Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: “Standard” and “High Quality”. The intended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user’s manual or other Renesas Electronics document.
7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION (“Vulnerability Issues”). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user’s manuals, application notes, “General Notes for Handling and Using Semiconductor Devices” in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
(Note2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)
   A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.
2. Processing at power-on
   The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.
3. Input of signal during power-off state
   Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.
4. Handling of unused pins
   Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.
5. Clock signals
   After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.
6. Voltage application waveform at input pin
   Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).
7. Prohibition of access to reserved addresses
   Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.
8. Differences between products
   Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems. The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

Preface

1. About this document

This manual is generally organized into an overview of the product, descriptions of the CPU, system control functions, peripheral functions, electrical characteristics, and usage notes. This manual describes the product specification of the microcontroller (MCU) superset. Depending on your product, some pins, registers, or functions might not exist. Address space that store unavailable registers are reserved.

2. Audience

This manual is written for system designers who are designing and programming applications using the Renesas Microcontroller. The user is expected to have basic knowledge of electrical circuits, logic circuits, and the MCU.

3. Renesas Publications

Renesas provides the following documents. Before using any of these documents, visit www.renesas.com for the most up-to-date version of the document.

Component	Document Type	Description
Microcontrollers	Data sheet	Features, overview, and electrical characteristics of the MCU
	User's Manual: Hardware	MCU specifications such as pin assignments, memory maps, peripheral functions, electrical characteristics, timing diagrams, and operation descriptions
	Application Notes	Technical notes, board design guidelines, and software migration information
	Technical Update (TU)	Preliminary reports on product specifications such as restriction and errata
Software	User's Manual: Software	API reference and programming information
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications
Tools & Kits, Solutions	User's Manual: Development Tools	User's manual and quick start guide for developing embedded software applications with Development Kits (DK), Starter Kits (SK), Promotion Kits (PK), Product Examples (PE), and Application Examples (AE)
	User's Manual: Software	
	Quick Start Guide	
	Application Notes	Project files, guidelines for software programming, and application examples to develop embedded software applications

4. Numbering Notation

The following numbering notation is used throughout this manual:

Example	Description
011b	Binary number. For example, the binary equivalent of the number 3 is 011b.
0x1F	Hexadecimal number. For example, the hexadecimal equivalent of the number 31 is described 0x1F. In some cases, a hexadecimal number is shown with the suffix "h".
1234	Decimal number. A decimal number is followed by this symbol only when the possibility of confusion exists. Decimal numbers are generally shown without a suffix.

5. Typographic Notation

The following typographic notation is used throughout this manual:

Example	Description
WDT.WDTRCR.RSTIRQS	Periods separated a function module symbol (WDT), register symbol (WDTRCR), and bit field symbol (RSTIRQS).
WDT.WDTRCR	A period separated a function module symbol (WDT) and register symbol (WDTRCR).
WDTRCR.RSTIRQS	A period separated a register symbol (WDTRCR) and bit field symbol (RSTIRQS).
CKS[3:0]	Numbers in brackets expresses a bit number. For example, CKS[3:0] occupies bits 3 to 0 of the WDT Control Register (WDTCR) register.

6. Unit and Unit Prefix

The following units and unit prefixes are sometimes misleading. Those unit prefixes are described throughout this manual with the following meaning:

Symbol	Name	Description
b	Binary Digit	Single 0 or 1
B	Byte	This unit is generally used for memory specification of the MCU and address space.
k	kilo-	$1000 = 10^3$. k is also used to denote 1024 (2^{10}) but this unit prefix is used to denote 1000 (10^3) throughout this manual.
K	Kilo-	$1024 = 2^{10}$. This unit prefix is used to denote 1024 (2^{10}) not 1000 (10^3) throughout this manual.

7. Special Terms

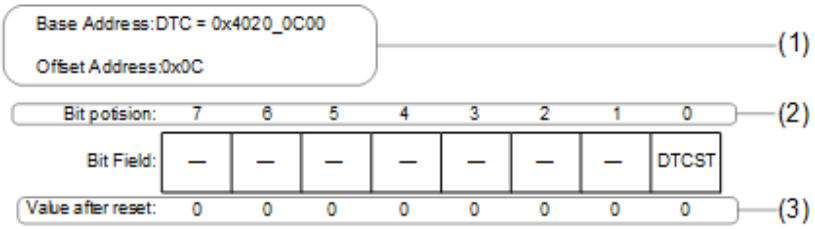
The following terms have special meanings.

Term	Description
NC	Not connected pin. NC means that pin is not connected to the MCU.
Hi-Z	High impedance.

8. Register Description

Each register description includes both a register diagram that shows the bit assignments and a register bit table that describes the content of each bit. The example of symbols used in these tables are described in the sections that follow. The following is an example of a register description and associated bit field definition.

XXXX DTCST : DTC Module Start Register



(4) (5) (6)

Bit	Symbol	Function	R/W
0	DTCST	DTC Module Start 0:DTC module stop 1:DTC module start	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

(1) Function module symbol, register symbol, and address assignment

Function module symbol, register symbol, and address assignment of this register are generally expressed. Base Address and Offset Address mean DTC Module Start Register (DTCST) of Data Transfer Controller (DTC) is assigned to address 0x4020_0C00.

(2) Bit number

This number indicates the bit number. This bits are shown in order from bits 31 to 0 for 32-bit register, from bits 15 to 0 for 16-bit register, and from bits 7 to 0 for 8-bit register.

(3) Value after reset

This symbol or number indicate the value of each bit after a hard reset. The value is shown in binary unless specified otherwise.

- 0: Indicates that the value is 0 after a reset.
- 1: Indicates that the value is 1 after a reset.
- x: Indicates that the value is undefined after a reset.

(4) Symbol

Symbol indicates the short name of bit field. Reserved bit is expressed with a —.

(5) Function

Function indicates the full name of the bit field and enumerated values.

(6) R/W

The R/W column indicates access type whether the bit field is readable or writable.

- R/W: The bit field is readable and writable.
- R: The bit field is readable only. Writing to this bit field has no effect.
- W: The bit field is writable only. The read value is the same as after a reset unless specified otherwise.

9. Abbreviations

Abbreviations used in this document are shown in the following table.

Abbreviation	Description
AES	Advanced Encryption Standard
AHB	Advanced High-performance Bus
AHB-AP	AHB Access Port
APB	Advanced Peripheral Bus
ARC	Alleged RC
ATB	Advanced Trace Bus
BCD	Binary Coded Decimal
BSDL	Boundary Scan Description Language
DES	Data Encryption Standard
DSA	Digital Signature Algorithm
ETB	Embedded Trace Buffer
ETM	Embedded Trace Macrocell
FLL	Frequency Locked Loop
FPU	Floating Point Unit
HMI	Human Machine Interface
IrDA	Infrared Data Association
LSB	Least Significant Bit
MSB	Most Significant Bit
NVIC	Nested Vector Interrupt Controller
PC	Program Counter
PFS	Port Function Select
PLL	Phase Locked Loop
POR	Power-on reset
PWM	Pulse Width Modulation
RSA	Rivest Shamir Adleman
SHA	Secure Hash Algorithm
S/H	Sample and Hold
SP	Stack Pointer
SWD	Serial Wire Debug
SW-DP	Serial Wire-Debug Port
TRNG	True Random Number Generator
UART	Universal Asynchronous Receiver/Transmitter
VCO	Voltage Controlled Oscillator

Renesas RA8D1 Group
User's Manual

High-performance 480 MHz Arm® Cortex®-M85 core with Helium™, up to 2 MB code flash memory with Dual-bank, background and SWAP operation, 12 KB Data flash memory, and 1 MB SRAM with Parity/ECC. High-integration with Ethernet MAC controller, USB 2.0 High-Speed, CANFD, SDHI, I3C, Octal SPI, Decryption on-the-fly, Graphics LCD Controller, 2D Drawing Engine, MIPI DSI and advanced analog. Integrated Renesas Secure IP with cryptography accelerators, key management support, tamper detection and power analysis resistance in concert with Arm® TrustZone for integrated secure element functionality.

Features

Arm® Cortex®-M85 core with Helium™

- Armv8.1-M architecture profile
- Armv8-M Security Extension
- Maximum operating frequency: 480 MHz
- Memory Protection Unit (Arm MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- SysTick timer
  - Embeds two Systick timers: Secure and Non-secure instance
  - Driven by CPUCLK or MOCO divided by 8
- CoreSight™ ETM-M85

Memory

- Up to 2 MB code flash memory
- 12 KB data flash memory (100,000 program/erase (P/E) cycles)
- 1 MB SRAM including 128 KB of TCM

Connectivity

- Serial Communications Interface (SCI) × 6 , up to 60 Mbps
  - Asynchronous interfaces
  - 8 bit clock synchronous interface
  - Smart card interface
  - Simple IIC
  - Simple SPI
  - Manchester coding (SCI0)
  - Simple LIN (SCI0, SCI1)
- I^2C bus interface (IIC) × 2
- I^3C bus interface (I3C)
- Serial Peripheral Interface (SPI) × 2, up to 60 Mbps
- Octal Serial Peripheral Interface (OSPI)
- USB 2.0 Full-Speed Module (USBFS)
- USB 2.0 High-Speed Module (USBHS)
- CAN with Flexible Data-rate (CANFD) × 2
- Ethernet MAC/DMA Controller (ETHERC/EDMAC)
- SD/MMC Host Interface (SDHI) × 2
- Serial Sound Interface Enhanced (SSIE) × 2

Analog

- 12-bit A/D Converter (ADC12) × 2
- 12-bit D/A Converter (DAC12) × 2
- High-Speed Analog Comparator (ACMPHS) × 2
- Temperature Sensor (TSN)

Timers

- General PWM Timer 32-bit (GPT32) × 8
- General PWM Timer 16-bit (GPT16) × 6
- Low Power Asynchronous General Purpose Timer (AGT) × 2
- Ultra-Low-Power Timer (ULPT) × 2

Security and Encryption

- Renesas Secure IP (RSIP-E51A)
  - Symmetric cryptography: AES
  - Asymmetric cryptography: RSA, ECC
  - Message digest computation: HASH
  - 128 bit unique ID
- Arm® TrustZone®
  - Up to two or four regions for the code flash, depending on the bank mode
  - Up to two regions for the data flash
  - Up to two regions for the SRAM
  - Individual Secure or Non-secure security attribution for each peripheral
- Privileged control
- Device lifecyle management
- Secure boot
- Decryption on-the-fly (DOTF)
- Pin function
  - Up to three tamper-resistant pins
  - Secure pin multiplexing

System and Power Management

- Low power modes
- Battery backup function (VBATT)
- Realtime Clock (RTC) with calendar and VBATT support
- Event Link Controller (ELC)
- Data Transfer Controller (DTC)
- DMA Controller (DMAC) × 8
- Power-on reset
- Programable Voltage Detection (PVD) with voltage settings
- Watchdog Timer (WDT)
- Independent Watchdog Timer (IWDT)

Human Machine Interface (HMI)

- Graphics LCD Controller (GLCDC)
- 2D Drawing Engine (DRW)
- Capture Engine Unit (CEU)
- MIPI DSI

Multiple Clock Sources

- Main clock oscillator (MOSC) (8 to 48 MHz)
- Sub-clock oscillator (SOSC) (32.768 kHz)
- High-speed on-chip oscillator (HOCO) (16/18/20/32/48 MHz)
- Middle-speed on-chip oscillator (MOCO) (8 MHz)
- Low-speed on-chip oscillator (LOCO) (32.768 kHz)
- Clock trim function for HOCO/MOCO/LOCO
- PLL1/PLL2
- Clock out support

General-Purpose I/O Ports

- 5-V tolerance, open drain, input pull-up, switchable driving ability

Operating Voltage

- VCC: 1.68 to 3.6 V
- VCC2: 1.65 to 3.6 V

Operating Junction Temperature and Packages

- Tj = -40°C to +125°C
  - 176-pin LQFP (24 mm × 24 mm, 0.5 mm pitch)
  - 224-pin BGA (13 mm × 13 mm, 0.8 mm pitch)

1. Overview

The MCU integrates multiple series of software-compatible Arm®-based 32-bit cores that share a common set of Renesas peripherals to facilitate design scalability and efficient platform-based product development.

The MCU in this series incorporates a high-performance Arm® Cortex®-M85 core with Helium™running up to 480 MHz with the following features:

- Up to 2 MB code flash memory
- 1 MB SRAM (128 KB of TCM RAM, 896 KB of user SRAM)
- Octal Serial Peripheral Interface (OSPI)
- Ethernet MAC Controller (ETHERC), USBFS, USBHS, SD/MMC Host Interface
- Graphics LCD Controller (GLCDC)
- 2D Drawing Engine (DRW)
- MIPI DSI interface
- Analog peripherals
- Security and safety features

1.1 Function Outline

Table 1.1 Arm core

Feature	Functional description
Arm® Cortex®-M85 core	• Maximum operating frequency: up to 480 MHz • Arm® Cortex®-M85 core – Revision: (r0p2-00rel0) – ARMv8.1-M architecture profile – Armv8-M Security Extension – Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008 Scalar half, single, and double-precision floating-point operation – M-profile Vector Extension (MVE) Integer, half-precision, and single-precision floating-point MVE (MVE-F) – Helium™ technology is M-profile Vector Extension (MVE) • Arm® Memory Protection Unit (Arm MPU) – Protected Memory System Architecture (PMSAv8) – Secure MPU (MPU_S): 8 regions – Non-secure MPU (MPU_NS): 8 regions • SysTick timer – Embeds two Systick timers: Secure instance (SysTick_S) and Non-secure instance (SysTick_NS) – Driven by CPUCLK or MOCO divided by 8 • CoreSight™ ETM-M85

Table 1.2 Memory

Feature	Functional description
Code flash memory	Maximum 2 MB of code flash memory. See section 52, Flash Memory.
Data flash memory	12 KB of data flash memory. See section 52, Flash Memory.
Option-setting memory	The option-setting memory determines the state of the MCU after a reset. See section 6, Option-Setting Memory.
SRAM	On-chip high-speed SRAM with either parity bit or Error Correction Code (ECC). SRAM0 is ECC. SRAM1 is Parity check. See section 50, SRAM.
Standby SRAM	On-chip SRAM that can retain data in Deep Software Standby mode 1. See section 51, Standby SRAM.
ROM	On-chip immutable ROM contains First Stage Bootloader (FSBL)

Table 1.3 System

Feature	Functional description
Operating modes	Three operating modes: ● Single-chip mode ● JTAG boot mode ● SCI/USB boot mode See section 3, Operating Modes.
Resets	This MCU provides the following 13 types of reset. See section 5, Resets.
Programable Voltage Detection (PVD)	The Programable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin. The detection level can be selected by register settings. The PVD module consists of three separate voltage level detectors (PVD0, PVD1, PVD2). PVD0, PVD1, and PVD2 measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC changes at various voltage thresholds. See section 7, Programmable Voltage Detection (PVD).
Clocks	● Main clock oscillator (MOSC) ● Sub-clock oscillator (SOSC) ● High-speed on-chip oscillator (HOCO) ● Middle-speed on-chip oscillator (MOCO) ● Low-speed on-chip oscillator (LOCO) ● PLL1/PLL2 ● Clock out support See section 8, Clock Generation Circuit.
Clock Frequency Accuracy Measurement Circuit (CAC)	The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated. See section 9, Clock Frequency Accuracy Measurement Circuit (CAC).
Interrupt Controller Unit (ICU)	The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts. See section 13, Interrupt Controller Unit (ICU).
Low power modes	Power consumption can be reduced in multiple ways, including setting clock dividers, controlling EBCLK output, controlling SDCLK output, stopping modules, power gating control, selecting operating power control modes in normal operation, and transitioning to low power modes and processor low power modes. See section 10, Low Power Modes.
Battery backup function	A battery backup function is provided for partial powering by a battery. The battery-powered area includes the RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection and switch between VCC and VBATT. See section 11, Battery Backup Function.
Register write protection	The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS). See section 12, Register Write Protection.
Memory Protection Unit (MPU)	All bus masters have Memory Protection Units (MPUs). See section 15, Memory Protection Unit (MPU).

Table 1.4 Event link

Feature	Functional description
Event Link Controller (ELC)	The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention. See section 18, Event Link Controller (ELC).

Table 1.5 Direct memory access

Feature	Functional description
Data Transfer Controller (DTC)	A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request. See section 17, Data Transfer Controller (DTC).
DMA Controller (DMAC)	The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address. See section 16, DMA Controller (DMAC).

Table 1.6 External bus interface

Feature	Functional description
External buses	• CS area (ECBI): Connected to the external devices (external memory interface) • SDRAM area (ECBI): Connected to the SDRAM (external memory interface) • OSPI area (EOBI): Connected to the OSPI (external device interface)

Table 1.7 Timers

Feature	Functional description
General PWM Timer (GPT)	The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 8 channels and a 16-bit timer with GPT16 × 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter. In addition, PWM waveforms can be generated for controlling brushless DC motors. The GPT can also be used as a general-purpose timer. See section 21, General PWM Timer (GPT).
Port Output Enable for GPT (POEG)	The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state See section 20, Port Output Enable for GPT (POEG).
Low Power Asynchronous General Purpose Timer (AGT)	The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register. See section 22, Low Power Asynchronous General Purpose Timer (AGT).
Ultra-Low-Power Timer (ULPT)	The Ultra-Low-Power Timer (ULPT) is a 32-bit timer which can be used for outputting pulses or counting external events. This 32-bit timer consists of reload registers and a down-counter. The reload registers and the down-counter are allocated to the same address and can be accessed through the ULPTCNT register. See section 23, Ultra-Low-Power Timer (ULPT)
Realtime Clock (RTC)	The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar. See section 24, Realtime Clock (RTC).
Watchdog Timer (WDT)	The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt. See section 25, Watchdog Timer (WDT).
Independent Watchdog Timer (IWDT)	The Independent Watchdog Timer (IWDT) has a 14-bit down-counter, which resets the MCU by a reset output when the down-counter underflows. Alternatively, generation of an interrupt request when the counter underflows can be selected. This enables detection of a program runaway taking the refresh interval into account. The IWDT has two start modes: auto start mode, in which counting automatically starts after release from the reset state, and register start mode, in which counting is started by refreshing (writing to a specific register). See section 26, Independent Watchdog Timer (IWDT).

Table 1.8 Communication interfaces (1 of 2)

Feature	Functional description
Serial Communications Interface (SCI)	The Serial Communications Interface (SCI) × 6 channels have asynchronous and synchronous serial interfaces: ● Asynchronous interfaces (UART and Asynchronous Communications Interface Adapter (ACIA)) ● 8-bit clock synchronous interface ● Simple IIC (master-only) ● Simple SPI ● Smart card interface ● Manchester interface ● Simple LIN interface The smart card interface complies with the ISO/IEC 7816-3 standard for electronic signals and transmission protocol. All channels have FIFO buffers to enable continuous and full-duplex communication, and the data transfer speed can be configured independently using an on-chip baud rate generator. The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate. See section 31, Serial Communications Interface (SCI).
I^2C Bus interface (IIC)	The I^2C Bus interface (IIC) has 2 channels. The IIC module conforms with and provides a subset of the NXP I^2C (Inter-Integrated Circuit) bus interface functions. See section 32, I2C Bus Interface (IIC).
I3C Bus Interface (I3C)	The I3C Bus Interface (I3C) has 1 channel. The I3C module conform with and provide a subset of the NXP I^2C (Inter-Integrated Circuit) bus interface functions and a subset of the MIPI I3C. See section 33, I3C Bus Interface (I3C).
Serial Peripheral Interface (SPI)	The Serial Peripheral Interface (SPI) provides high-speed full-duplex synchronous serial communications with multiple processors and peripheral devices. The maximum rate supported on this MCU. Refer to the electrical characteristics for the actual rate. See section 36, Serial Peripheral Interface (SPI).
Control Area Network with Flexible Data-Rate Module (CANFD)	The CAN with Flexible Data-Rate (CANFD) module can handle classical CAN frames and CANFD frames complied with ISO 11898-1 standard. The module supports 4 transmit buffers per channel and 16 receive buffers per channel. See section 34, CAN with Flexible Data-rate (CANFD).
USB 2.0 Full-Speed module (USBFS)	The USB 2.0 Full-Speed module (USBFS) can operate as a host controller or device controller. The module supports full-speed and low-speed (host controller only) transfer as defined in Universal Serial Bus Specification 2.0. The module has an internal USB transceiver and supports all of the transfer types defined in Universal Serial Bus Specification 2.0. The USB has buffer memory for data transfer, providing a maximum of 10 pipes. Pipes 1 to 9 can be assigned any endpoint number based on the peripheral devices used for communication or based on your system. See section 29, USB 2.0 Full-Speed Module (USBFS).
USB 2.0 High-speed Module (USBHS)	The USB 2.0 High-Speed Module (USBHS) that operates as a host or a device controller compliant with the Universal Serial Bus (USB) Specification revision 2.0. The host controller supports USB 2.0 high-speed, full speed, and low-speed transfers, and the device controller supports USB 2.0 high-speed and full-speed transfers. The USBHS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification. The USBHS has FIFO buffer for data transfers, providing a maximum of 10 pipes. See section 30, USB 2.0 High-Speed Module (USBHS).
Octal Serial Peripheral Interface (OSPI)	The Octal Serial Peripheral Interface (OSPI) is a memory controller that supports EXpanded Serial Peripheral Interface (xSPI) (JEDEC Standard JESD251, JESD251-1 and JESD252) . The OSPI supports 1-bit, 2-bit, 4-bit and 8-bit protocols. JESD251 specifies two interface profiles where profile 1.0 is Octal SPI and profile 2.0 is HyperBus™. See section 37, Octal Serial Peripheral Interface (OSPI).
Serial Sound Interface Enhanced (SSIE)	The Serial Sound Interface Enhanced (SSIE) peripheral provides functionality to interface with digital audio devices for transmitting I^2S/Monaural/TDM audio data over a serial bus. The SSIE supports an audio clock frequency of up to 50 MHz, and can be operated as a slave or master receiver, transmitter, or transceiver to suit various applications. The SSIE includes 32-stage FIFO buffers in the receiver and transmitter, and supports interrupts and DMA-driven data reception and transmission. See section 39, Serial Sound Interface Enhanced (SSIE).

Table 1.8 Communication interfaces (2 of 2)

Feature	Functional description
SD/MMC Host Interface (SDHI)	The Secure Digital (SD) Card and Multi Media Card (MMC) Host Interface provides the functionality required to connect a variety of external memory cards to the MCU. The SDHI supports both 1- and 4-bit buses for connecting memory cards that support SD, SDHC, and SDXC formats. When developing host devices that are compliant with the SD Specifications, you must comply with the SD Host/Ancillary Product License Agreement (SD HALA). The MMC interface supports 1-bit, 4-bit, and 8-bit MMC buses that provide eMMC 4.51 (JEDEC Standard JESD 84-B451) device access. This interface also provides backward compatibility and supports high-speed SDR transfer modes. See section 40, SD/MMC Host Interface (SDHI).
Ethernet Controller (ETHERC)	One-channel Ethernet Controller (ETHERC) compliant with the Ethernet/IEEE802.3 Media Access Control (MAC) layer protocol. An ETHERC channel provides one channel of the MAC layer interface, connecting the MCU to the physical layer LSI (PHY-LSI) that allows transmission and reception of frames compliant with the Ethernet and IEEE802.3 standards. The ETHERC is connected to the Ethernet DMA Controller (EDMAC) so data can be transferred without using the CPU. See section 27, Ethernet MAC Controller (ETHERC).

Table 1.9 Analog

Feature	Functional description
12-bit A/D Converter (ADC12)	A 12-bit successive approximation A/D Converter is provided. Up to 25 analog input channels are selectable. Temperature sensor output, and internal reference voltage and VBATT 1/3 voltage monitor are selectable for conversion. See section 45, 12-Bit A/D Converter (ADC12).
12-bit D/A Converter (DAC12)	A 12-bit D/A Converter (DAC12) is provided. See section 46, 12-Bit D/A Converter (DAC12).
Temperature Sensor (TSN)	The on-chip Temperature Sensor (TSN) determines and monitors the die temperature for reliable operation of the device. The sensor outputs a voltage directly proportional to the die temperature, and the relationship between the die temperature and the output voltage is fairly linear. The output voltage is provided to the ADC12 for conversion and can be further used by the end application. See section 47, Temperature Sensor (TSN).
High-Speed Analog Comparator (ACMPHS)	The High-Speed Analog Comparator (ACMPHS) can be used to compare an analog input voltage with a reference voltage and to provide a digital output based on the result of conversion. Both the analog input voltage and the reference voltage can be provided to the ACMPHS from internal sources (D/A converter output or internal reference voltage) and an external source. Such flexibility is useful in applications that require go/no-go comparisons to be performed between analog signals without necessarily requiring A/D conversion. See section 48, High-Speed Analog Comparator (ACMPHS).

Table 1.10 Human machine interfaces (1 of 2)

Feature	Functional description
Graphics LCD Controller (GLCDC)	The Graphics LCD Controller (GLCDC) provides multiple functions and supports various data formats and panels. Key GLCDC features include: ● GLCDC0BI/GLCDC1BI master function for accessing graphics data ● Superimposition of three planes (single-color background plane, graphic 1-plane, and graphic 2-plane) ● Support for many types of 32-bit or 16-bit per pixel graphics data and 8-bit, 4-bit, or 1-bit LUT data format ● Digital interface signal output supporting a video image size of WXGA. See section 56, Graphics LCD Controller (GLCDC).

Table 1.10 Human machine interfaces (2 of 2)

Feature	Functional description
2D Drawing Engine (DRW)	The 2D Drawing Engine (DRW) provides flexible functions that can support almost any object geometry rather than being bound to only a few specific geometries such as lines, triangles, or circles. The edges of every object can be independently blurred or antialiased. Rasterization is executed at one pixel per clock on the bounding box of the object from left to right and top to bottom. The DRW can also raster from bottom to top to optimize the performance in certain cases. In addition, optimization methods are available to avoid rasterization of many empty pixels of the bounding box. The distances to the edges of the object are calculated by a set of edge equations for every pixel of the bounding box. These edge equations can be combined to describe the entire object. If a pixel is inside the object, it is selected for rendering. If it is outside, it is discarded. If it is on the edge, an alpha value can be chosen proportional to the distance of the pixel to the nearest edge for antialiasing. Every pixel that is selected for rendering can be textured. The resulting ARGB quadruple can be modified by a general raster operation approach independently for each of the four channels. The ARGB quadruples can then be blended with one of the multiple blend modes of the DRW. The DRW provides two inputs (texture read and framebuffer read), and one output (framebuffer write). The internal color format is always ARGB (8888). The color formats from the inputs are converted to the internal format on read and a conversion back is made on write. See section 55, 2D Drawing Engine (DRW).
Capture Engine Unit (CEU)	The Capture Engine Unit (CEU) is a capture module that fetches image data externally input and transfers it to the memory. See section 53, Capture Engine Unit (CEU).
MIPI DSI interface	The MIPI DSI interface module has a Transmitter function for MIPI Alliance Specification for Display Serial Interface 2 (DSI-2). This module supports MIPI Alliance Specification for Display Serial Interface 2 (DSI-2) Specification. And it works with MIPI Alliance Specification for D-PHY Specification. This module provides a solution for transmitting MIPI DSI-2 compliant digital video and packets. See section 57, MIPI PHY.

Table 1.11 Data processing

Feature	Functional description
Cyclic Redundancy Check (CRC) calculator	The Cyclic Redundancy Check (CRC) calculator generates CRC codes to detect errors in the data. The bit order of CRC calculation results can be switched for LSB-first or MSB-first communication. Additionally, various CRC-generation polynomials are available. The snoop function allows monitoring reads from and writes to specific addresses. This function is useful in applications that require CRC code to be generated automatically in certain events, such as monitoring writes to the serial transmit buffer and reads from the serial receive buffer. See section 41, Cyclic Redundancy Check (CRC).
Data Operation Circuit (DOC)	The Data Operation Circuit (DOC) compares, adds, and subtracts 32-bits data. When a selected condition applies, 32-bit data is compared and an interrupt can be generated. See section 49, Data Operation Circuit (DOC).

Table 1.12 Security (1 of 2)

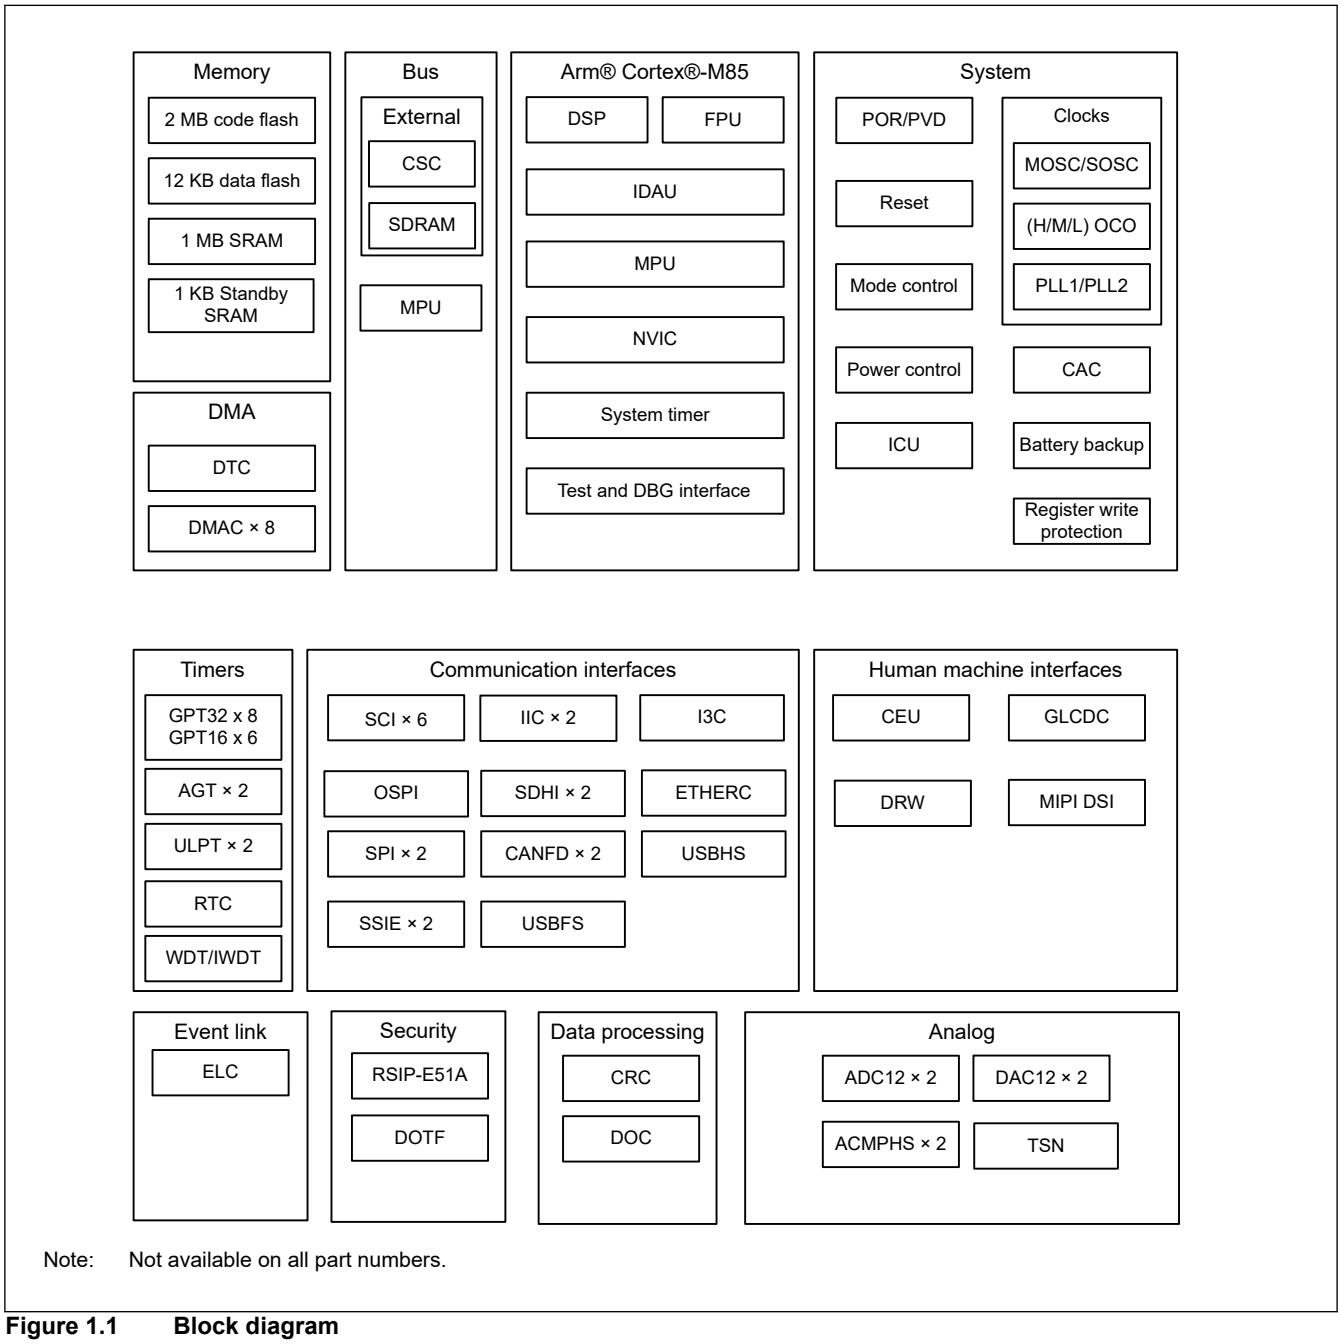
Feature	Functional description
Security function	• ARMv8-M TrustZone security • Privileged control • Device lifecycle management • Authentication Level (AL) • Key injection • Secure pin multiplexing • VBATT backup registers zeroization • Secure boot • Secure factory programming See section 43, Security Features .

Table 1.12 Security (2 of 2)

Feature	Functional description
Renesas Secure IP (RSIP-E51A)	• Symmetric cryptography: AES • Asymmetric cryptography: RSA, ECC • Message digest computation: HASH • 128-bit true random number generation circuit • 256-bit Hardware Unique Key (HUK) • 128-bit unique ID • OEM boot loader version • Key data for the decryption on-the-fly (DOTF) • SPA/DPA Protections See section 44, Renesas Secure IP (RSIP-E51A).
Decryption on-the-fly (DOTF)	Decryption on-the-fly (DOTF) decrypts the encrypted content stored in the external memory in real-time. See section 38, Decryption On The Fly (DOTF).

1.2 Block Diagram

Figure 1.1 shows a block diagram of the MCU superset. Some individual devices within the group have a subset of the features.



Note: Not available on all part numbers.

Figure 1.1 Block diagram

1.3 Part Numbering

Figure 1.2 shows the product part number information, including memory capacity and package type. Table 1.13 shows a list of products.

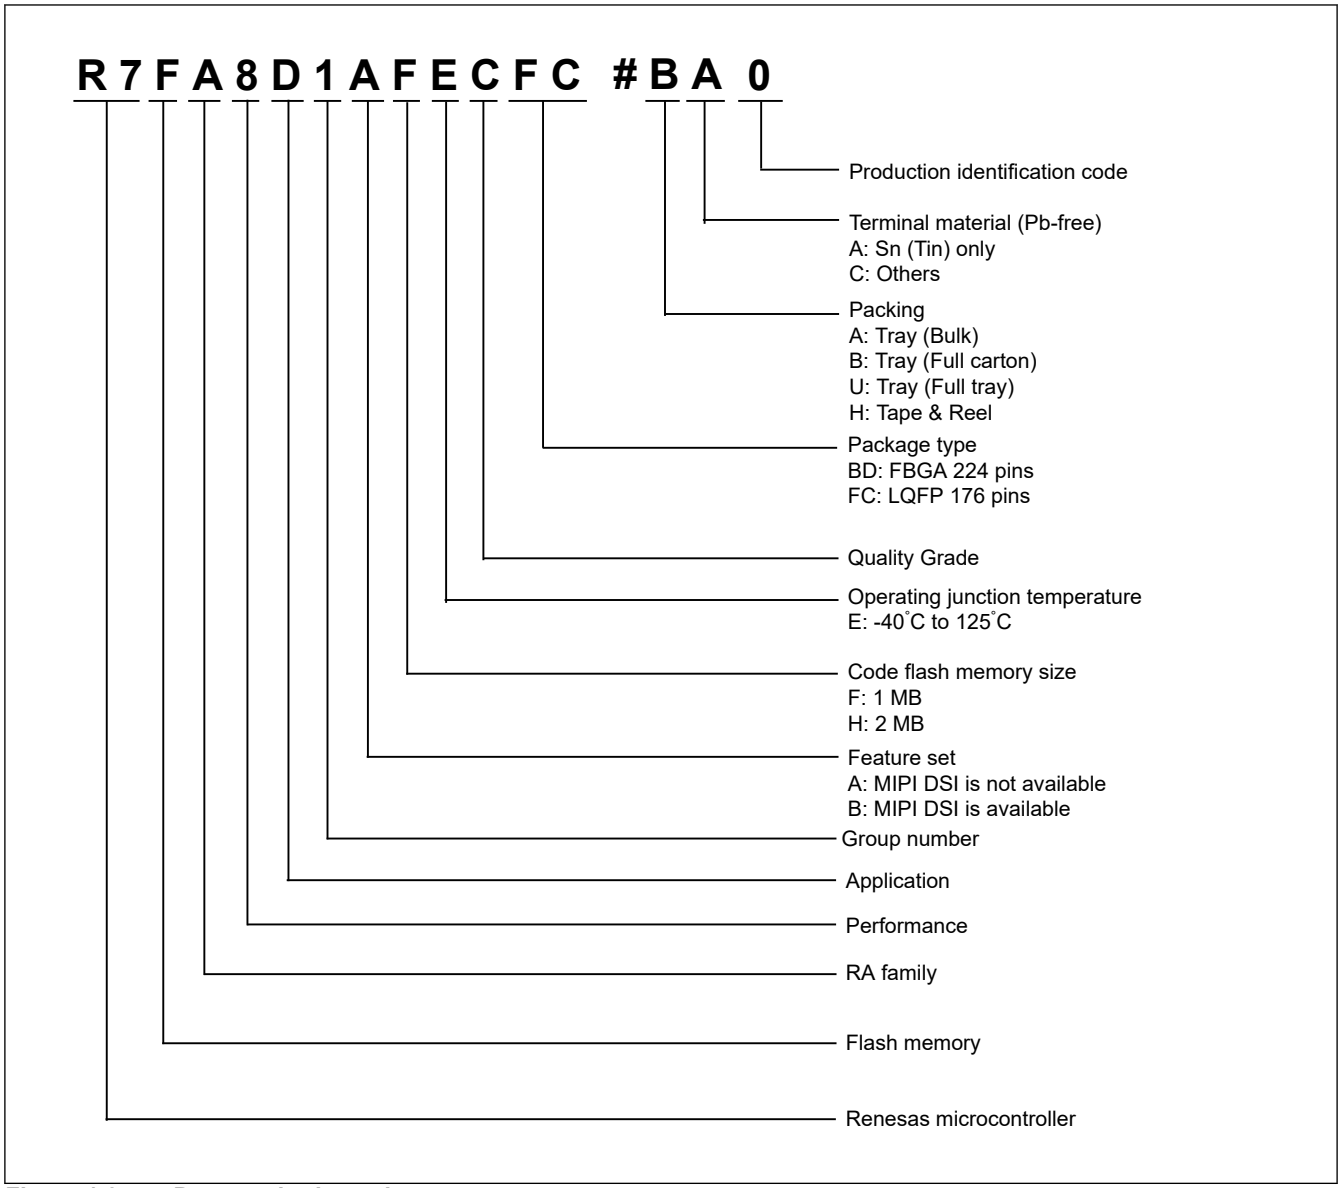


Figure 1.2 Part numbering scheme

Table 1.13 Product list

Product part number	MIPI	Package code	Code flash	Data flash	SRAM	Operating junction temperature
R7FA8D1AHECBD	—	PLBG0224GD-A	2 MB	12 KB	1 MB	−40 to +125°C
R7FA8D1BHECBD	✓

	CEU	Yes			
Data processing	CRC	Yes			
	DOC	Yes			
Event control	ELC	Yes			
Security		RSIP-E51A, Secure Debug, Immutable Storage, TrustZone, and Lifecycle management			

Note: The product name differs depend on the memory size and MIPI DSI is supported. see section 1.3. Part Numbering.
Note 1. Available pins depend on the Pin count, about details see section 1.7. Pin Lists.

1.5 Pin Functions

Table 1.15 Pin functions (1 of 7)

Function	Signal	I/O	Description
Power supply	VCC, VCC2	Input	Power supply pin. Connect it to the system power supply. Connect this pin to VSS by a 0.1-μF capacitor. The capacitor should be placed close to the pin.
	VCC_DCDC	Input	Switching regulator power supply pin.
	VLO	I/O	Switching regulator pin.
	VCL	Input	Connect this pin to the VSS pin by the smoothing capacitor used to stabilize the internal power supply. Place the capacitor close to the pin.
	VBATT	Input	Battery Backup power pin
	VSS, VSS_DCDC	Input	Ground pin. Connect it to the system power supply (0 V).
Clock	XTAL	Output	Pins for a crystal resonator. An external clock signal can be input through the EXTAL pin.
	EXTAL	Input	
	XCIN	Input	Input/output pins for the sub-clock oscillator. Connect a crystal resonator between XCOUT and XCIN.
	XCOUT	Output	
	EXCIN	Input	External sub-clock input
	CLKOUT	Output	Clock output pin
Operating mode control	MD	Input	Pin for setting the operating mode. The signal level on this pin must not be changed during operation mode transition on release from the reset state.
System control	RES	Input	Reset signal input pin. The MCU enters the reset state when this signal goes low.
CAC	CACREF	Input	Measurement reference clock input pin
On-chip emulator	TMS	Input	On-chip emulator or boundary scan pins
	TDI	Input	
	TCK	Input	
	TDO	Output	
	TCLK	Output	Output clock for synchronization with the trace data
	TDATA0 to TDATA3	Output	Trace data output
	SWO	Output	Serial wire trace output pin
	SWDIO	I/O	Serial wire debug data input/output pin
	SWCLK	Input	Serial wire clock pin
Interrupt	NMI	Input	Non-maskable interrupt request pin
	IRQn	Input	Maskable interrupt request pins
	IRQn-DS	Input	Maskable interrupt request pins that can also be used in Deep Software Standby mode

Table 1.15 Pin functions (2 of 7)

Function	Signal	I/O	Description
External bus interface	EBCLK	Output	Outputs the external bus clock for external devices
	RD	Output	Strobe signal indicating that reading from the external bus interface space is in progress, active-low.
	WR	Output	Strobe signal indicating that writing to the external bus interface space is in progress, in 1-write strobe mode, active-low.
	WRn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08, D23 to D16 or D31 to D24) is valid in writing to the external bus interface space, in byte strobe mode, active-low.
	BCn	Output	Strobe signals indicating that either group of data bus pins (D07 to D00, D15 to D08, D23 to D16 or D31 to D24) is valid in access to the external bus interface space, in 1-write strobe mode, active-low.
	ALE	Output	Address latch signal when address/data multiplexed bus is selected.
	WAIT	Input	Input pin for wait request signals in access to the external space, active-low.
	CSn	Output	Select signals for CS areas, active-low
	A00 to A23	Output	Address bus
	D00 to D31	I/O	Data bus
	A00/D00 to A15/D15	I/O	Address/data multiplexed bus
SDRAM interface	SDCLK	Output	Outputs the SDRAM-dedicated clock
	CKE	Output	SDRAM clock enable signal
	SDCS	Output	SDRAM chip select signal, active low
	RAS	Output	SDRAM low address strobe signal, active low
	CAS	Output	SDRAM column address strobe signal, active low
	WE	Output	SDRAM write enable signal, active low
	DQMn	Output	SDRAM I/O data mask enable signal for DQ07 to DQ00, DQ15 to DQ08, DQ23 to DQ16 or DQ31 to DQ24.
	A00 to A16	Output	Address bus
	DQ00 to DQ31	I/O	Data bus
GPT	GTETRGA, GTETRGB, GTETRGC, GTETRGD	Input	External trigger input pins
	GTIOCnA, GTIOCnB	I/O	Input capture, output compare, or PWM output pins
	GTADSM0, GTADSM1	Output	A/D conversion start request monitoring output pins
	GTIU	Input	Hall sensor input pin U
	GTIV	Input	Hall sensor input pin V
	GTIW	Input	Hall sensor input pin W
	GTOUUP	Output	3-phase PWM output for BLDC motor control (positive U phase)
	GTOULO	Output	3-phase PWM output for BLDC motor control (negative U phase)
	GTOVUP	Output	3-phase PWM output for BLDC motor control (positive V phase)
	GTOVLO	Output	3-phase PWM output for BLDC motor control (negative V phase)
	GTOWUP	Output	3-phase PWM output for BLDC motor control (positive W phase)
	GTOWLO	Output	3-phase PWM output for BLDC motor control (negative W phase)

Table 1.15 Pin functions (3 of 7)

Function	Signal	I/O	Description
AGT	AGTEEn	Input	External event input enable signals
	AGTIOn	I/O	External event input and pulse output pins
	AGTOn	Output	Pulse output pins
	AGTOAn	Output	Output compare match A output pins
	AGTOBn	Output	Output compare match B output pins
ULPT	ULPTEEn	Input	External count control input
	ULPTEVIn	Input	External event input
	ULPTOn	Output	Pulse output
	ULPTOAn	Output	Output compare match A output
	ULPTOBn	Output	Output compare match B output
	ULPTEEn-DS	Input	External count control input that can also be used in Deep Software Standby mode1
	ULPTEVIn-DS	Input	External event input that can also be used in Deep Software Standby mode1
	ULPTOn-DS	Output	Pulse output that can also be used in Deep Software Standby mode1
	ULPTOAn-DS	Output	Output compare match A output that can also be used in Deep Software Standby mode1
	ULPTOBn-DS	Output	Output compare match B output that can also be used in Deep Software Standby mode1
RTC	RTCOUT	Output	Output pin for 1-Hz or 64-Hz clock
	RTCICn	Input	Time capture event input pins
SCI	SCKn	I/O	Input/output pins for the clock (clock synchronous mode)
	RXDn	Input	Input pins for received data (asynchronous mode/clock synchronous mode)
	TXDn	Output	Output pins for transmitted data (asynchronous mode/clock synchronous mode)
	CTSn_RTSn	I/O	Input/output pins for controlling the start of transmission and reception (asynchronous mode/clock synchronous mode), active-low.
	CTSn	Input	Input for the start of transmission.
	DEn	Output	Driver enable signal for RS-485
	SCLn	I/O	Input/output pins for the IIC clock (simple IIC mode)
	SDAn	I/O	Input/output pins for the IIC data (simple IIC mode)
	SCKn	I/O	Input/output pins for the clock (simple SPI mode)
	MISOn	I/O	Input/output pins for slave transmission of data (simple SPI mode)
	MOSIn	I/O	Input/output pins for master transmission of data (simple SPI mode)
	SSn	Input	Chip-select input pins (simple SPI mode), active-low
IIC	SCLn	I/O	Input/output pins for the clock
	SDAn	I/O	Input/output pins for data
I3C	I3C_SCL0	I/O	Input/output pins for the clock
	I3C_SDA0	I/O	Input/output pins for data

Table 1.15 Pin functions (4 of 7)

Function	Signal	I/O	Description
SPI	RSPCKA, RSPCKB	I/O	Clock input/output pin
	MOSIA, MOSIB	I/O	Input or output pins for data output from the master
	MISOA, MISOB	I/O	Input or output pins for data output from the slave
	SSLA0, SSLB0	I/O	Input or output pin for slave selection
	SSLA1 to SSLA3, SSLB1 to SSLB3	Output	Output pins for slave selection
CANFD	CRXn	Input	Receive data
	CTXn	Output	Transmit data
USBFS	VCC_USB	Input	Power supply pin
	VSS_USB	Input	Ground pin
	USB_DP	I/O	D+ pin of the USB on-chip transceiver. Connect this pin to the D+ pin of the USB bus.
	USB_DM	I/O	D- pin of the USB on-chip transceiver. Connect this pin to the D- pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. Connect this pin to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip
	USB_OVRCURA, USB_OVRCURB	Input	Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_OVRCURA-DS, USB_OVRCURB-DS	Input	Overcurrent pins for USBFS that can also be used in Deep Software Standby mode1. Connect the external overcurrent detection signals to these pins. Connect the VBUS comparator signals to these pins when the OTG power supply chip is connected.
	USB_ID	Input	Connect the MicroAB connector ID input signal to this pin during operation in OTG mode
USBHS	VCC_USBHS	Input	Power supply pin
	VSS1_USBHS, VSS2_USBHS	Input	Ground pin
	AVCC_USBHS	Input	Analog power supply
	USBHS_RREF	I/O	Reference current source pin for the USBHS Must be connected to the VSS2_USBHS pin through a 2.2-kΩ (±1%) resistor.
	USBHS_DP	I/O	Input/output pin for the D+ data line of the USB bus
	USBHS_DM	I/O	Input/output pin for the D- data line of the USB bus
	USBHS_EXICEN	Output	Must be connected to the OTG power supply IC
	USBHS_ID	input	Must be connected to the OTG power supply IC
	USBHS_VBUSEN	Output	VBUS power supply enable pin for the USBHS
	USBHS_OVRCURA, USBHS_OVRCURB	Input	Overcurrent pin for the USBHS
	USBHS_OVRCURA-DS, USBHS_OVRCURB-DS	Input	Overcurrent pin for the USBHS that can also be used in Deep Software Standby mode1.
	USBHS_VBUS	Input	USB cable connection monitor input pin

Table 1.15 Pin functions (5 of 7)

Function	Signal	I/O	Description
OSPI	OM_SCLK	Output	Clock output (OCTACLK divided by 2)
	OM_SCLKN	Output	Inverted clock output (OCTACLK divided by 2)
	OM_CSn	Output	Chip select signal for an OctaFlash device, active-low
	OM_DQS	I/O	Read data strobe/write data mask signal
	OM_SIOn	I/O	Data input/output
	OM_RESET	Output	Reset signal for both slave devices, active-low
	OM_ECSINT1	Input	Error Correction Status and Interrupt for slave1
	OM_RSTO1	Input	Slave reset status for slave1
	OM_WP1	Output	Write Protect for slave1, active-low
SSIE	SSIBCK0, SSIBCK1	I/O	SSIE serial bit clock pins
	SSILRCK0/SSIFS0, SSILRCK1/SSIFS1	I/O	LR clock/frame synchronization pins
	SSITXD0	Output	Serial data output pin
	SSIRXD0	Input	Serial data input pin
	SSIDATA1	I/O	Serial data input/output pins
	AUDIO_CLK	Input	External clock pin for audio (input oversampling clock)
SDHI/MMC	SDnCLK	Output	SD clock output pins
	SDnCMD	I/O	Command output pin and response input signal pins
	SDnDATA0 to SDnDATA7	I/O	SD and MMC data bus pins
	SDnCD	Input	SD card detection pins
	SDnWP	Input	SD write-protect signals

Table 1.15 Pin functions (6 of 7)

Function	Signal	I/O	Description
ETHERC	REF50CK0	Input	50-MHz reference clock. This pin inputs reference signal for transmission/reception timing in RMII mode.
	RMII0_CRS_DV	Input	Indicates carrier detection signals and valid receive data on RMII0_RXD1 and RMII0_RXD0 in RMII mode .
	RMII0_TXDn	Output	2-bit transmit data in RMII mode
	RMII0_RXDn	Input	2-bit receive data in RMII mode
	RMII0_TXD_EN	Output	Output pin for data transmit enable signal in RMII mode
	RMII0_RX_ER	Input	Indicates an error occurred during reception of data in RMII mode
	ET0_CRS	Input	Carrier detection/data reception enable signal
	ET0_RX_DV	Input	Indicates valid receive data on ET0_ERXD3 to ET0_ERXD0
	ET0_EXOUT	Output	General-purpose external output pin
	ET0_LINKSTA	Input	Input link status from the PHY-LSI
	ET0_ETXDn	Output	4 bits of MII transmit data
	ET0_ERXDn	Input	4 bits of MII receive data
	ET0_TX_EN	Output	Transmit enable signal. Functions as signal indicating that transmit data is ready on ET0_ETXD3 to ET0_ETXD0.
	ET0_TX_ER	Output	Transmit error pin. Functions as signal notifying the PHY_LSI of an error during transmission.
	ET0_RX_ER	Output	Receive error pin. Functions as signal to recognize an error during reception.
	ET0_TX_CLK	Input	Transmit clock pin. This pin inputs reference signal for output timing from ET0_TX_EN, ET0_ETXD3 to ET0_ETXD0, and ET0_TX_ER.
	ET0_RX_CLK	Input	Receive clock pin. This pin inputs reference signal for input timing to ET0_RX_DV, ET0_ERXD3 to ET0_ERXD0, and ET0_RX_ER.
	ET0_COL	Input	Input collision detection signal
	ET0_WOL	Output	Receive Magic packets
	ET0_MDC	Output	Output reference clock signal for information transfer through ET0_MDIO
	ET0_MDIO	I/O	Input or output bidirectional signal for exchange of management data with PHY-LSI
Analog power supply	AVCC0	Input	Analog voltage supply pin. This is used as the analog power supply for the respective modules.
	AVSS0	Input	Analog ground pin. This is used as the analog ground for the respective modules. Supply this pin with the same voltage as the VSS pin.
	VREFH	Input	Analog reference voltage supply pin for the ADC12 (unit 1) and D/A Converter. Connect this pin to AVCC0 when not using the ADC12 (unit 1) and D/A Converter.
	VREFL	Input	Analog reference ground pin for the ADC12 and D/A Converter. Connect this pin to AVSS0 when not using the ADC12 (unit 1) and D/A Converter.
	VREFH0	Input	Analog reference voltage supply pin for the ADC12 (unit 0). Connect this pin to AVCC0 when not using the ADC12 (unit 0).
	VREFL0	Input	Analog reference ground pin for the ADC12. Connect this pin to AVSS0 when not using the ADC12 (unit 0).

Table 1.15 Pin functions (7 of 7)

Function	Signal	I/O	Description
ADC12	ANmn	Input	Input pins for the analog signals to be processed by the A/D converter. (m: ADC unit number, n: pin number)
	ADTRGm	Input	Input pins for the external trigger signals that start the A/D conversion, active-low.
DAC12	DAn	Output	Output pins for the analog signals processed by the D/A converter.
ACMPHS	VCOUT	Output	Comparator output pin
	IVREFn	Input	Reference voltage input pins for comparator
	IVCMPn	Input	Analog voltage input pins for comparator
I/O ports	Pmn	I/O	General-purpose input/output pins (m: port number, n: pin number)
	P200	Input	General-purpose input pin
GLCDC	LCD_DATA23 to LCD_DATA00	Output	Data output pins for panel
	LCD_TCON3 to LCD_TCON0	Output	Output pins for panel timing adjustment
	LCD_CLK	Output	Panel clock output pin
	LCD_EXTCLK	Input	Panel clock source input pin
MIPI	VCC18_MIPI	Input	Power supply pin
	AVCC_MIPI	Input	Analog power supply
	VSS_MIPI	Input	Ground pin
	MIPI_CL_P	Output	DSI Clock Lane positive pin
	MIPI_CL_N	Output	DSI Clock Lane negative pin
	MIPI_DL0_P	I/O	DSI Data Lane 0 positive pin
	MIPI_DL0_N	I/O	DSI Data Lane 0 negative pin
	MIPI_DL1_P	Output	DSI Data Lane 1 positive pin
	MIPI_DL1_N	Output	DSI Data Lane 1 negative pin
	DSI_TE	Input	DSI Tearing Effect pin
CEU	VIO_D15 to VIO_D0	Input	CEU data bus pins
	VIO_CLK	Input	CEU clock pin
	VIO_VD	Input	CEU vertical sync pin
	VIO_HD	Input	CEU horizontal sync pin

Note: Several pin names have the added suffix of _A, _B, and _C. These suffixes have special conditions for electrical characteristics. See section 60, Electrical Characteristics for detail.

2. CPU

The MCU is based on the Arm® Cortex®-M85 Processor.

2.1 Overview

2.1.1 CPU

- Arm® Cortex®-M85 Processor
  - Revision: r0p2-00rel0
  - ARMv8.1-M architecture profile
  - Armv8-M Security Extension
- Extension Processing Unit (EPU)
  - Floating Point Unit (FPU) compliant with the ANSI/IEEE Std 754-2008
    Scalar half, single, and double-precision floating-point operation
  - M-profile Vector Extension (MVE)
    Integer, half-precision, and single-precision floating-point MVE (MVE-F)
- Security Attribution Unit (SAU): 8 regions
- Implementation Defined Attribution Unit (IDAU)
- Memory Protection Unit (MPU)
  - Protected Memory System Architecture (PMSAv8)
  - Secure MPU (MPU_S): 8 regions
  - Non-secure MPU (MPU_NS): 8 regions
- System Timer (SysTick)
  - Reference clock:
    - CPUCLK
    - SYSTICKCLK
  - Two system timers are implemented:
    - Secure instance (SysTick_S)
    - Non-secure instance (SysTick_NS)
- Low power modes
  - CPU Sleep mode
  - CPU Deep Sleep mode
- Cache
  - Instruction cache: 16 KB with ECC
  - Data cache: 16 KB with ECC
- Tightly Coupled Memory (TCM)
  - ITCM: 64 KB with ECC (8 KB × 8 block)
  - DTCM: 64 KB with ECC (8 KB × 8 block)
- Nested Vectored Interrupt Controller (NVIC): 96 IRQs

See section 2.14. References [1], [2] for the detail.

2.1.2 Debug

CPU Debug Components

- Arm® CoreSight™ ETM-M85
  - Revision: r0p2-00rel0
  - ARM ETM Architecture version 4.5
- Instrumentation Trace Macrocell (ITM)
- Data Watchpoint and Trace unit (DWT)
  - 8 Data Watchpoint and Trace (DWT) comparators, up to 2 data value comparison
- Breakpoint Unit (BPU)
  - 8 instruction comparators
- Cortex®-M85 Trace Port Interface Unit (TPIU)
  - 4 bits TPIU Formatter output
  - Serial Wire Output (SWO)

Common Debug Components

- Debug Access Port (DAP)
  - CoreSight SoC-400 Debug Access Port
  - JTAG Debug Port and Serial Wire Debug Port (SWJ-DP)
    Serial Wire protocol version 2 (target instance is fixed value: 0b0000)
- Timestamp Generator (TSG)
  - CoreSight SoC-400 Timestamp Generator
  - Global Timestamp for ETM and ITM
  - Driven by DCLK
- Cross Trigger Interface (CTI)
  - CoreSight SoC-400 CTI (CTI)
  - Processor CTI (CTI0)
- Embedded Trace Buffer (ETB)
  - CoreSight™ Trace Memory Controller with ETB configuration
  - Buffer size: 8 KB
- Debug Register Module (DBGREG)
- On-Chip Debug Register Module (OCDREG)
- Authentication method through JTAG/SWD: Challenge response

See section 2.14. References [1], [2] for the detail.

2.2 Block Diagram

Figure 2.1 shows the block diagram of CPU and CoreSight Debug subsystem (DBGSS).

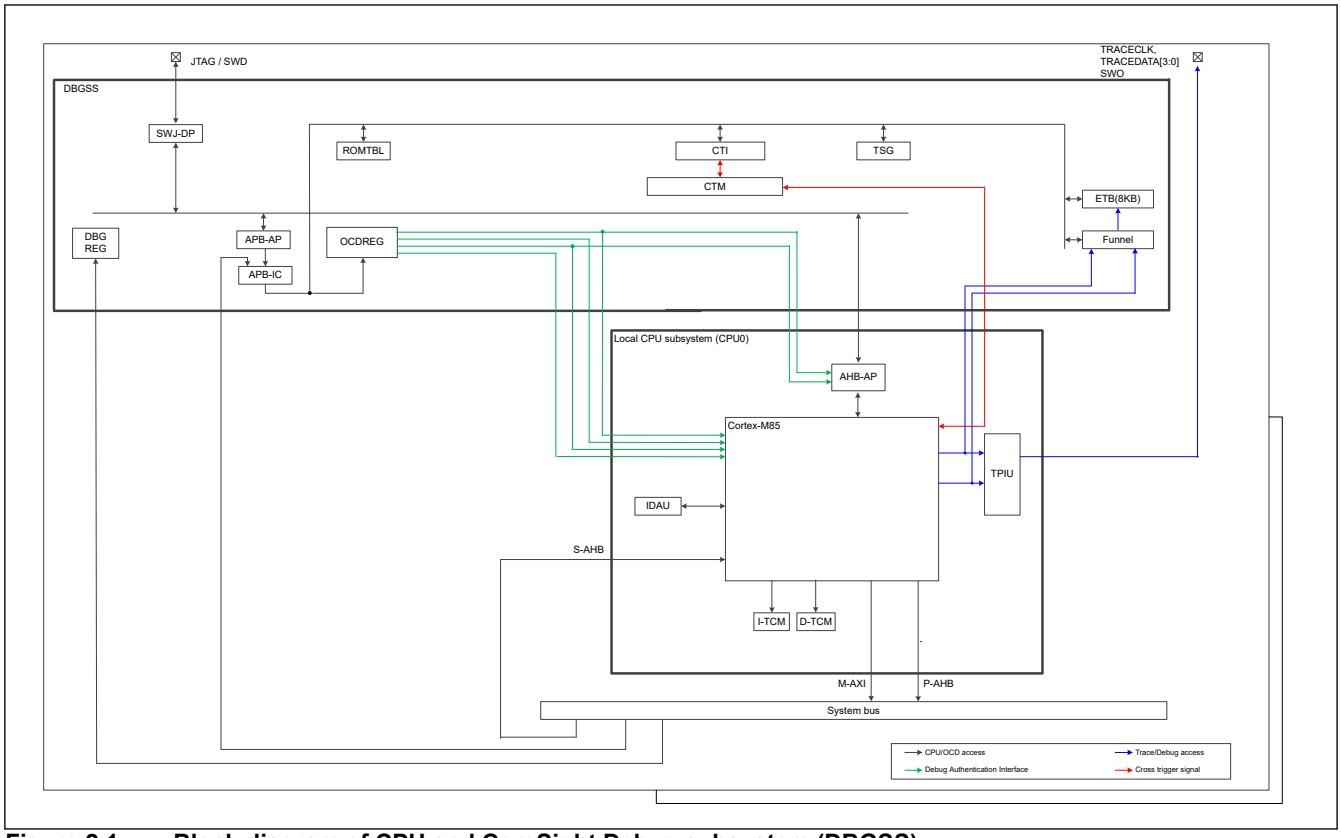

Figure 2.1 Block diagram of CPU and CoreSight Debug subsystem (DBGSS)

Note: See section 2.14. References [2] for detail of Cortex-M85 block diagram. Cortex-M85 block diagram described in this document is just for illustrative purposes only.

2.3 Implementation Options

Table 2.1 shows the implementation options of the MCU.

Table 2.1 Implementation options (1 of 2)

Option	Implementation
SAU	8 regions
IDAU	Included
MPU	MPU_S: 8 regions MPU_NS: 8 regions
MVE	Integer and half and single-precision floating-point MVE
FPU	Scalar half, single, and double-precision floating-point
Interrupts	96
Priority bits	4 bits (16 levels)
Sleep mode power-saving	CPU Sleep mode, CPU Deep Sleep mode
TCM	• ITCM : 64 KB • DTCM : 64 KB • ECC enable（determined by OFS1(_SEC).INITECCEN） • ITCMCR.EN = 1 and DTCMCR.EN = 1, cannot be rewrite
CACHE	• I-Cache: 16 KB • D-Cache: 16 KB • ECC enable（determined by OFS1(_SEC).INITECCEN） • Automatic invalidation is enabled During debug, it is controlled by CACHEDBGCR L1RSTDIS

Table 2.1 Implementation options (2 of 2)

Option	Implementation
P-AHB	• PAHBCR.SZ is 0b011 (256 MB) • PAHBCR.EN is always 1
SysTick	Included two system timers, SysTick_S and SysTick_NS External reference clock with frequency = SYSTICKCLK SYST_CALIB = 0x0000270F NOREF, bit[31] = 0: Reference clock is implemented SKEW, bit[30] = 0: TENMS calibration value is exact Bit[29:24] = 0x00: Reserved TENMS, bit[23:0] = 0x00270F: (0x270F + 1) × 1 µs = 10 ms
PACBTI	Included and Enabled
Software reset request output	AIRCR.SYSRESETREQ bit causes the Software reset
DWT	8 comparators
BPU	8 comparators
CTI	Included, CTI and CTI0
ITM	Included
ETM	Included
TPIU	Included • 4-bit TPIU formatter output • Serial Wire Output (SWO)

Table 2.2 DBGSS implementation options

Option	Implementation
TSG	Included Driven by clock with frequency = ICLK/2
ETB	8 KB
DAP	SWJ-DP AHB-AP : AP0 APB-AP : AP1

2.4 Trace Interface

A Trace Port Interface Unit (TPIU) and Serial Wire Output (SWO) provide trace output. Table 2.3 shows the MCU pins for the function. These pins are multiplexed with other functions.

Table 2.3 Trace function pins

Name	I/O	Width	Function	When not in use
TCLK	Out	1 bit	Trace clock	Open
TDATA0	Out	1 bit	Trace data output	Open
TDATA1	Out	1 bit	Trace data output	Open
TDATA2	Out	1 bit	Trace data output	Open
TDATA3	Out	1 bit	Trace data output	Open
SWO	Out	1 bit	Serial Wire Output	Open

2.5 JTAG/SWD Interface

Table 2.4 shows JTAG/SWD pins.

Table 2.4 JTAG/SWD pins (1 of 2)

Name	I/O	P/N	Width	Function	When not in use
TCK/SWCLK	In	Pos.	1 bit	JTAG Clock pin Serial Wire Data Clock pin	Pull-up

Table 2.4 JTAG/SWD pins (2 of 2)

Name	I/O	P/N	Width	Function	When not in use
TMS/SWDIO	In-Out	Neg.	1 bit	JTAG TMS pin Serial Wire Data In-Out pin	Pull-up
TDI	In	Pos.	1 bit	JTAG TDI pin	Pull-up
TDO	Out	Neg.	1 bit	JTAG TDO pin	Open

2.6 Initial Vector Table Base Address

In the MCU, the secure vector table base address is determined by the operating mode as shown in Table 2.5, and the non-secure vector table base address is fixed at 0x0000_0000.

Table 2.5 Initial vector table base address

Operating mode	CPU INITSVTOR
Single-chip mode (not execute FSBL)	0x0200_0000
Single-chip mode (execute FSBL)	0x0700_0000

2.7 Debug Function

The MCU provides ability to debug software by either external debug or self-hosted debug.

The external debug function can be enabled by JTAG/SWD. See section 2.7.1. External Debugger Connectivity and Authentication Through JTAG/SWD.

Self-hosted debug function can be enabled by software programming. See section 2.7.2. Debug Protection Mechanism by Software for details.

When debug function is enabled, operation of system can be affected. See section 2.7.3. Effect of Debug Function for details.

2.7.1 External Debugger Connectivity and Authentication Through JTAG/SWD

When debug function is enabled by performing authentication through JTAG/SWD, the three debug levels that correspond to the three Authentication Level (AL) are AL0, AL1, and AL2.

- AL0: No debug functions[*1] are available.
- AL1: Only non-secure debug functions[*1] is enabled, and debugger can access only defined Non-secure debug accessible regions. It is defined as Non-secure debug in section 2.14. References [1].
- AL2: Non-secure and Secure debug functions[*1] are enabled and accessible from the debugger. It is defined as Secure debug in section 2.14. References [1].

Authentication Level is determined as follows:

- When Device Life Cycle state (DLM state) is not OEM (CM, LCK_BOOT, RMA_RET, RMA_REQ, RMA_ACK), AL is determined by DLM state. See Table 2.6.
- When Device Life Cycle state (DLM state) is equal to OEM, AL can be determined by performing authentication through JTAG/SWD. In the MCU, authentication method is the challenge response method with the authentication key installed by user.
  In this case, initial value of AL is determined by PL value (see Table 2.7).
  See section 2.13.5.2. Connecting Sequence and JTAG/SWD Authentication for authentication sequence.

In addition, using authentication key AL2 and AL1 can be prohibited by setting Protection LCKS and LCKNS respectively. Setting LCKS and LCKNS can be performed by the boot command. After setting, LCKS can only be cleared by the All erase command, LCKNS can be cleared either by the All erase command or secure access.

Note 1. Both of invasive and non-invasive debug. See section 2.14. References [1] for details about invasive and non-invasive debug.

Description in Table 2.6 and Table 2.7 can also be used for serial Flash programmer.

Table 2.6 Authentication Level (1)

Conditions			
DLM state	**LCKS**	**LCKNS**	**Available Authentication Level**
CM	Don't care	Don't care	AL2 (default)
LCK_BOOT	Don't care	Don't care	AL0 (default)
RMA_RET	Don't care	Don't care	AL0 (default)
RMA_REQ	Don't care	Don't care	AL0 (default)
RMA_ACK	Don't care	Don't care	AL2 (default)

Table 2.7 Authentication Level (2)

Condition				
DLM state	**PL**	**LCKS**	**LCKNS**	**Available Authentication Level**
OEM	PL2	Don't care	Don't care	AL2 (default)
OEM	PL1	0b111	Don't care	AL1 (default) AL2 (authentication using AL2_KEY)
OEM	PL1	0b000 (using AL2_KEY is prohibited)	Don't care	AL1 (default)
OEM	PL0	0b111	0b111	AL0 (default) AL1 (authentication using AL1_KEY) AL2 (authentication using AL2_KEY)
OEM	PL0	0b111	0b000 (using AL1_KEY is prohibited)	AL0 (default) AL2 (authentication using AL2_KEY)
OEM	PL0	0b000 (using AL2_KEY is prohibited)	0b111	AL0 (default) AL1 (authentication using AL1_KEY)
OEM	PL0	0b000 (using AL2_KEY is prohibited)	0b000 (using AL1_KEY is prohibited)	AL0 (default)

Note: When debugging using SWJ-DP, set CDBGPWRUPREQ to 1.
Note: Debug connection from external emulator to CoreSight components through Debug APB is enabled as default setting, don't care is the authentication mechanism. However, this connection can be disabled by software programming. See DBGAUTH0.DEVICEEN for details.

Debug connection while in Boot mode

Debug capability is not available while the MCU is operating in Boot mode.

2.7.2 Debug Protection Mechanism by Software

In this mechanism, the challenge and response authentication procedure does not perform, instead software can program to directly enable debug function of the MCU. In other words, debug function is controlled completely by software.

The debug function can be enabled by setting the following bits:

- DBGAUTH0.NIDEN0 = 1: Non-invasive debug enable
- DBGAUTH0.DBGEN0 = 1: Invasive debug enable
- DAUTHCTRL.INTSPNIDEN = 1: Secure non-invasive debug enable. See Reference [1] for details
- DAUTHCTRL.INTSPIDEN = 1: Secure invasive debug enable. See Reference [1] for details.

In addition, external debug access to processor through AHB-AP can also be enabled by writing 1 to DBGAUTH0.DBGENAP and DBGAUTH1.SPIDENAP for Non-secure and Secure access respectively.

See DBGAUTH0 and DBGAUTH1 in section 2.8.5.3. DBGSTOPCR : Debug Stop Control Register and section 2.8.5.4. DBGAUTH0 : Debug Authentication Control Register 0 for more details.

Note: Authentication through software programming is controlled by OFS1(_SEC).SWDBG.

Writing 1 to OFS1(_SEC).SWDBG disables authentication through software programming, writing 0 to OFS1(_SEC).SWDBG enables authentication through software programming.

Note: Authentication through software programming is not restricted by DLM state, PL, and LCK(N)S.

Note: Except DAUTHCTRL.INTSPNIDEN and DAUTHCTRL.INTSPIDEN overrides processor external Secure invasive/ non-invasive debug authentication interface, debug function enabled by authentication through JTAG/SWD cannot be disabled by software.

2.7.3 Effect of Debug Function

The debug function affects the inside and outside of CPU. This section describes the effects of debug function excluding debug authentication.

2.7.3.1 Low power mode

All CoreSight debug components can store the register settings even when the CPU enters Deep Sleep, Software Standby, or Deep Software Standby mode if SYOCDCR.DBGEN0 is 1 and any of the following is true:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1.

However, AHB-AP cannot respond to On-Chip Debug (OCD) access in these low power modes. The OCD must wait for cancellation of the low power mode to access the CoreSight debug components.

The MCU does not response to On-Chip Debug (OCD) when the OCD starts to connect to the MCU while the MCU is in Software Standby mode or Deep Software Standby mode.

2.7.3.2 Resets and interrupts

During On-Chip Debug (OCD) mode, when the CPU enters the break state, IWDT and corresponding WDT are stopped. During OCD mode, the CPU is running the application and debug function AL2 or AL1 is enabled, some resets and interrupts are restrained depending on DBGSTOPCR setting such as PVDn, WDT, and IWDT. For PVDn (n = 1, 2), interrupt and reset depend on whether DBGSTOPCR is in the break state or not. Some access errors are not generated by external debugger (DAP) access. For details, see Table 2.8.

Table 2.8 Controlling of resets and interrupts generation in OCD mode

Reset and interrupt name	Break state	Running application
RES pin reset	Same as user mode	
Power-on reset	Same as user mode	
Independent watchdog timer reset/interrupt*2	Does not occur*1	Depends on DBGSTOPCR setting*2
Watchdog timer reset/interrupt	Does not occur*1	Depends on DBGSTOPCR setting*2
CPU lockup reset/interrupt	Does not occur	Same as user mode
Voltage monitor 0 reset	Same as user mode	
Voltage monitor 1 reset/interrupt	Depends on DBGSTOPCR setting*3	
Voltage monitor 2 reset/interrupt	Depends on DBGSTOPCR setting*3	
Cache/TCM ECC error BusFaults	Same as user mode	
SRAM Parity/ECC error reset/interrupt	Same as user mode*3	
Deep software standby reset	Same as user mode	
Software reset	Same as user mode	
Bus error reset/interrupt	Same as user mode*4	

Note 1. IWDT and WDT always stop in this mode if any of the following is true:
- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

Note 2. IWDT and WDT operation depends on DBGSTOPCR setting if any of the following is true:
- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

Note 3. Reset or interrupt masking depends on DBGSTOPCR setting.
Note 4. The reset request or interrupt request is not generated when an error is detected for DAP access.

2.8 Registers Description

2.8.1 CPU Control Registers

In addition to Cortex-M85 registers, the MCU also provides additional specific control and status registers that can be considered as CPU control register.

2.8.1.1 CPUSAR : CPU Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x170

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CPUSA0	CPU Control Registers Security Attribution 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

CPUSA0 bit (CPU Control Registers Security Attribution)

The CPUSA0 bit is Security attributes for CPU Control registers. The target registers are:

- CPU.CPULCKUPCR
- CPU.CPUCRPT

2.8.1.2 CPULCKUPCR : CPU Lockup Control Register

Base address: CPU_CTRL = 0x4000_F000
CPU_CTRL_NS = 0x5000_F000

Offset address: 0x030

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection of CPU lockup 0: Non-maskable Interrupt 1: CPU Lockup reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3 (CPUSAR.CPUSA0), P-TYPE-2

When CPU enters the lockup state, it can be selected to generate either a CPU Lockup reset or an interrupt[*1] by writing to CPULCKUPCR.OAD.

The CPULCKUPCR security attribution is controlled by CPUSAR. The AIRCR.BFHFNMINS and CPUSAR.CPUSA0 bits are recommended to be set to the same security attribution.

Writing to CPULCKUPCR.OAD bit is protected by CPU Control Register Protect Register (CPUCRPT).

Note 1. If lockup state occurs from a Secure HardFault when AIRCR.BFHFNMINS is set to 1 or the NMI handler, an NMI does not cause the processor exit lockup state. See section 2.14. References [4].

2.8.1.3 CPUCRPT : CPU Control Register Protection Register

Base address: CPU_CTRL = 0x4000_F000 (Secure)
CPU_CTRL_NS = 0x5000_F000 (Non-secure)

Offset address: 0x840

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Writing to CPULCKUPCR register is permitted. 1: Writing to CPULCKUPCR register is not permitted. Read access is permitted.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 in KEY[7:0] bits at the same time. When values other than 0xA5 are written to KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.	W

Note: S-TYPE-3 (CPUSAR.CPUSA0), P-TYPE-2

The CPUCRPT.PROTECT bit enables writing to CPULCKUPCR.

The security attribution of CPUCRPT is controlled by CPUSAR.

2.8.1.4 CPULOCKCR : CPU Function Lock Control Register

Base address: CPU_CTRL = 0x4000_F000 (Secure)

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	LCKDCAIC	LCKDTGU	LCKITGU	LCKSAU	LCKSMPU	LCKSVTAIR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKSVTAIR	Disable writes to the following secure registers from software or from a debug agent that is connected to the processor: **VTOR_S**, **AIRCR.PRIS**, **AIRCR.BFHFNMINS**	R/W*1
1	LCKSMPU	Disable writes to registers that are associated with the Secure MPU region from software or from a debug agent connected to the processor: **MPU_CTRL**, **MPU_RNR**, **MPU_RBAR**, **MPU_RLAR**, **MPU_RBAR_An**, **MPU_RLAR_An**	R/W*1
2	LCKSAU	Disable writes to registers that are associated with the SAU region from software or from a debug agent connected to the processor: **SAU_CTRL**, **SAU_RNR**, **SAU_RBAR**, **SAU_RLAR**	R/W*1
3	LCKITGU	Disable writes to registers that are associated with the ITCM interface security gating from software or from a debug agent connected to the processor: **ITGUCTRL**, **ITGU_LUTn**	R/W*1

Bit	Symbol	Function	R/W
4	LCKDTGU	Disable writes to registers that are associated with the DTCM interface security gating from software or from a debug agent connected to the processor: **DTGUCTRL**, **DTGU_LUTn**	R/W*1
5	LCKDCAIC	Disable access to the instruction cache direct cache access registers **DCAICLR** and **DCAICRR**	R/W*1
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note 1. Writing 0 is ignored.

This register controls some miscellaneous processor signals. Reset is the only clear condition.

2.8.1.5 CPULOCKCRNS : CPU Non-secure Function Lock Control Register

Base address CPU_CTRL_NS = 0x5000_F000 (Non-secure)

Offset address: 0x500

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LCKNSMPU	LCKNSVTOR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCKNSVTOR	Disable writes to the **VTOR_NS** register	R/W*1
1	LCKNSMPU	Disable writes to registers that are associated with the Non-secure MPU region from software or from a debug agent connected to the processor: **MPU_CTRL_NS**, **MPU_RNR_NS**, **MPU_RBAR_NS**, **MPU_RLAR_NS**, **MPU_RBAR_A_NSn**, **MPU_RLAR_A_NSn**	R/W*1
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-7, P-TYPE-2
Note 1. Writing 0 is ignored.

This register controls some miscellaneous processor signals. Reset is the only clear condition.

2.8.2 Address Spaces for External Debugger

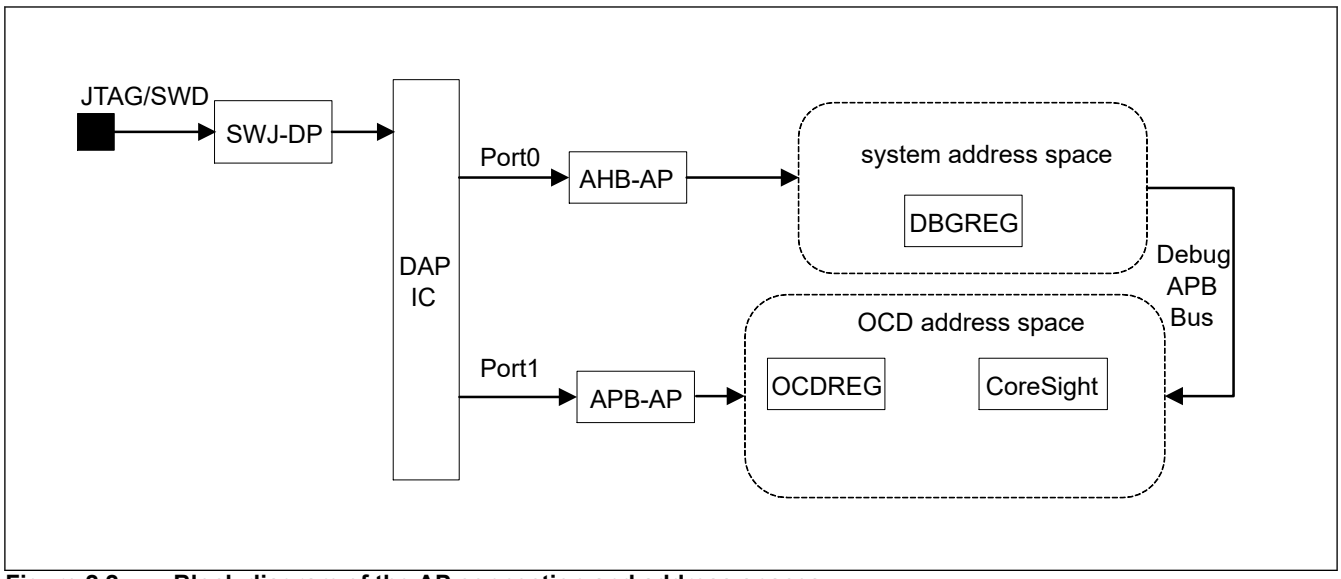

Figure 2.2 Block diagram of the AP connection and address spaces

The MCU debug system includes two CoreSight Access Ports (AP):

- AHB-AP, which is connected to the CPU bus matrix and has the same access to the system address space as the CPU
- APB-AP, which has OCD address space and is connected to the Coresight components and OCDREG registers.

Figure 2.2 shows a block diagram of the AP connection and address spaces. For debug purpose, there are two address spaces, DBGREG and OCDREG.

DBGREG is located in the system address space and can be accessed from an OCD emulator, a CPU, or other bus masters in the MCU.

OCDREG is located in the OCD address space and can be accessed from an OCD emulator, a CPU, or other bus masters in the MCU. See Table 2.10 for details.

2.8.3 CPU Peripheral

CoreSight components are accessible from either CPU or OCD emulator. Table 2.9 shows dedicated Peripheral address of CPU. Table 2.10, Table 2.11, and Table 2.12 describe CoreSight component address.

Table 2.9 CPU peripherals

Component name	Start address	End address	Note

2.8.4 ROM Table

The MCU has three ROM Tables:

- A processor ROM Table
- An EPPB ROM Table for the Cortex-M85 CPU
- A system ROM Table

The EPPB ROM Table points to the TPIU component and processor ROM Table. The EPPB ROM Table does not point to or be pointed by system ROM Table.

The processor ROM Table contains entries that hold a list of debug components that are implemented in Cortex-M85. The system ROM Table contains entries that hold a list of debug components implemented as CoreSight debug components of the MCU.

2.8.4.1 ROM entries

ROM entries holds a list of CoreSight debug components in the system. The OCD emulator can use the ROM entries to determine which components are implemented in the system.

The entries of Debug components are described as bellow.

Table 2.13: System ROM entries

Table 2.14: EPPB ROM entries

Table 2.15: Processor ROM entries (see section 2.14. References).

Table 2.13 System ROM entries

#	Address*1	Access size	R/W	Value	Target module
0	0x4001_0000	32 bits	Read-only	0x00001003	OCDREG
1	0x4001_0004	32 bits	Read-only	0x00002003	CTI
2	0x4001_0008	32 bits	Read-only	0x00003003	Funnel
3	0x4001_000C	32 bits	Read-only	0x00004003	ETB
4	0x4001_0010	32 bits	Read-only	0x00005003	TSG
5	0x4001_0014	32 bits	Read-only	0x00000000	(End of entries)

Note 1. The base address 0x4001_0000 is dedicated for CPU secure access.
The base address for CPU non-secure access is 0x5001_0000.
The base address for OCD emulator access is 0x8001_0000.

Table 2.14 EPPB ROM entries (1 of 2)

#	Address	Access size	R/W	Value	Target module
0	0xE00F_E000	32 bits	Read-only	0x00001003	Processor ROM Table
1	0xE00F_E004	32 bits	Read-only	0xFFF42003	TPIU

Table 2.14 EPPB ROM entries (2 of 2)

#	Address	Access size	R/W	Value	Target module
2	0xE00F_E008	32 bits	Read-only	0x00000000	(End of entries)

Table 2.15 Processor ROM entries

#	Address	Access size	R/W	Value	Target module
0	0xE00F_F000	32 bits	Read-only	0xFFF0F003	SCS
1	0xE00F_F004	32 bits	Read-only	0xFFF02003	DWT
2	0xE00F_F008	32 bits	Read-only	0xFFF03003	BPU
3	0xE00F_F00C	32 bits	Read-only	0xFFF01003	ITM
5	0xE00F_F014	32 bits	Read-only	0xFFF42003	ETM
6	0xE00F_F018	32 bits	Read-only	0xFFF04003	PMU
7	0xE00F_F01C	32 bits	Read-only	0xFFF43003	CTI0
8	0xE00F_F020	32 bits	Read-only	0xFFF47002	PMC
9	0xE00F_F024	32 bits	Read-only	0x00000000	(End of entries)

2.8.4.2 CoreSight Component Registers

ROM Table has CoreSight Component Register defined in Arm CoreSight Architecture.

Table 2.16 shows the registers of system ROM Table.

Table 2.17 shows processor EPPB ROM Table.

Table 2.18 shows processor ROM Table. See section 2.14. References [2].

Table 2.16 Registers of system ROM Table

Name	Address	Access size	R/W	Initial value
PID4	0x8001_0FD0	32 bits	Read-only	0x00000004
PID5	0x8001_0FD4	32 bits	Read-only	0x00000000
PID6	0x8001_0FD8	32 bits	Read-only	0x00000000

CID3	0xE00F_FFFC	32 bits	Read-only	0x000000B1

2.8.5 DBGREG

Base_Address: CPU_DBG = 0x4001_B000

The DBGREG module controls the debug functionality.

Table 2.19 shows a list of DBGREG registers.

Table 2.19 DBGREG registers

Name	Symbol	DAP port	Address	Access size	R/W
Debug Status Register	DBGSTR	Port 0	0x4001_B000	32 bits	Read-only
Debug Stop Control Register	DBGSTOPCR	Port 0	0x4001_B010	32 bits	Read/Write
Debug Authentication Control Register0	DBGAUTH0	Port 0	0x4001_B020	32 bits	Read/Write
Debug Authentication Control Register1	DBGAUTH1	Port 0	0x4001_B024	32 bits	Read/Write
Trace Port Control Register	TRPORTCR	Port 0	0x4001_B030	32 bits	Read/Write
Cache Debug Control Register	CACHEDBGCR	Port 0	0x4001_B040	32 bits	Read/Write
MOCO Enable Register for Debug	DBGMOCOEN	Port 0	0x4001_B300	32 bits	Read/Write
Flash Sequencer Clock Select Register for Debug	DBGFCLKSEL	Port 0	0x4001_B310	32 bits	Read/Write

2.8.5.1 DEBUGSAR : Debug Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x180

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGSA0	Debug Resources Security Attribution 0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

DBGSA0 bit (Debug Resources Security Attribution 0)

Security attributes of registers for Debug Control. The target registers are as follow:

- DBGREG.DBGAUTH0
- The CoreSight registers connected to APB-AP and mapped to the system address space

Note: This does not affect access from external to APB-AP.

2.8.5.2 DBGSTR : Debug Status Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	CDBGPWRUPACK	CDBGPWRUPREQ	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	x	x	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
27:0	—	These bits are read as 0.	R
28	CDBGPWRUPREQ	Debug power-up request 0: OCD is not requesting debug power-up 1: OCD is requesting debug power-up	R
29	CDBGPWRUPACK	Debug power-up acknowledge 0: Debug power-up request is not acknowledged 1: Debug power-up request is acknowledged	R
31:30	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

The DBGSTR register is a debug status register to notify OCD status to programs. This register is monitoring Debug connecting state.

2.8.5.3 DBGSTOPCR : Debug Stop Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DBGSTOP_RER	—	—	—	—	—	—	DBGSTOP_PVD	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DBGSTOP_WDT0	DBGSTOP_IWDT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	DBGSTOP_IWDT	Mask bit for IWDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and IWDT counter is stopped, regardless of this bit value. 0: Enable IWDT reset/interrupt 1: Mask IWDT reset/interrupt and stop IWDT counter	R/W
1	DBGSTOP_WDT0	Mask bit for WDT reset/interrupt in the OCD run mode In the OCD break mode, the reset/interrupt is masked and WDT counter is stopped, regardless of this bit value. 0: Enable WDT reset/interrupt 1: Mask WDT reset/interrupt and stop WDT counter	R/W
16:2	—	These bits are read as 0. The write value should be 0.	R/W
17	DBGSTOP_PVD	Mask bit for PVDn (n = 1, 2) reset/interrupt 0: Enable PVDn (n = 1, 2) reset/interrupt 1: Mask PVDn (n = 1, 2) reset/interrupt	R/W
23:18	—	These bits are read as 0. The write value should be 0.	R/W
24	DBGSTOP_RER	Mask bit for SRAM parity/ECC error reset/interrupt 0: Enable SRAM parity/ECC error reset/interrupt 1: Mask SRAM parity/ECC error reset/interrupt	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

Debug Stop Control Register (DBGSTOPCR) specifies functional stop during debugging.

This register is valid only when any of the following conditions are true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1

When none of the above conditions are true, the MCU ignores this register setting and considers all bits to be 0.

2.8.5.4 DBGAUTH0 : Debug Authentication Control Register 0

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x020

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SWDBG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEVICEEN
Value after reset:	OFS1(_SEC).SWDBG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DBGENAP	—	—	—	NIDEN0	—	—	—	DBGEN0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DBGEN0*1	CPU invasive debug enable 0: Disabled 1: Enabled	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	NIDEN0	CPU non-invasive debug enable 0: Disabled 1: Enabled	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
8	DBGENAP*1	CPU AHB-AP (AP0) debug enable 0: Disabled 1: Enabled	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	DEVICEEN*2	APB-AP (AP1) authentication 0: Disabled 1: Enabled	R/W
30:17	—	These bits are read as 0. The write value should be 0.	R/W
31	SWDBG	Software control of debug function 0: Disabled 1: Enabled	R/W

Note: S-TYPE-3 (DEBUGSAR.DBGSA0), P-TYPE-2
Note 1. When AL2 or AL1, the MCU ignores this bit and considers as if it is set to 1.
Note 2. When AL2, the MCU ignores this bit and considers as if it is set to 1.

When software control of debug function (OFS1(_SEC).SWDBG=0) is enabled, non-secure invasive and non-invasive debug function of processor enabling can be controlled by DBGEN0 and NIDEN0 bits of the register.

Non-secure AHB-AP access can be enabled by DBGENAP bit of the register.

Access from APB-AP to Coresight components through Debug APB can be enabled by DEVICEEN bit of the register.

When OFS1(_SEC).SWDBG is 1, the MCU ignores this register and considers as if it is set to its initial value.

Note: MCU behaves according to DBGSTOPCR, SYOCDCR, MCUCTRL when DBGEN0 = 1, and also according to TRPORTCR when (DBGEN0 = 1 or NIDEN0 = 1) is true.

2.8.5.5 DBGAUTH1 : Debug Authentication Control Register 1

Base address: CPU_DBG = 0x4001_B000

Offset address: 0x024

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SPIDENAP	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 0. The write value should be 0.	R/W
8	SPIDENAP*1	CPU AHB-AP (AP0) debug enable 0: Disabled 1: Enabled	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

Note 1. When AL2, the MCU ignores this bit and considers as if it is set to 1.

When software control of debug function (OFS1(_SEC).SWDBG = 0) is enabled, secure access from AHB-AP port to D-AHB can be enabled by SPIDENAP bit of the register.

When OFS1(_SEC).SWDBG is 1, the MCU ignores this register and considers as if it is set to its initial value.

2.8.5.6 CACHEDBGCR : Cache Debug Control Register

Base address: CPU_DBG = 0x4001_B000

Offset address: 0x040

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	L1RSTDIS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	L1RSTDIS	Disable L1 cache automatic invalidation 0: Enable automatic invalidation of the L1 cache 1: Disable automatic invalidation of the L1 cache	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2

The CACHEDBGCR register can control Disable L1 cache invalidation out of reset during debugging.

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1 and AL is AL2 or AL1
- OFS1(_SEC).SWDBG is 0 and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1

Note: See section 4.6 Cache Initialization Signal in section 2.14. References [2] before writing to this bit.

2.8.5.7 TRPORTCR : Trace Port Control Register

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x030

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	DRV[1:0]		—	OE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
0	OE	Data Out Enable bit indicates whether Trace Clock, Trace Data, and SWO outputs are enabled. 0: Output disabled 1: Output enabled	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
3:2	DRV[1:0]	Port Drive Capability Control indicates trace port buffer speed: 0 0: Low-drive 0 1: Middle-drive 1 0: High-speed high-drive 1 1: High-drive	R/W
31:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The TRPORTCR register controls trace port of tracing data.

Note: The setting of the register is valid only if any of the following conditions apply:

- CDBGPWRUPREQ = 1, and AL is AL2 or AL1.
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 or DBGAUTH0.NIDEN0 is 1.

2.8.5.8 DBGMOCOEN : MOCO Enable Request Register for Debug

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MOCOEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MOCOEN	MOCO enable request 0: No request MOCO enable 1: Request MOCO enable	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The DBGMOCOEN register enables MOCO operation. When external debugger is not connected, the register does not have any effect. During P/E mode, the value of this register cannot be updated.

Note: Usage of the register:

When only non-secure debug function is enabled, the debugger cannot set clock-related registers that are protected by TrustZone. Therefore, writing to flash memory (by setting software breakpoint) is not available if the FCLK frequency is not at minimum required speed for programming flash operation.

In this case, by setting DBGMOCOEN and DBGFCLKSEL, the flash sequency clock can be changed to MOCO to enable writes to flash memory.

2.8.5.9 DBGFCLKSEL : Flash Sequencer Clock Select Register for Debug

Base address: CPU_DBG = 0x4001_B000
CPU_DBG_NS = 0x5001_B000

Offset address: 0x310

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FCLK SEL
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FCLKSEL	Flash sequencer clock select 0: FCLK 1: MOCO	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2

The DBGFCLKSEL register switches the flash P/E sequencer clock. When external debugger is not connected, the register does not have any effect. During P/E mode, the value of this register cannot be updated.

Flash P/E is available with MOCO instead of FCLK even when FCLK is not in the range to support flash P/E. The following flow shows how to use MOCO instead of FCLK.

1. Wait until CPU is in debug state (DHCSR.S_HALT = 1).
2. Check that the flash is not in P/E mode (when flash is in P/E mode, flash P/E by the external host cannot be performed.)
3. Set DBGMOCOEN.MOCOEN to 1.
4. Wait for MOCO oscillation settling time.
5. Set DBGFCLKSEL.FCLKSEL to 1.
6. Perform flash P/E.
7. Clear DBGFCLKSEL.FCLKSEL to 0.
8. Clear DBGMOCOEN.MOCOEN to 0.
9. Restart the CPU.

Note: Usage of the register:

When only non-secure debug function is enabled, the debugger cannot set clock-related registers that are protected by TrustZone. Therefore, writing to flash memory (by setting software breakpoint) is not available if the FCLK frequency is not at minimum required speed for programming flash operation.

In this case, by setting DBGMOCOEN and DBGFCLKSEL, the flash sequency clock can be changed to MOCO to enable writes to flash memory.

2.8.5.10 CoreSight Component Registers

DBGREG has CoreSight Component Registers defined in ARM CoreSight Architecture. Table 2.20 shows the list of the registers.

Table 2.20 CoreSight component registers

Name	Address	Access size	R/W	Initial value
PID4	0x4001_BFD0	32 bits	Read-only	0x00000004
PID5	0x4001_BFD4	32 bits	Read-only	0x00000000
PID6	0x4001_BFD8	32 bits	Read-only	0x00000000
PID7	0x4001_BFDC	32 bits	Read-only	0x00000000
PID0	0x4001_BFE0	32 bits	Read-only	0x00000005
PID1	0x4001_BFE4	32 bits	Read-only	0x00000030
PID2	0x4001_BFE8	32 bits	Read-only	0x0000000A
PID3	0x4001_BFEC	32 bits	Read-only	0x00000000
CID0	0x4001_BFF0	32 bits	Read-only	0x0000000D
CID1	0x4001_BFF4	32 bits	Read-only	0x000000F0
CID2	0x4001_BFF8	32 bits	Read-only	0x00000005
CID3	0x4001_BFFC	32 bits	Read-only	0x000000B1

Note: S-TYPE-5, P-TYPE-2

2.8.6 OCDREG

OCDREG is a register module provided for OCD (On-Chip Debug) Emulator functionalities. OCDREG is implemented as a CoreSight compliant component. Table 2.21 shows register list of OCDREG.

Table 2.21 Register list of OCDREG (1 of 2)

Name	Symbol	DAP port	OCD Address	CPU Address	Access size	R/W
MCU Status Register	MCUSTAT	Port 1	0x8000_0400	Cannot be accessed from CPU	32 bits	Read only
MCU Control Register	MCUCTRL	Port 1	0x8001_1004	0x4001_1004 (Secure) 0x5001_1004 (Non-secure)	32 bits	Read/Write
JTAG Boot Mode Entry Register	JBMDR	Port 1	0x8001_1100	0x4001_1100 (Secure) 0x5001_1100 (Non-secure)	32 bits	Read/Write
JTAG Boot Receive Data Register	JBRDR	Port 1	0x8001_1120	0x4001_1120 (Secure) 0x5001_1120 (Non-secure)	32 bits	Read/Write
JTAG Boot Transmit Data Register	JBTDR	Port 1	0x8001_1130	0x4001_1130 (Secure) 0x5001_1130 (Non-secure)	32 bits	Read/Write
JTAG Boot Status Register	JBSTR	Port 1	0x8001_1140	0x4001_1140 (Secure) 0x5001_1140 (Non-secure)	32 bits	Read/Write
JTAG Boot Interrupt Control Register	JBICR	Port 1	0x8001_1150	0x4001_1150 (Secure) 0x5001_1150 (Non-secure)	32 bits	Read/Write

Table 2.21 Register list of OCDREG (2 of 2)

Name	Symbol	DAP port	OCD Address	CPU Address	Access size	R/W
First Stage Boot Loader Status Monitor Register	FSBLSTATM	Port 1	0x8001_1300	0x4001_1300 (Secure) 0x5001_1300 (Non-secure)	32 bits	Read only

Note: Accesses to OCDREG from CPU is only permitted by privileged access.
Accesses to OCDREG from external debug through APB-AP is permitted by either Privileged access or Unprivileged access.
Note: Do not write to MCUCTRL using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR or JBICR.
Do not write to JBMDR using JTAG/SWD except during RES pin reset.
Do not write to JBRDR using JTAG/SWD while the CPU is accessing MCUCTRL, JBMDR, JBRDR, JBTDR or JBICR.
Do not write to JBTDT using JTAG/SWD.
Do not write to JBSTR using JTAG/SWD.
Do not write to JBICR using JTAG/SWD.

2.8.6.1 MCUSTAT : MCU Status Register

Base address: 0x8000_0400*1

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	DSTBY3	DSTBY2	DSTBY1	—	—	—	STBY1
Value after reset:	0	0	0	0	0	0	0	0	0	x	x	x	0	0	x	x

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	AL[1:0]		—	—	—	—	—	—	—	—	—	CPUSTOPCLK	SLEEP	—
Value after reset:	1	0	0	0	0	0	0	1	0	0	0	0	0	x	x	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0.	R
1	SLEEP	Indicate CPU is in CPU Sleep mode 0: CPU is not in CPU Sleep mode 1: CPU is in CPU Sleep mode	R
2	CPUSTOPCLK	Indicate CPU clock is stopped 0: CPU clock is not stopped. It indicates that the MCU is in Normal or CPU Sleep mode. 1: CPU clock is stopped. It indicates that the MCU is in CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode.	R
7:3	—	These bits are read as 0.	R
8	—	This bit is read as 1.	R
11:9	—	These bits are read as 0.	R
13:12	AL[1:0]	AL monitor 0x0: AL0 0x1: AL1 0x3: AL2	R
14	—	This bit is read as 0.	R
15	—	This bit is read as 1.	R
16	STBY1	Indicate the MCU is in Software Standby mode 0: MCU is not in Software Standby mode 1: MCU is in Software Standby mode	R
19:17	—	These bits are read as 0.	R
20	DSTBY1	Indicate the MCU is in Deep Software Standby mode 1 0: MCU is not in Deep Software Standby mode 1 1: MCU is in Deep Software Standby mode 1	R

Bit	Symbol	Function	R/W
21	DSTBY2	Indicate the MCU is in Deep Software Standby mode 2 0: MCU is not in Deep Software Standby mode 2 1: MCU is in Deep Software Standby mode 2	R
22	DSTBY3	Indicate the MCU is in Deep Software Standby mode 3 0: MCU is not in Deep Software Standby mode 3 1: MCU is in Deep Software Standby mode 3	R
31:23	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note 1. The address of MCUSTAT register can only be accessed by external debugger.

The MCUSTAT register indicates the MCU status and authentication status. All bits in the MCUSTAT register are monitoring bits, so they cannot be reset. The register has no security protection.

2.8.6.2 MCUCTRL : MCU Control Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPUWAIT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	EDBGRQ
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EDBGRQ	External Debug Request. Writing 1 to the bit causes a CPU Halt or Debug Monitor exception request. 0: Debug event is not requested 1: Debug event is requested	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W
16	CPUWAIT	CPU Wait Setting 0: Deassert CPUWAIT CPU starts boot-up sequence and instruction execution out of Reset. 1: Assert CPUWAIT CPU is forced into a quiescent state out of Reset.	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2
Note: This register is valid only when any of the following conditions are true:

- CDBGPWRUPREQ is 1, and AL is AL2 or AL1.
- OFS1(_SEC).SWDBG is 0, and DBGAUTH0.DBGEN0 is 1.

When none of the above conditions are true, the MCU ignores this register setting and considers all bits to be 0.
Note 1. This address is accessed from external debugger.

The MCUCTRL register provides the external debugger ability to enter debug state by external event.

2.8.6.3 Authentication Control Registers

Authentication registers accessible from debugger are placed in OCDREG.

2.8.6.3.1 JBMDR : JTAG Boot Mode Entry Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x100

Bit position:	31																								7							0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	KEY[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	KEY[7:0]	Mode entry key Pin reset releases after 0xA5 is set, then system enters the JTAG boot mode. MDSR.JBOTS = 1 when system transitions to JTAG boot mode.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The JBMDR register sets command from the debugger.

This register is initialized by the factors listed Table 5.2 in section 5, Resets, but also initialized by debugger disconnection.

2.8.6.3.2 JBRDR : JTAG Boot Receive Data Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x120

Bit position:	31																															0
Bit field:	RDAT[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	RDAT[31:0]	Received data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: External host R: CPU (Boot firmware) When JBSTR.RDF = 1, write is not possible and an error occurs.	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The JBRDR register is used for receiving data from the debugger.

2.8.6.3.3 JBTDR : JTAG Boot Transmit Data Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x130

Bit position:	31																															0
Bit field:	TDAT[31:0]																															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TDAT[31:0]	Transmitted data register R/W is possible for both the external host and CPU, but the following usage is recommended: W: CPU (Boot firmware) R: External host When JBSTR.TDE = 1, read is not possible and an error occurs.	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The JBTDR register is used for transmitting data to the debugger.

2.8.6.3.4 JBSTR : JTAG Boot Status Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x140

Bit position:	31																													1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TDE	RDF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	RDF	Receive buffer full 0: No receiving data 1: There is receiving data	R/W
1	TDE	Transmit data empty 0: There is data transmission 1: No data transmission	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The JBSTR register is used for monitoring booting status.

RDF flag (Receive buffer full

The RDF bit indicates receive buffer is full or not.

[Set conditions]

- Read access to JBTDR
- Write 1 to JBSTR.RDF

[Clear conditions]

- Write access to JBTDR
- Write 0 to JBSTR.RDF

TDE flag (Transmit data empty

The TDE bit indicates transmit data is empty or not.

[Set conditions]

- Read access to JBTDR
- Write 1 to JBSTR.TDE

[Clear conditions]

- Write access to JBTDR

- Write 0 to JBSTR.TDE

2.8.6.3.5 JBICR : JTAG Boot Interrupt Control Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x150

Bit position:	31																													0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RDFIE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RDFIE	Receive buffer full interrupt enabled 0: Interrupt request disabled by RDF = 1 1: Enable interrupt request by RDF = 1	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The JBICR register is used for controlling interrupt during JTAG boot.

2.8.6.3.6 FSBLSTATM : First Stage Boot Loader Status Monitor Register

Base address: OCD_CPU = 0x4001_1000
OCD_CPU_NS = 0x5001_1000
OCD_DAP = 0x8001_1000*1

Offset address: 0x300

Bit position:	31																												1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RS	CS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CS	FSBL completion status 0: FSBL is not complete 1: FSBL is complete	R
1	RS	FSBL result status 0: FSBL failed 1: FSBL passed	R
31:2	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note 1. This address is accessed from external debugger.

The FSBLSTATM indicates first stage boot loader status.

Deep Software Standby reset and software reset do not initialize the CS and RS bits of the FSBLSTATM register when FSBL execution is skipped by those resets.

2.8.6.4 CoreSight Component Registers

OCDREG has CoreSight Component Registers defined in ARM CoreSight Architecture. Table 2.22 shows the list of the registers.

See section 2.14. References [7] for the detail of each register

Table 2.22 CoreSight component registers

Name	Address	Access size	R/W	Initial value
PID4	0x8001_1FD0	32 bits	Read-only	0x00000004
PID5	0x8001_1FD4	32 bits	Read-only	0x00000000
PID6	0x8001_1FD8	32 bits	Read-only	0x00000000
PID7	0x8001_1FDC	32 bits	Read-only	0x00000000
PID0	0x8001_1FE0	32 bits	Read-only	0x00000004
PID1	0x8001_1FE4	32 bits	Read-only	0x00000030
PID2	0x8001_1FE8	32 bits	Read-only	0x0000000A
PID3	0x8001_1FEC	32 bits	Read-only	0x00000000
CID0	0x8001_1FF0	32 bits	Read-only	0x0000000D
CID1	0x8001_1FF4	32 bits	Read-only	0x000000F0
CID2	0x8001_1FF8	32 bits	Read-only	0x00000005
CID3	0x8001_1FFC	32 bits	Read-only	0x000000B1

Note: S-TYPE-5, P-TYPE-2

2.9 CoreSight Cross Trigger Interface (CTI)

Table 2.23 CTI channel

Number of CTI channel	CTITRIGIN		CTITRIGOUT	
CTI	0	ACQCOMP	0	—
	1	FULL	1	—
	2	—	2	ETB FLUSHIN
	3	—	3	ETB TRIGIN
	4	—	4	—
	5	—	5	—
	6	—	6	—
	7	—	7	—
CTI0	0	Processor Halted	0	Processor debug request
	1	DWT Comparator Output 0	1	Processor Restart
	2	DWT Comparator Output 1	2	CTIIRQ[0] (connected to ICU0)
	3	DWT Comparator Output 2	3	CTIIRQ[1] (connected to ICU0)
	4	ETM Event Output 0	4	ETM Event Input 0
	5	ETM Event Output 1	5	ETM Event Input 1
	6	—	6	ETM Event Input 2
	7	—	7	ETM Event Input 3

The MCU supports processor CTI0 and CoreSight Common CTI which are implemented in Debug module. The ICU setting is necessary when CTIIRQ is used.

2.10 CoreSight ATB Funnel

The MCU has one CoreSight ATB funnel. The funnel has two ATB slaves and one ATB master, and it is used to select the debug trace sources from ETM and ITM to ETB. Figure 2.3 shows the CoreSight ATB connection in the MCU.

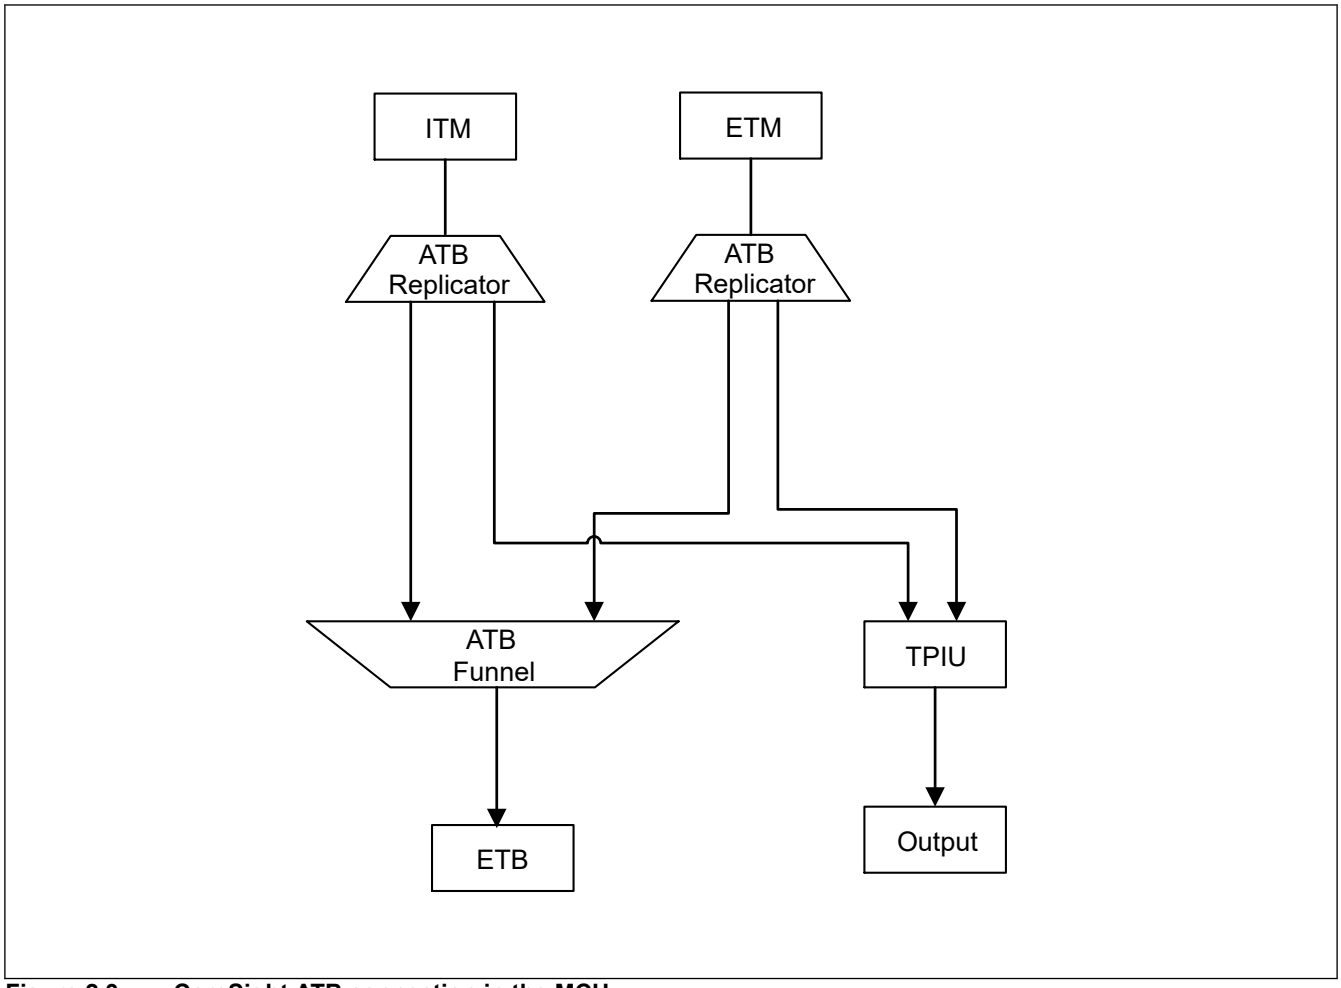

Figure 2.3 CoreSight ATB connection in the MCU

Table 2.24 shows funnel ATB slave connection.

Table 2.24 Funnel ATB slave connection.

ATB slave number	Connected trace source
#0	CPU-ITM
#1	CPU-ETM

See section 2.14. References [5] for detail of ATB and Funnel.

2.11 SysTick System Timer

The MCU has two SysTick system timers, secure SysTick and non-secure SysTick.

The SysTick source is CPUCLK or SYSTICKCLK (MOCO/8). When the SysTick source is SYSTICKCLK (MOCO/8), the CPUCLK frequency must be 2 MHz or higher.

Figure 2.4 shows the SysTick Timer block diagram.

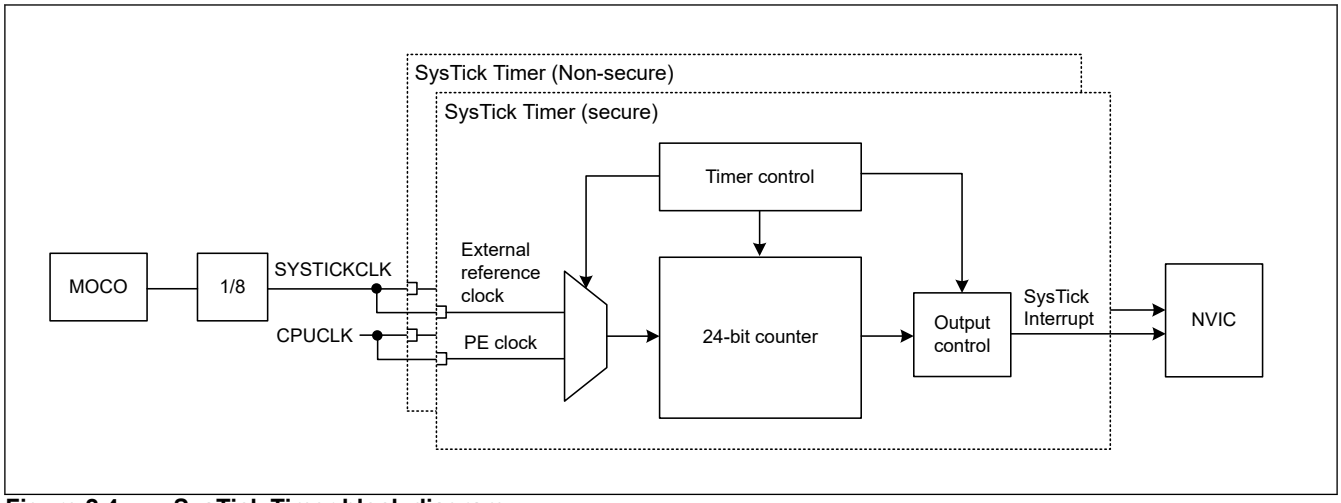

Figure 2.4 SysTick Timer block diagram

2.12 CoreSight Timestamp Generator

The MCU has a CoreSight Timestamp Generator to provide timestamp to ITM and ETM.

The timestamp is generated by a 64-bit counter operating with ICLK/2.

See section 2.14. References [5] for detail.

2.13 OCD Emulator Connection

In this product, the MCU confirms access permission for MCU resources by checking the current authentication level stored in OCDREG.

There are two ways to control authentication level:

- Through JTAG/SWD. See Figure 2.5.
- Using software. See Figure 2.6.

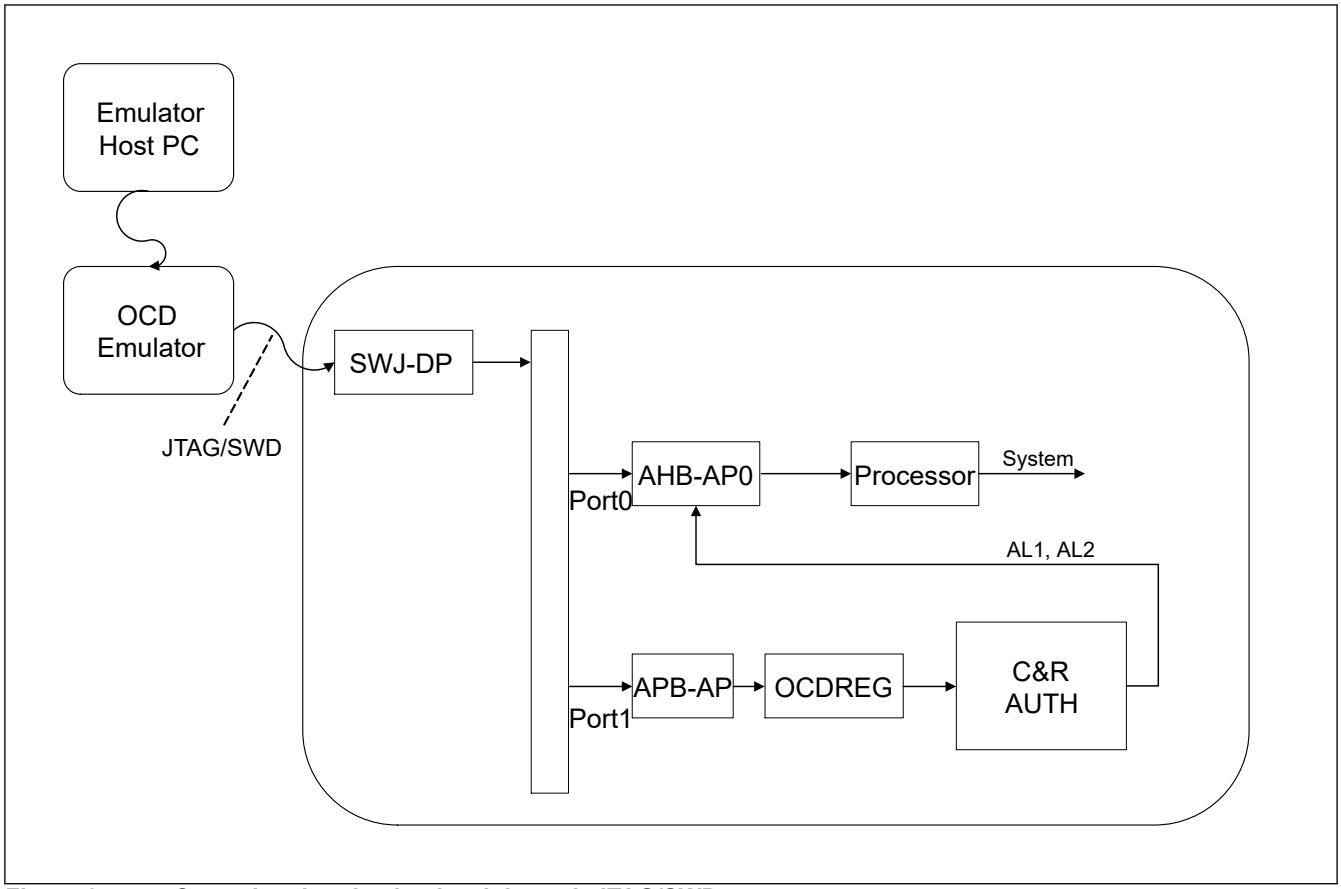

Figure 2.5 Control authentication level through JTAG/SWD

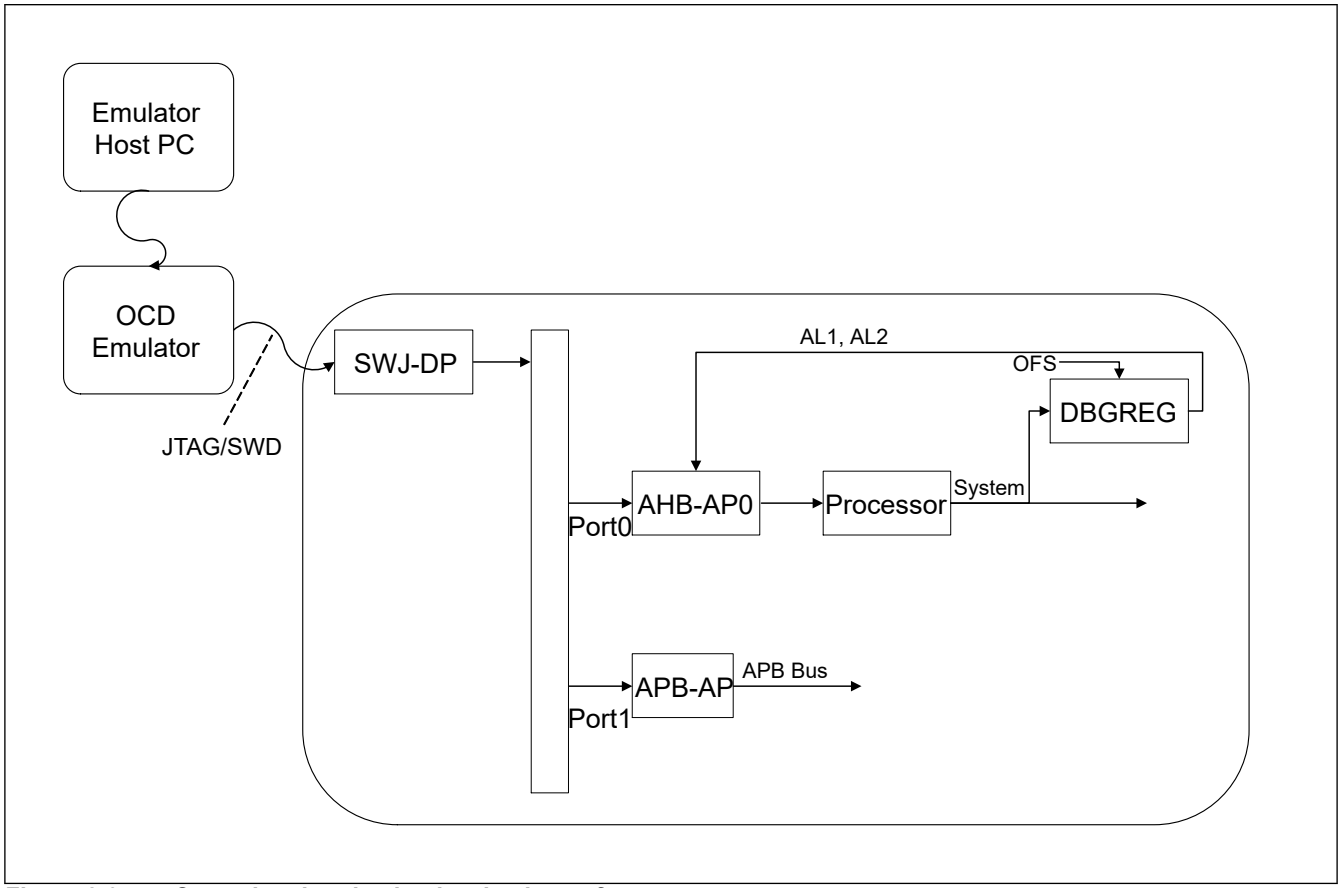

Figure 2.6 Control authentication level using software

2.13.1 SYOCDCR.DBGEN

See section 2.7.3.1. Low power mode for details.

2.13.2 Restriction in OCD Emulator Connecting

There are some restrictions regarding emulator access. This section describes those restrictions.

2.13.3 Starting Connection While in Low Power Mode

When starting a JTAG/SWD connection from an OCD emulator, the MCU must be in Normal, CPU Sleep, or CPU Deep Sleep mode. If the MCU is in Software Standby or Deep Software Standby mode, the OCD emulator can cause the MCU to hang.

2.13.4 Low Power Mode Change During Debugging

When the MCU is in OCD mode, the low power mode can be changed. However, system bus access from AHB-AP is prohibited in Deep Sleep, Software Standby, or Deep Software Standby mode. Only SWJ-DP, APB-AP, and OCDREG can be accessed from OCD emulator in these modes. Table 2.25 shows the limitations.

Table 2.25 Low power mode change during debugging

Current mode	Start OCD emulator connection	Change low power mode	Access AHB-AP and system bus	Access APB-AP and OCDREG
Normal	Available	Available	Available	Available
Sleep	Available	Available	Available	Available
Deep Sleep	Available	Available	N/A	Available
Software Standby	N/A	Available	N/A	Available
Deep Software Standby	N/A	Available	N/A	Available

2.13.5 Connecting Sequence and JTAG/SWD Authentication

This section provides steps on how to authenticate the MCU. First, the section introduces which mechanism is used to authenticate the MCU. Next, using the previously described mechanism, the section describes steps for connecting sequence and authenticating the MCU using JTAG/SWD. See section 2.8.5. DBGREG and section 2.8.6. OCDREG for details about the registers control JTAG/SWD authentication.

2.13.5.1 JTAG/SWD Authentication Mechanism

The common platform of the MCU supports challenge-response authentication.

For challenge-response authentication, Boot FW authenticates.

2.13.5.2 Connecting Sequence and JTAG/SWD Authentication

For challenge-response authentication:

1. Connect the OCD debugger to the MCU through the JTAG or SWD interface.
2. Set up SWJ-DP to access DAP bus.
   In the setup, the OCD emulator must assert CDBGPWRUPREQ in the SWJDP Control Status Register, and then wait until CDBGPWRUPACK in the same register is asserted.
3. Set the APB-AP to access OCDREG. This APB-AP is connected to DAP bus port 1.
4. Set boot mode request.
5. Negate RES.
6. Check MCUSTAT.AL.
   If MCUSTAT.AL is higher than or equal to request AL, there is no need to authenticate.
7. Set authentication data.
8. Check MCUSTAT.AL.

(a) If MCUSTAT.AL does not request AL, authentication failed.

(b) If retry authentication: go to step 7.

9. Assert RES to move to single chip mode.
10. Set up the AHB-AP to access the system address space. The AHB-AP is connected to DAP bus port 0.
11. Start accessing the CPU debug resources using the AHB-AP.

2.15 Usage Notes

2.15.1 Restrictions for OSPI

There are restrictions to using OSPI, see section 37.3.8.3. Memory Write Combination Mode and section 37.3.8.5. Restriction in 8D-8D-8D profile 1.0 formatt.

3. Operating Modes

3.1 Overview

Table 3.1 shows the selection of operating modes by the mode-setting pin(MD pin) and JTAG accessible command. For details, see section 3.3. Details of Operating Modes.

Table 3.1 Selection of operating modes by the mode-setting pin

Mode-setting pin (MD)	Operating mode	On-chip Flash	External bus
1	Single chip mode/ JTAG Boot Mode	Enable	Disable
0	SCI / USB boot mode	Enable	Disable

3.2 Operating Mode Types and Selection

Table 3.1 show the relationship between levels on the mode-setting pins (MD) on release from the reset state and the operating mode selected at that time. For details on each of the operating modes, see section 3.3. Details of Operating Modes. Operation starts with the on-chip Flash enabled and the external bus disabled, regardless of the mode in which operation started.

3.3 Details of Operating Modes

3.3.1 Single-Chip Mode

In single-chip mode, all I/O pins are available for use as input or output port, inputs or outputs for peripheral functions, or as interrupt inputs. When a reset is released while the MD pin is high, the MCU starts in single-chip mode and the on-chip flash is enabled.

3.3.2 JTAG Boot Mode

In this mode, the on-chip flash memory programming routine (JTAG boot program), stored in the boot area within the MCU, is used. The on-chip flash, including code flash memory and data flash memory, can be modified from outside the MCU by using the JTAG and SWD interface. CSW.DbgSwEnable bit in APB-AP Control/Status Word register must be 1 in this mode.

To enter this mode, it is necessary to input the request from the JTAG and SWD-I/F during RES-pin reset.

3.3.3 SCI Boot Mode

In this mode, the on-chip flash memory programming routine (SCI boot program), stored in a dedicated area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using a universal asynchronous receiver/transmitter (UART) SCI. For details, see section 52, Flash Memory. The MCU starts in SCI boot mode if the MD pin is held low on release from the reset state.

3.3.4 USB Boot Mode

In this mode, the on-chip flash memory programming routine (USB boot program), stored in the boot area within the MCU, is used. The on-chip flash, including the code flash memory and data flash memory, can be modified from outside the MCU by using the USB. For details, see section 52, Flash Memory. The MCU starts in USB boot mode if the MD pin is held low on release from the reset state.

3.4 Operating Modes Transitions

3.4.1 Operation modes and the relationship of Mode Transition

Figure 3.1 shows that the operation modes and the relationship of mode transition. Operating mode can be transitioned in the direction of the arrow at the figure.

JTAG Boot mode is not possible using POR.

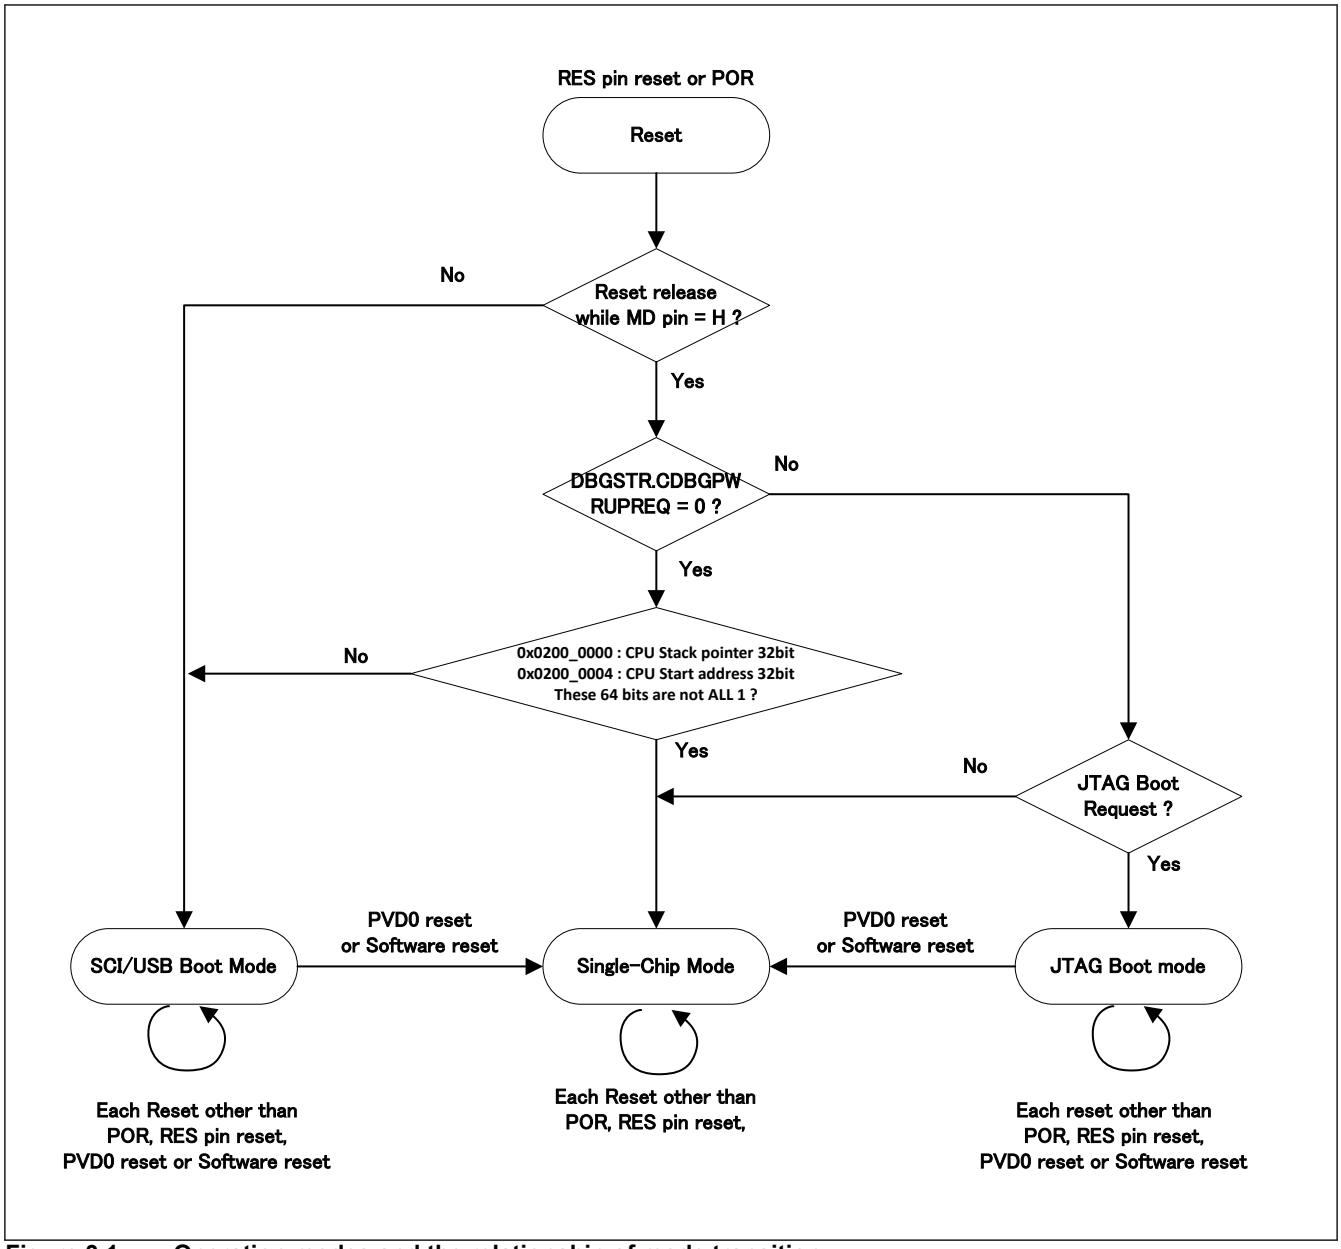

Figure 3.1 Operation modes and the relationship of mode transition

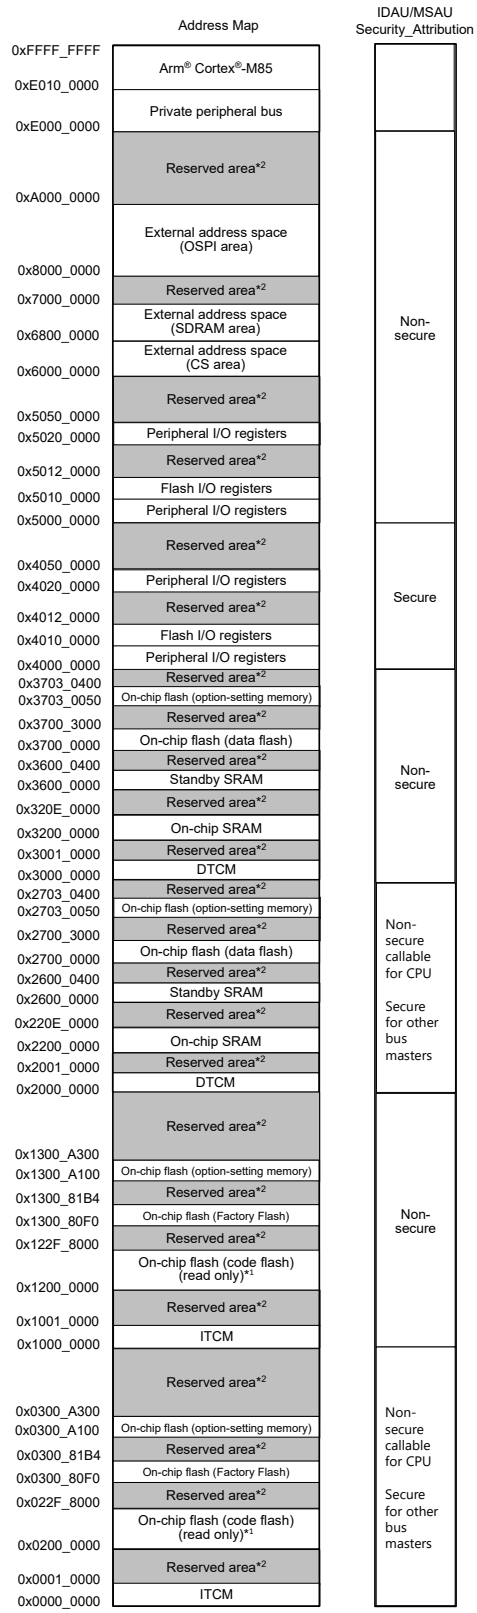
4. Address Space

4.1 Address Space

The MCU supports a 4 GB linear address space ranging from 0x0000_0000 to 0xFFFF_FFFF that can contain both program and data. In the address from 0x0000_0000 to 0x5FFF_FFFF, secure and non-secure region are isolated by using bit 28 of the address. For detail on the security attributes, see section 43.3. Arm Security Features.Figure 4.1 shows the memory map example of 2 MB flash product.



Note 1. See Table 4.1. The capacity of the flash differs depending on the product.
Note 2. Do not access reserved areas.

Figure 4.1 Memory map example of 2 MB flash product

Table 4.1 Capacity of the code flash memory, data flash memory, and SRAM0 in Secure alias

Code flash memory			Data flash memory		On-chip SRAM	
Capacity	Address		Capacity	Address	Capacity	Address
	Linear mode	Dual mode (BANKSEL.BANKSWP[2:0] = 111b)				
2 MB	0x0200_0000 - 0x021F_7FFF	upper side bank 0x0220_0000 - 0x022F_7FFF	12 KB	0x2700_0000 - 0x2700_2FFF	896 KB	0x2200_0000 - 0x220D_FFFF
		lower side bank 0x0200_0000 - 0x020F_7FFF				
1 MB	0x0200_0000 - 0x020F_FFFF	upper side bank 0x0220_0000 - 0x0227_FFFF				
		lower side bank 0x0200_0000 - 0x0207_FFFF				

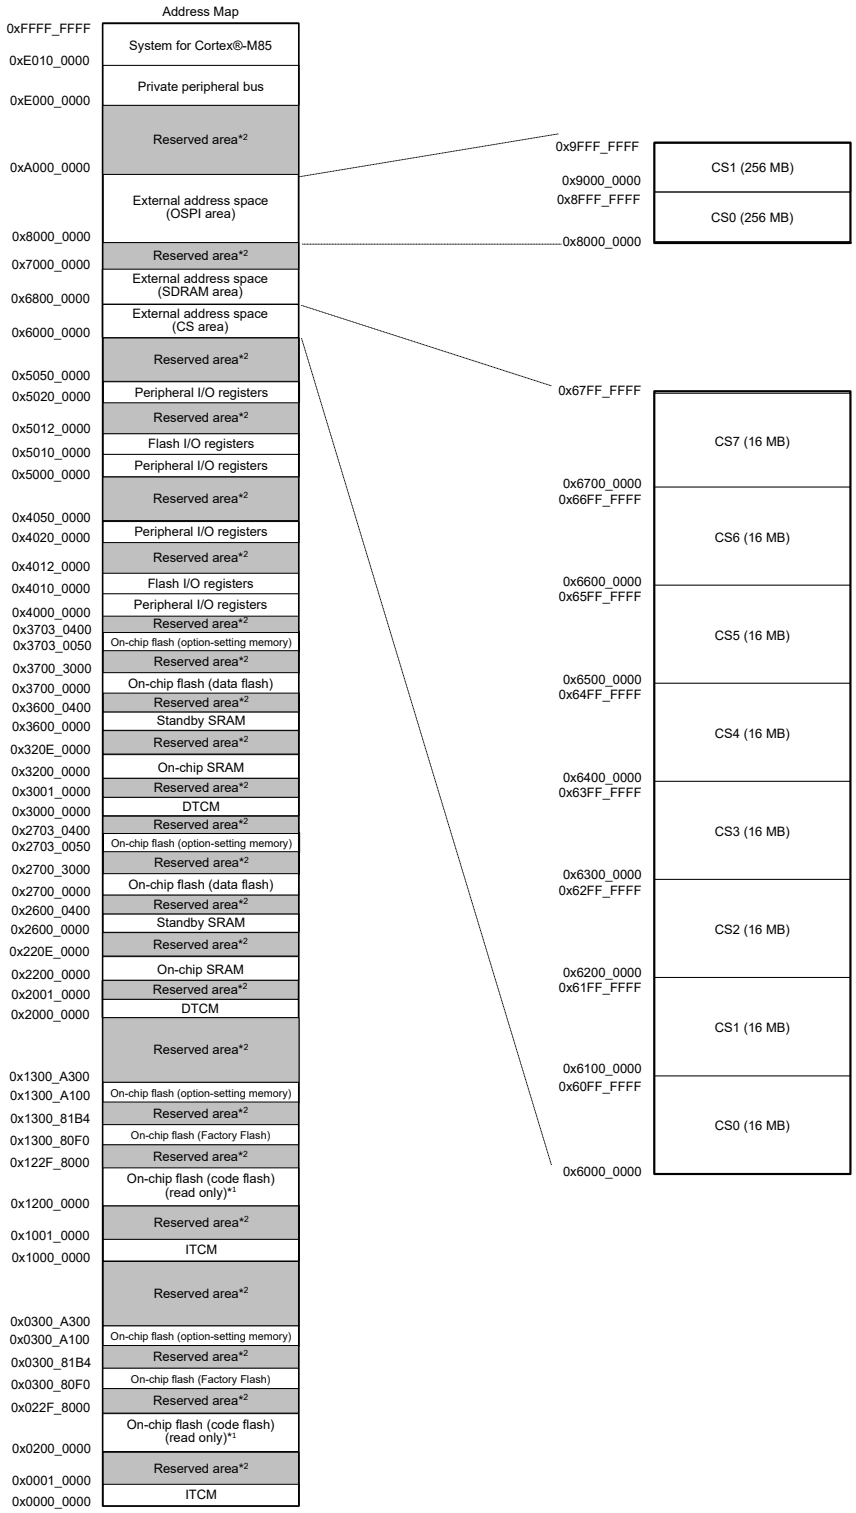
Table 4.2 Capacity of the code flash memory, data flash memory, and On-chip SRAM in Non-secure alias

Code flash memory			Data flash memory		On-chip SRAM	
Capacity	Address		Capacity	Address	Capacity	Address
	Linear mode	Dual mode (BANKSEL.BANKSWP[2:0] = 111b)				
2 MB	0x1200_0000 - 0x121F_7FFF	upper side bank 0x1220_0000 - 0x122F_7FFF	12 KB	0x3700_0000 - 0x3700_2FFF	896 KB	0x3200_0000 - 0x320D_FFFF
		lower side bank 0x1200_0000 - 0x120F_7FFF				
1 MB	0x1200_0000 - 0x120F_FFFF	upper side bank 0x1220_0000 - 0x1227_FFFF				
		lower side bank 0x1200_0000 - 0x1207_FFFF				

4.2 External Address Space

The external address space is divided into CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1). The eight CS areas (CS0 to CS7) each correspond to the CSn signal output from a CSn (n = 0 to 7) pin. The two OSPI areas (CS0 and CS1) each correspond to the OM_CSn signal output from a OM_CSn (n = 0, 1) pin.

Figure 4.2 shows the address ranges associated with the individual CS areas (CS0 to CS7), SDRAM area (SDCS), and OSPI areas (CS0 and CS1).



Note 1. See Table 4.1. The capacity of the flash differs depending on the product.
Note 2. Do not access reserved areas.

Figure 4.2 Detailed address map for CS area and OSPI area

5. Resets

5.1 Overview

This MCU provides the following 13 types of reset.

It also has a function to control the reset generation by only Secure program access.

System reset is all factors such that can initialize CPU core. All reset factors except VBATT_POR are system reset for this product.

On the other hand, CPU has a reset that initializes itself individually. That reset is not a system reset. See section 2, CPU for detals.

Table 5.1 lists the reset names and sources.

Table 5.1 Reset names and sources

Reset Name		Source
System reset	RES Pin reset	The RES pin voltage input is driven low
	Power-on reset (POR)	VCC falls (voltage detection: V_{POR})*1
	Voltage Monitor 0 reset	VCC falls (voltage detection: V_{det0})*1
	Voltage Monitor 1 reset	VCC falls (voltage detection: V_{det1})*1
	Voltage Monitor 2 reset	VCC falls (voltage detection: V_{det2})*1
	Independent Watchdog Timer reset	IWDT underflow or refresh error
	Watchdog Timer reset	WDT underflow or refresh error for CPU
	CPU Lockup reset	This reset is generated when CPU encounters lockup
	Bus Error reset	BUS error (MSAU error, MMPU error, Illegal address error, STZF error, Slave Bus error, Bufferable write error)
	Common Memory Error reset	RAM error (ECC error or Parity error of SRAM and Standby SRAM)
	Deep Software Standby reset	Deep Software Standby mode is canceled by an interrupt
	Software reset	Register setting (use the software reset bit AIRCR.SYSRESETREQ)
VBATT_POR reset		VBATT_R falls (voltage detection: $V_{PDR\ (BATR)}$)*1

Note 1. For details on the voltages to be monitored (V_{POR}, V_{det0}, V_{det1}, V_{det2}, and $V_{PDR\ (BATR)}$), see section 7, Programmable Voltage Detection (PVD), section 11, Battery Backup Function, and section 60, Electrical Characteristics.

The internal state and pins are initialized by a reset. Table 5.2 and Table 5.3 list the targets initialized by resets.

Some of these registers are initialized when returning from Software Standby mode. See section 10, Low Power Modes.

In this table, registers of modules marked as "Undesfined" in Software Standby mode are initialized.

Table 5.2 Reset detect flags initialized by each reset source (1 of 4)

Flag to be initialized	Reset source						
	RES pin reset	Power-on reset	Voltage monitor 0 reset	Independent watchdog timer reset	Watchdog timer reset	CPU Lockup reset	Voltage monitor 1 reset
Power-On Reset Detect Flag (RSTSR0.PORF)	✓	—	—	—	—	—	—
Voltage Monitor 0 Reset Detect Flag (RSTSR0.PVD0RF)	✓	✓	—	—	—	—	—
Independent Watchdog Timer Reset Detect Flag (RSTSR1.IWDTRF)	✓	✓	✓	—	—	—	—
Watchdog Timer Reset Detect Flag (RSTSR1.WDT0RF)	✓	✓	✓	—	—	—	—
CPU Lockup Reset Detect Flag (RSTSR1.CLU0RF)	✓	✓	✓	—	—	—	—

Table 5.2 Reset detect flags initialized by each reset source (2 of 4)

Flag to be initialized	Reset source						
	RES pin reset	Power-on reset	Voltage monitor 0 reset	Independent watchdog timer reset	Watchdog timer reset	CPU Lockup reset	Voltage monitor 1 reset
Voltage Monitor 1 Reset Detect Flag (RSTSR0.PVD1RF)	✓	✓	✓	—	—	—	—

Other than specified		✓	✓	✓	✓	✓	✓	✓	—

Note: ✓ : Initialized
— : Not initialized

Note 1. RTC has Software reset for RTC. Some control bits are not initialized by all types of resets. For details on the target bits, section 24, Realtime Clock (RTC).

Note 2. Depend on setting of DPSBYCR.IOKEEP.

Note 3. After the debugger authentication passes, setting SYOCDCR.DBGEN to 1 does not initialize this register or the function. For details, see section 2, CPU.

SOSC and LOCO can be selected as the clock sources of the RTC.

Table 5.4 and Table 5.5 show the states of SOSC and LOCO when a reset occurs.

Table 5.4 States of SOSC when a reset occurs

		Reset source	
		VBATT_POR reset	Other
SOSC	Enable or disable	Initialized to enable	Continue with the state that was selected before the reset occurred
	Drive capability	Initialized to standard drive capability	

Table 5.5 States of LOCO when a reset occurs

		Reset source	
		Power-on reset, Voltage-Monitoring0 reset, Deep software standby 2,3 reset	Other
LOCO	Enable or disable	Initialized to enable	
	Oscillation accuracy*1	Initialized to accuracy before trimming by LOCOUTCR (accuracy: ± 15%)	Continue with the accuracy that was trimmed by LOCOUTCR

Note 1. If the LOCO that is trimmed by LOCOUTCR is selected as the RTC source clock, please be careful that LOCO oscillation accuracy will be initialized by Power-on reset, Voltage-Monitor 0 reset and Deep software standby 2, 3 reset.

When a reset is released, reset exception handling starts. For details on the reset exception handling, see section 5.3.12. Determination of Reset Generation Source.

Table 5.6 lists the pin related to the reset function.

For details on the reset exception handling, see section 5.3.12. Determination of Reset Generation Source.

Table 5.6 Pin related to reset

Pin name	I/O	Function
RES	Input	Reset pin

5.2 Register Descriptions

5.2.1 RSTSAR : Reset Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3C4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC2	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: Reset Status Register 0 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: Reset Status Register 1 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: Reset Status Register 2 0: Secure 1: Non-secure	R/W
31:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of RSTSR0.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of RSTSR1.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of RSTSR2.

5.2.2 RSTSR0 : Reset Status Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DPSRSTF	—	—	—	PVD2RF	PVD1RF	PVD0RF	PORF
Value after reset:	x*1	0	0	0	x*1	x*1	x*1	x*1

Bit	Symbol	Function	R/W
0	PORF	Power-On Reset Detect Flag 0: Power-on reset not detected 1: Power-on reset detected	R/W*2
1	PVD0RF	Voltage Monitor 0 Reset Detect Flag 0: Voltage monitor 0 reset not detected 1: Voltage monitor 0 reset detected	R/W*2
2	PVD1RF	Voltage Monitor 1 Reset Detect Flag 0: Voltage monitor 1 reset not detected 1: Voltage monitor 1 reset detected	R/W*2
3	PVD2RF	Voltage Monitor 2 Reset Detect Flag 0: Voltage monitor 2 reset not detected 1: Voltage monitor 2 reset detected	R/W*2
6:4	—	These bits are read as 0. The write value should be 0.	R/W
7	DPSRSTF	Deep Software Standby Reset Flag 0: Deep Software Standby mode cancellation not requested by an interrupt or a reset*3. 1: Deep Software Standby mode cancellation requested by an interrupt or a reset*3.	R/W*2

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.
Note 3. Independent watchdog timer reset, Voltage Monitor 1 reset, Voltage Monitor 2 reset.

PORF flag (Power-On Reset Detect Flag)

The PORF flag indicates that a power-on reset occurred.

[Setting condition]

- When a power-on reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from PORF flag.

PVD0RF flag (Voltage Monitor 0 Reset Detect Flag)

The PVD0RF flag indicates that the Voltage Monitor 0 reset has occurred.

[Setting condition]

- When a voltage monitor 0 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from PVD0RF flag.

PVD1RF flag (Voltage Monitor 1 Reset Detect Flag)

The PVD1RF flag indicates that the Voltage Monitor 1 reset has occurred.

[Setting condition]

- When a voltage monitor 1 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from PVD1RF flag.

PVD2RF flag (Voltage Monitor 2 Reset Detect Flag)

The PVD2RF flag indicates that the Voltage Monitor 2 reset has occurred.

[Setting condition]

- When a voltage monitor 2 reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from PVD2RF flag.

DPSRSTF flag (Deep Software Standby Reset Flag)

The DPSRSTF flag indicates that Deep Software Standby mode is canceled by an external or internal interrupt, and that an internal reset (Deep Software Standby reset) occurs when an exception from Deep Software Standby mode occurs.

[Setting condition]

- When Deep Software Standby mode is cancelled by an external or an internal interrupt. For details, see section 10, Low Power Modes.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs.
- When 0 is written after 1 is read from DPSRSTF flag.

5.2.3 RSTSR1 : Reset Status Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	CMRF	—	—	—	BUSRF	—	—	—	—	—	CLU0RF	—	SWRF	WDT0RF	IWDTRF
Value after reset:	0	x*1	0	0	0	x*1	0	0	0	0	0	x*1	0	x*1	x*1	x*1

Bit	Symbol	Function	R/W
0	IWDTRF	Independent Watchdog Timer Reset Detect Flag 0: Independent watchdog timer reset not detected 1: Independent watchdog timer reset detected	R/W*2
1	WDT0RF	Watchdog Timer Reset Detect Flag 0: Watchdog timer reset not detected 1: Watchdog timer reset detected	R/W*2
2	SWRF	Software Reset Detect Flag 0: Software reset not detected 1: Software reset detected	R/W*2
3	—	This bit is read as 0. The write value should be 0.	
4	CLU0RF	CPU Lockup Reset Detect Flag 0: CPU Lockup reset not detected 1: CPU Lockup reset detected	R/W*2
9:5	—	These bits are read as 0. The write value should be 0.	R/W
10	BUSRF	Bus Error Reset Detect Flag 0: Bus error reset not detected 1: Bus error reset detected	R/W*2
13:11	—	These bits are read as 0. The write value should be 0.	R/W
14	CMRF	Common Memory Error Reset Detect Flag 0: Common memory error reset not detected 1: Common memory error reset detected	R/W*2
31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 0 can be written to clear the flag. The flag must be cleared by writing 0 after 1 is read.

IWDTRF flag (Independent Watchdog Timer Reset Detect Flag)

The IWDTRF flag indicates that an Independent watchdog timer reset occurred.

[Setting condition]

- When an independent watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from IWDTRF flag.

WDT0RF flag (Watchdog Timer Reset Detect Flag)

The WDT0RF flag indicates that a Watchdog timer reset occurred.

[Setting condition]

- When a watchdog timer reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from WDT0RF flag.

SWRF flag (Software Reset Detect Flag)

The SWRF flag indicates that a Software reset occurred.

[Setting condition]

- When a software reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from SWRF flag.

CLU0RF flag (CPU Lockup Reset Detect Flag)

The CLU0RF flag indicates that a CPU Lockup reset occurred.

[Setting condition]

- When a CPU Lockup reset occurs

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from CLU0RF flag.

BUSRF flag (Bus Error Reset Detect Flag)

The BUSRF flag indicates that BUS error reset (MSAU error, MMPU error, Illegal address error, Slave TrustZone Filter error, Slave Bus error, Bufferable write error) occurred.

[Setting condition]

- When a bus error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from BUSRF flag.

CMRF flag (Common Memory Error Reset Detect Flag)

The CMRF flag indicates that a Common memory error reset (ECC error or Parity error of SRAM and Standby SRAM) occurred.

[Setting condition]

- When a Common memory error reset occurs.

[Clearing conditions]

- When a reset listed in Table 5.2 occurs
- When 0 is written after 1 is read from CMRF flag.

There are several causes for setting this reset flag.

If you want to identify the reset factor, see section 13, Interrupt Controller Unit (ICU).

5.2.4 RSTSR2 : Reset Status Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA44

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CWSF
Value after reset:	0	0	0	0	0	0	0	x*1

Bit	Symbol	Function	R/W
0	CWSF	Cold/Warm Start Determination Flag 0: Cold start 1: Warm start	R/W*2
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The value after reset depends on the reset source.
Note 2. Only 1 can be written to set the flag.

RSTSR2 determines whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

CWSF flag (Cold/Warm Start Determination Flag)

The CWSF flag indicates the type of reset processing, either cold start or warm start. CWSF flag is initialized by a power-on reset. It is not initialized by a reset signal generated by the RES pin.

[Setting condition]

- When 1 is written by software. Writing 0 to CWSF does not set it to 0.

[Clearing condition]

- When a reset listed in Table 5.2 occurs.

5.2.5 SYRSTMSK0 : System Reset Mask Control Register 0

Base address: SYSC = 0x4001_E000

Offset address: 0xAD0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BUSMASK	CMMASK	—	CLU0MASK	—	SWMASK	WDT0MASK	IWDTMASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTMASK	Independent Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	WDT0MASK	Watchdog Timer Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
2	SWMASK	Software Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	CLU0MASK	CPU Lockup Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Bit	Symbol	Function	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	CMMASK	Common Memory Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7	BUSMASK	Bus Error Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK0 is a register that controls the occurrence of reset.

The IWDTMASK bit cannot be rewritten while the independent watchdog timer is operating. The WDT0MASK bit cannot be rewritten while the watchdog timer is operating.

5.2.6 SYRSTMSK2 : System Reset Mask Control Register 2

Base address: SYSC = 0x4001_E000

Offset address: 0xAD8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	PVD2 MASK	PVD1 MASK
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PVD1MASK	Voltage Monitor 1 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
1	PVD2MASK	Voltage Monitor 2 Reset Mask 0: Reset occurrence is enabled 1: Reset occurrence is disabled	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-6, P-TYPE-2
Note: Set the PRCR.PRC5 bit to 1 (write enabled) before rewriting this register.

The SYRSTMSK2 is a register that controls the occurrence of reset.

5.3 Operation

5.3.1 RES Pin Reset

The RES pin generates this reset. When the RES pin is driven low, all the processing in progress is aborted and the MCU enters a reset state. To successfully reset the MCU, the RES pin must be held low for the power supply stabilization time specified at power-on.

When the RES pin is driven high from low, the internal reset is canceled after the post-RES cancellation wait time (t_{RESWT}) elapses. The CPU then starts the reset exception handling.

For details, see section 60, Electrical Characteristics.

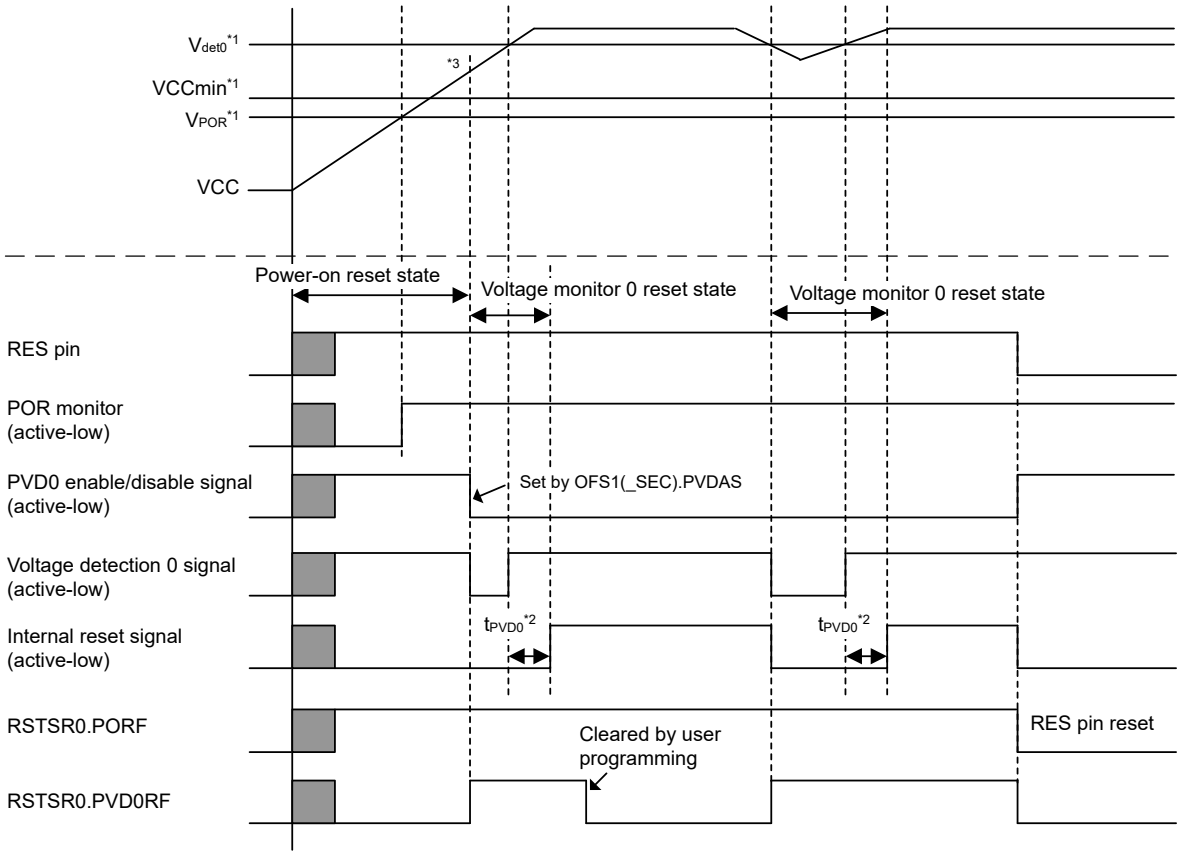
5.3.2 Power-On Reset

The power-on reset circuit generates this internal reset. If the RES pin is in a high-level state when power is supplied, a power-on reset is generated.

After VCC exceeds V_{POR} and the specified period (power-on reset time) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The power-on reset time is the stabilization period for the external power supply and the MCU circuit.

After a power-on reset is generated, the PORF flag in the RSTSR0 is set to 1. The PORF flag is initialized by the RES pin reset.

Figure 5.1 shows examples of operations during a power-on reset and voltage monitor 0 reset.



Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. V_{det0} shows a voltage monitor 0 reset detection level, V_{POR} shows a power-on reset detection level, and VCCmin shows minimum guaranteed voltage of MCU.
Note 2. tPVD0 shows the reset time of Voltage Monitor 0.
Note 3. At power-on, VCC should rise to the minimum guaranteed voltage before the power-on reset is released.

Figure 5.1 Example of operations during a power-on reset and Voltage Monitor 0 Reset

5.3.3 Voltage Monitor Reset

The voltage monitor 0 reset is an internal reset generated by the voltage monitor circuit. If the Voltage Detection 0 Circuit Start bit PVDAS) in Option Function Select Register 1 (OFS1) is 0 (voltage monitor 0 reset is enabled after a reset) and VCC falls below V_{det0}, the RSTSR0.PVD0RF flag is set to 1 and the voltage detection circuit generates a voltage monitor 0 reset. Clear the OFS1(_SEC).PVDAS bit to 0 if the voltage monitor 0 reset is to be used. After VCC exceeds V_{det0} and the voltage monitor 0 reset time (t_{PVD0}) elapses, the internal reset is canceled, and the CPU starts the reset exception handling. The V_{det0} voltage detection level can be changed by the setting in the VDSEL[1:0] bits in Option Function Select Register 1 (OFS1).

- Case of PVDmFCR.RHSEL = 0

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC falls to or below Vdet1.

Similarly, timing for release from the Voltage Monitor 1 reset state is selectable in the Voltage Monitor 1 Reset Negate Select bit (RN) in PVD1CR0. When the RN bit is 0 and VCC falls to or below Vdet1, the CPU is released from the internal

reset state and starts reset exception handling when the PVD1 reset time (t_{PVD1}) elapses after VCC rises above Vdet1. When the PVD1CR0.RN bit is 1 and VCC falls to or below Vdet1, the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time ($_{tPVD1}$) elapses.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC falls to or below Vdet2.

Similarly, timing for release from the Voltage Monitor 2 reset state is selectable in the Voltage Monitor 2 Reset Negate Select bit (RN) in PVD2CR0. When the RN bit is 0 and VCC falls to or below Vdet2, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses after VCC rises above Vdet2. When the PVD2CR0.RN bit is 1 and VCC falls to or below Vdet2, the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses.

- Case of PVDmFCR.RHSEL = 1.

When the Voltage Monitor 1 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 1 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 1 Circuit Control Register 0 (PVD1CR0), the RSTSR0.PVD1RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 1 reset if VCC rises above Vdet1.

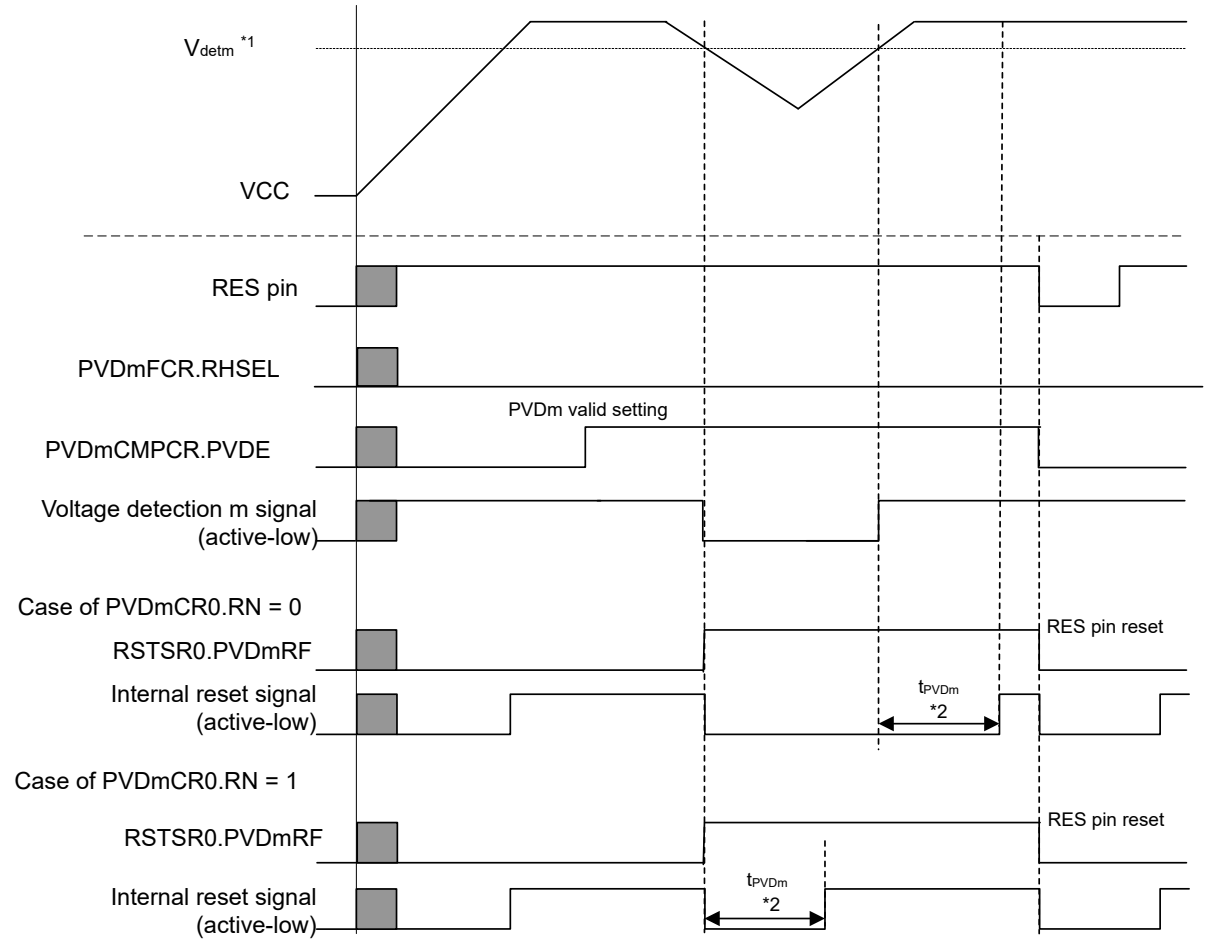
Then the CPU is released from the internal reset state and starts reset exception handling when the PVD1 reset time (t_{PVD1}) elapses after VCC falls to or below Vdet1.

Likewise, when the Voltage Monitor 2 Interrupt/Reset Enable bit (RIE) is set to 1 (enabling generation of a reset or interrupt by the voltage detection circuit) and the Voltage Monitor 2 Circuit Mode Select bit (RI) is set to 1 (selecting generation of a reset in response to detection of a low voltage) in Voltage Monitor 2 Circuit Control Register 0 (PVD2CR0), the RSTSR0.PVD2RF flag is set to 1 and the voltage detection circuit generates a Voltage Monitor 2 reset if VCC rises above Vdet2.

Then the CPU is released from the internal reset state and starts reset exception handling when the PVD2 reset time (t_{PVD2}) elapses after VCC falls to or below Vdet2.

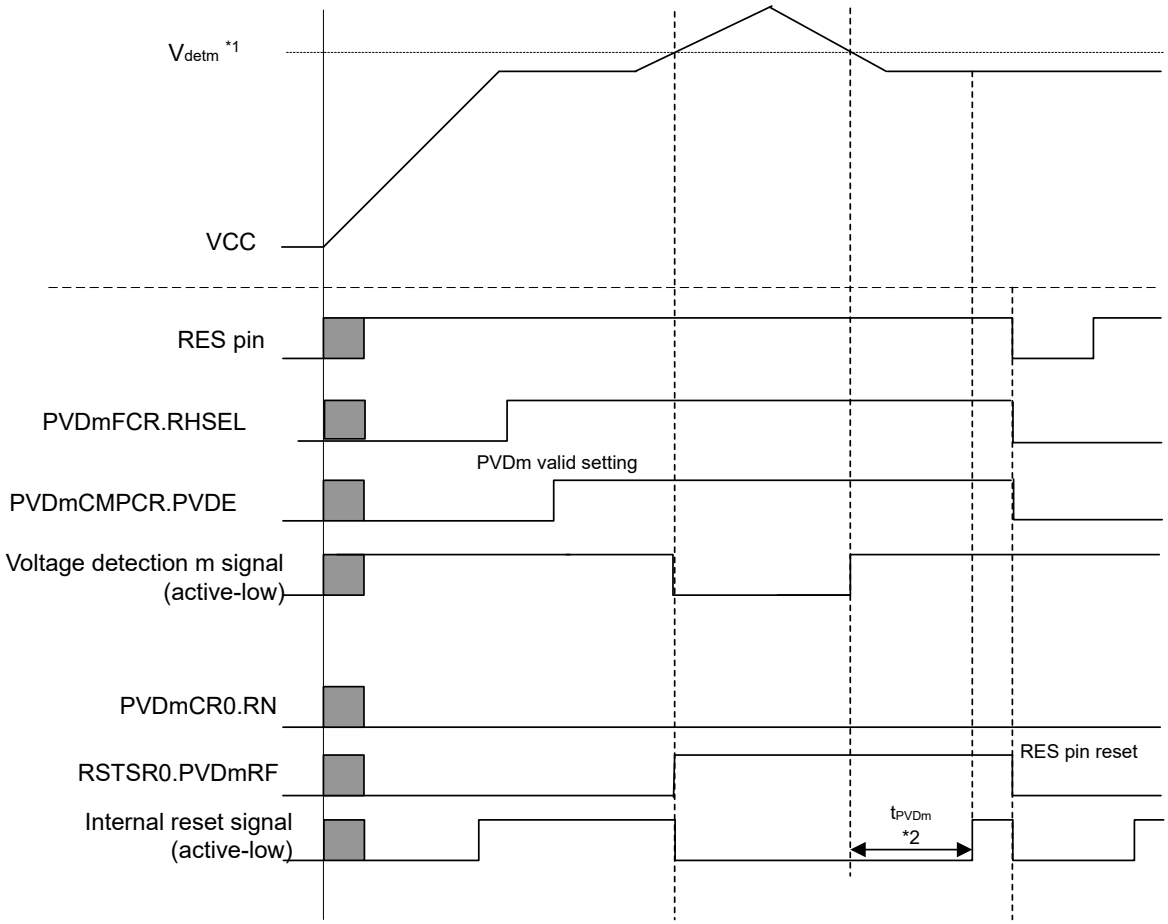
Figure 5.2 shows examples of operations during the voltage monitor 1 and 2 reset when PVDmFCR.RHSEL=0.

Figure 5.3 shows examples of operations during the voltage monitor 1 and 2 reset when PVDmFCR.RHSEL=1.



Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. V_{detm} indicates the detection level of the voltage monitor m reset. (m = 1, 2)
Note 2. t_{PVDm} indicates the time for the voltage monitor m reset. (m = 1, 2)

Figure 5.2 Example of operations during voltage monitor m (m = 1, 2) reset when PVDmFCR.RHSEL = 0



Note: For details on the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. V_{detm} indicates the detection level of the voltage monitor m reset. (m = 1, 2)
Note 2. t_{PVDm} indicates the time for the voltage monitor m reset. (m = 1, 2)

Figure 5.3 Example of operations during voltage monitor m (m = 1, 2) reset when PVDmFCR.RHSEL = 1

5.3.4 Deep Software Standby Reset

These internal resets are generated when either of the Deep Software Standby mode are canceled by an associated interrupt.

The Deep Software Standby reset is canceled after t_{DSBY} (return time after Deep Software Standby mode cancellation) elapses. At the same time, Deep Software Standby mode is also canceled.

When t_{DSBYWT} (wait time after Deep Software Standby mode cancellation) elapses after Deep Software Standby mode has been canceled, the internal reset is canceled, and the CPU starts the reset exception handling.

For details of the Deep Software Standby reset, see section 10, Low Power Modes.

5.3.5 Independent Watchdog Timer Reset

The independent watchdog timer reset is an internal reset generated from the Independent Watchdog Timer (IWDT). Output of the reset from the IWDT can be selected in the Option Function Select Register 0 (OFS0).

When output of the independent watchdog timer reset is selected, the reset is generated if the IWDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the independent watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the independent watchdog timer reset, see section 26, Independent Watchdog Timer (IWDT).

5.3.6 Watchdog Timer Reset

The watchdog timer reset is an internal reset generated from the Watchdog Timer (WDT). Output of the reset from the WDT can be selected in the WDT Reset Control Register (WDTRCR) or Option Function Select register 0 (OFS0).

When output of the watchdog timer reset is selected, the reset is generated if the WDT underflows, or if data is written when refresh operation is disabled. When the internal reset time (t_{RESW2}) elapses after the watchdog timer reset is generated, the internal reset is canceled and the CPU starts the reset exception handling.

For details on the watchdog timer reset, see section 25, Watchdog Timer (WDT).

5.3.7 CPU Lockup Reset

The CPU Lockup reset is an internal reset generated by Arm core. Output of the reset from Arm core can be selected by CPULCKUPCR.OAD.

When output of the CPU Lockup reset is selected, CPU generated if Arm core is in the lockup state. When the internal reset time (t_{RESW2}) elapses after the CPU Lockup reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the CPU Lockup reset, see section 2, CPU.

5.3.8 Software Reset

This internal reset is generated by a software setting of the SYSRESETREQ bit in the AIRCR register in the Arm core. When the SYSRESETREQ bit is set to 1, a software reset is generated. When the internal reset time (t_{RESW2}) elapses after the software reset is generated, the internal reset is canceled, and the CPU starts the reset exception handling.

5.3.9 Bus Error Reset

Bus error reset is an internal reset generated by buses.

It is an integrated reset generated by buses, and it consists of the following:

- Bus error reset (MSAU error, MMPU error, Illegal address error, Slave TrustZone Filter error, Slave Bus error, Bufferable write error)

Output of Bus error reset can be selected by OADCFG.OAD.

When the internal reset time (t_{RESW2}) elapses after the Bus error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Bus error reset, see section 14, Buses. Determination of reset generation source in Bus error reset is similar to determination of interrupt generation source, see section 13, Interrupt Controller Unit (ICU).

5.3.10 Common Memory Error Reset

Common memory error reset is an internal reset generated by SRAMs.

It is an integrated reset generated by SRAMs and consists of the following:

- SRAM error reset (ECC error, Parity error)
- Standby SRAM error reset (Parity error)

Output of SRAM error reset can be selected by SRAMCR0.OAD or SRAMCR1.OAD. Output of Standby SRAM error reset can be selected by STBRAMCR.OAD.

When the internal reset time (t_{RESW2}) elapses after the Common memory error reset is generated, the internal reset is cancelled, and the CPU starts the reset exception handling.

For details on the Common memory error reset, see section 14, Buses. Determination of reset generation source in Common memory error reset is similar to determination of interrupt generation source, see section 13, Interrupt Controller Unit (ICU).

5.3.11 Determination of Cold/Warm Start

Read the CWSF flag in RSTSR2 to determine the cause of reset processing. This flag indicates whether a power-on reset caused the reset processing (cold start) or a reset signal input during operation caused the reset processing (warm start).

The CWSF flag is set to 0 when a power-on reset occurs (cold start), otherwise the flag is not set to 0. The flag is set to 1 when 1 is written to it through software. It is not set to 0 even on writing 0 to it.

Figure 5.4 shows an example of cold/warm start determination operation.

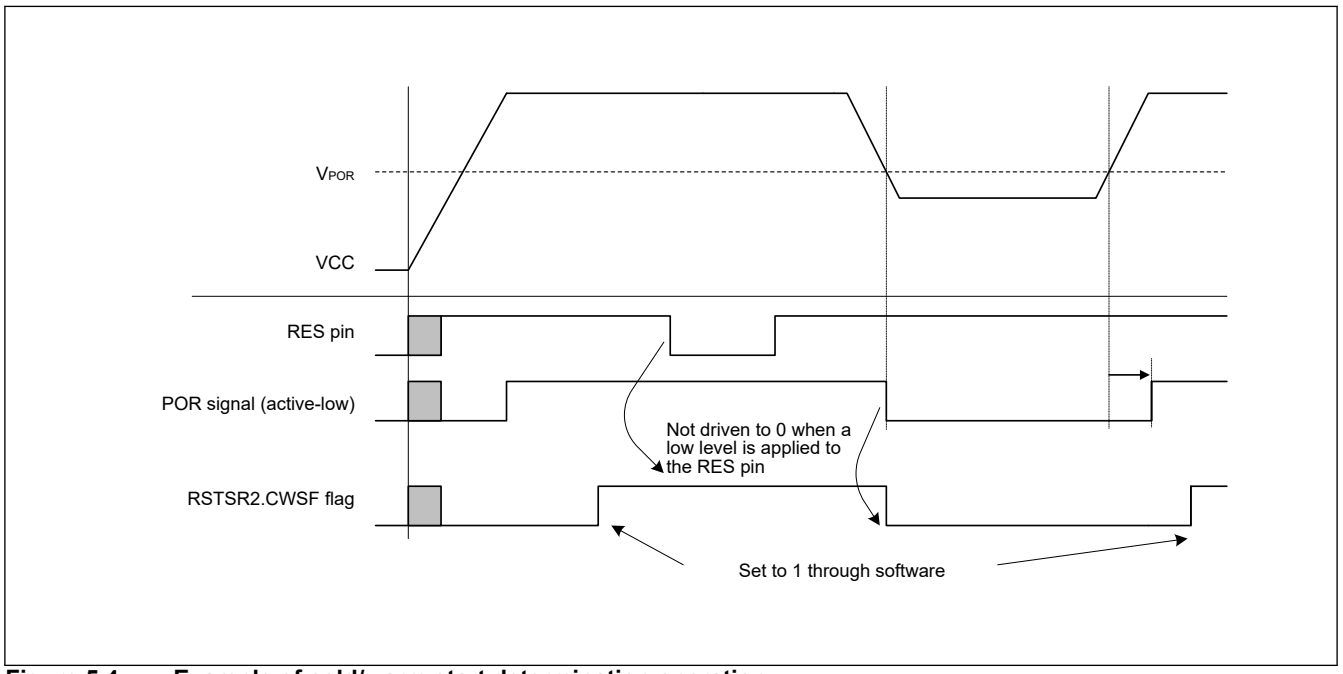


Figure 5.4 Example of cold/warm start determination operation

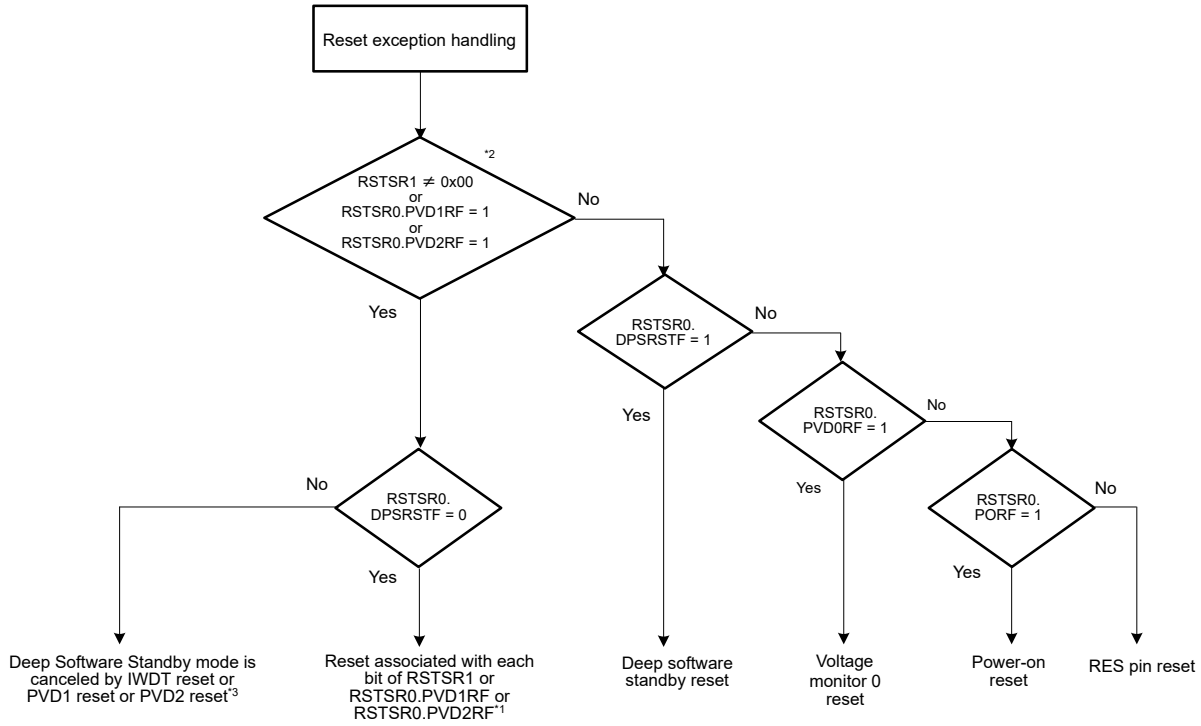
5.3.12 Determination of Reset Generation Source

Read RSTSR0 and RSTSR1 to determine which reset executes the reset exception handling.

Figure 5.5 shows an example of the flow to identify a reset generation source. The reset flag must be written with 0 after 1 is read.



Note 1. If a reset associated with each bit of RSTSR1, RSTSR0.PVD1RF, or RSTSR0.PVD2RF occurred at the same time, all occurrences of the reset flags are set to 1.
Note 2. After checking RSTSR1 ≠ 0x00, RSTSR0.PVD1RF = 1 or RSTSR0.PVD2RF = 1, check RSTSR0.DPSRSTF to determine whether it caused the cancellation of Deep Software Standby mode.
Note 3. The Reset Status registers (RSTSR0, RSTSR1 and RSTSR2) should be cleared before the Deep Software Standby transition. If the reset flag has not been cleared, the return factor cannot be correctly identified.

Figure 5.5 Example of reset generation source determination flow

5.4 Reset Protection from Non-secure Programs

The reset occurrence can be controlled. A reset is generated according to the setting of SYRSTMSK0 and SYRSTMSK2 that can only be accessed from a Secure program.

The reset source is generated but is not propagated to the MCU. The reset flags of RSTSR0 and RSTSR1 bits are not set.

The resets that can be controlled are as follows:

- Independent watchdog timer reset
- Watchdog timer reset
- CPU Lockup reset
- Common memory error reset
- Bus error reset
- Voltage monitor 1 reset
- Voltage monitor 2 reset
- Software reset

6. Option-Setting Memory

6.1 Overview

The option-setting memory determines the state of the MCU after a reset. The option-setting memory is allocated to the configuration setting area of the flash memory.

Figure 6.1 shows the option-setting memory area. The option-setting memory area has Secure region and Non-secure region. Table 6.1 shows the programming condition of the option-setting memory area.

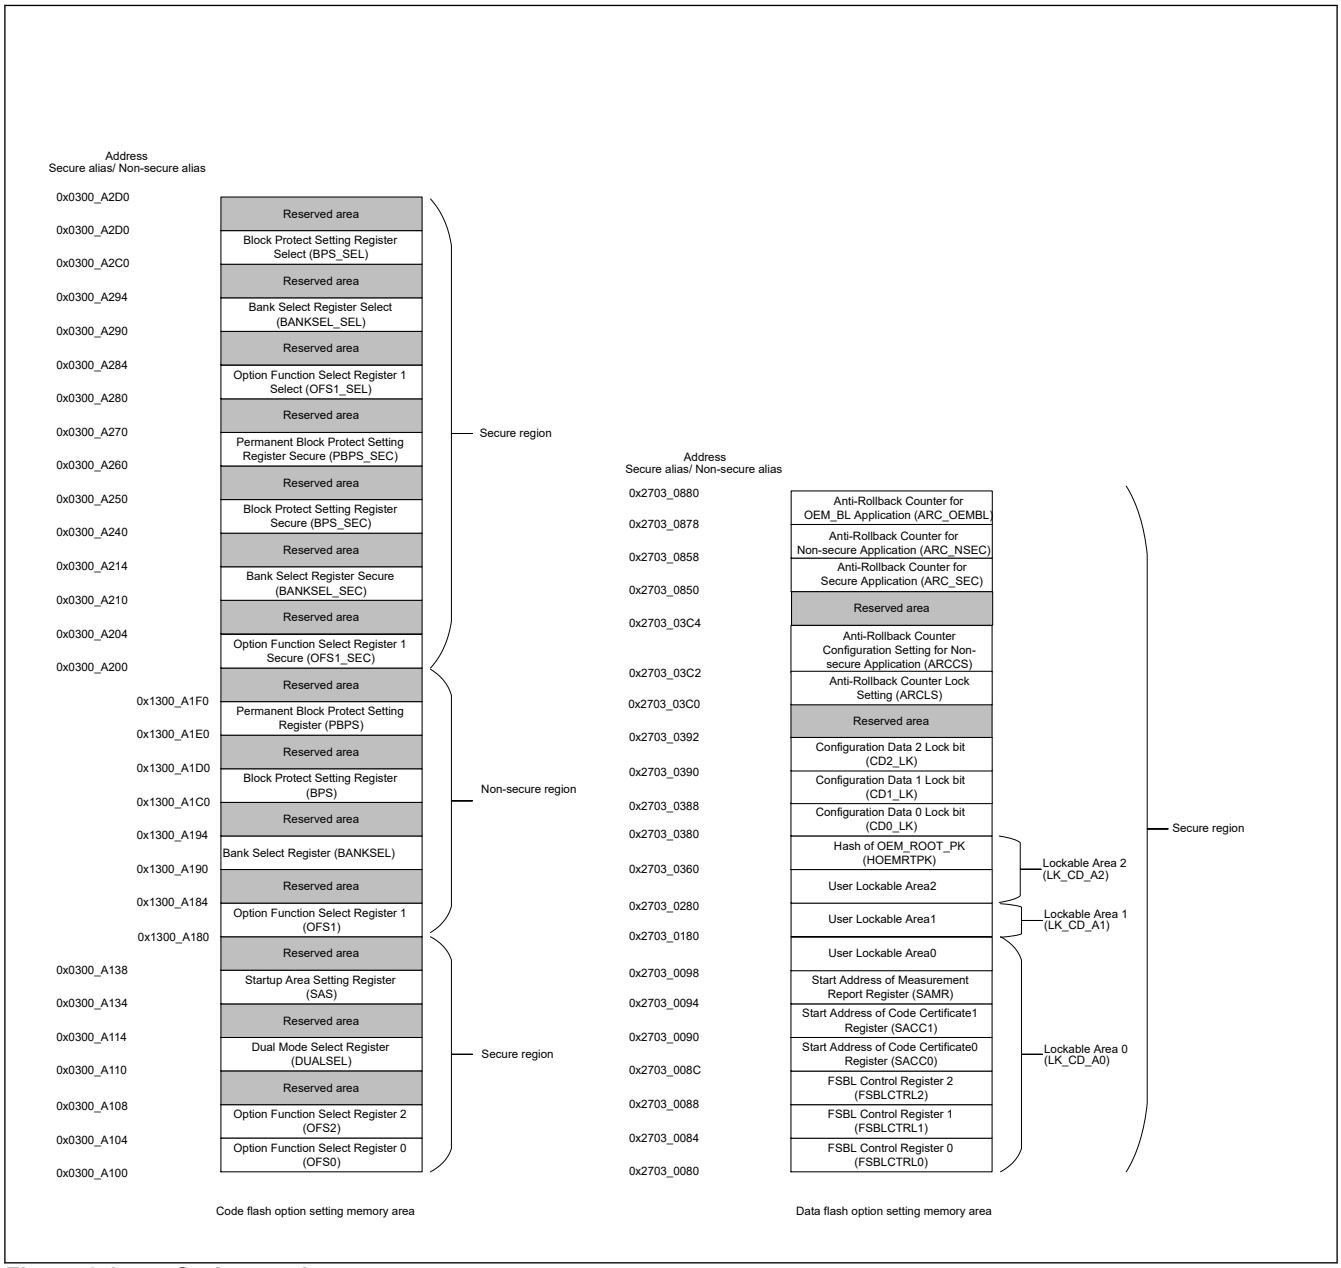


Figure 6.1 Option-setting memory area

Table 6.1 The programming condition of the option-setting memory area (1 of 2)

	Self programming	Serial programming	Programming by the on-chip debugger
Secure region	Programming commands issued via Secure alias access.	Programming commands issued when the authentication level is AL2.	Programming commands issued when the authentication level is AL2.

Table 6.1 The programming condition of the option-setting memory area (2 of 2)

	Self programming	Serial programming	Programming by the on-chip debugger
Non-secure region	Programming commands issued via Non-secure alias access.	Programming commands issued when the authentication level is AL2 or AL1.	Programming commands issued when the authentication level is AL2 or AL1.

6.2 Register Descriptions

6.2.1 OFS0 : Option Function Select Register 0

Address: 0x0300_A100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

29	—	The program value is read from this bit.*2	R
30	WDT0STPCTL	WDT Stop Control 0: Continue counting 1: Stop counting when entering CPU Sleep mode or CPU Deep Sleep mode	R
31	—	The program value is read from this bit.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

IWDTSTRT bit (IWDT Start Mode Select)

The IWDTSTRT bit selects the mode in which the IWDT is activated after a reset (stopped state or activated state). When IWDT is activated in auto start mode, the OFS0 register setting for the IWDT is valid.

IWDTTOPS[1:0] bits (IWDT Timeout Period Select)

The IWDTTOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow, as 128, 512, 1024, or 2048 cycles of the frequency-divided clock set in the IWDTCKS[3:0] bits. The time it takes for the counter to underflow after a refresh operation is determined by the combination of the IWDTCKS[3:0] and IWDTTOPS[1:0] bits.

For details, see section 26, Independent Watchdog Timer (IWDT).

IWDTCKS[3:0] bits (IWDT-Dedicated Clock Frequency Division Ratio Select)

The IWDTCKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of the clock for the IWDT as 1/1, 1/16, 1/32, 1/64, 1/128, and 1/256. Using this setting combined with the IWDTTOPS[1:0] bits setting, the IWDT counting period can be set from 128 to 524,288 IWDT clock cycles.

For details, see section 26, Independent Watchdog Timer (IWDT).

IWDTRPES[1:0] bits (IWDT Window End Position Select)

The IWDTRPES[1:0] bits specify the position where the window for the down counter ends as 0%, 25%, 50%, or 75% of the count value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the IWDTRPSS[1:0] and IWDTRPES[1:0] bits vary with the setting in the IWDTTOPS[1:0] bits.

For details, see section 26, Independent Watchdog Timer (IWDT).

IWDTRPSS[1:0] bits (IWDT Window Start Position Select)

The IWDTRPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the window starts and ends positions becomes the period in which a refresh is possible. Refresh is not possible outside this period.

For details, see section 26, Independent Watchdog Timer (IWDT).

IWDTRSTIRQS bit (IWDT Reset Interrupt Request Select)

The IWDTRSTIRQS bit selects the operation on an underflow of the down counter or generation of a refresh error. The operation is selectable to an independent watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 26, Independent Watchdog Timer (IWDT).

IWDTSTPCTL bit (IWDT Stop Control)

The IWDTSTPCTL bit specifies whether to stop counting when entering CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode1.

For details, see section 26, Independent Watchdog Timer (IWDT).

WDT0STRT bit (WDT Start Mode Select)

The WDT0STRT bit selects the mode in which the WDT is activated after a reset (stopped state or activated in auto start mode). When WDT is activated in auto start mode, the OFS0 register setting for the WDT is valid.

WDT0TOPS[1:0] bits (WDT Timeout Period Select)

The WDT0TOPS[1:0] bits specify the timeout period, that is, the time it takes for the down counter to underflow as 1024, 4096, 8192, or 16384 cycles of the frequency-divided clock set in the WDT0CKS[3:0] bits. The number of PCLKB cycles that takes to underflow after a refresh operation is determined by a combination of the WDT0CKS[3:0] and WDT0TOPS[1:0] bits.

For details, see section 25, Watchdog Timer (WDT).

WDT0CKS[3:0] bits (WDT Clock Frequency Division Ratio Select)

The WDT0CKS[3:0] bits specify the division ratio of the prescaler for dividing the frequency of PCLKB as 1/4, 1/64, 1/128, 1/512, 1/2048, and 1/8192. Using this setting combined with the WDT0TOPS[1:0] bits setting, the WDT counting period can be set from 4,096 to 134,217,728 PCLKB cycles.

For details, see section 25, Watchdog Timer (WDT).

WDT0RPES[1:0] bits (WDT Window End Position Select)

The WDT0RPES[1:0] bits specify the position where the window on the down counter ends as 0%, 25%, 50%, or 75% of the counted value. The value of the window end position must be smaller than the value of the window start position, otherwise only the value for the window start position is valid.

The counter values associated with the settings for the start and end positions of the window in the WDT0RPSS[1:0] and WDT0RPES[1:0] bits vary with the setting of the WDT0TOPS[1:0] bits.

For details, see section 25, Watchdog Timer (WDT).

WDT0RPSS[1:0] bits (WDT Window Start Position Select)

The WDT0RPSS[1:0] bits specify the position where the window for the down counter starts as 25%, 50%, 75%, or 100% of the counted value. The point at which counting starts is 100% and the point at which an underflow occurs is 0%. The interval between the positions where the window starts and ends becomes the period in which a refresh is possible.

Refresh is not possible outside this period.

For details, see section 25, Watchdog Timer (WDT).

WDT0RSTIRQS bit (WDT Reset Interrupt Request Select)

The WDT0RSTIRQS bit selects the operation on an underflow of the down-counter or generation of a refresh error. The operation is selectable to a watchdog timer reset, a non-maskable interrupt request, or an interrupt request.

For details, see section 25, Watchdog Timer (WDT).

WDT0STPCTL bit (WDT Stop Control)

The WDT0STPCTL bit specifies whether to stop counting when entering CPU Sleep mode or CPU Deep Sleep mode.

For details, see section 25, Watchdog Timer (WDT).

6.2.2 OFS2 : Option Function Select Register 2

address: 0x0300_A104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DCDCEN
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
0	DCDCEN	DCDC enable 0: Disable DCDC 1: Enable DCDC	R
31:1	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

DCDCEN bit (DCDC enable)

The DCDCEN bit selects whether the DCDC is enabled or disabled.

6.2.3 DUALSEL : Dual Mode Select Register

address: 0x0300_A110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BANKMD[2:0]		
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
2:0	BANKMD[2:0]	Bank Mode Select 0 0 0: Dual mode 1 1 1: Linear mode Others: Reserved	R
31:3	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

BANKMD[2:0] bit (Bank Mode Select)

The BANKMD[2:0] bits select bank mode of the dual bank function of the code flash memory

6.2.4 SAS : Startup Area Setting Register

Address: 0x0300_A134

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BTFLG	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FSPR	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
14:0	—	The program value is read from these bits.*2	R
15	FSPR	Protection of Startup Area Select Function This bit controls the programming of the write/erase protection for the Startup Area Select flag (SAS.BTFLG), and the temporary boot swap control. When this bit is set to 0, it cannot be changed to 1. 0: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is invalid. 1: Executing the configuration setting command for programming the Startup Area Select flag (SAS.BTFLG) is valid.	R
30:16	—	The program value is read from these bits.*2	R
31	BTFLG	Startup Area Select Flag This bit specifies whether the address of the startup area is exchanged for the boot swap function or not. In dual mode (the DUALSEL.BANKMD[2:0] bits are 000b), set 1 to this bit. 0: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are exchanged. 1: First 8 KB area (0x0200_0000 to 0x0200_1FFF) and second 8 KB area (0x0200_2000 to 0x0200_3FFF) are not exchanged.	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

6.2.5 OFS1, OFS1_SEC : Option Function Select Register 1 for Non-secure and Secure

Address: OFS1: 0x1300_A180 (Non-secure)
OFS1_SEC: 0x0300_A200 (Secure)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—
Value after reset:	The value set by the user*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HOCOFRQ0[2:0]			HOCOEN	—	—	PVDLPSEL	—	PVDAS	VDSEL[2:0]		
Value after reset:	The value set by the user*1															

Bit	Symbol	Function	R/W
2:0	VDSEL[2:0]	Voltage Detection 0 Level Select 0 0 0: Select 2.85 V 0 0 1: Select 2.58 V 0 1 0: Select 2.15 V 0 1 1: Select 2.00 V 1 0 0: Select 1.90 V 1 0 1: Select 1.80 V 1 1 0: Select 1.70 V 1 1 1: Select 1.60 V*3	R
3	PVDAS	Voltage Detection 0 Circuit Start 0: Enable voltage monitor 0 reset after a reset 1: Disable voltage monitor 0 reset after a reset	R
4	—	The program value is read from this bit.*2	R
5	PVDLPSEL	Low Power Consumption Function of PVD0 Select at Deep Software Standby mode 0: Enable low power consumption function of PVD0 during DSTBY1 and DSTBY2. 1: Disable low power consumption function of PVD0 during DSTBY1 and DSTBY2.	R
7:6	—	The program value is read from these bits.*2	R
8	HOCOEN	HOCO Oscillation Enable 0: Enable HOCO oscillation after a reset 1: Disable HOCO oscillation after a reset	R
11:9	HOCOFRQ0[2:0]	HOCO Frequency Setting 0 0 0 0: 16 MHz 0 0 1: 18 MHz 0 1 0: 20 MHz 1 0 0: 32 MHz 1 1 1: 48 MHz Others: Reserved.	R
23:12	—	The program value is read from these bits.*2	R
24	SWDBG	Software Debug Control 0: Enable software debug control. The MCU behaves according to DBGAUTH0 and DBGAUTH1, and IWDT and WDT automatically stops when CPU is in the debug state. 1: Disable software debug control. The MCU ignores DBGAUTH0 and DBGAUTH1, and IWDT and WDT continue the operation even when CPU is in the debug state. However, when CDBGPWRUPREQ is 1 and AL is not AL0, IWDT and WDT automatically stops when CPU is in the debug state.	R
25	INITECCEN	Initial ECC Enable 0: Disable ECC function of TCM and CACHE. 1: Enable ECC function of TCM and CACHE.	R
31:26	—	The program value is read from these bits.*2	R

Note 1. The value of OFS1 and OFS1_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.
Note 3. Setting prohibited when VBATT function is enabled, OFS1(_SEC).PVDAS and PVDLPSEL bits are 0 and at least one of Deep Software Standby mode 1 and 2 is used.

OFS1 register is for Non-secure developer, and OFS1_SEC register is for Secure developer.

VDSEL[2:0] bits (Voltage Detection 0 Level Select)

The VDSEL[2:0] bits select the voltage detection level of the voltage detection 0 circuit.

PVDAS bits (Voltage Detection 0 Circuit Start)

The PVDAS bit selects whether the voltage monitor 0 reset is enabled or disabled after a reset.

PVDLPSEL bits (Low Power Consumption Function of PVD0 Select at Deep Software Standby mode)

The PVDLPSEL selects whether the low power consumption function ofPVD0 is enabled or disabled during DSTBY1 and DSTBY2 mode.

When disable this function, the response time is faster instead of increasing current consumption. When enable this function, the current consumption is smaller instead of response time delay.

See section 60, Electrical Characteristics

HOCOEN bit (HOCO Oscillation Enable)

The HOCOEN bit selects whether the HOCO oscillation is enabled or disabled after a reset. Setting this bit to 0 allows the HOCO oscillation to start before the CPU starts operation, which reduces the wait time for oscillation stabilization.

Note: When the HOCOEN bit is set to 0, the system clock source is not switched to HOCO. The system clock source is only switched to HOCO by setting the Clock Source Select bits (SCKSCR.CKSEL[2:0]). To use the HOCO clock, Set the OFS1(_SEC).HOCOFRQ0 bit to an optimum value.

HOCOFRQ0[2:0] bits (HOCO Frequency Setting 0)

The HOCOFRQ0[2:0] bits specify the HOCO frequency after a reset as 16 to 48 MHz.

SWDBG bit (Software Debug Control)

The SWDBG bit selects whether software debug control is enabled or disabled.

INITECCEN bit (Initial ECC Enable)

The INITECCEN bit selects whether ECC function of TCM and CACHE is enabled or disabled.

6.2.6 OFS1_SEL : Option Function Select Register 1 for Security Attribution

Address: OFS1_SEL: 0x0300_A280

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	INITECCEN	SWDBG	—	—	—	—	—	—	—	—
Value after reset:	The value set by the user*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HOCOFRQ0[2:0]			HOCOEN	—	—	PVDLPSEL	—	PVDAS	VDSEL[2:0]		
Value after reset:	The value set by the user*1															

Bit	Symbol	Function	R/W
2:0	VDSEL[2:0]	Security attributes of Voltage Detection 0 Level Select 0 0 0: Select OFS1_SEC.VDSEL[2:0] 1 1 1: Select OFS1.VDSEL[2:0] Others: Select Reserved.	R

Bit	Symbol	Function	R/W
3	PVDAS	Security attributes of Voltage Detection 0 Circuit Start 0: Select OFS1_SEC.PVDAS 1: Select OFS1.PVDAS	R
4	—	The program value is read from this bit.	R
5	PVDLPSEL	Security attributes of Low Power Consumption Function of PVD0 Select at Deep Software standby mode 0: Select OFS1_SEC.PVDLPSEL 1: Select OFS1.PVDLPSEL	R
7:6	—	The program value is read from these bits.	R
8	HOCOEN	Security attributes of HOCO Oscillation Enable 0: Select OFS1_SEC.HOCOEN 1: Select OFS1.HOCOEN	R
11:9	HOCOFRQ0[2:0]	Security attributes of HOCO Frequency Setting 0 0 0 0: Select OFS1_SEC.HOCOFRQ0[2:0] 1 1 1: Select OFS1.HOCOFRQ0[2:0] Others: Reserved	R
23:12	—	The program value is read from these bits.	R
24	SWDBG	Security attributes of Software Debug Control 0: Select OFS1_SEC.SWDBG 1: Select OFS1.SWDBG	R
25	INITECCEN	Security attributes of Initial ECC Enable 0: Select OFS1_SEC.INITECCEN 1: Select OFS1.INITECCEN	R
31:26	—	The program value is read from these bits.	R

Note 1. The value of OFS1_SEL in a blank product is 0x00000000. It is set to the value written by your application

The OFS1_SEL register selects the security attribute. Which security attribute is applied, OFS or OFS_SEC, is determined by the setting value of the corresponding bit in the OFS1_SEL register. For details, see section 6.3.3. Security attribution of code flash option-setting memory

6.2.7 BANKSEL, BANKSEL_SEC : Bank Select Register for Non-secure and Secure

Address: BANKSEL: 0x1300_A190 (Non-secure)
BANKSEL_SEC: 0x0300_A210 (Secure)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	BLCKSWP[6:0]						
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BANKSWP[2:0]		
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
2:0	BANKSWP[2:0]	Startup Bank Switch This setting is valid in dual mode. 0 0 0: Start address of Bank0 is code flash base address + 0x0020_0000 and Bank is code flash base address + 0x0000_0000 in dual mode 1 1 1: Start address of Bank0 is code flash base address + 0x0000_0000 and Bank is code flash base address + 0x0020_0000 in dual mode Others: Reserved	R
15:3	—	The program value is read from these bits. *1	R

Bit	Symbol	Function	R/W
22:16	BLCKSWP[6:0]	Block Swap Select When all bits are set to 1, the block swap is disabled. When at least one bit is set to 0, block swap is enabled and the corresponding blocks of code flash memory are swapped.	R
31:23	—	The program value is read from these bits..*1	R

Note 1. The value of BANKSEL and BANKSEL_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

BANKSEL register is for Non-secure developer, and BANKSEL_SEC register is for Secure developer.

BANKSWP[2:0] bits (Startup Bank Switch)

The BANKSWP[2:0] bits select the start address of the bank0 and bank1 of code flash memory in dual mode. For details of the startup bank selection, see section 52, Flash Memory.

BLCKSWP[6:0] bit (Block Swap Select)

The BLCKSWP[6:0] bits enable the block swap and select the valid blocks of the code flash memory in linear mode. Figure 6.2 shows the mapping of the flash memory in linear mode. Table 6.2 shows the specification of BLCKSWP bits for each product. Unused bits are reserved and should be set to 1. For details of block swap, see section 52, Flash Memory.

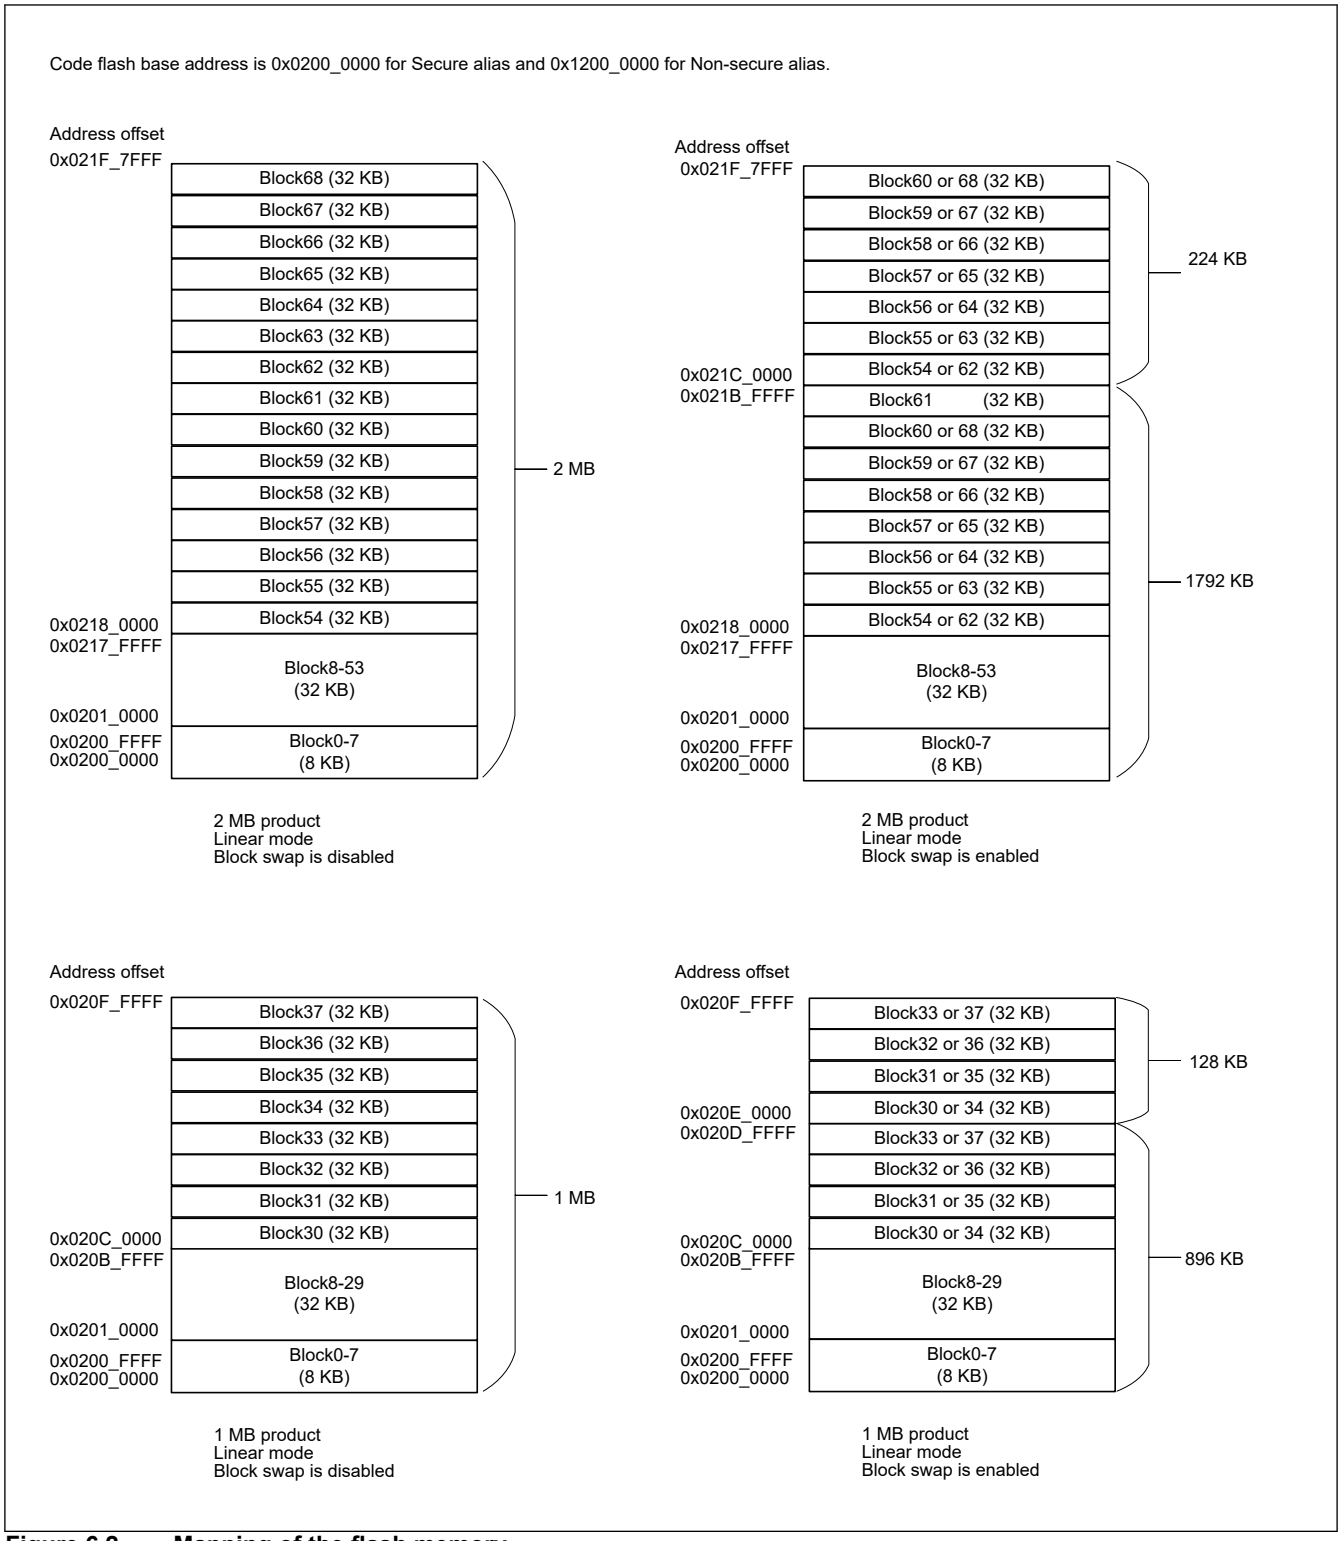

Figure 6.2 Mapping of the flash memory

Table 6.2 Specification of BLCKSWP bits for each product

	BLCKSWP bits	Select 0/1: Start address offset for each Block
2 MB product	BLCKSWP[0]	1 : Block54 start address is 0x0018_0000. Block62 start address is 0x001C_0000. 0 : Block54 start address is 0x001C_0000. Block62 start address is 0x0018_0000.
	BLCKSWP[1]	1 : Block55 start address is 0x0018_8000. Block63 start address is 0x001C_8000. 0 : Block55 start address is 0x001C_8000. Block63 start address is 0x0018_8000.
	BLCKSWP[2]	1 : Block56 start address is 0x0019_0000. Block64 start address is 0x001D_0000. 0 : Block56 start address is 0x001D_0000. Block64 start address is 0x0019_0000.
	BLCKSWP[3]	1 : Block57 start address is 0x0019_8000. Block65 start address is 0x001D_8000. 0 : Block57 start address is 0x001D_8000. Block65 start address is 0x0019_8000.
	BLCKSWP[4]	1 : Block58 start address is 0x001A_0000. Block66 start address is 0x001E_0000. 0 : Block58 start address is 0x001E_0000. Block66 start address is 0x001A_0000.
	BLCKSWP[5]	1 : Block59 start address is 0x001A_8000. Block67 start address is 0x001E_8000. 0 : Block59 start address is 0x001E_8000. Block67 start address is 0x001A_8000.
	BLCKSWP[6]	1 : Block60 start address is 0x001B_0000. Block68 start address is 0x001F_0000. 0 : Block60 start address is 0x001F_0000. Block68 start address is 0x001B_0000.
1 MB product	BLCKSWP[0]	1 : Block30 start address is 0x000C_0000. Block34 start address is 0x000E_0000. 0 : Block30 start address is 0x000E_0000. Block34 start address is 0x000C_0000.
	BLCKSWP[1]	1 : Block31 start address is 0x000C_8000. Block35 start address is 0x000E_8000. 0 : Block31 start address is 0x000E_8000. Block35 start address is 0x000C_8000.
	BLCKSWP[2]	1 : Block32 start address is 0x000D_0000. Block36 start address is 0x000F_0000. 0 : Block32 start address is 0x000F_0000. Block36 start address is 0x000D_0000.
	BLCKSWP[3]	1 : Block33 start address is 0x000D_8000. Block37 start address is 0x000F_8000. 0 : Block33 start address is 0x000F_8000. Block37 start address is 0x000D_8000.

6.2.8 BANKSEL_SEL : Bank Select Register for Security Attribution

Address: BANKSEL_SEL: 0x0300_A290

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	BLCKSWP[6:0]						
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BANKSWP[2:0]		
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
2:0	BANKSWP[2:0]	Security Attributes of Startup Bank Switch 0 0 0: Select BANKSEL_SEC.BANKSWP[2:0] 1 1 1: Select BANKSEL.BANKSWP[2:0] Others: Reserved	R
15:3	—	The program value is read from these bits. *1	R
22:16	BLCKSWP[6:0]	Security Attributes of Block Swap Select BANKSEL_SEL.BLCKSWP[6:0] bits can select Secure or Non-secure access for each bit. The bit positions of BLCKSWP[6:0] in the BANKSEL_SEL register and the bit positions of BLCKSWP[6:0] in the BANKSEL and BANKSEL_SEC registers correspond to indicate the same block. For example, when BANKSEL_SEL.BLCKSWP[0] = 0 and BANKSEL_SEL.BLCKSWP[6] = 1, then BANKSEL_SEC.BLCKSWP[0] and BANKSEL.BLCKSWP[6] are selected.	R
31:23	—	The program value is read from these bits..*1	R

Note 1. The value of BANKSEL_SEL in a blank product is 0x00000000. It is set to the value written by your application
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 0

The BANKSEL_SEL register selects the security attribute. Which security attribute is applied, BANKSEL or BANKSEL_SEC, is determined by the setting value of corresponding bit in the BANKSEL_SEL register. For details, see section 6.3.3. Security attribution of code flash option-setting memory

.

6.2.9 BPS, BPS_SEC, BPS_SEL : Block Protect Setting Register

address:

BPS: 0x1300_A1C0, 0x1300_A1C4, 0x1300_A1C8, 0x1300_A1CC (Non-secure)
BPS_SEC: 0x0300_A240, 0x0300_A244, 0x0300_A248, 0x0300_A24C (Secure)
BPS_SEL: 0x0300_A2C0, 0x0300_A2C4, 0x0300_A2C8, 0x0300_A2CC (Secure)

Bit position:	31	0
Bit field:		
Value after reset:	User setting*1	

Note 1. The value of BPS and BPS_SEC in a blank product is 0xFFFFFFFF. The value of BPS_SEL in factory shipment product is 0x00000000. It is set to the value written by your application.

BPS_SEC and BPS_SEL register is for Secure developer, and BPS register is for Non-secure developer.

The BPS and BPS_SEC registers invalidate the programming and erasure to the code flash memory. When the bit of this register is set to 0, the programming and erasure to the corresponding block are invalid. Figure 6.3 shows the code flash block structure of each product. Figure 6.4 shows the relationship between the bit of register and the block number. Unused bits of BPS and BPS_SEC register are reserved and should be programed to 1.

The BPS_SEL register selects the security attribute. Whether the security attribute BPS or BPS_SEC, PBPS or PBPS_SEC is applied is determined by the setting value of the corresponding bit in the BPS_SEL register. For details, see section 6.3.3. Security attribution of code flash option-setting memory.

Figure 6.4 The relationship between the bit of register and the block number

6.2.10 PBPS, PBPS_SEC : Permanent Block Protect Setting Register

Address: PBPS: 0x1300_A1E0, 0x1300_A1E4, 0x1300_A1E8 (Non-secure)
PBPS_SEC: 0x0300_A260, 0x0300_A264, 0x0300_A268 (Secure)

Bit position:	31	0
Bit field:		
Value after reset:	User setting*1	

Note 1. The value of PBPS and PBPS_SEC in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

PBPS_SEC register is for secure developer, and PBPS register is for non-secure developer. The applied setting value is determined by the setting value of the corresponding bit in BPS_SEL register. For details, see section 6.3.3. Security attribution of code flash option-setting memory. The security attribution register is same BPS_SEL register between the block protection and permanent block protection.

The PBPS and PBPS_SEC registers invalidate writes to bits of BPS and BPS_SEC. The bit of this register can be programmed 0 when corresponding bit of BPS and BPS_SEC is programmed to 0. When the bit of this register is programmed to 0, writing the corresponding bit of BPS and BPS_SEC register is invalid. Once the bit of this register is set to 0, it is impossible to change the bit to 1. Table 6.3 shows the relationship between the bit of applied PBPS and bit of applied BPS.

When the applied setting value of this register selected by BPS_SEL register is 0, corresponding bit of BPS_SEL register cannot be changed.

The relationship between the bit of this register and the block number is same as BPS and BPS_SEC registers (Figure 6.4). Unused bits are reserved and should be set to 1.

Table 6.3 The relationship between the bit of PBPS, PBPS_SEC and bit of BPS, BPS_SEC

The bit of applied PBPS and PBPS_SEC	The bit of applied BPS and BPS_SEC	Content
1	1	Programming and erasure to the corresponding block is valid.
1	0	Programming and erasure to the corresponding block is invalid. This protection can be canceled by FBPROT0 or FBPROT1 registers.
0	1	Can not set this condition
0	0	Programming and erasure to the corresponding block is invalid permanently

Note: When PBS_SEL = 0, BPS and PBPS correspond. When PBS_SEL = 1, BPS_SEC and PBPS_SEC correspond.

6.2.11 FSBLCTRL0 : FSBL Control Register 0

Address: 0x2703_0080

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	FSBLCLK[2:0]			FSBLSKIPDS[2:0]			FSBLSKIPSW[2:0]			FSBLEN[2:0]		
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
2:0	FSBLEN[2:0]	FSBL Enable 0 0 0: Enable FSBL 1 1 1: Disable FSBL Others: Reserved	R

Bit	Symbol	Function	R/W
5:3	FSBLSKIPSW[2:0]	FSBL Skip Enable for Software Reset 0 0 0: Enable skip 1 1 1: Disable skip Others: Reserved	R
8:6	FSBLSKIPDS[2:0]	FSBL Skip Enable for Deep Software Standby Reset 0 0 0: Enable skip 1 1 1: Disable skip Others: Reserved	R
11:9	FSBLCLK[2:0]	Clock Frequency Selection during FSBL Execution 0 0 0: CPUCLK = 120 MHz ICLK = 120 MHz 1 1 1: CPUCLK = 240 MHz ICLK = 240 MHz Others: Reserved	R
31:12	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

6.2.12 FSBLCTRL1 : FSBL Control Register 1

Address: 0x2703_0084

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FSBLEXMD[1:0]	
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
1:0	FSBLEXMD[1:0]	FSBL Execution Mode 0 0: CRC boot and not report measurement 0 1: CRC boot and report measurement 1 0: Secure boot and not report measurement 1 1: Secure boot and report measurement	R
31:2	—	The program value is read from these bits.*2	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

6.2.13 FSBLCTRL2 : FSBL Control Register 2

Address: 0x2703_0088

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PORTGN[4:0]					PORTPN[3:0]			
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
3:0	PORTPN[3:0]	FSBL Error Notification Port Pin Number*2 0 0 0 0: PORTn00 0 0 0 1: PORTn01 ⋮ 1 1 1 1: PORTn15 (n = 0 to 9, A, B)	R
8:4	PORTGN[4:0]	FSBL Error Notification Port Group Name*2 0 0 0 0 0: PORT0m 0 0 0 0 1: PORT1m ⋮ 0 1 0 1 1: PORTBm Others: Reserved (m = 0 to 15)	R
31:9	—	The program value is read from these bits.*3	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.
Note 2. When non-existent pin is selected, FSBL error notification is not output.
Note 3. This register can only be programmed by FACI command. When programming, the set value should be 1.

FSBLCTRL2 register selects the port to output when an Error occurs during FSBL execution. The PORTGN bits select a group of ports, and the PORTPN bits select the pins of that group. It thereby determines the unique port.

6.2.14 SACC0 : Start Address of Code Certificate 0

Address: 0x2703_008C

Bit position:	31	0
Bit field:		
Value after reset:	User setting*1	

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

6.2.15 SACC1 : Start Address of Code Certificate 1

Address: 0x2703_0090

Bit position:	31	0
Bit field:		
Value after reset:	User setting*1	

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

6.2.16 SAMR : Start Address of Measurement Report

Address: 0x2703_0094

Bit position:	31	0
Bit field:		
Value after reset:	User setting*1	

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application.

6.2.17 HOEMRTPK :Hash of OEM_ROOT_PK

Base address: FDFS = 0x2703_0000

Offset address: 0x360

Bit position:	31 ... 0
Bit field:	
Value after reset:	User setting*1

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

This register can be programmed only by boot firmware.

This register does not contain the Hash value, but a processed Hash value.

6.2.18 CFGD0LOCK : Configuration Data 0 Lock Bit

Base address: 0x2703_0380

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CD0LK31	CD0LK30	CD0LK29	CD0LK28	CD0LK27	CD0LK26	CD0LK25	CD0LK24	CD0LK23	CD0LK22	CD0LK21	CD0LK20	CD0LK19	CD0LK18	CD0LK17	CD0LK16
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CD0LK15	CD0LK14	CD0LK13	CD0LK12	CD0LK11	CD0LK10	CD0LK9	CD0LK8	CD0LK7	CD0LK6	CD0LK5	CD0LK4	CD0LK3	CD0LK2	CD0LK1	CD0LK0
Value after reset:	User setting*1															

Base address: 0x2703_0384

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CD0LK63	CD0LK62	CD0LK61	CD0LK60	CD0LK59	CD0LK58	CD0LK57	CD0LK56	CD0LK55	CD0LK54	CD0LK53	CD0LK52	CD0LK51	CD0LK50	CD0LK49	CD0LK48
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CD0LK47	CD0LK46	CD0LK45	CD0LK44	CD0LK43	CD0LK42	CD0LK41	CD0LK40	CD0LK39	CD0LK38	CD0LK37	CD0LK36	CD0LK35	CD0LK34	CD0LK33	CD0LK32
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
31:0	CD0LK31 to CD0LK0	Configuration Data 0 Lock Bit 0: LK_CD_A0 protection is enabled 1: LK_CD_A0 protection is disabled	R
31:0	CD0LK63 to CD0LK32	Configuration Data 0 Lock Bit 0: LK_CD_A0 protection is enabled 1: LK_CD_A0 protection is disabled	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

CD0LKn bits (Configuration Data 0 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 0 (LK_CD_A0) in configuration area of data flash. CD0_LK(n) protects 4 bytes data in LK_CD_A0.

CD0_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1".

6.2.19 CFGD1LOCK : Configuration Data 1 Lock Bit

Base address: 0x2703_0388

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CD1LK31	CD1LK30	CD1LK29	CD1LK28	CD1LK27	CD1LK26	CD1LK25	CD1LK24	CD1LK23	CD1LK22	CD1LK21	CD1LK20	CD1LK19	CD1LK18	CD1LK17	CD1LK16

Value after reset:	User setting*1															

Base address: 0x2703_038C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	CD1LK63	CD1LK62	CD1LK61	CD1LK60	CD1LK59	CD1LK58	CD1LK57	CD1LK56	CD1LK55	CD1LK54	CD1LK53	CD1LK52	CD1LK51	CD1LK50	CD1LK49	CD1LK48
Value after reset:	User setting*1															

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CD1LK47	CD1LK46	CD1LK45	CD1LK44	CD1LK43	CD1LK42	CD1LK41	CD1LK40	CD1LK39	CD1LK38	CD1LK37	CD1LK36	CD1LK35	CD1LK34	CD1LK33	CD1LK32
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
31:0	CD1LK31 to CD1LK0	Configuration Data 1 Lock Bit 0: LK_CD_A1 protection is enabled 1: LK_CD_A1 protection is disabled	R
31:0	CD1LK63 to CD1LK32	Configuration Data 1 Lock Bit 0: LK_CD_A1 protection is enabled 1: LK_CD_A1 protection is disabled	R

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application

CD1LKn bits (Configuration Data 1 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 1 (LK_CD_A1) in configuration area of data flash. CD1_LK(n) protects 4 bytes data in LK_CD_A1.

CD1_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1"

6.2.20 CFGD2LOCK : Configuration Data 2 Lock Bit

Base address: 0x2703_0390

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	CD2LK15	CD2LK14	CD2LK13	CD2LK12	CD2LK11	CD2LK10	CD2LK9	CD2LK8	CD2LK7	CD2LK6	CD2LK5	CD2LK4	CD2LK3	CD2LK2	CD2LK1	CD2LK0
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
15:0	CD2LK15 to CD2LK0	Configuration Data 2 Lock Bit 0: LK_CD_A2 protection is enabled 1: LK_CD_A2 protection is disabled	R

Note 1. The value in a blank product is 0xFFFF_FFFF. It is set to the value written by your application

CD2LKn bits (Configuration Data 2 Lock Bit)

These bits specify write protection for Lockable Configuration Data Area 2 (LK_CD_A2) in configuration area of data flash. CD2_LK(n) protects 4 bytes data in LK_CD_A2. CD2_LK bits can be set to "0" by the "Configuration set" command and cannot be changed from "0" to "1".

Settings for Configuration Data Lock Bit (CDn_LK) (n = 0 to 2) are shown in Table 6.4

Table 6.4 The correspondence between the lock bit and lockable are address

Area	Bit	Address
Lockable area 0	CD0_LK0	0x2703_0080 to 0x2703_0083
	CD0_LK1	0x2703_ 0084 to 0x2703_0087
	…	…
	CD0_LKn (n = 0 to 63)	0x2703_0080 + 0x04 × n to 0x2703_0083 + 0x04 × n
	…	…
	CD0_LK63	0x2703_017C to 0x2703_017F
Lockable area 1	CD1_LK0	0x2703_0180 to 0x2703_0183
	CD1_LK1	0x2703_0184 to 0x2703_0187
	…	…
	CD1_LKn (n = 0 to 63)	0x2703_0180 + 0x04 × n to 0x2703_0183 + 0x04 × n
	…	…
	CD1_LK63	0x2703_00x27C to 0x2703_027F
Lockable area 2	CD2_LK0	0x2703_0280 to 0x2703_028F
	CD2_LK1	0x2703_0290 to 0x2703_029F
	…	…
	CD2_LKn (n = 0 to 15)	0x2703_0280 + 0x10 × n to 0x2703_028F + 0x10 × n
	…	…
	CD2_LK15	0x2703_0370 to 0x2703_037F

6.2.21 ARCLS : Anti-Rollback Counter Lock Setting

Base address: 0x2703_03C0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	ARCBL_LK	ARCNS_LK[3:0]				ARCS_LK
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
0	ARCS_LK	ARC_SEC Lock 0: ARC_SEC protection is enabled 1: ARC_SEC protection is disabled	R/W
4:1	ARCNS_LK[3:0]	ARC_NSEC Lock In case of 64 bits x 4 counter setting x x x 0: ARC_NSEC[63:0] protection is enabled x x 0 x: ARC_NSEC[127:64] protection is enabled x 0 x x: ARC_NSEC[191:128] protection is enabled 0 x x x : ARC_NSEC[255:192] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is disabled Others Reserved. In case of 256 bits counter setting 0 0 0 0: ARC_NSEC[255:0] protection is enabled 1 1 1 1: ARC_NSEC[255:0] protection is disabled Others Reserved.	R/W

Bit	Symbol	Function	R/W
5	ARCBL_LK	ARC_OEMBL Lock 0: ARC_OEMBL protection is enabled 1: ARC_OEMBL protection is disabled	R/W
15:6	—	The program value is read from these bits*2	R/W

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

Anti-rollback counter Lock bits setting are located in the data flash configuration area. Anti-rollback counter Lock bits setting can be set to “0” by the "Program" command and cannot be changed from "0" to "1". When the lock bit is 0, the anti-rollback counter corresponding to each bit cannot be updated by the "Increment Counter" command.

6.2.22 ARCCS : Anti-Rollback Counter Configuration Setting for Non-secure Application

Base address: 0x2703_03C2

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CNF_ARCNS[1:0]	
Value after reset:	User setting*1															

Bit	Symbol	Function	R/W
1:0	CNF_ARCNS[1:0]	Configuration setting for ARC_NSEC 0 0: ARC_NSEC configuration is 4 × 64 bits 0 1: ARC_NSEC configuration is 1 × 256 bits Others ARC_NSEC configuration is disable	R/W
15:2	—	The program value is read from these bits*2	R/W

Note 1. The value in a blank product is 0xFFFFFFFF. It is set to the value written by your application
Note 2. This register can only be programmed by FACI command. When programming, the set value should be 1.

ARC_NSEC configuration setting is located in the data flash configuration area. These bits specify two types of ARC_NSEC configuration: 4 × 64 bits or 1 × 256 bits. “Increment Counter” or “Read Counter” command cannot be issued to ARC_NSEC when counter configuration setting is disabled.

6.2.23 ARC_SECn : Anti-Rollback Counter for Secure Application n (n = 0, 1)

Base address: 0x2703_0000

Offset address: 0x850 + 0x004 × n (n = 0, 1)

Bit position:	31	0
Bit field:	ARC_SEC[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_SEC[32 × n + 31 : 32 × n]	Anti-Rollback Counter for Secure Application The counter value is obtained by arranging the read values from the upper register (n = 1) to the lower register (n = 0). See section 52.12.5. Anti-Rollback Counter for detail	R/W

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

6.2.24 ARC_NSECn : Anti-Rollback Counter for Non-secure Application n (n = 0 to 7)

Base address: 0x2703_0000

Offset address: 0x858 + 0x004 × n (n = 0 to 7)

Bit position:	31	0
Bit field:	ARC_NSECn[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_NSECn[32 × n + 31 : 32 × n]	Anti-Rollback Counter for Non-secure Application The counter value is obtained by arranging the read values from the upper register (n = 7) to the lower register (n = 0). See section 52.12.5. Anti-Rollback Counter for detail	R/W

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

6.2.25 ARC_OEMBLn : Anti-Rollback Counter for OEMBL (n = 0, 1)

Base address: 0x2703_0000

Offset address: 0x878 + 0x004 × n (n = 0, 1)

Bit position:	31	0
Bit field:	ARC_OEMBL[32 × n + 31 : 32 × n]	
Value after reset:	User setting*1	

Bit	Symbol	Function	R/W
31:0	ARC_OEMBL[32*n +31 : 32*n]	Anti-Rollback Counter for OEM_BL Application The counter value is obtained by arranging the read values from the upper register (n = 1) to the lower register (n = 0). See section 52.12.5. Anti-Rollback Counter for detail	R/W

Note 1. The value in a blank product is 0x0. It is set to the value written by your application

6.3 Setting Option-Setting Memory

6.3.1 Allocation of Data in Option-Setting Memory

Programming data is allocated to the addresses in the option-setting memory shown in Figure 6.1. The allocated data is used by FSBL or tools such as a flash programming software or an on-chip debugger.

Note: Programming formats vary depending on the compiler. See the compiler manual for details.

6.3.2 Setting Data for Programming Option-Setting Memory

Allocating data according to the procedure described in section 6.3.1. Allocation of Data in Option-Setting Memory, alone does not actually write the data to the option-setting memory. You must also follow one of the actions described in this section.

(1) Changing the option-setting memory by self-programming

Use the configuration setting command to write data to the option-setting memory in the configuration setting area.

The code flash option-setting memory does not support background operations (BGO). When write the option-setting memory, jump to SRAM after copying writing softwere to SRAM.

For details of the configuration setting command, see section 52, Flash Memory.

(2) Debugging through an OCD or programming by a flash writer

This procedure depends on the tool in use, see the tool manual for details.

The MCU provides two setting procedures:

- Read the data allocated as described in section 6.3.1. Allocation of Data in Option-Setting Memory, from an object file or Motorola S-format file generated by the compiler, and write the data to the MCU
- Use the GUI interface of the tool to program the same data as allocated in section 6.3.1. Allocation of Data in Option-Setting Memory.

6.3.3 Security attribution of code flash option-setting memory

Some functionality has 3 registers for Non-secure (FUNC NAME), and Secure (FUNC NAME_SEC), and security attribution (FUNC NAME_SEL). Only Secure developer can set the registers for Secure and security attribution. As shown in Figure 6.5, when the bit of security attribution register is set to 0, the corresponding bit of Secure register is applied. When the bit of security attribution register is set to 1, the corresponding bit of Non-secure register is applied.

For example, if the Secure developer wants to configure PVD of OFS1 as Secure, HOCO of OFS1 as Non-secure, the Secure developer needs to set OFS1_SEL as follows.

OFS1_SEL = 0xFFFF_FFF0

By this setting, PVDAS and VDSEL[2:0] values of OFS1_SEC and HOCOFRQ0[2:0] and HOCOEN values of OFS1 are applied to MCU. The reserved bits of the security attribution register (FUNC NAME_SEL) should be set to 0.

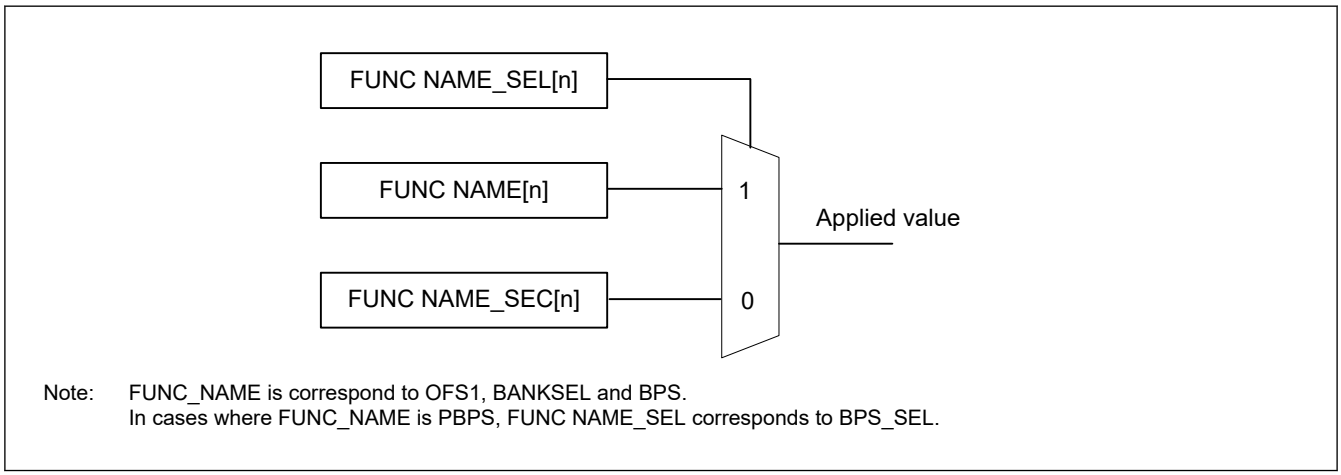

Figure 6.5 Selection of applied value

6.3.4 Timing of the Setting Value

For SAS, BPS, BPS_SEC, PBPS, PBPS_SEC and BPS_SEL registers, the setting value of the related startup area and block protection is applied immediately after programming. For other registers, the setting value is applied after the MCU is reset.

6.4 Usage Notes

6.4.1 Data for Programming Reserved Areas and Reserved Bits in the Option-Setting Memory

- Security attribution region (0x0300 A280 to 0x0300 A2FF)
  When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 0 to all bits in reserved areas and all reserved bits. Operation is not guaranteed if 1 is written to these bits.
- Other region
  When reserved areas and reserved bits in the option-setting memory are within the scope of programming, write 1 to all bits of reserved areas and all reserved bits. If 0 is written to these bits, normal operation cannot be guaranteed.

6.4.2 FSBL execution after system reset

When FSBLCTRL0.FSBLEN bit is set to 000b, FSBL is always executed after system reset is released. However, setting FSBLCTRL0.FSBLSKIPSW or FSBLCTRL0.FSBLSKIPDS bit adds a condition to Skip FSBL. See Table 6.5.

Table 6.5 FSBL execution conditions

FSBLEN	FSBLSKIPSW	FSBLSKIPDS	FSBL execution after system reset
111b	*	*	Not executed
000b	111b	111b	Executed
000b	111b	000b	Deep Software Standby reset : Not executed Other reset than above : Executed
000b	000b	111b	Software reset : Not executed Other reset than above : Executed
000b	000b	000b	Software reset : Not executed Deep Software Standby reset : Not executed Other reset than above : Executed

When using the FSBL skip function, the reset status registers (RSTSR0 and RSTSR1) should be cleared before the system reset is released.

Note: the FSBL will always run if at least one of the reset flags that allows the FSBL to run is set.

6.4.3 FSBL Skip Function

To skip FSBL execution after a software reset release, RSTSR0 and RSTSR1 should be cleared before executing software reset. If any flags other than RSTSR1.SWRF is set, FSBL may be executed.

To skip FSBL execution after a Deep Software Standby Reset release, RSTSR0 and RSTSR1 should be cleared before the transition to Deep Software Standby mode. If any flags other than RSTSR0.DPSRSTF is set, FSBL may be executed.

7. Programmable Voltage Detection (PVD)

7.1 Overview

The Programable Voltage Detection (PVD) module monitors the voltage level input to the VCC pin and the detection level can be selected using a software program. The PVD module consists of several separate voltage level detectors which measure the voltage level input to the VCC pin. PVD registers allow your application to configure detection of VCC change at various voltage thresholds.

Each voltage level detector has a voltage monitor associated with it. Voltage monitor registers are used to configure the PVD to trigger an interrupt, event link output, or reset when the thresholds are crossed.

Table 7.1 lists the PVD specifications. Figure 7.1 shows a block diagram of the voltage monitor 0 reset generation circuit. Figure 7.2 shows a block diagram of the voltage monitor m interrupt and reset circuit (m = 1, 2).

Table 7.1 PVD specifications

Item		Voltage monitor 0	Voltage monitor m （m = 1, 2）
Voltage Monitoring	Monitored pin	VCC	VCC
	Detected Event	Voltage falls past V_{det0}	Voltage rises or falls past V_{detm}
	Detection Voltage	Selectable from among 8 different levels by using OFS1(_SEC).VDSEL[2:0] bits as V_{det0}	Selectable from among 13 different levels by using PVDmCMPCR.PVDLVL[4:0] bits as V_{detm}
	Monitor Flag	None	PVDmSR.MON flag: Monitors whether voltage is higher or lower than V_{detm}
			PVDmSR.DET flag: V_{detm} passage detection
Process on voltage detection	Reset	Voltage monitor 0 reset	Voltage monitor m reset
		Reset when V_{det0} > VCC CPU restart after specified time with VCC > V_{det0}	Reset condition selectable Reset when V_{detm} > VCC or V_{detm} < VCC CPU restart timing selectable: after specified time with VCC > V_{detm} or V_{detm} > VCC
	Interrupt	No interrupt	Voltage monitor m interrupt
			Non-maskable interrupt or maskable interrupt selectable
			Interrupt request issued in response to either or both V_{detm} > VCC and VCC > V_{detm}
Digital filter	Enable/ Disable Switching	Digital filter function not available	Available
	Sampling Time	—	1/n LOCO frequency × 2 (n: 2, 4, 8, 16)
Event linking		None	Available Output of event signals on detection of V_{detm} crossings

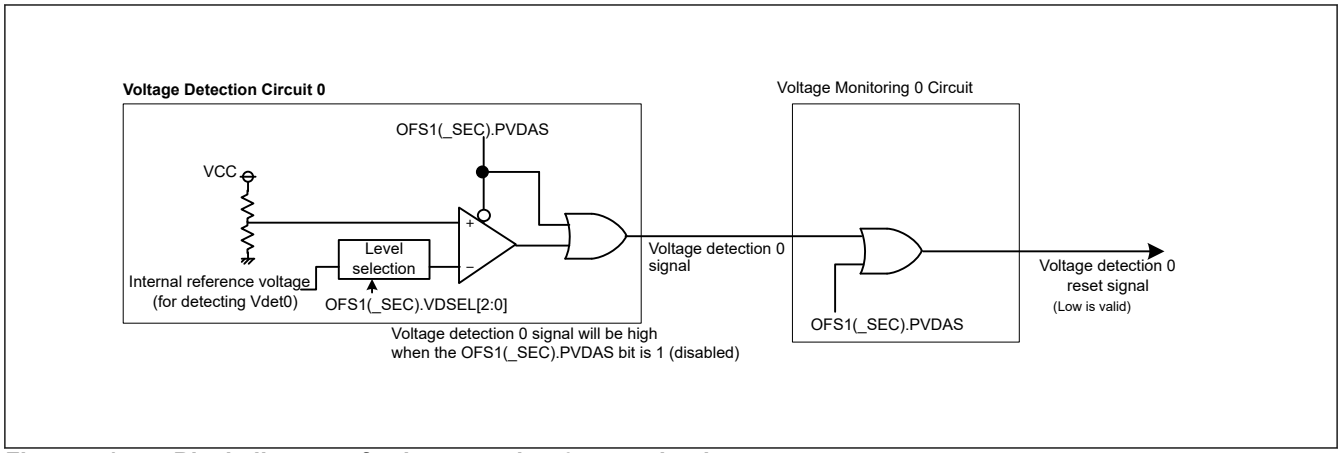

Figure 7.1 Block diagram of voltage monitor 0 reset circuit

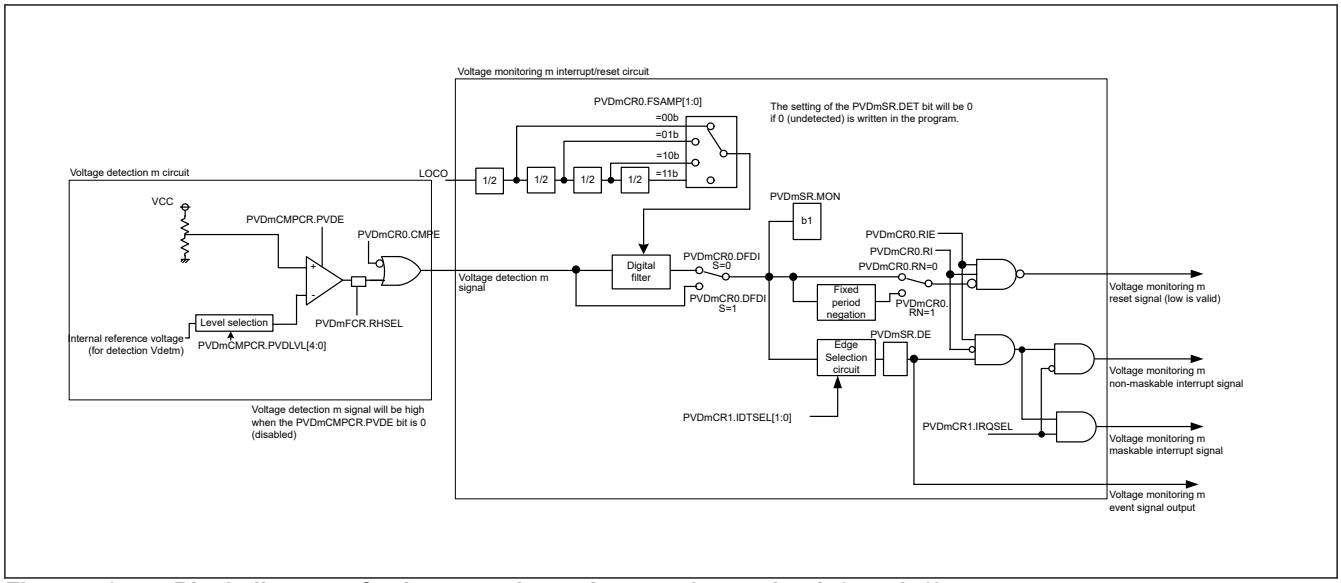

Figure 7.2 Block diagram of voltage monitor m interrupt/reset circuit (m = 1, 2)

7.2 Register Descriptions

7.2.1 PVDSAR : Programable Voltage Detection Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3CC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non Secure Attribute bit 0 Target register: registers for PVD1 0: Secure 1: Non Secure	R/W
1	NONSEC1	Non Secure Attribute bit 1 Target register: registers for PVD2 0: Secure 1: Non Secure	R/W
31:2	—	These bits are read as 1. The write value must be 1 when it is possible to write.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: This register is write-protected by PRCR register.

The PVDSAR register controls the secure attribute of PVD registers.

NONSEC0 bit (Non Secure Attribute bit 0)

This bit controls the security attribute of PVD1CMPCR, PVD1CR0, PVD1CR1, PVD1SR and PVD1FCR.

NONSEC1 bit (Non Secure Attribute bit 1)

This bit controls the security attribute of PVD2CMPCR,PVD2CR0, PVD2CR1, PVD2SR and PVD2FCR.

7.2.2 PVDmCMPCR : Voltage Monitor m Comparator Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA58 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PVDE	—	—	PVDLVL[4:0]				
Value after reset:	0	0	0	0	1	1	1	1

Bit	Symbol	Function	R/W
4:0	PVDLVL[4:0]	Detection Voltage m Level Select Settings other than the following are prohibited. These are standard voltage level during the fall of voltage. For details on standard voltage level during the rise of voltage, see section 60, Electrical Characteristics. 0x03: 3.86 V (Vdetm_3) 0x04: 3.14 V (Vdetm_4) 0x05: 3.10 V (Vdetm_5) 0x06: 3.08 V (Vdetm_6) 0x07: 2.85 V (Vdetm_7) 0x08: 2.83 V (Vdetm_8) 0x09: 2.80 V (Vdetm_9) 0x0A: 2.62V (Vdetm_10) 0x0B: 2.33V (Vdetm_11) 0x0C: 1.90V (Vdetm_12) 0x0D: 1.86V (Vdetm_13) 0x0E: 1.74V (Vdetm_14) 0x0F: 1.71V (Vdetm_15) Others: Setting prohibited	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	PVDE	Voltage Detection m Enable 0: Voltage detection m circuit disabled 1: Voltage detection m circuit enabled	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

PVDLVL[4:0] bits (Detection Voltage m Level Select)

The PVDmCMPCR.PVDLVL can be changed only if the PVDmCMPCR.PVDE bits are both 0. All the voltage detection circuits should not be set at the same voltage detection level.

Do not change PVDmCMPCR.PVDLVL and PVDmCMPCR.PVDE at the same time.

The PVDmCMPCR.PVDE can be changed only when the PVDmCR0.CMPE is 0.

PVDE bit (Voltage Detection m Enable)

When using voltage detection m interrupt/reset or the PVDmSR.MON bit, set the PVDmCMPCR.PVDE bit to 1. The voltage detection m circuit starts once td(E-A) passes after the PVDmCMPCR.PVDE bit value is changed from 0 to 1. When using the voltage detection m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

7.2.3 PVDmCR0 : Voltage Monitor m Circuit Control Register 0 (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA70 + 0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RN	RI	FSAMP[1:0]		—	CMPE	DFDIS	RIE
Value after reset:	1	0	0	0	x	0	1	0

Bit	Symbol	Function	R/W
0	RIE	Voltage Monitor m Interrupt/Reset Enable 0: Disable 1: Enable	R/W
1	DFDIS	Voltage monitor m Digital Filter Disabled Mode Select 0: Enable the digital filter 1: Disable the digital filter	R/W
2	CMPE	Voltage Monitor m Circuit Comparison Result Output Enable 0: Voltage monitor m circuit comparison result output disabled 1: Voltage monitor m circuit comparison result output enabled	R/W
3	—	The read value is undefined. The write value should be 1.	R/W
5:4	FSAMP[1:0]	Sampling Clock Select 0 0: 1/2 LOCO frequency 0 1: 1/4 LOCO frequency 1 0: 1/8 LOCO frequency 1 1: 1/16 LOCO frequency	R/W
6	RI	Voltage Monitor m Circuit Mode Select (1) case of PVDmFCR.RHSEL = 0 0: Voltage monitor m interrupt during V_{detm} passage 1: Voltage monitor m reset enabled when the voltage falls to and below V_{detm} (2) case of PVDmFCR.RHSEL = 1 0: prohibited 1: Voltage monitoring m reset enabled when the voltage rises to and up Vdetm	R/W
7	RN	Voltage Monitor m Reset Negate Select (1) case of PVDmFCR.RHSEL = 0 0: Negation follows a stabilization time (t_{PVDm}) after VCC > V_{detm} is detected 1: Negation follows a stabilization time (t_{PVDm}) after assertion of the PVDm reset. (2) case of PVDmFCR.RHSEL = 1 0: Negation follows a stabilization time (t_{PVDm}) after VCC < Vdetm is detected. 1: Prohibited	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

RIE bit (Voltage Monitor m Interrupt/Reset Enable)

The RIE bit enables or disables voltage monitor m interrupt/reset. Ensure that neither a voltage monitor m interrupt nor a voltage monitor m reset is generated during programming or erasure of the flash memory.

DFDIS bit (Voltage monitor m Digital Filter Disabled Mode Select)

The DFDIS bit disables the digital filter circuit. Set the LOCOCR.LCSTP bit to 0 (the LOCO operates) if the DFDIS bit is 0 (enabling the digital filter circuit).Set the DFDIS bit to 1 (digital filter circuit disabled) when using voltage monitor m circuit in software standby mode or Deep Software Standby mode.

CMPE bit (Voltage Monitor m Circuit Comparison Result Output Enable)

The CMPE bit enables or disables voltage monitor m circuit comparison result output. Set the CMPE bit to 1 after the voltage detection m circuit enables and stabilization time ($t_{d(E-A)}$) elapses. When stopping the voltage detection m circut, disable the voltage detection m circuit after setting the CMPE bit is 0.

FSAMP[1:0] bits (Sampling Clock Select)

The FSAMP[1:0] bits can be rewritten only when the PVDmCR0.DFDIS bit is 1 (digital filter circuit disabled). The FSAMP[1:0] bits should not be modified when the PVDmCR0.DFDIS bit is 0 (digital filter circuit enabled).

RI bit (Voltage Monitor m Circuit Mode Select)

When the PVDmCR0.RI bit is 1 (voltage monitor m reset selected), a transition to Deep Software Standby mode 2 or 3 cannot be made, instead a transition to Deep Software Standby mode 1 is made. To enter Deep Software Standby mode 2 or 3, set all the PVDmCR0.RI bits to 0 (voltage monitor m interrupt selected).

RN bit (Voltage Monitor m Reset Negate Select)

Case of PVDmFCR.RHSEL = 0

- If the RN bit is set to 1 (negation follows a stabilization time after assertion of the PVDm reset signal), set the LOCOCR.LCSTP bit to 0 (the LOCO operates). Furthermore, if a transition to Software Standby mode or Deep Software Standby mode is to be made, the only possible value for the RN bit is 0 (negation follows a stabilization time after VCC > V_{detm} is detected. Do not set the RN bit to 1 (negation follows a stabilization time after assertion of the PVDm reset signal) when this is the case.

Case of PVDmFCR.RHSEL = 1

- Do not set the RN bit to 1.

.

7.2.4 PVDmCR1 : Voltage Monitor m Circuit Control Register 1 (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0E0 + 0x2 × (m-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	IRQSEL	IDTSEL[1:0]	
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
1:0	IDTSEL[1:0]	Voltage Monitor m Interrupt Generation Condition Select (1) case of PVDmFCR.RHSEL = 0 0 0: When VCC ≥ V_{detm} (rise) is detected 0 1: When VCC < V_{detm} (fall) is detected 1 0: When fall and rise are detected 1 1: Settings prohibited (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
2	IRQSEL	Voltage Monitor m Interrupt Type Select 0: Non-maskable interrupt 1: Maskable interrupt*1	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (writing enabled) before rewriting this register.
Note 1. When enabling maskable interrupts, do not change the value of the NMIER.PVDmEN bit on the ICU side from the reset state.

7.2.5 PVDmSR : Voltage Monitor m Circuit Status Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0E1 +0x2 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MON	DET
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
0	DET	Voltage Monitor m Voltage Change Detection Flag*1 (1) case of PVDmFCR.RHSEL = 0 0: Not detected 1: V_{detm} passage detection (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
1	MON	Voltage Monitor 1 Signal Monitor Flag (1) case of PVDmFCR.RHSEL = 0 0: VCC ≤ V_{detm} 1: VCC > V_{detm} or MON is disabled (2) case of PVDmFCR.RHSEL = 1 This bit is not applicable.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to this bit. After writing 0 to this bit, 2 system clock (ICLK) cycles are required for the bit to be read as 0.

DET flag (Voltage Monitor m Voltage Change Detection Flag)

The DET flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

The DET flag should be set to 0 after PVDmCR0.RIE is set to 0 (disabled). PVDmCR0.RIE can be set to 1 (enabled) after a period of two or more cycles of PCLKB has elapsed.

Depending on the number of cycles of PCLKB defined for access to read an I/O register, two or more cycles than PCLKB may have to be secured as waiting time.

MON flag (Voltage Monitor 1 Signal Monitor Flag)

The MON flag is enabled when the PVDmCMPCR.PVDE bit is 1 (voltage detection m circuit enabled) and the PVDmCR0.CMPE bit is 1 (voltage monitor m circuit comparison result output enabled).

7.2.6 PVDmFCR : Voltage Monitor m Function Control Register (m = 1, 2)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB20 +0x4 × (m - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RHSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RHSEL	Rise Hysteresis Select 0: Hysteresis level for VCC-fall detection is selected. 1: Hysteresis level for VCC-rise detection is selected.	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

The PVDmFCR.RHSEL can be changed only when all the PVDmCMPCR.PVDE bits are 0.

RHSEL flag (Rise Hysteresis Select)

When RHSEL=0 for VCC-fall detection, the hysteresis level is set above the voltage detection level set by PVDLVL[4:0].
When RHSEL=1 for VCC-rise detection, the hysteresis level is set under the voltage detection level set by PVDLVL[4:0] .
Refer to the chapter of electrical characteristics about the detail of hysteresis level of PVDm.

When PVDm reset generated by the VCC-fall detection is required, set RHSEL to 0.

When PVDm reset generated by the VCC-rise detection is required, set RHSEL to 1.

RHSEL must not be set to “1” when PVDmCR0.RI = 0.

RHSEL must not be set to “1” when PVDmCR0.RN = 1.

7.3 VCC Input Voltage Monitor

7.3.1 Monitoring V_{det0}

The comparison results from voltage monitor 0 are not available for reading.

7.3.2 Monitoring V_{detm}

After the settings are completed, results of comparison by voltage Monitor m can be monitored by using the PVDmSR.MON flag.

Table 7.2 Procedures to set up monitoring against V_{detm}

Step		Monitoring the comparison results from voltage monitor 1
Setting the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 to disable voltage detection m before writing to the PVDmCMPCR.PVDLVL[4:0] bits.
	2	Select the detection voltage in the PVDmCMPCR.PVDLVL[4:0] bits.
	3	Set PVDmCMPCR.PVDE = 1 to enable the voltage detection m circuit.
	4	Wait for at least $t_{d\ (E\text{-}A)}$.*1
Setting the digital filter*2	5	Select the sampling clock for the digital filter in the PVDmCR0.FSAMP[1:0] bits.
	6	Set PVDmCR0.DFDIS = 0 to enable the digital filter.
	7	Wait for at least 2n + 3 cycles of the LOCO (where n = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by n).
Enabling output	8	Set PVDmCR0.CMPE = 1 to enable output of the comparison results from voltage monitor m.

Note 1. Steps 5 to 7 can be performed during the waiting time of step 4.
Note 2. Steps 5 to 7 are not required if the digital filter is not in use.

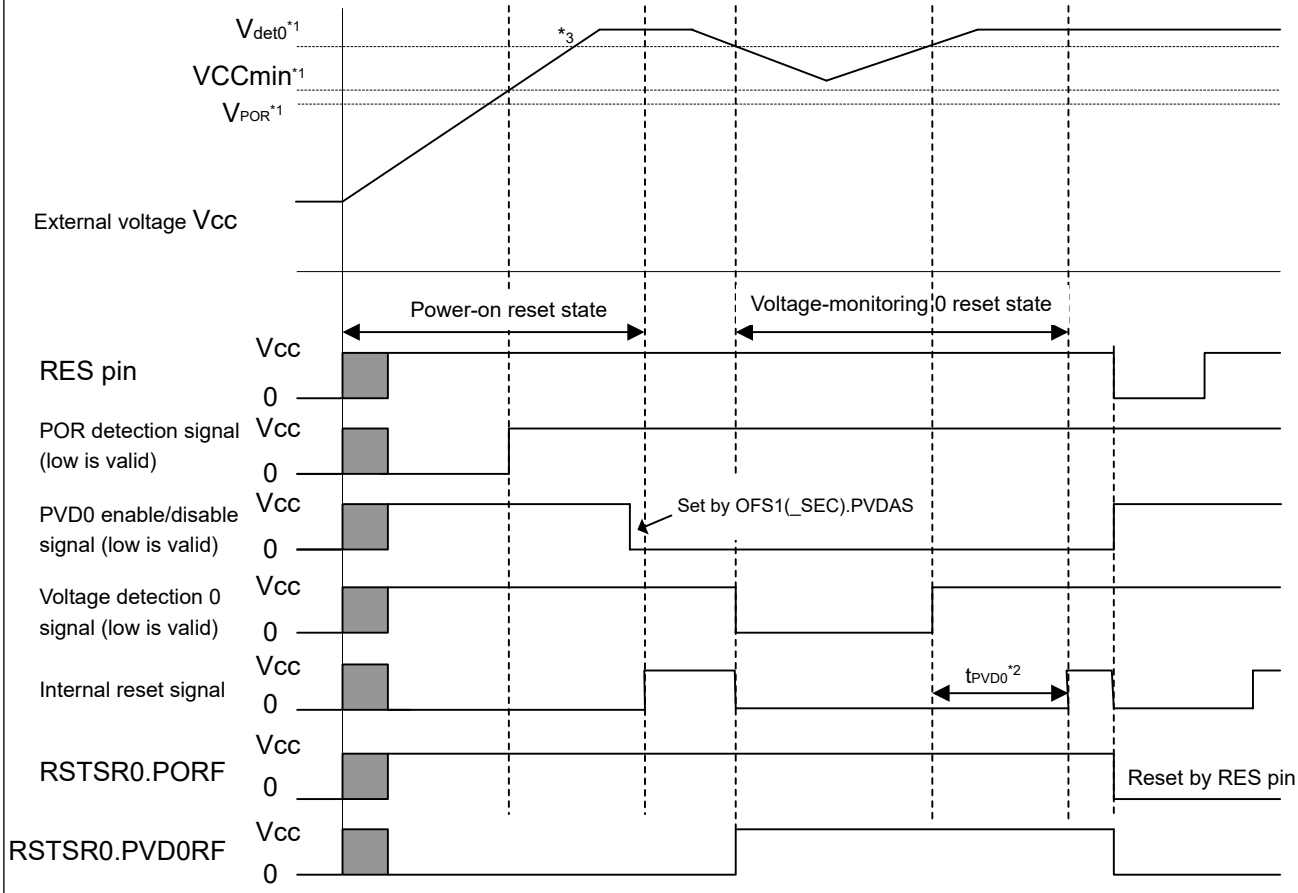
After configuring the PVDm according to the procedure in the table above, if you change the PVDm setting again, first set PVDmCR0.CMPE to 0, and then configure PVDm again according to the procedure in the table above.

When changing the PVDmCMPCR.PVDLVL, comply with the description of the section 7.2.2. PVDmCMPCR : Voltage Monitor m Comparator Control Register (m = 1, 2) .

7.4 Reset from Voltage Monitor 0

When using the reset from voltage monitor 0, clear the OFS1(_SEC).PVDAS bit to 0. (enabling the voltage monitor 0 reset after a reset)

Figure 7.3 shows an example of operations for a voltage monitor 0 reset.



Note: For details of the electrical characteristics, see section 60, Electrical Characteristics.
Note 1. V_{POR} indicates the detection level for a power-on reset and V_{det0} indicates the detection level for a voltage monitor 0 reset and VCC_{min} shows minimum guranteed voltage of MCU.
Note 2. t_{PVD0}: the period until the voltage monitor 0 reset is released.
Note 3. At the time the power-supply voltage rises, VCC must rise to at least the minimum guaranteed voltage before release from the POR reset state.

Figure 7.3 Example of voltage monitor 0 reset operation

7.5 Interrupt and Reset from Voltage Monitor m (m = 1, 2)

An interrupt or reset can be generated in response to the results of comparison by the voltage detection m circuit

Table 7.3 shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates. Table 7.4 shows the procedures for setting bits related to the voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops. Figure 7.4 shows an example of operations for a voltage monitor m interrupt. For the operation of the voltage monitor m reset, see Figure 5.2 in section 5, Resets.

Furthermore, if you intend to use the voltage Monitor m circuit in software standby or Deep Software Standby mode, make settings for the voltage Monitor m circuit according to the following procedures.

(1) Setting in Software Standby mode

- Disable the digital filter (PVDmCR0.DFDIS = 1).
- Case of PVDmFCR.RHSEL = 0
- After VCC > V_{detm} is detected, negate the voltage monitor m reset signal (PVDmCR0.RN = 0) following a stabilization time.

(2) Settings in Deep Software Standby mode

- Disable the digital filter (PVDmCR0.DFDIS = 1).
- Enable the voltage monitor m interrupt (PVDmCR0.RI = 0). If the voltage monitor m reset is enabled (PVDmCR0.RI = 1), a transition to Deep Software Standby mode 2 or 3 is not be possible, and the transition will be to Deep Software Standby mode 1 instead.
- During Deep Software Standby mode 3, the voltage Monitor m circuit is stopped. If you intend to use the voltage Monitor m circuit in Deep Software Standby mode, do not transit to Deep Software Standby mode 3.

(3) Disabling at on-chip debug mode

- The function of the voltage Monitor m circuit is disabled by setting DBGSTOPCR.DBGSTOP_PVD at on-chip debug mode.

Table 7.3 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring operates (m = 1, 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output)	Voltage monitor m reset
Setting up the voltage detection m circuit	1	Set PVDmCMPCR.PVDE = 0 (disable voltage detection m before writing to the PVDmCMPCR.PVDLVL and PVDmFCR.RHSEL register.)	
	2	Select the detection voltage by setting the PVDmCMPCR.PVDLVL bits.	
	3	—	Select the type of the reset condition by setting the PVDmFCR.RHSEL bit.
	4	Set PVDmCMPCR.PVDE = 1 (enabling the voltage detection m circuit).	
	5	Wait for at least $t_{d\ (E\text{-}A)}$. *1	
Setting the digital filter*2	6	Select the sampling clock for the digital filter by the setting PVDmCR0.FSAMP[1:0] bits.	
	7	Set PVDmCR0.DFDIS = 0 (enabling the digital filter).	
	8	Wait for at least 2n + 3 cycles of the LOCO (where n = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by n).*4.	
Setting up the voltage monitor m interrupt or reset	9	Set PVDmCR0.RI = 0 to select the voltage monitor m interrupt.	• Set PVDmCR0.RI = 1 (selecting the voltage monitor m reset). • Select the type of the reset negation by setting the PVDmCR0.RN bit.
	10	• Select the timing of interrupt requests by setting the PVDmCR1.IDTSEL[1:0] bits. • Select the type of interrupt by setting the PVDmCR1.IRQSEL bit.	—
Enabling output	11	Set PVDmSR.DET = 0.	
	12	Set PVDmCR0.RIE = 1 (enabling the voltage Monitor m interrupt or reset).*3	
	13	Set PVDmCR0.CMPE = 1 (enabling output of the results of comparison by voltage monitor m).	

Note 1. Steps 6 to 12 can be performed during the wait time in step 4.
Note 2. Steps 6 to 8 are not required if the digital filter is not in use.
Note 3. Step 12 is not required if only the ELC event signal is to be output.
Note 4. Steps 9 to 12 can be performed during the waiting time of step 8.

After configuring the PVDm according to the procedure in the Table 7.3, if you change the PVDm settings again, stop PVDm according to the procedure in Table 7.4, and then configure PVDm again according to the procedure in the Table 7.3.

When changing the PVDmCMPCR.PVDLVL, comply with the description of the section 7.2.2. PVDmCMPCR : Voltage Monitor m Comparator Control Register (m = 1, 2).

Table 7.4 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (1 of 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset
Stopping the enabling output	1	Set PVDmCR0.CMPE = 0 (disabling output of the results of comparison by voltage Monitor m).

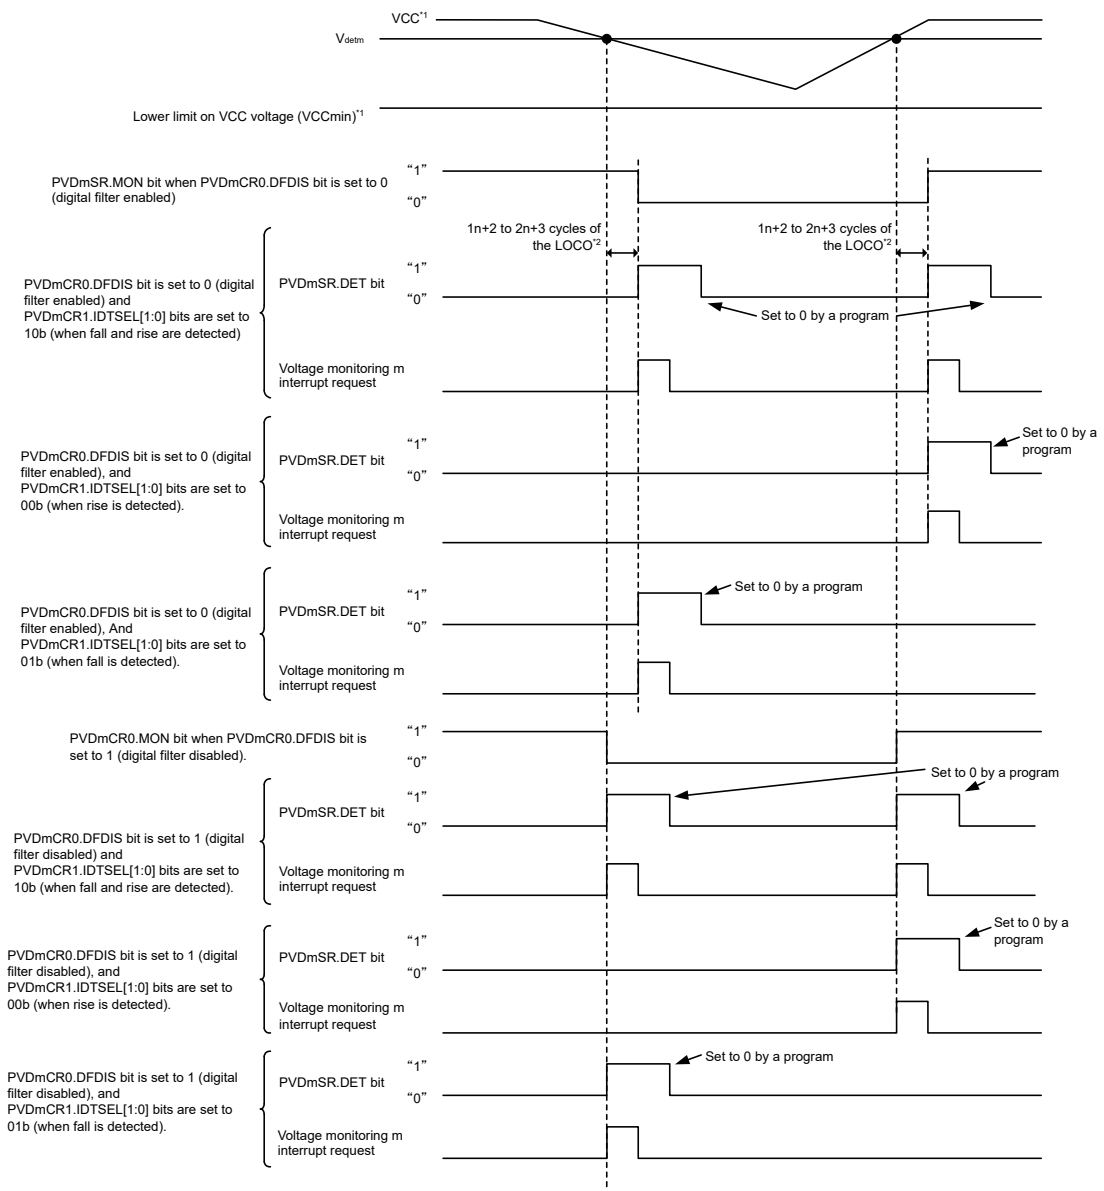
Table 7.4 Procedures for setting bits related to voltage monitor m interrupt and voltage monitor m reset so that voltage monitoring stops (m = 1, 2) (2 of 2)

Step		Voltage monitor m interrupt (voltage monitor m ELC event output), voltage monitor m reset
	2	Wait for at least 2n + 3 cycles of the LOCO (where n = 2, 4, 8, 16, and the sampling clock for the digital filter is the LOCO frequency-divided by n.)*1
	3	Set PVDmCR0.RIE = 0 (disabling the voltage monitor m interrupt or reset).*3
Stopping the digital filter	4	Set PVDmCMPCR.DFDIS = 1 (disabling the digital filter). *1, *2
Stopping the voltage detection m circuit	5	Set PVDmCMPCR.PVDE = 0 (disabling the voltage detection m circuit).

Note 1. Steps 2 and 4 are not required if the digital filter is not in use.
Note 2. To disable the digital filter from its enabled state and then re-enable it, disable it and wait for at least two cycles of the LOCO before re-enabling it.
Note 3. Step 3 is not required if only the ELC event signal is to be output.

If the voltage monitor m interrupt or voltage monitor m reset setting is to be made again after it has been used and stopped once, the following steps in the procedures for stopping and making the setting can be omitted according to the condition:

- Setting or stopping the voltage detection m circuit is not required if the setting for the voltage detection m circuit is not to be changed
- Setting or stopping the digital filter is not required if the setting for the digital filter is not to be changed
- Setting the voltage monitor m interrupt or reset is not required if the setting for the voltage monitor m interrupt or voltage monitor m reset is not to be changed.



Note 1. When the voltage monitor 0 reset is not in use, use at VCC ≥ VCCmin.
Note 2. n: Frequency of the sampling clock for the digital filter is the LOCO frequency divided by n.

Figure 7.4 Example of voltage monitor m interrupt operation (m = 1, 2)

7.6 Event Link Controller (ELC) Output

The PVDm (m = 1, 2) can output the event signals to the Event Link Controller (ELC).

(1) V_{detm} passage detection event

The PVDm outputs the event signal when it is detected that the voltage has passed the V_{detm} voltage while both the voltage detection m circuit and the voltage monitor m circuit comparison result output are enabled.

When enabling the event link output function of the PVDm, be sure to specify settings to enable the PVDm before enabling the PVDm event link function of the ELC. To stop the event link output function of the PVDm, be sure to specify settings to stop the PVDm before disabling the PVDm event link function of the ELC.

7.6.1 Interrupt Handling and Event Linking

Each PVD has bits to separately enable or disable the voltage monitor m interrupts. When an interrupt source is generated and the interrupt is enabled by the interrupt enable bit, the interrupt signal is output to the CPU.

On the contrary, as soon as an interrupt source is generated, the event link signal is output as the event signal to the other module through the ELC regardless of the state of the interrupt enable bit.

It is possible to output voltage monitor m interrupts in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2. The event signals for the ELC in Software Standby mode, Deep Software Standby mode 1, and Deep Software Standby mode 2 are output as follows:

- When the event V_{detm} is detected in Software Standby mode, no event signals are generated for the ELC because no clock is presented in Software Standby mode. Because V_{detm} passage detection flag is preserved, when the supply of the clock is resumed after restoring from Software Standby mode, the event signals for the ELC is output according to the state of the V_{detm} passage detection flag.
- If event of passing V_{detm} is detected in Deep Software Standby mode, no event signal is generated for the ELC.

8. Clock Generation Circuit

8.1 Overview

The MCU provides a clock generation circuit. Table 8.1 and Table 8.2 list the clock generation circuit specifications. Figure 8.1 show a block diagram, and Table 8.3 lists the I/O pins.

Table 8.1 Clock generation circuit specifications for the clock sources

Clock source	Description	Specification
Main clock oscillator (MOSC)	Resonator frequency	8 MHz to 48 MHz
	External clock input frequency	Up to 48 MHz
	Connectable resonator or additional circuit: ceramic resonator, crystal Connection pins: EXTAL, XTAL	Available
	Drive capability switching	Available
	Automatic Gain Control Function	Available
	Oscillation stop detection function	Available
Sub-clock oscillator (SOSC)	Resonator frequency	32.768 kHz
	Connectable resonator or additional circuit: crystal resonator Connection pin: XCIN, XCOUT	Available
	External clock input	Available
	Drive capability switching	Available
PLL1 circuit PLL2 circuit	Input clock source	MOSC/HOCO
	Input pulse frequency division ratio	Selectable from 1/2/3/4
	Input clock frequency	8 MHz to 48 MHz
	Input clock frequency (After input frequency division)	6 MHz to 12 MHz
	Frequency multiplication ratio	Selectable from 26 to 180 (after the decimal point : 0/0.33/0.50/0.66)
	VCO frequency	640 MHz to 1440 MHz
	Number of output clocks	Output 3 different clocks
	PLL Output clock P	40 MHz to 480 MHz (output division ratio : 2/4/6/8/16)
	PLL Output clock Q	71 MHz to 480 MHz (output division ratio : 2/3/4/5/6/8/9)
	PLL Output clock R	71 MHz to 480 MHz (output division ratio : 2/3/4/5/6/8/9)
High-speed on-chip oscillator (HOCO)	Oscillation frequency	16/18/20/32/48 MHz
	FLL function	Available
	User trimming	Available
Middle-speed on-chip oscillator (MOCO)	Oscillation frequency	8 MHz
	User trimming	Available
Low-speed on-chip oscillator (LOCO)	Oscillation frequency	32.768 kHz
	User trimming	Available
External clock input for JTAG (TCK)	Input clock frequency	Up to 25 MHz
External clock input for SWD (SWCLK)	Input clock frequency	Up to 25 MHz

Table 8.2 Clock generation circuit specifications for the internal clocks (1 of 2)

Item	Clock source	Clock supply	Specification
CPU clock (CPUCLK)	MOSC/SOSC/HOCO/MOCO/ PLL1P	CPU, TCM	Up to 480 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
System clock (ICLK)	MOSC/SOSC/HOCO/MOCO/ PLL1P	DMAC, DTC, Flash (Reading from code flash), SRAM, Standby SRAM, System BUS, I/O Ports, ICU	Up to 240 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Debugger clock (DCLK)	1/2 ICLK	Debug Subsystem	Up to 120MHz
Peripheral module clock A (PCLKA)	MOSC/SOSC/HOCO/MOCO/ PLL1P	High-speed peripheral bus (ETHERC, EDMAC, USBHS, SCI, I3C, CANFD, CNECC, SPI, CRC, DOC, ADC12, DAC12, RSIP-E51A, GPT, DOTF AES clock, CEU, MIPI, DRW, LCDC bus)	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock B (PCLKB)	MOSC/SOSC/HOCO/MOCO/ PLL1P	Low-speed peripheral bus (CAC, ELC, POEG, RTC, WDT, IWDT, AGT, ULPT, IIC, USBFS, SSIE, SDHI, TSN, ACMPHS, OSPI, DOTF bus clock)	Up to 60 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock C (PCLKC)	MOSC/SOSC/HOCO/MOCO/ PLL1P	Peripheral module (ADC12 conversion clock)	Up to 60 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock D (PCLKD)	MOSC/SOSC/HOCO/MOCO/ PLL1P	Peripheral module(GPT count clock)	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
Peripheral module clock E (PCLKE)	MOSC/SOSC/HOCO/MOCO/ PLL1P	Peripheral module (CNECC)	Up to 240 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
FlashIF clock (FCLK)	MOSC/SOSC/HOCO/MOCO/ PLL1P	FlashIF	4 MHz to 60 MHz(P/E) Up to 60 MHz(read) Division ratio: 1/2/3/4/6/8/12/16/32/64
External bus clock (BCLK)	MOSC/SOSC/HOCO/MOCO/ PLL1P	External bus	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64
EBCLK pin output (EBCLK)	BCLK or 1/2 BCLK	EBCLK pin	Up to 60 MHz Division ratio: 1 or 2
SDCLK pin output (SDCLK)	BCLK	SDCLK pin	Up to 120 MHz
Trace clock (TRCLK)	MOSC/SOSC/HOCO/MOCO/ PLL1P	CPU-OCD	Up to 120 MHz Division ratio: 1/2/3/4/6/8/12/16/32/64/128/256
SCI clock (SCICLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/ PLL1Q/PLL1R/ PLL2P/PLL2Q/PLL2R	SCI	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8
SPI clock (SPICLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	SPI	Up to 120 MHz Division ratio: 1/2/3/4/5/6/8
Octal-SPI clock (OCTACLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	Octal-SPI	Up to 200 MHz Division ratio: 1/2/3/4/5/6/8
Octal-SPI divide clock (OCTADIVCLK)	1/2 OCTACLK	Octal-SPI	Up to 100 MHz
CANFD core clock (CANFDCLK)	MOSC/SOSC/HOCO/MOCO/ LOCO/PLL1P/PLL1Q/PLL1R/ PLL2P/ PLL2Q/PLL2R	CANFD	Up to 80 MHz Division ratio: 1/2/3/4/5/6/8
LCD clock (LCDCLK)	MOCO/PLL1P/ PLL1Q/ PLL1R/PLL2P/PLL2Q/PLL2R	GLCDC	Up to 240 MHz Division ratio: 1/2/3/4/5/6/8
LCD_CLK pin output (LCD_CLK) and graphic LCD pixel clock (PXCLK)	LCD_EXTCLK, LCDCLK	GLCDC	Up to 54 MHz (parallel RGB) Up to 60 MHz (serial RGB) LCD_CLK division ratios: 1, 2, 3, 4, 5, 6, 7, 8, 9, 12, 16, 24, 32 LCD_CLK : PXCLK = 1:1 (parallel RGB) LCD_CLK : PXCLK = 4:1 (serial RGB)

Table 8.2 Clock generation circuit specifications for the internal clocks (2 of 2)

Item	Clock source	Clock supply	Specification
USB clock (USBCLK)	MOSC/HOCO/MOCO/PLL1P/PLL1Q/PLL1R/PLL2P/PLL2Q/PLL2R	USBFS, USBHS	48 MHz Division ratio: 1/2/3/4/5/6/8
USB clock (USB60CLK)	MOSC/HOCO/MOCO/PLL1P/PLL1Q/PLL1R/PLL2P/PLL2Q/PLL2R	USBHS	60 MHz Division ratio: 1/2/3/4/5/6/8
I3C clock (I3CCLK)	MOCO/PLL1P/PLL1Q/PLL1R/PLL2P/PLL2Q/PLL2R	I3C	Up to 200 MHz Division ratio: 1/2/3/4/5/6/8
Clock/buzzer output (CLKOUT)	MOSC/SOSC/HOCO/MOCO/LOCO	CLKOUT pin	Up to 60 MHz Division ratio: 1/2/4/8/16/32/64/128
MOSC clock for USBHS (USBMCLK)	MOSC	USBHS	12/20/24/48 MHz No division
CAN clock (CANMCLK)	MOSC	CANFD	8 MHz to 48 MHz No division
MIPI clock (MIPIMCLK)	MOSC	MIPI	Up to 48 MHz No division
ULPT LOCO clock (ULPTLCLK)	LOCO	ULPT	32.768 kHz No division
ULPT Sub-clock (ULPTSCLK)	SOSC	ULPT	32.768 kHz No division
AGT LOCOclock (AGTLCLK)	LOCO	AGT	32.768 kHz No division
AGT Sub clock (AGTSCLK)	SOSC	AGT	32.768 kHz No division
CAC Main clock (CACMCLK)	MOSC	CAC	Up to 48 MHz No division
CAC Sub clock (CACSCLK)	SOSC	CAC	32.768 kHz No division
CAC HOCO clock (CACHCLK)	HOCO	CAC	16/18/20/32/48 MHz No division
CAC MOCO clock (CACMOCLK)	MOCO	CAC	8 MHz No division
CAC LOCO clock (CACLCLK)	LOCO	CAC	32.768 kHz No division
RTC LOCO clock (RTCLCLK)	LOCO	RTC	32.768 kHz No division
RTC Sub clock (RTCSCLK)	SOCO	RTC	32.768 kHz No division
IWDT clock (IWDTCLK)	1/2 LOCO	IWDT	16.384 kHz No division
SysTick timer clock (SYSTICKCLK)	1/8 MOCO	SysTick timer	1 MHz No division
JTAG clock (JTAGTCK)	TCK	JTAG	Up to 25 MHz No division
Serial wire clock (SWCLK)	TCK	OCD	Up to 25 MHz No division
TCLK pin output (TCLK)	1/2 TRCLK	TCLK pin	Up to 60 MHz

Note: When selecting PLL as the clock source, set the PLL output frequency to 480 MHz or less.
Note: If the PLL reference clock source is HOCO, the PLL multiplication setting must be set within output frequency range of PLL in consideration of HOCO frequency (minimum/maximum).
Note: Restrictions on setting clock frequency: CPUCLK≥ICLK, ICLK≥PCLKA≥PCLKB, ICLK≥FCLK, ICLK≥BCLK, PCLKD≥PCLKA≥PCLKB
Restrictions on clock frequency ratio: (N: integer, and up to 64)
CPUCLK:ICLK=N:1, ICLK:FCLK=N:1, ICLK:BCLK=N:1, ICLK:PCLKA=N:1, ICLK:PCLKB=N:1, ICLK:PCLKC=N:1 or 1:N, ICLK:PCLKD=N:1 or 1:N, ICLK:PCLKE=N:1 or 1:N

When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.
If the A/D converter is enabled, the clock frequency ratio is constrained as follows:
PCLKA:PCLKC = 1:1 or 2:1 or 4:1 or 8:1 or 1:2 or 1:4
If the CAN-FD is used, clock frequency ratio is constrained to be PCLKA:PCLKE=1:2.

Note: Restrictions on the minimum FCLK frequency 4MHz when P/E.

Note: The multiplication of PLL1 and PLL2 should be set to be within the output frequency range of PLL1 and PLL2, taking the frequency of HOCO into consideration when not using the FLL function.

Note: Clocks have a permissible frequency range (See Table 8.2).
Flash memory and SRAM also have a permissible operating frequency range in each wait cycle setting. (See section 50, SRAM, section 52, Flash Memory)
Those clock frequency ranges must be satisfied even if the HOCO has its maximum or minimum frequency when not using FLL function. (See section 60, Electrical Characteristics).

Note: When using ETHERC, the PCLKA frequency is as follows:
12.5 MHz ≤ PCLKA ≤ 120 MHz

Note: PLLCCR.PLSRCSEL bit must be set to 0 when CPUCLK is set to over 360 MHz.

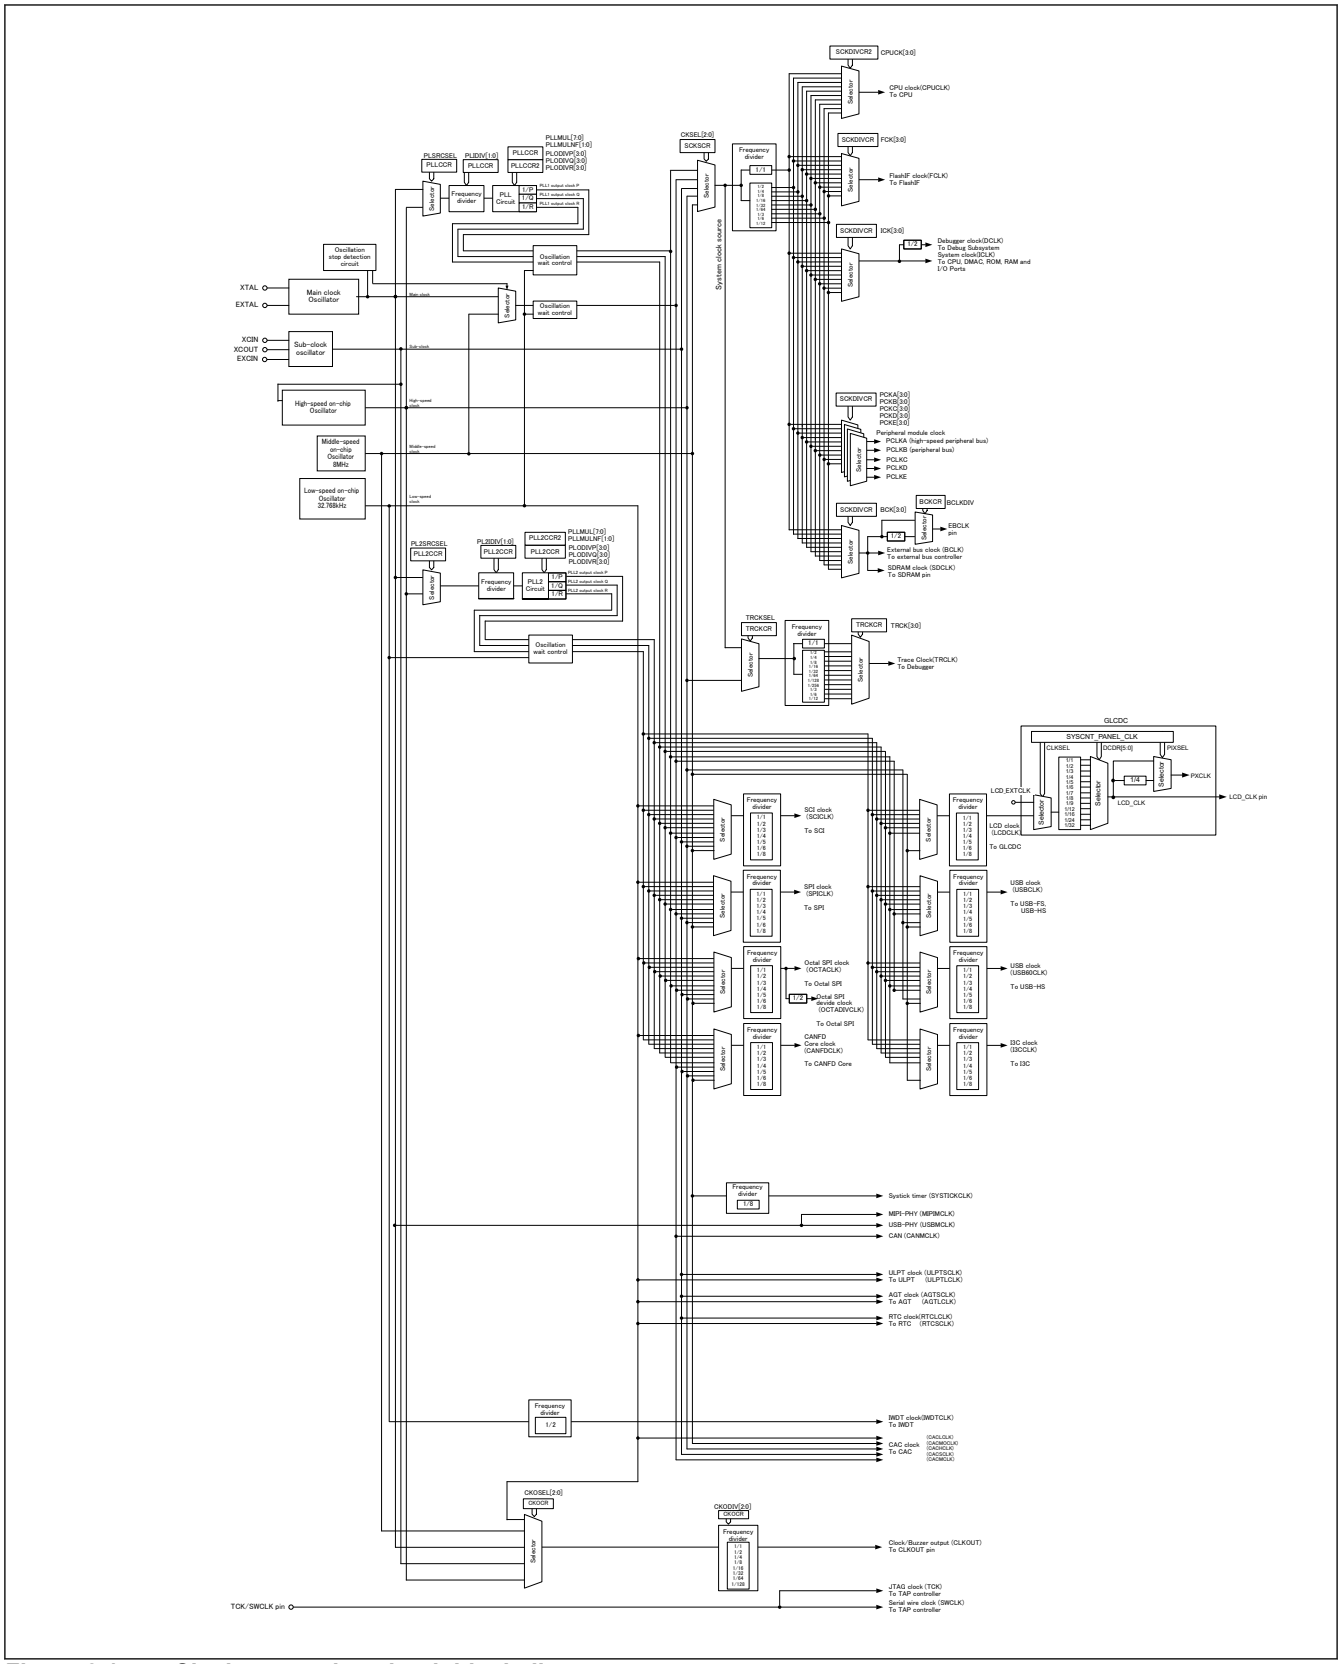


Figure 8.1 Clock generation circuit block diagram

Table 8.3 lists the input/output pins of the clock generation circuit.

Table 8.3 Input/Output Pins of Clock Generation Circuit

Pin name	I/O	Description
XTAL	Output	These pins are used to connect a ceramic resonator or crystal resonator. The EXTAL pin can also be used to input an external clock. For details, see section 8.3.2. External Clock Input.
EXTAL	Input	
XCIN	Input	These pins are used to connect a 32.768-kHz crystal resonator
XCOUT	Output	
EXCIN	Input	External sub-clock input
TCK/SWCLK	Input	This pin is used to input the clock for the JTAG/SWD
EBCLK	Output	This pin is used to supply external devices with the external bus clock (EBCLK)
SDCLK	Output	SDRAM clock (SDCLK) supply for external devices
CLKOUT	Output	This pin is used to output the CLKOUT clock
TRCLK	Output	TRACE clock output.

8.2 Register Descriptions

8.2.1 CGFSAR : Clock Generation Function Security Attribute Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3C0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	NONSEC26	—	—	—	NONSEC22	NONSEC21	NONSEC20	NONSEC19	NONSEC18	NONSEC17	NONSEC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

26	NONSEC26	Non Secure Attribute bit 26 Target register: LCDCKDIVCR, LCDCKCR Target factor: LCDCLK 0: Secure 1: Non Secure	R/W
31:27	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

CGFSAR register controls the secure attribute of Clock Generation Function registers.

NONSEC00 bit (Non Secure Attribute bit 00)

This bit controls the security attribute of SCKDIVCR, SCKDIVCR2, SCKSCR.

NONSEC02 bit (Non Secure Attribute bit 02)

This bit controls the security attribute of HOCOCR, FLLCR1, FLLCR2, HOCOUTCR, HOCOSCR.

NONSEC03 bit (Non Secure Attribute bit 03)

This bit controls the security attribute of MOCOCR, MOCOUTCR.

NONSEC04 bit (Non Secure Attribute bit 04)

This bit controls the security attribute of LOCOCR, LOCOUTCR.

NONSEC05 bit (Non Secure Attribute bit 05)

This bit controls the security attribute of MOSCCR, MOSCWTCR, MOMCR, MOSCSCR.

NONSEC06 bit (Non Secure Attribute bit 06)

This bit controls the security attribute of OSTDCR, OSTDSR.

NONSEC07 bit (Non Secure Attribute bit 07)

This bit controls the security attribute of SOSCCR, SOMCR.

NONSEC08 bit (Non Secure Attribute bit 08)

This bit controls the security attribute of PLLCCR, PLLCCR2, PLLCR.

NONSEC09 bit (Non Secure Attribute bit 09)

This bit controls the security attribute of PLL2CCR, PLL2CCR2, PLL2CR.

NONSEC11 bit (Non Secure Attribute bit 11)

This bit controls the security attribute of CKOCR.

NONSEC12 bit (Non Secure Attribute bit 12)

This bit controls the security attribute of BCKCR, EBCKOCR.

NONSEC13 bit (Non Secure Attribute bit 11)

This bit controls the security attribute of SDCKOCR.

NONSEC16 bit (Non Secure Attribute bit 16)

This bit controls the security attribute of USBCKDIVCR, USBCKCR.

NONSEC17 bit (Non Secure Attribute bit 17)

This bit controls the security attribute of OCTACKDIVCR, OCTACKCR.

NONSEC18 bit (Non Secure Attribute bit 18)

This bit controls the security attribute of CANFDCKDIVCR, CANFDCKCR.

NONSEC19 bit (Non Secure Attribute bit 19)

This bit controls the security attribute of USB60CKDIVCR, USB60CKCR.

NONSEC20 bit (Non Secure Attribute bit 20)

This bit controls the security attribute of I3CCKDIVCR, I3CCKCR.

NONSEC21 bit (Non Secure Attribute bit 21)

This bit controls the security attribute of SCICKDIVCR, SCICKCR.

NONSEC22 bit (Non Secure Attribute bit 22)

This bit controls the security attribute of SPICKDIVCR, SPICKCR.

NONSEC26 bit (Non Secure Attribute bit 26)

This bit controls the security attribute of LCDCKDIVCR, LCDCKCR.

8.2.2 SCKDIVCR : System Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.
Note 1. The following relation is required between the frequencies of the system clock (ICLK) and the FlashIF clock (FCLK).
ICLK:FCLK=N:1 (N: integer)
Note 2. The following relation is required between the frequencies of the system clock (ICLK) and the external bus clock (BCLK).
ICLK:BCLK=N:1 (N: integer)
Note 3. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKA, PCLKB)
ICLK:PCLKA = N:1, ICLK:PCLKB = N:1 (N: integer)
Note 4. The following relation is required between the frequencies of the system clock (ICLK) and the peripheral module clocks (PCLKC, PCLKD, PCLKE):
ICLK:PCLKC, PCLKD PCLKE = N:1or1:N (N: integer)
Note 5. The following relation is required between the frequencies of the CPU clock (CPUCLK) and the system clock (ICLK):
CPUCLK:ICLK=N:1 (N: integer)

SCKDIVCR selects the frequencies of the system clock (ICLK), peripheral module clock (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), FlashIF clock (FCLK), and external bus clock (BCLK).

8.2.3 SCKDIVCR2 : System Clock Division Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—				CPUCK[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CPUCK[3:0]*1	CPU Clock (CPUCLK) Select 0 0 0 0: × 1/1 0 0 0 1: × 1/2 0 0 1 0: × 1/4 0 0 1 1: × 1/8 0 1 0 0: × 1/16 0 1 0 1: × 1/32 0 1 1 0: × 1/64 1 0 0 0: × 1/3 1 0 0 1: × 1/6 1 0 1 0: × 1/12 Others: Setting prohibited.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: When one clock selects 3, 6, 12-divisions, the other clocks set by SCKDIVCR and SCKDIVCR2 registers must not select 2, 4, 8, 16, 32, 64- divisions.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The following relation is required between the frequencies of the CPU clock (CPUCLK) and the system clock (ICLK): CPUCLK:ICLK=N:1 (N: integer)

SCKDIVCR2 selects the frequencies of the cpu clock (CPUCLK).

8.2.4 SYRACCR : System Register Access Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xCC

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BUSY
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSY	Access Ready monitor 0: Ready to read/write access 1: Writing in progress	R
7:1	—	These bits are read as 0. The write value should be 0.	R

Note: S-TYPE-5, P-TYPE-5
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SYRACCR register monitor that the target registers can be accessed.

The target registers are LOCOCR and LOCOUTCR.

BUSY bit (Access Ready monitor)

When SYRACCR.BUSY is 0, you can access the target registers.

Make sure that SYRACCR.BUSY is 0 before accessing the target registers.

When SYRACCR.BUSY is 1, the write access to one of the target registers is in progress. If SYRACCR.BUSY is 1, further writing to one of the target registers is ignored, and the read value from the target registers is not guaranteed.

8.2.5 SCKSCR : System Clock Source Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x026

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CKSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	CKSEL[2:0]	Clock Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: Setting prohibited 0 1 1: Main clock oscillator (MOSC) 1 0 0: Sub-clock oscillator (SOSC) 1 0 1: PLL1 output clock P (PLL1P) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: S-TYPE-3, P-TYPE-2

The SCKSCR register selects system clock source.

CKSEL[2:0] bits (Clock Source Select)

The CKSEL[2:0] bits select the source for the following modules:

- CPU clock (CPUCLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- FlashIF clock (FCLK)
- external bus clock (BCLK)
- SDRAM clock (SDCLK)

The bits select from one of the following sources:

- Middle-speed on-chip oscillator (MOCO)
- High-speed on-chip oscillator (HOCO)
- Main clock oscillator (MOSC)
- Sub-clock oscillator (SOSC)
- PLL1 output clock P (PLL1P)

The operating state of each clock source is controlled not only by the clock oscillation enable settings but also by the operating modes of the product. Some clock sources might be forcibly stopped depending on the product operating mode being used.

Check the operation state of clock sources in each product operating mode, and do not select the clock source to be stopped in SCKSCR. The clock sources should be switched when there are no occurring internal asynchronous interrupt. For details, see section 10, Low Power Modes.

8.2.6 PLLCCR : PLL Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x028

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLLMUL[7:0]								PLLMULNF[1:0]		—	PLSR CSEL	—	—	PLIDIV[1:0]	
Value after reset:	0	0	0	1	1	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PLIDIV[1:0]*1	PLL1 Input Frequency Division Ratio Select 0 0: 1/1 0 1: 1/2 1 0: 1/3 1 1: 1/4	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PLSRCSEL	PLL1 Clock Source Select 0: Main clock oscillator*3 1: HOCO*4	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
7:6	PLLMULNF[1:0]*2	PLL1 Frequency Multiplication Fractional Factor Select 0 0: 0.00 (Value after reset) 0 1: 0.33 (1/3) 1 0: 0.66 (2/3) 1 1: 0.50 (1/2)	R/W
15:8	PLLMUL[7:0]*2	PLL1 Frequency Multiplication Factor Select 0x19: × 26 (Value after reset) 0x1A: × 27 0x1B: × 28 ⋮ 0x58: × 89 0x59: ×90 0x5A: × 91 ⋮ 0xB2: ×179 0xB3: × 180 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. PLIDIV[1:0] should be set so that the frequency of PLL1 input signal is within the range of section 8.1. Overview.
Note 2. PLLMUL[7:0] and PLLMULNF[1:0] should be set so that the frequency of PLL1 output signal is within the range of section 8.1. Overview.
Note 3. PLSRCSEL must be set to 0 when CPUCLK is set to over 360MHz.
Note 4. The FLL function must be enabled when using USBCLK.

The PLLCCR register sets the operation of the PLL1 circuit.

Writing to the PLLCCR is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

PLIDIV[1:0] bits (PLL1 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL1 clock source.

PLSRCSEL bit (PLL1 Clock Source Select)

This bit selects the clock source for the PLL1.

PLLMULNF[1:0] bit (PLL1 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL1 circuit.

PLLMUL[7:0] bits (PLL1 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL1 circuit.

8.2.7 PLLCCR2 : PLL Clock Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x4C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—				PLODIVR[3:0]				PLODIVQ[3:0]				PLODIVP[3:0]			
Value after reset:	0	0	0	0	0	1	0	1	0	1	0	1	0	1	0	1

Bit	Symbol	Function	R/W
3:0	PLODIVP[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W
7:4	PLODIVQ[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
11:8	PLODIVR[3:0]*1	PLL1 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. It must be set so that the frequency of PLL1 output signal is within the range listed in Table 8.1.

The PLLCCR2 register sets up the operation of the PLL1 circuit. Writing to the PLLCCR2 is prohibited when the PLLCR.PLLSTP bit is 0 (the PLL1 operates).

Even if only one of the PLL1 output clock P, Q, or R is used, PLLCCR2 must be set so that the frequency of PLL1 output signal is within the range listed in Table 8.1.

PLODIVP[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL1 output clock P (PLL1P).

PLODIVQ[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL1 output clock Q (PLL1Q).

PLODIVR[3:0] bit (PLL1 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL1 output clock R (PLL1R).

8.2.8 PLLCR : PLL Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x02A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLLSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLLSTP	PLL1 Stop Control 0: PLL1 is operating 1: PLL1 is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLLCR register controls the operation of the PLL1 circuit.

PLLSTP bit (PLL1 Stop Control)

This bit runs or stops the PLL1 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL1 by the PLLCCR.PLSRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLLSTP bit setting is changed to run the PLL1, only use the PLL1 clock after confirming that the OSCSF.PLLSF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL1 operation. A fixed time is also required for oscillation to stop after stopping the PLL1 operation. Additionally, apply the following limitations when starting and stopping the PLL1 operation by the PLLSTP bit:

- After stopping the PLL1, confirm that the OSCSF.PLLSF bit is 0 before restarting the PLL1.
- Confirm that the PLL1 is operating and that the OSCSF.PLLSF bit is 1 before stopping the PLL1.
- Regardless of whether the PLL1 clock is selected as the system clock source, confirm that the OSCSF.PLLSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL1.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL1, confirm that the OSCSF.PLLSF bit is cleared to 0 before executing a WFI instruction.

Writing 1 to the PLLSTP bit is prohibited when SCKSCR.CKSEL[2:0] = 101 (system clock source = PLL1 output clock P (PLL1P)).

Confirm the following conditions before writing 0 to PLLSTP:

- When PLL1 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When PLL1 source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

8.2.9 PLL2CCR : PLL2 Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x048

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PLL2MUL[7:0]								PLL2MULNF[1:0]		—	PL2SRCSEL	—	—	PL2IDIV[1:0]	
Value after reset:	0	0	0	1	1	0	0	1	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	PL2IDIV[1:0]*1	PLL2 Input Frequency Division Ratio Select 0 0: 1/1 (Value after reset) 0 1: 1/2 1 0: 1/3 1 1: 1/4	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	PL2SRCSEL	PLL2 Clock Source Select 0: Main clock oscillator 1: HOCO*3	R/W
5	—	These bits are read as 0. The write value should be 0.	R/W
7:6	PLL2MULNF[1:0]*2	PLL2 Frequency Multiplication Fractional Factor Select 00: 0.00 (Value after reset) 01: 0.33 (1/3) 10: 0.66 (2/3) 11: 0.50 (1/2)	R/W
15:8	PLL2MUL[7:0]*2	PLL2 Frequency Multiplication Factor Select 0x19: × 26 (Value after reset) 0x1A: × 27 0x1B: × 28 ⋮ 0x58: × 89 0x59: × 90 0x5A: × 91 ⋮ 0xD2: × 179 0xD3: × 180 Others: Setting prohibited.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. PL2IDIV[1:0] should be set so that the frequency of PLL2 input signal is within the range of section 8.1. Overview.
Note 2. PLL2MUL[7:0] and PLL2MULNF[1:0] should be set so that the frequency of PLL2 output signal is within the range of section 8.1. Overview.
Note 3. The FLL function must be enabled when using USBCLK.

The PLL2CCR register sets the operation of the PLL2 circuit.

Writing to the PLL2CCR register is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

PL2IDIV[1:0] bits (PLL2 Input Frequency Division Ratio Select)

These bits select the frequency division ratio of the PLL2 clock source.

PL2SRCSEL bit (PLL2 Clock Source Select)

This bit selects the clock source for the PLL2.

PLL2MULNF[1:0] bit (PLL2 Frequency Multiplication Fractional Factor Select)

These bits select the fractional part of the frequency multiplication factor for the PLL2 circuit.

PLL2MUL[7:0] bits (PLL2 Frequency Multiplication Factor Select)

These bits select the frequency multiplication factor of the PLL2 circuit.

8.2.10 PLL2CCR2 : PLL2 Clock Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x4E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—				PL2ODIVR[3:0]				PL2ODIVQ[3:0]				PL2ODIVP[3:0]			
Value after reset:	0	0	0	0	0	1	0	1	0	1	0	1	0	1	0	1

Bit	Symbol	Function	R/W
3:0	PL2ODIVP[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock P 0001: × 1/2 0011: × 1/4 0101: × 1/6 (Value after reset) 0111: × 1/8 1111: × 1/16 Others: Setting prohibited.	R/W
7:4	PL2ODIVQ[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock Q 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
11:8	PL2ODIVR[3:0]*1	PLL2 Output Frequency Division Ratio Select for output clock R 0001: × 1/2 0010: × 1/3 0011: × 1/4 0100: × 1/5 0101: × 1/6 (Value after reset) 0111: × 1/8 1000: × 1/9 Others: Setting prohibited.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. It must be set so that the frequency of PLL2 output signal is within the range listed in Table 8.1.

The PLL2CCR2 register sets up the operation of the PLL2 circuit. Writing to the PLL2CCR2 is prohibited when the PLL2CR.PLL2STP bit is 0 (the PLL2 operates).

Even if only one of the PLL2 output clock P, Q, or R is used, PLL2CCR2 must be set so that the frequency of PLL2 output signal is within the range listed in Table 8.1.

PL2ODIVP[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock P)

These bits select the output frequency division ratio for PLL2 output clock P (PLL2P).

PL2ODIVQ[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock Q)

These bits select the output frequency division ratio for PLL2 output clock Q (PLL2Q).

PL2ODIVR[3:0] bit (PLL2 Output Frequency Division Ratio Select for output clock R)

These bits select the output frequency division ratio for PLL2 output clock R (PLL2R).

8.2.11 PLL2CR : PLL2 Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x04A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	PLL2STP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PLL2STP	PLL2 Stop Control 0: PLL2 is operating 1: PLL2 is stopped.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The PLL2CR register controls the operation of the PLL2 circuit.

PLL2STP bit (PLL2 Stop Control)

This bit runs or stops the PLL2 circuit.

If the main clock oscillator is to be selected as the clock source for the PLL2 by the PLL2CCR.PL2SRCSEL bit, the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set.

After the PLL2STP bit setting is changed to run the PLL2, only use the PLL2 clock after confirming that the OSCSF.PLL2SF bit is set to 1. That is, a fixed time for stabilization is required after starting the PLL2 operation. A fixed time is also required for oscillation to stop after stopping the PLL2 operation. Additionally, apply the following limitations when starting and stopping the PLL2 operation by the PLL2STP bit:

- After stopping the PLL2, confirm that the OSCSF.PLL2SF bit is 0 before restarting the PLL2.
- Confirm that the PLL2 is operating and that the OSCSF.PLL2SF bit is 1 before stopping the PLL2.
- Confirm that the OSCSF.PLL2SF bit is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after operating the PLL2.
- When transitioning to Software Standby or Deep Software Standby mode after stopping the PLL2, confirm that the OSCSF.PLL2SF bit is cleared to 0 before executing a WFI instruction.

Confirm the following conditions before writing 0 to PLL2STP:

- When the PLL2 source clock = MOSC: MOSCCR.MOSTP = 0 (MOSC is enabled)
- When the PLL2 source clock = HOCO: HOCOCR.HCSTP = 0 (HOCO is enabled).

8.2.12 BCKCR : External Bus Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x030

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BCLKDIV
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BCLKDIV	BCLK Pin Output Select 0: BCLK 1: BCLK/2.	R/W

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The BCKCR register controls the external bus clock.

BCLKDIV bit (BCLK Pin Output Select)

This bit selects the clock signal for output from the BCLK pin.

Either the BCLK clock with the frequency selected by the BCK[2:0] bits in SCKDIVCR or the BCLK clock divided by 2 can be selected.

8.2.13 MOSCCR : Main Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x032

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	MOSTP	Main Clock Oscillator Stop 0: Operate the main clock oscillator*1 1: Stop the main clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: S-TYPE-3, P-TYPE-2
Note 1. MOMCR register must be set before setting MOSTP to 0.

The MOSCCR register controls the main clock oscillator.

MOSTP bit (Main Clock Oscillator Stop)

The MOSTP bit starts or stops the main clock oscillator.

When changing the value of the MOSTP bit, execute subsequent instructions only after reading the bit to check that the value is updated.

When using the main clock, the Main Clock Oscillator Mode Oscillation Control Register (MOMCR) and the Main Clock Oscillator Wait Control Register (MOSCWTCR) must be set before setting MOSTP to 0. After setting the MOSTP bit to 0, confirm that the OSCSF.MOSCSF bit is set to 1 before using the main clock oscillator.

A fixed stabilization wait time is required after setting the main clock oscillator to start operation. A fixed wait time is also required for oscillation to stop after stopping the main clock oscillator.

The following restrictions apply when starting and stopping operation:

- After stopping the main clock oscillator, confirm that the OSCSF.MOSCSF bit is 0 before restarting the main clock oscillator
- Confirm that the main clock oscillator operates and that the OSCSF.MOSCSF bit is 1 before stopping the main clock oscillator
- Regardless of whether the main clock oscillator is selected as the system clock source, confirm that the OSCSF.MOSCSF bit is set to 1 before executing a WFI instruction to place the MCU in Software standby after operating the main clock oscillator or Deep Software Standby mode.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the main clock oscillator, confirm that the OSCSF.MOSCSF bit is set to 0 before executing the WFI instruction.

Writing 1 to MOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 0 (PLL2 source clock = MOSC) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.14 SOSCCR : Sub-Clock Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SOSTP
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	SOSTP	Sub-Clock Oscillator Stop 0: Operate the sub-clock oscillator*1 1: Stop the sub-clock oscillator	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The SOMCR register must be set before setting SOSTP to 0.

The SOSCCR register controls the sub-clock oscillator.

SOSTP bit (Sub-Clock Oscillator Stop)

The SOSTP bit starts or stops the sub-clock oscillator. When changing the value of the SOSTP bit, only execute subsequent instructions after reading the bit to check that the value is updated. Use the SOSTP bit when using the sub-clock oscillator as the source for a peripheral module, for example the RTC. When using the sub-clock oscillator, set the Sub-Clock Oscillator Mode Control Register (SOMCR) before setting SOSTP to 0.

When selecting External clock input by SOMCR.SOSEL, set SOMCR.SOSEL to 1 and wait 50us, then set SOSTP to 0.

The following restrictions apply when starting and stopping the operation:

- After stopping the sub-clock oscillator, allow a stop interval of at least 5 SOSC clock cycles before restarting it
- After setting the SOSTP bit to 0, use the sub-clock only after the sub-clock oscillation stabilization time ($t_{SUBOSCWT}$) has elapsed.
- Regardless of whether the sub-clock oscillator is selected as the system clock source, confirm that the sub-clock oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting to stop the sub-clock oscillator, wait for at least 3 SOSC clock cycles before executing the WFI instruction.

Writing 1 to SOSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 100b (system clock source = SOSC).

8.2.15 LOCOCR : Low-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x400

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	LCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	LCSTP	LOCO Stop 0: Operate the LOCO clock 1: Stop the LOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.

The LOCOCR register controls the LOCO clock.

LCSTP bit (LOCO Stop)

The LCSTP bit starts or stops the LOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

8.2.16 HOCOCR : High-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x036

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HCSTP
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HCSTP	HOCO Stop 0: Operate the HOCO clock *2 1: Stop the HOCO clock	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. The HCSTP bit value after a reset is 0 when the OFS1(_SEC).HOCOEN bit is 0. It is 1 when the OFS1(_SEC).HOCOEN bit is 1.
Note 2. If you are using the HOCO (HCSTP = 0), set the OFS1(_SEC).HOCOFRQ0[2:0] bit to an optimum value.

The HOCOCR register controls the HOCO clock.

HCSTP bit (HOCO Stop)

The HCSTP bit starts or stops the HOCO clock.

After setting the HCSTP bit to 0 to start the HOCO clock, confirm that the OSCSF.HOCOSF is set to 1 before using the clock. When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is also set to 1 before using the HOCO clock. A fixed stabilization wait time is required after setting the HOCO clock to start operation. A fixed wait time is also required after setting the HOCO clock to stop.

The following limitations apply when starting and stopping operation:

- After stopping the HOCO clock,wait more than HOCO stop width time and confirm that the OSCSF.HOCOSF is 0 before restarting the HOCO clock.See section 60, Electrical Characteristics for HOCO stop width time.
- Confirm that the HOCO clock operates and that the OSCSF.HOCOSF is 1 before stopping the HOCO clock.
- Regardless of whether the HOCO clock is selected as the system clock source, confirm that the OSCSF.HOCOSF is set to 1 before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode after setting HOCO operation with the HCSTP bit.
- When a transition to Software Standby or Deep Software Standby mode is to follow the setting of the HOCO clock to stop, confirm that the OSCSF.HOCOSF is set to 0 after setting the HOCO clock and before executing the WFI instruction.

Writing 1 to HCSTP is prohibited under the following conditions:

- SCKSCR.CKSEL[2:0] = 000b (system clock source = HOCO).
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P)
- PLLCCR.PLSRCSEL = 1 (PLL1 source clock = HOCO) and PLLCR.PLLSTP = 0 (PLL1 is operating)
- PLL2CCR.PL2SRCSEL = 1 (PLL2 source clock = HOCO) and PLL2CR.PLL2STP = 0 (PLL2 is operating)

8.2.17 MOCOCR : Middle-Speed On-Chip Oscillator Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x038

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MCSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MCSTP	MOCO Stop 0: MOCO clock is operating 1: MOCO clock is stopped	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOCOCR register controls the MOCO clock.

MCSTP bit (MOCO Stop)

This bit starts or stops the MOCO clock.

When changing the value of the bit, only execute subsequent instructions after reading the bit and checking that its value has actually been updated.

There are restrictions on MOCO operation conditions, MOCO stop conditions and the setting of the MCSTP bit. For details, see section 8.6. Middle speed On Chip Oscillator (MOCO).

8.2.18 FLLCR1 : FLL Control Register1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x039

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	FLLEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FLLEN	FLL Enable 0: FLL function is disabled 1: FLL function is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: HOCO must be stopped (HOCOCR.HCSTP = 1) before FLLCR1.FLLEN is modified.
Note: SOSC must be operating with stabilization while FLL is enabled (FLLCR1.FLLEN = 1).
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The FLLCR1 register controls the FLL function of the HOCO.

FLLEN bit (FLL Enable)

This bit enables or disables the FLL function of the HOCO.

If FLL is enabled, the frequency accuracy is guaranteed after FLL is stabilized. The FLL stabilization can be checked by the CAC frequency measurement, but it must be executed after HOCO stabilization.

In addition, you must disable FLL by setting the FLLEN bit to 0 before transitioning to Software Standby mode.

Table 8.4 show an example flow of the FLL setting for each case.

Table 8.4 FLL setting flow (1 of 2)

Step		Operation
After reset release/Deep Software Standby cancellation	1	Start (After reset release / Deep Software Standby cancellation)
	2	FLL setting (FLLCR2.FLLCNTL)
	3	Enable FLL (FLLCR1.FLLEN = 1) Note: SOSC must be running with the oscillation stabilization.
	4	Enable HOCO (HOCOCR.HCSTP = 0)
	5	Wait for the FLL stabilization (t_{FLLWT})
	6	Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	7	End (HOCO can be used.)

Table 8.4 FLL setting flow (2 of 2)

Step		Operation
Software standby transition/ cancellation	1	Start (FLL is being used.)
	2	Stop HOCO (HOCOCR.HCSTP = 1) Note: If HOCO is used as the system clock source or the PLL reference clock, these clock source must be changed to another clock before HOCO is stopped.
	3	Disable FLL (FLLCR1.FLLEN = 0)
	4	WFI instruction
	5	Software standby mode
	6	Software standby cancellation
	7	Enable FLL (FLLCR1.FLLEN = 1)
	8	Enable HOCO (HOCOCR.HCSTP = 0)
	9	Wait for the FLL stabilization (t_{FLLWT})
	10	Check the HOCO stabilization (OSCSF.HOCOSF = 1)
	11	End (HOCO can be used.)

8.2.19 FLLCR2 : FLL Control Register2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	FLLCNTL[10:0]										
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
10:0	FLLCNTL[10:0]	FLL Multiplication Control When OFS1(_SEC).HOCOFRQ0[2:0] is 000b (16 MHz) or 100b (32 MHz), these bits must be set to 0x1E9. When OFS1(_SEC).HOCOFRQ0[2:0] is 001b (18 MHz), these bits must be set to 0x226. When OFS1(_SEC).HOCOFRQ0[2:0] is 010b (20 MHz), these bits must be set to 0x263. When OFS1(_SEC).HOCOFRQ0[2:0] is 111b (48 MHz), these bits must be set to 0x1E9. Settings other than above are prohibited.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The FLLCR2 register controls the FLL function of the HOCO.

FLLCNTL[10:0] bits (FLL Multiplication Control)

These bits select the multiplication ratio of the FLL reference clock.

These bits must be set before FLL is enabled (FLLCR1.FLLEN=1).

8.2.20 OSCSF : Oscillation Stabilization Flag Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PLL2SF	PLLSF	—	MOSCSF	—	—	HOCOSF
Value after reset:	0	0	0	0	0	0	0	0/1*1

Bit	Symbol	Function	R/W
0	HOCOSF	HOCO Clock Oscillation Stabilization Flag 0: The HOCO clock is stopped or is not yet stable 1: The HOCO clock is stable, so is available for use as the system clock source	R
2:1	—	These bits are read as 0.	R
3	MOSCSF	Main Clock Oscillation Stabilization Flag 0: The main clock oscillator is stopped or is not yet stable*2 1: The main clock oscillator is stable, so is available for use as the system clock source	R
4	—	This bit is read as 0.	R
5	PLLSF	PLL1 Clock Oscillation Stabilization Flag 0: The PLL1 clock is stopped or is not yet stable. 1: The PLL1 clock is stable, so is available for use as the system clock source	R
6	PLL2SF	PLL2 Clock Oscillation Stabilization Flag 0: The PLL2 clock is stopped or is not yet stable. 1: The PLL2 clock is stable	R
7	—	This bit is read as 0.	R

Note: S-TYPE-5, P-TYPE-5
Note 1. The value after reset depends on the OFS1(_SEC).HOCOEN setting.
When OFS1(_SEC).HOCOEN = 1 (disable HOCO), the value after reset of HOCOSF is 0.
When OFS1(_SEC).HOCOEN = 0 (enable HOCO), the HOCOSF value is set to 0 immediately after reset is released, and the HOCOSF value is set to 1 after the HOCO oscillation stabilization wait time elapses.
Note 2. This is true when an appropriate value is set in the Wait Control register for the main clock oscillator. If the wait time value is not sufficient, the oscillation stabilization flag is set to 1 and supply of the clock signal to the internal circuits starts before oscillation is stable.

This register is not controlled by CGFSAR register.

The OSCSF register contains flags that indicates the operating status of the oscillation stabilization wait circuit of each oscillator. After oscillation starts, these circuits generate a waiting time until the output clock of each oscillator stabilizes. The status of each oscillation stabilization wait flag set to 1 indicates that the clock supply is stable and can be used in related circuits.

HOCOSF flag (HOCO Clock Oscillation Stabilization Flag)

The HOCOSF flag indicates the operating status of the counter that measures the wait time for the high-speed clock oscillator (HOCO). When OFS1(_SEC).HOCOEN is set to 0, confirm that OSCSF.HOCOSF is set to 1 before using the HOCO clock.

[Setting condition]

- After the HOCO clock stops and the HOCOCR.HCSTP bit is set to 0, HOCOSF is set to 1 after HOCO clock is stable to ±10% or less. If the HOCO clock is used at 1.5%, it must wait for wait time specified in the electrical characteristics. (For details, see section 60, Electrical Characteristics)
The HOCO clock is supplied when HOCOCR.HCSTP bit is set to 0, regardless of the state of HOCOSF.

[Clearing condition]

- When the HOCO clock is operating and then is deactivated because the HOCOCR.HCSTP bit is set to 1.

Note: Even if OFS1(_SEC).HOCOEN has been set to 0, confirm that the OSCSF.HOCOSF has been set to 1 before starting to use the HOCO clock.

Note: In debugging mode, even if HOCO is oscillating, this flag is masked to 0 for the user program debugging when all of following conditions are met simultaneously:

- The Trace Clock is operating enabled by TRCKCR.TRCKEN bit is 1.
- The Trace Clock source is selected HOCO for oscillation in debug mode by TRCKCR.TRCKSEL bit is 1.
- HOCOCR.HCSTP bit is set to 1.

MOSCSF flag (Main Clock Oscillation Stabilization Flag)

The MOSCSF flag indicates the operating status of the counter that measures the wait time for the main clock oscillator.

[Setting condition]

- When the main clock oscillator is stopped and the MOSCCR.MOSTP bit is set to 0, and then the number of LOCO clock cycles corresponding to the setting of the MOSCWTCR register is counted and supply of the main clock within the MCU is started.

[Clearing condition]

- When the main clock oscillator is operating and then is deactivated because the MOSCCR.MOSTP bit is set to 1.

PLLSF flag (PLL1 Clock Oscillation Stabilization Flag)

The PLLSF flag indicates the oscillation stabilization status for the PLL1.

[Setting condition]

- After the PLL1 stops and the PLLCR.PLLSTP bit is set to 0, supply of the PLL1 clock starts after PLL1 clock is stable. If oscillation by the PLL1 clock source selected in the PLLCCR.PLSRCSEL bit is not stable when the PLLSTP bit is set to 0, waiting for the PLL1 oscillation stabilization after the PLL1 clock source oscillation is stabilized.

[Clearing condition]

- When the PLL1 is operating and then is deactivated because the PLLCR.PLLSTP bit is set to 1.

PLL2SF flag (PLL2 Clock Oscillation Stabilization Flag)

This flag indicates the oscillation stabilization status for the PLL2.

[Setting condition]

- After the PLL2 stops and the PLL2CR.PLL2STP bit is set to 0, supply of the PLL2 clock starts after PLL2 clock is stable.
  If oscillation by the PLL2 clock source selected in the PLLCCR.PLSRCSEL is not stable when the PLL2STP bit is set to 0, waiting for the PLL2 oscillation stabilization after the oscillation of the PLL2 clock source is stabilized.

[Clearing condition]

- When the PLL2 is operating and then is deactivated because the PLL2CR.PLL2STP bit is set to 1.

8.2.21 OSCMONR : Oscillator Monitor Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x43

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LOCOMON	MOCOMON	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
1	MOCOMON	MOCO operation monitor 0: MOCO is set to operate. 1: MOCO is set to stop.	R
2	LOCOMON	LOCO operation monitor 0: LOCO is set to operate. 1: LOCO is set to stop.	R
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-5, P-TYPE-5

This register is not controlled by CGFSAR register.

MOCOMON bit (MOCO operation monitor)

MOCOMON indicates the operation or stop setting status for MOCO.

[Clearing condition]

- When MOCO operating conditions are met. For details, see section 8.6.1. MOCO Operating conditions.

[Setting condition]

- When MOCO stop conditions are met.For details, see section 8.6.2. MOCO Stop conditions.

LOCOMON bit (LOCO operation monitor)

LOCOMON indicates the operation or stop setting status for LOCO.

[Clearing condition]

- When LOCO operating conditions are met. For details, see section 8.5.1. LOCO Operating conditions.

[Setting condition]

- When LOCO stop conditions are met. For details, see section 8.5.2. LOCO Stop conditions.

8.2.22 OSTDCR : Oscillation Stop Detection Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x040

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OSTDE	—	—	—	—	—	—	OSTDIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDIE	Oscillation Stop Detection Interrupt Enable 0: Disable oscillation stop detection interrupt (do not notify the POEG) 1: Enable oscillation stop detection interrupt (notify the POEG)	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	OSTDE	Oscillation Stop Detection Function Enable 0: Disable oscillation stop detection function 1: Enable oscillation stop detection function	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OSTDCR register controls the oscillation stop detection function.

OSTDIE bit (Oscillation Stop Detection Interrupt Enable)

The OSTDIE bit enables the oscillation stop detection function interrupt. It also controls whether oscillation stop detection is reported to the POEG.

If the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) requires clearing, set the OSTDIE bit to 0 before clearing OSTDF. Wait for at least 2 PCLKB cycles before setting the OSTDIE bit to 1. By reading the I/O register whose access cycle number is defined by PCLKB, it is possible to secure waiting time of 2 or more cycles of PCLKB.

OSTDE bit (Oscillation Stop Detection Function Enable)

The OSTDE bit enables the oscillation stop detection function.

When the OSTDE bit is 1 (enabled), the MOCO stop bit (MOCOCR.MCSTP) is set to 0 and the MOCO operation starts. The MOCO clock cannot be stopped while the oscillation stop detection function is enabled. Writing 1 to the MOCOCR.MCSTP bit (MOCO stopped) is invalid.

When the Oscillation Stop Detection flag in the Oscillation Stop Detection Status Register (OSTDSR.OSTDF) is 1 (main clock oscillation stop detected), writing 0 to the OSTDE bit is invalid.

The following restrictions apply when using the oscillation stop detection function:
In low-speed mode, selecting division by 1, 2, 4, 8 for ICLK, FCLK, BCLK, PCLKA, PCLKB, PCLKC, PCLKD and PCLKE is prohibited.

8.2.23 OSTDSR : Oscillation Stop Detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x041

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	OSTDF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OSTDF	Oscillation Stop Detection Flag 0: Main clock oscillation stop not detected 1: Main clock oscillation stop detected	R/W*1
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note 1. This bit can only be set to 0. This bit is cleared to 0 by writing 0 after reading it as 1.

The OSTDSR register indicates the stop detection status of the main clock oscillator.

OSTDF flag (Oscillation Stop Detection Flag)

The OSTDF flag indicates the main clock oscillator status. When this flag is 1, it indicates that the main clock oscillation stop was detected. After this stop is detected, the OSTDF flag is not set to 0 even when the main clock oscillation is restarted. The OSTDF bit is cleared to 0 by writing 0 after reading it as 1.

At least 3 ICLK cycles of wait time are required between writing 0 to OSTDF and reading it as 0. If the OSTDF flag is set to 0 when the main clock oscillation is stopped, the OSTDF flag becomes 0 then returns to 1.

The OSTDF flag cannot be set to 0 under the following conditions:

- SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC).
- PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P)

The OSTDF flag must be set to 0 after switching the clock source to sources other than the main clock oscillator and PLL1P.

[Setting condition]

- The main clock oscillator is stopped when OSTDCR.OSTDE = 1 (oscillation stop detection function enabled).

[Clearing condition]

- 1 is read and then 0 is written when the SCKSCR.CKSEL[2:0] bits are neither 011b (system clock source is MOSC) nor, 101b (system clock source is PLL1P) and PLLCCR.PLSRCSEL bit is not 0 (PLL1 source clock is MOSC).

8.2.24 MOSCWTCR : Main Clock Oscillator Wait Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A2

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	MSTS[3:0]			
Value after reset:	0	0	0	0	0	1	0	1

Bit	Symbol	Function	R/W
3:0	MSTS[3:0]	Main Clock Oscillator Wait Time Setting 0x0: Wait time = 3 cycles (11.4 µs) 0x1: Wait time = 35 cycles (133.5 µs) 0x2: Wait time = 67 cycles (255.6 µs) 0x3: Wait time = 131 cycles (499.7 µs) 0x4: Wait time = 259 cycles (988.0 µs) 0x5: Wait time = 547 cycles (2086.6 µs) 0x6: Wait time = 1059 cycles (4039.8 µs) 0x7: Wait time = 2147 cycles (8190.2 µs) 0x8: Wait time = 4291 cycles (16368.9 µs) 0x9: Wait time = 8163 cycles (31139.4 µs) Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MSTS[3:0] bits (Main Clock Oscillator Wait Time Setting)

The MSTS[3:0] bits specify the oscillation stabilization wait time for the main clock oscillator.

Set the main clock oscillation stabilization time to a period longer than or equal to the stabilization time recommended by the oscillator manufacturer. When the main clock is input externally, set these bits to 0x0 because the oscillation stabilization time is not required.

The wait time set in these bits is counted using: 1 cycle (µs) = $1/(f_{LOCO}[MHz] \times 8) = 1/(0.032768 \times 8) = 3.81$ (µs) (min.)
The LOCO clock automatically oscillates when necessary, regardless of the value of the LOCO.LCSTP bit. After the specified wait time elapses, supply of the main clock starts internally in the MCU, and the OSCSF.MOSCSF flag is set to 1. If the specified wait time is short, supply of the main clock starts before oscillation of the clock becomes stable.

Only rewrite the MOSCWTCR register when the MOSCCR.MOSTP bit is 1 and the OSCSF.MOSCSF flag is 0. Do not rewrite this register under any other conditions.

8.2.25 MOMCR : Main Clock Oscillator Mode Oscillation Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MOSEL	—	—	MODRV0[2:0]			—
Value after reset:	0	0	0	1	1	0	1	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3:1	MODRV0[2:0]	Main Clock Oscillator Drive Capability 0 Switching 0 0 0: 8 MHz 0 1 1: 8MHz to 24MHz 1 0 1: 8MHz to 48MHz Others: Setting prohibited	R/W
4	—	This bit is read as 1. The write value should be 1.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	MOSEL	Main Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: The EXTAL/XTAL pins are also used as ports. In the initial state, the pin is set as a port.
Note: The MOSCCR.MOSTP bit must be 1 (MOSC is stopped) before changing this register.
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

MODRV0[2:0] bits (Main Clock Oscillator Drive Capability 0 Switching)

The MODRV0[2:0] bits switches the drive capability for the main clock oscillator. The drive capability of Main Clock Oscillator needs to choose suitable drive capability according to the frequency.

MOSEL bit (Main Clock Oscillator Switching)

The MOSEL bit switches the source for the main clock oscillator.

8.2.26 SOMCR : Sub-Clock Oscillator Mode Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SOSEL	—	—	—	—	SODRV[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	SODRV[1:0]	Sub-Clock Oscillator Drive Capability Switching 0 0: Standard (12.5pf) 0 1: Lowpower mode 1 (9pf) 1 0: Lowpower mode 2 (7pf) 1 1: Lowpower mode 3 (4pf)	R/W
5:2	—	These bits are read as 0. The write value should be 0.	R/W
6	SOSEL	Sub-Clock Oscillator Switching 0: Resonator 1: External clock input	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The SOMCR register must be modified when SOSCCR.SOSTP is 1 (SOSC is stopped).

SODRV[1:0] bits (Sub-Clock Oscillator Drive Capability Switching)

The SODRV[1:0] bits switch the drive capability of the sub-clock oscillator.

SOSEL bit (Sub-Clock Oscillator Switching)

The SOSEL bits switchs the source for the Sub-clock oscillator.

For details, see section 8.4. Sub-Clock Oscillator.

If VCC voltage of the MCU is lower than 1.8 V and this bit is set to 1, RTC registers and VBTBKR[n](n = 0 t o127) (VBATT Backup Register) can be accessed 20 µs after the setting of this bit.

8.2.27 CKOCR : Clock Out Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CKOEN	CKODIV[2:0]			—	CKOSEL[2:0]		
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
2:0	CKOSEL[2:0]	Clock Out Source Select 0 0 0: HOCO 0 0 1: MOCO (Value after reset) 0 1 0: LOCO 0 1 1: MOSC 1 0 0: SOSC Others: Setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
6:4	CKODIV[2:0]	Clock Output Frequency Division Ratio 0 0 0: × 1/1 0 0 1: × 1/2 0 1 0: × 1/4 0 1 1: × 1/8 1 0 0: × 1/16 1 0 1: × 1/32 1 1 0: × 1/64 1 1 1: × 1/128	R/W
7	CKOEN	Clock Out Enable 0: Disable clock out 1: Enable clock out	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CKOSEL[2:0] bits (Clock Out Source Select)

The CKOSEL[2:0] bits select the source of the clock to be output from the CLKOUT pin. When changing the clock source, set the CKOEN bit to 0.

CKODIV[2:0] bits (Clock Output Frequency Division Ratio)

The CKODIV[2:0] bits specify the clock division ratio. Set the CKOEN bit to 0 when changing the division ratio.

CKOEN bit (Clock Out Enable)

The CKOEN bit enables output from the CLKOUT pin.

When this bit is set to 1, the selected clock is output. When this bit is set to 0, low is output. When changing this bit, confirm that the clock out source clock selected in the CKOSEL[2:0] bits is stable. Otherwise, a glitch might be generated in the output.

Clear this bit before entering Software Standby or Deep Software Standby mode if the selecting clock out source clock is stopped in that mode.

8.2.28 EBCKOCR : External Bus Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x052

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EBCKOEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EBCKOEN	EBCLK Pin Output Control 0: EBCLK pin output is disabled (fixed high) 1: EBCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

8.2.29 SDCKOCR : SDRAM Clock Output Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x053

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SDCKOEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SDCKOEN	SDCLK Pin Output Control 0: SDCLK pin output is disabled. (Fixed high) 1: SDCLK pin output is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SDCKOEN bit (SDCLK Pin Output Control)

This bit selects controls the output of the SDCLK pin.

8.2.30 LOCOUTCR : LOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x402

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	LOCOUTRM[7:0]	LOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: Make sure that SYRACCR.BUSY is 0 before accessing LOCOUTCR. When SYRACCR.BUSY is 1, the write access is ignored and the read value is not guaranteed.
Note: MCU operation is not guaranteed when LOCOUTCR is set to a value that causes the LOCO frequency to be outside of the specification range.
Note: After changing LOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The LOCOUTCR register is added to the original LOCO trimming data.

When the ratio of the LOCO frequency and the other oscillation frequency is an integer value, changing the LOCOUTCR value is prohibited.

Changing LOCOUTCR during RTC operation is prohibited.

8.2.31 MOCOUTCR : MOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x061

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MOCOUTRM[7:0]	MOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: MCU operation is not guaranteed when MOCOUTCR is set to a value that causes the MOCO frequency to be outside of the specification range.
Note: After changing MOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.

The MOCOUTCR register is added to the original MOCO trimming data.

When the ratio of the MOCO frequency and the other oscillation frequency is an integer value, changing the MOCOUTCR value is prohibited.

8.2.32 HOCOUTCR : HOCO User Trimming Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x062

Bit position:	7	6	5	4	3	2	1	0
Bit field:	HOCOUTRM[7:0]							
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	HOCOUTRM[7:0]	HOCO User Trimming 0x80: -128 0x81: -127 ⋮ 0xFF: -1 0x00: Center Code 0x01: +1 ⋮ 0x7E: +126 0x7F: +127	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.
Note: MCU operation is not guaranteed when HOCOUTCR is set to a value that causes the HOCO frequency to be outside of the specification range.
Note: After changing HOCOUTCR, it takes certain time until the frequency to be stable. The time is same as the oscillation stabilization time in startup.
Note: These bits must be 0x00 when FLL is enabled (FLLCR1.FLLEN = 1).

The HOCOUTCR register is added to the original HOCO trimming data.

8.2.33 MOSCSCR : Main Clock Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MOSCSOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MOSCSOKP	Main Clock Oscillator Standby Oscillation Keep select 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The MOSCSCR must be changed while MOSCCR.MOSTP bit is 1 (MOSC is stopped).

MOSCSOKP bit (Main Clock Oscillator Standby Oscillation Keep select)

This bit controls that Main Clock Oscillator keeps oscillating in Software Standby mode.

If this bit is disabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator stops in Software Standby mode.

If this bit is enabled and MOSCCR.MOSTP bit is 0 (MOSC is run), the Main Clock Oscillator will keep oscillating in Software Standby mode.

If MOSCCR.MOSTP bit is 1 (MOSC is stopped), the Main Clock Oscillator stops in Software Standby mode regardless of the setting of this bit.

8.2.34 HOCOSCR : High-Speed On-Chip Oscillator Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x07D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	HOCOSOKP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	HOCOSOKP	HOCO Standby Oscillation Keep select. 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

HOCOSOKP bit (HOCO Standby Oscillation Keep select.)

This bit controls that HOCO keeps oscillating in Software Standby mode.

If this bit is disabled and HOCOCR.HCSTP bit is 0 (HOCO is run), the HOCO stops in Software Standby mode.

If this bit is enabled and HOCOCR.HCSTP bit is 0 (HOCO is run), the HOCO will keep oscillating in Software Standby mode.

If HOCOCR.HCSTP bit is 1 (HOCO is stopped), the HOCO stops in Software Standby mode regardless of the setting of this bit.

8.2.35 USBCKDIVCR : USB Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	USBCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	USBCKDIV[2:0]	USB Clock (USBCLK) Division Select 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKDIVCR register controls the USB clock.

USBCKDIV[2:0] bits (USB Clock (USBCLK) Division Select)

These bits select the frequency of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

8.2.36 OCTACKDIVCR : Octal-SPI Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OCTACKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	OCTACKDIV[2:0]	Octal-SPI Clock (OCTACLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

OCTACKDIVCR controls the Octal-SPI clock.

OCTACKDIV[2:0] bits (Octal-SPI Clock (OCTACLK) Division Select)

These bits select the frequency of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

8.2.37 CANFDCKDIVCR : CANFD Core Clock Division Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CANFDCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CANFDCKDIV[2:0]	CANFD core clock (CANFDCLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

CANFDCKDIVCR controls the CANFD core clock.

CANFDCKDIV[2:0] bits (CANFD core clock (CANFDCLK) Division Select)

These bits select the frequency of the CANFD core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

8.2.38 USB60CKDIVCR : USB60 clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x06F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	USB60CKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	USB60CKDIV[2:0]	USB clock (USB60CLK) Division Select 0 0 0: 1/1(Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

USB60CKDIVCR controls the USB clock.

USB60CKDIV[2:0] bits (USB clock (USB60CLK) Division Select)

These bits select the frequency of the USB clock USB60CKDIV and must be modified when USB60CKCR.USB60CKSRDY = 1.

8.2.39 I3CCKDIVCR : I3C clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x070

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	I3CCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	I3CCKDIV[2:0]	I3C clock (I3CCLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

I3CCKDIVCR controls the I3C clock.

I3CCKDIV[2:0] bits (I3C clock (I3CCLK) Division Select)

These bits select the frequency of the I3C clock (I3CCLK) and must be modified when I3CCKCR.I3CCKSRDY = 1.

8.2.40 USBCKCR : USB Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x074

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USBCKSRDY	USBCKSREQ	—	—	USBCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	USBCKSEL[3:0]	USB Clock (USBCLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0011: Main clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	USBCKSREQ	USB Clock (USBCLK) Switching Request 0: No request 1: Request switching.	R/W
7	USBCKSRDY	USB Clock (USBCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USBCKCR register controls the USB clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[3:0], use the following procedure:

1. Write 1 to USBCKSREQ.
2. Poll until USBCKSRDY is read as 1. While USBCKSRDY = 1, no clock is output to USBCLK.
3. Write to USBCKDIVCR.USBCKDIV[2:0] and USBCKSEL[3:0].
4. Write 0 to USBCKSREQ.
5. Poll until USBCKSRDY is read as 0.
6. When USBCKSRDY becomes 0, USBCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USBCKSREQ = 1 and USBCKSRDY = 0, or when USBCKSREQ = 0 and USBCKSRDY = 1.

USBCKSEL[3:0] bits (USB Clock (USBCLK) Source Select)

These bits select the clock source of the USB clock (USBCLK) and must be modified when USBCKCR.USBCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

USBCKSREQ bit (USB Clock (USBCLK) Switching Request)

This bit selects the USBCLK switching request.

USBCKSRDY flag (USB Clock (USBCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the USBCLK. When USBCKSRDY = 1, no clock is output to USBCLK.

8.2.41 OCTACKCR : Octal-SPI Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x075

Bit position:	7	6	5	4	3	2	1	0
Bit field:	OCTACKSRDY	OCTACKSREQ	—	—	OCTACKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	OCTACKSEL[3:0]	Octal-SPI Clock (OCTACLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	OCTACKSREQ	Octal-SPI Clock (OCTACLK) Switching Request 0: No request 1: Request switching.	R/W
7	OCTACKSRDY	Octal-SPI Clock (OCTACLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The OCTACKCR register controls the Octal-SPI clock.

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output.

To change the set value of OCTACKDIVCR.OCTACKDIV[2:0] and OCTACKSEL[3:0], use the following procedure:

1. Write 1 to OCTACKSREQ.
2. Poll until OCTACKSRDY is read as 1. While OCTACKSRDY = 1, no clock is output to OCTACLK.
3. Write to OCTACKDIVCR.OCTACKDIV[2:0] and OCTACKSEL[3:0].
4. Write 0 to OCTACKSREQ.
5. Poll until OCTACKSRDY is read as 0.
6. When OCTACKSRDY becomes 0, OCTACLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when OCTACKSREQ = 1 and OCTACKSRDY = 0, or when OCTACKSREQ = 0 and OCTACKSRDY = 1.

OCTACKSEL[3:0] bits (Octal-SPI Clock (OCTACLK) Source Select)

These bits select the clock source of the Octal-SPI clock (OCTACLK) and must be modified when OCTACKCR.OCTACKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

OCTACKSREQ bit (Octal-SPI Clock (OCTACLK) Switching Request)

This bit selects the OCTACLK switching request.

OCTACKSRDY flag (Octal-SPI Clock (OCTACLK) Switching Ready state flag)

This flag indicates the state of switching ready for the OCTACLK. When OCTACKSRDY = 1, no clock is output to OCTACLK.

8.2.42 CANFDCKCR : CANFD Core Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x076

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CANFDCKSRDY	CANFDCKSREQ	—	—	CANFDCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	CANFDCKSEL[3:0]	CANFD Core Clock (CANFDCLK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 0: LOCO 0 0 1 1: Main clock oscillator 0 1 0 0: Sub-clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	CANFDCKSREQ	CANFD Core Clock (CANFDCLK) Switching Request 0: No request 1: Request switching	R/W
7	CANFDCKSRDY	CANFD Core Clock (CANFDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The CANFDCKCR register controls the CANFD Core Clock (CANFDCLK).

When switching the clock source, ensure that the clock before the switch and the clock after the switch generate stable output. To change the set value of CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[3:0], use the following procedure:

1. Write 1 to CANFDCKSREQ.
2. Poll until CANFDCKSRDY is read as 1. While CANFDCKSRDY = 1, no clock is output to CANFDCLK.
3. Write to CANFDCKDIVCR.CANFDCKDIV[2:0] and CANFDCKSEL[3:0].
4. Write 0 to CANFDCKSREQ.
5. Poll until CANFDCKSRDY is read as 0.

6. When CANFDCKSRDY becomes 0, CANFDCLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when CANFDCKSREQ = 1 and CANFDCKSRDY = 0, or when CANFDCKSREQ = 0 and CANFDCKSRDY = 1.

CANFDCKSEL[3:0] bits (CANFD Core Clock (CANFDCLK) Source Select)

These bits select the clock source of the CANFD Core clock (CANFDCLK) and must be modified when CANFDCKCR.CANFDCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

CANFDCKSREQ bit (CANFD Core Clock (CANFDCLK) Switching Request)

This bit selects the CANFDCLK switching request.

CANFDCKSRDY flag (CANFD Core Clock (CANFDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the CANFDCLK. When CANFDCKSRDY = 1, no clock is output to CANFDCLK.

8.2.43 USB60CKCR : USB60 Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x077

Bit position:	7	6	5	4	3	2	1	0
Bit field:	USB60CKSRDY	USB60CKSREQ	—	—	USB60CKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	USB60CKSEL[3:0]	USB60 Clock (USB60CK) Source Select 0 0 0 0: HOCO 0 0 0 1: MOCO (Value after reset) 0 0 1 1: Main clock oscillator 0 1 0 1: PLL1P 0 1 1 0: PLL2P 0 1 1 1: PLL1Q 1 0 0 0: PLL1R 1 0 0 1: PLL2Q 1 0 1 0: PLL2R Others: Setting prohibited.	R/W
5:3	—	These bits are read as 0. The write value should be 0.	R/W
6	USB60CKSREQ	USB60 Clock (USB60CK) Switching Request 0: No request 1: Request switching	R/W
7	USB60CKSRDY	USB60 Clock (USB60CK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

The USB60CKCR register controls the USB60 Clock.

To change the set value of USB60CKDIVCR. USB60CKDIV[2:0] and USB60CKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure：

1. Write 1 to USB60CKSREQ.

2. Poll until USB60CKSRDYY is read as 1. While USB60CKSRDY = 1, no clock is output to USB60CLK.
3. Write to USB60CKDIVCR.USB60CKDIV[2:0] and USB60CKSEL[3:0].
4. Write 0 to USB60CKSREQ.
5. Poll until USB60CKSRDY is read as 0.
6. When USB60CKSRDY becomes 0, USB60CLK starts to output. Clock switching is complete.

When transitioning to Software Standby or Deep Software Standby mode, do not execute the WFI instruction while performing clock switching. That is, do not execute the WFI instruction when USB60CKSREQ = 1 and USB60CKSRDY = 0, or when USB60CKSREQ = 0 and USB60CKSRDY = 1.

USB60CKSEL[3:0] bits (USB60 Clock (USB60CK) Source Select)

These bits select the clock source of the USB Clock (USB60CLK) and must be modified when USB60CKCR.USB60CKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

USB60CKSREQ bit (USB60 Clock (USB60CK) Switching Request)

This bit selects the USB60CLK switching request.

USB60CKSRDY flag (USB60 Clock (USB60CK) Switching Ready state flag)

This flag indicates the state of switching ready for the USB60CLK. When USB60CKSRDY = 1, no clock is output to USB60CLK.

8.2.44 I3CCKCR : I3C clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x078

Bit position:	7	6	5	4	3	2	1	0
Bit field:	I3CCKSRDY	I3CCKSREQ	—	—	I3CCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	I3CCKSEL[3:0]	I3C clock (I3CCLK) Source Select 0001: MOCO (Value after reset) 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	I3CCKSREQ	I3C clock (I3CCLK) Switching Request 0: No request 1: Request switching	R/W
7	I3CCKSRDY	I3C clock (I3CCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

I3CCKCR controls the I3C clock.

To change the set value of I3CCKDIVCR.I3CCKDIV[2:0] and I3CCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to I3CCKSREQ.
2. Polling until I3CCKSRDY is read as 1. While I3CCKSRDY = 1, no clock is output to I3CCLK.
3. Write the setting value to I3CCKDIVCR.I3CCKDIV[2:0] and I3CCKSEL[3:0].
4. Write 0 to I3CCKSREQ.
5. Polling until I3CCKSRDY is read as 0.
6. When I3CCKSRDY becomes 0, I3CCLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with I3CCKSREQ = 1 and I3CCKSRDY = 0, or I3CCKSREQ = 0 and I3CCKSRDY = 1.

I3CCKSEL[3:0] bits (I3C clock (I3CCLK) Source Select)

These bits select the clock source of the I3C clock (I3CCLK) and must be modified when I3CCKCR.I3CCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

I3CCKSREQ bit (I3C clock (I3CCLK) Switching Request)

This bit selects the I3CCLK switching request.

I3CCKSRDY bit (I3C clock (I3CCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the I3CCLK.

While I3CCKSRDY = 1, no clock is output to I3CCLK.

8.2.45 SCICKDIVCR : SCI clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x054

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCICKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SCICKDIV[2:0]	SCI clock (SCICLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SCICKDIVCR controls the SCI clock.

SCICKDIV[2:0] bits (SCI clock (SCICLK) Division Select)

These bits select the frequency of the SCI clock (SCICLK) and must be modified when SCICKCR.CKSRDY = 1.

8.2.46 SPICKDIVCR : SPI clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x056

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SPICKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	SPICKDIV[2:0]	SPI clock (SPICLK) Division Select 0 0 0: 1/1 (Value after reset) 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

SPICKDIVCR controls the SPI clock.

SPICKDIV[2:0] bits (SPI clock (SPICLK) Division Select)

These bits select the frequency of the SPI clock (SPICLK) and must be modified when SPICKCR.CKSRDY = 1.

8.2.47 LCDCKDIVCR : LCD clock Division control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	LCDCKDIV[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	LCDCKDIV[2:0]	LCD clock (LCDCLK) Division Select 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/6 1 0 0: 1/8 1 0 1: 1/3 1 1 0: 1/5 Others: Setting prohibited.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

LCDCKDIVCR controls the LCD clock.

LCDCKDIV[2:0] bits (LCD clock (LCDCLK) Division Select)

These bits select the frequency of the LCD clock (LCDCLK) and must be modified when LCDCKCR.CKSRDY = 1.

8.2.48 SCICKCR : SCI clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x055

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SCICKSRDY	SCICKSREQ	—	—	SCICKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	SCICKSEL[3:0]0	SCI clock (SCICLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SCICKSREQ	SCI clock (SCICLK) Switching Request 0: No request 1: Request switching	R/W
7	SCICKSRDY	SCI clock (SCICLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

SCICKCR controls the SCI clock.

To change the set value of SCICKDIVCR.SCICKDIV[2:0] and SCICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to SCICKSREQ.
2. Polling until SCICKSRDY is read as 1. While SCICKSRDY = 1, no clock is output to SCICLK.
3. Write the setting value to SCICKDIVCR.SCICKDIV[2:0] and SCICKSEL[3:0].
4. Write 0 to SCICKSREQ.
5. Polling until SCICKSRDY is read as 0.
6. When SCICKSRDY becomes 0, SCICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SCICKSREQ = 1 and SCICKSRDY = 0, or SCICKSREQ = 0 and SCICKSRDY = 1.

SCICKSEL[3:0] bits (SCI clock (SCICLK) Source Select)

These bits select the clock source of the SCI clock (SCICLK) and must be modified when SCICKCR.SCICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SCICKSREQ bit (SCI clock (SCICLK) Switching Request)

This bit selects the SCICLK switching request.

SCICKSRDY bit (SCI clock (SCICLK) Switching Ready state flag)

This flag indicates the state of switching ready for the SCICLK.

While SCICKSRDY = 1, no clock is output to SCICLK.

8.2.49 SPICKCR : SPI clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x057

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SPICKSRDY	SPICKSREQ	—	—	SPICKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	SPICKSEL[3:0]	SPI clock (SPICLK) Source Select 0000: HOCO 0001: MOCO (Value after reset) 0010: LOCO 0011: Main clock oscillator 0100: Sub-clock oscillator 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	SPICKSREQ	SPI clock (SPICLK) Switching Request 0: No request 1: Request switching	R/W
7	SPICKSRDY	SPI clock (SPICLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

SPICKCR controls the SPI clock.

To change the set value of SPICKDIVCR.SPICKDIV[2:0] and SPICKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure :

1. Write 1 to SPICKSREQ.
2. Polling until SPICKSRDY is read as 1. While SPICKSRDY = 1, no clock is output to SPICLK.
3. Write the setting value to SPICKDIVCR.SPICKDIV[2:0] and SPICKSEL[3:0].
4. Write 0 to SPICKSREQ.
5. Polling until SPICKSRDY is read as 0.
6. When SPICKSRDY becomes 0, SPICLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with SPICKSREQ = 1 and SPICKSRDY = 0, or SPICKSREQ = 0 and SPICKSRDY = 1.

SPICKSEL[3:0] bits (SPI clock (SPICLK) Source Select)

These bits select the clock source of the SPI clock (SPICLK) and must be modified when SPICKCR.SPICKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

SPICKSREQ bit (SPI clock (SPICLK) Switching Request)

This bit selects the SPICLK switching request.

SPICKSRDY bit (SPI clock (SPICLK) Switching Ready state flag)

This flag indicates the state of switching ready for the SPICLK.

While SPICKSRDY = 1, no clock is output to SPICLK.

8.2.50 LCDCKCR : LCD clock control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x05F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LCDCKSRDY	LCDCKSREQ	—	—	LCDCKSEL[3:0]			
Value after reset:	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
3:0	LCDCKSEL[3:0]	LCD clock (LCDCLK) Source Select 0001: MOCO (Value after reset) 0101: PLL1P 0110: PLL2P 0111: PLL1Q 1000: PLL1R 1001: PLL2Q 1010: PLL2R Others: Setting prohibited.	R/W
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	LCDCKSREQ	LCD clock (LCDCLK) Switching Request 0: No request 1: Request switching	R/W
7	LCDCKSRDY	LCD clock (LCDCLK) Switching Ready state flag 0: Impossible to Switch 1: Possible to Switch	R

Note: S-TYPE-3, P-TYPE-2

LCDCKCR controls the LCD clock.

To change the set value of LCDCKDIVCR.LCDCKDIV[2:0] and LCDCKSEL[3:0], follow the procedure below.

When switching the clock source, it is necessary that the clock before switching and the clock after switching are stably output.

Clock selection switching procedure：

1. Write 1 to LCDCKSREQ.
2. Polling until LCDCKSRDY is read as 1. While LCDCKSRDY = 1, no clock is output to LCDCLK.
3. Write the setting value to LCDCKDIVCR.LCDCKDIV[2:0] and LCDCKSEL[3:0].
4. Write 0 to LCDCKSREQ.

5. Polling until LCDCKSRDY is read as 0.
6. When LCDCKSRDY becomes 0, LCDCLK starts outputting. Clock switching complete.

When a transition to Software Standby or Deep Software Standby, do not execute the WFI instruction while performing clock selection switching. In other words, do not execute the WFI instruction with LCDCKSREQ = 1 and LCDCKSRDY = 0, or LCDCKSREQ = 0 and LCDCKSRDY = 1.

LCDCKSEL[3:0] bits (LCD clock (LCDCLK) Source Select)

These bits select the clock source of the LCD clock (LCDCLK) and must be modified when LCDCKCR.LCDCKSRDY = 1.

Do not stop the oscillator selected by these bits except when MOCO is selected.

LCDCKSREQ bit (LCD clock (LCDCLK) Switching Request)

This bit selects the LCDCLK switching request.

LCDCKSRDY bit (LCD clock (LCDCLK) Switching Ready state flag)

This flag indicates the state of switching ready for the LCDCLK.

While LCDCKSRDY = “1”, no clock is output to LCDCLK.

8.2.51 TRCKCR : Trace Clock Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x03F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TRCKEN	—	—	TRCKSEL	TRCK[3:0]			
Value after reset:	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
3:0	TRCK[3:0]	Trace Clock operating frequency select 0000: 1/1 0001: 1/2 0010: 1/4 (Value after reset) 0011: 1/8 0100: 1/16 0101: 1/32 0110: 1/64 0111: 1/128 1000: 1/256 1001: 1/3 1010: 1/6 1011: 1/12 Others: Setting prohibited	R/W
4	TRCKSEL	Trace Clock source select 0: System clock source (Value after reset) 1: HOCO (oscillation in debug mode)	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	TRCKEN	Trace Clock operating Enable 0: Stop 1: Operation enable	R/W

Note: S-TYPE5, P-TYPE-2
Note: Set the PRCR.PRC0 bit to 1 (write enabled) before rewriting this register.

Trace Clock Control Register controls switching the trace clock.

This register is not controlled by CGFSAR register.

When changing the frequency of the Trace Clock, the Trace Clock must be stopped (TRCKCR.TRCKEN = 0).

TRCK[3:0] bit (Trace Clock operating frequency select)

These bits select the frequency of the Trace Clock.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKSEL bit (Trace Clock source select)

This bit selects the clock source of the Trace Clock. According to this bit, the Trace Clock is as follows:

[The Case of this bit is set 0]

- The system clock source is selected as the clock source for the trace clock.
  The system clock source is selected by SCKSCR.CKSEL[2:0] bits.
- The clock supply to the trace clock is selected of MOCO divided by 1 when in Software Standby mode or Deep Software Standby mode.

[The Case of this bit is set 1]

- The HOCO is selected as the clock source for the trace clock
- If TRCKSEL is set to 1, HOCO is operated no depending on the state of HOCOCR.HCSTP. However, OSCSF does not confirm that the swing is stable, so wait for the user to wait for the stable wait time
- HOCO continues to oscillate and supply the Trace Clock even if in Software Standby mode or Deep Software Standby mode.

This bit must change when TRCKCR.TRCKEN = 0.

TRCKEN bit (Trace Clock operating Enable)

This bit enables or disables the clock supply of the Trace Clock.

TRCK[3:0] bits and TRCKSEL bit must be set before changing this bit from 0 (stop) to 1 (enable).

When changing this bit from 1 (enable) to 0 (stop), Trace function must be disable.

The trace clock is output with this bit set to 1 and under the following conditions.
CDBGPWRUPREQ=1 & AL≠AL0 | DBGAUTH0.DBGEN0 =1 & OFS1(_SEC).SWDBG=0.

8.3 Main Clock Oscillator

To supply the clock signal to the main clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.3.1 Connecting a Crystal Resonator

Figure 8.2 shows an example of connecting a crystal resonator. A damping resistor (Rd) can be added, if required.

Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the manufacturer recommends using an external feedback resistor (Rf), insert an Rf between EXTAL and XTAL by following the instructions.

When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the main clock oscillator as described in Table 8.1.

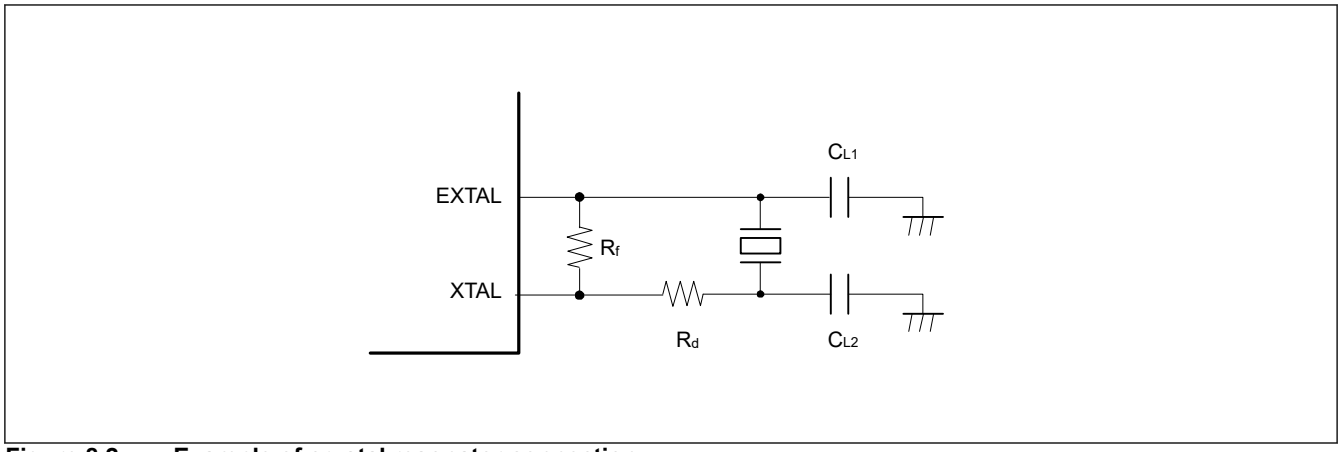

Figure 8.2 Example of crystal resonator connection

Figure 8.3 shows an equivalent circuit of the crystal resonator.

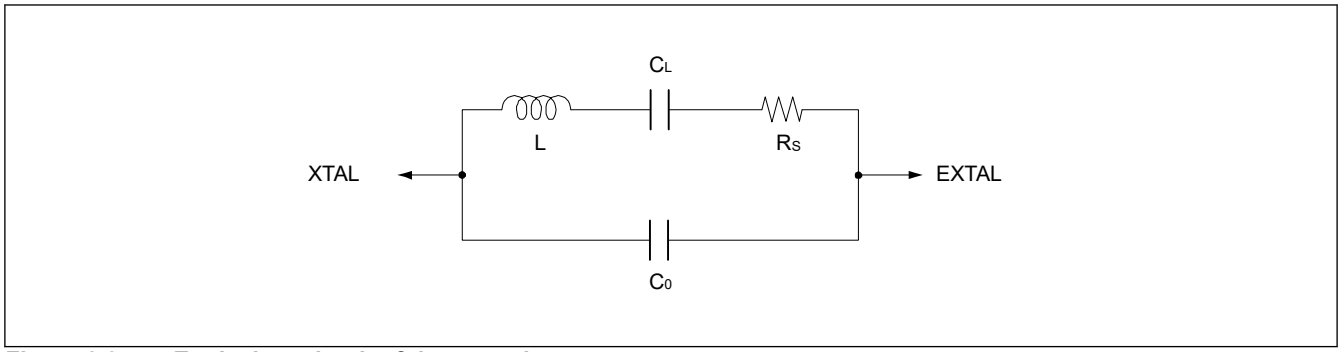

Figure 8.3 Equivalent circuit of the crystal resonator

8.3.2 External Clock Input

Figure 8.4 shows an example of connecting an external clock input. To operate the oscillator with an external clock signal, set the MOMCR.MOSEL bit to 1. The XTAL pin becomes high impedance.

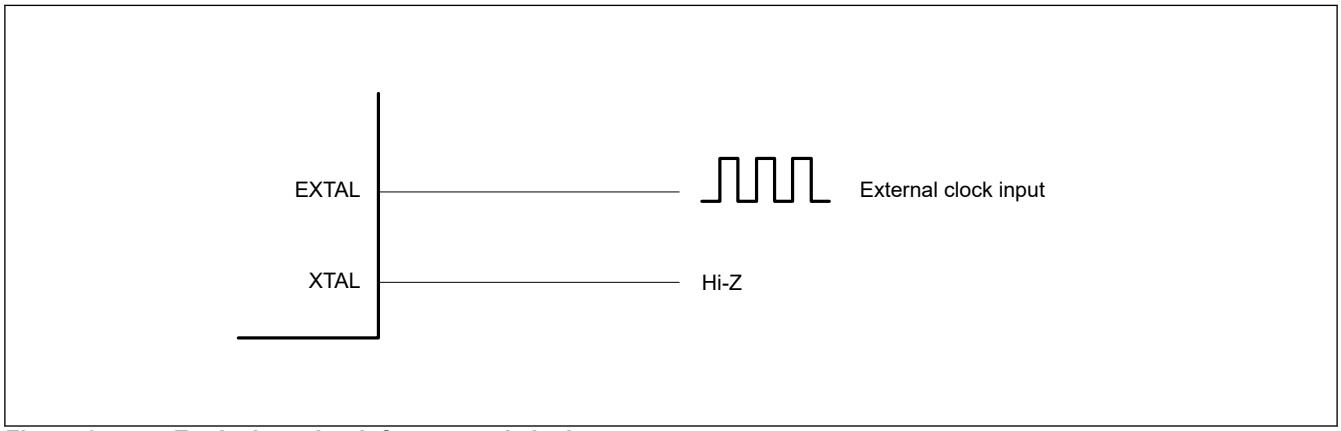

Figure 8.4 Equivalent circuit for external clock

8.3.3 Notes on External Clock Input

- The frequency of the external clock input can only be changed when the main clock oscillator is stopped. Do not change the frequency of the external clock input when the setting of the Main Clock Oscillator Stop bit (MOSCCR.MOSTP) is 0.
- To reduce current consumption during software standby mode, it is recommended to stop the external clock and keep it pull-up or pull-down.

However, if an external clock is used as the system clock source, it must be supplied while transitioning to and returning from software standby mode.
To do this safely, it is recommended to change the system clock source to another clock source before transitioning to software standby mode, or continue to use the external clock despite current consumption increase.

8.3.4 Note on Oscillation Keep in Software Standby mode

By using the oscillation keep function of the Main Clock Oscillator in Software Standby mode, the Main Clock Oscillator stabilization wait time after canceling Software standby mode can be shortened.

If MCU enters Software Standby mode under the MOSCSCR.MOSCSOKP bit is set to enabled (MOSCSCR.MOSCSOKP bit is 1) and under the Main Clock Oscillator is operating, the Main Clock Oscillator will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the Main clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

8.4 Sub-Clock Oscillator

To supply the clock signal to the sub-clock oscillator, use one of the following ways:

- Connect an oscillator
- Connect the input of an external clock signal.

8.4.1 Connecting a 32.768-kHz Crystal Resonator

To supply a clock to the sub-clock oscillator, connect a 32.768-kHz crystal resonator as shown in Figure 8.5. A damping resistor (Rd) can be added, if necessary. Because the resistor values vary according to the resonator and the oscillation drive capability, use values recommended by the resonator manufacturer. If the resonator manufacturer recommends the use of an external feedback resistor (Rf), insert an Rf between XCIN and XCOUT by following the instructions. When connecting a resonator to supply the clock, the frequency of the resonator must be in the frequency range of the resonator for the sub-clock oscillator as described in Table 8.1.

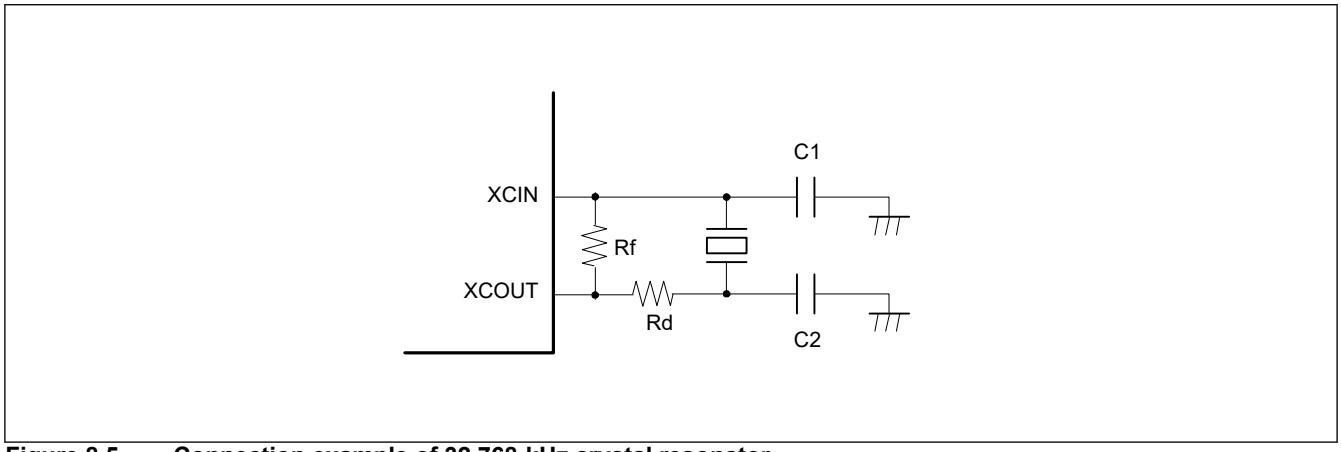

Figure 8.5 Connection example of 32.768-kHz crystal resonator

Figure 8.6 shows an equivalent circuit for the 32.768-kHz crystal resonator.

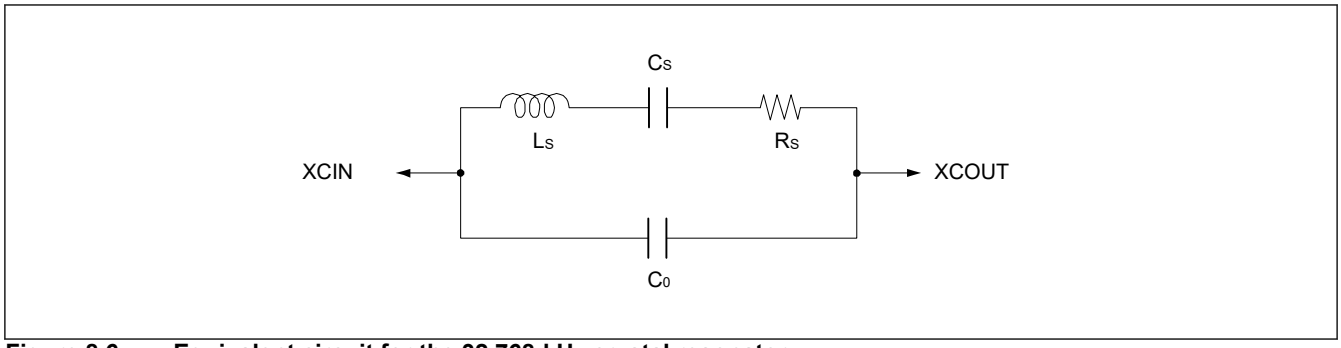

Figure 8.6 Equivalent circuit for the 32.768-kHz crystal resonator

8.4.2 Pin Handling When the Sub-Clock Oscillator Is Not Used

When the sub-clock oscillator is not in use, connect the XCIN pin to VSS through a resistor (to pull VSS down) and leave the XCOUT pin open as shown in Figure 8.7. In addition, if an oscillator is not connected, set the Sub-Clock Oscillator Stop bit (SOSCCR.SOSTP) to 1 to stop the oscillator.

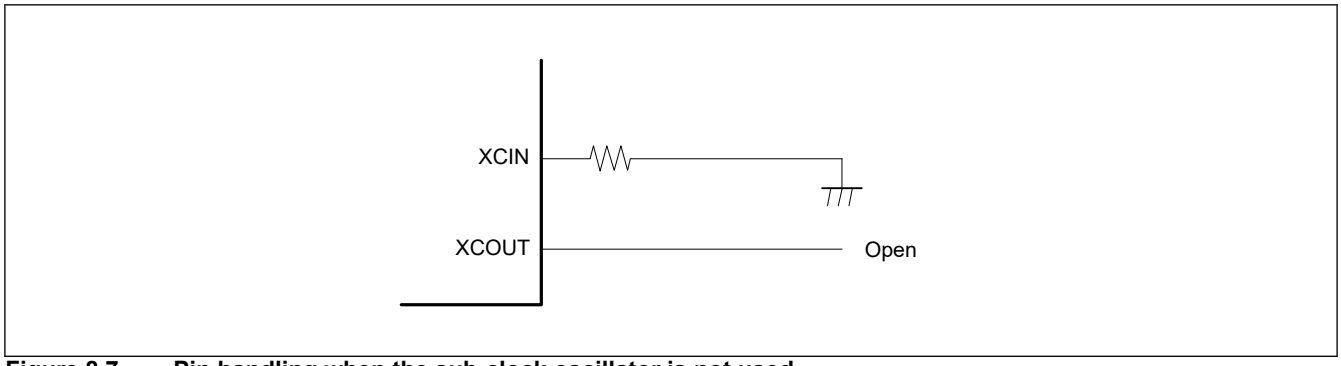

Figure 8.7 Pin handling when the sub-clock oscillator is not used

8.4.3 External Clock Input

In the external clock input mode, clock is input from EXCIN pin. In this case, set the XCIN/XCOUT pin as shown in as Figure 8.7.

8.5 Low speed On Chip Oscillator (LOCO)

Low speed On Chip Oscillator (LOCO) is the internal oscillator that supplies a low-speed clock.

8.5.1 LOCO Operating conditions

There are restriction on LOCO operation setting. For detail, see section 8.5.3. Restrictions on LOCO operation and stopping

LOCO oscillates when any of the following conditions is met.*1

[LOCO operating conditions]

- When LOCO is set to operate in the LOCOCR register (LOCOCR.LCSTP bit is 0).
- When IWDT is set to the auto start mode. (OFS0.IWDTSTRT bit is 0)*2
- When IWDT is set to the register start mode (OFS0.IWDTSTRT bit is 1) and counting is started.*3
- \When waiting for the oscillation stabilization of the Main Clock Oscillator (while MOCOCR.MCSTP bit is 0 and OSCSF.MOSCSF bit is 0).*4

Note 1. LOCO stops at Deep Software Standby mode 2 or Deep Software Standby mode 3.
Note 2. When IWDT is set to the auto start mode, regardless of the setting of IWDTSTPCTL bit in OFS0 register ,LOCO continues to oscillate.
Note 3. When IWDT is set to the register start mode, regardless of the setting of SLCSTP bit in IWDTCSTPR register ,LOCO continues to oscillate once IWDT starts counting.

Note 4. Even if the Main Clock Oscillator is set to the external clock input mode, LOCO operates because the oscillation stabilization wait circuit operates when the Main Clock Oscillator starts operating.

8.5.2 LOCO Stop conditions

There are restriction on LOCO stop setting. For detail, see section 8.5.3. Restrictions on LOCO operation and stopping.

There are two ways to top LOCO: stop by transition to Low Power mode or stop by LOCOCR register.

(A) LOCO stop conditions related to Low Power mode

LOCO stops when transitioning to the following Low Power mode

- Deep Software Standby mode 2
- Deep Software Standby mode 3

(B) LOCO stop conditions related to LOCOCR register

When LOCO is stopped using the LOCOCR register, even if the LCSTP bit set to stop (LOCOCR.LCSTP bit is 1), LOCO may not be stopped depending on the operating status of IWDT and oscillator.

LOCO can be stopped when all of the following conditions are met.

- LOCO is set to stop using the LOCOCR register (LOCOCR.LCSTP bit is 1)
- IWDT is not operating. (Include the case of stopping in CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, and Deep Software Standby mode 1 by setting the OFS0.IWDTSTPCTL bit or the IWDTCSTPR.SLCSTP bit.).
- Main Clock Oscillator is stopped or Main Clock oscillation is stable. (MOCOCR.MCSTP bit is 1 or OSCSF.MOSCSF bit is 1)

8.5.3 Restrictions on LOCO operation and stopping

After setting the LCSTP bit in LOCOCR to 0 to start the LOCO clock, only use the clock after the LOCO clock oscillation stabilization wait time (tLOCOWT) elapses. A fixed stabilization wait is required after setting the LOCO clock to start operation. A fixed wait for the oscillation to stop is also required.

The following restrictions apply when starting and stopping operation:

- After stopping the LOCO clock, read OSCMONR.LOCOMON, make sure LOCO is stopped, and then set the operation.
- Confirm that LOCO oscillation is stable before stopping the LOCO clock
- Confirm that LOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or Deep Software Standby mode.
- When a transition to Software Standby mode or Deep Software Standby mode after setting LOCO to stop, read OSCMONR.LOCOMON, make sure LOCO is stopped, and executing the WFI instruction.

The LOCO clock is used to measure the oscillation stabilization wait time of the main clock oscillator. While the main clock oscillator is waiting for oscillation stabilization, the LOCO clock oscillates regardless of the LCSTP bit setting. At this time, it is necessary to prevent conflicts between the LOCO stop (or operation) by the LCSTP bit in LOCOCR and the LOCO clock oscillation for the Main clock Oscillator stabilization wait time (or LOCO clock stop after Main clock oscillation stabilization). Therefore, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycle before setting the start of main clock oscillator operation until the main clock oscillator stabilization can be confirmed with the oscillation stabilization flag in the OSCSF register.

When using IWDT in the register start mode (OFS0.IWDTSTRT bit is 1), set the LOCO to run (LOCOCR.LCSTP = 0) before IWDT count operation, and use IWDT after LOCO oscillation has stabilized. When IWDT is used in register start mode, do not change the LOCOCR.LCSTP bit during the period from the 3 LOCO clock cycles before IWDT count operation starts until the start of IWDT count operation can be confirmed.

When using the Digital filter or the Reset negate select for Voltage monitor m (m = 1 to 2) in Programmable Voltage Detection (PVDm), set the LOCO to run (LOCOCR.LCSTP = 0) before enabling PVDm and use PVDm after LOCO oscillation has stabilized.

8.6 Middle speed On Chip Oscillator (MOCO)

Middle speed On Chip Oscillator (MOCO) is the internal oscillator that supplies a middle-speed clock.

8.6.1 MOCO Operating conditions

There are restriction on MOCO operation setting. For detail, see section 8.6.3. Restrictions on MOCO operation and stopping.

MOCO oscillates when any of the following conditions is met.

[MOCO operating conditions]

- When MOCO is set to operate in the LOCOCR register (MOCOCR.MCSTP = 0)
- When waiting for the HOCO oscillation stabilization (while OFS1(_SEC).HOCOEN bit is 0 or HOCOCR.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0).
- When waiting for the PLL1 oscillation stabilization (while PLLCR.PLLSTP bit is 0, and OSCSF.PLLSF bit is 0).
- When waiting for the PLL2 oscillation stabilization (while PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0).

Note: MOCO stops at Software Standby mode or Deep Software Standby mode.

8.6.2 MOCO Stop conditions

There are restriction on MOCO stop setting. For detail, see section 8.6.3. Restrictions on MOCO operation and stopping.

There are two ways to top MOCO: stop by transition to Low Power mode or stop by MOCOCR register.

(A) MOCO stop conditions related to Low Power mode

MOCO stops when transitioning to the following Low Power mode.

- Software Standby mode
- Deep Software Standby mode

Note: When the On-Chip Debugger function is enabled, MOCO does not stop when transitioning to each standby mode.

(B) MOCO stop conditions related to MOCOCR register

When MOCO is stopped using the MOCOCR register, even if the MCSTP bit set to stop (MOCOCR.MCSTP bit is 1), MOCO may not be stopped depending on the operating status of the system.

MOCO can be stopped when all of the following conditions are met.

[MOCO stop conditions]

- MOCO is set to stop using the MOCOCR register (MOCOCR.MCSTP bit is 1)
- When HOCO is stopped or HOCO oscillation is stable. (OFS1(_SEC).HOCOEN bit is 1 and HOCOCR.HCSTP bit is 1, or OSCSF.HOCOSF bit is 1)
- PLL1 circuit is stopped or PLL1 oscillation is stable. (PLLCR.PLSTP bit is 1 or OSCSF.PLLSF bit is 1)
- PLL2 circuit is stopped or PLL2 oscillation is stable. (PLL2CR.PL2STP bit is 1 or OSCSF.PLL2SF bit is 1)

8.6.3 Restrictions on MOCO operation and stopping

After setting the MCSTP bit to 0 to start the MOCO clock, only use the clock after the MOCO clock oscillation stabilization time (tMOCOWT) elapses. A fixed stabilization wait is required after setting the MOCO clock to start operation. A fixed wait for oscillation to stop is also required.

The following restrictions apply when starting and stopping operation.

- After stopping the MOCO clock, read OSCMONR.MOCOMON, make sure MOCO is stopped, and then set the operation.
- Confirm that MOCO oscillation is stable before stopping the MOCO clock.
- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing a WFI instruction to place the MCU in Software Standby or CPU Deep Software Standby mode. If MOCO is stopped, operate the MOCO.

- Regardless of whether the MOCO clock is selected as the system clock source, confirm that MOCO oscillation is stable before executing the wait instruction to place the CPU in the CPU Deep Sleep mode. If MOCO is stopped, operate the MOCO.
- Confirm that MOCO oscillation is stable before executing a Power Control for each power domain by Software. If MOCO is stopped, operate the MOCO.
- Confirm that MOCO oscillation is stable before programming or erasing Flash Memory. If MOCO is stopped, operate the MOCO.

Writing 1 to MCSTP is prohibited under the following condition:

- SCKSCR.CKSEL[2:0] = 001b (system clock source = MOCO).
- Oscillation stop detection is enabled (OSTDCR.OSTDE bit is 1).
- While waiting for the HOCO oscillation stabilization (OFS1(_SEC).HOCOEN bit is 0 or HOCOCR.HCSTP bit is 0, and OSCSF.HOCOSF bit is 0)
- While waiting for the PLL1 oscillation stabilization (PLLCR.PLLSTP bit is 0, and OSCSF.PLLSF bit is 0)
- While waiting for the PLL2 oscillation stabilization (PLL2CR.PLL2STP bit is 0, and OSCSF.PLL2SF bit is 0)
- While executing a Power Control for each power domain by software (During the Power Gating Control)
- While measuring the Operation Stability wait time for Flash Memory
- While Flash Memory programming or erasure

The MOCO clock is used to measure the oscillation stabilization wait time of the HOCO/PLL1/PLL2 clock. While waiting for the HOCO/PLL1/PLL2 clock to stabilize, the MOCO clock oscillates regardless of the MOCOCR.MCSTP bit setting. At this time, it is necessary to prevent conflicts between the MOCO stop (or operation) by the MCSTP bit in MOCOCR and the MOCO clock oscillation for HOCO/PLL1/PLL2 clock oscillation stabilization wait time (or MOCO clock stop after HOCO/PLL1/PLL2 clock oscillation stabilization). Therefore, do not change the MOCOCR.MCSTP bit during the period from the 3 MOCO clock cycles before the start of HOCO/PLL1/PLL2 clock operation setting until the HOCO/PLL1/PLL2 clock oscillation stability can be confirmed by the HOCOSF/PLLSF/PLL2SF flag in the OSCSF register.

8.7 High speed On Chip Oscillator (HOCO)

High-speed On Chip Oscillator (HOCO) is the internal oscillator that supplies a high-speed clock.

8.7.1 Frequency Locked Loop Function

HOCO supports the Frequency Locked Loop (FLL) function that corrects the frequency accuracy of the HOCO clock using the Sub-Clock Oscillator. When the FLL function is enabled, the frequency accuracy of the HOCO clock can be improved compared to when the FLL function is disabled.

When using the FLL function, the oscillation of the Sub-Clock Oscillator must be stable. In addition, the sub-clock oscillator must meet the frequency accuracy specified in the electrical characteristics. (For details, section 60, Electrical Characteristicssee section Electrical Characteristics)

When enabling the FLL function and using HOCO, enable the FLL function in advance and enable HOCO (HOCOCR.HCTSP=0) after SOSC has stabilized.

Set FLLCR2.FLLCNTL[10:0] as follows for each HOCO frequency setting. And the HOCO clock reaches the desired frequency after tFLLWT after enabling HOCO.

Table 8.5 FLLCNTL setting for each HOCO frequency setting

FLLCR2.FLLCNTL[10:0]	OFS1(_SEC).HOCOFRQ0[2:0]	Target Frequency (FHOCO)
0x1E9	000b	16 MHz
0x226	001b	18 MHz
0x263	010b	20 MHz
0x1E9	100b	32 MHz
0x1E9	111b	48 MHz

8.7.2 Note on Oscillation Keep in Software Standby mode

By using the oscillation keep function of the HOCO in Software Standby mode, the HOCO oscillation stabilization wait time after canceling Software standby mode can be shortened.

To keep the HOCO oscillation in Software Standby mode, make the following settings:

- Enable the HOCO Standby Oscillation Keep function in the HOCOSCR register. (HOCOSCR.HOCOSOKP bit is set to 1)
- The setting of power control for HOCO in HOCOLDOCR.

If MCU enters Software Standby mode under the above settings and under the HOCO is operating, the HOCO will keep oscillating in Software Standby mode. When canceling Software Standby mode in this state, the HOCO clock can be used without the oscillator stabilization wait time.

If using this function, confirm that the setting value is written to the register before entering the Software standby mode.

However, even if this function is enabled, the clock supply to the system and peripheral modules during Software Standby mode is stopped.

8.7.3 Note on using as TRACE clock source

If HOCO is selected as Trace clock source with TRCKCRSEL bit on TRCKCR register, and then Trace clock function is enable (TRCKCR.TRCKEN=1), HOCO oscillates regardless of the value of HCSTP bit on HOCOCR register. In this situation, HOCO will continue to oscillate even if MCU is in Software Standby mode, Deep Software Standby mode, or Reset (except POR and PVD0) to keep supplying the clock to the TRACE module.

If HOCO is used as Trace clock source, Trace clock should be enabled with TRCKEN bit on TRCKCR register while HOCO is stopped (OFS1(_SEC).HOCOEN=1 and HOCOCR.HCSTP=1) or HOCO is oscillating and stable (OSCSF.HOCOSF=1).

8.8 PLL Circuit

The PLL circuit has a function to multiply the frequency from the oscillator.

Figure 8.8 shows the block diagram of PLL1 circuit, and Figure 8.9 shows the PLL2 circuit. PLL1 and PLL2 have the same circuit configuration. The PLL1 circuit is explained the following as an example.

The input clock source selection circuit selects the clock source input to the PLL.

The input clock divider circuit divides the input clock and generates the PLL reference clock.

The frequency control circuit controls the VCO clock to be generated from the PLL reference clock according to the frequency multiplier setting. The frequency multiplication ratio is determined by the combination of the PLLMUL bits and PLLMULNF bits. The PLLMUL bit determines the integer part of the multiplication ratio, and the PLLMULNF bit determines the fractional part of the multiplication ratio. For example, if the PLLMUL bit setting is 26 and the PLLMULNF bit setting is 0.33, the multiplication ratio is 26.33.

The PLL circuit has the 3 output clocks. The output clock divider circuit divides the VCO clock to generate each PLL clock output. The division ratio for generating each output clock can be set independently with the PLODIVP, PLODIVQ, and PLODIVR bits.

The PLL Input clock frequency, the PLL Reference clock frequency, the VCO clock frequency, and each Output clock frequency must be within the specified in section 60, Electrical Characteristics.

The PLL frequency setting can only be changed the PLL circuit is stopped. Do not change the PLL frequency setting when PLL stop control bit (PLLSTP) is 0.

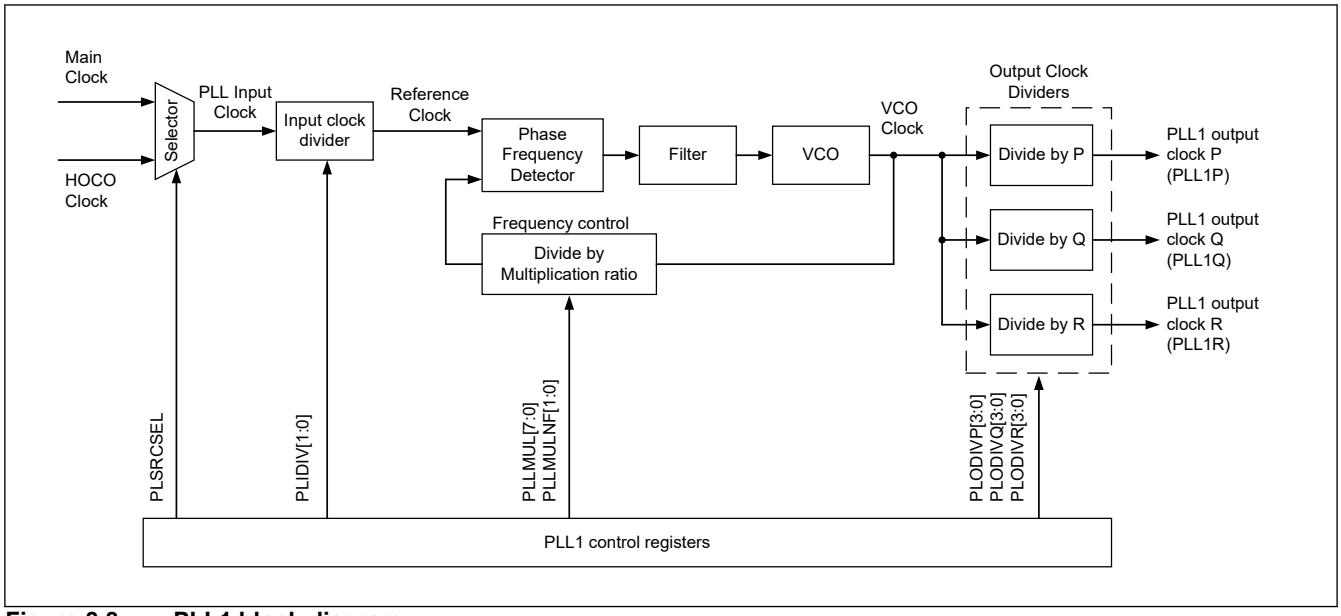

Figure 8.8 PLL1 block diagram

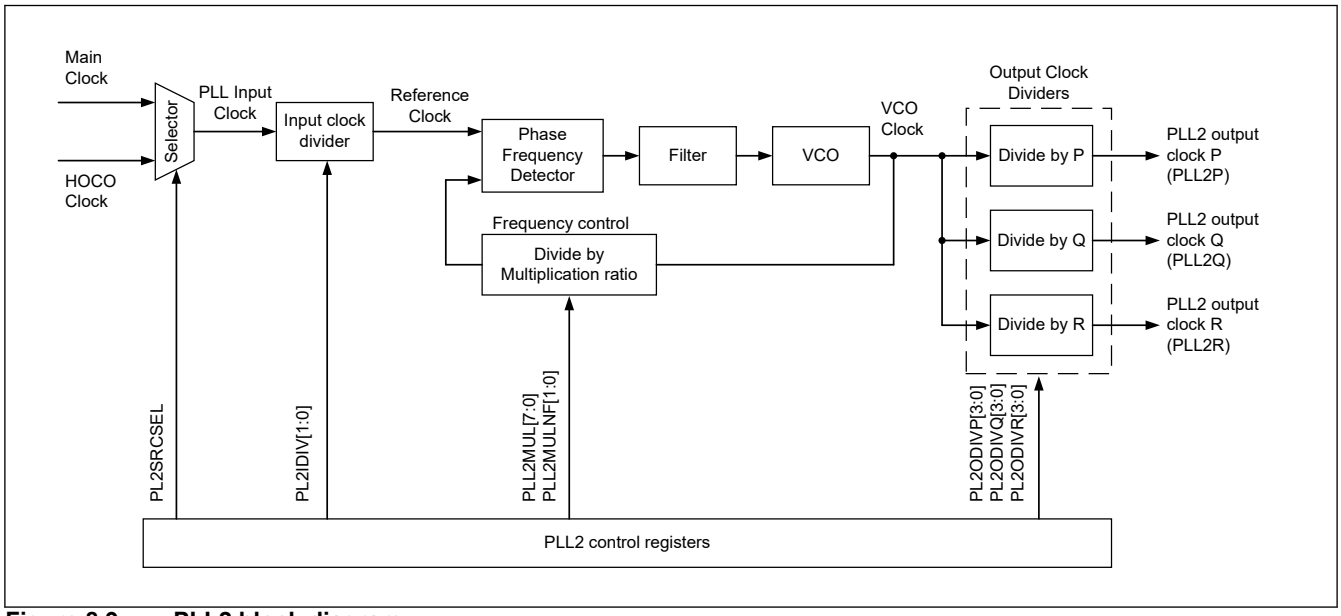

Figure 8.9 PLL2 block diagram

8.9 Oscillation Stop Detection Function

8.9.1 Oscillation Stop Detection and Operation after Detection

The oscillation stop detection function detects the main clock oscillator stop. When oscillation stop is detected, the system clock source switches as follows:

- If an oscillation stop is detected with SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC), the system clock source switches to the MOCO clock.
- If an oscillation stop is detected with PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (system clock source = PLL1P), PLL1 clock remains the system clock source. The frequency becomes free-running, and the setting in the SCKSCR.CKSEL[2:0] bits does not change.

An oscillation stop detection interrupt request can be generated when an oscillation stop is detected. In addition, the General PWM Timer (GPT) output can be forced to stop state on detection.

The main clock oscillation stop is detected when the input clock remains at 0 or 1 for a certain period, for example, when a malfunction occurs in the main clock oscillator. See section 60, Electrical Characteristics.

Switching between the main clock oscillator and the MOCO clock or between the PLL1 clock and PLL1 free-running clockis controlled by the Oscillation Stop Detection Flag (OSTDSR.OSTDF).

OSTDF controls the switched clock as follows:

- When SCKSCR.CKSEL[2:0] = 011b (system clock source = MOSC):
  - When OSTDF changes from 0 to 1, the clock source switches to the MOCO clock.
  - When OSTDF changes from 1 to 0, the clock source switches back to MOSC.
- When PLLCCR.PLSRCSEL = 0 (PLL1 source clock = MOSC) and SCKSCR.CKSEL[2:0] = 101b (System clock source = PLL1P):
  - When OSTDF changes 0 to 1, the clock source switches to the PLL1 free-running oscillation clock.
  - When OSTDF changes 1 to 0, the clock source switches back to PLL1.

To switch the clock source to the main clock or PLL1 clock again after the oscillation stop detection, set the CKSEL[2:0] bits to a clock source other than the main clock or PLL1 clock and clear the OSTDF flag to 0. Also, check that the OSTDF flag is not 1, then set the CKSEL[2:0] bits to the main clock or PLL1 clock after the specified oscillation stabilization time elapses.

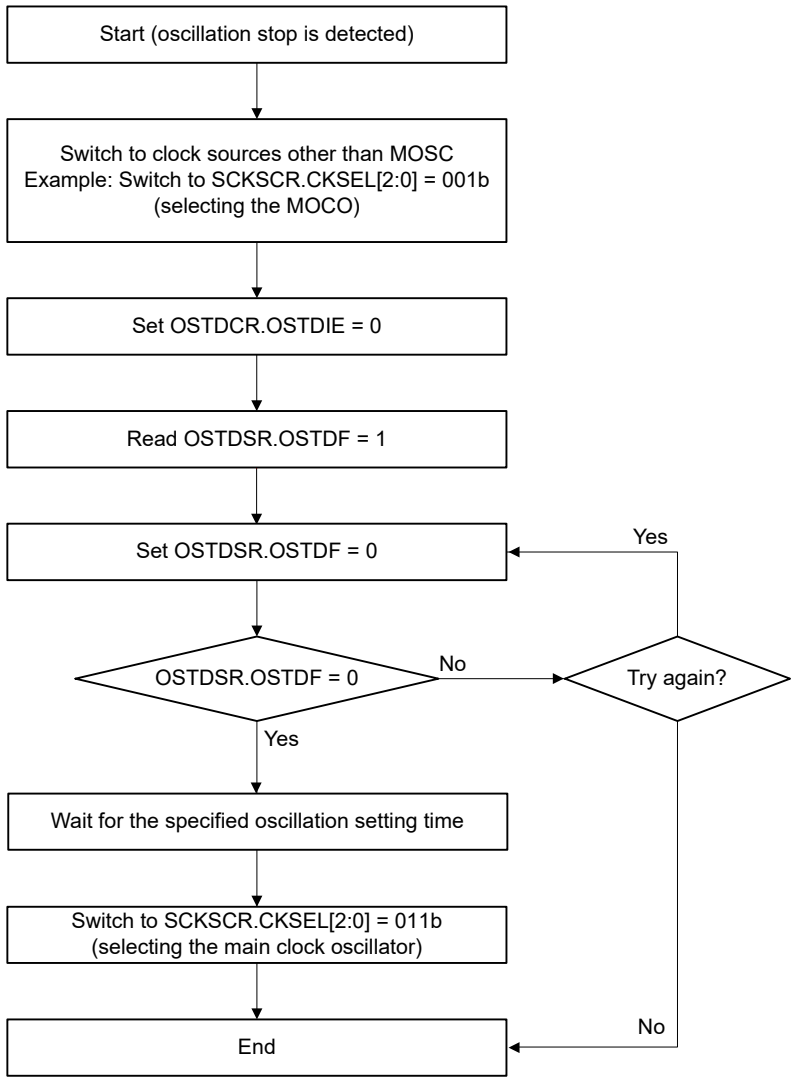
After a reset release, the main clock oscillator is stopped and the oscillation stop detection function is disabled. To enable the oscillation stop detection function, activate the main clock oscillator and write 1 to the oscillation stop detection function enable bit (OSTDCR.OSTDE) after a specified oscillation stabilization time elapses.

The oscillation stop detection function detects when the main clock is stopped by an external cause.

The oscillation stop detection function switches the following clocks to the MOCO clock (when the system clock source is MOSC) or the PLL1 free-running clock (when the system clock source is PLL1P) :

- All clocks that can be selected as the MOSC clock or PLL1 except CLKOUT, USBMCLK, MIPIMCLK and CACMCLK.
- The system clock (ICLK) frequency during the MOCO(when the system clock source is MOSC) or PLL1 free-running (when the system clock source is PLL1P) operation is specified by the MOCO oscillation frequency and the division ratio set by the system clock select bits (SCKDIVCR.ICK[3:0])

Example of returning when CKSEL[2:0] = 011b (selecting the main clock oscillator) after an oscillation stop is detected



Note: On return from the oscillation-stopped state, the factor responsible for stopping the main clock oscillation circuit must be removed from the system to allow oscillation to resume.

Figure 8.10 Flow of recovery on detection of oscillator stop

8.9.2 Oscillation Stop Detection Interrupts

An oscillation stop detection interrupt (MOSC_STOP) is generated when the Oscillation Stop Detection Flag (OSTDSR.OSTDF) is 1 and the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE) is 1 (enabled). The Port Output Enable for GPT (POEG) is notified of the main clock oscillator stop. On receiving the notification, the POEG sets the Oscillation Stop Detection Flag in the POEG Group n Setting Register (POEGGn.OSTPF) to 1 (n = A, B, C, D).

After the oscillation stop is detected, wait at least 10 PCLKB clock cycles before writing to the POEGGn.OSTPF flag. When the OSTDSR.OSTDF flag requires clearing, do so after clearing the Oscillation Stop Detection Interrupt Enable bit in the Oscillation Stop Detection Control Register (OSTDCR.OSTDIE). Wait at least 2 PCLKB clock cycles before setting the OSTDCR.OSTDIE bit to 1 again. A longer PCLKB wait time might be required, depending on the number of cycles required to read a given I/O register.

The oscillation stop detection interrupt is a non-maskable interrupt. Because non-maskable interrupts are disabled in the initial state after a reset release, enable non-maskable interrupts through software before using oscillation stop detection interrupts. For details, see section 13, Interrupt Controller Unit (ICU).

8.10 Internal Clock

Clock sources for the internal clock signals include:

- Main clock oscillator
- Sub-clock oscillator
- HOCO clock
- MOCO clock
- LOCO clock
- PLL1 clock (PLL1P, PLL1Q and PLL1R)
- PLL2 clock (PLL2P, PLL2Q and PLL2R)
- External clock input for JTAG
- External clock input for SWD

The following internal clocks are produced from these sources.

- Operating clock of the CPU : CPU clock (CPUCLK)
- Operating clock of the DMAC, DTC, Flash, SRAM, System Bus , I/O Port and ICU: System clock (ICLK)
- Operating clock of the Debug Subsystem : Debug clock (DCLK)
- Operating clocks of peripheral modules: Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, and PCLKE)
- Operating clock of the FlashIF: FlashIF clock (FCLK)
- Clock for the external bus controller and external pin output: External bus clock (BCLK, EBCLK)
- Clock for the external bus controller and external pin output for the SDRAM : SDRAM clock (SDCLK)
- Clock for the trace function and external pin output : Trace clock (TRCLK)
- Operating clock for the SCI : SCI clock (SCICLK)
- Operating clock for the SPI : SPI clock (SPICLK)
- Operating clock for the Octal SPI : Octal-SPI clock (OCTACLK, OCTADIVCLK)
- Operating clock for the CANFD Core : CANFD Core clock (CANFDCLK)
- Operating clock for the USBFS and USBHS : USB clock (USBCLK)
- Operating clock for the USBHS : USB clock (USB60CLK)
- Operating clock for the LCD : LCD clock (LCDCLK)
- Operating clock for the I3C : I3C clock (I3CCLK)
- Clock for external pin output : Clock/Buzzer output (CLKOUT)
- Operating clock for the USBHS : MOSC clock for USBHS (USBMCLK)
- Operating clock for the MIPI : MIPI clock (MIPIMCLK)
- Operating clock for the CAN : CAN clock (CANMCLK)
- Operating clocks for the ULPT : ULPT LOCO clock (ULPTLCLK) and ULPT sub-clock (ULPTSCLK)
- Operating clock for the AGT : AGT LOCO clock (AGTLCLK) and AGT sub-clock (AGTSCLK)
- Operating clocks for the CAC : CAC clock (CACCLK)
- Operating clocks for the RTC : RTC LOCO clock (RTCLCLK) and RTC Sub-clock (RTCSCLK)
- Operating clock for the IWDT : IWDT clock (IWDTCLK)
- Operating clock for the SysTick timer : SysTick timer clock (SYSTICKCLK)
- Operating clock for the JTAG : JTAG clock (JTAGTCK)

For details on the registers used to set the frequencies of the internal clocks, see section 8.10.2. System Clock (ICLK) to section 8.10.27. JTAG Clock (JTAGTCK)

If the value of any of these bits is changed, subsequent operation is at the frequency determined by the new value.

8.10.1 CPU Clock (CPUCLK)

The CPU clock (CPUCLK) is the operating clock for the CPU. Specify the frequency in the following bits:

- CPUCK[3:0] bits in SCKDIVCR2
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], and PLODIVP[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC)

8.10.2 System Clock (ICLK)

The system clock (ICLK) is the operating clock of the DMAC, DTC, Flash, SRAM, System Bus, I/O Port, and ICU. Specify the frequency in the following bits:

- ICK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0]its in OFS1(_SEC)

When the ICLK clock source is switched, the duration of the ICLK clock cycle becomes longer during the clock source transition period. See Figure 8.11 and Figure 8.12.

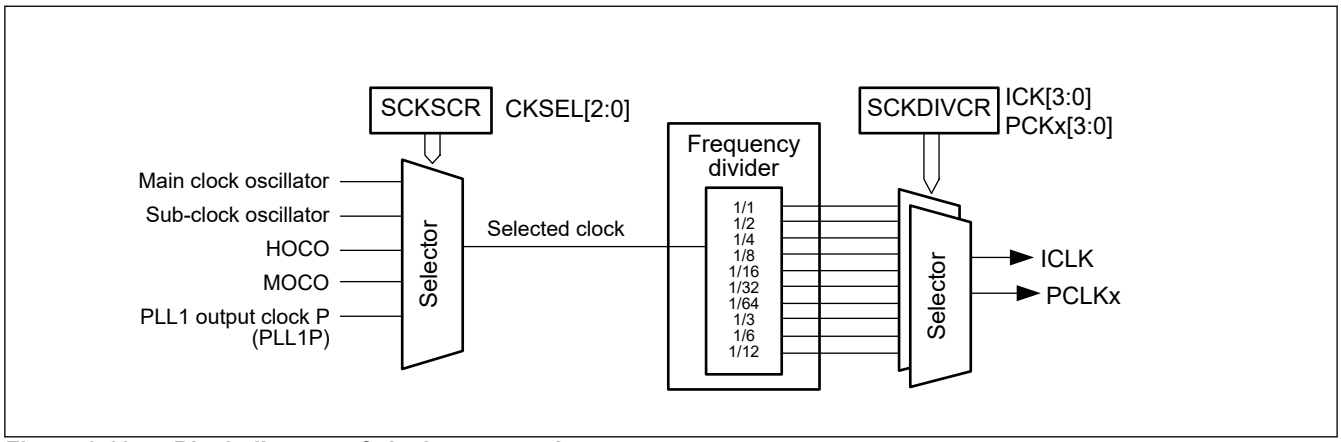


Figure 8.11 Block diagram of clock source selector

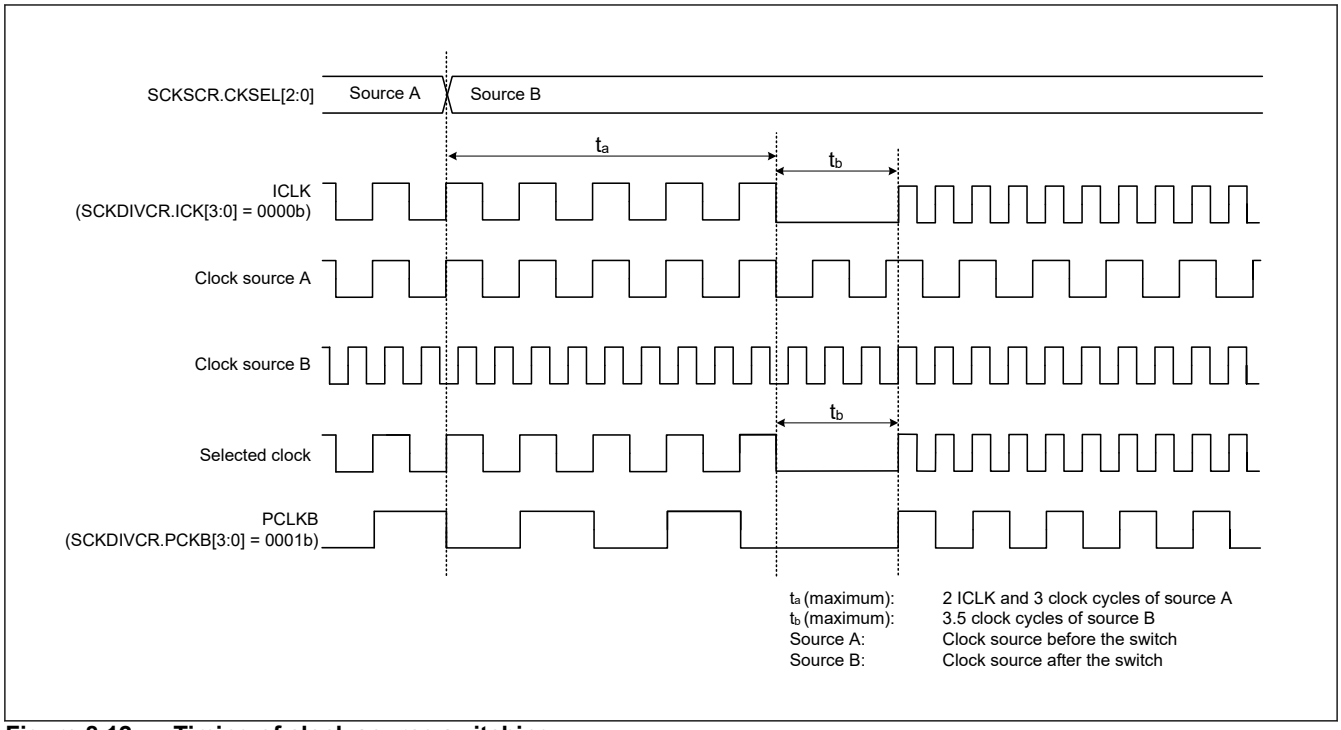

Figure 8.12 Timing of clock source switching

8.10.3 Debugger Clock (DCLK)

The Debugger clock (DCLK) is the operating clock for the Debug Subsystem. The frequency is ICLK divided by 2.

8.10.4 Peripheral Module Clock (PCLKA, PCLKB, PCLKC, PCLKD,PCLKE)

The peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE) are the operating clocks for the peripheral modules.

The frequency of the given clock is specified in the following bits:

- PCKA[3:0], PCKB[3:0], PCKC[3:0] , PCKD[3:0] and PCKE[3:0]bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

When the clock source of the peripheral module clock is switched, the duration of the peripheral module clock cycle becomes longer during the clock source transition period. See Figure 8.11 and Figure 8.12.

8.10.5 FlashIF Clock (FCLK)

The flash interface clock (FCLK) is the operating clock for the flash memory interface. In addition to reading from the data flash, FCLK is used for the programming and erasure of the code flash and data flash.

The FCLK frequency is specified in the following bits:

- FCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.6 External Bus Clock (BCLK, EBCLK)

The external bus clock (BCLK) is an operating clock for the external bus controller. It is also output externally from the EBCLK pin for the external connection bus.

BCLK can be output from the EBCLK pin by setting the EBCKOCR.EBCKOEN bit to 1 and setting the PmnPFS.PSEL[4:0] to 01011b. Make sure that modification of the PmnPFS.PSEL[4:0] to 01011b must always be performed while the EBCKOCR.EBCKOEN bit is 0.

When the BCKCR.BCLKDIV bit is set to 1, the BCLK clock divided by 2 is output from the EBCLK pin.

Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

A frequency higher than the system clock (ICLK) should not be set for the BCLK.

8.10.7 SDRAM Clock (SDCLK)

The SDRAM clock (SDCLK) is an operating clock for the external bus controller. It is output externally from the SDCLK pin for the SDRAM that is connected to the external bus. To output SDCLK on the SDCLK pin, set the SDCKOCR.SDCKOEN bit to 1 and set the PmnPFS.PSEL[4:0] bits to 01011b(enabling SDCLK output). Only change the value in the PmnPFS.PSEL[4:0] bits when the SDCKOCR.SDCKOEN bit is 0. Specify the frequency in the following bits:

- BCK[3:0] bits in SCKDIVCR
- CKSEL[2:0] bits in SCKSCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

Do not set SDCLK to a frequency higher than that of the system clock (ICLK).

8.10.8 Trace Clock (TRCLK)

The trace clock (TRCLK) is the CPU tracing clock for the On-Chip Debugger function.

The TRCLK frequency is specified by the TRCK[3:0] bits and TRCKSEL bit in TRCKCR (The Trace Clock frequency division ratio and the Trace Clock Source select) . When changing the frequency of the Trace Clock, the Trace Clock must be stopped (TRCKCR.TRCKEN = 0).

8.10.9 SCI Clock (SCICLK)

The SCI clock (SCICLK) is the operating clock for the SCI module.

Specify the frequency in the following bits:

- SCICKDIV[2:0] bits in SCICKDIVCR
- SCICKSEL[3:0] bits in SCICKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.10 SPI Clock (SPICLK)

The SPI clock (SPICLK) is the operating clock for the SPI module.

Specify the frequency in the following bits:

- SPICKDIV[2:0] bits in SPICKDIVCR
- SPICKSEL[3:0] bits in SPICKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.11 Octal-SPI clock (OCTACLK, OCTADIVCLK)

The Octal-SPI clock (OCTACLK) is the operating clock for the Octal-SPI module.

Specify the frequency in the following bits:

- OCTACKDIV[2:0] bits in OCTACKDIVCR
- OCTACKSEL[3:0] bits in OCTACKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

OCTADIVCLK always outputs 2-division of OCTACLK.

8.10.12 CANFD Core clock (CANFDCLK)

The CANFD Core clock (CANFDCLK) is the operating clock for the CANFD module.

Specify the frequency in the following bits:

- CANFDCKDIV[2:0] bits in CANFDCKDIVCR
- CANFDCKSEL[3:0] bits in CANFDCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.13 USB Clock (USBCLK)

The USB clock (USBCLK) is the operating clock for the USBFS and USBHS module.

A 48-MHz clock must be supplied when using the USBFS module or when using the USBHS module in CL-Only mode. USBCLK does not need to be supplied when not using USBHS module in CL-Only mode.

The USBCLK frequency is specified in the following bits:

- USBCKDIV[2:0] bits in USBCKDIVCR
- USBCKSEL[3:0] bits in USBCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.14 USB Clock (USB60CLK)

The USB clock (USB60CLK) is the operating clock for the USBHS module. A 60-MHz clock must be supplied when using the USBHS module in CL-Only mode. USB60CLK does not need to be supplied when not using USBHS in CL-Only mode.

Specify the frequency in the following bits:

- USB60CKDIV[2:0] bits in USB60CKDIVCR
- USB60CKSEL[3:0] bits in USB60CKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.15 MOSC clock for USBHS (USBMCLK)

The MOSC clock for USBHS (USBMCLK) is the operating clock for the USBHS when not using the module in CL-Only mode. USBMCLK does not need to be supplied when using USBHS in CL-Only mode.

The USBMCLK frequency is 12 MHz or 20 MHz or 24 MHz or 48 MHz supplied from the main clock oscillator.

8.10.16 LCD Clock (LCDCLK)

The LCD clock (LCDCLK) is the operating clock for the LCD module.

Specify the frequency in the following bits:

- LCDCKDIV[2:0] bits in LCDCLDIVCR
- LCDCKSEL[3:0] bits in LCDCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.17 I3C Clock (I3CCLK)

The I3C clock (I3CCLK) is the operating clock for the I3C module.

Specify the frequency in the following bits:

- I3CCKDIV[2:0] bits in I3CCKDIVCR
- I3CCKSEL[3:0] bits in I3CCKCR
- PLLMUL[7:0], PLLMULNF[1:0], PLIDIV[1:0], PLODIVP[3:0], PLODIVQ[3:0] and PLODIVR[3:0] bits in PLLCCR and PLLCCR2
- PLL2MUL[7:0], PLL2MULNF[1:0], PL2IDIV[1:0], PL2ODIVP[3:0], PL2ODIVQ[3:0] and PL2ODIVR[3:0] bits in PLL2CCR and PLL2CCR2
- HOCOFRQ0[2:0] bits in OFS1(_SEC).

8.10.18 CAN Clock (CANMCLK)

The CAN clock (CANMCLK) is the operating clock for the CAN module. CANMCLK is generated by the main clock oscillator.

8.10.19 MIPI Clock (MIPIMCLK)

The MIPI clock (MIPIMCLK) is the operating clock for the MIPI module. MIPIMCLK is generated by the main clock oscillator.

8.10.20 ULPT Clock (ULPTLCLK, ULPTSCLK)

The ULPT clocks (ULPTLCLK and ULPTSCLK) are the operating clock for the ULPT module. ULPTLCLK is generated by the LOCO clock and ULPTSCLK is generated by the Sub-clock oscillator.

8.10.21 CAC Clock (CACCLK)

The CAC clock (CACCLK) is the operating clock for the CAC. CACCLK includes the following clocks:

- CAC Main clock (CACMCLK) is generated by the Main clock oscillator
- CAC Sub oscillator clock (CACSCLK) is generated by the Sub-clock oscillator
- CAC HOCO clock (CACHCLK) is generated by the HOCO clock
- CAC MOCO clock (CACMOCLK) is generated by the MOCO clock
- CAC LOCO clock (CACLCLK) is generated by the LOCO clock

8.10.22 RTC Clock (RTCSCLK, RTCLCLK)

The RTC clock (RTCSCLK, RTCLCLK) is the operating clock for the RTC.

RTCSCLK is generated by the sub-clock oscillator, and RTCLCLK is generated by the LOCO clock.

8.10.23 IWDT Clock (IWDTCLK)

The IWDT clock (IWDTCLK) is the operating clock for the IWDT.

IWDTCLK is internally generated by the LOCO clock which is always divided by 2.

8.10.24 AGT Clock (AGTSCLK, AGTLCLK)

The AGT clocks (AGTSCLK and AGTLCLK) are the operating clocks for the AGT. AGTSCLK is generated by the sub-clock oscillator, and AGTLCLK is generated by the LOCO clock.

8.10.25 SysTick Timer Clock (SYSTICKCLK)

The SysTick timer clock (SYSTICKCLK) is the operating clock for the SysTick timer. SYSTICKCLK is generated by the MOCO clock which is always divided by 8.

8.10.26 External Pin Output Clock (CLKOUT)

The CLKOUT is output externally from the CLKOUT pin for the clock or buzzer output. The CLKOUT is output to the CLKOUT pin when the CKOCR.CKOEN bit is set to 1. Only change the value in the CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR when the CKOCR.CKOEN bit is 0.

The CLKOUT clock frequency is specified in the following bits:

- CKODIV[2:0] bits or CKOSEL[2:0] bits in CKOCR
- HOCOFRQ0[2:0] bits in OFS1(_SEC)

8.10.27 JTAG Clock (JTAGTCK)

The JTAG clock (JTAGTCK) is the clock for the JTAG.

JTAGTCK is generated by the JTAG external clock (TCK).

8.11 Clock Setting

8.11.1 System Clock Setting

8.11.1.1 Initial System Clock Setting

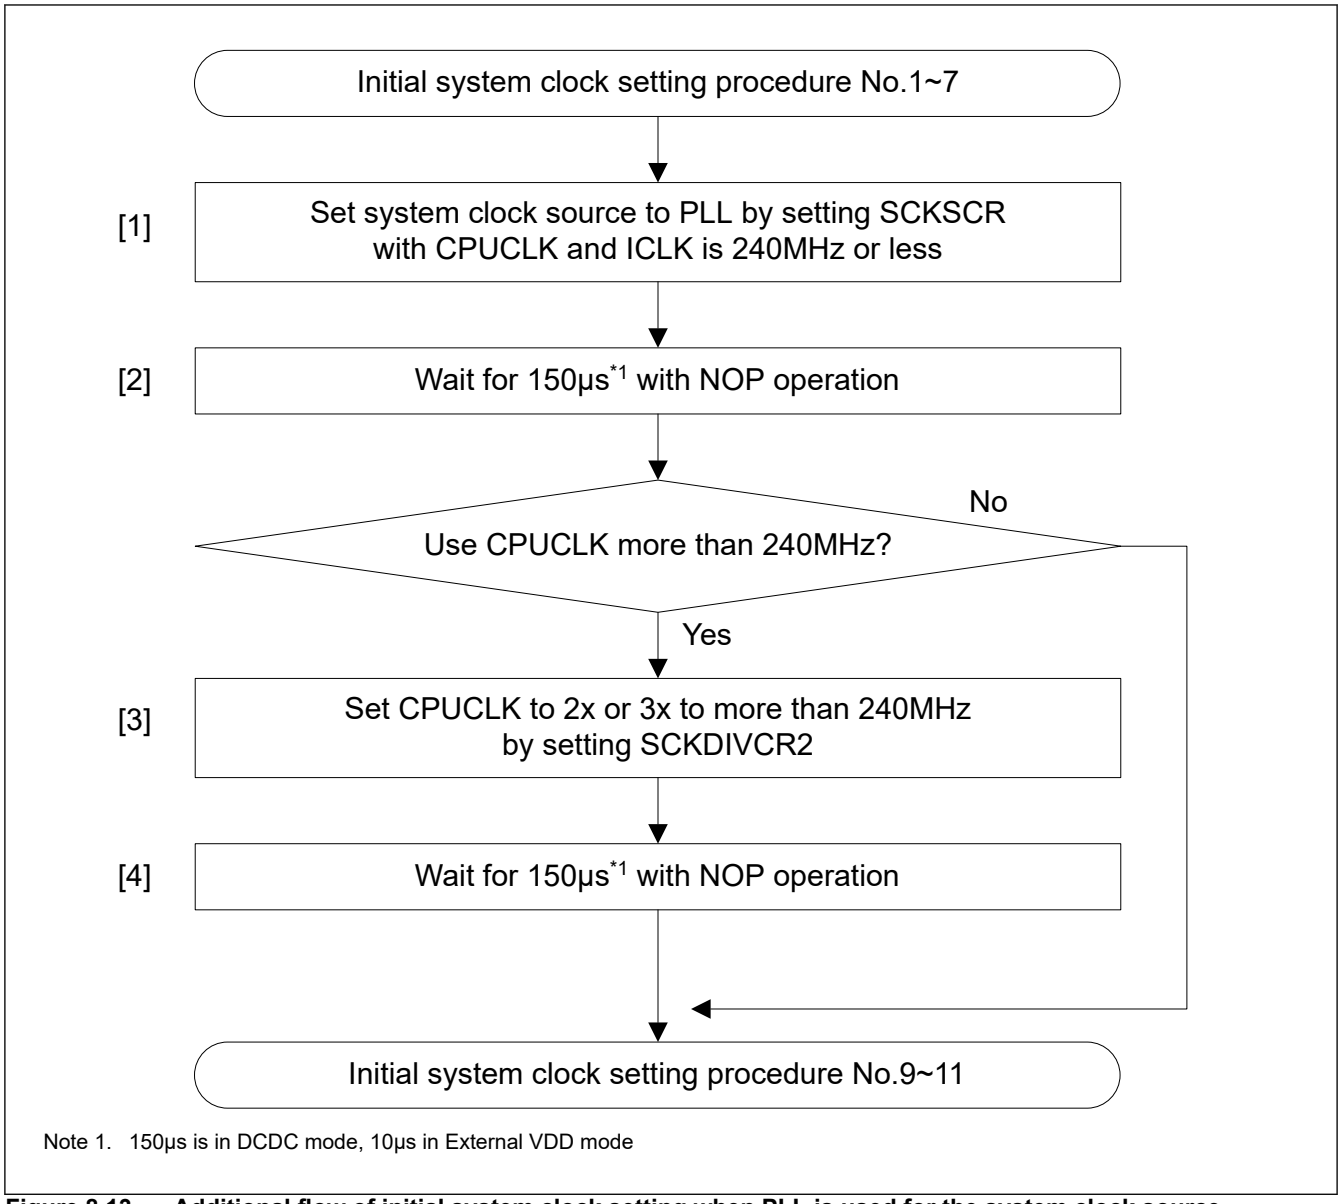
An example of the initial system clock setting procedure is shown in Table 8.6.

Table 8.6 Example of the initial system clock setting procedure after reset release / after Deep Software Standby cancellation

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. *1 For details, see section 10, Low Power Modes.
4	Set a clock source to oscillate	Set a clock source that switches to the system clock source to oscillate.
5	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 52, Flash Memory.
6	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR register.
7	Set External Bus clock output / SDRAM clock output*3	Set the EBCLK pin output setting with BCKCR. Set the SDCLK pin output setting with SDCKOCR.
8	Switch the System Clock source	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. *2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 *1*2bit in PRCR register
11	End	System clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the External bus or SDRAM are not used.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.8. This additional procedure is shown in Figure 8.13. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 150µs is in DCDC mode, 10µs in External VDD mode

Figure 8.13 Additional flow of initial system clock setting when PLL is used for the system clock source. (assuming all module stop bis are initial value)

8.11.1.2 System Clock Setting for Faster Frequency

An example of setting procedure when changing the current system clock frequency to a faster frequency is shown in Table 8.7

Table 8.7 Example of Setting Procedure When changing the current system clock frequency to a Faster frequency (1 of 2)

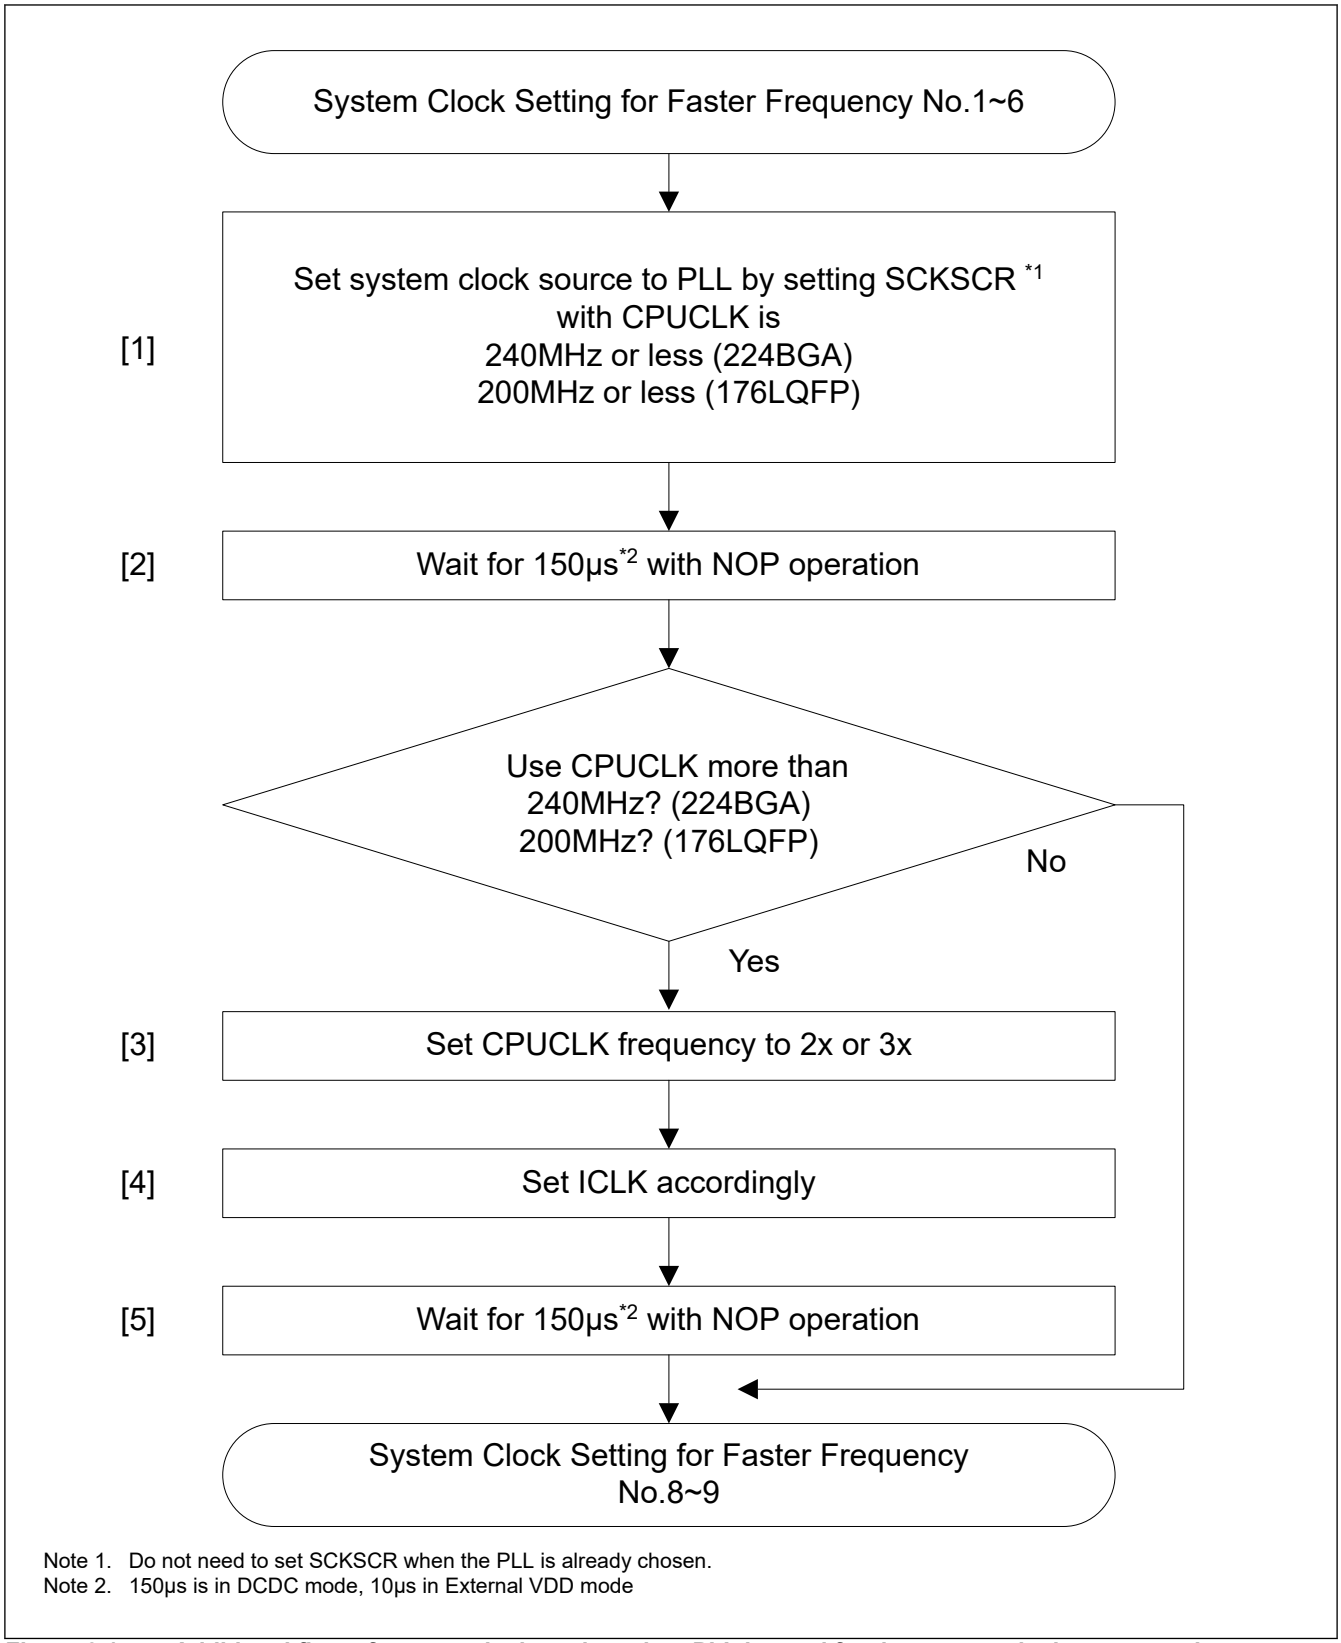
No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1*1*2 bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register.*1 For details, see section 10, Low Power Modes.
4	Set a clock source to oscillate*3	Set a clock source that switches to the system clock source to oscillate.*4
5	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 52, Flash Memory.

Table 8.7 Example of Setting Procedure When changing the current system clock frequency to a Faster frequency (2 of 2)

No.	Step	Description
6	Set internal clock division ratio	Set the internal clock division ratio with SCKDIVCR register.
7	Switch the System Clock source*3	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
8	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. *2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1*1*2 bit in PRCR register
11	End	System clock is changed to a Faster frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the system clock source is not changed.
Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.7. This additional procedure is shown in Figure 8.14. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt



Note 1. Do not need to set SCKSCR when the PLL is already chosen.
Note 2. 150µs is in DCDC mode, 10µs in External VDD mode

Figure 8.14 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK to be faster frequency

8.11.1.3 System Clock Setting for Slower frequency

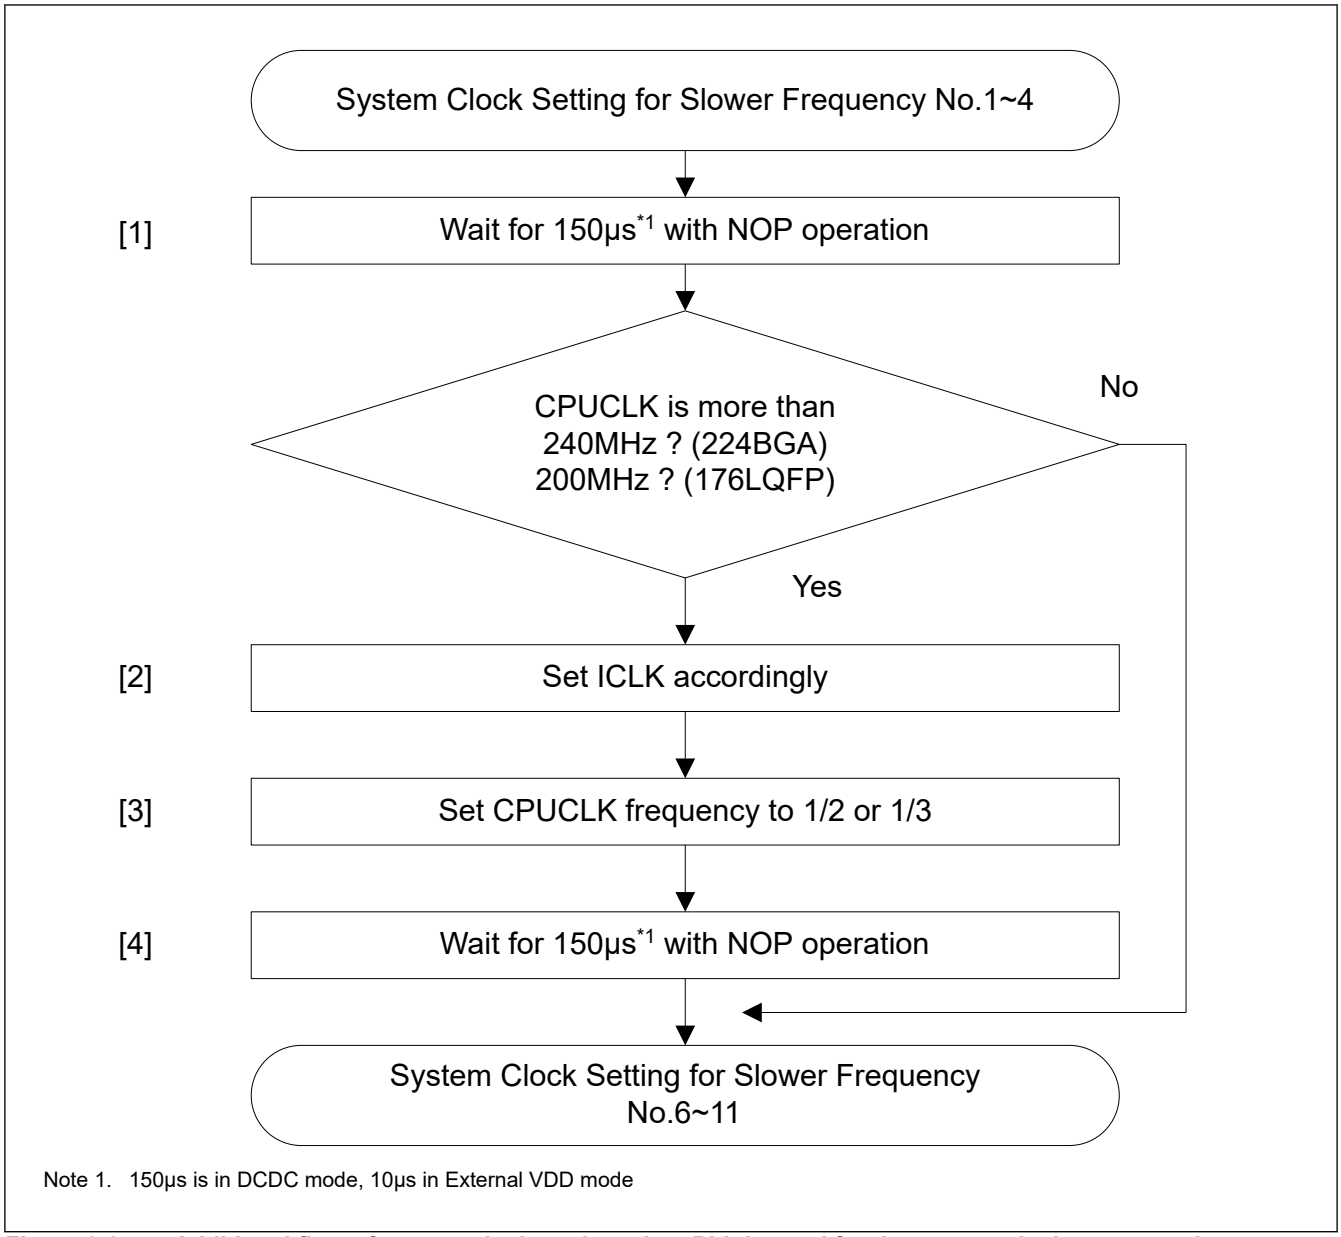
An example of setting procedure when changing the current system clock frequency to a slower frequency is shown in Table 8.8.

Table 8.8 Example of Setting Procedure When changing the current system clock frequency to a Slower frequency

No.	Step	Description
1	Start	
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1[*1*2] bit in PRCR register
3	Change Operating Power Control Mode to High-Speed mode[*1]	Change to High-Speed mode with OPCCR register.[*1] For details, see section 10, Low Power Modes.
4	Set a clock source to oscillate[*3]	Set a clock source that switches to the system clock source to oscillate.[*4]
5	Set internal clock division ratio	Make the following settings so that the frequency does not exceed the electrical characteristics range when the system clock source is switched in the next step. ● Set the internal clock division ratio larger than the current division ratio. ● Set the internal clock division ratio so that the frequency after switching the system clock source is slower than the current frequency.[*3]
6	Switch the System Clock source[*3]	Switch the system clock source with SCKSCR register. Before switching the system clock source, confirm that the clock source oscillation is stable.
7	Re-set internal clock division ratio	Re-set the internal clock division ratio with SCKDIVCR register according to the frequency after switching the system clock source.
8	Set Flash Wait Cycle	Set an appropriate access wait count for the flash memory according to the frequency at which it operates after the system clock (ICLK) is set. For details, see section 52, Flash Memory.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. [*2]
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 [*1*2] bit in PRCR register
11	End	System clock is changed to a Slower frequency.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.
Note 3. Setting is not necessary if the system clock source is not changed.
Note 4. To change the frequency of the PLL selected as the system clock source, it is necessary to change the system clock source to another clock source, stop the PLL, and then change the PLL setting.

When the PLL1 is selected as the system clock source, additional procedure is required for procedure No.5. This additional procedure is shown in Figure 8.15. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 150µs is in DCDC mode, 10µs in External VDD mode

Figure 8.15 Additional flow of system clock setting when PLL is used for the system clock source and CPUCLK to be slower frequency

8.11.2 Peripheral module-dedicated Clock Setting

This section describes the setting procedure of the operating clock for the peripheral module. The target clocks are as follows : SCICLK, SPICLK, OCTACLK, CANFDCLK, USBCLK, USB60CLK, LCDCLK and I3CCLK.

8.11.2.1 Initial Peripheral module-dedicated Clock Setting

An example of the initial clock setting procedure for peripheral module is shown in Table 8.9.

Table 8.9 Example of the setting procedure of the operating clock for peripheral module after reset release / after Deep Software Standby cancellation (1 of 2)

No.	Step	Description
1	Start	After reset release / Deep software standby cancellation (MOCO is selected as system clock source)
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2bit in PRCR register

Table 8.9 Example of the setting procedure of the operating clock for peripheral module after reset release / after Deep Software Standby cancellation (2 of 2)

No.	Step	Description
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. *1 For details, see section 10, Low Power Modes.
4	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1 While CKSRDY is 1, the clock suppling stops.
5	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
6	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[2:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
7	Clear CKSREQ and wait for clearing CKSRDY	Write 0 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock suppling starts.
8	Cancel the Module Stop Control	Cancel the Module Stop Control in MSTPCRn register (n = A to E) and supply clock to peripheral module.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register.*2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	End	Clock setting is completed. And then, set the peripheral modules.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.2.2 Peripheral module-dedicated Clock source changing

Table 8.10 shows an example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use.

Table 8.10 Example of the setting change procedure when switching the clock source of the operating clock for peripheral module in use

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1*1*2bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode *1	Change to High-Speed mode with OPCCR register.*1 For details, see section 10, Low Power Modes.
5	Set CKSREQ and wait for setting CKSRDY	Write 1 to CKSREQ bit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 1.While CKSRDY is 1, the clock suppling stops.
6	Set a clock source to oscillate	Set a clock source that switches to the peripheral module-dedicated clock source to oscillate.
7	Set the clock division ratio and switch the clock source	Write the setting value to CKDIV[2:0] in each CKDIVCR register. Write the setting value to CKSEL[3:0] in each CKCR register.
8	Clear CKSREQ andwait for clearing CKSRDY	Write 0 to CKSREQbit in each CKCR register. Polling until CKSRDY bit in each CKCR register is read as 0. After CKSRDY is 0, the clock suppling starts.
9	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register. *2
10	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
11	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed.After that, restart the operation of the peripheral module.
12	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.2.3 Peripheral module-dedicated Clock division ratio changing

Table 8.11 shows an example of the setting change procedure when switching the switching the division ratio of the operating clock for peripheral module in use.

Table 8.11 Example of the setting change procedure when switching the division ratio of the operating clock for peripheral module in use (without the clock source change)

No.	Step	Description
1	Start	The operating clock for the peripheral module is being used.
2	Stop the peripheral module	Stop the operation of the peripheral module that the operating clock is to be changed.
3	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 *1*2 bit in PRCR register
4	Change Operating Power Control Mode to High-Speed mode *1	Change to High-Speed mode with OPCCR register. *1 For details, see section 10, Low Power Modes.
5	Set the clock division ratio	Write the setting value to CKDIV[2:0] in each CKDIVCR register.
6	Change Operating Power Control Mode	Change the Operating Power Control Mode with OPCCR register.*2
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bitin PRCR register
8	Restart the peripheral module	Change the peripheral module settings according to the operating clock after the settings are changed. After that, restart the operation of the peripheral module.
9	End	Clock setting is completed.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. Setting is not necessary if the operating power control mode is not changed.

8.11.3 Main Clock Oscillator Setting

Table 8.12 shows an example of the initial setting procedure for the Main Clock Oscillator.

Table 8.12 Example of the initial setting procedure for Main Clock Oscillator after reset release / after Deep Software Standby cancellation

No.	Step	Description
1	Start	The Main Clock Oscillator is stopped after reset release / Deep software standby cancellation
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Set the mode of Main Clock Oscillator	Set the following Main Clock Oscillator mode with MOMCR register • Resonator or Clock input • Auto Gain Control function • Drive Capability
4	Set the oscillation stabilization wait time	Set the Main Clock Oscillator Wait Time in MOSCWTCR register.
5	Set the oscillation keep in Software Standby mode	Set MOSCSCR register if Main Clock Oscillator keeps oscillation in Software Standby mode.
6	Set the Main Clock Oscillator to operate	Set the Main Clock Oscillator to start oscillating with the MOSCCR register.
7	Wait for Main Clock oscillation to stabilize	Polling until MOSCSF bit in OSCSF register is read as 1 (Oscillation is stable)
8	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
9	End	The Main Clock Oscillator setting is completed. The Main Clock is available.

8.11.4 Sub-Clock Oscillator Setting

Table 8.13 shows an example of the initial setting procedure for the Sub-Clock Oscillator.

Table 8.13 Example of the initial setting procedure for Sub-Clock Oscillator after VBAT Power On Reset release

No.	Step	Description
1	Start	The Sub-Clock Oscillator is stopped after VBAT Power On Reset release.
2	Cancel Register Write Protection	Set 1 to PRC0 bit in PRCR register
3	Setting the mode of Sub-Clock Oscillator	Set the following Sub-Clock Oscillator mode with SOMCR register ● Resonator or Clock input ● Drive Capability
4	Set the Sub-Clock Oscillator to operate	Set the Sub-Clock Oscillator to start oscillating with the SOSCCR register.
5	Wait for Sub-Clock oscillation to stabilize	Wait for sub-clock oscillation stabilization time (tSUBOSCWT). For the sub-clock oscillation stabilization time, see section 60, Electrical Characteristics.
6	Apply Register Write Protection	Set 0 to PRC0 bit in PRCR register
7	End	The Sub-Clock Oscillator setting is completed. The Sub-Clock is available.

8.11.5 High-speed On Chip Oscillator Setting

8.11.5.1 HOCO Initial Clock Setting

Table 8.14 shows an example of the initial setting procedure for the HOCO.

Table 8.14 Example of the HOCO initial setting procedure after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1, without FLL)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Check the HOCO power supply*1	Check the following bit in the HOCOLDOCR register ● LDOSTP bit is 0 (LDO is enabled)
4	Set the oscillation keep in Software Standby mode	If HOCO keeps oscillation in Software Standby mode, set the following: ● HOCOSOKP bit in HOCOSCR register ● SKEEP bit in HOCOLDOCR register
5	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
6	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
8	End	HOCO clock setting is completed.HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO. If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See section 60, Electrical Characteristics on waiting time for the HOCO power supply to stabilize.

8.11.5.2 HOCO Setting with FLL function

Table 8.15shows an example of the initial setting procedure for HOCO with FLL function.

Table 8.16 shows the FLL function setting flow for the Software Standby mode transition and cancellation.

Table 8.15 Example of the HOCO setting procedure with FLL function after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1) (1 of 2)

No.	Step	Description
1	Start	The HOCO is stopped after reset release / Deep software standby cancellation when OFS1(_SEC).HOCOEN is 1.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register

Table 8.15 Example of the HOCO setting procedure with FLL function after reset release / after Deep Software Standby cancellation (OFS1(_SEC).HOCOEN = 1) (2 of 2)

No.	Step	Description
3	Check the HOCO power supply*1	Check the following bit in the HOCOLDOCR register. ● LDOSTP bit is 0 (LDO is enabled)
4	Set the FLL function to enable*2	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
5	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
6	Wait for HOCO clock oscillation to stabilize	Polling until HOCOSF bit in OSCSF register is read as 1 (Oscillation is stable)
7	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
8	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1
9	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
10	End	FLL setting is completed. HOCO Clock is available.

Note 1. When HOCOLDOCR.LDOSTP bit is 1, do not operate HOCO.
If HOCOLDOCR.LDOSTP is switched from 1 to 0, waiting for the HOCO power supply to stabilize is required. See section 60, Electrical Characteristics on waiting time for the HOCO power supply to stabilize.
Note 2. Sub-Clock Oscillator must be oscillating with the stabilization.

Table 8.16 FLL setting flow for Software Standby mode transition and cancellation

No.	Step	Description
1	Start	The HOCO is oscillating with FLL is enabled
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register
3	Stop HOCO*1	Set HOCO to stop with HOCOCR register.
4	Disable FLL	Set the FLL function to disable with FLLCR1 register.
5	WFI instruction*2	Transition to Software Standby mode with WFI instruction
6	Software Standby mode*2	MCU is in Software Standby mode
7	Cancellation Software Standby mode*2	Software Standby mode is cancelled
8	Set the FLL function to enable*3	Set the FLL Multiplication Control with FLLCR2 register. Set the FLL function to enable with FLLCR1 register.
9	Set HOCO to operate	Set HOCO to start oscillating with the HOCOCR register.
10	Wait for FLL stabilization	Wait for FLL stabilization wait time (t_{FLLWT}), or wait until the HOCO clock is measured to confirm that the frequency accuracy is stable.
11	Check the HOCO stabilization	Check that HOCOSF bit in OSCSF register is read as 1.
12	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
13	End	HOCO Clock is available.

Note 1. If HOCO is used as the system clock source or the clock source of PLL, these clock source must be changed to another clock before HOCO is stopped.
Note 2. See section 10, Low Power Modes for detail of Software Standby mode.
Note 3. Sub-Clock Oscillator must be oscillating with the stabilization.

8.11.6 PLL Setting

8.11.6.1 PLL Initial Clock Setting

Table 8.17 shows an example of the initial setting procedure for the PLL.

Table 8.17 Example of the PLL initial setting procedure after reset release / after Deep Software Standby cancellation (PLL1 or PLL2)

No.	Step	Description
1	Start	The PLL1 is stopped after reset release / Deep software standby cancellation. The PLL2 is stopped after reset release / Deep software standby cancellation.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.
3	Change Operating Power Control Mode to High-Speed mode*1	Change to High-Speed mode with OPCCR register. For details, see section 10, Low Power Modes.
4	Check the PLL power supply*2	[PLL1] Check the following bit in the PLL1LDOCR register. ● LDOSTP bit is 0 (LDO is enabled). [PLL2] Check the following bit in the PLL2LDOCR register. ● LDOSTP bit is 0 (LDO is enabled).
5	Configure the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] ● PLL input frequency division ratio ● PLL clock source ● Frequency Multiplication Factor ● Frequency Multiplication Fractional Factor ● PLL Output Frequency Division Ratio (P/Q/R)
6	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
7	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1(Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
8	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register
9	End	PLL1 or PLL2 clock setting is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. Setting is not necessary if the operating power control mode is already the High-Speed mode.
Note 2. When PLL1LDOCR.LDOSTP bit is 1, do not operate PLL1.
If PLL1LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL1 power supply to stabilize is required. See section 60, Electrical Characteristics on waiting time for the PLL1 power supply to stabilize.
When PLL2LDOCR.LDOSTP bit is 1, do not operate PLL2.
If PLL2LDOCR.LDOSTP is switched from 1 to 0, waiting for the PLL2 power supply to stabilize is required. See section 60, Electrical Characteristics on waiting time for the PLL2 power supply to stabilize.

8.11.6.2 PLL Clock Setting Change

Table 8.18 shows an example of the initial setting procedure for the PLL.

Table 8.18 Example of the PLL setting change procedure (PLL1 or PLL2) (1 of 2)

No.	Step	Description
1	Start	PLL1 is oscillating and the PLL1 clocks (PLL1P, PLL1Q, PLL1R) are being used. PLL2 is oscillating and the PLL2 clocks (PLL2P, PLL2Q, PLL2R) are being used.
2	Cancel Register Write Protection	Set 1 to PRC0 bit and PRC1 bit in PRCR register.

Table 8.18 Example of the PLL setting change procedure (PLL1 or PLL2) (2 of 2)

No.	Step	Description
3	Stop PLL*1	[PLL1] Set PLL1 to stop with PLLCR register. [PLL2] Set PLL2 to stop with PLL2CR register.
4	Change the PLL settings	[PLL1] Configure the following PLL1 settings in PLLCCR and PLLCCR2 registers. [PLL2] Configure the following PLL2 settings in PLL2CCR and PLL2CCR2 registers. [Setting Items] ● PLL input frequency division ratio ● PLL clock source ● Frequency Multiplication Factor ● Frequency Multiplication Fractional Factor ● PLL Output Frequency Division Ratio (P/Q/R)
5	Set PLL to operate	[PLL1] Set PLL1 to start oscillating with the PLLCR register. [PLL2] Set PLL2 to start oscillating with the PLL2CR register.
6	Wait for PLL clock oscillation to stabilize	[PLL1] Polling until PLLSF bit in OSCSF register is read as 1 (Oscillation is stable). [PLL2] Polling until PLL2SF bit in OSCSF register is read as 1 (Oscillation is stable).
7	Apply Register Write Protection	Set 0 to PRC0 bit and PRC1 bit in PRCR register.
8	End	PLL1 or PLL2 clock setting change is completed. [PLL1] PLL1P, PLL1Q, PLL1R clocks are available. [PLL2] PLL2P, PLL2Q, PLL2R clocks are available.

Note 1. If PLL1P clock is used as the system clock source, the system clock source must be changed to another clock source before PLL1 is stopped.

8.12 Usage Notes

8.12.1 Notes on Clock Generation Circuit

The frequency of the following clocks supplied to each module changes according to the setting of the SCKDIVCR and SCKDIVCR2 register:

- CPU clock (CPUCLK)
- System clock (ICLK)
- Peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD and PCLKE)
- FlashIF clock (FCLK)
- external bus clock (BCLK)

Each frequency must meet the following conditions:

- Each frequency must be selected within the operation-guaranteed range of the operating frequency (f) specified in the AC characteristics. See section 60, Electrical Characteristics.
- Each clock must be set according to Table 8.2.
- Do not change the clock frequency during external bus access. Furthermore, when access via the external bus is to start after a change to the clock frequency, only start access via the bus after confirming that the change to the frequencies has been completed.

To ensure correct processing after the clock frequency changes, first write to the relevant Clock Control register to change the frequency, then read the value from the register, and finally perform the subsequent processing.

8.12.2 Notes on Resonator

Because various resonator characteristics relate closely to your board design, adequate evaluation is required before use. See the resonator connection example in Figure 8.5. The circuit constants for the resonator depend on the resonator to be used and the stray capacitance of the mounting circuit. Therefore, consult the resonator manufacturer when determining the circuit constants. The voltage to be applied between the resonator pins must be within the absolute maximum rating.

8.12.3 Notes on Board Design

When using a crystal resonator, place the resonator and its load capacitors as close to the XTAL and EXTAL pins as possible. Other signal lines should be routed away from the oscillation circuit as shown in Figure 8.16 to prevent electromagnetic induction from interfering with correct oscillation. Figure 8.16 shows the case which the main clock oscillator is used. In case of sub-clock oscillator, it is also same as Figure 8.16.

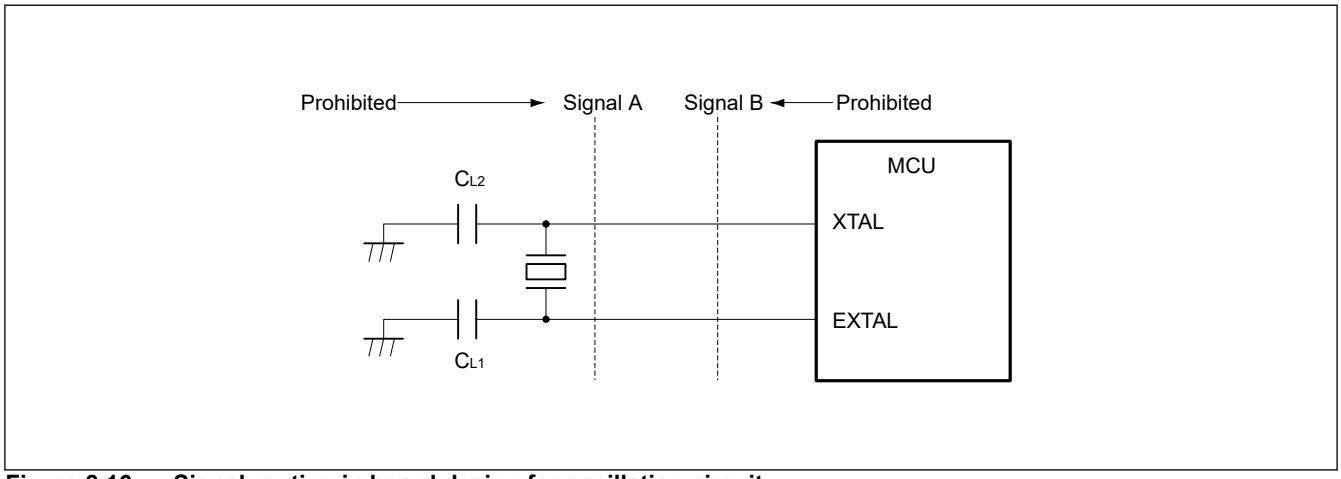


Figure 8.16 Signal routing in board design for oscillation circuit

8.12.4 Notes on Resonator Connect Pin

When the main clock is not used, the EXTAL and XTAL pins can be used as general ports. When these pins are used as general ports, the main clock must be stopped (MOSCCR.MOSTP bit should be set to 1).

8.12.5 Notes on Using Sub-Clock Oscillator

The output of the P212 (EXTAL), P213 (XTAL) and P706 pins may affect the oscillation by the sub-clock oscillator.

If the sub-clock oscillator is used, implement board design so as not to affect the oscillation. Renesas strongly recommends setting the PmnPFS.DSCR[1:0] bits to 00b or 01b when using the P212 (EXTAL), P213 (XTAL) and P706 as output pins and using the sub-clock oscillator.

In addition, when using the sub-clock oscillator in Low power mode drive capability (SOMCR.SODRV[1:0]= 01b, 10b and 11b), Renesas recommecds setting the PmnPFS.DSCR[1:0] bits to 00b when using the P212 (EXTAL), P213 (XTAL) and P706 as output pins and using the sub-clock oscillator.

9. Clock Frequency Accuracy Measurement Circuit (CAC)

9.1 Overview

The Clock Frequency Accuracy Measurement Circuit (CAC) counts pulses of the clock to be measured (measurement target clock) within the time generated by the clock selected as the measurement reference (measurement reference clock), and determines the accuracy depending on whether the number of pulses is within the allowable range. When measurement is complete or the number of pulses within the time generated by the measurement reference clock is not within the allowable range, an interrupt request is generated.

Table 9.1 lists the CAC specifications, Figure 9.1 shows the CAC block diagram, and Table 9.2 lists the CAC I/O pin.

Table 9.1 CAC specifications

Parameter	Specifications
Measurement target clocks	Frequency can be measured for: • Main clock oscillator (CACMCLK) • Sub-clock oscillator (CACSCLK) • HOCO clock (CACHCLK) • MOCO clock (CACMOCLK) • LOCO clock (CACLCLK) • Peripheral module clock B (PCLKB)
Measurement reference clocks	Frequency can be referenced to: • External clock input to the CACREF pin • Main clock oscillator (CACMCLK) • Sub-clock oscillator (CACSCLK) • HOCO clock (CACHCLK) • MOCO clock (CACMOCLK) • LOCO clock (CACLCLK) • Peripheral module clock B (PCLKB)
Selectable function	Digital filter
Interrupt sources	• Measurement end • Frequency error • Overflow
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set

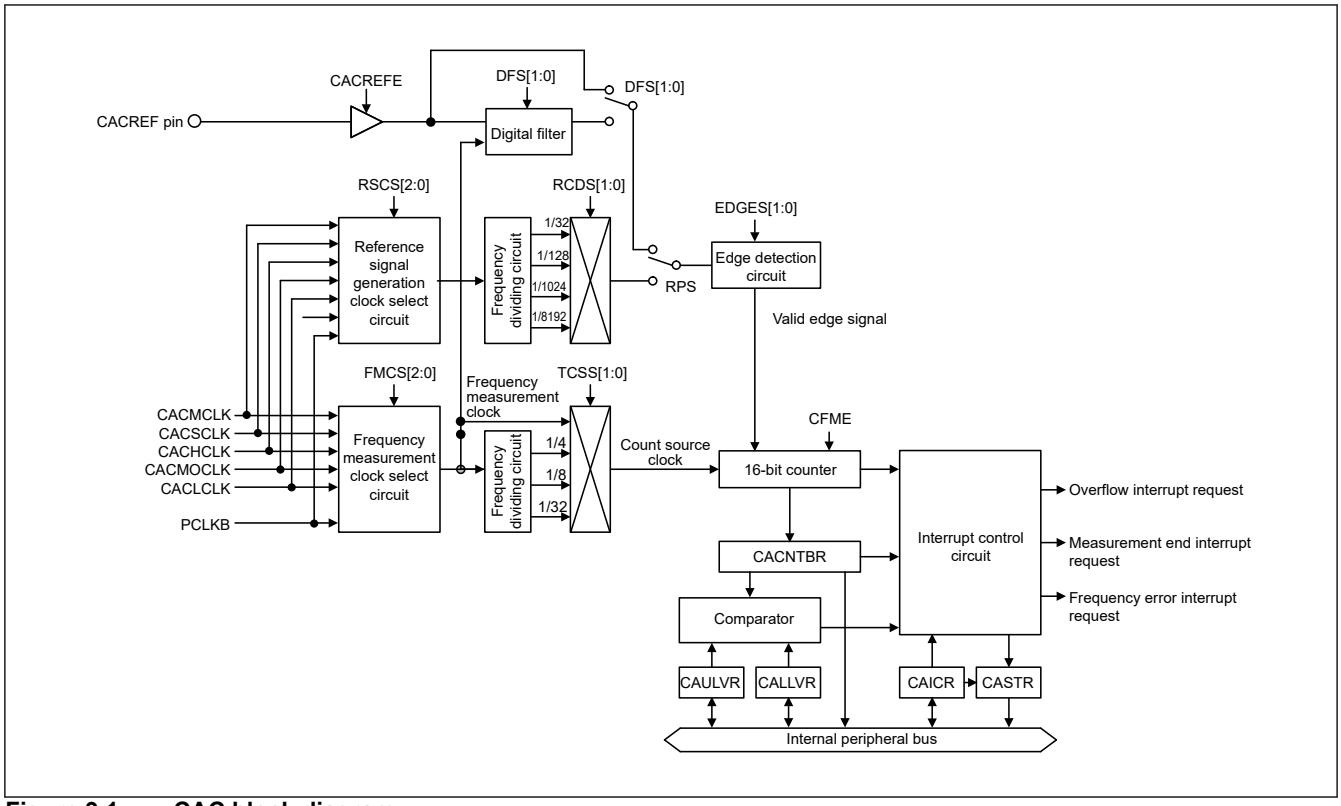

Figure 9.1 CAC block diagram

Table 9.2 CAC I/O pin

Function	Pin name	I/O	Description
CAC	CACREF	Input	Measurement reference clock input pin

9.2 Register Descriptions

9.2.1 CACR0 : CAC Control Register 0

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	CFME
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CFME	Clock Frequency Measurement Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

CFME bit (Clock Frequency Measurement Enable)

The CFME bit enables clock frequency measurement. Changes made to this bit are not immediately reflected to the internal circuit. Read the bit to confirm that the change has been reflected.

9.2.2 CACR1 : CAC Control Register 1

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	EDGES[1:0]		TCSS[1:0]		FMCS[2:0]			CACREFE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CACREFE	CACREF Pin Input Enable 0: Disable 1: Enable	R/W
3:1	FMCS[2:0]	Measurement Target Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
5:4	TCSS[1:0]	Timer Count Clock Source Select 0 0: No division 0 1: × 1/4 clock 1 0: × 1/8 clock 1 1: × 1/32 clock	R/W
7:6	EDGES[1:0]	Valid Edge Select 0 0: Rising edge 0 1: Falling edge 1 0: Both rising and falling edges 1 1: Setting prohibited	R/W

Note: S-TYPE3, P-TYPE3
Note: Set the CACR1 register when the CACR0.CFME bit is 0.

CACREFE bit (CACREF Pin Input Enable)

The CACREFE bit enables the CACREF pin input.

FMCS[2:0] bits (Measurement Target Clock Select)

The FMCS[2:0] bits select the measurement target clock whose frequency is to be measured.

TCSS[1:0] bits (Timer Count Clock Source Select)

The TCSS[1:0] bits select the division ratio of the measurement target clock.

EDGES[1:0] bits (Valid Edge Select)

The EDGES[1:0] bits select the valid edge for the reference signal.

9.2.3 CACR2 : CAC Control Register 2

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DFS[1:0]		RCDS[1:0]		RSCS[2:0]			RPS
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RPS	Reference Signal Select 0: CACREF pin input 1: Internal clock (internally generated signal)	R/W
3:1	RSCS[2:0]	Measurement Reference Clock Select 0 0 0: Main clock oscillator (CACMCLK) 0 0 1: Sub-clock oscillator (CACSCLK) 0 1 0: HOCO clock (CACHCLK) 0 1 1: MOCO clock (CACMOCLK) 1 0 0: LOCO clock (CACLCLK) 1 0 1: Peripheral module clock B (PCLKB) 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
5:4	RCDS[1:0]	Measurement Reference Clock Frequency Division Ratio Select 0 0: × 1/32 clock 0 1: × 1/128 clock 1 0: × 1/1024 clock 1 1: × 1/8192 clock	R/W
7:6	DFS[1:0]	Digital Filter Select 0 0: Disable digital filtering 0 1: Use sampling clock for the digital filter as the frequency measuring clock 1 0: Use sampling clock for the digital filter as the frequency measuring clock divided by 4 1 1: Use sampling clock for the digital filter as the frequency measuring clock divided by 16.	R/W

Note: S-TYPE3, P-TYPE3
Note: Set the CACR2 register when the CACR0.CFME bit is 0.

RPS bit (Reference Signal Select)

The RPS bit selects whether to use the CACREF pin input or an internal clock (internally generated signal) as the reference signal.

RSCS[2:0] bits (Measurement Reference Clock Select)

The RSCS[2:0] bits select the reference clock for measurement.

RCDS[1:0] bits (Measurement Reference Clock Frequency Division Ratio Select)

The RCDS[1:0] bits select the frequency-divisor of the reference clock for measurement when an internal reference clock is selected. When RPS = 0 (CACREF pin is used as the reference clock source), the reference clock is not divided.

DFS[1:0] bits (Digital Filter Select)

The DFS[1:0] bits enable or disable the digital filter and selects its sampling clock.

9.2.4 CAICR : CAC Interrupt Control Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x03

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OVFFCL	MENDFCL	FERRFCL	—	OVFIE	MENDIE	FERRIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRIE	Frequency Error Interrupt Request Enable 0: Disable 1: Enable	R/W
1	MENDIE	Measurement End Interrupt Request Enable 0: Disable 1: Enable	R/W
2	OVFIE	Overflow Interrupt Request Enable 0: Disable 1: Enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	FERRFCL	FERRF Clear 0: No effect 1: The CASTR.FERRF flag is cleared	W
5	MENDFCL	MENDF Clear 0: No effect 1: The CASTR.MENDF flag is cleared	W
6	OVFFCL	OVFF Clear 0: No effect 1: The CASTR.OVFF flag is cleared.	W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

FERRIE bit (Frequency Error Interrupt Request Enable)

The FERRIE bit enables or disables the frequency error interrupt request.

MENDIE bit (Measurement End Interrupt Request Enable)

The MENDIE bit enables or disables the measurement end interrupt request.

OVFIE bit (Overflow Interrupt Request Enable)

The OVFIE bit enables or disables the overflow interrupt request.

FERRFCL bit (FERRF Clear)

Setting the FERRFCL bit to 1 clears the CASTR.FERRF flag.

MENDFCL bit (MENDF Clear)

Setting the MENDFCL bit to 1 clears the CASTR.MENDF flag.

OVFFCL bit (OVFF Clear)

Setting the OVFFCL bit to 1 clears the CASTR.OVFF flag.

9.2.5 CASTR : CAC Status Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	OVFF	MENDF	FERRF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	FERRF	Frequency Error Flag 0: Clock frequency is within the allowable range 1: Clock frequency has deviated beyond the allowable range (frequency error).	R
1	MENDF	Measurement End Flag 0: Measurement is in progress 1: Measurement ended	R
2	OVFF	Overflow Flag 0: Counter has not overflowed 1: Counter overflowed	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

FERRF flag (Frequency Error Flag)

The FERRF flag indicates a deviation of the clock frequency from the set value (frequency error).

[Setting condition]

- The clock frequency is outside the allowable range defined in the CAULVR and CALLVR registers.

[Clearing condition]

- 1 is written to the FERRFCL bit.

MENDF flag (Measurement End Flag)

The MENDF flag indicates the end of measurement.

[Setting condition]

- Measurement ends.

[Clearing condition]

- 1 is written to the MENDFCL bit.

OVFF flag (Overflow Flag)

The OVFF flag indicates that the counter overflowed.

[Setting condition]

- The counter overflows.

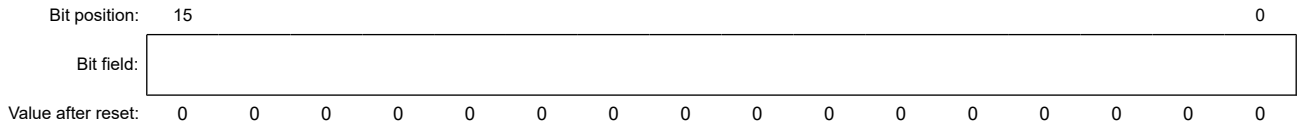
[Clearing condition]

- 1 is written to the CAICR.OVFFCL bit.

9.2.6 CAULVR : CAC Upper-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x06



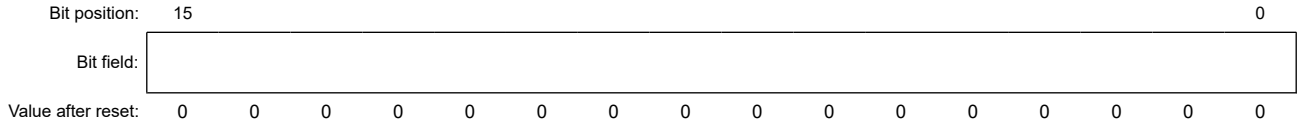
Bit	Symbol	Function	R/W
15:0	n/a	The Upper Value of the Allowable Range The CAULVR register is a 16-bit read/write register that specifies the upper value of the allowable range. When the counter value exceeds the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

9.2.7 CALLVR : CAC Lower-Limit Value Setting Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x08



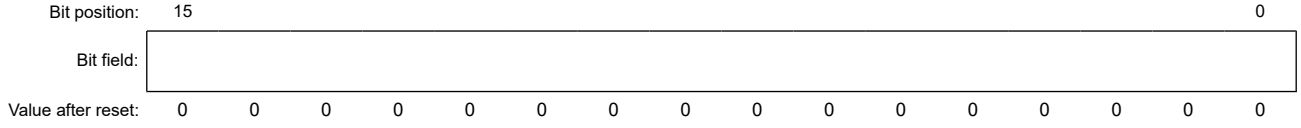
Bit	Symbol	Function	R/W
15:0	n/a	The Lower Value of the Allowable Range The CALLVR register is a 16-bit read/write register that specifies the lower value of the allowable range. When the counter value falls below the value specified in this register, a frequency error is detected. Write to this register when the CACR0.CFME bit is 0. The counter value stored in CACNTBR can vary depending on the difference between the phases of the digital filter and edge-detection circuit, and the signal on the CACREF pin. Ensure that this setting allows an adequate margin.	R/W

Note: S-TYPE3, P-TYPE3

9.2.8 CACNTBR : CAC Counter Buffer Register

Base address: CAC = 0x4020_2400
CAC_NS = 0x5020_2400

Offset address: 0x0A



Bit	Symbol	Function	R/W
15:0	n/a	The Measurement Result The CACNTBR register is a 16-bit read-only register that stores the measurement result.	R

Note: S-TYPE3, P-TYPE3

9.3 Operation

9.3.1 Measuring Clock Frequency

The CAC measures the clock frequency using the CACREF pin input or an internal clock as a reference. Figure 9.2 shows an operating example of the CAC.

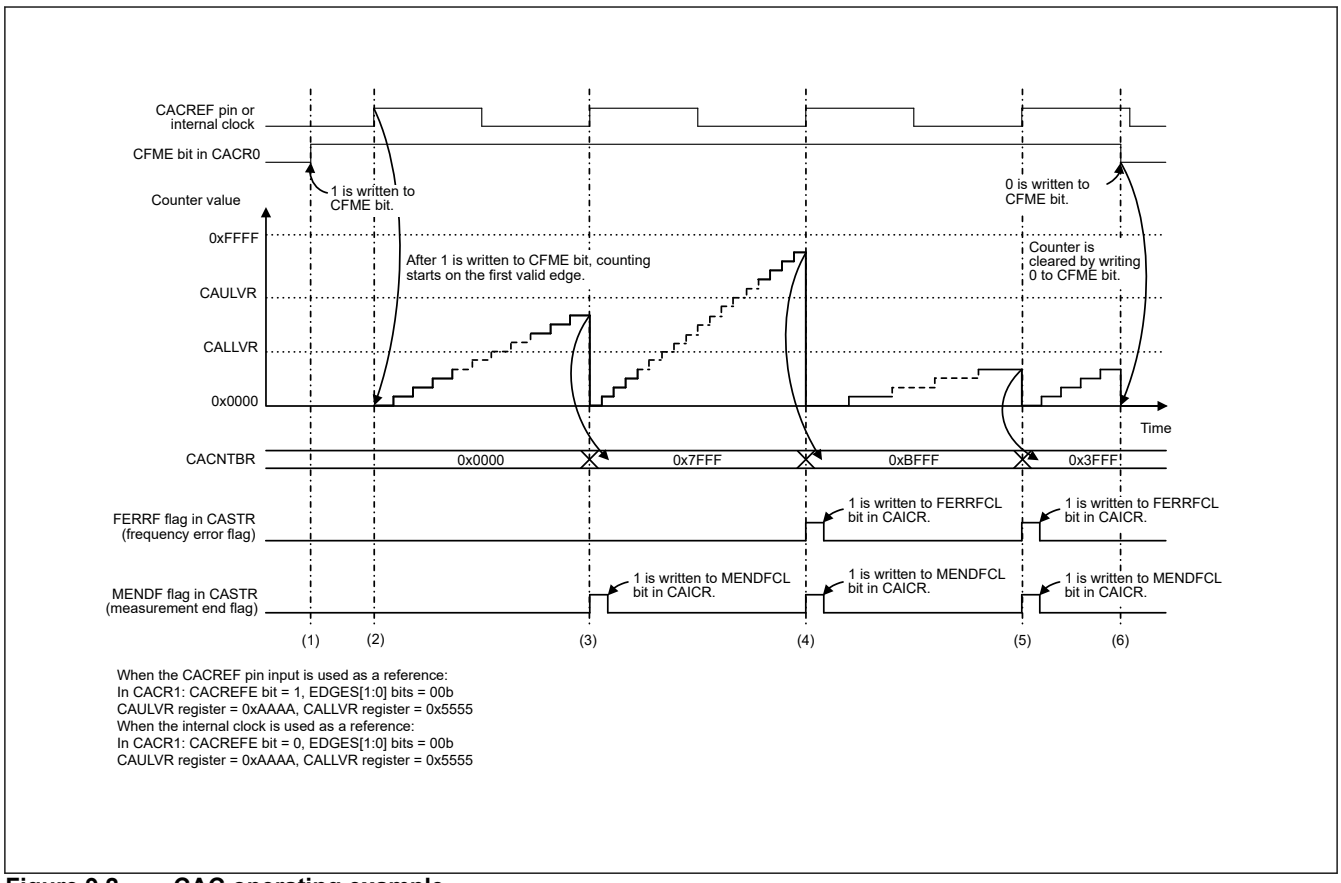


Figure 9.2 CAC operating example

The events in Figure 9.2 are:

1. When the CACREF pin input is used as reference (CACR1.CACREFE = 1), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 0 and the CACR1.CACREFE bit is set to 1. When the internal clock is used as reference (CACR1.CACREFE = 0), frequency measurement is enabled by writing 1 to the CACR0.CFME bit while the CACR2.RPS bit is set to 1.
2. When the CACREF pin input is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input from the CACREF pin. When the internal clock is used as reference, after 1 is written to the CFME bit, the timer starts up-counting if the valid edge selected by the CACR1.EDGES[1:0] bits (rising edge (CACR1.EDGES[1:0] = 00b) in Figure 9.2) is input based on the clock source selected by the CACR2.RSCS[2:0] bits.
3. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If both CACNTBR ≤ CAULVR and CACNTBR ≥ CALLVR are true, only the MENDF flag in CASTR is set to 1, because the clock frequency is correct. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
4. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR > CAULVR, the FERRF flag in CASTR is set to 1, because the clock frequency is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.
5. When the next valid edge is input, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR. If CACNTBR < CALLVR, the FERRF flag in CASTR is set to 1, because the clock frequency

is erroneous. If the FERRIE bit in CAICR is 1, a frequency error interrupt is generated. The MENDF flag in CASTR is set to 1 at the end of measurement. If the MENDIE bit in CAICR is 1, a measurement end interrupt is generated.

6. When the CFME bit in CACR0 is 1, the counter value is transferred to CACNTBR and compared with the values in CAULVR and CALLVR every time a valid edge is input. Writing 0 to the CFME bit in CACR0 clears the counter and stops up-counting.

9.3.2 Digital Filtering of Signals on CACREF Pin

The CACREF pin has a digital filter, and levels on the CACREF pin are transmitted to the internal circuitry after three consecutive matches in the selected sampling interval. The same level continues to be transmitted internally until the level on the pin has three consecutive matches again. Enabling or disabling of the digital filter and its sampling clock are selectable.

The counter value transferred to CACNTBR might be in error by up to 1 cycle of the sampling clock because of the difference between the phases of the digital filter and the signal input to the CACREF pin. When a frequency dividing clock is selected as a count source clock, the counter value error is obtained using the following formula:

$$\text{Counter value error} = (1 \text{ cycle of the count source clock}) / (1 \text{ cycle of the sampling clock})$$

9.4 Interrupt Requests

The CAC generates three types of interrupt requests:

- Frequency error interrupt
- Measurement end interrupt
- Overflow interrupt

When an interrupt source is generated, the associated status flag is set to 1. Table 9.3 provides information on the CAC interrupt requests.

Table 9.3 CAC interrupt requests

Interrupt request	Interrupt enable bit	Status flag	Interrupt sources
Frequency error interrupt	CAICR.FERRIE	CASTR.FERRF	The result of comparing CACNTBR with CAULVR and CALLVR is either CACNTBR > CAULVR or CACNTBR < CALLVR
Measurement end interrupt	CAICR.MENDIE	CASTR.MENDF	• Valid edge is input from the CACREF pin or internal clock • Measurement end interrupt does not occur at the first valid edge after writing 1 to the CACR0.CFME bit
Overflow interrupt	CAICR.OVFIE	CASTR.OVFF	Counter overflows

9.5 Usage Notes

9.5.1 Settings for the Module-Stop Function

The Module Stop Control Register C (MSTPCRC) can enable or disable CAC operation. The CAC module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

10. Low Power Modes

10.1 Overview

The MCU has several functions for reducing power consumption, such as setting clock dividers, EBCLK output control, SDCLK output control, stopping modules, power gating control, selecting operating power control mode in Normal mode, and transitioning to low power modes.

Table 10.1 lists the specifications of the low power mode functions. Table 10.2 to Table 10.4 lists the conditions to transition to low power modes, the states of the CPU and peripheral modules, and the method for canceling each mode. After a reset, the MCU enters the program execution state, but only the DMAC, DTC and SRAM operate.

Table 10.1 Specifications of the low power mode functions

Item	Specification
Reducing power consumption by switching clock signals	The frequency division ratio can be selected independently for the CPU clock (CPUCLK), system clock (ICLK), peripheral module clocks (PCLKA, PCLKB, PCLKC, PCLKD, PCLKE), external bus clock (BCLK), and flash interface clock (FCLK). *1
EBCLK output control	BCLK output or high-level output can be selected.*1
SDCLK output control	SDCLK output or high-level output can be selected.
Module stop	Functions can be stopped independently for each peripheral module
Power gating control	This function can be controlled the power state of the power domain. • Control the turning On/OFF for the power domain • Control the retention of specific circuits during power gating
Processor low power modes	• CPU Sleep mode • CPU Deep Sleep mode
Low-power modes	• Software Standby mode*2 • Deep Software Standby mode 1, 2, 3*2
Operating power control modes	• Power consumption can be reduced in Normal and Processor low power mode by selecting an appropriate operating power control mode according to the operating frequency. • Two operating power control modes are available: High-speed mode Low-speed mode*2
TrustZone Filter	Security and Privilege attribution can be set

Note 1. For details, see section 8, Clock Generation Circuit
Note 2. This mode is not supported in external VDD mode.

Table 10.2 Operating state of processor low power mode

Item	CPU Sleep mode	CPU Deep Sleep mode
Transition condition	WFI instruction after set CPU0.SCR. SLEEPDEEP = 0.	WFI instruction after set CPU0.SCR. SLEEPDEEP = 1
Canceling method	All interrupts. Any reset available in the mode.	Interrupts shown in Table 10.4 Any reset available in the mode.
State after cancellation by an interrupt	Program execution state (interrupt processing)	Program execution state (interrupt processing)
State after cancellation by a reset	Reset state	Reset state
CPU	Stop (Retained)	Stop (Retained)
DMA Controller (DMAC)	Selectable	Selectable
Data Transfer Controller (DTC)	Selectable	Selectable
Watchdog Timer (WDT)	Selectable*1	Selectable*1
Independent Watchdog Timer (IWDT)	Selectable*1	Selectable*1
ARM Debug function	Stop*2	Stop*2
Trace function	Stop*3	Stop*3
Other peripheral modules	—	—

Note: Selectable means that operating or not operating can be selected by setting the control registers before entering Processor Low Power Mode.
Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.

Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.
" — " means that the operation is not affected.

Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode.
In WDT, operating or stopping is selected by setting the WDT Stop Control bit (WDTSTPCTL) in Option Function Select Register 0 (OFS0) in WDT auto start mode. Also, operating or stopping is selected by setting the WDT.WDTCSTPR.SLCSTP bit in WDT register start mode.

Note 2. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDCR.DBGEN = 1) before entering this mode.

Note 3. This function is operating if debugger is connecting (DBGSTR.CDBGPWRUPREQ = 1 and SYOCDCR.DBGEN = 1) and TRCKCR.TRCKEN = 1 before entering this mode.

Table 10.3 Operating state of each low power mode (1 of 2)

Item	Software Standby Mode(SSTBY)	Deep Software Standby mode(DSTBY)		
	SSTBY	DSTBY1	DSTBY2	DSTBY3
Transition condition	WFI instruction after set LPSCR and CPU0.SCR.SLEEPDEEP=1	WFI instruction after set LPSCR and CPU0.SCR.SLEEPDEEP=1.

Capture Engine Unit(CEU)	Stop (Undefined)	Stop (Undefined)		
2D Drawing Engine (DRW)	Stop (Undefined)	Stop (Undefined)		
Graphics LCD Controller (GLCDC)	Stop (Undefined)	Stop (Undefined)		
MIPI DSI	Stop (Undefined)	Stop (Undefined)		
Temperature Sensor (TSN)	Stop (Undefined)	Stop (Undefined)		
High-Speed Analog Comparator 0 (ACMPHS0)	Selectable	Stop (Undefined)		
High-Speed Analog Comparator 1 (ACMPHS1)	Selectable *20	Stop (Undefined)		
IRQn (n = 0 to 15) pin interrupt	Selectable	Stop (Undefined)		
NMI, IRQn-DS (n = 0 to 15) pin interrupt	Selectable	Selectable		
Programable Voltage Detect (PVD)	Selectable	Selectable*18	Selectable*18	Stop (Undefined)*7
VBATT_R voltage drop detection	Selectable	Selectable	Selectable	Stop (Undefined)
Power-on reset circuit	Operating	Operating	Operating	Operating*8
I/O Ports	Retained*9	Retained*9		

Note: Selectable means that operating or not operating can be selected by setting the control registers before low power mode.

Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off. After canceling from each low power mode, the internal registers are initialized.

Note 1. In IWDT, operating or stopping is selected by setting the IWDT Stop Control bit (IWDTSTPCTL) in Option Function Select register 0 (OFS0) in IWDT auto start mode. Also, operating or stopping is selected by setting the IWDT.IWDTCSTPR.SLCSTP bit in IWDT register start mode.

Note 2. If IWDT is not used and LOCOCR.LCSTP = 0, LOCO is not stopped in Software Standby mode or Deep Software Standby mode 1.
If IWDT is used and IWDT Stop Control bit is 0 (OFS.IWDTSTPCTL = 0 or IWDT.IWDTCSTPR.SLCSTP = 0), LOCO is not stopped regardless the value of LOCOCR.LCSTP in Software Standby mode or Deep Software Standby mode 1.
If IWDT is used and IWDT Stop Control bit is 1 (OFS.IWDTSTPCTL = 1 or IWDT.IWDTCSTPR.SLCSTP = 1), LOCO is not stopped with LOCOCR.LCSTP = 0 in Software Standby mode or Deep Software Standby mode 1.
In other cases, LOCO is stopped in Software Standby mode or Deep Software Standby mode 1.

Note 3. Stopped when the clock output source select bits (CKOCR.CKOSEL[2:0]) are set to a value other than 010b (LOCO) and 100b (SOSC).

Note 4. Only sub clock oscillator can be selected as the count source clock for RTC. When the RCR4.RCKSEL bit set to 1 (LOCO), the LPSCR must set to Deep Software Standby mode 1 before entering Deep Software Standby mode.

Note 5. AGT0 operation is possible when 100b (AGTLCLK) or 110b (AGTSCLK) is selected by the AGT0.AGTMR1.TCK[2:0] bits.
AGT1 operation is possible when 100b (AGTLCLK), 110b (AGTSCLK) or 101b (Underflow event signal from AGT0) is selected by the AGT1.AGTMR1.TCK[2:0] bits.

Note 6. Only IIC0 wakeup function is available.

Note 7. When using PVD in Deep Software Standby mode, LPSCR must be set to DSTBY1 or DSTBY2 before entering Deep Software Standby mode.

Note 8. When the MCU enters Deep Software Standby mode 3, the PVD circuit stops and the low-power function of the power-on reset circuit is enabled.

Note 9. For the address bus and bus control signals (For SRAM : [CS0 to CS7, RD, WR0 to WR3, WR, BC0 to BC3 and ALE], and for SDRAM: [SDCS, RAS, CAS and WE]), keeping the output state or changing to the high-impedance state can be selected by SBYCR.OPE bit.

Note 10. When MOSCSCR.MOSCSOKP = 1 while MOSC is oscillated, MOSC continues to oscillate in Software Standby mode.

Note 11. When HOCOSCR.HOCOSOKP = 1 while HOCO is oscillated, HOCO continues to oscillate in Software Standby mode.

Note 12. The function is depending on the setting value of the MOSCSCR.MOSCSOKP bit.

Note 13. If PDRAMSCR0.RKEEPn bit is set to 0, the contents of the target User SRAM is not retained.

Note 14. If DPSBYCR.SRKEEP bit is set to 0, the contents of Standby RAM is not retained.

Note 15. If PDRAMSCR1.RKEEPn bit is set to 0, the contents of the target TCM is not retained.

Note 16. This function is operating if debugger is connecting before entering this mode.

Note 17. This function is operating if debugger is connecting and TRCKCR.TRCKEN = 1 before entering this mode.

Note 18. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, low power consumption function of PVD0 is enabled during DSTBY1 and DSTBY2. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 1, low power consumption function of PVD0 is disabled during DSTBY1 and DSTBY2. See section 60, Electrical Characteristics.

Note 19. When the on-chip debugger function is valid, MOCO does not stop in this mode.

Note 20. Only VCOUT function is permitted. The VCOUT pin operates when ACMPHS uses no digital filter. For details on digital filter, see section 48, High-Speed Analog Comparator (ACMPHS).

Note 21. Only I3C wakeup function is available.

Table 10.4 Interrupt source for canceling CPU Deep Sleep, Software Standby and Deep Software Standby modes (1 of 2)

Interrupt source	Name	CPU Deep Sleep Mode	Software Standby Mode	Deep Software Standby mode		
				DSTBY1	DSTBY2	DSTBY3
NMI		Yes	Yes	Yes	Yes	Yes
Port	PORT_IRQn (n = 0 to 15)	Yes	Yes	No	No	No
	PORT_IRQn-DS (n = 0 to 15)	Yes	Yes	Yes	Yes	Yes
PVD	PVD_PVDm (m = 1, 2)	Yes	Yes	Yes	Yes	No

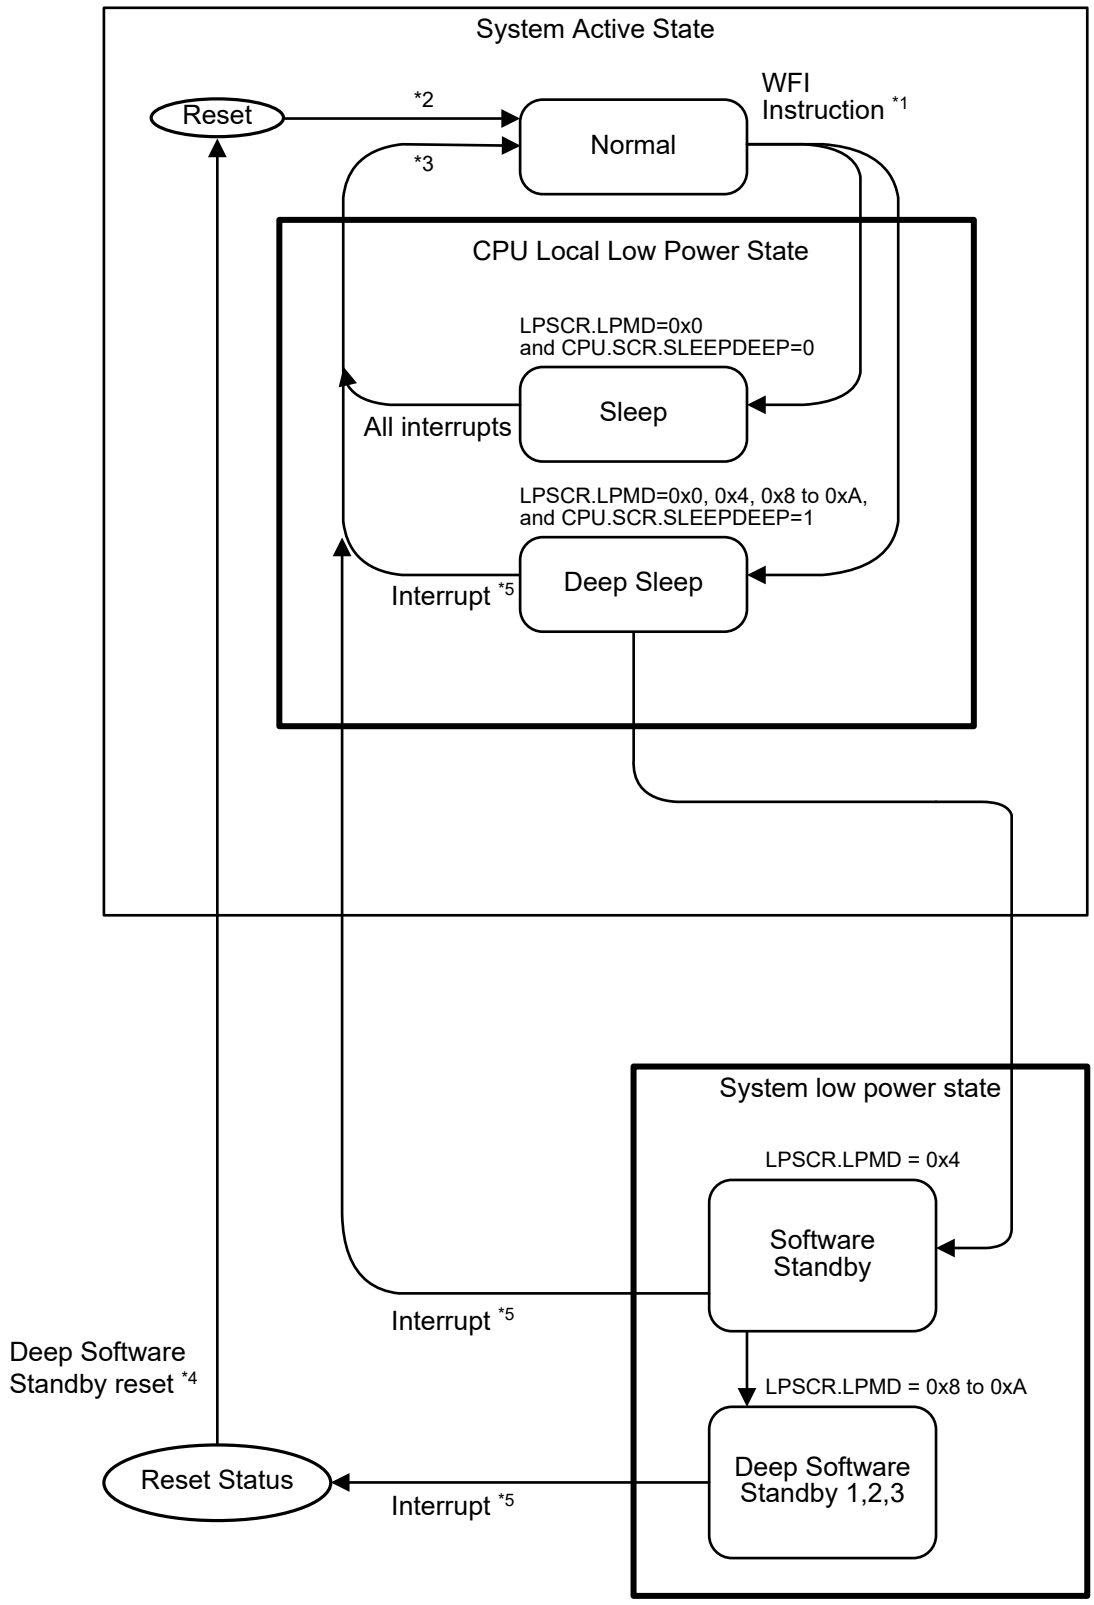
I3C	I3C_WU	Yes	Yes	No	No	No
BBF (Battery Backup Function)	VBATT_TADI	Yes	Yes	Yes	Yes	Yes



Note 1. When an interrupt as a trigger for cancel is received during a transition to the program-stopped state after the execution of a WFI instruction, the MCU executes interrupt exception handling instead of transitioning to low power mode. When entering to Deep Software Standby mode, if an interrupt occurs after the state has transitioned, after mode transition is completed, returning with Deep Software Standby reset.

Note 2. The MOCO clock is the source of the operating clock following a transition from the reset state to Normal mode.
Note 3. When the transition to Normal mode is done because of an interrupt from CPU Sleep mode, CPU Deep Sleep mode or Software Standby mode, the clock source is the same as before entering the each low power modes.
Note 4. When an available interrupt request is generated, an internal reset (Deep Software Standby reset) is generated over a fixed period. Canceling of Deep Software Standby mode accompanies release from the internal reset state, and then the MCU transitions to Normal mode and executes reset exception processing with the MOCO clock as the source of the operating clock.
Note 5. For interrupt sources for canceling each low power modes, see Table 10.4

Figure 10.1 Mode Transitions

10.2 Register Descriptions

10.2.1 LPMSAR : Low Power Mode Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3C8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	NONSEC21	—	NONSEC19	NONSEC18	NONSEC17	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	NONSEC8	—	—	—	—	—	NONSEC2	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non-secure Attribute bit 0 Target register: OPCCR 0: Secure 1: Non-secure	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: LPSCR, DPSWCR 0: Secure 1: Non-secure	R/W
2	NONSEC2	Non-secure Attribute bit 2 Target register: SBYCR, SSCR1 0: Secure 1: Non-secure	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	NONSEC8	Non-secure Attribute bit 8 Target register: DPSBYCR 0: Secure 1: Non-secure	R/W
16:9	—	These bits are read as 0. The write value should be 0.	R/W
17	NONSEC17	Non-secure Attribute bit 17 Target register: HOCOLDOCR 0: Secure 1: Non-secure	R/W
18	NONSEC18	Non-secure Attribute bit 18 Target register: PLL1LDOCR 0: Secure 1: Non-secure	R/W
19	NONSEC19	Non-secure Attribute bit 19 Target register: PLL2LDOCR 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
20	—	This bit is read as 0. The write value should be 0.	R/W
21	NONSEC21	Non-secure Attribute bit 21 Target register: LVOCR 0: Secure 1: Non-secure	R/W
31:22	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The LPMSAR register controls the secure attribute of Low Power Mode registers.

NONSEC0 bit (Non-secure Attribute bit 0)

This bit controls the security attribute of OPCCR.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of LPSCR, DPSECR.

NONSEC2 bit (Non-secure Attribute bit 2)

This bit controls the security attribute of SBYCR, SSCR1.

NONSEC8 bit (Non-secure Attribute bit 8)

This bit controls the security attribute of DPSBYCR.

NONSEC17 bit (Non-secure Attribute bit 17)

This bit controls the security attribute of HOCOLDOCR.

NONSEC18 bit (Non-secure Attribute bit 18)

This bit controls the security attribute of PLL1LDOCR.

NONSEC19 bit (Non-secure Attribute bit 19)

This bit controls the security attribute of PLL2LDOCR.

NONSEC21 bit (Non-secure Attribute bit 21)

This bit controls the security attribute of LVOCR.

10.2.2 PGCSAR : Power Gating Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D8

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	NONSEC1	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
1	NONSEC1	Non-secure Attribute bit 1 Target register: PDCTRGD 0: Secure 1: Non-secure	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The PGCSAR register controls the secure attribute of power gating registers.

NONSEC1 bit (Non-secure Attribute bit 1)

This bit controls the security attribute of PDCTRGD.

10.2.3 DPFSAR : Deep Software Standby Interrupt Factor Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DPFSA31	—	DPFSA29	—	DPFSA27	DPFSA26	DPFSA25	DPFSA24	—	—	—	DPFSA20	DPFSA19	DPFSA18	DPFSA17	DPFSA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DPFSA15	DPFSA14	DPFSA13	DPFSA12	DPFSA11	DPFSA10	DPFSA9	DPFSA8	DPFSA7	DPFSA6	DPFSA5	DPFSA4	DPFSA3	DPFSA2	DPFSA1	DPFSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DPFSA7 to DPFSA0	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7) Target register: DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 0 to 7) 0: Secure 1: Non-secure	R/W
15:8	DPFSA15 to DPFSA8	Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15) Target register: DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) Target factor : IRQn-DS Pin (n = 8 to 15) 0: Secure 1: Non-secure	R/W
16	DPFSA16	Deep Software Standby Interrupt Factor Security Attribute bit 16 Target register: DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 Target factor : PVD1 0: Secure 1: Non-secure	R/W
17	DPFSA17	Deep Software Standby Interrupt Factor Security Attribute bit 17 Target register: DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1 Target factor : PVD2 0: Secure 1: Non-secure	R/W
18	DPFSA18	Deep Software Standby Interrupt Factor Security Attribute bit 18 Target register: DPSIER2.b2, DPSIFR2.b2 Target factor : RTC Interval 0: Secure 1: Non-secure	R/W

Bit	Symbol	Function	R/W
19	DPFSA19	Deep Software Standby Interrupt Factor Security Attribute bit 19 Target register: DPSIER2.b3, DPSIFR2.b3 Target factor : RTC Alarm 0: Secure 1: Non-secure	R/W
20	DPFSA20	Deep Software Standby Interrupt Factor Security Attribute bit 20 Target register: DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4 Target factor : NMI Pin 0: Secure 1: Non-secure	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
24	DPFSA24	Deep Software Standby Interrupt Factor Security Attribute bit 24 Target register: DPSIER3.b0, DPSIFR3.b0 Target factor : USBFS Suspend/Resume 0: Secure 1: Non-secure	R/W
25	DPFSA25	Deep Software Standby Interrupt Factor Security Attribute bit 25 Target register: DPSIER3.b1, DPSIFR3.b1 Target factor : USBHS Suspend/Resume 0: Secure 1: Non-secure	R/W
26	DPFSA26	Deep Software Standby Interrupt Factor Security Attribute bit 26 Target register: DPSIER3.b2, DPSIFR3.b2 Target factor : ULPT0 0: Secure 1: Non-secure	R/W
27	DPFSA27	Deep Software Standby Interrupt Factor Security Attribute bit 27 Target register: DPSIER3.b3, DPSIFR3.b3 Target factor : ULPT1 0: Secure 1: Non-secure	R/W
28	—	This bit is read as 0. The write value should be 0.	R/W
29	DPFSA29	Deep Software Standby Interrupt Factor Security Attribute bit 29 Target register: DPSIER3.b5, DPSIFR3.b5 Target factor : IWDT Underflow 0: Secure 1: Non-secure	R/W
30	—	This bit is read as 0. The write value should be 0.	R/W
31	DPFSA31	Deep Software Standby Interrupt Factor Security Attribute bit 31 Target register: DPSIER3.b7, DPSIFR3.b7 Target factor : Tamper Detection 0: Secure 1: Non-secure	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The DPFSAR register controls the secure attribute of Deep Software Standby Interrupt Factor control registers.

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 0 to 7))

This bit controls the security attribute of DPSIER0.bn, DPSIFR0.bn, DPSIEGR0.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 0 to 7).

DPFSA bit (Deep Software Standby Interrupt Factor Security Attribute bit n (n = 8 to 15))

This bit controls the security attribute of DPSIER1.bn, DPSIFR1.bn, DPSIEGR1.bn (n = 0 to 7) .

Target factor is IRQn-DS Pin (n = 8 to 15).

DPFSA16 bit (Deep Software Standby Interrupt Factor Security Attribute bit 16)

This bit controls the security attribute of DPSIER2.b0, DPSIFR2.b0, DPSIEGR2.b0 .

Target factor is PVD1.

DPFSA17 bit (Deep Software Standby Interrupt Factor Security Attribute bit 17)

This bit controls the security attribute of DPSIER2.b1, DPSIFR2.b1, DPSIEGR2.b1.

Target factor is PVD2.

DPFSA18 bit (Deep Software Standby Interrupt Factor Security Attribute bit 18)

This bit controls the security attribute of DPSIER2.b2, DPSIFR2.b2.

Target factor is RTC Interval.

DPFSA19 bit (Deep Software Standby Interrupt Factor Security Attribute bit 19)

This bit controls the security attribute of DPSIER2.b3, DPSIFR2.b3.

Target factor is RTC Alarm.

DPFSA20 bit (Deep Software Standby Interrupt Factor Security Attribute bit 20)

This bit controls the security attribute of DPSIER2.b4, DPSIFR2.b4, DPSIEGR2.b4.

Target factor is NMI Pin.

DPFSA24 bit (Deep Software Standby Interrupt Factor Security Attribute bit 24)

This bit controls the security attribute of DPSIER3.b0, DPSIFR3.b0.

Target factor is USBFS Suspend/Resume.

DPFSA25 bit (Deep Software Standby Interrupt Factor Security Attribute bit 25)

This bit controls the security attribute of DPSIER3.b1, DPSIFR3.b1.

Target factor is USBHS Suspend/Resume.

DPFSA26 bit (Deep Software Standby Interrupt Factor Security Attribute bit 26)

This bit controls the security attribute of DPSIER3.b2, DPSIFR3.b2.

Target factor is ULPT0.

DPFSA27 bit (Deep Software Standby Interrupt Factor Security Attribute bit 27)

This bit controls the security attribute of DPSIER3.b3, DPSIFR3.b3.

Target factor is ULPT1.

DPFSA29 bit (Deep Software Standby Interrupt Factor Security Attribute bit 29)

This bit controls the security attribute of DPSIER3.b5, DPSIFR3.b5.

Target factor is IWDT Underflow.

DPFSA31 bit (Deep Software Standby Interrupt Factor Security Attribute bit 31)

This bit controls the security attribute of DPSIER3.b7, DPSIFR3.b7.

Target factor is Tamper Detection.

10.2.4 RSCSAR : RAM Standby Control Security Attribution Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3E4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RSCSA17	RSCSA16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	RSCSA14	RSCSA13	RSCSA12	RSCSA11	RSCSA10	RSCSA9	RSCSA8	RSCSA7	RSCSA6	RSCSA5	RSCSA4	RSCSA3	RSCSA2	RSCSA1	RSCSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	RSCSA14 to RSCSA0	RAM Standby Control Security Attribute bit n (n = 0 to 14) Target register: PDRAMSCR0.bn (n = 0 to 14) 0: Secure 1: Non-secure	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W
17:16	RSCSA17 to RSCSA16	RAM Standby Control Security Attribute bit n (n = 16 to 17) Target register: PDRAMSCR1.bn (n = 0 to 1) 0: Secure 1: Non-secure	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Set the PRCR.PRC4 bit to 1 (write enabled) before rewriting this register.

The RSCSAR register controls the secure attribute of RAM Standby Control registers.

RSCSAn (n = 0 to 14) bit (RAM Standby Control Security Attribute bit n)

This bit controls the security attribute of PDRAMSCR0.bn (n = 0 to 14).

RSCSAn (n = 16 to 17) bit (RAM Standby Control Security Attribute bit n)

This bit controls the security attribute of PDRAMSCR1.bn (n = 0 to 1).

10.2.5 MSTPCRA : Module Stop Control Register A

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x000

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	MSTPA22	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	0	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSTPA15	—	—	—	—	—	—	—	—	—	—	—	—	—	MSTPA1	MSTPA0
Value after reset:	0	1	1	1	1	1	1	1	1	1	1	1	1	1	0	0

Bit	Symbol	Function	R/W
0	MSTPA0	SRAM0 Module Stop*2 Target module: SRAM0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPA1	SRAM1 Module Stop*2 Target module: SRAM1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14:2	—	These bits are read as 1. The write value should be 1.	R/W
15	MSTPA15	Standby SRAM Module Stop Target module: Standby SRAM 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:16	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPA22	DMA Controller and Data Transfer Controller Module Stop*1 Target module: DMAC, DTC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:23	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-4, P-TYPE-2
Note 1. When rewriting the MSTPA22 bit from 0 to 1, disable the DMAC and DTC before setting the MSTPA22 bit.
Note 2. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.

10.2.6 MSTPCRB : Module Stop Control Register B

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x004

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTPB31	MSTPB30	MSTPB29	MSTPB28	MSTPB27	—	—	—	—	MSTPB22	—	—	MSTPB19	MSTPB18	—	MSTPB16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSTPB15	—	—	MSTPB12	MSTPB11	—	MSTPB9	MSTPB8	—	—	—	MSTPB4	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 1. The write value should be 1.	R/W
4	MSTPB4	I3C Bus Interface Module Stop*1 Target module: I3C 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
7:5	—	These bits are read as 1. The write value should be 1.	R/W
8	MSTPB8	I2C Bus Interface 1 Module Stop Target module: IIC1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	MSTPB9	I2C Bus Interface 0 Module Stop Target module: IIC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
10	—	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
11	MSTPB11	Universal Serial Bus 2.0 FS Interface Module Stop*2 Target module: USBFS 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12	MSTPB12	Universal Serial Bus 2.0 HS Interface Module Stop*2 Target module: USBHS 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14:13	—	These bits are read as 1. The write value should be 1.	R/W
15	MSTPB15	ETHERC0 and EDMAC0 Controller Module Stop Target module: ETHERC0 and EDMAC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
16	MSTPB16	Octal Serial Peripheral Interface and Decryption On The Fly Module Stop*3 Target module: OSPI and DOTF 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
17	—	This bit is read as 1. The write value should be 1.	R/W
18	MSTPB18	Serial Peripheral Interface 1 Module Stop*4 Target module: SPI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
19	MSTPB19	Serial Peripheral Interface 0 Module Stop*4 Target module: SPI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21:20	—	These bits are read as 1. The write value should be 1.	R/W
22	MSTPB22	Serial Communication Interface 9 Module Stop*5 Target module: SCI9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26:23	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPB27	Serial Communication Interface 4 Module Stop*5 Target module: SCI4 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPB28	Serial Communication Interface 3 Module Stop*5 Target module: SCI3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPB29	Serial Communication Interface 2 Module Stop*5 Target module: SCI2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPB30	Serial Communication Interface 1 Module Stop*5 Target module: SCI1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPB31	Serial Communication Interface 0 Module Stop*5 Target module: SCI0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two I3C clock (I3CCLK) cycles after writing, and then execute a WFI instruction (i = 4).

Note 2. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two USB clock (USBCLK) cycles after writing, and then execute a WFI instruction (i = 11 to 12).
Note 3. The MSTPB16 bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPB16 bit, wait for two Octal-SPI clock (OCTACLK) cycles after writing, and then execute a WFI instruction. When changing the value of this bit, only execute subsequent instructions after reading this bit to check that the value was updated.
Note 4. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two SPI clock (SPICLK) cycles after writing, and then execute a WFI instruction (i = 18 to 19).
Note 5. The MSTPBi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPBi bit, wait for two SCI clock (SCICLK) cycles after writing, and then execute a WFI instruction (i = 22, 27 to 31).

10.2.7 MSTPCRC : Module Stop Control Register C

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x008

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTPC31	—	—	—	MSTPC27	MSTPC26	—	—	—	—	—	—	—	—	—	MSTPC16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MSTPC14	MSTPC13	MSTPC12	MSTPC11	MSTPC10	—	MSTPC8	MSTPC7	MSTPC6	—	MSTPC4	—	—	MSTPC1	MSTPC0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	MSTPC0	Clock Frequency Accuracy Measurement Circuit Module Stop[*1] Target module: CAC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
1	MSTPC1	Cyclic Redundancy Check Calculator Module Stop Target module: CRC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
3:2	—	These bits are read as 1. The write value should be 1.	R/W
4	MSTPC4	Graphics LCD Controller Module Stop[*2] Target module: GLCDC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
5	—	This bit is read as 1. The write value should be 1.	R/W
6	MSTPC6	2D Drawing Engine Module Stop Target module: DRW 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
7	MSTPC7	Serial Sound Interface Enhanced 1 Module Stop Target module: SSIE1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
8	MSTPC8	Serial Sound Interface Enhanced 0 Module Stop Target module: SSIE0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	—	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
10	MSTPC10	MIPI Display Serial Interface Module Stop Target module: MIPI DSI 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
11	MSTPC11	Secure Digital Host IF / Multi Media Card 1 Module Stop Target module: SDHI/MMC1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12	MSTPC12	Secure Digital Host IF / Multi Media Card 0 Module Stop Target module: SDHI/MMC0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
13	MSTPC13	Data Operation Circuit Module Stop Target module: DOC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14	MSTPC14	Event Link Controller Module Stop Target module: ELC 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
15	—	This bit is read as 1. The write value should be 1.	R/W
16	MSTPC16	Capture Engine Unit Module Stop Target module: CEU 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
25:17	—	These bits are read as 1. The write value should be 1.	R/W
26	MSTPC26	Controller Area Network with Flexible Data-Rate 1 Module Stop*3 Target module: CANFD1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
27	MSTPC27	Controller Area Network with Flexible Data-Rate 0 Module Stop*3 Target module: CANFD0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30:28	—	These bits are read as 1. The write value should be 1.	R/W
31	MSTPC31	Renesas Secure IP Module Stop Target module: RSIP-E51A 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. The MSTPC0 bit must be written while the oscillation of the clock to be controlled by this bit is stable. To enter Software Standby mode after writing this bit, wait for 2 cycles of the slowest clock from the clocks output by the oscillators, then execute a WFI instruction.

Note 2. The MSTPC4 bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPC4 bit, wait for two GLCDC clock (GLCDCCLK) cycles after writing, and then execute a WFI instruction.

Note 3. The MSTPCi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPCi bit, wait for two CANFD clock (CANFDCLK) cycles after writing, and then execute a WFI instruction(i = 26 to 27)

10.2.8 MSTPCRD : Module Stop Control Register D

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x00C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	MSTPD28	MSTPD27	—	—	—	—	MSTPD22	—	MSTPD20	—	—	—	MSTPD16
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSTPD15	MSTPD14	MSTPD13	MSTPD12	MSTPD11	—	—	—	—	—	MSTPD5	MSTPD4	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 1. The write value should be 1.	R/W
4	MSTPD4	Low Power Asynchronous General Purpose Timer 1 Module Stop*1 Target module: AGT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
5	MSTPD5	Low Power Asynchronous General Purpose Timer 0 Module Stop*1 Target module: AGT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
10:6	—	These bits are read as 1. The write value should be 1.	R/W
11	MSTPD11	Port Output Enable for GPT Group D Module Stop Target module: POEG Group D 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
12	MSTPD12	Port Output Enable for GPT Group C Module Stop Target module: POEG Group C 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
13	MSTPD13	Port Output Enable for GPT Group B Module Stop Target module: POEG Group B 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
14	MSTPD14	Port Output Enable for GPT Group A Module Stop Target module: POEG Group A 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
15	MSTPD15	12-bit A/D Converter 1 Module Stop Target module: ADC12_1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
16	MSTPD16	12-bit A/D Converter 0 Module Stop Target module: ADC12_0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
19:17	—	These bits are read as 1. The write value should be 1.	R/W
20	MSTPD20	12-bit D/A Converter Module Stop Target module: DAC12 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21	—	This bit is read as 1. The write value should be 1.	R/W

Bit	Symbol	Function	R/W
22	MSTPD22	Temperature Sensor Module Stop Target module: TSN 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26:23	—	These bits are read as 1. The write value should be 1.	R/W
27	MSTPD27	High-Speed Analog Comparator 1 Module Stop Target module: ACMPHS1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPD28	High-Speed Analog Comparator 0 Module Stop Target module: ACMPHS0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31:29	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. When the count source is sub-clock oscillator or LOCO, AGTn counting does not stop even if MSTPDi is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the AGTn registers. (n =0,1) (i = 4, 5)

10.2.9 MSTPCRE : Module Stop Control Register E

Base address: MSTP = 0x4020_3000
MSTP_NS = 0x5020_3000

Offset address: 0x010

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSTPE31	MSTPE30	MSTPE29	MSTPE28	MSTPE27	MSTPE26	MSTPE25	MSTPE24	MSTPE23	MSTPE22	MSTPE21	MSTPE20	MSTPE19	MSTPE18	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MSTPE8	MSTPE8	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	—	These bits are read as 1. The write value should be 1.	R/W
8	MSTPE8	Ultra-Low Power Timer 1 Module Stop*1 Target module: ULPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
9	MSTPE9	Ultra-Low Power Timer 0 Module Stop*1 Target module: ULPT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
17:10	—	These bits are read as 1. The write value should be 1.	R/W
18	MSTPE18	General PWM Timer 13 Module*2 Target module: GPT13 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
19	MSTPE19	General PWM Timer 12 Module*2 Target module: GPT12 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Bit	Symbol	Function	R/W
20	MSTPE20	General PWM Timer 11 Module*2 Target module: GPT11 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
21	MSTPE21	General PWM Timer 10 Module*2 Target module: GPT10 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
22	MSTPE22	General PWM Timer 9 Module*2 Target module: GPT9 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
23	MSTPE23	General PWM Timer 8 Module*2 Target module: GPT8 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
24	MSTPE24	General PWM Timer 7 Module*2 Target module: GPT7 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
25	MSTPE25	General PWM Timer 6 Module*2 Target module: GPT6 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
26	MSTPE26	General PWM Timer 5 Module*2 Target module: GPT5 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
27	MSTPE27	General PWM Timer 4 Module*2 Target module: GPT4 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
28	MSTPE28	General PWM Timer 3 Module*2 Target module: GPT3 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
29	MSTPE29	General PWM Timer 2 Module*2 Target module: GPT2 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
30	MSTPE30	General PWM Timer 1 Module*2 Target module: GPT1 0: Cancel the module-stop state 1: Enter the module-stop state	R/W
31	MSTPE31	General PWM Timer 0 Module*2 Target module: GPT0 0: Cancel the module-stop state 1: Enter the module-stop state	R/W

Note: S-TYPE-4, P-TYPE-4

Note 1. When the count source is sub-clock oscillator or LOCO, ULPTn counting does not stop even if MSTPEi is set to 1. If the count source is the sub-clock oscillator or LOCO, this bit must be set to 1 except when accessing the ULPTn registers. (n = 1, 0) (i = 8, 9)

Note 2. The MSTPEi bit must be written while the oscillation of the clock controlled by this bit is stabilized. For entering Software Standby mode after writing the MSTPEi bit, wait for two GPT clock (GPTCLK) cycles after writing, and then execute a WFI instruction (i = 18 to 31).

10.2.10 SBYCR : Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x00C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	OPE	—	—	—	—	—	—
Value after reset:	0	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
6	OPE	Output Port Enable 0: In Software Standby mode or Deep Software Standby mode, set the address bus and other bus control signal to the high-impedance state. 1: In Software Standby mode or Deep Software Standby mode, address bus and other bus control signal retain the output state.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The SBYCR register controls the bus signal output in Software Standby mode and Deep Software Standby mode.

OPE bit (Output Port Enable)

The OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals. For SRAM : [(CS0 to CS7, RD, WR0 to WR3, WR, BC0 to BC3, and ALE) in Software Standby mode or Deep Software Standby mode.

10.2.11 OPCCR : Operating Power Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x0A0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	OPCMTSF	—	—	OPCM[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	OPCM[1:0]	Operating Power Control Mode Select 0 0: High-speed mode 0 1: Setting prohibited 1 0: Setting prohibited 1 1: Low-speed mode	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	OPCMTSF	Operating Power Control Mode Transition Status Flag 0: Transition completed 1: During transition	R
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The OPCCR register is used to reduce power consumption in Normal and Processor low power mode by specifying a lower operating frequency. For the procedure to change the operating power control modes, see section 10.5. Function for Lower Operating Power Consumption.

When transitioning from Software Standby mode to Normal mode, the setting in the OPCCR.OPCM[1:0] bits are as follows, regardless of the setting before entering Software Standby mode:

- OPCCR.OPCM[1:0] = 00b (High-speed mode)

If Software Standby mode is canceled by interrupt before the transition to Software Standby completes, the OPCCR.OPCM[1:0] bits retain the setting from before the WFI instruction is executed. If this causes any problem, set the MCU to High-speed mode during the exception handling procedure when canceling Software Standby mode.

OPCM[1:0] bits (Operating Power Control Mode Select)

The OPCM[1:0] bits select the operating power control mode in Normal and Processor low power mode. Table 10.5 shows the relationship between the operating power control modes and the OPCM[1:0] settings.

OPCMTSF flag (Operating Power Control Mode Transition Status Flag)

The OPCMTSF flag indicates the switching control state when the operating power control mode is switched. This flag becomes 1 when the OPCM bit is written, and 0 when mode transition completes. Read this flag and confirm that it is 0 before proceeding.

Table 10.5 The operating power control modes

Operating power control mode	OPCM[1:0] bits	Power consumption
High-speed mode	00b	High
Low-speed mode	11b	Low

Operating frequency range and voltage range are shown in Electrical characteristics.

Each operating power control mode is described below.

- High-speed mode
  After a reset cancellation, the MCU is activated in this mode.
- Low-speed mode
  The following restrictions apply in Low-speed mode:
  - P/E operations for flash memory are prohibited.
  - Using the PLL1/PLL2 is prohibited. See section 10.8.1. Register Access
  - Writing to PLL1LDOCR, PLL2LDOCR and HOCOLDOCR is prohibited.

  In this mode, lower power consumption is possible than in high-speed mode when the same operation is performed under the same conditions (operating frequency, operating voltage).

10.2.12 PDCTRGD : Graphics Power Domain Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x110

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PDPGSF	PDCSF	—	—	—	—	—	PDDE
Value after reset:	1	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
0	PDDE	Power control enable 0: Power on the target domain 1: Power off the target domain	R/W
5:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
6	PDCSF	Power control status flag 0: Power gating control is not executed (idle) 1: Power gating control is in progress	R
7	PDPGSF	Power gating status flag 0: Target domain is power on (not gating) 1: Target domain is power off (during Gating)	R

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The PDCTRGD register controls power gating for Graphics power domain.

For restrictions on this register, not only in this section , please also refer to section 10.6.1. Power Gating Control using power domain control register.

PDDE bit (Power control enable)

The PDDE bit controls the power gating of the target domain. The PDDE bit should be set from 0 to 1, after confirmed that the PDCSF=0 and PDPGSF=0. On the other hand, the PDDE bit should be set from 1 to 0, after confirmed that the PDCSF=0 and PDPGSF=1.

PDCSF bit (Power control status flag)

The PDCSF bit indicates the power control status of the target domain.

PDPGSF bit (Power gating status flag)

The PDPGSF bit indicates whether the target domain is power gated.

10.2.13 PDRAMSCR0 : SRAM Power Domain Standby Control Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x140

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	RKEEP6	RKEEP5	RKEEP4	RKEEP3	RKEEP2	RKEEP1	RKEEP0
Value after reset:	0	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
6:0	RKEEP6 to RKEEP0	RAM Retention 0: When entering the Software Standby mode, the contents of the target RAM are not kept. 1: When entering the Software Standby mode, the contents of the target RAM are kept.	R/W
14:7	—	These bits are read as 1. The write value should be 1.	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The PDRAMSCR0 register controls the target memory in Software Standby mode.

RKEEPn bit (RAM Retention) (n = 0 to 6)

The RKEEPn (n = 0 to 6) 6bit controls whether to retain the contents of the target memory in Software Standby mode.

Table 10.6 shows the relationship between each bit and the target memory.

Table 10.6 Relationship between each bit and the target memory

PDRAMSCR0 register bit	Target memory
PDRAM.b0	SRAM0: 0x2200_0000 to 0x2201_FFFF (Secure alias) 0x3200_0000 to 0x3201_FFFF (Non-secure alias)
PDRAM.b1	SRAM0: 0x2202_0000 to 0x2203_FFFF (Secure alias) 0x3202_0000 to 0x3203_FFFF (Non-secure alias)
PDRAM.b2	SRAM0: 0x2204_0000 to 0x2205_FFFF (Secure alias) 0x3204_0000 to 0x3205_FFFF (Non-secure alias)
PDRAM.b3	SRAM1: 0x2206_0000 to 0x2207_FFFF (Secure alias) 0x3206_0000 to 0x3207_FFFF (Non-secure alias)
PDRAM.b4	SRAM1: 0x2208_0000 to 0x2209_FFFF (Secure alias) 0x3208_0000 to 0x3209_FFFF (Non-secure alias)
PDRAM.b5	SRAM1: 0x220A_0000 to 0x220B_FFFF (Secure alias) 0x320A_0000 to 0x320B_FFFF (Non-secure alias)
PDRAM.b6	SRAM1: 0x220C_0000 to 0x220D_FFFF (Secure alias) 0x320C_0000 to 0x320D_FFFF (Non-secure alias)

10.2.14 PDRAMSCR1 : SRAM Power Domain Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x142

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RKEEP0
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	RKEEP0	RAM Retention 0: When entering the CPU Deep Sleep and Software Standby mode, the contents of the target RAM are not kept. 1: When entering the CPU Deep Sleep and Software Standby mode, the contents of the target RAM are kept.	R/W
1	—	This bit is read as 1. The write value should be 1.	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The PDRAMSCR1 register controls the target memory in CPU Deep Sleep and Software Standby mode.

RKEEP0 bit (RAM Retention)

The RKEEP0 bit controls whether to retain the contents of the target memory in CPU Deep Sleep and Software Standby mode.

Table 10.7 shows the relationship between each bit and the target memory.

Table 10.7 Relationship between each bit and the target memory

PDRAM register bit	Target memory
PDRAM.b0	ITCM and DTCM

10.2.15 SSCR1 : Software Standby Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA98

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SS1FR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SS1FR	Software Standby Fast Return 0: When returning from Software Standby mode, fast return function is disabled 1: When returning from Software Standby mode, fast return function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

SS1FR bit (Software Standby Fast Return)

When the SS1FR bit is 1, the recovery time from Software Standby mode is shorter.

Refer to the chapter of electrical characteristics on the detail of the recovery time.

Note: It is recommended to set this bit to 1. Otherwise it just increases the recovery time.

10.2.16 LPSCR : Low Power State Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA90

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	LPMD[3:0]			
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
3:0	LPMD[3:0]	Low power mode setting bit 0x0: System Active 0x4: Software Standby mode 0x8: Deep Software Standby mode 1 0x9: Deep Software Standby mode 2 0xA: Deep Software Standby mode 3 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The LPSCR register controls the transition destination of low power mode.

LPSCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets.

LPMD[3:0] bit (Low power mode setting bit)

The LPMD[3:0] bit indicate the destination of low power mode. Actual low power mode transition is executed by WFI instruction in CPU.

The transition of Software Standby mode and Deep Software Standby mode does not occur unless the WFI instruction of each CPU is executed.

When the low power mode is canceled by an interrupt, The LPMD[3:0] bit remains the value before transition. Writing 0 to this bit clears the bit itself.

While FENTRYR.FENTRYi (i = 0 to 3) is 1 or FENTRYR.FENTRYD bit is 1, the setting to Software Standby and Deep Software Standby mode is ineffective. Even if LPMD is any of 0x4, 0x8 to 0xA, the MCU is keep to System active state on execution of a WFI instruction. Refer to Table 10.10 for the detail.

While OFS0.IWDTSTPCTL bit is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

While IWDTCSTPR.SLCSTP is 0 (counting continues), the setting to Deep software Standby 2 and 3 mode is ineffective. Even if LPMD is any of 0x9 or 0xA, the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction.

Refer to Table 10.10 for the detail.

While the voltage monitor n (n=1, 2) reset is enabled (PVDnCR0.RI=1), the setting to Deep Software Standby mode 2, 3 is ineffective. Even if LPMD is any of 0x9 or 0xA the MCU enters Deep Software Standby 1 mode on execution of a WFI instruction. Refer to Table 10.10 for the detail.

10.2.17 DPSBYCR : Deep Software Standby Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	IOKEEP	—	SRKEEP	—	DCSSMODE	—	—
Value after reset:	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	DCSSMODE	DCDC Soft Start Mode 0: When the Deep Software Standby mode is canceled, the time required to recover is the standard time. 1: When the Deep Software Standby mode is canceled, the time required to recover is shortened.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	SRKEEP	Standby SRAM Retention 0: When entering the Software Standby mode or the Deep Software Standby mode 1, the contents of Standby SRAM are not kept. 1: When entering the Software Standby mode or the Deep Software Standby mode 1, the contents of Standby SRAM are kept.	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	IOKEEP	I/O Port Rentention 0: When the Deep Software Standby mode is canceled, the I/O ports are in the reset state. 1: When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

The DPSBYCR register controls the Deep Software Standby mode.

DPSBYCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets.

DCSSMODE bit (DCDC Soft Start Mode)

The DCSSMODE bit specifies whether to shorten the time required to recover from the Deep Software Standby mode. For details, see section 60, Electrical Characteristics.

SRKEEP bit (Standby SRAM Retention)

The SRKEEP bit specifies whether to keep the contents of Standby SRAM or not when entering the Software Standby mode or the Deep Software Standby mode 1.

IOKEEP bit (I/O Port Rentention)

In Deep Software Standby mode, I/O ports keep the same states as in the Software Standby mode. The IOKEEP bit specifies whether to reset the state of the I/O ports or not when the Deep Software Standby mode is canceled.

10.2.18 DPSWCR : Deep Software Standby Wait Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	WTSTS[7:0]							
Value after reset:	0	0	0	0	1	0	1	1

Bit	Symbol	Function	R/W
7:0	WTSTS[7:0]	Deep Software Wait Standby Time Setting Bit 0x0B: Wait cycle for fast recovery 0x9A: Wait cycle for slow recovery*1 Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. Only Deep Software Standby mode 2 is supported.

The DPSWCR register is a register appointing waiting stabilization time when a Deep Software Standby mode is canceled by certain pins which are sources of external pin interrupts or peripheral interrupts.

During a waiting stabilization period appointed in this register, Deep Software Standby reset occurs, and this MCU is initialized.

The DPSWCR is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets

WTSTS[7:0] bits (Deep Software Wait Standby Time Setting Bit)

Set only 2 following values to WTSTS.

1. WTSTS = 0x0B:
   The DSTBY recovery time is set to be fast. In this case, after returning from Deep Software Standby mode 2, it is necessary to be secured 700µs in the program before transition to next Software Standby mode or next Deep Software Standby mode.
   For details of this fast recovery time, see section 60, Electrical Characteristics
2. WTSTS = 0x9A:
   The DSTBY recovery time is set to be slow for Deep Software Standby mode 2. In this case, there is not the time constraint as the case of WTSTS = 0x0B.
   For details of this slow recovery time, see section 60, Electrical Characteristics

Note: When you use Deep Software Standby mode 1 or Deep Software Standby mode 3, you should set 0x0B to WTSTS to avoid extra waiting time.

10.2.19 DPSIER0 : Deep Software Standby Interrupt Enable Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7E	DIRQ6E	DIRQ5E	DIRQ4E	DIRQ3E	DIRQ2E	DIRQ1E	DIRQ0E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0E	IRQ0-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ1E	IRQ1-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ2E	IRQ2-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ3E	IRQ3-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ4E	IRQ4-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ5E	IRQ5-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ6E	IRQ6-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ7E	IRQ7-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER0 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

After the setting of DPSIER0 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR0 being set to 1. Therefore, DPSIFR0 should be cleared to 0 before entering Deep Software Standby mode.

Refer to Table 10.4 to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.20 DPSIER1 : Deep Software Standby Interrupt Enable Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15E	DIRQ14E	DIRQ13E	DIRQ12E	DIRQ11E	DIRQ10E	DIRQ9E	DIRQ8E
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8E	IRQ8-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DIRQ9E	IRQ9-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DIRQ10E	IRQ10-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DIRQ11E	IRQ11-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DIRQ12E	IRQ12-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
5	DIRQ13E	IRQ13-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	DIRQ14E	IRQ14-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
7	DIRQ15E	IRQ15-DS Pin Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER1 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

After the setting of DPSIER1 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR1 being set to 1. Therefore, DPSIFR1 should be cleared to 0 before entering Deep Software Standby mode.

Refer to Table 10.4 to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.21 DPSIER2 : Deep Software Standby Interrupt Enable Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIE	DRTCAIE	DRTCIIE	DPVD2IE	DPVD1IE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IE	PVD1 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DPVD2IE	PVD2 Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DRTCIIE	RTC Interval interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Bit	Symbol	Function	R/W
3	DRTCAIE	RTC Alarm interrupt Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	DNMIE	NMI Pin Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W*1
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. 1 can be written only once. Once 1 is written to this bit, subsequent write accesses are disabled.

DPSIER2 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

After the setting of DPSIER2 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR2 being set to 1. Therefore, DPSIFR2 should be cleared to 0 before entering Deep Software Standby mode.

Refer to Table 10.4 to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.22 DPSIER3 : Deep Software Standby Interrupt Enable Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBATTADIE	—	DIWDTIE	—	DULPT1IE	DULPT0IE	DUSBHSIE	DUSBFSIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIE	USBFS Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
1	DUSBHSIE	USBHS Suspend/Resume Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
2	DULPT0IE	ULPT0 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
3	DULPT1IE	ULPT1 Overflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWDTIE	IWDT Underflow Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	DVBATTADIE	VBATT Tamper Detection Deep Software Standby Cancel Signal Enable 0: Canceling Deep Software Standby mode is disabled 1: Canceling Deep Software Standby mode is enabled	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIER3 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

After the setting of DPSIER3 is modified, an edge may be internally generated depending on the state of the pin, resulting in DPSIFR3 being set to 1. Therefore, DPSIFR3 should be cleared to 0 before entering Deep Software Standby mode.

Refer to Table 10.4 to know the relation between this register and interrupt source for canceling Deep Software Standby mode.

10.2.23 DPSIFR0 : Deep Software Standby Interrupt Flag Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7F	DIRQ6F	DIRQ5F	DIRQ4F	DIRQ3F	DIRQ2F	DIRQ1F	DIRQ0F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0F	IRQ0-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ1F	IRQ1-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ2F	IRQ2-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ3F	IRQ3-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DIRQ4F	IRQ4-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
5	DIRQ5F	IRQ5-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	DIRQ6F	IRQ6-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ7F	IRQ7-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR0 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER0 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR0 is cleared to 0x00.

To clear DPSIFR0 to 0x00 after modifying DPSIER0, wait for at least 6 PCLKB cycles, read DPSIFR0, and then write 0 to DPSIFR0. Six or more PCLKB cycles can be secured, for example, by reading DPSIER0.

DPSIFR0 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source.

For details, see section 5, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 0 to 7)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR0 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.24 DPSIFR1 : Deep Software Standby Interrupt Flag Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA1C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15F	DIRQ14F	DIRQ13F	DIRQ12F	DIRQ11F	DIRQ10F	DIRQ9F	DIRQ8F
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8F	IRQ8-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DIRQ9F	IRQ9-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DIRQ10F	IRQ10-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DIRQ11F	IRQ11-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DIRQ12F	IRQ12-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
5	DIRQ13F	IRQ13-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	DIRQ14F	IRQ14-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7	DIRQ15F	IRQ15-DS Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR1 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER1 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR1 is cleared to 0x00.

To clear DPSIFR1 to 0x00 after modifying DPSIER1, wait for at least 6 PCLKB cycles, read DPSIFR1, and then write 0 to DPSIFR1. Six or more PCLKB cycles can be secured, for example, by reading DPSIER1.

DPSIFR1 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

DIRQnF flag (IRQn-DS Pin Deep Software Standby Cancel Flag) (n = 8 to 15)

The DIRQnF flag indicates that a cancel request by the IRQn-DS pin has been generated.

[Setting condition]

A cancel request by the IRQn-DS pin specified by DPSIEGR1 is generated.

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.25 DPSIFR2 : Deep Software Standby Interrupt Flag Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIF	DRTCAIF	DRTCIIF	DPVD2IF	DPVD1IF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1IF	PVD1 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DPVD2IF	PVD2 Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DRTCIIF	RTC Interval Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DRTCAIF	RTC Alarm Interrupt Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	DNMIF	NMI Pin Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when a cancel request specified by DPSIEGR2 is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER2 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR2 is cleared to 0x00.

To clear DPSIFR2 to 0x00 after modifying DPSIER2, wait for at least 6 PCLKB cycles, read DPSIFR2, and then write 0 to DPSIFR2. Six or more PCLKB cycles can be secured, for example, by reading DPSIER2.

DPSIFR2 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

DPVDmIF flag (PVDm Deep Software Standby Cancel Flag) (m = 1 to 2)

The DPVDmIF flag indicates that a cancel request by the voltage monitor m signal has been generated.

[Setting condition]

A cancel request is generated by the voltage monitor m signal that is selected in DPSIEGR2.

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCIIF flag (RTC Interval Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC interval interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC interval interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DRTCAIF flag (RTC Alarm Interrupt Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the RTC alarm interrupt signal has been generated.

[Setting condition]

A cancel request by the RTC alarm interrupt signal is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

DNMIF flag (NMI Pin Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the NMI pin has been generated.

[Setting condition]

A cancel request by the NMI pin specified by DPSIEGR2 is generated

[Clearing condition]

Writing 0 to each flag after 1 is read.

10.2.26 DPSIFR3 : Deep Software Standby Interrupt Flag Register 3

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DVBATTADIF	—	DIWDTIF	—	DULPT1IF	DULPT0IF	DUSBHSIF	DUSBFSIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DUSBFSIF	USBFS Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
1	DUSBHSIF	USBHS Suspend/Resume Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
2	DULPT0IF	ULPT0 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
3	DULPT1IF	ULPT1 Overflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
4	—	This bit is read as 0. The write value should be 0.	R/W
5	DIWDTIF	IWDT Underflow Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1
6	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	DVBATTADIF	VBATT Tamper Detection Deep Software Standby Cancel Flag 0: The cancel request is not generated 1: The cancel request is generated	R/W*1

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.
Note 1. Only 0 can be written to clear flag. The flag must be cleared by writing 0 after 1 is read.

Each flag is set to 1 when the corresponding cancel request is generated.

Each flag may be set to 1 when a cancel request is generated in any mode (not only in Deep Software Standby mode) or when the setting of DPSIER3 is modified. Therefore, a transition to Deep Software Standby mode should be made after DPSIFR3 is cleared to 0x00.

To clear DPSIFR3 to 0x00 after modifying DPSIER3, wait for at least 6 PCLKB cycles, read DPSIFR3, and then write 0 to DPSIFR3. Six or more PCLKB cycles can be secured, for example, by reading DPSIER3.

DPSIFR3 is not initialized by the internal reset signal used as Deep Software Standby mode Canceling source. For details, see section 5, Resets.

DUSBFSIF flag (USBFS Suspend/Resume Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the USBFS suspend/resume has been generated.

The DUSBFSIF flag is a flag for USBFS.

[Setting condition]

A cancel request by the USBFS suspend/resume is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DUSBHSIF bit (USBHS Suspend/Resume Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the USBHS suspend/resume has been generated.

The DUSBHSIF flag is a flag for USBHS.

[Setting condition]

A cancel request by the USBHS suspend/resume is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DULPT0IF flag (ULPT0 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT0 overflow has been generated.

[Setting condition]

A cancel request by the ULPT0 is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DULPT1IF flag (ULPT1 Overflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the ULPT1 overflow has been generated.

[Setting condition]

A cancel request by the ULPT1 is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DIWDTIF bit (IWDT Underflow Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the IWDT underflow has been generated.

[Setting condition]

A cancel request by the IWDT is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

DVBATTADIF bit (VBATT Tamper Detection Deep Software Standby Cancel Flag)

This flag indicates that a cancel request by the VBATT tamper detection has been generated.

[Setting condition]

A cancel request by the VBATT tamper detection is generated.

[Clearing condition]

Writing 0 to each bit after reading the bit as 1.

10.2.27 DPSIEGR0 : Deep Software Standby Interrupt Edge Register 0

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ7EG	DIRQ6EG	DIRQ5EG	DIRQ4EG	DIRQ3EG	DIRQ2EG	DIRQ1EG	DIRQ0EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ0EG	IRQ0-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
1	DIRQ1EG	IRQ1-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
2	DIRQ2EG	IRQ2-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
3	DIRQ3EG	IRQ3-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
4	DIRQ4EG	IRQ4-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
5	DIRQ5EG	IRQ5-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
6	DIRQ6EG	IRQ6-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7	DIRQ7EG	IRQ7-DS Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR0 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets.

10.2.28 DPSIEGR1 : Deep Software Standby Interrupt Edge Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA2C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DIRQ15EG	DIRQ14EG	DIRQ13EG	DIRQ12EG	DIRQ11EG	DIRQ10EG	DIRQ9EG	DIRQ8EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DIRQ8EG	IRQ8-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
1	DIRQ9EG	IRQ9-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
2	DIRQ10EG	IRQ10-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge	R/W
3	DIRQ11EG	IRQ11-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
4	DIRQ12EG	IRQ12-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
5	DIRQ13EG	IRQ13-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
6	DIRQ14EG	IRQ14-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W
7	DIRQ15EG	IRQ15-DS Pin Edge Select 0: A cancel request is generated at a falling edge. 1: A cancel request is generated at a rising edge.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR1 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets.

10.2.29 DPSIEGR2 : Deep Software Standby Interrupt Edge Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DNMIEG	—	—	DPVD2EG	DPVD1EG
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DPVD1EG	PVD1 Edge Select 0: A cancel request is generated when VCC < V_{det1} (fall) is detected 1: A cancel request is generated when VCC ≥ V_{det1} (rise) is detected	R/W

Bit	Symbol	Function	R/W
1	DPVD2EG	PVD2 Edge Select 0: A cancel request is generated when VCC < V_{det2} (fall) is detected 1: A cancel request is generated when VCC ≥ V_{det2} (rise) is detected	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
4	DNMIEG	NMI Pin Edge Select 0: A cancel request is generated at a falling edge 1: A cancel request is generated at a rising edge	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-4, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

DPSIEGR2 is not initialized by the internal reset signal that is the source to cancel the Deep Software Standby mode. For details, see section 5, Resets.

10.2.30 SYOCDCR : System Control OCD Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA38

Bit position:	7	6	5	4	3	2	1	0
Bit field:	DBGEN	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	—	The read value is undefined. The write value should be 0.	R/W
6:1	—	These bits are read as 0. The write value should be 0.	R/W
7	DBGEN	Debugger Enable bit 0: On-chip debugger is disabled 1: On-chip debugger is enabled*1	R/W

Note: S-TYPE-5, P-TYPE-2
Note 1. The value of DBGEN can be set by software. However, it is not until the debugger authentication passes that the on-chip debugger function is valid. That is, even if the DBGEN is 1, the on-chip debugger function is invalid unless the debugger authentication passes. For detail, see section 2, CPU.

This register is not controlled by any security attribute register (eg. LPMSAR, DPFSAR).

DBGEN bit (Debugger Enable bit)

The DBGEN bit enables the on-chip debugger function.

[Setting condition]

- Power-on reset is generated
- Voltage Monitor 0 reset is generated.
- Writing 1 to the bit.

[Clearing condition]

- Writing 0 to the bit.

Note: Certain restrictions apply in terms of the MCU states in which the DBGEN bit can be set to 1. For details, see section 2.13.2. Restriction in OCD Emulator Connecting.

10.2.31 PLL1LDOCR : PLL1-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL1-LDO is enabled 1: PLL1-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: PLL1-LDO is stopped during Software Standby mode. 1: PLL1-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for PLL1(PLL1-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The PLL1-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 1 µs. This bit can be set 0 to this bit only when 1us has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL1.

SKEEP bit (STBY Keep)

The PLL1-LDO state during Software Standby mode is controlled by this bit. If the PLL1-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.2.32 PLL2LDOCR : PLL2-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: PLL2-LDO is enabled 1: PLL2-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: PLL2-LDO is stopped during Software Standby mode. 1: PLL2-LDO state before Software Standby mode is retained during Software Standby mode.	R/W

Bit	Symbol	Function	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for PLL2 (PLL2-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The PLL2-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 1 µs. This bit can be set 0 to this bit only when 1us has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 25 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the PLL2.

SKEEP bit (STBY Keep)

The PLL2-LDO state during Software Standby mode is controlled by this bit. If the PLL2-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.2.33 HOCOLDOCR : HOCO-LDO Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xB0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	SKEEP	LDOSTP
Value after reset:	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
0	LDOSTP	LDO Stop 0: HOCO-LDO is enabled 1: HOCO-LDO is stopped	R/W
1	SKEEP	STBY Keep 0: HOCO-LDO is stopped during Software Standby mode. 1: HOCO-LDO state before Software Standby mode is retained during Software Standby mode.	R/W
2	—	The read value is undefined.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

It can be controlled the operation of the LDO dedicated for HOCO (HOCO-LDO) by using this register.

Writing to this register is prohibited in low-speed mode.

LDOSTP bit (LDO Stop)

The HOCO-LDO state during Normal mode is controlled by this bit. After setting 1 to this bit, do not set 0 to this bit for at least 2 µs. This bit can be set 0 to this bit only when 2 µs has elapsed after setting 1 to this bit.

When this bit is changed from 1 to 0, it takes 5 µs for the power supply to stabilize.

Allow the power supply to stabilize before operating the HOCO.

SKEEP bit (STBY Keep)

The HOCO-LDO state during Software Standby mode is controlled by this bit. If the HOCO-LDO operation is stopped during Software Standby mode, the power consumption during Software Standby mode can be reduced.

10.3 Reducing Power Consumption by Switching Clock Signals

The clock frequency changes when the SCKDIVCR and SCKDIVCR2 registers are set.

For information on module and clock associations, see section 8.2.2. SCKDIVCR : System Clock Division Control Register and section 8.2.3. SCKDIVCR2 : System Clock Division Control Register 2.

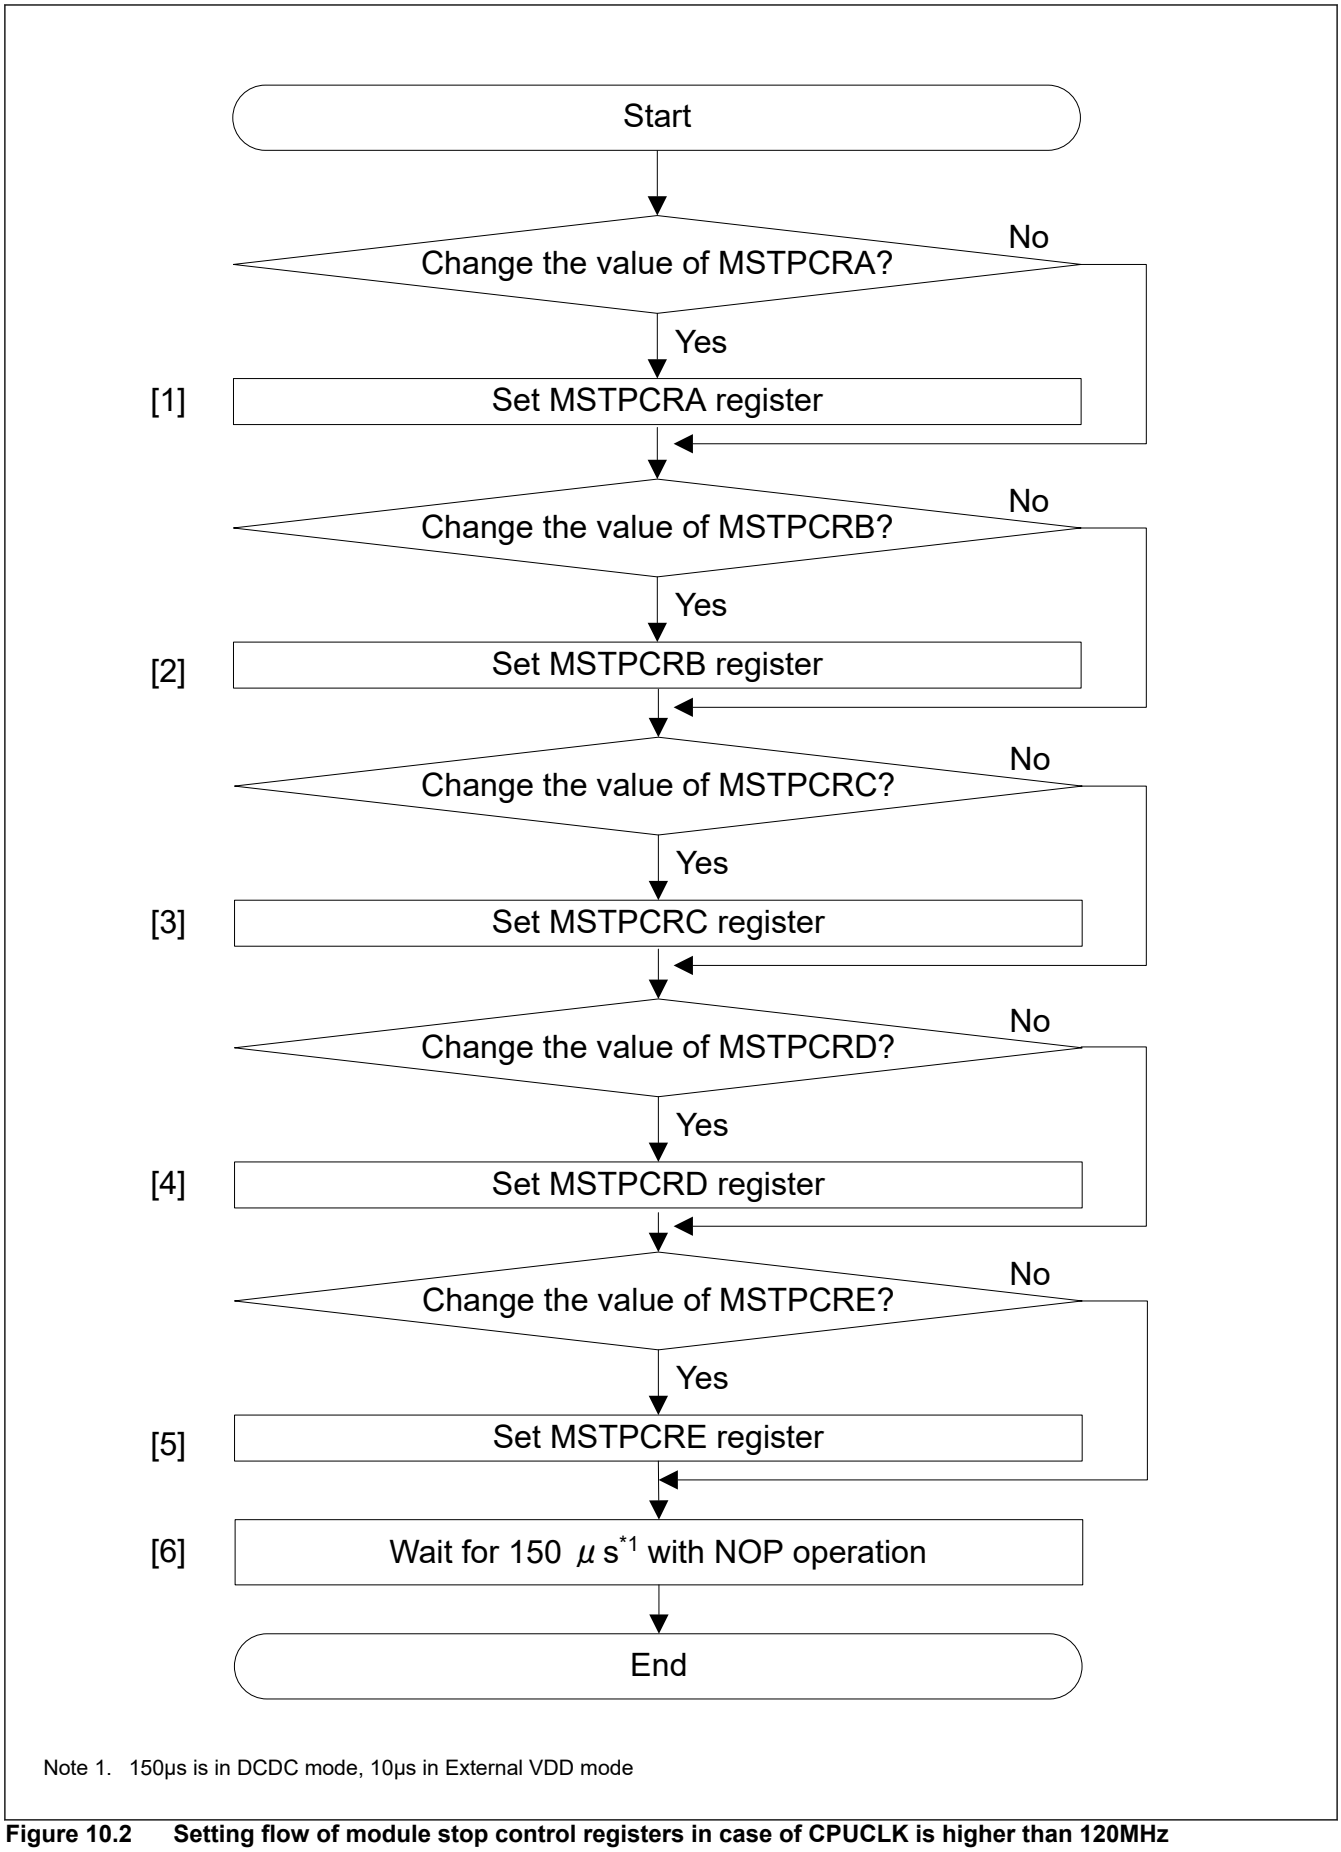
10.4 Module-Stop Function

The module stop function can stop the clock supply set for each peripheral module.

When the MSTPmi bit (m = A to E, i = 31 to 0) in MSTPCRn (n = A to E) is set to 1, the specified module stops operating and enters the module-stop state, but the CPU continues to operate independently. Setting the MSTPmi bit to 0 cancels the module-stop state, allowing the module to resume operation at the end of the bus cycle.

After a reset is canceled, all modules other than the DMAC, DTC and SRAMn (n = 0, 1) modules are placed in the module-stop state. Do not access the module while the corresponding MSTPmi bit is 1. Additionally, do not set 1 to the MSTPmi bit while the corresponding module is accessed.

If the CPU clock is faster than 120 MHz, after the MSTPmi bit is changed, a wait time should be provided according to the flow shown in Figure 10.2. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt.



Note 1. 150μs is in DCDC mode, 10μs in External VDD mode

Figure 10.2 Setting flow of module stop control registers in case of CPUCLK is higher than 120MHz

10.5 Function for Lower Operating Power Consumption

By selecting an appropriate operating power consumption control mode according to the operating frequency, power consumption can be reduced in Normal mode and Processor low power mode.

10.5.1 Setting Operating Power Control Mode

Ensure the operating condition such as the frequency range is always within the specified range before and after switching the operating power control modes.

In External VDD mode, make sure to set OPCCR.OPCM is 00b.

This section provides example procedures for switching operating power control modes.

Table 10.8 Available oscillators in each mode

Mode	Oscillator					
	PLL1, PLL2	High-speed on-chip oscillator	Middle-speed on-chip oscillator	Low-speed on-chip oscillator	Main clock oscillator	Sub-clock oscillator
High-speed	Available	Available	Available	Available	Available	Available
Low-speed	Not Available	Available	Available	Available	Available	Available

(1) Switching from a higher power mode to a lower power mode

Example : From High-speed mode to Low-speed mode:

(Operation begins in High-speed mode)

1. Change the oscillator to what is used in Low-speed mode. Set the frequency of each clock lower than or equal to the maximum operating frequency in Low-speed mode.
2. Turn off the oscillator that is not required in Low-speed mode.
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Set the OPCCR.OPCM[1:0] bits to 11b (Low-speed mode).
5. Confirm that OPCCR.OPCMTSF flag is 0 (indicates transition completed).

(2) Switching from a lower power mode to a higher power mode

Example : From Low-speed mode to High-speed mode

(Operation begins in Low-speed mode)

1. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
2. Set the OPCCR.OPCM[1:0] bits to 00b (High-speed mode).
3. Confirm that the OPCCR.OPCMTSF flag is 0 (indicates transition completed).
4. Turn on any required oscillator in High-speed mode.
5. Set the frequency of each clock lower than or equal to the maximum operating frequency for High-speed mode.

(Operation is now in High-speed mode)

10.6 Power Gating Control

The MCU supports the power gating function of the power domain.

User can individually control the power on/off of the divided power domains.

The power domain is consist of normal operation-area and retention-area.

10.6.1 Power Gating Control using power domain control register

Table 10.9 shows the relationship PDCTR register and the target power domain.

When the PDCTR register is set, power gating control is executed.

In addition, when using the power gating function, it should be set MOCOCR.MCSTP to 0 (MOCO is operated) in advance.

Table 10.9 Relationship between the PDCTR register and the target power domain

Control register				Target Power Domain name	Implemented module name
Register name	PDDE	PDCSF	PDPGSF		
PDCTRGD	Available	Available	Available	Graphic domain	MIPI DSI, DRW, GLCDC

Examples of the procedures for power gating control:

(1) Power OFF by PDCTRGD.PDDE*1

STEP1 : Confirm that the target domain is not performing the Power gating process

Check PDCTRGD.PDCSF = 0

STEP2 : Set the module stop control register to stop.

Write MSTPCR* = 1 (*:all register for target domain)

STEP3 : Set PDCTRGD.PDDE bit and start the power control.

Write PDCTRGD.PDDE = 1

STEP4 : Confirm that the power gating process is completed and the powered off

Check PDCTRGD.PDCSF = 0 & PDCTRGD.PDPGSF = 1

(2) Power ON by PDCTRGD.PDDE*1

STEP1 : Confirm that the target domain is not performing the Power gating process

Check PDCTRGD.PDCSF = 0

STEP2 : Set PDCTRGD.PDDE bit and start the power control.

Write PDCTRGD.PDDE = 0

STEP3 : Confirm that the power gating process is completed and the powered on

Check PDCTRGD.PDCSF = 0 & PDCTRGD.PDPGSF = 0

STEP4 : Set the module stop control register to operate.

Write MSTPCR* = 0 (*:all register for target domain)

Note 1. When PDCTRGD.PDCSF bit is 1 (during power gating control processing) , PDCTRGD register must not be changed.

10.7 Low Power Modes

10.7.1 CPU Sleep Mode

10.7.1.1 Transition to CPU Sleep mode

When a WFI instruction is executed while SCR.SLEEPDEEP bit is 0, the MCU enters CPU Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. Available resets or interrupts in CPU Sleep mode cause the MCU to cancel CPU Sleep mode. All interrupt sources are available. If using an interrupt to cancel CPU Sleep mode, you must set the associated IELSRn register before executing a WFI instruction. For details, see section 13, Interrupt Controller Unit (ICU).

Counting by IWDT stops when the MCU enters CPU Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by IWDT stops when the MCU enters CPU Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 1 (IWDT stops in CPU Sleep mode or CPU Deep Sleep mode).

Counting by IWDT continues when the MCU enters CPU Sleep mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by IWDT continues when the MCU enters CPU Sleep mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 0 (IWDT does not stop in CPU Sleep mode or CPU Deep Sleep mode).

Counting by WDT stops when the MCU enters CPU Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 1 (WDT stops in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by WDT

stops when the MCU enters CPU Sleep mode while the WDT is in register start mode and the SLCSTP bit in WDTCSTPR is 1 (WDT stops in CPU Sleep mode or CPU Deep Sleep mode).

Counting by WDT continues when the MCU enters CPU Sleep mode while the WDT is in auto start mode and the OFS0.WDTSTPCTL bit is 0 (WDT does not stop in CPU Sleep mode or CPU Deep Sleep mode). Similarly, counting by WDT continues when the MCU enters CPU Sleep mode while the WDT is in register start mode and the SLCSTP bit in WDTCSTPR is 0 (WDT does not stop in CPU Sleep mode or CPU Deep Sleep mode).

WFI instruction and sleep-on-exit function for entering CPU Sleep mode purpose.

For the transition to CPU Sleep mode, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state.

10.7.1.2 Canceling CPU Sleep mode

CPU Sleep mode is canceled by:

- An interrupt
- A reset:
  - RES pin reset
  - Power-on reset
  - Voltage Monitor 0 reset
  - Independent watchdog timer reset
  - Watchdog timer reset
  - Voltage Monitor m reset (m = 1, 2)
  - Common memory error reset
  - Bus error reset

The operations are as follows:

1. Canceling by an interrupt
   When an available interrupt request is generated, CPU Sleep mode is canceled and the MCU starts the interrupt handling.
2. Canceling by RES pin reset
   When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in section 60, Electrical Characteristicssection 50, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
   CPU Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in CPU Sleep mode and an internal reset for canceling CPU Sleep mode is not generated in the following conditions:
   - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
   - OFS0.IWDTSTRT = 1 (register start mode) and OFS0.IWDTSTPCTL = 1
4. Canceling by WDT reset
   CPU Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in CPU Sleep mode even when counting in Normal mode and an internal reset for canceling CPU Sleep mode is not generated in the following conditions:
   - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1
   - OFS0.WDTSTRT = 1 (register start mode) and WDTCSTPR.SLCSTP = 1
5. Canceling by other resets available in CPU Sleep mode
   CPU Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

Note: For details on proper setting of the interrupts, see section 13, Interrupt Controller Unit (ICU)

10.7.2 CPU Deep Sleep mode

10.7.2.1 Transition to CPU Deep Sleep mode

When a WFI instruction is executed while SCR.SLEEPDEEP is set as 1, the MCU enters CPU Deep Sleep mode. In this mode, the CPU stops operating but the contents of its internal registers are retained. Other peripheral functions do not stop. However, accessing to TCM is not available and SysTick also stops in this mode. Available resets or wakeup enabled interrupts in CPU Deep Sleep mode cause the MCU to cancel CPU Deep Sleep mode. Not all interrupt sources are available, in detail user must also set WUPEN0 and WUPEN1 registers located in ICU to enable wakeup from CPU Deep Sleep mode. For details, see section 13, Interrupt Controller Unit (ICU).

IWDT and WDT operation in CPU Deep Sleep mode is same with CPU Sleep mode.

For the transition to CPU Deep Sleep mode, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state.

10.7.2.2 Canceling CPU Deep Sleep mode

CPU Deep Sleep mode is canceled by:

- An available interrupt shown in Table 10.4.
- A reset:
  - RES pin reset
  - Power-on reset
  - Voltage Monitor 0 reset
  - Independent watchdog timer reset
  - Watchdog timer reset
  - Voltage Monitor m reset (m = 1, 2)
  - Common memory error reset
  - Bus error reset

The operations are as follows:

1. Canceling by an interrupt
   When an available interrupt request (for available interrupt, See Table 10.4) is generated, each oscillator which was operating before the transition to CPU Deep Sleep mode restarts. After all these oscillators have been stabilized, the MCU returns from CPU Deep Sleep mode to Normal mode and starts interrupt handling. When canceling the CPU Deep Sleep mode by interrupt, each power domain returns to the same power state as the state before entering the Deep Sleep state
   (For available interrupt, See Table 10.4)
2. Canceling by RES pin reset
   When the RES pin is driven low, the MCU enters the reset state. Be sure to keep the RES pin low for the time period specified in section 60, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by IWDT reset
   CPU Deep Sleep mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in CPU Deep Sleep mode and an internal reset for canceling CPU Deep Sleep mode is not generated in the following conditions:
   - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
   - OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1
4. Canceling by WDT reset
   CPU Deep Sleep mode is canceled by an internal reset generated by a WDT underflow and the MCU starts the reset exception handling. However, WDT stops in CPU Deep Sleep mode even when counting in Normal mode and an internal reset for canceling CPU Deep Sleep mode is not generated in the following conditions:
   - OFS0.WDTSTRT = 0 (auto start mode) and OFS0.WDTSTPCTL = 1

- OFS0.WDTSTRT = 1 (register start mode) and WDTCSTPR.SLCSTP = 1

5. Canceling by other resets available in CPU Deep Sleep mode
   CPU Deep Sleep mode is canceled by other resets and the MCU starts the reset exception handling.

   Note: For details on proper setting of the interrupts, see section 13, Interrupt Controller Unit (ICU)

For CPU Deep Sleep mode cancellation, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state.

10.7.3 Software Standby Mode

10.7.3.1 Transition to Software Standby Mode

When a WFI instruction is executed while LPSCR.LPMD bit is 0x4 and CPU0.SCR.SLEEPDEEP bit is 1, the MCU enters Software Standby mode depending on LPSCR.LPMD setting. It must be set MOCOCR.MCSTP to 0 (MOCO is operated) before executed the WFI instruction to entry this mode.

In this mode, the CPU, most of the on-chip peripheral functions and most of the oscillators stop*1. However, the contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions and the I/O ports are retained.

Software Standby mode allows significant reduction in power consumption because most of the oscillators stops*1 in this mode. Table 10.3 shows the status of each on-chip peripheral functions and oscillators. Available resets or interrupts in Software Standby mode make the MCU to return to Normal mode. See Table 10.4 for available interrupt sources for each mode. In case of using an interrupt to return to Normal mode, corresponding IELSRn register must be set before executing a WFI instruction. For the detail, see section 13, Interrupt Controller Unit (ICU).

Note 1. The state of the oscillators depends on the setting of the control register for each oscillator. For details, refer to the chapter of clock generation circuit.

The status of address bus and bus control signals in Software Standby mode can be selected by SBYCR.OPE bit. The SBYCR.OPE bit specifies whether to set to the high-impedance state or to retain the output of the address bus and bus control signals in Software Standby mode.

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction.

Counting by IWDT stops when the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 1 (IWDT stops in Software Standby mode). Similarly, counting by IWDT stops when the MCU enters Software Standby mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 1 (IWDT stops in Software Standby mode).

Counting by IWDT continues when the MCU enters Software Standby mode while the IWDT is in auto start mode and the OFS0.IWDTSTPCTL bit is 0 (IWDT does not stop in Software Standby mode). Similarly, counting by IWDT continues when the MCU enters Software Standby mode while the IWDT is in register start mode and the SLCSTP bit in IWDTCSTPR is 0 (IWDT does not stop in Software Standby mode).

WDT stops counting when the MCU enters Software Standby mode because the PCLK stops.

Do not enter Software Standby mode while the flash memory is in programming or erasing procedure. In order to enter Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

In External VDD mode, do not enter Software Standby Mode.

Table 10.10 shows the setting of the related control bits and the modes to enter after executing WFI instruction.

Table 10.10 Setting of the bits what affect the mode after executing WFI instruction

		Setting mode of LPSCR.LPMD bit and CPU.SCR.SLEEPDEEP bit			
		Software Standby	**Deep Software Standby 1**	**Deep Software Standby 2**	**Deep Software Standby 3**
		(LPSCR.LPMD = 0x4, CPU0.SCR. SLEEPDEEP = 1)	**(LPSCR.LPMD = 0x8, CPU0.SCR. SLEEPDEEP = 1)**	**(LPSCR.LPMD = 0x9, CPU0.SCR. SLEEPDEEP = 1)**	**(LPSCR.LPMD = 0xA, CPU0.SCR. SLEEPDEEP = 1)**
FENTRYR.FENTRYC FENTRYR.FENTRYD	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active	CPU Deep Sleep mode and Keep System Active
OFS0.IWDTSTPCTL (auto-start mode) IWDTCSTPR.SLCSTP (register start mode)	0	Software Standby	Deep Software Standby 1	Deep Software Standby 1	Deep Software Standby 1
	1			Deep Software Standby 2	Deep Software Standby 3
PVD1CR0.RI PVD2CR0.RI	0	Software Standby	Deep Software Standby 1	Deep Software Standby 2	Deep Software Standby 3
	1			Deep Software Standby 1	Deep Software Standby 1

Note: When multiple mode transition conditions conflict, mode transition is performed according to the following priority order.
CPU Deep Sleep mode and Keep System Active > Software Standby > Deep Software Standby 1 > Deep Software Standby 2 > Deep Software Standby 3.

For the transition to Software Standby mode, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state.

10.7.3.2 Canceling Software Standby Mode

Software Standby mode is canceled by:

- An available interrupt shown in Table 10.4
- A reset:
  - RES pin reset
  - Power-on reset
  - Voltage monitor reset
  - Reset caused by an IWDT underflow

On exiting Software Standby mode, the oscillators that operate before the transition to the mode restart. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode. See section 13.2.15. WUPEN0 : Wake Up Interrupt Enable Register 0, section 13.2.16. WUPEN1 : Wake Up interrupt enable register 1 for information on how to wake up the MCU from Software Standby mode.

You can cancel Software Standby mode in any of the following ways:

1. Canceling by an interrupt
   When an available interrupt request (see Table 10.4) is generated, an oscillator that operates before the transition to Software Standby mode restarts. After all the oscillators are stabilized, the MCU returns to Normal mode from Software Standby mode and starts the interrupt handling.
   When canceling the software standby mode by interrupt , each power domain returns to the same power state as the state before entering the software standby state.
2. Canceling by a RES pin reset
   When the RES pin is driven low, the MCU enters the reset state, and the oscillators whose default status is operating, start the oscillation. Be sure to keep the RES pin low for the time period specified in section 60, Electrical Characteristics. When the RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset

Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.

4. Canceling by a voltage monitor reset
   Software Standby mode is canceled by a voltage monitor reset from the voltage detection circuit and the MCU starts the reset exception handling.
5. Canceling by IWDT reset
   Software Standby mode is canceled by an internal reset generated by an IWDT underflow and the MCU starts the reset exception handling. However, IWDT stops in Software Standby mode and an internal reset for canceling Software Standby mode is not generated in the following condition:
   - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
   - OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

For Software Standby mode cancellation, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state

10.7.3.3 Example of Software Standby Mode Application

Figure 10.3 shows an example of entry to Software Standby mode on detection of a falling edge of the IRQn pin, and exit from Software Standby mode by a rising edge of the IRQn pin.

In this example, an IRQn pin interrupt is accepted with the IRQCRi.IRQMD[1:0] (i = 0 to 15) bits of the ICU set to 00b (falling edge) in Normal mode, and the IRQCRi.IRQMD[1:0] bits are set to 01b (rising edge). Then, if MOCO is not operated, it must set MOCOCR.MCSTP to 0 (MOCO is operated). After that, the LPSCR.LPMD bit is set to 0x4 and CPU.SCR.SLEEPDEEP bit is set to 1, and then a WFI instruction is executed. As a result, entry to Software Standby mode completes and exit from Software Standby mode is initiated by a rising edge of the IRQn pin.

Setting the ICU is also required to exit Software Standby mode. For details, see section 13, Interrupt Controller Unit (ICU). The oscillation stabilization time in Figure 10.3 is specified in section 60, Electrical Characteristics.

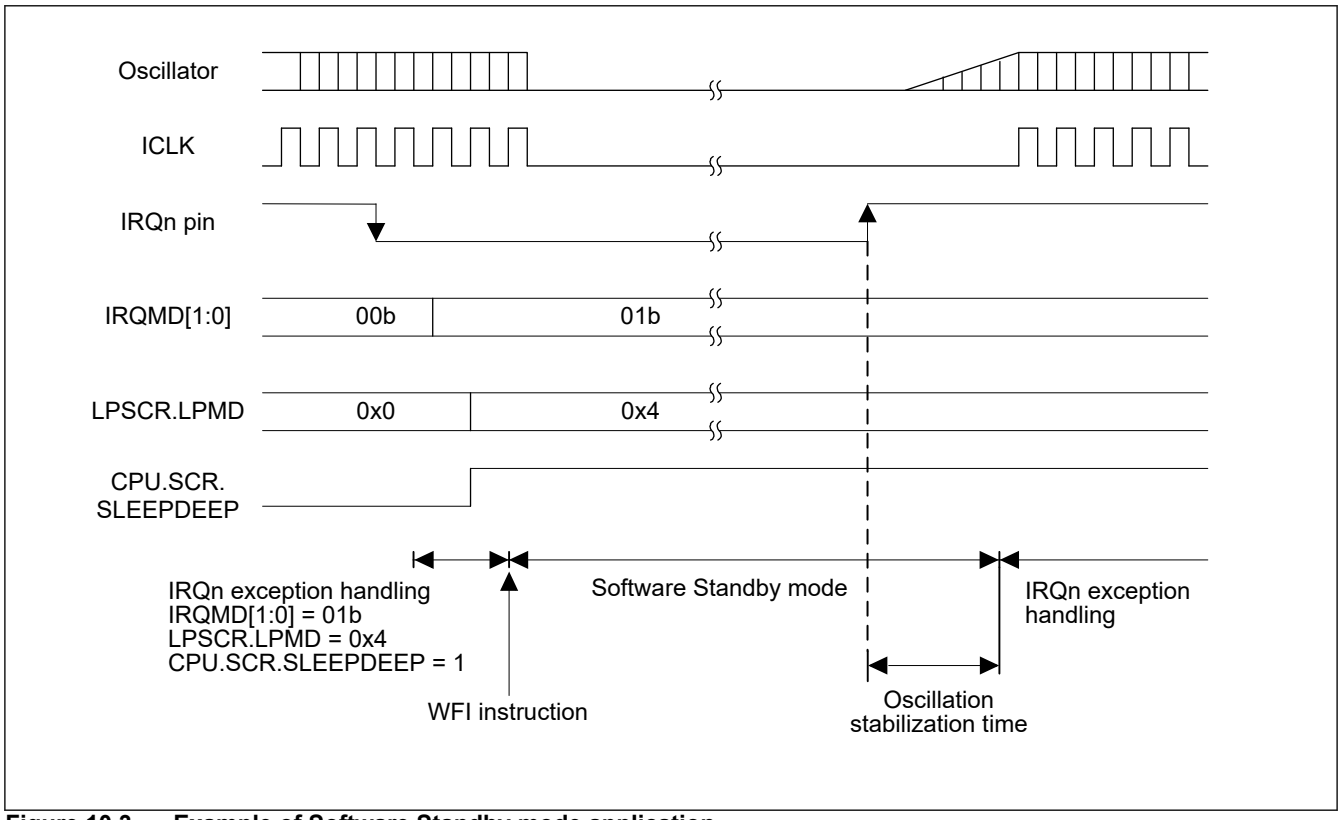


Figure 10.3 Example of Software Standby mode application

10.7.4 Deep Software Standby Mode

10.7.4.1 Transition to Deep Software Standby Mode

When a WFI instruction is are executed while LPSCR.LPMD bit is 0x8, 0x9, 0xA and CPU.SCR.SLEEPDEEP bit is 1, the MCU enters Deep Software Standby mode 1 or 2 or 3 depending on LPSCR.LPMD setting. It must be set MOCOCR.MCSTP to 0 (MOCO is operated) before executed the WFI instruction to entry this mode. See Table 10.10 for the setting of the related control bits.

In these mode , the CPU, on-chip peripheral functions, SRAM, and oscillators are almost stopped as shown in Table 10.3. Furthermore, since the internal power supply to these inactive modules is stopped, power consumption is remarkably reduced. The contents of all the registers of the CPU and specific internal peripheral modules become undefined. Table 10.3. shows the status of each on-chip peripheral functions and oscillators.

Data in the standby SRAM are preserved in Deep Software Standby mode 1. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, the low-power-consumption function of PVD0 is enabled, so power consumption is further reduced. In Deep Software Standby mode 2, the internal supply of power to the standby SRAM, the USB resume detecting unit and IWDT are cut off, reducing power consumption. Data in the standby SRAM become undefined at this time. When OFS1(_SEC).PVDAS = 0 and OFS1(_SEC).PVDLPSEL = 0, the low-power-consumption function of PVD0 is enabled, so power consumption is further reduced. In Deep Software Standby mode 3, the PVD is also stopped. For details, see section 60, Electrical Characteristics.

Clear DMAST.DMST bit and DTCST.DTCST bit to 0 before executing WFI instruction.

When the MCU enters Deep Software Standby mode 2 or 3 while the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 1, power supply to the LOCO and the IWDT is cut off. Counting by the IWDT also stops.

When the IWDT is in auto-start mode and the OFS0.IWDTSTPCTL bit is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD.

When the IWDT is in register start mode and the IWDTCSTPR.SLCSTP is 0, the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD.

Do not enter Deep Software Standby mode while the flash memory is in programming or erasing procedure. In order to enter Deep Software Standby mode, execute a WFI instruction after programming or erasing procedure completes.

In External VDD mode, do not enter Deep Software Standby mode.

When PVDnCR0.RI (n = 1, 2) = 1 (selecting the voltage monitor n reset), the MCU enters Deep Software Standby mode 1 instead of Deep Software Standby mode 2 or 3, regardless of the setting in the LPSCR.LPMD. The I/O port states are same as Software Standby mode.

For the transition to Deep Software Standby mode, there is a procedure according to the CPUCLK frequency. For details, see section 10.8.10. Notes on transitioning to or canceling low power state

10.7.4.2 Canceling Deep Software Standby Mode

Deep Software Standby mode is canceled by:

- An available interrupt shown in Table 10.4
- A reset:
  - RES pin reset
  - Power-on reset
  - Voltage monitor reset
  - Reset caused by an IWDT underflow

1. Canceling by an interrupt
   Canceling by interrupts is controlled by DPSIERn (n = 0 to 3) and DPSIFRn (n = 0 to 3). When a Deep Software Standby Canceling interrupt is generated, the corresponding flag in DPSIFRn is set to 1. If the interrupt is enabled in DPSIERn, Deep Software Standby mode is canceled. Rising edge or falling edge can be selected by DPSIEGRn (n = 0 to 2). The interrupts for which an edge can be selected are the NMI, IRQ0-DS to IRQ15-DS, voltage monitor n (n = 1, 2) interrupts. When a Deep Software Standby mode canceling request occurs, the internal power is supplied and MOCO starts oscillating, and then the internal reset (Deep Software Standby reset) is generated for the entire MCU.

The stable MOCO clock is then supplied to the entire MCU and Deep Software Standby reset is canceled. And the MCU starts reset exception handling.
When Deep Software Standby mode is canceled by an external interrupt pin or internal interrupt signal, the RSTSR0.DPSRSTF flag is set to 1.

2. Canceling by RES pin reset
When the RES pin is driven low, the MCU cancels Deep Software Standby mode and enters the reset state. Make sure to keep RES pin low for the time period specified in the chapter of Electrical Specification. When RES pin is driven high after the specified time period, the CPU starts the reset exception handling.
3. Canceling by a power-on reset
Deep Software Standby mode is canceled by a power-on reset and the MCU starts the reset exception handling.
4. Canceling by a voltage monitor 0 reset
Deep Software Standby mode is canceled by a voltage monitor 0 reset from the voltage detection circuit and the MCU starts the reset exception handling.
5. Canceling by a voltage monitor n reset (n = 1, 2)
Deep Software Standby mode 1 is canceled by a voltage monitor n reset (n= 1,2))from the voltage detection circuit and the MCU starts the reset exception handling.
6. Canceling by a IWDT reset
Deep Software Standby mode 1 is canceled by a IWDT reset (an internal reset generated by IWDT underflow) and the MCU starts the reset exception handling.
However, IWDT stops in Deep Software Standby mode 1 and a IWDT reset for Canceling Deep Software Standby mode 1 is not generated in the following conditions:
   - OFS0.IWDTSTRT = 0 (auto start mode) and OFS0.IWDTSTPCTL = 1
   - OFS0.IWDTSTRT = 1 (register start mode) and IWDTCSTPR.SLCSTP = 1

10.7.4.3 Pin States when Deep Software Standby mode is Canceled

In Deep Software Standby mode, the I/O ports retain the same states as before transition to the Deep Software Standby mode. The MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled. Upon cancellation of Deep Software Standby mode, the reset exception handling starts immediately.

Whether to initialize the I/O ports or to retain the I/O port states as before transition to the Deep Software Standby mode can be selected by the DPSBYCR.IOKEEP bit.

- When the DPSBYCR.IOKEEP bit = 0
I/O ports are initialized by an internal reset generated when Deep Software Standby mode is canceled.
- When the DPSBYCR.IOKEEP bit = 1
Although the MCU is initialized by an internal reset generated when Deep Software Standby mode is canceled, I/O ports retain their states as before transition to the Deep Software Standby mode regardless of the MCU internal state. At this time, the I/O port states remain unchanged as before transition to the Deep Software Standby mode even if settings of I/O ports or peripheral modules are made. Then, the retained I/O port states are released by clearing the DPSBYCR.IOKEEP bit to 0, and the MCU operates according to the internal state.

The DPSBYCR.IOKEEP bit is not initialized by the internal reset signal (Deep Software Standby reset signal) that is the source to cancel the Deep Software Standby mode.

10.7.4.4 Example of Deep Software Standby Mode Application

(1) Entering and exiting Deep Software Standby mode

Figure 10.4 shows an example where a transition to Deep Software Standby mode is made at the falling edge of the IRQn-DS pin, and exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin. In this example, an IRQn interrupt is accepted with the IRQCRi.IRQMD[1:0] bits of the ICU set to 00b (falling edge). If MOCO is not operated, it must set MOCOCR.MCSTP to 0 (MOCO is operated).

Then, after the DPSIEGRy.DIRQnEG (y = 0 or 1, n = 0 to 15) bit is set to 1 (rising edge) and the LPSCR.LPMD bit is set to 0x8 or 0x9 or 0xA and CPU.SCR.SLEEPDEEP bit is set to 1, the WFI instruction is executed. Thus a transition to Deep Software Standby mode is made. After that, exiting Deep Software Standby mode is made at the rising edge of the IRQn-DS pin.

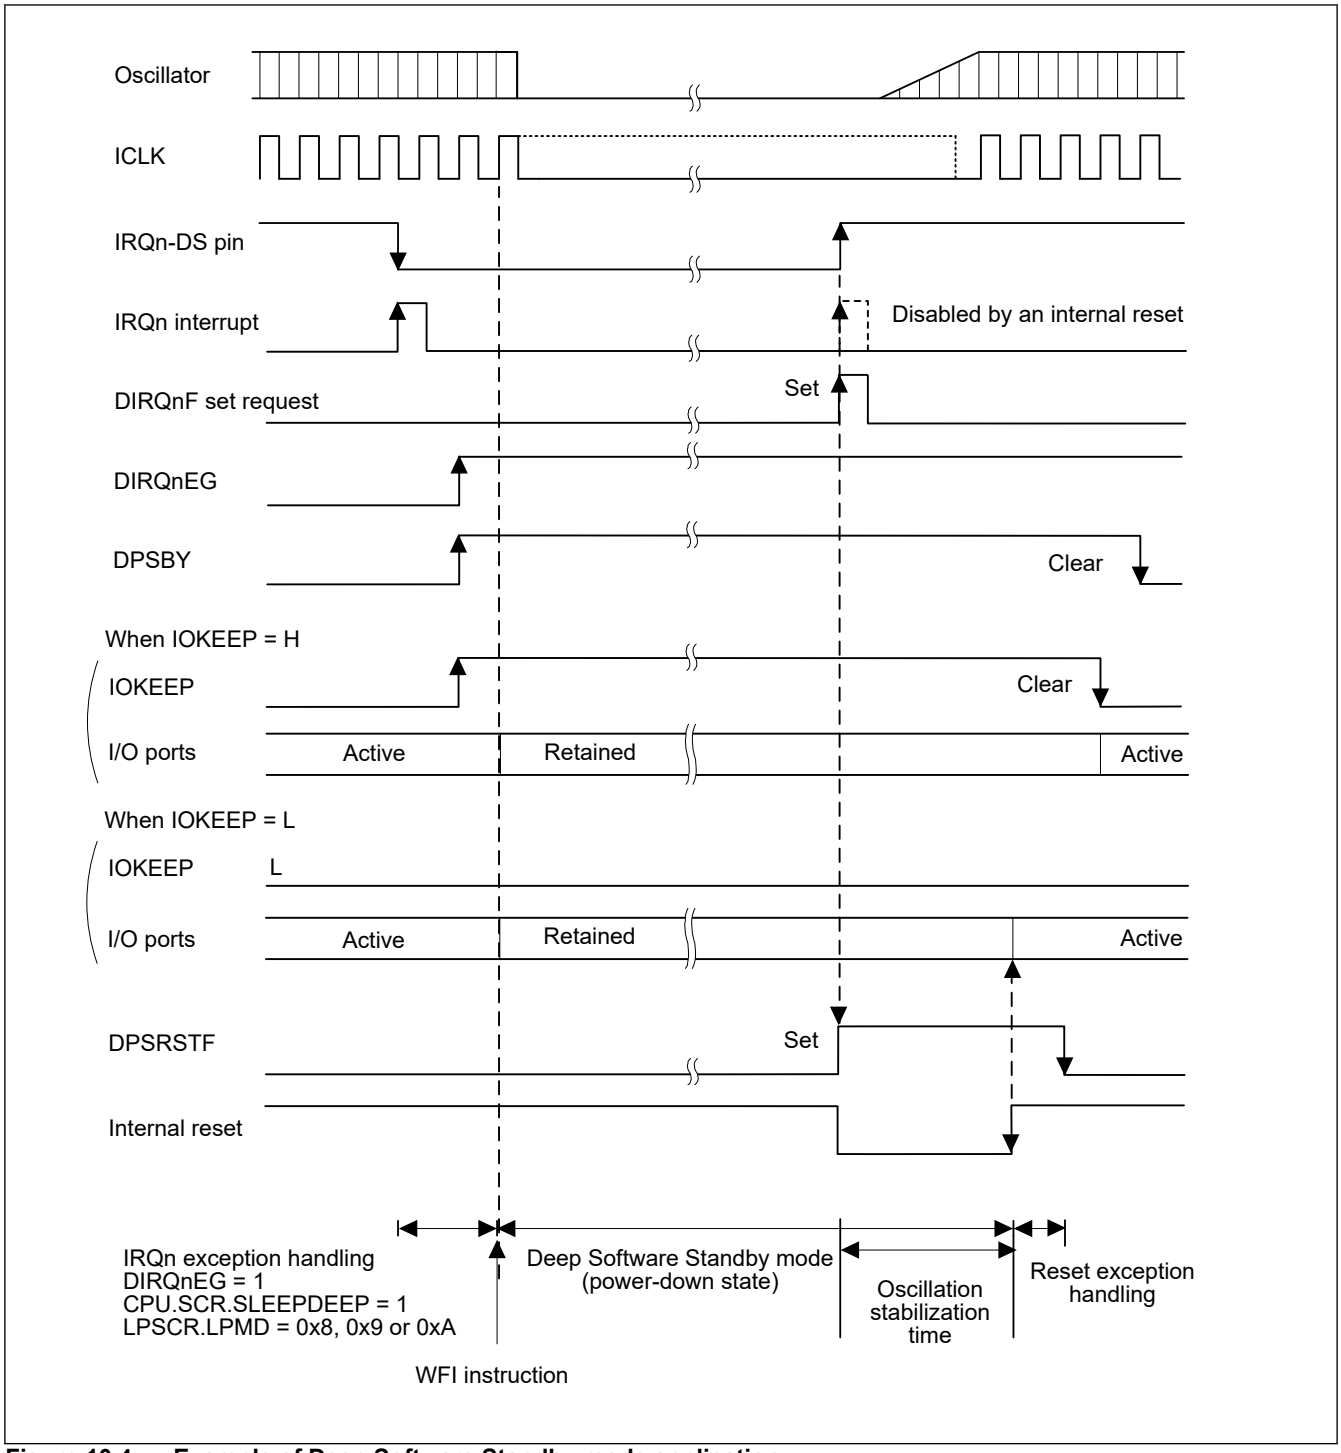

Figure 10.4 Example of Deep Software Standby mode application

10.7.4.5 Usage Flow for Deep Software Standby Mode

Figure 10.5 shows an example flow for using Deep Software Standby mode.

In this example, the RSTSR0.DPSRSTF flag of the reset function is read after the reset exception handling to determine whether a reset was generated by the RES pin or by the cancellation of Deep Software Standby mode.

For a reset by the RES pin, the MCU transitions to Deep Software Standby mode after the required register settings are made.

For a reset by cancellation of Deep Software Standby mode, the DPSBYCR.IOKEEP bit is cleared to 0 after the I/O port settings are made.

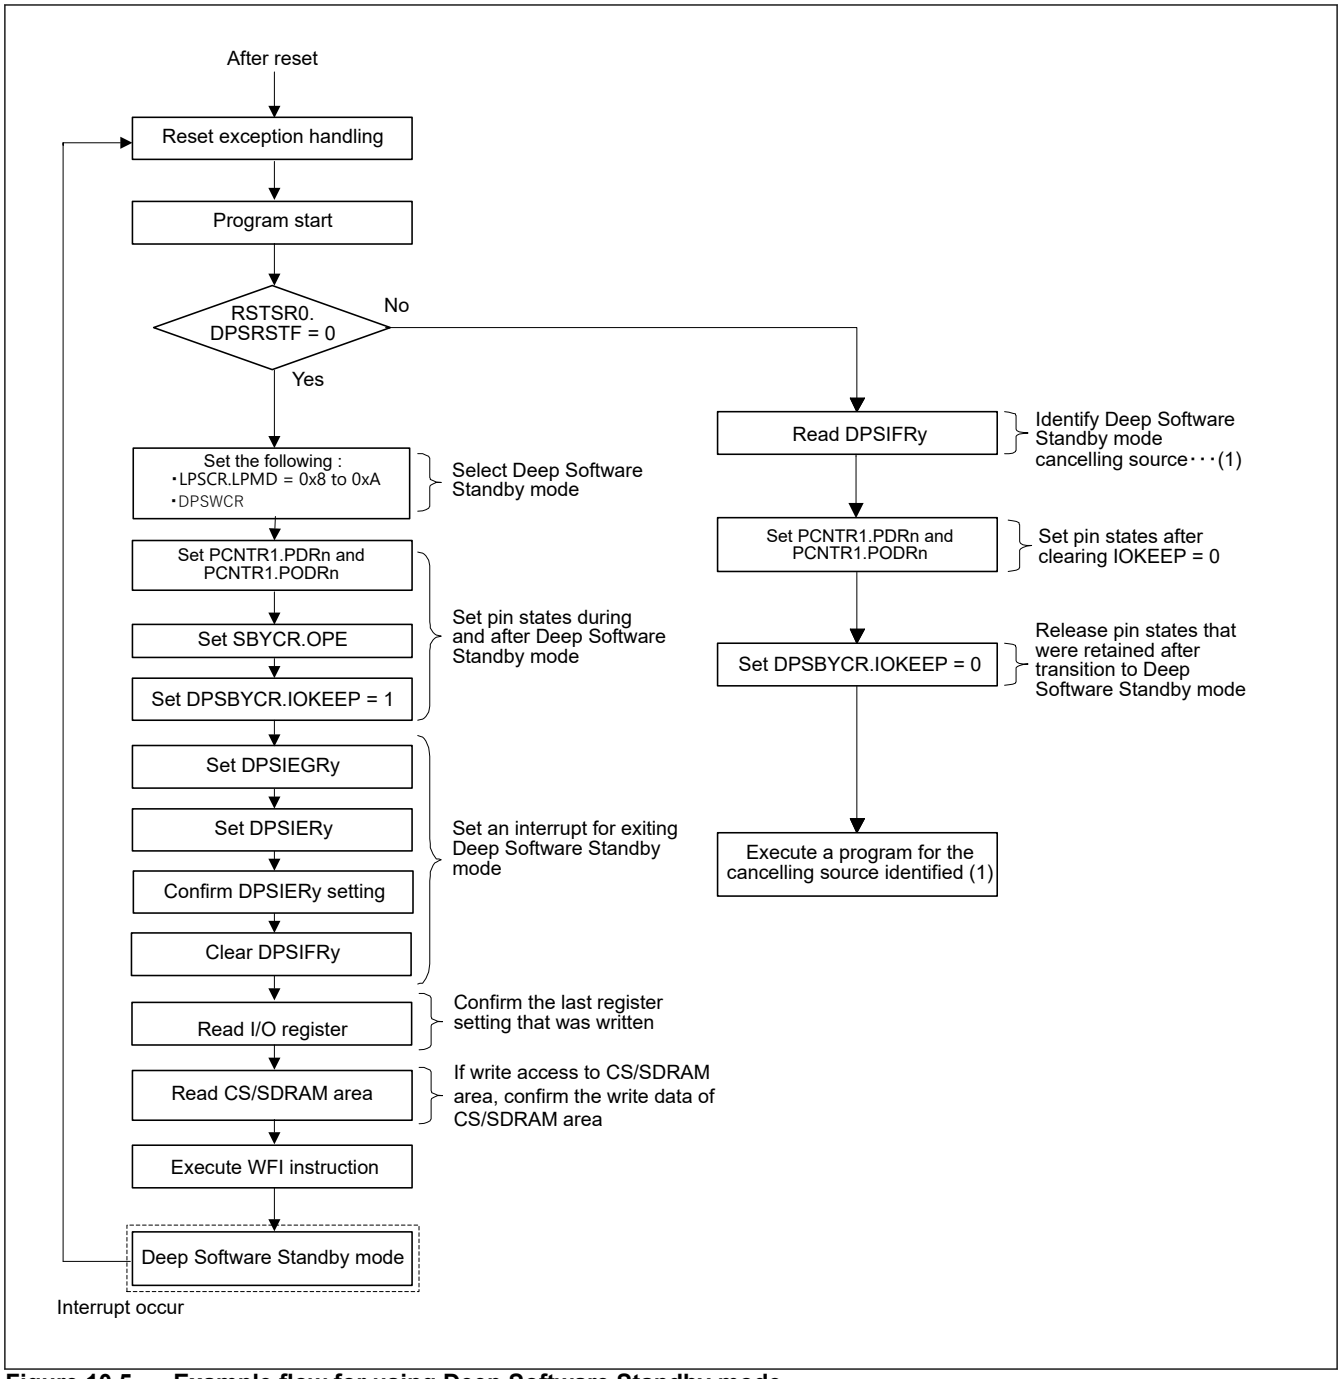

Figure 10.5 Example flow for using Deep Software Standby mode

10.8 Usage Notes

10.8.1 Register Access

(1) Invalid register write accesses during specific modes or transitions:

Do not write to registers under any of the conditions listed in this section.

[Registers]

- All registers with a peripheral name of “SYSTEM”.

[Conditions]

- OPCCR.OPCMTSF = 1 (during transition of operating power control mode)

- FENTRYR.FENTRYi = 1 (i = 0 to 3) or FENTRYR.FENTRYD = 1 (Flash P/E mode, dataFlash P/E mode)
- During the time period from executing a WFI instruction to returning to Normal mode

(2) Valid setting for the clock-related registers

Table 10.11 and Table 10.12 shows the valid setting of the clock related registers in each operating power control mode. Do not write any value other than the valid setting. Also, each register has some prohibited settings under certain condition other than the operating power control modes. See section 8, Clock Generation Circuit for another condition of each register.

Table 10.11 Valid setting of the clock related registers(1)

Mode	Valid settings		
	SCKSCR.CKSEL[2:0] CKOCR.CKOSEL[2:0]	PLLCR.PLLSTP	PLL2CR.PLL2STP
High-speed	000b (HOCO) 001b (MOCO) 010b (LOCO)*2 011b (MOSC) 100b (SOSC) 101b (PLL1P) *1	0 (operating) 1 (stop)	0 (operating) 1 (stop)
Low-speed	000b (HOCO) 001b (MOCO) 010b (LOCO)*2 011b (MOSC) 100b (SOSC)	1 (stop)	1 (stop)

Note 1. SCKSCR.CKSEL[2:0] only
Note 2. CKOCR.CKOSEL[2:0] only

Table 10.12 Valid setting of the clock related registers (2)

Operating oscillator	Valid settings
	OPCCR.OPCM[1:0]
PLL1, PLL2	00b
High-speed on-chip oscillator	00b, 11b

(3) Invalid register write accesses by the DTC or DMAC

Do not write to registers listed in this section by the DTC or DMAC.

[Registers]

- MSTPCRA
- MSTPCRB
- MSTPCRC
- MSTPCRD
- MSTPCRE

(4) Invalid write access when PRCR.PRC1 is 0

Write access to the registers listed below is invalid when PRCR.PRC1 bit is 0.

[Registers]

- OPCCR
- PDCTRGD
- PDRAMSCRn

- SBYCR
- SSCR1
- LPSCR
- DPSBYCR
- DPSIERn
- DPSIFRn
- DPSIEGRn
- PLL1LDOSCR
- PLL2LDOSCR
- HOCOLDOSCR
- LVOCR

(5) Invalid write access when PRCR.PRC4 is 0

Write access to the registers listed below is invalid when PRCR.PRC4 bit is 0.

[Registers]

- LPMSAR
- PGCSAR
- DPFSAR
- RSCSAR

10.8.2 I/O Port States

I/O port states in Software Standby mode, Deep Software Standby mode are as same as before entering the modes. Therefore, the supply current is not reduced while output signals are held high.

10.8.3 Module-Stop State of DMAC and DTC

Before writing 1 to MSTPCRA.MSTPA22, clear the DMAST.DMST bit of the DMAC and the DTCST.DTCST bit of the DTC to 0. For details, see section 16, DMA Controller (DMAC) and section 17, Data Transfer Controller (DTC)

10.8.4 Internal Interrupt sources

Interrupts do not operate in the module-stop state. If setting module-stop bit while an interrupt request is generated, a CPU interrupt source or a DMAC or DTC startup source cannot be cleared. For this reason, make sure to disable the corresponding interrupts before setting the module-stop bits.

10.8.5 Input Buffer Control by DIRQnE Bit

Setting the DPSIERy.DIRQnE (y = 0 or 1, n = 0 to 15) bit to 1 enables the input buffer of the IRQ0-DS to IRQ15-DS pins. Note that, although inputs to these pins are sent to the DPSIFRy.DIRQnF (y = 0 or 1, n = 0 to 15) bits, they are not sent to the interrupt controller, peripheral modules, and I/O ports.

10.8.6 Transition to Low Power Modes

Since the MCU does not support wakeup by event, do not enter low power modes (CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode) by executing a WFE instruction.

10.8.7 Timing of WFI Instructions

It is possible for the WFI instruction to be executed before I/O register and CS/SDRAM area writes are complete, in which case operation may not be as intended. This can happen if the WFI is placed immediately after a write to a I/O register and CS/SDRAM area. To avoid this problem it is advisable to read back the register and CS/SDRAM area that was written to confirm that the write has completed.

10.8.8 Writing WDT/IWDT registers by DMAC or DTC

Do not write registers in WDT or IWDT by DMAC or DTC while WDT or IWDT stops by entering Processer low power mode.

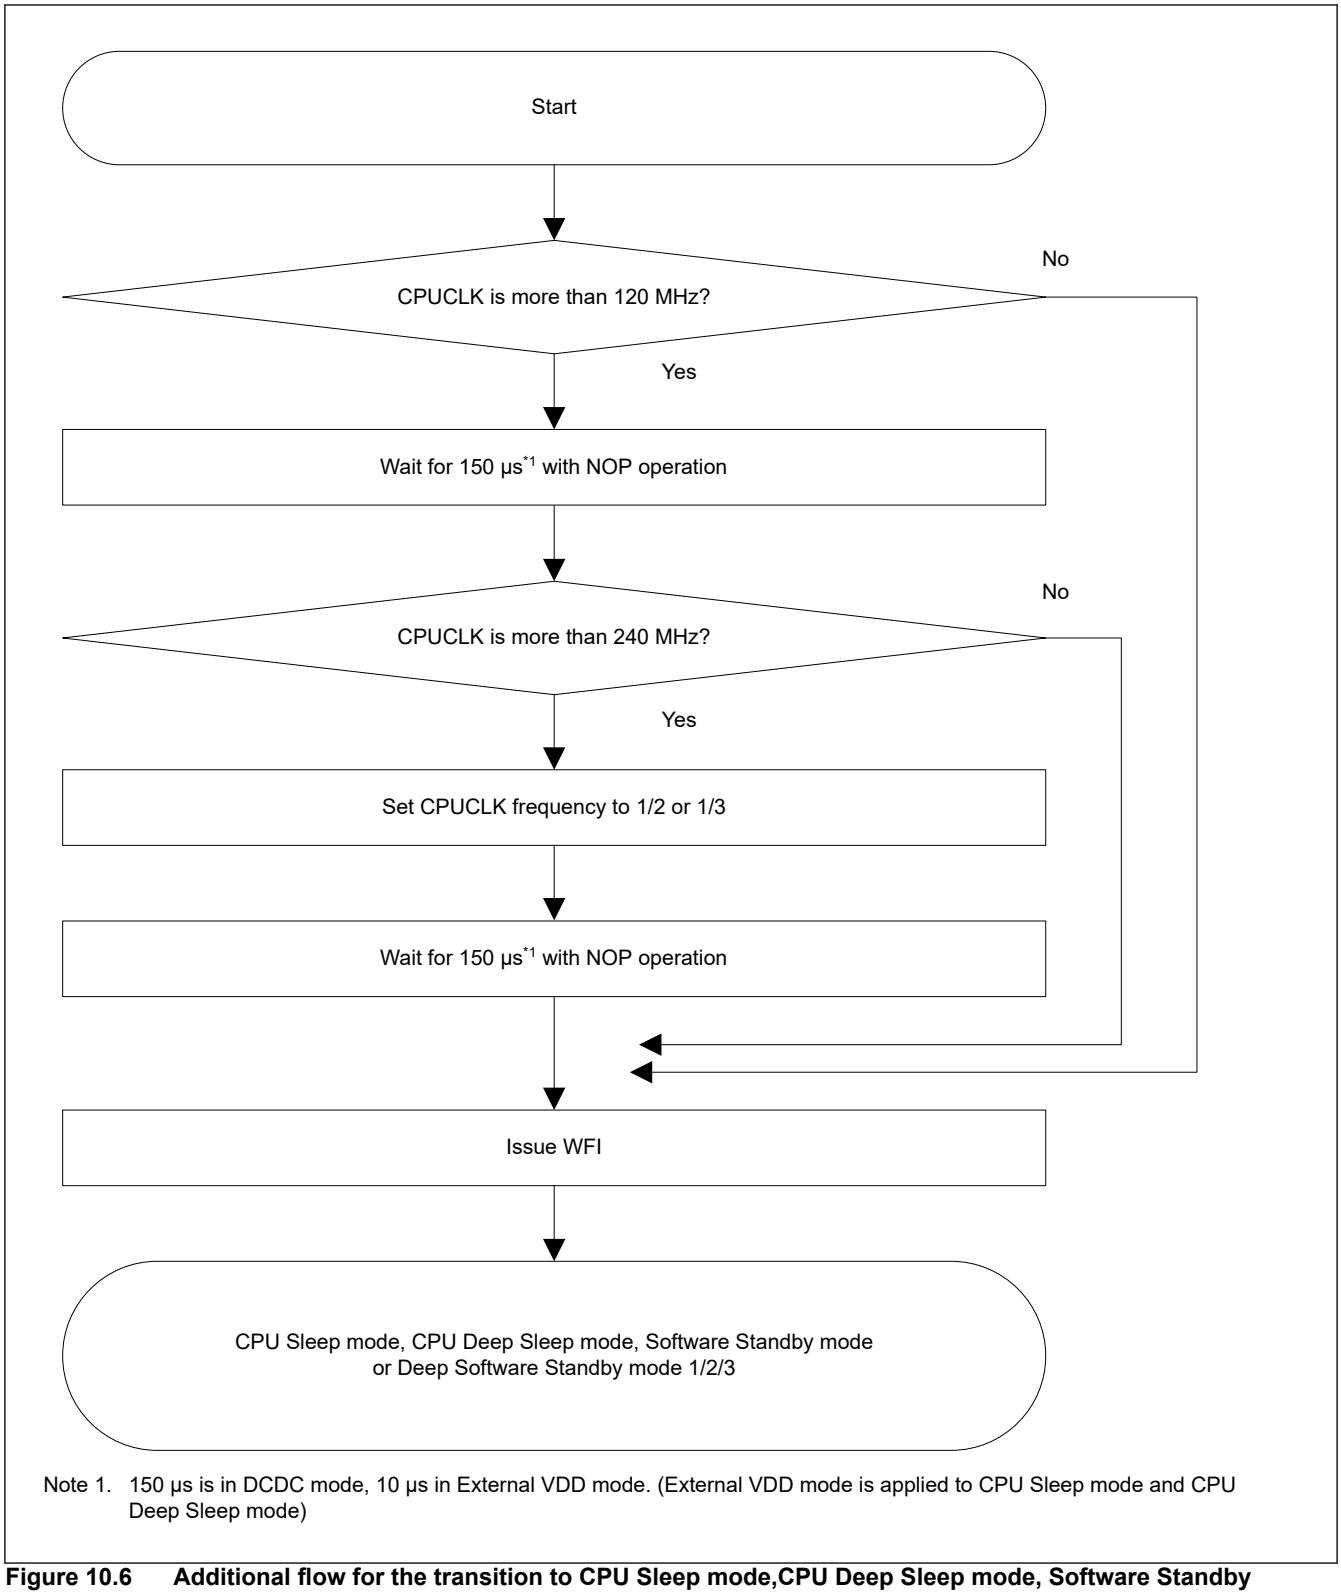
10.8.9 Module stop bit write timing

It is possible that the access to I/O register may be executed before the corresponding module stop bit write is completed. In this case, the access to I/O register may not proceed as intended. To avoid this issue, before accessing I/O register, read back the module stop bit that was written to confirm that the write completed.

10.8.10 Notes on transitioning to or canceling low power state

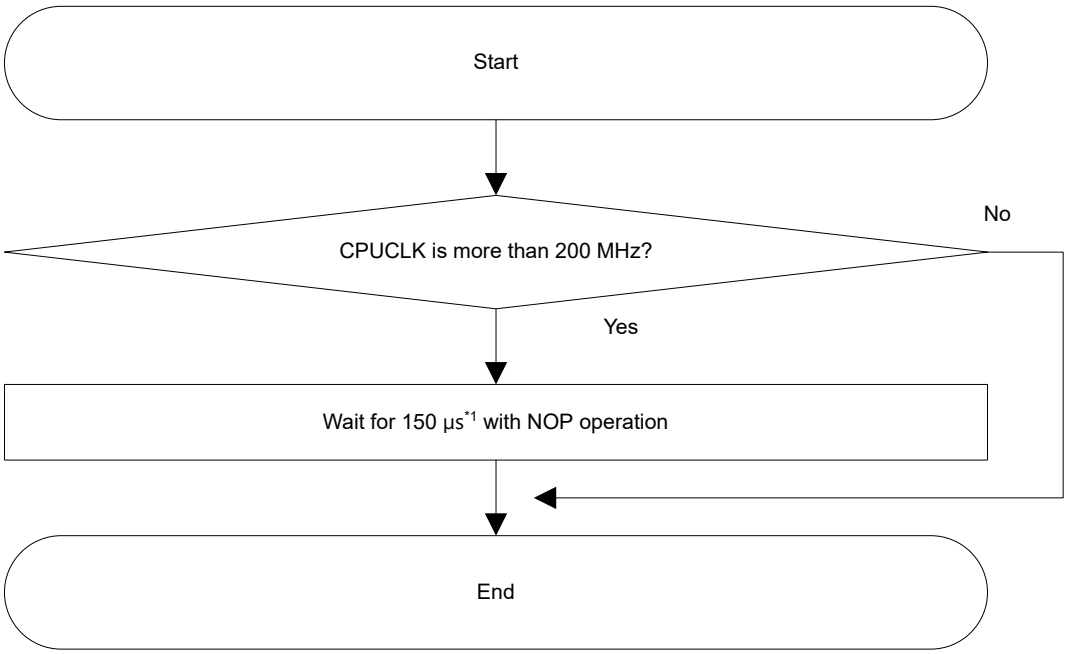
Transitioning to/returning from the low power state requires procedures according to the CPUCLK frequency.

These flows are shown in Figure 10.6, Figure 10.7 and Figure 10.8. It is recommended to use software to measure the wait time. Be sure to consider the worst-case conditions to ensure that the required wait time elapses. If an interrupt is unavoidably generated during the wait time, retry the measurement after return from the interrupt



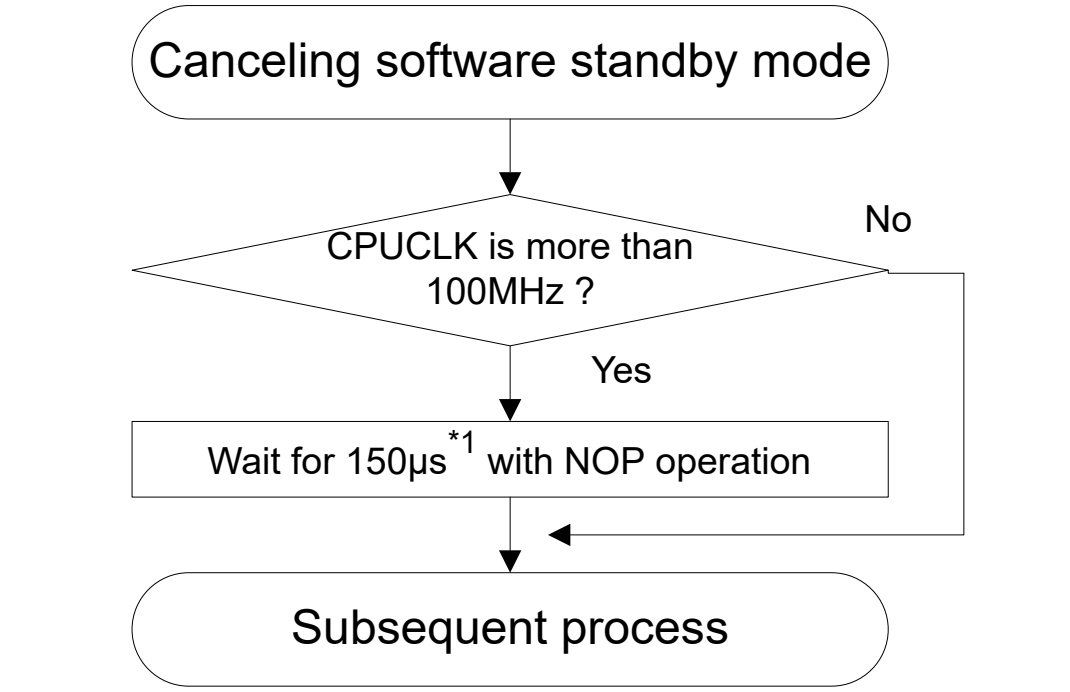
Note 1. 150 µs is in DCDC mode, 10 µs in External VDD mode. (External VDD mode is applied to CPU Sleep mode and CPU Deep Sleep mode)

Figure 10.6 Additional flow for the transition to CPU Sleep mode,CPU Deep Sleep mode, Software Standby mode and Deep Software Standby mode 1/2/3 according to CPUCLK frequency



Note 1. 150 µs is in DCDC mode, 10 µs in External VDD mode.

Figure 10.7 Additional flow for the return from CPU Deep Sleep mode according to CPUCLK frequency



Note 1. 150 µs is in DCDC mode, 10 µs in External VDD mode.

Figure 10.8 Additional flow for the canceling software standby mode

11. Battery Backup Function

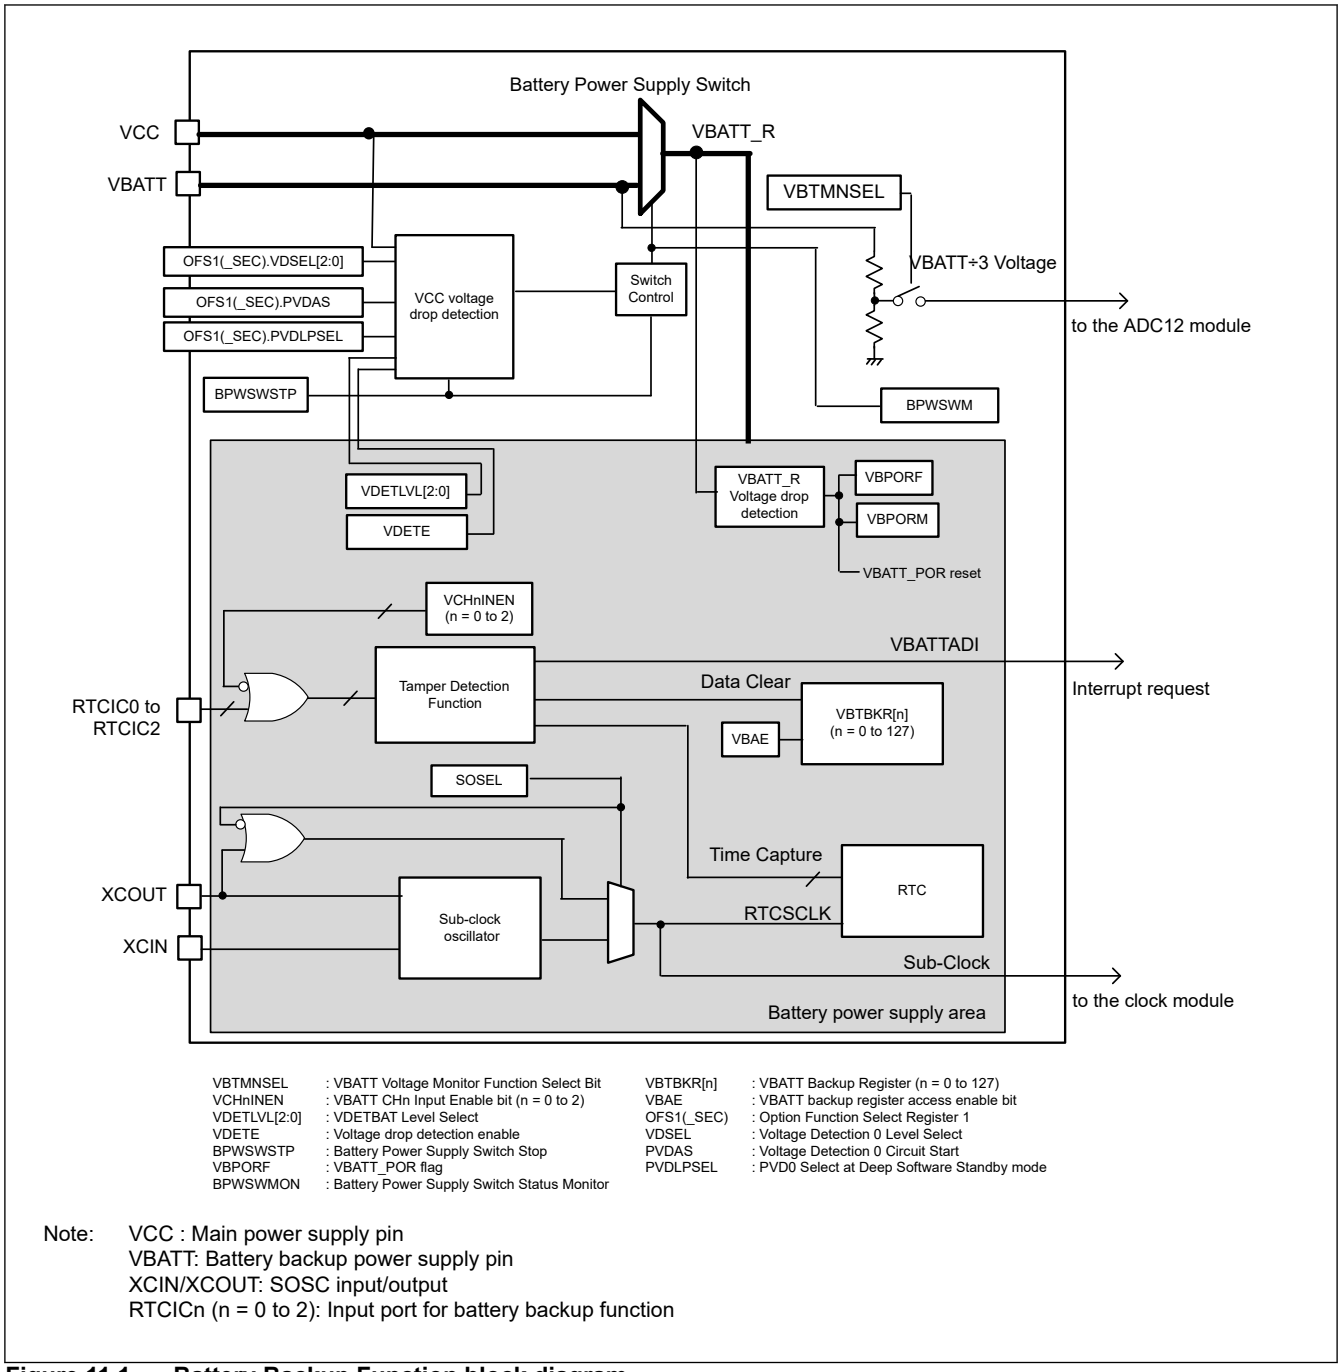
11.1 Overview

The MCU provides a battery backup function that maintains partial battery powering in the event of a power loss. Switching between VCC and VBATT, the battery-powered area includes RTC, SOSC, backup register, tamper detection and VBATT_R voltage drop detection. VBATT_R is the output voltage of the battery power supply switch. This is the power supply of the battery powered area.

During normal operation, the battery-powered area is powered by the main power supply, the VCC pin. When a VCC voltage drop is detected, the power source switches to the dedicated battery backup power pin, the VBATT pin. When the voltage rises again, the power source switches back from VBATT to VCC.

11.1.1 Battery backup function block diagram

Figure 11.1 shows the configuration of the battery backup function.



Note: VCC : Main power supply pin
VBATT: Battery backup power supply pin
XCIN/XCOUT: SOSC input/output
RTCICn (n = 0 to 2): Input port for battery backup function

Figure 11.1 Battery Backup Function block diagram

11.1.2 Features of Battery Backup Function

The features include:

- Battery power supply switch
- VBATT_R voltage drop detection function
- Backup registers
- Time capture pin detection
- Tamper Detection function
- VBATT voltage monitor function

11.1.3 Battery Power Supply Switch

When the voltage applied to the VCC pin drops, this feature switches the power supply from the VCC pin to the VBATT pin. When the voltage rises, it switches the power supply from the VBATT pin back to the VCC pin.

When VCC is lower than VDETBATT, and VCC is higher than VBAT, the injected current connects from the VCC to the VBATT pin through an internal diode. If the power supply battery connected to the VBATT pin cannot support this current injection, for example if the battery is not rechargeable, Renesas strongly recommends that you connect through a low-voltage threshold diode between the power supply battery and the VBATT pin.

It is necessary to enable voltage monitor 0 resets to use the battery backup function. The voltage monitor 0 level must be higher than the VBATT switch level.

11.1.4 VBATT_R voltage drop detection function

VBATT_R voltage drop detection function supports the battery-powered area. This function monitors the VBATT_R voltage level. VBATT_R is the output voltage of the battery power supply switch. This voltage drop detection causes a VBATT_POR reset and initializes the battery-powered area. See details in each register description. The VBATT status register includes a flag to check for this voltage drop detections.

11.1.5 Backup Registers

The battery-powered area provides 128-byte backup registers. These registers retain data when VBATT is supplied and VCC is powered off. When tampering is detected, data of backup register can be cleared to 0x00.

11.1.6 Time Capture Function

The RTC detects RTCICn (n = 0 to 2) pin input level change. For more information, see section 24, Realtime Clock (RTC).

11.1.7 Tamper Detection Function

The tamper detection function detects the RTCICn (n = 0 to 2) pin input event. The input event is defined as a change of RTCICn (n = 0 to 2) pin input level. The tamper detection flag is set to 1 by the input event . When interrupt is enabled and flag is set to 1, tamper detection interrupt is generated. When backup registers clear is enabled and flag is set to 1, the data of backup registers is cleared. Time Capture Function can select this flag as the source of the time capture trigger.

11.1.8 VBATT Voltage Monitor Function

VBATT voltage monitor function is to monitor the input voltage level to the VBATT pin. The voltage level can be monitored as analog signal. For more information, see section 45, 12-Bit A/D Converter (ADC12).

11.2 Register Descriptions

11.2.1 BBFSAR : Battery Backup Function Security Attribute Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0x3D0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	NONSEC4	NONSEC3	NONSEC2	NONSEC1	NONSEC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NONSEC0	Non Secure Attribute bit 0 Target register: VBATTMNSELR 0: Secure 1: Non Secure	R/W
1	NONSEC1	Non Secure Attribute bit 1 Target register: VBTBER 0: Secure 1: Non Secure	R/W
2	NONSEC2	Non Secure Attribute bit 2 Target register: VBTICTLR, VBTICTLR2, VBTIMONR 0: Secure 1: Non Secure	R/W
3	NONSEC3	Non Secure Attribute bit 3 Target register: VBTBPCR1, VBTBPCR2, VBTBPSR 0: Secure 1: Non Secure	R/W
4	NONSEC4	Non Secure Attribute bit 4 Target register: VBTADSR,VBTADCR1, VBTADCR2 0: Secure 1: Non Secure	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR register.

The BBFSAR register controls the secure attribute of the battery backup function registers.

NONSEC0 bit (Non Secure Attribute bit 0)

This bit controls the security attribute of VBATTMNSELR.

NONSEC1 bit (Non Secure Attribute bit 1)

This bit controls the security attribute of VBTBER.

NONSEC2 bit (Non Secure Attribute bit 2)

This bit controls the security attribute of VBTICTLR, VBTICTLR2, and VBTIMONR.

NONSEC3 bit (Non Secure Attribute bit 3)

This bit controls the security attribute of VBTBPCR1 and VBTADCR2.

NONSEC4 bit (Non Secure Attribute bit 4)

This bit controls the security attribute of VBTADSR, VBTADCR1 and VBTADCR2.

11.2.2 VBRSABAR : VBATT Backup Register Security Attribute Boundary Address Register

Base address: SYSC = 0x4001_E000

Offset address: 0x3B0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SABA[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	SABA[15:0]	Boundary address between secure and non-secure	R/W

Note: S-TYPE-6, P-TYPE-2

VBRSABAR specify the boundary address between Secure and Non-secure regions of VBATT Backup Register. This register specifies lower 16 bits of VBATT Backup Register address. Secure region is less than SABA. non-secure region is SABA or higher. The boundary address can set in units of 32 byte, so the value written from b4 to b0 should be 0. SABA has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Secure region : 0x4001_ED00 ≤ Address < 0x4001_0000 + SABA

Non-secure region : 0x4001_0000 + SABA ≤ Address

The initial value specifies an address greater than the end address of VBATT Backup Register, so all area is Secure.

If you specify all area of the VBATT Backup Register as non-secure, specify the top address in the VBATT Backup Register area.

11.2.3 VBRPABARS : VBATT Backup Register Privilege Attribute Boundary Address Register for Secure Region

Base address: SYSC = 0x4001_E000

Offset address: 0x3B4

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PABAS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PABAS[15:0]	Boundary address between privileged and unprivileged.	R/W

Note: S-TYPE-6, P-TYPE-2

VBRPABARS specify the boundary address between Privileged and Unprivileged areas in Secure region of VBATT Backup Register. This register further separates the Secure region of VBATT Backup Register set by VBRSABAR register into Privileged and Unprivileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABAS. Unprivileged area is PABAS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABAS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Secure region : 0x4001_ED00 ≤ Address < 0x4001_0000 + PABAS
0x4001_ED00 ≤ Address < 0x4001_0000 + SABA

This area that satisfies both address conditions.

Unprivileged area in Secure region : 0x4001_0000 + PABAS ≤ Address < 0x4001_0000 + SABA

The initial value specifies before the top address of the VBATT Backup Register, so all the Secure region is Unprivileged. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Secure region, specify VBRPABARS register to the 0xFFE0 .

This is to narrow the verification space of the target specification base verification.

11.2.4 VBRPABARNS : VBATT Backup Register Privilege Attribute Boundary Address Register for Non-secure Region

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3B8

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PABANS[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PABANS[15:0]	Boundary address between privileged and unprivileged.	R/W

Note: S-TYPE-7, P-TYPE-2

VBRPABARNS specify the boundary address between Privileged area and Unprivileged area in Non-secure region of VBATT Backup Register. This register further separates the Non-secure region of VBATT Backup Register set by VBRSABAR register into Privileged and Unprivileged areas. This register specifies lower 16 bits of VBATT Backup Register address. Privileged area is less than PABANS. Unprivileged area is PABANS or higher. The boundary address can set in units of 32byte, so the value written from b4 to b0 should be 0. PABANS has no effect other than VBATT backup register.

VBATT Backup register is separated as follows.

Privileged area in Secure region :	0x5001_0000 + SABA ≤ Address < 0x5001_0000 + PABANS
Unprivileged area in Secure region :	0x5001_0000 + PABANS ≤ Address 0x5001_0000 + SABA ≤ Address This area that satisfies both address conditions

The initial value specifies before the top address of VBATT Backup Register, so all the Non-secure region is Unprivileged. In this case, the setting of this register is actually ignored.

If you specify Privileged for the entire VBATT Backup Register that you have set as the Non-secure region, specify VBRPABARNS register to the 0xFFE0 .

This is to narrow the verification space of the target specification base verification

11.2.5 VBATTMNSELR : Battery Backup Voltage Monitor Function Select Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA84

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	VBTMNSEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTMNSEL	VBATT Voltage Monitor Function Select Bit 0: Disables VBATT voltage monitor function 1: Enables VBATT voltage monitor function	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC3 bit to 1 (write enabled) before rewriting this register.

VBATTMNSELR is the register which controls VBATT voltage monitor function.

This register is initialized by all reset sources except VBATT_POR reset.

VBTMNSEL bit (VBATT Voltage Monitor Function Select Bit)

Select VBATT low voltage monitor function. After setting this bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize.

Consumption current increases while VBTMNSEL = 1. So, after monitoring the VBATT voltage level, clear VBTMNSEL to 0 in order to reduce power consumption of VBATT power supply.

For more information on t_{MONWT}, see section 60, Electrical Characteristics

11.2.6 VBTBER : VBATT Backup Enable Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	VBAE	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	VBAE	VBATT backup register access enable bit 0: Disable to access VBTBKR[n] 1: Enable to access VBTBKR[n]	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBAE bit is initialized by the power on reset of VCC or after transition to VBATT mode.

VBAE bit (VBATT backup register access enable bit)

You must write 1 to VBAE before accessing VBTBKR[n] (n = 0 to127) and you must write 0 to VBAE after finishing all access (write or read) to VBTBKR[n]. If you do not write 0 to VBAE, the data of VBTBKR[n] is not kept in VBATT mode.

Also, while VBAE is set to 0, the value of VBTBKR[n] can be retained even if the VDD power supply and VCC power supply are powered off.

To access VBTBKR[n], wait for at least 500 ns after writing 1 to VBAE, and then access VBTBKR[n].

Before entering the Deep Software Standby mode, you must write 0 to VBAE.

Wait at least 250 ns after writing 0 to VBAE, before entering the Deep Software Standby mode.

If it is not used VBTBKR[n], It shouid be changed VBAE to 0 to reduce power consumption of VBTBKR[n].

11.2.7 VBTBKR[n] : VBATT Backup Register (n = 0 to 127)

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xD00 + 0x001 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	n/a	VBATT Backup Register The value of this register is retained even in VBATT mode. This register is not initialized by any reset sources.	R/W

Note: S-TYPE-3, P-TYPE-3

VBTBKR[n] bits (VBATT Backup Register)

The value of this register is retained even in VBATT mode.

You can use 32 ,16 or 8-bit access instruction when accessing the VBTBKR[n] register. When accessing, please note that the byte order of the data stored in the VBTBKR[n] register is little endian.

The data of VBTBKR[n] register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

Table 11.1 Address of VBATT Backup Register for Secure Region

Address	Symbol
0x4001_ED00 to 0x4001_ED0F	VBTBKR[0] to VBTBKR[15]
0x4001_ED10 to 0x4001_ED1F	VBTBKR[16] to VBTBKR[31]
0x4001_ED20 to 0x4001_ED2F	VBTBKR[32] to VBTBKR[47]
0x4001_ED30 to 0x4001_ED3F	VBTBKR[48] to VBTBKR[63]
0x4001_ED40 to 0x4001_ED4F	VBTBKR[64] to VBTBKR[79]
0x4001_ED50 to 0x4001_ED5F	VBTBKR[80] to VBTBKR[95]
0x4001_ED60 to 0x4001_ED6F	VBTBKR[96] to VBTBKR[111]
0x4001_ED70 to 0x4001_ED7F	VBTBKR[112] to VBTBKR[127]

11.2.8 VBTICTLR : VBATT Input Control Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2INEN	VCH1INEN	VCH0INEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VCH0INEN	VBATT CH0 Input Enable 0: RTCIC0 input disable 1: RTCIC0 input enable	R/W
1	VCH1INEN	VBATT CH1 Input Enable 0: RTCIC1 input disable 1: RTCIC1 input enable	R/W
2	VCH2INEN	VBATT CH2 Input Enable 0: RTCIC2 input disable 1: RTCIC2 input enable	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: Note: S-TYPE-3, P-TYPE-2
Note: Set the PRCR.PRC1 bit to 1 (write enabled) before rewriting this register.

VBTICTLR is the register that can select RTCICn (n = 0 to 2) pin as input. This register is only initialized by VBATT_POR reset.

VCHnINEN bits (VBATT CHn Input Enable Bits) (n = 0 to 2)

The VCHnINEN bits enable the input direction on the RTCICn. A wait time of 50 µs is required for the operation to stabilize after the RTCICn pin input is enabled. If VCC voltage of the MCU is lower than 1.8V and these bits are set to 1, RTC registers and VBTBKR[n] (n = 0 to127) can be accessed 20 µs after the setting of this bit.

11.2.9 VBTICTLR2 : VBATT Input Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VCH2EG	VCH1EG	VCH0EG	—	VCH2NCE	VCH1NCE	VCH0NCE
Value after reset:	0	1	1	1	0	0	0	0

Bit	Symbol	Function	R/W
0	VCH0NCE	VBATT CH0 Input Noise Canceler Enable 0: RTCIC0 pin input noise canceler disable 1: RTCIC0 pin input noise canceler enable	R/W
1	VCH1NCE	VBATT CH1 Input Noise Canceler Enable 0: RTCIC1 pin input noise canceler disable 1: RTCIC1 pin input noise canceler enable	R/W
2	VCH2NCE	VBATT CH2 Input Noise Canceler Enable 0: RTCIC2 pin input noise canceler disable 1: RTCIC2 pin input noise canceler enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VCH0EG	VBATT CH0 Input Edge Select 0: RTCIC0 pin input event is detected on falling edge 1: RTCIC0 pin input event is detected on rising edge	R/W
5	VCH1EG	VBATT CH1 Input Edge Select 0: RTCIC1 pin input event is detected on falling edge 1: RTCIC1 pin input event is detected on rising edge	R/W
6	VCH2EG	VBATT CH2 Input Edge Select 0: RTCIC2 pin input event is detected on falling edge 1: RTCIC2 pin input event is detected on rising edge	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

VBTICTLR2 is the register that can select RTCICn (n = 0 to 2) pin input mode. This register is only initialized by VBATT_POR reset.

VCHnNCE bits (VBATT CHn Input Noise Canceler Enable) (n = 0 to 2)

The VCHnNCEN bit enables the input noise canceler on the RTCICn (n = 0 to 2) pin input.

VCHnEG bits (VBATT CHn Input Edge Select) (n = 0 to 2)

The VCHnEG bit selects input event detection edge to set VBTADFn flag.

11.2.10 VBTIMONR : VBATT Input Monitor Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VCH2MON	VCH1MON	VCH0MON
Value after reset:	0	0	0	0	0	x	x	x

Bit	Symbol	Function	R/W
0	VCH0MON	VBATT CH0 Input monitor 0: RTCIC0 pin input is low level 1: RTCIC0 pin input is high level.	R
1	VCH1MON	VBATT CH1 Input monitor 0: RTCIC1 pin input is low level 1: RTCIC1 pin input is high level	R
2	VCH2MON	VBATT CH2 Input monitor 0: RTCIC2 pin input is low level 1: RTCIC2 pin input is high level.	R
7:3	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-2

VBTIMONR is the register that can monitor RTCICn (n = 0 to 2) pin input level.

VCHnMON bits (VBATT CHn Monitor) (n = 0 to 2)

The VCHnMON bit indicates input level on the RTCICn (n = 0 to 2) pin.

11.2.11 VBTBPCR1 : VBATT Battery Power Supply Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xA88

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BPWSWSTP
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BPWSWSTP	Battery Power Supply Switch Stop 0: Battery power supply switch enable 1: Battery power supply switch stop	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR1 register controls battery power supply switch. This register is initialized by all reset sources except Deep Software Standby reset and VBATT_POR reset.

BPWSWSTP bit (Battery Power Supply Switch Stop)

The BPWSWSTP bit can enable switching the backup module supply power source from VCC to VBATT when the voltage applied to the VCC pin drops.

When stop is selected, the battery backup module power supply is always from VCC. Set the VDETE bit to 0 after setting theBPWSWSTP bit to 1. The BPWSWSTP bit must not be set from 1 to 0 while the VDETE bit is 1. If this setting is made, the state of the backup power area cannot be guaranteed.

11.2.12 VBTBPCR2 : VBATT Battery Power Supply Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC45

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	VDETE	—	VDETLVL[2:0]		
Value after reset:	0	0	0	0	0	1	0	0

Bit	Symbol	Function	R/W
2:0	VDETLVL[2:0]	V_{DETBAT} Level Select 0 0 0: 2.80 V 0 0 1: 2.53 V 0 1 0: 2.10 V 0 1 1: 1.95 V 1 0 0: 1.85 V 1 0 1: 1.75 V 1 1 0: setting prohibited 1 1 1: setting prohibited	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VDETE	Voltage drop detection enable 0: VCC Voltage drop detection disable 1: VCC Voltage drop detection enable	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPCR2 register controls battery power supply switch. This register is only initialized by VBATT_POR reset.

VDETLVL[2:0] bits (V_{DETBAT} Level Select)

The VDETLVL[2:0] bit selects V_{DETBAT} level. When the voltage of the VCC pin drops below V_{DETBAT}, the power supply source switches from the VCC pin to the VBATT pin. The V_{DETBAT} level should be below Voltage monitoring 0 level.

This MCU can reduce power consumption of the Deep Software Standby mode 1 or 2. When the MCU enters the Deep Software Standby mode 1 or 2 and the low power consumption function of voltage monitor 0 is enabled by OFS1(_SEC).PVDLPSEL bit and OFS1(_SEC).PVDAS bit, the battery power supply switch is controlled by the voltage monitor 0.

The VDETLVL[2:0] bit should change while the VDETE bit is 0. The VCC voltage detection function needs t_{DETWT} wait time for stabilization at the change of V_{DETBAT} level. The VDETE bit should be set to 1 after this wait time.

For details on VDETLVL[2:0] bit, see section 11.3.2. VBATT Battery Power Supply Switch Usage.

For more information on t_{DETWT}, see section 60, Electrical Characteristics.

VDETE bit (Voltage drop detection enable)

The VDETE bit enables the VCC voltage drop detection function for the battery power supply switch. The initial value of the VDETE bit is 0, at this time, the VCC voltage drop detection function for the battery power supply switch is disabled. If you use the battery power supply switch function, you must select V_{DETBAT} level and enables the VCC voltage drop detection function.

For details on VDETE bit, see section 11.3.2. VBATT Battery Power Supply Switch Usage.

11.2.13 VBTBPSR : VBATT Battery Power Supply Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC46

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BPWSWM	VBPORM	—	—	—	VBPORF
Value after reset:	0	0	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	VBPORF	VBATT_POR Flag 0: VBATT_R voltage drop is not detected 1: VBATT_R voltage drop is detected	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
4	VBPORM	VBATT_POR Monitor 0: VBATT_R voltage < $V_{PDR\ (BATR)}$ 1: VBATT_R voltage > $V_{PDR\ (BATR)}$	R
5	BPWSWM	Battery Power Supply Switch Status Monitor 0: VCC voltage < $V_{DETBATT\_m}$ 1: VCC voltage > $V_{DETBATT\_m}$	R
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTBPSR register indicate battery power supply status.

VBPORF bit (VBATT_POR Flag)

The VBPORF flag indicates that VBATT_R voltage drop was detected and VBATT_POR reset was asserted.

[Setting condition]

- When VBATT_R voltage drops below $V_{PDR\ (BATR)}$.

[Clearing conditions]

- When 0 is written.

VBPORM bit (VBATT_POR Monitor)

The VBPORM bit indicates comparison result between VBATT_R and $V_{PDR\ (BATR)}$.

BPWSWM bit (Battery Power Supply Switch Status Monitor)

The BPWSWM bit indicates comparison result between VCC and $V_{DETBATT\_m}$ (m = 0 to 6).

11.2.14 VBTADSR : VBATT Tamper detection Status Register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC48

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBTADF2	VBTADF1	VBTADF0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADF0	VBATT Tamper Detection flag 0 0: RTCIC0 input edge is not detected 1: RTCIC0 input edge is detected	R/W
1	VBTADF1	VBATT Tamper Detection flag 1 0: RTCIC1 input edge is not detected 1: RTCIC1 input edge is detected	R/W
2	VBTADF2	VBATT Tamper Detection flag 2 0: RTCIC2 input edge is not detected 1: RTCIC2 input edge is detected	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADSR register indicate tamper detection function status. This register is only initialized by VBATT_POR reset.

VBTADFn flags (VBATT Tamper Detection flag n) (n = 0, 1, 2)

The VBTADFn (n = 0, 1, 2) flag indicates that RTCICn (n = 0, 1, 2) input edge is detected. The edge type of RTCICn (n = 0, 1, 2) input can be selected by VCHnEG (n = 0, 1, 2) bit.

[Setting condition]

- When RTCICn (n = 0, 1, 2) input edge is detected.

[Clearing conditions]

- When 0 is written after 1 is read from VBTADFn (n = 0, 1, 2) flag.

11.2.15 VBTADCR1 : VBATT Tamper detection Control Register 1

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC49

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	VBTADCE2	VBTADCE1	VBTADCE0	—	VBTADIE2	VBTADIE1	VBTADIE0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBTADIE0	VBATT Tamper Detection Interrupt Enable 0 0: Interrupt by VBTADF0 flag is disable 1: Interrupt by VBTADF0 flag is enable	R/W
1	VBTADIE1	VBATT Tamper Detection Interrupt Enable 1 0: Interrupt by VBTADF1 flag is disable 1: Interrupt by VBTADF1 flag is enable	R/W
2	VBTADIE2	VBATT Tamper Detection Interrupt Enable 2 0: Interrupt by VBTADF2 flag is disable 1: Interrupt by VBTADF2 flag is enable	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	VBTADCE0	VBATT Tamper Detection Backup Register Clear Enable 0 0: Clear Backup Register by VBTADF0 flag is disable 1: Clear Backup Register by VBTADF0 flag is enable	R/W
5	VBTADCE1	VBATT Tamper Detection Backup Register Clear Enable 1 0: Clear Backup Register by VBTADF1 flag is disable 1: Clear Backup Register by VBTADF1 flag is enable	R/W
6	VBTADCE2	VBATT Tamper Detection Backup Register Clear Enable 2 0: Clear Backup Register by VBTADF2 flag is disable 1: Clear Backup Register by VBTADF2 flag is enable	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR1 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBTADIEn bits (VBATT Tamper Detection Interrupt Enable) (n = 0, 1, 2)

The VBTADIEn (n = 0, 1, 2) bit enables Tamper detection interrupt.

VBTADCEn bits (VBATT Tamper Detection Backup Register Clear Enable) (n = 0, 1, 2)

The VBTADCEn (n = 0, 1, 2) bit enables backup register clearing by tamper detection flag.

11.2.16 VBTADCR2 : VBATT Tamper detection Control Register 2

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xC4A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	VBRTCES2	VBRTCES1	VBRTCES0
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	VBRTCES0	VBATT RTC Time Capture Event Source Select 0 0: RTCIC0 1: VBTADF0	R/W
1	VBRTCES1	VBATT RTC Time Capture Event Source Select 1 0: RTCIC1 1: VBTADF1	R/W
2	VBRTCES2	VBATT RTC Time Capture Event Source Select 2 0: RTCIC2 1: VBTADF2	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

The VBTADCR2 register control tamper detection functions. This register is only initialized by VBATT_POR reset.

VBRTCESn bits (VBATT RTC Time Capture Event Source Select) (n = 0, 1, 2)

The VBRTCESn (n = 0, 1, 2) bit selects RTC time capture event source.

11.3 Operation

11.3.1 Battery Backup Function

When the voltage on the VCC pin drops, power can be supplied to the VBATT_R backup power area from the VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DETBATT\_m}$ (m = 0 to 6). When a drop of power supply from VCC pin is detected, backup power area enter the VBATT Mode. In the VBATT Mode, power supply is switched to VBATT pin. The power supply from the VCC pin is resumed when the voltage on the VCC pin exceeds $V_{DETBATT\_m}$ (m = 0 to 6). This power supply change does not affect the VBATT_R backup power area function.

It is necessary to enable voltage monitor 0 reset to use the battery backup

The VBATT_R backup power area include following functions:

- RTC (including time capture detection, triggered by a change of the time capture pin input level)
- Sub-clock oscillator (including XCIN and XCOUT pins)
- VBATT Backup Register
- Tamper Detection Function
- VBATT Voltage Monitor Function

Table 11.2 shows the operating states in VBATT mode.

Table 11.2 Operating States in VBATT Mode (1 of 2)

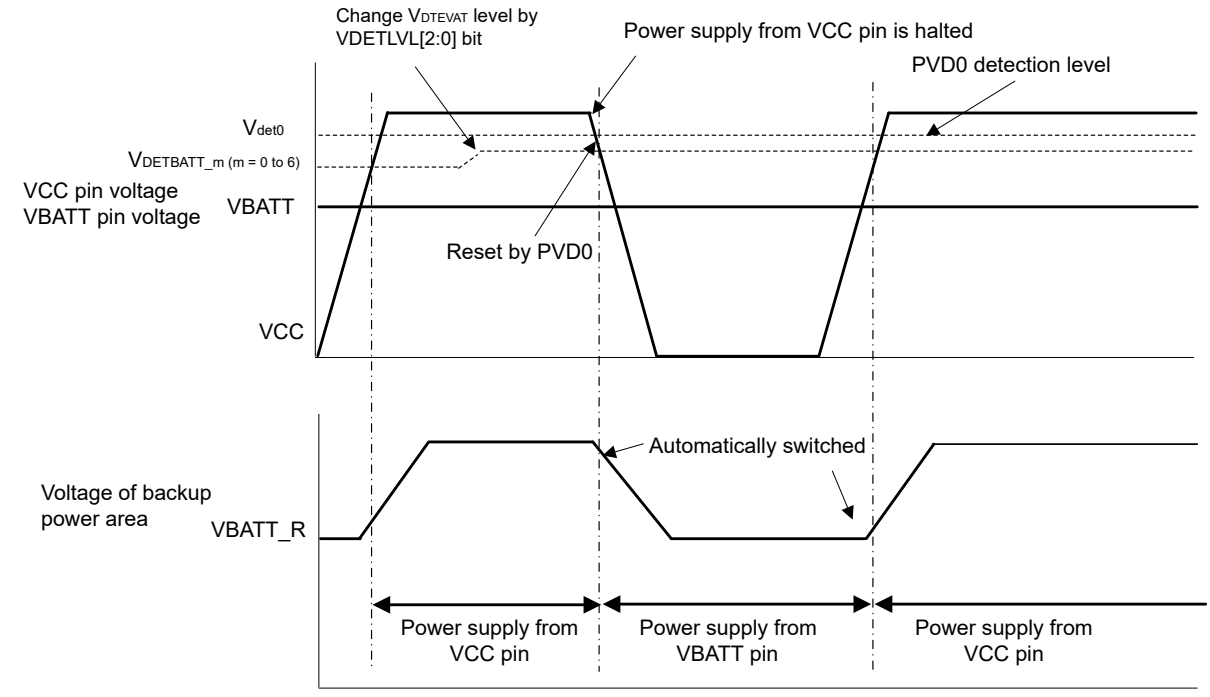
Operating state	VBATT Mode
Transition condition	Detection of VCC voltage drop
Canceling method other than reset	Detection of VCC voltage rise
State after cancellation by an interrupt	—

Table 11.2 Operating States in VBATT Mode (2 of 2)

Operating state	VBATT Mode
State after cancellation by a reset	—
Main clock oscillator	Stop
Sub-clock oscillator	Operating or not operating can be selected by SOSCCR.SOSTP bit. The status of the oscillator is same as before entering VBATT mode.
High-speed on-chip oscillator	Stop
Middle-speed on-chip oscillator	Stop
Low-speed on-chip oscillator	Stop
PLL1	Stop
PLL2	Stop
CPU	Stop (Undefined)
SRAM (ECC RAM included)	Stop (Undefined)
Standby SRAM	Stop (Undefined)
VBATT Backup Register	Stop (Retained or zeroized is selectable when Tamper input was detected.)
Flash memory	Stop (Retained)
Realtime clock (RTC)	Selectable when selecting clock which is operating as the count source.
Programmable voltage detection circuit (PVD)	Stop
Power-on reset circuit	Stop
Other Peripheral modules	Stop (Undefined)
I/O ports	RTCICn ports (n = 0 to 2): Selectable EXCIN: Selectable All ports not specified here: Undefined

Note: Stop (Retained) means that the contents of the internal registers are retained but the operations are suspended.
Note: Stop (Undefined) means that the contents of the internal registers are undefined and power to the internal circuit is cut off.

Figure 11.2 shows switching sequence of Battery backup function.



Note: For details, see section 60, Electrical Characteristics.
Note 1. $V_{DETBATT}$ indicates the threshold level of the power supply change between the VCC pin and the VBATT pin.

Figure 11.2 Switching sequence of battery backup function

11.3.2 VBATT Battery Power Supply Switch Usage

The battery power supply switch can switch the power supply from the VCC pin to the VBATT pin when the voltage being applied to the VCC pin drops. When the voltage rises, this switch changes the power supply from the VBATT pin to the VCC pin.

The VCC voltage drop detection function for the battery power supply switch in "Figure 11.1" consists of two voltage drop detectors. One is a VCC drop detector for normal operation of the battery power supply switch that operates according to the settings of the VDTETLVL[2:0] bit and the VDETE bit. The other is voltage monitoring 0 to reduce power consumption during the Deep Software Standby mode 1 or 2.

In cold start, VDETE bit is initialized by VBATT_POR reset and the VCC voltage drop detection function for the battery power supply switch is disabled.

To use the battery power supply switch, the proper $V_{DETBATT\_m}$ (m = 0 to 6) level must be selected by VDETLVL[2:0] bits and wait t_{DETWT} for stabilization. After wait, the VCC voltage drop detection function is enabled by VDETE bit. The battery power supply switch has a constraint that the $V_{DETBATT\_m}$ (m = 0 to 6) level selected by VDETLVL[2:0] bits should be below Voltage monitoring 0 level.

When the MCU transitions to the Deep Software Standby mode 1 or 2 and the low power consumption function of voltage monitor 0 is enabled, the VCC drop detector for normal operation of the battery power supply switch is stopped to reduce power consumption. At this time, the power supply switch is controlled by the voltage monitor 0. This control by voltage monitor 0 continues until it returns from Deep Software Standby mode.

The battery backup function should be used after the voltage monitoring 0 reset is enabled (OFS1(_SEC).PVDAS bit is 0).

When the low power consumption function of voltage monitor 0 is enabled by OFS1(_SEC).PVDLPSEL bit, the voltage monitor 1 and 2 must be disabled before enter the Deep Software Standby mode 1 or 2.

If you don't use battery power supply switch. You must set BPWSWSTP bit to 1 and short the VCC and VBATT pins. When BPWSWSTP bit is 1, switch is stop, and power is always supplied from VCC pin.

11.3.3 VBATT_R voltage drop detection function Usage

This function enables to detect VBATT_R voltage drop. When VBATT_R voltage is drop and lower than $V_{PDR\ (BATR)}$, VBATT_POR reset is asserted. The VBPORF flag is set to 1 by VBATT_POR reset. If VBPORF flag is 1, RTC counter and register is invalid and Battery Backup Function registers are reset. You must initialize the functions included backup power area.

Figure 11.3 shows VBATT_R voltage drop detection function.

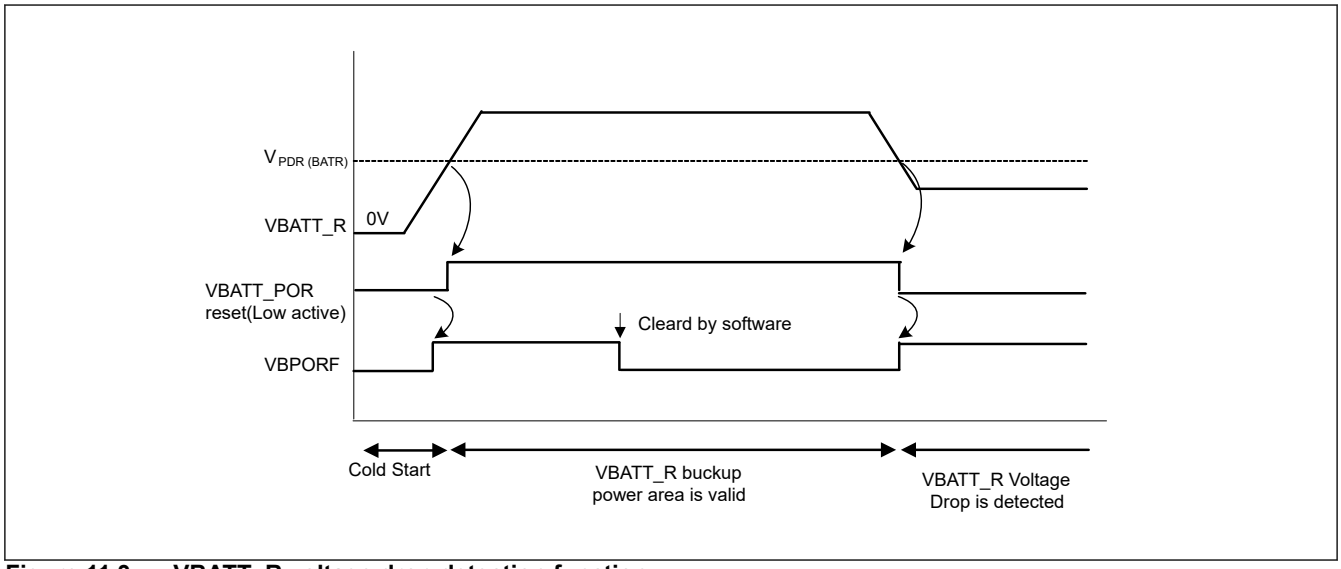


Figure 11.3 VBATT_R voltage drop detection function

11.3.4 VBATT Backup Register Usage

You can use 32 ,16 or 8-bit access instruction when accessing the VBATT backup registers.

However, for example, when a 32bit access instruction is executed, 8-bit read or write operation is executed with 4 consecutive times. When accessing, please note that the byte order of the data stored in the VBTBKR[n] (n = 0 to 127) register is little endian.

The data of VBATT backup register is cleared to 0x00 by VBATT_POR reset or tamper detection function.

The tamper detection function starts clearing operation of the VBATT backup register when the clear function is enabled and the tamper detection flag is set to 1. Do not cancel the clearing operation for 100ns after starting. To cancel the clearing operation, disable the clear function or clear the tamper detection flag to 0. After canceling the clearing operation, do not access the VBATT backup register for 500ns.

11.3.5 Tamper Detection Usage

The tamper detection function detects the RTCICn (n = 0 to 2) pin input event. The input event is defined as a change of RTCICn pin input level. The VBTADFn (n = 0 to 2) flag is set to 1 by the input event . When generate interrupt is enabled and the flag is set to 1, tamper detection interrupt is generated. When backup register clear function is enabled and flag is set to 1, the data of VBATT backup register is cleared. RTC time capture event source can select RTCICn pin input or the VBTADFn flag. If you need to synchronize time capture with a set of VBTADFn flags to 1, select the VBTADFn flag as the RTC time capture event source is recommended.

Figure 11.4 shows Tamper detection function.

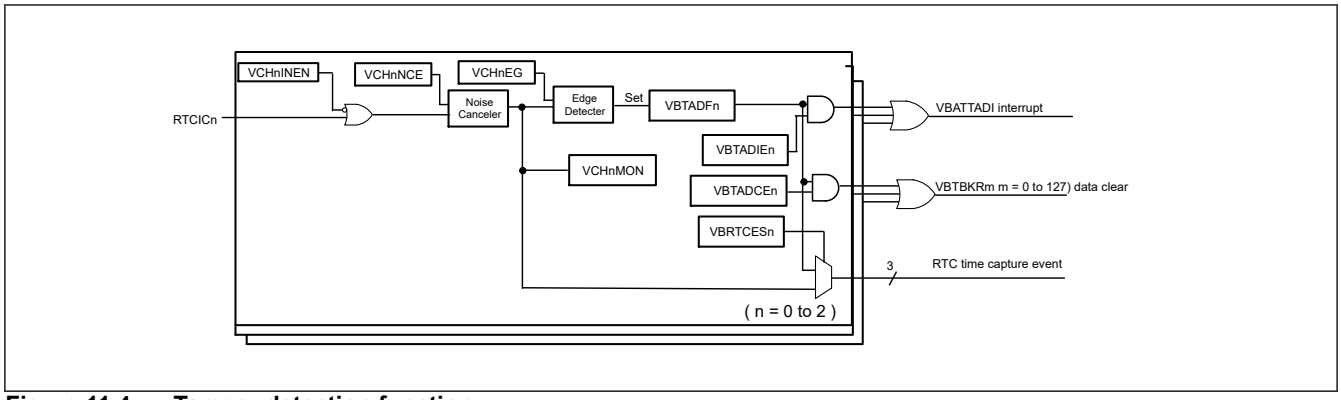

Figure 11.4 Tamper detection function

RTCICn pin inputs is enabled by the VCHnINEN (n = 0 to 2) bit. A wait time of 50us is required for the operation to stabilize after the RTCICn input is enabled.

The VCHnNCE (n = 0 to 2) bit enables noise canceler. The noise canceler samples input signals at the Sub-Clock (RTCSCLK) and removes the pulses whose length is less than three sampling cycles. Figure 11.5 shows noise canceler circuit block diagram.

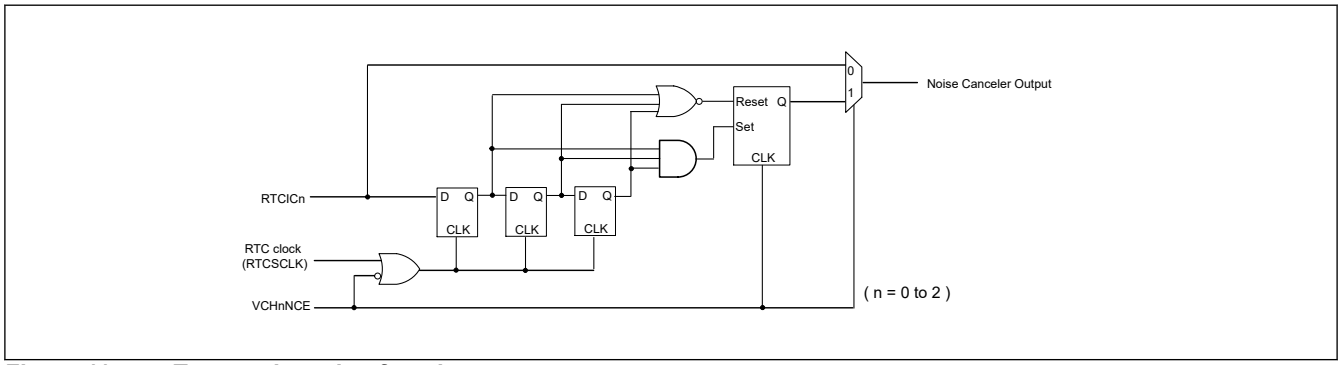

Figure 11.5 Tamper detection function

After enabling this noise canceler, a stabilization time of 5 clocks is required.

The VCHnEG (n = 0 to 2) bit enables to select Tamper detection edge. The edge detector operate asynchronously. When these control registers are changed, The VBTADFn flag may be set to 1 in a pseudo. The VBTADFn flag need check and clear to 0 after initialization of control registers . The VCHNnMON (n = 0 to 2) bit enables to monitor current input status. This bit also need check for inactive level after initialization of control registers .

The VBATTADI interrupt is asserted when 1 or more of 3 channels are flagged and interrupt is enabled.

The VBTBKRm(m = 0 to 127) register data is cleared to 0x00 when 1 or more of 3 channels are flagged and the VBATT backup register clear function is enabled.

11.3.6 VBATT voltage monitor function Usage

You can monitor the input voltage level of VBATT pin. 1/3 of VBATT pin voltage level can be monitored as analog signal. After setting the VBTMNSEL bit to 1, it is necessary to wait t_{MONWT} for the monitor level to stabilize. For details on t_{MONWT}, see section 60, Electrical Characteristics.

Figure 11.6 shows VBATT voltage monitor function.

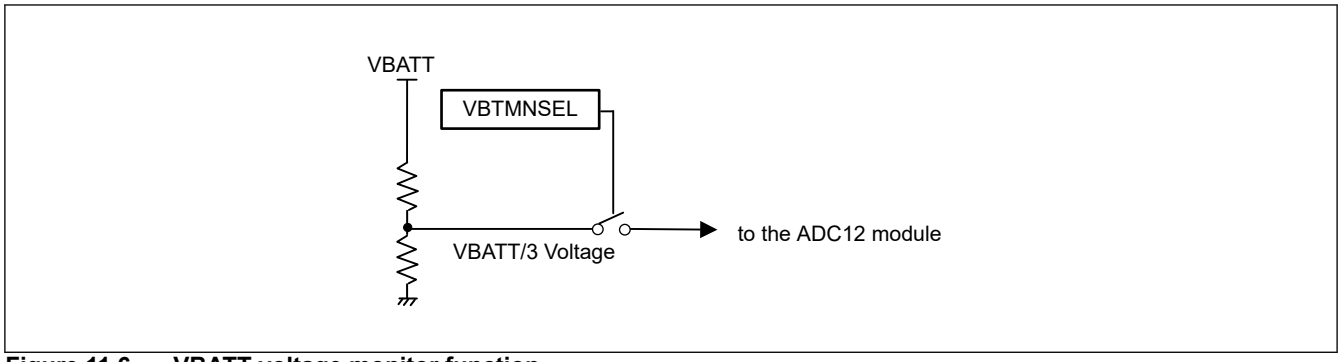

Figure 11.6 VBATT voltage monitor function

Note: For more information, see section 45, 12-Bit A/D Converter (ADC12).

Note: When VBTMNSEL bit is 1, VBAT power consumption is increased. It is recommended that VBTMNSEL bit sets to 1 only monitor timing.

11.3.7 Initial Settings Examples

11.3.7.1 Cold start and using the power supply switch flow example

When turning on VCC pin and VBATT pin power for the first time, use the following flow to initialize.

1. Check VBPORM bit. If VBPORM flag is 0, wait until it changes to 1.
2. Clear VBPORF flag to 0.
3. Set the VDETLVL[2:0] bit to appropriate value. The $V_{DETBATT\_m}$ level is Selected.
4. Wait t_{DETWT} for the VCC voltage detection function stabilization.
5. Set the VDETE bit to 1. The VCC voltage detection function is enabled.
6. Enable Sub-Clock Oscillator if needed.
7. Set Other Battery Backup Function and RTC registers.

For details on t_{DETWT}, see section 60, Electrical Characteristics.

For details on Sub-Clock Oscillator, see section 8, Clock Generation Circuit .

11.3.7.2 Warm start and using the power supply switch flow example

The MCU transitions to VBATT mode when the power of the VCC pin is turned off while the power of the VBATT pin is on. In this section, warm start means when the power supply of the VCC pin is turned on in VBATT mode. When the MCU starts processing with a warm start, execute the following flow in order to check the VBATT_R voltage drop before executing other process.

1. Check VBPORM flag. If VBPORM flag is 0, wait until it changes to 1.
2. Check VBPORF flag. If VBPORF flag is 1, the VBATT_R voltage drop is detected. Branch “section 11.3.7.1. Cold start and using the power supply switch flow example 2 to re-initialize the backup power area. If not, it means that the VBATT_R voltage does not drop and the state of the backup power area is retained. So, you do not need to re-initialize the backup power area.

11.3.7.3 Not using the power supply switch flow example

When not using the power supply switch, VCC pin and VBATT pin should be shorted. In this case, the VBATT_POR reset cannot follow the power on reset of VCC and VBATT_R voltage drop may not be detected. So, initialize the backup power supply area with the following flow.

1. Set the BPWSWSTP bit to 1. The power supply switch is stopped.
2. Check VBPORM flag. If VBPORM flag is 1, wait until it changes to 0.
3. Clear the VDETE bit to 0. The VCC voltage drop detection function is stopped.

4. Clear the VDETLVL[2:0] bit to 110b. The initial value is selected.
5. Check VBPORF flag. When VBPORF flag is 1, clear it to 0.
6. Set the SOSTP bit to 1 regardless of its value. Stop Sub-Clock Oscillator.
7. Initialize the VBTICTLR register and SOMCR.SOSEL bit. Initialization is recommended because these registers are related to the control of the IO port.
8. Initialize Other Battery Backup Function registers if need. Other Battery Backup Function registers are VBTICTLR2, VBTADSR, VBTADCR1, VBTADCR2, and VBTBKR[n].
9. Enable Sub-Clock Oscillator if needed.
10. Set RTC registers.

For details on Sub-Clock Oscillator, see section 8, Clock Generation Circuit.

11.3.7.4 Tamper detection function initialization setting flow example

If using the tamper detection function, it is recommended to initialize according to the following flow example.

1. Set the VCHnINEN to appropriate value.
2. Wait 50us to stabilize after the RTCICn input.
3. Set the VCHnNCE bit and the VCHnEG bit.
4. Wait 5 RTC-clocks to stabilize , if noise canceler is enabled.
5. Checking the VCHnMON bit indicates inactive is recommended. If it is active, it may not be possible to detect the tamper.
6. Initialize the invalid status of VBTADFn flag by clear to 0 after reading dummy read.
7. Set VBTADCR1, VBTADCR2 to enable interrupt, backup register clear, and RTC time capture event.
8. nables RTC time capture function if needed.

11.4 Interrupt Sources

The Battery Backup Function has two interrupt sources and are listed in Table 11.3.

Table 11.3 Battery Backup Function interrupt Sources

Symbol	Interrupt source	Interrupt flag	Interrupt conditions
VBATTADI	VBATT Tamper detection	VBTADF0	VBTADF0 = 1, VBTADIE0 = 1
		VBTADF1	VBTADF1 = 1, VBTADIE1 = 1
		VBTADF2	VBTADF2 = 1, VBTADIE2 = 1

11.5 Usage Notes

1. Operation of the sub-clock oscillator and RTC are not guaranteed when the voltage level on VBATT is lower than the guaranteed operation range. Initialize the RTC when the VBATT pin falls below the guaranteed operating voltage and then powers up again.
2. A reset generated while writing to registers described in this section might destroy the register value.
3. When VCC is higher than $V_{DETBATT\_m}$, the VCC pin and VBATT pin are separated. When VCC is lower than $V_{DETBATT}$ and the switch is connected to the VBATT pin, and if the voltage on VBATT drops lower than VCC, current might flow into the VBATT pin through the parasitic diode between the VCC and VBATT pins.
4. During RTC operation using the voltage from the VBATT pin and the I/O ports within the backup, the power supply area can only be used as time capture event input pins for the RTC.

12. Register Write Protection

12.1 Overview

The register write protection function protects important registers from being overwritten due to software errors. The registers to be protected are set with the Protect Register (PRCR_S and PRCR_NS).

The two protected registers work on one Secure set registers/bits and the other for Non-secure set registers/bits. They are collectively mentioned as PRCR.

Table 12.1 lists the association between the bits in the PRCR register and the registers to be protected.

The register information to which the PRCR bit is applied is provided in the description of each register.

Table 12.1 Association between the bits in the PRCR register and registers to be protected

PRCR bit	Register to be protected
PRC0	• Registers related to the clock generation circuit:
PRC1	• Registers related to the low power modes: SBYCR, OPCCR, PDCTRGD, PDRAMSCR0, PDRAMSCR1, SSCR1, LPSCR, DPSBYCR, DPSWCR, DPSIER0-3, DPSIFR0-3, DPSIEGR0-2, PLL1LDOCR, PLL2LDOCR, HOCOLDOCR, LVOCR • Register related to the battery backup function: VBTBER, VBTICTLR, VBTBKR[n] (n = 0 to 127), VBTBPCR1, VBTBPCR2, VBTBPSR, VBTADSR, VBTADCR1, VBTADCR2, VBTICTLR2
PRC3	• Registers related the PVD: PVD1CR1, PVD1SR, PVD2CR1, PVD2SR, PVD1CMPCR, PVD2CMPCR, PVD1CR0, PVD2CR0, PVD1FCR, PVD2FCR, VBATTMNSELR
PRC4	• Registers related to the Security and Privilege setting registers: ELCSARx (x=A,B)*1, ELCPARx (x=A,B), PSARx (x=A to E), MSSAR, PPARx (x=A to E), MSPAR, PmSAR (m=0 to 9, A to G), CPUSAR, DEBUGSAR, ICUSARx (x=A,B,E to I), SRAMSAR, BUSSARx(x=A to C), BUSPARC, MMPUSARx (x=A,B), DTCSAR, DMACSAR, DMACCHSAR, DMACCHPAR, TEVTRCR, SRAMSABAR0-1, STBRAMSABAR, STBRAMPABAR_NS, STBRAMPABAR_S, FSAR, CGFSAR, RSTSAR, LPMSAR, PVDSAR, BBFSAR, DPFSAR, RSCSAR, PGCSAR, VBRSABAR, VBRPABARS, VBRPABARNS
PRC5*1	• Registers related to the reset control SYRSTMSK0, SYRSTMSK2

Note 1. Only PRCR_S is supported.

12.2 Register Descriptions

12.2.1 PRCR_S : Protect Register for Secure (PRCR_S)

Base address: SYSC = 0x4001_E000

Offset address: 0x3FA

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	PRC5	PRC4	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Disable writes 1: Enable writes	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Disable writes 1: Enable writes	R/W
4	PRC4	Enables writing to the registers related to the security and privilege setting registers. 0: Disable writes 1: Enable writes	R/W
5	PRC5	Enables writing to the registers related to the reset control. 0: Disable writes 1: Enable writes	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	0xA5: Enables writing to the PRCR_S register. Other than the above: Disables writing to the PRCR_S register. 0x00 are readable if these bits are read.	W

Note: S-TYPE6, P-TYPE2

PRCR_S is used to protect registers that are always Secure or configured as Secure.

PRCn bits (Protect bit n) (n = 0, 1, 3, 4, 5)

The PRCn bits enable or disable writing to the protected registers listed in Table 12.1. Setting the PRCn bits to 1 enables writing, and to 0 disables writing.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_S and its controlled registers are continuously written access. Avoid continuous write access or read the PRCR_S after PRC4 change, and then write to the register controlled by PRC4.

PRKEY[7:0] (Register write protection key bit)

These bits control permission and prohibition of writing to the PRCR_S register. To write PRCn bits of PRCR_S register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCn bits do not be changed even if writing to the PRCR_S register.

12.2.2 PRCR_NS : Protect Register for Non-secure (PRCR_NS)

Base address: SYSC_NS = 0x5001_E000

Offset address: 0x3FE

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	PRC4	PRC3	—	PRC1	PRC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRC0	Enable writing to the registers related to the clock generation circuit 0: Disable writes 1: Enable writes	R/W
1	PRC1	Enable writing to the registers related to the low power modes, and the battery backup function 0: Disable writes 1: Enable writes	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	PRC3	Enable writing to the registers related to the PVD 0: Disable writes 1: Enable writes	R/W

Bit	Symbol	Function	R/W
4	PRC4	Enables writing to the registers related to the security and pprivilege setting registers. 0: Disable writes 1: Enable writes	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	0xA5: Enables writing to the PRCR_NS register. Other than the above: Disables writing to the PRCR_NS register. 0x00 are readable if these bits are read.	W

Note: S-TYPE7, P-TYPE2

PRCR_NS is used to protect registers that are configured as Non-secure.

PRCn bits (Protect bit n) (n = 0, 1, 3, 4)

The PRCn bits enable or disable writing to the protected registers listed in Table 12.1. Setting the PRCn bits to 1 enables writing, and to 0 disables writing.

The register controlled by PRC4 may not reflect the PRC4 change when PRCR_NS and its controlled registers are continuously written access. Avoid continuous write to that registers or read the PRCR_NS after PRC4 change, and then write to the register controlled by PRC4.

PRKEY (Register write protection key bit)

These bits control permission and prohibition of writing to the PRCR_NS register. To write PRCn bits of PRCR_NS register, write 0xA5 to the PRKEY[7:0]. In case of writing other than 0xA5 to PRKEY[7:0], PRCn bits do not be changed even if writing to the PRCR_NS register.

13. Interrupt Controller Unit (ICU)

13.1 Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the Nested Vector Interrupt Controller (NVIC), the DMA Controller (DMAC), and the Data Transfer Controller (DTC) modules. The ICU also controls non-maskable interrupts.

Table 13.1 lists the ICU specifications, Figure 13.1 shows a block diagram, and Table 13.2 lists the I/O pins.

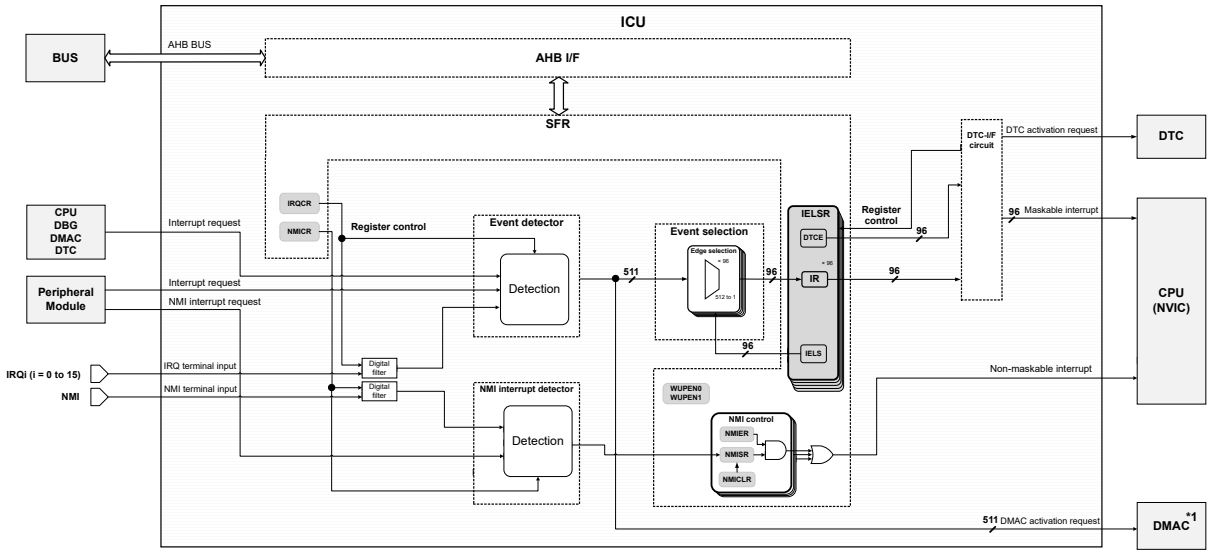
Table 13.1 ICU specifications

Parameter		Description
Maskable interrupts	Peripheral function interrupts	• Interrupts from peripheral modules Number of sources: 306 (select factor within event list numbers 17 to 511)
	External pin interrupts	• Interrupt detection on low level*4, falling edge, rising edge, rising and falling edges. One of these detection methods can be set for each source • Digital filter function supported • 16 sources, with interrupts from IRQi (i = 0 to 15) pins.
	Interrupt requests to CPU (NVIC)	• 96 interrupt requests are output to NVIC.*5
	DMAC control	• The DMAC can be activated using interrupt sources*1 • The target interrupt source can be selected individually for every DMAC channels.
	DTC control	• The DTC can be activated using interrupt sources*1 • The method for selecting an interrupt source is the same as that of the interrupt request to NVIC.
Non-maskable interrupts*2	NMI pin interrupt	• Interrupt from the NMI pin • Interrupt detection on falling edge or rising edge • Digital filter function supported
	Oscillation stop detection interrupt*3	Interrupt on detecting that the main oscillation has stopped
	WDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	IWDT underflow/refresh error*3	Interrupt on an underflow of the down-counter or occurrence of a refresh error
	Voltage-monitoring 1 interrupt*3	Voltage monitor 1 interrupt of the voltage monitor 1 circuit (PVD_PVD1)
	Voltage-monitoring 2 interrupt*3	Voltage monitor 2 interrupt of the voltage monitor 2 circuit (PVD_PVD2)
	Common memory error interrupt	Common memory errors include SRAM ECC error, SRAM parity error, or Standby SRAM parity error
	Bus error Interrupt	Bus error includes MPU and TZF error
	CPU Lockup error interrupt	CPU Lockup error
Security	Secure	Some registers have Security Attribution
	Privilege	Each register of the ICU can only be accessed with Privilege access
Low power modes		• CPU Sleep mode: return is initiated by non-maskable interrupts or any other interrupt source • CPU Deep Sleep and Software Standby mode: Return is initiated by non-maskable interrupts. Interrupt can be selected as WUPEN register. See section 13.2.15. WUPEN0 : Wake Up Interrupt Enable Register 0, section 13.2.16. WUPEN1 : Wake Up interrupt enable register 1.
TrustZone Filter		Available

Note 1. For the DMAC and DTC activation sources, see section 13.3.2. Event Number.
Note 2. Non-maskable interrupts can be enabled only once after a reset release.
Note 3. These non-maskable interrupts can also be used as maskable interrupts. When used as maskable interrupts, do not change the value of the NMIER register from the reset state. To enable voltage monitor 1 and voltage monitor 2 interrupts, set the PVD1CR1.IRQSEL and PVD2CR1.IRQSEL bits to 1.

Note 4. Low level: interrupt detection is not canceled if you do not clear it after a detection.
Note 5. Appropriate alignment of the vector table according to the number of interrupts to be used is required. For example, in case of using maximum number of interrupts available in this products, at least 128-words alignment must be set.

Figure 13.1 shows the ICU block diagram.



Note 1. For more information on DELSR settings, see section 16, DMA Controller (DMAC)

Figure 13.1 ICU block diagram

Table 13.2 lists the ICU input/output pins.

Table 13.2 ICU I/O pins

Pin name	I/O	Description
NMI	Input	Non-maskable interrupt request pin
IRQi (i = 0 to 15)	Input	External interrupt request pins

13.2 Register Descriptions

This chapter does not describe the Arm® NVIC internal registers. For information about these registers, see Arm Limited., Arm® Cortex®-M85 Processor Technical Reference Manual (101924_0002_05_en).

13.2.1 ICUSARA : Interrupt Controller Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIRQ CR15	SAIRQ CR14	SAIRQ CR13	SAIRQ CR12	SAIRQ CR11	SAIRQ CR10	SAIRQ CR9	SAIRQ CR8	SAIRQ CR7	SAIRQ CR6	SAIRQ CR5	SAIRQ CR4	SAIRQ CR3	SAIRQ CR2	SAIRQ CR1	SAIRQ CR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	SAIRQCR15 to SAIRQCR0	Security attributes of registers for the IRQCRn register 0: Secure 1: Non-secure	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

SAIRQCRn bits (Security attributes of registers for the IRQCRn register)

The target registers are as follows:

- IRQCR0 to IRQCR15 registers
- WUPEN0.IRQWUPEN[15:0] bits

13.2.2 ICUSARB : Interrupt Controller Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SANMI
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SANMI	Security attributes of registers for nonmaskable interrupt 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

SANMI bit (Security attributes of registers for nonmaskable interrupt)

Security attributes of registers for non-maskable interrupt. The target registers are as follows:

- NMISR
- NMIER
- NMICLR
- NMICR

The value of AIRCR.BFHFNMINS bit [13] in Application Interrupt and Reset Control Register of Arm CPU should be the same as the value of security attribution. The initial values of AIRCR.BFHFNMINS and the SANMI bits are different. AIRCR.BFHFNMINS is secure and SANMI is non-secure. Polarity has the same meaning so program these to match.

Note: Only one of Secure and Non-secure can set security attribution for non-maskable interrupt-related registers. If you program the Secure attribute as secure, it always goes to the Secure interrupt handler. To release any of the Non-maskable interrupt sources to the non-secure user, write a function to execute a nonsecure program from the interrupt handler for Secure.

13.2.3 ICUSARE : Interrupt Controller Unit Security Attribution Register E

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x50

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIIC0WUP	SAAGT1CBWUP	SAAGT1CAWUP	SAAGT1UDWUP	SAUSBFS0WUP	SAUSBHSWUP	SARTCPRDWUP	SARTCALMWUP	—	—	—	SAVBATTWUP	SAPVD2WUP	SAPVD1WUP	—	SAIWDTWUP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	—	These bits are read as 0. The write value should be 0.	R/W
16	SAIWDTWUP	Security attributes of registers for WUPEN0.b16 0: Secure 1: Non-secure	R/W
17	—	This bit is read as 0. The write value should be 0.	R/W
18	SAPVD1WUP	Security attributes of registers for WUPEN0.b18 0: Secure 1: Non-secure	R/W
19	SAPVD2WUP	Security attributes of registers for WUPEN0.b19 0: Secure 1: Non-secure	R/W
20	SAVBATTWUP	Security attributes of registers for WUPEN0.b20 0: Secure 1: Non-secure	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
24	SARTCALMWUP	Security attributes of registers for WUPEN0.b24 0: Secure 1: Non-secure	R/W
25	SARTCPRDWUP	Security attributes of registers for WUPEN0.b25 0: Secure 1: Non-secure	R/W
26	SAUSBHSWUP	Security attributes of registers for WUPEN0.b26 0: Secure 1: Non-secure	R/W
27	SAUSBFS0WUP	Security attributes of registers for WUPEN0.b27 0: Secure 1: Non-secure	R/W
28	SAAGT1UDWUP	Security attributes of registers for WUPEN0.b28 0: Secure 1: Non-secure	R/W
29	SAAGT1CAWUP	Security attributes of registers for WUPEN0.b29 0: Secure 1: Non-secure	R/W
30	SAAGT1CBWUP	Security attributes of registers for WUPEN0.b30 0: Secure 1: Non-secure	R/W
31	SAIIC0WUP	Security attributes of registers for WUPEN0.b31 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

13.2.4 ICUSARF : Interrupt Controller Unit Security Attribution Register F

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x54

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit field:	—	SAULP1BWUP	SAULP1AWUP	SAULP1UWUP	SAI3CWUP	SAULP0BWUP	SAULP0AWUP	SAULP0UWUP	—	—	—	—	SACOMPHS0WUP	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	SACOMPHS0WUP	Security attributes of registers for WUPEN1.b3 0: Secure 1: Non-secure	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	SAULP0UWUP	Security attributes of registers for WUPEN1.b8 0: Secure 1: Non-secure	R/W
9	SAULP0AWUP	Security attributes of registers for WUPEN1.b9 0: Secure 1: Non-secure	R/W
10	SAULP0BWUP	Security attributes of registers for WUPEN1.b10 0: Secure 1: Non-secure	R/W
11	SAI3CWUP	Security attributes of registers for WUPEN1.b11 0: Secure 1: Non-secure	R/W
12	SAULP1UWUP	Security attributes of registers for WUPEN1.b12 0: Secure 1: Non-secure	R/W
13	SAULP1AWUP	Security attributes of registers for WUPEN1.b13 0: Secure 1: Non-secure	R/W
14	SAULP1BWUP	Security attributes of registers for WUPEN1.b14 0: Secure 1: Non-secure	R/W
31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

13.2.5 ICUSARG : Interrupt Controller Unit Security Attribution Register G

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x70

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIELSR31	SAIELSR30	SAIELSR29	SAIELSR28	SAIELSR27	SAIELSR26	SAIELSR25	SAIELSR24	SAIELSR23	SAIELSR22	SAIELSR21	SAIELSR20	SAIELSR19	SAIELSR18	SAIELSR17	SAIELSR16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIELSR15	SAIELSR14	SAIELSR13	SAIELSR12	SAIELSR11	SAIELSR10	SAIELSR9	SAIELSR8	SAIELSR7	SAIELSR6	SAIELSR5	SAIELSR4	SAIELSR3	SAIELSR2	SAIELSR1	SAIELSR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR31 to SAIELSR0	Security attributes of registers for IELSR31 to IELSR0 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR31 to IELSR0)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 0 to 31). NVIC internal registers are in NVIC_ITNS0[31:0]. Polarity has the same meaning so program these to match.

13.2.6 ICUSARH : Interrupt Controller Unit Security Attribution Register H

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x74

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIELSR63	SAIELSR62	SAIELSR61	SAIELSR60	SAIELSR59	SAIELSR58	SAIELSR57	SAIELSR56	SAIELSR55	SAIELSR54	SAIELSR53	SAIELSR52	SAIELSR51	SAIELSR50	SAIELSR49	SAIELSR48
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIELSR47	SAIELSR46	SAIELSR45	SAIELSR44	SAIELSR43	SAIELSR42	SAIELSR41	SAIELSR40	SAIELSR39	SAIELSR38	SAIELSR37	SAIELSR36	SAIELSR35	SAIELSR34	SAIELSR33	SAIELSR32
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR63 to SAIELSR32	Security attributes of registers for IELSR63 to IELSR32 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR63 to IELSR32)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 32 to 63). NVIC internal registers are in NVIC_ITNS1[31:0]. Polarity has the same meaning so program these to match.

13.2.7 ICUSARI : Interrupt Controller Unit Security Attribution Register I

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x78

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	SAIELSR95	SAIELSR94	SAIELSR93	SAIELSR92	SAIELSR91	SAIELSR90	SAIELSR89	SAIELSR88	SAIELSR87	SAIELSR86	SAIELSR85	SAIELSR84	SAIELSR83	SAIELSR82	SAIELSR81	SAIELSR80
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SAIELSR79	SAIELSR78	SAIELSR77	SAIELSR76	SAIELSR75	SAIELSR74	SAIELSR73	SAIELSR72	SAIELSR71	SAIELSR70	SAIELSR69	SAIELSR68	SAIELSR67	SAIELSR66	SAIELSR65	SAIELSR64
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	SAIELSR95 to SAIELSR64	Security attributes of registers for IELSR95 to IELSR64 0: Secure 1: Non-secure	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4 register

SAIELSRn bits (Security attributes of registers for IELSR95 to IELSR64)

The Secure Attribute managed within the Arm CPU NVIC must match the security attribution of IELSEn (n = 64 to 95). NVIC internal registers are in NVIC_ITNS2[31:0]. Polarity has the same meaning so program these to match.

13.2.8 TEVTRCR : Trusted Event Route Control Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x600

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TEVTE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TEVTE	Trusted Event Route Control Register for IELSRn, DELSRn and ELCSRn 0: Disable 1: Enable	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE1, P-TYPE1
Note: This register is write-protected by PRCR_S.PRC4

TEVTE bit (Trusted Event Route Control Register for IELSRn, DELSRn and ELCSRn)

When TEVTE = 1, the IELS [8: 0] bits of IELSRn (n = 0 to 95), all DELS [8: 0] bits of DMAC.DELSRn (n = 0 to 7), and all ELS [8:0] bits of ELC.ELSRn (n = 0 to18) are allowed secure access write. non-secure access write is protected. Additionally, when TEVTE = 1, if the Security Attribution of the target register (IELS[31:16] bits of IELSRn (n = 0 to 95)) is non-secure, then secure access is not allowed. At this time, the upper level [31:16] cannot be read and write, but the response is OK, and no error occurs.

- IELSRn.IELS[8:0] (n = 0 to 95)
- DMAC.DELSRn.DELS[7:0] (n = 0 to 7)
- ELC.ELSRn.IELS[8:0] (n = 0 to 18)

13.2.9 IRQCRi : IRQ Control Register i (i = 0 to 15)

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x000 + 0x1 × i

Bit position:	7	6	5	4	3	2	1	0
Bit field:	FLTEN	—	FCLKSEL[1:0]		—	—	IRQMD[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	IRQMD[1:0]	IRQi Detection Sense Select 0 0: Falling edge 0 1: Rising edge 1 0: Rising and falling edges 1 1: Low level	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
5:4	FCLKSEL[1:0]	IRQi Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	FLTEN	IRQi Digital Filter Enable 0: Digital filter is disabled 1: Digital filter is enabled.	R/W

Note: S-TYPE3, P-TYPE2

IRQCRi register changes must satisfy the following conditions:

- For a CPU interrupt or DTC trigger:
  Change the IRQCRi register value before setting the target IELSRn register (n = 0 to 95).
  The register value should be changed only when the value of the target IELSRn register is 0x0000.
- For a DMAC trigger:
  Change the IRQCRi register value before setting the target DMAC.DELSRn register (n = 0 to 7).
  The register value should be changed only when the value of the target DELSRn register is 0x0000.
- For a wakeup enable signal:
  Change the IRQCRi register setting before setting the target WUPEN0.IRQWUPEN[n] (n = 0 to 15). The register value should be changed when the target WUPEN0.IRQWUPEN[n] is 0.

IRQMD[1:0] bits (IRQi Detection Sense Select)

The IRQMD[1:0] bits set the detection sensing method for the IRQi external pin interrupt sources. For setting method when using external pin interrupt, see section 13.5.7. External Pin Interrupts.

FCLKSEL[1:0] bits (IRQi Digital Filter Sampling Clock Select)

The FCLKSEL[1:0] bits select the digital filter sampling clock for the IRQi external pin interrupt request pins, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 13.5.6. Digital Filter.

FLTEN bit (IRQi Digital Filter Enable)

The FLTEN bit enables the digital filter used for the IRQi external pin interrupt sources. The digital filter is enabled when the IRQCRi.FLTEN bit is 1 and disabled when the IRQCRi.FLTEN bit is 0. The IRQi pin level is sampled at the clock cycle specified in the IRQCRi.FCLKSEL[1:0] bits. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 13.5.6. Digital Filter.

13.2.10 NMISR : Non-Maskable Interrupt Status Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x120

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUST	—	CMST	BUSST	—	—	—	—	NMIST	OSTST	—	—	PVD2ST	PVD1ST	WDTST	IWDTST
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTST	IWDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
1	WDTST	WDT Underflow/Refresh Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
2	PVD1ST	Voltage Monitor 1 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
3	PVD2ST	Voltage Monitor 2 Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
5:4	—	These bits are read as 0.	R
6	OSTST	Main Clock Oscillation Stop Detection Interrupt Status Flag 0: Interrupt not requested for main clock oscillation stop 1: Interrupt requested for main clock oscillation stop	R
7	NMIST	NMI Pin Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
11:8	—	These bits are read as 0.	R
12	BUSST	Bus Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
13	CMST	Common Memory Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R
14	—	This bit is read as 0.	R
15	LUST	CPU Lockup Error Interrupt Status Flag 0: Interrupt not requested 1: Interrupt requested	R

Note: S-TYPE3, P-TYPE2

The NMISR register monitors the status of non-maskable interrupt sources. Writes to the NMISR register are ignored. The setting in the Non-Maskable Interrupt Enable Register (NMIER) does not affect the status flags in this register. Before the end of the non-maskable interrupt handler, check that all of the bits in this register are set to 0 to confirm that no other NMI requests are generated during handler processing.

IWDTST flag (IWDT Underflow/Refresh Error Interrupt Status Flag)

The IWDTST flag indicates an IWDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.IWDTCLR bit.

[Setting condition]

When the IWDT underflow/refresh error interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.IWDTCLR bit.

WDTST flag (WDT Underflow/Refresh Error Interrupt Status Flag)

The WDTST flag indicates a WDT underflow/refresh error interrupt request. It is read-only and cleared by the NMICLR.WDTCLR bit.

[Setting condition]

When the WDT underflow/refresh error interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.WDTCLR bit.

PVD1ST flag (Voltage Monitor 1 Interrupt Status Flag)

The PVD1ST flag indicates a request for voltage monitor 1 interrupt. It is read-only and cleared by the NMICLR.PVD1CLR bit.

[Setting condition]

When the voltage monitor 1 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD1CLR bit.

PVD2ST flag (Voltage Monitor 2 Interrupt Status Flag)

The PVD2ST flag indicates a request for voltage monitor 2 interrupt. It is read-only and cleared by the NMICLR.PVD2CLR bit.

[Setting condition]

When the voltage monitor 2 interrupt is generated and this interrupt source is enabled.

[Clearing condition]

When 1 is written to the NMICLR.PVD2CLR bit.

OSTST flag (Main Clock Oscillation Stop Detection Interrupt Status Flag)

The OSTST flag indicates a main clock oscillation stop detection interrupt request. It is read-only and cleared by the NMICLR.OSTCLR bit.

[Setting condition]

When the main clock oscillation stop detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.OSTCLR bit.

NMIST flag (NMI Pin Interrupt Status Flag)

The NMIST flag indicates an NMI pin interrupt request. It is read-only and cleared by the NMICLR.NMICLR bit.

[Setting condition]

When an edge specified by the NMICR.NMIMD bit is input to the NMI pin.

[Clearing condition]

When 1 is written to the NMICLR.NMICLR bit.

BUSST flag (Bus Error Interrupt Status Flag)

The BUSST flag indicates a bus error interrupt request. It is read-only and cleared by the NMICLR.BUSCLR bit.

Bus error includes MPU and TZF errors.

[Setting condition]

When the bus error detection interrupt is generaed.

[Clearing condition]

When 1 is written to the NMICLR.SPECLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.BUSCLR.

CMST flag (Common Memory Error Interrupt Status Flag)

The CMST flag indicates common memory error interrupt request. It is read-only and cleared by the NMICLR.CMCLR bit.

Common memory errors include SRAM ECC, SRAM Parity or StandbyRAM Parity.

[Setting condition]

When the common memory error detection interrupt is generated.

[Clearing condition]

When 1 is written to the NMICLR.CMCLR bit.

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.CMCLR.

LUST flag (CPU Lockup Error Interrupt Status Flag)

The LUST flag indicates a CPU Lockup error interrupt request. It is read-only and cleared by the NMICLR. LUCLR bit.

[Setting condition]

When the CPU Lockup error interrupt is generated.

[Clearing condition]

Be sure to clear the error status of the request source before clearing. If CPU does not clear the error status of the request source, the NMI status is set again even if this status is cleared, and an NMI request is issued to the CPU. If the CPU returns from the NMI handler, the CPU jumps back to the NMI handler.

In the case of level detection, use the following steps to clear the Status flag.

(1)Negate the level of an input factor.

(2)Perform a peripheral read access once and make sure the level interrupt is cleared.

(3)Clear the status flag by NMICLR.LUSTCLR.

13.2.11 NMIER : Non-Maskable Interrupt Enable Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x100

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUEN	—	CMEN	BUSEN	—	—	—	—	NMIEN	OSTEN	—	—	PVD2EN	PVD1EN	WDTEN	IWDTEN
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTEN	IWDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
1	WDTEN	WDT Underflow/Refresh Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
2	PVD1EN	Voltage monitor 1 Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
3	PVD2EN	Voltage monitor 2 Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTEN	Main Clock Oscillation Stop Detection Interrupt Enable 0: Disabled 1: Enabled	R/W*1 *2
7	NMIEN	NMI Pin Interrupt Enable 0: Disabled 1: Enabled	R/W*1
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSEN	Bus Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1
13	CMEN	Common Memory Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1
14	—	This bit is read as 0. The write value should be 0.	R/W
15	LUEN	CPU Lockup Error Interrupt Enable 0: Disabled 1: Enabled	R/W*1

Note: S-TYPE3, P-TYPE2
Note 1. You can write 1 to this bit only once after reset. Subsequent write accesses are invalid. Writing 0 to this bit is invalid.
Note 2. Do not write 1 to this bit when the source is used as an interrupt signal.

IWDTEN bit (IWDT Underflow/Refresh Error Interrupt Enable)

The IWDTEN bit enables IWDT underflow/refresh error interrupt as an NMI trigger.

WDTEN bit (WDT Underflow/Refresh Error Interrupt Enable)

The WDTEN bit enables WDT underflow/refresh error interrupt as an NMI trigger.

PVD1EN bit (Voltage monitor 1 Interrupt Enable)

The PVD1EN bit enables voltage monitor 1 interrupt as an NMI trigger.

PVD2EN bit (Voltage monitor 2 Interrupt Enable)

The PVD2EN bit enables voltage monitor 2 interrupt as an NMI trigger.

OSTEN bit (Main Clock Oscillation Stop Detection Interrupt Enable)

The OSTEN bit enables main clock oscillation stop detection interrupt as an NMI trigger.

NMIEN bit (NMI Pin Interrupt Enable)

The NMIEN bit enables NMI pin interrupt as an NMI trigger.

BUSEN bit (Bus Error Interrupt Enable)

The BUSEN bit enables bus error interrupt as an NMI trigger. Bus error includes MPU and TZF errors.

CMEN bit (Common Memory Error Interrupt Enable)

The CMEN bit enables common memory error interrupt as an NMI trigger. Common memory errors include SRAM ECC, SRAM Parity or Standby RAM Parity.

LUEN bit (CPU Lockup Error Interrupt Enable)

LUEN bit enables CPU Lockup error interrupt as an NMI trigger.

13.2.12 NMICLR : Non-Maskable Interrupt Status Clear Register

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x110

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	LUCLR	—	CMCLR	BUSCLR	—	—	—	—	NMICLR	OSTCLR	—	—	PVD2CLR	PVD1CLR	WDTCLR	IWDTCLR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	IWDTCLR	IWDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.IWDTST flag	R/W*1
1	WDTCLR	WDT Underflow/Refresh Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.WDTST flag	R/W*1
2	PVD1CLR	Voltage Monitor 1 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD1ST flag	R/W*1
3	PVD2CLR	Voltage Monitor 2 Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.PVD2ST flag.	R/W*1
5:4	—	These bits are read as 0. The write value should be 0.	R/W
6	OSTCLR	Oscillation Stop Detection Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.OSTST flag	R/W*1
7	NMICLR	NMI Pin Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.NMIST flag	R/W*1
11:8	—	These bits are read as 0. The write value should be 0.	R/W
12	BUSCLR	Bus Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.BUSST flag	R/W*1

Bit	Symbol	Function	R/W
13	CMCLR	Common Memory Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.CMST flag	R/W*1
14	—	This bit is read as 0. The write value should be 0.	R/W
15	LUCLR	CPU Lockup Error Interrupt Status Flag Clear 0: No effect 1: Clear the NMISR.LUST flag	R/W*1

Note: S-TYPE3, P-TYPE2
Note: here may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.
Note 1. Only write 1 to this bit.

IWDTCLR bit (IWDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the IWDTCLR bit clears the NMISR.IWDTST flag. This bit is read as 0.

WDTCLR bit (WDT Underflow/Refresh Error Interrupt Status Flag Clear)

Writing 1 to the WDTCLR bit clears the NMISR.WDTST flag. This bit is read as 0.

PVD1CLR bit (Voltage Monitor 1 Interrupt Status Flag Clear)

Writing 1 to the PVD1CLR bit clears the NMISR.PVD1ST flag. This bit is read as 0.

PVD2CLR bit (Voltage Monitor 2 Interrupt Status Flag Clear)

Writing 1 to the PVD2CLR bit clears the NMISR.PVD2ST flag. This bit is read as 0.

OSTCLR bit (Oscillation Stop Detection Interrupt Status Flag Clear)

Writing 1 to the OSTCLR bit clears the NMISR.OSTST flag. This bit is read as 0.

NMICLR bit (NMI Pin Interrupt Status Flag Clear)

Writing 1 to the NMICLR bit clears the NMISR.NMIST flag. This bit is read as 0.

BUSCLR bit (Bus Error Interrupt Status Flag Clear)

Writing 1 to the BUSCLR bit clears the NMISR.BUSST flag. This bit is read as 0.

CMCLR bit (Common Memory Error Interrupt Status Flag Clear)

Writing 1 to the CMCLR bit clears the NMISR.CMST flag. This bit is read as 0.

LUCLR bit (CPU Lockup Error Interrupt Status Flag Clear)

Writing 1 to the LUCLR bit clears the NMISR.LUST flag. This bit is read as 0.

13.2.13 NMICR : NMI Pin Interrupt Control Register

Base address: ICU_COMMON = 0x4000_6000
ICU_COMMON_NS = 0x5000_6000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	NFLTEN	—	NFCLKSEL[1:0]		—	—	—	NMIMD
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	NMIMD	NMI Detection Set 0: Falling edge 1: Rising edge	R/W

Bit	Symbol	Function	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	NFCLKSEL[1:0]	NMI Digital Filter Sampling Clock Select 0 0: PCLKB 0 1: PCLKB/8 1 0: PCLKB/32 1 1: PCLKB/64	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	NFLTEN	NMI Digital Filter Enable 0: Disabled 1: Enabled	R/W

Note: S-TYPE3, P-TYPE2

Change the NMICR register settings before enabling NMI pin interrupts, that is, before setting NMIER.NMIEN to 1.

NMIMD bit (NMI Detection Set)

The NMIMD bit selects the detection sensing method for the NMI pin interrupts.

NFCLKSEL[1:0] bits (NMI Digital Filter Sampling Clock Select)

The NFCLKSEL[1:0] bits select the digital filter sampling clock for the NMI pin interrupts, selectable to:

- PCLKB (every cycle)
- PCLKB/8 (once every 8 cycles)
- PCLKB/32 (once every 32 cycles)
- PCLKB/64 (once every 64 cycles)

For details of the digital filter, see section 13.5.6. Digital Filter.

NFLTEN bit (NMI Digital Filter Enable)

The NFLTEN bit enables the digital filter used for NMI pin interrupts. The filter is enabled when NFLTEN is 1, and disabled when NFLTEN is 0. The NMI pin level is sampled at the clock cycle specified in NFCLKSEL[1:0]. When the sampled level matches three times, the output level from the digital filter changes. For details of the digital filter, see section 13.5.6. Digital Filter.

13.2.14 IELSRn : ICU Event Link Setting Register n (n = 0 to 95)

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x300 + 0x4 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	DTCE	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	IELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	IELS[8:0]	ICU Event Link Select 0x00: Disable interrupts to the associated NVIC or DTC module Others: Event signal number to be linked. For details, see section 13.3.2. Event Number.	R/W*1
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
16	IR	Interrupt Status Flag 0: No interrupt request generated. 1: An interrupt request is generated.	R/W*2
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	DTCE	DTC Activation Enable 0: DTC activation is disabled. 1: DTC activation is enabled.	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The [15:0] bits in this register can only be accessed in halfword or word access. Byte access is ignored.
Note 2. Writing 1 to the IR flag is prohibited.
This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).
If the security attribution is configured as secure,

- Secure access is allowed.
- Non-secure write access is ignored and non-secure read access is read as 0. TrustZone access error is generated.

If the security attribution is configured as non-secure and the trusted event route is disabled:

- Secure write access is ignored and secure read access is read as 0. TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as non-secure and the trusted event route is enabled:

- Secure access to IELS bit is allowed.
- Non-secure write access is ignored and non-secure read access is allowed.
- Secure write access to other bits is ignored and secure read access to other bits is read as 0.
- Non-secure access to other bits is allowed.
- TrustZone access error is not generated.

P-TYPE-2

The IELSRn register selects the interrupt source used by the NVIC. For details, see Table 13.3. IELSRn corresponds to the NVIC interrupt input source number, where n = 0 to 95.

IELS[8:0] bits (ICU Event Link Select)

The IELS[8:0] bits link an event signal to the associated NVIC or DTC module. Event options are classified into 8 groups (groups 0 to 7). For details, see section 13.3. Vector Table. All IELS[8:0] bits must be written at the same time.

IR flag (Interrupt Status Flag)

The IR status flag indicates an individual interrupt request from the event specified in IELS[8:0].

[Setting condition]

When an interrupt request is received from the associated peripheral module or IRQi pin.

[Clearing condition]

- The IR flag is cleared to 0 by writing 0.
- In the case of DTC.DISEL = 0. At the time other than the final transfer end in DTC transfer during DTCE = 1, IR flag repeat set and cleared by Hardware.
- In the case of DTC.DISEL = 1. For DTC transfers during DTCE = 1, the hardware does not clear the IR flag. Should be cleared by the CPU writing 0.

When DTC transfer except last transfer is completed (DTCE bit is changed from 1 to 0).

During DTCE = 1, write 0 to IR register is prohibited.

In the case of level detection, clear of the IR flag should follow the steps below.

1. Negate the input interrupt signal.
2. Run the peripheral read access once and wait for 2 clock cycles of the target module clock.
3. Clear the IR flag by writing 0.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read this register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

DTCE bit (DTC Activation Enable)

When the DTCE bit is set to 1, the associated event is selected as the source for DTC activation.

[Setting condition]

- When 1 is written to the DTCE bit.

[Clearing condition]

- When the specified number of transfers is complete. For chain transfers, when the specified number of transfers for the last chain transfer is complete.
- When 0 is written to the DTCE bit.

Note: The secure attribution managed within the Arm CPU NVIC must match the SA（Security Attribution) of IELSEn (n = 0 to 95).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

13.2.15 WUPEN0 : Wake Up Interrupt Enable Register 0

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x1A0

Note: S-TYPE4, P-TYPE2
Note 1. Description is a description of each bit.

IRQWUPEN[15:0] bits (IRQn Interrupt Deep Sleep/Software Standby Mode Returns Enable(n = 0 to 15))

The IRQWUPEN[15:0] are the enable bits to control the use of the IRQn pin as a Deep Sleep/Software Standby mode return factor. n= 0 to 15

IWDTWUPEN bit (IWDT Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The IWDTWUPEN is the enable bit to control the use of the IWDT interrupt as a Deep Sleep/Software Standby mode return factor.

PVD1WUPEN bit (PVD1 Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The PVD1WUPEN is the enable bit to control the use of the PVD1 interrupt as a Deep Sleep/Software Standby mode return factor.

PVD2WUPEN bit (PVD2 Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The PVD2WUPEN is the enable bit to control the use of the PVD2 interrupt as a Deep Sleep/Software Standby mode return factor.

VBATTWUPEN bits (VBATT Monitor Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The VBATTWUPEN is the enable bit to control the use of the VBATT monitor interrupt as a Deep Sleep/Software Standby mode return factor.

RTCALMWUPEN bits (RTC Alarm Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The RTCALMWUPEN is the enable bit to control the use of the RTC alarm interrupt as a Deep Sleep/Software Standby mode return factor.

RTCPRDWUPEN bits (RTC Period Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The RTCPRDWUPEN is the enable bit to control the use of the RTC period interrupt as a Deep Sleep/Software Standby mode return factor.

USBHSWUPEN bits (USBHS Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The USBHSWUPEN is the enable bit to control the use of the USBHS interrupt as a Deep Sleep/Software Standby mode return factor.

USBFS0WUPEN bits (USBFS Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The USBFS0WUPEN is the enable bit to control the use of the USBFS interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1UDWUPEN bits (AGT1 Underflow Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1UDWUPEN is the enable bit to control the use of the AGT1 underflow interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1CAWUPEN bits (AGT1 Compare Match A Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1CAWUPEN is the enable bit to control the use of the AGT1 compare match A interrupt as a Deep Sleep/Software Standby mode return factor.

AGT1CBWUPEN bits (AGT1 Compare Match B Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The AGT1CBWUPEN is the enable bit to control the use of the AGT1 compare match B interrupt as a Deep Sleep/Software Standby mode return factor.

IIC0WUPEN bits (IIC0 Address Match Interrupt Deep Sleep/Software Standby Mode Returns Enable)

The IIC0WUPEN is the enable bit to control the use of the IIC0 interrupt as a Deep Sleep/Software Standby mode return factor.

Note: The security attribution of this register is set for each wakeup event.
To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.2.16 WUPEN1 : Wake Up interrupt enable register 1

Base address: ICU = 0x4000_C000
ICU_NS = 0x5000_C000

Offset address: 0x1A4

11	I3CWUPEN	I3C Wakeup Condition Detection Interrupt Deep Sleep/Software Standby Mode returns Enable bit 0: Deep Sleep/Software Standby returns by I3C wake up interrupt is disabled. 1: Deep Sleep/Software Standby returns by I3C wake up interrupt is enabled.	R/W
12	ULP1UWUPEN	ULPT1 Underflow Interrupt Deep Sleep/Software Standby Mode returns Enable bit 0: Deep Sleep/Software Standby returns by ULPT1 Underflow interrupt is disabled. 1: Deep Sleep/Software Standby returns by ULPT1 Underflow interrupt is enabled	R/W
13	ULP1AWUPEN	ULPT1 Compare Match A Interrupt Deep Sleep/Software Standby Mode returns Enable bit 0: Deep Sleep/Software Standby returns by ULPT1 Compare match A interrupt is disabled. 1: Deep Sleep/Software Standby returns by ULPT1 Compare match A interrupt is enabled.	R/W
14	ULP1BWUPEN	ULPT1 Compare Match B Interrupt Deep Sleep/Software Standby Mode returns Enable bit 0: Deep Sleep/Software Standby returns by ULPT1 Compare match B interrupt is disabled. 1: Deep Sleep/Software Standby returns by ULPT1 Compare match B interrupt is enabled.	R/W
31:15	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE4, P-TYPE2

COMPHS0WUPEN bit (Comparator-HS0 Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the Comparator-HS0 interrupt as a Deep Sleep/Software Standby return factor.

ULP0UWUPEN bit (ULPT0 Underflow Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Underflow interrupt as a Deep Sleep/Software Standby return factor.

ULP0AWUPEN bit (ULPT0 Compare Match A Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match A interrupt as a Deep Sleep/Software Standby return factor.

ULP0BWUPEN bit (ULPT0 Compare Match B Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT0 Compare match B interrupt as a Deep Sleep/Software Standby return factor

I3CWUPEN bit (I3C Wakeup Condition Detection Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the I3C wake up condition detection interrupt as a Deep Sleep/Software Standby return factor.

ULP1UWUPEN bit (ULPT1 Underflow Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Underflow interrupt as a Deep Sleep/Software Standby return factor.

ULP1AWUPEN bit (ULPT1 Compare Match A Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match A interrupt as a Deep Sleep/Software Standby return factor.

ULP1BWUPEN bit (ULPT1 Compare Match B Interrupt Deep Sleep/Software Standby Mode returns Enable bit)

This bit is the enable bit to control the use of the ULPT1 Compare match B interrupt as a Deep Sleep/Software Standby return factor.

Note: The security attribution of this register is set for each wakeup event.

To avoid the occurrence of a security hole, the target event of a wakeup and the security attribution added to this bit must match.

13.3 Vector Table

The ICU detects maskable and non-maskable interrupts. Interrupt priorities are set up in the Arm NVIC. For information about these registers, see section 13.10. Reference.

13.3.1 Interrupt Vector Table

Table 13.3 describes the interrupt vector table. The interrupt vector addresses conform to the NVIC specifications.

Table 13.3 Interrupt vector table (1 of 4)

Exception number	IRQ number	Vector offset	Source	Description
0	—	0x000	Arm	Initial stack pointer
1	—	0x004	Arm	Initial program counter (reset vector)
2	—	0x008	Arm	Non-Maskable Interrupt (NMI)
3	—	0x00C	Arm	HardFault
4	—	0x010	Arm	MemManage Fault
5	—	0x014	Arm	BusFault

Table 13.3 Interrupt vector table (2 of 4)

Exception number	IRQ number	Vector offset	Source	Description
6	—	0x018	Arm	UsageFault
7	—	0x01C	Arm	SecureFault
8	—	0x020	Arm	Reserved
9	—	0x024	Arm	Reserved
10	—	0x028	Arm	Reserved
11	—	0x02C	Arm	Supervisor Call (SVCall)
12	—	0x030	Arm	DebugMonitor
13	—	0x034	Arm	Reserved
14	—	0x038	Arm	Pendable request for system service (PendableSrvReq)

13.3.2 Event Number

The following table lists heading details for Table 13.4, which describes each event number.

Heading	Description
Interrupt request source	Name of the source generating the interrupt request
Name	Name of the interrupt
Connect to NVIC	“ ✓” indicates the interrupt can be used as a CPU interrupt
Invoke DTC	“ ✓” indicates the interrupt can be used to request DTC activation
Invoke DMAC	“✓” indicates the interrupt can be used to request DMAC activation
Canceling CPU Deep Sleep	“✓” indicates the interrupt can be used to request a return from CPU Deep Sleep mode
Canceling Software Standby	“ ✓” indicates the interrupt can be used to request a return from Software Standby mode
Canceling Deep Software Standby	“✓” indicates the interrupt can be used to request a return from Deep Software Standby mode

Note 1. Only supported when CMPCTL0.CSTEN = 1.
Note 2. Only the first edge detection is valid.
Note 3. Support only interrupt after DTC transfer.
Note 4. Only supported in Deep Software Standby mode 1 and Deep Software Standby mode 2.
Note 5. Only supported in Deep Software Standby mode 1.

13.4 Maskable Interrupt Operation

The ICU performs the following functions:

- Detecting interrupts
- Enabling and disabling interrupts
- Selecting interrupt request destinations such as CPU interrupt, DTC activation.

13.4.1 Detecting Interrupts

The ICU selects an event source input from a peripheral function interrupt or an external pin interrupt with IELSRn.IELS [8:0].

The accepted interrupt source sets the IELSRn.IR to 1 and sends an interrupt request to the NVIC.

External pin interrupt requests are detected by either:

- Edges (falling edge, rising edge, or rising and falling edges)
- Level (low level) of the interrupt signal.

Set the IRQCRi.IRQMD[1:0] bits to select the detection mode for the IRQi pins. For interrupt sources associated with peripheral modules, see Table 13.3 and Table 13.4. Events must be accepted by the NVIC before an interrupt occurs and is accepted by the CPU.

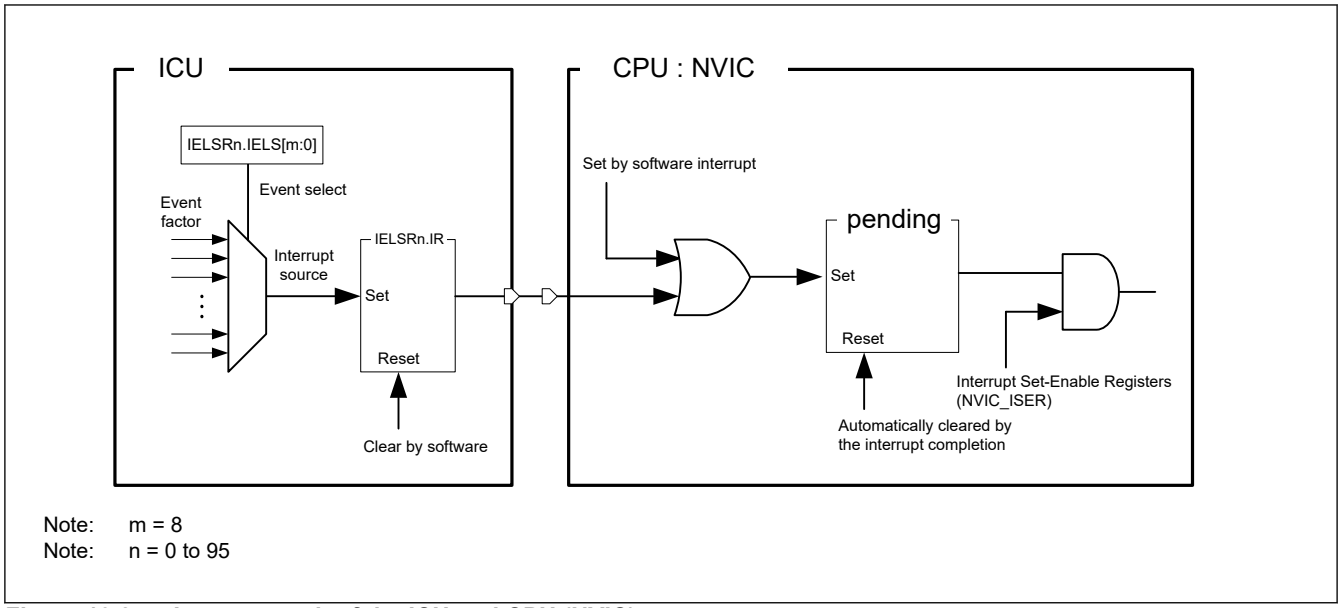

Figure 13.2 Interrupt path of the ICU and CPU (NVIC)

13.5 Maskable Interrupt setting procedure

13.5.1 Operations During an Interrupt

-When an interrupt is generated: except for software interrupts:

The IELSRn.IR (n = 0 to 95) flag and Interrupt Set Pending Register (NVIC_ISPRn) are set.

- When an interrupt is generated: software interrupts:

Interrupt Set Pending Register (NVIC_ISPRn) are set.

- When an interrupt is complete:

Clear the IELSRn.IR (n = 0 to 95) flag by software. The Interrupt Set Pending Register (NVIC_ISPRn) is automatically cleared.

Note: There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the IR. Then the CPU will accidentally jump to the interrupt handler again. To avoid this, be sure to read IELSRn (n = 0 to 95) register before exiting the interrupt handler and make sure that IR is cleared before exiting the interrupt handler.

13.5.2 Enabling Interrupt Requests

The procedure for enabling an interrupt request is as follows:

1. Set the Interrupt Set-Enable register (NVIC_ISER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN register setting).

13.5.3 Disabling Interrupt Requests

The procedure to disable the interrupt request is as follows:

1. Disable the operation settings for the event source, such as Deep Sleep/Software Standby mode cancellation (WUPEN register setting).
2. Clear the interrupt source setting (IELSRn.IELS[8:0] = 0x00).
3. Clear the interrupt status flag (IELSRn.IR = 0).
4. Clear the interrupt Clear-Enable register (NVIC_ICER) and interrupt Clear-Pending register (NVIC_ICPR).

13.5.4 Polling for interrupts

The procedure for polling for interrupt requests is as follows:

1. Set the Interrupt Clear-Enable register (NVIC_ICER).
2. Set the IELSRn.IELS[8:0] bits as the interrupt source.
3. Specify the operation settings for the event source, such as DMAC activation (DELSRn.DELS[8:0]), Deep Sleep/ Software Standby mode cancellation (WUPEN register setting).
4. Poll the interrupt Set-Pending register (NVIC_ISPR).

13.5.5 Selecting Interrupt Request Destinations

The available destinations are fixed for each interrupt, as described in Table 13.3, Table 13.4.

The interrupt output destination, CPU and DTC can be independently selected for each interrupt source.

Use an interrupt request destination setting that is indicated by a "✓" in the event list (see section 13.3.2. Event Number).

Note: Setting the same interrupt source for IELSRn and DELSRn is prohibited.

If the DMAC or DTC is selected as the destination for requests from an IRQi pin, you must set the IRQCRi.IRQMD[1:0] bits for that interrupt to select edge detection.

13.5.5.1 CPU interrupt request

When IELSRn.DTCE = 0, the event specified in the IELSRn register is output to the NVIC.

13.5.5.2 DTC activation

When IELSRn.DTCE = 1, the event specified in the IELSRn register is output to the DTC. Use the following procedure:

1. Set the IELSRn.IELS[8:0] bits to the target event and set the IELSRn.DTCE bit to 1.
2. Set the DTC Module Start bit (DTCST.DTCST) to 1.

Table 13.5 shows operation when the DTC is the interrupt request destination.

Table 13.5 Operation when DTC becomes interrupt request destination

Interrupt request destination	DISEL*1	Remaining transfer operations	Operation per request	IR*2	Interrupt request destination after transfer
DTC*3	1	≠ 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)
	0	≠ 0	DTC transfer	Cleared at the start of DTC data transfer after reading DTC transfer data	DTC
		= 0	DTC transfer → CPU interrupt	Cleared on interrupt acceptance by the CPU	CPU (IELSRn.DTCE bit is automatically cleared)

Note 1. DTC.MRB.DISEL bit controles the interrupt generates timing from DTC to CPU.
Note 2. When the IELSRn.IR flag is 1, an interrupt request (DTC activation request) that occurs again is ignored.
Note 3. For chain transfers, DTC transfer continues until the last chain transfer ends. The DISEL bit state and the remaining transfer count determine whether a CPU interrupt occurs, the IELSRn.IR flag clear timing, and the interrupt request destination after transfer. See Table 17.2 in section 17, Data Transfer Controller (DTC).

Note: Error during DTC transfer

If an error response occurs during DTC transfer, the DTC notifies the ICU that an error has occurred. ICU clears all bits of the target IELSRn (n = 0 to 95). IELSRn that is not the target is not cleared.

13.5.6 Digital Filter

A digital filter function is provided for the external interrupt request pins IRQi, (i = 0 to 15) and the NMI pin interrupt. It samples input signals on the filter PCLKB sampling clock and removes any signal with a pulse width less than 3 sampling cycles.

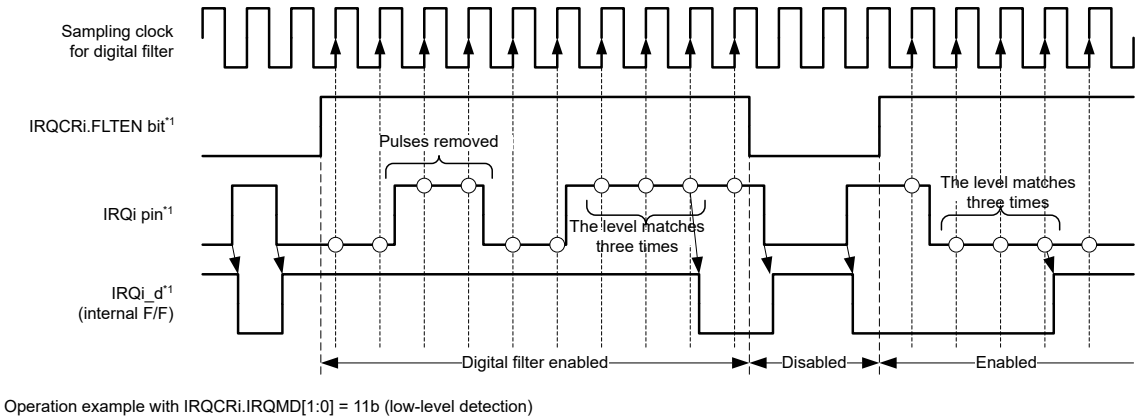
To use the digital filter for an IRQi pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the IRQCRi.FCLKSEL[1:0] bits (i = 0 to 15).
2. Set the IRQCRi.FLTEN bit (i = 0 to 15) to 1 (digital filter enabled).

To use the digital filter for an NMI pin:

1. Set the sampling clock cycle to PCLKB, PCLKB/8, PCLKB/32, or PCLKB/64 in the NMICR.NFCLKSEL[1:0] bits.
2. Set the NMICR.NFLTEN bit to 1 (digital filter enabled).

Figure 13.3 shows an example of digital filter operation.



Note 1. i = 0 to 15

Figure 13.3 Digital filter operation example

During Software Standby mode or Deep Software Standby mode, the digital filter is forcibly turned off by Hardware. After returning to normal mode from Software Standby mode or Deep Software Standby mode, follow the values of IRQCRi.FLTEN (i = 0 to 15) and NMICR.NFLTEN. Once the filter is disabled, the event information sampled up to that point will be lost.

13.5.7 External Pin Interrupts

To use external pin interrupts:Configure I/O ports settings.

1. Clear the IRQCRi.FLTEN bit (i = 0 to 15) to 0 (digital filter disabled).
2. Specify or confirm the I/O port settings.
3. Set the IRQMD[1:0] the FCLKSEL[1:0] bits, and the FLTEN bit of the IRQCRi register (i = 0 to 15) register.
4. Select the IRQ pin as follows:
   - If the IRQ pin is to be used for CPU interrupt requests, set the IELSRn.IELS[8:0] (n = 0 to 95) bits and the IELSRn.DTCE (n = 0 to 95) bit to 0.
   - If the IRQ pin is to be used for DTC activation, set the IELSRn.IELS[8:0] (n = 0 to 95) bits and the IELSRn.DTCE (n = 0 to 95) bit to 1

- If the IRQ pin is to be used for DMAC activation, set the DMAC. DELSRn.DELS[8:0] (n = 0 to 7) bits.

13.6 Non-Maskable Interrupt Operation

The following sources can trigger a non-maskable interrupt:

- NMI pin interrupt
- Oscillation stop detection interrupt
- WDT underflow/refresh error interrupt
- IWDT underflow/refresh error interrupt
- Voltage monitor 1 interrupt
- Voltage monitor 2 interrupt
- Common memory error interrupt
- Bus error interrupt
- CPU Lockup error interrupt

Non-maskable interrupts can only be used with the CPU, not to activate the DTC. Non-maskable interrupts take precedence over all other interrupts. The non-maskable interrupt states can be verified in the Non-Maskable Interrupt Status Register (NMISR). Confirm that all bits in the NMISR are 0 before returning from the NMI handler.

There may be a difference in processing speed between the CPU and ICU, and the CPU may exit the interrupt handler before clearing the NMISR. Then the CPU will accidentally jump to the NMI handler again. To avoid this, be sure to read NMISR before exiting the NMI handler and make sure that NMISR is cleared before exiting the NMI handler.

Non-maskable interrupts are disabled by default. To use non-maskable interrupts:

1. Clear the NMICR.NFLTEN bit to 0 (digital filter disabled).
2. Set the NMIMD bit, NFCLKSEL[1:0] bits, and NFLTEN bit of NMICR register.
3. Write 1 to the NMICLR.NMICLR bit to clear the NMISR.NMIST flag to 0.
4. Enable the non-maskable interrupt by writing 1 to the associated bit in the Non-Maskable Interrupt Enable Register (NMIER).

After 1 is written to the NMIER register, subsequent write access to the NMIEN bit in NMIER is ignored. An NMI cannot be disabled when enabled, except by a reset.

13.6.1 Correspondence to TrustZone-M by NMI

The NMI security is set by AIRCR.BFHFNMINS.

Although there is only one NMI per CPU, multiple factors can be set. This section describes the procedure for mixing Secure and NonSecure programs of NMI. When doing so, the NMI-related registers of the ICU are set to Secure.

Register related to Non-Maskable Interrupt :

- NMISR
- NMIER
- NMICLR
- NMICR

Figure 13.4 shows the flow.

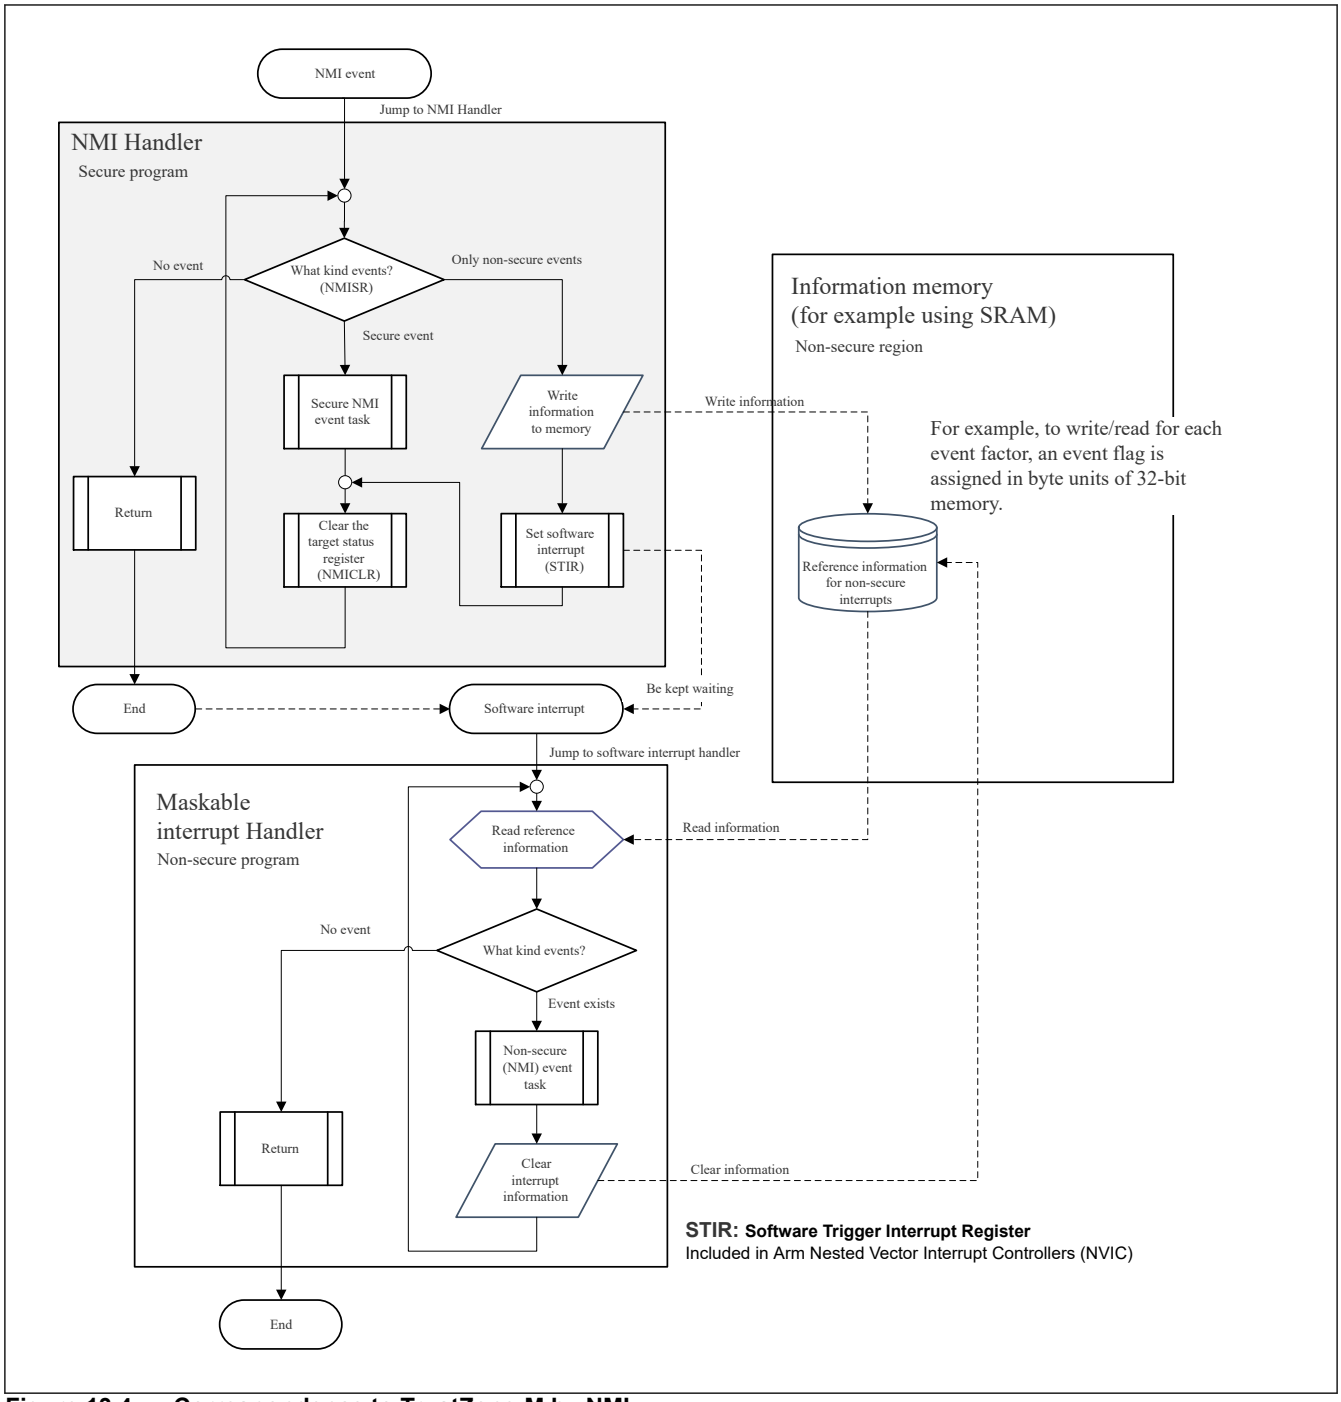


Figure 13.4 Correspondence to TrustZone-M by NMI

13.7 Security

13.7.1 Security Related to CPU Interrupt Inputs

Non-maskable interrupt

Arm CPU NMI Secure is modified by AIRCR.BFHFNMINS and is managed by the software developer who manages Secure.

The following registers must follow the secure attribution set in AIRCR.BFHFNMINS.

- ICU.NMISR
- ICU.NMIER

- ICU.NMICLR

Therefore, the secure attribute set by ICUSARB must match the secure attribute set by AIRCR.BFHFNMINS.

Maskable interrupts

The secure of maskable interrupts are set in the Arm CPU NVIC internal registers (NVIC_ITNS0 to NVIC_ITNS15).

Which maskable interrupts are secured is controlled by the software developer who manages secure.

The following registers must follow the secure attribution set in NVIC_ITNS0 to NVIC_ITNS15.

- ICU.IELSRn (n = 0 to 95)

Therefore, the secure attribute set by ICUSARG, ICUSARH, and ICUSARI must match the secure attribute set by NVIC_ITNS0 to NVIC_ITNS15.

13.7.2 Trusted Interrupt Management

The secure-interrupt should not be visible to non-secure-operation. Because there is a risk that vital information will be leaked to the attacker, the on-chip interrupt network can route any interrupt to secure or non-secure world. However, secure interrupt routing must be suppressed so that it can only be configured from a secure world.

When set TEVTRCR.TEVTE = 1, secure program manages the selection of interrupt factors. It protects non-secure programs from using and monitoring secure interrupt factors without permission. Specifically, when TEVTRCR.TEVTE = 1, the write permission of IELSR.IELS [8: 0] is limited to the secure attribute, and the write by the non-secure attribute is ignored. TEVTRCR.TEVTE protects only IELS [8: 0], and the security attributes of IR and DTCE follow the settings of ICUSARG, ICUSARH, and ICUSARI. If TEVTRCR.TEVTE = 1, it is necessary to set all IELS including non-secure interrupts in the secure program or prepare a secure API to set IELS in response to the request from the non-secure program.

13.7.3 Trusted IELSR Setting Procedure

13.7.3.1 Case where Secure program sets all IELSRs

Case where all settings are performed in the secure initial sequence.

Initial IELSR setting procedure after system reset release

1. Secure program sets TEVTE=1
2. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
3. Secure program selects all interrupt source (ICU.IELSRn.IELS)
4. Secure program allows secure interrupts (NVIC_ISER for secure interrupt)
5. Secure program jumps to non-secure program
6. Non-secure program allows non-secure interrupts (NVIC_ISER for non-secure interrupt)

13.7.3.2 Case where Non-secure program sets IELSRn by Secure API

Case of setting upon receiving a request from a non-secure program.

Initial IELSR setting procedure after system reset release

1. Secure program sets TEVTE=1
2. Secure program sets security attributes of all interrupts (NVIC_ITNS, Security Attribution of ICU.IELSRn.IELS)
3. Secure program selects secure interrupt source (ICU.IELSRn.IELS)
4. Secure program enables secure interrupt (NVIC_ISER for secure interrupt)
5. Secure program jumps to non-secure program
6. Non-secure program calls secure program (API call)
7. Secure program selects the cause of non-secure interrupt (ICU.IELSRn.IELS)
8. Secure program returns to non-secure program
9. Non-secure program allows non-secure interrupt (NVIC_ISER for non-secure interrupt)

13.7.3.3 IELSR release procedure when TEVTE=1

< When clearing interrupt settings of secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS = 0x00)
2. Clear the interrupt status flag (ICU.IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

<When clearing interrupt settings of non-secure attribute by the secure program >

1. Clear the interrupt source setting (IELSRn.IELS =0x00)
2. Clear the interrupt status flag by using the non-secure alias address (IELSRn.IR = 0)
3. Clear the Interrupt Clear Enable register (NVIC_ICPR)

Secure can also rewrite NVIV_ICPRn_NS .

< When clearing interrupt settings of secure attribute by the non-secure program >

It cannot be canceled.

< When clearing interrupt settings of non-secure attribute by non-secure program>

1. Non-secure program calls secure program (API call)
2. Clear the interrupt source setting (IELSRn.IELS = 0x00)
3. Return from secure program to non-secure program
4. Clear the interrupt status flag (IELSRn.IR = 0)
5. Clear the Interrupt Clear Enable register (NVIC_ICPR)

13.8 Return from Low Power Modes

section 13.3.2. Event Number lists the interrupt sources that can be used to exit Sleep, Deep Sleep, Software Standby mode or Deep Software Standby mode. For more information, see section 10, Low Power Modes.

Note: The return factor from low power mode must have a priority that the CPU can accept.

13.8.1 Return from CPU Sleep Mode

To return from CPU Sleep mode in response to an interrupt:

non-maskable interrupt

- Use the NMIER register to enable the target interrupt request.

maskable interrupt

- Select the CPU as the interrupt request destination.
- Enable the interrupt in the NVIC.

13.8.2 Return from CPU Deep Sleep Mode

The ICU returns from CPU Deep Sleep mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see Table 13.4 .

To return from CPU Deep Sleep mode:

Non-maskable interrupt

Use the NMIER register to enable the target interrupt request.

Maskable interrupt

1. Select the interrupt source that enables return from CPU Deep Sleep mode.

2. Use the WUPEN register to enable the target interrupt request.
3. Select the CPU as the interrupt request destination.
4. Enable the interrupt in the NVIC.

Interrupt requests through the IRQi (i = 0 to 15) pins that do not satisfy these conditions are not detected while the clock is stopped in CPU Deep Sleep mode. Similarly, it cannot detect a request for a non-maskable interrupt from a request source whose clock is stopped in CPU Deep Sleep mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from software standby mode because the following NMI events do not occur.

- CPU Lockup error interrupt

13.8.3 Return from Software Standby Mode

MCU goes to the Software Standby mode via CPU Deep sleep state.

The ICU returns from Software Standby mode using a non-maskable interrupt or a maskable interrupt. For maskable interrupt of canceling source, see Table 13.4.

Waking up from Software Standby mode is triggered by the same event as CPU Deep Sleep mode. No event occurs from the function that stops in Software Standby mode. Therefore, those events cannot be used as return factors. For example, the CPU cannot return from Software Standby mode because the following NMI events do not occur.

- WDT underflow/refresh error
- Common memory error interrupt
- Bus error interrupt
- CPU Lockup error interrupt

13.9 Using the WFI Instruction with Non-Maskable Interrupts

Whenever a WFI instruction is executed, confirm that all status flags in the NMISR register are 0.

14. Buses

14.1 Overview

Table 14.1 lists the bus masters and bus slaves, Figure 14.1 shows the system bus configuration, and Table 14.3 lists the addresses assigned for each bus.

Table 14.1 Bus specifications

Classification	Bus master/ slave name	Sync clock	Description
Bus masters	CPUMAXIBI (Arm® Cortex®-M85)	CPUCLK	Connected to the CPU Master-AXI (M-AXI) Interface
	CPUPAHBI (Arm® Cortex®-M85)	CPUCLK	Connected to the CPU Peripheral AHB (P-AHB) Interface
	DMAC/DTCBI	ICLK	Connected to the DMAC/DTC Interface
	EDMACBI	PCLKA	Connected to the Ether DMAC Interface
	CEUBI	PCLKA	Connected to the CEU Interface
	GLCDC0BI	PCLKA	Connected to the GLCDC0 Interface
	GLCDC1BI	PCLKA	Connected to the GLCDC1 Interface
	DRW0BI	PCLKA	Connected to the DRW0 Interface
	DRW1BI	PCLKA	Connected to the DRW1 Interface
	MIPIBI	PCLKA	Connected to the MIPI-DSI Interface
Bus slaves	FHBI	ICLK	Connected to Code Flash memory and Configration area
	FLBI	FCLK	Connected to Data Flash memory and FACI
	CPUSAHBI	CPUCLK	Connected to CPU S-AHB
	S0BI	ICLK	Connected to SRAM0
	S1BI	ICLK	Connected to SRAM1
	STBYSBI	ICLK	Connected to Standby SRAM
	ECBI	BCLK	Connected to the external devices (External Memory Interface)
	EOBI	PCLKA	Connected to the OSPI (External Memory Interface)
	PBBI	PCLKB	Connected to peripheral modules synchronizes with PCLKB
	PABI	PCLKA	Connected to peripheral modules synchronizes with PCLKA
	PIBI	ICLK	Connected to peripheral modules synchronizes with ICLK
	ICUBI	ICLK	Connected to ICU controller
	PSBI	ICLK	Connected to peripheral system modules (MPU, CSC/SDRAM, SRAM, Debug component, Flash controller, Bus controller, common ICU controller, DMAC/DTC, CPU controller and security attribution controller)
		PCLKB	Connected to peripheral system module. (system controller)
		DCLK	Connected to peripheral system module. (debug controller)

Note: BCLK (external bus clock) : 120 MHz (max.) (The CSC (CS area controller) operates in synchronization with the BCLK).
BCLK pin output: The frequency is the same as the default of BCLK. Half of BCLK can be supplied by setting the EBCLK pin and the output select bit (BCKCR.BCLKDIV) in the External Bus Clock Control register. For details, see section 8, Clock Generation Circuit
CPUMAXIBI : CPU M-AXI Bus Interface
CPUPAHBI : CPU P-AHB Bus Interface
DMAC/DTCBI : DMAC/DTC Bus Interface
EDMACBI : EDMAC (Ether) Bus Interface
GLCDC0BI : GLCDC (graphic 1) Bus Interface
GLCDC1BI : GLCDC (graphic 2) Bus Interface
DRW0BI : DRW (texture) Bus Interface
DRW1BI : DRW (data) Bus Interface
CEUBI : CEU Bus Interface

MIPIBI : MIPI Bus Interface
FHBI : Flash High-speed Bus Interface
FLBI : Flash Low-speed Bus Interface
CPUSAHBI : CPU S-AHB Interface
S0BI : SRAM0 Bus Interface
S1BI : SRAM1 Bus Interface
STBYSBI : Standby SRAM Bus Interfacece
ECBI : External memory CSC and SDRAM Bus Interface
EOBI : External memory OSPI Bus Interface
PBBI : Peripheral synchronizes with PCLKB Bus Interface
PABI : Peripheral synchronizes with PCLKA Bus Interface
PIBI : Peripheral synchronizes with ICLK Bus Interface
ICUBI : ICU Controller Bus Interface
PSBI : Peripheral System Bus Interface

	EOBI	T	F	T	T	T	T	T	T

Note: TZF is TrustZone Filter for memory resources. CPUMAXIBI accesses Data Flash Memory and Configuration area through FLBI. CPUPAHBI accesses FACI (Peripheral region) through FLBI.
Note 1. GDSSBI is a BUS interface that combines DRW0BI, DRW1BI and MIPIBI.

T : The master can access slaves

F : The master cannot access slaves

Table 14.3 Addresses assigned for each slave (1 of 2)

Region	Address	Bus Interface	Area
Code	0x0000_0000 to 0x0000_FFFF (Non-secure callable or Secure) 0x1000_0000 to 0x1000_FFFF (Non-secure)	CPUSAHBI	ITCM
	0x0200_0000 to 0x022F_7FFF (Non-secure callable or Secure) 0x1200_0000 to 0x122F_7FFF (Non-secure)	FHBI	Code Flash memory
	0x0300_8000 to 0x0300_A2FF (Non-secure callable or Secure) 0x1300_8000 to 0x1300_A2FF (Non-secure)	FHBI	Factory Flash and option-setting memory
Data	0x2000_0000 to 0x2000_FFFF (Non-secure callable or Secure) 0x3000_0000 to 0x3000_FFFF (Non-secure)	CPUSAHBI	DTCM
	0x2200_0000 to 0x2205_FFFF (Non-secure callable or Secure) 0x3200_0000 to 0x3205_FFFF (Non-secure)	S0BI	SRAM0
	0x2206_0000 to 0x220D_FFFF (Non-secure callable or Secure) 0x3206_0000 to 0x320D_FFFF (Non-secure)	S1BI	SRAM1
	0x2600_0000 to 0x2600_03FF (Non-secure callable or Secure) 0x3600_0000 to 0x3600_03FF (Non-secure)	STBYSBI	Standby SRAM
	0x2700_0000 to 0x2700_2FFF (Non-secure callable or Secure) 0x3700_0000 to 0x3700_2FFF (Non-secure)	FLBI	Data Flash memory
	0x2703_0050 to 0x2703_03FF (Non-secure callable or Secure) 0x3703_0050 to 0x3703_03FF (Non-secure)	FLBI	option-setting memory

Table 14.3 Addresses assigned for each slave (2 of 2)

Region	Address	Bus Interface	Area
Peripheral	0x4000_0000 to 0x4000_0FFF (Secure) 0x5000_0000 to 0x5000_0FFF (Non-secure)	PSBI	MPU controller
	0x4000_2000 to 0x4000_2FFF (Secure) 0x5000_2000 to 0x5000_2FFF (Non-secure)		SRAM controller
	0x4000_3000 to 0x4000_3FFF (Secure) 0x5000_3000 to 0x5000_3FFF (Non-secure)		CSC/SDRAM controller
	0x4000_4000 to 0x4000_4FFF (Secure) 0x5000_4000 to 0x5000_4FFF (Non-secure)		BUS controller
	0x4000_6000 to 0x4000_6FFF (Secure) 0x5000_6000 to 0x5000_6FFF (Non-secure)		Common ICU controller
	0x4000_8000 to 0x4000_8FFF (Secure) 0x5000_8000 to 0x5000_8FFF (Non-secure)		Security attribution controller
	0x4000_A000 to 0x4000_AFFF (Secure) 0x5000_A000 to 0x5000_AFFF (Non-secure)		DMAC/DTC
	0x4000_C000 to 0x4000_CFFF (Secure) 0x5000_C000 to 0x5000_CFFF (Non-secure)	ICUBI	ICU controller
	0x4000_F000 to 0x4000_FFFF (Secure) 0x5000_F000 to 0x5000_FFFF (Non-secure)	PSBI	CPU controller
	0x4001_0000 to 0x4001_AFFF (Secure) 0x5001_0000 to 0x5001_AFFF (Non-secure)		Debug component
	0x4001_B000 to 0x4001_BFFF (Secure) 0x5001_B000 to 0x5001_BFFF (Non-secure)		Debug controller
	0x4001_C000 to 0x4001_CFFF (Secure) 0x5001_C000 to 0x5001_CFFF (Non-secure)		Flash controller
	0x4001_E000 to 0x4001_EFFF (Secure) 0x5001_E000 to 0x5001_EFFF (Non-secure)		System controller
	0x4010_0000 to 0x401F_FFFF (Secure) 0x5010_0000 to 0x501F_FFFF (Non-secure)	FLBI	Flash register
	0x4020_0000 to 0x402F_FFFF (Secure) 0x5020_0000 to 0x502F_FFFF (Non-secure)	PBBI	Peripheral synchronizes with PCLKB
	0x4030_0000 to 0x403F_FFFF (Secure) 0x5030_0000 to 0x503F_FFFF (Non-secure)	PABI	Peripheral synchronizes with PCLKA
	0x4040_0000 to 0x404F_FFFF (Secure) 0x5040_0000 to 0x504F_FFFF (Non-secure)	PIBI	Peripheral synchronizes with ICLK
External RAM	0x6000_0000 to 0x6FFF_FFFF	ECBI	CSC/SDRAM (external bus)
	0x8000_0000 to 0x9FFF_FFFF	EOBI	OSPI

14.2 Description of Buses

14.2.1 Arbitration

For arbitration between masters in each slave, fixed-priority and round-robin methods can be selected. For details, see section 14.3.24. BUSMABT : Bus Master Arbitration Control Register, section 14.3.25. BUSSABT0<slave> : Bus Slave Arbitration Control Register 0(<slave> = FLBI, STBYSBI, ECBI, EOBI, PBBI, PABI, PIBI, PSBI) and section 14.3.26. BUSSABT1<slave> : Bus Slave Arbitration Control Register 1(<slave> = FHBI, S0BI, S1BI).

14.2.2 External Bus

The external bus controller arbitrates requests for bus access on the external address space from the CPU M-AXI bus, DMAC/DTC bus, EDMAC (Ether) bus, GLCDC0 bus, GLCDC1 bus, DRW0 bus, DRW1 bus, MIPI bus and CEU bus. See section 14.2.1. Arbitration for the priority and arbitration method of each master to the External bus.

The bus system provides an external space for the OSPI (EOBI). See section 37, Octal Serial Peripheral Interface (OSPI).

Table 14.4 lists the external bus specifications and Table 14.5 lists the I/O pins.

Table 14.4 External bus specifications

Parameter	Specifications
External address space	• The external address space is divided into 8 CS areas (CS0 to CS7) and the SDRAM area (SDCS) for management. • Chip select signals can be output for each area. • The bus width can be set for each area. – Separate bus: Selectable to 8-bit, 16-bit or 32-bit bus space – Address/data multiplexed bus: Selectable to 8-bit or 16-bit bus space • Endian mode can be specified for each area.
CS area controller	• Recovery cycles can be inserted: – Read recovery: Up to 15 cycles – Write recovery: Up to 15 cycles • Cycle wait function: Wait for up to 31 cycles (for page access, up to 7 cycles) • Use wait control to set up: – Assertion and negation timing of chip select signals (CS0 to CS7) – Assertion timing of the read signal (RD) and write signals (WR0/WR and WR1 to WR3) – Timing of data output starts and ends • Write access modes: – Single-write strobe mode and byte strobe mode Separate bus or address/data multiplexed bus can be set for each area.
SDRAM area controller	• Multiplexed output of row address and column address (8, 9, 10, or 11 bits) • Self-refresh and auto-refresh selectable • CAS latency can be specified from 1 to 3 cycles.
Write buffer function	When write data from the bus master is written to the write buffer, write access by the bus master is complete.
Frequency	• The CS area controller (CSC) operates in synchronization with the external bus clock (BCLK)*1 • The frequency of the EBCLK pin output is the same as BCLK by default. Half of the BCLK cycles can be supplied by setting the EBCLK Pin Output Select bit, BCKCR.BCLKDIV, in the External Bus Clock Control Register. For more information, see section 8, Clock Generation Circuit. • The SDRAM area controller (SDRAMC) operates in synchronization with the SDRAM clock (SDCLK).

Note 1. BCLK and SDCLK must operate at the same frequency when the SDRAM is in use.

Table 14.5 External bus I/O pins (1 of 2)

Pin name	I/O	Related functions	Description
EBCLK, SDCLK*1	Output	CSC, SDRAMC	Clock output pin
A23 to A00*2	Output	CSC, SDRAMC	Address output pins
D31 to D00 DQ31 to DQ00	I/O	CSC, SDRAMC	D31 to D00 are CSC data input/output pins. DQ31 to DQ00 are SDRAMC data input/output pins. • D31 to D00, DQ31 to DQ00 pins are enabled when the 32-bit bus space is specified. • D15 to D00, DQ15 to DQ00 pins are enabled when the 16-bit bus space is specified. • D07 to D00, DQ07 to DQ00 pins are enabled when the 8-bit bus space is specified.
BC0	Output	CSC	• Strobe signal that indicates (when low) that D07 to D00 are valid during access to an external address space in single-write strobe mode, active-low. • When an 8-bit bus space is specified, this output pin is always held low regardless of the write access mode.
BC1	Output	CSC	• Strobe signal that indicates (when low) that D15 to D08 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8-bit bus space is specified.
BC2	Output	CSC	• Strobe signal that indicates (when low) that D23 to D16 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8- or 16-bit bus space is specified.
BC3	Output	CSC	• Strobe signal that indicates (when low) that D31 to D24 are valid during access to an external address space in single-write strobe mode, active-low. • This pin is not used when the 8- or 16-bit bus space is specified.
CS0*3	Output	CSC	Chip select signal for area 0 (CS0), active-low

Table 14.5 External bus I/O pins (2 of 2)

Pin name	I/O	Related functions	Description
CS1*3	Output	CSC	Chip select signal for area 1 (CS1), active-low
CS2*3	Output	CSC	Chip select signal for area 2 (CS2), active-low
CS3*3	Output	CSC	Chip select signal for area 3 (CS3), active-low
CS4	Output	CSC	Chip select signal for area 4 (CS4), active-low
CS5	Output	CSC	Chip select signal for area 5 (CS5), active-low
CS6	Output	CSC	Chip select signal for area 6 (CS6), active-low
CS7	Output	CSC	Chip select signal for area 7 (CS7), active-low
RD	Output	CSC	Strobe signal that indicates that a read from an external address space (CS0 to CS7) is in progress, active-low.
WR0/WR*4	Output	CSC	• WR0 signal is a strobe signal that indicates that a write to an external address space is in progress in byte strobe mode, and D07 to D00 are valid, active-low. • WR signal is a strobe signal that indicates that a write to an external address space is in progress in single-write strobe mode, active-low. • When an 8-bit bus space is specified, this output pin is held low during a write access regardless of the write access mode.
WR1	Output	CSC	• Strobe signal that indicates that D15 to D08 are valid during a write to an external address space in byte strobe mode, active-low. • This signal is invalid in single-write strobe mode. • This pin is not used when the 8-bit bus space is specified.
WR2	Output	CSC	• Strobe signal that indicates that D23 to D16 are valid during a write to an external address space in byte strobe mode, active-low. • This signal is invalid in single-write strobe mode. • This pin is not used when the 8- or 16-bit bus space is specified.
WR3	Output	CSC	• Strobe signal that indicates that D31 to D24 are valid during a write to an external address space in byte strobe mode, active-low. • This signal is invalid in single-write strobe mode. • This pin is not used when the 8- or 16-bit bus space is specified.
ALE	Output	CSC	Address latch signal when address/data multiplexed bus is selected.
WAIT	Input	CSC	Wait request signal used when accessing the external address space (CS0 to CS7), active-low
CKE	Output	SDRAMC	Clock enable signal
SDCS	Output	SDRAMC	Chip select signal, active-low
RAS	Output	SDRAMC	Row address strobe signal, active-low
CAS	Output	SDRAMC	Column address strobe signal, active-low
WE	Output	SDRAMC	Write enable signal, active-low
DQM0	Output	SDRAMC	I/O data mask enable signal for DQ07 to DQ00
DQM1	Output	SDRAMC	I/O data mask enable signal for DQ15 to DQ08
DQM2	Output	SDRAMC	I/O data mask enable signal for DQ23 to DQ16
DQM3	Output	SDRAMC	I/O data mask enable signal for DQ31 to DQ24

Note 1. The EBCLK and the SDCLK pin functions are shared by the CS area controller (CSC) and the SDRAM area controller (SDRAMC). When using the CSC and the SDRAMC simultaneously, the SDCLK pin function is valid.

Note 2. The A23 to A00 pin functions are shared by the CSC and the SDRAMC.
When using the CSC only:
The A00 and BC0 pin functions share the same pin, and either becomes valid according to the area, with the function being A00 in byte strobe mode and BC0 in single-write strobe mode. Setting the 8-bit external bus width is prohibited in single-write strobe mode.
When using the SDRAMC only:
The A16 to A00 pin functions are valid.
The A00 and DQM1, A01 and DQM3 pin functions share the same pin, and either pin function becomes valid according to the external bus width.
When selecting 8-bit bus width, the pin function is A00 and A01. When selecting 16-bit bus width, the pin function is A0 and DQM1.
When selecting 32-bit bus width, the pin function is DQM1 and DQM3.
When using the CSC and the SDRAMC simultaneously:

The A23 to A17 pin functions are valid for CSC. The A16 to A00 pin functions are shared by the CSC and the SDRAMC. In the SDRAMC functions, the A00 and the DQM1 pin functions work as described.
In the CSC functions, the A00 and the BC0 pin function works as described.

Note 3. The CS0 to CS3 (CSC) and SDRAMC pin functions share the same pin. When using the CSC and the SDRAMC simultaneously, the CS0 to CS3 pin functions are invalid.

Note 4. The WR0 signal and WR signal are identical. The WR0 signal is referred to as WR in single-write strobe mode.

14.2.3 Parallel Operation

Parallel operation is possible when different bus-master modules are requesting access to different slave interface. For example, if the CPU is fetching an instruction from Code Flash and an operand from SRAM0, the DMAC can handle transfers between a peripheral module and the external memory interface at the same time.

Figure 14.2 shows an example of parallel operations. In this example, the CPU uses CPUMAXIBI to access FHBI. Furthermore, the DMAC/DTC or EDMAC simultaneously accesses the peripheral bus or the external bus during access to FHBI and S0BI by the CPU.

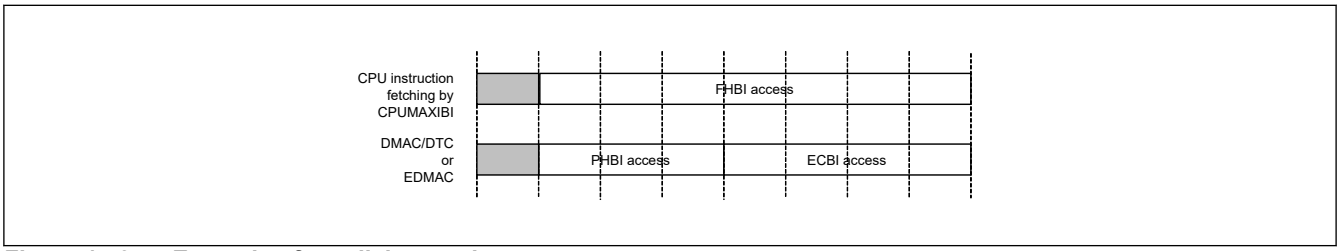

Figure 14.2 Example of parallel operations

14.2.4 Bus Settings

Set up the external bus with the following registers :

- Mode settings :
  CSn Mode Register (CSnMOD)
  CSn Wait Control Register 1 (CSnWCR1)
  CSn Wait Control Register 2 (CSnWCR2)
  CSn Control Register (CSnCR)
  CSn Recovery Cycle Setting Register (CSnREC)
  CS Recovery Cycle Insertion Enable Register (CSRECEN)
  Bus Master Arbitration Control Register (BUSMABT)
  Bus Slave Arbitration Control Register 2 (BUSSABT2)
- I/O port assignments :
  PmnPFS.PMR = 1 and PmnPFS.PSEL[4:0] = 0x0B
- Frequency of the external bus clock (BCLK) and SDRAM clock (SDCLK) :
  SCKDIVCR register.

See section 19, I/O Ports, for information on PmnPFS and section Clock Generation Function for information on SCKDIVCR.

14.2.5 Restrictions

14.2.5.1 Endianness constraint

Memory space must be little-endian to execute code of the Arm® Cortex®-M85 core.

14.2.5.2 Bufferable write access

If an access violation occurs due to bufferable write access, an error response is not returned to the bus master, but an NMI or RESET request is issued depending on the setting of the BUSOAD register. For more information, see section 14.7.2. Operations When a Bus Error Occurs.

14.2.5.3 Access to the reserved area of FLBI

Access to the reserved area of FLBI is prohibited. Operation is not guaranteed if accessed.

14.3 Register Descriptions

14.3.1 BUSSARA : Bus Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSA0	Bus Security Attribution A0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSA0 bit (Bus Security Attribution A0)

Security attributes of registers for Slave Bus Control Register. The target registers are as follows:

- BUSMABT
- BUSSABT0<slave>
  <slave> = FLBI/STBYSBI/ECBI/EOBI/PBBI/PABI/PIBI/PSBI
- BUSSABT1<slave>
  <slave> = FHBI/S0BI/S1BI
- BUSDIVBYP

14.3.2 BUSSARB : Bus Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x104

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSB0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSB0	Bus Security Attribution B0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSB0 bit (Bus Security Attribution B0)

Security attributes of bus error related registers. The target registers are as follows:

- BUSnERRCLR
- MBWERRCLR
- SBWERRCLR
- BUSOAD
- BUSOADPT

14.3.3 BUSSARC : Bus Security Attribution Register C

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x110

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSSC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BUSSC0	Bus Security Attribution C0 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

BUSSC0 bit (Bus Security Attribution C0)

Security attributes of registers for bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF

- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR
- BUS.SDADR
- BUS.SDTR
- BUS.SDMOD
- BUS.SDSR
- BUS.BUSPARC

14.3.4 BUSPARC : Bus Privileged Attribution Register C

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x114

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BUSPA0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	BUSPA0	External bus controller privilege attribution 0: Privileged 1: Unprivileged	R/W
31:1	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1

BUSPA0 bit (External bus controller privilege attribution)

Privileged attributes of registers for Bus (SDRAMC/CSC) Control. The target registers are as follows:

- BUS.CSnCR (n = 0 to 7)
- BUS.CSnREC (n = 0 to 7)
- BUS.CSRECEN
- BUS.CSnMOD (n = 0 to 7)
- BUS.CSnWCR1 (n = 0 to 7)
- BUS.CSnWCR2 (n = 0 to 7)
- BUS.SDCCR
- BUS.SDCMOD
- BUS.SDAMOD
- BUS.SDSELF
- BUS.SDRFCR
- BUS.SDRFEN
- BUS.SDICR
- BUS.SDIR

- BUS.SDADR
- BUS.SDTR
- BUS.SDMOD
- BUS.SDSR

14.3.5 CSnCR : CSn Control Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x802 + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MPXEN	—	—	—	EMODE	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable operation 1: Enable operation	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	External Bus Width Select 0 0: 16-bit bus space 0 1: 32-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	EMODE	Endian Mode 0: Little endian 1: Big endian	R/W
11:9	—	These bits are read as 0. The write value should be 0.	R/W
12	MPXEN	Address/Data Multiplexed I/O Interface Select 0: Separate bus interface is selected for area n. 1: Address/data multiplexed I/O interface is selected for area n.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write the CSnCR register while the external bus is being accessed.

EXENB bit (Operation Enable)

The EXENB bit enables operation of the associated CS area. On MCU reset, operation is enabled (EXENB = 1) only for area 0. Operation in other areas is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When the CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (External Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the associated area. The Arm® Cortex®-M85 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it. Only CPU, DMAC and DTC can access to big-endian area. Memory type of big-endian area must be Device-Memory. For changing the memory type, see section 14.8. References[1]. CPU can't access to big-endian area when using M-profile Vector Extension(MVE).

MPXEN bit (Address/Data Multiplexed I/O Interface Select)

The MPXEN bit specifies separate bus interface or address/data multiplexed I/O interface of each area.

14.3.6 CSnREC : CSn Recovery Cycle Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x80A + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	WRCV[3:0]				—	—	—	—	RRCV[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	RRCV[3:0]	Read Recovery 0 0 0 0: Do not insert any recovery cycles. 0 0 0 1: Insert 1 recovery cycle. 0 0 1 0: Insert 2 recovery cycles. 0 0 1 1: Insert 3 recovery cycles. 0 1 0 0: Insert 4 recovery cycles. 0 1 0 1: Insert 5 recovery cycles. 0 1 1 0: Insert 6 recovery cycles. 0 1 1 1: Insert 7 recovery cycles. 1 0 0 0: Insert 8 recovery cycles. 1 0 0 1: Insert 9 recovery cycles. 1 0 1 0: Insert 10 recovery cycles. 1 0 1 1: Insert 11 recovery cycles. 1 1 0 0: Insert 12 recovery cycles. 1 1 0 1: Insert 13 recovery cycles. 1 1 1 0: Insert 14 recovery cycles. 1 1 1 1: Insert 15 recovery cycles.	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
11:8	WRCV[3:0]	Write Recovery 0 0 0 0: Do not insert any recovery cycles. 0 0 0 1: Insert 1 recovery cycle. 0 0 1 0: Insert 2 recovery cycles. 0 0 1 1: Insert 3 recovery cycles. 0 1 0 0: Insert 4 recovery cycles. 0 1 0 1: Insert 5 recovery cycles. 0 1 1 0: Insert 6 recovery cycles. 0 1 1 1: Insert 7 recovery cycles. 1 0 0 0: Insert 8 recovery cycles. 1 0 0 1: Insert 9 recovery cycles. 1 0 1 0: Insert 10 recovery cycles. 1 0 1 1: Insert 11 recovery cycles. 1 1 0 0: Insert 12 recovery cycles. 1 1 0 1: Insert 13 recovery cycles. 1 1 1 0: Insert 14 recovery cycles. 1 1 1 1: Insert 15 recovery cycles.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write to the CSnREC register while the external bus is being accessed.

When the preceding bus access is from a separate bus, CSnREC is valid when the recovery cycle insertion is enabled in the Separate Bus Recovery Cycle Insertion Enable bit (RCVENi (i = 0 to 7)) in CSRECEN. When the preceding bus access is an address/data multiplexed bus access, CSnREC is valid when the recovery cycle insertion is enabled with the Multiplexed Bus Recovery Cycle Insertion Enable bit (RCVENMj (j = 0 to 7)) in CSRECEN. For more information, see section 14.5.4. Insertion of Recovery Cycles.

RRCV[3:0] bits (Read Recovery)

The RRCV[3:0] bits specify the number of recovery cycles inserted after a read access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.

WRCV[3:0] bits (Write Recovery)

The WRCV[3:0] bits specify the number of recovery cycles inserted after a write access on the external bus for CSn (n = 0 to 7). When recovery cycle insertion is enabled and a value other than 0000 is set, 1 to 15 recovery cycles are inserted when:

- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

14.3.7 CSRECEN : CS Recovery Cycle Insertion Enable Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x880

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCVENM7	RCVENM6	RCVENM5	RCVENM4	RCVENM3	RCVENM2	RCVENM1	RCVENM0	RCVEN7	RCVEN6	RCVEN5	RCVEN4	RCVEN3	RCVEN2	RCVEN1	RCVEN0
Value after reset:	0	0	1	1	1	1	1	0	0	0	1	1	1	1	1	0

Bit	Symbol	Function	R/W
0	RCVEN0	Separate Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
1	RCVEN1	Separate Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W
2	RCVEN2	Separate Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
3	RCVEN3	Separate Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
4	RCVEN4	Separate Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W
5	RCVEN5	Separate Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
6	RCVEN6	Separate Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
7	RCVEN7	Separate Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W

Bit	Symbol	Function	R/W
8	RCVENM0	Multiplexed Bus Recovery Cycle Insertion Enable 0 0: Disabled 1: Enabled	R/W
9	RCVENM1	Multiplexed Bus Recovery Cycle Insertion Enable 1 0: Disabled 1: Enabled	R/W
10	RCVENM2	Multiplexed Bus Recovery Cycle Insertion Enable 2 0: Disabled 1: Enabled	R/W
11	RCVENM3	Multiplexed Bus Recovery Cycle Insertion Enable 3 0: Disabled 1: Enabled	R/W
12	RCVENM4	Multiplexed Bus Recovery Cycle Insertion Enable 4 0: Disabled 1: Enabled	R/W
13	RCVENM5	Multiplexed Bus Recovery Cycle Insertion Enable 5 0: Disabled 1: Enabled	R/W
14	RCVENM6	Multiplexed Bus Recovery Cycle Insertion Enable 6 0: Disabled 1: Enabled	R/W
15	RCVENM7	Multiplexed Bus Recovery Cycle Insertion Enable 7 0: Disabled 1: Enabled	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write the CSRECEN register while the external bus is being accessed. For more information on insertion recovery cycles, see section 14.5.4. Insertion of Recovery Cycles.

RCVENi Bit (Separate Bus Recovery Cycle Insertion Enable i) (i = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

RCVENMj Bit (Multiplexed Bus Recovery Cycle Insertion Enable j) (j = 0 to 7)

This bit enables the insertion of read or write recovery cycles when, after a read or write access on the external bus, a read or write access is made on the external bus to the same or different area.

Table 14.6 Access type associations with the RCVENn bits (1 of 2)

Access type	External Address Space	Insertion of recovery cycles	Associated bits (Separate/ Multiplexed)
Read access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN0/RCVENM0
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN1/RCVENM1
Write access after read access	Same area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN2/RCVENM2
	Different area	Recovery cycles specified in the RRCV[3:0] bits are inserted for the priority access area	RCVEN3/RCVENM3
Read access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN4/RCVENM4
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN5/RCVENM5

Table 14.6 Access type associations with the RCVENn bits (2 of 2)

Access type	External Address Space	Insertion of recovery cycles	Associated bits (Separate/ Multiplexed)
Write access after write access	Same area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN6/RCVENM6
	Different area	Recovery cycles specified in the WRCV[3:0] bits are inserted for the priority access area	RCVEN7/RCVENM7

14.3.8 CSnMOD : CSn Mode Register (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x002 + 0x10 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRMOD	—	—	—	—	—	PWENB	PRENB	—	—	—	—	EWENB	—	—	WRMOD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WRMOD	Write Access Mode Select 0: Byte strobe mode 1: Single-write strobe mode	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	EWENB	External Wait Enable 0: Disabled 1: Enabled	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	PRENB	Page Read Access Enable 0: Disabled 1: Enabled	R/W
9	PWENB	Page Write Access Enable 0: Disabled 1: Enabled	R/W
14:10	—	These bits are read as 0. The write value should be 0.	R/W
15	PRMOD	Page Read Access Mode Select 0: Normal access compatible mode 1: External data read continuous assertion mode	R/W

Note: S-TYPE-3, P-TYPE-3

Do not write to the CSnMOD register while access to the CSn area is in progress.

WRMOD bit (Write Access Mode Select)

The WRMOD bit selects the write access operating mode. Writing 0 selects byte strobe mode, in which data writes are controlled by the WRn signals (n = 0 to 1) associated with the respective byte positions. Writing 1 selects single-write strobe mode, in which data writes are controlled by the BCn (n = 0 to 1) and WR signals associated with the respective byte positions.

Note: Setting the external bus width to 8 bits is prohibited in single-write strobe mode.

Table 14.7 Control signals for write access mode

Mode	Pin name							
Write access mode	**WR3**	**WR2**	**WR1**	**WR0/WR**	**BC3**	**BC2**	**BC1**	**BC0**
Byte strobe mode	✓	✓	✓	✓ (WR0)	—	—	—	—
Single write strobe mode	—	—	—	✓ (WR)	✓	✓	✓	✓

✓ : Enabled, — : Disabled

EWENB bit (External Wait Enable)

The EWENB bit enables external waits. Writing 0 disables the WAIT signal. Writing 1 selects external wait and allows the WAIT signal to control the number of waits per cycle. In this state, wait cycles are inserted when the WAIT signal is low.

PRENB bit (Page Read Access Enable)

The PRENB bit enables page read accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PRENB should not be set to enable page read accesses. Page read accesses are not supported in the address/data multiplexed I/O interface.

PWENB bit (Page Write Access Enable)

The PWENB bit enables page write accesses.

Note: When the address/data multiplexed I/O interface is selected with the CSnCR.MPXEN bit, PWENB should not be set to enable page write accesses. Page write accesses are not supported in the address/data multiplexed I/O interface.

PRMOD bit (Page Read Access Mode Select)

The PRMOD bit selects the operating mode for page read accesses. Writing 0 selects normal access compatible mode, in which the RD signal is negated and an RD assert wait is inserted each time a unit of data is read. When there is no RD assert wait, the RD signal is negated only in the final transfer of the external bus access.

Writing 1 selects external data read continuous assertion mode, in which an RD assert wait is inserted and the RD signal is continuously asserted during the wait.

14.3.9 CSnWCR1 : CSn Wait Control Register 1 (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x004 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	CSRWAIT[4:0]					—	—	—	CSWWAIT[4:0]				
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	CSPRWAIT[2:0]			—	—	—	—	—	CSPWWAIT[2:0]		
Value after reset:	0	0	0	0	0	1	1	1	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
2:0	CSPWWAIT[2:0]	Page Write Cycle Wait Select*1 0 0 0: Do not insert wait. 0 0 1: Insert wait of 1 clock cycle. 0 1 0: Insert wait of 2 clock cycles. 0 1 1: Insert wait of 3 clock cycles. 1 0 0: Insert wait of 4 clock cycles. 1 0 1: Insert wait of 5 clock cycles. 1 1 0: Insert wait of 6 clock cycles. 1 1 1: Insert wait of 7 clock cycles.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
10:8	CSPRWAIT[2:0]	Page Read Cycle Wait Select*2 0 0 0: Do not insert wait 0 0 1: Insert wait of 1 clock cycle. 0 1 0: Insert wait of 2 clock cycles. 0 1 1: Insert wait of 3 clock cycles. 1 0 0: Insert wait of 4 clock cycles. 1 0 1: Insert wait of 5 clock cycles. 1 1 0: Insert wait of 6 clock cycles. 1 1 1: Insert wait of 7 clock cycles.	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
20:16	CSWWAIT[4:0]	Normal Write Cycle Wait Select 0 0 0 0 0: Do not insert wait. 0 0 0 0 1: Insert wait of 1 clock cycle. 0 0 0 1 0: Insert wait of 2 clock cycles. 0 0 0 1 1: Insert wait of 3 clock cycles. ⋮ 1 1 1 0 1: Insert wait of 29 clock cycles. 1 1 1 1 0: Insert wait of 30 clock cycles. 1 1 1 1 1: Insert wait of 31 clock cycles.	R/W
23:21	—	These bits are read as 0. The write value should be 0.	R/W
28:24	CSRWAIT[4:0]	Normal Read Cycle Wait Select 0 0 0 0 0: Do not insert wait. 0 0 0 0 1: Insert wait of 1 clock cycle. 0 0 0 1 0: Insert wait of 2 clock cycles. 0 0 0 1 1: Insert wait of 3 clock cycles. ⋮ 1 1 1 0 1: Insert wait of 29 clock cycles. 1 1 1 1 0: Insert wait of 30 clock cycles. 1 1 1 1 1: Insert wait of 31 clock cycles.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. The CSPWWAIT[2:0] value is only valid when the CSnMOD.PWENB bit is set to 1.
Note 2. The CSPRWAIT[2:0] value is only valid when the CSnMOD.PRENB bit is set to 1.

Do not attempt to write to the CSnWCR1 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in (1)Constraints on using separate bus interface or (2)Constraints on using address/data multiplexed bus interface, according to the bus interface used.

CSPWWAIT[2:0] bits (Page Write Cycle Wait Select)

The CSPWWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page write cycle. The setting is enabled when the CSnMOD.PWENB bit is set to 1.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

CSPRWAIT[2:0] bits (Page Read Cycle Wait Select)

The CSPRWAIT[2:0] bits specify the number of wait cycles to be inserted into the second and subsequent accesses during a page read cycle. The setting is enabled when the CSnMOD.PRENB bit is set to 1.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

CSWWAIT[4:0] bits (Normal Write Cycle Wait Select)

The CSWWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal write cycle or page write cycle.

Note: The settings must satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

CSRWAIT[4:0] bits (Normal Read Cycle Wait Select)

The CSRWAIT[4:0] bits specify the number of wait cycles to be inserted into the first access during a normal read cycle or page read cycle.

Note: The settings must satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

14.3.10 CSnWCR2 : CSn Wait Control Register 2 (n = 0 to 7)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x008 + 0x10 × n

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Do not attempt to write to the CSnWCR2 register while the external bus is being accessed. Set each of these bits within a range of the restrictions described in (1)Constraints on using separate bus interface or (2)Constraints on using address/data multiplexed bus interface, according to the bus interface used.

CSROFF[2:0] bits (Read Access CS Extension Cycle Select)

The CSROFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (RD signal negated) until the CSn signal (n = 0 to 7) is negated in read access mode.

CSWOFF[2:0] bits (Write Access CS Extension Cycle Select)

The CSWOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the CSn signal (n = 0 to 7) is negated in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

WDOFF[2:0] bits (Write Data Output Extension Cycle Select)

The WDOFF[2:0] bits specify the number of wait cycles to be inserted during the period from the end of a wait cycle (WRn signal (n = 0 to 1) negated) until the write-data output is complete in write access mode.

Note: The settings must satisfy CSnWCR2.WDOFF[2:0] value ≤ CSnWCR2.CSWOFF[2:0] value.

AWAIT[1:0] bits (Address Cycle Wait Select)

AWAIT[1:0] bits specify the number of wait cycles to be inserted into an address output cycle with the address/data multiplexed I/O interface.

Note: CSnWCR2.CSON[2:0] value ≤ CSnWCR2.AWAIT[1:0] value.

For read access, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For write access, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value and CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

RDON[2:0] bits (RD Assert Wait Select)

RDON[2:0] bits specify the number of wait cycles to be inserted before the RD signal is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

WRON[2:0] bits (WR Assert Wait Select)

The WRON[2:0] bits specify the number of wait cycles to be inserted before the WRn signal (n = 0 to 1) is asserted.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value, and CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

WDON[2:0] bits (Write Data Output Wait Select)

The WDON[2:0] bits specify the number of wait cycles to be inserted before the write data is output.

Note: For normal write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy 1 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.AWAIT[1:0] value + 2 ≤ CSnWCR2.WDON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

CSON[2:0] bits (CS Assert Wait Select)

The CSON[2:0] bits specify the number of wait cycles to be inserted before the CSn signal (n = 0 to 7) is asserted.

Note: For normal read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSRWAIT[4:0] value.

For page read access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.RDON[2:0] value ≤ CSnWCR1.CSPRWAIT[2:0] value.

For normal write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSWWAIT[4:0] value.

For page write access, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.WRON[2:0] value ≤ CSnWCR1.CSPWWAIT[2:0] value.

When the address/data multiplexed I/O interface is selected, satisfy CSnWCR2.CSON[2:0] value ≤ CSnWCR2.AWAIT[1:0] value.

14.3.11 SDCCR : SDC Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	BSIZE[1:0]		—	—	—	EXENB
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EXENB	Operation Enable 0: Disable 1: Enable	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
5:4	BSIZE[1:0]	SDRAM Bus Width Select 0 0: 16-bit bus space 0 1: 32-bit bus space 1 0: 8-bit bus space Others: Setting prohibited	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

EXENB bit (Operation Enable)

The EXENB bit enables the operation of the SDRAM address space. On reset, operation is disabled (EXENB = 0). Attempts to access disabled areas have no effect.

When CSC and SDRAMC are in use at the same time, EBCLK and SDCLK must operate at the same frequency.

BSIZE[1:0] bits (SDRAM Bus Width Select)

The BSIZE[1:0] bits specify the data bus width for the associated area.

14.3.12 SDCMOD : SDC Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC01

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	EMODE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EMODE	Endian Mode 0: Endian order of SDRAM address space is the same as the endian order of the operating mode. 1: Endian order of SDRAM address space is not the endian order of the operating mode.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. The second and subsequent writes to this register are prohibited. SDRAM access operation is not guaranteed if more than one write access is attempted.

EMODE bit (Endian Mode)

The EMODE bit specifies the endianness for the SDRAM address space. The Arm® Cortex®-M85 core is fixed at little-endian order, so instruction code can only be allocated to external spaces with little-endian specified. If an area is specified as big-endian, no instruction code can be allocated to it.

14.3.13 SDAMOD : SDRAM Access Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BE	Continuous Access Enable 0: Continuous access is disabled 1: Continuous access is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set SDAMOD while the conditions listed in Table 14.34 are satisfied. The operation is not guaranteed if this register is set while these conditions are not satisfied.

BE bit (Continuous Access Enable)

This bit enables or disables continuous access to the SDRAM access space.

14.3.14 SDSELF : SDRAM Self-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	SFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SFEN	SDRAM Self-Refresh Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the SDSELF register only when the conditions in Table 14.34 are satisfied. Otherwise, operation of SDRAM I/F function is not guaranteed.

SFEN bit (SDRAM Self-Refresh Enable)

The SFEN bit controls the self-refresh operation. Setting this bit to 1 initiates an auto-refresh cycle, after which self-refresh begins. Clearing this bit to 0 ends the self-refresh, and auto-refresh resumes. When the bit is set to 1, the write value takes effect when the self-refresh operation starts. When it is cleared to 0, if the self-refresh operation has already finished, the

write value takes effect before the auto-refresh starts. If the self-refresh operation is in progress, the write value takes effect after the self-refresh is finished and before the auto-refresh is started.

14.3.15 SDRFCR : SDRAM Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	REFW[3:0]				RFC[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1

Bit	Symbol	Function	R/W
11:0	RFC[11:0]	Auto-Refresh Request Interval Setting 0 0 0 0 0 0 0 0 0 0 0 0: Setting prohibited 0 0 0 0 0 0 0 0 0 0 0 1: 2 cycles 0 0 0 0 0 0 0 0 0 0 1 0: 3 cycles ⋮ 1 1 1 1 1 1 1 1 1 1 1 1: 4096 cycles	R/W
15:12	REFW[3:0]	Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting 0 0 0 0: 1 cycle 0 0 0 1: 2 cycles 0 0 1 0: 3 cycles 0 0 1 1: 4 cycles 0 1 0 0: 5 cycles 0 1 0 1: 6 cycles 0 1 1 0: 7 cycles 0 1 1 1: 8 cycles 1 0 0 0: 9 cycles 1 0 0 1: 10 cycles 1 0 1 0: 11 cycles 1 0 1 1: 12 cycles 1 1 0 0: 13 cycles 1 1 0 1: 14 cycles 1 1 1 0: 15 cycles 1 1 1 1: 16 cycles	R/W

Note: S-TYPE-3, P-TYPE-3

RFC[11:0] bits (Auto-Refresh Request Interval Setting)

The RFC[11:0] bits specify the auto-refresh request interval. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If auto-refresh is enabled, the write value takes effect after the end of the auto-refresh cycles. The refresh counter uses SDCLK.

REFW[3:0] bits (Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting)

The REFW[3:0] bits specify the number of auto-refresh cycles and the number of self-refresh clearing cycles. They can be written to at any time, regardless of the state of the Auto-Refresh Operation Enable bit (RFEN) in SDRFEN. If an auto-refresh cycle is in progress, the value written to the bits while auto-refresh is enabled takes effect after the cycle completes.

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. This means they must sometimes wait until the access completes for the auto-refresh interval to be extended. Set the RFC[11:0] bits to an auto-refresh request interval value that meets the specifications of the SDRAM being used. Additionally, make sure to set the auto-refresh request interval to a duration longer than the auto-refresh cycle. The auto-refresh interval cannot be automatically adjusted when the frequency is changed during operation. In this case, perform a self-refresh operation and set the auto-refresh interval to an appropriate value for the frequency again.

14.3.15.1 Auto-refresh request interval and RFC set value

The SDRAMC (SDRAM area controller) includes a 12-bit refresh counter that generates auto-refresh requests at fixed intervals. Use the following equation to calculate the set value for the RFC[11:0] bits from the auto-refresh request interval:

RFC = (Auto-refresh request interval / SDCLK cycle) - 1

Note: Auto-refresh requests are not accepted while the SDRAM is being accessed. They must wait until the access completes. However, the counter value is updated regardless of whether or not the request was accepted. If two or more auto-refresh requests are generated while the SDRAM is being accessed, the second and subsequent requests are ignored.

14.3.16 SDRFEN : SDRAM Auto-Refresh Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC16

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RFEN
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RFEN	Auto-Refresh Operation Enable 0: Disable 1: Enable	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

RFEN bit (Auto-Refresh Operation Enable)

The RFEN bit enables auto-refresh operation. When auto-refresh is required, set the RFEN bit to 1 before SDRAM access.

Clearing this bit to 0 while auto-refreshing is enabled causes RFEN to be cleared to 0 and auto-refresh operation to halt after the end of the auto-refresh cycle.The interval at which refresh requests are generated is determined by the value in the Auto-Refresh Request Interval Setting bits (RFC[11:0]) in the SDRAM Refresh Control Register (SDRFCR).

14.3.17 SDICR : SDRAM Initialization Sequence Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC20

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	INIRQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	INIRQ	Initialization Sequence Start 0: Invalid 1: Start initialization sequence	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

INIRQ bit (Initialization Sequence Start)

Setting the INIRQ bit to 1 starts the SDRAM initialization sequence and automatically sets the Initialization Status bit (INIST) in the SDRAM Status Register (SDSR) to 1. The INIST bit clears automatically after the initialization sequence ends. The value written to the INIRQ bit is not retained.

Note: Set the INIRQ bit to start the SDRAM initialization sequence only when the conditions in Table 14.34 are satisfied. Otherwise, operation is not guaranteed.

14.3.18 SDIR : SDRAM Initialization Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC24

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	PRC[2:0]			ARFC[3:0]				ARFI[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0

Bit	Symbol	Function	R/W
3:0	ARFI[3:0]	Initialization Auto-Refresh Interval 0 0 0 0: 3 cycles 0 0 0 1: 4 cycles 0 0 1 0: 5 cycles 0 0 1 1: 6 cycles 0 1 0 0: 7 cycles 0 1 0 1: 8 cycles 0 1 1 0: 9 cycles 0 1 1 1: 10 cycles 1 0 0 0: 11 cycles 1 0 0 1: 12 cycles 1 0 1 0: 13 cycles 1 0 1 1: 14 cycles 1 1 0 0: 15 cycles 1 1 0 1: 16 cycles 1 1 1 0: 17 cycles 1 1 1 1: 18 cycles	R/W
7:4	ARFC[3:0]	Initialization Auto-Refresh Count 0 0 0 0: Setting prohibited 0 0 0 1: 1 time 0 0 1 0: 2 times 0 0 1 1: 3 times 0 1 0 0: 4 times 0 1 0 1: 5 times 0 1 1 0: 6 times 0 1 1 1: 7 times 1 0 0 0: 8 times 1 0 0 1: 9 times 1 0 1 0: 10 times 1 0 1 1: 11 times 1 1 0 0: 12 times 1 1 0 1: 13 times 1 1 1 0: 14 times 1 1 1 1: 15 times	R/W
10:8	PRC[2:0]	Initialization Precharge Cycle Count 0 0 0: 3 cycles 0 0 1: 4 cycles 0 1 0: 5 cycles 0 1 1: 6 cycles 1 0 0: 7 cycles 1 0 1: 8 cycles 1 1 0: 9 cycles 1 1 1: 10 cycles	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

ARFI[3:0] bits (Initialization Auto-Refresh Interval)

The ARFI[3:0] bits specify the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence.

ARFC[3:0] bits (Initialization Auto-Refresh Count)

The ARFC[3:0] bits specify the number of times auto-refresh is to be performed in the SDRAM initialization sequence.

PRC[2:0] bits (Initialization Precharge Cycle Count)

The PRC[2:0] bits specify the number of precharged cycles in the SDRAM initialization sequence.

Note: Implement settings that satisfy the specifications of the connected SDRAM before starting the initialization sequence.

14.3.19 SDADR : SDRAM Address Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC40

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	MXC[1:0]	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	MXC[1:0]	Address Multiplex Select 0 0: 8-bit shift 0 1: 9-bit shift 1 0: 10-bit shift 1 1: 11-bit shift	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set SDADR only when the conditions in Table 14.34 are satisfied. Otherwise, operation is not guaranteed.

MXC[1:0] bits (Address Multiplex Select)

The MXC[1:0] bits select the size of the shift towards the lower half of the row address in row address/column address multiplexing. For details, see Table 14.39.

14.3.20 SDTR : SDRAM Timing Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC44

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	RAI[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RCD[1:0]		RP[2:0]			WR	—	—	—	—	—	CL[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	Symbol	Function	R/W
2:0	CL[2:0]	SDRAMC Column Latency 0 0 0: Setting prohibited 0 0 1: 1 cycle 0 1 0: 2 cycles 0 1 1: 3 cycles 1 0 0: Setting prohibited 1 0 1: Setting prohibited 1 1 0: Setting prohibited 1 1 1: Setting prohibited	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	WR	Write Recovery Interval 0: 1 cycle 1: 2 cycles	R/W
11:9	RP[2:0]	Row Precharge Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: 8 cycles	R/W
13:12	RCD[1:0]	Row Column Latency 0 0: 1 cycle 0 1: 2 cycles 1 0: 3 cycles 1 1: 4 cycles	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W
18:16	RAI[2:0]	Row Active Interval 0 0 0: 1 cycle 0 0 1: 2 cycles 0 1 0: 3 cycles 0 1 1: 4 cycles 1 0 0: 5 cycles 1 0 1: 6 cycles 1 1 0: 7 cycles 1 1 1: Setting prohibited	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The SDTR register specifies the timing for read and write accesses to the SDRAM. For more information, see section 14.6.12.3. Timing register settings and access timing.

Set the SDTR register only when the conditions in Table 14.34 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted

CL[2:0] bits (SDRAMC Column Latency)

The CL[2:0] bits specify the column latency of the SDRAM controller. This setting only affects the latency setting on the SDRAM controller side. To specify the column latency for externally connected SDRAM, use the SDRAM mode register (SDMOD).

WR bit (Write Recovery Interval)

The WR bit specifies the interval that must elapse between the SDRAM write command (WRIT) and deactivation (PALL).

RP[2:0] bits (Row Precharge Interval)

The RP[2:0] bits specify the minimum number of cycles that must elapse between the SDRAM deactivation command (PALL) and the next valid command.

RAI[2:0] bits (Row Active Interval)

The RAI[2:0] bits specify the minimum interval that must elapse between the SDRAM row activation command (ACTV) and deactivation (PALL). The value specified in these bits must be less than or equal to the sum of the row column latency (RCD[1:0]) and column latency (CL[2:0]) settings.

14.3.21 SDMOD : SDRAM Mode Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC48

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	MR[14:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
14:0	MR[14:0]	Mode Register Setting Writing to these bits triggers a mode register set command	R/W
15	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The SDMOD register specifies the value to be written to the SDRAM mode register. Writing to SDMOD causes a mode register set command to be issued automatically to the SDRAM. Set SDMOD only when the conditions in Table 14.34 are satisfied. Otherwise, operation is not guaranteed.

Writing to this register is possible only once after release from reset. Operation is not guaranteed if more than one write access is attempted.

MR[14:0] bits (Mode Register Setting)

Writing to the MR[14:0] bits causes a mode register set command to be issued to the SDRAM, and the setting in the MR[14:0] bits is output to the lower bits of the address. For more information, see section 14.6.11. Setting the Mode Register.

Note: 1. Set a burst length of 1 for the SDRAM. Operation is not guaranteed with any other burst length setting.
2. The SDRAM column latency must match the setting in the SDRAMC Column Latency setting (CL[2:0]) in the SDRAM Timing Register (SDTR). Operation is not guaranteed if the latency settings do not agree.
3. Make sure the SRFST, INIST, and MRSST status bits in the SDRAM Status Register (SDSR) are all 0.

14.3.22 SDSR : SDRAM Status Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0xC50

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	SRFST	INIST	—	—	MRSST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MRSST	Mode Register Setting Status 0: Mode register setting not in progress 1: Mode register setting in progress	R
2:1	—	These bits are read as 0.	R

Bit	Symbol	Function	R/W
3	INIST	Initialization Status 0: Initialization sequence not in progress 1: Initialization sequence in progress	R
4	SRFST	Self-Refresh Transition/Recovery Status 0: Transition/recovery not in progress 1: Transition/recovery in progress	R
7:5	—	These bits are read as 0.	R

Note: S-TYPE-3, P-TYPE-3

MRSST bit (Mode Register Setting Status)

When set to 1, the MRSST bit indicates that SDRAM mode register setting is in progress.

INIST bit (Initialization Status)

When set to 1, the INIST bit indicates that the SDRAM initialization sequence is in progress.

SRFST bit (Self-Refresh Transition/Recovery Status)

When set to 1, the SRFST bit indicates that a transition to or recovery from a self-refresh operation is in progress for the SDRAM. The in progress interval begins when the bits in Table 14.8 are written to and lasts until the associated commands are issued.

Note: Execution of a self-refresh, initialization sequence, or mode register setting can only be performed when all the status bits are 0. Do not rewrite the registers and bits in Table 14.8 when any of the SRFST, INIST, or MRSST status bits is set to 1.

Table 14.8 Registers and bits requiring status bit checking

Function	Register	Bits
Self-refresh	SDSELF	SFEN
Initialization sequence	SDICR	INIRQ
Mode register setting	SDMOD	MR[14:0]

14.3.23 BUSDIVBYP : Bus Divider Bypass Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1300

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CPU0SBPE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	GDSSBPE	—	—	EDMABPE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	EDMABPE	Divider for EDMACBI bypass enable 0: Disable 1: Enable	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	GDSSBPE	Divider for GDSSBI bypass enable 0: Disable 1: Enable	R/W

Bit	Symbol	Function	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W
16	CPU0SBPE	Divider for CPUSAHBI bypass enable 0: Disable 1: Enable	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

EDMABPE bit (Divider for EDMACBI bypass enable)

This bit enables the through transfer between master and slave by bypassing the frequency divider implemented for EDMACBI. It can reduce the waiting time of 1 PCLKA cycle. This bit can be set to 1 only when ICLK frequency is the same as PCLKA frequency. This bit cannot be switched during EDMACBI operation.

GDSSBPE bit (Divider for GDSSBI bypass enable)

This bit enables the through transfer between master and slave by bypassing the frequency divider implemented for GDSSBI. It can reduce the waiting time of 1 PCLKA cycle. This bit can be set to 1 only when ICLK frequency is the same as PCLKA frequency. This bit cannot be switched during GDSSBI operation.

CPU0SBPE bit (Divider for CPUSAHBI bypass enable)

This bit enables the through transfer between master and slave by bypassing the frequency divider implemented for CPUSAHBI. It can reduce the waiting time of 1 ICLK cycle. This bit can be set to 1 only when CPUCLK frequency is the same as ICLK frequency. This bit cannot be switched during CPUSAHBI operation.

14.3.24 BUSMABT : Bus Master Arbitration Control Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1100

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ARBS	Arbitration Select for GDSSBI 0: Fixed priority 1: Round-robin	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

This register specifies the arbitration method for GDSSBI that DRW (texture), DRW (data) and MIPI connect to.

ARBS bit (Arbitration Select for GDSSBI)

This bit specifies the priority between bus masters connected to GDSSBI . For fixed priority, see Table 14.9. For round-robin, see Table 14.10.

Table 14.9 Bus priorities with fixed-priority arbitration (ARBS = 0)

Bus Master Arbitration Control Register	Bus interface	Priority order*1
BUSMABT	GDSSBI	DRW (texture) > DRW (data) > MIPI

Note 1. “>” represents left side has high priority.

Table 14.10 Bus priorities with round-robin arbitration (ARBS = 1)

Bus Master Arbitration Control Register	Bus interface	Priority order*1
BUSMABT	GDSSBI	DRW (texture) <-> DRW (data) <-> MIPI

Note 1. “<->” represents round-robin.

14.3.25 BUSSABT0<slave> : Bus Slave Arbitration Control Register 0(<slave> = FLBI, STBYSBI, ECBI, EOBI, PBBI, PABI, PIBI, PSBI)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1210 (BUSSABT0FLBI)
0x1248 (BUSSABT0STBYSBI)
0x1250(BUSSABT0ECBI)
0x1258(BUSSABT0EOBI)
0x1260 (BUSSABT0PBBI)
0x1268 (BUSSABT0PABI)
0x1270 (BUSSABT0PIBI)
0x1278 (BUSSABT0PSBI)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ARBS	Arbitration Select for <slave> 0: Fixed priority 1: Round-robin	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

<slave> is bus interface unit name for slave.

This register specifies the arbitration method for <slave> buses.

(<slave> =FLBI/STBYSBI/PBBI/PABI/PIBI/PSBI)

ARBS bit (Arbitration Select for <slave>)

The ARBS bit specifies the priority between bus masters connected to <slave>. For fixed priority, see Table 14.11. For round-robin, see Table 14.12.

Table 14.11 Bus priorities with fixed-priority arbitration (ARBS = 0)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT0FLBI	FLBI	DMAC/DTC > CPU M-AXI > CPU P-AHB
BUSSABT0STBYSBI	STBYSBI	EDMAC > DMAC/DTC > CPU M-AXI
BUSSABT0PBBI	PBBI	DMAC/DTC > CPU P-AHB
BUSSABT0PABI	PABI	DMAC/DTC > CPU P-AHB
BUSSABT0PIBI	PIBI	DMAC/DTC > CPU P-AHB
BUSSABT0PSBI	PSBI	DMAC/DTC > CPU P-AHB

Note 1. “>” represents left side has high priority.

Table 14.12 Bus priorities with round-robin arbitration (ARBS = 1)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT0FLBI	FLBI	DMAC/DTC <-> CPU M-AXI <-> CPU P-AHB
BUSSABT0STBYSBI	STBYSBI	EDMAC <-> DMAC/DTC <-> CPU M-AXI
BUSSABT0PBBI	PBBI	DMAC/DTC <-> CPU P-AHB
BUSSABT0PABI	PABI	DMAC/DTC <-> CPU P-AHB
BUSSABT0PIBI	PIBI	DMAC/DTC <-> CPU P-AHB
BUSSABT0PSBI	PSBI	DMAC/DTC <-> CPU P-AHB

Note 1. “<->” represents round-robin.

14.3.26 BUSSABT1<slave> : Bus Slave Arbitration Control Register 1(<slave> = FHBI, S0BI, S1BI)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1200 (BUSSABT1FHBI)
0x1218 (BUSSABT1S0BI)
0x1220 (BUSSABT1S1BI)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ARBS[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	ARBS[1:0]	Arbitration Select for <slave> 0 0: Fixed priority 0 1: Setting prohibited 1 0: Combination of round-robin and fixed priority 1 1: Round-robin	R/W
31:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

<slave> is bus interface unit name for slave.

This register specifies the arbitration method for <slave> buses.

(<slave> = FHBI/S0BI/S1BI)

ARBS[1:0] bits (Arbitration Select for <slave>)

The ARBS bits specify the priority between bus masters connected to <slave>. For priority of each setting, see Table 14.13, Table 14.14 and Table 14.15.

Table 14.13 Bus priorities with fixed-priority arbitration (ARBS[1:0] = 00)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > DMAC/DTC > CPU M-AXI
BUSSABT1S0BI	S0BI	CEU > GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > EDMAC > DMAC/DTC > CPU M-AXI
BUSSABT1S1BI	S1BI	CEU > GLCDC (graphic 1) > GLCDC (graphic 2) > GDSSBI > EDMAC > DMAC/DTC > CPU M-AXI

Note 1. “>” represents left side has high priority.

Table 14.14 Bus priorities with combination of round-robin and fixed priority arbitration (ARBS[1:0] = 10)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	(GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI) > DMAC/DTC > CPU M-AXI
BUSSABT1S0BI	S0BI	CEU > (GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> EDMAC> DMAC/DTC > CPU M-AXI
BUSSABT1S1BI	S1BI	CEU > (GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> EDMAC > DMAC/DTC > CPU M-AXI

Note 1. “<->” represents round-robin. “>” represents left side has high priority.

Table 14.15 Bus priorities with round-robin arbitration (ARBS[1:0] = 11)

Bus Slave Arbitration Control Register	Slave interface	Priority order*1
BUSSABT1FHBI	FHBI	GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> DMAC/DTC <-> CPU M-AXI
BUSSABT1S0BI	S0BI	CEU <-> GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> EDMAC) <-> DMAC/DTC <-> CPU M-AXI
BUSSABT1S1BI	S1BI	CEU <-> GLCDC (graphic 1) <-> GLCDC (graphic 2) <-> GDSSBI <-> EDMAC) <-> DMAC/DTC <-> CPU M-AXI

Note 1. “<->” represents round-robin.

14.3.27 BUSnERRADD : BUS Error Address Register (n = 4 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1800 + 0x10 × (n-1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	BERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	BERAD[31:0]	Bus Error Address When a bus error occurs, it stores an error address.	R

Note: S-TYPE-5, P-TYPE-2

Table 14.16 shows the register numbers associated with each bus type.

This register is cleared by set the BUSnERRCLR.ILERRCLR, BUSnERRCLR.MMERRCLR, or BUSnERRCLR.SLERRCLR bits or reset other than Bus error reset and Common memory error reset.

BERAD[31:0] bits (Bus Error Address)

The BERAD[31:0] bits indicates the address, when an error occurs on the associated bus. For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 12) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 12) is set to 1, at the same time, the BERAD[31:0] bits stores the address of the bus error access.

When the error address is set once, it is not updated until the value is cleared by the BUSnERRCLR Register.

When all of ILERRSTAT, MMERRSTAT, SLERRSTAT, MSERRSTAT in BUSnERRSTAT (n =1 to 12) are set to 0, the BERAD[31:0] bits are indefinite.

Table 14.16 Associations between bus types and registers

Bus type	Bus error status register	Bus error clear register	Bus error address register	Bus error RW register
CPUMAXIBI_R channel	BUS1ERRSTAT	BUS1ERRCLR	—	—
CPUMAXIBI_W channel	BUS2ERRSTAT	BUS2ERRCLR	—	—
CPUPAHBI	BUS3ERRSTAT	BUS3ERRCLR	—	—
DMAC/DTCBI	BUS4ERRSTAT	BUS4ERRCLR	BUS4ERRADD BMSA4ERRADD	BUS4ERRRW BMSA4ERRRW
EDMACBI	BUS5ERRSTAT	BUS5ERRCLR	BUS5ERRADD BMSA5ERRADD	BUS5ERRRW BMSA5ERRRW
GLCDC0BI	BUS6ERRSTAT	BUS6ERRCLR	BUS6ERRADD BMSA6ERRADD	BUS6ERRRW BMSA6ERRRW
GLCDC1BI	BUS7ERRSTAT	BUS7ERRCLR	BUS7ERRADD BMSA7ERRADD	BUS7ERRRW BMSA7ERRRW
DRW0BI	BUS8ERRSTAT	BUS8ERRCLR	BUS8ERRADD BMSA8ERRADD	BUS8ERRRW BMSA8ERRRW
DRW1BI	BUS9ERRSTAT	BUS9ERRCLR	BUS9ERRADD BMSA9ERRADD	BUS9ERRRW BMSA9ERRRW
CEUBI_W channel	BUS10ERRSTAT	BUS10ERRCLR	—	—
MIPIBI_R channel	BUS11ERRSTAT	BUS11ERRCLR	—	—
MIPIBI_W channel	BUS12ERRSTAT	BUS12ERRCLR	—	—

14.3.28 BUSnERRRW : BUS Error Read Write (n = 4 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1804 + 0x10 × (n-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RWSTAT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RWSTAT	Error access Read/Write Status The status at the time of the error. 0: Read access 1: Write access	R
7:1	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

This register is cleared by a reset other than the Bus error reset and Common memory error reset, and the BUSnERRCLR.ILERRCLR, BUSnERRCLR.MMERRCLR and BUSnERRCLR.SLERRCLR.

Table 14.16 shows the register numbers associated with each bus type.

RWSTAT bit (Error access Read/Write Status)

The RWSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus.

For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 12) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of ILERRSTAT, MMERRSTAT, SLERRSTAT, in BUSnERRSTAT (n = 1 to 12) is set to 1, at the same time, the RWSTAT bits stores the read/write status of the bus error access.

When all of ILERRSTAT, MMERRSTAT, SLERRSTAT in BUSnERRSTAT (n = 1 to 12) are set to 0, the RWSTAT bit is indefinite.

When the RWSTAT bit is set once, it is not updated until the value is cleared by the BUSnERRCLR Register.

14.3.29 BMSAnERRADD : Bus Master Security Attribution Unit Error Address (n = 4 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1900 + 0x10 × (n-1)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	MSERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MSERAD[31:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	MSERAD[31:0]	Bus Master Security Attribution Unit Error Address When a Master Security Attribution Unit error occurs, It stores an error address.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is cleared by set the BUSnERRCLR.MSERRCLR bit or reset other than Bus error reset and Common memory error reset.

Table 14.16 lists the registers associated with each bus type.

MSERAD[31:0] bits (Bus Master Security Attribution Unit Error Address)

The MSERAD[31:0] bits indicates the address, when an error occurs on the associated bus.

For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 12) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of MSERRSTAT in BUSnERRSTAT (n = 1 to 12) is set to 1, at the same time, the MSERAD[31:0] bits stores the address of the bus error access.

When the error address is set once, it is not updated until the value is cleared by the BUSnERRCLR (n=1 to 12).

When all of MSERRSTAT in BUSnERRSTAT (n = 1 to 12) is set to 0, the MSERAD[31:0] bits are indefinite.

14.3.30 BMSAnERRRW : BUS Master Security Attribution Unit Error Read Write (n = 4 to 9)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1904 + 0x10 × (n-1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MSARWSTAT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MSARWSTAT	Master Security Attribution Unit error access Read/Write Status The status at the time of the error. 0: Read access 1: Write access	R

Bit	Symbol	Function	R/W
7:1	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is cleared by set the BUSnERRCLR.MSERRCLR bits or reset other than Bus error reset and Common memory error reset.

Table 14.16 shows the register numbers associated with each bus type.

MSARWSTAT bit (Master Security Attribution Unit error access Read/Write Status)

The MSARWSTAT bit indicates the access status, write access or read access, when an error occurs on the associated bus.

For detail of error that occurs by bus, see section 14.3.31. BUSnERRSTAT : BUS Error Status Register (n = 1 to 12) and section 14.7. Bus Error Monitoring Section.

When an error occurs on the bus, the corresponding bit of MSERRSTAT in BUSnERRSTAT (n = 1 to 12) is set to 1, at the same time, the MSARWSTAT bits stores the read/write status of the bus error access.

When the MSARWSTAT bit is set once, it is not updated until the value is cleared by the BUSnERRCLR (n = 1 to 12).

When all of MSERRSTAT in BUSnERRSTAT (n =1 to 12) are set to 0, the MSARWSTAT bit is indefinite.

14.3.31 BUSnERRSTAT : BUS Error Status Register (n = 1 to 12)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A00 + 0x10 × (n - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSERRSTAT	ILERRSTAT	MMERRSTAT	—	—	SLERRSTAT
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLERRSTAT	Slave Bus Error Status 0: No error occurred 1: Error occurred	R
2:1	—	These bits are read as 0.	R
3	MMERRSTAT	Master MPU Error Status 0: No error occurred 1: Error occurred	R
4	ILERRSTAT	Illegal Address Access Error Status 0: No error occurred 1: Error occurred	R
5	MSERRSTAT	Master Security Attribution Unit Error Status 0: No error occurred 1: Error occurred	R
7:6	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2

This register is cleared by reset other than Bus error reset and Common memory error reset.

Table 14.16 shows the register numbers associated with each bus type.

When the bus error occurred to plural at the same time, the STAT bit becomes effective only 1 by the following order of priority.The left side is high priority.

Master Security attribution unit > Master-MPU Error > Illegal access Error, Slave TrustZone filter, Slave bus Error

Illegal access Error, Slave TrustZone filter Error and Slave bus Error don’t occur at the same time.

After one of MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are set once, MSERRSTAT, ILERRSTAT, MMERRSTAT, and SLERRSTAT are not renewed.

SLERRSTAT bit (Slave Bus Error Status)

When slave error or TrustZone filter error occurs by bus, BUSnERRSTAT.SLERRSTAT (n = 1 to 12) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.SLERRCLR to 1.

Slave error is an error that occurs on a slave such as Time-out.

The SLERRSTAT bit is not set when debugger violate.

For detail of slave error that occurs by bus, see section 14.7. Bus Error Monitoring Section.

MMERRSTAT bit (Master MPU Error Status)

When master mpu error occurs by bus, BUSnERRSTAT. MMERRSTAT (n = 1 to 12) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.MMERRCLR to 1.

For detail of master mpu error that occurs by bus, see section 15, Memory Protection Unit (MPU).

ILERRSTAT bit (Illegal Address Access Error Status)

When illegal address access error occurs by bus and write access to FHBI occurs, BUSnERRSTAT.ILERRSTAT (n = 1 to 12) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.ILLERRCLR to 1.

The ILERRSTAT bit is not set when debugger violate.

For detail of illegal address access error that occurs by bus, see section 14.7. Bus Error Monitoring Section.

MSERRSTAT bit (Master Security Attribution Unit Error Status)

When MSAU error occurs by bus, BUSnERRSTAT.MSERRSTAT (n = 1 to 12) is set to 1.

There is clearing conditions.

- Set BUSnERRCLR.MSERRCLR to 1.

For detail of MSAU error that occurs by bus, see section 14.7. Bus Error Monitoring Section.

14.3.32 BUSnERRCLR : BUS Error Clear Register (n = 1 to 12)

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1A08 + 0x10 × (n - 1)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	MSERRCLR	ILERRCLR	MMERRCLR	—	—	SLERRCLR
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SLERRCLR	Slave Bus Error Clear Writing 1 to this bit clears the BUSnERRSTAT.SLERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W*1
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	MMERRCLR	Master MPU Error Clear Writing 1 to this bit clears the BUSnERRSTAT.MMERRSTAT,BUSnERRADD.BERAD and BUSnERRRW.RWSTAT .	R/W*1

Bit	Symbol	Function	R/W
4	ILERRCLR	Illegal Address Access Error Clear Writing 1 to this bit clears the BUSnERRSTAT.ILERRSTAT,BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W*1
5	MSERRCLR	Master Security Attribution Unit Error Clear Writing 1 to this bit clears the BUSnERRSTAT.MSERRSTAT,BUSnERRADD.BERAD and BUSnERRRW.RWSTAT.	R/W*1
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. Only 1 can be written to this bit. This bit is read as 0. Writing 0 to this bit has no effect.

Table 14.16 shows the register numbers associated with each bus type.

When writing 1 to BUSnERRCLR (n = 1 to 12), stop the bus access that causes an error in the corresponding bus master.

SLERRCLR bit (Slave Bus Error Clear)

Writing 1 to the SLERRCLR bit clears the BUSnERRSTAT.SLERRSTAT, BMSAnERRADD.MSERAD and BMSAnERRRW.MSARWSTAT (n =1 to 12).

This bit is read as 0.

MMERRCLR bit (Master MPU Error Clear)

Writing 1 to the MMERRCLR bit clears the BUSnERRSTAT.MMERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n =1 to 12).

This bit is read as 0.

ILERRCLR bit (Illegal Address Access Error Clear)

Writing 1 to the ILERRCLR bit clears the BUSnERRSTAT.ILERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n =1 to 12).

This bit is read as 0.

MSERRCLR bit (Master Security Attribution Unit Error Clear)

Writing 1 to the MSERRCLR bit clears the BUSnERRSTAT.MSERRSTAT, BUSnERRADD.BERAD and BUSnERRRW.RWSTAT (n =1 to 12).

This bit is read as 0.

14.3.33 BUSOAD : BUS Operation After Detection Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	BWERROAD	SLERROAD	ILERROAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ILERROAD	Illegal address access error operation after detection CPU 0: Only error response is returned. 1: Reset Other master 0: NMI 1: Reset	R/W

Bit	Symbol	Function	R/W
1	SLERROAD	Slave bus error operation after detection CPU 0: Only error response is returned. 1: Reset Other master 0: NMI 1: Reset	R/W
2	BWERROAD	Bufferable write error operation after detection All bus master 0: NMI 1: Reset	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note: When an error occurs in a speculative access issued by CPU with OAD bit is set to 1, a system reset request may occur. In that case, it can be avoided by using Arm-MPU. See section 14.8. References[3] for the detail.

ILERROAD bit (Illegal address access error operation after detection)

The OAD bit specify operation when the illegal address access error is detected. When OAD bit is 0, the operation differs depending on the bus master. If CPU causes access violation, only error response is returned and NMI is not generated. If master other than CPU causes access violation, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

SLERROAD bit (Slave bus error operation after detection)

The OAD bit specify operation when the slave bus error is detected. When OAD bit is 0, the operation differs depending on the bus master. If CPU causes access violation, only error response is returned and NMI is not generated. If master other than CPU causes access violation, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

BWERROAD bit (Bufferable write error operation after detection)

The OAD bit specify operation when the bufferable write error is detected.

When OAD bit is 0, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

14.3.34 BUSOADPT : BUS Operation After Detection Protect Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: BUSOAD register writing is possible. 1: BUSOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key code These bits enable or disable writes to the PROTECT bit.	W

Note: S-TYPE-3, P-TYPE-2

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

BUSOADPT.PROTECT controls the following registers:

- BUSOAD

When the PROTECT bit is set simultaneously, write 0xA5 to the KEY[7:0] bits using half word access.

KEY[7:0] bits (Key code)

The KEY[7:0] bits enable or disable writes to the PROTECT bit. When writing to the PROTECT bit simultaneously, write 0xA5 to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

14.3.35 MBWERRSTAT : Master Bufferable Write Error Status Register

Base address: BUS = 0x4000_3000
BUS_NS = 0x5000_3000

Offset address: 0x1B00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	MBWERR23	MBWERR22	MBWERR21	MBWERR20	MBWERR19	MBWERR18	MBWERR17	MBWERR16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MBWERR8	—	—	—	—	—	—	MBWERR1	MBWERR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MBWERR0	Master Bufferable Write Error 0: No bufferable write error in Master #0 1: Bufferable write error occurs in Master #0	R
1	MBWERR1	Master Bufferable Write Error 0: No bufferable write error in Master #1 1: Bufferable write error occurs in Master #1	R
7:2	—	These bits are read as 0.	R
8	MBWERR8	Master Bufferable Write Error 0: No bufferable write error in Master #8 1: Bufferable write error occurs in Master #8	R
15:9	—	These bits are read as 0.	R
16	MBWERR16	Master Bufferable Write Error 0: No bufferable write error in Master #16 1: Bufferable write error occurs in Master #16	R
17	MBWERR17	Master Bufferable Write Error 0: No bufferable write error in Master #17 1: Bufferable write error occurs in Master #17	R
18	MBWERR18	Master Bufferable Write Error 0: No bufferable write error in Master #18 1: Bufferable write error occurs in Master #18	R
19	MBWERR19	Master Bufferable Write Error 0: No bufferable write error in Master #19 1: Bufferable write error occurs in Master #19	R
20	MBWERR20	Master Bufferable Write Error 0: No bufferable write error in Master #20 1: Bufferable write error occurs in Master #20	R
21	MBWERR21	Master Bufferable Write Error 0: No bufferable write error in Master #21 1: Bufferable write error occurs in Master #21	R

Bit	Symbol	Function	R/W
22	MBWERR22	Master Bufferable Write Error 0: No bufferable write error in Master #22 1: Bufferable write error occurs in Master #22	R
23	MBWERR23	Master Bufferable Write Error 0: No bufferable write error in Master #23 1: Bufferable write error occurs in Master #23	R
31:24	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is cleared by reset other than Bus error reset and Common memory error reset.

MBWERRn bit (Master Bufferable Write Error Clear n)

When bufferble write access error occurs by MBWERRSTAT. MBWERRn is set to 1.

There are clearing conditions.

- Set MBWERRCLR. MBWERRCn to 1

Table 14.17 lists the registers associated with each bus master type.

Table 14.17 Associations between bus master types and bits

Bus master type	Master bufferable write error status bit	Master bufferable write error clear bit
CPUMAXIBI_W channel	MBWERR0	MBWECLR0

31:13	—	These bits are read as 0.	R

Note: S-TYPE-5, P-TYPE-2
Note: This register is cleared by reset other than Bus error reset and Common memory error reset.

SBWERRn bit (Slave Bufferable Write Error n)

When bufferble write access error occurs by SBWERRSTAT.SBWERRn is set to 1.

There are clearing conditions.

- Set SBWERRCLR.SBWECLRn to 1.

Table 14.18 lists the registers associated with each bus slave type.

Table 14.18 Associations between bus slave types and bits (1 of 2)

31:13	—	These bits are read as 0.	R/W*1

Note: S-TYPE-3, P-TYPE-2
Note 1. Only 1 can be written to this bit.

SBWECLRn bit (Slave Bufferable Write Error Clear n)

Writing 1 to this bit clears the SBWERRSTAT.SBWERRn flag.

This bit is read as 0.

14.4 Endian and Data Alignment

The external bus has a data alignment function to control which byte of the data bus (D31 to D24, D23 to D16, D15 to D08, D07 to D00) is used when accessing the external address space (the CS and SDRAM areas). Alignment is based on the bus specifications of the area to be accessed (8-bit, 16-bit, or 32-bit bus space), the data size, and the endian order.

14.4.1 Data Alignment Control for the CS Area

14.4.1.1 32-Bit Bus Space

When a 32-bit width is selected for a bus space by the BSIZE[1:0] bits in CSnCR, the address buses A23 to A2 are enabled to output address signals in units of 32 bits, and the address buses A1 and A0 are disabled (always output low).

When byte strobe mode is selected (the WRMOD bit = 0 in CSnMOD), the WR0 to WR3 pins are enabled. The BC0 to BC3 pins are not used.

When single-write strobe mode is selected (the WRMOD bit = 1 in CSnMOD), only the WR0 pin is enabled and always outputs the low level during write access, regardless of the data size. The WR1 to WR3 pins are invalid (always output high). The valid byte position is indicated by the BC0 to BC3 pins.

In 32-bit bus space, the valid positions of data external to the MCU and of control signals differ according to whether the endian is big or little.

Table 14.19 Data alignment (little-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	WR3/BC3	WR2/BC2	WR1/BC1	WR0/BC0
						RD			
						Data bus			
						D31 D24	D23 D16	D15 D8	D7 D0
8 bits	4n	One	First	8 bits	4n				7 0
	4n + 1	One			4n			7 0	
	4n + 2	One	First	8 bits	4n		7 0		
	4n + 3	One			4n	7 0			
16 bits	4n	One	First	16 bits	4n			15 8	7 0
	4n + 2	One	First	16 bits	4n	15 8	7 0		
32 bits	4n	One	First	32 bits	4n	31 24	23 16	15 8	7 0

Table 14.20 Data alignment (big-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	WR3/BC3 RD Data bus D31 D24	WR2/BC2 RD Data bus D23 D16	WR1/BC1 RD Data bus D15 D8	WR0/BC0 RD Data bus D7 D0
8 bits	4n	One	First	8 bits	4n	7 0			
	4n + 1	One			4n		7 0		
	4n + 2	One	First	8 bits	4n			7 0	
	4n + 3	One			4n				7 0
16 bits	4n	One	First	16 bits	4n	15 8	7 0		
	4n + 2	One	First	16 bits	4n			15 8	7 0
32 bits	4n	One	First	32 bits	4n	31 24	23 16	15 8	7 0

14.4.1.2 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, address buses A23 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low).

When byte strobe mode is selected (WRMOD = 0 in CSnMOD), the WR0 and WR1 pins are enabled, and the WR2 and WR3 pins are disabled (fixed high). The BC0 to BC3 pins are not used.

When single-write strobe mode is selected (WRMOD = 1 in CSnMOD), only the WR0 pin is enabled, and it always outputs low during write access, regardless of the data size. The WR1 to WR3 pins are invalid (always outputs high). The valid byte position is indicated by the BC0 and BC1 pins.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 14.21 and Table 14.22.

Page access can occur for accesses to data in 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary and causes no change in the BC0 and BC1 signals. The conditions in which page access occurs are indicated by the letter (p) in Table 14.21 and Table 14.22.

Table 14.21 Data alignment (little-endian) in 16-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		WR1/BC1 RD Data bus D15 D08	WR0/BC0 RD Data bus D07 D00
8 bits	4n	One	First	8 bits	4n			7 0
	4n + 1	One	First	8 bits	4n		7 0	
	4n + 2	One	First	8 bits	4n + 2			7 0
	4n + 3	One	First	8 bits	4n + 2		7 0	
16 bits	4n	One	First	16 bits	4n		15 8	7 0
	4n+2	One	First	16 bits	4n + 2		15 8	7 0
32 bits	4n	Two	First	16 bits	4n		15 8	7 0
			Second	16 bits	4n + 2	(p)	31 24	23 16

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

Table 14.22 Data alignment (big-endian) in 16-bit bus space

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		WR1/BC1 RD Data bus D15 D08	WR0/BC0 RD Data bus D07 D00
8 bits	4n	One	First	8 bits	4n		7 0	
	4n + 1	One	First	8 bits	4n			7 0
	4n + 2	One	First	8 bits	4n + 2		7 0	
	4n + 3	One	First	8 bits	4n + 2			7 0
16 bits	4n	One	First	16 bits	4n		15 8	7 0
	4n+2	One	First	16 bits	4n + 2		15 8	7 0
32 bits	4n	Two	First	16 bits	4n		31 24	23 16
			Second	16 bits	4n + 2	(p)	15 8	7 0

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

14.4.1.3 8-Bit Bus Space

When an 8-bit bus space is selected by the BSIZE[1:0] bits in CSnCR, the address buses A23 to A0 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0# pin is valid regardless of write access mode, and always outputs the low level during write access. The WR1# to WR3# pins and the BC0# to BC3# pins are not used.

Page access can occur in access to data in 16- or 32-bit units. Specifically, page access can occur when an access does not spread over a 32-bit boundary. The conditions in which page access occurs are indicated by the letter (p) in Table 14.23 and Table 14.24.

In 8-bit bus space, the valid positions of data external to the MCU are D7 to D0 and WR0# is used as the control signal, regardless of the endian mode.

When an 8-bit bus space is selected in the BSIZE[1:0] bits in CSnCR, the address buses A23 to A00 are enabled to output address signals in byte units.

In 8-bit bus space, only the WR0 pin is valid, regardless of the write access mode, and it always outputs low during write access. The WR1 to WR3 pins and the BC0 to BC3 pins are not used.

The valid positions of data external to the MCU are D07 to D00, and WR0 is used as the control signal, regardless of the endian mode. See Table 14.23 and Table 14.24.

Page access can occur for accesses to data in 16-bit or 32-bit units. Page access can only occur when an access does not extend over a 32-bit boundary. The conditions in which page access occurs are indicated by the letter (p) in Table 14.23 and Table 14.24.

Table 14.23 Data alignment (little-endian) in 8-bit bus space (1 of 2)

Data size	Accessed address	Number of accesses	Bus cycle	Unit of data	Address		WR1/BC1 RD Data bus D15 D08	WR0/BC0 RD Data bus D07 D00

			Third	8 bits	4n + 2	(p)		15 8
			Fourth	8 bits	4n + 3	(p)		7 0

(p):Page access (only when page access is enabled in the PRENB and PWENB bits in CSnMOD)

14.4.2 Data Alignment Control for the SDRAM Area

14.4.2.1 32-Bit Bus Space

When a 32-bit width is selected for a bus space by the BSIZE[1:0] bits in SDCCR, the address buses A26 to A02 are enabled to output address signals in units of 32 bits, and the address buses A01 and A00 are disabled (always output low). The valid byte position is indicated by DQM0 to DQM3 signals.

The external data is accessed using the D31 to D24, D23 to D16, D15 to D8, and D7 to D0 pins. Data can be accessed in either 8-bit, 16-bit, or 32-bit units at a time.

In 32-bit bus space, the valid positions of data external to the chip and of SDRAM control signals (DQM0 to DQM3) differ according to whether the endian is big or little. Table 14.25 and Table 14.26 show data alignment control when the endian is little and big, respectively.

Table 14.25 Data alignment (little-endian) in 32-bit bus space

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	DQM3		DQM2		DQM1		DQM0	
						WE							
						Data bus							
						D31	D24	D23	D16	D15	D8	D7	D0
8 bits	4n	One	First	8 bits	4n							7	0
	4n + 1	One			4n					7	0		
	4n + 2	One	First	8 bits	4n			7	0				
	4n + 3	One			4n	7	0						
16 bits	4n	One	First	16 bits	4n					15	8	7	0
	4n + 2	One	First	16 bits	4n	15	8	7	0				
32 bits	4n	One	First	32 bits	4n	31	24	23	16	15	8	7	0

Table 14.26 Data alignment (big-endian) in 32-bit bus space (1 of 2)

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	DQM3		DQM2		DQM1		DQM0	
						WE							
						Data bus							
						D31	D24	D23	D16	D15	D8	D7	D0
8 bits	4n	One	First	8 bits	4n	7	0						
	4n + 1	One			4n			7	0				
	4n + 2	One	First	8 bits	4n					7	0		
	4n + 3	One			4n							7	0

Table 14.26 Data alignment (big-endian) in 32-bit bus space (2 of 2)

Data size	Access address	Number of access	Bus cycle	Unit of data	Address	DQM3	DQM2	DQM1	DQM0
						WE			
						Data bus			
						D31 D24	D23 D16	D15 D8	D7 D0
16 bits	4n	One	First	16 bits	4n	15 8	7 0		
	4n + 2	One	First	16 bits	4n			15 8	7 0
32 bits	4n	One	First	32 bits	4n	31 24	23 16	15 8	7 0

14.4.2.2 16-Bit Bus Space

When a 16-bit bus space is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A01 are enabled to output address signals in 16-bit units, and the address bus A00 is disabled (always outputs low). The valid byte position is indicated by the DQM0 and DQM1 signals.

External data is accessed using the DQ15 to DQ08 and DQ07 to DQ00 pins and DQM0 and DQM1 control signals. Data can be accessed in either 8-bit or 16-bit units at a time.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 14.27 and Table 14.28.

For divided access, continuous access is possible by setting SDAMOD.BE = 1.

Table 14.27 Data alignment in 16-bit bus space with little-endian order for SDRAM area

			Second	16 bits	4n + 2	15	8	7	0

14.4.2.3 8-Bit Bus Space

When an 8-bit width is selected in the BSIZE[1:0] bits in SDCCR, address buses A26 to A00 are enabled to output address signals in 8-bit units.

External data is accessed using the DQ07 to DQ00 pins and DQM0 control signal. Eight-bit data is accessed in single 8-bit access, 16-bit data with two 8-bit accesses, and 32-bit data with four 8-bit accesses.

The valid positions of control signals and data external to the MCU differ depending on the endian order. See Table 14.29 and Table 14.30.

For divided access, continuous access is possible by setting SDAMOD.BE = 1.

Table 14.29 Data alignment in 8-bit bus space with little-endian order for SDRAM area (1 of 2)

14.5 Operation of CS Area Controller

14.5.1 Separate Bus

This section describes the periods shown in the timing diagrams. The CS area controller (CSC) operates in synchronization with the external bus clock, BCLK. Operation cycles, such as wait cycles, specified in the CSC register, are counted on BCLK. In the following description, the frequencies of BCLK and EBCLK pin output are the same, unless otherwise noted. Access through the external bus starts at the same point as the output of a rising edge on the EBCLK pin. However, if the external bus clock, BCLK, and the output on the EBCLK pin are at different frequencies, the wait settings can cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 14.10 to Figure 14.14. If recovery cycles are inserted for bus access, the setting for the number of recovery cycles can also cause the start of access for the second and subsequent rounds to coincide with the falling edge of the output on the EBCLK pin. See Figure 14.32.

Tw1 to Twn (Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle)

The period from Tw1 to Twn is the number of clock cycles from the start of access through the external bus clock to 1 cycle before the strobe signal is valid. The number of cycles is selectable from 0 to 31. Within this period, the timing of CSn, RD, and WRn assertion (driving the signals low) is determined by the respective wait settings. The wait periods are controlled by the following bits in the CSn Wait Control Register 2 (CSnWCR2) .

- CS Assert Wait Select bits (CSON)
- RD Assert Wait Select bits (RDON)
- WR Assert Wait Select bits (WRON)
- Write-Data Output Wait Select bits (WDON)

The number of clock cycles for each of these wait periods is selectable as a value from 0 to 7, counted from the start of external bus access. The selectable number of cycles is also within the overall number of clock cycles required for waiting read or write.

Tend (Clock Cycle where the Strobe Signal is Valid)

Tend is the next clock cycle after completion of the wait period for a normal cycle of read or write, or for a cycle of page read or page write. If the wait select bit for these cycles is 0, bus access starts on the clock cycle where the strobe signal is valid. The RD and WRn signals are negated in the next clock cycle. For a read access, the clock cycle where the strobe signal is valid is where the data to be read is sampled. If an external wait is enabled, the wait signal is sampled on the cycle where the strobe signal is valid. The bus cycle is extended if the wait signal is low. The bus cycle completes in the next clock cycle if the wait signal is high. Tend indicates the cycle where sampling of the wait signal starts.

After the first cycle where the strobe signal is valid during page access, second and subsequent page access operations (see Tpw1 to Tpwn (Page-Read Cycle Wait or Page-Write Cycle Wait)) start in the next cycle, except during write access with a setting other than 0 for write-data output extension clock cycles (see Tdw1 to Tdwn (Write-Data Output Extension Clock

Cycles)). If the setting for the RD or WR assertion wait is any value other than 0, the RD and WRn signals are negated in the next clock cycle. If the setting is 0, assertion continues. Additionally, the CSn signal continues to be asserted rather than negated.

Tn1 to Tnm (Clock Cycles of CS Extension)

For normal access, Tn1 to Tnm represent the clock cycles of the period following the cycle where the strobe signal is valid (Tend) up to negation of the CSn signal. For read or write access, the negation timing can be controlled by the read-access CS Extension Cycle Select bits (CSROFF) and the write-access CS Extension Cycle Select bits (CSWOFF) in the CSn Wait Control Register 2 (CSnWCR2). The number of cycles is counted from the cycle following the cycle where the strobe signal is valid.

For page access, Tn1 to Tnm represent the clock cycles of the period following the last cycle where the strobe signal is valid up to negation of the CSn signal.

For write access, setting the Write Data Output Extension Cycle Select bits (WDOFF) controls extension of the period where the address and output data is valid.

Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles)

For write access, if the wait setting for the write-data output extension is any value other than 0, the specified clock cycles are inserted from the cycle following the cycle where the strobe signal is valid (Tend).

For normal access, this period is inserted within the clock cycle period for CS extension (Tn1 to Tnm).

For page access, this period is inserted within the clock cycle period where the strobe signal is valid and subsequent page accesses, or within the clock cycle period for the CS extension (Tn1 to Tnm). Valid address and data output are extended over this period, and the WRn signal is negated.

Tpw1 to Tpwn (Page-Read Cycle Wait or Page-Write Cycle Wait)

For the second and subsequent bus cycles during page access, the values for a page-read cycle wait or page-write cycle wait are used instead of the settings for a normal read or write cycle wait. The settings in the WR Assert Wait Select bits become enabled in the same way as for the first access. The RD assertion control operation depends on the page read access mode setting (the PRMOD bit in CSnMOD) as follows:

- CSnMOD.PRMOD = 0: A wait for RD assertion is inserted in the same way as for the first access, and the RD signal is negated
- CSnMOD.PRMOD = 1: Although a wait for RD assertion is inserted in the same way as for normal-access compatibility mode, the RD signal continues to be asserted over this period.

Tr1 to Trn (Recovery Cycles)

Recovery cycles can be inserted from the point where a bus cycle is complete (CSn signal negation). The number of recovery cycles can be controlled by setting the Read Recovery (RRCV) or Write Recovery (WRCV) bits in the CSn Recovery Cycle Register (CSnREC). Both numbers of recovery cycles are counted from the end of a bus cycle (CSn negation) and can be selected from 0 to 15 cycles. For more information, see section 14.5.4. Insertion of Recovery Cycles.

(1) Normal Access

When the PRENB and PWENB bits in CSnMOD are set to 0 to disable page read and page write access, all bus accesses take the form of normal read and write operations. Even when these bits are set to 1 to enable page read and page write access, bus access other than page access takes the form of normal read and write operations. Figure 14.3 to Figure 14.5 show the normal access operations.

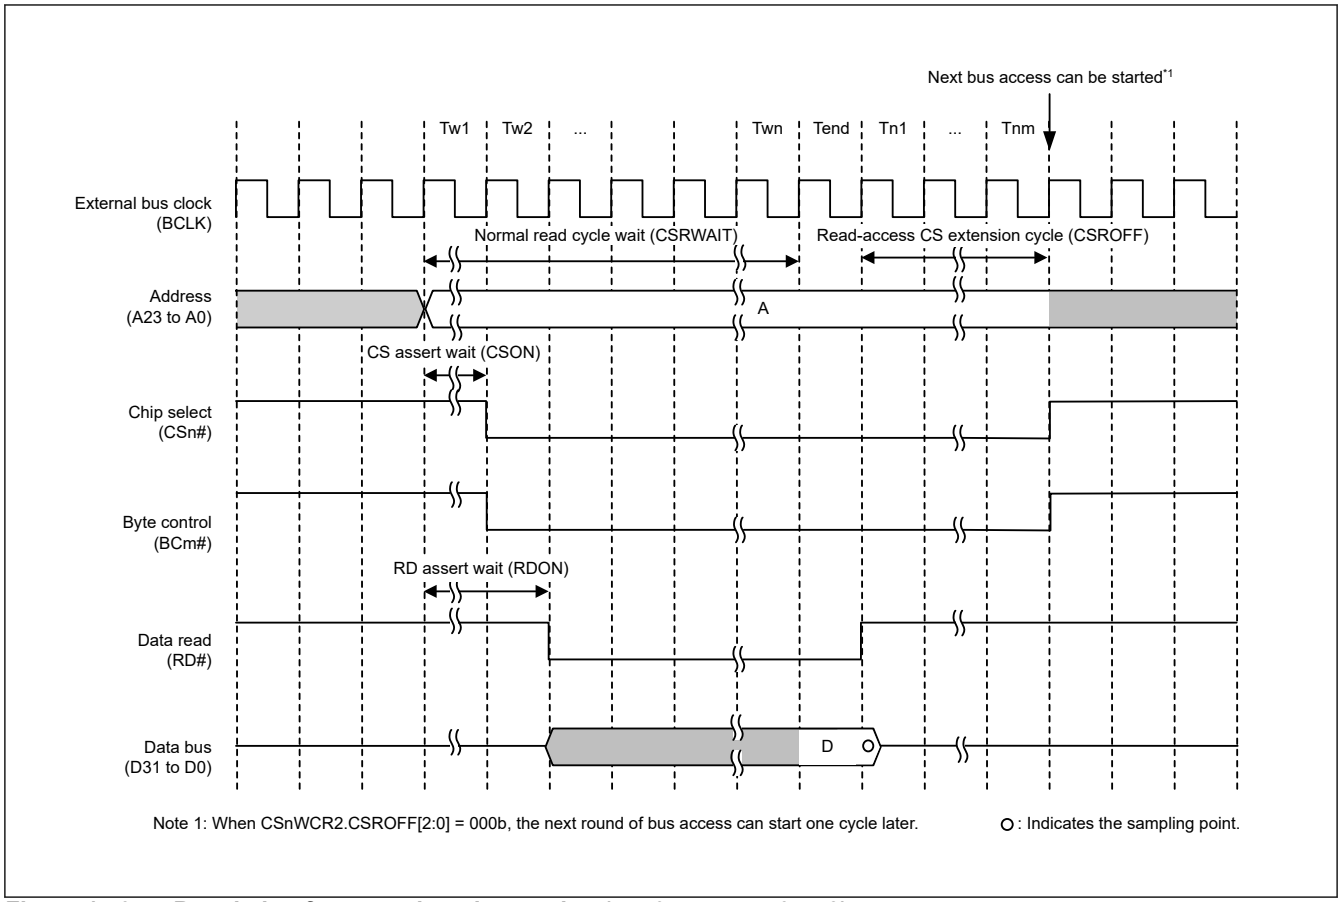

Figure 14.3 Bus timing for normal read operation (n = 0 to 7, m = 0 to 3)

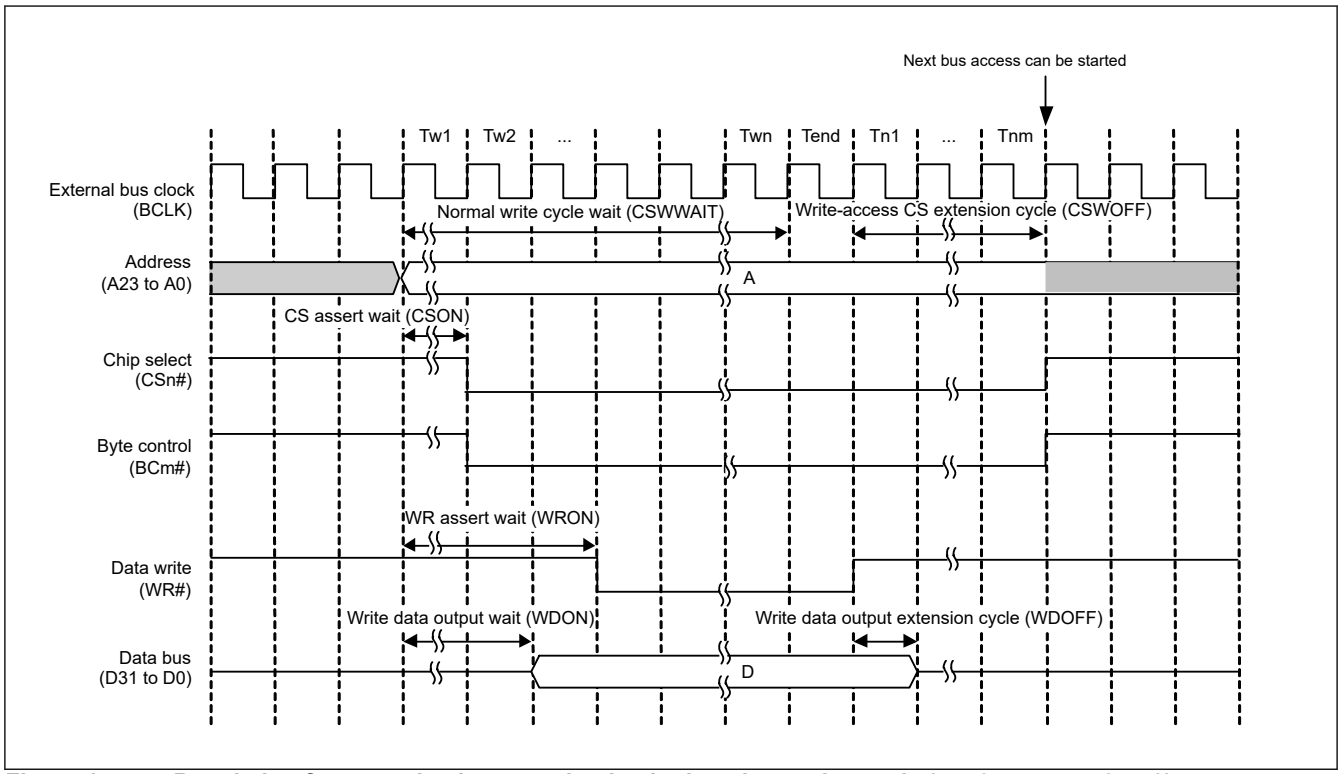

Figure 14.4 Bus timing for normal write operation in single-write strobe mode (n = 0 to 7, m = 0 to 3)

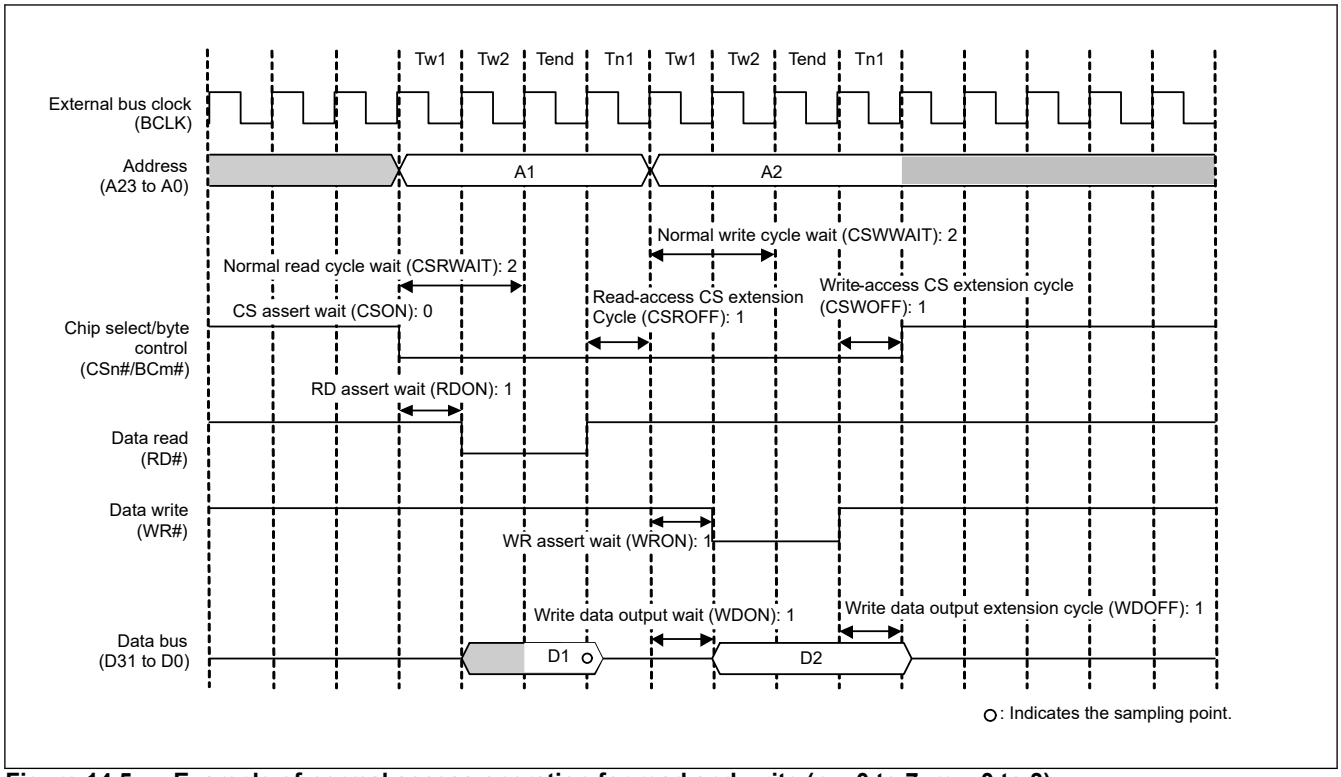

Figure 14.5 Example of normal access operation for read and write (n = 0 to 7, m = 0 to 3)

When two or more rounds of external bus access are required in response to a single request for transfer from a bus master, normal access operations are repeated. See Tw1 to Twn (Clock Cycles of Wait for a Normal Read Cycle or Normal Write Cycle) to Tdw1 to Tdwn (Write-Data Output Extension Clock Cycles). Figure 14.6 and Figure 14.7 show examples of operations when two rounds of bus access are generated in response to a single transfer request. If the recovery cycle insertion condition is satisfied, recovery cycles Tr1 to Trn (Recovery Cycles) are also inserted in the second and subsequent external bus accesses. See Figure 14.30.

The values in the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

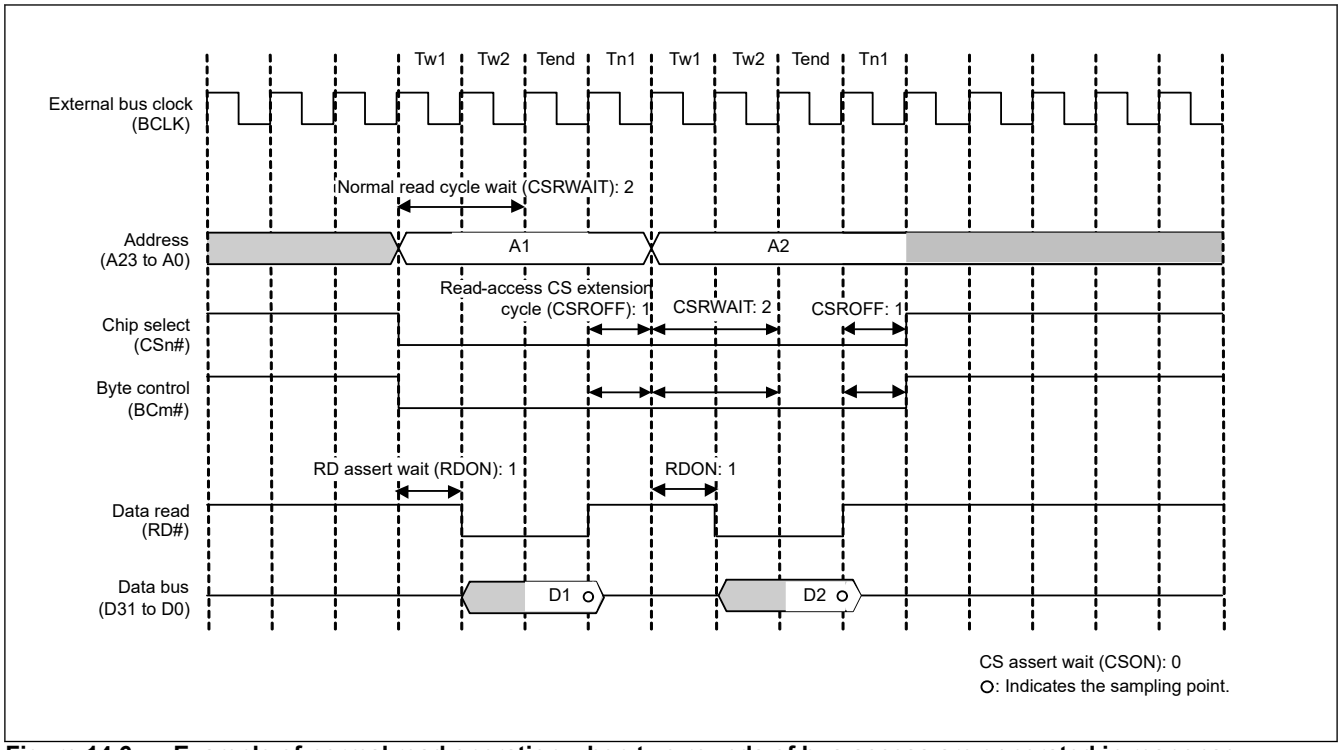

Figure 14.6 Example of normal read operation when two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

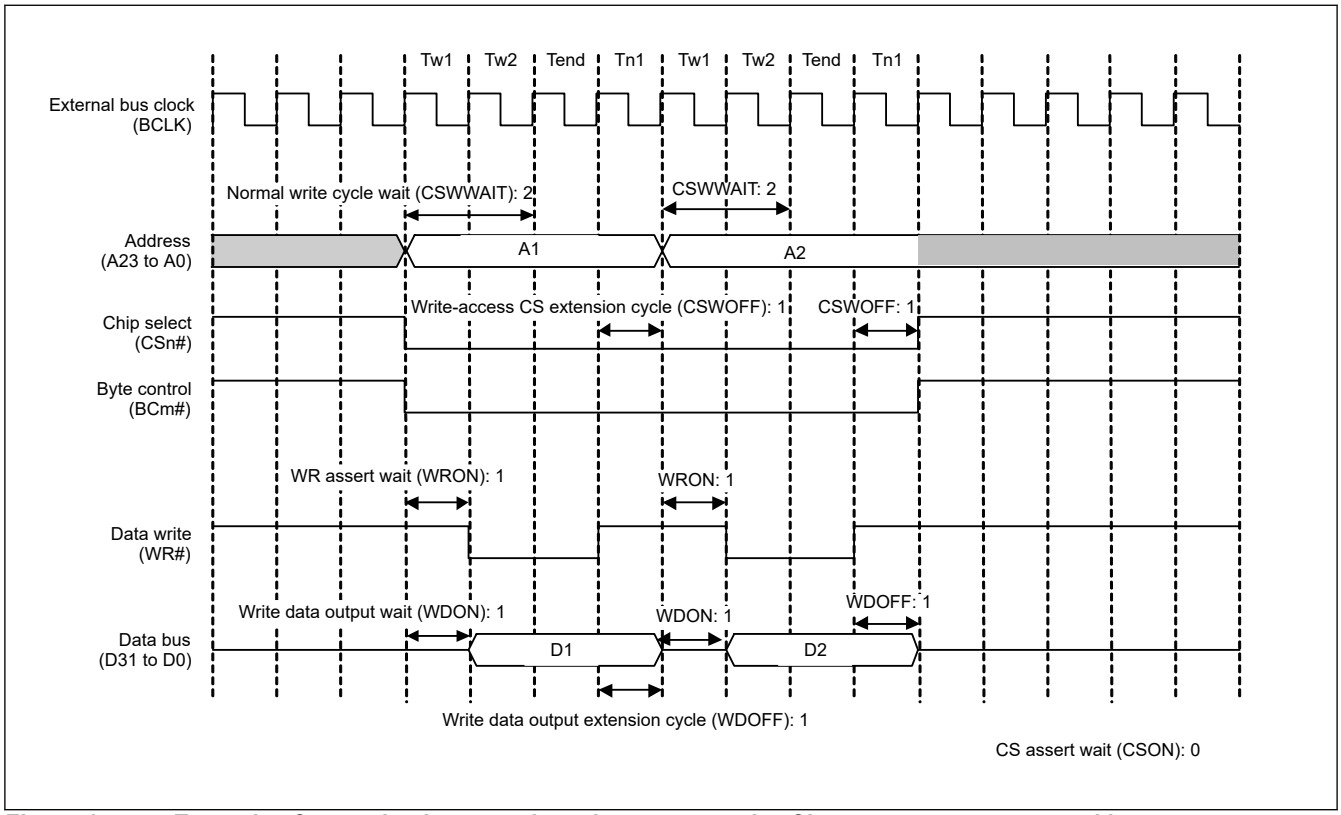

Figure 14.7 Example of normal write operation when two rounds of bus access are generated in response to a single transfer request in single-write strobe mode (n = 0 to 7, m = 0 to 3)

Figure 14.8 and Figure 14.9 show examples of normal read and write accesses to a 32-bit bus space in 16 bits.

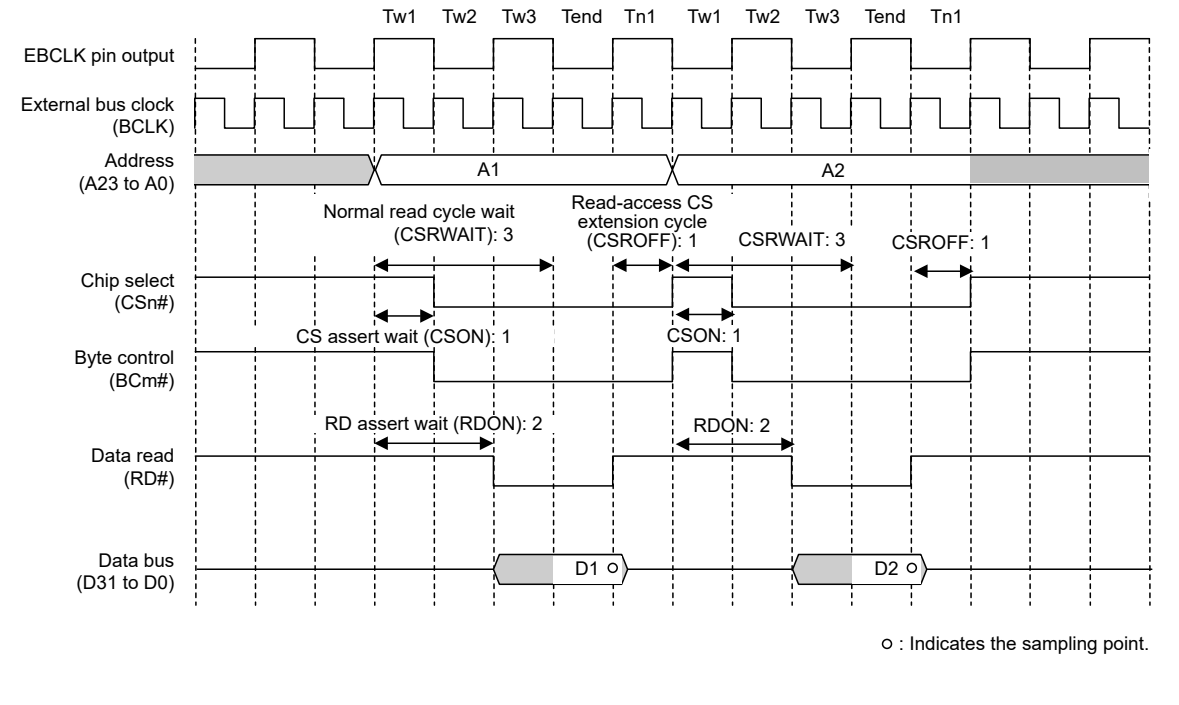

Figure 14.13 Example of normal read operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

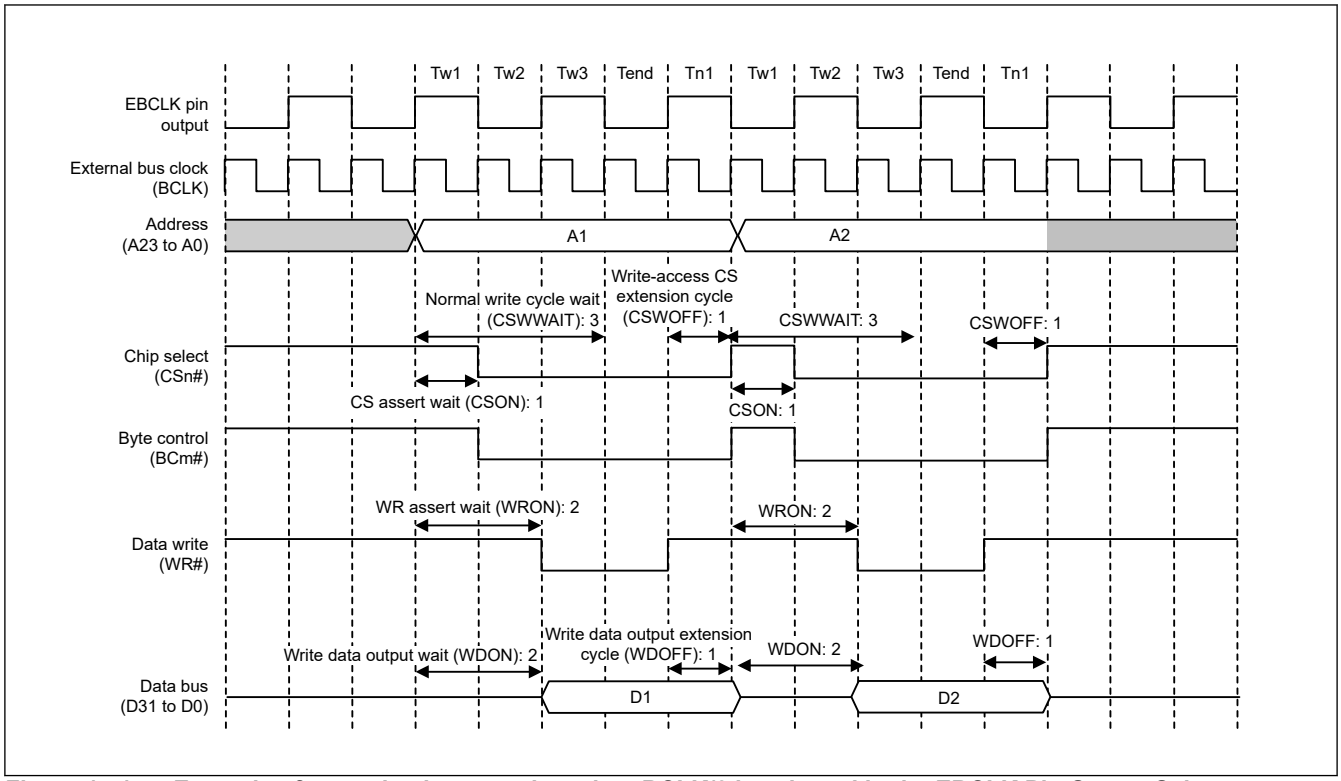

Figure 14.14 Example of normal write operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request (n = 0 to 7, m = 0 to 3)

(2) Page Access

When the PRENB and PWENB bits in CSnMOD are set to 1 to enable page read and page write access, the bus access for page access operations becomes page read and write. Page access can only occur when two or more rounds of external bus access are required for a single transfer request from the bus master. However, normal access is made when split accesses are not aligned or access extends across the 32-bit boundary. See Table 14.21 to Table 14.24 for the conditions under which page access occurs.

Figure 14.15 and Figure 14.16 show examples of page access operations.

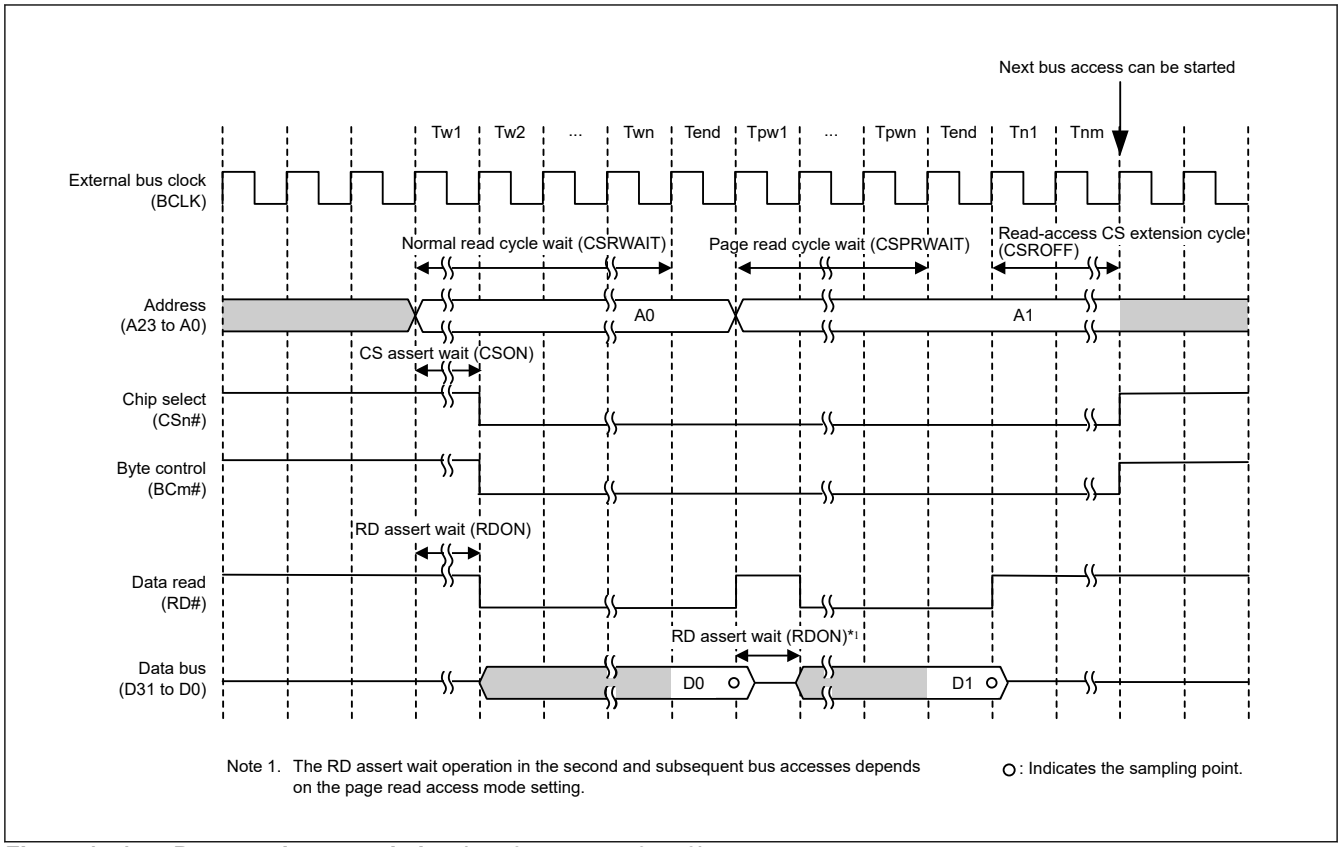

Figure 14.15 Page read access timing (n = 0 to 7, m = 0 to 3)

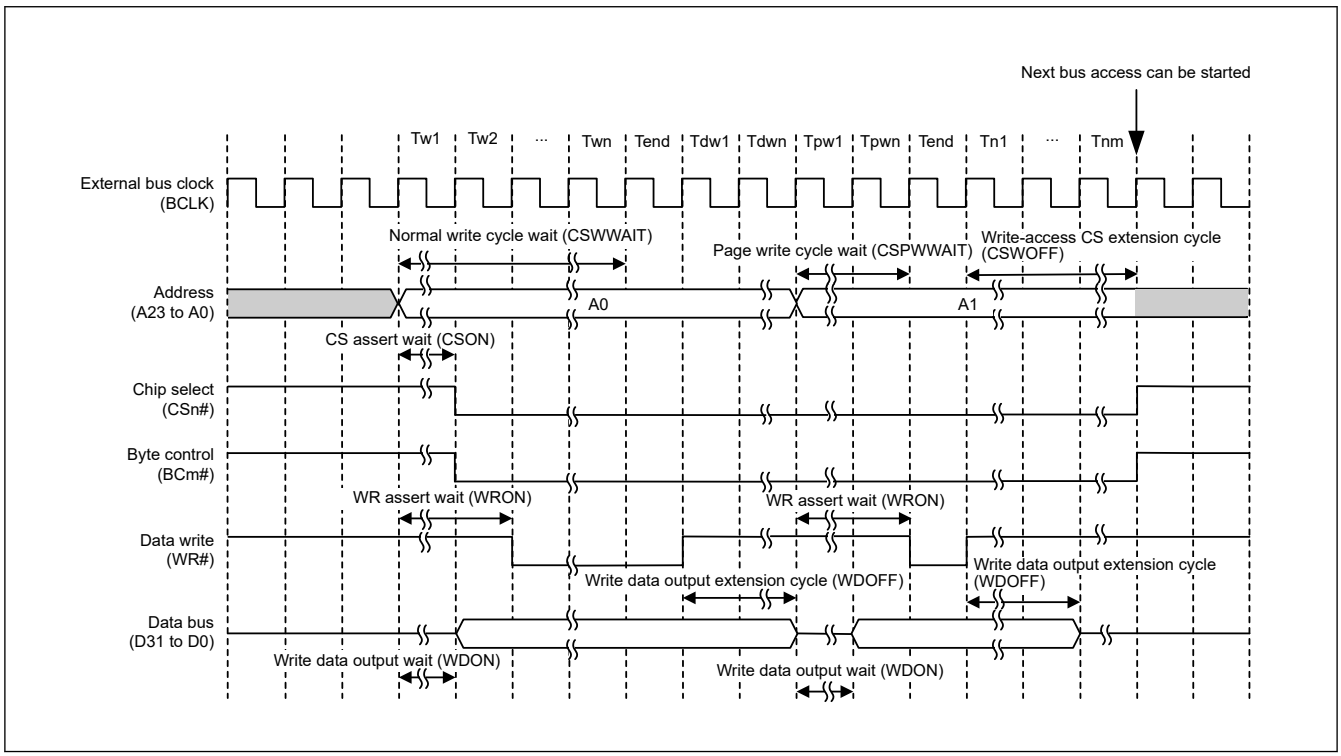

Figure 14.16 Page write access timing (n = 0 to 7, m = 0 to 3)

Figure 14.17 and Figure 14.18 show examples of operations for access to a 16-bit bus space in 32 bits. The values of the wait control registers shown in the figures are example settings. In your application, set the registers appropriately for the specifications of connected devices.

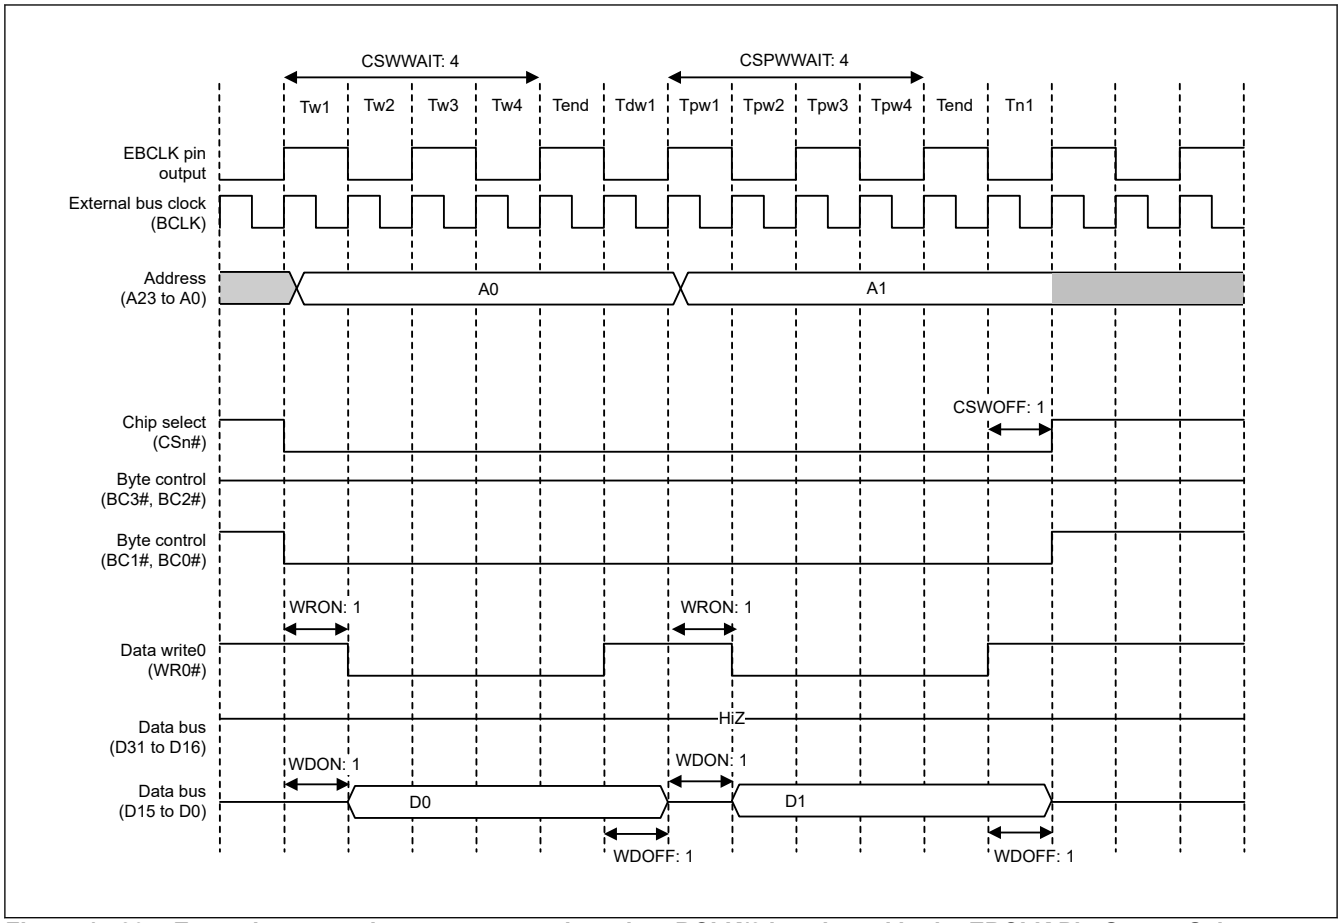

Figure 14.20 Example page write access operation when BCLK/2 is selected in the EBCLK Pin Output Select bit and two rounds of bus access are generated in response to a single transfer request, in single-write strobe mode (n = 0 to 7)

14.5.2 Address/Data Multiplexed Bus

When the address/data Multiplexed I/O Interface Select bit (MPXEN) in CSnCR is set to 1, addresses and data can be multiplexing input/output to/from the D15 to D00 pins in the corresponding area. Using this function enables direct connection of this MCU to peripherals of the MCU requiring address/data multiplexing. When 8-bit width is selected with the BSIZE[1:0] bits in CSnCR, D7 to D00 are multiplexed with A07 to A00. When 16-bit width is selected, D15 to D00 are multiplexed with A15 to A00. In the address/data multiplexed I/O space, accesses are controlled with the ALE, RD, WRn, and BCn signals.

Byte strobe mode or single-write strobe mode is selectable in the same way as for a separate bus. However, with regard to the BCn signals within the address cycle, the byte-control signal is output for the data being read or written.

During the address/data multiplexed I/O space access, after the number of wait cycles specified by the Address Cycle Wait Select bits (AWAIT[1:0]) in CSnWCR2 is inserted in the address output cycle, data access is performed.

Ta1 to Tan (Address Cycle Wait)

The period Ta1 to Tan is valid only when the address/data multiplexed I/O space is specified. This period is made up of the number of clock cycles between the start of external bus access and 1 cycle before the address latch (ALE) signal is negated. The number of cycles are selectable within the range from 0 to 3. Addresses are output until the next cycle of ALE signal negation (address cycle). The timing of ALE signal is the same as that of CS assertion. After the address cycle, a data cycle is started. CSnWCR1 and CSnWCR2 should be set so that an address cycle and a data cycle do not overlap.

Page access to the address/data multiplexed I/O space is invalid. When the PRENB or PWENB bit in CSnMOD is set to 1 to enable page-read or page-write access, these settings are ignored and normal read or write operation is performed.

Figure 14.21 to Figure 14.23 show examples of operations with the address/data multiplexed I/O interface

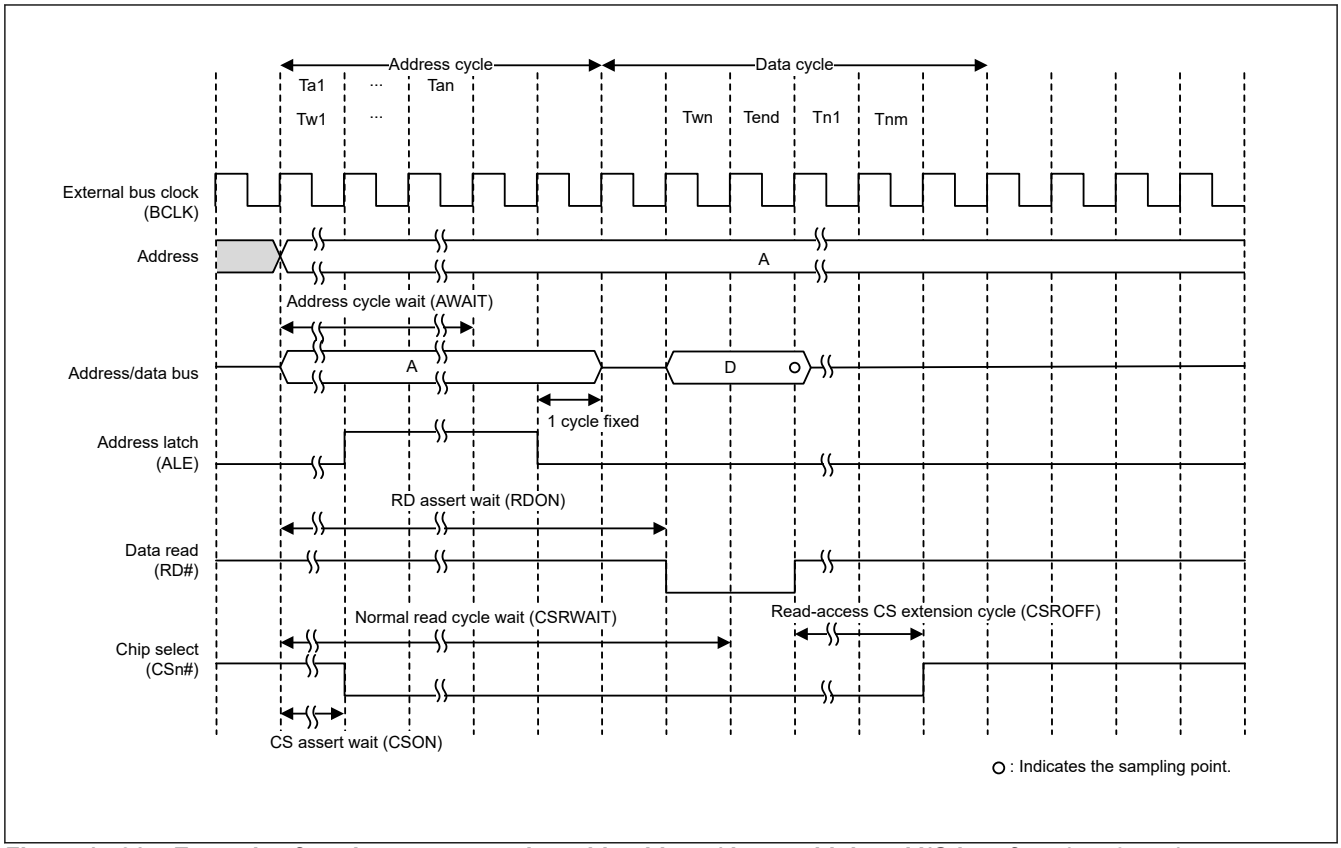

Figure 14.21 Example of read access operation with address/data multiplexed I/O interface (n = 0 to 7)

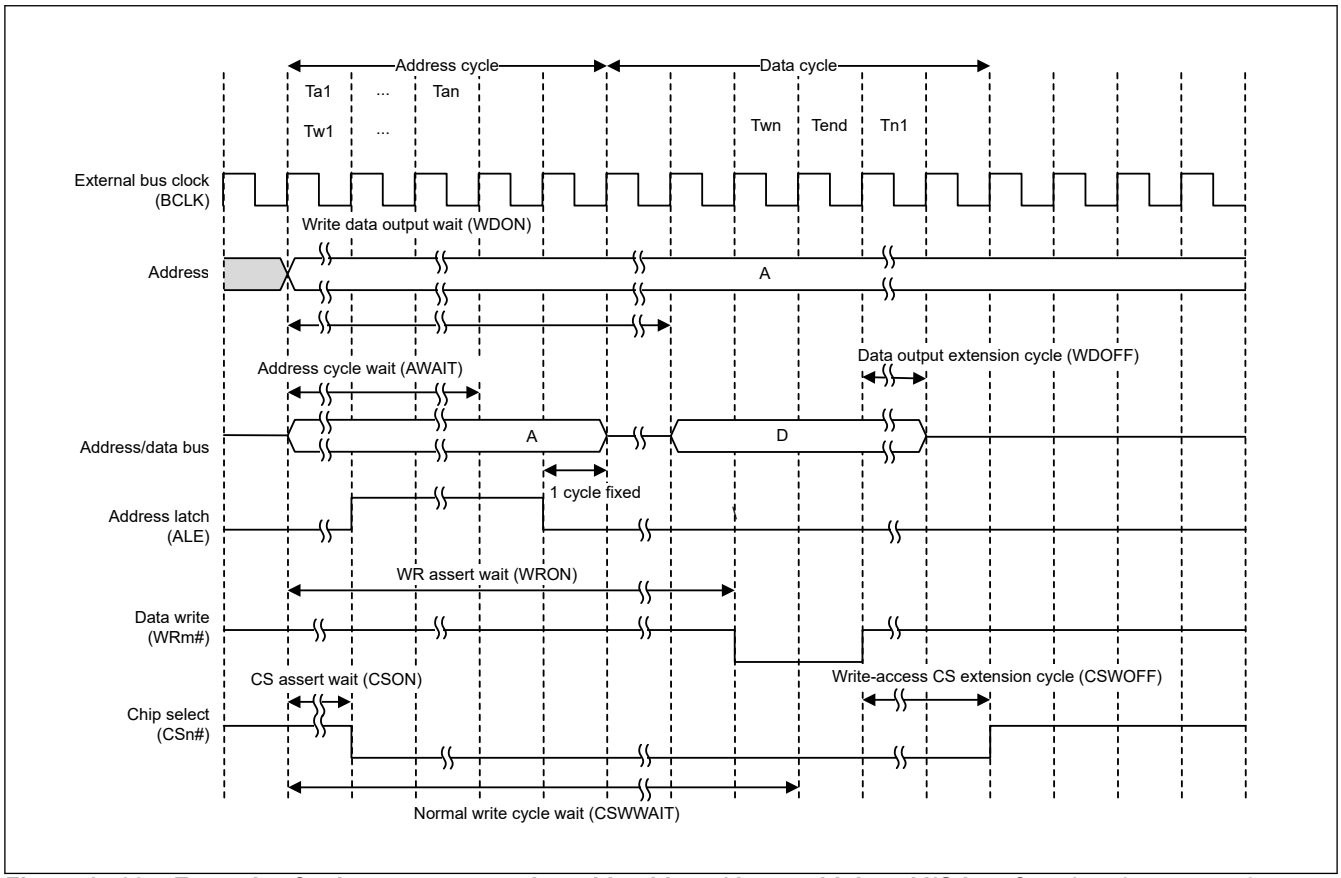

Figure 14.22 Example of write access operation with address/data multiplexed I/O interface (n = 0 to 7, m = 0 to 3)

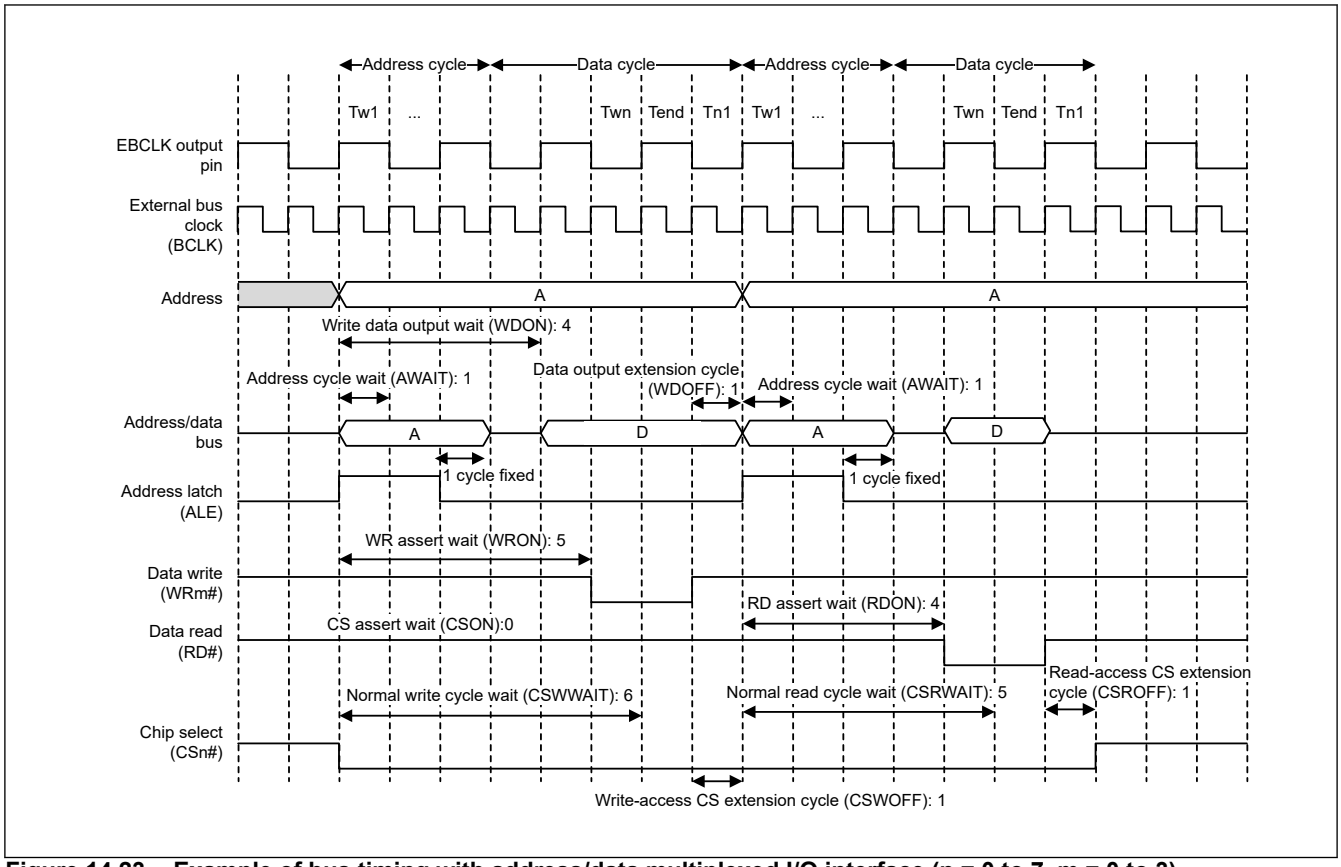

Figure 14.23 Example of bus timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0 to 3)

14.5.3 External Wait Function

Wait cycles can be extended by the WAIT signal beyond the length of the normal access cycle wait specified in the CSRWAIT[4:0] and CSWWAIT[4:0] bits in CSnWCR1, and the page access cycle wait specified in the CSPRWAIT[2:0] and CSPWWAIT[2:0] bits in CSnWCR1.

When external wait is enabled (EWENB = 1 in CSnMOD), wait cycles are inserted while the WAIT signal is held low. When external wait is disabled (EWENB = 0 in CSnMOD), the WAIT signal has no effect. All wait cycles specified in CSnWCR1 are inserted independently of the WAIT signal.

(1) Normal Access

Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in CSnWCR1. The bus cycle is extended while the WAIT signal is held low. The wait cycle ends (Tend) at the next cycle after the WAIT signal goes high.

(2) Page Access

The first access operation is the same as the normal access operation. Sampling of the WAIT signal begins on completion of the wait cycle (Tend) specified in the CSnWCR1 register. The bus cycle is extended while the WAIT signal is held low. The wait cycle (Tend) ends at the next cycle after the WAIT signal goes high.

For the second and subsequent accesses, sampling of the WAIT signal begins on completion of the page access wait cycle (Tend). The page access wait cycle is extended while the WAIT signal is held low, and ends (Tend) at the next cycle after the WAIT signal goes high.

Figure 14.24 to Figure 14.27 show examples of external wait insertion timing with the separate bus interface.

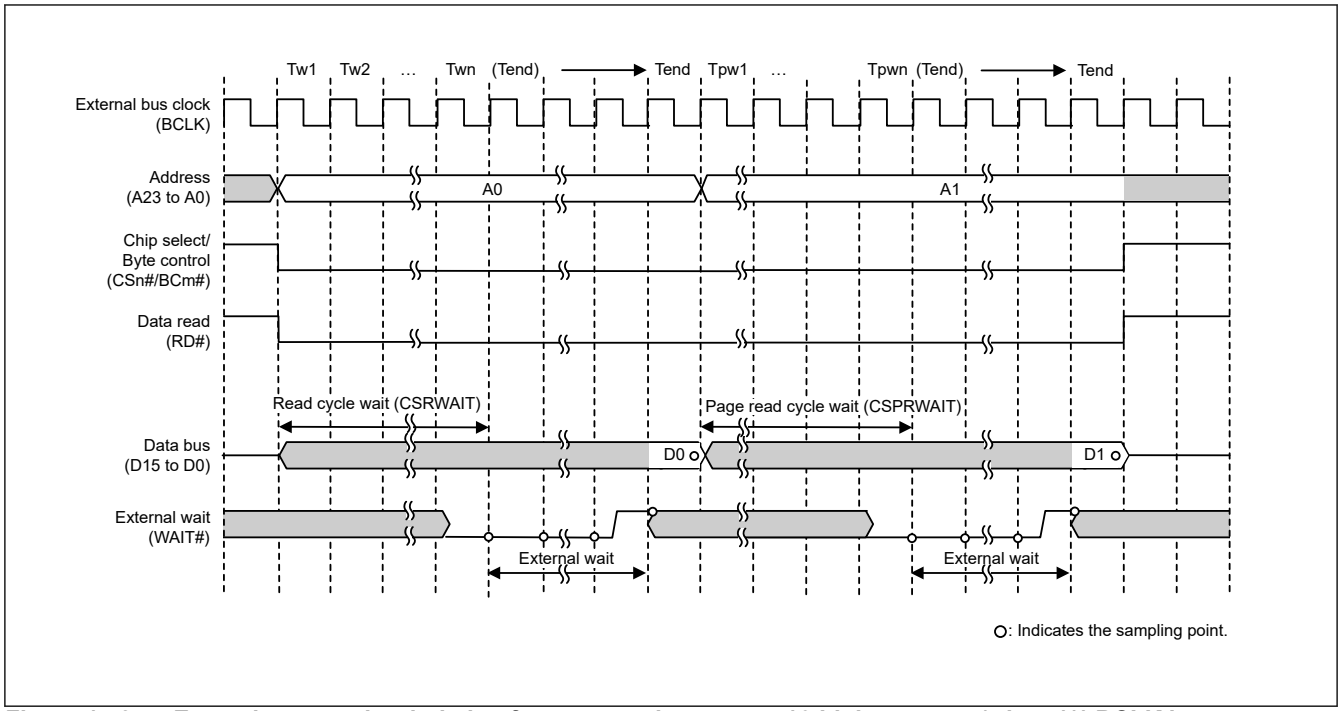

Figure 14.24 Example external wait timing for page read access to 16-bit bus space (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

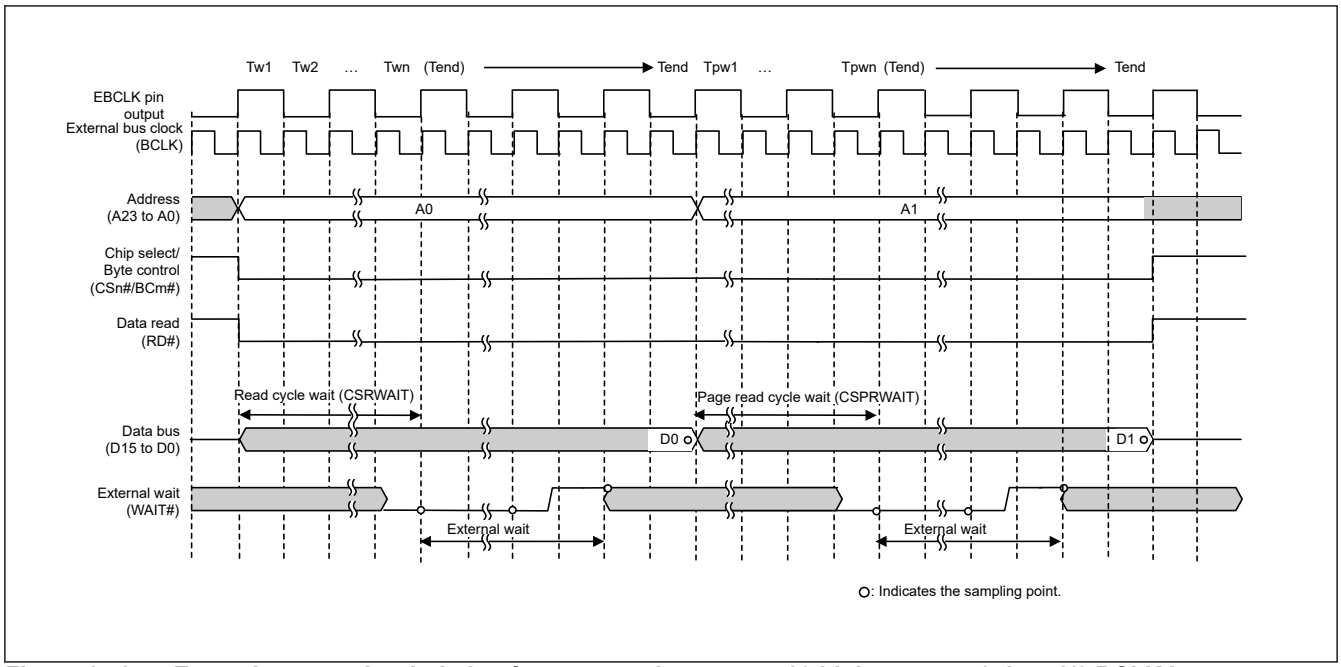

Figure 14.25 Example external wait timing for page read access to 16-bit bus space (when 1/2 BCLK is Selected with the EBCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

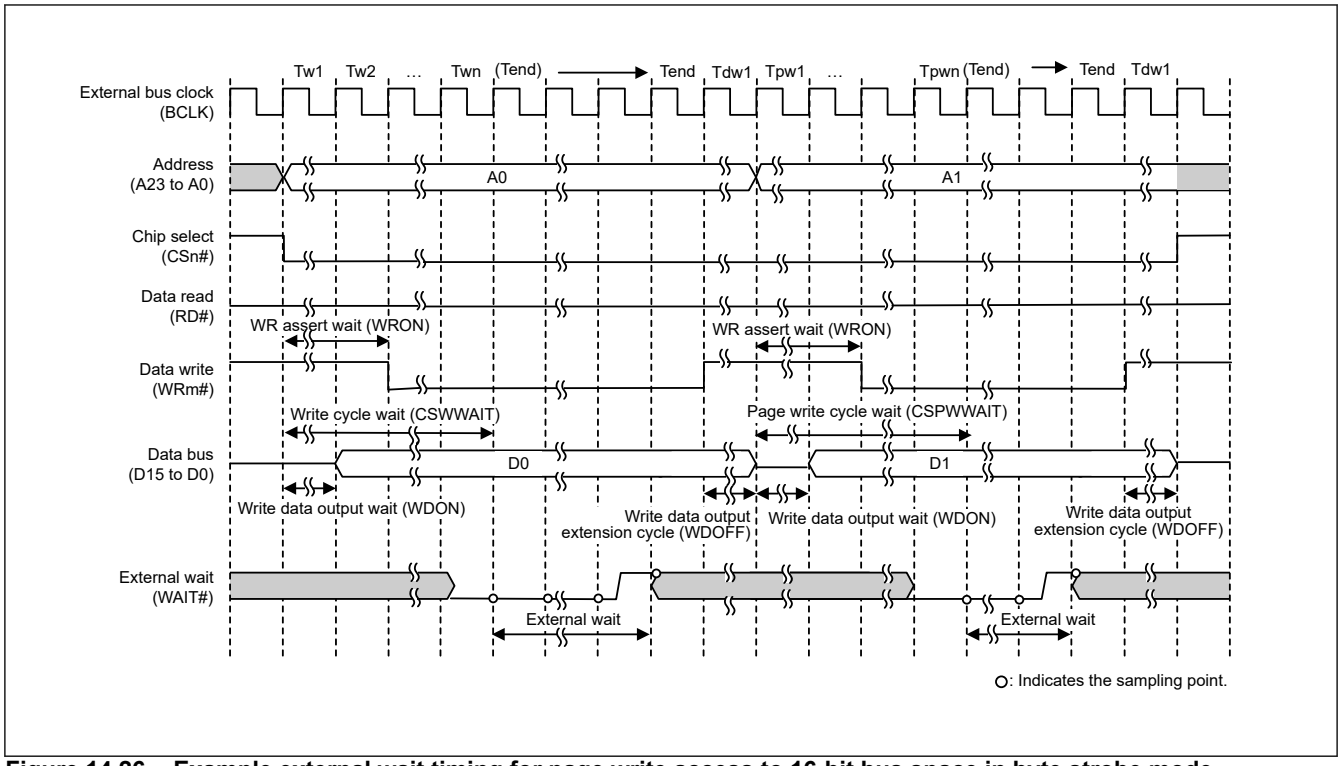

Figure 14.26 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/1 BCLK is selected with the BCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

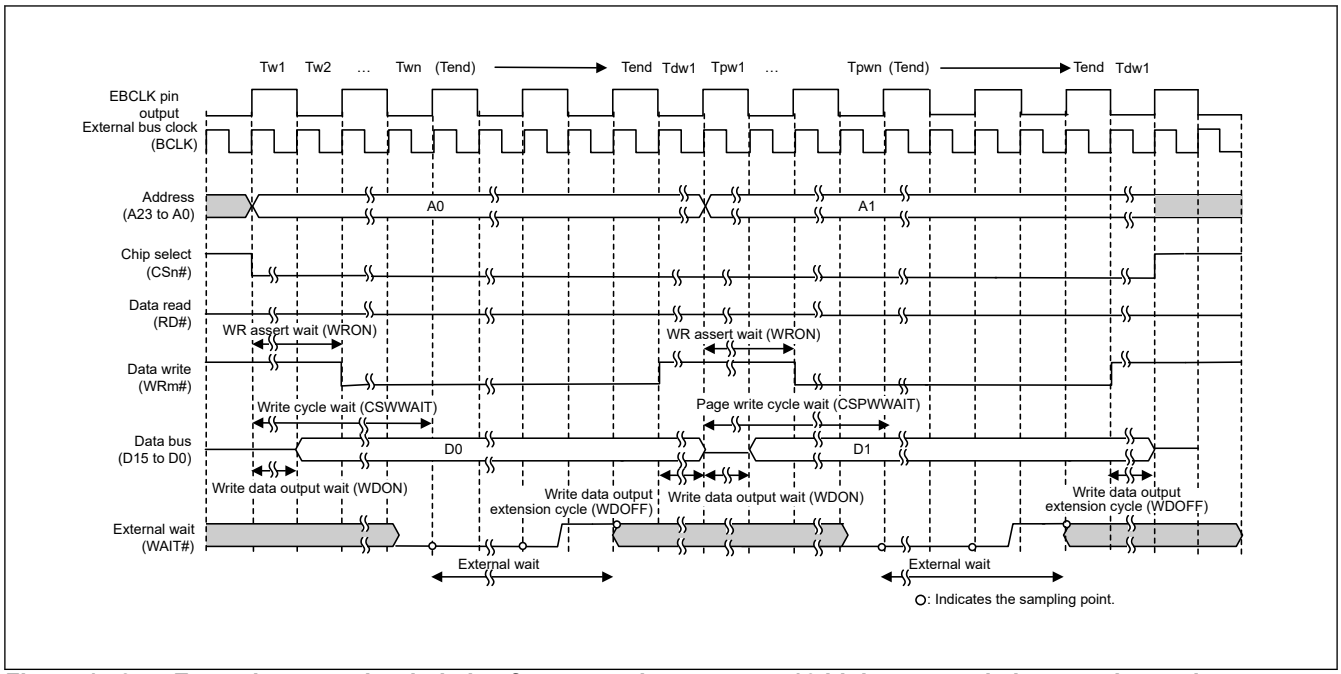

Figure 14.27 Example external wait timing for page write access to 16-bit bus space in byte strobe mode (when 1/2 BCLK is selected with the EBCLK Pin Output Select bit) (n = 0 to 7, m = 0, 1)

(3) Address/Data Multiplexed I/O Interface

In a data cycle with the address/data multiplexed I/O interface, programmed waits and pin waits using the WAIT pin can be inserted in the same way as that with the separate bus interface.

Address cycles are not affected by the wait control settings. Figure 14.28 shows an example of external wait insertion timing with the address/data multiplexed I/O interface.

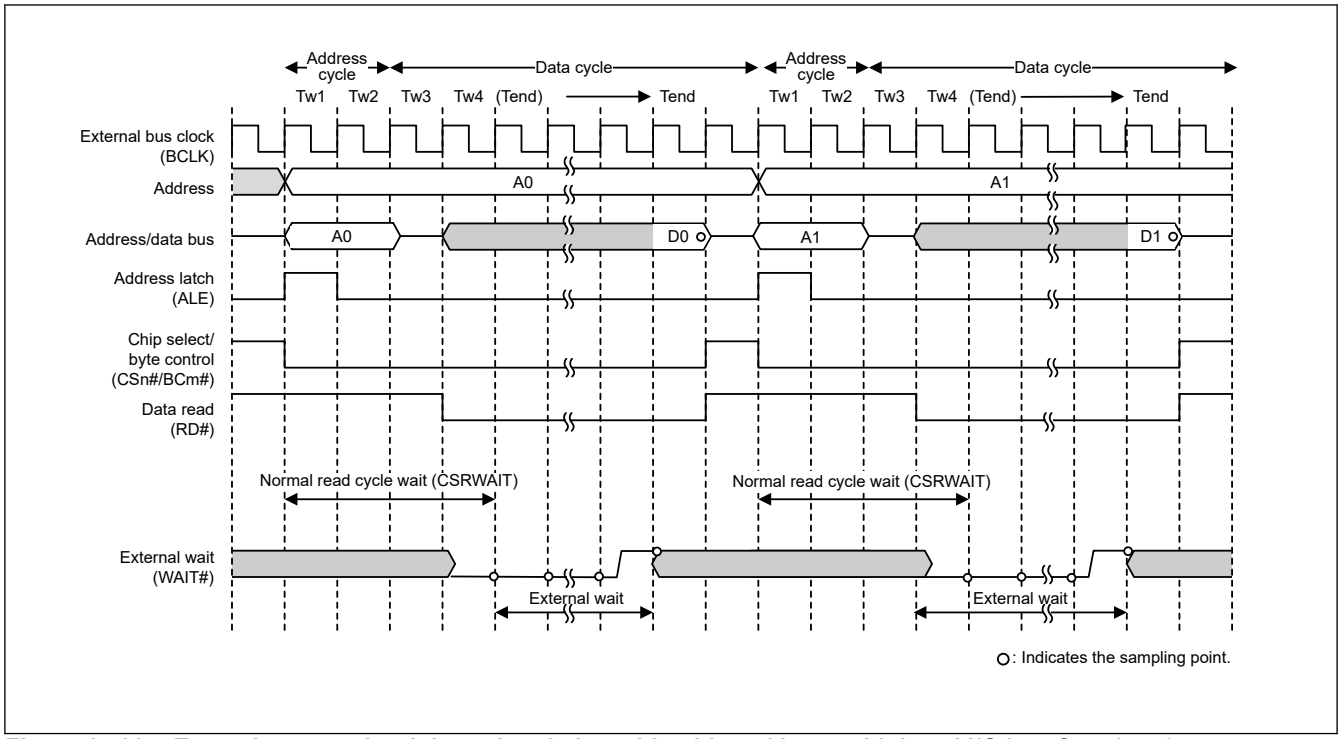

Figure 14.28 Example external wait insertion timing with address/data multiplexed I/O interface (n = 0 to 7, m = 0, 1)

14.5.4 Insertion of Recovery Cycles

Recovery cycles can be inserted between consecutive rounds of external bus access by setting the Recovery Cycle Insertion Enable bit in CSRECEN to 1.

The number of recovery cycles to be inserted after read cycles and write cycles can be independently set for each area using CSnREC. When the preceding bus cycle is a write access, the number of write recovery cycles must be set with the WRCV[3:0] bits for the associated area. When the preceding bus cycle is a read access, the number of read recovery cycles must be set with the RRCV[3:0] bits for the associated area. For example, when a CS1 read access occurs after a CS0 read access, the number of recovery cycles to be inserted between them is set in the RRCV[3:0] bits in CS0REC.

Recovery cycle insertion can be enabled or disabled with RCVENi (i = 0 to 7) in CSRECEN when the preceding bus access is a separate bus access, and with RCVENMj (j = 0 to 7) when the preceding bus access is an address/data multiplexed bus access.

Recovery cycles can be inserted on any of the following conditions:

- After a read access to the external bus, a read access is made to the external bus in the same area.
- After a read access to the external bus, a read access is made to the external bus in a different area.
- After a read access to the external bus, a write access is made to the external bus in the same area.
- After a read access to the external bus, a write access is made to the external bus in a different area.
- After a write access to the external bus, a read access is made to the external bus in the same area.
- After a write access to the external bus, a read access is made to the external bus in a different area.
- After a write access to the external bus, a write access is made to the external bus in the same area.
- After a write access to the external bus, a write access is made to the external bus in a different area.

The recovery cycle starts at the end of the preceding bus cycle, for example when the CSn signal (n = 0 to 7) is negated. A high-level period of the CSn signal is inserted for the specified recovery cycle period starting from this point.

In the fastest case, the CSn signal for the next round of bus access is asserted immediately after the end of the recovery cycles. Even if the next request for access to an external address space is generated during the recovery period, the next access over the external bus starts immediately after the end of the recovery cycles.

When two or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, recovery cycles are also inserted between these bus access cycles. However, when page read access is enabled (CSnMOD.PRENB = 1) or page write access is enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted except after the last bus access cycle of the transfer, even if the recovery cycle insertion condition is satisfied. See Figure 14.32.

Similarly, during normal access with page access enabled, recovery cycles are not inserted between bus access cycles but only after the last bus access cycle of the transfer. With the address/data multiplexed I/O interface, when the recovery cycle insertion condition is satisfied, recovery cycles are inserted between bus access cycles regardless of the page access enable setting.

Figure 14.29 to Figure 14.32 show examples of recovery cycle insertion with the separate bus interface.

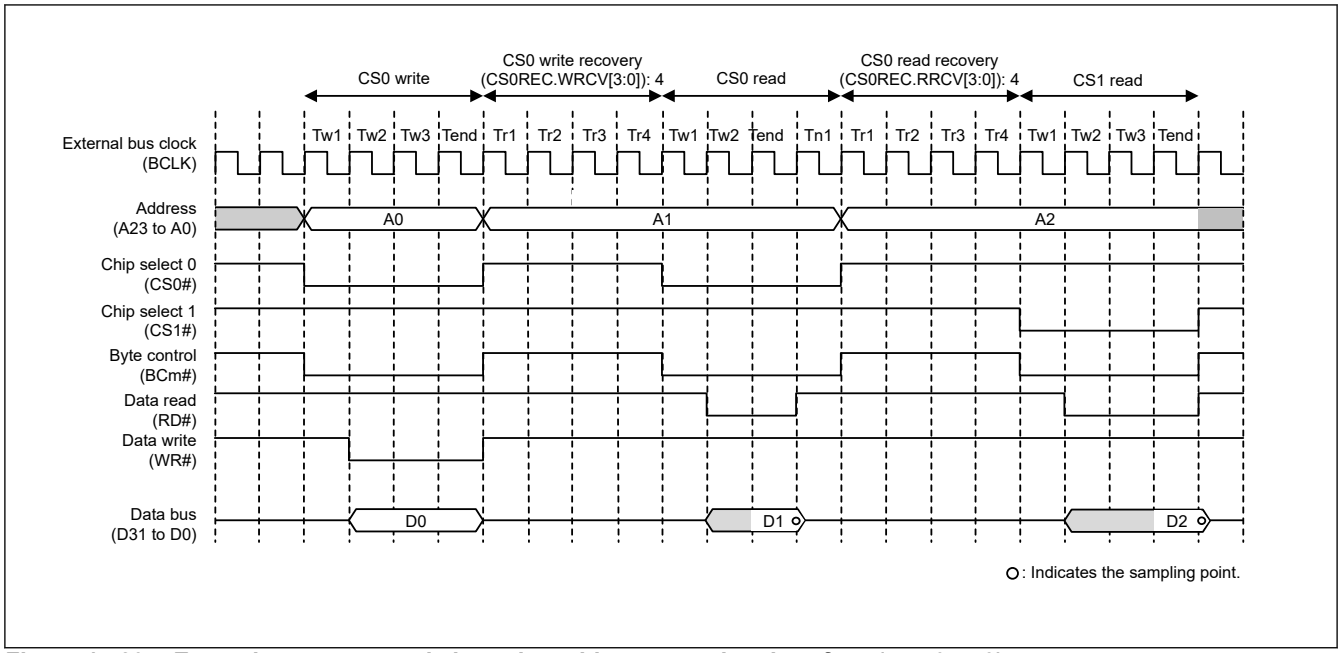

Figure 14.29 Example recovery cycle insertion with separate bus interface (m = 0 to 3)

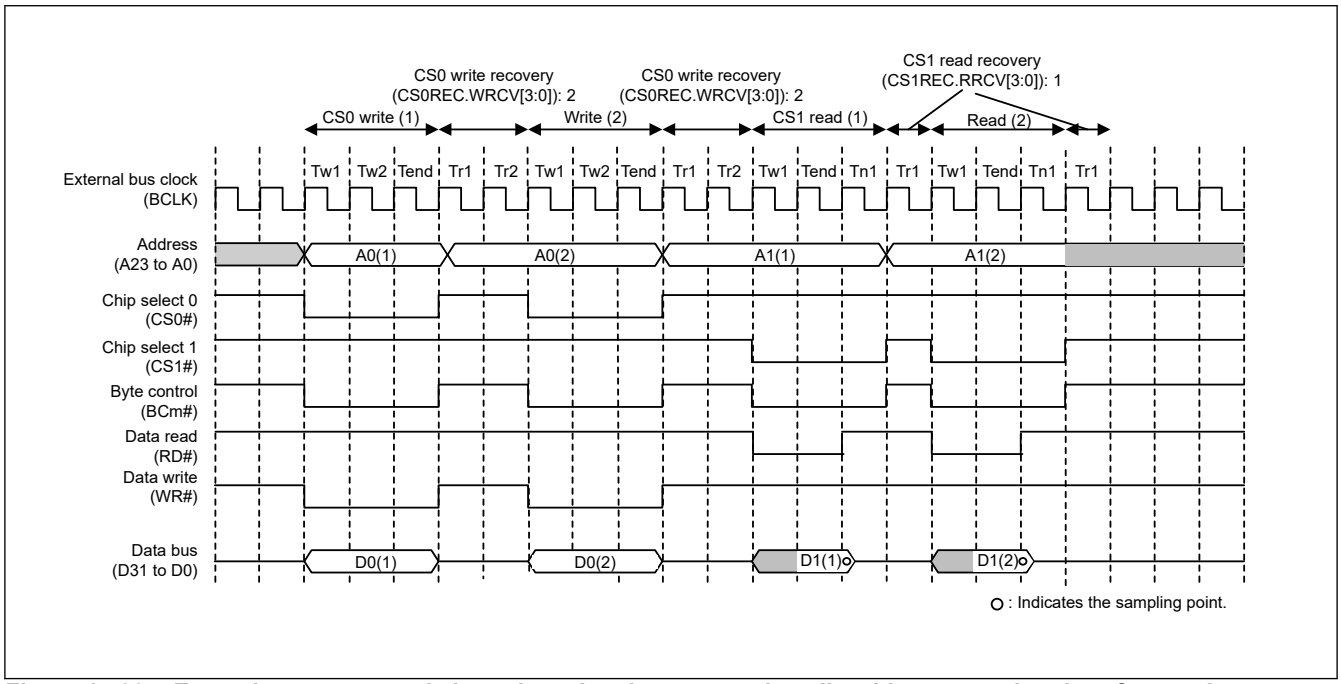

Figure 14.30 Example recovery cycle insertion when bus access is split, with separate bus interface and normal access (m = 0 to 3)

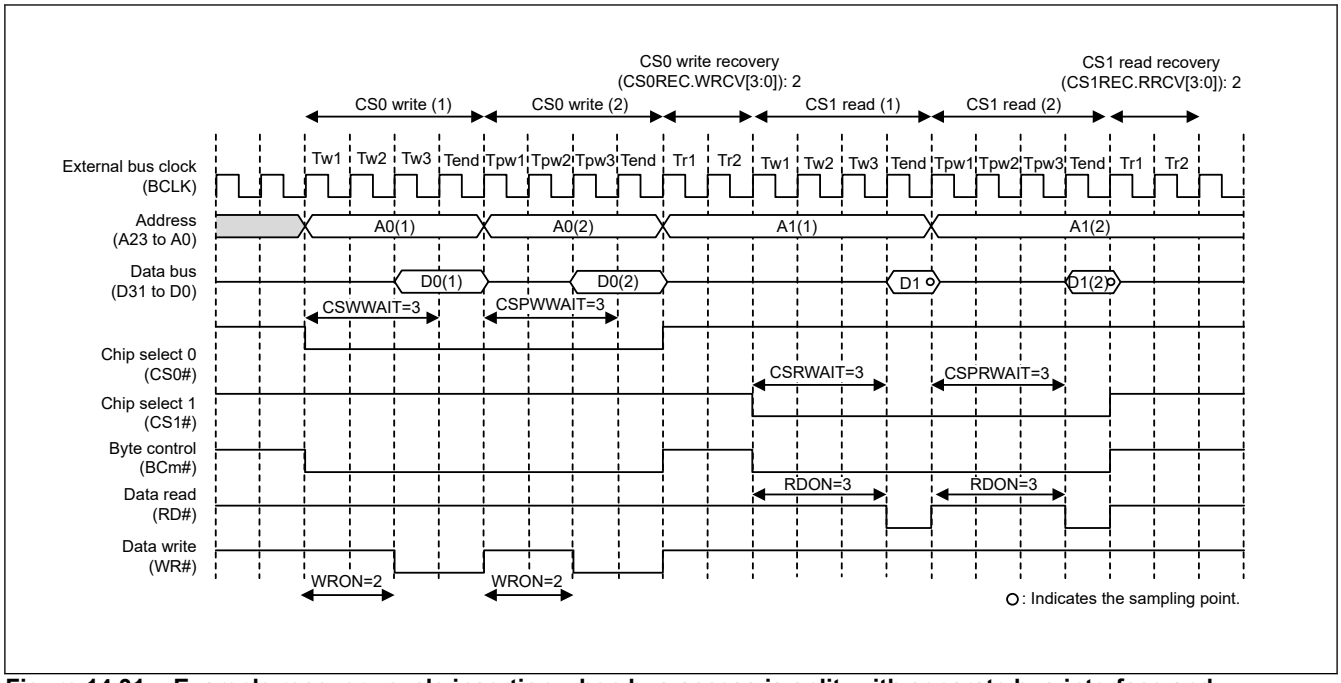

Figure 14.31 Example recovery cycle insertion when bus access is split, with separate bus interface and page access (m = 0 to 3)

Figure 14.32 shows an example operation when BCLK/2 is selected as the frequency division in the EBCLK Pin Output Select bit.

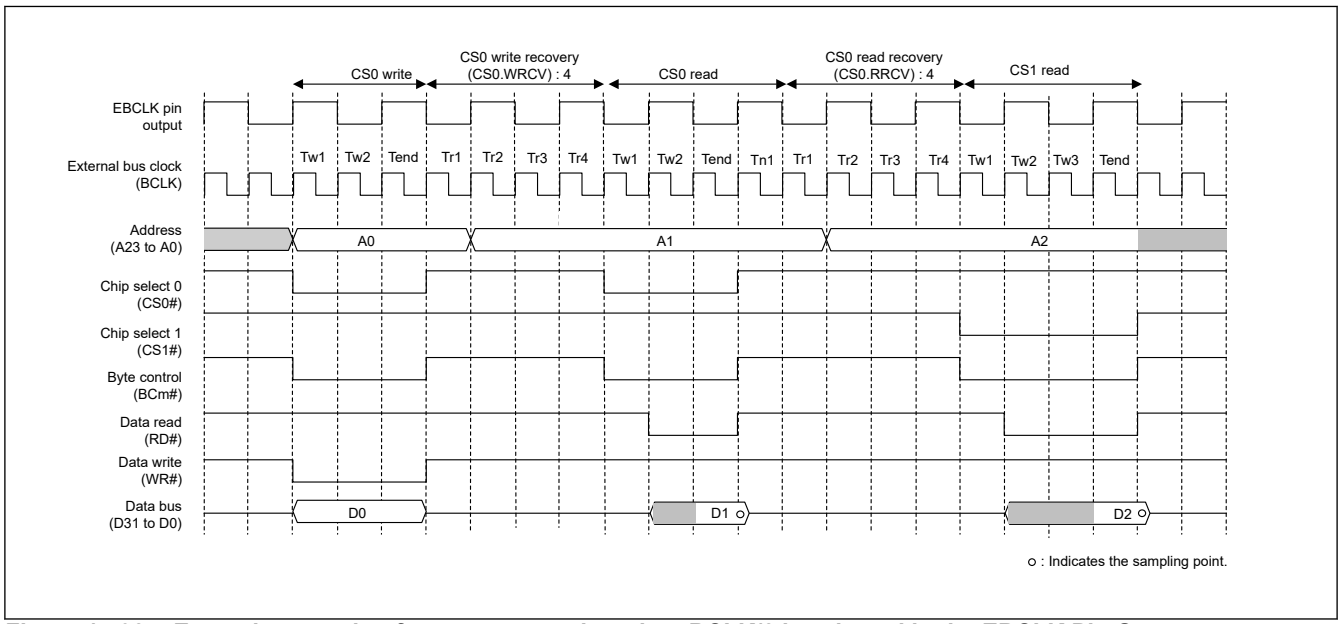

Figure 14.32 Example operation for recovery cycles when BCLK/2 is selected in the EBCLK Pin Output Select bit, with normal access through a separate bus interface (m = 0 to 3)

With the address/data multiplexed I/O interface, recovery cycles are inserted in the same way as that with the separate bus interface. Figure 14.33 and Figure 14.34 show examples of recovery cycle insertion with the address/data multiplexed I/O interface.

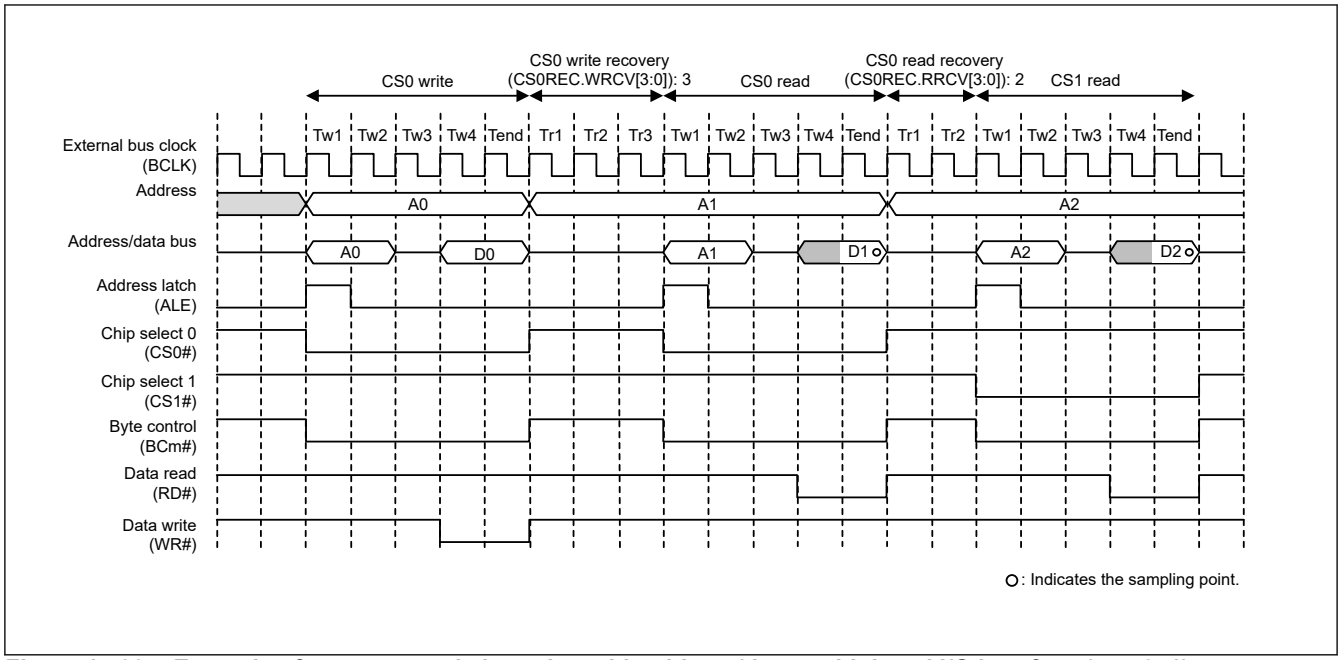

Figure 14.33 Example of recovery cycle insertion with address/data multiplexed I/O interface (m = 0, 1)

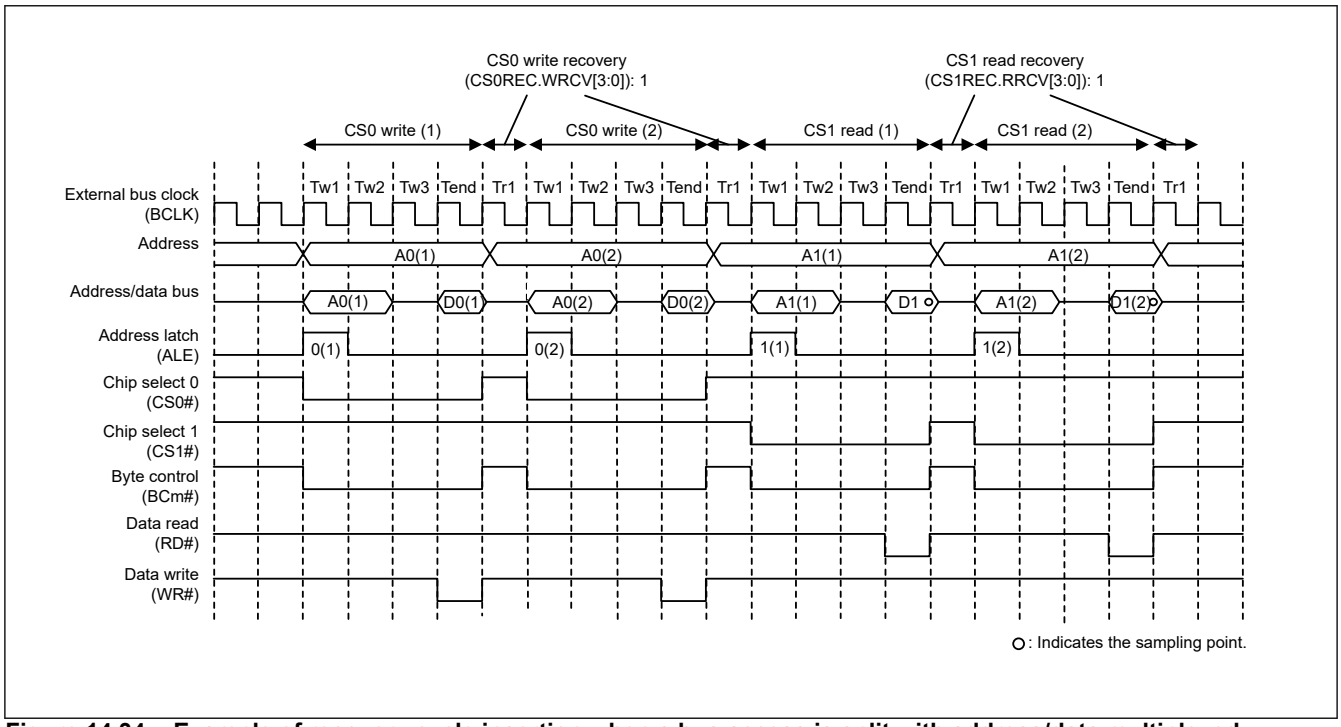

Figure 14.34 Example of recovery cycle insertion when a bus access is split with address/data multiplexed I/O interface (m = 0, 1)

14.5.5 No Access State

When no external address space is accessed, CSn, BCn, WRn, and RDn signals are high, ALE signal is low, and D31 to D00 are in the high-impedance state.

14.5.6 Write Buffer Function (External Bus)

In write access, the main bus is released by writing data to the write buffer before the access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

Figure 14.35 shows an example of operation when the write buffer function is in use. When this function is in use, if the next operation after an external write is an internal access, the internal access is executed in parallel with the external write, for example without waiting for completion of the latter operation.

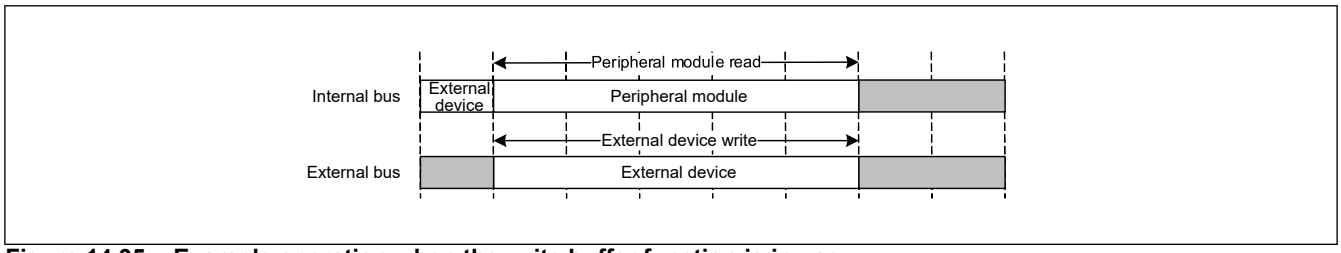

Figure 14.35 Example operation when the write buffer function is in use

14.5.7 Limitations

(1) Constraints on using separate bus interface

Table 14.31 lists the constraints that apply to bits in the CSn Wait Control Register 1 (CSnWCR1) and CSn Wait Control Register 2 (CSnWCR2) when normal and page accesses occur.

Even if the Page Read Access Enable bit or Page Write Access Enable bit in the CSn Mode Register is set to enable (CSnMOD.PRENB = 1 or CSnMOD.PWENB = 1), the first page access or access that does not fall within the scope of a page access is a normal access operation. Because of this, constraints on normal access must be satisfied.

Table 14.31 Constraints on normal access and page access

Limitations at the time of normal access		Limitations at the time of page access	
Reading	**Writing**	**Reading**	**Writing**
CSON[2:0] ≤ CSRWAIT RDON[2:0] ≤ CSRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSWWAIT WRON[2:0] ≤ CSWWAIT WDON[2:0] ≤CSWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON	CSON[2:0] ≤ CSPRWAIT RDON[2:0] ≤ CSPRWAIT CSON[2:0] ≤ RDON	1 ≤ WDON[2:0] CSON[2:0] ≤ CSPWWAIT WRON[2:0] ≤ CSPWWAIT WDON[2:0] ≤ CSPWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON

Note: When 2 or more external bus access cycles are required for a single transfer request from a bus master, and the recovery cycle insertion condition is satisfied, with page read access enabled (CSnMOD.PRENB = 1) or page write access enabled (CSnMOD.PWENB = 1), recovery cycles are not inserted between bus access cycles and are inserted only after the last bus access cycle of the transfer.

(2) Constraints on using address/data multiplexed bus interface

In the address/data multiplexed I/O space, page accesses are invalid. If a page access setting is specified, the setting is ignored and the normal read or write operation is performed. When the address/data multiplexed I/O interface is set, the BSIZE[1:0] bits in CSnCR should not be set to the 32-bit bus space. If set, the operation cannot be guaranteed.

Table 14.32 Constraints at the time of normal access

Reading	Writing
CSON[2:0] ≤ CSRWAIT RDON[2:0] ≤ CSRWAIT CSON[2:0] ≤ RDON AWAIT[1:0] + 2 ≤ RDON CSON[2:0] ≤ AWAIT	CSON[2:0] ≤ CSWWAIT WRON[2:0] ≤ CSWWAIT WDON[2:0] ≤ CSWWAIT WDOFF[2:0] ≤ CSWOFF WDON[2:0] ≤ WRON CSON[2:0] ≤ WRON AWAIT[1:0] + 2 ≤ WRON AWAIT[1:0] + 2 ≤ WDON CSON[2:0] ≤ AWAIT

(3) Constraint on pin multiplexing between the A00 and BC0 functions

Setting the single-write strobe mode is prohibited in the 8-bit bus space.

(4) Constraints when BCLK/2 is selected in the EBCLK Pin Output Select bit

When 1/2 cycle of BCLK is selected in the EBCLK Pin Output Select bit, the external bus access cycle starts on the rising edge of the EBCLK pin output. However, when 2 or more external bus access cycles are generated for a single transfer request from a bus master, the second or subsequent external bus access cycle can start on the falling edge of the EBCLK pin output, depending on the wait cycle settings. Set the registers appropriately for the specifications of connected devices.

(5) Instruction code constraints

You must fix the instruction code to little-endian order.

14.6 SDRAM Area Controller Operation

This section describes how the SDRAM area controller (SDRAMC) is enabled and the SDRAM bus width is set, followed by a description of the SDRAMC operations, including read, write, auto-refresh, self-refresh, initialization sequence, and mode register settings.

14.6.1 Enabling/Disabling SDRAM Access and Setting the SDRAM Bus Width

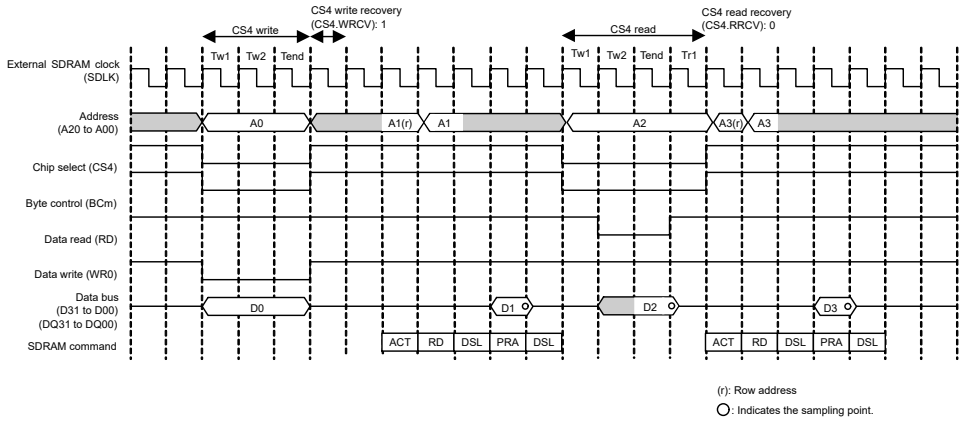
SDRAM access can be enabled or disabled using the SDC Control Register (SDCCR). The SDRAM bus width can also be set using SDCCR. The refresh operation is available even when the operation of the SDRAM address space is disabled, as long as self-refresh or auto-refresh is enabled.

14.6.2 No Access State

When no external address space is accessed, the SDCS, WE, RAS and CAS signals are high.

14.6.3 Insertion of Recovery Cycles

When access to the SDRAM area follows access to the CS area, data recovery cycles are inserted for the CS area controller (CSC). If the number of recovery cycles for the CSC is 0, the ACT command for the next SDRAM access is issued immediately after negation of CSn signal at the earliest. If the number of recovery cycles are not 0, the ACT command is issued 2 cycles after the specified recovery cycle period elapsed after negation of CSn signal at the earliest. Because no data conflicts can occur during access to the SDRAM area, there is no need to set data recovery cycles for the SDRAM (fixed to 0 cycle).



Note: When using SDRAM and CS Area access simultaneously.
- EBCLK cannot be used.
- CS0 to CS3 cannot be used.

Figure 14.36 Example of recovery timing for SDRAM access

14.6.4 Write Buffer Function

In write access, the main bus is released by writing data to the write buffer before access is complete. This allows the next round of bus access to start. However, if the next access is to an external address space or to a register of the external bus controller, it is suspended until the external bus operations already in progress are complete.

14.6.5 SDRAM Commands

To control the SDRAM, the SDRAMC issues a command for each bus cycle. Commands are defined by a combination of the SDCS, RAS, CAS, WE, CKE, and other signals. Table 14.33 lists the commands issued by the SDRAMC.

Table 14.33 SDRAMC commands

Name	Abbreviation	Command	SDCS	RAS	CAS	WE	CKE		BA1	BA0
							n-1	n		
DESL	DSL	Device deselect	H	x	x	x	H	x	x	x
ACTV	ACT	Bank active	L	L	H	H	H	x	V	V
READ	RD	Read	L	H	L	H	H	x	V	V
WRIT	WRI	Write	L	H	L	L	H	x	V	V
PALL	PRA	All bank precharge	L	L	H	L	H	x	x	x
REF	RFA	Auto-refresh	L	L	L	H	H	x	x	x
MRS	MRS	Mode register set	L	L	L	L	H	x	L	L
SELF	RFS	Self-refresh entry	L	L	L	H	H	L	x	x
SELFX	RFX	Self-refresh end	H	x	x	x	L	H	x	x

Note: H = High level, L = Low level, V = Valid, x = Don't care.
n = Command issue cycle, n – 1 = 1 cycle before the command is issued.

14.6.6 Conditions for Setting the SDRAMC Registers

The SDRAMC registers must only be modified when all the conditions shown in Table 14.34 are satisfied.

Table 14.34 Conditions for register modification

Function or operation	Registers	Conditions
Self-refresh	SDSELF*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is enabled (SDRFEN.RFEN = 1).
Auto-refresh	SDRFCR	Self-refresh operation is disabled (SDSELF.SFEN = 0)
	SDRFEN	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Self-refresh operation is disabled (SDSELF.SFEN = 0).
Initialization sequence	SDIR*1	SDICR is not set yet, and the same conditions as for SDICR modification are satisfied
	SDICR*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0).
Address register	SDADR	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0).
Timing register	SDTR	• Self-refresh operation is in progress (SDSELF.SFEN = 1) or • SDRAM access is disabled (SDCCR.EXENB = 0*2) • Auto-refresh operation is disabled (SDRFEN.RFEN = 0) • Self-refresh operation is disabled (SDSELF.SFEN = 0).
Mode register	SDMOD*1	• SDRAM access is disabled (SDCCR.EXENB = 0*2) • Self-refresh operation is disabled (SDSELF.SFEN = 0).

Note 1. Before modifying this register, confirm that all the status bits in SDSR are 0.
Note 2. After writing 0 to the EXENB bit, confirm that it is cleared to 0.

14.6.7 Self-Refresh

Transition to or recovery from self-refresh mode is controlled with the SDRAM Self-Refresh Control Register (SDSELF). Immediately before the transition to self-refresh mode, an auto-refresh operation is performed. In self-refresh mode, the CKE signal is low. Immediately after recovery from self-refresh mode, the auto-refresh cycle starts.

Figure 14.37 and Figure 14.38 show timing examples of the transition to and recovery from self-refresh mode.

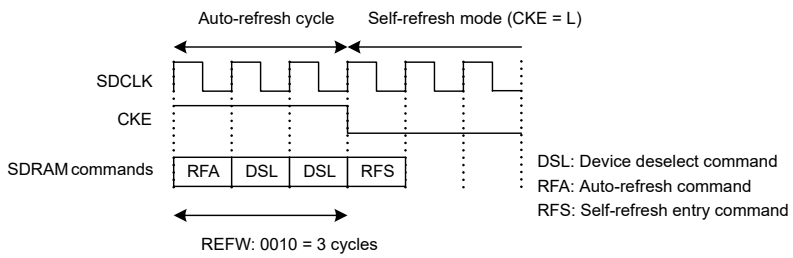


Figure 14.37 Example timing for transition to self-refresh mode when SDRFCR.REFW[3:0] = 0010 (3 cycles)

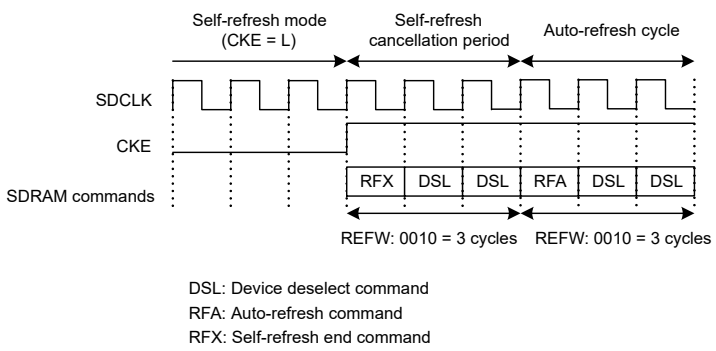

Figure 14.38 Example timing for recovery from self-refresh mode

(1) Self-refresh in Software Standby mode

When invoking self-refresh in Software Standby mode, first follow the procedure shown in section 14.6.12.2. Procedure for transitioning to and recovering from self-refresh mode. Next, set up the transition to Software Standby mode. In this mode, set the Output Port Enable bit (OPE) in the Standby Control Register (SBYCR) to 1 to hold the output state of the address bus and bus control signals.

After canceling Software Standby mode, follow the procedure shown in section 14.6.12.2. Procedure for transitioning to and recovering from self-refresh mode. For details on invoking and canceling Software Standby mode, see section 10, Low Power Modes.

(2) Self-refresh in Deep Software Standby mode

Deep Software Standby mode is invoked from within Software Standby mode. On this transition, the pin states remain unchanged. Therefore, invoking of self-refresh in Deep Software Standby mode can be handled the same as for Software Standby mode with one additional setting. You must also set the I/O Port Keep bit (IOKEEP) in the Deep Software Standby mode Control Register (DPSBYCR) to 1.

Because the SDRAMC is reset internally when Deep Software Standby mode is canceled, the SDRAM control registers must be set again. After canceling Software Standby mode, follow the procedure in this section to cancel self-refresh.

Figure 14.39 shows self-refresh timing in Deep Software Standby mode. For details on invoking and canceling Deep Software Standby mode, see section 10, Low Power Modes.

To cancel self-refresh mode:

1. Set DPSBYCR.IOKEEP to 1 to keep the CKE signal output low in Deep Software Standby mode.

2. Start the clock supply to the SDRAMC.
3. Set the SDRAM control registers (SDCMOD, SDADR, and SDTR) again. These registers were initialized by an internal reset on entering Deep Software Standby mode.
4. Enable an auto-refresh operation by setting SDRFEN.RFEN to 1.
5. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 1 to select self-refresh mode again.
6. Modify the port settings for the SDRAM interface.
7. Set SDCKOCR.SDCKOEN to 1 to start the clock supply to the SDRAM with the SDCLK pin.
8. Check that all the status bits in SDSR are cleared to 0 and set SDSELF.SFEN to 0 to cancel self-refresh mode.

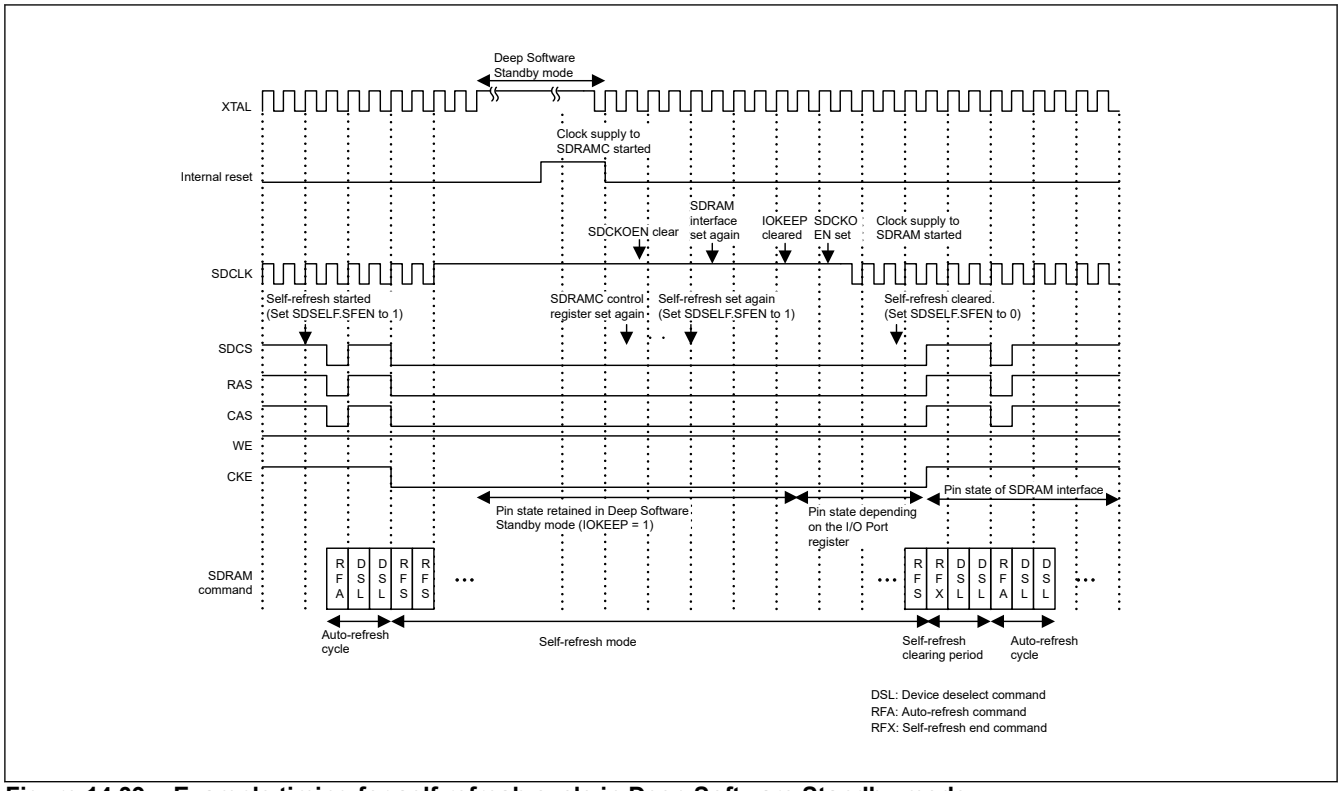

Figure 14.39 Example timing for self-refresh cycle in Deep Software Standby mode

14.6.8 Auto-Refresh

The auto-refresh cycle can be started by setting the Auto-Refresh Operation Enable bit (RFEN) in the SDRAM Auto-Refresh Control Register (SDRFEN) to 1. After the cycle starts, refresh requests are generated at fixed intervals determined by the refresh counter. However, because refresh requests are not accepted during read or write access, the auto-refresh cycle might be suspended.

If an SDRAM access and a refresh request are generated at the same time, the refresh request takes precedence. A CS area access and a refresh request can be made at the same if the SDCS, RAS, CAS, WE, and CKE signals, which are required for issuing the refresh command, are exclusively provided for SDRAM access.

The refresh counter is halted during a self-refresh operation. After recovery from the self-refresh mode, the auto-refresh cycle starts and the counter value is reset, resuming the counter operation.

Figure 14.40 shows a timing example of an auto-refresh cycle.

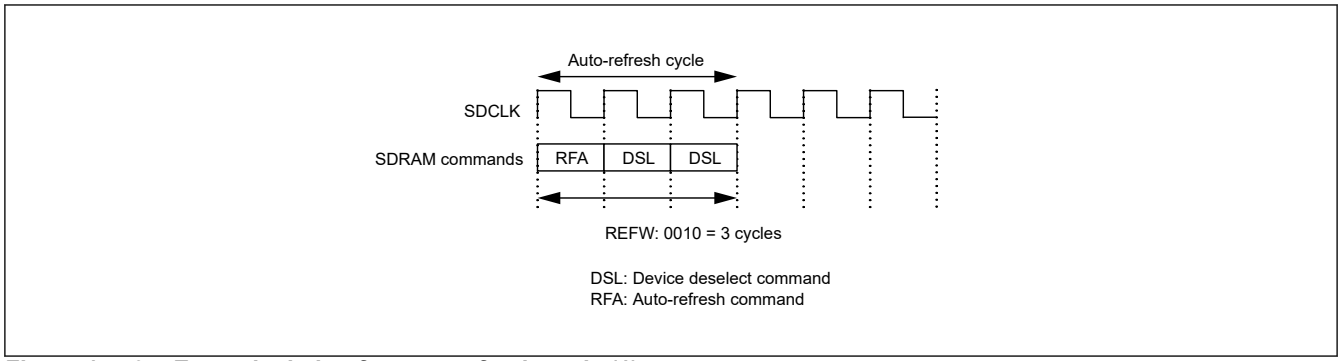

Figure 14.40 Example timing for auto-refresh cycle (1)

Figure 14.41 shows examples of operation when an auto-refresh request is generated during single access.

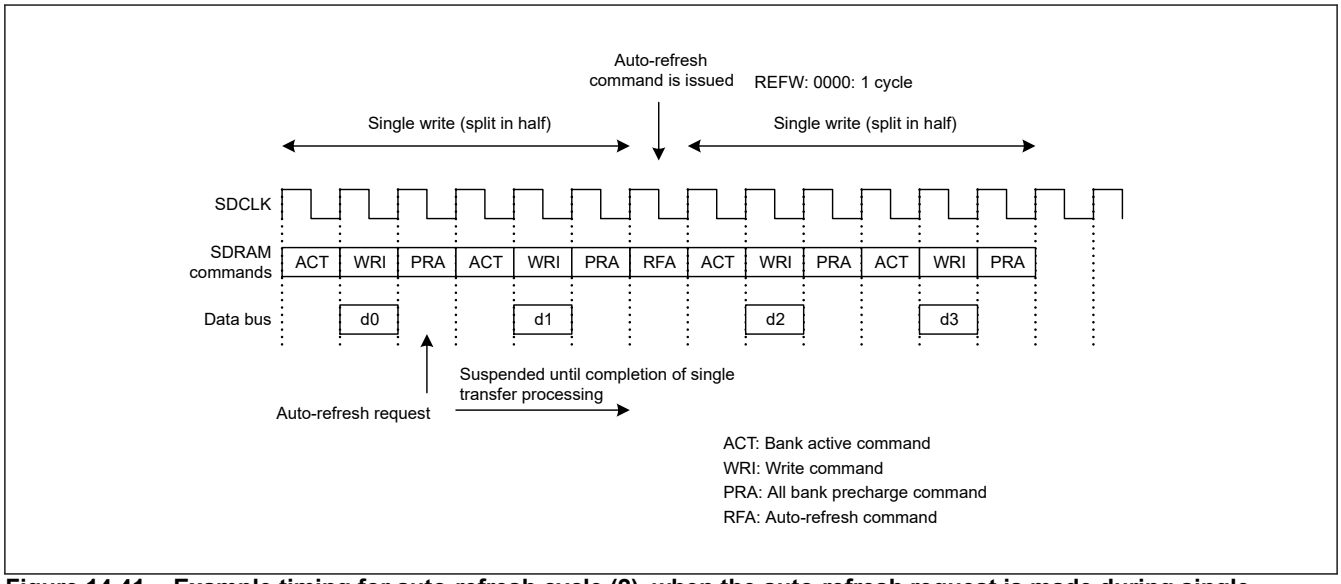

Figure 14.41 Example timing for auto-refresh cycle (2), when the auto-refresh request is made during single access

14.6.9 Initialization Sequencer

The SDRAMC has a sequencer to issue SDRAM initialization commands. After a reset, the initialization sequencer must be activated without fail. Operation is not guaranteed if the SDRAM is not initialized.

The SDRAM initialization sequencer issues an all-bank precharge command followed by auto-refresh commands n times, where n = 1 to 15. The SDRAM initialization sequence timing can be set using the SDRAM Initialization Register (SDIR). The SDRAM initialization sequence can be activated using the SDRAM Initialization Sequence Control Register (SDICR). These registers must be set only when the conditions listed in Table 14.34 are satisfied.

Figure 14.42 shows a timing example of the SDRAM initialization sequence. When the ARFC[3:0] bits in SDIR are set so that auto-refresh operation is performed two or more times, auto-refresh cycles are repeated in the initialization sequence accordingly.

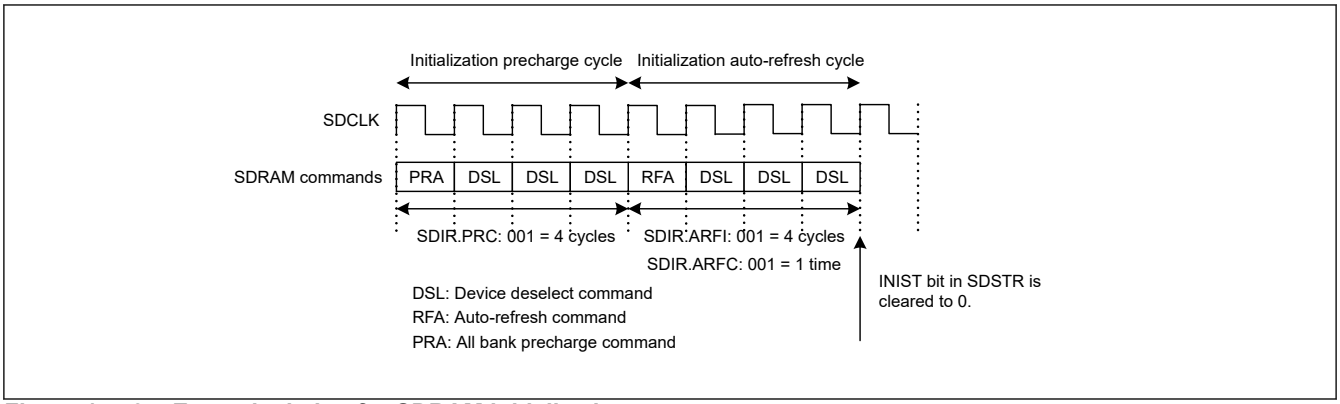

Figure 14.42 Example timing for SDRAM initialization sequence

14.6.10 Read/Write Access

The SDRAMC controls read/write access in the following two modes.

- Single access mode: the row address is output each time data is accessed
- Consecutive access mode: when the same row address is accessed consecutively, only the column address is changed after the row address is output, enabling quick data access.

Consecutive SDRAM access is enabled by setting the continuous access enable bit (BE) in SDRAM access mode register (SDAMOD) to 1. Consecutive SDRAM access targets burst transfers from bus master and transfers divided by the relationship between data size and SDRAM bus width.

Furthermore, setting the SDRAMC column-latency setting bits (CL[2:0]) in SDTR to 1 (CL = 1) in consecutive-access mode is prohibited, and operation is not guaranteed if this setting is made.

When the BE bit in SDAMOD is 0, single access is used in all transfers.

Note: WRAP (Wrapping Burst) of CPU does not result in consecutive SDRAM access.

14.6.10.1 Single Access

Figure 14.43 and Figure 14.44 show timing examples of single read and Figure 14.45 show timing examples of single write, respectively. The specific access timing depends on the SDRAM timing register (SDTR) settings. For details, see section 14.6.12.3. Timing register settings and access timing.

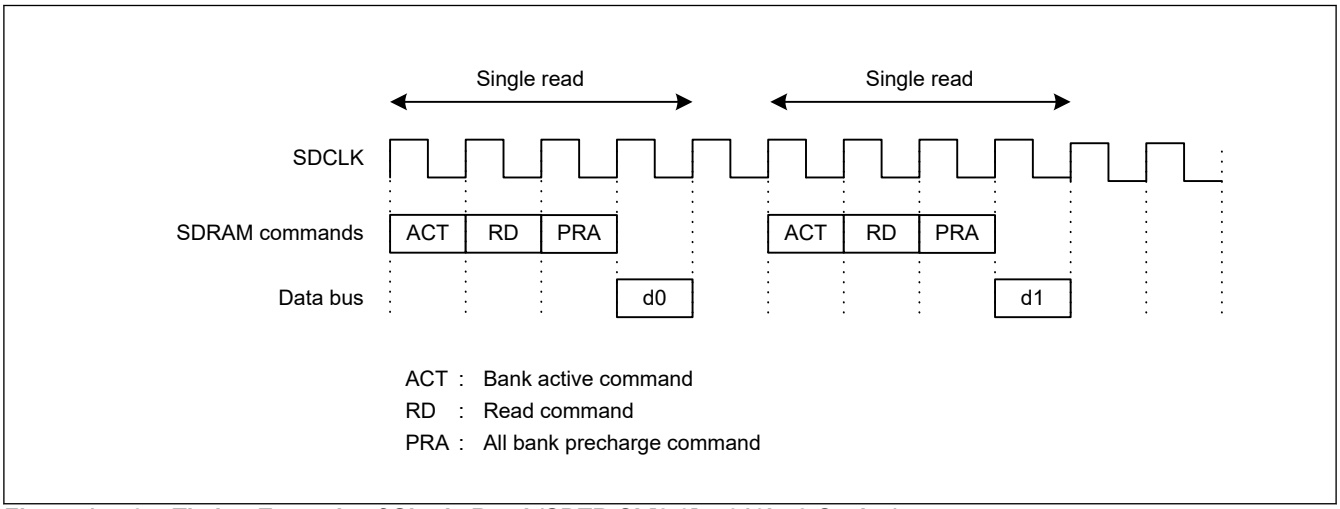

Figure 14.43 Timing Example of Single Read (SDTR.CL[2:0] = 010b: 2 Cycles)

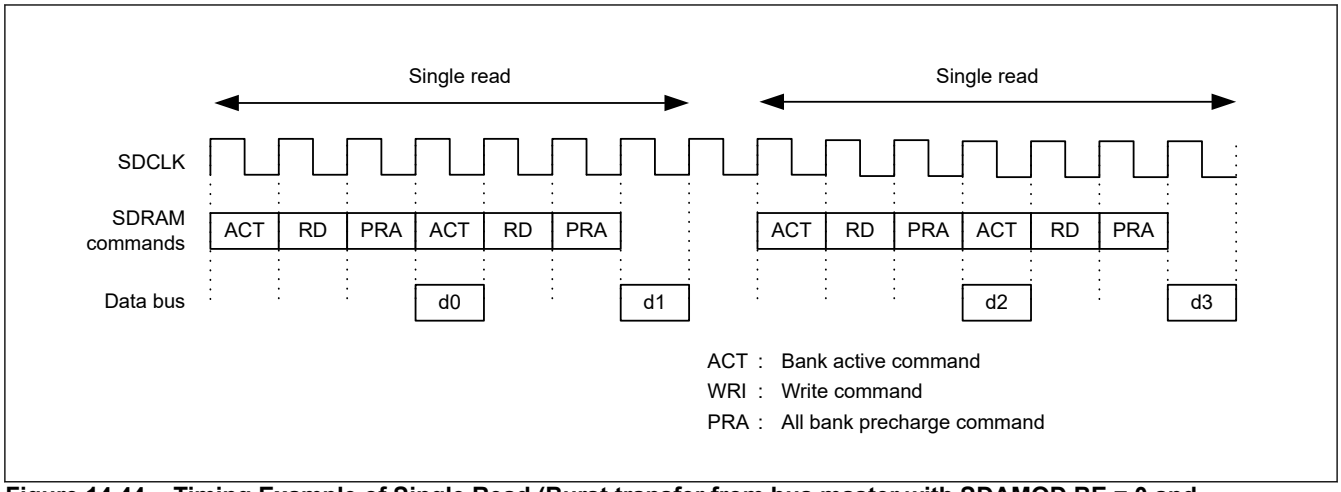

Figure 14.44 Timing Example of Single Read (Burst transfer from bus master with SDAMOD.BE = 0 and SDTR.CL[2:0] = 010b: 2 Cycles)

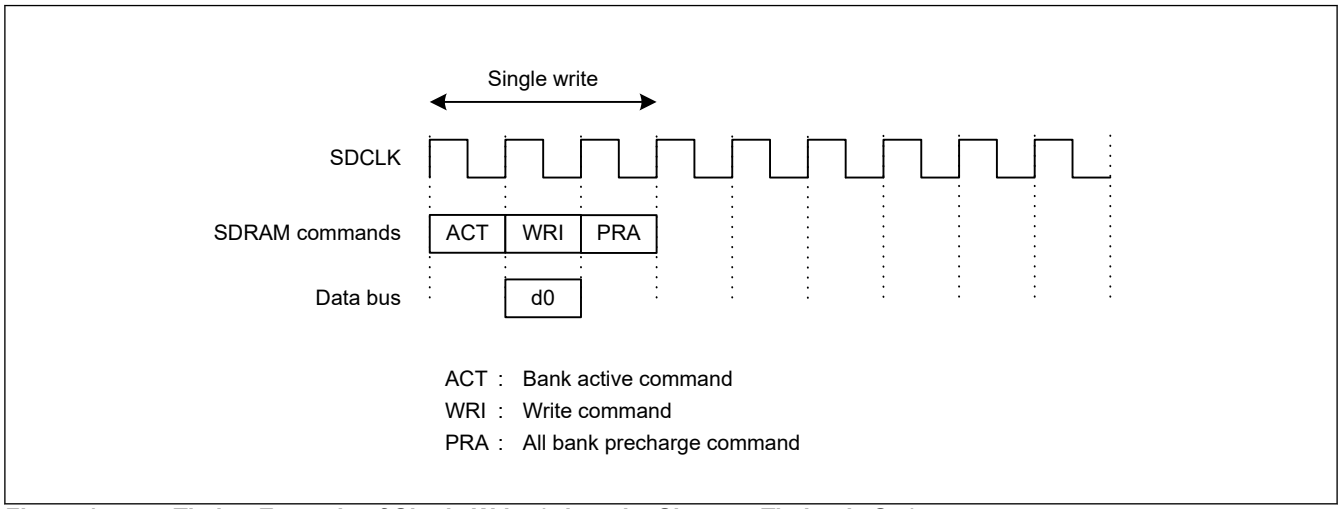

Figure 14.45 Timing Example of Single Write (when the Shortest Timing is Set)

14.6.10.2 Consecutive Access

Figure 14.46 and Figure 14.47 show timing examples of consecutive read and consecutive write for four data, respectively.

The specific access timing depends on the SDRAM timing register (SDTR) settings. For details, see section 14.6.12.3. Timing register settings and access timing.

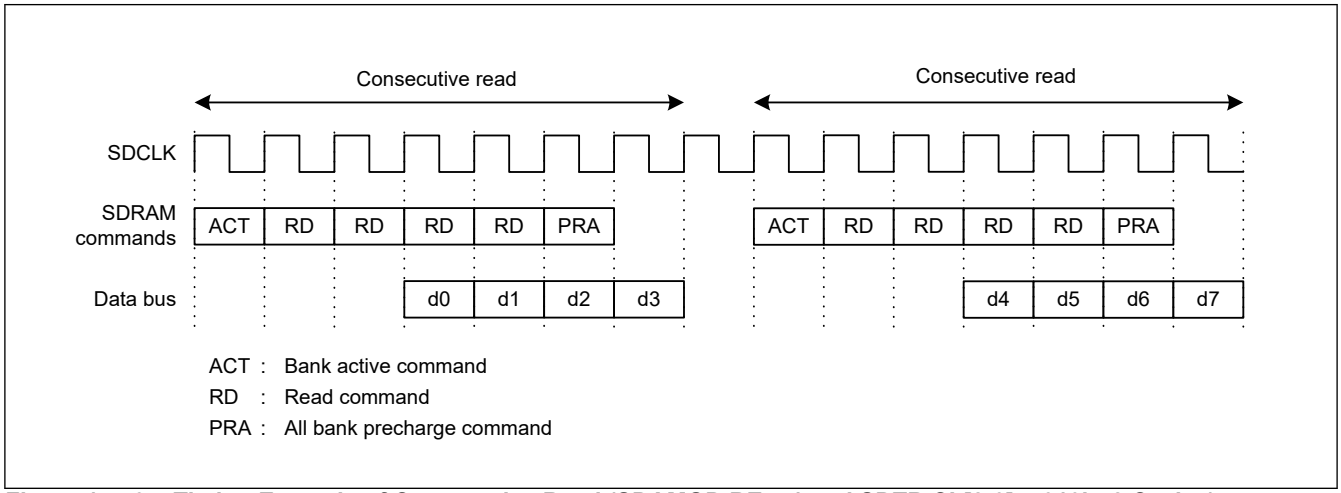

Figure 14.46 Timing Example of Consecutive Read (SDAMOD.BE = 1 and SDTR.CL[2:0] = 010b: 2 Cycles)

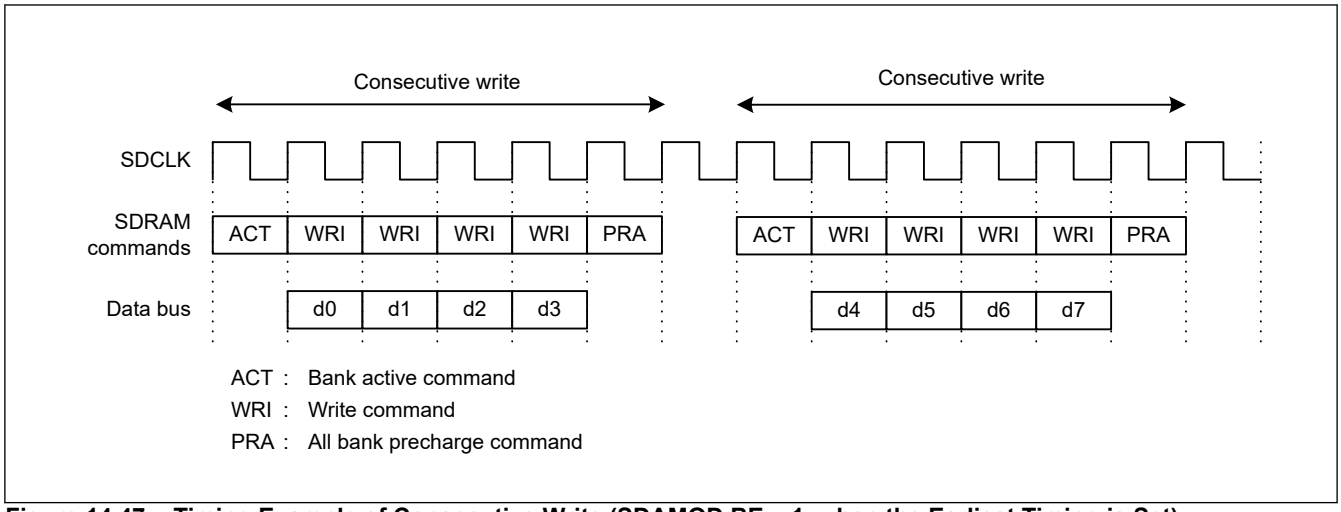

Figure 14.47 Timing Example of Consecutive Write (SDAMOD.BE = 1, when the Earliest Timing is Set)

14.6.11 Setting the Mode Register

Setting the SDRAM Mode Register (SDMOD) allows the mode register set command to be issued to the SDRAM and the value set in the MR[14:0] bits in SDMOD to be output to the lower bits of the address, specifically to A14 to A00 for 8-bit bus width, A15 to A01 for 16-bit bus width, and A16 to A2 for 32-bit bus width. Before setting the mode register, set the SDRAM Bus Width Select bits in the SDC Control Register (SDCCR.BSIZE[1:0]) to determine the data bus width of the SDRAM.

Figure 14.48 shows the mode register setting timing.

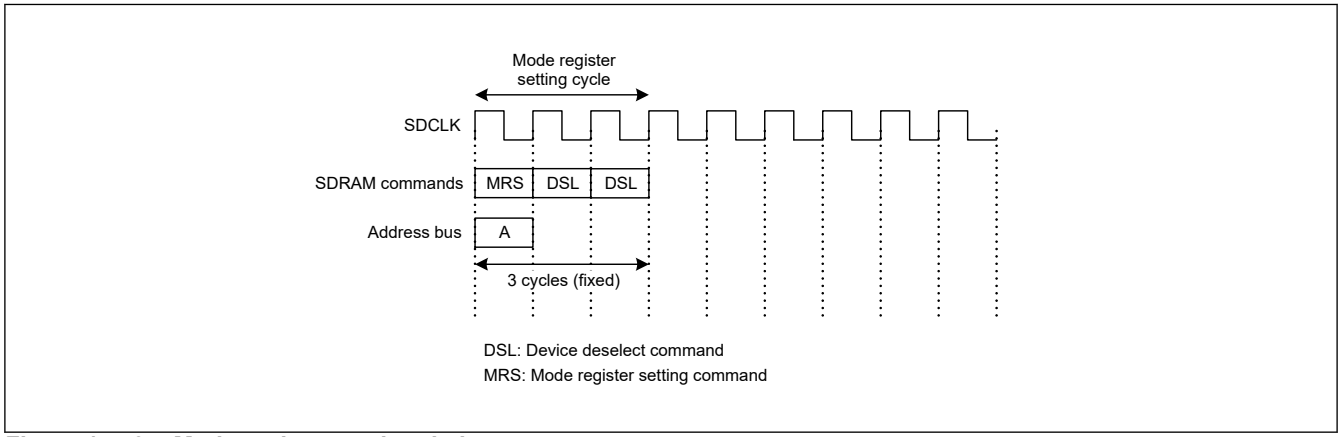

Figure 14.48 Mode register setting timing

14.6.12 SDRAMC Setting Examples

This section describes the following:

- SDRAMC setting procedure
- Timing register setting examples
- Procedure for transitioning to and recovering from self-refresh mode.

14.6.12.1 SDRAMC access procedure

Figure 14.49 shows the SDRAMC setting procedure.

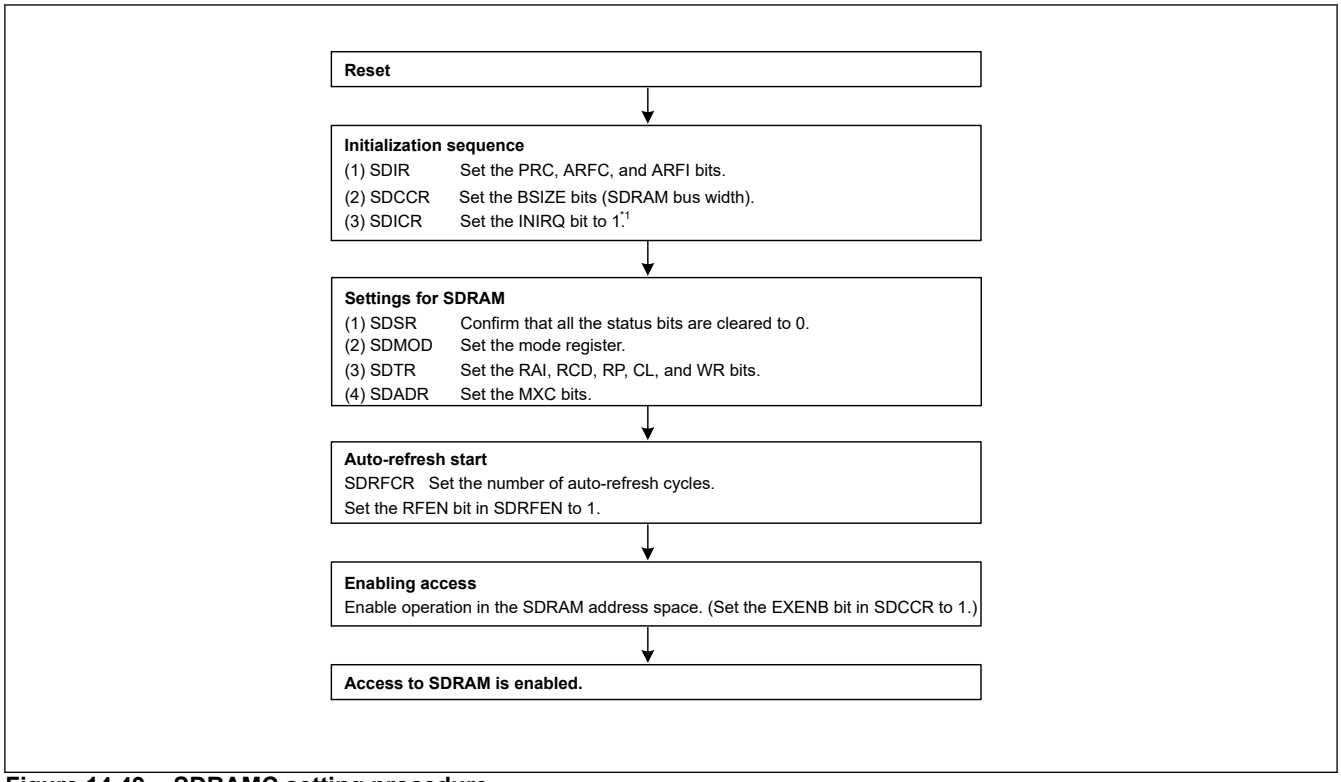

Figure 14.49 SDRAMC setting procedure

14.6.12.2 Procedure for transitioning to and recovering from self-refresh mode

Figure 14.50 shows the procedure for transitioning to and recovering from self-refresh mode.

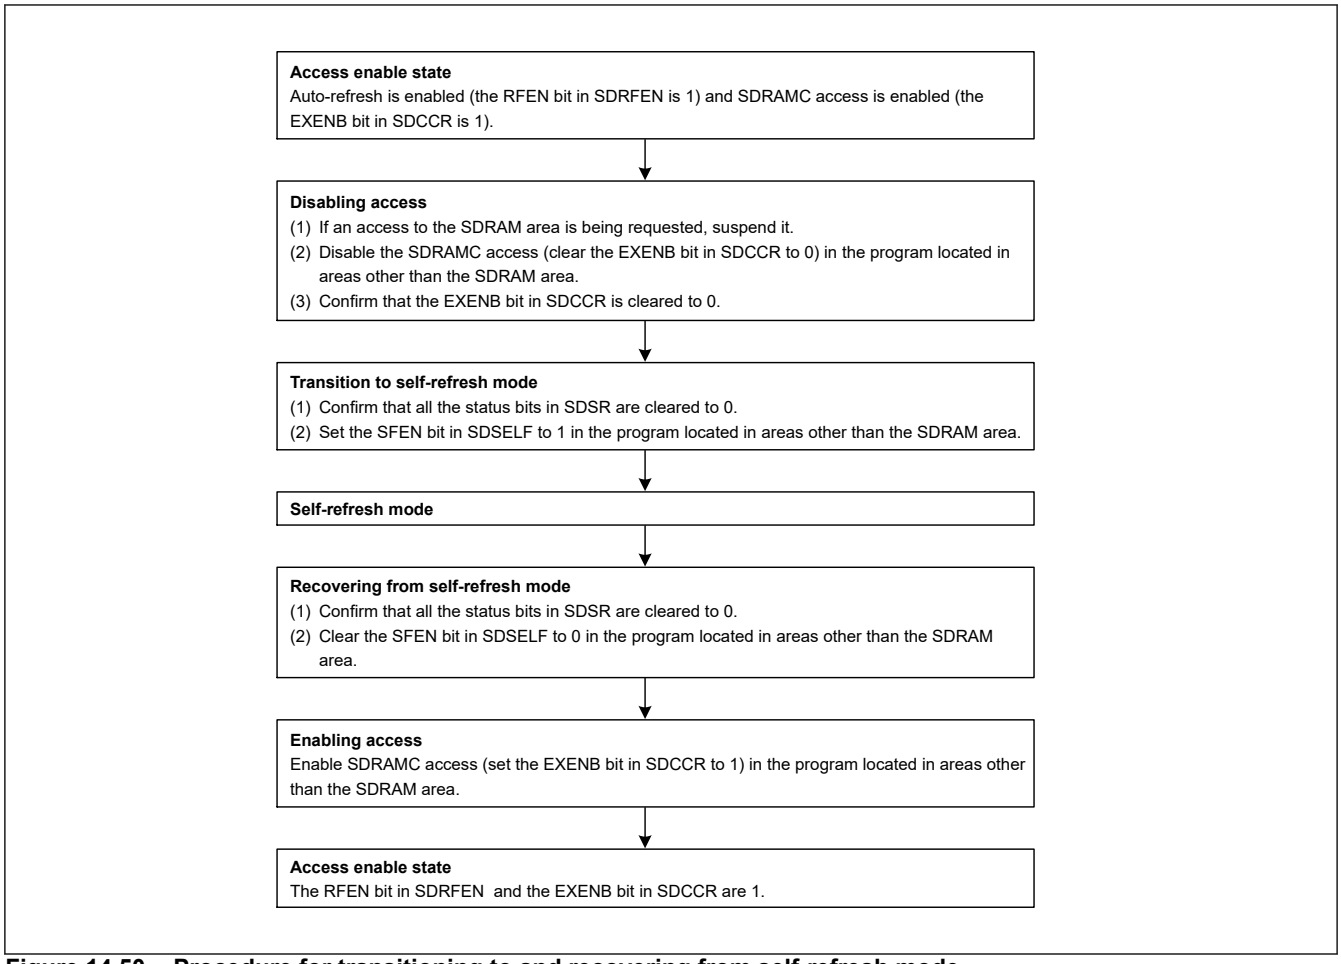

Figure 14.50 Procedure for transitioning to and recovering from self-refresh mode

Note: Self-refresh mode cannot be invoked during SDRAM access. SDRAM access must be disabled during both transition to and recovery from self-refresh mode. Follow the programming instructions shown in Figure 14.51.

Before transitioning to self-refresh mode, disable access to the SDRAM area.

During transition to self-refresh mode, self-refresh operation, and recovery from self-refresh mode, do not allow any operand access or instruction fetch, including prefetch to the SDRAM area, to be generated.

Figure 14.51 shows the procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode.

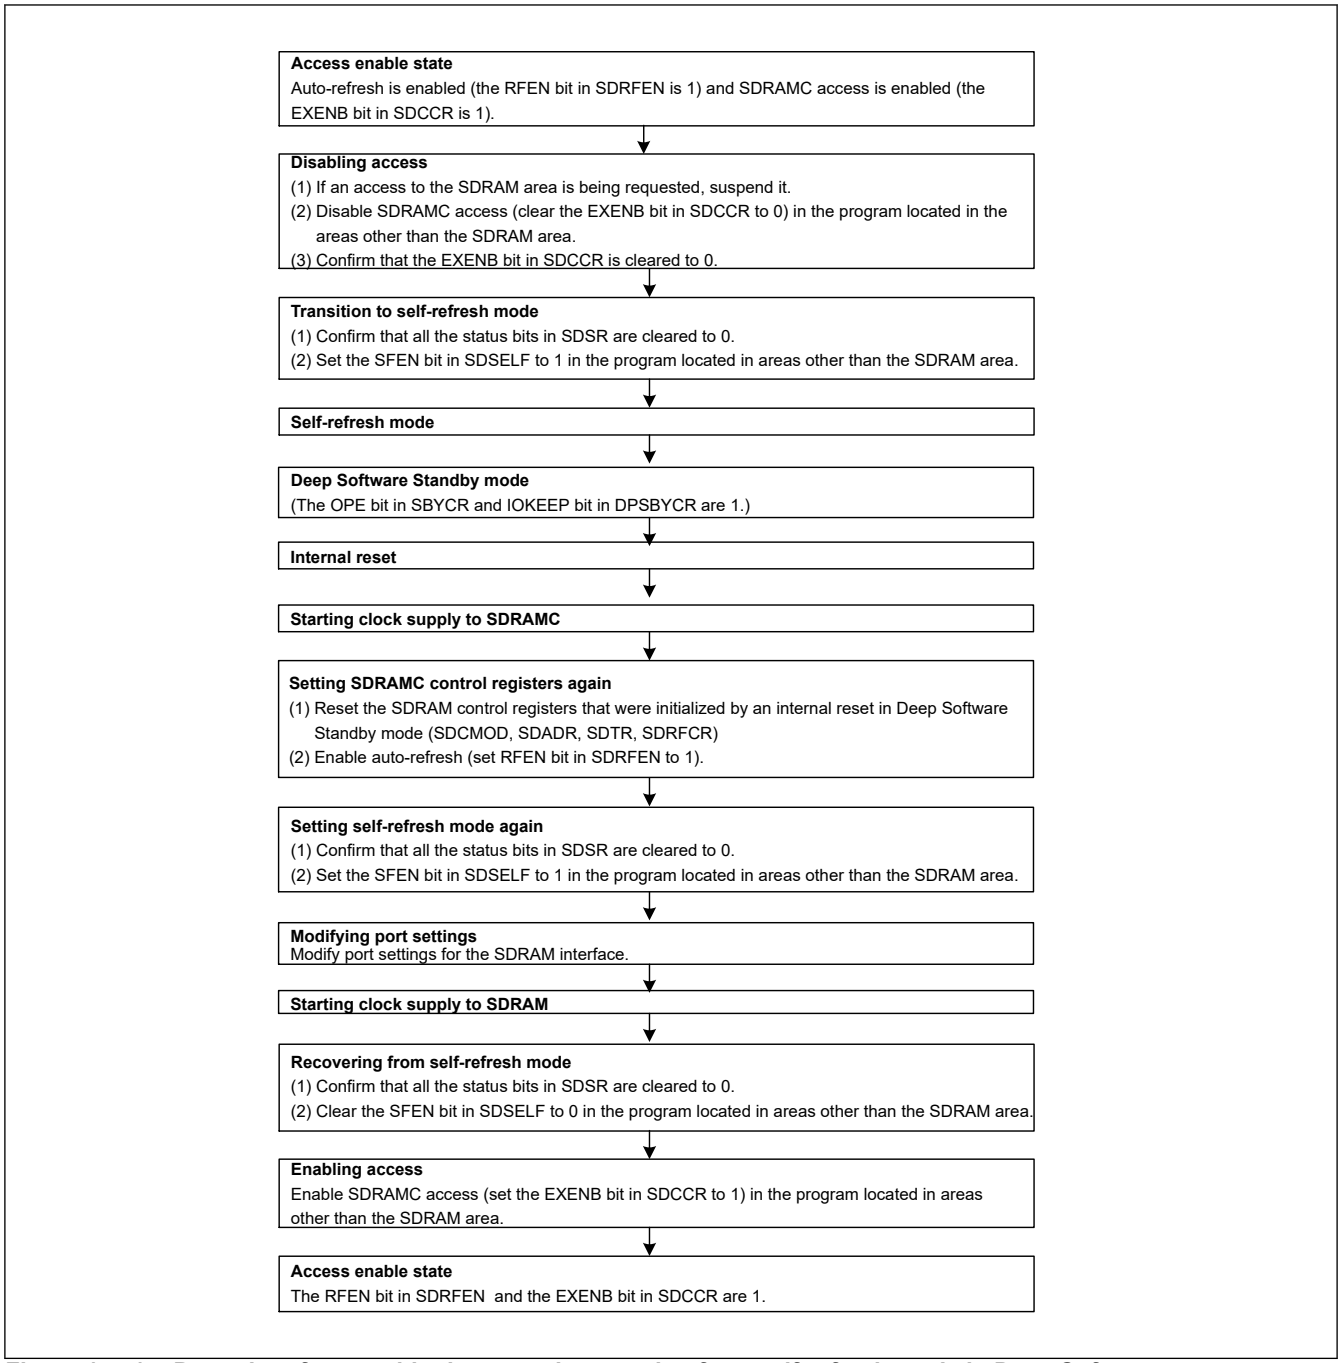

Figure 14.51 Procedure for transitioning to and recovering from self-refresh mode in Deep Software Standby mode

14.6.12.3 Timing register settings and access timing

This section describes the relationship between read and write timing and the settings in the SDRAM Timing Register (SDTR).

(1) Single read timing examples

Figure 14.52 to Figure 14.56 show the relationship between single read timing and the SDTR register settings. Table 14.35 shows the correspondence between the figures and the SDTR register settings.

During read access, the next bus access is enabled at the earliest 2 cycles after the read data becomes valid. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the read data becomes valid, as shown in Figure 14.56.

Table 14.35 Correspondence between timing figures and STDR register settings for single read timing

Figure number	RAI[2:0] settings	Number of cycles	RCD[1:0] settings	Number of cycles	RP[2:0] settings	Number of cycles	CL[2:0] settings	Number of cycles

(2) Single write timing examples

Figure 14.57 to Figure 14.61 show the relationship between the single write timing and the SDTR register settings. Table 14.36 shows the association between the figures and the SDTR register settings. During write access, the next bus access is enabled at the earliest 2 cycles after an all bank precharge command (PRA) is issued. However, if two or more accesses occur for one transfer request, the next bus access is enabled at the earliest 1 cycle after the PRA is issued, as shown in Figure 14.61.

Table 14.36 Association between timing figures and STDR register settings for single write timing

Figure number	RAI[2:0] settings	Number of cycles	RCD[1:0] settings	Number of cycles	RP[2:0] settings	Number of cycles	WR settings	Number of cycles

14.6.13 Address Multiplexing

In the SDRAM space, row and column addresses are multiplexed. The size of the shift in a row address must be specified in the Address Multiplex Select bits (SDADR.MXC[1:0]) in the SDRAM Address Register (SDADR). Additionally, in the SDRAM space, the address precharge-select command (Precharge-sel) is output to the upper bits of column addresses. Table 14.39 shows the relationship between the SDADR.MXC[1:0] settings and the shift amount.

Table 14.39 Address multiplexing (1 of 2)

MXC [1:0]	Shift amount	Data bus width	Address	Address pins external to the MCU															
				A16	A15	A14	A13	A12	A11	A10	A09	A08	A07	A06	A05	A04	A03	A02	A01	A00

		32bits	Row	—	A26	A25	A24	A23*1	A22	A21	A20	A19	A18	A17	A16	A15	A14	A13	A12	A11
			Column	—	A26	A25	A24	P	A11	A10	A09	A08	A07	A06	A05	A04	A03	A02	A01	A00

Note: P: Precharge-select command (Precharge-sel) is output.
Note 1. When the PALL command is issued, Precharge-sel = 1 (high) is output. When the Active command is issued, the associated address is output.

14.6.14 Example SDRAM Connections

14.6.14.1 32-Bit Bus Space

Table 14.40 shows an example for connecting to two 512-Mb SDRAMs with 13-bit row address, 10-bit column address and 16-bit bus.

Table 14.40 SDRAM connection example (512-Mb × 2, with 16-bit bus) (1 of 2)

This MCU (shift amount: 10 bits)					SDRAM (512 Mb, with 16-bit bus)			
No.	Pin name	Row	Column		Pin name	BA/AP	Row	Column
1	RAS			→	RAS#			
2	CAS			→	CAS#			
3	WE			→	WE#			
4	CKE			→	CKE			
5	SDCS			→	CS#			
6	SDCLK			→	CLK			
7	DQM1			→	UDQM			
8	DQM0			→	LDQM

25	DQ07 to DQ00			↔	DQ[7:0]			

14.6.15 Constraints

(1) Constraints on using separate bus interface

In Software Standby and Deep Software Standby modes, auto-refresh operation is not available because the clock supply to the SDRAMC is stopped. To retain the data in the SDRAM when the SDRAM is externally connected, use the self-refresh function. For the procedure for transitioning to and recovering from self-refresh mode, see section 14.6.7. Self-Refresh.

(2) Setting the SDRAM Timing Register

Set the RAI[2:0] bits in the SDRAM Timing Register (SDTR) to a value less than or equal to the sum of the row column latency (SDTR.RCD[1:0]) and column latency (SDTR.CL[2:0]) settings. Operation is not guaranteed if this condition is not satisfied.

(3) Instruction code constraint

It should be fixed the instruction code to little-endian order.

(4) Consecutive-Access Mode

For consecutive access mode, the setting CL = 1 is prohibited, and operation is not guaranteed if this setting is made.

14.7 Bus Error Monitoring Section

This monitoring system monitors each individual area, and whenever it detects an error, it returns the error to the requesting master using the AHB-Lite error response protocol.

14.7.1 Bus Error Types

The following types of errors can occur on each bus:

- Master Security Attribution Unit error
- Bus master MPU error.
- Illegal address access.
- Slave TrustZone Filter error
- Bus error transmitted from each slave module.

Table 14.49 lists the address ranges where access leads to illegal address access errors. The reserved area in the slave does not trigger an illegal address access error. For more information on the bus master MPU, see section 15, Memory Protection Unit (MPU).

14.7.2 Operations When a Bus Error Occurs

In the following bufferable write access, the write response can be given from the midpoint in the following cases.

1. CEU accesses ECBI.
2. CPU M-AXI accesses ECBI, FLBI, ROMBI and STBYRAMBI.
3. CPU P-AHB accesses an accessible area.
4. CPU P-AHB accesses illegal address.
5. DMA accesses ECBI, EOBI, FLBI, PABI, PBBI, SRAM0BI, SRAM1BI, DBGCBI and SYSCBI.

If an access violation occurs due to these bufferable write accesses, an error response may not be returned to the bus master.

When a bufferable write access error that does not return an error response is detected, access is blocked and 1 is set in the bit corresponding to the error occurrence location of MBWERRSTAT or SBWERRSTAT. Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.BWERROAD. Since MBWERRSTAT or SBWERRSTAT are held until reset other than Bus and Memory Error Reset or cleared by MBWERRCLR or SBWERRCLR, they can be confirmed in the BusFault Handler or Interrupt handler. Error address information and Error R/W information is not remain with a bufferable write access. If error information is required, please set the BUS Master to Non-bufferable access.

A bufferable write access error can occur in the following cases. In this case, BUSnERRSTAT is not set and NMI request or Reset request is not generated according to the setting of the BUSOAD.ILERROAD or BUSOAD.SLERROAD.

1. CEU accesses ECBI and a slave error or slave TrustZone Filter error occurs.
2. CPU M-AXI accesses ECBI, FLBI, ROMBI and STBYRAMBI and a slave error or slave TrustZone Filter error occurs.
3. CPU P-AHB accesses an accessible area and a slave error or slave TrustZone Filter error occurs.
4. CPU P-AHB accesses illegal address and a illegal address access error occurs.
5. DMA accesses ECBI, EOBI, FLBI, PABI, PBBI, SRAM0BI, SRAM1BI, DBGCBI and SYSCBI and a slave error or slave TrustZone Filter error occurs.

Table 14.46 Bus error notice method for Bufferable write access

	DAP	CPU	DMAC/DTC	EDMAC	DRW0/1	MIPI	GLCDC0/1, CEU
BUSOAD.BWERROAD = 0	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI	BUSERR.NMI
BUSOAD.BWERROAD = 1	Reset	Reset	Reset	Reset	Reset	Reset	Reset

When a bus error occurs for an access other than the bufferable write, error access is blocked, and error operations determine by OAD setting and the bus master are performed. Table 14.47 shows OAD setting corresponding to the each error. Table 14.48 shows how to notify when a bus error occurs.

When OAD setting is NMI.

If CPU is the bus master, it only returns an error response to bus master. CPU generates BusFault when it receives error response. If master other than CPU is the bus master, error response is returned to the master and NMI is generated.

When OAD setting is Reset.

Error response is returned to the bus master and reset request is generated.

Table 14.47 OAD setting corresponding to the each error

Error type	OAD bit
MSAU Error	MSAOAD.OAD
MPU Error	MMPUOAD.OAD
Illgal access Error	BUSOAD.ILERROAD
Slave Bus Error	BUSOAD.SLERROAD
Slave TrustZone Filter error	BUSOAD.SLERROAD

Table 14.48 Bus error notice method for Non-bufferable write access

OAD setting	DAP*2	CPU*1	DMAC/DTC	EDMAC	DRW0/1	MIPI	GLCDC0/1, CEU
NMI	Error response only	CPU.BusFault	DMA0_TRANSERR*1 BUSERR.NMI	ETHER_EINT*1 BUSERR.NMI	DRW_IRQ*1 BUSERR.NMI	DSI_SEQ0*1 / DSI_SEQ1*1 / DSI_RCV*1 BUSERR.NMI	BUSERR.NMI
Reset	Error response only	Reset	Reset	Reset	Reset	Reset	Reset

Note 1. DMAC/DTC, EDMAC, DRW and MIPI can issue interrupt when it receives error response. This NMI is output to ICU and transmitted from ICU to CPU.
Note 2. Only when the bus master is DAP, only an error response is returned regardless of the BUSOAD.ILERROAD or the BUSOAD.SLERROAD settings, and NMI and RESET requests are not generated.

Figure 14.68 shows the OAD setting flow after reset. During this register setting, stop the Bus Master.

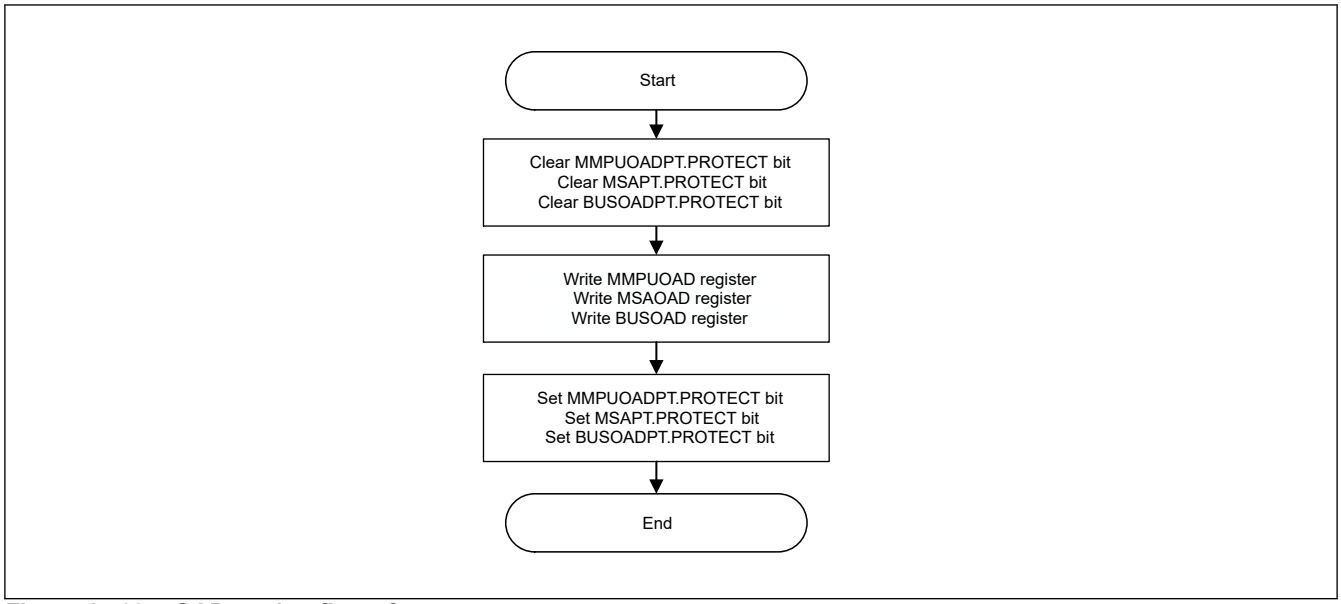

Figure 14.68 OAD setting flow after reset

See for details of section 15.3.1.41. MMPUOADPT : MMPU Operation After Detection Protect Register and section 15.3.1.40. MMPUOAD : MMPU Operation After Detection Register.

See for details of section 43.9.15. MSAPT : Master Security Attribution Protect Register and section 43.9.14. MSAOAD : Master Security Attribution Operation After Detection Register.

(1) Master Security Attribution Unit Error

The bus master of other than CPU and DAP has MSAU to block access to Secure alias address from Non-secure masters. The CPU does not have MSAU since it has IDAU and SAU. When MSAU Error is detected, an Error response is returned to the Master. At the same time, store the address when MSAU Error occurs in BMSAnERRADD (n = 4 to 9), store the RW information when MSAU Error occurs in BMSAnERRRW (n = 4 to 9), set 1 to MSERRSTAT bit of BUSnERRSTAT (n = 1 to 12). Furthermore, NMI request or Reset request is generated according to the setting of the MSAOAD.OAD. Since BMSAnERRADD (n = 4 to 9), BMSAnERRRW (n = 4 to 9), BUSnERRSTAT (n = 1 to 12) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 12), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first MSAU Error after reset or clearing BUSnERRSTAT (n = 1 to 12) .MSERRSTAT bit by BUSnERRCLR (n = 1 to 12).

(2) Bus Master MPU Error

The bus master of other than CPU and DAP has Master-MPU for access control of the set address area.The CPU does not have Master-MPU since it has Arm MPU. When Master-MPU Error is detected, an Error response is returned to the Master. At the same time, store the address when Master-MPU Error occurs in BUSnERRADD (n = 4 to 9), store the RW information when Master-MPU Error occurs in BUSnERRRW (n = 4 to 9), set 1 to MMERRSTAT bit of BUSnERRSTAT (n = 1 to 12). Furthermore, NMI request or Reset request is generated according to the setting of the MMPUOAD.OAD. Since BUSnERRADD (n = 4 to 9), BUSnERRRW (n = 4 to 9), BUSnERRSTAT (n = 1 to 12) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 12), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first Master-MPU Error after reset or clearing BUSnERRSTAT (n = 1 to 12) .MMERRSTAT bit by BUSnERRCLR (n = 1 to 12).

(3) Illegal Access Error

According to section 14.7.3. Conditions Leading to Illegal Address Access Errors, Illegal Access Error occurs. When Illegal Access Error is detected, an Error response is returned to the Master. When a master other than DAP caused Illigal address access error, store the Illegall Access Error occurresce address in BUSnERRADD (n = 4 to 9), store the Illegal Access Error occurrence RW information in BUSnERRRW (n = 4 to 9), set 1 to ILERRSTAT bit of BUSnERRSTAT (n = 1 to 12). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.ILERROAD. Since BUSnERRADD (n = 4 to 9), BUSnERRRW (n = 4 to 9), BUSnERRSTAT (n = 1 to 12) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 12), they can be confirmed in the BusFault Handler or the NMI handler. NMI request is generated only at the first Illegal Error after reset or clearing BUSnERRSTAT (n = 1 to 12).ILERRSTAT bit by BUSnERRCLR (n = 1 to 12).

(4) Slave TrustZone Filter Error

When Slave TrustZone Filter Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave TrustZone Filter error, store the Slave TrustZone Filter error occurrence address in BMSAnERRADD (n = 4 to 9), store the Slave TrustZone Filter error occurrence RW information in BMSAnERRRW (n = 4 to 9), set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 12). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.SLERROAD. Since BMSAnERRADD (n = 4 to 9), BMSAnERRRW (n = 4 to 9) and BUSnERRSTAT (n = 1 to 12) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 12), they can be confirmed in the NMI handler or after reset. NMI request is generated only at the first Slave TrustZone Filter Error after reset or clearing BUSnERRSTAT (n = 1 to 12).SLERRSTAT bit by BUSnERRCLR (n = 1 to 12).

(5) Slave Bus Error

Slave Bus Error occurs in the slave. When Slave Bus Error is detected, an Error response is returned to the Master. When a master other than DAP caused Slave Bus error, store the Slave Bus error occurrence address in BUSnERRADD (n = 4 to 9), store the Slave Bus error Occurrence RW informationin BUSnERRRW (n = 4 to 9), set 1 to SLERRSTAT bit of BUSnERRSTAT (n = 1 to 12). Furthermore, NMI request or Reset request is generated according to the setting of the BUSOAD.SLERROAD. Since BUSnERRADD (n = 4 to 9), BUSnERRRW (n = 4 to 9), BUSnERRSTAT (n = 1 to 12) are held until reset other than Bus error reset and Common memory error reset, or cleared by BUSnERRCLR (n = 1 to 12), they can be confirmed in the BusFault Handler or NMI handler. NMI request is generated only at the first Slave-Bus Error after reset or clearing BUSnERRSTAT (n = 1 to 12).SLERRSTAT bit by BUSnERRCLR (n = 1 to 12).

14.7.3 Conditions Leading to Illegal Address Access Errors

Illegal address access error by bus access occurs in the address space shown in Table 14.49.

Table 14.49 Conditions leading to illegal address access errors (1 of 3)

Address		SLAVE bus	MASTER bus

0xA000_0000	0xFFFF_FFFF	Reserved	E	N/A	E	E	E	E

Note: “E” : A bus error is occurred.
“N/A“ : Transfer does not occur.
“—“ : A bus error has not occurred. Even if there is reserved area, a bus error has not occurred.
Do not access the reserved area in FLB, S0B and S1B. If accessed, a slave TZF error may occur.
Note 1. If CPU issues bufferable write accesses, a bufferable write access error occur instead of an illegal address access error.

14.7.4 Timeout

As for some peripheral module, a timeout error can occur in the module-stop function.

When there is no response from the slave for a certain time period, a timeout error is detected.

Timeout error is returned to the request master by Error response of the AHB-Lite protocol.

15. Memory Protection Unit (MPU)

15.1 Overview

All bus masters have Memory Protection Units (MPUs).

Table 15.1 lists the MPU specifications, and Table 15.2 shows the behavior on detection of each MPU error.

Table 15.1 MPU specifications

Classification	Module/Function	Specifications
Memory protection	Arm MPU	Memory protection function for the CPU: • CPU: Secure MPU 8 regions and Non-secure MPU 8 regions
	Bus master MPU	Memory protection function for each bus master except for the CPU: • DMAC (DMAC/DTC): 8 regions • EDMAC (Ether-DMAC): 4 regions • GLCDC (GLCDC0/GLCDC1): 2 regions • DRW (DRW0/DRW1): 3 regions • MIPI DSI:1 region • CEU: 2 regions

Table 15.2 Behavior on MPU Error detection

MPU type	Access permissions setting	Boundary address setting minimum unit	Error response for the MPU error notification	Bus access at error detection	Hold the information of error access
Arm MPU	Read access Write access Execution	32 bytes	Supported*1	• Incorrectly write access • Incorrectly read access	Hold in CPU
Bus master MPU	Read access Write access Privileged access (DMAC/DTC only)	DMAC: 32 bytes EDMAC: 32 bytes GLCDC: 1 KB DRW: 1 KB MIPI DSI: 4 KB CEU: 4 KB	Supported	• Write access ignored • Read access is read as 0	Hold

Note 1. A privileged DAP request through the unprivileged debug extension mechanism is demoted to an unprivileged access and is subject to MPU checks. Both privileged and unprivileged requests are subject to MPU checks.

For information on error access for the Arm MPU, see section 15.4. References. For information on error access for other MPUs, see section 15.3.1. Register Descriptions and section 14.7. Bus Error Monitoring Section.

15.2 Arm MPU

The Arm MPU provides full support for:

- CPU: 8 secure regions and 8 non-secure regions
- Access permissions
- Export of memory attributes to the system

Arm MPU mismatches and permission violations invoke the programmable-priority MemManage fault (Hard Fault) handler. For details, see section 15.4. References.

15.3 Bus master MPU

The bus master MPU monitors the addresses accessed by the bus masters in the entire address space (0x0000_0000 to 0xFFFF_FFFF). The access control information can be set up to:

- 8 regions in DMAC/DTC
- 4 regions in EDMAC
- 2 regions in GLCDC
- 3 regions in DRW

- 1 region in MIPI DSI
- 2 regions in CEU

The bus master MPU monitors access to each region based on these settings.

If accesses violate the access permissions that are configured in bus master MPU, the bus master MPU returns an error response. For information on error access, see section 15.3.1. Register Descriptions and section 14.7.2. Operations When a Bus Error Occurs.

Table 15.3 lists the specifications of the bus master MPU.

Table 15.3 Bus master MPU specifications

Parameter	Description
Master groups	(Group name: Corresponding bus master) • DMAC: DMAC/DTC • EDMAC: Ether-DMAC • GLCDC: GLCDC0/GLCDC1 • DRW: DRW0/DRW1 • MIPI DSI: MIPI DSI • CEU: CEU
Protected regions	0x0000_0000 to 0xFFFF_FFFF
Number of regions	• DMAC: 8 regions • EDMAC: 4 regions • GLCDC: 2 regions • DRW: 3 regions • MIPI DSI: 1 region • CEU: 2 regions
Address specification for individual regions	• Region start and end addresses configurable
Enable or disable setting for memory protection in individual regions	• Settings enabled or disabled for the associated region
Access-control settings for individual regions	• Permission to read and write • Permission to unprivileged access
Operation on error detection	• Reset or error response
Register protection	• Register can be protected from illegal writes

15.3.1 Register Descriptions

Register writes processing should be performed after stopping the corresponding master group bus access.

SA (Secure Attribution) is set in each register and the SA is used to determine whether the target register is a secure register or a non-secure register.

15.3.1.1 MMPUSARA : Master Memory Protection Unit Security Attribution Register A

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x130

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	MMPUASAn[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	MMPUASAn[7:0]	MMPUA Security Attribution n (n = 0 to 7) 0: Secure 1: Non-secure	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

MMPUASAn[7:0] bits (MMPUA Security Attribution n (n = 0 to 7))

Security attributes of bus master MPU Region Setting register. The target registers are as follows:

- MMPUSDMACn (n = 0 to 7)
- MMPUEDMACn (n = 0 to 7)
- MMPUACDMACn (n = 0 to 7)

15.3.1.2 MMPUSARB : Master Memory Protection Unit Security Attribution Register B

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x134

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	MMPUBSA8	—	—	—	—	—	—	—	MMPUBSA0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	MMPUBSA0	MMPUB Security Attribution 0 0: Secure 1: Non-secure	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
8	MMPUBSA8	MMPUB Security Attribution 8 0: Secure 1: Non-secure	R/W
31:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1
P-TYPE-1

MMPUBSA0 bit (MMPUB Security Attribution 0)

Security attributes of DMAC MPU Enable Setting register. The target registers are as follows:

- MMPUENDMAC
- MMPUENPTDMAC

MMPUBSA8 bit (MMPUB Security Attribution 8)

Security attributes of MPU Operation After Detection Setting register. The target registers are as follows:

- MMPUOAD
- MMPUOADPT

15.3.1.3 MMPUSDMACn : MMPU Start Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0204 + 0x010 × n

Bit position:	31																									0
Bit field:																										
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FFE0. Writing is ignored for bit 0 to bit 4. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSDMACn (n = 0 to 7) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

Regions set by MMPUSDMACn (n = 0 to 7), MMPUEDMACn (n = 0 to 7) and MMPUACDMACn (n = 0 to 7) registers, can be set for a secure access or a non-secure access with the MMPUSARA register. If the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 1, it is only possible to use that region with a non-secure access. On the other hand, if the corresponding MMPUSARA.MMPUASAn (n = 0 to 7) bit is set to 0, it is only possible to use that region with a secure access.

15.3.1.4 MMPUSEDMACn : MMPU Start Address Register for EDMAC (n = 0 to 3)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0604+ 0x010 × n

Bit position:	31																									0
Bit field:																										
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for EDMAC Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FFE0. Writing is ignored for bit 0 to bit 4. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSEDMACn (n = 0 to 3) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.5 MMPUSGLCDCn : MMPU Start Address Register for GLCDC (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0804+ 0x010 × n

Bit position:	31																													0
Bit field:																														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for GLCDC Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FC00. Writing is ignored for bit 0 to bit 9. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSGLCDCn (n = 0, 1) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.6 MMPUSDRWn : MMPU Start Address Register for DRW (n = 0 to 2)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0A04+ 0x010 × n

Bit position:	31																													0
Bit field:																														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for DRW Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_FC00. Writing is ignored for bit 0 to bit 9. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSDRWn (n = 0 to 2) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.7 MMPUSMIPI : MMPU Start Address Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0C04

Bit position:	31																													0
Bit field:																														
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for MIPI DSI Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_F000. Writing is ignored for bit 0 to bit 11. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSMIPI register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.8 MMPUSCEUn : MMPU Start Address Register for CEU (n = 0 to 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E04+ 0x010 × n

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Region start address register for CEU Address where the region starts, for use in region determination. The starting address of the MPU area must be set in the range of 0x0000_0000 to 0xFFFF_F000. Writing is ignored for bit 0 to bit 11. These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUSCEUn (n = 0 to 1) register specifies the start address where the region starts.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.9 MMPUEDMACn : MMPU End Address Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0208+ 0x010 × n

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register Address where the region end, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_001F to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 4. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEDMACn (n = 0 to 7) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.10 MMPUEEDMACn : MMPU End Address Register for EDMAC (n = 0 to 3)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0608+ 0x010 × n

Bit position:	31																								0
Bit field:																									
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for EDMAC Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_001F to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 4. These bits are read as 1.The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEEDMACn (n = 0 to 3) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.11 MMPUEGLCDCn : MMPU End Address Register for GLCDC (n = 0 to 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0808+ 0x010 × n

Bit position:	31																								0
Bit field:																									
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for GLCDC Address where the region ends, for use in region determination. The endting address of the MPU area must be set in the range of 0x0000_03FF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 9. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEGLCDCn (n = 0 to 1) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.12 MMPUEDRWn : MMPU End Address Register for DRW (n = 0 to 2)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0A08+ 0x010 × n

Bit position:	31																								0
Bit field:																									
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for DRW Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_03FF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 9. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEDRWn (n = 0 to 2) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.13 MMPUEMIPI : MMPU End Address Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0C08

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for MIPI DSI Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_0FFF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 11. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUEMIPI register specify the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.14 MMPUECEUn : MMPU End Address Register for CEU (n = 0 to 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E08+ 0x010 × n

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	Region end address register for CEU Address where the region ends, for use in region determination. The ending address of the MPU area must be set in the range of 0x0000_0FFF to 0xFFFF_FFFF. Writing is ignored for bit 0 to bit 11. These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-3
P-TYPE-2

The MMPUECEUn (n = 0 to 1) register specifies the end address where the region ends.

This register requires word access. Byte access and halfword access is prohibited. When byte access and halfword access is executed, operation is not guaranteed.

15.3.1.15 MMPUACDMACn : MMPU Access Control Register for DMAC (n = 0 to 7)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0200+ 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	PP	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: DMAC region n unit is disabled. 1: DMAC region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
3	PP	Privilege protection 0: Unprivileged access permission 1: Unprivileged access protection	R/W
15:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the DMAC region n (n = 0 to 7) unit.

When the ENABLE bit is set to 1, the RP bit, the WP bit and the PP bit are enabled for permit or protect access to the region that is set in MMPUSDMACn (n = 0 to 7) and MMPUEDMACn (n = 0 to 7).

When the ENABLE bit is set to 0, the access to DMAC region n (n = 0 to 7) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the WP bit is available.

PP bit (Privilege protection)

The PP bit enables or disables unprivileged access protection for DMAC region n (n = 0 to 7).

When the ENABLE bit is set to 1, the PP bit is available.

15.3.1.16 MMPUACEDMACn : MMPU Access Control Register for EDMAC (n = 0 to 3)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0600+ 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: EDMAC region n unit is disabled. 1: EDMAC region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the EDMAC region n (n = 0 to 3) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit bit are enabled for permit or protect access to the region that is set in MMPUSEDMACn (n = 0 to 3) and MMPUEEDMACn (n = 0 to 3).

When the ENABLE bit is set to 0, the access to EDMAC region n (n = 0 to 3) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for EDMAC region n (n = 0 to 3).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for EDMAC region n (n = 0 to 3).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.17 MMPUACGLCDCn : MMPU Access Control Register for GLCDC (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0800 + 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: GLCDC region n unit is disabled. 1: GLCDC region n unit is enabled.	R/W

Bit	Symbol	Function	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the GLCDC region n (n = 0, 1) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSGLCDCn (n = 0, 1) and MMPUEGLCDCn (n = 0, 1).

When the ENABLE bit is set to 0, the access to GLCDC region n (n = 0, 1) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for GLCDC region n (n = 0, 1).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for GLCDC region n (n = 0, 1).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.18 MMPUACDRWn : MMPU Access Control Register for DRW (n = 0 to 2)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0A00+ 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: DRW region n unit is disabled. 1: DRW region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the DRW region n (n = 0 to 2) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSDRWn (n = 0 to 2) and MMPUEDRWn (n = 0 to 2).

When the ENABLE bit is set to 0, the access to DRW region n (n = 0 to 2) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for DRW region n (n = 0 to 2).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for DRW region n (n = 0 to 2).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.19 MMPUACMIPI : MMPU Access Control Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0C00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: MIPI DSI region unit is disabled. 1: MIPI DSI region unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the MIPI DSI region unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit bit are enabled for permit or protect access to the region that is set in MMPUSMIPI and MMPUEMIPI.

When the ENABLE bit is set to 0, the access to MIPI DSI region is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for MIPI DSI region.

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for MIPI DSI region.

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.20 MMPUACCEUn : MMPU Access Control Register for CEU (n = 0, 1)

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0E00+ 0x010 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	WP	RP	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Region Enable 0: CEU region n unit is disabled. 1: CEU region n unit is enabled.	R/W
1	RP	Read protection 0: Read permission 1: Read protection	R/W
2	WP	Write protection 0: Write permission 1: Write protection	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3
P-TYPE-2

ENABLE bit (Region Enable)

The ENABLE bit enables or disables the CEU region n (n = 0, 1) unit.

When the ENABLE bit is set to 1, the RP bit and the WP bit are enabled for permit or protect access to the region that is set in MMPUSCEUn (n = 0, 1) and MMPUECEUn (n = 0, 1).

When the ENABLE bit is set to 0, the access to CEU region n (n = 0, 1) is not specified.

RP bit (Read protection)

The RP bit enables or disables read protection for CEU region n (n = 0, 1).

When the ENABLE bit is set to 1, the RP bit is available.

WP bit (Write protection)

The WP bit enables or disables write protection for CEU region n (n = 0, 1).

When the ENABLE bit is set to 1, the WP bit is available.

15.3.1.21 MMPUENDMAC : MMPU Enable Register for DMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0100

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of DMAC Enable 0: Bus master MPU of DMAC is disabled. 1: Bus master MPU of DMAC is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access. Byte-write access is prohibited.
When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of DMAC Enable)

The ENABLE bit enables or disables the bus master MPU function for DMAC.

When the ENABLE bits is set to 1, MMPUACDMACn (n = 0 to 7) is available.

When the ENABLE bits is set to 0, MMPUACDMACn (n = 0 to 7) is unavailable, including permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the ENABLE.

When writing the ENABLE bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated.The KEY[7:0] bits are always read as 0x00.

15.3.1.22 MMPUENEDMAC : MMPU Enable Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0500

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of EDMAC Enable 0: Bus master MPU of EDMAC is disabled. 1: Bus master MPU of EDMAC is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of EDMAC Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACEDMACn (n = 0 to 3) is available.

When the ENABLE bit is set to 0, MMPUACEDMACn (n = 0 to 3) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.23 MMPUENGLCDC : MMPU Enable Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0700

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of GLCDC Enable 0: Bus master MPU of GLCDC is disabled. 1: Bus master MPU of GLCDC is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of GLCDC Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACGLCDCn (n = 0, 1) is available.

When the ENABLE bit is set to 0, MMPUACGLCDCn (n = 0, 1) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.24 MMPUENDRW : MMPU Enable Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0900

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of DRW Enable 0: Bus master MPU of DRW is disabled. 1: Bus master MPU of DRW is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of DRW Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACDRWn (n = 0 to 2) is available.

When the ENABLE bit is set to 0, MMPUACDRWn (n = 0 to 2) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.25 MMPUENMIPI : MMPU Enable Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0B00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of MIPI DSI Enable 0: Bus master MPU of MIPI DSI is disabled. 1: Bus master MPU of MIPI DSI is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of MIPI DSI Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bits is set to 1, MMPUACMIPI is available.

When the ENABLE bits is set to 0, MMPUACMIPI is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the ENABLE.

When writing the ENABLE bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.26 MMPUENCEU : MMPU Enable Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	ENABLE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ENABLE	Bus master MPU of CEU Enable 0: Bus master MPU of CEU is disabled. 1: Bus master MPU of CEU is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the ENABLE bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

ENABLE bit (Bus master MPU of CEU Enable)

The ENABLE bit enables or disables the bus master MPU function of each master group.

When the ENABLE bit is set to 1, MMPUACCEUn (n = 0, 1) is available.

When the ENABLE bit is set to 0, MMPUACCEUn (n = 0, 1) is unavailable, and permission for all regions.

The bus master MPU function of each master group sets the ENABLE bit.

When the ENABLE bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the ENABLE bit.

When writing the ENABLE bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.27 MMPUENPTDMAC : MMPU Enable Protect Register for DMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0104

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENDMAC register write is possible. 1: MMPUENDMAC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENDMAC register.

When the PROTECT bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the PROTECT.

When writing the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.28 MMPUENPTEDMAC : MMPU Enable Protect Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0504

Bit position:	15	8	0
Bit field:	KEY[7:0]	— — — — — — —	PROTECT
Value after reset:	0 0 0 0 0 0 0 0	0 0 0 0 0 0 0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENEDMAC register write is possible. 1: MMPUENEDMAC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENEDMAC register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.29 MMPUENPTGLCDC : MMPU Enable Protect Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0704

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENGLCDC register write is possible. 1: MMPUENGLCDC register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENGLCDC register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.30 MMPUENPDRW : MMPU Enable Protect Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0904

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENDRW register write is possible. 1: MMPUENDRW register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENDRW register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.31 MMPUENPTMIPI : MMPU Enable Protect Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0B04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENMIPI register write is possible. 1: MMPUENMIPI register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENMIPI register.

When the PROTECT bit is set, write 0xA5 in KEY[7:0] at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing of the PROTECT.

When writing the PROTECT bit, write 0xA5 in KEY[7:0] at the same time.

When a value other than 0xA5 is written in KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.32 MMPUENPTCEU : MMPU Enable Protect Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D04

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUENCEU register write is possible. 1: MMPUENCEU register write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.

Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit controls protection of MMPUENCEU register.

When the PROTECT bit is set, write 0xA5 to the KEY[7:0] bits at the same time.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits are used to enable or disable writing to the PROTECT bit.

When writing the PROTECT bit, write 0xA5 to the KEY[7:0] bits at the same time.

When a value other than 0xA5 is written to the KEY[7:0] bits, the ENABLE bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.33 MMPURPTDMAC : MMPU Regions Protect Register for DMAC Non-secure

Base address: RMPU_NS = 0x5000_0000

Offset address: 0x0108

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC write is possible. 1: Bus master MPU register for DMAC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-7
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of non-secure
- MMPUEDMACn (n = 0 to 7) of non-secure
- MMPUACDMACn (n = 0 to 7) of non-secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultane-ously to the KEY[7:0] bits. When a value other than 0xA5 is written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.34 MMPURPTDMAC_SEC : MMPU Regions Protect register for DMAC Secure

Base address: RMPU = 0x4000_0000

Offset address: 0x010C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DMAC Secure write is possible. 1: Bus master MPU register for DMAC Secure write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-6
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTDMAC_SEC.PROTECT controls the following registers:

- MMPUSDMACn (n = 0 to 7) of Secure
- MMPUEDMACn (n = 0 to 7) of Secure
- MMPUACDMACn (n = 0 to 7) of Secure

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultane-ously to the KEY[7:0] bits. When a value other than 0xA5 is written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.35 MMPURPTEDMAC : MMPU Regions Protect Register for EDMAC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0508

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for EDMAC write is possible. 1: Bus master MPU register for EDMAC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTEDMAC.PROTECT controls the following registers:

- MMPUSEDMACn (n = 0 to 3)
- MMPUEEDMACn (n = 0 to 3)
- MMPUACEDMACn (n = 0 to 3)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.36 MMPURPTGLCDC : MMPU Regions Protect Register for GLCDC

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0708

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for GLCDC write is possible. 1: Bus master MPU register for GLCDC write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTGLCDC.PROTECT controls the following registers:

- MMPUSGLCDCn (n = 0, 1)
- MMPUEGLCDCn (n = 0, 1)
- MMPUACGLCDCn (n = 0, 1)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.37 MMPURPTDRW : MMPU Regions Protect Register for DRW

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0908

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for DRW write is possible. 1: Bus master MPU register for DRW write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPDRW.PROTECT controls the following registers:

- MMPUSDRWn (n = 0 to 2)
- MMPUEDRWn (n = 0 to 2)
- MMPUACDRWn (n = 0 to 2)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.38 MMPURPTMIPI : MMPU Regions Protect Register for MIPI DSI

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0B08

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for MIPI DSI write is possible. 1: Bus master MPU register for MIPI DSI write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writes to the associated registers to be protected.

MMPURPTMIPI.PROTECT controls the following registers:

- MMPUSMIPI
- MMPUEMIPI
- MMPUACMIPI

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits, using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultane-ously to the KEY[7:0] bits. When a value other than 0xA5 is written in KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.39 MMPURPTCEU : MMPU Regions Protect Register for CEU

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0D08

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: Bus master MPU register for CEU write is possible. 1: Bus master MPU register for CEU write is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPURPTCEU.PROTECT controls the following registers:

- MMPUSCEUn (n = 0, 1)
- MMPUECEUn (n = 0, 1)
- MMPUACCEUn (n = 0, 1)

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When a value other than 0xA5 is written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.1.40 MMPUOAD : MMPU Operation After Detection Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	OAD
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	OAD	Operation after detection 0: NMI 1: Reset	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code This bit is used to enable or disable writing of the OAD bit.	R/W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

OAD bit (Operation after detection)

The OAD bit specify operation when the access violation is detected.

When OAD bit is 0, error response is returned and NMI is generated.

When OAD bit is 1, reset request is generated.

When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the OAD bit. When writing to the OAD bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written, the OAD bit is not updated.

The KEY[7:0] bits always read as 0x00.

15.3.1.41 MMPUOADPT : MMPU Operation After Detection Protect Register

Base address: RMPU = 0x4000_0000
RMPU_NS = 0x5000_0000

Offset address: 0x0004

Bit position:	15							8								0
Bit field:	KEY[7:0]								—	—	—	—	—	—	—	PROTECT
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PROTECT	Protection of register 0: MMPUOAD register writing is possible. 1: MMPUOAD register writing is protected. Read is possible.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W
15:8	KEY[7:0]	Key Code These bits enable or disable writing to the PROTECT bit.	W

Note: S-TYPE-3
P-TYPE-2

Note: It is necessary to write by halfword access.
Byte-write access is prohibited. When byte-write access is executed, operation is not guaranteed.

PROTECT bit (Protection of register)

The PROTECT bit enables or disables writing to the associated registers to be protected.

MMPUOAD.PROTECT controls the following registers:

- MMPUOAD

When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits using halfword access.

KEY[7:0] bits (Key Code)

The KEY[7:0] bits enable or disable writing to the PROTECT bit. When writing to the PROTECT bit, write 0xA5 simultaneously to the KEY[7:0] bits. When other values are written to the KEY[7:0] bits, the PROTECT bit is not updated. The KEY[7:0] bits are always read as 0x00.

15.3.2 Operation

15.3.2.1 Memory protection

The bus master MPU monitors memory access using control settings made individually for the access control regions. If accesses violate the access permissions that are configured in bus master MPU, the bus master MPU generates a memory protection error.

Bus master MPU has master groups of DMAC, EDMAC, GLCDC, DRW, MIPI DSI and CEU. The memory protection function checks the address of the bus for a unified master group, and blocks illegal access of the master group to the protected region by bus master MPU.

The region setting registers of the bus master MPU for DMAC can be set for secure master and non-secure master using the MMPUSARA register. The MPU region setting with MMPUSARA.MMPUASAn = 0 applies only to access from the secure master, and the MPU region setting with MMPUSARA.MMPUASAn = 1 applies only to access from the non-secure master. Figure 15.1 shows an example of access authorization for the secure master and non-secure master when both secure and non-secure MPU settings are configured.

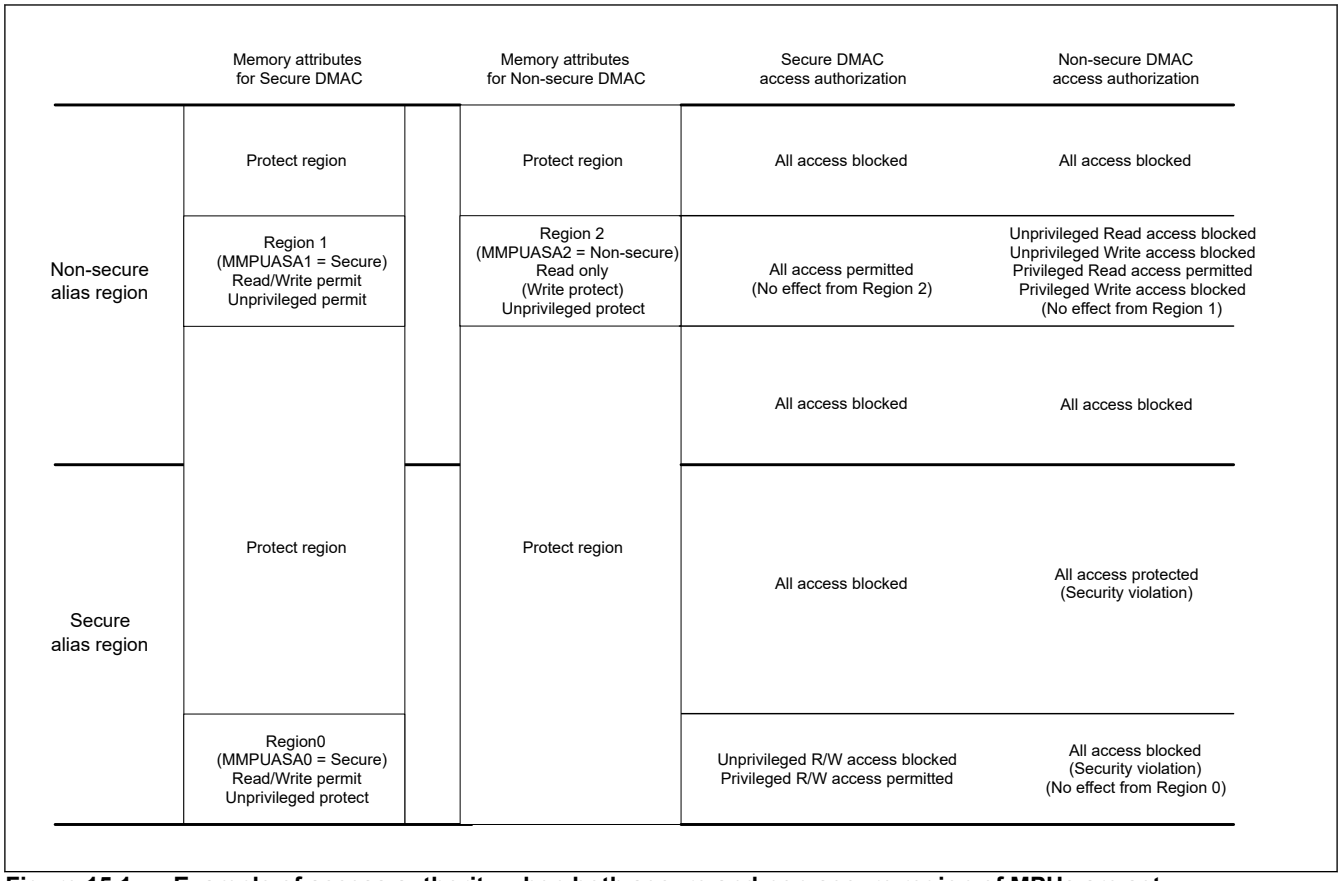

Figure 15.1 Example of access authority when both secure and non-secure region of MPUs are set

Bus master MPU permit of all regions after reset. If MMPUENXXXX.ENABLE is 1 and there is no MPU region setting for the corresponding bus master, all regions are protected. (XXXX = Master Group name)

Figure 15.2 shows the access permission or protection by the overlapping bus master MPU regions.

Access control for the overlapping regions is as follows:

- The region is handled as a protected region when output of one or more region units is a protected region
- The region is handled as a protected region when output of all region units is outside of the regions
- Other cases are handled as permitted regions.

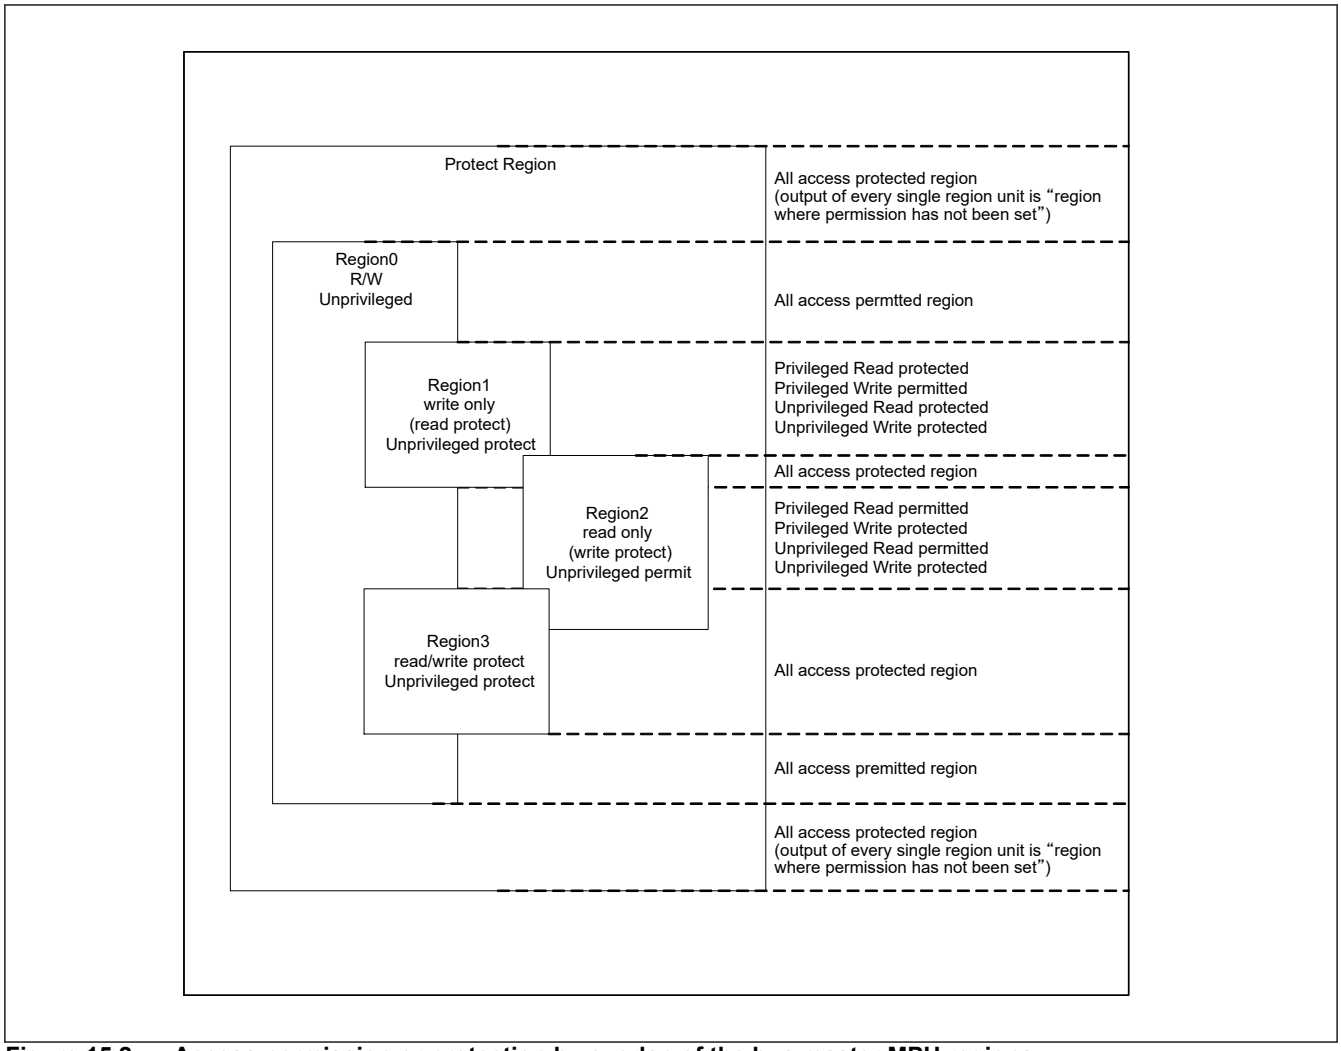

Figure 15.2 Access permission or protection by overlap of the bus master MPU regions

Figure 15.3 shows the register setting flow after reset. During this register setting, stop the bus master except the CPU.

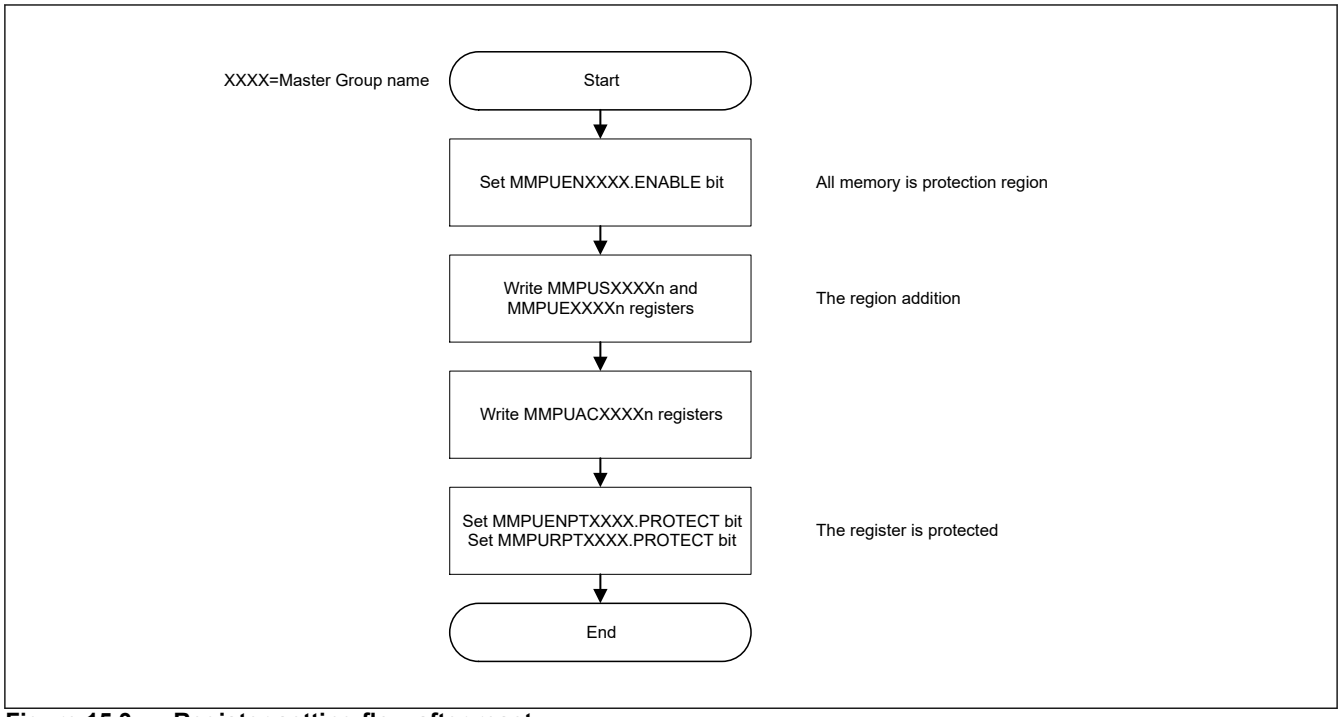

Figure 15.3 Register setting flow after reset

Figure 15.4 shows the register setting flow for adding regions. During this register setting, stop the master except the CPU.

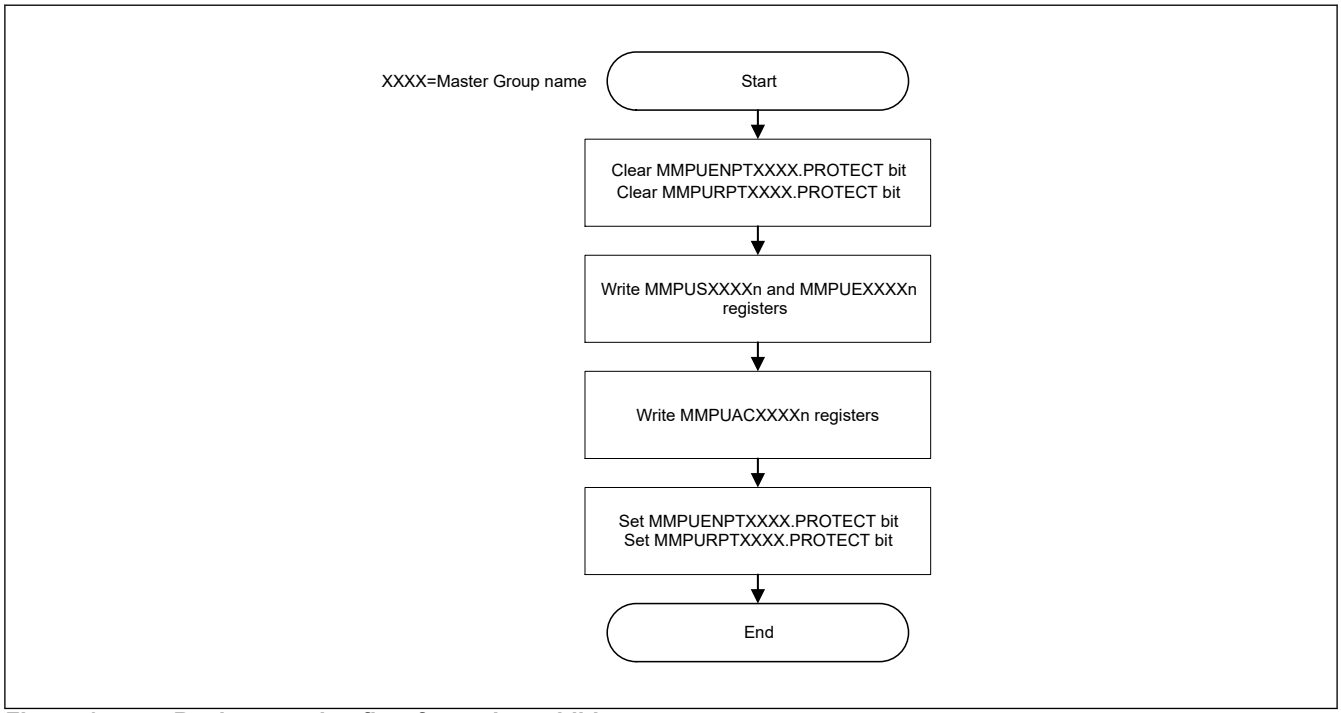

Figure 15.4 Register setting flow for region addition

15.3.2.2 Protecting the registers

Registers related to the bus master MPU can be protected with the PROTECT bit as shown in Table 15.4.

Table 15.4 PROTECT bit and protect target registers (1 of 2)

PROTECT bit	Protect target registers
MMPUENPTDMAC.PROTECT	MMPUENDMAC

Table 15.4 PROTECT bit and protect target registers (2 of 2)

PROTECT bit	Protect target registers
MMPUENPTEDMAC.PROTECT	MMPUENEDMAC
MMPUENPTGLCDC.PROTECT	MMPUENGLCDC
MMPUENPDRW.PROTECT	MMPUENDRW
MMPUENPTMIPI.PROTECT	MMPUENMIPI
MMPUENPTCEU.PROTECT	MMPUENCEU
MMPURPTDMAC.PROTECT	The following registers set to Non-secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7)
MMPURPTDMAC_SEC.PROTECT	The following registers set to Secure by MMPUSARA.MMPUASAn (n = 0 to 7). MMPUSDMACn (n = 0 to 7) MMPUEDMACn (n = 0 to 7) MMPUACDMACn (n = 0 to 7)
MMPURPTEDMAC.PROTECT	MMPUSEDMACn (n = 0 to 3) MMPUEEDMACn (n = 0 to 3) MMPUACEDMACn (n = 0 to 3)
MMPURPTGLCDC.PROTECT	MMPUSGLCDCn (n = 0 to 1) MMPUEGLCDCn (n = 0 to 1) MMPUACGLCDCn (n = 0 to 1)
MMPURPDRW.PROTECT	MMPUSDRWn (n = 0 to 2) MMPUEDRWn (n = 0 to 2) MMPUACDRWn (n = 0 to 2)
MMPURPTMIPI.PROTECT	MMPUSMIPI MMPUEMIPI MMPUACMIPI
MMPURPTCEU.PROTECT	MMPUSCEUn (n = 0 to 1) MMPUECEUn (n = 0 to 1) MMPUACCEUn (n = 0 to 1)
MMPUOADPT.PROTECT	MMPUOAD.OAD

15.3.2.3 Memory Protection error

If access to a protected region is detected, the bus master MPU generates an error. Set the MMPUOAD bit to select whether the error is reported as a non-maskable interrupt or a reset.

See section 14, Buses for details of bus master MPU error.

The non-maskable interrupt status is indicated in ICU.NMISR.BUSST. For details, see section 13, Interrupt Controller Unit (ICU). The reset status is indicated in SYSC.RSTSR1.BUSRF. For details, see section 5, Resets.

16. DMA Controller (DMAC)

16.1 Overview

The 8-channel direct memory access controller (DMAC) that can transfer data without intervention from the CPU. When a DMA transfer request is generated, the DMAC transfers data stored at the transfer source address to the transfer destination address.

Table 16.1 lists the DMAC specifications, and Figure 16.1 shows a block diagram of the DMAC.

Table 16.1 DMAC specifications (1 of 2)

Item		Description
Number of channels		8 channels (DMACn (n = 0 to 7))
Transfer space		4 GB (0x00000000 to 0xFFFFFFFF excluding reserved areas)
Maximum transfer volume		64 M data (Maximum number of transfers in block transfer mode: 1,024 data × 65,536 blocks)
DMAC activation source		Selectable for each channel: ● Software trigger ● Interrupt requests from peripheral modules or trigger from external interrupt input pins.*1
Channel priority		Channel 0 > Channel 1 > Channel 2 > Channel 3… > Channel 7 (Channel 0: Highest)
Transfer data	Single data	Bit length: 8, 16, 32 bits
	Block size	Number of data: 1 to 1,024
Transfer mode	Normal transfer mode	● One data transfer by one DMA transfer request ● Free running function (setting in which total number of data transfers is not specified) settable
	Repeat transfer mode	● One data transfer by one DMA transfer request ● Program returns to the transfer start address on completion of the repeat size of data transfer specified for the transfer source or destination. ● Maximum settable repeat size: 1,024 ● Selectable free running function
	Repeat-block transfer mode	● One block data transfer by one DMA transfer request ● Maximum settable block size: 1,024 ● Block transfer can be repeated ● Maximum settable repeat size: 64K ● Selectable free running function
	Block transfer mode	● One block data transfer by one DMA transfer request ● Maximum settable block size: 1,024 data ● Selectable free running function
Selective functions	Extended repeat area function	● Function in which data can be transferred by repeating the address values in the specified range with the upper bit values in the transfer address register fixed ● Area of 2 bytes to 128 Mbytes separately settable as extended repeat area for transfer source and destination
Processing on DMAC transfer error		● When the DMAC transfer error occurs, it is stop the transfer that caused the error channel ● Request to clear the register for activation request of DMAC error channel to ICU
Interrupt (DMAC0n_INT)	Transfer end interrupt	Generated on completion of transferring data volume specified by the transfer counter.
	Transfer escape end interrupt	● Generated when the repeat size of data transfer is completed. ● Generated when the source address extended repeat area overflows. ● Generated when the destination address extended repeat area overflows.
Interrupt (DMA0_TRANSERR)	Error response detection interrupt	● Generated when the DMAC transfer error occurs
Event link activation (DMAC0n_INT)		An event link request is generated after each data transfer (for block transfer, after each block is transferred).
Module-stop function		Module-stop state can be set to reduce power consumption.

Table 16.1 DMAC specifications (2 of 2)

Item	Description
TrustZone Filter	Security and Privilege can be set for each channels

Note: Security attribution Register of DMAC channel is described in ICU.ICUSARC
Note 1. For details on DMAC activation sources, see Table 13.4 in section 13, Interrupt Controller Unit (ICU).

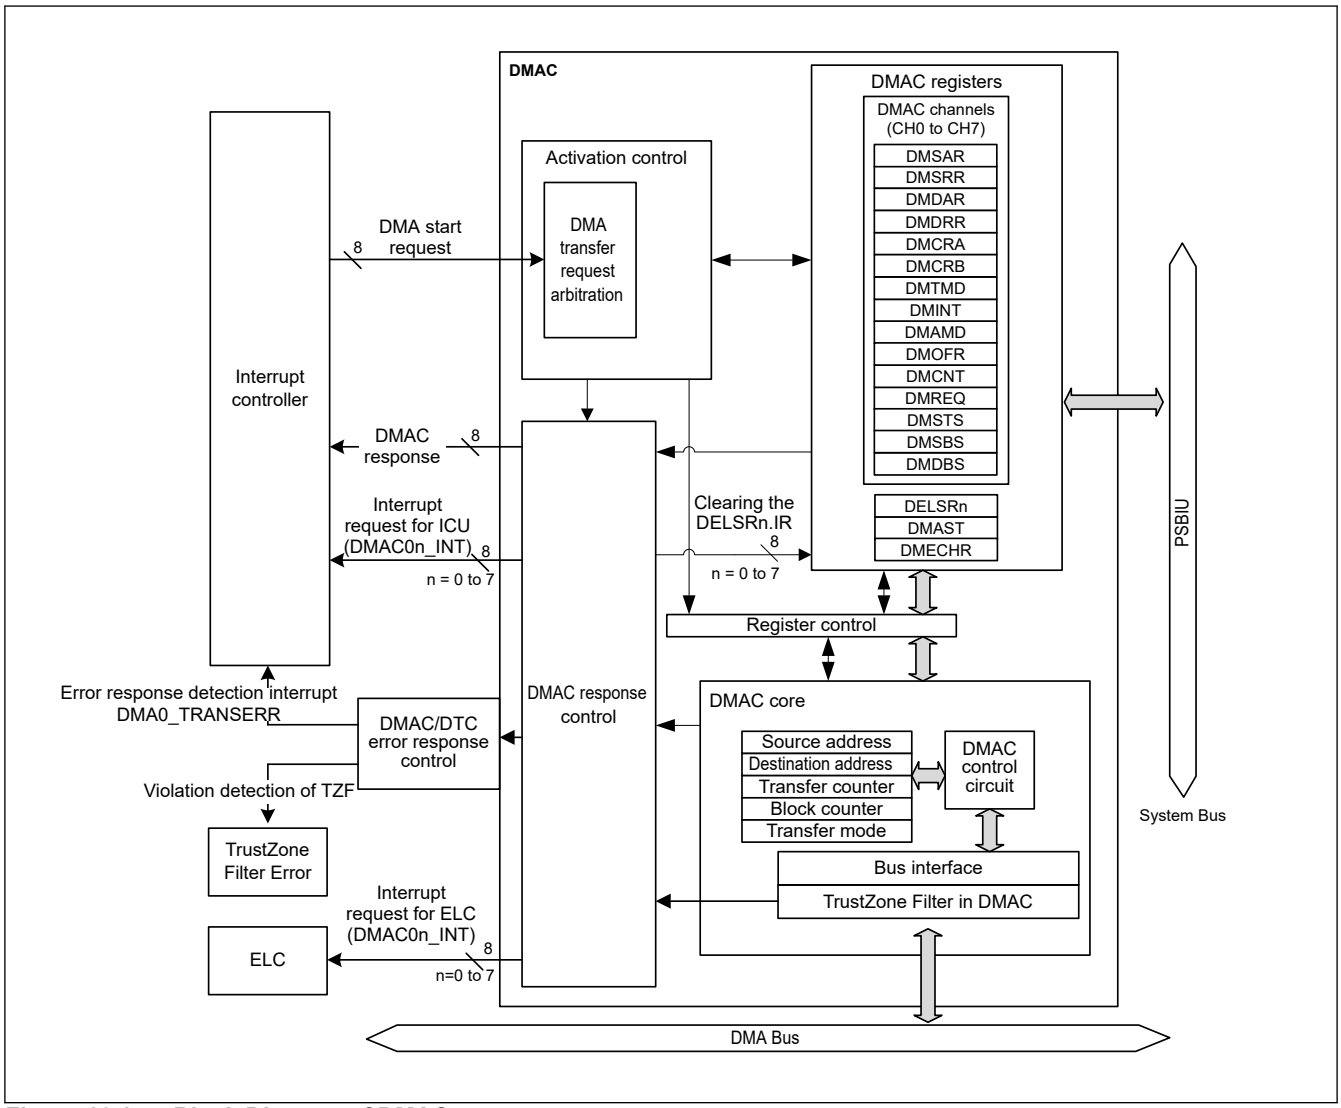

Figure 16.1 Block Diagram of DMAC

16.2 Register Descriptions

16.2.1 DMACCHSAR : DMA channel Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x1A0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	SADMAC7	SADMAC6	SADMAC5	SADMAC4	SADMAC3	SADMAC2	SADMAC1	SADMAC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	SADMAC7 to SADMAC0	Security attributes of output and registers for DMAC channel 0: Secure 1: Non-secure	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

SADMACn (n = 0 to 7)

Security attributes registers for DMAC channel.

This bit determines the security attribute of the output as the master for each DMAC channel.

The controlled channel of DMAC registers are shown below.

- CPSCU.DMACCHPAR.PADMACn
- DMAC.DELSR channel n
- DMAC.DMSAR channel n
- DMAC.DMSRR channel n
- DMAC.DMDAR channel n
- DMAC.DMDRR channel n
- DMAC.DMCRA channel n
- DMAC.DMCRB channel n
- DMAC.DMTMD channel n
- DMAC.DMINT channel n
- DMAC.DMAMD channel n
- DMAC.DMOFR channel n
- DMAC.DMCNT channel n
- DMAC.DMREQ channel n
- DMAC.DMSTS channel n
- DMAC.DMSBS channel n
- DMAC.DMDBS channel n
- DMAC.DMBWR channel n

16.2.2 DMACCHPAR : DMA channel Privilege Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x1F0

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	PADMAC7	PADMAC6	PADMAC5	PADMAC4	PADMAC3	PADMAC2	PADMAC1	PADMAC0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	PADMAC7 to PADMAC0	Privilege attributes of outputs and registers for DMAC channel 0: Privileged. 1: Unprivileged.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-2, P-TYPE-1

PADMACn (n = 0 to 7)

Privilege attributes of output and registers for DMAC channel.

This bit determines the Privilege attribute of the output as the master for each DMAC channel. It also determines the privileged attributes of DMAC registers for each channel. (See section 16.3.14. Channel Privilege.

The controlled the channel of DMAC registers are shown below.

- DMAC.DMSAR channel n
- DMAC.DMSRR channel n
- DMAC.DMDAR channel n
- DMAC.DMDRR channel n
- DMAC.DMCRA channel n
- DMAC.DMCRB channel n
- DMAC.DMTMD channel n
- DMAC.DMINT channel n
- DMAC.DMAMD channel n
- DMAC.DMOFR channel n
- DMAC.DMCNT channel n
- DMAC.DMREQ channel n
- DMAC.DMSTS channel n
- DMAC.DMSBS channel n
- DMAC.DMDBS channel n
- DMAC.DMBWR channel n

16.2.3 DMACSAR : DMAC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x34

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMASTSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DMASTSA	DMAST Security Attribution 0: Secure 1: Non-secure	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1
Note: Only Secure access can write to this register. Both Secure access and Non-secure read access are allowed but Non-secure write access is not allowed and TrustZone access error is not generated.
Note: This register is write-protected by PRCR register.

For DMAC, security attribution is set for each channel. However, this register only sets the DMAST register security attribute.

DMASTSA bit (DMAST Security Attribution)

Security attributes of registers for DMAST. Do not write to DMASTSA bit while DMA transfer is enabled or a bus master is writing to the DMA registers.

16.2.4 DELSRn : DMAC Event Link Setting Register n (n = 0 to 7)

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x080+ 0x04 × n (n = 0 to 7)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DELS[8:0]	DMAC Event Link Select 0x00: Disable interrupts to the associated DMAC module Others: Event signal number to be linked. For details, see Table 13.4.	R/W*1
15:9	—	These bits are read as 0. The write value should be 0.	R/W
16	IR	DMAC Activation Request Status flag 0: No DMAC activation request occurred. 1: DMAC activation request occurred.	R/W*2
31:17	—	These bits are read as 0. The write value should be 0.	R/W*1

Note: P-TYPE-2 See below for access by security attribution.
Note 1. This register must be accessed by half-word or word.
Note 2. Writing 1 to the IR flag is prohibited.

This register has different secure access permission depending on the setting of Trusted Event Route Control Register(TEVTRCR).

If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access to DELS bit is allowed.
- Non-secure write access to DELS bit is ignored and Non-secure read access to DELS bit is allowed.
- Secure write access to other bits is ignored and Secure read access to other bits is read as 0.
- Non-secure access to other bits is allowed.
- TrustZone access error is not generated.

DELS[8:0] bits (DMAC Event Link Select)

The DELS[8:0] bits link an event signal to the associated DMAC module. All DELS[8:0] bits must be written to simultaneously. Do not set the same event number in multiple DELSRn registers.

[Setting condition]

- When value is written to these bits.

[Clearing conditions]

- When 0 is written to these bits.
- When DMA transfer is stopped by the access error occurs. See section 16.5. Processing on DMA Transfer Error.

IR flag (DMAC Activation Request Status flag)

This flag is a status flag for a DMAC activation request.

This flag is associated with the DELS[8:0] bits of this register.

[Setting condition]

- When a DMAC activation request occurs from the associated peripheral module or IRQi pin.

[Clearing conditions]

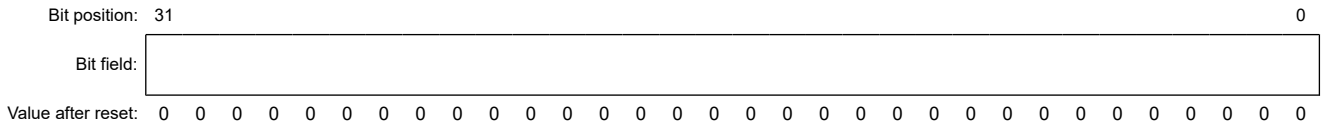
- When 0 is written to the flag
- When the DMA transfer is started after a DMAC activation request occurs.
- When DMA transfer is stopped by the access error occurs. See section 16.5. Processing on DMA Transfer Error.

Note: IR Flag is automatically cleared after completion of DMA transfer, so do not write "0" except in case of emergency, such as when an abort occurs. DMA transfer operation when "0" is written during DMA transfer can not be guaranteed.

16.2.5 DMSAR : DMA Source Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x00



Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source start address Setting range is 0x00000000 to 0xFFFFFFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

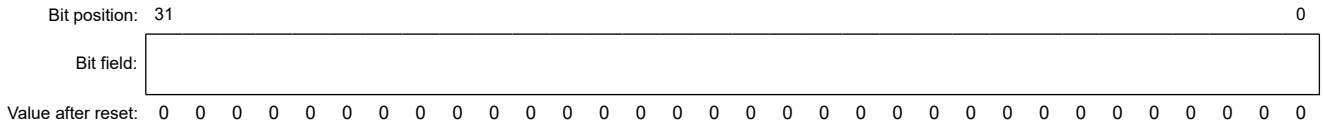
Set DMSAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

16.2.6 DMSRR : DMA Source Reload Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x20



Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer source reload address 0x0000 0000 to 0xFFFF FFFF (4 GB)	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMSRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

DMSRR is used to store the start address of the buffer size set in DMSBS during repeat-block transfer mode. In repeat-block transfer mode, DMSAR reloads value of DMSRR after specified transfer finished.

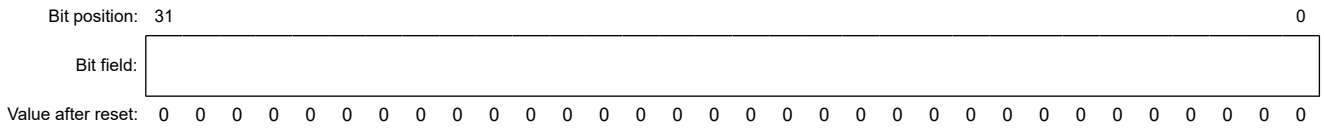
In normal transfer mode, repeat transfer mode and block transfer mode, DMSRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bit.

16.2.7 DMDAR : DMA Destination Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x04



Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination start address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDAR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

16.2.8 DMDRR : DMA Destination Reload Address Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x24

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	n/a	Specifies the transfer destination reload address Setting range is 0x0000_0000 to 0xFFFF_FFFF (4 GB).	R/W

Note: S-TYPE-3, P-TYPE-3

Set DMDRR while DMAC activation is disabled (DMAST.DMST = 0) or DMA transfer of the corresponding channel is disabled (DMCNT.DTE = 0).

DMDRR is used to store the start address of the buffer size set in DMDBS during repeat-block transfer mode. In repeat-block transfer mode, DMDAR reloads the value of DMDRR after the specified transfer is finished.

In normal transfer mode, repeat transfer mode and block transfer mode, DMDRR is not used. The setting is invalid.

Note: Address alignment in this register must match the Transfer Data Size value selected in the DMTMD.SZ bits.

16.2.9 DMCRA : DMA Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	DMCRAH[9:0]									
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMCRAL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMCRAL[15:0]	Lower bits of transfer count Specifies the number of transfer operations.	R/W
25:16	DMCRAH[9:0]	Upper bits of transfer count Specifies the number of transfer operations.	R/W
31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMCRAH and DMCRAL in repeat transfer mode, block transfer mode, and repeat-block transfer mode. Bits 15 to 10 are fixed to 0 in repeat transfer mode, block transfer mode, and repeat-block transfer mode.

(1) Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

DMCRAL functions as a 16-bit transfer counter.

The number of transfer operations is one when the setting is 0x0001, and 65,535 when it is 0xFFFF. The value is decremented by one each time data is transferred.

When the setting is 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free running function).

Free running function is not selected by DMTMD.TKP bit in normal transfer mode.

DMCRAH is not used in normal transfer mode. Write 0x0000 to DMCRAH.

(2) Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

DMCRAH specifies the repeat size and DMCRAL functions as a 10-bit transfer counter.

The number of transfer operations is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat transfer mode, a value in the range of 0x000 to 0x3FF (1 to 1024) can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(3) Block Transfer Mode (DMTMD.MD[1:0] = 10b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

(4) Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

DMCRAH specifies the block size and DMCRAL functions as a 10-bit block size counter.

The block size is one when the setting is 0x001, 1023 when it is 0x3FF, and 1024 when it is 0x000. In repeat-block transfer mode, a value in the range of 0x000 to 0x3FF can be set for DMCRAH and DMCRAL.

Setting bits 15 to 10 in DMCRAL is invalid. Write 0 to these bits.

The value in DMCRAL is decremented by one each time data is transferred until it reaches 0x000, at which the value in DMCRAH is loaded into DMCRAL.

16.2.10 DMCRB : DMA Block Transfer Count Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMCRBH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMCRBL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMCRBL[15:0]	Functions as a number of block, repeat or repeat-block transfer counter. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W
31:16	DMCRBH[15:0]	Specifies the number of block, repeat or repeat-block transfer operations. 0x0001 to 0xFFFF (1 to 65535) 0x0000 (65536)	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMCRBH and DMCRBL in repeat transfer mode, block transfer mode and repeat-block transfer mode.

DMCRBH specifies the number of block, repeat and repeat-block transfer operations, and DMCRBL functions as a 16-bit the number of block counter in block, repeat, and repeat-block transfer mode, respectively.

The number of transfer operations is one when the setting is 0x0001, 65535 when it is 0xFFFF, and 65536 when it is 0x0000.

In repeat transfer mode, the value is decremented by one when the final data of one repeat size is transferred.

In block transfer mode and repeat-block transfer mode, the value is decremented by one when the final data of one block size is transferred.

In normal transfer mode, DMCRB is not used. The setting is invalid.

When DMTMD.TKP is 1 and the final data of one repeat size or one block size is transferred, DMCRBL reloads the value of DMCRBH automatically.

16.2.11 DMTMD : DMA Transfer Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x10

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	MD[1:0]		DTS[1:0]		—	TKP	SZ[1:0]		—	—	—	—	—	—	DCTG[1:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	DCTG[1:0]	Transfer Request Source Select 0 0: Software request 0 1: Hardware request*1 1 0: Setting prohibited 1 1: Setting prohibited	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W
9:8	SZ[1:0]	Transfer Data Size Select 0 0: 8 bits 0 1: 16 bits 1 0: 32 bits 1 1: Setting prohibited	R/W
10	TKP	Transfer Keeping 0: Transfer is stopped by completion of specified total number of transfer operations. 1: Transfer is not stopped by completion of specified total number of transfer operations (free-running).	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
13:12	DTS[1:0]	Repeat Area Select 0 0: The destination is specified as the repeat area or block area. 0 1: The source is specified as the repeat area or block area. 1 0: The repeat area or block area is not specified. 1 1: Setting prohibited.	R/W

Bit	Symbol	Function	R/W
15:14	MD[1:0]	Transfer Mode Select 0 0: Normal transfer 0 1: Repeat transfer 1 0: Block transfer 1 1: Repeat-block transfer	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. To select the DMAC activation source, use the DELSRn registers. For details on DMAC activation sources, see Table 13.4 in section 13, Interrupt Controller Unit (ICU).

DTS[1:0] bits (Repeat Area Select)

DTS[1:0] select either the source or destination as the repeat area in repeat or block transfer mode. In normal or repeat-block transfer mode, setting these bits is invalid.

TKP bit (Transfer Keeping)

TKP selects either stopping transfer or keeping transfer by completion of specified total number of transfer operations in repeat, block or repeat-block transfer mode. In normal transfer mode, setting this bit is invalid.

16.2.12 DMINT : DMA Interrupt Setting Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x13

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	DTIE	ESIE	RPTIE	SARIE	DARIE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DARIE	Destination Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the destination address. 1: Enables an interrupt request for an extended repeat area overflow on the destination address.	R/W
1	SARIE	Source Address Extended Repeat Area Overflow Interrupt Enable 0: Disables an interrupt request for an extended repeat area overflow on the source address. 1: Enables an interrupt request for an extended repeat area overflow on the source address.	R/W
2	RPTIE	Repeat Size End Interrupt Enable 0: Disables the repeat size end interrupt request. 1: Enables the repeat size end interrupt request.	R/W
3	ESIE	Transfer Escape End Interrupt Enable 0: Disables the transfer escape end interrupt request. 1: Enables the transfer escape end interrupt request.	R/W
4	DTIE	Transfer End Interrupt Enable 0: Disables the transfer end interrupt request. 1: Enables the transfer end interrupt request.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

DARIE bit (Destination Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the destination address occurs while DARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the destination address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the destination address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

SARIE bit (Source Address Extended Repeat Area Overflow Interrupt Enable)

When an extended repeat area overflow on the source address occurs while SARIE bit is set to 1, the DMCNT.DTE bit is cleared to 0. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that an interrupt by an extended repeat area overflow on the source address is requested.

When block transfer mode is used with the extended repeat area function, an interrupt is requested after completion of a 1-block size transfer. When setting 1 in the DMCNT.DTE bit of the channel for which a transfer has been stopped, the transfer is resumed from the state when the transfer is stopped.

When the extended repeat area is not specified for the source address, this bit is ignored.

When set to repeat-block transfer mode, do not use this bit.

RPTIE bit (Repeat Size End Interrupt Enable)

When RPTIE bit is set to 1 in repeat transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-repeat size data transfer. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When this bit is set to 1 in block transfer mode, the DMCNT.DTE bit is cleared to 0 after completion of a 1-block data transfer in the same way as repeat transfer mode. At the same time, the DMSTS.ESIF flag is set to 1 to indicate that the repeat size end interrupt request has been generated. The repeat size end interrupt request can be generated even when the DMTMD.DTS[1:0] bits are 10b (= repeat area or block area is not specified).

When set to repeat-block transfer mode, do not use this bit.

ESIE bit (Transfer Escape End Interrupt Enable)

ESIE bit enables or disables the transfer escape end interrupt requests (repeat size end interrupt request and extended repeat area overflow interrupt request) that are generated during DMA transfer.

The transfer escape end interrupt is generated when the DMSTS.ESIF flag is set to 1 with this bit set to 1. The transfer escape end interrupt is cleared by clearing this bit or the DMSTS.ESIF flag to 0.

DTIE bit (Transfer End Interrupt Enable)

DTIE bit enables or disables the transfer end interrupt request to be generated on completion of a specified number of data transfers.

The transfer end interrupt is generated when the DMSTS.DTIF flag is set to 1 with this bit set to 1. The transfer end interrupt is cleared by clearing this bit or the DMSTS.DTIF flag to 0.

16.2.13 DMAMD : DMA Address Mode Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x14

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	SM[1:0]		SADR	SARA[4:0]					DM[1:0]		DADR	DARA[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	DARA[4:0]	Destination Address Extended Repeat Area Specifies the extended repeat area on the destination address. For details on the settings, see Table 16.2.	R/W

Bit	Symbol	Function	R/W
5	DADR	Destination Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W
7:6	DM[1:0]	Destination Address Update Mode 0 0: Destination address is fixed. 0 1: Offset addition. 1 0: Destination address is incremented. 1 1: Destination address is decremented.	R/W
12:8	SARA[4:0]	Source Address Extended Repeat Area Specifies the extended repeat area on the source address. For details on the settings, see Table 16.2.	R/W
13	SADR	Source Address Update Select After Reload 0: Only reloading. 1: Add index after reloading.	R/W
15:14	SM[1:0]	Source Address Update Mode 0 0: Source address is fixed. 0 1: Offset addition. 1 0: Source address is incremented. 1 1: Source address is decremented.	R/W

Note: S-TYPE-3, P-TYPE-3

DARA[4:0] bits (Destination Address Extended Repeat Area)

DARA[4:0] bits specify the extended repeat area on the destination address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer destination, do not specify the extended repeat area on the destination address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 00b (the transfer destination is specified as the repeat area or block area), write 00000b in the DARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the DARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.DARIE bit set to 1. Table 16.2 lists the settings and the corresponding extended repeat areas.

DADR bits (Destination Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMDAR after reloading DMDRR.

When this bit is set to 1, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after reloading DMDRR.

When this bit is set to 0, DMDAR only reloads DMDRR. This behavior is described in Table 16.13.

In normal, repeat or block transfer mode, this bit is ignored.

DM[1:0] bits (Destination Address Update Mode)

DM[1:0] bits select the mode of updating the destination address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the destination address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

SARA[4:0] bits (Source Address Extended Repeat Area)

SARA[4:0] bits specify the extended repeat area on the source address. The extended repeat area function is realized by updating the specified lower address bits with the remaining upper address bits fixed. The size of the extended repeat area can be any power of two between 2 bytes and 128 Mbytes.

When the lower address overflows the extended repeat area by address increment, the start address of the extended repeat area is set. Similarly, when the lower address underflows the extended repeat area by address decrement, the end address of the extended repeat area is set.

When the repeat area or block area is specified as a transfer source, do not specify the extended repeat area on the source address. When repeat transfer or block transfer is selected, and when DMTMD.DTS[1:0] = 01b (the transfer source is specified as the repeat area or block area), write 00000b in the SARA[4:0] bits.

In repeat-block transfer mode, write 00000b in the SARA[4:0] bits.

An interrupt can be requested when an overflow or underflow occurs in the extended repeat area with the DMINT.SARIE bit set to 1. Table 16.2 lists the settings and the corresponding extended repeat areas.

SADR bits (Source Address Update Select After Reload)

In repeat-block transfer mode, this bit specifies the behavior of DMSAR after reloading DMSRR.

When this bit is set to 1, an index value ((DMSBSH-DMSBSL) × DataSize) is added to DMSAR after reloading DMSRR.

When this bit is set to 0, DMSAR only reloads DMSRR. This behavior is described in Table 16.12.

In normal, repeat or block transfer mode, this bit is ignored.

SM[1:0] bits (Source Address Update Mode)

SM[1:0] bits select the mode of updating the source address.

When increment is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is incremented by 1, 2, or 4, respectively.

When decrement is selected and the DMTMD.SZ[1:0] bits are set to 00b, 01b, or 10b, the source address is decremented by 1, 2, or 4, respectively.

When offset addition is selected, the offset specified by the DMOFR register is added to the address.

Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (1 of 2)

SARA[4:0] or DARA[4:0] settings	Extended repeat area
00000b	Not specified
00001b	2 bytes specified as extended repeat area by the lower 1 bit of the address
00010b	4 bytes specified as extended repeat area by the lower 2 bits of the address
00011b	8 bytes specified as extended repeat area by the lower 3 bits of the address
00100b	16 bytes specified as extended repeat area by the lower 4 bits of the address
00101b	32 bytes specified as extended repeat area by the lower 5 bits of the address
00110b	64 bytes specified as extended repeat area by the lower 6 bits of the address
00111b	128 bytes specified as extended repeat area by the lower 7 bits of the address
01000b	256 bytes specified as extended repeat area by the lower 8 bits of the address
01001b	512 bytes specified as extended repeat area by the lower 9 bits of the address
01010b	1 Kbyte specified as extended repeat area by the lower 10 bits of the address
01011b	2 Kbytes specified as extended repeat area by the lower 11 bits of the address
01100b	4 Kbytes specified as extended repeat area by the lower 12 bits of the address
01101b	8 Kbytes specified as extended repeat area by the lower 13 bits of the address
01110b	16 Kbytes specified as extended repeat area by the lower 14 bits of the address
01111b	32 Kbytes specified as extended repeat area by the lower 15 bits of the address
10000b	64 Kbytes specified as extended repeat area by the lower 16 bits of the address
10001b	128 Kbytes specified as extended repeat area by the lower 17 bits of the address
10010b	256 Kbytes specified as extended repeat area by the lower 18 bits of the address
10011b	512 Kbytes specified as extended repeat area by the lower 19 bits of the address

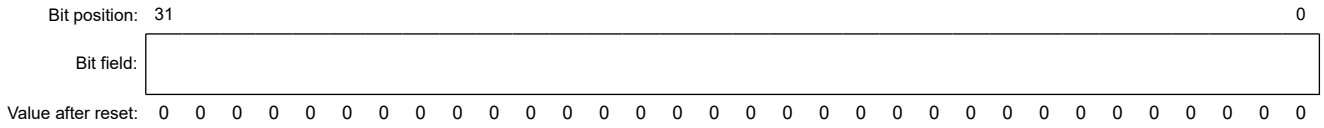
Table 16.2 SARA[4:0] or DARA[4:0] settings and corresponding repeat areas (2 of 2)

SARA[4:0] or DARA[4:0] settings	Extended repeat area
10100b	1 Mbyte specified as extended repeat area by the lower 20 bits of the address
10101b	2 Mbytes specified as extended repeat area by the lower 21 bits of the address
10110b	4 Mbytes specified as extended repeat area by the lower 22 bits of the address
10111b	8 Mbytes specified as extended repeat area by the lower 23 bits of the address
11000b	16 Mbytes specified as extended repeat area by the lower 24 bits of the address
11001b	32 Mbytes specified as extended repeat area by the lower 25 bits of the address
11010b	64 Mbytes specified as extended repeat area by the lower 26 bits of the address
11011b	128 Mbytes specified as extended repeat area by the lower 27 bits of the address
11100b to 11111b	Setting prohibited.

16.2.14 DMOFR : DMA Offset Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x18



Bit	Symbol	Function	R/W
31:0	n/a	Specifies the offset when offset addition is selected as the address update mode for transfer source or destination. 0x00000000 to 0x00FFFFFF (0 bytes to (16 M – 1) bytes) 0xFF000000 to 0xFFFFFFFF (–16 Mbytes to –1 byte)	R/W

Note: S-TYPE-3, P-TYPE-3

Write to this register while the DMAC operation is stopped or DMA transfer is disabled (not during data transfer).

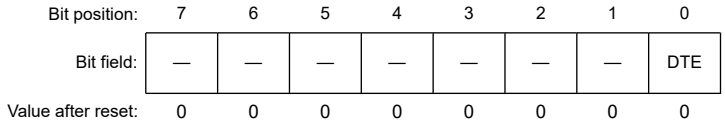
Setting bits 31 to 25 is invalid; a value of bit 24 is extended to bits 31 to 25. Reading DMOFR returns the extended value.

In repeat-block transfer mode, the offset is not specified by DMOFR when offset addition is selected, write 0 to DMOFR.

16.2.15 DMCNT : DMA Transfer Enable Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1C



Bit	Symbol	Function	R/W
0	DTE	DMA Transfer Enable 0: Disables DMA transfer. 1: Enables DMA transfer.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

DTE bit (DMA Transfer Enable)

When the DMAST.DMST bit is set to 1 (DMAC activation is enabled) and this bit is set to 1 (DMA transfer is enabled), DMA transfer can be started for the corresponding channel.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When 0 is written to this bit.
- When the specified total volume of data transfer is completed.
- When DMA transfer is stopped by the repeat size end interrupt.
- When DMA transfer is stopped by the extended repeat area overflow interrupt.
- When DMA transfer is stopped by the access error occurs. See section 16.5. Processing on DMA Transfer Error.

If the DTE of the corresponding channel is set to 0 during DMA transfer, no new transfer requests will be accepted after the transfer ends.

16.2.16 DMREQ : DMA Software Start Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	CLRS	—	—	—	SWREQ
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SWREQ	DMA Software Start 0: DMA transfer is not requested. 1: DMA transfer is requested.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	CLRS	DMA Software Start Bit Auto Clear Select 0: SWREQ bit is cleared after DMA transfer is started by software. 1: SWREQ bit is not cleared after DMA transfer is started by software.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

SWREQ bit (DMA Software Start)

When 1 is written to SWREQ bit, a DMA transfer request is generated. After DMA transfer is started in response to the request, this bit is cleared to 0 if the CLRS bit is set to 0. This bit is not cleared to 0 while the CLRS bit is set to 1. In this case, a DMA transfer request can be issued again after completion of a transfer.

Note that, however, setting this bit is valid and DMA transfer by software is enabled only when the DMTMD.DCTG[1:0] bits are set to 00b (DMAC activation source is software).

Setting this bit is invalid when the DMTMD.DCTG[1:0] bits are set to a value other than 00b.

To start DMA transfer by software with the CLRS bit being 0, ensure that the SWREQ bit is 0, and then write 1 to the SWREQ bit.

[Setting condition]

- When 1 is written to this bit.

[Clearing conditions]

- When a DMA transfer request by software is accepted and DMA transfer is started while the CLRS bit is set to 0 (the SWREQ bit is cleared after DMA transfer is started by software).
- When 0 is written to this bit.

When DMA transfer is stopped by the access error occurs. See section 16.5. Processing on DMA Transfer Error

CLRS bit (DMA Software Start Bit Auto Clear Select)

CLRS bit specifies whether to clear the SWREQ bit to 0 after DMA transfer is started in response to the DMA transfer request generated by setting the SWREQ bit to 1. With this bit set to 0, the SWREQ bit is cleared to 0 after DMA transfer is started. With this bit set to 1, the SWREQ bit is not cleared to 0. In this case, a DMA transfer request can be issued again after completion of a transfer.

16.2.17 DMSTS : DMA Status Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x1E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ACT	—	—	DTIF	—	—	—	ESIF
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ESIF	Transfer Escape End Interrupt Flag 0: A transfer escape end interrupt has not been generated. 1: A transfer escape end interrupt has been generated.	R/W*1
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	DTIF	Transfer End Interrupt Flag 0: A transfer end interrupt has not been generated. 1: A transfer end interrupt has been generated.	R/W*1
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	ACT	DMAC Active Flag 0: DMAC is in the idle state. 1: DMAC is operating.	R

Note: S-TYPE-3, P-TYPE-3
Note 1. Only 0 can be written to clear the flag.

ESIF flag (Transfer Escape End Interrupt Flag)

This flag indicates that the transfer escape end interrupt has been generated.

[Setting conditions]

- When 1-repeat size data transfer is completed in repeat transfer mode with the DMINT.RPTIE bit set to 1.
- When 1-block data transfer is completed in block transfer mode with the DMINT.RPTIE bit set to 1.
- When an extended repeat area overflow on the source address occurs while the DMINT.SARIE bit is set to 1 and the DMAMD.SARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer source address).
- When an extended repeat area overflow on the destination address occurs while the DMINT.DARIE bit is set to 1 and the DMAMD.DARA[4:0] bits are set to a value other than 00000b (extended repeat area is specified on the transfer destination address).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

DTIF flag (Transfer End Interrupt Flag)

This flag indicates that the transfer end interrupt has been generated.

[Setting conditions]

- When the specified number of unit-transfers are completed in normal transfer mode (the value of DMCRAL becoming 0 on completion of transfer).
- When the specified number of repeat transfer operations are completed in repeat transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).
- When the specified number of blocks have been transferred in block transfer mode and repeat-block transfer mode (the value of DMCRBL becoming 0 on completion of transfer with DMTMD.TKP = 0 or the value of DMCRBL reloading DMCRBH with DMTMD.TKP = 1).

[Clearing conditions]

- When 0 is written to this bit.
- When 1 is written to the DMCNT.DTE bit.

ACT flag (DMAC Active Flag)

This flag indicates whether the DMAC is in the idle or active state.

[Setting condition]

- When the DMAC starts data transfer operation.

[Clearing condition]

- When data transfer in response to one transfer request is completed.

16.2.18 DMSBS : DMA Source Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMSBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMSBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMSBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode See Table 16.3 for available settings.	R/W
31:16	DMSBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode See Table 16.3 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMSBSH and DMSBSL in repeat-block transfer mode. Write 0x00000000 to DMSBS in normal, repeat and block transfer mode.

DMSBSH specifies buffer size and DMSBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, source repeat area is specified by DMSBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMSBSH and DMSBSL to 0x0000 is prohibited. When final data of one buffer size is transferred,

DMSBSL reloads value of DMSBSH. When address update mode is fixed address, this register is ignored. Table 16.3 shows the setting values of DMA Source Buffer Size Register corresponding to Transfer Data Size in Source Address Update Mode.

Table 16.3 Available setting for DMSBS register in repeat-block transfer mode

Source address update mode (DMAMD.SM)	Transfer data size (DMTMD.SZ)	Available setting for DMSBSH and DMSBSL bits
Source address is fixed (SM = 00b)	Don't care	0x0000 (DMSBS is not used)
Offset addition (SM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
Source address is incremented or decremented (SM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMSBS is not used. The setting is invalid.

16.2.19 DMDBS : DMA Destination Buffer Size Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x2C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	DMDBSH[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	DMDBSL[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	DMDBSL[15:0]	Functions as data transfer counter in repeat-block transfer mode. See Table 16.4 for available settings.	R/W
31:16	DMDBSH[15:0]	Specifies the repeat-area size in repeat-block transfer mode. See Table 16.4 for available settings.	R/W

Note: S-TYPE-3, P-TYPE-3

Set the same value for DMDBSH and DMDBSL in repeat-block transfer mode. Write 0x00000000 to DMDBS in normal, repeat and block transfer mode.

DMDBSH specifies buffer size and DMDBSL functions as a 16-bit buffer size counter in repeat-block transfer mode. In repeat-block transfer mode, destination repeat area is specified by DMDBSH.

When address update mode is incremented address or decremented address, this register means the numbers of data of whole buffer. When address update mode is offset addition, this register means the numbers of data of an individual buffer. In offset addition, setting DMDBSH and DMDBSL to 0x0000 is prohibited. When final data of one buffer size is transferred, DMDBSL reloads value of DMDBSH. When address update mode is fixed address, this register is ignored. Table 16.4 shows the setting values of Destination Buffer Size Register corresponding to Transfer Data Size in Destination Address Update Mode.

Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (1 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Destination address is fixed (DM = 00b)	Don't care	0x0000 (DMDBS is not used)

Table 16.4 Available setting for DMDBS register in repeat-block transfer mode (2 of 2)

Destination address update mode (DMAMD.DM)	Transfer data size (DMTMD.SZ)	Available setting for DMDBSH and DMDBSL bits
Offset addition (DM = 01b)	8 bits (SZ = 00b)	0x0001 to 0xFFFF (1 to 65535)
	16 bits (SZ = 01b)	0x0001 to 0x7FFF (1 to 32767)
	32 bits (SZ = 10b)	0x0001 to 0x3FFF (1 to 16383)
Destination address is incremented or decremented (DM = 1xb)	Don't care	0x0000 (infinite) 0x0001 to 0xFFFF (1 to 65535)

In normal, repeat and block transfer mode, DMDBS is not used. The setting is invalid.

16.2.20 DMBWR : DMA Bufferable Write Enable Register

Base address: DMAC0n = 0x4000_A000 + 0x0040 × n (n = 0 to 7)
DMAC0n_NS = 0x5000_A000 + 0x0040 × n (n = 0 to 7)

Offset address: 0x30

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	BWE
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	BWE	Bufferable Write Enable 0: Disables Bufferable Write 1: Enables Bufferable Write	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

BWE bit (Bufferable Write Enable)

BWE bit indicates bufferable write is either enabled or disabled.

If this bit is 1, even if the write access as DMAC is completed, the actual slave write may not have ended.

When this bit is 1, it requests an early response by writing write data to the temporary buffer if possible to the slave. Therefore, even if write access as DMAC is completed, the actual slave write may not be finished. If an error occurs during write access to the target slave, the error may not be detected and the transfer may not be automatically stopped. In such cases, the error response detection interrupt (DMA_TRANSERR) will not occur.

See section 14.7.2. Operations When a Bus Error Occurs for slave groups that support bufferable writes and slave groups for which error response detection interrupts cannot be generated.

Some individual slave modules also support bufferable writes, so Refer to the respective module chapters.

[Setting condition]

- When 1 is written to this bit

[Clearing conditions]

- When 0 is written to this bit

16.2.21 DMAST : DMA Module Activation Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMST
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DMST	DMAC Operation Enable 0: DMAC activation is disabled. 1: DMAC activation is enabled.	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE2

DMST bit (DMAC Operation Enable)

Setting the DMAST.DMST to 1 enables DMAC activation for all channels. When the DMST bit is set to 1 (DMAC activation is enabled), and 1 is written to the DMCNT.DTE bit (DMA transfer is enabled) for multiple channels, all associated channels can be placed in the transfer request ready state at the same time.

When the DMST bit clears to 0 during DMA transfer, DMA transfer is suspended after the current data transfer associated with a single transfer request completes. To resume DMA transfer, set the DMST bit to 1 again.

[Setting condition]

- When 1 is written to this bit.

[Clearing condition]

- When 0 is written to this bit.

16.2.22 DMECHR : DMAC Error Channel Register

Base address: DMA0 = 0x4000_A800
DMA0_NS = 0x5000_A800

Offset address: 0x40

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DMECHSAM	—	—	—	—	—	DMECH		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	DMECH	DMAC Error channel Indicates the channel number causing the error 0 0 0: Error occurred on Channel 0 0 0 1: Error occurred on Channel 1 0 1 0: Error occurred on Channel 2 ⋮ ⋮ 1 1 1: Error occurred on Channel 7	R
7:3	—	These bits are read as 0. The write value should be 0.	R

Bit	Symbol	Function	R/W
8	DMECHSAM	DMAC Error channel Security Attribution Monitor Indicates the security attribution of a channel causing the error 0: secure channel 1: non-secure channel	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DMESTA	DMAC Error Status 0: No DMA transfer error occurred 1: DMA transfer error occurred	R/W*1
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE-2 See below for access by security attribution.
Note 1. Writing to DMESTA depends on the value of DMECHSAM

When reading this register, it can be accessed from both secure and non-secure access.

When writing this register, it depends on DMECHR.DMESA.

- When DMESA = 1, it can be accessed from secure and non-secure access.
- When DMESA = 0, it can be accessed from secure. An error is returned when write access is performed in a non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt (DMA0_TRANSERR) in BUS.OADCFG.OAD when you want to debug the program.

DMECH[2:0] bit (DMAC Error channel)

When a transfer error due to DMA transfer occurs, it stores the channel of DMAC that was violated.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMECHSAM bit (DMAC Error channel Security Attribution Monitor)

When a transfer error due to DMA transfer occurs, it indicates the security attribution of the violating DMAC channel.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs and DMESTA = 0.

[Clearing condition]

- When 1 is written to DMESTA.

DMESTA bit (DMAC Error Status)

Indicates whether or not a DMA transfer error occurred.

DMECH, DMECHSAM, DMESTA are cleared by writing 1 to DMESTA. Writing 0 to DMESTA is ignored.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Set condition]

- When the DMAC transfer error occurs.

[Clearing condition]

- When 1 is written to DMESTA.

Note: When DMECHSAM = 1, it can be cleared in the secure state and non-secure state. DMECHSAM = 0, it can not be cleared in the non-secure state.

16.3 Operation

16.3.1 Transfer Mode

16.3.1.1 Normal Transfer Mode

In normal transfer mode, one data is transferred by one transfer request. A maximum of 65535 can be set as the number of transfer operations using the DMCRAL register. When these bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped (free-running function). Setting DMCRB register is invalid in normal transfer mode. Except in free-running function, a transfer end interrupt request can be generated after completion of the specified number of transfer operations.

Table 16.5 summarizes the register update operation in normal transfer mode, and Figure 16.2 shows the operation in normal transfer mode.

Table 16.5 Register update operation in normal transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition
DMCRAL	Transfer count	Decremented by one/not updated (in free running function)
DMCRAH	—	Not updated (Not used in normal transfer mode)
DMCRB	—	Not updated (Not used in normal transfer mode)

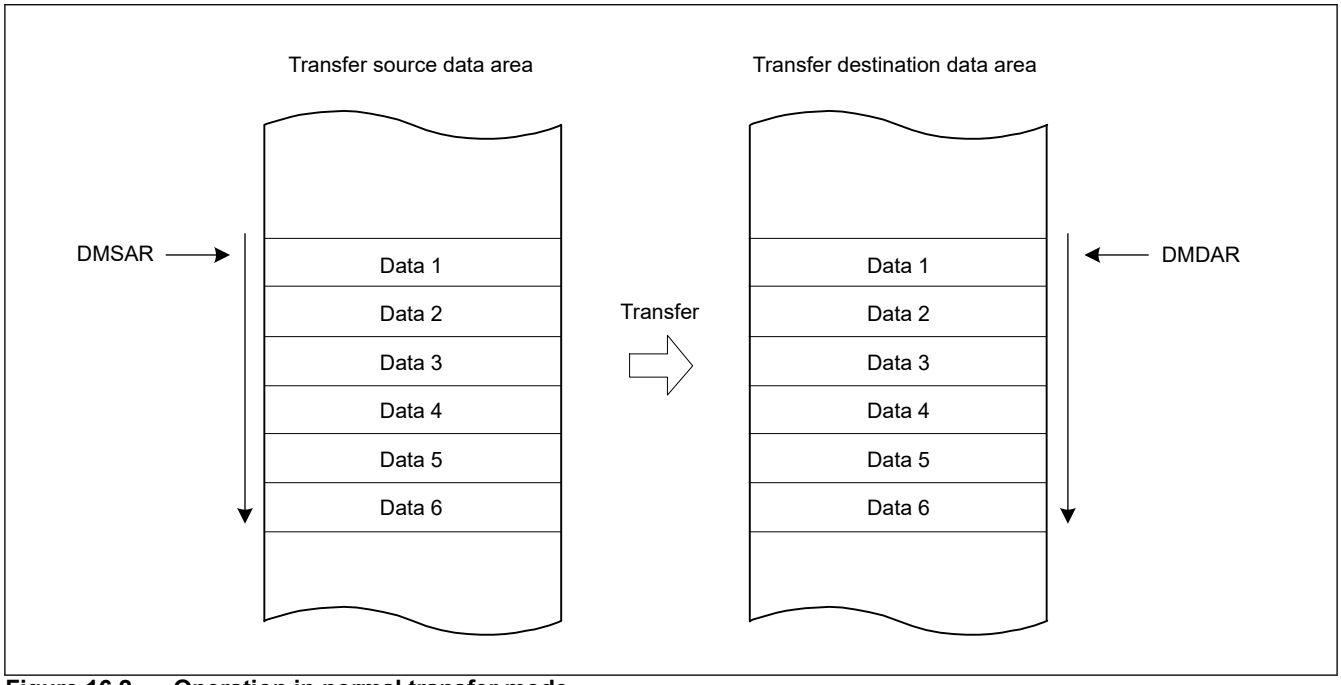


Figure 16.2 Operation in normal transfer mode

16.3.1.2 Repeat Transfer Mode

In repeat transfer mode, one data is transferred by one transfer request.

A maximum of 1K data can be set as a total repeat transfer size using DMCRA register.

A maximum of 64K can be set as the number of repeat transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of repeat transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a repeat area. When transfer of the repeat size data is completed, the address of the specified repeat area (DMSAR or DMDAR) returns to the transfer start address. When data of the specified repeat size has all been transferred in repeat transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

A transfer end interrupt request can be generated after completion of the specified number of repeat transfer operations.

Table 16.6 summarizes the register update operation in repeat transfer mode, and Figure 16.3 shows the operation in repeat transfer mode.

Table 16.6 Register update operation in repeat transfer mode

Register	Function	Update operation after completion of a transfer by one transfer request	
		When DMCRAL register is not 1	When DMCRAL register is 1 (Transfer of the last data in repeat size)
DMSAR	Transfer source address	Increment/decrement/fixed/offset addition	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	Increment/decrement/fixed/offset addition	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMCRAH	Repeat size	Not updated	Not updated
DMCRAL	Transfer count	Decremented by one	DMCRAH
DMCRBH	Number of repeat transfer operations	Not updated	Not updated
DMCRBL	Count of repeat transfer operations	Not updated	Decremented by one

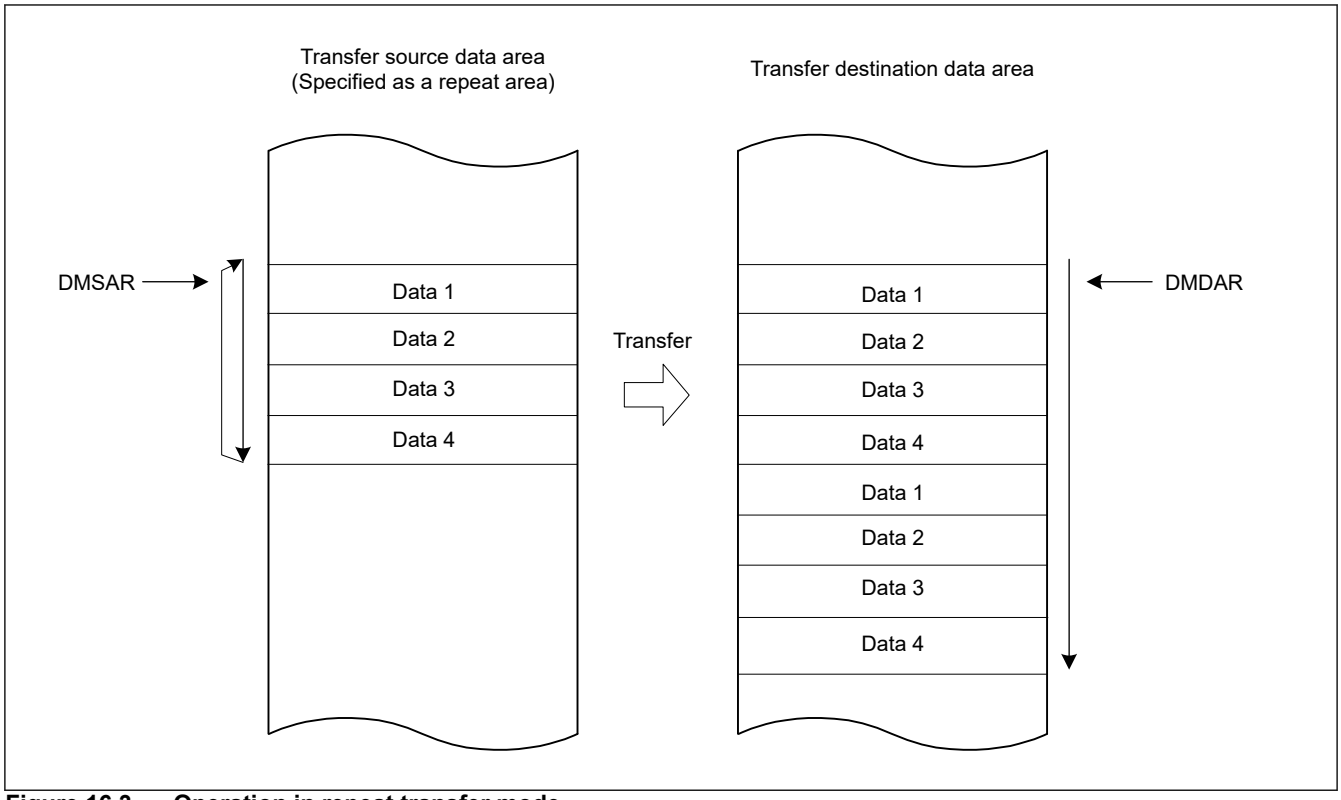

Figure 16.3 Operation in repeat transfer mode

16.3.1.3 Block Transfer Mode

In block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA register.

A maximum of 64K can be set as the number of block transfer operations using DMCRB register; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

Either the transfer source or transfer destination can be specified as a block area. When transfer of a single block data is completed, the address of the specified block area (DMSAR or DMDAR) returns to the transfer start address. When a single block data has all been transferred in block transfer mode, DMA transfer can be stopped, and the repeat size end interrupt can be requested. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the repeat size end interrupt handling.

Transfer end interrupt request can be generated after completion of the specified number of block transfer operations.

Table 16.7 summarizes the register update operation in block transfer mode, and Figure 16.4 shows the operation in block transfer mode.

Table 16.7 Register update operation in block transfer mode (1 of 2)

Register	Function	Update operation after completion of single-block transfer by one transfer request
DMSAR	Transfer source address	• DMTMD.DTS[1:0] = 00b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 01b Initial value of DMSAR • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition
DMDAR	Transfer destination address	• DMTMD.DTS[1:0] = 00b Initial value of DMDAR • DMTMD.DTS[1:0] = 01b Increment/decrement/fixed/offset addition • DMTMD.DTS[1:0] = 10b Increment/decrement/fixed/offset addition

Table 16.7 Register update operation in block transfer mode (2 of 2)

Register	Function	Update operation after completion of single-block transfer by one transfer request
DMCRAH	Block size	Not updated
DMCRAL	Transfer count	DMCRAH
DMCRBH	Number of block transfer operations	Not updated
DMCRBL	Count of block transfer operations	Decremented by one

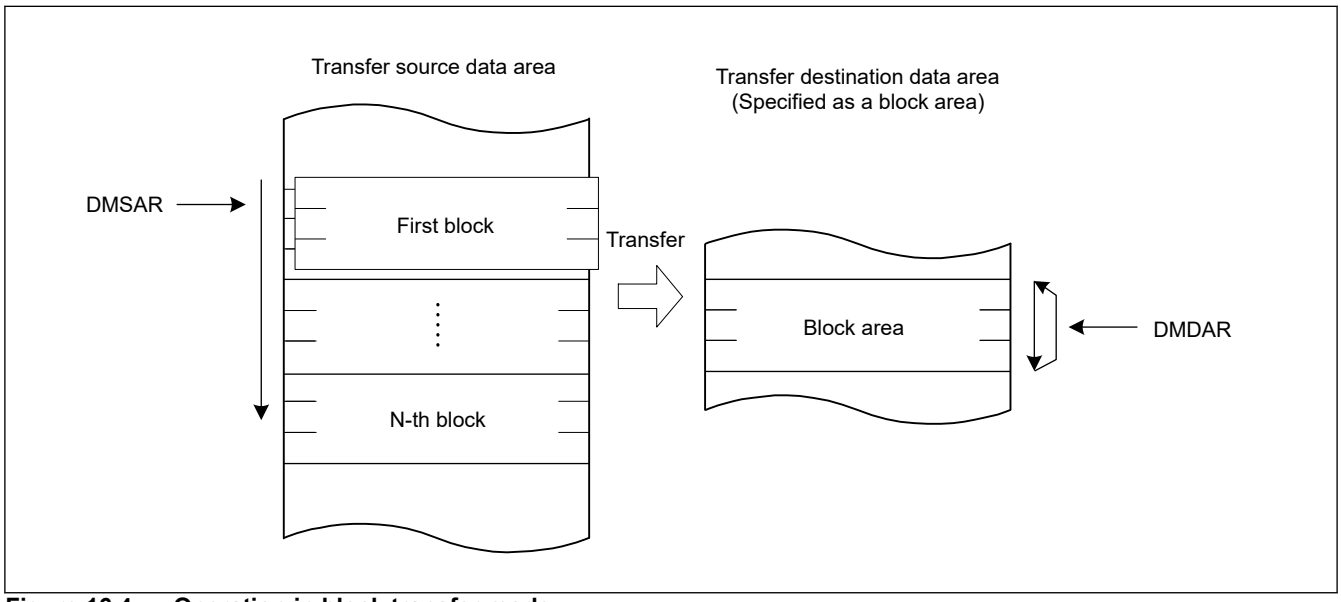

Figure 16.4 Operation in block transfer mode

16.3.1.4 Repeat-Block Transfer Mode

Repeat-block transfer is the operation mode with the following functions added to the block transfer function.

Repeat function: Added function (ring buffer) to repeat specified address area.

Offset function: Multiple areas with offset can be specified within one block transfer.

The repeat function and the offset function can be used for both the transfer source and the transfer destination of repeat-block transfer.

Figure 16.5 shows an example of adding a repeat function to the transfer destination.

Figure 16.6 shows repeat-block transfer with an offset to the transfer destination.

In repeat-block transfer mode, a single block data is transferred by one transfer request.

A maximum of 1K data can be set as a total block transfer size using DMCRA of the DMACn.

A maximum of 64K can be set as the number of block transfer operations using DMCRB of the DMACn; therefore, a maximum of 64M data (1K data × 64K counts of block transfer operations) can be set as a total data transfer size.

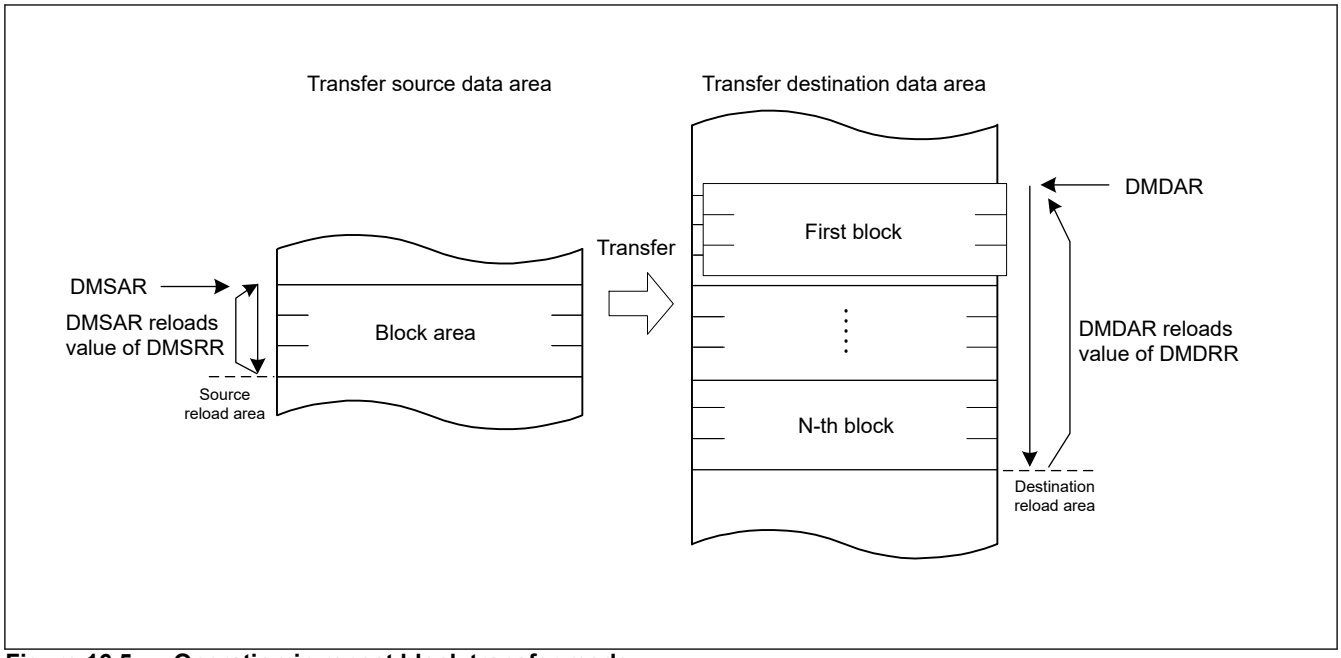

Figure 16.5 Operation in repeat block transfer mode

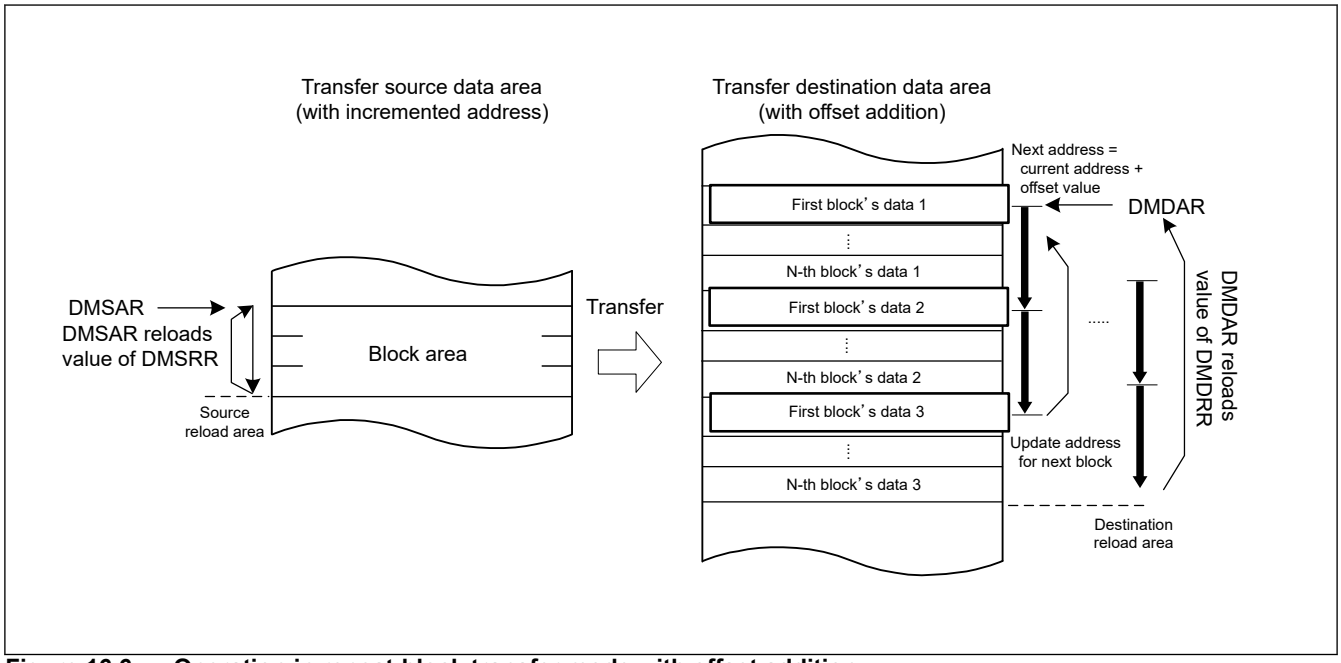

Figure 16.6 Operation in repeat-block transfer mode with offset addition

Table 16.8 to Table 16.13 summarize the register update operations in repeat-block transfer mode.

For more information about address update function in repeat-block transfer mode, see section 16.3.5. Address Update Function in Repeat-Block Transfer Mode.

16.3.2 Extended Repeat Area Function

The DMAC supports a function to specify the extended repeat areas on the transfer source and destination addresses. With the extended repeat areas set, the address registers repeatedly indicate the addresses of the specified extended repeat areas.

The extended repeat areas can be specified separately to the transfer source address register (DMSAR) and transfer destination address register (DMDAR).

The extended repeat area on the source address is specified by the DMAMD.SARA[4:0] bits. The extended repeat area on the destination address is specified by the DMAMD.DARA[4:0] bits. The size can be specified separately for the source and destination sides.

However, the area (of transfer source or transfer destination) which is specified as the repeat area or block area should not be specified as the extended repeat area.

When the address register value reaches the end address of the extended repeat area and the extended repeat area overflows, DMA transfer is stopped and an interrupt by an extended repeat area overflow can be requested. When an overflow occurs in the extended repeat area on the transfer source while the DMINT.SARIE bit is set to 1, the DMSTS.ESIF flag is set to 1 and the DMCNT.DTE bit is cleared to 0 to stop DMA transfer. At this time, if the DMINT.ESIE bit is set to 1, an interrupt by an extended repeat area overflow is requested. When the DMINT.DARIE bit is set to 1, the destination address register becomes a target to apply the function. DMA transfer can be resumed by writing 1 to the DMCNT.DTE bit in the interrupt handling.

Figure 16.7 shows an example of the extended repeat area operation.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b). The data size is eight bits (DMTMD.SZ[1:0] = 00b).

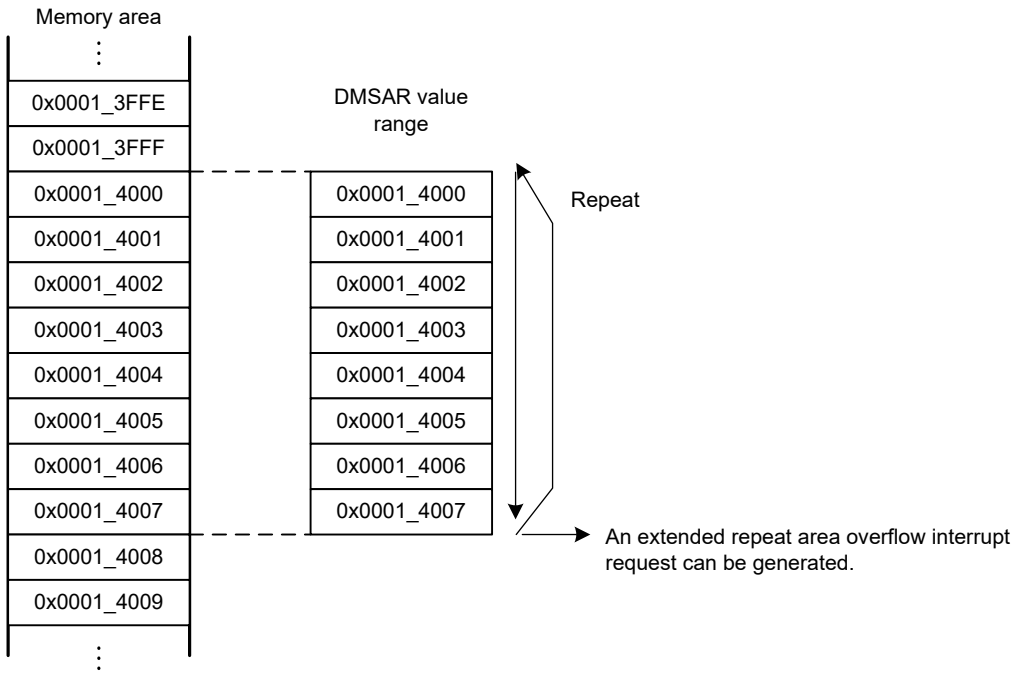

Figure 16.7 Example of extended repeat area operation

When an interrupt by an extended repeat area overflow is used in block transfer mode, the following should be taken into consideration.

When a transfer is stopped by an interrupt by an extended repeat area overflow, the address register must be set so that the block size is a power of 2 or the block size boundary is aligned with the extended repeat area boundary. When an overflow on the extended repeat area occurs during a transfer of one block, the interrupt by the overflow is suspended until transfer of the block is completed, and the transfer overruns.

Figure 16.8 shows an example when the extended repeat area function is used in block transfer mode.

Eight bytes are specified as an extended repeat area by the lower three bits of DMSAR (DMAMD.SARA[4:0] bits = 00011b), block transfer mode with block size 5 is set (DMCRA = 0x0005_0005), and transfer source address is not specified as a block area. Data size is eight bits (DMTMD.SZ[1:0] bits = 00b).

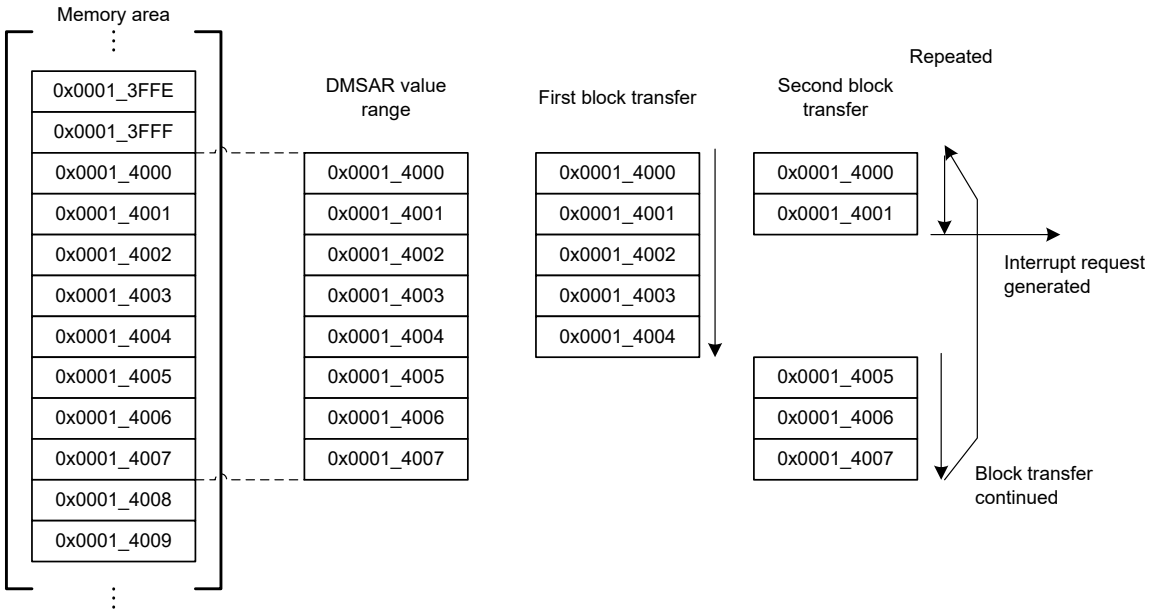

Figure 16.8 Example of extended repeat area function in block transfer mode

16.3.3 Free-running Function

The DMAC supports free-running function. This function allows to transfer repeatedly without reconfiguring in interrupt handler.

16.3.3.1 In Normal Transfer Mode

In normal transfer mode, when DMCRA.DMCRAL bits are set to 0x0000, no specific number of transfer operations is set; data transfer is performed with the transfer counter stopped.

For more information, see section 16.3.1.1. Normal Transfer Mode.

16.3.3.2 In Other Transfer Modes

In repeat, block and repeat-block transfer mode, the DMAC supports free-running function using the DMTMD.TKP bit. If the DMTMD.TKP bit is to be set to 1, the transfer is not stopped by completion of specified total number of transfer operations and reloads DMCRBH repeatedly.

Figure 16.9 show an example of block transfer operation without free-running function.

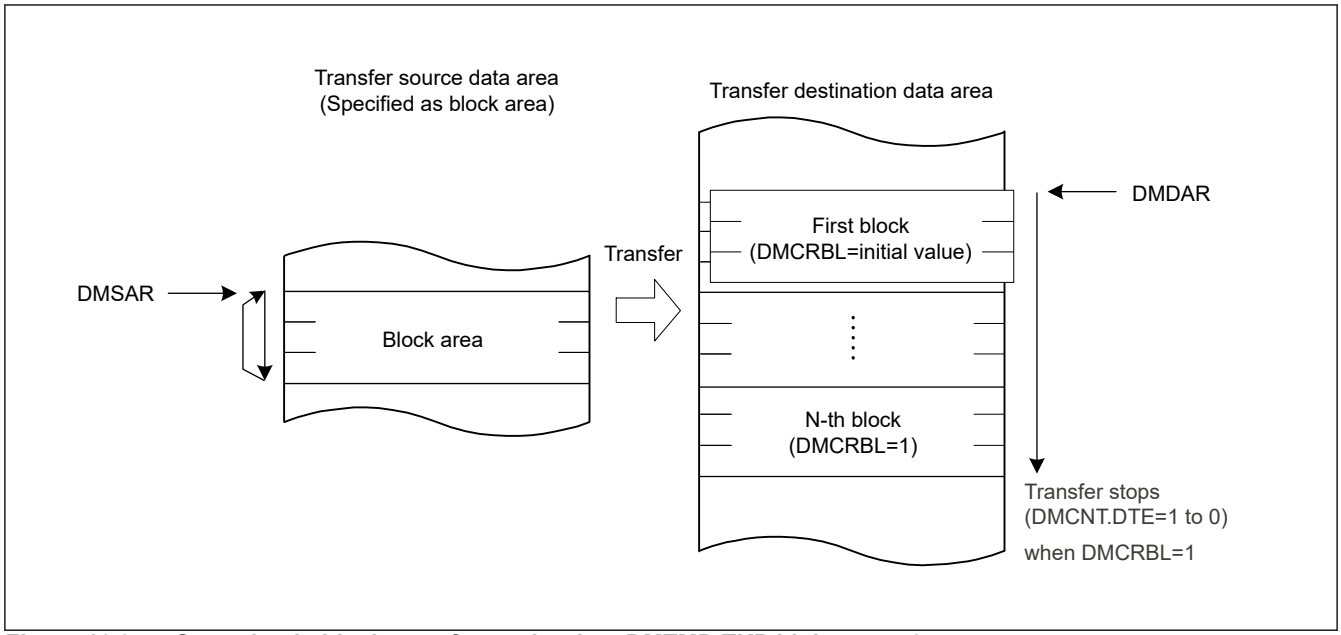

Figure 16.9 Operation in block transfer mode when DMTMD.TKP bit is set to 0

Figure 16.10 show an example of block transfer operation with free-running function.

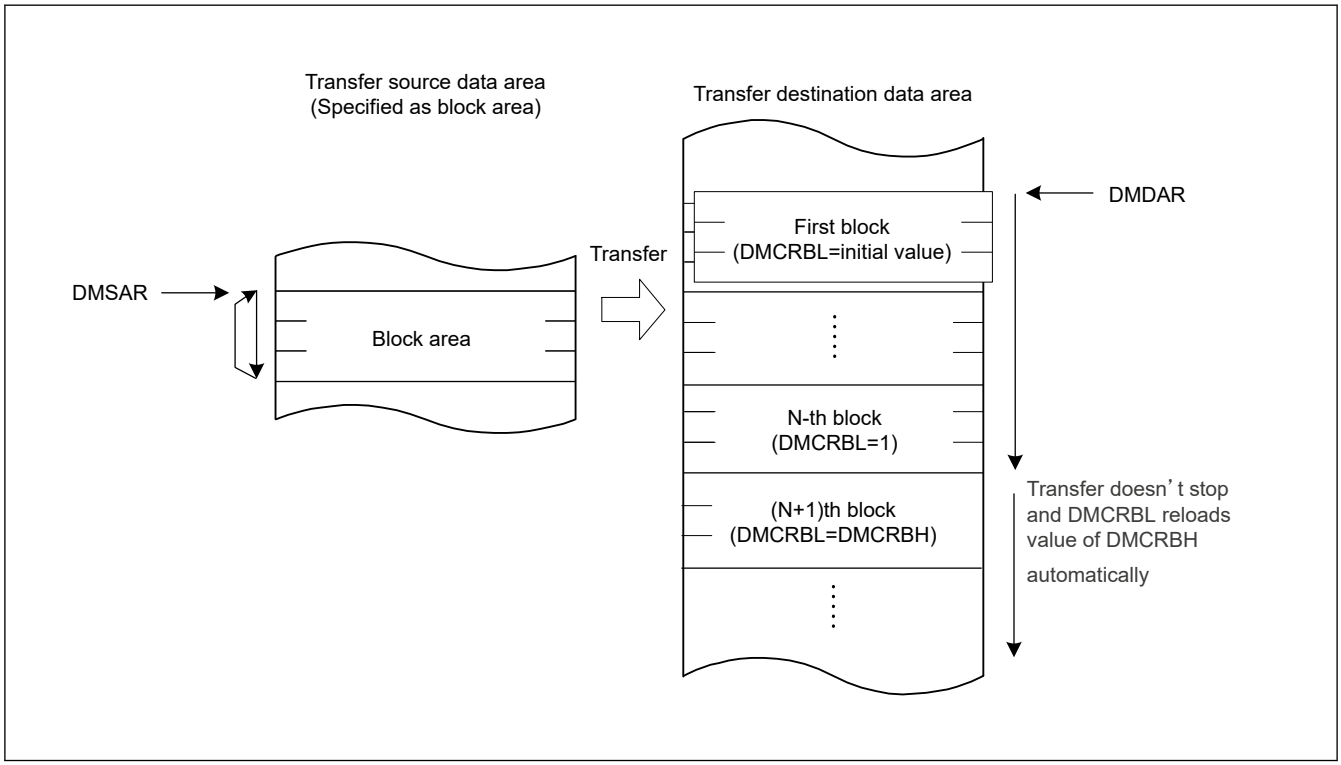

Figure 16.10 Operation in block transfer mode when DMTMD.TKP bit is set to 1

16.3.4 Address Update Function using Offset

The source and destination addresses can be updated by fixing, increment, decrement, or offset addition. In normal, repeat and block transfer mode, when the offset addition is selected, the offset specified by the DMA offset register (DMOFR) is added to the address every time the DMAC performs one data transfer. This function realizes a data transfer where addresses are allocated to separated areas.

Offset subtraction can also be realized by setting a negative value in DMOFR. In this case, the negative value must be 2's complement.

DMSBS or DMDBS are used instead of DMOFR in repeat-block transfer mode. For more information section 16.3.1.4. Repeat-Block Transfer Mode

Table 16.14 shows the address update method in each address update mode.

Table 16.14 Address update method in each address update mode

Address update mode	Settings of DMAMD.SM[1:0] and DMAMD.DM[1:0] for address update modes	Address update method (for different SZ[1:0] settings in DMTMD)		
		SZ[1:0] = 00b	SZ[1:0] = 01b	SZ[1:0] = 10b
Address fixed	00b	Fixed		
Offset addition	01b	+DMOFR*1		
Increment	10b	+1	+2	+4
Decrement	11b	–1	–2	–4

Note 1. When setting a negative value in the DMA Offset Register, the value must be in two's complement, obtained by the following formula:
two's complement of a negative offset value = ~ (offset) + 1 (~ = bit inversion)

16.3.4.1 Basic Transfer Using Offset Addition

Figure 16.11 shows an example of address updating using offset addition.

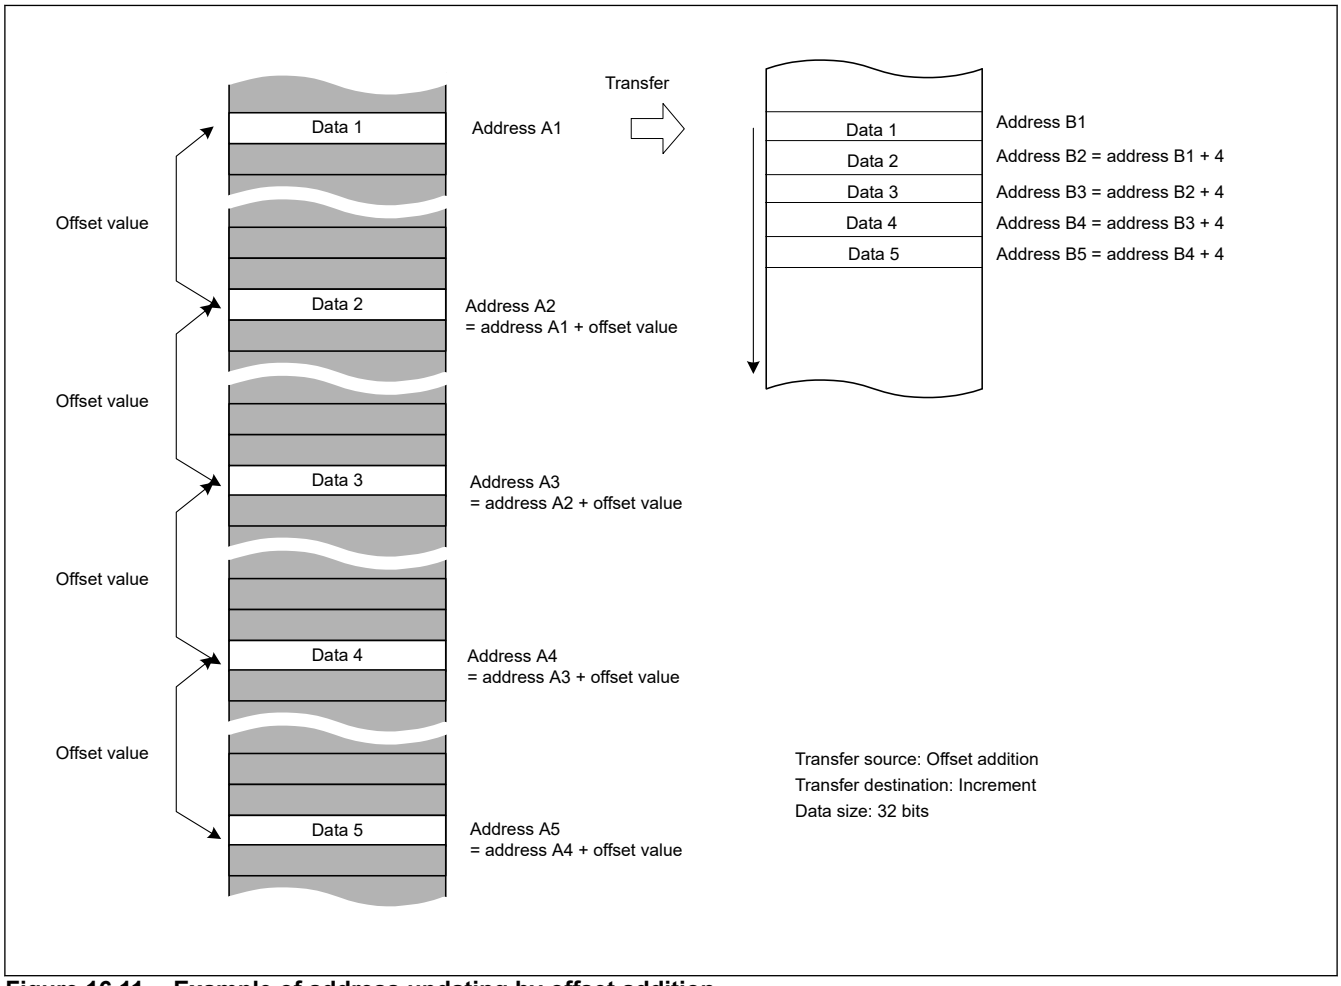

Figure 16.11 Example of address updating by offset addition

Figure 16.11 shows the setting of the following.

- The transfer data is 32 bits long.
- Offset addition is set as the transfer source address update mode.

- Increment is set as the transfer destination address update mode.

The second and subsequent data is each read from the transfer source address obtained by adding the offset value to the previous address. The data read from the addresses at the specified intervals is written to the continuous locations on the destination.

16.3.4.2 Example of XY Conversion Using Offset Addition

Figure 16.12 shows the XY conversion using offset addition in repeat transfer mode.

Settings are as follows:

- DMAMD.SM — Transfer source address update mode: Offset addition.
- DMAMD.DM — Transfer destination address update mode: Destination address is incremented.
- DMTMD.SZ — Transfer data size select: 32 bits.
- DMTMD.MD — Transfer mode select: Repeat transfer.
- DMTMD.DTS — Repeat area select: The source is specified as the repeat area.
- DMOFR — Offset address: 0x10.
- DMCRA — Repeat size: 0x4.
- DMINT.RPTIE — The repeat size end interrupt is enabled.

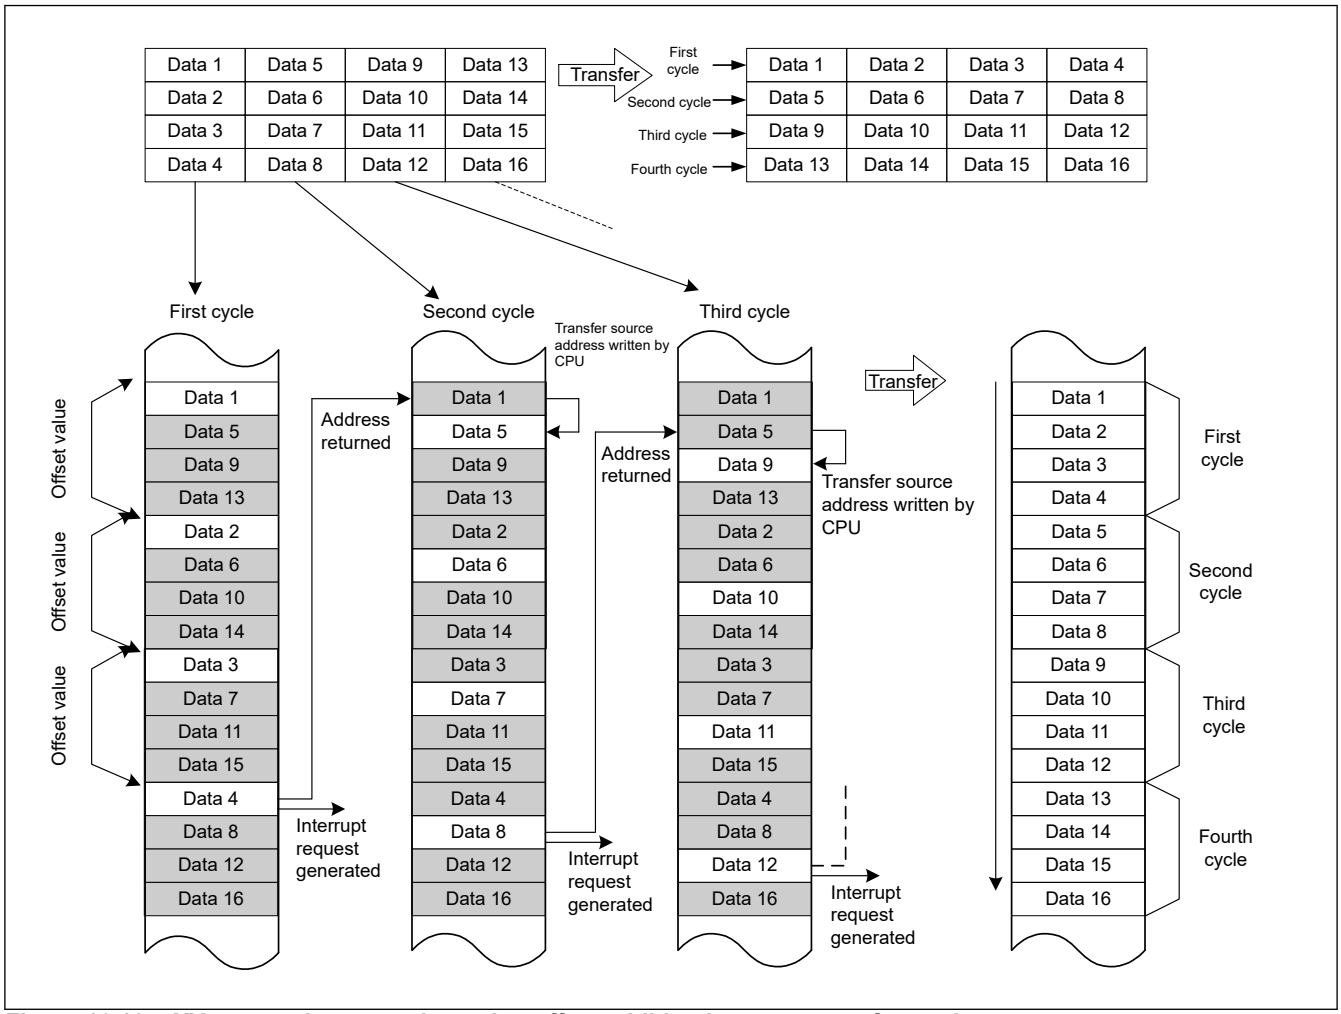

Figure 16.12 XY conversion operation using offset addition in repeat transfer mode

When a transfer starts, the offset value is added to the transfer source address every time data is transferred. The transfer data is written to continuous transfer destination addresses. When data 4 is transferred:

- The repeat size of data transfer is complete.

- The transfer source address returns to the transfer start address (the address of data 1 on the transfer source).
- A repeat size end interrupt is requested.

During the time this interrupt pauses the transfer, the following operations are performed.

- DMSAR — Rewrite the DMA transfer source address to the address of data 5
  (with the above example, the data 1 address + 4).
- DMCNT — Set the DTE bit to 1.

The DMA transfer is resumed from the state when the DMA transfer is stopped. After that, the operations described above are repeated until the transfer source data is transposed to the destination area (XY conversion).

Figure 16.13 shows a flowchart of the XY conversion.

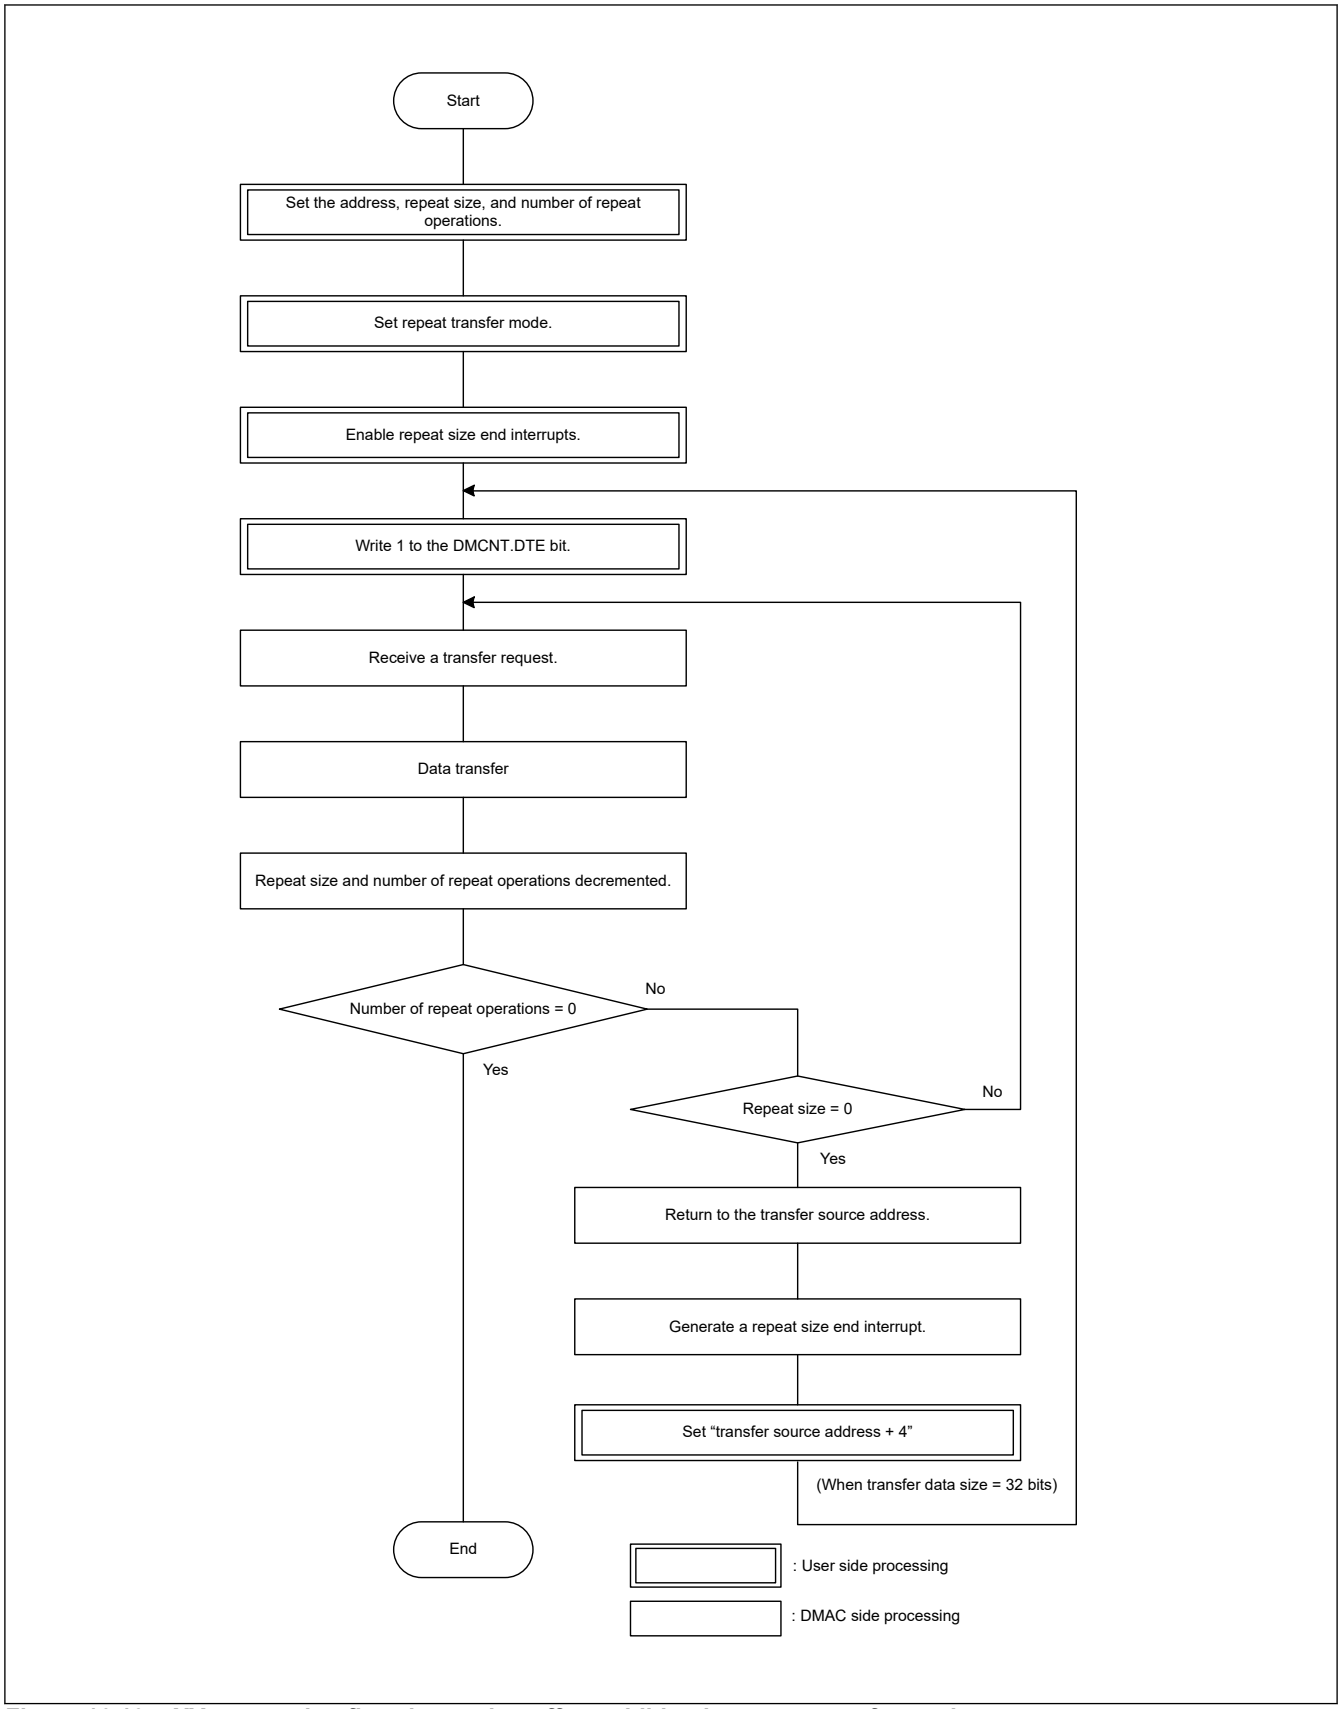

Figure 16.13 XY conversion flowchart using offset addition in repeat transfer mode

16.3.5 Address Update Function in Repeat-Block Transfer Mode

Repeat-block transfer mode is an extension of repeat transfer mode and block transfer mode. However, the detailed behavior of the address update is different from these two modes. Here are the details of the address update function in repeat-block transfer mode.

16.3.5.1 Fixed Address Mode

When DMAMD.SM[1:0] is set to 00b, the address update mode of the source is fixed address. And when DMAMD.DM[1:0] is set to 00b, the address update mode of the destination is fixed address.

In fixed address, the address is not updated from the initial value of DMSAR and DMDAR. If the block size (DMCRA) is larger than 1, the same data will be transferred multiple times for one request.

Figure 16.14 shows address update in fixed address.

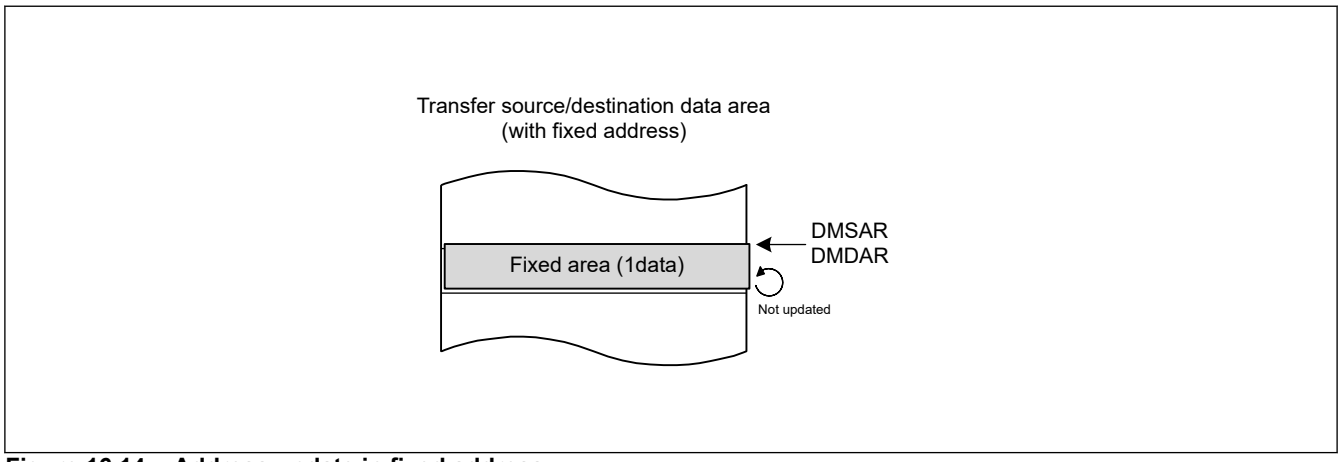

Figure 16.14 Address update in fixed address

16.3.5.2 Incremental and Decremental Address Mode

When DMAMD.SM[1:0] is set to 10b, the address update mode of the source is incremental address. And when DMAMD.DM[1:0] is set to 10b, the address update mode of the destination is incremental address. When DMAMD.SM[1:0] is set to 11b, the address update mode of the source is decremental address. And when DMAMD.DM[1:0] is set to 11b, the address update mode of the destination is decremental address.

In these update modes, the address is incremented or decremented according to the setting of DMTMD.SZ[1:0].

In these update modes DMSBS and DMDBS indicates a reload area. The unit of DMSBS and DMDBS is "number of data". At the start of transfer, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, operates as a down counter and decrements each time one data transfer is performed. When the value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

Figure 16.15 shows address update in incremental address.

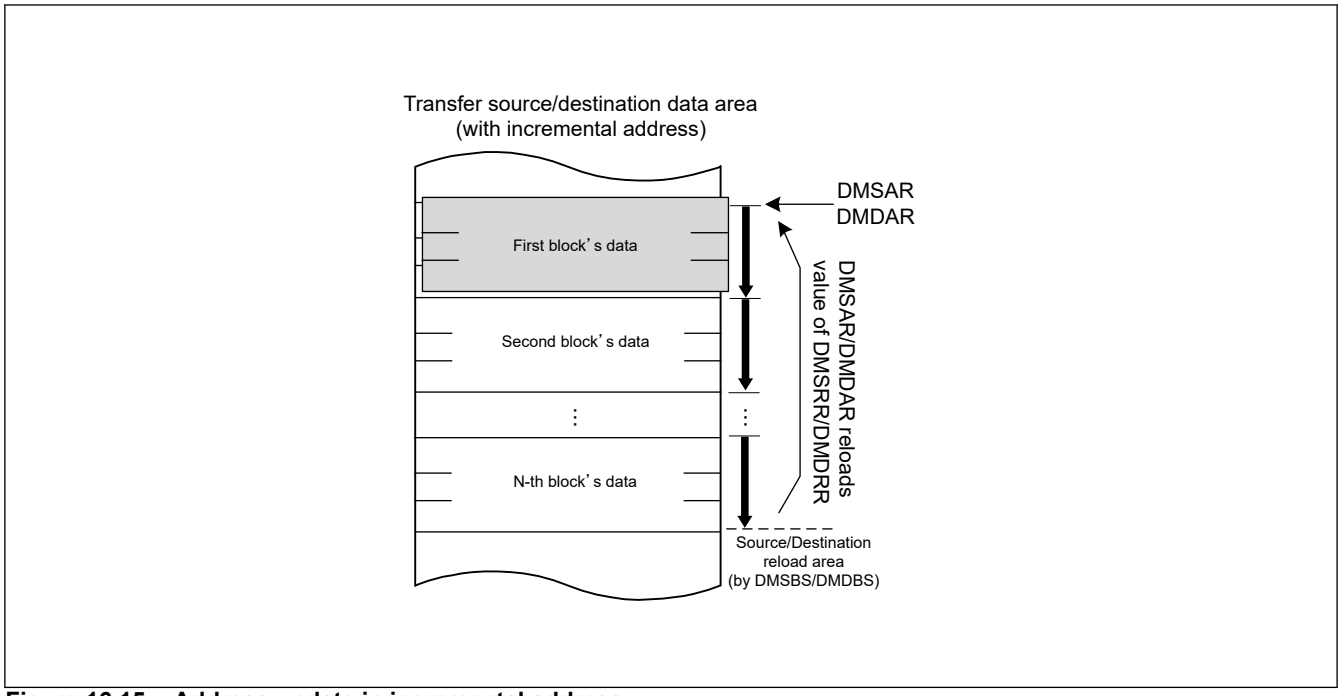

Figure 16.15 Address update in incremental address

16.3.5.3 Offset Addition Mode

When DMAMD.SM[1:0] is set to 01b, the address update mode of the source is offset addition. And when DMAMD.DM[1:0] is set to 01b, the address update mode of the destination is offset addition.

In offset addition, DMSBS and DMDBS indicates reload area and also works as an access offset value. Unlike other transfer modes, DMOFR register is not used in repeat-block transfer mode. In offset addition, the unit of DMSBS and DMDBS is the number of blocks. When the transfer starts, DMCRAL operates as a down counter, DMSAR and DMDAR reloads the value of DMSRR and DMDRR every time one block is transferred. In addition, DMSBSL and DMDBSL, which is the lower 16 bits of DMSBS and DMDBS, also operates as a down counter and decrements every time one block is transferred. When the DMSBS and DMDBS value becomes 1, DMSAR and DMDAR reloads the value of DMSRR and DMDRR.

When DMAMD.SADR and DMAMD.DADR is set to 0, offset addition operation of the same area is repeated. DMDAR only reloads DMDRR. Figure 16.16 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=0.

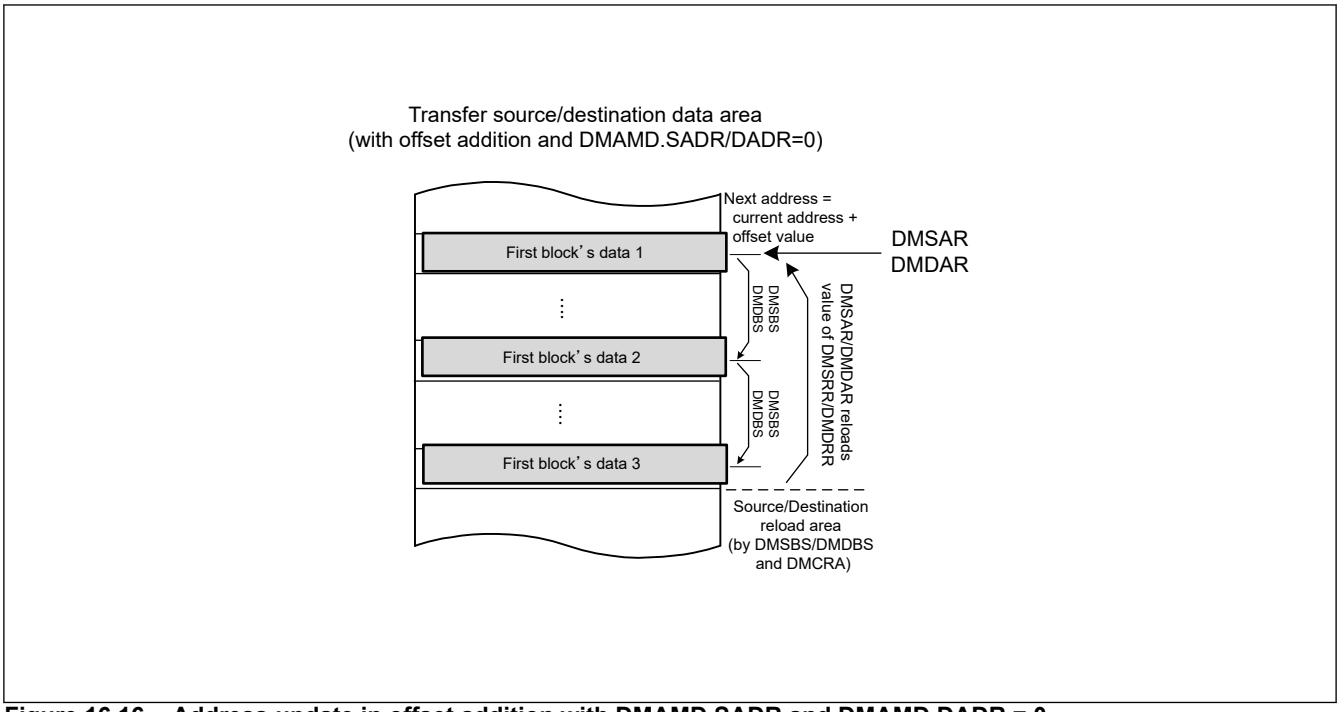

Figure 16.16 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 0

When DMAMD.SADR and DMAMD.DADR is set to 1, the address is incremented by one data unit after DMSRR and DMDRR is reloaded by DMCRAL=1. In other words, an index value ((DMDBSH-DMDBSL) × DataSize) is added to DMDAR after DMDRR is reloaded. This behavior is used to implement multiple ring buffers. Figure 16.17 shows address update in offset addition with DMAMD.SADR and DMAMD.DADR=1.

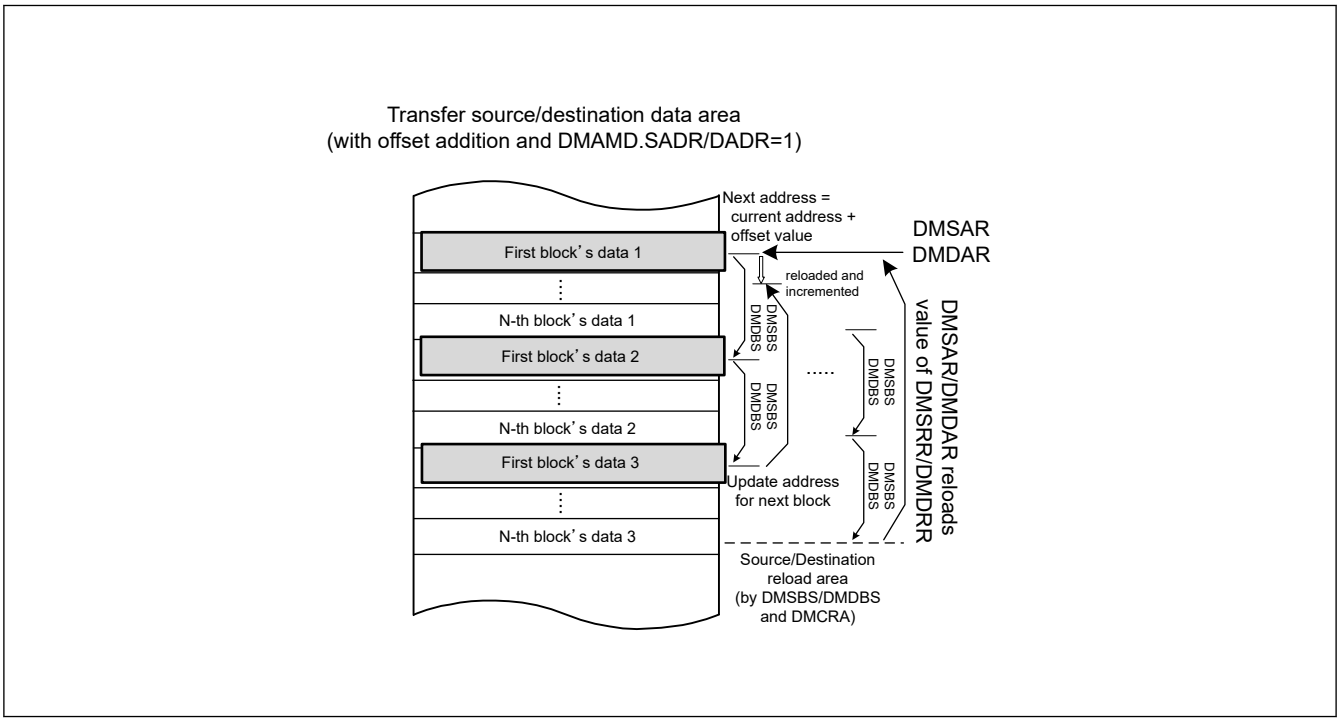

Figure 16.17 Address update in offset addition with DMAMD.SADR and DMAMD.DADR = 1

16.3.6 Example of Using Repeat-Block Transfer Mode

In repeat-block transfer mode, it is possible to realize repeated access to interval data and single or multiple ring buffers by combining the above address update modes. Following sections shows some usage examples.

16.3.6.1 Interval Address to Single Ring Buffer

Figure 16.18 shows an example of reading interval ADDRn registers (data register) of ADC12 module and storing it in single ring buffer. It transfers 2 data every 4 halfwords per 1 request. DMSAR is incremented by one data every one request. This can be achieved by setting the transfer source to offset addition and DMAMD.SADR=1, the block size (DMCRA) to 2, and the transfer source offset (DMSBS) to 4. Table 16.15 shows setting of this example.

Table 16.15 Setting of use case: from interval address to single ring buffer

Register	Value	Description
DMSAR, DMSRR	0x4033_2020	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.SADR	1	Incremental source address after reloading
DMAMD.SM[1:0]	01b	Source update mode is offset addition
DMAMD.DM[1:0]	10b	Destination update mode is incremental address
DMCRAH, DMCRAL	2	Transfer block size
DMSBSH, DMSBSL	4	Source whole buffer size (unit is 'blocks') and Source access offset (unit is 'data')
DMDBSH, DMDBSL	N × 2 (DMCRA)	Destination buffer size (unit is 'data')

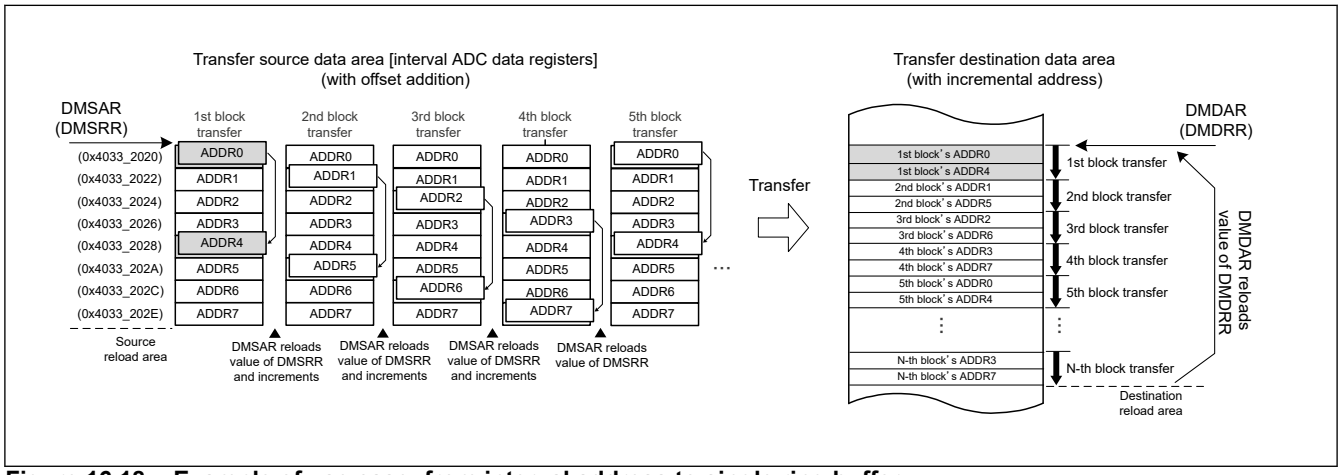

Figure 16.18 Example of use case: from interval address to single ring buffer

16.3.6.2 Unaligned Ring Buffer to Single Ring Buffer

Figure 16.19 shows an example of reading ADBUFn registers of ADC12 module (conversion result storage ring buffer) incrementally and storing it in single ring buffer. In this example, wrapping occurs because ADBUFn overflows in the fourth scan, but transfer source address of DMAC is also updated accordingly. This can be realized by setting the transfer source to incremental address and setting the DMSBS register to 16 which is the length of ADBUFn. This makes it possible to continue transfer without performing CPU processing using interrupts. Table 16.16 shows setting of this example.

Table 16.16 Setting of use case: from unaligned ring buffer to single ring buffer (1 of 2)

Register	Value	Description
DMSAR, DMSRR	0x4033_20B0	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.SM[1:0]	10b	Source update mode is incremental address
DMAMD.DM[1:0]	10b	Destination update mode is incremental address

Table 16.16 Setting of use case: from unaligned ring buffer to single ring buffer (2 of 2)

Register	Value	Description
DMCRAH, DMCRAL	5	Transfer block size
DMSBSH, DMSBSL	16	Source buffer size (unit is ‘data’)
DMDBSH, DMDBSL	N × 5(DMCRA)	Destination buffer size (unit is ‘data’)

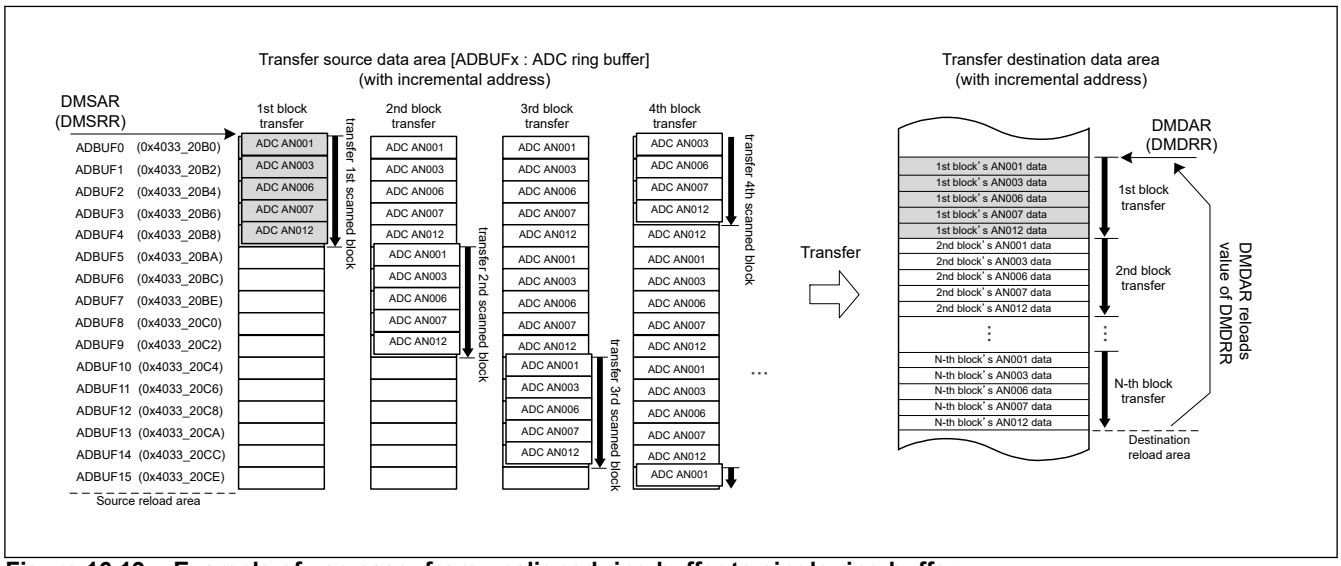

Figure 16.19 Example of use case: from unaligned ring buffer to single ring buffer

16.3.6.3 Single Block to Multi Ring Buffer

Figure 16.20 shows an example of storing the continuous ADDRn registers (data register) of ADC12 module individually in multiple ring buffers. In this example, a ring buffer in which only the first element (ADDR0) in a single block is arranged in transfer order is created at the destination. Also, in the next area, create a ring buffer in which only the second element (ADDR1) is arranged in transfer order. In the following case, create a ring buffer of length N, which is defined by DMDBS. And the number of data elements in the block is 3, which is defined by DMCRA. Table 16.17 shows setting of this example.

Table 16.17 Setting of use case: from single block to multi ring buffer

Register	Value	Description
DMSAR, DMSRR	0x4033_2020	Initial source address
DMDAR, DMDRR	0x2000_0000	Initial destination address
DMTMD.SZ[1:0]	01b	Data size is halfword
DMAMD.DADR	1	Incremental destination address after reloading
DMAMD.SM[1:0]	10b	Source update mode is incremental address
DMAMD.DM[1:0]	01b	Destination update mode is offset addition
DMCRAH, DMCRAL	3	Transfer block size
DMSBSH, DMSBSL	3	Source buffer size (unit is ‘data’)
DMDBSH, DMDBSL	N	Destination whole buffer size (unit is ‘blocks’) and Destination access offset (unit is ‘data’)

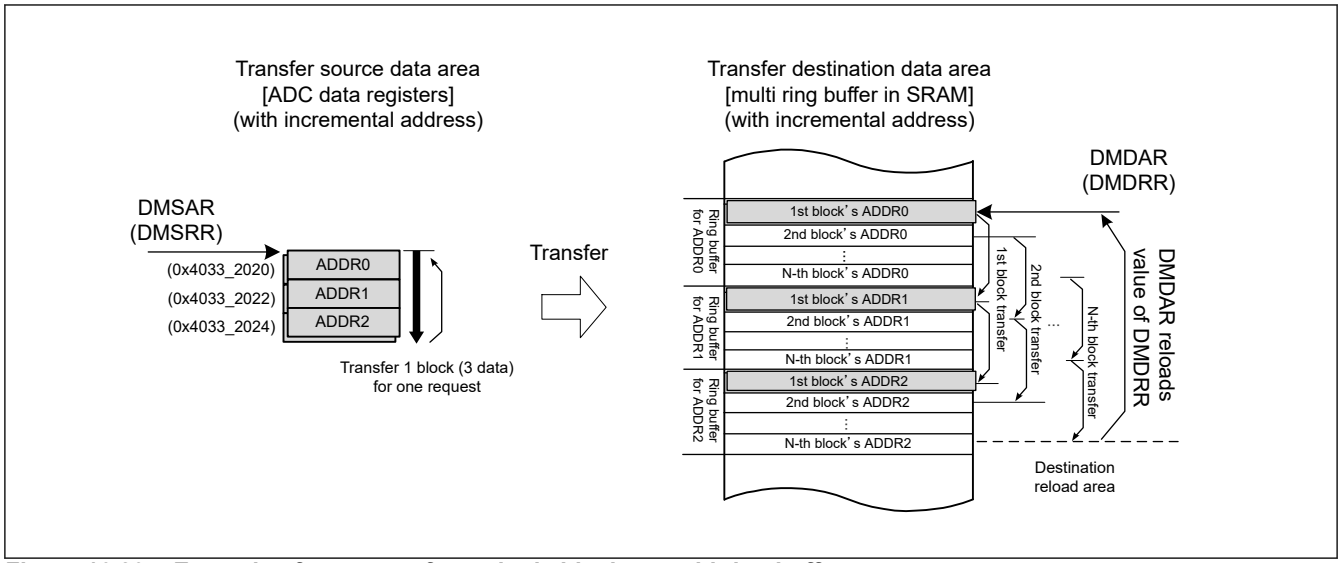

Figure 16.20 Example of use case: from single block to multi ring buffer

16.3.7 Activation Sources

Software, interrupt requests from the peripheral modules, and external interrupt requests can all be specified as DMAC activation sources. Set the DMTMD.DCTG[1:0] bits to select the activation source.

16.3.7.1 DMAC Activation by Software

When DMA transfer is started by software, follow below procedure.

1. Set the DMTMD.DCTG[1:0] bits to 00b.
2. Set the DMCNT.DTE bit to 1 (DMA transfer is enabled).
3. Set the DMAST.DMST bit set to 1 (DMAC activation enabled).
4. Set the DMREQ.SWREQ bit to 1 (DMA requested).

When the DMAC is activated by software while the DMREQ.CLRS bit is 0, the DMREQ.SWREQ bit is cleared to 0 after data transfer is started in response to a DMA transfer request.

When the DMAC is activated by software while the CLRS bit is 1, the SWREQ bit is not cleared to 0 after data transfer is started. In this case, a DMA transfer request is issued again after completion of a transfer.

16.3.7.2 DMAC Activation through Interrupt Requests from On-Chip Peripheral Modules or External Interrupt Requests

You can specify interrupt requests from on-chip peripheral modules and external interrupt requests as DMAC activation sources. The activation sources can be selected individually for each channel in DELSRn.DELS[8:0] (n = 0 to 7).

To start DMA transfer through an interrupt request from an on-chip peripheral module or an external interrupt request, follow the procedures as indicated below.

1. Set the DELSR.DELS[8:0] bits to the event number (select the DMAC event link).
2. Set the DMTMD.DCTG[1:0] bits to 01b (interrupts from the peripheral modules and the external interrupt pins).
3. Set the DMCNT.DTE bit to 1 (enable DMA transfer).
4. Set the DMAST.DMST bit set to 1 (DMAC activation enabled)

For interrupt requests specified as DMAC activation sources, see Table 13.3, in section 13, Interrupt Controller Unit (ICU).

16.3.8 Operation Timing

The following timing charts show the minimum number of execution cycles.

Figure 16.21 and Figure 16.22 show DMAC operation timing examples.

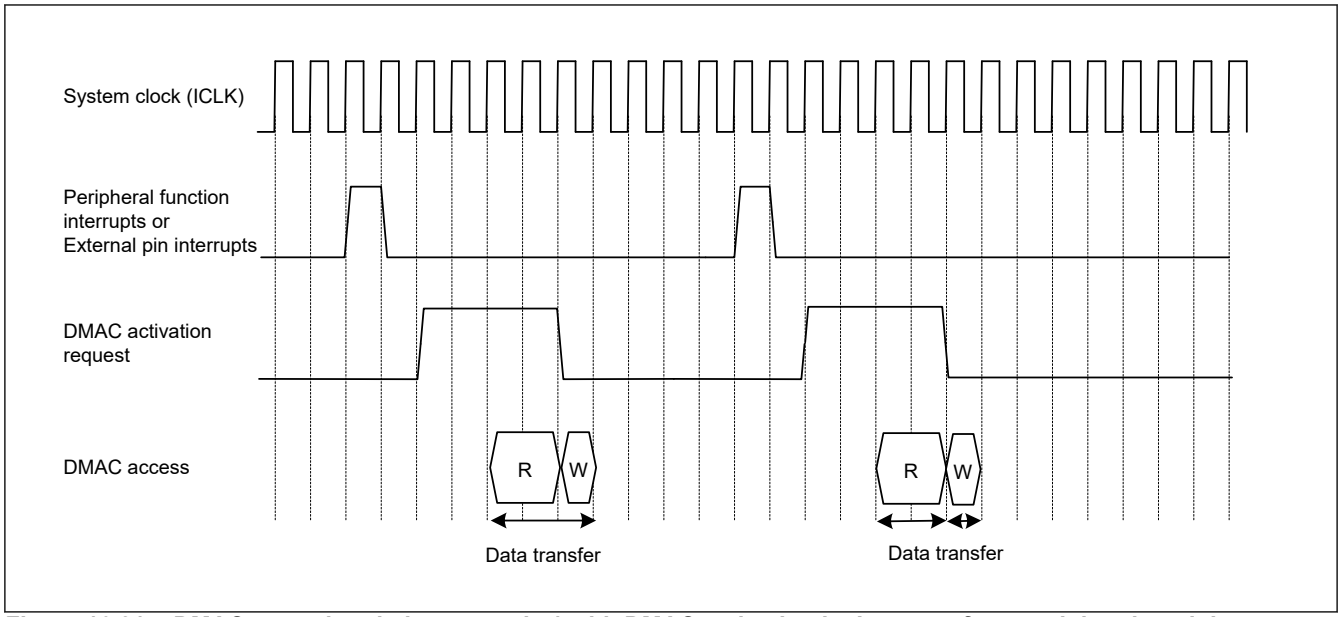

Figure 16.21 DMAC operation timing example 1 with DMAC activation by Interrupt from peripheral module or external interrupt input pin, in normal transfer mode or repeat transfer mode

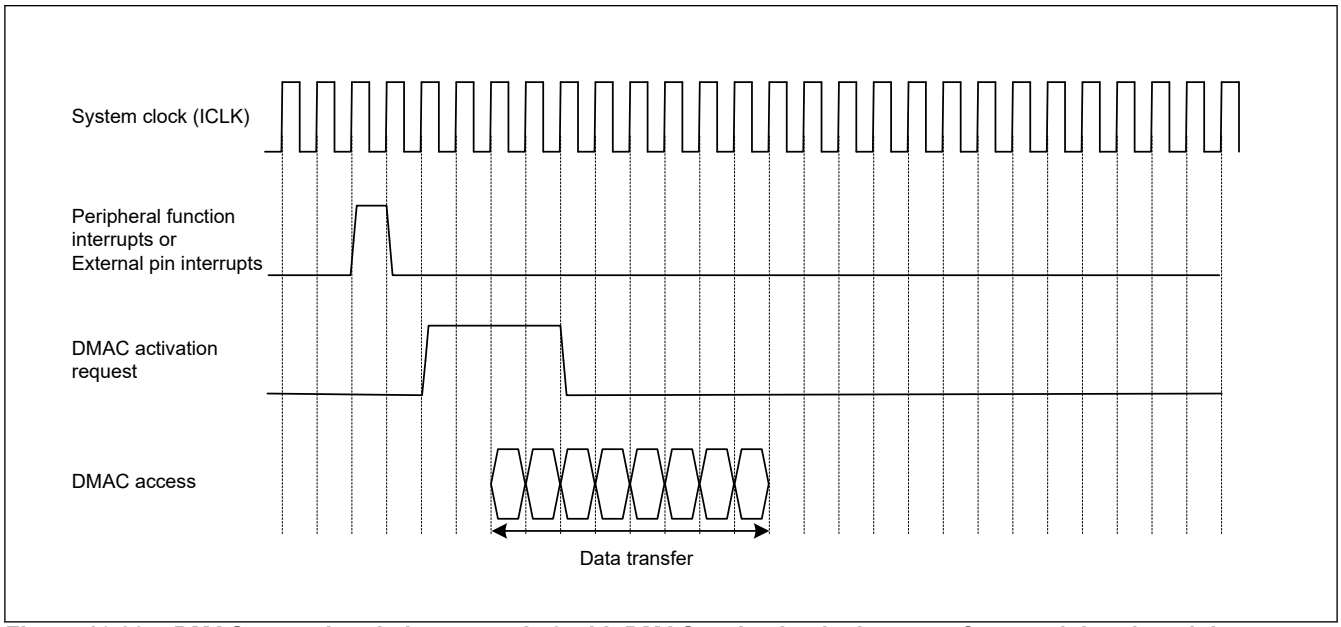

Figure 16.22 DMAC operation timing example 2 with DMAC activation by interrupt from peripheral module or external interrupt input pin, in block transfer mode with block size = 4

16.3.9 Activating the DMAC

Table 16.18 shows the register setting procedure of normal, repeat and block transfer mode and Table 16.19 shows register setting procedure of repeat-block transfer mode.

Table 16.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (1 of 2)

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMAC activation sources. Disable the control register for the peripheral function.
2	Disable the IRQn pin as the DMAC request source.	To use external pin interrupts as DMAC activation sources.
3	Set the DELSR.DELS[8:0] bits to 0x00.	Disable the DMAC request.

Table 16.18 Register Setting Procedure of Normal Transfer Mode, Repeat Transfer Mode and Block Transfer Mode (2 of 2)

No.	Step Name	Description
4	Clear the DMCNT.DTE bit to 0	Disable DMA transfer.
5	Set the interrupt request as a DMAC request source in the DELSR register.	To use internal peripheral interrupts or external pin interrupts as DMAC activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMAC activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQn pin function by using the ICU.	To use external pin interrupt as a DMAC activation source. Set the IRQn pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DARA[4:0] bits Set the DMAMD.SARA[4:0] bits	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address extended repeat area bits Set the Transfer source address extended repeat area bits
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.DTS[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Repeat area select bits Set the Transfer mode select bits Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMCRA register	Set the transfer source start address. Set the transfer destination start address. Set the number of transfer operations.
11	Set the DMCRB register	To use block transfer mode or repeat transfer mode. Set the number of block transfer operations.
12	Set the DMOFR register	To use the address update function with offset. Set the offset value.
13	Set the DMINT.DTIE bit to 1	To use the DMA transfer end interrupts. Enable DMAC transfer end interrupts.
14	Set the DMINT.RPTIE bit Set the DMINT.SARIE bit Set the DMINT.DARIE bit Set the DMINT.ESIE bit to 1	To use the DMA transfer escape end interrupts Set the repeat size end interrupt. Set the transfer source address extended repeat area overflow interrupt. Set the transfer destination address extended repeat area overflow interrupt. Enable the DMA transfer escape end interrupt.
15	Set the DMCNT.DTE bit to 1	Enable DMA transfer.
16	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1 Common settings for DMAC
17	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMAC activation source
18	Enable the IRQn pin as a DMAC request source	To use external pin interrupt as a DMAC activation source
19	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

Table 16.19 Register Setting Procedure of Repeat-Block Transfer Mode (1 of 2)

No.	Step Name	Description
1	Disable the peripheral function as the DMAC request source.	To use peripheral function interrupts as DMA activation sources. Disable the control register for the peripheral function.
2	Disable the IRQ pin as the DMAC request source.	To use external pin interrupts as DMA activation sources.
3	Set the DELSR.DELS[8:0] bits to 0x00.	Disable the DMAC request.
4	Clear the DMCNT.DTE bit to 0	Disable DMAC transfer.

Table 16.19 Register Setting Procedure of Repeat-Block Transfer Mode (2 of 2)

No.	Step Name	Description
5	Set the interrupt request as a DMAC request source in the DELSR register.	To use internal peripheral interrupts or external pin interrupts as DMA activation sources. Enable the interrupt bit for the activation source. Set the DMAC activation source.
6	Set the peripheral module as a DMAC request source	To use peripheral function interrupt as a DMA activation source. Set the control register for the peripheral function without starting it.
7	Set the IRQ pin function by using the Interrupt Controller Unit.	To use external pin interrupt as a DMA activation source. Set the IRQ pin function by using the Interrupt Controller Unit.
8	Set the DMAMD.DM[1:0] bits Set the DMAMD.SM[1:0] bits Set the DMAMD.DADR bit Set the DMAMD.SADR bit	Set the Transfer destination address update mode bits Set the Transfer source address update mode bits Set the Transfer destination address update select after reload Set the Transfer source address update select after reload
9	Set the DMTMD.DCTG[1:0] bits Set the DMTMD.SZ[1:0] bits Set the DMTMD.MD[1:0] bits Set the DMTMD.TKP bit	Set the Transfer request select bits Set the Data transfer size bits Set the Transfer mode to repeat-block transfer mode Set the transfer keeping select bit
10	Set the DMSAR register Set the DMDAR register Set the DMSRR register Set the DMDRR register Set the DMCRA register Set the DMCRB register	Set the transfer source start address Set the transfer destination start address Set the initial value of source start address Set the initial value of destination start address Set the number of transfer operations Set the number of block transfer operations
11	Set the DMSBS register Set the DMDBS register	To use the address update function with incremental, decremental or offset Set the source buffer size and access offset Set the destination buffer size and access offset
12	Set the DMINT.DTIE bit to 1	To use DMA transfer end interrupts. Enable DMAC transfer end interrupts.
13	Set the DMCNT.DTE bit to 1	Enable DMAC transfer
14	Set the DMAST.DMST bit to 1	Enable DMAC operation. *1
15	Start the peripheral function as a DMAC request source	To use peripheral function interrupt as a DMA activation source
16	Enable the IRQ pin as a DMAC request source	To use external pin interrupt as a DMA activation source
17	End of initial settings	For activation by software On completion of the initial settings, writing 1 to the DMA software start bit (DMREQ.SWREQ) starts DMA transfer.

Note 1. The DMAST.DMST bit setting does not necessarily have to follow the settings for the individual activation sources.

16.3.10 Starting DMA Transfer

To enable the DMA transfer, set the DMCNT.DTE bit to 1 (enable the DMA transfer), and then set the DMAST.DMST bit to 1 (enable the DMAC activation).

New activation requests are not accepted during the transfer of another DMAC channel or DTC. When the preceding transfer is complete, channel arbitration selects the DMA transfer request of the highest priority channel, and the DMA transfer of that channel starts. When the DMA transfer starts, the DMSTS.ACT flag is set to 1 (the DMAC is in the active state).

16.3.11 Registers during DMA Transfer

The DMAC registers are updated by a DMA transfer. The value to be updated differs according to the other settings and the transfer state. The registers to be updated are DMSAR, DMDAR, DMCRA, DMCRB, DMSBS, DMDBS, DMCNT, and DMSTS.

DMA Source Address Register (DMSAR)

When data has been transferred in response to one transfer request, the contents of DMSAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 16.5 to Table 16.13.

DMA Destination Address Register (DMDAR)

When data has been transferred in response to one transfer request, the contents of DMDAR are updated to the address to be accessed by the next transfer request.

For details on register update operation in each transfer mode, see Table 16.5 to Table 16.13.

DMA Transfer Count Register (DMCRA)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 16.5 to Table 16.13.

DMA Block Transfer Count Register (DMCRB)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 16.5 to Table 16.13.

DMA Source Buffer Size Register (DMSBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 16.8 to Table 16.13.

DMA Destination Buffer Size Register (DMDBS)

When data has been transferred in response to one transfer request, the count value is updated. The update operation depends on the transfer mode selected.

For details on register update operation in each transfer mode, see Table 16.8 to Table 16.13.

DMA Transfer Enable Bit (DMCNT.DTE)

Although the DMCNT.DTE bit enables or disables data transfer by the register write access, it is automatically cleared to 0 by the DMAC according to the DMA transfer state.

The conditions for clearing this bit by the DMAC are as follows:

- When the specified total volume of data transfer is completed
- When DMA transfer is stopped by the repeat size end interrupt
- When DMA transfer is stopped by the extended repeat area overflow interrupt
- When DMA transfer error occurs

Writing to the registers for the channels when the corresponding DMCNT.DTE bit is set to 1 is prohibited (except for DMCNT). In this case, writing must be performed after the bit is cleared to 0.

DMAC Active Flag (DMSTS.ACT)

The DMSTS.ACT flag indicates whether the DMACn is in the idle or active state.

This flag is set to 1 when the DMAC starts data transfer, and is cleared to 0 when data transfer in response to one transfer request is completed.

Even when DMA transfer is stopped by writing 0 to the DMCNT.DTE bit during DMA transfer, this flag remains 1 until DMA transfer is completed.

Transfer End Interrupt Flag (DMSTS.DTIF)

The DMSTS.DTIF flag is set to 1 after DMA transfer of the total transfer size of data is completed.

When both this flag and the DMINT.DTIE bit are set to 1, a transfer end interrupt is requested.

This flag is set to 1 when the DMA transfer bus cycle is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during the interrupt handling.

Transfer Escape End Interrupt Flag (DMSTS.ESIF)

The DMSTS.ESIF flag is set to 1 when a repeat size end interrupt or extended repeat area overflow interrupt is requested. When this bit and the DMINT.ESIE bit are set to 1, a transfer escape end interrupt is requested.

This flag is set to 1 when the bus cycle of the DMA transfer having caused the interrupt request is completed and the DMSTS.ACT flag is cleared to 0 indicating the DMA transfer end.

This flag is automatically cleared to 0 when the DMCNT.DTE bit is set to 1 during an interrupt handling.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 13, Interrupt Controller Unit (ICU).

16.3.12 Channel Priority

When multiple DMA transfer requests are present, the DMAC determines the priority of channels that have DMA transfer requests.

- The channel priority is fixed as follows: Channel 0 > Channel 1 > Channel 2 > Channel 3… > Channel 7 (Channel 0: Highest).

When a DMA transfer request is generated during data transfer, channel arbitration is started after the final data has been transferred, and DMA transfer of the higher-priority channel starts.

16.3.13 Channel Security

The secure attribute can be set with CPSCU.DMASARA.DMASARAn for each DMAC channel.

When the CPSCU.DMASARA.DMASARAn bit is 0.

- When the corresponding channel transfers, it behaves as a secure master.
- The register of corresponding channel has a secure attribute.

When the CPSCU.DMACCHSAR.SADMACn bit is 1.

- When the corresponding channel transfers, it behaves as a non-secure master.
- The register of corresponding channel has a non-secure attribute.

Refer to the Security chapter and BUS chapter for areas accessible to secure and non-secure masters.

Do not change to the CPSCU.DMACSAR while DMA transfer.

16.3.14 Channel Privilege

The privileged attribute can be set with CPSCU.DMACCHPAR.DMACCHPARn for each DMAC channel n.

When the CPSCU.DMACCHPAR.DMACCHPARn bit is 0.

- When the corresponding channel transfers, it behaves as a privileged master.
- The registers of channel are protected from a unprivileged access.

When the CPSCU.DMACCHPAR.DMACCHPARn bit is 1.

- The transfer of DMAC channel is unprivileged access for both read and write.
- The registers of channel are unprivileged attributes.

Do not change to the CPSCU.DMACCHPAR while DMA transfer.

16.4 Ending DMA Transfer

The operation for ending DMA transfer depends on the transfer end conditions. When DMA transfer ends, the DMCNT.DTE bit and the DMSTS.ACT flag are changed from 1 to 0, indicating that DMA transfer has ended.

16.4.1 Transfer End by Completion of Specified Total Number of Transfer Operations

(1) In Normal Transfer Mode (DMTMD.MD[1:0] = 00b)

When the value of DMCRAL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, a transfer end interrupt request is issued to the CPU or the DTC.

(2) In Repeat Transfer Mode (DMTMD.MD[1:0] = 01b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

If the DMTMD.TKP bit is 1 (in free-running function), the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(3) In Block Transfer Mode (DMTMD.MD[1:0] = 10b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set.

For details, see section 13, Interrupt Controller Unit (ICU).

If the DMTMD.TKP bit is 1 (in free-running function),the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

(4) In Repeat-Block Transfer Mode (DMTMD.MD[1:0] = 11b)

When the value of DMCRBL changes from 1 to 0, DMA transfer ends on the corresponding channel, and the DMCNT.DTE bit is cleared to 0 and the DMSTS.DTIF flag is set to 1 at the same time. If the DMINT.DTIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 13, Interrupt Controller Unit (ICU).

If the DMTMD.TKP bit is 1 (in free-running function),the DMSTS.DTIF bit is set to 1, but the DMCNT.DTE bit is not cleared to 0.

16.4.2 Transfer End by Repeat Size End Interrupt

In repeat transfer mode, a repeat size end interrupt is requested when transfer of a 1-repeat size of data is completed while the DMINT.RPTIE bit is set to 1. When the interrupt is requested to complete DMA transfer, the DMCNT.DTE bit is cleared to 0 and the DMSTS.ESIF flag is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function). If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC. Here, the transfer can be resumed by writing 1 to the DMCNT.DTE bit.

A repeat size end interrupt can be requested also in block transfer mode. In block transfer mode, the interrupt is requested in the same way as in repeat transfer mode when transfer of a 1-block size data is completed.

Repeat size end interrupt cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 13, Interrupt Controller Unit (ICU).

16.4.3 Transfer End by Interrupt on Extended Repeat Area Overflow

When an overflow on the extended repeat area occurs while the extended repeat area is specified and the DMINT.SARIE or DMINT.DARIE bit is set to 1 even if the DMTMD.TKP bit is 1 (in free-running function), an interrupt by an extended repeat area overflow is requested. When the interrupt is requested, the DMA transfer is terminated, the DMCNT.DTE bit is cleared to 0, and the ESIF flag in DMSTS is set to 1. If the DMINT.ESIE bit is 1 at this time, an interrupt request is issued to the CPU or the DTC.

Even if an interrupt by an extended repeat area overflow is requested during a read cycle, the following write cycle is performed.

In block transfer mode, even if an interrupt by an extended repeat area overflow is requested during a 1-block transfer, the remaining data in the block is transferred; transfer is terminated after a block transfer.

An interrupt by an extended repeat area overflow cannot be requested in repeat-block transfer mode.

Before sending an interrupt request from the DMAC to the CPU or the DTC, the interrupt control register must be set. For details, see section 13, Interrupt Controller Unit (ICU).

16.5 Processing on DMA Transfer Error

DMA transfer error occurs with MSAU error, the Slave TrustZone Filter error, the Master MPU error, the Slave Bus Error or the Illegal Access Error. If the access error occurs during the DMA transfer, the DMAC immediately stops the transfer of error occurred channel. At this time, the ICU setting of the corresponding channel is also cleared. If there is a request other than the channel which caused the error, it will be re-arbitration as it is.

When the transfer error occurs, DMCNT.DTE of the error causing channel is set to 0. Also, the error response is informed to the DELSRn of the corresponding channel is cleared. Write back to each register is not performed. The information of the channel that caused the error is set in DMECHR.

16.6 Interrupts

16.6.1 Transfer End Interrupt

Each DMAC channel can output an interrupt request (DMAC0n_INT) to the CPU or the DTC after transfer in response to one request is completed.

When the transfer destination is the external bus, an interrupt request is generated upon completion of data write to the write buffer not to the actual transfer destination.

In repeat-block transfer mode, do not enable escape transfer end interrupt.

Table 16.20 lists the relation among the interrupt sources, the interrupt status flags, and the interrupt enable bits. Figure 16.23 shows the schematic logic diagram of interrupt outputs (DMACn (n = 0 to 7)). Figure 16.24 shows the DMAC interrupt handling routine to resume/terminate DMA transfer.

Table 16.20 Relation among interrupt sources, interrupt status flags, and interrupt enable bits

Interrupt sources		Interrupt enable bits	Interrupt status flags	Request output enable bits
Transfer end		—	DMSTS.DTIF	DMINT.DTIE
Escape transfer end	Repeat size end	DMINT.RPTIE	DMSTS.ESIF	DMINT.ESIE
	Source address extended repeat area overflow	DMINT.SARIE		
	Destination address extended repeat area overflow	DMINT.DARIE		

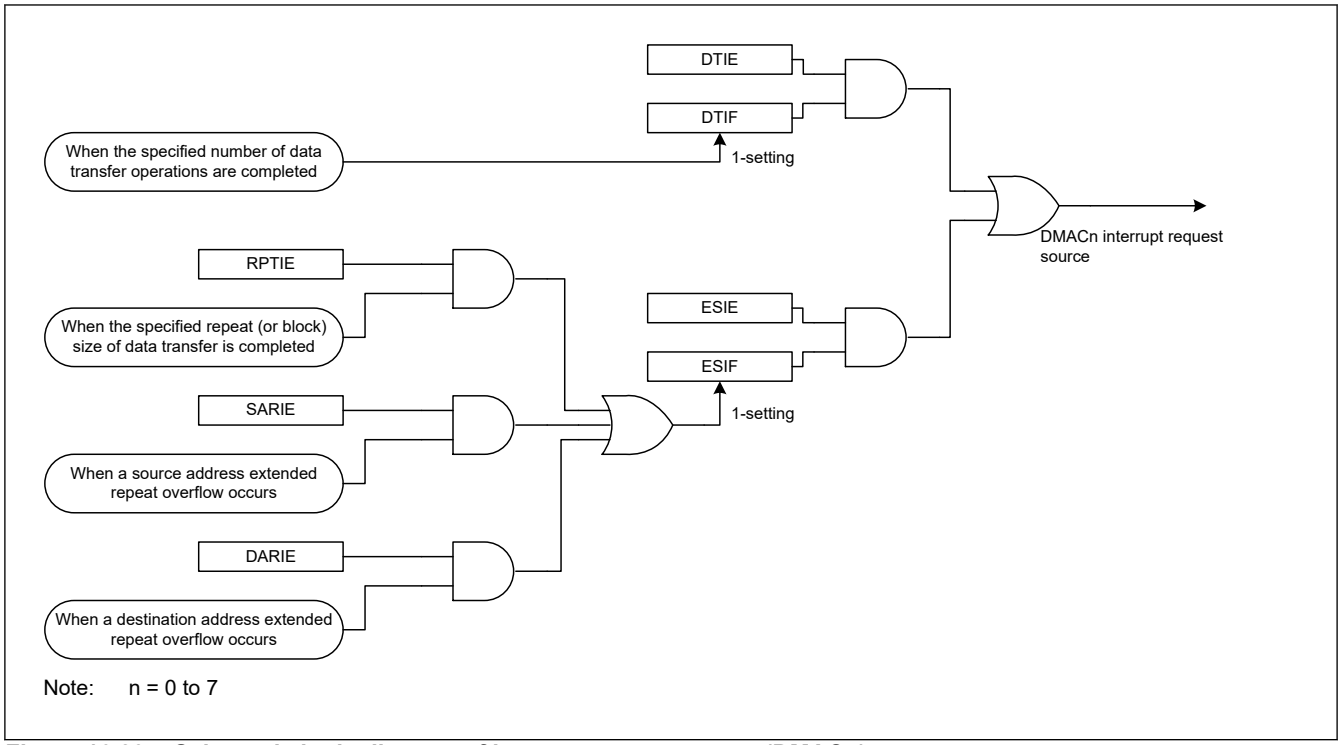

Figure 16.23 Schematic logic diagram of interrupt output source (DMACn)

Specifically, the different procedures are used for canceling an interrupt to restart DMA transfer in the following two cases:

- When terminating a DMA transfer
- When continuing a DMA transfer

16.6.1.1 When Discontinuing or Terminating a DMA Transfer

Write 0 to the DMSTS.DTIF flag to clear a transfer end interrupt, and to the DMSTS.ESIF flag to clear a repeat size interrupt and an extended repeat area overflow interrupt. The corresponding DMACn channel remains in the stop state. When starting another DMA transfer after that, set the appropriate registers, and set the DMCNT.DTE bit to 1 (DMA transfer enabled).

16.6.1.2 When Continuing a DMA Transfer

Write 1 to the DMCNT.DTE bit. The DMSTS.ESIF flag is automatically cleared to 0 (interrupt source cleared), and DMA transfer is resumed.

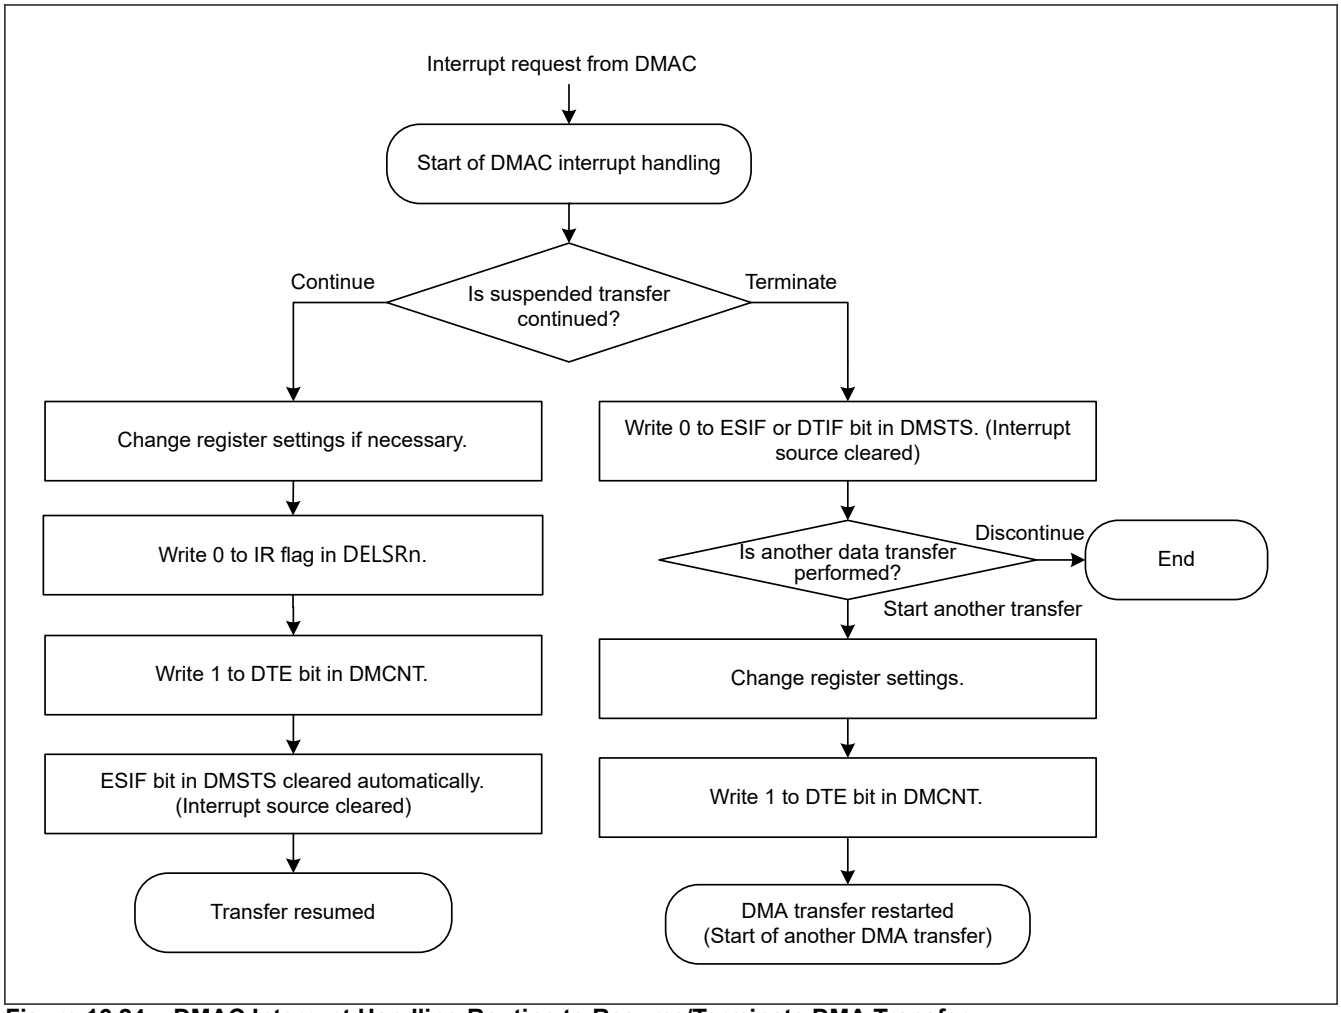

Figure 16.24 DMAC Interrupt Handling Routine to Resume/Terminate DMA Transfer

16.6.2 Transfer Error Interrupt

Error response detection interrupt request (DMA0_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DMAC transfer.

The types of interrupts that occur when a DMAC transfer error occurs are listed in the Table 16.21. The Table 16.21 also shows error information stored when a transfer error occurs.

Table 16.21 Interrupt and error information due to DMAC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Address Error R/W	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MSERRSTAT	BUS.BMSA4ERRADD BUS.BMSA4ERRRW	DMAC. DMECHR
Master MPU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MMERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
Illegal Access Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. ILERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
Slave Bus Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. SLERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR
TrustZone Filter error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. STERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DMAC. DMECHR

Note 1. If ICU.NMIER.BUSEN is enabled with DMA0_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. Only NMI can be generated by not setting DMA_TRANSERR to ICU.IELSR.

16.7 Event Link

Each DMAC channel outputs an event link request signal (DMAC0n_INT) every time it completes a data transfer, or a block transfer in block transfer mode.

When the transfer destination is the external bus, an event link request signal is generated when the writing to the write buffer is accepted.

For details, see section 18, Event Link Controller (ELC).

16.8 Low-Power Consumption Function

Before entering the module-stop state, Software Standby mode or Deep Software Standby mode, you must first set the DMAST.DMST bit to 0 (the DMAC module suspended) and use the settings in the sections that follow.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DMAC. If a DMA transfer is in progress when 1 is written to the MSTPA22 bit, the transition to the module-stop state proceeds after the DMA transfer ends. Access to the DMAC registers is prohibited while the MSTPA22 bit is 1. Writing 0 to the MSTPA22 bit releases the DMAC from the module-stop state.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in section 10.7.3.1. Transition to Software Standby Mode, or in Transitioning to Deep Software Standby Mode .

If DMA transfer operations are in progress when the WFI instruction is executed, the DMA transfer completes before the transition to Software Standby mode or Deep Software Standby mode.

(3) Notes on low power consumption function

For information on the WFI instruction and register settings, see Timing of WFI Instruction.

To perform a DMA transfer after returning from a low power mode, set the DMAST.DMST bit to 1 again. To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DMAC startup request, specify the CPU as the interrupt request destination, as described in section 13.5.5. Selecting Interrupt Request Destinations, and then execute the WFI instruction.

16.9 Usage Notes

16.9.1 DMA Transfer to External Devices

In a DMA transfer to an external device, the DMSTS.ACT flag may change to 0 (the DMAC suspended) before the external bus access ends after the final data write is started.

16.9.2 Access to the Registers during DMA Transfer

Do not write to the following registers while the DMSTS.ACT flag of the same channel is set to 1 (DMAC active state) or the DMCNT.DTE bit of the same channel is set to 1 (DMA transfer enabled):

- DELSR
- DMSAR
- DMDAR
- DMCRA
- DMCRB
- DMTMD
- DMINT
- DMAMD
- DMOFR
- DMSBS

- DMDBS
- DMSRR
- DMDRR
- DMBWR
- ICUSARC
- DMACSAR

16.9.3 DMA Transfer to Reserved Areas

DMA transfer to the reserved areas is prohibited. If such an access is made, transfer results are not guaranteed. For details on the reserved areas, see section 4, Address Space.

16.9.4 Setting of DMAC Event Link Setting Register of the Interrupt Controller Unit (DELSRn)

The DMAC event link setting register (DELSRn) should be set while the DMA transfer enable bit (DMCNT.DTE) is cleared to 0 (DMA transfer is disabled). Moreover, the DTC activation enable register (ICU.IELSRn.DTCE (n = 0 to 95)) that corresponds to the same event number that has been set by the DELSRn register should not be set to 1. For details on the ICU.IELSRn.DTCE, see section 13, Interrupt Controller Unit (ICU).

16.9.5 Suspending or Restarting DMAC Activation

To suspend a DMAC activation request, write 0x00 to the DMAC Event Link select bits (DELSRn.DELS[8:0]). To restart the DMA transfer, write the event number to the DELSRn.DELS[8:0] bits following the settings shown in section 16.3.9. Activating the DMAC.

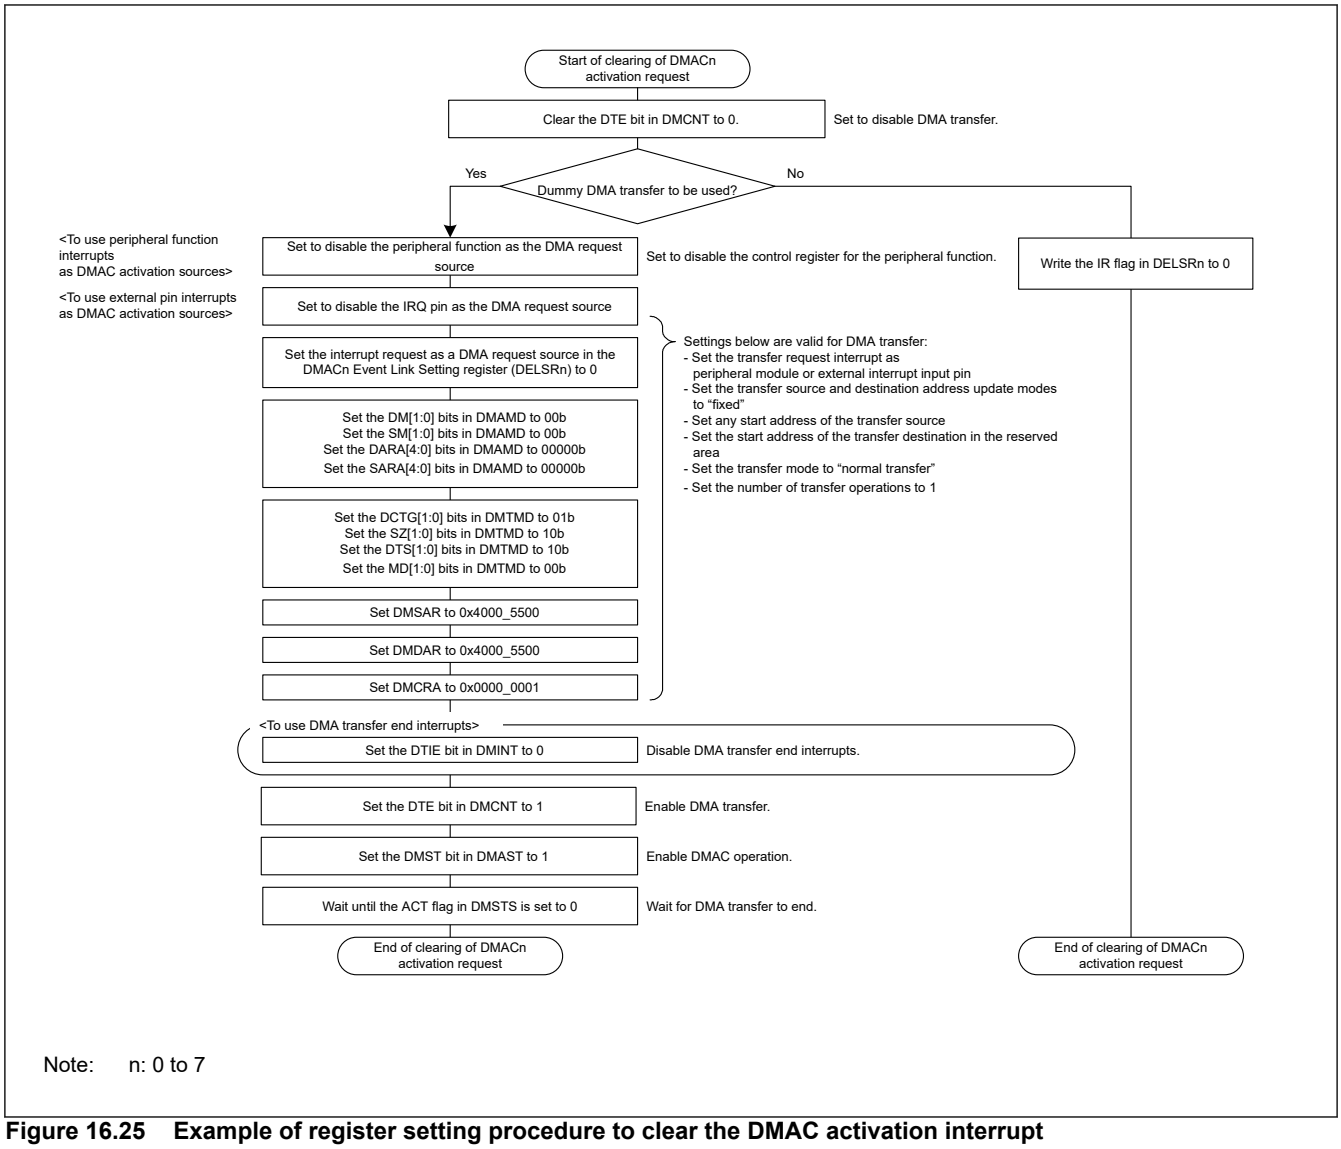
16.9.6 Precautions for Resuming DMA Transfer

A DMAC activation request might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMAC activation request is held in the DMAC. To prevent this, stop the DMAC activation requests by setting the DELSRn.DELS[8:0] bits to 0.

When a DMAC activation request occurs after the last round of the DMA transfer is generated, clear the DMAC activation request with either of the following approaches.

- Clear the DMAC activation request with a DMA dummy transfer.
- Set the DMCNT.DTE bit to 0 and then set the DELSRn.IR flag to 0.

See Figure 16.25.



Note: n: 0 to 7

Figure 16.25 Example of register setting procedure to clear the DMAC activation interrupt

16.9.7 Restriction for OSPI

There is a restriction to using OSPI, see section 37.3.8.5. Restriction in 8D-8D-8D profile 1.0 format.

17. Data Transfer Controller (DTC)

17.1 Overview

A Data Transfer Controller (DTC) module is provided for transferring data when activated by an interrupt request.

Table 17.1 lists the DTC specifications and Figure 17.1 shows DTC block diagram.

Table 17.1 DTC specifications

Parameter	Description
Transfer modes	• Normal transfer mode A single activation leads to a single data transfer. • Repeat transfer mode A single activation leads to a single data transfer. The transfer address returns to the start address after the number of data transfers reaches the specified repeat size. The maximum number of repeat transfers is 256 and the maximum data transfer size is 256 × 32 bits (1024 bytes) • Block transfer mode A single activation leads to a transfer of a single block. The maximum block size is 256 × 32 bits = 1024 bytes.
Transfer channel	• Channel transfer can be associated with the interrupt source (transferred by a DTC activation request from the ICU) • Multiple data units can be transferred on a single activation source (chain transfer) • Chain transfers are selectable to either execute when the counter is 0, or always execute.
Transfer space	• 4 GB area from 0x0000_0000 to 0xFFFF_FFFF, excluding reserved areas
Data transfer units	• Single data unit: 1 byte (8 bits), 1 halfword (16 bits), 1 word (32 bits) • Single block size: 1 to 256 data units.
CPU interrupt source	• An interrupt request can be generated to the CPU on a DTC activation interrupt • An interrupt request can be generated to the CPU after a single data transfer • An interrupt request can be generated to the CPU after a data transfer of a specified volume.
Processing on DTC transfer error	• When the DTC transfer error occurs, it stops the transfer that caused the error • Request to clear the register for activation request of DTC error number to ICU
Error response detection interrupt	Generated when the DTC transfer error occurs
Event link function	An event link request is generated after one data transfer (for block, after one block transfer)
Read skip	Read of transfer information can be skipped
Write-back skip	When the transfer source or destination address is specified as fixed, a write-back of transfer information can be skipped
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set for each activation source

Note: Security attribution Regiser of DTC is described in ICU.ICUSARG, ICU.ICUSARH and ICU.ICUSARI

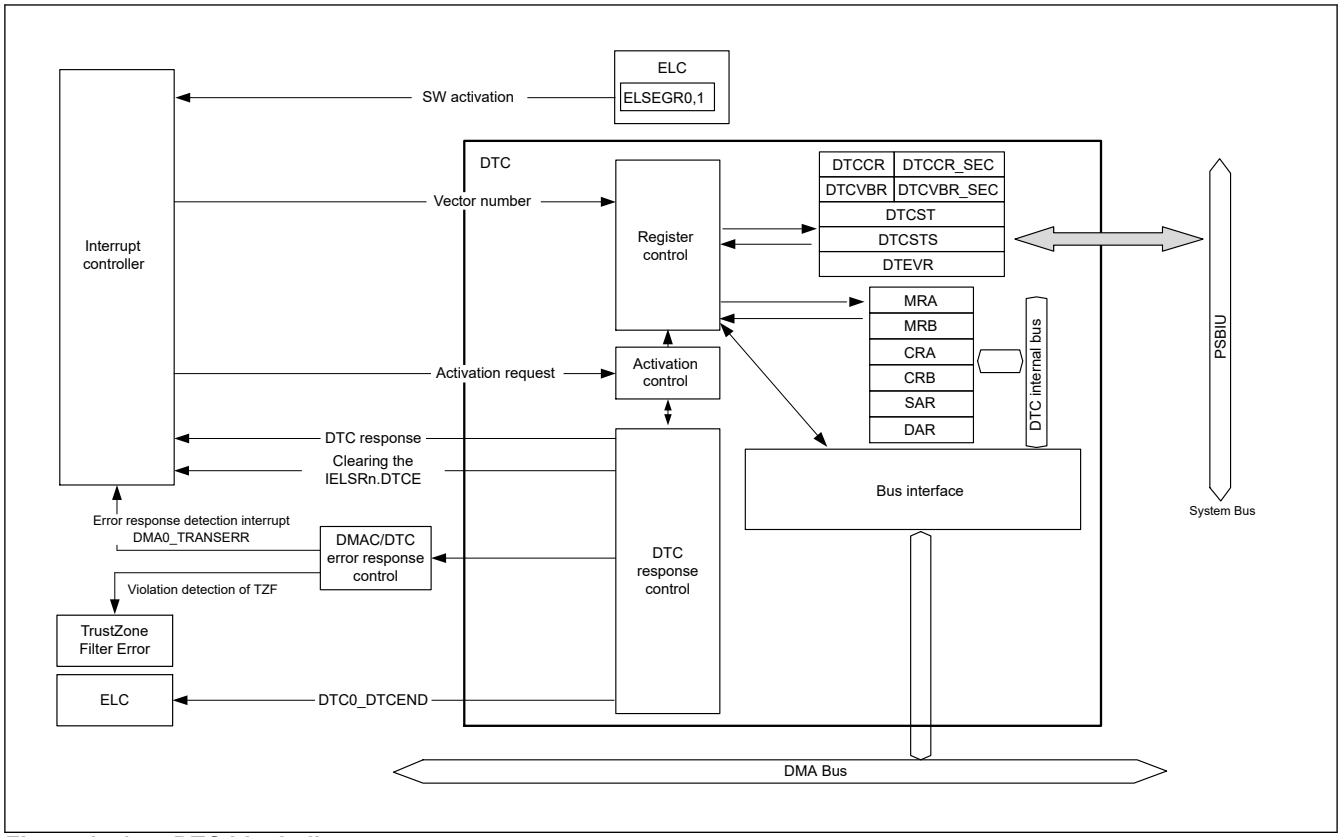


Figure 17.1 DTC block diagram

See section 13.1. Overview in section 13, Interrupt Controller Unit (ICU) for the connections between the DTC and NVIC in the CPU.

17.2 Register Descriptions

MRA, MRB, SAR, DAR, CRA, and CRB are all DTC internal registers that cannot be directly accessed from the CPU. Values to be set in these DTC internal registers are placed in the SRAM area as transfer information. When an activation request is generated, the DTC reads the transfer information from the SRAM area and sets it in its internal registers. After the data transfer ends, the internal register contents are written back to the SRAM area as transfer information.

17.2.1 DTCSAR : DTC Controller Security Attribution Register

Base address: CPSCU = 0x4000_8000
CPSCU_NS = 0x5000_8000

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTCSTSA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	DTCSTSA	DTC Security Attribution 0: Secure. 1: Non-secure.	R/W

Bit	Symbol	Function	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-1, P-TYPE-1

This register only sets the DTCST security attribute.

DTCSTSA bit (DTC Security Attribution)

Security attributes of registers for DTCST and DTCSTS.

Do not write to the DTCSTSA bit while DTC transfer is enabled or a bus master is writing to the DTC registers.

17.2.2 MRA : DTC Mode Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x03 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	MD[1:0]		SZ[1:0]		SM[1:0]		—	—
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
1:0	—	The read values are undefined. The write value should be 0.	—
3:2	SM[1:0]	Transfer Source Address Addressing Mode 0 0: Address in the SAR register is fixed (write-back to SAR is skipped.) 0 1: Address in the SAR register is fixed (write-back to SAR is skipped.) 1 0: SAR value is incremented after data transfer: +1 when SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: SAR value is decremented after data transfer: -1 when SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b	—
5:4	SZ[1:0]	DTC Data Transfer Size 0 0: Byte (8-bit) transfer 0 1: Halfword (16-bit) transfer 1 0: Word (32-bit) transfer 1 1: Setting prohibited	—
7:6	MD[1:0]	DTC Transfer Mode Select 0 0: Normal transfer mode 0 1: Repeat transfer mode 1 0: Block transfer mode 1 1: Setting prohibited	—

The MRA register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x03) and DTC transfers it automatically to and from the MRA register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

17.2.3 MRB : DTC Mode Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x02 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CHNE	CHNS	DISEL	DTS	DM[1:0]		—	—
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
1:0	—	The read values are undefined. The write value should be 0.	—
3:2	DM[1:0]	Transfer Destination Address Addressing Mode 0 0: Address in the DAR register is fixed (write-back to DAR is skipped) 0 1: Address in the DAR register is fixed (write-back to DAR is skipped) 1 0: DAR value is incremented after data transfer: +1 when MRA.SZ[1:0] = 00b +2 when SZ[1:0] = 01b +4 when SZ[1:0] = 10b 1 1: DAR value is decremented after data transfer: -1 when MRA.SZ[1:0] = 00b -2 when SZ[1:0] = 01b -4 when SZ[1:0] = 10b	—
4	DTS	DTC Transfer Mode Select 0: Select transfer destination as repeat or block area. 1: Select transfer source as repeat or block area.	—
5	DISEL	DTC Interrupt Select 0: Generate an interrupt request to the CPU when specified data transfer is complete. 1: Generate an interrupt request to the CPU each time DTC data transfer is performed.	—
6	CHNS	DTC Chain Transfer Select 0: Chain transfer is continuous. 1: Chain transfer occurs only when the transfer counter changes from 1 to 0 or 1 to CRAH.	—
7	CHNE	DTC Chain Transfer Enable 0: Chain transfer is disabled. 1: Chain transfer is enabled.	—

The MRB register cannot be accessed directly from the CPU, however the CPU can access the SRAM area (transfer information (n) start address + 0x02) and DTC transfers it automatically to and from the MRB register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

DM[1:0] bits (Transfer Destination Address Addressing Mode)

The DM[1:0] bits are to fix the address of the DAR register or specify increment / decrement of the DAR register after transfer.

DTS bit (DTC Transfer Mode Select)

The DTS bit specifies whether the transfer source or destination is the repeat or block area in repeat or block transfer mode.

DISEL bit (DTC Interrupt Select)

The DISEL bit specifies the condition for generating an interrupt request to the CPU.

CHNS bit (DTC Chain Transfer Select)

The CHNS bit selects the chain transfer condition. When CHNE is 0, the CHNS setting is ignored. For details on the conditions for chain transfer, see Table 17.3.

When the next transfer is chain transfer, completion of the specified number of transfers is not determined, the activation source flag is not cleared, and an interrupt request to the CPU is not generated.

CHNE bit (DTC Chain Transfer Enable)

The CHNE bit enables chain transfer. The chain transfer condition is selected by the CHNS bit. For details on chain transfer, see section 17.4.6. Chain Transfer. When the chain transfer settings are CHNE = 1 and CHNS = 0, the transfer count according to the transfer settings will be -1 for each transfer request. Therefore, the transfer count for each transfer information must match.

17.2.4 SAR : DTC Transfer Source Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x04 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

The SAR sets the transfer source start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x04) and DTC transfers it automatically to and from the SAR register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

17.2.5 DAR : DTC Transfer Destination Register

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x08 + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	31																												0
Bit field:																													
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

The DAR sets the transfer destination start address and cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x08) and DTC transfers it automatically to and from the DAR register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

Misalignment is prohibited for DTC transfers. Bit[0] must be 0 when MRA.SZ[1:0] = 01b, and bit[1] and bit[0] must be 0 when MRA.SZ[1:0] = 10b.

17.2.6 CRA : DTC Transfer Count Register A

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0E + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	CRAL	Transfer Counter A Lower Register Specify the transfer count.	—
15:8	CRAH	Transfer Counter A Upper Register Specify the transfer count.	—

Note: The function depends on the transfer mode.
Note: Set CRAH and CRAL to the same value in repeat transfer mode and block transfer mode.

The CRA register consists of 16 bits. CRAL is the lower 8 bits and CRAH is the upper 8 bits. CRA is used in normal mode.

CRAL and CRAH are used in repeat transfer mode and block transfer mode.

The CRA register cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0E) and DTC transfers it automatically to and from the CRA register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

(1) Normal transfer mode (MRA.MD[1:0] = 00b)

In normal transfer mode, CRA functions as a 16-bit transfer counter. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRA value is decremented (-1) on each data transfer.

(2) Repeat transfer mode (MRA.MD[1:0] = 01b)

In repeat transfer mode, the CRAH register holds the transfer count and the CRAL register functions as an 8-bit transfer counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

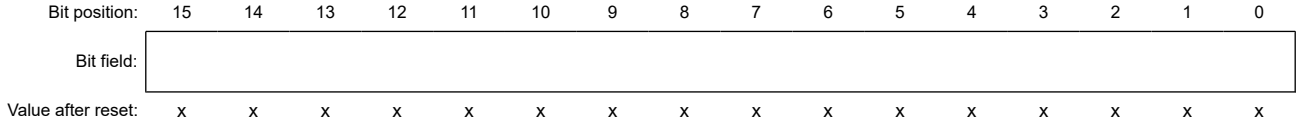
(3) Block transfer mode (MRA.MD[1:0] = 10b)

In block transfer mode, the CRAH register holds the block size and the CRAL register functions as an 8-bit block size counter. The transfer count is 1, 255, and 256 when the set value is 0x01, 0xFF, and 0x00, respectively. The CRAL value is decremented (-1) on each data transfer. When it reaches 0x00, the CRAH value is transferred to CRAL.

17.2.7 CRB : DTC Transfer Count Register B

Base address: DTCVBR_SEC
DTCVBR

Offset address: 0x0C + 0x4 × Vector number
(Inaccessible directly from the CPU. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.)



The CRB sets the block transfer count for block transfer mode. The transfer count is 1, 65535, and 65536 when the set value is 0x0001, 0xFFFF, and 0x0000, respectively. The CRB value is decremented (-1) when the final data of a single block size is transferred. When normal transfer mode or repeat transfer mode is selected, this register is not used, and the set value is ignored.

The CRB cannot be accessed directly from the CPU. However, the CPU can access the SRAM area (transfer information (n) start address + 0x0C) and DTC transfers it automatically to and from the CRB register. See section 17.3.1. Allocating Transfer Information and DTC Vector Table.

17.2.8 DTCCR : DTC Control Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRS	DTC Transfer Information Read Skip Enable for Non-secure 0: Transfer information read is not skipped 1: Transfer information read is skipped when vector numbers match	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE7, P-TYPE2

RRS bit (DTC Transfer Information Read Skip Enable for Non-secure)

The RRS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRS bit value.

17.2.9 DTCCR_SEC : DTC Control Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	RRSS	—	—	—	—
Value after reset:	0	0	0	0	1	0	0	0

Bit	Symbol	Function	R/W
2:0	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 1. The write value should be 1.	R/W
4	RRSS	DTC Transfer Information Read Skip Enable for Secure 0: Transfer information read is not skipped. 1: Transfer information read is skipped when vector numbers match.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE6, P-TYPE2

RRSS bit (DTC Transfer Information Read Skip Enable for Secure)

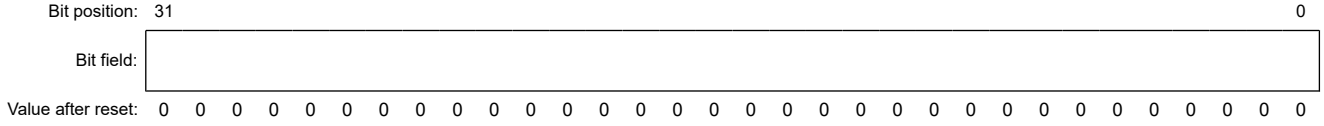
The RRSS bit enables skipping of transfer information reads when vector numbers match. The DTC vector number is compared with the vector number in the previous activation process. When these vector numbers match and the RRSS bit is set to 1, DTC data transfer is performed without reading the transfer information. However, when the previous transfer is a chain transfer, the transfer information is read regardless of the RRSS bit.

When the transfer counter (CRA register) becomes 0 during the previous normal transfer and when the transfer counter (CRB register) becomes 0 during the previous block transfer, the transfer information is read regardless of the RRSS bit value.

17.2.10 DTCVBR : DTC Vector Base Register

Base address: DTC0_NS = 0x5000_AC00

Offset address: 0x04



Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Non-secure region Set the DTC vector base address. The lower 10 bits should be 0.	R/W

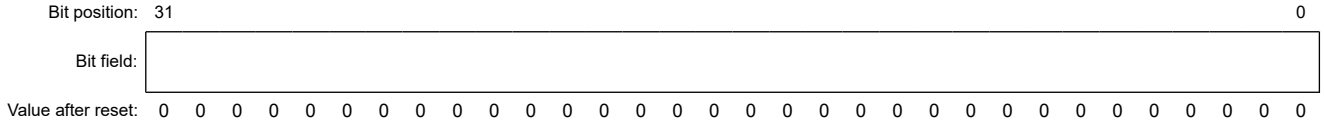
Note: S-TYPE7, P-TYPE2

The DTCVBR sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1 KB units.

17.2.11 DTCVBR_SEC : DTC Vector Base Register for Secure Region

Base address: DTC0 = 0x4000_AC00

Offset address: 0x14



Bit	Symbol	Function	R/W
31:0	n/a	DTC Vector Base Address for Secure region Set DTC Vector Base Address for Secure region. The lower 10 bits should be 0.	R/W

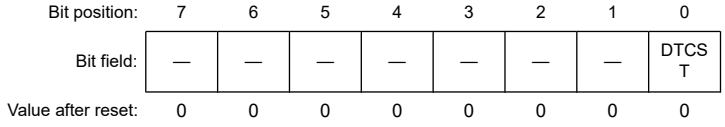
Note: S-TYPE6, P-TYPE2

The DTCVBR_SEC sets the base address for calculating the DTC vector table address, which can be set in the range of 0x0000_0000 to 0xFFFF_FFFF (4 GB) in 1-KB units.

17.2.12 DTCST : DTC Module Start Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x0C



Bit	Symbol	Function	R/W
0	DTCST	DTC Module Start 0: DTC module stopped 1: DTC module started	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE2

DTCST bit (DTC Module Start)

Set the DTCST bit to 1 to enable the DTC to accept transfer requests. When this bit is set to 0, transfer requests are no longer accepted. If this bit is set to 0 during a data transfer, the accepted transfer request is active until processing completes.

DTCST must be set to 0 before transitioning to one of the following state or mode:

- Module-stop state
- Software Standby mode
- Deep Software Standby mode

For details on these transitions, see section 17.10. Low Power Consumption Function and section 10, Low Power Modes.

17.2.13 DTCSTS : DTC Status Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ACT	—	—	—	—	—	—	—	VECN[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	VECN[7:0]	DTC-Activating Vector Number Monitoring These bits indicate the vector number for the activation source when a DTC transfer is in progress. The value is only valid if a DTC transfer is in progress (ACT flag is 1).	R
14:8	—	These bits are read as 0.	R
15	ACT	DTC Active Flag 0: DTC transfer operation is not in progress. 1: DTC transfer operation is in progress.	R

Note: S-TYPE3, P-TYPE2

VECN[7:0] bits (DTC-Activating Vector Number Monitoring)

While transfer by the DTC is in progress, the VECN[7:0] bits indicate the vector number associated with the activation source for the transfer. The value read from the VECN[7:0] bits is valid if the ACT flag is 1, indicating a DTC transfer in progress, and invalid if the ACT flag is 0, indicating no DTC transfer is in progress.

ACT flag (DTC Active Flag)

The ACT flag indicates the state of the DTC transfer operation.

[Setting condition]

- When the DTC is activated by a transfer request.

[Clearing condition]

- When transfer by the DTC, in response to a transfer request, is complete.

17.2.14 DTEVR : DTC Error Vector Register

Base address: DTC0 = 0x4000_AC00
DTC0_NS = 0x5000_AC00

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTESTA
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	DTEVSAM	DTEV[7:0]							
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
7:0	DTEV[7:0]	DTC Error Vector Number These bits represent error vector of the DTC.	R
8	DTEVSAM	DTC Error Vector Number SA Monitor Indicates the SA of vector number causing the error. 0: Secure vector number 1: Non-secure vector number	R
15:9	—	These bits are read as 0. The write value should be 0.	R
16	DTESTA	DTC Error Status Flag 0: No DTC transfer error occurred 1: DTC transfer error occurred	R/W
31:17	—	These bits are read as 0. The write value should be 0.	R

Note: P-TYPE2 See below for access by security attribution.
Note: Writing to DTESTA depends on the value of DTEVSAM

When reading this register, it can be accessed from both Secure and Non-secure access.

When writing this register, it depends on DTEVR.DTESTA.

- When DMESA = 1, it can be accessed from Secure and Non-secure access.
- When DMESA = 0, it can be accessed from Secure. An error is returned when write access is performed in a Non-secure access.

This register is cleared by a reset caused by a transfer error. Please select interrupt (DMA0_TRANSERR) in BUS.OADCFG.OAD when you want to debug the program.

DTEV[7:0] bit (DTC Error Vector Number)

When a transfer error due to DTC transfer occurs, it stores the channel of DTC that was violated.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

DTEVSAM bit (DTC Error Vector Number SA Monitor)

When a transfer error due to DTC transfer occurs, it indicates the SA of the violating DTC vector number.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs and DTESTA = 0.

[Clearing condition].

- When 1 is written to DTEVR.DTESTA.

DTESTA bit (DTC Error Status Flag)

Indicates whether or not a DTC transfer error occurred.

DTEV, DTEVSAM, DTESTA are cleared by writing 1 to DTESTA.

Writing 0 to DTESTA is ignored.

When reset was selected in MMPUOAD.OAD and MSAOAD.OAD, Since this register is also reset. Please select NMI when you want to debug the program.

[Setting condition]

- When the DTC transfer error occurs.

[Clearing condition]

- When 1 is written to DTEVR.DTESTA.

Note: When DTEVSAM = 1, it can be cleared in the Secure state and Non-secure state. DTEVSAM = 0, it cannot be cleared in the Non-secure state.

17.3 Activation Sources

The DTC is activated by an interrupt request. Setting the ICU.IELSRn.DTCE bit to 1 enables activation of the DTC by the associated interrupt. The selector output *n* number set in ICU.IELSRn is defined as the interrupt vector number, where n = 0 to 95. For an enabled interrupt, the specific DTC interrupt source associated with each interrupt vector number *n* is selected in ICU.IELSRn.IELS[8:0] where n = 0 to 95, as listed in section 13.3.2. Event Number in section 13, Interrupt Controller Unit (ICU). For activation by software, see section 18.2.2. ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1).

The interrupt vector number is equivalent to the DTC vector table number. After the DTC accepted an activation request, it does not accept another activation request until the transfer for that single request is complete, regardless of the priority of the requests. When multiple activation requests are generated during a DTC transfer, the highest priority request is accepted on completion of the transfer. When multiple activation requests are generated while the DTC Module Start bit (DTCST.DTCST) is 0, the DTC accepts the highest priority request when DTCST.DTCST is subsequently set to 1. The smaller interrupt vector number has higher priority.

The DTC performs the following operations at the start of a single data transfer or for a chain transfer, after the last of the consecutive transfers:

- On completion of a specified round of data transfer, the ICU.IELSRn.DTCE bit is set to 0, and an interrupt request is sent to the CPU.
- If the MRB.DISEL bit is 1, an interrupt request is sent to the CPU on completion of a data transfer.
- For other transfers, the ICU.IELSRn.IR flag of the activation source is set to 0 at the start of the data transfer.

17.3.1 Allocating Transfer Information and DTC Vector Table

The DTC reads the start address of the transfer information associated with each activation source from the vector table and reads the transfer information starting at that address.

DTC has two vector tables, Non-secure side or Secure side. Because the interrupt vector number that serves as a trigger for DTC is divided into Non-secure or Secure. Place the vector table of the interrupt vector number of SA = 1 in DTCVBR which is the Non-secure side. Place the vector table of interrupt number SA = 0 in DTCVBR_SEC which is the Secure side.

The vector table must be located so that the lower 10 bits of the base address (start address) are 0. Use the DTC Vector Base Register (DTCVBR) to set the base address of the DTC vector table. Transfer information is allocated in the SRAM area. In the SRAM area, the start address of the transfer information *n* with vector number *n* must be 4n added to the base address in the vector table.

When setting the DTC transfer attribution for the privilege access or non-privileged access, allocating the vector table and transfer information as follows. The vector table should be located in the privileged area. Transfer information with the privileged attribution is located in the privileged area. Transfer information with the unprivileged attribution is located in the Unprivileged area. Privileged area is set by MMPU (see section 15, Memory Protection Unit (MPU)). Privileged and non-privileged access settings are located at bit 0 of the address corresponding to each vector number in the vector table.

Figure 17.2 shows the relationship between the DTC vector table and transfer information.

Figure 17.3 shows the bit arrangement in the vector table.

Figure 17.4 shows the allocation of transfer information in the SRAM area.

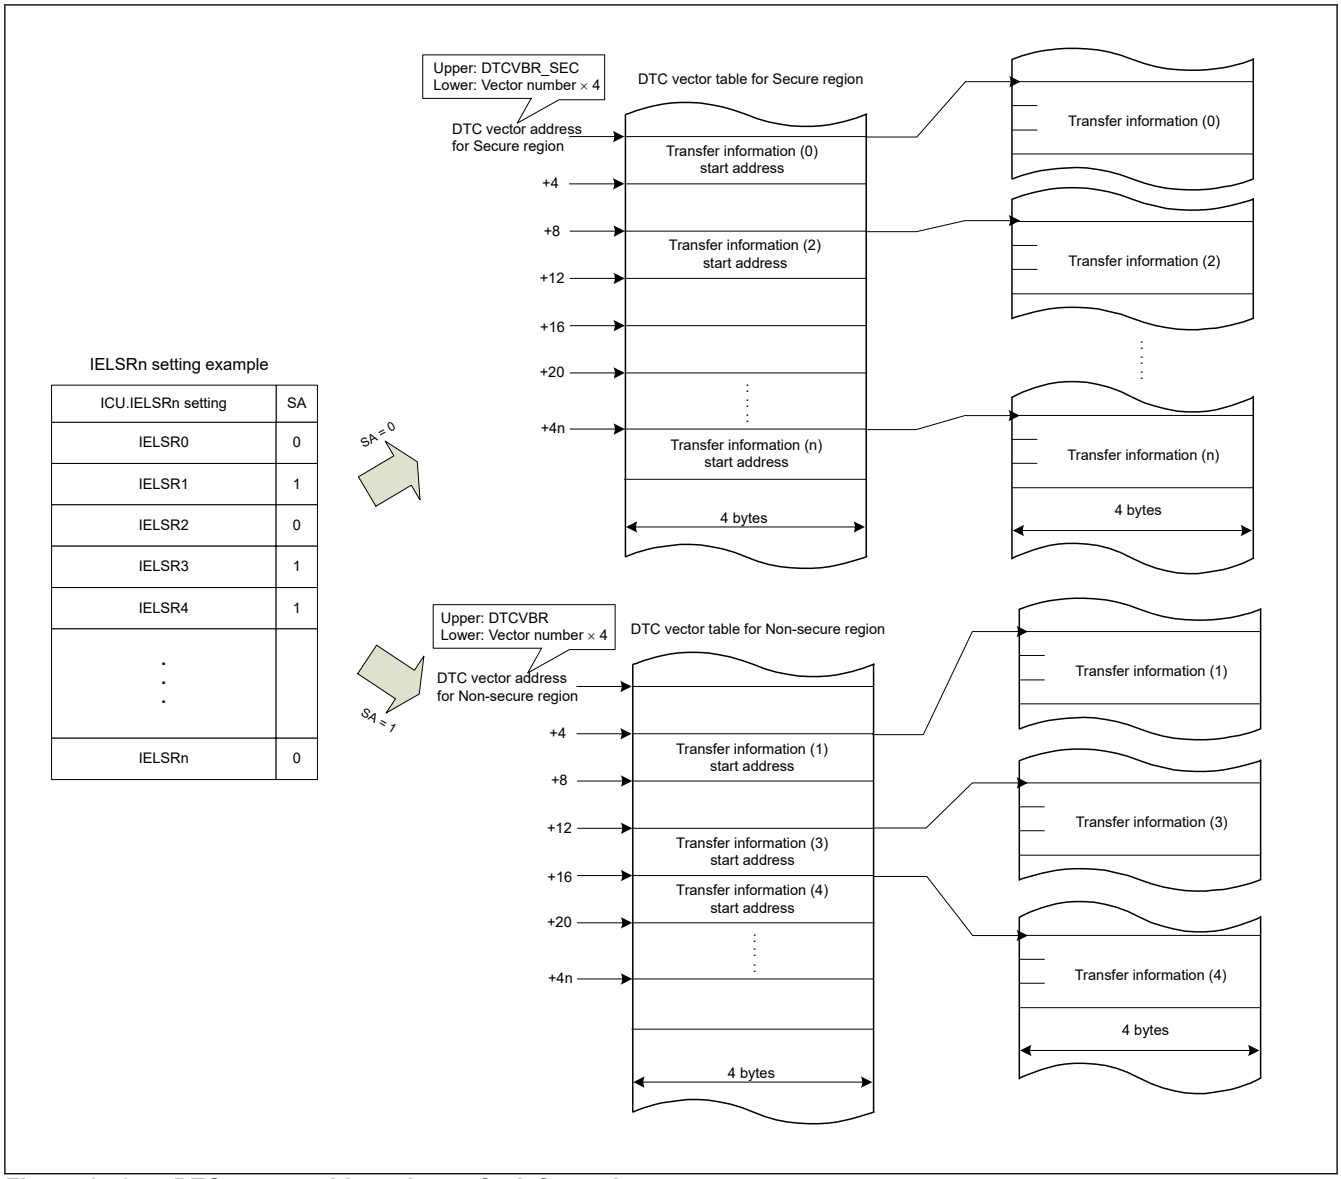


Figure 17.2 DTC vector table and transfer information

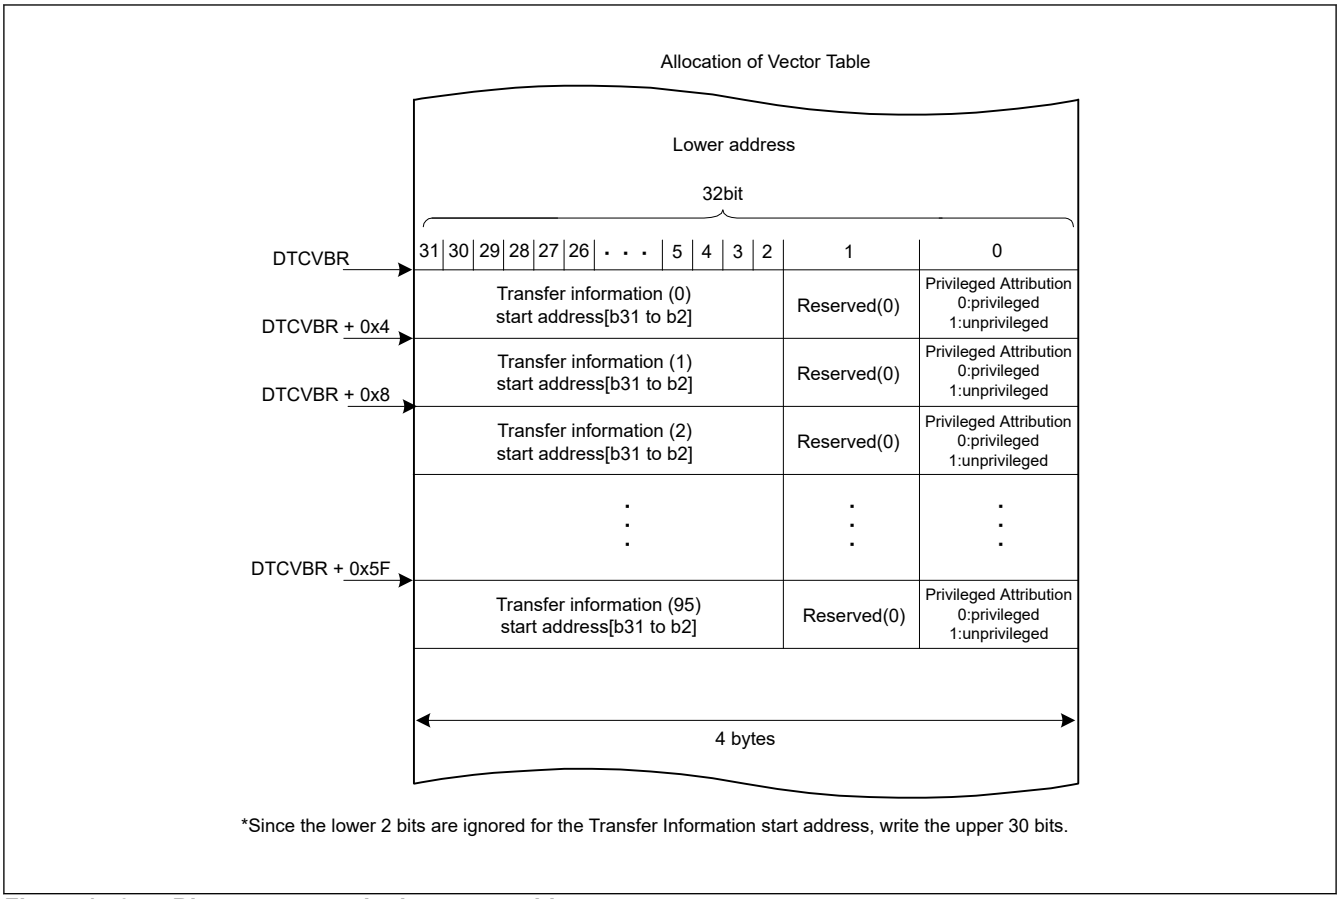

Figure 17.3 Bit arrangement in the vector table

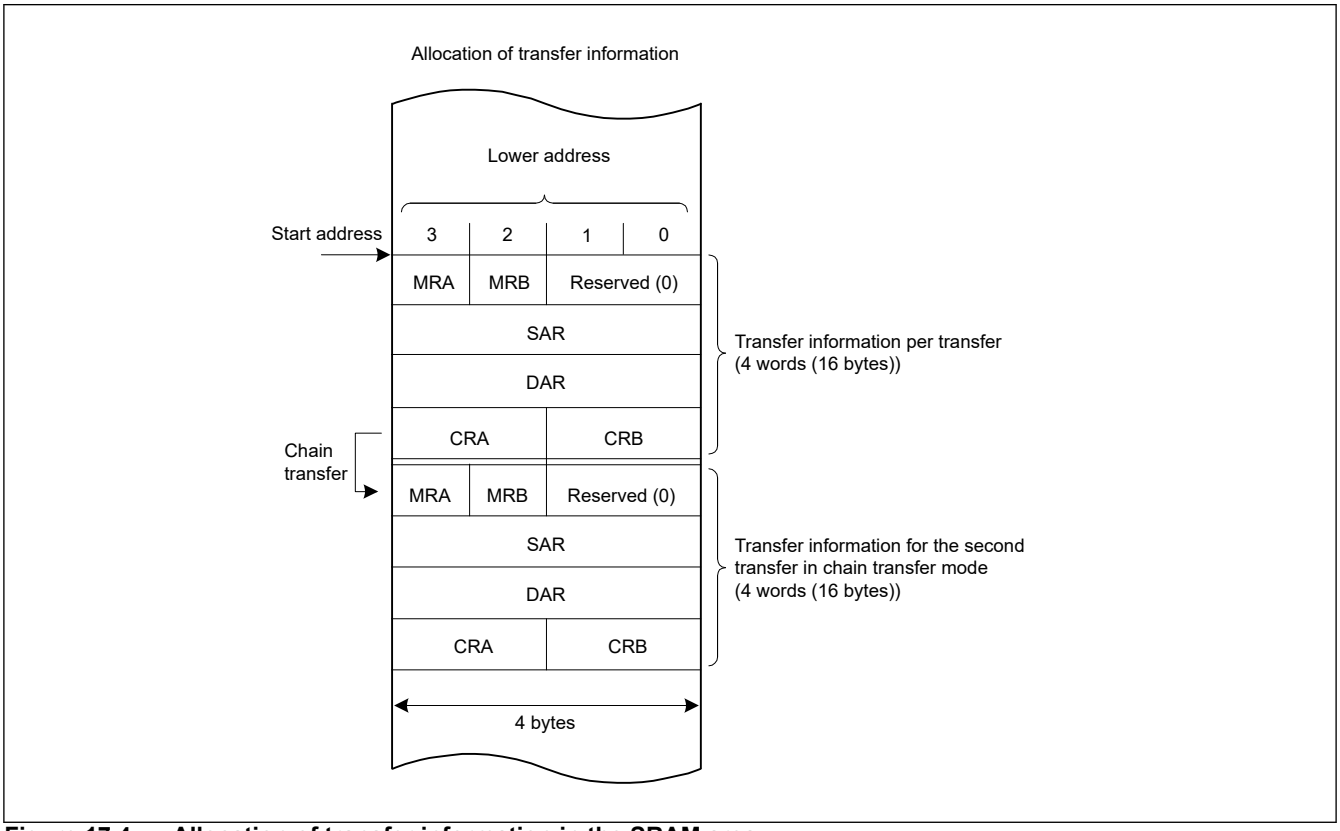

Figure 17.4 Allocation of transfer information in the SRAM area

17.4 Operation

The DTC transfers data according to the transfer information. Storage of the transfer information in the SRAM area is required before a DTC operation. When the DTC is activated, it reads the DTC vector associated with the vector number. The DTC reads the transfer information from the transfer information store address referenced by the DTC vector and transfers the data. After the data transfer, the DTC writes back the transfer information. Storing the transfer information in the SRAM area allows data transfer of any number of channels.

The transfer modes include:

- Normal transfer mode
- Repeat transfer mode
- Block transfer mode.

The DTC specifies a transfer source address in the SAR register and a transfer destination address in the DAR register. The values of these registers are incremented, decremented, or address-fixed independently after the data transfer.

Table 17.2 describes the DTC transfer modes.

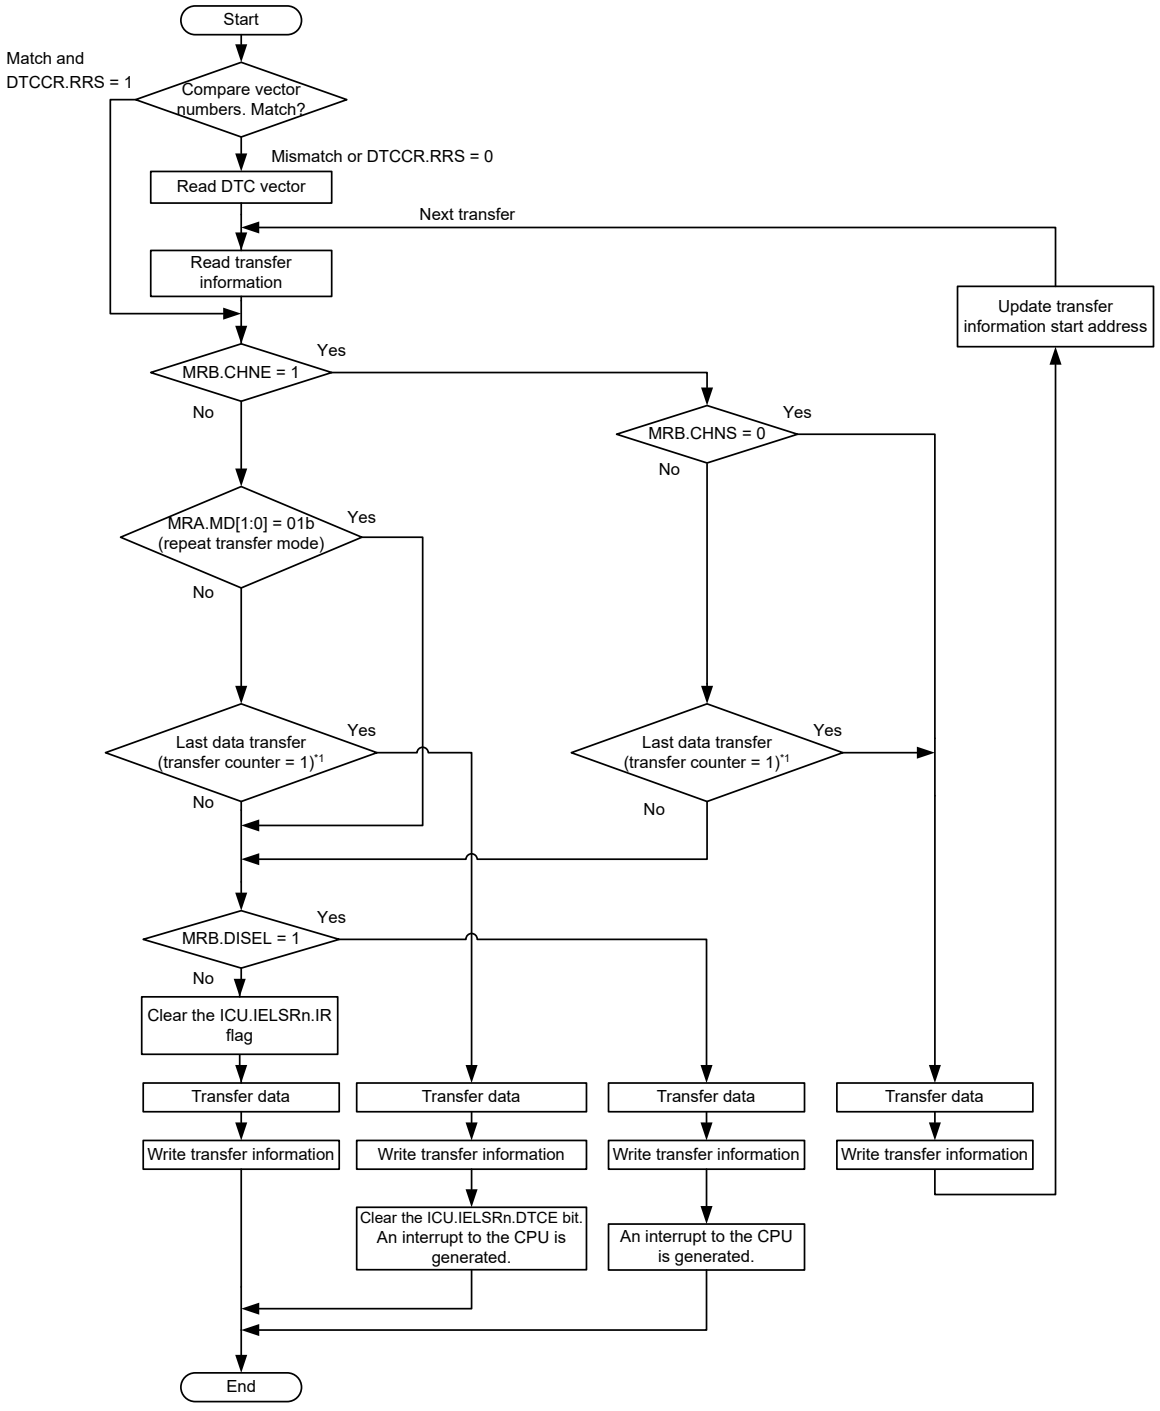
Table 17.2 DTC transfer modes

Transfer mode	Data size transferred on single transfer request	Increment or decrement of memory address	Settable transfer count
Normal transfer mode	1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 65536
Repeat transfer mode*1	1 byte (8 bit), 1 halfword (16 bit), 1 word (32 bit)	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 256*3
Block transfer mode*2	Block size specified in CRAH (1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes))	Incremented or decremented by 1, 2, or 4 or address-fixed	1 to 65536

Note 1. Set the transfer source or transfer destination as the repeat area.
Note 2. Set the transfer source or transfer destination as the block area.
Note 3. After a data transfer of the specified count, the initial state is restored and operation restarts.

Setting the MRB.CHNE bit to 1 allows multiple transfers or chain transfer on a single activation source. It also enables a chain transfer when the specified data transfer is complete.

Figure 17.5 shows the operation flow of the DTC. Table 17.3 lists the chain transfer conditions. The combination of control information for the second and subsequent transfers are omitted in this table.



Note 1. Counter value before starting data transfer.

Figure 17.5 DTC operation flow

Table 17.3 Chain transfer conditions

First transfer				Second transfer*3				
CHNE bit	CHNS bit	DISEL bit	Transfer counter*1 *2	CHNE bit	CHNS bit	DISEL bit	Transfer counter*1 *2	DTC transfer
0	—	0	Other than (1 → 0)	—	—	—	—	Ends after the first transfer
0	—	0	(1 → 0)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU
0	—	1	—	—	—	—	—	
1	0	—	—	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	0	Other than (1 → *)	—	—	—	—	Ends after the first transfer
1	1	—	(1 → *)	0	—	0	Other than (1 → 0)	Ends after the second transfer
				0	—	0	(1 → 0)	Ends after the second transfer with an interrupt request to the CPU
				0	—	1	—	
1	1	1	Other than (1 → *)	—	—	—	—	Ends after the first transfer with an interrupt request to the CPU

Note 1. The transfer counter used depends on the transfer modes as follows:
Normal transfer mode — CRA register
Repeat transfer mode — CRAL register
Block transfer mode — CRB register

Note 2. On completion of a data transfer, the counters operate as follows:
1 → 0 in normal and block transfer modes
1 → CRAH in repeat transfer mode
(1 → *) in the table indicates both of these two operations, depending on the mode.

Note 3. Chain transfer can be selected for the second or subsequent transfers. The conditions for the combination of the second transfer and CHNE = 1 is omitted.

17.4.1 Transfer Information Read Skip Function

Reading of vector addresses and transfer information can be skipped by setting the DTCCR.RRS bit. When a DTC activation request is generated, the current DTC vector number is compared with the DTC vector number in the previous activation process. When these vector numbers match and the RRS bit is set to 1, the DTC data transfer is performed without reading the vector address and transfer information. However, when the previous transfer is a chain transfer, the vector address and transfer information are read. Additionally, when the transfer counter (CRA register) becomes 0 during the previous normal transfer, and when the transfer counter (CRB register) becomes 0 during the previous block transfer, transfer information is read regardless of the RRS bit. Figure 17.13 shows an example when reading the transfer information is skipped.

To update the vector table and transfer information, set the RRS bit to 0, update the vector table and transfer information, then set the RRS bit to 1. The stored vector number is discarded by setting the RRS bit to 0. The updated DTC vector table and transfer information are read in the next activation process.

17.4.2 Transfer Information Write-Back Skip Function

When the MRA.SM[1:0] bits or the MRB.DM[1:0] bits are set to address fixed, a part of the transfer information is not written back. Table 17.4 lists the transfer information write-back skip conditions and the associated registers. The CRA and CRB registers are written back, and the write-back of the MRA and MRB registers is skipped.

Table 17.4 Transfer information write-back skip conditions and applicable registers

MRA.SM[1:0] bits		MRB.DM[1:0] bits			
b3	b2	b3	b2	SAR register	DAR register
0	0	0	0	Skip	Skip
0	0	0	1		
0	1	0	0		
0	1	0	1		
0	0	1	0	Skip	Write-back
0	0	1	1		
0	1	1	0		
0	1	1	1		
1	0	0	0	Write-back	Skip
1	0	0	1		
1	1	0	0		
1	1	0	1		
1	0	1	0	Write-back	Write-back
1	0	1	1		
1	1	1	0		
1	1	1	1		

17.4.3 Normal Transfer Mode

The normal transfer mode allows a 1-byte (8 bit), 1-halfword (16 bit), 1-word (32 bit) data transfer on a single activation source. The transfer count can be set from 1 to 65536. Transfer source and destination addresses can be independently set to increment, decrement, or fixed. This mode enables an interrupt request to the CPU to be generated at the end of a specified-count transfer.

Table 17.5 lists register functions in normal transfer mode, and Figure 17.6 shows the memory map of normal transfer mode.

Table 17.5 Register functions in normal transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	Increment, decrement, or fixed*1
DAR	Transfer destination address	Increment, decrement, fixed*1
CRA	Transfer counter A	CRA - 1
CRB	Transfer counter B	Not updated

Note 1. Write-back operation is skipped in address-fixed mode.

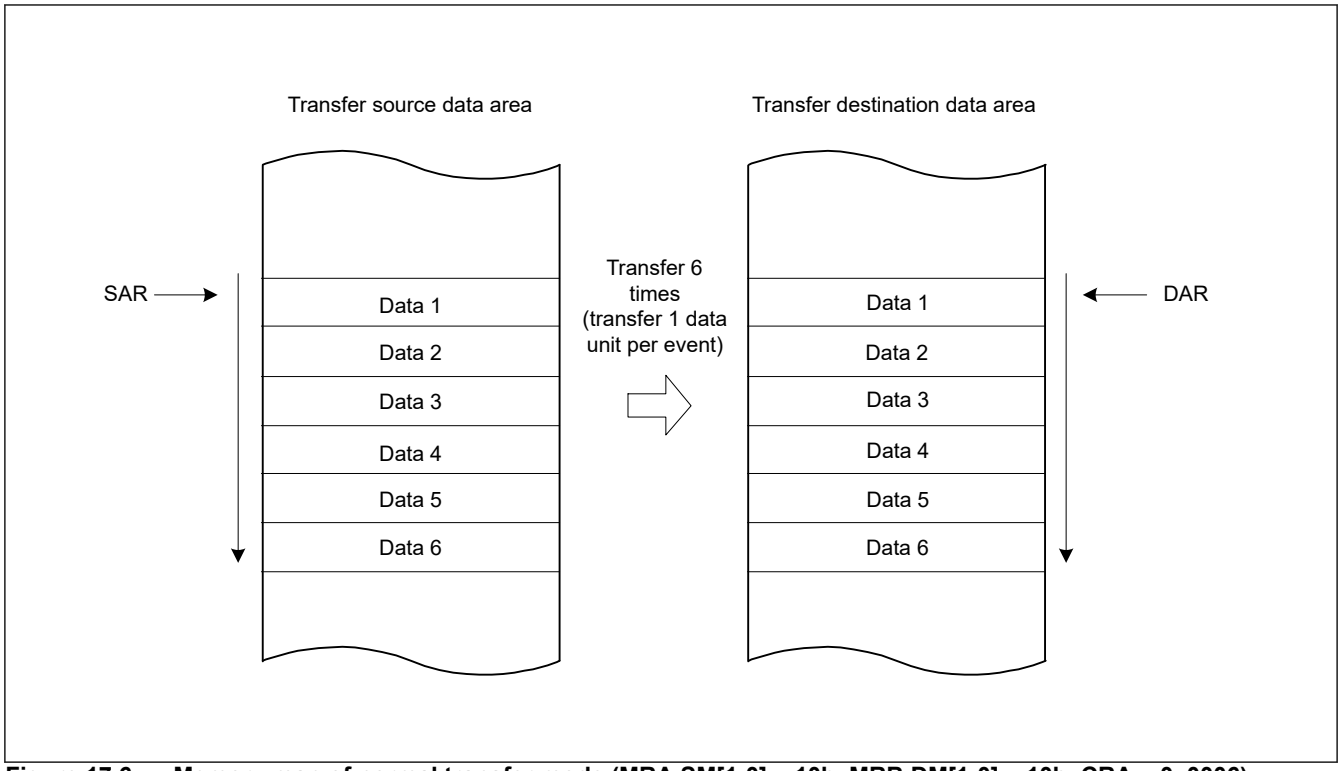


Figure 17.6 Memory map of normal transfer mode (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRA = 0x0006)

17.4.4 Repeat Transfer Mode

The repeat transfer mode allows a 1-byte (8-bit), 1-halfword (16-bit), or 1-word (32-bit) data transfer on a single activation source. Transfer source or transfer destination for the repeat area must be specified in the MRB.DTS bit. The transfer count can be set from 1 to 256. When the specified transfer count is complete, the initial value of the address register specified in the repeat area is restored, the initial value of the transfer counter is restored, and transfer is repeated. The other address register is incremented or decremented continuously or remains unchanged.

When the transfer counter CRAL decrements to 0x00 in repeat transfer mode, the CRAL value is updated to the value set in the CRAH register. As a result, the transfer counter does not clear to 0x00, which disables interrupt requests to the CPU when the MRB.DISEL bit is set to 0. An interrupt request to the CPU is generated when the specified data transfer completes.

Table 17.6 lists the register functions in repeat transfer mode, and Figure 17.7 shows the memory map of repeat transfer mode.

Table 17.6 Register functions in repeat transfer mode

Register	Description	Value written back by writing transfer information	
		When CRAL is not 1	When CRAL is 1
SAR	Transfer source address	Increment, decrement, fixed*1	• When the MRB.DTS bit is 0 Increment, decrement, or fixed*1 • When the MRB.DTS bit is 1 SAR register initial value
DAR	Transfer destination address	Increment, decrement, or fixed*1	• When the MRB.DTS bit is 0 DAR register initial value • When the MRB.DTS bit is 1 Increment, decrement, or fixed*1
CRAH	Retains transfer counter	CRAH	CRAH
CRAL	Transfer counter A	CRAL - 1	CRAH
CRB	Transfer counter B	Not updated	Not updated

Note 1. Write-back is skipped in address-fixed mode.

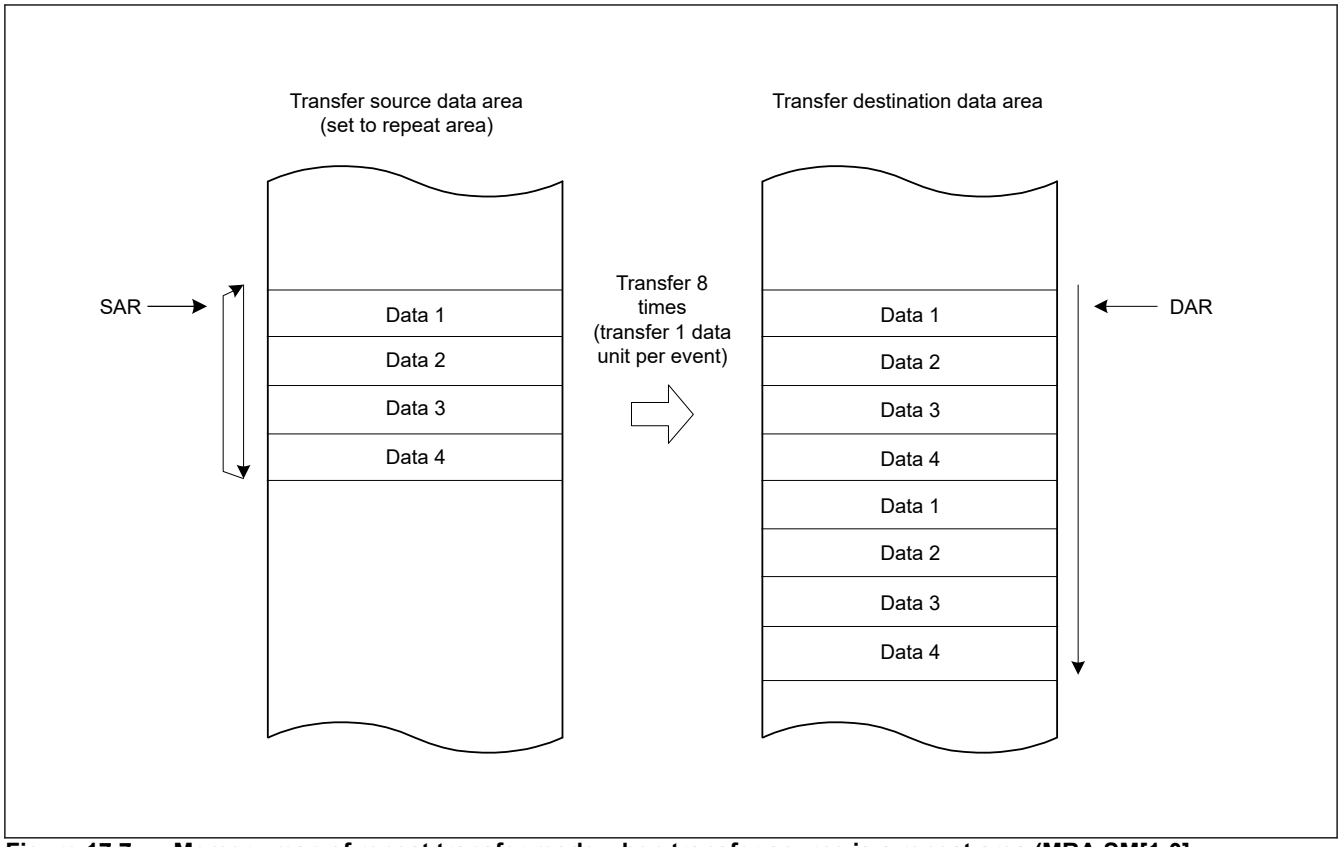

Figure 17.7 Memory map of repeat transfer mode when transfer source is a repeat area (MRA.SM[1:0] = 10b, MRB.DM[1:0] = 10b, CRAH = 0x04)

17.4.5 Block Transfer Mode

The block transfer mode allows single-block data transfer on a single activation source. Transfer source or transfer destination for the block area must be specified in the MRB.DTS bit. The block size can be set from 1 to 256 bytes, 1 to 256 halfwords (2 to 512 bytes), or 1 to 256 words (4 to 1024 bytes). When transfer of the specified block completes, the initial values of the block size counter CRAL and the address register (the SAR register when the MRB.DTS = 1 or the DAR register when the DTS = 0) specified in the block area are restored. The other address register is incremented or decremented continuously or remains unchanged.

The transfer count (block count) can be set from 1 to 65536. This mode enables an interrupt request to the CPU to be generated at the end of the specified-count block transfer.

Table 17.7 lists the register functions in block transfer mode, and Figure 17.8 shows the memory map for block transfer mode.

Table 17.7 Register functions in block transfer mode

Register	Description	Value written back by writing transfer information
SAR	Transfer source address	• When MRB.DTS bit is 0 Increment, decrement, or fixed*1 • When MRB.DTS bit is 1 SAR register initial value.
DAR	Transfer destination address	• When MRB.DTS bit is 0 DAR register initial value • When MRB.DTS bit is 1 Increment, decrement, or fixed*1.
CRAH	Holds block size	CRAH
CRAL	Block size counter	CRAH
CRB	Block transfer counter	CRB - 1

Note 1. Write-back is skipped in address-fixed mode.

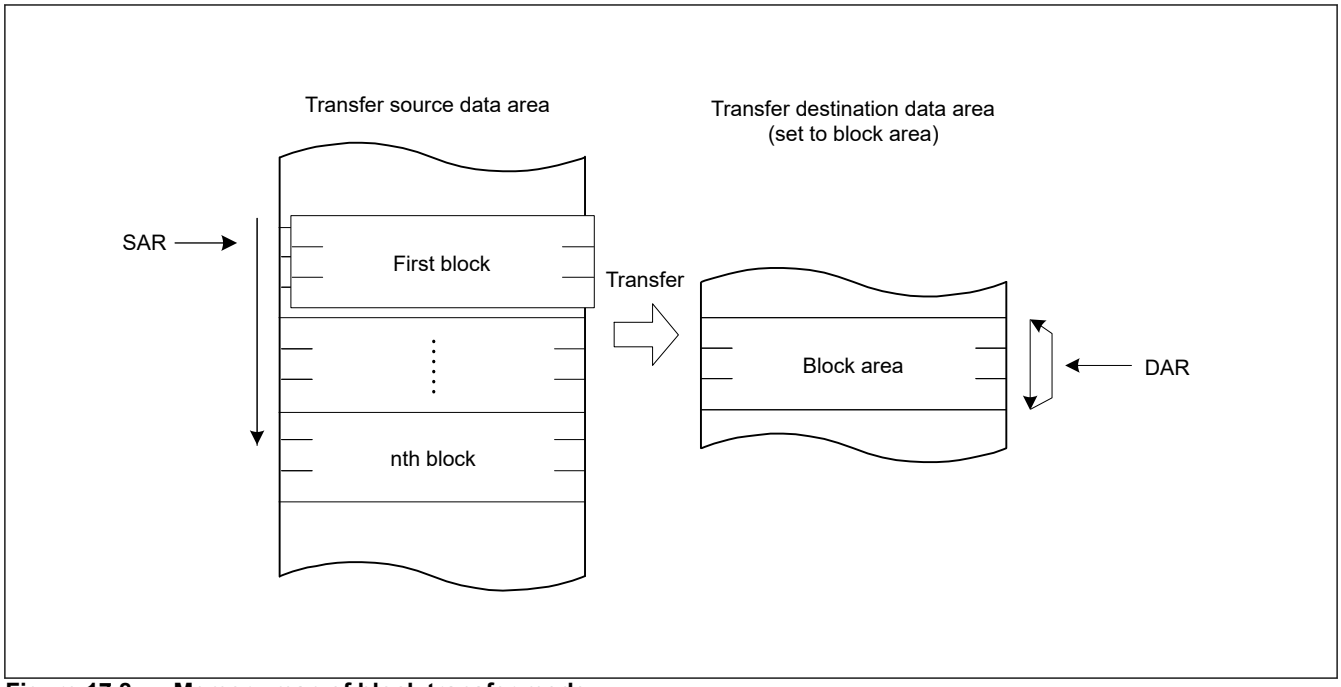

Figure 17.8 Memory map of block transfer mode

17.4.6 Chain Transfer

Setting the MRB.CHNE bit to 1 allows chain transfer to be performed continuously on a single activation source. If the MRB.CHNE is set to 1 and CHNS to 0, an interrupt request to the CPU is not generated on completion of the specified number of rounds of transfer or by setting the MRB.DISEL bit to 1. An interrupt request is sent to the CPU each time DTC data transfer is performed. Data transfer has no effect on the ICU.IELSRn.IR flag of the activation source.

The SAR, DAR, CRA, CRB, MRA, and MRB registers can be set independently of each other to define the data transfer. Figure 17.9 shows a chain transfer operation.

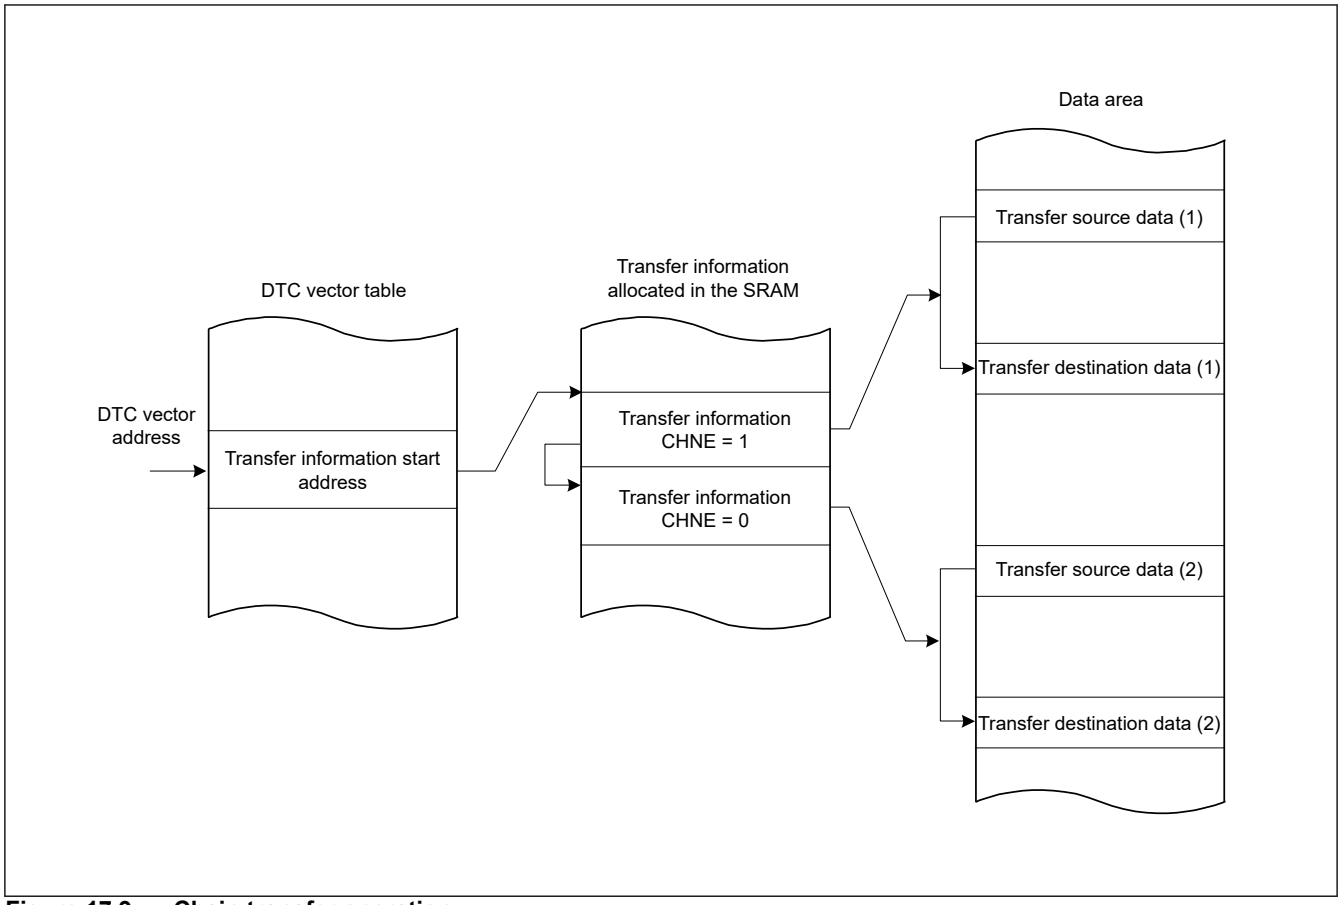

Figure 17.9 Chain transfer operation

Writing 1 to the MRB.CHNE and CHNS bits enables chain transfer to be performed only after completion of the specified data transfer. In repeat transfer mode, chain transfer is performed after completion of the specified data transfer. For details on chain transfer conditions, see Table 17.3.

17.4.7 Operation Timing

Figure 17.10 to Figure 17.13 are timing diagrams that show the minimum number of execution cycles.

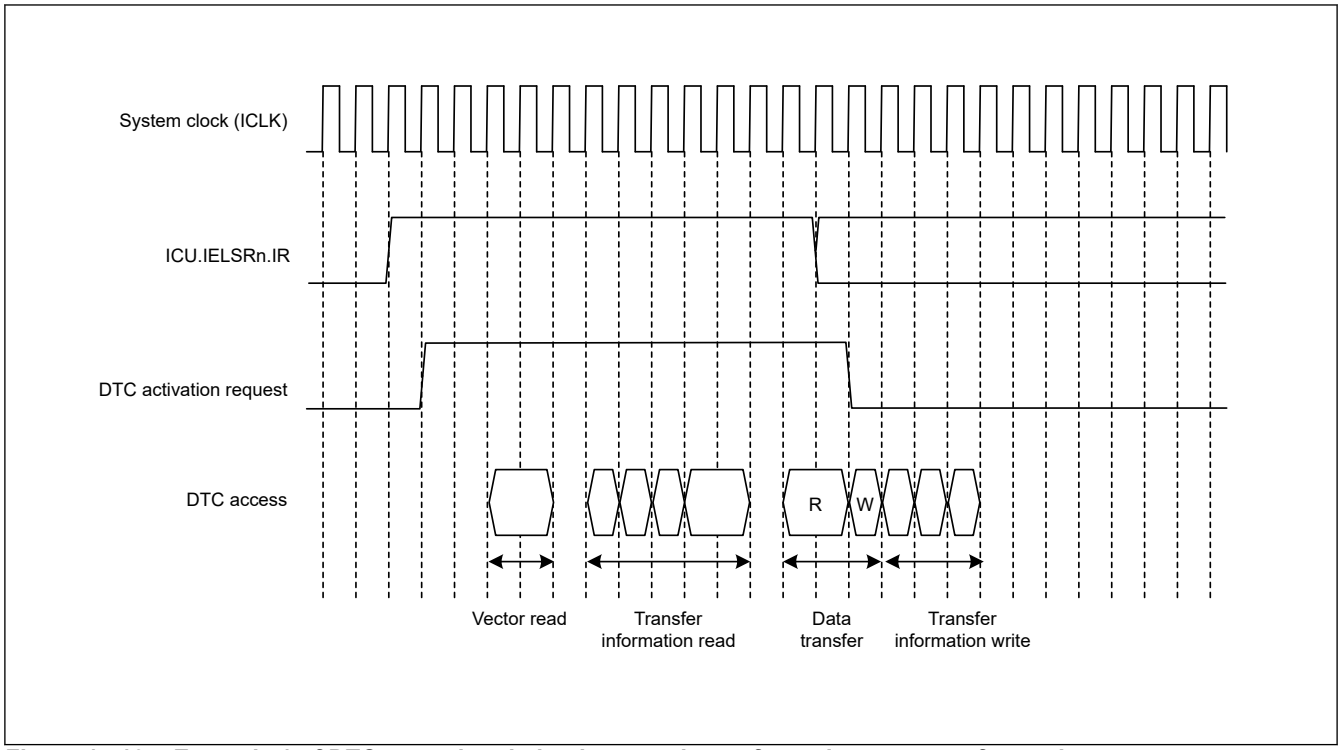

Figure 17.10 Example 1 of DTC operation timing in normal transfer and repeat transfer modes

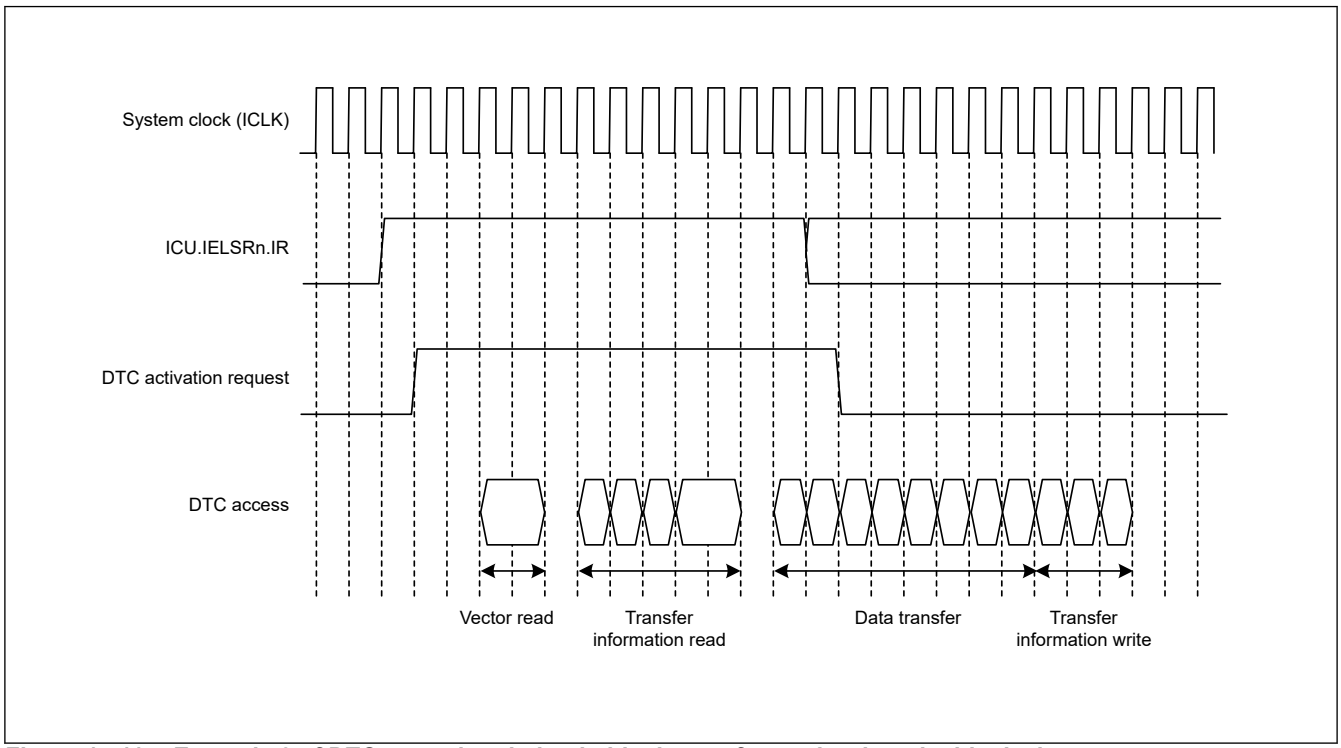

Figure 17.11 Example 2 of DTC operation timing in block transfer mode when the block size = 4

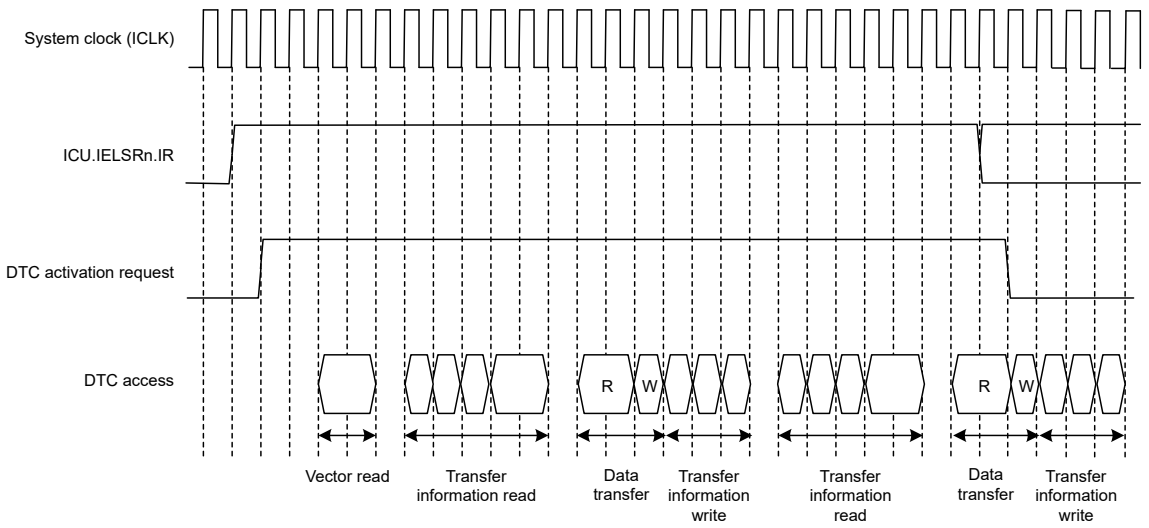
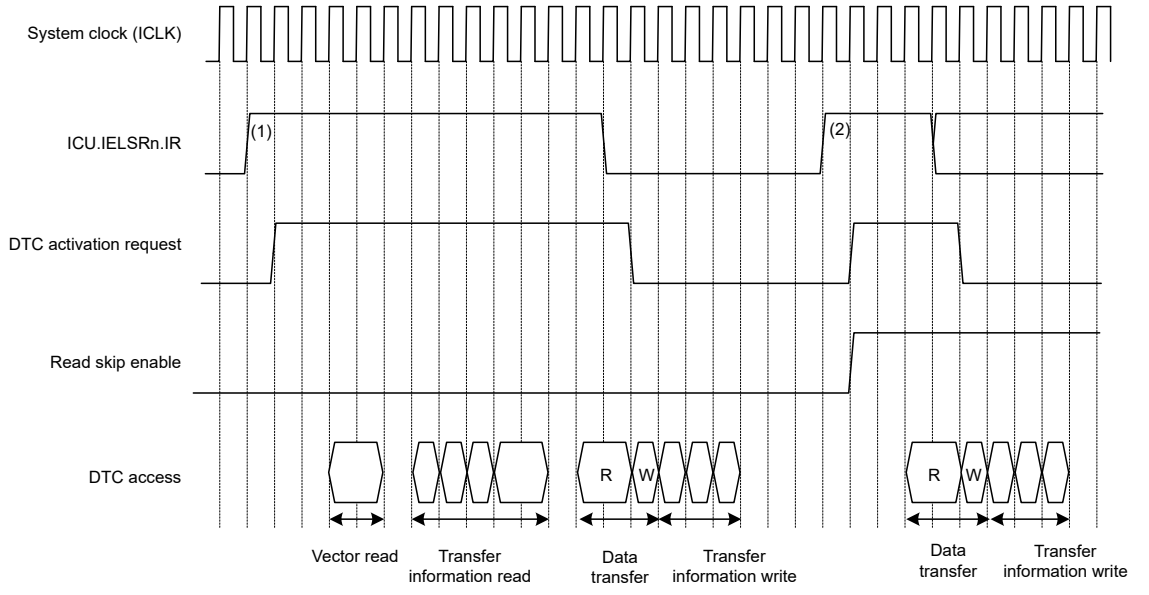


Note: n = Vector number

Figure 17.12 Example 3 of DTC operation timing for chain transfer



Note: n = Vector number
Note: When activation sources (vector numbers) of (1) and (2) are the same and the RRS = 1, the transfer information read for request (2) is skipped.

Figure 17.13 Example of operation when a transfer information read is skipped with the vector, transfer information, and transfer destination data on the SRAM, and the transfer source data on the peripheral module

17.4.8 Vector Security

The security attribute of transfer access of DTC vector n and security attribute of access to the IELSRn (n = 0 to 95) register of ICU are controlled by SAIELSRn bit of ICUSARx (x = G,H or I) registers in CPSCU. For details on the CPSCU.ICUSARx registers, see section 13, Interrupt Controller Unit (ICU).

When the CPSCU.ICUSARx.IELSRnSA bit is 0

- IELSRn register have security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a Secure master.

When the CPSCU.ICUSARx.IELSRnSA bit is 1

- IELSRn register have non-security attribute
- The vector number of DTC activated by the interrupt request set in IELS behaves as a Non-secure master.

For areas accessible to Secure or Non-secure masters, See section 14, Buses, and section 43, Security Features .

17.4.9 Vector privilege

The privileged attribute of transfer access of DTC vector n is controlled bit0 in vector table.

If bit0 corresponding to each vector number in the vector table is set to 0, DTC transfer is privileged access.

If bit0 is set to 1, DTC transfers are unprivileged access.

Refer to for vector table and transfer information.

17.5 DTC Setting Procedure

Before using the DTC, set the DTC Vector Base Register (DTCVBR). Set the ICU.IELSRn.IELS[8:0] bits to 0 to disable the interrupt in the NVIC and follow the procedure in Table 17.8 to set the DTC.

Table 17.8 DTC setting procedure

No.	Step Name	Description
1	Set the DTCCR*1.RRS bit to 0	Set the DTCCR*1.RRS bit to 0 to reset the transfer information read skip flag. After that, the transfer information read is not skipped while the DTC is activated. Be sure to specify this setting when the transfer information is updated.
2	Set transfer information (MRA, MRB, SAR, DAR, CRA, and CRB)	Allocate transfer information (MRA, MRB, SAR, DAR, CRA, and CRB) in the data area. To set transfer information, see section 17.2. Register Descriptions. To allocate transfer information, see section 17.3.1. Allocating Transfer Information and DTC Vector Table.
3	Set transfer information start addresses in the DTC vector table	Set the transfer information start addresses in the DTC vector table. To set the DTC vector table, see section 17.3.1. Allocating Transfer Information and DTC Vector Table.
4	Set the DTCCR*1.RRS bit to 1	Set the DTCCR*1.RRS bit to 1 to enable skipping of the second and subsequent transfer information read cycles for continuous DTC activation from the same interrupt source. The RRS bit can be set to 1, but if this is set during DTC transfer, it becomes valid from the next transfer.
5	Set the ICU.IELSRn.DTCE bit to 1. Set the ICU.IELSRn.IELS[8:0] as interrupt source. The interrupt should be enabled in the NVIC.	Set the ICU.IELSRn.DTCE bit to 1. Set ICU.IELSRn.IELS[8:0] as interrupt sources that trigger DTC. The interrupt must be enabled in the NVIC. See section 13.3.2. Event Number in section 13, Interrupt Controller Unit (ICU).
6	Set the enable bit for an activation source interrupt	Set the enable bit for the activation source interrupts to 1. When a source interrupt is generated, the DTC is activated. To set the interrupt source enable bit, see the settings for the modules that are to be the activation sources.
7	Set the DTCST.DTCST bit to 1	Set the DTC Module Start bit (DTCST.DTCST) to 1.

Note: The DTCST.DTCST bit can be set even if the setting for each activation source is not completed.
Note: When DTCSAR.DTCSTSA = 0 is set, DTCST.DTCST = 1 must be set in the Secure state to use DTC in the Non-secure state.
Note 1. When used in Secure state, access DTCCR_SEC instead of DTCCR.

17.6 Examples of DTC Usage

17.6.1 Normal Transfer

This section provides an example of DTC usage and its application when receiving 128 bytes of data from an SCI.

(1) Transfer information settings

In the MRA register, select a fixed source address (MRA.SM[1:0] = 00b), normal transfer mode (MRA.MD[1:0] = 00b), and byte-sized transfer (MRA.SZ[1:0] = 00b). In the MRB register, specify incrementation of the destination address (MRB.DM[1:0] = 10b) and single data transfer by a single interrupt (MRB.CHNE = 0 and MRB.DISEL = 0). The MRB.DTS bit can be set to any value. Set the RDR register address of the SCI in the SAR register, the start address of the SRAM area for data storage in the DAR register, and 128 (0x0080) in the CRA register. The CRB register can be set to any value.

(2) DTC vector table settings

The start address of the transfer information for the RXI interrupt is set in the vector table for the DTC.

(3) ICU settings and DTC module activation

Set the ICU.IELSRn.DTCE bit to 1 and set ICU.IELSRn.IELS[8:0] as the SCI interrupt. The interrupt must be enabled in the NVIC. Set the DTCST.DTCST bit to 1.

(4) SCI settings

Enable the SCIn_RXI (n = 0 to 4, 9) interrupt by setting the SCR.RIE bit in the SCI to 1. If a reception error occurs during the SCI receive operation, reception stops. To manage this, use settings that allow the CPU to accept receive error interrupts.

(5) DTC transfer

Each time a reception of 1 byte by the SCI is complete, an SCIn_RXI interrupt is generated to activate the DTC. The DTC transfers the received byte from the RDR of the SCI to the SRAM, after which the DAR register is incremented and the CRA register is decremented.

(6) Interrupt handling

After 128 rounds of data transfer are complete and the value in the CRA register becomes 0, an SCIn_RXI interrupt request is generated for the CPU. Complete the process in the handling routine for this interrupt.

17.6.2 Chain transfer

This section provides an example of chain transfer by the DTC and describes its use in the output of pulses by the General PWM Timer (GPT). You can use chain transfer to transfer PWM timer compare data and change the period of the PWM timer for the GPT.

For the first of the chain transfers, normal transfer mode is specified for transfer to the GPT32n.GTCCRC register (n = 0 to 7) or GPT16m.GTCCRC register (m = 8 to 13). For the second transfer, normal transfer mode is specified for transfer to the GPT32n.GTCCRE register (n = 0 to 7) or GPT16m.GTCCRE register (m = 8 to 13). For the third transfer of the chained transfer, normal transfer mode for transfer to the GPT32n.GTPBR register (n = 0 to 7) or GPT16m.GTPBR register (m = 8 to 13) is specified. This is because clearing of the activation source and generation of an interrupt on completion of the specified number of transfers are restricted to the third of the chain transfers, that is, transfer while MRB.CHNE = 0.

The following example shows how to use the counter overflow interrupt with the GPT320.GTPR register as an activating source for the DTC.

(1) First transfer information setting

Set up transfer to the GPT320.GTCCRC register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1 and MRB.CHNS = 0).

4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRC register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(2) Second transfer information setting

Set up for transfer to the GPT320.GTCCRE register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up chain transfer (MRB.CHNE = 1, MRB.CHNS = 0).
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTCCRE register.
6. Set the CRAH and CRAL registers to the size of the data table. The CRB register can be set to any value.

(3) Third transfer information set

Set up transfer to the GPT320.GTPBR register.

1. In the MRA register, select incrementation of the source address (MRA.SM[1:0] = 10b).
2. Set the transfer to normal transfer mode (MRA.MD[1:0] = 00b) and word-sized transfer (MRA.SZ[1:0] = 10b).
3. In the MRB register, select the destination address as fixed (MRB.DM[1:0] = 00b) and set up single data transfer per interrupt (MRB.CHNE = 0, MRB.DISEL = 0). The MRB.DTS bit can be set to any value.
4. Set the SAR register to the first address of the data table.
5. Set the DAR register to the address of the GPT320.GTPBR register.
6. Set the CRA register to the size of the data table. The CRB register can be set to any value.

(4) Transfer information assignment

Place the transfer information for use in the transfer to the GPT320.GTPBR immediately after the transfer control information for use in the GPT320.GTCCRC and GPT320.GTCCRE registers.

(5) DTC vector table

In the DTC vector table, set the address where the transfer control information for use in transfer to the GPT320.GTCCRC and GPT320.GTCCRE registers starts.

(6) ICU setting and DTC module activation

1. Set the ICU.IELSRn.DTCE bit associated with the GPT320 counter overflow interrupt.
2. Set the ICU.IELSRn.IELS[8:0] bits and specify the GPT320 counter overflow.
3. Set the DTCST.DTCST bit to 1.

(7) GPT settings

1. Set the GPT320.GTIOR register so that the GTCCRA and GTCCRB registers operate as output compare registers.
2. Set the default PWM timer compare values in the GPT320.GTCCRA and GPT320.GTCCRB registers and the next PWM timer compare values in the GPT320.GTCCRC and GPT320.GTCCRE registers.
3. Set the default PWM timer period values in the GPT320.GTPR register and the next PWM timer period values in the GPT320.GTPBR register.
4. Set 1 to the output bit in PmnPFS.PDR, and set 00011b to the Peripheral Select bits in PmnPFS.PSEL[4:0].

(8) GPT activation

Set the GPT320.GTSTR.CSTRT bits to 1 to start the GPT320.GTCNT counter.

(9) DTC transfer

Each time a GPT320 counter overflow is generated with the GPT320.GTPR register, the next PWM timer compare values are transferred to the GPT320.GTCCRC and GPT320.GTCCRE registers. The setting for the next PWM timer period is transferred to the GPT320.GTPBR register.

(10) Interrupt handling

After the specified rounds of data transfer are complete, for example when the value in the CRA register for GPT transfer becomes 0, a GPT320 counter overflow interrupt request is issued for the CPU. Complete the process for this interrupt in the handling routine.

17.6.3 Chain Transfer when Counter = 0

The second data transfer is performed only when the transfer counter is set to 0 in the first data transfer, and the first data transfer information is repeatedly changed in the second transfer. Chain transfer enables transfers to be repeated 256 times or more.

The following procedure shows an example of configuring a 1-KB input buffer, where the input buffer is set so that its lower address starts with 0x00. Figure 17.14 shows a chain transfer when the counter = 0.

1. Set the normal transfer mode to input data for the first data transfer. Set the following:
   (a) Transfer source address = fixed.
   (b) CRA register = 0x0200 (512) times.
   (c) MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) MRB.CHNS bit = 1 (chain transfer is performed only when the transfer counter is 0).
   (e) MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
2. Prepare the upper 8-bit address of the start address at every 512 times of the transfer destination address for the first data transfer in different area such as the flash. For example, when setting the input buffer to 0x8000 to 0x83FF, prepare 0x82 and 0x80.
3. For the second data transfer:
   (a) Set the repeat transfer mode (with transfer source and destination address = fixed.) to reset the transfer counter of the first data transfer.
   (b) Specify the CRA register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 1 (chain transfer is enabled).
   (d) Set the MRB.CHNS bit = 0 (select continuous chain transfer).
   (e) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (f) CRA register = 0x0101 (The transfer count is 1).
4. For the third data transfer:
   (a) Set the repeat transfer mode (with the source as the repeat area) to reset the transfer destination address of the first data transfer.
   (b) Specify the upper 8 bits of the DAR register in the first transfer information area for the transfer destination.
   (c) Set the MRB.CHNE bit = 0 (chain transfer is disabled).
   (d) Set the MRB.DISEL bit = 0 (an interrupt request to the CPU is generated when the specified data transfer completes).
   (e) When setting the input buffer to 0x8000 to 0x83FF, also set the transfer counter to 2.
5. The first data transfer is performed by an interrupt 512 times. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
6. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to

0x82. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.

7. In succession, the first data transfer is performed by an interrupt 512 times as specified for the first data transfer. When the transfer counter of the first data transfer becomes 0, the second data transfer starts. Set the transfer counter of the first data transfer to 0x0200. The lower 8 bits of the transfer destination address and the transfer counter of the first data transfer becomes 0x0200.
8. The second data transfer is performed by an interrupt 1 times. When the transfer counter of the first data transfer becomes 0, the third data transfer starts. Set the upper 8 bits of the transfer destination address of the first data transfer to 0x80. The lower 8 bits of the transfer destination address becomes 0x00 and the transfer counter of the first data transfer becomes 0x0200.
9. Steps 5 to 8 are repeated indefinitely. Because the second data transfer is in repeat transfer mode, no interrupt request to the CPU is generated.

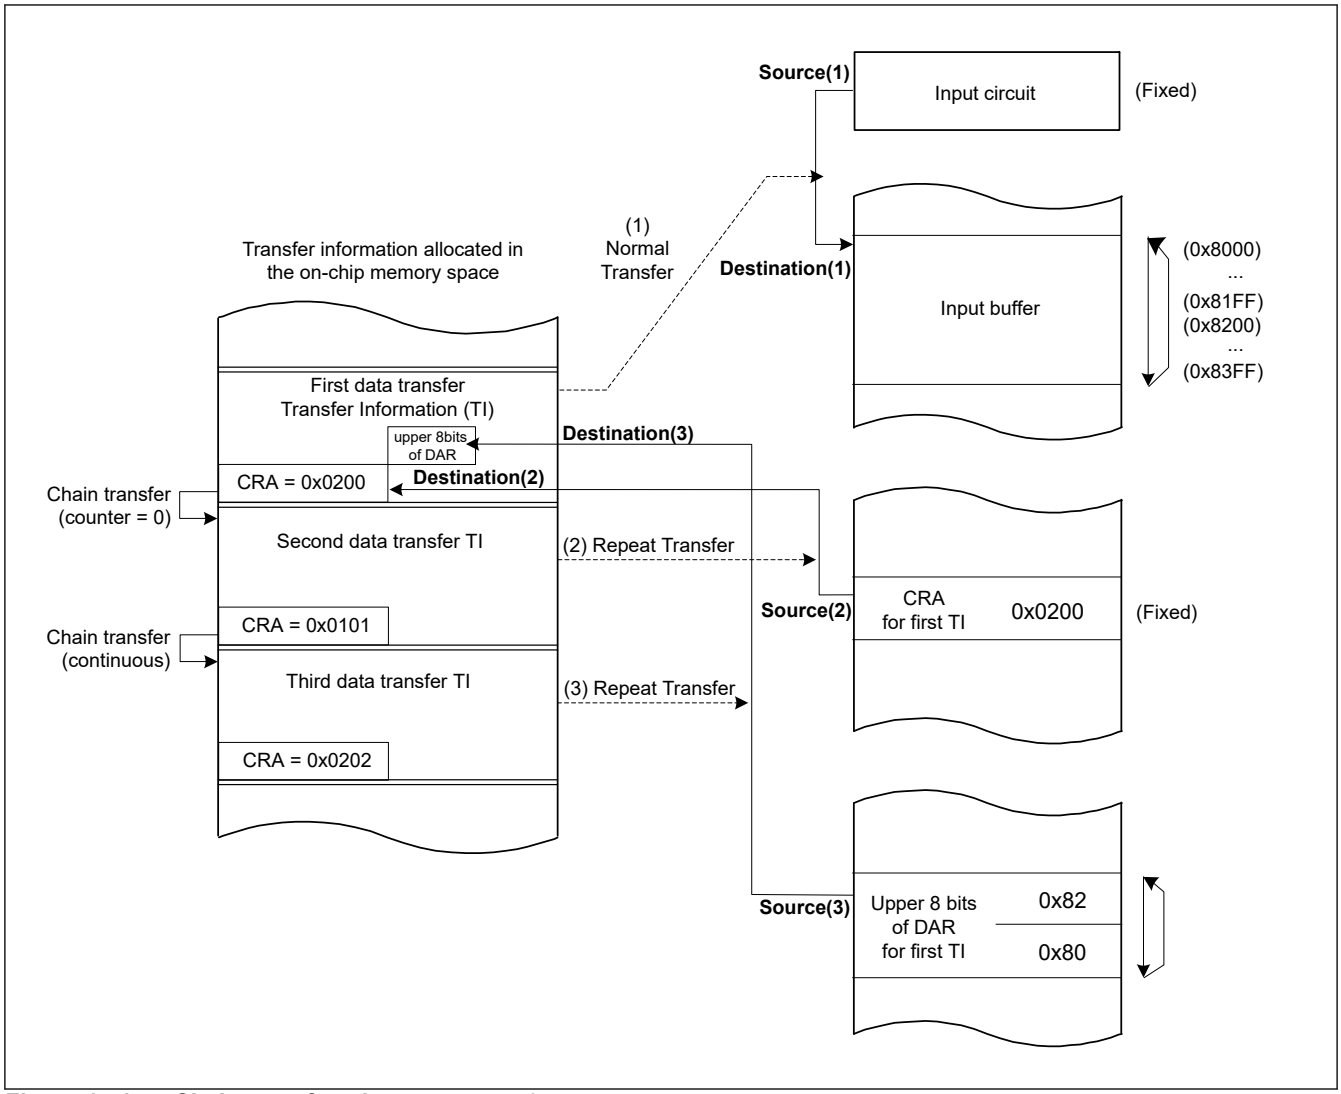


Figure 17.14 Chain transfer when counter = 0

17.7 Processing on DTC Transfer Error

If the access error occurs during DTC transfer, the DTC immediately stops access during transfer. DTC is stopped only for the vector number that caused the error. Therefore, inform the vector number that caused the error to the ICU and cleared the corresponding ICU setting (IELSR). After that, if there is a request other than the vector number which caused the error, it will be re-arbitration as it is.

The error response is informed to ICU when the transfer error occurs. ICU clears the ICU.IELSRn of the corresponding vector number which caused the transfer error. Write back to SRAM is not performed.

17.8 Interrupt

17.8.1 Interrupt Request of Transfer End

When the DTC completes data transfer of the specified count or when data transfer with MRB.DISEL set to 1 is complete, a DTC activation source generates an interrupt to the CPU. Two types of interrupt are available: interrupts triggered by a DTC activation (per channel) and an interrupt triggered by the event signal DTC0_COMPLETE (common to all channels). Interrupts to the CPU are controlled according to the settings in the NVIC and the ICU.IELSRn.IELS[8:0] bits. See section 13, Interrupt Controller Unit (ICU). The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

17.8.2 Interrupt Request of Transfer Error

The error response detection interrupt request (DMA0_TRANSERR) is generated from the DMAC/DTC when the transfer error is detected during DTC transfer.

The types of interrupts that occur when the DTC transfer error occurs are listed in Table 17.9. The Table 17.9 also shows error information stored when a transfer error occurs.

Table 17.9 Interrupt and error information due to DTC transfer error cause

Transfer error factor	NMI/RESET*1 Request	Interrupt Request	Bus Error Status	Error Address Error R/W	Error Channel Information
MSAU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MSERRSTAT	BUS.BMSA4ERRADD BUS.BMSA4ERRRW	DTC.DTEVR
Master MPU Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. MMERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
Illegal Access Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. ILERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
Slave Bus Error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. SLERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR
TrustZone Filter error	ICU.NMISR.BUSST	DMA0_TRANSERR*1	BUS.BUS4ERRSTAT. STERRSTAT	BUS.BUS4ERRADD BUS.BUS4ERRRW	DTC.DTEVR

Note 1. If ICU.NMIER.BUSEN is enabled with DMA0_TRANSERR set in ICU.IELSR, NMI and an interrupt will occur due to a transfer error caused by DMA. it is able to be generated only NMI by not setting DMA0_TRANSERR to ICU.IELSR.

17.9 Event Link

The DTC can produce an event link request on completion of one transfer request. When the destination for transfer is an external bus, however, the event link request will be issued after completion of writing to the write buffer rather than after completion of writing to the actual destination for transfer.

17.10 Low Power Consumption Function

Before transitioning to the module-stop state, Software Standby mode or Deep Software Standby mode, set the DTCST.DTCST bit to 0, and then perform the operations described in the following sections.

(1) Module-stop function

Writing 1 to the MSTPCRA.MSTPA22 bit enables the module-stop function of the DTC. If a DTC transfer is in progress when 1 is written to the MSTPCRA.MSTPA22 bit, the transition to the module-stop state proceeds after the DTC transfer ends. While the MSTPCRA.MSTPA22 bit is 1, accessing the DTC registers is prohibited. Writing 0 to the MSTPCRA.MSTPA22 bit releases the DTC from the module-stop state.

(2) Software Standby mode and Deep Software Standby mode

Use the settings described in section 10.7.3.1. Transition to Software Standby Mode or Transitioning to Deep Software Standby Mode.

If DTC transfer operations are in progress when the WFI instruction is executed, the transition to Software Standby mode or Deep Software Standby mode follows the completion of the DTC transfer.

(3) Notes on Low Power Consumption Function

For the WFI instruction and the register setting procedure, see section 10, Low Power Modes.

To perform a DTC transfer after returning from a low power mode.

To use a request that is generated in Software Standby mode as an interrupt request to the CPU but not as a DTC activation request, specify the CPU as the interrupt request destination as described in section 13.5.5. Selecting Interrupt Request Destinations, then execute the WFI instruction.

17.11 Usage Notes

17.11.1 Transfer Information Start Address

You must set multiples of 4 for the transfer information start addresses in the vector table. Otherwise, such addresses are accessed with their lowest 2 bits regarded as 00b.

17.11.2 Restriction for OSPI

There is a restriction to using OSPI, see section 37.3.8.5. Restriction in 8D-8D-8D profile 1.0 format.

18. Event Link Controller (ELC)

18.1 Overview

The Event Link Controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect them to different modules, allowing direct link between the modules without CPU intervention.

Table 18.1 lists the ELC specifications, and Figure 18.1 shows a block diagram.

Table 18.1 ELC Specifications

Item	Description
Event link function	246 types of event signals can be directly connected to modules. The ELC generates the ELC event signal, and events that activate the DTC.
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set for each registers

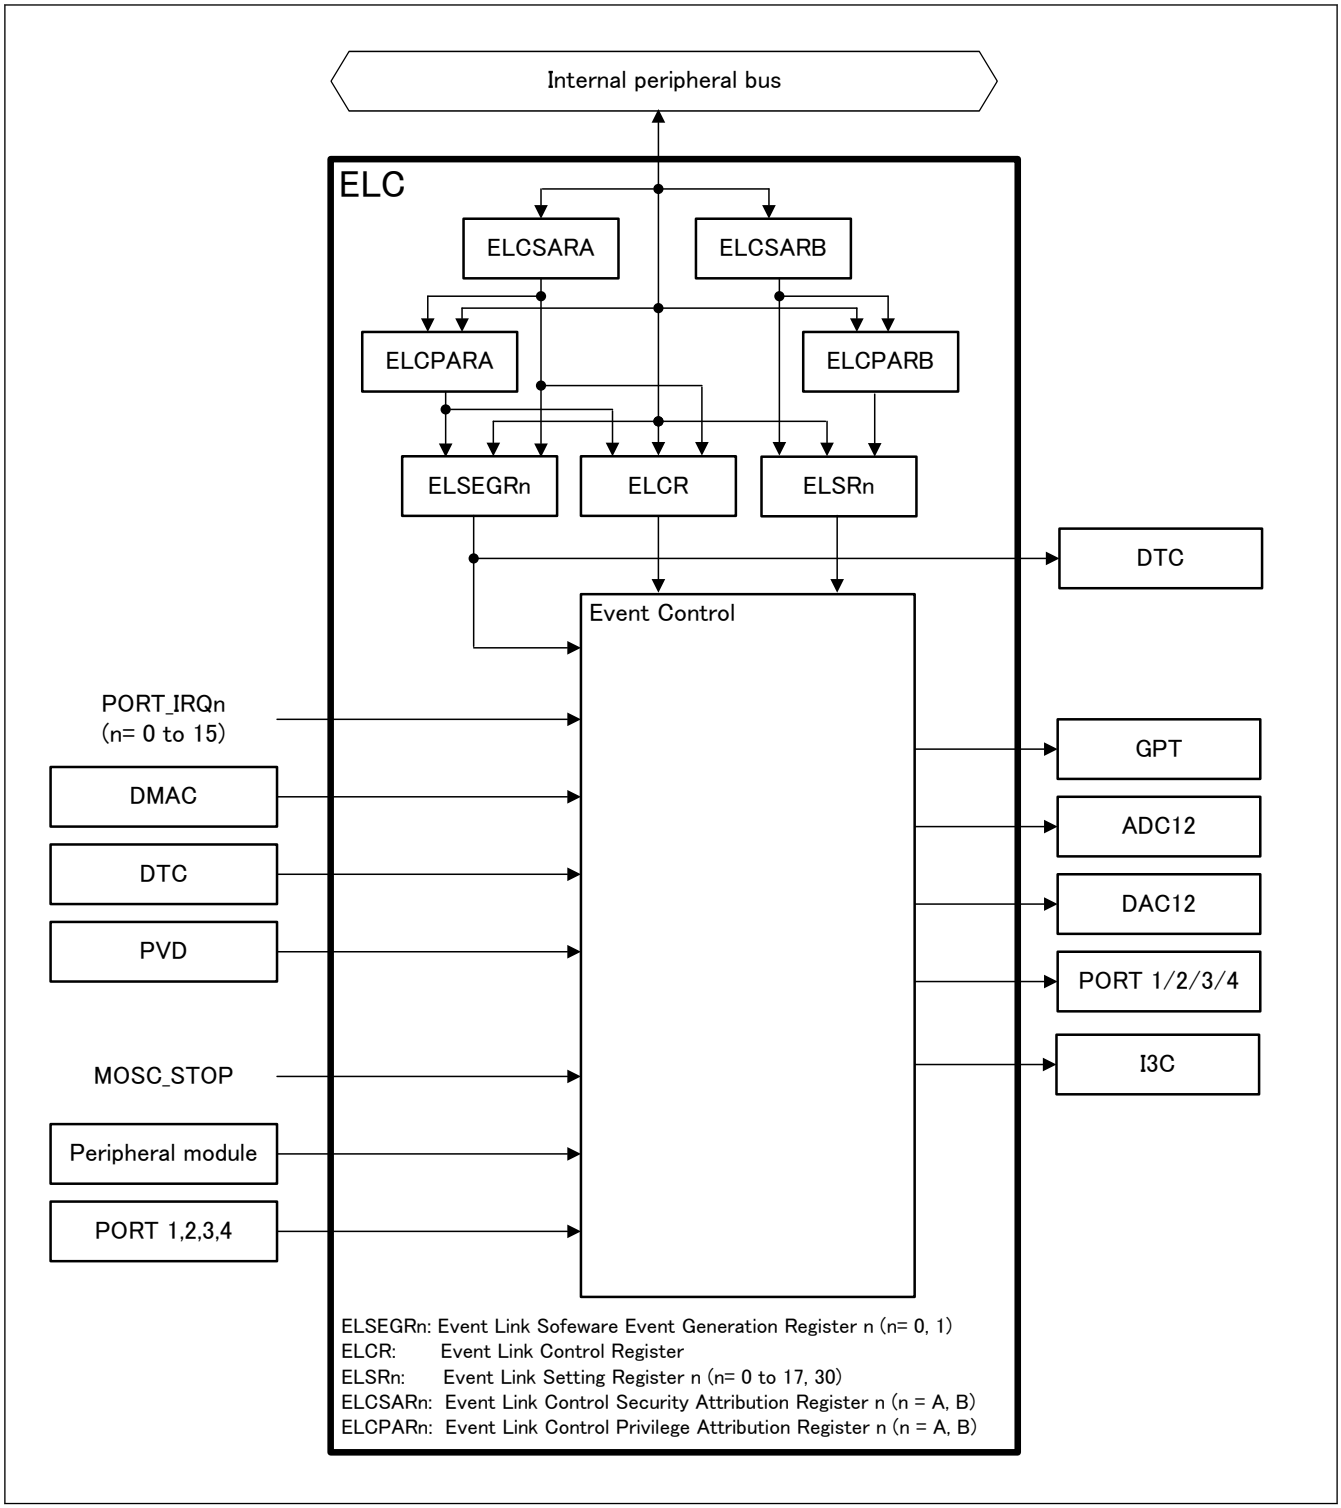

Figure 18.1 ELC block diagram

18.2 Register Descriptions

18.2.1 ELCR : Event Link Controller Register

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ELCON	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	ELCON	All Event Link Enable 0: ELC function is disabled. 1: ELC function is enabled.	R/W

Note: S-TYPE-3, P-TYPE-3

The ELCR register controls the ELC operation.

18.2.2 ELSEGRn : Event Link Software Event Generation Register n (n = 0, 1)

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x04 + 0x04 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	WI	WE	—	—	—	—	—	SEG
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SEG	Software Event Generation 0: Normal operation 1: Software event is generated.	W
5:1	—	These bits are read as 0. The write value should be 0.	R/W
6	WE	SEG Bit Write Enable 0: Write to SEG bit disabled. 1: Write to SEG bit enabled.	R/W
7	WI	ELSEGR Register Write Disable 0: Write to ELSEGR register enabled. 1: Write to ELSEGR register disabled.	W

Note: S-TYPE-3, P-TYPE-3

SEG bit (Software Event Generation)

When 1 is written to the SEG bit while the WE bit is 1, a software event is generated. This bit is read as 0. Even when 1 is written to this bit, data is not stored. The WE bit must be set to 1 before writing to this bit.

A software event can trigger a linked DTC event.

WE bit (SEG Bit Write Enable)

The SEG bit can only be written to when the WE bit is 1. Clear the WI bit to 0 before writing to this bit.

[Setting condition]

- If 1 is written to this bit while the WI bit is 0, this bit becomes 1.

[Clearing condition]

- If 0 is written to this bit while the WI bit is 0, this bit becomes 0.

WI bit (ELSEGR Register Write Disable)

The ELSEGR register can only be written to when the write value to the WI bit is 0. This bit is read as 1. Before setting the WE or SEG bit, the WI bit must be set to 0.

18.2.3 ELSRn : Event Link Setting Register n (n = 0 to 17, 30)

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0x20 + 0x04 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	ELS[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	ELS[8:0]	Event Link Select 0x000: Event output disabled for the associated peripheral module 0x001: Number setting for the event signal to be linked ⋮ 0x1BA: Number setting for the event signal to be linked Others: Settings prohibited	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W

Note: P-TYPE-3

Note: This register has different secure access permission depending on the setting of Trusted Event Route Control Register (TEVTRCR).
If the security attribution is configured as Secure,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is read as 0, TrustZone access error is generated.

If the security attribution is configured as Non-secure and the trusted event route is disabled,

- Secure write access is ignored and Secure read access is read as 0, TrustZone access error is generated.
- Non-secure access is allowed.

If the security attribution is configured as Non-secure and the trusted event route is enabled,

- Secure access is allowed.
- Non-secure write access is ignored and Non-secure read access is allowed.
- TrustZone access error is not generated.

The register specifies an event signal to be linked to each peripheral module. Table 18.2 shows the association between the register and the peripheral modules. Table 18.3 shows the association between the event signal names set in the register and the signal numbers.

Table 18.2 Association between the registers and peripheral functions (1 of 2)

Register name	Peripheral function (module)	Event name
ELSR0	GPT (A)	ELC_GPTA
ELSR1	GPT (B)	ELC_GPTB
ELSR2	GPT (C)	ELC_GPTC
ELSR3	GPT (D)	ELC_GPTD
ELSR4	GPT (E)	ELC_GPTE
ELSR5	GPT (F)	ELC_GPTF
ELSR6	GPT (G)	ELC_GPTG
ELSR7	GPT (H)	ELC_GPTH

Table 18.2 Association between the registers and peripheral functions (2 of 2)

Register name	Peripheral function (module)	Event name
ELSR8	ADC12A0	ELC_AD00
ELSR9	ADC12B0	ELC_AD01
ELSR10	ADC12A1	ELC_AD10
ELSR11	ADC12B1	ELC_AD11
ELSR12	DAC12 channel 0	ELC_DA0
ELSR13	DAC12 channel 1	ELC_DA1

Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
0	ELCR	Event Link Controller Register Privilege Attribution Target register: ELCR 0: Privileged 1: Unprivileged	R/W
1	ELSEGR0	Event Link Software Event Generation Register 0 Privilege Attribution Target register: ELSEGR0 0: Privileged 1: Unprivileged	R/W
2	ELSEGR1	Event Link Software Event Generation Register 1 Privilege Attribution Target register: ELSEGR1 0: Privileged 1: Unprivileged	R/W
31:3	—	These bits are read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1
Note: This register is write-protected by PRCR_S and PRCR_NS register.

This register specifies the privilege attribution for the Register ELCR, ELSEGR0 and ELSEGR1 registers.

18.2.7 ELCPARB : Event Link Controller Privilege Attribution Register B

Base address: ELC = 0x4020_1000
ELC_NS = 0x5020_1000

Offset address: 0xF4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	ELSR30	—	—	—	—	—	—	—	—	—	—	—	—	ELSR[17:16]	
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	ELSR[15:0]															
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
17:0	ELSR[17:0]	Event Link Setting Register n Privilege Attribution (n = 0 to 17) Target register: ELSR[17:0] 0: Privileged 1: Unprivileged	R/W
29:18	—	These bits are read as 1. The write value should be 1.	R/W
30	ELSR30	Event Link Setting Register 30 Privilege Attribution Target register: ELSR30 0: Privileged 1: Unprivileged	R/W
31	—	This bit is read as 1. The write value should be 1.	R/W

Note: S-TYPE-2, P-TYPE-1
Note: This register is write-protected by PRCR_S and PRCR_NS register.

This register specifies the privilege attribution for the Register ELSRn (n = 0 to 17, 30) registers.

18.3 Operation

18.3.1 Relation between Interrupt Handling and Event Linking

Event number for an event link is the same as that for the associated interrupt source. For information on generating event signals, see the explanation in the chapter for each event source module.

18.3.2 Linking Events

When an event occurs and that event is already set as a trigger in the Event Link Setting Register (ELSRn), the associated module is activated. The operation of the module must be set up in advance. Table 18.4 lists the operations of modules when an event occurs.

Table 18.4 Module operations when event occurs (1 of 2)

Module	Operations When Event is Input
GPT	• Start counting • Stop counting • Clear counting • Up counting • Down counting • Input capture
DAC12	Start D/A conversion

Table 18.4 Module operations when event occurs (2 of 2)

Module	Operations When Event is Input
I/O Ports	• Change pin output based on the EORR (reset) or EOSR (set) • Latch pin state to EIDR • The following ports can be used for the ELC: PORT 1 PORT 2 PORT 3 PORT 4
I3C	Start operation
ADC12	Start A/D conversion
DTC	Start DTC data transfer

18.3.3 Example of Procedure for Linking Events

To link events:

1. Set the operation of the module for which an event is to be linked.
2. Set the appropriate ELSRn.ELS[8:0] bits for the module to be linked.
3. Set the ELCR.ELCON bit to 1 to enable linkage of all events.
4. Configure the module from which an event is output and activate the module. The link between the two modules is now active.
5. To stop event linkage of modules individually, set 0 to the ELSRn.ELS[8:0] bit associated with the modules. To stop linkage of all the events, set the ELCR.ELCON bit to 0.

If event link output from the RTC is to be used, set the ELC after the RTC settings, for example, for initialization and time setting. Unintended events may be generated if RTC settings are made after the ELC settings.

If event link output from the PVD is to be used, set the ELC after setting the PVD. To disable the PVD, do so after setting 0x00 to the associated ELSRn register.

18.4 Usage Notes

18.4.1 Linking DMAC/DTC Transfer End Signals as Events

When linking the DMAC/DTC transfer end signals as events, do not set the same peripheral module as the DMAC/DTC transfer destination and event link destination. If set, the peripheral module might be started before DMAC/DTC transfer to the peripheral module is complete.

18.4.2 Setting Clocks

To link events, you must enable the ELC and the related modules. The modules cannot operate if the related modules are in the module-stop state or in low power mode in which the module is stopped (CPU Deep Sleep mode, Software Standby mode or Deep Software Standby mode). For more information, seeTable 18.3 and section 10, Low Power Modes.

18.4.3 Module-Stop Function Setting

The Module Stop Control Register C (MSTPCRC) can enable or disable ELC operation. The ELC is initially stopped after reset. Releasing the module-stop state enables access to the registers. The ELCON bit must be set to 0 before disabling ELC operation using the Module Stop Control Register. For more information, see Table 18.3 and section 10, Low Power Modes.

18.4.4 ELC Delay Time

In Figure 18.2, module A accesses module B through the ELC. There is a delay time in the ELC between module A and module B. Table 18.5 shows the ELC delay time.

Table 18.6 shows the clock domain of each module A. Table 18.7 shows the clock domain of each module B.

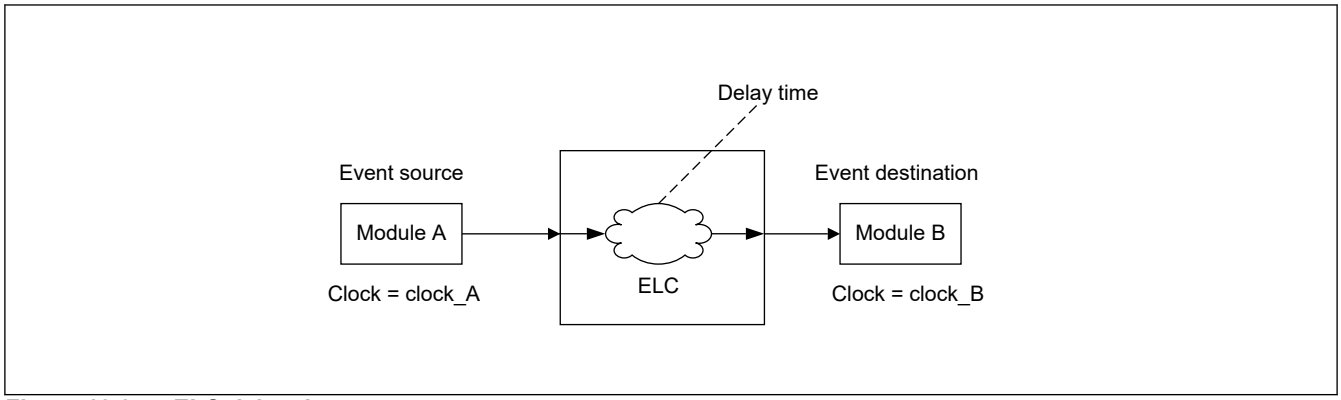

Figure 18.2 ELC delay time

Table 18.5 ELC delay time

Clock domain*1	Clock frequency	ELC delay time
clock_A = clock_B	clock_A = clock_B	0 cycle
clock_A ≠ clock_B	clock_A = clock_B	1 cycle to 2 cycles
	clock_A > clock_B	1 cycle to 2 cycles of clock_B
	clock_A < clock_B	1 cycle to 2 cycles of clock_A

Note 1. When PORT_IRQ, PVD, MOSC, DMAC, DTC, I/O Ports is selected as event source module, the ELC delay time is 2 cycles to 4 cycles of PCLKB.

Table 18.6 Clock domain of each module A

Module A	Clock domain of clock_A
PORT_IRQ, PVD, MOSC	ASYNC
DMAC, DTC, I/O Ports	ICLK
ULPT, AGT, IWDT, CWDT, IIC, ACMPHS, ELC, RTC	PCLKB
GPT	PCLKD
SCI, SPI, I3C, ADC12, DOC	PCLKA

Table 18.7 Clock domain of each module B

Module B	Clock domain of clock_B
ADC12, DAC12, I3C	PCLKA
DTC, I/O Ports	ICLK
GPT	PCLKD

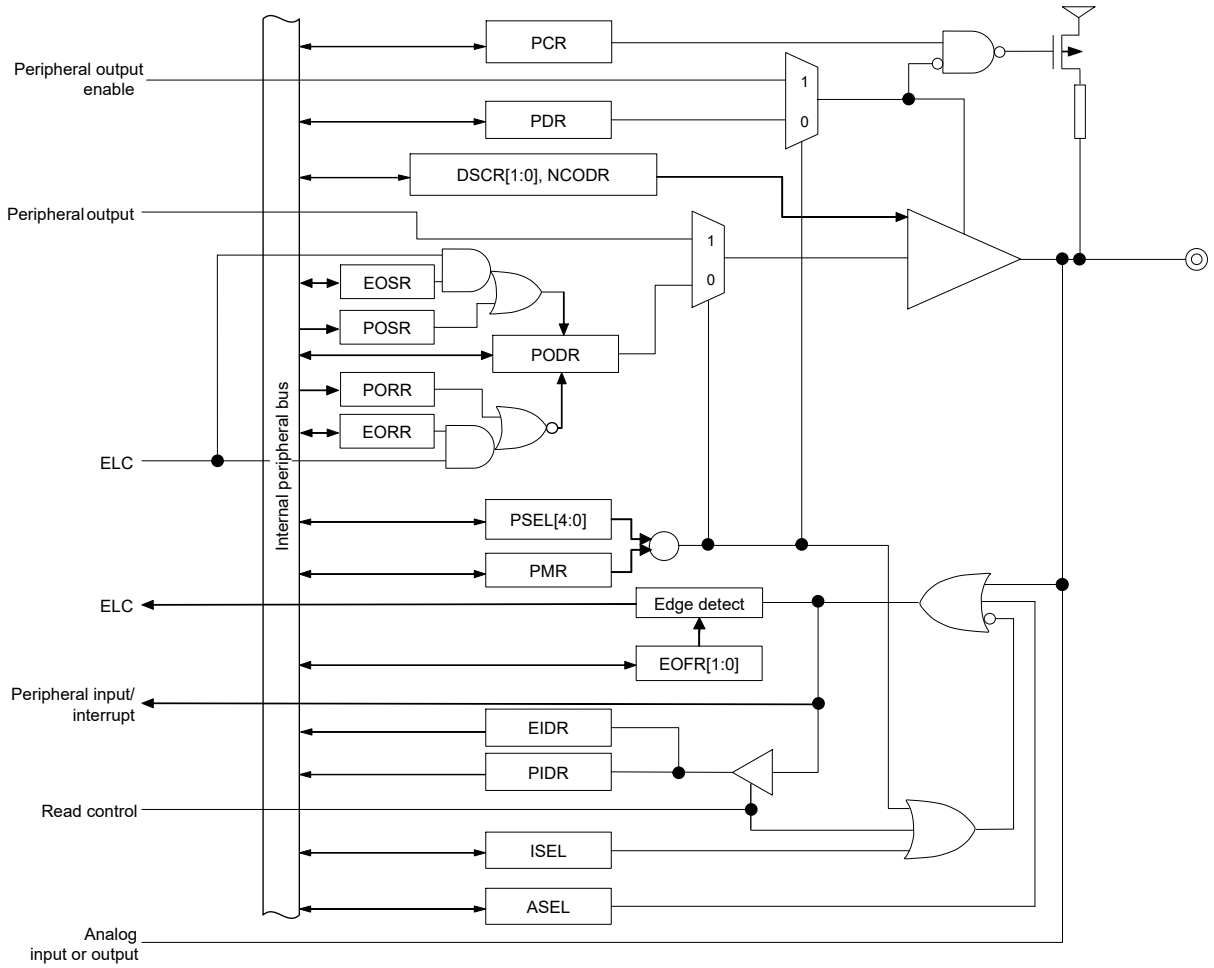
19. I/O Ports

19.1 Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

All pins except P209 (as TDO of JTAG ports) operate as input pins immediately after a reset, and pin functions are switched by register settings. The I/O ports and peripheral modules for each pin are specified in the associated registers.

Figure 19.1 shows a connection diagram for the I/O port registers. The configuration of the I/O ports differs for different packages. Table 19.1 lists the I/O port specifications by package, and Table 19.2 lists the port functions.



Note: This figure shows a basic port configuration. The configuration differs depending on the ports.

Figure 19.1 Connection diagram for I/O port registers

Table 19.1 I/O port specifications (1 of 3)

Port	Package		Package	
	224 pins	Number of pins	224 pins (without MIPI)	Number of pins

19.2 Register Descriptions

19.2.1 PCNTR1/PODR/PDR : Port Control Register 1

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B)

Offset address: 0x000 (PCNTR1/PDR)
0x002 (PODR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PODR15	PODR14	PODR13	PODR12	PODR11	PODR10	PODR09	PODR08	PODR07	PODR06	PODR05	PODR04	PODR03	PODR02	PODR01	PODR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PDR15	PDR14	PDR13	PDR12	PDR11	PDR10	PDR09	PDR08	PDR07	PDR06	PDR05	PDR04	PDR03	PDR02	PDR01	PDR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PDR15 to PDR00	Pmn Direction 0: Input (functions as an input pin) 1: Output (functions as an output pin)	R/W
31:16	PODR15 to PODR00	Pmn Output Data 0: Low output 1: High output	R/W

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, n = 00 to 15

The Port Control Register 1 (PCNTR1/PODR/PDR) is a 32-bit or 16-bit read/write register that controls port direction and port output data. The PCNTR1 specifies the port direction and output data, and is accessed in 32-bit units. The PDRn (bits [15:0] in PCNTR1) and PODRn (bits [31:16] in PCNTR1) respectively, are accessed in 16-bit units.

PDRn bits (Pmn Direction)

The PDRn bits select the input or output direction for individual pins on the associated port when the pins are configured as general I/O pins. Each pin on port m is associated with a PORTm.PCNTR1.PDRn bit. The I/O direction can be specified in 1-bit unit. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PDRn bits are reserved. See section 19.1. Overview. The PDRn bit in the PORTm.PCNTR1 register serves the same function as the PDR bit in the PFS.PmnPFS register.

PODRn bits (Pmn Output Data)

The PODRn bits hold data to be output from the general I/O pins. Bits of non-existent port m are reserved. Reserved bits are read as 0. The write value should be 0. In the case of input only ports, PODRn bits are reserved. See section 19.1. Overview. The PODRn bit in the PORTm.PCNTR1 register serves the same function as the PODR bit in the PFS.PmnPFS register.

19.2.2 PCNTR2/EIDR/PIDR : Port Control Register 2

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B)

Offset address: 0x004 (PCNTR2/PIDR)
0x006 (EIDR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EIDR15	EIDR14	EIDR13	EIDR12	EIDR11	EIDR10	EIDR09	EIDR08	EIDR07	EIDR06	EIDR05	EIDR04	EIDR03	EIDR02	EIDR01	EIDR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PIDR15	PIDR14	PIDR13	PIDR12	PIDR11	PIDR10	PIDR09	PIDR08	PIDR07	PIDR06	PIDR05	PIDR04	PIDR03	PIDR02	PIDR01	PIDR00
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	PIDR15 to PIDR00	Pmn State 0: Low level 1: High level	R
31:16	EIDR15 to EIDR00 *2	Port Event Input Data*1 When an ELC_PORTx signal occurs 0: Low input 1: High input	R

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, n = 00 to 15
Note 1. x = 1, 2, 3 or 4 for EIDR only
Note 2. Supported by ports 1, 2, 3 or 4.

The Port Control Register 2 (PCNTR2/EIDR/PIDR) allows read access to the Pmn state and the port event input data using 32-bit or 16-bit access.

The PCNTR2 specifies the Pmn state and the port event input data, and is accessed in 32-bit units.

The PIDRn (bits [15:0] in PCNTR2) and EIDRn (bits [31:16] in PCNTR2) respectively, are accessed in 16-bit units. Bits associated with non-existent pins are reserved. Reserved bits are read as undefined.

PIDRn bits (Pmn State)

The PIDRn bits reflect the individual pin states of the port, regardless of the values set in PmnPFS.PMR and PORTm.PCNTR1.PDRn. The PIDRn bit in the PORTm.PCNTR2 register serves the same function as the PIDR bit in the PFS.PmnPFS register.

A pin state cannot be reflected in PIDRn when one of the following functions is enabled:

- RTC Time Capture input and tamper detection (RTCIC)
- CS area controller (CSC)
- Analog function (ASEL = 1)
- Trace interface (TCLK, TDATAn (n = 0 to 3), SWO)

EIDRn bits (Port Event Input Data)

The EIDRn bits latch a pin state when an ELC_PORTx signal occurs. Pin states can only be input to EIDRn when PmnPFS.PMR and PORTm.PCNTR1.PDRn are 0. When the PmnPFS.ASEL bit is set to 1, the associated pin state is not reflected in EIDRn.

19.2.3 PCNTR3/PORR/POSR : Port Control Register 3

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 0 to 9, A, B)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 0 to 9, A, B)

Offset address: 0x008 (PCNTR3/POSR)
0x00A (PORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	PORR15	PORR14	PORR13	PORR12	PORR11	PORR10	PORR09	PORR08	PORR07	PORR06	PORR05	PORR04	PORR03	PORR02	PORR01	PORR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	POSR15	POSR14	POSR13	POSR12	POSR11	POSR10	POSR09	POSR08	POSR07	POSR06	POSR05	POSR04	POSR03	POSR02	POSR01	POSR00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	POSR15 to POSR00	Pmn Output Set 0: No effect on output 1: High output	W
31:16	PORR15 to PORR00	Pmn Output Reset 0: No effect on output 1: Low output	W

Note: S-TYPE-4, P-TYPE-5
Note: m = 0 to 9, A, B, n = 00 to 15

The Port Control Register 3 (PCNTR3/PORR/POSR) is a 32-bit or 16-bit write register that controls the setting or resetting of the port output data.

The PCNTR3 controls the setting or resetting of the port output data, and is accessed in 32-bit units.

The POSRn (bits [15:0] in PCNTR3) and the PORRn (bits [31:16] in PCNTR3) respectively, are accessed in 16-bit units.

POSRn bits (Pmn Output Set)

POSR changes PODR when set by a software write. For example, for P100, when PORT1.PCNTR3.POSR00 = 1, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, POSRn bits are reserved. See section 19.1. Overview.

PORRn bits (Pmn Output Reset)

PORR changes PODR when reset by a software write. For example, for P100, when PORT1.PCNTR3.PORR00 = 1, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. In the case of input only ports, PORRn bits are reserved. See section 19.1. Overview.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.
Note: PORRn and POSRn should not be set at the same time.

19.2.4 PCNTR4/EORR/EOSR : Port Control Register 4

Base address: PORTm = 0x4040_0000 + 0x0020 × m (m = 1 to 4)
PORTm_NS = 0x5040_0000 + 0x0020 × m (m = 1 to 4)

Offset address: 0x00C (PCNTR4/EOSR)
0x00E (EORR)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	EORR 15	EORR 14	EORR 13	EORR 12	EORR 11	EORR 10	EORR 09	EORR 08	EORR 07	EORR 06	EORR 05	EORR 04	EORR 03	EORR 02	EORR 01	EORR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	EOSR 15	EOSR 14	EOSR 13	EOSR 12	EOSR 11	EOSR 10	EOSR 09	EOSR 08	EOSR 07	EOSR 06	EOSR 05	EOSR 04	EOSR 03	EOSR 02	EOSR 01	EOSR 00
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	EOSR15 to EOSR00	Pmn Event Output Set When an ELC_PORTx signal occurs 0: No effect on output 1: High output	R/W
31:16	EORR15 to EORR0	Pmn Event Output Reset When an ELC_PORTx signal occurs 0: No effect on output 1: Low output	R/W

Note: S-TYPE-4, P-TYPE-5
Note: m = 1 to 4, n = 00 to 15, x = 1 to 4

The Port Control Register 4 (PCNTR4/EORR/EOSR) is a 32-bit or 16-bit read/write register that controls the setting or resetting of the port output data by an event input from the ELC.

The PCNTR4 controls the setting or resetting of the port output data by an event input from the ELC, and is accessed in 32-bit units.

The EOSRn (bits [15:0] in PCNTR4) and EORRn (bits [31:16] in PCNTR4) respectively, are accessed in 16-bit units.

EOSRn bits (Pmn Event Output Set)

EOSR changes PODR when set because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EOSR00 is set to 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 1. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EOSRn bits are reserved. See section 19.1. Overview.

EORRn bits (Pmn Event Output Reset)

EORR changes PODR when reset because an ELC_PORTx signal occurs. For example, for P100 if PORT1.PCNTR4.EORR00 = 1 when the ELC_PORTx occurs, PORT1.PCNTR1.PODR00 outputs 0. Bits associated with non-existent pins are reserved. The write value should always be 0. For input only ports, EORRn bits are reserved. See section 19.1. Overview.

Note: When EORRn or EOSRn is set, writing is prohibited to PODRn, PORRn, and POSRn.

Note: EORRn and EOSRn should not be set at the same time.

19.2.5 PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, n = 00 to 15)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x000 + 0x040 × m + 0x004 × n (PmnPFS/PmnPFS_HA/PmnPFS_BY)

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	PSEL[4:0]					—	—	—	—	—	—	—	PMR
Value after reset:	0	0	0	0*1	0	0	0*1	0*1	0	0	0	0	0	0	0	0*1

3	—	This bit is read as 0. The write value should be 0.	R/W
4	PCR	Pull-up Control 0: Disable input pull-up 1: Enable input pull-up	R/W
5	—	This bit is read as 0. The write value should be 0.	R/W
6	NCODR	N-Channel Open-Drain Control 0: CMOS output 1: NMOS open-drain output	R/W
9:7	—	These bits are read as 0. The write value should be 0.	R/W
11:10	DSCR[1:0]	Port Drive Capability 0 0: Low drive 0 1: Middle drive 1 0: High-speed high-drive 1 1: High drive	R/W
13:12	EOFR[1:0]	Event on Falling/Event on Rising*2 0 0: Don't care 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
14	ISEL	IRQ Input Enable 0: Not used as an IRQn input pin 1: Used as an IRQn input pin	R/W
15	ASEL	Analog Input Enable 0: Not used as an analog pin 1: Used as an analog pin	R/W
16	PMR	Port Mode Control 0: Used as a general I/O pin 1: Used as an I/O port for peripheral functions	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
28:24	PSEL[4:0]	Peripheral Select These bits select the peripheral function. For individual pin functions, see the associated tables in this chapter.	R/W
31:29	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2
Note 1. The initial value of P201, P208, P209. P210, P211, P814 and P815 is not 0x0000_0000. P201 is 0x0000_0010, P208 is 0x0001_0010, P209 is 0x0001_0400, P210 is 0x0001_0410, P211 is 0x0001_0010, P814 is 0x1301_0000 and P815 is 0x1301_0000.
Note 2. Supported by PORTn (n = 1 to 4).

Port mn Pin Function Select Register (PmnPFS/PmnPFS_HA/PmnPFS_BY) is a 32-bit, 16-bit, or 8-bit read/write control register that selects the port mn pin function, and is accessed in 32-bit units. PmnPFS_HA (PmnPFS [15:0] bits) is accessed in 16-bit units. PmnPFS_BY (PmnPFS[7:0] bits) is accessed in 8-bit units.

The available Port mn pin depends on the product. For details, see Table 19.1

PODR bit (Port Output Data), PIDR bit (Port State), PDR bit (Port Direction)

The PDR, PIDR, and PODR bits serve the same function as the PCNTR. When these bits are read, the PCNTR value is read.

PCR bit (Pull-up Control)

The PCR bit enables or disables an input pull-up resistor on the individual port pins. When a pin is in the input state with the associated bit in PmnPFS.PCR set to 1, the pull-up resistor connected to the pin is enabled. When a pin is set as a general port output pin, or a peripheral function output pin, the pull-up resistor for the pin is disabled regardless of the PCR setting. The pull-up resistor is also disabled in the reset state. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

NCODR bit (N-Channel Open-Drain Control)

The NCODR bit specifies the output type for the port pins. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

DSCR[1:0] bits (Port Drive Capability)

The DSCR[1:0] bits switches the capability of the port. If the capability of a pin is fixed, the associated bit is a read/write bit, but the capability cannot be changed. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

EOFR[1:0] bits (Event on Falling/Event on Rising)

The EOFR[1:0] bits select the edge detection method for the port group input signal. These bits support rising, falling, or both edge detections. When the EOFR[1:0] bits are set to 01b, 10b, or 11b, the input enable of the I/O cell is asserted. Following that, the event pulse is input from the external pin, and the GPIO outputs the event pulse to the ELC. Bits associated with non-existent pins are reserved. Reserved bits are read as 0. The write value should be 0.

ISEL bit (IRQ Input Enable)

The ISEL bit specifies IRQ input pins. This setting can be used in combination with the peripheral functions, although an IRQn (external pin interrupt) of the same number must only be enabled for one pin. The ISEL bit for an unspecified IRQn is reserved.

ASEL bit (Analog Input Enable)

The ASEL bit specifies analog pins. When a pin is set as an analog pin by this bit:

1. Specify it as a general I/O port in the Port Mode Control bit (PmnPFS.PMR).
2. Disable the pull-up resistor in the Pull-up Control bit (PmnPFS.PCR).
3. Specify the input in the Port Direction bit (PmnPFS.PDR). The pin state cannot be read at this point. The PmnPFS register is protected by the Write-Protect Register for Non-secure(PWPR_NS) . Release write-protect before modifying the register.

The ASEL bit for an unspecified analog I/O pin is reserved.

PMR bit (Port Mode Control)

The PMR bit specifies the port pin function. Bits associated with non-existent pins are reserved. The write value should be 0.

PSEL[4:0] bits (Peripheral Select)

The PSEL[4:0] bits assign the peripheral function.

19.2.6 PWPR_NS : Write-Protect Register for Non-secure

Base address: PFS_NS = 0x5040_0800

Offset address: 0x50C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Writing to the PmnPFS register is disabled 1: Writing to the PmnPFS register is enabled	R/W
7	B0WI	PFSWE Bit Write Disable 0: Writing to the PFSWE bit is enabled 1: Writing to the PFSWE bit is disabled	R/W

Note: S-TYPE-7, P-TYPE-2
Note: The access to this register is not controlled by any security attribution register.

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

19.2.7 PFENET : Ethernet Control Register

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x500

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PHYMODE0	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	PHYMODE0	Ethernet Mode Setting ch0 0: RMII mode (ETHERC channel 0) 1: MII mode (ETHERC channel 0)	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: The access to PHYMODE0 bit is controlled by PSARB.PSARB15 bit and PPARB.PPARB15 bit.

PHYMODE0 bit (Ethernet Mode Setting ch0)

The PHYMODE0 bit specifies the PHY mode of ETHERC channel 0. Select the same mode as that specified in the pin function select bits (PmnPFS.PSEL[4:0]). When the signals for the RMII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 0 (RMII mode). When the signals for the MII mode are specified in the PmnPFS.PSEL[4:0] bits, set the PHYMODE bit to 1 (MII mode).

19.2.8 PWPR_S : Write-Protect Register for Secure

Base address: PFS = 0x4040_0800

Offset address: 0x514

Bit position:	7	6	5	4	3	2	1	0
Bit field:	B0WI	PFSWE	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	PFSWE	PmnPFS Register Write Enable 0: Disable writes to the PmnPFS register 1: Enable writes to the PmnPFS register	R/W
7	B0WI	PFSWE Bit Write Disable 0: Enable writes the PFSWE bit 1: Disable writes to the PFSWE bit	R/W

Note: S-TYPE-6, P-TYPE-2

PFSWE bit (PmnPFS Register Write Enable)

Writing to the PmnPFS register of the IO port pin set as secure by the PmSAR register is enabled only when the PFSWE bit is set to 1. You must first write 0 to the B0WI bit before setting PFSWE to 1.

B0WI bit (PFSWE Bit Write Disable)

Writing to the PFSWE bit is enabled only when the B0WI bit is set to 0.

19.2.9 PmSAR : Port Security Attribution register (m = 0 to 9, A, B)

Base address: PFS = 0x4040_0800
PFS_NS = 0x5040_0800

Offset address: 0x530 + 0x004 × m

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PMNSA[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	PMNSA[15:0]	Pmn Security Attribution Target I/O port pin : Pmn 0: Secure 1: Non Secure	R/W

Note: S-TYPE-1, P-TYPE-1
Note: This register is write-protected by PRCR register.
Note: m = 0 to 9, A, B, n = 00 to 15

Port Security Attribution Register is a 16-bit register that setting the Security Attribution of the each port, the registers are accessed only in 16-bit units.

PMNSA[15:0] bits (Pmn Security Attribution)

The PmnSA bit specifies the Security Attribution of Pmn.

19.2.10 LVOCR : Low Voltage Operation Control register

Base address: SYSC = 0x4001_E000
SYSC_NS = 0x5001_E000

Offset address: 0xAB0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	LVO1E	LVO0E
Value after reset:	0	0	0	0	0	0	1	1

Bit	Symbol	Function	R/W
0	LVO0E	Low Voltage Operation 0 Enable 0: Disable 1: Enable	R/W
1	LVO1E	Low Voltage Operation 1 Enable 0: Disable 1: Enable	R/W
7:2	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-2

Low voltage operation control register controls the IO when VCC/VCC2 is lower than 2.7V.

LVO0E bit (Low Voltage Operation 0 Enable)

When VCC is lower than 2.7V, set the LVO0E bit to 1.

LVO1E bit (Low Voltage Operation 1 Enable)

When VCC2 is lower than 2.7V, set the LVO1E bit to 1.

19.3 Operation

19.3.1 General I/O Ports

All pins except P208 to P211, P814 and P815 operate as general I/O ports after reset. General I/O ports are organized as 16 bits per port and can be accessed by port with the Port Control Registers (PCNTRn, where n = 1 to 4), or by individual pins with the Port mn Pin Function Select register. For details on these registers, see section 19.2. Register Descriptions.

Each port has the following bits:

- Port Security Attribution register (PmSAR)(m = 0 to 9, A, B), which indicates the security attribution.
- Port Direction bit (PDRn), which selects input or output direction
- Port Output Data bit (PODRn), which holds data for output
- Port Input Data bit (PIDRn), which indicates the pin states
- Event Input Data bit (EIDRn), which indicates the pin state when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Port Output Set bit (POSRn), which indicates the output value when a software write occurs
- Port Output Reset bit (PORRn), which indicates the output value when a software write occurs
- Event Output Set bit (EOSRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs
- Event Output Reset bit (EORRn), which indicates the output value when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.

19.3.2 Port Function Select

The following port functions are available for configuring each pin:

- Security function: Security attribution for each pins
- I/O configuration: CMOS output or NMOS open-drain output, pull-up control, and drive capability
- General I/O port: Port direction, output data setting, and read input data
- Alternate function: Configured function mapping to the pin.

Each pin is associated with a Port mn Pin Function Select register (PmnPFS), which includes the associated PODR, PIDR, and PDR bits. In addition, the PmnPFS register includes the following:

- PCR: Pull-up resistor control bit that turns the input pull-up MOS on or off
- NCODR: N-channel open-drain control bit that selects the output type for each pin
- DSCR[1:0]: Drive capability control bit that selects the drive capability
- EOFR[1:0]: For selecting the edge of the event that input from the port group
- ISEL: IRQ input enable bit to specify an IRQ input pin
- ASEL: Analog input enable bit to specify an analog pin
- PMR: Port mode bit to specify the pin function of each port
- PSEL[4:0]: Port function select bits to select the associated peripheral function.

These configurations can be made by a single-register access to the Port mn Pin Function Select register. For details, see section 19.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, n = 00 to 15).

19.3.3 Port Group Function for ELC

In the MCU, Port 1 are assigned for the ELC port group function.

19.3.3.1 Behavior When ELC_PORTn (n = 1, 2, 3 or 4) is Input from ELC

The MCU supports the two functions described in this section when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC.

(1) Input to EIDR

For the GPI function (PDR = 0 and PMR = 0 in the PmnPFS register), when an ELC_PORTn (n = 1, 2, 3 or 4) signal comes from the ELC, the input enable of the I/O cell is asserted, and data from the external pins is read into the EIDR bit. See Figure 19.2

For the GPO function (PDR = 1) or the peripheral mode (PMR = 1), 0 is input into the EIDR bit from the external pins.

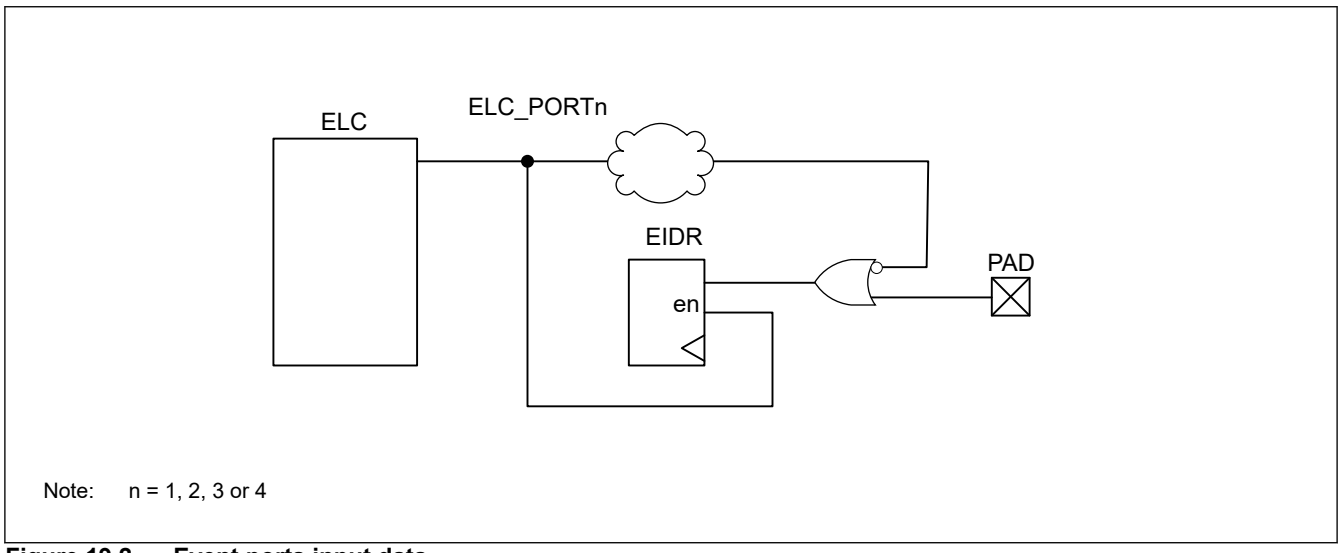

Figure 19.2 Event ports input data

(2) Output from PODR by EOSR and EORR

When an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the data is output from the PODR to the external pin based on the settings in the EOSR and EORR registers.

- If EOSR is set to 1, when an ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 1 to the external pin. Otherwise, when EOSR = 0, the PODR value is retained.
- If EORR is set to 1, when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs, the PODR register outputs 0 to the external pin. Otherwise, when EORR = 0, the PODR value is retained.

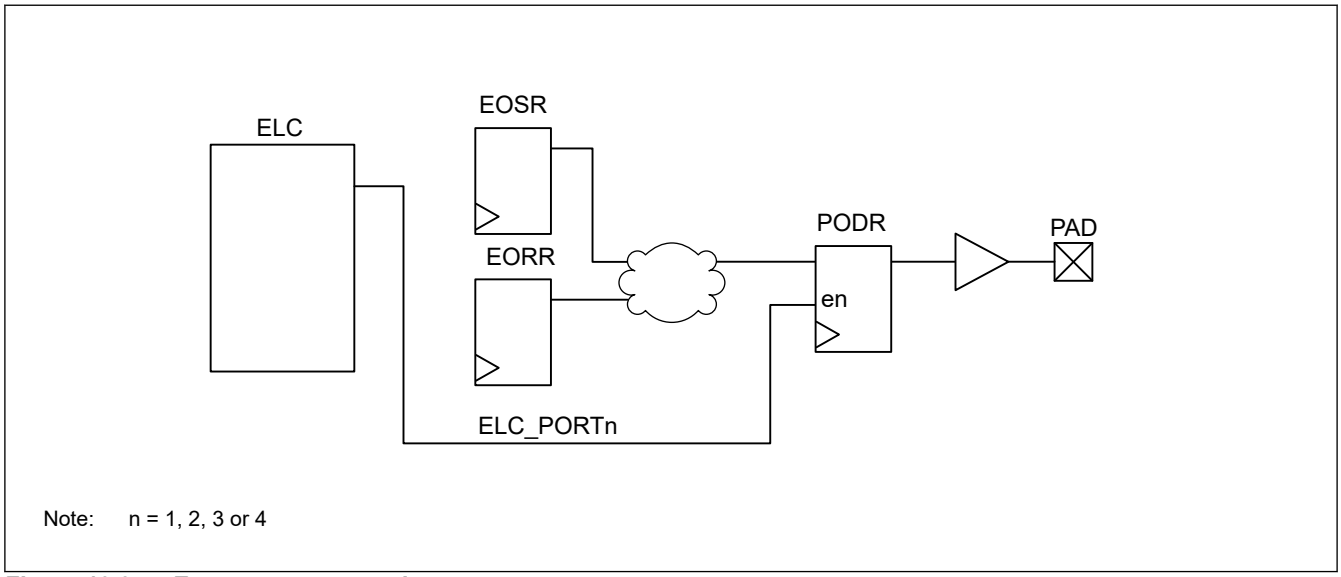

Figure 19.3 Event ports output data

19.3.3.2 Behavior When an Event Pulse is Output to ELC

To output the event pulse from the external pins to the ELC, set the EOFR[1:0] bits in the PmnPFS register. For details, see section 19.2.5. PmnPFS/PmnPFS_HA/PmnPFS_BY : Port mn Pin Function Select Register (m = 0 to 9, A, B, n = 00 to 15). When the EOFR[1:0] bits are set, the input enable of the I/O cell is asserted.

Data from the external pin is the input. For example, for Port 1, when the data is input from P100 to P115, the data of those 16 pins is organized by OR logic. This data is formed into a one-shot pulse that goes to the ELC. The operation of Port n (n = 2 to 4) is also the same as Port 1. See Figure 19.4.

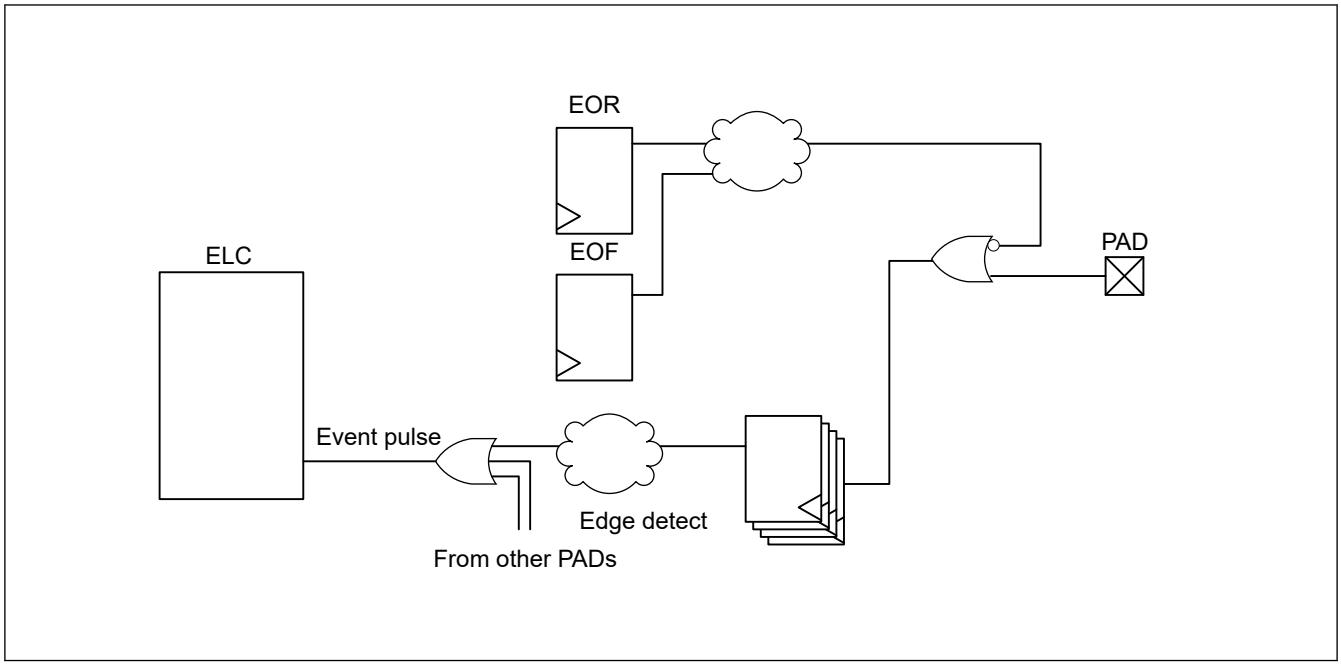

Figure 19.4 Generation of event pulse

19.4 Handling of Unused Pins

Table 19.3 shows how to handle unused pins.

Table 19.3 Handling of unused pins (1 of 2)

Pin name	Description
MD	Use as a mode selection pin
RES	Connect to VCC through a resistor
USB_DP, USB_DM	When both P814PFS.PMR and P815PFS.PMR bits are set to 1, keep these pins open. When P814PFS.PMR or P815PFS.PMR bit is set to 0, configure it in the same way as Other ports.
P200/NMI	Connect to VCC through a resistor
EXTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P212). When this pin is not used as port P212, configure it in the same way as ports 1 to B.
XTAL	When the main clock oscillator is not used, set the MOSCCR.MOSTP bit to 1 (general port P213). When the external clock is input to the EXTAL pin, the XTAL pin functions as P213. When this pin is not used as port P213, configure it in the same way as ports 1 to B.
XCIN	Connect to VSS through a resistor
XCOUT	Keep pin open
P000 to P015	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to AVCC0 through a resistor or to AVSS0 through a resistor *1 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
P100 to P107, P500 to P502, P600, P800 to P804, P808 to P812	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC2 through a resistor or to VSS through a resistor *1 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1
Other ports	• If the direction is set to input (PCNTR1.PDRn = 0), connect the associated pin to VCC through a resistor or to VSS through a resistor *1 *2 • If the direction is set to output (PCNTR1.PDRn = 1), keep pin open *1 *3
USBHS_DP, USBHS_DM, USBHS_RREF	• Preconditions: – AVCC_USBHS = VCC_USBHS: Connect to VCC – VSS1_USBHS = VSS2_USBHS: Connect to VSS – Set the module-stop state for USBHS (MSTPCRB.MSTPB12 = 1) • Processing details: – USBHS_DP, USBHS_DM, and USBHS_RREF: Open

Table 19.3 Handling of unused pins (2 of 2)

Pin name	Description
VREFH0, VREFH	Connect to AVCC0
VREFL0, VREFL	Connect to AVSS0

VLO	Keep pin open*4
VBATT	Connect to VCC

Note 1. Clear the PmnPFS.PMR, PmnPFS.ISEL, PmnPFS.PCR, and PmnPFS.ASEL bits to 0.
Note 2. P208, P210 and P211 are recommended for pull up VCC through a resistor, because these pins are input pull-up enabled from the initial value (PmnPFS.PCR = 1).
Note 3. P209 is recommended for setting the direction to output (PCNTR1.PDRn = 1), because this pin is output from the initial value.
Note 4. For more information, see section 59, Internal Voltage Regulator

19.5 Usage Notes

19.5.1 Procedure for Specifying the Pin Functions

To specify the I/O pin functions:

1. Clear the B0WI bit in the PWPR_NS register. This enables writing to the PFSWE bit in the PWPR_NS register.*1
2. Set 1 to the PFSWE bit in the PWPR_NS register. This enables writing to the PmnPFS register.*1
3. Clear the Port Mode Control bit in the PMR to 0 for the target pin to select the general I/O port.
4. Specify the I/O function for the pin through the PSEL[4:0] bits settings in the PmnPFS register.
5. Set the PMR bit to 1 as required to switch to the selected I/O function for the pin.
6. Clear the PFSWE bit in the PWPR_NS register. This disables writing to the PmnPFS register.*1
7. Set 1 to the B0WI bit in the PWPR_NS register. This disables writing to the PFSWE bit in the PWPR_NS register.*1

Note 1. When the security attribution of Pmn is set to 0, set the PWPR_S register to write to the PmnPFS register.

19.5.2 Procedure for Using Port Group Input

To use the port group input (port n (n = 1 to 4)):

1. Set the ELSRx.ELS[8:0] bits to all 0 to ignore unexpected pulses. For more information, see section 18, Event Link Controller (ELC).
2. Set the EOFR[1:0] bits of the PmnPFS register to specify the rising, falling, or both edge detections.
3. Execute a dummy read or wait for a short time, for example 100 ns. Ignoring of unexpected pulses depends on the initial value of the external pin.
4. Set the ELSRx.ELS[8:0] bits to enable the event signals.

19.5.3 Port Output Data Register (PODR) Summary

This register outputs data as follows:

1. Outputs 0 if PCNTR4.EORR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
2. Outputs 1 if PCNTR4.EOSR is set to 1 when ELC_PORTn (n = 1, 2, 3 or 4) signal occurs.
3. Outputs 0 if PCNTR3.PORR is set to 1.
4. Outputs 1 if PCNTR3.POSR is set to 1.
5. Outputs 0 or 1 because PCNTR1.PODRn is set.

6. Outputs 0 or 1 because PmnPFS.PODRn is set.

Numbers in this list correspond to the priority for writing to the PODRn. For example, if 1. and 3. from the list occur at the same time, the higher priority event 1. is executed.

19.5.4 Notes on Using Analog Functions

To use an analog function, set the Port Mode Control bit (PMR) and the Port Direction bit (PDRn) to 0 so that the pin acts as a general input port. Next, set the Analog Input Enable bit (ASEL) in the Port mn Pin Function Select Register (PmnPFS.ASEL) to 1.

19.5.5 I/O Buffer Specification

The P402, P403, and P404 can be used as the RTC input, tamper detection and other peripheral functions. Table 19.4 lists the P402, P403, P404 specifications.

Table 19.4 P402, P403, P404 specifications

I/O port	RTC and tamper detection			Other peripheral	
	RTC and tamper detection input enable register	RTC	Tamper detection	Other peripheral enable register	CAC, CEU GPT, CAN, SCI, SDHI, SSIE, ETHERC (MII), ETHERC (RMII), and interrupt
P402	VBTICTLR.VCH0INEN	RTCIC0	RTCIC0	P402PFS.PSEL and PMR	For details, see section 19.6. Peripheral Select Settings for Each Product.
P403	VBTICTLR.VCH1INEN	RTCIC1	RTCIC1	P403PFS.PSEL and PMR	
P404	VBTICTLR .VCH2INEN	RTCIC2	RTCIC2	P404PFS.PSEL and PMR	

These RTC inputs and tamper detection are controlled by the VBTICTLR register and this register has the highest priority for selecting the functions.

P402, P403, and P404 can be used as IRQn-DS (n = 4, 14, 15) whether RTC inputs and tamper detection are selected or not. When using these interrupts, set the interrupt procedure after setting the VBTICTLR register. See section 11.2.8. VBTICTLR : VBATT Input Control Register.

See Figure 19.5.

The VBTICTLR register is only initialized by VBATT_POR reset. Therefore, when not using the RTC inputs and tamper detection, the associated bit of VBTICTLR register must be set to 0 after except VBATT_POR reset.

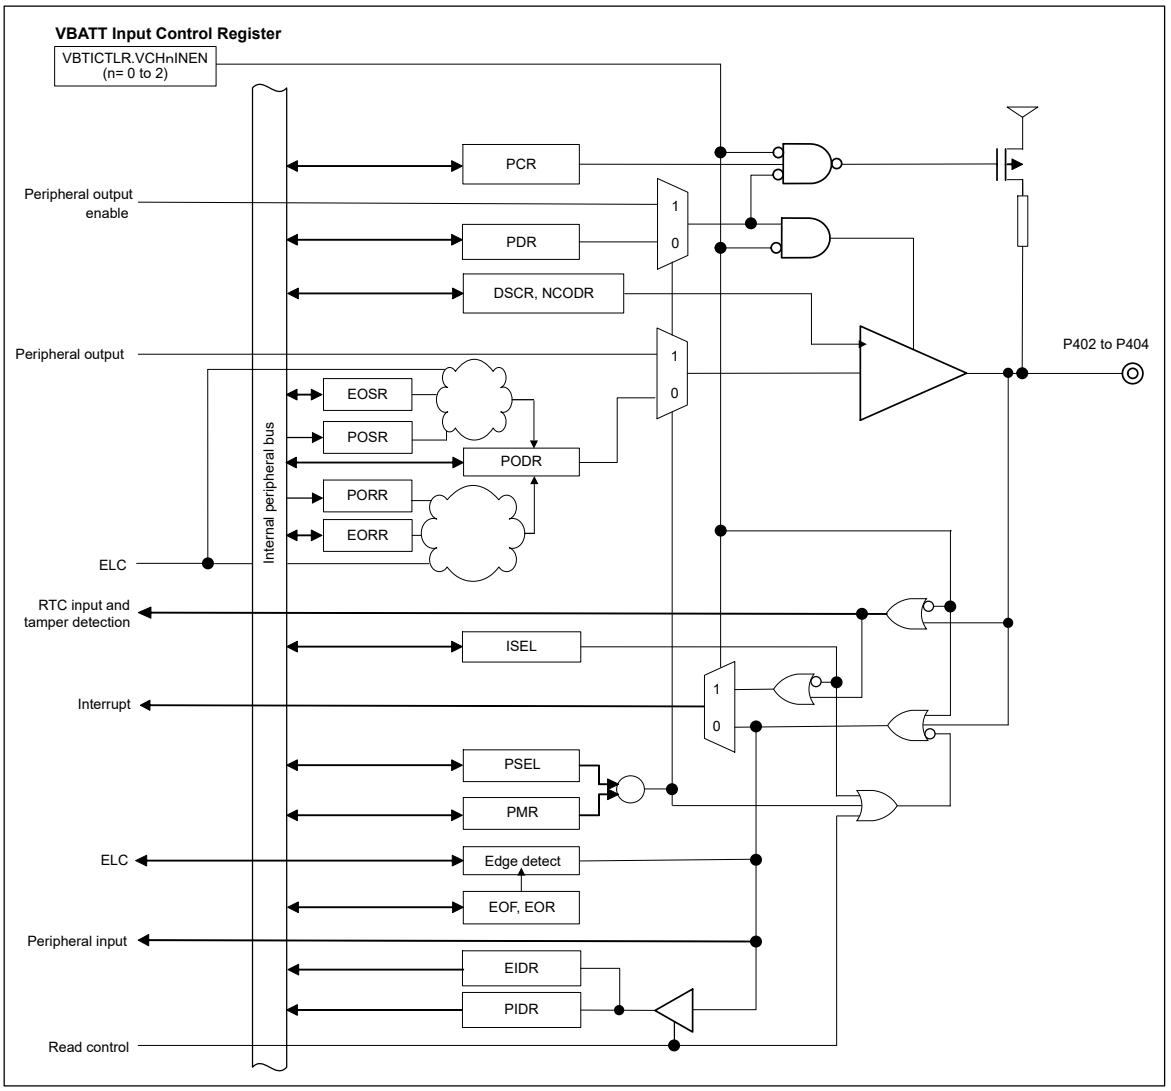

Figure 19.5 P402, P403, P404 diagram

19.5.6 Selecting Pins USB_DP and USB_DM

Pins USB_DP and USB_DM are shared with pins P814 and P815, respectively. Pins USB_DP and P814 can be set with the PFS.P814PFS.PMR bit, and pins USB_DM and P815 can be set with the PFS.P815PFS.PMR bit. Table 19.5 shows setting values of bits PFS.P814PFS.PMR and PFS.P815PFS.PMR with each selected pin.

Table 19.5 Selecting the USB/PORT pins

PMR Bits Settings		Pins Selected	
P814PFS.PMR bit	P815PFS.PMR bit	P814/USB_DP Pin	P815/USB_DM Pin
0	0	P814	P815
0	1	P814	P815
1	0	P814	P815
1	1	USB_DP	USB_DM

Note: When using P814/USB_DP and P815/USB_DM as GPIO pins (P814 and P815), use the USB related registers with their initial values.

Note: When using P814/USB_DP and P815/USB_DM as USB pins (USB_DP and USB_DM), use the GPIO related registers for P814 and P815 with their initial values.

Note: When using P814/USB_DP and P815/USB_DM as GPIO pins or USB pins, set these pins only once after a reset.

19.5.7 Pull-up/Pull-down Setting for P814 and P815 at USBFS/GPIO Function

When the GPIO function of P814 and P815 is used, the Pull-up/Pull-down function of USBFS register affects to P814 and P815. Therefore, before using GPIO function, the pull-up and pull-down control of USBFS needs to be disabled. The control register is SYSCFG.DPRPU and SYSCFG.DRPD bits.

19.6 Peripheral Select Settings for Each Product

This section describes the pin function select configuration using the PmnPFS register. Some pin names have added _A, _B, or _C suffixes. When assigning IIC, SPI, SSIE, ETHERC and SDHI functionality, select the functional pins having the same suffix. The other pins can be selected regardless of the suffix. Assigning the same function to two or more pins simultaneously is prohibited.

1. In Pmn pin function select register(PmnPFS), the PSEL bits have to be set when the PMR bit of the target pin is 0. If the PSEL bits are set when the PMR bit is 1, the unexpected edges may be input at the input function or the unexpected pulses may be output to the external pin at the output function.
2. Only the allowed values (functions) should be specified in the PSEL bits of PmnPFS register. If a value which is not allowed for the register is specified, the correct operation is not guaranteed.
3. The single function should not be assigned to the multiple pins by PmnPFS register. When the GPT1, GPT5, SCI3, IIC0 or SPI0 are configured as secure and these pin function is being assigned to the pin which security attribution is set as secure by the PmSAR register, the write access to the PSEL bits for setting same function as secure pin in other pins is ignored when the security attribution of that pin is non-secure. For example, if the PSARE.PSARE30 bit is 0 (GPT1 is secure) and the P209PFS.PSEL bits is 00011b (pin function is GTIOC1A) and the P2SAR.109SA bit is 0 (P209 is secure), the write 00011b to the P405PFS.PSEL bits is ignored when the P4SAR.405SA bit is 1 (P405 is non-secure).
4. The PORT0, PORT5 and PORT8 have the analog functions such as A/D converter. When these pins are used as an analog function, for avoiding the loss of resolution, the PMR bit should be set to 0 and PDR bit should be set to 0. After that, ASEL bit should be set to 1

Note 1. Recommend using pins that have a letter appended to their names, for instance "_A", "_B", or "_C", to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.

Note 2. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

Note 1. To use this pin function, set the associated pin as a general input (set the PmnPFS.PDR and PmnPFS.PMR bits to 0).

Note 2. Recommend using pins that have a letter appended to their names, for instance "_A", "_B", or "_C", to indicate group membership. For the interface, the AC portion of the electrical characteristics is measured for each group.
Note 3. There are 2 types output buffer which are middle drive and high drive. Recommend using same drive buffer for output skew spec (t_{GTISK}).

20. Port Output Enable for GPT (POEG)

20.1 Overview

The Port Output Enable (POEG) function can place the General PWM Timer (GPT) output pins in the output disable state in one of the following ways:

- Input level detection of the GTETRGn (n = A to D) pins
- Output-disable request from the GPT
- Comparator interrupt request detection
- Oscillation stop detection of the clock generation circuit
- Register settings

The GTETRGn (n = A to D) pins can be used as GPT external trigger input pins.

Table 20.1 lists the POEG specifications, Figure 20.1 shows a block diagram, and Table 20.2 lists the input pins.

Table 20.1 POEG specifications

Parameter	Specifications
Output-disable control through input level detection	The GPT output pins can be disabled when a GTETRGn rising edge or high level is sampled after polarity and filter selection.
Output-disable request from the GPT	When the GTIOCxA pin and the GTIOCxB pin are driven to an active level simultaneously, the GPT generates an output-disable request to the POEG. Through reception of these requests, the POEG can control whether the GTIOCxA and GTIOCxB pins are output-disabled.
Output-disable control through the comparator (ACMPHS) interrupt request detection	The GPT output pins can be disabled when an interrupt request is generated by a change in the output results of any of the comparators.
Output-disable control through oscillation stop detection	The GPT output pins can be disabled when oscillation of the clock generation circuit stops.
Output-disable control by software (registers)	The GPT output pins can be disabled by modifying the register settings.
Interrupt	Interrupts can be generated by detecting the input level of external trigger input pins (GTETRGn pins). Interrupts can be generated when all GPT or ACMPHS output pins are driven to an active level simultaneously.
External trigger output to the GPT	The GTETRGn signals can be output to the GPT after polarity and filter selection. (count start, count stop, count clear, up-count, down-count, or input capture function)
Noise filtering	For input from the GTETRGn pins, PCLKB/1, PCLKB/8, PCLKB/32, or PCLKB/128 can be selected as the noise filtering clock. (Filtering is performed by sampling the input signals three times using the selected clock.) Positive or negative polarity can be selected for any of the GTETRGn input pins. Signal state after polarity and filter selection can be monitored.
Module-stop function	Module-stop state can be set for each groups to reduce power consumption.
TrustZone Filter	Security and Privilege attribution can be set for each groups.

Note: n = A to D, x = 0 to 13

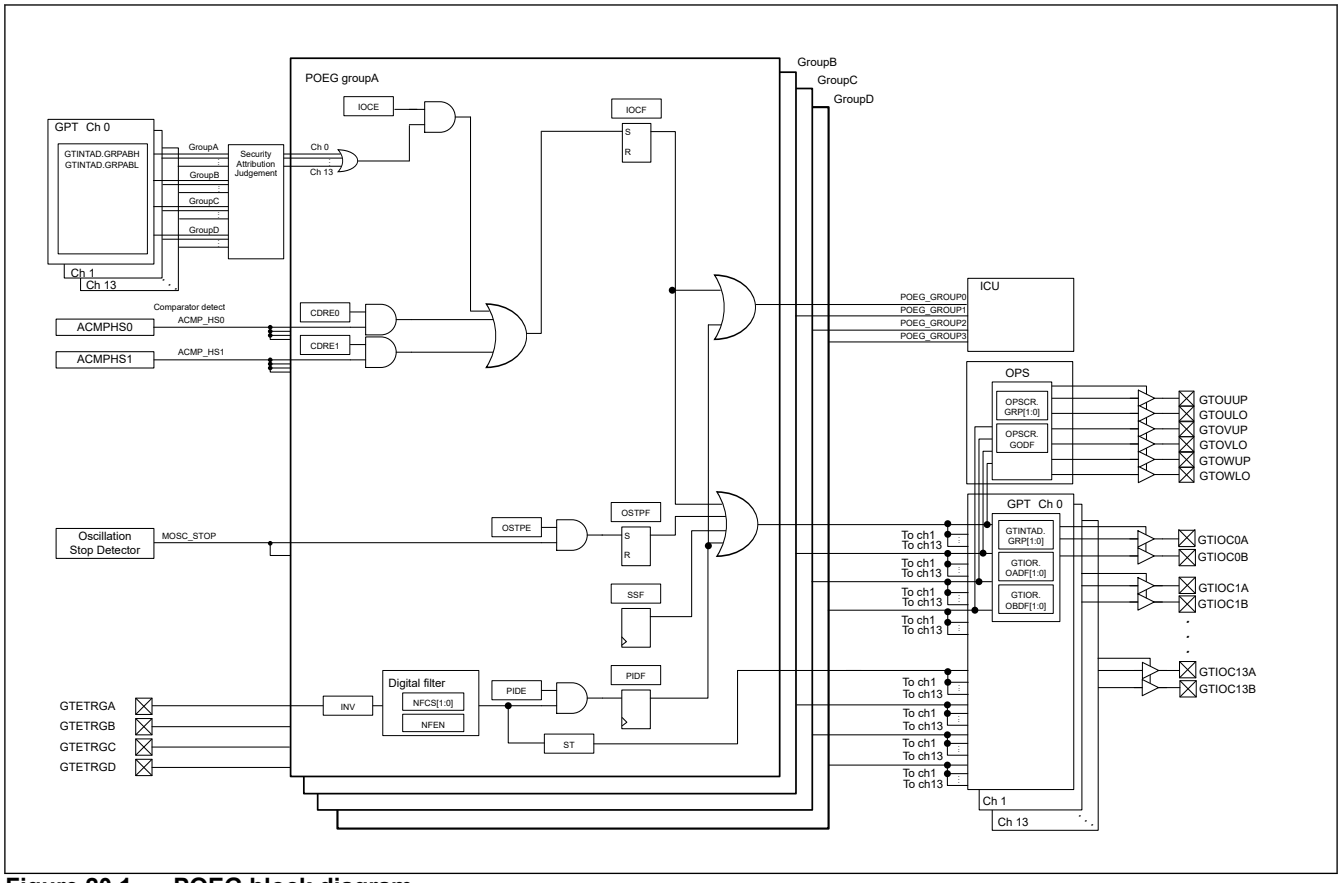

Figure 20.1 POEG block diagram

Table 20.2 POEG input pins

Pin name	I/O	Description
GTETRGA	Input	GPT output pin output-disable request signal or GPT external trigger input pin A
GTETRGB	Input	GPT output pin output-disable request signal or GPT external trigger input pin B
GTETRGC	Input	GPT output pin output-disable request signal or GPT external trigger input pin C
GTETRGD	Input	GPT output pin output-disable request signal or GPT external trigger input pin D

5	IOCE	Enable for GPT Output-Disable Request 0: Disable output-disable requests from GPT 1: Enable output-disable requests from GPT	R/W*2
6	OSTPE	Oscillation Stop Detection Enable 0: Disable output-disable requests from oscillation stop detection 1: Enable output-disable requests from oscillation stop detection	R/W*2
7	—	This bit is read as 0. The write value should be 0.	R/W
8	CDRE0	ACMP_HS0 Enable 0: Disable output-disable request from ACMPHS0 1: Enable output-disable request from ACMPHS0	R/W*2
9	CDRE1	ACMP_HS1 Enable 0: Disable output-disable request from ACMPHS1 1: Enable output-disable request from ACMPHS1	R/W*2
15:10	—	These bits are read as 0. The write value should be 0.	R/W
16	ST	GTETRGn Input Status Flag 0: GTETRGn input after filtering was 0 1: GTETRGn input after filtering was 1	R
27:17	—	These bits are read as 0. The write value should be 0.	R/W
28	INV	GTETRGn Input Reverse 0: Input GTETRGn as-is 1: Input GTETRGn in reverse	R/W
29	NFEN	Noise Filter Enable 0: Disable noise filtering 1: Enable noise filtering	R/W
31:30	NFCS[1:0]	Noise Filter Clock Select 0 0: Sample GTETRGn pin input level three times every PCLKB 0 1: Sample GTETRGn pin input level three times every PCLKB/8 1 0: Sample GTETRGn pin input level three times every PCLKB/32 1 1: Sample GTETRGn pin input level three times every PCLKB/128	R/W

Note: S-TYPE3, P-TYPE3
Note 1. Only 0 can be written to clear the flag.
Note 2. Can be modified only once after a reset.

The POEGGn (n = A to D) registers control the output-disable state of the GPT pins, interrupts, and the external trigger input to the GPT.

In the descriptions, POEGGn represents the POEGGn (n = A to D) registers.

20.3 Output-Disable Control Operation

If any of the following conditions is satisfied, the GTIOCxA, GTIOCxB, and the 3-phase PWM output for BLDC motor control pins can be set to output-disable:

- Input level or edge detection of the GTETRGn pins
  When POEGGn.PIDE is 1, the POEGGn.PIDF flag is set to 1.
- Output-disable request from the GPT
  When POEGGn.IOCE is 1, the POEGGn.IOCF flag is set to 1 if the disable request is enabled by GTINTAD. The GTINTAD.GRPABH and GTINTAD.GRPABL settings apply to the group selected by the GPT register GTINTAD.GRP[1:0] or OPSCR.GRP[1:0].

  Note: The disable request is valid only when the security attributions of GPT and POEG are same. The disable request from GPT with a security attribution different from the security attribution of POEG is invalidated by the security attribution judgment.
- Comparator (ACMPHS) interrupt request detection
  Comparator interrupt detection is activated when any of the POEGGn.CDREi (i = 0, 1) is 1. When the associated comparator interrupt is generated, the GPT output pins are disabled. POEGGn.IOCF indicates the detection status.
- Oscillation stop detection for the clock generation circuit
  While POEGGn.OSTPE is 1, the halt status of the main clock oscillator is detected and the POEGGn. OSTPF flag is set to 1.
- SSF bit setting
  When POEGGn.SSF is set to 1, the GPT and PWM output are disabled.

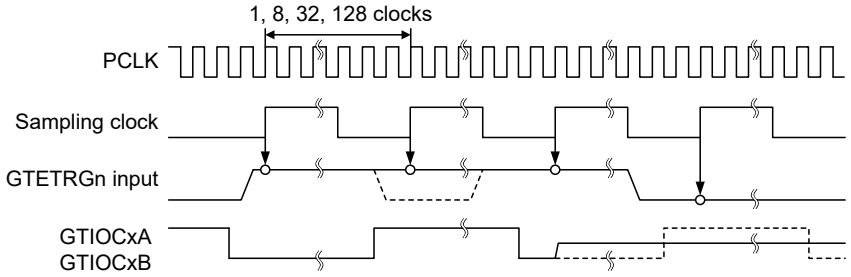
The output-disable state is controlled in the GPT module. The output-disable of the GTIOCxA and GTIOCxB pins is set in the GTINTAD.GRP[1:0], GTIOR.OADF[1:0], and GTIOR.OBDF[1:0] bits in GPTx. The output-disable of the 3-phase PWM output for BLDC motor control pins is set in the OPSCR.GRP[1:0] bits and OPSCR.GODF bit in GPT_OPS.

20.3.1 Pin Input Level Detection Operation

If the input conditions set in POEGGn.PIDE, POEGGn.NFCS[1:0], POEGGn.NFEN, and POEGGn.INV occur on the GTETRGn pins, the GPT output pins are output-disabled.

20.3.1.1 Digital Filter

Figure 20.2 shows high-level detection by the digital filter. When a high level associated with the POEGGn.INV polarity setting is detected three times consecutively with the sampling clock selected in POEGGn.NFCS[1:0], the detected level is recognized as high, and the GPT output pins are output-disabled. If even one low level is detected during this interval, the detected level is not recognized as high. In addition, in an interval where the sampling clock is not output, changes of the levels on the GTETRGn pins are ignored.



When high level is sampled at all points	[1]	[2]	[3]	Flag set (GTETRGn received)
When low level is sampled at least once	[1]	[0]	[1]	Flag not set

Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT setting. Low level sampling can be set in the POEGGn.INV setting.

Figure 20.2 Example of digital filter operation

20.3.2 Output-Disable Requests from the GPT

For details on the operation, see the description for GTIOC Pin Output Negate Control in section 21, General PWM Timer (GPT).

20.3.3 Comparator Interrupt Detection

If POEGGn.CDREi (i = 0, 1) is 1 when an associated comparator interrupt request is generated, the GPT output pins are output-disabled for each group. The status flag is POEGGn.IOCF which is shared with GPT output-disable detection.

20.3.4 Output-Disable Control Using Detection of Stopped Oscillation

When the oscillation stop detection function in the clock generation circuit detects stopped oscillation while POEGGn.OSTPE is 1, the GPT output pins are output-disabled for each group.

20.3.5 Output-Disable Control Using Registers

The GPT output pins can be directly controlled by writing 1 to the Software Stop flag, POEGGn.SSF.

20.3.6 Release from Output-Disable

To release the GPT output pins placed in the output-disable state, either return them to their initial state with a reset or clear all of the following flags:

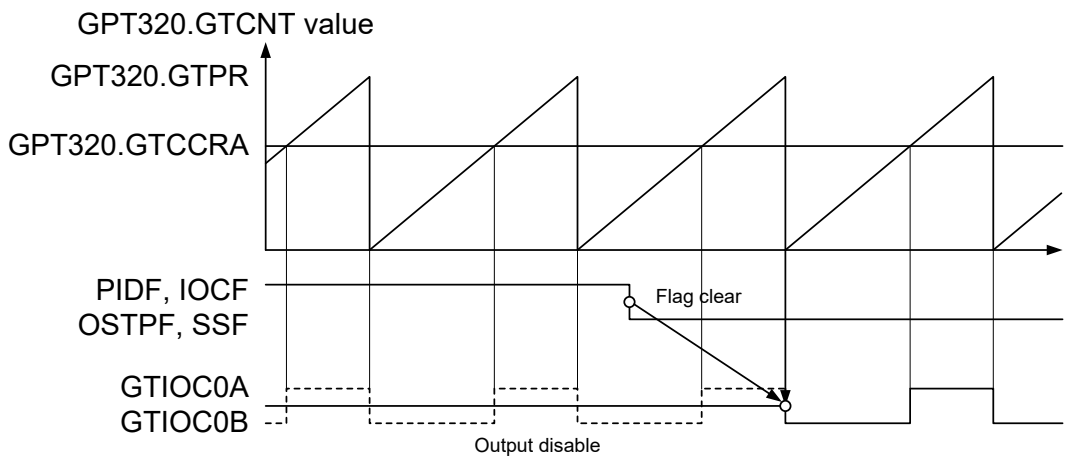
- POEGGn.PIDF
- POEGGn.IOCF
- POEGGn.OSTPF
- POEGGn.SSF

Writing 0 to the POEGGn.PIDF flag is ignored (the flag is not cleared) if the external input pins, GTETRGn are not disabled and the POEGGn.ST bit is not set to 0.

Writing 0 to the POEGGn.IOCF flag is valid (the flag is cleared) only if all of the GTST.OABHF and GTST.OABLF flags in the GPT are set to 0.

Writing 0 to the POEGGn.OSTPF flag is ignored (the flag is not cleared) if the OSTDSR.OSTDF flag in the clock generation circuit is not set to 0. In addition, when the flag set and release occur at the same time, the flag set takes precedence.

Figure 20.3 shows the release timing for output-disable. The output-disable is released at the beginning of the next count cycle of the GPT after the flag is cleared.



Note: The base address of the registers are the same.

Figure 20.3 Output-disable release timing for GPT pin outputs

20.4 Interrupt Sources

The POEG generates an interrupt request for the following factors:

- Output-disable control by the input level detection
- Output-disable request from the GPT or the comparator (ACMPHS) interrupt request detection

Table 20.3 lists the conditions for interrupt requests.

Table 20.3 Interrupt sources and conditions

Interrupt source	Symbol	Associated flag	Trigger conditions
POEG group A interrupt	POEG_GROUPA	POEGGA.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGA.PIDF	An output-disable request from the GTETRGA pin occurred
POEG group B interrupt	POEG_GROUPB	POEGGB.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGB.PIDF	An output-disable request from the GTETRGB pin occurred
POEG group C interrupt	POEG_GROUPC	POEGGC.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGC.PIDF	An output-disable request from the GTETRGC pin occurred
POEG group D interrupt	POEG_GROUPD	POEGGD.IOCF	An output-disable request from a GPT disable request occurred
			An output-disable request from ACMPHS interrupt occurred
		POEGGD.PIDF	An output-disable request from the GTETRGD pin occurred

20.5 External Trigger Output to the GPT

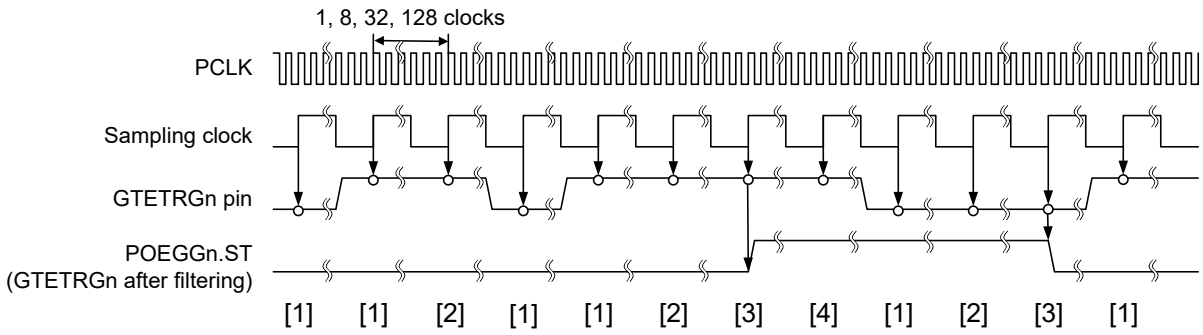
The POEG outputs signals generated by filtering and level detection of GTETRGn pins input signals as the GPT operation trigger signal for the following:

- Count start
- Count stop
- Count clear

- Up-count
- Down-count
- Input capture

For the POEGGn.INV polarity setting signal, when the same level is input three times continuously with the sampling clock selected in POEGGn.NFCS[1:0], that value is output. Set the control registers the same as for the input level detection operation described in section 20.3.1. Pin Input Level Detection Operation The state after filtering can be monitored in POEGGn.ST.

Figure 20.4 shows the output timing of an external trigger to the GPT.



Note: PCLK = PCLKB
Note: Each channel output can be set in the GPT settings. Polarity can be reversed in POEGGn.INV.

Figure 20.4 Output timing of external trigger to the GPT

20.6 Usage Notes

20.6.1 Transition to Software Standby Mode

When using the POEG, do not invoke Software Standby mode. In this mode, the POEG stops and therefore output disable of the pins cannot be controlled.

20.6.2 Specifying Pins Associated with the GPT

The POEG controls output-disable only when a pin is associated with the GPT in the PmnPFS.PMR and PmnPFS.PSEL settings. When the pin is specified as a general I/O pin, the POEG does not perform output-disable control.

21. General PWM Timer (GPT)

21.1 Overview

The General PWM Timer (GPT) is a 32-bit timer with GPT32 × 8 channels and a 16-bit timer with GPT16 × 6 channels. PWM waveforms can be generated by controlling the up-counter, down-counter, or the up- and down-counter.This GPT provides the A/D conversion start request function. The GPT can also be used as a general-purpose timer.

Table 21.1 lists the GPT specifications, Table 21.2 shows the GPT functions, and Figure 21.1 shows a block diagram.

Table 21.1 GPT specifications

Parameter	Description
Functions	• 32 bits × 8 channels (GPT32n (n = 0 to 7)) • 16 bits × 6 channels (GPT16m (m = 8 to 13)) • Up-counting or down-counting (saw waves) or up/down-counting (triangle waves) for each counter • Clock sources independently selectable for each channel • Two input/output pins per channel • Two output compare/input capture registers per channel • For the two output compare/input capture registers of each channel, four registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use • In output compare operation, buffer switching can be at crests or troughs, enabling the generation of laterally asymmetric PWM waveforms • Registers for setting up frame cycles in each channel with capability for generating interrupts at overflow or underflow • Generation of dead times in PWM operation • Synchronous starting, stopping and clearing counters for arbitrary channels • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 8 ELC events • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to the status of two input pins • Count start, count stop, count clear, up-count, down-count, or input capture operation in response to a maximum of 4 external triggers • Control output disable request from the POEG • A/D conversion start request generation function • PWM waveform for controlling brushless DC motors can be generated • Compare match A to F event and overflow/underflow event can be output to the ELC • Enables the noise filter for input capture • Period count function • Logical operation between the channel output • Bus clock: PCLKA, Core clock: PCLKD • Frequency ratio: PCLKA:PCLKD = 1:N (N = 1/2/4/8/16/32/64)

Table 21.2 GPT functions (1 of 2)

Parameter	Description
Count clock	PCLKD PCLKD/2 PCLKD/4 PCLKD/8 PCLKD/16 PCLKD/32 PCLKD/64 PCLKD/256 PCLKD/1024 GTETRGA, GTETRGB, GTETRGC, GTETRGD

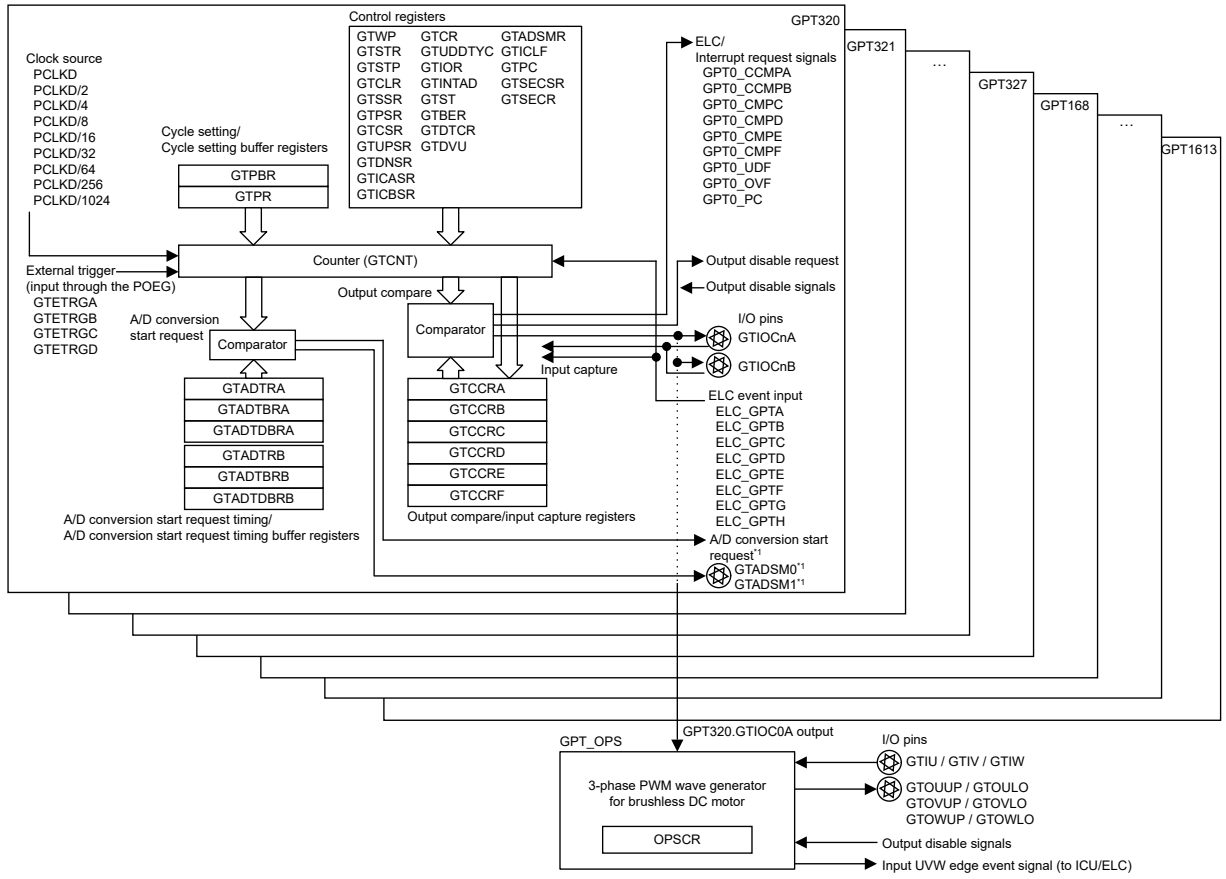
Compare/buffer registers	GTCCRC GTCCRD GTCCRE GTCCRF
Cycle setting buffer register	GTPBR

Table 21.2 GPT functions (2 of 2)

Parameter		Description
I/O pins		GTIOCnA GTIOCnB (n = 0 to 13)
External trigger input pin*1		GTETRGA GTETRGB GTETRGC GTETRGD
Counter clear sources		GTPR register compare match Input capture Input pin status ELC event input GTETRGn (n = A to D) pin input
Period count function		Available (GPT32n (n = 0 to 3), GPT16m (m = 8 to 10))
Compare match output	Low output	Available
	High output	Available
	Toggle output	Available
Input capture function		Available
Automatic addition of dead time		Available (no dead time buffer)
PWM mode		Available
Phase count function		Available
Buffer operation		Simultaneous operation disable control for multiple channels
One-shot operation		Available
DMAC/DTC activation		All the interrupt sources
A/D conversion start request		Compare match of GTADTRA or GTADTRB register
Interrupt sources		9 sources • GTCCRA comare match/input capture(GPTn_CCMPA) • GTCCRB comare match/input capture(GPTn_CCMPB) • GTCCRC comare match(GPTn_CMPC) • GTCCRD comare match(GPTn_CMPD) • GTCCRE comare match(GPTn_CMPE) • GTCCRF comare match(GPTn_CMPF) • GTCNT overflow (GTPR compare match) (GPTn_OVF) • GTCNT underflow (GPTn_UDF) • GTPC count stop(GPTx_PC) (x = 0 to 3, 8 to 10)
Event linking (ELC) function		Available*2
Noise filtering function		Available
Logical operation between the channel output		Available
Module-stop function		Module-stop state can be set for each channels to reduce power consumption
TrustZone Filter		Security and Privilege attribution can be set for each channels

Note 1. GTETRGn connects to GPT through the POEG module. Therefore, to use the GPT function, supply the POEG clock by clearing the MSTPCRD.MSTPDn (n = 11 to 14) bit.
Note 2. See section 21.6. Operations Linked by ELC.



Note 1. This function is only available in GPT32n (n = 0 to 7).

Figure 21.1 GPT block diagram (Saw-wave PWM mode, Saw-wave one-shot pulse mode, Triangle-wave PWM mode 1,2,3)

Figure 21.2 shows an example using multiple GPTs.

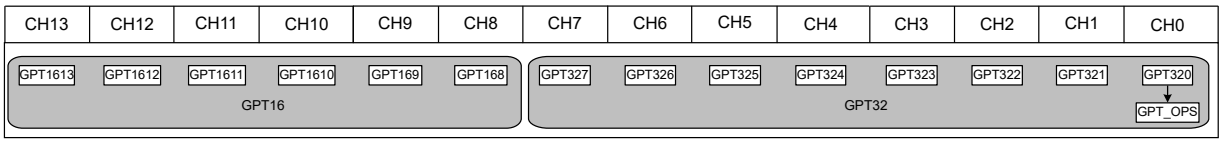


Figure 21.2 Association between GPT channels and module names

Table 21.3 lists the I/O pins.

Table 21.3 GPT I/O pins (1 of 2)

Channel	Pin name	I/O	Function
Common	GTETRGx	Input	External trigger input pin x (input through the POEG)
	GTADSM0	Output	A/D conversion start request monitor 0 output pin
	GTADSM1	Output	A/D conversion start request monitor 1 output pin

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	PRKEY[7:0]								—	—	—	CMNWP	CLRWP	STPWP	STRWP	WP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	WP	Register Write Disable 0: Write to the register enabled 1: Write to the register disabled	R/W
1	STRWP	GTSTR.CSTRT Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
2	STPWP	GTSTP.CSTOP Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
3	CLRWP	GTCLR.CCLR Bit Write Disable 0: Write to the bit is enabled 1: Write to the bit is disabled	R/W
4	CMNWP	Common Register Write Disabled 0: Write to the register is enabled 1: Write to the register is disabled	R/W

Bit	Symbol	Function	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
15:8	PRKEY[7:0]	GTWP Key Code When 0xA5 is written to these bits, writing to the WP, STRWP, STPWP, CLRWP, and CMNWP bits are permitted. These bits are read as 0.	W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

GTWP enables or disables writing to registers to prevent accidental modification. Protection by the GTWP register is only for the writes by the CPU. GTWP does not protect registers from updates that occur in association with CPU writes.

WP bit (Register Write Disable)

The following is a list of write enabled or disabled registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTADSMR, GTICLF, GTPC.

STRWP bit (GTSTR.CSTRT Bit Write Disable)

The STRWP bit enables or disables starting the updating of counter values by writing to the CSTRTn bit (n = 0 to 13) corresponding to a channel number in the GTSTR register.

The bit position of each CSTRTn bit in the GTSTR register is allocated to the channel with the corresponding number, and writing to the GTSTR register for any channel results in writing to the registers of all channels. The STRWP bit for each channel does not control writing but only controls updating of the CSTRT bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTRT bits of a channel for which the setting of the STRWP bit is 1(disabling writing), the CSTRT bit for the given channel is not updated, but the CSTRT bits corresponding to channel for which the setting of the STRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter starts to run. When the setting of the GPT320.GTWP.STRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTR.CSTRT0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter does not run.

If you want to protect all bits in the GTSTR register from being updated, set the STRWP bits of all channels to 1.

STPWP bit (GTSTP.CSTOP Bit Write Disable)

The STPWP bit enables or disables starting the updating of counter values by writing to the CSTOPn bit (n = 0 to 13) corresponding to a channel number in the GTSTP register.

The bit position of each CSTOPn bit in the GTSTP registers is allocated to the channel with the corresponding number, and the writing to the GTSTP register for any channel results in writing to the registers of all channels. The STPWP bit for each channel does not control writing but only controls updating of the CSTOP bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CSTOP bits of a channel for which the setting of the STPWP bit is 1(disabling writing), the CSTOP bit for the given channel is not updated, but the CSTOP bits corresponding to channel for which the setting of the STPWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.STPWP bit is 0 (enabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is stopped. When the setting of the GPT320.GTWP.STPWP bit is 1 (disabling writing), writing 1 to the GPT321.GTSTP.CSTOP0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not stopped.

If you want to protect all bits in the GTSTP register from being updated, set the STPWP bits of all channels to 1.

CLRWP bit (GTCLR.CCLR Bit Write Disable)

CLRWP bit enables or disables starting the updating of counter values by writing to the CCLRn bit (n = 0 to 13) corresponding to a channel number in the GTCLR register.

The bit position of each CCLRn bit in the GTCLR registers is allocated to the channel with the corresponding number, and the writing to the GTCLR register for any channel results in writing to the registers of all channels. The CLRWP bit for each channel does not control writing but only controls updating of the CCLR bit for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the CCLR bits of a channel for which the setting of the CLRWP bit is 1(disabling writing), the CCLR bit for the given channel is not updated, but the CCLR bits corresponding to channel for which the setting of the CLRWP bit is 0 (enabling writing) are updated. For example, when the setting of the GPT320.GTWP.CLRWP bit is 0 (enabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 causes the value to be updated, and the GPT320.GTCNT counter is cleared. When the setting of the GPT320.GTWP.CLRWP bit is 1 (disabling writing), writing 1 to the GPT321.GTCLR.CCLR0 bit when its current setting is 0 leaves the bit with the value 0, and the GPT320.GTCNT counter is not cleared.

If you want to protect all bits in the GTCLR register from being updated, set the CLRWP bits of all channels to 1.

CMNWP bit (Common Register Write Disabled)

CMNWP bit enables or disables starting the updating of counter values by writing to the SECSELn bit (n = 0 to 13) corresponding to a channel number in the GTSECSR register or to the GTSECR register.

The bit position of each SECSEL bit in the GTSECSR registers is allocated to the channel with the corresponding number, and the writing to the GTSECSR register for any channel results in writing to the registers of all channels. Writing to the GTSECR register of any channel leads to writing to the registers of all channels. The CMNWP bit for each channel does not control writing but only controls updating of the SECSEL bit and the GTSECR register value for the corresponding channel when simultaneously writing to all channels.

Therefore, when writing to the SECSEL bit and the GTSECR register value of a channel for which the setting of the CMNWP bit is 1(disabling writing), the SECSEL bit and the GTSECR register value for the given channel is not updated, but the SECSEL bit and the GTSECR register value corresponding to channel for which the setting of the CMNWP bit is 0 (enabling writing) are updated.

For example, when the setting of the GPT320.GTWP.CMNWP bit is 0 (enabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit causes the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register updates the value of the GPT320.GTSECR register. When the setting of the GPT320.GTWP.CMNWP bit is 1 (disabling writing), writing to the GPT321.GTSECSR.SECSEL0 bit does not cause the value of the GPT320.GTSECSR.SECSEL0 bit to be updated. In the same way, writing to the GPT321.GTSECR register does not update the value of the GPT320.GTSECR register.

If you want to protect all bits in the GTSECSR and GTSECR registers from being updated, set the CMNWP bits of all channels to 1.

PRKEY[7:0] bit (GTWP Key Code)

This bit controls whether the WP, STRWP, STPWP, CLRWP, and CMNWP bits can be overwritten.

21.2.2 GTSTR : General PWM Timer Software Start Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x04

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CSTRT13	CSTRT12	CSTRT11	CSTRT10	CSTRT9	CSTRT8	CSTRT7	CSTRT6	CSTRT5	CSTRT4	CSTRT3	CSTRT2	CSTRT1	CSTRT0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CSTRT0 to CSTRT13	Channel n GTCNT Count Start (n : the same as bit position value) 0: GTCNT counter not start 1: GTCNT counter start	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSTR starts the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTR bit number represents the channel number. The GTSTR register of each channel is shared by all of the channels. The GTCNT counter starts for the channel associated with the GTSTR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter and the value of GTSTR register.

For the association between module names and channel numbers, see Figure 21.2.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CSTRTn bits (Channel n GTCNT Count Start (n = 0 to 13))

The CSTRTn bits start channel n of the GTCNT counter operation. Writing to the GTSTR.CSTRTn bit (n = 0 to 13) has no effect unless the GTSSR.CSTRT bit is set to 1.

The read data shows the counter status of each channel (GTCR.CST bit). A value of 0 means the counter is stopped and 1 means the counter is running.

21.2.3 GTSTP : General PWM Timer Software Stop Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CSTOP13	CSTOP12	CSTOP11	CSTOP10	CSTOP9	CSTOP8	CSTOP7	CSTOP6	CSTOP5	CSTOP4	CSTOP3	CSTOP2	CSTOP1	CSTOP0
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
13:0	CSTOP0 to CSTOP13	Channel n GTCNT Count Stop (n : the same as bit position value) 0: GTCNT counter not stop 1: GTCNT counter stop	R/W
31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSTP stops the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTSTP bit number represents the channel number. The GTSTP register of each channel is shared by all the channels. The GTCNT counter stops for the channel associated with the GTSTP bit number where 1 is written. Writing 0 has no effect on the status of the GTCNT counter and the value of GTSTP register.

For the association between module names and channel numbers, see Figure 21.2.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CSTOPn bits (Channel n GTCNT Count Stop (n = 0 to 13))

The CSTOPn bits stop channel n of the GTCNT counter operation. Writing to the GTSTP.CSTOPn bit (n = 0 to 13) has no effect unless the GTPSR.CSTOP bit is set to 1. The read data shows the counter status of each channel (invert of GTCR.CST bit). A value of 0 means the counter is running and 1 means the counter is stopped.

21.2.4 GTCLR : General PWM Timer Software Clear Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x0C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	CCLR13	CCLR12	CCLR11	CCLR10	CCLR9	CCLR8	CCLR7	CCLR6	CCLR5	CCLR4	CCLR3	CCLR2	CCLR1	CCLR0
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CCLR0 to CCLR13	Channel n GTCNT Count Clear (n : the same as bit position value) 0: GTCNT counter is not cleared 1: GTCNT counter is cleared	W
31:14	—	These bits are read as 0. The write value should be 0.	W

The GTCLR is a write-only register that clears the GTCNT counter operation for each channel n, where n = 0 to 13.

The GTCLR bit number represents the channel number. The GTCLR register of each channel is shared by all the channels. The GTCNT counter is cleared for the channel associated with the GTCLR bit number where 1 is written. Writing 0 has no effect on the status of GTCNT counter.

For the association between module names and channel numbers, see Figure 21.2.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

CCLRn bits (Channel n GTCNT Count Clear (n = 0 to 13))

When the counting direction flag is set for decrement (GTST.TUCF flag = 0) with saw-wave mode selected in the GTCR.MD[2:0] bits, the value of the GTCNT counter becomes that of the corresponding GTPR register in response to writing 1 to the CCLRn bit. The value of the counter becomes 0x0000 0000 with other settings. These bits are read as 0.

21.2.5 GTSSR : General PWM Timer Start Source Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)

23	SSELCH	ELC_GPTH Event Source Counter Start Enable 0: Counter start disabled at the ELC_GPTH input 1: Counter start enabled at the ELC_GPTH input	R/W
30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTRT	Software Source Counter Start Enable 0: Counter start disabled by the GTSTR register 1: Counter start enabled by the GTSTR register	R/W

Note: n = 0 to 13

The GTSSR sets the source to start the GTCNT counter.

Input from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

SSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Start Enable)

The SSGTRGAR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGA pin input.

SSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Start Enable)

The SSGTRGAF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGA pin input.

SSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Start Enable)

The SSGTRGBR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGB pin input.

SSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Start Enable)

The SSGTRGBF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGB pin input.

SSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Start Enable)

The SSGTRGCR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGC pin input.

SSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Start Enable)

The SSGTRGCF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGC pin input.

SSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Start Enable)

The SSGTRGDR bit enables or disables the GTCNT counter start on the rising edge of the GTETRGD pin input.

SSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Start Enable)

The SSGTRGDF bit enables or disables the GTCNT counter start on the falling edge of the GTETRGD pin input.

SSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCARBL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Start Enable)

The SSCARBH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Start Enable)

The SSCAFBL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

SSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Start Enable)

The SSCAFBH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

SSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBRAL bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBRAH bit enables or disables the GTCNT counter start on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Start Enable)

The SSCBFAL bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

SSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Start Enable)

The SSCBFAH bit enables or disables the GTCNT counter start on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

SSELCm bit (ELC_GPTm Event Source Counter Start Enable) (m = A to H)

The SSELCm bit enables or disables the GTCNT counter start at the ELC_GPTm event input.

CSTRT bit (Software Source Counter Start Enable)

The CSTRT bit enables or disables the GTCNT counter start by GTSTR register.

21.2.6 GTPSR : General PWM Timer Stop Source Select Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)

30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CSTOP	Software Source Counter Stop Enable 0: Counter stop disabled by the GTSTP register 1: Counter stop enabled by the GTSTP register	R/W

Note: n = 0 to 13

The GTPSR sets the source to stop the GTCNT counter.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

PSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Stop Enable)

The PSGTRGAR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGA pin input.

PSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Stop Enable)

The PSGTRGAF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGA pin input.

PSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Stop Enable)

PSGTRGBR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGB pin input.

PSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Stop Enable)

The PSGTRGBF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGB pin input.

PSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Stop Enable)

PSGTRGCR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGC pin input.

PSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Stop Enable)

The PSGTRGCF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGC pin input.

PSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Stop Enable)

PSGTRGDR bit enables or disables the GTCNT counter stop on the rising edge of the GTETRGD pin input.

PSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Stop Enable)

The PSGTRGDF bit enables or disables the GTCNT counter stop on the falling edge of the GTETRGD pin input.

PSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCARBL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCARBH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Stop Enable)

The PSCAFBL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

PSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Stop Enable)

The PSCAFBH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

PSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBRAL bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBRAH bit enables or disables the GTCNT counter stop on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Stop Enable)

The PSCBFAL bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

PSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Stop Enable)

The PSCBFAH bit enables or disables the GTCNT counter stop on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

PSELCm bit (ELCm Event Source Counter Stop Enable) (m = A to H)

The PSELCm bit enables or disables the GTCNT counter stop at the ELC_GPTm event input.

CSTOP bit (Software Source Counter Stop Enable)

The CSTOP bit enables or disables the GTCNT counter stop by the GTSTP register.

30:24	—	These bits are read as 0. The write value should be 0.	R/W
31	CCLR	Software Source Counter Clear Enable 0: Counter clear disabled by the GTCLR register 1: Counter clear enabled by the GTCLR register	R/W

Note: n = 0 to 13

The GTCSR sets the source to clear the GTCNT counter.

Counter clearing can be executed whether the counter is running (GTCR.CST=1) or stopped (GTCR.CST=0).

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

CSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Clear Enable)

The CSGTRGAR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGA pin input.

CSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Clear Enable)

The CSGTRGAF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGA pin input.

CSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Clear Enable)

The CSGTRGBR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGB pin input.

CSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Clear Enable)

The CSGTRGBF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGB pin input.

CSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Clear Enable)

The CSGTRGCR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGC pin input.

CSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Clear Enable)

The CSGTRGCF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGC pin input.

CSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Clear Enable)

The CSGTRGDR bit enables or disables the GTCNT counter clear on the rising edge of the GTETRGD pin input.

CSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Clear Enable)

The CSGTRGDF bit enables or disables the GTCNT counter clear on the falling edge of the GTETRGD pin input.

CSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCARBL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCARBH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Clear Enable)

The CSCAFBL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

CSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Clear Enable)

The CSCAFBH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

CSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBRAL bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBRAH bit enables or disables the GTCNT counter clear on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Clear Enable)

The CSCBFAL bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

CSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Clear Enable)

The CSCBFAH bit enables or disables the GTCNT counter clear on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

CSELCm bit (ELCm Event Source Counter Clear Enable) (m = A to H)

The CSELCm bit enables or disables the GTCNT counter clear at the ELC_GPTm event input.

CCLR bit (Software Source Counter Clear Enable)

The CCLR bit enables or disables the GTCNT counter clear by the GTCLR register.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13

The GTUPSR sets the source to count up the GTCNT counter.

When at least one bit in the GTUPSR register is set to 1, the GTCNT counter is counted up by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of increment in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

USGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Up Enable)

The USGTRGAR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGA pin input.

USGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Up Enable)

The USGTRGAF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGA pin input.

USGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Up Enable)

The USGTRGBR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGB pin input.

USGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Up Enable)

The USGTRGBF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGB pin input.

USGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Up Enable)

The USGTRGCR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGC pin input.

USGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Up Enable)

The USGTRGCF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGC pin input.

USGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Up Enable)

The USGTRGDR bit enables or disables the GTCNT counter count up on the rising edge of the GTETRGD pin input.

USGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Up Enable)

The USGTRGDF bit enables or disables the GTCNT counter count up on the falling edge of the GTETRGD pin input.

USCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCARBL bit enables or disables GTCNT counter count up on the rising edge of GTIOCnA pin input, when GTIOCnB input is 0.

USCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCARBH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Up Enable)

The USCAFBL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

USCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Up Enable)

The USCAFBH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

USCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBRAL bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

USCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBRAH bit enables or disables the GTCNT counter count up on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Up Enable)

The USCBFAL bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

USCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Up Enable)

The USCBFAH bit enables or disables the GTCNT counter count up on the falling edge of the GTIOCnB pin input, when the GTIOCnA input is 1.

USELCm bit (ELC_GPTm Event Source Counter Count Up Enable) (m = A to H)

The USELCm bit enables or disables the GTCNT counter count up at the ELC_GPTm event input.

21.2.9 GTDNSR : General PWM Timer Down Count Source Select Register

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13

The GTDNSR sets the source to count down the GTCNT counter.

When at least one bit in the GTDNSR register is set to 1, the GTCNT counter is counted down by the source that is set to 1 in this register. In this case, GTCR.TPCS has no effect.

Number of decrement in counting is one even when multiple sources are generated simultaneously.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

DSGTRGAR bit (GTETRGA Pin Rising Input Source Counter Count Down Enable)

The DSGTRGAR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGA pin input.

DSGTRGAF bit (GTETRGA Pin Falling Input Source Counter Count Down Enable)

The DSGTRGAF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGA pin input.

DSGTRGBR bit (GTETRGB Pin Rising Input Source Counter Count Down Enable)

The DSGTRGBR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGB pin input.

DSGTRGBF bit (GTETRGB Pin Falling Input Source Counter Count Down Enable)

The DSGTRGBF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGB pin input.

DSGTRGCR bit (GTETRGC Pin Rising Input Source Counter Count Down Enable)

The DSGTRGCR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGC pin input.

DSGTRGCF bit (GTETRGC Pin Falling Input Source Counter Count Down Enable)

The DSGTRGCF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGC pin input.

DSGTRGDR bit (GTETRGD Pin Rising Input Source Counter Count Down Enable)

The DSGTRGDR bit enables or disables the GTCNT counter count down on the rising edge of the GTETRGD pin input.

DSGTRGDF bit (GTETRGD Pin Falling Input Source Counter Count Down Enable)

The DSGTRGDF bit enables or disables the GTCNT counter count down on the falling edge of the GTETRGD pin input.

DSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCARBL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

DSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCARBH bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source Counter Count Down Enable)

The DSCAFBL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

DSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source Counter Count Down Enable)

The DSCAFBH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

DSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBRAL bit enables or disables the GTCNT counter count down on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBRAH bit enables or disables the GTCNT counter count down on the rising edge of GTIOCnB pin input, when GTIOCnA input is 1.

DSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source Counter Count Down Enable)

The DSCBFAL bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

DSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source Counter Count Down Enable)

The DSCBFAH bit enables or disables the GTCNT counter count down on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

DSELCm bit (ELC_GPTm Event Source Counter Count Down Enable) (m = A to H)

The DSELCm bit enables or disables the GTCNT counter count down at the ELC_GPTm event input.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13

The GTICASR sets the source of input capture for GTCCRA.

When at least one bit among bits in the GTICASR register is set to 1, input capture operation making the GTCCRA register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

ASGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGAR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGA pin input.

ASGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGAF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGA pin input.

ASGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGBR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGB pin input.

ASGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGBF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGB pin input.

ASGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGCR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGC pin input.

ASGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGCF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGC pin input.

ASGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRA Input Capture Enable)

The ASGTRGDR bit enables or disables the input capture for GTCCRA on the rising edge of the GTETRGD pin input.

ASGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRA Input Capture Enable)

The ASGTRGDF bit enables or disables the input capture for GTCCRA on the falling edge of the GTETRGD pin input.

ASCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCARBL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCARBH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

ASCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRA Input Capture Enable)

The ASCAFBL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

ASCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRA Input Capture Enable)

The ASCAFBH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnA pin input, when the GTIOCnB input is 1.

ASCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBRAL bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when the GTIOCnA input is 0.

ASCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBRAH bit enables or disables the input capture for GTCCRA on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRA Input Capture Enable)

The ASCBFAL bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

ASCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRA Input Capture Enable)

The ASCBFAH bit enables or disables the input capture for GTCCRA on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

ASELCm bit (ELC_GPTm Event Source Counter GTCCRA Input Capture Enable) (m = A to H)

The ASELCm bit enables or disables the input capture for GTCCRA at the ELC_GPTm event input.

31:24	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13

The GTICBSR sets the source of input capture for GTCCRB.

When at least one bit among bits in the GTICBSR register is set to 1, input capture operation making the GTCCRB register as an input capture register is performed.

Inputs from GTETRGn (n = A to D) pins are input to the GPT through the POEG. Set the polarity of these signals with the POEG.

BSGTRGAR bit (GTETRGA Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGAR bit enables or disables the input capture for GTCCRB on the rising edge of the GTETRGA pin input.

BSGTRGAF bit (GTETRGA Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGAF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGA pin input.

BSGTRGBR bit (GTETRGB Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGBR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGB pin input.

BSGTRGBF bit (GTETRGB Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGBF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGB pin input.

BSGTRGCR bit (GTETRGC Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGCR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGC pin input.

BSGTRGCF bit (GTETRGC Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGCF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGC pin input.

BSGTRGDR bit (GTETRGD Pin Rising Input Source GTCCRB Input Capture Enable)

The BSGTRGDR bit enables or disables the input capture for GTCCRB on the rising edge of GTETRGD pin input.

BSGTRGDF bit (GTETRGD Pin Falling Input Source GTCCRB Input Capture Enable)

The BSGTRGDF bit enables or disables the input capture for GTCCRB on the falling edge of the GTETRGD pin input.

BSCARBL bit (GTIOCnA Pin Rising Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCARBL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when the GTIOCnB input is 0.

BSCARBH bit (GTIOCnA Pin Rising Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCARBH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCAFBL bit (GTIOCnA Pin Falling Input during GTIOCnB Value Low Source GTCCRB Input Capture Enable)

The BSCAFBL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 0.

BSCAFBH bit (GTIOCnA Pin Falling Input during GTIOCnB Value High Source GTCCRB Input Capture Enable)

The BSCAFBH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnA pin input, when GTIOCnB input is 1.

BSCBRAL bit (GTIOCnB Pin Rising Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBRAL bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBRAH bit (GTIOCnB Pin Rising Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBRAH bit enables or disables the input capture for GTCCRB on the rising edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSCBFAL bit (GTIOCnB Pin Falling Input during GTIOCnA Value Low Source GTCCRB Input Capture Enable)

The BSCBFAL bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 0.

BSCBFAH bit (GTIOCnB Pin Falling Input during GTIOCnA Value High Source GTCCRB Input Capture Enable)

The BSCBFAH bit enables or disables the input capture for GTCCRB on the falling edge of the GTIOCnB pin input, when GTIOCnA input is 1.

BSELCm bit (ELC_GPTm Event Source Counter GTCCRB Input Capture Enable) (m = A to H)

The BSELCm bit enables or disables the input capture for GTCCRB at the ELC_GPTm event input.

31:27	—	These bits are read as 0. The write value should be 0.	R/W

The GTCR controls GTCNT.

CST bit (Count Start)

The CST bit controls the GTCNT counter start and stop.

[Setting conditions]

- The GTSTR value where the channel number associated with the bit number is set to 1 with the GTSSR.CSTRT bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input that are enabled by GTSSR for the starting counter source, occurs (n = 0 to 13)
- 1 is written by software directly.

[Clearing conditions]

- The GTSTP value where the channel number associated with the bit number is set to 1 with the GTPSR.CSTOP bit at 1
- The ELC event input, the external trigger, or the GTIOCnA/GTIOCnB input enabled by GTPSR as the counter stop source, occurs (n = 0 to 13)
- 0 is written by software directly.
- When the period count function is finished while the GTPC.ASTP bit is 1.

MD[2:0] bits (Mode Select)

The MD[2:0] bits select the GPT operating mode.

Only the MD[2] bit is valid at input capture. Counting in saw-wave mode is performed with 0 for the MD[2] bit, and counting in triangle-wave mode is performed with 1 for the MD[2] bit.The MD bits must be set while the GTCNT operation is stopped.During the event count operation (when at least one bit among the bits for the GTUPSR and GTDNSR registers is set to 1), setting of the MD bits are ignored, where counting in saw-wave or triangle-wave modes is not performed. Instead, up-counting or down-counting by a source set by the GTUPSR and GTDNSR registers is performed.

TPCS[3:0] bits (Timer Prescaler Select)

The TPCS[3:0] bits select the clock for GTCNT. A clock prescaler can be selected independently for each channel. The TPCS[3:0] bits must be set while the GTCNT operation is stopped. When the GTETRGA, GTETRGB, GTETRGC, or GTETRGD is selected, output for the POEG at rising becomes a clock source. Set the polarity of these signals with the POEG.

21.2.13 GTUDDTYC : General PWM Timer Count Direction and Duty Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x30

18	OADTYF	Forcible GTIOCnA Output Duty Setting 0: Not forcibly set 1: Forcibly set	R/W
19	OADTYR	GTIOCnA Output Value Selecting after Releasing 0%/100% Duty Setting 0: The function selected by the GTIOA[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1: The function selected by the GTIOA[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.	R/W
23:20	—	These bits are read as 0. The write value should be 0.	R/W
25:24	OBDTY[1:0]	GTIOCnB Output Duty Setting 0 0: GTIOCnB pin duty depends on the compare match 0 1: GTIOCnB pin duty depends on the compare match 1 0: GTIOCnB pin duty 0% 1 1: GTIOCnB pin duty 100%	R/W
26	OBDTYF	Forcible GTIOCnB Output Duty Setting 0: Not forcibly set 1: Forcibly set	R/W
27	OBDTYR	GTIOCnB Output Value Selecting after Releasing 0%/100% Duty Setting 0: The function selected by the GTIOB[3:2] bits is applied to the output value when the duty cycle is set after release from the 0 or 100% duty-cycle setting. 1: The function selected by the GTIOB[3:2] bits is applied to the compare match output value which is masked after release from the 0 or 100% duty-cycle setting.	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13

The GTUDDTYC sets the direction in which the GTCNT counts (up-counting or down-counting), and sets the duty of the GTIOCnA/GTIOCnB pin output.

The setting is invalid during the event count operation.

Count Direction:

- In saw-wave mode.
  When the UD value is set to 0 during up-counting, the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value is set to 1 during down-counting, the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UD value changes from 1 to 0 with the UDF bit being 0 and while counting stops, the counter starts up-counting and the count direction changes at an overflow (the timing synchronous with count clock after the GTCNT value becomes the GTPR value). When the UD value changes from 0 to 1 with the UDF bit being 0 and while counting stops, the counter starts down-counting and the count direction changes at an underflow (the timing synchronous with count clock after the GTCNT value becomes 0).
  When the UDF bit is set to 1 while counting stops, the UD bit value is reflected in the count direction when counting starts.
- In triangle-wave mode.
  When the UD value changes during counting, the count direction does not change. When the UD value changes while the UDF bit is 0 and counting stops, the change is not reflected in the count direction when counting starts.
  When the UDF bit is set to 1 while counting is stopped, the UD value is reflected in the count direction when counting starts.

UD bit (Count Direction Setting)

The UD bit sets the count direction (up-counting or down-counting) for GTCNT.

UDF bit (Forcible Count Direction Setting)

The UDF bit forcibly sets the count direction when GTCNT starts operation as the UD value. Only 0 should be written to this bit during counter operation. When 1 is written to this bit while counting stops, return this bit to 0 before counting starts.

Output duty

- In saw-wave mode.
  When the OADTY/OBDTY value changes during up-counting, the duty is reflected at an overflow (GTCNT = GTPR).
  When the OADTY/OBDTY value is changed during down-counting, the duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops the output duty is not reflected at the starting counter operation. When the count direction is up, the output duty is reflected at an overflow (GTCNT = GTPR). When the count direction is down, the output duty is reflected at an underflow (GTCNT = 0).
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.
- In triangle-wave mode.
  When the OADTY/OBDTY value changes during counting, the duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 0 and while counting stops, the output duty is not reflected at the starting counter operation. The output duty is reflected at an underflow.
  When the OADTY/OBDTY value is changed with the OADTYF/OBDTYF bit being 1 and while counting stops, the output duty is reflected at starting counter operation.

In both saw-wave mode and triangle-wave mode, when the OADTYF/OBDTYF bit is set back to 0 and the OADTY[1:0]/OBDTY[1:0] bits are set after setting the OADTYF/OBDTYF bit to 1 and setting the OADTY[1:0]/OBDTY[1:0] bits for the duty of first cycle while count operation is stopped, these duty-cycle set during stopping count operation are reflected in the first cycle and the second cycle after starting count operation.

OmDTY[1:0] bits (GTIOCnm Output Duty Setting) (m = A, B)

The OmDTY[1:0] bits set the output duty (0%, 100% or compare match control) of the GTIOCnm pin.

OmDTYF bit (Forcible GTIOCnm Output Duty Setting) (m = A, B)

The OmDTYF bit forcibly sets the output duty cycle to the OmDTY setting. Set this bit to 0 during counter operation.

OmDTYR bit (GTIOCnm Output Value Selecting after Releasing 0%/100% Duty Setting) (m = A, B)

The OmDTYR bit selects the value that is the object of output retained or toggled at cycle end, when the control changes from 0% or 100% duty setting to compare match for the GTIOCnm pin and GTIOR.GTIOm[3:2] bits are set to 00b (output retained at cycle end) or the GTIOR.GTIOm[3:2] bits are set to 11b (output toggled at cycle end).

The GPT internally continues to perform compare match operation during duty-cycle 0% or 100% operation. When the OmDTYR bit is 1, the value after the period has elapsed due this compare match operation is target for the GTIOm[3:2] bits.

21.2.14 GTIOR : General PWM Timer I/O Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x34

26:25	OBDF[1:0]	GTIOCnB Pin Disable Value Setting 0 0: None of the below options are specified 0 1: GTIOCnB pin is set to Hi-Z in response to controlling the output negation 1 0: GTIOCnB pin is set to 0 in response to controlling the output negation 1 1: GTIOCnB pin is set to 1 in response to controlling the output negation	R/W
28:27	—	These bits are read as 0. The write value should be 0.	R/W
29	NFBEN	Noise Filter B Enable 0: The noise filter for the GTIOCnB pin is disabled 1: The noise filter for the GTIOCnB pin is enabled	R/W
31:30	NFCSB[1:0]	Noise Filter B Sampling Clock Select 0 0: PCLKD/1 0 1: PCLKD/4 1 0: PCLKD/16 1 1: PCLKD/64	R/W

Note: n = 0 to 13

The GTIOR sets the functions of the GTIOCnA and GTIOCnB pins. (n = 0 to 13)

GTIOA[4:0] bits (GTIOCnA Pin Function Select)

The GTIOA[4:0] bits select the GTIOCnA pin function. For details, see Table 21.4.

OADFLT bit (GTIOCnA Pin Output Value Setting at the Count Stop)

The OADFLT bit sets whether the GTIOCnA pin outputs high or low when counting stops.

OAHLD bit (GTIOCnA Pin Output Setting at the Start/Stop Count)

The OAHLD bit specifies whether the GTIOCnA pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OAHLD bit is set to 0:

- The value specified in bit [4] of the GTIOA[4:0] bits is output when counting starts
- The value specified in the OADFLT bit is output when counting stops
- If the OADFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OAHLD bit is set to 1:

- The output is retained when counting starts or stops.

OAE bit (GTIOCnA Pin Output Enable)

The OAE bit disables or enables the GTIOCnA pin output.

When GTCCRA register is used as the input capture register (at least one bit in the GTICASR register is set to 1), the GTIOCnA pin does not output regardless of the OAE bit value.

OADF[1:0] bits (GTIOCnA Pin Disable Value Setting)

The OADF[1:0] bits select the output value of the GTIOCnA pin in response to a request to disable output from the POEG.

NFAEN bit (Noise Filter A Enable)

The NFAEN bit disables or enables the noise filter for input from the GTIOCnA pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSA[1:0] bits (Noise Filter A Sampling Clock Select)

The NFCSA[1:0] bits set the sampling interval for the noise filter of the GTIOCnA pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

GTIOB[4:0] bits (GTIOCnB Pin Function Select)

The GTIOB[4:0] bits select the GTIOCnB pin function. For details, see Table 21.4.

OBDFLT bit (GTIOCnB Pin Output Value Setting at the Count Stop)

The OBDFLT bit sets whether the GTIOCnB pin outputs high or low when counting stops.

OBHLD bit (GTIOCnB Pin Output Setting at the Start/Stop Count)

The OBHLD bit specifies whether theGTIOCnB pin output level is retained or the level at the start or stop of counting depends on the register setting.

When the OBHLD bit is set to 0:

- The value specified in bit [4] of the GTIOB[4:0] bits is output when counting starts
- The value specified in the OBDFLT bit is output when counting stops
- If the OBDFLT bit is modified while counting stops, the new value is immediately reflected in the output.

When the OBHLD bit is set to 1:

- The output is retained when counting starts or stops.

OBE bit (GTIOCnB Pin Output Enable)

The OBE bit disables or enables the GTIOCnB pin output.

When GTCCRB register is used as the input capture register (at least one bit in the GTICBSR register is set to 1), the GTIOCnB pin does not output regardless of the OBE bit value.

OBDF[1:0] bits (GTIOCnB Pin Disable Value Setting)

The OBDF[1:0] bits select the output value of the GTIOCnB pin in response to a request to disable output from the POEG.

NFBEN bit (Noise Filter B Enable)

The NFBEN bit disables or enables the noise filter for input from the GTIOCnB pin. Because changing the value of the bit might lead to the internal generation of an unexpected edge, select the output compare function for the relevant pin in the GTIOR register before doing so.

NFCSB[1:0] bits (Noise Filter B Sampling Clock Select)

The NFCSB[1:0] bits set the sampling interval for the noise filter of the GTIOCnB pin. When setting these bits, wait for 2 cycles of the selected sampling interval before setting the input capture function.

Table 21.4 Settings of GTIOA[4:0] and GTIOB[4:0] bits

GTIOA/GTIOB[4:0] bits					Function		
b4	b3	b2	b1	b0	b4	b3, b2*1 *2 *3	b1, b0*2
0	0	0	0	0	Initial output is low	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	0	1	0			High output at GTCCRA/GTCCRB compare match
0	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	0	1	1	0			High output at GTCCRA/GTCCRB compare match
0	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	0	1	0			High output at GTCCRA/GTCCRB compare match
0	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
0	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
0	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
0	1	1	1	0			High output at GTCCRA/GTCCRB compare match
0	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	0	0	0	Initial output is high	Output retained at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	0	1	0			High output at GTCCRA/GTCCRB compare match
1	0	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	0	1	0	0		Low output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	0	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	0	1	1	0			High output at GTCCRA/GTCCRB compare match
1	0	1	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	0	0	0		High output at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	0	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	0	1	0			High output at GTCCRA/GTCCRB compare match
1	1	0	1	1			Output toggled at GTCCRA/GTCCRB compare match
1	1	1	0	0		Output toggled at cycle end	Output retained at GTCCRA/GTCCRB compare match
1	1	1	0	1			Low output at GTCCRA/GTCCRB compare match
1	1	1	1	0			High output at GTCCRA/GTCCRB compare match
1	1	1	1	1			Output toggled at GTCCRA/GTCCRB compare match

Note 1. The cycle end means an overflow (GTCNT changes from GTPR to 0 in up-counting), an underflow (GTCNT changes from 0 to GTPR in down-counting), or counter clearing for saw-wave mode, and means a trough (GTCNT changes from 0 to 1) for triangle-wave mode.

Note 2. When the timing of a cycle end and the timing of a GTCCRA/GTCCRB compare match are the same in a compare-match operation, the b3 and b2 settings are given priority in saw-wave PWM mode, and the b1 and b0 settings are given priority in any other mode.

Note 3. In event count operation where at least one bit in GTUPSR or GTDNSR is set to 1, the setting of b3 and b2 is ignored.

21.2.15 GTINTAD : General PWM Timer Interrupt Output Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x38

31	—	This bit is read as 0. The write value should be 0.	R/W

The GTINTAD enables or disables interrupt requests, A/D conversion start request, and output disable requests.

ADTRAUEN bit (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter up-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRADEN bit (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRA register compare matches during GTCNT counter down-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBUEN bit (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter up-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

ADTRBDEN bit (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Enable)

This bit enables or disables A/D conversion start requests generated by GTADTRB register compare matches during GTCNT counter down-counting.

The setting is invalid during the event count operation, and A/D conversion start request is not generated.

GRP[1:0] bits (Output Disable Source Select)

These bits select the group of output disable request from GPT to POEG and the group of output disable for GTIOCnA pin and GTIOCnB pin from POEG to GPT.

The output disable request to POEG is output to the group selected in the GRP[1:0] bit, with dead-time errors, simultaneous high output, and simultaneous low output factors following their respective disable request enable bits.

GTST.ODF shows the request of the output disable source group that is selected with the GRP[1:0] bits. Set the GRP[1:0] bits when both GTIOR.OAE and GTIOR.OBE bits are 0.

If the POEG other than the group connected to GPT is selected in the GRP[1:0] bits, ODF flag is always 0, and the status never change to the output disable state.

GRPABH bit (Same Time Output Level High Disable Request Enable)

The GRPABH bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

GRPABL bit (Same Time Output Level Low Disable Request Enable)

The GRPABL bit enables or disables the output disable request when the GTIOCnA pin and GTIOCnB pin output 0 at the same time.

21.2.16 GTST : General PWM Timer Status Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x3C

16	ADTRAUF	GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag 0: No GTADTRA register compare match has occurred in up-counting. 1: A GTADTRA register compare match has occurred in up-counting.	R/W*1
17	ADTRADF	GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag 0: No GTADTRA register compare match has occurred in down-counting. 1: A GTADTRA register compare match has occurred in down-counting.	R/W*1
18	ADTRBUF	GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag 0: No GTADTRB register compare match has occurred in up-counting. 1: A GTADTRB register compare match has occurred in up-counting.	R/W*1
19	ADTRBDF	GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag 0: No GTADTRB register compare match has occurred in down-counting. 1: A GTADTRB register compare match has occurred in down-counting.	R/W*1
23:20	—	These bits are read as 0. The write value should be 0.	R/W
24	ODF	Output Disable Flag 0: No output disable request is generated 1: An output disable request is generated	R
28:25	—	These bits are read as 0. The write value should be 0.	R/W
29	OABHF	Same Time Output Level High Flag 0: No simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 1 both for the GTIOCA and GTIOCB pins has occurred.	R
30	OABLF	Same Time Output Level Low Flag 0: No simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred. 1: A simultaneous generation of 0 both for the GTIOCA and GTIOCB pins has occurred.	R

Bit	Symbol	Function	R/W
31	PCF*2	Period Count Function Finish Flag 0: No period count function finish has occurred 1: A period count function finish has occurred	R/W*1

Note 1. Only 0 can be written to this bit. Do not write 1.
When clearing the ADTRAUF, ADTRADF, ADTRBUF, or ADTRBDF flag, be sure to write 0 only to the target flag or flags for clearing and to write 1 to the other flags not for clearing.
Note 2. This bit is only available in GPT320 to GPT323, GPT168 to GPT1610. In GPT324 to GPT327, GPT1611 to GPT1613, this bit is read as 0. The write value should be 0.

The GTST indicates the status of the GPT.

TCFA flag (Input Capture/Compare Match Flag A)

The TCFA flag indicates the status for the input capture or compare match of GTCCRA.

[Setting conditions]

- GTCNT = GTCCRA, when the GTCCRA register functions as a compare match register
- GTCNT counter value is transferred to GTCCRA by the input capture signal when the GTCCRA register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFB flag (Input Capture/Compare Match Flag B)

The TCFB flag indicates the status for the input capture or compare match of GTCCRB.

[Setting conditions]

- GTCNT = GTCCRB, when the GTCCRB register functions as a compare match register
- GTCNT counter value is transferred to GTCCRB by the input capture signal when the GTCCRB register functions as an input capture register.

[Clearing condition]

- 0 is written to this flag.

TCFC flag (Input Compare Match Flag C)

The TCFC flag indicates the status for the compare match of GTCCRC.

When GTCCRC performs buffer operation, GTCCRC doesn't perform compare match.

[Setting condition]

- GTCNT = GTCCRC.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (GTCCRC performs buffer operation).

TCFD flag (Input Compare Match Flag D)

The TCFD flag indicates the status for the compare match of GTCCRD.

When GTCCRD performs buffer operation, GTCCRD doesn't perform compare match.

[Setting condition]

- GTCNT = GTCCRD.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (GTCCRD performs buffer operation).

TCFE flag (Input Compare Match Flag E)

The TCFE flag indicates the status for the compare match of GTCCRE.

When GTCCRE performs buffer operation, GTCCRE doesn't perform compare match.

[Setting condition]

- GTCNT = GTCCRE.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (GTCCRE performs buffer operation).

TCFF flag (Input Compare Match Flag F)

The TCFF flag indicates the status for the compare match of GTCCRF.

When GTCCRF performs buffer operation, GTCCRF doesn't perform compare match.

[Setting condition]

- GTCNT = GTCCRF.

[Clearing condition]

- 0 is written to this flag.

[Not comparing condition]

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (Triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (GTCCRF performs buffer operation).

TCFPO flag (Overflow Flag)

The TCFPO flag indicates when an overflow or crest has occurred.

[Setting conditions]

- In saw-wave mode, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred
- In triangle-wave mode, a crest (GTCNT changes from GTPR to GTPR - 1) has occurred
- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up-counting) has occurred.

[Clearing condition]

- 0 is written to this flag.

TCFPU flag (Underflow Flag)

The TCFPU flag indicates when an underflow or trough has occurred.

[Setting conditions]

- In saw-wave mode, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred
- In triangle-wave mode, a trough (GTCNT changes from 0 to 1) has occurred
- In counting by hardware sources, an underflow (GTCNT changes from 0 to GTPR in down-counting) has occurred.

[Clearing condition]

- 0 is written to this bit.

TUCF flag (Count Direction Flag)

The TUCF flag indicates the count direction of GTCNT. In event count operation, this flag is set to 1 in up-counting and to 0 in down-counting.

ADTRAUF flag (GTADTRA Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in up-counting.

[Clearing condition]

- 0 is written to the ADTRAUF flag.

ADTRADF flag (GTADTRA Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRA register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRA register in down-counting.

[Clearing condition]

- 0 is written to the ADTRADF flag.

ADTRBUF flag (GTADTRB Register Compare Match (Up-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in up-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in up-counting.

[Clearing condition]

- 0 is written to the ADTRBUF flag.

ADTRBDF flag (GTADTRB Register Compare Match (Down-Counting) A/D Conversion Start Request Flag)

This status flag indicates generation of a GTADTRB register compare match in down-counting.

[Setting condition]

- The GTCNT counter matches the GTADTRB register in down-counting.

[Clearing condition]

- 0 is written to the ADTRBDF flag.

ODF flag (Output Disable Flag)

The ODF flag shows the request of the output disable source group that is selected in the GRP[1:0] bits.

When output is disabled, an output disable control is not released within the same cycle in which an output disable request is negated. It is released in the next cycle.

OABHF flag (Same Time Output Level High Flag)

The OABHF flag indicates that the GTIOCnA pin and GTIOCnB pin output 1 at the same time.

When the GTIOCnA or GTIOCnB pin outputs 0, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABHF flag is enabled (GTINTAD.GRPABH = 1), the OABHF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the high level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or OBE bit is set to 0.

OABLF flag (Same Time Output Level Low Flag)

The OABLF flag indicates that the GTIOCnA and GTIOCnB pins output 0 at the same time.

When the GTIOCnA pin or GTIOCnB pin outputs 1, this flag returns to 0. This flag is read only. Writing 0 to clear the flag is prohibited.

When the output disable request by the OABLF flag is enabled (GTINTAD.GRPABL = 1), the OABLF flag is output to POEG as an output disable request. The GPT does not have an interrupt to indicate that outputs have been simultaneous driven to the low level. Use the interrupt function in the POEG if this is necessary.

[Setting condition]

- The GTIOCnA and GTIOCnB pins output 0 at the same time when both OAE and OBE bits are set to 1.

[Clearing conditions]

- The GTIOCnA pin output value is different from the GTIOCnB pin output value when both OAE and OBE bits are set to 1
- The GTIOCnA and GTIOCnB pins output 1 at the same time when both OAE and OBE bits are set to 1
- Either the OAE bit or the OBE bit is set to 0.

The compare-target signals to generate the OABHF/OABLF flag are the compare match outputs (PWM outputs) signals before they are masked by the output disable function. Even during the output disable condition, compare match operation continues internally, where the OABHF or OABLF flag is updated based on the operation results.

PCF flag (Period Count Function Finish Flag)

This bit is status flag of period count function finish.

[Setting condition]

- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 1 at the end of cycle.
- The GTPC.PCEN bit is 1 and the GTPC.PCNT counter is 0 at the count clock.

[Clearing condition]

- 0 is written to this bit.

21.2.17 GTBER : General PWM Timer Buffer Enable Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 0: In triangle wave mode, transfer at trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing. 1 1: In triangle wave mode, transfer at both crest and trough. In saw-wave mode, transfer at underflow (in down-counting), overflow (in up-counting), or counter clearing.	R/W
30	ADTDB	GTADTRB Register Double Buffer Operation 0: Single buffer operation (GTADTBRB → GTADTRB) 1: Double buffer operation (GTADTDBRB → GTADTBRB → GTADTRB)	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

The GTBER register provides settings for the buffer operation. Set the GTBER register while the GTCNT counter is stopped.

BD0 bit (GTCCR Buffer Operation Disable)

The BD0 bit disables the buffer operation using GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, and GTCCRF combined.

When GTDTCR.TDE is 1 and when BD0 is set to 0, GTCCRB does not perform buffer operation. The GTCCRB register is automatically set to a compare match value for negative-phase waveform with dead time.

A value for the BD0 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDCE or GTSECR.SBDCD.

BD1 bit (GTPR Buffer Operation Disable)

The BD1 bit disables the buffer operation using GTPR and GTPBR combined.

A value for the BD1 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the GTSECR.SBDPE or GTSECR.SBDPD.

BD2 bit (GTADTRA/GTADTRB Registers Buffer Operation Disable)

This bit disables buffer operation using the GTADTRA, GTADTBRA, and GTADTDBRA registers together and buffer operation using the GTADTRB, GTADTBRB, and GTADTDBRB registers together.

The setting is invalid during the event count operation, and the buffer operation using the GTADTRA and GTADTRB registers is not performed.

A value for the BD2 bit in the channel related to the position of the bit written with 1 by the GTSECSR register can be set when 1 is written to the SBDAE or SBDAD bit in the GTSECR register.

CCRA[1:0] bits (GTCCRA Buffer Operation)

The CCRA[1:0] bits set the buffer operation with GTCCRA, GTCCRC, and GTCCRD combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

CCRB[1:0] bits (GTCCRB Buffer Operation)

The CCRB[1:0] bits set the buffer operation using GTCCRB, GTCCRE, and GTCCRF combined. When the buffer operation is restricted by the operating mode set in GTCR, the GTCR setting is given priority.

The buffer operation mode is fixed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3 (64-bit transfer at trough).

PR[1:0] bits (GTPR Buffer Operation)

The PR[1:0] bits set the buffer operation with GTPR and GTPBR combined.

CCRSWT bit (GTCCRA and GTCCRB Forcible Buffer Operation)

Writing 1 to the CCRSWT bit forces a buffer transfer of GTCCRA and GTCCRB. This bit automatically returns to 0 after the 1 is written. This bit is read as 0, and is valid only when counting is stopped with a compare match operation specified.

ADTTA[1:0] bits (GTADTRA Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRA, GTADTBRA, and GTADTDBRA registers.

The setting is invalid during the event count operation.

ADTDA bit (GTADTRA Register Double Buffer Operation)

These bits set buffer operation with the GTADTRA, GTADTBRA, and GTADTDBRA registers combined.

The setting is invalid during the event count operation.

ADTTB[1:0] bits (GTADTRB Register Buffer Transfer Timing Select)

These bits set the transfer timing for buffer operation of the GTADTRB, GTADTBRB, and GTADTDBRB registers.

The setting is invalid during the event count operation.

ADTDB bit (GTADTRB Register Double Buffer Operation)

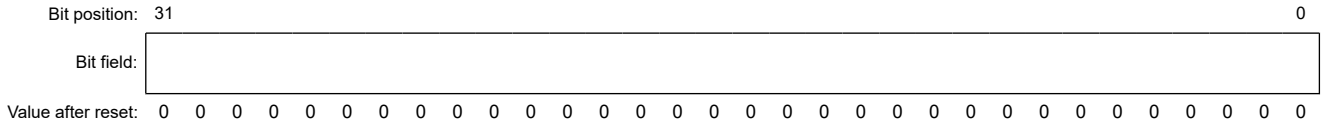
These bits set buffer operation with the GTADTRB, GTADTBRB, and GTADTDBRB registers combined.

The setting is invalid during the event count operation.

21.2.18 GTCNT : General PWM Timer Counter

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x48

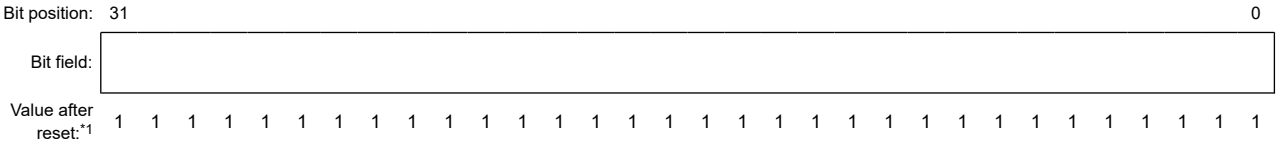


Bit	Symbol	Function	R/W
31:0	n/a	GTCNT is a 32-bit read/write counter for GPT32n (n = 0 to 7). For GPT16m (m = 8 to 13), GTCNT is a 16-bit register. GTCNT can only be written to after counting stops. For GPT16m (m = 8 to 13), the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCNT must be set within the range of 0 ≤ GTCNT ≤ GTPR.	R/W

21.2.19 GTCCRk : General PWM Timer Compare Capture Register k (k = A to F)

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x4C (GTCCRA)
0x50 (GTCCRB)
0x54 (GTCCRC)
0x58 (GTCCRE)
0x5C (GTCCRD)
0x60 (GTCCRF)



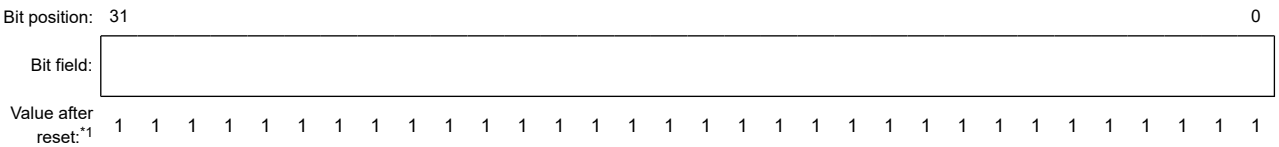
Bit	Symbol	Function	R/W
31:0	n/a	GTCCRk registers are read/write registers. The effective size of GTCCRk is the same as GTCNT (16- or 32-bit). If the effective size of GTCCRk is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. GTCCRA and GTCCRB are registers used for both output compare and input capture. GTCCRC and GTCCRE are compare match registers, and can also function as buffer registers for GTCCRA and GTCCRB. GTCCRD and GTCCRF are compare match registers, and can also function as buffer registers for GTCCRC and GTCCRE (double-buffer registers for GTCCRA and GTCCRB).	R/W

Note 1. For GPT16m (m = 8 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.20 GTPR : General PWM Timer Cycle Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x64



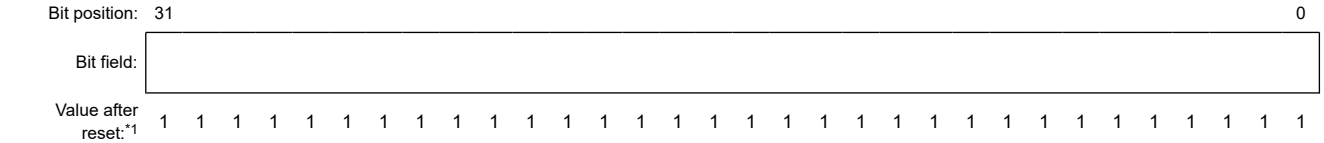
Bit	Symbol	Function	R/W
31:0	n/a	GTPR is a read/write register that sets the maximum count value of GTCNT. The effective size of GTPR is the same as GTCNT (16- or 32-bit). If the effective size of GTPR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. For saw waves, the value of (GTPR + 1) is the cycle. For triangle waves, the value of (GTPR value × 2) is the cycle.	R/W

Note 1. For GPT16m (m = 8 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.21 GTPBR : General PWM Timer Cycle Setting Buffer Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x68



Bit	Symbol	Function	R/W
31:0	n/a	GTPBR is a read/write register that functions as a buffer register for GTPR. The effective size of GTPBR is the same as GTCNT (16- or 32-bit). If the effective size of GTPBR is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored.	R/W

Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TDE	Negative-Phase Waveform Setting 0: GTCCRB is set without using GTDVU 1: GTDVU is used to set the compare match value for negative-phase waveform with dead time automatically in GTCCRB	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

GTDTCR enables automatic setting of a compare match value for negative-phase waveform with dead time.

The setting is invalid during the event count operation.

TDE bit (Negative-Phase Waveform Setting)

The TDE bit specifies whether to use GTDVU. When GTDVU is used, the compare match value for a negative-phase waveform with dead time obtained by the compare match value of a positive-phase waveform (GTCCRA) and the dead time value (GTDVU) is automatically set in GTCCRB.

The TDE bit setting is ignored in saw-wave PWM mode, and the GTCCRB is not automatic setting.

The GTCCRB value is automatically set and has the following upper and lower limit values. If the obtained GTCCRB value is not within the upper or lower limit, the following limit value is set in GTCCRB.

- Triangle waves:
  Upper limit value: GTPR − 1

Lower limit value: 1 in up-counting, 0 in down-counting

- Saw-wave one-shot pulse mode:
  Upper limit value: GTPR
  Lower limit value: 0.

21.2.26 GTDVU : General PWM Timer Dead Time Value Register U

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0x8C

Bit position:	31																												0
Bit field:																													
Value after reset:*1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	n/a	GTDVU is a read/write register that sets the dead time for generating PWM waveforms with dead time. The effective size of GTDVU is the same as GTCNT (16 or 32 bits). If the effective size of GTDVU is 16 bits, the upper 16 bits for access in a 32-bit unit are always read as 0x0000, and writing to these bits is ignored. In the case of a saw-waves, the GTDVU register controls the front dead time and the GTDVD register controls the rear dead time, regardless of whether the count is up or down. Setting a GTDVU value greater than or equal to GTPR is prohibited. When using the automatic dead time setting function, do not set a value that makes a change point of the waveform exceeding the count period. The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. When GTDVU is used, writing to GTCCRB is prohibited. When this register is set to 0, waveforms without dead time are output.	R/W

Note 1. For GPT16m (m = 8 to 13), the value of the upper 16 bits after reset is 0x0000.

21.2.27 GTADSMR : General PWM Timer A/D Conversion Start Request Signal Monitoring Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

31:25	—	These bits are read as 0. The write value should be 0.	R/W

The GTADSMR register is used to control monitors for the A/D conversion start request signal that is synchronized with a frame period.

ADSMSk[1:0] bits (A/D Conversion Start Request Signal Monitor k Selection) (k = 0, 1)

These bits are used to select A/D conversion start request signal synchronized with a frame period which is monitored by the GTASMk pin.

In triangle-wave PWM mode, the following settings are prohibited:

- Set ADSMSk[1:0] bit to 00b (A/D conversion start request during up-counting) when GTADTRA = 0
- Set ADSMSk[1:0] bit to 10b (A/D conversion start request during up-counting) when GTADTRB = 0
- Set ADSMSk[1:0] bit to 01b (A/D conversion start request during down-counting) when GTADTRA = GTPR
- Set ADSMSk[1:0] bit to 11b (A/D conversion start request during down-counting) when GTADTRB = GTPR

ADSMENk bit (A/D Conversion Start Request Signal Monitor k Output Enabling) (k = 0, 1)

This bit enables or disables the monitor output to the GTADSMk pin.

When the output is disabled, the GTADSMk pin goes to the low level.

When the bit is 1, the signal on the GTADSMk pin goes to the high level on assertion of the signal to request to the start of A/D conversion selected by the ADSMSk[1:0] bits and returns to the low level at the end of the current cycle of the timer for the channel that generated the given signal to request the start of A/D conversion. When the counter stops, the value when the counter stopped is retained for output. Set the ADSMENk bit to 0 to output the low level.

When a signal to request the start of A/D conversion is generated at the end of a timer period, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next period.

When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT.

21.2.28 GTICLF : General PWM Timer Inter Channel Logical Operation Function Setting Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

31:26	—	These bits are read as 0. The write value should be 0.	R/W

Note: n = 0 to 13
Note 1. The signal before performing output disable control is selected.
Note 2. When channel's own GTIOCnA is selected, C is treated as "1".
Note 3. When channel's own GTIOCnB is selected, D is treated as "1".

The GTICLF register sets the logical operation function between compare match outputs. The logical operation is performed with the signals that the duty 0%/100% control is performed after compare match control. (The output disable control is performed with the signal after logical operation.)

Access in 8-bit units to GTICLF is prohibited.

ICLFm[2:0] bit (GTIOCnm Output Logical Operation Function Select) (m = A, B)

These bits select the logical operation function between signals before performing output disable control for GTIOCnm. To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed. When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal to operate logical function AND, OR, EXOR and NOR is selected, one signal is treated as "1".

ICLFSELk[5:0] bit (Inter Channel Signal k Select) (k = C, D)

These bits select the signal k that the logical operation is performed with the signal before performing output disable control for GTIOCnm.

21.2.29 GTPC : General PWM Timer Period Count Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 3)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 3)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 10)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 10)

Offset address: 0xBC

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	PCNT[11:0]											
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PCEN	Period Count Function Enable 0: Period count function is disabled 1: Period count function is enabled	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
8	ASTP	Automatic Stop Function Enable 0: Automatic stop function is disabled 1: Automatic stop function is enabled	R/W
15:9	—	These bits are read as 0. The write value should be 0.	R/W
27:16	PCNT[11:0]	Period Counter Counter for the number of period	R/W
31:28	—	These bits are read as 0. The write value should be 0.	R/W

The GTPC register counts the number of period.

PCEN bit (Period Count Function Enable)

This bit enables or disables period count function.

Writing is available when counting is both in progress and stopped.

When 1 is written to either the GTSECR.SPCE bit or the GTSECR.SPCD bit, the value is simultaneously set to the PCEN bit in the channels set to 1 by the GTSECSR register.

ASTP bit (Automatic Stop Function Enable)

This bit enables or disables the GTCNT counter automatic stopping after finishing counting the number of period.

When the PCEN bis is 0, writing is available.

When the PCEN bit is 1, writing is disabled.

When the PCEN bit is 1, the ASTP bit is 1, and the PCNT counter is stopped at PCNT = 0, the GTCNT counter is also stopped. When the ASTP bit is 0, the GTCNT counter continues to count.

PCNT[11:0] bit (Period Counter)

This counter counts the number of period.

When the PCEN bis is 0, writing the number of period is available.

When the PCEN bit is 1, writing is disabled, and down-counting is performed at the end of period. In saw-wave mode, the end of period refers to overflow, underflow, or counter clearing. In triangle-wave mode, it refers to trough.

When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

21.2.30 GTSECSR : General PWM Timer Operation Enable Bit Simultaneous Control Channel Select Register

31:14	—	These bits are read as 0. The write value should be 0.	R/W

The GTSECSR register selects an intended channel n (n = 0 to 13) for updating an operation enable bit by the GTSECR register. A bit position for the GTSECSR register indicates a channel number. The GTSECSR register of each channel is a common register, and writing 1 to a bit in the GTSECSR register in any channel and updating it changes a channel, related to the position of the bit written with 1 by the GTSECSR register, to be simultaneously controlled of the operation enable bit by the GTSECR register.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

For the association between the GTSECSR bit number and a channel number, see Figure 21.2.

Access in 8-bit or 16-bit units to GTSECSR is prohibited, and it should be accessed in 32-bit units.

SECSELn bit (Operation Enable Bit Simultaneous Control Channel Select) (n = 0 to 13)

This bit enables or disables the simultaneous control of operation enable in channel n.

When the bit is set to 1, the simultaneous control is enabled, and disabled when the bit is 0.

21.2.31 GTSECR : General PWM Timer Operation Enable Bit Simultaneous Control Register

Base address: GPT32n = 0x4032_2000 + 0x0100 × n (n = 0 to 7)
GPT32n_NS = 0x5032_2000 + 0x0100 × n (n = 0 to 7)
GPT16m = 0x4032_2000 + 0x0100 × m (m = 8 to 13)
GPT16m_NS = 0x5032_2000 + 0x0100 × m (m = 8 to 13)

Offset address: 0xD4

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	SPCD	—	—	—	—	—	—	—	SPCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SBDAD	SBDPD	SBDCD	—	—	—	—	—	SBDAE	SBDPE	SBDCE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SBDCE	GTCCR Register Buffer Operation Simultaneous Enable 0: Disable simultaneous enabling GTCCR buffer operations 1: Enable GTCCR register buffer operations simultaneously	R/W
1	SBDPE	GTPR Register Buffer Operation Simultaneous Enable 0: Disable simultaneous enabling GTPR buffer operations 1: Enable GTPR register buffer operations simultaneously	R/W
2	SBDAE	GTADTR Register Buffer Operation Simultaneous Enable 0: Disable simultaneous enabling GTADTR buffer operations 1: Enable GTADTR register buffer operations simultaneously	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W
8	SBDCD	GTCCR Register Buffer Operation Simultaneous Disable 0: Disable simultaneous disabling GTCCR buffer operations 1: Disable GTCCR register buffer operations simultaneously	R/W
9	SBDPD	GTPR Register Buffer Operation Simultaneous Disable 0: Disable simultaneous disabling GTPR buffer operations 1: Disable GTPR register buffer operations simultaneously	R/W
10	SBDAD	GTADTR Register Buffer Operation Simultaneous Disable 0: Disable simultaneous disabling GTADTR buffer operations 1: Disable GTADTR register buffer operations simultaneously	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W
16	SPCE	Period Count Function Simultaneous Enable*1 0: Disable simultaneous enabling period count function 1: Enable period count function simultaneously	R/W
23:17	—	These bits are read as 0. The write value should be 0.	R/W
24	SPCD	Period Count Function Simultaneous Disable*1 0: Disable simultaneous disabling period count function 1: Disable period count function simultaneously	R/W
31:25	—	These bits are read as 0. The write value should be 0.	R/W

Note 1. This bit is only available in GPT320 to GPT323, GPT168 to GPT1610.
In GPT324 to GPT327, GPT1611 to GPT1613, this bit is read as 0. The write value should be 0.

The GTSECR register simultaneously updates the value for operation enable bits of a channel set by the GTSECSR register.

Writing 1 to a bit in the GTSECR register in any channel and updating it updates an operation enable bit for all channels, related to the position of the bit written with 1 by the all GTSECSR registers.

Setting enable and disable bits for the same operation enable bit to 1 in the GTSECR is prohibited.

Contrary to a security attribute for write or read access, if the security and privilege attributes set on each channel has the security violation or the privilege violation, the bit of the channel number that violates security cannot be written or read, and the read value of the bit is "0".

A bit written to 1 is automatically cleared. When the GTSECR is read, 0 is read.

Access in 8-bit or 16-bit units to the GTSECR register is prohibited, and it should be accessed in 32-bit units.

SBDCE bit (GTCCR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are enabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPE bit (GTPR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are enabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAE bit (GTADTR Register Buffer Operation Simultaneous Enable)

When 1 is written to this bit, 0 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are enabled.

Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SBDCD bit (GTCCR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[0] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTCCRA, GTCCRC, and GTCCRD registers and using the GTCCRB, GTCCRE, and GTCCRF registers are disabled.

Simultaneous setting of SBDCE and SBDCD bits to 1 is prohibited.

SBDPD bit (GTPR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[1] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTPR and GTPBR registers are disabled.

Simultaneous setting of SBDPE and SBDPD bits to 1 is prohibited.

SBDAD bit (GTADTR Register Buffer Operation Simultaneous Disable)

When 1 is written to this bit, 1 is simultaneously set to a GTBER.BD[2] bit in the channels set to 1 by the GTSECSR register, and buffer operations using the GTADTRA, GTADTBRA, and GTADTDBRA registers and using the GTADTRB, GTADTBRB, and GTADTDBRB registers are disabled.

Simultaneous setting of SBDAE and SBDAD bits to 1 is prohibited.

SPCE bit (Period Count Function Simultaneous Enable)

When 1 is written to this bit, 1 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is enabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

SPCD bit (Period Count Function Simultaneous Disable)

When 1 is written to this bit, 0 is simultaneously set to GTPC.PCEN bit in the channels set to 1 by the GTSECSR register, and period count function is disabled.

Simultaneous setting of SPCE and SPCD bits to 1 is prohibited.

21.2.32 OPSCR : Output Phase Switching Control Register

Base address: GPT_OPS = 0x4032_3F00
GPT_OPS_NS = 0x5032_3F00

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26	GODF	Group Output Disable Function 0: This bit function is ignored 1: Group disable clears the OPSCR.EN bit*1	R/W
28:27	—	These bits are read as 0. The write value should be 0.	R/W
29	NFEN	External Input Noise Filter Enable 0: Do not use a noise filter on the external input 1: Use a noise filter on the external input	R/W
31:30	NFCS[1:0]	External Input Noise Filter Clock Selection Noise filter sampling clock setting of the external input. 0 0: PCLKD/1 0 1: PCLKD/4 1 0: PCLKD/16 1 1: PCLKD/64	R/W

Note 1. When OPSCR.GODF = 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

The OPSCR register sets the output of the signal waveform required for brushless DC motor control.

UF , VF , WF bits (Input Phase Soft Setting)

The UF , VF , WF bits set the input phase from the software settings. When OPSCR.FB bit is 1, these bits are valid. The set value of the UF /VF /WF takes the place of the U/V/W external input.

U, V, W bits (Input Phase Monitor)

When the OPSCR.FB bit is 0, external inputs that are synchronized by PCLKD are monitored by these bits. When the OPSCR.FB bit is 1, the OPSCR.U, OPSCR.V, and OPSCR.W bits can read the OPSCR.UF , OPSCR.VF , and OPSCR.WF bits.

EN bit (Output Phase Enable)

The EN bit controls the output enable signal of output phase (positive phase/negative phase).

When the OPSCR.EN bit is 1, the signal waveform is output.

When the OPSCR.EN bit is 0, first set OPSCR.FB, OPSCR.UF /VF /WF (software setting is selected), OPSCR.P/N, OPSCR.INV, OPSCR.RV, OPSCR.ALIGN, OPSCR.GRP[1:0], OPSCR.GODF, OPSCR.NFEN, OPSCR.NFCS. Then, set the EN bit to 1. The EN bit should be set when output disable request does not occur from POEG. Also when OPSCR.GODF is 1 and the signal value selected in the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0. Even if 1 is written by software, the EN bit remains at 0.

For the return, after clearing the Output Disable Request by software, set the EN bit to 1.

Priority order of the EN bit is as follows (when the conflict occurs).

When writing 1 by software and clearing to 0 by the Output Disable Request conflict for the EN bit, clearing to 0 by the Output Disable Request is enabled.

FB bit (External Feedback Signal Enable)

The FB bit selects the input phase from the software settings (OPSCR.UF, VF, WF) and external input such as a Hall element.

P bit (Positive-Phase Output (P) Control)

The P bit selects one of the level signal output or PWM signal output for the positive-phase output (GTOUUP, GTOVUP and GTOWUP pins).

N bit (Negative-Phase Output (N) Control)

The N bit selects one of the level signal output or PWM signal output for the negative-phase output (GTOULO, GTOVLO and GTOWLO pins).

INV bit (Output Phase Invert Control)

The INV bit selects one of the positive logic (active-high) output or negative logic (active-low) output for the output phase.

RV bit (Output Phase Rotation Direction Reversal Control)

The RV bit reverses the direction of rotation of the motor by inverting the input phase.

ALIGN bit (Input Phase Alignment)

The ALIGN bit selects the PCLKD or PWM for the sampling of the input phase (input phase is specified in the OPSCR.FB bit).

When OPSCR.ALIGN bit is 0, input phase is aligned to PCLKD.

Note: When the chopping is performed, there are cases where the PWM width of output is shorter than the width of the PWM used to chop just before or after switching of output phase, depending on the phase difference between the phase output switch timing and the phase of PWM.

When OPSCR.ALIGN bit is 1, input phase is aligned with the falling edge of PWM.

GRP[1:0] bit (Output Disabled Source Selection)

The GRP[1:0] bit selects the output disable source.

The GRP bits should be set when GODF bit is 0. If GRP bits select a POEG except for the connected groups, the status of output pin never change to disable.

GODF bit (Group Output Disable Function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP[1:0] bit is high, the OPSCR.EN bit is set to 0.

When OPSCR.GODF bit is 0, this bit is ignored.

The GODF bit should be set when output disable request does not occur from POEG.

NFEN bit (External Input Noise Filter Enable)

The NFEN bit selects the noise filter for external input. When OPSCR.NFEN bit is 0, a noise filter for the external input is not used.

Note: Set this bit during the EN bit is 0 to avoid generation of unintentional internal edge caused by switching this bit.

NFCS[1:0] bits (External Input Noise Filter Clock Selection)

The NFCS[1:0] bits select the clock for the external input noise filter. When the OPSCR.NFEN bit is 1, noise filter sampling clock setting of the external input is enabled.

1. Set the NFCS[1:0].
2. Wait for 2 cycles.
3. Set the OPSCR.EN bit to 1.

21.3 Operation

21.3.1 Basic Operation

Each channel has a 32-bit and 16-bit timer that performs a periodic count operation using the count clock and hardware sources. The count function provides both up-counting and down-counting. The GTPR controls the count cycle.

When the GTCNT counter value matches the value in GTCCRA or GTCCRB, the output from the associated GTIOCnA or GTIOCnB can be changed (n = 0 to 13). GTCCRA or GTCCRB can be used as an input capture register with hardware resources.

GTCCRC and GTCCRD can function as buffer registers for GTCCRA. GTCCRE and GTCCRF can function as buffer registers for GTCCRB.

21.3.1.1 Counter operation

(1) Counter start and stop

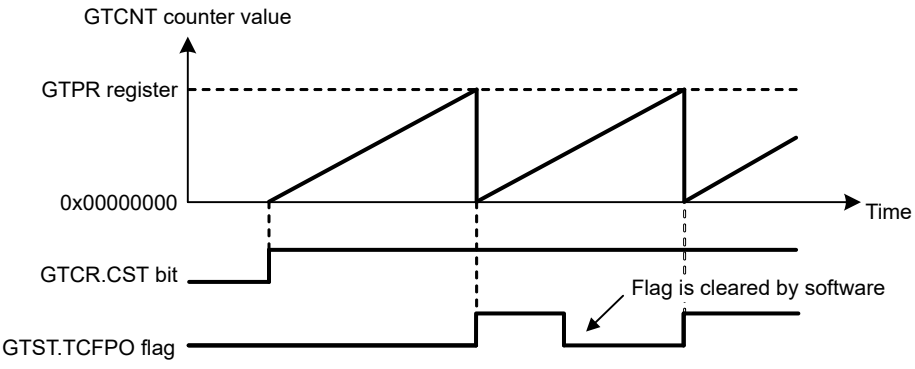
The counter of each channel starts the count operation when GTCR.CST is set to 1, and stops counting when the bit is set to 0. The GTCR.CST bit value is changed by the following sources:

- Writing to GTCR register
- Writing 1 to the bit in GTSTR associated with the GPT channel number when the GTSSR.CSTRT bit set to 1
- Writing 1 to the bit in GTSTP associated with the GPT channel number when the GTPSR.CSTOP bit set to 1
- The hardware source selected in the GTSSR register
- The hardware source selected in the GTPSR register
- Completion of the period count function while the GTPC.ASTP bit is 1

(2) Periodic count operation in up-counting by count clock

The GTCNT counter in each channel starts up-counting when the associated GTCR.CST bit is set to 1 with GTUPSR and GTDNSR registers set to 0x00000000. When the GTCNT value changes from the GTPR value to 0 (overflow), the GTST.TCFPO flag is set to 1, and the overflow interrupt(GPTn_OVF) is also generated. After GTCNT overflows, up-counting resumes from 0x00000000.

Figure 21.3 shows an example of a periodic count operation in up-counting by the count clock.



Note: The base address of registers are the same.

Figure 21.3 Example of periodic count operation in up-counting by the count clock

Table 21.5 shows an example for setting periodic count operation in up-counting by the count clock.

Table 21.5 Example for setting a periodic count operation in up-counting by the count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.3, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.3, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.3, 0x00000000 is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(3) Periodic count operation in down-counting by count clock

The GTCNT counter in each channel can perform down-counting by setting GTUDDTYC.UD with GTUPSR and GTDNSR registers set to 0x00000000. When GTCNT changes from 0 to the GTPR value (underflow), GTST.TCFPU is set to 1, and the underflow interrupt(GPTn_UDF) is also generated. After the GTCNT counter underflows, down-counting resumes from the GTPR value.

Figure 21.4 shows an example of periodic count operation in down-counting by the count clock.

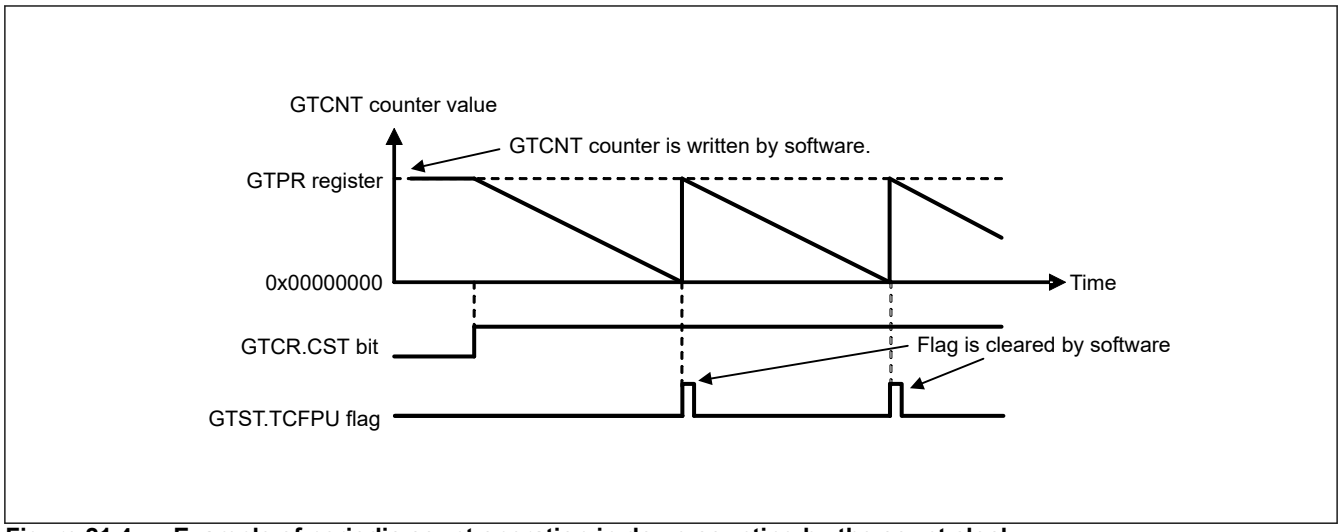


Figure 21.4 Example of periodic count operation in down-counting by the count clock

Table 21.6 shows an example for setting periodic count operation in down-counting by the count clock.

Table 21.6 Example for setting periodic count operation in down-counting by count clock

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.4, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction with the GTUDDTYC register. In Figure 21.4, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.4, the GTPR register value is set.
6	Start count operation	Set the GTCR.CST bit to 1 to start count operation. In Figure 21.4, 1 is set in the CST bit.

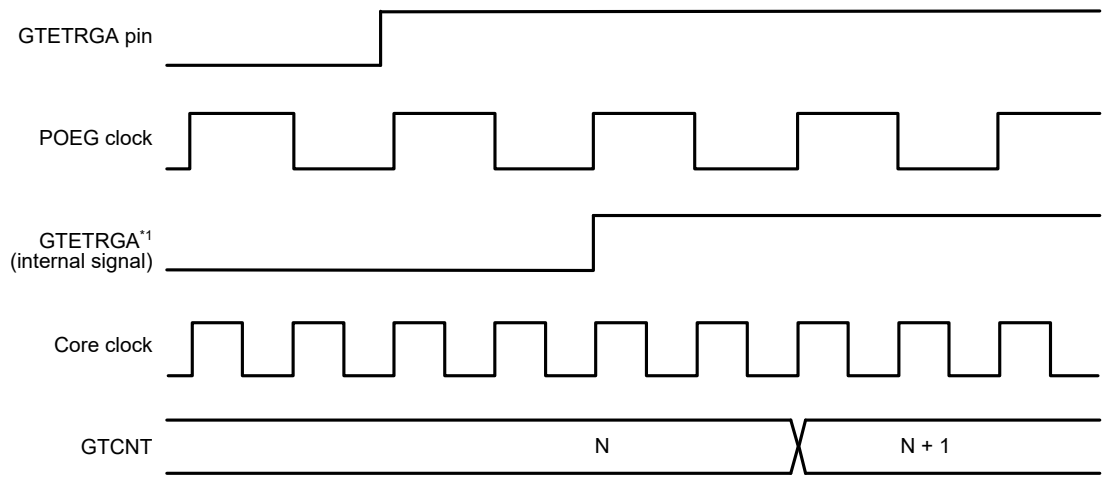
(4) Event count operation in up-counting using hardware sources

The GTCNT counter in each channel can perform up-counting using hardware sources as set in GTUPSR.

When GTUPSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The overflow behavior when up-counting using hardware sources is the same as when up-counting by the count clock.

If you are using a hardware source to count up, set the GTCR.CST bit to 1 to enable the counting operation. After GTCR.CST is set to 1, the counter cannot count up for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized by the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count up with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.5 shows an example of an event count operation in up-counting by a hardware resource (the rising edge of GTETRGA pin input).



Note: POEG clock :PCLKB, Core clock : PCLKD
Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 21.5 Example of event count operation in up-counting using hardware sources

Table 21.7 shows an example for setting event count operation in up-counting by a hardware source.

Table 21.7 Example for setting an event count operation in up-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-up hardware source with the GTUPSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

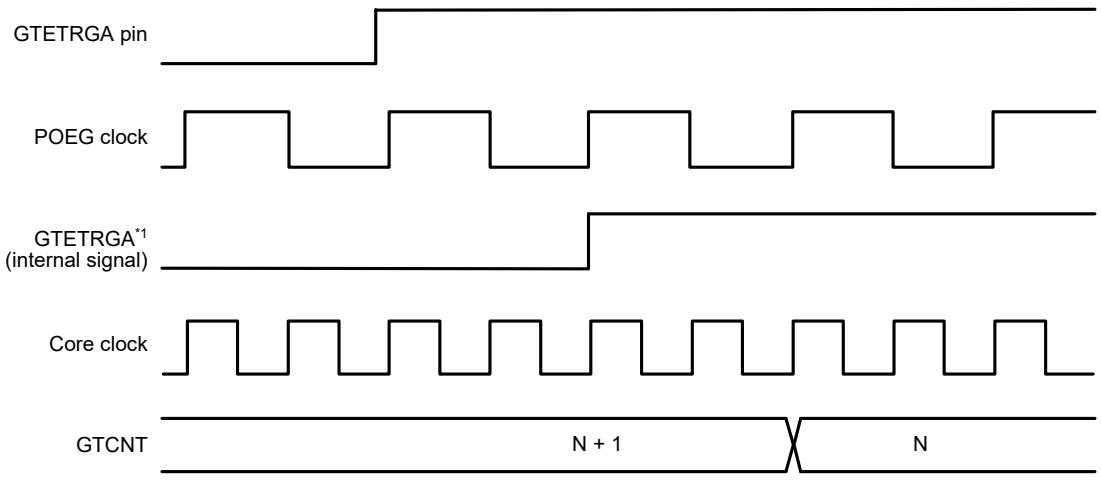
(5) Event count operation in down-counting using hardware sources

The GTCNT counter in each channel can perform down-counting using hardware sources set in the GTDNSR.

When GTDNSR is set to enable, the count clock selected in GTCR.TPCS[3:0] and the count direction selected in GTUDDTYC.UD are ignored. If up-counting and down-counting using hardware sources occur at the same time, the GTCNT counter value does not change. The underflow behavior when down-counting using hardware sources is the same as when down-counting by the count clock.

When GTCR.CST bit is set to 1 to count down using hardware sources, the count operation is enabled. After GTCR.CST is set to 1, the counter cannot count down for 1 clock cycle as specified in GTCR.TPCS[3:0] because the count operation is synchronized with the count clock selected in GTCR.TPCS[3:0]. Set GTCR.TPCS[3:0] to 000b to count down with a 1 PCLKD delay after GTCR.CST is set to 1.

Figure 21.6 shows an example of a event count operation in down-counting by a hardware resource (rising edge of GTETRGA pin).



Note: POEG clock: PCLKB, Core clock: PCLKD
Note 1. The GTETRGA internal signal reflects the signal being input to the GPT when the digital noise filter for the GTETRGA pin in the POEG is not in use.

Figure 21.6 Example of event count operation in down-counting using hardware sources

Table 21.8 shows an example for setting a periodic count operation in down-counting using a hardware resource.

Table 21.8 Example for setting an event count operation in down-counting using hardware sources

No.	Step Name	Description
1	Set count source	Select the counting-down hardware source with the GTDNSR register.
2	Set cycle	Set the cycle in the GTPR register.
3	Set initial value for counter	Set the initial value in the GTCNT counter.
4	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

(6) Counter clear operation

The counter of each channel is cleared by following sources:

- Writing 0 to GTCNT register
- Writing 1 to the bit in GTCLR associated with the GPT channel number when the GTCSR.CCLR bit set to 1
- The hardware source selected in GTCSR register.

Writing to the GTCNT register is prohibited during count operation. The GTCNT counter can be cleared both by writing 1 to the GTCLR and by the clear request of hardware sources, whether GTCNT is counting (GTCR.CST is 1) or not (GTCR.CST is 0).

When the count direction flag is set as decrement (GTST.TCUF flag = 0) in saw-wave mode selected with GTCR.MD[2:0] bits, the GTCNT register is set to the value of the GTPR register when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

When not in saw-waves mode and down-counting, the GTCNT register is set to 0 when writing 1 to the GTCLR register and when clearing by hardware sources are performed.

In event count operation when at least 1 bit in the GTUPSR or GTDNSR is set to 1, after clear sources occur, both writing to GTCLR register and clearing by hardware sources are performed immediately to synchronize with PCLKD. If other settings are used, clear is synchronized with the counter clock selected in GTCR.TPCS[3:0].

21.3.1.2 Waveform output by compare match

Compare match means that the GTCNT counter value matches the value of GTCCRA or GTCCRB. When a compare match occurs, the compare match flag is generated synchronously with the count clock, including the event count. At the same time, the GPT can output low, high, or toggled output from the associated GTIOCnA or GTIOCnB output pin (n = 0 to 13). In addition, the GTIOCnA or GTIOCnB pin output can be low, high, or toggled at the cycle end which is determined by GTPR.

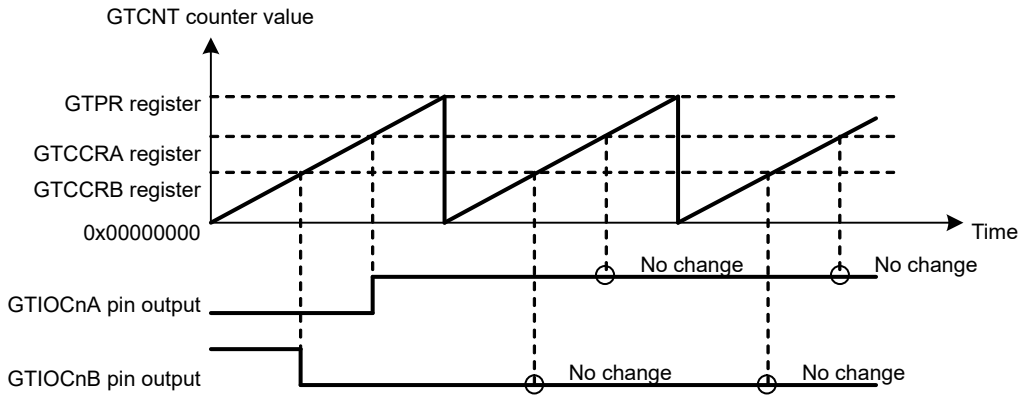
The cycle end is:

- For saw waves in up-counting – when GTCNT changes from the GTPR value to 0 (overflow)
- For saw waves in down-counting – when GTCNT changes from 0 to GTPR value (underflow)
- For saw waves – when the GTCNT counter is cleared
- For triangle waves – when the GTCNT changes from 0 to 1 (trough).

(1) Low output and high output

Figure 21.7 shows an example of low output and high output operation by a compare match of GTCCRA and GTCCRB.

In this example, the GTCNT counter performs up-counting, and settings are made so that high is output from the GTIOCnA pin by a GTCCRA compare match, and low is output from the GTIOCnB pin by a GTCCRB compare match. The pin level does not change when the specified level and pin level match.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is low, high output at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is high, low output at compare match, output retained at cycle end

Note: The base address of registers are the same.

Figure 21.7 Example of low output and high output operation

Table 21.9 shows an example for setting low output and high output operation.

Table 21.9 Example for setting low output and high output operation (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.7, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.7, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.

Table 21.9 Example for setting low output and high output operation (2 of 2)

No.	Step Name	Description
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.7, GTIOA[4:0] = 00010b, GTIOB[4:0] = 10001b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

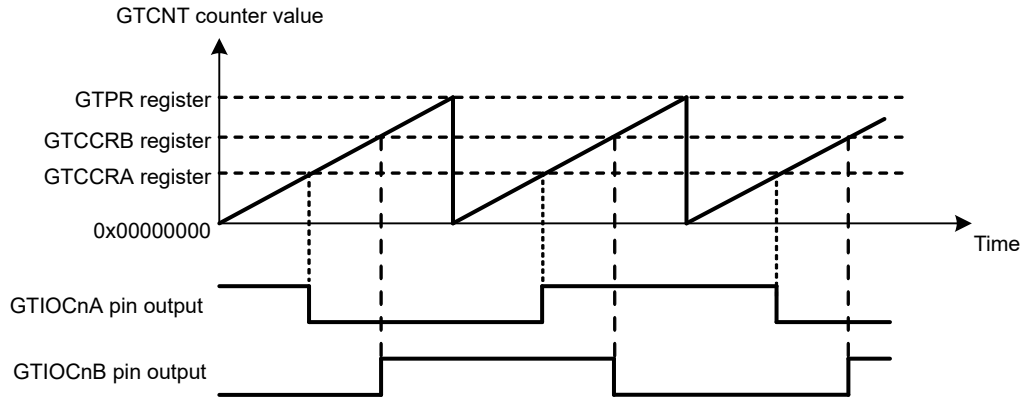
Note: n: 0 to 13
m: A, B

(2) Toggled output

Figure 21.8 and Figure 21.9 show examples of toggled output operation by compare matches of GTCCRA and GTCCRB.

In Figure 21.8, the GTCNT counter performs up-counting, and settings are made so that the GTIOCnA pin output by a GTCCRA compare match and GTIOCnB pin output by a GTCCRB compare match are toggled.

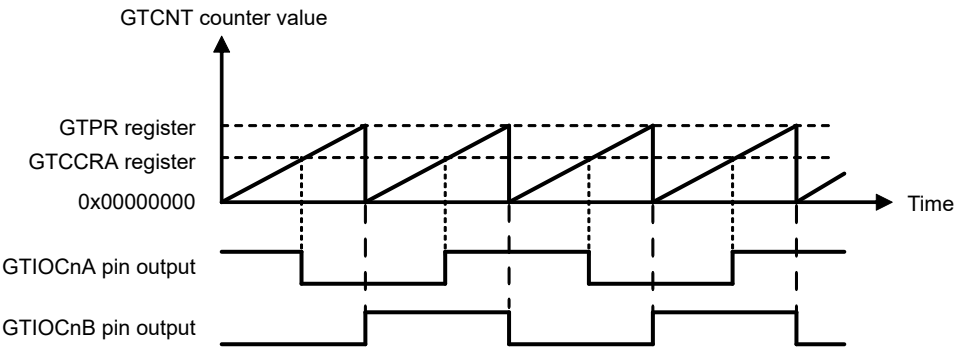
In Figure 21.9, the GTCNT counter performs up-counting, and settings are made so that a GTCCRA compare match toggles the GTIOCnA pin output level and a cycle end toggles the GTIOCnB pin output level.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output toggled at compare match, output retained at cycle end

Note: The base address of registers are the same.

Figure 21.8 Example of toggled output operation (1)



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial output is high, output toggled at compare match, output retained at cycle end
GTIOR.GTIOB[4:0] bits: Initial output is low, output retained at compare match, output toggled at cycle end

Note: The base address of registers are the same.

Figure 21.9 Example of toggled output operation (2)

Table 21.10 shows an example for setting toggled output operation.

Table 21.10 Example for setting toggled output operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.8 and Figure 21.9, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.8 and Figure 21.9, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.8, GTIOA[4:0] = 10011b, GTIOB[4:0] = 00011b, and in Figure 21.9, GTIOA[4:0] = 10011b, GTIOB[4:0] = 01100b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set compare match values in the GTCCRA and GTCCRB registers.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

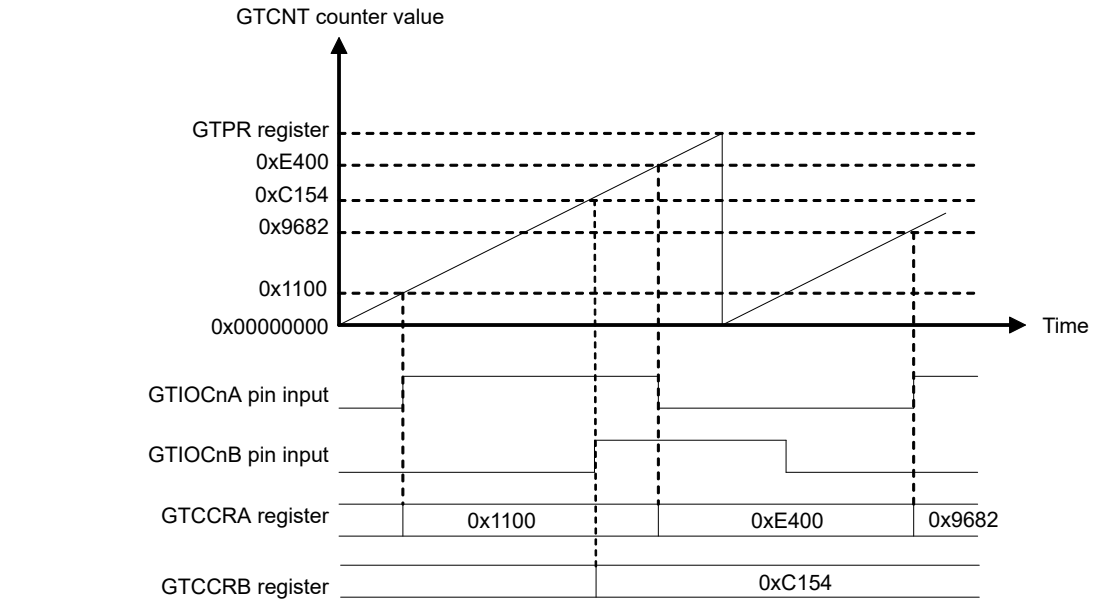
Note: n: 0 to 13
m: A, B

21.3.1.3 Input Capture Function

The GTCNT counter value can be transferred to either GTCCRA or GTCCRB on detection of the hardware source that is set in GTICASR and GTICBSR.

Figure 21.10 shows an example of the input capture function.

In this example, the GTCNT counter performs up-counting by the count clock, and settings are made so that an input capture is performed to GTCCRA at both edges of the GTIOCnA input pin and to GTCCRB on the rising edge of the GTIOCnB input pin.



Note: The base address of registers are the same.
Note: [Setting examples]
GTICASR setting: input capture at both edges
GTICBSR setting: input capture at the rising edge

Figure 21.10 Example of input capture operation

Table 21.11 and Table 21.14 show the example for setting an input capture operation with count operation by the count clock.

Table 21.11 Example for setting input capture operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.10, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.10, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select the input capture source in the GTICASR and GTICBSR registers. In Figure 21.10, GTICASR = 0x00000F00, GTICBSR = 0x00003000.
7	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

21.3.2 Buffer Operation

The following buffer operations can be set with GTBER:

- GTPR and GTPBR
- GTCCRA, GTCCRC, and GTCCRD
- GTCCRB, GTCCRE, and GTCCRF
- GTADTRA, GTADTBRA, and GTADTDBRA
- GTADTRB, GTADTBRB, and GTADTDBRB

21.3.2.1 GTPR Register Buffer Operation

GTPBR can function as a buffer register for GTPR.

The buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count, and at a trough in triangle-wave mode.

In saw-wave mode or in event count, the buffer transfer is performed when the following counter clear operations occur during counting:

- Clear by hardware sources (the clear source is selected in GTCSR register)
- Clear by software (when GTCSR.CCLR bit is 1 and GTCLR.CCLRn bit is set to 1, n = 0 to 13).

To set GTPR to function as a buffer, set the GTBER.PR bit to 1. To set GTPR not to function as a buffer, set the GTBER.PR bit to 0.

Figure 21.11 to section 21.3.2.1. GTPR Register Buffer Operation show examples of GTPR buffer operation and Table 21.12 shows an example for setting GTPR buffer operation.

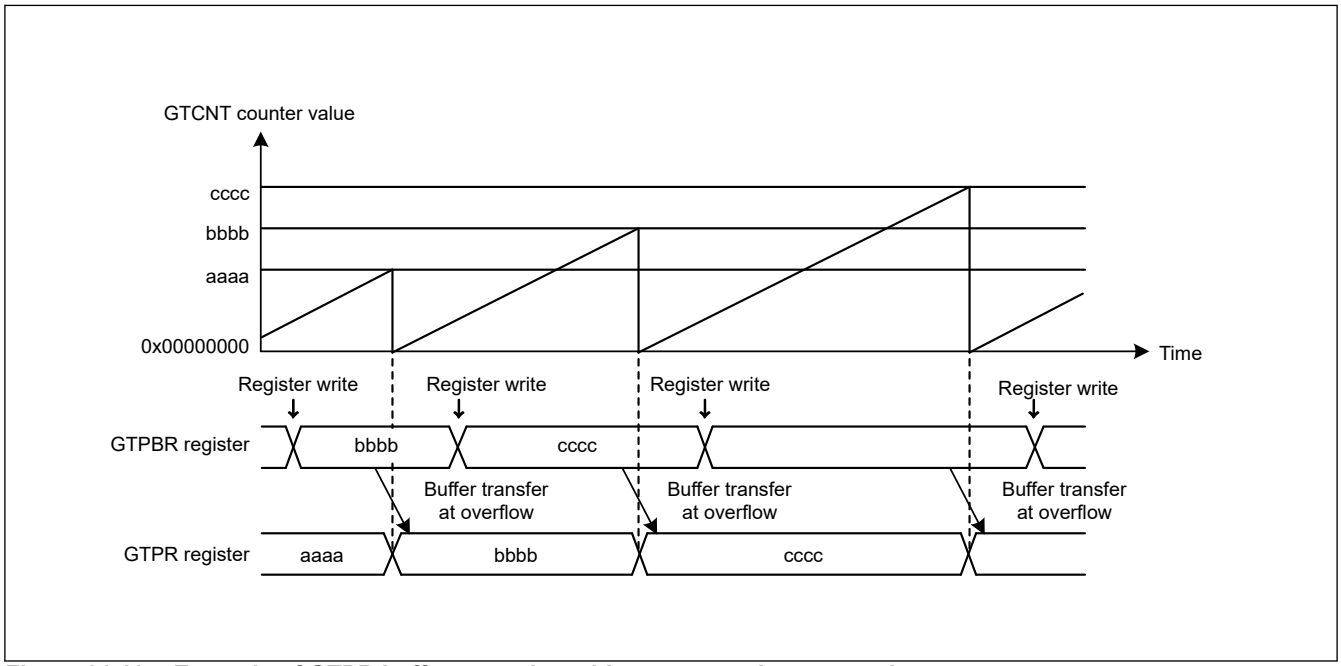


Figure 21.11 Example of GTPR buffer operation with saw waves in up-counting

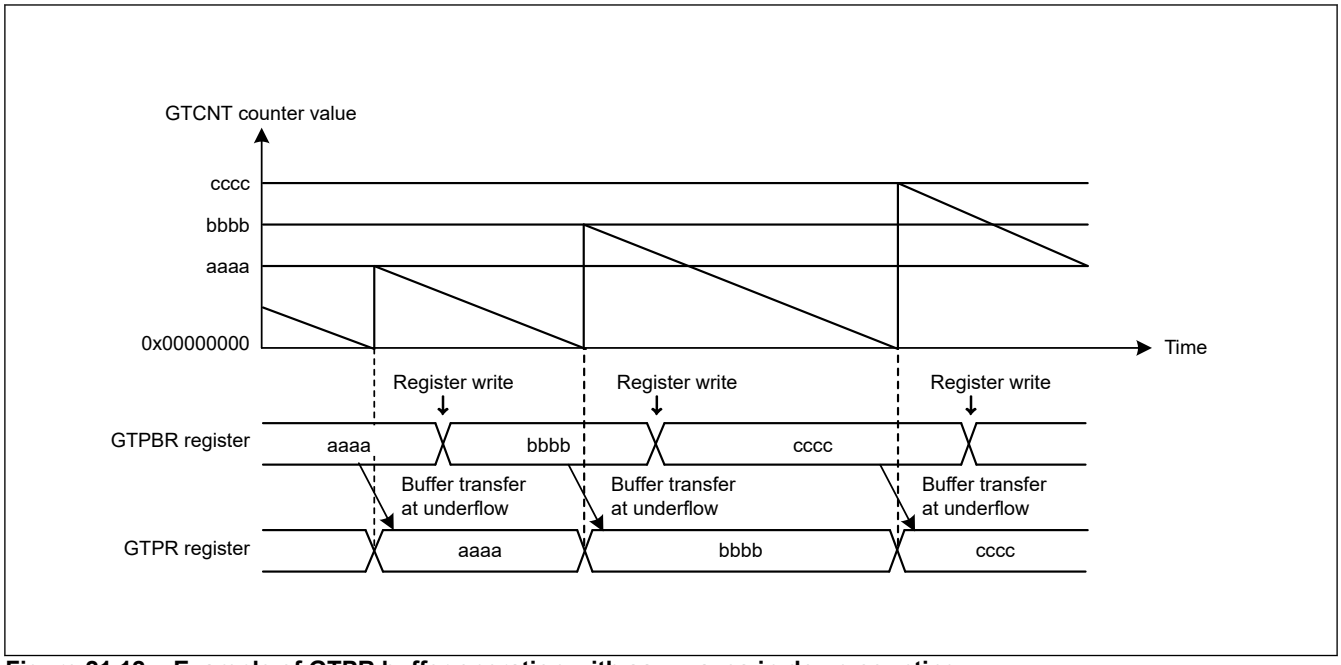

Figure 21.12 Example of GTPR buffer operation with saw waves in down-counting

Table 21.12 Example for setting GTPR register buffer operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.11 and Figure 21.12, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.11, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.12, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the GTBER.PR[1:0] bits. In Figure 21.11, Figure 21.12, and section 21.3.2.1. GTPR Register Buffer Operation, PR[1:0] = 01b.
7	Set buffer value	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
9	Set buffer value for each cycle	For buffer operation, set a value in one cycle after the current cycle in the GTPBR register.

21.3.2.2 Buffer Operation for GTCCRA and GTCCRB Registers

GTCCRC can function as the GTCCRA buffer register and GTCCRD can function as the GTCCRC buffer register (double-buffer register for GTCCRA). Similarly, GTCCRE can function as the GTCCRB buffer register and GTCCRF can function as the GTCCRE buffer register (double-buffer register for GTCCRB).

To set GTCCRA or GTCCRB to function as a double buffer, set GTBER.CCRA[1:0] or GTBER.CCRB[1:0] to 10b or 11b. For single buffer operation, set 01b. To set GTCCRA or GTCCRB to not function as a buffer, set 00b.

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits.

(1) When GTCCRA or GTCCRB Functions as Output Compare Register

In saw-wave one-shot pulse mode, triangle-wave PWM mode 3, the buffer operations that specific each PWM output operation mode are performed regardless of the setting of GTBER.CCRA [1:0] bits and GTBER.CCRB [1:0] bits. For details, see section 21.3.3. PWM Output Operating Mode. Other than above PWM output operation mode, Buffer transfer occurs in the following situations:

Buffer transfer occurs in the following situations:

- Buffer transfer by overflow or underflow
  Buffer transfer is performed at an overflow (during up-counting) or an underflow (during down-counting) in saw-wave mode or in event count operation. In triangle-wave mode, buffer transfer is performed at a trough (triangle-wave PWM mode 1) or a crest and trough (triangle-wave PWM mode 2).
- Buffer transfer by counter clear
  In saw-wave mode or in event count operation, during counting, buffer transfer (which is the same as an overflow during up-counting or an underflow during down-counting) is performed by the counter clear sources similar to the case shown in section 21.3.2.1. GTPR Register Buffer Operation.
  In triangle-wave mode, buffer transfer is not performed by the counter clear.
- Forcible buffer transfer
  When GTBER.CCRSWT bit is set to 1 while the count operation is stopped, the GTCCRA and the GTCCRB register buffer transfer are performed forcibly in saw-wave mode, in event count operation and in triangle-wave mode. Additionally buffer transfer from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B are performed in saw-wave one-shot pulse mode or triangle-wave PWM mode 3.

Figure 21.13 to Figure 21.15 show examples of GTCCRA and GTCCRB buffer operation and Table 21.13 shows an example for setting GTCCRA and GTCCRB buffer operation.

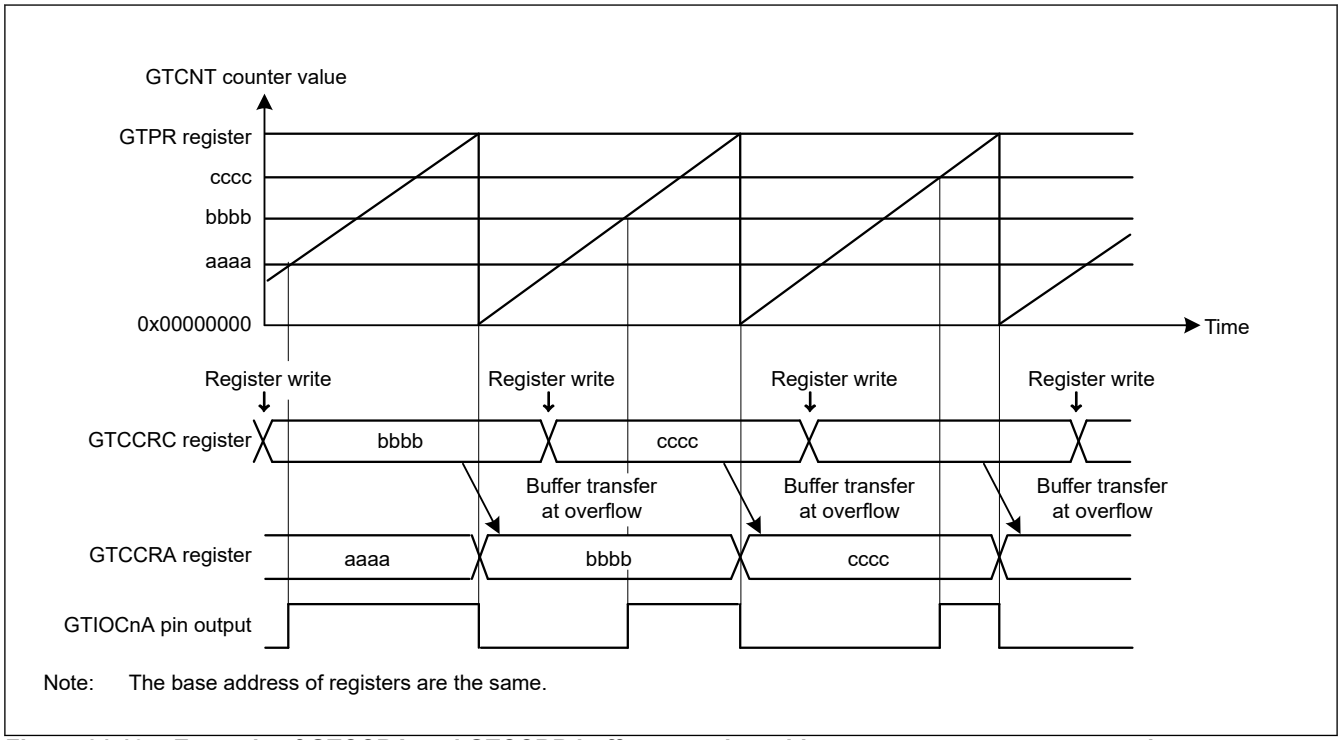

Figure 21.13 Example of GTCCRA and GTCCRB buffer operation with output compare, saw waves in up-counting, high output at GTCCRA compare match, and low output at cycle end

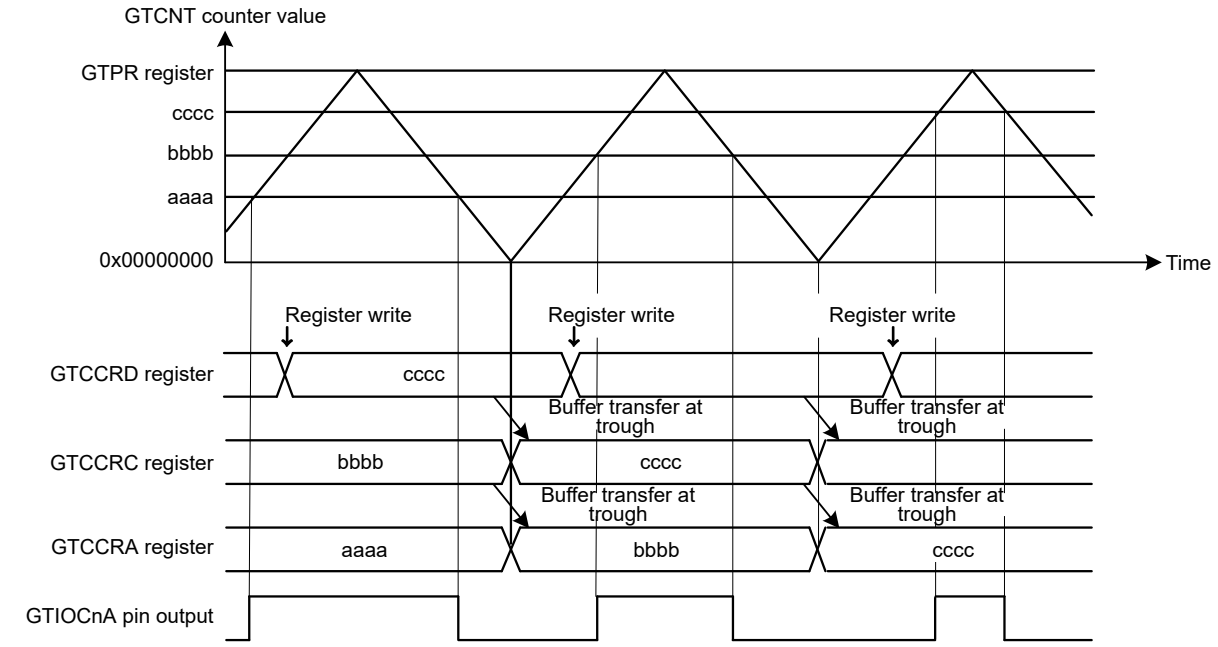
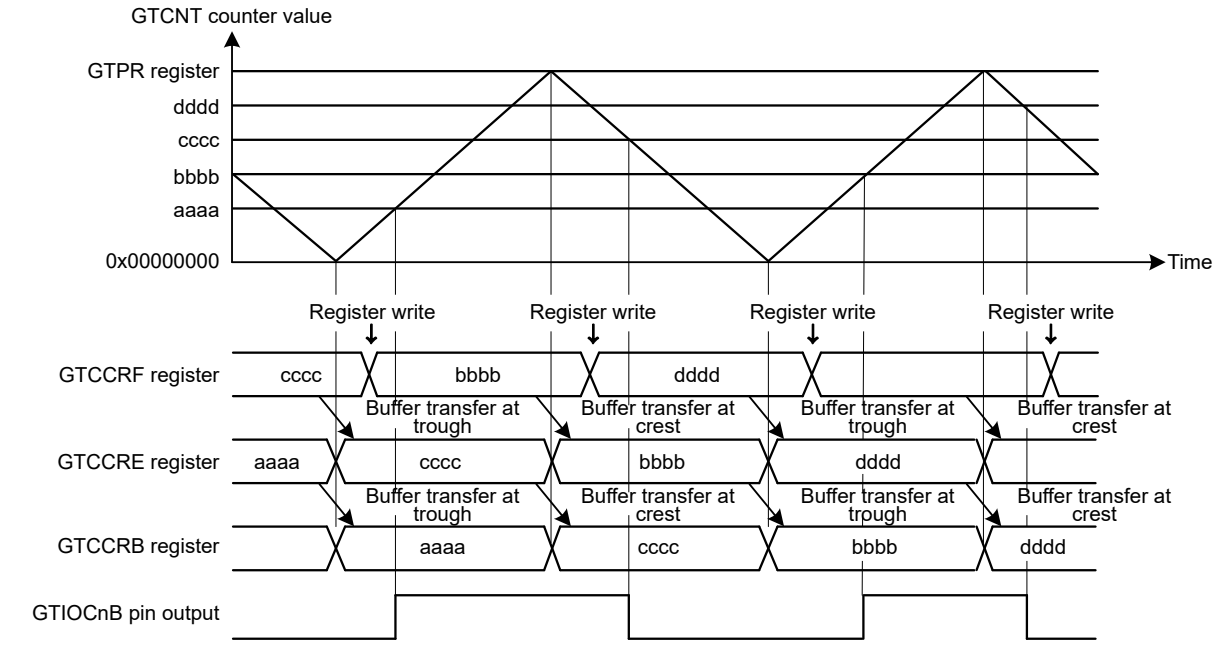


Note: The base address of registers are the same.

Figure 21.14 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at trough, output toggled at GTCCRA compare match, and output retained at cycle end



Note: The base address of registers are the same.

Figure 21.15 Example of GTCCRA and GTCCRB double buffer operation with output compare, triangle waves, buffer operation at both troughs and crests, output toggled at GTCCRB compare match, and output retained at cycle end

Table 21.13 Example for setting GTCCRA and GTCCRB buffer operation for output compare

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.13, 000b (saw-wave PWM mode) is set, in Figure 21.14, 100b (triangle-wave PWM mode 1) is set, and in Figure 21.15, 101b (triangle-wave PWM mode 2) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.13, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.13, GTIOA[4:0] = 00110b, in Figure 21.14, GTIOA[4:0] = 00011b, and in Figure 21.15, GTIOB[4:0] = 00011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.13, CCRA[1:0] = 01b, in Figure 21.14, CCRA[1:0] = 1xb, and in Figure 21.15, CCRB[1:0] = 1xb.
9	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or 1 cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

(2) When GTCCRA or GTCCRB Functions as Input Capture Register

When an input capture is generated, the GTCNT counter value is transferred to GTCCRA and GTCCRB and the stored GTCCRA and GTCCRB register values are transferred to the buffer registers. In input capture operation, the buffer transfer is not performed by the counter clear.

Figure 21.16 and Figure 21.17 show examples of GTCCRA and GTCCRB buffer operation and Table 21.14 shows an example for setting GTCCRA and GTCCRB buffer operation.

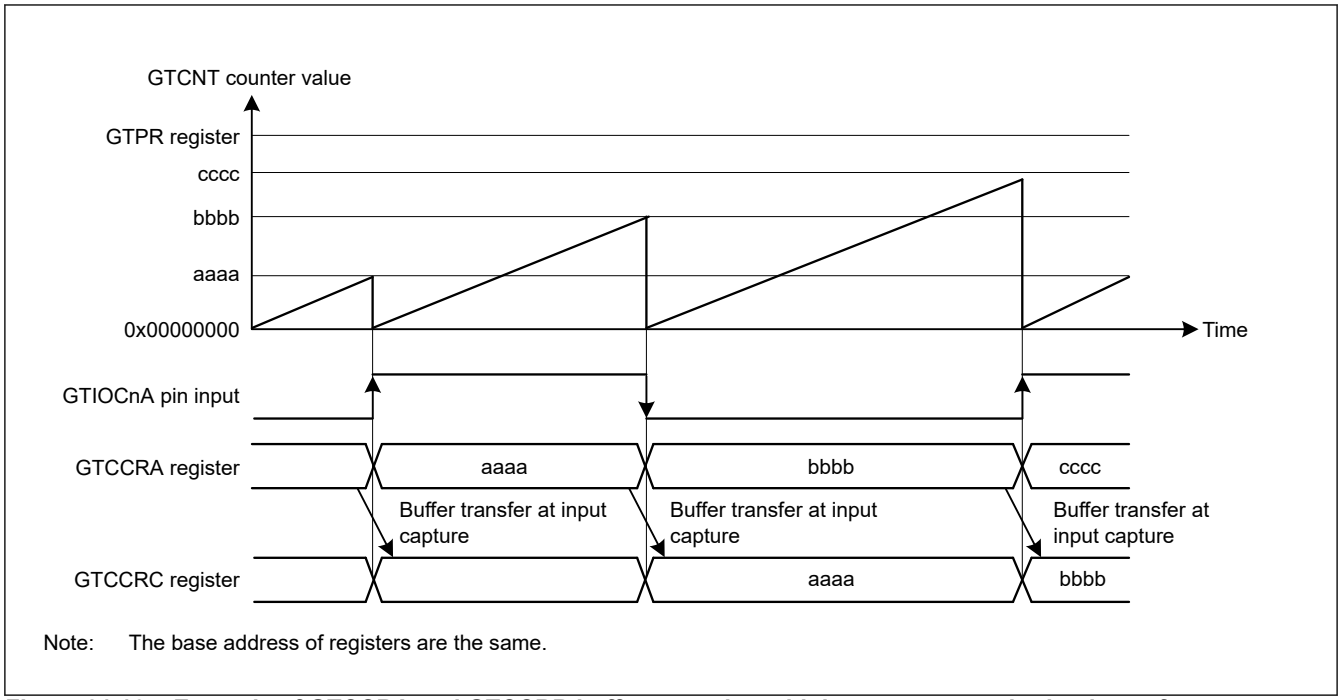


Figure 21.16 Example of GTCCRA and GTCCRB buffer operation with input capture at both edges of GTIOCnA input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnA input

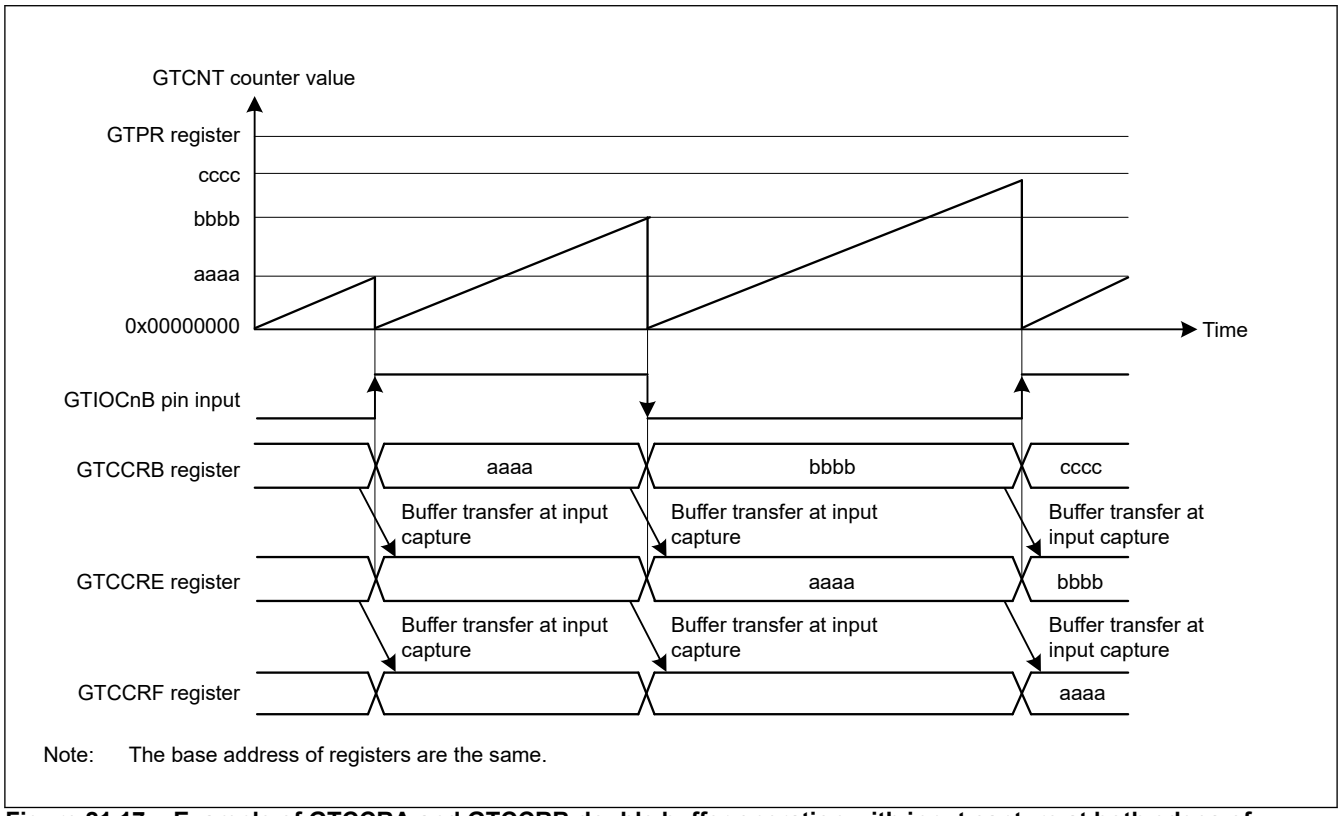

Figure 21.17 Example of GTCCRA and GTCCRB double buffer operation with input capture at both edges of GTIOCnB input, saw waves in up-counting, and GTCNT counter cleared at both edges of GTIOCnB input

Table 21.14 Example for setting GTCCRA and GTCCRB buffer operation for input capture

No.	Step Name	Description
1	Set operating mode and counter clear sources	Set the operating mode with the GTCR.MD[2:0] bits and count clear source with the GTCSR register. In Figure 21.16, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0x00000F00, and in Figure 21.17, MD[2:0] = 000b (saw-wave PWM mode) and GTCSR = 0x0000F000.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.16, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Select input capture source	Select input capture source in the GTICASR register and GTICBSR register. In Figure 21.16, GTICASR = 0x00000F00, and in Figure 21.17, GTICBSR = 0x0000F000.
7	Set buffer operation	Set buffer operation with the CCRA and CCRB bits in the GTBER register. In Figure 21.16, CCRA[1:0] = 01b, and in Figure 21.17, CCRB[1:0] = 1xb.
8	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

21.3.2.3 Buffer Operation for GTADTRA and GTADTRB Registers

The GTADTBRA register can function as the GTADTRA buffer register and the GTADTDBRA register can function as the GTADTBRA buffer register (double buffer register for the GTADTRA register). Similarly, the GTADTBRB register can function as the GTADTRB buffer register and the GTADTDBRB register can function as the GTADTBRB buffer register (double buffer register for the GTADTRB register).

To set the GTADTRA or GTADTRB register to function as a double buffer, set the GTBER.ADTDA or ADTDB bit to 1. For single buffer operation, set 0. Not to function as buffer, set the GTBER.ADTTA[1:0] or ADTTB[1:0] bits to 00b.

The buffer transfer timing can be set with the ADTTA[1:0] and ADTTB[1:0] bits to an overflow (in up-counting) or an underflow (in down-counting) in saw-wave mode, with ADTTA[1:0] and ADTTB[1:0] bits to 01b for a crest, to 10b for a trough, or to 11b for both crest and trough in triangle-wave mode.

In saw-wave mode, when the ADTTA[1:0] and ADTTB[1:0] bits are set to value other than 00b and in count operation, the buffer transfer, by similar counter clearing sources in section 21.3.2.1. GTPR Register Buffer Operation, is performed in the same way at an overflow (in up-counting) or an underflow (in down-counting).

Figure 21.18 to section 21.3.2.3. Buffer Operation for GTADTRA and GTADTRB Registers show examples of buffer operation of the GTADTRA and GTADTRB registers, and Table 21.15 shows an example for setting buffer operation of the GTADTRA and GTADTRB registers.

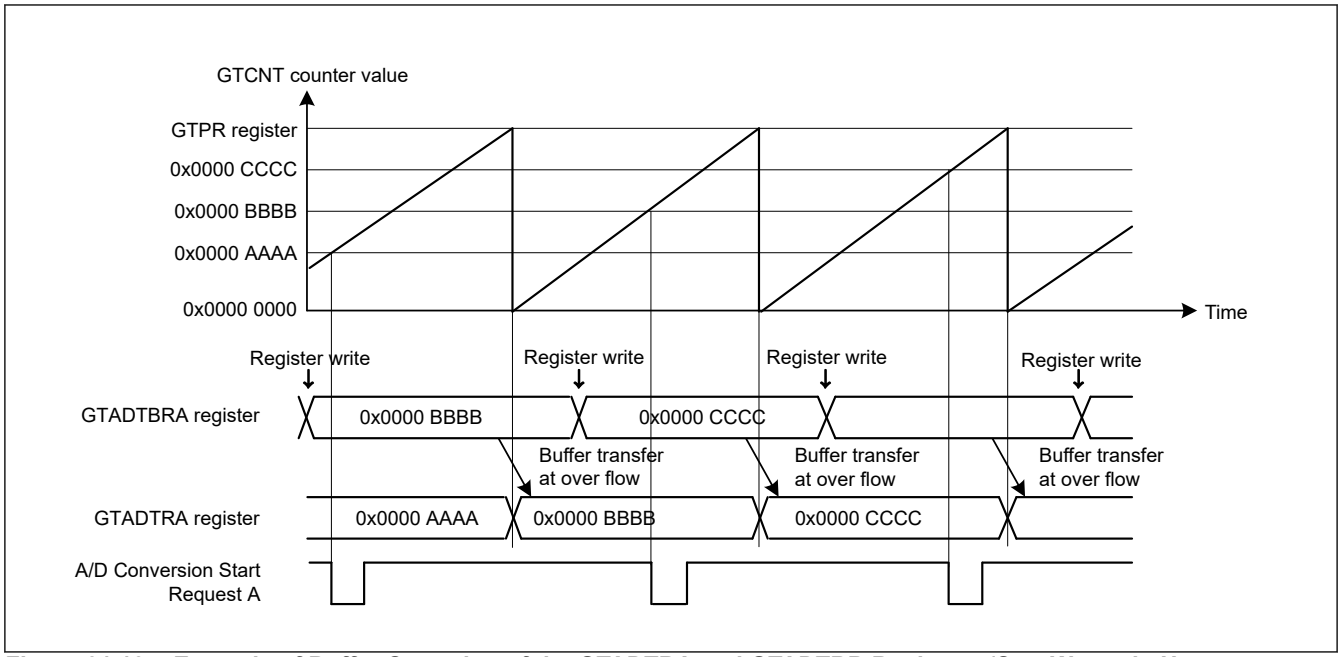

Figure 21.18 Example of Buffer Operation of the GTADTRA and GTADTRB Registers (Saw Waves in Up-Counting, A/D Conversion Start Request Generated by Up-Counting)

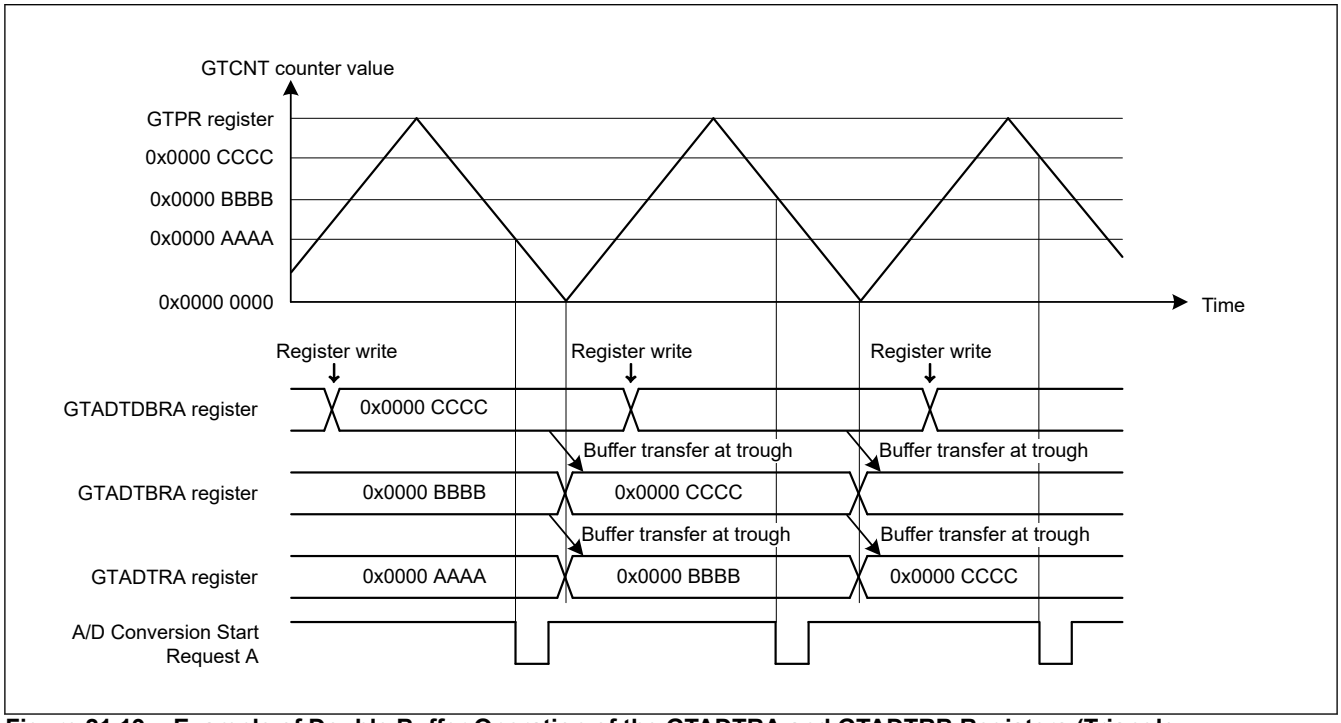

Figure 21.19 Example of Double Buffer Operation of the GTADTRA and GTADTRB Registers (Triangle Waves, Buffer Transfer at Troughs, A/D Conversion Start Request Generated by Down-Counting)

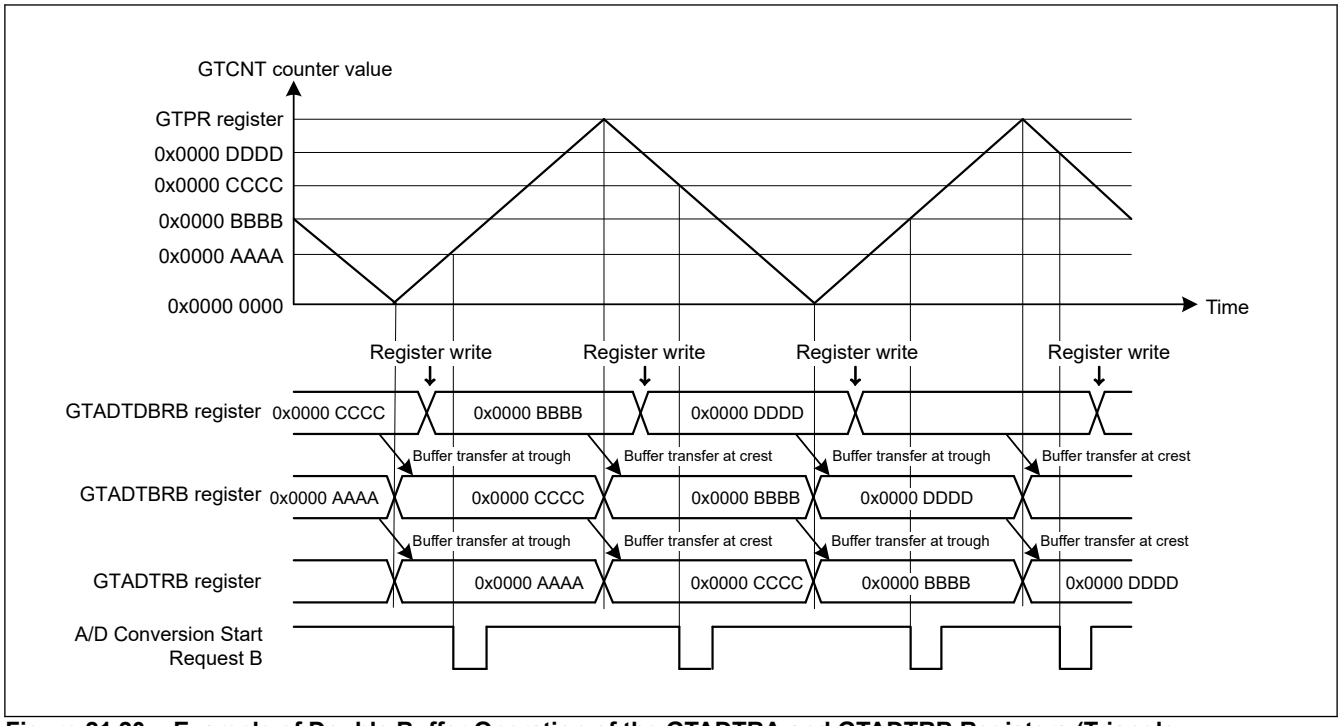

Figure 21.20 Example of Double Buffer Operation of the GTADTRA and GTADTRB Registers (Triangle Waves, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Request Generated by Both Up- and Down-Counting)

Table 21.15 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. (In Figure 21.18 000b (saw-wave PWM mode) is set, in Figure 21.19 and Figure 21.20, 100b, 101b, 110b (triangle-wave PWM mode) is set.)
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. (In Figure 21.18, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).)
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set buffer operation	Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in GTBER register. (In Figure 21.18, ADTTA[1:0] bits = 01b, 10b, or 11b and ADTDA bit = 0, in Figure 21.19, ADTTA[1:0] bits = 10b and ADTDA bit = 1, and in Figure 21.20, ADTTB[1:0] bits = 11b and ADTDB bit = 1.)
7	Set compare match value	Set the A/D conversion start request point in the GTADTRA and GTADTRB registers.
8	Set buffer value	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
9	Enable A/D conversion start request	Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. (In Figure 21.18, ADTRAUEN bit = 1, in Figure 21.19, ADTRADEN bit = 1, and in Figure 21.20, ADTRBUEN bit = 1 and ADTRBDEN bit = 1.)
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.

Table 21.15 Example for Setting Buffer Operation of the GTADTRA and GTADTRB registers (2 of 2)

No.	Step Name	Description
11	Set buffer value of each cycle	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

21.3.3 PWM Output Operating Mode

The GPT can output PWM waveforms to the GTIOCnA or GTIOCnB pin (n = 0 to 13) by a compare match between the GTCNT counter and GTCCRA or GTCCRB.

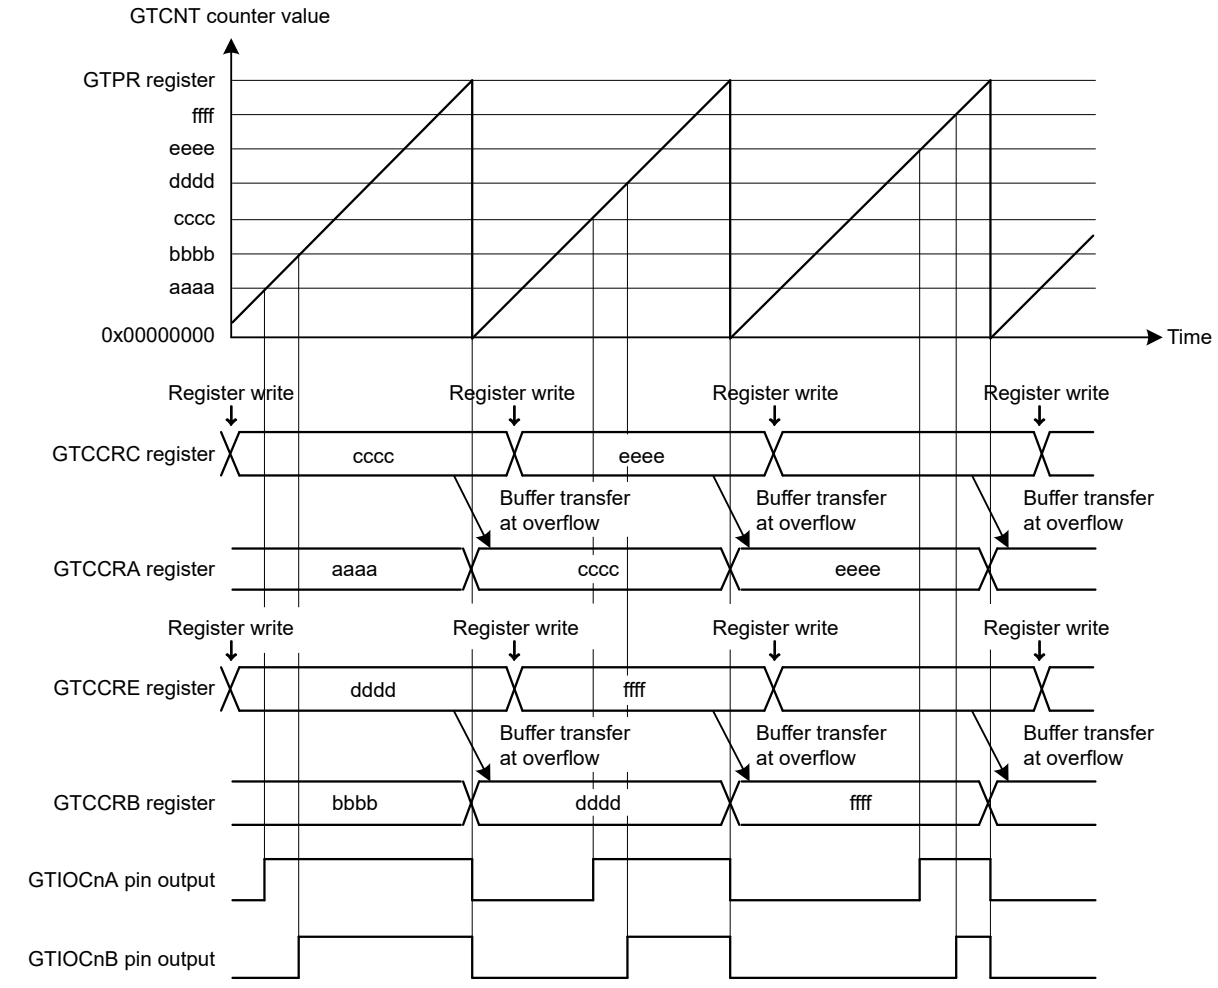
By setting GTDTCR and GTDVU, the compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

21.3.3.1 Saw-Wave PWM Mode

In saw-wave PWM mode, GTCNT performs saw-wave (half-wave) operation by setting the cycle in GTPR and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

When the timing of the end of cycle and the timing of GTCCRk register compare match are the same time, the output pin performs along the PWM output setting for the end of cycle set by the GTIOR.GTIOx[3:2] bits (x = A, B).

Figure 21.21 shows an example of saw-wave PWM mode operation, and Table 21.16 shows an example for setting saw-wave PWM mode.



Note: The base address of registers are the same.

Figure 21.21 Example of saw-wave PWM mode operation with up-counting, buffer operation, high output at GTCCRA/GTCCRB compare match, and low output at cycle end

Table 21.16 Example for setting saw-wave PWM mode (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.21, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.21, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.21, GTIOA[4:0] = 00110b and GTIOB[4:0] = 00110b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.21, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
9	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register and the GTIOCnB pin transition in the GTCCRB register.

Table 21.16 Example for setting saw-wave PWM mode (2 of 2)

No.	Step Name	Description
10	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

21.3.3.2 Saw-Wave One-Shot Pulse Mode

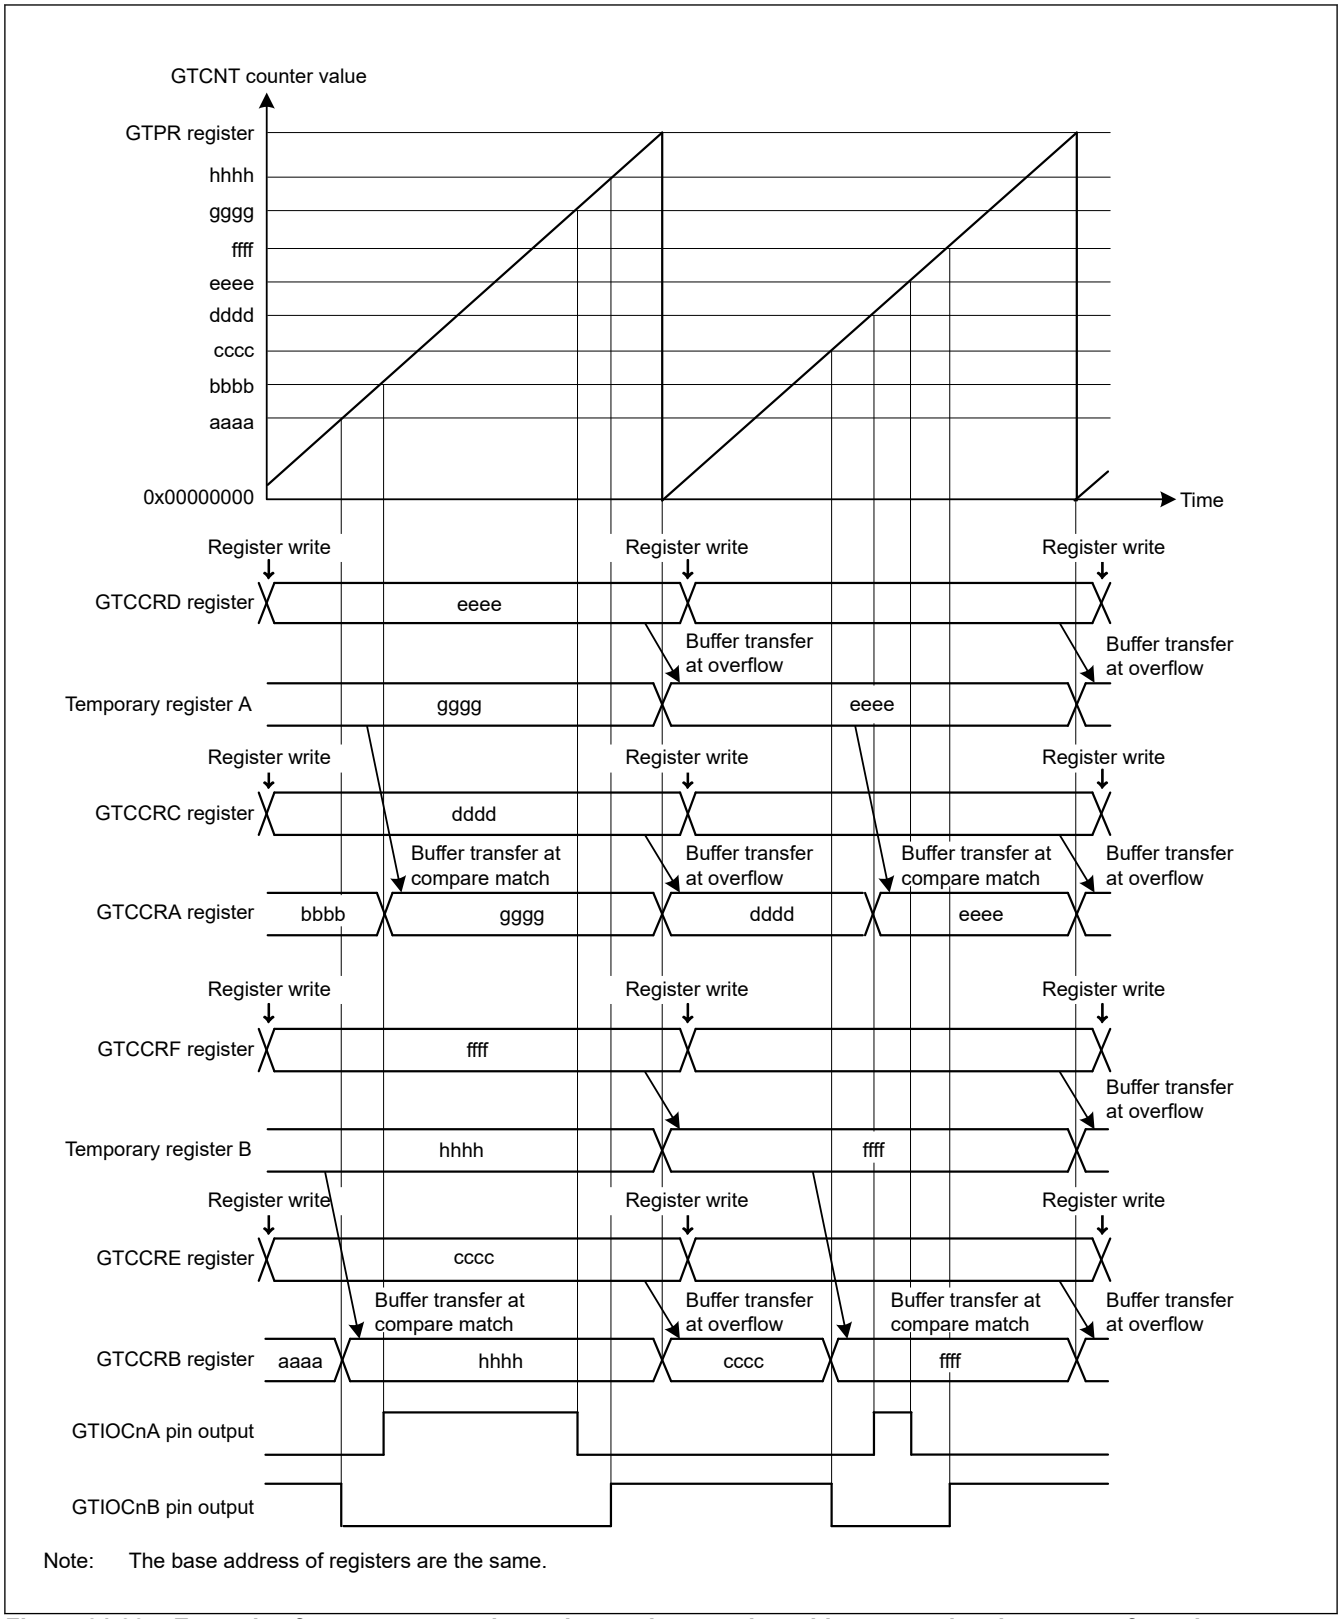
The saw-wave one-shot pulse mode is a mode in which the cycle is set in GTPR, the GTCNT counter performs saw-wave (half-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed.

Buffer operation in saw-wave one-shot pulse mode is different from the usual buffer operation. Buffer transfer is performed from:

- GTCCRC to GTCCRA at the cycle end
- GTCCRE to GTCCRB at the cycle end
- GTCCRD to temporary register A at the cycle end
- GTCCRF to temporary register B at the cycle end
- Temporary register A to GTCCRA at a GTCCRA compare match
- Temporary register B to GTCCRB at a GTCCRB compare match.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and the cycle end according to the GTIOR setting. When the GTBER.CCRSWT bit is set to 1 while count operation is stopped, the buffer is transferred forcibly from the GTCCRD register to temporary register A and from the GTCCRF register to temporary register B. By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.22 shows an example of saw-wave one-shot pulse mode operation, and Table 21.17 shows an example for setting saw-wave one-shot pulse mode.



Note: The base address of registers are the same.

Figure 21.22 Example of saw-wave one-shot pulse mode operation with up-counting, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

Table 21.17 Example setting for saw-wave one-shot pulse mode

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.22, 001b (saw-wave one-shot pulse mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.22, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.22, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set compare match value	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
9	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
10	Set buffer value	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
11	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
12	Set buffer value for each cycle	For buffer operation, set the GTIOCnA pin transition in one cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

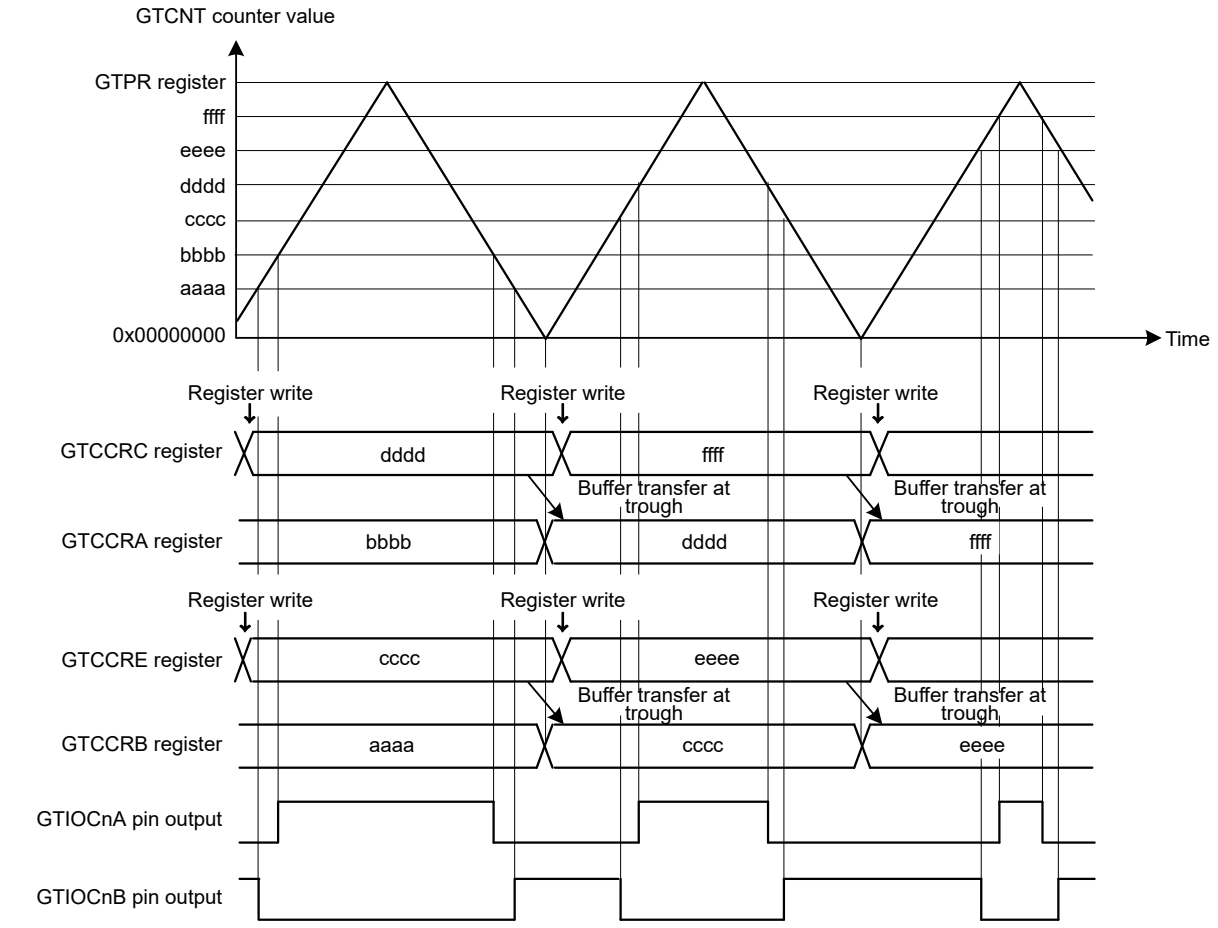
Note: n: 0 to 13
m: A, B

21.3.3.3 Triangle-Wave PWM Mode 1 (32-Bit Transfer at Trough)

The triangle-wave PWM mode 1 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. Buffer transfer is performed at the trough. The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.23 shows an example of a triangle-wave PWM mode 1 operation, and Table 21.18 shows an example for setting a triangle-wave PWM mode 1.



Note: The base address of registers are the same.

Figure 21.23 Example of triangle-wave PWM mode 1 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB register compare match, and output retained at cycle end

Table 21.18 Example setting for triangle-wave PWM mode 1 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.23, 100b (triangle-wave PWM mode 1) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.23, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.23, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.
9	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

Table 21.18 Example setting for triangle-wave PWM mode 1 (2 of 2)

No.	Step Name	Description
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 2 cycles after the current cycle in the GTCCRD and GTCCRF registers, respectively.

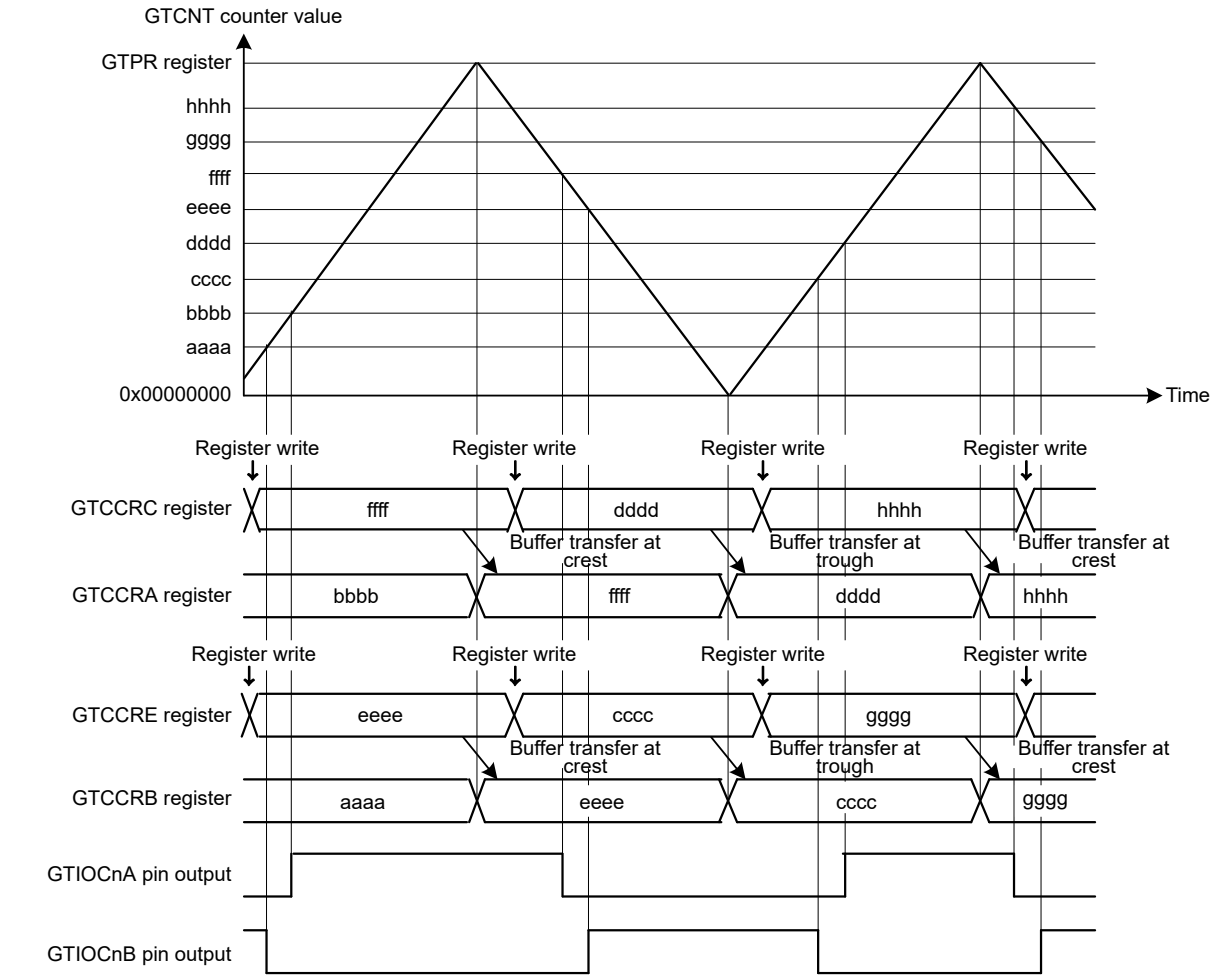
Note: n: 0 to 13
m: A, B

21.3.3.4 Triangle-Wave PWM Mode 2 (32-Bit Transfer at Crest and Trough)

Similarly to triangle-wave PWM mode 1, in triangle-wave PWM mode 2 the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation, and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) when a GTCCRA or GTCCRB compare match occurs. The buffer transfer is performed at both crests and troughs. The pin output value can be selected from low output, high output, or toggle output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.24 shows an example of triangle-wave PWM mode 2 operation, and Table 21.19 shows an example for setting triangle-wave PWM mode 2.



Note: The base address of registers are the same.

Figure 21.24 Example of triangle-wave PWM mode 2 operation with buffer operation, low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/ GTCCRB compare match, and output retained at cycle end

Table 21.19 Example for setting triangle-wave PWM mode 2 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.24, 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.24, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation	Set buffer operation with the CCRA[1:0] and CCRB[1:0] bits in the GTBER register. In Figure 21.24, CCRA[1:0] = 01b and CCRB[1:0] = 01b.
8	Set compare match value	Set the GTIOCnA and GTIOCnB pins transitions in the GTCCRA and GTCCRB registers, respectively.

Table 21.19 Example for setting triangle-wave PWM mode 2 (2 of 2)

No.	Step Name	Description
9	Set buffer value	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in the GTCCRD and GTCCRF registers, respectively.
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each half cycle	For buffer operation, set the GTIOCnA and GTIOCnB pins transitions in half cycle after the current cycle in the GTCCRC and GTCCRE registers, respectively. For double buffer operation, also set the GTIOCnA and GTIOCnB pins transitions in 1 cycle after the current cycle in GTCCRD and GTCCRF registers, respectively.

Note: n: 0 to 13
m: A, B

21.3.3.5 Triangle-Wave PWM Mode 3 (64-Bit Transfer at Trough)

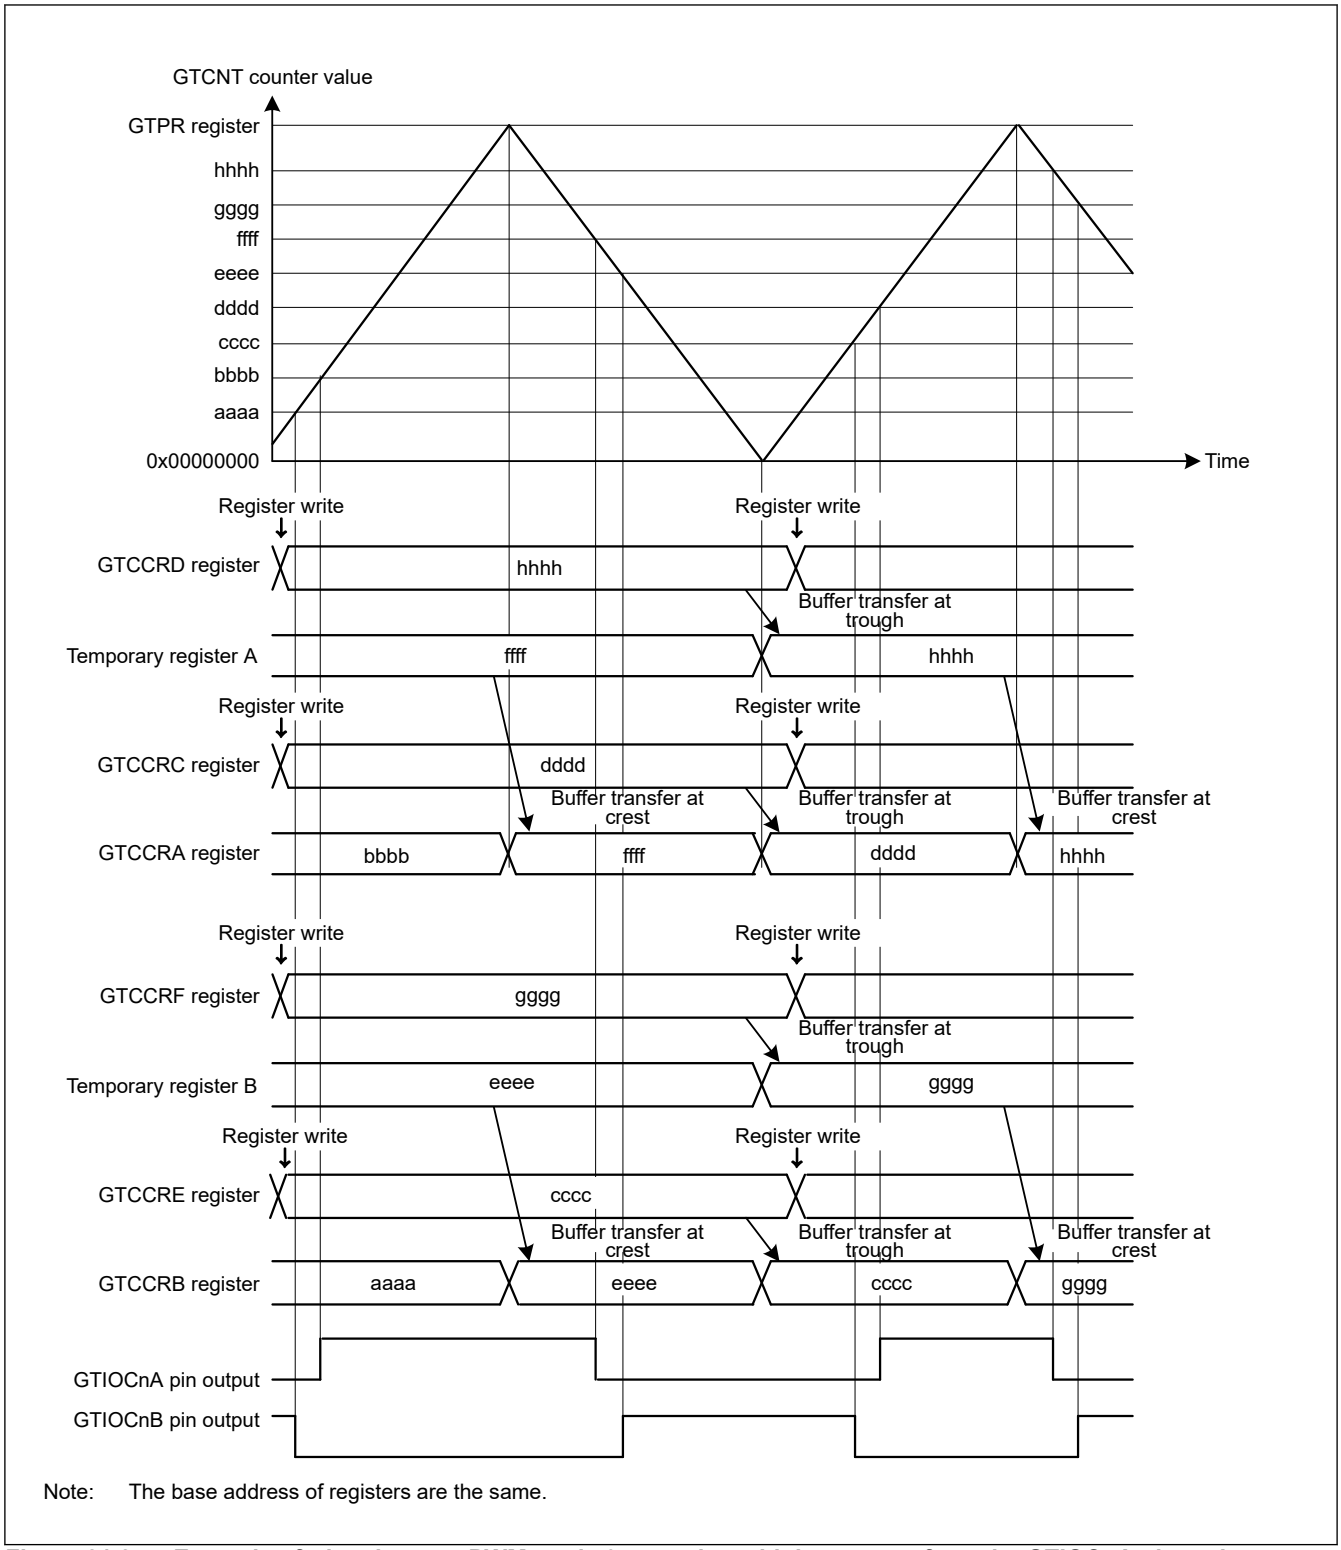
The triangle-wave PWM mode 3 is a mode in which the cycle is set in GTPR. The GTCNT counter performs triangle-wave (full-wave) operation and a PWM waveform is output to the GTIOCnA or GTIOCnB pin (n = 0 to 13) at a compare match of GTCCRA or GTCCRB with buffer operation fixed. Buffer operation in triangle-wave PWM mode 3 is different from the usual buffer operation. Buffer transfer is performed from the following:

- GTCCRC to GTCCRA at the trough
- GTCCRE to GTCCRB at the trough
- GTCCRD to temporary register A at the trough
- GTCCRF to temporary register B at the trough
- Temporary register A to GTCCRA at the crest
- Temporary register B to GTCCRB at the crest.

The pin output value can be selected from low output, high output, or toggled output separately for a compare match and for the cycle end according to the GTIOR setting.

By setting GTDTCR, GTDVU, a compare match value for a negative-phase waveform with dead time can automatically be set to GTCCRB.

Figure 21.25 shows an example of triangle-wave PWM mode 3 operation, and Table 21.20 shows an example for setting triangle-wave PWM mode 3.



Note: The base address of registers are the same.

Figure 21.25 Example of triangle-wave PWM mode 3 operation with low output from the GTIOCnA pin and high output from the GTIOCnB pin at count start, output toggled at GTCCRA/GTCCRB compare match, and output retained at cycle end

Table 21.20 Example setting for triangle-wave PWM mode 3 (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.25, 110b (triangle-wave PWM mode 3) is set.

Table 21.20 Example setting for triangle-wave PWM mode 3 (2 of 2)

No.	Step Name	Description
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.25, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set compare match value	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
8	Set forcible buffer transfer	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly.
9	Set buffer value	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.
10	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
11	Set buffer value for each cycle	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers and the GTIOCnB pin transition in the GTCCRE and GTCCRF registers.

Note: n: 0 to 13
m: A, B

21.3.4 Automatic Dead Time Setting Function

By setting GTDTCR, a compare match value for a negative waveform with dead time obtained by a compare match value for a positive waveform (GTCCRA value) and specified dead time value (GTDVU value) can automatically be set to GTCCRB.

The automatic dead time setting function can be used in saw-wave one-shot pulse mode and all the triangle PWM modes.

Dead time for the changing point of a negative waveform is set in the GTDVU register.

The change point of the negative-phase waveform, which is automatically calculated, is obtained by reading the GTCCRB register. Writing to GTCCRB is prohibited when the automatic dead time setting function is used.

Do not set the dead time that makes the change point of the waveform exceeding the count period. When any dead-time setting which would generate a dead-time error is made, adjust the change points of the positive- and negative-phase waveforms to generate waveforms with secured dead-time as shown inTable 21.21. The adjusted change point of the negative-phase waveform is automatically set in the GTCCRB register. An internal signal is used to judge the change point of the positive-phase waveform, thus the value of the GTCCRA register is not updated by the adjusted value.

In saw-wave one-shot pulse mode, if the order of the change point becomes inconsistent by adjustment of the waveform change point due to occurrence of dead time errors, or if the change point exceeds the count period even after the adjustment, the complementary relation between the positive- and negative-phases cannot be guaranteed.

Automatic setting for a dead time value to the GTCCRB register is performed at the next count clock after the register value for calculating the automatic setting value is updated. In triangle-wave mode, it also can be done at the next count clock from the current crest.

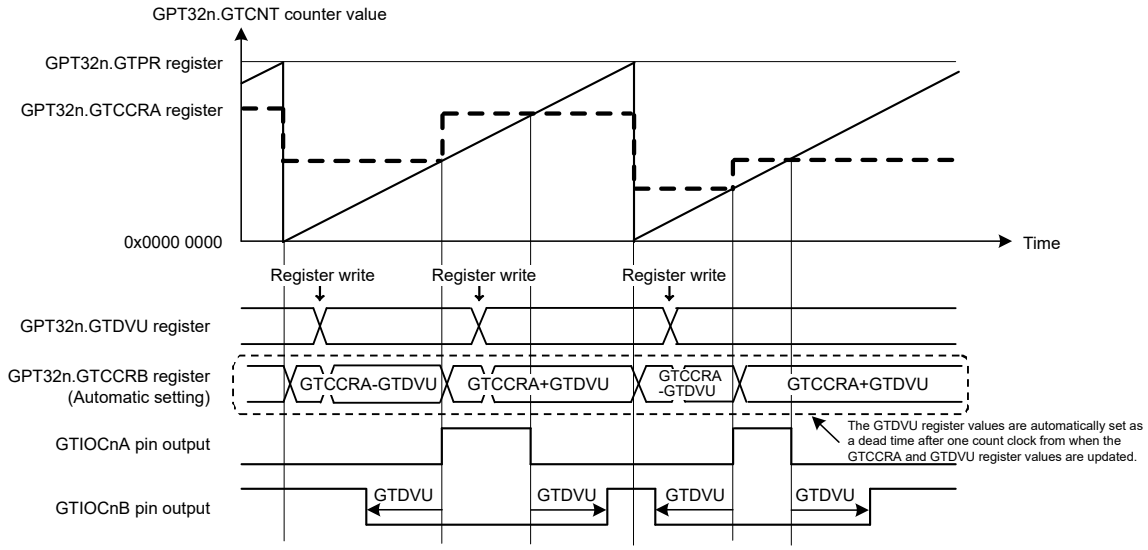
Table 21.21 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs (1 of 2)

Mode	Count Direction	Period	Condition for Dead Time Error	Change Point of the Positive-Phase Waveform after Adjustment	Change Point of the Negative-Phase Waveform after Adjustment
Sawtooth-wave one-shot pulse mode	Up-counting	First half	GTCCRA - GTDVU < 0	GTDVU	0
		Second half	GTCCRA + GTDVU > GTPR	GTPR - GTDVU	GTPR
	Down-counting	First half	GTCCRA + GTDVU > GTPR	GTPR - GTDVU	GTPR
		Second half	GTCCRA - GTDVU < 0	GTDVU	0

Table 21.21 Adjustment of the Waveform Change Point When a Dead-Time Error Occurs (2 of 2)

Mode	Count Direction	Period	Condition for Dead Time Error	Change Point of the Positive-Phase Waveform after Adjustment	Change Point of the Negative-Phase Waveform after Adjustment
Triangle-wave PWM mode 1/2/3	Up-counting	(First half)	GTCCRA - GTDVU ≤ 0	GTDVU + 1	1
	Down-counting	(Second half)	GTCCRA - GTDVU < 0	GTDVU	0

Figure 21.26 to Figure 21.29 show examples of automatic dead time setting function operation. Table 21.22 and Table 21.23 show the setting examples.



Note: The base address of registers are the same.

Table 21.22 Example setting for automatic dead time setting function in saw-wave one-shot pulse mode, and triangle-wave PWM mode 3

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.26 and Figure 21.27, 001b (saw-wave one-shot pulse mode) is set. In Figure 21.29, 110b (triangle-wave PWM mode 3) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.26, 01b is set after 11b is set in the GTUDDTYC[1:0] bits (up count). In Figure 21.27, 00b is set after 10b is set in the GTUDDTYC[1:0] bits (down count).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter.
6	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.26, Figure 21.27, and Figure 21.29, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
7	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
8	Set buffer value for compare match	Set the GTIOCnA pin transition immediately after the count start in the GTCCRC and GTCCRD registers.
9	Set forcible buffer transfer for compare match	Set the GTBER.CCRSWT bit to 1 to transfer buffer register data forcibly to the GTCCRA register.
10	Set buffer value for compare match	Set the GTIOCnA pin transition in 1 cycle after the current cycle in the GTCCRC and GTCCRD registers.
11	Set automatic dead time setting function	Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.
12	Set dead time value	Set the first half dead time value in GTDVU.
13	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
14	Set buffer value for each cycle	Set the GTIOCnA pin transition in 1 cycle after the current cycle in GTCCRC and GTCCRD.

Note: n: 0 to 13
m: A, B

Table 21.23 Example setting for automatic dead time setting function in triangle-wave PWM mode 1 or 2

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.28, 100b (triangle-wave PWM mode 1) is set. In Figure 21.29, 101b (triangle-wave PWM mode 2) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set GTIOCnm pin function	Set the GTIOCnm pin function with the GTIOA[4:0] and GTIOB[4:0] bits in the GTIOR register. In Figure 21.28 and Figure 21.29, GTIOA[4:0] = 00011b and GTIOB[4:0] = 10011b.
6	Enable GTIOCnm pin output	Set to enable the GTIOCnm pin output with the OAE and OBE bits in the GTIOR register.
7	Set buffer operation for compare match	Set buffer operation with the CCRA[1:0] bits in the GTBER register.
8	Set compare match value	Set the GTIOCnA pin transition in the GTCCRA register.
9	Set buffer value for compare match	For buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRC register. For double buffer operation, also set the GTIOCnA pin transition in 2 cycles after the current cycle (in triangle-wave PWM mode 1) or 1 cycle after the current cycle (in triangle-wave PWM mode 2) in the GTCCRD registers.
10	Set automatic dead time setting function	Set the GTDTCR.TDE bit to 1 to enable the automatic dead time setting function.
11	Set dead time value	Set the first half dead time value in GTDVU.
12	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
13	Set buffer value for each cycle	When the compare match register is used for buffer operation, set the GTIOCnA pin transition in 1 cycle after the current cycle (in triangle-wave PWM mode 1) or half cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRC. When the compare match register is used for double-buffered operation, set the GTIOCnA pin changing point in two cycles after the current cycle (in triangle-wave PWM mode 1) or one cycle after the current cycle (in triangle-wave PWM mode 2) in GTCCRD.

Note: n: 0 to 13
m: A, B

21.3.5 Count Direction Changing Function

The count direction of the GTCNT counter can be changed by modifying the UD bit in GTUDDTYC.

In saw-wave mode, if the UD bit in GTUDDTYC is modified during count operation, the count direction is changed at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.UD bit is modified while the count operation stops and the GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit modification is not reflected at the start of counting and the count direction is changed at an overflow or an underflow. If the UDF bit is set to 1 while the count operation stops, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

In triangle-wave mode, the count direction does not change even though the UD bit in GTUDDTYC is modified during the count operation. Similarly, even though the GTUDDTYC.UD bit is modified while the count operation stops and GTUDDTYC.UDF bit is 0, the GTUDDTYC.UD bit value is not reflected to the count operation. If the GTUDDTYC.UDF bit is set to 1 while the count operation is stopped, the GTUDDTYC.UD bit value at that time is reflected at the start of counting.

If the count direction changes during a saw-wave count operation, the GTPR value after the start of up-counting is reflected in the count cycle during up-counting and the GTPR value after the start of down-counting is reflected in the count cycle during down-counting.

Figure 21.30 shows an example of count direction changing function operation.

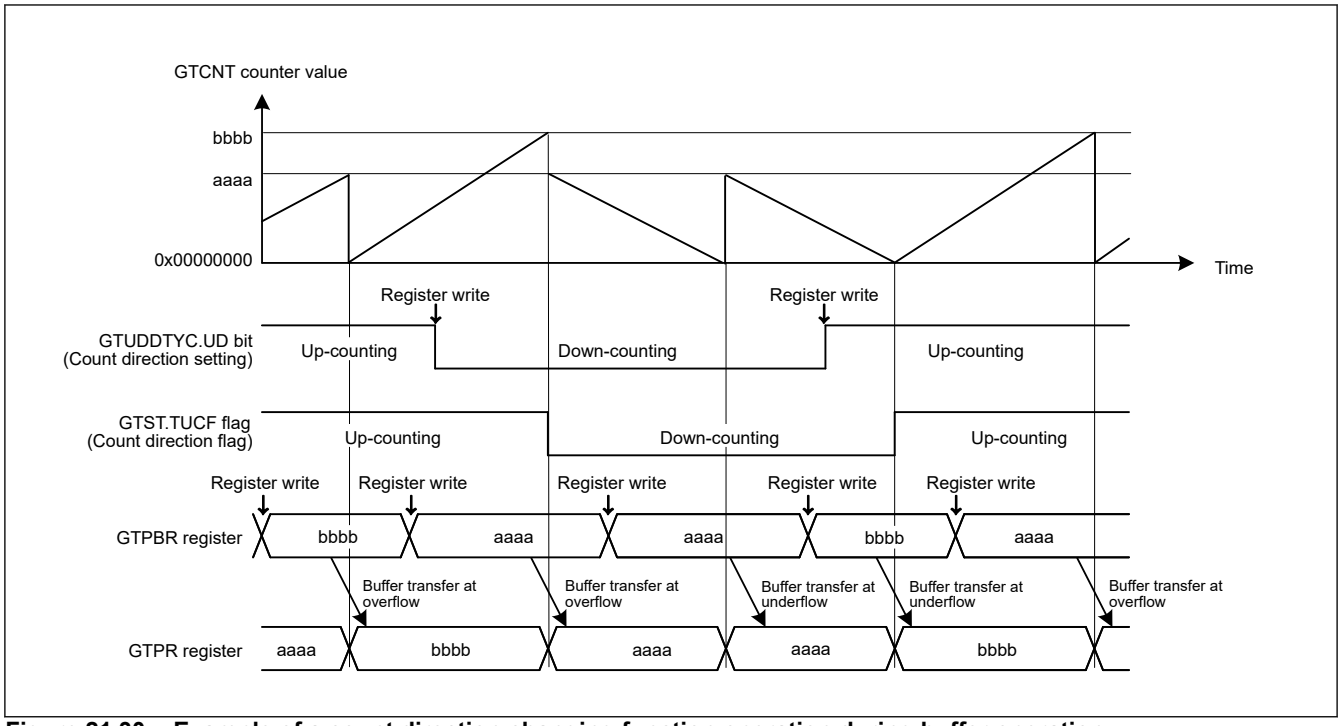

Figure 21.30 Example of a count direction changing function operation during buffer operation

21.3.6 Function of Output Duty 0% and 100%

The output duty of the GTIOCnA pin and the GTIOCnB pin (n = 0 to 13) are set to 0% or 100% by changing the GTUDDTYC.OADTY bit or GTUDDTYC.OBDTY bit.

In saw-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected at an overflow (when modified during up-counting) or an underflow (when modified during down-counting). If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an overflow or an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 1, the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit value at that time is reflected at the start of counting.

In triangle-wave mode, if the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified during the count operation, the output duty setting is reflected an underflow.

If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation is stopped and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 0, the output duty modification is not reflected at the start of counting. The output duty changes at an underflow. If the GTUDDTYC.OADTY bit or the GTUDDTYC.OBDTY bit is modified while the count operation stops and the GTUDDTYC.OADTYF bit or the GTUDDTYC.OBDTYF bit is 1, the output duty modification is reflected at the start of counting.

In performing 0% or 100% duty operation, GPT internally continues to:

- Perform compare match operation
- Set compare match flag
- Output interrupt
- Perform buffer operation.

When the control is changed from 0% or 100% duty setting to compare match, the output value of GTIOCnA pin at cycle end is decided by GTIOR.GTIOA[3:2] and GTUDDTYC.OADTYR. The output value of GTIOCnB pin at cycle end is decided by GTIOR.GTIOB[3:2] and GTUDDTYC.OBDTYR.

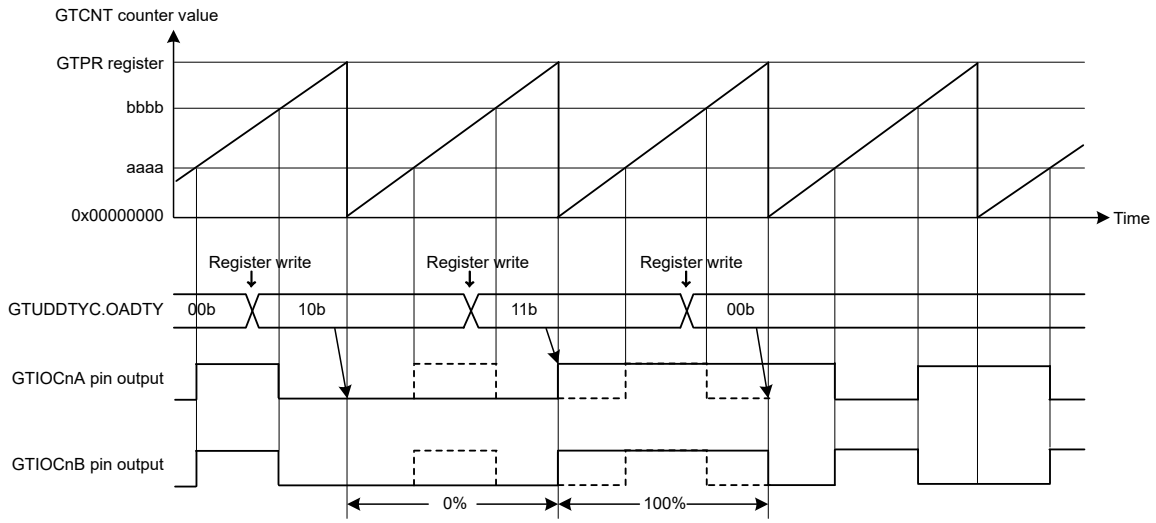
When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 01b, the output pins output low at cycle end. When GTIOR.GTIOA[3:2] and GTIOR.GTIOB[3:2] are set to 10b, the output pins output high at cycle end.

GTUDDTYC.OADTYR selects the value that is the object of output retained/toggled at cycle end, when GTIOR.GTIOm[3:2] are set to 00b (output retained at cycle end) or when GTIOR.GTIOm[3:2] are set to 11b (output toggled at cycle end). Table 21.24 shows the values of GTIOCnA and GTIOCnB pin output at cycle end.

Table 21.24 Output values after releasing 0% or 100% duty setting (m = A, B)

GTIOR.GTIOm[3:2]	Compare match value at cycle end masked by 0% or 100% duty setting	GTUDDTYC.OmDTYR in duty 0% setting		GTUDDTYC.OmDTYR in duty 100% setting	
		0	1	0	1
00 (output retained at cycle end)	0	0	0	1	0
	1	0	1	1	1
01 (low output at cycle end)	—	0	0	0	0
10 (high output at cycle end)	—	1	1	1	1
11 (output toggled at cycle end)	0	1	1	0	1
	1	1	0	0	0

Figure 21.31 shows an example of output duty 0% and 100% function.



Note: The base address of registers are the same.

Note: [Setting examples]

GTIOR.GTIOA[4:0] bits: 00011b
initial low output, output toggled at compare match, output retained at cycle end

GTUDDTYC.OADTYR bit: 0b
The function selected by GTIOA[3:2] is applied to the output value when the duty cycle is set after release from 0 or 100% duty-cycle setting.

GTIOR.GTIOB[4:0] bits: 00011b
initial low output, output toggled at compare match, output retained at cycle end

GTUDDTYC.OBDTYR bit: 1
The function of GTIOB[3:2] is applied to the compare match output value which is masked after 0 or 100% duty setting release.

Figure 21.31 Example of output duty 0% and 100% function

21.3.7 Hardware Count Start/Count Stop and Clear Operation

The GTCNT counter can be started, stopped, or cleared by the following hardware sources:

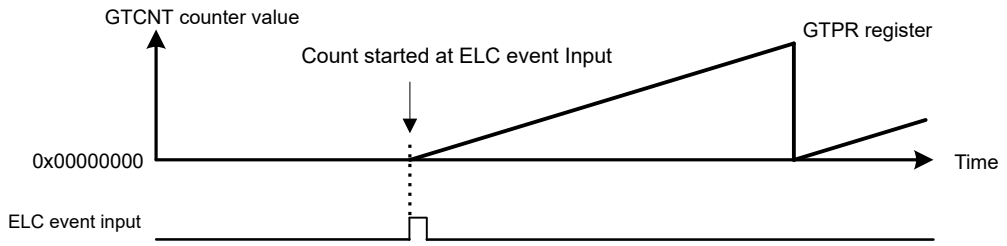
- External trigger input

- ELC event input
- GTIOCnA and GTIOCnB pin input (n = 0 to 13).

21.3.7.1 Hardware Start Operation

The GTCNT counter can be started by selecting a hardware source using GTSSR.

Figure 21.32 shows an example of a count start operation by a hardware source. Table 21.25 shows the setting example.



Note: ELC event input: ELCA event input

Figure 21.32 Example of count start operation by a hardware source started at the input of the signal from the ELCA event

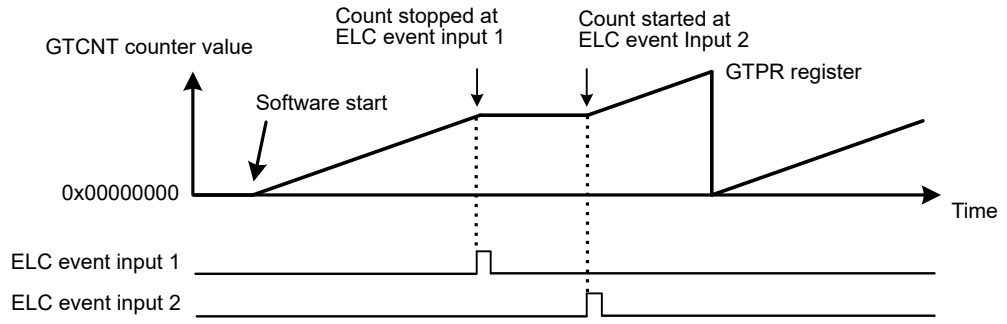
Table 21.25 Example setting for count start operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.32, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.32, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.32, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register. In Figure 21.32, GTSSR.SSELCA = 1
7	Set hardware source operation	Set operation of the hardware source selected by the GTSSR register and start counting. In Figure 21.32, the ELCA event input operation is set.

21.3.7.2 Hardware Stop Operation

The GTCNT counter can be stopped by selecting a hardware source using GTPSR.

Figure 21.33 shows an example of a count stop operation by a hardware source. Table 21.26 shows the setting example. In this example, the count operation stops at the ELCA event input and restarts at the ELCB event input.



Note: ELC event input 1: ELCA event input
ELC event input 2: ELCB event input

Figure 21.33 Example of count stop operation by hardware source started by software, stopped at ELCA input, and restarted at ELCB input

Table 21.26 Example setting for count stop operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with GTCR.MD[2:0] bits. In Figure 21.33, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.33, after 11b is set in GTUDDTYC[1:0], 01b is set in GTUDDTYC[1:0] (up-counting).
3	Select count clock	Select the count clock with GTCR.TPCS[3:0].
4	Set cycle	Set the cycle in GTPR.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.33, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation in GTSSR register, and wait for count start by the hardware source. In Figure 21.33, GTSSR.SSELCB = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation in GTPSR register and wait for count stop by the hardware source. In Figure 21.33, GTPSR.PSELCA = 1.
8	Set hardware source operation	Set operation of the hardware source selected in GTSSR register or GTPSR register, and start or stop counting. In Figure 21.33, ELCA input operation and ELCB input operation are set.

Figure 21.34 shows an example of a count start/stop operation by a hardware source. Table 21.27 shows the setting example. In this example, the counter operates during the high-level periods of the external trigger input GTETRGA.

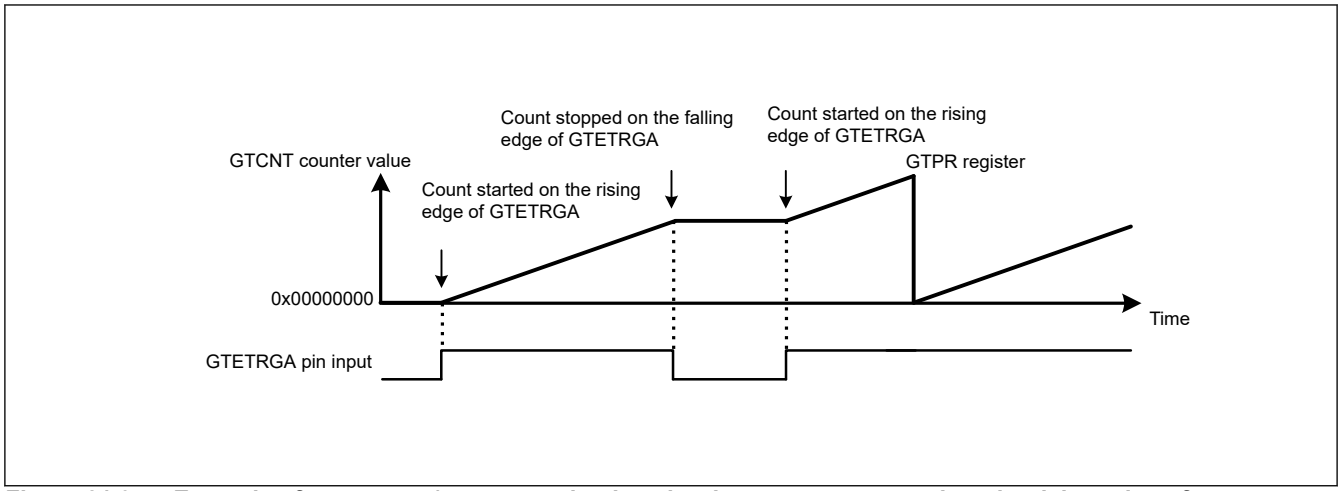


Figure 21.34 Example of count start/stop operation by a hardware source started on the rising edge of GTETRGA pin input, and stopped on the falling edge of GTETRGA pin input

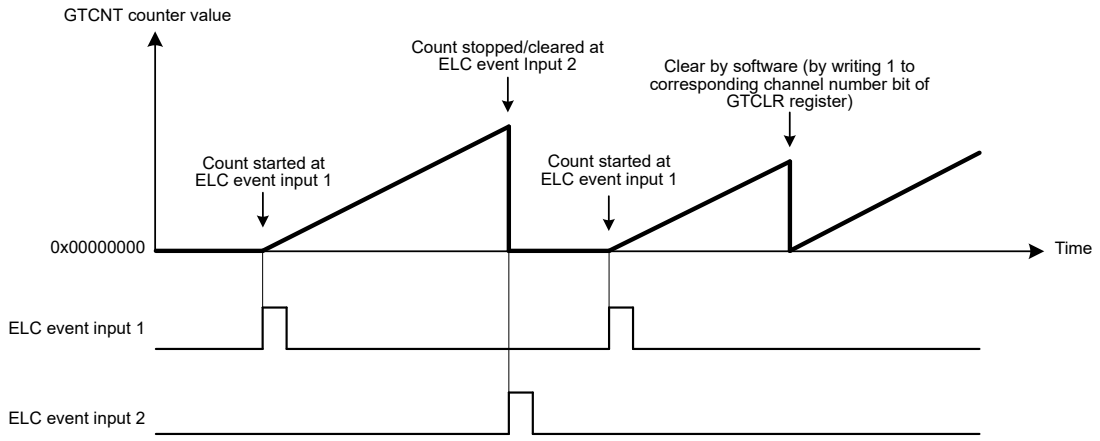
Table 21.27 Example setting for count start/stop operation by a hardware source

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.34, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.34, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.34, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.34, GTSSR.SSGTRGAR = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.34, GTPSR.PSGTRGAF = 1.
8	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register or GTPSR register and start or stop counting. In Figure 21.34, the GTETRGA pin operation is set.

21.3.7.3 Hardware Clear Operation

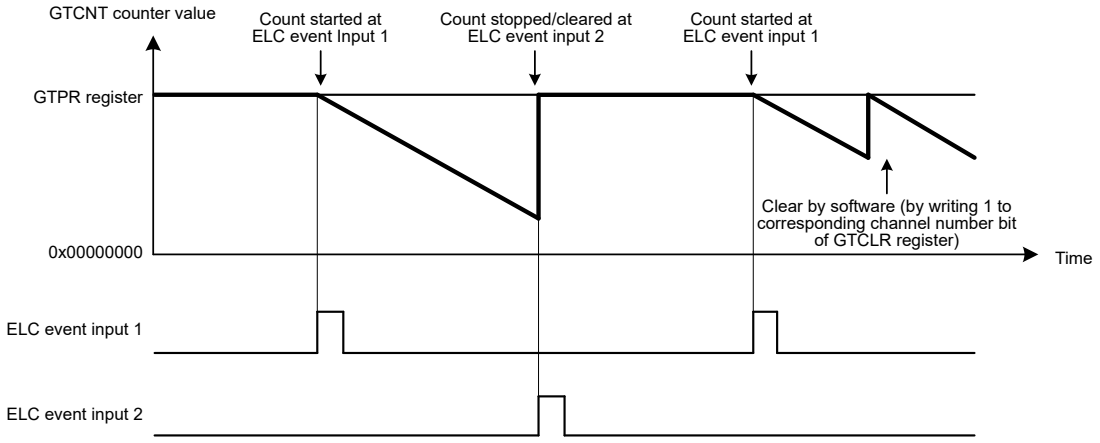
The GTCNT counter can be cleared by selecting a hardware source using GTCSR. The GPTn_OVF/GPTn_UDF (n = 0 to 13) interrupt (overflow/underflow interrupt) is not generated when the GTCNT counter is cleared by a hardware source or by software.

Figure 21.35 and Figure 21.36 show examples of the GTCNT counter clearing operation by a hardware source. Table 21.28 shows the setting example. In this example, the GTCNT counter starts at the ELCA input, and the counter stops and clears at the ELCB input.



Note: ELC event input 1: ELCA event input
ELC event input 2: ELCB event input

Figure 21.35 Examples of count clearing operation by hardware source in saw wave up-counting, started at ELCA input, and stopped/cleared at ELCB input



Note: ELC event input 1: ELCA event input
ELC event input 2: ELCB event input

Figure 21.36 Examples of count clearing operation by hardware source in saw wave down-counting, started at ELCA input, and stopped/cleared at ELCB input

Table 21.28 Example setting for count clearing operation by a hardware source (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.35 and Figure 21.36, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.35, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting). In Figure 21.36, after 10b is set in the GTUDDTYC[1:0] bits, 00b is set in the GTUDDTYC[1:0] bits (down-counting).

Table 21.28 Example setting for count clearing operation by a hardware source (2 of 2)

No.	Step Name	Description
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.35, 0x00000000 is set. In Figure 21.36, the GTPR register value is set.
6	Set hardware count start	Select a hardware source for starting count operation in the GTSSR register, and wait for count start by the hardware source. In Figure 21.35 and Figure 21.36, GTSSR.SSELCA = 1.
7	Set hardware count stop	Select a hardware source for stopping count operation in the GTPSR register, and wait for count stop by the hardware source. In Figure 21.35 and Figure 21.36, GTPSR.PSELCB = 1.
8	Set hardware count clear	Select a hardware source for clearing count operation in the GTCSR register, and wait for count clear by the hardware source. In Figure 21.35 and Figure 21.36, GTCSR.CSELCB = 1.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR register, GTPSR register or GTCSR register and start, stop or clear counting. In Figure 21.35 and Figure 21.36, the ELCA input and ELCB input are set.

The GPTn_OVF/GPTn_UDF (n = 0 to 13) interrupt (overflow/underflow interrupt) is not generated when the counter is cleared by a hardware source or by software.

Figure 21.37 shows the relationship between the counter clearing by a hardware source and the GPTn_OVF (n = 0 to 13) interrupt.

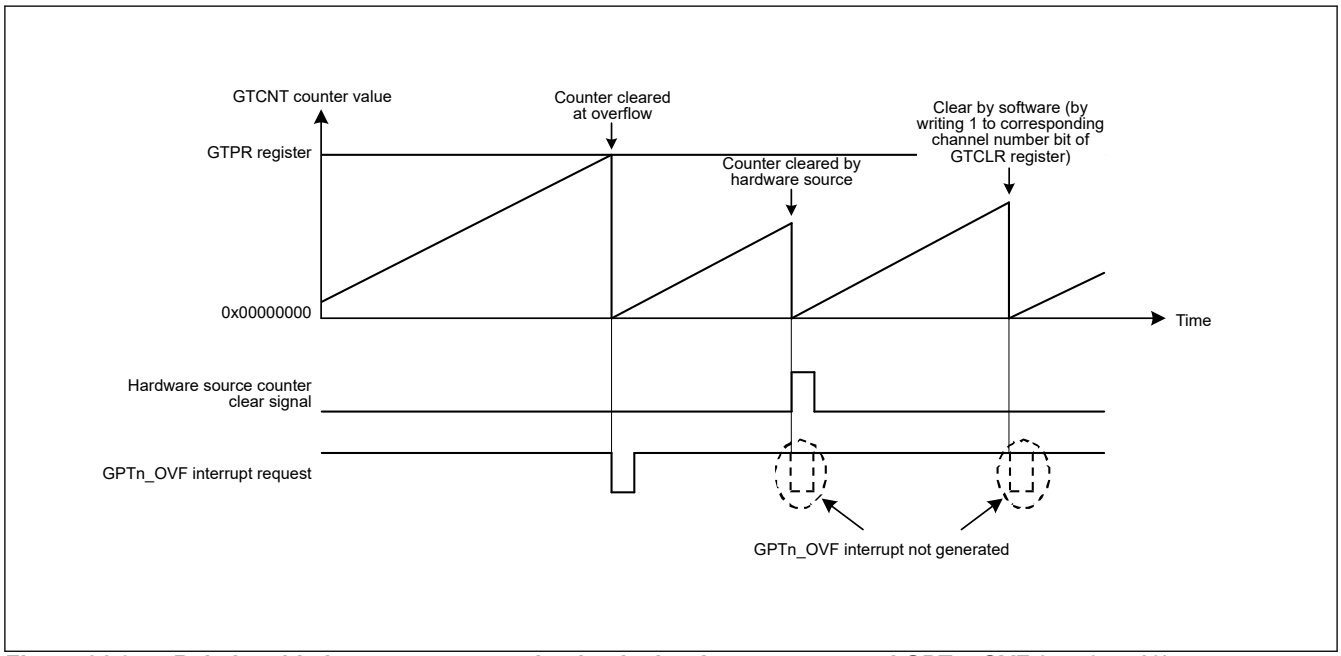


Figure 21.37 Relationship between counter clearing by hardware source and GPTn_OVF (n = 0 to 13) interrupt

21.3.8 Synchronized Operation

Synchronized operation on channels such as a synchronized start, stop, and clear operation can be performed.

21.3.8.1 Synchronized Operation by Software

The GTCNT counters can be started, stopped, and cleared on multiple channels by setting the associated GTSTR, GTSTP, or GTCLR bits simultaneously to 1.

Count start with a phase difference is possible by setting the initial value in the GTCNT counter and setting the associated GTSTR bits simultaneously to 1.

Because the clock of count operation is selected by GTCR.TPCS[3:0] bits in respective channels, if the clock period of each channel that performs synchronous operation (count start/stop/clear) is different from others, the synchronous operation timings of every channels are not exact same.

Figure 21.38 shows an example of a simultaneous start, stop, and clear by software. Figure 21.39 shows an example of phase start operation by software. Figure 21.40, Figure 21.41, Figure 21.42 show an example of simultaneous start/stop/clearing with different count period.

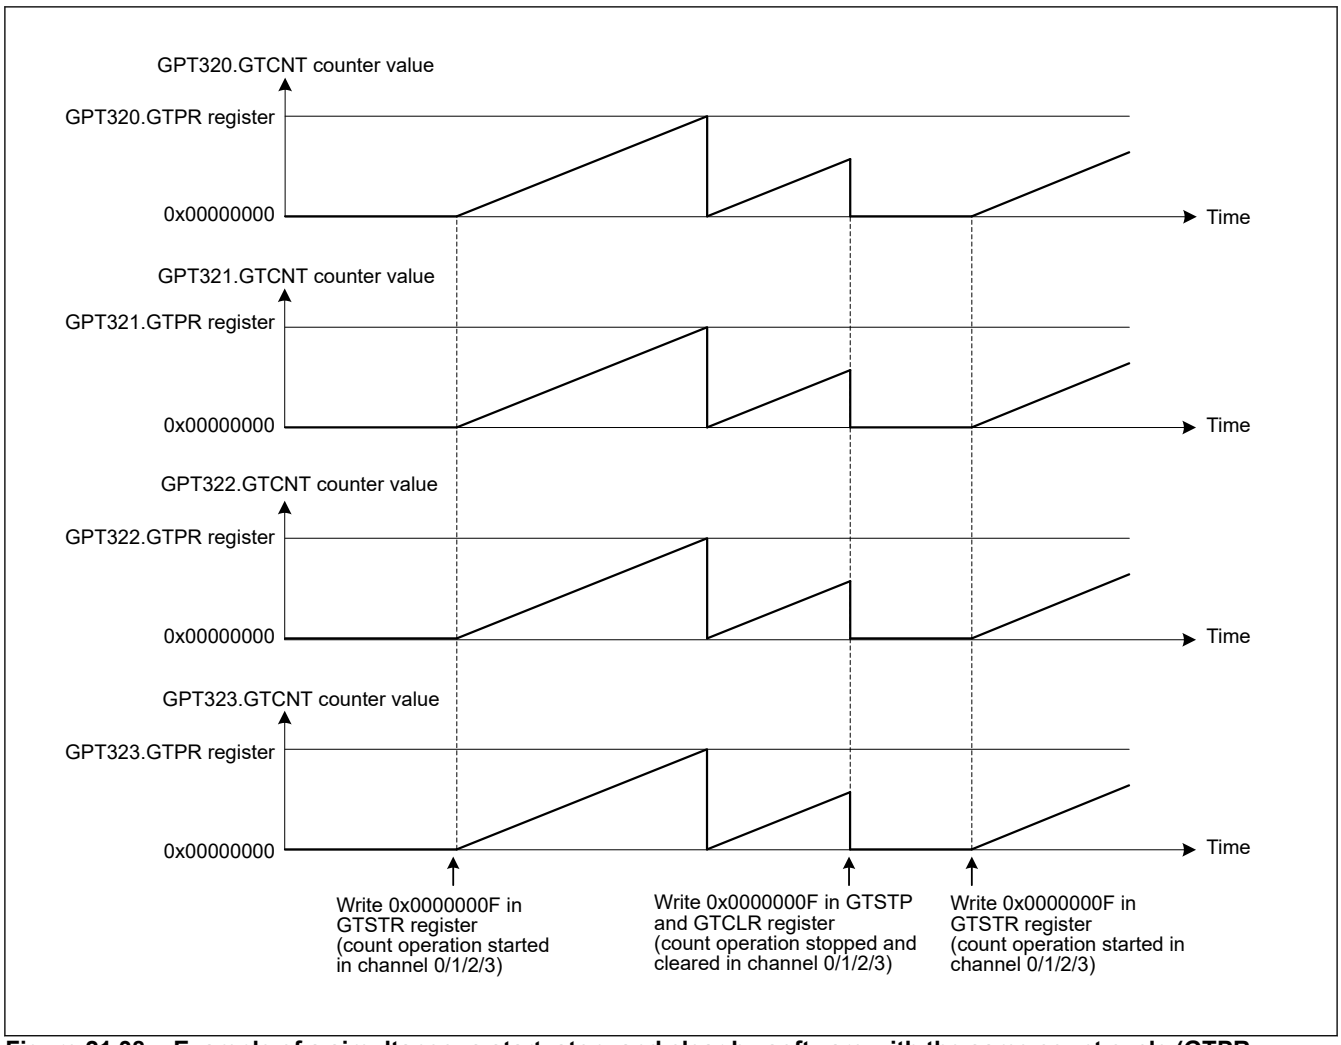

Figure 21.38 Example of a simultaneous start, stop, and clear by software with the same count cycle (GTPR register value)

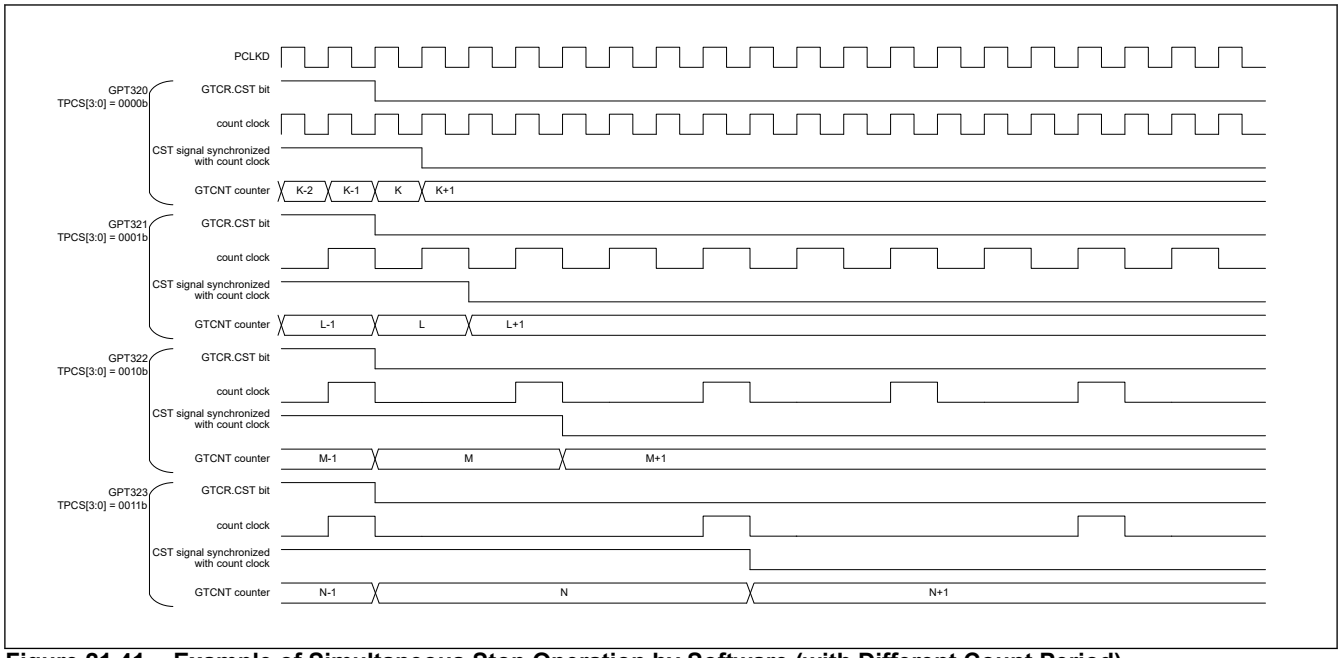

Figure 21.41 Example of Simultaneous Stop Operation by Software (with Different Count Period)

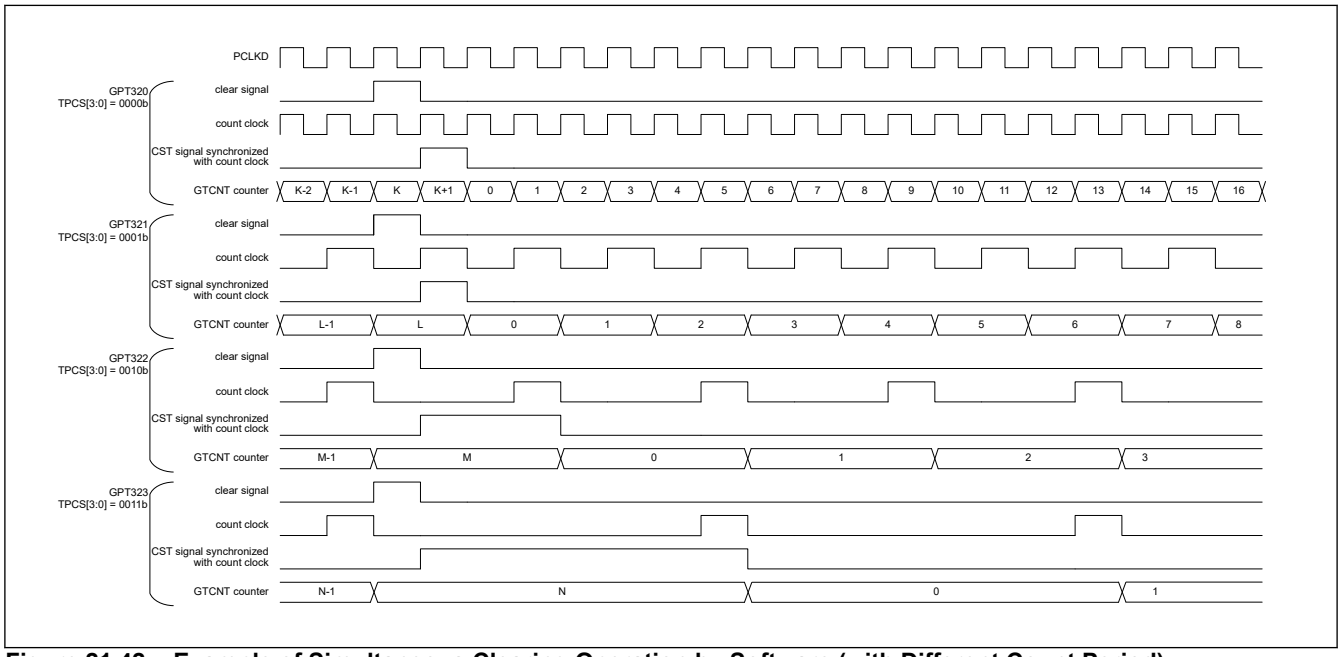

Figure 21.42 Example of Simultaneous Clearing Operation by Software (with Different Count Period)

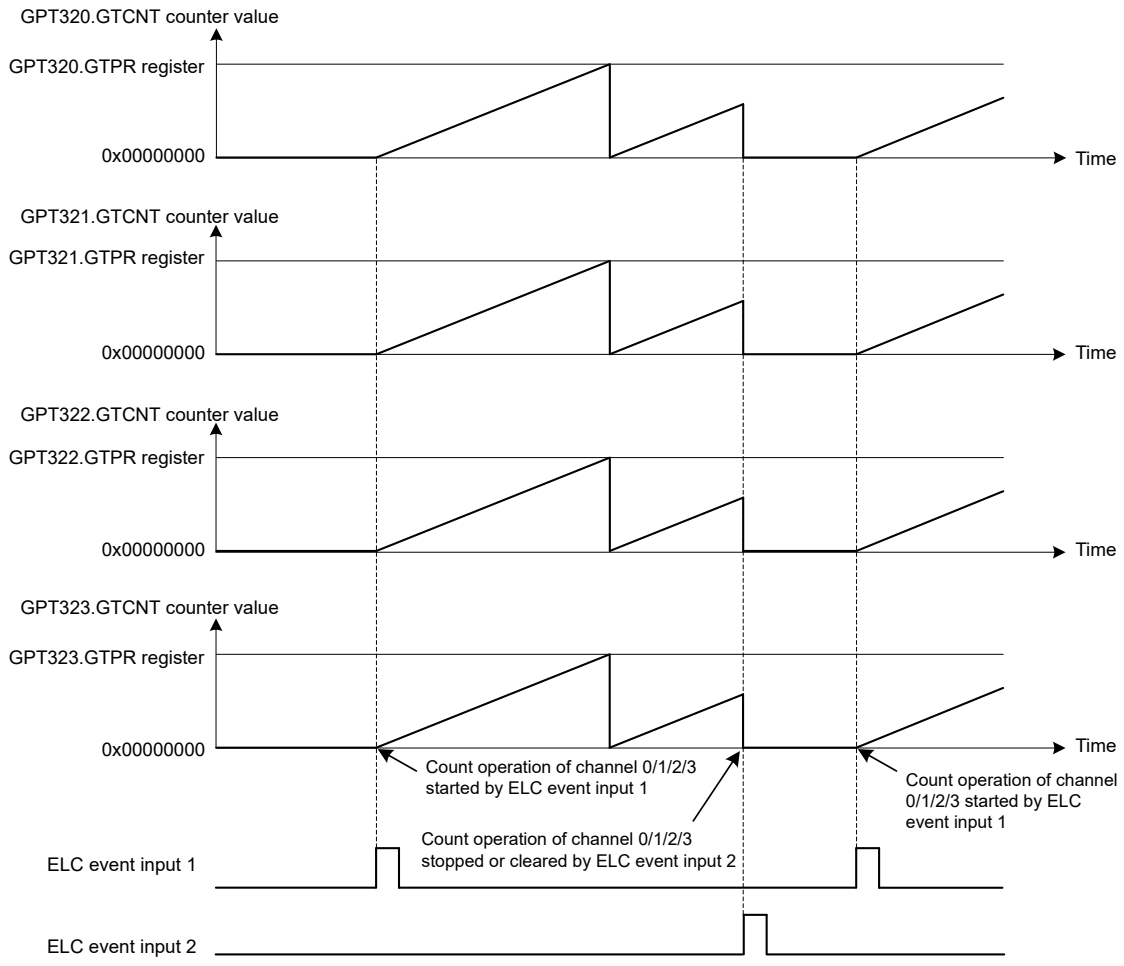
21.3.8.2 Synchronized Operation by Hardware

The counters for multiple channels can be started, stopped, and cleared simultaneously by ELC event input.

Figure 21.43 shows an example of a simultaneous start, stop, and clear operation by a hardware source. Table 21.29 shows the setting example.



Note: ELC event input 1: ELCA event input
ELC event input 2: ELCB event input

Figure 21.43 Example of a simultaneous start, stop, and clear by a hardware source with the same count cycle (GTPR register value)

Table 21.29 Example setting for simultaneous start by a hardware source (1 of 2)

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.43, 000b (saw-wave PWM mode) is set.
2	Set count direction	Select the count direction (up or down) with the GTUDDTYC register. In Figure 21.43, after 11b is set in the GTUDDTYC[1:0] bits, 01b is set in the GTUDDTYC[1:0] bits (up-counting).
3	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
4	Set cycle	Set the cycle in the GTPR register.
5	Set initial value for counter	Set the initial value in the GTCNT counter. In Figure 21.43, 0x00000000 is set.
6	Set hardware count start	Select a hardware source for starting count operation with the GTSSR register, and wait for count start by the hardware source. In Figure 21.43, GTSSR.SSELCA = 1.

Table 21.29 Example setting for simultaneous start by a hardware source (2 of 2)

No.	Step Name	Description
7	Set hardware count stop	Select a hardware source for stopping count operation with the GTPSR register, and wait for count stop by the hardware source. In Figure 21.43, GTPSR.PSELCB = 1.
8	Set hardware count clear	Select a hardware source for clearing count operation with the GTCSR register, and wait for count clear by the hardware source. In Figure 21.43, GTCSR.CSELCB = 1.
9	Set hardware source operation	Set operation of the hardware source selected in the GTSSR, GTPSR, or GTCSR registers, and start, stop, or clear counting. In Figure 21.43, ELCA input and ELCB input are set.

21.3.9 PWM Output Operation Examples

(1) Synchronized PWM output

The GPT outputs 14 × 2 phases of linked PWM waveforms for a maximum of GPT × 14 channels.

Figure 21.44 shows an example in which four channels perform synchronized operation in saw-wave PWM mode and eight phases of PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB is set so that it outputs low as the initial value, high at a GTCCRB compare match, and low at the cycle end.

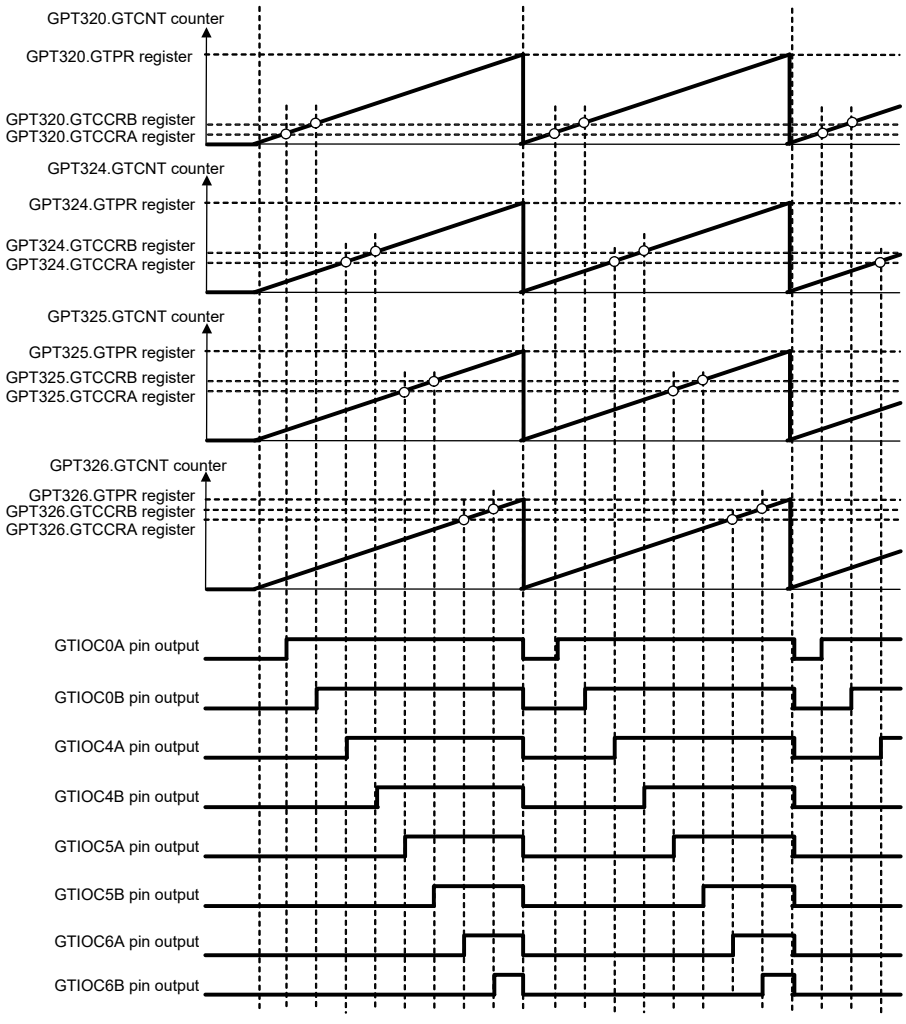


Figure 21.44 Example of synchronized PWM output

(2) 3-phase saw-wave complementary PWM output

Figure 21.45 shows an example in which three channels perform synchronized operation in saw-wave PWM mode and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, high at a GTCCRA compare match, and low at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, low at a GTCCRB compare match, and high at the cycle end.

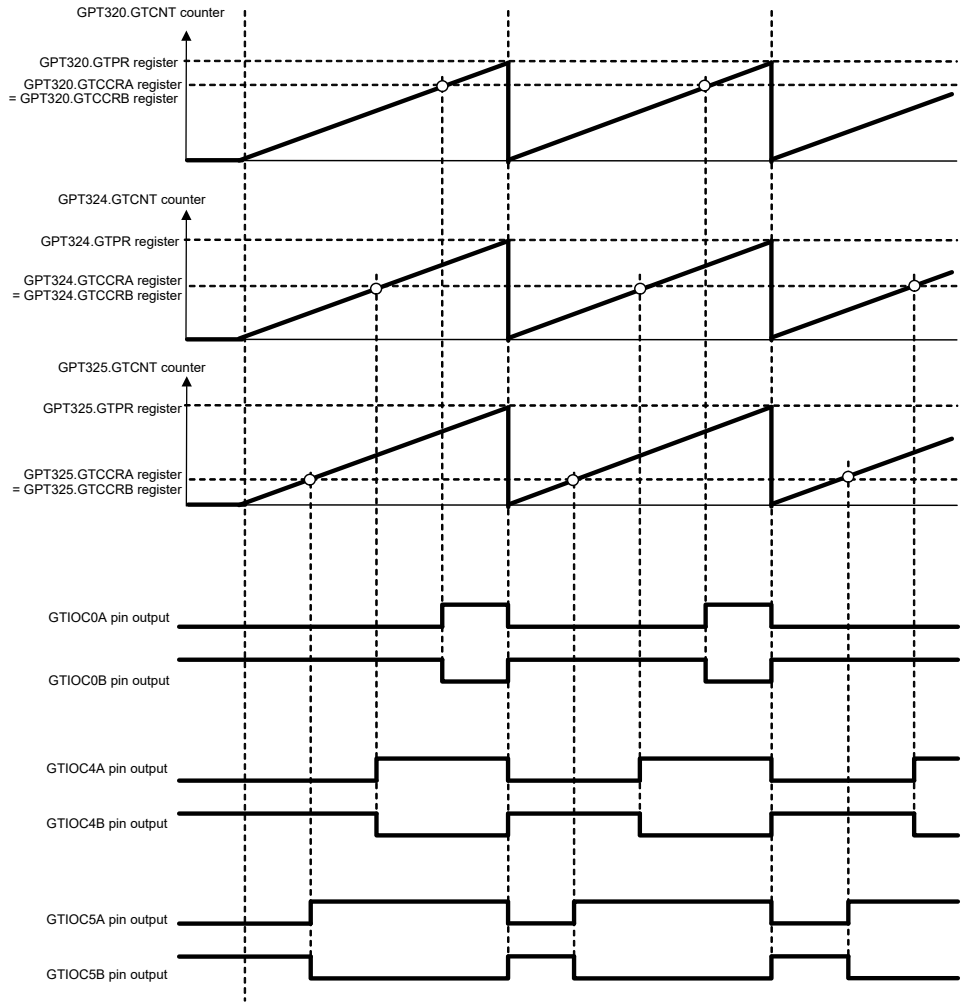

Figure 21.45 Example of 3-phase saw-wave complementary PWM output

(3) 3-phase saw-wave complementary PWM output with automatic dead time setting

Figure 21.46 shows an example in which three channels perform synchronized operation in saw-wave one-shot pulse mode with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTIOCnB compare match, and retains the output at the cycle end.

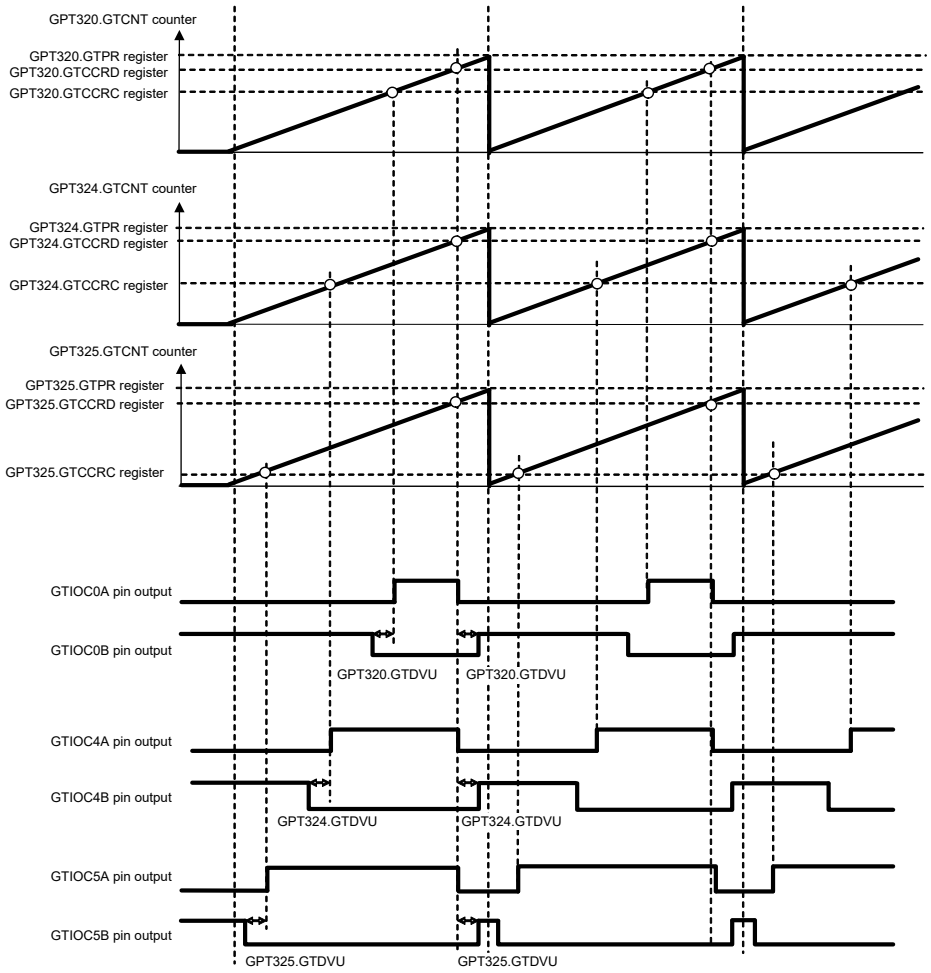

Figure 21.46 Example of 3-phase saw-wave complementary PWM output with automatic dead time setting

(4) 3-phase triangle-wave complementary PWM output

Figure 21.47 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

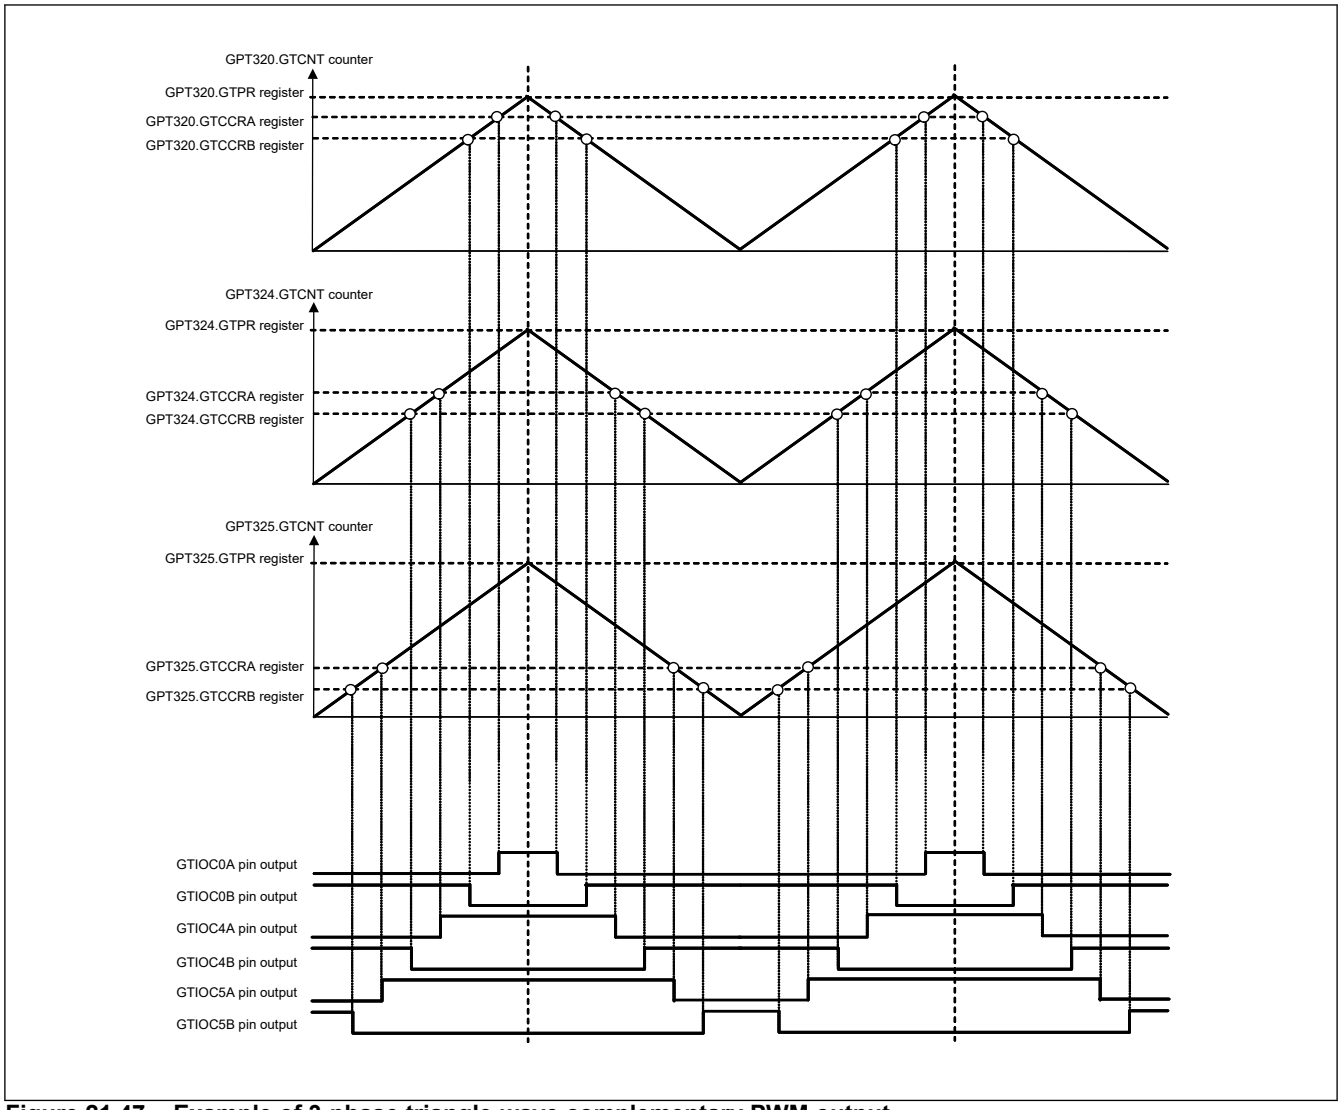

Figure 21.47 Example of 3-phase triangle-wave complementary PWM output

(5) 3-phase triangle-wave complementary PWM output with automatic dead time setting

Figure 21.48 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 1 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA pin is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB pin is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

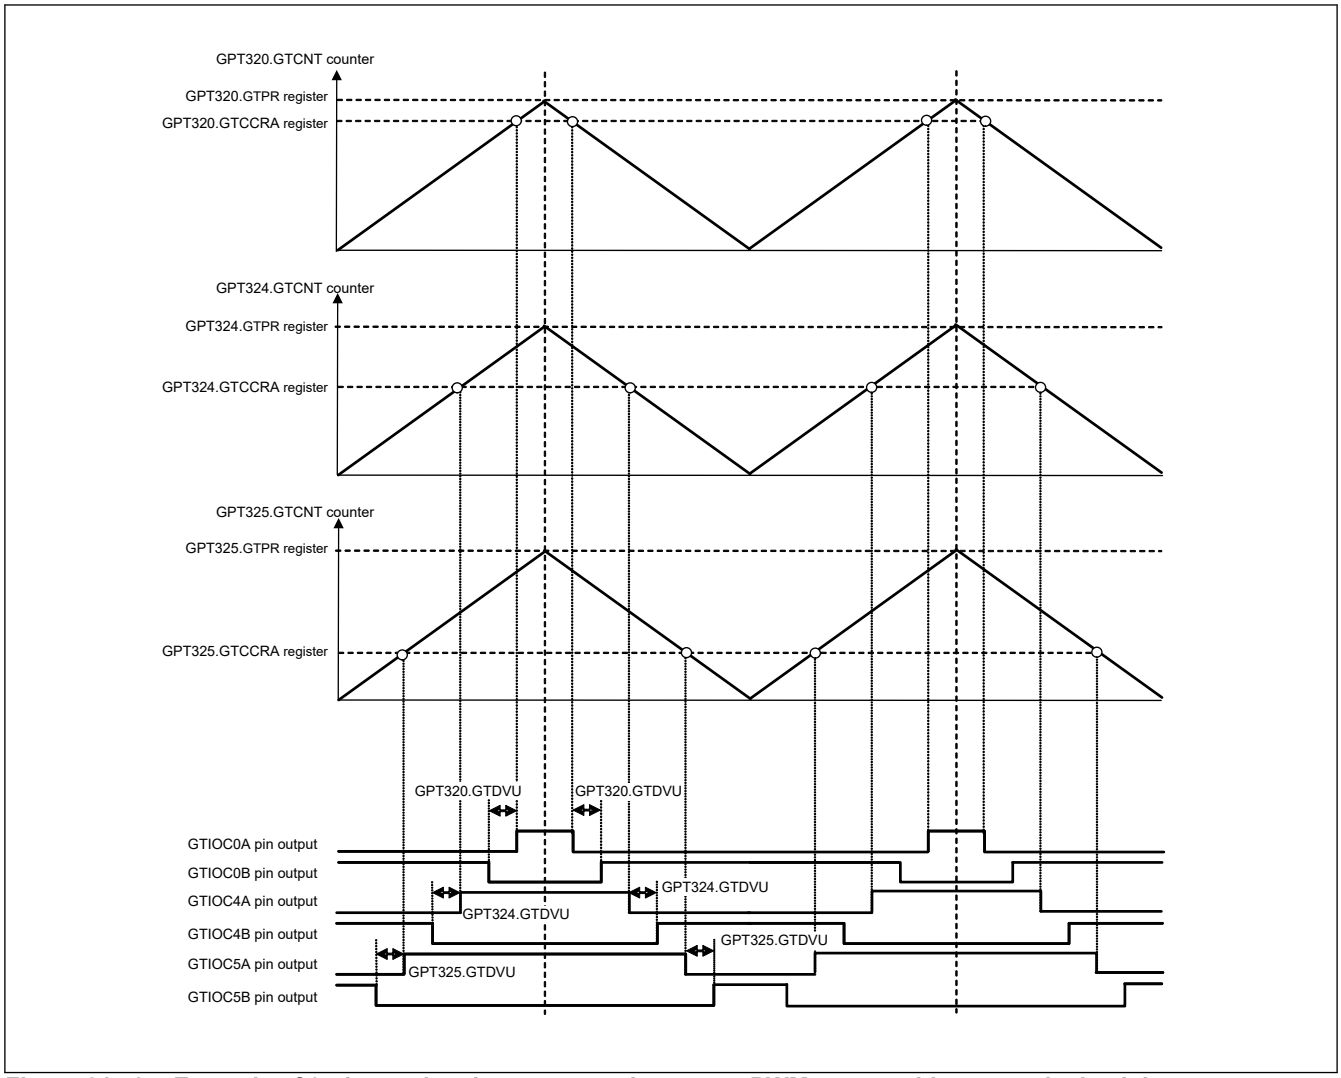

Figure 21.48 Example of 3-phase triangle-wave complementary PWM output with automatic dead time setting

(6) 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

Figure 21.49 shows an example in which three channels perform synchronized operation in triangle-wave PWM mode 3 with automatic dead time setting and 3-phase complementary PWM waveforms are output. The GTIOCnA is set so that it outputs low as the initial value, toggles the output at a GTCCRA compare match, and retains the output at the cycle end. The GTIOCnB is set so that it outputs high as the initial value, toggles the output at a GTCCRB compare match, and retains the output at the cycle end.

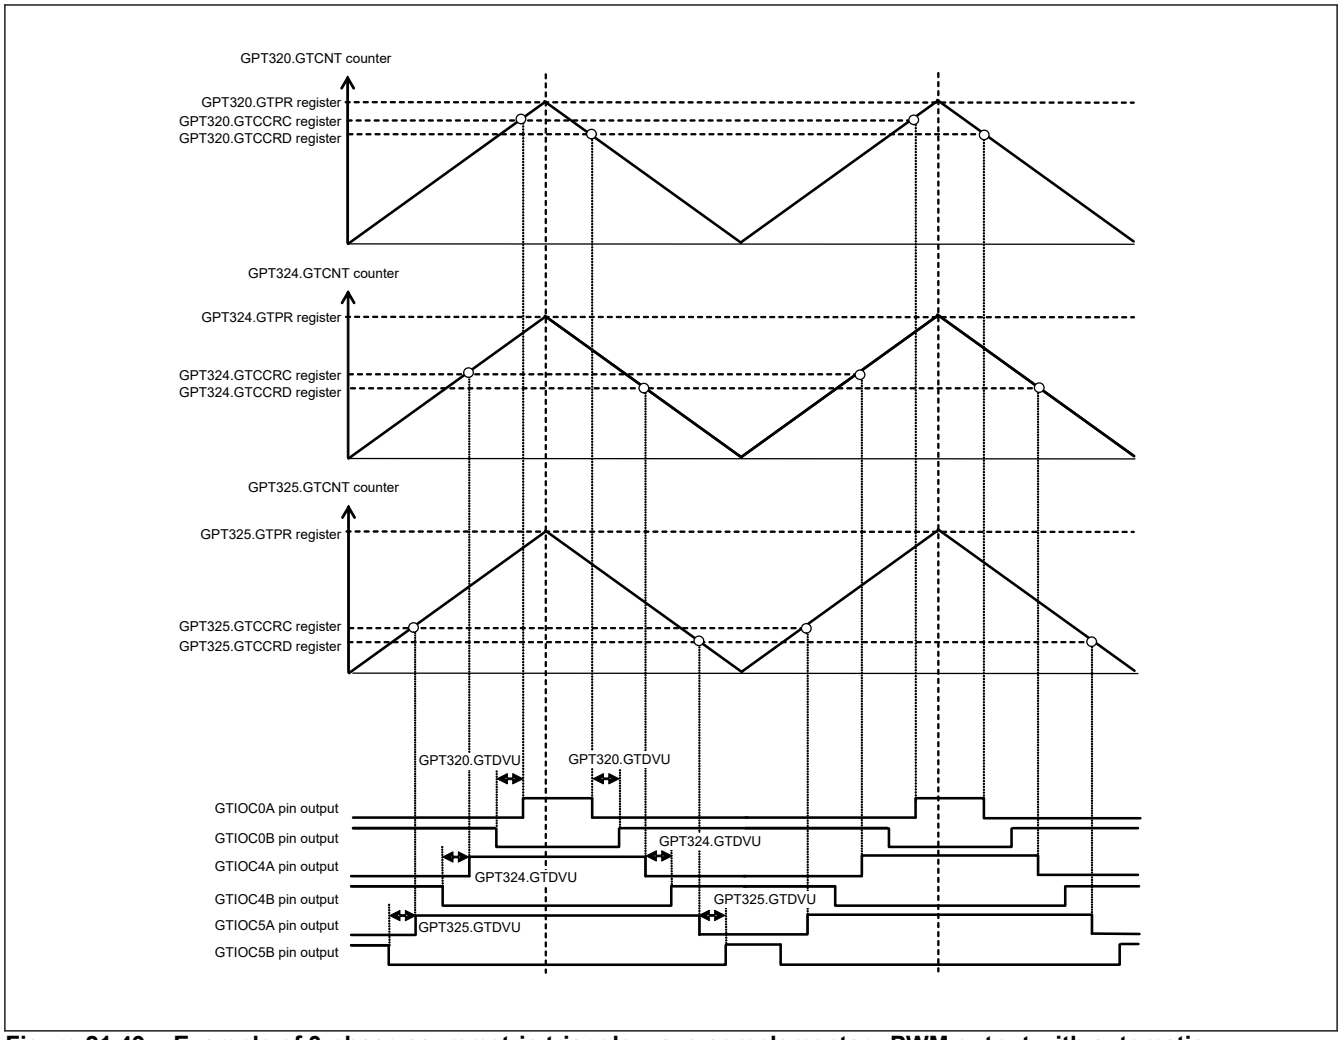

Figure 21.49 Example of 3-phase asymmetric triangle-wave complementary PWM output with automatic dead time setting

21.3.10 Period Count Function

By setting the GTPC register, the end of period can be counted.

The number of period to be counted should be set into the GTPC.PCNT counter when the GTPC.PCEN bit is 0. When the PCEN bit is 1, the PCNT counter can be read, but writing is disabled. When the PCEN bit is 1, down-counting is performed at the end of period. When the PCNT counter is 1 at the end of period, it becomes 0 and counting is stopped to finish the period count function. At that time, the GTST.PCF flag is set, and the period count function finish interrupt request GPTn_PC is generated. When the GTPC.ASTP bit is 1, the GTCNT counter is also stopped at the same time that the period count function is finished.

When the GTCNT counter is stopped while period count function is enabled, the PCNT counter keeps its value. When the GTCNT counter restarts counting and the PCEN bit is 1, the PCNT counter restarts down-counting from the hold value.

When the PCEN bit is changed from 0 to 1 while the PCNT counter is 0 and the ASTP bit is 1, the GTCNT counter is stopped at the count clock immediately after that.

When either GTSECR.SPCE bit or GTSECR.SPCD bit is set to 1, the PCEN bit in the channels set to 1 by the GTSECSR register is simultaneously set the value to enable or disable the period count function for multiple channels.

Figure 21.50 and Figure 21.51 show examples of PWM cycle count function.

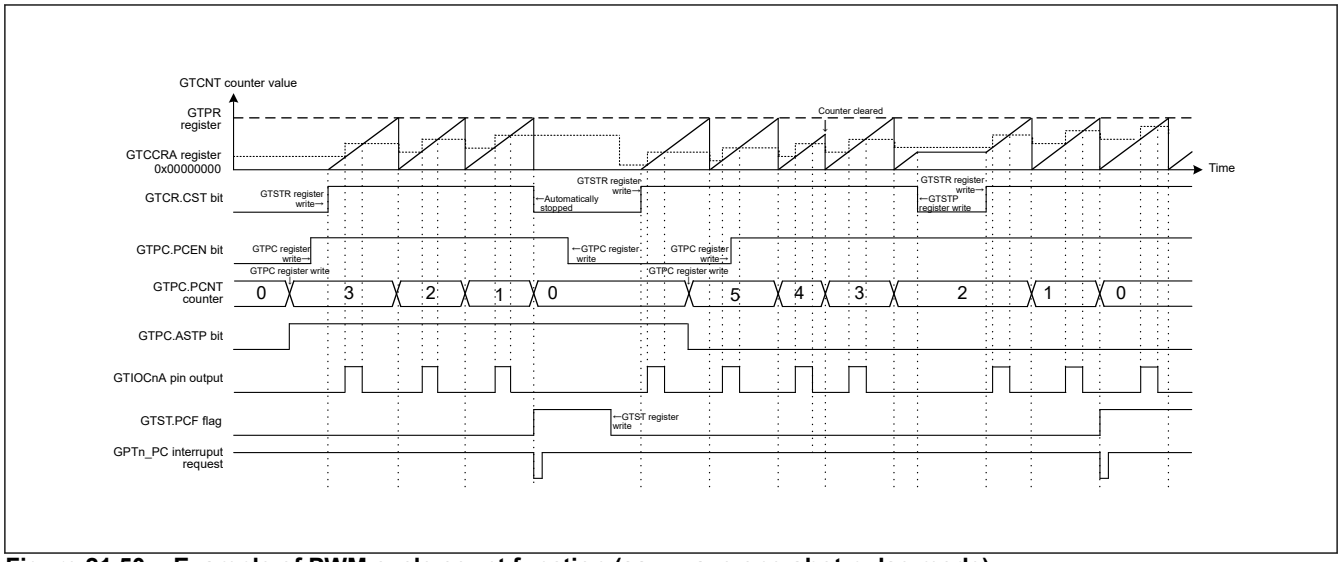

Figure 21.50 Example of PWM cycle count function (saw-wave one-shot pulse mode)

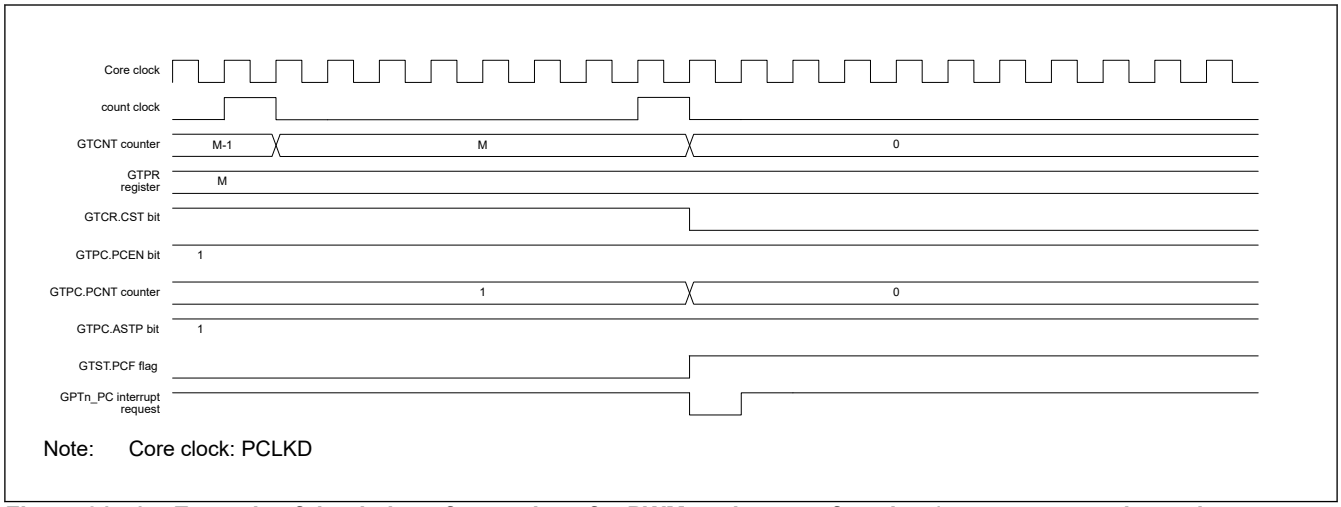

Note: Core clock: PCLKD

Figure 21.51 Example of the timing of operations for PWM cycle count function (saw-wave one-shot pulse mode, up-counting)

21.3.11 Phase Counting Function

The phase difference between the GTIOCnA and GTIOCnB pin (n = 0 to 13) inputs is detected and the associated GTCNT counts up or counts down. The detectable phase difference is available in any combination with the relationship between the edge and the level of GTIOCnA and GTIOCnB pin inputs being set in the GTUPSR and GTDNSR registers. For details on count operation, see section 21.3.1.1. Counter operation.

Figure 21.52 to Figure 21.61 show an example of phase counting modes 1 to 5 operation when the GTIOCnA, GTIOCnB pins are used. Table 21.30 to Table 21.39 show conditions of up-counting or down-counting and list settings for the GTUPSR and GTDNSR registers which is corresponding to Figure 21.52 to Figure 21.61.

21.3.12 Output Phase Switching (GPT_OPS)

GPT_OPS provides a function for easy control of brushless DC motor operation using the Output Phase Switching Control Register (OPSCR).

GPT_OPS outputs a PWM signal to be used for chopper control or level signal for each phase (U-positive phase/negative phase, V-positive phase/negative phase, W-positive phase/negative phase) of the 6-phase motor control. This function uses a soft setting value (OPSCR.UF, VF, WF) set by software or external signals detected by the Hall element, a PWM waveform of GPT320.GTIOC0A.

Figure 21.62 shows the conceptual diagram of GPT_OPS control flow.

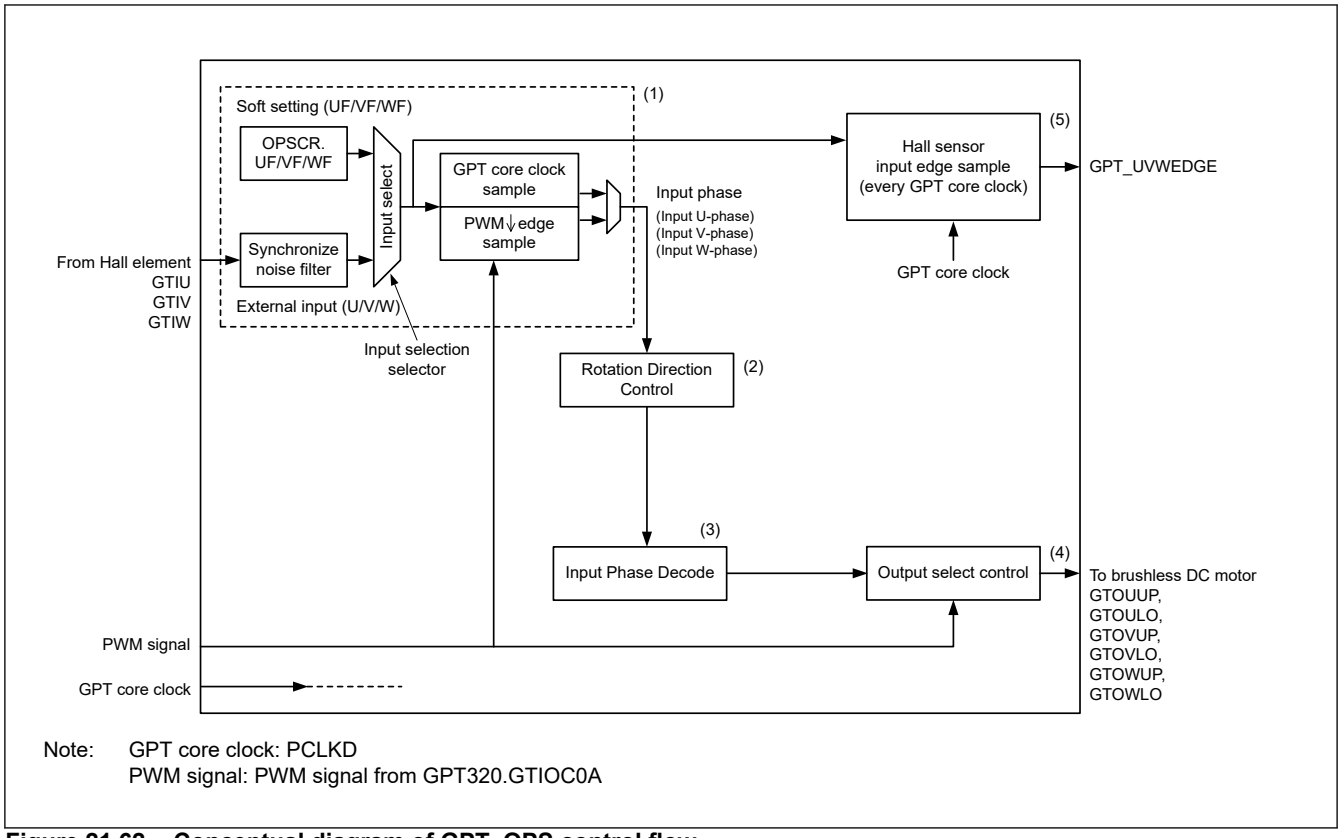

Figure 21.62 Conceptual diagram of GPT_OPS control flow

Figure 21.63 and Figure 21.64 shows a 6-phase level signals output example of a GPT_OPS operation.

The GPT_UVWEDGE signal in Figure 21.63 is the Hall sensor input edge that outputs to the ELC.

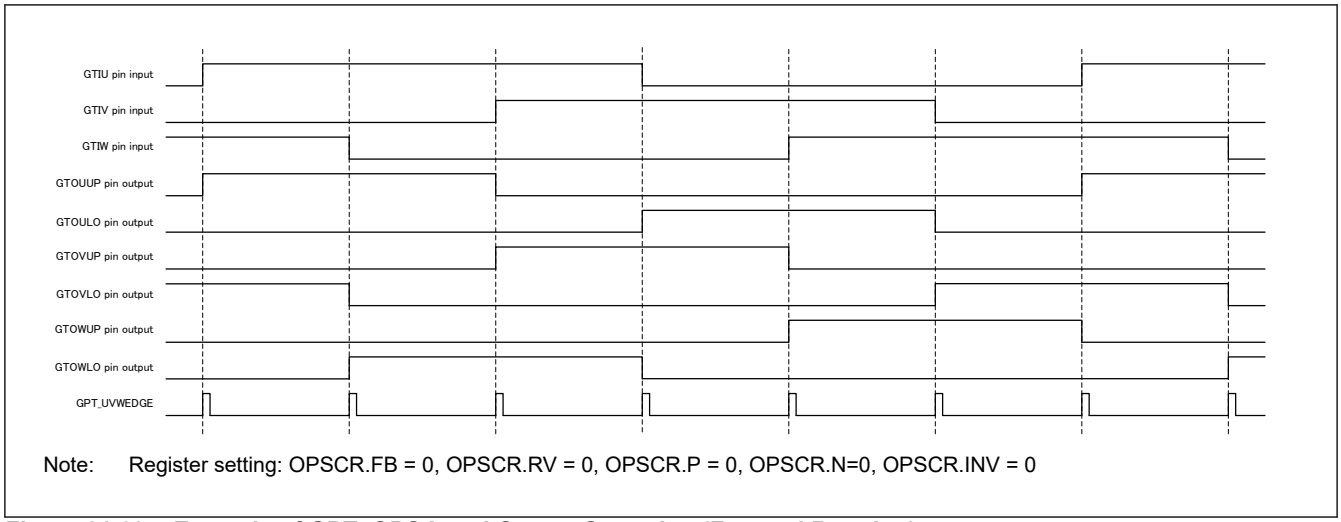

Figure 21.63 Example of GPT_OPS Level Output Operation (Forward Rotation)

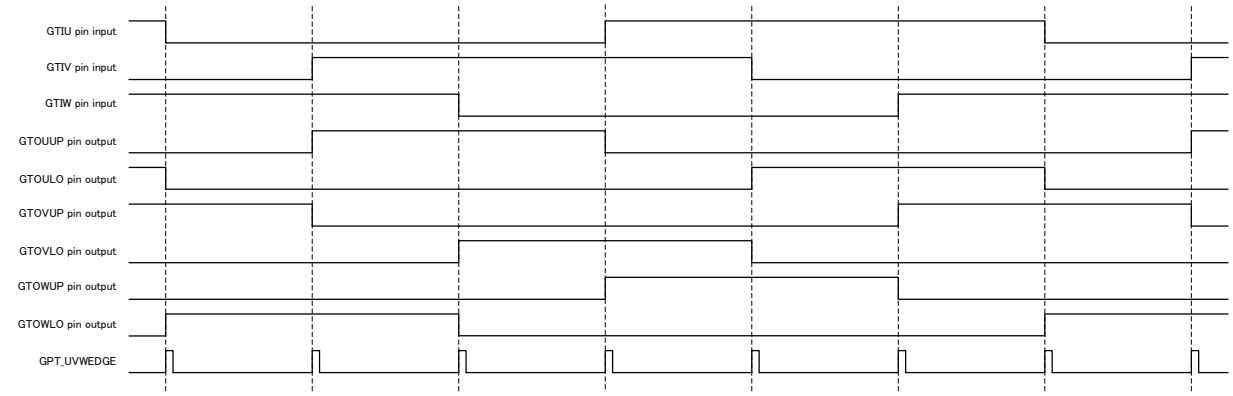
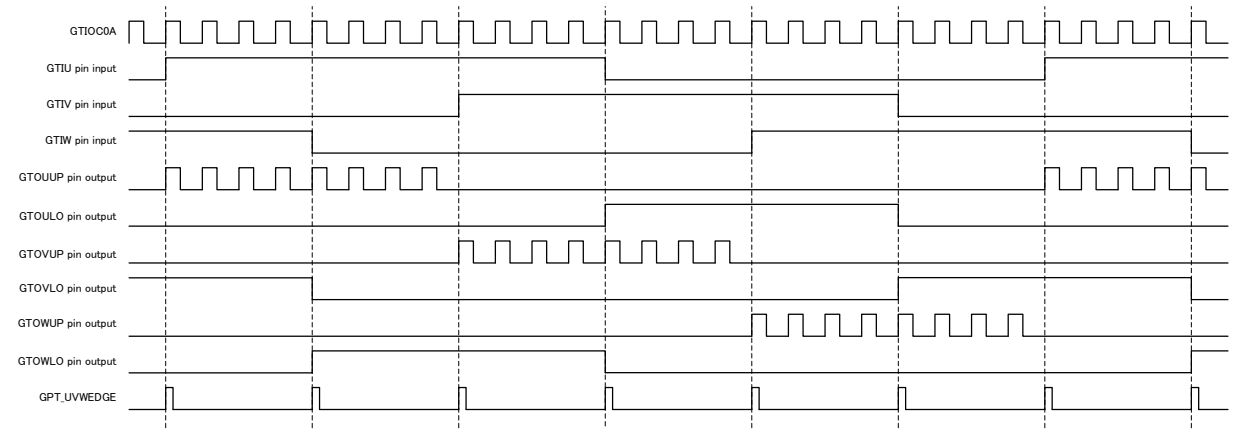


Note: Register setting: OPSCR.FB = 0, OPSCR.RV = 1, OPSCR.P = 0, OPSCR.N = 0, OPSCR.INV = 0

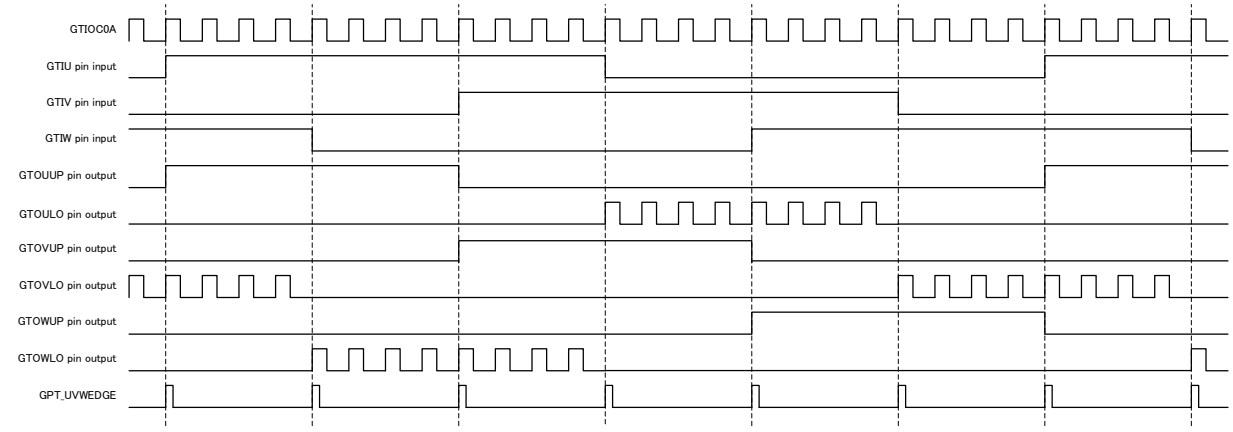
Figure 21.64 Example of GPT_OPS Level Output Operation (Reverse Rotation)

Figure 21.65 and Figure 21.66 shows a 6-phase PWM output example of a GPT_OPS operation with chopper control.



Note: Register setting: OPSCR.FB = 0, OPSCR.RV = 0, OPSCR.P = 1, OPSCR.N = 0, OPSCR.INV = 0

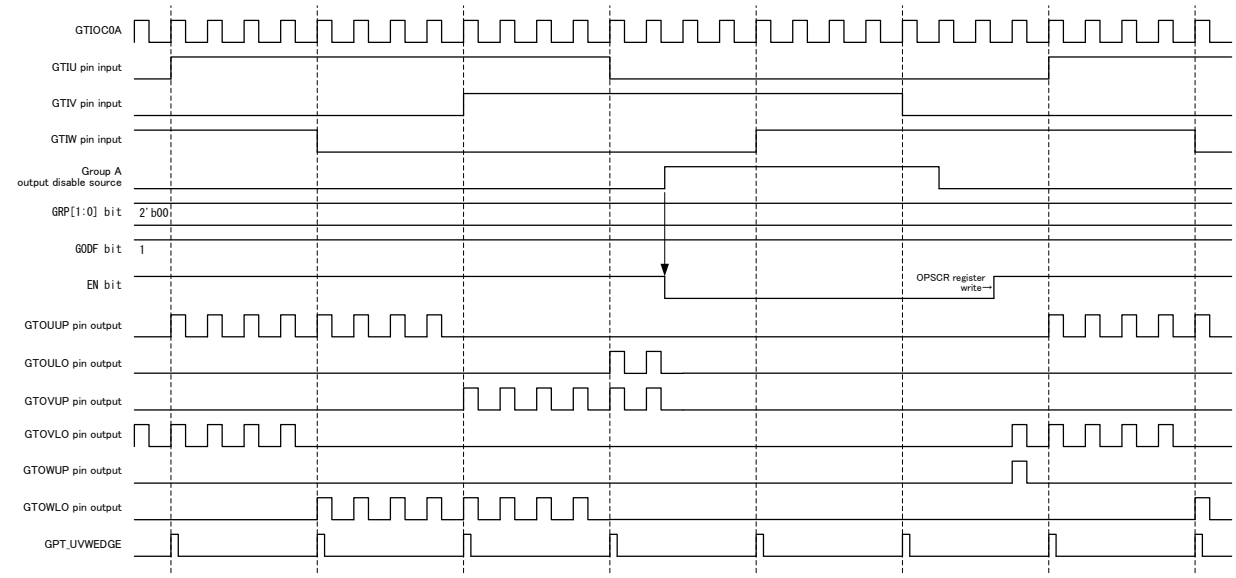
Figure 21.65 Example of GPT_OPS Chopped Output Operation (Positive Phase 120-degree)



Note: Register setting: OPSCR.FB = 0, OPSCR.RV = 0, OPSCR.P = 0, OPSCR.N = 1, OPSCR.INV = 0

Figure 21.66 Example of GPT_OPS Chopped Output Operation (Negative Phase 120-degree)

Figure 21.67 shows a 6-phase PWM output example of an output disable control operation.



Note: Register settings: OPSCR.FB = 0, OPSCR.RV = 0, OPSCR.P = 1, OPSCR.N = 1, OPSCR.INV = 0

Figure 21.67 Example of group output disable control operation

21.3.12.1 Input Selection and Synchronization of External Input Signal

In the GPT_OPS control flow conceptual diagram shown in Figure 21.62, (1) is a selection of input phase from the software settings and external input by the OPSCR.FB bit.

When OPSCR.FB bit is 0, select the external input. Enable the input signal after synchronization with the GPT core clock (PCLKD). After carrying out noise filtering (optional), set the external input to the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.FB bit is 1, select the soft setting (OPSCR.UF, VF, WF) with the value of the input phase of PWM (PWM of GPT320.GTIOC0A) using falling edge sampling with OPSCR.ALIGN bit set to 1.

When OPSCR.ALIGN bit is 0, GPT_OPS operates with the input phase of PCLKD synchronization with either OPSCR.FB bit set to 0 or OPSCR.FB bit set to 1. However, there are cases where the PWM pulse width of the output U/V/W phases (PWM output mode) of switch timing (just before/just after) is shortened.

Table 21.40 shows the input selection process and setting of associated OPSCR bits.

Table 21.40 Input selection processing method

Register OPSCR		Selection of input phase sampling method (U/V/W-phase)	Synchronization input/output selection process (GPT_OPS internal node name)
FB bit	ALIGN bit		
0	1	External Input at PWM Falling Edge Sampling (PCLKD synchronization + falling edge sample)	Input Phase Input U-Phase (gtu_sync) Input V-Phase (gtv_sync) Input W-Phase (gtw_sync)
	0	External Input at PCLKD Synchronization Output (PCLKD synchronization + through mode)	
1	1	Software Settings at PWM Falling Edge Sampling (OPSCR.UF, VF, WF of falling edge sample)	
	0	Software Setting Value Selection (= OPSCR.UF/VF/WF value) (= PCLKD synchronization)	

21.3.12.2 Input Sampling

The OPSCR.U, V, W bits indicate the PCLKD sampling results of the input selected in the OPSCR.FB bit.

When OPSCR.FB bit is 0 and after synchronization with the GPT core clock (PCLKD) and noise filtering (optional), OPSCR.U, V, W bits indicate the sampling results of the external input. When OPSCR.FB bit is 1, OPSCR.U, V, W bits are the value (OPSCR.UF, VF, WF) of the soft setting.

21.3.12.3 Input Phase Decode

In the GPT_OPS control flow conceptual diagram shown in Figure 21.62, (3) enables the 6-phase signals by decoding the input phase selected in the OPSCR.FB bit.

Table 21.41 shows the decode table of input phase when OPSCR.RV bit is 0.

Table 21.41 Decode table of input phase (OPSCR.RV = 0)

Input phase (U/V/W) (GPT_OPS internal node name)			6-phase enable {U/V/W (Up/Lo)} by decoding input phase (GPT_OPS internal node name)					
Input U-Phase	Input V-Phase	Input W-Phase	U-phase (Up)	U-phase (Lo)	V-phase (Up)	V-phase (Lo)	W-phase (Up)	W-phase (Lo)
(gtu_sync)	(gtv_sync)	(gtw_sync)	(gtuup_en)	(gtulo_en)	(gtvup_en)	(gtvlo_en)	(gtwup_en)	(gtwlo_en)
1	0	1	1	0	0	1	0	0
1	0	0	1	0	0	0	0	1

21.3.12.4 Rotation Direction Control

In the GPT_OPS control flow conceptual diagram shown in Figure 21.62, (2) controls the direction of rotation of a 3-phase motor using the OPSCR.RV bit.

When the rotation direction is reverse (RV bit = 1), the input phase is inverted.

Table 21.43 shows the assigned output phases based on the OPSCR.RV bit setting (before and after rotation direction control).

Table 21.43 Rotation Direction Control Method

Reversal of Direction of Rotation Using Output Phases as Specified in OPSCR Register	Output of Rotation Direction Control [U/V/W (Positive/Negative)] (GPT_OPS Internal Node Name after Control)					
OPSCR.RV bit	(gtuup_ren)	(gtulo_ren)	(gtvup_ren)	(gtvlo_ren)	(gtwup_ren)	(gtwlo_ren)
0	U-phase (Up) (gtuup_en)	U-phase (Lo) (gtulo_en)	V-phase (Up) (gtvup_en)	V-phase (Lo) (gtvlo_en)	W-phase (Up) (gtwup_en)	W-phase (Lo) (gtwlo_en)
1	U-phase (Up) (gtuup_en)	U-phase (Lo) (gtulo_en)	W-phase (Up) (gtwup_en)	W-phase (Lo) (gtwlo_en)	V-phase (Up) (gtvup_en)	V-phase (Lo) (gtvlo_en)

21.3.12.5 Output Selection Control

In the GPT_OPS control flow conceptual diagram in Figure 21.62, (4) represents the selection of the output waveform by setting the OPSCR register bit.

For output selection, the following bits are relevant:

- The OPSCR.EN bit controls whether to output the 6-phase output, or to stop
- The OPSCR.P and OPSCR.N bits can select from the level signal or PWM signal (chopper output) for the output phase
- The polarity of the output phase can be set to a positive logic or negative logic by the OPSCR. INV bit.

Table 21.44 and Table 21.45 show the output selection control method using the OPSCR register bit.

Table 21.44 Output selection control method (positive phase)

Enable-phase output control	Positive-phase output (P) control	Invert-phase output control	Output port name (positive phase = up) (output selection internal node allocation)	
OPSCR.EN	OPSCR.P	OPSCR.INV	GTOUUP GTOVUP GTOWUP	Mode
0	x	x	0	Output Stop (External pin: Hi-Z) GPT_OPS → 0 output
1	0	0	Level signal (gtuup_ren) (gtvup_ren) (gtwup_ren)	Level Output Mode (Positive phase) (Positive logic)
1	0	1	Level signal (~gtuup_ren) (~gtvup_ren) (~gtwup_ren)	Level Output Mode (Positive phase) (Negative logic)
1	1	0	PWM signal (PWM & gtuup_ren) (PWM & gtvup_ren) (PWM & gtwup_ren)	PWM Output Mode (Positive phase) (Positive logic)
1	1	1	PWM signal (~(PWM & gtuup_ren)) (~(PWM & gtvup_ren)) (~(PWM & gtwup_ren))	PWM Output Mode (Positive phase) (Negative logic)

Table 21.45 Output selection control method (negative phase)

Enable-phase output control	Positive-phase output (N) control	Invert-phase output control	Output port name (negative phase = Lo) (output selection internal node allocation)	
OPSCR.EN	OPSCR.N	OPSCR.INV	GTOULO GTOVLO GTOWLO	Mode
0	x	x	0	Output Stop (External pin: Hi-Z) GPT_OPS → 0 output
1	0	0	Level signal (gtulo_ren) (gtvlo_ren) (gtwlo_ren)	Level Output Mode (Negative phase) (Positive logic)
1	0	1	Level signal (~gtulo_ren) (~gtvlo_ren) (~gtwlo_ren)	Level Output Mode (Negative phase) (Negative logic)
1	1	0	PWM signal (PWM & gtulo_ren) (PWM & gtvlo_ren) (PWM & gtwlo_ren)	PWM Output Mode (Negative phase) (Positive logic)
1	1	1	PWM signal (~(PWM & gtulo_ren)) (~(PWM & gtvlo_ren)) (~(PWM & gtwlo_ren))	PWM Output Mode (Negative phase) (Negative logic)

21.3.12.6 Output Selection Control (Group Output Disable Function)

When OPSCR.GODF is 1 and the signal value selected by the OPSCR.GRP bit is high (output disable request), the group output-disable function asynchronously sets the output to Hi-Z. When an output-disable request is generated, the OPSCR.EN bit is cleared to 0. For the return, set the OPSCR.EN bit to 1 after clearing the output disable request by software.

To ensure output-disable control, use the POEG_GROUPn (n = A to D) interrupt to clear the flag in the POE or check that the OPSCR.EN bit is 0 and then clear the flag. For an example of the operation for group output disable control, see Figure 21.67.

21.3.12.7 Event Link Controller (ELC) Output

In the GPT_OPS control flow conceptual diagram shown in Figure 21.62, (5) outputs the Hall sensor input signal edge to the ELC.

The Hall sensor input edge signal is the logical OR of the rising and falling edge signals of each U-phase/V-phase/W-phase input sampled at PCLKD. That is, if the high period of each of the U-phase/V-phase/W-phase of the input phase is short in duration, the Hall sensor edge input signal is not output at that time.

When the OPSCR.FB bit is 0, the Hall sensor input edge signal is the logical OR of the edge signals of the external input phase sampled at PCLKD.

When OPSCR.FB bit is 1, the Hall sensor input edge signal is the logical OR of the edge of the soft setting (OPSCR.UF, VF, WF) sampled at PCLKD.

See Figure 21.63 to Figure 21.67 for examples of the output signal to the ELC.

21.3.12.8 GPT_OPS Start Operation Setting Flow

Table 21.46 Example setting of GPT_OPS start operation (1 of 2)

No.	Step Name	Description
1	GPT32n operation mode setting	GPT320.GTIOC0A set the PWM output operation mode of the saw-wave or triangle-wave. For details, see section 21.3.3. PWM Output Operating Mode.
2	Counting of GPT32n	Start the count operation of GPT32n, and outputs a PWM waveform.

Table 21.46 Example setting of GPT_OPS start operation (2 of 2)

No.	Step Name	Description
3	GPT_OPS input data set (only software setting is selected)	Set software setting to OPSCR.UF, VF, and WF bits.
4	Noise filter settings of GPT_OPS external input (only external input is selected)	When using a noise filter, set the sampling clock of the noise filter by OPSCR.NFCS[1:0] bits. Then the noise filter is enabled if OPSCR.NFEN = 1.
5	GPT_OPS input phase selection setting/input phase alignment setting	Select the input phase from the external input or software setting by OPSCR.FB bit. Select the alignment of the input phase by OPSCR.ALIGN bit.
6	Setting the GPT_OPS output phase	Set the level output/PWM output of the positive/negative phase output by OPSCR.P/OPSCR.N bit. Set the positive logic/negative logic of the output phase by OPSCR.INV bit. Set the rotation direction by OPSCR.RV bit
7	GPT_OPS setting the group output disable function	Set the selection of output disable source by OPSCR.GRP bit. Perform the setting of on/off of the group output disable function by OPSCR.GODF bit.
8	GPT_OPS Working	Setting the OPSCR.EN = 1 outputs the 6-phase output to drive the brushless DC motor from the GPT_OPS.

21.3.13 Inter Channel Logical Operation Function

The logical operation function between compare match outputs can be performed.

Figure 21.68 shows the block diagram of inter channel logical operation.

To prevent hazard to the GPT output, the signal after logical operation is latched with PCLKD. After latching, the output disable control is performed.

When the logical operation function which causes the delay of 1 PCLKD is selected, the output enable signal is also delayed with 1 PCLKD and input to the output disable control.

When the same signal (C = A or D = B) to operate logical function AND, OR, EXOR and NOR is selected, C or D is treated as 1. In the case of GTIOCnA pin output, when A of same channel is selected for C, the result of AND is A, the result of OR is 1, the result of EXOR is NOT A, and the result of NOR is 0.

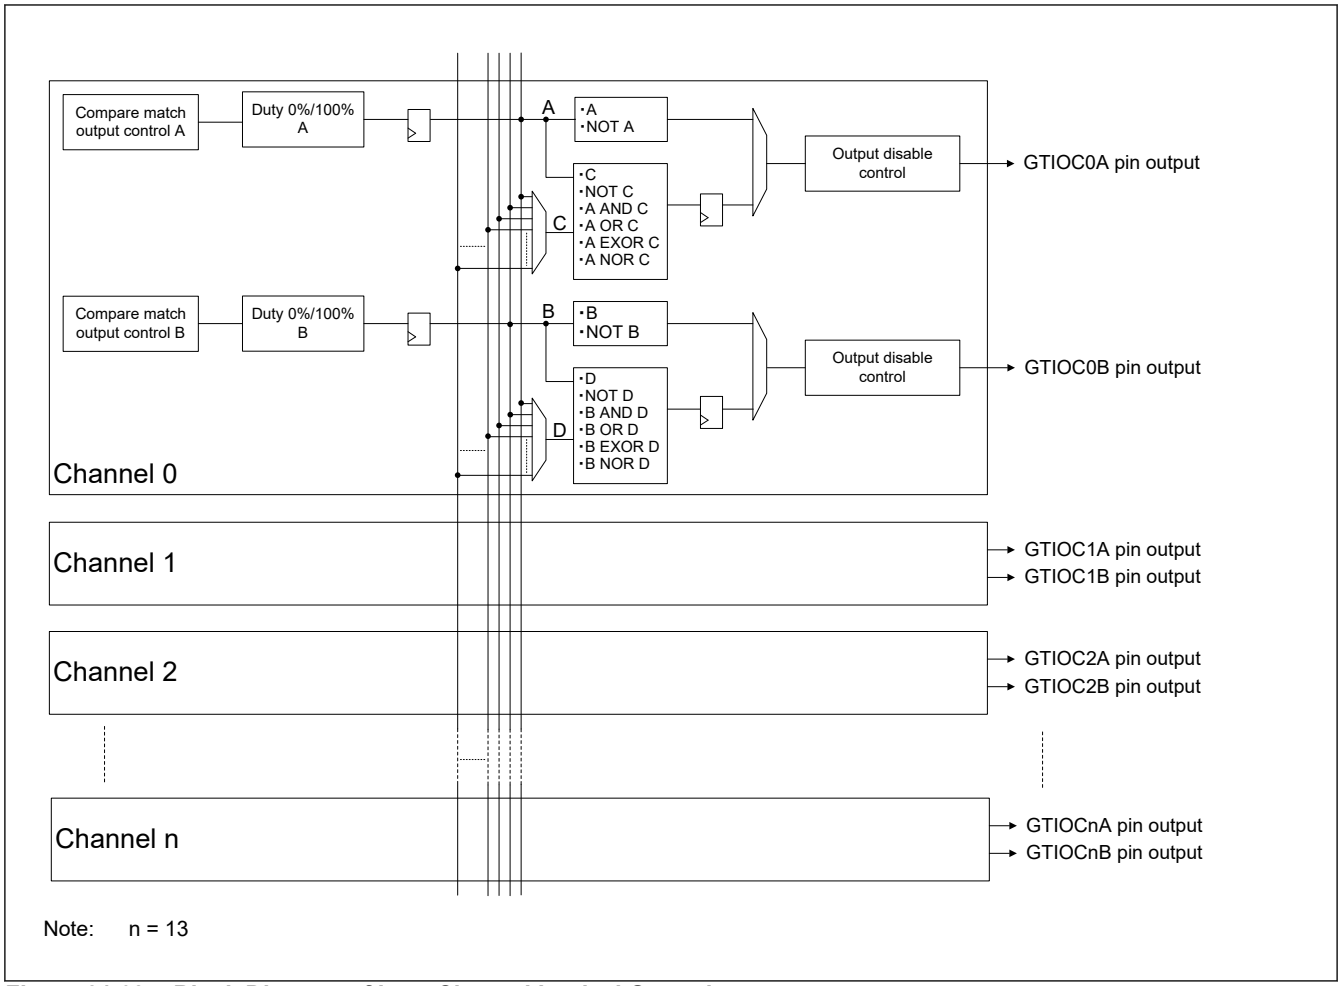

Figure 21.68 Block Diagram of Inter Channel Logical Operation

Figure 21.69 shows an example of inter channel logical operation.

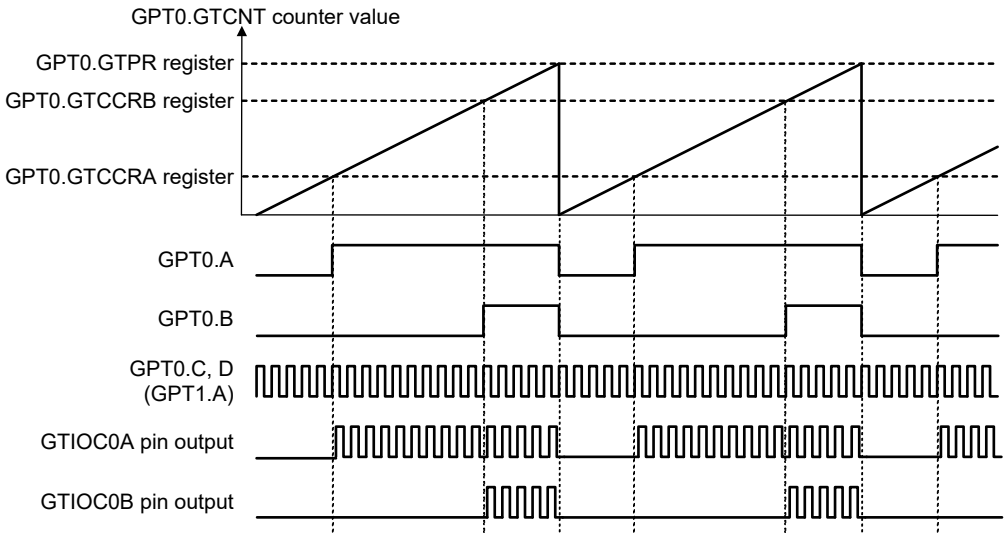

Figure 21.69 Example of Inter Channel Logical Operation

21.4 Interrupt Sources

21.4.1 Interrupt Sources

The GPT provides the following interrupt sources:

- GTCCR input capture/compare match
- GTCNT counter overflow (GTPR compare match)/underflow.
- Period count function finish

Each interrupt source has its own status flag. When an interrupt source signal is generated, the associated status flag in GTST is set to 1, and an interrupt request is generated. The associated status flag in GTST can be cleared by writing 0. If flag set and flag clear occur at the same time, flag clear takes priority over flag set. These flags are automatically updated by the internal state. The Interrupt Controller Unit can change the relative channel priorities. However, the priority within a channel is fixed. For details, see section 13, Interrupt Controller Unit (ICU).

Table 21.47 lists the GPT interrupt sources.

Table 21.47 Interrupt sources

Channel	Name	Interrupt source	Interrupt flag	DTC activation
n = 0 to 7	GPTn_CCMPA	GPT32n.GTCCRA input capture/compare match	GTST[0] (TCFA)	Possible
	GPTn_CCMPB	GPT32n.GTCCRB input capture/compare match	GTST[1] (TCFB)	Possible
	GPTn_CMPC	GPT32n.GTCCRC compare match	GTST[2] (TCFC)	Possible
	GPTn_CMPD	GPT32n.GTCCRD compare match	GTST[3] (TCFD)	Possible
	GPTn_CMPE	GPT32n.GTCCRE compare match	GTST[4] (TCFE)	Possible
	GPTn_CMPF	GPT32n.GTCCRF compare match	GTST[5] (TCFF)	Possible
	GPTn_OVF	GPT32n.GTCNT overflow (GPT32n.GTPR compare match)	GTST[6] (TCFPO)	Possible
	GPTn_UDF	GPT32n.GTCNT underflow	GTST[7] (TCFPU)	Possible
	GPTn_PC	Period count function finish (n = 0 to 3)	GTST[31] (PCF)	Possible
n = 8 to 13	GPTn_CCMPA	GPT16n.GTCCRA input capture/compare match	GTST[0] (TCFA)	Possible
	GPTn_CCMPB	GPT16n.GTCCRB input capture/compare match	GTST[1] (TCFB)	Possible
	GPTn_CMPC	GPT16n.GTCCRC compare match	GTST[2] (TCFC)	Possible
	GPTn_CMPD	GPT16n.GTCCRD compare match	GTST[3] (TCFD)	Possible
	GPTn_CMPE	GPT16n.GTCCRE compare match	GTST[4] (TCFE)	Possible
	GPTn_CMPF	GPT16n.GTCCRF compare match	GTST[5] (TCFF)	Possible
	GPTn_OVF	GPT16n.GTCNT overflow (GPT32n.GTPR compare match)	GTST[6] (TCFPO)	Possible
	GPTn_UDF	GPT16n.GTCNT underflow	GTST[7] (TCFPU)	Possible
	GPTn_PC	Period count function finish (n = 8 to 10)	GTST[31] (PCF)	Possible

(1) GPTn_CCMPA interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRA register functions as a compare match register, the GTCNT counter value matches with the GTCCRA register
- When the GTCCRA register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRA register.

(2) GPTn_CCMPB interrupt (n = 0 to 13)

An interrupt request is generated under the following conditions:

- When the GTCCRB register functions as a compare match register, the GTCNT counter value matches with the GTCCRB register

- When the GTCCRB register functions as an input capture register, the input-capture signal causes transfer of the GTCNT counter value to the GTCCRB register.

(3) GPTn_CMPC interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRC register functions as a compare match register, the GTCNT counter value matches with the GTCCRC register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRC register).

(4) GPTn_CMPD interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRD register functions as a compare match register, the GTCNT counter value matches with the GTCCRD register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRA[1:0] = 10b, 11b (buffer operation with the GTCCRD register).

(5) GPTn_CMPE interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRE register functions as a compare match register, the GTCNT counter value matches with the GTCCRE register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 01b, 10b, 11b (buffer operation with the GTCCRE register).

(6) GPTn_CMPF interrupt (n = 0 to 13)

An interrupt request is generated under the following condition:

- When the GTCCRF register functions as a compare match register, the GTCNT counter value matches with the GTCCRF register.

A compare match is not performed and therefore, an interrupt is not requested in the following conditions:

- GTCR.MD[2:0] = 001b (saw-wave one-shot pulse mode)
- GTCR.MD[2:0] = 110b (triangle-wave PWM mode 3)
- GTBER.CCRB[1:0] = 10b, 11b (buffer operation with the GTCCRF register).

(7) GPTn_OVF interrupt (n = 0 to 13)

An interrupt request is generated in the following conditions:

- In saw-wave mode, interrupt requests are enabled at overflows (when the GTCNT counter value changes from GTPR to 0 during up-counting)
- In triangle-wave mode, interrupt requests are enabled at crests (the GTCNT changes from GTPR to GTPR-1)

- In counting by hardware sources, an overflow (GTCNT changes from GTPR to 0 in up count) has occurred.

(8) GPTn_UDF interrupt (n = 0 to 13)

An interrupt request is generated in the following conditions.

- In saw-wave mode, interrupt requests are enabled at underflows (when the GTCNT counter value changes from 0 to GTPR during down-counting)
- In triangle-wave mode, interrupt requests are enabled at troughs (the GTCNT changes from 0 to 1)
- In counting by hardware sources, underflow (GTCNT changes from 0 to GTPR in down count) has occurred.

About Interrupt signals and interrupt status flags, see section 21.2.16. GTST : General PWM Timer Status Register.

(9) GPTn_PC Interrupt (n = 0 to 3, 8 to 10)

When the GTCNT counter value matches with GTADTRA, an interrupt request is generated under the following condition.

- In Up-counting, the interrupt enable bit (ADTRAUEN) in GTINTAD is 1.
- In Down-counting, the interrupt enable bit (ADTRADEN) in GTINTAD is 1. In event count operation performing, this interrupt request isn't generated.

21.4.2 DMAC and DTC Activation

The DMAC and DTC can be activated by the interrupt in each channel. For details, see section 13, Interrupt Controller Unit (ICU), section 16, DMA Controller (DMAC), and section 17, Data Transfer Controller (DTC).

21.5 A/D Conversion Start Request

The A/D conversion start request can be issued at a compare match between the GTCNT counter and the GTADTRA or GTADTRB register. Up-counting only, down-counting only, or both up-counting and down-counting can be specified by setting the GTINTAD register.

During event count operation, the A/D conversion start request can not be generated.

The A/D conversion start request is directry output to ADC12.

The GTADTRA and GTADTRB registers each has two buffer registers. Buffer operation with the GTADTRA register used together with the GTADTBRA and GTADTDBRA registers, and buffer operation with the GTADTRB register used together with the GTADTBRB and GTADTDBRB registers can be performed.

The timing of the generation of requests to start A/D conversion can be monitored by an external pin. When the A/D conversion start request signal to be monitored is selected in the GTADSMR.ADSMSk bit (k = 0, 1) and when the output is enabled in the ADSMENk bit, a signal is output synchronized with a cycle frame of the timer used to generate the A/D conversion start request signal, of which the output is driven high at the generation of the A/D conversion start request signal by the GTADSMk pin, or at the end of the cycle of which the output is driven low. When a signal to request the start of A/D conversion is generated at the end of the cycle, the generation of this signal has priority in terms of monitoring output and the output remains at the high level till the end of the next cycle. The registers (GTADTRA and GTADTRB) that are sources of generating the A/D conversion start request signals and their counting directions can be checked by the A/D conversion start request flags (ADTRAUF, ADTRADF, ADTRBUF, and ADTRBDF) in the GTST register. When the output of the same A/D conversion start request signal monitoring output is enabled for multiple channels, ORed signals will be output from the GPT32.

Figure 21.70 shows an example of A/D conversion start request operation, Table 21.48 shows example for setting A/D conversion start request operation.

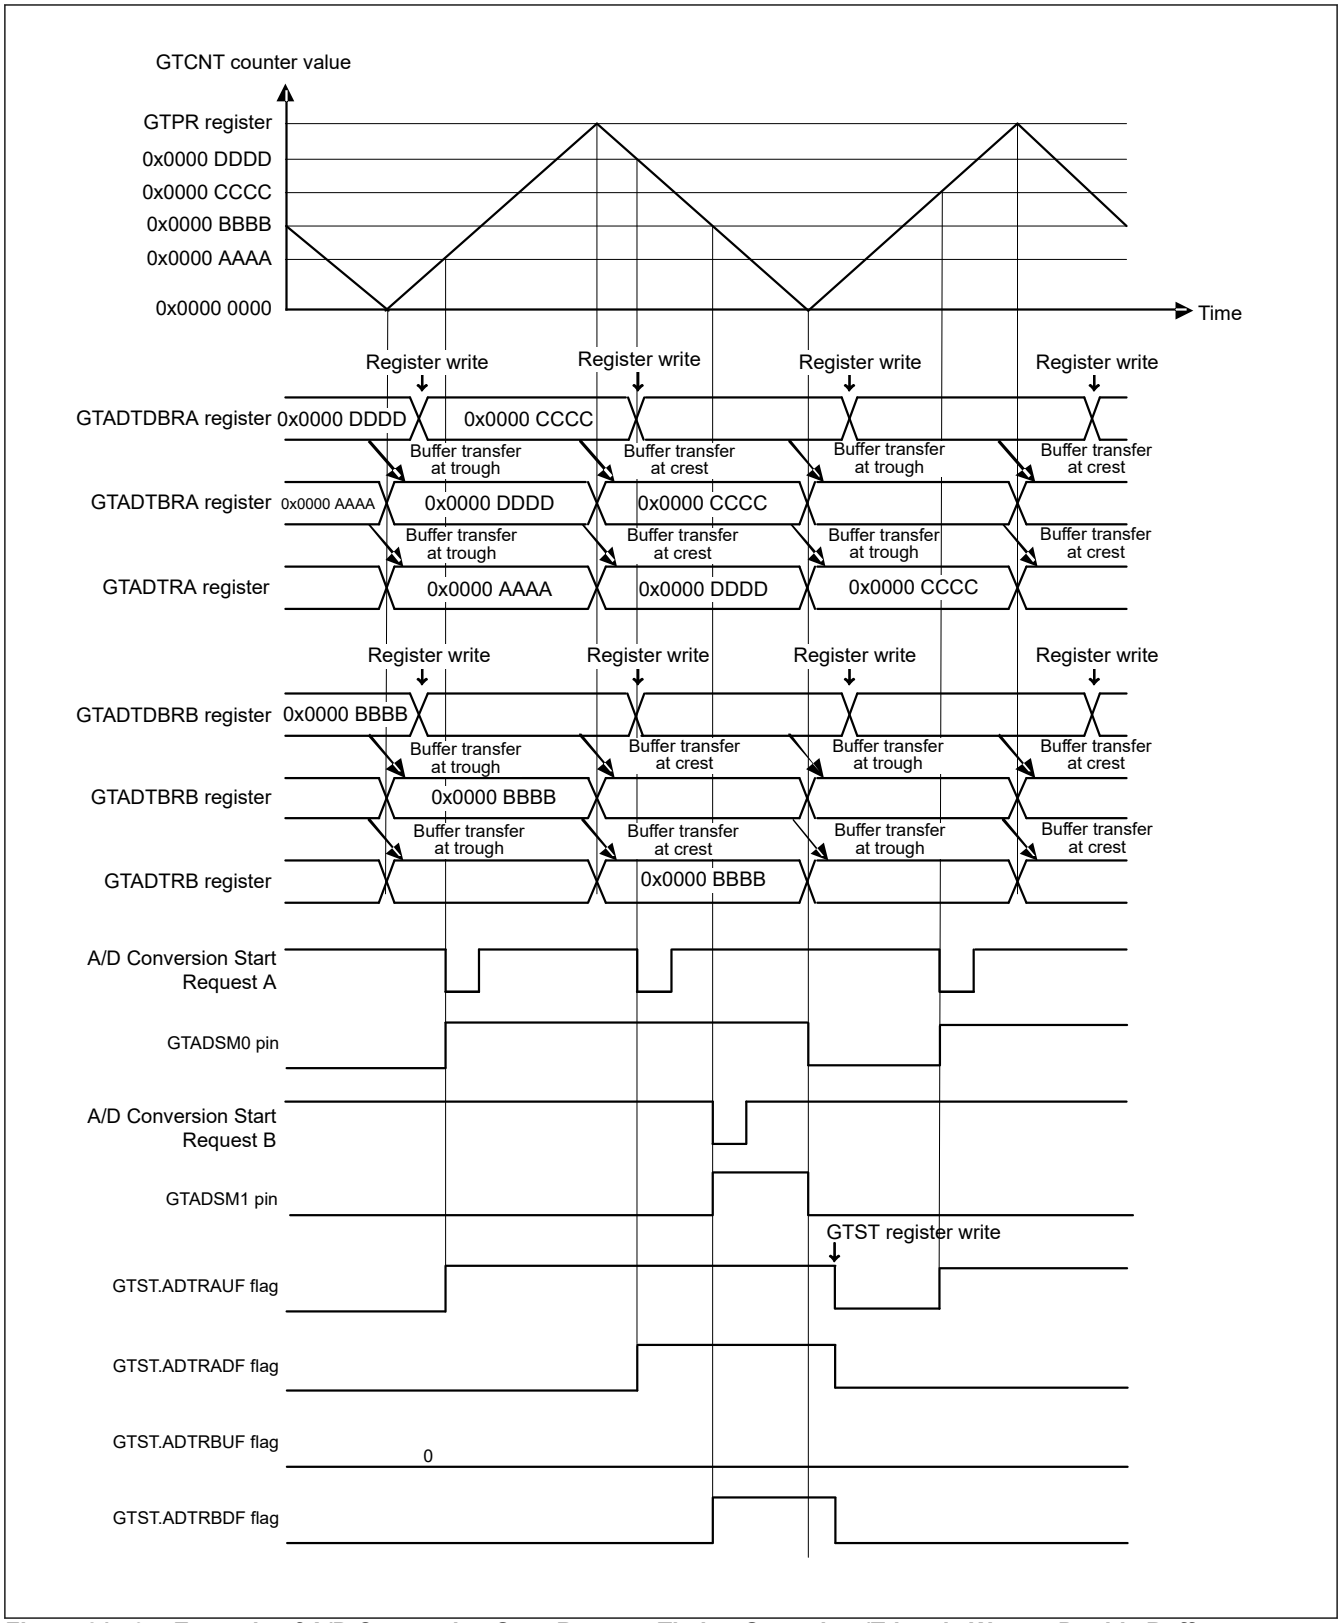

Figure 21.70 Example of A/D Conversion Start Request Timing Operation (Triangle Waves, Double Buffer Operation, Buffer Transfer at Both Troughs and Crests, A/D Conversion Start Request by GTADTRA Register at Both Up-Counting and Down-Counting, A/D Conversion Start Request by GTADTRB Register at Down-Counting)

Table 21.48 Example for Setting A/D Conversion Start Request Timing Operation

No.	Step Name	Description
1	Set operating mode	Set the operating mode with the GTCR.MD[2:0] bits. In Figure 21.70, 100b, 101b, or 110b (triangle-wave PWM mode) is set.
2	Select count clock	Select the count clock with the GTCR.TPCS[3:0] bits.
3	Set cycle	Set the cycle in the GTPR register.
4	Set initial value for counter	Set the initial value in the GTCNT counter.
5	Set buffer operation	Set buffer operation with the ADTTA[1:0], ADTTB[1:0], ADTDA, and ADTDB bits in the GTBER register. In Figure 21.70, ADTTA[1:0] = 11b, ADTTB[1:0] = 11b, ADTDA = 1, and ADTDB = 1.
6	Set compare match value	Set the A/D conversion start request point in the GTADTRA and GTADTRB registers.
7	Set buffer value	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.
8	Enable A/D conversion start request	Set to enable A/D conversion start request with the ADTRAUEN, ADTRADEN, ADTRBUEN, and ADTRBDEN bits in the GTINTAD register. In Figure 21.70, ADTRAUEN = 1, ADTRADEN = 1, ADTRBUEN = 0, and ADTRBDEN = 1.
9	Start count operation	Set the GTCR.CST bit to 1 to start count operation.
10	Set buffer value for each cycle	For buffer operation, set the A/D conversion start request point in one cycle after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or half cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTBRA and GTADTBRB registers. For double buffer operation, also set the A/D conversion start request point in two cycles after the current cycle (in saw-wave mode or triangle-wave mode with buffer transfer at trough or crest) or one cycle after the current cycle (in triangle-wave mode with buffer transfer at both trough and crest) in the GTADTDBRA and GTADTDBRB registers.

Figure 21.71 shows an example for A/D conversion start request timing operation.

This shows an example of the output of A/D conversion start request A for the A/D converter. The A/D conversion start request A signal is output in response to a match in comparison with the GTADTRA register.

If GPT is operating with PCLKD and ADC is operating with PCLKA, A/D conversion start request A is passed to synchronizer on the next rising edge of PCLKA.

A/D conversion start request A is synchronized and passed to ADC.

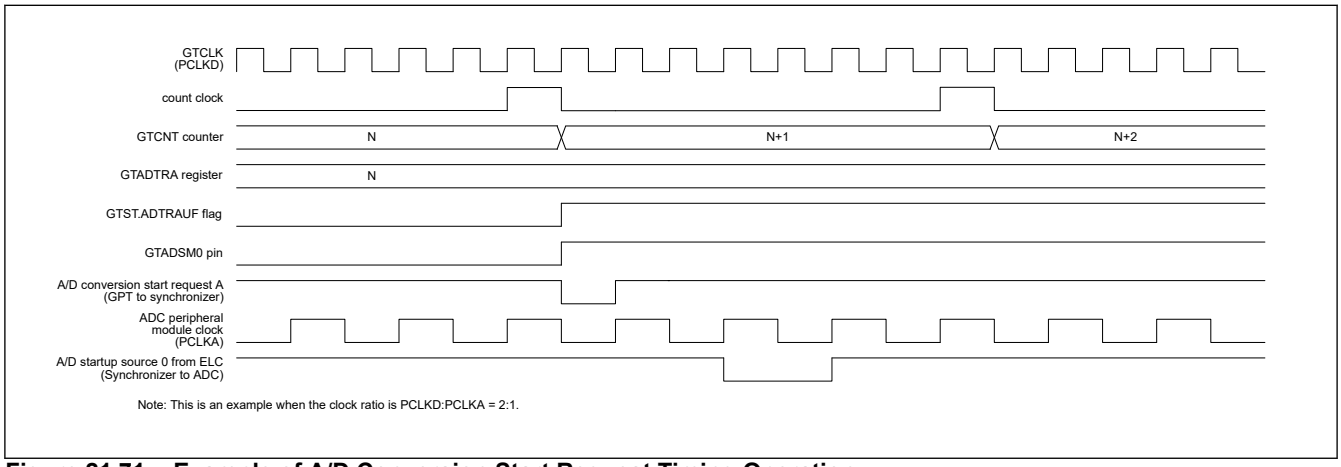

Figure 21.71 Example of A/D Conversion Start Request Timing Operation

21.6 Operations Linked by ELC

21.6.1 Event Signal Output to ELC

The GPT can perform operation linked with another module set in advance when its interrupt request signal is used as an event signal by the Event Link Controller (ELC).

The A/D conversion start request during up-counting/down-counting can be enabled/disabled individually with the A/D conversion start request enable bit to output events output to ELC.

The GPT has the following ELC event signals:

- Generation of compare match and input capture A interrupt (GPTn_CCMPA)
- Generation of compare match and input capture B interrupt (GPTn_CCMPB)
- Generation of compare match C interrupt (GPTn_CMPC)
- Generation of compare match D interrupt (GPTn_CMPD)
- Generation of compare match E interrupt (GPTn_CMPE)
- Generation of compare match F interrupt (GPTn_CMPF)
- Generation of overflow interrupt (GPTn_OVF)
- Generation of underflow interrupt (GPTn_UDF)
- Finish of period count function (GPTm_PC)

Note: n = 0 to 13
m = 0 to 3, 8 to 10

21.6.2 Event Signal Inputs from ELC

The GPT can perform the following operations in response to a maximum of 8 events from the ELC:

- Start counting, stop counting, clear counting
- Up-counting, down-counting
- Input capture.

See section 18, Event Link Controller (ELC) for the connection between the ELC and the event signal input.

21.7 Noise Filter Function

Each pin for use in input capture and Hall sensor input to the GPT is equipped with a noise filter. The noise filter samples input signals at the sampling clock and removes the pulses whose length is less than 3 sampling cycles.

The noise filter functionality includes enabling and disabling the noise filter for each pin and setting of the sampling clock for each channel.

Figure 21.72 shows the timing of noise filtering.

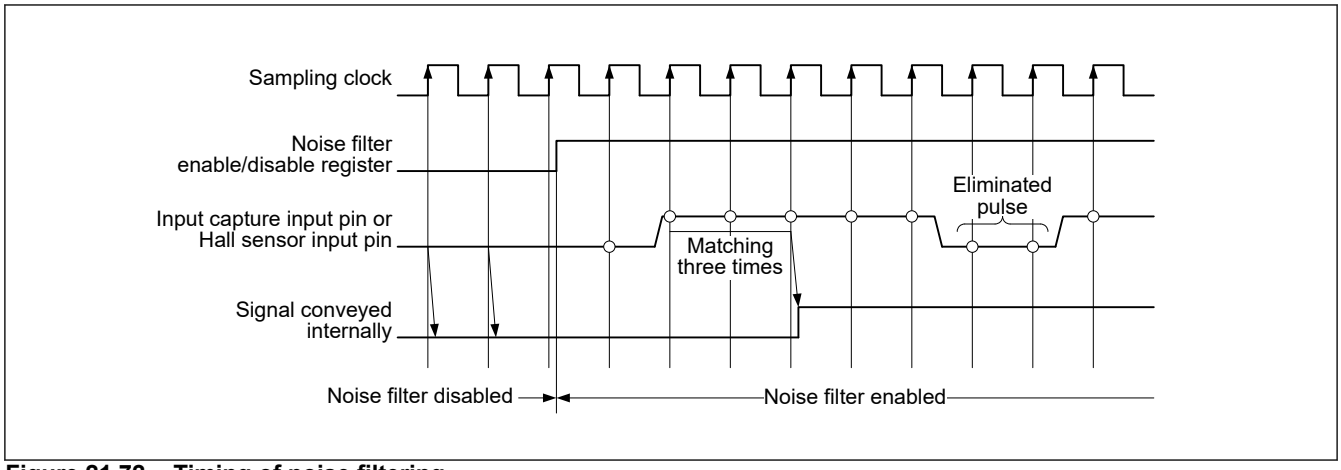

Figure 21.72 Timing of noise filtering

If noise filtering is enabled, the input capture operation or hall sensor input operation is performed on the edges of the noise filtered signal after a delay of (sampling interval × 2 + PCLKD) at the shortest. This is due to the noise filtering for the input capture input or hall sensor input.

21.8 Protection Function

21.8.1 Write-Protection for Registers

To prevent registers from being accidentally modified, registers can be write-protected in channel units by setting GTWP.WP. Write-protection can be set for the following registers:

GTSSR, GTPSR, GTCSR, GTUPSR, GTDNSR, GTICASR, GTICBSR, GTCR, GTUDDTYC, GTIOR, GTINTAD, GTST, GTBER, GTCNT, GTCCRA, GTCCRB, GTCCRC, GTCCRD, GTCCRE, GTCCRF, GTPR, GTPBR, GTADTRA, GTADTBRA, GTADTDBRA, GTADTRB, GTADTBRB, GTADTDBRB, GTDTCR, GTDVU, GTADSMR, GTICLF, GTPC.

Every bit in registers GTSTR, GTSTP and GTCLR which can update the corresponding registers in other channels and can be updated by any of the corresponding registers in other channels conversely, can be protected by setting the GTWP.STRWP, STPWP, and CLRWP bits, respectively, per channel.

Likewise, writing to the GTSECSR and GTSECR registers, which can control all channels by writing to the GTSECSR and GTSECR registers of a given channel, can by enabled or disabled by the setting of the GTWP.CMNWP bit.

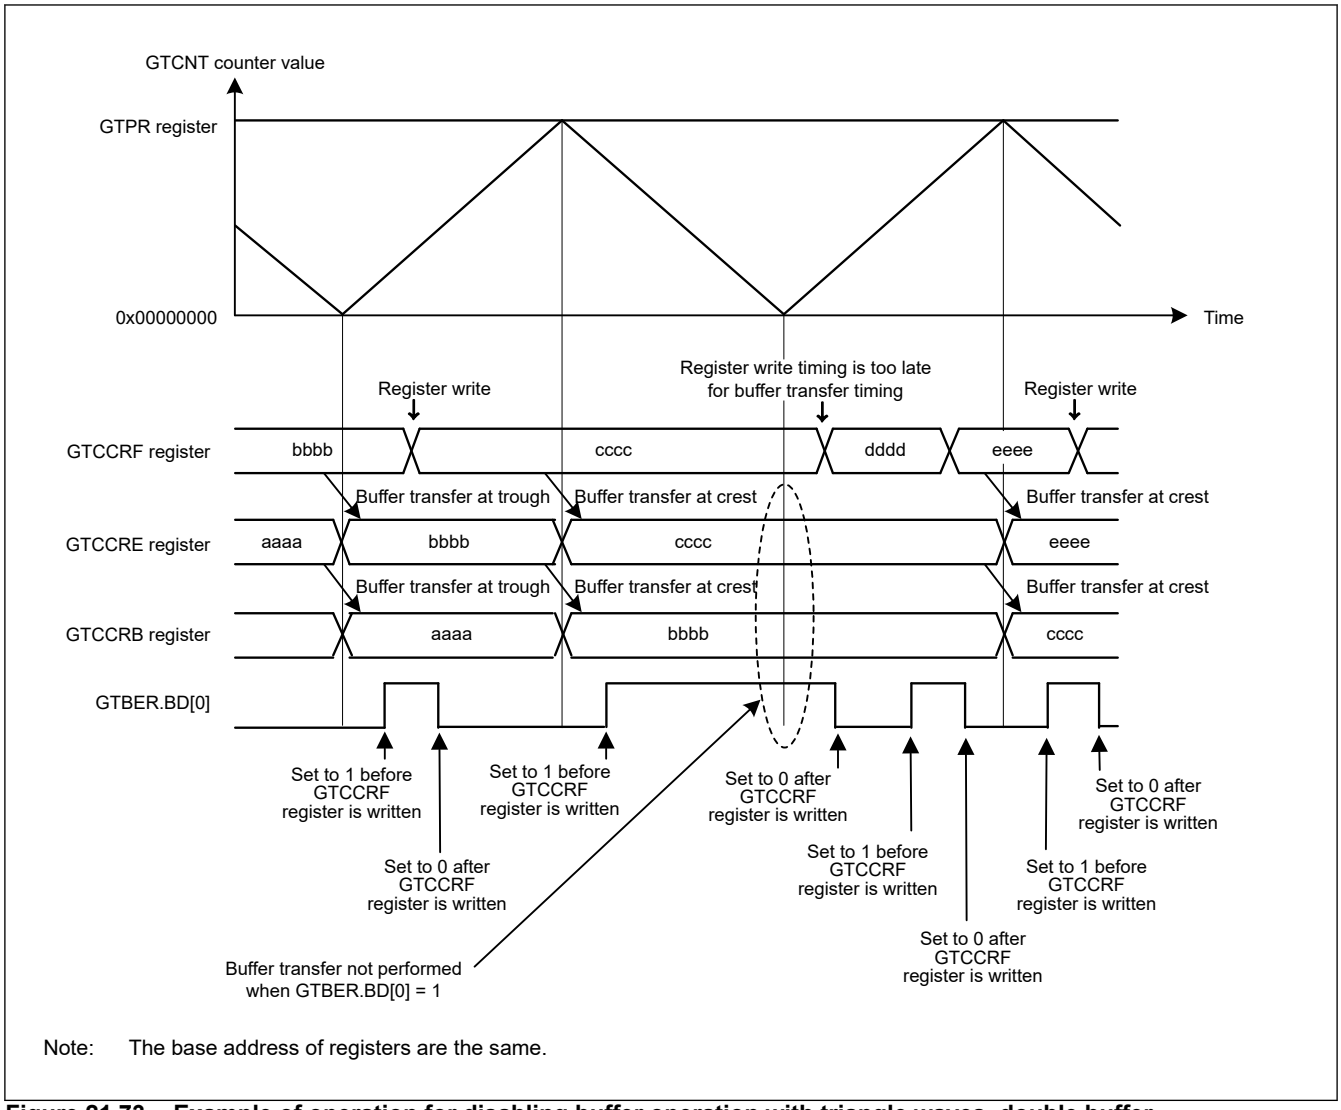
Protection using the GTWP register is only for write operations by the CPU. This protection does not cover updates to registers that occur in association with CPU writes.

21.8.2 Disabling of Buffer Operation

If the timing of the buffer register write is delayed relative to the timing for the buffer transfer, buffer operation can be suspended with the GTBER.BD[2], BD[1] and BD[0] bits settings. Specifically, buffer transfer can be temporarily disabled even though a buffer transfer condition is generated during buffer register write, by setting the BD[2], BD[1] and BD[0] bits to 1 (buffer operation disabled) before buffer register write, and setting the bits to 0 (buffer operation enabled) after completion of writing to all the buffer registers.

The BD[2], BD[1] and BD[0] bits can be set on channel basis by writing directly to the GTBER register or it can be set to 0 simultaneously by setting the GTSECR register for multiple channels which were set by the GTSECSR register.

Figure 21.73 shows an example of operation for disabling buffer operation by writing to the GTBER register.



Note: The base address of registers are the same.

Figure 21.73 Example of operation for disabling buffer operation with triangle waves, double buffer operation, and buffer transfer at both troughs and crests

21.8.2.1 Simultaneous Control of Buffer Operations of Multiple Channels

The GTBER.BD bit can be set by writing directly to the GTBER register per channel or by making settings in the GTSECR register for multiple channels that have already set in the GTSECSR register.

Follow the procedure below to simultaneously set the GTBER.BD bits of multiple channels.

1. Select the channels for simultaneously setting by the GTSECSR register
   Set the GTSECSR register so that the values at the bit positions for the corresponding channels for simultaneously setting of the GTBER.BD bits become 1. All GTSECSR registers can be updated by writing to the GTSECSR register of any channel.
2. Simultaneously set the GTBER.BD bits by updating the GTSECR register
   In the GTSECR register, set the operation of the GTBER.BD bits (enabling or disabling of buffer operation) which are to be simultaneously set. Writing to a GTSECR register from any channel updates the GTBER.BD bits in all channels corresponding to the bits set as 1 in the GTSECSR register, in accordance with the value of the GTSECR register.

Figure 21.74 show examples of simultaneously controlling the enabling or disabling of buffer operation for multiple channels.

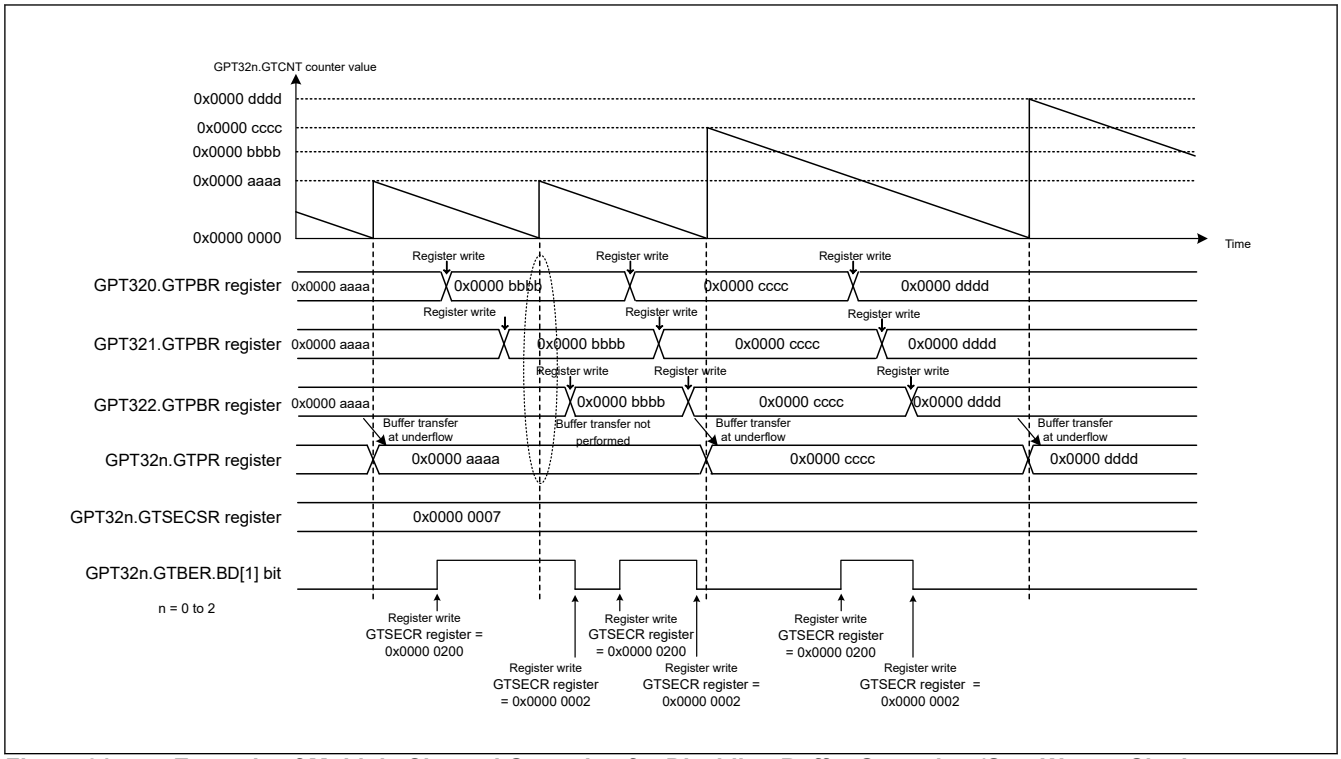


Figure 21.74 Example of Multiple Channel Operation for Disabling Buffer Operation (Saw Waves, Single Buffer Operation)

21.8.3 GTIOCnm Pin Output Negate Control (n = 0 to 13, m = A, B)

For protection from system failure, the output disable control that changes the GTIOCnm pin output value forcibly is provided for GTIOCnm pin output by the request of output disable from POEG. Output protection is required when the same output level being on the GTIOCnA and GTIOCnB pins is detected. GPT detects this condition and generates output disable requests to POEG according to the setting of the output disable request permission bits, such as GTINTAD.GRPABH, GTINTAD.GRPABL. After the POEG performs the logical OR of the output disable request from each channel and the output disable request from the external input, the POEG generates output disable requests to GPT.

One output disable signal (representing the shared output disable request signal of the GTIOCnA pin and the GTIOCnB pin) out of 4 output disable requests generated by the POEG is selected by setting GTINTAD.GRP[1:0]. The status of the selected disable output request is monitored by reading the GTST.ODF bit. The output level during output disable is set based on the GTIOR.OADF[1:0] bits for the GTIOCnA pin and the GTIOR.OBDF[1:0] setting for the GTIOCnB pin.

The change to the output disable state is performed asynchronously by generating the output disable request from the POEG. The release of the output disable state is performed at end of cycle by terminating the output disable request. It is after 3 PCLKD at shortest when the output disable condition is released after the output disable request becomes no longer satisfied. To reliably control output disabling, clear the flag of POEG for which the condition for the request to disable the output is no longer satisfied after 4 cycles of PCLKD.

When event count is performed or when the output disable state should be released immediately without waiting for end of cycle, GTIOR.OADF[1:0] should be set to 00b (for GTIOCnA pin) or GTIOR.OBDF[1:0] should be set to 00b (for the GTIOCnB pin).

Figure 21.75 shows an example of the GTIOCnm pin output disable control operation. (n = 0 to 13, m = A, B)

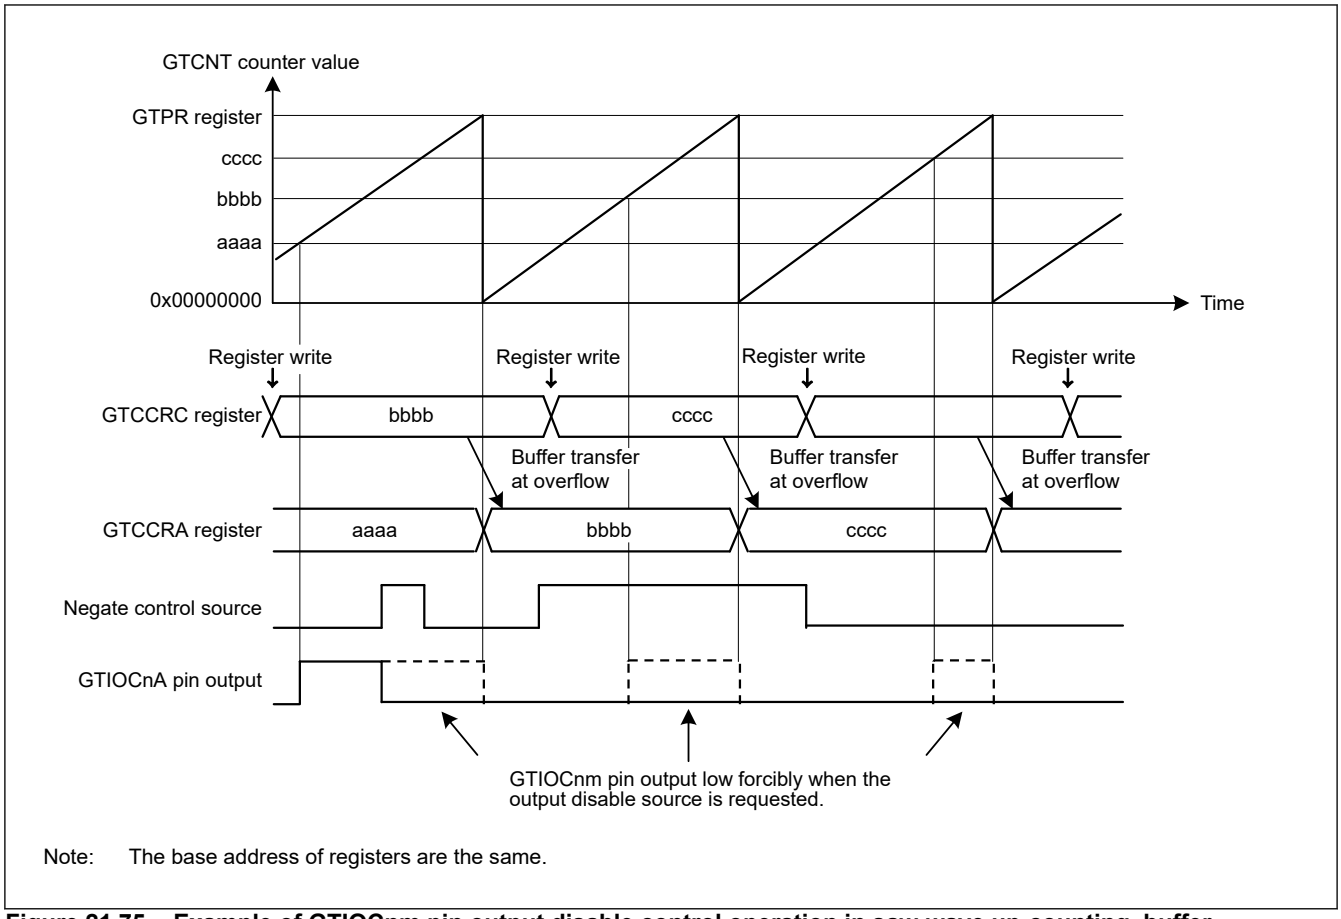

Figure 21.75 Example of GTIOCnm pin output disable control operation in saw-wave up-counting, buffer operation, active level 1, high output at GTCCRA compare match, low output at cycle end, and low output at output disable (n = 0 to 13, m = A, B)

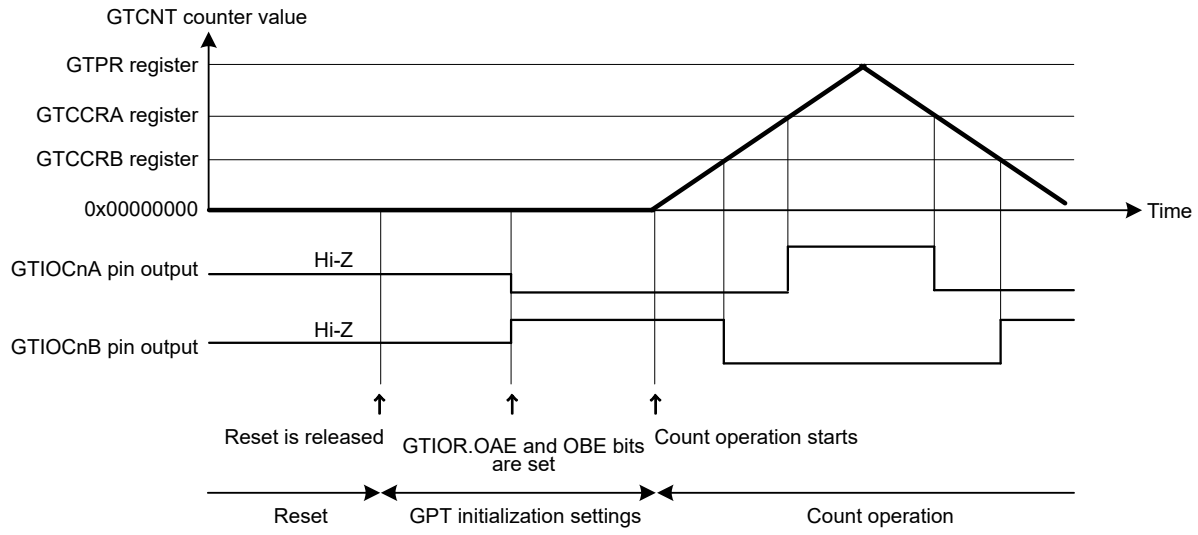
21.9 Initialization Method of Output Pins

21.9.1 Pin Settings after Reset

The GPT registers are initialized at a reset. Start counting after selecting the port pin function with the PmnPFS register, setting GTIOR.OAE and GTIOR.OBE bits, and outputting the GPT function to external pins.



[Setting examples]
GTIOR.GTIOA[4:0] bits: Initial low output, output retained at cycle end, output toggled at compare match
GTIOR.GTIOB[4:0] bits: Initial high output, output retained at cycle end, output toggled at compare match

Note: The base address of registers are the same.

Figure 21.76 Example of pin settings after reset

21.9.2 Pin Initialization Due to Error during Operation

If an error occurs during GPT operation, the following four types of pin control can be performed before pin initialization:

- Set the OAHLD and OBHLD bits in GTIOR to 1 and retain the outputs at count stop
- Set the OAHLD and OBHLD bits in GTIOR to 0, specify arbitrary output values at OADFLT and OBDFLT in GTIOR, and output the arbitrary values at count stop
- Set the pin to output an arbitrary value as a general output port by setting the PDR, PODR registers and PmnPFS.PMR bit of the I/O port in advance. Set the OAE and OBE bits in GTIOR to 0, and the control bit associated with the pin in the PMR to 0 to allow arbitrary values to be output from the pin set as a general output port when an error occurs.
- Drive the output to a high impedance state using the POEG function.

If the automatic dead time setting is made, clear the GTDTCR.TDE bit to 0 after counting stops. When counting stops, only the values of registers that are changed by a GPT external source change. If counting is resumed, operation continues from where it stopped. If counting is stopped, the registers must be initialized before counting starts.

21.10 Usage Notes

21.10.1 Module-Stop Function Setting

The Module Stop Control Register can enable or disable GPT operation. The GPT is initially stopped after a reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

21.10.2 GTCCRn Settings during Compare Match Operation (n = A to F)

(1) When automatic dead time setting is made in triangle-wave PWM mode

The GTCCRA register must satisfy all of the following conditions:

- GTDVU < GTCCRA
- 0 < GTCCRA < GTPR

(2) When automatic dead time setting is not made in triangle-wave PWM mode

The GTCCRA register must be set within the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. When GTCCRA > GTPR, no compare match occurs.

Similarly, GTCCRB must be set within the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB is 0 or GTCCRB = GTPR is satisfied. When GTCCRB > GTPR, no compare match occurs.

(3) When automatic dead time setting is made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, the correct output waveforms with secured dead time may not be obtained.

- In up-counting: GTCCRC < GTCCRD, GTCCRC > GTDVU, GTCCRD < GTPR - GTDVU
- In down-counting: GTCCRC > GTCCRD, GTCCRC < GTPR - GTDVU, GTCCRD > GTDVU

(4) When automatic dead time setting is not made in saw-wave one-shot pulse mode

The GTCCRC and GTCCRD registers must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRC < GTCCRD < GTPR
- In down-counting: GTPR > GTCCRC > GTCCRD > 0

Similarly, GTCCRE and GTCCRF must be set to satisfy the following restrictions. If the restrictions are not satisfied, two compare matches do not occur and pulse output cannot be performed.

- In up-counting: 0 < GTCCRE < GTCCRF < GTPR
- In down-counting: GTPR > GTCCRE > GTCCRF > 0.

(5) In saw-wave PWM mode

The GTCCRA register must be set with the range of 0 < GTCCRA < GTPR. If GTCCRA = 0 or GTCCRA = GTPR is set, a compare match occurs within the cycle only when GTCCRA = 0 or GTCCRA = GTPR is satisfied. If GTCCRA > GTPR is set, no compare match occurs.

Similarly, GTCCRB must be set with the range of 0 < GTCCRB < GTPR. If GTCCRB = 0 or GTCCRB = GTPR is set, a compare match occurs within the cycle only when GTCCRB = 0 or GTCCRB = GTPR is satisfied. If GTCCRB > GTPR is set, no compare match occurs.

21.10.3 Setting Range for GTCNT Counter

The GTCNT counter register must be set with the range of 0 ≤ GTCNT ≤ GTPR.

21.10.4 Starting and Stopping the GTCNT Counter

The control timing of starting and stopping the GTCNT counter by the GTCR.CST bit synchronizes the count clock that is selected in GTCR.TPCS[3:0]. When GTCR.CST is updated, the GTCNT counter starts/stops after a count clock that is selected in GTCR.TPCS[3:0]. Therefore, an event generated before the GTCNT counter actually starts is ignored, resulting in situations in which an event is accepted or an interrupt occurs after GTCR.CST is set to 0.

21.10.5 Priority Order of Each Event

(1) GTCNT register

Table 21.49 shows a priority order of events updating the GTCNT register.

Table 21.49 Priority order of sources updating GTCNT

Source updating GTCNT	Priority order
Writing by CPU (writing to GTCNT/GTCLR)	High
Clear by hardware sources set in GTCSR	↑
Count up or down by hardware sources set in GTUPSR/GTDNSR	↑
Count operation	Low

If up-counting and down-counting by hardware sources occur at the same time, the GTCNT counter value does not change. When there is a conflict between updating the GTCNT register and reading by the CPU, pre-update data is read.

(2) GTCR.CST bit

When there is a conflict between starting/stopping by hardware sources set in the GTSSR/GTPSR registers and writing by the CPU (writing to GTCR/GTSTR/GTSTP registers), the writing by CPU has priority over the starting/stopping by hardware sources.

In case that stop by the period count function conflicts with start by the CPU writing (GTCR register writing/GTSTR register writing), the period count function is finished with setting the GTST.PCF flag. The CST bit is not changed and the GTCNT continues to count.

When there is a conflict between starting by hardware sources set in the GTSSR register and stopping by hardware sources set in GTPSR register, the GTCR.CST bit value does not change. When there is a conflict between updating the GTCR.CST bit and reading by the CPU (reading from GTCR/GTSTR/GTSTP registers), pre-update data is read.

(3) GTCCRm registers (m = A to F)

When there is a conflict between input capture/buffer transfer operation and writing to the GTCCRm registers, the writing to GTCCRm registers has priority over input capture/buffer transfer operation. When there is a conflict between input capture and writing to the counter register by the CPU or updating the counter register by hardware sources, the pre-update counter value is captured. When there is a conflict between updating the GTCCRm registers and reading by the CPU, pre-update data is read.

(4) GTPR register

When there is a conflict between buffer transfer operation and writing to the GTPR register, writing to GTPR register has priority over buffer transfer operation. When there is a conflict between updating GTPR register and reading by the CPU, pre-update data is read.

(5) GTADTRm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTADTRm register, writing to GTADTRm register has priority over buffer transfer operation.

When there is a conflict between updating the GTADTRm register and reading by the CPU, pre-update data is read.

(6) GTDVU registers

When there is a conflict between buffer transfer operation and writing to GTDVU register, writing to GTDVU register has priority over buffer transfer operation.

When there is a conflict between updating the GTDVU register and reading by the CPU, pre-update data is read.

(7) GTIOR.GTIOm registers (m = A, B)

When there is a conflict between buffer transfer operation and writing to GTIOR.GTIOm register, writing to GTIOR.GTIOm register has priority over buffer transfer operation.

When there is a conflict between updating the GTIOR.GTIOm and reading by the CPU, pre-update data is read.

21.10.6 Prohibit Invalid Register Setting

The register settings that are instructed to be invalid, such as "The setting is invalid during event counting operation", are not guaranteed. These setting is prohibited.

22. Low Power Asynchronous General Purpose Timer (AGT)

22.1 Overview

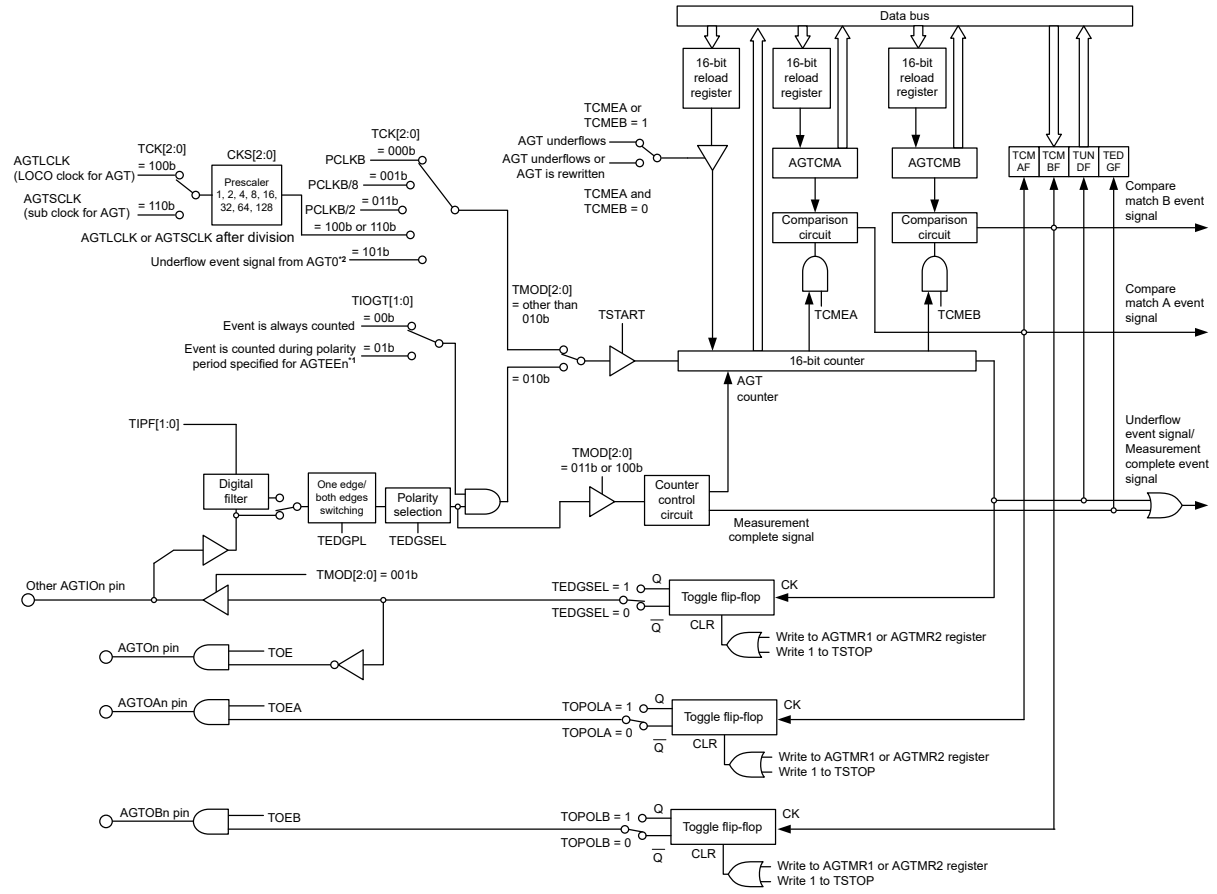
The Low Power Asynchronous General Purpose Timer (AGT) is a 16-bit timer that can be used for pulse output, external pulse width or period measurement, and counting external events. This timer consists of a reload register and a down counter. The reload register and the down counter are allocated to the same address, and can be accessed with the AGT register.

Table 22.1 lists the AGT specifications, Figure 22.1 shows a block diagram, and Table 22.2 lists the I/O pins.

Table 22.1 AGT specifications

Parameter		Description
Operating modes	Timer mode	The count source is counted
	Pulse output mode	The count source is counted and the output is inverted at each timer underflow
	Event counter mode	An external event is counted
	Pulse width measurement mode	An external pulse width is measured
	Pulse period measurement mode	An external pulse period is measured
Number of Channels		16 bits × 2 channels (AGTn (n = 0, 1))
Count source (operating clock)*2	Timer mode	PCLKB, PCLKB/2, PCLKB/8, AGTLCLK/d, AGTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, or 128), or underflow signal of AGT0 selectable.*1
	Pulse output mode	
	Pulse width measurement mode	
	Pulse period measurement mode	
	Event counting mode	External event input
Interrupt and Event Link function		• Underflow event signal or measurement complete event signal – When the counter underflows – When the measurement of the active width of the external input pin (AGTIOn) completes in pulse width measurement mode – When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode. • Compare match A event signal – When the values of AGT register and AGTCMA register matched (compare match A function enabled). • Compare match B event signal – When the values of AGT and AGTCMB registers matched (compare match B function enabled). • Return from Software Standby mode can be performed with AGT1_AGTI, AGT1_AGTCMAI, or AGT1_AGTCMBI*3
Selectable functions		• Compare match function One or two of the AGT Compare Match A register and AGT Compare Match B register is selectable.
Module-stop function		Module-stop state can be set for each channel to reduce power consumption.
TrustZone Filter		Security and Privilege attribution can be set for each channels.

Note 1. AGT0 cannot use underflow signal. AGT1 connects directly with the underflow event signal from the AGT0 timer.
Note 2. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.
Note 3. For details, see section 10, Low Power Modes.



Note 1. The polarity can be selected by the EEPS bit in the AGTISR register.
Note 2. AGT0 cannot use AGT0 underflow event. AGT1 uses the underflow of AGT0.

Figure 22.1 AGT block diagram

Table 22.2 AGT I/O pins

Pin name	I/O	Function
AGTEEn	Input	External event input enable for AGT
AGTIOn	Input/output	External event input and pulse output for AGT
AGTOn	Output	Pulse output for AGT
AGTOAn	Output	Compare match A output for AGT
AGTOBn	Output	Compare match B output for AGT

Note: Channel number: n = 0, 1

22.2 Register Descriptions

22.2.1 AGT : AGT Counter Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x00

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit counter and reload register Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3

AGTn.AGT is a 16-bit register. The write value is written to the reload register and the read value is read from the counter.

The states of the reload register and the counter change according to the TSTART bit in the AGTCR register and TCMEA/TCMEB bit in the AGTCMSR register. For details, see section 22.3.1. Reload Register and Counter Rewrite Operation.

When 1 is written to the TSTOP bit in the AGTCR register, AGT counter is forcibly stopped and set to 0xFFFF.

When the TCK[2:0] bits setting in the AGTMR1 register are a value other than 001b (PCLKB/8) or 011b (PCLKB/2), if the AGT register is set to 0x0000, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts. The AGTOn, AGTIOn pin output are toggled.

When the AGT register is set to 0x0000 in event counter mode, regardless of the value of TCK[2:0] bits, a request signal to the ICU, the DTC, the DMAC, and the ELC is generated once immediately after the count starts.

In addition, the AGTOn pin output is toggled even during a period other than the specified count period. When the AGT register is set to 0x0001 or more, a request signal is generated each time AGT underflows.

22.2.2 AGTCMA : AGT Compare Match A Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit compare match A data is stored.*1 Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Set the AGTCMA register to 0xFFFF when compare match A is not used.

The AGTCMA register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register A change according to the TSTART bit in the AGTCR register. For details, see section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation.

22.2.3 AGTCMB : AGT Compare Match B Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:																
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
15:0	n/a	16-bit compare match B data is stored.*1 Setting range : 0x0000 to 0xFFFF	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Set the AGTCMB register to 0xFFFF when compare match B is not used.

The AGTCMB register is a read/write register to set a value for compare match with the AGT counter. The states of the reload register and compare register B change according to the TSTART bit in the AGTCR register. For details, see section 22.3.2. Reload Register and AGT Compare Match A/B Register Rewrite Operation.

22.2.4 AGTCR : AGT Control Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCMBF	TCMAF	TUNDF	TEDGF	—	TSTOP	TCSTF	TSTART
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSTART	AGT Count Start*2 0: Count stops 1: Count starts	R/W
1	TCSTF	AGT Count Status Flag*2 0: Count stopped 1: Count in progress	R
2	TSTOP	AGT Count Forced Stop*1 0: Writing is invalid 1: The count is forcibly stopped	W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TEDGF	Active Edge Judgment Flag 0: No active edge received 1: Active edge received	R/(W)*3
5	TUNDF	Underflow Flag 0: No underflow 1: Underflow	R/(W)*3
6	TCMAF	Compare Match A Flag 0: No match 1: Match	R/(W)*3
7	TCMBF	Compare Match B Flag 0: No match 1: Match	R/(W)*3

Note: S-TYPE-3, P-TYPE-3

Note 1. When 1 (count is forcibly stopped) is written to the TSTOP bit, the TSTART bit and TCSTF flag are initialized at the same time. The pulse output level is also initialized. The read value is 0.
Note 2. For information on using the TSTART bit and TCSTF flag, see section 22.4.1. Count Operation Start and Stop Control.
Note 3. Only 0 can be written to clear the flag.

TSTART bit (AGT Count Start)

The count operation is started by writing 1 to the TSTART bit and stopped by writing 0. When the TSTART bit is set to 1 (count starts), the TCSTF flag is set to 1 (count in progress) in synchronization with the count source. Also, after 0 is written to the TSTART bit, the TCSTF flag is set to 0 (count stops) in synchronization with the count source. For details, see section 22.4.1. Count Operation Start and Stop Control.

TCSTF flag (AGT Count Status Flag)

The TCSTF flag indicates the AGT count status.

[Setting condition]

- When 1 is written to the TSTART bit (the TCSTF flag is set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (the TCSTF flag is set to 0 in synchronization with the count source)
- When 1 is written to the TSTOP bit.

TSTOP bit (AGT Count Forced Stop)

When 1 is written to the TSTOP bit, the count is forcibly stopped. The read value is 0.

TEDGF flag (Active Edge Judgment Flag)

The TEDGF flag indicates that an active edge was detected.

[Setting condition]

- When the measurement of the active width of the external input pin (AGTIOn) is complete in pulse width measurement mode
- When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode.

[Clearing condition]

- When 0 is written to this flag by software.

TUNDF flag (Underflow Flag)

The TUNDF flag indicates that the counter underflowed.

[Setting condition]

- When the counter underflows.

[Clearing condition]

- When 0 is written to this flag by software.

TCMAF flag (Compare Match A Flag)

The TCMAF flag indicates that compare match A was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMA register.

[Clearing condition]

- When 0 is written to this flag by software.

TCMBF flag (Compare Match B Flag)

The TCMBF flag indicates that compare match B was detected.

[Setting condition]

- When the value in the AGT register matches the value in the AGTCMB register.

[Clearing condition]

- When 0 is written to this flag by software.

22.2.5 AGTMR1 : AGT Mode Register 1

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x09

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TCK[2:0]			TEDGPL	TMOD[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	TMOD[2:0]	Operating Mode*3 0 0 0: Timer mode 0 0 1: Pulse output mode 0 1 0: Event counter mode 0 1 1: Pulse width measurement mode 1 0 0: Pulse period measurement mode Others: Setting prohibited	R/W
3	TEDGPL	Edge Polarity*4 0: Single-edge 1: Both-edge	R/W
6:4	TCK[2:0]	Count Source*1 *2 *5 *7 0 0 0: PCLKB 0 0 1: PCLKB/8 0 1 1: PCLKB/2 1 0 0: Divided clock AGTLCLK specified by CKS[2:0] bits in the AGTMR2 register 1 0 1: Underflow event signal from AGT0*6 1 1 0: Divided clock AGTSCLK specified by CKS[2:0] bits in the AGTMR2 register Others: Setting prohibited	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Write access to the AGTMR1 register initializes the output from the AGTOn, AGTIOn, AGTOAn, and AGTOBn pins. For details on the output level at initialization, see section 22.2.7. AGTIOC : AGT I/O Control Register.
Note 1. When event counter mode is selected, the external input pin (AGTIOn) is selected as the count source regardless of the setting of TCK[2:0] bits.
Note 2. Do not switch count sources during count operation. Only switch count sources when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).
Note 3. The operating mode can only be changed when the count is stopped while both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count is stopped). Do not change the operating mode during count operation.
Note 4. The TEDGPL bit is enabled only in event counter mode.
Note 5. To run AGT in Software Standby mode, select AGTLCLK or AGTSCLK (TCK[2:0] = 100b, 110b).
Note 6. AGT0 cannot use AGT0 underflow (setting prohibited). AGT1 uses the AGT0 underflow.
Note 7. Do not change the TCK[2:0] bits when the CKS[2:0] bits in the AGTMR2 register is not 000b. First, change the CKS[2:0] bits in the AGTMR2 register to 000b. Then change the TCK[2:0] bits and wait for one cycle of the count source.

22.2.6 AGTMR2 : AGT Mode Register 2

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LPM	—	—	—	—	CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CKS[2:0]	AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio*1 *2 *3 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	LPM	Low Power Mode 0: Normal mode 1: Low power mode	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Do not rewrite the CKS[2:0] bits during count operation. Only rewrite the CKS[2:0] bits when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).
Note 2. When count source is AGTLCLK or AGTSCLK, the switch of CKS[2:0] bits is valid.
Note 3. Do not switch the TCK[2:0] bits in the AGTMR1 register when CKS[2:0] bits are not 000b. Switch the TCK[2:0] bits in the AGTMR1 register after CKS[2:0] bits are set to 000b, and wait for 1 cycle of the count source.

CKS[2:0] bit (AGTLCLK or AGTSCLK Count Source Clock Frequency Division Ratio)

CKS[2:0] bits select the Count Source Clock Frequency Division Ratio for AGTLCLK or AGTSCLK.

LPM bit (Low Power Mode)

The LPM bit sets the low power operation, which impacts access to certain AGT registers. Set this bit to 1 to operate in low power.

When this bit is 1, access to the following registers is prohibited:

- AGT/AGTCMA/AGTCMB/AGTCR.

After this bit is switched from 1 to 0, the first access to the register is constrained as follows:

- When reading from the AGT register, read AGT register twice. Only the second reading of data is valid.
- When writing to the AGT, AGTCMA, AGTCMB, and AGTCR register, allow at least 2 cycles of the count source clock when writing to the register.
- When confirm the value written to the AGT, AGTCMA, AGTCMB, and AGTCR registers.
  - When the count operation is stopped; after writing data, it can be read in the next cycle.
  - When the count operation is operating; after writing data, it can be read 4 cycles after the count source clock.

Figure 22.2 shows the flow of how to write LPM bit

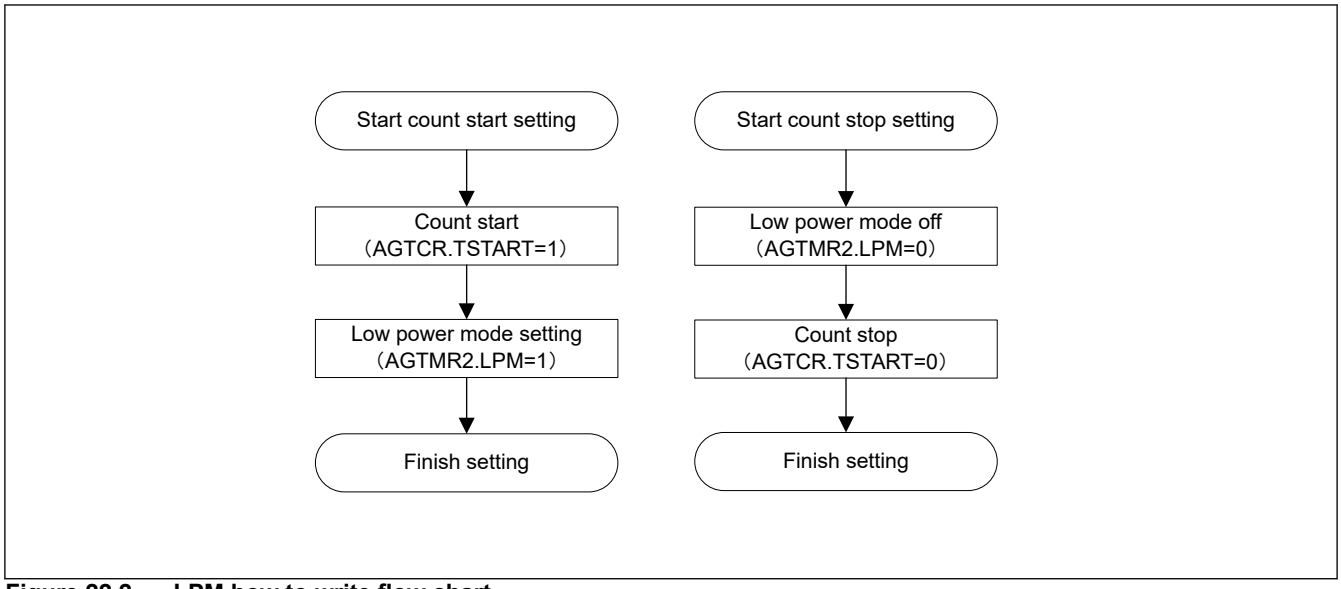


Figure 22.2 LPM how to write flow chart

22.2.7 AGTIOC : AGT I/O Control Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TIOGT[1:0]		TIPF[1:0]		—	TOE	—	TEDG SEL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TEDGSEL	I/O Polarity Switch Function varies depending on the operating mode (see Table 22.3 and Table 22.4).	R/W
1	—	This bit is read as 0. The write value should be 0.	R/W
2	TOE	AGTOn pin Output Enable 0: AGTOn pin output disabled 1: AGTOn pin output enabled	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TIPF[1:0]	Input Filter*3 These bits specifies the sampling frequency of the filter for the AGTIOn input. If the input to the AGTIOn pin is sampled and the value matches three successive times, that value is taken as the input value. 0 0: No filter 0 1: Filter sampled at PCLKB 1 0: Filter sampled at PCLKB/8 1 1: Filter sampled at PCLKB/32	R/W
7:6	TIOGT[1:0]	Count Control*1 *2 0 0: Event is always counted 0 1: Event is counted during polarity period specified for AGTEEn pin Others: Setting prohibited	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. When AGTEEn pin is used, the polarity to count an event can be selected with the EEPS bit in the AGTISR register.
Note 2. TIOGT[1:0] bits are enabled only in event counter mode.
Note 3. When event counter mode operation is performed during Software Standby mode, the digital filter function cannot be used.

TEDGSEL bit (I/O Polarity Switch)

The TEDGSEL bit switches the AGTOn pin output polarity and the AGTIOn pin input/output edge and polarity.

In pulse output mode, it only controls polarity of the AGTOn pin output and AGTIOn pin output. AGTOn pin output and AGTIOn pin output are initialized when the AGTMR1 register is written or the TSTOP bit in the AGTCR register is written with 1.

TOE bit (AGTOn pin Output Enable)

The TOE bit selects whether the AGTOn pin output is disabled or enabled.

TIPF[1:0] bits (Input Filter)

The TIPF[1:0] bits specify the sampling frequency of the AGTIOn pin input filter. When the input to the AGTIOn pin is sampled and the values match three times in succession, the value is regarded as the input value.

TIOGT[1:0] bits (Count Control)

The TIOGT[1:0] bits control the event count.

Table 22.3 AGTIOn pin I/O edge and polarity switching

Operating mode	Function
Timer mode	Not used
Pulse output mode	0: Output is started at high (initialization level: high) i.e. inverted output 1: Output is started at low (initialization level: low). i.e. normal output
Event counter mode	0: Count on rising edge 1: Count on falling edge.
Pulse width measurement mode	0: Low-level width is measured 1: High-level width is measured.
Pulse period measurement mode	0: Measure from one rising edge to the next rising edge 1: Measure from one falling edge to the next falling edge.

Table 22.4 AGTOn pin output polarity switching

Operating mode	Function
All modes	0: Output is started at low (initial level: low): Normal output 1: Output is started at high (initial level: high): Inverted output

22.2.8 AGTISR : AGT Event Pin Select Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	EEPS	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	EEPS	AGTEEn Polarity Selection 0: An event is counted during the low-level period 1: An event is counted during the high-level period	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

EEPS bit (AGTEEn Polarity Selection)

The EEPS bit selects the polarity of events to be counted.

22.2.9 AGTCMSR : AGT Compare Match Function Select Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TOPOLB	TOEB	TCMEB	—	TOPOLA	TOEA	TCMEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCMEA	AGT Compare Match A Register Enable*1 *2 0: AGT Compare match A register disabled 1: AGT Compare match A register enabled	R/W
1	TOEA	AGTOAn Pin Output Enable*1 *2 0: AGTOAn pin output disabled 1: AGTOAn pin output enabled	R/W
2	TOPOLA	AGTOAn Pin Polarity Select*1 *2 0: AGTOAn pin output is started on low. i.e. normal output 1: AGTOAn pin output is started on high. i.e. inverted output	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TCMEB	AGT Compare Match B Register Enable*1 *2 0: Compare match B register disabled 1: Compare match B register enabled	R/W
5	TOEB	AGTOBn Pin Output Enable*1 *2 0: AGTOBn pin output disabled 1: AGTOBn pin output enabled	R/W
6	TOPOLB	AGTOBn Pin Polarity Select*1 *2 0: AGTOBn pin output is started on low. i.e. normal output 1: AGTOBn pin output is started on high. i.e. inverted output	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Do not rewrite the AGTCMSR register during a count operation. Only rewrite the AGTCMSR register when both the TSTART bit and TCSTF flag in the AGTCR register are set to 0 (count stops).
Note 2. Do not set 1 when in pulse width measurement mode or pulse period measurement mode.

22.2.10 AGTIOSEL : AGT Pin Select Register

Base address: AGTn = 0x4022_1000 + 0x0100 × n (n = 0, 1)
AGTn_NS = 0x5022_1000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TIES	—	—	—	
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	TIES	AGTIOn Pin Input Enable 0: External event input is disabled during Software Standby mode 1: External event input is enabled during Software Standby mode	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The AGTIOSEL register sets the AGTIOn pin when using the AGTIOn pin in Software Standby mode.

TIES bit (AGTIOn Pin Input Enable)

The TIES bit enables or disables an external event input.

22.3 Operation

22.3.1 Reload Register and Counter Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and the counter differs depending on the value of the TSTART bit in the AGTCR register and of the TCMEA or TCMEB bit in the AGTCMSR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and the counter. When the TSTART bit is 1 (count starts) and the TCMEA bit and TCMEB bit are 0 (AGT compare match A/B register are invalid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the next count source. When the TSTART bit is 1 (count starts) and the TCMEA bit or the TCMEB bit is 1 (AGT compare match A register or compare match B register is valid), the value is written to the reload register in synchronization with the count source, and then to the counter in synchronization with the underflow of the counter.

Figure 22.3 and Figure 22.4 show the timing of rewrite operation with TSTART bit value and TCMEA/TCMEB bit value.

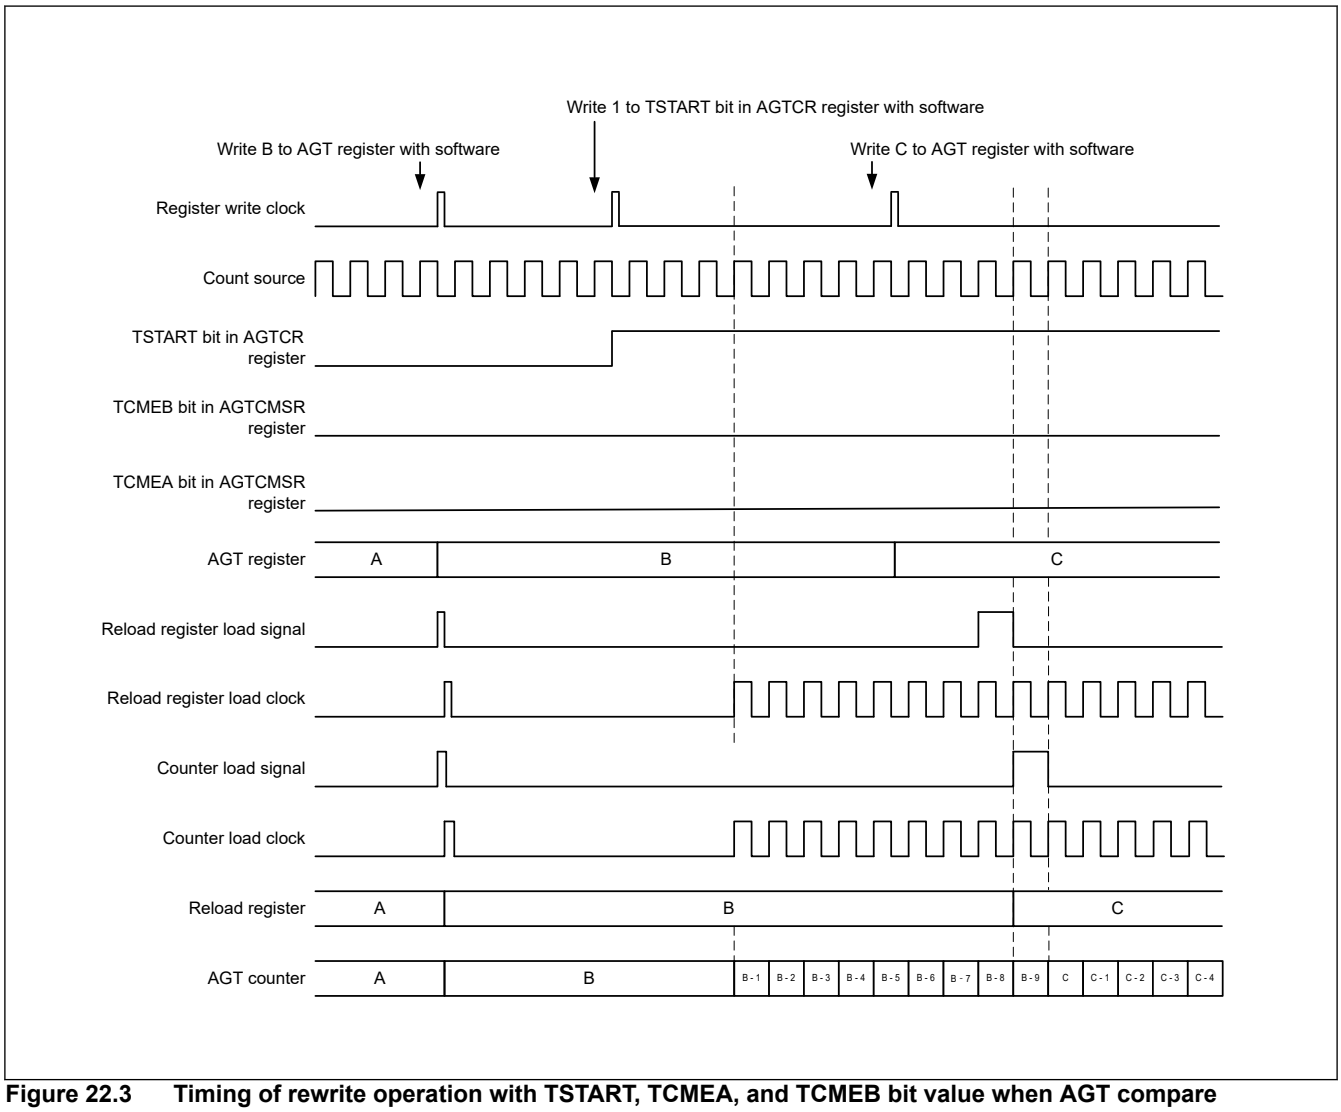

Figure 22.3 Timing of rewrite operation with TSTART, TCMEA, and TCMEB bit value when AGT compare match A register and AGT compare match B register is invalid

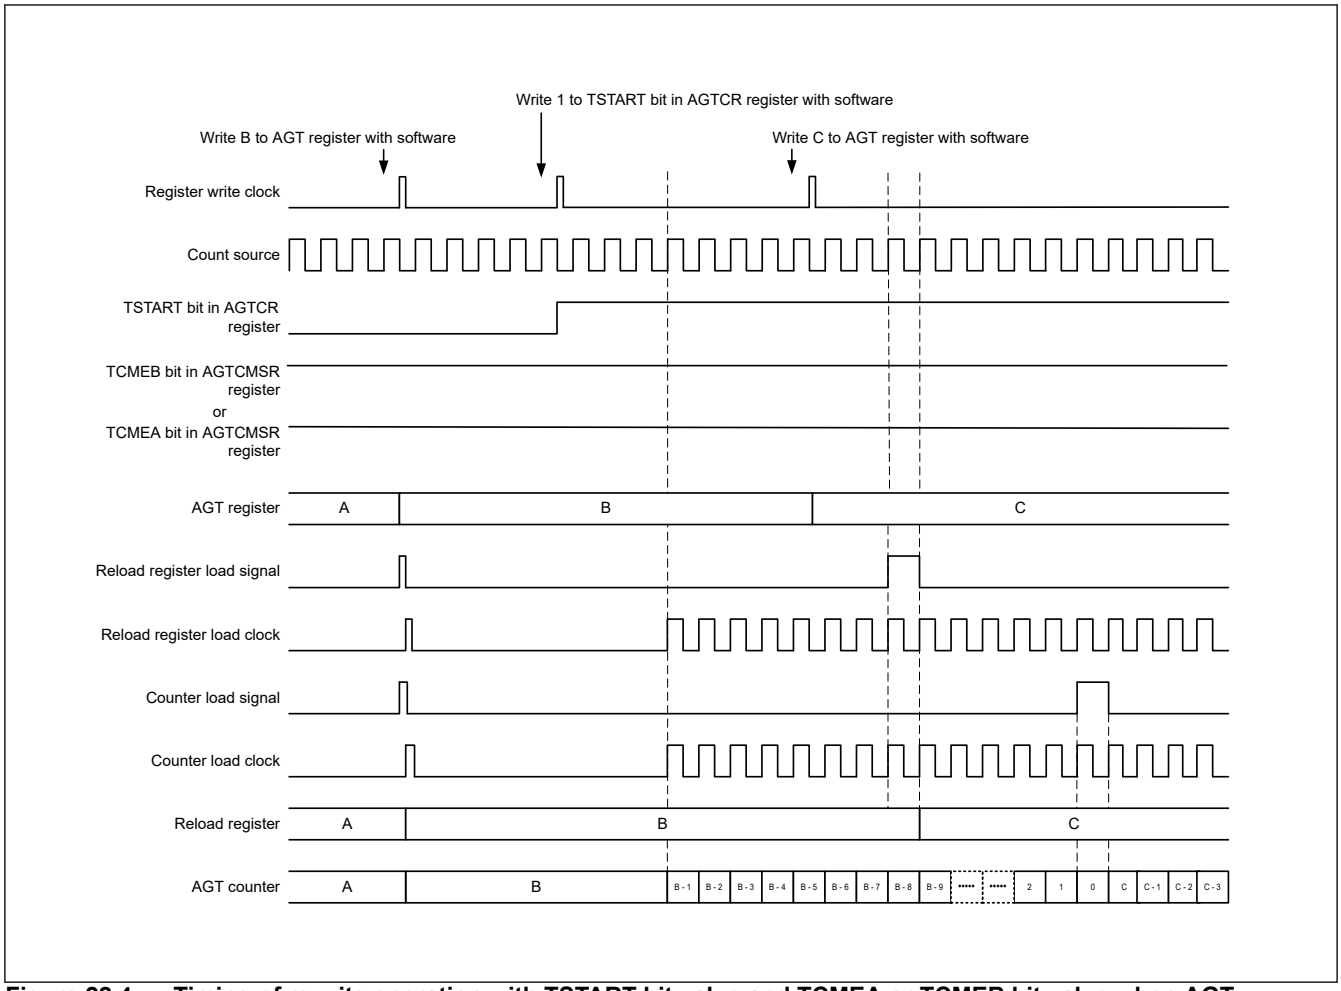

Figure 22.4 Timing of rewrite operation with TSTART bit value and TCMEA or TCMEB bit value when AGT compare match A register or AGT compare match B register is valid

22.3.2 Reload Register and AGT Compare Match A/B Register Rewrite Operation

Regardless of the operating mode, the timing of the rewrite operation to the reload register and AGT compare register A/B depends on the value of the TSTART bit in the AGTCR register. When the TSTART bit is 0 (count stops), the count value is directly written to the reload register and AGT compare register A/B. When the TSTART bit is 1 (count starts), the value is written to the reload register in synchronization with the count source, and then to the compare register in synchronization with the underflow of the counter.

Figure 22.5 shows the timing of rewrite operation with TSTART bit value for compare register A. AGT Compare register B is of the same timing as AGT compare register A.

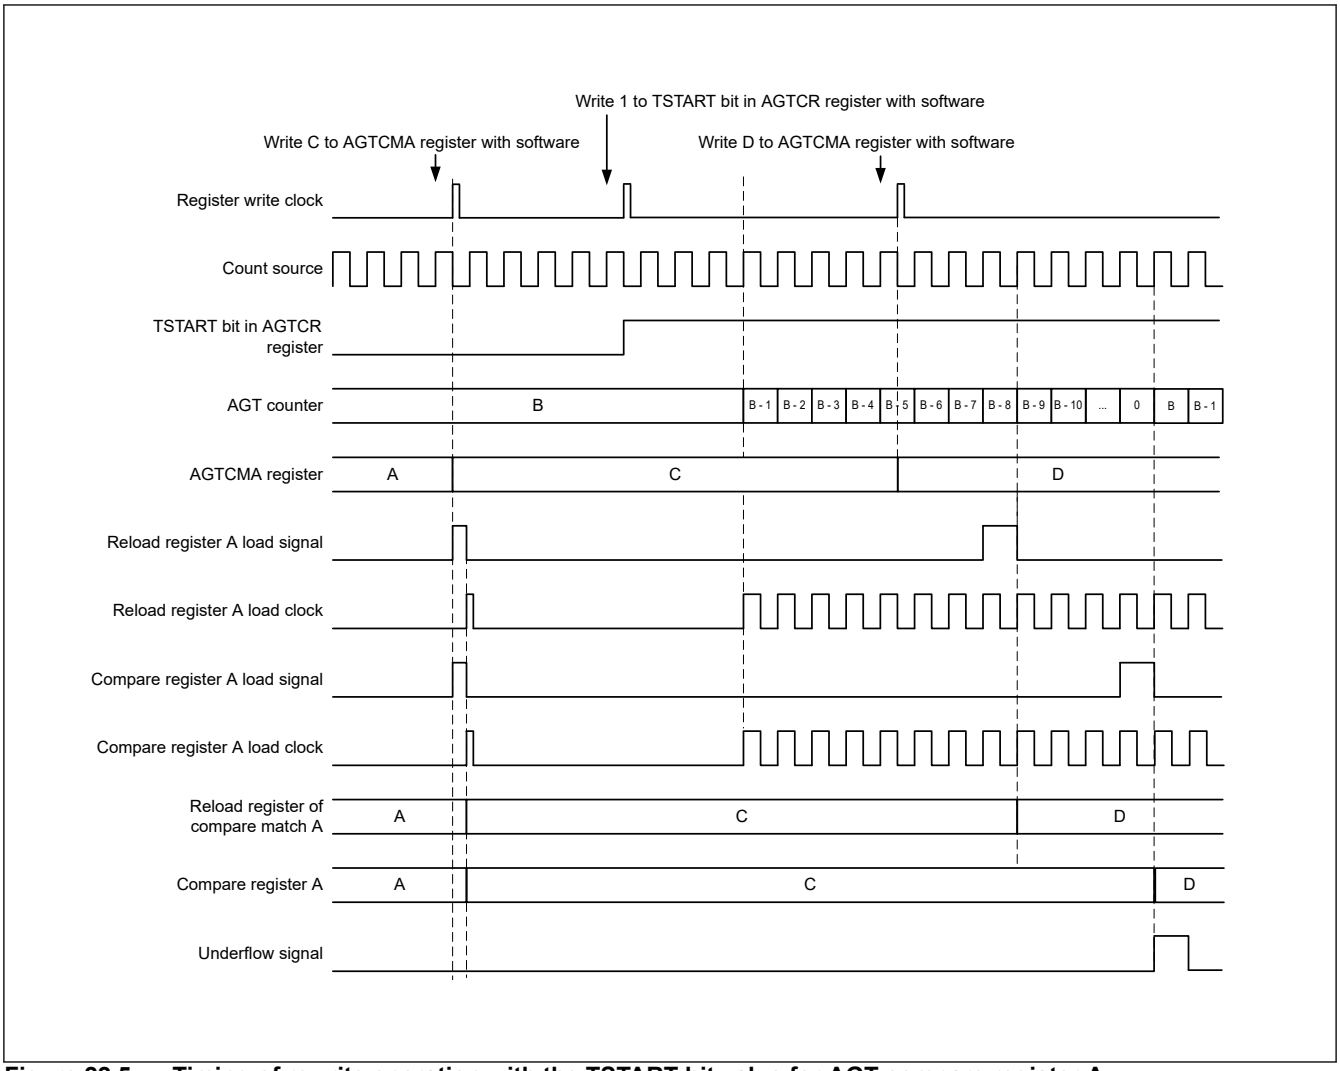

Figure 22.5 Timing of rewrite operation with the TSTART bit value for AGT compare register A

22.3.3 Timer Mode

In this mode, the AGT counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register. In timer mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated.

Figure 22.6 shows the operation example in timer mode.

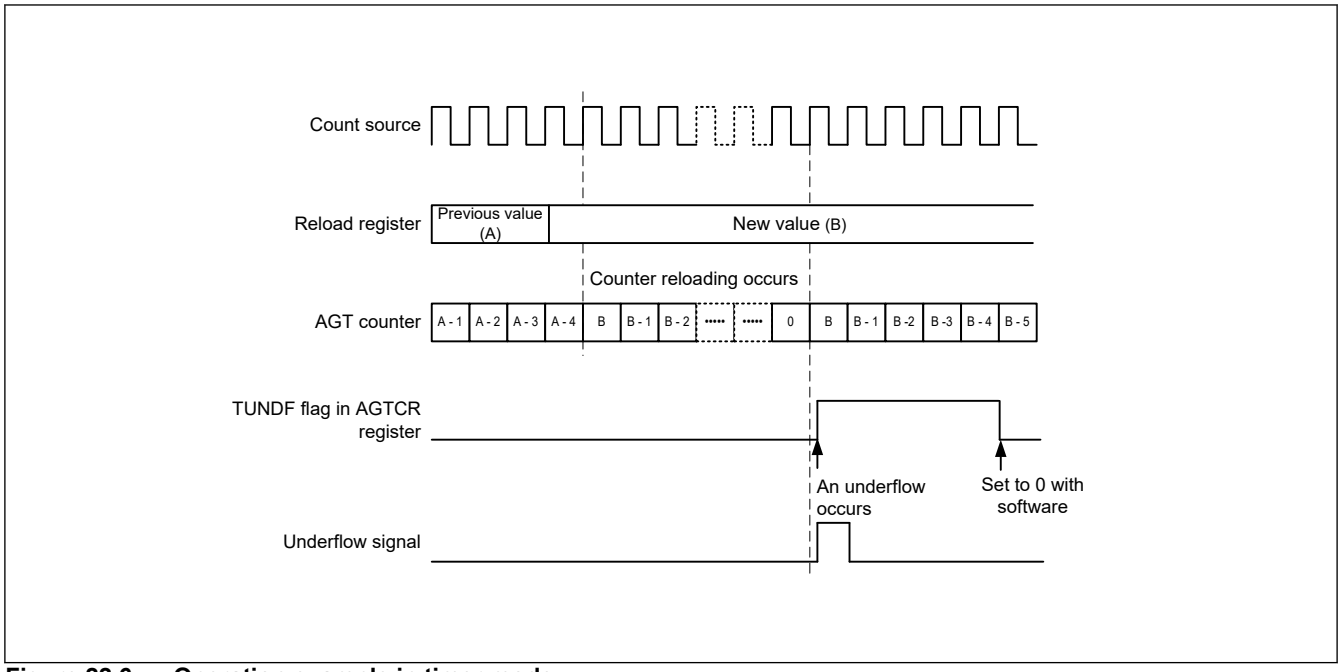

Figure 22.6 Operation example in timer mode

22.3.4 Pulse Output Mode

In pulse output mode, the counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and the output level of the AGTIOn and AGTOn pins inverted each time an underflow occurs.

In pulse output mode, the count value is decremented by 1 on each rising edge of the count source. When the count value reaches 0x0000 and the next count source is input, an underflow occurs and an interrupt request is generated. In addition, a pulse can be output from the AGTIOn and AGTOn pins. The output level is inverted each time an underflow occurs. The pulse output from the AGTOn pin can be stopped with the TOE bit in the AGTIOC register. The output level can be selected with the TEDGSEL bit in the AGTIOC register.

Figure 22.7 shows the operation example in pulse output mode.

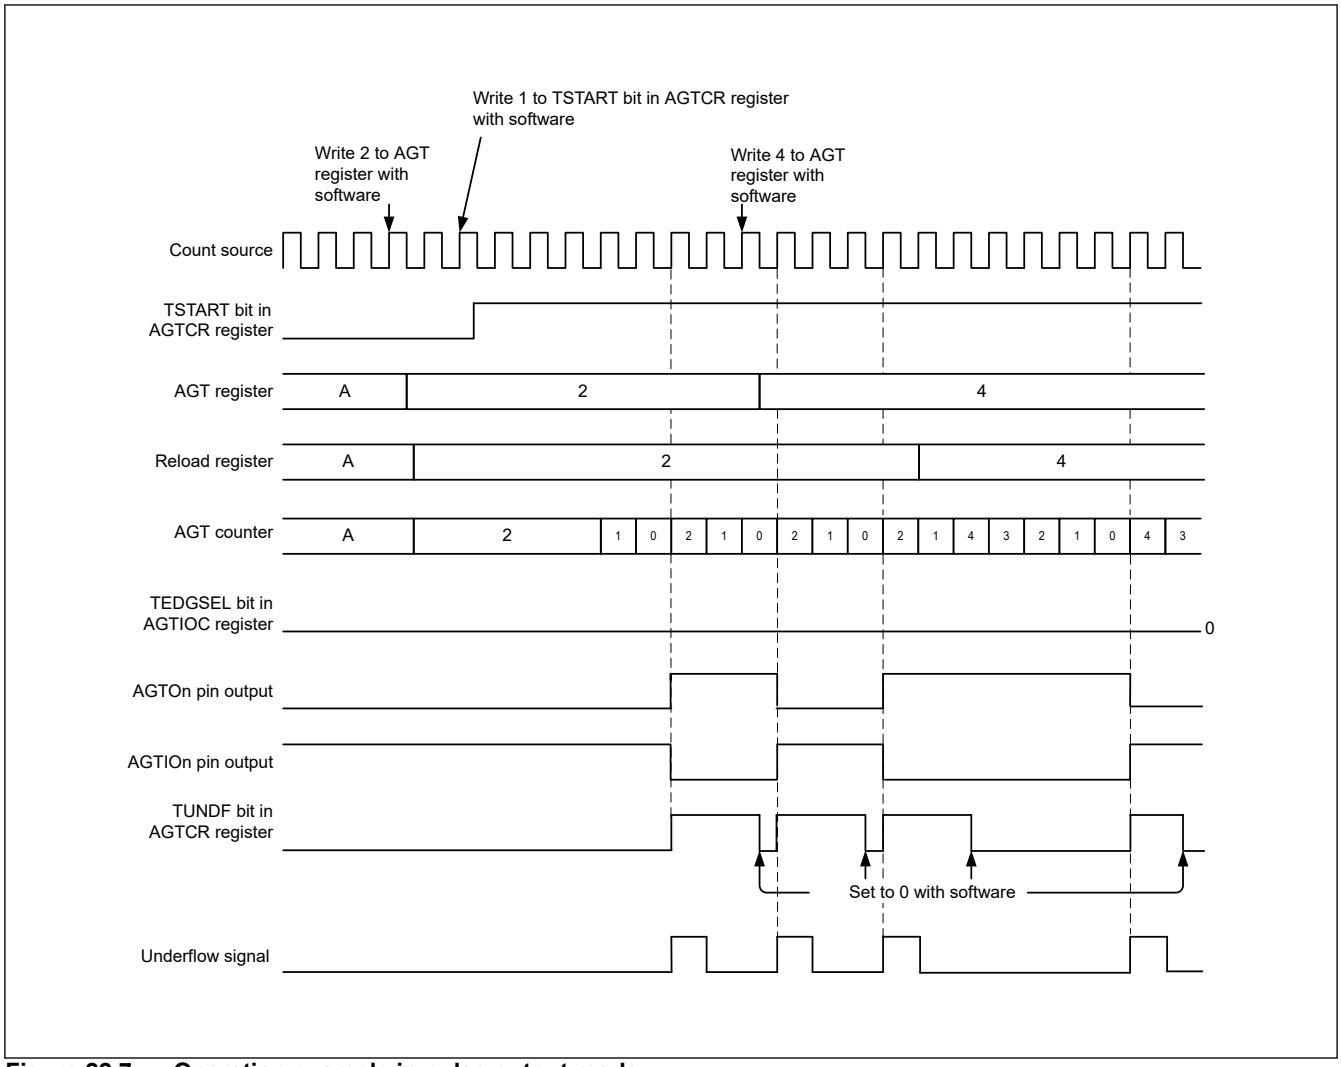

Figure 22.7 Operation example in pulse output mode

22.3.5 Event Counter Mode

In event counter mode, the counter is decremented by an external event signal (count source) input to the AGTIOn pin. Various periods for counting events can be set with the TIOGT[1:0] bits in the AGTIOC register and AGTISR registers. In addition, the filter function for the AGTIOn pin input can be specified with bits TIPF[1:0] in the AGTIOC register. The output from the AGTOn pin can be toggled even in event counter mode.

Figure 22.8 shows the operation example in event counter mode.

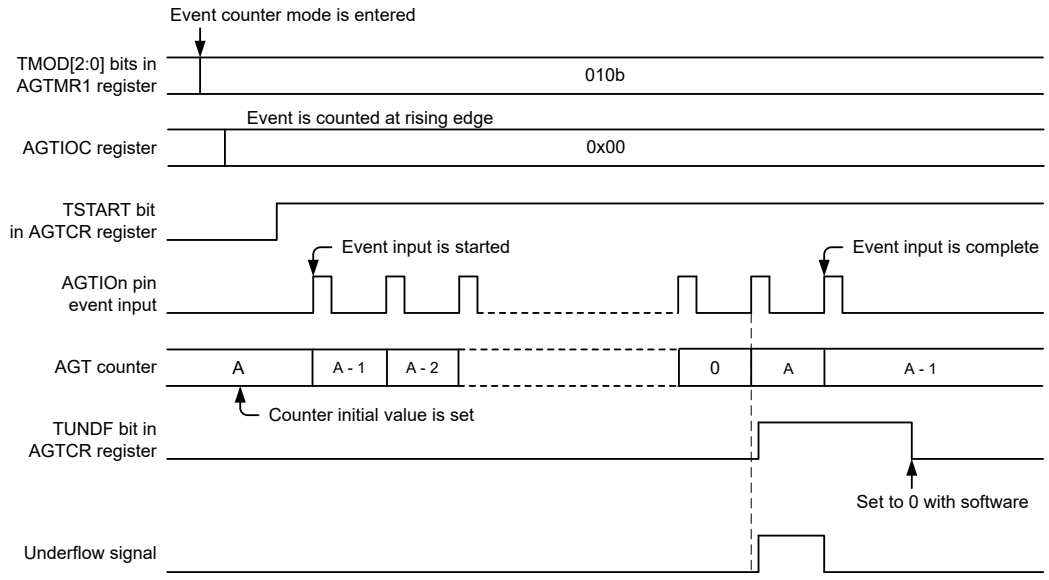

Figure 22.8 Operation example 1 in event counter mode

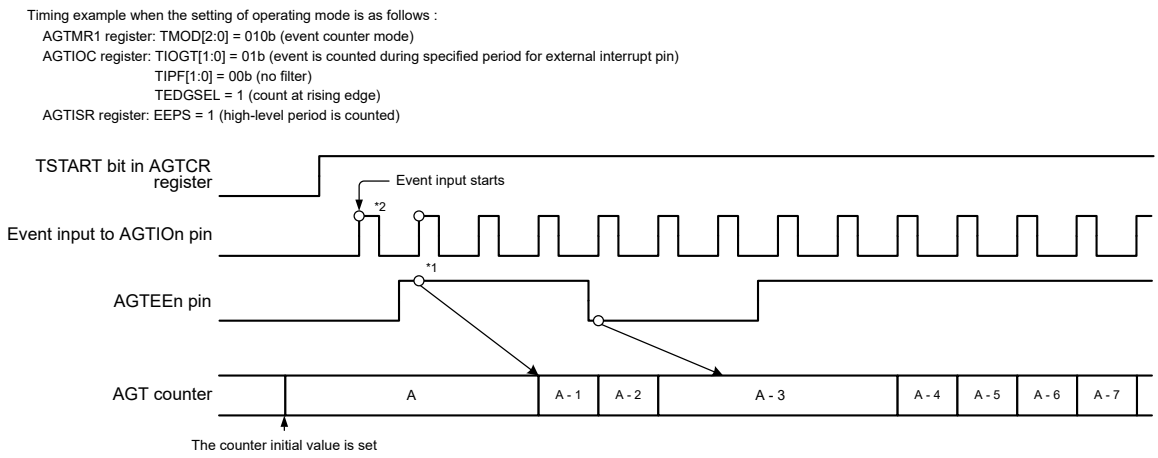
Figure 22.9 shows an operation example for counting during the specified period in event counter mode (TIOGT[1:0] bits in the AGTIOC register are set to 01b).



Note 1. To control synchronization, there is a delay of 2 cycles of the count source until the count operation is affected. It is also possible that the count start timing is shifted by 1 cycle because of the phase difference between the AGTEEn pin and the sampling clock.

Note 2. Count operation can be performed for 2 cycles of the count source immediately after the count starts, depending on the previous state before the count stops.
To disable the count for 2 cycles immediately after the count starts, write 1 to the TSTOP bit in the AGTCR register to initialize the internal circuit, and then complete the operation settings before starting the count operation.

Figure 22.9 Operation example 2 in event counter mode

22.3.6 Pulse Width Measurement Mode

In pulse width measurement mode, the pulse width of an external signal input to the AGTIOn pin is measured. When the level specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the counter is decremented by the

count source selected with the TCK[2:0] bits in the AGTMR1 register. When the specified level on the AGTIOn pin ends, the counter is stopped, the TEDGF flag in the AGTCR register is set to 1 (active edge received), and an interrupt request is generated. The measurement of pulse width data is performed by reading the count value while the counter is stopped. Also, when the counter underflows during measurement, the TUNDF flag in the AGTCR register is set to 1 and an interrupt request is generated.

Figure 22.10 shows the operation example in pulse width measurement mode.

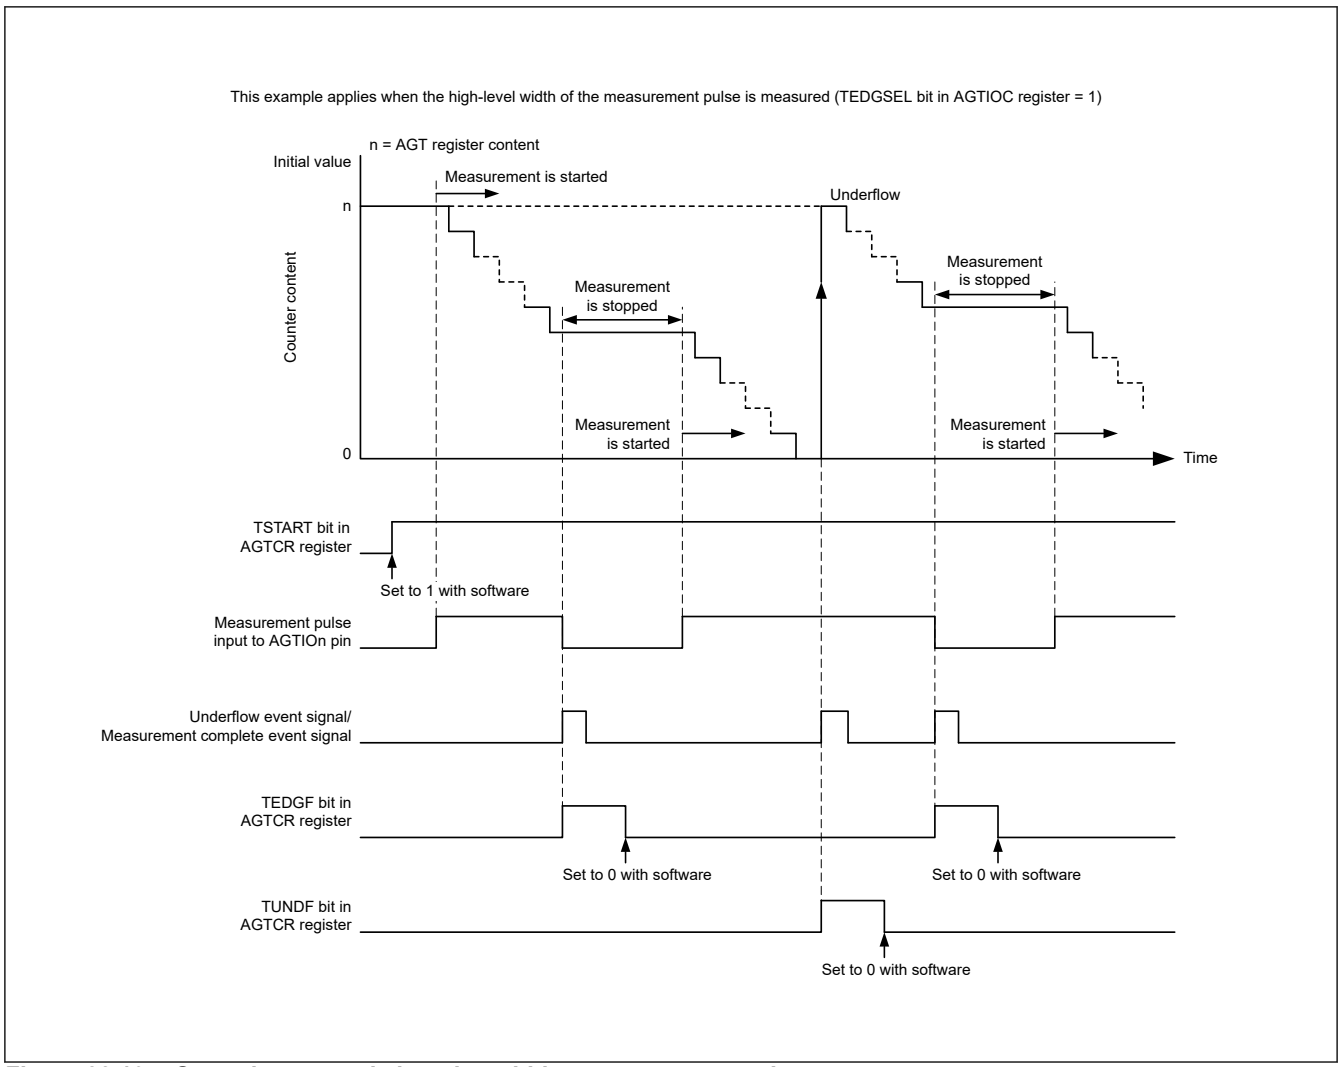


Figure 22.10 Operation example in pulse width measurement mode

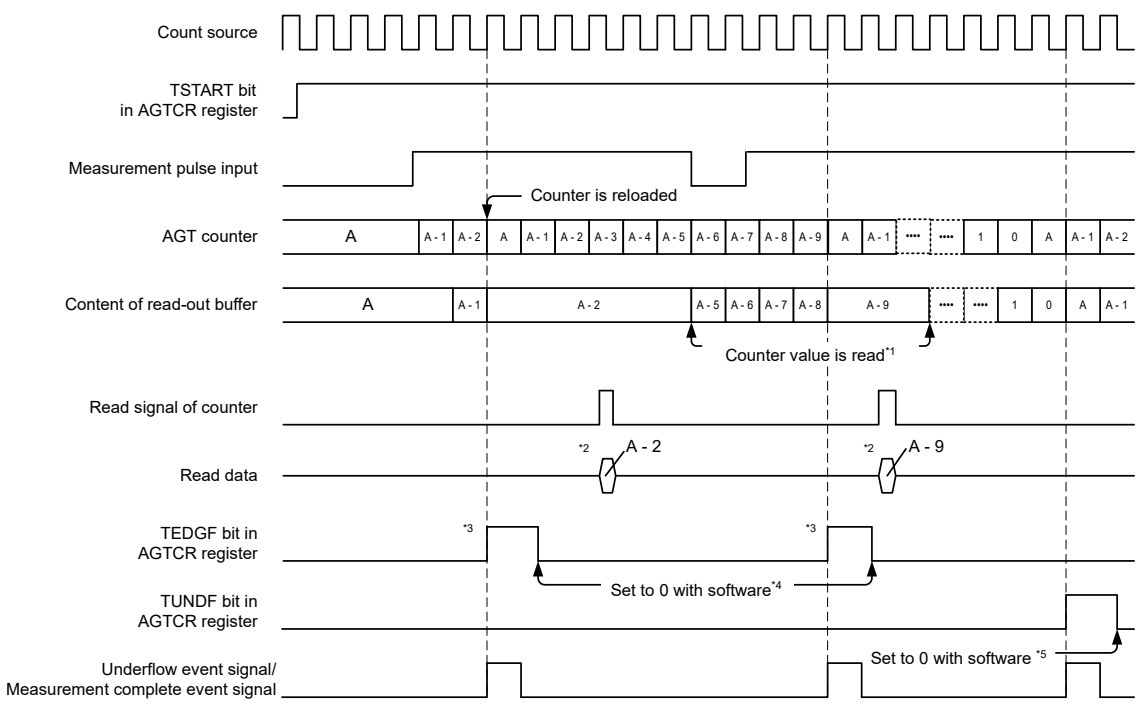
22.3.7 Pulse Period Measurement Mode

In pulse period measurement mode, the pulse period of an external signal input to the AGTIOn pin is measured. The counter is decremented by the count source selected with TCK[2:0] bits in the AGTMR1 register. When a pulse with the period specified by the TEDGSEL bit in the AGTIOC register is input to the AGTIOn pin, the count value is transferred to the read-out buffer on the rising edge of the count source. The value in the reload register is loaded to the counter at the next rising edge. Simultaneously, the TEDGF flag in the AGTCR register is set to 1 (active edge received) and an interrupt request is generated. The read-out buffer (AGT register) is read at this time and the difference from the reload value (see section 22.4.6. How to Calculate Event Number, Pulse Width, and Pulse Period) is the period data of the input pulse. The period data is retained until the read-out buffer is read. When the counter underflows, the TUNDF flag in the AGTCR register is set to 1 (underflow) and an interrupt request is generated.

Figure 22.11 shows the operation example in pulse period measurement mode.

Only input pulses with a period longer than twice the period of the count source are measured. Also, the low-level and high-level widths must both be longer than the period of the count source. If a pulse period shorter than these conditions is input, the input might be ignored.



This example applies when the initial value of the AGT register is set to A, the TEDGSEL bit in the AGTIOC register is set to 0, and the period from one rising edge to the next edge of the measurement pulse is measured.

Note 1. Reading from the AGT register must be performed during the period from when the TEDGF flag is set to 1 (active edge received) until the next active edge is input. The content of the read-out buffer is retained until the AGT register is read. If it is not read before the active edge is input, the measurement result of the previous period is retained.
Note 2. When the AGT register is read in pulse period measurement mode, the content of the read-out buffer is read.
Note 3. When the active edge of the measurement pulse is input and then the set edge of an external pulse is input, the TEDGF flag in the AGTCR register is set to 1 (active edge received).
Note 4. To set to 0 with software, write 0 to the TEDGF flag in the AGTCR register with an 8-bit memory manipulation instruction.
Note 5. To set to 0 with software, write 0 to the TUNDF flag in the AGTCR register with an 8-bit memory manipulation instruction.

Figure 22.11 Operation example in pulse period measurement mode

22.3.8 Compare Match function

The compare match function detects matches (compare match) between the content of the AGTCMA or AGTCMB register and the content of the AGT register. This function is enabled when the TCMEA or TCMEB bit in the AGTCMSR register is 1 (compare match A register or compare match B register is valid). The counter is decremented by the count source selected with the TCK[2:0] bits in the AGTMR1 register, and when the values of AGT and AGTCMA or AGTCMB match, the TCMAF/TCMBF flag in the AGTCR register is set to 1 (match), and an interrupt request is generated.

When the compare match function is enabled, the timing of the rewrite operation to the reload register and the counter differs. See section 22.3.1. Reload Register and Counter Rewrite Operation for details. In addition, the output level of the AGTOAn, AGTOBn pins is inverted by the match and by the underflow. The output level can be selected with the TOPOLA or TOPOLB bit in the AGTCMSR register.

Figure 22.12 shows the operation example in compare match function.

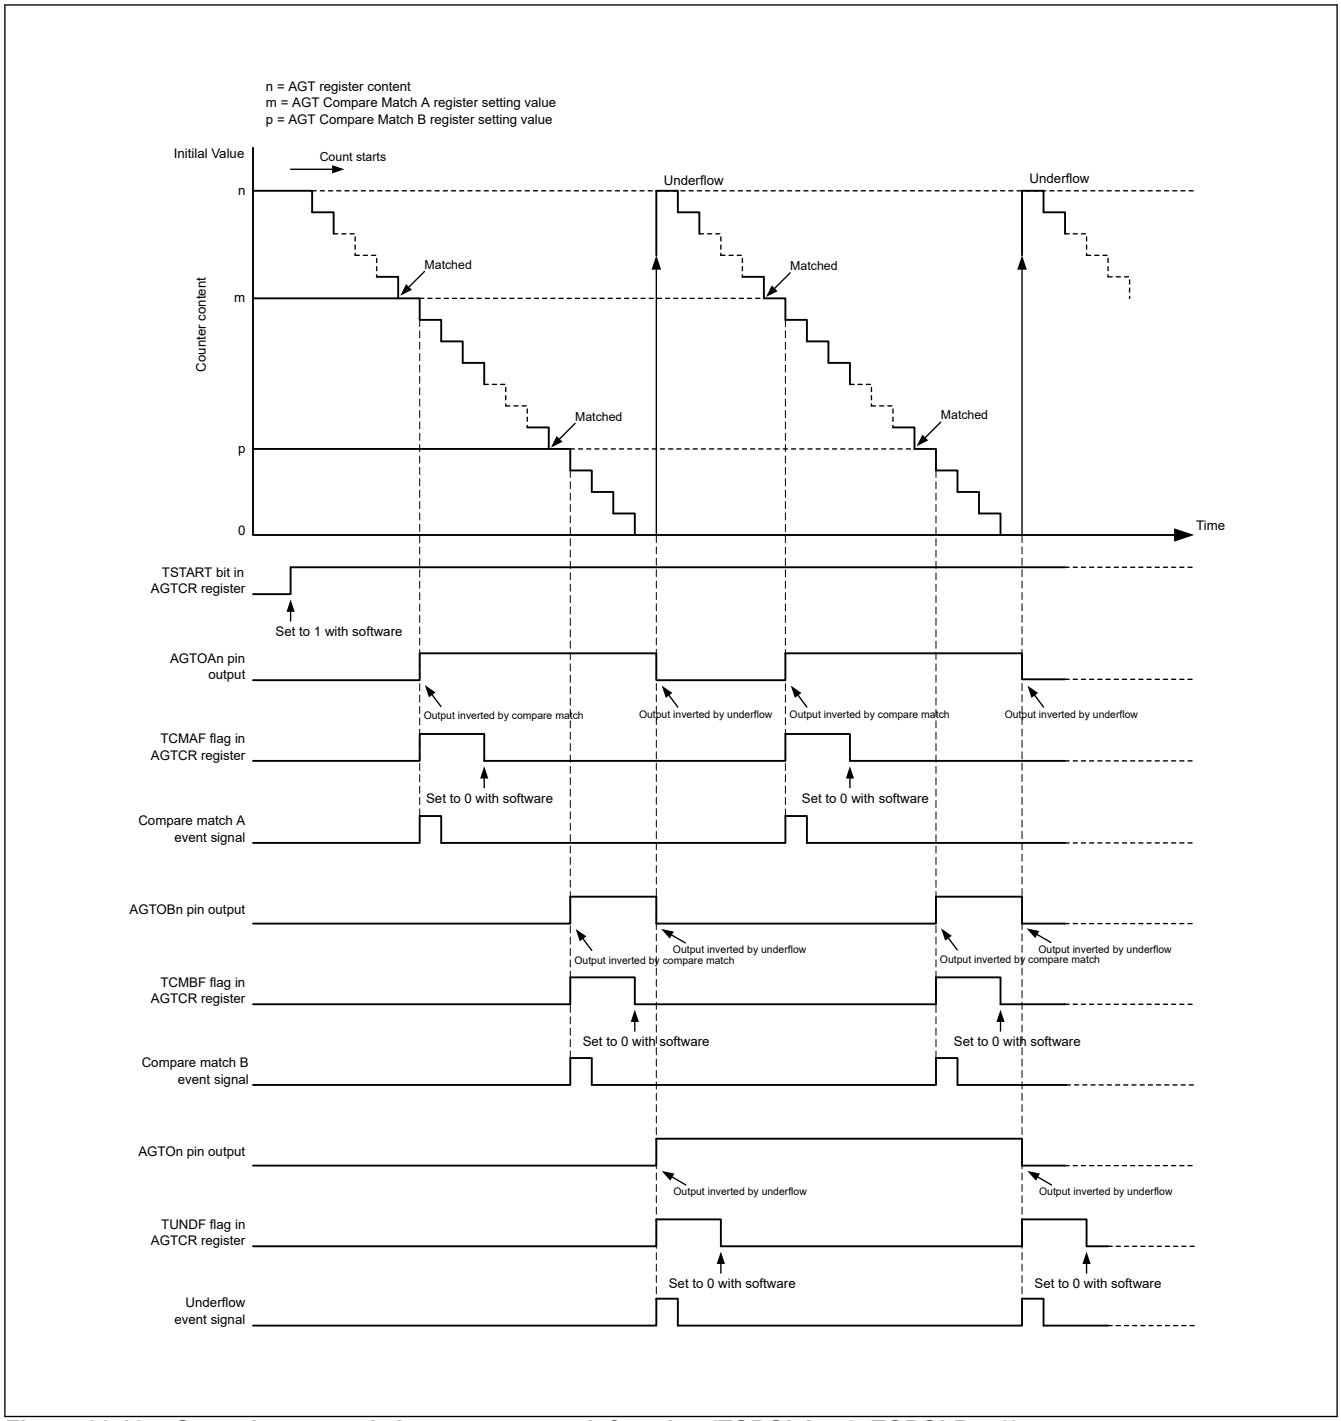


Figure 22.12 Operation example in compare match function (TOPOLA = 0, TOPOLB = 0)

22.3.9 Output Settings for Each Mode

Table 22.5 to Table 22.8 list the states of pins AGTOn, AGTIOn, AGTOAn, and AGTOBn pins in each mode.

Table 22.5 AGTOn pin setting

Operating mode	AGTIOC register		AGTOn pin output
	TOE bit	TEDGSEL bit	
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 22.6 AGTIOn pin setting

Operating mode	AGTIOC register TEDGSEL bit	AGTIOn pin I/O
Timer mode	0 or 1	Input (not used)
Pulse output mode	1	Normal output
	0	Inverted output
Event counter mode	0 or 1	Input
Pulse width measurement mode		
Pulse period measurement mode		

Table 22.7 AGTOAn pin setting

Operating mode	AGTCMSR register		AGTOAn pin output
	TOEA bit	TOPOLA bit	
Timer mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse output mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Event counter mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse width measurement mode	0	0	Prohibited
Pulse period measurement mode			

Table 22.8 AGTOBn pin setting

Operating mode	AGTCMSR register		AGTOBn pin output
	TOEB bit	TOPOLB bit	
Timer mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse output mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Event counter mode	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled (not used)
Pulse width measurement mode	0	0	Prohibited
Pulse period measurement mode			

22.3.10 Standby Mode

The AGT can operate in Software Standby mode. Set it to Software Standby mode with count operation start (TSTART = 1, TCSTF = 1).

Table 22.9 and Table 22.10 show the setting that can be used in Software Standby mode.

Table 22.9 Usable settings in Software Standby mode (AGT0)

Operating mode	AGTMR1.TCK[2:0]	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse output mode	100b or 110b	AGTLCLK or AGTSCLK	—
Event counter mode*2	—	AGTIO0*1	—
Pulse width measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—
Pulse period measurement mode	100b or 110b	AGTLCLK or AGTSCLK	—

Note: —: invalid
Note 1. When using the AGTIO0 pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.
Note 2. AGTEE pin is not available during Software Standby mode. External events are always enabled.

Table 22.10 Usable settings in Software Standby mode (AGT1)

Operating mode	AGTMR1.TCK[2:0]	Operating clock	Resurgence factor of CPU
Timer mode	100b or 110b or 101b*1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Compare match A/B
Pulse output mode	100b or 110b or 101b*1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Compare match A/B
Event counter mode*3	—	AGTIO1*2	• Underflow • Compare match A/B
Pulse width measurement mode	100b or 110b or 101b*1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Active edge
Pulse period measurement mode	100b or 110b or 101b*1	AGTLCLK or AGTSCLK or AGT0 underflow	• Underflow • Active edge

Note: —: invalid
Note: Release of Software Standby mode is only AGT1.
Note: Compare match A/B is resurgence factor of CPU from Software Standby mode.
Note 1. Only when AGT0 operates in Table 22.9
Note 2. When using the AGTIO1 pin for external event input in Software Standby mode, set AGTIOSEL.TIES = 1.
Note 3. AGTEE pin is not available during Software Standby mode. External events are always enabled

22.3.11 Interrupt Sources

The AGTn has three interrupt sources as listed in Table 22.11.

Table 22.11 AGT interrupt sources

Name	Interrupt source	DMAC/DTC activation
AGTn_AGTI	• When the counter underflows • When measurement of the active width of the external input pin (AGTIOn) is complete in pulse width measurement mode • When the set edge of the external input pin (AGTIOn) is input in pulse period measurement mode.	Possible
AGTn_AGTCMAI	• When the values of AGT register and AGTCMA register match	Possible
AGTn_AGTCMBI	• When the values of AGT register and AGTCMB register match	Possible

Note: Channel number (n = 0, 1)

22.3.12 Event Signal Output to ELC

The AGT uses the Event Link Controller (ELC) to perform a link operation to a specified module using the interrupt request signal as the event signal. The AGT outputs compare match A, compare match B, and underflow/measurement complete signals as event signals. For details, see section 18, Event Link Controller (ELC).

22.4 Usage Notes

22.4.1 Count Operation Start and Stop Control

- When the operating mode (see Table 22.1) is set to other than the event counter mode, or the count source is set to other than AGTn underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 3 cycles of the count source. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 3 cycles of the count source. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.
- When the operating mode (see Table 22.1) is set to event counter mode, or the count source is set to AGT1 underflow event signal (TCK[2:0] = 101b):
  - After 1 (count starts) is written to the TSTART bit in the AGTCR register while the count is stopped, the TCSTF flag in the AGTCR register remains 0 (count stops) for 2 PCLKB cycles. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 1 (count in progress).
  - After 0 (count stops) is written to the TSTART bit during a count operation, the TCSTF flag remains 1 for 2 PCLKB cycles. When the TCSTF flag is set to 0, the count is stopped. Do not access the registers associated with AGT other than the TCSTF flag until this flag is set to 0.

22.4.2 Access to Counter Register

When the TSTART bit and TCSTF flag in the AGTCR register are both 1 (count starts), allow at least 3 cycles of the count source clock between writes when writing to the AGT register successively.

22.4.3 When Changing Mode

The registers associated with AGT operating mode (AGTMR1, AGTMR2, AGTIOC, AGTISR, and AGTCMSR) can be changed only when the count is stopped with both the TSTART bit and TCSTF flag set to 0 (count stops). Do not change these registers during count operation.

When the registers associated with AGT operating mode are changed, the values of TEDGF, TUNDF, TCMAF, and TCMBF flags are undefined. Before starting the count, write 0 to the following flags:

- TEDGF (no active edge received)
- TUNDF (no underflow)
- TCMAF (no match)
- TCMBF (no match).

22.4.4 Output pin setting

When using the AGTOn, AGTIOn, AGTOAn, or AGTOBn as an output pin, set up the Operation and determine the initial output values. Then set PmnPFS.PMR bit to 1.

When using the AGTIOn as an input pin in pulse width measurement mode or pulse period measurement mode, set up the Operation and start count operation. Then start to enter external events from the AGTIOn pin. Invalidate the first measurement and validate the second and later completed measurements.

22.4.5 Digital Filter

When using the digital filter, do not start the timer operation for 5 cycles of the digital filter clock after setting TIPF[1:0] bits and when the TEDGSEL bit in the AGTIOC register changes.

22.4.6 How to Calculate Event Number, Pulse Width, and Pulse Period

- In event counter mode, event number is expressed mathematically as follows:
  Event number = initial value of counter [AGT register] - counter value of active event end

- In pulse width measurement mode, pulse width is expressed mathematically as follows:
  Pulse width = counter value of stopping measurement - counter value of next stopping measurement
- In pulse period measurement mode, input pulse period is expressed mathematically as follows:
  Period of input pulse = (initial value of counter [AGT register] - reading value of the read-out buffer) + 1.

22.4.7 When Count is Forcibly Stopped by TSTOP Bit

After the counter is forcibly stopped by the TSTOP bit in the AGTCR register, do not access the following I/O registers for 1 cycle of the count source:

- AGT
- AGTCMA
- AGTCMB
- AGTCR
- AGTMR1
- AGTMR2.

22.4.8 When Selecting AGT0 Underflow as the Count Source

Operate according to the following procedures described in this section when selecting the underflow event signal as the count source.

(1) Procedure for starting operation

1. Set AGT.
2. Start the count operation of AGT1.
3. Start the count operation of AGT0.

(2) Procedure for stopping operation

1. Stop the count operation of AGT0.
2. Stop the count operation of AGT1.
3. Stop the count source clock of AGT1 (write 000b in the AGTMR1.TCK[2:0] bits).

22.4.9 Module-stop function

AGT operation can be disabled or enabled using Module Stop Control Register D (MSTPCRD). The AGT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes

22.4.10 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. Therefore, when using the AGTIOn, AGTEEn, or both input as external event input, the clock source should not be switched. If switching the clock source while using the external event input, extend the input pulse width by 4 clock cycles of the switched source clock cycles.

23. Ultra-Low-Power Timer (ULPT)

23.1 Overview

This ultra-low-power timer (ULPT) is a 32-bit timer that can output pulses or count external events.

This 32-bit timer consists of reload registers and a down-counter. The reload registers and the down-counter are allocated to the same address and can be accessed through the ULPTCNT register.

Table 23.1 lists the ULPT specifications.

Table 23.1 ULPT specifications

Item		Description
Operating mode	Timer mode	Count the internal clock.
	Event counter mode	Count external events.
Number of Channels		32 bits × 2 channels (ULPTn (n = 0, 1))
Count source (operating clock)*1		The following signals can be selected: ● Internal clock: ULPTLCLK/d or ULPTSCLK/d (d = 1, 2, 4, 8, 16, 32, 64, 128) ● External event: ULPTEVIn pin
Count operation		The following functions can be selected: ● Selection between continuous mode and one-shot mode ● Selection among count enable mode, count start mode, and count restart mode
Interrupt/event link function (output)		● Underflow signal – When the counter underflows ● Compare match A signal – When the ULPTCNT value matches the ULPTCMA value (The compare match A function is enabled.) ● Compare match B signal – When the ULPTCNT value matches the ULPTCMB value (The compare match B function is enabled.)
Selectable functions		● Pulse output function – Inverts the output each time the counter underflows. ● Compare match function – Either or both compare match A register and compare match B register are selectable. ● Return from Software Standby mode can be performed with ULPTn_ULPTI, ULPTn_ULPTCMAI, or ULPTn_ULPTCMBI (n=0, 1).*2 ● Return from Deep Software Standby mode 1 can be performed with ULPTn_ULPTI (n=0, 1).*2
Module-stop function		Module-stop state can be set for each channels to reduce power consumption
TrustZone Filter		Security and Privilege attribution can be set for each channels.

Note 1. Make sure that the frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source clock.
Note 2. For details, see section 10, Low Power Modes.

23.2 Configuration

Figure 23.1 shows the ULPT block diagram. Table 23.2 lists the I/O pins of the ULPT.

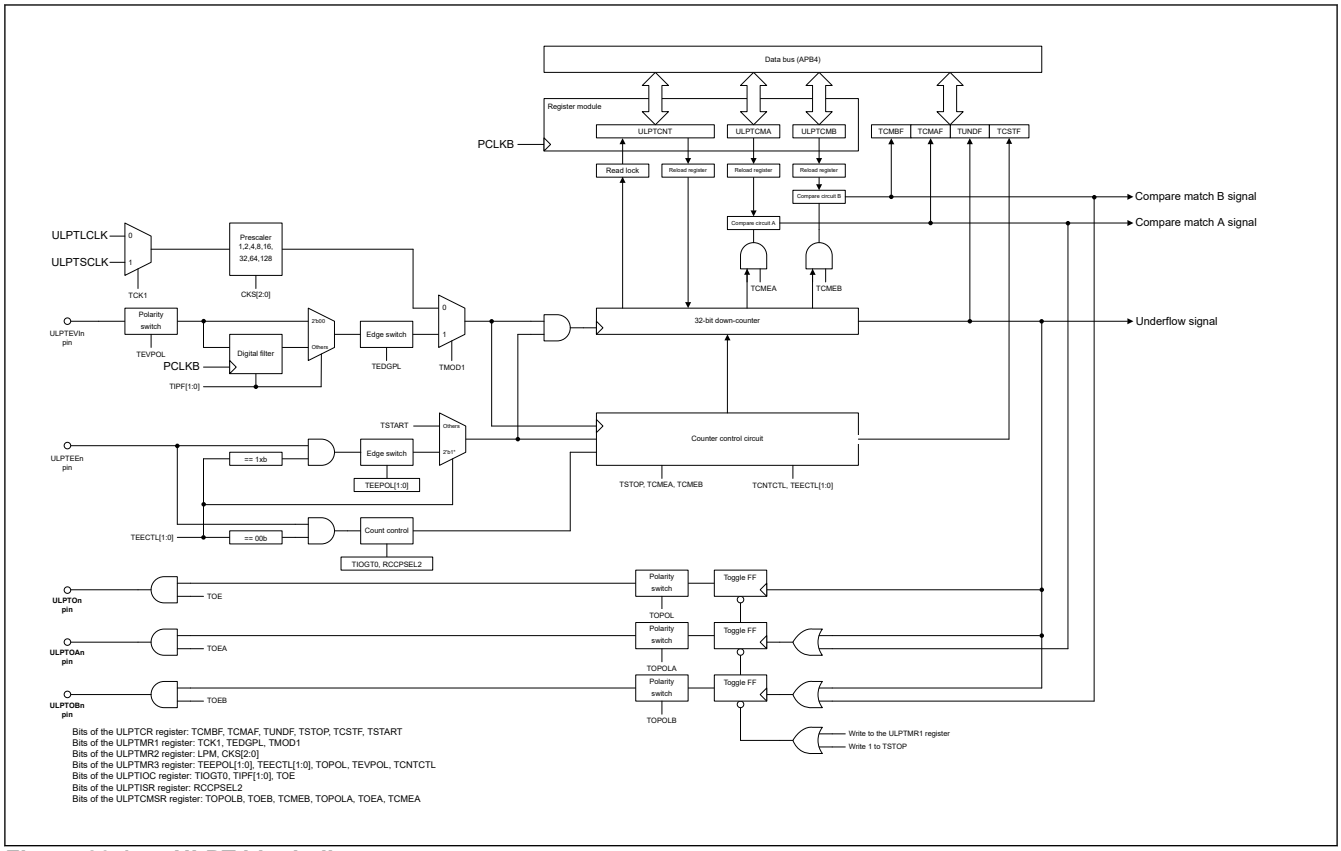

Figure 23.1 ULPT block diagram

Table 23.2 ULPT I/O pins

Pin name	I/O	Function
ULPTEEn*2	Input	External count control input*1
ULPTEVIn*2	Input	External event input
ULPTOn*2	Output	Pulse output
ULPTOAn*2	Output	Output compare match A output
ULPTOBn*2	Output	Output compare match B output

Note: Channel number: n = 0, 1
Note 1. The function of the ULPTEEn pin can be selected by the ULPTMR3.TEECTL[1:0] bits. For more details, see section 23.3.7. ULPTMR3 : ULPT Mode Register 3.
Note 2. Only pins marked "-DS" can be used in Deep Software Standby mode1.

23.3 Register Descriptions

23.3.1 ULPTCNT : ULPT Counter Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x00

Bit position:	31																												0
Bit field:	ULPTCNT																												
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	ULPTCNT	32-bit counter and reload register*1*2 Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. When 1 is written to the ULPTCR.TSTOP bit, the counter is forcibly stopped and set to 0xFFFFFFFF. The reload register is set to 0xFFFFFFFF
Note 2. When 0x00000000 is set in the ULPTCNT register, a request signal to the ICU, DTC, and ELC occurs only once immediately after the start of count operation (when the ULPTCR.TSTART bit is set to 1). However, the pulse output at the ULPTOn pin continues to be toggled.
The pulse output from the ULPTOn pin can be enabled or disabled by the ULPTIOC.TOE bit.
When the ULPTCNT register is set to a value equal to or greater than 0x00000001, a request signal is generated each time the counter underflows.

The ULPTCNT is a 32-bit register. The register value is written to the reload register and is read from the counter.

The states of the counter and reload register change according to the TSTART/TCSTF bit in the ULPTCR register and TCMEA/TCMEB bit in the ULPTCMSR register. For details, see section 23.4.2. Rewriting the counter and reload register.

The ULPTCNT register is only available for 32-bit read/write access.

23.3.2 ULPTCMA : ULPT Compare Match A Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x04

Bit position:	31																													0
Bit field:	ULPTCMA																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	ULPTCMA	32-bit Compare Match A Data*1*2 Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. When 1 is written to the ULPTCR.TSTOP bit, 0xFFFFFFFF is set in the ULPTCMA register.
Note 2. Set the ULPTCMA register to 0xFFFFFFFF when compare match A is not used (ULPTCMSR.TCMEA bit = 0).

The ULPTCMA register is a readable/writable register to set a value for compare match with the counter.

The states of compare circuit A and the reload register change according to the TSTART and TCSTF bits in the ULPTCR register. For details, see section 23.4.3. Rewriting the compare circuits and reload registers for compare match A/B.

The ULPTCMA register is only available for 32-bit read/write access.

23.3.3 ULPTCMB : ULPT Compare Match B Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x08

Bit position:	31																													0
Bit field:	ULPTCMB																													
Value after reset:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
31:0	ULPTCMB	32-bit Compare Match B Data*1*2 Setting range : 0x00000000 to 0xFFFFFFFF	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. When 1 is written to the ULPTCR.TSTOP bit, 0xFFFFFFFF is set in the ULPTCMB register.
Note 2. Set the ULPTCMB register to 0xFFFFFFFF when compare match B is not used (ULPTCMSR.TCMEB bit = 0).

The ULPTCMB register is a readable/writable register to set a value for compare match with the counter.

The states of compare circuit B and the reload register change according to the TSTART and TCSTF bits in the ULPTCR register. For details, see section 23.4.3. Rewriting the compare circuits and reload registers for compare match A/B.

The ULPTCMB register is only available for 32-bit read/write access.

23.3.4 ULPTCR : ULPT Control Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCMBF	TCMAF	TUNDF	—	—	TSTOP	TCSTF	TSTART
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TSTART	Counter Start 0: Stop the counter. 1: Start the counter.	R/W
1	TCSTF	Counter Status Flag*2 0: Counter stopped 1: Counter running	R
2	TSTOP	Counter Forcible Stop*1 0: Writing is invalid. 1: Stop the counter forcibly.	W
4:3	—	These bits are read as 0. The write value should be 0.	R/W
5	TUNDF	Underflow Flag 0: No underflow occurred (counter ≠ 0x00000000). 1: Underflow occurred (counter = 0x00000000).	R/W*3
6	TCMAF	Compare Match A Flag 0: Not matched (counter ≠ ULPTCMA[31:0]) 1: Matched (counter = ULPTCMA[31:0])	R/W*3
7	TCMBF	Compare Match B Flag 0: Not matched (counter ≠ ULPTCMB[31:0]) 1: Matched (counter = ULPTCMB[31:0])	R/W*3

Note: S-TYPE-3, P-TYPE-3
Note 1. When 1 (stop the counter forcibly) is written to the TSTOP bit, the TSTOP, TSTART, and TCSTF bits are initialized. The pulse output, compare match A output and compare match B output are also initialized. This bit is read as 0.
Note 2. For precautions on using the TCSTF bit, see section 23.5.1. Start and stop control of the counter.
Note 3. Only 0 can be written to clear the flag.

The ULPTCR register controls the start and stop of the counter and indicates the status of the ULPT.

The ULPTCR register is only available for 8-bit read/write access.

It is recommended to set 1 to the TUNDF, TCMAF and TCMBF bits when changing the TSTART or TSTOP bits to prevent clearing TUNDF, TCMAF, or TCMBF by mistake. At this time, setting 1 to TUNDF, TCMAF and TCMBF bits is ignored.

TSTART bit (Counter Start)

When and how the counter is started depends on the setting of the ULPTMR3.TEECTL[1:0] bits.

The counter is stopped in the same way in any mode.

For details, see section 23.4.1. Count operation.

[Starting the counter]

- In count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
  When 1 is written to the TSTART bit.
- In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)

When 1 is written to the TSTART bit, and then an edge at the ULPTEEn pin is input.

[Stopping the counter]

- When 0 is written to the TSTART bit.
- When 1 is written to the TSTOP bit.

TCSTF bit (Counter Status Flag)

The operation of this bit depends on the settings of the TCNTCTL and TEECTL[1:0] bits of the ULPTMR3 register.

For details, see section 23.4.1. Count operation.

[Setting conditions]

- In timer mode (ULPTMR1.TMOD1 = 0) and
  count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
  When 1 is written to the TSTART bit (with the TCSTF bit set to 1 in synchronization with the count source).
- In event counter mode (ULPTMR1.TMOD1 = 1) and
  count enable mode (ULPTMR3.TEECTL[1:0] bits = 00)
  When 1 is written to the TSTART bit (with the TCSTF bit set to 1 in synchronization with the count source).
- In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)
  When 1 is written to the TSTART bit, and then an edge at the ULPTEEn pin is input
  (with the TCSTF bit set to 1 in synchronization with the count source).

[Clearing conditions]

- When 0 is written to the TSTART bit (with the TCSTF bit set to 0 in synchronization with the count source).
- When 1 is written to the TSTOP bit.
- When the counter underflows in one-shot mode (ULPTMR3.TCNTCTL = 1).
  Only under this condition, the TSTART bit does not change from 1.

TSTOP bit (Counter Forcible Stop)

When 1 is written to this bit, the counter is forcibly stopped. This bit is read as 0.

TUNDF bit (Underflow Flag)

[Setting condition]

- When the counter underflows (counter = 0x00000000).

[Clearing condition]

- When 0 is written to this bit.

TCMAF bit (Compare Match A Flag)

[Setting condition]

- When the ULPTCNT register value matches the ULPTCMA register value (counter = ULPTCMA[31:0]).

[Clearing condition]

- When 0 is written to this bit.

TCMBF bit (Compare Match B Flag)

[Setting condition]

- When the ULPTCNT register value matches the ULPTCMB register value (counter = ULPTCMB[31:0]).

[Clearing condition]

- When 0 is written to this bit.

23.3.5 ULPTMR1 : ULPT Mode Register 1

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0D

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	TCK1	—	TEDGPL	—	TMOD1	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	—	This bit is read as 0. The write value should be 0.	R/W
1	TMOD1	Operating Mode*1 0: Timer mode 1: Event counter mode	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W
3	TEDGPL	ULPTEVIn Edge Polarity 0: Either edge (rising) 1: Both edges This bit is valid only in event counter mode (TMOD1 = 1).	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	TCK1	Count Source*2 0: Divided clock specified by the ULPTMR2.CKS[2:0] bits (ULPTLCLK) 1: Divided clock specified by the ULPTMR2.CKS[2:0] bits (ULPTSCLK) This bit is valid only in timer mode (TMOD1 = 0).	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).
Note: A write access to this register initializes the output from pins ULPTOn, ULPTOAn, and ULPTOBn, For details on the output level at initialization, see section 23.3.7. ULPTMR3 : ULPT Mode Register 3 and section 23.3.8. ULPTIOC : ULPT I/O Control Register.
Note 1. Timer mode: The internal clock (ULPTLCLK or ULPTSCLK) is used as the count source. The counter is decremented by 1 on each rising edge of the count source.
Event counter mode: The external event input (ULPTEVIn pin) is used as the count source. The counter is decremented on each edge of the count source. The edge polarity can be selected by the TEDGPL bit and the ULPTMR3.TEVPOL bit.
For details, see section 23.4.1. Count operation.
Note 2. The TCK1 bit can be changed only when the ULPTMR2.CKS[2:0] bits are 000. Otherwise, do not change the bit. Set the ULPTMR2.CKS[2:0] bits to 000, and then change the TCK1 bit after one cycle of the count source.

The ULPTMR1 register sets the operating mode of the ULPT.

The ULPTMR1 register is only available for 8-bit read/write access.

23.3.6 ULPTMR2 : ULPT Mode Register 2

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	LPM	—	—	—	—	CKS[2:0]		
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	CKS[2:0]	ULPTLCLK/ULPTSCLK Count Source Clock Division Ratio*1*2 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128 This bit is valid only in timer mode (ULPTMR1.TMOD1 = 0)	R/W
6:3	—	These bits are read as 0. The write value should be 0.	R/W
7	LPM	Low Power Mode 0: Normal mode 1: Low power mode	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).
Note 1. The CKS[2:0] bits can be changed only in timer mode (ULPTMR1.TMOD1 = 0).
Set the CKS[2:0] bits to 000 in event counter mode (ULPTMR1.TMOD1 = 1).
Note 2. The ULPTMR1.TCK1 bit can be changed only when the CKS[2:0] bits are 000. Set the CKS[2:0] bits to 000, and then change the ULPTMR1.TCK1 bit after one cycle of the count source.

The ULPTMR2 register sets the operating mode of the ULPT.

The ULPTMR2 register is only available for 8-bit read/write access.

LPM bit (Low Power Mode)

This bit implements low power consumption by restricting the register access. Set this bit to 1 for low-power mode operation.

When this bit is 1, access to the following registers is prohibited:

- ULPTCNT, ULPTCMA, ULPTCMB, and ULPTCR

After this bit is switched from 1 to 0, the first access to an access-prohibited register is restricted as follows:

- ULPTCNT: The register must be read twice. Only the second reading of data is valid.
- ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR: In write access, leave two cycles of the count source.

23.3.7 ULPTMR3 : ULPT Mode Register 3

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x0F

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TEEPOL[1:0]		TEECTL[1:0]		—	TOPOL	TEVPOL	TCNTCTL
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCNTCTL	Count Function Select*1*2 0: Continuous mode 1: One-shot mode	R/W
1	TEVPOL	ULPTEVIn Polarity Switch 0: External event input (ULPTEVIn pin) 1: External event input (ULPTEVIn pin) in reverse This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W

Bit	Symbol	Function	R/W
2	TOPOL	ULPTOn Polarity Select*3 0: Start the ULPTOn output with low level. 1: Start the ULPTOn output with high level.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TEECTL[1:0]	ULPTEEn Function Select*1 0 0: Count enable mode 1 0: Count start mode 1 1: Count restart mode Other settings are prohibited. The count enable mode is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W
7:6	TEEPOL[1:0]	ULPTEEn Edge Polarity Select 0 0: Rising edge 0 1: Falling edge 1 0: Both edges Other settings are prohibited. This bit is valid only in count start mode or count restart mode. (TEECTL[1:0] = 10 or 11)	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).
Note 1. For details, see section 23.4.1. Count operation.
Note 2. Continuous mode: After starting counting, the counter continues to count down (reload value to underflow) repeatedly until the counter stops.
One-shot mode: After starting counting, the counter counts down once (reload value to underflow).
Note 3. When data is set to the ULPTMR1 register or 1 is set to the ULPTCR.TSTOP bit, the ULPTOn output is initialized.

The ULPTMR3 register sets the operating mode of the ULPT.

The ULPTMR3 register is only available for 8-bit read/write access.

TEECTL[1:0] bits (ULPTEEn Function Select)

The ULPTEEn pin functions differently depending on the mode. For details, see section 23.4.1. Count operation.

In count enable mode, external events are counted while the ULPTEEn pin is valid. (The duration can be selected by the ULPTIOC.TIOGT0 bit, and the polarity can be selected by the ULPTISR.RCCPSEL2 bit.)

In count start mode, the counter starts counting at an edge trigger at the ULPTEEn pin. The operation of the ULPTEEn pin differs depending on the TSTART and TCSTF bits of the ULPTCR register.

In count restart mode, the counter starts counting at the first edge trigger at the ULPTEEn pin and resets the count at the second or following edge trigger. The operation of the ULPTEEn pin differs depending on the TSTART and TCSTF bits of the ULPTCR register.

Table 23.3 shows the operation of the ULPTEEn pin in count start or count restart mode.

Table 23.3 Operation of the ULPTEEn pin in count start mode or count restart mode

TEECTL[1:0]	ULPTCR.TSTART	ULPTCR.TCSTF	Function of the ULPTEEn pin and counter operation
10 (count start mode)	0 (stop the counter)	—	The edge input at the ULPTEEn pin is invalid. The counter remains stopped.
	1 (start the counter)	0 (counter stopped)	The counter starts counting from the reload value on the edge input at the ULPTEEn pin.
	1 (start the counter)	1 (counter running)	The edge input at the ULPTEEn pin is invalid. The counter continues to count.
11 (count restart mode)	0 (stop the counter)	—	The edge input at the ULPTEEn pin is invalid. The counter remains stopped.
	1 (start the counter)	0 (counter stopped)	The counter starts counting from the reload value on the edge input at the ULPTEEn pin.
	1 (start the counter)	1 (counter running)	The counter is reset on the edge input at the ULPTEEn pin, and it starts counting again from the reload value.

Note: The edge polarity of the ULPTEEn pin can be selected by the TEEPOL[1:0] bits.

23.3.8 ULPTIOC : ULPT I/O Control Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TIOGT 0	TIPF[1:0]		—	TOE	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W
2	TOE	ULPTOn Output Enable 0: Disable the ULPTOn output. 1: Enable the ULPTOn output.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TIPF[1:0]	ULPTEVIn Input Filter*2 0 0: No filter 0 1: Filter sampling at PCLKB 1 0: Filter sampling at PCLKB/8 1 1: Filter sampling at PCLKB/32 This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1).	R/W
6	TIOGT0	ULPTEVIn Count Control*1 0: Always count external events. 1: Count external events while the ULPTEVIn pin is valid. This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1) and count enable mode (ULPTMR3.TEECTL[1:0] = 00).	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).
Note 1. The polarity for counting external events can be selected by the ULPTISR.RCCPSEL2 bit.
Note 2. Set the TIPF[1:0] bits to 00 before entering Software Standby mode or Deep Software Standby mode1.

The ULPTIOC register controls the input/output of the ULPT.

The ULPTIOC register is only available for 8-bit read/write access.

TIPF[1:0] bits (ULPTEVIn Input Filter)

These bits are used to specify the sampling frequency of the ULPTEVIn input filter. Input to the ULPTEVIn pin is sampled. When a value matches three consecutive times, the value is regarded as the input value.

23.3.9 ULPTISR : ULPT Event Pin Select Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x11

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	RCCP SEL2	—	—
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
1:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
2	RCCPSEL2	ULPTEEn Polarity Select 0: Count external events when low level. 1: Count external events when high level. This bit is valid only in event counter mode (ULPTMR1.TMOD1 = 1), count enable mode (ULPTMR3.TEECTL[1:0] = 00), and when ULPTIOC.TIOGT0 = 1.	R/W
7:3	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).

The ULPTISR register sets the polarity of the ULPTEEn pin.

The ULPTISR register is only available for 8-bit read/write access.

23.3.10 ULPTCMSR : ULPT Compare Match Function Select Register

Base address: ULPTn = 0x4022_0000 + 0x0100 × n (n = 0, 1)
ULPTn_NS = 0x5022_0000 + 0x0100 × n (n = 0, 1)

Offset address: 0x12

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	TOPOLB	TOEB	TCMEB	—	TOPOLA	TOEA	TCMEA
Value after reset:	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TCMEA	Compare Match A Register Enable*1 0: Disable compare match A register. 1: Enable compare match A register.	R/W
1	TOEA	ULPTOAn Output Enable 0: Disable the ULPTOAn output. 1: Enable the ULPTOAn output.	R/W
2	TOPOLA	ULPTOAn Polarity Select*2 0: Start the ULPTOAn output with low. 1: Start the ULPTOAn output with high.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	TCMEB	Compare Match B Register Enable*1 0: Disable compare match B register. 1: Enable compare match B register.	R/W
5	TOEB	ULPTOBn Output Enable 0: Disable the ULPTOBn output. 1: Enable the ULPTOBn output.	R/W
6	TOPOLB	ULPTOBn Polarity Select*2 0: Start the ULPTOBn output with low. 1: Start the ULPTOBn output with high.	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: Do not rewrite this register while the counter is running. Rewrite this register only when the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0).
Note 1. When 1 (stop the counter forcibly) is set to the ULPTCR.TSTOP bit, the TCMEA, and TCMEB bits are set to 0.
Note 2. When data is set to the ULPTMR1 register or 1 is set to the ULPTCR.TSTOP bit, the ULPTOAn and ULPTOBn output is initialized.

The ULPTCMSR register controls the interrupt request signal and input/output of compare match A and compare match B.

The ULPTCMSR register is only available for 8-bit read/write access.

23.4 Operation

23.4.1 Count operation

The counter is decremented by one on each edge of the count source. When the count value reaches 0x00000000 and the next edge of the count source is input, an interrupt request of underflow is generated. The count operation is set by the ULPTMR1 register and the ULPTMR3 register. Table 23.4 lists the count operations.

Table 23.4 Count operation

Section No.	Count operation			Count source	ULPTMR1 register		ULPTMR3 register	
	Mode 1	Mode 2	Mode 3		TMOD1	TCK1	TCNTCTL	TEECTL[1:0]

Note: For details about register settings, see section 23.3.5. ULPTMR1 : ULPT Mode Register 1 and section 23.3.7. ULPTMR3 : ULPT Mode Register 3 .

[Mode 1]

The clock used as the count source is selected by the TMOD1 and TCK1 bits of the ULPTMR1 register.

Timer mode: The internal clock (ULPTLCLK or ULPTSCLK) is used as the count source.

The counter is decremented on each rising edge of the count source.

Event counter mode: The external event input (ULPTEVIn pin) is used as the count source.

The counter is decremented on each edge of the count source.

The edge polarity can be selected by the ULPTMR1.TEDGPL bit and the ULPTMR3.TEVPOL bit.

[Mode 2]

The counter behavior is selected by the TCNTCTL bit of the ULPTMR3 register.

Continuous mode: After starting counting, the counter continues to count down (reload value to underflow) repeatedly until the counter stops.

One-shot mode: After starting counting, the counter counts down once (reload value to underflow).

[Mode 3]

The function of the ULPTEEn pin is selected by the TEECTL[1:0] bits of the ULPTMR3 register.

Count enable mode: External events are counted while the ULPTEEn pin is valid.

(This bit is valid only in event counter mode.)

Note: Because the ULPTEEn pin is synchronized with the count source, external events are counted after three cycles of the count source.

Count start mode: The counter starts counting at an edge trigger of the ULPTEEn pin.

The edge polarity of the ULPTEEn pin can be selected by the ULPTMR3.TEEPOL[1:0] bits.

Note: Because the ULPTEEn pin is synchronized and held with the count source, external events are counted after four cycles of the count source.

Count restart mode: The counter starts counting at the first edge trigger of the ULPTEEn pin.

The counter resets the count at the second or following edge trigger.

The edge polarity of the ULPTEEn pin can be selected by the ULPTMR3.TEEPOL[1:0] bits.

Note: Because the ULPTEEn pin is synchronized and held with the count source, external events are counted after four cycles of the count source.

23.4.1.1 Timer & continuous mode

This mode operates in timer mode only.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.2 shows an operation example.

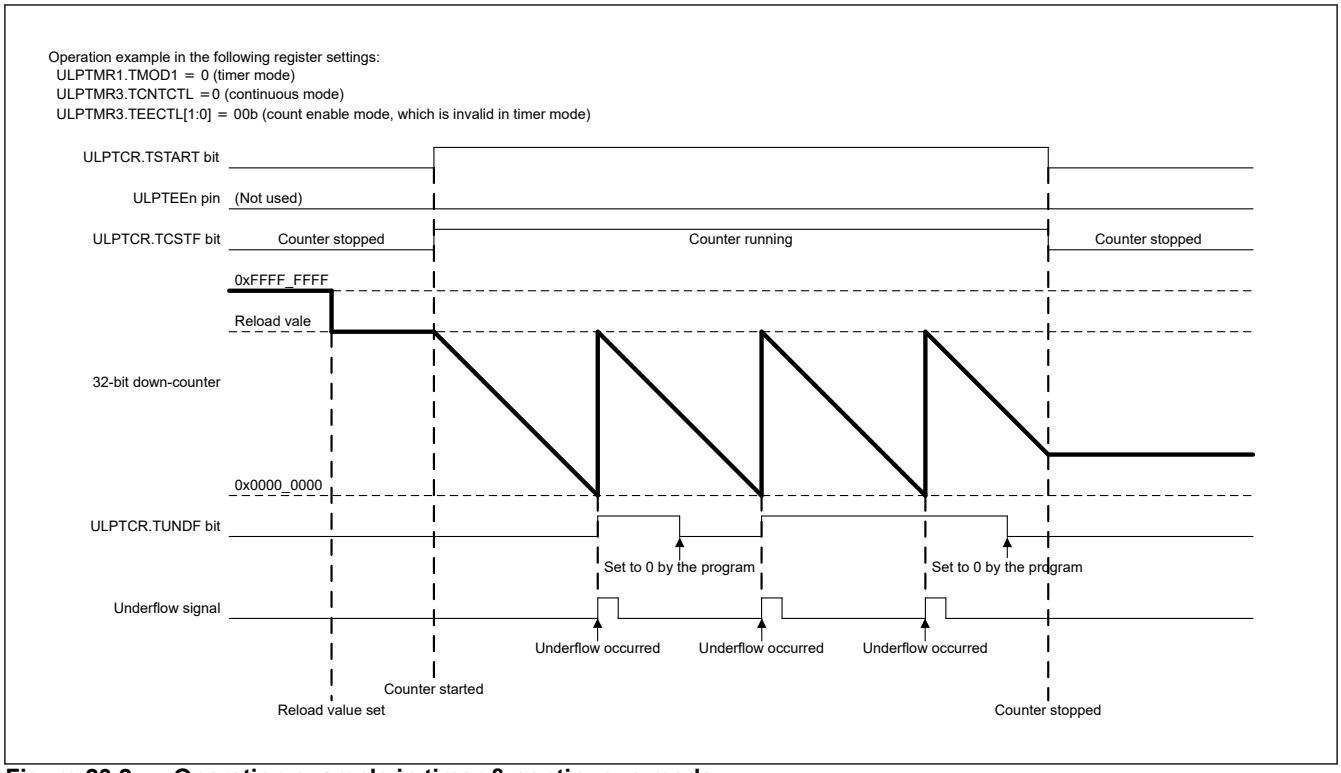

Figure 23.2 Operation example in timer & continuous mode

23.4.1.2 Timer & one-shot mode

This mode operates in timer mode only.

The counter counts down (reload value to underflow) once in synchronization with the count source.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

To restart the counter after the counter is stopped, perform the following procedure:

1. Read the ULPTCR.TUNDF bit to confirm that it is set to 1 (underflow occurred).
   This is to make sure that counting down is finished.
2. Write 0 to the ULPTCR.TSTART bit to stop the counter.
3. Write 1 to the ULPTCR.TSTART bit to start the counter.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.3 shows an operation example.

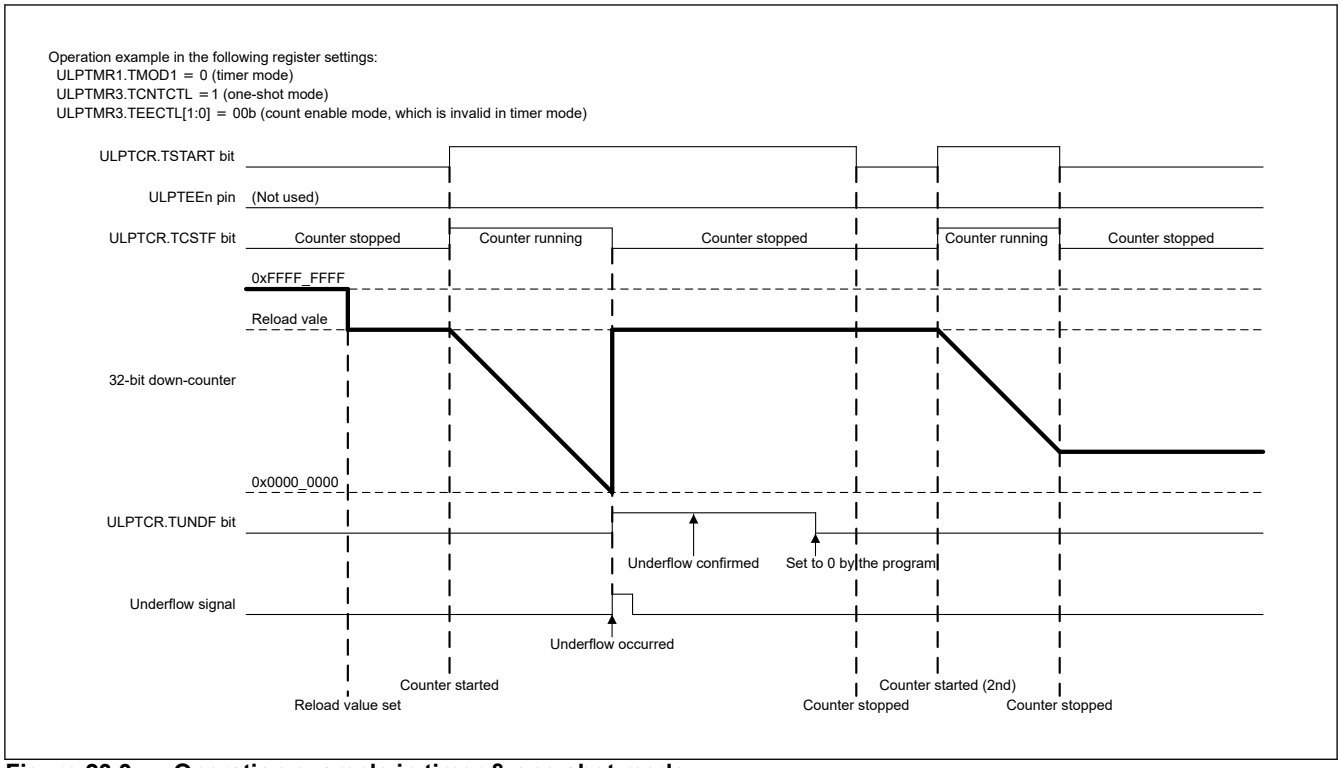

Figure 23.3 Operation example in timer & one-shot mode

23.4.1.3 Event counter & continuous & count enable mode

This mode operates in event counter mode only.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source. The duration in which the count source is counted can be specified by the ULPTIOC.TIOGT0 bit and ULPTISR.RCCPSEL2 bit.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.4 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 0, and Figure 23.5 and Figure 23.6 show operation examples when the ULPTIOC.TIOGT0 bit is set to 1.

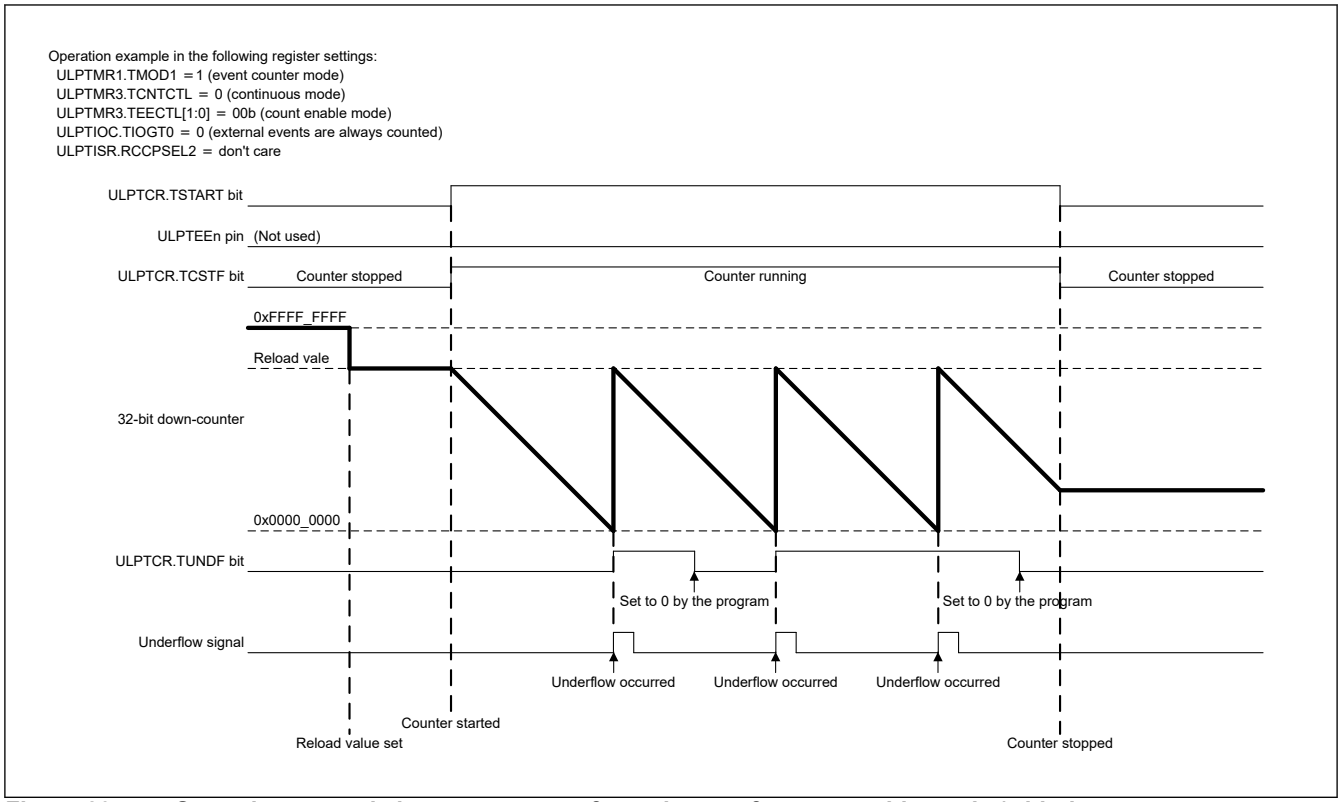

Figure 23.4 Operation example in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 0)

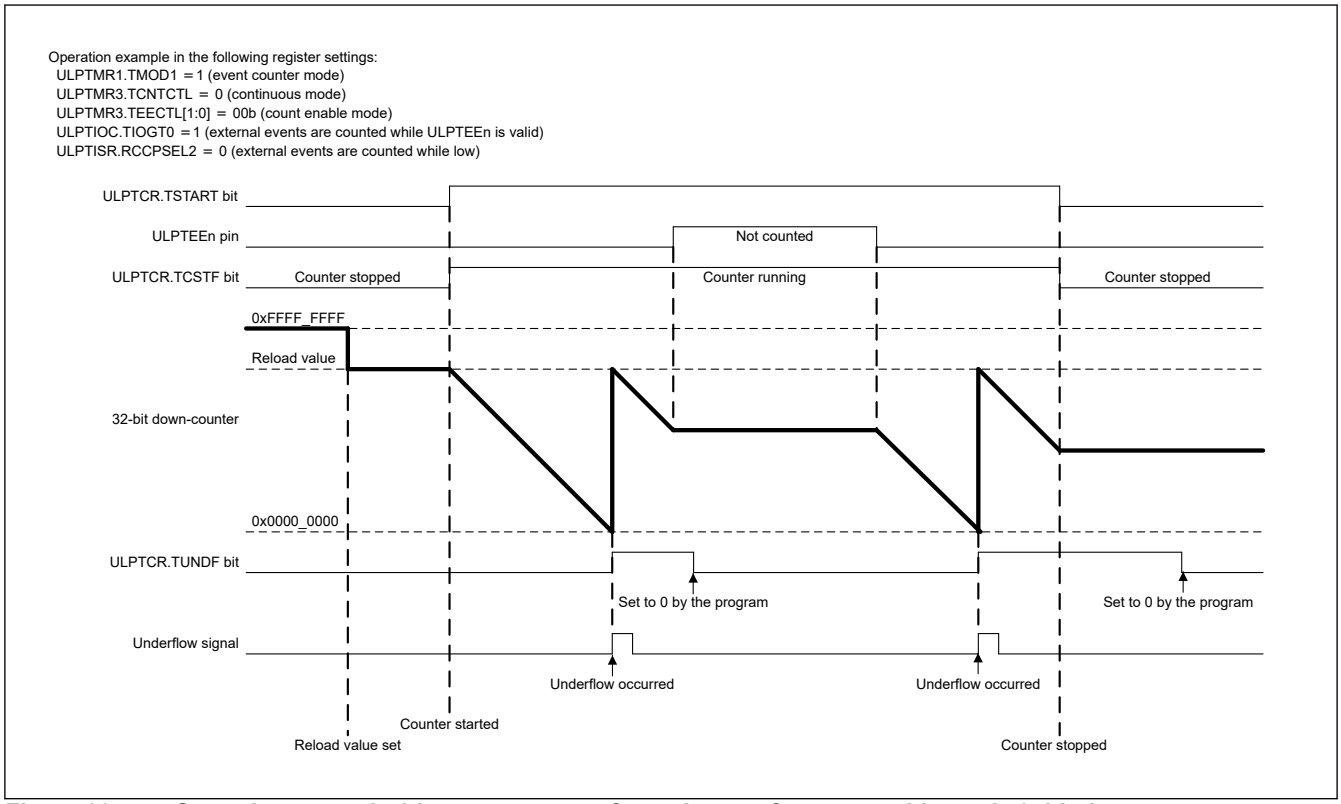

Figure 23.5 Operation example 1 in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

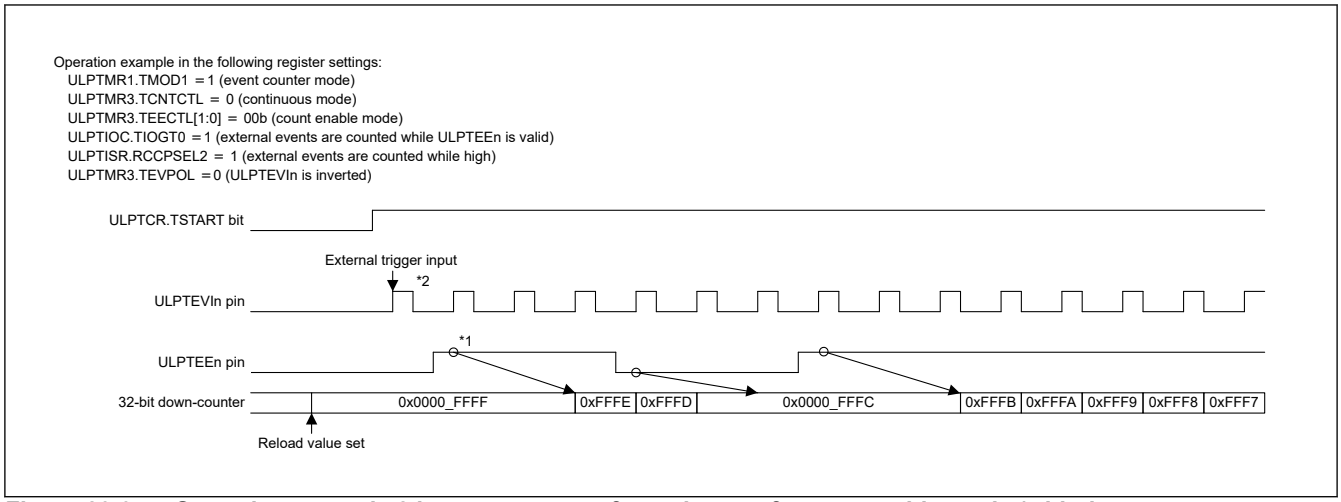

Figure 23.6 Operation example 2 in event counter & continuous & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

Note 1. When synchronization is controlled, there is a delay by two cycles of count source until external events are actually counted. In addition, the count start timing may be shifted by one cycle due to the phase difference between the ULPTEEn pin and the sampling clock.

Note 2. Depending on the state before the counter is stopped, counting may be performed during two cycles of the count source immediately after the counter is started.

To disable the counting operation during two cycles immediately after the counter is started, set 1 to the ULPTCR.TSTOP bit to initialize the internal circuits, and then finish the operation settings before starting the counter.

23.4.1.4 Event counter & one-shot & count enable mode

This mode operates in event counter mode only.

The counter counts down (reload value to underflow) once in synchronization with the count source. The duration in which the count source is counted can be specified by the ULPTIOC.TIOGT0 bit and ULPTISR.RCCPSEL2 bit.

When 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1).

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

To restart the counter after the counter is stopped, perform the following procedure:

1. Read the ULPTCR.TUNDF bit to confirm that it is set to 1 (underflow occurred).
   This is to make sure that counting down is finished.
2. Write 0 to the ULPTCR.TSTART bit to stop the counter.
3. Write 1 to the ULPTCR.TSTART bit to start the counter.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.7 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 00, and Figure 23.8 shows an operation example when the ULPTIOC.TIOGT0 bit is set to 01.

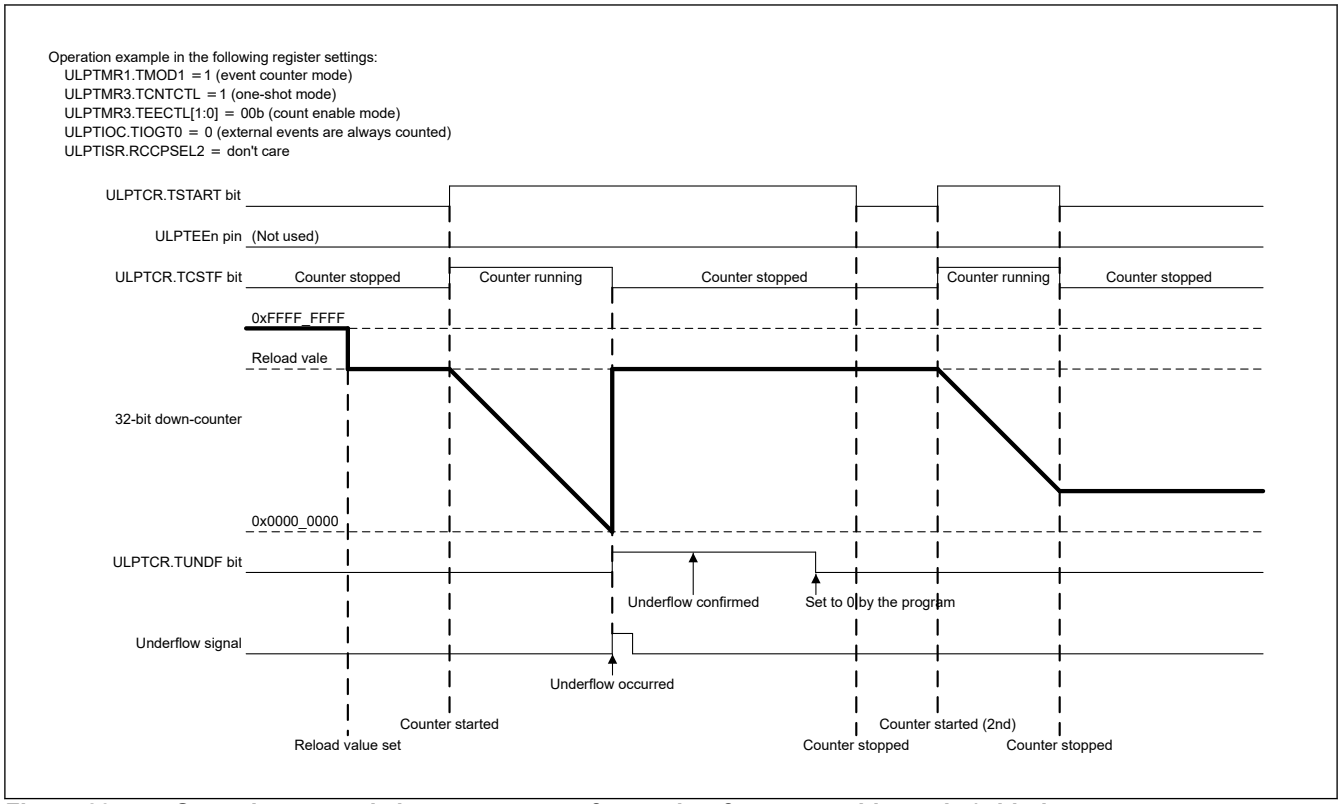

Figure 23.7 Operation example in event counter & one-shot & count enable mode (with the ULPTIOC.TIOGT0 bit set to 0)

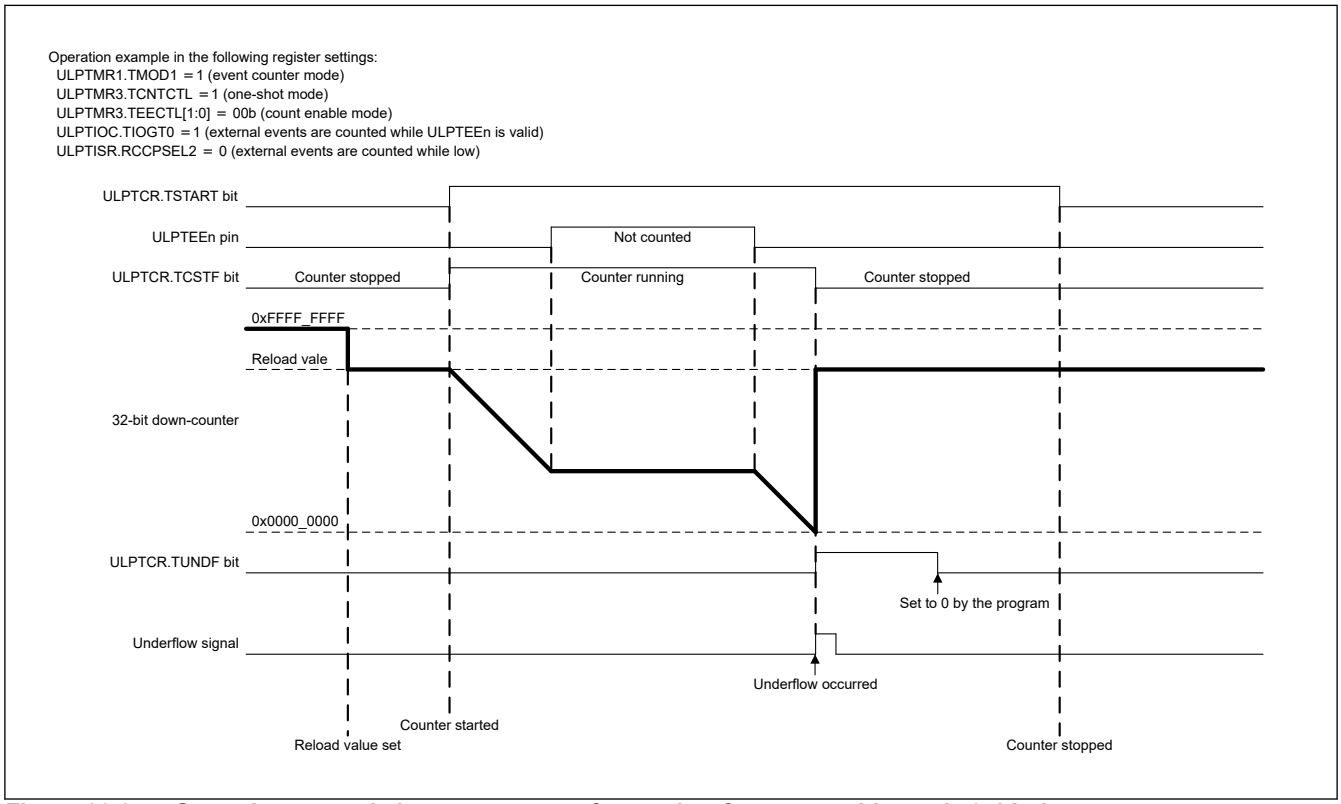

Figure 23.8 Operation example in event counter & one-shot & count enable mode (with the ULPTIOC.TIOGT0 bit set to 1)

23.4.1.5 Common & continuous & count start mode

This mode operates in both timer mode and event counter mode.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

When an underflow occurs, the counter counts down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.9 shows an operation example.

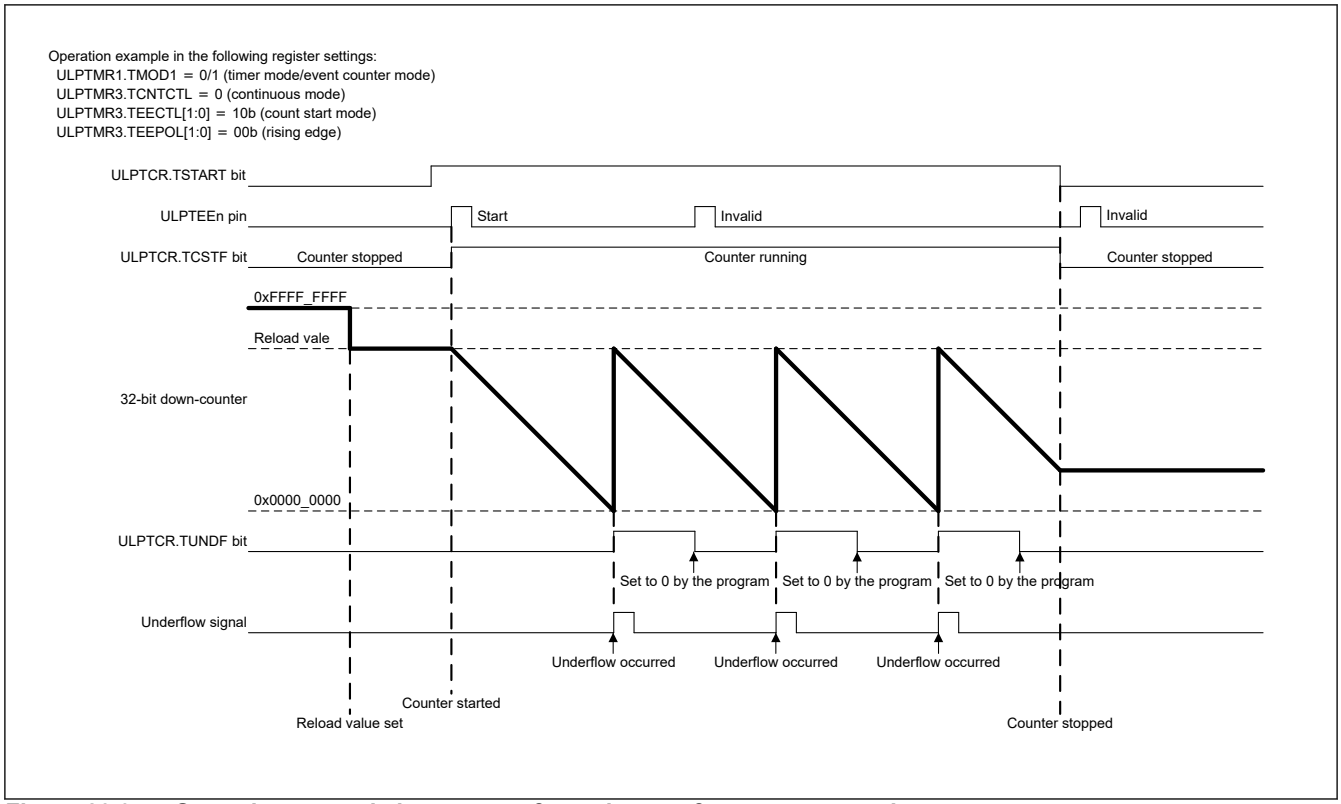

Figure 23.9 Operation example in common & continuous & count start mode

23.4.1.6 Common & continuous & count restart mode

This mode operates in both timer mode and event counter mode.

The counter continues to count down (reload value to underflow) repeatedly in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TCSTF bit set to 1), the counter is reset and it starts counting again from the reload value.

If no edge trigger is input from the ULPTEEn pin and an overflow occurs, the counter starts counting again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.10 shows an operation example.

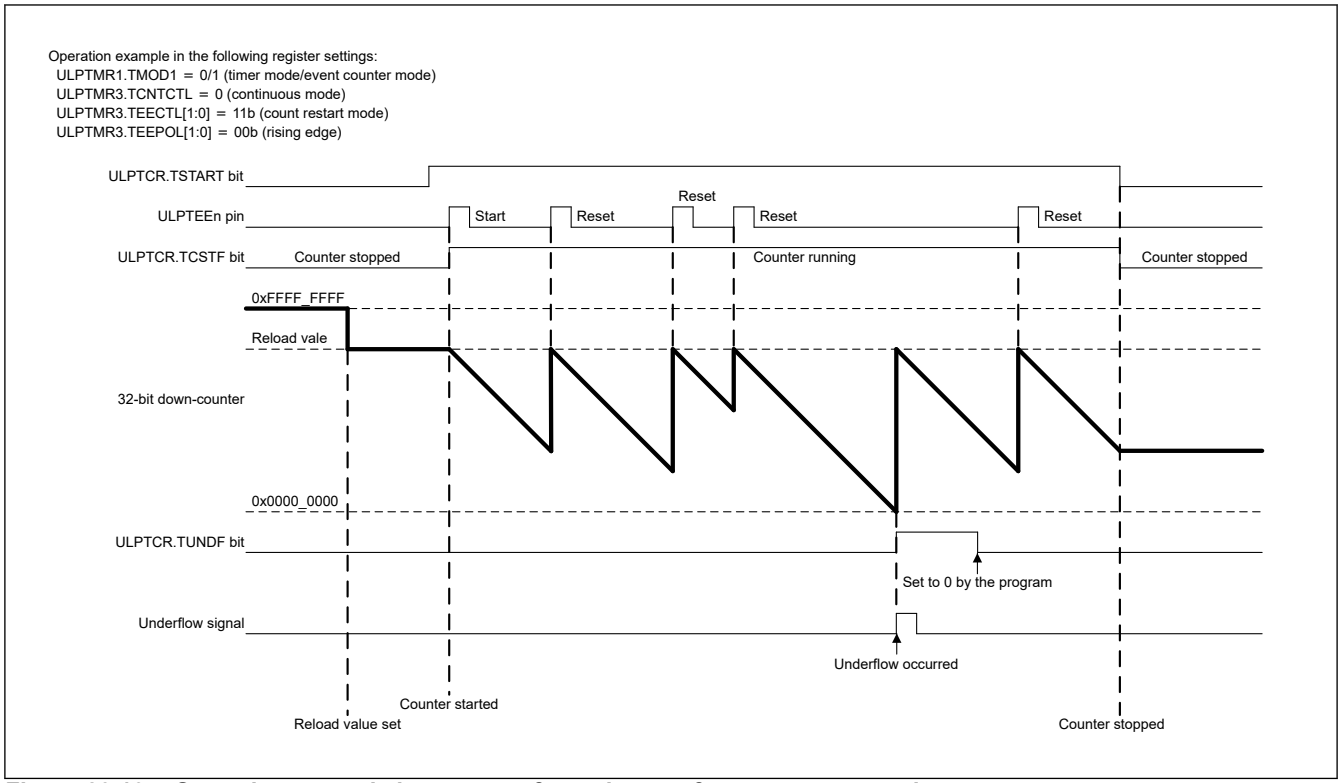

Figure 23.10 Operation example in common & continuous & count restart mode

23.4.1.7 Common & one-shot & count start mode

This mode operates in both timer mode and event counter mode.

The counter counts down (reload value to underflow) once in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger at the ULPTEEn pin.

When an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0), the counter starts counting down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.11 shows an operation example.

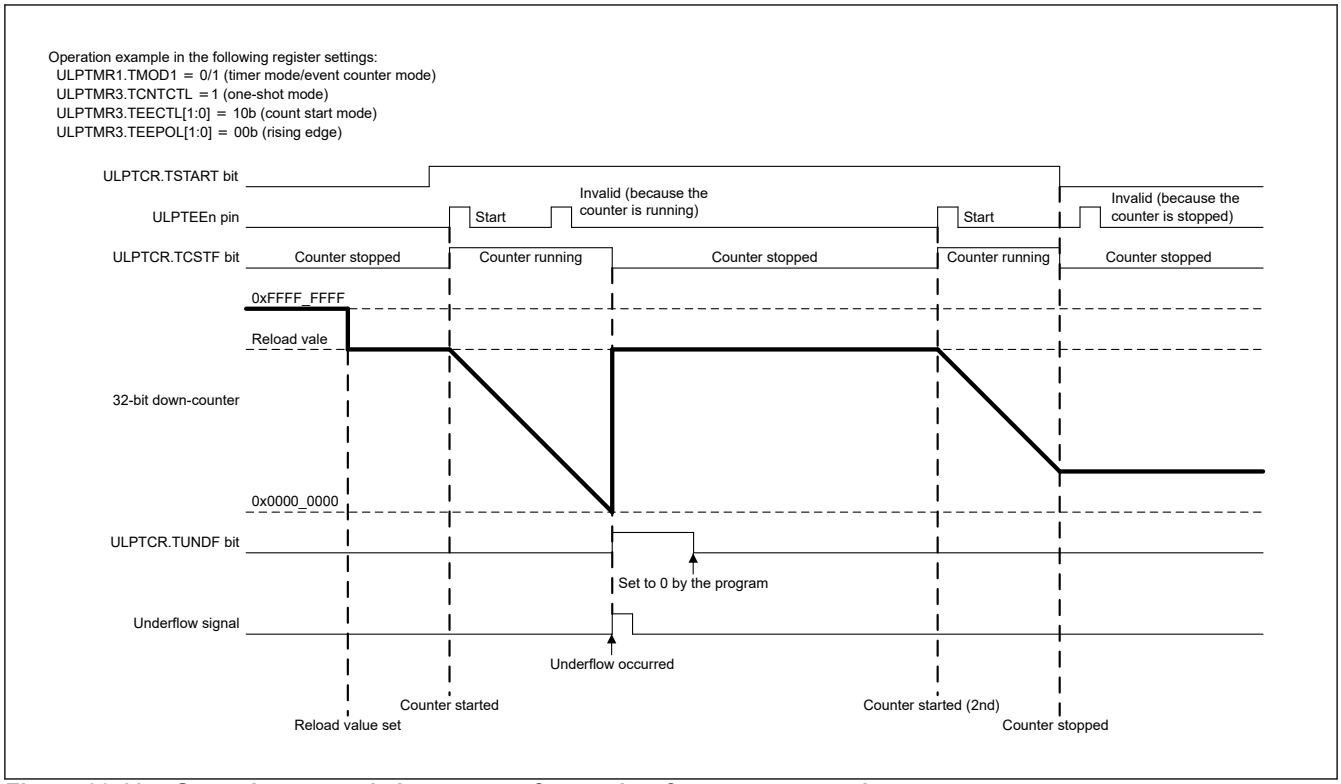

Figure 23.11 Operation example in common & one-shot & count start mode

23.4.1.8 Common & one-shot & count restart mode

This mode operates in both timer mode and event counter mode.

The counter counts down (reload value to underflow) once in synchronization with the count source.

After 1 is set to the ULPTCR.TSTART bit, the counter is started (with the ULPTCR.TCSTF bit set to 1) by an edge trigger of the ULPTEEn pin.

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TCSTF bit set to 1), the counter is reset and it starts counting again from the reload value.

If no edge trigger is input at the ULPTEEn pin and an underflow occurs, the counter is stopped (with the ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0).

On an edge trigger input at the ULPTEEn pin when the counter is running (with ULPTCR.TSTART bit set to 1 and the ULPTCR.TCSTF bit set to 0), the counter starts counting down again from the reload value.

When 0 is set to the ULPTCR.TSTART bit, the counter is stopped (with the ULPTCR.TCSTF bit set to 0).

Figure 23.12 shows an operation example.

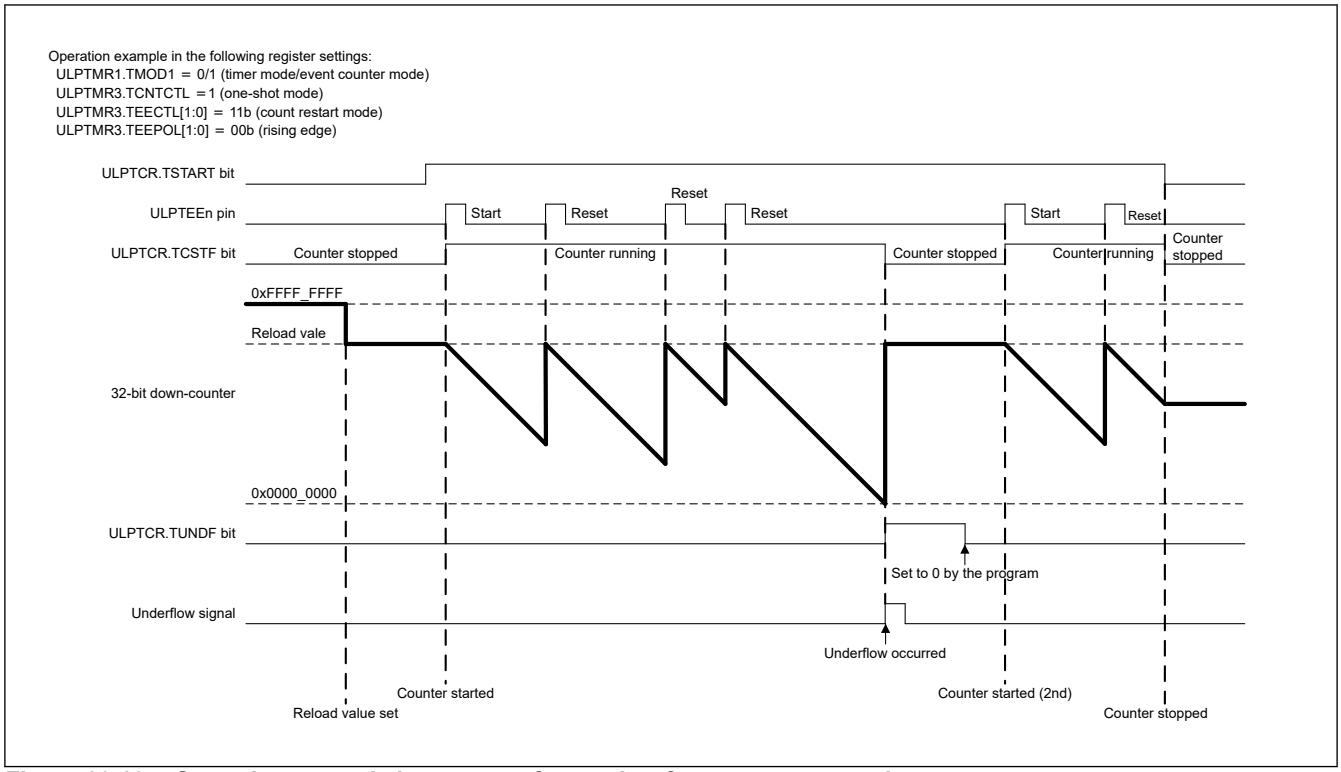

Figure 23.12 Operation example in common & one-shot & count restart mode

23.4.2 Rewriting the counter and reload register

Regardless of the operating mode, the counter and reload register rewrite timing changes depending on the TSTART and TCSTF bits of the ULPTCR register, the TCMEA and TCMEB bits of the ULPTCMSR register, and the TEECTL[1:0] bits of the ULPTMR3 register.

Condition A: When the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0)

A reload value is written directly to the counter and the reload register.

Condition B: When the counter is running (with the ULPTCR.TCSTF bit set to 1) and the compare match A/B registers are disabled (with both the TCMEA and TCMEB bits of the ULPTCR register set to 0)

After a reload value is written to the ULPTCNT register, the reload value is set first to the reload register, then to the counter in synchronization with the count source.

Condition C: When the counter is running (with the ULPTCR.TCSTF bit set to 1) and the compare match A/B registers are enabled (with either the TCMEA bit or the TCMEB bit of the ULPTCR register set to 1)

After a reload value is written to the ULPTCNT register, the reload value is written to the reload register in synchronization with the count source. Then, the reload value is set to the counter in synchronization with an underflow.

Condition D: When the counter is running (with ULPTCR.TCSTF bit set to 1) and when the count restart mode is enabled (with the ULPTMR3.TEECTL[1:0] bits set to 11)

After an edge trigger is an input from the ULPTEEn pin, the reload value set in the reload register is set to the counter in synchronization with the count source. In this condition, the reload register is not rewritten.

Figure 23.13 to Figure 23.15 show the counter and reload register rewrite timing.

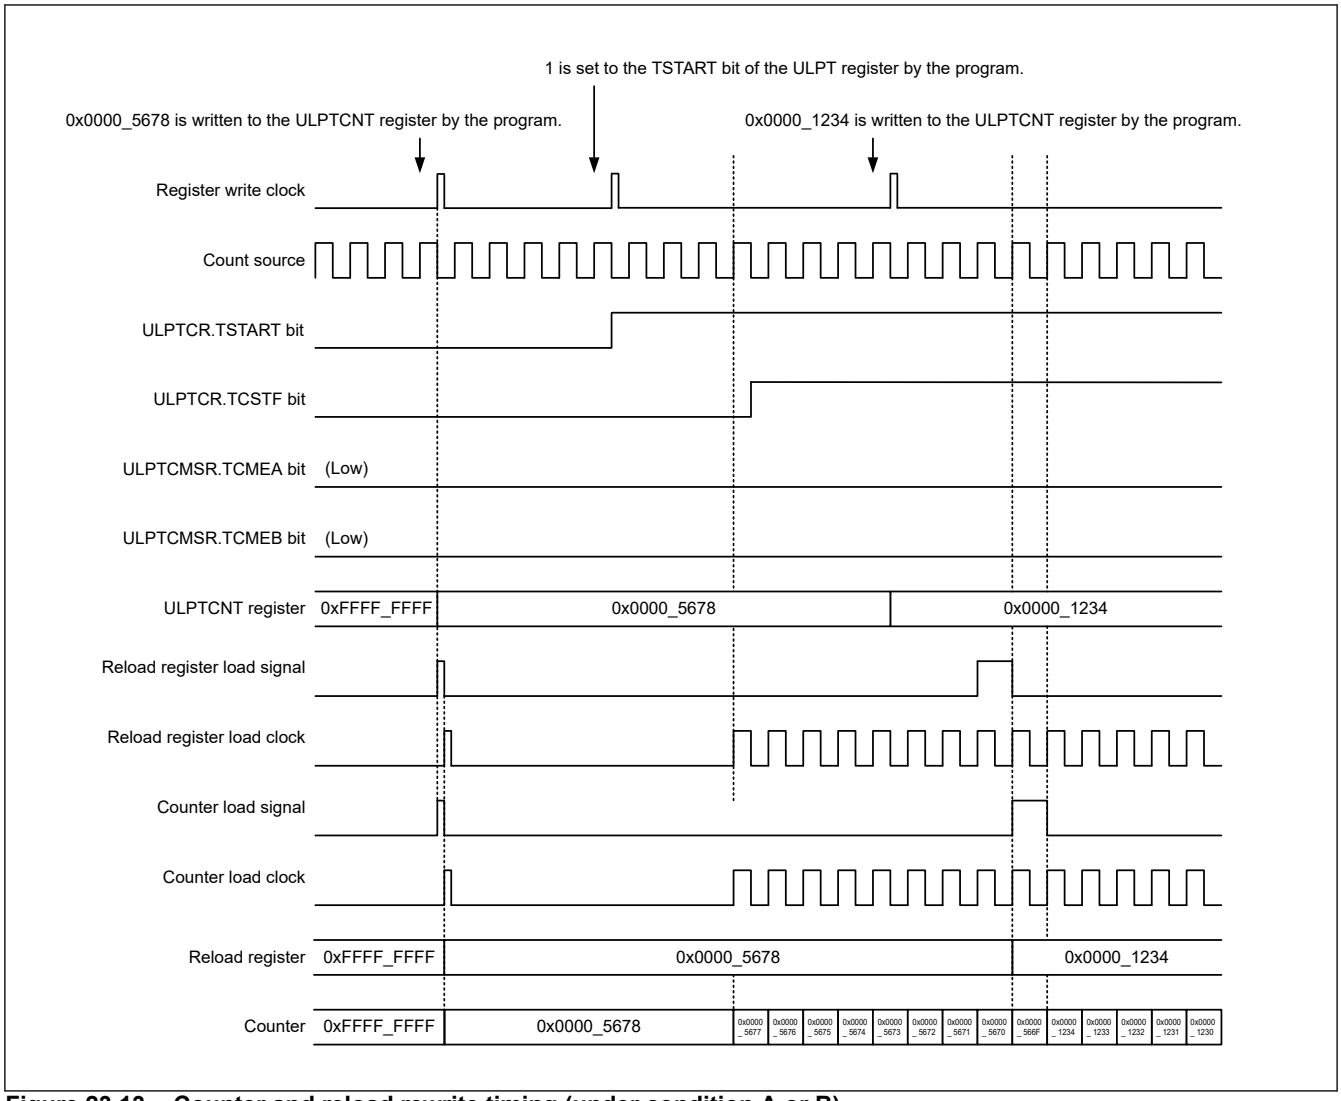

Figure 23.13 Counter and reload rewrite timing (under condition A or B)

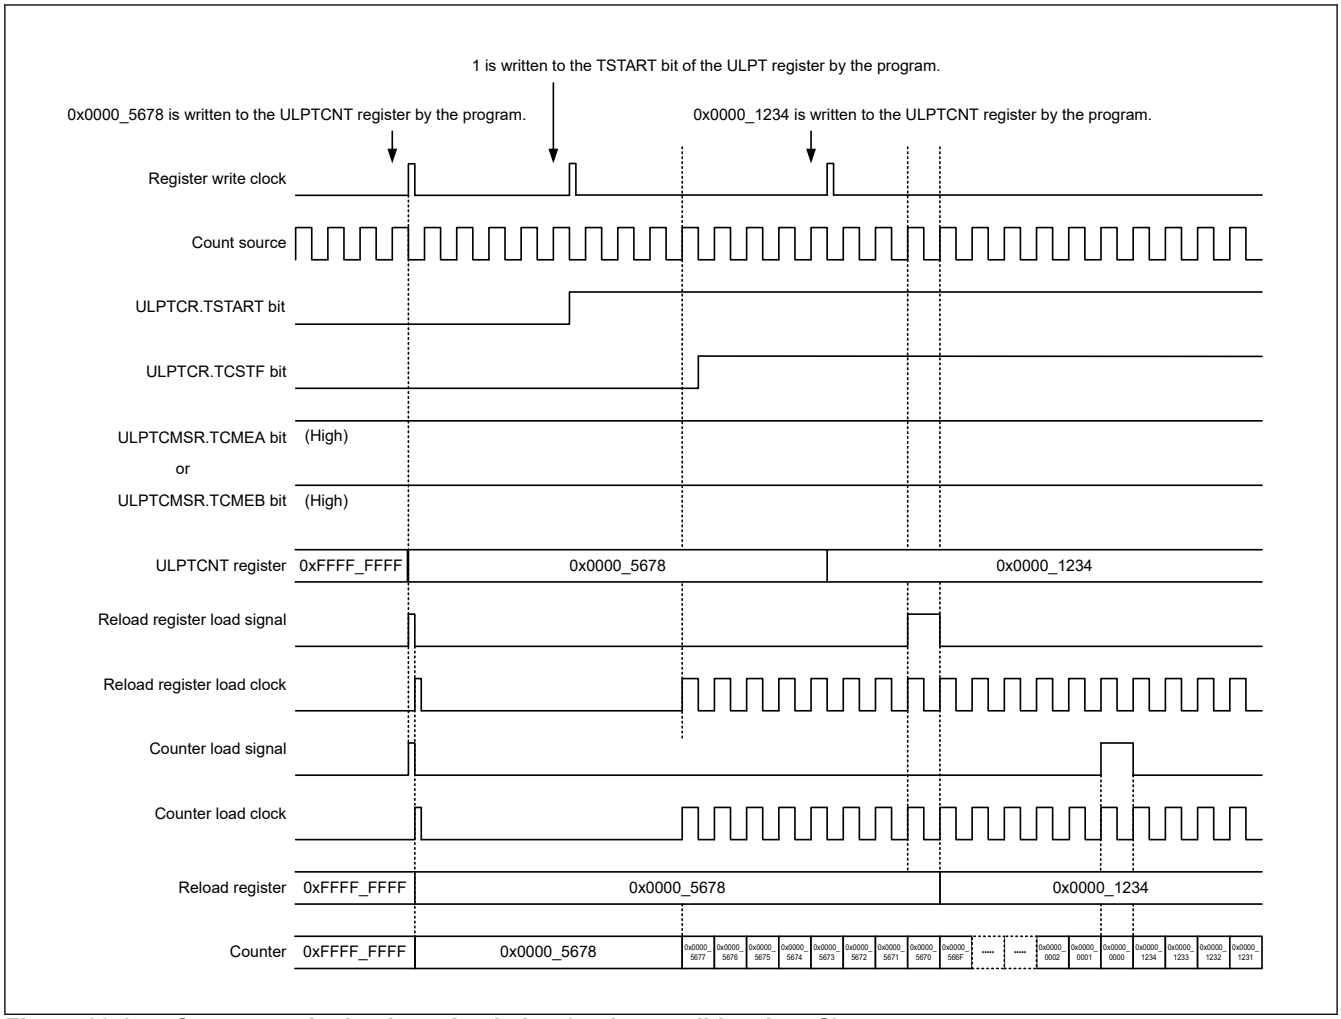

Figure 23.14 Counter and reload rewrite timing (under condition A or C)

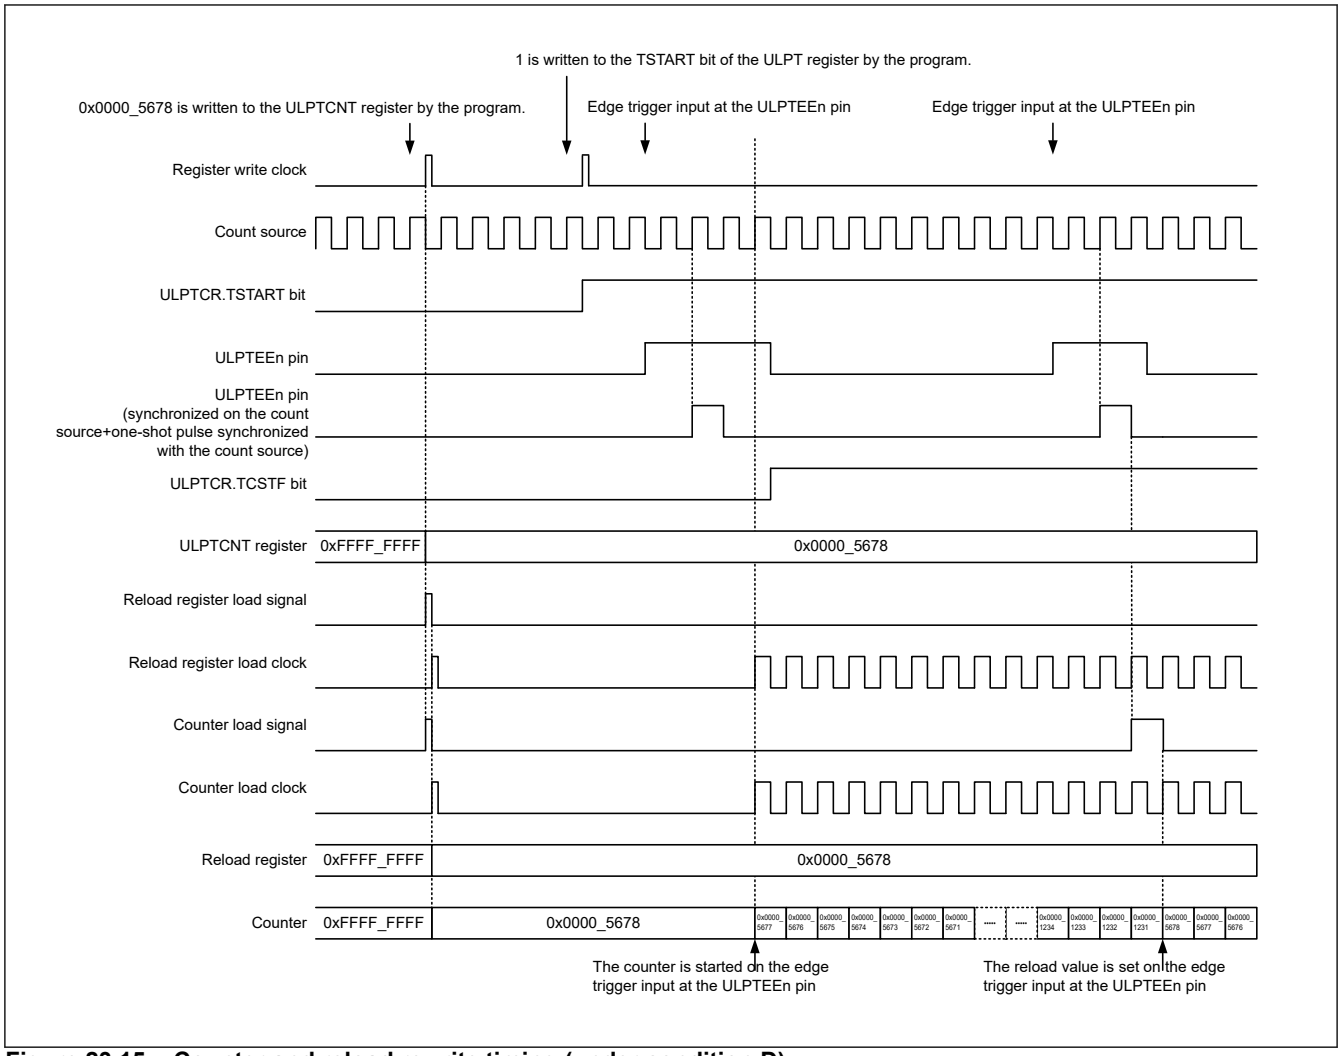

Figure 23.15 Counter and reload rewrite timing (under condition D)

23.4.3 Rewriting the compare circuits and reload registers for compare match A/B

Regardless of the operating mode, the rewrite timing for the compare circuits and reload registers for compare match A/B changes depending on the TSTART and TCSTF bits of the ULPTCR register.

Condition A: When the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0)

Compare match A/B values are written directly to the compare circuits and reload registers.

Condition B: When the counter is running (with the ULPTCR.TCSTF bit set to 1)

After compare match A/B values are written to the ULPTCMA and ULPTCMB registers, the compare match A/B values are written to the reload registers in synchronization with the count source. Then, the compare match A/B values are written to the compare circuits in synchronization with an underflow.

Figure 23.16 shows the rewrite timing for the compare circuit and reload register for compare match A.

The timing for compare match B is similar to that for compare match A.

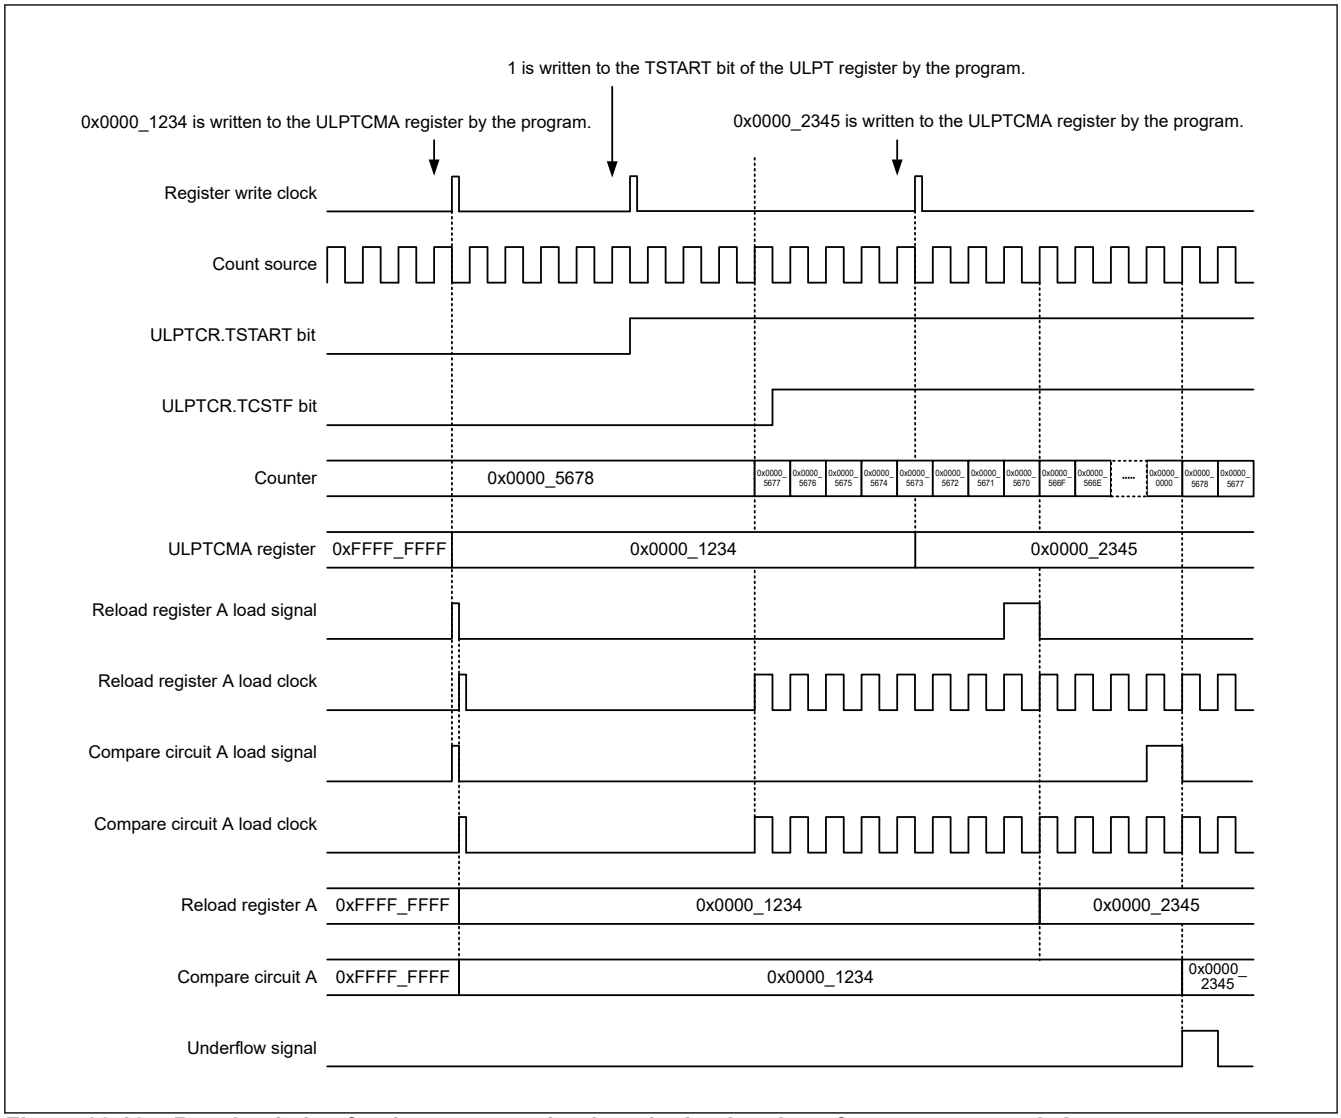

Figure 23.16 Rewrite timing for the compare circuit and reload register for compare match A

23.4.4 Pulse output

Regardless of the operating mode, the ULPTOn pin can output pulses. The output level is inverted each time the counter underflows. The pulse output from the ULPTOn pin can be stopped by the ULPTIOC.TOE bit. The initial value of the output level can be selected by the ULPTMR3.TOPOL bit.

Figure 23.17 shows an operation example of pulse output.

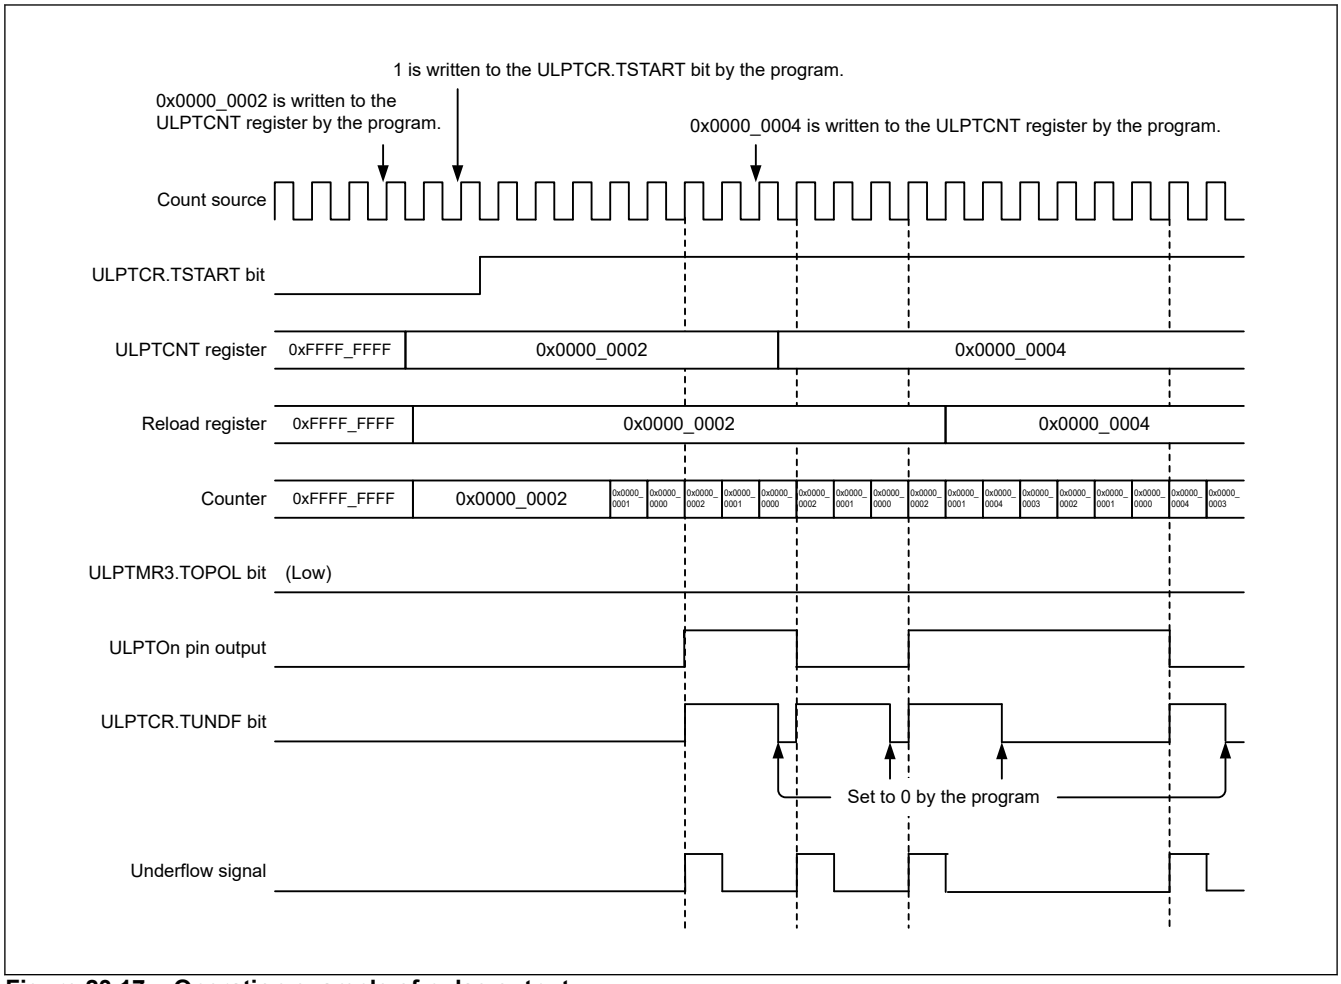

Figure 23.17 Operation example of pulse output

23.4.5 Compare match function

This function detects a match (compare match) between the ULPTCMA/ULPTCMB register contents and the ULPTCNT register contents. This function is enabled when the TCMEA or TCMEB bit of the ULPTCMSR register is set to 1 (the compare match A/B registers are enabled).

The counter is decremented in synchronization with the count source selected by the TMOD1/TCK1 bits of the ULPTMR1 register. When the ULPTCNT register value matches the ULPTCMA or ULPTCMB register value, the TCMAF or TCMBF bit of the ULPTCR register is set to 1 and an interrupt request is generated.

The counter and reload register rewrite timing differs depending on whether the compare match function is enabled. For details, see section 23.4.2. Rewriting the counter and reload register.

The output level of the ULPTOAn/ULPTOBn pin is inverted upon a match or underflow. The output level can be selected by the ULPTOAn/ULPTOBn bit of the ULPTCMSR register.

Figure 23.18 shows an operation example of the compare match function.

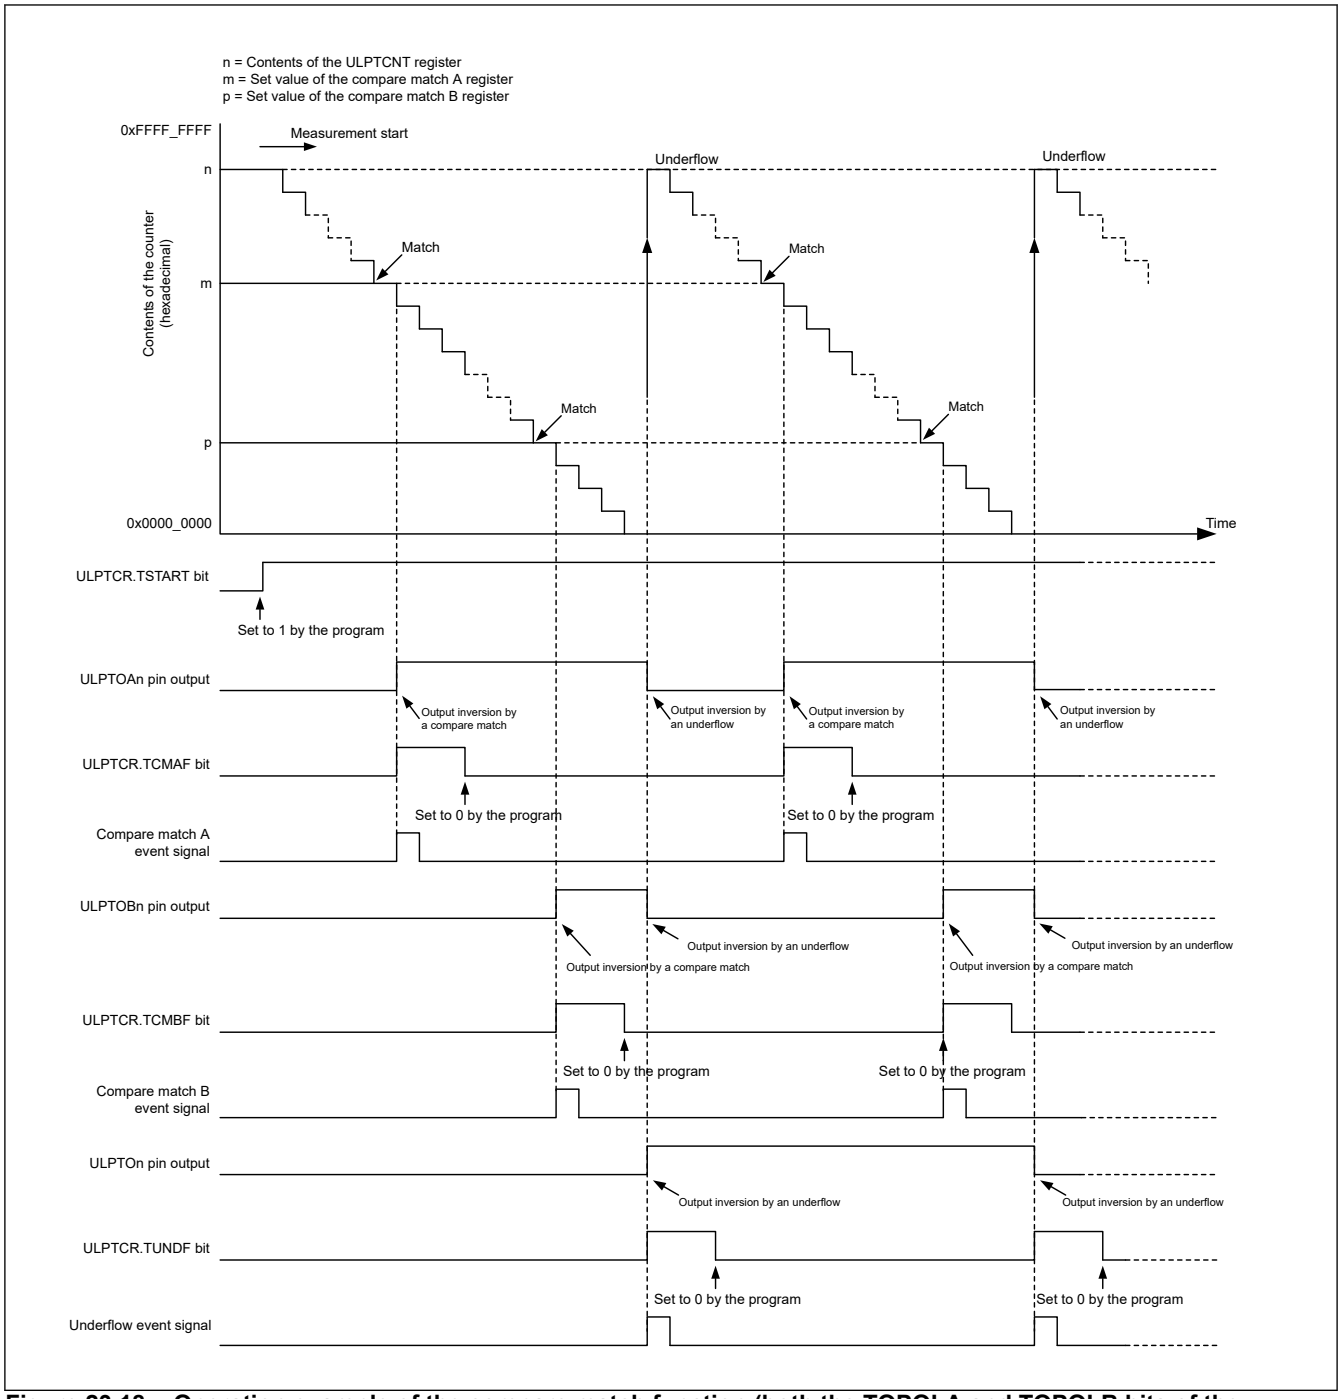

Figure 23.18 Operation example of the compare match function (both the TOPOLA and TOPOLB bits of the ULPTCMSR register are set to 0)

23.4.6 Input and output settings for each mode

Table 23.5 to Table 23.9 show the states of the input pins (ULPTEEn and ULPTEVIn) and output pins (ULPTOn, ULPTOAn, and ULPTOBn) in each mode.

Table 23.5 ULPTEEn pin settings

Operating mode		ULPTMR1 register TMOD1 bit	ULPTMR3 register TEECTL[1:0] bit	ULPTEEn pin input
Timer mode	-	0	00	Input disabled
	Count start		10	Normal input
	Count restart		11	
Event counter mode	Count enable	1	00	
	Count start		10	
	Count restart		11	

Table 23.6 ULPTEVIn pin settings

Operating mode	ULPTMR1 register TMOD1 bit	ULPTMR3 register TEVPOL bit	ULPTEVIn pin input
Timer mode	0	0 or 1	Input disabled
Event counter mode	1	0	Normal input
		1	Inverted input

Table 23.7 ULPTOn pin settings

Operating mode	ULPTIOC register TOE bit	ULPTMR3 register TOPOL bit	ULPTOn pin output
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 23.8 ULPTOAn pin settings

Operating mode	ULPTCMSR register TOEA bit	TOPOLA bit	ULPTOAn pin output
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

Table 23.9 ULPTOBn pin settings

Operating mode	ULPTCMSR register TOEB bit	TOPOLB bit	ULPTOBn pin output
All modes	1	1	Inverted output
		0	Normal output
	0	0 or 1	Output disabled

23.4.7 Standby mode

The ULPT can operate in Software Standby mode or Deep Software Standby mode1. Set it to each Standby mode with count operation start (ULPTCR.TSTART = 1, ULPTCR.TCSTF = 1).

Table 23.10 lists the settings available in Software Standby mode or Deep Software Standby mode1.

Table 23.10 Settings available in Software Standby mode or Deep Software Standby mode1

Section No.	Count operation			Count source	CPU recovery source
	Mode 1	Mode 2	Mode 3		
section 23.4.1.1. Timer & continuous mode	Timer	Continuous	—	ULPTLCLK, ULPTSCLK	• Underflow • Compare match A/B
section 23.4.1.5. Common & continuous & count start mode			Count start		
section 23.4.1.6. Common & continuous & count restart mode			Count restart		
section 23.4.1.2. Timer & one-shot mode		One-shot	—		
section 23.4.1.7. Common & one-shot & count start mode			Count start		
section 23.4.1.8. Common & one-shot & count restart mode			Count restart		
section 23.4.1.3. Event counter & continuous & count enable mode	Event counter	Continuous	Count enable	ULPTEVIn pin*1	• Underflow • Compare match A/B
section 23.4.1.5. Common & continuous & count start mode			Count start		
section 23.4.1.6. Common & continuous & count restart mode			Count restart		
section 23.4.1.4. Event counter & one-shot & count enable mode		One-shot	Count enable		
section 23.4.1.7. Common & one-shot & count start mode			Count start		
section 23.4.1.8. Common & one-shot & count restart mode			Count restart		

Note: The ULPT can operate in all modes even in Software Standby mode or Deep Software Standby mode1. For details about the count operations and register settings, see section 23.4.1. Count operation.

Note 1. Only ULPTEVIn pin can be used in Deep Software Standby mode1.

Only in event counter mode (ULPTMR1.TMOD1 = 1), set the ULPTIOC.TIPF[1:0] bits to 00 (no filter) before entering standby mode.

In Software Standby mode or Deep Software Standby mode1, the digital filter clock (PCLKB) stops (the digital filter does not function).

It is prohibited to rewrite the ULPT, ULPTCMA, and ULPTCMB registers immediately before setting each standby mode.

If the ULPT, ULPTCMA, and ULPTCMB registers are rewritten while the counter is running, set each standby mode after four or more cycles of the count source.

23.4.8 Interrupt sources

The ULPT has three interrupt sources: ULPTI, ULPTCMAI, and ULPTCMBI.

Table 23.11 lists the interrupt sources.

Table 23.11 ULPT interrupt sources

Name	Interrupt source	DMAC/DTC activation
ULPTn_ULPTI	When the counter underflows	Possible
ULPTn_ULPTCMAI	When the ULPTCNT value matches the ULPTCMA value	Possible
ULPTn_ULPTCMBI	When the ULPTCNT value matches the ULPTCMB value	Possible

23.4.9 Event output to the ELC

The ULPT is capable of link operation for a specified module via the event link controller (ELC) by using the interrupt request signal as an event signal.

The ULPT outputs an event signal when compare match A/compare match B or an underflow occurs. For details, see section 18, Event Link Controller (ELC).

23.5 Usage notes

23.5.1 Start and stop control of the counter

Condition A: In timer mode (ULPTMR1.TMOD1 = 0), continuous mode (ULPTMR3.TCNTCTL = 0), and count enable mode (ULPTMR3.TEECTL[1:0] = 00)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 (start the counter) is set to the TSTART bit of the ULPTCR register, the TCSTF bit remains at 0 (counter stopped) for five cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for five cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see section 13, Interrupt Controller Unit (ICU).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

Condition B: In event counter mode (ULPTMR1.TMOD1 = 1), continuous mode (ULPTMR3.TCNTCTL = 0), and count enable mode (ULPTMR3.TEECTL[1:0] = 00)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 (start the counter) is set to the TSTART bit of the ULPTCR register, the TCSTF bit remains at 0 (counter stopped) for two cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for two cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see section 13, Interrupt Controller Unit (ICU).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

Condition C: In count start mode or count restart mode (ULPTMR3.TEECTL[1:0] bits = 10 or 11)

When the counter is stopped (with the TCSTF bit of the ULPTCR register set to 0), even if 1 is set to the TSTART bit of the ULPTCR register and then the counter is started on an edge trigger of the ULPTEEn pin, the TCSTF bit remains at 0 (counter stopped) for five cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 1 (counter running).

When the counter is running (with the TCSTF bit set to 1), even if 0 (stop the counter) is set to the TSTART bit, the TCSTF bit remains at 1 (counter running) for five cycles of the count source.

Do not access the registers*1 related to the ULPT other than the TCSTF bit until the TCSTF bit is set to 0 (counter stopped).

Before changing the TSTART bit from 0 to 1, clear the interrupt register. For details, see section 13, Interrupt Controller Unit (ICU).

Note 1. Registers related to the ULPT: ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR

23.5.2 Access to flags (TUNDF, TCMAF, and TCMBF bits in ULPTCR register)

It is recommended to set 1 to the TUNDF, TCMAF and TCMBF bits when changing the TSTART or TSTOP bits to prevent clearing TUNDF, TCMAF, or TCMBF by mistake. At this time, setting 1 to TUNDF, TCMAF and TCMBF bits is ignored.

23.5.3 Access to the ULPTCNT, ULPTCMA, and ULPTCMB registers

When setting to the same register sequentially while the counter is running (ULPTCR.TCSTF bit = 1), leave three or more cycles of count source between writes. The following registers are applicable:

- ULPTCNT
- ULPTCMA
- ULPTCMB

23.5.4 Mode changes

Registers related to the operating mode of the ULPT (ULPTMR1, ULPTMR2, ULPTMR3, ULPTIOC, ULPTISR, and ULPTCMSR) can be changed only while the counter is stopped (both the TSTART and TCSTF bits of the ULPTCR register are set to 0). Do not change these registers while the counter is running.

If a register related to the operating mode of the ULPT is changed, the values of the TUNDF, TCMAF, and TCMBF bits of the ULPTCR register are undefined. Before starting the counter, write 0 to the TUNDF, TCMAF, and TCMBF bits.

- TUNDF (no underflow)
- TCMAF (no match for compare match A)
- TCMBF (no match for compare match B)

23.5.5 Setting the ULPTOn, ULPTOAn, and ULPTOBn pins

To use the ULPTOn, ULPTOAn, and ULPTOBn pins as output pins, set up the ULPT, and then set PmnPFS.PMR bit to 1 after determining the initial output values.

23.5.6 Calculating the number of events

In event counter mode, the number of events is calculated by using the following formula:

Number of events = Initial counter value (ULPTCNT register write value) − Counter value at the end of a valid event

23.5.7 When the counter is stopped forcibly by the TSTOP bit

Do not access the ULPTCNT, ULPTCMA, ULPTCMB, ULPTCR, ULPTMR1, ULPTMR2, or ULPTMR3 register during one cycle of the count source after stopping the counter forcibly by the ULPTCR.TSTOP bit.

23.5.8 Digital filter

When using a digital filter, do not start the timer within five cycles of the digital filter clock after setting the ULPTIOC.TIPF[1:0] bits.

Also, when ULPTMR3.TEVPOL bit is changed while a digital filter is in use, do not start the timer within five cycles of the digital filter clock after setting the bit.

In Software Standby mode or Deep Software Standby mode1, the digital filter clock (PCLKB) stops and the digital filter does not function. Before entering Software standby mode or Deep Software Standby mode1, set the ULPTIOC.TIPF[1:0] bits to 00 (no filter).

23.5.9 Restrictions on ULPTEEx-DS and ULPTEVIx-DS pins at DSTBY1

When using the ULPTEEx-DS and ULPTEVIx-DS pins in DSTBY1, set the input pins to 0 at the time of entering DSBTY1. After the DSTBY1 transition, these input pins can be used for pulse input (both 0 and 1 input is allowed). In order to see the transition to DSTBY1, IO port can be used utilizing the change when deep software standby happens.

(Examples of flow)

1. Use GPIO outputs to transmit to external devices before executing WFI instructions.
2. Execute WFI instruction and move to DSTBY1.
3. The external device detects the GPIO output. After 1ms seconds have passed, input is started for the ULPT.

23.5.10 Module-stop function

ULPT operation can be disabled or enabled using Module Stop Control Register E (MSTPCRE). The ULPT module is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

23.5.11 Setting the ULPTEEn and ULPTEVIn pins

To use the ULPTEEn and ULPTEVIn pins as input pins, set up the ULPT, and then set PmnPFS.PMR bit to 1.

24. Realtime Clock (RTC)

24.1 Overview

The realtime clock (RTC) has two counting modes, calendar count mode and binary count mode, that are used by switching register settings. For calendar count mode, the RTC has a 100-year calendar from 2000 to 2099 and automatically adjusts dates for leap years. For binary count mode, the RTC counts seconds and retains the information as a serial value. Binary count mode can be used for calendars other than the Gregorian (Western) calendar.

The sub-clock oscillator or LOCO can be selected as the count source of the time counters. The RTC uses a 128-Hz clock acquired by dividing the count source by a prescaler. Year, month, date, day-of-week, a.m. /p.m. (in 12-hour mode), hour, minute, second, or 32-bit binary is counted by 1/128 second.

Table 24.1 lists the RTC specifications, Figure 24.1 shows a block diagram, and Table 24.2 lists the I/O pins.

Table 24.1 RTC specifications

Parameter	Specifications
Count mode	Calendar count mode/binary count mode
Count source*1	Sub-clock(XCIN), External clock input(EXCIN) or LOCO
Clock and calendar functions	● Calendar count mode – Year, month, date, day of week, hour, minute, second are counted, BCD display – 12 hours/24 hours mode switching function – 30 seconds adjustment function (a number less than 30 is rounded down to 00 seconds, and 30 seconds or more are rounded up to 1 minute) – Automatic adjustment function for leap years ● Binary count mode – Count seconds in 32 bits, binary display ● Shared by both modes – Start/stop function – The sub-second digit is displayed in binary units (1 Hz, 2 Hz, 4 Hz, 8 Hz, 16 Hz, 32 Hz, or 64 Hz) – Clock error correction function – Clock (1-Hz/64-Hz) output
Interrupts	● Alarm interrupt (RTC_ALM) – As an alarm interrupt condition, selectable for comparison with the following: • Calendar count mode: Year, month, date, day-of-week, hour, minute, or second can be selected • Binary count mode: Each bit of the 32-bit binary counter ● Periodic interrupt (RTC_PRD) – 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second can be selected as an interrupt period. ● Carry interrupt (RTC_CUP) – An interrupt is generated at either of the following conditions: • When a carry from the 64-Hz counter to the second counter is generated. • When the 64-Hz counter is changed and the R64CNT register is read at the same time. (32-KHz count mode is only for 64-Hz counter reading) ● Return from Software Standby or Deep Software Standby mode can be performed by the alarm interrupt or periodic interrupt
Time capture function	● Times can be captured when the edge of the time capture event input pin is detected. For every event input, month, date, hour, minute, and second are captured or the 32-bit binary counter value is captured. ● Interrupt can be generated when the edge of the time capture event input is detected. The time capture event input pin and IRQ are shared.
Event link function	Periodic event output (RTC_PRD)
TrustZone filter	Security and Privilege attribution can be set

Note 1. The frequency of the peripheral module clock (PCLKB) ≥ the frequency of the count source should be satisfied.

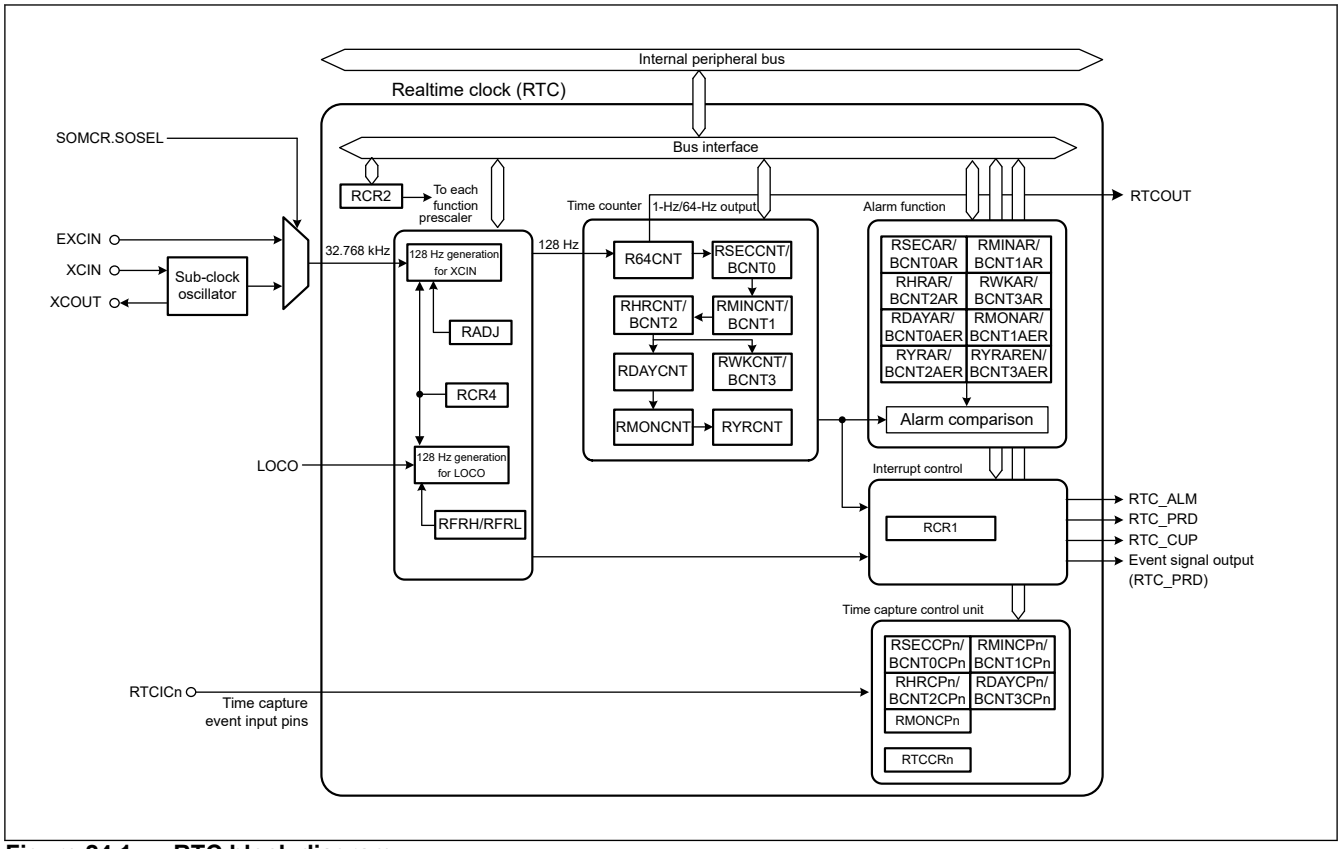

Figure 24.1 RTC block diagram

Table 24.2 RTC I/O pins

Pin name	I/O	Description
XCIN	Input	Connect a 32.768-kHz crystal to these pins
XCOUT	Output	
EXCIN	Input	External sub-clock input
RTCOUT	Output	This pin is used to output a 1-Hz/64-Hz waveform, but not in Deep Software Standby mode
RTCICn (n = 0 to 2)	Input	Time capture event input pins RTCICn can be controlled by the VBTICTLR register. For more information, see section 11, Battery Backup Function and section 19, I/O Ports.

24.2 Register Descriptions

Write or read from the RTC registers as described in section 24.6.5. Notes on Writing to and Reading from Registers.

If the value in an RTC register after a reset is given as x (undefined bits) in the list, it is not initialized by a reset. When RTC enters the reset state or a low power state during counting operations, for example, while the RCR2.START bit is 1, the year, month, day of the week, date, hours, minutes, seconds, and 64-Hz counters continue to operate.

Note: A reset generated while writing to a register might destroy the register value. In addition, do not allow the MCU to enter Software Standby mode, Deep Software Standby mode, or battery backup state immediately after setting any of these registers. For details, see section 24.6.4. Transitions to Low Power Modes after Setting Registers.

24.2.1 R64CNT : 64-Hz Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x00

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	F1HZ	F2HZ	F4HZ	F8HZ	F16HZ	F32HZ	F64HZ
Value after reset:	0	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
0	F64HZ	64-Hz Flag This bit indicates the 64-Hz state of the sub-second digit.	R
1	F32HZ	32-Hz Flag This bit indicates the 32-Hz state of the sub-second digit.	R
2	F16HZ	16-Hz Flag This bit indicates the 16-Hz state of the sub-second digit.	R
3	F8HZ	8-Hz Flag This bit indicates the 8-Hz state of the sub-second digit.	R
4	F4HZ	4-Hz Flag This bit indicates the 4-Hz state of the sub-second digit.	R
5	F2HZ	2-Hz Flag This bit indicates the 2-Hz state of the sub-second digit.	R
6	F1HZ	1-Hz Flag This bit indicates the 1-Hz state of the sub-second digit.	R
7	—	This bit is read as 0.	R

Note: S-TYPE3, P-TYPE3

The R64CNT counter is used in both calendar count mode and binary count mode The 64-Hz counter (R64CNT) generates the period for a second by counting up periods of the 128-Hz clock. The state in the sub-second range can be confirmed by reading this counter.

This counter is set to 0x00 by an RTC software reset or an execution of a 30-second adjustment. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.2 RSECCNT : Second Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x02

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1-Second Count Counts from 0 to 9 every second. When a carry is generated, 1 is added to the tens place.	R/W
6:4	SEC10[2:0]	10-Second Count Counts from 0 to 5 for 60-second counting.	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RSECCNT counter sets and counts the BCD-coded second value. It counts the carries generated once per second in the 64-Hz counter.

The setting range is decimal 00 to 59. The RTC does not operate normally if any other value is set. Before writing to this register, you must stop the count operation using the START bit in RCR2.

To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.3 RMINCNT : Minute Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x04

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1-Minute Count Counts from 0 to 9 every minute. When a carry is generated, 1 is added to the tens place.	R/W
6:4	MIN10[2:0]	10-Minute Count Counts from 0 to 5 for 60-minute counting.	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RMINCNT counter sets and counts the BCD-coded minute value. It counts the carries generated once every minute in the second counter.

A value from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.4 RHRCNT : Hour Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1-Hour Count Counts from 0 to 9 once per hour. When a carry is generated, 1 is added to the tens place.	R/W
5:4	HR10[1:0]	10-Hour Count Counts from 0 to 2 once per carry from the ones place.	R/W
6	PM	AM/PM select for time counter setting. 0: AM 1: PM	R/W
7	—	The read value is undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RHRCNT counter sets and counts the BCD-coded hour value. It counts the carries generated once per hour in the minute counter. The specifiable time differs based on the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – from 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – from 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. The PM bit is only enabled when the RCR2.HR24 bit is 0.

Otherwise, the setting in the PM bit has no effect. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.5 RWKCNT : Day-of-Week Counter (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
2:0	DAYW[2:0]	Day-of-Week Counting 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited	R/W
7:3	—	The read values are undefined. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RWKCNT counter sets and counts in the coded day-of-week value. It counts the carries generated once per day in the hour counter. A value from 0 through 6 can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.6 BCNTn : Binary Counter n (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x02 + 0x02 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BCNT[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	BCNT[7:0]	Binary Counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTn is a read/write 8-bit register to access BCNT[31:0] that is a 32-bit binary counter. BCNT3 is assigned to the BCNT[31:24] bits, BCNT2 is assigned to the BCNT[23:16] bits, BCNT1 is assigned to the BCNT[15:8] bits, and BCNT0 is assigned to the BCNT[7:0] bits. BCNTn performs count operation by a carry generated for each second of the 64-Hz counter. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.7 RDAYCNT : Day Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	0	0	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1-Day Count Counts from 0 to 9 once per day. When a carry is generated, 1 is added to the tens place.	R/W
5:4	DATE10[1:0]	10-Day Count Counts from 0 to 3 once per carry from the ones place.	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RDAYCNT counter is used in calendar count mode to set and count the BCD-coded date value. It counts the carries generated once per day in the hour counter. The count operation depends on the month and whether the year is a leap year. Leap years are determined according to whether the year counter (RYRCNT) value is divisible by 400, 100, and 4.

A value from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. When specifying a value, the range of specifiable days depends on the month and whether the year is a leap year. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.8 RMONCNT : Month Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0C

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1-Month Count Counts from 0 to 9 once per month. When a carry is generated, 1 is added to the tens place.	R/W
4	MON10	10-Month Count Counts from 0 to 1 once per carry from the ones place.	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RMONCNT counter is used in calendar count mode to set and count the BCD-coded month value. It counts the carries generated once per month in the date counter.

A value from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.9 RYRCNT : Year Counter

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x0E

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	YR1[3:0]	1-Year Count Counts from 0 to 9 once per year. When a carry is generated, 1 is added to the tens place.	R/W
7:4	YR10[3:0]	10-Year Count Counts from 0 to 9 once per carry from ones place. When a carry is generated in the tens place, 1 is added to the hundreds place.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RYRCNT counter is used in calendar count mode to set and count the BCD-coded year value. It counts the carries generated once per year in the month counter.

A value from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, you must stop the count operation using the START bit in RCR2. To read this counter, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.

24.2.10 RSECAR : Second Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x10

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1 Second Value for the ones place of seconds.	R/W
6:4	SEC10[2:0]	10 Seconds Value for the tens place of seconds.	R/W
7	ENB	ENB 0: Do not compare register value with RSECCNT counter value 1: Compare register value with RSECCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RSECAR is an alarm register associated with the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, the RSECAR value is compared with the RSECCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR

- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RSECAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.11 RMINAR : Minute Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x12

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1 Minute Value for the ones place of minutes.	R/W
6:4	MIN10[2:0]	10 Minutes Value for the tens place of minutes.	R/W
7	ENB	ENB 0: Do not compare register value with RMINCNT counter value 1: Compare register value with RMINCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RMINAR is an alarm register associated with the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, the RMINAR value is compared with the RMINCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RMINAR values from 00 through 59 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.12 RHRAR : Hour Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x14

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1 Hour Value for the ones place of hours.	R/W
5:4	HR10[1:0]	10 Hours Value for the tens place of hours.	R/W
6	PM	AM/PM select for alarm setting. 0: AM 1: PM	R/W
7	ENB	ENB 0: Do not compare register value with RHRCNT counter value 1: Compare register value with RHRCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RHRAR is an alarm register associated with the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, the RHRAR value is compared with the RHRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The specifiable time differs according to the setting in the hours mode bit (RCR2.HR24):

- When the RCR2.HR24 bit is 0 – From 00 to 11 (in BCD).
- When the RCR2.HR24 bit is 1 – From 00 to 23 (in BCD).

If a value outside of this range is specified, the RTC does not operate correctly. When the RCR2.HR24 bit is 0, you must set the PM bit. When the RCR2.HR24 bit is 1, the setting in the PM bit has no effect. This register is set to 0x00 by an RTC software reset.

24.2.13 RWKAR : Day-of-Week Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x16

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	—	—	—	—	DAYW[2:0]		
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
2:0	DAYW[2:0]	Day-of-Week Setting 0 0 0: Sunday 0 0 1: Monday 0 1 0: Tuesday 0 1 1: Wednesday 1 0 0: Thursday 1 0 1: Friday 1 1 0: Saturday 1 1 1: Setting prohibited	R/W
6:3	—	The read values are undefined. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	ENB	ENB 0: Do not compare register value with RWKCNT counter value 1: Compare register value with RWKCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RWKAR is an alarm register associated with the coded day-of-week counter RWKCNT. When the ENB bit is set to 1, the RWKAR value is compared with the RWKCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. RWKAR values from 0 through 6 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.14 BCNTnAR : Binary Counter n Alarm Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x10 + 0x02 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	BCNTAR							
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	BCNTAR	Alarm register associated with the 32-bit binary counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTnAR is a read/write alarm register associated with the 32-bit binary counter. BCNT3AR is assigned to the BCNTAR[31:24] bits, BCNT2AR is assigned to the BCNTAR[23:16] bits, BCNT1AR is assigned to the BCNTAR[15:8] bits, and BCNT0AR is assigned to the BCNTAR[7:0]. This register is set to 0x00 by an RTC software reset.

24.2.15 RDAYAR : Date Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x18

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1 Day Value for the ones place of days.	R/W

Bit	Symbol	Function	R/W
5:4	DATE10[1:0]	10 Days Value for the tens place of days.	R/W
6	—	The read value is undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with RDAYCNT counter value 1: Compare register value with RDAYCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RDAYAR is an alarm register associated with the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, the RDAYAR value is compared with the RDAYCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR
- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RDAYAR values from 01 through 31 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.16 RMONAR : Month Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x1A

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	—	—	MON10	MON1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1 Month Value for the ones place of months.	R/W
4	MON10	10 Months Value for the tens place of months.	R/W
6:5	—	The read values are undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with RMONCNT counter value 1: Compare register value with RMONCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

RMONAR is an alarm register associated with the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, the RMONAR value is compared with the RMONCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR

- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. The RMONAR values from 01 through 12 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x00 by an RTC software reset.

24.2.17 RYRAR : Year Alarm Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x1C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	YR10[3:0]				YR1[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	YR1[3:0]	1 Year Value for the ones place of years.	R/W
7:4	YR10[3:0]	10 Years Value for the tens place of years.	R/W
15:8	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

RYRAR is an alarm register associated with the BCD-coded year counter RYRCNT. The RYRAR values from 00 through 99 (in BCD) can be specified. If a value outside of this range is specified, the RTC does not operate correctly. This register is set to 0x0000 by an RTC software reset.

24.2.18 RYRAREN : Year Alarm Enable Register (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x1E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB	—	—	—	—	—	—	—
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
6:0	—	The read values are undefined. The write value should be 0.	R/W
7	ENB	ENB 0: Do not compare register value with the RYRCNT counter value 1: Compare register value with the RYRCNT counter value	R/W

Note: S-TYPE3, P-TYPE3

When the ENB bit in the RYRAREN register is set to 1, the RYRAR value is compared with the RYRCNT value. From the following alarm registers, only those selected with the ENB bits set to 1 are compared with the associated counters:

- RSECAR
- RMINAR
- RHRAR
- RWKAR

- RDAYAR
- RMONAR
- RYRAREN

When all the respective values match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

24.2.19 BCNTnAER : Binary Counter n Alarm Enable Register (n = 0 to 3) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x18 + 0x02 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	ENB[7:0]							
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
7:0	ENB[7:0]	Setting the alarm enable associated with the 32-bit binary counter	R/W

Note: S-TYPE3, P-TYPE3

BCNTnAER is a read/write register for setting the alarm enable (BCNTAER) associated with the 32-bit binary counter. BCNT3AER is assigned to the BCNTAER.ENB[31:24] bits, BCNT2AER register is assigned to the BCNTAER.ENB[23:16] bits, BCNT1AER is assigned to the BCNTAER.ENB[15:8] bits, and BCNT0AER is assigned to the BCNTAER.ENB[7:0] bits. The binary counter (BCNT[31:0]) associated with the BCNTAER.ENB[31:0] bits that are set to 1 is compared with the binary alarm register (BCNTAR) and, when all match, the IR flag associated with the RTC_ALM interrupt is set to 1. This register is set to 0x00 by an RTC software reset.

24.2.20 RCR1 : RTC Control Register 1

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x22

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PES[3:0]				RTCOS	PIE	CIE	AIE
Value after reset:	x	x	x	x	0	x	0	x

Bit	Symbol	Function	R/W
0	AIE	Alarm Interrupt Enable 0: Disable alarm interrupt requests 1: Enable alarm interrupt requests	R/W
1	CIE	Carry Interrupt Enable 0: Disable carry interrupt requests 1: Enable carry interrupt requests	R/W
2	PIE	Periodic Interrupt Enable 0: Disable periodic interrupt requests 1: Enable periodic interrupt requests	R/W
3	RTCOS	RTCOUT Output Select 0: Outputs 1 Hz on RTCOUT 1: Outputs 64 Hz RTCOUT	R/W

Bit	Symbol	Function	R/W
7:4	PES[3:0]	Periodic Interrupt Select 0x6: Generate periodic interrupt every 1/256 second*1 0x7: Generate periodic interrupt every 1/128 second 0x8: Generate periodic interrupt every 1/64 second 0x9: Generate periodic interrupt every 1/32 second 0xA: Generate periodic interrupt every 1/16 second 0xB: Generate periodic interrupt every 1/8 second 0xC: Generate periodic interrupt every 1/4 second 0xD: Generate periodic interrupt every 1/2 second 0xE: Generate periodic interrupt every 1 second 0xF: Generate periodic interrupt every 2 seconds Others: Do not generate periodic interrupts	R/W

Note: S-TYPE3, P-TYPE3
Note 1. When LOCO is selected (RCR4.RCKSEL = 1) while PES[3:0] = 0x6, a periodic interrupt is generated every 1/128 second.

The RCR1 register is used in both calendar count mode and binary count mode. Bits AIE, PIE, and PES[3:0] are updated synchronously with the count source. When the RCR1 register is modified, check that all the bits are updated before proceeding.

AIE bit (Alarm Interrupt Enable)

The AIE bit enables or disables alarm interrupt requests.

If the times indicated in the counters and alarm settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the AIE bit value.

CIE bit (Carry Interrupt Enable)

The CIE bit enables or disables interrupt requests when a carry to the RSECCNT/BCNT0 register occurs, or when a carry to the 64-Hz counter (R64CNT) occurs while reading the 64-Hz counter.

PIE bit (Periodic Interrupt Enable)

The PIE bit enables or disabled a periodic interrupt.

If the periods indicated in the counters and PES[3:0] settings match in Deep Software Standby mode, the MCU returns from Deep Software Standby mode regardless of the PIE bit value.

RTCOS bit (RTCOUT Output Select)

The RTCOS bit selects the RTCOUT output period. The RTCOS bit must be rewritten while the count operation is stopped (RCR2.START = 0) and the RTCOUT output is disabled (RCR2.RTCOE = 0). When RTCOUT is output to an external pin, the RCR2.RTCOE bit must be enabled.

PES[3:0] bits (Periodic Interrupt Select)

The PES[3:0] bits specify the period for the periodic interrupt. A periodic interrupt is generated with the period specified in these bits.

24.2.21 RCR2 : RTC Control Register 2 (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CNTMD	HR24	AADJP	AADJE	RTCOE	ADJ30	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	START	Start 0: Stop prescaler and time counter 1: Operate prescaler and time counter normally	R/W

Bit	Symbol	Function	R/W
1	RESET	RTC Software Reset 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or an RTC software reset has completed. 1: In writing: Initialize the prescaler and target registers for RTC software reset*1. In reading: RTC software reset in progress.	R/W
2	ADJ30	30-Second Adjustment 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or 30-second adjustment has completed. 1: In writing: Execute 30-second adjustment. In reading: 30-second adjustment in progress.	R/W
3	RTCOE	RTCOUT Output Enable 0: Disable RTCOUT output 1: Enable RTCOUT output	R/W
4	AADJE	Automatic Adjustment Enable*2*3 0: Disable automatic adjustment 1: Enable automatic adjustment	R/W
5	AADJP	Automatic Adjustment Period Select*2*3 0: The RADJ.ADJ[5:0] setting from the count value of the prescaler every minute. 1: The RADJ.ADJ[5:0] setting value is adjusted from the count value of the prescaler every 10 seconds.	R/W
6	HR24	Hours Mode*3 0: Operate RTC in 12-hour mode 1: Operate RTC in 24-hour mode	R/W
7	CNTMD	Count Mode Select*4 0: Calendar count mode 1: Binary count mode	R/W

Note: S-TYPE3, P-TYPE3
Note 1. R64CNT, RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAR, RYRAREN, RADJ, RTCCRn, RSECCPn, RMINCPn, RHRCPn, RDAYCPn, RMONCPn, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.
Note 2. When LOCO is selected, the setting of this bit is disabled.
Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See section 24.6.5. Notes on Writing to and Reading from Registers for notes on register writing/reading.
Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

The RCR2 register is related to hours mode, automatic adjustment function, enabling RTCOUT output, 30-second adjustment, RTC software reset, and controlling count operation.

START bit (Start)

The START bit stops or restarts the prescaler or time counter operation. This bit is updated in synchronization with the next cycle of the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. Check that this bit is 0 before proceeding.

ADJ30 bit (30-Second Adjustment)

The ADJ30 bit is for 30-second adjustment.

When 1 is written to the ADJ30 bit, the RSECCNT value of less than 30 seconds is rounded down to 00 second and the value of 30 seconds or more is rounded up to 1 minute.

The 30-second adjustment is performed in synchronization with the count source. When 1 is written to this bit, the ADJ30 bit is automatically set to 0 after the 30-second adjustment completes. If 1 is written to the ADJ30 bit, check that the bit is 0 before proceeding. When the 30-second adjustment is performed, the prescaler and R64CNT are also reset. The ADJ30 bit is set to 0 by an RTC software reset.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time.

When RTCOUT is to be output from an external pin, enable the RTCOE bit and set up the port control for the pin.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit.

The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit.

The AADJP bit is set to 0 by an RTC software reset.

HR24 bit (Hours Mode)

The HR24 bit specifies whether the RTC operates in 12- or 24-hour mode.

Use the START bit to stop counting before changing the value of the HR24 bit. Do not stop counting (write 0 to the START bit) and change the value of the HR24 bit at the same time.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see section 24.3.1. Outline of Initial Settings of Registers after Power On.

24.2.22 RCR2 : RTC Control Register 2 (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x24

Bit position:	7	6	5	4	3	2	1	0
Bit field:	CNTMD	—	AADJP	AADJE	RTCOE	—	RESET	START
Value after reset:	x	x	x	x	0	0	0	x

Bit	Symbol	Function	R/W
0	START	Start 0: Stop the 32-bit binary counter, 64-Hz counter, and prescaler 1: Operate the 32-bit binary counter, 64-Hz counter, and prescaler normally	R/W
1	RESET	RTC Software Reset 0: In writing: Invalid (writing 0 has no effect). In reading: Normal time operation in progress, or an RTC software reset has completed. 1: In writing: Initialize the prescaler and target registers for RTC software reset*1. In reading: RTC software reset in progress.	R/W
2	—	This bit is read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
3	RTCOE	RTCOUT Output Enable 0: Disable RTCOUT output 1: Enable RTCOUT output	R/W
4	AADJE	Automatic Adjustment Enable*2*3 0: Disable automatic adjustment 1: Enable automatic adjustment	R/W
5	AADJP	Automatic Adjustment Period Select*2*3 0: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 32 seconds 1: Add or subtract RADJ.ADJ [5:0] bits from prescaler count value every 8 seconds.	R/W
6	—	The read value is undefined. The write value should be 0.	R/W
7	CNTMD	Count Mode Select*4 0: Calendar count mode 1: Binary count mode	R/W

Note: S-TYPE3, P-TYPE3
Note 1. R64CNT, BCNTnAR, BCNTnAER, RADJ, RTCCRn, BCNTnCPm, RCR2.ADJ30, RCR2.AADJE, RCR2.AADJP.
Note 2. When LOCO is selected, the setting of this bit is disabled.
Note 3. When rewriting this bit, confirm that the value has been rewritten before performing the following processing. See section 24.6.5. Notes on Writing to and Reading from Registers for notes on register writing/reading.
Note 4. When rewriting this bit, confirm that the value has been rewritten before performing the following processing.

RCR2 in the binary count mode is a register related to the automatic correction function, RTCOUT output enable, RTC software reset, and count mode control.

START bit (Start)

The START bit stops or restarts the prescaler or counter (clock) operation. This bit is updated in synchronization with the count source. When the START bit is modified, check that the bit is updated before proceeding.

RESET bit (RTC Software Reset)

The RESET bit initializes the prescaler and registers to be reset by RTC software. When 1 is written to this bit, initialization starts in synchronization with the count source. When the initialization is complete, the RESET bit is automatically set to 0. When 1 is written to the RESET bit, check that the bit is 0 before proceeding.

RTCOE bit (RTCOUT Output Enable)

The RTCOE bit enables output of a 1-Hz/64-Hz clock signal from the RTCOUT pin.

Use the START bit to stop counting before changing the value of the RTCOE bit. Do not stop counting (write 0 to the START bit) and change the value of the RTCOE bit at the same time. When an RTCOUT signal is to be output from an external pin, enable the port control in addition to setting this bit.

AADJE bit (Automatic Adjustment Enable)

The AADJE bit controls (enables or disables) automatic adjustment.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJE bit. The AADJE bit is set to 0 by an RTC software reset.

AADJP bit (Automatic Adjustment Period Select)

The AADJP bit selects the automatic-adjustment period.

Correction period can be selected from 32 second units or 8 second units in binary count mode.

Set the plus-minus bits (RADJ.PMADJ[1:0]) to 00b (adjustment is not performed) before changing the value of the AADJP bit. The AADJP bit is set to 0 by an RTC software reset.

CNTMD bit (Count Mode Select)

The CNTMD bit specifies whether the RTC count mode operates in calendar count mode or in binary count mode.

When setting the count mode, execute an RTC software reset and start again from the initial settings. This bit is updated in synchronization with the count source. However, the count mode switches only after the RTC software reset. (Bit switches before RTC reset, mode switches after RTC reset.)

For details on initial settings, see section 24.3.1. Outline of Initial Settings of Registers after Power On .

24.2.23 RCR4 : RTC Control Register 4

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x28

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	RCKSEL
Value after reset:	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	RCKSEL	Count Source Select 0: Sub-clock oscillator is selected 1: LOCO is selected	R/W
7:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RCR4 register is used in both calendar count mode and binary count mode.

RCKSEL bit (Count Source Select)

The RCKSEL bit selects the count source from the sub-clock oscillator and LOCO.

The RCKSEL bit is only used in normal operation mode. When the RCKSEL bit is set to 0, the time is counted with the sub-clock oscillator. When the bit is set to 1, the time is counted with LOCO.

For details on count source setting, see section 24.3.1. Outline of Initial Settings of Registers after Power On and section 24.3.2. Clock and Count Mode Setting Procedure. The count source must be selected only once before specifying the initial settings of the RTC registers at power on.

24.2.24 RFRL : Frequency Register L

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2C

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RFC[15:0]															
Value after reset:	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	RFC[15:0]	Frequency Comparison Value Write 0x00FF to this register when using the LOCO.	R/W

Note: S-TYPE3, P-TYPE3

RFRL is a register for controlling the prescaler when LOCO is selected.

The RTC time counter operates on a 128-Hz clock signal as the base clock. Therefore, when LOCO is selected, LOCO is divided by the prescaler to generate a 128-Hz clock signal. Set the frequency comparison value in the RFC[15:0] bits to generate a 128-Hz clock from the LOCO frequency. Before writing to RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

A value from 0x0007 through 0x01FF can be specified as the frequency comparison value. If a value outside of this range is specified, the RTC does not operate correctly. Before writing to this register, be sure to stop the count operation through the setting of the START bit in RCR2. The operating frequency of the peripheral module clock and the LOCO should be such that the peripheral module clock is ≥ LOCO.

Calculation method of frequency comparison value:

RFC[15:0] = (LOCO clock frequency) / 128 - 1

When the LOCO frequency is 32.768 kHz, the RFRL register should be set to 0x00FF.

24.2.25 RFRH : Frequency Register H

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2A

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RFC16
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	RFC16	Write 0 before writing to the RFRL register after a cold start.	R/W
15:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

Before writing to RFRHL.RFC[15:0] after a cold start, write 0x0000 to the RFRH register.

24.2.26 RADJ : Time Error Adjustment Register

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x2E

Bit position:	7	6	5	4	3	2	1	0
Bit field:	PMADJ[1:0]		ADJ[5:0]					
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
5:0	ADJ[5:0]	Adjustment Value These bits specify the adjustment value from the prescaler.	R/W
7:6	PMADJ[1:0]	Plus-Minus 0 0: Do not perform adjustment. 0 1: Adjustment is performed by the addition to the prescaler 1 0: Adjustment is performed by the subtraction from the prescaler 1 1: Setting prohibited.	R/W

Note: S-TYPE3, P-TYPE3

The RADJ register is used in both calendar count mode and binary count mode. Adjustment is performed by the addition to or subtraction from the prescaler or 64-Hz counter. If the Automatic Adjustment Enable (RCR2.AADJE) bit is 0, adjustment is performed when writing to the RADJ. If the RCR2.AADJE bit is 1, adjustment is performed in the interval specified in the Automatic Adjustment Period Select (RCR2.AADJP) bit.

The current adjustment by software (disabling automatic adjustment) may be invalid if the following adjustment value is specified within 320 cycles of the count source after the register setting. To perform adjustment consecutively, wait for 320 cycles or more of the count source after the register setting, then specify the next adjustment value.

RADJ is updated in synchronization with the count source. When RADJ is modified, check that all the bits are updated before continuing with more processing. This register is set to 0x00 by an RTC software reset. The setting of this register is enabled only when the sub-clock oscillator is selected. When LOCO is selected, adjustment is not performed.

ADJ[5:0] bits (Adjustment Value)

The ADJ[5:0] bits specify the adjustment value (number of sub-clock cycles) from the prescaler.

PMADJ[1:0] bits (Plus-Minus)

The PMADJ[1:0] bits select whether the clock is set ahead or back depending on the error-adjustment value set in the ADJ[5:0] bits.

24.2.27 RTCCRn : Time Capture Control Register n (n = 0 to 2)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x40 + 0x02 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	TCEN	—	TCNF[1:0]		—	TCST	TCCT[1:0]	
Value after reset:	x	0	x	x	0	x	x	x

Bit	Symbol	Function	R/W
1:0	TCCT[1:0]	Time Capture Control 0 0: Do not detect events 0 1: Detect rising edge 1 0: Detect falling edge 1 1: Detect both edges	R/W
2	TCST	Time Capture Status 0: No event detected 1: Event detected*1	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
5:4	TCNF[1:0]	Time Capture Noise Filter Control 0 0: Turn noise filter off 0 1: Setting prohibited 1 0: Turn noise filter on (count source) 1 1: Turn noise filter on (count source by divided by 32)	R/W
6	—	This bit is read as 0. The write value should be 0.	R/W
7	TCEN	Time Capture Event Input Pin Enable 0: Disable the RTCICn pin as the time capture event input pin 1: Enable the RTCICn pin as the time capture event input pin	R/W

Note: S-TYPE3, P-TYPE3
Note 1. Indicates that an event is detected. Writing 1 to this bit has no effect. Writing 0 sets this bit to 0.

The RTCCRn register is used both in calendar count mode and in binary count mode. RTCCR0, RTCCR1, and RTCCR2 control the RTCIC0, RTCIC1, and RTCIC2 pins, respectively.

RTCCRn is updated in synchronization with the count source. When RTCCRn is modified, check that all the bits except the TCST bit are updated before continuing with additional processing. This register is cleared to 0x00 by an RTC software reset. When RTCICm is used as the time capture pin, VBTICTLR.VCHnIEN (n = 0 to 2) must be set to 1.

TCCT[1:0] bits (Time Capture Control)

The TCCT[1:0] bits control the edge detection of the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2. input pin, RTCIC0.The detection edge is selectable. The TCCT[1:0] bits must be set while the VBTICTLR.VCHnIEN bit is 1.

TCST bit (Time Capture Status)

The TCST bit indicates that an event on the time capture event input pins, RTCIC0, RTCIC1, and RTCIC2,was detected. When the TCST bit is 0, no event is detected. When the TCST bit is 1, this bit indicates that an event was detected on the associated pin and the capture register is valid. When multiple events are detected, the capture time for the first event is retained.

The event is detected only during count operation (RCR2.START bit = 1). Before reading the capture register, make sure that this bit is set to 1.

Set the TCST bit while the TCCT[1:0] bits are 00b (no event is detected). The TCST bit is set to 0 in synchronization with the count source. When the TCST bit is set to 0, check that the bit is updated before continuing with additional processing.

TCNF[1:0] bits (Time Capture Noise Filter Control)

The TCNF[1:0] bits control the noise filter of the time capture event input pins (RTCIC0, RTCIC1, and RTCIC2).

When the noise filter is on, the count source divided by 1 or divided by 32 is selectable. In this case, when the input level on the time capture event input pin matches three consecutive times at the set sampling period, the input level is determined.

Set the TCNF[1:0] bits while the TCCT[1:0] bits are 00b (no event is detected). When the noise filter is used, set the TCNF[1:0] bits, wait for 3 cycles of the specified sampling period, then set the TCCT[1:0] bits. Set the TCNF[1:0] bits when the VBTICTLR.VCHnIEN bit is 1.

TCEN bit (Time Capture Event Input Pin Enable)

The TCEN bit enables or disables the time capture event input pins RTCIC0, RTCIC1, and RTCIC2.When the functions of the time capture event input pins are multiplexed, set VBTICTLR first. If the TCEN bit is set to 0, also set the TCCT[1:0] bits to 00b.

Before setting this bit to 1, be sure to set the count source setting bit (RCR4.RCKSEL), RTC time capture event enable bit (RCPE.RTCEN), port control setting bits (PmnPFS.PDR, and PmnPFS.PMR). For details on the port control setting bits (PmnPFS.PDR and PmnPFS.PMR), see section 19, I/O Ports.

24.2.28 RSECCPn : Second Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x52 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	SEC10[2:0]			SEC1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	SEC1[3:0]	1-Second Capture Capture value for the ones place of seconds.	R
6:4	SEC10[2:0]	10-Second Capture Capture value for the tens place of seconds.	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RSECCPn is a read-only register that captures the RSECCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins ares stored in the RSECCP0, RSECCP1, and RSECCP2 registers, respectively. This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.29 RMINCPn : Minute Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x54 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	MIN10[2:0]			MIN1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MIN1[3:0]	1-Minute Capture Capture value for the ones place of minutes.	R

Bit	Symbol	Function	R/W
6:4	MIN10[2:0]	10-Minute Capture Capture value for the tens place of minutes.	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RMINCPn is a read-only register that captures the RMINCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMINCP0, RMINCP1, and RMINCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.30 RHRCPn : Hour Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x56 + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	PM	HR10[1:0]		HR1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	HR1[3:0]	1-Hour Capture Capture value for the ones place of hours	R
5:4	HR10[1:0]	10-Hour Capture Capture value for the tens place of hours	R
6	PM	PM 0: AM 1: PM	R
7	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RHRCPn is a read-only register that captures the RHRCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RHRCP0, RHRCP1, and RHRCP2 registers, respectively.

The PM bit is only enabled when the RCR2.HR24 bit is 0 (in 12-hour mode).

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

24.2.31 RDAYCPn : Date Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x5A + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	DATE10[1:0]		DATE1[3:0]			
Value after reset:	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	DATE1[3:0]	1-Day Capture Capture value for the ones place of days.	R

Bit	Symbol	Function	R/W
5:4	DATE10[1:0]	10-Day Capture Capture value for the tens place of days.	R
7:6	—	The read value is undefined.	R

Note: S-TYPE3, P-TYPE3

RDAYCPn is a read-only register that captures the RDAYCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RDAYCP0, RDAYCP1, and RDAYCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.32 RMONCPn : Month Capture Register n (n = 0 to 2) (in Calendar Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x5C + 0x10 × n

Bit position:	7	6	5	4	3	2	1	0
Bit field:	—	—	—	MON10	MON1[3:0]			
Value after reset:	0	0	0	x	x	x	x	x

Bit	Symbol	Function	R/W
3:0	MON1[3:0]	1-Month Capture Capture value for the ones place of months.	R
4	MON10	10-Month Capture Capture value for the tens place of months.	R
7:5	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

RMONCPn is a read-only register that captures the RMONCNT value when a time capture event is detected.

The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the RMONCP0, RMONCP1, and RMONCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, the time capture event detection should be stopped using the RTCCRn.TCCT[1:0] bits.

24.2.33 BCNTnCPm : BCNTn Capture Register m (n= 0 to 3, m = 0 to 2) (in Binary Count Mode)

Base address: RTC = 0x4020_2000
RTC_NS = 0x5020_2000

Offset address: 0x52 + 0x10 × m (BCNT0CPm)
0x54 + 0x10 × m (BCNT1CPm)
0x56 + 0x10 × m (BCNT2CPm)
0x5A + 0x10 × m (BCNT3CPm)

Bit position:	7	6	5	4	3	2	1	0
Bit field:								
Value after reset:	x	x	x	x	x	x	x	x

BCNTnCPm is a read-only register that captures the BCNTn value when a time capture event is detected. BCNT3CPm is assigned to the BCNTCPm[31:24] bits, BCNT2CPm is assigned to the BCNTCPm[23:16] bits, BCNT1CPm is assigned to the BCNTCPm[15:8] bits and BCNT0CPm is assigned to the BCNTCPm[7:0] bits. The event detection times detected by the RTCIC0, RTCIC1, and RTCIC2 pins are stored in the BCNTnCP0, BCNTnCP1, and BCNTnCP2 registers, respectively.

This register is cleared to 0x00 by an RTC software reset. Before reading from this register, you must stop the time capture event detection using the RTCCRn.TCCT[1:0] bits.

24.3 Operation

24.3.1 Outline of Initial Settings of Registers after Power On

After the power is turned on, perform the initial settings for the clock, count mode, time error adjustment, time, alarm, interrupts, and time capture.

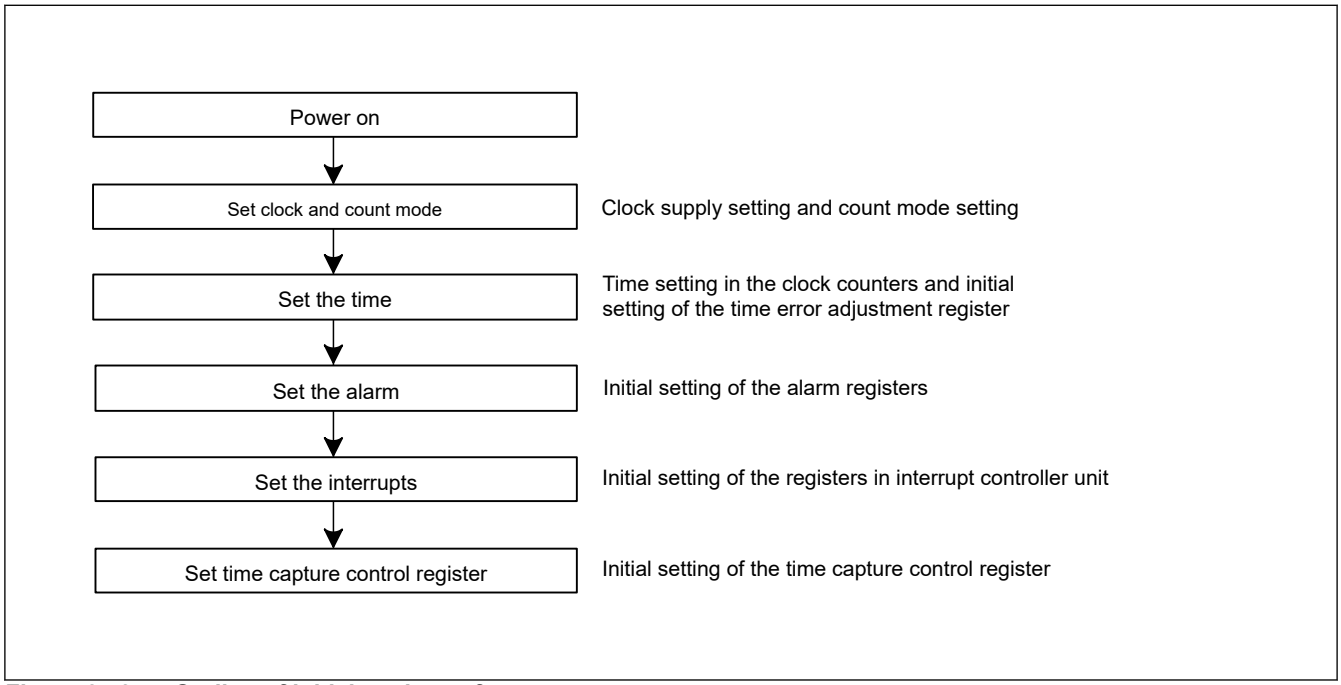

Figure 24.2 Outline of initial settings after a power on

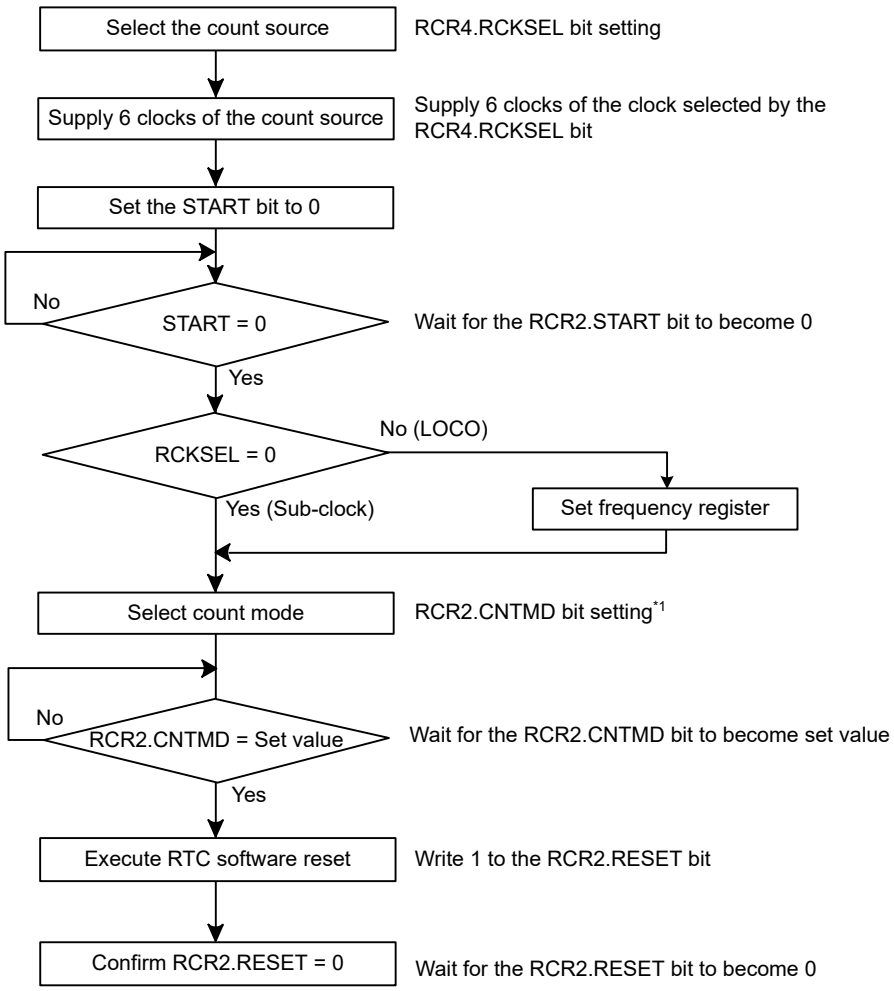
24.3.2 Clock and Count Mode Setting Procedure

Figure 24.3 shows how to set the clock and the count mode.

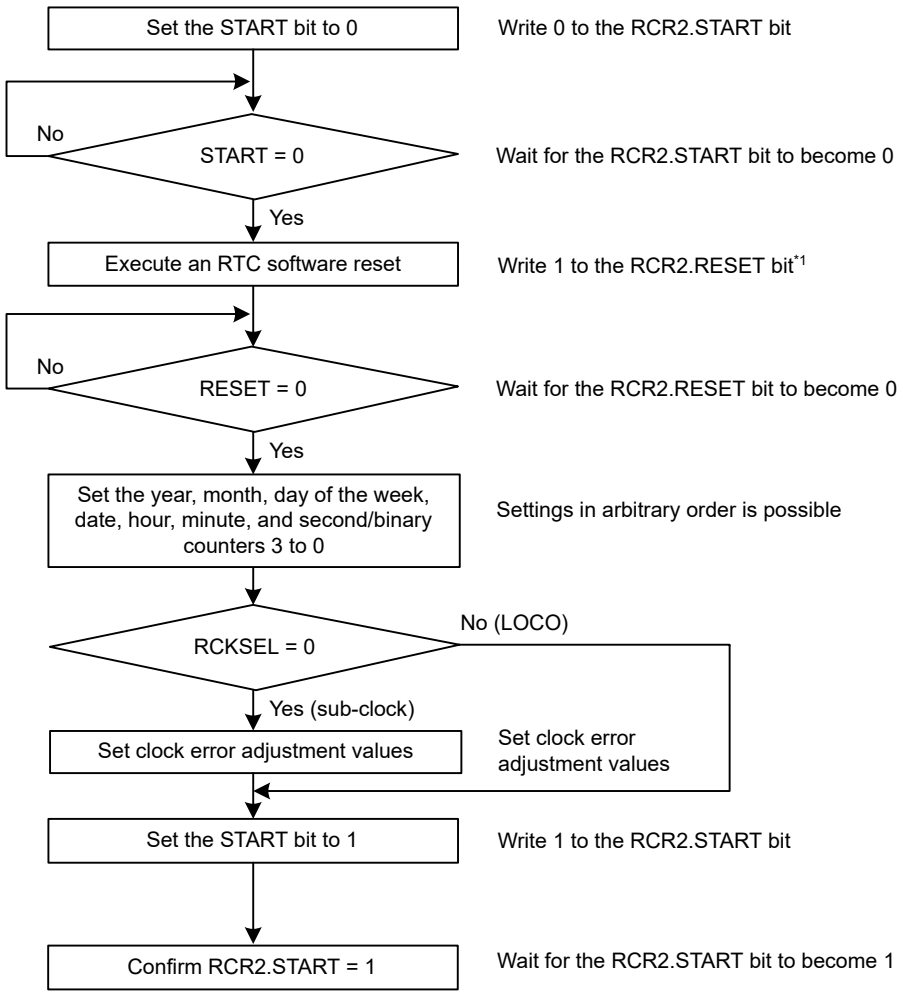


Note 1. This step is not required if the count mode is concurrently set by setting the START bit to 0. A value associated with the count mode setting must be written to the RCR2.CNTMD bit.

Figure 24.3 Clock and count mode setting procedure

24.3.3 Setting the Time

Figure 24.4 shows how to set the time.



Note 1. This step can be omitted in initial settings after power-on because an RTC software reset is executed in the clock setting procedure that is performed during initial settings at power-on.
Note 2. Set in any order.

Figure 24.4 Setting the time

24.3.4 30-Second Adjustment

Figure 24.5 shows how to execute a 30-second adjustment.

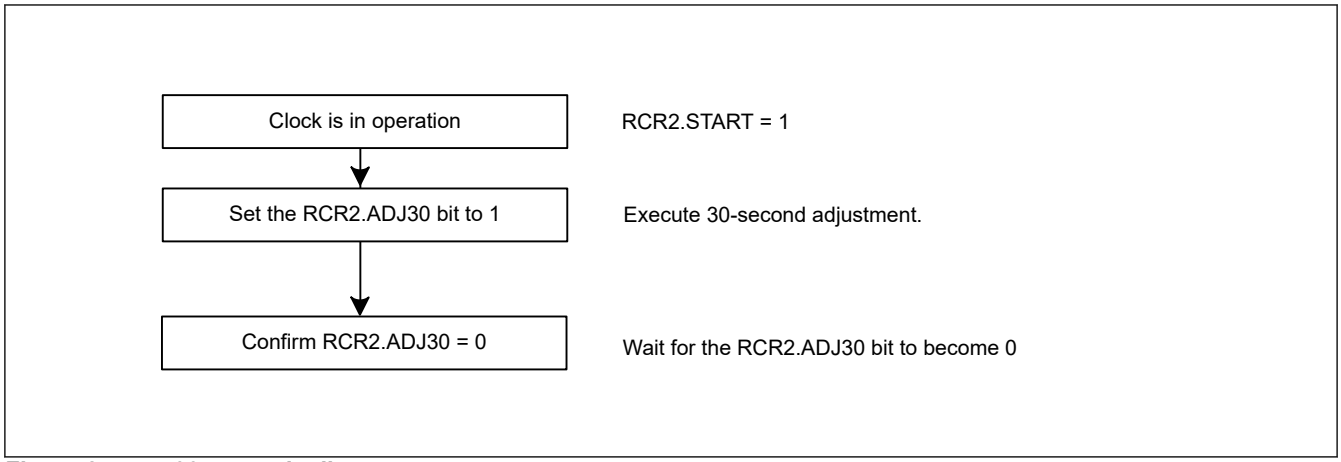


Figure 24.5 30-second adjustment

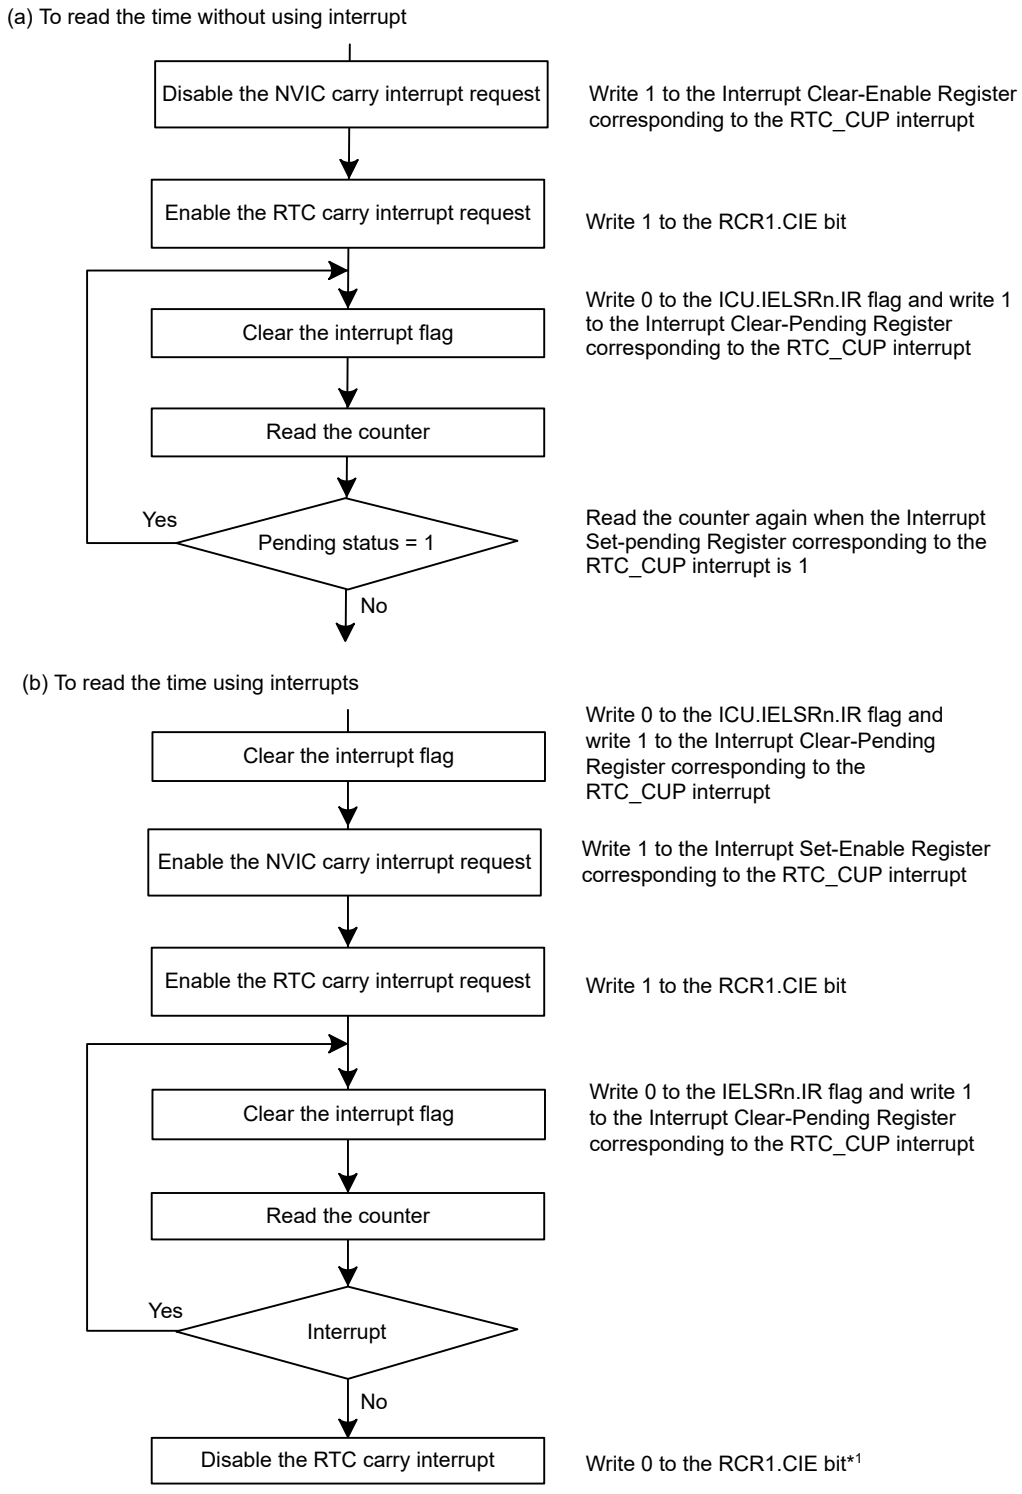
24.3.5 Reading 64-Hz Counter and Time

Figure 24.6 shows how to read a 64-Hz counter and time.



Note 1. Disable interrupts if required.

Figure 24.6 Reading time

If a carry occurs while the 64-Hz counter and time are read, the correct time is not obtained, therefore they must be read again. The procedure for reading the time without using interrupts is shown in (a) in Figure 24.6, and the procedure using carry interrupts is shown in (b). To keep the program simple, method (a) should be used in most cases.

24.3.6 Alarm Function

Figure 24.7 shows how to use the alarm function.

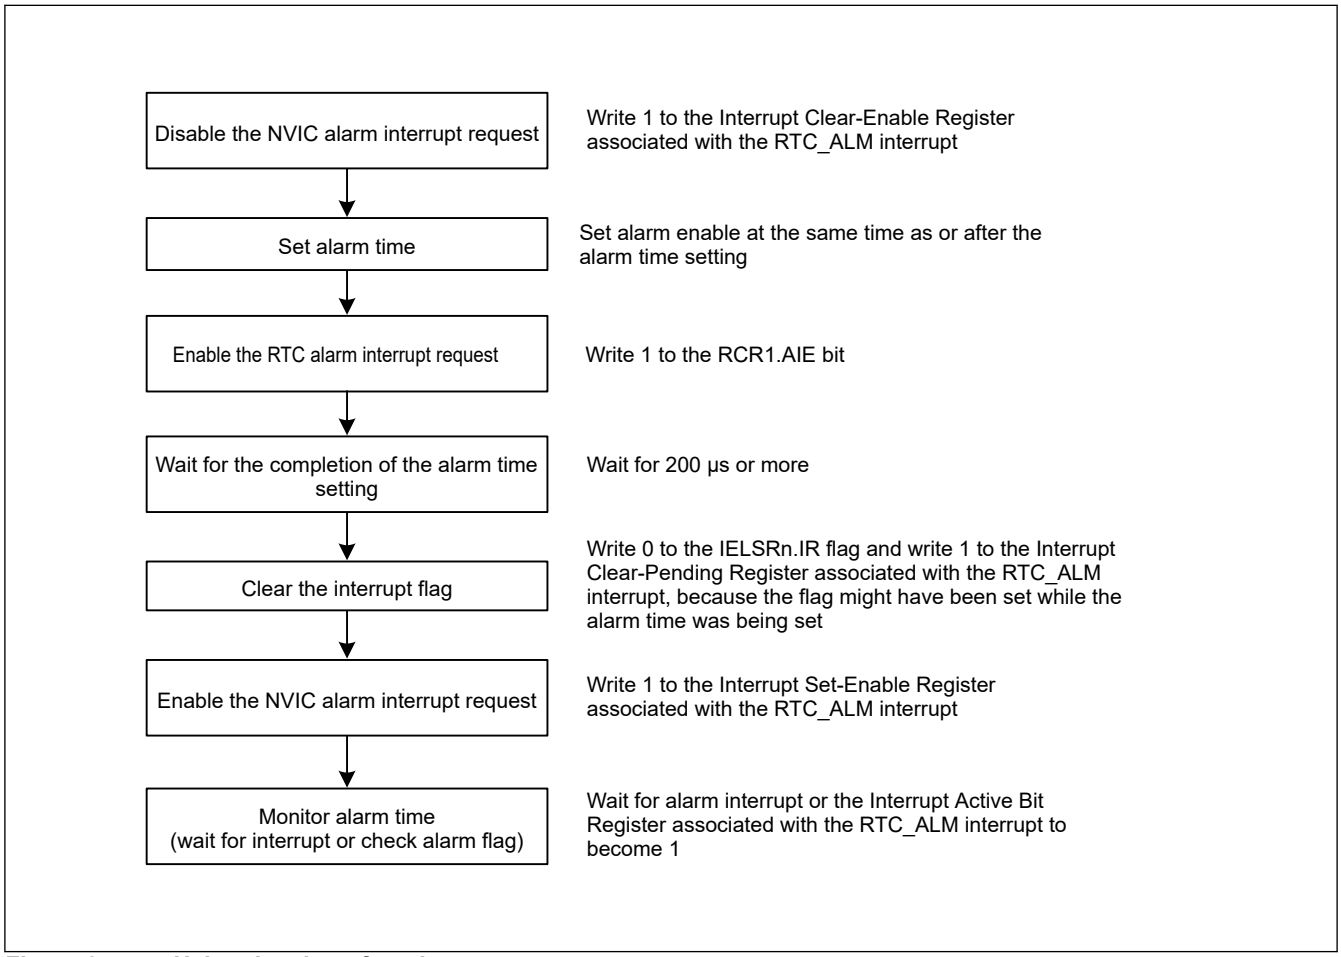


Figure 24.7 Using the alarm function

In calendar count mode, an alarm can be generated by any one of year, month, date, day-of-week, hour, minute or second, or any combination of those. Write 1 to the ENB bit in the alarm registers involved in the alarm setting, and set the alarm time in the lower bits. Write 0 to the ENB bit in registers not involved in the alarm setting.

In binary count mode, an alarm can be generated in any bit combination of 32 bits. Write 1 to the ENB bit of the Alarm Enable register associated with the target bit of the alarm, and set the alarm time in the alarm register. For bits that are not the target of the alarm, write 0 to the ENB bit of the Alarm Enable register.*1

For any of the ENB[31:0] bits that are set to 1, the bits in the corresponding positions in the binary counter (BCNT[31:0]) are compared with the values of the corresponding bits in the binary alarm registers*1. When all such bits match, the IR flag associated with the RTC_ALM interrupt is set to 1 and the corresponding bits in the Interrupt Set-Pending/Clear-Pending Registers are set to 1. Alarm detection can be confirmed by reading the Interrupt Set-Pending Register associated with the RTC_ALM interrupt, but an interrupt should be used in most cases. If 1 is set in the Interrupt Set-Enable Register associated with the RTC_ALM interrupt, an alarm interrupt is generated in the event of the alarm, enabling the alarm to be detected.

Writing 0 sets the IELSRn.IR flag associated with the RTC_ALM interrupt to 0. If interrupt is enabled, the Interrupt Set-Pending/Clear-Pending Register associated with the RTC_ALM interrupt is cleared automatically after exiting the interrupt handler. Otherwise, write 1 to the Interrupt Clear-Pending Register associated with the RTC_ALM interrupt to clear it.

When the counter and the alarm time match in a low power state, the MCU returns from the low power state.

Note 1. For any bits in the ENB bits that are set to 1, the values in the corresponding positions in the alarm registers from the following registers are compared with the corresponding bits of the counted values.

Counter registers: RSECCNT, RMINCNT, RHRCNT, RWKCNT, RDAYCNT, RMONCNT, RYRCNT

Alarm registers: RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, RYRAREN

24.3.7 Procedure for Disabling Alarm Interrupt

Figure 24.8 shows the procedure for disabling the enabled alarm interrupt request.

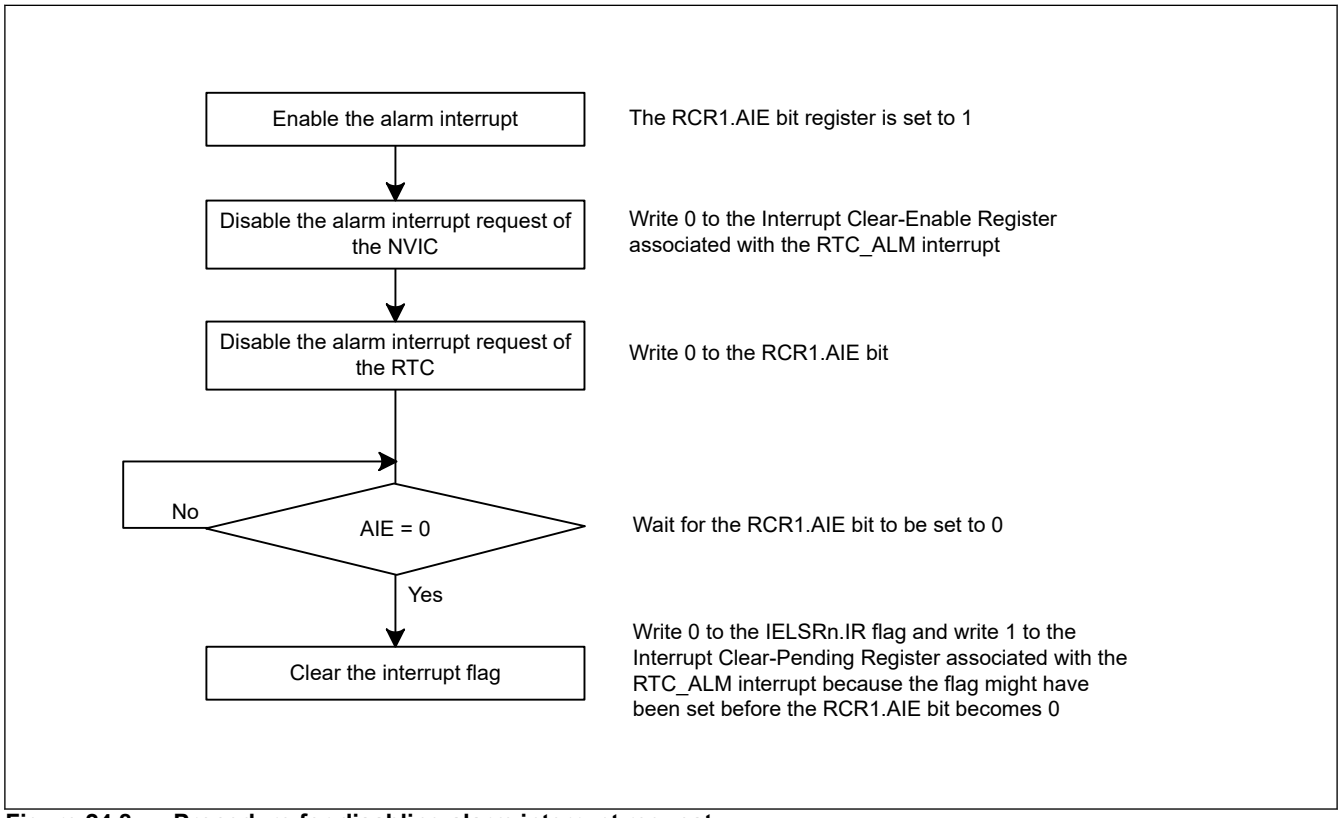

Figure 24.8 Procedure for disabling alarm interrupt request

24.3.8 Time Error Adjustment Function

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low.

The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

Use the RCR2.AADJE bit to select automatic adjustment or adjustment by software.

24.3.8.1 Automatic adjustment

Enable automatic adjustment by setting the RCR2.AADJE bit to 1.

Automatic adjustment is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register every time the adjustment period selected by the RCR2.AADJP bit elapses.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz

Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 60 clock cycles per minute, so adjustment can take the form of setting the clock back by 60 cycles every minute.

Register settings when RCR2.CNTMD = 0:

- RCR2.AADJP = 0 (adjustment every minute)
- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 60 (0x3C)

(2) Example 2: Sub-clock oscillator running at 32.766 kHz

Adjustment procedure

When the sub-clock oscillator is running at 32.766 kHz, 1 second elapses every 32766 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs slow by 2 clock cycles every second. The time on the clock is slow by 20 clock cycles every 10 seconds, so adjustment can take the form of setting the clock forward by 20 cycles every 10 seconds.

Register settings when RCR2.CNTMD = 0:

- RCR2.AADJP = 1 (adjustment every 10 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 20 (0x14)

(3) Example 3: Sub-clock oscillator running at 32.764 kHz

Adjustment procedure

When the sub-clock oscillator is running at 32.764 kHz, 1 second elapses on 32764 clock cycles. Because the RTC operates for 32768 clock cycles as 1 second, the clock is delayed for 4 clock cycles per second. In 8 seconds, the delay is 32 clock cycles, therefore correction can be made by advancing the clock 32 clock cycles every 8 seconds.

Register settings when RCR2.CNTMD = 1:

- RCR2.AADJP = 1 (adjustment every 8 seconds)
- RADJ.PMADJ[1:0] = 01b (adjustment is performed by the addition to the prescaler)
- RADJ.ADJ[5:0] = 32 (0x20)

24.3.8.2 Adjustment by software

Enable adjustment by software by setting the RCR2.AADJE bit to 0. Adjustment by software is the addition or subtraction of the value counted by the prescaler to or from the value in the RADJ register on execution of a write instruction to the RADJ register.

(1) Example 1: Sub-clock oscillator running at 32.769 kHz

Adjustment procedure

When the sub-clock oscillator is running at 32.769 kHz, 1 second elapses every 32769 clock cycles. The RTC is meant to run at 32768 clock cycles, so the clock runs fast by 1 clock cycle every second. The time on the clock is fast by 1 clock cycle per second, so adjustment can take the form of setting the clock back by 1 cycle every second.

Register settings

- RADJ.PMADJ[1:0] = 10b (adjustment is performed by the subtraction from the prescaler)
- RADJ.ADJ[5:0] = 1 (0x01)
  This is written to the RADJ register once per 1-second interrupt.

24.3.8.3 Procedure to change the mode of adjustment

When changing the mode of adjustment, change the value of the AADJE bit in RCR2 after setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

To change adjustment by software to automatic adjustment:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 1 (automatic adjustment is enabled).

3. Use the RCR2.AADJP bit to select the period of adjustment.
4. In RADJ, set the PMADJ[1:0] bits for addition or subtraction and the ADJ[5:0] bits to the value for use in time error adjustment.

To change automatic adjustment to adjustment by software:

1. Set the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).
2. Set the RCR2.AADJE bit to 0 (adjustment by software is enabled).
3. Proceed with the adjustment by setting the RADJ.PMADJ[1:0] bits for addition or subtraction and the RADJ.ADJ[5:0] bits to the value for use in time error adjustment at the wanted time. After that, the time is adjusted every time a value is written to the RADJ register.

24.3.8.4 Procedure to stop adjustment

Stop the adjustment by setting the RADJ.PMADJ[1:0] bits to 00b (adjustment is not performed).

24.3.9 Capturing the time

The RTC is capable of storing the month, date, hour, minute and second/binary counters 3 to 0 by detecting an edge of a signal on a time capture event input pin in calendar count mode or binary count mode .

A noise filter can also be used on a time capture event input pin. If the noise filter is enabled, the RTCCRn.TCST bit is set to 1 when the input level on the pin matches three times.

The noise filter can be switched on or off for each of the time capture event input pins.Set VBTICTLR.VCHnIEN (n = 0 to 2) to 1 to enable the RTCICn input. Operation when the noise filter is off is shown in Figure 24.9 and operation when the noise filter is on is shown in Figure 24.10.

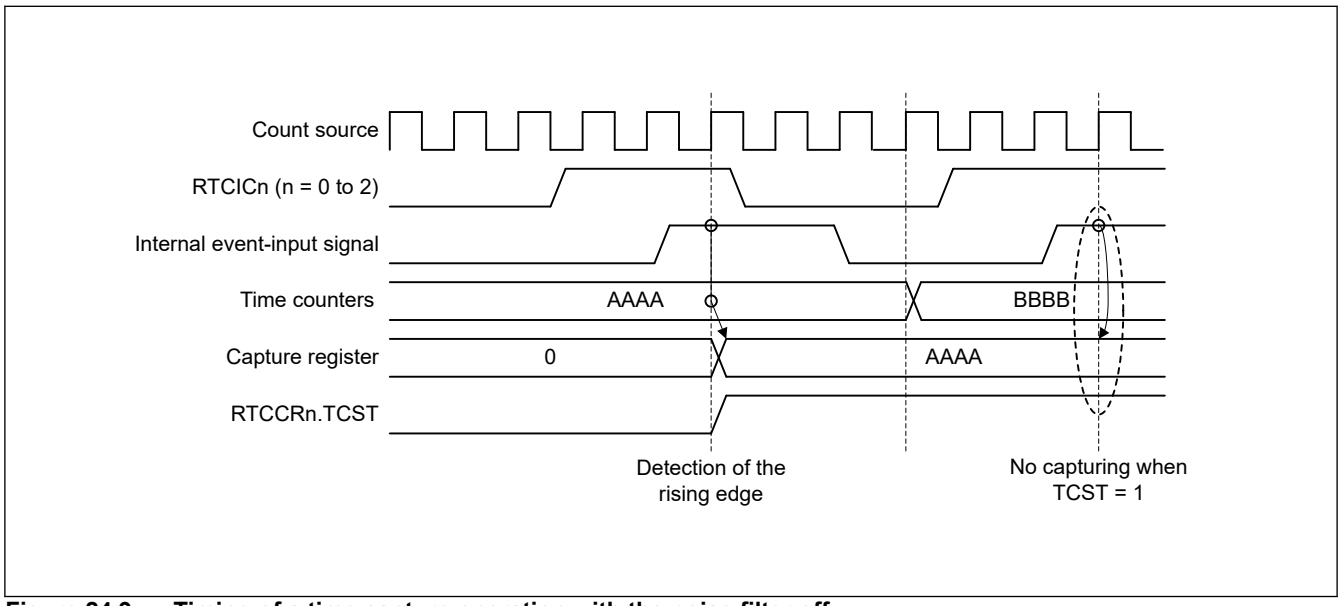

Figure 24.9 Timing of a time capture operation with the noise filter off

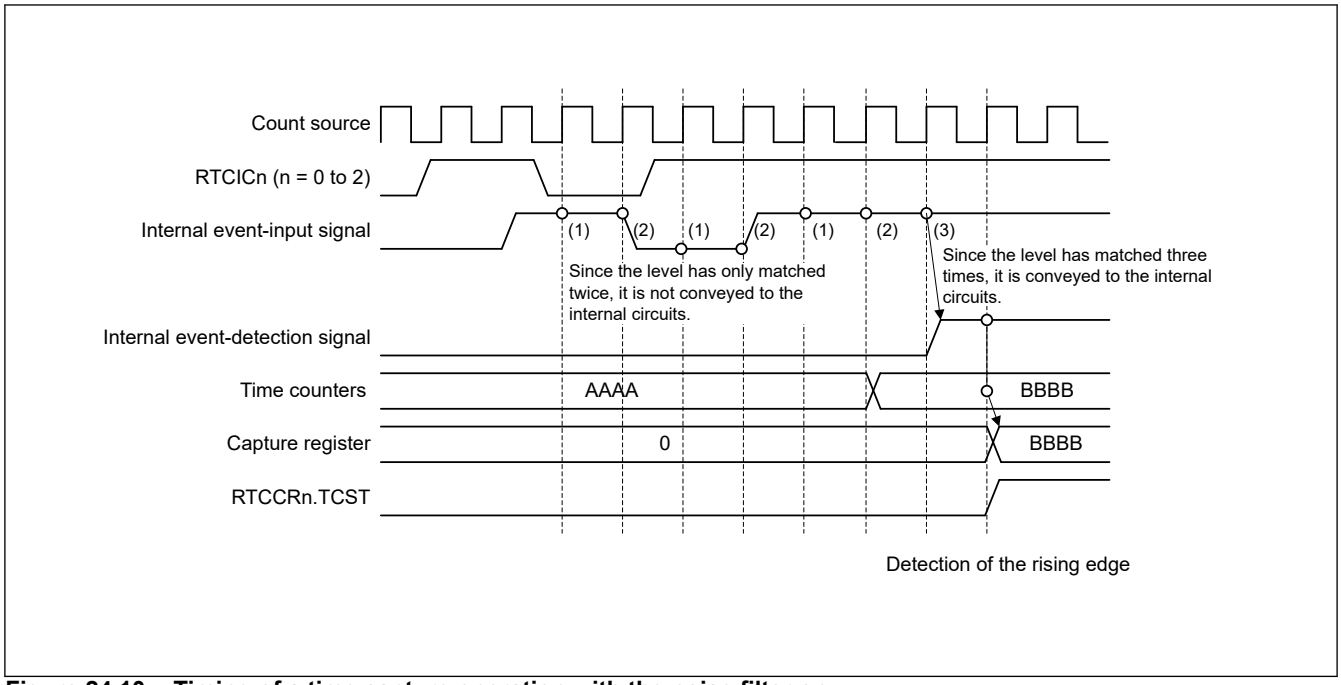

Figure 24.10 Timing of a time capture operation with the noise filter on

24.4 Interrupt Sources

The RTC has three interrupt sources, as listed in Table 24.3.

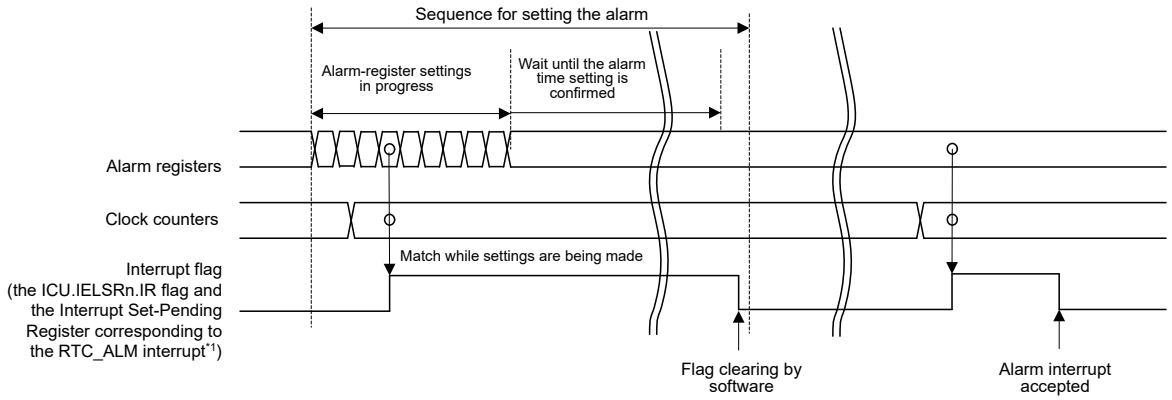
Table 24.3 RTC interrupt sources

Name	Interrupt source
RTC_ALM	Alarm interrupt
RTC_PRD	Periodic interrupt
RTC_CUP	Carry interrupt

(1) Alarm interrupt (RTC_ALM)

This interrupt is generated based on the comparison result between the alarm registers and RTC counters. For details, see section 24.3.6. Alarm Function.

Because there is a possibility that the interrupt flag might be set to 1 when the settings of the alarm registers match the clock counters, wait for the alarm time settings to be confirmed and clear the IELSRn.IR flag and the interrupt Set-Pending Register associated with the RTC_ALM interrupt to 0 again after modifying values of the alarm registers. After the interrupt flag for the alarm interrupt is set to 1 and the state is returned to mismatching of the alarm registers and clock counters, the flag is not 1 again until there is another match or the values of the alarm registers are modified again.



Note 1. See section 13, Interrupt Controller Unit (ICU) for details on the associated interrupt vector number.

Figure 24.11 Timing for the alarm interrupt (RTC_ALM)

(2) Periodic interrupt (RTC_PRD)

This interrupt is generated at intervals of 2 seconds, 1 second, 1/2 second, 1/4 second, 1/8 second, 1/16 second, 1/32 second, 1/64 second, 1/128 second, or 1/256 second. The interrupt interval can be selected in the RCR1.PES[3:0] bits.

(3) Carry interrupt (RTC_CUP)

This interrupt is generated when a carry to the second counter/binary counter 0 occurred or a carry to the R64CNT counter occurred during read access to the 64-Hz counter.

Figure 24.12 shows the timing of the carry interrupt (RTC_CUP).

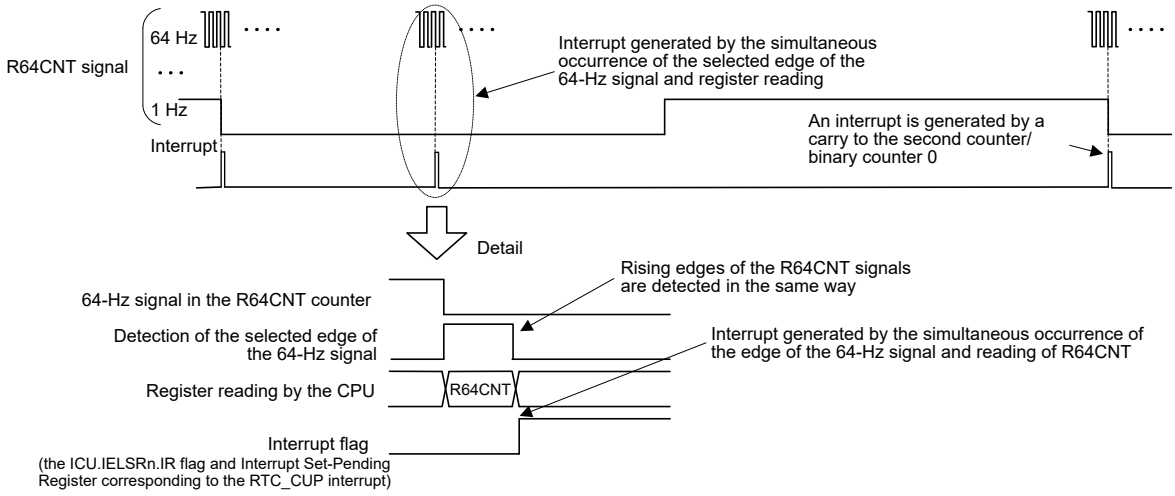


Figure 24.12 Timing for the carry interrupt (RTC_CUP)

24.5 Event Link Output

The RTC generates periodic event output (RTC_PRD) event signal for the ELC that can be used to initiate operations by other modules selected in advance.

The periodic event signal is output at the interval selected from 1/256, 1/128, 1/64, 1/32, 1/16, 1/8, 1/4, 1/2, 1, and 2 seconds by setting the RCR1.PES[3:0] bits.

The event generation period immediately after the event generation is selected is not guaranteed.

Note: If event linking from the RTC is used, only set the ELC after setting the RTC, for example initialization and time settings. Setting the RTC after the ELC can lead to output of unexpected event signals.

24.5.1 Interrupt Handling and Event Linking

The RTC has a bit to enable or disable periodic interrupts. An interrupt request signal is output to the CPU when an interrupt source is generated while the associated enable bit is enabled.

In contrast, an event link output signal is sent to other modules as an event signal through the ELC when an interrupt source is generated, regardless of the setting of the associated interrupt enable bit.

Note: Although alarm and periodic interrupts can still be output during Software Standby or Deep Software Standby mode, the periodic event signals for the ELC are not output.

24.6 Usage Notes

24.6.1 Register Writing during Counting

The following registers should not be written to during counting, that is, while the RCR2.START bit is 1:

- RSECCNT/BCNT0
- RMINCNT/BCNT1
- RHRCNT/BCNT2
- RDAYCNT
- RWKCNT/BCNT3
- RMONCNT
- RYRCNT
- RCR1.RTCOS
- RCR2.RTCOE
- RCR2.HR24
- RFRL

The counter should be stopped before writing to any of these registers.

24.6.2 Use of Periodic Interrupts

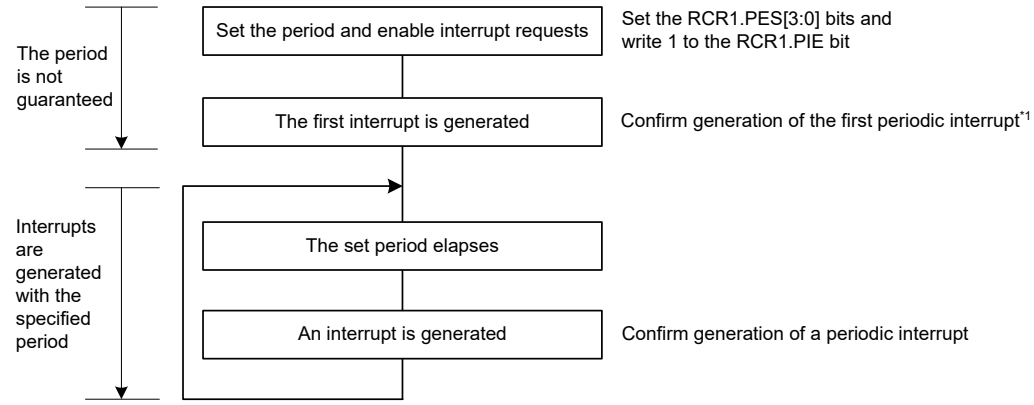
Figure 24.13 shows the procedure for using periodic interrupts.

The generation and period of the periodic interrupt can be changed by setting the RCR1.PES[3:0] bits. However, because the prescaler R64CNT and RSECCNT/BCNT0 are used to generate interrupts, the interrupt period is not guaranteed immediately after setting the RCR1.PES[3:0] bits.

In addition, any of the following operation can affect the interrupt period:

- Stopping/restarting or resetting counter operation
- Reset by RTC software
- 30-second adjustment by changing the RCR2 value

When the time error adjustment function is used, the interrupt generation period after adjustment is added or subtracted based on the adjustment value.



Note 1. When an interrupt generation period changes while the periodic interrupt is used, an interrupt might be generated at the completion of the setting. If the interrupt is generated immediately after the setting, the period is not guaranteed for two interrupts including the current interrupt.

Figure 24.13 Using the periodic interrupt function

24.6.3 RTCOUT (1-Hz/64-Hz) Clock Output

Stopping/restarting or resetting counter operation, reset by RTC software, and the 30-second adjustment by changing the RCR2 value affects the period of RTCOUT (1-Hz/64-Hz) output. When the time error adjustment function is used, the period of RTCOUT (1-Hz/64-Hz) output after adjustment is added or subtracted based on the adjustment value.

24.6.4 Transitions to Low Power Modes after Setting Registers

A transition to a low power state (Software Standby mode, Deep Software Standby mode, or battery backup state) during a write to an RTC register might corrupt the value of the register. After setting the register, confirm that the setting is in place before initiating a transition to a low power state.

24.6.5 Notes on Writing to and Reading from Registers

- When reading a counter register such as the second counter after writing to the counter register, follow the procedure in section 24.3.5. Reading 64-Hz Counter and Time.
- The value written to the count registers, alarm registers, year alarm enable register, bits RCR2.AADJE, AADJP, and HR24, RCR4 register, or frequency register is reflected when fourth read operations are performed after writing.
- The values written to the RCR1.CIE, RCR1.RTCOS, and RCR2.RTCOE bits can be read immediately after writing.
- To read the value from the timer counter after returning from a reset or a period in Software Standby mode, Deep Software Standby mode, or battery backup state, wait for 1/128 second while the clock is operating (RCR2.START bit = 1).
- After a reset is generated, write to the RTC register after 6 cycles of the count source clock have elapsed.

24.6.6 Changing the Count Mode

When changing the count mode (calendar count mode/binary count mode), set the RCR2.START bit to 0, stop the counting operation, then start it again from the initial setting. For details on the initial setting, see section 24.3.1. Outline of Initial Settings of Registers after Power On.

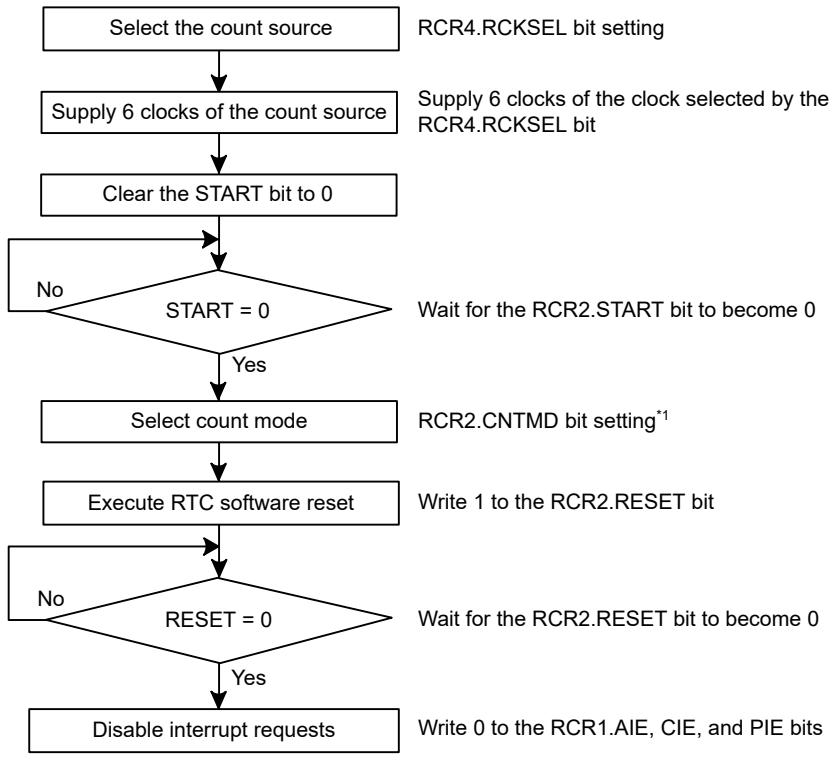
24.6.7 Initialization Procedure When the RTC Is Not to Be Used

Registers in the RTC are not initialized by a reset. Depending on the initial state, the generation of an unintentional interrupt request or operation of the counter might lead to increased power consumption.

For applications that do not require a realtime clock, initialize the registers by following the initialization procedure shown in Figure 24.14.

Alternatively, when the sub-clock oscillator is not used as the system clock source, realtime clock, operating clock of each peripheral modules or FLL function of HOCO, the counter can be stopped by writing 0 (sub-clock oscillator is selected) to the RCR4.RCKSEL bit and stopping the sub-clock oscillator. To stop the sub-clock oscillator, write 1 to the SOSCCR.SOSTP bit.

For details on the setting of the SOSCCR.SOSTP bit, see section 8, Clock Generation Circuit.



Note 1. This step is not necessary if the count mode is concurrently set by setting the START bit to 0.

Figure 24.14 Initialization procedure

24.6.8 When Switching Source Clock

When switching a clock source by changing SCKSCR.CKSEL[2:0], the clock output from the selector stops for 4 cycles of the switched clock. If the RTC periodical interrupt or RTC periodical event output was generated at this time, the interrupt or event is invalid.

24.6.9 When writing to the RTC registers

If VCC voltage of the MCU is lower than 1.8V and write access to the RTC registers is performed, read access should be performed at least once after one write access is performed, or for the consecutive write access, leave an interval of 167ns for each access.

25. Watchdog Timer (WDT)

25.1 Overview

The Watchdog Timer (WDT) is a 14-bit down counter that can be used to reset the MCU when the counter underflows because the system has run out of control and is unable to refresh the WDT. In addition, the WDT can be used to generate a non-maskable interrupt or an underflow interrupt.

Table 25.1 lists the WDT specifications and Figure 25.1 shows a block diagram.

Table 25.1 WDT specifications

Parameter	Specifications
Count source*1	Peripheral clock (PCLKB)
Clock division ratio	Division by 4, 64, 128, 512, 2048, or 8192
Counter operation	Counting down using a 14-bit down-counter
Condition for starting the counter	• Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs • Register start mode: Counting is started with a refresh by writing to the WDTRR register • Only secure developer can select Auto-start mode or Register-start mode
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values) • A counter underflows or a refresh error is generated
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods)
Watchdog timer reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the WDTSR register
Event link function (output)	• Down-counter underflow event output • Refresh error event output
Output signal (internal signal)	• Reset output • Interrupt request output • CPU Sleep mode or CPU Deep Sleep mode count stop control output
TrustZone Filter	Security and Privilege attribution can be set

Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≥ 4 × (the frequency of the count clock source after division).

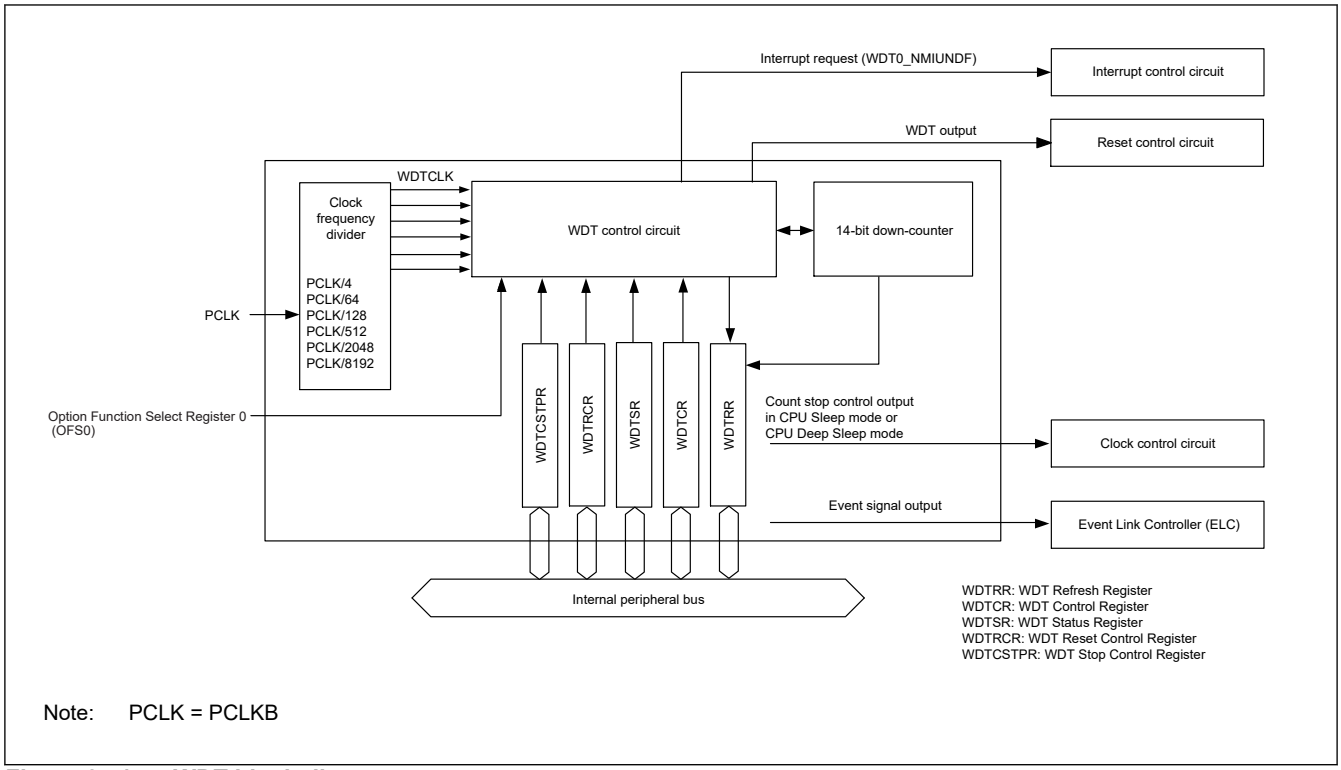


Figure 25.1 WDT block diagram

25.2 Register Descriptions

25.2.1 WDTRR : WDT Refresh Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x00

Bit position:	7							0
Bit field:								
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	n/a	The down-counter is refreshed by writing 0x00 and then writing 0xFF to this register.	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTRR register refreshes the down-counter of the WDT.

The down-counter of the WDT is refreshed by writing 0x00 and then writing 0xFF to WDTRR register (refresh operation) within the refresh-permitted period.

After the down-counter is refreshed, it starts counting down from the value selected by setting the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]) in the Option Function Select Register 0 in auto start mode. In register start mode, counting down starts from the value selected by setting the Timeout Period Select bits (WDTCR.TOPS[1:0]) in the WDT Control Register.

When 0x00 is written, the read value is 0x00. When a value other than 0x00 is written, the read value is 0xFF. For details of the refresh operation, see section 25.3.3. Refresh Operation.

25.2.2 WDTCR : WDT Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x02

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RPSS[1:0]		—	—	RPES[1:0]		CKS[3:0]				—	—	TOPS[1:0]	
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
1:0	TOPS[1:0]	Timeout Period Select 0 0: 1024 cycles (0x03FF) 0 1: 4096 cycles (0x0FFF) 1 0: 8192 cycles (0x1FFF) 1 1: 16384 cycles (0x3FFF)	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
7:4	CKS[3:0]	Clock Division Ratio Select 0 0 0 1: PCLKB/4 0 1 0 0: PCLKB/64 1 1 1 1: PCLKB/128 0 1 1 0: PCLKB/512 0 1 1 1: PCLKB/2048 1 0 0 0: PCLKB/8192 Others: Setting prohibited	R/W
9:8	RPES[1:0]	Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (do not specify window end position).	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	RPSS[1:0]	Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (do not specify window start position).	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTCR register is used to set the clock division ratio, and window start and end positions for refresh, and the timeout period until the down-counter underflows in register start mode.

Some constraints apply to writes to the WDTCR register. For details, see section 25.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the settings in the WDTCR register are disabled, and the settings in the Option Function Select Register 0 (OFS0) are enabled. The settings for the WDTCR register can also be made in the OFS0 register. For details, see section 25.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 1024, 4096, 8192, and 16384 cycles, taking the divided clock specified in the CKS[3:0] bits as 1 cycle. After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the number of PCLKB cycles until the counter underflows.

Table 25.2 lists the relationship between the CKS[3:0] and TOPS[1:0] bit settings, the timeout period, and the number of PCLKB cycles.

Table 25.2 Timeout period settings

CKS[3:0] bits	TOPS[1:0] bits	Clock division ratio	Timeout period (number of cycles)	PCLKB clock cycles
0x1	00b	PCLKB/4	1024	4096
	01b		4096	16384
	10b		8192	32768
	11b		16384	65536
0x4	00b	PCLKB/64	1024	65536
	01b		4096	262144
	10b		8192	524288
	11b		16384	1048576
0xF	00b	PCLKB/128	1024	131072
	01b		4096	524288
	10b		8192	1048576
	11b		16384	2097152
0x6	00b	PCLKB/512	1024	524288
	01b		4096	2097152
	10b		8192	4194304
	11b		16384	8388608
0x7	00b	PCLKB/2048	1024	2097152
	01b		4096	8388608
	10b		8192	16777216
	11b		16384	33554432
0x8	00b	PCLKB/8192	1024	8388608
	01b		4096	33554432
	10b		8192	67108864
	11b		16384	134217728

CKS[3:0] bits (Clock Division Ratio Select)

The CKS[3:0] bits specify the division ratio of the clock used for the down-counter. The division ratio can be selected from the PCLKB divided by 4, 64, 128, 512, 2048, and 8192. Combined with the TOPS[1:0] bit setting, this allows the WDT to be configured to a count period between 4096 and 134217728 PCLKB clock cycles.

RPES[1:0] bits (Window End Position Select)

The RPES[1:0] bits specify the window end position that indicates the refresh-permitted period. 75%, 50%, 25%, or 0% of the timeout period can be selected for the window end position. Set the window end position to a value less than the value for the window start position (window start position > window end position). If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

RPSS[1:0] bits (Window Start Position Select)

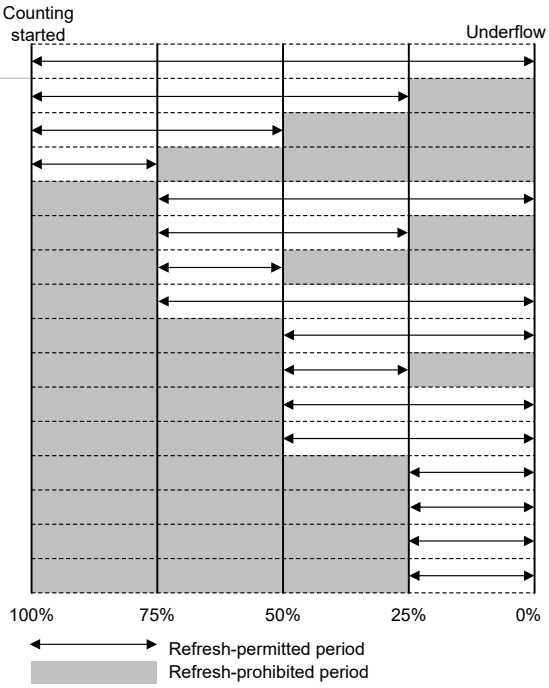
The RPSS[1:0] bits specify the window start position that indicates the refresh-permitted period. 100%, 75%, 50%, or 25% of the timeout period can be selected for the window start position. Set the window start position to a value greater than the value for the window end position. If the window start position is set to a value less than or equal to the window end position, the window start position setting is enabled and the window end position is set to 0%.

Table 25.3 lists the counter values for the window start and end positions, and Figure 25.2 shows the refresh-permitted period set in the RPSS[1:0], RPES[1:0], and TOPS[1:0] bits.

Table 25.3 Relationship between the timeout period and window start and end counter values

TOPS[1:0]	Timeout period		Window start and end counter value			
	Cycles	Counter value	100%	75%	50%	25%
00b	1024	0x03FF	0x03FF	0x02FF	0x01FF	0x00FF
01b	4096	0x0FFF	0x0FFF	0x0BFF	0x07FF	0x03FF
10b	8192	0x1FFF	0x1FFF	0x17FF	0x0FFF	0x07FF
11b	16384	0x3FFF	0x3FFF	0x2FFF	0x1FFF	0x0FFF

RPSS[1:0] bits		RPES[1:0] bits		Window	
b13	b12	b9	b8	Start (%)	End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75



Note: If window end position setting ≥ window start position setting, the window end position setting is set to 0%.

Figure 25.2 RPSS[1:0] and RPES[1:0] bits setting and refresh-permitted period

25.2.3 WDTSR : WDT Status Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x04

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	REFEF	UNDF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CNTVAL[13:0]	Down-Counter Value Value counted by the down-counter	R
14	UNDFF	Underflow Flag 0: No underflow occurred 1: Underflow occurred	R/W*1

Bit	Symbol	Function	R/W
15	REFEF	Refresh Error Flag 0: No refresh error occurred 1: Refresh error occurred	R/W*1

Note: S-TYPE-3, P-TYPE-3
Note 1. Only 0 can be written to clear the flag.

The WDTSR register indicates the counter value of the down-counter and the status of whether an underflow or refresh error occurred in the down-counter.

CNTVAL[13:0] bits (Down-Counter Value)

Read the CNTVAL[13:0] bits to confirm the value of the down-counter. The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the counter. A value of 1 indicates that the down counter underflowed. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the UNDFF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after an underflow. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error occurred, indicating that a refresh operation was performed during a prohibited period. A value of 1 indicates that a refresh error occurred. Write 0 to the flag to set the value to 0. Writing 1 has no effect.

Clearing of the REFEF flag takes (N+1) PCLKB cycles. In addition, clearing of the flag is ignored for (N+1) PCLKB cycles after a refresh error. N is specified in the WDTCR.CKS[3:0] bits as follows:

- When WDTCR.CKS[3:0] = 0x1, N = 4
- When WDTCR.CKS[3:0] = 0x4, N = 64
- When WDTCR.CKS[3:0] = 0xF, N = 128
- When WDTCR.CKS[3:0] = 0x6, N = 512
- When WDTCR.CKS[3:0] = 0x7, N = 2048
- When WDTCR.CKS[3:0] = 0x8, N = 8192

25.2.4 WDTRCR : WDT Reset Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x06

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	RSTIRQS	WDT Behavior Selection 0: Interrupt 1: Reset	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTRCR register controls reset output by a WDT down-counter underflow or interrupt request output.

Some constraints apply to writes to the WDTRCR register. For details, see section 25.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTRCR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTRCR register can also be made for the OFS0 register. For details, see section 25.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

25.2.5 WDTCSTPR : WDT Count Stop Control Register

Base address: WDT0 = 0x4020_2600
WDT0_NS = 0x5020_2600

Offset address: 0x08

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	SLCSTP	CPU Sleep-Mode Count Stop Control Register 0: Disable count stop 1: Stop count on transition to CPU Sleep mode or CPU Deep Sleep mode	R/W

Note: S-TYPE-3, P-TYPE-3

The WDTCSTPR register controls whether to stop the WDT counter in CPU Sleep mode or CPU Deep Sleep mode. Some constraints apply to writes to the WDTCSTPR register. For details, see section 25.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.

In auto start mode, the WDTCSTPR register settings are disabled, and the settings in the Option Function Select register 0 (OFS0) are enabled. The settings for the WDTCSTPR register can also be made for the OFS0 register. For details, see section 25.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

SLCSTP bit (CPU Sleep-Mode Count Stop Control Register)

The SLCSTP bit selects whether to stop counting on transition to CPU Sleep mode or CPU Deep Sleep mode.

25.2.6 Option Function Select Register 0 (OFS0)

For information on the OFS0 register, see section 25.3.8. Association between Option Function Select Register 0 (OFS0) and WDT Registers.

25.3 Operation

25.3.1 Count Operation in each Start Mode

The WDT has two start modes:

- Auto start mode, in which counting automatically starts after a release from the reset state
- Register start mode, in which counting starts with a refresh by writing to the register.

In auto start mode, counting automatically starts after a release from the reset state according to the settings in the Option Function Select register 0 (OFS0) in the flash.

In register start mode, counting starts with a refresh by writing to the WDTRR register after the respective registers are set after a release from the reset state.

Select auto start mode or register start mode by setting the WDT Start Mode Select bit (OFS0.WDTSTRT) in the OFS0 register.

When the auto start mode is selected, the settings in the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled while the settings in the OFS0 register are enabled.

When the register start mode is selected, the setting for the OFS0 register is disabled while the settings for the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

25.3.1.1 Register start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) is 1, register start mode is selected, the OFS0 register setting is invalid, and the WDT control register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are enabled.

After the reset state is released, set the following:

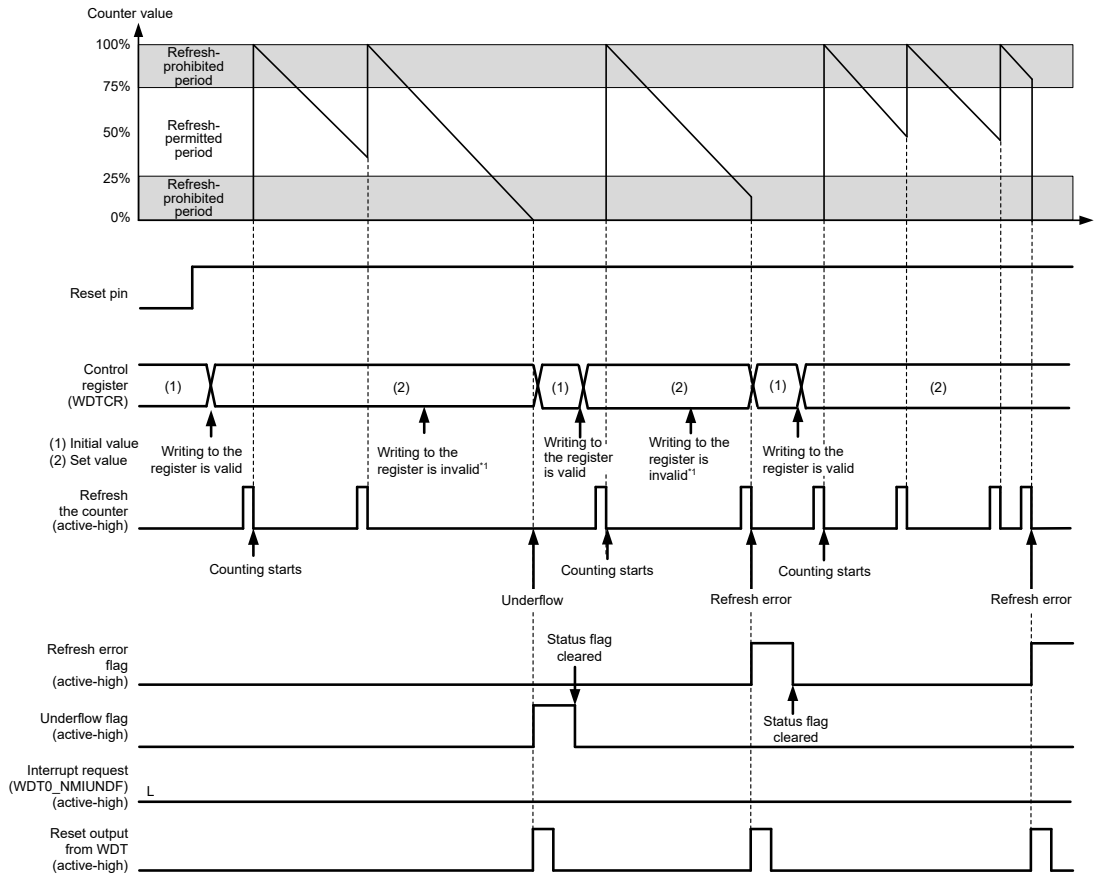
- Clock division ratio in the WDTCR register
- Window start and end positions in the WDTCR register
- Timeout period in the WDTCR register
- Reset output or interrupt request output in the WDTRCR register
- Counter stop control during transitions to CPU Sleep mode or CPU Deep Sleep mode in the WDTCSTPR register

The WDT refresh register (WDTRR) refreshes the down counter. As a result, the downcount starts at the value set by the timeout period selection bit (WDTCR.TOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request as long as counting continues. However, if the down-counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the WDT outputs the reset signal or a non-maskable interrupt request/interrupt request (WDT0_NMIUNDF). Reset output or interrupt request output can be selected in the WDT Reset Interrupt Request Select bit (WDTRCR.RSTIRQS). The interrupt enabled for operating the NMI can be selected in the WDT Underflow/Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 25.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.WDTSTRT = 1)
- WDT reset interrupt request selection (WDTRCR.RSTIRQS = 1)
- The window start position is 75% (WDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (WDTCR.RPES[1:0] = 10b)



Note: Refreshing the counter requires up to 4 count signal cycles from refresh request to execution.
Note 1. See section 25.3.2. Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers.
Reset pin = RES

Figure 25.3 Operation example in register start mode

25.3.1.2 Auto start mode

When the WDT Start Mode Select bit (OFS0.WDTSTRT) in the Option Function Select Register 0 (OFS0) is 0, auto start mode is selected, the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), and WDT Count Stop Control Register (WDTCSTPR) are disabled, and the settings in the OFS0 register are enabled.

Within the reset state, the setting values for the following in the Option Function Select Register 0 (OFS0) are set in the WDT registers:

- Clock division ratio
- Window start and end positions
- Timeout period
- Reset output or interrupt request
- Counter stop control during transition to CPU Sleep mode or CPU Deep Sleep mode

When the reset state is released, the down-counter automatically starts counting down from the value set in the WDT Timeout Period Select bits (OFS0.WDTTOPS[1:0]).

Thereafter, as long as the counter is refreshed in the refresh-permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The WDT does not output the reset signal or non-maskable interrupt request/interrupt request (WDT0_NMIUNDF) as long as the counting continues. However, if the down-counter underflows

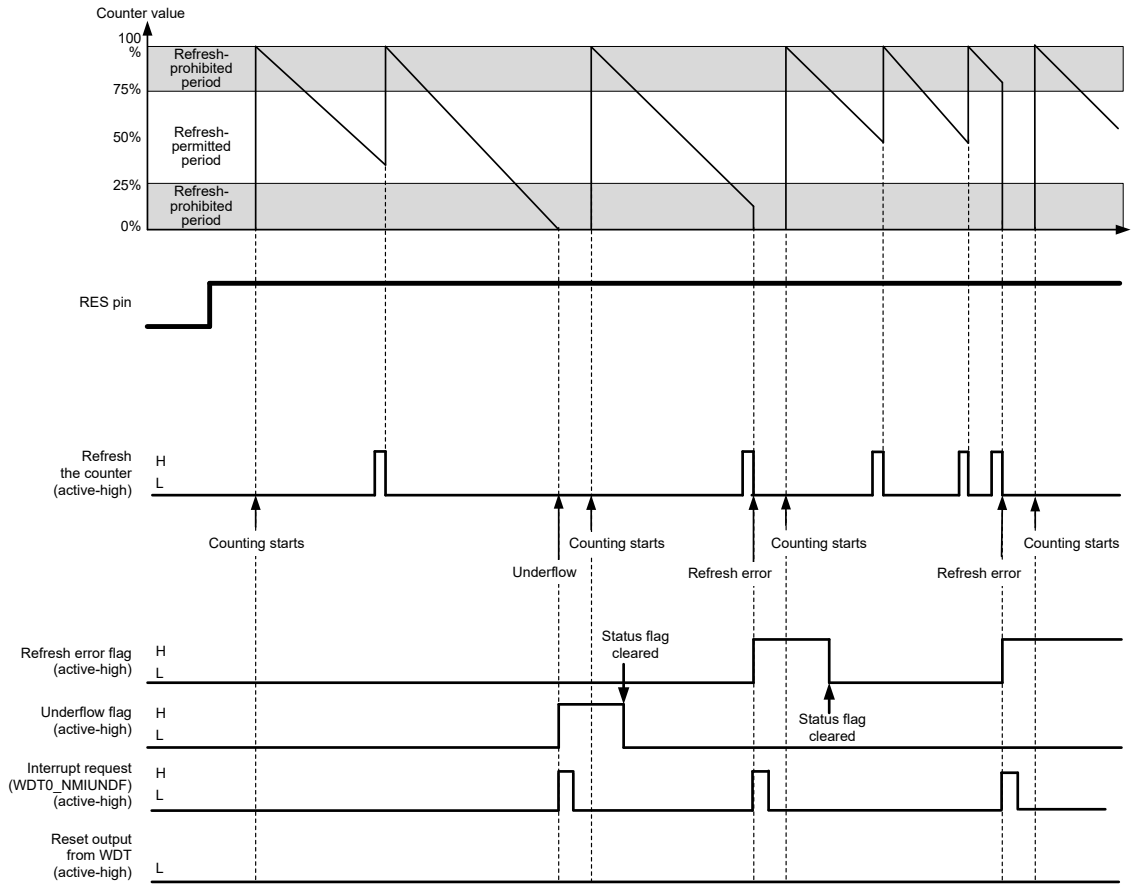
because refreshing of the down-counter is not possible due to a runaway program or if a refresh error occurs due to refreshing outside the refresh-permitted period, the WDT outputs the reset signal or non-maskable interrupt request/interrupt request (WDT0_NMIUNDF).

After the reset signal or non-maskable interrupt request/interrupt request is generated, the counter reloads the timeout period after counting for 1 cycle. The value of the timeout period is set in the down-counter and counting restarts.

Reset output or interrupt request output can be selected by setting the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS). Non-maskable interrupt request or interrupt request can be selected in the WDT Underflow/ Refresh Error Interrupt Enable bit (NMIER.WDTEN).

Figure 25.4 shows an example of operation (non-maskable interrupt) under the following conditions:

- Auto start mode (OFS0.WDTSTRT = 0)
- WDT behavior selection: interrupt (OFS0.WDTRSTIRQS = 0)
- Non-maskable Interrupt: WDT Underflow/Refresh Error Interrupt Enabled (NMIER.WDTEN = 1)
- The window start position is 75% (OFS0.WDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.WDTRPES[1:0] = 10b)



Note: Refreshing the counter requires up to 4 count signal cycles from refresh request to execution.
Note: Reset pin = RES

Figure 25.4 Operation example in auto start mode

25.3.2 Controlling Writes to the WDTCR, WDTRCR, and WDTCSTPR Registers

Writing to the WDT Control Register (WDTCR), WDT Reset Control Register (WDTRCR), or WDT Count Stop Control Register (WDTCSTPR) is possible once each between the release from the reset state and the first refresh operation.

After a refresh (counting starts) or a write to WDTCR, WDTRCR or WDTCSTPR register, the protection signal in the WDT becomes 1 to protect WDTCR, WDTRCR and WDTCSTPR register against subsequent write attempts. This protection is released by the reset source of the WDT. With other reset sources, the protection is not released.

Figure 25.5 shows control waveforms produced in response to writing to the WDTCR.

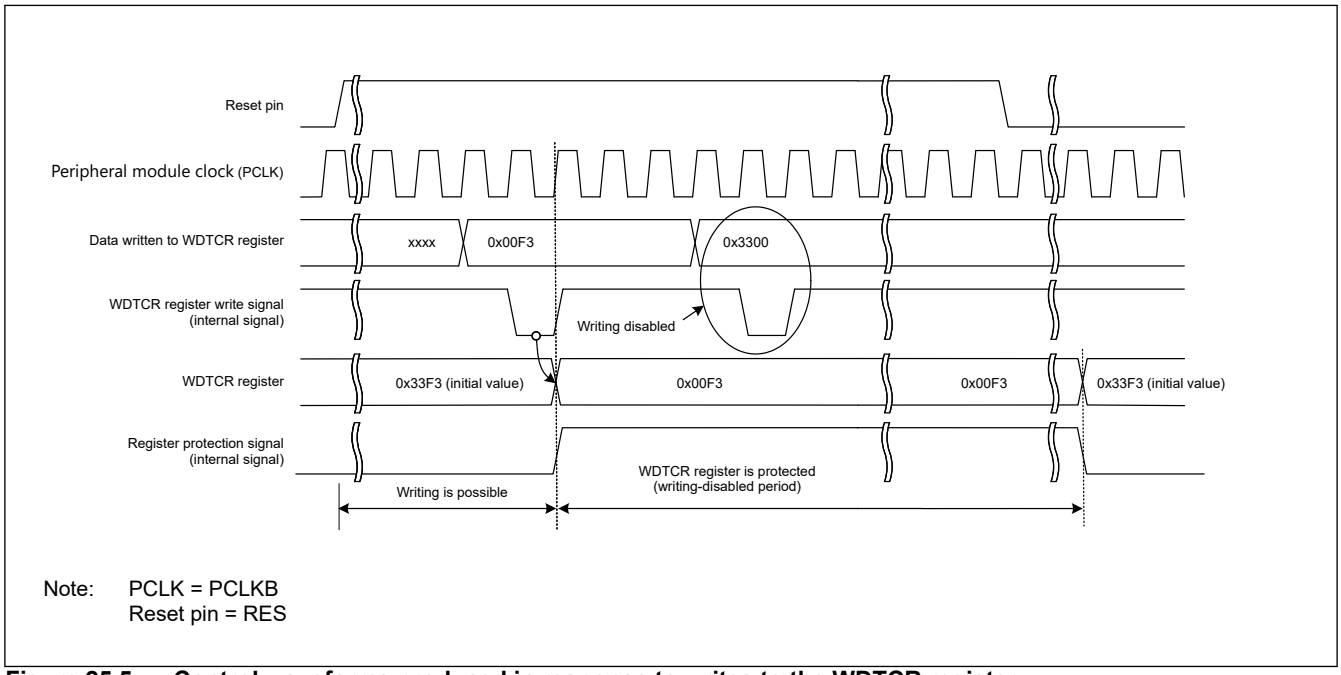


Figure 25.5 Control waveforms produced in response to writes to the WDTCR register

25.3.3 Refresh Operation

To refresh the down counter and start the counting operation, write to the WDT Refresh Register (WDTRR) in the order of values from 0x00 to 0xFF. If a value other than 0xFF is written after 0x00, the down-counter is not refreshed. If an invalid value is written, refreshing is performed normally by writing to the WDTRR register in the order of values from 0x00 to 0xFF.

Correct refreshing is also performed when a register other than WDTRR is accessed or WDTRR is read between writing 0x00 and writing 0xFF to WDTRR. Writes to refresh the counter must be made within the refresh-permitted period, and this is determined by the 0xFF write. For this reason, correct refreshing is performed even when 0x00 is written outside the refresh-permitted period.

[Example write sequences that are valid for refreshing the counter]

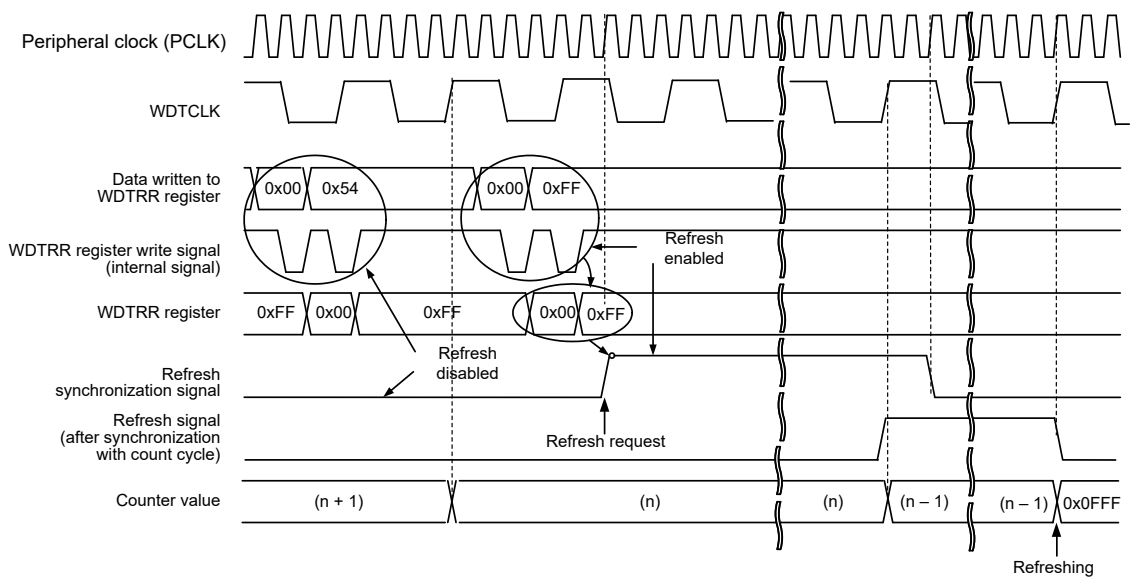
- 0x00 → 0xFF
- 0x00 ((n–1)th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from WDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF
- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

After 0xFF is written to the WDT Refresh Register (WDTRR), refreshing the down-counter requires up to 4 cycles of the signal for counting. To meet this requirement, complete writing 0xFF to WDTRR 4 count cycles before the down-counter underflows.

Figure 25.6 shows the WDT refresh-operation waveforms when the clock division ratio is PCLKB/64.



Note: PCLK = PCLKB

Figure 25.6 WDT refresh operation waveforms when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

Note: When setting the refresh time, consider the oscillation accuracy of the clock sources of the PCLKB and WDTCLK. Set values which ensure that refreshing is possible even when the frequency varies in the range of error of the oscillation accuracy.

25.3.4 Status Flags

The refresh error (WDTSR.REFEF) and underflow (WDTSR.UNDFF) flags retain the source of the interrupt request from the WDT. After a release from the interrupt request generation, read the WDTSR.REFEF and WDTSR.UNDFF flags to check for the interrupt source. For each flag, writing 0 clears the bit. Writing 1 has no effect. Leaving the status flags unchanged does not affect operation. If the flags are not cleared at the next interrupt request from the WDT, the earlier interrupt source is cleared and the new interrupt source is written. For the time period between when 0 is written in each flag and when its value is reflected, see section 25.2.3. WDTSR : WDT Status Register.

25.3.5 Reset Output

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 1 in register start mode, or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 1 in auto start mode, a reset signal is output for 1 cycle count when an underflow in the down-counter or a refresh error occurs.

In register start mode, the down-counter is initialized (all bits set to 0) and stopped in that state after output of a reset signal. After the reset state is released and the program is restarted, the counter is set up again and counting down starts again with a refresh. In auto start mode, counting down starts automatically after the reset state is released.

25.3.6 Interrupt Sources

When the Reset Interrupt Select bit (WDTRCR.RSTIRQS) is set to 0 in register start mode or when the WDT Reset Interrupt Request Select bit (OFS0.WDTRSTIRQS) in the Option Function Select Register 0 (OFS0) is set to 0 in auto start mode, an interrupt (WDT0_NMIUNDF) signal is generated when an underflow in the counter or a refresh error occurs. This interrupt can be used as a non-maskable interrupt or an interrupt. For details, see section 13, Interrupt Controller Unit (ICU).

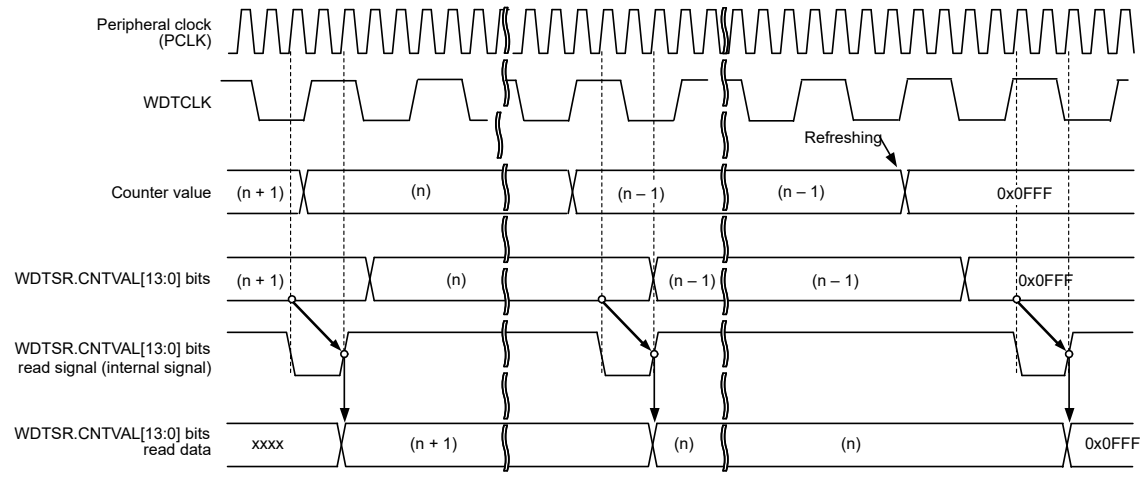
Table 25.4 WDT interrupt source

Name	Interrupt source	Interrupt to CPU	Start DMAC or DTC
WDT0_NMIUNDF	• Down-counter underflow • Refresh error	Possible	Not possible

25.3.7 Reading the Down-Counter Value

The WDT stores the counter value in the down-counter value bits (WDTSR.CNTVAL[13:0]) of the WDT Status Register. Check these bits to obtain the counter value. The read value of the down-counter might differ from the actual count by one.

Figure 25.7 shows the processing for reading the WDT down-counter value when the clock division ratio is PCLKB/64.



Note: PCLK = PCLKB

Figure 25.7 Processing for reading WDT down-counter value when WDTCR.CKS[3:0] = 0x4 and WDTCR.TOPS[1:0] = 01b

25.3.8 Association between Option Function Select Register 0 (OFS0) and WDT Registers

Table 25.5 lists the association between the Option Function Select Register 0 (OFS0) used in auto start mode, and the registers used in register start mode. For details on the Option Function Select Register 0 (OFS0), see section 6.2.1. OFS0 : Option Function Select Register 0.

Table 25.5 Association between Option Function Select Register 0 (OFS0) and the WDT registers

Control target	Function	OFS0 register (enabled in auto start mode) OFS0.WDTSTRT = 0	WDT registers (enabled in register start mode) OFS0.WDTSTRT = 1
Down-counter	Timeout period selection	OFS0.WDTTOPS[1:0]	WDTCR.TOPS[1:0]
	Clock division ratio selection	OFS0.WDTCKS[3:0]	WDTCR.CKS[3:0]
	Window start position selection	OFS0.WDTRPSS[1:0]	WDTCR.RPSS[1:0]
	Window end position selection	OFS0.WDTRPES[1:0]	WDTCR.RPES[1:0]
Reset output or interrupt request output	Select a reset interrupt request	OFS0.WDTRSTIRQS	WDTRCR.RSTIRQS
Count stop	CPU Sleep mode or CPU Deep Sleep mode count stop control	OFS0.WDTSTPCTL	WDTCSTPR.SLCSTP

25.4 Output to the Event Link Controller (ELC)

The WDT is capable of a link operation for the previously specified module when interrupt request signal is used as an event signal by the ELC. The event signal is output by the counter underflow and refresh error. An event signal is output regardless of the setting of the Reset Interrupt Request Select bit (WDTRCR.RSTIRQS) in register start mode or auto start mode. An event signal can also be output when the next interrupt source is generated while the Refresh Error flag (WDTSR.REFEF) or Underflow flag (WDTSR.UNDFF) is 1. For details, see section 18, Event Link Controller (ELC).

25.5 Usage Notes

25.5.1 ICU Event Link Setting Register n (IELSRn) Setting

Setting 0x53 to ICU Event Link Setting Register n (ICU.IELSRn) is prohibited when WDT reset interrupt request selection resets (OFS0.WDTRSTIRQS = 0 or WDTRCR.RSTIRQS = 0) or when enabling event link operation (ELSRn.ELS[8:0] = 0x53).

26. Independent Watchdog Timer (IWDT)

26.1 Overview

The Independent Watchdog Timer (IWDT) consists of a 14-bit down counter that must be serviced periodically to prevent counter underflow. The IWDT provides functionality to reset the MCU or to generate a non-maskable interrupt or an underflow interrupt. Because the timer operates with an independent clock from CPU clock (CPUCLK) and System clock (ICLK), it is particularly useful in returning the MCU to a known state as a fail-safe mechanism when the system runs out of control. The IWDT can be triggered automatically by a reset, underflow, refresh error, or a refresh of the count value in the registers.

The IWDT functions differ from those of the WDT in the following respects:

The divided IWDT clock (IWDTCLK) is used as the count source (not affected by PCLKB)

Table 26.1 lists the IWDT specifications.

Table 26.1 IWDT specifications

Parameter	Specifications
Count source*1	IWDT clock (IWDTCLK)
Clock division ratio	Division by 1, 16, 32, 64, 128, or 256
Counter operation	Counting down using a 14-bit down-counter
Conditions for starting the counter	• Auto start mode: Counting automatically starts after a reset or after an underflow or refresh error occurs. • Register start mode: Counting is started with a refresh by writing to the IWDTRR register. • Only secure developer can select Auto-start mode or Register-start mode.
Conditions for stopping the counter	• Reset (the down-counter and other registers return to their initial values). • A counter underflows or a refresh error is generated.
Window function	Window start and end positions can be specified (refresh-permitted and refresh-prohibited periods).
Independent watchdog timer reset sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Non-maskable interrupt/interrupt sources	• Down-counter underflows • Refreshing outside the refresh-permitted period (refresh error)
Reading of the counter value	The down-counter value can be read by the IWDTSR register.
Event link function (output)	• Down-counter underflow event output • Refresh error event output
Output signal (internal signal)	• Reset output • Interrupt request output • CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode and Deep Software Standby mode count stop control output.
Trust Zone Filter	Security and Privilege attribution can be set.

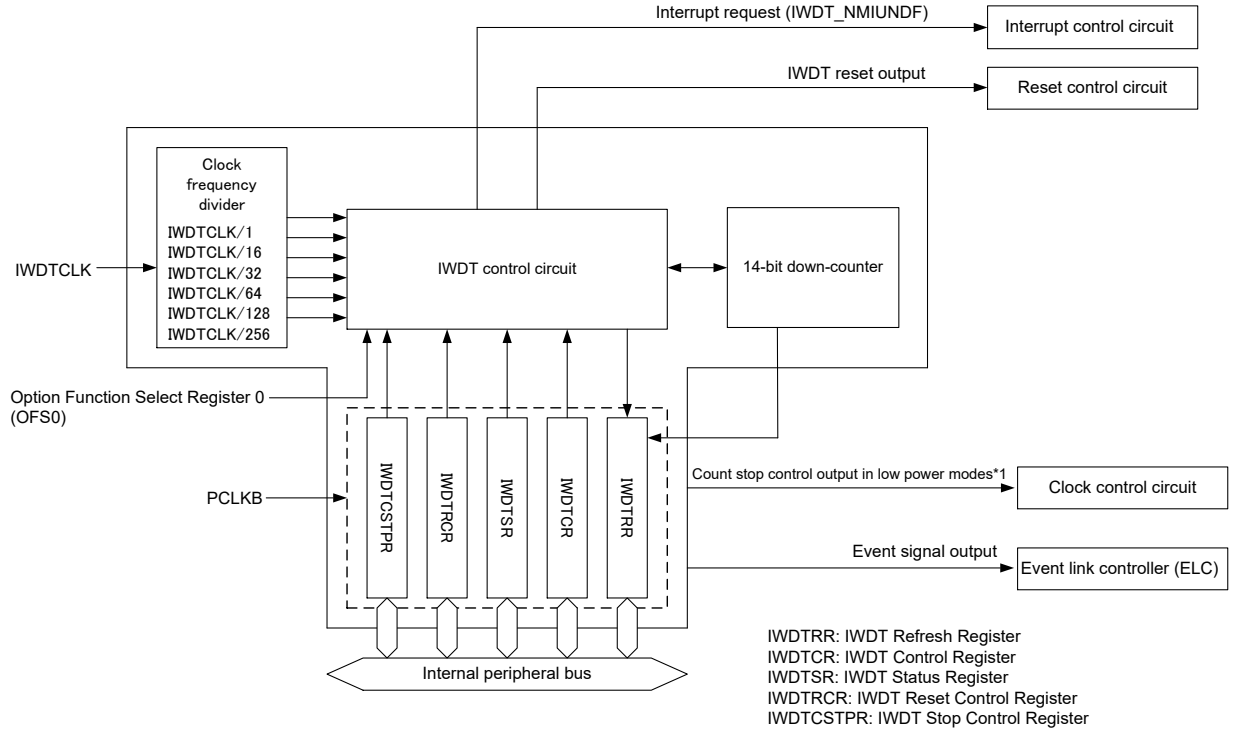
Note 1. Satisfy the frequency of the peripheral module clock (PCLKB) ≧ 4 × (the frequency of the count clock source after division). The bus interface and registers operate with PCLKB, and the 14-bit counter and control circuits operate with IWDTCLK.

26.1.1 Block diagram

In addition to the peripheral clock (PCLKB), an MCU needs the IWDT clock (IWDTCLK) that does not stop even in low power modes so that the MCU runs even in low power modes in which the peripheral clock (PCLKB) stops. The bus interface and registers operate with the peripheral clock (PCLKB), and the 14-bit down-counter and control circuits operate with the IWDT clock (IWDTCLK).

Signals are connected between the block operating with the peripheral clock (PCLKB) and the block operating with the IWDT clock (IWDTCLK) via a synchronization circuit.

Figure 26.1 shows a block diagram.



Note 1. Low power modes indicate CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, Deep Software Standby mode 1

Figure 26.1 IWDT block diagram

26.2 Register specifications

26.2.1 IWDTRR : IWDT Refresh Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x0

Bit position:	7	6	5	4	3	2	1	0
Bit field:	REFRESH[7:0]							
Value after reset:	1	1	1	1	1	1	1	1

Bit	Symbol	Function	R/W
7:0	REFRESH[7:0]	Refresh Register The counter is refreshed by writing 0x00 and then writing 0xFF to this register.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTRR register refreshes the down-counter of the IWDT.

REFRESH[7:0] bits (Refresh Register)

The down-counter of the IWDT is refreshed by writing 0x00 and then writing 0xFF to IWDTRR(refresh operation) within the refresh-permitted period. After the down-counter is refreshed, it starts counting down from the value selected by the IWDT time-out period selection bits (OFS0.IWDTTOPS[1:0]) in the auto start mode.

In the register start mode, counting down starts from the value set by the TOPS[1:0] bits in the IWDT Control Register (IWDTCR).

Also in the register start mode, counting down starts from the value set by the IWDTCR.TOPS[1:0] bits by the first refresh operation after the release from the reset state.

When 0x00 is written, the read value is always 0x00. When a value other than 0x00 is written, the read value is always 0xFF.

For details of the refresh operation, see section 26.3.3. Refresh operation.

26.2.2 IWDTCR : IWDT Control Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x2

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	RPSS[1:0]		—	—	RPES[1:0]		CKS[3:0]				—	—	TOPS[1:0]	
Value after reset:	0	0	1	1	0	0	1	1	1	1	1	1	0	0	1	1

Bit	Symbol	Function	R/W
1:0	TOPS[1:0]	Timeout Period Select 0 0: 128 cycles (0x007F) 0 1: 512 cycles (0x01FF) 1 0: 1024 cycles (0x03FF) 1 1: 2048 cycles (0x07FF) Each value in parentheses () denotes a start value of down-counting.	R/W
3:2	—	These bits are read as 0. The write value should be 0.	R/W
7:4	CKS[3:0]	Clock Division Ratio Select 0 0 0 0: IWDTCLK 0 0 1 0: IWDTCLK/16 0 0 1 1: IWDTCLK/32 0 1 0 0: IWDTCLK/64 1 1 1 1: IWDTCLK/128 0 1 0 1: IWDTCLK/256 Other settings are prohibited.	R/W
9:8	RPES[1:0]	Window End Position Select 0 0: 75% 0 1: 50% 1 0: 25% 1 1: 0% (No window end position setting)	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
13:12	RPSS[1:0]	Window Start Position Select 0 0: 25% 0 1: 50% 1 0: 75% 1 1: 100% (No window start position setting)	R/W
15:14	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTCR register is used to specify the timeout period (time until the down-counter underflows in the register start mode), clock division ratio, and the window start and end positions of refresh-permitted period. Some restrictions apply to writes to this register. For details, see section 26.3.2. Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSTPR registers.

In auto start mode, the settings of this register are disabled and the settings for the option function select register 0 (OFS0) are enabled. The same settings as in the bits in this register can be performed at the option function select register 0 (OFS0). For details, see section 26.3.8. Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

TOPS[1:0] bits (Timeout Period Select)

The TOPS[1:0] bits select the timeout period, the period until the down-counter underflows, from 128, 512, 1024, and 2048 cycles, taking the divided clock specified in the CKS[3:0] bits as one cycle.

After the down-counter is refreshed, the combination of the CKS[3:0] and TOPS[1:0] bits determines the time (number of IWDT clock (IWDTCLK) cycles) until the counter underflows.

section 26.2.2. IWDTCR : IWDT Control Register shows the relationship among the CKS[3:0] and TOPS[1:0] bits settings, the timeout period, and the number of IWDT clock (IWDTCLK) cycles.

Table 26.2 IWDT timeout period settings

CKS[3:0]				TOPS[1:0]		Clock division ratio	Timeout period (Number of cycles)	Number of IWDT clock (IWDTCLK) cycles
0	0	0	0	0	0	IWDTCLK	128	128
				0	1		512	512
				1	0		1024	1024
				1	1		2048	2048
0	0	1	0	0	0	IWDTCLK/16	128	2048
				0	1		512	8192
				1	0		1024	16384
				1	1		2048	32768
0	0	1	1	0	0	IWDTCLK/32	128	4096
				0	1		512	16384
				1	0		1024	32768
				1	1		2048	65536
0	1	0	0	0	0	IWDTCLK/64	128	8192
				0	1		512	32768
				1	0		1024	65536
				1	1		2048	131072
1	1	1	1	0	0	IWDTCLK/128	128	16384
				0	1		512	65536
				1	0		1024	131072
				1	1		2048	262144
0	1	0	1	0	0	IWDTCLK/256	128	32768
				0	1		512	131072
				1	0		1024	262144
				1	1		2048	524288

CKS[3:0] bits (Clock Division Ratio Select)

These bits select IWDT clock (IWDTCLK) division ratio from among division by 1, 16, 32, 64, 128, and 256.

Combined with the TOPS[1:0] bits setting, a count period between 128 and 524288 cycles of the IWDT clock (IWDTCLK) can be selected for the IWDT.

Note: In order to read the down-counter value correctly, the relationship between the peripheral clock (PCLKB) frequency and the count clock (IWDTCLK) frequency must be set appropriately. For the setting, see Note1 in Table 26.1

RPES[1:0] bits (Window End Position Select)

These bits select 75%, 50%, 25% or 0% of the count period for the window end position of the down-counter. The selected window end position should be a value smaller than the value for the window start position (that is, window start position > window end position). If the value for the window end position is greater than the value for the window start position, only the value for the window start position is effective.

The counter values for the window start and end positions selected by setting the RPES[1:0] and RPSS[1:0] bits change depending on the TOPS[1:0] bits setting.

Table 26.3 lists the counter values for the window start and end positions corresponding to TOPS[1:0] bits values.

Table 26.3 Relationship between timeout periods and window start and end counter values

TOPS[1:0]		Timeout period		Window start and end counter value			
		Number of cycles	Counter value	100%	75%	50%	25%
0	0	128	0x007F	0x007F	0x005F	0x003F	0x001F
0	1	512	0x01FF	0x01FF	0x017F	0x00FF	0x007F
1	0	1024	0x03FF	0x03FF	0x02FF	0x01FF	0x00FF
1	1	2048	0x07FF	0x07FF	0x05FF	0x03FF	0x01FF

RPSS[1:0] bits (Window Start Position Select)

These bits select a counter window start position from 100%, 75%, 50%, or 25% of the count period (100% when the count starts and 0% when the counter underflows). The interval between the window start position and window end position is the refresh-permitted period and the other periods are refresh-prohibited periods.

Figure 26.2 shows the relationship between the RPSS[1:0] and RPES[1:0] bits settings and the refresh-permitted and refresh-prohibited periods.

RPSS[1:0]		RPES[1:0]		Window Start (%)	Window End (%)
1	1	1	1	100	0
		1	0		25
		0	1		50
		0	0		75
1	0	1	1	75	0
		1	0		25
		0	1		50
		0	0		75
0	1	1	1	50	0
		1	0		25
		0	1		50
		0	0		75
0	0	1	1	25	0
		1	0		25
		0	1		50
		0	0		75

Note: If window end setting setting is set to 0%. window start setting, the window end

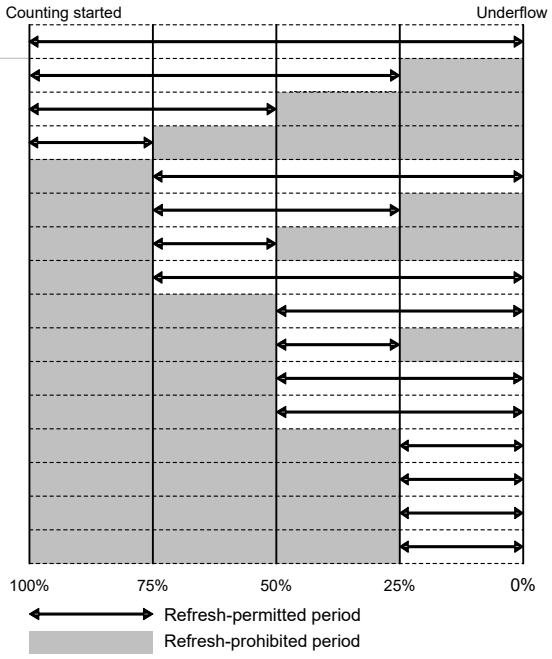


Figure 26.2 RPSS[1:0] and RPES[1:0] bits settings and refresh-permitted and refresh-prohibited periods

26.2.3 IWDTSR : IWDT Status Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x4

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	REFEF	UNDF	CNTVAL[13:0]													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
13:0	CNTVAL[13:0]	Down-Counter Value Counter value of the down-counter	R
14	UNDFF	Underflow Flag 0: No underflow occurred. 1: Underflow occurred.	R/W
15	REFEF	Refresh Error Flag 0: No refresh error occurred. 1: Refresh error occurred.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTSR register indicates the counter value of the down-counter and whether an underflow or refresh error occurred in the down-counter.

It is initialized by the reset source of the IWDT. IWDTSR is not initialized by other reset sources.

CNTVAL[13:0] bits (Down-Counter Value)

Read these bits to confirm the counter value of the down-counter.

Note: The read value might differ from the actual count by 1.

UNDFF flag (Underflow Flag)

Read the UNDFF flag to confirm whether an underflow occurred in the down-counter.

A value of 1 indicates that the down-counter underflowed. A value of 0 indicates that the down-counter has not underflowed.

Write 0 to the UNDFF flag to clear the value. Writing 1 has no effect.

REFEF flag (Refresh Error Flag)

Read the REFEF flag to confirm whether a refresh error (a refresh operation was performed during the prohibited period) occurred.

A value of 1 indicates that a refresh error occurred. A value of 0 indicates that no refresh error has occurred.

Write 0 to the REFEF flag to clear the value. Writing 1 has no effect.

26.2.4 IWDTRCR : IWDT Reset Control Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x6

Bit position:	7	6	5	4	3	2	1	0
Bit field:	RSTIRQS	—	—	—	—	—	—	—
Value after reset:	1	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
6:0	—	These bits are read as 0. The write value should be 0.	R/W
7	RSTIRQS	Reset Interrupt Request Select 0: Enable non-maskable interrupt requests or interrupt request output. 1: Enable reset output.	R/W

Note: S-TYPE-3, P-TYPE-3

IWDTRCR register controls the reset output or interrupt request output when the down-counter of the IWDT underflows. Some restrictions apply to writes to this register. For details, see section 26.3.2. Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSTPR registers.

In auto start mode, the settings of this register are disabled and the settings for the input ports (OFS0) are enabled. The same settings as in the bits in this register can be performed at the input ports (OFS0). For details, see section 26.3.8. Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

RSTIRQS bit (Reset Interrupt Request Select)

The RSTIRQS bit selects the reset output or interrupt request output when the down-counter underflows or a refresh error occurs.

26.2.5 IWDTCSTPR : IWDT Count Stop Control Register

Base address: IWDT = 0x4020_2200
IWDT_NS = 0x5020_2200

Offset address: 0x8

Bit position:	7	6	5	4	3	2	1	0
Bit field:	SLCSTP	—	—	—	—	—	—	—
Value after reset:	1	1	0	0	0	0	0	0

Bit	Symbol	Function	R/W
5:0	—	These bits are read as 0. The write value should be 0.	R/W
6	—	This bit is read as 1. The write value should be 1.	R/W
7	SLCSTP	CPU Sleep-Mode Count Stop Select 0: Disable count stop. 1: Stop the counter when the CPU enters CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode 1.	R/W

Note: S-TYPE-3, P-TYPE-3

The IWDTCSTPR register is used to stop the down-counter of the IWDT in case the CPU enters low-power modes. Some restrictions apply to writes to this register. For details, see section 26.3.2. Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSTPR registers.

In auto start mode, the settings of this register are disabled and the settings for the option function select register 0 (OFS0) are enabled. The same settings as in the bits in this register can be performed at the option function select register 0 (OFS0) . For details, see section 26.3.8. Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers.

SLCSTP bit (CPU Sleep-Mode Count Stop Select)

The SLCSTP bit selects whether to stop the counter in case the CPU enters CPU Sleep mode, CPU Deep Sleep mode, Software Standby mode, or Deep Software Standby mode 1.

26.3 Operation

26.3.1 Count operation in each start mode

The start mode of the IWDT is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit during a reset.

When the IWDT start mode selection (OFS0.IWDTSTRT) bit is 1 (register start mode), the IWDT Control Register (IWDTCR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSTPR) are enabled, and counting is started by writing to the IWDT Refresh Register (IWDTRR) to refresh the counter. When the IWDT start mode selection (OFS0.IWDTSTRT) bit is 0 (auto start mode), the settings of the option function select register 0 (OFS0) are enabled, and counting automatically starts after a reset.

(1) Register start mode

When the register start mode is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit to 1 during a reset, the IWDT Control Register (IWDTCR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSTPR) are enabled.

After the reset state is released, set the clock division ratio, window start and end positions, and timeout period in the IWDTCR register, the reset output or interrupt request output in the IWDTRCR register, and the IWDT down-counter stop control at transitions to low power modes in the IWDTCSTPR register. Then, refresh the down-counter to set the value specified by the IWDTCR.TOPS[1:0] bits in the counter and start counting down.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The IWDT does not output a reset signal as long as this continues.

However, if the down counter underflows because the down-counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or a non-maskable interrupt request (IWDT_NMIUNDF).

The reset output or interrupt request output is selected by setting the IWDTRCR.RSTIRQS bit.

Figure 26.3 shows an example of operation under the following conditions:

- Register start mode (OFS0.IWDTSTRT = 1)
- Reset output is enabled (IWDTRCR.RSTIRQS = 1)
- The window start position is 75% (IWDTCR.RPSS[1:0] = 10b)
- The window end position is 25% (IWDTCR.RPES[1:0] = 10b)

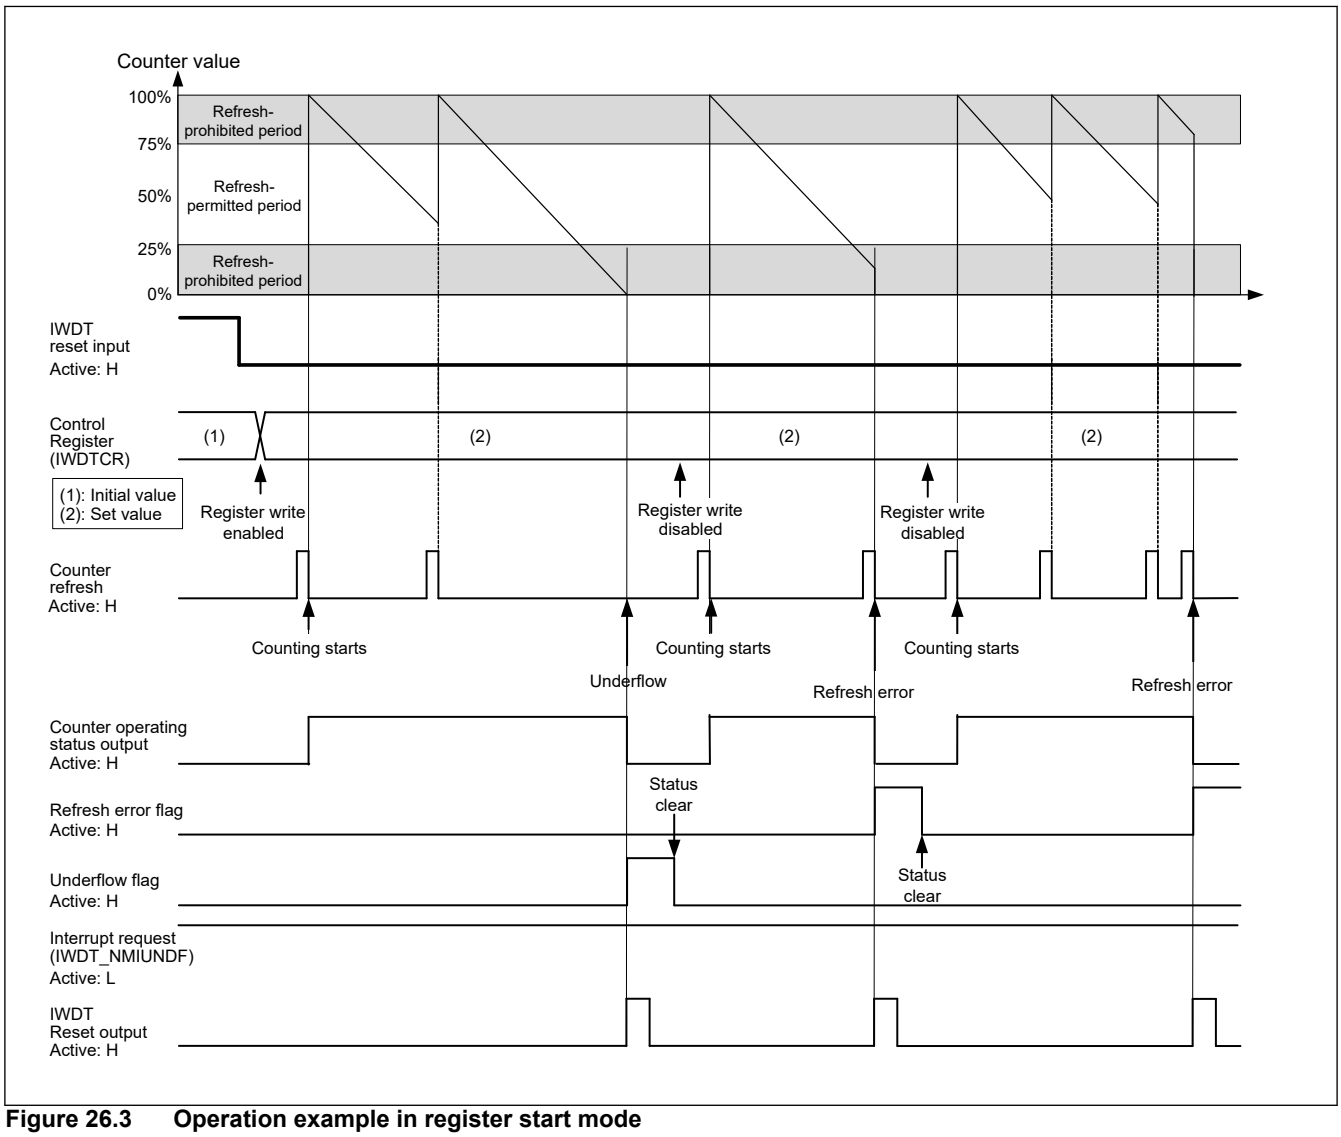

Figure 26.3 Operation example in register start mode

(2) Auto start mode

When the auto start mode is selected by setting the IWDT start mode selection (OFS0.IWDTSTRT) bit to 0 during a reset, the IWDT Control Register (IWDTCR), IWDT Reset Control Register (IWDTRCR), and IWDT Count Stop Control Register (IWDTCSTPR) are disabled.

During a reset, the clock division ratio, window start and end positions, timeout period, reset output or interrupt request output, and counter stop control at transitions to low power modes should be set through the the option function select register 0 (OFS0). Then, when the reset state is released, the timeout period set through the option function select register 0 (OFS0) is set in the down-counter, and then the down-counter automatically starts counting down.

After that, as long as the program continues normal operation and the counter is refreshed in the refresh permitted period, the value in the counter is reset each time the counter is refreshed and counting down continues. The IWDT does not output a reset signal as long as this continues.

However, if the down-counter underflows because the down counter cannot be refreshed due to a program runaway, or if a refresh error occurs because the counter was refreshed outside the refresh-permitted period, the IWDT outputs a reset signal or a non-maskable interrupt request (IWDT_NMIUNDF).

The reset output or interrupt request output is selected by setting the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS).

Figure 26.4 shows an example of operation under the following conditions:

- Auto start mode (OFS0.IWDTSTRT = 0)
- Non-maskable interrupt request output is enabled (OFS0.IWDTRSTIRQS = 0)
- The window start position is 75% (OFS0.IWDTRPSS[1:0] = 10b)
- The window end position is 25% (OFS0.IWDTRPES[1:0] = 10b)

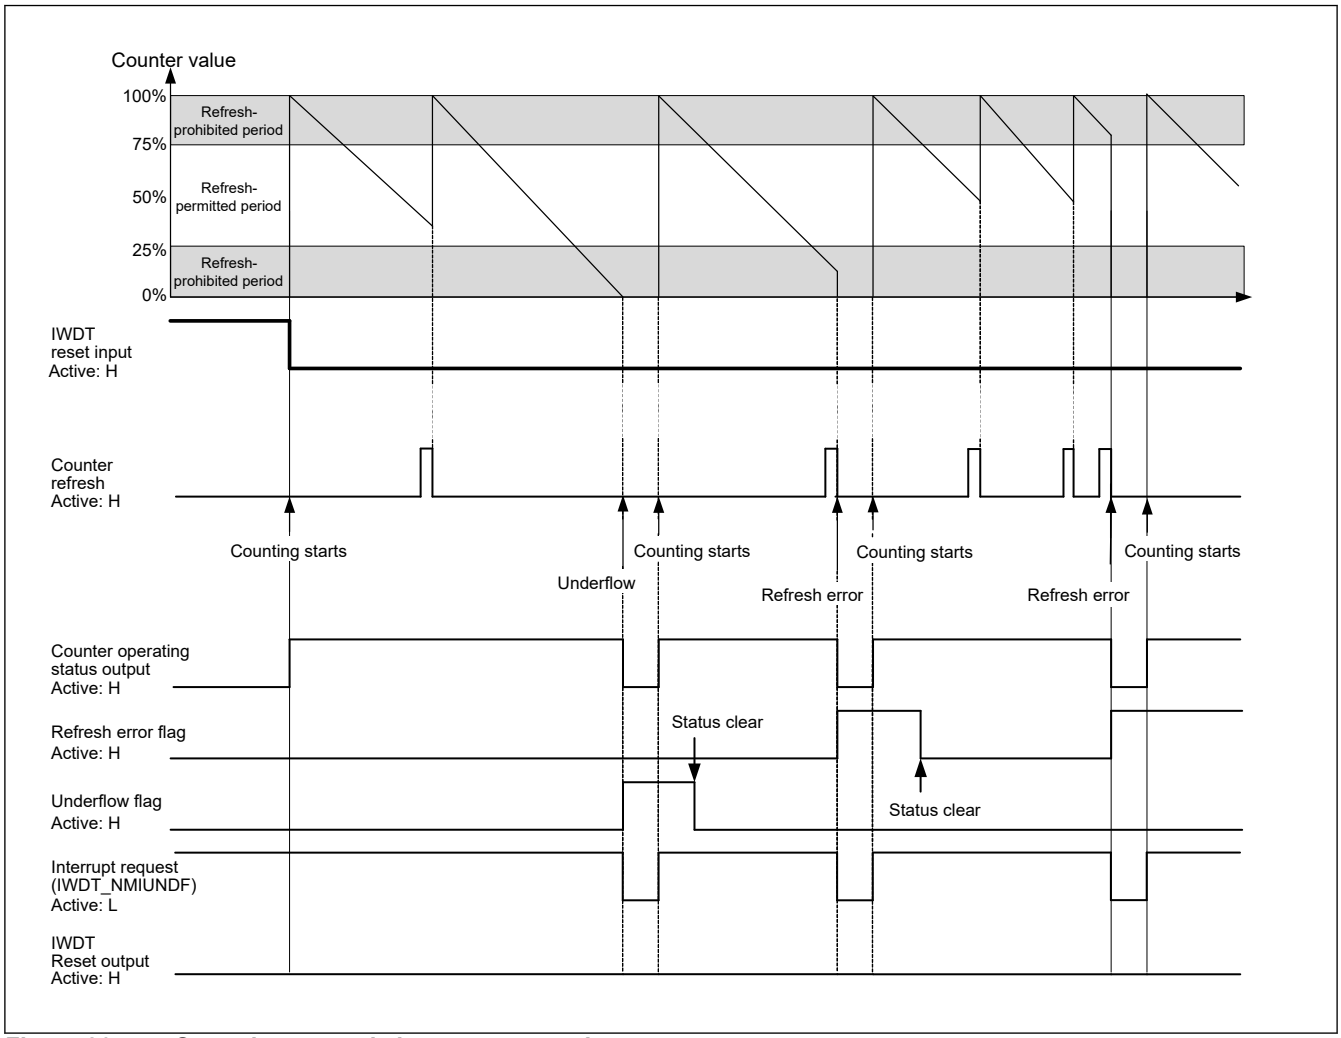

Figure 26.4 Operation example in auto start mode

26.3.2 Controlling writes to the IWDTCR, IWDTRCR, and IWDTCSTPR registers

Writing to the IWDT Control Register (IWDTCR) is possible only once between the release from the reset state and the first refresh operation.

After a refresh operation (counting starts) or by writing to the IWDTCR register, the protection signal in the IWDT becomes 1 to protect the IWDTCR register against subsequent attempts of writing.

The IWDT Reset Control Register (IWDTRCR) and the IWDT Count Stop Control Register (IWDTCSTPR) are also controlled in the same way.

This protection is released by a reset source to the IWDT. With other reset sources, the protection is not released.

Figure 26.5 shows control waveforms produced in response to writing to the IWDTCR register.

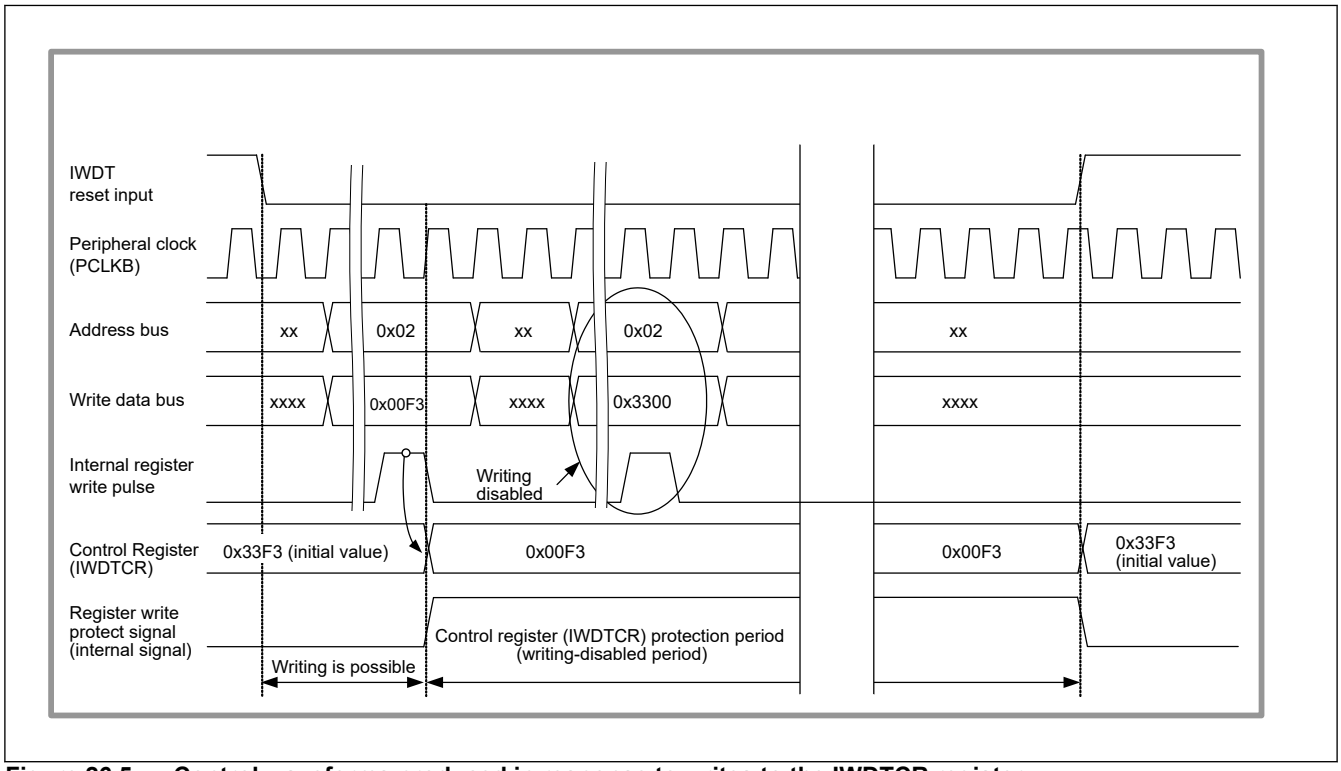

Figure 26.5 Control waveforms produced in response to writes to the IWDTCR register

26.3.3 Refresh operation

The down-counter is refreshed and starts operation (counting is started by refreshing) by writing the values 0x00 and then 0xFF to the IWDT Refresh Register (IWDTRR). If a value other than 0xFF is written after 0x00, the counter is not refreshed. After such invalid writing, correct refreshing is performed by writing 0x00 and then 0xFF again to the IWDT Refresh Register (IWDTRR).

When writing is done in the order of 0x00 (first time) → 0x00 (second time), and if 0xFF is written after that, the writing order 0x00 → 0xFF is satisfied; writing 0x00 ((n–1) th time) → 0x00 (nth time) → 0xFF is valid and correct refreshing will be done. Even when the first value written before 0x00 is not 0x00, correct refreshing will be done if the operation contains the sequence of writing 0x00 → 0xFF. Correct refreshing is also performed when a register other than IWDTRR is accessed or IWDTRR is read between writing 0x00 and writing 0xFF to IWDTRR.

[Example write sequences that are valid for refreshing the counter]

- 0x00 → 0xFF
- 0x00 ((n-1) th time) → 0x00 (nth time) → 0xFF
- 0x00 → access to another register or read from IWDTRR → 0xFF

[Example write sequences that are invalid for refreshing the counter]

- 0x23 (a value other than 0x00) → 0xFF

- 0x00 → 0x54 (a value other than 0xFF)
- 0x00 → 0xAA (0x00 and a value other than 0xFF) → 0xFF

Even when 0x00 is written to IWDTRR outside the refresh-permitted period, if 0xFF is written to IWDTRR in the refresh-permitted period, the writing sequence is valid and refreshing will be done.

After 0xFF is written to the IWDTRR register, refreshing the counter requires up to four cycles of the signal for counting (the clock division ratio select bits (IWDTCR.CKS[3:0]) determine how many cycles of the IWDT clock (IWDTCLK) make up one cycle for counting).

Therefore, writing 0xFF to the IWDTRR register should be completed four count cycles before the end position of the refresh-permitted period or the down-counter underflow. The value of the down-counter can be checked using the down-counter value bits (IWDTSR.CNTVAL[13:0]).

[Example refreshing timings]

- When the window start position is set to 0x1FFF, even if 0x00 is written to IWDTRR before 0x1FFF is reached (at 0x2002, for example), refreshing occurs if 0xFF is written to the IWDTRR register after the value of the IWDTSR.CNTVAL[13:0] bits reaches 0x1FFF.
- When the window end position is set to 0x1FFF, refreshing is done if 0x2003 (four count cycles before 0x1FFF) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to the IWDTRR register.
- When the refresh-permitted period continues until count 0x0000, refreshing can be done immediately before an underflow. In this case, if 0x0003 (four count cycles before an underflow) or a greater value is read from the IWDTSR.CNTVAL[13:0] bits immediately after writing 0x00 → 0xFF to the IWDTRR register, no underflow occurs and refreshing is done.

Figure 26.6 shows the IWDT refresh operation waveforms when the peripheral clock (PCLKB) > IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/1. Figure 26.7 shows the IWDT refresh operation waveforms when the peripheral clock (PCLKB) < IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/16.

When transitioning to Software Standby mode or Deep Software Standby mode 1, the refresh procedure must be completed before the transitioning (0xFF is written after 0x00 is written to the IWDTRR register).

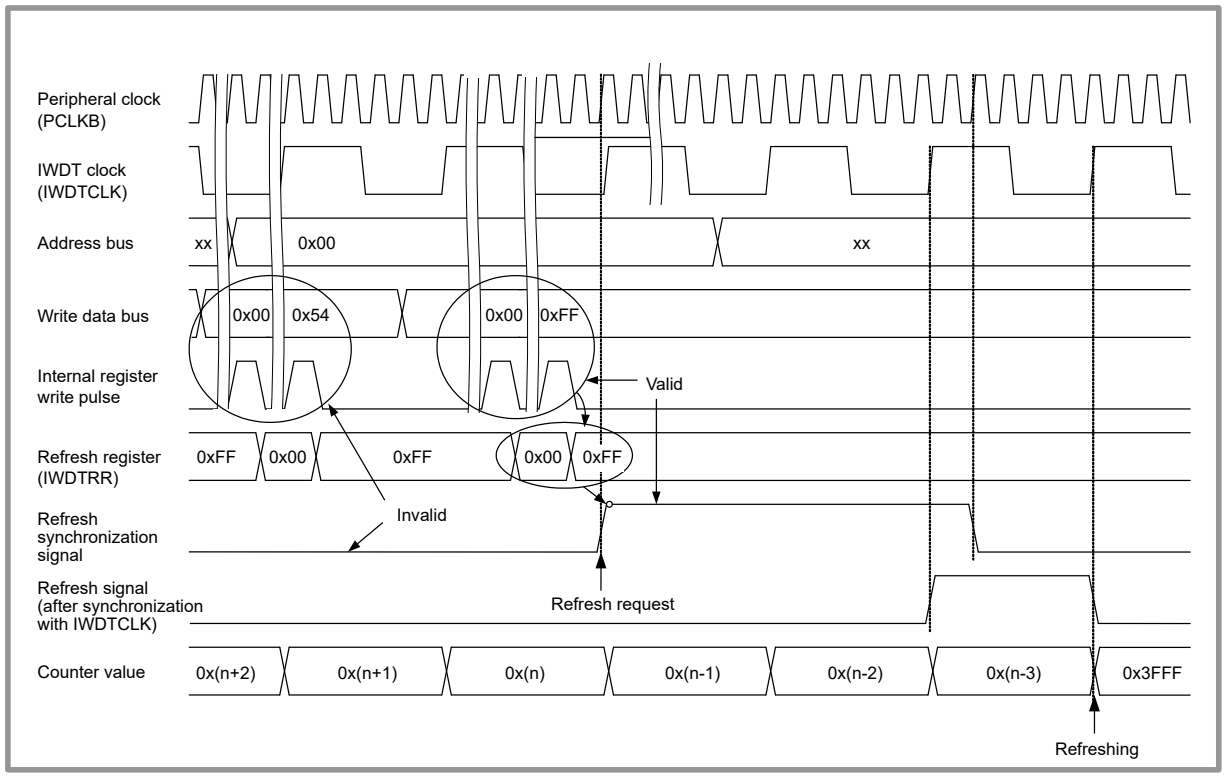

Figure 26.6 IWDT refresh operation waveforms (IWDTCR.CKS[3:0] = 0000b, IWDTCR.TOPS[1:0] = 11b)

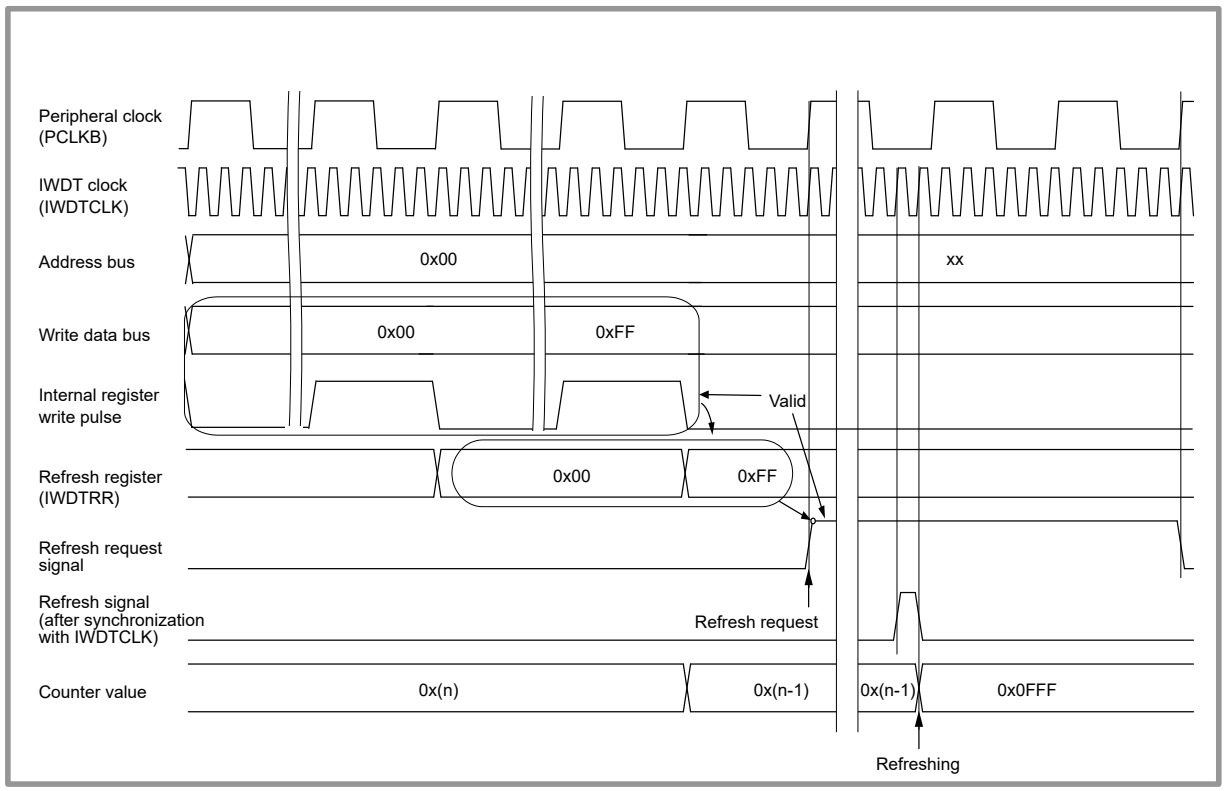

Figure 26.7 IWDT refresh operation waveforms (IWDTCR.CKS[3:0] = 0010b, IWDTCR.TOPS[1:0] = 01b)

26.3.4 Status flags

The refresh error flag (IWDTSR.REFEF) and underflow flag (IWDTSR.UNDFF) retain the source of the reset output from the IWDT or the source of the interrupt request from the IWDT.

Thus, after release from the reset state or interrupt request generation, read the IWDTSR.REFEF and IWDTSR.UNDFF flags to check for the reset or interrupt source.

For each flag, writing 0 clears the bit and writing 1 has no effect.

Leaving each flag unchanged does not affect operation. If the flags are not cleared, the earlier reset or interrupt source is cleared and the new reset or interrupt source is written when the IWDT outputs a reset signal next.

26.3.5 Reset output

When the reset interrupt select bit (IWDTRCR.RSTIRQS) is set to 1 in register start mode or when the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) is set to 1 in auto start mode, a reset signal is output for one count cycle when the down counter overflows or a refresh error occurs. In register start mode, the down counter is initialized (all bits set to 0) and kept in that state after assertion of the reset signal. After the reset is released and the program is restarted, the counter is set up again and counting down is started by refreshing. In auto start mode, counting down automatically starts after the reset output.

26.3.6 Interrupt sources

When the reset interrupt select bit (IWDTRCR.RSTIRQS) is set to 0 in register start mode or when the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) is set to 0 in auto start mode, a non-maskable interrupt (IWDT_NMIUNDF) is generated for one-count cycle when the down-counter overflows or a refresh error occurs.

26.3.7 Reading the down-counter value

Because the down-counter in the IWDT operates on the IWDT clock (IWDTCLK), the counter value cannot be read directly.

Therefore, the IWDT synchronizes the counter value with the peripheral clock (PCLKB) and stores it in the down-counter value bits (CNTVAL[13:0]) of the IWDT Status Register (IWDTSR). The counter value can be checked indirectly by reading the value stored in the IWDTSR.CNTVAL[13:0] bits.

Reading the counter value requires multiple peripheral clock (PCLKB) cycles (up to four clock cycles), and the read counter value may differ from the actual counter value by a value of one count.

Figure 26.8 shows the processing for reading the IWDT counter value when the peripheral clock (PCLKB) > IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/1. Figure 26.9 shows the processing for reading the IWDT counter value when the peripheral clock (PCLKB) < IWDT clock (IWDTCLK) and the clock division ratio = IWDTCLK/16.

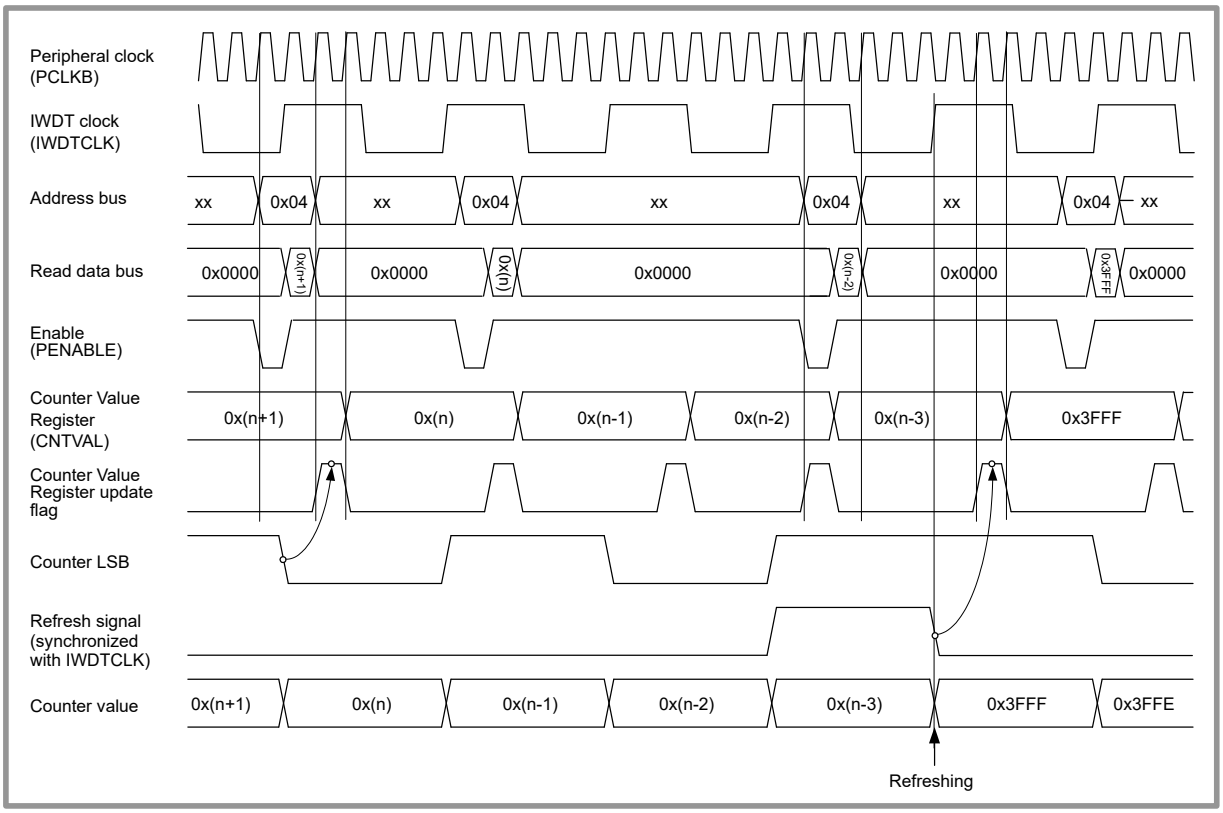

Figure 26.8 Processing for reading IWDT counter value when IWDTCR.CKS[3:0] = 0000b and IWDTCR.TOPS[1:0] = 11b

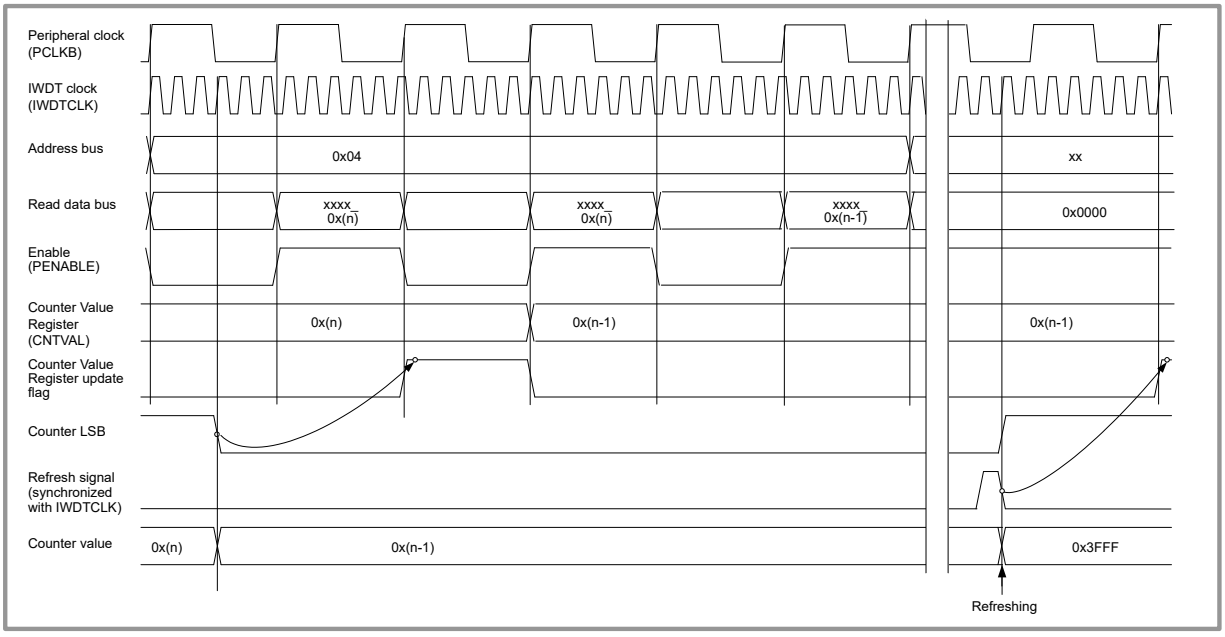

Figure 26.9 Processing for reading IWDT counter value when IWDTCR.CKS[3:0] = 0010b and IWDTCR.TOPS[1:0] = 11b

26.3.8 Correspondence between Option Function Select Register 0 (OFS0) and IWDT Registers

Table 26.4 lists the correspondence between the option function select register 0 (OFS0) and the IWDT registers (IWDT control register (IWDTCR), IWDT reset control register (IWDTRCR), and IWDT count stop control register (IWDTCSTPR)) regarding control of the down-counter, reset or interrupt request output, and count stop function.

Control can be switched between the option function select register 0 (OFS0) and the IWDT registers (IWDTCR, IWDTRCR, and IWDTCSTPR) through the setting of the IWDT start mode selection (OFS0.IWDTSTRT) bit.

Note that the option function select register 0 (OFS0) setting should be kept unchanged during IWDT operation.

Table 26.4 Association between Option Function Select Register 0 (OFS0) and the IWDT register

Control	Function	OFS0 register (enabled in auto start mode) OFS0.IWDTSTRT = 0	IWDT register (enabled in register start mode) OFS0.IWDTSTRT = 1
Down-counter	Timeout period selection	OFS0.IWDTTOPS[1:0]	IWDTCR.TOPS[1:0]
	Clock division ratio selection	OFS0.IWDTCKS[3:0]	IWDTCR.CKS[3:0]
	Window start position selection	OFS0.IWDTRPSS[1:0]	IWDTCR.RPSS[1:0]
	Window end position selection	OFS0.IWDTRPES[1:0]	IWDTCR.RPES[1:0]
Reset output/ interrupt request output	Reset output/ interrupt request output select	OFS0.IWDTRSTIRQS	IWDTRCR.RSTIRQS
Stop the counter	CPU Sleep-mode count stop selection	OFS0.IWDTSLCSTP	IWDTCSTPR.SLCSTP

26.4 Link operation by the event link function

The IWDT is capable of link operation for a specified module when an interrupt request signal is used as an event signal. The IWDT outputs an event signal on an underflow of the down-counter or generation of a refresh error.

It outputs an event signal regardless of the setting of the reset interrupt request select bit (IWDTRCR.RSTIRQS) in register start mode or the IWDT reset interrupt request select bit (OFS0.IWDTRSTIRQS) in auto start mode. It can output an event signal at generation of the next interrupt source while retaining the refresh error flag (IWDTSR.REFEF) or underflow flag (IWDTSR.UNDFF).

27. Ethernet MAC Controller (ETHERC)

27.1 Overview

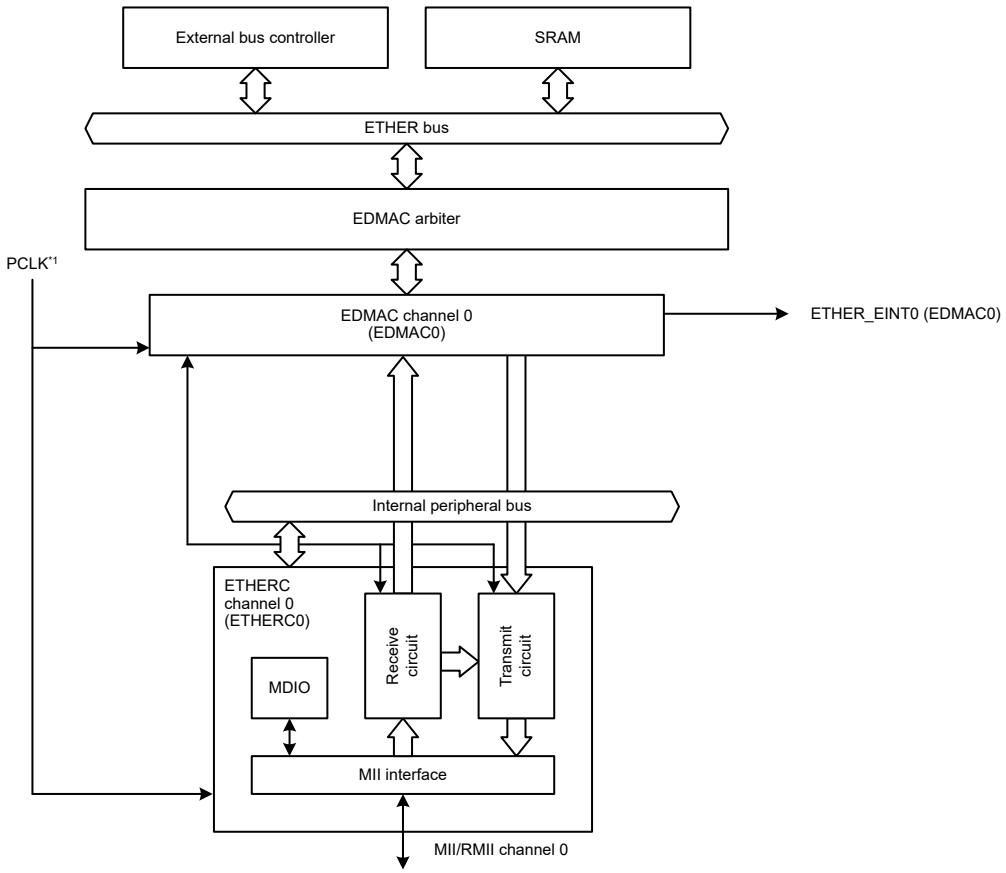
The MCU provides a one-channel Ethernet Controller (ETHERC) compliant with the Ethernet or IEEE802.3 Media Access Control (MAC) layer protocol. Each ETHERC channel has one channel of the MAC layer interface. Connecting the MCU to the physical layer LSI (PHY-LSI) allows transmission and reception of frames compliant with the Ethernet/IEEE802.3 standard. The ETHERC is connected to the Ethernet DMA Controller (EDMAC), so data can be transferred without using the CPU.

Table 27.1 lists the ETHERC specifications, Figure 27.1 shows the configuration, and Table 27.2 lists the I/O pins.

Figure 27.1 and Figure 27.3 show examples connections of the MCU to an external PHY-LSI.

Table 27.1 ETHERC specifications

Parameter	Specifications
Number of channels	One channel
Protocol	Flow control compliant with IEEE802.3x
Data transmission/reception	Frames compliant with the Ethernet/IEEE802.3 standard can be transmitted and received
Bit rate	Supports 10 Mbps and 100 Mbps
Operation modes	Supports full-duplex and half-duplex modes
Interfaces	Media Independent Interface (MII), Reduced Media Independent Interface (RMII), compliant with the IEEE802.3u standard
Functions	• Magic Packet™ detection • Wake-on-LAN (WOL) signal output
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set.



Note 1. PCLK: PCLKA
When using the ETHERC, 12.5 MHz ≤ PCLK ≤ 120 MHz.

Figure 27.1 ETHERC configuration

Table 27.2 ETHERC I/O pins (1 of 2)

Operating mode	Pin name	I/O	Description
MII	ET0_TX_CLK *1	Input	Transmit clock Timing reference signal for outputting the ET0_TX_EN, ET0_ETXD3 to ET0_ETXD0, and ET0_TX_ER signals.
	ET0_RX_CLK *1	Input	Receive clock Timing reference signal for inputting the ET0_RX_DV, ET0_ERXD3 to ET0_ERXD0, and ET0_RX_ER signals.
	ET0_TX_EN *1	Output	Transmit data valid This signal indicates that valid transmit data was output on pins ET0_ETXD3 to ET0_ETXD0.
	ET0_ETXD3 to ET0_ETXD0 *1	Output	4-bit transmit data
	ET0_TX_ER *1	Output	Transmit error This signal notifies the PHY-LSI that an error occurred during transmission.
	ET0_RX_DV *1	Input	Receive data valid This signal indicates that valid receive data is on pins ET0_ERXD3 to ET0_ERXD0.
	ET0_ERXD3 to ET0_ERXD0 *1	Input	4-bit receive data
	ET0_RX_ER *1	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC.
	ET0_CRS *1	Input	Carrier sense
	ET0_COL *1	Input	Collision detection signal
	ET0_MDC *1	Output	Management data clock Reference clock signal for transfer of information on the ET0_MDIO pin.
	ET0_MDIO *1	I/O	Management data Input/Output Bidirectional data signal for exchanging management data with the PHY-LSI.
	ET0_LINKSTA	Input	Link status input from the PHY-LSI
	ET0_EXOUT	Output	General output pin
	ET0_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received

Table 27.2 ETHERC I/O pins (2 of 2)

Operating mode	Pin name	I/O	Description
RMII	REF50CK0 *2	Input	Reference clock Timing reference signal for the RMII0_TXD_EN, RMII0_TXD1 to RMII0_TXD0, RMII0_CRS_DV, RMII0_RXD1 to RMII0_RXD0, and RMII0_RX_ER pins.
	RMII0_TXD_EN *2	Output	Transmit data valid This signal indicates that valid transmit data was output on the RMII0_TXD1 and RMII0_TXD0 pins.
	RMII0_TXD1 to RMII0_TXD0 *2	Output	2-bit transmit data
	RMII0_CRS_DV *2	Input	Carrier sense/receive data valid This signal indicates that valid receive data is on the RMII0_RXD1 and RMII0_RXD0 pins.
	RMII0_RXD1 to RMII0_RXD0 *2	Input	2-bit receive data
	RMII0_RX_ER *2	Input	Receive error This signal indicates that there is an error in a frame that is being transferred from the PHY-LSI to the ETHERC. See the note in section 27.5.2. Input to RMII0_RX_ER Pin While RMII Is Selected.
	ET0_MDC *2	Output	Management data clock Reference clock signal for transfer of information on the ET0_MDIO pin
	ET0_MDIO *2	I/O	Management data Input/Output Bidirectional data signal for exchanging management data with the PHY-LSI.
	ET0_LINKSTA	Input	Link status input from the PHY-LSI.
	ET0_EXOUT	Output	General output pin
	ET0_WOL	Output	Wake-on-LAN. This signal indicates that a Magic Packet was received.

Note 1. MII signal compliant with IEEE802.3u.
Note 2. RMII signal compliant with IEEE802.3u.

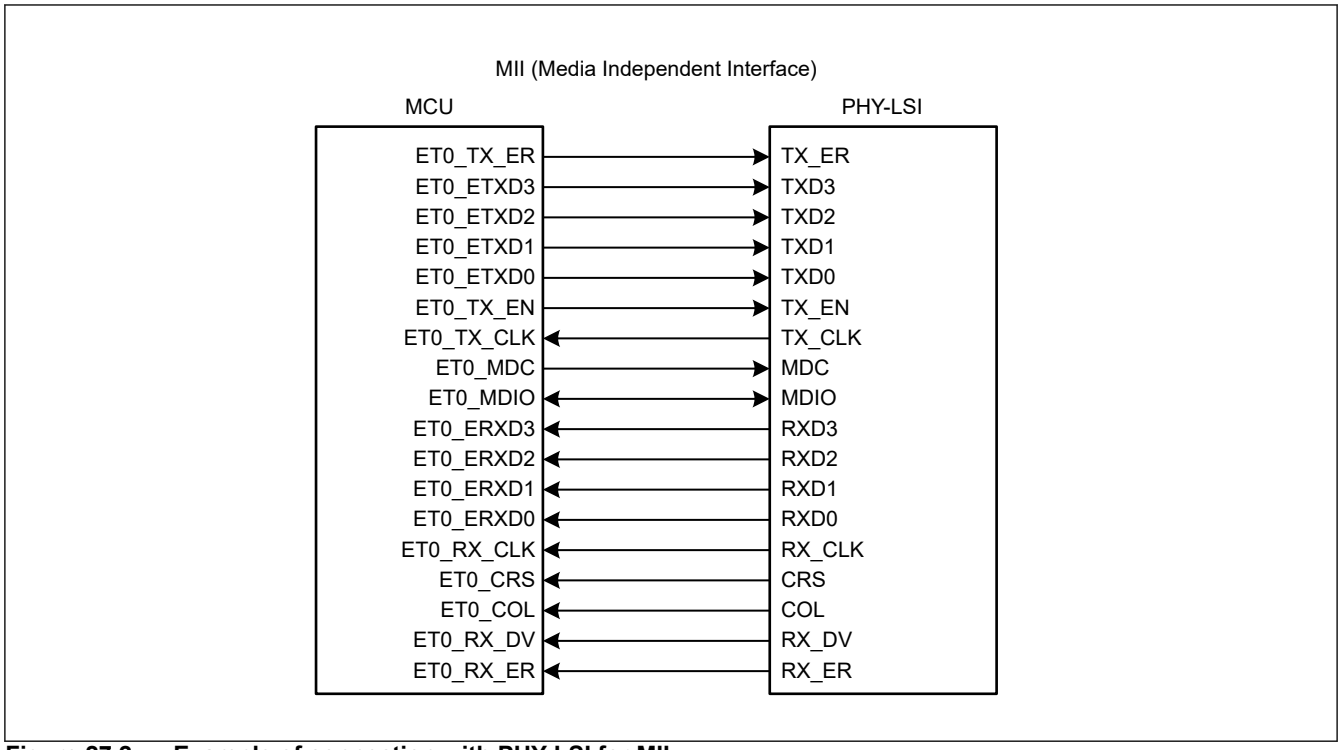


Figure 27.2 Example of connection with PHY-LSI for MII

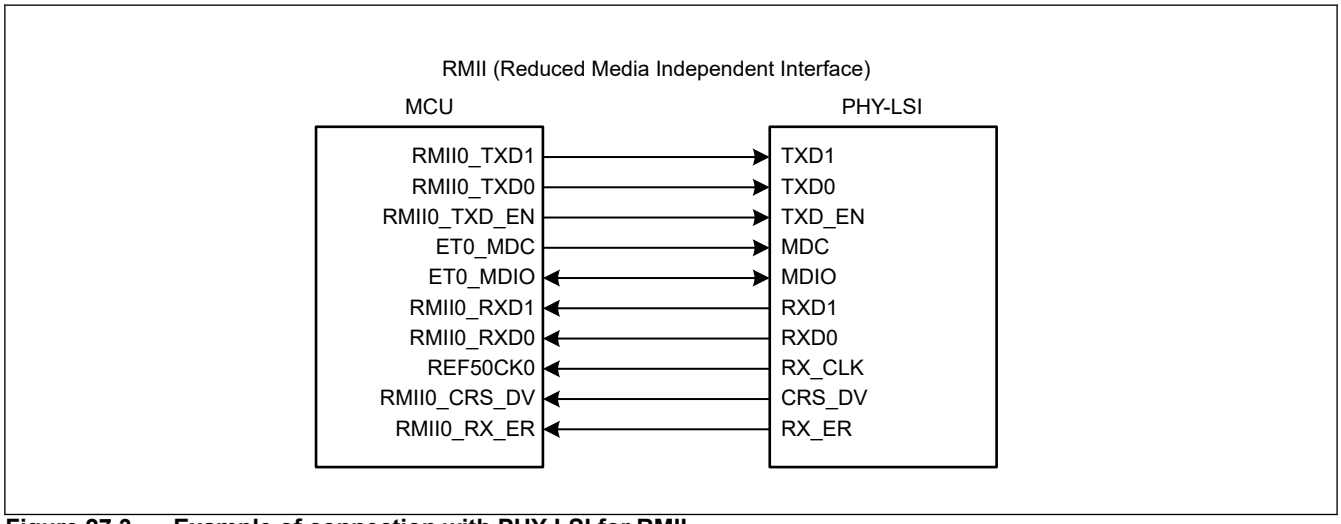

Figure 27.3 Example of connection with PHY-LSI for RMII

27.2 Register Descriptions

27.2.1 ECMR : ETHERC Mode Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	TPC	ZPF	PFR	RXF	TXF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	PRCEF	—	—	MPDE	—	—	RE	TE	—	ILB	RTM	DM	PRM
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	PRM	Promiscuous Mode 0: Disable promiscuous mode 1: Enable promiscuous mode.	R/W
1	DM	Duplex Mode 0: Half-duplex mode 1: Full-duplex mode.	R/W
2	RTM	Bit Rate 0: 10 Mbps 1: 100 Mbps.	R/W
3	ILB	Internal Loopback Mode 0: Perform normal data transmission or reception 1: Loop data back in the ETHERC when full-duplex mode is selected.	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	TE	Transmission Enable 0: Disable transmit function 1: Enable transmit function.	R/W
6	RE	Reception Enable 0: Disable receive function 1: Enable receive function.	R/W
8:7	—	These bits are read as 0. The write value should be 0.	R/W
9	MPDE	Magic Packet Detection Enable 0: Disable Magic Packet detection 1: Enable Magic Packet detection.	R/W
11:10	—	These bits are read as 0. The write value should be 0.	R/W
12	PRCEF	CRC Error Frame Receive Mode 0: Notify EDMAC of a CRC error 1: Do not notify EDMAC of a CRC error.	R/W
15:13	—	These bits are read as 0. The write value should be 0.	R/W
16	TXF	Transmit Flow Control Operating Mode 0: Disable automatic PAUSE frame transmission (PAUSE frame is not automatically transmitted) 1: Enable automatic PAUSE frame transmission (PAUSE frame is automatically transmitted as required).	R/W
17	RXF	Receive Flow Control Operating Mode 0: Disable PAUSE frame detection 1: Enable PAUSE frame detection.	R/W

Bit	Symbol	Function	R/W
18	PFR	PAUSE Frame Receive Mode 0: Do not transfer PAUSE frame to the EDMAC 1: Transfer PAUSE frame to the EDMAC.	R/W
19	ZPF	0 Time PAUSE Frame Enable 0: Do not use PAUSE frames that containing a pause_time parameter of 0 1: Use PAUSE frames that containing a pause_time parameter of 0.	R/W
20	TPC	PAUSE Frame Transmit 0: Transmit PAUSE frame even during a PAUSE period 1: Do not transmit PAUSE frame during a PAUSE period.	R/W
31:21	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The ECMR register controls ETHERC operation. Except for the TE and RE bits, set the bits in this register during initialization after a reset. When rewriting this register outside the initialization process, set the EDMAC0.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, then set this register again.

PRM bit (Promiscuous Mode)

When the PRM bit is set to 1, the ETHERC operates in promiscuous mode, where all Ethernet frames are received. In promiscuous mode, the ETHERC receives all valid frames regardless of whether the address matches the destination or broadcast address, and regardless of the multicast bit setting.

RTM bit (Bit Rate)

The RTM bit sets the bit rate when the RMII is selected.

ILB bit (Internal Loopback Mode)

When the ILB bit is set to 1, transmit frames can be looped back in the MCU. Set the DM bit to 1 (full-duplex mode) to perform a loopback test.

TE bit (Transmission Enable)

When the TE bit is set to 1, the ETHERC transmit function is enabled. When the TE bit is set to 0, the transmit function is disabled after the frame being processed is completely transmitted.

RE bit (Reception Enable)

When the RE bit is set to 1, the ETHERC receive function is enabled. When the RE bit is set to 0, the receive function is disabled after the frame being processed is completely received.

PRCEF bit (CRC Error Frame Receive Mode)

When the PRCEF bit is set to 1, the EDMAC is not notified that a CRC error has occurred even when the error is detected in a receive frame. Accordingly, the EDMAC0.EESR.CERF flag and RFS0 bit in receive descriptor 0 (RD0) do not set to 1.

ZPF bit (0 Time PAUSE Frame Enable)

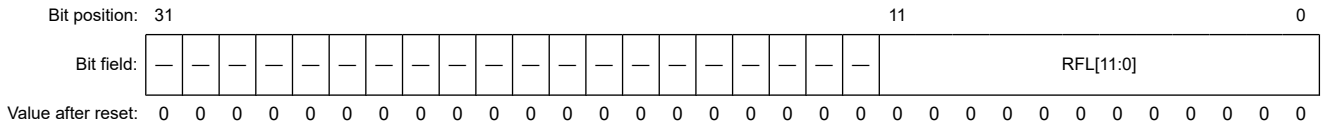
When the ZPF bit is 1, a PAUSE frame with a pause_time parameter of 0 is transmitted when a PAUSE frame transmit request is canceled before the PAUSE time of the previously transmitted PAUSE frame has elapsed. After the PAUSE frame containing the pause_time parameter of 0 is received, the ETHERC is ready for transmission.

When the ZPF bit is 0, even if the PAUSE frame transmit request from the receive FIFO is canceled, the next PAUSE frame is not transmitted until the PAUSE time of the previously transmitted PAUSE frame has elapsed. When a PAUSE frame containing a pause_time parameter of 0 is received, it is discarded.

27.2.2 RFLR : Receive Frame Maximum Length Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x08



Bit	Symbol	Function	R/W
11:0	RFL[11:0]	Receive Frame Maximum Length The set value becomes the maximum frame length. The minimum value that can be set is 1,518 bytes, and the maximum value that can be set is 2,048 bytes. Values less than 1,518 bytes are regarded as 1,518 bytes, and values larger than 2,048 bytes are regarded as 2,048 bytes.	R/W
31:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RFLR register specifies the maximum frame length that can be received by the MCU. Set the length in bytes. Do not rewrite this register while the ECMR.RE bit is 1 (receive function enabled).

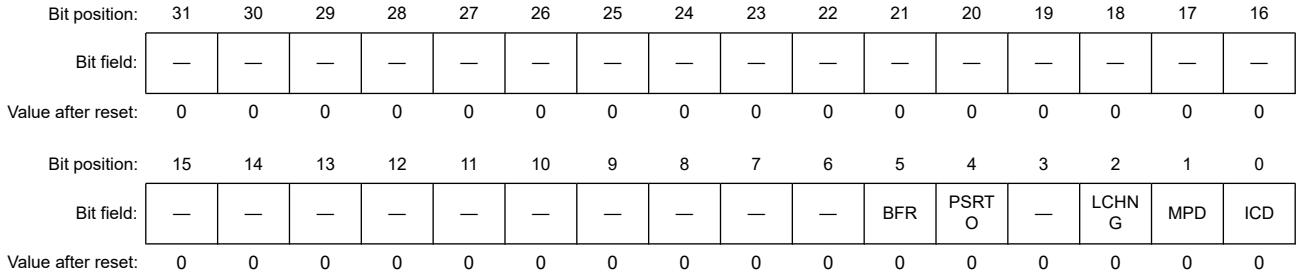
RFL[11:0] bits (Receive Frame Maximum Length)

The RFL[11:0] bits set the frame length to be checked. The frame length is the number of bytes in a field, extending from the destination address to the frame check sequence [FCS] of the received frame. When this length exceeds the RFL[11:0] bit value, the EDMAC is notified of a frame-too-long error, and the excess data is discarded.

27.2.3 ECSR : ETHERC Status Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x10



Bit	Symbol	Function	R/W
0	ICD	False Carrier Detect Flag 0: PHY-LSI has not detected a false carrier on the line 1: PHY-LSI detected a false carrier on the line.	R/W*1
1	MPD	Magic Packet Detect Flag 0: Magic Packet not detected 1: Magic Packet detected.	R/W*1
2	LCHNG	Link Signal Change Flag 0: Change in the ET0_LINKSTA signal not detected 1: Change in the ET0_LINKSTA signal detected (high to low, or low to high).	R/W*1
3	—	This bit is read as 0. The write value should be 0.	R/W
4	PSRTO	PAUSE Frame Retransmit Over Flag 0: PAUSE frame retransmit count has not reached the upper limit 1: PAUSE frame retransmit count reached the upper limit.	R/W*1

Bit	Symbol	Function	R/W
5	BFR	Continuous Broadcast Frame Reception Flag 0: Continuous reception of broadcast frames not detected 1: Continuous reception of broadcast frames detected.	R/W*1
31:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3
Note 1. Write 1 to clear the flag.

The ECSR register indicates the status of the ETHERC. When any flag in the ECSR register is set to 1 while the associated bit in the ECSIPR register is 1 (interrupt enabled), the EDMAC0.EESR.ECI flag is set to 1.

ICD flag (False Carrier Detect Flag)

The ICD flag indicates that the PHY-LSI has detected a false carrier on the line. The flag is set to 1 when a receive error signal shown in Figure 27.11 is received from the PHY-LSI. The information might not be correct when signals input from the PHY-LSI change faster than software recognizes the change. Check the timing of the PHY-LSI.

LCHNG flag (Link Signal Change Flag)

The LCHNG flag indicates that the ET0_LINKSTA signal input from the PHY-LSI has changed from high to low, or from low to high. Check the PSR.LMON flag for the current link status. See section 27.5.1. Preventing the LCHNG Flag from Erroneously Setting to 1 for more information.

PSRTO flag (PAUSE Frame Retransmit Over Flag)

The PSRTO flag indicates that the number of retransmissions reached the value set in the TPAUSER register when retransmitting a PAUSE frame while automatic PAUSE frame transmission is enabled.

27.2.4 ECSIPR : ETHERC Interrupt Enable Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x18

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	BFSIPR	PSRTOIP	—	LCHNGIP	MPDIP	ICDIP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ICDIP	False Carrier Detect Interrupt Enable 0: Disable interrupt notification 1: Enable interrupt notification.	R/W
1	MPDIP	Magic Packet Detect Interrupt Enable 0: Disable interrupt notification 1: Enable interrupt notification.	R/W
2	LCHNGIP	LINK Signal Change Interrupt Enable 0: Disable interrupt notification 1: Enable interrupt notification.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	PSRTOIP	PAUSE Frame Retransmit Over Interrupt Enable 0: Disable interrupt notification 1: Enable interrupt notification.	R/W

Bit	Symbol	Function	R/W
5	BFSIPR	Continuous Broadcast Frame Reception Interrupt Enable 0: Disable interrupt notification 1: Enable interrupt notification.	R/W
31:6	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The ECSIPR register selects whether to notify the EDMAC of the status indicated in the ECSR register. Each bit is associated with the flag with the same bit number in the ECSR register.

27.2.5 PIR : PHY Interface Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x20

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	MDI	MDO	MMD	MDC
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	x	0	0	0

Bit	Symbol	Function	R/W
0	MDC	MII/RMII Management Data Clock This value is output from the ET0_MDC pin to supply the management data clock to the MII or RMII.	R/W
1	MMD	MII/RMII Management Mode 0: Read 1: Write.	R/W
2	MDO	MII/RMII Management Data-Out This value is output from the ET0_MDIO pin when the MMD bit is 1 (write), and not when MMD is 0 (read).	R/W
3	MDI	MII/RMII Management Data-In This bit indicates the level of the ET0_MDIO pin. The write value should be 0.	R
31:4	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The PIR register accesses registers in the PHY-LSI through the MII or RMII. The management clock and management data are controlled by software. See section 27.3.4. Accessing the MII and RMII Registers for details on accessing the MII and RMII registers.

27.2.6 PSR : PHY Status Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LMON
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x

Bit	Symbol	Function	R/W
0	LMON	ET0_LINKSTA Pin Status Flag The link status can be read by connecting the link signal output from the PHY-LSI to the ET0_LINKSTA pin. For details on the polarity, see the specifications of the connected PHY-LSI.	R
31:1	—	These bits are read as 0.	R

Note: S-TYPE3, P-TYPE3

The PSR register monitors interface signals from the PHY-LSI.

27.2.7 RDMLR : Random Number Generation Counter Upper Limit Setting Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x40

Bit position:	31												19																	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	RMD[19:0]																	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Note: S-TYPE3, P-TYPE3

Bit	Symbol	Function	R/W
19:0	RMD[19:0]	Random Number Generation Counter 0x00000: Normal operation 0x00001 to 0xFFFFF: Setting prohibited.	R/W
31:20	—	These bits are read as 0. The write value should be 0.	R/W

The RDMLR register specifies the maximum value for the counter used in the random number generator. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled).

27.2.8 IPGR : Interpacket Gap Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x50

Bit position:	31																										4			0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	IPG[4:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0

Bit	Symbol	Function	R/W
4:0	IPG[4:0]	Interpacket Gap 0x00: 16 bit times 0x01: 20 bit times ⋮ 0x14: 96 bit times (initial value) ⋮ 0x1F: 140 bit times.	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The IPGR register specifies the interpacket gap (IPG) value. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). See section 27.3.6. Adjusting Transmission Efficiency by Changing the IPG for details on the IPG.

27.2.9 APR : Automatic PAUSE Frame Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x54

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	AP[15:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	AP[15:0]	Automatic PAUSE Time Setting These bits set the value of the pause_time parameter for PAUSE frames that are automatically transmitted. Transmission is not performed until a period equal to the set value multiplied by 512 bit times has elapsed.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The APR register specifies the PAUSE time for PAUSE frames that are automatically transmitted. The value set in the APR register is used for the pause_time parameter of the PAUSE frame. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled).

27.2.10 MPR : Manual PAUSE Frame Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x58

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MP[15:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x

Bit	Symbol	Function	R/W
15:0	MP[15:0]	Manual PAUSE Time Setting These bits set the value of the pause_time parameter for PAUSE frames that are manually transmitted. Transmission is not performed until the set value multiplied by 512 bit times has elapsed. The read value is undefined.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

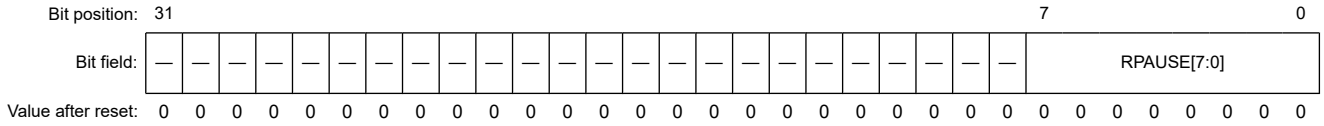
Note: S-TYPE3, P-TYPE3

The MPR register specifies the PAUSE time for PAUSE frames that are manually transmitted. The value set in the MPR register is used for the pause_time parameter of the PAUSE frame. When a value is set to this register, a PAUSE frame is transmitted. Rewrite this register while the ECMR.TE bit is 1 (transmit function enabled).

27.2.11 RFCF : Received PAUSE Frame Counter

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x60



Bit	Symbol	Function	R/W
7:0	RPAUSE[7:0]	Received PAUSE Frame Count Number of received PAUSE frames.	R
31:8	—	These bits are read as 0.	R

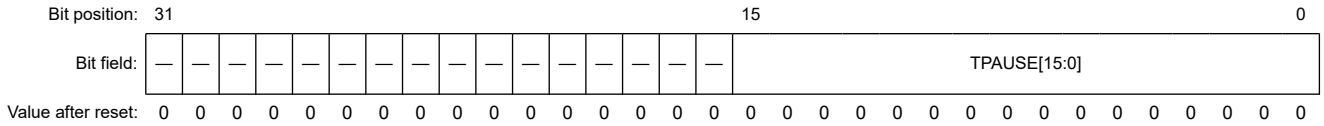
Note: S-TYPE3, P-TYPE3

The RFCF register is a counter that indicates the number of received PAUSE frames. The counter is reset after this register is read.

27.2.12 TPAUSER : PAUSE Frame Retransmit Count Setting Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x64



Bit	Symbol	Function	R/W
15:0	TPAUSE[15:0]	Automatic PAUSE Frame Retransmit Setting 0x0000 0: Number of retransmissions is unlimited 0x0000 1: Maximum number of retransmissions is 1 ⋮ ⋮ 0xFFFF F: Maximum number of retransmissions is 65,535.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

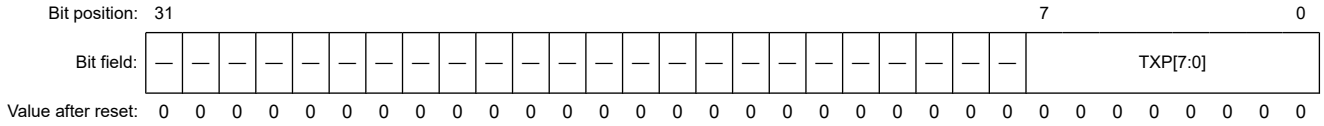
Note: S-TYPE3, P-TYPE3

The TPAUSECR register selects the maximum number of times a PAUSE frame is automatically transmitted. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled).

27.2.13 TPAUSECR : PAUSE Frame Retransmit Counter

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x68



Bit	Symbol	Function	R/W
7:0	TXP[7:0]	PAUSE Frame Retransmit Count Number of times a PAUSE frame was retransmitted.	R
31:8	—	These bits are read as 0.	R

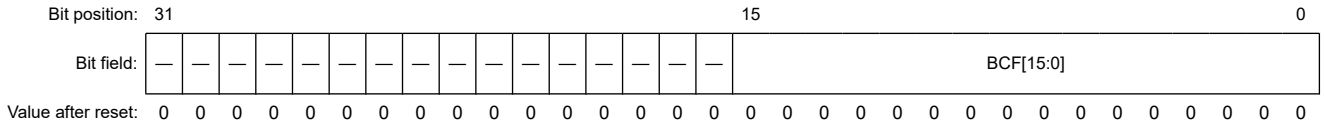
Note: S-TYPE3, P-TYPE3

The TPAUSECR register is a counter that indicates the number of times a PAUSE frame was automatically retransmitted. The counter is reset after this register is read.

27.2.14 BCFRR : Broadcast Frame Receive Count Setting Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0x6C



Bit	Symbol	Function	R/W
15:0	BCF[15:0]	Broadcast Frame Continuous Receive Count Setting 0x0000 Number of reception is unlimited : 0x0001 Receive 1 frame. : ⋮ 0xFFFF Receive 65,535 frames. :	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

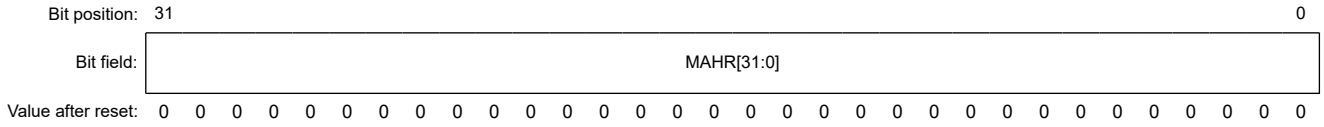
Note: S-TYPE3, P-TYPE3

The BCFRR register specifies the number of times broadcast frames can be received continuously. When the number of received frames exceeds the BCF[15:0] bit value, the excess broadcast frames are discarded. Do not rewrite this register while the EMCR.RE bit is 1 (receive function enabled).

27.2.15 MAHR : MAC Address Upper Bit Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xC0



Bit	Symbol	Function	R/W
31:0	MAHR[31:0]	MAC Address Upper Bit See the following.	R/W

Note: S-TYPE3, P-TYPE3

The MAHR register specifies the upper 32 bits ([47:16]) of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0x01234567.

Set the MAHR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). When rewriting this register, set the EDMAC0.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, then set this register again.

27.2.16 MALR : MAC Address Lower Bit Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xC8

Bit position:	31															15														0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	MALR[15:0]														
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	MALR[15:0]	MAC Address Lower Bit These bits set the lower 16 bits of the MAC address.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The MALR register specifies the lower 16 bits of the 48-bit MAC address. For example, if the MAC address is 01-23-45-67-89-AB, set the register to 0x000089AB.

Set the MALR register during initialization after a reset. Do not rewrite this register while the ECMR.TE bit is 1 (transmit function enabled) or while the ECMR.RE bit is 1 (receive function enabled). When rewriting this register, set the EDMAC0.EDMR.SWR bit to 1 to reset the EDMAC and ETHERC, then set this register again.

27.2.17 TROCR : Transmit Retry Over Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xD0

Bit position:	31																													0
Bit field:	TROCR[31:0]																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	TROCR[31:0]	Transmit Retry Over Counter See the following.	R/W

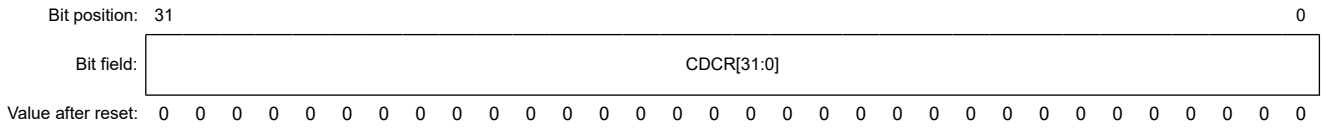
Note: S-TYPE3, P-TYPE3

The TROCR register is a counter that indicates the number of frames that failed to be retransmitted. The register value is incremented by 1 when a frame fails to be retransmitted 15 times. The counter stops when the register value becomes 0xFFFF_FFFF. Writing any value to the TROCR register clears the counter value to 0.

27.2.18 CDCR : Late Collision Detect Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xD4



Bit	Symbol	Function	R/W
31:0	CDCR[31:0]	Late Collision Detect Counter See the following.	R/W

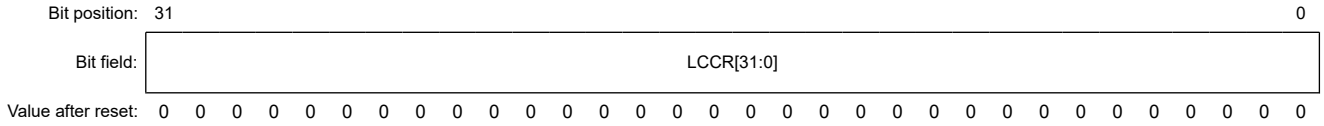
Note: S-TYPE3, P-TYPE3

The CDCR register is a counter that indicates the number of late collisions that are detected after transmission starts. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the CDCR register clears the counter value to 0.

27.2.19 LCCR : Lost Carrier Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xD8



Bit	Symbol	Function	R/W
31:0	LCCR[31:0]	Lost Carrier Counter See the following.	R/W

Note: S-TYPE3, P-TYPE3

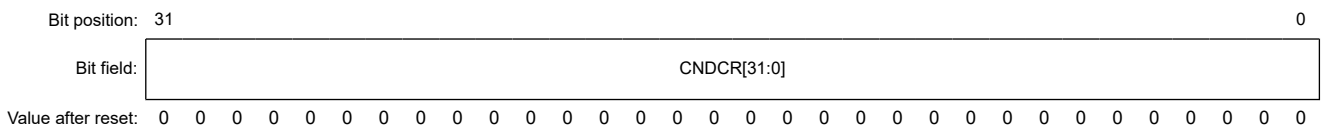
The LCCR register is a counter that indicates the number of times a loss of carrier is detected during frame transmission.

When the register value becomes 0xFFFF FFFF, the counter stops. Writing any value to the LCCR register clears the counter value to 0.

27.2.20 CNDCR : Carrier Not Detect Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xDC



Bit	Symbol	Function	R/W
31:0	CNDCR[31:0]	Carrier Not Detect Counter See the following.	R/W

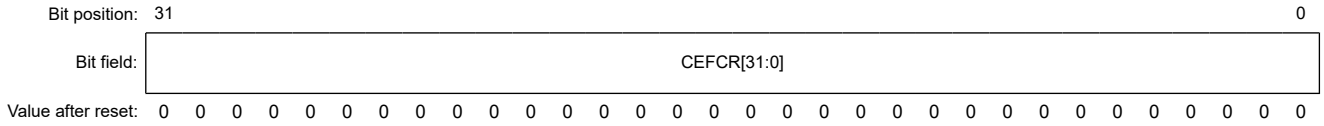
Note: S-TYPE3, P-TYPE3

The CNDCR register is a counter that indicates the number of times a carrier is not detected during preamble transmission. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the CNDCR register clears the counter value to 0.

27.2.21 CEFCR : CRC Error Frame Receive Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xE4



Bit	Symbol	Function	R/W
31:0	CEFCR[31:0]	CRC Error Frame Receive Counter See the following.	R/W

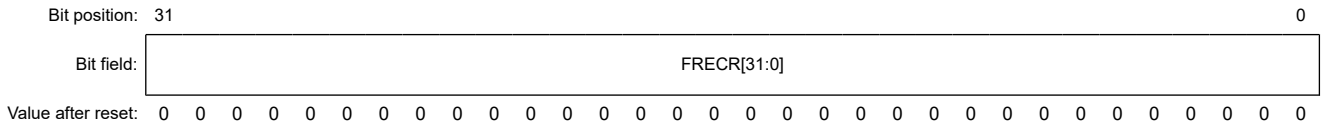
Note: S-TYPE3, P-TYPE3

The CEFCR register is a counter that indicates the number of received frames in which a CRC error was detected. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the CEFCR register clears the counter value to 0.

27.2.22 FRECR : Frame Receive Error Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xE8



Bit	Symbol	Function	R/W
31:0	FRECR[31:0]	Frame Receive Error Counter See the following.	R/W

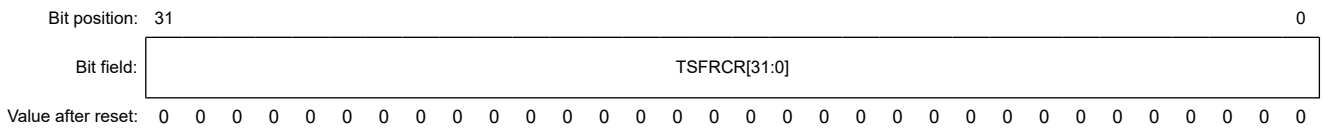
Note: S-TYPE3, P-TYPE3

The FRECR register is a counter that indicates the number of times a frame receive error has occurred. The PHY-LSI notifies the ETHERC of the frame receive error using the ET0_RX_ER pin. The FRECR register increments each time the ET0_RX_ER pin goes high. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the FRECR register clears the counter value to 0.

27.2.23 TSFRCR : Too-Short Frame Receive Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xEC



Bit	Symbol	Function	R/W
31:0	TSFRCR[31:0]	Too-Short Frame Receive Counter See the following.	R/W

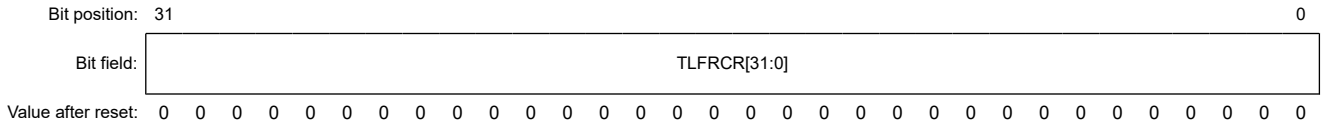
Note: S-TYPE3, P-TYPE3

The TSFRCR register is a counter that indicates the number of times a short frame that is shorter than 64 bytes was received. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the TSFRCR register clears the counter value to 0.

27.2.24 TLFRCR : Too-Long Frame Receive Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xF0



Bit	Symbol	Function	R/W
31:0	TLFRCR[31:0]	Too-Long Frame Receive Counter See the following.	R/W

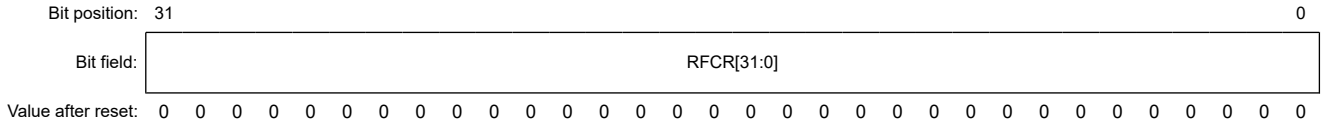
Note: S-TYPE3, P-TYPE3
Note: The TLFRCR register does not increment when a frame is received with an alignment error. In this case, the RFCR register increments.

The TLFRCR register is a counter that indicates the number of times a long frame that is longer than the RFLR register value was received. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the TLFRCR register clears the counter value to 0.

27.2.25 RFCR : Received Alignment Error Frame Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xF4



Bit	Symbol	Function	R/W
31:0	RFCR[31:0]	Received Alignment Error Frame Counter See the following.	R/W

Note: S-TYPE3, P-TYPE3

The RFCR register is a counter that indicates the number of times a frame was received with an alignment error, meaning that it is not an integral number of octets. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the RFCR register clears the counter value to 0.

27.2.26 MAFCR : Multicast Address Frame Receive Counter Register

Base address: ETHERC0 = 0x4035_4100
ETHERC0_NS = 0x5035_4100

Offset address: 0xF8

Bit position:	31																												0
Bit field:	MAFCR[31:0]																												
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	MAFCR[31:0]	Multicast Address Frame Receive Counter See the following.	R/W

Note: S-TYPE3, P-TYPE3

The MAFCR register is a counter that indicates the number of times a frame with the multicast address set was received. When the register value becomes 0xFFFF_FFFF, the counter stops. Writing any value to the MAFCR register clears the counter value to 0.

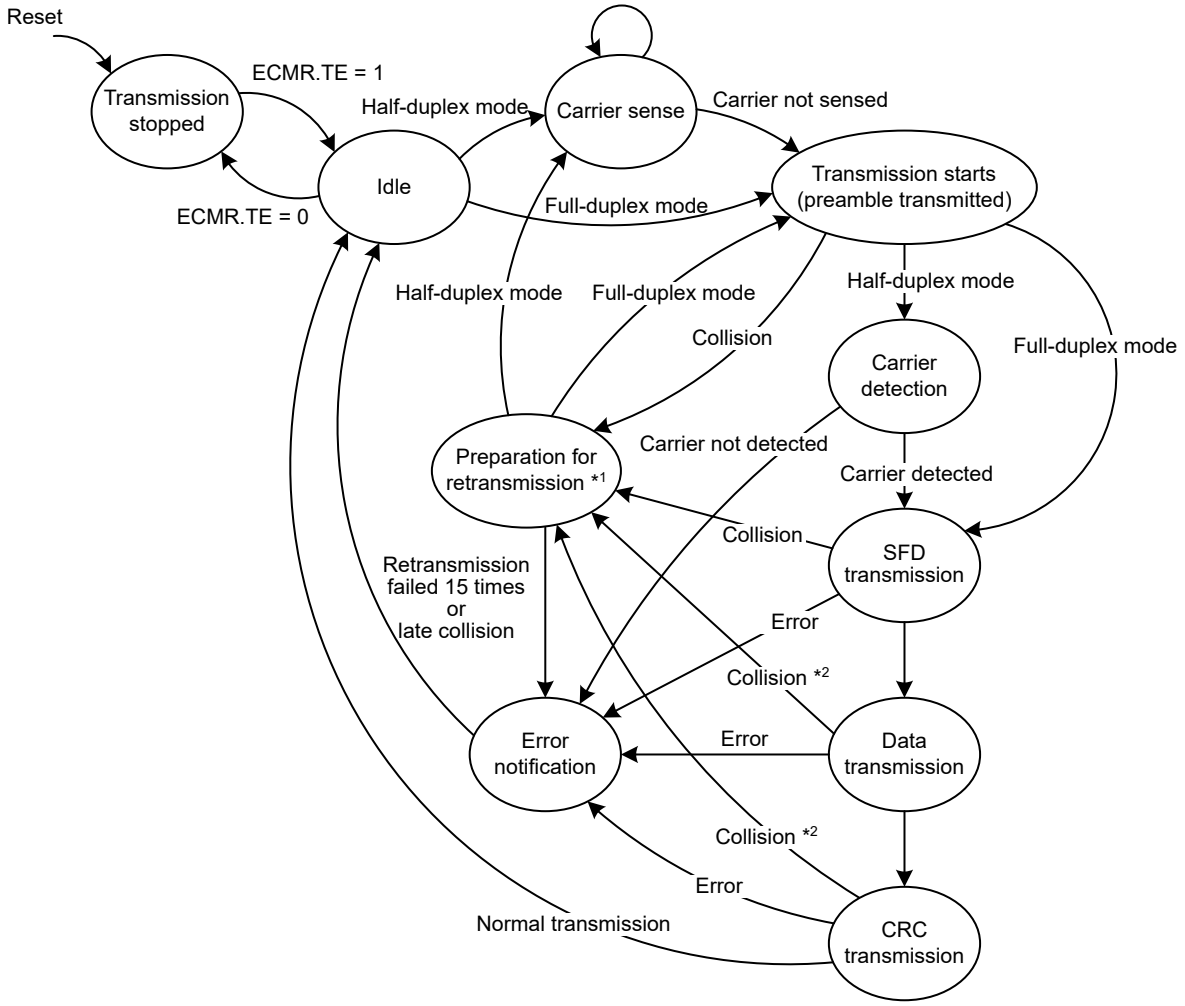
27.3 Operation

This section provides an overview of the ETHERC operations. ETHERC supports the flow control compliant with IEEE802.3x, and can transmit and receive PAUSE frames.

27.3.1 Transmission

The ETHERC transmitter assembles the transmit data into a frame and outputs it to the MII or RMII when a transmit request is received from the EDMAC. The frame transmitted through the MII or RMII is transmitted on the line by the PHY-LSI.

Figure 27.4 shows the state transitions of the ETHERC transmitter.



Note 1. Preparation for retransmission after a collision is detected includes transmitting a jam signal and adjusting transmission time intervals using the backoff algorithm.

Note 2. Preparation for retransmission is performed only when a collision is detected within 512 bit times after preamble transmission starts. When a collision is detected after 512 bit times, only a jam signal is transmitted and processing using the backoff algorithm is not performed.

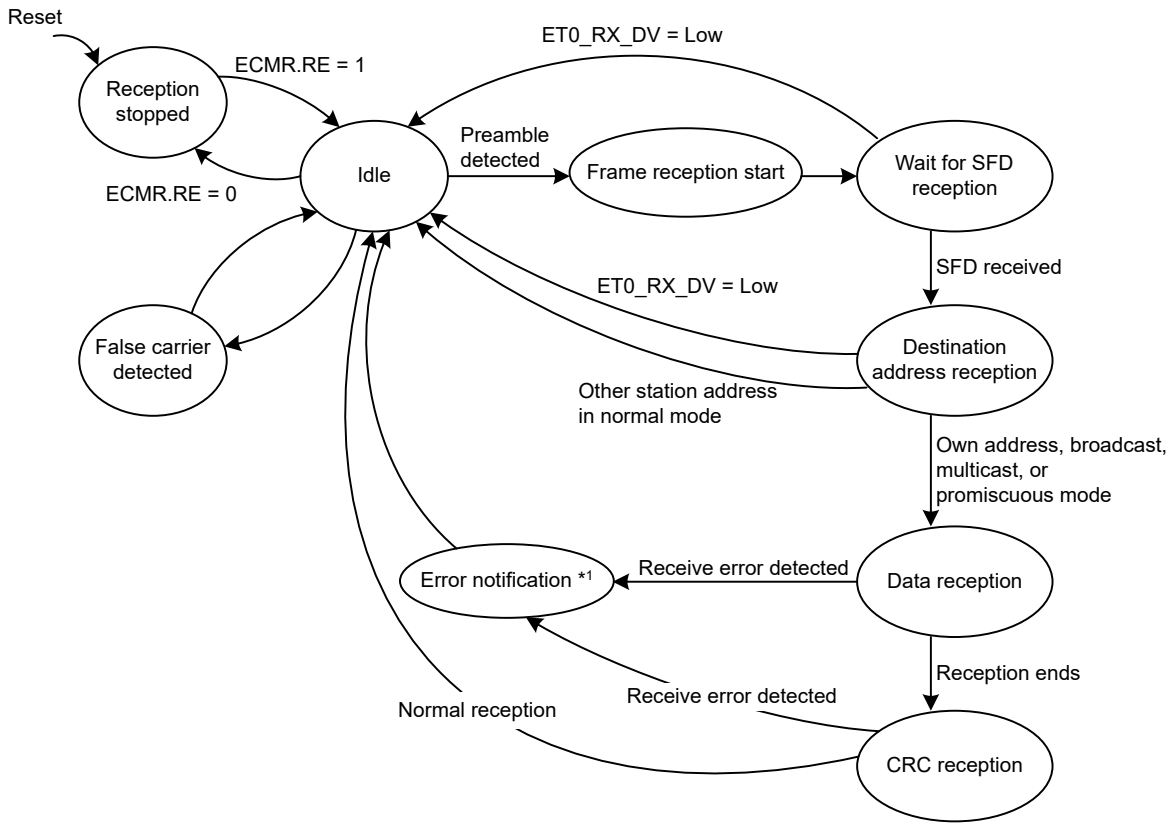
Figure 27.4 ETHERC transmitter state transitions

The ETHERC transmitter state transitions are as follows:

1. When the ECMR.TE bit is set to 1, the ETHERC enters the transmit idle state.
2. When a transmit request is received from the EDMAC, the ETHERC enters the carrier sense state. The ETHERC waits for the interpacket gap and then transmits a preamble to the MII or RMII. When full-duplex mode is selected, carrier sensing is not required, so the ETHERC transmits a preamble immediately after receiving a transmit request from the EDMAC.
3. The ETHERC transmits the Start Frame Delimiter (SFD), transmit data, and CRC sequentially. When the transmission completes successfully, the ETHERC notifies the EDMAC of successful completion, and the EDMAC sets the EDMAC0.EESR.TC flag to 1. When a late collision or loss of carrier is detected during data transmission, the ETHERC stops the transmission and notifies the EDMAC of the error.
4. After the time specified as the interpacket gap has elapsed, the ETHERC enters the idle state and continues the transmission when transmit data remains.

27.3.2 Reception

The ETHERC receiver separates the frame input from the MII or RMII into the preamble, SFD, receive data, and CRC, and transmits only the receive data (destination address, source address, type/length, data/LLC). Figure 27.5 shows the state transitions of the ETHERC receiver.



Note 1. Data in error frames is also transferred to the receive buffer.

Figure 27.5 ETHERC receiver state transitions

The ETHERC receiver state transitions are as follows:

1. When the ECMR.RE bit is set to 1, the ETHERC enters the receive idle state.
2. When the SFD following the preamble of the receive packet is detected, the ETHERC starts reception. If the received SFD is invalid, the ETHERC discards the frame.
3. In normal mode, the ETHERC starts data reception when the destination address of the receive frame is the address of the MCU or the receive frame is a broadcast or multicast frame. In promiscuous mode, the ETHERC starts data reception regardless of the receive frame type.
4. After receiving data from the MII or RMII, the ETHERC performs a CRC check. The ETHERC notifies the EDMAC of the CRC check result. After the received data is transferred to the receive buffer, the CRC check result is written back to the receive descriptor as status. The result is also reflected in the EDMAC0.EESR.CERF flag.
5. When the ECMR.RE bit is 1 after one frame is received, the ETHERC prepares to receive the next frame.

27.3.3 Frame Timing

27.3.3.1 MII frame timing

Figure 27.6 to Figure 27.11 show the MII frame timing.

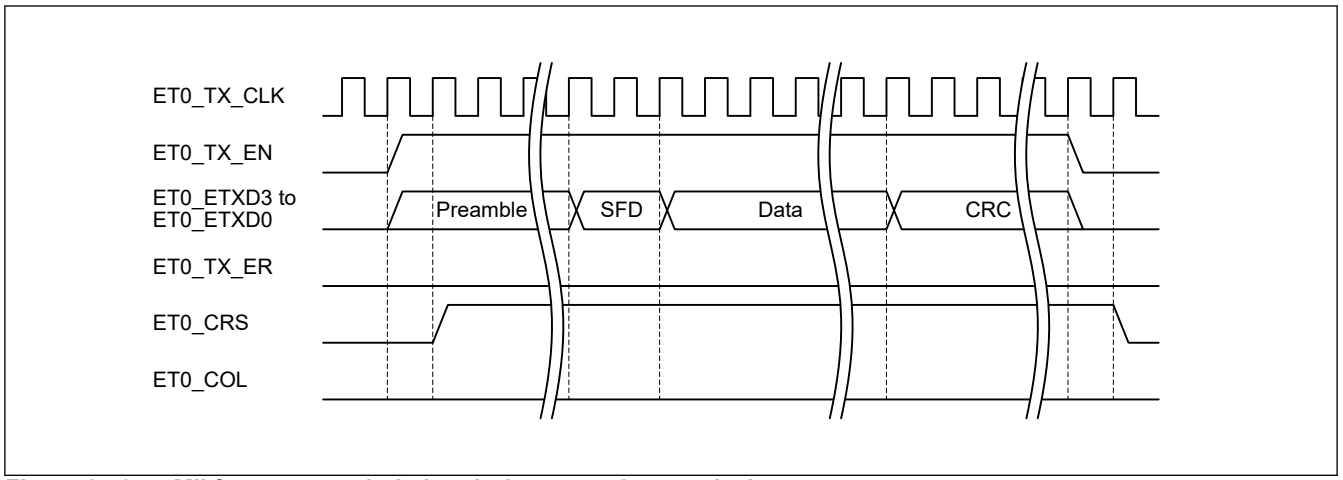


Figure 27.6 MII frame transmit timing during normal transmission

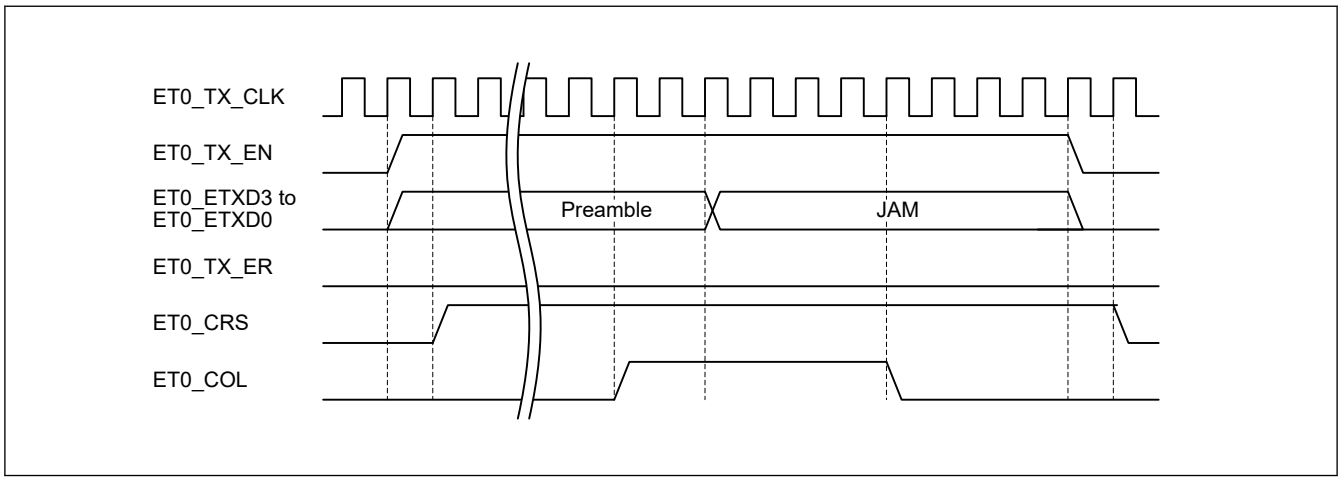

Figure 27.7 MII frame transmit timing when a collision occurs

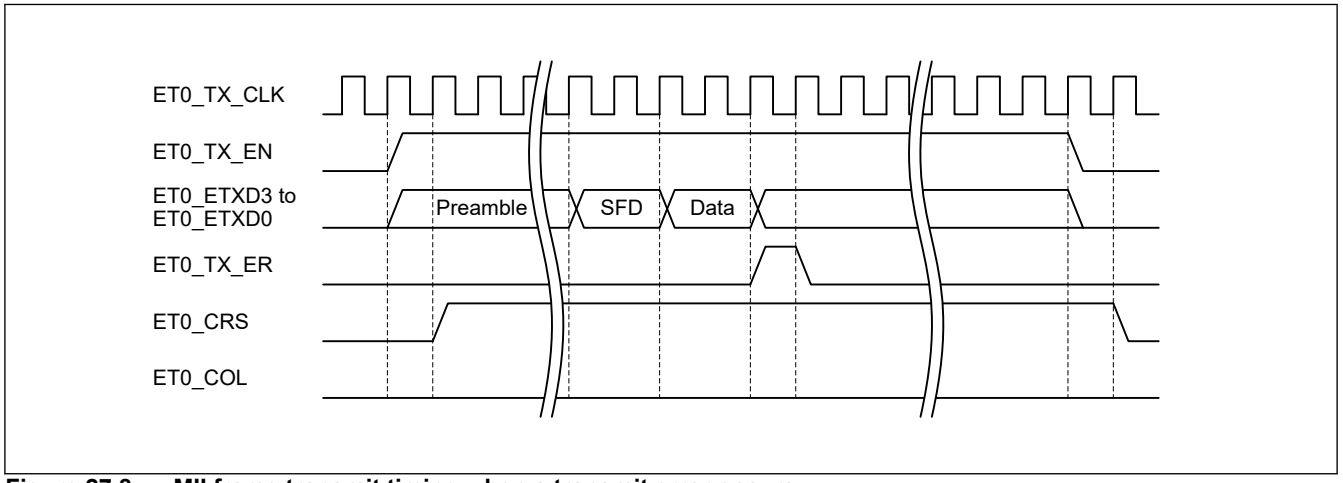

Figure 27.8 MII frame transmit timing when a transmit error occurs

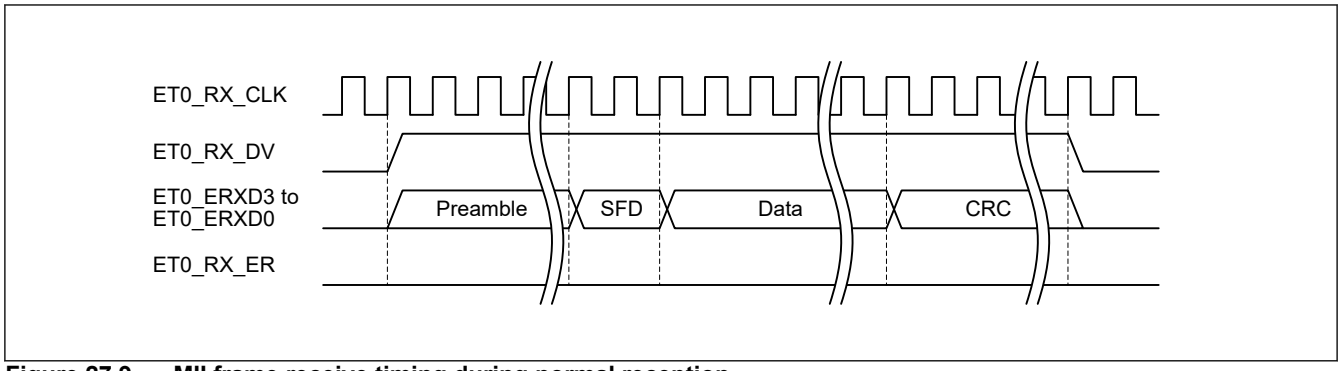

Figure 27.9 MII frame receive timing during normal reception

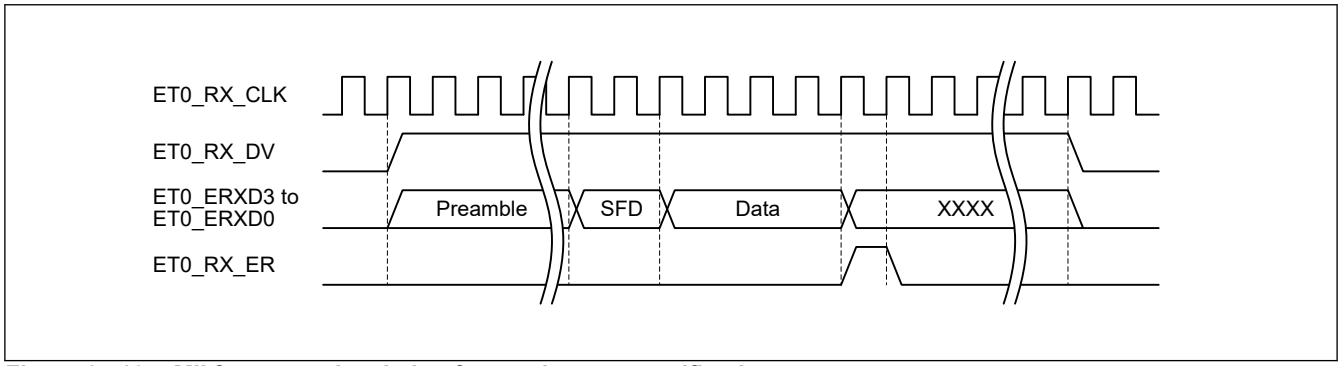

Figure 27.10 MII frame receive timing for receive error notification

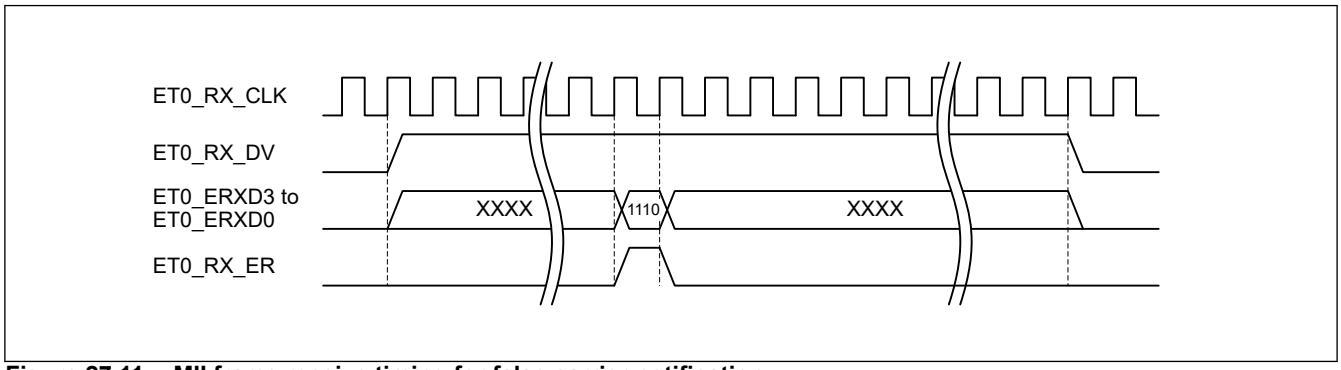

Figure 27.11 MII frame receive timing for false carrier notification

27.3.3.2 RMII frame timing

Figure 27.12 to Figure 27.14 show the RMII frame timing.

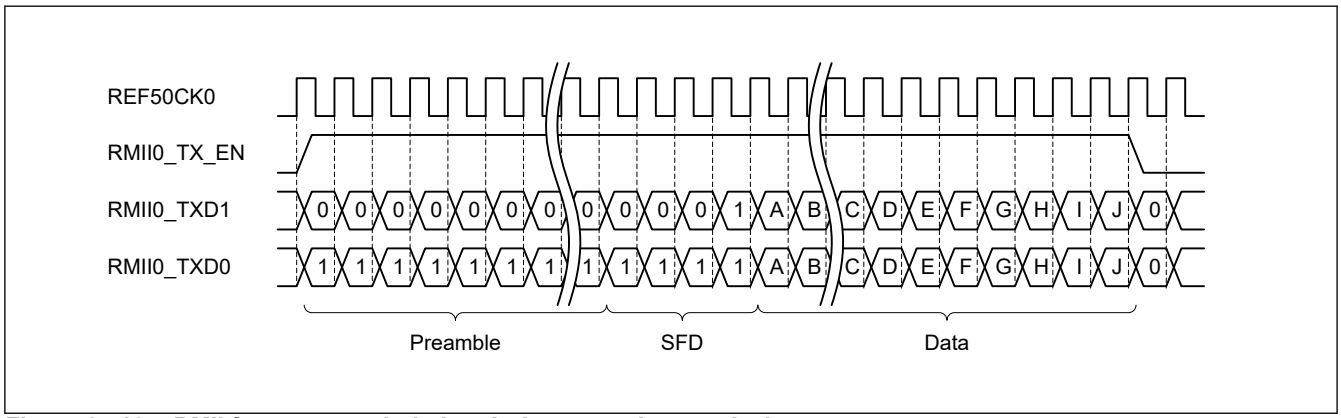

Figure 27.12 RMII frame transmit timing during normal transmission

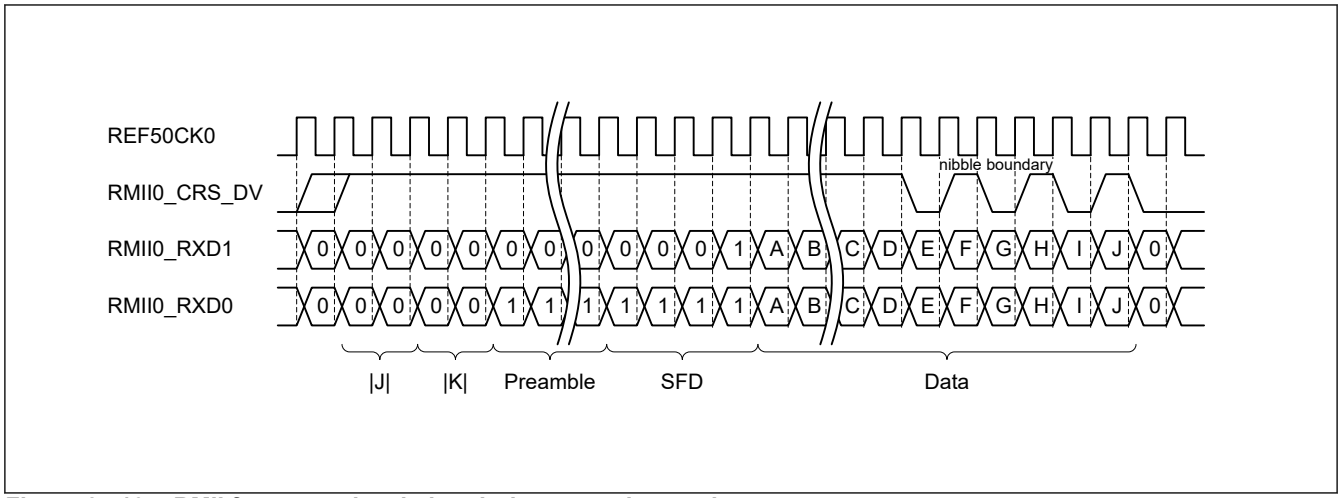

Figure 27.13 RMII frame receive timing during normal reception

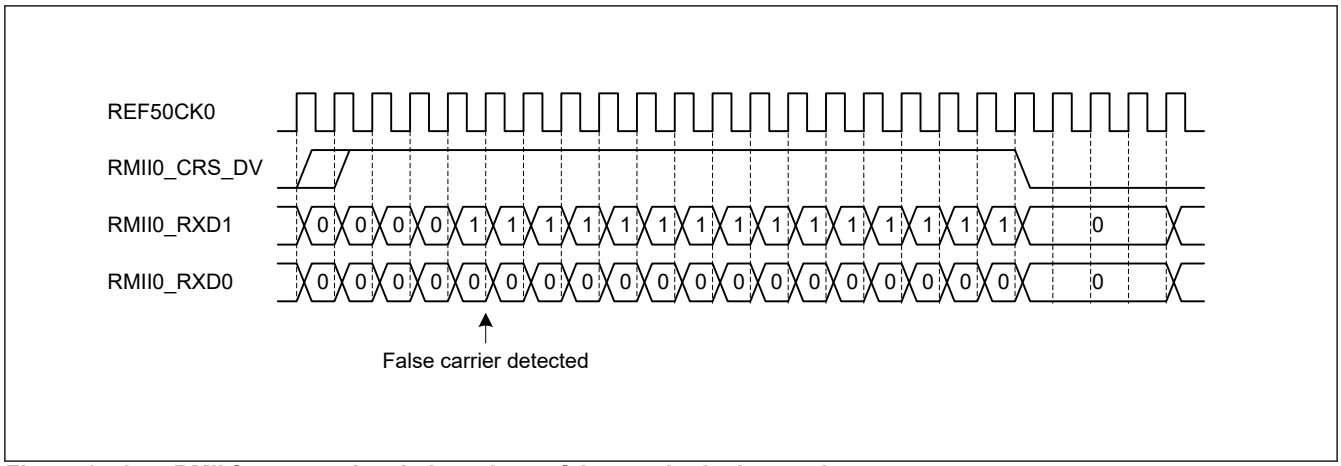

Figure 27.14 RMII frame receive timing when a false carrier is detected

27.3.4 Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

27.3.4.1 MII and RMII management frame format

Table 27.3 lists the MII and RMII management frame formats.

Table 27.3 MII and RMII management frame formats

	Access type	MII and RMII management frame							
	Parameter	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1…1	01	10	00001	RRRRR	Z0	DDDDDDDD DDDDDDDD	Z
Write		1…1	01	01	00001	RRRRR	10	DDDDDDDD DDDDDDDD	Z

Note: PRE (preamble): Send 32 consecutive 1s.
ST (start of frame): Send 01b.
OP (operation code): Send 10b for read or 01b for write.
PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 0x01.

REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 0x01.
TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation. Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write operation (Z is output). No control is required, because a bus was already released during a read operation.

27.3.4.2 MII and RMII register access procedure

Access to the MII and RMII registers includes writing data in 1-bit units, reading data in 1-bit units, and releasing the bus. Figure 27.15 to Figure 27.18 show examples of the MII and RMII register access timing. The access timing differs with the PHY-LSI type.

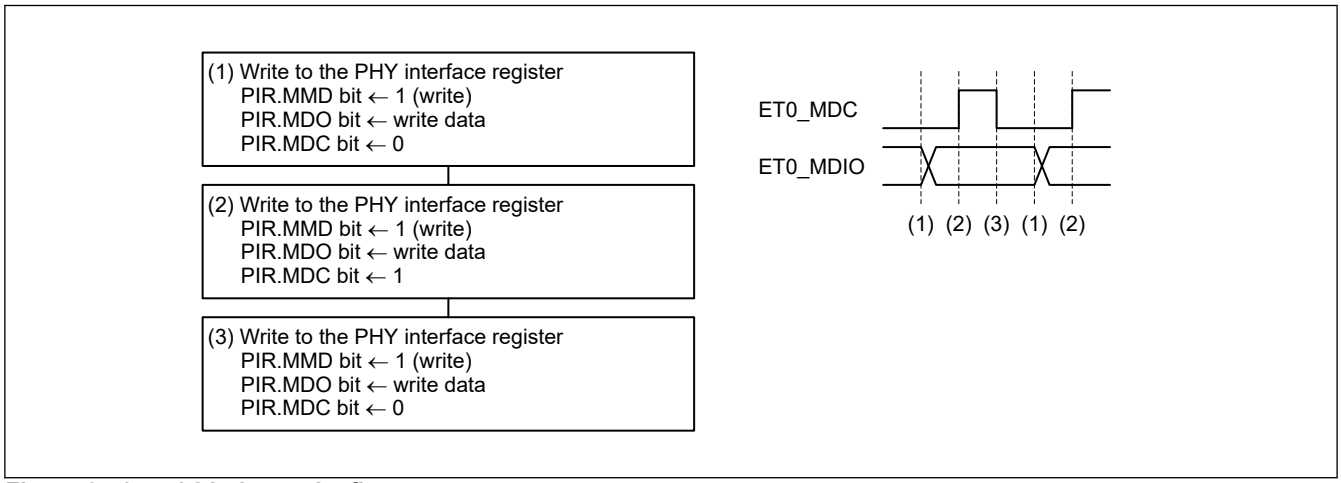

Figure 27.15 1-bit data write flow

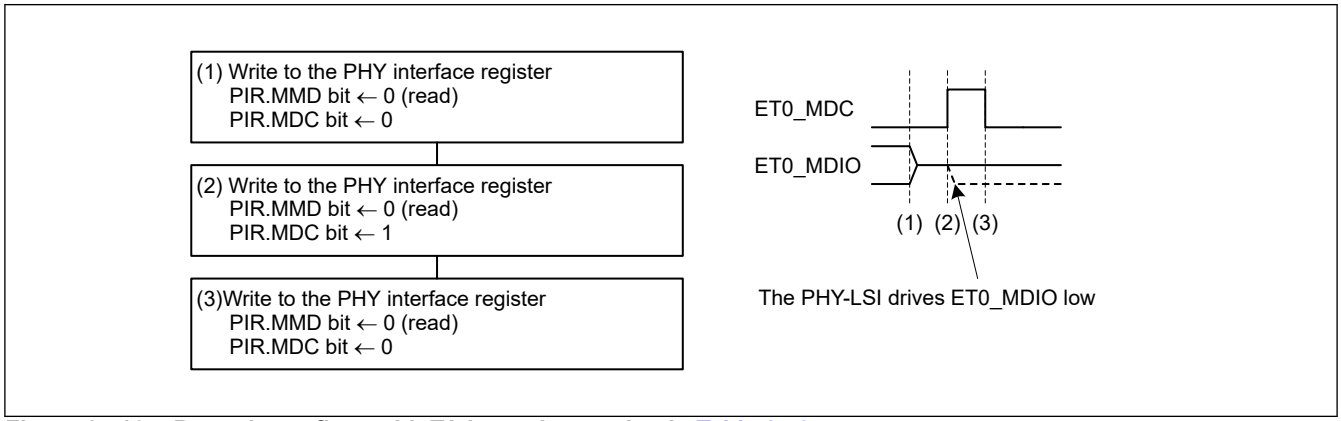

Figure 27.16 Bus release flow, with TA in read operation in Table 27.3

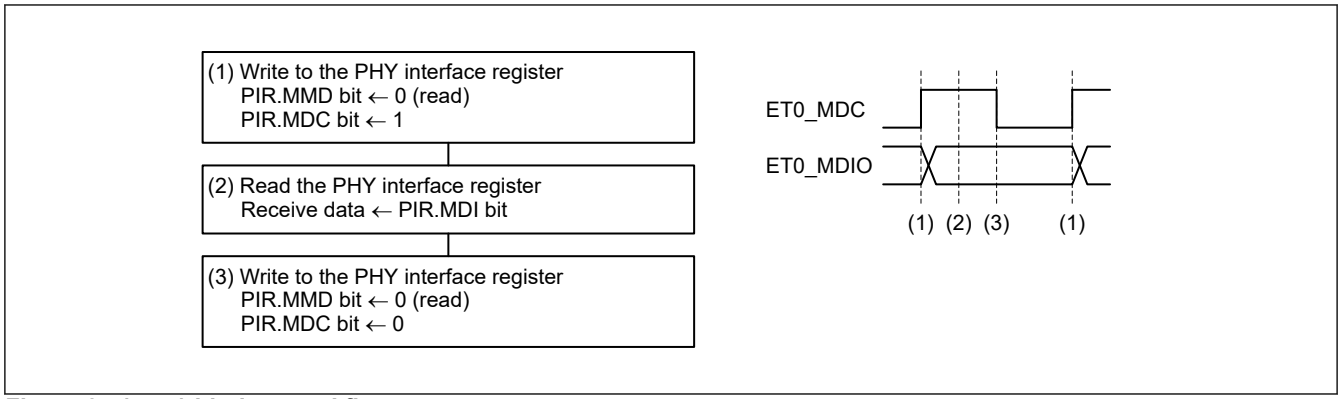

Figure 27.17 1-bit data read flow

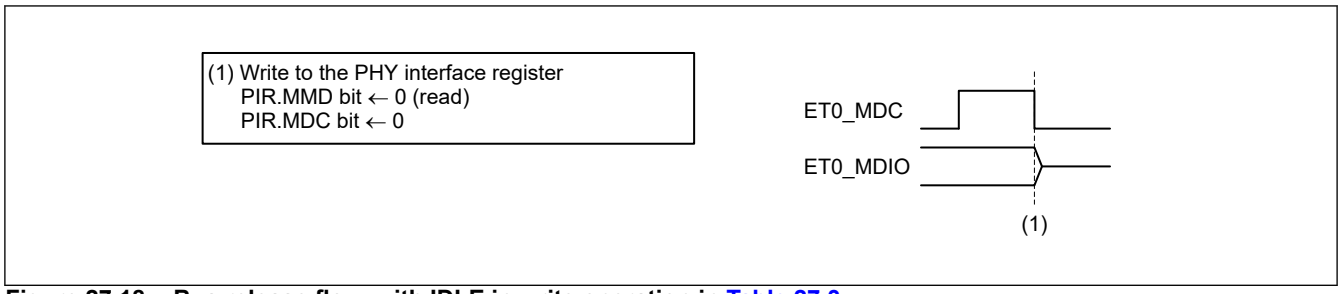

Figure 27.18 Bus release flow, with IDLE in write operation in Table 27.3

27.3.5 Magic Packet Detection

The ETHERC supports Wake-on-LAN (WOL). WOL is a function to detect a Magic Packet transmitted from a host device or other device, and to wake the MCU from a low power mode such as Sleep. When the ETHERC detects a Magic Packet, it outputs high on the ET0_WOL pin. Write 1 to the EDMAC0.EDMR.SWR bit to drive the ET0_WOL pin low.

Because a Magic Packet is transmitted in broadcast mode, it is received regardless of the destination MAC address selected in the format. The ETHERC outputs high on the ET0_WOL pin only when the destination MAC address matches its own MAC address. See the technical documentation provided by Advanced Micro Devices, Inc., for details on the Magic Packet.

To use WOL in the MCU, use the procedure in the following example:

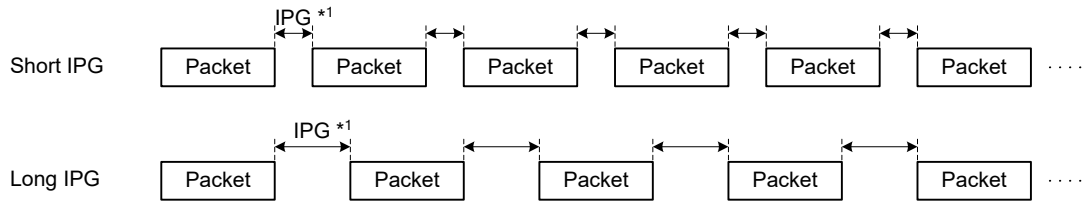
1. Configure the ICU to disable ETHER_EINT0 interrupt requests.
2. Set the ECMR.MPDE bit to 1 to enable Magic Packet detection, and set the ECMR.RE bit to 1 to enable reception.
3. Set the ECSIPR.MPDIP bit to 1 to enable notification of Magic Packet detection interrupts.
4. Set the EDMAC0.EESIPR.ECIIP bit to 1 to enable ETHERC status register source interrupts.
5. Configure the ICU to enable ETHER_EINT0 interrupt requests.
6. Change the CPU operating mode to CPU Sleep mode or place unused peripherals in the module-stop state, as required.
7. When a Magic Packet is detected, an interrupt request is sent to the CPU. High is output on the ET0_WOL pin to notify peripheral devices that the Magic Packet was detected.

27.3.5.1 Constraints on Magic Packet detection

The ETHERC receives packets, including broadcast packets, even when waiting to receive a Magic Packet. This means that receive data might already be stored in the receive FIFO of the EDMAC when a Magic Packet is detected. Also, flags in the ECSR and EDMAC0.EESR registers might have changed. When returning to normal operation after detecting a Magic Packet, set the EDMAC0.EDMR.SWR bit to 1 to reset the ETHERC and EDMAC.

27.3.6 Adjusting Transmission Efficiency by Changing the IPG

The IPG is a non-transmit period between transmit frames. The ETHERC can change the value of the IPG to increase or decrease transmission efficiency based on the value set in the IPGR register. Typical values are specified in the IEEE802.3 standard. When changing the setting, confirm that all devices in the same network operate normally.



Note 1. The IPG may be longer than the set value depending on the condition of the line or system bus.

Figure 27.19 Differences in transmission efficiency based on changes in the IPG

27.3.7 Flow Control

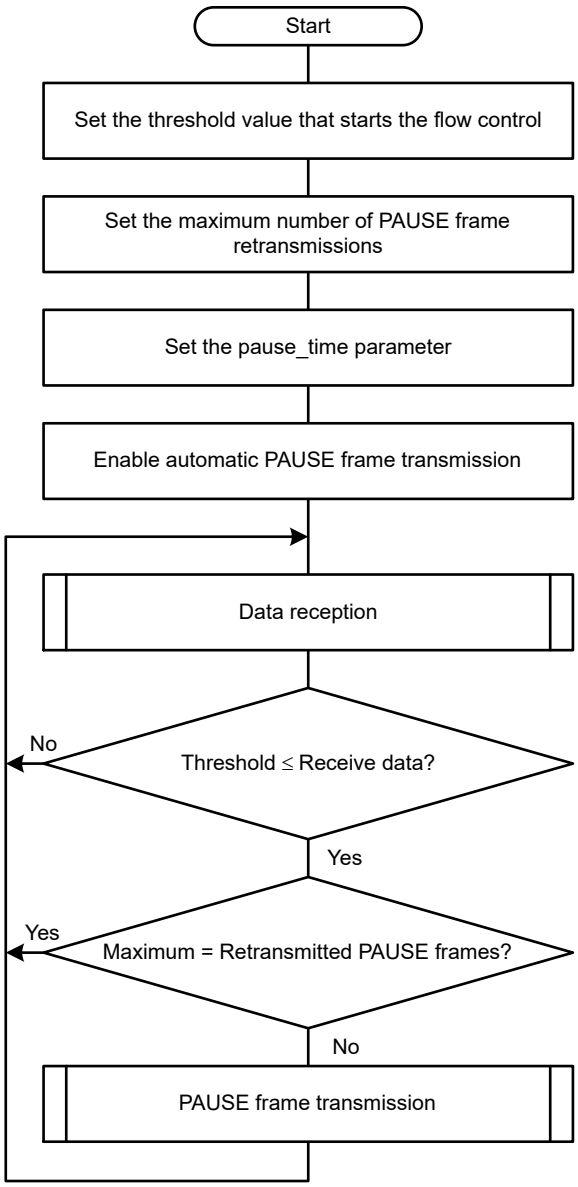
The ETHERC can perform flow control compliant with IEEE802.3x in full-duplex mode, and the receiver and transmitter can be set independently. PAUSE frames can be transmitted automatically or manually.

27.3.7.1 Automatic PAUSE frame transmission

When the ECMR.TXF bit is set to 1, automatic PAUSE frame transmission is enabled. A PAUSE frame is automatically transmitted by a PAUSE frame transmit request from the EDMAC. The APR.AP[15:0] bit value is used for the pause_time parameter of the PAUSE frame.

When a PAUSE frame is transmitted, if the EDMAC is still requesting PAUSE frame transmission after the PAUSE time elapses, a PAUSE frame is transmitted again. The maximum number of PAUSE frame retransmissions can be set in the TPAUSER.TPAUSE[15:0] bits. If the maximum number of retransmissions is reached, subsequent PAUSE frames are not transmitted.

Figure 27.20 shows the procedure for setting up automatic PAUSE frame transmission.



1. Set the threshold value in the EDMAC0.FCFTR.RFDO[2:0] bits or EDMAC0.FCFTR.RFFO[2:0] bits.
2. Set the maximum number of automatic PAUSE frame retransmissions in the TPAUSER.TPAUSE[15:0] bits.
3. Set the pause_time parameter of the automatic PAUSE frame in the APR.AP[15:0] bits.
4. Set the ECMR.TXF bit to 1.
5. Set the ECMR.RE bit to 1.
6. Check whether the amount of receive FIFO data or the number of received frames reached the threshold.
7. Check whether the number of automatic PAUSE frame retransmissions reached the threshold.

Figure 27.20 Example procedure for setting up automatic PAUSE frame transmission

27.3.7.2 Manual PAUSE frame transmission

A PAUSE frame can be manually transmitted at any time. When the software writes the pause_time parameter of the PAUSE frame to the MPR.MP[15:0] bits, the ETHERC transmits a PAUSE frame once. To transmit a PAUSE frame more than once, write to the MPR.MP[15:0] bits for each transmission.

27.3.7.3 PAUSE frame reception

When the ECMR.RXF bit is set to 1, PAUSE frame detection is enabled. After a PAUSE frame is received, the ETHERC completes transmission of the current frame and waits for the PAUSE time of the received PAUSE frame to elapse before it can transmit the next frame. The ETHERC also increments the RFCF.RPAUSE[7:0] bit value.

However, while waiting for the PAUSE time to elapse, if a PAUSE frame that contains a pause_time parameter of 0 is received and the ECMR.ZPF bit is 1, the ETHERC becomes ready to transmit immediately.

27.4 Interrupts

When a flag in the ECSR register sets to 1 and the associated bit in the ECSIPR register is 1, the ETHERC notifies the EDMAC of the interrupt source status. After receiving the notification, the EDMAC sets the EDMAC0.EESR.ECI flag to 1. When the EDMAC0.EESIPR.ECIIP bit is 1, the EDMAC sends an ETHER_EINT0 interrupt request to the CPU.

For details, see section 28, Ethernet DMA Controller (EDMAC).

27.5 Usage Notes

27.5.1 Preventing the LCHNG Flag from Erroneously Setting to 1

The ECSR.LCHNG flag might set to 1 even when the input level of the ET0_LINKSTA pin remains the same. In this case, high level is input to the ET0_LINKSTA pin when setting the PFS.PmnPFS register to assign the ET0_LINKSTA signal to a port, or when releasing the ETHERC and EDMAC software reset using the EDMAC0.EDMR.SWR bit. The ECSR.LCHNG flag is sets to 1 because the ET0_LINKSTA signal in the ETHERC is fixed low level regardless of the input level to the external pin if the MPC does not assign the ET0_LINKSTA signal or during an ETHERC and EDMAC software reset.

To avoid erroneously generating a link signal change interrupt, clear the ECSR.LCHNG flag, and then set the ECSIPR.LCHNGIP bit to 1.

27.5.2 Input to RMII0_RX_ER Pin While RMII Is Selected

When the width of a reception error signal received from the PHY-LSI is only 1 cycle of the REF50CK0 clock (50 MHz) while the RMII is selected, the signal is not recognized as an error signal.

27.5.3 Collision Occurrence in Half-Duplex Mode

Transmission might start and communication might collide within 21 clock cycles (50 MHz) from reception in halfduplex mode.

28. Ethernet DMA Controller (EDMAC)

28.1 Overview

The MCU provides one channel for the Ethernet DMA Controller (EDMAC) for the Ethernet Controller (ETHERC) .

The EDMAC controls most of the transmit and receive buffer management for communications. This reduces the load on the CPU and allows efficient data transmission and reception. The data transfers are controlled according to the information referred to as descriptors, in memory. EDMAC0 controls data transmission and reception for ETHERC0.

Table 28.1 lists the EDMAC specifications and Figure 28.1 shows the configuration. Figure 28.2 shows the configuration of descriptors and the transmit and receive buffers in memory.

Table 28.1 EDMAC specifications

Parameter	Specifications
Data transmission and reception	• Controls data transmission and reception according to descriptors • Supports single buffer frame transmission and reception (1 buffer per frame) and multi-buffer frame transmission and reception (multiple buffers per frame)
Functions	• Minimizes system bus occupancy time using block transfer (32-byte units) • Writes back the transmit or receive frame state to descriptors • Inserts padding in receive data
Module-stop function	Module-stop state can be set to reduce power consumption
Trust Zone Filter	Security and Privilege attribution can be set

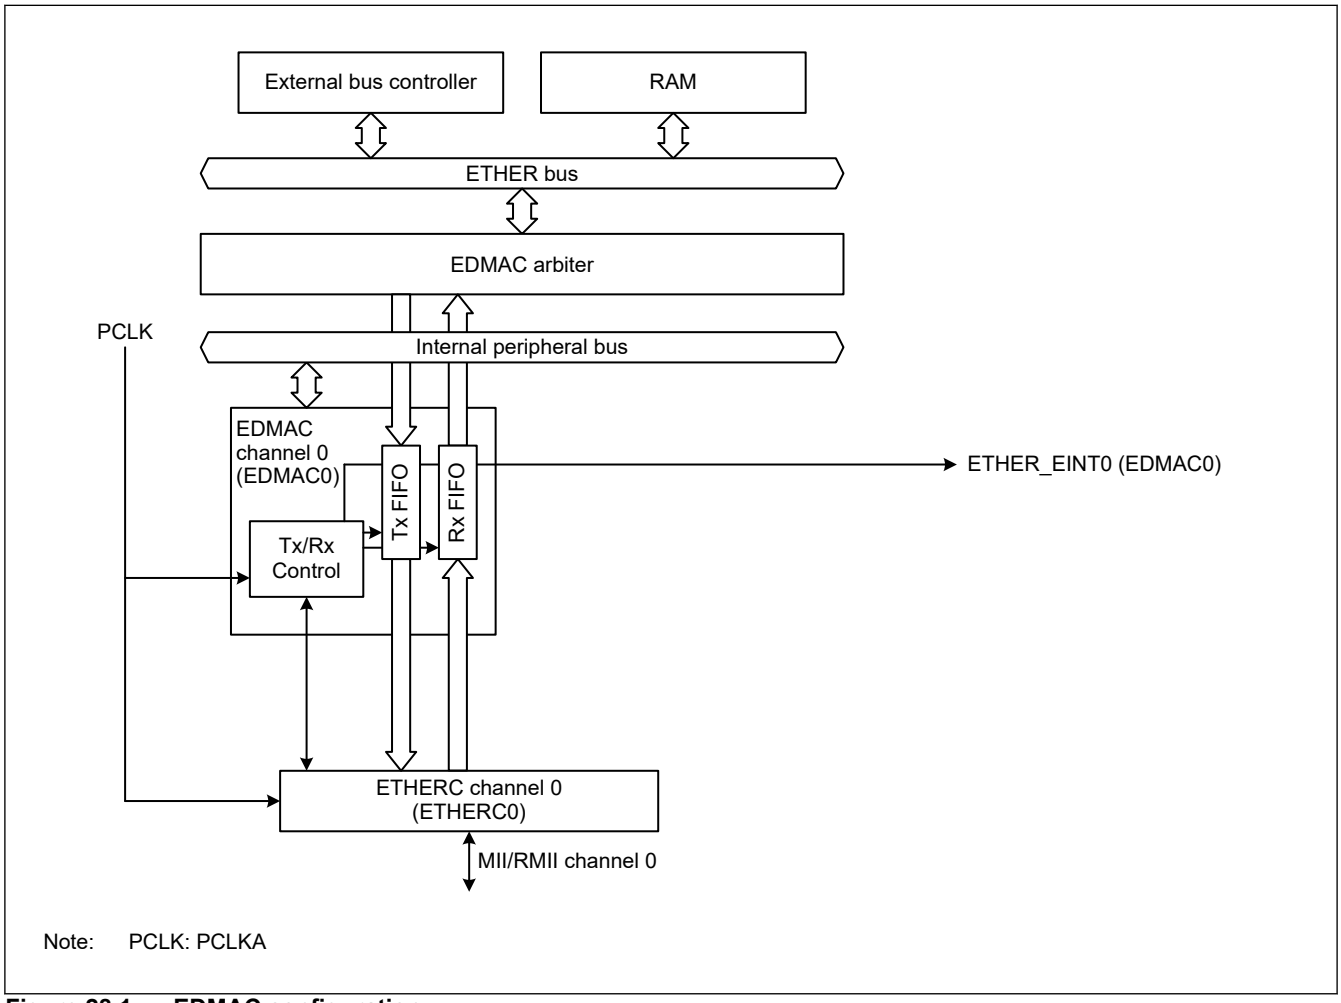


Figure 28.1 EDMAC configuration

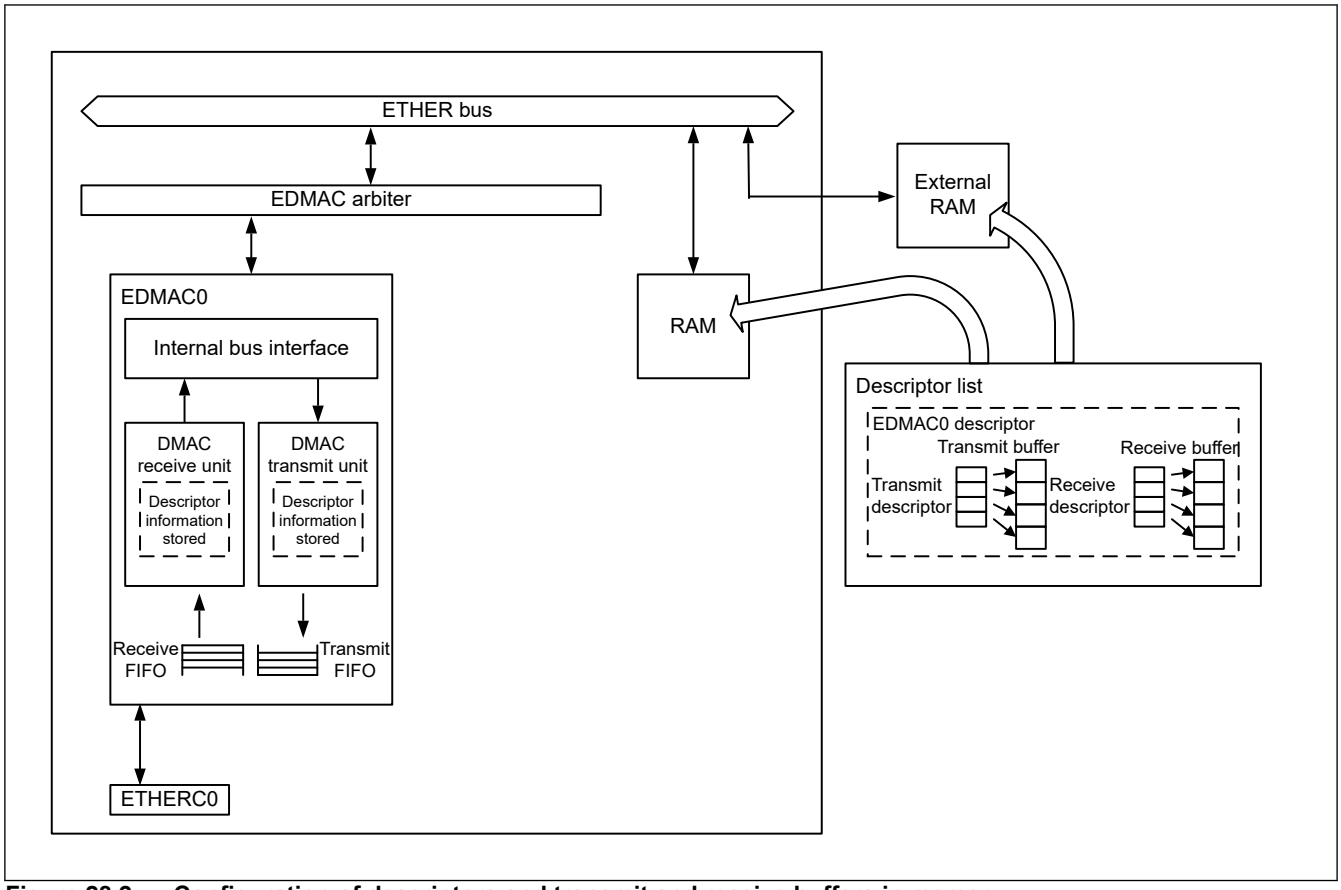

Figure 28.2 Configuration of descriptors and transmit and receive buffers in memory

28.2 Register Descriptions

28.2.1 EDMR : EDMAC Mode Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x00

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	DE	DL[1:0]		—	—	—	SWR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	SWR	Software Reset When 1 is written, the associated channels of the EDMAC and ETHERC are reset. The TDLAR, RDLAR, RMFCR, TFUCR, and RFOCR registers are not reset with this bit.The read value is 0.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
5:4	DL[1:0]	Transmit/Receive Descriptor Length 0 0: 16 bytes 0 1: 32 bytes 1 0: 64 bytes 1 1: 16 bytes.	R/W
6	DE	Big Endian Mode/Little Endian Mode*1 0: Big endian mode 1: Little endian mode.	R/W
31:7	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3
Note 1. This setting applies to data for the transmit and receive buffers. It does not apply to transmit and receive descriptors and registers.

The EDMR register controls EDMAC operation. Set the EDMR register during initialization process after a reset. When rewriting this register outside of the initialization process, set the SWR bit to 1 to reset the EDMAC and ETHERC, then set this register again. If the ETHERC and EDMAC are reset during data transmission or reception, abnormal data might be sent on the line. Do not rewrite this register while the ETHERC transmit or receive function is enabled. It takes 64 cycles of the peripheral module clock (PCLKA) to initialize the ETHERC and EDMAC. Complete the initialization before accessing registers in the ETHERC and EDMAC.

28.2.2 EDTRR : EDMAC Transmit Request Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x08

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	TR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	TR	Transmit Request When 1 is written, the EDMAC reads the associated descriptor and transmits frames where the TD0.TACT bit is 1. The TR bit clears to 0 after all the valid frames are transmitted. Writing 0 to this bit has no effect.	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The EDTRR register controls EDMAC transmission. After the EDMAC transmits one frame, it reads the next descriptor. When the TD0.TACT bit in the descriptor is 1, the EDMAC continues transmission. When the TD0.TACT bit is 0, the EDMAC sets the TR bit to 0 and stops transmission.

28.2.3 EDRRR : EDMAC Receive Request Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x10

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RR	Receive Request 0: Disable the receive function*1 1: Read receive descriptor and enable the receive function.	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

Note 1. If the receive function is disabled during frame reception, write-back to the receive descriptor is not performed successfully. Subsequent pointers for reading a receive descriptor become abnormal and the EDMAC cannot operate normally. In this case, to enable the EDMAC receive function again, execute a software reset by setting the EDMR.SWR bit to 1. To disable the EDMAC receive function without resetting the EDMAC, set the ETHERC0.ECMR.RE bit to 0. After the EDMAC completes reception and write-back to the receive descriptor is confirmed, set the RR bit to 0.

The EDRRR register controls EDMAC reception. When the RR bit sets to 1, the EDMAC reads the receive descriptor.

When the RD0.RACT bit is 1, the EDMAC waits for a receive request from the ETHERC. When the EDMAC has received data for the receive buffer size, it reads the next descriptor and waits to receive a frame. If the RD0.RACT bit is 0, the EDMAC sets the RR bit to 0 and stops reception.

28.2.4 TDLAR : Transmit Descriptor List Start Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x18

Bit position:	31	0
Bit field:		
Value after reset:	0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	

Bit	Symbol	Function	R/W
31:0	—	These bits specify the start address of the transmit descriptor list. Set the start address according to the descriptor length selected in the EDMR.DL[1:0] bits. ● 16-byte boundary: Lower 4 bits = 0000b ● 32-byte boundary: Lower 5 bits = 00000b ● 64-byte boundary: Lower 6 bits = 000000b.	R/W

Note: S-TYPE3, P-TYPE3

The TDLAR register specifies the start address of the transmit descriptor list. Align each descriptor on the associated boundary to the descriptor length selected in the EDMR.DL[1:0] bits. Do not rewrite the TDLAR register during transmission. Rewrite the TDLAR register while the EDTRR.TR bit is 0.

28.2.5 RDLAR : Receive Descriptor List Start Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x20

Bit position:	31																												0
Bit field:																													
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
31:0	—	The start address of the receive descriptor list is set. Set the start address according to the descriptor length selected in the EDMR.DL[1:0] bits. ● 16-byte boundary: Lower 4 bits = 0000b ● 32-byte boundary: Lower 5 bits = 00000b ● 64-byte boundary: Lower 6 bits = 000000b.	R/W

Note: S-TYPE3, P-TYPE3

The RDLAR register specifies the start address of the receive descriptor list. Allocate each descriptor on the associated boundary to the descriptor length selected in the EDMR.DL[1:0] bits. Do not rewrite the RDLAR register during reception. Rewrite the RDLAR register while the EDRRR.RR bit is 0.

28.2.6 EESR : ETHERC/EDMAC Status Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x28

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	TWB	—	—	—	TABT	RABT	RFCOF	ADE	ECI	TC	TDE	TFUF	FR	RDE	RFOF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CND	DLC	CD	TRO	RMAF	—	—	RRF	RTLF	RTSF	PRE	CERF
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CERF	CRC Error Flag 0: CRC error not detected 1: CRC error detected.	R/W
1	PRE	PHY-LSI Receive Error Flag 0: PHY-LSI receive error not detected 1: PHY-LSI receive error detected.	R/W
2	RTSF	Frame-Too-Short Error Flag 0: Frame-too-short error not detected 1: Frame-too-short error detected.	R/W
3	RTLF	Frame-Too-Long Error Flag 0: Frame-too-long error not detected 1: Frame-too-long error detected.	R/W
4	RRF	Alignment Error Flag 0: Alignment error not detected 1: Alignment error detected.	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
7	RMAF	Multicast Address Frame Receive Flag 0: Multicast address frame not received 1: Multicast address frame received.	R/W
8	TRO	Transmit Retry Over Flag 0: Transmit retry-over condition not detected 1: Transmit retry-over condition detected.	R/W
9	CD	Late Collision Detect Flag 0: Late collision not detected 1: Late collision detected during frame transmission.	R/W
10	DLC	Loss of Carrier Detect Flag 0: Loss of carrier not detected 1: Loss of carrier detected during frame transmission.	R/W
11	CND	Carrier Not Detect Flag 0: Carrier detected when transmission started 1: Carrier not detected during preamble transmission.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
16	RFOF	Receive FIFO Overflow Flag 0: No overflow occurred 1: Overflow occurred.	R/W
17	RDE	Receive Descriptor Empty Flag 0: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 1 1: EDMAC detected that the receive descriptor valid bit (RD0.RACT) is 0.	R/W
18	FR	Frame Receive Flag 0: Frame not received 1: Frame received and update of the receive descriptor is complete.	R/W
19	TFUF	Transmit FIFO Underflow Flag 0: No underflow occurred 1: Underflow occurred.	R/W
20	TDE	Transmit Descriptor Empty Flag 0: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 1 1: EDMAC detected that the transmit descriptor valid bit (TD0.TACT) is 0.	R/W
21	TC	Frame Transfer Complete Flag 0: Transfer not complete or no transfer requested 1: All frames indicated in the transmit descriptor were completely transferred to the transmit FIFO.	R/W
22	ECI	ETHERC Status Register Source Flag 0: ETHERC status interrupt source not detected 1: ETHERC status interrupt source detected.	R*1
23	ADE	Address Error Flag 0: Invalid memory address not detected (normal operation) 1: Invalid memory address detected.*2	R/W
24	RFCOF	Receive Frame Counter Overflow Flag 0: Receive frame counter did not overflow 1: Receive frame counter overflowed.	R/W
25	RABT	Receive Abort Detect Flag 0: Frame reception not aborted or no reception requested 1: Frame reception aborted.	R/W
26	TABT	Transmit Abort Detect Flag 0: Frame transmission not aborted or no transmission requested. 1: Frame transmission aborted.	R/W
29:27	—	These bits are read as 0. The write value should be 0.	R/W
30	TWB	Write-Back Complete Flag 0: Write-back not complete or no transmission requested 1: Write-back to the transmit descriptor completed.	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3
Note 1. The ECI flag is read-only. When the source in the ECSR register is cleared, the ECI flag is also cleared.
Note 2. When an address error is detected, the EDMAC halts the process. To resume operation, set the EDMR.SWR bit to 1 (resetting the EDMAC and ETHERC), and then reconfigure the EDMAC and ETHERC.

The EESR register indicates the ETHERC and EDMAC communication status. Each flag in the EESR register can be output as an interrupt request signal (ETHER_EINT0) from the EDMAC. Writing 1 clears all of the flags except ECI to 0. Writing 0 does not affect any of the flag values. The interrupt sources are enabled by setting the associated bits in the EESIPR register.

CERF flag (CRC Error Flag)

The CERF flag sets to 1 when an error is detected while checking the frame check sequence (FCS) field of the receive frame.

PRE flag (PHY-LSI Receive Error Flag)

The PRE flag indicates that the RX_ER signal output from the PHY-LSI is high.

RTSF flag (Frame-Too-Short Error Flag)

The RTSF flag indicates that a received frame is less than 64 bytes.

RTLF flag (Frame-Too-Long Error Flag)

The RTLF flag indicates that a received frame is greater than the upper limit of the receive frame length set in the ETHERC0.RFLR register. The excess data is discarded.

RRF flag (Alignment Error Flag)

The RRF flag indicates that a frame is not an integral number of octets. The last word that is not an integral number of octets is not transferred.

RMAF flag (Multicast Address Frame Receive Flag)

The RMAF flag indicates that a multicast frame was received.

TRO flag (Transmit Retry Over Flag)

The TRO flag indicates that a collision occurred again during the 15th retry of frame transmission.

CD flag (Late Collision Detect Flag)

The CD flag indicates that a late collision was detected during frame transmission.

DLC flag (Loss of Carrier Detect Flag)

The DLC flag indicates that a loss of carrier was detected during frame transmission.

CND flag (Carrier Not Detect Flag)

The CND flag sets to 1 when a carrier is not detected during preamble transmission.

RFOF flag (Receive FIFO Overflow Flag)

The RFOF flag indicates that the receive FIFO overflowed during frame reception.

RDE flag (Receive Descriptor Empty Flag)

The RDE flag indicates that the read receive descriptor is invalid. When this flag sets to 1, set the RD0.RACT bit in the receive descriptor to 1 and set the EDRRR.RR bit to 1 to resume reception.

FR flag (Frame Receive Flag)

The FR flag indicates that a frame was received and the receive descriptor was updated. The FR flag sets to 1 every time a frame is received.

TFUF flag (Transmit FIFO Underflow Flag)

The TFUF flag indicates that no data remains in the transmit FIFO during frame transmission. Incomplete data is sent to the line.

TDE flag (Transmit Descriptor Empty Flag)

The TDE flag indicates that the TD0.TACT bit of the transmit descriptor is 0 while the previous transmit descriptor indicates that the frame is not complete (TD0.TFP[1:0] bits are 10b or 00b) in multi-buffer frame transmission. As a result, an incomplete frame might be sent.

When this flag sets to 1, perform a software reset and then set the EDTRR.TR bit to 1 to resume transmission. Transmission starts from the address stored in the TDLAR register.

TC flag (Frame Transfer Complete Flag)

The TC flag indicates that all the data specified in the transmit descriptor was transmitted from the ETHERC. This flag is set to 1 when one frame was transmitted in a single-buffer frame transmission or when the last data of a frame is transmitted in multi-buffer frame transmission and the TD0.TACT bit in the next transmit descriptor is 0. After frame transmission is complete, the EDMAC writes the transfer status back to the descriptor.

ECI flag (ETHERC Status Register Source Flag)

The ECI flag is set to 1 when an interrupt request is generated by the ECSR register.

ADE flag (Address Error Flag)

The ADE flag indicates that the memory address that the EDMAC tried to use for transfer is invalid.

RFCOF flag (Receive Frame Counter Overflow Flag)

The RFCOF flag indicates that the next frame reception started while the number of frames stored in the receive FIFO reached the maximum number of frames (16 frames). The received frame is discarded while the RFCOF flag is 1.

RABT flag (Receive Abort Detect Flag)

The RABT flag indicates that the ETHERC aborted frame reception because of a CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or other errors.

TABT flag (Transmit Abort Detect Flag)

The TABT flag indicates that the ETHERC aborted frame transmission because of transmit retry over, loss of carrier, no carrier detection, or other errors.

TWB flag (Write-Back Complete Flag)

The TWB flag indicates the EDMAC completed writing back to the descriptor after frame transmission. This flag is set to 1 after each frame transmission when the TRIMD.TIM bit is 0. It only sets to 1 when the TRIMD.TIS bit is 1.

28.2.7 EESIPR : ETHERC/EDMAC Status Interrupt Enable Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x30

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	TWBIP	—	—	—	TABTIP	RABTIP	RFCOFIP	ADEIP	ECIIP	TCIP	TDEIP	TFUFIP	FRIP	RDEIP	RFOFIP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	CNDIP	DLCIP	CDIP	TROIP	RMAFIP	—	—	RRFIP	RTLFIP	RTSFIP	PREIP	CERFIP
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	CERFIP	CRC Error Interrupt Request Enable 0: Disable CRC error interrupt requests 1: Enable CRC error interrupt requests.	R/W

Bit	Symbol	Function	R/W
1	PREIP	PHY-LSI Receive Error Interrupt Request Enable 0: Disable PHY-LSI receive error interrupt requests 1: Enable PHY-LSI receive error interrupt requests.	R/W
2	RTSFIP	Frame-Too-Short Error Interrupt Request Enable 0: Disable frame-too-short error interrupt requests 1: Enable frame-too-short error interrupt requests.	R/W
3	RTLFIP	Frame-Too-Long Error Interrupt Request Enable 0: Disable frame-too-long error interrupt requests 1: Enable frame-too-long error interrupt requests.	R/W
4	RRFIP	Alignment Error Interrupt Request Enable 0: Disable alignment error interrupt requests 1: Enable alignment error interrupt requests.	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	RMAFIP	Multicast Address Frame Receive Interrupt Request Enable 0: Disable multicast address frame receive interrupt requests 1: Enable multicast address frame receive interrupt requests.	R/W
8	TROIP	Transmit Retry Over Interrupt Request Enable 0: Disable transmit retry over interrupt requests 1: Enable transmit retry over interrupt requests.	R/W
9	CDIP	Late Collision Detect Interrupt Request Enable 0: Disable late collision detected interrupt requests 1: Enable late collision detected interrupt requests.	R/W
10	DLCIP	Loss of Carrier Detect Interrupt Request Enable 0: Disable loss of carrier detected interrupt requests 1: Enable loss of carrier detected interrupt requests.	R/W
11	CNDIP	Carrier Not Detect Interrupt Request Enable 0: Disable carrier not detected interrupt requests 1: Enable carrier not detected interrupt requests.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W
16	RFOFIP	Receive FIFO Overflow Interrupt Request Enable 0: Disable overflow interrupt requests 1: Enable overflow interrupt requests.	R/W
17	RDEIP	Receive Descriptor Empty Interrupt Request Enable 0: Disable receive descriptor empty interrupt requests 1: Enable receive descriptor empty interrupt requests.	R/W
18	FRIP	Frame Receive Interrupt Request Enable 0: Disable frame reception interrupt requests 1: Enable frame reception interrupt requests.	R/W
19	TFUFIP	Transmit FIFO Underflow Interrupt Request Enable 0: Disable underflow interrupt requests 1: Enable underflow interrupt requests.	R/W
20	TDEIP	Transmit Descriptor Empty Interrupt Request Enable 0: Disable transmit descriptor empty interrupt requests 1: Enable transmit descriptor empty interrupt requests.	R/W
21	TCIP	Frame Transfer Complete Interrupt Request Enable 0: Disable frame transmission complete interrupt requests 1: Enable frame transmission complete interrupt requests.	R/W
22	ECIIP	ETHERC Status Register Source Interrupt Request Enable 0: Disable ETHERC status interrupt requests 1: Enable ETHERC status interrupt requests.	R/W
23	ADEIP	Address Error Interrupt Request Enable 0: Disable address error interrupt requests 1: Enable address error interrupt requests.	R/W

Bit	Symbol	Function	R/W
24	RFCOFIP	Receive Frame Counter Overflow Interrupt Request Enable 0: Disable receive frame counter overflow interrupt requests 1: Enable receive frame counter overflow interrupt requests.	R/W
25	RABTIP	Receive Abort Detect Interrupt Request Enable 0: Disable receive abort detected interrupt requests 1: Enable receive abort detected interrupt requests.	R/W
26	TABTIP	Transmit Abort Detect Interrupt Request Enable 0: Disable transmit abort detected interrupt requests 1: Enable transmit abort detected interrupt requests.	R/W
29:27	—	These bits are read as 0. The write value should be 0.	R/W
30	TWBIP	Write-Back Complete Interrupt Request Enable 0: Disable write-back complete interrupt requests 1: Enable write-back complete interrupt requests.	R/W
31	—	This bit is read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The EESIPR register enables interrupt requests associated with bits in the EESR register. When a bit in this register is 1, the associated interrupt request is enabled.

28.2.8 TRSCER : ETHERC/EDMAC Transmit/Receive Status Copy Enable Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x38

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	RMAFCE	—	—	RRFCE	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	—	These bits are read as 0. The write value should be 0.	R/W
4	RRFCE	RRF Flag Copy Enable 0: Reflect the EESR.RRF flag status in the RD0.RFE bit of the receive descriptor 1: Do not reflect the EESR.RRF flag status in the RD0.RFE bit of the receive descriptor.	R/W
6:5	—	These bits are read as 0. The write value should be 0.	R/W
7	RMAFCE	RMAF Flag Copy Enable 0: Reflect the EESR.RMAF flag status in the RD0.RFE bit of the receive descriptor 1: Do not reflect the EESR.RMAF flag status in the RD0.RFE bit of the receive descriptor.	R/W
31:8	—	These bits are read as 0. The write value should be 0.	R/W

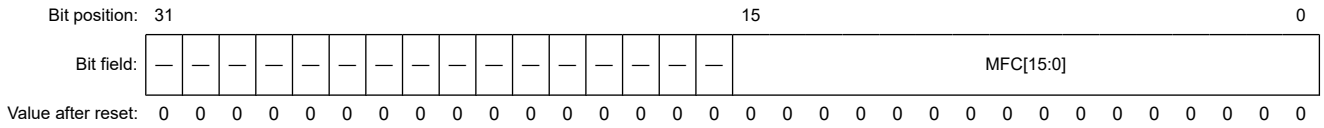
Note: S-TYPE3, P-TYPE3

The TRSCER register selects whether the receive status indicated in the EESR.RMAF and RRF flags is reflected in the RFE bit of the receive descriptor as a summary. The bits in this register are associated with bits in the EESR register that have the same number. When the RMAFCE or RRFCE bit is set to 0, the associated receive status is reflected in the RFE bit. When the RMAFCE or RRFCE bit is set to 1, the associated receive status is not reflected.

28.2.9 RMFCR : Missed-Frame Counter Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x40



Bit	Symbol	Function	R/W
15:0	MFC[15:0]	Missed-Frame Counter These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

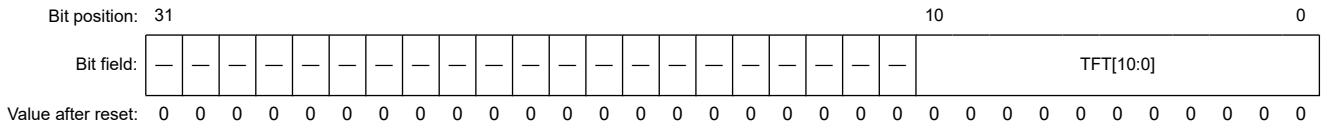
The RMFCR register indicates that the number of frames that could not be stored in the receive FIFO and so were discarded during reception. When the receive FIFO overflows, it stops receiving data, and the rest of frames are discarded. At the same time, the RMFCR register value is incremented. When the RMFCR register value reaches 0xFFFF, count-up is halted. Writing any value to the RMFCR register clears the counter value to 0.

For frames that are not completely received, after data in the receive FIFO is transferred to the receive buffer, the RACT bit in the receive descriptor 0 (RD0) clears to 0 (descriptor disabled), the RFS9 bit sets to 1 (receive FIFO overflowed), and the EESR.RFOF flag is set to 1 (overflow detected).

28.2.10 TFTR : Transmit FIFO Threshold Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x48



Bit	Symbol	Function	R/W
10:0	TFT[10:0]	Transmit FIFO Threshold 0x000: Store-and-forward mode 0x001 to 0x00C: Setting prohibited 0x00D to 0x200: The threshold is the set value multiplied by 4. 0x201 to 0x7FF: Setting prohibited Example: TFT[10:0] = 0x00D : 52 bytes TFT[10:0] = 0x040 : 256 bytes TFT[10:0] = 0x100 : 1024 bytes TFT[10:0] = 0x200 : 2048 bytes	R/W
31:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3
Note: When starting transmission before one frame data is completely written, take care to prevent an underflow. To prevent a transmit underflow, Renesas recommends using the initial value (store-and-forward mode).

The TFTR register specifies the transmit FIFO threshold at which the first transmission starts. The actual threshold is the set value multiplied by 4.

The ETHERC starts transmission when the amount of data in the transmit FIFO exceeds the number of bytes set in this register, when the transmit FIFO is full, or when one frame of data is completely written. Set the TFTR register while the EDTRR.TR bit is 0.

28.2.11 FDR : FIFO Depth Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x50

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	TFD[4:0]					—	—	—	RFD[4:0]				
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
4:0	RFD[4:0]	Receive FIFO Depth 0x0F: 4096 bytes Others: settings prohibited	R/W
7:5	—	These bits are read as 0. The write value should be 0.	R/W
12:8	TFD[4:0]	Transmit FIFO Depth 0x07: 2048 bytes Others: settings prohibited	R/W
31:13	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The FDR register specifies the transmit and receive FIFO depths. Set this register to 0x0000_070F before starting transmission and reception.

28.2.12 RMCR : Receive Method Control Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x58

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RNR
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	RNR	Receive Request Reset 0: EDRRR.RR bit (receive request bit) is cleared to 0 when one frame is received 1: EDRRR.RR bit (receive request bit) is not cleared to 0 when one frame is received.	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

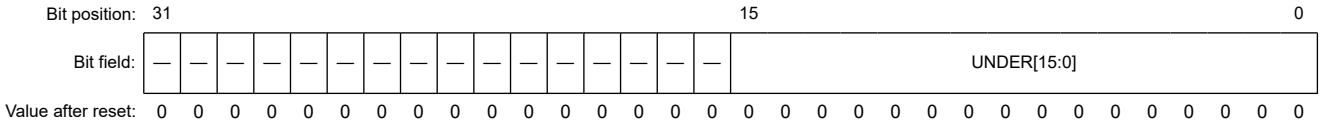
The RMCR register specifies how to control the EDRRR.RR bit when receiving a frame. When the RNR bit is 0, the EDRRR.RR bit clears to 0 when one frame is received, so it must be set to 1 by software to receive the subsequent frame. When the RNR bit is 1, the EDRRR.RR bit does not clear to 0 when one frame is received, and the EDMAC reads the next

receive descriptor and continues frame reception. Renesas recommends setting the RNR bit to 1 when receiving data continuously. Set the RMCR register while the EDRRR.RR bit is 0.

28.2.13 TFUCR : Transmit FIFO Underflow Counter

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x64



Bit	Symbol	Function	R/W
15:0	UNDER[15:0]	Transmit FIFO Underflow Count These bits indicate how many times the transmit FIFO underflows. The counter stops when the counter value reaches 0xFFFF.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

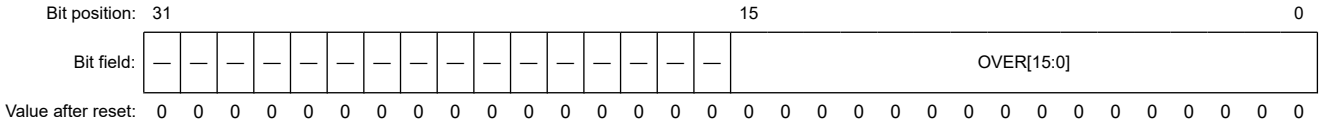
Note: S-TYPE3, P-TYPE3

The TFUCR register indicates how many times the transmit FIFO underflows. Writing any value to the TFUCR register clears the counter value to 0.

28.2.14 RFOCR : Receive FIFO Overflow Counter

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x68



Bit	Symbol	Function	R/W
15:0	OVER[15:0]	Receive FIFO Overflow Count These bits indicate how many times the receive FIFO overflows. The counter stops when the counter value reaches 0xFFFF.	R/W
31:16	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The RFOCR register indicates how many times the receive FIFO overflows. Writing any value to the RFOCR register clears the counter value to 0.

28.2.15 IOSR : Independent Output Signal Setting Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x6C

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ELB
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	ELB	External Loopback Mode 0: Output low on the ET0_EXOUT pin 1: Output high on the ET0_EXOUT pin.	R/W
31:1	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

The IOSR register selects the output level of the ETHERC external output pin (ET0_EXOUT) in external loopback mode. The ELB bit value is output on the ET0_EXOUT pin, which can be used to set loopback mode for the PHY-LSI.

To use the loopback function of the PHY-LSI through this register, you must connect the PHY-LSI to the ET0_EXOUT pin.

28.2.16 FCFTR : Flow Control Start FIFO Threshold Setting Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x70

Bit position:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	0
Bit field:	—	—	—	—	—	—	—	—	—	—	—	—	—	RFFO[2:0]		—	—	—	—	—	—	—	—	—	—	—	—	—	RFDO[2:0]	
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1

Bit	Symbol	Function	R/W
2:0	RFDO[2:0]	Receive FIFO Data PAUSE Output Threshold 0 0 0: When 224 (256 to 32) bytes of data is stored in the receive FIFO 0 0 1: When 480 (512 to 32) bytes of data is stored in the receive FIFO ⋮ 1 1 0: When 1760 (1792 to 32) bytes of data is stored in the receive FIFO 1 1 1: When 2016 (2048 to 32) bytes of data is stored in the receive FIFO.	R/W
15:3	—	These bits are read as 0. The write value should be 0.	R/W
18:16	RFFO[2:0]	Receive FIFO Frame PAUSE Output Threshold 0 0 0: When 2 receive frames are stored in the receive FIFO 0 0 1: When 4 receive frames are stored in the receive FIFO 0 1 0: When 6 receive frames are stored in the receive FIFO ⋮ 1 1 0: When 14 receive frames are stored in the receive FIFO 1 1 1: When 16 receive frames are stored in the receive FIFO.	R/W
31:19	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE3, P-TYPE3

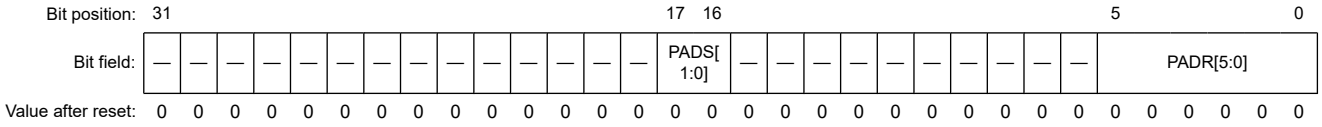
The FCFTR register specifies the ETHERC flow control. Set the threshold to automatically transmit a PAUSE frame.

The threshold can be set using the data size (RFDO[2:0] bits) and the number of frames (RFFO[2:0] bits) stored in the receive FIFO. Flow control starts when the stored data size or the number of stored frames reaches its threshold.

28.2.17 RPADIR : Receive Data Padding Insert Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x78



Bit	Symbol	Function	R/W
5:0	PADR[5:0]	Padding Slot 0x00: Insert padding at the head of received data 0x01: Insert padding between the 1st and 2nd bytes of received data ⋮ 0x3E: Insert padding between the 62nd and 63rd bytes of received data 0x3F: Insert padding between the 63rd and 64th bytes of received data.	R/W
15:6	—	These bits are read as 0. The write value should be 0.	R/W
17:16	PADS[1:0]	Padding Size 0 0: Do not insert padding Others: settings prohibited	R/W
31:18	—	These bits are read as 0. The write value should be 0.	R/W

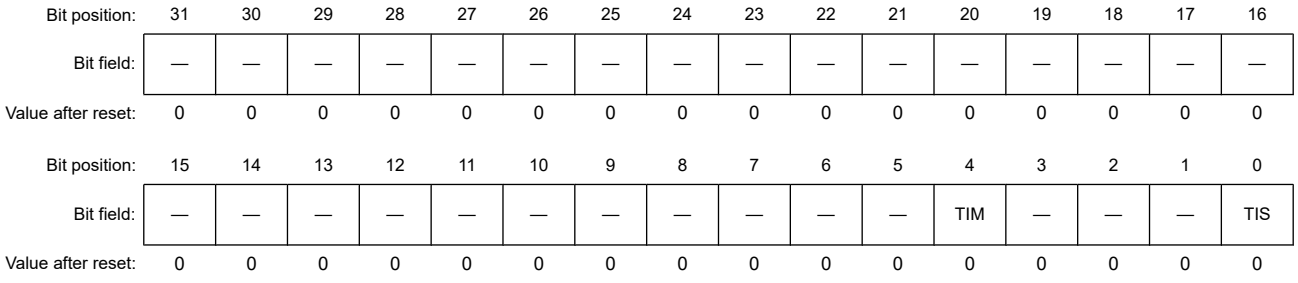
Note: S-TYPE3, P-TYPE3

The RPADIR register specifies insertion of padding for received data. The padding value is 0x00. Set the EDMR.SWR bit to 1 to reset before rewriting the PRADIR register.

28.2.18 TRIMD : Transmit Interrupt Setting Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0x7C



Bit	Symbol	Function	R/W
0	TIS	Transmit Interrupt Enable 0: Disable transmit interrupts 1: Enable transmit Interrupts. Set the EESR.TWB flag to 1 in the mode selected in the TIM bit to report an interrupt.	R/W
3:1	—	These bits are read as 0. The write value should be 0.	R/W
4	TIM	Transmit Interrupt Mode 0: Select transmission complete interrupt mode, where an interrupt occurs when a frame is transmitted 1: Select write-back complete interrupt mode, where an interrupt occurs when write-back to the transmit descriptor is complete while the TWBI bit is 1.	R/W

Bit	Symbol	Function	R/W
31:5	—	These bits are read as 0. The write value should be 0.	R/W

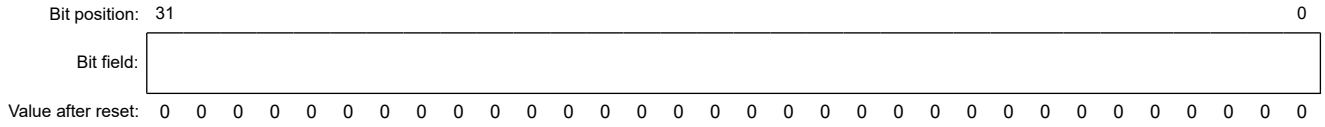
Note: S-TYPE3, P-TYPE3

The TRIMD register specifies the transmit interrupt mode and enables or disables transmit interrupts. When the condition selected in this register is satisfied, the EESR.TWB flag sets to 1, and an interrupt request is output when the EESIPR.TWBIP bit is 1.

28.2.19 RBWAR : Receive Buffer Write Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0xC8



Bit	Symbol	Function	R/W
31:0	n/a	The RBWAR register indicates the last address that the EDMAC wrote data to, when writing to the receive buffer.	R

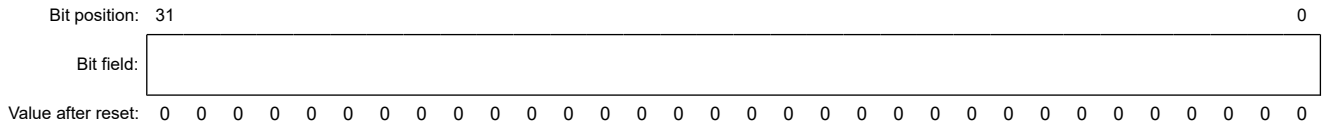
Note: S-TYPE3, P-TYPE3

The RBWAR register indicates the last address that the EDMAC wrote data to, when writing to the receive buffer. Check the contents of this register to identify the address in the receive buffer to which the EDMAC is writing data to. The address that the EDMAC is outputting to the receive buffer might not match the read value of the RBWAR register during data reception. The RBWAR register is read-only. Do not write to this register.

28.2.20 RDFAR : Receive Descriptor Fetch Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0xCC



Bit	Symbol	Function	R/W
31:0	n/a	The RDFAR register indicates the start address of the last fetched receive descriptor when the EDMAC is fetching descriptor information from the receive descriptor.	R

Note: S-TYPE3, P-TYPE3

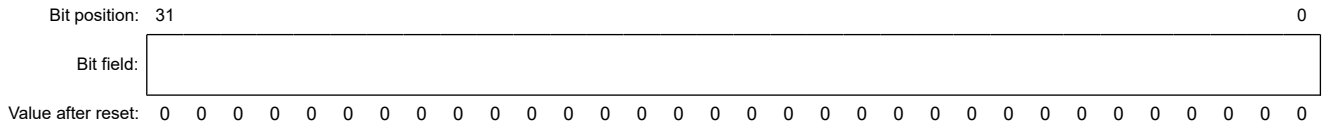
The RDFAR register indicates the start address of the last fetched receive descriptor when the EDMAC is fetching descriptor information from the receive descriptor. Check the contents of this register to identify which receive descriptor information the EDMAC is using for active processing. The address of the receive descriptor that the EDMAC is fetching might not match the read value of the RDFAR register during data reception. The RDFAR register is read-only.

Do not write to this register.

28.2.21 TBRAR : Transmit Buffer Read Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0xD4



Bit	Symbol	Function	R/W
31:0	n/a	The TBRAR register indicates the last address from which the EDMAC read data, when reading data from the transmit buffer.	R

Note: S-TYPE3, P-TYPE3

The TBRAR register indicates the last address from which the EDMAC read data, when reading data from the transmit buffer. Check the contents of this register to identify which address in the transmit buffer the EDMAC is reading from.

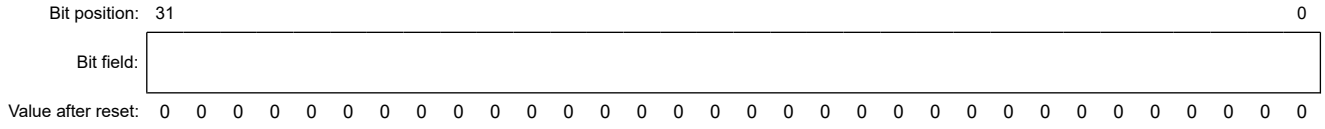
The address that the EDMAC is outputting to the transmit buffer might not match the read value of the TBRAR register.

The TBRAR register is read-only. Do not write to this register.

28.2.22 TDFAR : Transmit Descriptor Fetch Address Register

Base address: EDMAC0 = 0x4035_4000
EDMAC0_NS = 0x5035_4000

Offset address: 0xD8



Bit	Symbol	Function	R/W
31:0	n/a	The TDFAR register indicates the start address of the last fetched transmit descriptor when the EDMAC is fetching the descriptor information from the transmit descriptor.	R

Note: S-TYPE3, P-TYPE3

The TDFAR register indicates the start address of the last fetched transmit descriptor when the EDMAC is fetching the descriptor information from the transmit descriptor. Check the contents of this register to identify which transmit descriptor information the EDMAC is using for active processing. The address of transmit descriptor that the EDMAC fetches might not match the read value of the TDFAR register. The TDFAR is read only. Do not write to this register.

28.3 Operation

The EDMAC transfers data according to the information written in the descriptor. Two descriptors are provided: transmit and receive. A descriptor includes the buffer size, address, and transmit or receive status. The EDMAC transmits or receives data continuously by using sequentially arranged descriptors.

28.3.1 Descriptor Lists and Data Buffers

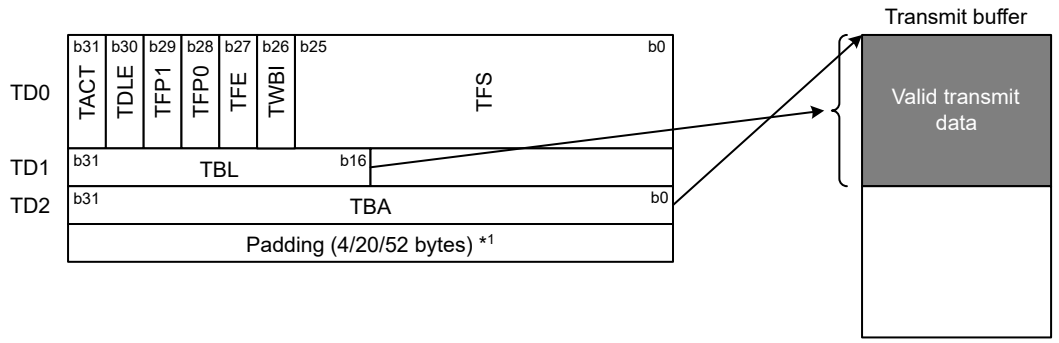
To transfer data using the EDMAC, create the transmit and receive descriptor lists in memory, set the start address of the transmit descriptor list in the TDLAR register, and set the start address of the receive descriptor list in the RDLAR register. Also, the transmit and receive buffers associated with each descriptor are required.

Align the descriptor list on the appropriate address boundary according to the descriptor length set in the EDMR.DL[1:0] bits. The transmit buffer can be aligned on a word boundary, halfword boundary, or byte boundary. When the valid transmit buffer size is 16 bytes or less, align it on a 32-byte boundary. When the valid transmit buffer size is larger than 16bytes, the transmit buffer setting on not aligned 32-byte boundary is permitted. However EDMAC0 might read the transmit buffer aligned on 32-byte boundary, therefore, initialize the transmit buffer area at the beginning of 32 byte-boundary where the

transmit buffer set in. Align the receive buffer on a 32-byte boundary. Set different addresses for the transmit and receive descriptors and buffers for EDMAC0.

28.3.1.1 Transmit descriptor

Figure 28.3 shows the relationship between a transmit descriptor and transmit buffer. A transmit descriptor consists of TD0 to TD2. The transmit frame and transmit buffer configuration can be specified as one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the transmit descriptor.



Note 1. The padding size is determined by the descriptor length (16/32/64 bytes).

Figure 28.3 Relationship between transmit descriptor and transmit buffer

(1) Transmit descriptor 0 (TD0)

Note: Bits for write-back are underlined.

Bit	Symbol	Function	R/W
25:0	TFS	Transmit Frame Status Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: TFS25 to TFS9: Reserved TFS8: Transmit abort was detected (value is equivalent to the EESR.TABT flag) TFS7 to TFS4: Reserved TFS3: No carrier was detected (value is equivalent to the EESR.CND flag) TFS2: Loss of carrier was detected (value is equivalent to the EESR.DLC flag) TFS1: Late collision during transmission was detected (value is equivalent to the EESR.CD flag) TFS0: Transmit retry over (value is equivalent to the EESR.TRO flag). When a bit sets to 1, it indicates that the associated error occurred during frame transmission. When any of the TFS bits sets to 1, the TFE bit also is set to 1. When any of bits TFS3 to TFS0 is set to 1, TFS8 is also set to 1.	R/W
26	TWBI	Write-Back Complete Interrupt Enable 0: Do not generate interrupt when write-back to this descriptor is complete 1: Generate interrupt when write-back to this descriptor is complete.	R/W
27	TFE	Transmit Frame Error 0: Frame transmission is successfully complete 1: Error occurred during frame transmission (transmission aborted).	R/W
29:28	TFP[1:0]	Transmit Frame Position 0 0: Transmit buffer indicated in this descriptor is the middle of a transmit frame (frame information is incomplete) 0 1: Transmit buffer indicated in this descriptor is the end of a transmit frame (frame information is complete) 1 0: Transmit buffer indicated in this descriptor is the head of a transmit frame (frame information is incomplete) 1 1: Transmit buffer indicated in this descriptor is all of a transmit frame (one buffer per frame).	R/W

Note: Bits for write-back are underlined.

Bit	Symbol	Function	R/W
30	TDLE	Transmit Descriptor List End When this bit is 1, it indicates that this descriptor is the last in the descriptor list.	R/W
31	TACT	Transmit Descriptor Valid This bit indicates that this descriptor is valid.	R/W

TD0 specifies the transmit frame settings and indicates the status after transmission.

TFE bit (Transmit Frame Error)

When the TFE bit is 1, it indicates that any of the TFS bits is 1.

TFP[1:0] bits (Transmit Frame Position)

The TFP[1:0] bits indicate which part of a transmit frame corresponds to the transmit buffer indicated in this descriptor.

The TFP[1:0] and TD1.TBL bit settings must be logically consistent in the previous and next descriptors.

TACT bit (Transmit Descriptor Valid)

The TACT bit indicates that this descriptor is valid. The TACT bit is set to 1 by software. This bit clears to 0 when the transmit frame is transferred or when the transmission is aborted.

(2) Transmit descriptor 1 (TD1)

Bit	Symbol	Function	R/W
15:0	—	The read value is 0. The write value should be 0.	R/W
31:16	TBL	Transmit Buffer Length Specifies the valid byte length of the associated transmit buffer. Set a value equal to or greater than 1.	R/W

TD1 specifies the valid byte length of the transmit buffer.

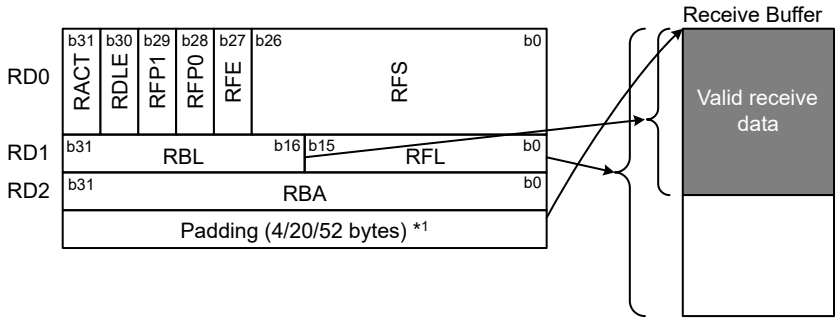
(3) Transmit descriptor 2 (TD2)

Bit	Symbol	Function	R/W
31:0	TBA	Transmit Buffer Address Specifies the start address of the transmit buffer. When the TD1.TBL bit value is 1 to 16 bytes, align it on a 32-byte boundary.	R/W

TD2 specifies the start address of the transmit buffer.

28.3.1.2 Receive descriptor

Figure 28.4 shows the relationship between a receive descriptor and receive buffer. The receive frame and receive buffer configuration can be specified as one buffer per frame (single-buffer frame transmission) or multiple buffers per frame (multi-buffer frame transmission) by setting the receive descriptor. If the receive buffer length (RBL) is set to 0, the operation indicated in the descriptor is not guaranteed.



Note 1. The padding size is determined by the descriptor length (16/32/64 bytes).

Figure 28.4 Relationship between receive descriptor and receive buffer

(1) Receive descriptor 0 (RD0)

Note: Bits for write-back are underlined.

Bit	Symbol	Function	R/W
26:0	RFS	Receive Frame Status Set all bits to 0 when creating a descriptor. After write-back, the bits indicate the following: RFS26 to RFS10: Reserved RFS9: Receive FIFO overflow (value is equivalent to the EESR.RFOF flag) RFS8: Receive abort was detected (value is equivalent to the EESR.RABT flag) RFS7: Multicast address frame was received (value is equivalent to the EESR.RMAF flag) RFS6 and RFS5: Reserved RFS4: Alignment error was detected (value is equivalent to the EESR.RRF flag) RFS3: Frame-too-long error (value is equivalent to the EESR.RTLF flag) RFS2: Frame-too-short error (value is equivalent to the EESR.RTSF flag) RFS1: PHY-LSI receive error (value is equivalent to the EESR.PRE flag) RFS0: CRC error (value is equivalent to the EESR.CERF flag). When a bit sets to 1, it indicates that the associated error occurred during frame reception. When any of the RFS bits sets to 1, the RFE bit also sets to 1. Set the TRSCER register to select whether bits RFS7 and RFS4 are reflected in the RFE bit. When any of bits RFS3 to RFS0 sets to 1, RFS8 also sets to 1.	R/W
27	RFE	Receive Frame Error 0: No error occurred in the received frame 1: Error occurred in the received frame.	R/W
29:28	RFP[1:0]	Receive Frame Position 0 0: Receive buffer indicated in this descriptor is the middle of a receive frame (frame information is incomplete) 0 1: Receive buffer indicated in this descriptor is the end of a receive frame (frame information is complete) 1 0: Receive buffer indicated in this descriptor is the head of a receive frame (frame information is incomplete) 1 1: Receive buffer indicated in this descriptor is all of a receive frame (one buffer per frame).	R/W
30	RDLE	Receive Descriptor List End When this bit is 1, it indicates that this descriptor is the last in the descriptor list.	R/W
31	RACT	Receive Descriptor Valid Indicates that this descriptor is valid.	R/W

RD0 indicates the receive frame status.

RFE bit (Receive Frame Error)

When the RFE bit is 1, it indicates that any of the RFS bits is 1. Set the TRSCER register to select whether the RFS7 and RFS4 bits of EDMAC0 are reflected in the RFE bit.

RFP[1:0] bits (Receive Frame Position)

The RFP[1:0] bits indicate which part of a receive frame corresponds to the receive buffer indicated in this descriptor.

RACT bit (Receive Descriptor Valid)

The RACT bit indicates that this descriptor is valid. The RACT bit is set to 1 by software. This bit clears to 0 when all the data is transferred to the receive buffer indicated in RD2 or when the receive buffer becomes full.

(2) Receive descriptor 1 (RD1)

Bit	Symbol	Function	R/W
15:0	RFL	Receive Frame Length Specifies the length (number of bytes) of the receive frame stored in the buffer. This does not include the number of bytes for padding set in the RPADIR register. These bits are written back to the descriptor associated with the end of a frame.	R/W
31:16	RBL	Receive Buffer Length Specifies the byte length of the associated receive buffer. Set an integral multiple of 32 as the buffer length.	R/W

Note: Bits for write-back are underlined.

RD1 specifies the receive buffer length. When reception is complete, the receive frame length is written back.

(3) Receive descriptor 2 (RD2)

Bit	Symbol	Function	R/W
31:0	RBA	Receive Buffer Address Specifies the start address of the receive buffer. Align the buffer address on a 32-byte boundary.	R/W

RD2 specifies the start address of the receive buffer.

28.3.2 Transmission

When the EDTRR.TR bit is set to 1 while the ETHERC0.ECMR.TE bit is 1, the EDMAC reads the descriptor following the previously used descriptor in the transmit descriptor list (or the descriptor indicated in the TDLAR register after a reset). When the TACT bit is 1 in the transmit descriptor (TD0), the EDMAC sequentially reads transmit data from the start address of the transmit buffer indicated in transmit descriptor 2 (TD2) and transfers it to the ETHERC through the transmit FIFO. The ETHERC creates a transmit frame and starts transmission to the MII or RMII. When all data indicated in the TD1.TBL bit is transferred, write-back is performed based on the TD0.TFP[1:0] bit setting as follows:

- When the TD0.TFP[1:0] bits are 00b or 10b (frame is incomplete), the TD0.TACT bit is written back
- When the TD0.TFP[1:0] bits are 01b or 11b (frame is complete), the TD0.TACT, TD0.TFS, and TD0.TFE bits are written back.

When the TD0.TACT bit in the read descriptor is 1, the EDMAC continues reading descriptors and transmit frames. When the TD0.TACT bit in the read descriptor is 0, the EDMAC sets the EDTRR.TR bit to 0 and stops transmission.

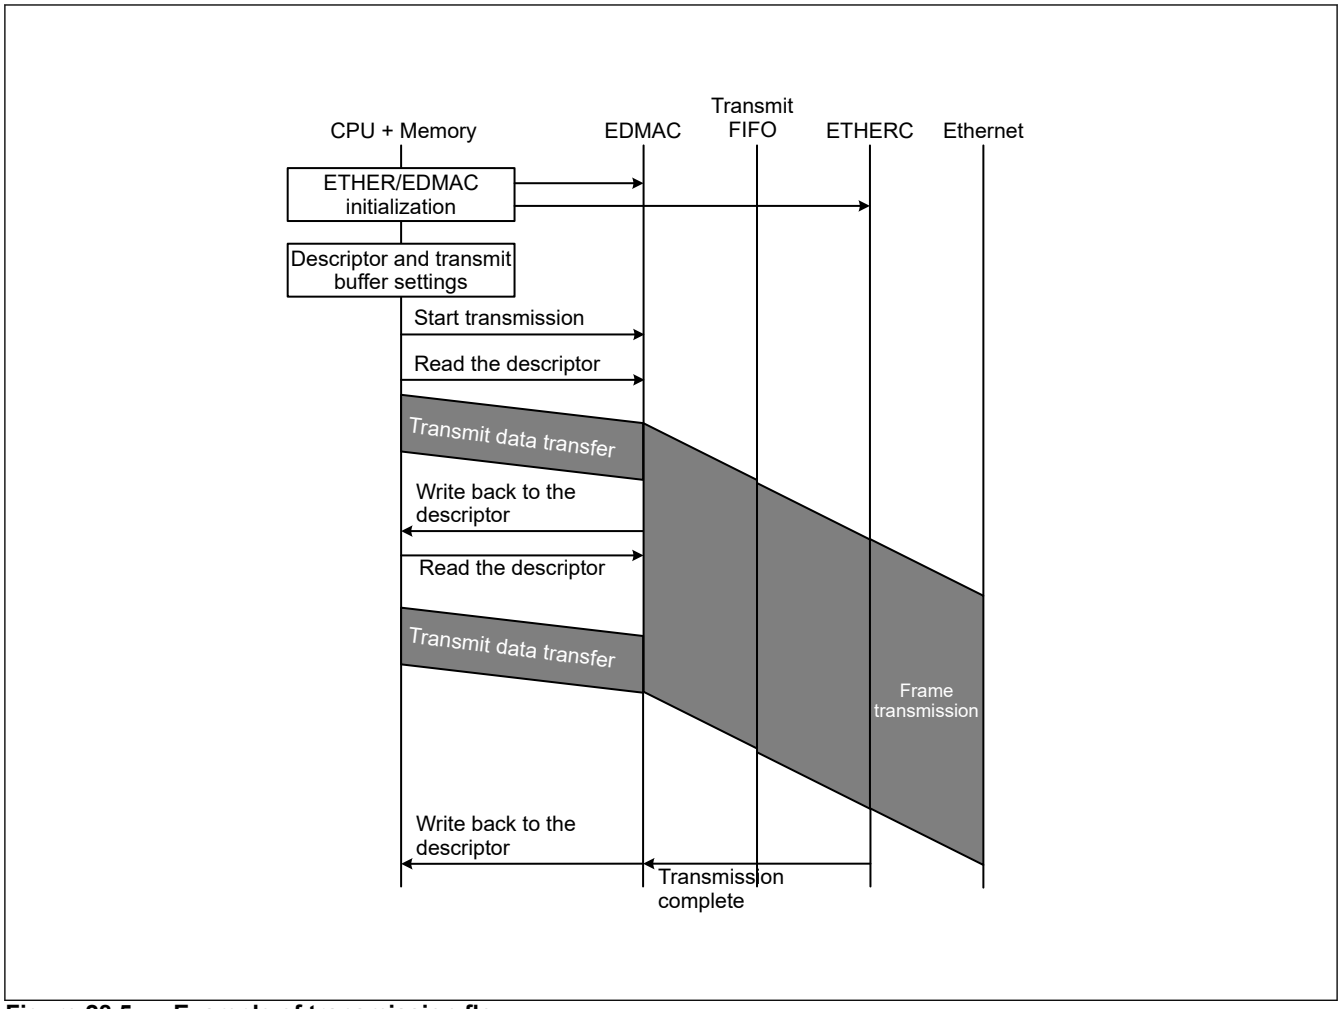


Figure 28.5 Example of transmission flow

28.3.3 Reception

When the EDRRR.RR bit is set to 1 while the ETHERC0.ECMR.RE bit is 1, the EDMAC reads the receive descriptor following the previously used descriptor (or the descriptor indicated in the RDLAR register after a reset) and then waits for reception. When the RD0.RACT bit is 1, if the data stored in the receive FIFO is 32 bytes or more, or if the end byte of the frame is stored in the receive buffer, the EDMAC transfers data from the receive FIFO to the receive buffer indicated in receive descriptor 2 (RD2).

If the data length of the received frame is longer than the buffer length set in the RBL bit in receive descriptor 1 (RD1), the EDMAC writes back 10b or 00b to the RD0.RFP[1:0] bits and 0 to the RD0.RACT bit when the receive buffer becomes full, and then the EDMAC reads the next data. After that, the EDMAC transfers data to another receive buffer.

When the frame reception is complete or when the frame reception is aborted by an error, the EDMAC writes back 11b or 01b to the RD0.RFP[1:0] bits, 0 to the RD0.RACT bit, and the receive frame length to the RD1.RFL bit. When the RMCR.RNR bit is 1, the EDMAC reads the next descriptor and waits for reception. When the RNR bit is 0, the EDMAC sets the EDRRR.RR bit to 0 and stops reception.

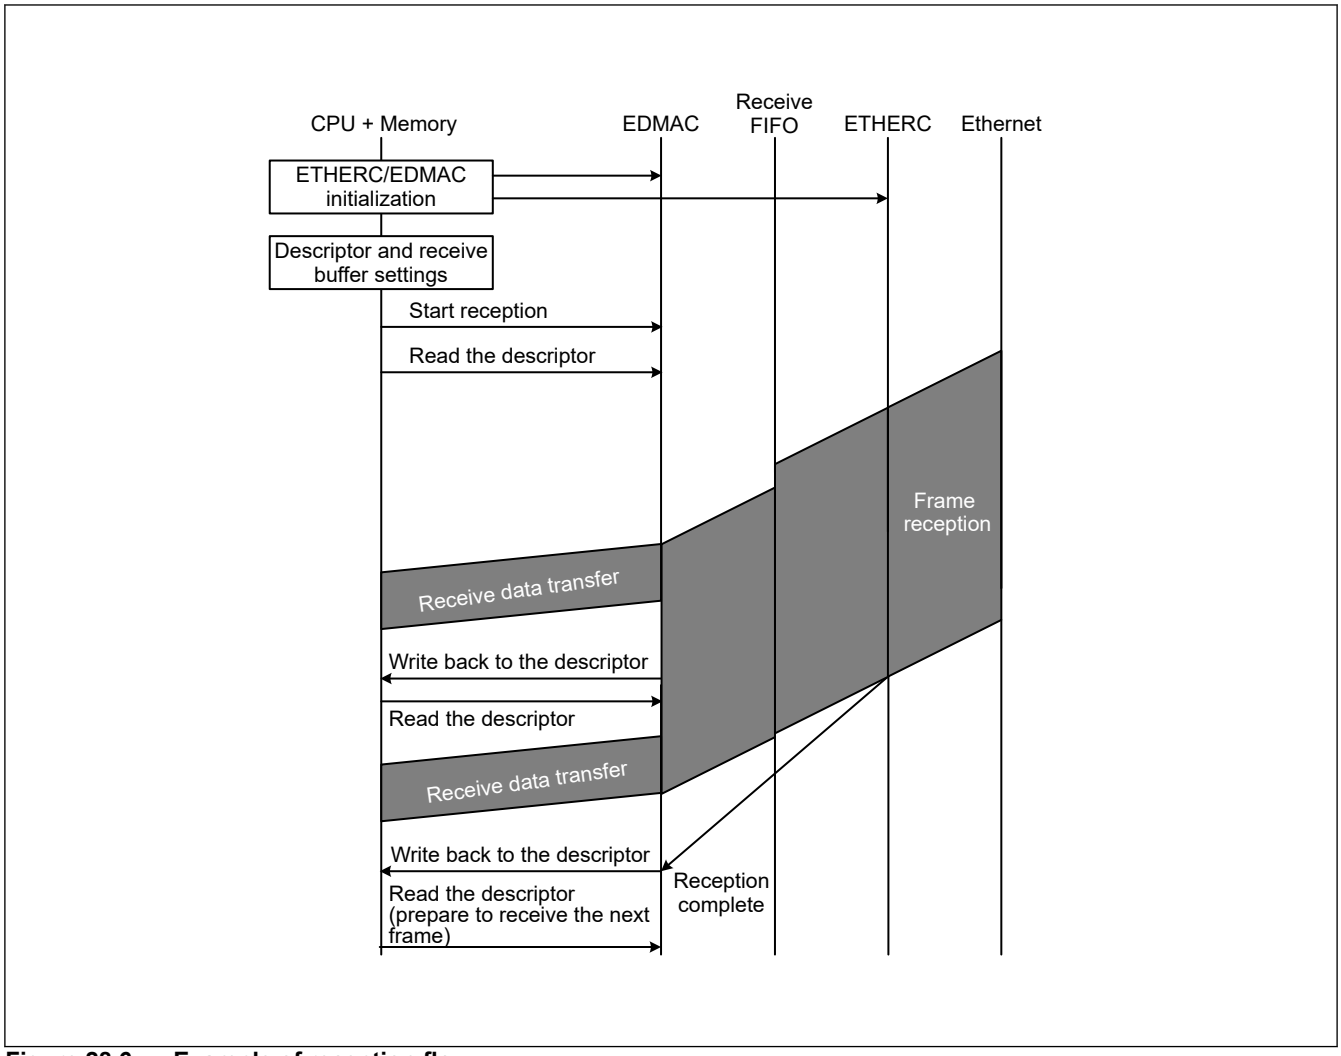

Figure 28.6 Example of reception flow

28.3.4 Multi-Buffer Frame Transmission

28.3.4.1 Error processing while transmitting multi-buffer frame

If an error occurs during multi-buffer frame transmission, the EDMAC performs the processing shown in Figure 28.7. In the figure, when the TACT bit of transmit descriptor 0 (TD0) is 0, the descriptor indicates that all data in the buffer is successfully transmitted. When the TACT bit is 1, the descriptor indicates that data in the buffer is not yet transmitted. If a frame transmit error*1 occurs in the head or at the middle of the frame while the TD0.TACT bit is 1, the EDMAC stops data transmission from the transmit FIFO and EDMAC data transfer, and sets the TD0.TACT bit to 0.

After that, the EDMAC reads the next descriptor to see if the descriptor indicates the middle of the frame (TD0.TFP[1:0] bits are 00b) or the end of the frame (TD0.TFP[1:0] bits are 01b). When the descriptor indicates the middle of the frame, the EDMAC sets the TD0.TACT bit to 0 and reads the next descriptor. When the descriptor indicates the end of the frame, in addition to setting the TD0.TACT bit to 0, the EDMAC also writes back to the TD0.TFE and TD0.TFS bits.

After an error occurs, data in the buffer is not transmitted until write-back to the descriptor for the end of the frame. When the associated transmit error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor for the end of the frame.

Note 1. A transmit retry-over condition, late collision, or loss of carrier is detected, or a carrier is not detected.

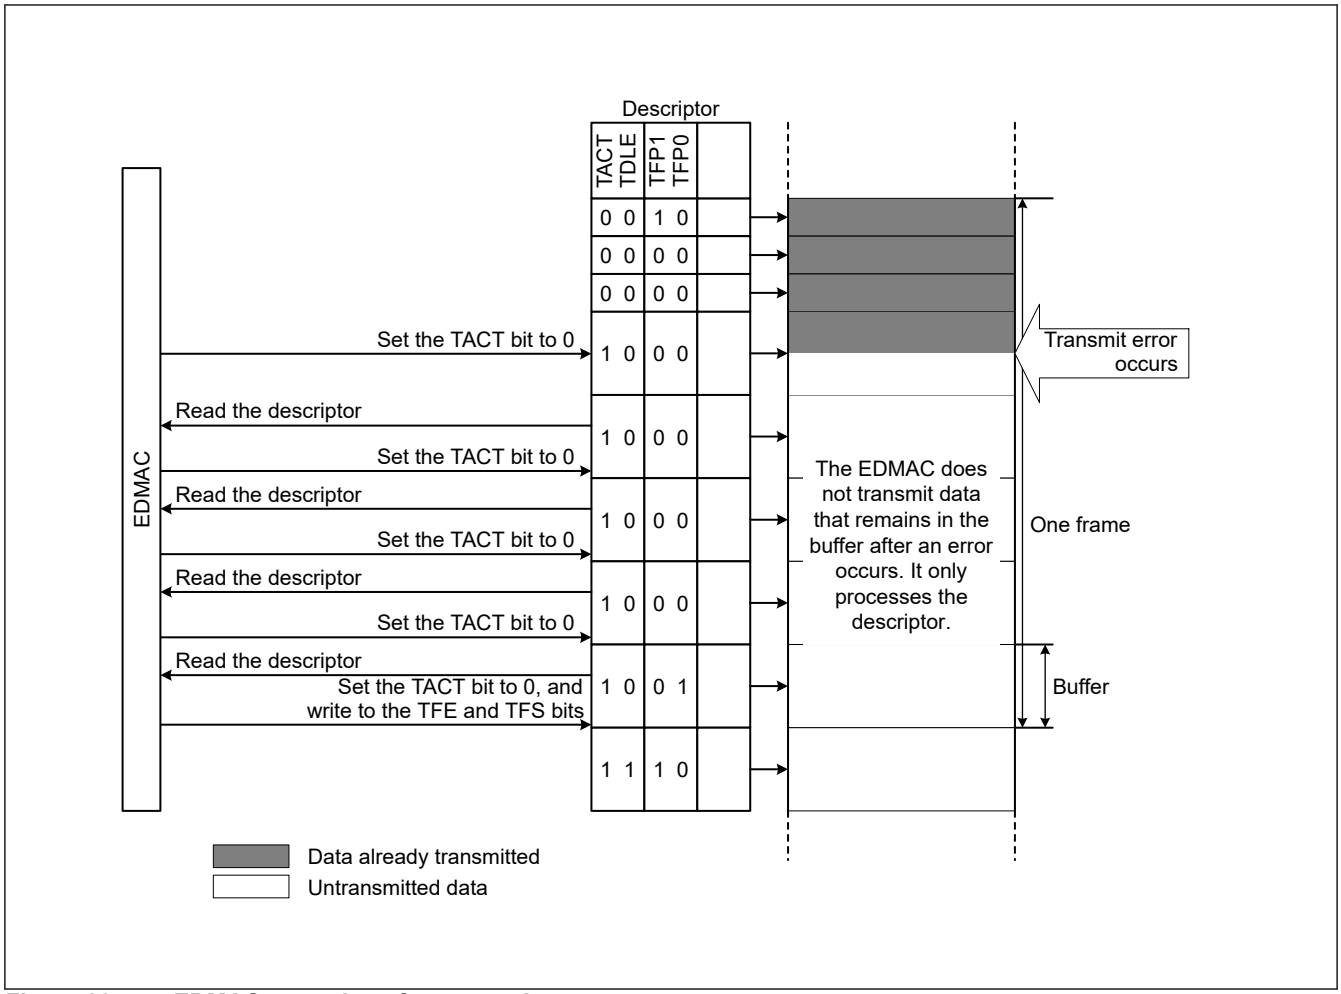

Figure 28.7 EDMAC operation after transmit error occurs

28.3.4.2 Error processing while receiving multi-buffer frame

If an error occurs during multi-buffer frame reception, the EDMAC performs the processing shown in Figure Figure 28.8. In the figure, when the RACT bit of receive descriptor 0 (RD0) is 0, the descriptor indicates that data was successfully received in the buffer. When the RACT bit is 1, the descriptor indicates that data is not yet received in the buffer. If a frame receive error*1 occurs, the EDMAC stops receiving new data, but it transfers data that is already stored in the receive FIFO to the receive buffer.

When the receive buffer becomes full during transfer, the EDMAC sets the RACT bit to 0 and the RFP[1:0] bits to 10b or 00b and reads the next descriptor. After all data in the receive FIFO is transferred, the EDMAC writes back the status to the descriptor.

When the associated receive error interrupt is enabled in the EESIPR register, an interrupt request is generated immediately after write-back to the descriptor. When there is a request to receive a new frame, the EDMAC continues reception using the descriptor following the descriptor where the error occurred.

Note 1. A CRC error, PHY-LSI receive error, frame-too-short error, frame-too-long error, or alignment error is detected.

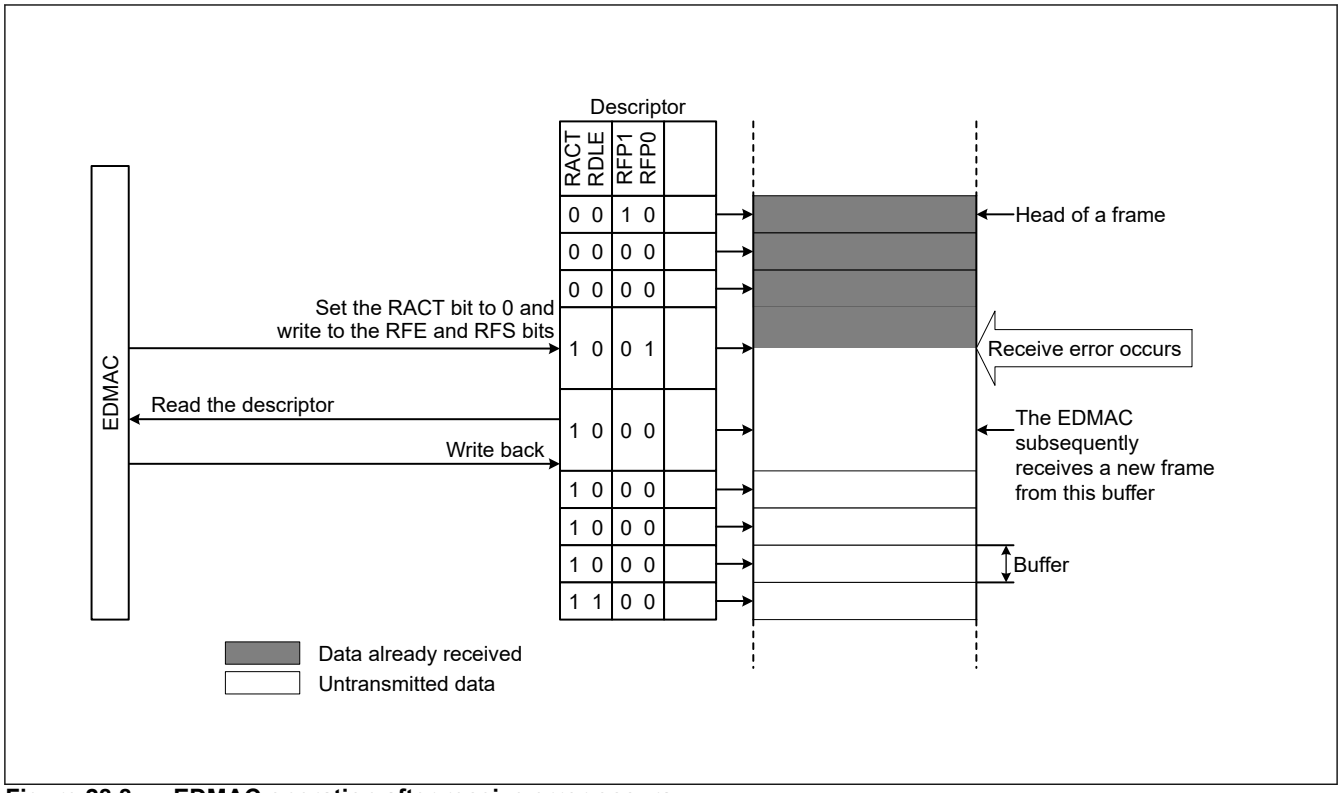

Figure 28.8 EDMAC operation after receive error occurs

28.3.5 Bus Transfer Error

Bus transfer error occurs with the slave TrustZone filter error, the master MPU error, the slave bus error or the illegal address access error. When the bus transfer error is detected, the EDMAC halts the process and EESR.ADE bit is set to 1.

Bus transfer error can be output as an interrupt request signal (ETHER_EINT0). The slave TrustZone error and the master MPU error can be output as NMI. When ETHER_EINT0 and NMI are generated, NMI always responds first. Figure 28.9 and Figure 28.10 show the processing for the bus error in NMI handler and ETHER_EINT0 handler.

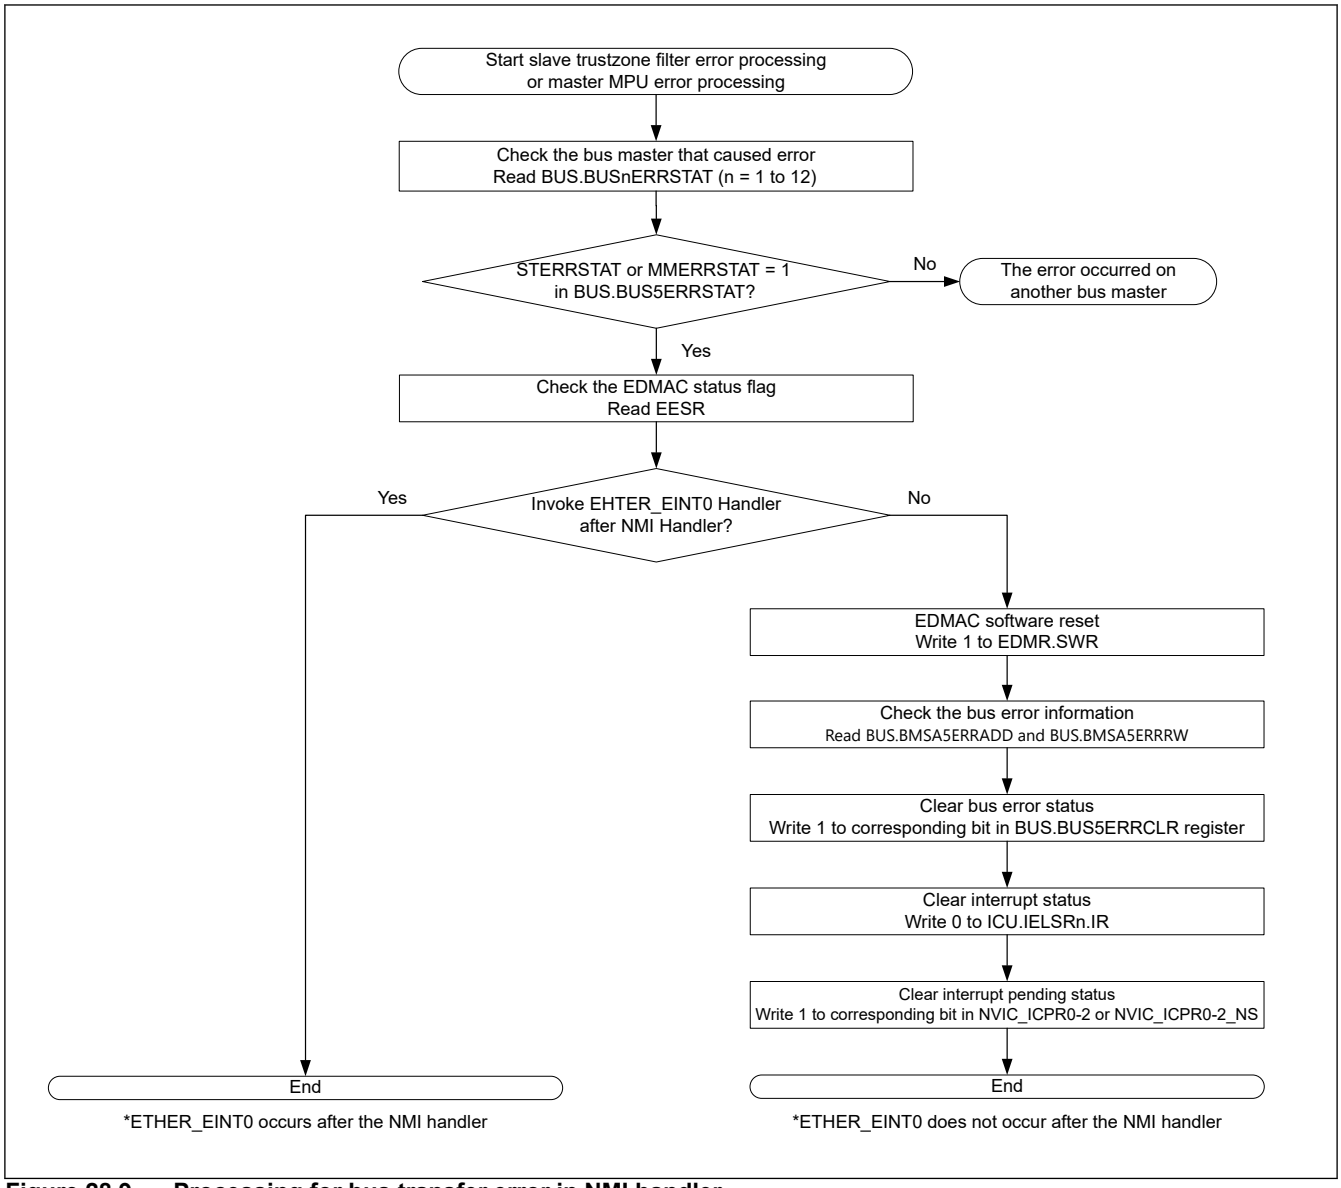

Figure 28.9 Processing for bus transfer error in NMI handler

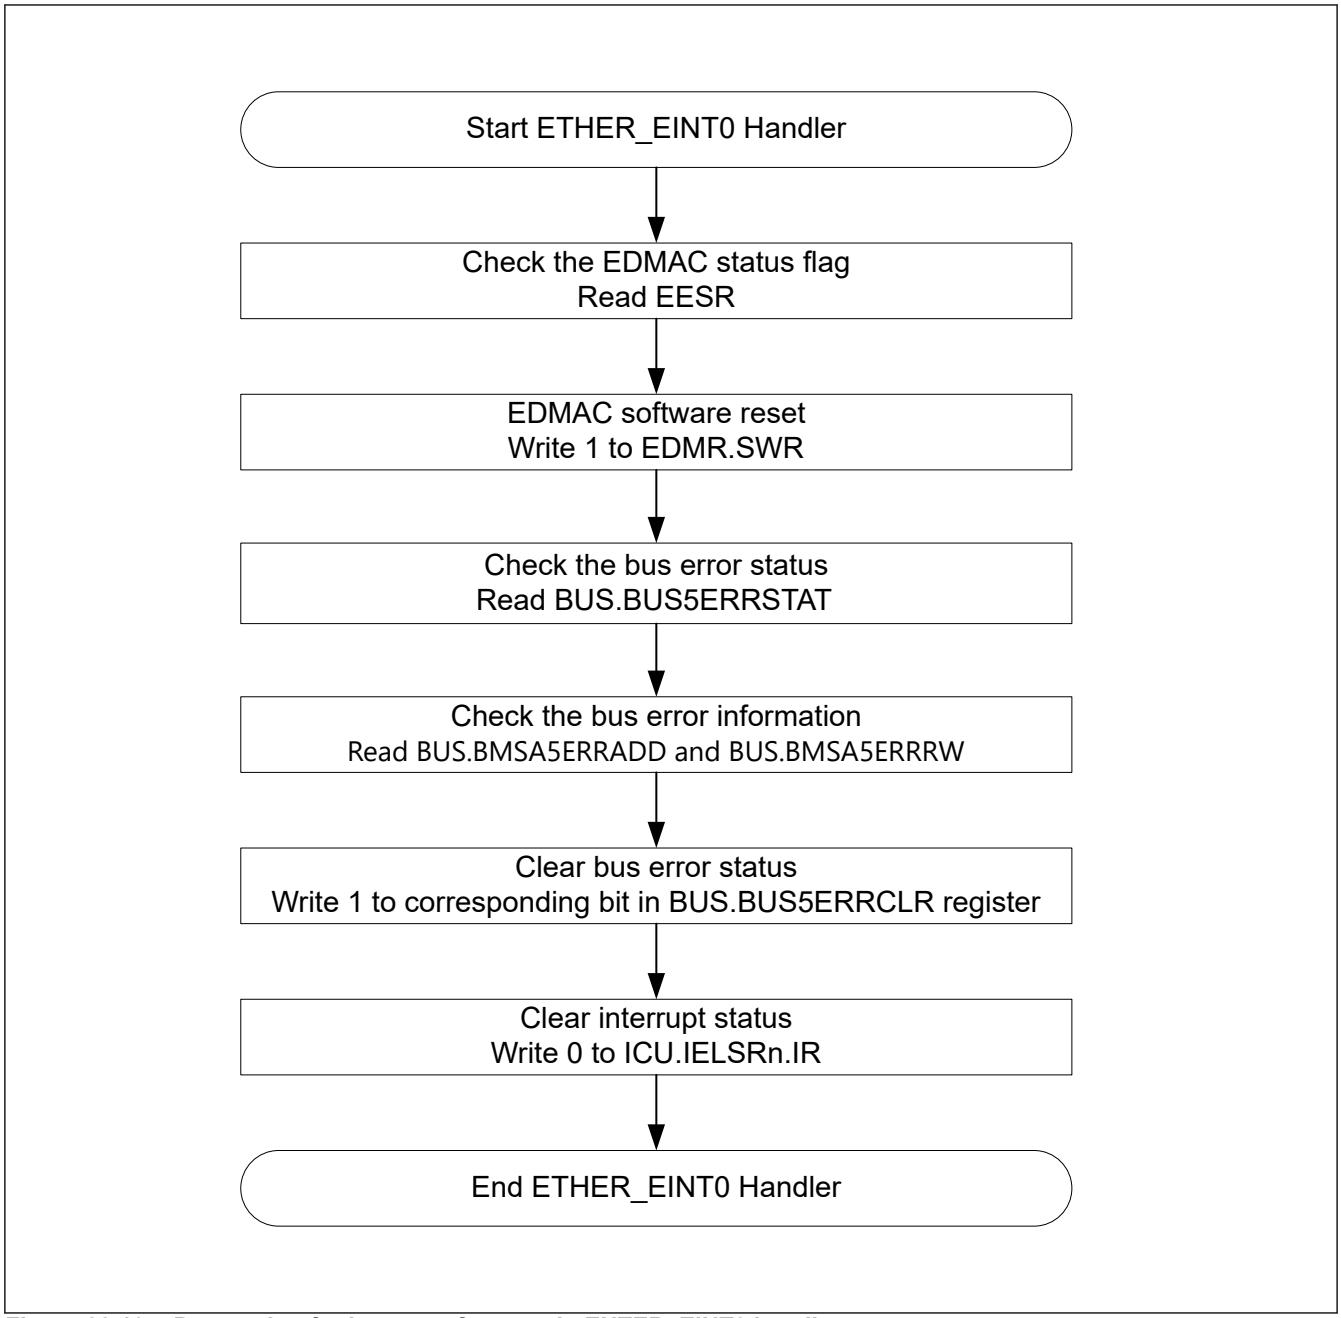

Figure 28.10 Processing for bus transfer error in EHTER_EINT0 handler

28.4 Interrupts

When any of the status flags in the EESR register sets to 1 while the associated interrupt request enable bit in the EESIPR register is 1, EDMAC0 issues an ETHER_EINT0 interrupt request.

28.5 Usage Notes

28.5.1 Settings for the Module-Stop Function

The following bit in Module Stop Control Register B (MSTPCRB) enables or disables EDMAC module operation:

- The MSTPB15 bit in enables or disables ETHERC0 and EDMAC0 operation

The modules are initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see section 10, Low Power Modes.

28.5.2 Stopping the EDMAC during Operation

When stopping EDMAC operation by using a Software Standby mode or the module-stop function while the EDMAC is running, confirm that the EDTRR.TR and EDRRR.RR bits are 0. If the EDMAC is stopped while the EDTRR.TR or EDRRR.RR bit is 1, data for the frame that is being transmitted or received might not be complete, and EDMAC operation after exiting Software Standby mode or the module-stop state is not guaranteed.

29. USB 2.0 Full-Speed Module (USBFS)

29.1 Overview

The USB 2.0 Full-Speed module (USBFS) operates as a host or device controller compliant with the Universal Serial Bus (USB) specification revision 2.0. The host controller supports USB 2.0 full-speed and low-speed transfers, and the device controller supports USB 2.0 full-speed transfers. The USBFS has an internal USB transceiver and supports all of the transfer types defined in the USB 2.0 specification

The USBFS has FIFO buffer for data transfers, providing a maximum of 10 pipes. Any endpoint number can be assigned to pipes 1 to 9, based on the peripheral devices or the communication requirements for your system.

Table 29.1 lists the USBFS specifications, Figure 29.1 shows a block diagram, and Table 29.2 lists the I/O pins.

Table 29.1 USBFS specifications

Parameter	Specifications
Features	● USB Device Controller (UDC) and USB 2.0 transceiver supporting host controller, and device controller, and On-The-Go (OTG) functions ● Host and device controller can be switched by software ● Self-power or bus power mode selectable
	Host controller features: ● Full-speed transfer (12 Mbps) and low-speed transfer (1.5 Mbps) ● Automatic scheduling for SOF and packet transmissions ● Programmable intervals for isochronous and interrupt transfers ● Communications with multiple peripheral devices connected through a single hub
	Device controller features: ● Full-speed transfer (12 Mbps)*1 ● Control transfer stage control function ● Device state control function ● Auto response function for SET_ADDRESS request ● SOF interpolation
Supported transfer types	● Control transfer ● Bulk transfer ● Interrupt transfer ● Isochronous transfer
Pipe configuration	● FIFO buffer for USB communication ● Up to 10 pipes selectable, including the Default Control Pipe (DCP) ● Pipes 1 to 9 assignable to any endpoint number
	Transfer conditions specifiable for each pipe: ● Pipe 0: Control transfer with 64-byte single buffer ● Pipes 1 and 2: Selectable to bulk transfer with 64-byte double buffer or isochronous transfer with 256-byte double buffer ● Pipes 3 to 5: Bulk transfer with 64-byte double buffer ● Pipes 6 to 9: Interrupt transfer with 64-byte single buffer
Other features	● Reception end function using transaction count ● Function that changes the BRDY interrupt event notification timing (BFRE) ● Automatic clearing of the FIFO buffer after the data for the pipe specified in the DnFIFO port (n = 0, 1) is read (DCLRM) ● NAK setting function for response PID generated on transfer end (SHTNAK) ● On-chip pull-up and pull-down resistors for D+ and D–
Module-stop function	Module-stop state can be set to reduce power consumption
TrustZone Filter	Security and Privilege attribution can be set

Note 1. Low-speed transfer (1.5 Mbps) is not supported.

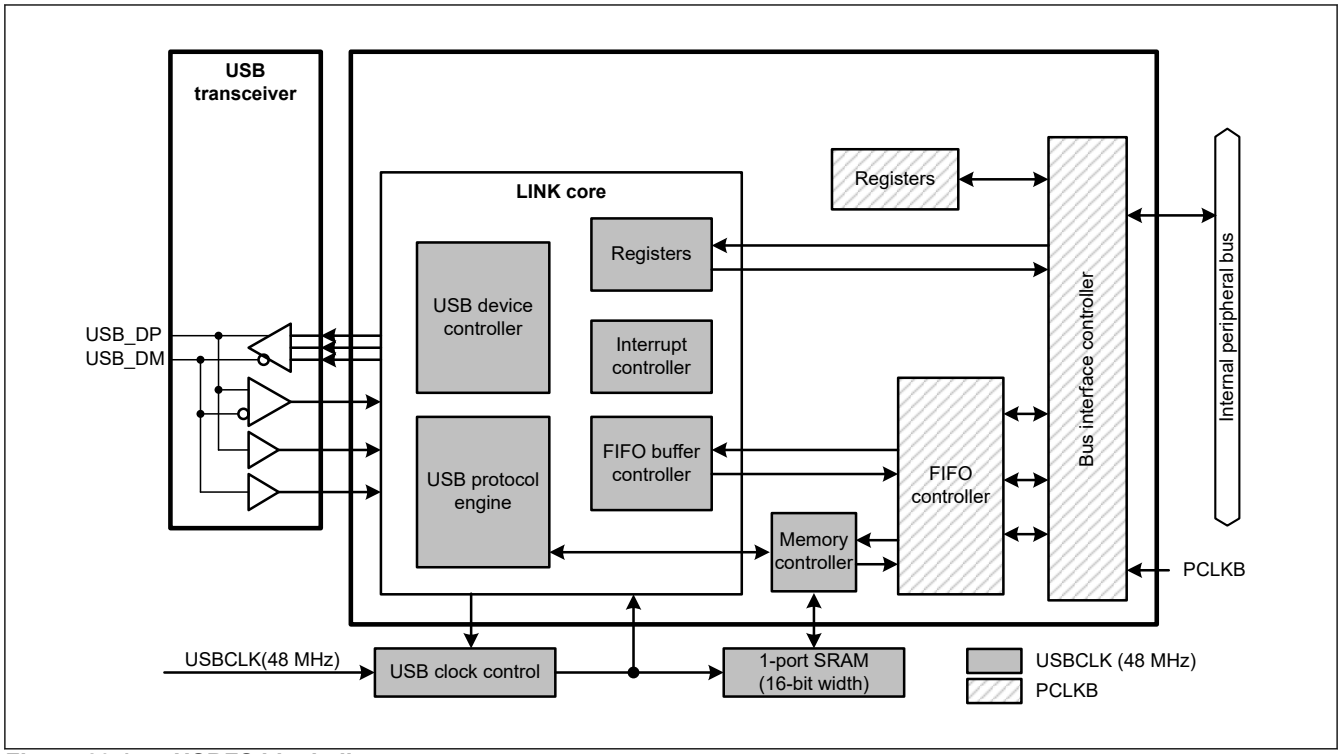

Figure 29.1 USBFS block diagram

Table 29.2 USBFS pin configuration

Function	Pin name	I/O	Description
USBFS	USB_DP	I/O	D+ I/O pin of the USB on-chip transceiver. This pin should be connected to the D+ pin of the USB bus.
	USB_DM	I/O	D– I/O pin of the USB on-chip transceiver. This pin should be connected to the D– pin of the USB bus.
	USB_VBUS	Input	USB cable connection monitor pin. This pin should be connected to VBUS of the USB bus. The VBUS pin status (connected or disconnected) can be detected when the USB module is operating as a function controller.
	USB_EXICEN	Output	Low-power control signal for external power supply (OTG) chip.
	USB_VBUSEN	Output	VBUS (5 V) supply enable signal for external power supply chip.
	USB_OVRCURA, USB_OVRCURB USB_OVRCURA-DS, USB_OVRCURB-DS	Input	External overcurrent detection signals should be connected to these pins. VBUS comparator signals should be connected to these pins when the OTG power supply chip is connected. USB_OVRCURA or USB_OVRCURB pins can be used in Software standby mode or in normal mode. USB_OVRCURA-DS, USB_OVRCURB-DS are dedicated pins that can generate interrupt in Software standby mode or in normal mode as well as for cancel Deep Software Standby mode 1.
	USB_ID	Input	MicroAB connector ID input signal should be connected to this pin during operation in OTG mode.
	VCC_USB	Input	Power supply pins.
	VSS_USB	Input	Ground pins.

29.2 Register Descriptions

29.2.1 SYSCFG : System Configuration Control Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x000

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	—	SCKE	—	—	—	DCFM	DRPD	DPRPU	—	—	—	USBE
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
0	USBE	USBFS Operation Enable 0: Disable 1: Enable	R/W
2:1	—	These bits are read as 0. The write value should be 0.	R/W
3	—	This bit is read as 0. The write value should be 0.	R/W
4	DPRPU	D+ Line Resistor Control 0: Disable line pull-up 1: Enable line pull-up	R/W
5	DRPD	D+/D– Line Resistor Control 0: Disable line pull-down 1: Enable line pull-down	R/W
6	DCFM	Controller Function Select 0: Select device controller 1: Select host controller	R/W
7	—	This bit is read as 0. The write value should be 0.	R/W
9:8	—	These bits are read as 0. The write value should be 0.	R/W
10	SCKE	USB Clock Enable 0: Stop clock supply to the USBFS 1: Enable clock supply to the USBFS	R/W
15:11	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3
Note: After writing 1 to the SCKE bit, read it to confirm that it is set to 1.

USBE bit (USBFS Operation Enable)

The USBE bit enables or disables operation of the USBFS.

Changing the USBE bit from 1 to 0 initializes the bits listed in Table 29.3. Only change this bit while the SCKE bit is 1. In host controller mode, this bit must be set to 1 after setting the DRPD bit to 1, eliminating SYSSTS0.LNST[1:0] flags chattering, and confirming that the USB bus state is stable.

Table 29.3 Registers initialized by writing 0 to the SYSCFG.USBE bit

Selected function	Register	Bit	Remarks
Device controller	SYSSTS0	LNST[1:0]	Value is saved in host controller mode
	DVSTCTR0	RHST[2:0]	—
	INTSTS0	DVSQ[2:0]	Value is saved in host controller mode
	USBADDR	USBADDR[6:0]	Value is saved in host controller mode
	USBREQ	BREQUEST[7:0], BMREQUESTTYPE[7:0]	Value is saved in host controller mode
	USBVAL	WVALUE[15:0]	Value is saved in host controller mode
	USBINDX	WINDEX[15:0]	Value is saved in host controller mode
	USBLENG	WLENTUH[15:0]	Value is saved in host controller mode
Host controller	DVSTCTR0	RHST[2:0]	—
	FRMNUM	FRNM[10:0]	Value is saved in device controller mode

DPRPU bit (D+ Line Resistor Control)

The DPRPU bit enables or disables pulling up the D+ line in device controller mode.

When the DPRPU bit is set to 1 in device controller mode, the USBFS pulls up the D+ line to notify the USB host that it attached. Changing the DPRPU bit from 1 to 0 releases the pull-up, thereby notifying the USB host that it detached.

Set this bit to 1 in device controller mode and to 0 in host controller mode.

DRPD bit (D+/D– Line Resistor Control)

TheDRPD bit enables or disables pulling down D+ and D– lines in host controller mode.

Set this bit to 1 in host controller mode and to 0 in device controller mode.

DCFM bit (Controller Function Select)

The DCFM bit selects the host or device function of the USBFS.

Only change this bit when the DPRPU and DRPD bits are both 0.

SCKE bit (USB Clock Enable)

The SCKE bit stops or enables the 48-MHz clock supply to the USBFS.

When this bit is 0, only SYSCFG is permitted to be read from and written to; the other registers related to the USB should not be read from or written to.

29.2.2 SYSSTS0 : System Configuration Status Register 0

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x004

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	OVCMON[1:0]		—	—	—	—	—	—	—	HTACT	SOFEA	—	—	IDMON	LNST[1:0]	
Value after reset:	x	x	0	0	0	0	0	0	0	0	0	0	0	x	0	0

Bit	Symbol	Function	R/W
1:0	LNST[1:0]	USB Data Line Status Monitor Indicates the status of the USB data lines, see Table 29.4	R
2	IDMON	External ID0 Input Pin Monitor 0: USB_ID pin is low 1: USB_ID pin is high	R
4:3	—	These bits are read as 0.	R

Bit	Symbol	Function	R/W
5	SOFEA	Active Monitor When the Host Controller Is Selected 0: SOF output stopped 1: SOF output operating	R
6	HTACT	USB Host Sequencer Status Monitor 0: Host sequencer completely stopped 1: Host sequencer not completely stopped	R
13:7	—	These bits are read as 0.	R
15:14	OVCMON[1:0]	External USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS Input Pin Monitor OVCMON[1] indicates the USB_OVRCURA or USB_OVRCURA-DS pin status. OVCMON[0] indicates the USB_OVRCURB or USB_OVRCURB-DS pin status.	R

Note: S-TYPE-3, P-TYPE-3
Note: The values of the OVCMON[1:0] and IDMON bits depend on the status of the USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS and USB_ID pins.

LNST[1:0] bits (USB Data Line Status Monitor)

The LNST[1:0] bits indicate the state of the USB data lines, D+ and D–. For details, see Table 29.4.

In device controller mode, read the LNST[1:0] bits after connection processing (SYSCFG.DPRPU bit = 1). In host controller mode, read them after enabling pull-down of the lines (SYSCFG.DRPD bit = 1).

Table 29.4 Status of the USB data bus lines (D+ and D–)

LNST[1:0] bits	During full-speed operation	During low-speed operation
00b	SE0	SE0
01b	J-State	K-State
10b	K-State	J-State
11b	SE1	SE1

SOFEA bit (Active Monitor When the Host Controller Is Selected)

The SOFEA bit is used in host controller mode to check whether the output of the last SOF is complete when the USBFS is suspended because of a 0 setting to the DVSTCTR0.UACT bit.

In host controller mode, check that both the HTACT and SOFEA bits are 0 before setting the SYSCFG.USBE bit to 0 to stop the USBFS or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

HTACT bit (USB Host Sequencer Status Monitor)

The HTACT bit is set to 0 when the host sequencer of the USBFS is completely stopped.

In host controller mode, check that the HTACT bit is 0 before setting the DVSTCTR0.UACT bit to 0 to place the USBFS in the suspended state or setting the SYSCFG.SCKE bit to 0 to stop the clock signal supply during communication.

OVCMON[1:0] bits (External USB_OVRCURA, USB_OVRCURA-DS, USB_OVRCURB or USB_OVRCURB-DS Input Pin Monitor)

The OVCMON[1:0] bits indicate the status of the overcurrent signals from an external power supply IC.

29.2.3 DVSTCTR0 : Device State Control Register 0

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x008

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	—	—	—	—	HNPBTOA	EXICEN	VBUSEN	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]		
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
2:0	RHST[2:0]	USB Bus Reset Status 0 0 0: In host controller mode: Communication speed indeterminate (powered state or no connection) In device controller mode: Communication speed indeterminate 0 0 1: In host controller mode: Low-speed connection In device controller mode: USB bus reset in progress 0 1 0: In host controller mode: Full-speed connection In device controller mode: USB bus reset in progress or full-speed connection 0 1 1: Setting prohibited Others: In host controller mode: USB bus reset in progress In device controller mode: Setting prohibited	R
3	—	This bit is read as 0. The write value should be 0.	R/W
4	UACT	USB Bus Enable 0: Disable downstream port (disable SOF transmission) 1: Enable downstream port (enable SOF transmission)	R/W
5	RESUME	Resume Output 0: Do not output resume signal 1: Output resume signal	R/W
6	USBRST	USB Bus Reset Output 0: Do not output USB bus reset signal 1: Output USB bus reset signal	R/W
7	RWUPE	Wakeup Detection Enable 0: Disable downstream port remote wakeup 1: Enable downstream port remote wakeup	R/W
8	WKUP	Wakeup Output 0: Do not output remote wakeup signal 1: Output remote wakeup signal	R/W
9	VBUSEN	USB_VBUSEN Output Pin Control 0: Output low on external USB_VBUSEN pin 1: Output high on external USB_VBUSEN pin	R/W
10	EXICEN	USB_EXICEN Output Pin Control 0: Output low on external USB_EXICEN pin 1: Output high on external USB_EXICEN pin	R/W
11	HNPBTOA	Host Negotiation Protocol (HNP) Control Use this bit when switching from device B to device A in OTG mode. If the HNPBTOA bit is 1, the internal function control remains in the Suspend state until the HNP processing ends even if SYSCFG.DPRPU = 0 or SYSCFG.DCFM = 1.	R/W
15:12	—	These bits are read as 0. The write value should be 0.	R/W

Note: S-TYPE-3, P-TYPE-3

The USBFS controller does not support low-speed connections in device controller mode. When this value is read, abnormal connection processing must be executed in higher level application software.

RHST[2:0] bits (USB Bus Reset Status)

RHST[2:0] bits indicate the status of the USB bus reset.

In host controller mode, writing 1 to the USBRST bit causes the RHST[2:0] bits to set to 100b. When 0 is written to the USBRST bit and the USBFS ends the SE0 state, the RHST[2:0]bits update to a new value.

In device controller mode, if the USBFS detects a USB bus reset, the RHST[2:0] bits indicate 010b if the DPRPU bit is 1, and a DVST interrupt is generated.

UACT bit (USB Bus Enable)

When set to 1 in host controller mode, the UACT bit enables USB bus operation by controlling SOF packet transmission to the USB bus in addition to data and reception. The USBFS starts SOF packet output within one frame period after the UACT bit is set to 1. When UACT is set to 0, the USBFS enters the idle state after the SOF packet output.

The USBFS sets the UACT bit to 0 on any of the following conditions:

- A DTCH interrupt is detected during communication (when UACT = 1)

- An EOFERR interrupt is detected during communication (when UACT = 1)

Always write 1 to the UACT bit at the end of the USB bus reset processing (writing 0 to the USBRST bit) or at the end of resume processing from the suspended state (writing 0 to the RESUME bit).

In device controller mode, always set this bit to 0.

RESUME bit (Resume Output)

The RESUME bit controls the resume signal output in host controller mode.

When this bit is set to 1, the USBFS drives the USB port to the K-state and outputs the resume signal. The USBFS sets the bit to 1 on detection of a remote wakeup signal while the RWUPE bit is 1 and in the USB Suspend state.

The USBFS continues outputting the K-state while the RESUME bit is 1, until the bit is cleared to 0 by software. The RESUME bit must be 1 (resume period) for the time defined in the USB 2.0 specification. Only set this bit to 1 while the interface is in the Suspend state. Write 1 to the UACT bit simultaneously with the end of the resume processing (writing 0 to the RESUME bit).

Always set this bit to 0 in device controller mode.

USBRST bit (USB Bus Reset Output)

The USBRST bit controls the output of the USB bus signal in host controller mode. When this bit set to 1, the USBFS drives the USB port to the SE0 state to reset the USB bus. The USBFS continues outputting SE0 while the USBRST bit is 1, until the bit is cleared to 0 by software. The USBRST bit must be 1 (USB bus reset period) for the time defined in the USB 2.0 specification. Writing 1 to the USBRST bit during communication (UACT = 1) or during resume processing (RESUME = 1) prevents the USBFS from starting USB bus reset processing until both the UACT and RESUME bits become 0. Write 1 to the UACT bit simultaneously with the end of the USB bus reset processing (writing 0 to the USBRST bit).

Always set this bit to 0 in device controller mode.

RWUPE bit (Wakeup Detection Enable)

The RWUPE bit enables or disables remote wakeup signals (resume signals) from downstream peripheral devices in host controller mode. When this bit is set to 1, the USBFS detects a remote wakeup signal (K-state for 2.5 µs) from a downstream peripheral device, and performs resume processing, driving the K-state. When the RWUPE bit is set to 0, the USBFS ignores remote wakeup signals (K-states) from peripheral devices connected to the USB port.

Do not stop the internal clock when the RWUPE bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in device controller mode.

WKUP bit (Wakeup Output)

The WKUP bit enables or disables remote wakeup signals (resume signals) to the USB bus in device controller mode.

The USBFS controls the output timing of the remote wakeup signals. When this bit is set to 1, the USBFS clears it to 0 after outputting the K-state for 10 ms. The USB 2.0 specification specifies that the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is sent. If the USBFS writes 1 to the WKUP bit immediately after detecting the Suspend state, the K-state is output after 2 ms.

Only write 1 to the WKUP bit when the device is in the Suspend state (INTSTS0.DVSQ[2:0] = 1xxb) and the USB host enables the remote wakeup signal. Do not stop the internal clock while this bit is 1, even in the Suspend state (SYSCFG.SCKE bit must be set to 1).

Always set this bit to 0 in host controller mode.

HNPBTOA bit (Host Negotiation Protocol (HNP) Control)

TheHNPBTOA bit is used when switching from device B to device A while in OTG mode.

If the HNPBTOA bit is 1, the internal function control maintains the Suspend state until HNP processing ends, even if the SYSCFG.DPRPU bit is set to 0 or the SYSCFG.DCFM bit is set to 1. Resume interrupts (RESM) are not generated even if a falling edge of D+ is detected.

After this bit is set to 1, the HNP processing ends when a host attach event is detected, because of a pull-up by the initiating party, or the HNPBTOA bit is cleared to 0 by software because the HNP processing times out.

29.2.4 CFIFO/CFIFOL : CFIFO Port Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x014

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FIFOPORT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	FIFOPORT[15:0]*1	FIFO Port Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND) in the associated port selection register. See Table 29.5 and Table 29.6.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT[15:0] bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 29.5 and Table 29.6.

Table 29.5 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Table 29.6 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from these areas is not allowed.

29.2.5 DnFIFO/DnFIFOL : DnFIFO Port Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x018 + 0x4 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	FIFOPORT[15:0]															
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
15:0	FIFOPORT[15:0]*1	FIFO Port Read receive data from the FIFO buffer or write transmit data to the FIFO buffer by accessing these bits	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. The valid bits depend on the MBW settings (CFIFOSEL.MBW, D0FIFOSEL.MBW, and D1FIFOSEL.MBW) and BIGEND settings (CFIFOSEL.BIGEND, D0FIFOSEL.BIGEND, and D1FIFOSEL.BIGEND) in the associated port selection register. See Table 29.7 and Table 29.8.

Three FIFO ports are available:

- CFIFO
- D0FIFO
- D1FIFO

Each FIFO port is configured with:

- A port register (CFIFO, D0FIFO, or D1FIFO) that handles reading of data from the FIFO buffer and writing of data to the FIFO buffer
- A port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL) that selects the pipe assigned to the FIFO port
- A port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR)

Each FIFO port has the following constraints:

- Access to the FIFO buffer for DCP control transfers is through the CFIFO port
- Access to the FIFO buffer for DMA or DTC transfers is through the D0FIO or D1FIFO port
- The D0FIFO and D1FIFO ports can also be accessed by the CPU
- When using functions specific to the FIFO port, such as the DMA or DTC transfer function, you cannot change the pipe number selected in the CURPIPE[3:0] bits of the port selection register
- Registers configuring a FIFO port do not affect other FIFO ports
- The same pipe must not be assigned to two or more FIFO ports
- There are two FIFO buffer states, one giving access rights to the CPU and the other to the serial interface engine (SIE). When the SIE has access rights, the FIFO buffer cannot be accessed by the CPU

FIFOPORT[15:0] bits (FIFO Port)

When the FIFOPORT bit is accessed, the USBFS reads the received data from the FIFO buffer or writes the transmit data to the FIFO buffer. The FIFO port register can be accessed only when the FRDY bit in the associated port control register (CFIFOCTR, D0FIFOCTR, or D1FIFOCTR) is 1.

The valid bits in the FIFO port register depend on the MBW and BIGEND settings in the port selection register (CFIFOSEL, D0FIFOSEL, or D1FIFOSEL). See Table 29.7 and Table 29.8.

Table 29.7 Endian operation in 16-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	N + 1 data	N + 0 data
1	N + 0 data	N + 1 data

Table 29.8 Endian operation in 8-bit access

CFIFOSEL.BIGEND bit D0FIFOSEL.BIGEND bit D1FIFOSEL.BIGEND bit	Bits [15:8]	Bits [7:0]
0	Access prohibited*1	N + 0 data
1	Access prohibited*1	N + 0 data

Note 1. Writing to or reading from these areas is not allowed.

29.2.6 CFIFOSEL : CFIFO Port Select Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x020

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCNT	REW	—	—	—	MBW	—	BIGEND	—	—	ISEL	—	CURPIPE[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CURPIPE[3:0]	CFIFO Port Access Pipe Specification 0x0: Default Control Pipe 0x1: Pipe 1 0x2: Pipe 2 0x3: Pipe 3 0x4: Pipe 4 0x5: Pipe 5 0x6: Pipe 6 0x7: Pipe 7 0x8: Pipe 8 0x9: Pipe 9 Others: Setting prohibited	R/W
4	—	This bit is read as 0. The write value should be 0.	R/W
5	ISEL	CFIFO Port Access Direction When DCP Is Selected 0: Select reading from the FIFO buffer 1: Select writing to the FIFO buffer	R/W
7:6	—	These bits are read as 0. The write value should be 0.	R/W
8	BIGEND	CFIFO Port Endian Control 0: Little endian 1: Big endian	R/W
9	—	This bit is read as 0. The write value should be 0.	R/W
10	MBW	CFIFO Port Access Bit Width 0: 8-bit width 1: 16-bit width	R/W
13:11	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
14	REW	Buffer Pointer Rewind 0: Do not rewind buffer pointer 1: Rewind buffer pointer	W*1
15	RCNT	Read Count Mode 0: The DTLN[8:0] bits (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) are cleared when all receive data is read from the CFIFO. In double buffer mode, the DTLN[8:0] value is cleared when all data is read from only a single plane. 1: The DTLN[8:0] bits are decremented each time the receive data is read from the CFIFO.	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Only 0 can be read.

Do not specify the same pipe number in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected.

Do not change the pipe number while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (CFIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the CFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

ISEL bit (CFIFO Port Access Direction When DCP Is Selected)

After writing a new value to the ISEL bit with the DCP as the selected pipe, read the ISEL bit to check that the written value agrees with the read value before proceeding to the next process. Set the ISEL and CURPIPE[3:0] bits simultaneously.

MBW bit (CFIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the CFIFO port.

When the selected pipe is receiving, set the CURPIPE[3:0] and MBW bits simultaneously. After a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all of the data is read.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the REW bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

29.2.7 DnFIFOSEL : DnFIFO Port Select Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x028 + 0x4 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	RCNT	REW	DCLRM	DREQE	—	MBW	—	BIGEND	—	—	—	—	CURPIPE[3:0]			
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
3:0	CURPIPE[3:0]	FIFO Port Access Pipe Specification 0x0: Default Control Pipe 0x1: Pipe 1 0x2: Pipe 2 0x3: Pipe 3 0x4: Pipe 4 0x5: Pipe 5 0x6: Pipe 6 0x7: Pipe 7 0x8: Pipe 8 0x9: Pipe 9 Others: Setting prohibited	R/W
7:4	—	These bits are read as 0. The write value should be 0.	R/W
8	BIGEND	FIFO Port Endian Control 0: Little endian 1: Big endian	R/W
9	—	This bit is read as 0. The write value should be 0.	R/W
10	MBW	FIFO Port Access Bit Width 0: 8-bit width 1: 16-bit width	R/W
11	—	This bit is read as 0. The write value should be 0.	R/W
12	DREQE	DMA/DTC Transfer Request Enable 0: Disable DMA/DTC transfer request 1: Enable DMA/DTC transfer request	R/W
13	DCLRM	Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read 0: Disable auto buffer clear mode 1: Enable auto buffer clear mode	R/W
14	REW	Buffer Pointer Rewind 0: Do not rewind buffer pointer 1: Rewind buffer pointer	W
15	RCNT	Read Count Mode 0: Clear DTLN[8:0] bits in (CFIFOCTR.DTLN[8:0], D0FIFOCTR.DTLN[8:0], D1FIFOCTR.DTLN[8:0]) when all receive data is read from DnFIFO (after read of a single plane in double buffer mode) 1: Decrement DTLN[8:0] bits each time receive data is read from DnFIFO	R/W

Note: S-TYPE-3, P-TYPE-3

The same pipe must not be specified in the CURPIPE[3:0] bits in the CFIFOSEL, D0FIFOSEL, and D1FIFOSEL registers. When the CURPIPE[3:0] bits in the D0FIFOSEL and D1FIFOSEL registers are set to 0000b, no pipe is selected. The pipe number must not be changed while DMA or DTC transfer is enabled.

CURPIPE[3:0] bits (FIFO Port Access Pipe Specification)

The CURPIPE[3:0] bits specify the pipe number to use for reading or writing data through the DnFIFO port. After writing to these bits, read them to check that the written value agrees with the read value before proceeding to the next process. Do not set the same pipe number to the CURPIPE[3:0] bits in CFIFOSEL, D0FIFOSEL, and D1FIFOSEL.

During FIFO buffer access, even when an attempt is made to change the CURPIPE[3:0] setting, the current access setting is retained until access is complete.

MBW bit (FIFO Port Access Bit Width)

The MBW bit specifies the bit width for accessing the DnFIFO port.

When the selected pipe is receiving, after a write to these bits starts a data read from the FIFO buffer, do not change the MBW bit until all of the data is read. Set the CURPIPE[3:0] and MBW bits simultaneously.

When the selected pipe is transmitting, the bit width cannot be changed from 8-bit to 16-bit while data is being written to the FIFO buffer.

An odd number of bytes can also be written through byte-access control even when 16-bit width is selected.

DREQE bit (DMA/DTC Transfer Request Enable)

The DREQE bit enables or disables issuing of DMA or DTC transfer requests. To enable DMA or DTC transfer requests, set this bit to 1 after setting the CURPIPE[3:0] bits. To change the CURPIPE[3:0] setting, first set this bit to 0.

DCLRM bit (Auto Buffer Memory Clear Mode Accessed after Specified Pipe Data is Read)

The DCLRM bit enables or disables automatic FIFO buffer clearing after data in the selected pipe is read.

When this bit is set to 1, on receiving a zero-length packet while the FIFO buffer assigned to the selected pipe is empty, or when reading of a received short packet is complete while the PIPECFG.BFRE bit is 1, the USBFS sets the BCLR bit in the FIFO port control register to 1.

When using the USBFS with the SOFCFG.BRDYM bit set to 1, set this bit to 0.

REW bit (Buffer Pointer Rewind)

The REW bit specifies whether to rewind the buffer pointer.

When the selected pipe is receiving, setting this bit to 1 while the FIFO buffer is being read allows re-reading of the FIFO buffer from the first data. In double buffering, this setting enables re-reading of the currently-read FIFO buffer plane from the first entry.

Do not set this bit to 1 while simultaneously changing the CURPIPE[3:0] bits. Before setting the bit to 1, be sure to check that the FRDY bit is 1.

To rewrite to the FIFO buffer from the first data for the transmitting pipe, use the BCLR bit.

RCNT bit (Read Count Mode)

The RCNT bit specifies the read mode for the value in the D0FIFOCTL.DTLN bit and D1FIFOCTL.DTLN bit. When accessing DnFIFO with the PIPECFG.BFRE bit set to 1, set the RCNT bit to 0.

29.2.8 CFIFOCTR : CFIFO Port Control Register

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x022

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BVAL	BCLR	FRDY	—	—	—	—	DTLN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DTLN[8:0]	Receive Data Length Indicates the receive data length. The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
12:9	—	These bits are read as 0. The write value should be 0.	R/W

Bit	Symbol	Function	R/W
13	FRDY	FIFO Port Ready 0: FIFO port access disabled 1: FIFO port access enabled	R
14	BCLR	CPU Buffer Clear 0: No operation 1: Clear FIFO buffer on the CPU side	W
15	BVAL	Buffer Memory Valid Flag 0: Invalid (writing 0 has no effect) 1: Writing ended	R/W

Note: S-TYPE-3, P-TYPE-3

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

  The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

  The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.

When the DCP is the selected pipe, setting the BCLR bit to 1 allows the USBFS to clear the FIFO buffer regardless of whether the CPU or SIE has access rights. To clear the buffer when the SIE has access rights, set the DCPCTR.PID[1:0] bits to 00b (NAK response) before setting the BCLR bit to 1.

When the selected pipe is transmitting, if 1 is written to the BVAL flag and the BCLR bit simultaneously, the USBFS clears the data that is already written, enabling transmission of a zero-length packet.

When the selected pipe is not the DCP, only write 1 to the BCLR bit while the FRDY bit in the FIFO port control register is 1 (set by the USBFS).

BVAL flag (Buffer Memory Valid Flag)

Set the BVAL flag to 1 when data is completely written to the FIFO buffer on the CPU side for the pipe selected in CURPIPE[3:0].

When the selected pipe is transmitting, set this flag to 1 in the following cases:

- To transmit a short packet, set this flag to 1 after data is written
- To transmit a zero-length packet, set this flag to 1 before data is written to the FIFO buffer

The USBFS then switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

When data of the maximum packet size is written for the pipe in continuous transfer mode, the USBFS sets the BVAL flag to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.

Only write 1 to the BVAL flag while the FRDY bit is 1 (set by the USBFS). When the selected pipe is receiving, do not set the BVAL flag to 1.

29.2.9 DnFIFOCTR : DnFIFO Port Control Register (n = 0, 1)

Base address: USBFS = 0x4025_0000
USBFS_NS = 0x5025_0000

Offset address: 0x02A + 0x4 × n

Bit position:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Bit field:	BVAL	BCLR	FRDY	—	—	—	—	DTLN[8:0]								
Value after reset:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	Symbol	Function	R/W
8:0	DTLN[8:0]	Receive Data Length Indicates the receive data length. The meaning of the values differs depending on the RCNT bit setting in the port select register. For details, see the description of the DTLN[8:0] bits.	R
12:9	—	These bits are read as 0. The write value should be 0.	R/W
13	FRDY	FIFO Port Ready 0: FIFO port access disabled 1: FIFO port access enabled	R
14	BCLR	CPU Buffer Clear 0: No operation 1: Clear FIFO buffer on the CPU side	R/W*1
15	BVAL	Buffer Memory Valid Flag 0: Invalid (writing 0 has no effect) 1: Writing ended	R/W

Note: S-TYPE-3, P-TYPE-3
Note 1. Only 0 can be read.

The CFIFOCTR, D0FIFOCTR, and D1FIFOCTR registers correspond to the CFIFO, D0FIFO, and D1FIFO buffers.

DTLN[8:0] bits (Receive Data Length)

The DTLN[8:0] bits indicate the length of the receive data.

While the FIFO buffer is being read, the DTLN[8:0] bits indicate different values depending on the DnFIFOSEL.RCNT bit (n = 0, 1), as follows:

- RCNT = 0

  The USBFS sets the DTLN[8:0] bits to indicate the length of the receive data until the CPU or DMA/DTC has read all of the received data from a single FIFO buffer plane.

  While the PIPECFG.BFRE bit = 1, the USBFS retains the length of the receive data until the BCLR bit is set to 1, even after all the data is read.

- RCNT = 1

The USBFS decrements the value indicated in the DTLN[8:0] bits each time data is read from the FIFO buffer. The value is decremented by 1 when MBW = 0, and by 2 when MBW = 1.

The USBFS sets these bits to 0 when all the data is read from one FIFO buffer plane. In double buffer mode, if data is received in one FIFO buffer plane before all of the data is read from the other plane, the USBFS sets these bits to indicate the length of the receive data in the former plane when all of the data is read from the latter plane.

FRDY bit (FIFO Port Ready)

The FRDY bit indicates whether the FIFO port can be accessed by the CPU or DMA/DTC.

In the following cases, the USBFS sets the FRDY bit to 1 but data cannot be read through the FIFO port because there is no data to be read:

- A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty
- A short packet is received and the data is completely read while the PIPECFG.BFRE bit = 1

In these cases, set the BCLR bit to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.

BCLR bit (CPU Buffer Clear)

Set the BCLR bit to 1 to clear the FIFO buffer on the CPU side for the selected pipe.

When double buffer mode is set for the FIFO buffer assigned to the selected pipe, the USBFS clears only one plane of the FIFO buffer even when both planes are read-enabled.
