition in repeat transfer mode

15.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

15.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 15.14 shows address update in fixed address.

Figure 15.14 Address update in fixed address

15.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 15.15 shows address update in incremental address.

Figure 15.15 Address update in incremental address

15.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. [Figure 15.16](#) shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

Figure 15.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRA=1. In other words, an index value $((DMDBSH-DMDBSL) \times DataSize)$ is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 15.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

Figure 15.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1

15.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

15.3.6.1 Interval Address to Single Ring Buffer

Figure 15.18 shows an example of reading interval ADDRn registers (data register) of ADC module and storing it in single ring buffer. It transfers 2 data every 4 words per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 15.15 shows setting of this example.

Table 15.15 Setting of use case: from interval address to single ring buffer

| Register | Value | Description |
|----------------|----------------------------|---------------------------------------------------------------------------------------|
| DMSAR, DMSRR | 0x4017_1000 | Initial source address |
| DMDAR, DMDRR | 0x2000_0000 | Initial destination address |
| DMTMD.SZ[1:0] | 10b | Data size is word |
| DMAMD.SADR | 1 | Incremental source address after reloading |
| DMAMD.SM[1:0] | 01b | Source update mode is offset addition |
| DMAMD.DM[1:0] | 10b | Destination update mode is incremental address |
| DMCRAH, DMCRAH | 2 | Transfer block size |
| DMSBSH, DMSBSL | 4 | Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data') |
| DMDBSH, DMDBSL | $N \times 2(\text{DMCRA})$ | Destination buffer size (unit is 'data') |

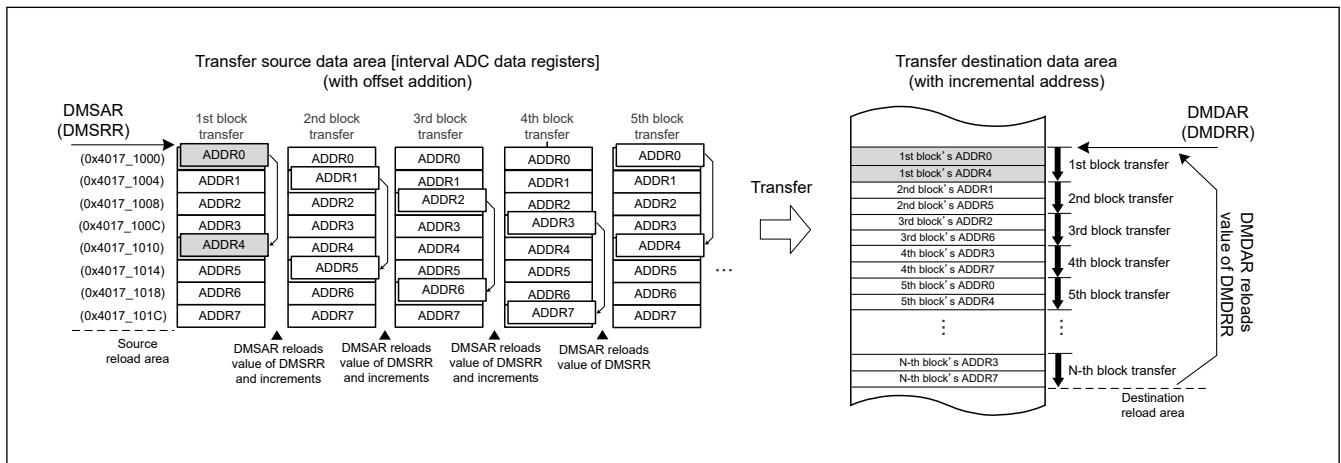

Figure 15.18 Example of Use Case: from Interval Address to Single Ring Buffer

15.3.6.2 Single Block to Multi Ring Buffer

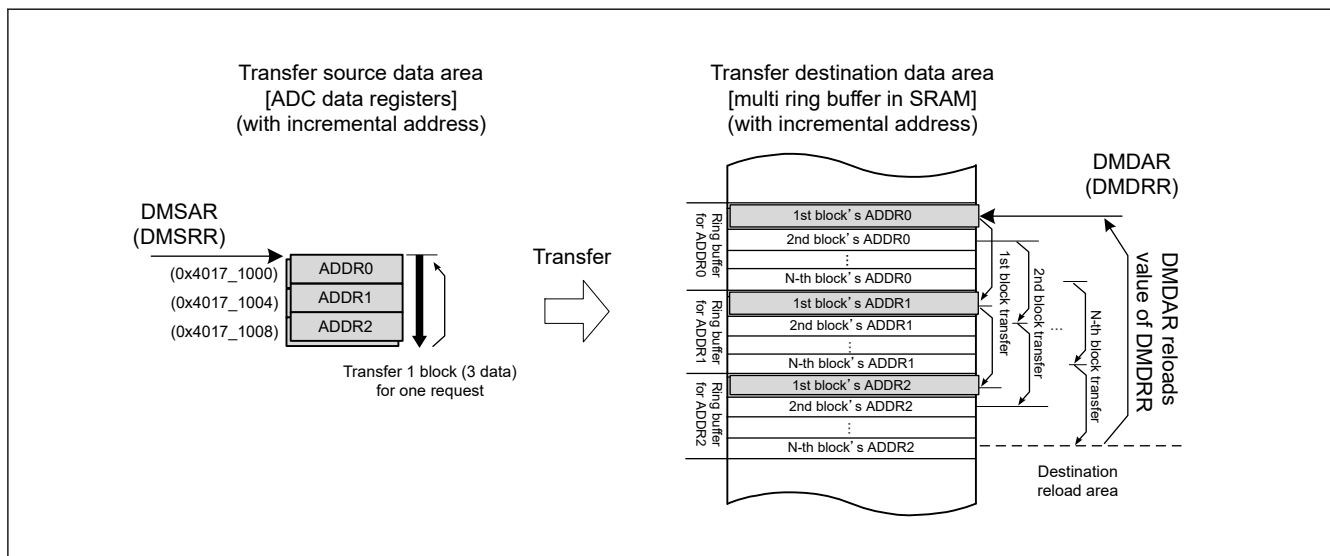

Figure 15.19 shows an example of storing the continuous ADDRn registers (data register) of ADC module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 15.16 shows setting of this example.

Table 15.16 Setting of use case: from single block to multi ring buffer (1 of 2)

| Register | Value | Description |
|---------------|-------------|-------------------------------------------------|
| DMSAR, DMSRR | 0x4017_1000 | Initial source address |
| DMDAR, DMDRR | 0x2000_0000 | Initial destination address |
| DMTMD.SZ[1:0] | 10b | Data size is word |
| DMAMD.SADR | 0 | Only reloading |
| DMAMD.DADR | 1 | Incremental destination address after reloading |

Table 15.16 Setting of use case: from single block to multi ring buffer (2 of 2)

| Register | Value | Description |
|----------------|-------|-------------------------------------------------------------------------------------------------|
| DMAMD.SM[1:0] | 10b | Source update mode is incremental address |
| DMAMD.DM[1:0] | 01b | Destination update mode is offset addition |
| DMCRAH, DMCRAL | 3 | Transfer block size |
| DMSBSH, DMSBSL | 3 | Source buffer size (unit is 'data') |
| DMDBSH, DMDBSL | N | Destination whole buffer size (unit is 'blocks') and Destination access offset (unit is 'data') |

**Figure 15.19 Example of Use Case: from Single Block to Multi Ring Buffer**

15.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

15.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

15.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in ICU.DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set ICU.DELSRn.DELS[8:0] (n = 0 to 7) to the event number (select the DMAC event link).

2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).

For interrupt requests specified as DMAC activation sources, see [Table 12.3](#), in [section 12, Interrupt Controller Unit \(ICU\)](#).

15.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

[Figure 15.20](#) and [Figure 15.21](#) show DMAC operation timing examples.

Figure 15.20 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

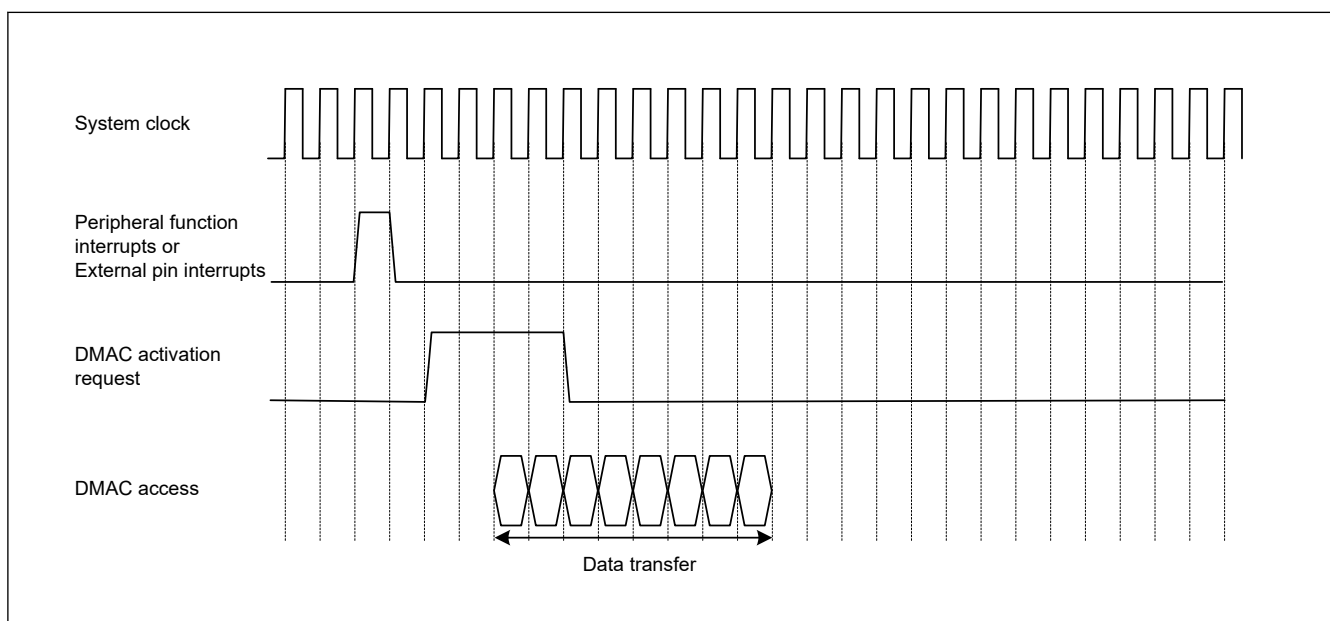

Figure 15.21 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

15.3.9 DMAC Execution Cycles

Table 15.17 lists execution cycles in one DMAC data transfer operation.

Table 15.17 DMAC execution cycles

| Transfer mode | Data transfer (read) | Data transfer (write) |
|---------------|----------------------|-----------------------|
| Normal | Cr+1 | Cw |
| Repeat | Cr+1 | Cw |
| Block*1 | P × Cr | P × Cw |

Note: P: Block size (DMCRAH register setting)
 Cr: Data read destination access cycle
 Cw: Data write destination access cycle

Note 1. This is the case when the block size is 2 or more. When the block size is 1, normal transfer cycle is applied.

Cr and Cw depend on the access destination. For the number of cycles for each access destination, see [section 41, SRAM](#), [section 43, Flash Memory](#), and [section 13, Buses](#). The frequency ratio of the system clock and the peripheral clock is also taken into consideration.

The unit for +1 in “Data Transfer (Read)” column is one system clock cycle (ICLK). For the operation example, see [section 15.3.8. Operation Timing](#).

15.3.10 Activating the DMAC

Table 15.18 shows the register setting procedure of normal, repeat and block transfer mode and Table 15.19 shows register setting procedure of repeat-block transfer mode.

Table 15.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (1 of 2)

| No. | Step Name | Description |
|-----|--------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Disable the peripheral function as the DMACn request source. | To use peripheral function interrupts as DMAC activation sources. Disable the control register for the peripheral function. |
| 2 | Disable the IRQn pin as the DMACn request source. | To use external pin interrupts as DMAC activation sources. |
| 3 | Set the DMACn Event Link select (ICU.DELSRn.DELS[8:0]) to 0x00 | Disable the DMACn request. |
| 4 | Clear the DMCNT.DTE bit to 0 | Disable DMA transfer. |
| 5 | Set the interrupt request as a DMACn request source in the DMAC Event Link Setting Register (ICU.DELSRn) by using the ICU. | To use internal peripheral interrupts or external pin interrupts as DMAC activation sources. Enable the interrupt bit for the activation source. Set the DMACn activation source. |
| 6 | Set the peripheral module as a DMACn request source | To use peripheral function interrupt as a DMAC activation source. Set the control register for the peripheral function without starting it. |
| 7 | Set the IRQn pin function by using the ICU. | To use external pin interrupt as a DMAC activation source. Set the IRQn pin function by using the Interrupt Controller Unit. |
| 8 | Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DARA[4:0] bits Set the DMAMD.SARA[4:0] bits | Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address extended repeat area bits Set the Transfer source address extended repeat area bits |
| 9 | Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.DTS[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit | Set the Transfer request select bits Set the Data transfer size bits Set the Repeat area select bits Set the Transfer mode select bits Set the transfer keeping select bit |
| 10 | Set the DMSAR register Set the DMDAR register Set the DMCRA register | Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations. |
| 11 | Set the DMCRB register | To use block transfer mode or repeat transfer mode. Set the number of block transfer operations. |

Table 15.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (2 of 2)

| No. | Step Name | Description |
|-----|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 12 | Set the DMOFR register | To use the address update function with offset. Set the offset value. |
| 13 | Set the DMINT.DTIE bit to 1 | To use the DMA transfer end interrupts. Enable DMACn transfer end interrupts. |
| 14 | Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1 | To use the DMA transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the DMA transfer escape end interrupt. |
| 15 | Set the DMCNT.DTE bit to 1 | Enable DMA transfer. |
| 16 | Set the DMAST.DMST bit to 1 | Enable DMAC operation. *1 Common settings for DMAC |
| 17 | Start the peripheral function as a DMACn request source | To use peripheral function interrupt as a DMAC activation source |
| 18 | Enable the IRQn pin as a DMACn request source | To use external pin interrupt as a DMAC activation source |
| 19 | End of initial settings | For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer. |

Note: n: DMAC channel (n = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

Table 15.19 Register Setting Procedure of Repeat-Block Transfer Mode (1 of 2)

| No. | Step Name | Description |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Disable the peripheral function as the DMACn request source. | To use peripheral function interrupts as DMA activation sources. Disable the control register for the peripheral function. |
| 2 | Disable the IRQ pin as the DMACn request source. | To use external pin interrupts as DMA activation sources. |
| 3 | Set the DMACn Event Link select (ICU.DELSRn.DELS[8:0]) to 00h | Disable the DMACn request. |
| 4 | Clear the DMCNT.DTE bit to 0 | Disable DMACn transfer. |
| 5 | Set the interrupt request as a DMACn request source in the DMACn Event Link Setting Register (ICU.DELSRn) by using the ICU. | To use internal peripheral interrupts or external pin interrupts as DMA activation sources. Enable the interrupt bit for the activation source. Set the DMACn activation source. |
| 6 | Set the peripheral module as a DMACn request source | To use peripheral function interrupt as a DMA activation source. Set the control register for the peripheral function without starting it. |
| 7 | Set the IRQ pin function by using the Interrupt Controller Unit. | To use external pin interrupt as a DMA activation source. Set the IRQ pin function by using the Interrupt Controller Unit. |
| 8 | Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit | Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address update select after reload Set the Transfer source address update select after reload |
| 9 | Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit | Set the Transfer request select bits Set the Data transfer size bits Set the Transfer mode to repeat-block transfer mode Set the transfer keeping select bit |
| 10 | Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register | Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations |

Table 15.19 Register Setting Procedure of Repeat-Block Transfer Mode (2 of 2)

| No. | Step Name | Description |
|-----|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11 | Set the DMSBS register Set the DMDBS register | To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset |
| 12 | Set the DMINT.DTIE bit to 1 | To use DMA transfer end interrupts. Enable DMACn transfer end interrupts. |
| 13 | Set the DMCNT.DTE bit to 1 | Enable DMACn transfer |
| 14 | Set the DMAST.DMST bit to 1 | Enable DMAC operation.*1 |
| 15 | Start the peripheral function as a DMACn request source | To use peripheral function interrupt as a DMA activation source |
| 16 | Enable the IRQ pin as a DMACn request source | To use external pin interrupt as a DMA activation source |
| 17 | End of initial settings | For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer. |

Note: m: DELSRn.DELS bit number (m = 0 to 8)
n: DMAC channel (n = 0 to 7)

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

15.3.11 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

15.3.12 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 15.5](#) to [Table 15.13](#).

DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see [Table 15.5](#) to [Table 15.13](#).

DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 15.5](#) to [Table 15.13](#).

DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 15.5](#) to [Table 15.13](#).

DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 15.8](#) to [Table 15.13](#).

DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see [Table 15.8](#) to [Table 15.13](#).

DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

DMAC Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

15.3.13 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3... > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

15.3.14 Channel Security

The security attribute of transfer access of DMACn, security attribute of access to register of DMACn, security attribute of access to the ICU.DELSRn register are controlled by ICUSARC.SADMACn bit. For details on the ICUSARC register, see [section 12, Interrupt Controller Unit \(ICU\)](#).

When the ICUSARC.SADMACn bit is 0, transfer of DMACn is secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are protected from a non-secure access.

When the ICUSARC.SADMACn bit is 1, transfer of DMACn is non-secure access for both read and write. At the same time, the registers of channel n and the DELSRn register are non-secure attributes.

Do not write to the ICUSARC.SADMACn bit while DMA transfer of same channel is enabled or a bus master is writing to the DMA registers of same channel.

[Figure 15.22](#) shows security attribute about each DMAC channels.

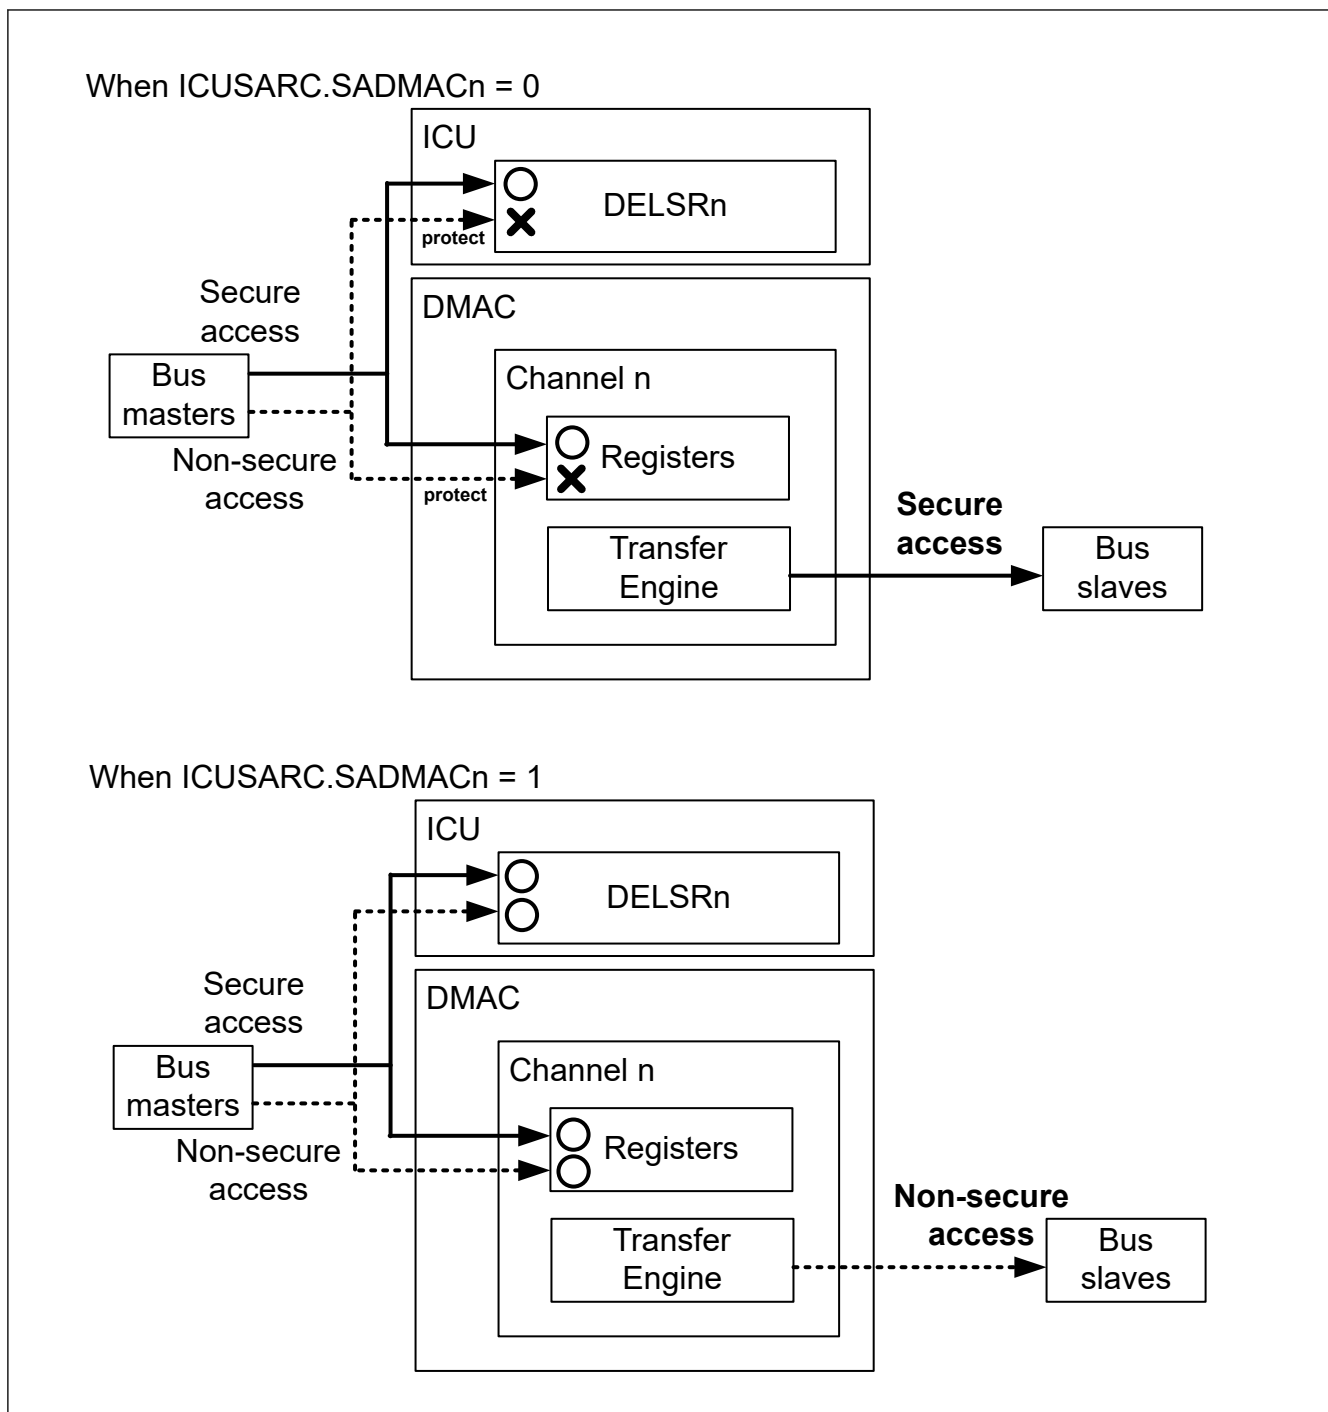

Figure 15.22 Security attribute about each DMAC channels

15.3.15 Master TrustZone Filter in DMAC

DMAC has the Master TrustZone Filter. The MasterTrustZone Filter in DMAC can detect the security areas of Flash area (code Flash and data Flash) and SRAM area defined by IDAU. When set No-secure channel accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

15.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

15.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRA1 changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRA1 changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRA1 changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRA1 changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

15.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

15.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

15.5 Processing on DMA Transfer Error

DMA transfer error occurs with the Master TrustZone Filter error in DMAC, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the ICU.DELSRn of the corresponding channel is cleared. Write back to each register is not performed. Furthermore, it generates the error response detection interrupt request (DMA_TRANSERR) to notify that an error has occurred by DMAC/DTC transfer.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DMAC by selecting NMI. The DMAC error channel register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DMAC, two interrupts(NMI and DMA_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA_TRANSERR) is not cleared in NMI handler.

[section 15.5.1. Processing on NMI handler](#) describes how to confirm the error information of the DMAC in the NMI handler.

[section 15.5.2. Processing on Error response detection interrupt request \(DMA_TRANSERR\) handler](#) describes how to confirm the error information of the DMAC in the DMA_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in [section 15.6.2. Transfer Error Interrupt](#).

15.5.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DMAC transfer error, the error response detection interrupt request (DMA_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DMAC channel in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 15.23](#) shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

[Figure 15.24](#) shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

[Figure 15.25](#) shows the flow for confirm the channel and Security Attribute that caused the Master MPU error in DMAC.

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA_TRANSERR) that occurs subsequently.

Figure 15.23 Processing in NMI handler by Master TrustZone Filter Error

Figure 15.24 Processing in NMI handler by Slave TrustZone Filter Error

Figure 15.25 Processing in NMI handler by Master MPU Error

15.5.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler

The cause of error response detection interrupt request (DMA_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the DMAC channel in which the error occurred.

Error cause confirmation procedure is shown [Figure 15.26](#).

[Figure 15.27](#) shows the flow for confirm the channel that caused the Master TrustZone Filter Error in DMAC

[Figure 15.28](#) shows the flow for confirm the channel that caused the Slave TrustZone Filter Error in DMAC

[Figure 15.29](#) shows the flow for confirm the channel and Security Attribute that caused the Master MPU Error in DMAC

[Figure 15.30](#) shows the flow for confirm the channel and Security Attribute that caused the Slave Bus Error in DMAC

[Figure 15.31](#) shows the flow for confirm the channel and Security Attribute that caused the Illegal Access Error in DMAC

15.6 Interrupts

15.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMACn_INT) to the CPU or the DTC after transfer in response to one request is completed.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

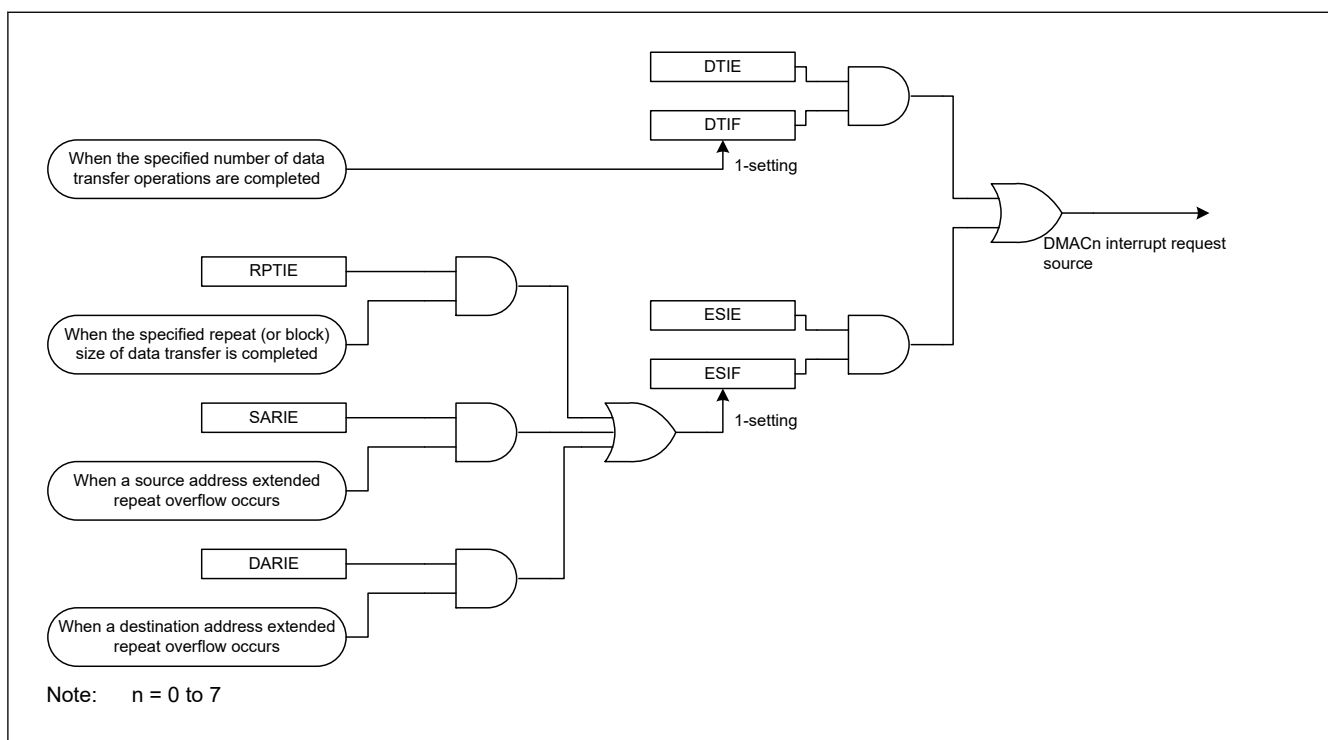

Table 15.20 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 15.32 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 15.33 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 15.20 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (1 of 2)

| Interrupt sources | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|-------------------|-----------------------|------------------------|----------------------------|
| Transfer end | — | DMSTS.DTIF | DMINT.DTIE |

Table 15.20 Relation among interrupt sources, interrupt status flags, and interrupt enable bits (2 of 2)

| Interrupt sources | | Interrupt enable bits | Interrupt status flags | Request output enable bits |
|---------------------|---------------------------------------------------|-----------------------|------------------------|----------------------------|
| Escape transfer end | Repeat size end | DMINT.RPTIE | DMSTS.ESIF | DMINT.ESIE |
| | Source address extended repeat area overflow | DMINT.SARIE | | |
| | Destination address extended repeat area overflow | DMINT.DARIE | | |

**Figure 15.32** Schematic logic diagram of interrupt output source (DMACn)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

15.6.1.1 When Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The DMACn remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

15.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

Figure 15.33 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

15.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer. The types of interrupts that occur when a DMAC transfer error occurs are listed in the [Table 15.21](#). The [Table 15.21](#) also shows error information stored when a transfer error occurs.

Table 15.21 Interrupt and error information due to DMAC transfer error cause

| Transfer error factor | NMI/RESET ^{*1} Request | Interrupt Request | Bus Error Status | Error Address Error R/W | Error Channel Information |
|---------------------------------------|---------------------------------|-------------------|--------------------------------------------|-----------------------------------|---------------------------|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST ^{*1} | DMA_TRANSERR | BUS.DMACDTCERRSTAT.MTERRSTAT ^{*1} | — | DMA.DMECHR |
| Slave TrustZone Filter | ICU.NMISR.TZFST ^{*1} | DMA_TRANSERR | BUS.BUS3ERRSTAT.STERRSTAT ^{*1} | BUS.BTZF3ERRADD BUS.BTZF3ERRRW | DMA.DMECHR |
| Master MPU | ICU.NMISR.BUSMST | DMA_TRANSERR | BUS.BUS3ERRSTAT.MMERRSTAT | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |
| Slave Bus Error | — ^{*2} | DMA_TRANSERR | BUS.BUS3ERRSTAT.SLERRSTAT ^{*2} | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |
| Illegal Access Error | — ^{*2} | DMA_TRANSERR | BUS.BUS3ERRSTAT.ILERRSTAT ^{*2} | BUS.BUS3ERRADD BUS.BUS3ERRRW | DMA.DMECHR |

Note 1. Interrupt generated, when NMI request selected as the operation after detection of the Master MPU error and the TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can be judged also by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA_TRANSERR) occurs.

15.7 Event Link

Each DMAC channel outputs an event link request signal (DMACn_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

For details, see [section 17, Event Link Controller \(ELC\)](#).

If a bus error occurs when writing the last data of transfer, a transfer end event and error response detection interrupt (DMA_TRANSERR) occurs.

15.8 Low-Power Consumption Function

Before entering the module-stop state or Software Standby mode, or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#), or in [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

(3) Notes on low power consumption function

For information on the WFI instruction and register settings, see [section 10.10.7. Timing of WFI Instruction](#).

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in [section 12.4.1. Detecting Interrupts](#), and then execute the WFI instruction.

15.9 Usage Notes

15.9.1 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS
- DMDBS
- DMSRR

- DMDRR
- ICUSARC
- DMAC SAR

15.9.2 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see [section 4, Address Space](#).

15.9.3 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (ICU.DELSRn n = 0 to 7)

The DMAC event link setting register (ICU.DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 95)) that corresponds to the same event number that has been set by the ICU.DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE and ICU.DELSRn, see [section 12, Interrupt Controller Unit \(ICU\)](#).

15.9.4 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (ICU.DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the ICU.DELSRn.DELS[8:0] bits following the settings shown in [section 15.3.10. Activating the DMAC](#).

15.9.5 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits in the ICU to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the ICU.DELSRn.IR flag to 0.

See [Figure 15.34](#).

Figure 15.34 Example of register setting procedure to clear the DMAC activation interrupt

16. Data Transfer Controller (DTC)

16.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

[Table 16.1](#) lists the DTC specifications and [Figure 16.1](#) shows DTC block diagram.

Table 16.1 DTC specifications

| Parameter | Description |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transfer modes | <ul style="list-style-type: none"> Normal transfer mode A single activation leads to a single data transfer. Repeat transfer mode A single activation leads to a single data transfer. The transfer address returns to the start address after the number of data transfers reaches the specified repeat size. The maximum number of repeat transfers is 256 and the maximum data transfer size is 256×32 bits (1024 bytes) Block transfer mode A single activation leads to a transfer of a single block. The maximum block size is 256×32 bits = 1024 bytes. |
| Transfer channel | <ul style="list-style-type: none"> Channel transfer can be associated with the interrupt source (transferred by a DTC activation request from the ICU) Multiple data units can be transferred on a single activation source (chain transfer) Chain transfers are selectable to either execute when the counter is 0, or always execute. |
| Transfer space | <ul style="list-style-type: none"> 4 GB area from 0x0000_0000 to 0xFFFF_FFFF, excluding reserved areas |
| Data transfer units | <ul style="list-style-type: none"> Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits) Single block size: 1 to 256 data units. |
| CPU interrupt source | <ul style="list-style-type: none"> An interrupt request can be generated to the CPU on a DTC activation interrupt An interrupt request can be generated to the CPU after a single data transfer An interrupt request can be generated to the CPU after a data transfer of a specified volume. |
| Processing on DTC transfer error | <ul style="list-style-type: none"> When the DTC transfer error occurs, it stops the transfer that caused the error Request to clear the register for activation request of DTC error number to ICU |
| Error response detection interrupt | Generated when the DTC transfer error occurs |
| Event link function | An event link request is generated after one data transfer (for block, after one block transfer) |
| Read skip | Read of transfer information can be skipped |
| Write-back skip | When the transfer source or destination address is specified as fixed, a write-back of transfer information can be skipped |
| TrustZone | TrustZone violation area of Flash and SRAM is detected in advance before access the bus. |
| Module-stop function | Module-stop state can be set to reduce power consumption |
| TrustZone Filter | Security attribution can be set for each activation source |

Note: Security attribution Register of DTC is described in ICU.ICUSARG, ICU.ICUSARH and ICU.ICUSARI

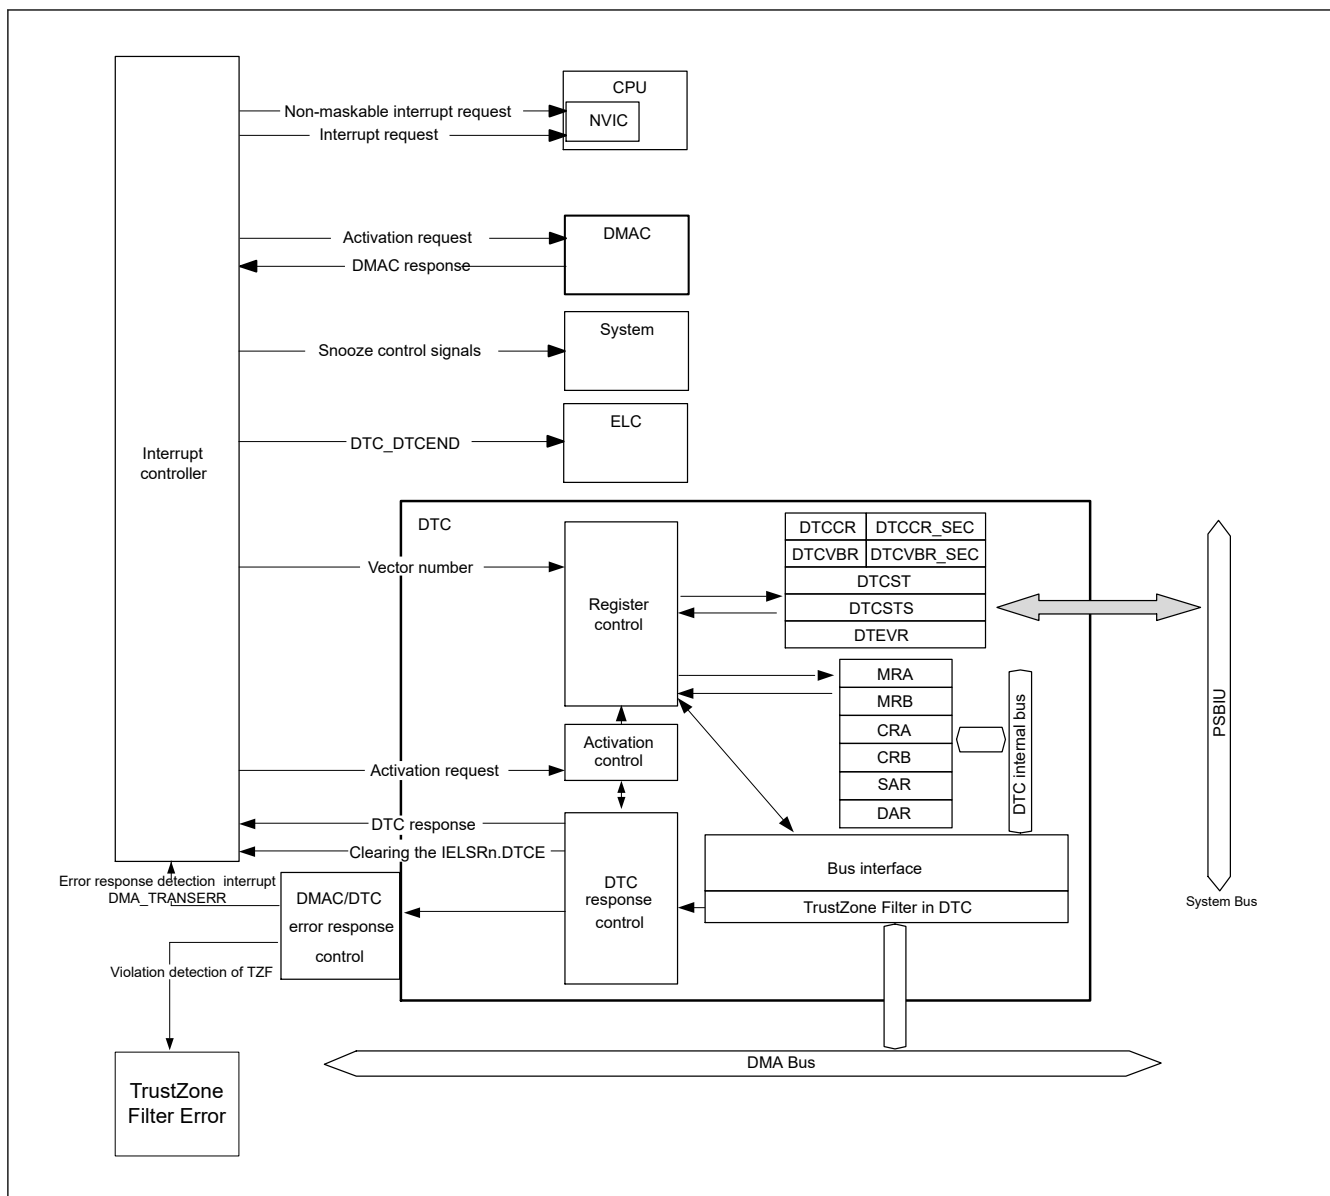

Figure 16.1 DTC block diagram

See [section 12.1. Overview](#) in [section 12, Interrupt Controller Unit \(ICU\)](#) for the connections between the DTC and NVIC in the CPU.

16.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

16.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000

Offset address: 0x30

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|-------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTCS TSA |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|----------|----------------------------------------------------------|-----|
| 0 | DTCS TSA | DTC Security Attribution 0: Secure. 1: Non-secure. | R/W |
| 31:1 | — | This bit is read as 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register only sets the DTCST security attribute.

DTCS TSA bit (DTC Security Attribution)

Security attributes of registers for DTCST.

Do not write to the DTCS TSA bit while DTC transfer is enabled or a bus master is writing to the DTC registers.

16.2.2 MRA : DTC Mode Register A

Base address: DTCVBR

Offset address: 0x03 + 0x4 × Vector number
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

| | | | | | | | | |
|--------------------|---------|---|---------|---|---------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | MD[1:0] | | SZ[1:0] | | SM[1:0] | | — | — |
| Value after reset: | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|-----|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | — | The read values are undefined. The write value should be 0. | — |
| 3:2 | SM[1:0] | Transfer Source Address Addressing Mode 0 0: Address in the SAR register is fixed (write-back to SAR is skipped.) 0 1: Address in the SAR register is fixed (write-back to SAR is skipped.) 1 0: SAR value is incremented after data transfer: +1 when SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: SAR value is decremented after data transfer: -1 when SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b | — |

| Bit | Symbol | Function | R/W |
|-----|---------|---------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 5:4 | SZ[1:0] | DTC Data Transfer Size 0 0: Byte (8-bit) transfer 0 1: Halfword (16-bit) transfer 1 0: Word (32-bit) transfer 1 1: Setting prohibited | — |
| 7:6 | MD[1:0] | DTC Transfer Mode Select 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited | — |

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x03) and DTC transfers it automatically to and from the MRA register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

16.2.3 MRB : DTC Mode Register B

Base address: DTCVBR

Offset address: 0x02 + 0x4 × Vector number
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

| | | | | | | | | |
|---------------|------|------|-------|-----|---------|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | CHNE | CHNS | DISEL | DTS | DM[1:0] | — | — | — |

Value after reset: x x x x x x x x

| Bit | Symbol | Function | R/W |

| 1:0 | — | The read values are undefined. The write value should be 0. | — |
| 3:2 | DM[1:0] | Transfer Destination Address Addressing Mode 0 0: Address in the DAR register is fixed (write-back to DAR is skipped) 0 1: Address in the DAR register is fixed (write-back to DAR is skipped) 1 0: DAR value is incremented after data transfer: +1 when MRA.SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: DAR value is decremented after data transfer: -1 when MRA.SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b | — |
| 4 | DTS | DTC Transfer Mode Select 0: Select transfer destination as repeat or block area. 1: Select transfer source as repeat or block area. | — |
| 5 | DISEL | DTC Interrupt Select 0: Generate an interrupt request to the CPU when specified data transfer is complete. 1: Generate an interrupt request to the CPU each time DTC data transfer is performed. | — |
| 6 | CHNS | DTC Chain Transfer Select 0: Chain transfer is continuous. 1: Chain transfer occurs only when the transfer counter changes from 1 to 0 or 1 to CRAH. | — |
| 7 | CHNE | DTC Chain Transfer Enable 0: Chain transfer is disabled. 1: Chain transfer is enabled. | — |

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

DM[1:0] bits (Transfer Destination Address Addressing Mode)

The DM[1:0] bits are to fix the address of the DAR register or specify increment / decrement of the DAR register after transfer.

DTS bit (DTC Transfer Mode Select)

The DTS bit specifies whether the transfer source or destination is the repeat or block area in repeat or block transfer mode.

DISEL bit (DTC Interrupt Select)

The DISEL bit specifies the condition for generating an interrupt request to the CPU.

CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see [Table 16.3](#).

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see [section 16.4.6. Chain Transfer](#).

16.2.4 SAR : DTC Transfer Source Register

Base address: DTCVBR

Offset address: $0x04 + 0x4 \times \text{Vector number}$
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

Bit position: 31

0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x

The SAR sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x04) and DTC transfers it automatically to and from the SAR register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

16.2.5 DAR : DTC Transfer Destination Register

Base address: DTCVBR

Offset address: $0x08 + 0x4 \times \text{Vector number}$
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

Bit position: 31

0

Bit field:

Value after reset: x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x x

The DAR sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x08) and DTC transfers it automatically to and from the DAR register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

16.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR

Offset address: $0x0E + 0x4 \times \text{Vector number}$
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|------|--------|------------------------------------------------------------------|-----|
| 7:0 | CRAL | Transfer Counter A Lower Register Specify the transfer count. | — |
| 15:8 | CRAH | Transfer Counter A Upper Register Specify the transfer count. | — |

Note: The function depends on the transfer mode.

Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode. CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

16.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR

Offset address: $0x0C + 0x4 \times \text{Vector number}$
(Inaccessible directly from the CPU. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#))

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | | | | | | | | | | | | | | | | |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See [section 16.3.1. Allocating Transfer Information and DTC Vector Table](#).

16.2.8 DTCCR : DTC Control Register

Base address: DTC = 0x4000_5400

Offset address: 0x00

| | | | | | | | | |
|--------------------|---|---|---|-----|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | RRS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | RRS | DTC Transfer Information Read Skip Enable 0: Transfer information read is not skipped 1: Transfer information read is skipped when vector numbers match | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

RRS bit (DTC Transfer Information Read Skip Enable)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

16.2.9 DTCCR_SEC : DTC Control Register for secure Region

Base address: DTC = 0x4000_5400

Offset address: 0x10

| | | | | | | | | |
|--------------------|---|---|---|-----|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | RRS | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 3 | — | This bit is read as 1. The write value should be 1. | R/W |
| 4 | RRS | DTC Transfer Information Read Skip Enable for Secure 0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match. | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: Secure access is allowed. Non-secure access is read-only.

RRS bit (DTC Transfer Information Read Skip Enable for Secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is

set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

16.2.10 DTCVBR : DTC Vector Base Register

Base address: DTC = 0x4000_5400

Offset address: 0x04

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | DTC Vector Base Address Set the DTC vector base address. The lower 10 bits should be 0. | R/W |

The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

16.2.11 DTCVBR_SEC : DTC Vector Base Register for secure Region

Base address: DTC = 0x4000_5400

Offset address: 0x14

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | DTC Vector Base Address for secure region Set DTC Vector Base Address for secure region. The lower 10 bits should be 0. | R/W |

Note: Secure access is allowed. Non-secure access is read-only.

The DTCVBR_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

16.2.12 DTCST : DTC Module Start Register

Base address: DTC = 0x4000_5400

Offset address: 0x0C

Bit position: 7 6 5 4 3 2 1 0

Bit field:

| | | | | | | | |
|---|---|---|---|---|---|---|-----------|
| — | — | — | — | — | — | — | DTCS T |
|---|---|---|---|---|---|---|-----------|

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------|-----|
| 0 | DTCST | DTC Module Start 0: DTC module stopped. 1: DTC module started. | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software standby mode

For details on these transitions, see [section 16.10. Low Power Consumption Function](#) and [section 10, Low Power Modes](#).

16.2.13 DTCSTS : DTC Status Register

Base address: DTC = 0x4000_5400

Offset address: 0x0E

| | | | | | | | | | | | | | | | | |
|--------------------|-----|----|----|----|----|----|---|---|-----------|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | ACT | — | — | — | — | — | — | — | VECN[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|-----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | VECN[7:0] | DTC-Activating Vector Number Monitoring These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (ACT flag is 1). | R |
| 14:8 | — | These bits are read as 0. | R |
| 15 | ACT | DTC Active Flag 0: DTC transfer operation is not in progress. 1: DTC transfer operation is in progress. | R |

VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

16.2.14 DTEVR : DTC Error Vector Register

Base address: DTC = 0x4000_5400

Offset address: 0x20

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|--------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DTESTA |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---------|-----------|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | DTEVSAM | DTEV[7:0] | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 7:0 | DTEV[7:0] | DTC Error Vector Number These bits represent error vector of the DTC. | R |
| 8 | DTEVSAM | DTC Error Vector Number SA Monitor Indicates the SA of vector number causing the error. 0: Secure vector number 1: Non-secure vector number | R |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R |
| 16 | DTESTA | DTC Error Status Flag 0: No DTC transfer error occurred 1: DTC transfer error occurred | R/W |
| 31:17 | — | These bits are read as 0. The write value should be 0. | R |

Note: Writing to DTESTA depends on the value of DTEVSAM

DTEV[7:0] bits (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, the DTEV[7:0] bits store the violating DTC channel.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, the DTEVSAM bit indicates the SA of the violating DTC vector number.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

DTESTA bit (DTC Error Status Flag)

The DTESTA bit indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

When reset is selected in MPU.MMPUOAD.OAD and TZF.TZFOAD.OAD, this register is also reset. Select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

Note: When DTEVSAM = 1, it can be cleared in the secure state and non-secure state. DTEVSAM = 0, it cannot be cleared in the non-secure state.

16.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output n number set in ICU.IELSRn is defined as the interrupt vector number, where $n = 0$ to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number n is selected in ICU.IELSRn.IELS[8:0] where $n = 0$ to 95, as listed in [section 12.3.2. Event Number](#) in [section 12, Interrupt Controller Unit \(ICU\)](#). For activation by software, see [section 17.2.2. ELSEGRn : Event Link Software Event Generation Register n \(\$n = 0, 1\$ \)](#).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

16.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, non-secure side or secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into non-secure or secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR_SEC which is the secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information n with vector number n must be $4n$ added to the base address in the vector table.

[Figure 16.2](#) shows the relationship between the DTC vector table and transfer information. [Figure 16.3](#) shows the allocation of transfer information in the SRAM area.

Figure 16.2 DTC vector table and transfer information

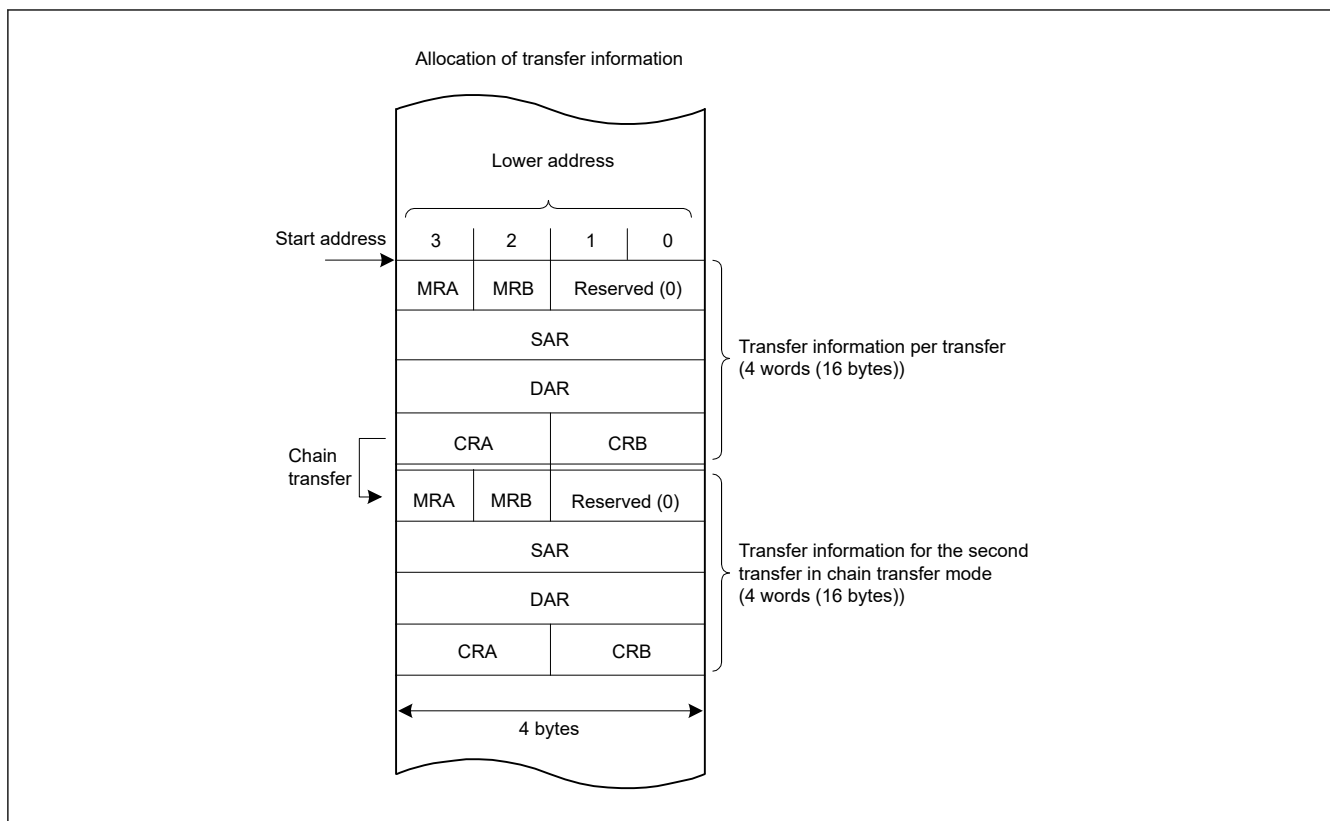

Figure 16.3 Allocation of transfer information in the SRAM area

16.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 16.2 describes the DTC transfer modes.

Table 16.2 DTC transfer modes

| Transfer mode | Data size transferred on single transfer request | Increment or decrement of memory address | Settable transfer count |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|-------------------------|
| Normal transfer mode | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536 |
| Repeat transfer mode ^{*1} | 1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 256 ^{*3} |
| Block transfer mode ^{*2} | Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes)) | Incremented or decremented by 1, 2, or 4 or address-fixed | 1 to 65536 |

Note 1. Set the transfer source or transfer destination as the repeat area.

Note 2. Set the transfer source or transfer destination as the block area.

Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 16.4 shows the operation flow of the DTC. Table 16.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.

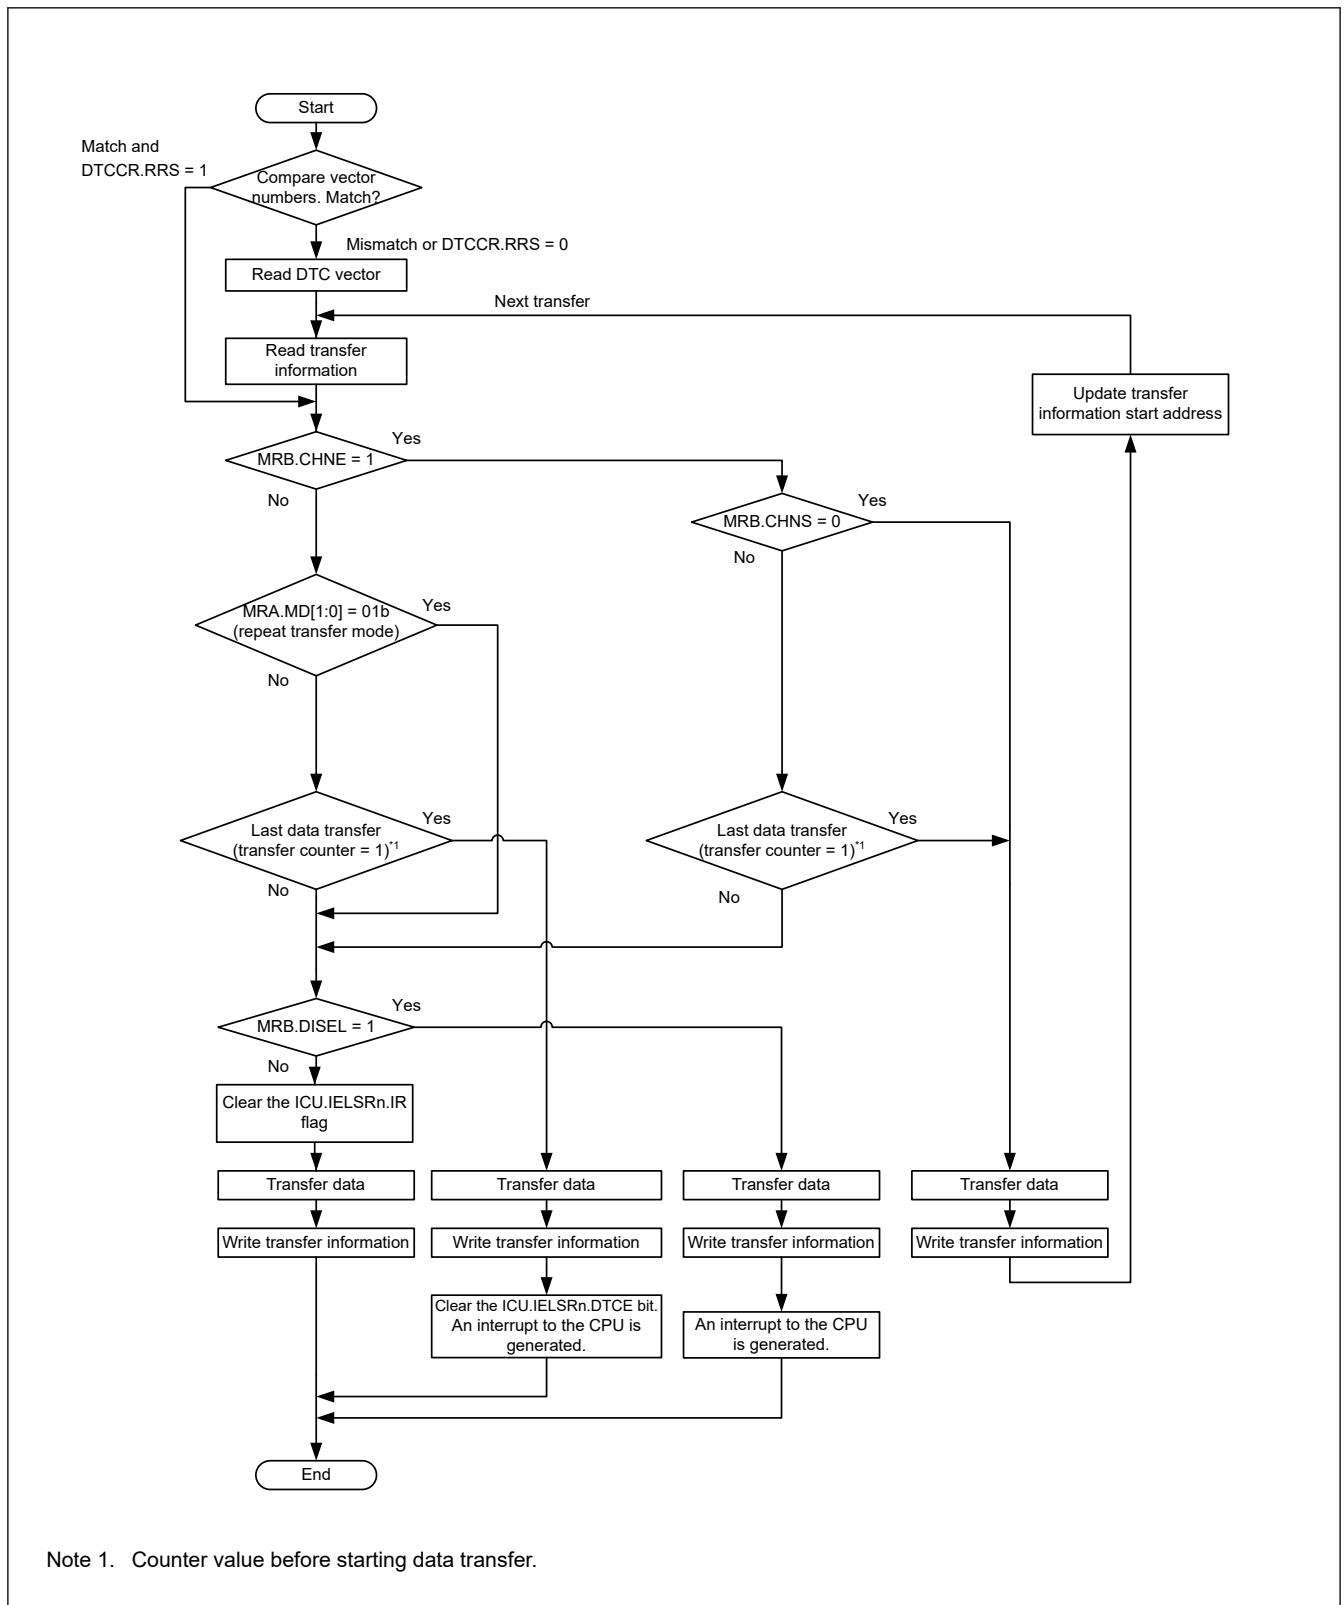

Figure 16.4 DTC operation flow

Table 16.3 Chain transfer conditions

| First transfer | | | | Second transfer ^{*3} | | | | DTC transfer |
|----------------|----------|-----------|-----------------------------------|-------------------------------|----------|-----------|-----------------------------------|---------------------------------------------------------------------|
| CHNE bit | CHNS bit | DISEL bit | Transfer counter ^{*1 *2} | CHNE bit | CHNS bit | DISEL bit | Transfer counter ^{*1 *2} | |
| 0 | — | 0 | Other than (1 → 0) | — | — | — | — | Ends after the first transfer |
| 0 | — | 0 | (1 → 0) | — | — | — | — | Ends after the first transfer with an interrupt request to the CPU |
| 0 | — | 1 | — | — | — | — | — | |
| 1 | 0 | — | — | 0 | — | 0 | Other than (1 → 0) | Ends after the second transfer |
| | | | | 0 | — | 0 | (1 → 0) | Ends after the second transfer with an interrupt request to the CPU |
| | | | | 0 | — | 1 | — | |
| 1 | 1 | 0 | Other than (1 → *) | — | — | — | — | Ends after the first transfer |
| 1 | 1 | — | (1 → *) | 0 | — | 0 | Other than (1 → 0) | Ends after the second transfer |
| | | | | 0 | — | 0 | (1 → 0) | Ends after the second transfer with an interrupt request to the CPU |
| | | | | 0 | — | 1 | — | |
| 1 | 1 | 1 | Other than (1 → *) | — | — | — | — | Ends after the first transfer with an interrupt request to the CPU |

Note 1. The transfer counter used depends on the transfer modes as follows:

Normal transfer mode — CRA register
Repeat transfer mode — CRAL register
Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:

1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

16.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. [Figure 16.12](#) shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

16.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. [Table 16.4](#) lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

Table 16.4 Transfer information write-back skip conditions and applicable registers

| MRA.SM[1:0] bits | | MRB.DM[1:0] bits | | SAR register | DAR register |
|------------------|----|------------------|----|--------------|--------------|
| b3 | b2 | b3 | b2 | | |
| 0 | 0 | 0 | 0 | Skip | Skip |
| 0 | 0 | 0 | 1 | | |
| 0 | 1 | 0 | 0 | | |
| 0 | 1 | 0 | 1 | | |
| 0 | 0 | 1 | 0 | Skip | Write-back |
| 0 | 0 | 1 | 1 | | |
| 0 | 1 | 1 | 0 | | |
| 0 | 1 | 1 | 1 | | |
| 1 | 0 | 0 | 0 | Write-back | Skip |
| 1 | 0 | 0 | 1 | | |
| 1 | 1 | 0 | 0 | | |
| 1 | 1 | 0 | 1 | | |
| 1 | 0 | 1 | 0 | Write-back | Write-back |
| 1 | 0 | 1 | 1 | | |
| 1 | 1 | 1 | 0 | | |
| 1 | 1 | 1 | 1 | | |

16.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

[Table 16.5](#) lists register functions in normal transfer mode, and [Figure 16.5](#) shows the memory map of normal transfer mode.

Table 16.5 Register functions in normal transfer mode

| Register | Description | Value written back by writing transfer information |
|----------|------------------------------|----------------------------------------------------|
| SAR | Transfer source address | Increment, decrement, or fixed*1 |
| DAR | Transfer destination address | Increment, decrement, fixed*1 |
| CRA | Transfer counter A | CRA - 1 |
| CRB | Transfer counter B | Not updated |

Note 1. Write-back operation is skipped in address-fixed mode.

Figure 16.5 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)

16.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 16.6 lists the register functions in repeat transfer mode, and Figure 16.6 shows the memory map of repeat transfer mode.

Table 16.6 Register functions in repeat transfer mode

| Register | Description | Value written back by writing transfer information | |
|----------|------------------------------|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | | When CRAL is not 1 | When CRAL is 1 |
| SAR | Transfer source address | Increment, decrement, fixed ^{*1} | <ul style="list-style-type: none"> When the MRB.DTS bit is 0 Increment, decrement, or fixed^{*1} When the MRB.DTS bit is 1 SAR register initial value |
| DAR | Transfer destination address | Increment, decrement, or fixed ^{*1} | <ul style="list-style-type: none"> When the MRB.DTS bit is 0 DAR register initial value When the MRB.DTS bit is 1 Increment, decrement, or fixed^{*1} |
| CRAH | Retains transfer counter | CRAH | CRAH |
| CRAL | Transfer counter A | CRAL - 1 | CRAH |
| CRB | Transfer counter B | Not updated | Not updated |

Note 1. Write-back is skipped in address-fixed mode.

Figure 16.6 Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)

16.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 16.7 lists the register functions in block transfer mode, and Figure 16.7 shows the memory map for block transfer mode.

Table 16.7 Register functions in block transfer mode

| Register | Description | Value written back by writing transfer information |
|----------|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SAR | Transfer source address | <ul style="list-style-type: none"> When MRB.DTS bit is 0 Increment, decrement, or fixed^{*1} When MRB.DTS bit is 1 SAR register initial value. |
| DAR | Transfer destination address | <ul style="list-style-type: none"> When MRB.DTS bit is 0 DAR register initial value When MRB.DTS bit is 1 Increment, decrement, or fixed^{*1}. |
| CRAH | Holds block size | CRAH |
| CRAL | Block size counter | CRAH |
| CRB | Block transfer counter | CRB - 1 |

Note 1. Write-back is skipped in address-fixed mode.

Figure 16.7 Memory map of block transfer mode

16.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer.

[Figure 16.8](#) shows a chain transfer operation.

Figure 16.8 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see [Table 16.3](#).

16.4.7 Operation Timing

[Figure 16.9](#) to [Figure 16.12](#) are timing diagrams that show the minimum number of execution cycles.

Figure 16.9 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

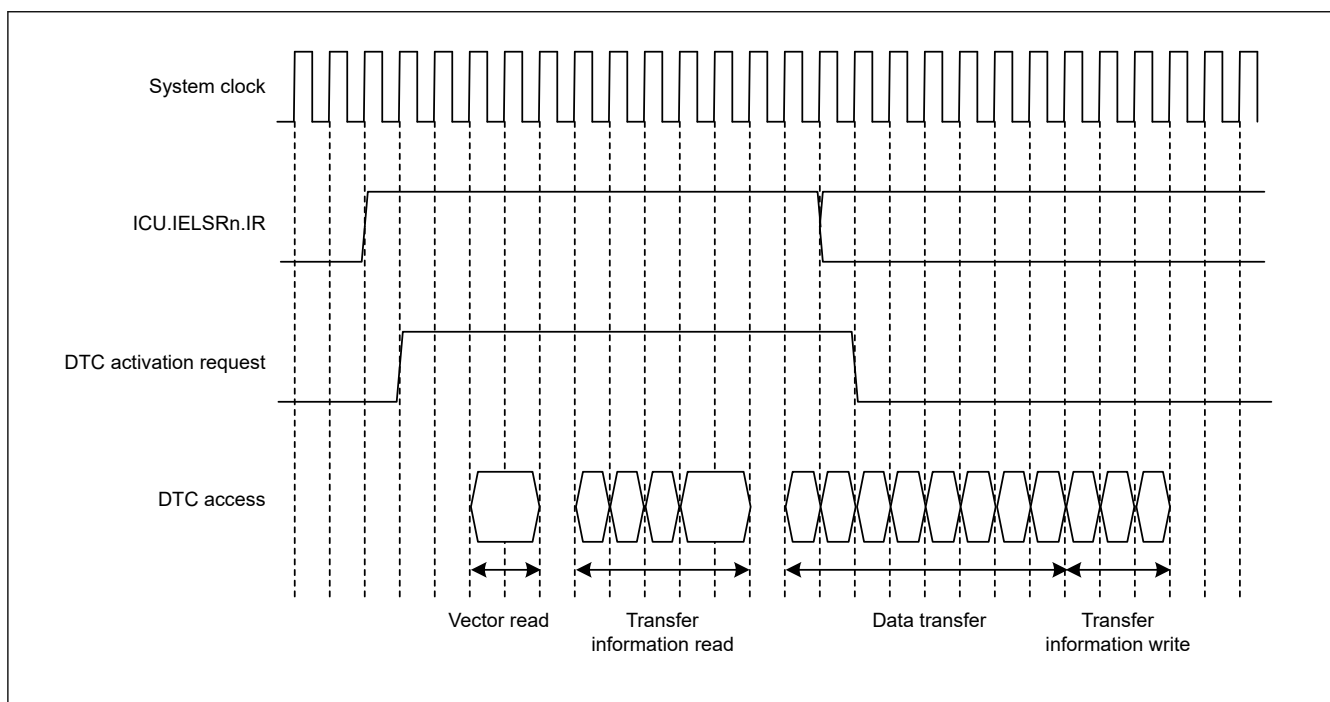

Figure 16.10 Example 2 of DTC operation timing in block transfer mode when the block size = 4

Figure 16.11 Example 3 of DTC operation timing for chain transfer

Figure 16.12 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

16.4.8 Execution Cycles of DTC

Table 16.8 lists the execution cycles of single data transfer of the DTC. For the order of the execution states, see [section 16.4.7. Operation Timing](#).

Table 16.8 Execution cycles of DTC

P: Block size (initial settings of CRAH and CRAL)

Cv: Cycles for access to vector transfer information storage destination

Ci: Cycles for access to transfer information storage destination address

Cr: Cycles for access to data read destination

Cw: Cycles for access to data write destination

The unit is for system clocks (ICLK) + 1 in the Vector read, Transfer information read, and Data transfer read columns and 2 in the Internal operation column.

Cv, Ci, Cr, and Cw vary depending on the corresponding access destination. For the number of cycles for respective access destinations, see [section 41, SRAM](#), [section 43, Flash Memory](#), and [section 13, Buses](#).

The frequency ratio of the system clock and peripheral clock is also taken into consideration.

The DTC response time is the time from when the DTC activation source is detected until DTC transfer starts.

[Table 16.8](#) does not include the time until DTC data transfer starts after the DTC activation source becomes active.

| Transfer mode | Vector read | | Transfer information read | | Transfer information write | | | Data transfer | | Internal operation | |
|---------------|-------------|-----|---------------------------|-----|----------------------------|--------------|------|---------------|--------|--------------------|-----|
| | | | | | | | | Read | Write | | |
| Normal | Cv + 1 | 0*1 | 4 × Ci + 1 | 0*1 | 3 × Ci + 1*2 | 2 × Ci + 1*3 | Ci*4 | Cr + 1 | Cw + 1 | 2 | 0*1 |
| Repeat | | | | | | | | Cr + 1 | Cw + 1 | | |
| Block*5 | | | | | | | | P × Cr | P × Cw | | |

Note 1. When transfer information read is skipped.

Note 2. When neither SAR nor DAR is set to address-fixed mode.

Note 3. When SAR or DAR is set to address-fixed mode.

Note 4. When SAR and DAR are set to address-fixed mode.

Note 5. When the block size is 2 or more. If the block size is 1, the cycle number for normal transfer applies.

16.4.9 DTC Bus Mastership Release Timing

The DTC does not release the bus mastership during transfer information reads. Before the transfer information is read or written, the bus is arbitrated according to the priority determined by the bus master arbitrator. For bus arbitration, see [section 13, Buses](#).

16.4.10 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn (n = 0 to 95) register of ICU are controlled by SAIELSRn bit of ICUSARx (x = G, H or I) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see [section 12, Interrupt Controller Unit \(ICU\)](#).

When the CPSCU.ICUSARx.SAIELSRn bit is 0, transfer of DTC vector n is secure access for both read and write. At the same time, the IELSRn register are protected from a non-secure access.

When the CPSCU.ICUSARx.SAIELSRn bit is 1, transfer of DTC vector n is non-secure access for both read and write. At the same time, the IELSRn register is non-secure attributes.

Do not write to the CPSCU.ICUSARx.SAIELSRn bit while DTC transfer is enabled or a bus master is writing to the DTC registers of same channel.

[section 16.3.1. Allocating Transfer Information and DTC Vector Table](#) shows security attribute about each DTC vectors.

16.4.11 Master TrustZone Filter in DTC

DTC has the Master TrustZone Filter. The Master TrustZone Filter in DTC can detect the security areas of Flash area (code Flash and data Flash) and SRAM area defined by IDAU. When no-secure accesses those addresses, it detects the security violation. Access of violation address is not performed. Detected the error is handled as the Master TrustZone Filter error.

16.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in [Table 16.9](#) to set the DTC.

Table 16.9 DTC setting procedure

| No. | Step Name | Description |
|-----|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set the DTCCR ^{*1} .RRS bit to 0 | Set the DTCCR ^{*1} .RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated. |
| 2 | Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) | Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see section 16.2. Register Descriptions . To allocate transfer information, see section 16.3.1. Allocating Transfer Information and DTC Vector Table . |
| 3 | Set transfer information start addresses in the DTC vector table | Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see section 16.3.1. Allocating Transfer Information and DTC Vector Table . |
| 4 | Set the DTCCR ^{*1} .RRS bit to 1 | Set the DTCCR ^{*1} .RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer. |
| 5 | Set the ICU.IELSRn.DTCE bit to 1. Set the ICU.IELSRn.IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC. | Set the ICU.IELSRn.DTCE bit to 1. Set ICU.IELSRn.IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See section 12.3.2. Event Number in section 12, Interrupt Controller Unit (ICU) . |
| 6 | Set the enable bit for an activation source interrupt | Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources. |
| 7 | Set the DTCST.DTCST bit to 1 | Set the DTC Module Start bit (DTCST.DTCST) to 1. |

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.

Note: When used in non-secure state, DTCSAR.DTCSTSA = 1 or DTCST.DTCST = 1 must be set.

Note 1. When used in secure state, access DTCCR_SEC instead of DTCCR.

16.6 Examples of DTC Usage

16.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

(1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

(2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

(4) SCI settings

Enable the SCIn_RXI (n = 0 to 4, 9) interrupt by setting the CCR0.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

(5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

16.6.2 Chain transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPTm.GTCCRC register (m = 320 to 329). For the second transfer, normal transfer mode is specified for transfer to the GPTm.GTCCRE register (m = 320 to 329). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPTm.GTPBR register (m = 320 to 329) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

(1) First transfer information setting

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(2) Second transfer information setting

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

(4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

(5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

(6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

(7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

(8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

(9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

(10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

16.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. [Figure 16.13](#) shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
 - (a) Transfer source address = fixed.
 - (b) CRA register = 0x0200 (512) times.
 - (c) MRB.CHNE bit = 1 (chain transfer is enabled).
 - (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
 - (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.

3. For the second data transfer:
 - (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
 - (b) Specify the CRA register in the first transfer information area for the transfer destination.
 - (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
 - (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
 - (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
 - (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
 - (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
 - (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
 - (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
 - (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
 - (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

Figure 16.13 Chain transfer when counter = 0

16.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. To stop only the vector number that caused the error, inform the vector number that caused the error to the ICU and clear the corresponding ICU setting. After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is. The condition under which the transfer error occurs is indicated when TrustZone Filter in DTC detects a violation.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Furthermore, it generates an error response detection interrupt to notify that an error has occurred by DMAC/DTC transfer. (section 16.8.2. Interrupt Request of Transfer Error). Write back to SRAM is not performed.

When the Master TrustZone Filter error occurs, the Slave TrustZone error occurs or the Master MPU error occurs, it is possible to confirm the error information of DTC by selecting NMI. The DTC error vector register is cleared by selecting reset. Under the conditions where NMI is generated due to transfer error in DTC, two interrupts(NMI and DMA_TRANSERR) are generated. In this case, NMI always responds first.

The error response detection interrupt request (DMA_TRANSERR) occurs when the Slave Bus error or the Illegal Access error occurs. Furthermore, it occurs after NMI when the error response detection interrupt request (DMA_TRANSERR) is not cleared in NMI handler.

section 16.7.1. Processing on NMI handler describes how to confirm the error information of the DTC in the NMI handler. section 16.7.2. Processing on Error response detection interrupt request (DMA_TRANSERR) handler describes how to confirm the error information of the DTC in the DMA_TRANSERR handler.

Interrupts and the error information generated due to transfer errors are shown in [section 16.8.2. Interrupt Request of Transfer Error](#).

16.7.1 Processing on NMI handler

The cause of NMI due to the DMA transfer error is the Master TrustZone Filter error, the Slave TrustZone Filter error or the Master MPU error. When NMI occurs due to the DTC transfer error, the error response detection interrupt request (DMA_TRANSERR) will occur after the end of NMI handler. It is possible to confirm the cause of the error and the DTC vector number in which the error occurred. When NMI occurs, perform the necessary processing according to the flow described in the ICU chapter.

[Figure 16.14](#) shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

[Figure 16.15](#) shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

[Figure 16.16](#) shows the flow for confirm the vector number and Security Attribute that caused the Master MPU error in DTC

If completing all processing in NMI handler, it is possible to clear the error response detection interrupt request (DMA_TRANSERR) that occurs subsequently.

Figure 16.14 Processing in NMI handler by Master TrustZone Filter Error

Figure 16.15 Processing in NMI handler by Slave TrustZone Filter Error

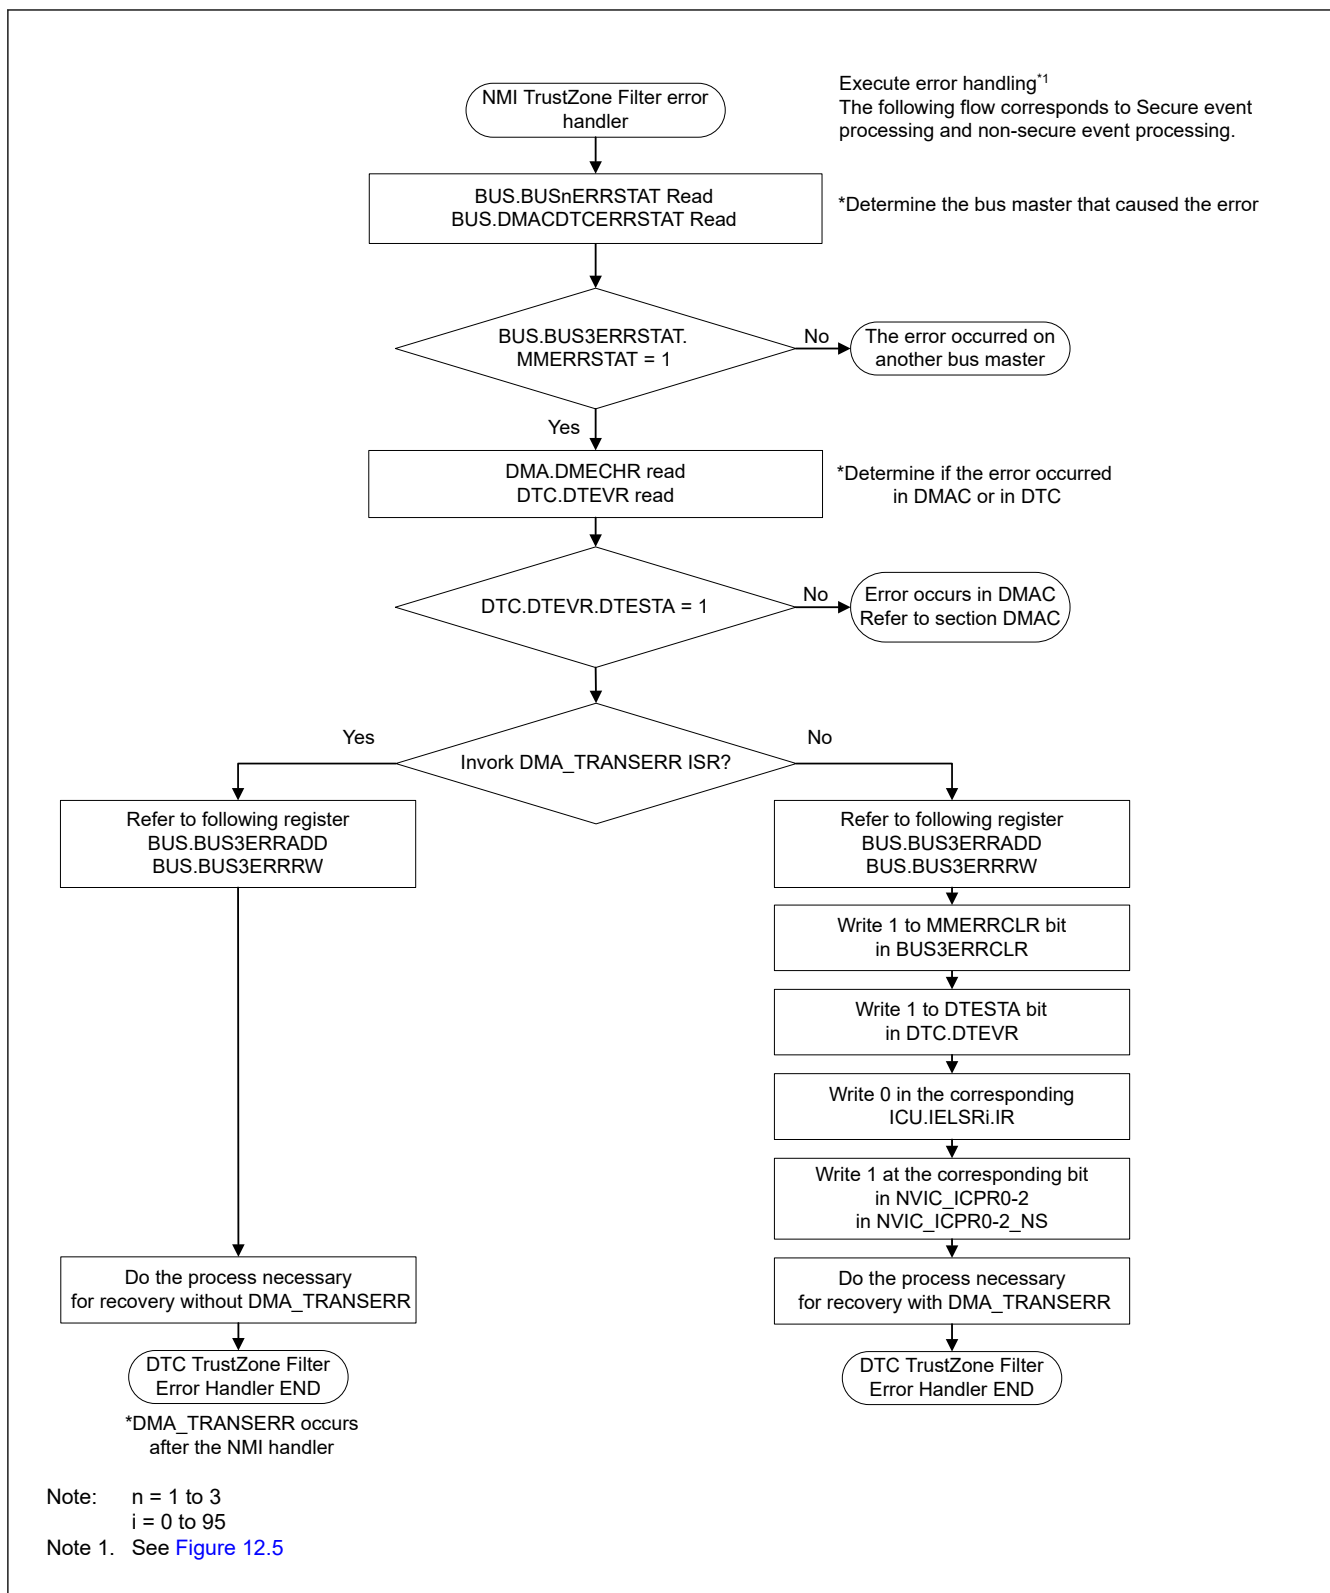

Figure 16.16 Processing in NMI handler by Master MPU Error

16.7.2 Processing on Error response detection interrupt request (DMA_TRANSERR) handler

The cause of error response detection interrupt request (DMA_TRANSERR) due to DMA transfer error is the Slave Bus Error or Illegal Access Error. Also, it occurs after the NMI handler error response detection interrupt request (DMA_TRANSERR) is not cleared by the NMI handler.

It is possible to confirm the cause of the error and the vector number of DTC in which the error occurred.

Error cause confirmation procedure is shown [Figure 16.17](#).

[Figure 16.18](#) shows the flow for confirm the vector number that caused the Master TrustZone Filter Error in DTC

[Figure 16.19](#) shows the flow for confirm the vector number that caused the Slave TrustZone Filter Error in DTC

[Figure 16.20](#) shows the flow for confirm the vector number and Security Attribute that caused the Master MPU Error in DTC

16.8 Interrupt

16.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC_COMPLETE (common to all channels). Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See [section 12, Interrupt Controller Unit \(ICU\)](#). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

16.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request (DMA_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer. The types of interrupts that occur when the DTC transfer error occurs are listed in the [Table 16.10](#). The [Table 16.10](#) also shows error information stored when a transfer error occurs.

Table 16.10 Interrupt and error information due to DMAC transfer error cause

| Transfer error factor | NMI/RESET ^{*1} Request | Interrupt Request | Bus Error Status | Error Address Error R/W | Error Channel Information |
|---------------------------------------|---------------------------------|-------------------|--------------------------------------------|-----------------------------------|---------------------------|
| Master TrustZone Filter (in DMAC/DTC) | ICU.NMISR.TZFST ^{*1} | DMA_TRANSERR | BUS.DMACDTCERRSTAT.MTERRSTAT ^{*1} | — | DTC.DTEVR |
| Slave TrustZone Filter | ICU.NMISR.TZFST ^{*1} | DMA_TRANSERR | BUS.BUS3ERRSTAT.STERRSTAT ^{*1} | BUS.BTZF3ERRADD BUS.BTZF3ERRRW | DTC.DTEVR |
| Master MPU | ICU.NMISR.BUSMST | DMA_TRANSERR | BUS.BUS3ERRSTAT.MMERRSTAT | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |
| Slave Bus Error | — ^{*2} | DMA_TRANSERR | BUS.BUS3ERRSTAT.SLERRSTAT ^{*2} | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |
| Illegal Access Error | — ^{*2} | DMA_TRANSERR | BUS.BUS3ERRSTAT.ILERRSTAT ^{*2} | BUS.BUS3ERRADD BUS.BUS3ERRRW | DTC.DTEVR |

Note 1. Interrupt generated, when NMI request selected as the operation after detection of the Master MPU error and The TrustZone Filter error. By confirming BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT, judge whether it is the Master or the Slave.

Note 2. If the error response detection interrupt (DMA_TRANSERR) occurs and NMI of the Master MPU or NMI of the TrustZone Filter has not occurred, treat it as the Illegal address access error or the Slave Bus Error. It can be judged also by BUS.BUS3ERRSTAT and BUS.DMACDTCERRSTAT.

Note that if the bus error occurs when writing the last data of transfer, the transfer end event and the error response detection interrupt (DMA_TRANSERR) occurs.

16.9 Event Link

The DTC can produce an event link request on completion of one transfer request.

16.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode without Snooze mode transition, Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections. The DTC is available in Snooze mode by setting the SYSTEM.SNZCR.SNZDTCEN bit to 1. See [section 10, Low Power Modes](#).

(1) Module-Stop Function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If a DTC transfer is in progress when 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after the DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

(2) Software Standby Mode and Deep Software Standby Mode

Use the settings described in [section 10.7.1. Transitioning to Software Standby Mode](#) or [section 10.9.1. Transitioning to Deep Software Standby Mode](#).

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode is executed after the completion of the DTC transfer.

(3) Snooze Mode

When the snooze control circuit receives a snooze request in Software Standby mode, the MCU transitions to Snooze mode. See [section 10.8.1. Transition to Snooze Mode](#). DTC operation in Snooze mode can be selected in the SYSTEM.SNZCR.SNZDTCEN bit. If DTC operation is enabled in Snooze mode, before transitioning to Software Standby mode, set the DTCST.DTCST bit to 1. To return to Software Standby mode through DTC, set SYSTEM.SNZEDCR0.DTCZRED or SYSTEM.SNZEDCR0.DTCNZRED to 1. See [section 10.8.3. Returning from Snooze Mode to Software Standby Mode](#). SYSTEM.SNZEDCR0.DTCZRED enables or disables a snooze end request on completion of the last DTC transmission, detected on DTC transmission completion when CRA and CRB are 0. SYSTEM.SNZEDCR0.DTCNZRED enables or disables a snooze end request on a not last DTC transmission completion (CRA and CRB are not 0), detected on DTC transmission completion when CRA and CRB are not 0. The DTC activation request from the ICU is stopped during Software Standby mode but not stopped during Snooze mode.

(4) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see [section 10, Low Power Modes](#).

To perform a DTC transfer after returning from a low power mode without a Snooze mode transition, set the DTCST.DTCST bit to 1 again.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in [section 12.4.1. Detecting Interrupts](#), then execute the WFI instruction. If DTC operation is enabled in Snooze mode, do not use the module-stop function of the DTC.

16.11 Usage Notes

16.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

17. Event Link Controller (ELC)

This is the ELC_B version of the ELC peripheral module.

ELC_B is referred to as ELC in this chapter.

17.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

[Table 17.1](#) lists the ELC specifications, and [Figure 17.1](#) shows a block diagram.

Table 17.1 ELC Specifications

| Item | Description |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| Event link function | 215 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC. |
| Module-stop function | Module-stop state can be set. |
| TrustZone Filter | Security attribution can be set for each registers |

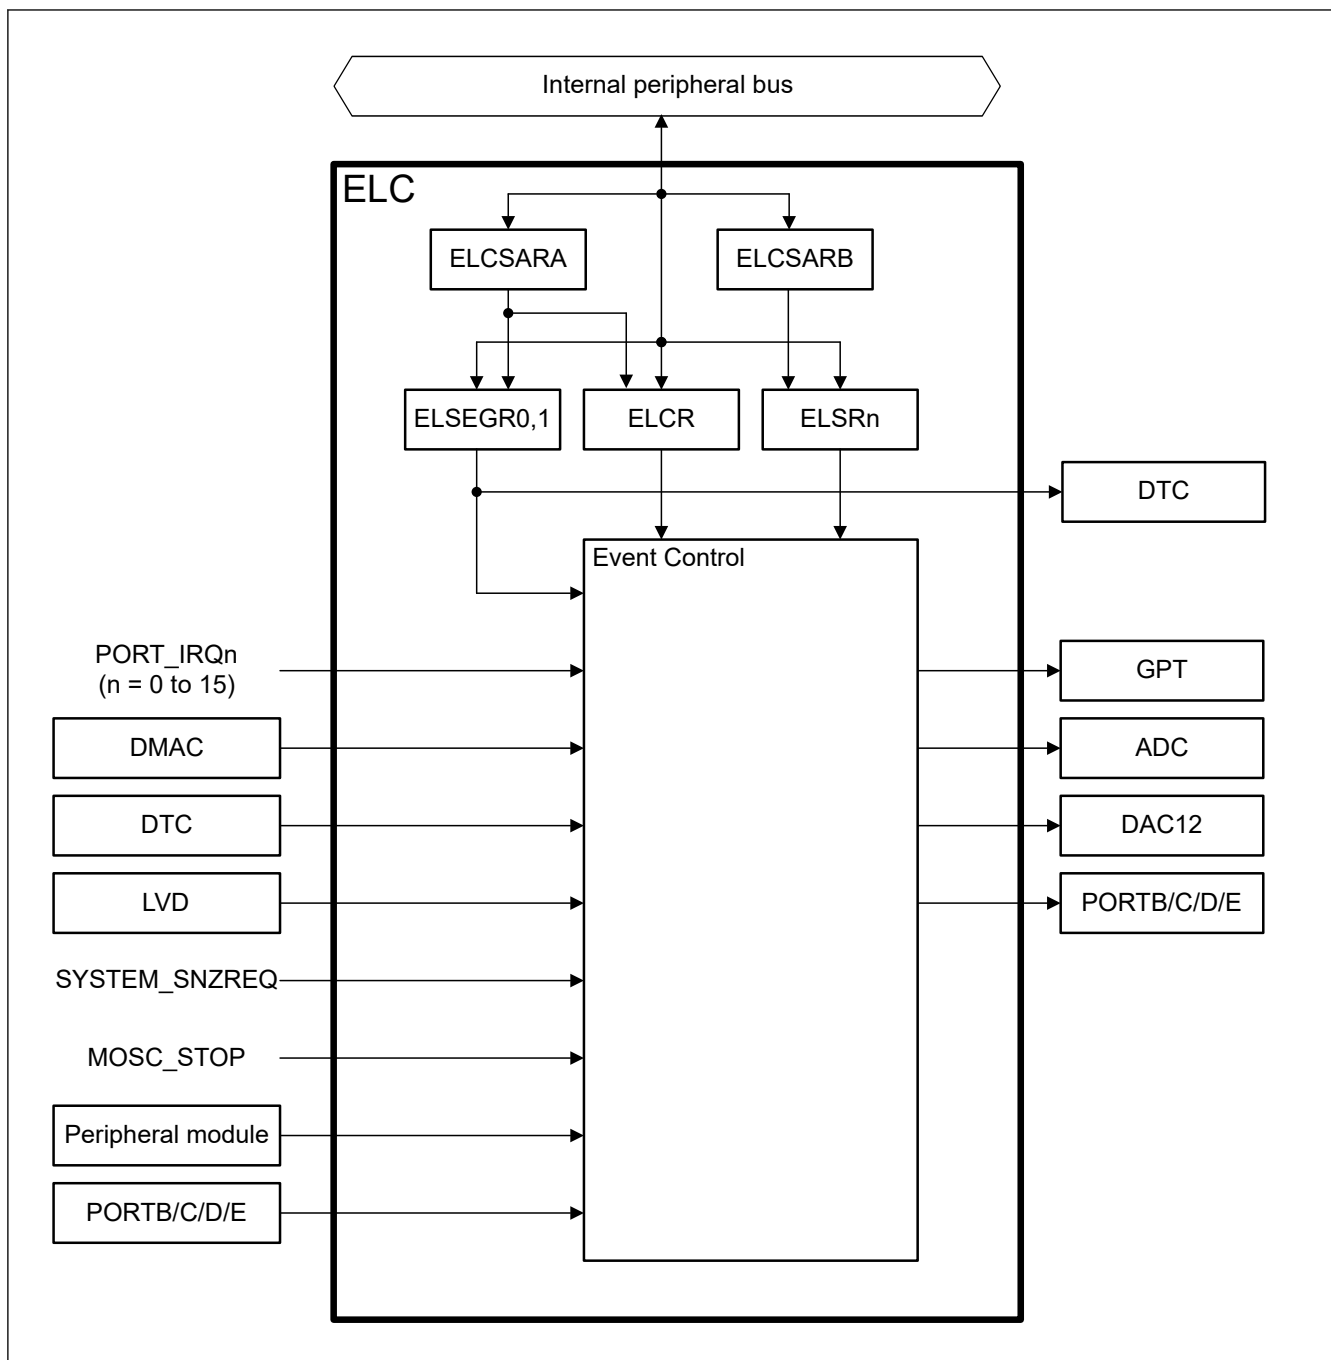

Figure 17.1 ELC block diagram

17.2 Register Descriptions

17.2.1 ELCR : Event Link Controller Register

Base address: ELC_B = 0x4008_2000

Offset address: 0x00

| | | | | | | | | |
|---------------|-----------|---|---|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | ELCO N | — | — | — | — | — | — | — |

Value after reset: 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------|-----|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | ELCON | All Event Link Enable 0: ELC function is disabled. 1: ELC function is enabled. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ELCR register controls the ELC operation.

17.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)

Base address: ELC_B = 0x4008_2000

Offset address: 0x04 + 0x04 × n

| | | | | | | | | |
|--------------------|----|----|---|---|---|---|---|-----|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | WI | WE | — | — | — | — | — | SEG |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|----------------------------------------------------------------------------------------------------------------|-----|
| 0 | SEG | Software Event Generation 0: Normal operation 1: Software event is generated. | W |
| 5:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | WE | SEG Bit Write Enable 0: Write to SEG bit disabled. 1: Write to SEG bit enabled. | R/W |
| 7 | WI | ELSEGR Register Write Disable 0: Write to ELSEGR register enabled. 1: Write to ELSEGR register disabled. | W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

17.2.3 ELSRn : Event Link Setting Register n (n = 0 to 7, 12 to 17, 19 to 24, 28, 29)

Base address: ELC_B = 0x4008_2000

Offset address: 0x20 + 0x04 × n

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|----------|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | ELS[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8:0 | ELS[8:0] | Event Link Select 0x000: Event output disabled for the associated peripheral module 0x001: Number setting for the event signal to be linked ⋮ 0x1DB: Number setting for the event signal to be linked Others: Settings prohibited | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

Note: If the security attribution is configured as Secure:

- Secure access and Non-secure read access are allowed
- Non-secure write access is ignored, and TrustZone access error is not generated.

If the security attribution is configured as Non-secure:

- Secure and Non-secure access are allowed.

The ELSRn register specifies an event signal to be linked to each peripheral module. [Table 17.2](#) shows the association between the ELSRn register and the peripheral modules. [Table 17.3](#) shows the association between the event signal names set in the ELSRn register and the signal numbers.

Table 17.2 Association between the ELSRn registers and peripheral functions (1 of 2)

| Register name | Peripheral function (module) | Event name |
|---------------|------------------------------|------------|
| ELSR0 | GPT (A) | ELC_GPTA |
| ELSR1 | GPT (B) | ELC_GPTB |
| ELSR2 | GPT (C) | ELC_GPTC |
| ELSR3 | GPT (D) | ELC_GPTD |
| ELSR4 | GPT (E) | ELC_GPTE |

| 0x1DB | DOC | DOC_DOPCI* ² | Data operation circuit interrupt |

Note 1. Only pulse (edge detection) is supported.

Note 2. This event can occur in Snooze mode.

Note 3. ELSR14 to ELSR17 and ELSR19 to ELSR24 can select this event.

Note 4. This event is not supported in FIFO mode.

17.2.4 ELCSARA : Event Link Controller Security Attribution Register A

Base address: ELC_B = 0x4008_2000

Offset address: 0xE0

| 27:25 | — | These bits are read as 1. The write value should be 1. | R/W |
| 29:28 | ELSR29 to ELSR28 | Event Link Setting Register n Security Attribution Target register: ELSRn (n = 28, 29) 0: Secure 1: Non-secure | R/W |
| 31:30 | — | These bits are read as 1. The write value should be 1. | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

This register specifies the security attribution for the Register ELSRn (n = 0 to 7, 12 to 17, 19 to 24, 28, 29).

17.3 Operation

17.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

17.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 17.4 lists the operations of modules when an event occurs.

Table 17.4 Module operations when event occurs

| Module | Operations When Event is Input |
|-----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GPT | <ul style="list-style-type: none"> Start counting Stop counting Clear counting Up counting Down counting Input capture |
| DAC12 | Start D/A conversion |
| I/O Ports | <ul style="list-style-type: none"> Change pin output based on the EORR (reset) or EOSR (set) Latch pin state to EIDR The following ports can be used for the ELC: <ul style="list-style-type: none"> Port B Port C Port D Port E |
| ADC | Start A/D conversion |
| DTC | Start DTC data transfer |

17.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the LVD is to be used, set the ELC after setting the LVD. To disable the LVD, do so after setting 0x00 to the associated ELSRn register.

17.4 Usage Notes

17.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

17.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (Software Standby mode or Deep Software Standby mode).

Some modules can perform in Snooze mode. For more information, see [Table 17.3](#) and [section 10, Low Power Modes](#).

17.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see [Table 17.3](#) and [section 10, Low Power Modes](#).

17.4.4 ELC Delay Time

In [Figure 17.2](#), module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. [Table 17.5](#) shows the ELC delay time.

Figure 17.2 ELC delay time

Table 17.5 ELC delay time

| Clock domain | Clock frequency | ELC delay time |
|-------------------|-------------------|--------------------------------|
| clock_A = clock_B | clock_A = clock_B | 0 cycle |
| clock_A ≠ clock_B | clock_A = clock_B | 1 cycle to 2 cycles |
| | clock_A > clock_B | 1 cycle to 2 cycles of clock_B |
| | clock_A < clock_B | 1 cycle to 2 cycles of clock_A |

17.4.5 Interval of Event Request

If the clocks of Event Source and Event Destination are combined as shown in [Table 17.6](#), the Event request may be lost if the interval between one Event request and the next is less than the following value (Event_Interval) for the same Event request signal.

However, this restriction does not apply if the Event Destination is GPT or ADC and uses a different ELSR register.

[Table 17.6](#) shows a combination of clocks with the restricted event interval, and [Figure 17.3](#) shows an example of the event interval for GPT0_ADTRGA.

The event interval is expressed by the following formula.

$$\text{Event_Interval [ns]} = \text{Period_of_Source_clock [ns]} \times 6 + \text{Period_of_Destination_clock [ns]} \times 4$$

Table 17.6 Combination of clocks with the restricted Event Interval

| Event Source | Source clock | Event Destination | Destination clock |
|----------------|----------------|-------------------|-------------------|
| Other than GPT | PCLKA or PCLKB | GPT | GPTCLK |
| | | ADC | GPTCLK or PCLKC |
| GPT | PCLKD | ADC | GPTCLK or PCLKC |
| | GPTCLK | ADC | PCLKA or PCLKC |
| | | DAC12 | PCLKA |
| | | I/O Port | PCLKB |

**Figure 17.3** Example of GPT0_ADTRGA Event Interval

18. I/O Ports

18.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, or port group function for the ELC.

All pins except PB03 (as TDO of JTAG ports) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 18.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 18.1 lists the I/O port specifications by package, and Table 18.2 lists the port functions.

Figure 18.1 Connection diagram for I/O port registers

Table 18.1 I/O port specifications (1 of 2)

| Port | Package | | Package | | Package | |
|-------|------------------|----------------|------------------|----------------|------------------|----------------|
| | 100 pins | Number of pins | 64 pins | Number of pins | 48 pins | Number of pins |
| PORT0 | P000 to P002 | 3 | P002 | 1 | — | 0 |

18.2 Register Descriptions

18.2.1 PCNTR1/PODR/PDR : Port Control Register 1

Base address: $\text{PORTm} = 0x4001_F000 + 0x0020 \times m$ ($m = 0, 2, A$ to E)

Offset address: $0x000$ (PCNTR1/PDR)
 $0x002$ (PODR)

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | PODR 15 | PODR 14 | PODR 13 | PODR 12 | PODR 11 | PODR 10 | PODR 09 | PODR 08 | PODR 07 | PODR 06 | PODR 05 | PODR 04 | PODR 03 | PODR 02 | PODR 01 | PODR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|-----------|-----------|-----------|-------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | PDR1 5 | PDR1 4 | PDR1 3 | PDR1 2 | PDR11 | PDR1 0 | PDR0 9 | PDR0 8 | PDR0 7 | PDR0 6 | PDR0 5 | PDR0 4 | PDR0 3 | PDR0 2 | PDR0 1 | PDR0 0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|------------------|-------------------------------------------------------------------------------------------------|-------------------|
| 15:0 | PDR15 to PDR00 | Pmn Direction 0: Input (functions as an input pin) 1: Output (functions as an output pin) | R/W ^{*1} |
| 31:16 | PODR15 to PODR00 | Pmn Output Data 0: Low output 1: High output | R/W ^{*2} |

Note: $m = 0, 2, A$ to E , $n = 00$ to 15

Note 1. If the security attribution is configured as Secure,

- Secure access and Non-secure read access are allowed,
- Non-secure write access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

Note 2. If the security attribution is configured as Secure,

- Secure access is allowed,
- Non-secure read value is 0, but TrustZone access error is not generated,
- Non-secure write access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See [section 18.1. Overview](#). The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See [section 18.1. Overview](#). The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

18.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: $\text{PORTm} = 0x4001_F000 + 0x0020 \times m$ ($m = 0, 2, A \text{ to } E$)

Offset address: $0x004$ (PCNTR2/PIDR)
 $0x006$ (EIDR)

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | EIDR1 5 | EIDR1 4 | EIDR1 3 | EIDR1 2 | EIDR1 1 | EIDR1 0 | EIDR0 9 | EIDR0 8 | EIDR0 7 | EIDR0 6 | EIDR0 5 | EIDR0 4 | EIDR0 3 | EIDR0 2 | EIDR0 1 | EIDR0 0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | PIDR1 5 | PIDR1 4 | PIDR1 3 | PIDR1 2 | PIDR1 1 | PIDR1 0 | PIDR0 9 | PIDR0 8 | PIDR0 7 | PIDR0 6 | PIDR0 5 | PIDR0 4 | PIDR0 3 | PIDR0 2 | PIDR0 1 | PIDR0 0 |
| Value after reset: | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x | x |

| Bit | Symbol | Function | R/W |
|-------|---------------------|---------------------------------------------------------------------------------------------|-----|
| 15:0 | PIDR15 to PIDR00 | Pmn State 0: Low level 1: High level | R |
| 31:16 | EIDR15 to EIDR00 *2 | Port Event Input Data*1 When an ELC_PORTx signal occurs 0: Low input 1: High input | R |

Note: If the security attribution is configured as Secure,
 • Secure read access is allowed,
 • Non-secure read value is 0, but TrustZone access error is not generated.
 If the security attribution is configured as Non-secure,
 • Secure and Non-secure read access are allowed.

Note: $m = 0, 2, A \text{ to } E$, $n = 00 \text{ to } 15$

Note 1. $x = B, C, D \text{ or } E$ for EIDR only

Note 2. Supported by ports B, C, D or E.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 represents the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when the following functions is enabled:

- Analog function (ASEL = 1)

EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

18.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: $\text{PORTm} = 0x4001_F000 + 0x0020 \times m$ ($m = 0, 2, A \text{ to } E$)

Offset address: 0x008 (PCNTR3/POSR)
0x00A (PORR)

| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | POSR 15 | POSR 14 | POSR 13 | POSR 12 | POSR 11 | POSR 10 | POSR 09 | POSR 08 | POSR 07 | POSR 06 | POSR 05 | POSR 04 | POSR 03 | POSR 02 | POSR 01 | POSR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|------------------|-------------------------------------------------------------|-----|
| 15:0 | POSR15 to POSR00 | Pmn Output Set 0: No effect on output 1: High output | W |
| 31:16 | PORR15 to PORR00 | Pmn Output Reset 0: No effect on output 1: Low output | W |

Note: If the security attribution is configured as Secure,

- Secure write access is allowed,
- Non-secure write access is ignored, but TrustZone access error is not generated.

 If the security attribution is configured as Non-secure,

- Secure and Non-secure write access are allowed.

 Note: $m = 0, 2, A \text{ to } E, n = 00 \text{ to } 15$

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

POSRn bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for PD00, when $\text{PORTD.PCNTR3.POSR00} = 1$, $\text{PORTD.PCNTR1.PODR00}$ outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See [section 18.1. Overview](#).

PORRn bits (Pmn Output Reset)

PORR changes PODR when reset by a software write. For example, for PD00, when $\text{PORTD.PCNTR3.PORR00} = 1$, $\text{PORTD.PCNTR1.PODR00}$ outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See [section 18.1. Overview](#).

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.
 Note: PORRn and POSRn should not be set at the same time.

18.2.4 PCNTR4/EORR/EOSR : Port Control Register 4

Base address: $\text{PORTm} = 0x4001_F000 + 0x0020 \times m$ ($m = B$ to E)

Offset address: $0x00C$ (PCNTR4/EOSR)
 $0x00E$ (EORR)

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | EORR 15 | EORR 14 | EORR 13 | EORR 12 | EORR 11 | EORR 10 | EORR 09 | EORR 08 | EORR 07 | EORR 06 | EORR 05 | EORR 04 | EORR 03 | EORR 02 | EORR 01 | EORR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| | | | | | | | | | | | | | | | | |
|--------------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|------------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | EOSR 15 | EOSR 14 | EOSR 13 | EOSR 12 | EOSR 11 | EOSR 10 | EOSR 09 | EOSR 08 | EOSR 07 | EOSR 06 | EOSR 05 | EOSR 04 | EOSR 03 | EOSR 02 | EOSR 01 | EOSR 00 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|------------------|------------------------------------------------------------------------------------------------------|-----|
| 15:0 | EOSR15 to EOSR00 | Pmn Event Output Set When an ELC_PORTx signal occurs 0: No effect on output 1: High output | R/W |
| 31:16 | EORR15 to EORR0 | Pmn Event Output Reset When an ELC_PORTx signal occurs 0: No effect on output 1: Low output | R/W |

Note: If the security attribution is configured as Secure,

- Secure access is allowed,
- Non-secure read value is 0, but TrustZone access error is not generated,
- Non-secure write access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

Note: $m = B$ to E , $n = 00$ to 15 , $x = B$ to E

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

EOSRn bits (Pmn Event Output Set)

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for PD00 if PORTD.PCNTR4.EOSR00 is set to 1 when the ELC_PORTx occurs, PORTD.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, EOSRn bits are reserved. See [section 18.1. Overview](#).

EORRn bits (Pmn Event Output Reset)

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for PD00 if PORTD.PCNTR4.EORR00 = 1 when the ELC_PORTx occurs, PORTD.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, EORRn bits are reserved. See [section 18.1. Overview](#).

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

18.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0, 2, A to E, n = 00 to 15)

Base address: PFS_B = 0x4001_F800

Offset address: 0x000 + 0x040 × m + 0x004 × n (m = 0, 2, A to E)

| | | | | | | | | | | | | | | | | |

| 14 | ISEL | IRQ Input Enable 0: Not used as an IRQn input pin 1: Used as an IRQn input pin | R/W ^{*7} |
| 15 | ASEL | Analog Input Enable 0: Not used as an analog pin 1: Used as an analog pin | R/W ^{*7} |
| 16 | PMR | Port Mode Control 0: Used as a general I/O pin 1: Used as an I/O port for peripheral functions | R/W ^{*7} |
| 23:17 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 28:24 | PSEL[4:0] | Peripheral Select These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter. | R/W ⁷ |
| 31:29 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The initial value of P002, P201, PA00 to PA05, PA13 to PA15, PB02 and PB03 is not 0x0000_0000. P002, PA00 to PA05 and PB02 is 0x0000_8000, P201 is 0x0000_0010, PA13 is 0x0001_0410, PA14 and PA15 is 0x0001_0010, and PB03 is 0x0001_0400.

Note 2. Only pins that support high-speed and high-drive can be set. Setting for other pins are prohibited.

Note 3. Only pins that support high current drive can be set. Setting for other pins are prohibited.

Note 4. Supported by PORTn (n = B to E).

Note 5. If the security attribution is configured as Secure,

- Secure access is allowed,
- Non-secure read value is 0, but TrustZone access error is not generated,
- Non-secure write access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

Note 6. If the security attribution is configured as Secure,

- Secure read access is allowed,
- Non-secure read value is 0, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure read access are allowed.

Note 7. If the security attribution is configured as Secure,

- Secure access and Non-secure read access are allowed,
- Non-secure write access is ignored, but TrustZone access error is not generated.

If the security attribution is configured as Non-secure,

- Secure and Non-secure access are allowed.

Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see [Table 18.1](#)

PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

DSCR[1:0] bits (Port Drive Capability)

The DSCR[1:0] bits switches the drive capacity of the port. If the drive capacity of a pin is fixed, the associated bit is a read/write bit, but the drive capacity cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

ISEL bit (IRQ Input Enable)

The ISEL bit specifies IRQ input pins. An IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

ASEL bit (Analog Input Enable)

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register (PWPR). Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

PMR bit (Port Mode Control)

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

PSEL[4:0] bits (Peripheral Select)

The PSEL[4:0] bits assign the peripheral function.

18.2.6 PWPR : Write-Protect Register

Base address: PFS_B = 0x4001_F800

Offset address: 0x50C

| | | | | | | | | |
|--------------------|------|-------|---|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | B0WI | PFSWE | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------|-----|
| 5:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 6 | PFSWE | PmnPFS Register Write Enable 0: Writing to the PmnPFS register is disabled 1: Writing to the PmnPFS register is enabled | R/W |
| 7 | B0WI | PFSWE Bit Write Disable 0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled | R/W |

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

18.2.7 PWPRS : Write-Protect Register for Secure

Base address: PFS_B = 0x4001_F800

Offset address: 0x514

| | | | | | | | | |
|--------------------|------|-------|---|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | B0WI | PFSWE | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------|-----|
| 5:0 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------------------------------------------|-----|
| 6 | PFSWE | PmnPFS Register Write Enable 0: Disable writes to the PmnPFS register 1: Enable writes to the PmnPFS register | R/W |
| 7 | B0WI | PFSWE Bit Write Disable 0: Enable writes the PFSWE bit 1: Disable writes to the PFSWE bit | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

18.2.8 PmSAR : Port m Security Attribution register (m = 0, 2, A to E)

Base address: PFS_B = 0x4001_F800

Offset address: 0x530 + 0x004 × m

| | | | | | | | | | | | | | | | | |
|--------------------|-------------|----|----|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | PMNSA[15:0] | | | | | | | | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|------|-------------|-------------------------------------------------------------------------------------|-----|
| 15:0 | PMNSA[15:0] | Pmn Security Attribution Target I/O port pin : Pmn 0: Secure 1: Non-secure | R/W |

Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.

Note: This register is write-protected by PRCR register.

Note: m = 0, 2, A to E, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

PMNSA[15:0] bits (Pmn Security Attribution)

The PMNSA bit specifies the Security Attribution of Pmn.

18.3 Operation

18.3.1 General I/O Ports

All pins except P002, PA00 to PA05, and PB02 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see [section 18.2. Register Descriptions](#).

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0, 2, A to E), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states

- Event Input Data bit (EIDRn), which indicates the pin state when an ELC_PORTn (n = B, C, D or E) signal occurs
- Port Output Set bit (POSrN), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC_PORTn (n = B, C, D or E) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC_PORTn (n = B, C, D or E) signal occurs.

18.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, pull-up control, and drive capacity
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capacity control bit that selects the drive capacity
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see [section 18.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register \(m = 0, 2, A to E, n = 00 to 15\)](#).

18.3.3 Port Group Function for ELC

In the MCU, Port B to Port E are assigned for the ELC port group function.

18.3.3.1 Behavior When ELC_PORTn (n = B, C, D or E) is Input from ELC

The MCU supports the two functions described in this section when an ELC_PORTn (n = B, C, D or E) signal comes from the ELC.

(1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORTn (n = B, C, D or E) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See [Figure 18.2](#)

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

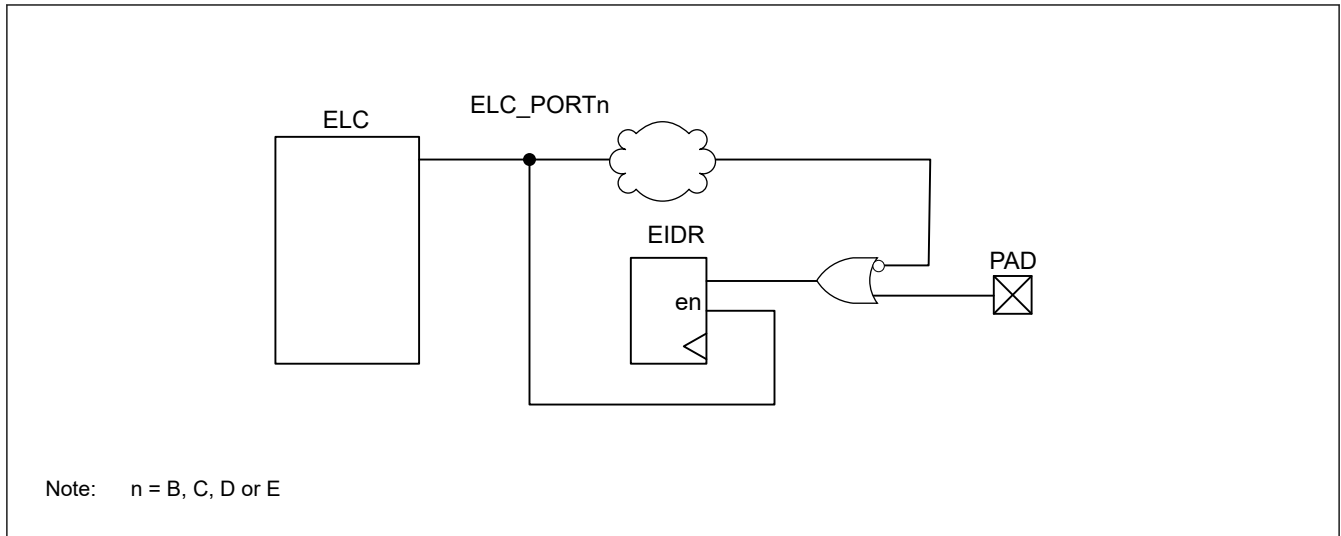

Figure 18.2 Event ports input data

(2) Output from PODR by EOSR and EORR

When an ELC_PORTn (n = B, C, D or E) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC_PORTn (n = B, C, D or E) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC_PORTn (n = B, C, D or E) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

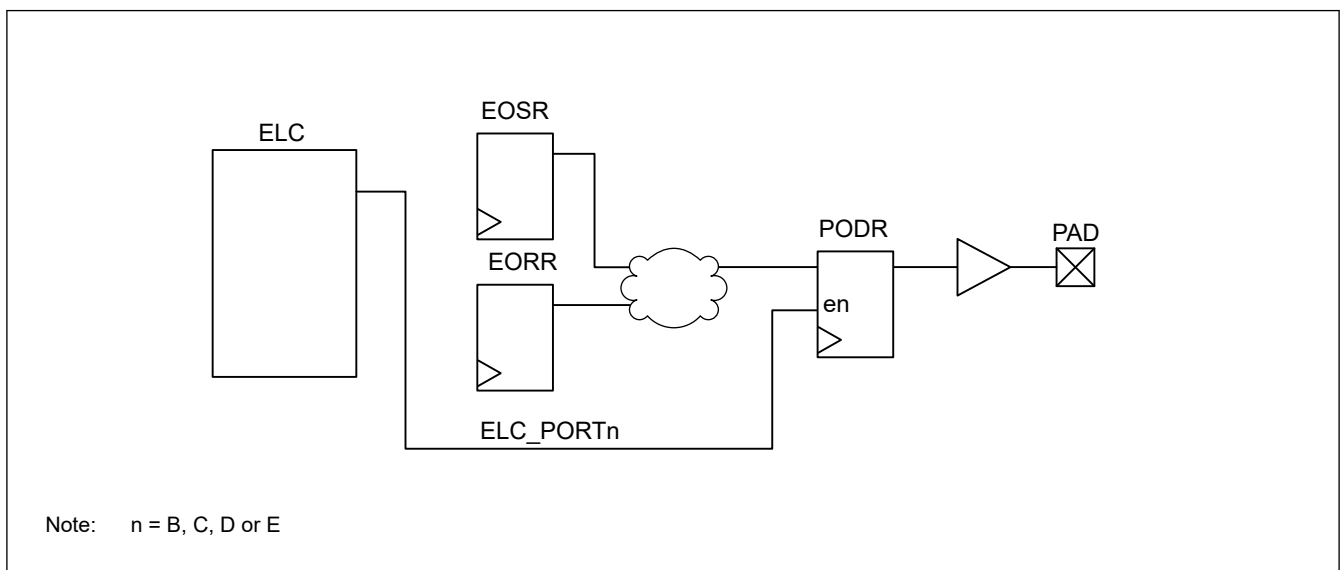

Figure 18.3 Event ports output data

18.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see [section 18.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register \(m = 0, 2, A to E, n = 00 to 15\)](#). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port E, when the data is input from PE00 to PE15, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = B to D) is also the same as Port E. See [Figure 18.4](#).

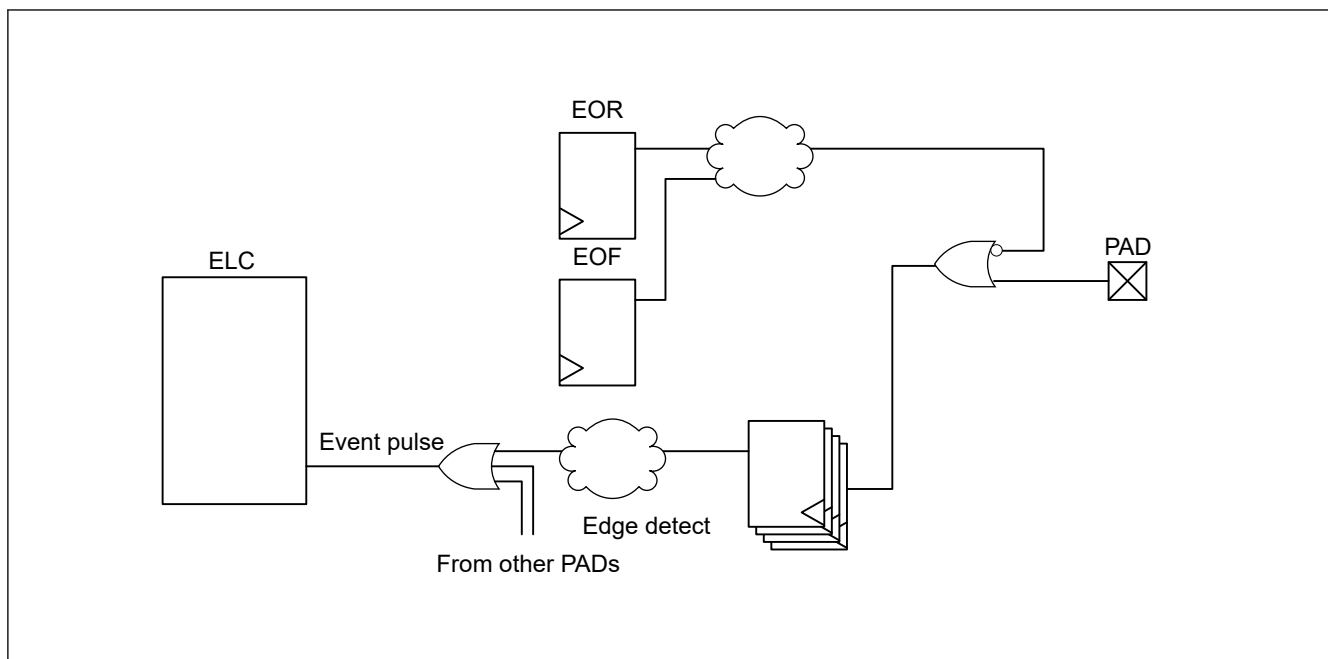

Figure 18.4 Generation of event pulse

18.4 Handling of Unused Pins

Table 18.3 shows how to handle unused pins.

Table 18.3 Handling of unused pins

| Pin name | Description |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MD | Use as a mode selection pin |
| RES | Connect to VCC through a resistor (pulling up) |
| PC13/NMI | Connect to VCC through a resistor (pulling up) |
| EXTAL | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports A to E. |
| XTAL | When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports A to E. |
| P000, P001 PA00, PA02, PA04, PA06, PA07 PB00 to PB02 PC00 to PC05 | Connect to AVCC0 (pulled up) through a resistor or to AVSS0 (pulled down) through a resistor ^{*1} |
| P002 PA01, PA03, PA05 | Connect to AVCC0 (pulling up) through a resistor |
| Other ports | <ul style="list-style-type: none"> If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC (pulled up) through a resistor or to VSS (pulled down) through a resistor.^{*1 *2} If the direction is set to output (PCNTR1.PDRn = 1), keep pin open.^{*1 *3} |
| VREFH0 | Connect to AVCC0 |
| VREFL0 | Connect to AVSS0 |

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.

Note 2. PA13 to PA15 should be enabled for input pull-up from the initial value (PmnPFS.PCR = 1).

Note 3. PB03 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.

18.5 Usage Notes

18.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR register. This enables writing to the PFSWE bit in the PWPR register.^{*1}
2. Set 1 to the PFSWE bit in the PWPR register. This enables writing to the PmnPFS register.^{*1}
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR register. This disables writing to the PmnPFS register.^{*1}
7. Set 1 to the B0WI bit in the PWPR register. This disables writing to the PFSWE bit in the PWPR register.^{*1}

Note 1. When the security attribution of Pmn is set to 0, set the PWPRS register to write to the PmnPFS register.

18.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = B to E)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see [section 17, Event Link Controller \(ELC\)](#).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

18.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORTn (n = B, C, D or E) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORTn (n = B, C, D or E) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.
6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

18.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

The pin to which the PGA function (PGAINn, PGAVSSn (n = 0 to 3)) is assigned cannot be used as general ports when the PGA is set to pseudo-differential input mode.

When using the corresponding pin as general ports, set the corresponding PGA to single-ended input mode (see [section 36.3.15.2. PGA Operation Setting](#)).

Then, set the corresponding pin to function as general ports.

18.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, _C, _D, _E or _F suffixes. When assigning IIC and SPI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register.
4. The PORT0 and A, B, C, E have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

Table 18.4 Register settings for input/output pin function (PORT0)

| PSEL[4:0] settings | Function | pin | | |
|----------------------------|------------------------|--------------|--------------|---------------|

Note 1. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (tGTISK).

- Note 2. Recommend using pins that have a letter appended to their names, for instance _B or _D or _E, to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.
- Note 3. Recommend using pins that have a letter appended to their names, for instance _B or _C, to indicate group membership. For details, see [section 46, Electrical Characteristics](#).
- Note 4. The PGAOUTn (n = 0 to 3) function is selected when the ASEL bit of the corresponding pin = 1 and the PSEL [4:0] bits are the specified combination. When using the corresponding pin as PGAOUTn, do not use it with other analog pin functions.
- Note 5. The drive capacity of this port cannot be controlled by PmnPFS.DSCR[1:0] bits.

19. Key Interrupt Function (KINT)

19.1 Overview

The key interrupt function (KINT) generates the key interrupt by detecting rising or falling edge on the key interrupt input pins. Figure 19.1 shows a block diagram and Table 19.1 lists the input pins.

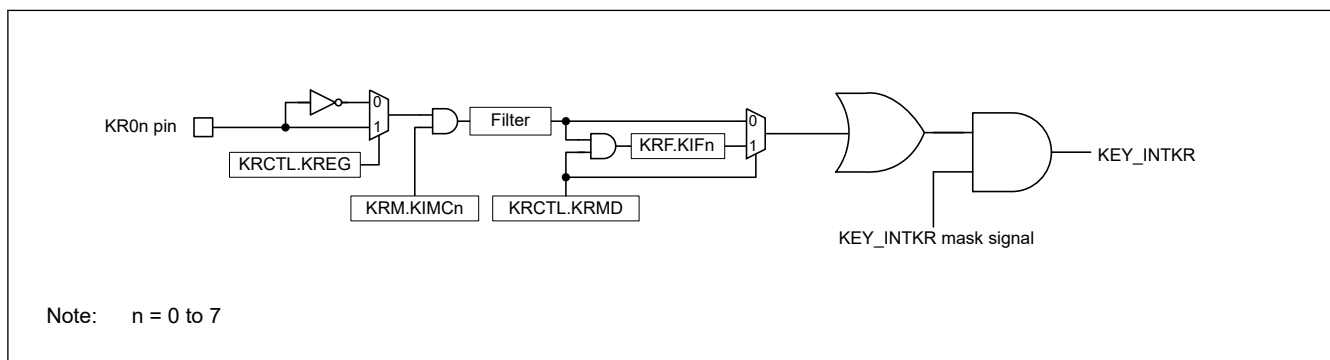

Figure 19.1 KINT block diagram

All key return factors are merged by an OR gate, and the key interrupt signal, KEY_INTKR, is the output of the AND gate to mask the merged key return factor by the KEY_INTKR mask signal. When using KRF.KIFn flag (KRCTL.KRMD = 1), the KEY_INTKR mask signal is used as the output mask that is asserted by clearing KRF.KIFn flag.

Table 19.1 KINT I/O pins

| Pin name | I/O | Function |
|--------------|-------|--------------------------|
| KR00 to KR07 | Input | Key interrupt input pins |

19.2 Register Descriptions

19.2.1 KRCTL : Key Return Control Register

Base address: KINT = 0x4008_5000

Offset address: 0x00

| | | | | | | | | |
|--------------------|------|---|---|---|---|---|---|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KRMD | — | — | — | — | — | — | KREG |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | KREG | Detection Edge Selection (KR00 to KR07 pins) 0: Falling edge 1: Rising edge | R/W |
| 6:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | KRMD | Usage of Key Interrupt Flags (KRF.KIF0 to KRF.KIF7) 0: Do not use key interrupt flags 1: Use key interrupt flags | R/W |

The KRCTL register controls the usage of the key interrupt flags, KRF.KIFn (n = 0 to 7), and sets the detection edge.

19.2.2 KRF : Key Return Flag Register

Base address: KINT = 0x4008_5000

Offset address: 0x04

| | | | | | | | | |
|--------------------|------|------|------|------|------|------|------|------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KIF7 | KIF6 | KIF5 | KIF4 | KIF3 | KIF2 | KIF1 | KIF0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------------|---------------------------------------------------------------------------|-----|
| 7:0 | KIF0 to KIF7 | Key Interrupt Flag n 0: No interrupt detected 1: Interrupt detected | R/W |

The KRF register controls the key interrupt flags, KIFn.

When KRCTL.KRMD = 0, setting the KIFn flag to 1 is prohibited. When setting the KIFn flag to 1, the KIFn value does not change.

To clear the KIFn flag, confirm the target flag is 1 before writing 0 to the bit, then write 1 to the other flags.

19.2.3 KRM : Key Return Mode Register

Base address: KINT = 0x4008_5000

Offset address: 0x08

| | | | | | | | | |
|--------------------|-------|-------|-------|-------|-------|-------|-------|-------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | KIMC7 | KIMC6 | KIMC5 | KIMC4 | KIMC3 | KIMC2 | KIMC1 | KIMC0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|----------------|-----------------------------------------------------------------------------------------------------------|-----|
| 7:0 | KIMC0 to KIMC7 | Key Interrupt Mode Control n 0: Do not detect key interrupt signals 1: Detect key interrupt signals | R/W |

The KRM register sets the key interrupt mode.

An interrupt is generated when the target bit in the KRM register is set while a low level (KRCTL.KREG = 0) or a high level (KRCTL.KREG = 1) is being input to the KR0n pin. To ignore this interrupt, set the KRM register after disabling the interrupt handling.

KINT can be assigned in the PmnPFS.PSEL[4:0] bits. The on-chip pull-up resistors can also be applied by setting the associated key interrupt input pin in the pull-up resistor. For details, see [section 18, I/O Ports](#).

19.3 Operation

19.3.1 Operation When Not Using the Key Interrupt Flags (KRCTL.KRMD = 0)

A key interrupt signal, KEY_INTKR, is generated when the valid edge specified in the KRCTL.KREG bit is input to a KR0n pin. To identify the channel to which the valid edge is input, read the port register and check the port level after the KEY_INTKR signal is generated.

The KEY_INTKR signal changes based on the input level of the KR0n pin.

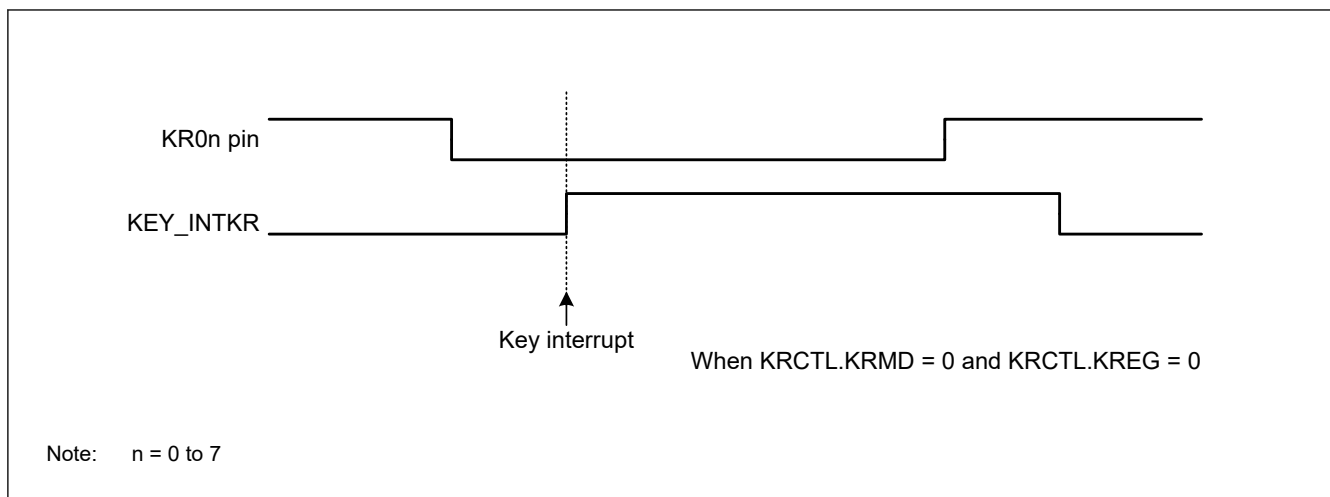

Figure 19.2 Operation of KEY_INTKR signal when a key interrupt is input to a single channel

Figure 19.3 shows the operation when a valid edge is input to multiple KR0n pins. The KEY_INTKR signal is set while a low level is being input to one pin (when KRCTL.KREG = 0). Therefore, even if a falling edge is input to another pin in this period, the KEY_INTKR signal is not generated again. See [1] in Figure 19.3.

Figure 19.3 Operation of KEY_INTKR signal when key interrupts are input to multiple channels

19.3.2 Operation When Using the Key Interrupt Flags (KRCTL.KRMD = 1)

The KEY_INTKR signal is generated when the valid edge specified in the KRCTL.KREG bit is input to KR0n pins. To identify the channels to which the valid edge is input, read the KRF register after the KEY_INTKR signal is generated. If the KRCTL.KRMD bit is set to 1, clear the KEY_INTKR signal by clearing the associated bit in the KRF register.

As Figure 19.4 shows, only one interrupt is generated each time a falling edge is input to one channel, (when KRCTL.KREG = 0), regardless of whether the KRF.KIFn flag is cleared before or after a rising edge is input.

Figure 19.4 Basic operation of KEY_INTKR signal when key interrupt flag is used

Figure 19.5 shows the operation when a valid edge is input to multiple KR0n pins. A falling edge is also input to the KR01 and KR05 pins after a falling edge is input to the KR00 pin (when KRCTL.KREG = 0). The KRF.KIF1 flag is set when the KRF.KIF0 flag is cleared. The KEY_INTKR signal is negated 1 PCLKB clock cycle, after the KRF.KIF0 flag is cleared. See [1] in Figure 19.5.

Also, after a falling edge is input to the KR05 pin, the KRF.KIF5 flag is set. The KRF.KIF1 flag is cleared at time [2] in the figure. The KEY_INTKR signal is negated 1 PCLKB clock cycle, after the KRF.KIF1 flag is cleared. See [3] in the figure. It is therefore possible to generate each key interrupt when a valid edge is input to multiple channels.

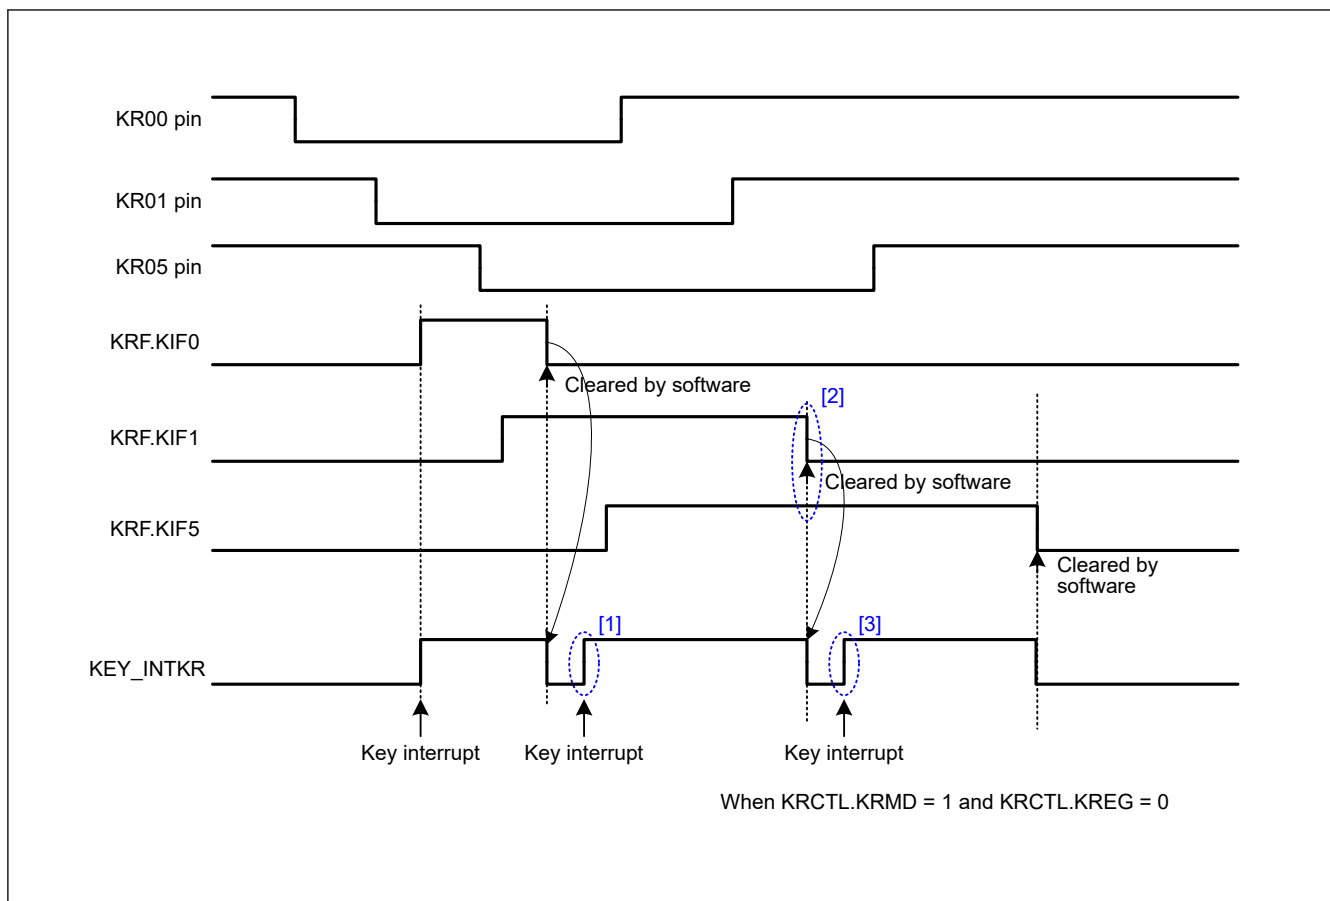

Figure 19.5 Operation of KEY_INTKR signal when key interrupts are input to multiple channels

19.4 Usage Notes

- If the KEY_INTKR signal is used as the snooze request, the KRCTL.KRMD bit should be set to 0.
- If the KEY_INTKR signal is used as the interrupt source for returning to Normal mode from Snooze and Software Standby modes, the KRCTL.KRMD bit should be set to 1.
- When KINT is assigned to a pin, this pin input is always enabled in the Software Standby mode, and if the pin level changes, the associated KRF.KIFn flag can be set. Therefore, a KEY_INTKR signal might be generated on canceling Software Standby mode. To ignore changes to the KR0n pin during a Software Standby, clear the associated KRM.KIMCn bit before entering Software Standby. After canceling Software Standby mode, the KRF.KIFn flag should be cleared before the associated KRM.KIMCn bit can be set.

20. Port Output Enable for GPT (POEG)

20.1 Overview

The POEG issues requests to stop output from output pins of the general PWM timer (GPT). Select the method of detection for stopping the output from the list below.

- Input level detection of the GTETR_{Gn} pin (n = A to D)
- Detection from the GPT to stop output
- Detection by comparator (edge detection or level detection)
- Detection of stopping of oscillation by the oscillation stop detection circuit for the main clock
- Register setting

The GTETR_{Gn} pin can be used for output to the external trigger input pins of the GPT.

[Table 20.1](#) shows specifications, [Figure 20.1](#) shows a block diagram, and [Table 20.2](#) shows input pins.

Table 20.1 POEG specifications

| Item | Description |
|-------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Request of output stopping in response to input level detection | <ul style="list-style-type: none"> • The request to stop output is issued to the GPT when a POEG_{Gn}.PIDF flag is set in response to the detection of input of the selected level on the corresponding GTETR_{Gn} pin (n = A to D). • The request to stop output is issued to the GPT immediately upon detection of input of the selected level on the corresponding GTETR_{Gn} pin. |
| Requests to stop output in the form of an output stopping signal from the GPT | <ul style="list-style-type: none"> • The request to stop output is issued to the GPT when the GPT detects the active level (high or low) on the GTIOCA and GTIOCB pins at the same time while the corresponding POEG_{Gn}.IOCF flag is set. • The request to stop output is issued to the GPT when the GPT detects a deadtime error while the corresponding POEG_{Gn}.IOCF flag is set. |
| Requests to stop output in response to detection by a comparator | <ul style="list-style-type: none"> • The request to stop output is issued to the GPT when a POEG_{Gn}.IOCF flag is set in response to edge-detection by a comparator. • The request to stop output is issued directly to the GPT upon detecting level on a comparator. |
| Requests to stop output in response to detecting the stopping of oscillation | A request to stop output is issued to the GPT when the oscillation stop detection circuit for the main clock detects the stopping of oscillation while the corresponding POEG _{Gn} .OSTPF flag is set. |
| Requests by software to stop output | The request to stop output is issued to the GPT when the software sets the POEG _{Gn} .SSF flag. |
| Interrupt | <ul style="list-style-type: none"> • An interrupt is generated in response to the request to stop output in the form of the POEG_{Gn}.PIDF flag. • An interrupt is generated in response to the request to stop output in the form of the POEG_{Gn}.IOCF flag. |
| External trigger output to the GPT | The GTETR _{Gn} pin is used for output as external triggers. |
| Noise removal | <ul style="list-style-type: none"> • Each GTETR_{Gn} pin has a digital noise filter. • Four types of sampling clock are selectable for the filter. |
| TrustZone Filter | <ul style="list-style-type: none"> • Security attribution can be set for each groups. |

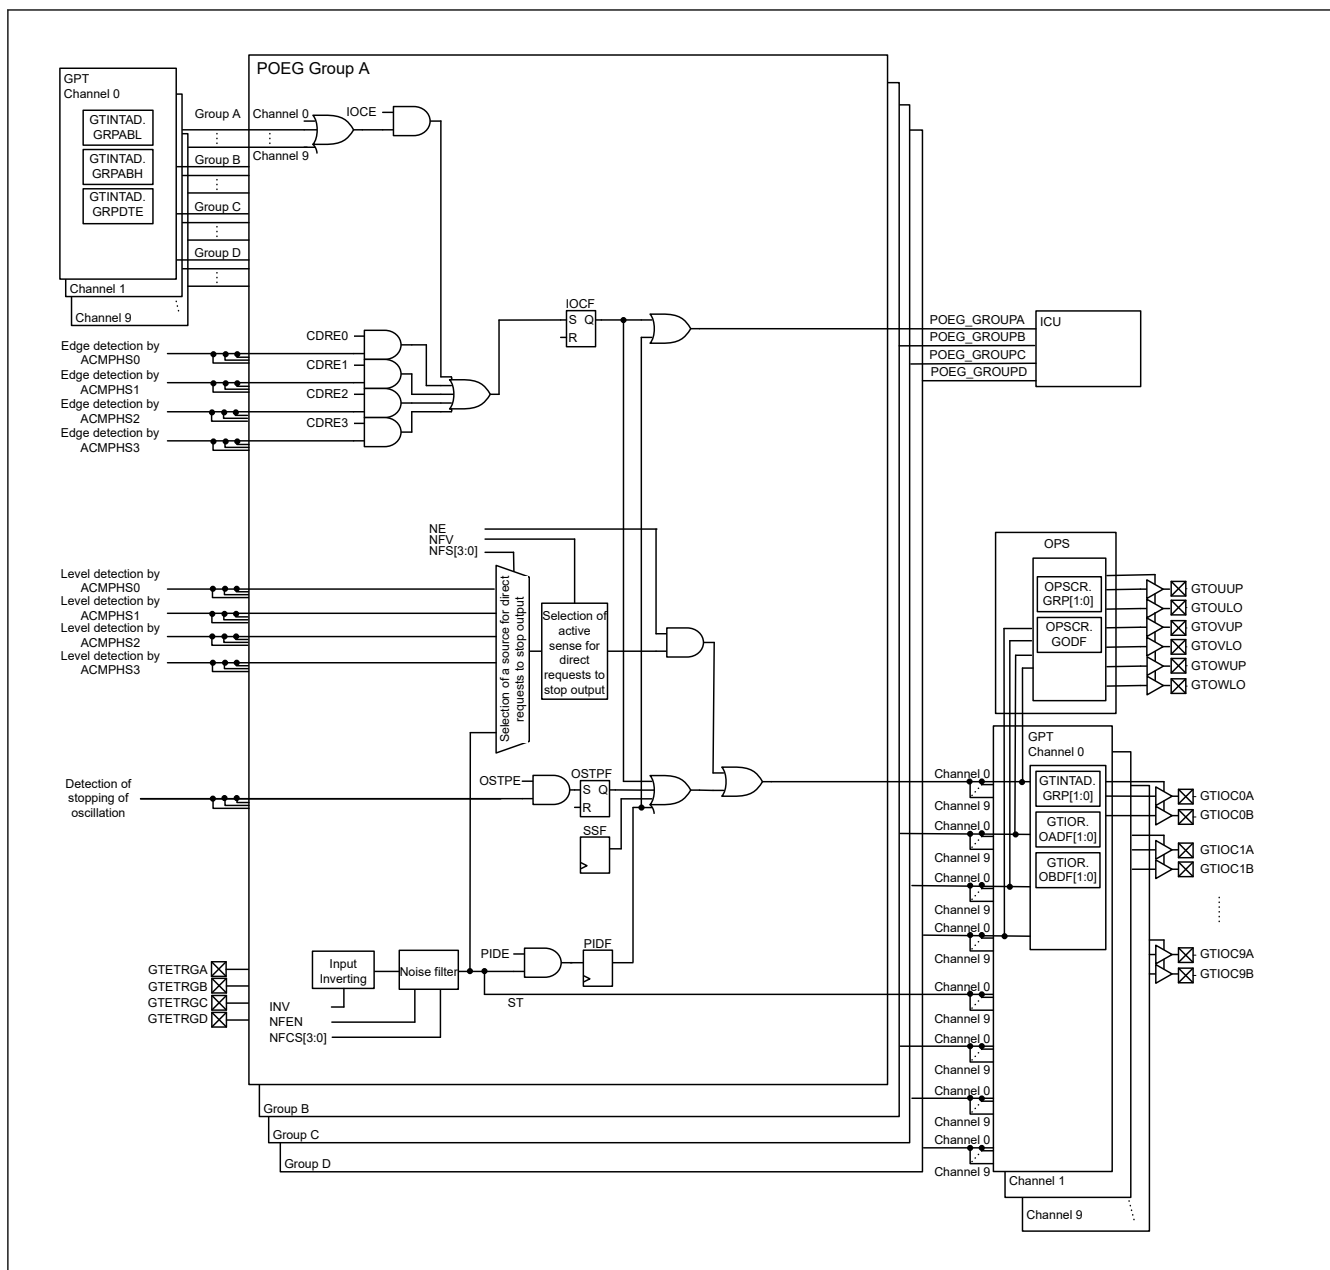

Figure 20.1 POEG Block Diagram

Table 20.2 POEG I/O pins

| Pin name | I/O | Function |
|----------|-------|-----------------------------------------------------------------------------------------|
| GTETRGA | Input | Output disable detection signal for GPT output pin and GPT external trigger input pin A |
| GTETRGB | Input | Output disable detection signal for GPT output pin and GPT external trigger input pin B |
| GTETRGC | Input | Output disable detection signal for GPT output pin and GPT external trigger input pin C |
| GTETRGD | Input | Output disable detection signal for GPT output pin and GPT external trigger input pin D |

Note 1. Only 0 can be written to clear the flag.

Note 2. Can be modified only once after a reset.

The POEG_{Gn} register (n = A to D) controls requests for stopping output and an external trigger for the GPT based in response to the detection of various signals.

SSF Flag (Software Stop Flag)

Writing 1 to the SSF flag leads to a request to stop output being issued to the GPT, and writing 0 to the flag releases the GPT from the request to stop output. In addition, requests to stop output issued by software can be monitored by reading the flag.

20.2.2 GTONCWP_n : GPT Output Stopping Control Group n Write Protection Register (n = A to D)

Base address: POEG = 0x4008_A000

Offset address: 0x040 (GTONCWPA)
0x140 (GTONCWPB)
0x240 (GTONCWPC)
0x340 (GTONCWPD)

Bit position: 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1 0

The GTONCCRn register (n = A to D) set up requests for stopping output in response to detected signals.

NE bit (Direct Stopping Request Setting)

Writing 1 to the NE bit leads to direct output of the stopping request signal in response to the signal for detection selected by the NFS[3:0] bits.

20.3 Operation

20.3.1 Request to Stop Output in Response to Detection of Input Level on the Corresponding GTETR Gn Pin (n = A to D)

There are two types of output stopping request: requests in response to setting of the POEG Gn.PIDF flag (n = A to D), and requests directly in response to the detected signal.

1. To request stopping of output in response to setting of the PIDF flag, the input set in the POEG Gn register (inversion or non-inversion set in the INV bit, filtering enabled or disabled by the NFEN bit, sample clock for filtering set in the NFCS[1:0] bits) is detected while the POEG Gn.PIDE bit is 1. After the POEG Gn.PIDF flag is set to 1 in response to this, the request to disable output is issued per group to each channel of the GPT. To de-assert the request signal for stopping output, clear the POEG Gn.PIDF flag. For cancelling requests to stop output, see [section 20.3.6. Cancelling Requests to Stop Output](#).
2. To request stopping of output in direct response to detection of the input level of a selected signal, the input set in the POEG Gn (inversion or non-inversion set in the INV bit, filtering enabled or disabled by the NFEN bit, sample clock for filtering set in the NFCS[1:0] bits) and GTONCCRn registers (active sense set in the NFV bit) to the GTETR Gn pin selected in the GTONCCRn.NFS[3:0] bits is detected while the GTONCCRn.NE bit is 1, and a request to stop output is then directly issued per channel group of the GPT. The signal to request stopping of output is de-asserted when the

detected input level does not match the conditions for issuing a request. For details, see [section 20.3.7. Requests to Stop Output in Response to Detected Signals and Cancelling the Requests](#).

20.3.1.1 Digital Noise Filter

Each GTETR_{Gn} pin input has a digital noise filter. [Figure 20.2](#) shows the operation example in detection of the high level with the use of the filter. When the digital noise filter is enabled (POEG_{Gn}.NFEN bit = 1) and the high level is detected 3 consecutive times with the sampling clock cycle selected by the POEG_{Gn}.NFCS[1:0] bits while inverted or non-inverted according to the setting of the POEG_{Gn}.INV bit, this is regarded as detection of the high level, and the request to stop output is issued to the GPT.

At this time, if the low level is detected even once in the sequence, it is not regarded as detection of the high level. In addition, changes in the levels on pins GTETR_{GA} through GTETR_{GD} are ignored while the sampling clock is not being output.

Digital noise filters can be used with requests to stop output in response to setting of the POEG_{Gn}.PIDF flags (n = A to D), requests to stop output in direct response to a detected signal, and the output of external triggers to the GPT.

Figure 20.2 Example for Operation of Digital Noise Filter

20.3.2 Requests to Stop Output in Response to Detection of Output Stopping from GPT

When any among a dead-time error or simultaneous high- or low-level output from the GPT is detected, the corresponding POEG_{Gn}.IOCF flag is set to 1 and the request to stop output per group is issued to each channel in the GPT. The POEG_{Gn}.IOCF flag is used to indicate both edge detection by the comparator and requests to stop output. To cancel a request to stop output, clear the given POEG_{Gn}.IOCF flag. For details, see [section 20.3.6. Cancelling Requests to Stop Output](#).

To detect any among a dead-time error or simultaneous high- or low-level output from the GPT, detection of output stopping must be permitted in the GRPDTE, GRPABH, and GRPABL bits of the given GPT32n.GTINTAD register. Specify the group of the GPT for which stopping is to be detected in the GPT32n.GTINTAD.GRP[1:0] bits. For details, see [section 21.2.15. GTINTAD : General PWM Timer Interrupt Output Setting Register](#).

20.3.3 Request to Stop Output in Response to Comparator Detection

A request to stop output can be issued to the GPT in response to detection by a comparator. There are two types of request to stop output: requests output in response to setting of a POEG_{Gn}.IOCF flag (n = A to D) due to edge detection by the comparator and requests that are directly output in response to level detection by the comparator.

1. To stop output in response to setting of an IOCF flag, the corresponding edge is detected by the comparator while the POEG_{Gn}.CDRE[3:0] bits are 1. The POEG_{Gn}.IOCF flag is then set to 1, which leads to a request to stop output from

the given group for each channel of the GPT. The POEGGn.IOCF flag is used for both comparator edge detection and the request to stop output. To cancel the request to stop output, clear the POEGGn.IOCF flag. For details, see [section 20.3.6. Cancelling Requests to Stop Output](#).

2. The output can also be stopped by using a detected signal as a direct request to stop output. When the comparator level detection signal selected in the GTONCCRN.NFS[3:0] bits matches the level set in the GTONCCRN.NFV bit, the request to stop output per group is issued to each channel of the GPT. The request to stop output is released when the comparator level detection does not match the issuing conditions. For details, see [section 20.3.7. Requests to Stop Output in Response to Detected Signals and Cancelling the Requests](#).

20.3.4 Requests to Stop Output by Oscillation Stop Detection

When the circuit for detecting stopping of oscillation by the main clock oscillator detects the stopping of the oscillation while a POEGGn.OSTPE bit is 1, the POEGGn.OSTPF flag is set to 1 and a request to stop output per group is issued to each channel of the GPT. To cancel the request to stop output, clear the POEGGn.OSTPF flag. For details, see [section 20.3.6. Cancelling Requests to Stop Output](#).

20.3.5 Requests to Stop Output by a Register

Writing 1 to the software stop flag (POEGGn.SSF) leads to a request to stop output per group to each channel in the GPT. To release from the request to disable output, clear the POEGGn.SSF flag. For details, see [section 20.3.6. Cancelling Requests to Stop Output](#).

20.3.6 Cancelling Requests to Stop Output

Requests to stop output are cancelled in any of the following three ways.

1. Cancellation by a reset (return to the initial state)
2. Cancellation by clearing all flags in the POEGGn register
3. Cancellation in response to direct input of a detected signal

(1) Cancellation by a reset

Any type of reset can cancel a request to stop output. For details, see [section 5, Resets](#).

(2) Cancellation by clearing all flags in the POEGGn register

- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.OSTPF
- POEGGn.SSF

Cancellation of the request is taken into the GPT at the end of the cycle of counting by the GPT, and the output pins are released from being stopped no less than 3 GTCLK cycles from that time. [Figure 20.3](#) shows the timing of release from the output-stopped state. To clear each of the flags, read the status flag for each source to check that the source condition is not being detected, and then write 0. Sources other than the edge detection by the comparators cannot be cleared even if the flag is cleared in the detected state. Since the comparators detect edges in edge detection, writing 0 in the detected state clears the flag, and the flag is not set until the relevant source generates the next edge. Status flags for the respective sources are listed below.

| | |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Detection of input level | POEGGn.ST (GTETRn input status flag) |
| Comparator edge detection | ACMPHSn.CMPMON.CMPMON (comparator output monitoring flag) |
| Oscillation stop detection | OSTDSR.OSTDF (oscillation stop detection flag) |
| Stopping detection from the GPT | GPT32n.GTST.DTEF (dead time error flag) GPT32n.GTST.OABLF (same time output level low flag) GPT32n.GTST.OABHF (same time output level high flag) |

Figure 20.3 Timing of Re-enabling Output from the GPT Output Pins Following Cancellation of a Request to Stop Output

(3) Cancellation in response to direct input of a detected signal

For details, see [section 20.3.7. Requests to Stop Output in Response to Detected Signals and Cancelling the Requests.](#)

20.3.7 Requests to Stop Output in Response to Detected Signals and Cancelling the Requests

The input level detection signals on the GTETR_{Gn} pin ($n = A$ to D) and comparator level detection signals on the ACMPHS_m ($m = 0$ to 3) can be used as direct requests to stop output in response to detected signals. The sources of the signals for detection are selected in the GTONCCR_n.NFS[3:0] bits, and the active senses of the signals for detection are set in the GTONCCR_n.NFV bit. Setting a GTONCCR_n.NE bit to activate direct requests to stop output results in the issuing of a request to stop output to the GPT when the selected source signal for output stopping detection is generated.

The request to stop output is released when the input level detection signals on the GTETR_{Gn} pin or comparator level detection does not match the issuing conditions. To cancel a request, confirm that the values of the PIDF and IOCF flags in the POEG_{Gn} register have become 0.

[Figure 20.4](#) shows the operation of a request to stop output issued in response to level detection by the ACMPHS0. The example shows the case where the comparator detects the analog input voltage on ACMPHS0 becoming higher than the reference voltage while the GPT is producing PWM waveforms on the GTIOC0A pin on a cyclic-counting basis, and the level-detection signal from the comparator is input to the POEG. The POEG outputs a request to stop output to the GPT on the basis of detection as described above, and the GPT remains stopped until the end of the cycle of counting, even if the request to stop output is cancelled before then.

If the request to stop output has not been cancelled at the end of the cycle of counting cycle, output from the GPT remains stopped until the end of the next cycle of counting, and so on.

The output-stopped state can be checked by reading the ODF flag in General PWM Timer Status Register (GTST) of the GPT. For details, see the description of the ODF flag in [section 21.2.16. GTST : General PWM Timer Status Register.](#)

[Figure 20.5](#) shows the procedure for setting requests to stop output in response to detected signals.

Figure 20.4 Example of Operation to Stop Output from the GTIOC Pin In Response to Level Detection by a Comparator

Figure 20.5 Example of Settings to Stop Output on the GTIOC Pin in Response to Level Detection by a Comparator

20.4 Interrupt Sources

The POEG generates interrupts for the interrupt controller when any of the following is detected.

- Detection of level of input, indicated by the POEGGn.PIDF flag
- Detection of stopping of output from the GPT, indicated by the POEGGn.IOCF flag
- Detection of edges by the comparator, indicated by the POEGGn.IOCF flag

Table 20.3 shows interrupt sources and conditions.

Table 20.3 Interrupt sources and conditions (1 of 2)

| Interrupt source | Symbol | Corresponding flag | Trigger condition |
|------------------------|-------------|--------------------|--------------------------------------------------|
| POEG Group A Interrupt | POEG_GROUPA | POEGGA.IOCF | Detection of stopping of output from the GPT |
| | | | Detection of edges by the comparator |
| | | POEGGA.PIDF | Detection of the level input from the GTETRG pin |

Table 20.3 Interrupt sources and conditions (2 of 2)

| Interrupt source | Symbol | Corresponding flag | Trigger condition |
|------------------------|-------------|--------------------|---------------------------------------------------|
| POEG Group B Interrupt | POEG_GROUPB | POEGGB.IOCF | Detection of stopping of output from the GPT |
| | | | Detection of edges by the comparator |
| | | POEGGB.PIDF | Detection of the level input from the GTETRGB pin |
| POEG Group C Interrupt | POEG_GROUPC | POEGGC.IOCF | Detection of stopping of output from the GPT |
| | | | Detection of edges by the comparator |
| | | POEGGC.PIDF | Detection of the level input from the GTETRC pin |
| POEG Group D Interrupt | POEG_GROUPD | POEGGD.IOCF | Detection of stopping of output from the GPT |
| | | | Detection of edges by the comparator |
| | | POEGGD.PIDF | Detection of the level input from the GTETRGD pin |

20.5 External Trigger Output to GPT

Detection of the level input from the GTETR_{Gn} pin can be monitored by the POEG_{Gn}.ST flag via active-sense selection and digital noise filtering. The GPT can function as follows in response to external trigger signals.

- Count start
- Count stop
- Counter clearing
- Up-counting
- Down-counting
- Input capture

For details of the above functions, see [section 21, General PWM Timer \(GPT\)](#).

20.6 Usage Notes

20.6.1 Transitions to Low-Power Modes

When the POEG is used, it should not be transitioned to software standby or deep software standby modes. In this mode, the stopping of output cannot be requested since the POEG is stopped.

20.6.2 Setting the Function for Stopping the Module

The module-stop control register can be set to enable or disable operation of the POEG. The POEG is stopped immediately after a reset. Registers of the POEG become accessible following release from the module-stopped state. For details, see [section 10, Low Power Modes](#).

20.6.3 Duplication of Requests to Stop Output

While either the PIDF or IOCF flag in the POEG_{Gn} register is 1, cancellation of requests to stop by the detection signal set in the GTONCCR_n register does not work due to the request to stop still being output because of the value of the flag. That is, note that requests to stop output will not be cancelled when a corresponding flag is set stop output in response to detection. Request signals to stop output in response to flag setting are obtained as the logical OR of the corresponding detection signals for stopping output.

21. General PWM Timer (GPT)

21.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with $GPT32 \times 10$ channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer.

This GPT provides the high resolution PWM waveform generation function for the channel 0 to 3, the A/D conversion start request function, the asymmetric automatic dead time setting function, and the enhanced interrupt skipping function. In addition, it is enhanced with the external pulse width measuring function for the channel 0 to 3, the additional PWM modes for the channel 4 to 9, the extended buffer transfer function, the GTCPPPO pin output function, and the inter-channel cooperation function.

Table 21.1 lists the GPT specifications, Table 21.2 shows the GPT functions, and Figure 21.1 shows a block diagram.

Table 21.1 GPT specifications

| Logical operation between the channel output | Available |
| Synchronous counter clearing/counter setting/input capture | Available |

Note 1. GTETRn connects to GPT through the POEG module. Therefore, to use the GPT function, supply the POEG clock by clearing the MSTPCRD.MSTPDn (n = 11 to 14) bit.

Note 2. See [section 21.6. Operations Linked by ELC](#).

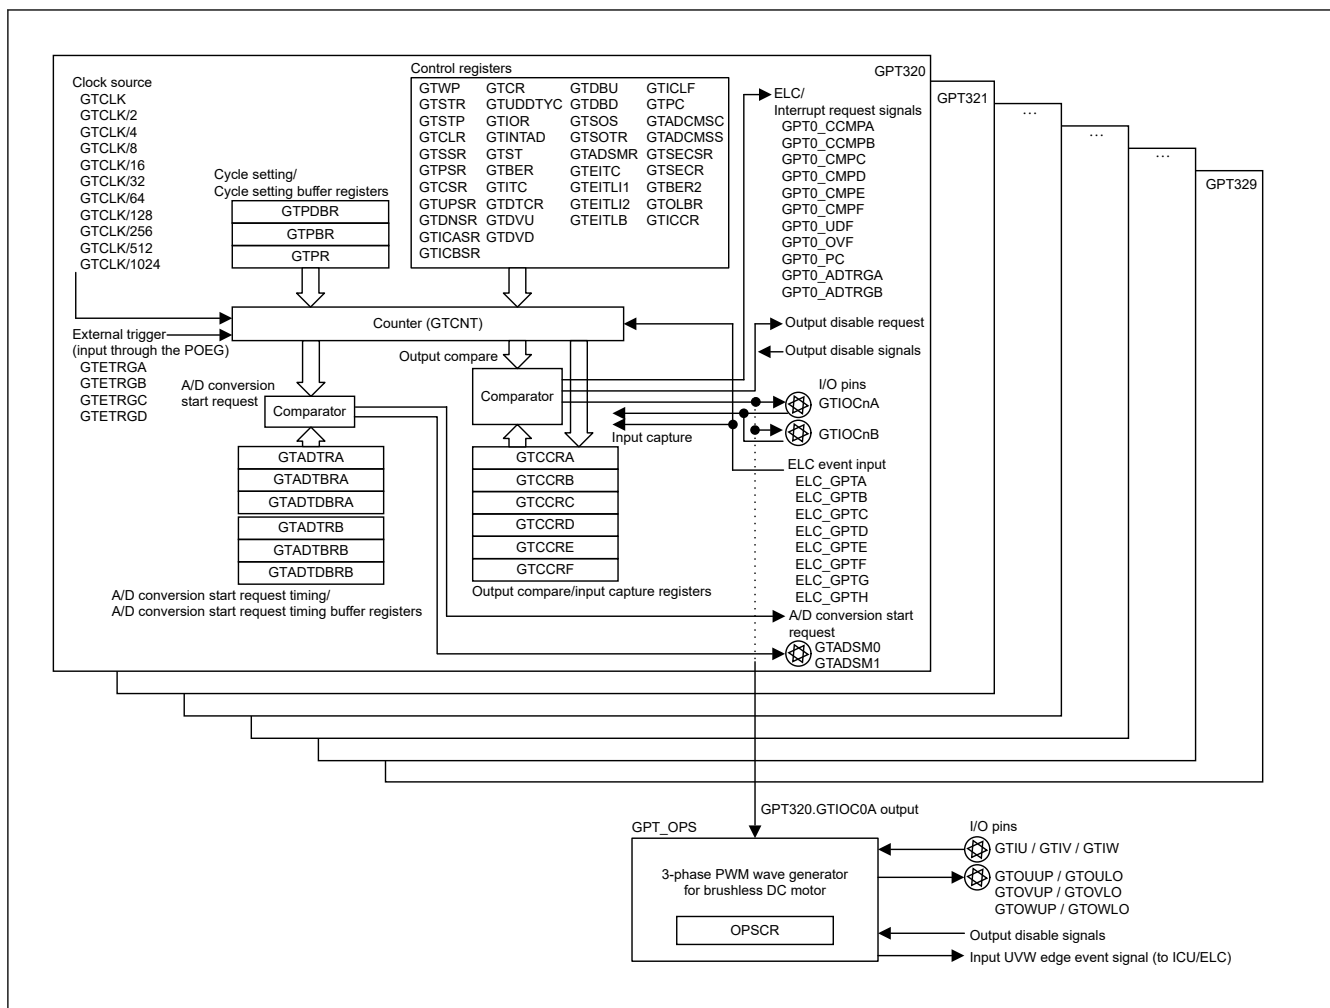

Figure 21.1 GPT block diagram (Saw-wave PWM mode 1, Saw-wave one-shot pulse mode, Triangle-wave PWM mode1,2,3)

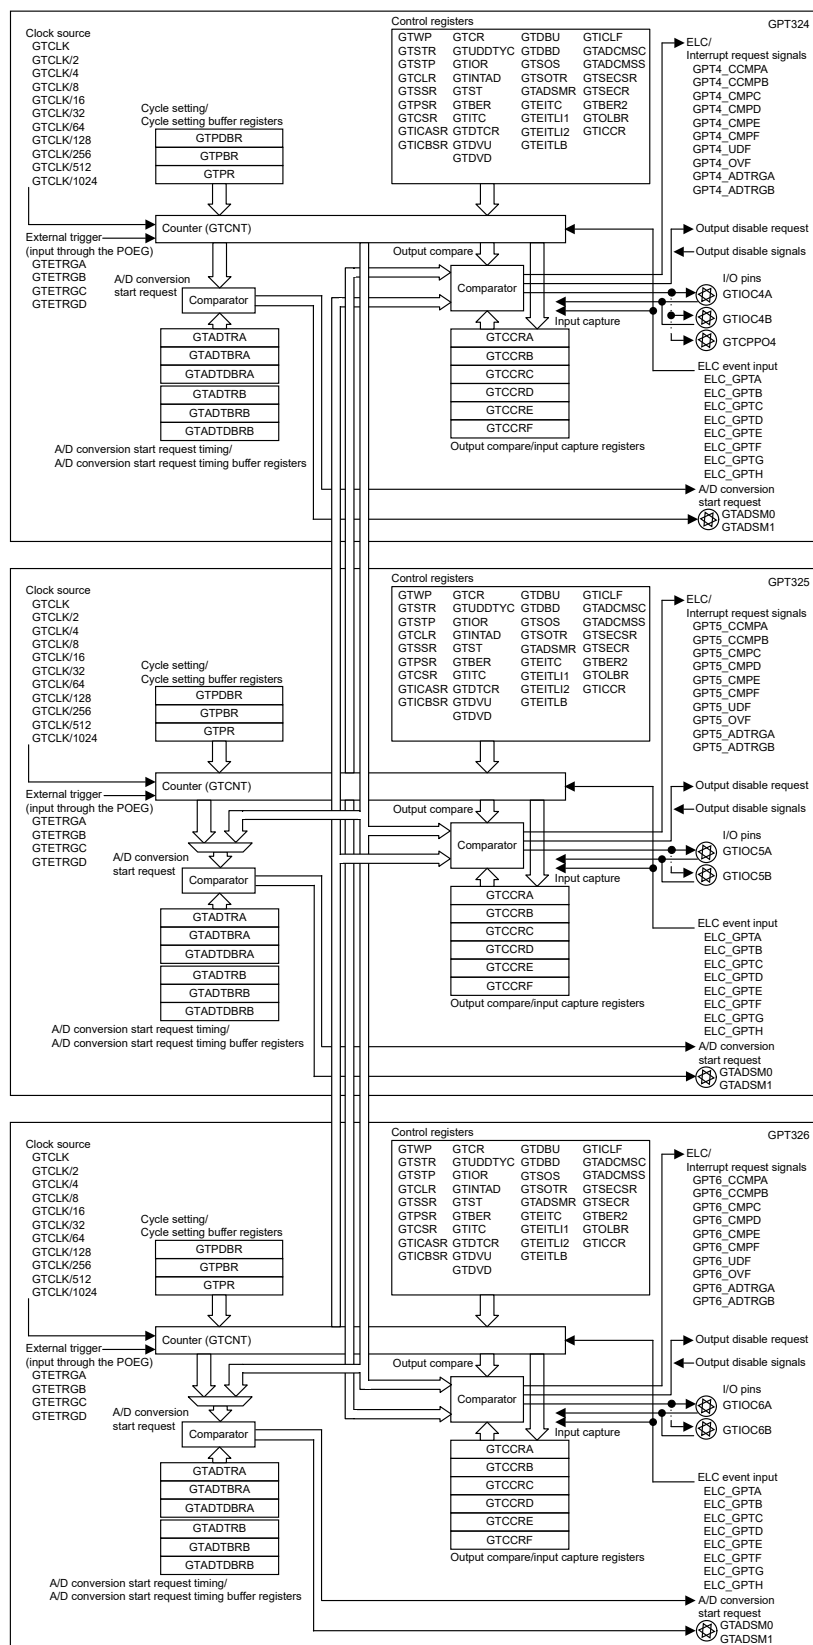

Figure 21.2 GPT block diagram (Saw-wave PWM mode 1, 2, Saw-wave one-shot pulse mode, Triangle-wave PWM mode 1, 2, 3, Complementary PWM mode 1, 2, 3, 4)

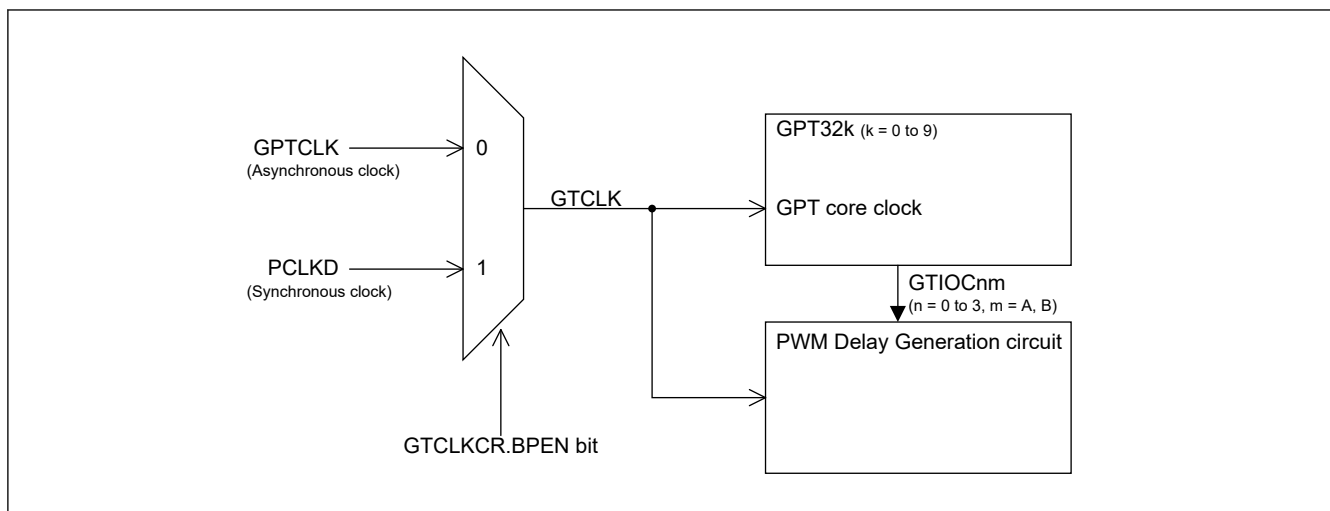

Figure 21.3 GPT core clock selection diagram

In this specification, three consecutive channels to configure complementary PWM mode is defined as complementary PWM mode channel group. The lowest position channel of complementary PWM mode channel group is defined as master channel. The second channel is defined as slave channel 1. The highest position channel is defined as slave channel 2.

Figure 21.4 shows an example using multiple GPTs.

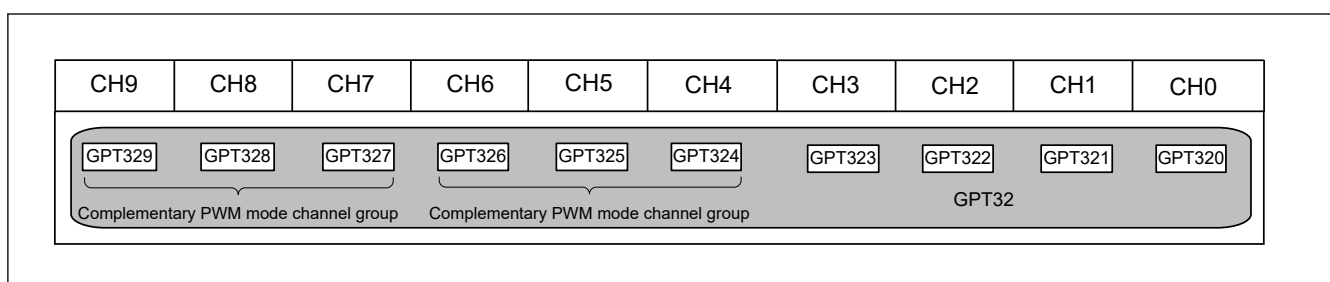

Figure 21.4 Association between GPT channels and module names

Table 21.3 lists the I/O pins.

Table 21.3 GPT I/O pins

| Channel | Pin name | I/O | Function |
|---------|----------|--------|--------------------------------------------------------------------------|
| Common | GTETRGe | Input | External trigger input pin x (input through the POEG) |
| | GTADSM0 | Output | A/D conversion start request monitor 0 output pin |
| | GTADSM1 | Output | A/D conversion start request monitor 1 output pin |
| GPT32n | GTIOCNm | I/O | GTCCRA register input capture input/output compare output/PWM output pin |
| | GTIOCNm | I/O | GTCCRB register input capture input/output compare output/PWM output pin |
| | GTCPPOk | Output | Toggle output synchronized with PWM period |
| GPT_OPS | GTIU | Input | Hall sensor input pin U |
| | GTIV | Input | Hall sensor input pin V |
| | GTIW | Input | Hall sensor input pin W |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive U-phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative U-phase) |
| | GTOVUP | Output | 3-phase PWM output for BLDC motor control (positive V-phase) |
| | GTOVLO | Output | 3-phase PWM output for BLDC motor control (negative V-phase) |
| | GTOUUP | Output | 3-phase PWM output for BLDC motor control (positive W-phase) |
| | GTOULO | Output | 3-phase PWM output for BLDC motor control (negative W-phase) |

n: 0 to 9
k: 0 to 4, 7

21.2 Register Descriptions

21.2.1 GTWP : General PWM Timer Write-Protection Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x00$

| | | | | | | | | | | | | | | | | |
|--------------------|------------|----|----|----|----|----|----|----|----|----|--------|-------|-------|-------|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | PRKEY[7:0] | | | | | | | — | — | — | CMN WP | CLRWP | STPWP | STRWP | WP | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | WP | Register Write Disable 0: Write to the register enabled 1: Write to the register disabled | R/W |
| 1 | STRWP | GTSTR.CSTRT Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled | R/W |
| 2 | STPWP | GTSTP.CSTOP Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled | R/W |
| 3 | CLRWP | GTCLR.CCLR Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled | R/W |
| 4 | CMNWP | Common Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15:8 | PRKEY[7:0] | GTWP Key Code When 0xA5 is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits are permitted. These bits are read as 0. | W |
| 31:16 | — | These bits are read as 0. The write value should be 0. | R/W |

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC, GTADCMSC, GTADCMSS, GTBER2, GTOLBR, GTICCR.

STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit ($n = 0$ to 9) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1 (disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter starts to run. When the setting of the GPT320.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 9) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1 (disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is stopped. When the setting of the GPT320.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 9) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1 (disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is cleared. When the setting of the GPT320.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP bit (Common Register Write Disabled)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 9) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1 (disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT320.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit causes the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register updates the value of the GPT320.GTSECR register. When the setting of the GPT320.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit does not cause the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register does not update the value of the GPT320.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] bits (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

21.2.2 GTSTR : General PWM Timer Software Start Register

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x04$

Bit position: 31

0

Bit field:

CSTRT31 to CSTRT0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | CSTRT0 to CSTRT31 ^{*1} | Channel n GTCNT Count Start (n is the same as the bit position value) 0: GTCNT counter is not started 1: GTCNT counter is started | R/W |

Note 1. The bits that can be used vary depending on the product. The n in CSTRTn is the same as the GPT channel number. For this product, n is 0 to 9.

The GTSTR starts the GTCNT counter operation for each channel n, where $n = 0$ to 9 .

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

In complementary PWM mode, writing to the CSTRTn bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see [Figure 21.4](#).

CSTRTn bits (Channel n GTCNT Count Start ($n = 0$ to 9))

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit ($n = 0$ to 9) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

21.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x08$

Bit position: 31

0

Bit field:

CSTOP31 to CSTOP0

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|------|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | CSTOP0 to CSTOP31 ^{*1} | Channel n GTCNT Count Stop (n is the same as the bit position value) 0: GTCNT counter is not stopped 1: GTCNT counter stopped | R/W |

Note 1. The bits that can be used vary depending on the product. The n in CSTOP n is the same as the GPT channel number. For this product, n is 0 to 9.

The GTSTP stops the GTCNT counter operation for each channel n , where $n = 0$ to 9 .

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels.

The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

In complementary PWM mode, writing to the CSTOP n bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see [Figure 21.4](#).

CSTOPn bits (Channel n GTCNT Count Stop ($n = 0$ to 9))

The CSTOP n bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOP n bit ($n = 0$ to 9) has no effect unless the GTPSR.CSTOP bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0 means the counter is running and 1 means the counter is stopped.

21.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x0C$

Bit position: 31

0

Bit field:

CCLR31 to CCLR0

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | CCLR0 to CCLR31 ^{*1} | Channel n GTCNT Count Clear (n : the same as bit position value) 0: GTCNT counter is not cleared 1: GTCNT counter is cleared | W |

Note 1. The bits that can be used vary depending on the product. The n of CCLR n is the same as the GPT channel number. For this product, n is 0 to 9.

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n , where $n = 0$ to 9 .

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels.

The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

In complementary PWM mode, writing to the CCLR n bit of master channel is only valid. The bit on slave channels reflects the bit value of master channel.

For the association between module names and channel numbers, see [Figure 21.4](#).

CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 9))

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

21.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

Offset address: 0x10

| | | | | | | | | | | | | | | | | |

| 30:24 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31 | CSTRT | Software Source Counter Start Enable 0: Counter start disabled by the GTSTR register 1: Counter start enabled by the GTSTR register | R/W ¹ |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables the GTCNT counter start at the ELC_GPTm event input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

21.2.6 GTPSR : General PWM Timer Stop Source Select Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

| 30:24 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31 | CSTOP | Software Source Counter Stop Enable 0: Counter stop disabled by the GTSTP register 1: Counter stop enabled by the GTSTP register | R/W ^{*1} |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables the GTCNT counter stop at the ELC_GPTm event input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

| 30:28 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31 | CCLR | Software Source Counter Clear Enable 0: Counter clear disabled by the GTCLR register 1: Counter clear enabled by the GTCLR register | R/W ^{*1} |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323, this bit is read as 0. The write value should be 0.

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETRn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

In complementary PWM mode, this setting is invalid.

CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

In complementary PWM mode, this setting is invalid.

CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

In complementary PWM mode, this setting is invalid.

CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

In complementary PWM mode, this setting is invalid.

CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables the GTCNT counter clear at the ELC_GPTm event input.

CSCMSC[2:0] bits (Compare Match/Input Capture/Synchronous counter clearing Source Counter Clear Enable)

Select enable or disable for the counter clear of the GTCNT counter by compare match/input capture/synchronous counter clearing group.

If counter clearing by compare match/input capture is enabled, it can be handled as synchronous clearing by inter channel cooperation as described in [section 21.3.8.3. Synchronous Clear Operation by Inter Channel Cooperation](#).

If this bit is set to 001b or 010b and counter clearing by input capture (excluding compare match) is allowed, set the same factor as the input capture factor selected in GTICmSR (m = A, B) register to the counter clearing factor in GTCSR register.

In addition, when the timer prescaler is not used (when GTCR.TPCS[3:0] = 0000b), the input capture by other channel factors (set GTICASR.ASOC or GTICBSR.BSOC to 1) can be used as a counter clear factor. The input capture by other channel factors cannot be used as the synchronous clearing factor for other channels but can be used as a counter clearing factor for its own channel. In this case, GTCSR configuration is not required.

Since the compare match by the register that is performing the buffer operation (including the wave mode specific case) does not occur, the counter clear enable setting that makes the target register of the buffer operation the compare match factor is invalid.

In complementary PWM mode, the counter clear enable setting for compare match of the GTCCRB register, GTCCRE register, and GTCCRF register is invalid even when the buffer operation is not performed.

CP1CCE bit (Complementary PWM mode1 Crest Source Counter Clear Enable)

Select enable or disable for the counter clear at the crest of complementary PWM mode 1.

To enable this bit, do not set 1 to the PSYE bit of the GTIOR register.

It is valid only for the master channel in complementary PWM mode. The master channel setting also clears the GTCNT counter of the slave channel in complementary PWM mode.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

21.2.8 GTUPSR : General PWM Timer Up Count Source Select Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 3)

| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETR_{Gn} (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

USAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)

The USAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables the GTCNT counter count up at the ELC_GPTm event input.

USILVL[3:0] bit (External Input Level Source Count-Up Enable)

Select enable or disable for the count-up of the GTCNT counter by the GTIOCnA pin input level, GTIOCnB pin input level, and GTETRGA/GTETRFB/GTETRGD/GTETRGC input level.

| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGN (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables the GTCNT counter count down at the ELC_GPTm event input.

DSILVL[3:0] bit (External Input Level Source Count-Down Enable)

Select enable or disable for the count-down of the GTCNT counter by the GTIOCnA pin input level, GTIOCnB pin input level, and GTETRGA/GTETRGB/GTETRGC/GTETRGD input level.

| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGN ($n = A$ to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC_GPTm event input.

ASOC bit (Other channel Source GTCCRA Input Capture Enable)

Select enable or disable for an input capture to the GTCCRA register by other channel factors of inter channel cooperation which is set in the GTICCR register of other channels.

Input capture of other channel factors which enabled by this bit is not subject to input capture factors to other channels set by the ICAFA and ICBFA bits of the GTICCR register.

21.2.11 GTICBSR : General PWM Timer Input Capture Source Select Register B

| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETR_{Gn} (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC_GPTm event input.

BSOC bit (Other channel Source GTCCRB Input Capture Enable)

Select enable or disable for an input capture to the GTCCRB register by other channel factors of inter channel cooperation which is set in the GTICCR register of other channels.

Input capture of other channel factors which enabled by this bit is not subject to input capture factors to other channels set by the ICAFB and ICBFB bits of the GTICCR register.

| 31:29 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. MD[3] bit is only available in GPT324 to GPT329. GPT320 to GPT323 only support Saw-wave PWM mode and Triangle-wave PWM mode except Saw-wave PWM mode 2.

The GTCR controls GTCNT.

Access in 8 bit unit to GTCR is prohibited.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCN_A/GTIOCN_B input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 9)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCN_A/GTIOCN_B input enabled by GTPSR as the counter stop source, occurs (n = 0 to 9)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is 1.

ICDS bit (Input Capture Operation Select During Count Stop)

This bit selects input capture operation during count stop, when the input capture function is selected.

SCGTIOC bit (GTIOC input Source Synchronous Clear Enable)

Select enable or disable the use of the counter clear by GTIOCN_A/GTIOCN_B input pin selected by the GTCSR register as the counter clear factor for other channels.

SSCGRP[1:0] bits (Synchronous Set/Clear Group Select)

Select the channel group of synchronous set/clear.

In complementary PWM mode, slave channels are also controlled by setting the SSCGRP[1:0] bits of the master channel.

SSCEN bit (Synchronous Set/Clear Enable)

Select disable or enable of Synchronous set/clear.

In complementary PWM mode, slave channels are also controlled by setting the SSCEN bits of the master channel.

MD[3:0] bits (Mode Select)

These bits select the GPT operating mode.

In complementary PWM mode, slave channels are also controlled by setting the MD bits of the master channel.

Only the MD[3:2] bit (MD[2] for GPT320 to GPT323) is valid at input capture. Counting in saw-wave mode is performed with 00 for the MD[3:2] bit (0 for the MD[2] of GPT320 to GPT323), and counting in triangle-wave mode is performed with 01 for the MD[3:2] bit (1 for MD[2] of GPT320 to GPT323), and counting in complementary PWM mode is performed with 1 for the MD[3].

The MD bits must be set while the GTCNT operation is stopped.

During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), set the MD bits to the initial value (0000b).

TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped.

CKEG[1:0] bits (Clock Edge Select)

When GTETRGR input is selected by TPCS[3:0] bits, select the edge of GTETRGR input used as the clock of GTCNT counter.

Set the CKEG[1:0] bits only when the GTCNT counter operation is stopped.

| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCnA/GTIOCnB pin output.

The setting is invalid during the event count operation, Saw-wave PWM mode 2, Complementary PWM mode.

Count Direction:

- In saw-wave mode.
When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.
When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode.
When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR).
When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.
- In triangle-wave mode.
When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.
When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

OmdTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmdTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCnm pin.

OmdTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmdTYF bit forcibly sets the output duty cycle to the OmdTY setting. Set this bit to 0 during counter operation.

OmdTYR bit (GTIOCnm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmdTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCnm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmdTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

21.2.14 GTIOR : General PWM Timer I/O Control Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0 to 9)

| Bit | Symbol | Function | R/W |
|-------|------------|------------------------------------------------------------------------------------------------------------------------------------|-----|
| 28 | — | This bit is read as 0. The write value should be 0. | R/W |
| 29 | NFBEN | Noise Filter B Enable 0: The noise filter for the GTIOCnB pin is disabled 1: The noise filter for the GTIOCnB pin is enabled | R/W |
| 31:30 | NFCSB[1:0] | Noise Filter B Sampling Clock Select 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64 | R/W |

Note 1. This bit is only available in GPT324 to GPT329.
In GPT320 to GPT323, this bit is read as 0. The write value should be 0.

The GTIOR sets the functions of the GTIOCnA, GTIOCnB and GTCPPOm pins. (n = 0 to 9, m = 0 to 4, 7)

GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see [Table 21.4](#) and [Table 21.5](#).

CPSCIR bit (Complementary PWM Mode Initial Output at Synchronous Clear Disable)

Select the output waveform when synchronous clear occurs in complementary PWM mode.

The initial output is disabled by this function only when synchronous clear occurs in the trough section in complementary PWM mode. If a synchronous clear occurs at any other time, the initial value set by the GTIOA[4]/GTIOB[4] bits is output regardless of the CPSCIR bit setting. In addition, the initial value set by the GTIOA[4]/GTIOB[4] bits is output even when the synchronous clear occurs in the trough section immediately after the count starts.

OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

OAHLDBit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLDBit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLDBit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLDBit is set to 1:

- The output is retained when counting starts or stops.

OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

OAE OCD bit (GTCCRA Compare Match Cycle End Output Invalidate)

If the cycle end matches the GTCCRA compare match timing in Saw-wave PWM mode 1 and 2, select invalid/valid of the setting of GTIOA[3:2] bits. When 1 (disabled) is set, the GTIOCnA pin holds the output when the cycle end and the GTCCRA compare match timing match.

PSYE bit (PWM Synchronous output Enable)

This bit set Enable/disable of output signal from GTCPPOm pin synchronized with the PWM cycle that toggles at the crest/trough/GTCNT counter clear of complementary PWM mode and Triangle-wave mode or the end of the cycle of the Saw-wave mode.

The initial output of the GTCPPOn output pin is Low, and the count start results in High.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see [Table 21.4](#) and [Table 21.5](#).

In Saw-wave PWM mode 2, only the GTIOB[1:0] bits are valid, and the GTIOCnA pin output is selected instead of the GTIOCnB pin by the GTCCRB register compare match.

OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether the GTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

OBECD bit (GTCCRB Compare Match Cycle End Output Invalidate)

If the cycle end matches the GTCCRB compare match timing in Saw-wave PWM mode 1 and 2, select invalid/valid of the GTIOB[3:2] bits setting in saw-wave PWM mode 1 or the GTIOA[3:2] bit setting in saw-wave PWM mode 2. When 1 (disabled) is set, the GTIOCnB pin in saw-wave PWM mode 1 or the GTIOCnA pin in saw-wave PWM mode 2 holds the output when the cycle end and the GTCCRB compare match timing match.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits (Saw-wave mode, Triangle-wave mode)

| GTIOA/GTIOB[4:0] bits | | | | | Function | | |
|-----------------------|----|----|----|----|------------------------|------------------------------|------------------------------------------------|
| b4 | b3 | b2 | b1 | b0 | b4*4 | b3, b2*1 *2 *3 *4 | b1, b0*2 |

| 1 | 0 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 0 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 0 | 0 | | High output at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 0 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 0 | 0 | | Output toggled at cycle end | Output retained at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 0 | 1 | | | Low output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 1 | 0 | | | High output at GTCCRA/GTCCRB compare match |
| 1 | 1 | 1 | 1 | 1 | | | Output toggled at GTCCRA/GTCCRB compare match |

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, if the OAECD and OBECD bits are set to 0 and the end of cycle output is enabled, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.(GPT320 to GPT323)

Note 4. In Saw-wave PWM mode 2, GTIOB[4:2] bits is invalid. Since only GTIOCnA pins are output pins, set GTIOA[4] bit for initial output. Set GTIOA[3:2] bits for output at the end of a cycle.

Table 21.5 Settings of GTIOA[4:0] and GTIOB[4:0] bits (Complementary PWM mode)

| GTIOA/GTIOB[4:0] bits ^{*1 *2 *3} | | | | | Function | | |
|-------------------------------------------|----|----|----|----|-------------------------------------------------|-------------------------------|---------------------------------|
| | | | | | Initial output, Active level | Up count Compare Match output | Down count Compare Match output |
| b4 | b3 | b2 | b1 | b0 | b4 | b3, b2 | b1, b0 |
| 0 | 0 | 1 | 1 | 0 | Initial output is Low. Active level is High. | Low output | High output |
| 0 | 1 | 0 | 0 | 1 | | High output | Low output |
| 1 | 0 | 1 | 1 | 0 | Initial output is High. Active level is Low. | Low output | High output |
| 1 | 1 | 0 | 0 | 1 | | High output | Low output |

Note 1. In complementary PWM mode, the only values that can be set in the GTIOA[4:0] bits are 01001b, and 10110b. Setting other values is prohibited.

Note 2. In complementary PWM mode, the only values that can be set in the GTIOB[4:0] bits are 00110b, and 11001b. Setting other values is prohibited.

Note 3. In complementary PWM mode, setting GTIOB[4:0] bits does not use compare match of GTCCRB register. The combination of counter and register that is the target of compare match depends on the operation period of complementary PWM mode. For details, see [section 21.3.3.7. Complementary PWM mode 1,2,3.](#)

21.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0 to 9)

Offset address: 0x38

| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

The GTINTAD enables or disables interrupt requests, A/D conversion start request, and output disable requests.

SCFA bit (GTCCRA Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRA register compare match/input capture as a clear factor for other channels.

SCFB bit (GTCCRB Register Compare Match/Input Capture Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRB register compare match/input capture as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFC bit (GTCCRC Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRC register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFD bit (GTCCRD Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRD register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFE bit (GTCCRE Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRE register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFF bit (GTCCRF Register Compare Match Source Synchronous Clear Enable)

This bit enables or disables use of GTCCRF register compare match as a clear factor for other channels.

The setting is invalid in complementary PWM mode.

SCFPO bit (Overflow Source Synchronous Clear Enable)

This bit enables or disables use of overflow as a clear factor for other channels.

In complementary PWM mode, it is valid only for the master channel.

SCFPU bit (Underflow Source Synchronous Clear Enable)

This bit enables or disables use of underflow as a clear factor for other channels.

In complementary PWM mode, it is valid only for the master channel.

ADTRAUEN bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter up-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRADEN bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter down-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBUEN bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter up-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBDEN bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter down-counting.

In complementary PWM mode, it is valid only for the master channel.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

GRPDTE bit (Dead Time Error Output Disable Request Enable)

This bit enables or disables the output disable request by a dead time error.

The dead time error output disable request is not generated during the event count operation.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

21.2.16 GTST : General PWM Timer Status Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x3C$

| 16 | ADTRAUF | GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag 0: No GTADTRA register compare match has occurred in up-counting. 1: A GTADTRA register compare match has occurred in up-counting. | R/W ^{*1} |
| 17 | ADTRADF | GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag 0: No GTADTRA register compare match has occurred in down-counting. 1: A GTADTRA register compare match has occurred in down-counting. | R/W ^{*1} |
| 18 | ADTRBUF | GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag 0: No GTADTRB register compare match has occurred in up-counting. 1: A GTADTRB register compare match has occurred in up-counting. | R/W ^{*1} |
| 19 | ADTRBDF | GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag 0: No GTADTRB register compare match has occurred in down-counting. 1: A GTADTRB register compare match has occurred in down-counting. | R/W ^{*1} |
| 23:20 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | ODF | Output Disable Flag 0: No output disable request is generated 1: An output disable request is generated | R |
| 27:25 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | DTEF | Dead Time Error Flag 0: No dead time error has occurred. 1: A dead time error has occurred. | R |
| 29 | OABHF | Same Time Output Level High Flag 0: No simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred. | R |
| 30 | OABLF | Same Time Output Level Low Flag 0: No simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred. | R |
| 31 | PCF ^{*2} | Period Count Function Finish Flag 0: No period count function finish has occurred 1: A period count function finish has occurred | R/W ^{*1} |

Note 1. Only 0 can be written to this bit. Do not write 1.

When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.

Note 2. This bit is only available in GPT320 to GPT323.

In GPT324 to GPT329, this bit is read as 0. The write value should be 0.

The GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register

- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- $GTCNT = GTCCRB$, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRC$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$ (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$ (triangle-wave PWM mode 3)
- $GTBER.CCRA[1:0] = 01b, 10b, 11b$ (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRD$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- $GTCR.MD[2:0] = 001b$ (saw-wave one-shot pulse mode)
- $GTCR.MD[2:0] = 110b$ (Triangle-wave PWM mode 3)
- $GTBER.CCRA[1:0] = 10b, 11b$ (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE does not perform compare match.

[Setting condition]

- $GTCNT = GTCCRE$.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF does not perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

ITCNT[2:0] flag (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Counter)

When the GPTn_OVF/GPTn_UDF interrupt skipping function is used (the GTITC.IVTC[1:0] bits are set to a value other than 00b), the counter is incremented by 1 every time the GPTn_OVF/GPTn_UDF interrupt source which is selected in GTITC.IVTC[1:0] is generated.

These bits are operated independently from the extended interrupt skipping by the GTEITC register.

[Clearing conditions]

- The GPTn_OVF/GPTn_UDF interrupt skipping function is not used (the GTITC.IVTT[2:0] bits are 000b when the IVTC[1:0] bits are 00b).
- The GPTn_OVF/GPTn_UDF interrupt skipping count matches the specified count (the ITCNT[2:0] bits match the skipping count specified by the IVTT[2:0] bits).
- When the count operation is stopped

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

ADTRAUF flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting.

[Clearing condition]

- 0 is written to the ADTRAUF flag.

ADTRADF flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting.

[Clearing condition]

- 0 is written to the ADTRADF flag.

ADTRBUF flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting.

[Clearing condition]

- 0 is written to the ADTRBUF flag.

ADTRBDF flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting.

[Clearing condition]

- 0 is written to the ADTRBDF flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

DTEF flag (Dead Time Error Flag)

This flag indicates that the timer output toggle point after the automatic addition of dead time has exceeded the count period.

This flag returns to 0 when the timer output toggle point after the automatic addition of dead time is back within the period.

This flag can only be read from. (Writing 0 to clear the flag is not allowed.)

When the output disable request by the DTEF flag is enabled (when GTINTAD.GRPDTE bit is 1), the DTEF flag is output as the output disable request to the POEG. The GPT does not have a dead time error interrupt. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- When a change point of the waveform after the automatic setting of dead time has exceeded the count period (in the following cases).
 - Up-counting in triangle-wave mode:
GTCCRA register – GTDVU register ≤ 0
 - Down-counting in triangle-wave mode:
GTCCRA register – GTDVD register < 0
 - Up-counting in saw-wave one-shot pulse mode:
GTCCRA register – GTDVU register < 0 , or
GTCCRA register + GTDVD register $> GTPR$ register
 - Down-counting in saw-wave one-shot pulse mode:
GTCCRA register + GTDVU register $> GTPR$ register, or
GTCCRA register - GTDVD register < 0

[Clearing condition]

- The timer output toggle point after the automatic addition of dead time is within the count period.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF flag (Period Count Function Finish Flag)

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

21.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: 0x40

In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 0: In triangle wave or complementary PWM mode, transfer at trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 1: In triangle wave or complementary PWM mode, transfer at both crest and trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. | R/W |
| 30 | ADTDB | GTADTRB Register Double Buffer Operation 0: Single buffer operation (GTADTBRA → GTADTRB) 1: Double buffer operation (GTADTBRA → GTADTBRA → GTADTRB) | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTBER register provides settings for the buffer operation. Set the GTBER register except the BDx (x = 0 to 3) bits while the GTCNT counter is stopped.

BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation in Saw-wave one-shot pulse mode or Triangle-wave PWM mode. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

In complementary PWM mode, it is valid only for the buffer operation of GTCCRC register and GTCCRE register. The buffer operation of GTCCRA registers cannot be disabled. Buffer operation of GTCCRE register and GTCCRF register is enabled/disabled by CP3DB bit of GTBER2 register. No buffer transfer to GTCCRB is performed in complementary PWM mode.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCE.

When the DBRTEC_m (m = A, B) bit is 1, setting the BD0 bit to 1 while the mode of operation is saw-wave one-shot pulse mode or triangle-wave PWM mode 3 results in transfer from the intermediate buffer to the GTCCR_m register.

BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR, GTPDBR, and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPD.

In complementary PWM mode, the slave channel is also controlled by setting the BD1 bit of the master channel.

BD2 bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.

The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.

A value for the BD2 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAB or SBDAD bit in the GTSECR register.

BD3 bit (GTDVU/GTDVD Registers Buffer Operation Disable)

In Saw-wave PWM mode 1, Saw-wave one-shot pulse mode or Triangle-wave PWM mode, this bit disables buffer operation using the GTDVU and GTDBU registers together and buffer operation using the GTDVD and GTDBD registers together.

Even though the BD3 bit is set to 0, buffer operation in the GTDVD register is not performed if the GTDTCR.TDFER bit is set to 1. Instead, the value in the GTDVU register is set automatically.

In Saw-wave PWM mode 2 or complementary PWM mode, this bit is invalid and GTDVU and GTDVD registers don't perform buffer operation.

The setting is invalid during the event count operation, and the buffer operation using the GTDVU and GTDVD registers is not performed.

A value for the BD3 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDDE or SBDDE bit in the GTSECR register.

DBRTEC_m bits (GTCCR_m Register Double Buffer Repeat Operation Enable) (m = A,B)

This setting enables the operation to repeat a transfer to the GTCCR_m register from the intermediate buffer by cycle during the buffer transfer disable period when performing the double buffer operation using the GTCCR_m register.

It is valid in saw-wave one-shot pulse mode and triangle-wave PWM mode 3.

The disabling period of buffer transfer indicates the period that buffer transfer is stopped by setting of the BD0 bit (CPU writing or simultaneous buffer operation control by the GTSECSR register) and the period for buffer transfer extended skipping (except the case for skipping by counting both crests and troughs) by the GTEITLB register.

When the DBRTECm bit is 1, writing by the CPU to the GTCCRM register sets the same value in temporary register x (x = C, E). The value of the GTCCR_x (x = C, E) register is also transferred to the temporary register x (x = C, E) by forcible buffer transfer.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough), or complementary PWM mode.

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set the buffer operation with GTPR, GTPDBR, and GTPBR combined.

The setting is invalid in complementary PWM mode. Buffer operation unique to complementary PWM mode is performed regardless of the setting value of the PR[1:0] bits.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

The setting is invalid in complementary PWM mode.

ADTTA[1:0] bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.

The setting is invalid during the event count operation.

ADTDA bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.

The setting is invalid during the event count operation.

ADTTB[1:0] bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.

The setting is invalid during the event count operation.

ADTDB bit (GTADTRB Register Double Buffer Operation)

These bits set buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers combined.

The setting is invalid during the event count operation.

21.2.18 GTITC : General PWM Timer Interrupt and A/D Conversion Start Request Skipping Setting Register

| Bit | Symbol | Function | R/W |
|-------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 14 | ADTBL | GTADTRB Register A/D Conversion Start Request Link 0: Not linked with GPTn_OVF/GPTn_UDF interrupt skipping function. 1: Linked with GPTn_OVF/GPTn_UDF interrupt skipping function. | R/W |
| 31:15 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. Saw-wave PWM mode 2 is not the target of this function.

The GTITC register sets the skipping function for the GTCNT counter overflow (GTPR compare match) interrupt (GPTn_OVF) and underflow interrupt (GPTn_UDF) and also sets whether to link the other interrupts and A/D conversion start requests with the GPTn_OVF/GPTn_UDF interrupt skipping function. Note the output disable request to POEG cannot be linked with the GPTn_OVF/GPTn_UDF interrupt skipping function. Additionally, if the interrupt skipping function is performed, the change in the status flag is also skipped.

The setting is invalid during the event count operation.

The setting is operated independently from the extended interrupt skipping by the GTEITC register.

ITLA bit (GTCCRA Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRA compare match/input capture interrupt (GPTn_CCMPIA) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLB bit (GTCCRB Register Compare Match/Input Capture Interrupt Link)

This bit specifies whether to link the GTCCRB compare match/input capture interrupt (GPTn_CCMPIB) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLC bit (GTCCRC Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRC compare match interrupt (GPTn_CMPC) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLD bit (GTCCRD Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRD compare match interrupt (GPTn_CMPD) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLE bit (GTCCRE Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRE compare match interrupt (GPTn_CMPE) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ITLF bit (GTCCRF Register Compare Match Interrupt Link)

This bit specifies whether to link the GTCCRF compare match interrupt (GPTn_CMPF) with the GPTn_OVF/GPTn_UDF interrupt skipping function.

IVTC[1:0] bit (GPTn_OVF/GPTn_UDF Interrupt Skipping Function Select)

These bits set the skipping function for the GTPR compare match (GTCNT counter overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF).

IVTT[2:0] bit (GPTn_OVF/GPTn_UDF Interrupt Skipping Count Select)

These bits set the skipping count for the GTPR compare match (GTCNT counter overflow) interrupt (GPTn_OVF) and GTCNT counter underflow interrupt (GPTn_UDF).

When modifying the IVTT[2:0] bits, first set the IVTC[1:0] bits to 00b.

ADTAL bit (GTADTRA Register A/D Conversion Start Request Link)

This bit specifies whether to link the GTADTRA A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRA register, with the GPTn_OVF/GPTn_UDF interrupt skipping function.

ADTBL bit (GTADTRB Register A/D Conversion Start Request Link)

This bit specifies whether to link the GTADTRB A/D conversion start request, which is generated in response to a compare match with the GTCNT counter and the GTADTRB register, with the GPTn_OVF/GPTn_UDF interrupt skipping function.

21.2.19 GTCNT : General PWM Timer Counter

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x48$

Bit position: 31

0

Bit field:

Value after reset: 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | GTCNT is a 32-bit read/write counter for GPT32n ($n = 0$ to 9). GTCNT can only be written to after counting stops. Access in 8-bit or 16-bit units to the GTCNT counter is prohibited, and it should be accessed in 32-bit units. In saw waves or triangle waves, GTCNT must be set within the range of $0 \leq \text{GTCNT} \leq \text{GTPR}$. | R/W |

21.2.20 GTCCRk : General PWM Timer Compare Capture Register k ($k = A$ to F)

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x4C$ (GTCCRA)
 $0x50$ (GTCCRB)
 $0x54$ (GTCCRC)
 $0x58$ (GTCCRE)
 $0x5C$ (GTCCRD)
 $0x60$ (GTCCRF)

Bit position: 31

0

Bit field:

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | GTCCRk registers are read/write registers. Access in 8-bit or 16-bit units to the GTCCRk register is prohibited, and it should be accessed in 32-bit units. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB). | R/W |

21.2.21 GTPR : General PWM Timer Cycle Setting Register

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0x64$

| 0 | TDE | Negative-Phase Waveform Setting 0: GTCCRB is set without using GTDVU and GTDVD 1: GTDVU and GTDVD are used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB | R/W |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | TDBUE | GTDVU Register Buffer Operation Enable 0: GTDVU register buffer operation is disabled 1: GTDVU register buffer operation is enabled | R/W |
| 5 | TDBDE | GTDVD Register Buffer Operation Enable 0: GTDVD register buffer operation is disabled 1: GTDVD register buffer operation is enabled | R/W |
| 7:6 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | TDFER | GTDVD Register Setting 0: GTDVU and GTDVD registers are set separately. 1: The value written to GTDVU register is automatically set to GTDVD register. | R/W |
| 31:9 | — | These bits are read as 0. The write value should be 0. | R/W |

GTDTCCR enables automatic setting of a compare match value for negative-phase waveform with dead time. GPT has a dead time control function and GTDVU and GTDVD registers are used for setting dead time value.

This register is invalid in Saw-wave PWM mode 2 or complementary PWM mode.

The setting is invalid during the event count operation.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU and GTDVD. When GTDVU and GTDVD are used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU and GTDVD) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatic setting.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB, and GTST.DTEF flag becomes 1. However, if the obtained GTCCRB value exceeds the upper limit in triangle-wave PWM mode, DTEF flag becomes 0.

- Triangle waves:
Upper limit value: $GTPR - 1$
Lower limit value: 1 in up-counting, 0 in down-counting
- Saw-wave one-shot pulse mode:
Upper limit value: $GTPR$
Lower limit value: 0.

TDBUE bit (GTDVU Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVU and GTDBU registers combined.

The timing of buffer transfer is at troughs in triangle-wave mode, and at overflows or underflows in saw-wave mode.

TDBDE bit (GTDVD Register Buffer Operation Enable)

This bit enables buffer operation with the GTDVD and GTDBD registers combined.

The buffer transfer timing is the trough in triangle-wave mode, and at an overflow or underflow in saw-wave mode.

When this bit and the TDFER bit are set to 1 simultaneously, the TDFER bit setting is given priority.

TDFER bit (GTDVD Register Setting)

This bit sets whether or not the value written to the GTDVU register is also set to the GTDVD register automatically.

21.2.28 GTDVK : General PWM Timer Dead Time Value Register k (k = U, D)

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

Offset address: 0x8C (GTDVU)
0x90 (GTDVD)

| 7:2 | — | These bits are read as 0. | R |
| 9:8 | — | The read value is undefined. | R |
| 31:10 | — | These bits are read as 0. | R |

The GTSOS register is a status register that indicates the status of the output protection function. The output protection function is enabled only when the dead time is automatically set (GTDTCR.TDE bit = 1) in triangle-wave mode.

SOS[1:0] bit (Output Protection Function Status)

This bit indicates the status of the output protection function in triangle-wave PWM mode. For details of the output protection function, see [section 21.8.4. Output Protection Function for GTIOCNm Pin Output \(n = 0 to 9; m = A, B\)](#).

21.2.31 GTSOTR : General PWM Timer Output Protection Function Temporary Release Register

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0xA0$

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------|-----|
| 0 | SOTR | Output Protection Function Temporary Release 0: Protected state is not released 1: Protected state is released | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTSOTR register temporarily releases the protected state of GTIOCNB pin output ($n = 0$ to 9) when output protection has been set.

The protected state can be released only for the case of GTSOS.SOS[1:0] bits are 10b (protected state in which GTCCRA register \geq GTPR register has occurred during transfer at trough). The protected state cannot be released for any other case.

SOTR bit (Output Protection Function Temporary Release)

This bit sets whether to temporarily release the protected state of the GTIOCnB pin output in an output protected state.

After the SOTR bit has been set to 1, the output protection function is canceled from the first trough. After the SOTR bit has been set to 0, output protection is resumed from the first trough.

21.2.32 GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register

Base address: $\text{GPT32n} = 0x4016_9000 + 0x0100 \times n$ ($n = 0$ to 9)

Offset address: $0xA4$

| | | | | | | | | | | | | | | | | |

| 17:16 | ADSMS1[1:0] | A/D Conversion Start Request Signal Monitor 1 Selection 0 0: A/D conversion start request signal generated by the GTADTRA register during up-counting. 0 1: A/D conversion start request signal generated by the GTADTRA register during down-counting. 1 0: A/D conversion start request signal generated by the GTADTRB register during up-counting. 1 1: A/D conversion start request signal generated by the GTADTRB register during down-counting. | R/W |
| 23:18 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | ADSMEN1 | A/D Conversion Start Request Signal Monitor 1 Output Enabling 0: Output of A/D conversion start request signal monitor 1 is disabled. 1: Output of A/D conversion start request signal monitor 1 is enabled. | R/W |
| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTADSMR register is used to control monitors for the A/D conversion start request signal that is synchronized with a frame period.

ADSMsk[1:0] bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select A/D conversion start request signal synchronized with a frame period which is monitored by the GTASMc pin.

In triangle-wave PWM mode or complementary PWM mode, the following settings are prohibited:

- Set ADSMsk[1:0] bit to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set ADSMsk[1:0] bit to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set ADSMsk[1:0] bit to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set ADSMsk[1:0] bit to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.

When the output is disabled, the GTADSMk pin goes to the low level.

When the bit is 1, the signal on the GTADSMk pin goes to the high level on assertion of the signal to request the start of A/D conversion selected by the ADSMsk[1:0] bits and returns to the low level at the end of the current cycle of the timer for the channel that generated the given signal to request the start of A/D conversion. When the counter stops, the value when the counter stopped is retained for output. Set the ADSMENk bit to 0 to output the low level.

When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.

When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT.

21.2.33 GTEITC : General PWM Timer Extended Interrupt Skipping Counter Control Register

| 31:28 | EITCNT2[3:0] | Extended Interrupt Skipping Counter 2 | R |

Note 1. The EITCNT2IV[3:0] bits are only writable when the value other than 00b is written to the EIVTC2[1:0] bits that have been 00b.

GTEITC register sets the extended interrupt skipping function to skip the interrupts, A/D conversion start requests, and buffer transfers independently by counting at overflow and underflow in the GTCNT counter.

The setting is operated independently from the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

Access in 8-bit units to GTEITC is prohibited.

EIVTCk[1:0] bits (Extended Interrupt Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the extended interrupt skipping counter k.

Setting only with these bits does not skip the interrupts, A/D conversion start requests, and buffer transfers. Skipping function for the interrupt, A/D conversion start request, and buffer transfer, all of which are a target of skipping, is set individually with the GTEITL1, GTEITL2, and GTEITLB registers.

EIVTTk[3:0] bits (Extended Interrupt Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the EIVTCk[1:0] bits to the next generation of the count source.

When the count source is generated while the EIVTTk[3:0] bits match the EITCNTk[3:0] bits, the EITCNTk[3:0] bits are cleared.

When these bits are 0x0, skipping is not performed.

EITCNT1[3:0] bits (Extended Interrupt Skipping Counter 1)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT1[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

[Clearing conditions]

- 00b is written to the EIVTC1[1:0] bits.
- 0x0 is written to the EIVTT1[3:0] bits.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC1[1:0] bits is generated when the extended interrupt skipping 1 skipping count set by the EIVTT1[3:0] bits match the value for the EITCNT1[3:0]

EITCNT2IV[3:0] bit (Extended Interrupt Skipping Counter 2 Initial Value)

These bits are the value of the initial value for the extended interrupt skipping counter 2.

Writing to the EITCNT2IV[3:0] is performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the EITCNT2[3:0] bits are set not to count (EIVTC2[1:0] bits are 00b). When the EITCNT2IV[3:0] bits are written, the value written to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits simultaneously.

The writing to the EITCNT2IV[3:0] bits are ignored when the EITCNT2[3:0] bits are set to count (EIVTC2[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the EIVTC2[1:0] bits).

The EITCNT2IV[3:0] bits are not reset by the writing 00b to the EIVTC2[1:0] bits.

EITCNT2[3:0] bit (Extended Interrupt Skipping Counter 2)

The counting is incremented by 1 every time a count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the EIVTT2[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

Setting of the initial value for the EITCNT2[3:0] bits are performed only when the writing value to the EIVTC2[1:0] bits are other than 00b and when the GTEITC register is written by the access of upper 16 bits or 32 bits while the extended interrupt skipping counter 2 is set as not to count (EIVTC2[1:0] bits are 00b).

When the initial value is set, the written value to the EITCNT2IV[3:0] bits is written to the EITCNT2[3:0] bits as the initial value.

[Clearing condition]

- 00b is written to the EIVTC2[1:0] bits.
- 0x0 is written to the EIVTT2[3:0] bits.
- The value other than 00b is written to the EIVTC2[1:0] bits and the 0x0 is written to the EITCNT2IV[3:0] bits simultaneously while 00b is set to the EIVTC2[1:0] bits.
- A count source (overflow/underflow/crest/trough) selected by the EIVTC2[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the EIVTT2[3:0] bits match the value for the EITCNT2[3:0].

| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

The GTEITLI1 register sets the extended skipping function for interrupts such as compare match/input capture, overflow and underflow.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

EITLm[2:0] bits (GTCCRm Register Compare Match/Input Capture Interrupt Extended Skipping Function Select) (m = A, B)

These bits select the extended interrupt skipping function to skip the compare match/input capture interrupt (GPTn_CCMPm) in the GTCCRm register. See [Table 21.6](#).

EITLx[2:0] bits (GTCCRx Register Compare Match Interrupt Extended Skipping Function Select) (x = C, D, E, F)

These bits select the extended interrupt skipping function to skip the compare match interrupt (GPTn_CMPx) in the GTCCRx register. See [Table 21.6](#).

EITLV[2:0] bit (Overflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at overflow (GPTn_OVF). See [Table 21.6](#).

EITLU[2:0] bit (Underflow Interrupt Extended Skipping Function Select)

These bits select the extended interrupt skipping function to skip the interrupt at underflow (GPTn_UDF). See [Table 21.6](#).

Table 21.6 Setting the Function select for the GTEITLI1 (1 of 2)

| EITLy[2:0] | Function |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 0 0 | Do not perform an extended interrupt skipping |
| 0 0 1 | Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An interrupt is output in the period of the EITCNT1[3:0] bits = 0) |
| 0 1 0 | Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An interrupt is output in the period of the EITCNT2[3:0] bits = 0) |
| 0 1 1 | Skip an interrupt in the period the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An interrupt is output in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0) |
| 1 0 0 | Setting prohibited |
| 1 0 1 | Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An interrupt is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits) |
| 1 1 0 | Skip an interrupt in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An interrupt is output in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |

Table 21.6 Setting the Function select for the GTEITL1 (2 of 2)

| EITLy[2:0] | Function |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 1 1 | Skip an interrupt in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An interrupt is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |

- Note:
- y = A, B, C, D, E, F, V, U
 - When the intended skipping counter is set as not to count (the EIVTCK[1:0] bits = 00b or the EIVTTk[3:0] bits = 0x0), skipping is not performed.(k = 1, 2)
 - When the EITLy[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

21.2.35 GTEITL12 : General PWM Timer Extended Interrupt Skipping Setting Register 2

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

Offset address: 0xB0

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|-------------|----|----|----|-------------|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | EADTBL[2:0] | | | — | EADTAL[2:0] | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|-------------|---------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | EADTAL[2:0] | GTADTRA Register A/D Conversion Start Request Extended Skipping Function Select See Table 21.7 . | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 6:4 | EADTBL[2:0] | GTADTRB Register A/D Conversion Start Request Extended Skipping Function Select See Table 21.7 . | R/W |
| 31:7 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTEITL12 register sets the extended skipping function for A/D conversion start requests.

Setting only with this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register or the GTADCMSC register.

The setting is invalid during the event count operation.

EADTmL[2:0] bits (GTADTRm Register A/D Conversion Start Request Extended Skipping Function Select) (m = A, B)

These bits select the extended skipping function to skip A/D conversion start requests for the compare match in the GTADTRm register. See [Table 21.7](#).

Table 21.7 Setting the Function Select for the GTEITL12 Register (1 of 2)

| EADTmL[2:0] | Function |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 0 0 | Do not perform an extended interrupt skipping |
| 0 0 1 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = 0) |
| 0 1 0 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of the EITCNT2[3:0] bits = 0) |

Table 21.7 Setting the Function Select for the GTEITLI2 Register (2 of 2)

| EADTmL[2:0] | Function |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 1 1 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0) |
| 1 0 0 | Setting prohibited |
| 1 0 1 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits) |
| 1 1 0 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |
| 1 1 1 | Skip an A/D conversion start request in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |

- Note:
- m = A, B
 - When the intended skipping counter is set as not to count (the EIVTCK[1:0] bits = 00b or the EIVTTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
 - When the EADTmL[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

21.2.36 GTEITLB : General PWM Timer Extended Buffer Transfer Skipping Setting Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

Offset address: 0xB4

| 23 | — | This bit is read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-------|--------------|------------------------------------------------------------------------------------------------------|-----|
| 26:24 | EBTLDVU[2:0] | GTDVU Register Buffer Transfer Extended Skipping Function Select See Table 21.8 . | R/W |
| 27 | — | This bit is read as 0. The write value should be 0. | R/W |
| 30:28 | EBTLDVD[2:0] | GTDVD Register Buffer Transfer Extended Skipping Function Select See Table 21.8 . | R/W |
| 31 | — | This bit is read as 0. The write value should be 0. | R/W |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

The GTEITLB register sets the extended skipping function for buffer transfers.

Setting only this register does not perform skipping. The GTEITC register should be set so that a corresponding extended interrupt skipping counter operates the counting.

The setting is operated independently from the interrupt skipping by the GTITC register.

The buffer transfer from the GTOLBR register to the GTIOR.GTIOA[4:0], GTIOB[4:0] bits is not target of the extended buffer transfer skipping function.

The setting is invalid during the event count operation.

EBTLCA[2:0] bit (GTCCRA Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRA, GTCCRC, GTCCRD registers and a temporary register A) in the GTCCRA register. See [Table 21.8](#).

An extended skipping of buffer transfers in the GTCCRA register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRA register should be performed in the condition of not performing the extended buffer transfer skipping.

The buffer transfer between the GTCCRC, GTCCRE, and GTCCRA in complementary PWM mode cannot be skipped.

EBTLCB[2:0] bit (GTCCRB Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTCCRB, GTCCRE, GTCCRF registers and a temporary register B) in the GTCCRB register. See [Table 21.8](#).

An extended skipping of buffer transfers in the GTCCRB register is valid for forcible buffer transfers by the GTBER.CCRSWT bit while the count operation is stopped. Forcible buffer transfers in the GTCCRB register should be performed in the condition of not performing the extended buffer transfer skipping.

EBTLPR[2:0] bit (GTPR Register Buffer Transfer Extended Skipping Function Select)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTPR, GTPBR, and GTPDBR registers) in the GTPR register. See [Table 21.8](#).

If the buffer transfer of GTPR is skipped in complementary PWM mode, GTEITC setting of slave channel should be matched to the master channel so that the buffer transfer timing of the slave channel matches the master channel.

EBTLADm[2:0] bits (GTADTRm Register Buffer Transfer Extended Skipping Function Select) (m = A, B)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers among the GTADTRm, GTADTBm, and GTADTDBRm registers) in the GTADTRm register. See [Table 21.8](#).

EBTLDVm[2:0] bits (GTDVm Register Buffer Transfer Extended Skipping Function Select) (m = U, D)

These bits select the extended buffer transfer skipping function to skip buffer transfers (transfers between the GTDVm and GTDBm registers) in the GTDVm register. See [Table 21.8](#).

Table 21.8 Setting the Function Select for the GTEITLB Register (1 of 2)

| EBTLx[2:0] bits | Function |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 0 0 | Do not perform an extended interrupt skipping |
| 0 0 1 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than 0 (Buffer is transferred in the period of the EITCNT1[3:0] bits = 0) |

Table 21.8 Setting the Function Select for the GTEITLB Register (2 of 2)

| EBTLx[2:0] bits | Function |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 1 0 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than 0 (Buffer is transferred in the period of the EITCNT2[3:0] bits = 0) |
| 0 1 1 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the EITCNT1[3:0] bits = 0 and the EITCNT2[3:0] bits = 0) |
| 1 0 0 | Setting prohibited |
| 1 0 1 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits) |
| 1 1 0 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |
| 1 1 1 | Skip a buffer transfer in the period when the value for the extended interrupt skipping counter 1 or 2 is other than the skipping count (Buffer is transferred in the period of the EITCNT1[3:0] bits = the EIVTT1[3:0] bits and the EITCNT2[3:0] bits = the EIVTT2[3:0] bits) |

- Note:
- x = CA, CB, PR, ADA, ADB, DVU, DVD
 - When the intended skipping counter is set as not to count (EIVTck[1:0]bits = 00b or EIVTTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
 - When the EBTLx[2:0] bits are set to 011b or 111b, and when one of the skipping counter 1 or 2 is set as not to count, skipping is not performed.

21.2.37 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

| 31:26 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. The signal before performing output disable control is selected.

Note 2. When channel's own GTIOCnA is selected, C is treated as "1".

Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with GTCLK. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 GTCLK is selected, the output enable signal is also delayed with 1 GTCLK and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as "1".

ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

21.2.38 GTPC : General PWM Timer Period Count Register

Base address: GPT32n = 0x4016_9000 + 0x0100 × n (n = 0 to 3)

Offset address: 0xBC

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|------------|----|----|------|----|----|----|----|----|----|----|------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | ASTP | — | — | — | — | — | — | — | PCEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|------------|-------------------------------------------------------------------------------------------------------------------|-----|
| 0 | PCEN | Period Count Function Enable 0: Period count function is disabled 1: Period count function is enabled | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | ASTP | Automatic Stop Function Enable 0: Automatic stop function is disabled 1: Automatic stop function is enabled | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |
| 27:16 | PCNT[11:0] | Period Counter Counter for the number of period | R/W |
| 31:28 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTPC register counts the number of period.

PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bit is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bit is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode or complementary PWM mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

| 27:24 | ADCMSCNT2IV[3:0] | A/D Conversion Start Request Compare Match Skipping Counter 2 Initial Value | R/W ² |
| 31:28 | ADCMSCNT2[3:0] | A/D Conversion Start Request Compare Match Skipping Counter 2 | R |

Note 1. Writing is possible only when the ADCMSC1[1:0] bits are 00b and a value other than 00b is written to the ADCMSC1[1:0] bits.

Note 2. Writing is possible only when the ADCMSC2[1:0] bits are 00b and a value other than 00b is written to the ADCMSC2[1:0] bits.

The GTADCMSC register is a register that controls the skipping counter of the A/D conversion start request compare match skipping function that counts compare matches of GTADTRA register and GTADTRB register, and skipping A/D conversion start request and buffer transfer independently.

This register setting is operated independently from the interrupt skipping by the GTITC register or GTEITC register.

Access in 8-bit units to GTADCMSC is prohibited.

ADCMSCk[1:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k Count Source Select) (k = 1, 2)

These bits select the way of counting for the A/D conversion start request compare match skipping counter k.

Setting only with these bits does not skip the A/D conversion start requests and buffer transfers. Skipping function for the A/D conversion start request and buffer transfer which are a target of skipping is set individually with the GTADCMSS register.

ADCMSTk[3:0] bits (A/D Conversion Start Request Compare Match Skipping k Skipping Count Setting) (k = 1, 2)

A count for the period with continuous skipping is set as a skipping count, where a period is from a generation of a count source selected by the ADCMSck[1:0] bits to the next generation of the count source.

When the count source is generated while the ADCMSTk[3:0] bits match the ADCMSCNTk[3:0] bits, the ADCMSCNTk[3:0] bits are cleared.

When these bits are 0x0, skipping is not performed.

ADCMSCNTkIV[3:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k Initial Value) (k = 1, 2)

These bits are the value of the initial value for the A/D conversion start request compare match skipping counter k.

Writing to the ADCMSCNTkIV[3:0] is performed only when the writing value to the ADCMSck[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the ADCMSCNTk[3:0] bits are set not to count (ADCMSCk[1:0] bits are 00b). When the ADCMSCNTkIV[3:0] bits are written, the value written to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits simultaneously.

The writing to the ADCMSCNTkIV[3:0] bits are ignored when the ADCMSCNTk[3:0] bits are set to count (ADCMSCk[1:0] bits are other than 00b) or perform the setting of not to count (00b is written to the ADCMSck[1:0] bits).

The ADCMSCNTkIV[3:0] bits are not reset by the writing 00b to the ADCMSck[1:0] bits.

ADCMSCNTk[3:0] bits (A/D Conversion Start Request Compare Match Skipping Counter k) (k=1,2)

The counting is incremented by 1 every time a count source selected by the ADCMSck[1:0] bits is generated.

Counting is performed periodically within the range between 0 and the ADCMSTk[3:0] bits.

Even if the GTCNT counter is stopped, the value is not cleared, and value at stop of the GTCNT counter is retained.

Setting of the initial value for the ADCMSCNTk[3:0] bits are performed only when the writing value to the ADCMSck[1:0] bits are other than 00b and when the GTADCMSC register is written by the access of 16 bits or 32 bits while the A/D conversion start request compare match skipping counter k is set as not to count (ADCMSCk[1:0] bits are 00b).

When the initial value is set, the written value to the ADCMSCNTkIV[3:0] bits is written to the ADCMSCNTk[3:0] bits as the initial value.

[Clearing condition]

- 00b is written to the ADCMSck[1:0] bits.
- 0x0 is written to the ADCMSTk[3:0] bits.
- The value other than 00b is written to the ADCMSck[1:0] bits and the 0x0 is written to the ADCMSCNTkIV[3:0] bits simultaneously while 00b is set to the ADCMSck[1:0] bits.
- A count source selected by the ADCMSck[1:0] bits is generated when the extended interrupt skipping 2 skipping count set by the ADCMSTk[3:0] bits match the value for the ADCMSCNTk[3:0].

| 31:23 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTADCMSS register is a register that selects the A/D conversion start request compare match skipping function or the GTADTRm ($m = A, B$) register buffer transfer by A/D conversion start request compare match skipping function.

Setting only with this register does not perform skipping. The GTADCMSC register should be set so that a corresponding A/D conversion start request compare match skipping counter operates the counting.

This register setting is operated independently from the interrupt skipping by the GTITC register or GTEITC register.

ADCMSmL[2:0] bits (GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select) ($m = A, B$)

These bits select the A/D conversion start request compare match skipping function of the GTADTRm ($m = A, B$) register. [Table 21.9](#).

ADCMSmB[2:0] bits (GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select) ($m = A, B$)

These bits select the GTADTRm ($m = A, B$) register buffer transfer by A/D conversion start request compare match skipping function which skips the buffer transfer of GTADTRm ($m = A, B$) register (Transfer between GTADTRm register, GTADTBm register, GTADTDBm register). See [Table 21.10](#).

Table 21.9 Setting of the GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select bit ($m = A, B$) (1 of 2)

| ADCMSmL[2:0] | Function |
|--------------|-----------------------------------------------------------------------|
| 0 0 0 | Do not perform an A/D conversion start request compare match skipping |

Table 21.9 Setting of the GTADTRm Register A/D Conversion Start Request Compare Match Skipping Function Select bit (m = A, B) (2 of 2)

| ADCMSmL[2:0] | Function |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 0 1 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0) |
| 0 1 0 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = 0) |
| 0 1 1 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = 0 and the ADCMSCNT2[3:0] bits = 0) |
| 1 0 0 | Setting prohibited |
| 1 0 1 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits) |
| 1 1 0 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits) |
| 1 1 1 | Skip an A/D conversion start request in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (An A/D conversion start request is output in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits) |

- Note:
- m = A, B
 - When the intended skipping counter is set as not to count (the ADCMSCK[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
 - When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counters is set as not to count, skipping is not performed.

Table 21.10 Setting of the GTADTRm Register Buffer Transfer by A/D Conversion Start Request Compare Match Skipping Function Select bit (m = A, B)

| ADCMBSm[2:0] | Function |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 0 0 0 | Do not perform an GTADTRm register buffer transfer by A/D conversion start request compare match skipping |
| 0 0 1 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0) |
| 0 1 0 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = 0) |
| 0 1 1 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than 0 (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = 0 and the ADCMSCNT2[3:0] bits = 0) |
| 1 0 0 | Setting prohibited |
| 1 0 1 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits) |
| 1 1 0 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 2 is other than the skipping count (Buffer is transferred in the period of the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits) |
| 1 1 1 | Skip a buffer transfer in the period when the value for the A/D conversion start request compare match skipping counter 1 or 2 is other than the skipping count (A Buffer is transferred in the period of the ADCMSCNT1[3:0] bits = the ADCMST1[3:0] bits and the ADCMSCNT2[3:0] bits = the ADCMST2[3:0] bits) |

- Note:
- m = A, B
 - When the intended skipping counter is set as not to count (the ADCMSCK[1:0] bits = 00b or the ADCMSTk[3:0] bits = 0x0), skipping is not performed. (k = 1, 2)
 - When the ADCMSmL[2:0] bits are set to 011b or 111b, and when one of the skipping counters is set as not to count, skipping is not performed.

21.2.41 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

The GTSECSR register selects an intended channel n ($n = 0$ to 9) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 9)

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

21.2.42 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ (n = 0 to 9)

Offset address: 0xD4

| 31:26 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. When in complementary PWM mode, no matter which register of master channel/slave channel 1/slave channel 2 is written, three channels are written at the same time.

Note 2. This bit is only available in GPT320 to GPT323.
In GPT324 to GPT329, this bit is read as 0. The write value should be 0.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCE bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPDBR, and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDPE bits to 1 is prohibited.

SBDAD bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.

Simultaneous setting of SBDAD and SBDAD bits to 1 is prohibited.

SBDDE bit (GTDV Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are enabled.

Simultaneous setting of SBDDE and SBDDE bits to 1 is prohibited.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCE bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR, GTPDBR, and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPE bits to 1 is prohibited.

SBDAD bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are disabled.

Simultaneous setting of SBDAD and SBDAD bits to 1 is prohibited.

SBDDD bit (GTDV Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[3] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTDVU and GTDBU registers and using the GTDVD and GTDBD registers are disabled.

Simultaneous setting of SBDDE and SBDDD bits to 1 is prohibited.

SPCE bit (Period Count Function Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCE bit (Synchronous Set/Clear Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTCR.SSCEN bit in the channels set to 1 by the GTSECSR register and Enable synchronous set/clear function.

Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

SPCD bit (Period Count Function Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SSCD bit (Synchronous Set/Clear Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTCR.SSCEN bit in the channels set to 1 by the GTSECSR register and Disable synchronous set/clear function.

Simultaneous setting of SSCE and SSCD bits to 1 is prohibited.

| 31:30 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. This bit is only available in GPT324 to GPT329.

In GPT320 to GPT323, this bit is read as 0. The write value should be 0.

The GTBER2 register makes settings for buffer operation.

Set the CP3DB bit and OLTTm[1:0] (m = A, B) bits when the GTCNT counter is stopped.

CCTCA bit (Counter Clear Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCA bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTCA bit setting, the CCTCA bit setting has priority.

The setting is invalid during the event count operation.

CCTCB bit (Counter Clear Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTCCRB, GTCCRE, and GTCCRF registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTCB bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTCB bit setting, the CCTCB bit setting has priority.

The setting is invalid during the event count operation.

CCTPR bit (Counter Clear Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTPR, GTPBR, and GTPDBR registers together.

This bit is effective when the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTPR bit is 0, buffer transfer is not performed by counter clear.

The setting is invalid during the event count operation.

CCTADm bit (Counter Clear Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by counter clear using the GTADTRm, GTADTBm and GTADTDBRm registers together.

This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTADm bit is 0, buffer transfer is not performed by counter clear.

If there is a conflict with the CMTADm bit setting, the CCTADm bit setting has priority.

The setting is invalid during the event count operation.

CCTDV bit (Counter Clear Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by counter clear using the GTDVU and GTDBU or GTDVD and GTDBD registers together.

This bit is effective when the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode. Even if the CCTDV bit is 0, buffer transfer is not performed by counter clear.

The setting is invalid during the event count operation.

CMTCA[1:0] bit (Compare Match Source GTCCRA Register Buffer Transfer Enable)

This bit enables buffer transfer by compare match of GTCCRA using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTCA bit setting, the CCTCA bit setting has priority.

The setting is invalid during the event count operation.

CMTCB[1:0] bit (Compare Match Source GTCCRB Register Buffer Transfer Enable)

This bit enables buffer transfer by compare match of GTCCRB using the GTCCRB, GTCCRE, and GTCCRF registers together.

This bit is effective when the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTCB bit setting, the CCTCB bit setting has priority.

The setting is invalid during the event count operation.

CMTADm bit (Compare Match Source GTADTRm Register Buffer Transfer Enable) (m = A, B)

This bit enables buffer transfer by compare match of GTADTRm using the GTADTRm, GTADTBm and GTADTDBRm registers together.

This bit is effective when the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

If there is a conflict with the CCTADm bit setting, the CCTADm bit setting has priority.

The setting is invalid during the event count operation.

CPTCA bit (Overflow/Underflow Source GTCCRA Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTCCRA, GTCCRC, and GTCCRD registers together.

This bit is effective when the CCTCA bit is 0 (GTCCRA register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRA[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTCB bit (Overflow/Underflow Source GTCCRB Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTCCRB, GTCCRE and GTCCRF registers together.

This bit is effective when the CCTCB bit is 0 (GTCCRB register buffer transfer by counter clear is enabled), the GTBER.BD[0] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.CCRB[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTPR bit (Overflow/Underflow Source GTPR Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTPR, GTPBR, and GTPDBR registers together.

This bit is effective when the CCTPR bit is 0 (GTPR register buffer transfer by counter clear is enabled), the GTBER.BD[1] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTBER.PR[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTADm bit (Overflow/Underflow Source GTADTRm Register Buffer Transfer Disable) (m = A, B)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTADTRm, GTADTBm and GTADTDBm registers together.

This bit is effective when the CCTADm bit is 0 (GTADTRm register buffer transfer by counter clear is enabled), the GTBER.BD[2] bit is 0 (buffer operation enabled) and the buffer operation is selected by the ADTTm[1:0] bits with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CPTDV bit (Overflow/Underflow Source GTDVU/GTDVD Register Buffer Transfer Disable)

This bit disables buffer transfer by overflow/underflow in saw-waves using the GTDVU and GTDBU or GTDVD and GTDBD registers together.

This bit is effective when the CCTDV bit is 0 (GTDVU/GTDVD register buffer transfer by counter clear is enabled), the GTBER.BD[3] bit is 0 (buffer operation enabled) and the buffer operation is selected by the GTDTCR.TDBUE or GTDTCR.TDBDE bit with saw-waves.

The setting is invalid in triangle waves or complementary PWM mode.

The setting is invalid during the event count operation.

CP3DB bit (Complementary PWM mode 3,4 Double Buffer select)

This bit enables buffer transfer using the GTCCRA, GTCCRE and GTCCRF registers together in complementary PWM mode 3,4.

CPBTD bit (Complementary PWM mode Buffer Transfer Disable)

This bit disables buffer transfer from temporary register (temporary register A and temporary register P) to the GTCCRC and GTPBR registers during timer counting in complementary PWM mode 1, 2 and 3. When CP3DB bit is 1, the buffer transfer from temporary register B to GTCCRE register is also disabled. The setting is invalid in complementary PWM mode 4.

OLTTm[1:0] bits (GTIOCnA Output Level Buffer Transfer Timing Select) (m = A, B)

This bit set the timing of buffer transfer from GTOLBR.GTIOmB[4:0] bits to GTIOR.GTIOm[4:0] bits.

21.2.44 GTOLBR : General PWM Timer Output Level Buffer Register

Base address: $GPT32n = 0x4016_9000 + 0x0100 \times n$ ($n = 4$ to 9)

The GTOLBR register is a buffer register for the GTIOR.GTIOA[4:0] bits and GTIOR.GTIOB[4:0] bits.

GTIOmB[4:0] bits (GTIOm buffer bits) (m = A, B)

These bits are buffer bits of GTIOR.GTIOm[4:0] bits.

These bits are transferred to the GTIOR.GTIOm[4:0] bits at the transfer timing selected by the GTBER2.OLTTm[1:0] (m = A, B) bits.

21.2.45 GTICCR : General PWM Timer Inter Channel Cooperation Input Capture Control Register

| 29:25 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31:30 | ICBGRP[1:0] | GTCCRB Input Capture Group Select 0 0: Select group A 0 1: Select group B 1 0: Select group C 1 1: Select group D | R/W |

The GTICCR register is a register that controls input capture by inter channel cooperation.

For channels that perform input capture by inter channel cooperation, the forwarding enable bit of the input capture source corresponding to the GTCCRA register or GTCCRB register where the input capture occurs is invalid.

ICAFm bit (Forwarding GTCCRm register Compare Match/Input Capture to Other Channel GTCCRA Input Capture Source Enable) (m = A, B)

Enables/disables the use of compare match/input capture of GTCCRm register as the input capture source of other channel's GTCCRA register.

ICAFx bit (Forwarding GTCCR_x register Compare Match to Other Channel GTCCRA Input Capture Source Enable) (x = C, D, E, F)

Enables/disables the use of compare match of GTCCR_x register as the input capture source of other channel's GTCCRA register.

ICAFPO bit (Forwarding Overflow to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use the overflow of saw-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICAFPU bit (Forwarding Underflow to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use the underflow of saw-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRA register.

ICACLK bit (Forwarding Count Clock to Other Channel GTCCRA Input Capture Source Enable)

Enable/disable to use count clock as the input capture source of other channel's GTCCRA register.

ICAGRP[1:0] bit (GTCCRA Input Capture Group Select)

Select the group of input capture by inter channel cooperation for GTCCRA register.

For channels that accept input capture of the GTCCRA register due to input capture sources from other channels, set the GTICASR.ASOC bit to 1 and select the group of inter channel cooperation with the ICAGRP[1:0] bits.

ICBFm bit (Forwarding GTCCR_m register Compare Match/Input Capture to Other Channel GTCCRB Input Capture Source Enable) (m = A, B)

Enables/disables the use of compare match/input capture of GTCCR_m register as the input capture source of other channel's GTCCRB register.

ICBFx bit (Forwarding GTCCR_x register Compare Match to Other Channel GTCCRB Input Capture Source Enable) (x = C, D, E, F)

Enables/disables the use of compare match of GTCCR_x register as the input capture source of other channel's GTCCRB register.

ICBFPO bit (Forwarding Overflow to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use the overflow of saw-waves, the crest of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBFPU bit (Forwarding Underflow to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use the underflow of saw-waves, the trough of triangle-waves or complementary PWM mode as the input capture source of other channel's GTCCRB register.

ICBCLK bit (Forwarding Count Clock to Other Channel GTCCRB Input Capture Source Enable)

Enable/disable to use count clock as the input capture source of other channel's GTCCRB register.

ICBGRP[1:0] bit (GTCCRB Input Capture Group Select)

Select the group of input capture by inter channel cooperation for GTCCRB register.

For channels that accept input capture of the GTCCRB register due to input capture sources from other channels, set the GTICBSR.BSOC bit to 1 and select the group of inter channel cooperation with the ICBGRP[1:0] bits.

| 26 | GODF | Group Output Disable Function 0: This bit function is ignored 1: Group disable clears the OPSCR.EN bit*1 | R/W |
| 28:27 | — | These bits are read as 0. The write value should be 0. | R/W |
| 29 | NFEN | External Input Noise Filter Enable 0: Do not use a noise filter on the external input 1: Use a noise filter on the external input | R/W |
| 31:30 | NFCS[1:0] | External Input Noise Filter Clock Selection Noise filter sampling clock setting of the external input. 0 0: GTCLK/1 0 1: GTCLK/4 1 0: GTCLK/16 1 1: GTCLK/64 | R/W |

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF , VF , WF bits (Input Phase Soft Setting)

The UF , VF , WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF /VF /WF takes the place of the U/V/W external input.

U, V, W bits (Input Phase Monitor)

When the OPSCR.FB bit is 0, external inputs that are synchronized by GTCLK are monitored by these bits. When the OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF , OPSCR.VF , and OPSCR.WF bits.

EN bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).

When the OPSCR.EN bit is 1, the signal waveform is output.

When the OPSCR.EN bit is 0, first set OPSCR.FB, OPSCR.UF /VF /WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP[1:0], OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set the EN bit to 1. The EN bit should be set when output disable request does not occur from POEG. Also when OPSCR.GODF is 1 and the signal value selected in the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0. Even if 1 is written by software, the EN bit remains at 0.

For the return, after clearing the Output Disable Request by software, set the EN bit to 1.

Priority order of the EN bit is as follows (when the conflict occurs).

When writing 1 by software and clearing to 0 by the Output Disable Request conflict for the EN bit, clearing to 0 by the Output Disable Request is enabled.

FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

P bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

N bit (Negative-Phase Output (N) Control)

The N bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

INV bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

RV bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the GTCLK or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit is 0, input phase is aligned to GTCLK.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When OPSCR.ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

GRP[1:0] bit (Output Disabled Source Selection)

The GRP[1:0] bit selects the output disable source.

The GRP bits should be set when GODF bit is 0. If GRP bits select a POEG except for the connected groups, the status of output pin never change to disable.

GODF bit (Group Output Disable Function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

When OPSCR.GODF bit is 0, this bit is ignored.

The GODF bit should be set when output disable request does not occur from POEG.

NFEN bit (External Input Noise Filter Enable)

The NFEN bit selects the noise filter for external input. When OPSCR.NFEN bit is 0, a noise filter for the external input is not used.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by switching this bit.

NFCS[1:0] bits (External Input Noise Filter Clock Selection)

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit is 1, noise filter sampling clock setting of the external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

21.2.47 GTCLKCR : General PWM Timer Clock Control Register

Base address: GPT_GTCLK = 0x4016_9B00

Offset address: 0x00

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|----|----|----|----|----|----|----|----|----|------|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | BPEN |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | BPEN | Synchronization Circuit Bypass Enable 0: In case of using Bus Clock and GPT Core Clock asynchronously 1: In case of using Bus Clock and GPT Core Clock synchronously | R/W |
| 31:1 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTCLKCR register is a register that controls the clock.

Set first of initial setting after resetting.

If MSTPCRE.MSTPE31 bit is 0, changing this register is prohibited.

BPEN bit (Synchronization Circuit Bypass Enable)

Enable or disable the synchronization bypass function between the bus clock (PCLKA) and GPT core clock (GTCLK).

Set 0 when using an asynchronous clock (GPTCLK) or 1 when using a synchronous clock (PCLKD) as the core clock.

21.3 Operation

21.3.1 Basic Operation

Each channel has a 32-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR or GTCCRM (m = A to F) controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 9). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

21.3.1.1 Counter operation

(1) Counter start and stop

The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register
- Completion of the period count function while the GTPC.ASTP bit is 1

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow) or the GTCCRm (m = A to F) value selected by the GTCSR.CSCMSC[2:0] bits to 0 in Saw-wave PWM mode 2, the GTST.TCFPO flag is set to 1, and the overflow interrupt(GPTn_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 21.5 shows an example of a periodic count operation in up-counting by the count clock.

Figure 21.5 Example of periodic count operation in up-counting by the count clock

Table 21.11 shows an example for setting periodic count operation in up-counting by the count clock.

Table 21.11 Example for setting a periodic count operation in up-counting by the count clock

| No. | Step Name | Description |
|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.5, 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.5, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCR _x (x = A to F) by GTCSR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.5, 0x00000000 is set. |
| 6 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 21.6 shows an example of periodic count operation in down-counting by the count clock.

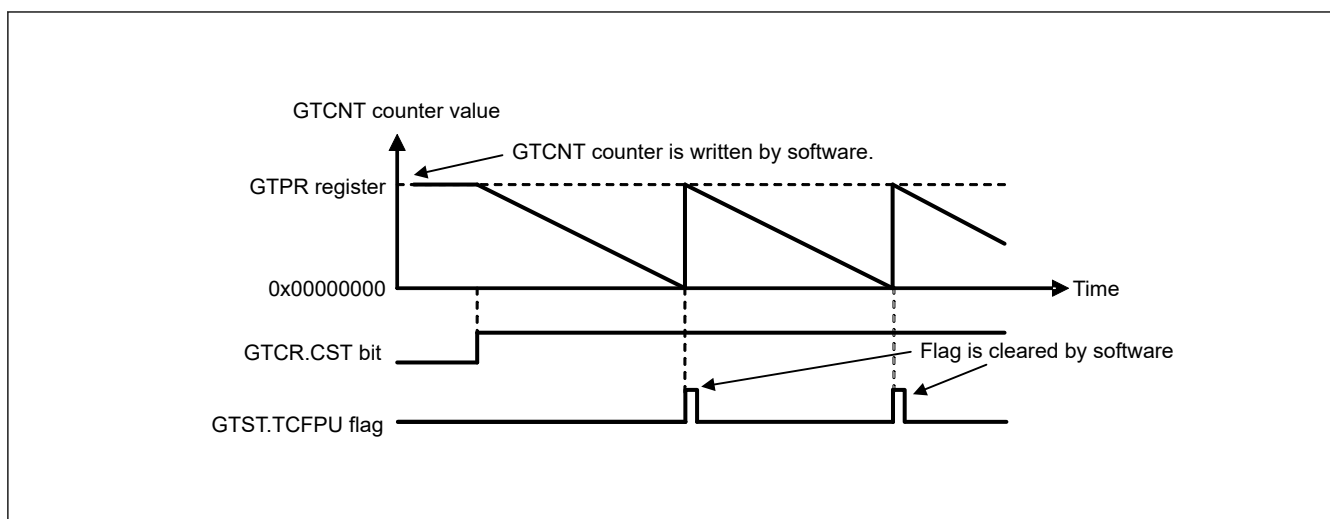

Figure 21.6 Example of periodic count operation in down-counting by the count clock

Table 21.12 shows an example for setting periodic count operation in down-counting by the count clock.

Table 21.12 Example for setting periodic count operation in down-counting by count clock

| No. | Step Name | Description |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.6, 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction with the GTUDDTYC register. In Figure 21.6, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.6, the GTPR register value is set. |
| 6 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. In Figure 21.6, 1 is set in the CST bit. |

(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 GTCLK delay after GTCR.CST is set to 1.

Figure 21.7 and Figure 21.8 show an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input and the rising edge of GTIOCnA pin input).

Figure 21.7 Example of event count operation in up-counting using hardware sources

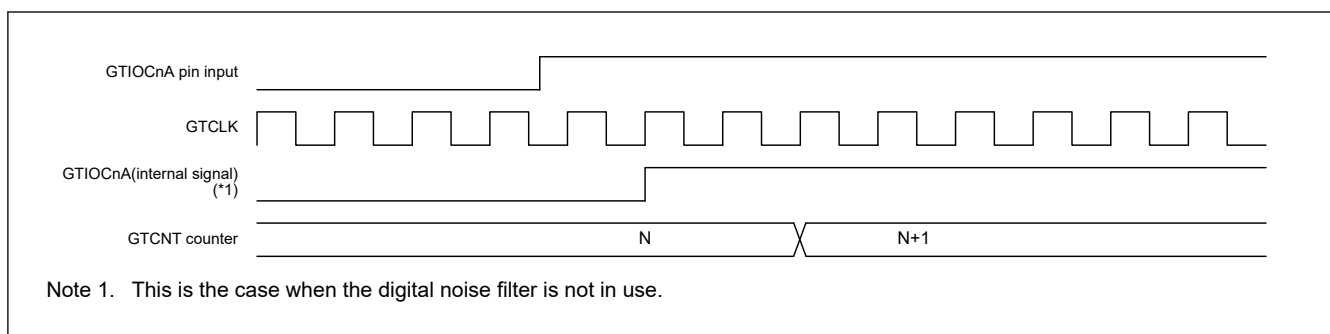

Figure 21.8 Example of Event Count Operation (Up-Counting of Rising Edges of the Input on the GTIOcNA Pin)

Figure 21.9 shows an example of event count operation by ELC_GPTA event input.

This is an example of event count operation of GPT321.GTCNT counter. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

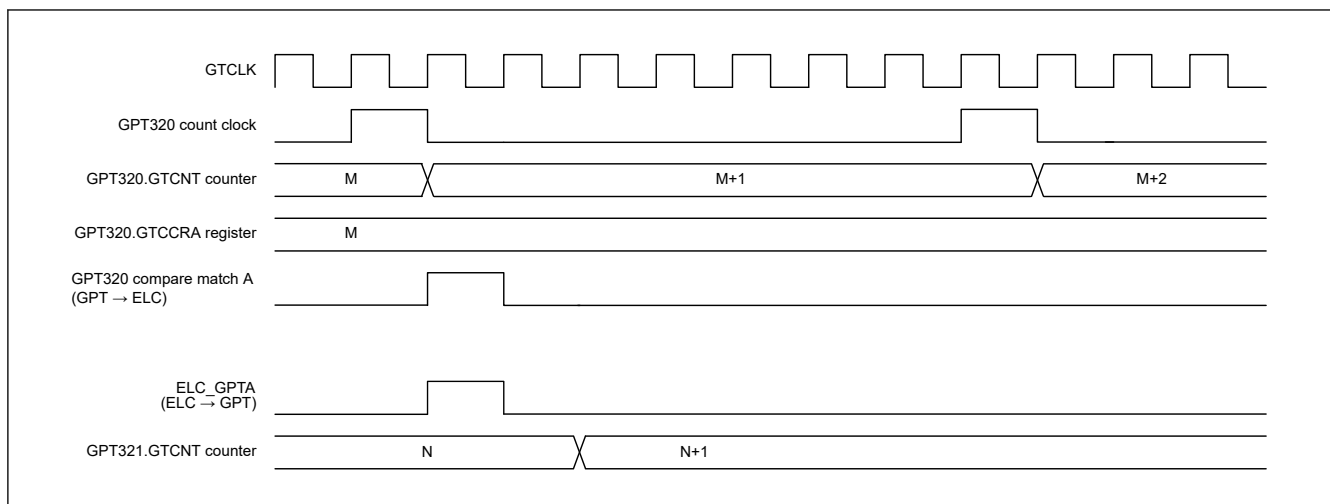

Figure 21.9 Example of Event Count Operation (Up-Counting the Number of Event Signals Input from ELC_GPTA)

Table 21.13 shows an example for setting event count operation in up-counting by a hardware source.

Table 21.13 Example for setting an event count operation in up-counting using hardware sources

| No. | Step Name | Description |
|-----|-------------------------------|------------------------------------------------------------------|
| 1 | Set count source | Select the counting-up hardware source with the GTUPSR register. |
| 2 | Set cycle | Set the cycle in the GTPR register. |
| 3 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 GTCLK delay after GTCR.CST is set to 1.

Figure 21.10 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).

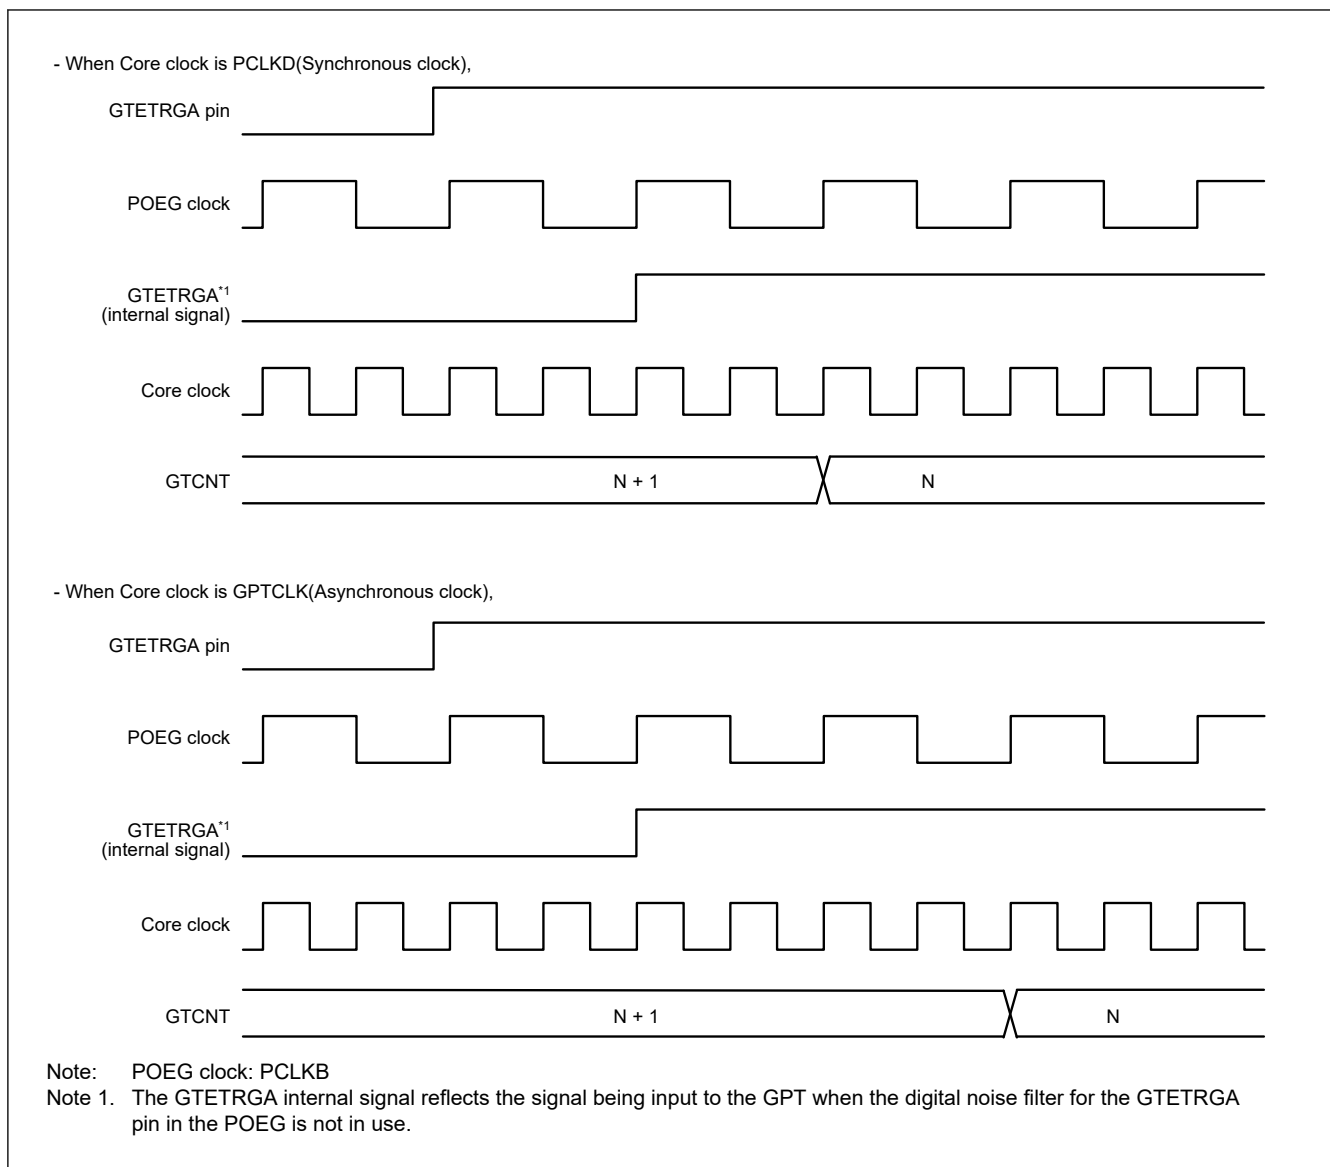

Figure 21.10 Example of event count operation in down-counting using hardware sources

Table 21.14 shows an example for setting a periodic count operation in down-counting using a hardware resource.

Table 21.14 Example for setting an event count operation in down-counting using hardware sources

| No. | Step Name | Description |
|-----|-------------------------------|--------------------------------------------------------------------|
| 1 | Set count source | Select the counting-down hardware source with the GTDNSR register. |
| 2 | Set cycle | Set the cycle in the GTPR register. |
| 3 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

(6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. Write access during counting (when CST = 1) is disabled. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode (Except saw-wave PWM mode 2) selected with GTCR.MD[2:0] bits or GTCR.MD[3:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode (except saw-wave PWM mode 2) and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with GTCLK. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

21.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCN_A or GTIOCN_B output pin (n = 0 to 9). In addition, the GTIOCN_A or GTIOCN_B pin output can be low, high, or toggled at the cycle end which is determined by GTPR or GTCCRM selected as a counter clear source by the GTCR.CSCMSC[2:0] bits in saw-wave PWM mode 2 (n = 0 to 9, m = A to F).

The cycle end is:

- For saw waves (except saw-wave PWM mode 2) in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves (except saw-wave PWM mode 2) in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw-wave PWM mode 2 and GTCCRM register (m = A to F) selected as a counter clear source by the GTCR.CSCMSC[2:0] bits – When the GTCNT counter value changes from the GTCCRM register value to 0x0000 0000
- For saw waves – when the GTCNT counter is cleared
- For triangle waves or complementary PWM mode – when the GTCNT changes from 0 to 1 (trough).

(1) Low output and high output

Figure 21.11 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCN_A pin by a GTCCRA compare match, and low is output from the GTIOCN_B pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.

**Figure 21.11 Example of low output and high output operation**

Table 21.15 shows an example for setting low output and high output operation.

Table 21.15 Example for setting low output and high output operation

| No. | Step Name | Description |
|-----|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.11, 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.11, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOcNm pin function | Set the GTIOcNm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.11, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b. |
| 7 | Enable GTIOcNm pin output ^{*1} | Set to enable the GTIOcNm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value ^{*1} | Set compare match values in the GTCCRA and GTCCRB registers. |
| 9 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

Note: n: 0 to 9
 m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOcNm pin output enable and setting for a compare match value.

(2) Toggled output

Figure 21.12 and Figure 21.13 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In Figure 21.12, the GTCNT counter performs up-counting, and settings are made so that the GTIOcNA pin output by a GTCCRA compare match and GTIOcNB pin output by a GTCCRB compare match are toggled.

In Figure 21.13, the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOcNA pin output level and a cycle end toggles the GTIOcNB pin output level.

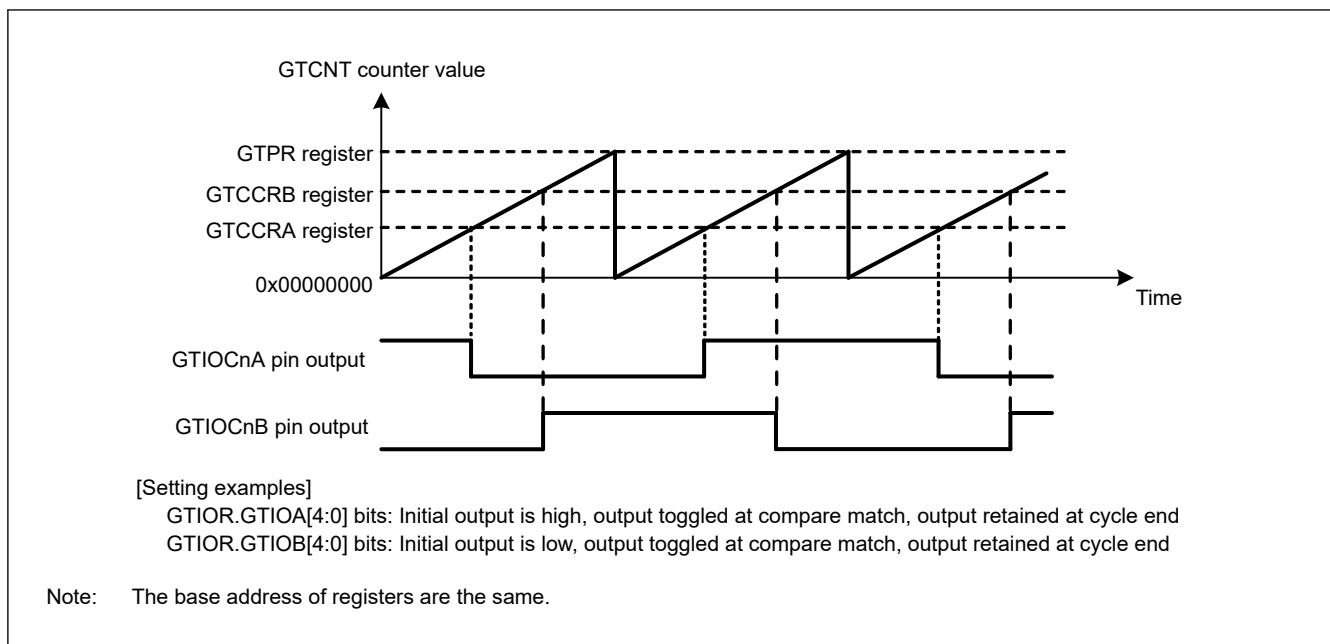

Figure 21.12 Example of toggled output operation (1)

Figure 21.13 Example of toggled output operation (2)

Table 21.16 shows an example for setting toggled output operation.

Table 21.16 Example for setting toggled output operation (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.12 and Figure 21.13, 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.12 and Figure 21.13, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |

Table 21.16 Example for setting toggled output operation (2 of 2)

| No. | Step Name | Description |
|-----|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.12 , GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b, and in Figure 21.13 , GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b. |
| 7 | Enable GTIOCnm pin output* ¹ | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value* ¹ | Set compare match values in the GTCCRA and GTCCRB registers. |
| 9 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

21.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR. In complementary PWM mode, GTCCRA and GTCCRB registers do not function as input capture registers.

[Figure 21.14](#) shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.

**Figure 21.14 Example of input capture operation**

[Table 21.17](#) and [Table 21.21](#) show the example for setting an input capture operation with count operation by the count clock.

Table 21.17 Example for setting input capture operation

| No. | Step Name | Description |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.14 , 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.14 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCR _x (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Select input capture source | Select the input capture source in the GTICASR and GTICBSR registers. In Figure 21.14 , GTICASR = 0x00000F00, GTICBSR = 0x00003000. When input capture by other channel sources is used, set the GTICmSR.mSOC bit (m = A or B) to 1 and allow input capture by other channel sources, and select the group that cooperates with other channel sources by the GTICCR register. |
| 7 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

[Figure 21.15](#) shows an example of the timing of input capture operation in response to a rising edge of the input on the GTETRGA pin.

Figure 21.15 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 21.16 shows an example of the timing of input capture operation in response to a rising edge of the input on the GTIOCnA pin.

Figure 21.16 Example of the Timing of Input Capture Operation in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 21.17 shows an example of the timing of input capture operation in response to ELC_GPTA event input.

This is an example of capture of the counter value by the GPT321.GTCCRA register in response to an input signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

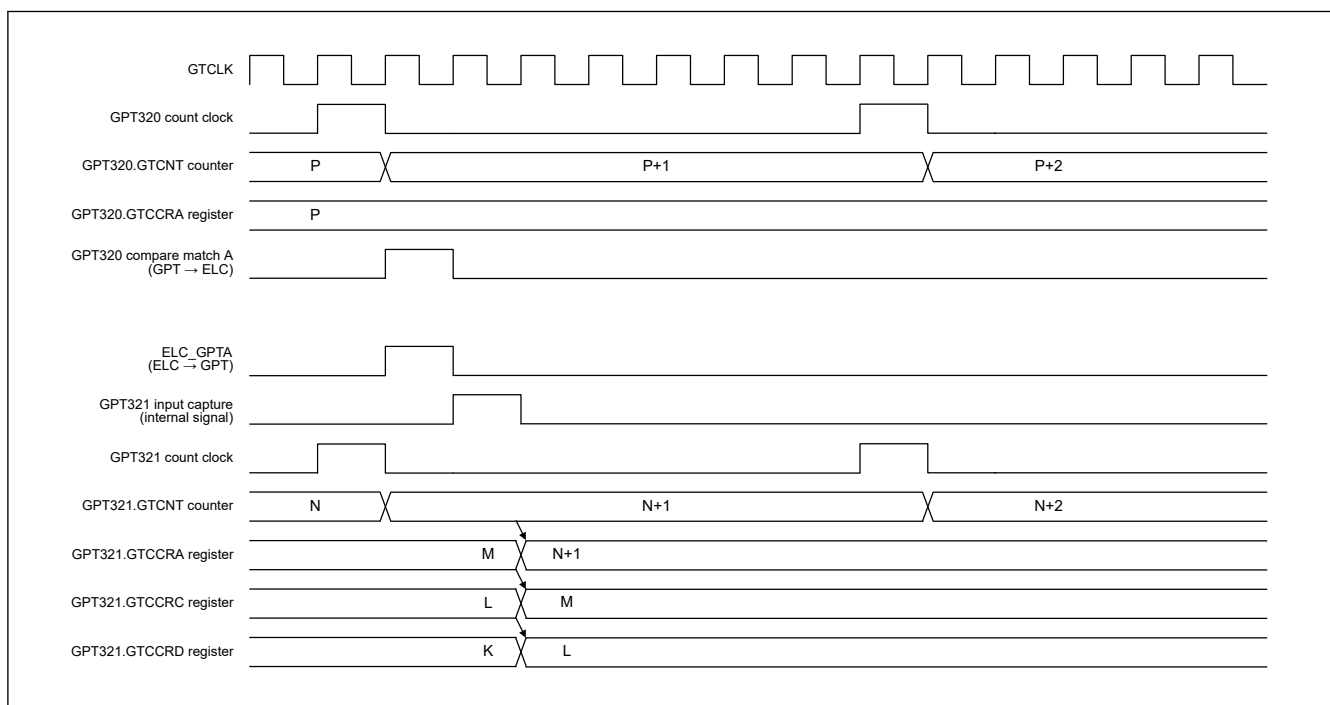

Figure 21.17 Example of the Timing of Input Capture Operation in Response to ELC_GPTA Event Input

Figure 21.18 shows an example of the timing of input capture operation in response to count clock from other channel.

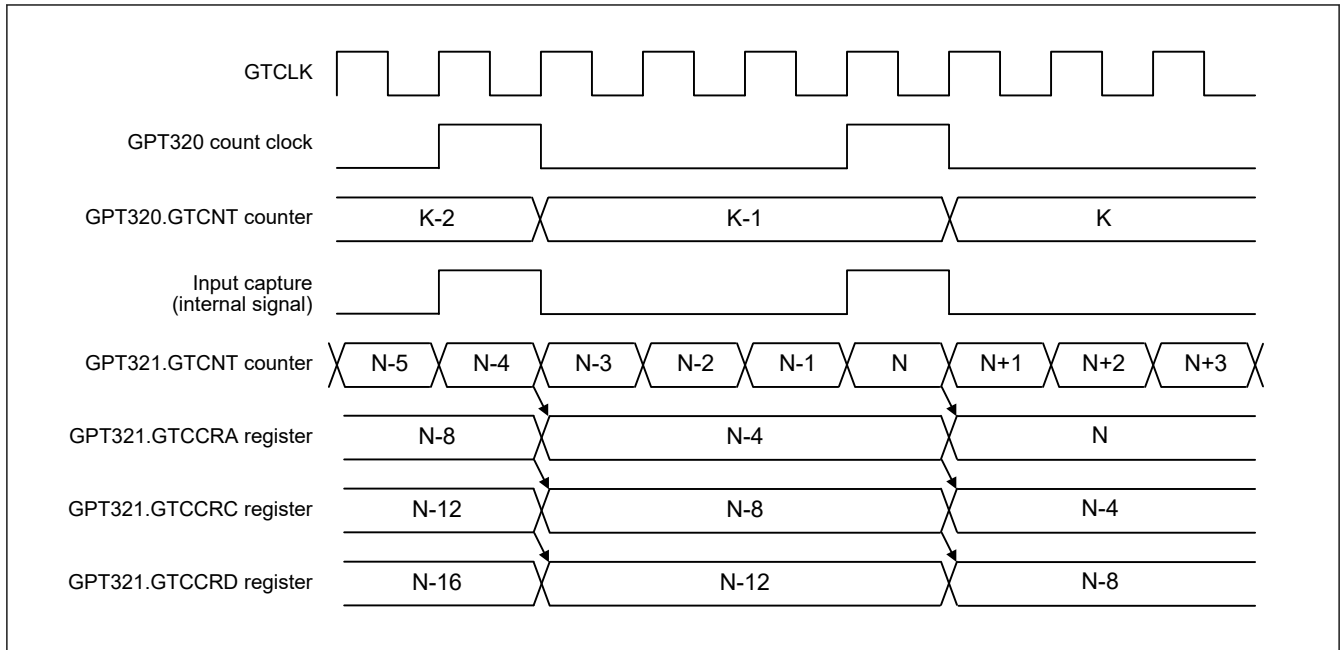

Figure 21.18 Example of the Timing of Input Capture Operation in Response to Count Clock from Other Channel

21.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR, GTPBR, and GTPDBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDDBRA
- GTADTRB, GTADTBRB, and GTADTDDBRB

The following buffer operation is enabled by setting GTDTCR:

- GTDVU and GTDBU
- GTDVD and GTDBD

The following buffer operation is enabled by setting GTBER2:

- GTCCRA, GTCCRE, and GTCCRF (in complementary PWM mode 3, 4)
- GTOLBR.GTIOAB[4:0] bits and GTIOR.GTIOA[4:0] bits
- GTOLBR.GTIOBB[4:0] bits and GTIOR.GTIOB[4:0] bits

21.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

GTPDBR register can function as a buffer register for the GTPBR register (double-buffer register for the GTPR register).

In complementary PWM mode, the buffer transfer from the GTPDBR register to temporary register P is performed only in the master channel (GPT32n). The temporary register P is transferred to each GTPBR register of master channel, slave channel 1 (GPT32n+1), and slave channel 2 (GPT32n+2). Transfer from the GTPBR register to the GTPR register is made concurrently in three channels. Therefore, the same value is stored in the same register of the three channels. The GTPR register of the master channel represents the GTCNT counter's (GTCNTn) period of the master channel. In the slave channels, periods are controlled using the GTPR register value and the GTDVU register value.

The setting is invalid in the Saw-wave PWM mode 2.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 9).

In the case of saw waves, the buffer transfer by clearing counter can be prohibited by GTBER2.CCTPR bit.

Table 21.18 shows the buffer transfer timing in the complementary PWM mode.

Table 21.18 GTPR buffer transfer timing in complementary PWM mode

| | Complementary PWM mode 1 | Complementary PWM mode 2 | Complementary PWM mode 3, 4 |
|-------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GTPDBR ↓ Temporary register P | (1) Counting in process After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2) (2) Counting stopped After one GTCLK cycle from GTPDBR register write | (1) Counting in process After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2) (2) Counting stopped After one GTCLK cycle from GTPDBR register write | (1) Counting in process After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2) (2) Counting stopped After one GTCLK cycle from GTPDBR register write |
| Temporary register P ↓ GTPBR | (1) When data is transferred to temporary register P during up-counting middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than up-counting middle section: At the end of trough section | (1) When data is transferred to temporary register P during down-counting middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than down-counting middle section: At the end of crest section | (1) When data is transferred to temporary register P during middle section: After one GTCLK cycle from data transfer to temporary register P (2) When data is transferred to temporary register P during a section other than middle section: At the end of crest/trough sections |
| GTPBR ↓ GTPR | At the end of crest section Counter clear in up-counting middle section and crest section (including counter clear by setting GTCSR.CP1CCE) | At the end of trough section Counter clear in down-counting middle section and trough section | At the end of crest section At the end of trough section Counter clear |

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

To set the GTPR register to function as double buffer, set the GTBER.PR[1:0] bits to 10b or 11b. For single buffer operation, set 01b. Not to function as buffer, set 00b.

In complementary PWM mode, complementary PWM mode-specific buffer operation is performed regardless of the GTBER.PR[1:0] bit setting.

Figure 21.19 to Figure 21.24 show examples of GTPR buffer operation and Table 21.19 shows an example for setting GTPR buffer operation. For details of operation settings in complementary PWM mode, see section 21.3.3.7. **Complementary PWM mode 1,2,3.**

Table 21.19 Example for setting GTPR register buffer operation

| No. | Step Name | Description |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.19 and Figure 21.20 , 000b or 0000b (saw-wave PWM mode 1) is set, and in Figure 21.21 , 100b or 0100b (triangle-wave PWM mode 1) is set. In Figure 21.22 to Figure 21.24 , 11xxb (complementary PWM mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.19 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.20 , after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set buffer operation | Set buffer operation with the GTBER.PR[1:0] bits. In Figure 21.19 and Figure 21.20 , PR[1:0] = 01b. In Figure 21.21 , PR[1:0] = 1xb. In Figure 21.22 to Figure 21.24 , no PR[1:0] bits setting required. |
| 7 | Set buffer value | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. For double buffer operation, also set a value of the period for the cycle after the next cycle in the GTPDBR register. |
| 8 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 9 | Set buffer value for each cycle | For buffer operation, set a value in one cycle after the current cycle in the GTPBR register. For double buffer operation, also set a value of the period for the cycle after the next cycle in the GTPDBR register. In complementary PWM mode 1 (crest transfer), when the GTPDBR register is set in the up-counting trough or middle section, a value of the period for the next cycle is set. In other sections, a value of the period for the cycle after the next cycle is set. In complementary PWM mode 2 (trough transfer), when the GTPDBR register is set in the up-counting section or the down-counting crest or middle sections, a value of the period for the next cycle is set. In other sections, a value of the period for the cycle after the next cycle is set. In complementary PWM mode 3 or 4 (crest/trough immediate transfer), when the GTPDBR register is set in a section other than the down-counting trough section, a value of the period for the next cycle is set. In the down-counting trough section, a value of the period for the cycle after the next cycle is set. |

21.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, complementary PWM mode, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, complementary PWM mode, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits. For details, see [section 21.3.3. PWM Output Operating Mode](#). Other than above PWM output operation mode, Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in [section 21.3.2.1. GTPR Register Buffer Operation](#).
In saw-wave, the buffer transfer of GTCCRM register by counter clearing is possible to be disabled with GTBER2.CCTCm bit (m = A, B).
In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Buffer transfer by compare match
In saw-wave, the buffer transfer by the compare match of GTCCRM register enabled by GTBER2.CMTCm (m = A, B) bit is performed.
- Forcible buffer transfer
When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

When the setting of the GTBER.DBRTCEm (m = A, B) bit is 1 in saw-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffers to the GTCCRM (m = A, B) registers is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or buffer transfer extended skipping function (function for repeated double-buffer operation while buffer transfer is disabled). For details, see [section 21.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer](#).

[Figure 21.25](#) to [Figure 21.28](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.20](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

Figure 21.25 Example of GTCCRA and GTCCRB buffer operation with output compare, Saw-wave PWM mode 1 in up-counting, high output at GTCCRA compare match, and low output at cycle end

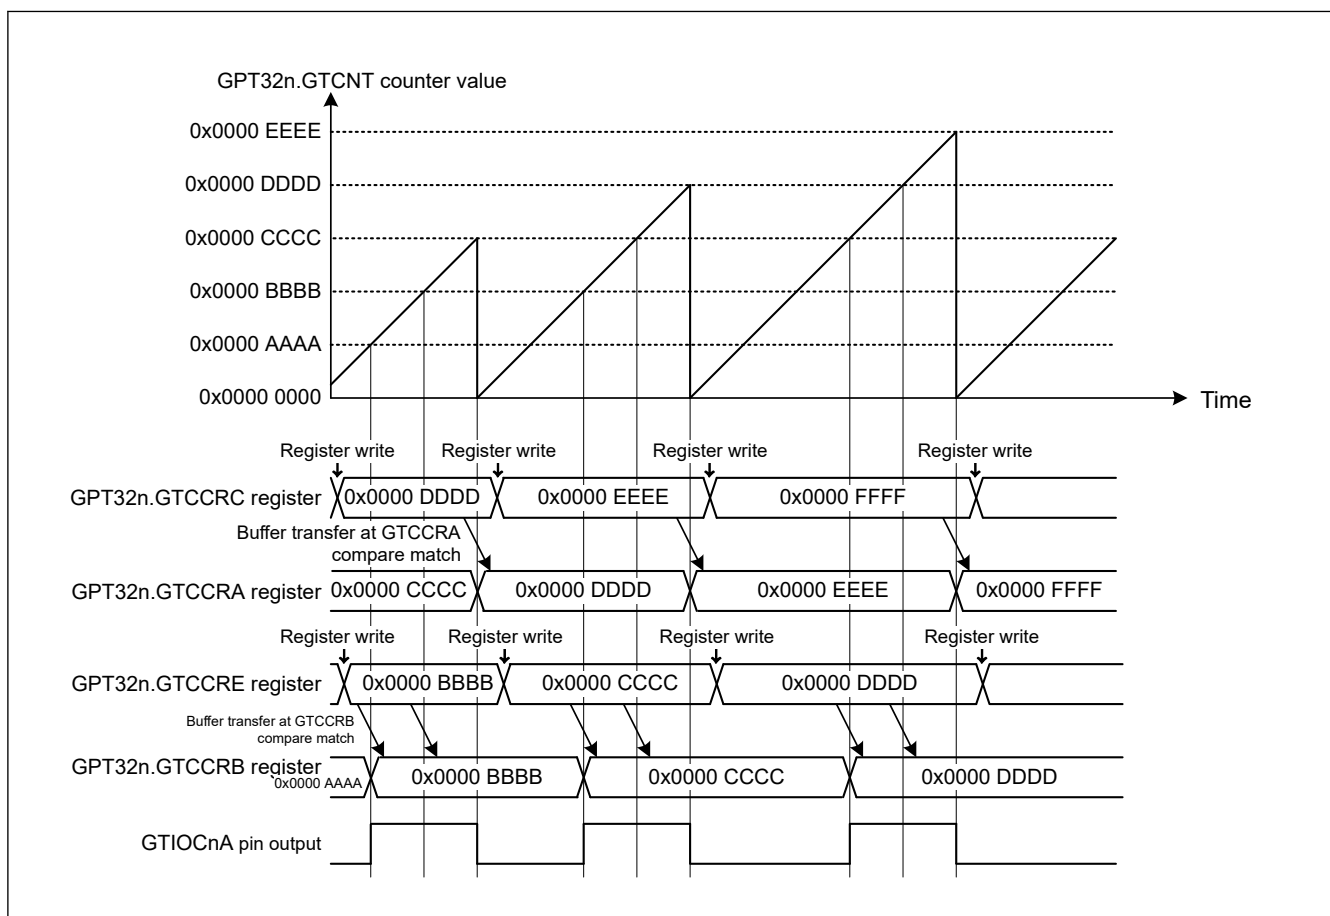

Figure 21.26 Example of GTCCRA and GTCCRB Registers Buffer Operation (Output Compare, Saw-Wave PWM Mode 2, Buffer Transfer at GTCCRA Register Compare Match, Counter Clearing, Low Output, Buffer Transfer at GTCCRB Register Compare Match, High Output) (n = 4 to 9)

Table 21.20 Example for setting GTCCRA and GTCCRB buffer operation for output compare

| No. | Step Name | Description |
|-----|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.25 , 000b or 0000b (saw-wave PWM mode 1) is set, in Figure 21.26 , 0010b (saw-wave PWM mode 2) is set, in Figure 21.27 , 100b or 0100b (triangle-wave PWM mode 1) is set, and in Figure 21.28 , 101b or 0101b (triangle-wave PWM mode 2) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.25 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.25 , GTIOA[4:0] = 00110b, in Figure 21.26 , GTIOA[4:0] = 00101b and GTIOB[1:0] = 10b, in Figure 21.27 , GTIOA[4:0] = 00011b, and in Figure 21.28 , GTIOB[4:0] = 00011b. |
| 7 | Enable GTIOCnm pin output ^{*1} | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTCR register. In Figure 21.25 , CCRA[1:0] = 01b, in Figure 21.26 , CCRA[1:0] = 01b and CCRB[1:0] = 01b, in Figure 21.27 , CCRA[1:0] = 1xb, and in Figure 21.28 , CCRB[1:0] = 1xb. |
| 9 | Set compare match value ^{*1} | Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register. |
| 10 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

[Figure 21.29](#) and [Figure 21.30](#) show examples of GTCCRA and GTCCRB buffer operation and [Table 21.21](#) shows an example for setting GTCCRA and GTCCRB buffer operation.

Figure 21.29 Example of GTCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input

Figure 21.30 Example of GTCRA and GTCCRB double buffer operation with input capture at both edges of GTIOCnB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnB input

Table 21.21 Example for setting GTCCRA and GTCCRB buffer operation for input capture

| No. | Step Name | Description |
|-----|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode and counter clear sources | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits and count clear source with the GTCR register. In Figure 21.29 , MD[2:0] = 000b or MD[3:0] = 0000b (saw-wave PWM mode 1) and GTCR = 0x00000F00, and in Figure 21.30 , MD[2:0] = 000b or MD[3:0] = 0000b (saw-wave PWM mode 1) and GTCR = 0x0000F000. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.29 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode2, set the cycle in the GTPR register. In the saw-wave PWM mode2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Select input capture source | Select input capture source in the GTICASR register and GTICBSR register. In Figure 21.29 , GTICASR = 0x00000F00, and in Figure 21.30 , GTICBSR = 0x0000F000. To perform input capture with sources of other channels, select a group that performs inter-channel cooperation by the GTICCR.ICmGRP bit (m = A or B). For the output-side channel of the input capture sources, set the GTICCR register to enables the input capture sources to output to other channels. For input-side channels, set the GTIOmSR.mSOC bit (m = A or B) to 1 to enable input capture with sources of other channels. |
| 7 | Set buffer operation | Set buffer operation with the CCRA and CCRB bits in the GTBER register. In Figure 21.29 , CCRA[1:0] = 01b, and in Figure 21.30 , CCRB[1:0] = 1xb. |
| 8 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |

21.3.2.3 Buffer Operation for GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in saw-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode or complementary PWM mode.

In saw-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in [section 21.3.2.1. GTPR Register Buffer Operation](#), is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

In complementary PWM mode, the buffer transfer is performed after one GTCLK cycle from GTCCRD register write of slave channel 2.

In saw-wave mode, the buffer transfer of GTADTRm register by counter clearing can be disabled by GTBER2.CCTADm (m = A, B) bit setting.

In saw-wave mode, the buffer transfer of GTADTRm register by its own compare match can be enabled by the GTBER2.CMTADm (m = A, B) bit setting.

[Figure 21.31](#) to [Figure 21.35](#) show examples of buffer operation of the GTADTRA and GTADTRB registers, and [Table 21.22](#) shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

Table 21.22 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. (In Figure 21.31 and Figure 21.32 , 000b or 0000b (saw-wave PWM mode 1) is set, in Figure 21.33 and Figure 21.34 , 100b, 101b, 110b, 0100b, 0101b, or 0110b (triangle-wave PWM mode) is set.) |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. (In Figure 21.31 and Figure 21.32 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).) |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode 2, set the cycle in the GTPR register. In the saw-wave PWM mode 2, select the counter clear source compare match register GTCCRx (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set buffer operation | Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in GTBER register. To perform buffer transfer at a compare match of the ADTRAm (m = A, B) register, set the GTBER2.CMTADm bit to 1. (In Figure 21.31 , ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0, in Figure 21.32 , CMTADA bit = 1, in Figure 21.33 , ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 21.34 , ADTTB[1:0] bits = 11b and ADTDB bit = 1.) |
| 7 | Set compare match value | Set the A/D conversion start request point in the GTADTRA and GTADTRB registers. |
| 8 | Set buffer value | For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTRBR registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTRBR registers. |

Table 21.22 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (2 of 2)

| No. | Step Name | Description |
|-----|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9 | Enable A/D conversion start request | Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. (In Figure 21.31 and Figure 21.32 , ADTRAUEN bit = 1, in Figure 21.33 , ADTRADEN bit = 1, and in Figure 21.34 , ADTRBUEN bit = 1 and ADTRBDEN bit = 1.) |
| 10 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 11 | Set buffer value of each cycle | For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. |

21.3.2.4 Buffer operation for GTIOA and GTIOB

The GTOLBR.GTIOAB[4:0] bits can function as the buffer register of the GTIOR.GTIOA[4:0] bits and the GTOLBR.GTIOBB[4:0] bits can function as the buffer register of the GTIOR.GTIOB[4:0] bits.

Buffer transfer timing can be set with the GTBER2.OLTTm[1:0] bits (m = A, B). It can be selected from the end of cycle or GTCCR register compare match (in saw-wave mode), from crest, trough, or both crest and trough (in triangle-wave mode and complementary PWM mode). In the case that the GTBER2.OLTTm[1:0] bits are 00b, buffer transfer is not performed.

In complementary PWM mode, it is prohibited to set the buffer transfer timing to overlap with the dead time. Therefore, when the buffer transfer timing is crest, set the GTCCRM (m = A, C, E) register to satisfy $GTCCRM < GTPR$. And when the buffer transfer timing is trough, set the GTCCRM register to satisfy $GTDVU < GTCCRM$.

[Figure 21.36](#) to [Figure 21.38](#) show examples of buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits. [Table 21.23](#) shows an example for setting buffer operation of the GTIOR.GTIOA[4:0] and GTIOR.GTIOB[4:0] bits.

Figure 21.36 Example of Buffer Operation of the GTIOA and GTIOB Bits (Up-Counting in Saw-Wave PWM Mode 1, Buffer Transfer at the End of Cycle)

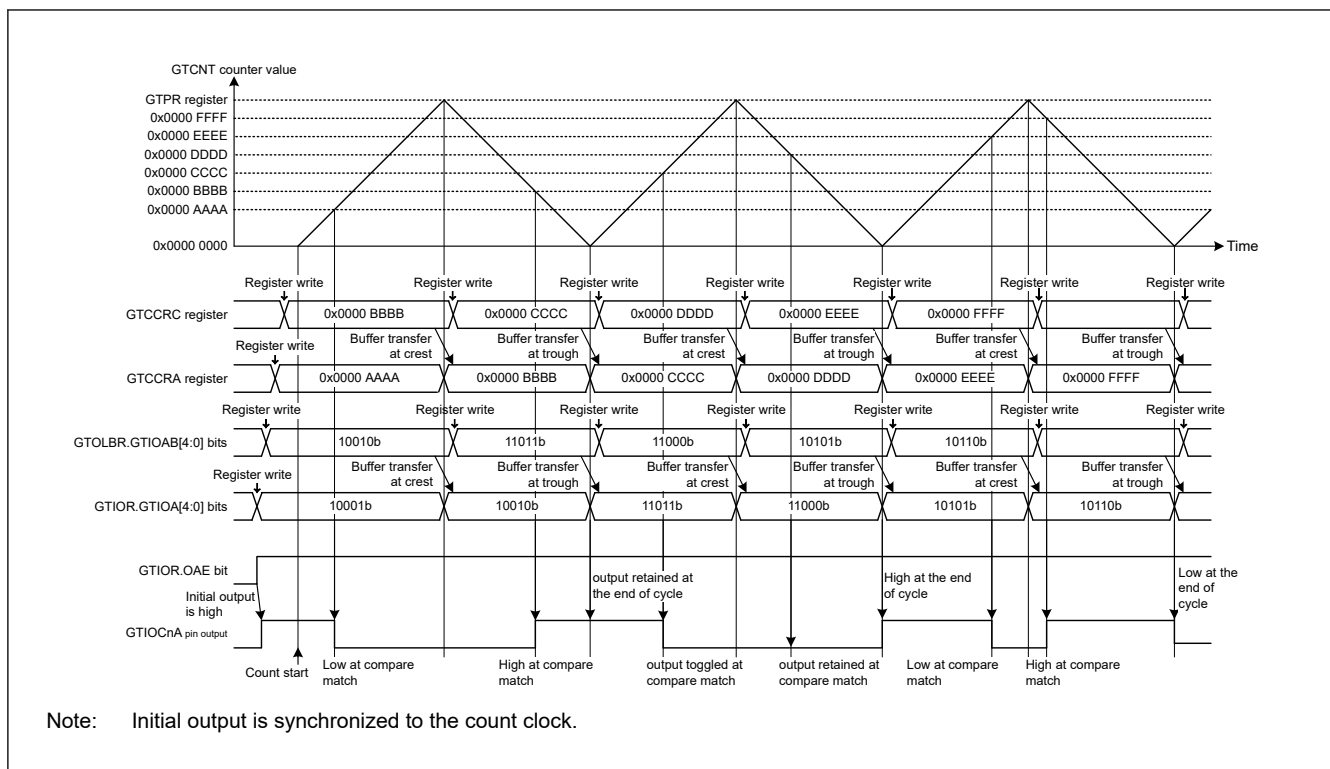

Figure 21.37 Example of Buffer Operation of the GTIOA and GTIOB Bits (Triangle-Wave PWM Mode 2, Buffer Transfer at Crests and Troughs)

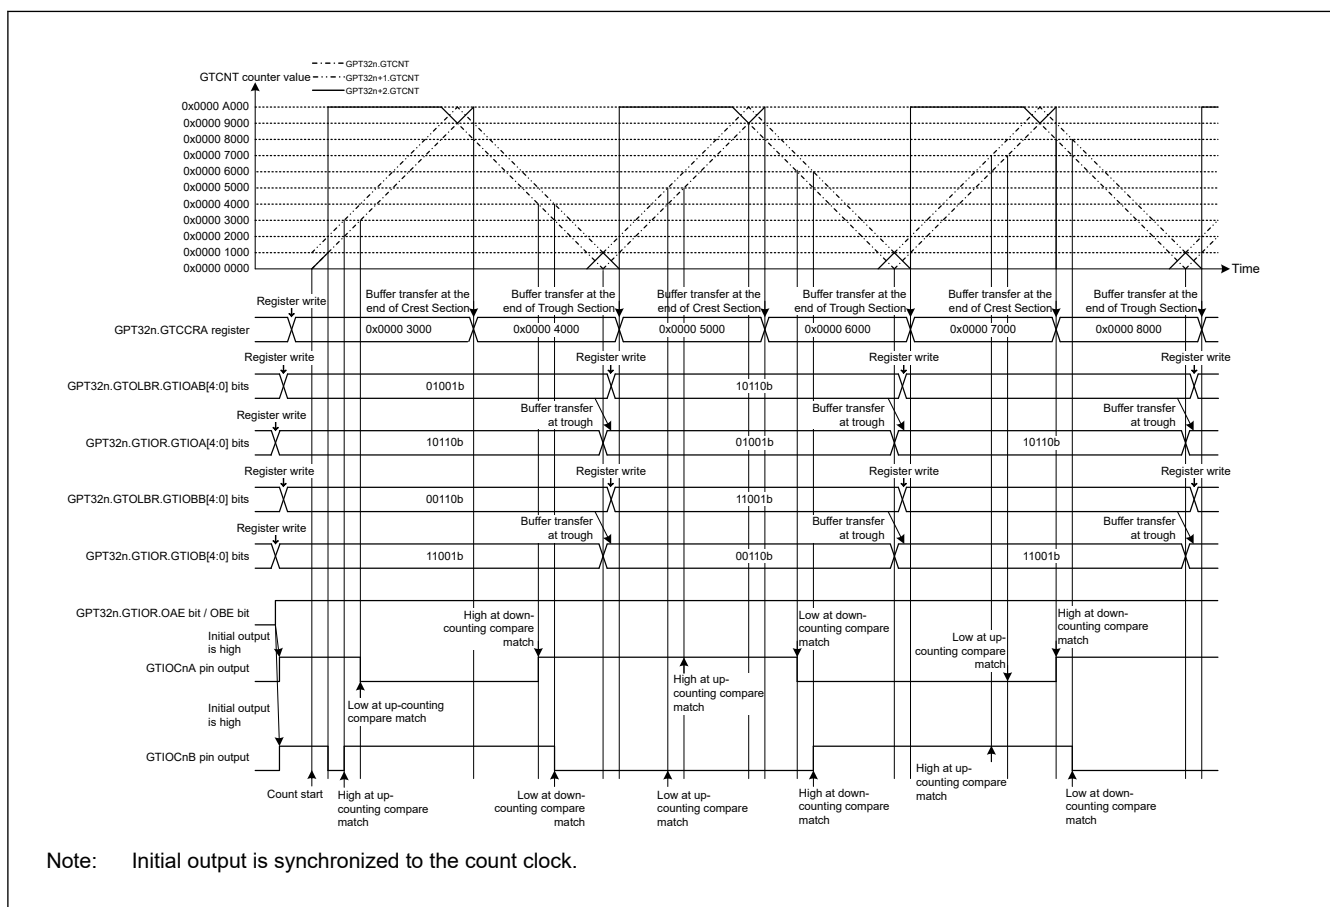

Figure 21.38 Example of Buffer Operation of the GTIOA and GTIOB Bits (Complementary PWM Mode 3, Buffer Transfer at Troughs)

Table 21.23 Example for Setting Buffer Operation of the GTIOA and GTIOB

| No. | Step Name | Description |
|-----|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[3:0]. (In Figure 21.36 , 0000b (saw-wave PWM mode 1) is set, in Figure 21.37 , 0101b (triangle-wave PWM mode 2) is set, in Figure 21.38 , 1110b (complementary PWM mode 3) is set.) |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. (In Figure 21.36 , after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).) |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Other than the saw-wave PWM mode 2, Set the cycle in GTPR. In the saw-wave PWM mode 2, Select the counter clear source compare match register GTCCR _x (x = A to F) by GTCR.CSCMSC[2:0] bits and set the cycle in that register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIO _{Cnm} pin function | Set the GTIO _{Cnm} pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In Figure 21.36 , GTIOA[4:0] = 11001b, in Figure 21.37 , GTIOA[4:0] = 10001b, in Figure 21.38 , GTIOA[4:0] = 10110b and GTIOB[4:0] = 11001b.) |
| 7 | Enable GTIO _{Cnm} pin output | Set to enable the GTIO _{Cnm} pin output with OAE and OBE in GTIOR. |
| 8 | Set buffer operation | Set buffer operation with OLTT _m [1:0] bits in GTBER2 register. (In Figure 21.36 , 01b is set in OLTTA[1:0], in Figure 21.37 , 11b is set in OLTTA[1:0], in Figure 21.38 , 10b is set in OLTTA[1:0] and 10b is set in OLTTB[1:0].) |
| 9 | Set buffer value | For buffer operation, set the GTIO _{Cnm} pin function in one cycle after the current cycle (in saw-wave mode and in triangle-wave/complementary PWM mode with buffer transfer at crest or trough) or half cycle after the current cycle (in triangle-wave/complementary PWM mode with buffer transfer at crest and trough) in the GTOLBR register. |
| 10 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 11 | Set buffer value of each cycle | For buffer operation, set the GTIO _{Cnm} pin function in one cycle after the current cycle (in saw-wave mode and in triangle-wave/complementary PWM mode with buffer transfer at crest or trough) or half cycle after the current cycle (in triangle-wave/complementary PWM mode with buffer transfer at crest and trough) in the GTOLBR register. |

Note: n = 4 to 9
m = A, B

21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIO_{CnA} or GTIO_{CnB} pin (n = 0 to 9) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

By setting GTDTCR, GTDVU, and GTDVD, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

In complementary PWM mode, it is possible to output PWM waveforms (positive phase, negative phase) with dead time that guarantees the linearity of the PWM output pulse width near 0% and 100% duty.

In saw-wave mode other than saw-wave PWM mode 2, or triangle-wave mode, or the master channel of complementary PWM mode, the signal synchronized with the PWM cycle can be output from the GTCPPOn output terminal by setting the GTIOR.PSYE bit to 1. The GTCPPOn output is toggled at the end of cycle in saw-wave mode or at the timing of crest / trough / GTCNT counter clearing in triangle-wave mode or complementary PWM mode. The initial output of GTCPPOn is low, and it becomes high when the count starts.

21.3.3.1 Saw-Wave PWM Mode 1

In saw-wave PWM mode 1, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIO_{CnA} or GTIO_{CnB} pin (n = 0 to 9) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

When 0 is set in the GTIOR.OxEECD (x = A, B) bit and the timing of the end of cycle and the timing of GTCCR_x register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIO_x[3:2] bit.

When 1 is set in the GTIOR.OxEECD bit, GTIO_{Cnx} output is retained.

Figure 21.39 shows an example of saw-wave PWM mode 1 operation, and Table 21.24 shows an example for setting saw-wave PWM mode 1.

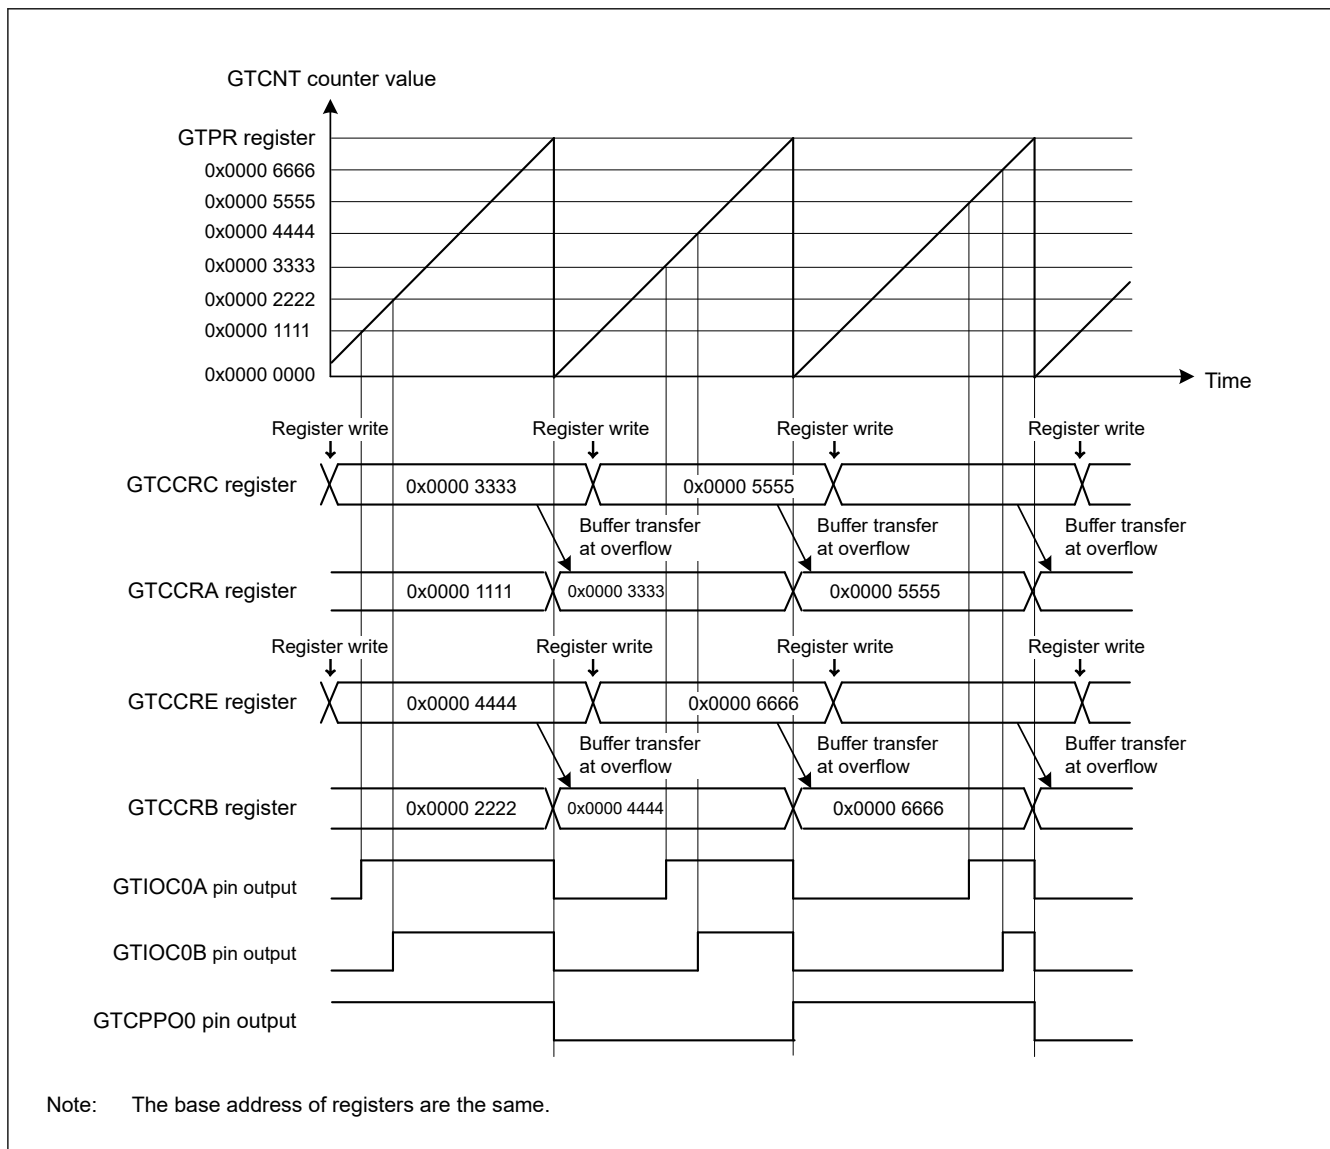

Figure 21.39 Example of saw-wave PWM mode 1 operation with up-counting, buffer operation, high output at GTCCR/GTCCRB compare match, low output at cycle end, and GTIOR.PSYE = 1

Table 21.24 Example for setting saw-wave PWM mode 1 (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.39, 000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.39, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.39, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b. |
| 7 | Enable GTCPPOn pin output | Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register. |

Table 21.24 Example for setting saw-wave PWM mode 1 (2 of 2)

| No. | Step Name | Description |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8 | Enable GTIOCNm pin output*1 | Set to enable the GTIOCNm pin output with the OAE and OBE bits in the GTIOR register. |
| 9 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.39 , CCRA[1:0] = 01b and CCRB[1:0] = 01b. |
| 10 | Set compare match value*1 | Set the GTIOCNm pin transition in the GTCCRA register and the GTIOCNB pin transition in the GTCCRB register. |
| 11 | Set buffer value | For buffer operation, set the GTIOCNm and GTIOCNB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCNm and GTIOCNB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |
| 12 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 13 | Set buffer value for each cycle | For buffer operation, set the GTIOCNm and GTIOCNB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCNm and GTIOCNB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCNm pin output enable and setting for a compare match value.

21.3.3.2 Saw-Wave PWM Mode 2

The saw-wave PWM mode 2 is a mode in which the GTCNT counter is operated as a saw wave by up-counting without using the GTPR register, and the PWM waveform is output by the compare match of the GTCCRA and GTCCRB registers. The pin output level can be selected from low output, high output, or toggle output separately for a compare match according to the GTIOR register setting.

The GTIOCNm pin is used as an output pin. Use the GTIOR.GTIOB[1:0] bits for setting the GTIOCNm pin output at a compare match of the GTCCRB register.

When a counter clear occurs due to the GTCNT counter clearing source selected in the GTCSR register, this is handled at the end of cycle and PWM output operation at the end of the cycle selected with the GTIOR.GTIOA[3:2] bits is performed. If a counter clear (at the end of cycle) conflicts with a PWM output change due to a GTCCRx (x = A, B) register compare match, PWM output operation is performed at the end of cycle (in the case of the GTIOR.OxEOCD bit = 0) or the PWM output is retained (in the case of GTIOR.OxEOCD bit = 1).

[Figure 21.40](#) to [Figure 21.42](#) shows an example of saw-wave PWM mode 2 operation. [Table 21.25](#) shows an example for setting saw-wave PWM mode 2.

Figure 21.40 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Single Buffer Operation, No Clear Setting) (n = 4 to 9)

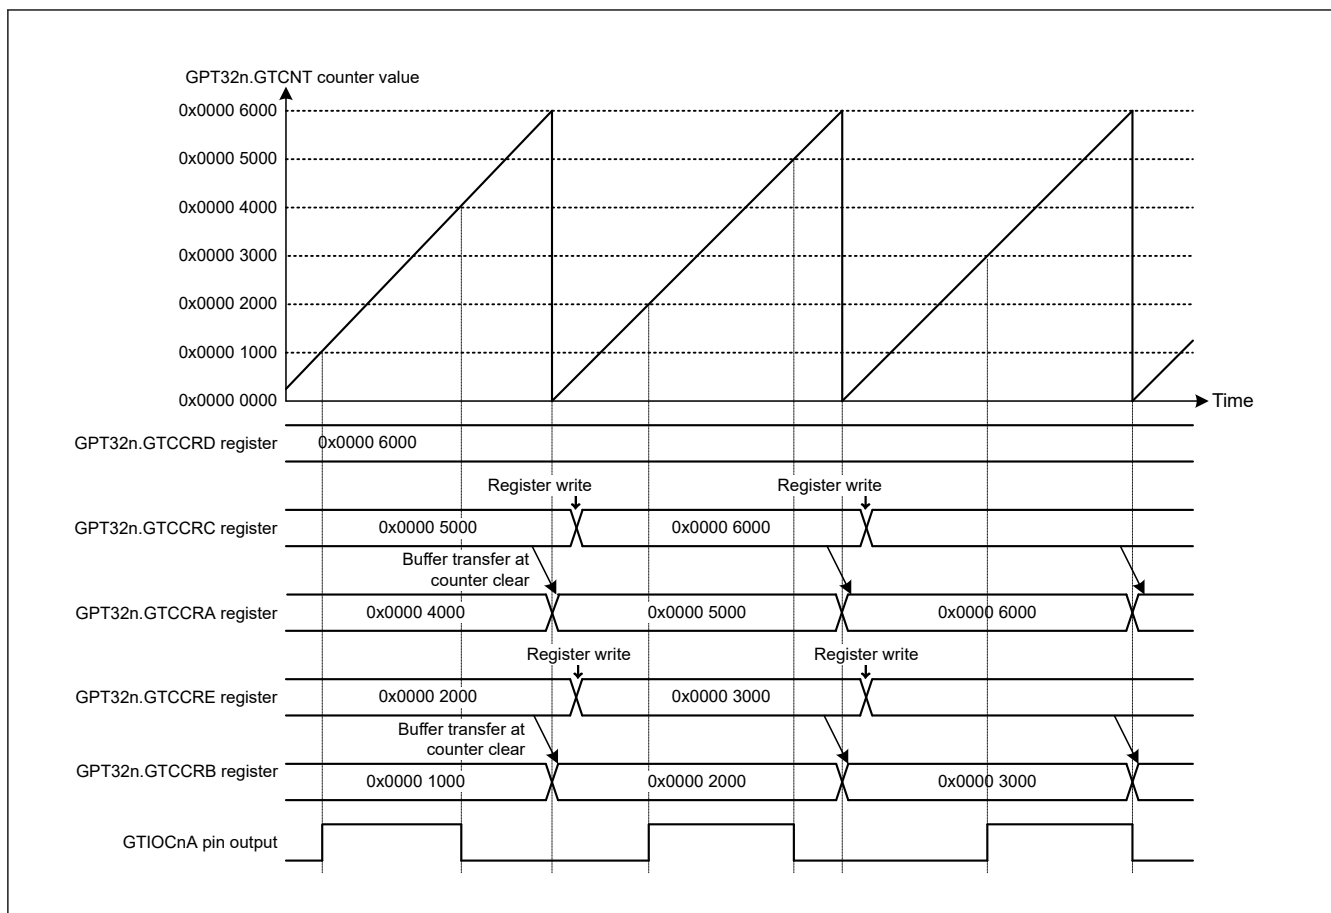

Figure 21.41 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at GTCCRD Register Compare Match, GTIOR.OAEOCD Bit = 0) (n = 4 to 9)

Figure 21.42 Example of Saw-Wave PWM Mode 2 Operation (Low Output at GTCCRA Register Compare Match, High Output at GTCCRB Register Compare Match, Low Output at the End of Cycle, Single Buffer Operation, Cleared at GTCCRD Register Compare Match, GTIOR.OAEOD Bit =1) (n = 4 to 9)

Table 21.25 Example for Setting Saw-wave PWM mode 2

| No. | Step Name | Description |
|-----|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[3:0]. (In Figure 21.40 to Figure 21.42, 0010b (saw-wave PWM mode 2) is set.) |
| 2 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits. |
| 3 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 4 | Set GTIOcNA pin function | Set the GTIOcNA pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. (In Figure 21.40 to Figure 21.42, GTIOA[4:0] = 00001b and GTIOB[1:0] = 10b.) |
| 5 | Enable GTIOcNA pin output*1 | Set to enable the GTIOcNA pin output with OAE in GTIOR. |
| 6 | Set buffer operation | Set buffer operation with CCRA[1:0] and CCRB[1:0] bits in GTBER (In Figure 21.40 to Figure 21.42, CCRA[1:0] = 01b and CCRB[1:0] = 01b.) |
| 7 | Set compare match value*1 | Set the GTIOcNA pin changing point in GTCCRA and GTCCRB. |
| 8 | Set buffer value | For buffer operation, set the GTCCRA register value and the GTCCRB register value which used in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTCCRA register value and the GTCCRB register value which used in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |
| 9 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 10 | Set buffer value of each cycle | For buffer operation, set the GTCCRA register value and the GTCCRB register value which used in one cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTCCRA register value and the GTCCRB register value which used in two cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 4 to 9

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnA pin output enable and setting for a compare match value.

21.3.3.3 Saw-Wave One-Shot Pulse Mode

The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 9) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

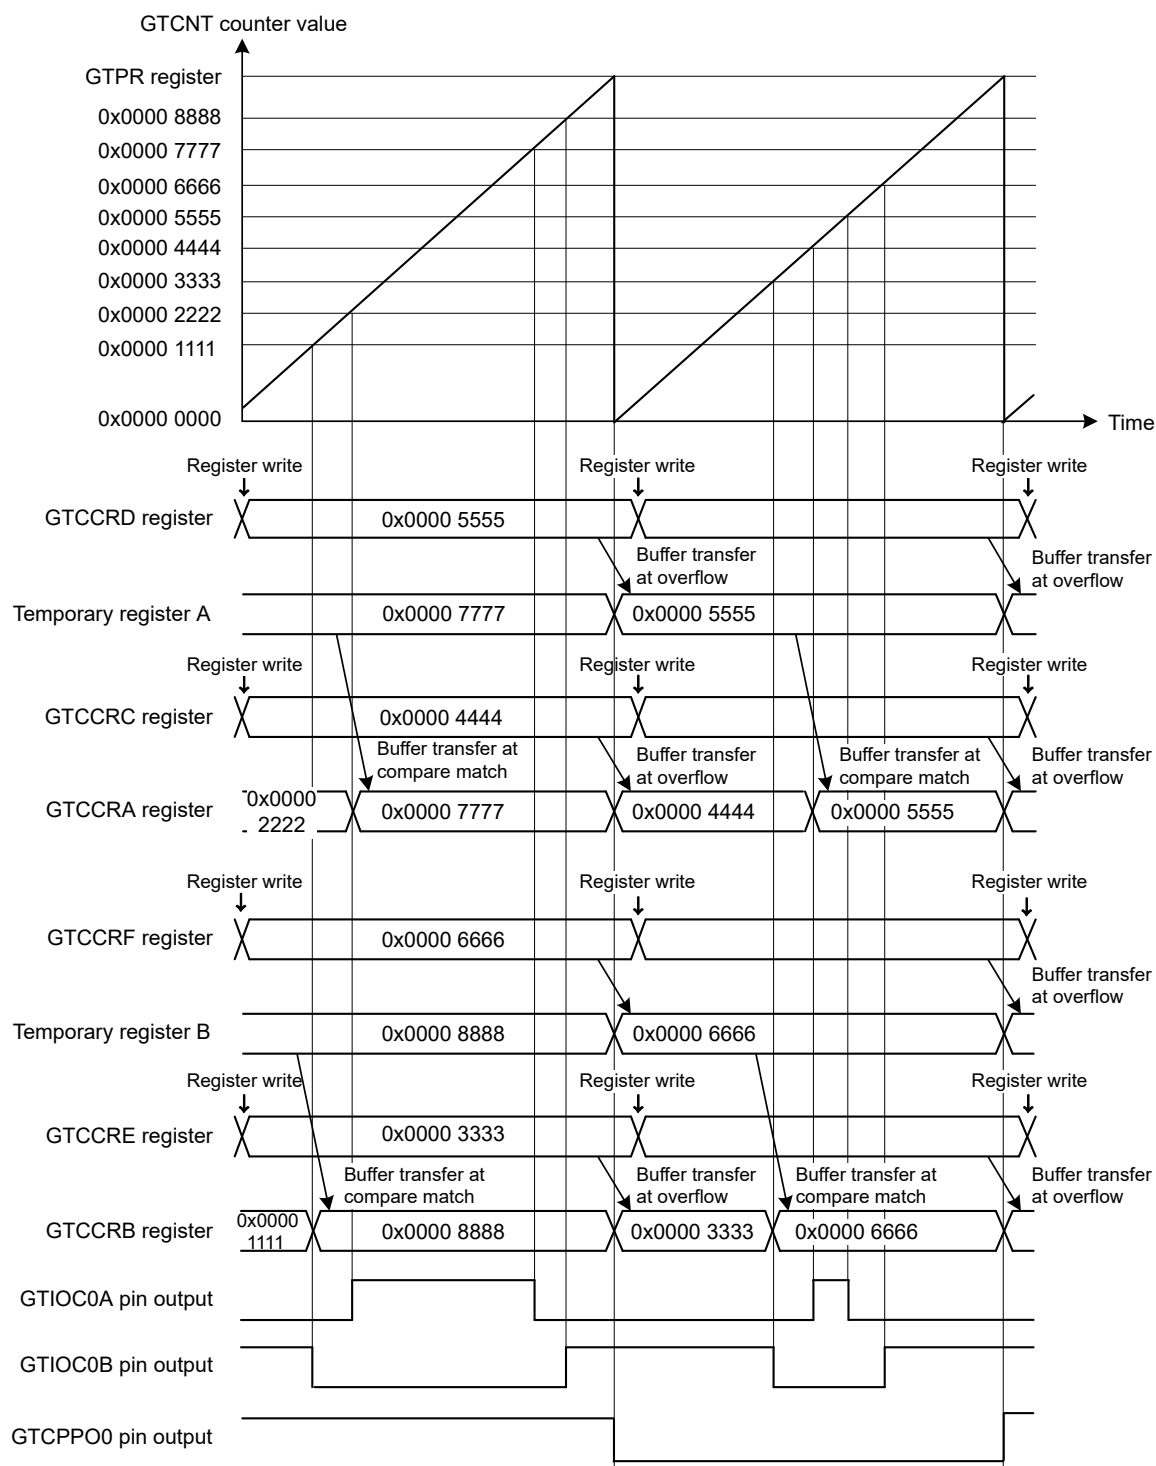

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

When the GTBER.DBRTCEm (m = A, B) bit is set to 1, transfer from an intermediate buffer to the GTCCRm register is repeated on a cyclic basis with using the temporary register x (x = C, E) and temporary register m which operate as intermediate buffers for the GTCCR_x and GTCCR_m registers, respectively, even while buffer transfer is disabled (repeated double buffer operation function during disabling of buffer transfer). For details, see [section 21.8.2.2. Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer](#).

[Figure 21.43](#) shows an example of saw-wave one-shot pulse mode operation, and [Table 21.26](#) shows an example for setting saw-wave one-shot pulse mode.

Note: The base address of registers are the same.

Figure 21.43 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 21.26 Example setting for saw-wave one-shot pulse mode

| No. | Step Name | Description |
|-----|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.43 , 001b (saw-wave one-shot pulse mode) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.43 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOCn pin function | Set the GTIOCn pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.43 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 7 | Enable GTCPPOn pin output | Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register. |
| 8 | Enable GTIOCn pin output* ¹ | Set to enable the GTIOCn pin output with the OAE and OBE bits in the GTIOR register. |
| 9 | Set compare match value* ¹ | Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 10 | Set forcible buffer transfer* ¹ | Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly. |
| 11 | Set buffer value | For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |
| 12 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 13 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of Enable GTIOCn pin output and Set compare match value + Set forcible buffer transfer.

21.3.3.4 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 9) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

[Figure 21.44](#) shows an example of a triangle-wave PWM mode 1 operation, and [Table 21.27](#) shows an example for setting a triangle-wave PWM mode 1.

Figure 21.44 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 21.27 Example setting for triangle-wave PWM mode 1 (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.44 , 100b (triangle-wave PWM mode 1) is set. |
| 2 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOCnm pin function | Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.44 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTCPPOn pin output | Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register. |
| 7 | Enable GTIOCnm pin output*1 | Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.44 , CCRA[1:0] = 01b and CCRB[1:0] = 01b. |
| 9 | Set compare match value*1 | Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively. |

Table 21.27 Example setting for triangle-wave PWM mode 1 (2 of 2)

| No. | Step Name | Description |
|-----|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 10 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

21.3.3.5 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin ($n = 0$ to 9) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.45 shows an example of triangle-wave PWM mode 2 operation, and Table 21.28 shows an example for setting triangle-wave PWM mode 2.

Figure 21.45 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOA pin and high output from the GTIOB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 21.28 Example for setting triangle-wave PWM mode 2 (1 of 2)

| No. | Step Name | Description |
|-----|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.45 , 101b (triangle-wave PWM mode 2) is set. |
| 2 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOA pin function | Set the GTIOA pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.45 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTCPP0 pin output | Set to enable/disable the GTCPP0 pin output with the PSYE bit in the GTIOR register. |
| 7 | Enable GTIOA pin output ^{*1} | Set to enable the GTIOA pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set buffer operation | Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.45 , CCRA[1:0] = 01b and CCRB[1:0] = 01b. |

Table 21.28 Example for setting triangle-wave PWM mode 2 (2 of 2)

| No. | Step Name | Description |
|-----|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 9 | Set compare match value ^{*1} | Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively. |
| 10 | Set buffer value | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each half cycle | For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

21.3.3.6 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 9) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, and GTDVD, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.46 shows an example of triangle-wave PWM mode 3 operation, and Table 21.29 shows an example for setting triangle-wave PWM mode 3.

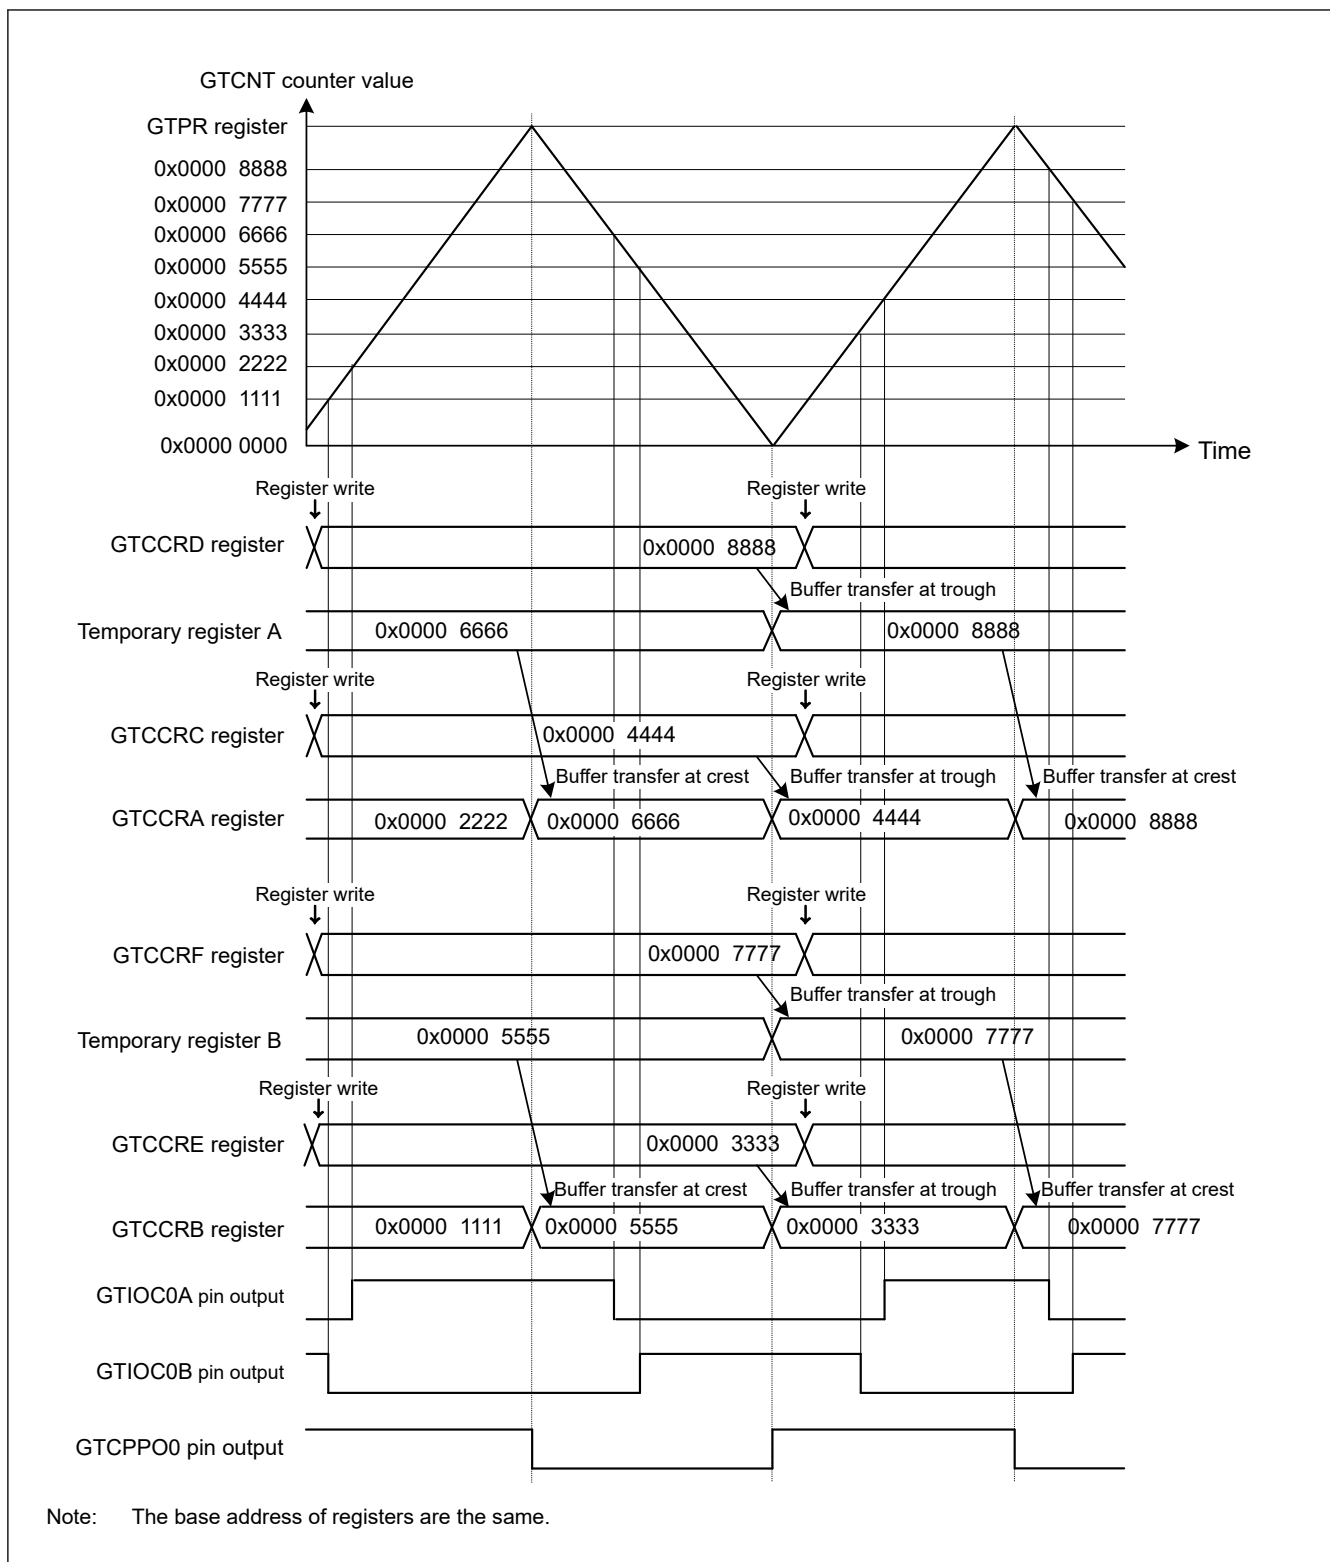

Figure 21.46 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, output retained at cycle end, and GTIOR.PSYE = 1

Table 21.29 Example setting for triangle-wave PWM mode 3 (1 of 2)

| No. | Step Name | Description |
|-----|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.46 , 110b (triangle-wave PWM mode 3) is set. |

Table 21.29 Example setting for triangle-wave PWM mode 3 (2 of 2)

| No. | Step Name | Description |
|-----|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOCNm pin function | Set the GTIOCNm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.46 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTCPPOn pin output | Set to enable/disable the GTCPPOn pin output with the PSYE bit in the GTIOR register. |
| 7 | Enable GTIOCNm pin output* ¹ | Set to enable the GTIOCNm pin output with the OAE and OBE bits in the GTIOR register. |
| 8 | Set compare match value* ¹ | Set the GTIOCNm pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCNB pin transition in the GTCCRE and GTCCRF registers. |
| 9 | Set forcible buffer transfer* ¹ | Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly. |
| 10 | Set buffer value | Set the GTIOCNm pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCNB pin transition in the GTCCRE and GTCCRF registers. |
| 11 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 12 | Set buffer value for each cycle | Set the GTIOCNm pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCNB pin transition in the GTCCRE and GTCCRF registers. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of Enable GTIOCNm pin output and Set compare match value + Set forcible buffer transfer.

21.3.3.7 Complementary PWM mode 1,2,3

In complementary PWM mode, a three-phase PWM waveform with dead time that ensures the linearity in the vicinity of duty 0% and 100% can be output using the GTCNT counter of consecutive three channels. There are four modes depending on differences in buffer operation: (1) complementary PWM mode 1 (transfer at crests), (2) complementary PWM mode 2 (transfer at troughs), (3) complementary PWM mode 3 (transfer at crests and troughs), and (4) complementary PWM mode 4 (immediate transfer).

[Figure 21.47](#) shows the block diagram in complementary PWM modes 1 to 3.

Among consecutive three channels, the lowest channel is referred to as master channel, and the adjacent upper two channels are referred to as slave channel 1 (lower) and slave channel 2 (upper).

The GTCNT counter of each channel performs individual count operation under the cycle operation by the master channel. In each channel, compare match with the GTCCRA register is performed selecting one of the three GTCNT counters in each operation section, and a positive-phase waveform and a negative-phase waveform are output from the GTIOCN+iA pin ($i = 0, 1, 2$) and the GTIOCN+iB pin respectively with a non-overlapping section of the dead time value set in the GTDVU register of the master channel.

The GTCCRA register performs buffer operation by the GTCCRC register, temporary register A, and GTCCRD register. In complementary PMW mode 3, setting the GTBER2.CP3DB bit to 1 also enables buffer operation of the GTCCRA register by the GTCCRE register, temporary register B, and GTCCRF register, allowing double buffer operation.

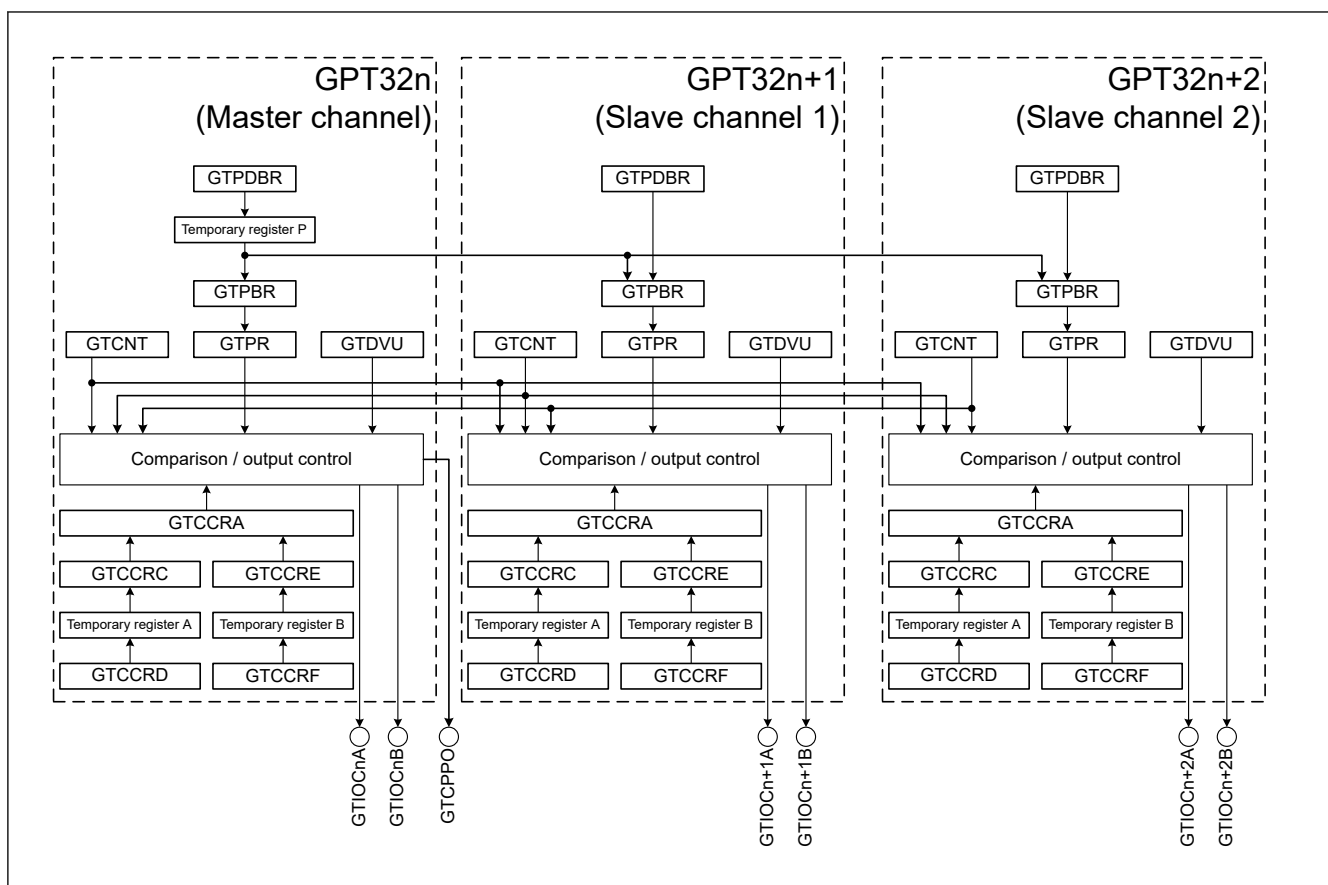

Figure 21.47 Block Diagram in Complementary PWM Mode 1, 2, 3 (n = 4, 7)

The GPT32n.GTCNT counter performs count operation for triangle waves using the GPT32n.GTPR register as a cycle register. A section where the GPT32n.GTCNT counter value is not larger than the dead time value is referred to as trough section.

The GPT32n+1.GTCNT counter performs count operation with the value (GPT32n.GTCNT counter value + dead time value set in the GPT32n.GTDVU register). A section where the GPT32n+1.GTCNT counter value is larger than the GPT32n.GTPR register value is referred to as crest section.

Crest section and trough section are classified into up-counting crest section, down-counting crest section, up-counting trough section, and down-counting trough section according to counting direction. A section between trough section and crest section is referred to as up-counting middle section or down-counting middle section according to counting direction. A section equivalent to the up-counting trough section after starting count operation is referred to as initial output section where operation differs partially from other up-counting trough sections.

The GPT32n+2.GTCNT counter functions as a counter to ensure the linearity in the vicinity of duty 0% and 100%. In a crest section, this counter performs count operation for a triangle wave (up-counting after down-counting) with the value (GPT32n.GTPR register value + dead time value) as an initial value and the GPT32n.GTPR register value as a trough. This counter is cleared to 0 at the end of the crest section, and then stops counting until the next trough section. In a trough section, this counter performs count operation for a triangle wave with an initial value of 0 and dead time value as a crest. This counter becomes the value (GPT32n.GTPR register value + dead time value) at the end of the trough section, and then stops counting until the next crest section. In the initial output section, however, this counter counts up with an initial value of 0 until the dead time value, and then becomes the value (GPT32n.GTPR register value + dead time value).

If the counter stops and then restarts in complementary PWM mode, the counter of each channel returns to the initial value after starting count operation, and then starts counting from the initial output section.

Table 21.30 and Table 21.31 shows count operation (counting direction/counting range) in each section. In these tables, registers with no channel identification indicate that the same value is stored in them of the master channel, slave channel 1, and slave channel 2.

Table 21.30 Count Operation in Complementary PWM Mode

| Counter | Initial Value | Initial Output Section (After Start) | Up-Counting Middle Section | Up-Counting Crest Section | Down-Counting Crest Section |
|----------------|---------------|--------------------------------------|-----------------------------------|------------------------------------|------------------------------------|
| GPT32n.GTCNT | 0 | Up-counting 0 to GTDVU | Up-counting GTDVU+1 to GTPR-GTDVU | Up-counting GTPR-GTDVU+1 to GTPR | Down-counting GTPR-1 to GTPR-GTDVU |
| GPT32n+1.GTCNT | GTDVU | Up-counting GTDVU to GTDVU×2 | Up-counting GTDVU×2+1 to GTPR | Up-counting GTPR+1 to GTPR+GTDVU | Down-counting GTPR+GTDVU-1 to GTPR |
| GPT32n+2.GTCNT | 0 | Up-counting 0 to GTDVU | Stop GTPR+GTDVU | Down-counting GTPR+GTDVU-1 to GTPR | Up-counting GTPR+1 to GTPR+GTDVU |

Table 21.31 Count Operation in Complementary PWM Mode

| Counter | Down-Counting Middle Section | Down-Counting Trough Section | Up-Counting Trough Section |
|----------------|-------------------------------------|----------------------------------|--------------------------------|
| GPT32n.GTCNT | Down-counting GTPR-GTDVU-1 to GTDVU | Down-counting GTDVU-1 to 0 | Up-counting 1 to GTDVU |
| GPT32n+1.GTCNT | Down-counting GTPR-1 to GTDVU×2 | Down-counting GTDVU×2-1 to GTDVU | Up-counting GTDVU+1 to GTDVU×2 |
| GPT32n+2.GTCNT | Stop 0 | Up-counting 1 to GTDVU | Down-counting GTDVU-1 to 0 |

In complementary PWM mode, the GTCCRA register performs unusual buffer operation.

Data transfers from the GTCCRD register to the temporary register A and from the GTCCRF register to the temporary register B are performed at the same time in three channels by writing a value to the GTCCRD register of the GPT32n+2 channel.

Data transfers from the temporary register A and temporary register B to the GTCCRC and GTCCRE registers vary depending on the transfer timing to the temporary register A and temporary register B. Data transfers from the GTCCRC and GTCCRE registers to the GTCCRA register are performed according to each complementary PWM mode name (crest transfer, trough transfer, and crest/trough transfer).

Buffer operation of the GTPR register in complementary PWM mode is described in [section 21.3.2.1. GTPR Register Buffer Operation](#). Do not perform buffer operation for the GTDVU register in complementary PWM mode.

[Table 21.32](#) shows buffer transfer timing during single buffer operation in complementary PWM modes 1 to 3. [Table 21.33](#) shows buffer transfer timing during double buffer operation in complementary PWM mode 3.

Table 21.32 Single Buffer Transfer Timing in Complementary PWM Mode 1, 2, 3

| Buffer Transfer | Complementary PWM Mode 1 | Complementary PWM Mode 2 | Complementary PWM Mode 3 (Single Buffer) |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Buffer Transfer | Transfer Timing | Buffer Transfer | Transfer Timing |
| GTCCRD ↓ Temporary register A | After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2) | GTCCRF ↓ Temporary register B | After one GTCLK cycle from GTCCRD register write of slave channel 2 (GPT32n+2) |
| Temporary register A ↓ GTCCRC | (1) When data is transferred to temporary register A in middle section After one GTCLK cycle from transfer to temporary register A (2) When data is transferred to temporary register A in a section other than middle section At the end of crest and trough sections | Temporary register B ↓ GTCCRE | (1) When data is transferred to temporary register B in middle section After one GTCLK cycle from transfer to temporary register B (2) When data is transferred to temporary register B in a section other than middle section At the end of crest and trough sections |
| GTCCRC ↓ GTCCRA | At the end of crest section Counter clear | GTCCRE ↓ GTCCRA | At the end of trough section (excluding initial output section) |

An output level change in the positive-phase waveform from the GTIOCN+iA pin ($i = 0, 1, 2$) and the negative-phase waveform from the GTIOCN+iB pin occurs at a compare match in combination of counters and registers determined for each operation section. In middle sections, the positive-phase waveform output level changes at a compare match of the GPT32n.GTCNT counter and the GTCCRA register, and the negative-phase waveform output level changes at a compare match between the GPT32n+1.GTCNT counter and the GTCCRA register. In crest and trough sections, compare match operation is performed using the GPT32n+2.GTCNT counter, GTCCRC register, and GTCCRE register to ensure the linearity in the vicinity of duty 0% and 100%.

In the case that the compare match value equals to or larger than the GPT32n.GTPR register value, the duty becomes 0% (positive-phase waveform OFF, negative-phase waveform ON). In the case that the compare match value is 0, the duty becomes 100% (positive-phase waveform ON, negative-phase waveform OFF).

Table 21.34 lists combinations of counters and registers used for compare match operation to generate a positive-phase waveform and a negative-phase waveform in each operation section.

Table 21.34 Combinations of Counters and Registers for Compare Match Operation in Complementary PWM Mode

| | Up-Counting Middle Section | Up-Counting Crest Section | Down-Counting Crest Section | Down-Counting Middle Section | Down-Counting Trough Section | Up-Counting Trough Section |
|--------------------|------------------------------|------------------------------|-----------------------------|---------------------------------------------|---------------------------------------------|---------------------------------------------|
| Negative-phase OFF | GPT32n+1.GTCNT | GPT32n+1.GTCNT | — | GPT32n+2.GTCNT ^{*1} | GPT32n+2.GTCNT | GPT32n+1.GTCNT |
| | GTCCRA | GTCCRA | — | GTCCRC (GTCCRE for double buffer operation) | GTCCRC (GTCCRE for double buffer operation) | GTCCRC (GTCCRE for double buffer operation) |
| Positive-phase ON | GPT32n.GTCNT | GPT32n.GTCNT | GPT32n+2.GTCNT | — | GPT32n.GTCNT ^{*1} | GPT32n.GTCNT |
| | GTCCRA | GTCCRA | GTCCRA | — | GTCCRC (GTCCRE for double buffer operation) | GTCCRC (GTCCRE for double buffer operation) |
| Positive-phase OFF | GPT32n+2.GTCNT ^{*1} | GPT32n+2.GTCNT | GPT32n.GTCNT | GPT32n.GTCNT | GPT32n.GTCNT | — |
| | GTCCRC | GTCCRC | GTCCRC | GTCCRA | GTCCRA | — |
| Negative-phase ON | — | GPT32n+1.GTCNT ^{*1} | GPT32n+1.GTCNT | GPT32n+1.GTCNT | GPT32n+1.GTCNT | GPT32n+2.GTCNT |
| | — | GTCCRC | GTCCRC | GTCCRA | GTCCRA | GTCCRA |

Note 1. Compare match is performed only at the time of final count in the target section, but is not performed at count values other than the final count.

In the case of normal complementary PWM mode waveform, a PWM waveform change occurs in the order of negative-phase OFF → positive-phase ON → positive-phase OFF → negative-phase ON. However, this order may vary depending on operation section and register values. In this case, OFF takes precedence in trough sections and ON takes precedence in crest sections (for negative-phase waveforms), and ON takes precedence in trough sections and OFF takes precedence in crest sections (for positive-phase waveforms). A lower-priority compare match that occurs at the same time or after a higher-priority compare match is ignored.

In the initial output section, the initial output set in the GTIOR register is retained. In the case that the GTCCRA register value is larger than the GTDVU register value, negative phase is enabled. In the case that the GTCCRA register value is not larger than the GTDVU register value, positive phase is enabled.

As operation examples of normal complementary PWM mode waveform where compare match operation occurs in the middle section, Figure 21.48 and Figure 21.49 show complementary PWM mode 1, Figure 21.50 and Figure 21.51 show complementary PWM mode 2, Figure 21.52 and Figure 21.53 show single buffer complementary PWM mode 3, and Figure 21.54 and Figure 21.55 show double buffer complementary PWM mode 3.

Figure 21.56 to Figure 21.67 show complementary PWM mode waveforms where compare match operation occurs in crest sections and trough sections and differences due to compare match occurrence order.

Figure 21.68 and Figure 21.69 show examples of initial output operation according to the GTCCRA register value.

Table 21.35 shows an example for setting complementary PWM modes 1 to 3.

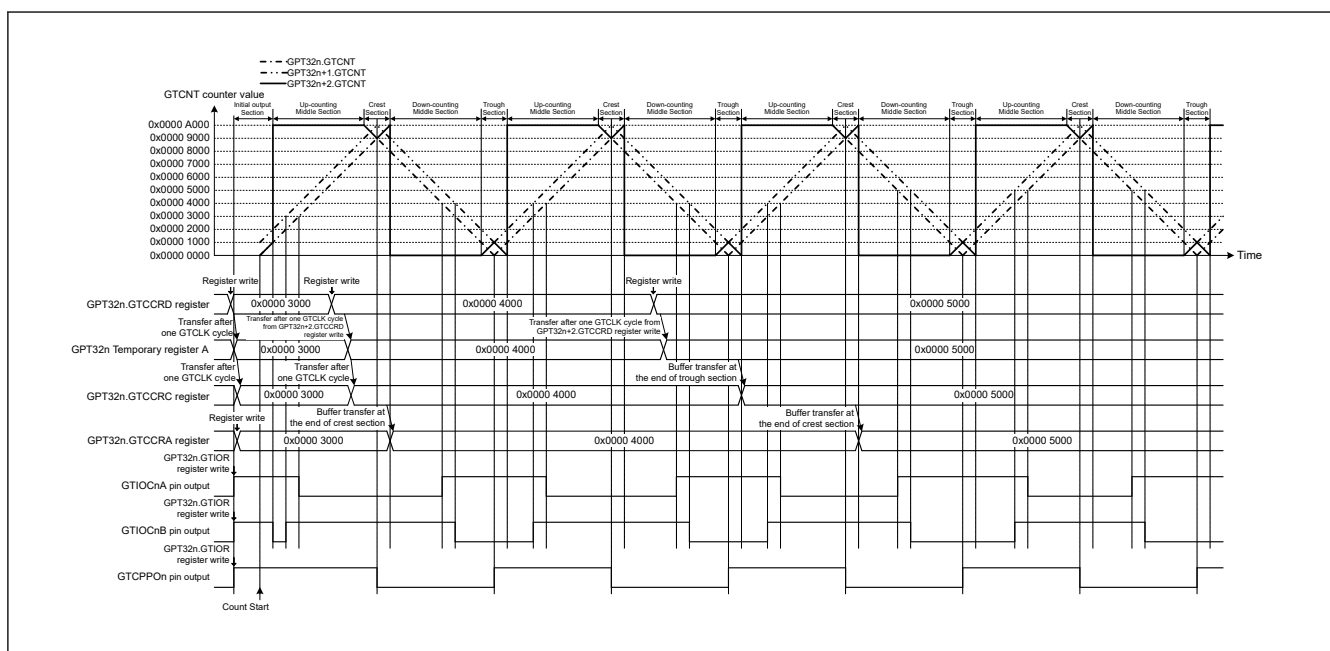

Figure 21.48 Example of Complementary PWM Mode 1 Operation (GTIOCnA pin = High / GTIOCnB pin = High as initial output, GTIOCnA pin = Low / GTIOCnB pin = High at GTCCRA register compare match during up-counting, GTIOCnA pin = High / GTIOCnB pin = Low at GTCCRA register compare match during down-counting, the dead time value is 0x0000 1000 and updating GTCCRD register in middle section) (n = 4, 7)

Table 21.35 Example for Setting Complementary PWM Mode 1,2,3 (1 of 2)

| No. | Step Name | Description |
|-----|--------------------|--------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[3:0] bits of GTP32n channel. |
| 2 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits of GPT32n channel. |
| 3 | Set cycle | Set the cycle in GTPR, GTPBR and GTPDBR of GPT32n channel. |

Table 21.35 Example for Setting Complementary PWM Mode 1,2,3 (2 of 2)

| No. | Step Name | Description |
|-----|--------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4 | Set GTIOCNm /GTIOCN+1m / GTIOCN+2m pin function | Set the function of the GTIOCNm, GTIOCN+1m, and GTIOCN+2m pins with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 5 | Enable GTCPPOn pin output | Set to enable or disable PWM synchronous output from the GTCPPOn pin with the PSYE bit in the GTIOR register of the GPT32n channel. |
| 6 | Enable GTIOCNm / GTIOCN+1m /GTIOCN+2m pin output | Set to enable the output from the GTIOCNm, GTIOCN+1m, and GTIOCN+2m pins with the OAE and OBE bits in the GTIOR register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 7 | Set buffer operation | In complementary PWM mode 3, set buffer operation with the GTBER2.CP3DB bit of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 8 | Set compare match value | Set the output pin changing point during up-counting after count start in the GTCCRA register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 9 | Set buffer value | For single buffer operation, set data (to be transferred for the first buffer transfer to the GTCCRA register after count start) in the GTCCRD register. For buffer operation in complementary PWM mode 2, set the same value as the GTCCRA register in the GTCCRD register because the first buffer transfer does not take place. For double buffer operation in complementary PWM mode 3, set data to be transferred at the first end of crest in the GTCCRD register and set data to be transferred at the first end of trough in the GTCCRF register. |
| 10 | Set dead time value | Set the dead time value in GTDVU of GTP32n channel. |
| 11 | Start count operation | Set GTCR.CST of GPT32n channel to 1 to start count operation. |
| 12 | Set buffer value for each cycle | For single buffer operation, set data (to be transferred for the next buffer transfer to the GTCCRA register) in the GTCCRD register. For double buffer operation in complementary PWM mode 3, set data to be transferred for the next buffer transfer in the GTCCRF register. Make settings for the GPT32n+2.GTCCRD register finally. (Data is transferred to the temporary register.) |

Note: n = 4, 7
m = A, B

21.3.3.8 Complementary PWM mode 4

In complementary PWM mode 4, the value written to the GTCCRD and GTCCRF registers is immediately applied to compare match operation by transferring data also to the GTCCRA register during buffer transfer to a temporary register before crest or trough transfer timing.

Figure 21.70 shows the block diagram in complementary PWM mode 4.

In the configuration of complementary PWM mode 4, a buffer transfer path from the GTCCRD register to the GTCCRC and GTCCRA registers and a buffer transfer path from the GTCCRF register to the GTCCRE and GTCCRA registers are added to other complementary PWM modes shown in Table 21.35.

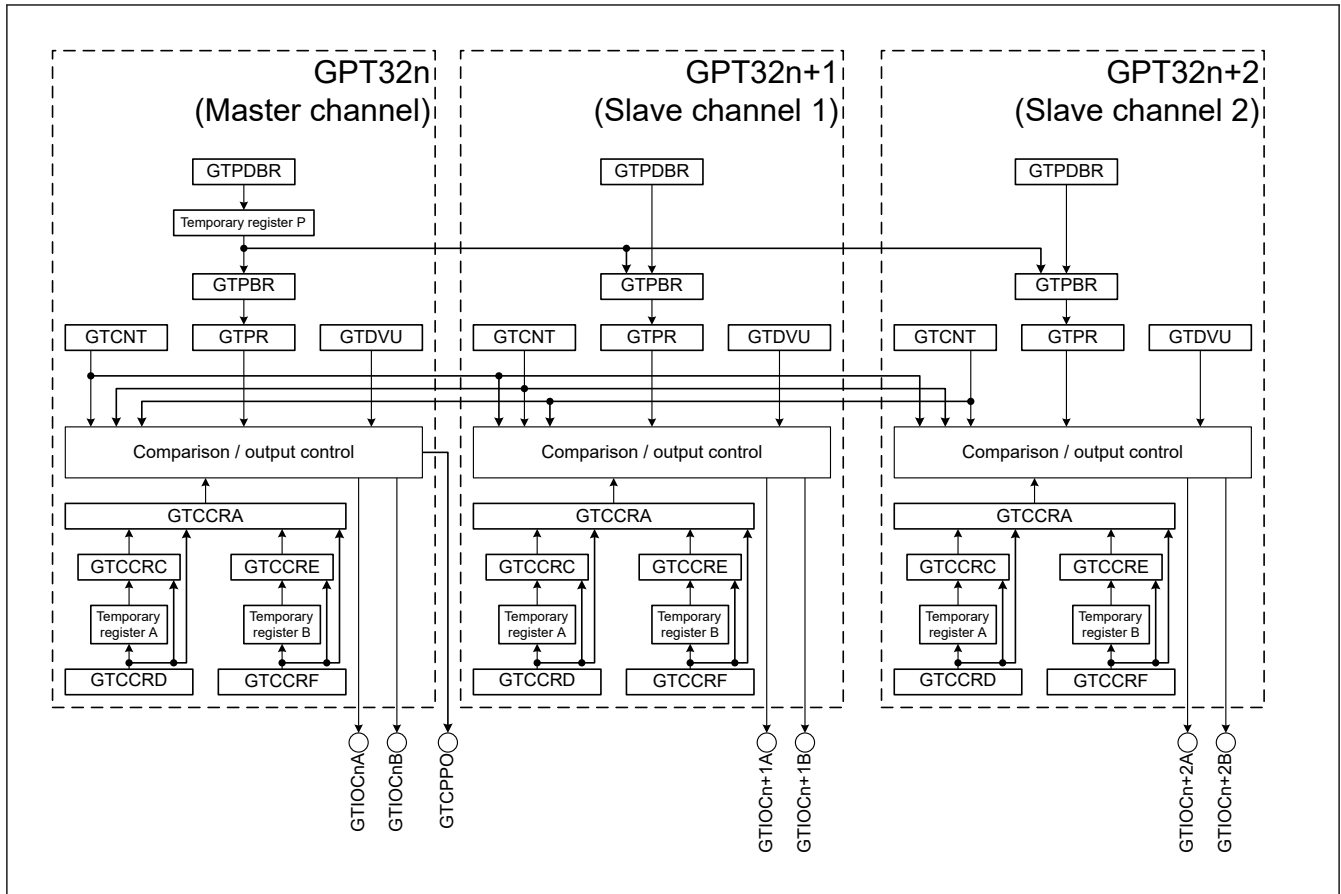

Figure 21.70 Block Diagram in Complementary PWM Mode 4 (n = 4, 7)

Count operation is performed in the same way as complementary PWM modes 1 to 3. See [Table 21.30](#) and [Table 21.31](#).

With respect to buffer operation and PWM waveform changes in complementary PWM mode 4, buffer transfer (shown in [Figure 21.70](#)) from the GTCCRD and GTCCRF registers is added based on the complementary PWM mode 3 operation. Buffer transfer and PWM waveform are controlled according to operation section, state of comparison with the GTCCRA register, and write value.

The double buffer function by writing to the GTCCRF register can be enabled or disabled with the GTBER2.CP3DB bit. In double buffer operation, the value written to the GTCCRD register is used as a compare match value for positive-phase OFF (negative-phase ON) during down-counting, and the value written to the GTCCRF register is used as a compare match value for negative-phase OFF (positive-phase ON) during up-counting. Transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.

Double buffer operation is guaranteed only in the up-counting middle section and down-counting middle section. Setting a value not larger than the dead time value and not less than the count cycle is prohibited.

In single buffer operation, a compare match value is written only to the GTCCRD register, and transfer register, transfer value, and PWM output changes are controlled by operation section (where the value is written), state of comparison with the GTCCRA register, and write value.

Transfer from the GTCCRD register to the temporary register A and transfer from the GTCCRF register to the temporary register B are performed in the same way as other complementary PWM modes. Transfers are concurrently performed in three channels by writing a value to the GPT32n+2.GTCCRD register. Transfer from the GTCCRD register to the GTCCRC register, GTCCRA register, temporary register B, and GTCCRE register and transfer from the GTCCRF register to the GTCCRE register and the GTCCRA register are performed at the same time as the above-mentioned transfer to the temporary register.

[Table 21.36](#) and [Table 21.37](#) show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPT32n+2.GTCCRD register) to the GTCCRC and GTCCRA registers by writing a value to the GTCCRD register during single buffer operation in complementary PWM mode 4 for each compare match state in each operation section. Transfers (from the GTCCRD register to the temporary register A, from the temporary register A to the GTCCRC register, and from

the GTCCRC register to the GTCCRA register) other than those shown in [Table 21.36](#) and [Table 21.37](#) are the same as single buffer transfer in complementary PWM mode 3 shown in [Table 21.32](#).

[Table 21.38](#) and [Table 21.39](#) show immediate buffer transfer (for transfer to the temporary register by writing a value to the GPT32n+2.GTCCRD register) to each register by writing a value to the GTCCRD and GTCCRF registers during double buffer operation in complementary PWM mode 4 for each compare match state in each operation section. Transfers (from the GTCCRD register to the temporary register A, from the GTCCRF register to the temporary register B, from the temporary register A to the GTCCRC register, from the temporary register B to the GTCCRE register, and from the GTCCRC and GTCCRE registers to the GTCCRA register) other than those shown in [Table 21.38](#) and [Table 21.39](#) are the same as double buffer transfer in complementary PWM mode 3 shown in [Table 21.33](#).

Table 21.40 Example for Setting Complementary PWM Mode 4 (1 of 2)

| No. | Step Name | Description |
|-----|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode (1111b) with GTCR.MD[3:0] of GTP32n channel. |
| 2 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits of GPT32n channel. |
| 3 | Set cycle | Set the cycle in GTPR, GTPBR and GTPDBR of GPT32n channel. |
| 4 | Set GTIOcNm / GTIOcN+1m / GTIOcN+2m pin function | Set the function of the GTIOcNm, GTIOcN+1m, and GTIOcN+2m pins with GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 5 | Enable GTIOcNm / GTIOcN+1m / GTIOcN+2m pin output | Set to enable the output from the GTIOcNm, GTIOcN+1m, and GTIOcN+2m pins with the OAE and OBE bits in the GTIOR register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 6 | Set buffer operation | Set buffer operation with the GTBER2.CP3DB bit of the GPT32n, GPT32n+1, and GPT32n+2 channels. |
| 7 | Set compare match value | Set the output pin changing point during up-counting after count start in the GTCCRA register of the GPT32n, GPT32n+1, and GPT32n+2 channels. |

Table 21.40 Example for Setting Complementary PWM Mode 4 (2 of 2)

| No. | Step Name | Description |
|-----|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8 | Set buffer value | For single buffer operation, set data (to be transferred for the first buffer transfer to the GTCCRA register after count start) in the GTCCRD register. For double buffer operation, set data to be transferred at the first end of crest in the GTCCRD register and set data to be transferred at the first end of trough in the GTCCRF register. |
| 9 | Set dead time value | Set the dead time value in GTDVU of GTP32n channel. |
| 10 | Start count operation | Set GTCR.CST of GPT32n channel to 1 to start count operation. |
| 11 | Set compare match value to be transferred immediately | For single buffer operation, set data (to be transferred immediately to the GTCCRA register) in the GTCCRD register. For double buffer operation, set the compare match value for down-counting to be transferred immediately in the GTCCRD register and the compare match value for up-counting in the GTCCRF register. Make settings for the GPT32n+2.GTCCRD register finally. (Data is transferred to the temporary register.) |

Note: n = 4, 7
m = A, B

21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU and GTDVD value) can automatically be set to GTCCRB.

The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time can be separately set for the first half and second half of a waveform. Dead time for the changing point in the first half of a negative waveform is set in the GTDVU register and that in the second half is set in GTDVD register. The same dead time can also be set for the first and second halves by setting the GTDTCR.TDFER bit to 1.

The GTDBU register can be used as a buffer register of the GTDVU register, and the GTDBD register can be used as a buffer register of the GTDVD registers. Buffer transfer is performed at the end of the cycle (in saw-wave mode: either of an overflow of the GTCNT counter (up-counting), an underflow (down-counting), or the GTCNT counter clearing; in triangle-wave mode: a trough).

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to GTCCRB is prohibited when the automatic dead time setting function is used.

Do not set the dead time that makes the change point of the waveform exceeding the count period. When any dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown in [Table 21.41](#). The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to judge the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In saw-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

In triangle-wave PWM mode, if dead time exceeds the count period by setting 0x00000000 or a value greater than or equal to the setting value of the GTPR register is set in the GTCCRA register, output change is controlled by the output protection function (see [section 21.8.4. Output Protection Function for GTIOcnm Pin Output \(n = 0 to 9; m = A, B\)](#)). When the GTCCRA register is greater than or equal to [GTPR register + GTDVm (m = U, D) register], [GTPR register - 1] is set in the GTCCRB register as the upper limit.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

Table 21.41 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs

| PWM Output Operating Mode | Count Direction | Period | Condition for Dead Time Error | Change Point of the Positive-Phase Waveform after Adjustment | Change Point of the Negative-Phase Waveform after Adjustment |
|------------------------------|-----------------|---------------|----------------------------------------------------------------------|--------------------------------------------------------------|--------------------------------------------------------------|
| Saw-wave one-shot pulse mode | Up-counting | First half | $GTCCRA - GTDVU < 0$ | $GTDVU$ | 0 |
| | | Second half | $GTCCRA + GTDVD > GTPR$ ($GTCCRA + GTDVU > GTPR$)* ¹ | $GTPR - GTDVD$ ($GTPR - GTDVU$)* ¹ | $GTPR$ |
| | Down-counting | First half | $GTCCRA + GTDVU > GTPR$ | $GTPR - GTDVU$ | $GTPR$ |
| | | Second half | $GTCCRA - GTDVD < 0$ ($GTCCRA - GTDVU < 0$)* ¹ | $GTDVD$ ($GTDVU$)* ¹ | 0 |
| Triangle-wave PWM mode 1/2/3 | Up-counting | (First half) | $GTCCRA - GTDVU \leq 0$ | $GTDVU + 1$ | 1 |
| | Down-counting | (Second half) | $GTCCRA - GTDVD < 0$ ($GTCCRA - GTDVU < 0$)* ¹ | $GTDVD$ ($GTDVU$)* ¹ | 0 |

Note 1. In the case of $GTDTCR.TDFER = 1$.

Figure 21.80 to Figure 21.83 show examples of automatic dead time setting function operation. Table 21.42 and Table 21.43 show the setting examples.

Figure 21.80 Example of automatic dead time setting function operation in saw-wave one-shot pulse mode, up-counting, GTDVU and GTDVD set to buffer operation, and active-high

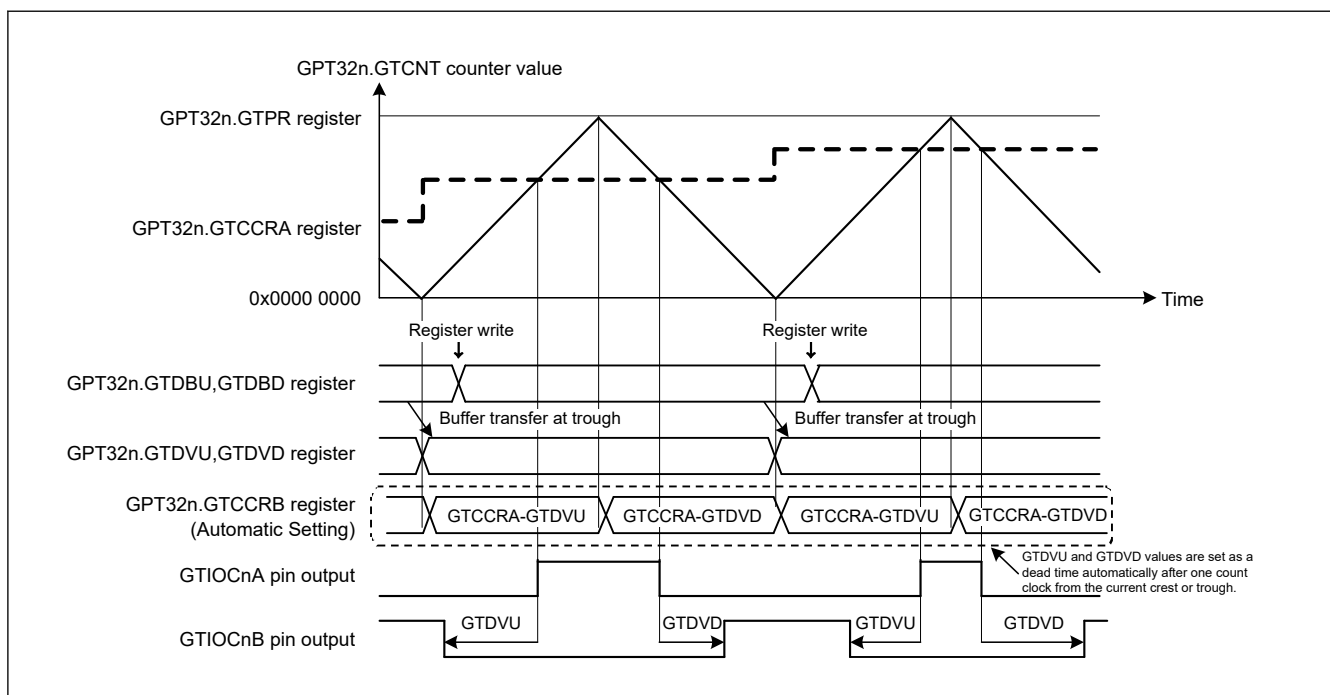

Figure 21.82 Example of automatic compare-match value setting function with dead time in triangle-wave PWM mode 1, GTDVU and GTDVD set to buffer operation, and active-high

Figure 21.83 Example of automatic compare-match value setting function with dead time in triangle-wave PWM mode 2 or 3, GTDVU and GTDVD set to buffer operation, and active-high

Table 21.42 Example setting for automatic dead time setting function in saw-wave one-shot pulse mode, and triangle-wave PWM mode 3 (1 of 2)

| No. | Step Name | Description |
|-----|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[2:0] or GTCR.MD[3:0]. In Figure 21.80 and Figure 21.81 , 001b or 0001b (saw-wave one-shot pulse mode) is set. In Figure 21.83 , 110b or 0110b (triangle-wave PWM mode 3) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.80 , 01b is set after 11b is set in GTUDDTYC[1:0] (up count). In Figure 21.81 , 00b is set after 10b is set in GTUDDTYC[1:0] (down count). |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0]. |
| 4 | Set cycle | Set the cycle in GTPR. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 6 | Set GTIOcNm pin function | Set the GTIOcNm pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. In Figure 21.80 , Figure 21.81 , and Figure 21.83 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 7 | Enable GTIOcNm pin output ^{*1} | Set to enable the GTIOcNm pin output with OAE and OBE in GTIOR. |
| 8 | Set buffer value for compare match ^{*1} | Set the GTIOcNA pin transition immediately after the count start in GTCCRC and GTCCRD. |
| 9 | Set forcible buffer transfer for compare match ^{*1} | Set GTBER.CCRSWT to 1 to transfer buffer register data forcibly to GTCCRA. |
| 10 | Set buffer value for compare match | Set the GTIOcNA pin transition in 1 cycle after the current cycle in GTCCRC and GTCCRD. |
| 11 | Set automatic dead time setting function | Set GTDTCR.TDE to 1 to enable the automatic dead time setting function. |
| 12 | Set buffer operation for dead time setting | Set buffer operation with TDBUE and TDBDE bits in GTDTCR. |
| 13 | Set dead time value | Set the first half dead time value in GTDVU and the second half dead time in GTDVD. When GTDVU is set with GTDTCR.TDFER bit set to 1, the same value is also set to GTDVD, the same dead time value can be set for the first and second halves. |
| 14 | Set buffer value for dead time | For buffer operation, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD. |

Table 21.42 Example setting for automatic dead time setting function in saw-wave one-shot pulse mode, and triangle-wave PWM mode 3 (2 of 2)

| No. | Step Name | Description |
|-----|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 15 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 16 | Set buffer value for each cycle | Set the GTIOCnA pin transition in 1 cycle after the current cycle in GTCCRC and GTCCRD. When the dead time register is used for buffer operation, set the dead time value in the first half of the next cycle from the current cycle to GTDBU and the dead time value in the second half to GTDBD. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for Enable GTIOCnm pin output and setting for Set buffer value for compare match + Set forcible buffer transfer for compare match.

Table 21.43 Example setting for automatic dead time setting function in triangle-wave PWM mode 1 or 2

| No. | Step Name | Description |
|-----|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[2:0] or GTCR.MD[3:0]. In Figure 21.82 , 100b or 0100b (triangle-wave PWM mode 1) is set. In Figure 21.83 , 101b or 0101b (triangle-wave PWM mode 2) is set. |
| 2 | Select count clock | Select the count clock with GTCR.TPCS[3:0]. |
| 3 | Set cycle | Set the cycle in GTPR. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set GTIOCnm pin function | Set the GTIOCnm pin function with GTIOA[4:0] and GTIOB[4:0] in GTIOR. In Figure 21.82 and Figure 21.83 , GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b. |
| 6 | Enable GTIOCnm pin output*1 | Set to enable the GTIOCnm pin output with OAE and OBE in GTIOR. |
| 7 | Set buffer operation for compare match | Set buffer operation with CCRA in GTBER. |
| 8 | Set compare match value*1 | Set the GTIOCnA pin transition in GTCCRA. |
| 9 | Set buffer value for compare match | For buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. For double buffer operation, also set the GTIOCnA pin transition in 2 cycles after the current cycle (in triangle-wave PWM mode 1) or 1 cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD. |
| 10 | Set automatic dead time setting function | Set GTDTCR.TDE to 1 to enable the automatic dead time setting function. |
| 11 | Set buffer operation for dead time setting | Set buffer operation with TDBUE and TDBDE bits in GTDTCR. |
| 12 | Set dead time value | Set the first half dead time value in GTDVU and the second half dead time in GTDVD. When GTDVU is set with GTDTCR.TDFER bit set to 1, the same value is also set to GTDVD, the same dead time value can be set for the first and second halves. |
| 13 | Set buffer value for dead time | For buffer operation, set the first half dead time in one cycle after the current cycle in GTDBU and the second half dead time in GTDBD. |
| 14 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 15 | Set buffer value for each cycle | When the compare match register is used for buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. When the compare match register is used for double-buffered operation, set the GTIOCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD. In the same way, set the dead time value in the first half of the cycle after current cycle in GTDBU and the dead time in the second half in GTDBD. |

Note: n: 0 to 9
m: A, B

Note 1. When using PWM Delay Generation circuit, change the order of setting for the GTIOCnm pin output enable and setting for a compare match value.

21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value after the start of down-counting is reflected in the count cycle during down-counting.

Figure 21.84 shows an example of count direction changing function operation.

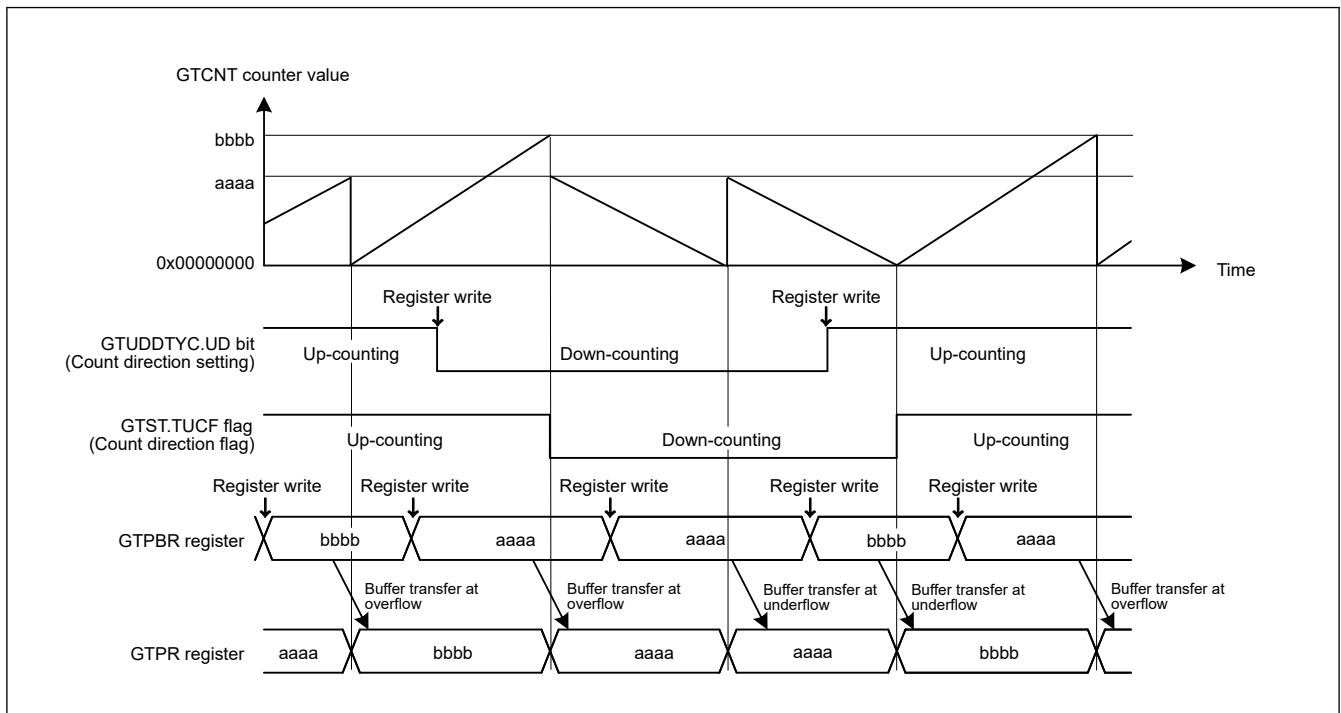

Figure 21.84 Example of a count direction changing function operation during buffer operation

21.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 0 to 9) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

This function is invalid in saw-wave PWM mode 2 or complementary PWM mode. For complementary PWM mode, 0%/100% output duty is possible regardless of the GTUDDTYC.OADTY[1:0] and OBDTY[1:0] bit settings.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the

GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 21.44 shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

Table 21.44 Output values after releasing 0% or 100% duty setting (m = A, B)

| GTIOR.GTIOm[3:2] | Compare match value at cycle end masked by 0% or 100% duty setting | GTUDDTYC.OmDTYR in duty 0% setting | | GTUDDTYC.OmDTYR in duty 100% setting | |
|--------------------------------------|--------------------------------------------------------------------|------------------------------------|---|--------------------------------------|---|
| | | 0 | 1 | 0 | 1 |
| 00 (output retained at cycle end) | 0 | 0 | 0 | 1 | 0 |
| | 1 | 0 | 1 | 1 | 1 |
| 01 (low output at cycle end) | — | 0 | 0 | 0 | 0 |
| 10 (high output at cycle end) | — | 1 | 1 | 1 | 1 |
| 11 (output toggled at cycle end) | 0 | 1 | 1 | 0 | 1 |
| | 1 | 1 | 0 | 0 | 0 |

Figure 21.85 shows an example of output duty 0% and 100% function.

Figure 21.85 Example of output duty 0% and 100% function

21.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

- External trigger input
- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 9).

21.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 21.86 shows an example of a count start operation by a hardware source. Table 21.45 shows the setting example.

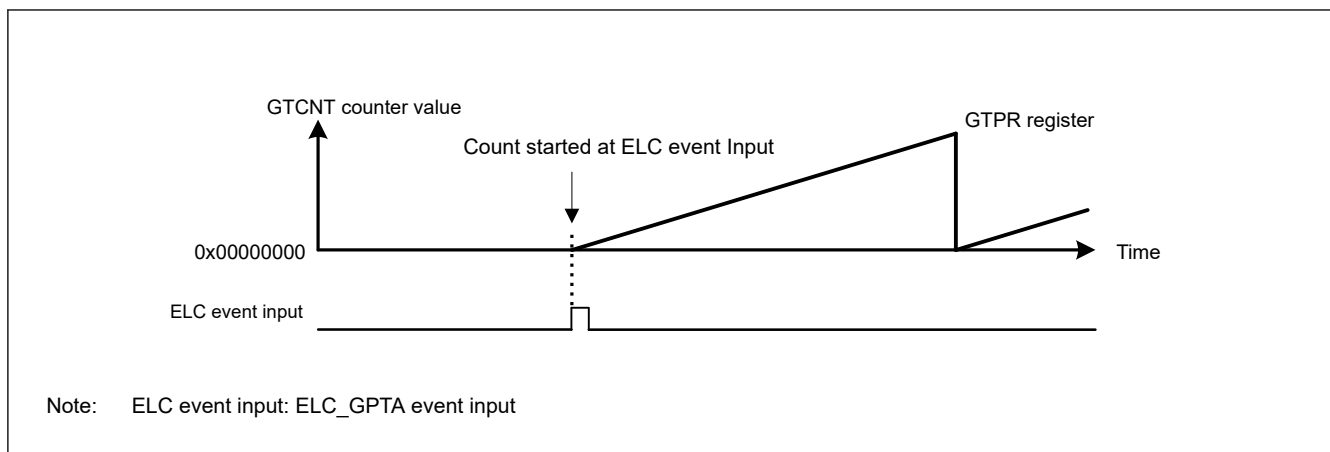

Figure 21.86 Example of count start operation by a hardware source started at the input of the signal from the ELC_GPTA event

Table 21.45 Example setting for count start operation by a hardware source

| No. | Step Name | Description |
|-----|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.86 , 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.86 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.86 , 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in the GTSSR register. In Figure 21.86 , GTSSR.SSELCA = 1 |
| 7 | Set hardware source operation | Set operation of the hardware source selected by the GTSSR register and start counting. In Figure 21.86 , the ELC_GPTA event input operation is set. |

[Figure 21.87](#) shows an example of timing of operations to start counting in response to a rising edge of the input on the GTETRGA pin.

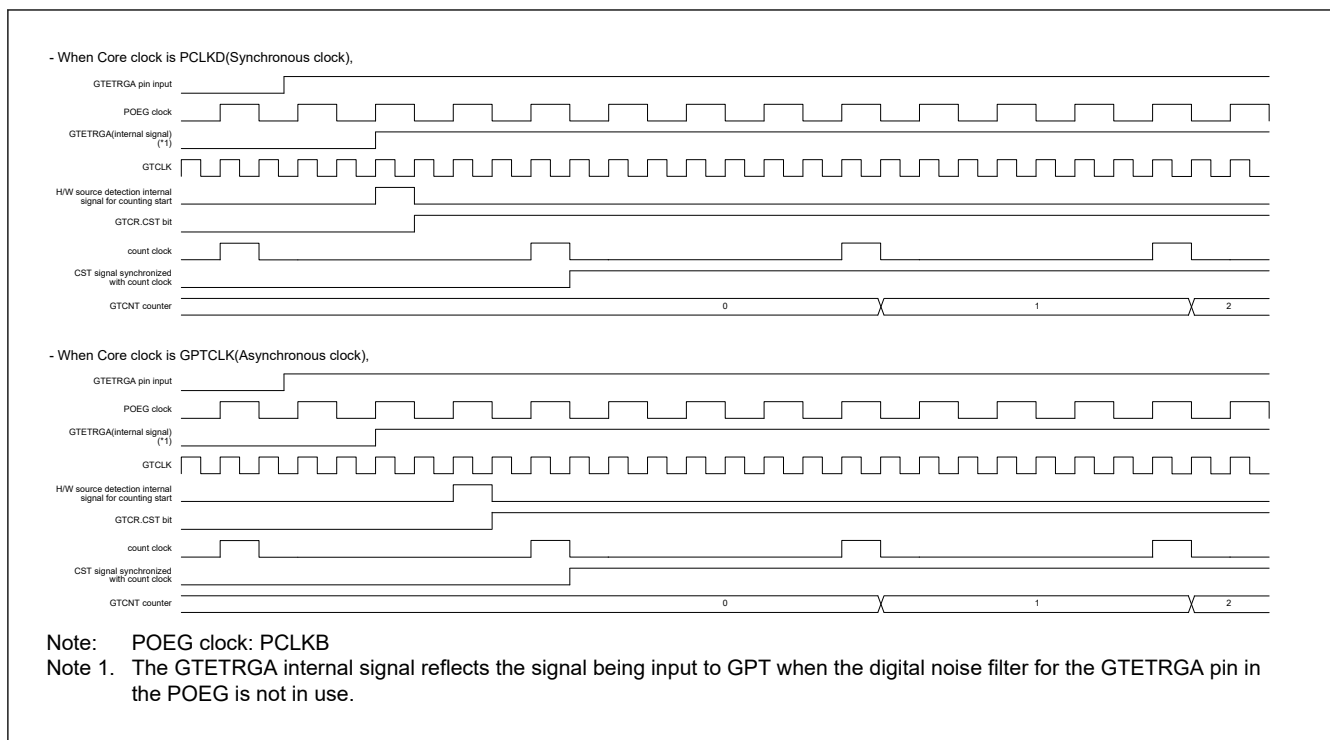

Figure 21.87 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 21.88 shows an example of timing of operations to start counting in response to a rising edge of the input on the GTIOCnA pin.

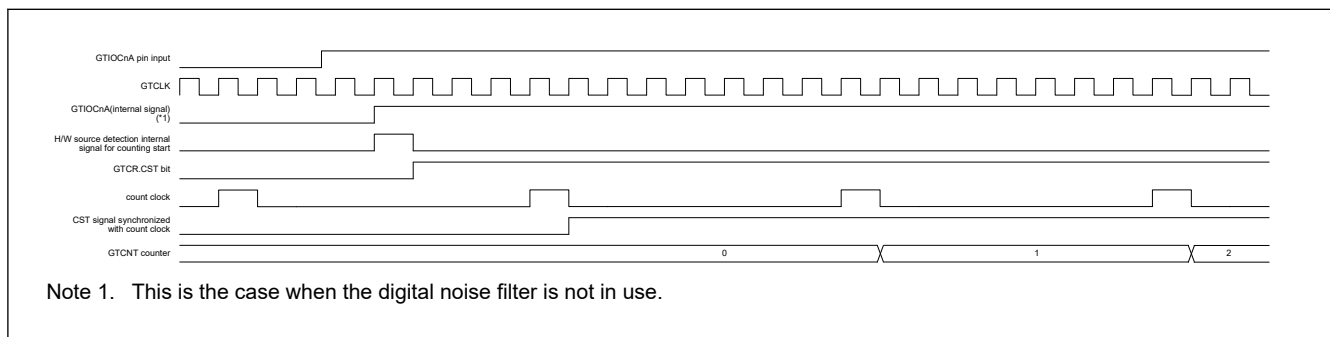

Figure 21.88 Example of Timing of Operations to Start Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 21.89 shows an example of the timing of operations to start counting in response to ELC_GPTA event input.

This is an example of operations to start counting by the GPT321.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

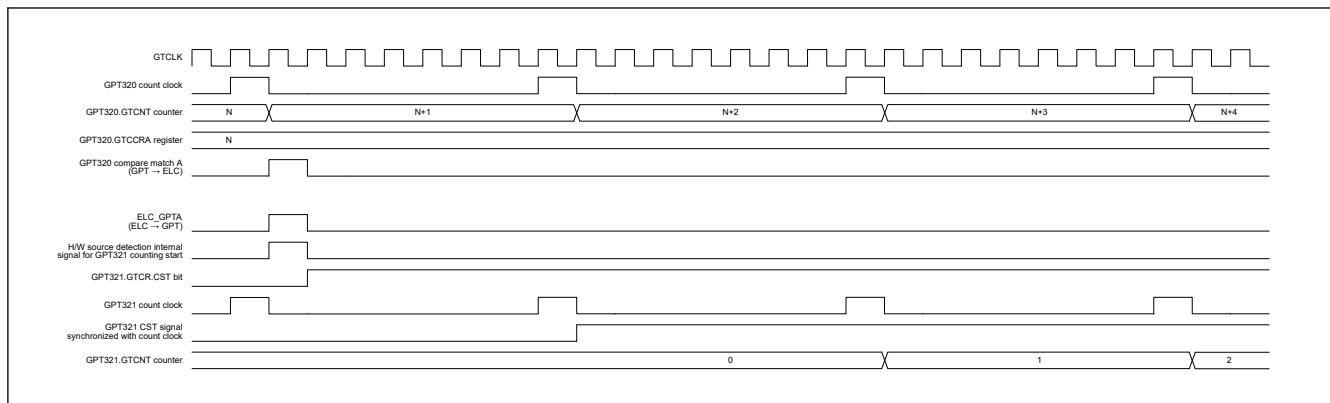

Figure 21.89 Example of Timing of Operations to Start Counting in Response to Event Input from ELC_GPTA

21.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 21.90 shows an example of a count stop operation by a hardware source. Table 21.46 shows the setting example. In this example, the count operation stops at the ELC_GPTA event input and restarts at the ELC_GPTB event input.

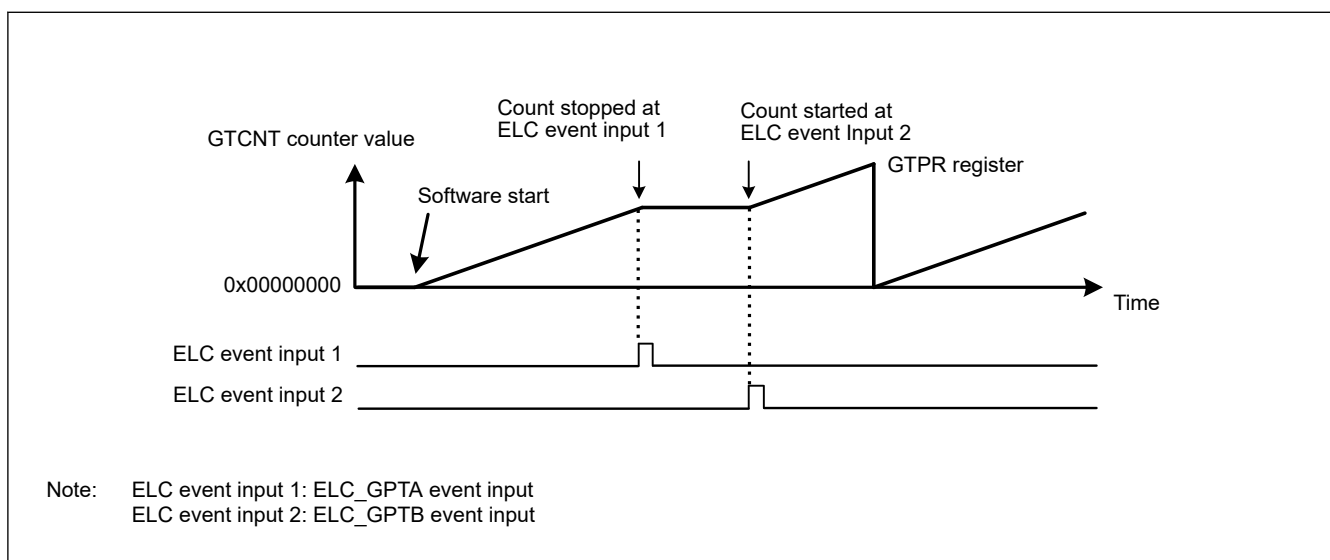

Figure 21.90 Example of count stop operation by hardware source started by software, stopped at ELC_GPTA input, and restarted at ELC_GPTB input

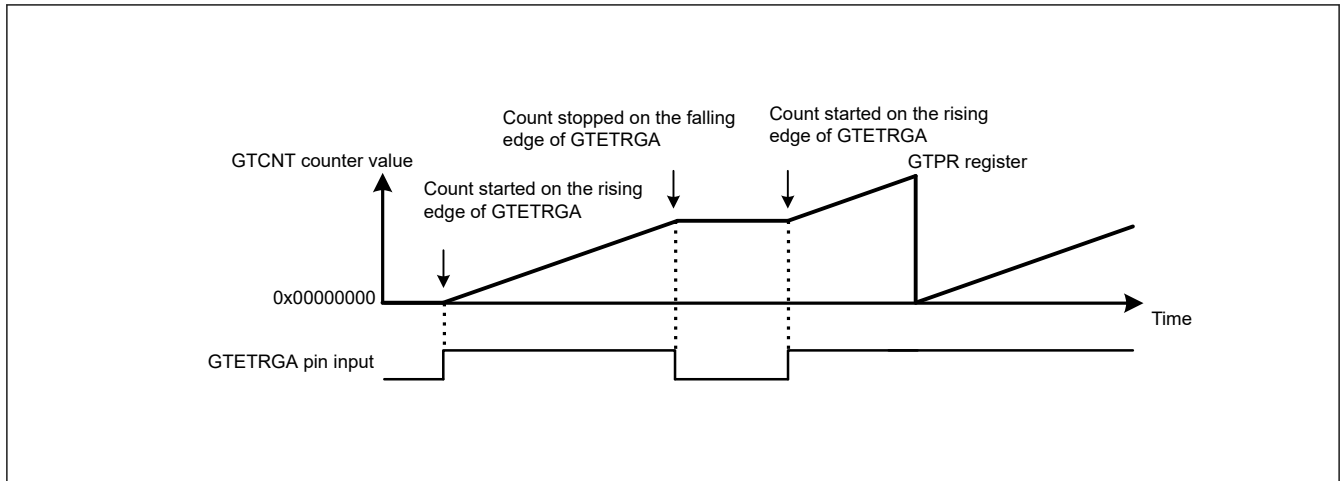

Table 21.46 Example setting for count stop operation by a hardware source (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[2:0] or GTCR.MD[3:0] bits. In Figure 21.90, 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.90, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting). |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0]. |
| 4 | Set cycle | Set the cycle in GTPR. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.90, 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In Figure 21.90, GTSSR.SSELCB = 1. |

Table 21.46 Example setting for count stop operation by a hardware source (2 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 | Set hardware count stop | Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 21.90 , GTPSR.PSELCA = 1. |
| 8 | Set hardware source operation | Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In Figure 21.90 , ELC_GPTA input operation and ELC_GPTB input operation are set. |

[Figure 21.91](#) shows an example of a count start/stop operation by a hardware source. [Table 21.47](#) shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

**Figure 21.91 Example of count start/stop operation by a hardware source started on the rising edge of GTETRGA pin input, and stopped on the falling edge of GTETRGA pin input****Table 21.47 Example setting for count start/stop operation by a hardware source**

| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.91 , 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.91 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.91 , 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.91 , GTSSR.SSGTRGAR = 1. |
| 7 | Set hardware count stop | Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.91 , GTPSR.PSGTRGAF = 1. |
| 8 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting. In Figure 21.91 , the GTETRGA pin operation is set. |

[Figure 21.92](#) shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTETRGA pin.

Figure 21.92 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTETRGA Pin

Figure 21.93 shows an example of timing of operations to stop counting in response to a rising edge of the input on the GTIOCnA pin.

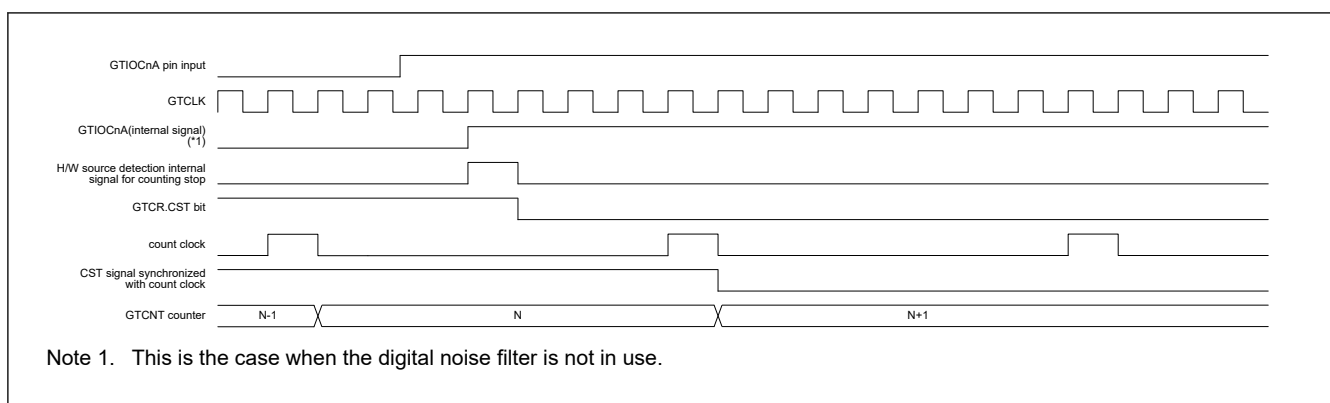

Figure 21.93 Example of Timing of Operations to Stop Counting in Response to a Rising Edge of the Input on the GTIOCnA Pin

Figure 21.94 shows an example of timing of operations to stop counting in response to event input from ELC_GPTA.

This is an example of operations to stop counting by the GPT321.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

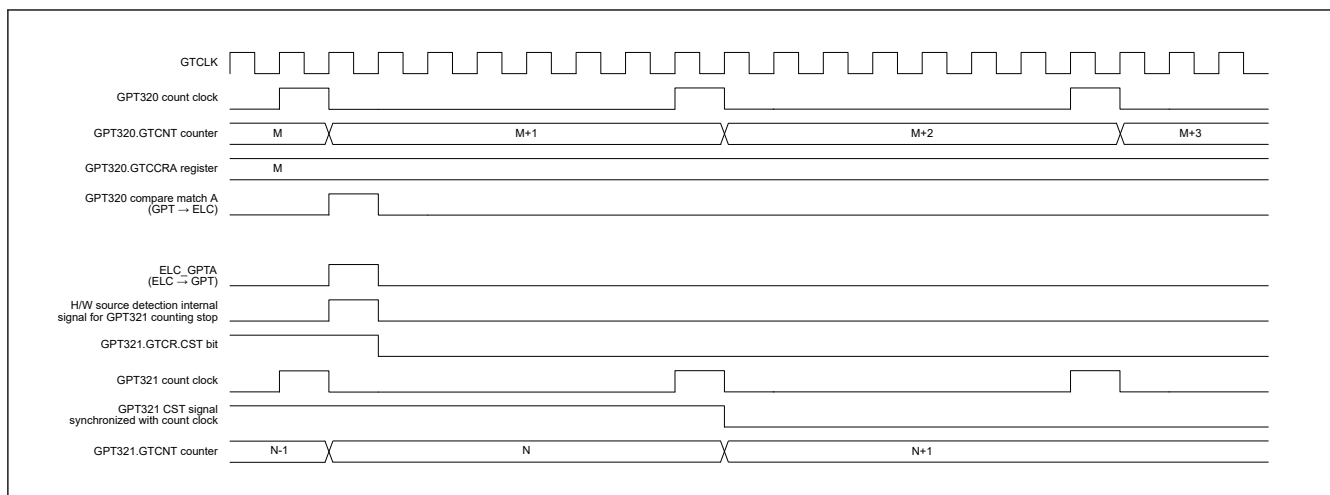

Figure 21.94 Example of Timing of Operations to Stop Counting in Response to Event Input from ELC_GPTA

21.3.7.3 Hardware Clear Operation

The GTCNT counter can be cleared by selecting a hardware source using GTCR. The GPTn_OVF/GPTn_UDF (n = 0 to 9) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 21.95 and Figure 21.96 show examples of the GTCNT counter clearing operation by a hardware source. Table 21.48 shows the setting example. In this example, the GTCNT counter starts at the ELC_GPTA input, and the counter stops and clears at the ELC_GPTB input.

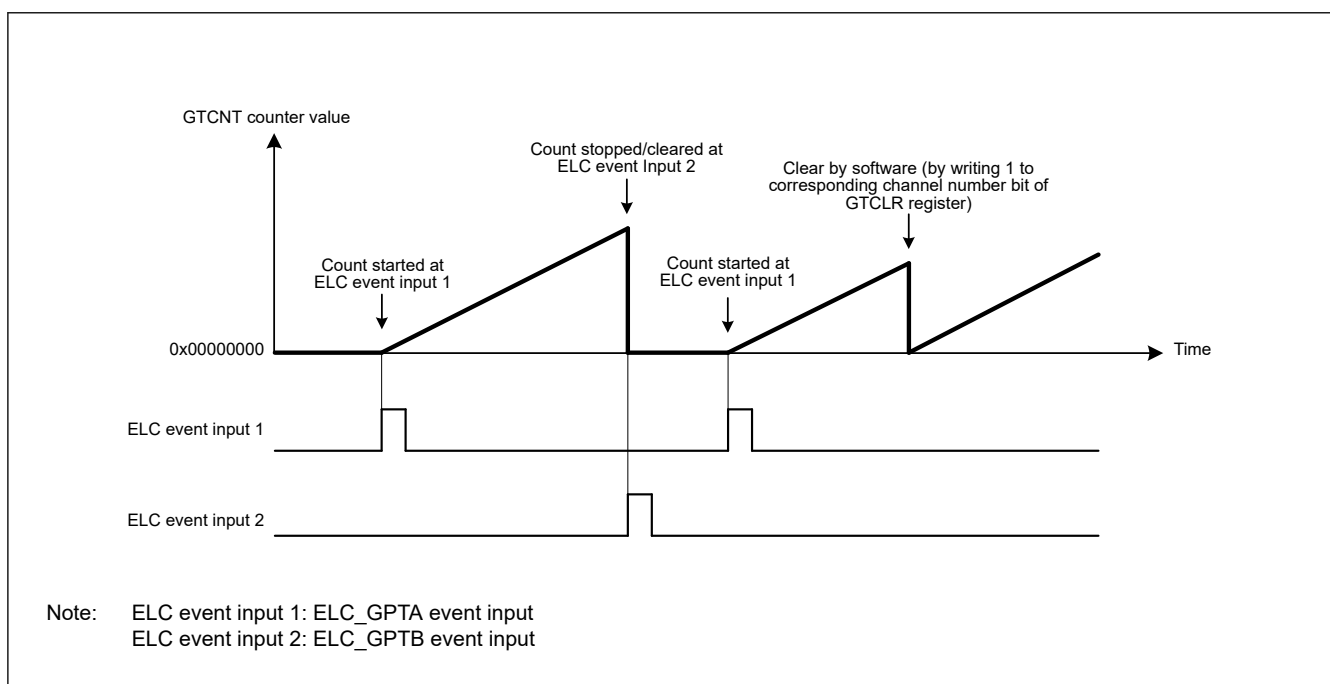

Figure 21.95 Examples of count clearing operation by hardware source in saw wave up-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input

Figure 21.96 Examples of count clearing operation by hardware source in saw wave down-counting, started at ELC_GPTA input, and stopped/cleared at ELC_GPTB input

Table 21.48 Example setting for count clearing operation by a hardware source

| No. | Step Name | Description |
|-----|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.95 and Figure 21.96 , 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.95 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.96 , after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.95 , 0x00000000 is set. In Figure 21.96 , the GTPR register value is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In Figure 21.95 and Figure 21.96 , GTSSR.SSELCA = 1. |
| 7 | Set hardware count stop | Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In Figure 21.95 and Figure 21.96 , GTPSR.PSELCB = 1. |
| 8 | Set hardware count clear | Select a hardware source for clearing count operation in the GTCR register, and wait for count clear by the hardware source. In Figure 21.95 and Figure 21.96 , GTCR.CSELCB = 1. |
| 9 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCR register and start, stop or clear counting. In Figure 21.95 and Figure 21.96 , the ELC_GPTA input and ELC_GPTB input are set. |

The GPTn_OVF/GPTn_UDF (n = 0 to 9) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

[Figure 21.97](#) shows the relationship between the counter clearing by a hardware source and the GPTn_OVF (n = 0 to 9) interrupt.

Figure 21.97 Relationship between counter clearing by hardware source and GPTn_OVF (n = 0 to 9) interrupt

Figure 21.98 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.

The GTCNT counter is cleared when counting is in progress after the GPT32 has detected the internal clearing signal.

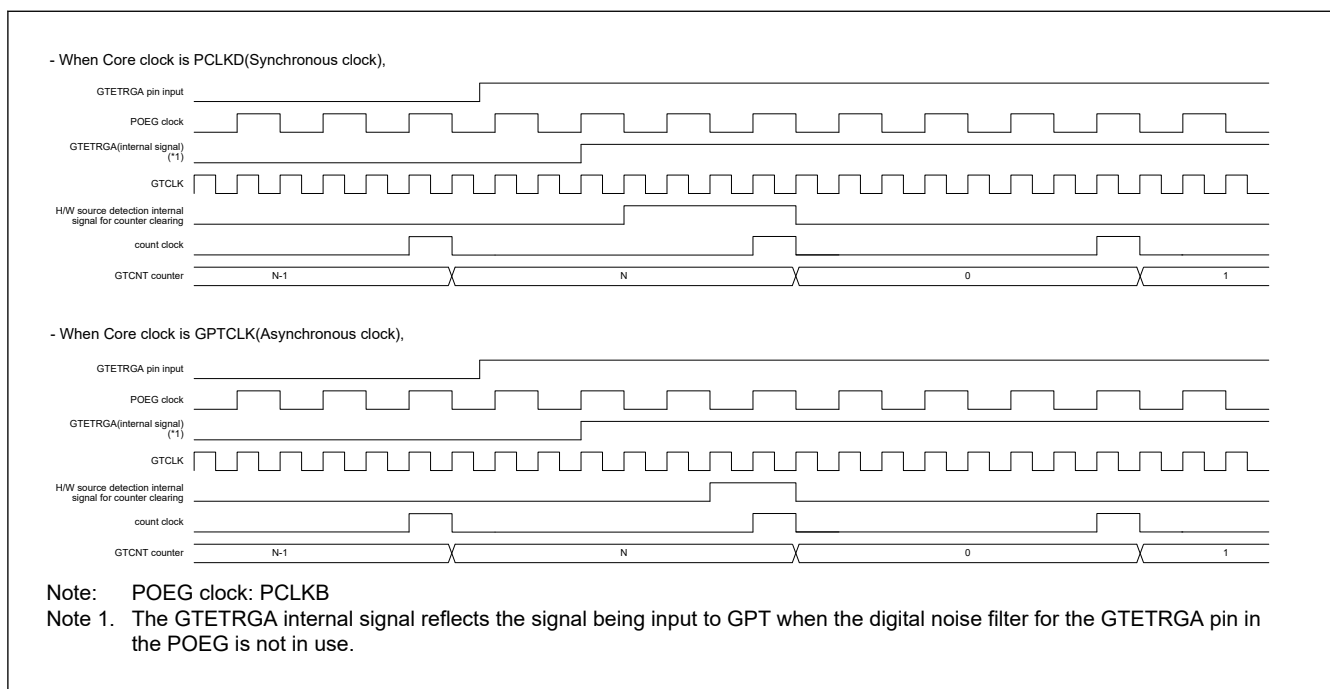

Figure 21.98 Examples of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRGA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 21.99 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOCnA pin when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.

The GTCNT counter is cleared when counting is in progress after the GPT32 has detected the internal clearing signal.

Figure 21.99 Examples of Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOCnA Pin (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 21.100 shows an example of the timing of operations to clear the counter in response to event input from ELC_GPTA when a clock signal produced by frequency-dividing the GTCLK signal is used as the counter clock for the GTCNT counter.

This is an example of operations to clear counting by the GPT321.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

The GTCNT counter is cleared when counting is in progress after the GPT32 has detected the internal clearing signal.

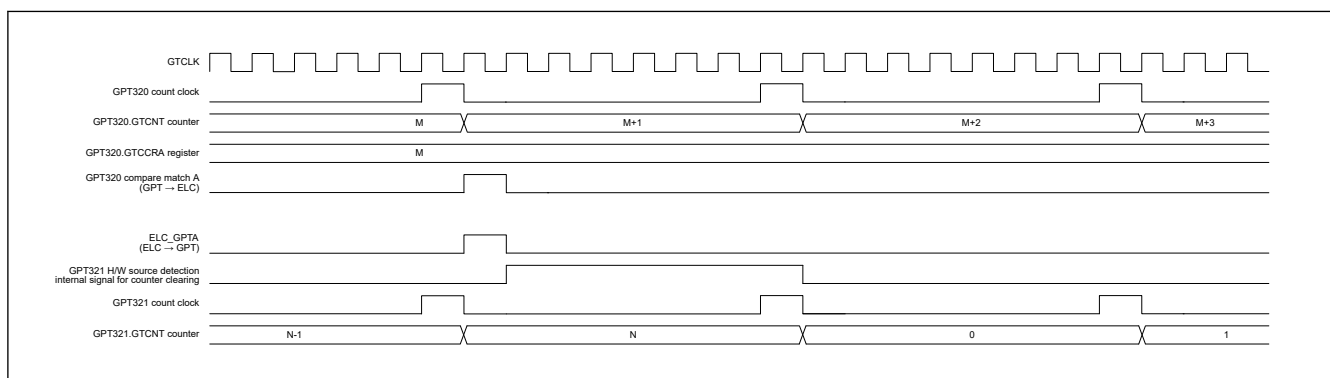

Figure 21.100 Examples of Timing of Operations for Counter Clearing in Response to Event Input from the ELC_GPTA (During the Counting of Cycles of Clock Signal Produced by Dividing the GTCLK Frequency)

Figure 21.101 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTETRGA pin input when counting is triggered by a hardware source.

The GTCNT counter is cleared in synchronization with GTCLK after the GPT32 has detected the internal clearing signal.

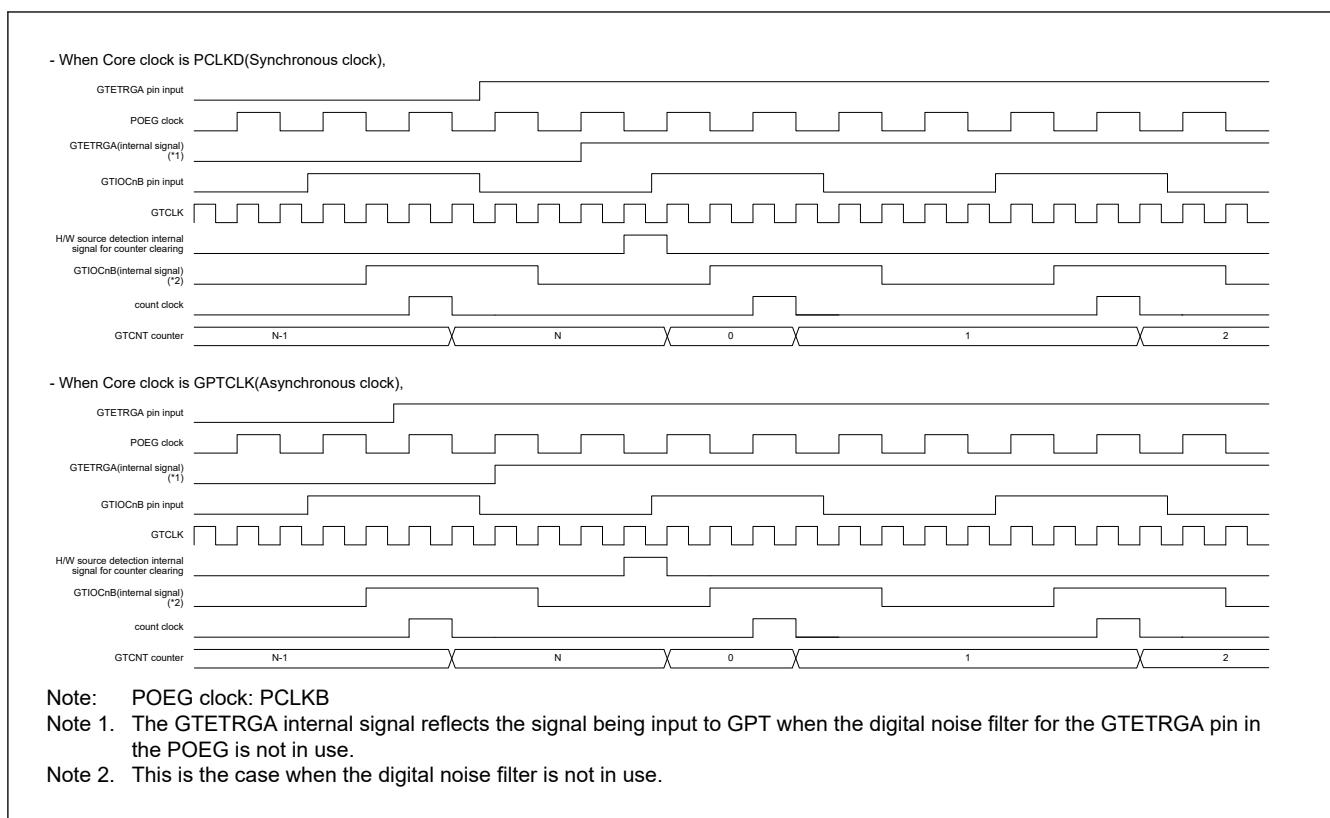

Figure 21.101 Examples of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTETRG Pin (During Counting Triggered by Hardware Source)

Figure 21.102 shows an example of the timing of operations to clear the counter in response to a rising edge of the input on the GTIOcA pin input when counting is triggered by a hardware source.

The GTCNT counter is cleared in synchronization with GTCLK after the GPT32 has detected the internal clearing signal.

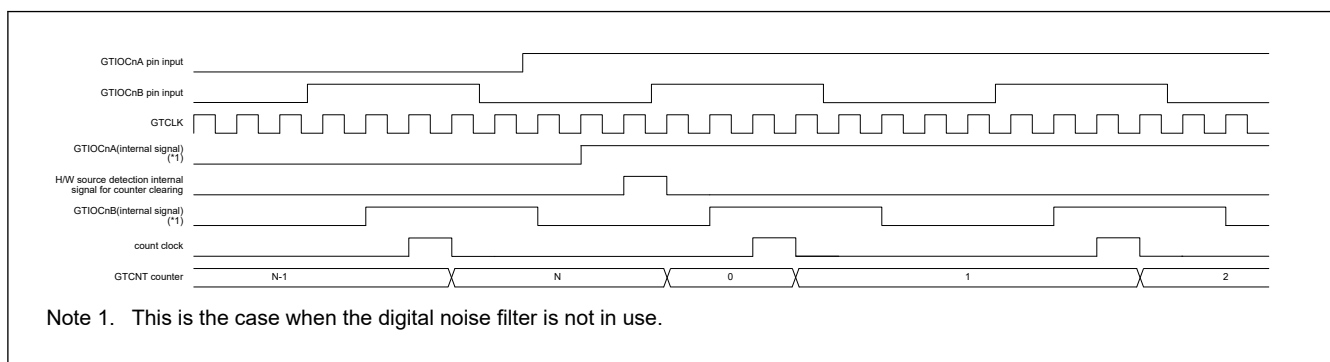

Figure 21.102 Examples of the Timing of Operations for Counter Clearing in Response to a Rising Edge of the Input on the GTIOcA Pin (During Counting Triggered by Hardware Source)

Figure 21.103 shows an example of the timing of operations for clearing the counter in response to the input of an event signal from the ELC_GPTA when counting is triggered by a hardware source.

This is an example of operations to clear counting by the GPT321.GTCNT counter in response to a signal. An event signal is output to the ELC after matches in comparison with the GPT320.GTCCRA register. This is selected as a trigger for output to the GPT321 by the ELC as ELC_GPTA.

ELC passes the event signal output from GPT320 without delay to GPT321.

The GTCNT counter is cleared in synchronization with GTCLK after the GPT32 has detected the internal clearing signal.

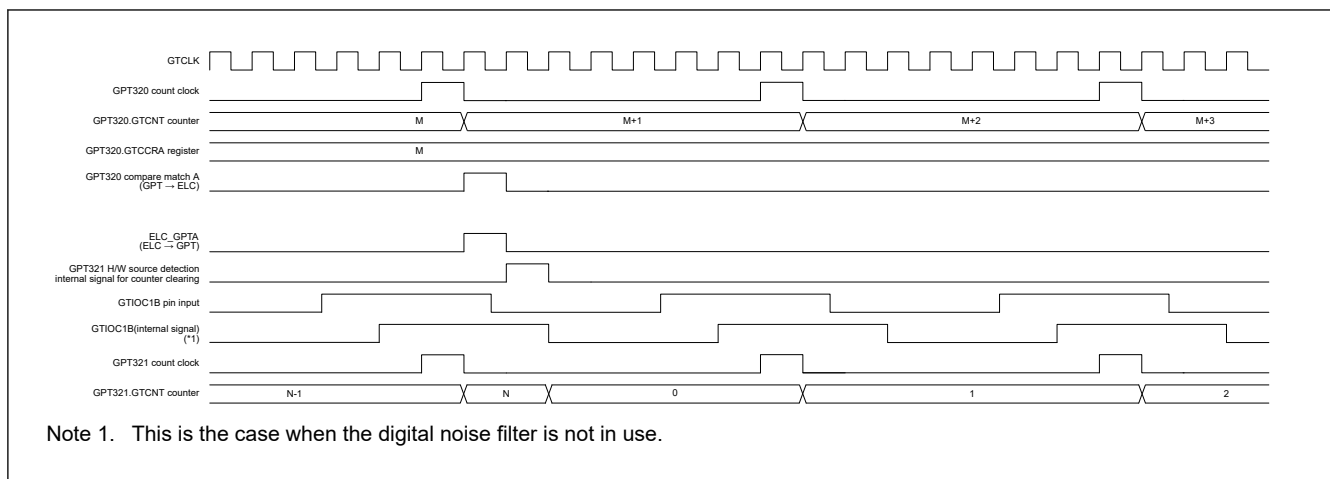

Figure 21.103 Examples of the Timing of Operations for Counter Clearing in Response to Event Input from the ELC_GPTA (During Counting Triggered by Hardware Source)

21.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

21.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

When the GTCNT synchronous set/clear function is enabled on the GTCR.SSCEN bit, the GTCNT registers of the channel set in same group on the GTCR.SSCGRP [1:0] bits can be written at the same time.

The synchronous GTCNT write is invalid in complementary PWM mode.

When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels that selected on the GTSECSR register are set to 0 or 1 and the GTCNT synchronous set/clear function of multiple channels are enabled or disabled at the same time.

Because the clock of count operation is selected by GTCR.TPCS[3:0] bits in respective channels, if the clock period of each channel that performs synchronous operation (count start/stop/clear) is different from others, the synchronous operation timings of every channels are not exact same.

Figure 21.104 shows an example of a simultaneous start, stop, and clear by software. Figure 21.105 shows an example of phase start operation by software. Figure 21.106, Figure 21.107, Figure 21.108 show an example of simultaneous start/stop/clearing with different count period.

Figure 21.104 Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)

Figure 21.105 Example of software phase start with the same count cycle (GTPR register value)

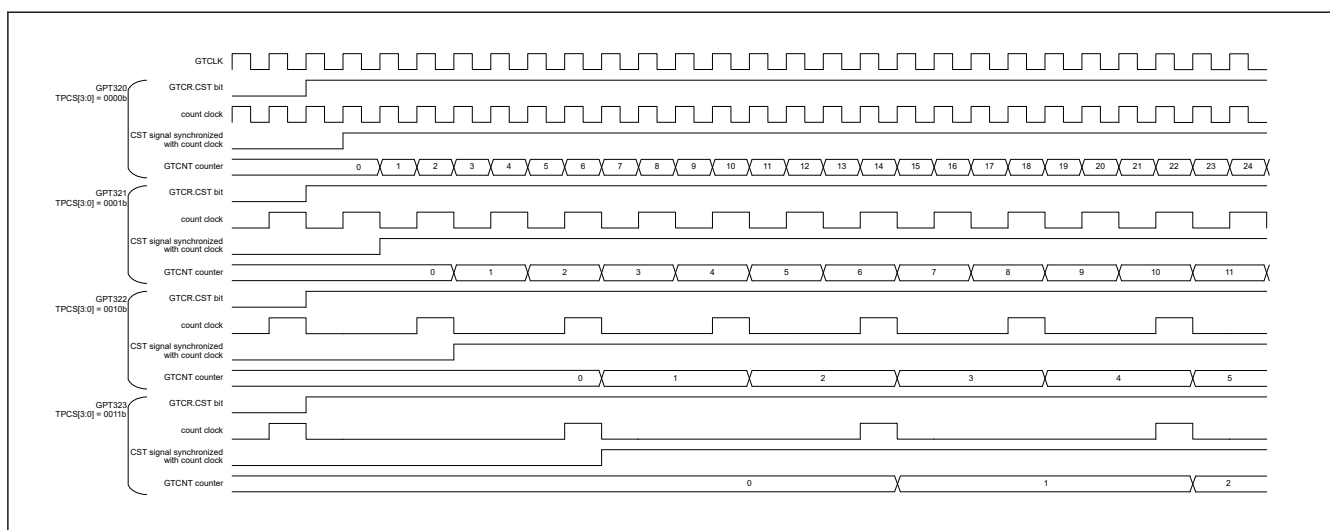

Figure 21.106 Example of Simultaneous Start Operation by Software (with Different Count Period)

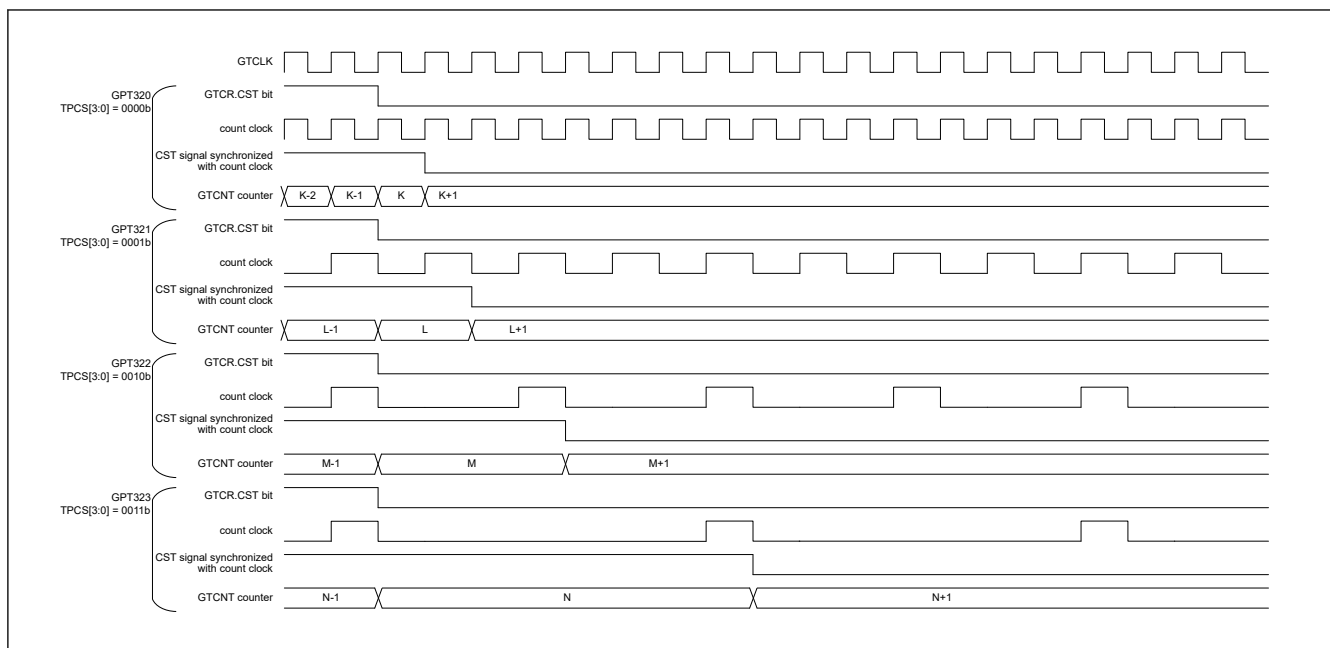

Figure 21.107 Example of Simultaneous Stop Operation by Software (with Different Count Period)

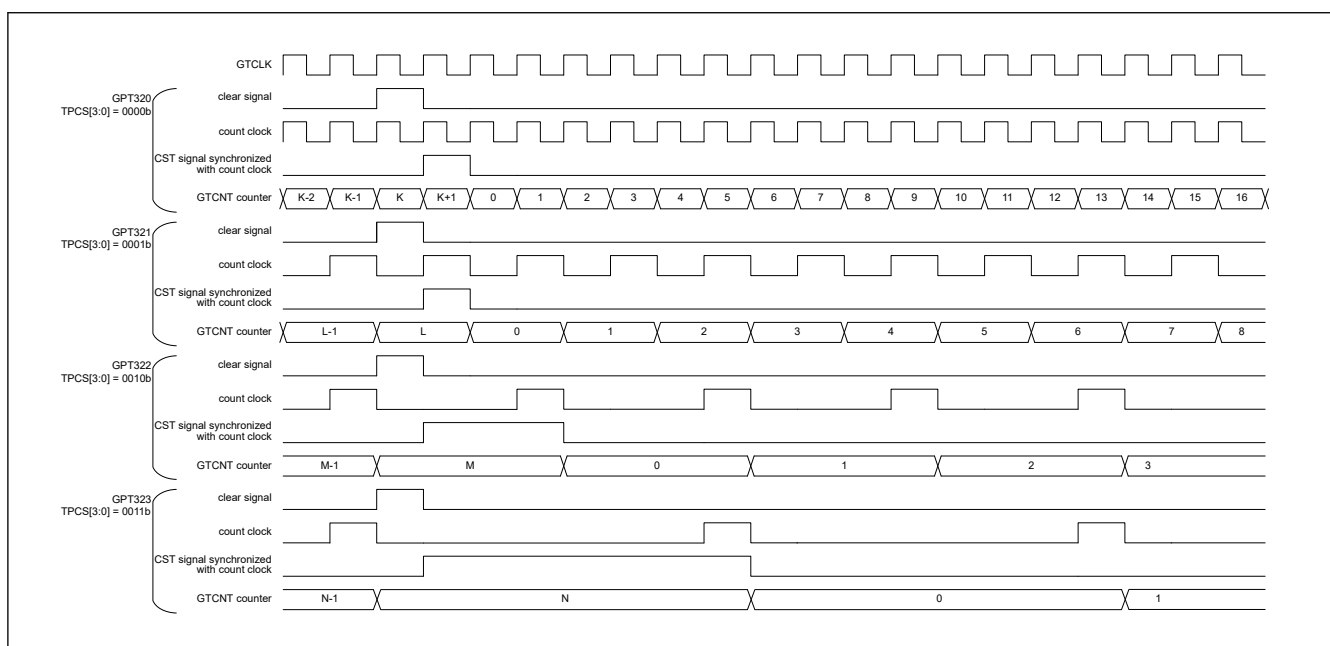

Figure 21.108 Example of Simultaneous Clearing Operation by Software (with Different Count Period)

21.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by the following hardware sources. Hardware sources that can cause a synchronized operation are external trigger input and ELC event input. Synchronized operation through the GTIOCnA and GTIOCnB pin inputs is possible by setting an ELC event due to input capture as a hardware source ($n = 0$ to 9).

Figure 21.109 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 21.49 shows the setting example.

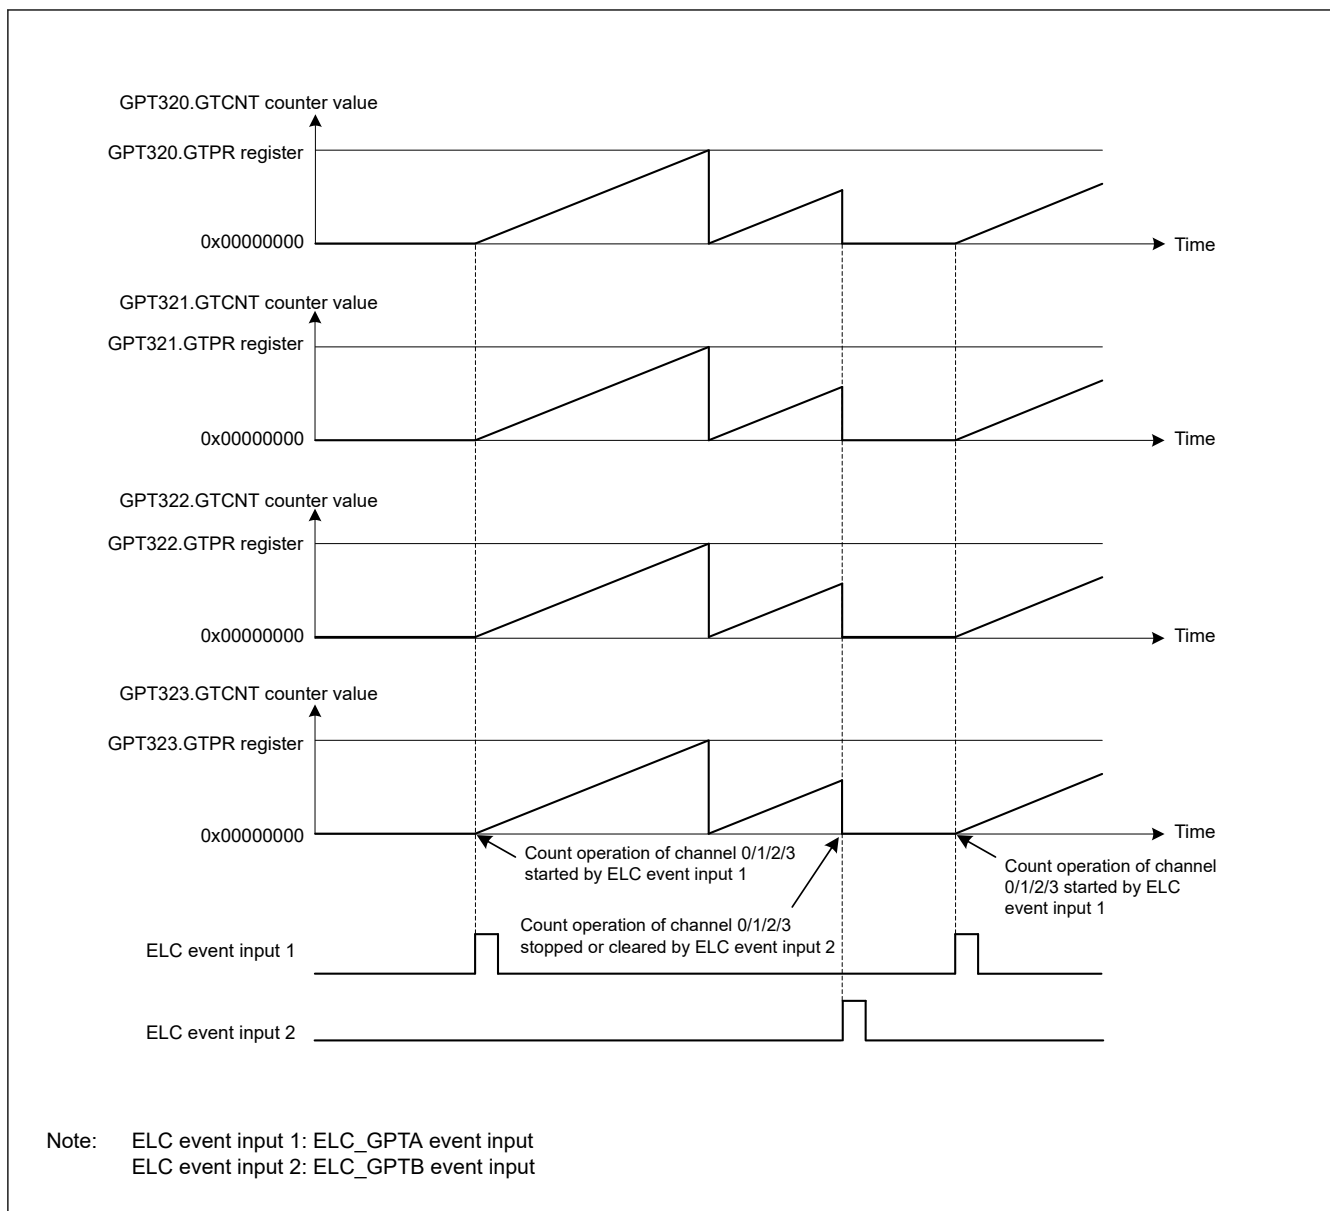

Figure 21.109 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)

Table 21.49 Example setting for simultaneous start by a hardware source (1 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.109 , 000b or 0000b (saw-wave PWM mode 1) is set. |
| 2 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.109 , after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). |
| 3 | Select count clock | Select the count clock with the GTCR.TPCS[3:0] bits. |
| 4 | Set cycle | Set the cycle in the GTPR register. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter. In Figure 21.109 , 0x00000000 is set. |
| 6 | Set hardware count start | Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.109 , GTSSR.SSELCA = 1. |

Table 21.49 Example setting for simultaneous start by a hardware source (2 of 2)

| No. | Step Name | Description |
|-----|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 7 | Set hardware count stop | Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.109 , GTPSR.PSELCB = 1. |
| 8 | Set hardware count clear | Select a hardware source for clearing count operation with the GTCSR register, and wait for count clear by the hardware source. In Figure 21.109 , GTCSR.CSELCB = 1. |
| 9 | Set hardware source operation | Set operation of the hardware source selected in the GTSSR, GTPSR, or GTCSR registers, and start, stop, or clear counting. In Figure 21.109 , ELC_GPTA input and ELC_GPTB input are set. |

21.3.8.3 Synchronous Clear Operation by Inter Channel Cooperation

The counters of other channels can be cleared at the same time with the counter clear of some channel caused by the compare match, input capture, saw wave up-count overflow, saw wave down-count underflow, and the GTIOCnA / GTIOCnB pin input selected in the GTCSR register.

The counter clear caused by GTCLR register, external trigger input and the ELC input can perform as synchronous clear when the same counter clear factor is set to target channels of synchronous clear. Therefore, these factors are not prepared for the synchronous clear operation by inter channel cooperation.

Set the channel that generates the synchronization clear source and the channel that is synchronized clear in the same synchronous set/clear group with the GTCR.SSCGRP[1:0] bits.

Similar to the synchronous operation in [section 21.3.8.1. Synchronized Operation by Software](#), if the count clock selected by the GTCR.TPCS [3:0] bits is different for each channel, the synchronous clear operation cannot be performed at exact same timing. Similar to the example of simultaneous clearing operation by software in [Figure 21.108](#), if the count clock is different for each channel, the synchronous clear factor is synchronized with the count clock of each channel before counter clearing.

When either the SSCE bit or the SSCD bit of the GTSECR register is set to 1, the GTCR.SSCEN bits of the channels that selected on the GTSECSR register are set to 0 or 1 and the GTCNT synchronous set/clear function of multiple channels are enabled or disabled at the same time.

[Table 21.50](#) shows synchronous clear factor register setting and [Figure 21.110](#) shows an example of synchronous clear operation by inter channel cooperation.

[Table 21.51](#) and [Table 21.52](#) show examples for setting synchronous clear operation by inter channel cooperation.

Table 21.50 Synchronous clear factor register setting (1 of 2)

| Synchronous clear factor by inter channel cooperation | Setting register | Setting value |
|-------------------------------------------------------|-------------------|---------------|
| GTCCRA register compare match/input capture | GTINTAD.SCFA | 1b |
| | GTCSR.CSCMSC[2:0] | 001b |
| GTCCRB register compare match/input capture | GTINTAD.SCFB | 1b |
| | GTCSR.CSCMSC[2:0] | 010b |
| GTCCRC register compare match | GTINTAD.SCFC | 1b |
| | GTCSR.CSCMSC[2:0] | 011b |

| | GTCSR.CSCMSC[2:0] | 110b |
| Overflow of saw-wave up-count | GTINTAD.SCFPO | 1b |

Table 21.50 Synchronous clear factor register setting (2 of 2)

| Synchronous clear factor by inter channel cooperation | Setting register | Setting value |
|-------------------------------------------------------|------------------|---------------|
| Underflow of saw-wave down-count | GTINTAD.SCFPU | 1b |
| Clear caused by GTIOCnA/GTIOCnB pin | GTCR.SCGTIOC | 1b |

Figure 21.110 Example of synchronous clear operation by inter channel cooperation (clear caused by GTIOCnA/GTIOCnB pin) (GPT320 is saw-wave and counter is cleared by the rising edge of the GTIOC0A, GPT321 is triangle wave, GPT324,5,6 are complementary PWM mode. GPT320,1,4,5,6 are the same synchronous set/clear group)

Table 21.51 Example for setting synchronous clear operation by inter channel cooperation (clear caused by GTIOCnA/GTIOCnB pin)

| No. | Step name | Description |
|-----|------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with GTCR.MD[2:0] or GTCR.MD[3:0]. In Figure 21.110, 000b (saw-wave PWM mode 1) is set to GPT320. 100b (triangle-wave PWM mode 1) is set to GPT321. 1100b (complementary PWM mode 1) is set to GPT324(GPT325,6). |
| 2 | Set count direction | Select the count direction (up or down) with GTUDDTYC. In Figure 21.110, for GPT320 and GPT321, lower 2 bits of GTUDDTYC is set to 11b, and then lower 2 bits of GTUDDTYC is set to 01b (up-counting). |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits of the corresponding channel. |
| 4 | Set cycle | Set the cycle in GTPR of the corresponding channel. When in complementary PWM mode, set the cycle in GTPR of the master channel. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter of the corresponding channel. |
| 6 | Inter channel cooperation synchronous clear setting (source channel) | Set the GTINTAD register, GTCR.CSCMSC[2:0] bits, and GTCR.SCGTIOC bit in the source channel of inter channel cooperation synchronous clear to enable synchronous clear. When in complementary PWM mode, set GTINTAD of the master channel. In Figure 21.110, GPT320.GTCR.SCGTIOC bit is 1. |
| 7 | Inter channel cooperation synchronous clear setting (cleared channels) | Set GTCR.CSCMSC[2:0] bits in the cleared channels of inter channel cooperation synchronous clear to select the counter clear by synchronous counter clearing group. In Figure 21.110, GTCR.CSCMSC[2:0] bits of GPT321, GPT324, GPT325, and GPT326 is 111b. |
| 8 | Set group of inter channel cooperation synchronous clear | Set the same value to GTCR.SSCGRP[1:0] bits in the source channel and cleared channels of inter channel cooperation synchronous clear and set them in the same synchronous set/clear group. When in complementary PWM mode, set GTCR of the master channel. |
| 9 | Enable inter channel cooperation synchronous clear | Set GTCR.SSCEN bits in the source channel and cleared channels of inter channel cooperation synchronous clear to enable synchronous clear. |

Table 21.52 Example for setting synchronous clear operation by inter channel cooperation (clear caused by the GTCCRA input capture using the GTIOCnA/GTIOCnB pin)

| No. | Step name | Description |
|-----|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. |
| 2 | Set count direction | Select the count direction (up or down) with GTUDDTYC. |
| 3 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits of the corresponding channel. |
| 4 | Set cycle | Set the cycle in GTPR of the corresponding channel. When in complementary PWM mode, set the cycle in GTPR of the master channel. |
| 5 | Set initial value for counter | Set the initial value in the GTCNT counter of the corresponding channel. |
| 6 | Inter channel cooperation synchronous clear setting (source channel) | Set the input capture factor using GTIOCnA/B pin to GTICASR and set the same factor as the GTICASR to the GTCR as the count clearing factor. In addition, set GTINTAD.SCFA bit = 1b and GTCR.CSCMSC[2:0] bits = 001b to enable synchronous clear by the GTCCRA input capture. When in complementary PWM mode, set GTINTAD of the master channel. |
| 7 | Inter channel cooperation synchronous clear setting (cleared channels) | Set GTCR.CSCMSC[2:0] bits in the cleared channels of inter channel cooperation synchronous clear to 111b and select the counter clear by synchronous counter clearing group. |
| 8 | Set group of inter channel cooperation synchronous clear | Set the same value to GTCR.SSCGRP[1:0] bits in the source channel and cleared channels of inter channel cooperation synchronous clear and set them in the same synchronous set/clear group. When in complementary PWM mode, set GTCR of the master channel. |
| 9 | Enable inter channel cooperation synchronous clear | Set GTCR.SSCEN bits in the source channel and cleared channels of inter channel cooperation synchronous clear to enable synchronous clear. |

21.3.8.4 Input Capture Operation by Inter Channel Cooperation

The events of compare match, input capture, saw-wave up-count overflow, saw-wave down-count underflow, the crest and trough of triangle-wave and complementary PWM mode and the count clock can be used as the input capture factor for the GTCCRM register (m = A or B) of other channels. The input capture factors by inter channel cooperation can be set by the GTICCR register of the channel that generates the input capture factor. Input capture by other channel factors can be

enabled by GTICmSR.mSOC bit (m = A or B) in the captured channels. The channels that generate input capture factors and the channels that are captured are set to the same input capture group by GTICCR.ICmGRP[1:0] bits (m = A or B).

Figure 21.111 shows an example of input capture operation by inter channel cooperation and Table 21.53 shows an example for setting input capture operation by inter channel cooperation.

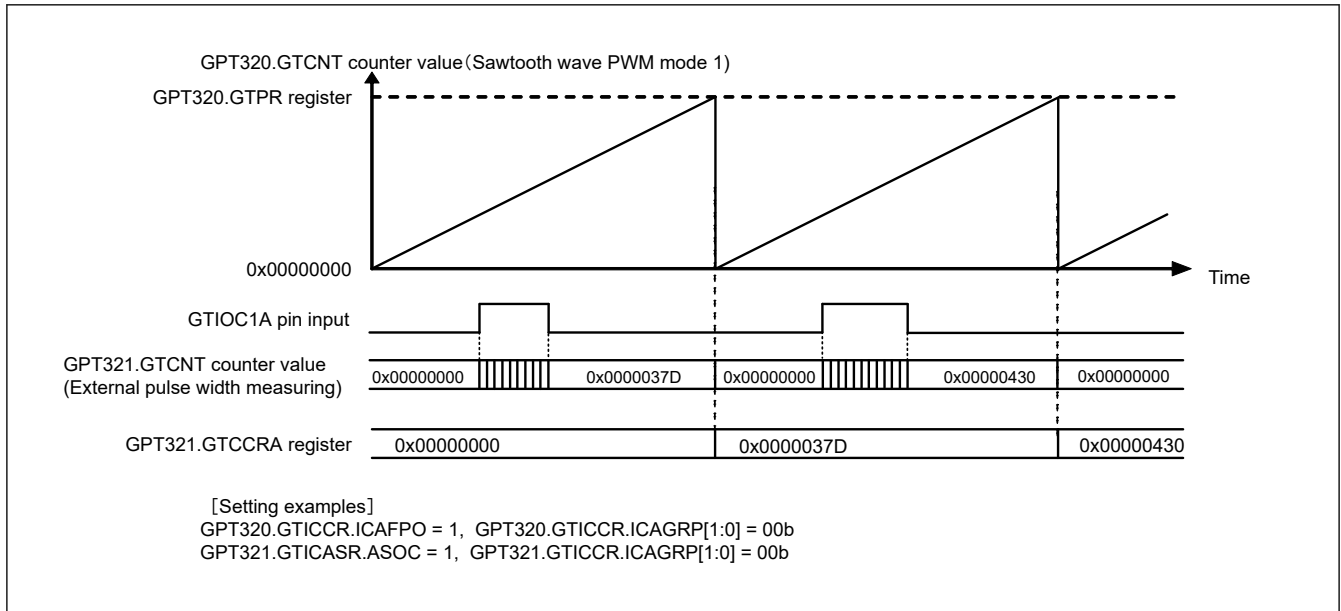

Figure 21.111 Example of input capture operation by inter channel cooperation (channel 1 is captured by the overflow of channel 0)

Table 21.53 Example for setting input capture operation by inter channel cooperation

| No. | Step name | Description |
|-----|--------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] or the GTCR.MD[3:0] bits. In Figure 21.111, GTCR.MD[2:0] = 000b or GTCR.MD[3:0] = 0000b (sawtooth-wave PWM mode 1) is set to GPTW0. |
| 2 | Set external pulse width measuring function | Enable external pulse width measuring function with the GTUPSR.USILVL[3:0] bits for up-counting operation and the GTDNSR.DSILVL[3:0] bits for down-counting operation and select the input pin and level to measure. In Figure 21.111, GTUPSR.USILVL[3:0] = 0011b (count up when GTIOCnA pin is 1). |
| 3 | Set count direction | Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.111, for GPTW0, the lower 2 bits of the GTUDDTYC register is set to 11b, and the lower 2 bits of the GTUDDTYC register is set to 01b (up-counting). |
| 4 | Select count clock | Select the count clock with GTCR.TPCS[2:0] bits or GTCR.TPCS[3:0] bits of the corresponding channel. |
| 5 | Period setting | Set a period in the GTPR register of the corresponding channel. |
| 6 | Set initial value for counter | Set the initial value in the GTCNT counter of the corresponding channel. |
| 7 | Set counter clear factor to the inter channel cooperation Input capture (cleared channels) | Set the GTCSR.CSCMSC[2:0] bit in the channel to be cleared by input capture by inter channel cooperation to 001b, 010b, and select input capture as counter clear factor. In Figure 21.111, GPTW1.GTCSR.CSCMSC[2:0] bits are 001b. |
| 8 | Inter channel cooperation input capture setting (source channel) | Set the input capture factor using the GTICCR register in the source channels of inter channel cooperation input capture. In Figure 21.111, GPTW0.GTICCR.ICAFFO bit is 1b. |
| 9 | Inter channel cooperation input capture setting (captured channels) | Set the GTICmSR.mSOC bit (m = A or B) in the captured channels to allow input capture to the GTCCRM register (m = A or B) by other channel factors. In Figure 21.111, GPTW1.GTICASR.ASOC bit is 1. |
| 10 | Set group of inter channel cooperation input capture | Set the same value to the GTICCR.ICmGRP[1:0] bits (m = A or B) in the source channels and cleared channels of inter channel cooperation input capture and set them in the same input capture group. |

21.3.9 PWM Output Operation Examples

(1) Synchronized PWM output

The GPT outputs 10×2 phases of linked PWM waveforms for a maximum of $\text{GPT} \times 10$ channels.

Figure 21.112 shows an example in which four channels perform synchronized operation in saw-wave PWM mode 1 and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

Figure 21.112 Example of synchronized PWM output

(2) 3-phase saw-wave complementary PWM output

Figure 21.113 shows an example in which three channels perform synchronized operation in saw-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

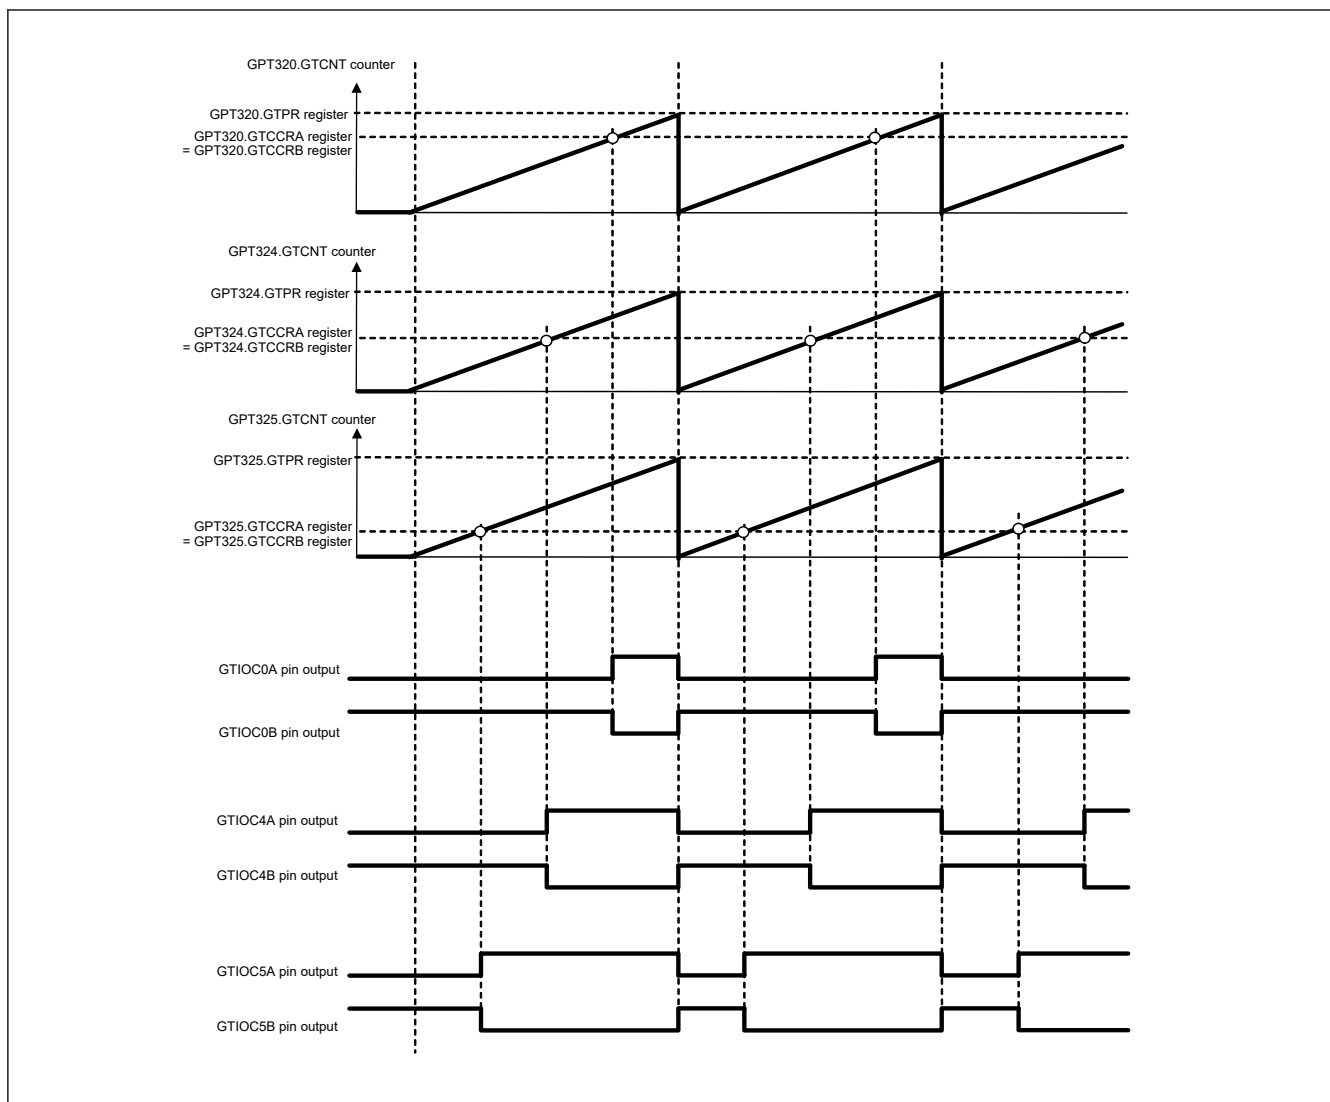

Figure 21.113 Example of 3-phase saw-wave complementary PWM output

(3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 21.114 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTIOCnB compare match, and retains the output at the cycle end.

Figure 21.114 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

(4) 3-phase triangle-wave complementary PWM output

Figure 21.115 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.115 Example of 3-phase triangle-wave complementary PWM output

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 21.116 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

Figure 21.116 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 21.117 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, toggles the output at a GTCCR A compare match, and retains the output at the cycle end. The GTIOCnB is set so that it outputs high as the initial value, toggles the output at a GTCCR B compare match, and retains the output at the cycle end.

Figure 21.117 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

21.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set, and the period count function finish interrupt request GPTn_PC is generated. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 21.118 and Figure 21.119 show examples of PWM cycle count function.

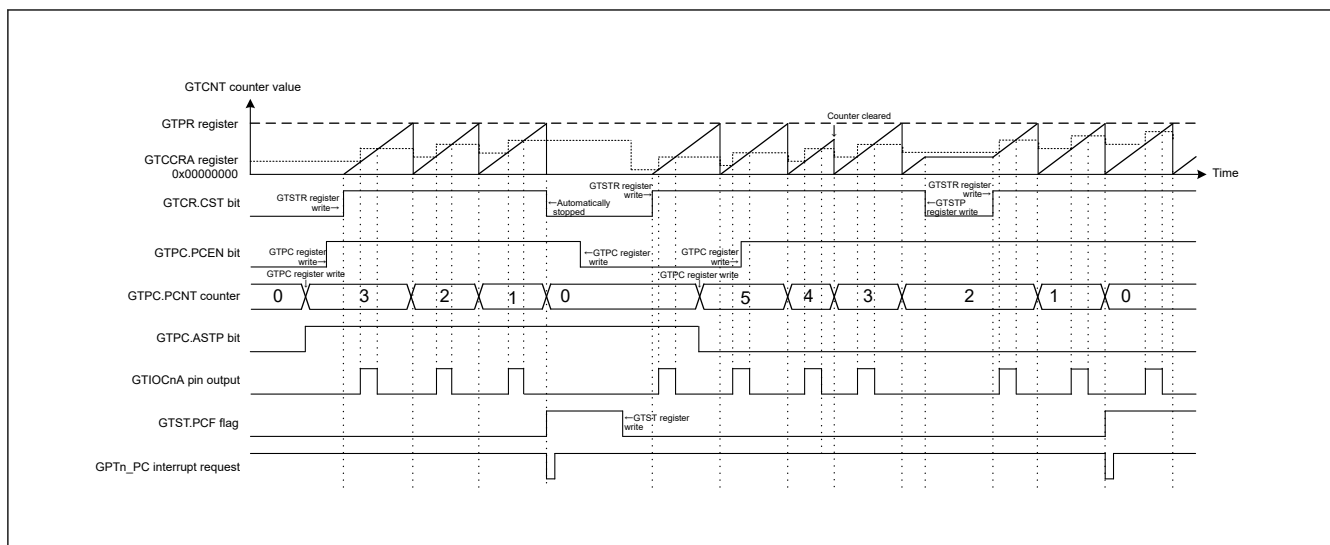

Figure 21.118 Example of PWM cycle count function (saw-wave one-shot pulse mode)

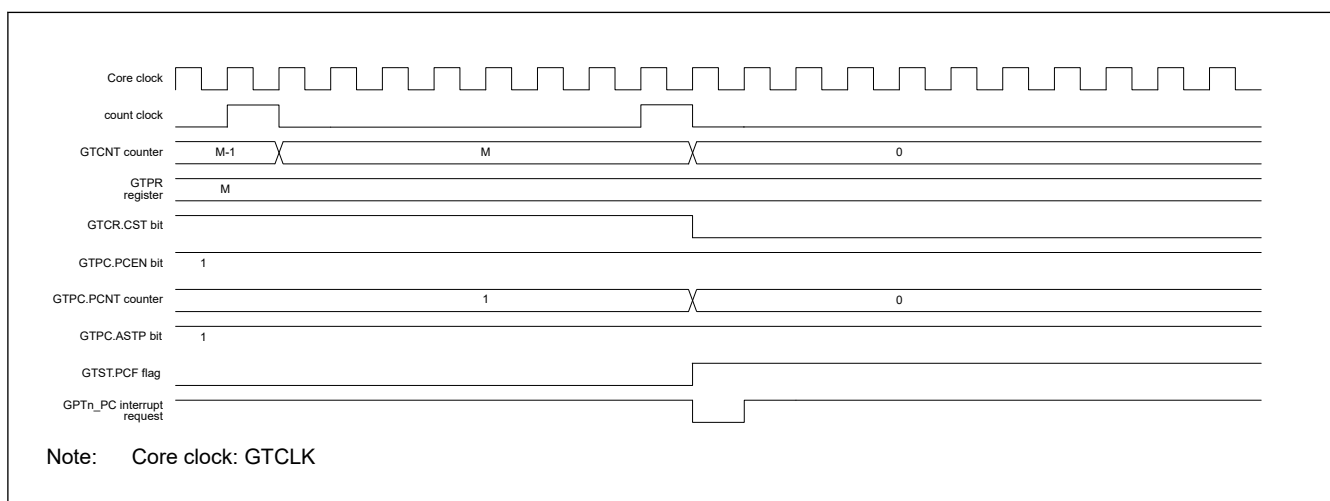

Figure 21.119 Example of the timing of operations for PWM cycle count function (saw-wave one-shot pulse mode, up-counting)

21.3.11 Phase Counting Function

The phase difference between the GTIOCnA and GTIOCnB pin ($n = 0$ to 3) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCnA and GTIOCnB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see [section 21.3.1.1. Counter operation](#).

[Figure 21.120](#) to [Figure 21.129](#) show an example of phase counting modes 1 to 5 operation when the GTIOCnA, GTIOCnB pins are used. [Table 21.54](#) to [Table 21.63](#) show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to [Figure 21.120](#) to [Figure 21.129](#).

21.3.12 External pulse width measuring function

The pulse width of GTIOcNA pin input (n = 0 to 3), GTIOcNB pin input, and GTETRGA / GTETRGB / GTETRGC / GTETRGD pin inputs can be measured.

The setting to enable or disable count-up of the GTCNT counter and the input pin and level which measured pulse width are selected by the USILVL[3:0] bits of the GTUPSR register.

The setting to enable or disable count-down of the GTCNT counter and the input pin and level which measured pulse width are selected by the DSILVL[3:0] bits of the GTDNSR register.

The setting to enable both count-up and count-down of the GTCNT counter at the same time is prohibited.

The counting operation performs periodic counting with the period of the GTPR register.

If the phase counting function and the pulse width measuring function are enabled at the same time, the pulse width measuring function does not work and the phase counting function works.

Figure 21.130, Figure 21.131 show examples of external pulse width measuring function and Table 21.64 shows example for setting external pulse width measuring function.

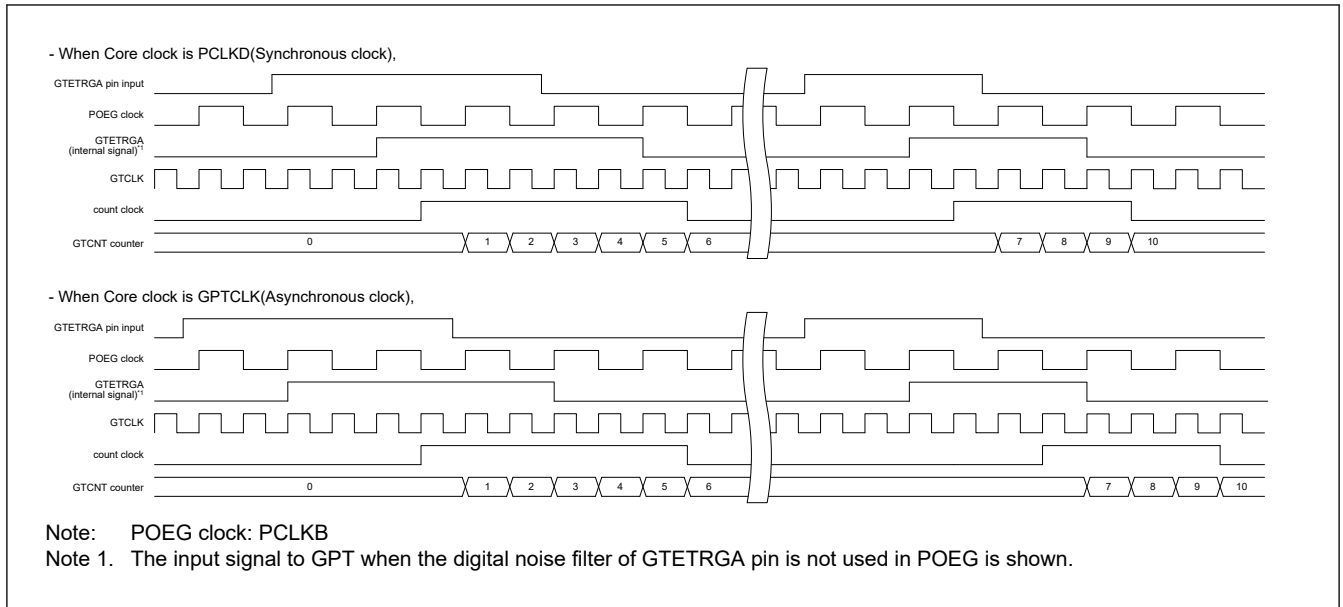

Figure 21.130 Example of External pulse width measuring function(Up-counting)

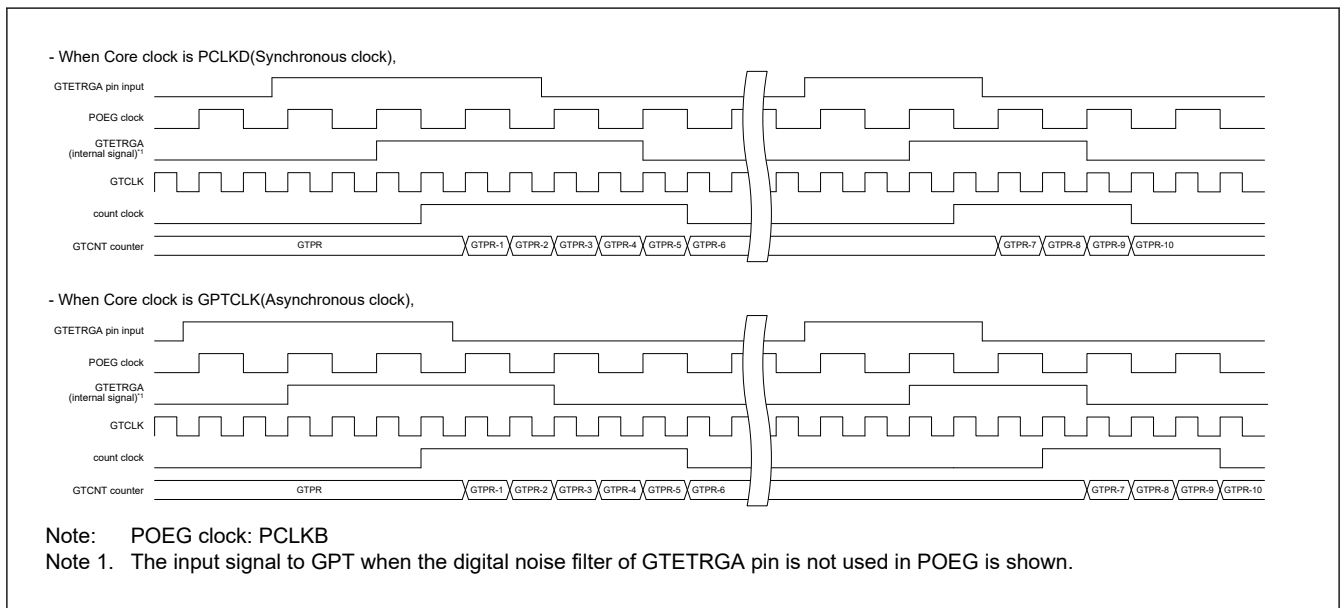

Figure 21.131 Example of External pulse width measuring function(Down-counting)

Table 21.64 Example for Setting External pulse width measuring function

| No. | Step Name | Description |
|-----|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set external pulse width measuring function | Enable external pulse width measuring function with the GTUPSR.USILVL[3:0] bits for up-counting operation and the GTDNSR.DSILVL[3:0] bits for down-counting operation and select the input pin and level to measure. In Figure 21.130, GTUPSR.USILVL[3:0] = 1001b (count up when GTETRGA pin is 1), In Figure 21.131, GTDNSR.DSILVL[3:0] = 1001b (count down when GTETRGA pin is 1) |
| 2 | Select count clock | Select the count clock with GTCR.TPCS[3:0] bits of the corresponding channel. |
| 3 | Set cycle | Set the cycle in GTPR of the corresponding channel. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter of the corresponding channel. In Figure 21.130, 0000 0000h is set. In Figure 21.131, the GTPR register value is set. |
| 5 | Start count operation | Input a pulse to the input pin to be measured to start count operation. |

21.3.13 Output Phase Switching (GPT_OPS)

GPT_OPS can easily control Brushless DC motor using Output Phase Switching Control Register (OPSCR).

GPT_OPS uses S/W setting value (OPSCR.UF, VF, WF bits) or external signals detected by the Hall element as input signals. GPT_OPS outputs either level signals or chopped signals by GPT320's PWM as the 6-phase (U-positive phase / negative phase, V-positive phase / negative phase, W-positive phase / negative phase) signals to control motor.

Figure 21.132 shows the block diagram of GPT_OPS.

The GPT_UVWEDGE signal is output signal to ELC generated by detecting the edge of input signal.

Figure 21.132 GPT_OPS Block Diagram

Figure 21.133 and Figure 21.134 show examples of GPT_OPS level output operation.

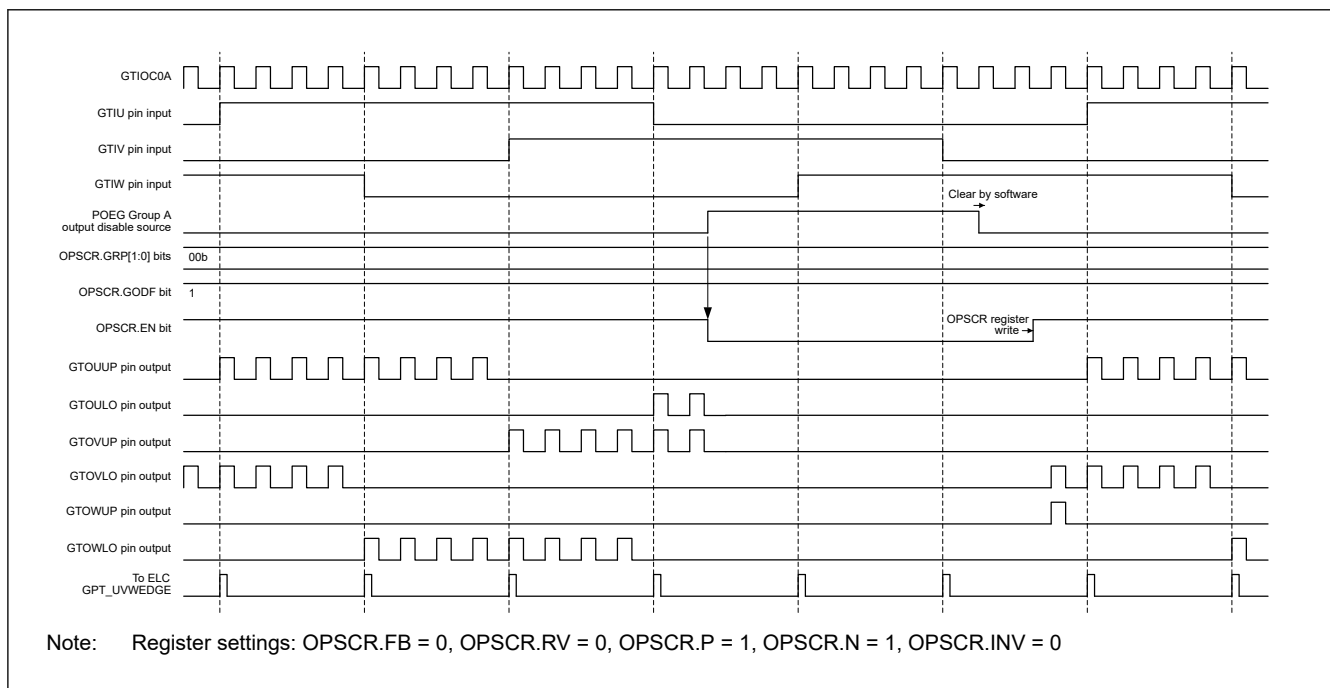

Figure 21.137 Example of GPT_OPS Output Disable Control Operation

21.3.13.1 Input Selection and Sampling

The FB bit selects either the software setting value or external input for the input signal.

When the FB bit is 0, the GTIU, GTIV, GTIW external input are selected for the input signal to GPT_OPS after synchronization with the GPT core clock (GTCLK) and noise filtering.

When the FB bit is 1, the software setting value (UF, VF, WF bits) are selected for the input signal to GPT_OPS.

The selected input signals are sampled by the method selected by the ALIGN bit, and they are treated as input phase of GPT_OPS.

When the ALIGN bit is 0, the input signals are sampled by GTCLK.

When the ALIGN bit is 1, the input signals are sampled by the falling edge of GTIOC0A pin output.

The signals after sampling can be read by the U, V, W bits.

Table 21.65 shows the input selection by the FB bit and sampling method by the ALIGN bit.

Table 21.65 Input Selection and Sampling Method

| OPSCR Register | | Input Selection Sampling Method | Input Phase (GPT_OPS internal signal) |
|----------------|-----------|-------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| FB bit | ALIGN bit | | |
| 0 | 0 | GTIU, GTIV, GTIW external input GTCLK sampling | Input U-phase (gtu_sync) Input V-phase (gtv_sync) Input W-phase (gtw_sync) |
| | 1 | GTIU, GTIV, GTIW external input GTIOC0A falling edge sampling | |
| 1 | 0 | Software setting value UF, VF, WF bits GTCLK sampling | |
| | 1 | Software setting value UF, VF, WF bits GTIOC0A falling edge sampling | |

21.3.13.2 Rotation Direction Control

When the rotation direction is reverse (RV bit = 1), the input phase is inverted.

21.3.13.3 Input phase decode

The 6-phase signals by decoding input phase after rotation direction control are generated.

Table 21.66 and Table 21.67 show the decode tables of input phase to rotate motor in forward (RV = 0) and reverse (RV = 1).

Table 21.66 The Decode Table of Input Phase (Forward Rotation)

| | Input Phase | | | Input Phase after Rotation Direction Control | | | 6-Phase Signals | | | | | |
|--|----------------------|----------------------|----------------------|----------------------------------------------|-------------------------|-------------------------|------------------|------------------|------------------|------------------|------------------|------------------|
| | U Phase | V Phase | W Phase | U Phase | V Phase | W Phase | U Positive Phase | U Negative Phase | V Positive Phase | V Negative Phase | W Positive Phase | W Negative Phase |
| | gtu_syn _c | gtv_syn _c | gtw_syn _c | gtu_syn _{c_rv} | gtv_syn _{c_rv} | gtw_syn _{c_rv} | gtuup_en | gtulo_en | gtvup_en | gtvlo_en | gtwup_en | gtwlo_en |
| | 1 | 0 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| | 0 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |

| | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 0 |
| | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 0 |
| | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 1 |
| | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

21.3.13.4 Output selection control

The EN, P, N, INV bits select the output wave.

The EN bit enables output of the 6-phase output. When the EN bit is 1, output of the 6-phase output is enabled. When the EN bit is 0, the external pin output is Hi-Z.

The P, N bits select whether chopping positive and negative phase are performed or not. When P, N bits are 1, chopping is performed by GTIOC0A pin output.

When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

The INV bit selects the polarity (either positive logic or negative logic) of phase output.

Table 21.68 and Table 21.69, show the output selection control method for positive and negative phase output.

Table 21.68 Output Selection Control Method (Positive Phase)

| EN bit | P bit | INV bit | GTOUUP / GTOVUP / GTOWUP |
|--------|-------|---------|----------------------------------------------------------------------------------------------------------------|
| 0 | x | x | 0 (External pin output is Hi-Z) |
| 1 | 0 | 0 | Positive logic level output (gtuup_en) (gtvup_en) (gtwup_en) |
| 1 | 0 | 1 | Negative logic level output (~gtuup_en) (~gtvup_en) (~gtwup_en) |
| 1 | 1 | 0 | Positive logic chopped output (GTIOC0A & gtuup_en) (GTIOC0A & gtvup_en) (GTIOC0A & gtwup_en) |
| 1 | 1 | 1 | Negative logic chopped output (~(GTIOC0A & gtuup_en)) (~(GTIOC0A & gtvup_en)) (~(GTIOC0A & gtwup_en)) |

Table 21.69 Output Selection Control Method (Negative Phase)

| EN bit | N bit | INV bit | GTOULO / GTOVLO / GTOWLO |
|--------|-------|---------|----------------------------------------------------------------------------------------------------------------|
| 0 | x | x | 0 (External pin output is Hi-Z) |
| 1 | 0 | 0 | Positive logic level output (gtulo_en) (gtvlo_en) (gtwlo_en) |
| 1 | 0 | 1 | Negative logic level output (~gtulo_en) (~gtvlo_en) (~gtwlo_en) |
| 1 | 1 | 0 | Positive logic chopped output (GTIOC0A & gtulo_en) (GTIOC0A & gtvlo_en) (GTIOC0A & gtwlo_en) |
| 1 | 1 | 1 | Negative logic chopped output (~(GTIOC0A & gtulo_en)) (~(GTIOC0A & gtvlo_en)) (~(GTIOC0A & gtwlo_en)) |

21.3.13.5 Output Selection Control (Group Output Disable Function)

When $GODF = 1$ and signal value selected by the GRP bit is Hi (Output Disable Request), GPT_OPS's output pins are changed to Hi-Z asynchronously and the OPSCR.EN bit is cleared to 0 by the output disable request signal synchronized with GTCLK.

For the return, after clearing the Output Disable Request by software, set the EN bit to 1.

The timing of EN bit cleared to 0 is 3 GTCLK cycles after generating the output disable request. In order to perform the output disable control surely, the output disable request flag in POEG should be cleared in the timing that terminating the output disable request is at least 4 GTCLK cycles after generating the output disable request.

The example of the operation of the group output disable control, see the above-mentioned [Figure 21.137](#).

21.3.13.6 Event Link Controller (ELC) Output

The logical sum of the pulse detected by rising and falling edge of U, V, W phase input is output to the event link controller (ELC). When the high level period of input phase is short, there are cases that the detected edge is not transmitted to the ELC correctly because of the logical sum.

21.3.13.7 GPT_OPS Start Operation Setting Flow

Table 21.70 Example for Setting of GPT_OPS Start Operation

| No. | Step Name | Description |
|-----|------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set Operation Mode of GPT320 | Set the PWM output operation mode of GPT320. See section 21.3.3. PWM Output Operating Mode |
| 2 | Start Count Operation of GTP320 | Start count operation of GPT320, and outputs PWM waveform. |
| 3 | Set GPT_OPS Input Condition | <ul style="list-style-type: none"> When the soft setting is selected, set the soft setting values in the UF, VF, WF bits. When the external input is selected, if necessary, use noise filtering. Select the sampling clock for external input into NFCS[1:0] bits, and set NFEN bit to 1. |
| 4 | Select GPT_OPS Input phase and Alignment | Select input phase by FB bit. Select alignment of input phase by ALIGN bit. |
| 5 | Set GPT_OPS Output phase Condition | Set the rotation direction by RV bit. Select whether chopping is performed or not by P, N bits. Select the output polarity by INV bit. |
| 6 | Set GPT_OPS Output Disable Condition | Select the error group by GRP[1:0] bits Set ON/OFF of the group output disable function by GODF bit. |
| 7 | Set GPT_OPS Operation | Set EN bit to 1 to output the 6-phase output to drive the brushless DC motor. |

21.3.14 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

[Figure 21.138](#) shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with GTCLK. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 GTCLK is selected, the output enable signal is also delayed with 1 GTCLK and input to the output disable control.

When the same signal ($C = A$ or $D = B$) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

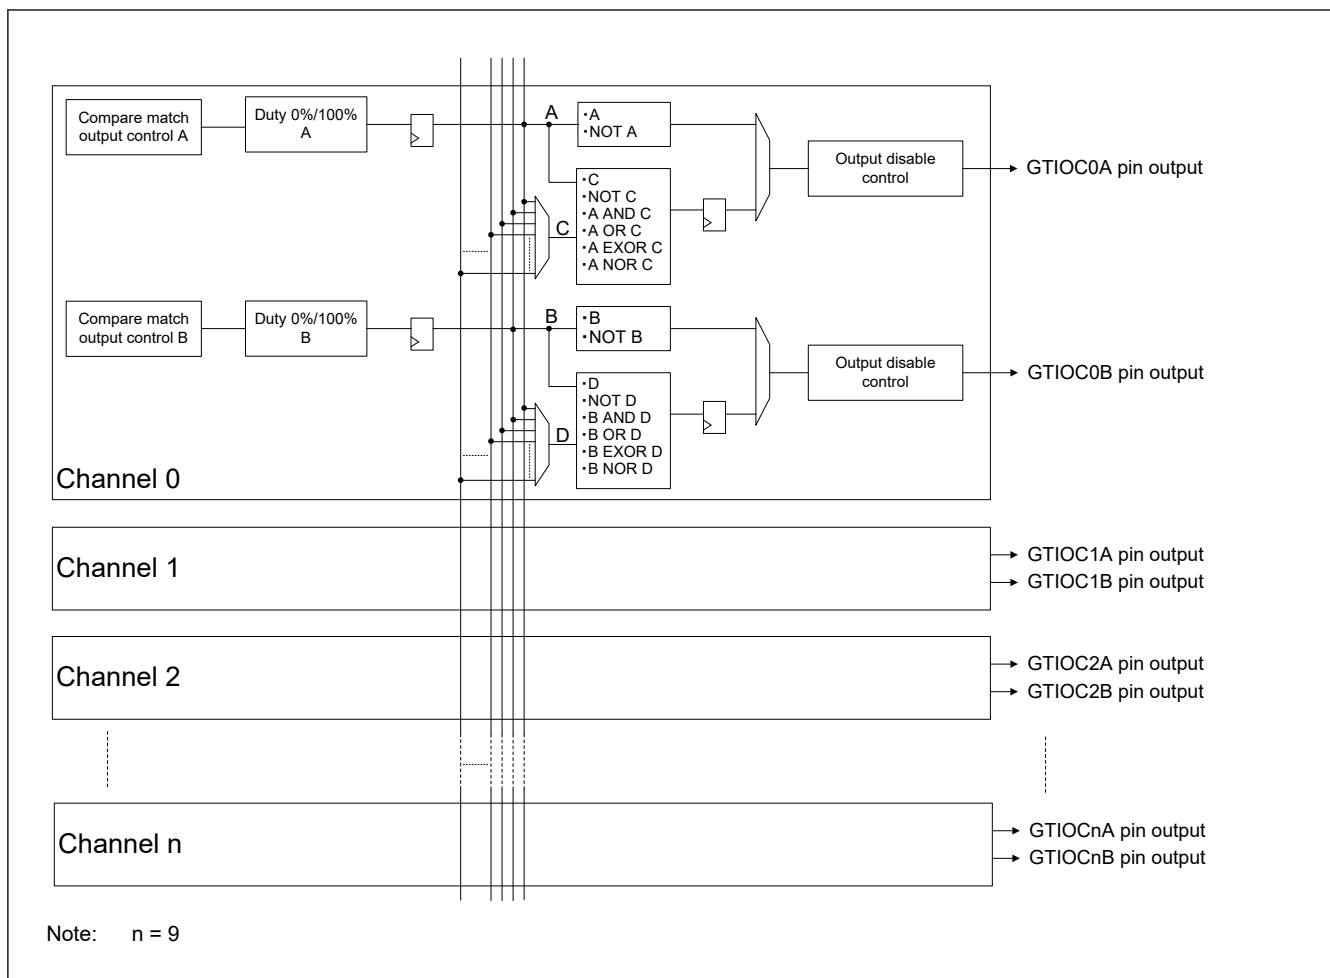

Figure 21.138 Block Diagram of Inter Channel Logical Operation

Figure 21.139 shows an example of inter channel logical operation.

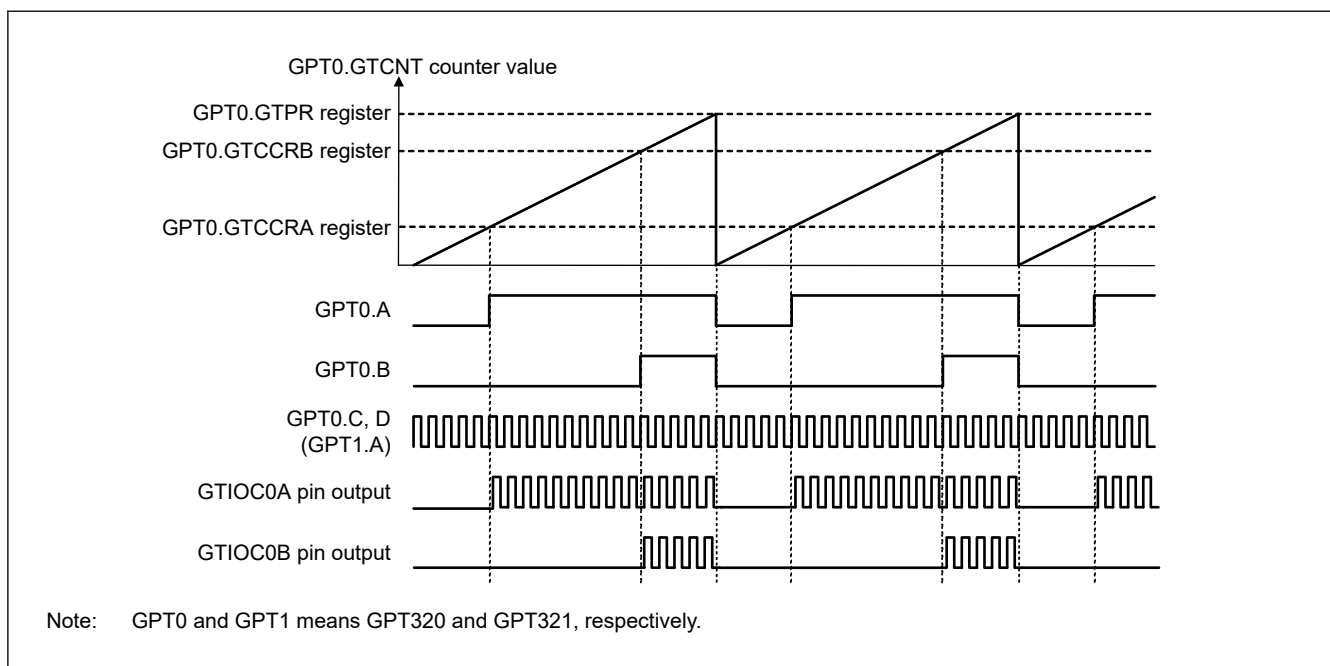

Figure 21.139 Example of Inter Channel Logical Operation

21.4 Interrupt Sources

21.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTADTR compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1, and an interrupt request is generated. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

[Table 21.71](#) lists the GPT interrupt sources.

Table 21.71 Interrupt sources

| Channel | Name | Interrupt source | Interrupt flag | DTC activation |
|------------|-------------|---------------------------------------------------|--------------------------------------|----------------|
| n = 0 to 9 | GPTn_CCMPA | GPT32n.GTCCRA input capture/compare match | GTST[0] (TCFA) | Possible |
| | GPTn_CCMPB | GPT32n.GTCCRB input capture/compare match | GTST[1] (TCFB) | Possible |
| | GPTn_CMPC | GPT32n.GTCCRC compare match | GTST[2] (TCFC) | Possible |
| | GPTn_CMPD | GPT32n.GTCCRD compare match | GTST[3] (TCFD) | Possible |
| | GPTn_CMPE | GPT32n.GTCCRE compare match | GTST[4] (TCFE) | Possible |
| | GPTn_CMPF | GPT32n.GTCCRF compare match | GTST[5] (TCFF) | Possible |
| | GPTn_OVF | GPT32n.GTCNT overflow (GPT32n.GTPR compare match) | GTST[6] (TCFPO) | Possible |
| | GPTn_UDF | GPT32n.GTCNT underflow | GTST[7] (TCFPU) | Possible |
| | GPTn_ADTRGA | GPT32n.GTADTRA compare match | GTST[17:16] (ADTRADE, ADTRAUF) | Possible |
| | GPTn_ADTRGB | GPT32n.GTADTRB compare match | GTST[19:18] (ADTRBDF, ADTRBUF) | Possible |
| | GPTn_PC | Period count function finish (n = 0 to 3) | GTST[31] (PCF) | Possible |

(1) GPTn_CCMPA interrupt (n = 0 to 9)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register. In complementary PWM mode, GTCCRA register does not function as an input capture register.

(2) GPTn_CCMPB interrupt (n = 0 to 9)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register. In complementary PWM mode, GTCCRB register does not function as a compare match register.
- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register. In complementary PWM mode, GTCCRB register does not function as an input capture register.

(3) GPTn_CMPC interrupt (n = 0 to 9)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, GTCNT counter value of master channel) matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[3:0] = 0001b (saw-wave one-shot pulse mode)
- GTCR.MD[3:0] = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(4) GPTn_CMPD interrupt (n = 0 to 9)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[3:0] = 0001b (saw-wave one-shot pulse mode)
- GTCR.MD[3:0] = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(5) GPTn_CMPE interrupt (n = 0 to 9)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[3:0] = 0001b (saw-wave one-shot pulse mode)
- GTCR.MD[3:0] = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

(6) GPTn_CMPF interrupt (n = 0 to 9)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value (in complementary PWM mode, the GTCNT counter value of master channel) matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[3:0] = 0001b (saw-wave one-shot pulse mode)
- GTCR.MD[3:0] = 0110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(7) GPTn_OVF interrupt (n = 0 to 9)

An interrupt request is generated in the following conditions:

- In saw-wave PWM mode 1 and saw-wave one-shot pulse mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In saw-wave PWM mode 2, interrupt requests are enabled at overflows (GTCNT counter value changes from GTCCRm (m = A to F) register value selected with GTCSR.CSCMSC[2:0] bits to 0) or the time when GTCNT counter value matches GTPR register value.
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- In complementary PWM mode, interrupt requests are enabled at crests (GTCNT counter value of master channel changes from GTPR register value to GTPR register value minus 1).
- In counting by hardware sources (include external pulse width measuring function), an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(8) GPTn_UDF interrupt (n = 0 to 9)

An interrupt request is generated in the following conditions.

- In saw-wave PWM mode 1 and saw-wave one-shot pulse mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In complementary PWM mode, interrupt requests are enabled at troughs (GTCNT counter value of master channel changes from 0 to 1).
- In counting by hardware sources (include external pulse width measuring function), underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see [section 21.2.16. GTST : General PWM Timer Status Register](#).

(9) GPTn_ADTRGA interrupt (n = 0 to 9)

When the GTCNT counter value matches with GTADTRA, an interrupt request is generated under the following condition.

- In Up-counting, the interrupt enable bit (ADTRAUEN) in GTINTAD is 1.
- In Down-counting, the interrupt enable bit (ADTRADEN) in GTINTAD is 1.
In event count operation performing, this interrupt request isn't generated.

(10) GPTn_ADTRGB interrupt (n = 0 to 9)

When the GTCNT counter value matches with GTADTRB, an interrupt is generated under the following condition.

- In Up-counting, the interrupt enable bit (ADTRBUEN) in GTINTAD is 1.
- In Down-counting, the interrupt enable bit (ADTRBDEN) in GTINTAD is 1.
In event count operation performing, this interrupt request isn't generated.

(11) GPTn_PC Interrupt (n = 0 to 3)

When the GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1, an interrupt request is generated at the end of cycle.

21.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#), [section 15, DMA Controller \(DMAC\)](#), and [section 16, Data Transfer Controller \(DTC\)](#).

21.4.3 Interrupt and A/D Conversion Start Request Skipping Function

21.4.3.1 Interrupt Skipping Function by GTITC Register

By setting the GTITC register, the GTCNT counter overflow (GTPR register compare match) interrupt (GPTn_OVF) and underflow interrupt (GPTn_UDF) can be skipped. Other interrupts and A/D conversion start request signals can be skipped in coordination with the GPTn_OVF/GPTn_UDF skipping function. When the interrupt is skipped, the updating of relevant status flag is also skipped. The interrupt skipping is continued even if the status flag is set to 1.

The interrupt skipping function is related only to the GTITC register setting, and is not related to setting of the GTINTAD register interrupt enable bit. The interrupt skipping is continued even if the interrupt is disabled with GTINTAD register setting.

When both troughs and crests are counted and skipped in triangle-wave mode, if the number of times of skipping is odd, GPTn_OVF/GPTn_UDF interrupt requests cannot be generated at troughs only or at crests only depending on the skipping counter start timing. Therefore, in order to count both troughs and crests and generate the GPTn_OVF/GPTn_UDF interrupts at troughs only or crests only in triangle-wave mode, the number of times of skipping should be even.

Similarly, in saw-wave mode, when both overflows and underflows are counted and skipped with the count direction changed, GPTn_OVF/GPTn_UDF interrupt requests are sometimes not generated at overflows only or at underflows only. Therefore, in order to count both overflows and underflows with the count direction changed and generate the GPTn_OVF/GPTn_UDF interrupts at overflows only or underflows only in saw-wave mode, the skipping state should be carefully checked before using.

When changing the skipping count, be sure to release the skipping count setting (GTITC.IVTC[1:0] bits = 00b).

Figure 21.140 to Figure 21.145 show examples of skipping function operation.

Figure 21.140 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Crests, Skipping Count: 2)

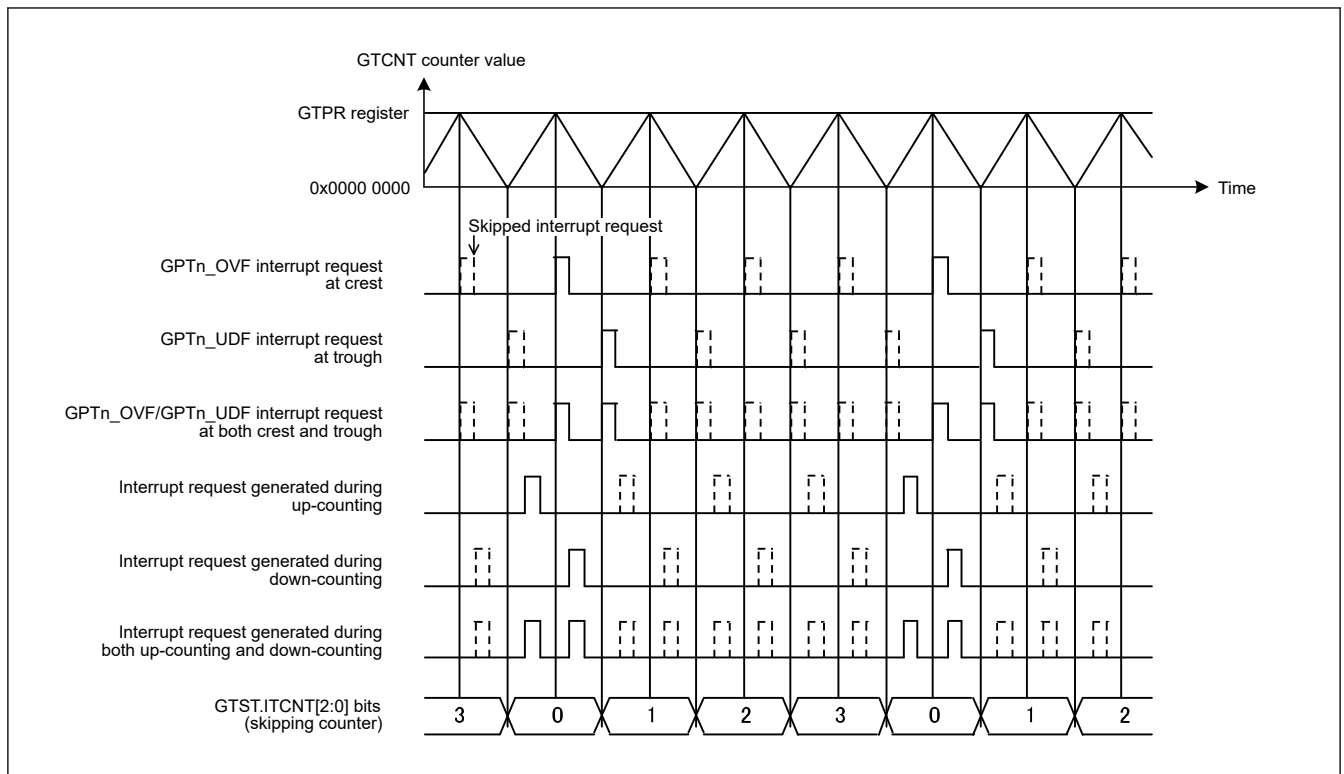

Figure 21.141 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Troughs, Skipping Count: 3)

Figure 21.143 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Up-Counting)

Figure 21.144 Example of Interrupt Skipping Function Operation (Triangle Waves, Counting and Skipping Both Troughs and Crests, Skipping Count: 3, Skipping Started at Down-Counting)

Figure 21.145 Example of Interrupt Skipping Function Operation (Saw Waves, Operation with Count Direction Changed, Counting and Skipping Both Overflows and Underflows, Skipping Count: 4)

21.4.3.2 Extended Interrupt Skipping Function

Overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer can be skipped by counting the GTCNT counter overflow or underflow based on settings of the GTEITC, GTEITLI1, GTEITLI2 and GTEITLB registers.

Overflow/underflow interrupt, compare match/input capture interrupt, A/D conversion start request, and buffer transfer can individually be set for skipping and the skipping period using the GTEITLI1, GTEITLI2, and GTEITLB registers.

The skipping period is set, related to the operation of the two independent extended interrupt skipping counters (EITCNT1[3:0] and EITCNT2[3:0] bits in the GTEITC registers), as a period that either of the counter value for such skipping counters is other than 0 or other than the skipping count. The skipping period can also be set as a period that the both skipping counters are set as other than 0 or other than the skipping count for the counter value.

Figure 21.146 shows the counter operation for interrupt skipping by the GTITC register and extended interrupt skipping.

The counter operation for extended interrupt skipping is set by the GTEITC register.

The EITCNT1[3:0] bits are set for 0 as initial value and then they count the count source (in Figure 21.146, a crest is selected) selected by the extended interrupt counter 1 count source select bit (GTEITC.EIVTC1[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in Figure 21.146, count is 2) set by the extended interrupt skipping 1 skipping count setting bit (EIVTT1[3:0] bits) is achieved.

The EITCNT2[3:0] bits can be set for the initial value and they count the count source (in Figure 21.146, a trough is selected) selected by the extended interrupt counter 2 count source select bit (EIVTC2[1:0] bits), and repeat the count operation which return to 0 when the skipping count (in Figure 21.146 count is 2) set by the EIVTT2[3:0] bits is achieved. The initial value is set when the GTEITC register is written by the access of upper 16 bits or 32 bits while the setting for the extended interrupt skipping counter 2 is not counted (EIVTC2[1:0] bits are 00b) and when the write value to the EIVTC2[1:0] bits is other than 00b. When the initial value is set, the write value to the extended interrupt skipping counter 2 initial value bits (EITCNT2IV[3:0] bits) are set as the initial value for the EITCNT2[3:0] bits.

The extended interrupt skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The interrupt skipping count counter (GTST.ITCNT[2:0] bits) for the interrupt skipping function set by the GTITC register is reset to 000b when the GTCNT counter operation is stopped; however, the EITCNT1[3:0] and EITCNT2[3:0] bits for the extended interrupt skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped. When values for the EITCNT1[3:0] and EITCNT2[3:0] bits are to be reset (0000b), set the EIVTC1[1:0] and EIVTC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the EIVTC1[1:0] bit or the EIVTC2[1:0] bit to 00b).

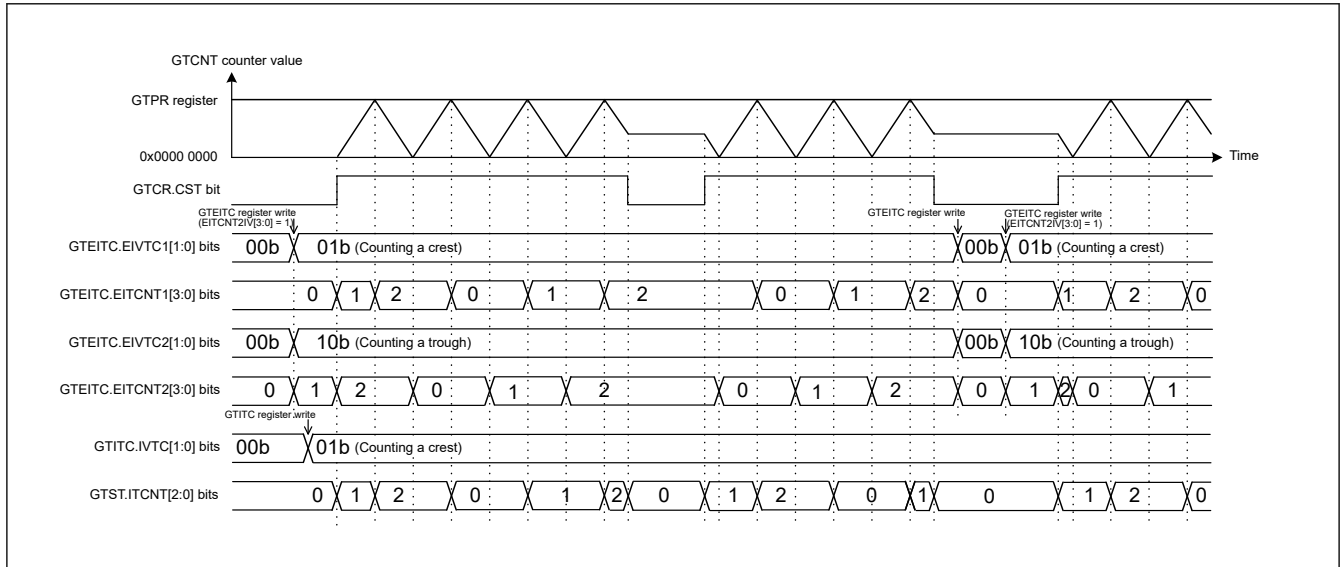

Figure 21.146 Example of Counter Operation for Interrupt Skipping

Interrupt skipping by the GTEITL1 register and A/D conversion start request skipping by the GTEITL2 register can be performed simultaneously with skipping by the GTITC register or GTADCMSC register. A skipping period in this case is represented by OR-ed skipping periods of respective registers.

Figure 21.147 shows corresponding interrupt skipping operations by different registers are performed simultaneously.

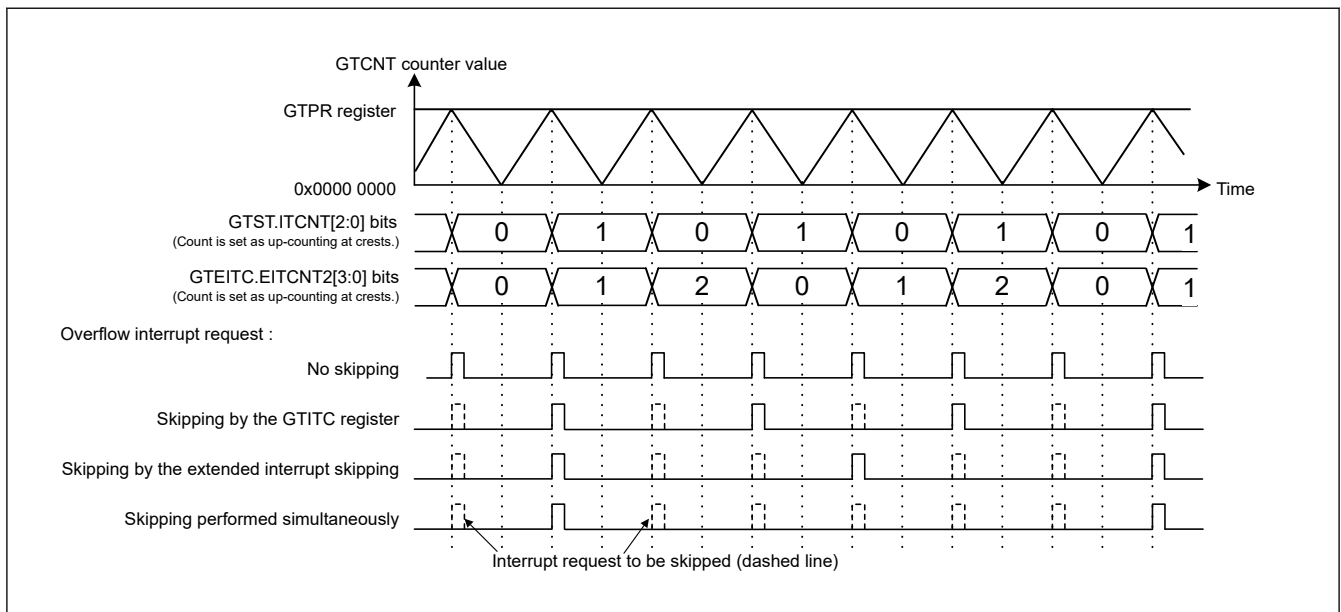

Figure 21.147 Example of Interrupt Skipping Operation (Skipping by the GTITC Register: Counting crests, Extended Interrupt Skipping: EIVTC1[1:0] bits = 00b, EIVTC2[1:0] bits = 01b, EITLV[2:0] bits = 010b)

When the extended interrupt skipping selected by GTEITL1 is performed, the relevant status flag is also skipped. The skipping function is continued even if the status flag is set to 1.

When A/D conversion start request skipping selected by GTEITL2 is performed, the relevant status flag is also skipped. The skipping function is continued even if the status flag is set to 1.

Skipping of updating of status flag and ELC event source outputs corresponding to A/D conversion start request for which skipping can be set up in the GTEITL2 register is only based on the settings of the GTITC register and the extended interrupt skipping register, and has no connection with the setting of A/D conversion start request enable bit in the

GTINTAD register. The A/D conversion start request enable bit is used only for A/D conversion start request output(ELC event source output) after skipping.

A buffer transfer skipping by the GTEITLB register is performed in all of buffer operation which is enabled in the GTBER and GTDTCR registers and GTBER2 register, or all buffer operations performed by saw-wave one-shot pulse mode or triangle-wave PWM mode 3 or complementary PWM mode (excludes buffer transfer from GTCCRC, GTCCRE to GTCCRA).

An interrupt skipping and a buffer transfer skipping are operated individually. An interrupt output without performing a buffer transfer and performing a buffer transfer without an interrupt output can also be operated.

Figure 21.148 to Figure 21.155 show examples of extended skipping function operation.

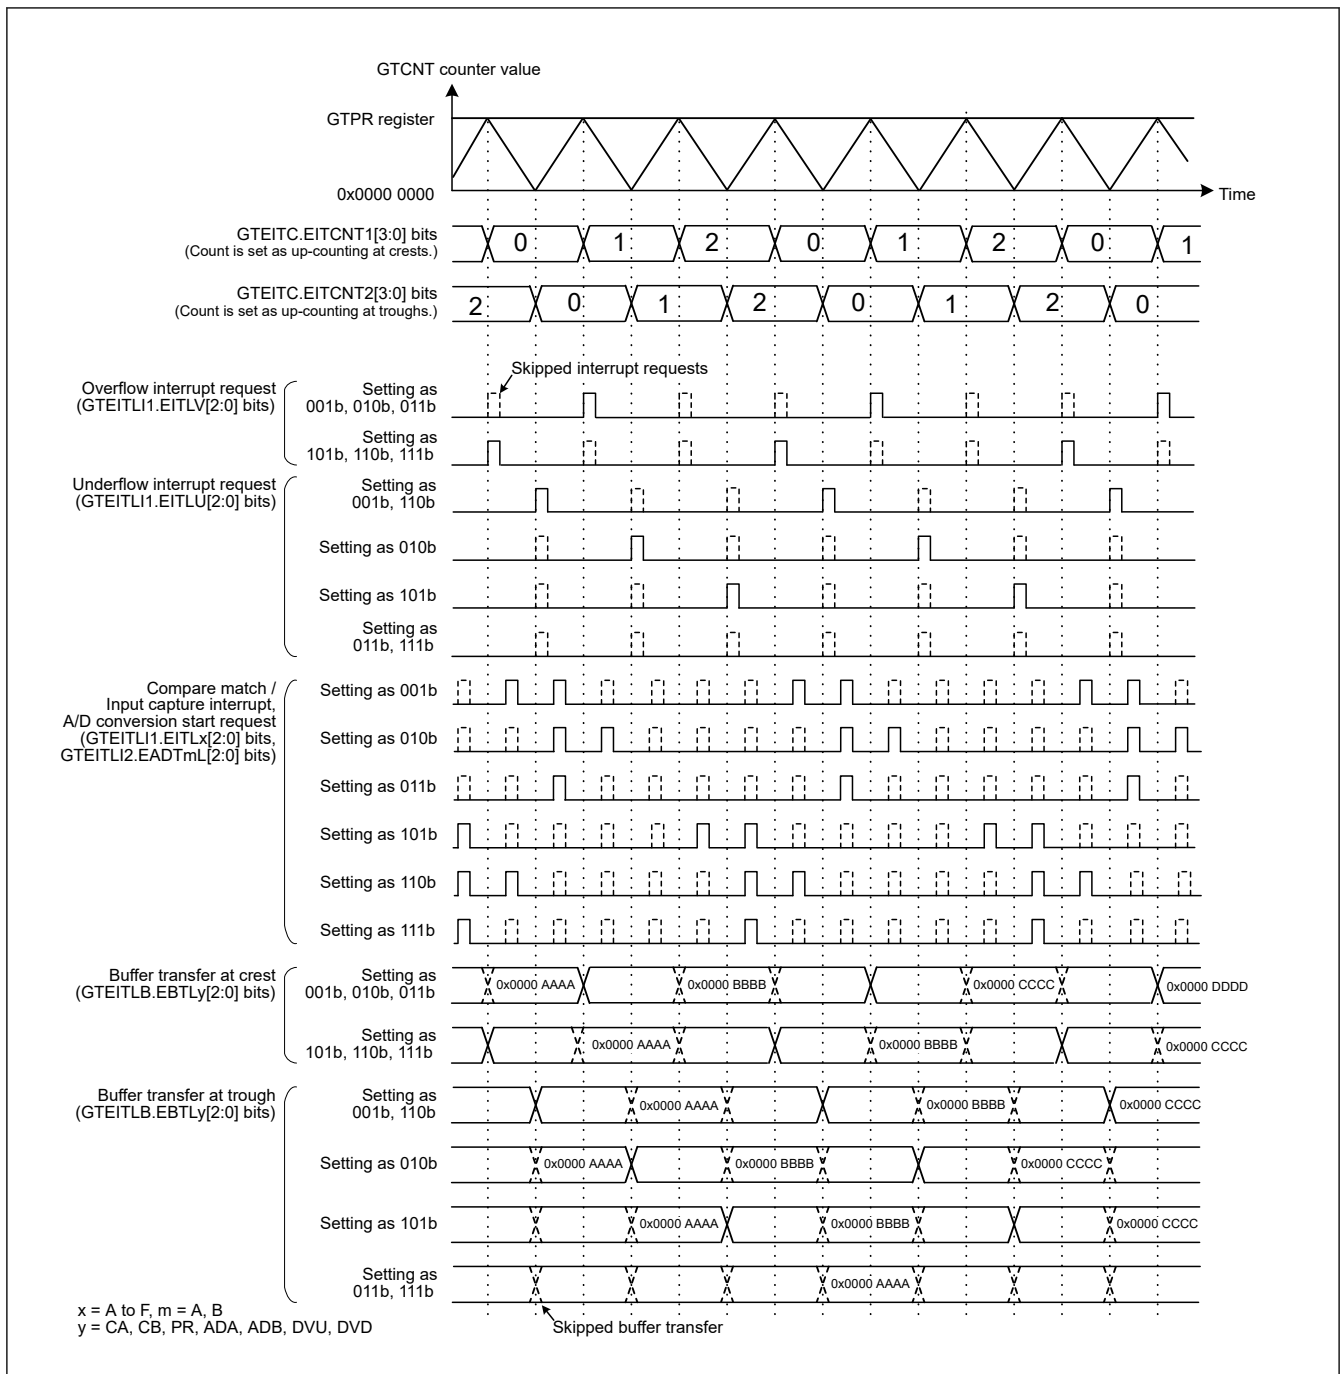

Figure 21.148 Example of Extended Interrupt Skipping Function (Triangle wave, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Troughs, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0)

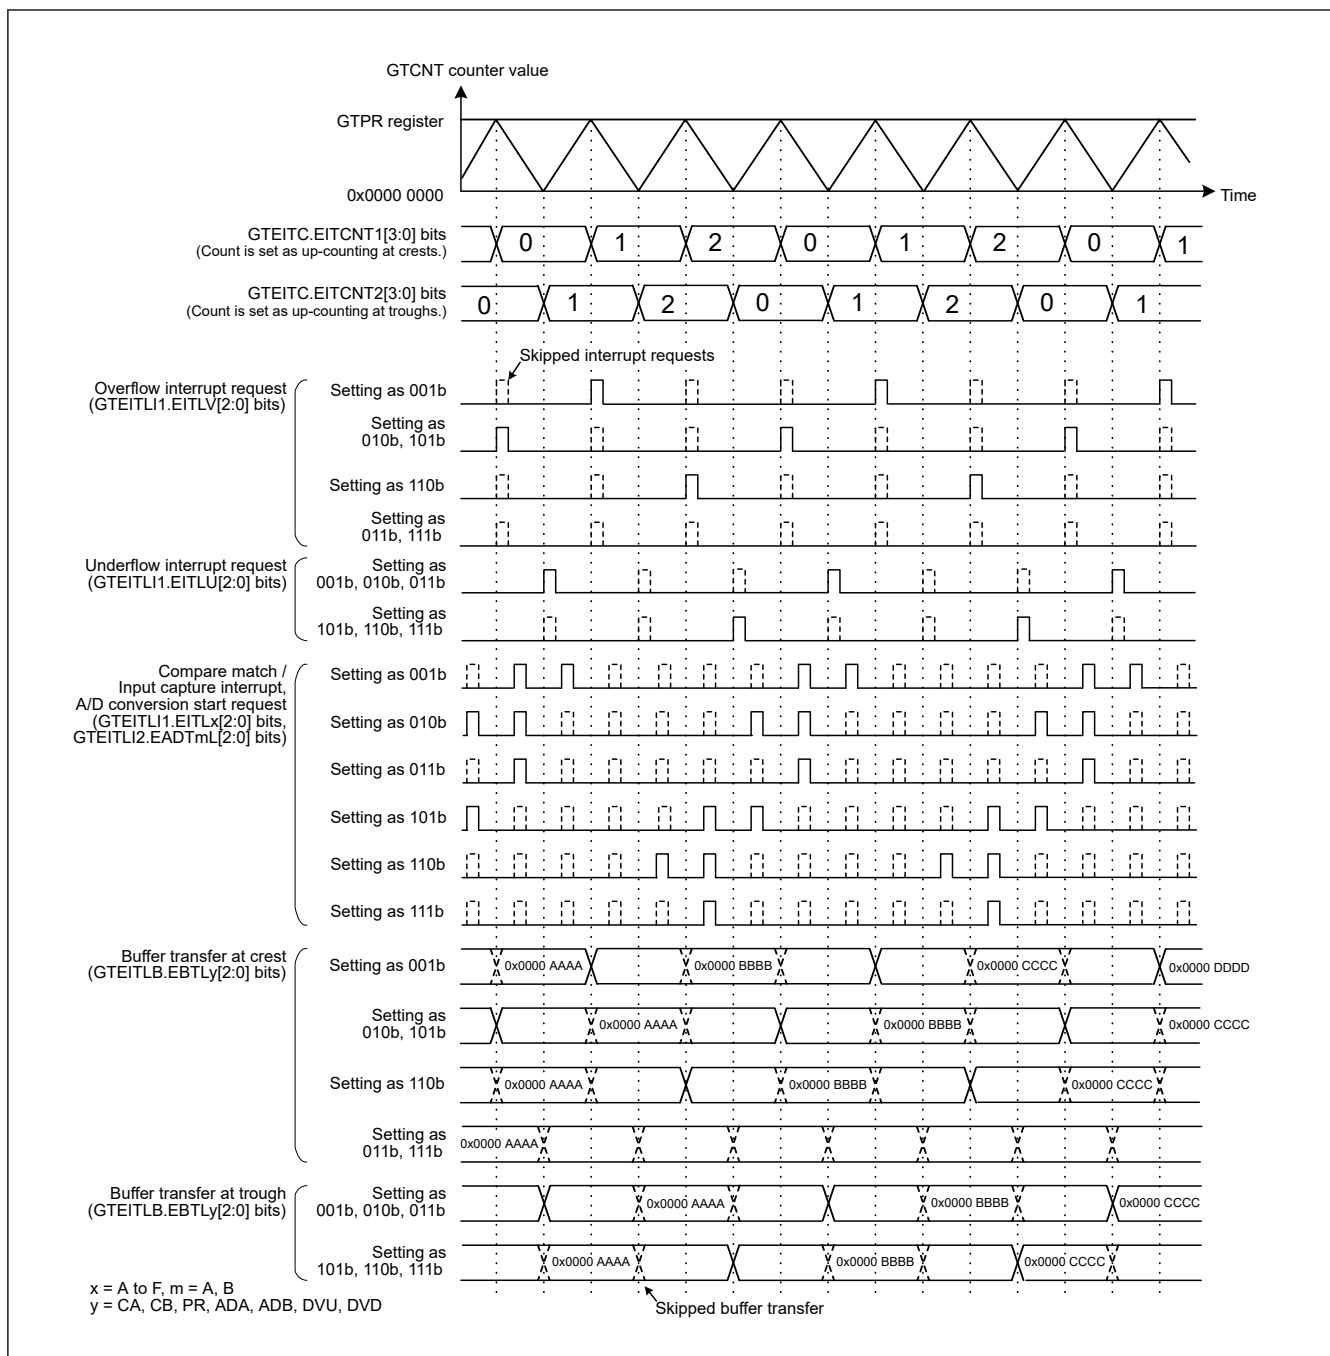

Figure 21.149 Example of Extended Interrupt Skipping Function (Triangle Waves, Count Crests by the Extended Interrupt Skipping 1 with Skipping Count: 2, Count Troughs by the Extended Interrupt Skipping 2 with Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 1)

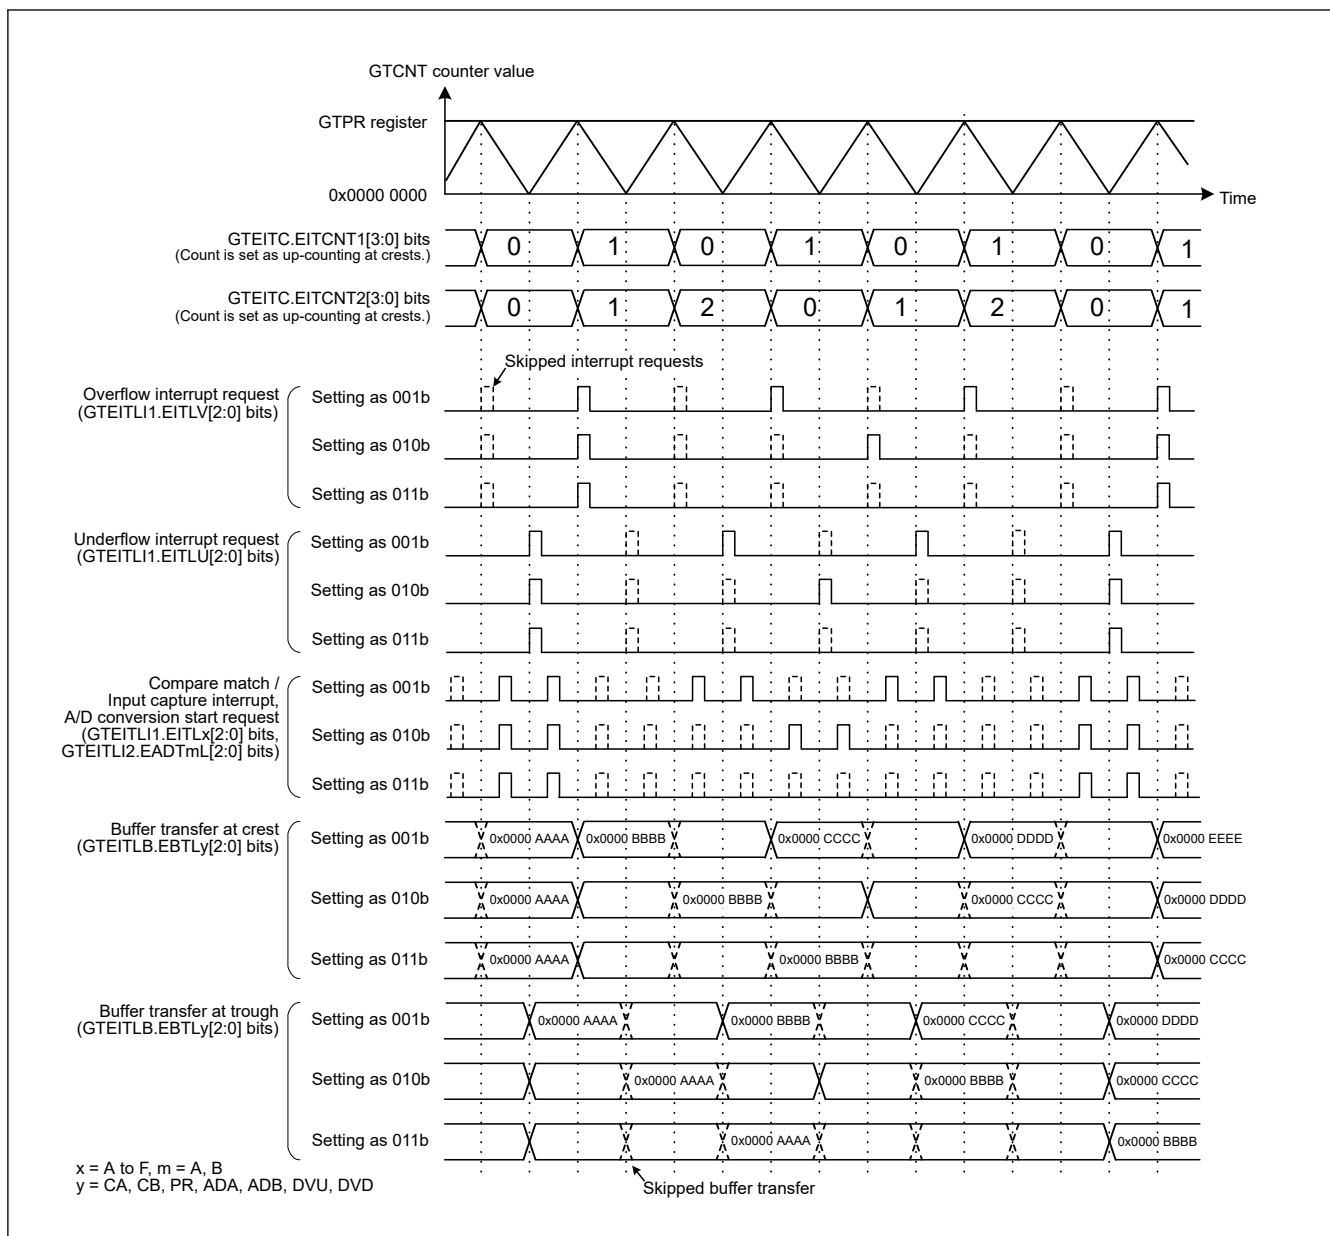

Figure 21.150 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

Figure 21.151 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting Crests, Extended Interrupt Skipping 1 Skipping Count: 1, Counting Crests, Extended Interrupt Skipping 2 Skipping Count: 2, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bits.)

Figure 21.152 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

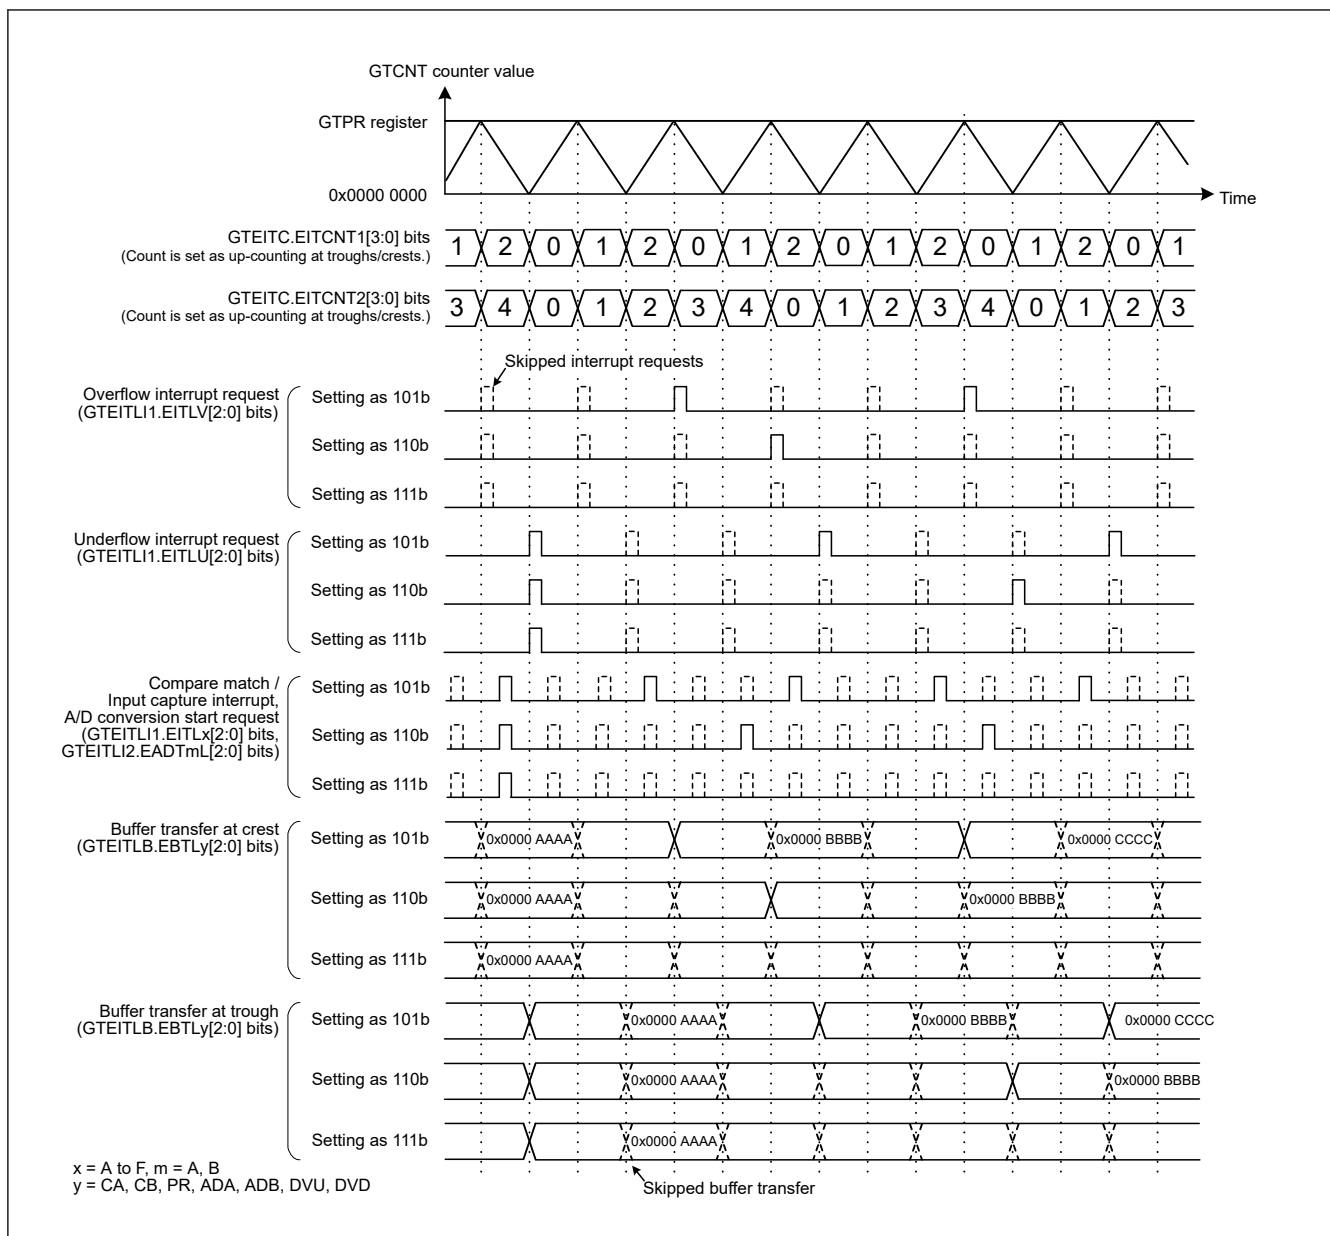

Figure 21.153 Example of Extended Interrupt Skipping Function Operation (Triangle Waves, Counting both Crests and Troughs, Extended Interrupt Skipping 1 Skipping Count: 2, Counting both Crests and Troughs, Extended Interrupt Skipping 2 Skipping Count: 4, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bit.)

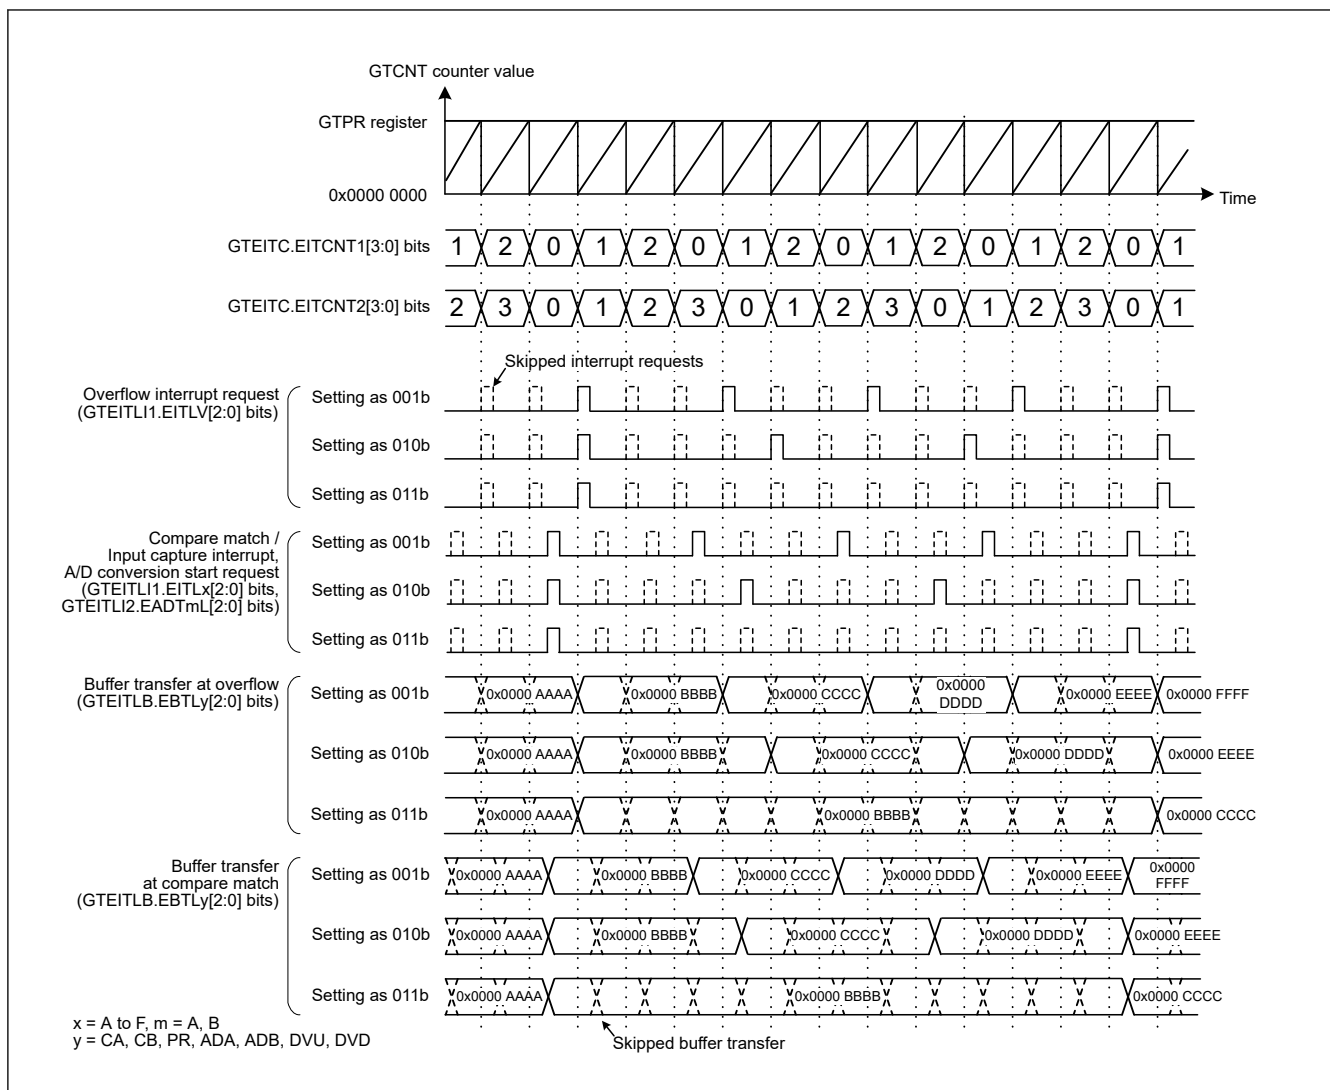

Figure 21.154 Example of Extended Interrupt Skipping Function Operation (Up-Counting in Saw Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as 0)

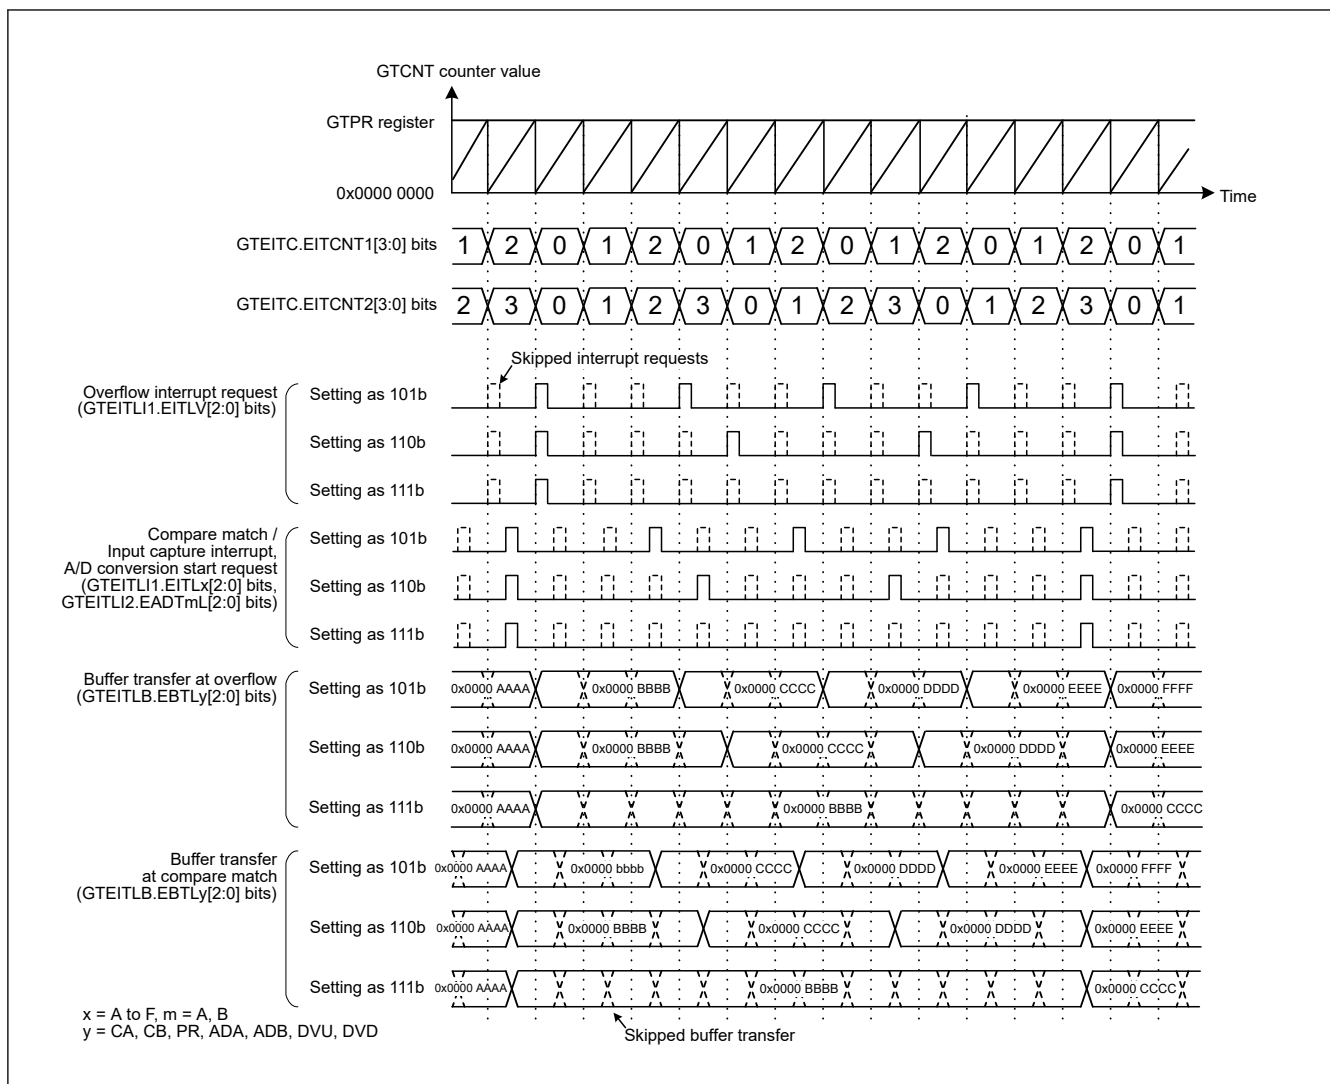

Figure 21.155 Example of Extended Interrupt Skipping Function Operation (Up-Counting Saw Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Counting Overflow, Extended Interrupt Skipping 2 Skipping Count: 3, Extended Interrupt Skipping Counter 2 Initial Value: 0, Skipped in the Period other than GTEITC.EITCNTk bits (k = 1, 2) as GTEITC.EIVTTk bits.)

Figure 21.156 shows an example of the extended interrupt skipping operation on the input capture. When the setting is for the input capture operation setting (GTCR.ICDS bit = 0) at count stop of the GTCNT counter, the interrupt by the input capture and the extended skipping on buffer transfer is enabled even at count stop of the GTCNT counter.

When the input capture is generated at count stop of the GTCNT counter by setting the ICDS bit as 0, an interrupt and a buffer transfer are skipped if the skipping counter value is the same with the skipping period set in a corresponding interrupt skipping function select bit.

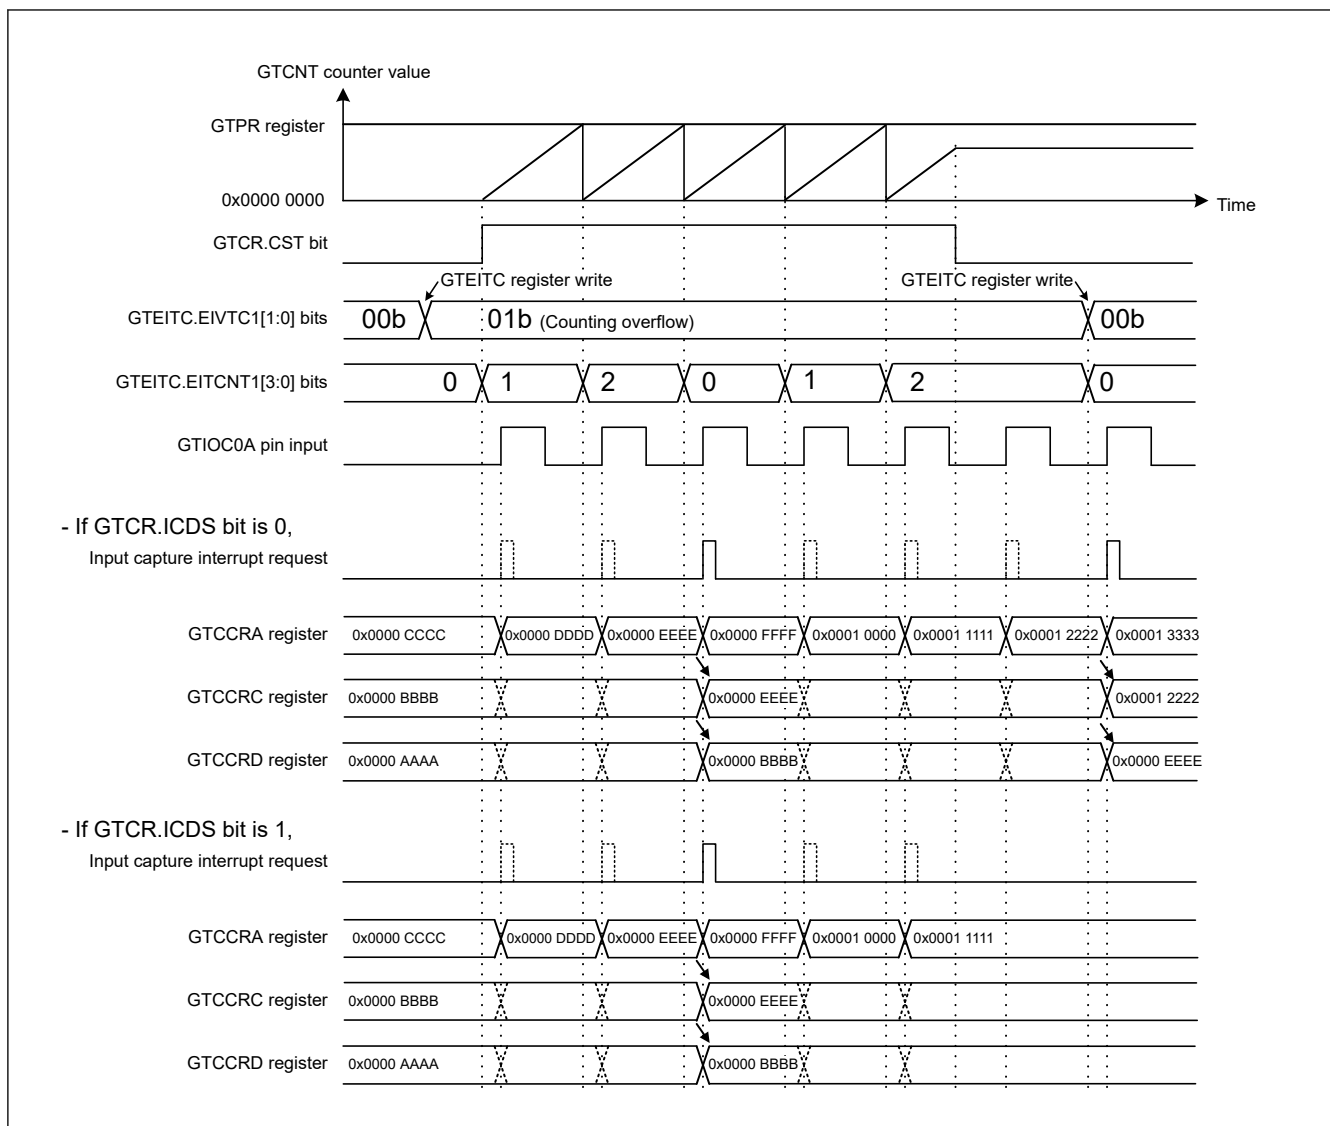

Figure 21.156 Example of Input Capture Operation in the Extended Interrupt Skipping Function Operation (Up-Counting Saw Waves, Counting Overflow, Extended Interrupt Skipping 1 Skipping Count: 2, Skipped in the Period other than the EITCNT1 as 0, Input Capture at the Input Rising)

Table 21.72 shows an example of setting the extended interrupt skipping.

The extended interrupt skipping counter 2 initial value is set by the written value to the ETICNT2IV[3:0] bits which is applied to change the setting from not counting the extended interrupt skipping counter 2 count source (GTEITC.EIVTC2[1:0] bits = 00b) to counting (EIVTC2[1:0] bits = other than 00b). Writing to the extended interrupt skipping counter 2 initial value bit (ETICNT2IV[3:0] bits) is performed only when the setting of the above mentioned extended interrupt skipping counter 2 initial value is written.

Table 21.72 Example for Setting the Extended Interrupt Skipping (1 of 2)

| No. | Step Name | Description |
|-----|----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set GTCNT counter operation, Set buffer operation, Set compare match value | See section 21.3.2. Buffer Operation, section 21.3.3. PWM Output Operating Mode, and so on. |
| 2 | Set the extended interrupt skipping function | Select the skipping counter used for skipping and the skipping period with the skipping function select bit for the interrupt, for the A/D conversion start request, and for a buffer transfer, all which are to be skipped, in the GTEITL1, GTEITL2, and GTEITLB registers respectively. |

| No. | Step Name | Description |
|-----|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Set the extended skipping counter | With the GTEITC register, set a count source of the skipping counter used for skipping, skipping count, and the skipping counter 2 initial value as the following order. Set EIVTCk[1:0] bits (k = 1,2) as value other than 00b, and set EIVTTk[3:0] bits as value other than 0000b. When the skipping counter 2 is used, change EIVTC2[1:0] bits from 00b to value other than 00b as well as set EITCNT2IV[3:0] bits to the skipping counter 2 initial value. |
| 4 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 5 | Set buffer value for each cycle | See section 21.3.2. Buffer Operation , section 21.3.3. PWM Output Operating Mode , and so on. |

21.4.3.3 A/D conversion Start Request Compare Match Skipping Function

The A/D conversion start request and GTADTR register buffer transfer can be skipped by counting the compare matches of GTADTRA register and GTADTRB register based on settings of the GTADCMSC register and GTADCMSS register.

The skipping period is set, related to the operation of the two independent A/D conversion start request compare match skipping counters (ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits in the GTADCMSC register), as a period that either of the counter value for such skipping counters is other than 0 or other than the skipping count. The skipping period can also be set as a period that the both skipping counters are set as other than 0 or other than the skipping count for the counter value.

[Figure 21.157](#) shows the counter operation for A/D conversion start request compare match skipping.

The counter operation for A/D conversion start request compare match skipping is set by the GTADCMSC register.

The ADCMSCNT1[3:0] bits count the count source (in [Figure 21.157](#), a crest is selected) selected by the A/D conversion start request compare match skipping counter 1 count source select bit (GTADCMSC.ADCMSC1[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in [Figure 21.157](#), count is 2) set by the A/D conversion start request compare match skipping 1 skipping count setting bit (ADCMST1[3:0] bits) is achieved.

The ADCMSCNT2[3:0] bits count the count source (in [Figure 21.157](#), a trough is selected) selected by the A/D conversion start request compare match skipping counter 2 count source select bit (GTADCMSC.ADCMSC2[1:0] bits), and repeat the count operation which returns to 0 when the skipping count (in [Figure 21.157](#), count is 2) set by the A/D conversion start request compare match skipping 2 skipping count setting bit (ADCMST2[3:0] bits) is achieved.

The ADCMSCNTk[3:0] bits (k = 1, 2) can be set for the initial value. The initial value is set when the GTADCMSC register is written by the access of 16 bits or 32 bits while the setting for the A/D conversion start request compare match skipping counter k is not counted (ADCMSCk [1:0] bits are 00b) and the write value to the ADCMSCk[1:0] bits is other than 00b. When the initial value is set, the write value to the A/D conversion start request compare match skipping counter k initial value bits (ADCMSCNTkIV[3:0] bits) are set as the initial value for the ADCMSCNT2[3:0] bits.

The A/D conversion start request compare match skipping counter starts up-counting at the first count clock after the setting is modified from not counting to counting.

The ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits for the A/D conversion start request compare match skipping function retain the value even after the GTCNT counter operation is stopped, and the counting can be resumed from the value before the counter is stopped. When values for the ADCMSCNT1[3:0] and ADCMSCNT2[3:0] bits are to be reset (0000b), set the ADCMSC1[1:0] and ADCMSC2[1:0] bits to the setting for not counting (not skipping) (00b).

When the skipping count is to be changed, change the count after stopping the skipping counter operation (set either of the ADCMSC1[1:0] bit or the ADCMSC 2[1:0] bit to 00b).

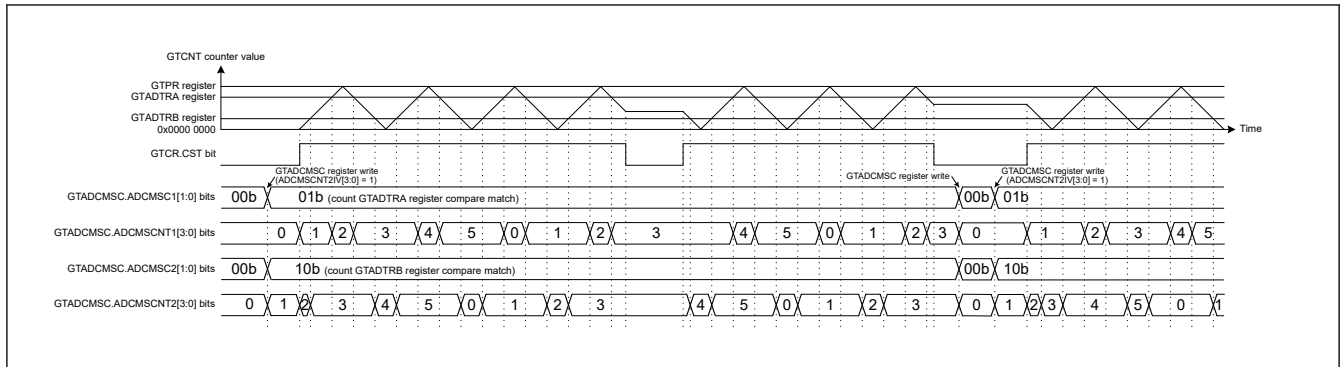

Figure 21.157 Example of A/D Conversion Start Request Compare Match Skipping Function Operation

A/D conversion start request skipping by the ADCMSC register can be performed simultaneously with skipping by the GTITC register or GTEITC register. A skipping period in this case is represented by OR-ed skipping periods of respective registers.

Figure 21.158 shows corresponding interrupt skipping operations and A/D conversion start request skipping operation are performed simultaneously.

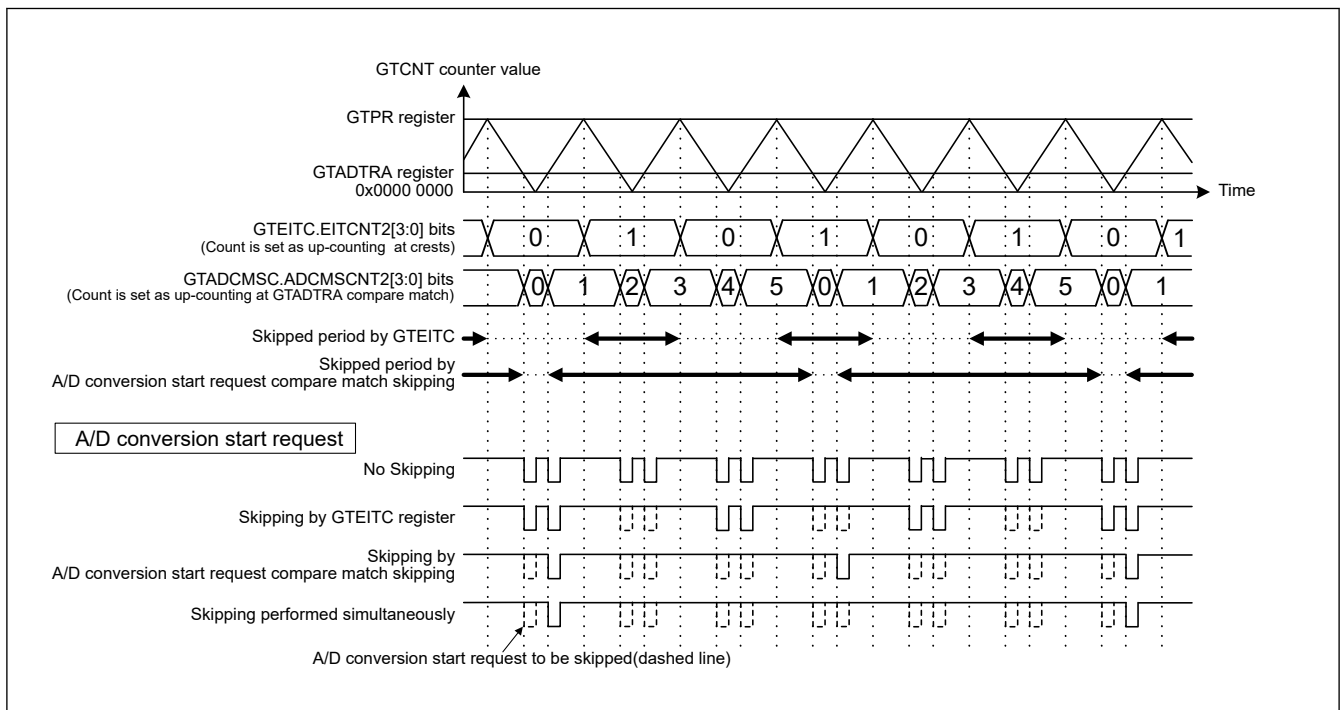

Figure 21.158 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Extended Interrupt Skipping: EIVTC2[1:0] = 01b, EADTAL[2:0] = 01b, A/D Conversion Start Request Compare Match Skipping: ADCMSC2[1:0] = 01b, ADCMSAL[2:0] = 010b)

When A/D conversion start request skipping which can be set by the GTADCMSS register is performed, updating of status flag and the ELC event output depend on the A/D conversion start request enable bit in the GTINTAD register. All the operations by A/D conversion start request which are set as disable by the GTINTAD register is not performed.

A buffer transfer skipping by the GTADCMSS register is performed in all of buffer operation which is enabled in the GTBER and GTBER2 register, or all buffer operations performed by saw-wave one-shot pulse mode or triangle-wave PWM mode 3 or complementary PWM mode (excludes buffer transfer from GTCCRC, GTCCRE to GTCCRA).

An A/D conversion start request skipping and a buffer transfer skipping are operated individually.

Figure 21.159, Figure 21.160 show examples of extended skipping function operation.

Figure 21.159 Example of A/D Conversion Start Request Compare Match Skipping Function Operation
 (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count:
 3 Counting GTADTRA compare match, A/D Conversion Start Request Compare Match
 Skipping 2 Skipping Count: 7 Counting GTADTRB compare match)

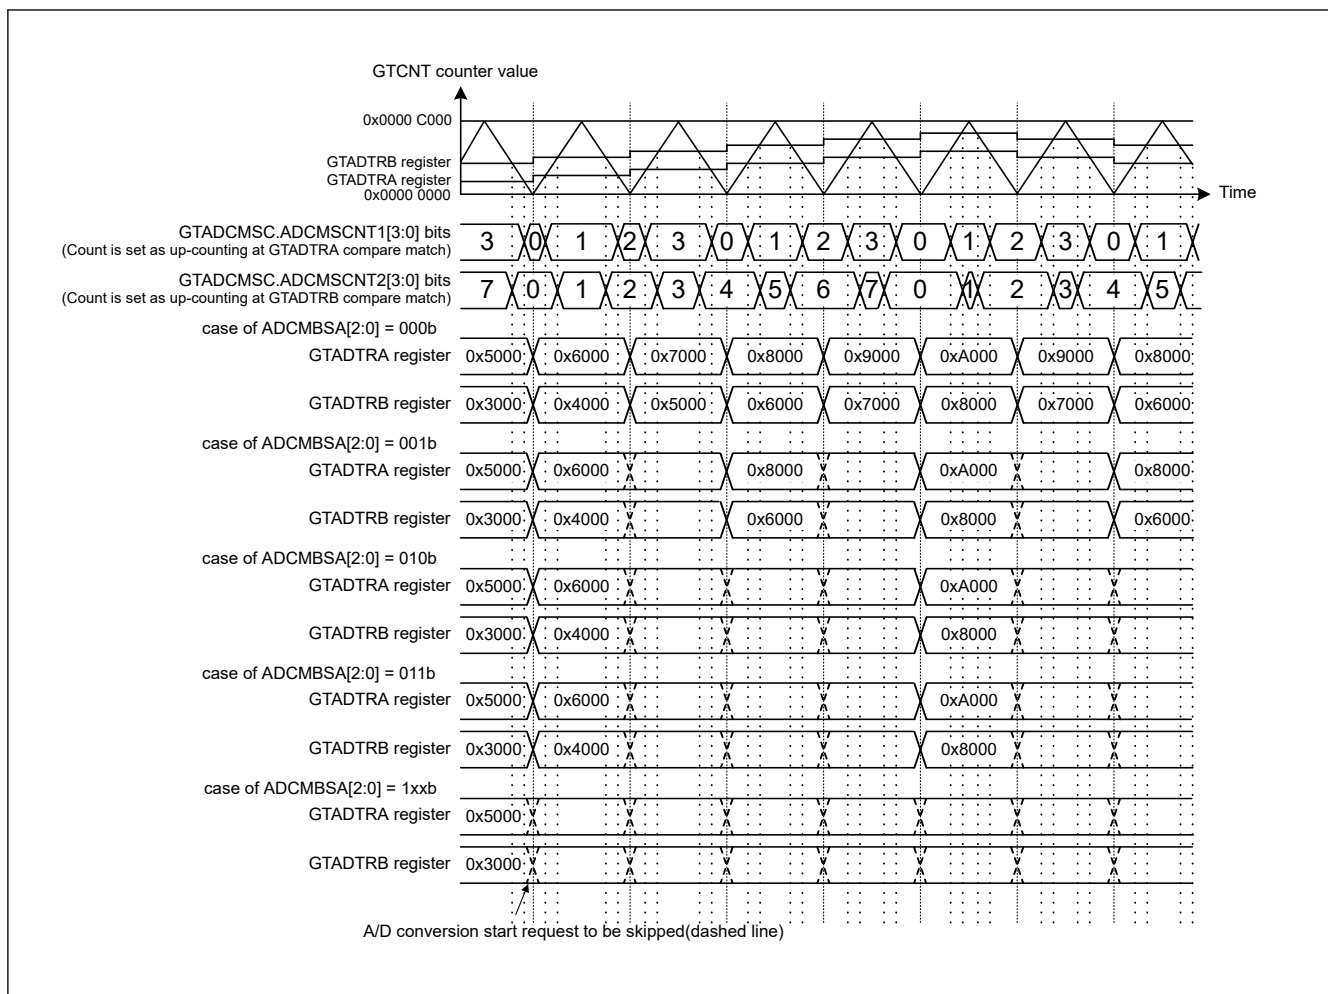

Figure 21.160 Example of A/D Conversion Start Request Compare Match Skipping Function Operation (Triangle wave, A/D Conversion Start Request Compare Match Skipping 1 Skipping Count: 3 Counting GTADTRA compare match, A/D Conversion Start Request Compare Match Skipping 2 Skipping Count: 7 Counting GTADTRB compare match, Buffer transfer of GTADTRA and GTADTRB at trough)

Table 21.73 shows an example of setting the A/D conversion start request compare match skipping.

The A/D conversion start request compare match skipping counter 2 initial value is set by the written value to the ADCMSCNT2IV[3:0] bits which is applied to change the setting from not counting the extended interrupt skipping counter 2 count source (GTADCMSC.ADCMSC2[1:0] bits = 00b) to counting (ADCMSC2[1:0] bits = other than 00b). Writing to the A/D conversion start request compare match skipping counter 2 initial value bit (ADCMSCNT2IV[3:0] bits) is performed only when the setting of the above mentioned A/D conversion start request compare match skipping counter 2 initial value is written.

Table 21.73 Example for Setting the A/D Conversion Start Request Compare Match Skipping (1 of 2)

| No. | Step Name | Description |

| 1 | Set GTCNT counter operation, Set buffer operation, Set compare match value | See section 21.3.2. Buffer Operation , section 21.3.3. PWM Output Operating Mode , section 21.5. A/D Conversion Start Request , and so on. |
| 2 | Set the A/D conversion start request compare match skipping function | Select the skipping counter and the skipping period with the skipping function select bit for the A/D conversion start request or the bit for the buffer transfer to be skipped in the GTADCMSS register. |

Table 21.73 Example for Setting the A/D Conversion Start Request Compare Match Skipping (2 of 2)

| No. | Step Name | Description |
|-----|----------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 3 | Set the A/D conversion start request compare match skipping counter k (k = 1, 2) | With the GTADCMSC register, set a count source of the skipping counter, skipping count, and the skipping counter k initial value as the following order. Set the GTADCMSC.ADCMSCk[1:0] bits as value other than 00b, and set the ADCMSTk[3:0] bits as value other than 0000b. Change the ADCMSCk[1:0] bits from 00b to value other than 00b as well as set the ADCMSCNTkIV[3:0] bits to the skipping counter k initial value. |
| 4 | Start count operation | Set GTCR.CST to 1 to start count operation. |
| 5 | Set buffer value for each cycle | See section 21.3.2. Buffer Operation , section 21.3.3. PWM Output Operating Mode , section 21.5. A/D Conversion Start Request , and so on. |

21.5 A/D Conversion Start Request

The A/D conversion start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register. Up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

In complementary PWM mode, the A/D conversion start request can be issued at a compare match with the GTCNT counter of master channel.

During event count operation, the A/D conversion start request cannot be generated.

The A/D conversion start request is output as event signals to ELC.

The GTADTRA and GTADTRB registers each has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

The timing of the generation of requests to start A/D conversion can be monitored by an external pin. When the A/D conversion start request signal to be monitored is selected in the GTADSMR.ADSMSk bit (k = 0, 1) and when the output is enabled in the ADSMENk bit, a signal is output synchronized with a cycle frame of the timer used to generate the A/D conversion start request signal, of which the output is driven high at the generation of the A/D conversion start request signal by the GTADSMk pin, or at the end of the cycle of which the output is driven low. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D conversion start request signals and their counting directions can be checked by the A/D conversion start request flags (ADTRAUF, ADTRAUF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT32.

[Figure 21.161](#) shows an example of A/D conversion start request operation, [Table 21.74](#) shows example for setting A/D conversion start request operation.

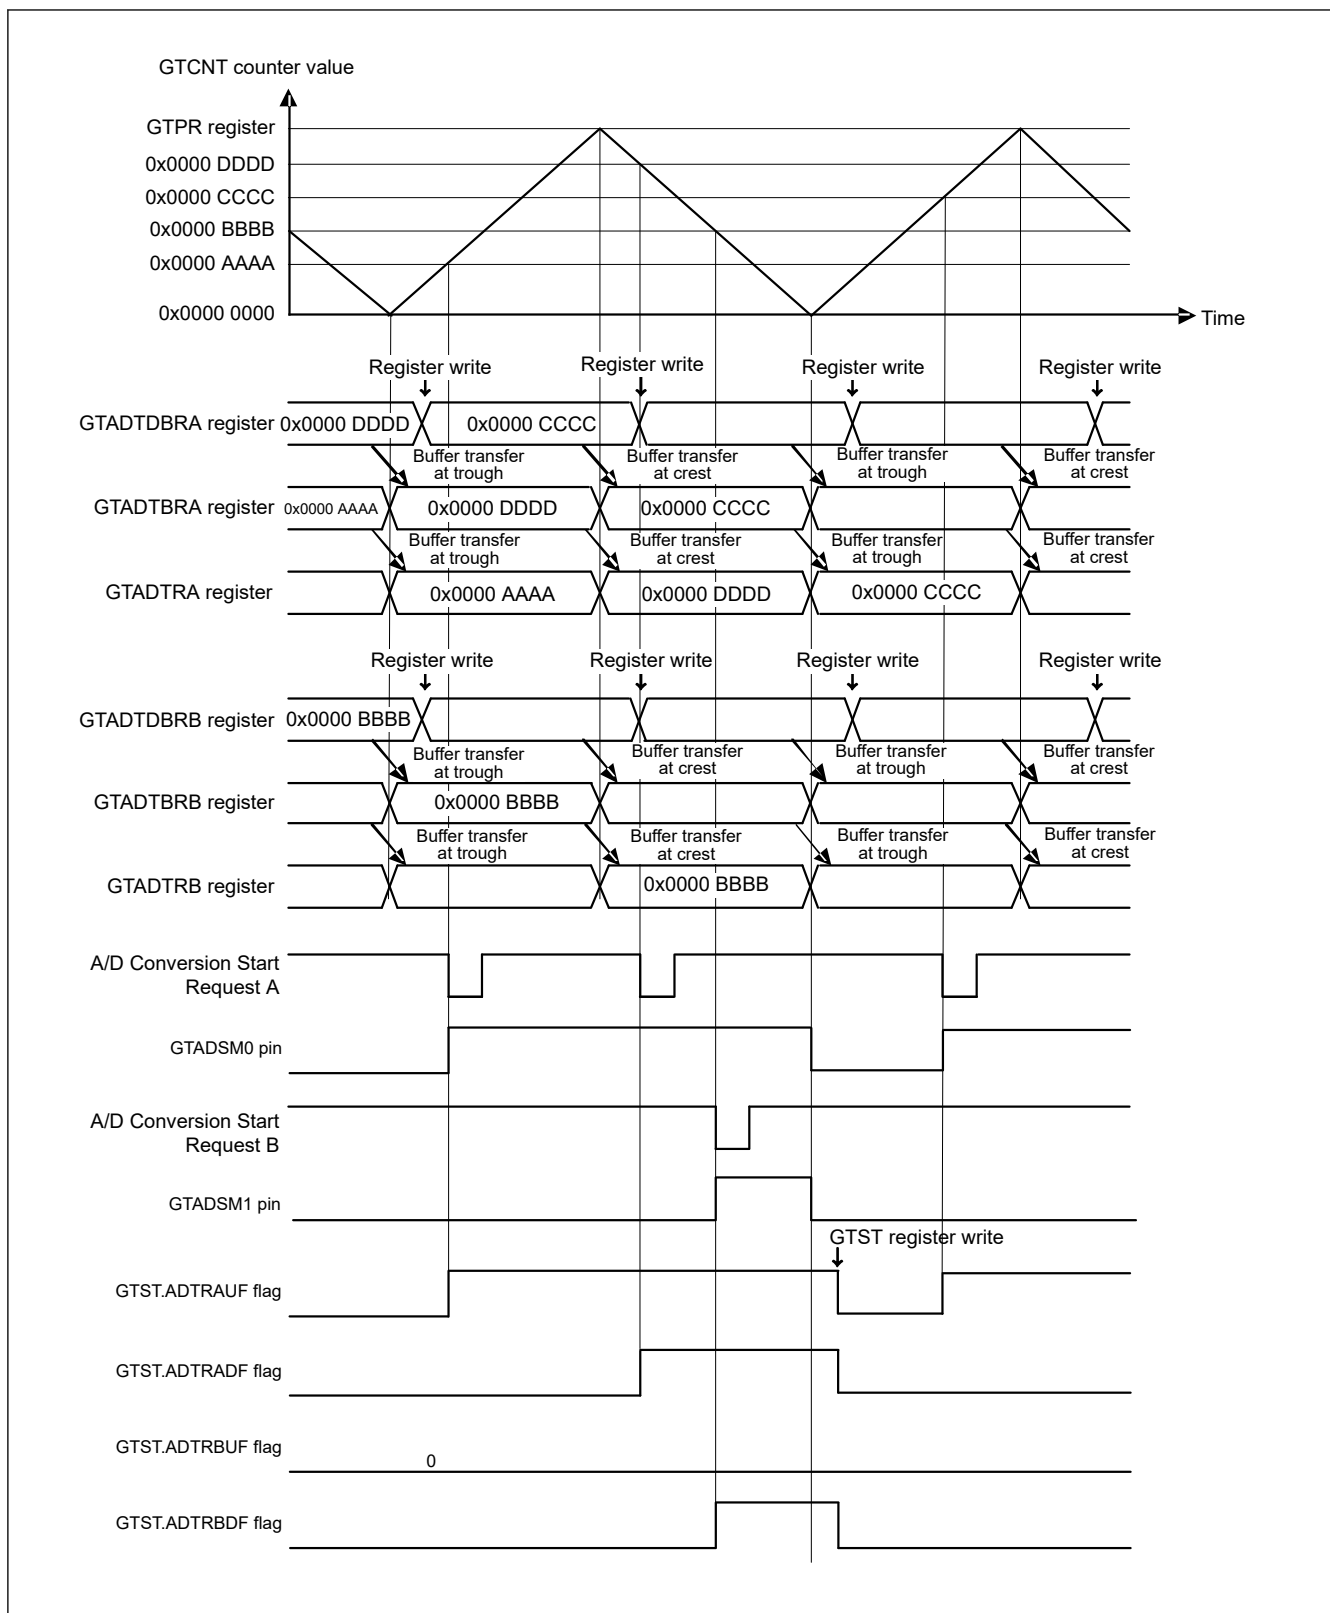

Figure 21.161 Example of A/D Conversion Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Request by GTADTRA Register at Both Up-Counting and Down-Counting, A/D Conversion Start Request by GTADTRB Register at Down-Counting, Monitoring of the GTADTRA Register Up-Counting by the GTADSM0 Pin, Monitoring of the GTADTRB Register Down-Counting by the GTADSM1 Pin)

Table 21.74 Example for Setting A/D Conversion Start Request Timing Operation

| No. | Step Name | Description |
|-----|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1 | Set operating mode | Set the operating mode with the GTCR.MD[2:0] bits or GTCR.MD[3:0] bits. In Figure 21.161 , 100b, 101b, or 110b (0100b, 0101b, or 0110b) (triangle-wave PWM mode) is set. |

| 3 | Set cycle | Set the cycle in the GTPR register. |
| 4 | Set initial value for counter | Set the initial value in the GTCNT counter. |
| 5 | Set buffer operation | Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTBER register. In Figure 21.161 , ADTTA[1:0] = 11b, ADTTB[1:0] = 11b, ADTDA = 1, and ADTDB = 1. |
| 6 | Set compare match value | Set the A/D conversion start request point in the GTADTRA and GTADTRB registers. |
| 7 | Set buffer value | For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers. |
| 8 | Set A/D conversion start request for monitoring | Select the A/D conversion start request signal to be monitored with ADSMS0[1:0] and ADSMS1[1:0] bits in GTADSMR from GTADSM0 and GTADSM1 pins and enable output of the A/D conversion start request signal being monitored to ADSMEN0 and ADSMEN1 bits in GTADSMR. In Figure 21.161 , ADSMS0[1:0] = 00b, ADSMS1[1:0] = 11b, ADSMEN0 = 1, and ADSMEN1 = 1. |
| 9 | Enable A/D conversion start request | Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. In Figure 21.161 , ADTRAUEN = 1, ADTRADEN = 1, ADTRBUEN = 0, and ADTRBDEN = 1. |
| 10 | Start count operation | Set the GTCR.CST bit to 1 to start count operation. |
| 11 | Set buffer value for each cycle | For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers. |

[Figure 21.162](#) shows an example for A/D conversion start request timing operation.

This shows an example of the output of A/D conversion start request A by the ELC as start source 0 (ELC_AD00) for the A/D converter. The A/D conversion start request A signal is output by the ELC in response to a match in comparison with the GTADTRA register.

The same timing applies when the A/D conversion start request A signal from GPT is directly input to ADC without going through ELC.

If GPT is operating with PCLKD and ADC is operating with PCLKA, A/D conversion start request A is passed to ELC on the next rising edge of PCLKA.

If GPT is operating with GPTCLK and ADC is also operating with GPTCLK, A/D conversion start request A is passed to ELC without delay.

For all other clock combinations, A/D conversion start request A is synchronized and passed to ELC.

Figure 21.162 Example of A/D Conversion Start Request Timing Operation

For the restriction of A/D Conversion Start Request, see [section 17, Event Link Controller \(ELC\)](#), and [section 21.10.7. Interval of interrupt request](#).

21.6 Operations Linked by ELC

21.6.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The A/D conversion start request during up-counting/down-counting can be enabled/disabled individually with the A/D conversion start request enable bit to output events output to ELC.

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn_CCMPB)

- Generation of compare match C interrupt (GPTn_CMPC)
- Generation of compare match D interrupt (GPTn_CMPD)
- Generation of compare match E interrupt (GPTn_CMPE)
- Generation of compare match F interrupt (GPTn_CMPF)
- Generation of overflow interrupt (GPTn_OVF)
- Generation of underflow interrupt (GPTn_UDF)
- Generation of A/D conversion start request A (GPTn_ADTRGA)
- Generation of A/D conversion start request B (GPTn_ADTRGB)
- Finish of period count function (GPTm_PC)

Note: n = 0 to 9

m = 0 to 3

21.6.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See [section 17, Event Link Controller \(ELC\)](#) for the connection between the ELC and the event signal input.

21.7 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

[Figure 21.163](#) shows the timing of noise filtering.

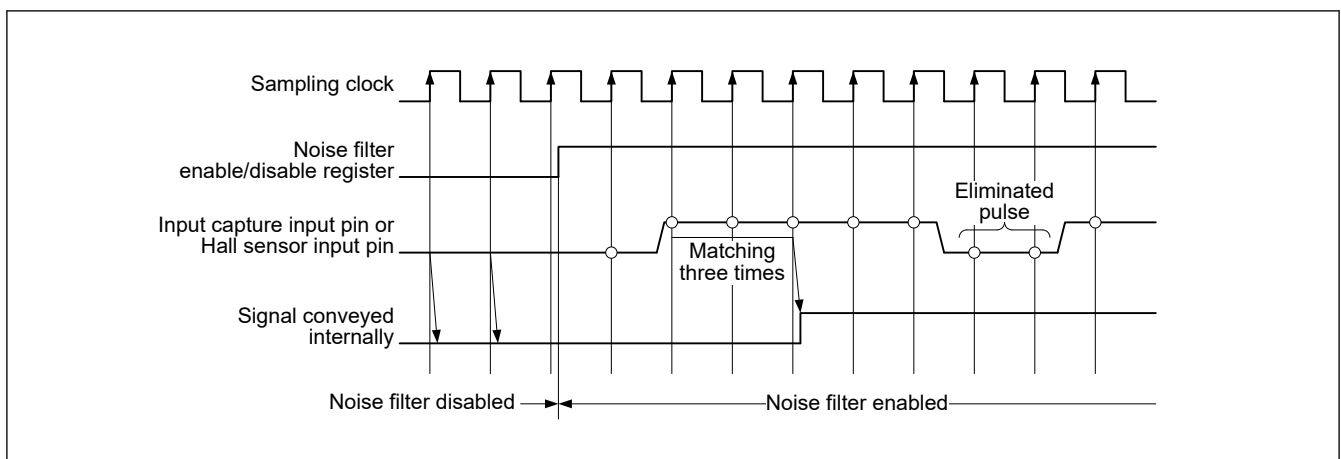

Figure 21.163 Timing of noise filtering

If noise filtering is enabled, the input capture operation or hall sensor input operation is performed on the edges of the noise filtered signal after a delay of $(\text{sampling interval} \times 2 + \text{GTCLK})$ at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

21.8 Protection Function

21.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTITC, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTPDBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTDVD, GTDBU, GTDBD, GTSOS, GTSOTR, GTADSMR, GTEITC, GTEITLI1, GTEITLI2, GTEITLB, GTICLF, GTPC, GTADCMSC, GTADCMSS, GTBER2, GTOLBR, GTICCR.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can be enabled or disabled by the setting of the GTWP.CMNWP bit.

Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

21.8.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[3], BD[2], BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[3], BD[2], BD[1] and BD[0] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[3], BD[2], BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register or it can be set to 0 simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 21.164 shows an example of operation for disabling buffer operation by writing to the GTBER register.

Figure 21.164 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

21.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register
Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register
In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 21.165 and Figure 21.166 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

Figure 21.165 Example of Multiple Channel Operation for Disabling Buffer Operation (Triangle Waves, Double Buffer Operation)

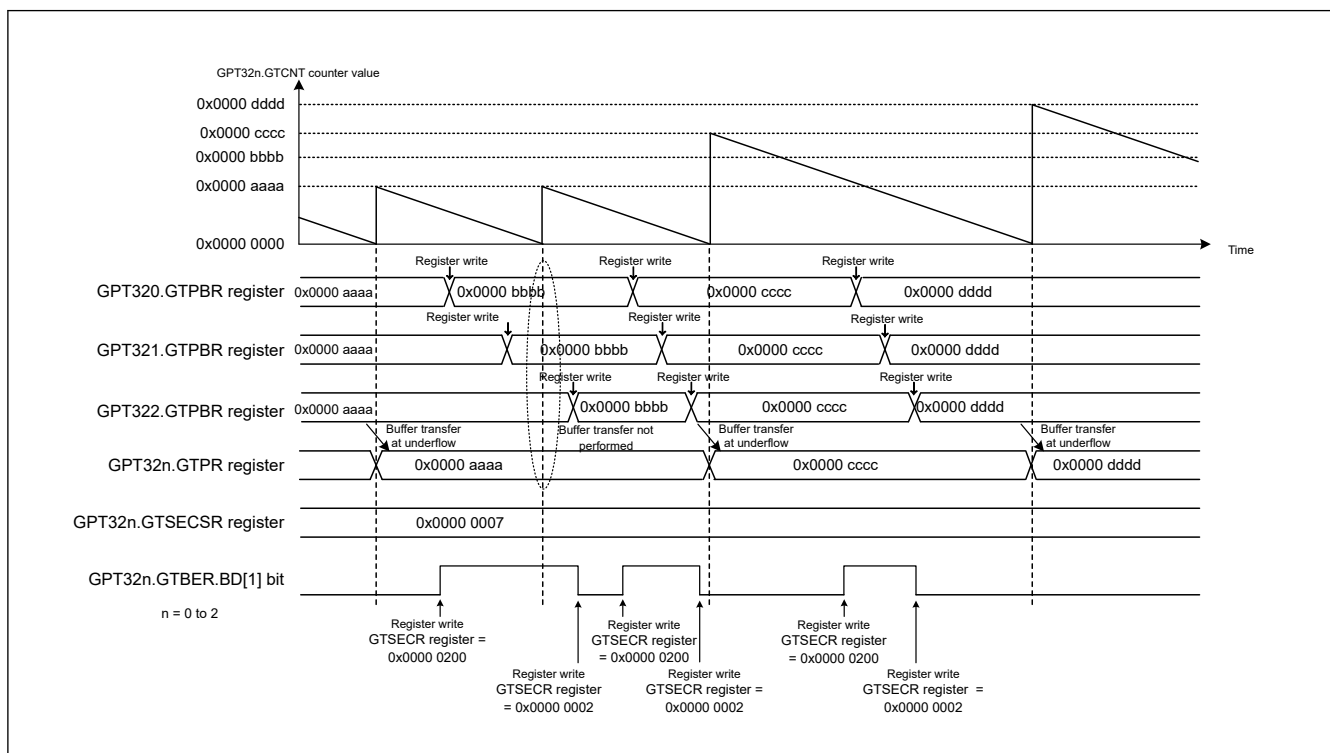

Figure 21.166 Example of Multiple Channel Operation for Disabling Buffer Operation (Saw Waves, Single Buffer Operation)

21.8.2.2 Repeated Double-Buffered Operation When Disabling GTCCR Buffer Transfer

When a GTBER.DBRTEC_m ($m = A, B$) bit is set to 1 in saw-wave one-shot pulse mode or triangle-wave PWM mode 3, transfer from the intermediate buffer to the GTCCR_m ($m = A, B$) register is repeated on a cyclic basis even while buffer transfer is disabled by the setting of the GTBER.BD[0] bit or by the buffer transfer extended skipping function.

(1) In saw-wave one-shot pulse mode

In saw-wave one-shot pulse mode, the compare match value for the first half of a waveform is stored in temporary register x ($x = C, E$) as the intermediate buffer for the GTCCR_x ($x = C, E$) register and the compare match value for the second half of a waveform is stored in temporary register m ($m = A, B$) as the intermediate buffer for the GTCCR_y ($y = D, F$) register, respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCR_m ($m = A, B$) registers.

Table 21.75 lists the types of buffer transfer of the GTCCR register during counting in saw-wave one-shot pulse mode.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCR_y ($y = D, F$) registers are transferred to temporary registers m ($m = A, B$), and the values of the GTCCR_x ($x = C, E$) are transferred to temporary registers x ($x = C, E$) when the setting of the corresponding GTBER.DBRTEC_m ($m = A, B$) bit is 1, respectively.

When the setting of the GTBER.DBRTEC_m ($m = A, B$) bit is 1, values written by the CPU to the GTCCR_m ($m = A, B$) registers are reflected as the values of temporary registers x ($x = C, E$).

Table 21.75 GTCCR Buffer Transfer Operation in Saw-Wave One Shot Pulse Mode during GTCNT Counting

| GTBER.DBRTEC _m | Buffer Transfer | Timing of transfer | | | | |
|---------------------------|--------------------------|-----------------------------------------------|---------------------------------------------------|---------------------------------------------------|---------------------------------------------------|---------------------------------------------------|
| | | GTCCR _x ↓ GTCCR _m | GTCCR _x ↓ Temporary register x | Temporary register x ↓ GTCCR _m | GTCCR _y ↓ Temporary register m | Temporary register m ↓ GTCCR _m |
| 0 | Transfer enabled period | Overflow or Underflow | No transfer | No transfer | Overflow or Underflow | GTCCR _m compare match |
| | Transfer disabled period | No transfer | No transfer | No transfer | No transfer | No transfer |
| 1 | Transfer enabled period | Overflow or Underflow | Overflow or Underflow | No transfer | Overflow or Underflow | GTCCR _m compare match |
| | Transfer disabled period | No transfer | No transfer | Overflow or Underflow | No transfer | GTCCR _m compare match |

Note: $m = A, B$
 $x = C, E$
 $y = D, F$

Figure 21.167 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in saw-wave one-shot pulse mode.

Figure 21.168 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in saw-wave one-shot pulse mode.

In triangle-wave PWM mode 3, the compare match value for the first half of a waveform is stored in the temporary register x (x = C, E) as the intermediate buffer for the GTCCR_x (x = C, E) register and the compare match value for the second half of a waveform is stored in temporary register m (m = A, B) as the intermediate buffer for the GTCCR_y (y = D, F) register,

respectively, for compare match values during repeated buffer operation, and the given values are alternately transferred to the GTCCRM ($m = A, B$) register.

Table 21.76 lists the types of buffer transfer of the GTCCR register during counting operation in triangle-wave PWM mode 3.

While counting is stopped, the setting of the value in the temporary register is transferred through forcible buffer transfer. In forcible buffer transfer, the values of the GTCCRY ($y = D, F$) registers are transferred to temporary registers m ($m = A, B$), and the values of the GTCCR x ($x = C, E$) are transferred to temporary registers x ($x = C, E$), when the setting of the corresponding GTBER.DBRTECM ($m = A, B$) bit is 1, respectively.

When the setting of the GTBER.DBRTECM ($m = A, B$) bit is set to 1, values written by the CPU to the GTCCRM ($m = A, B$) registers are reflected as the values of temporary registers x ($x = C, E$).

Table 21.76 GTCCR Buffer Transfer Operation in Triangle-Wave PWM Mode 3 during GTCNT Counting

| GTBER.DBRTECM | Buffer Transfer | Timing of transfer | | | | |
|---------------|--------------------------|--------------------------|------------------------------------------|---------------------------------------|---------------------------------------|---------------------------------------|
| | | GTCCR x ↓ GTCCRM | GTCCR x ↓ Temporary register x | Temporary register x ↓ GTCCRM | GTCCRY ↓ Temporary register m | Temporary register m ↓ GTCCRM |
| 0 | Transfer enabled period | Trough | No transfer | No transfer | Trough | Crest |
| | Transfer disabled period | No transfer | No transfer | No transfer | No transfer | No transfer |
| 1 | Transfer enabled period | Trough | Trough | No transfer | Trough | Crest |
| | Transfer disabled period | No transfer | No transfer | Trough | No transfer | Crest |

Note: $m = A, B$
 $x = C, E$
 $y = D, F$

Figure 21.169 shows the operation of generating transfer-disabled period by extended buffer transfer skipping as an example of repeated double buffer operations when the GTCCR buffer transfer disabled in triangle-wave PWM mode 3.

Figure 21.170 shows the operation of generating transfer-disabled period by updating the GTBER.BD[0] bit as an example of repeated double-buffer operations when the GTCCR buffer transfer is disabled in triangle-wave PWM mode 3.

Figure 21.170 Example of Repeated Double-Buffer Operation When GTCCR Buffer Transfer is Disabled (Triangle-Wave PWM Mode 3, Updating the GTBER.BD[0] Bit)

21.8.3 GTIOCNm Pin Output Negate Control (n = 0 to 9, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCNm pin output value forcibly is provided for GTIOCNm pin output by the request of output disable from POEG. Output protection is required when a dead time error or the same output level being on the GTIOCN_A and GTIOCN_B pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPDTE, GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCN_A pin and the GTIOCN_B pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCN_A pin and the GTIOR.OBDF[1:0] setting for the GTIOCN_B pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 GTCLK at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of GTCLK.

When event count is performed or when the operating mode is saw-wave PWM mode 2 or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCN_A pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCN_B pin).

Figure 21.171 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 9, m = A, B)

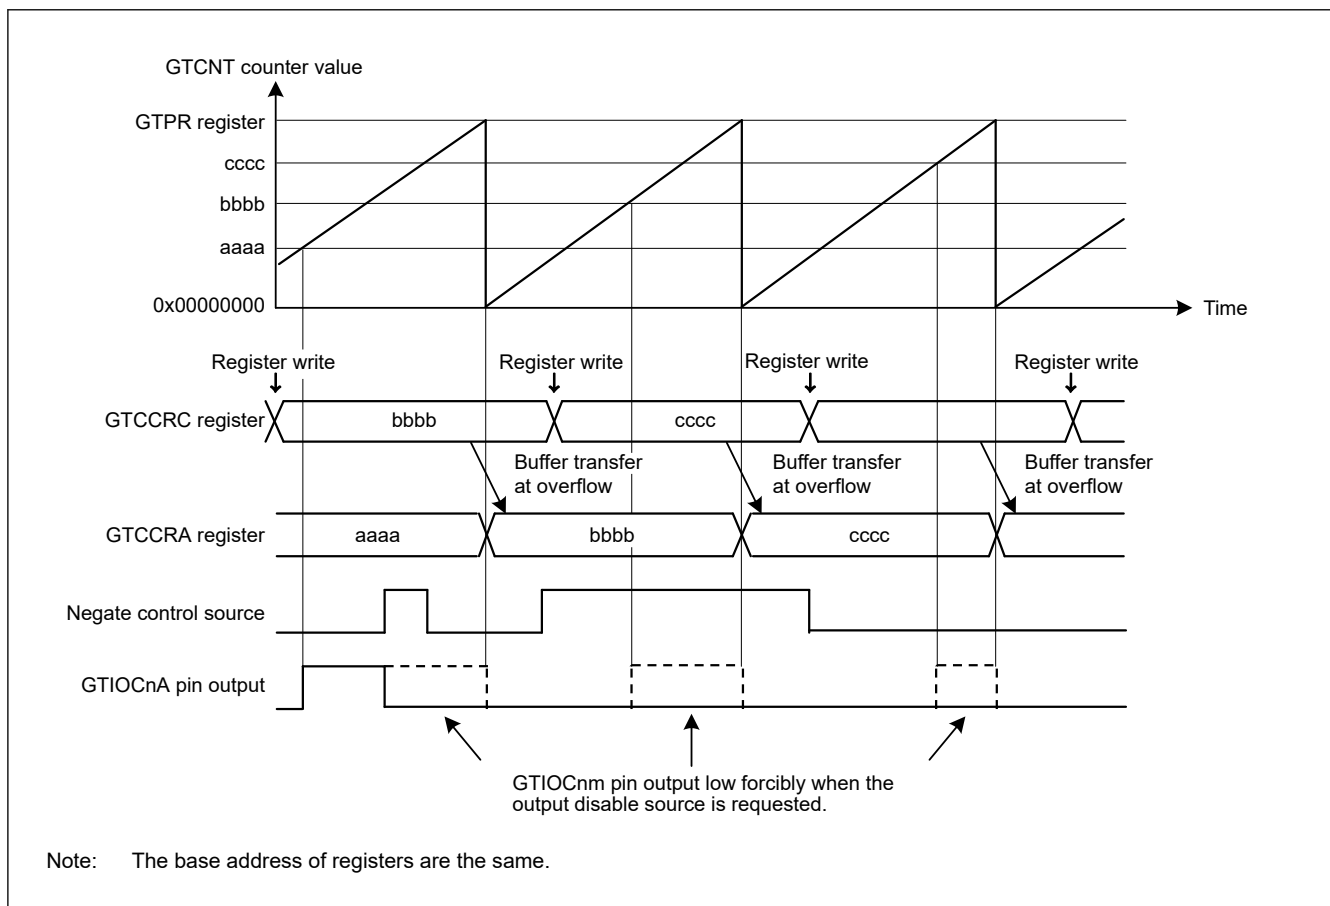

Figure 21.171 Example of GTIOCnm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 0 to 9, m = A, B)

21.8.4 Output Protection Function for GTIOCnm Pin Output (n = 0 to 9; m = A, B)

To prepare for a case when an incorrect value (0x0000 0000 or a value greater than or equal to the GTPR register value) is set in the GTCCRA register, the output protection function for the GTIOCnm pin output (disabling function) is activated when the automatic dead time is set (GTDTCR.TDE bit = 1) in triangle-wave PWM mode.

The status of the output protection function can be read from the GTSOS.SOS[1:0] bits.

Figure 21.172 shows the output protection function state transition.

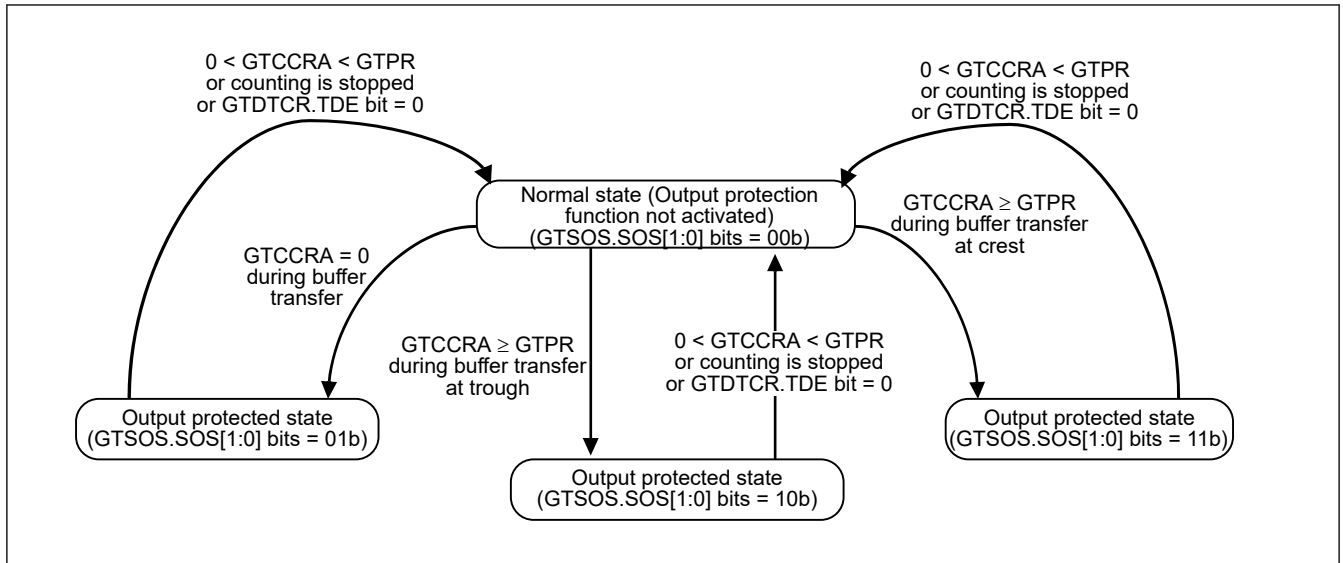

Figure 21.172 Output Protection Function

(1) Output Protection Function When the GTCCRA Register is Set to 0x0000 0000 during Buffer Transfer

Figure 21.173 and Figure 21.174 show examples of output protection function operation when the GTCCRA register is set to 0x0000 0000 during buffer transfer at troughs, and Figure 21.175 and Figure 21.176 show examples when the GTCCRA register is set to 0x0000 0000 during buffer transfer at crests.

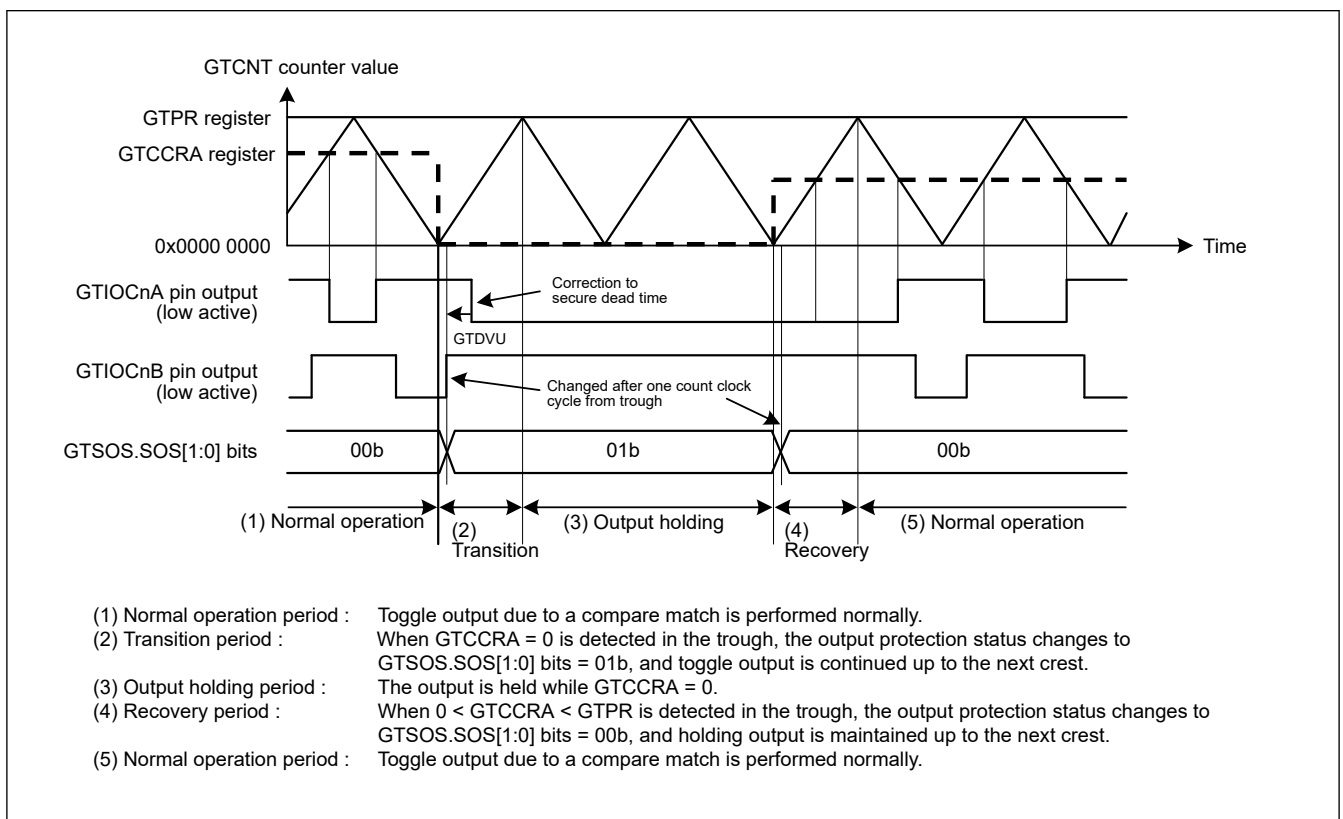

Figure 21.173 Example of Output Protection Function Operation When GTCCRA is Set to 0x0000 0000 during Buffer Transfer at Troughs (Restored to 0 < GTCCRA < GTPR during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 9)

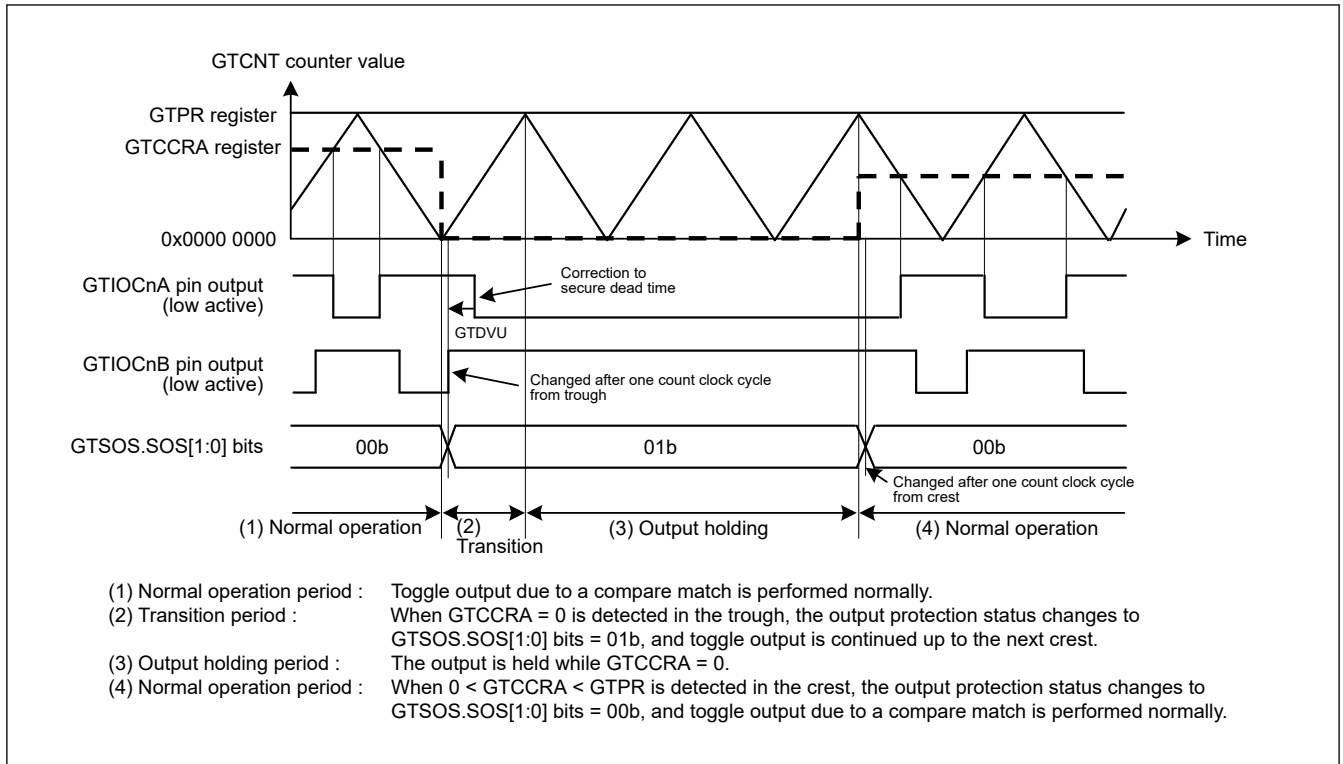

Figure 21.174 Example of Output Protection Function Operation When GTCCRA is Set to 0x0000 0000 during Buffer Transfer at Troughs (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 9)

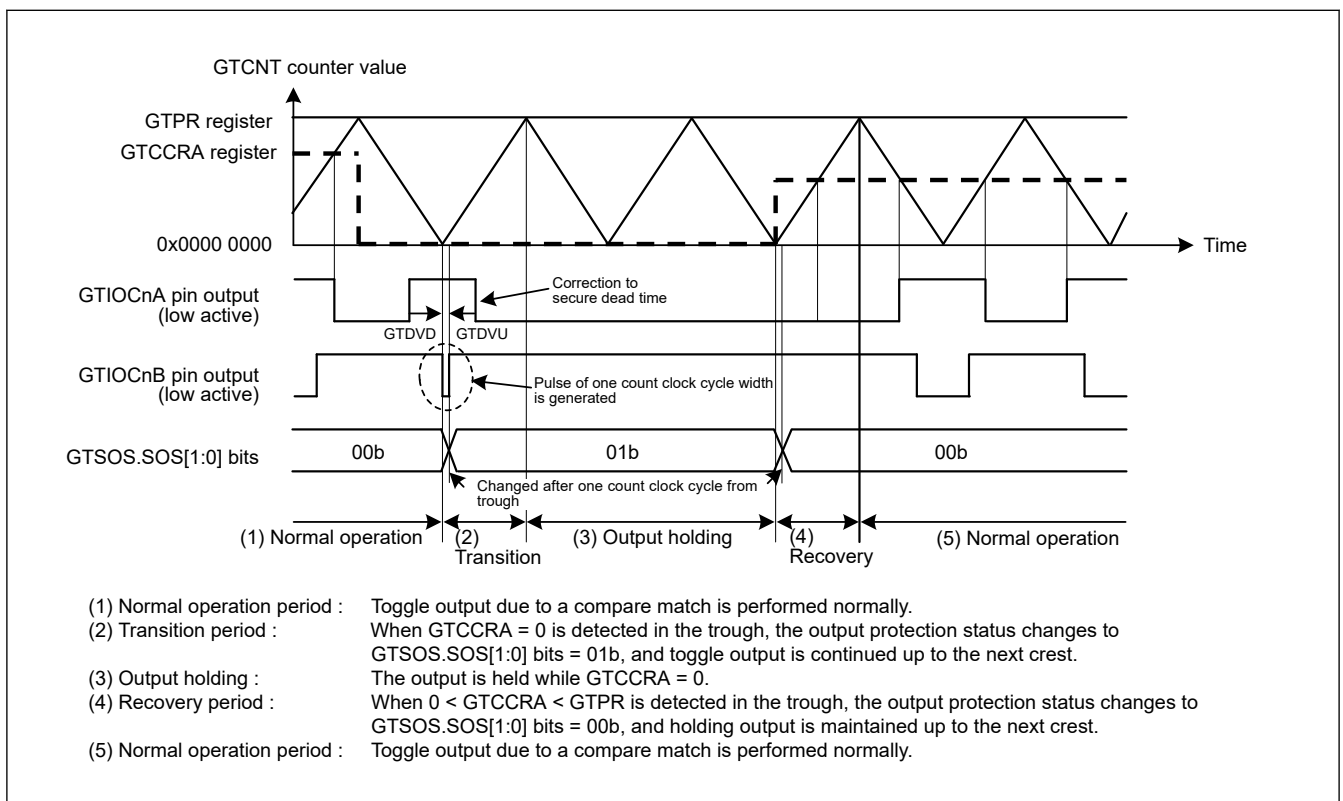

Figure 21.175 Example of Output Protection Function Operation When GTCCRA is Set to 0x0000 0000 during Buffer Transfer at Crests (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 9)

Figure 21.176 Example of Output Protection Function Operation When the GTCCRA is Set to 0x0000 0000 during Buffer Transfer at Crests (Restored to $0 < \text{GTCCRA} < \text{GTPR}$ during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 9)

(2) Output Protection Function When GTCCRA Register \geq GTPR Register is Set during Buffer Transfer at Troughs

Figure 21.177 and Figure 21.178 show examples of output protection function operation when GTCCRA register \geq GTPR register is set during buffer transfer at troughs.

Figure 21.177 Example of Output Protection Function Operation When $GTCCRA \geq GTPR$ is set during Buffer Transfer at Troughs (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Troughs, Active Level: Low) ($n = 0$ to 9)

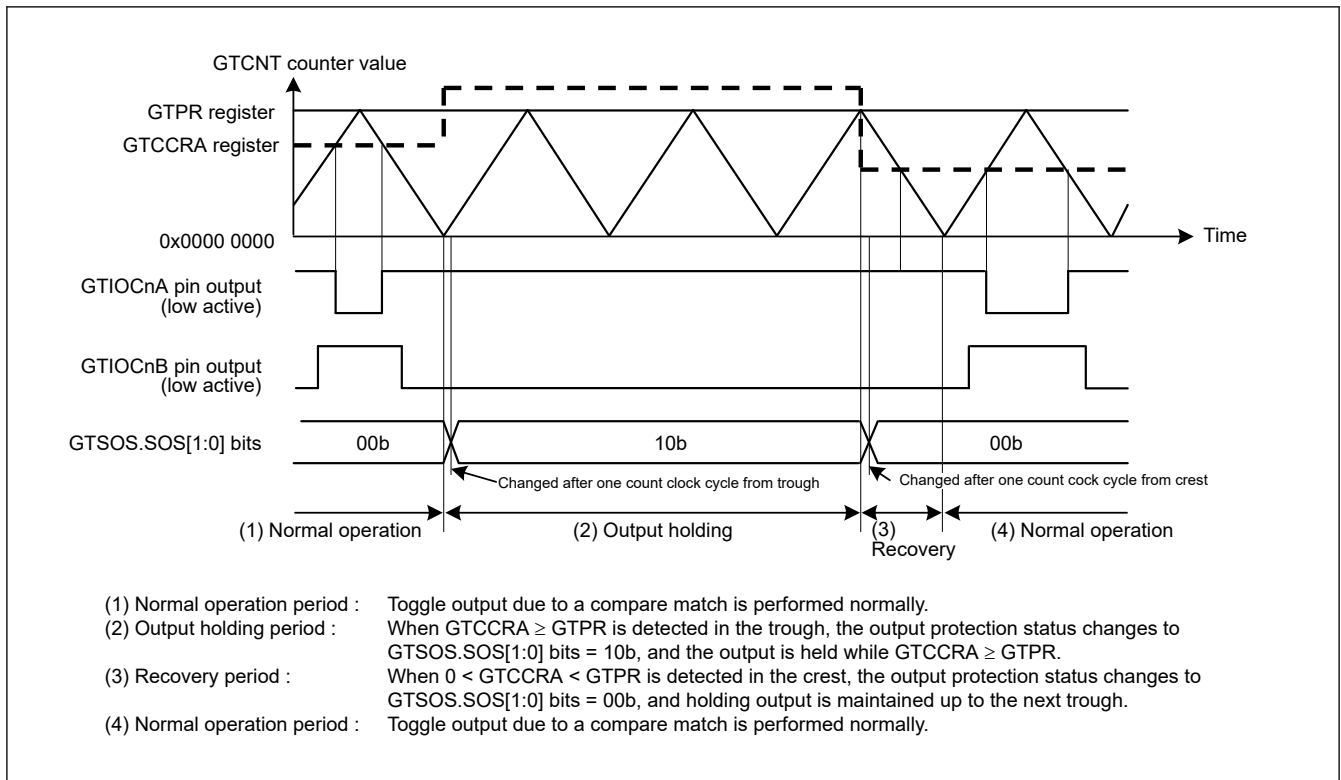

Figure 21.178 Example of Output Protection Function Operation When $GTCCRA \geq GTPR$ is Set during Buffer Transfer at Troughs (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Crests, Active Level: Low) ($n = 0$ to 9)

(3) Output Protection Function When $GTCCRA \geq GTPR$ is Set during Buffer Transfer at Crests

Figure 21.179 and Figure 21.180 show examples of output protection function operation when $GTCCRA \geq GTPR$ is set during buffer transfer at crests.

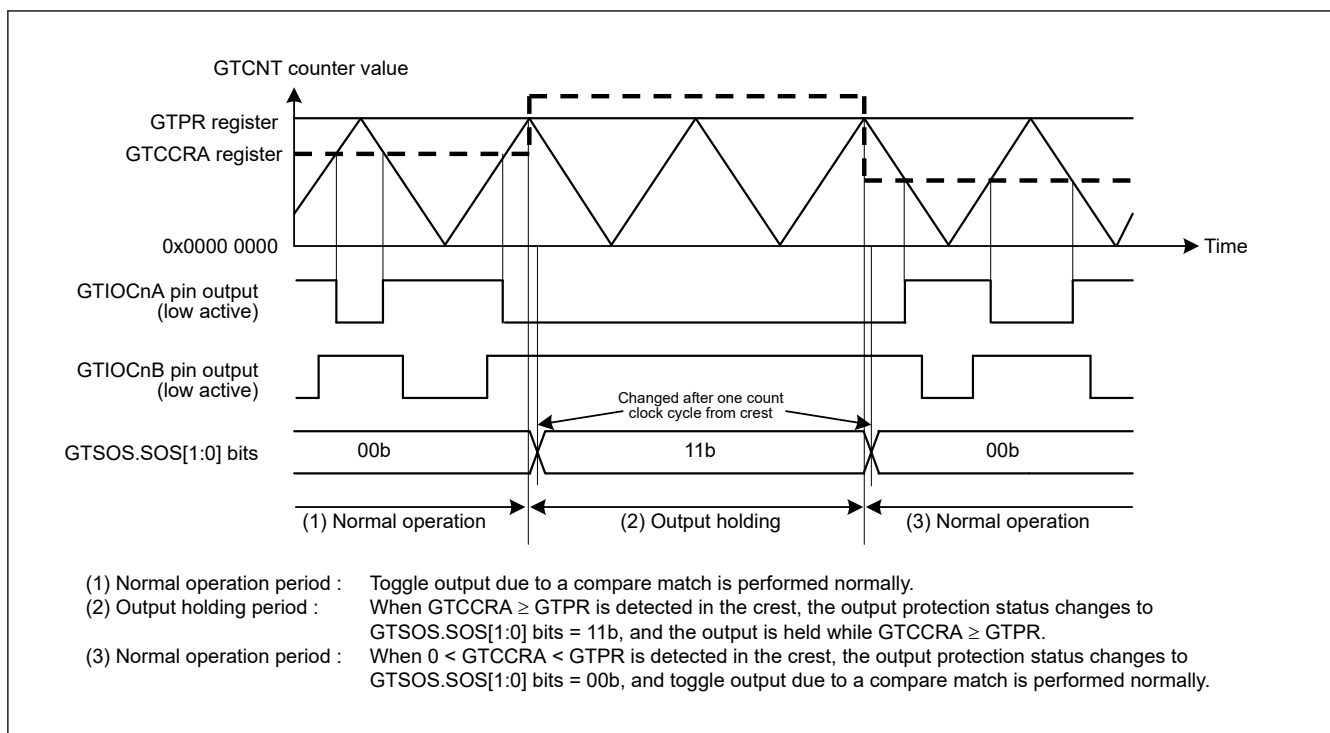

Figure 21.179 Example of Output Protection Function Operation When $GTCCRA \geq GTPR$ is Set during Buffer Transfer at Crests (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Crests, Active Level: Low) (n = 0 to 9)

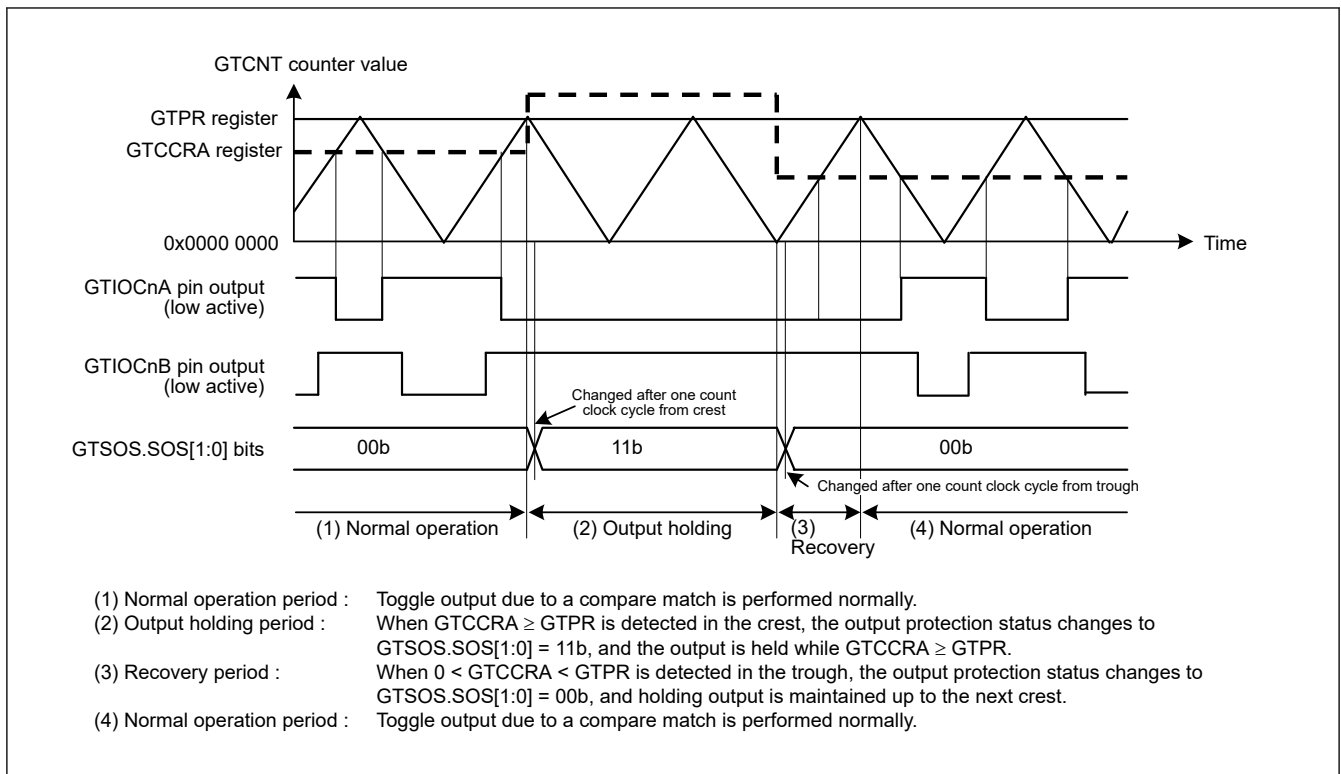

Figure 21.180 Example of Output Protection Function Operation When $GTCCRA \geq GTPR$ is Set during Buffer Transfer at Crests (Restored to $0 < GTCCRA < GTPR$ during Buffer Transfer at Troughs, Active Level: Low) ($n = 0$ to 9)

(4) Restricted Specification of Output Protection Function

Even if an incorrect value (0x0000 0000 or a value greater than or equal to the GTPR register value) is set in the GTCCRA register during count operation, the output protection functions in a specific way such that one of the positive- and negative-phase outputs becomes non-active. However, if the following condition is not satisfied, the output protection does not operate normally.

- When the GTCCRA register value at the start of count operation is greater than 0x0000 0000, and less than the setting value of the GTPR register

(5) Temporary Release of Output Protection Function

When the $GTSOS.SOS[1:0]$ bits = 10b (protected state in which $GTCCRA$ register \geq GTPR register has occurred during transfer at trough), the protected state of the GTIOCNB pin output can be temporarily released by setting the $GTSOTR.SOTR$ bit to 1. The $SOS[1:0]$ bits retain 10b even if the output protection function is released.

When the SOTR bit is set to 0, the GTIOCNB pin output protection can be restarted.

Figure 21.181 shows examples of the operation of temporary release of output protection when the setting of the GTCCRA register \geq GTPR register during buffer transfer at troughs.

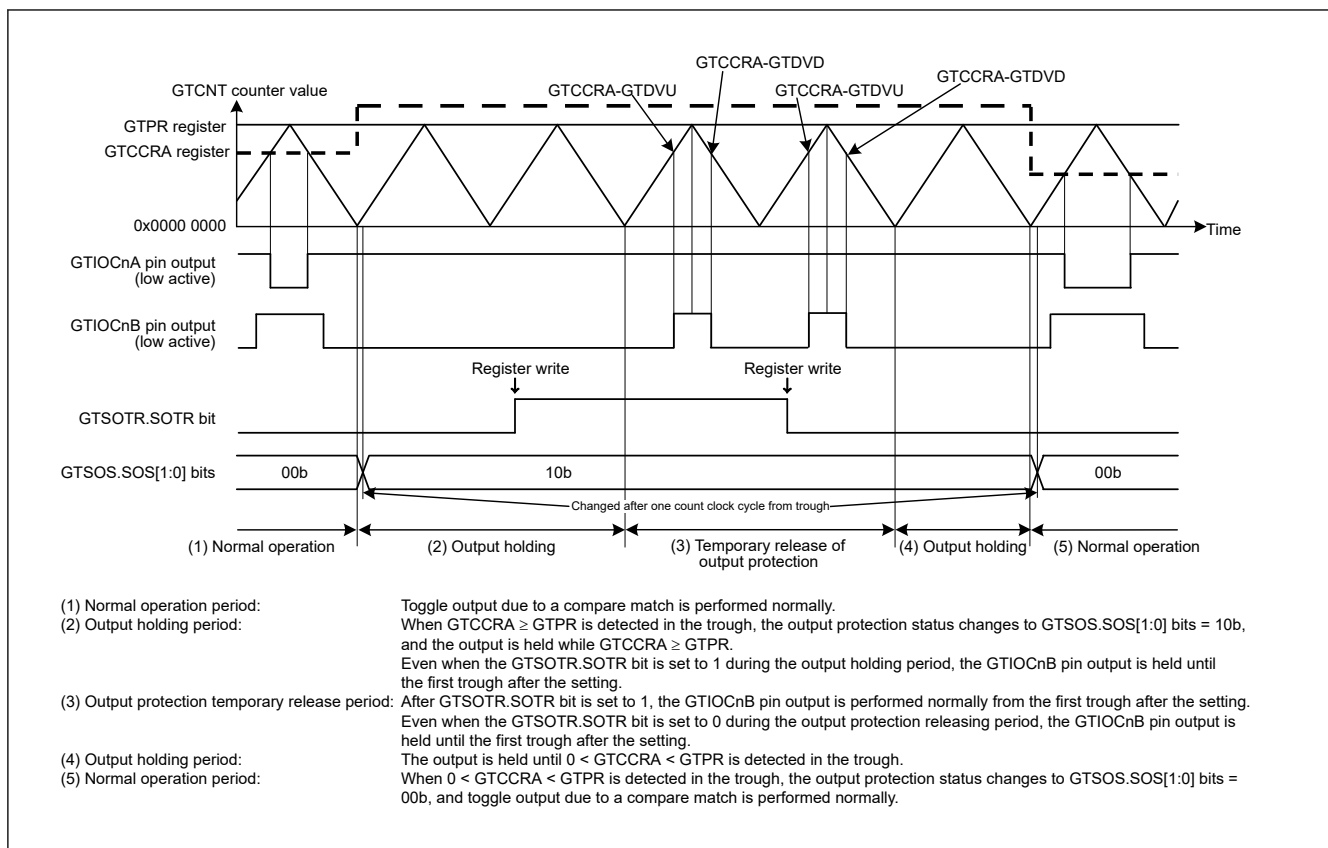

Figure 21.181 Example of Temporary Release of Output Protection When the Setting of the GTCCRA \geq GTPR during Buffer Transfer at Troughs (Restored to $0 < \text{GTCCRA} < \text{GTPR}$ during Buffer Transfer at Troughs, Active Level: Low) (n = 0 to 9)

21.9 Initialization Method of Output Pins

21.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.

Figure 21.182 Example of pin settings after reset

21.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

21.10 Usage Notes

21.10.1 Module-Stop Function Setting

The Module Stop Control Register E (MSTPCRE) can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

Set GTCLKCR register before releasing the module-stop state.

21.10.2 GTCCRN Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy all of the following conditions:

- $GTDVU < GTCCRA$
- $GTCCRA > GTDVD$

- $0 < \text{GTCCRA} < \text{GTPR}$

When the setting of $\text{GTCCRA} = 0$ or $\text{GTCCRA} \geq \text{GTPR}$ is made for the GTCCRA register during count operation, the output protection function is activated. However, if the following condition is not satisfied, the output protection function does not work normally:

- The value of the GTCCRA register at the start of counting is larger than 0 and less than GTPR.

For details, see [section 21.8.4. Output Protection Function for GTIOCNm Pin Output \(n = 0 to 9; m = A, B\)](#)

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of $0 < \text{GTCCRA} < \text{GTPR}$. If $\text{GTCCRA} = 0$ or $\text{GTCCRA} = \text{GTPR}$ is set, a compare match occurs within the cycle only when $\text{GTCCRA} = 0$ or $\text{GTCCRA} = \text{GTPR}$ is satisfied. When $\text{GTCCRA} > \text{GTPR}$, no compare match occurs.

Similarly, GTCCRB must be set within the range of $0 < \text{GTCCRB} < \text{GTPR}$. If $\text{GTCCRB} = 0$ or $\text{GTCCRB} = \text{GTPR}$ is set, a compare match occurs within the cycle only when $\text{GTCCRB} = 0$ or $\text{GTCCRB} = \text{GTPR}$ is satisfied. When $\text{GTCCRB} > \text{GTPR}$, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting: $\text{GTCCRC} < \text{GTCCRD}$, $\text{GTCCRC} > \text{GTDVU}$, $\text{GTCCRD} < \text{GTPR} - \text{GTDVD}$
- In down-counting: $\text{GTCCRC} > \text{GTCCRD}$, $\text{GTCCRC} < \text{GTPR} - \text{GTDVU}$, $\text{GTCCRD} > \text{GTDVD}$

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: $0 < \text{GTCCRC} < \text{GTCCRD} < \text{GTPR}$
- In down-counting: $\text{GTPR} > \text{GTCCRC} > \text{GTCCRD} > 0$

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: $0 < \text{GTCCRE} < \text{GTCCRF} < \text{GTPR}$
- In down-counting: $\text{GTPR} > \text{GTCCRE} > \text{GTCCRF} > 0$.

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of $0 < \text{GTCCRA} < \text{GTPR}$. If $\text{GTCCRA} = 0$ or $\text{GTCCRA} = \text{GTPR}$ is set, a compare match occurs within the cycle only when $\text{GTCCRA} = 0$ or $\text{GTCCRA} = \text{GTPR}$ is satisfied. If $\text{GTCCRA} > \text{GTPR}$ is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of $0 < \text{GTCCRB} < \text{GTPR}$. If $\text{GTCCRB} = 0$ or $\text{GTCCRB} = \text{GTPR}$ is set, a compare match occurs within the cycle only when $\text{GTCCRB} = 0$ or $\text{GTCCRB} = \text{GTPR}$ is satisfied. If $\text{GTCCRB} > \text{GTPR}$ is set, no compare match occurs.

(6) In Complementary PWM mode 1, 2, 3

The GTCCRn register must be set with the range of $0 \leq \text{GTCCRn} \leq \text{GTPR} + \text{GTDVU}$.

(7) In Complementary PWM mode 4

In single buffer operation, the GTCCRn register must be set with the range of $0 \leq \text{GTCCRn} \leq \text{GTPR} + \text{GTDVU}$.

In double buffer operation, the GTCCRn register must be set with the range of $\text{GTDVU} < \text{GTCCRn} < \text{GTPR}$.

21.10.3 Setting Range for GTCNT Counter

Other than the Saw-wave PWM mode 2 and Complementary PWM mode, the GTCNT counter register must be set with the range of $0 \leq \text{GTCNT} \leq \text{GTPR}$.

If GTCNT counter > GTPR register is set and the counter starts, the count operation performs the following three cases.

1. In triangle-waves
After the start of counting, GTCNT counter = GTPR register and GTST.TCUF flag = 0 are set, the counter performs down-counting.
2. In saw-wave up-counting
After the start of counting, GTCNT counter = 0 is set, the counter performs up-counting.
3. In saw-wave down-counting
After the start of counting, once GTCNT counter = 0 is set and GTCNT counter = GTPR register is set, the counter performs down-counting.

21.10.4 Setting Range of GTPBR and GTPDBR in Complementary PWM Mode

In complementary PWM modes 1, 3, and 4, if GTPR buffer transfer occurs at the end of the crest section, set GTPBR and GTPDBR value to the restricted range ($GTPBR \geq GTPR - GTDVU$, $GTPDBR \geq GTPR - GTDVU$) so that the GTPR value after the buffer transfer is not less than the GTCNT counter value of the master channel at the end of the crest section. When GTPR buffer transfer occurs at the end of the trough section or clearing counter, there is no restriction on the setting range of GTPBR and GTPDBR.

21.10.5 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[3:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

21.10.6 Priority Order of Each Event

(1) GTCNT register

Table 21.77 shows a priority order of events updating the GTCNT register.

Table 21.77 Priority order of sources updating GTCNT

| Source updating GTCNT | Priority order |
|-----------------------------------------------------------|----------------|
| Writing by CPU (writing to GTCNT/GTCLR) | High |
| Clear by hardware sources set in GTCSR | ↑ |
| Count up or down by hardware sources set in GTUPSR/GTDNSR | ↑ |
| Count operation | Low |

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

(3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture

and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

(4) GTPR register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTADTRm register, writing to GTADTRm register has priority over buffer transfer operation.

When there is a conflict between updating the GTADTRm register and reading by the CPU, pre-update data is read.

(6) GTDVM registers (m = U, D)

When there is a conflict between buffer transfer operation and writing to GTDVM register, writing to GTDVM register has priority over buffer transfer operation.

When there is a conflict between updating the GTDVM register and reading by the CPU, pre-update data is read.

(7) GTIOR.GTIOm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTIOR.GTIOm register, writing to GTIOR.GTIOm register has priority over buffer transfer operation.

When there is a conflict between updating the GTIOR.GTIOm and reading by the CPU, pre-update data is read.

21.10.7 Interval of interrupt request

When the core clock of GPT is GPTCLK, interrupt may be lost if the interval between the same interrupt signal is shorter than the following value. However, this restriction does not apply to different interrupt signals.

$$\text{Interrupt_Interval [ns]} = \text{Period_of_GPTCLK [ns]} * 6 + \text{Period_of_PCLKA [ns]} * 4$$

For the restriction of event signal, see [section 17, Event Link Controller \(ELC\)](#).

Also, ADC can receive the A/D conversion start request from GPT without going through ELC by setting ADTRGGPTx register (x = 0 to 8).

Again, when the clocks of GPT and ADC are combined as shown in [Table 21.78](#), the A/D conversion start request may be lost if the interval between one A/D conversion start request and the next is less than the following value for the same A/D conversion start request.

However, this restriction does not apply to different A/D conversion start request.

$$\text{Event_Interval [ns]} = \text{Period_of_GPT_core_clock [ns]} * 6 + \text{Period_of_ADC_core_clock [ns]} * 4$$

Table 21.78 Combination of clocks with the restricted Event Interval

| GPT core clock | ADC core clock |
|----------------|-----------------|
| GPTCLK | PCLKA or PCLKC |
| PCLKD | PCLKC or GPTCLK |

Figure 21.183 Example of GPT0_ADTRGA Event Interval

21.10.8 Notes on the GTIOCNm signal input to PWM Delay Generation Circuit (n = 0 to 3, m = A, B)

When controlling the delay of PWM waveform in PWM Delay Generation Circuit, the following limitations exist.

- In saw-wave mode, It is prohibited to change the GTIOCNm signal during the three clock cycles immediately before overflow or underflow.
- In saw-wave mode, it is prohibited to clear the GTCNT register by GTCSR during counting operation.
- In triangle-wave mode, It is prohibited to change the GTIOCNm signal during the three clock cycles immediately before trough.

If the above limitations are not followed, the edge of signal waveform output from PWM Delay Generation Circuit may disappear.

Figure 21.184 shows an example of the change timing of an unacceptable GTIOCNm signal.

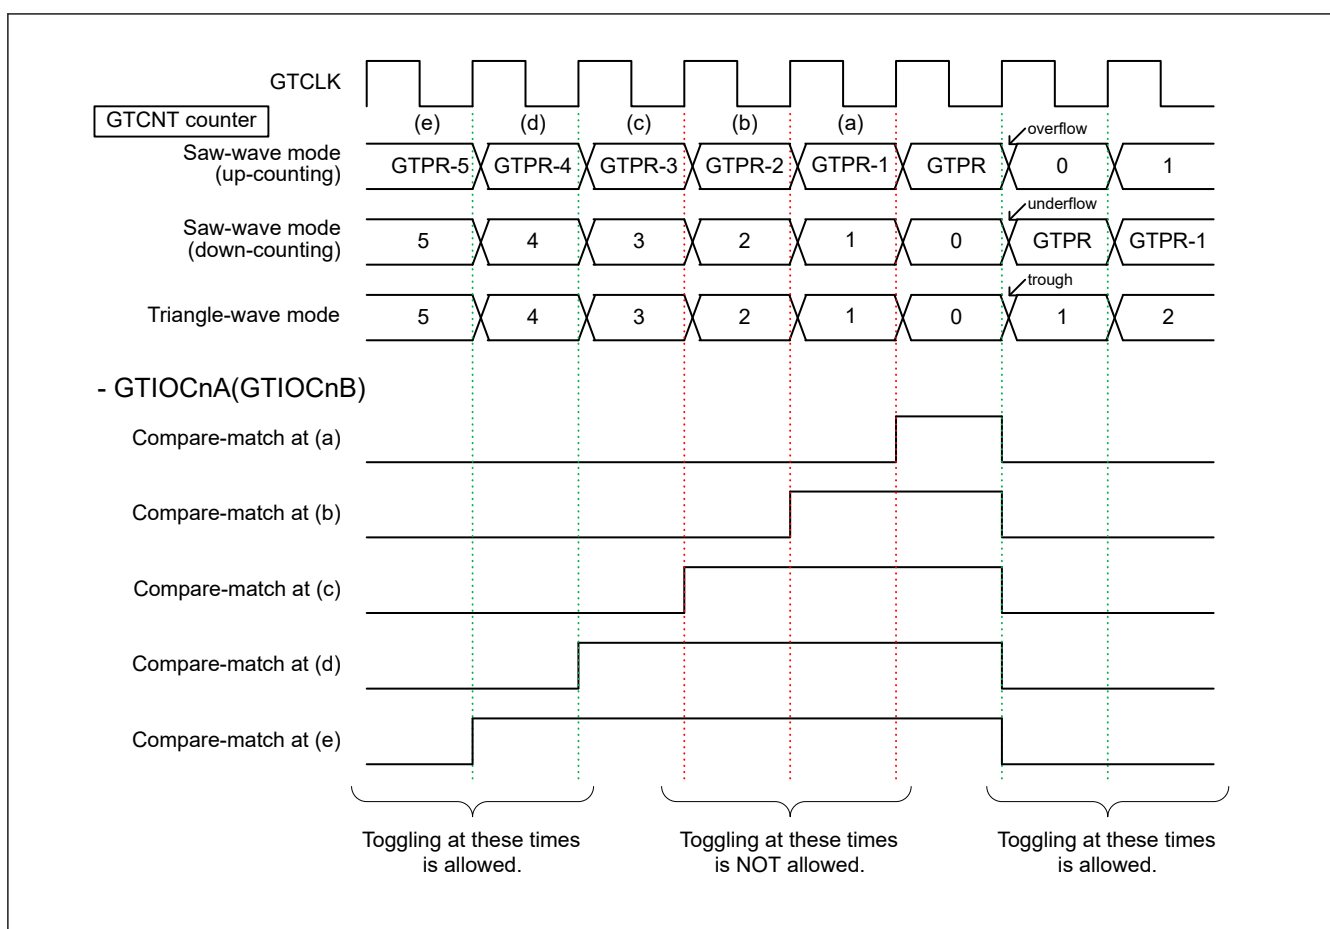

Figure 21.184 Example of unacceptable GTIOCNm signal timing (n = 0 to 3, m = A, B)

21.10.9 Counter Clear Operation in Complementary PWM Mode

During complementary PWM mode, the counter clear at the end of the trough section including the initial output section (GTCNT count value of the master channel matches the value of GTDVU register) is prohibited. When the counter is cleared in complementary PWM mode, adjust the timing so that counter clearing does not occur at the end of the trough section. By using synchronous clear operation by inter channel cooperation as described in [section 21.3.8.3. Synchronous Clear Operation by Inter Channel Cooperation](#) and selecting compare match as the counter clearing source, it is possible to avoid the counter clear at the end of the trough section.

21.10.10 Setting Range of the Compare Match Registers when GTIOR.CPSCIR = 1

In complementary PWM mode, when GTIOR.CPSCIR = 1 and the initial output of GTIOCnA/GTIOCnB pins after synchronization clearing is disabled, set the compare match registers (GTCCRA, GTCCRC, GTCCRD, GTCCRE, GTCCRF) to greater than twice the value of GTDVU.

21.10.11 Prohibit Invalid Register Setting

The register settings that are determined to be invalid, such as "The setting is invalid during event counting operation", are not guaranteed. These settings are prohibited.

21.10.12 Setting Range of the GTPBR and GTPDBR register in complementary PWM mode (GPT32n (n = 4 to 9))

In complementary PWM modes 1, 3, and 4, if GTPR buffer transfer occurs at the end of the crest section, set the GTPBR and GTPDBR value to the restricted range ($GTPBR \geq GTPR - GTDVU$, $GTPDBR \geq GTPR - GTDVU$) so that the GTPR value after the buffer transfer is not less than the GTCNT counter value of the master channel at the end of the crest section. When GTPR buffer transfer occurs at the end of the trough section or clearing counter, there is no restriction on the setting range of GTPBR and GTPDBR.

22. PWM Delay Generation Circuit (PDG)

22.1 Overview

The PWM Delay Generation circuit (PDG) has 4 channels delay circuits that can connect to the GPT. The PDG can control the rise and fall edge timing with which the PWM output for the GPT320 through the GPT323.

[Table 22.1](#) lists the specifications for the PWM Delay Generation Circuit, [Figure 22.1](#) shows a block diagram, and [Table 22.2](#) lists the I/O pins.

Table 22.1 Specifications of the PWM Delay Generation Circuit

| Parameter | Specifications |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Function | The circuit can control the timing with which signals on the two PWM output pins for channel 0/1/2/3 rise and fall to an accuracy of up to 1/32 times the period of the GPT core clock (GTCLK). The GPT core clock (GTCLK) can be selected from PCLKD or GPTCLK. |

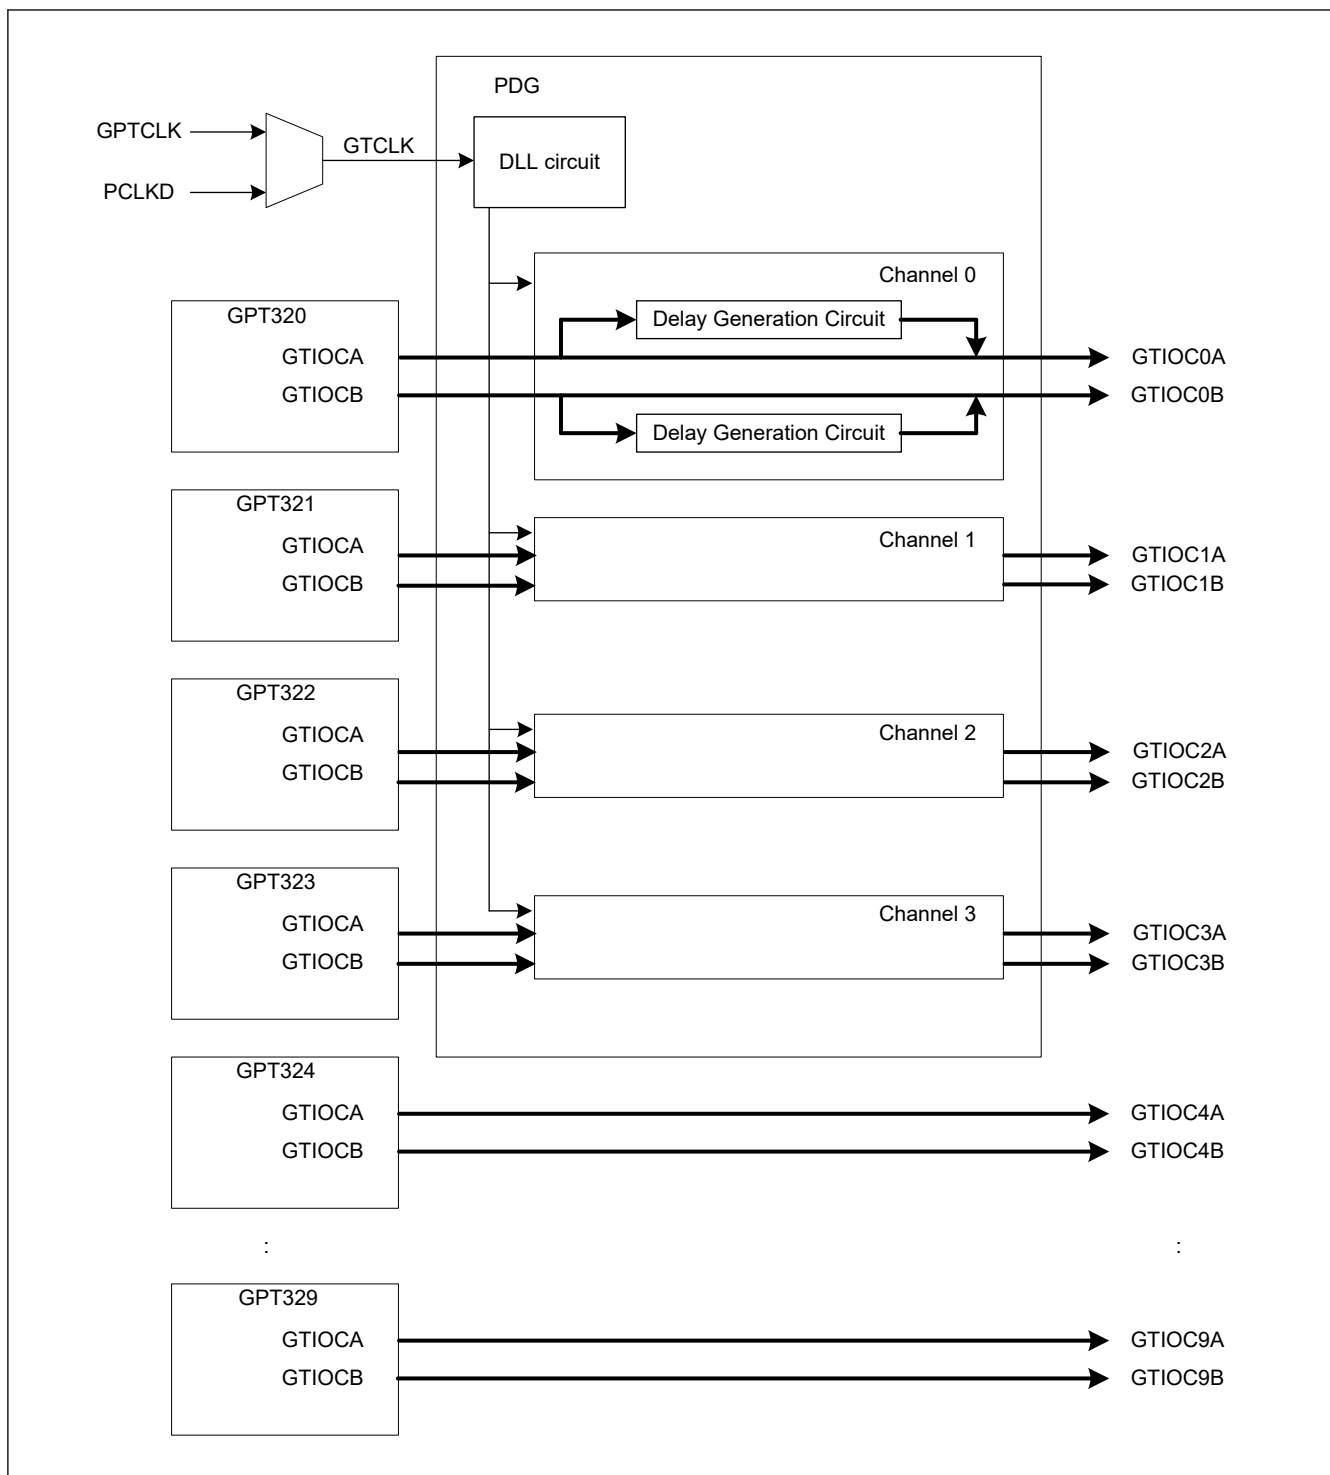

Figure 22.1 PWM delay generation circuit block diagram

Table 22.2 PWM delay generation circuit I/O pins (1 of 2)

| I/O pin | I/O | Function |
|---------|--------|-----------------------------------------------|
| GTIOC0A | Output | Delayed output of GTIOCA pin of GPT channel 0 |
| GTIOC0B | Output | Delayed output of GTIOCB pin of GPT channel 0 |
| GTIOC1A | Output | Delayed output of GTIOCA pin of GPT channel 1 |
| GTIOC1B | Output | Delayed output of GTIOCB pin of GPT channel 1 |
| GTIOC2A | Output | Delayed output of GTIOCA pin of GPT channel 2 |

Table 22.2 PWM delay generation circuit I/O pins (2 of 2)

| I/O pin | I/O | Function |
|---------|--------|-----------------------------------------------|
| GTIOC2B | Output | Delayed output of GTIOCB pin of GPT channel 2 |
| GTIOC3A | Output | Delayed output of GTIOCA pin of GPT channel 3 |
| GTIOC3B | Output | Delayed output of GTIOCB pin of GPT channel 3 |

22.2 Register Descriptions

22.2.1 GTDLYCR : PWM Output Delay Control Register

Base address: PDG = 0x4016_A000

Offset address: 0x0000

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|------------|---|---|---|---|---|---|------------|-----------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | FRAN GE | — | — | — | — | — | — | DLYR ST | DLLE N |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------|-----------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DLEN | DLL Operation Enable 0: DLL operation disabled 1: DLL operation enabled | R/W |
| 1 | DLYRST | PWM Delay Generation Circuit Reset 0: Normal operation 1: Reset | R/W |
| 7:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | FRANGE | GPT core clock Frequency Range 0: GPT core clock frequency is 115 MHz to 200 MHz 1: GPT core clock frequency is 80 MHz to 120 MHz | R/W |
| 15:9 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYCR register controls the PWM delay generation circuit, which applies delays to the PWM outputs. GTDLYCR register can be written when register write protection is disabled (GPT320.GTWP.WP = 0).

When changing GTDLYCR after changing the value of GPT320.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYCR.

DLEN bit (DLL Operation Enable)

The DLEN bit selects whether the on-chip DLL in the PWM delay generation circuit is activated or not.

DLYRST bit (PWM Delay Generation Circuit Reset)

The DLYRST bit resets the internal state of the PWM delay generation circuit.

FRANGE bit (GPT core clock Frequency Range)

The FRANGE bit sets the frequency range of the GPT core clock.

Set the FRANGE bit only when the DLEN bit is 0.

22.2.2 GTDLYCR2 : PWM Output Delay Control Register 2

Base address: PDG = 0x4016_A000

Offset address: 0x0002

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|---------|---------|---------|---------|---|---|---|---|---------|---------|---------|---------|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | DLYE N3 | DLYE N2 | DLYE N1 | DLYE N0 | — | — | — | — | DLYB S3 | DLYB S2 | DLYB S1 | DLYB S0 |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DLYBS0 | PWM Delay Generation Circuit bypass for channel 0 0: Delay generation circuit of channel 0 bypassed 1: Delay generation circuit of channel 0 not bypassed | R/W |
| 1 | DLYBS1 | PWM Delay Generation Circuit bypass for channel 1 0: Delay generation circuit of channel 1 bypassed 1: Delay generation circuit of channel 1 not bypassed | R/W |
| 2 | DLYBS2 | PWM Delay Generation Circuit bypass for channel 2 0: Delay generation circuit of channel 2 bypassed 1: Delay generation circuit of channel 2 not bypassed | R/W |
| 3 | DLYBS3 | PWM Delay Generation Circuit bypass for channel 3 0: Delay generation circuit of channel 3 bypassed 1: Delay generation circuit of channel 3 not bypassed | R/W |
| 7:4 | — | These bits are read as 0. The write value should be 0. | R/W |
| 8 | DLYEN0 | PWM Delay Generation Circuit enable for channel 0 0: Delay generation circuit of channel 0 enabled 1: Delay generation circuit of channel 0 disabled | R/W |
| 9 | DLYEN1 | PWM Delay Generation Circuit enable for channel 1 0: Delay generation circuit of channel 1 enabled 1: Delay generation circuit of channel 1 disabled | R/W |
| 10 | DLYEN2 | PWM Delay Generation Circuit enable for channel 2 0: Delay generation circuit of channel 2 enabled 1: Delay generation circuit of channel 2 disabled | R/W |
| 11 | DLYEN3 | PWM Delay Generation Circuit enable for channel 3 0: Delay generation circuit of channel 3 enabled 1: Delay generation circuit of channel 3 disabled | R/W |
| 15:12 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYCR2 register controls each channel of PWM delay generation circuit. GTDLYCR2 can be written when register write protection is disabled (GPT320.GTWP.WP = 0).

When changing GTDLYCR2 after changing the value of GPT320.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYCR2.

DLYBSn (n = 0 to 3) bit (PWM Delay Generation Circuit Bypass for channel n)

The DLYBSn bit selects whether delays are applied to PWM output signals from the GTIOCnA and GTIOCnB pins (n = 0 to 3) by the PWM delay generation circuit or whether the circuit is bypassed.

A signal delayed in the PWM delay generation circuit is output 3 cycles of GPT core clock (GTCLK) later than if it bypasses the PWM delay generation circuit.

DLYENn (n = 0 to 3) bit (PWM Delay Generation Circuit Enable for channel n)

The DLYENn bit selects whether channel n (n = 0 to 3) of PWM delay generation circuit is power on or off. If channel n of the PWM delay generation circuit is not used, set to 1.

22.2.3 GTDLYRnA : GTIOCN A Rising Output Delay Register (n = 0 to 3)

Base address: PDG = 0x4016_A000

Offset address: 0x018 + 0x4 × n

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|----------|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | DLY[4:0] | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 4:0 | DLY[4:0] | GTIOCN A Output Rising Edge Delay Setting 0x00: Delay on rising edges is not applied 0x01: Delay of 1/32 times GTCLK period applied 0x02: Delay of 2/32 times GTCLK period applied 0x03: Delay of 3/32 times GTCLK period applied 0x04: Delay of 4/32 times GTCLK period applied 0x05: Delay of 5/32 times GTCLK period applied 0x06: Delay of 6/32 times GTCLK period applied 0x07: Delay of 7/32 times GTCLK period applied 0x08: Delay of 8/32 times GTCLK period applied 0x09: Delay of 9/32 times GTCLK period applied 0x0A: Delay of 10/32 times GTCLK period applied 0x0B: Delay of 11/32 times GTCLK period applied 0x0C: Delay of 12/32 times GTCLK period applied 0x0D: Delay of 13/32 times GTCLK period applied 0x0E: Delay of 14/32 times GTCLK period applied 0x0F: Delay of 15/32 times GTCLK period applied 0x10: Delay of 16/32 times GTCLK period applied 0x11: Delay of 17/32 times GTCLK period applied 0x12: Delay of 18/32 times GTCLK period applied 0x13: Delay of 19/32 times GTCLK period applied 0x14: Delay of 20/32 times GTCLK period applied 0x15: Delay of 21/32 times GTCLK period applied 0x16: Delay of 22/32 times GTCLK period applied 0x17: Delay of 23/32 times GTCLK period applied 0x18: Delay of 24/32 times GTCLK period applied 0x19: Delay of 25/32 times GTCLK period applied 0x1A: Delay of 26/32 times GTCLK period applied 0x1B: Delay of 27/32 times GTCLK period applied 0x1C: Delay of 28/32 times GTCLK period applied 0x1D: Delay of 29/32 times GTCLK period applied 0x1E: Delay of 30/32 times GTCLK period applied 0x1F: Delay of 31/32 times GTCLK period applied | R/W |
| 15:5 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYRnA register sets a delay to be applied to rising edges of output signals on the GTIOCN A pin. On the timing for the transfer of settings, see [section 22.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#).

GTDLYRnA can be written when register write protection is disabled (GPT32n.GTWP.WP = 0).

When changing GTDLYRnA after changing the value of GPT32n.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYRnA.

22.2.4 GTDLYFnA : GTIOCnA Falling Output Delay Register (n = 0 to 3)

Base address: PDG = 0x4016_A000

Offset address: 0x028 + 0x4 × n

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|----|----|----|---|---|---|---|---|----------|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 4:0 | DLY[4:0] | GTIOCNB Output Rising Edge Delay Setting 0x00: Delay on rising edges is not applied 0x01: Delay of 1/32 times GTCLK period applied 0x02: Delay of 2/32 times GTCLK period applied 0x03: Delay of 3/32 times GTCLK period applied 0x04: Delay of 4/32 times GTCLK period applied 0x05: Delay of 5/32 times GTCLK period applied 0x06: Delay of 6/32 times GTCLK period applied 0x07: Delay of 7/32 times GTCLK period applied 0x08: Delay of 8/32 times GTCLK period applied 0x09: Delay of 9/32 times GTCLK period applied 0x0A: Delay of 10/32 times GTCLK period applied 0x0B: Delay of 11/32 times GTCLK period applied 0x0C: Delay of 12/32 times GTCLK period applied 0x0D: Delay of 13/32 times GTCLK period applied 0x0E: Delay of 14/32 times GTCLK period applied 0x0F: Delay of 15/32 times GTCLK period applied 0x10: Delay of 16/32 times GTCLK period applied 0x11: Delay of 17/32 times GTCLK period applied 0x12: Delay of 18/32 times GTCLK period applied 0x13: Delay of 19/32 times GTCLK period applied 0x14: Delay of 20/32 times GTCLK period applied 0x15: Delay of 21/32 times GTCLK period applied 0x16: Delay of 22/32 times GTCLK period applied 0x17: Delay of 23/32 times GTCLK period applied 0x18: Delay of 24/32 times GTCLK period applied 0x19: Delay of 25/32 times GTCLK period applied 0x1A: Delay of 26/32 times GTCLK period applied 0x1B: Delay of 27/32 times GTCLK period applied 0x1C: Delay of 28/32 times GTCLK period applied 0x1D: Delay of 29/32 times GTCLK period applied 0x1E: Delay of 30/32 times GTCLK period applied 0x1F: Delay of 31/32 times GTCLK period applied | R/W |
| 15:5 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYRnB register sets a delay to be applied to rising edges of output signals on the GTIOCNB pin. On the timing for the transfer of settings, see [section 22.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#).

GTDLYRnB can be written when register write protection is disabled (GPT32n.GTWP.WP = 0).

When changing GTDLYRnB after changing the value of GPT32n.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYRnB.

22.2.6 GTDLYFnB : GTIOcNB Falling Output Delay Register (n = 0 to 3)

| 15:5 | — | These bits are read as 0. The write value should be 0. | R/W |

The GTDLYFnB register sets a delay to be applied to falling edges of output signals on the GTIOcNB pin. On the timing for the transfer of settings, see [section 22.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#).

GTDLYFnB can be written when register write protection is disabled (GPT32n.GTWP.WP = 0).

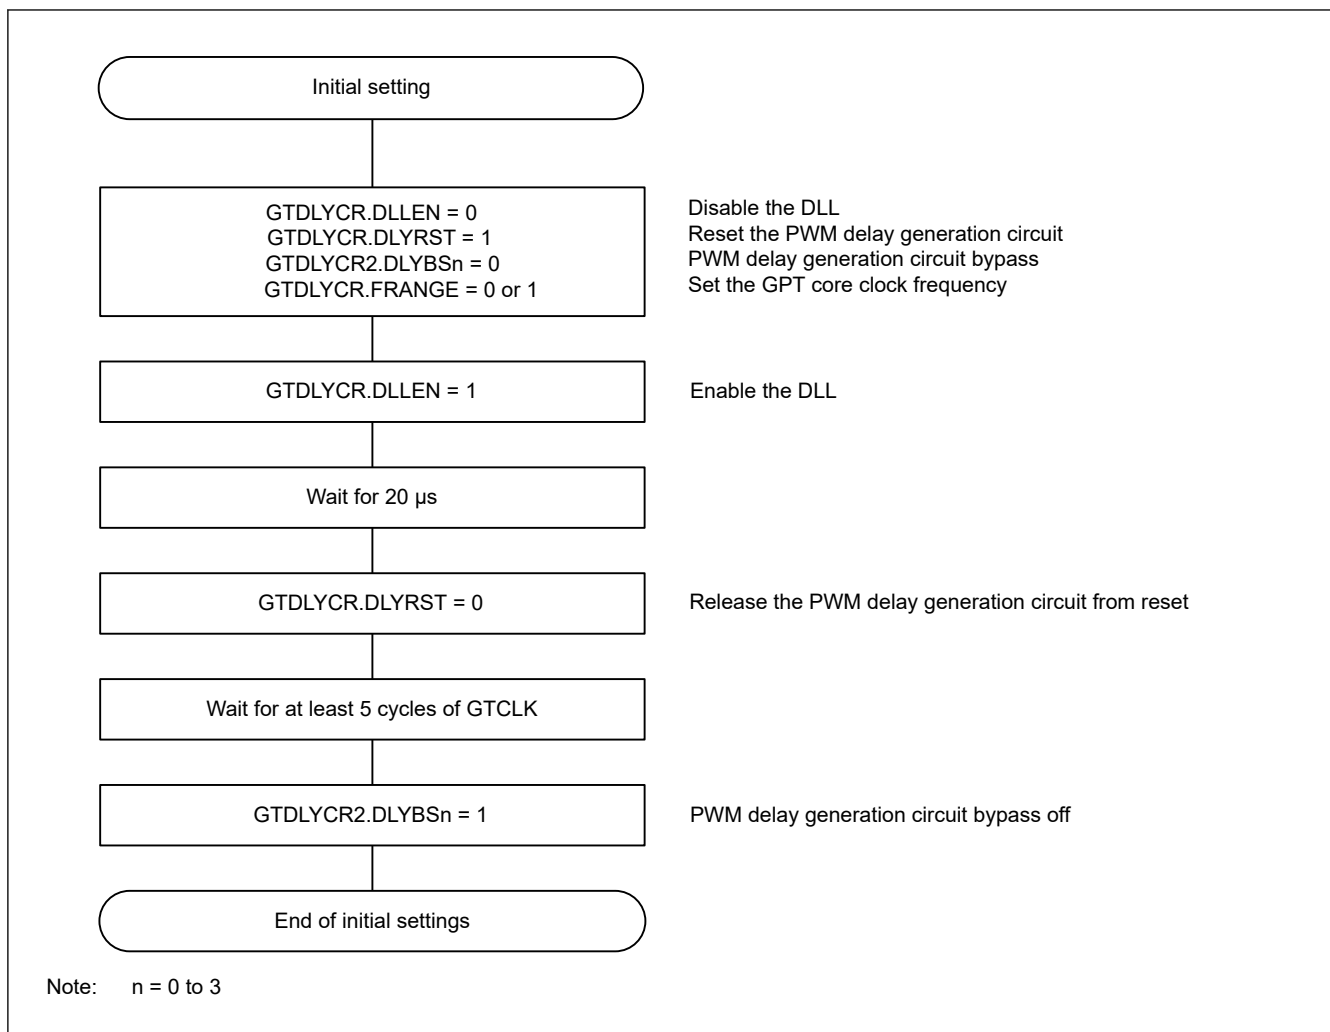

When changing GTDLYFnB after changing the value of GPT32n.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYFnB.

22.3 Operation

22.3.1 Adjustments to the Timing of Rising and Falling Edges in PWM Waveforms

The timing of rising and falling edges in PWM waveforms which are output from the GTIOcNA and GTIOcNB pins, where n = channel number, can be delayed to an accuracy of 1/32 of the GPT core clock (GTCLK) period.

If the timing of rising or falling edges in PWM waveforms output from the GTIOcNA and GTIOcNB pins must be adjusted, initialize the PWM generation circuit as shown in the procedure in [Figure 22.2](#).

**Figure 22.2** Example of initialization flow for the PWM delay generation circuit

In the PWM delay generation circuit, delay can be applied to rising and falling edges of the PWM output to an accuracy of 1/32 of the period of the GPT core clock (GTCLK). This is described in [section 21.3.3. PWM Output Operating Mode](#). Delays associated with the settings are reflected in the PWM output with the timing described in [section 22.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#). [Table 22.3](#) shows the association between the GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB registers and the PWM outputs.

Table 22.3 Association between PWM output pins and delay setting registers

| PWM output pin | Rising-edge delay setting register | Falling-edge delay setting register |
|----------------|------------------------------------|-------------------------------------|
| GTIOC0A | GTDLYR0A | GTDLYF0A |
| GTIOC0B | GTDLYR0B | GTDLYF0B |
| GTIOC1A | GTDLYR1A | GTDLYF1A |
| GTIOC1B | GTDLYR1B | GTDLYF1B |
| GTIOC2A | GTDLYR2A | GTDLYF2A |
| GTIOC2B | GTDLYR2B | GTDLYF2B |
| GTIOC3A | GTDLYR3A | GTDLYF3A |
| GTIOC3B | GTDLYR3B | GTDLYF3B |

When the PWM delay generation circuit is in use, the timing with which a PWM output signal rises and falls can be controlled to an accuracy of 1/32 of the period of the GPT core clock (GTCLK). When this option is not in use, the period of the PWM output waveform is controlled to an accuracy of one period of the input clock for the timer counter, which is GTCLK. With the PWM delay generation circuit, the output can be controlled to an accuracy 32 times better. Additionally,

the delay settings also control the periods at high and low level for the PWM waveform to the given accuracy. PWM delay generation circuit channels can be individually enabled or disabled.

22.3.2 Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings

Settings for the GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB registers are initially transferred to temporary registers, and then reflected in the delay on the GTIOCnA and GTIOCnB ($n = 0$ to 3) outputs. Transfer of the settings takes place on overflows (in up-counting) or underflows (in down-counting) for saw waves, and in the troughs of triangle waves.

Figure 22.3 and Figure 22.4 show examples of the operation of the GTDLYR0A and GTDLYF0A registers.

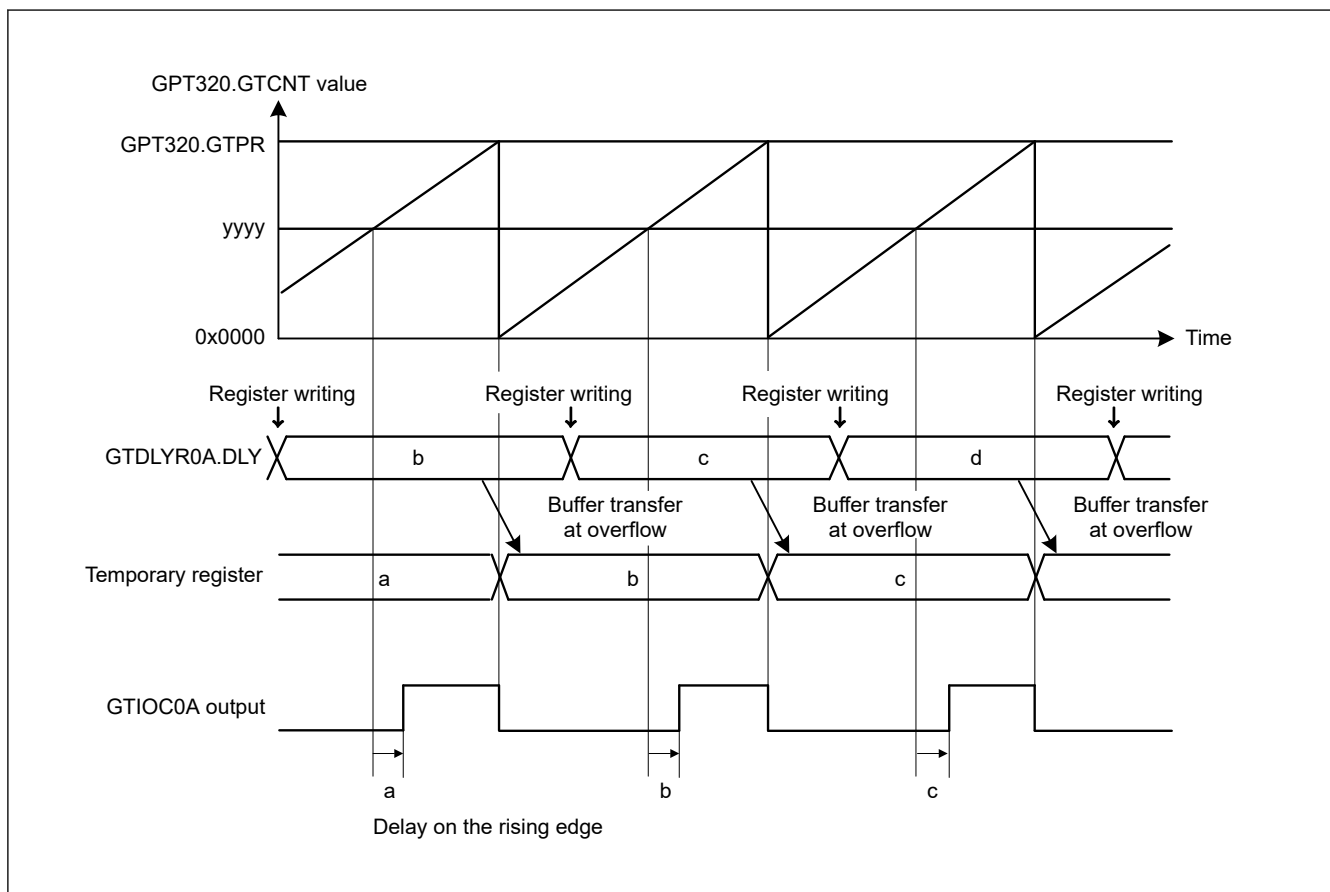

Figure 22.3 Example of GTDLYR0A register operation with PWM saw-wave generation

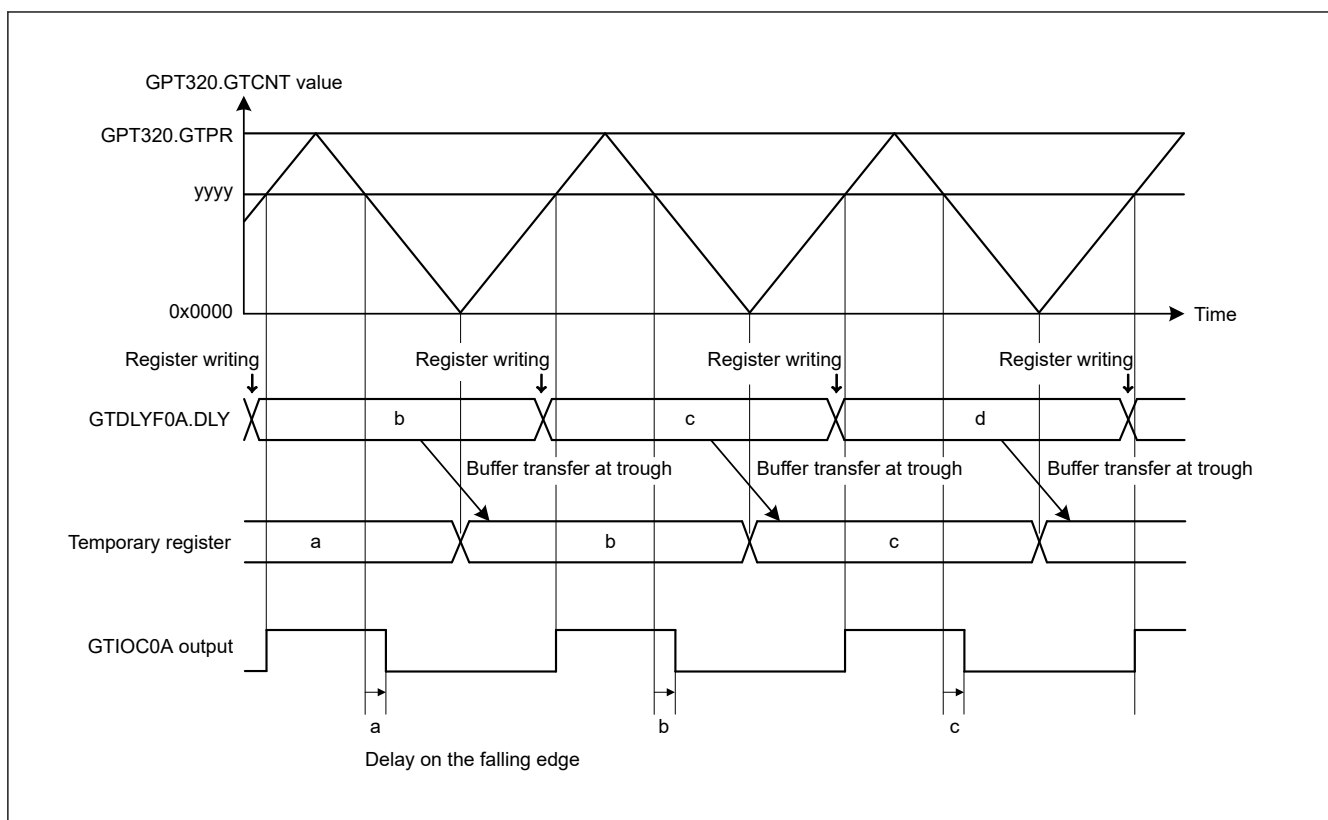

Figure 22.4 Example of GTDLYF0A register operation with PWM triangle-wave generation

22.4 Usage Notes

22.4.1 Settings for the Module-Stop Function

The Module Stop Control Register E (MSTPCRE) can enable or disable operation of the PWM delay generation circuit. The PWM delay generation circuit is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#).

22.4.2 Notes on Delay Settings for PWM Delay Generation Circuit

When the PWM delay generation circuit generates delays for a PWM output waveform and the waveform is toggled in response to compare-matches, do not change the settings for delay while the compare-match value is within the ranges listed in [Table 22.4](#). This constraint applies to the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers.

Table 22.4 Constraints on delay settings

| Mode | Direction of counting | Compare-match value |
|--------------------|-----------------------|---------------------|
| Saw-wave mode | Up | GTPR - 2 or above |
| | Down | 2 or below |
| Triangle-wave mode | Down | 2 or below |

[Figure 22.5](#) shows an example of how the constraints apply to the timing of setting GTDLYFnA in saw-wave waveform one-shot pulse mode (counting up). Do not change the value set in GTDLYFnA while $GTCCRD \geq GTPR - 2$.

Figure 22.5 Constraints on the timing of GTDLYF0A register settings

Changing the values in the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers during periods where changes to settings are not allowed, might lead to faulty output waveforms such as shifts in the timing of output waveform transitions from the expected values.

22.4.3 Register Write Interval

When GPT core clock is GPTCLK, the writing value may not be reflected if the interval between writing to the GTDLYRnA/GTDLYFnA/GTDLYRnB/GTDLYFnB register is shorter than the following interval time. This restriction only applies to successive writes to the same register.

$$\text{Write_Interval [ns]} = \text{Period_of_PCLKA [ns]} \times 6 + \text{Period_of_GPTCLK [ns]} \times 4$$

23. Low Power Asynchronous General Purpose Timer (AGTW)

This is the AGTW_B version of the AGTW peripheral module.

AGTW_B is referred to as AGTW in this chapter.

23.1 Overview

The low power Asynchronous General Purpose Timer (AGT) is a 32-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 23.1 lists the AGTW specifications, Figure 23.1 shows a block diagram, and Table 23.2 lists the I/O pins.

Table 23.1 AGTW specifications

| Parameter | | Description |
|-----------------------------------|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Operating modes | Timer mode | The count source is counted |
| | Pulse output mode | The count source is counted and the output is inverted at each timer underflow |
| | Event counter mode | An external event is counted |
| | Pulse width measurement mode | An external pulse width is measured |
| | Pulse period measurement mode | An external pulse period is measured |
| Number of Channels | | 32 bits × 2 channels (AGTWn (n = 0, 1)) |
| Count source (operating clock)*2 | Timer mode | PCLKB, PCLKB/2, PCLKB/8, AGTLCLK/d (d = 1, 2, 4, 8, 16, 32, 64, or 128), or underflow signal of AGTW0 selectable.*1 |
| | Pulse output mode | |
| | Pulse width measurement mode | |
| | Pulse period measurement mode | |
| | Event counting mode | External event input |
| Interrupt and Event Link function | | <ul style="list-style-type: none"> Underflow event signal or measurement complete event signal <ul style="list-style-type: none"> When the counter underflows When the measurement of the active width of the external input pin (AGTWIOn) completes in pulse width measurement mode When the set edge of the external input pin (AGTWIOn) is input in pulse period measurement mode. Compare match A event signal <ul style="list-style-type: none"> When the values of AGT register and AGTCMA register matched (compare match A function enabled). Compare match B event signal <ul style="list-style-type: none"> When the values of AGT and AGTCMB registers matched (compare match B function enabled). Return from Snooze mode or Software Standby mode can be performed with AGT1_AGTI, AGT1_AGTCMAI, or AGT1_AGTCMBI*3 |
| Selectable functions | | <ul style="list-style-type: none"> Compare match function One or two of the AGT Compare Match A register and AGT Compare Match B register is selectable. |
| TrustZone Filter | | Security attribution can be set for each channels |

Note 1. AGTW0 cannot use underflow signal. AGTW1 connects directly with the underflow event signal from the AGTW0 timer.

Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.

Note 3. For details, see [section 10, Low Power Modes](#).

| Pin name | I/O | Function |
|----------|--------------|------------------------------------------------|
| AGTEEn | Input | External event input enable for AGTW |
| AGTIOn | Input/output | External event input and pulse output for AGTW |
| AGTOOn | Output | Pulse output for AGTW |
| AGTOAn | Output | Compare match A output for AGTW |
| AGTOBn | Output | Compare match B output for AGTW |

23.2 Register Descriptions

23.2.1 AGT : AGT Counter Register

[illegible]

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------|-----|
| 31:0 | n/a | 32-bit counter and reload register Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

AGTWn.AGT is a 32-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see [section 23.3.1. Reload Register and Counter Rewrite Operation](#).

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFFFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x00000000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The and AGTWOn, AGTWIO pin output are toggled.

When the AGT register is set to 0x00000000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTWOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x00000001 or more, a request signal is generated each time AGT underflows.

23.2.2 AGTCMA : AGT Compare Match A Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x04

Bit position: 31

0

Bit field:

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | 32-bit compare match A data is stored.*1 Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

Note 1. Set the AGTCMA register to 0xFFFFFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see [section 23.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

23.2.3 AGTCMB : AGT Compare Match B Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Bit position: 31

0

Bit field:

Value after reset: 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|------|--------|--------------------------------------------------------------------------------------|-----|
| 31:0 | n/a | 32-bit compare match B data is stored.*1 Setting range : 0x00000000 to 0xFFFFFFFF | R/W |

Note 1. Set the AGTCMB register to 0xFFFFFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see [section 23.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation](#).

23.2.4 AGTCR : AGT Control Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

| | | | | | | | | |
|--------------------|-----------|-----------|-----------|-----------|---|-----------|-----------|------------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | TCMB F | TCMA F | TUND F | TEDG F | — | TSTO P | TCST F | TSTA RT |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------------------|---------------------|
| 0 | TSTART | AGT Count Start* ² 0: Count stops 1: Count starts | R/W |
| 1 | TCSTF | AGT Count Status Flag* ² 0: Count stopped 1: Count in progress | R |
| 2 | TSTOP | AGT Count Forced Stop* ¹ 0: Writing is invalid 1: The count is forcibly stopped | W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | TEDGF | Active Edge Judgment Flag 0: No active edge received 1: Active edge received | R/(W)* ³ |
| 5 | TUNDF | Underflow Flag 0: No underflow 1: Underflow | R/(W)* ³ |
| 6 | TCMAF | Compare Match A Flag 0: No match 1: Match | R/(W)* ³ |
| 7 | TCMBF | Compare Match B Flag 0: No match 1: Match | R/(W)* ³ |

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.

Note 2. For information on using the TSTART bit and TCSTF flag, see [section 23.4.1. Count Operation Start and Stop Control](#).

Note 3. Only 0 can be written to clear the flag.

TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see [section 23.4.1. Count Operation Start and Stop Control](#).

TCSTF flag (AGT Count Status Flag)

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

TSTOP bit (AGT Count Forced Stop)

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

TEDGF flag (Active Edge Judgment Flag)

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTWION) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTWION) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

TUNDF flag (Underflow Flag)

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

TCMAF flag (Compare Match A Flag)

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

TCMBF flag (Compare Match B Flag)

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

23.2.5 AGTMR1 : AGT Mode Register 1

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

| | | | | | | | | |
|--------------------|---|----------|---|---|------------|-----------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | TCK[2:0] | | | TEDG PL | TMOD[2:0] | | |
| Value after reset: | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 2:0 | TMOD[2:0] | Operating Mode*3 0 0 0: Timer mode 0 0 1: Pulse output mode 0 1 0: Event counter mode 0 1 1: Pulse width measurement mode 1 0 0: Pulse period measurement mode Others: Setting prohibited | R/W |

| Bit | Symbol | Function | R/W |
|-----|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 3 | TEDGPL | Edge Polarity* ⁴ 0: Single-edge 1: Both-edge | R/W |
| 6:4 | TCK[2:0] | Count Source* ¹ * ² * ⁵ * ⁷ 0 0 0: PCLKB 0 0 1: PCLKB/8 0 1 1: PCLKB/2 1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register 1 0 1: Underflow event signal from AGTW0* ⁶ 1 1 0: Setting prohibited Others: Setting prohibited | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

Note: Write access to the AGTMR1 register initializes the output from the AGTWOn, AGTWIOOn, AGTWOAn, and AGTWOBn pins. For details on the output level at initialization, see [section 23.2.7. AGTIOC : AGT I/O Control Register](#).

Note 1. When event counter mode is selected, the external input pin (AGTWIOOn) is selected as the count source regardless of the setting of TCK[2:0] bits.

Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.

Note 4. The TEDGPL bit is enabled only in event counter mode.

Note 5. To run AGT in Software Standby mode, Snooze mode, select AGTLCLK (TCK[2:0] = 100b).

Note 6. AGTW0 cannot use AGTW0 underflow (setting prohibited). AGTW1 uses the AGTW0 underflow.

Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

23.2.6 AGTMR2 : AGT Mode Register 2

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

| 2:0 | CKS[2:0] | AGTLCLK Count Source Clock Frequency Division Ratio* ¹ * ² * ³ 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128 | R/W |
| 6:3 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | LPM | Low Power Mode 0: Normal mode 1: Low power mode | R/W |

Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. When count source is AGTLCLK, the switch of CKS[2:0] bits is valid.

Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

CKS[2:0] bit (AGTLCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK.

LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
 - When the count operation is stopped; after writing data, it can be read in the next cycle.
 - When the count operation is operating; after writing data, it can be read 4 cycles after the count source clock.

Figure 23.2 shows the flow of how to write LPM bit

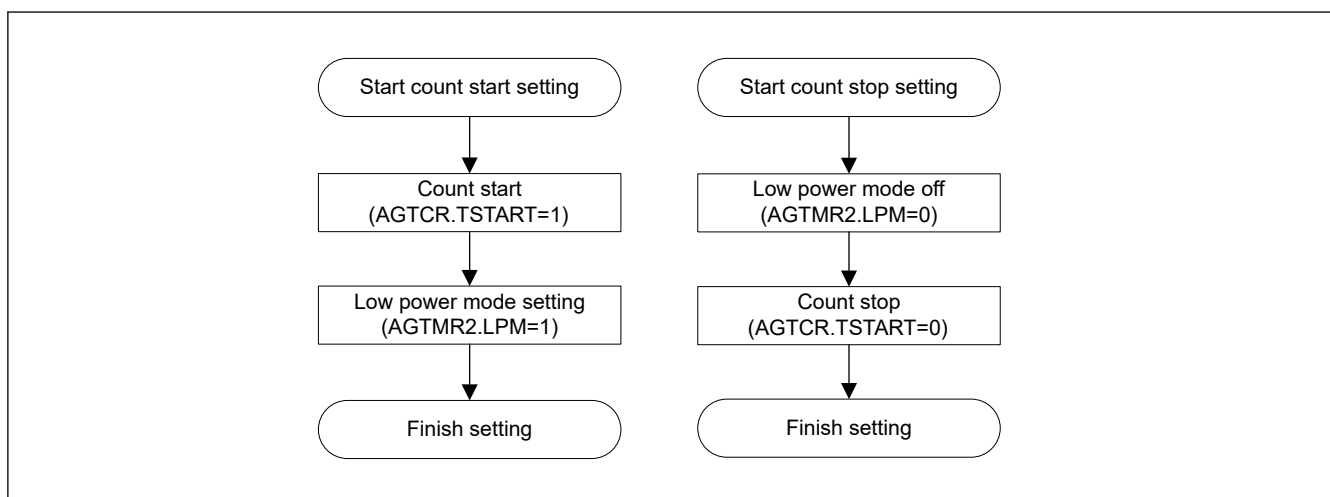

Figure 23.2 LPM how to write flow chart

23.2.7 AGTIOC : AGT I/O Control Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

| | | | | | | | | |
|--------------------|------------|---|-----------|---|---|-----|---|---------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | TIOGT[1:0] | | TIPF[1:0] | | — | TOE | — | TEDGSEL |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|---------|---------------------------------------------------------------------------------------------------------|-----|
| 0 | TEDGSEL | I/O Polarity Switch Function varies depending on the operating mode (see Table 23.3 and Table 23.4). | R/W |
| 1 | — | This bit is read as 0. The write value should be 0. | R/W |
| 2 | TOE | AGTWOn pin Output Enable 0: AGTWOn pin output disabled 1: AGTWOn pin output enabled | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 5:4 | TIPF[1:0] | Input Filter ^{*3} These bits specifies the sampling frequency of the filter for the AGTWIOn input. If the input to the AGTWIOn pin is sampled and the value matches three successive times, that value is taken as the input value. 0 0: No filter 0 1: Filter sampled at PCLKB 1 0: Filter sampled at PCLKB/8 1 1: Filter sampled at PCLKB/32 | R/W |
| 7:6 | TIOGT[1:0] | Count Control ^{*1 *2} 0 0: Event is always counted 0 1: Event is counted during polarity period specified for AGTWEEEn pin Others: Setting prohibited | R/W |

Note 1. When AGTWEEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.

Note 2. TIOGT[1:0] bits are enabled only in event counter mode.

Note 3. When event counter mode operation is performed during Software Standby mode, the digital filter function cannot be used.

TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTWOn pin output polarity and the AGTWIOn pin input/output edge and polarity.

In pulse output mode, it only controls polarity of the AGTWOn pin output and AGTWIOn pin output. AGTWOn pin output and AGTWIOn pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

TOE bit (AGTWOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIOOn pin input filter. When the input to the AGTIOOn pin is sampled and the values match three times in succession, the value is regarded as the input value.

TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

Table 23.3 AGTWIOn pin I/O edge and polarity switching

| Operating mode | Function |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timer mode | Not used |
| Pulse output mode | 0: Output is started at high (initialization level: high) i.e. inverted output 1: Output is started at low (initialization level: low). i.e. normal output |
| Event counter mode | 0: Count on rising edge 1: Count on falling edge. |
| Pulse width measurement mode | 0: Low-level width is measured 1: High-level width is measured. |
| Pulse period measurement mode | 0: Measure from one rising edge to the next rising edge 1: Measure from one falling edge to the next falling edge. |

Table 23.4 AGTWOn pin output polarity switching

| Operating mode | Function |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------|
| All modes | 0: Output is started at low (initial level: low): Normal output 1: Output is started at high (initial level: high): Inverted output |

23.2.8 AGTISR : AGT Event Pin Select Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

| | | | | | | | | |
|--------------------|---|---|---|---|---|------|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | — | — | EEPS | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 2 | EEPS | AGTWEEEn Polarity Selection 0: An event is counted during the low-level period 1: An event is counted during the high-level period | R/W |
| 7:3 | — | These bits are read as 0. The write value should be 0. | R/W |

EEPS bit (AGTWEEEn Polarity Selection)

The EEPS bit selects the polarity of events to be counted.

23.2.9 AGTCMSR : AGT Compare Match Function Select Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x12

| | | | | | | | | |
|--------------------|---|------------|------|-----------|---|------------|------|-----------|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | TOPO LB | TOEB | TCME B | — | TOPO LA | TOEA | TCME A |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | TCMEA | AGT Compare Match A Register Enable ^{*1 *2 *3} 0: AGT Compare match A register disabled 1: AGT Compare match A register enabled | R/W |
| 1 | TOEA | AGTWOAn Pin Output Enable ^{*1 *2} 0: AGTWOAn pin output disabled 1: AGTWOAn pin output enabled | R/W |
| 2 | TOPOLA | AGTWOAn Pin Polarity Select ^{*1 *2} 0: AGTWOAn pin output is started on low. i.e. normal output 1: AGTWOAn pin output is started on high. i.e. inverted output | R/W |
| 3 | — | This bit is read as 0. The write value should be 0. | R/W |
| 4 | TCMEB | AGT Compare Match B Register Enable ^{*1 *2 *3} 0: Compare match B register disabled 1: Compare match B register enabled | R/W |
| 5 | TOEB | AGTWOBn Pin Output Enable ^{*1 *2} 0: AGTWOBn pin output disabled 1: AGTWOBn pin output enabled | R/W |
| 6 | TOPOLB | AGTWOBn Pin Polarity Select ^{*1 *2} 0: AGTWOBn pin output is started on low. i.e. normal output 1: AGTWOBn pin output is started on high. i.e. inverted output | R/W |
| 7 | — | This bit is read as 0. The write value should be 0. | R/W |

Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).

Note 2. Do not set 1 when in pulse width measurement mode or pulse period measurement mode.

Note 3. When 1 is written to the TSTOP bit in the AGTCR register, TCMEA and TCMEB is forcibly stopped and set to 0.

23.2.10 AGTIOSEL : AGT Pin Select Register

Base address: AGTW_Bn = 0x400E_8000 + 0x0100 × n (n = 0, 1)

Offset address: 0x13

| | | | | | | | | |
|--------------------|---|---|---|------|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | TIES | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 3:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | TIES | AGTWIOn Pin Input Enable 0: External event input is disabled during Software Standby mode 1: External event input is enabled during Software Standby mode | R/W |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

The AGTIOSEL register sets the AGTWIOn pin when using the AGTWIOn pin in Software Standby mode.

TIES bit (AGTWIOn Pin Input Enable)

The TIES bit enables or disables an external event input.

23.3 Operation

23.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

Figure 23.3 and Figure 23.4 show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

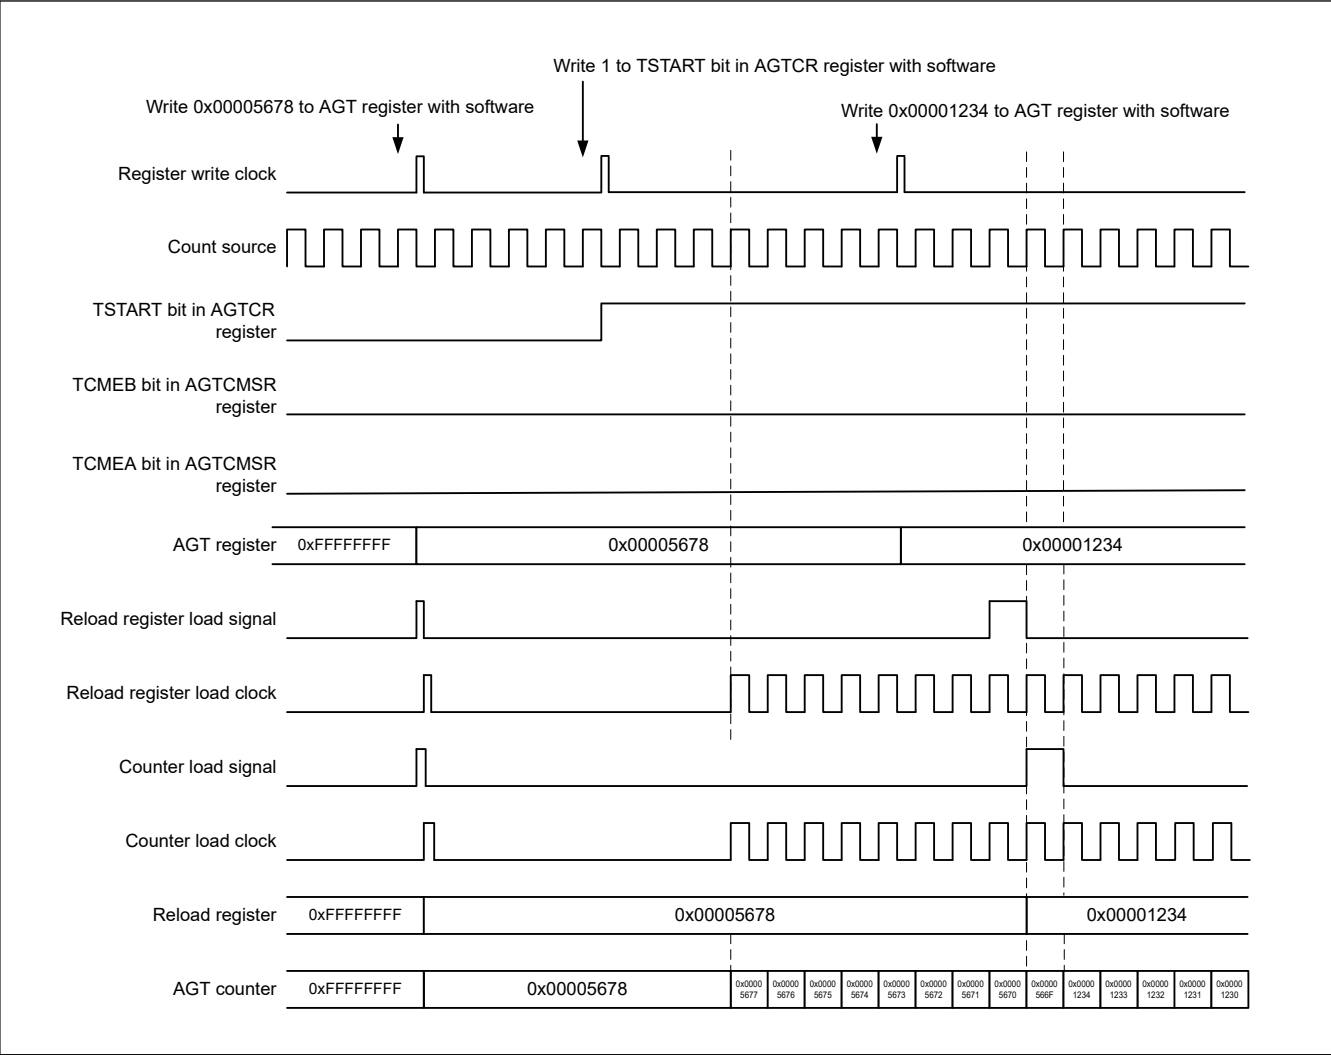

Figure 23.3 Timing of rewrite operation with TSTART, TCMEA, and TCMEB bit value when AGT compare match A register and AGT compare match B register is invalid

Figure 23.4 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid

23.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 23.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

Figure 23.5 Timing of rewrite operation with the TSTART bit value for AGT compare register A

23.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x00000000 and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 23.6 shows the operation example in timer mode.

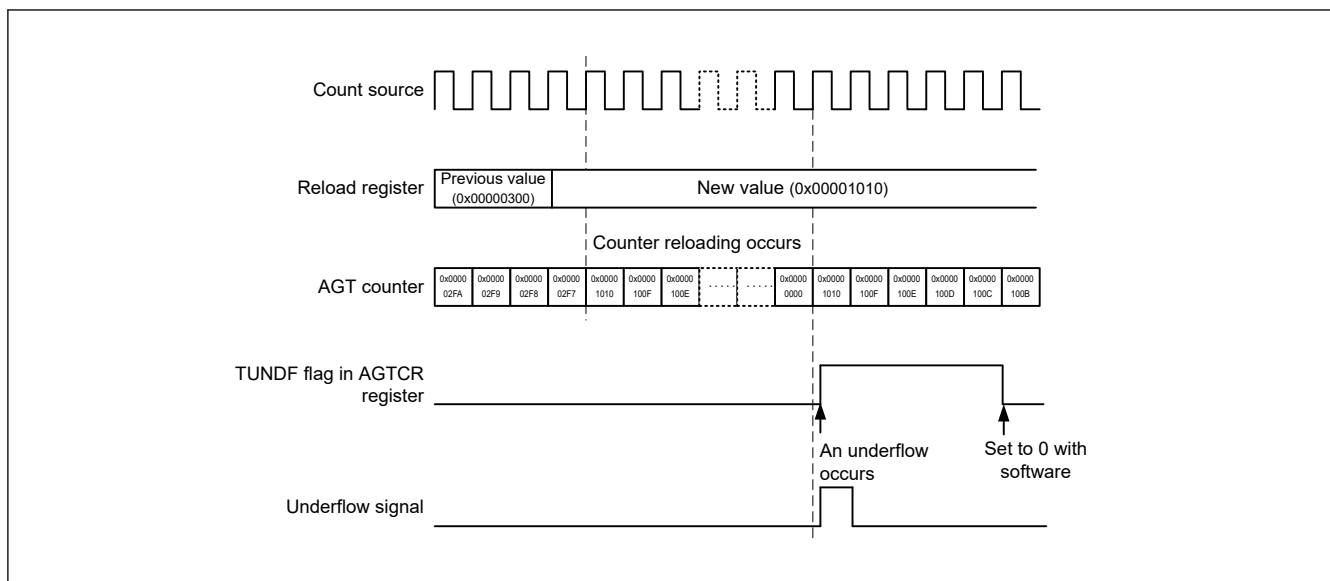

Figure 23.6 Operation example in timer mode

23.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTWION and AGTON pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x00000000 and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTWION and AGTON pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTWION pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 23.7 shows the operation example in pulse output mode.

Figure 23.7 Operation example in pulse output mode

23.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTWIO pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTWIO pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTWIO pin can be toggled even in event counter mode.

Figure 23.8 shows the operation example in event counter mode.

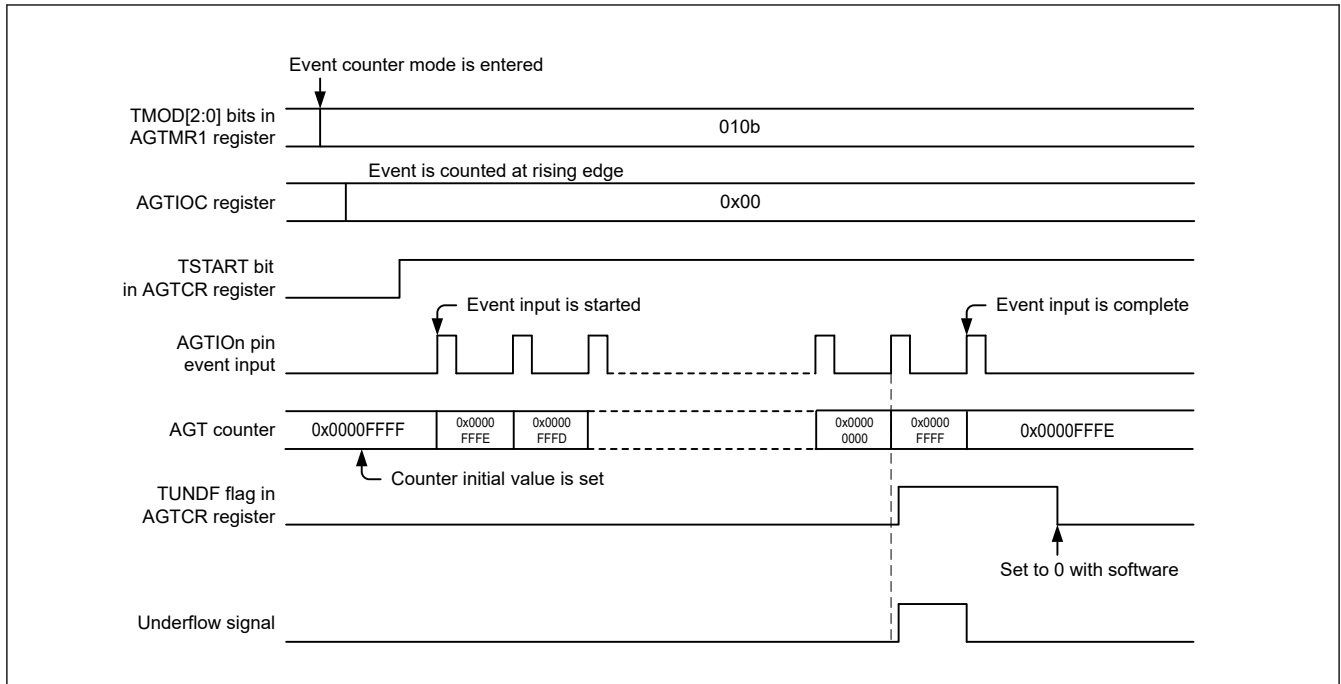

Figure 23.8 Operation example 1 in event counter mode

Figure 23.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).

Figure 23.9 Operation example 2 in event counter mode

23.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTWIO pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTWIO pin, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTWIO pin ends, the counter is stopped, the TEDGF flag in the AGTCR register is set to 1 (active edge received), and an interrupt

request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF flag in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 23.10 shows the operation example in pulse width measurement mode.

Figure 23.10 Operation example in pulse width measurement mode

23.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTWIO pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTWIO pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see [section 23.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period](#)) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 23.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.

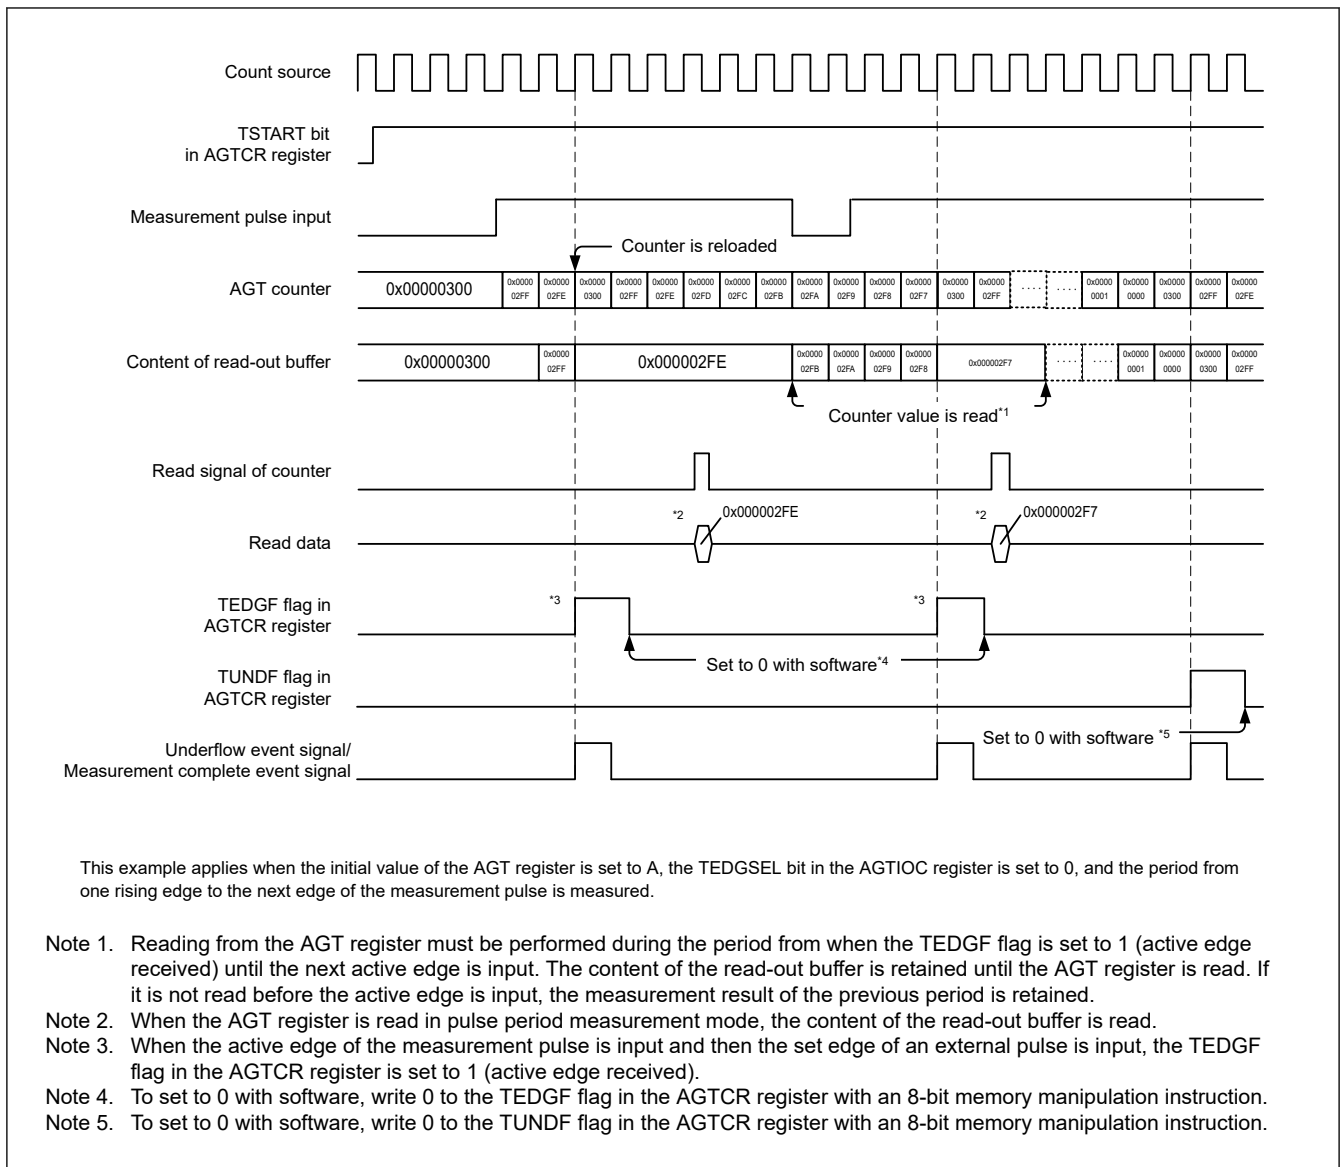

Figure 23.11 Operation example in pulse period measurement mode

23.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See [section 23.3.1. Reload Register and Counter Rewrite Operation](#) for details. In addition, the output level of the AGTWOAn, AGTWOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

[Figure 23.12](#) shows the operation example in compare match function.

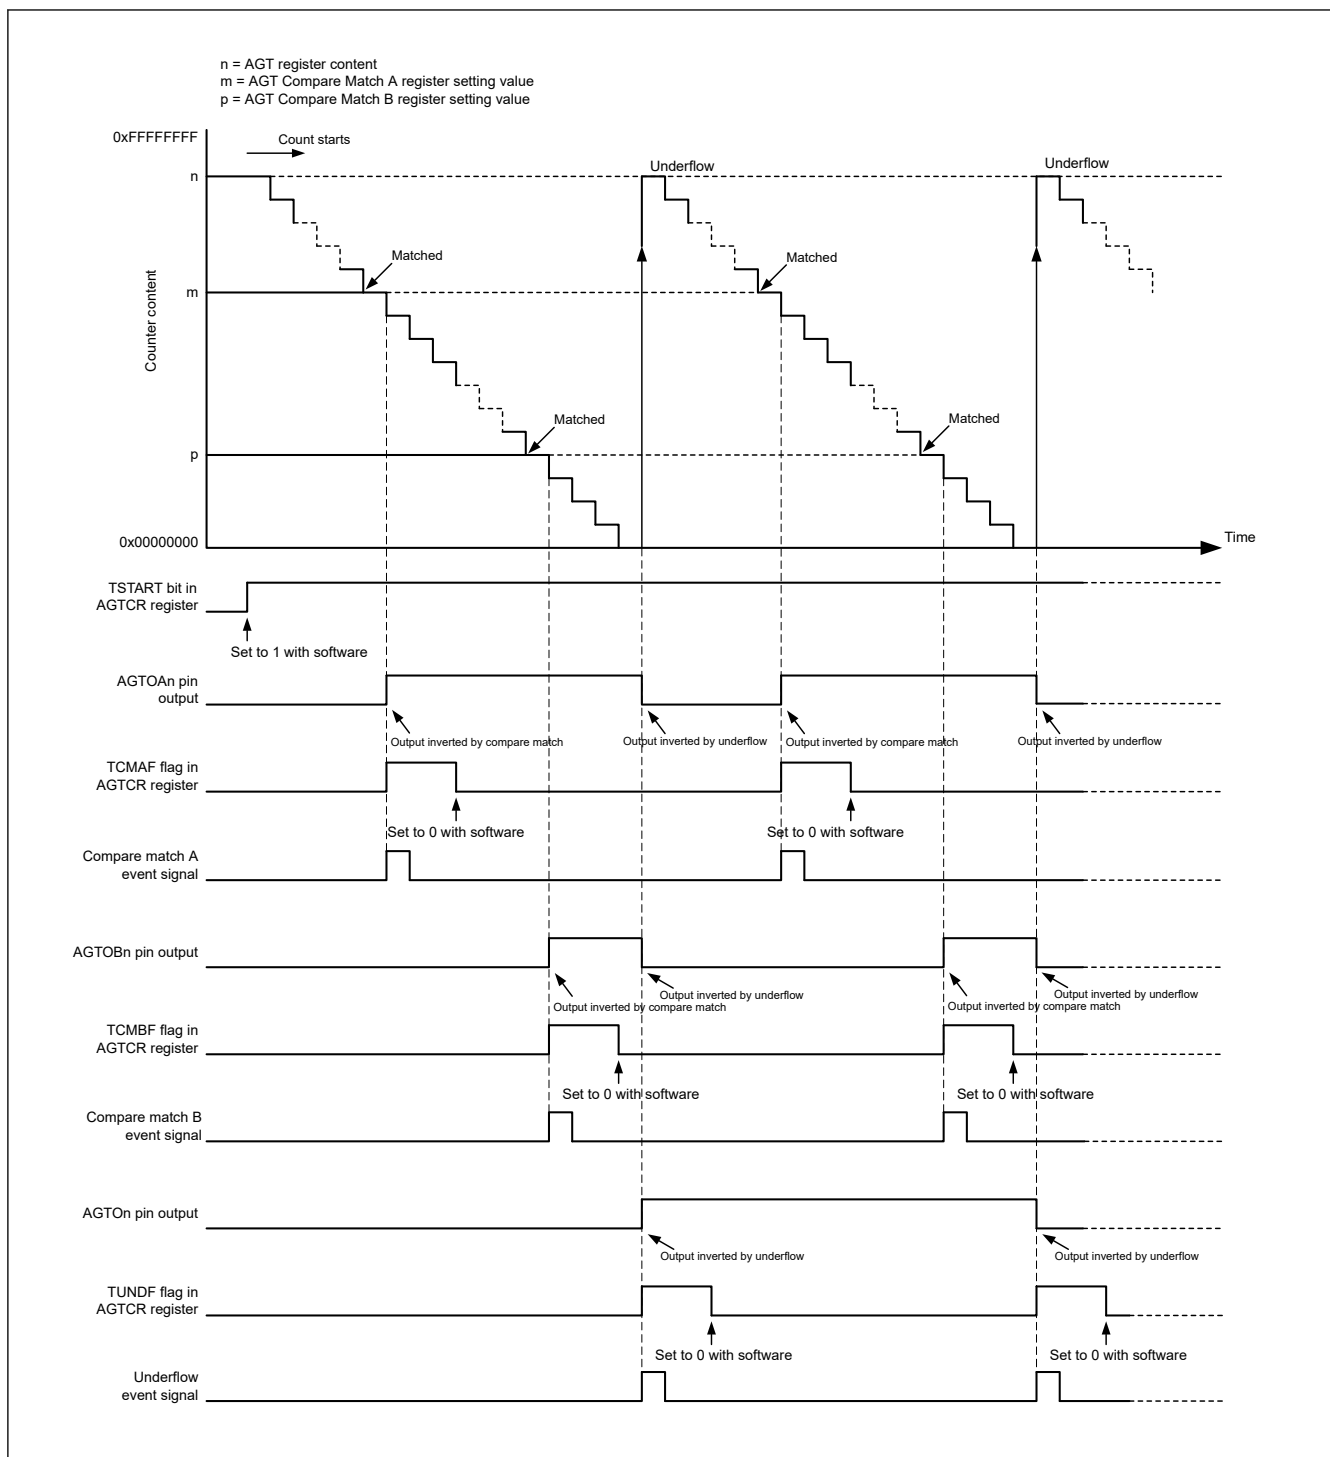

Figure 23.12 Operation example in compare match function (TOPOLA = 0, TOPOLB = 0)

23.3.9 Output Settings for Each Mode

Table 23.5 to Table 23.8 list the states of pins AGTWO_n, AGTWIO_n, AGTWOA_n, and AGTWOB_n pins in each mode.

Table 23.5 AGTWOn pin setting

| Operating mode | AGTIOC register | | AGTWOn pin output |
|----------------|-----------------|-------------|-------------------|
| | TOE bit | TEDGSEL bit | |
| All modes | 1 | 1 | Inverted output |
| | | 0 | Normal output |
| | 0 | 0 or 1 | Output disabled |

Table 23.6 AGTWIO pin setting

| Operating mode | AGTIOC register | AGTWIO pin I/O |

| Pulse width measurement mode | 0 | 0 | Prohibited |
| Pulse period measurement mode | | | |

23.3.10 Standby Mode

The AGT can operate in Software Standby mode. Set it to Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

Table 23.9 and Table 23.10 show the setting that can be used in Software Standby mode.

Table 23.9 Usable settings in Software Standby mode (AGTW0)

| Operating mode | AGTMR1.TCK[2:0] | Operating clock | Resurgence factor of CPU |
|-------------------------------|-----------------|-------------------------------|--------------------------|
| Timer mode | 100b | AGTLCLK | — |
| Pulse output mode | 100b | AGTLCLK | — |
| Event counter mode*2 | — | AGTWIO _n (n = 0)*1 | — |
| Pulse width measurement mode | 100b | AGTLCLK | — |
| Pulse period measurement mode | 100b | AGTLCLK | — |

Note: —: invalid

Note 1. When using the AGTWIO_n pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 2. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

Table 23.10 Usable settings in Software Standby mode (AGTW1)

| Operating mode | AGTMR1.TCK[2:0] | Operating clock | Resurgence factor of CPU |
|-------------------------------|-----------------|-------------------------------|----------------------------------------------------------------------------------------|
| Timer mode | 100b or 101b*1 | AGTLCLK or AGTW0 underflow | <ul style="list-style-type: none"> Underflow Compare match A/B |
| Pulse output mode | 100b or 101b*1 | AGTLCLK or AGTW0 underflow | <ul style="list-style-type: none"> Underflow Compare match A/B |
| Event counter mode*3 | — | AGTWIO _n (n = 1)*2 | <ul style="list-style-type: none"> Underflow Compare match A/B |
| Pulse width measurement mode | 100b or 101b*1 | AGTLCLK or AGTW0 underflow | <ul style="list-style-type: none"> Underflow Active edge |
| Pulse period measurement mode | 100b or 101b*1 | AGTLCLK or AGTW0 underflow | <ul style="list-style-type: none"> Underflow Active edge |

Note: —: invalid

Note: Release of Software Standby mode is only AGT1.

Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.

Note 1. Only when AGTW0 operates in Table 23.9

Note 2. When using the AGTWIO_n pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.

Note 3. When AGTIOSEL.TIES = 0 and the external event input signal is disabled during Software Standby mode, stop the count operation before entering Software Standby mode. After returning from Software Standby mode, restart the count operation if necessary.

23.3.11 Interrupt Sources

The AGTW_n has three interrupt sources as listed in Table 23.11.

Table 23.11 AGTW interrupt sources (1 of 2)

| Name | Interrupt source | DMAC/DTC activation |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|
| AGT _n _AGTI | <ul style="list-style-type: none"> When the counter underflows When measurement of the active width of the external input pin (AGTWIO_n) is complete in pulse width measurement mode When the set edge of the external input pin (AGTWIO_n) is input in pulse period measurement mode. | Possible |

Table 23.11 AGTW interrupt sources (2 of 2)

| Name | Interrupt source | DMAC/DTC activation |
|--------------|-------------------------------------------------------------------------------------------------------------|---------------------|
| AGTn_AGTCMAI | <ul style="list-style-type: none"> When the values of AGT register and AGTCMA register match | Possible |
| AGTn_AGTCMBI | <ul style="list-style-type: none"> When the values of AGT register and AGTCMB register match | Possible |

Note: Channel number (n = 0, 1)

23.3.12 Event Signal Output to ELC

The AGTWn (n = 0, 1) uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGTWn (n = 0, 1) outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see [section 17, Event Link Controller \(ELC\)](#).

23.4 Usage Notes

23.4.1 Count Operation Start and Stop Control

- When the operating mode (see [Table 23.1](#)) is set to other than the event counter mode, or the count source is set to other than AGTWn underflow event signal (TCK[2:0] = 101b):
 - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGTW other than the TCSTF flag until this flag is set to 1 (count in progress).
 - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGTW other than the TCSTF flag until this flag is set to 0.
- When the operating mode (see [Table 23.1](#)) is set to event counter mode, or the count source is set to AGTW1 underflow event signal (TCK[2:0] = 101b):
 - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGTW other than the TCSTF flag until this flag is set to 1 (count in progress).
 - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGTW other than the TCSTF flag until this flag is set to 0.

23.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

23.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

23.4.4 Output pin setting

When using the AGTWOn, AGTWIOOn, AGTWOAn, or AGTWOBn as an output pin, set up the Operation and determine the initial output values. Then set an output mode in the port register.

When using the AGTWIOn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTWIOn pin. Invalidate the first measurement and validate the second and later completed measurements.

23.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

23.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:
Event number = initial value of counter [AGT register] - counter value of active event end
- In pulse width measurement mode, pulse width is expressed mathematically as follows:
Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:
Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

23.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

23.4.8 When Selecting AGTW0 Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

(1) Procedure for starting operation

1. Set AGTW.
2. Start the count operation of AGTW1.
3. Start the count operation of AGTW0.

(2) Procedure for stopping operation

1. Stop the count operation of AGTW0.
2. Stop the count operation of AGTW1.
3. Stop the count source clock of AGTW1 (write 000b in the AGTMR1.TCK[2:0] bits).

23.4.9 Module-stop function

AGTW operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD). The AGTW module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 10, Low Power Modes](#)

23.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTWIOn, AGTWEEn, or both input as external event input, the clock

source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

24. Watchdog Timer (WDT)

24.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 24.1 lists the WDT specifications and Figure 24.1 shows a block diagram.

Table 24.1 WDT specifications

| Parameter | Specifications |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count source ^{*1} | Peripheral clock (PCLKB) |
| Clock division ratio | Division by 4, 64, 128, 512, 2048, or 8192 |
| Counter operation | Counting down using a 14-bit down-counter |
| Condition for starting the counter | <ul style="list-style-type: none"> Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs Register start mode: Counting is started with a refresh by writing to the WDTRR register Only secure developer can select Auto-start mode or Register-start mode |
| Conditions for stopping the counter | <ul style="list-style-type: none"> Reset (the down-counter and other registers return to their initial values) A counter underflows or a refresh error is generated |
| Window function | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods) |
| Watchdog timer reset sources | <ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error) |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> Down-counter underflows Refreshing outside the refresh-permitted period (refresh error) |
| Reading of the counter value | The down-counter value can be read by the WDTSR register |
| Event link function (output) | <ul style="list-style-type: none"> Down-counter underflow event output Refresh error event output |
| Output signal (internal signal) | <ul style="list-style-type: none"> Reset output Interrupt request output Sleep-mode count stop control output |
| TrustZone Filter | Security attribution can be set |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) $\geq 4 \times$ (the frequency of the count clock source after division).

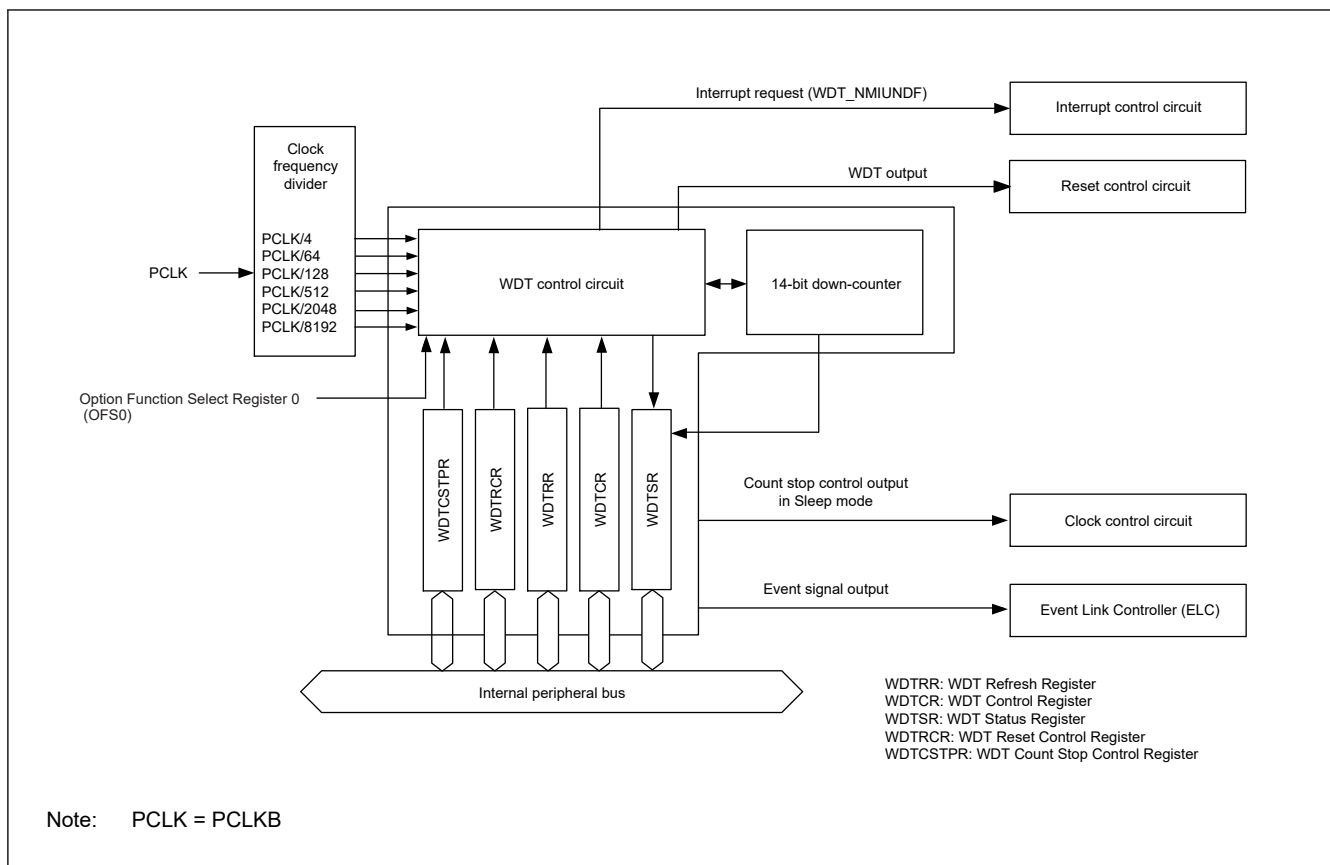

Figure 24.1 WDT block diagram

24.2 Register Descriptions

24.2.1 WDTRR : WDT Refresh Register

Base address: WDT = 0x4008_3400

Offset address: 0x00

Value after reset: 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------------|-----|
| 7:0 | n/a | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register. | R/W |

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTPPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTCCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 24.3.3. Refresh Operation](#).

24.2.2 WDTCR : WDT Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x02

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|-----------|----|----|-----------|----------|---|---|---|---|-----------|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | RPSS[1:0] | — | — | RPES[1:0] | CKS[3:0] | | | — | — | TOPS[1:0] | | | | |
| Value after reset: | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 1:0 | TOPS[1:0] | Timeout Period Select 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF) | R/W |
| 3:2 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7:4 | CKS[3:0] | Clock Division Ratio Select 0x1: PCLKB/4 0x4: PCLKB/64 0xF: PCLKB/128 0x6: PCLKB/512 0x7: PCLKB/2048 0x8: PCLKB/8192 Others: Setting prohibited | R/W |
| 9:8 | RPES[1:0] | Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (do not specify window end position). | R/W |
| 11:10 | — | These bits are read as 0. The write value should be 0. | R/W |
| 13:12 | RPSS[1:0] | Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (do not specify window start position). | R/W |
| 15:14 | — | These bits are read as 0. The write value should be 0. | R/W |

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writes to the WDTCR register. For details, see [section 24.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCTPR Registers](#).

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

[Table 24.2](#) lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

Table 24.2 Timeout period settings

| CKS[3:0] bits | TOPS[1:0] bits | Clock division ratio | Timeout period (number of cycles) | PCLKB clock cycles |
|---------------|----------------|----------------------|--------------------------------------|--------------------|
| 0x1 | 00b | PCLKB/4 | 1024 | 4096 |
| | 01b | | 4096 | 16384 |
| | 10b | | 8192 | 32768 |
| | 11b | | 16384 | 65536 |
| 0x4 | 00b | PCLKB/64 | 1024 | 65536 |
| | 01b | | 4096 | 262144 |
| | 10b | | 8192 | 524288 |
| | 11b | | 16384 | 1048576 |
| 0xF | 00b | PCLKB/128 | 1024 | 131072 |
| | 01b | | 4096 | 524288 |
| | 10b | | 8192 | 1048576 |
| | 11b | | 16384 | 2097152 |
| 0x6 | 00b | PCLKB/512 | 1024 | 524288 |
| | 01b | | 4096 | 2097152 |
| | 10b | | 8192 | 4194304 |
| | 11b | | 16384 | 8388608 |
| 0x7 | 00b | PCLKB/2048 | 1024 | 2097152 |
| | 01b | | 4096 | 8388608 |
| | 10b | | 8192 | 16777216 |
| | 11b | | 16384 | 33554432 |
| 0x8 | 00b | PCLKB/8192 | 1024 | 8388608 |
| | 01b | | 4096 | 33554432 |
| | 10b | | 8192 | 67108864 |
| | 11b | | 16384 | 134217728 |

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

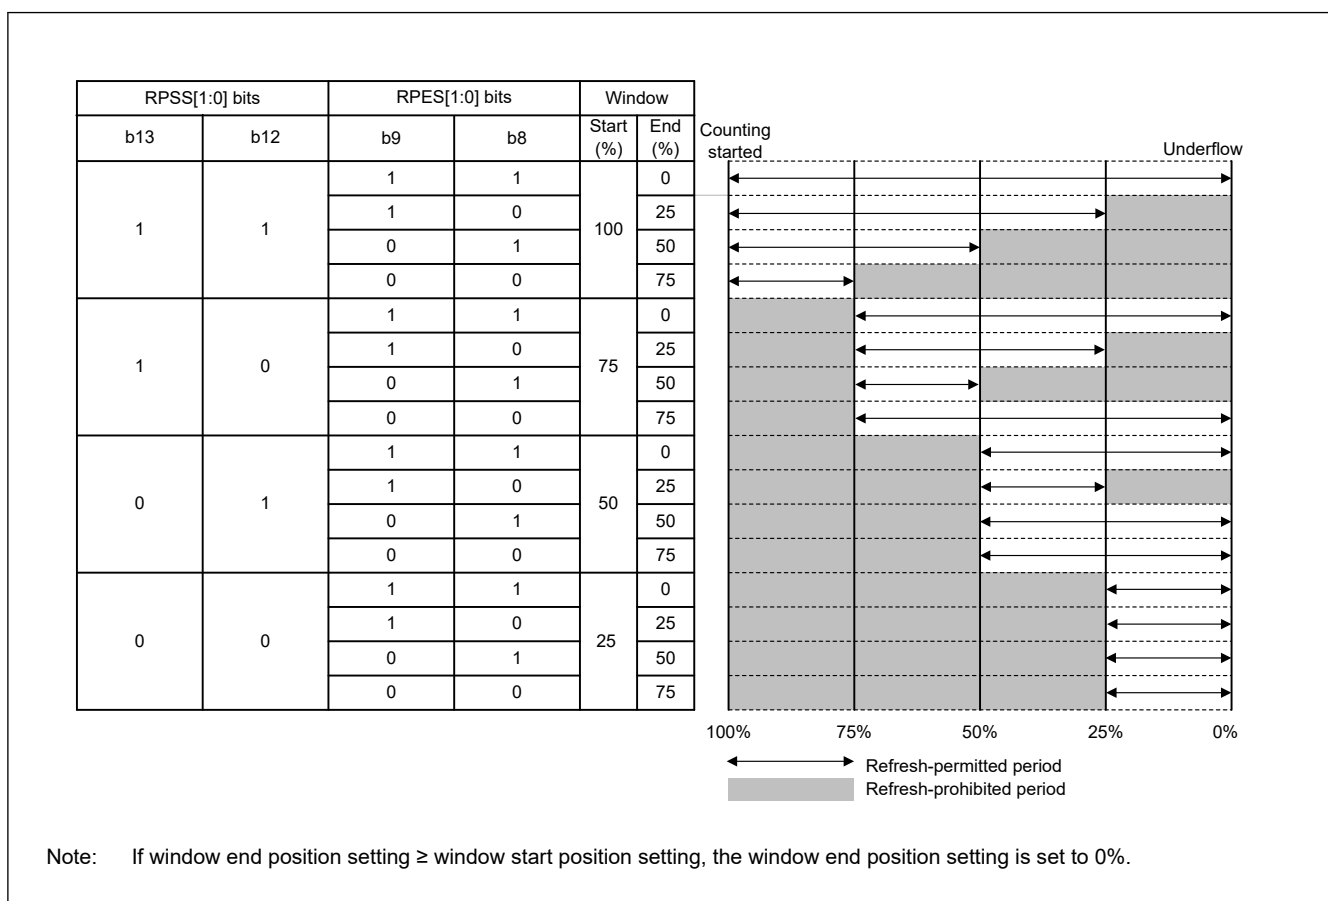

RPSS[1:0] bits (Window Start Position Select)

The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 24.3 lists the counter values for the window start and end positions, and Figure 24.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 24.3 Relationship between the timeout period and window start and end counter values

| TOPS[1:0] | Timeout period | | Window start and end counter value | | | |
|-----------|----------------|---------------|------------------------------------|--------|--------|--------|
| | Cycles | Counter value | 100% | 75% | 50% | 25% |
| 00b | 1024 | 0x03FF | 0x03FF | 0x02FF | 0x01FF | 0x00FF |
| 01b | 4096 | 0x0FFF | 0x0FFF | 0x0BFF | 0x07FF | 0x03FF |
| 10b | 8192 | 0x1FFF | 0x1FFF | 0x17FF | 0x0FFF | 0x07FF |
| 11b | 16384 | 0x3FFF | 0x3FFF | 0x2FFF | 0x1FFF | 0x0FFF |

**Figure 24.2 RPSS[1:0] and RPES[1:0] bits setting and refresh-permitted period**

24.2.3 WDTSR : WDT Status Register

Base address: WDT = 0x4008_3400

Offset address: 0x04

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|-----------|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | REFE F | UNDF F | CNTVAL[13:0] | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------------|---------------------------------------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-Counter Value Value counted by the down-counter | R |
| 14 | UNDF | Underflow Flag 0: No underflow occurred 1: Underflow occurred | R/W ¹ |

| Bit | Symbol | Function | R/W |
|-----|--------|---------------------------------------------------------------------------------|-------------------|
| 15 | REFEF | Refresh Error Flag 0: No refresh error occurred 1: Refresh error occurred | R/W ^{*1} |

Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFE flag (Underflow Flag)

Read the UNDFE flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFE flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCSR.CKS[3:0] bits as follows:

- When WDTCSR.CKS[3:0] = 0x1, N = 4
- When WDTCSR.CKS[3:0] = 0x4, N = 64
- When WDTCSR.CKS[3:0] = 0xF, N = 128
- When WDTCSR.CKS[3:0] = 0x6, N = 512
- When WDTCSR.CKS[3:0] = 0x7, N = 2048
- When WDTCSR.CKS[3:0] = 0x8, N = 8192

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCSR.CKS[3:0] bits as follows:

- When WDTCSR.CKS[3:0] = 0x1, N = 4
- When WDTCSR.CKS[3:0] = 0x4, N = 64
- When WDTCSR.CKS[3:0] = 0xF, N = 128
- When WDTCSR.CKS[3:0] = 0x6, N = 512
- When WDTCSR.CKS[3:0] = 0x7, N = 2048
- When WDTCSR.CKS[3:0] = 0x8, N = 8192

24.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x06

| | | | | | | | | |
|--------------------|-------------|---|---|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | RSTIR QS | — | — | — | — | — | — | — |
| Value after reset: | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------|-----|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-----|---------|----------------------------------------------------|-----|
| 7 | RSTIRQS | WDT Behavior Selection 0: Interrupt 1: Reset | R/W |

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply to writes to the WDTRCR register. For details, see [section 24.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

24.2.5 WDTCSNPR : WDT Count Stop Control Register

Base address: WDT = 0x4008_3400

Offset address: 0x08

| | | | | | | | | |
|---------------|------------|---|---|---|---|---|---|---|
| Bit position: | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | SLCS TP | — | — | — | — | — | — | — |

Value after reset: 1 0 0 0 0 0 0 0

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------------------------------|-----|
| 6:0 | — | These bits are read as 0. The write value should be 0. | R/W |
| 7 | SLCSTP | Sleep-Mode Count Stop Control Register 0: Disable count stop 1: Stop count on transition to Sleep mode | R/W |

The WDTCSNPR register controls whether to stop the WDT counter in Sleep mode. Some constraints apply to writes to the WDTCSNPR register. For details, see [section 24.3.2. Controlling Writes to the WDTCSR, WDTRCR, and WDTCSNPR Registers](#).

In auto start mode, the WDTCSNPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSNPR register can also be made for the OFS0 register. For details, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

SLCSTP bit (Sleep-Mode Count Stop Control Register)

The SLCSTP bit selects whether to stop counting on transition to Sleep mode.

24.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see [section 24.3.8. Association between Option Function Select Register 0 \(OFS0\) and WDT Registers](#).

24.3 Operation

24.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

24.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected, the OFS0 register setting is invalid, and the WDT control register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSSTPR) are enabled.

After the reset state is released, set the following:

- Clock division ratio in the WDTCR register
- Window start and end positions in the WDTCR register
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to Sleep mode in the WDTCSSTPR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the downcount starts at the value set by the timeout period selection bit (WDTCR.TOP[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). The interrupt enabled for operating the NMI can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- WDT reset interrupt request selection (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)

Note: Refreshing the counter requires up to 4 count signal cycles from refresh request to execution.

Note 1. See [section 24.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSPTPR Registers](#).
Reset pin = RES

Figure 24.3 Operation example in register start mode

24.3.1.2 Auto start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSPTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTPOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt

request/interrupt request (WDT_NMIUNDF) as long as the counting continues. However, if the down-counter underflows because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 24.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- WDT behavior selection: interrupt (OFS0.WDTRSTIRQS = 0)
- Non-maskable Interrupt: IWDT Underflow/Refresh Error Interrupt Enabled (NMIER.WDTEN = 1)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)

Figure 24.4 Operation example in auto start mode

24.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSSTPR) is possible once each between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSSTPR register, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSSTPR register against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 24.5 shows control waveforms produced in response to writing to the WDTCR.

Figure 24.5 Control waveforms produced in response to writes to the WDTCR register

24.3.3 Refresh Operation

To refresh the down counter and start the counting operation, write to the WDT Refresh Register (WDTRR) in the order of values from 0x00 to 0xFF. If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the WDTRR register in the order of values from 0x00 to 0xFF.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 24.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.

Figure 24.6 WDT refresh operation waveforms when WDTCSR.CKS[3:0] = 0x4 and WDTCSR.TOPS[1:0] = 01b

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

24.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see [section 24.2.3. WDTSR : WDT Status Register](#).

24.3.5 Reset Output

When the Reset Interrupt Select bit (WDTCSR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

24.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTCSR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt (WDT_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

Table 24.4 WDT interrupt source

| Name | Interrupt source | Interrupt to CPU | Start DMAC or DTC |
|-------------|-------------------------------------------------------------------------------------------------|------------------|-------------------|
| WDT_NMIUNDF | <ul style="list-style-type: none"> Down-counter underflow Refresh error | Possible | Not possible |

24.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 24.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.

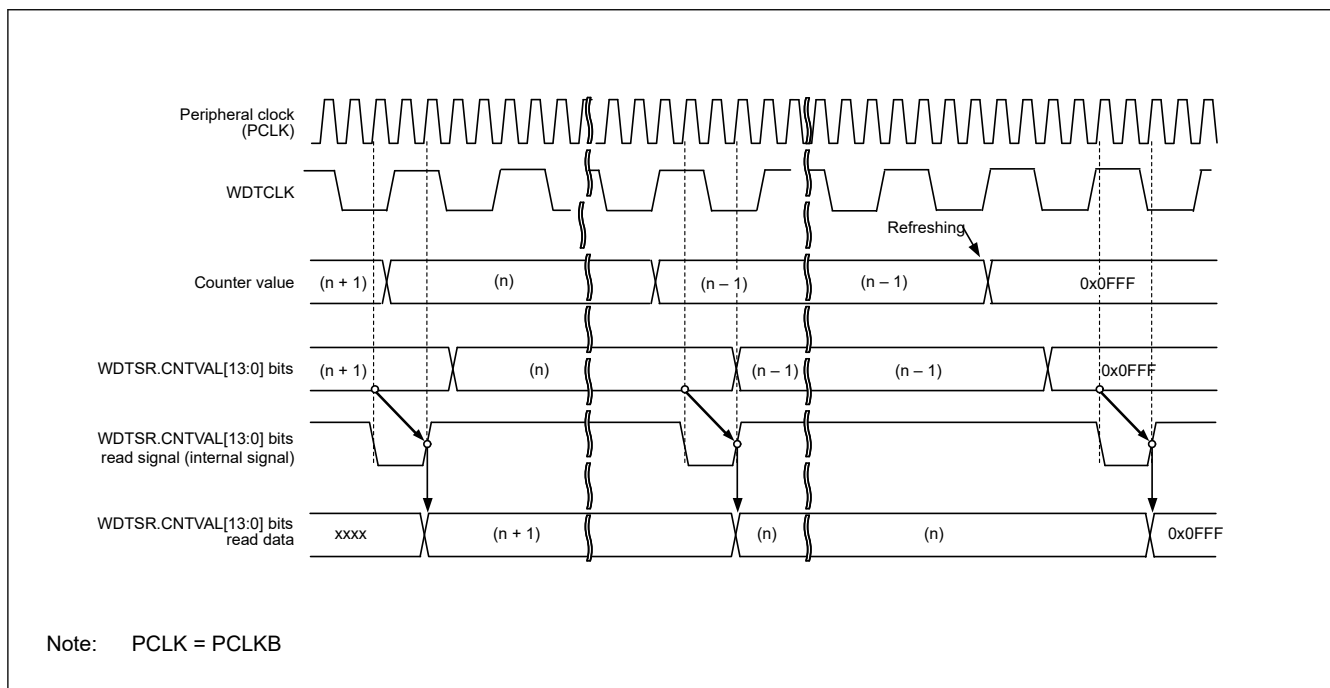

Figure 24.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

24.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 24.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see [section 6.2.1. OFS0 : Option Function Select Register 0](#).

Table 24.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers

| Control target | Function | OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0 | WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1 |
|------------------------------------------|----------------------------------|-------------------------------------------------------------------|-----------------------------------------------------------------------|
| Down-counter | Timeout period selection | OFS0.WDTTOPS[1:0] | WDTCR.TOPS[1:0] |
| | Clock division ratio selection | OFS0.WDTCKS[3:0] | WDTCR.CKS[3:0] |
| | Window start position selection | OFS0.WDTRPSS[1:0] | WDTCR.RPSS[1:0] |
| | Window end position selection | OFS0.WDTRPES[1:0] | WDTCR.RPES[1:0] |
| Reset output or interrupt request output | Select a reset interrupt request | OFS0.WDTRSTIRQS | WDTCCR.RSTIRQS |
| Count stop | Sleep mode count stop control | OFS0.WDTSTPCTL | WDTCSMPR.SLCSTP |

24.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the setting of the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDF) is 1. For details, see [section 17, Event Link Controller \(ELC\)](#).

24.5 Usage Notes

24.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when WDT reset interrupt request selection resets (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x53).

25. Independent Watchdog Timer (IWDT)

25.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent, dedicated clock source, it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

- The divided IWDT-dedicated clock (IWDTCLK) is used as the count source (not affected by PCLKB)
- IWDT does not support register start mode

Table 25.1 lists the IWDT specifications and Figure 25.1 shows a block diagram.

Table 25.1 IWDT specifications

| Parameter | Description |
|------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Count source*1 | IWDT-dedicated clock (IWDTCLK) |
| Clock division ratio | Division by 1, 16, 32, 64, 128, or 256 |
| Counter operation | Counting down using a 14-bit down-counter |
| Condition for starting the counter | <ul style="list-style-type: none"> • Counting automatically starts after a reset • Only secure developer can start the IWDT |
| Conditions for stopping the counter | <ul style="list-style-type: none"> • Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated (counting restarts automatically). |
| Window function | Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods) |
| Reset output sources | <ul style="list-style-type: none"> • Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error). |
| Non-maskable interrupt/interrupt sources | <ul style="list-style-type: none"> • Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error). |
| Reading the counter value | The down-counter value can be read by the IWDTSR register |
| Event link function | <ul style="list-style-type: none"> • Down-counter underflow event output • Refresh error event output. |
| Output signal (internal signal) | <ul style="list-style-type: none"> • Reset output • Interrupt request output • Sleep-mode count stop control output. |
| Auto start mode | Configurable to the following triggers: <ul style="list-style-type: none"> • Clock frequency division ratio after a reset (OFS0.IWDTCKS[3:0] bits) • Timeout period of the Independent Watchdog Timer (OFS0.IWDTTOPS[1:0] bits) • Window start position in the Independent Watchdog Timer (OFS0.IWDTRPSS[1:0] bits) • Window end position in the Independent Watchdog Timer (OFS0.IWDRPES[1:0] bits) • Reset output or interrupt request output (OFS0.IWDRSTIRQS bit) • Down-count stop function at transition to Sleep, Snooze, or Software Standby mode (OFS0.IWDTSTPCTL bit). |
| TrustZone Filter | Security attribution can be set |

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) $\geq 4 \times$ (the frequency of the count clock source after division).

The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

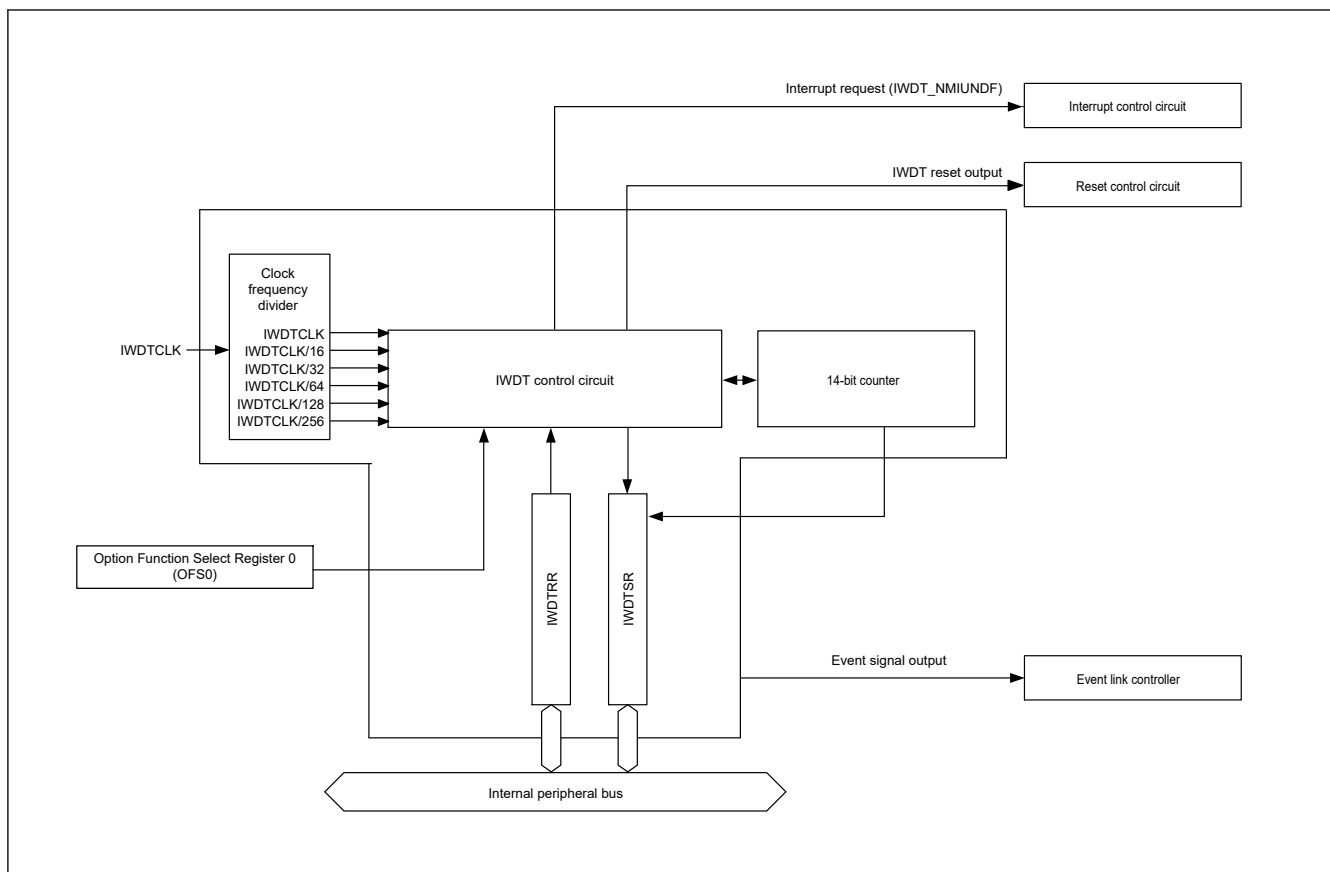

Figure 25.1 IWDT block diagram

25.2 Register Descriptions

25.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4008_3200

Offset address: 0x00

Value after reset: 1 1 1 1 1 1 1 1

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------|-----|
| 7:0 | n/a | The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register | R/W |

The IWDTRR register refreshes the down-counter of the IWDT. The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR (refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]) in the Option Function Select Register 0 (OFS0).

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see [section 25.3.2. Refresh Operation](#).

25.2.2 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4008_3200

Offset address: 0x04

| | | | | | | | | | | | | | | | | |
|--------------------|-----------|-----------|--------------|----|----|----|---|---|---|---|---|---|---|---|---|---|
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | REFE F | UNDF F | CNTVAL[13:0] | | | | | | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|------|--------------|---------------------------------------------------------------------------------|------------------|
| 13:0 | CNTVAL[13:0] | Down-counter Value Value counted by the down-counter | R |
| 14 | UNDF | Underflow Flag 0: No underflow occurred 1: Underflow occurred | R/W ¹ |
| 15 | REFE | Refresh Error Flag 0: No refresh error occurred 1: Refresh error occurred | R/W ¹ |

Note 1. Only 0 can be written to clear the flag.

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

CNTVAL[13:0] bits (Down-counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDF flag (Underflow Flag)

Read the UNDF flag to confirm whether an underflow occurred in the down-counter. The value 1 indicates that the down-counter underflowed. Write 0 to the UNDF flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDF flag takes (N + 2) IWDTCCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCCLK cycles after an underflow. N is specified in the IWDTCCKS[3:0] bits as follows:

- When OFS0.IWDTCCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCCKS[3:0] = 0x5, N = 256.

REFE flag (Refresh Error Flag)

Read the REFE flag to confirm whether a refresh error occurred. This indicates that a refresh operation was performed during a prohibited period. The value 1 indicates that a refresh error occurred. Write 0 to the REFE flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFE flag takes (N + 2) IWDTCCLK cycles and 2 PCLKB cycles. In addition, clearing of this flag is ignored for (N + 2) IWDTCCLK cycles following a refresh error. N is specified in the IWDTCCKS[3:0] bits as follows:

- When OFS0.IWDTCCKS[3:0] = 0x0, N = 1
- When OFS0.IWDTCCKS[3:0] = 0x2, N = 16
- When OFS0.IWDTCCKS[3:0] = 0x3, N = 32
- When OFS0.IWDTCCKS[3:0] = 0x4, N = 64
- When OFS0.IWDTCCKS[3:0] = 0xF, N = 128
- When OFS0.IWDTCCKS[3:0] = 0x5, N = 256.

25.2.3 OFS0 : Option Function Select Register 0

For information on the Option Function Select Register 0 (OFS0), see [section 6.2.1. OFS0 : Option Function Select Register 0](#).

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits select the timeout period, that is, the period until the down-counter underflows, from 128, 512, 1024, or 2048 cycles, taking the divided clock specified in the IWDTCKS[3:0] bits as 1 cycle.

After the down-counter is refreshed, the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits determines the number of IWDTCCLK cycles until the counter underflows.

[Table 25.2](#) lists the relationship between the IWDTCKS[3:0] and IWDTTOPS[1:0] bit settings, the timeout period, and the number of IWDTCCLK cycles.

Table 25.2 Timeout period settings

| IWDTCKS[3:0] bits | | | | IWDTTOPS[1:0] bits | | Clock division ratio | Timeout period (number of cycles) | IWDTCCLK cycles |
|-------------------|----|----|----|--------------------|----|----------------------|-----------------------------------|-----------------|
| b7 | b6 | b5 | b4 | b3 | b2 | | | |
| 0 | 0 | 0 | 0 | 0 | 0 | IWDTCCLK | 128 | 128 |
| | | | | 0 | 1 | | 512 | 512 |
| | | | | 1 | 0 | | 1024 | 1024 |
| | | | | 1 | 1 | | 2048 | 2048 |
| 0 | 0 | 1 | 0 | 0 | 0 | IWDTCCLK/16 | 128 | 2048 |
| | | | | 0 | 1 | | 512 | 8192 |
| | | | | 1 | 0 | | 1024 | 16384 |
| | | | | 1 | 1 | | 2048 | 32768 |
| 0 | 0 | 1 | 1 | 0 | 0 | IWDTCCLK/32 | 128 | 4096 |
| | | | | 0 | 1 | | 512 | 16384 |
| | | | | 1 | 0 | | 1024 | 32768 |
| | | | | 1 | 1 | | 2048 | 65536 |
| 0 | 1 | 0 | 0 | 0 | 0 | IWDTCCLK/64 | 128 | 8192 |
| | | | | 0 | 1 | | 512 | 32768 |
| | | | | 1 | 0 | | 1024 | 65536 |
| | | | | 1 | 1 | | 2048 | 131072 |
| 1 | 1 | 1 | 1 | 0 | 0 | IWDTCCLK/128 | 128 | 16384 |
| | | | | 0 | 1 | | 512 | 65536 |
| | | | | 1 | 0 | | 1024 | 131072 |
| | | | | 1 | 1 | | 2048 | 262144 |
| 0 | 1 | 0 | 1 | 0 | 0 | IWDTCCLK/256 | 128 | 32768 |
| | | | | 0 | 1 | | 512 | 131072 |
| | | | | 1 | 0 | | 1024 | 262144 |
| | | | | 1 | 1 | | 2048 | 524288 |

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the IWDT-dedicated clock (IWDTCCLK) divided by 1, 16, 32, 64, 128, and 256. Combined with the IWDTTOPS[1:0] bit setting, the IWDT can be configured to a count period between 128 and 524,288 IWDTCCLK cycles.

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 25.3 lists the counter values for the window start and end positions, and Figure 25.2 shows the refresh-permitted period set in the IWDTRPSS[1:0], IWDTRPES[1:0], and IWDTTOPS[1:0] bits.

Table 25.3 Relationship between the timeout period and window start and end counter values

| IWDTTOPS[1:0] bits | | Timeout period | | Window start and end counter value | | | |
|--------------------|----|----------------|---------------|------------------------------------|--------|--------|--------|
| b3 | b2 | Cycles | Counter value | 100% | 75% | 50% | 25% |
| 0 | 0 | 128 | 0x007F | 0x007F | 0x005F | 0x003F | 0x001F |
| 0 | 1 | 512 | 0x01FF | 0x01FF | 0x017F | 0x00FF | 0x007F |
| 1 | 0 | 1024 | 0x03FF | 0x03FF | 0x02FF | 0x01FF | 0x00FF |
| 1 | 1 | 2048 | 0x07FF | 0x07FF | 0x05FF | 0x03FF | 0x01FF |

**Figure 25.2 IWDTRPSS[1:0] and IWDTRPES[1:0] bit settings and refresh-permitted period****IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)**

The IWDTRSTIRQS bit specifies the behavior when an underflow or a refresh error occurs. Setting 1 selects reset output. Setting 0 selects interrupt.

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit selects whether to stop counting on transition to Sleep, Snooze, or Software Standby mode.

25.3 Operation**25.3.1 Auto Start Mode**

When the IWDT Start Mode Select bit (OFS0.IWDTSTRT) in the Option Function Select Register 0 is 0, auto start mode is selected, otherwise the IWDT is disabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the IWDT registers:

- Clock division ratio (OFS0.IWDTCKS[3:0])
- Window start and end positions (OFS0.IWDRPSS[1:0], OFS0.IWDRPES[1:0])
- Timeout period (OFS0.IWDTTOPS[1:0])
- Reset output or interrupt request (OFS0.IWDRSTIRQS)

When the reset state is released, the counter automatically starts counting down from the value selected in the IWDT Timeout Period Select bits (OFS0.IWDTTOPS[1:0]).

After that, as long as the program continues normal operation and the counter is refreshed within the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and down-counting continues. The IWDT does not output the reset signal as long as this procedure continues. However, if the counter underflows because the program crashed or because a refresh error occurred when an attempt is made to refresh outside the refresh-permitted period, the IWDT asserts the reset signal or non-maskable interrupt request/interrupt request (IWDT_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle, the value of the timeout period is set in the down-counter and counting starts. The reset output or interrupt request output can be selected with the IWDT Reset Interrupt Request Select bit (OFS0.IWDRSTIRQS). The interrupt enabled for operating the NMI can be selected with the IWDT Underflow/Refresh Error Interrupt Enable bit (NMIER.IWDTEN).

Figure 25.3 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- IWDT behavior selection: interrupt (OFS0.IWDRSTIRQS = 0)
- Non-maskable Interrupt: IWDT Underflow/Refresh Error Interrupt Enabled (NMIER.IWDTEN = 1)
- The window start position is 75% (OFS0.IWDRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDRPES[1:0] = 10b).

Figure 25.3 Operation example in auto start mode

25.3.2 Refresh Operation

To refresh the down counter and start the counting operation, write to the IWDT Refresh Register (IWDTRR) in the order of values from 0x00 to 0xFF. If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the IWDTRR register in the order of values from 0x00 to 0xFF.

When writes are made in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied. Writing 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF is valid, and the refresh is performed correctly. Even when the first value written before 0x00 is not 0x00, correct refreshing is performed as long as the operation contains the write sequence of 0x00 → 0xFF.

Correct refreshing is also performed regardless of whether a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR. Writes to refresh the counter must be made within the refresh-permitted period. Whether writing is done within the refresh-permitted period is determined when 0xFF is written. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid to refresh the counter]

- 0x00 → 0xFF
- 0x00 ((n - 1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF.

[Example write sequences that are not valid to refresh the counter]

- 0x23 (a value other than 0x00) → 0xFF

- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF.

After 0xFF is written to the IWDTRR register, refreshing the counter requires up to 4 cycles of the signal for counting (the IWDT-Dedicated Clock Frequency Division Ratio Select bits (OFS0.IWDTCKS[3:0]) to determine how many cycles of the IWDT-dedicated clock (IWDTCCLK) make up 1 cycle for counting. To meet this requirement, writing 0xFF to the IWDTRR must be completed 4 count cycles before the end of the refresh-permitted period or a down-counter underflow. The value of the counter can be checked with the counter bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 0x1FFF, even if 0x00 is written to IWDTRR before 0x1FFF is reached at (0x2002, for example), refreshing occurs if 0xFF is written to IWDTRR after the value of the IWDTSR.CNTVAL[13:0] bits reaches 0x1FFF
- When the window end position is set to 0x1FFF, refreshing occurs if 0x2003 (4 count cycles before 0x1FFF) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR
- When the refresh-permitted period continues until count 0x0000, refreshing can be performed immediately before an underflow. In this case, if 0x0003 (4 count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to IWDTRR, no underflow occurs and refreshing is performed.

Figure 25.4 shows the IWDT refresh-operation waveforms when $PCLKB > IWDTCCLK$ and the clock division ratio is $IWDTCCLK$.

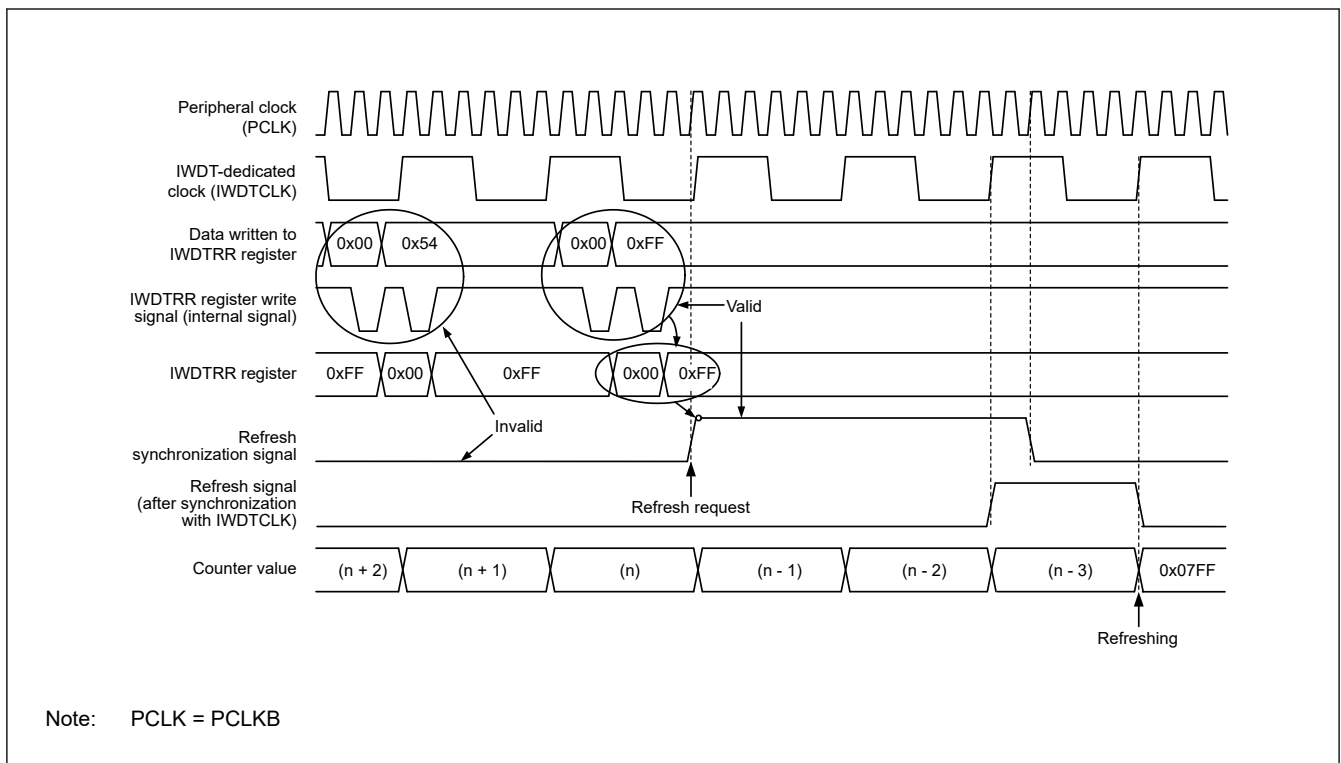

Figure 25.4 IWDT refresh operation waveforms when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b

25.3.3 Status Flags

The refresh error (IWDTSR.REFEF) and underflow (IWDTSR.UNDFF) flags retain the source of the interrupt request from the IWDT. Therefore, after a release from the interrupt request generation, read the IWDTSR.REFEF and UNDFF flags to check for the interrupt source. For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the time of the next interrupt request from the IWDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see [section 25.2.2. IWDTSR : IWDT Status Register](#).

25.3.4 Reset Output

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1, a reset signal is output when an underflow in the counter or a refresh error occurs. Counting down automatically starts after the reset output.

25.3.5 Interrupt Sources

When the IWDT Reset Interrupt Request Select bit (OFS0.IWDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0, an interrupt (IWDT_NMIUNDF) signal occurs when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see [section 12, Interrupt Controller Unit \(ICU\)](#).

Table 25.4 IWDT interrupt source

| Name | Interrupt source | Interrupt to CPU | Start DMAC or DTC |
|--------------|-------------------------------------------------------------------------------------------------|------------------|-------------------|
| IWDT_NMIUNDF | <ul style="list-style-type: none"> Down-counter underflow Refresh error | Possible | Not possible |

25.3.6 Reading the Down-Counter Value

As the counter is a IWDT-dedicated clock (IWDTCCLK), the counter value cannot be read directly. The IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (IWDTSR.CNTVAL[13:0]) of the IWDT Status Register. Check these bits to obtain the counter value indirectly.

Reading the counter value requires multiple PCLKB clock cycles (up to 4 clock cycles), and the read counter value might differ from the actual counter value by a value of one count.

[Figure 25.5](#) shows the processing for reading the IWDT counter value when $PCLKB > IWDTCCLK$ and the clock division ratio is IWDTCCLK.

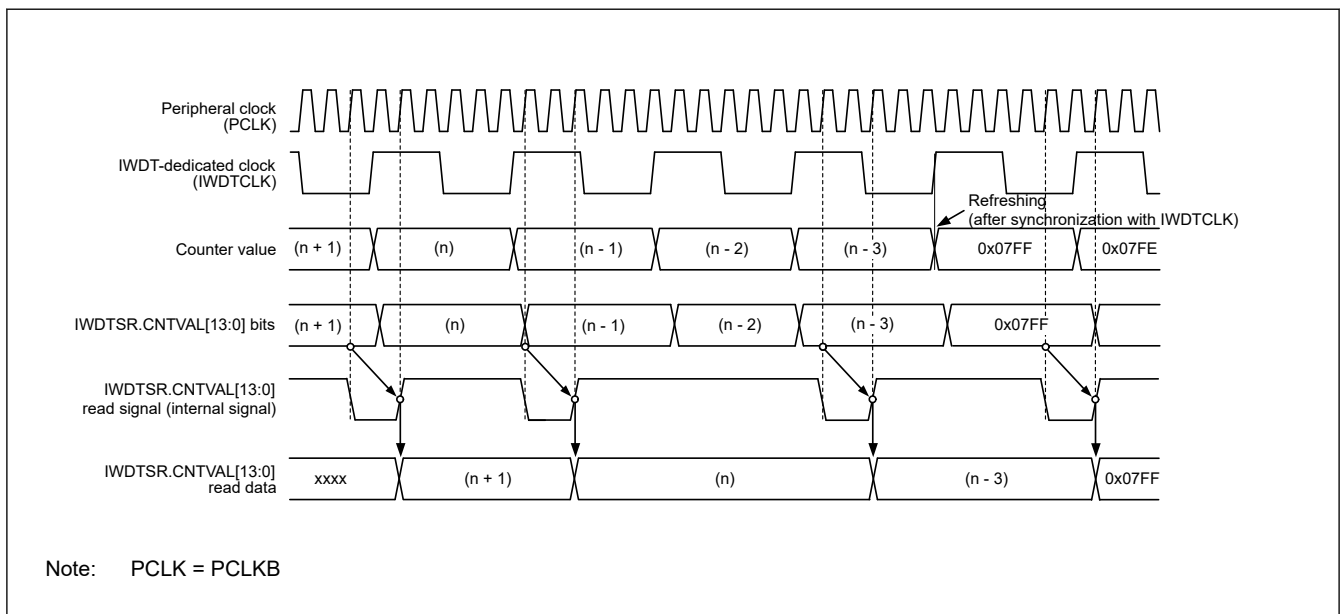

Figure 25.5 Processing for reading IWDT counter value when OFS0.IWDTCKS[3:0] = 0000b, OFS0.IWDTTOPS[1:0] = 11b

25.4 Output to the Event Link Controller (ELC)

The IWDT is capable of link operation for a specified module when the interrupt request signal is used as an event signal by the event link controller (ELC). The event signal is output by the counter underflow or refresh error.

An event signal is output regardless of the setting of the OFS0.IWDTRSTIRQS bit. An event signal can also be output at generation of the next interrupt source while the Refresh Error flag (IWDTSR.REFEF) or Underflow flag (IWDTSR.UNDFF) is 1. For details, see [section 17, Event Link Controller \(ELC\)](#).

25.5 Usage Notes

25.5.1 Refresh Operations

While configuring the refresh time, consider variations in the range of errors given the accuracy of PCLKB and IWDTCCLK. Set values that ensure refreshing is possible.

25.5.2 Clock Division Ratio Setting

Satisfy the frequency of the peripheral module clock ($PCLKB \geq 4 \times$ (the frequency of the count clock source after division)).

25.5.3 Constraints on the ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x52 to ICU Event Link Setting Register n (IELSRn.IELS[8:0]) is prohibited when enabling the IWDT reset assertion (OFS0.IWDTRSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x52).

26. Serial Communications Interface (SCI)

This is the SCI_B version of the SCI peripheral module.

SCI_B is referred to as SCI in this chapter.

26.1 Overview

The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces:

- Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA))
- 8-bit clock synchronous interface
- Simple IIC (master-only)
- Simple SPI
- Simple LIN
- Smart card interface
- Manchester interface

The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. SCIn (n = 0 to 4, 9) has FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator.

In this section, PCLK refers to PCLKA, TCLK refers to SCITCLK.

Table 26.1 lists the SCI specifications, Figure 26.1 shows a block diagram of SCI, and Table 26.2 lists the I/O pins.

Table 26.1 SCI specifications (1 of 4)

| Parameter | | Specifications |
|----------------------------------------------|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of modules | | 6 (SCIn (n = 0 to 4, 9)) |
| Serial communication modes | | <ul style="list-style-type: none"> • Asynchronous • Clock synchronous • Simple IIC • Simple SPI • Simple LIN • Smart card interface • Manchester interface |
| Transfer speed | | Bit rate specifiable with the on-chip baud rate generator |
| Full-duplex communications | | <ul style="list-style-type: none"> • Transmitter: Continuous transmission possible using double-buffering • Receiver: Continuous reception possible using double-buffering |
| Half-duplex communications | | Half-duplex communication is possible by using only TXDn pins |
| Data transfer | | Selectable as LSB-first or MSB-first transfer |
| Inverter for communication pins (RXDn, TXDn) | | Selectable inverter for each pins (RXDn, TXDn) |
| Interrupt sources | | Transmit end, transmit data empty, receive data full, receive error, receive data ready, address match. Break Field detection/output, Bus collision detection, Active edge detection. Completion of generation of a start condition, restart condition, or stop condition. (for simple IIC mode) |
| Loop Back function | | Self-diagnosis of communication function by IP internal transmission / reception is possible |
| Synchronizer Bypass function | | Ability to bypass synchronization circuit between bus clock and operation clock (TCLK) |
| Module-stop function | | Module-stop state can be set for each channel |
| Snooze end request | | SCI0 address mismatch (SCI0_DCUF) |
| Clock synchronous mode | Data length | 8 bits |
| | Adjustment of receive sampling timing | Adjustable receive sampling timing after the default timing in master mode only when using internal clock |

Table 26.1 SCI specifications (2 of 4)

| Parameter | | Specifications |
|---------------------------|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|
| | Receive error detection | Overrun error |
| | Clock source | Selectable to internal clock (master mode) or external clock (slave mode) |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |
| | Hardware flow control | Transmission and reception controllable with CTSn_RTSn pins |
| | Transmission and reception | Selectable to 1-stage register or 16-stage FIFO |
| Asynchronous mode | Data length | 7, 8, or 9 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Adjustment of receive sampling timing | Adjustable receive sampling timing before/after the default timing |
| | Adjustment of transmit timing | Adjustable edge timing of transmit waveform controlled by the setting value of registers. |
| | Parity | Even parity, odd parity, or no parity |
| | Receive error detection | <ul style="list-style-type: none"> Parity error Overrun error Framing error |
| | Hardware flow control | Transmission and reception controllable with CTSn_RTSn pin and CTSn pin |
| | Transmission and reception | Selectable to 1-stage register or 16-stage FIFO |
| | Address match | Interrupt request/event output can be issued upon detecting a match between received data and the value in the compare match register |
| | Address mismatch (SCI0 only) receive data | Snooze end request can be issued when detecting a mismatch between the received data and the value in the compare match register |
| | Start-bit detection | Selectable to low level or falling edge detection |
| | Break detection | Breaks from framing errors detectable by read from CSR register |
| | Clock source | Selectable to internal or external clock |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |
| | Multi-processor communications function | Serial communication enabled among multiple processors |
| | RS-485 driver control function | Output DEN signal to enable external transceiver transmit mode |
| | Noise cancellation | Digital noise filters included on signal paths from the RXDn pin inputs |
| Smart card interface mode | Error processing | Error signal can be automatically transmitted upon detecting a parity error during reception |
| | | Data can be automatically retransmitted upon receiving an error signal during transmission |
| | Data type | Both direct and inverse convention supported |
| Manchester mode | Communication format | Manchester code with the preface and the Start Bit added |
| | Data length | 7,8, or 9 bits |
| | Transmission stop bit | 1 or 2 bits |
| | Parity function | Even parity, odd parity, or no parity |
| | Receive error detection | Parity, overrun, framing, Manchester errors |
| | Hardware flow control | Transmission and reception controllable with CTSn_RTSn pin and CTSn pin |
| | Clock source | Only internal clock can be used. |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |

Table 26.1 SCI specifications (3 of 4)

| Parameter | | Specifications |
|------------------------------|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| | Multi-processor communication function | Serial communication among multiple processors |
| | Manchester encoding / decoding function | Function to perform Manchester encoding / decoding of transmission / reception data and communicate using Manchester code |
| | Noise cancellation | The signal paths from input on the RXDn pins incorporate digital noise filters |
| | Preface setting / detection function | The function outputs the configured the preface pattern and detects it. |
| | Start Bit setting / detection function | The function outputs the configured the Start Bit pattern and detects it. |
| | Reception retiming function | Timing correction is performed for each bit of the received signal |
| Simple IIC mode | Transfer format | I ² C bus format (MSB-first only) |
| | Operating mode | Master (single-master operation only) |
| | Transfer rate | Up to 400 kbps |
| | Noise cancellation | The signal paths from input on the SCLn and SDAn pins incorporate digital noise filters and provide an adjustable interval for noise cancellation |
| Simple SPI mode | Data length | 8 bits |
| | Error detection | Overrun error |
| | Clock source | Selectable to internal clock (master mode) or external clock (slave mode) |
| | Double-speed mode | Baud rate generator double-speed mode is selectable |
| | Transmission / Reception | Selectable either 1 stage register or 16-stage FIFO |
| | Adjustment of receive sampling timing | Adjustable receive sampling timing after the default timing in master mode only when using internal clock |
| | SSn input pin function | High impedance state can be invoked on the output pins by driving the SSn pin high. |
| | Clock settings | Configurable among four clock phase and clock polarity settings |

26.2 Register Descriptions

26.2.1 RSR : Receive Shift Register

RSR is a shift register that receives serial data input from the RXD_n pin and converts it into parallel data. When one frame of data is received, the data is automatically transferred to the RDR register. The RSR register cannot be directly accessed by the CPU.

26.2.2 RDR/RDR_BY : Receive Data Register

Base address: $SCI_Bn = 0x4011_8000 + 0x0100 \times n$ ($n = 0$ to $4, 9$)

Offset address: $0x00$

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|------|------|----|-----|-----------|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | FER | PER | — | — | ORER | — | — | — | — | — | — | — | — |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | FFER | FPER | DR | MPB | RDAT[8:0] | | | | | | | | |
| Value after reset: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | Symbol | Function | R/W |
|-------|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8:0 | RDAT[8:0] | Serial receive data RDAT is a 9-bit register for storing received data. Received data is stored in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. In the unused bit, 0 is stored. Use RDR_BY for byte access to RDR [7:0]. | R |
| 9 | MPB | Multi-processor flag 0: Data transmission cycles 1: ID transmission cycles | R |
| 10 | DR | Receive data ready flag FRSR.DR can be read. | R |
| 11 | FPER | FIFO parity error flag Valid only in Asynchronous mode 0: There is no parity error in the data read from the receive-FIFO 1: There is parity error in the data read from the receive-FIFO | R |
| 12 | FFER | FIFO framing error flag Valid only in Asynchronous mode 0: There is no framing error in the data read from the receive-FIFO 1: There is framing error in the data read from the receive-FIFO | R |
| 23:13 | — | These bits are read as 0. | R |
| 24 | ORER | Overrun Error flag CSR.ORER can be read. | R |
| 26:25 | — | These bits are read as 0. | R |
| 27 | PER | Parity error flag CSR.PER can be read. | R |
| 28 | FER | Framing error flag CSR.FER can be read. | R |
| 31:29 | — | These bits are read as 0. | R |

In FIFO mode ($CCR3.FM = 1$), this register is 16-stage FIFO buffer configuration. When using FIFO mode, use RDR for 32-bit access.

RDAT[8:0] bits (Serial receive data)

After one frame of data is received, the received data is transferred from the RSR register to this register, thus allowing the RSR register to receive the next data.

The RSR and RDR registers have a double-buffered construction to enable continuous reception.

For Non-FIFO mode, read RDR only once when a receive data full interrupt ($SCIIn_RXI$) request is issued. Without reading received data from RDR, if the next one frame is received, an overrun error occurs.

For FIFO mode, continuous reception is executed until 16 stages are stored. If data is read when there is no received data in the receive-FIFO(RDR), the value is undefined. When the receive-FIFO (RDR) are full of received data, subsequent serial receive data is lost.

The CPU cannot write to RDR.

0 is stored in the bit position which isn't received (RDR.bit8 or RDR.bit7) at the time of 7bit or 8bit communication of Asynchronous and Manchester mode.

MPB bit (Multi-processor flag)

In Asynchronous mode and Manchester mode, during multi-processor communication (CCR3.MP = 1), the value of the multi-processor bit corresponding to the received data (RDAT[8:0]) can be read.

FPER bit (FIFO parity error flag)

Indicates whether the data read from the receive-FIFO has a parity error.

0 is stored for non-FIFO mode.

FFER bit (FIFO framing error flag)

Indicates whether the data read from receive-FIFO has a framing error.

0 is stored for non-FIFO mode.

26.2.3 TDR/TDRLL/TDRLH : Transmit Data Register

Base address: SCI_Bn = 0x4011_8000 + 0x0100 × n (n = 0 to 4, 9)

Offset address: 0x04 (TDR/TDRLL)
0x05 (TDRLH)

| | | | | | | | | | | | | | | | | |
|--------------------|----|----|----|-----------|----|----|------|-----------|----|----|----|----|----|----|----|----|
| Bit position: | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
| Bit field: | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| Bit position: | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| Bit field: | — | — | — | TSYN C | — | — | MPBT | TDAT[8:0] | | | | | | | | |
| Value after reset: | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

| Bit | Symbol | Function | R/W |
|-------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 8:0 | TDAT[8:0] | Serial transmit data TDAT is a 9-bit register for setting transmit data. Transmit data is set in [6:0] when 7-bit data is selected, in [7:0] when 8-bit data is selected, and in [8:0] when 9-bit data is selected. When byte access occurs, write TDR[15:8] and then write TDR[7:0]. Use TDRLL for byte access to TDR[7:0], TDRLH for byte access to TDR[15:8]. | R/W |
| 9 | MPBT | Multi-processor transfer bit flag Value of the multi-processor bit in the transmission frame. This bit is use in Asynchronous and Manchester mode. When writing to this bit when not used, write the initial value. 0: Data transmission cycles 1: ID transmission cycles | R/W |
| 11:10 | — | These bits are read as 1. The write value should be 1. | R/W |
| 12 | TSYNC | Transmit SYNC data It is valid when MCR.SBSEL = 1 and MCR.SYNSEL = 1 in Manchester mode. When this bit is not used, write the initial value. 0: The Start Bit is transmitted as DATA SYNC. 1: The Start Bit is transmitted as COMMAND SYNC. | R/W |
| 31:13 | — | These bits are read as 1. The write value should be 1. | R/W |

In FIFO mode (CCR3.FM = 1), this register is 16-stage FIFO buffer configuration. When using FIFO mode, use TDR for 32-bit access.

TDAT[8:0] bit (Serial transmit data)

The TDR is a 9-bit register for storing transmit data.

When empty space is detected in the TSR register, the transmit data stored in the TDR registers is transferred to TSR, and transmitting is started.

The TSR and TDR registers have a double-buffered construction to realize continuous transmission. When the next data to be transmitted is stored in TDR after one frame of data has been transmitted, the transmitting operation is continued by transfer to the TSR register.

When the SCI detects that the transmit shift register (TSR) is empty, it transmits data written in the transmit-FIFO (TDR) into TSR and starts serial transmission. Continuous serial transmission is executed until there is no transmit data left in the transmit-FIFO (TDR).

For non-FIFO mode, when a transmit data empty interrupt (SCIn_TXI) request is issued and CCR0.TE is 1, write transmit data to the TDR only once.

For FIFO mode, when transmit-FIFO is full of transmit data 16 frames, no more data can be written. If writing of new data is attempted, the data is ignored.

The TDR register can always be read / written from the CPU. When byte access occurs, write TDR[15:8] and then write TDR[7:0].

MPBT bit (Multi-processor transfer bit flag)

Selects the multi processor bit of transmit frame.

TSYNC bit (Transmit SYNC data)

When MCR.SBSEL = 1 and MCR.SYNSEL = 1 in Manchester mode, the type of SYNC selected according to this bit becomes the Start Bit of the transmission frame.

26.2.4 TSR : Transmit Shift Register

TSR is a shift register that transmits serial data. To perform serial data transmission, the SCI first automatically transfers transmit data from TDR to TSR, then sends the data to the TXDn pin. The CPU cannot directly access the TSR.

26.2.5 CCR0 : Common Control Register 0

Base address: SCI_Bn = 0x4011_8000 + 0x0100 × n (n = 0 to 4, 9)

Offset address: 0x08

| | | | | | | | | | | | | | | | | |

| Bit | Symbol | Function | R/W |
|-----|--------|--------------------------------------------------------------------------------------------|----------|
| 0 | RE | Receive Enable 0: Serial reception is disabled 1: Serial reception is enabled | R/W*1 *3 |
| 3:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 4 | TE | Transmit Enable 0: Serial transmission is disabled 1: Serial transmission is enabled | R/W*1 |
| 7:5 | — | These bits are read as 0. The write value should be 0. | R/W |

| Bit | Symbol | Function | R/W |
|-------|--------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| 8 | MPIE | Multi-Processor Interrupt Enable Valid in Asynchronous mode and Manchester mode when CCR3.MP is 1. This bit should set 0 in smart card interface mode. 0: Non-Multi-Processor reception 1: Multi -Processor reception When the data with the multi-processor bit set to 0 is received, the data is not read, and setting the status flags to 1 is disabled. When the data with the multiprocessor bit set to 1 is received, the MPIE bit is automatically cleared to 0, and non-multi-processor reception is resumed. If you want to continue receiving operation using the multiprocessor function, set this bit to 1 sufficiently earlier than receiving the STOP bit of the next received frame. (Consider the synchronization delay time.) | R/W ² |
| 9 | DCME | Data Compare Match Enable Valid only in Asynchronous mode 0: Address match function is disabled 1: Address match function is enabled | R/W ² |
| 10 | IDSEL | ID frame select Valid only in Asynchronous mode with multi-processor 0: Always compare data irrespective of the value of the MPB bit 1: Compare data only when the MPB bit is 1 (ID frame) | R/W |
| 15:11 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | RIE | Receive Interrupt Enable 0: SCIn_RXI and SCIn_ERI interrupt requests are disabled 1: SCIn_RXI and SCIn_ERI interrupt requests are enabled | R/W |
| 19:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 20 | TIE | Transmit Interrupt Enable 0: SCIn_TXI interrupt request is disabled 1: SCIn_TXI interrupt request is enabled | R/W |
| 21 | TEIE | Transmit End Interrupt Enable This bit should set 0 in smart card interface mode. 0: SCIn_TEI interrupt request is disabled 1: SCIn_TEI interrupt request is enabled | R/W |
| 23:22 | — | These bits are read as 0. The write value should be 0. | R/W |
| 24 | SSE | SSn Pin Function Enable Valid in Simple SPI mode. In slave mode (CCR3.CKE[1:0] = 1x), set 1 to this bit. 0: SSn pin function is disabled. 1: SSn pin function is enabled. | R/W |
| 31:25 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. In clock-synchronous mode (CCR3.MOD[2:0] = 010b), Simple SPI mode (CCR3.MOD[2:0] = 011b), and Simple IIC mode (CCR3.MOD[2:0] = 100b), 1 can be written only when TE = 0 and RE = 0. After setting TE or RE to 1, only 0 can be written in TE and RE. In other mode, writing is enabled under any condition.

Note 2. This bit is a bit that is cleared by hardware. Note that writing to a bit other than this bit with a bit manipulation instruction may cause this bit to be unintentionally set to 1 by a read-modify-write operation.

Note 3. In clock synchronous mode and Simple SPI mode, receive only setting is prohibited in the internal clock (master mode) (TE = 0 and RE = 1 setting prohibited).

RE bit (Receive Enable)

Enables or disables serial receive operation.

When this bit is set to 1, serial reception becomes possible after the synchronization delay time has elapsed in asynchronous mode or the synchronous clock input in clock synchronous mode or the neg-edge of RXDn in Manchester mode or start bit in smart-card-interface-mode.

Note that CCR3 should be set prior to setting the RE bit to 1 in order to designate the reception format.

Except smart-card-interface-mode, even if reception is halted by setting the RE bit to 0, the CSR.RDRF, FER, PER, ORER, MSR.MER, SBER, SYER, PFER, FRSR. DR flags are not affected, and the previous values is retained. In smart-card-interface-mode, even if reception is halted by setting the RE bit to 0, the CSR.FER, PER, ORER flags are not affected and the previous value is retained. Also, to stop the reception operation, synchronization delay time will be required from when the RE bit is set to 0 until the reception operation is stopped.

TE bit (Transmit Enable)

Enables or disables serial transmission.

When this bit is set to 1, serial transmission becomes possible after the synchronization delay time has elapsed. After the synchronization delay time, transmission is started by writing transmit data to TDR. Note that CCR3 should be set prior to setting the TE bit to 1 in order to designate the transmission format. In addition, the synchronization delay time is required until the transmission control circuit is stopped after the TE bit is set to 0.

MPIE bit (Multi-Processor Interrupt Enable)

When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the status flags (CSR.RDRF, ORER, FER, FRSR, DR, MSR.MER, SYER, PFER, SBER) are disabled.

When the data with the multi-processor bit set to 1 is received, the MPIE is automatically cleared to 0, and normal reception is resumed. For details, see [section 26.4. Multi-Processor Communication Function](#). If you want to continue receiving operation using the multiprocessor function, set this bit to 1 sufficiently earlier than receiving the STOP bit of the next received frame.

When the receive data includes the MPB bit set to 0, the receive data is not transferred from the RSR to the RDR, a receive error is not detected, and setting the flags ORER, FER, MER, SYER, PFER, and SBER to 1 is disabled.

When the receive data includes the MPB bit set to 1, the MPIE bit is automatically cleared to 0, the SCIn_RXI and SCIn_ERI interrupt requests are enabled (if CCR0.RIE is set to 1), and setting the flags ORER, FER, MER, SYER, PFER, and SBER to 1 is enabled.

MPIE should be set to 0 if multi-processor communications function is not to be used.

DCME bit (Data Compare Match Enable)

It can select whether the Address match function (data compare match function) uses or not.

When DCME is 1, if SCI detects the match to the comparison data (CCR4.CMPD) with receive data, DCME is cleared automatically, and after that, SCI operation mode will be receive mode without data compare match function.

See [section 26.3.6. Address Match \(Receive Data Match Detection\) Function](#).

The write value should be 0 other than asynchronous mode.

IDSEL bit (ID frame select)

It can select whether it is compared irrespective of the value of MPB bit or it is compared only the data of MPB bit = 1 (ID frame) when the Address match function is valid. Set at the same time as DCME.

RIE bit (Receive Interrupt Enable)

Enables or disables SCIn_RXI and SCIn_ERI interrupt requests.

SCIn_RXI and SCIn_ERI interrupt request is disabled by setting the RIE bit to 0.

An SCIn_ERI interrupt request can be canceled by reading 1 from the CSR.ORER, FER, or PER and then setting the flag to 0 or setting the RIE bit to 0.

In the case of Manchester mode, the MER, SYER, PFER and SBER flags are also the cause of SCIn_ERI interrupt request, so the same processing is necessary. For details of these flags, see [section 26.2.12. MCR : Manchester Control Register](#) and [section 26.2.21. MSR : Manchester Status Register](#).

TIE bit (Transmit Interrupt Enable)

Enables or disables SCIn_TXI interrupt request.

An SCIn_TXI interrupt request is disabled by setting the TIE bit to 0. At the beginning of transmission, set 1 to CCR0.TE and CCR0.TIE simultaneously. Then the SCIn_TXI interrupt request is generated.

TEIE bit (Transmit End Interrupt Enable)

Enables or disables a SCIn_TEI interrupt request. A SCIn_TEI interrupt request is disabled by setting the TEIE bit to 0.

In simple IIC mode, the SCIn_TEI is allocated to the interrupt on completion of issuing a start, restart, or stop condition (STIn). In this case, the TEIE bit can be used to enable or disable the STIn.

SSE bit (SSn Pin Function Enable)

Set this bit to 1 if the SSn pin is to be used in control of transmission and reception (in simple SPI mode).

Set this bit to 0 in any other mode. Do not set both the SSE and CTSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

In the slave mode (CCR3.CKE[1:0] = 10 or 11), SSE should be set 1.

In the master mode (CCR3.CKE[1:0] = 00 or 01) and single-master, the SSn pin on the master side is not required to control reception and transmission, so SSE should be set 0.

26.2.6 CCR1 : Common Control Register 1

Base address: SCI_Bn = 0x4011_8000 + 0x0100 × n (n = 0 to 4, 9)

Offset address: 0x0C

| 15:14 | — | These bits are read as 0. The write value should be 0. | R/W |
| 16 | SPLP | Loopback Control It can be used when internal clock operation in asynchronous mode, internal mode operation in Manchester mode, internal clock operation in clock synchronous mode. 0: Normal mode 1: Loopback mode | R/W |
| 19:17 | — | These bits are read as 0. The write value should be 0. | R/W |
| 20 | SHARPS | Half-duplex communication select In the Simple IIC mode, in the Smart Card Interface Mode or in the Simple SPI mode, this bit should be set 0. 0: TXDn pin, RXDn pin independent 1: TXDn / RXDn pin combination use (Half-duplex communication using TXDn pin) | R/W |
| 23:21 | — | These bits are read as 0. The write value should be 0. | R/W |
| 26:24 | NFCS[2:0] | Noise Filter Clock Select Valid in Asynchronous mode and Manchester mode, Simple LIN mode, and Simple IIC mode. In Simple IIC mode, 000 setting is prohibited. The on-chip baud rate generator source clock means the clock selected by CCR2.CKS [1:0]. Select for the noise filter's clock source. 0 0 0: The base clock signal divided by 1. 0 0 1: The on-chip baud rate generator source clock divided by 1. 0 1 0: The on-chip baud rate generator source clock divided by 2. 0 1 1: The on-chip baud rate generator source clock divided by 4. 1 0 0: The on-chip baud rate generator source clock divided by 8. others: Setting prohibited. | R/W |
| 27 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | NFEN | Digital Noise Filter Function Enable Valid in Asynchronous mode, manchester mode, Simple LIN mode and Simple IIC mode 0: In Asynchronous, Manchester, Simple LIN mode: Disable noise cancellation function for RXDn input signal In Simple IIC mode: Disable noise cancellation function for SCLn and SDAn input signals 1: In Asynchronous, Manchester, Simple LIN mode: Enable noise cancellation function for RXDn input signal In Simple IIC mode: Enable noise cancellation function for SCLn and SDAn input signals | R/W |
| 31:29 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. Use this bit in asynchronous mode and manchester mode only. Operation by other mode is not guaranteed.

Note 2. RINV/TINV should be set 0 in smart card interface mode and simple IIC mode.

CTSE bit (CTS Enable)

Set this bit to 1 if the SSn pin is to be used for inputting of the CTSn control signal to control of transmission and reception. The RTSn signal is output when this bit is set to 0. Set this bit to 0 in smart card interface mode, simple SPI mode, Simple LIN mode, and simple IIC mode. Do not set both the CTSE and SSE bits to enabled (even if this setting is made, operation is the same as that when these bits are set to 0).

CTSPEN bit (CTS external pin Enable)

When CTSE is 1, the CTSPEN bit selects the pins usage method when using the CTS and RTS functions. Set this bit to 1 when assigning the CTS/RTS function to 2 pins and using them at the same time. Set it to 0 except in Asynchronous and Manchester modes.

Table 26.3 shows the relationship between the CTSE bit and CTSPEN bit settings and the functions of the CTSn_RTSn pin and CTSn pin.

Table 26.3 CTSE bit and CTSPEN bit settings and pin functions

| CTSE bit | CTSPEN bit | CTSn_RTSn pin | CTSn pin |
|----------|------------|--------------------|-------------------|
| 0 | 0 | RTSn signal output | Not use |
| 1 | 0 | CTSn signal input | Not use |
| 1 | 1 | RTSn signal output | CTSn signal input |

Note: Set CTSPEN bit = 0 when CTSE bit = 0.

SPB2DT bit (Serial port break data select), SPB2IO bit (Serial port break I/O)

The TXDn pin status decided by combination of CCR0.TE bit, CCR1.SPB2IO bit and CCR1.SPB2DT bit is indicated in Table 26.4.

Table 26.4 TXDn pin status

| The value of CCR0.TE | The value of CCR1.SPB2IO | The value of CCR1.SPB2DT | TXDn pin status (When TINV is 0.) |
|----------------------|--------------------------|--------------------------|-------------------------------------|
| 0 | 0 | — | Hi-Z (initial value) |
| 0 | 1 | 0 | Low level output |
| 0 | 1 | 1 | High level output |
| 1 | — | — | Serial transmission data is output. |

Note: —: Don't care

PE bit (Parity Enable)

When the PE bit is 1, the parity bit is added to transmit data before transmission, and the parity bit is checked in reception. In the multiprocessor format, the parity bit is not added or checked regardless of this bit setting.

PM bit (Parity Mode)

Selects the parity mode for transmission and reception (even or odd). In multi-processor mode, this bit is invalid.

For details on the usage of this bit in smart card interface mode, see [section 26.7.2. Data Format \(Except in Block Transfer Mode\)](#).

TINV bit (TXD invert), RINV bit (RXD invert)

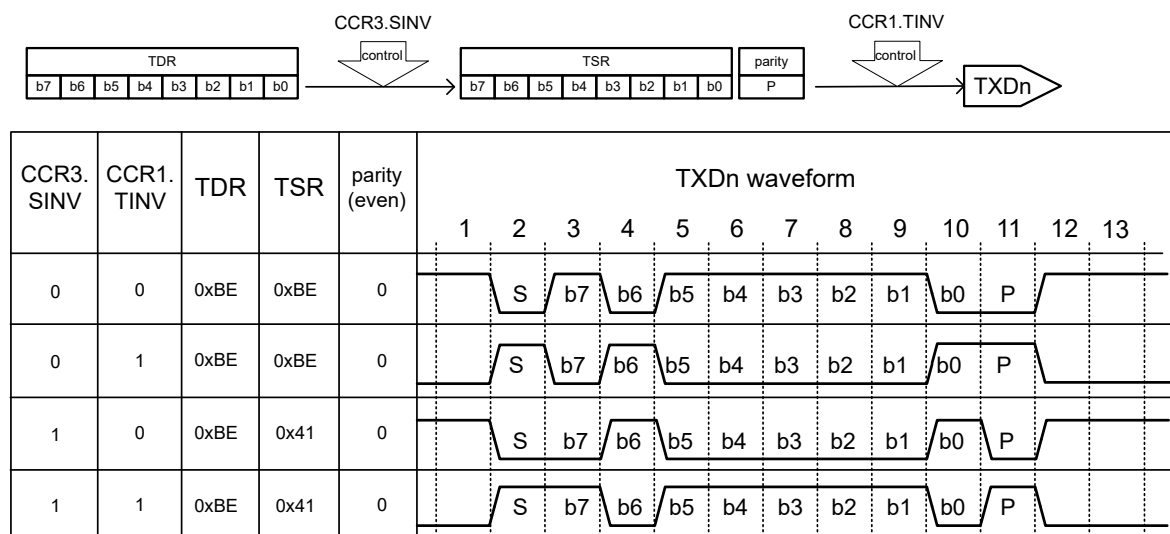

The data of RDR is controlled by RINV and CCR3.SINV. The data from TXDn pin is controlled by TINV and CCR3.SINV. The control by RINV/TINV are done to communication pins (RXDn / TXDn), so they can control not only data-bits but also other bits (start bit, stop bit, parity bit). For details, see [Figure 26.3](#).

During half-duplex communication and slave operation in simple SPI mode, use the TXDn pin for reception, so set the inversion control of the received data with the TINV bit.

Note: Sentences and a timing chart of the IP operation explanation are mentioned by TINV = 0 and RINV = 0 when TINV's value and RINV's value are not specified.

The receive/transmit data control (Data size = 8bits, Even parity, MSB first)

The transmit data is controlled by CCR1.TINV and CCR3.SINV.

The received data is controlled by CCR1.RINV and CCR3.SINV.

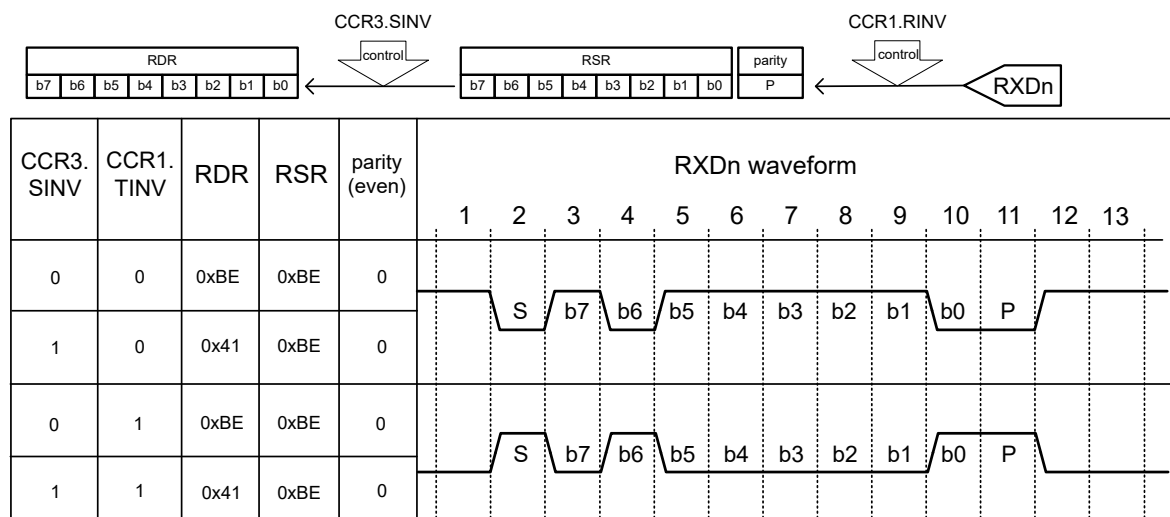

Figure 26.3 Example of the receive or transmit data control

SPLP bit (Loopback Control)

When this bit is 1, SCI blocks the input path from RXDn and connects the output path to TXDn to the reception data register.

Transmit data can be inverted and received by combining it with TINV bit.

Clock synchronous mode at slave operation, Asynchronous mode when using an external clock, and Simple LIN mode, set this bit to 0.

SHARPS bit (Half-duplex communication select)

Setting this bit to 1 enables half-duplex communication using the TXDn pin. However, it cannot be used in Simple SPI mode, Simple IIC mode and Smart Card Interface mode.

If this bit is set to 1 and CCR0.TE = 1, CCR0.RE = 0, the TXDn pin becomes communication output. If this bit is set to 1 and CCR0.TE = 0, CCR0.RE = 1, the TXDn pin becomes the communication input. For details, see [section 26.18. Half-Duplex communication Function](#).

NFCS[2:0] bits (Noise Filter Clock Select)

These bits select the sampling clock for the digital noise filter.

To use the noise filter in asynchronous mode, manchester mode and Simple LIN mode set these bits from 000b to 100b. In simple IIC mode, set the bits to a value in the range from 001b to 100b.

NFEN bit (Digital Noise Filter Function Enable)

This bit enables or disables the digital noise filter function. When the function is enabled, noise cancellation is applied to the RXDn input signal in asynchronous mode, manchester mode, Simple LIN mode, and noise cancellation is applied to the SDAn and SCLn input signals in simple IIC mode. In any mode other than above, set the NFEN bit to 0 to disable the digital noise filter function. When the function is disabled, input signals are transferred as is, as internal signals.

| 23:22 | — | These bits are read as 0. The write value should be 0. | R/W |
| 31:24 | MDDR[7:0] | Modulation Duty Setting MDDR corrects the bit rate adjusted by the BRR[7:0] bits. | R/W |

Note 1. S is the value of S in BRR[7:0] bits explanation.

Note 2. n is the decimal notation of the value of n in BRR[7:0] bits explanation.

BCP[2:0] bit (Base Clock Pulse)

These bits select the number of base clock cycles in a 1-bit data transfer time in smart card interface mode.

For details, see [section 26.7.4. Receive Data Sampling Timing and Reception Margin](#).

BGDM bit (Baud Rate Generator Double-Speed Mode Select)

This bit is valid when the on-chip baud rate generator is selected as the clock source (CCR3.CKE[1] = 0) in asynchronous mode, Manchester mode, clock synchronous mode, Simple SPI mode. When external clock is selected (CCR3.CKE[1] = 1), set it to 0. For the clock output from the baud rate generator, either single or doubled frequency can be selected. The base clock is generated by the clock output from the baud rate generator. When the BGDM bit is set to 1, the base clock cycle is halved, and the bit rate is doubled.

Set this bit to 0 in modes other than asynchronous mode or Manchester mode or clock synchronous mode or Simple SPI mode.

ABCS bit (Asynchronous Mode Base Clock Select)

Selects the clock cycles for 1-bit period.

Set it to 0 in modes other than Asynchronous mode, Manchester mode and Simple LIN mode.

ABCSE bit (Asynchronous Mode Extended Base Clock Select)

The pulse number for a base clock at 1-bit period is 6 and the clock of a double frequency is output from baud rate generator. Only when the bit rate is set to 6 dividing frequency of the bus clock, use this bit and set CCR2.CKS [1:0] = 00b and BRR[7:0] = 0x00.

Set it to 0 in modes other than asynchronous mode. Even in asynchronous mode, set it to 0 when using external clock.

Table 26.5 Base clock cycle number per 1-bit

| ABCSE | ABCS | BGDM | The base clock cycles /1bit | The frequency of the baud rate generator |
|-------|----------------|----------------|-----------------------------|------------------------------------------|
| 0 | 0 | 0 | 16 | ×1 |
| 0 | 0 | 1 | 16 | ×2 |
| 0 | 1 | 0 | 8 | ×1 |
| 0 | 1 | 1 | 8 | ×2 |
| 1 | — (don't care) | — (don't care) | 6 | ×2 |

BRR[7:0] bit (Bit rate setting)

BRR is an 8-bit register that adjusts the bit rate.

SCI has independent baud rate generator control, different bit rates can be set for each. [Table 26.6](#) shows the relation-ship between the setting (N) in the BRR and the bit rate (B) for asynchronous mode, multiprocessor transfer, Manchester mode, clock synchronous mode, smart card interface mode, simple SPI mode, and simple IIC mode.

Table 26.6 Relationship between N Setting in BRR and Bit Rate B

| Mode | CCR2 settings | | | BRR[7:0] setting | Error |
|---------------------------------------------------------------------|---------------|------------|-----------------|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| | BGDM bit | ABCS bit | ABCS E bit | | |
| Asynchronous, multi-processor, Manchester, Simple-LIN ^{*3} | 0 | 0 | 0 | $N = \frac{TCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| | 1 | 0 | 0 | $N = \frac{TCLK \times 10^6}{32 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| | 0 | 1 | 0 | | |
| | 1 | 1 | 0 | $N = \frac{TCLK \times 10^6}{16 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| | Don't care | Don't care | 1 ^{*2} | $N = \frac{TCLK \times 10^6}{12 \times 2^{2n-1} \times B} - 1$ | $Error (\%) = \left\{ \frac{TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (N+1)} - 1 \right\} \times 100$ |
| Clock synchronous, simple SPI | | | | $N = \frac{TCLK \times 10^6}{8 \times 2^{2n-1} \times B} - 1$ | — |
| Smart card interface | | | | $N = \frac{TCLK \times 10^6}{S \times 2^{2n+1} \times B} - 1$ | $Error (\%) = \left\{ \frac{TCLK \times 10^6}{B \times S \times 2^{2n+1} \times (N+1)} - 1 \right\} \times 100$ |
| Simple IIC ^{*1} | | | | $N = \frac{TCLK \times 10^6}{64 \times 2^{2n-1} \times B} - 1$ | — |

Note: B: Bit rate (bps)

N: BRR setting for on-chip baud rate generator ($0 \leq N \leq 255$)

TCLK: Operating frequency (MHz)

n and S: Determined by the settings of the CCR2 registers as listed in [Table 26.8](#) and [Table 26.9](#). Please be careful about $2^{(2n+1)}$ is used in the expression for Smart card interface, $2^{(2n-1)}$ is used in other mode.

Note 1. Adjust the bit rate so that the widths at high and low level of the SCL output in simple IIC mode satisfy the IIC standard.

Note 2. In Manchester mode, only ABCSE = 0 can be selected.

Note 3. In Simple LIN mode, BGDM = 0 and ABCSE = 0 can be selected.

Table 26.7 Calculating Widths at High and Low Level for SCL

| Mode | SCLn | Formula (result in seconds) |
|------|-------------------------------------|-----------------------------------------------------------------------------|
| IIC | Width at high level (minimum value) | $(N+1) \times 4 \times 2^{2n-1} \times 7 \times \frac{1}{TCLK \times 10^6}$ |
| | Width at low level (minimum value) | $(N+1) \times 4 \times 2^{2n-1} \times 8 \times \frac{1}{TCLK \times 10^6}$ |

Table 26.8 Clock Source Settings

| CCR2 setting | Clock source | n |
|--------------|---------------|---|
| CKS[1:0] bit | | |
| 00 | TCLK clock | 0 |
| 01 | TCLK/4 clock | 1 |
| 10 | TCLK/16 clock | 2 |
| 11 | TCLK/64 clock | 3 |

Table 26.9 Base Clock Settings in Smart Card Interface Mode (1 of 2)

| CCR2 setting | Base clock cycles for 1-bit period | S |
|------------------|------------------------------------|-----|
| BCP[2:0] setting | | |
| 0 0 0 | 93 clock cycles | 93 |
| 0 0 1 | 128 clock cycles | 128 |
| 0 1 0 | 186 clock cycles | 186 |
| 0 1 1 | 512 clock cycles | 512 |

Table 26.9 Base Clock Settings in Smart Card Interface Mode (2 of 2)

| CCR2 setting | Base clock cycles for 1-bit period | S |
|------------------|------------------------------------|-----|
| BCP[2:0] setting | | |
| 1 0 0 | 32 clock cycles | 32 |
| 1 0 1 | 64 clock cycles | 64 |
| 1 1 0 | 372 clock cycles | 372 |
| 1 1 1 | 256 clock cycles | 256 |

Table 26.10 and Table 26.11 list examples of N settings in BRR in asynchronous mode and Manchester mode. Table 26.12 lists the maximum bit rate settable for each operating frequency. Examples of BRR (N) settings in clock synchronous mode and simple SPI mode are listed in Table 26.15. Examples of BRR (N) settings in smart card interface mode are listed in Table 26.17. Examples of BRR (N) settings in simple IIC mode are listed in Table 26.19. In smart card interface mode, the number of base clock cycles S in a 1-bit data transfer time can be selected. For details, see section 26.7.4. [Receive Data Sampling Timing and Reception Margin](#). Table 26.14 and Table 26.16 list the maximum bit rates with external clock input.

When either the asynchronous mode base clock select bit (ABCS) or the baud rate generator double-speed mode select bit (BGDM) is set to 1 in asynchronous mode and manchester mode, the bit rate becomes twice that listed in Table 26.10 and Table 26.11. When both of those registers are set to 1, the bit rate becomes four times the listed value.

Table 26.10 Examples of BRR Settings for various Bit Rates (Asynchronous Mode and Manchester Mode) (1) (1 of 3)

| Bit rate (bps) | Operating Frequency TCLK (MHz) | | | | | | | | | | | | | | |

**Table 26.10 Examples of BRR Settings for various Bit Rates (Asynchronous Mode and Manchester Mode)
(1) (3 of 3)**

| Bit rate (bps) | Operating Frequency TCLK (MHz) | | | | | | | | | | | | | | |
|-------------------|--------------------------------|----|-----------|----|----|-----------|---------|----|-----------|----|----|-----------|---------|----|-----------|
| | 14 | | | 16 | | | 17.2032 | | | 18 | | | 19.6608 | | |
| | n | N | Error (%) | n | N | Error (%) | n | N | Error (%) | n | N | Error (%) | n | N | Error (%) |
| 19200 | 0 | 22 | -0.93 | 0 | 25 | 0.16 | 0 | 27 | 0 | 0 | 28 | 1.02 | 0 | 31 | 0 |
| 31250 | 0 | 13 | 0 | 0 | 15 | 0 | 0 | 16 | 1.2 | 0 | 17 | 0 | 0 | 19 | -1.7 |
| 38400 | — | — | — | 0 | 12 | 0.16 | 0 | 13 | 0 | 0 | 14 | -2.34 | 0 | 15 | 0 |

Note: This is an example when the CCR2.ABCS = 0, CCR2.BGDM = 0 and CCR2.ABCSE = 0.
 When either ABCS bit or BGDM bit is set to 1, the bit rate doubles.
 When both ABCS = 1 and BGDM = 1, the bit rate increases four times.

BRME bit (Bit Modulation Enable)

Enables and disables the bit rate modulation function. The bit rate generated by on-chip baud rate generator is evenly corrected when this function is enabled.

Set to 0 in Clock-synchronous mode, Simple SPI mode, Smart Card Interface mode, Manchester mode and Simple LIN mode.

CKS[1:0] bit (Clock Select)

These bits select the clock source for the on-chip baud rate generator.

For the relationship between the settings of these bits and the baud rate, see BRR[7:0] bits explanation.

MDDR[7:0] bit (Modulation Duty Setting)

When the BRME bit is set to 1, the bit rate generated by the on-chip baud rate generator is evenly corrected according to the settings of MDDR (M/256). The relationship between the MDDR setting (M) and the bit rate (B) is given in [Table 26.21](#).

The initial value of MDDR is 0xFF. Bit 7 in this register is fixed to 1.

Table 26.21 Relationship between MDDR Setting (M) and Bit Rate (B) When Bit Rate Modulation Function is Used

| Mode*1 | CCR2 settings | | | BRR setting | Error |
|---------------------------------------|-----------------|-----------------|-------------|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| | BG DM bit | AB CS bit | AB CS E bit | | |
| Asynchronous, Multiprocessor transfer | 0 | 0 | 0 | $N = \frac{TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $\text{Error (\%)} = \left\{ \frac{TCLK \times 10^6}{B \times 64 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| | 1 | 0 | 0 | $N = \frac{TCLK \times 10^6}{32 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $\text{Error (\%)} = \left\{ \frac{TCLK \times 10^6}{B \times 32 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| | 0 | 1 | 0 | | |
| | 1 | 1 | 0 | $N = \frac{TCLK \times 10^6}{16 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $\text{Error (\%)} = \left\{ \frac{TCLK \times 10^6}{B \times 16 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| | x (Arbitrarily) | x (Arbitrarily) | 1*2 | $N = \frac{TCLK \times 10^6}{12 \times 2^{2n-1} \times (256/M) \times B} - 1$ | $\text{Error (\%)} = \left\{ \frac{TCLK \times 10^6}{B \times 12 \times 2^{2n-1} \times (256/M) \times (N+1)} - 1 \right\} \times 100$ |
| Simple IIC*2 | | | | $N = \frac{TCLK \times 10^6}{64 \times 2^{2n-1} \times (256/M) \times B} - 1$ | |

Note: B: Bit rate (bps)

M: MDDR setting ($128 \leq M \leq 255$)N: BRR setting for bound rate generator ($0 \leq N \leq 255$)

TCLK: Operating frequency (MHz)

n: Determined by the settings of the CKS[1:0] as listed in Table 26.8.

Note 1. Do not use this function in Clock-synchronous mode, Simple SPI mode, Smart card Interface mode, Manchester mode and Simple LIN mode.

Note 2. Adjust the bit rate so that the widths at high and low level of the SCL output in simple IIC mode satisfy the I2C standard.

Table 26.22 and Table 26.23 list examples of N settings in BRR and M settings in MDDR in asynchronous mode.

Table 26.22 Examples of BRR and MDDR Settings for Various Bit Rates (Asynchronous Mode) (1) (1 of 3)

| Bit rate (bps) | Operating frequency TCLK (MHz) | | | | | | | | | | | | | | |

| 27:26 | — | These bits are read as 0. The write value should be 0. | R/W |
| 28 | GM | <p>GSM Mode</p> <p>Valid only in Smart card interface mode</p> <p>0: Non-GSM mode operation</p> <p>1: GSM mode operation</p> | R/W |

| Bit | Symbol | Function | R/W |
|-------|--------|--------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 29 | BLK | Block Transfer Mode Valid only in Smart card interface mode 0: Non-block transfer mode operation 1: Block transfer mode operation | R/W |
| 31:30 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. In other than asynchronous mode and manchester mode, this bit setting is invalid and a fixed data length of 8 bits is used. In the Simple LIN mode, only the data length of 8 bits can be used, so set it to the initial value.

Note 2. LSB first is fixed and the MSB (bit 7) in TDR is not transmitted in transmission.

CPHA bit (Clock Phase Select)

This bit selects the phase of the clock signal output through the SCKn pin. For details, see [Figure 26.97](#).

Set the bit to 1 in other than simple SPI mode and clock synchronous mode.

CPOL bit (Clock Polarity Select)

This bit selects the polarity of the clock signal output through the SCKn pin. For details, see [Figure 26.97](#).

Set the bit to 1 in other than simple SPI mode and clock synchronous mode.

BPEN bit (Synchronizer bypass enable)

The synchronization circuit can be bypassed by this bit only when the same clock is input to the bus clock and the operation clock (TCLK). For details, see [section 26.19. Synchronizer Bypass Function](#).

Note: For details of this bit setting, see [section 26.20.17. Notes on CCR3.BPEN bit setting](#).

CHR[1:0] bit (Character Length)

Selects the data length for transmission and reception.

Except of asynchronous mode and manchester mode, a fixed data length of 8 bits is used.

LSBF bit (LSB First select)

Select whether to transmit/receive data in MSB first or LSB first.

SINV bit (Transmitted/Received Data Invert)

SINV can invert the transmit data-bit from TDR to TSR, and can invert the received data from RSR to RDR. This bit does not affect the logic level of the parity bit. To invert the parity bit, invert the CCR1.PM.

STP bit (Stop Bit Length)

Selects the stop bit length in transmission.

In reception, only the first stop bit is checked regardless of this bit setting. If the second stop bit is 0, it is treated as the start bit of the next transmit frame.

In addition, it is used as Break Delimiter length setting when sending Start Frame in simple LIN mode.

RXDESEL bit (Asynchronous Start Bit Edge Detection Select)

Selects the detection method of the start bit for reception in asynchronous mode. When a break occurs, data receiving operation depends on the settings of this bit. Set this bit to 1 when reception should be stopped while a break occurs or when reception should be started without retaining the RXDn pin input at high level for the period of one data frame or longer after completion of the break.

Set this bit to 1 in Simple LIN mode. Set this bit to 0 in modes except of asynchronous mode and Simple LIN mode.

MOD[2:0] bit (Communication mode select)

Selects the SCI communication mode.

Table 26.24 Relationship between communication mode selection bits (MOD[2:0]), other operation mode setting bits

| Communication mode | Asynchronous | | | | | | | | Smart Card Interface | Clock synchronous | Simple SPI | | | | Simple IIC | Manchester | | Simple LIN |
|--------------------|--------------|---|---|---|---|---|---|---|----------------------|-------------------|------------|---|---|---|------------|------------|---|------------|
| CCR3.MOD[2:0] | 000b | | | | | | | | 001b | 010b | 011b | | | | 100b | 101b | | 110b |
| CCR3.MP | 0 | | | | 1 | | | | — | — | — | | | | — | 0 | 1 | — |
| CCR3.FM | 0 | | 1 | | 0 | | 1 | | — | 0 | 1 | 0 | | 1 | — | — | | — |
| CCR3.DEN | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | — | — | — | | | | — | — | | — |
| CCR0.SSE | — | | | | | | | | — | — | 0 | 1 | 0 | 1 | — | — | | — |

Note: — is Prohibited setting.

MP bit (Multi-Processor Mode)

Disables/enables the multi-processor communications function. The settings of the PE bit and PM bit are invalid in multi-processor mode.

FM bit (FIFO Mode select)

When the FM bit is set to 1, the TDR register / RDR register switches to FIFO configuration, and transmit FIFO (TDR register) / receive FIFO (RDR register) can be used for serial transmission / reception.

DEN bit (Driver enable)

Select RS-485 Driver control function disable or enable.

CKE[1:0] bit (Clock enable)

These bits select the clock source and SCKn pin function.

In smart card interface mode, these bits control the clock output from the SCKn pin.

In GSM mode, clock output can be dynamically switched. For details, see [section 26.7.8. Clock Output Control](#).

GM bit (GSM Mode)

Setting this bit to 1 allows GSM mode operation.

In GSM mode, the CSR.TEND flag set timing is put forward to 11.0 etu (elementary time unit = 1-bit transfer time) from the start and the clock output control function is appended. For details, see [section 26.7.6. Serial Data Transmission \(Except in Block Transfer Mode\)](#), [section 26.7.8. Clock Output Control](#).

BLK bit (Block Transfer Mode)

Setting this bit to 1 allows block transfer mode operation.

For details, see [section 26.7.3. Block Transfer Mode](#).

26.2.9 CCR4 : Common Control Register 4

| 26:24 | AST[2:0] | Adjustment value for receive Sampling Timing This bit enables only when ASEN is 1. in Asynchronous mode and Simple LIN mode using internal clock The sampling timing of RXDn pin is adjusted from the middle of bit by the following formula. Adjustment sampling timing = base clock × the setting value of AST[2:0]. In Clock-synchronous mode and Simple SPI mode using internal clock The RXDn sampling timing can be adjusted by delaying 1 to 4 TCLK 0 0 0: 1TCLK delay 0 0 1: 2TCLK delay 0 1 0: 3TCLK delay 0 1 1: 4TCLK delay Others: Setting prohibited | R/W |
| 27 | AJD | Adjustment Direction for receive sampling timing Valid in Asynchronous mode using internal clock, Simple LIN mode using internal clock This bit enables only when ASEN is 1. Adjustment direction for RXDn receive sampling timing is determined by this bit. For details, see section 26.3.10. The function of adjust receive sampling timing (Asynchronous Mode) . 0: The sampling timing is adjusted backward to the middle of bit. 1: The sampling timing is adjusted forward to the middle of bit. | R/W |
| 30:28 | ATT[2:0] | Adjustment value for Transmit timing Valid in Asynchronous mode using internal clock, Simple LIN mode using internal clock This bit enables only when ATEN is 1. The selected edge timing of TXDn is adjusted by the following formula. Adjustment edge timing = base clock × the setting value of ATT[2:0] This setting timing is limited by setting the base clock cycles. For details, see section 26.3.11. The function of adjust transmit timing (Asynchronous Mode) . | R/W |
| 31 | AET | Adjustment edge for transmit timing Valid in Asynchronous mode using internal clock, Simple LIN mode using internal clock The adjustable edge is set by this bit. This bit enables only when ATEN is 1. For details, see section 26.3.11. The function of adjust transmit timing (Asynchronous Mode) . 0: When CCR1.TINV is 0, adjust the rising edge timing. When CCR1.TINV is 1, adjust the falling edge timing. 1: When CCR1.TINV is 0, adjust the falling edge timing. When CCR1.TINV is 1, adjust the rising edge timing. | R/W |

CMPD[8:0] bit (Compare Match Data)

Set the comparison data for receive data when Address match function is enabled (CCR0.DCME = 1). CCR4.CMPD[8:0] should be written while CCR0.DCME is 0.

For the comparison data, it can select length from 3 types, they are CMPD[6:0] with 7bit length enable, CMPD[7:0] with 8bit, and CMPD[8:0] with 9bit length.

Note: If the description in this document and the timing chart do not specify the ASEN / ATEN setting value, it means that the reception sampling adjustment function / transmission timing adjustment function are OFF (CCR4.ASEN = 0, CCR4.ATEN = 0).

ASEN bit (Adjust receive sampling timing enable)

When this bit is 1, the receive sampling timing adjustment function is enabled. Control is different in Asynchronous mode, Simple LIN mode, Clock-synchronous mode, and Simple SPI mode.

For details of using internal clock in Asynchronous mode, see [section 26.6.7. Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with internal clock used](#). The operation when the Simple LIN mode internal clock is selected is the same as when the Asynchronous mode internal clock is selected.

For details of Clock-synchronous mode operating as master and Simple SPI mode operating as master, see [section 26.6.6. Simultaneous Serial Data Transmission and Reception in Clock Synchronous Mode](#). Only the digital delay of the master mode receive sampling clock (MRCLK) can be controlled by this bit. MRCLK analog delay cannot be controlled.

ATEN bit (Adjust transmit timing enable)

When this bit is 1, the transmission timing adjustment function is enabled. The transmission timing adjustment function can adjust the edge timing of the waveform output from the TXDn pin. For details, see [section 26.3.11. The function of adjust transmit timing \(Asynchronous Mode\)](#).

AST[2:0] bit (Adjustment value for receive Sampling Timing)

When the ASEN bit is 1, the receive sampling timing can be adjusted according to this bit setting value.

In Asynchronous mode and Simple LIN mode using internal clock.

The sampling timing of RXDn pin is adjusted from the middle of bit by the following formula. This setting value is limited by setting the base clock cycles. For details, see [section 26.3.10. The function of adjust receive sampling timing \(Asynchronous Mode\)](#).

Adjustment sampling timing = base clock × the setting value of AST[2:0].

In Clock-synchronous mode and Simple SPI mode using internal clock

The sampling timing of RXDn pin can be adjusted by delaying 1 to 4 TCLK. For details, see [section 26.6.7. Reception Sampling Timing Adjustment Function in Clock Synchronous Mode with internal clock used](#).

000: 1TCLK delay

001: 2TCLK delay

010: 3TCLK delay

011: 4TCLK delay

1xx: Setting prohibited

AJD bit (Adjustment Direction for receive sampling timing)

Set the RXDn pin sampling timing adjustment direction from the bit center to the rear or front. For details, see [section 26.3.10. The function of adjust receive sampling timing \(Asynchronous Mode\)](#).

ATT[2:0] bit (Adjustment value for Transmit timing)

The edge timing of the TXDn pin specified by the AET bit is adjusted by the base clock × ATT[2:0] setting value. The upper limit of the adjustment time that can be set is limited by the number of base clock cycles. For details, see [section 26.3.11. The function of adjust transmit timing \(Asynchronous Mode\)](#).

AET bit (Adjustment edge for transmit timing)

Set the TXDn pin edge for timing adjustment. For details, see [section 26.3.11. The function of adjust transmit timing \(Asynchronous Mode\)](#).

| 21:20 | IICSDAS[1:0] | SDA Output Select 0 0: Serial data output 0 1: Generate a start, restart, or stop condition. 1 0: Output the low level on the SDAn pin. 1 1: Place the SDAn pin in the high-impedance state. | R/W |

| Bit | Symbol | Function | R/W |
|-------|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 23:22 | IICSCLS[1:0] | SCL Output Select 0 0: Serial clock output 0 1: Generate a start, restart, or stop condition. 1 0: Output the low level on the SCLn pin. 1 1: Place the SCLn pin in the high-impedance state. | R/W |
| 31:24 | — | These bits are read as 0. The write value should be 0. | R/W |

Note 1. In the bus free state, perform the start condition generation.

Note 2. In the bus busy state, perform restart or stop condition generation when the SCLn pin after acknowledgment described in [Figure 26.84](#) and [Figure 26.85](#) is low level.

Note 3. Do not set more than one from among the IICSTAREQ, IICRSTAREQ, and IICSTPREQ bits to 1 at a given time.

Note 4. Execute the generation of a condition after the value of the IICSTIF flag is 0.

Note 5. Do not write 0 to this bit while it is 1. Generation of a condition is suspended by writing 0 to this bit while it is 1.

IICDL[4:0] bit (SDA Delay Output Select)

These bits are used to set a delay for output on the SDA_n pin relative to the falling edge of the output on the SCL_n pin. The available delay settings range from no delay to 31 cycles, with the clock signal from the on-chip baud rate generators the base. The signal obtained by frequency-dividing TCLK by the divisor set in CCR2.CKS[1:0] is supplied as the clock signal from the on-chip baud rate generator.

Set these bits to 00000b unless operation is in simple IIC mode. In simple IIC mode, set the bits to a value in the range from 00001b to 11111b.

IICINTM bit (IIC Interrupt Mode Select)

This bit selects the sources of interrupt requests in Simple IIC mode.

IICCSC bit (Clock Synchronization)

Set the IICCSC bit to 1 if the internally generated SCL_n clock signal is to be synchronized when the SCL_n pin has been placed at the low level in the case of a wait inserted by the other device, etc.

The SCL_n clock signal is not synchronized if the IICCSC bit is 0. The SCL_n clock signal is generated in accord with the rate selected in the BRR regardless of the level being input on the SCL_n pin.

Set the IICCSC bit to 1 except during debugging.

IICACKT bit (ACK Transmission Data)

Transmitted data contains ACK bits. Set this bit to 1 when ACK and NACK bits are received.

IICSTAREQ bit (Start Condition Generation)

When a start condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTAREQ bit to 1.

If you want to generate the start condition after generating the stop condition, start the generation of the start condition with a half cycle period of the bit rate from the stop condition generation interrupt (STI) request output.

[Setting condition]

- Writing 1 to the bit

[Clearing condition]

- Completion of generation of the start condition

IICRSTAREQ bit (Restart Condition Generation)

When a restart condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICRSTAREQ bit to 1.

[Setting condition]

- Writing 1 to the bit

[Clearing condition]

- Completion of generation of the restart condition

IICSTPREQ bit (Stop Condition Generation)

When a stop condition is to be generated, set both the IICSDAS[1:0] and IICSCLS[1:0] bits to 01b as well as setting the IICSTPREQ bit to 1.

[Setting condition]

- Writing 1 to the bit

[Clearing condition]

- Completion of generation of the stop condition

IICSDAS[1:0] bit (SDA Output Select)

These bits control output from the SDA_n pin.

IICSCLS[1:0] bit (SCL Output Select)

These bits control output from the SCL_n pin.

26.2.11 FCR : FIFO Control Register

Base address: SCI_Bn = 0x4011_8000 + 0x0100 × n (n = 0 to 4, 9)

Offset address: 0x24

| Bit | Symbol | Function | R/W |
|-------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 0 | DRES | Receive data ready error select bit Valid in Asynchronous mode This bit select the interrupt request for a reception data ready detection. 0: reception data full interrupt (SCIn_RXI) 1: receive error interrupt (SCIn_ERI) | R/W |
| 7:1 | — | These bits are read as 0. The write value should be 0. | R/W |
| 12:8 | TTRG[4:0] | Transmit FIFO data trigger number Valid in Asynchronous mode (including multi processor mode), Clock-synchronous mode, Simple SPI mode Trigger number must be set to 15 or less number. 0x00: Trigger number 0 ⋮ 0x1F: Trigger number 31 | R/W |
| 14:13 | — | These bits are read as 0. The write value should be 0. | R/W |
| 15 | TFRST | Transmit FIFO Data Register Reset This bit enables only when CCR3.FM is 1. The read value is always 0. 0: It is invalid. It does not affect the operation. 1: The number of data stored in Transmit-FIFO (TDR register) are made 0 | W |
| 20:16 | RTRG[4:0] | Receive FIFO data trigger number Valid in Asynchronous mode (including multi processor mode), Clock-synchronous mode, Simple SPI mode Trigger number must be set to 15 or less number. 0x00: Trigger number 0 ⋮ 0x1F: Trigger number 31 | R/W |

| Bit | Symbol | Function | R/W |
|-------|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| 22:21 | — | These bits are read as 0. The write value should be 0. | R/W |
| 23 | RFRST | Receive FIFO Data Register Reset This bit enables only when CCR3.FM is 1. The read value is always 0. 0: It is invalid. It does not affect the operation. 1: The number of data stored in Receive-FIFO(RDR register) are made 0 | W |
| 28:24 | RSTRG[4:0] | RTS Output Active Trigger Number Select Valid in Asynchronous mode (including multi processor mode), Clock-synchronous mode This bit enables only when CCR3.FM = 1 and CCR1.CTSE = 0 and CCR0.SSE = 0. Trigger number must be set to 15 or less number. 0x00: Trigger number 0 ⋮ 0x1F: Trigger number 31 | R/W |
| 31:29 | — | These bits are read as 0. The write value should be 0. | R/W |

DRES bit (Receive data ready error select bit)

Select whether the detection of receive data ready (FRSR.DR flag = 1) is the cause of SCIn_RXI interrupt request or the cause of SCIn_ERI interrupt request.

TTRG[4:0] bits (Transmit FIFO data trigger number)

The TDFE flag is set to 1 when the quantity of transmit data in the transmit-FIFO(TDR register) is equal to or less than the specified transmit triggering number. If SCR.TIE = 1, SCIn_TXI interrupt request is occurred.

Note: Trigger number have to be set 15. In case the trigger number is set 16 or more, unexpected SCIn_TXI interrupt will occur.

TFRST bit (Transmit FIFO Data Register Reset)

When the TFRST bit is set to 1, the number of the transmission data stored in Transmit-FIFO(TDR register) is made 0.

RTRG[4:0] bits (Receive FIFO data trigger number)

The CSR.RDRF flag is set to 1 when the quantity of receive data in the receive-FIFO(RDR register) is equal to or greater than the specified receive triggering number. If CCR0.RIE = 1, SCIn_RXI interrupt request is occurred. When FCR.RTRG is set to 0, RDRF bit is set if the quantity of data in receive-FIFO is greater than or equal to 1.

Note: Trigger number have to be set to 15. In case the trigger number is set to 16 or more, unexpected SCIn_RXI interrupt will occur.

RFRST bit (Receive FIFO Data Register Reset)

When the RFRST bit is set to 1, the number of the reception data stored in Receive-FIFO(RDR register) is made 0.

RSTRG[4:0] bits (RTS Output Active Trigger Number Select)

When the quantity of receive data stored in the receive-FIFO (RDR register) is equal to or greater than this number, the RTSn signal is in the High state. When FCR.RSTRG is set to 0, RTSn is in the high state if the quantity of data in receive FIFO is greater than or equal to 1.

Note: Trigger number have to be set 15. In case the trigger number is set 16 or more, RTSn will go to High state at unexpected timing.
