struct rm_ble_mesh_access_instance_ctrl_t

RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_ACCESS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_ACCESS_Open()

fsp_err_t RM_BLE_MESH_ACCESS_Open (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_cfg_t const *const *p_cfg*)

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements rm_ble_mesh_access_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_ACCESS_Close()

fsp_err_t RM_BLE_MESH_ACCESS_Close (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_access_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_RegisterModel()

fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_t const *const *p_model*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements rm_ble_mesh_access_api_t::registerModel.

Example:

```
/* Register a model with the access layer. */
   err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_model and p_model_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *elem_addr*, rm_ble_mesh_access_element_handle_t *const *p_handle*)

Get element handle. This routine searches for the element handle associated with specific element address.

Implements rm_ble_mesh_access_api_t::getElementHandle.

Example:

```
/* Get element handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_element_handle_t *const *p_elem_handle*)

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements rm_ble_mesh_access_api_t::getElementHandleForModelHandle.

Example:

```
/* Get element handle for a given model handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_elem_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_element_handle_t *elem_handle*, rm_ble_mesh_access_model_id_t *model_id*, rm_ble_mesh_access_model_handle_t *const *p_handle*)

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements rm_ble_mesh_access_api_t::getModelHandle.

Example:

```
/* Get model handle. */
   err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Publish()

fsp_err_t RM_BLE_MESH_ACCESS_Publish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint8_t *reliable*)

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::publish.

Example:

```
/* Publish access layer message. */
   err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReliablePublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint32_t *rsp_opcode*)

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::reliablePublish.

Example:

```
/* Reliably publish access layer message. */
   err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_Reply()

fsp_err_t RM_BLE_MESH_ACCESS_Reply (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, uint8_t *ttl*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*)

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements rm_ble_mesh_access_api_t::reply.

Example:

```
/* Reply to access layer message. */
   err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*, rm_ble_mesh_access_publish_setting_t const *const *p_publish_setting*)

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements rm_ble_mesh_access_api_t::replyAndPublish.

Example:

```
/* Reply to access layer message. */
   err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_SendPdu()

fsp_err_t RM_BLE_MESH_ACCESS_SendPdu (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_pdu_t const *const *p_pdu*, uint8_t *reliable*)

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_access_api_t::sendPdu.

Example:

```
/* Send Access PDUs. */
   err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetCompositionData()

fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_buffer_t *const *p_buffer*)

Get composition data.

Implements rm_ble_mesh_access_api_t::getCompositionData.

Example:

```
/* Get composition data. */
   err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_buffer is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Reset()

fsp_err_t RM_BLE_MESH_ACCESS_Reset (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements rm_ble_mesh_access_api_t::reset.

Example:

```
/* Reset a node. */
   err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementCount()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_count*)

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements rm_ble_mesh_access_api_t::getElementCount.

Example:

```
/* Get the number of elements in local node. */
   err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_count is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To set primary unicast address. This routine sets primary unicast address.

Implements rm_ble_mesh_access_api_t::setPrimaryUnicastAddress.

Example:

```
/* Set primary unicast address. */
   err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *const *p_addr*)

To get primary unicast address. This routine gets primary unicast address.

Implements rm_ble_mesh_access_api_t::getPrimaryUnicastAddress.

Example:

```
/* Get primary unicast address. */
   err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ttl*)

To set default TTL. This routine sets default TTL.

Implements rm_ble_mesh_access_api_t::setDefaultTtl.

Example:

```
/* Set default TTL. */
   err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_ttl*)

To get default TTL. This routine gets default TTL.

Implements rm_ble_mesh_access_api_t::getDefaultTtl.

Example:

```
/* Get default TTL. */
   err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_ttl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *iv_index*, uint8_t *iv_update_flag*)

To set IV Index. This routine sets IV Index.

Implements rm_ble_mesh_access_api_t::setIvIndex.

Example:

```
/* Set IV Index. */
   err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_IN_USE	Resource is busy.

◆ RM_BLE_MESH_ACCESS_GetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *const *p_iv_index*, uint8_t *const *p_iv_update_flag*)

To get IV Index. This routine gets IV Index.

Implements rm_ble_mesh_access_api_t::getIvIndex.

Example:

```
/* Get IV Index. */
   err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index and p_iv_update_flag are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetIvIndexByIvi()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ivi*, uint32_t *const *p_iv_index*)

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements rm_ble_mesh_access_api_t::getIvIndexByIvi.

Example:

```
/* Get IV Index by IVI. */
   err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *enable*, uint8_t *feature*)

To enable/disable a feature. This routine enables/disables a feature field.

Implements rm_ble_mesh_access_api_t::setFeaturesField.

Example:

```
/* Enable/Disable a feature. */
   err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_enable*, uint8_t *feature*)

To get state of a feature. This routine gets the state of a feature field.

Implements rm_ble_mesh_access_api_t::getFeaturesField.

Example:

```
/* Get state of a feature. */
   err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_enable is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeatures()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_features*)

To get state of all features. This routine gets the state of all features.

Implements rm_ble_mesh_access_api_t::getFeatures.

Example:

```
/* Get state of all features. */
   err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_features is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_friend_role*)

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::getFriendshipRole.

Example:

```
/* Get friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_friend_role is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *friend_role*)

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::setFriendshipRole.

Example:

```
/* Set friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_dev_key*, rm_ble_mesh_network_address_t *uaddr*, uint8_t *num_elements*)

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements rm_ble_mesh_access_api_t::addDeviceKey.

Example:

```
/* Add Device Key. */
   err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OVERFLOW	Device key table is full.

◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *dev_key_index*, uint8_t **const *p_dev_key*)

To get Device Key. This routine gets Device Key entry.

Implements rm_ble_mesh_access_api_t::getDeviceKey.

Example:

```
/* Get Device Key. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To remove all Device Keys. This routine removes all Device Keys from table.

Implements rm_ble_mesh_access_api_t::removeAllDeviceKeys.

Example:

```
/* Remove all Device Keys. */
   err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_provisioned_device_entry_t const *const *p_prov_dev_list*, uint16_t *const *p_num_entries*)

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements rm_ble_mesh_access_api_t::getProvisionedDeviceList.

Example:

```
/* Get list of provisioned device list. */
   err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_dev_list and p_num_entries are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *prim_elem_uaddr*, rm_ble_mesh_access_device_key_handle_t *const *p_handle*)

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements rm_ble_mesh_access_api_t::getDeviceKeyHandle.

Example:

```
/* Get Device Key handle. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_appkey_handle_t *appkey_handle*, uint8_t **const *p_app_key*, uint8_t *const *p_aid*)

To get AppKey. This routine gets AppKey along with AID entry.

Implements rm_ble_mesh_access_api_t::getAppKey.

Example:

```
/* Get AppKey. */
   err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key and p_aid are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, uint32_t *opcode*, uint8_t const *const *p_net_key*)

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addUpdateNetkey.

Example:

```
/* Add/Update NetKey. */
   err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*, rm_ble_mesh_access_friend_security_credential_info_t *info*)

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::addFriendSecurityCredential.

Example:

```
/* Add security credential of a LPN or the friend. */
   err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*)

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::deleteFriendSecurityCredential.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
   err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_FindSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*)

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::findSubnet.

Example:

```
/* Find a subnet associated with the NetKey. */
   err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *friend_subnet_handle*, rm_ble_mesh_network_subnet_handle_t *const* *p_master_subnet_handle*)

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements rm_ble_mesh_access_api_t::findMasterSubnet.

Example:

```
/* Close the module. */
   err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_master_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteNetKey.

Example:

```
/* Delete NetKey. */
   err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_net_key*)

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getNetKey.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_netkey_count*, uint16_t *const *p_netkey_index_list*)

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements rm_ble_mesh_access_api_t::getNetKeyIndexList.

Example:

```
/* Get list of all known NetKeys. */
   err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_netkey_count and p_netkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_LookUpNid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *nid*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for NID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNid.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_network_id*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNetworkId.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id, p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpAid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *aid*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*, uint8_t *const *p_app_key*)

To search for AID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpAid.

Example:

```
/* Search for AID. */
   err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle and p_app_key are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_data_t const *const *p_prov_data*)

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements rm_ble_mesh_access_api_t::setProvisioningData.

Example:

```
/* Set provisioning data. */
   err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_nid*)

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNid.

Example:

```
/* Get NID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_nid is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_privacy_key*)

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetPrivacyKey.

Example:

```
/* Get Privacy Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_privacy_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_network_id*)

To get Network ID associated with a subnet. This routine fetches the Netowrk ID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNetworkId.

Example:

```
/* Get Network ID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_beacon_key*)

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetBeaconKey.

Example:

```
/* Get Beacon Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_beacon_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_identity_key*)

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetIdentityKey.

Example:

```
/* Get Identity Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_identity_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_encrypt_key*)

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetEncryptionKey.

Example:

```
/* Get Encryption Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_encrypt_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To get Node Identity. This routine gets Node Identity State of a node

Implements rm_ble_mesh_access_api_t::getNodeIdentity.

Example:

```
/* Get node identity. */
   err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To set Node Identity. This routine sets Node Identity State of a node.

Implements rm_ble_mesh_access_api_t::setNodeIdentity.

Example:

```
/* Set node identity. */
   err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_key_refresh_state*)

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements rm_ble_mesh_access_api_t::getKeyRefreshPhase.

Example:

```
/* Get key refresh phase. */
   err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t const *const *p_key_refresh_state*)

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements rm_ble_mesh_access_api_t::setKeyRefreshPhase.

Example:

```
/* Set key refresh phase. */
   err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *tx_state*)

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::setTransmitState.

Example:

```
/* Set network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *const *p_tx_state*)

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::getTransmitState.

Example:

```
/* Get network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_tx_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addAppKey.

Example:

```
/* Add AppKey. */
   err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::updateAppKey.

Example:

```
/* Update AppKey. */
   err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteAppKey.

Example:

```
/* Delete AppKey. */
   err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*)

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyHandle.

Example:

```
/* Get AppKey handle for a given AppKey index. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                            subnet_handle,
                                            appkey_index,
                                            &app_key,
                                            &appkey_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyIndexList.

Example:

```
/* Get list of all known AppKeys. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                               subnet_handle,
                                                &appkey_count,
                                                &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::bindModelWithAppKey.

Example:

```
/* Bind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::unbindModelWithAppKey.

Example:

```
/* Unbind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements rm_ble_mesh_access_api_t::getModelAppKeyList.

Example:

```
/* Get list of all AppKeys associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                               model_handle,
                                               &appkey_count,
                                               &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublication.

Example:

```
/* Set publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint8_t *period_divisor*)

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor.

Example:

```
/* Set publication fast period divisor information associated with a model. */
   err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::getModelPublication.

Example:

```
/* Get publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::addModelSubscription.

Example:

```
/* Add an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteModelSubscription.

Example:

```
/* Delete an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

To discard a model subscription list. This routine discards a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteAllModelSubscription.

Example:

```
/* Discard a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements rm_ble_mesh_access_api_t::getModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of a model. */
   err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                     model_handle,
                                                         &sub_addr_count,
                                                         &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements rm_ble_mesh_access_api_t::getAllModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of all the models. */
   err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidElementAddress.

Example:

```
/* Check if valid element address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
   err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidSubscriptionAddress.

Example:

```
/* Check if valid subscription address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_iv_update_test_mode_t *mode*)

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements rm_ble_mesh_access_api_t::enableIvUpdateTestMode.

Example:

```
/* Set the IV update test mode feature. */
   err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Bluetooth Low Energy Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Config Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Config Server (rm_mesh_config_srv).

Configuration	Options	Default	Description
Interrupts > Callback	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_srv0	Module name.

Data Structures

struct	rm_mesh_config_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_srv_instance_ctrl_t

struct rm_mesh_config_srv_instance_ctrl_t

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_SRV_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_SRV_Open()

fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_SRV_Close()

fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_SRV_StateUpdate()

fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

Return values

FSP_ERR_UNSUPPORTED	This function is unsupported.

Bluetooth Low Energy Mesh Network Config Client (rm_mesh_config_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_config_client_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t server_addr, uint8_t *p_dev_key)
fsp_err_t	RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Config Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Config Client (rm_mesh_config_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_clt0	Module name.

Data Structures

struct	rm_mesh_config_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_clt_instance_ctrl_t

struct rm_mesh_config_clt_instance_ctrl_t
BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_CLT_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_CLT_Open()

fsp_err_t RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_config_client_cfg_t const *const *p_cfg*)

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements rm_ble_mesh_config_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_CLT_Close()

fsp_err_t RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Close Configuration Client middleware.

Implements rm_ble_mesh_config_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_CLT_SetServer()

fsp_err_t RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *server_addr*, uint8_t * *p_dev_key*)

This is to sets the information about server which is to be configured.

Implements rm_ble_mesh_config_client_api_t::setServer.

Example:

```
/* Sets the information about server which is to be configured. */
   err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.

◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_config_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconGet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconSet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_CompositionDataGet()

fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlGet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlSet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxyGet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxySet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelayGet()

fsp_err_t RM_MESH_CONFIG_CLT_RelayGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelaySet()

fsp_err_t RM_MESH_CONFIG_CLT_RelaySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentityGet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentitySet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppBind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppUnbind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeReset()

fsp_err_t RM_MESH_CONFIG_CLT_NodeReset (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendGet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendSet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()

fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)

fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t company_id, uint8_t fault_code)
fsp_err_t	RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status, uint16_t length)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Health Server (rm_mesh_health_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Health Server (rm_mesh_health_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health server ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_srv0	Module name.
Company Id	Invalid Company Id	0	Select company id.
Number of Self Tests	Invalid Number of Self Tests	0	Select number of self tests.
Self Tests	Name Must Be a Valid C Symbol	NULL	Self test

Data Structures

struct	rm_mesh_health_server_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_server_instance_ctrl_t

struct rm_mesh_health_server_instance_ctrl_t
BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_SERVER_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_SERVER_Open()

fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_health_server_cfg_t const *const *p_cfg*)

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.
 	
Implements rm_ble_mesh_health_server_api_t::open.
 	
Example:
`/* Open the module. */`
`err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl, &g_mesh_health_srv0_cfg);`
 	
Return values
FSP_SUCCESS — Model opened successfully.
FSP_ERR_ASSERTION — Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN — Model is already open.
FSP_ERR_NOT_FOUND — The number of models has exceeded the limit.
FSP_ERR_ABORTED — Model initialization is failed.

◆ RM_MESH_HEALTH_SERVER_Close()

fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*)

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_SERVER_ReportFault()

fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, const rm_ble_mesh_access_model_handle_t *const *model_handle*, uint8_t *test_id*, uint16_t *company_id*, uint8_t *fault_code*)

API to report self-test fault. This is to report fault observed during self-test procedure.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	model_handle	Model Handle identifying the Health Server model instance.
[in]	test_id	Identifier of the self-test.
[in]	company_id	Company Identifier.
[in]	fault_code	Fault value indicating the error.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, uint8_t * *status*, uint16_t *length*)

API to publish current status.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	status	Current status.
[in]	length	Length of status.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_GetModelHandle

	(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultClear (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Health Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_health_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Health Client (rm_mesh_health_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Health Client (rm_mesh_health_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_clt0	Module name.

Data Structures

struct	rm_mesh_health_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_clt_instance_ctrl_t

struct rm_mesh_health_clt_instance_ctrl_t
BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_CLIENT_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_CLIENT_Open()

fsp_err_t RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_HEALTH_CLIENT_Close()

fsp_err_t RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Health Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_CLIENT_GetModelHandle()

fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of health client model. */
   err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_HEALTH_CLIENT_SendReliablePdu()

fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to set the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClear()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTest()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_BEARER_PLATFORM_Disconnect (rm_mesh_bearer_platform_ctrl_t *const p_ctrl, uint16_t handle)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Bearer Platform module supports the following

devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

Configuration	Options	Default	Description
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7	7	Maximum number of connections.
Maximum connection data length	Value must be an integer between 27 and 251	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2	2	Maximum periodic sync set number.
Store Security Data	• Disable • Enable	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7	7	Number of remote device bonding information.
Connection Event Start Notify	• Disable • Enable	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	• Disable • Enable	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	• Disable • Enable	Disable	Set Advertising event start notify

			enable/disable.
Advertising Event Close Notify	• Disable • Enable	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	• Disable • Enable	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	• Disable • Enable	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	• Disable • Enable	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	• Disable • Enable	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15	6	Load capacitance adjustment.
DC-DC converter	• Disable • Enable	Disable	Set DC-DC converter for RF part.
Slow Clock Source	• Use RF_LOCO • Use External 32.768kHz	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	• P109 • P205	P109	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	• MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz	MCU CLKOUT frequency 32.768kHz	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500	250	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.

Transmission Power Maximum Value	• max +0dBm • max +4dBm	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW).
CLKOUT_RF Output	• No output • 4MHz output • 2MHz output • 1MHz output	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	• Disable • Enable	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an	247	MTU Size configured by

	integer between 23 and 247		GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10	10	The maximum number of timer slot.

Configurations for Networking > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

Configuration	Options	Default	Description
General > Name	Name Must Be a Valid C Symbol	g_rm_mesh_bearer_platform0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Device Address Type	Invalid Device Address Type	0	Select device address type (public : 0, random : 1).
GATT Server Callback Number	Invalid Callback Number	1	Number of GATT server collback.
GATT Client Callback Number	Invalid Callback Number	1	Number of GATT client collback.
Vender Specific Callback	Name Must Be a Valid C Symbol.	NULL	Vendor specific callback function name.

Data Structures

struct	rm_mesh_bearer_platform_instance_ctrl_t
struct	rm_mesh_bearer_platform_extended_cfg_t

Typedefs

typedef void(*	rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr) Callback function for GATT interface event. More...

Enumerations

enum	rm_mesh_bearer_platform_interface_event_t

Data Structure Documentation

◆ **rm_mesh_bearer_platform_instance_ctrl_t**

struct rm_mesh_bearer_platform_instance_ctrl_t
RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

◆ rm_mesh_bearer_platform_extended_cfg_t

struct rm_mesh_bearer_platform_extended_cfg_t
Bearer port extension for renesas BLE stack.

Typedef Documentation

◆ rm_mesh_bearer_platform_gatt_iface_cb_t

typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)

Callback function for GATT interface event.

Parameters

event_name	The event defined by rm_mesh_bearer_platform_interface_event_t
event_param	The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t
conn_hdl	The connection handle
peer_addr	Pointer to the connected device address

Enumeration Type Documentation

◆ rm_mesh_bearer_platform_interface_event_t

enum rm_mesh_bearer_platform_interface_event_t	
GATT Interface Events	
Enumerator	
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP	The event GATT Bearer BLE Link Layer connected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN	The event GATT Bearer BLE Link Layer disconnected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE	The event GATT Bearer service enabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE	The event GATT Bearer service disabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND	The event discovery process is not completed
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN	The event that connectable device having Mesh GATT Service is found
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL	The Event GATT/BLE link layer connection creation is canceled

Function Documentation

◆ RM_MESH_BEARER_PLATFORM_Open()

fsp_err_t RM_MESH_BEARER_PLATFORM_Open (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_cfg_t const *const *p_cfg*)

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements rm_mesh_bearer_platform_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_BEARER_PLATFORM_Close()

fsp_err_t RM_MESH_BEARER_PLATFORM_Close (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Close Bearer Platform middleware. Terminate BLE stack.

Implements rm_mesh_bearer_platform_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Setup()

fsp_err_t RM_MESH_BEARER_PLATFORM_Setup (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_CallbackSet()

fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_iface_cb_t *callback*)

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	callback	Callback function.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Set GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_GetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t * *p_mode*)

Get current GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	p_mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_mode is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_data*, uint8_t *len*)

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements rm_mesh_bearer_platform_api_t::setScanResponseData.

Example:

```
 /* Set scan response data in connectable and scannable undirected advertising
event.. */
    err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ScanGattBearer()

fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	state	Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_Connect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Connect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_remote_address*, uint8_t *address_type*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements rm_mesh_bearer_platform_api_t::connect.

Example:

```
/* Request to create connection. */
   err = RM_MESH_BEARER_PLATFORM_Connect(&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remote_address is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_DiscoverService()

fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking RM_MESH_BEARER_PLATFORM_ConfigureNotification().

Implements rm_mesh_bearer_platform_api_t::discoverService.

Example:

```
/* Start service discovery for Mesh GATT service. */
   err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                                 handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements rm_mesh_bearer_platform_api_t::configureNotification.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
   err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                              handle,
 RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
 RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Disconnect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*)

Terminate Connection. API to terminate connection.

Implements rm_mesh_bearer_platform_api_t::disconnect.

Example:

```
/* Terminate Connection. */
   err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Bluetooth Low Energy Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server

			ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_admin_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_admin_prop_srv_info_t
struct	rm_mesh_generic_admin_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_admin_prop_srv_info_t

struct rm_mesh_generic_admin_prop_srv_info_t		
Generic Admin Property is a state representing a device property of an element that can be read or written		
Data Fields		
uint16_t	property_id	Admin Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	Admin Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_admin_prop_srv_instance_ctrl_t

struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t
BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ADMIN_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery client ISR occurs
Name	Name Must Be a Valid	g_rm_mesh_generic_ba	Module name.

C Symbol ttery_clt0

Data Structures

struct	rm_mesh_generic_battery_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_clt_instance_ctrl_t

struct rm_mesh_generic_battery_clt_instance_ctrl_t
BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_CLT_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.
Implements rm_ble_mesh_model_client_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl, &g_mesh_generic_battery_clt0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Battery Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Battery client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Battery client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_battery_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl,

	rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_srv0	Module name.

Data Structures

struct	rm_mesh_generic_battery_srv_info_t
struct	rm_mesh_generic_battery_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_srv_info_t

struct rm_mesh_generic_battery_srv_info_t

Generic Battery state is a set of four values representing the state of a battery

Data Fields		
uint8_t	generic_battery_level	Generic Battery Level state is a value ranging from 0 percent through 100 percent
uint32_t	generic_battery_time_to_discharge	Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint32_t	generic_battery_time_to_charge	Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint8_t	generic_battery_flags	Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability

◆ **rm_mesh_generic_battery_srv_instance_ctrl_t**

struct rm_mesh_generic_battery_srv_instance_ctrl_t

BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)

Functions

fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_Close

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_client_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_client_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_client_prop_srv_instance_ctrl_t

struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_CLIENT_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                              &g_mesh_generic_client_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_clt0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

struct rm_mesh_generic_dtt_clt_instance_ctrl_t

BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_CLT_Open()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl,
&g_mesh_generic_dtt_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Close()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Default Transition Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Default_Transition_Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic default transition time client model. */
   err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_DTT_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Default_Transition_Time client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic default transition time client model. */
   err = RM_MESH_GENERIC_DTT_CLT_SetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Get()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Set()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

fsp_err_t	RM_MESH_GENERIC_DTT_SRV_GetTime (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Tmeout Occurs	Name must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_srv0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

struct rm_mesh_generic_dtt_srv_instance_ctrl_t
BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_SRV_Open()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_SRV_Close()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_generic_dtt_srv_transtion_time_info_t *const *p_info*)

API to get default transition time. This is to get default transition time.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_srv control block.
[in]	p_info	rm_mesh_generic_dtt_srv status information.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_clt0	Module name.

Data Structures

struct	rm_mesh_generic_level_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_clt_instance_ctrl_t

struct rm_mesh_generic_level_clt_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Level client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle().

Example:

```
/* Get the handle of generic level client model. */
   err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Level client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic level client model. */
   err = RM_MESH_GENERIC_LEVEL_CLT_SetModelHandle(&g_mesh_generic_level_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Get()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Set()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided Shen Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_srv0	Module name.

Data Structures

struct	rm_mesh_generic_level_srv_info_t
struct	rm_mesh_generic_level_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_srv_info_t

struct rm_mesh_generic_level_srv_info_t		
Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element		
Data Fields		
uint16_t	level	Generic Level
uint32_t	delta_level	Delta Level
uint16_t	move_level	Move Level
uint8_t	tid	
uint8_t	transition_time	
uint8_t	delay	
uint16_t	target_level	Target Level

◆ rm_mesh_generic_level_srv_instance_ctrl_t

struct rm_mesh_generic_level_srv_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_clt0	Module name.

Data Structures

struct	rm_mesh_generic_loc_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_generic_loc_clt_instance_ctrl_t**

struct rm_mesh_generic_loc_clt_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Location Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Location client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic_location client model. */
   err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_LOC_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Location client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic location client model. */
   err = RM_MESH_GENERIC_LOC_CLT_SetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_srv0	Module name.

Data Structures

struct	rm_mesh_generic_loc_srv_global_info_t
struct	rm_mesh_generic_loc_srv_local_info_t

struct	rm_mesh_generic_loc_srv_state_info_t
struct	rm_mesh_generic_loc_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_loc_srv_global_info_t

struct rm_mesh_generic_loc_srv_global_info_t		
Generic Global Location state defines location information of an element		
Data Fields		
uint32_t	global_latitude	Global Coordinates (Latitude)
uint32_t	global_longitude	Global Coordinates (Longitude)
uint16_t	global_altitude	Global Altitude

◆ rm_mesh_generic_loc_srv_local_info_t

struct rm_mesh_generic_loc_srv_local_info_t		
Generic Local Location state defines location information of an element		
Data Fields		
uint16_t	local_north	Local Coordinates (North)
uint16_t	local_east	Local Coordinates (East)
uint16_t	local_altitude	Local Altitude
uint8_t	floor_number	Floor Number
uint16_t	uncertainty	Uncertainty

◆ rm_mesh_generic_loc_srv_state_info_t

struct rm_mesh_generic_loc_srv_state_info_t		
Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state		
Data Fields		
rm_mesh_generic_loc_srv_global_info_t	global_location	Global Location
rm_mesh_generic_loc_srv_local_info_t	local_location	Local Location

◆ rm_mesh_generic_loc_srv_instance_ctrl_t

struct rm_mesh_generic_loc_srv_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

The Bluetooth Low Energy Energy Mesh Network Generic Manufacturer Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_mfr_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_mfr_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must be a Valid C Symbol	NULL	Callback provided when mesh generic manufacturer property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_mfr_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_mfr_prop_srv_info_t
struct	rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_mfr_prop_srv_info_t

struct rm_mesh_generic_mfr_prop_srv_info_t		
Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read		
Data Fields		
uint16_t	property_id	Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property
uint8_t	user_access	Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property
uint8_t *	property_value	Manufacturer Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

Configuration	Options	Default	Description

Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_clt0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

struct rm_mesh_generic_on_off_clt_instance_ctrl_t

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic on_off client model. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic on_off client model. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_SetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Get()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Set()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_ON_OFF_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_GENERIC_ON_OFF_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server ISR occurs
Interrupts > Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_srv0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_srv_info_t
struct	rm_mesh_generic_on_off_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_srv_info_t

struct rm_mesh_generic_on_off_srv_info_t		
Generic OnOff state is a Boolean value that represents the state of an element		
Data Fields		
uint8_t	onoff	Generic On/Off
uint8_t	target_onoff	Target On/Off - Used in response path
uint8_t	last_onoff	Last On/Off
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_on_off_srv_instance_ctrl_t

struct rm_mesh_generic_on_off_srv_instance_ctrl_t
BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_clt0	Module name.

Data Structures

struct	rm_mesh_generic_pl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_pl_clt_instance_ctrl_t

struct rm_mesh_generic_pl_clt_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Level client model. Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power level client model. */
   err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_PL_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_PL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Power_Level client model.FIXME XXX.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic power level client model. */
   err = RM_MESH_GENERIC_PL_CLT_SetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands. Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LastGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_srv0	Module name.

Data Structures

struct	rm_mesh_generic_pl_srv_actual_state_info_t

struct	rm_mesh_generic_pl_srv_last_state_info_t
struct	rm_mesh_generic_pl_srv_default_state_info_t
struct	rm_mesh_generic_pl_srv_range_state_info_t
struct	rm_mesh_generic_pl_srv_state_info_t
struct	rm_mesh_generic_pl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_pl_srv_actual_state_info_t

struct rm_mesh_generic_pl_srv_actual_state_info_t		
Generic Power Actual state determines the linear percentage of the maximum power level of an element, representing a range from 0 percent through 100 percent		
Data Fields		
uint16_t	power_actual	Generic Power Actual
uint8_t	tid	
uint16_t	power_target	Generic Power Target - Used only in response path
uint8_t	transition_time	Transition Time - Used in request path Used as Remaining Time in response path
uint8_t	delay	
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_pl_srv_last_state_info_t

struct rm_mesh_generic_pl_srv_last_state_info_t		
Generic Power Last state is a 16-bit value representing a percentage ranging from (1/65535) percent to 100 percent		
Data Fields		
uint16_t	power_last	Generic Power Last

◆ rm_mesh_generic_pl_srv_default_state_info_t

struct rm_mesh_generic_pl_srv_default_state_info_t		
Generic Power Default state is a 16-bit value ranging from 0 through 65535		
Data Fields		
uint16_t	power_default	Generic Power Default

◆ rm_mesh_generic_pl_srv_range_state_info_t

struct rm_mesh_generic_pl_srv_range_state_info_t		
Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output		
Data Fields		
uint16_t	power_range_min	Generic Power Range - Minimum
uint16_t	power_range_max	Generic Power Range - Maximum
uint8_t	status	Status - Used only in the response path

◆ rm_mesh_generic_pl_srv_state_info_t

struct rm_mesh_generic_pl_srv_state_info_t		
Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state		
Data Fields		
rm_mesh_generic_pl_srv_actual_state_info_t	generic_power_actual	Generic Power Actual
rm_mesh_generic_pl_srv_last_state_info_t	generic_power_last	Generic Power Last
rm_mesh_generic_pl_srv_default_state_info_t	generic_power_default	Generic Power Default
rm_mesh_generic_pl_srv_range_state_info_t	generic_power_range	Generic Power Range

◆ rm_mesh_generic_pl_srv_instance_ctrl_t

struct rm_mesh_generic_pl_srv_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt).

Configuration	Options	Default	Description

Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_clt0	Module name.

Data Structures

struct	rm_mesh_generic_poo_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_clt_instance_ctrl_t

struct rm_mesh_generic_poo_clt_instance_ctrl_t

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_CLT_Open()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_POO_CLT_Close()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power on off client model. */
   err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_POO_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_POO_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Power_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic power on off client model. */
   err = RM_MESH_GENERIC_POO_CLT_SetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupGet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Power On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_srv0	Module name.

Data Structures

struct	rm_mesh_generic_poo_srv_on_power_up_state_info_t

struct	rm_mesh_generic_poo_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

struct rm_mesh_generic_poo_srv_on_power_up_state_info_t		
Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up		
Data Fields		
uint8_t	onpowerup	Generic OnPowerUp

◆ rm_mesh_generic_poo_srv_instance_ctrl_t

struct rm_mesh_generic_poo_srv_instance_ctrl_t
BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_SRV_Open()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl,
&g_mesh_generic_poo_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_POO_SRV_Close()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic Property Client (rm_mesh_generic_prop_clt)

fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet

	(rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic Property Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_prop_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_prop_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic property client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_prop_clt0	Module name.

Data Structures

struct	rm_mesh_generic_prop_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_prop_clt_instance_ctrl_t

struct rm_mesh_generic_prop_clt_instance_ctrl_t
BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PROP_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PROP_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PROP_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Property client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic property client model. */
   err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_GENERIC_PROP_CLT_SetModelHandle()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Generic_Property client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic property client model. */
   err = RM_MESH_GENERIC_PROP_CLT_SetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Client Properties Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Close

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_user_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_user_prop_srv_info_t
struct	rm_mesh_generic_user_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_user_prop_srv_info_t

struct rm_mesh_generic_user_prop_srv_info_t		
Generic User Property is a state representing a device property of an element		
Data Fields		
uint16_t	property_id	User Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	User Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_user_prop_srv_instance_ctrl_t

struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Control Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_clt0	Module name.

Data Structures

struct	rm_mesh_light_ctl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_clt_instance_ctrl_t

struct rm_mesh_light_ctl_clt_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Ctl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Ctl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light ctl client model. */
   err = RM_MESH_LIGHT_CTL_CLT_GetModelHandle(&g_mesh_light_ctl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_LIGHT_CTL_CLT_SetModelHandle()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Light_Ctl client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of light ctl client model. */
   err = RM_MESH_LIGHT_CTL_CLT_SetModelHandle(&g_mesh_light_ctl_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_CTL_CLT_SendReliablePdu(&g_mesh_light_ctl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Control Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_srv0	Module name.

Data Structures

struct	rm_mesh_light_ctl_srv_info_t

struct	rm_mesh_light_ctl_srv_default_info_t
struct	rm_mesh_light_ctl_srv_temperature_info_t
struct	rm_mesh_light_ctl_srv_temperature_range_info_t
struct	rm_mesh_light_ctl_srv_extended_cfg_t
struct	rm_mesh_light_ctl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_srv_info_t

struct rm_mesh_light_ctl_srv_info_t		
Light CTL state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	target_ctl_lightness	Target Light CTL Lightness - Used in response path
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Terget Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_ctl_srv_default_info_t

struct rm_mesh_light_ctl_srv_default_info_t		
Light CTL Default state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	ctl_delta_uv	Light CTL Delta UV

◆ rm_mesh_light_ctl_srv_temperature_info_t

struct rm_mesh_light_ctl_srv_temperature_info_t		
Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Target Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint16_t	target_ctl_delta_uv	Target Light CTL Delta UV - Used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ **rm_mesh_light_ctl_srv_temperature_range_info_t**

struct rm_mesh_light_ctl_srv_temperature_range_info_t		
Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting		
Data Fields		
uint16_t	ctl_temperature_range_min	CTL Temperature Range Min
uint16_t	ctl_temperature_range_max	CTL Temperature Range Max
uint8_t	status	Status - Used in response path

◆ **rm_mesh_light_ctl_srv_extended_cfg_t**

struct rm_mesh_light_ctl_srv_extended_cfg_t		
BLE mesh light ctl extension for BLE mesh light ctl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_temperature_access_instance	Pointer to access instance for temperature model.

◆ **rm_mesh_light_ctl_srv_instance_ctrl_t**

struct rm_mesh_light_ctl_srv_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_clt0	Module name.

Data Structures

struct	rm_mesh_light_hsl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_clt_instance_ctrl_t

struct rm_mesh_light_hsl_clt_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl,
&g_mesh_light_hsl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Hsl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Hsl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light hsl client model. */
   err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_LIGHT_HSL_CLT_SetModelHandle()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Light_Hsl client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of light hsl client model. */
   err = RM_MESH_LIGHT_HSL_CLT_SetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv)

fsp_err_t	RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_srv0	Module name.

Data Structures

struct	rm_mesh_light_hsl_srv_info_t

struct	rm_mesh_light_hsl_srv_target_info_t
struct	rm_mesh_light_hsl_srv_default_info_t
struct	rm_mesh_light_hsl_srv_hue_info_t
struct	rm_mesh_light_hsl_srv_saturation_info_t
struct	rm_mesh_light_hsl_srv_range_info_t
struct	rm_mesh_light_hsl_srv_extended_cfg_t
struct	rm_mesh_light_hsl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_srv_info_t

struct rm_mesh_light_hsl_srv_info_t

Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields

uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_hsl_lightness	Target Perceived lightness - used in the response path
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	target_hsl_hue	Target hue - used in the response path
uint16_t	hsl_saturation	The saturation of a color light
uint16_t	target_hsl_saturation	Target saturation - used in the response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_hsl_srv_target_info_t

struct rm_mesh_light_hsl_srv_target_info_t

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_default_info_t

struct rm_mesh_light_hsl_srv_default_info_t		
Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_hue_info_t

struct rm_mesh_light_hsl_srv_hue_info_t		
Light HSL Hue		
Data Fields		
uint16_t	hsl_hue	The 16-bit value representing the hue

◆ rm_mesh_light_hsl_srv_saturation_info_t

struct rm_mesh_light_hsl_srv_saturation_info_t		
Light HSL Saturation		
Data Fields		
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_range_info_t

struct rm_mesh_light_hsl_srv_range_info_t		
Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hue_range_min	The value of the Hue Range Min field of the Light HSL Hue

		Range state
uint16_t	hue_range_max	The value of the Hue Range Max field of the Light HSL Hue Range state
uint16_t	saturation_range_min	The value of the Saturation Range Min field of the Light HSL Saturation Range state
uint16_t	saturation_range_max	The value of the Saturation Range Max field of the Light HSL Saturation Range state
uint8_t	status	Status - Used only in response path

◆ rm_mesh_light_hsl_srv_extended_cfg_t

struct rm_mesh_light_hsl_srv_extended_cfg_t		
BLE mesh light hsl extension for BLE mesh light hsl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_hue_access_instance	Pointer to access instance for hue model.
rm_ble_mesh_access_instance_t const *	p_saturation_access_instance	Pointer to access instance for saturation model.

◆ rm_mesh_light_hsl_srv_instance_ctrl_t

struct rm_mesh_light_hsl_srv_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_clt0	Module name.

Data Structures

struct	rm_mesh_light_lightness_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lightness_clt_instance_ctrl_t

struct rm_mesh_light_lightness_clt_instance_ctrl_t

BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lightness Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lightness client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lightness client model. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Light_Lightness client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle().

Example:

```
/* Set the handle of light lightness client model. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Get()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Data Structure Documentation

◆ rm_mesh_light_lightness_srv_linear_info_t

struct rm_mesh_light_lightness_srv_linear_info_t		
Light Lightness Linear state represents the lightness of a light on a linear scale		
Data Fields		
uint16_t	lightness_linear	Light Lightness Linear
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ rm_mesh_light_lightness_srv_actual_info_t

struct rm_mesh_light_lightness_srv_actual_info_t		
Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_actual	Light Lightness Actual
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_lightness_srv_last_info_t

struct rm_mesh_light_lightness_srv_last_info_t		
Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_last	Light Lightness Last

◆ rm_mesh_light_lightness_srv_default_info_t

struct rm_mesh_light_lightness_srv_default_info_t		
Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state		
Data Fields		
uint16_t	lightness_default	Light Lightness Default

◆ rm_mesh_light_lightness_srv_range_info_t

struct rm_mesh_light_lightness_srv_range_info_t		
Light Lightness Range state determines the minimum and maximum lightness of an element		
Data Fields		
uint16_t	lightness_range_min	Light Lightness Range Min
uint16_t	lightness_range_max	Light Lightness Range Max

◆ rm_mesh_light_lightness_srv_info_t

struct rm_mesh_light_lightness_srv_info_t		
Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states		
Data Fields		
rm_mesh_light_lightness_srv_linear_info_t	light_lightness_linear	Light Lightness Linear state represents the lightness of a light on a linear scale
rm_mesh_light_lightness_srv_actual_info_t	light_lightness_actual	Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_last_info_t	light_lightness_last	Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_default_info_t	light_lightness_default	Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default

		lightness level for the Light Lightness Actual state
rm_mesh_light_lightness_srv_range_info_t	light_lightness_range	Light Lightness Range state.
uint8_t	range_status	Status field used only for the Range Status

◆ rm_mesh_light_lightness_srv_instance_ctrl_t

struct rm_mesh_light_lightness_srv_instance_ctrl_t
BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)
API to initialize Light_Lightness Server model and to initialize Light_Lightness_Setup Server model. This is to initialize Light_Lightness Server model and to register with Access layer. And this is to initialize Light_Lightness_Setup Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_clt0	Module name.

Data Structures

struct	rm_mesh_light_lc_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lc_clt_instance_ctrl_t

struct rm_mesh_light_lc_clt_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lc Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lc client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lc client model. */
   err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_LIGHT_LC_CLT_SetModelHandle()

fsp_err_t RM_MESH_LIGHT_LC_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Light_Lc client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of light lc client model. */
   err = RM_MESH_LIGHT_LC_CLT_SetModelHandle(&g_mesh_light_lc_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Light Location Server (rm_mesh_light_lc_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_LC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_LIGHT_LC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_LC_SRV_StateUpdate

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Location Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light Lightness Controller Server (rm_mesh_light_lc_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_srv0	Module name.

Data Structures

struct	rm_mesh_light_lc_srv_mode_info_t
struct	rm_mesh_light_lc_srv_om_info_t
struct	rm_mesh_light_lc_srv_light_onoff_info_t
struct	rm_mesh_light_lc_srv_property_id_info_t

struct	rm_mesh_light_lc_srv_property_info_t
struct	rm_mesh_light_lc_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lc_srv_mode_info_t

struct rm_mesh_light_lc_srv_mode_info_t		
Light LC Mode state		
Data Fields		
uint8_t	present_mode	Light LC Mode state - present
uint8_t	target_mode	Light LC Mode state - target

◆ rm_mesh_light_lc_srv_om_info_t

struct rm_mesh_light_lc_srv_om_info_t		
Light LC Occupancy Mode state		
Data Fields		
uint8_t	present_mode	Light LC Occupancy Mode state - present
uint8_t	target_mode	Light LC Occupancy Mode state - target

◆ rm_mesh_light_lc_srv_light_onoff_info_t

struct rm_mesh_light_lc_srv_light_onoff_info_t		
Light LC Light OnOff State		
Data Fields		
uint8_t	present_light_onoff	Light LC Light OnOff State
uint8_t	target_light_onoff	Light LC Light OnOff State
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_lc_srv_property_id_info_t

struct rm_mesh_light_lc_srv_property_id_info_t
Property ID identifying a Light LC Property

Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property

◆ rm_mesh_light_lc_srv_property_info_t

struct rm_mesh_light_lc_srv_property_info_t		
Light LC Property state		
Data Fields		
uint16_t	property_id	Property ID identifying a Light LC Property
uint8_t *	property_value	Raw value for the Light LC Property
uint16_t	property_value_len	

◆ rm_mesh_light_lc_srv_instance_ctrl_t

struct rm_mesh_light_lc_srv_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt)

fsp_err_t	RM_MESH_LIGHT_XYL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_clt0	Module name.

Data Structures

struct	rm_mesh_light_xyl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_xyl_clt_instance_ctrl_t

struct rm_mesh_light_xyl_clt_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Xyl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Xyl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light xyl client model. */
   err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_LIGHT_XYL_CLT_SetModelHandle()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Light_Xyl client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set Unacknowledged is an unacknowledged message used to set the Light xyL Lightness, Light xyL x, and the Light xyL y states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light xyL Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Get message is a Light xyL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Set message is a Light xyL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set is an acknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Set message is a Light xyL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set Unacknowledged is an unacknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Light Xyl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_srv0	Module name.

Data Structures

struct	rm_mesh_light_xyl_srv_info_t
struct	rm_mesh_light_xyl_srv_target_info_t
struct	rm_mesh_light_xyl_srv_default_info_t
struct	rm_mesh_light_xyl_srv_range_info_t
struct	rm_mesh_light_xyl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_xyl_srv_info_t

struct rm_mesh_light_xyl_srv_info_t		
Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_xyl_lightness	Target perceived lightness - used in response path
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	target_xyl_x	Target x coordinate - used in response path
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light
uint16_t	target_xyl_y	Target y coordinate - used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_xyl_srv_target_info_t

struct rm_mesh_light_xyl_srv_target_info_t		
Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931

		color light

◆ rm_mesh_light_xyl_srv_default_info_t

struct rm_mesh_light_xyl_srv_default_info_t		
Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_range_info_t

struct rm_mesh_light_xyl_srv_range_info_t		
Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element		
Data Fields		
uint16_t	xyl_x_range_min	The minimum value of a Light xyL x state of an element
uint16_t	xyl_x_range_max	The maximum value of a Light xyL x state of an element
uint16_t	xyl_y_range_min	The minimum value of a Light xyL y state of an element
uint16_t	xyl_y_range_max	The maximum value of a Light xyL y state of an element
uint8_t	status	Status - Used in the response path

◆ rm_mesh_light_xyl_srv_instance_ctrl_t

struct rm_mesh_light_xyl_srv_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_clt0	Module name.

Data Structures

struct	rm_mesh_scene_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

struct rm_mesh_scene_clt_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

fsp_err_t RM_MESH_SCENE_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_CLT_Close()

fsp_err_t RM_MESH_SCENE_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scene Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_SCENE_CLT_SetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_SetModelHandle(&g_mesh_scene_clt0_ctrl, model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Get()

fsp_err_t RM_MESH_SCENE_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Recall()

fsp_err_t RM_MESH_SCENE_CLT_Recall (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RegisterGet()

fsp_err_t RM_MESH_SCENE_CLT_RegisterGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Store()

fsp_err_t RM_MESH_SCENE_CLT_Store (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Delete()

fsp_err_t RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Data Structures

struct	rm_mesh_scene_srv_number_info_t
struct	rm_mesh_scene_srv_status_info_t
struct	rm_mesh_scene_srv_register_status_info_t

struct	rm_mesh_scene_srv_ext_tid_and_transition_info_t
struct	rm_mesh_scene_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_srv_number_info_t

struct rm_mesh_scene_srv_number_info_t		
The state to identify a scene		
Data Fields		
uint16_t	number	The number to identify a scene

◆ rm_mesh_scene_srv_status_info_t

struct rm_mesh_scene_srv_status_info_t		
The current status of a currently active scene		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t	target_scene	Scene Number of a target scene.
uint8_t	remaining_time	

◆ rm_mesh_scene_srv_register_status_info_t

struct rm_mesh_scene_srv_register_status_info_t		
The current status of scene register		
Data Fields		
uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t *	scenes	A list of scenes stored within an element
uint16_t	scenes_count	

◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

struct rm_mesh_scene_srv_ext_tid_and_transition_info_t
TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional. TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

◆ rm_mesh_scene_srv_instance_ctrl_t

struct rm_mesh_scene_srv_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_SRV_Open()

fsp_err_t RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_scene_server_cfg_t const *const *p_cfg*)

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_SRV_Close()

fsp_err_t RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*)

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_SRV_StateUpdate()

fsp_err_t RM_MESH_SCENE_SRV_StateUpdate (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_clt0	Module name.

Data Structures

struct	rm_mesh_scheduler_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_clt_instance_ctrl_t

struct rm_mesh_scheduler_clt_instance_ctrl_t

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_CLT_Open()

fsp_err_t RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl,
&g_mesh_scheduler_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCHEDULER_CLT_Close()

fsp_err_t RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scheduler Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scheduler client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scheduler client model. */
   err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_SCHEDULER_CLT_SetModelHandle()

fsp_err_t RM_MESH_SCHEDULER_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Scheduler client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of scheduler client model. */
   err = RM_MESH_SCHEDULER_CLT_SetModelHandle(&g_mesh_scheduler_clt0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_Get()

fsp_err_t RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionGet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Scheduler Server (rm_mesh_scheduler_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Scheduler Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_srv0	Module name.

Data Structures

struct	rm_mesh_scheduler_srv_schedules_info_t
struct	rm_mesh_scheduler_srv_entry_index_info_t
struct	rm_mesh_scheduler_srv_entry_info_t
struct	rm_mesh_scheduler_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_srv_schedules_info_t

struct rm_mesh_scheduler_srv_schedules_info_t		
The current Schedule Register state of an element.		
Data Fields		
uint16_t	schedules	Bit field indicating defined Actions in the Schedule Register

◆ rm_mesh_scheduler_srv_entry_index_info_t

struct rm_mesh_scheduler_srv_entry_index_info_t		
The entry index of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry

◆ rm_mesh_scheduler_srv_entry_info_t

struct rm_mesh_scheduler_srv_entry_info_t		
The entry of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry
uint8_t	year	Scheduled year for the action
uint16_t	month	Scheduled month for the action
uint8_t	day	Scheduled day of the month for the action
uint8_t	hour	Scheduled hour for the action
uint8_t	minute	Scheduled minute for the action
uint8_t	second	Scheduled second for the action
uint8_t	dayofweek	Schedule days of the week for the action
uint8_t	action	Action to be performed at the scheduled time
uint8_t	transition_time	Transition time for this action
uint16_t	scene_number	Scene number to be used for some actions

◆ rm_mesh_scheduler_srv_instance_ctrl_t

struct rm_mesh_scheduler_srv_instance_ctrl_t
BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_SRV_Open()

fsp_err_t RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl, &g_mesh_scheduler_srv0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCHEDULER_SRV_Close()

fsp_err_t RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Sensor Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_clt0	Module name.

Data Structures

struct	rm_mesh_sensor_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_sensor_clt_instance_ctrl_t

struct rm_mesh_sensor_clt_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_CLT_Open()

fsp_err_t RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_CLT_Close()

fsp_err_t RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Sensor Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_CLT_GetModelHandle()

fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Sensor client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of sensor client model. */
   err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_SENSOR_CLT_SetModelHandle()

fsp_err_t RM_MESH_SENSOR_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Sensor client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of sensor client model. */
   err = RM_MESH_SENSOR_CLT_SetModelHandle(&g_mesh_sensor_clt0_ctrl, model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_DescriptorGet()

fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Descriptor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_Get()

fsp_err_t RM_MESH_SENSOR_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_ColumnGet()

fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Column Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SeriesGet()

fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Series Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceGet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingsGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Sensor Server (rm_mesh_sensor_srv)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Sensor Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Sensor Server (rm_mesh_sensor_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_srv0	Module name.

Data Structures

struct	rm_mesh_sensor_srv_descriptor_info_t
struct	rm_mesh_sensor_srv_settings_info_t
struct	rm_mesh_sensor_srv_setting_info_t

struct	rm_mesh_sensor_srv_cadence_info_t
struct	rm_mesh_sensor_srv_data_info_t
struct	rm_mesh_sensor_srv_series_column_info_t
struct	rm_mesh_sensor_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_sensor_srv_descriptor_info_t

struct rm_mesh_sensor_srv_descriptor_info_t		
Sensor Descriptor state represents the attributes describing the sensor data		
Data Fields		
uint16_t	sensor_property_id	Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor
uint16_t	sensor_positive_tolerance	Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting
uint16_t	sensor_negative_tolerance	Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting
uint8_t	sensor_sampling_function	Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value
uint8_t	sensor_measurement_period	Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken
uint8_t	sensor_update_interval	measurement reported by a sensor is internally refreshed at the frequency indicated in the Sensor Update Interval field

uint8_t	status	Status - used in response to indicate if other fields to be included

◆ rm_mesh_sensor_srv_settings_info_t

struct rm_mesh_sensor_srv_settings_info_t		
Sensor Settings state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t *	setting_property_ids	Property ID of a setting within a sensor
uint16_t	setting_property_ids_count	

◆ rm_mesh_sensor_srv_setting_info_t

struct rm_mesh_sensor_srv_setting_info_t		
Sensor Setting state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t	sensor_setting_property_id	Property ID of a setting within a sensor
uint8_t	sensor_setting_access	Read/Write access rights for the setting
uint8_t *	sensor_setting_raw	Raw value of a setting within a sensor
uint16_t	sensor_setting_raw_len	
uint8_t	status	

◆ rm_mesh_sensor_srv_cadence_info_t

struct rm_mesh_sensor_srv_cadence_info_t		
Sensor Cadence state controls the cadence of sensor reports		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint8_t	fast_cadence_period_divisor	Divisor for the Publish Period
uint8_t	status_trigger_type	Defines the unit and format of the Status Trigger Delta fields
uint8_t *	status_trigger_delta_down	Delta down value that triggers a status message
uint16_t	status_trigger_delta_down_len	
uint8_t *	status_trigger_delta_up	Delta up value that triggers a

		status message
uint16_t	status_trigger_delta_up_len	
uint8_t	status_min_interval	Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherantly check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses.
uint8_t *	fast_cadence_low	Low value for the fast cadence range
uint16_t	fast_cadence_low_len	
uint8_t *	fast_cadence_high	High value for the fast cadence range
uint16_t	fast_cadence_high_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_data_info_t

struct rm_mesh_sensor_srv_data_info_t		
The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID		
Data Fields		
uint16_t	property_id_1	ID of the 1st device property of the sensor
uint8_t *	raw_value_1	Raw Value field with a size and representation defined by the 1st device property
uint16_t	raw_value_1_len	
uint16_t	property_id_2	ID of the 2nd device property of the sensor
uint8_t *	raw_value_2	Raw Value field with a size and representation defined by the 2nd device property
uint16_t	raw_value_2_len	
uint16_t	property_id_n	ID of the nth device property of

		the sensor
uint8_t *	raw_value_n	Raw Value field with a size and representation defined by the nth device property
uint16_t	raw_value_n_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_series_column_info_t

struct rm_mesh_sensor_srv_series_column_info_t		
Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms		
Data Fields		
uint16_t	sensor_property_id	Property describing the data series of the sensor
uint8_t *	sensor_raw_value_x	Raw value representing the left corner of a column on the X axis
uint16_t	sensor_raw_value_x_len	
uint8_t *	sensor_column_width	Raw value representing the width of the column
uint16_t	sensor_column_width_len	
uint8_t *	sensor_raw_value_y	Raw value representing the height of the column on the Y axis
uint16_t	sensor_raw_value_y_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_instance_ctrl_t

struct rm_mesh_sensor_srv_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_SRV_Open()

fsp_err_t RM_MESH_SENSOR_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_SRV_Close()

fsp_err_t RM_MESH_SENSOR_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_SRV_StateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_sensor_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Time Client (rm_mesh_time_clt).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_clt0	Module name.

Data Structures

struct	rm_mesh_time_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_time_clt_instance_ctrl_t**

struct rm_mesh_time_clt_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_CLT_Open() is called.

Function Documentation

◆ RM_MESH_TIME_CLT_Open()

fsp_err_t RM_MESH_TIME_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_CLT_Close()

fsp_err_t RM_MESH_TIME_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_CLT_GetModelHandle()

fsp_err_t RM_MESH_TIME_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of time client model. */
   err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

◆ RM_MESH_TIME_CLT_SetModelHandle()

fsp_err_t RM_MESH_TIME_CLT_SetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

This is to set the handle of Time client model.

Implements rm_ble_mesh_model_client_api_t::setModelHandle.

Example:

```
/* Set the handle of time client model. */
   err = RM_MESH_TIME_CLT_SetModelHandle(&g_mesh_time_clt0_ctrl, model_handle);
```

Return values

FSP_SUCCESS	Changed model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_CLT_SendReliablePdu()

fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Get()

fsp_err_t RM_MESH_TIME_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Set()

fsp_err_t RM_MESH_TIME_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneGet()

fsp_err_t RM_MESH_TIME_CLT_ZoneGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state , and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneSet()

fsp_err_t RM_MESH_TIME_CLT_ZoneSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Zone Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaGet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaSet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to TAI-UTC Delta Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleGet()

fsp_err_t RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleSet()

fsp_err_t RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Role Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Bluetooth Low Energy Mesh Network Time Server (rm_mesh_time_srv)

Modules » Networking » Bluetooth Low Energy Mesh Network Modules

Functions

fsp_err_t	RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t

	*const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The Bluetooth Low Energy Energy Mesh Network Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_time_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Model Time Server (rm_mesh_time_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Model Time Server (rm_mesh_time_srv).

Configuration	Options	Default	Description
Interrupts > Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server ISR occurs
Interrupts > Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_srv0	Module name.

Data Structures

struct	rm_mesh_time_srv_info_t
struct	rm_mesh_time_srv_zone_info_t
struct	rm_mesh_time_srv_tai_utc_delta_info_t
struct	rm_mesh_time_srv_role_info_t
struct	rm_mesh_time_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_time_srv_info_t

struct rm_mesh_time_srv_info_t		
Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC)		
Data Fields		
uint8_t	tai_seconds[5]	Current TAI time in seconds since the epoch.
uint8_t	subsecond	The sub-second time in units of 1/256s.
uint8_t	uncertainty	Estimated uncertainty in 10-millisecond steps.
uint8_t	time_authority	0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC.
uint16_t	tai_utc_delta	Current difference between TAI and UTC in seconds
uint8_t	time_zone_offset	The local time zone offset in 15-minute increments

◆ rm_mesh_time_srv_zone_info_t

struct rm_mesh_time_srv_zone_info_t		
Time Zone		
Data Fields		
uint8_t	time_zone_offset_current	Current local time zone offset. Meaningful only in 'Time Zone Status' response.
uint8_t	time_zone_offset_new	Upcoming local time zone offset.
uint8_t	tai_of_zone_change[5]	Absolute TAI time when the Time Zone Offset will change from Current to New.

◆ rm_mesh_time_srv_tai_utc_delta_info_t

struct rm_mesh_time_srv_tai_utc_delta_info_t
TAI-UTC Delta
Data Fields

uint16_t	tai_utc_delta_current	Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response.
uint16_t	tai_utc_delta_new	Upcoming difference between TAI and UTC in seconds.
uint8_t	padding	Always 0b0. Other values are Prohibited.
uint8_t	tai_of_delta_change[5]	TAI Seconds time of the upcoming TAI-UTC Delta change

◆ rm_mesh_time_srv_role_info_t

struct rm_mesh_time_srv_role_info_t		
The Time Role state of an element		
Data Fields		
uint8_t	role	Time Role

◆ rm_mesh_time_srv_instance_ctrl_t

struct rm_mesh_time_srv_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called.

Function Documentation

◆ RM_MESH_TIME_SRV_Open()

fsp_err_t RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_SRV_Close()

fsp_err_t RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_SRV_StateUpdate()

fsp_err_t RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

4.2.11.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Modules » Networking

Functions

CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t *p_instance_ctrl, CellularCommInterfaceReceiveCallback_t receive_callback, void *pUserData)
CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t commInterfaceHandle, const uint8_t *pData, uint32_t dataLength, uint32_t timeoutMilliseconds, uint32_t

	*pDataSentLength)
CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Receive (CellularCommInterfaceHandle_t commInterfaceHandle, uint8_t *pBuffer, uint32_t bufferLength, uint32_t timeoutMilliseconds, uint32_t *pDataReceivedLength)
CellularCommInterfaceError_t	RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t commInterfaceHandle)
void	comm_uart_aws_callback (uart_callback_args_t *p_args)

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works:
https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Receive Buffer	Size should be greater than zero	256	Temporary buffer for received bytes. When read function is called reamaining bytes will be read directly into buffer specified by read function argument.
Receive Transfer Size	Size should be greater than zero	512	The comm interface will break down UART reads into smaller read requests based on this number. For instance if

this is set to 512 bytes then the interface will request 512 bytes at a time until the requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_cellular_comm_uart0	Module name.

Function Documentation

◆ **RM_CELLULAR_COMM_UART_AWS_Open()**

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t * *p_instance_ctrl*, CellularCommInterfaceReceiveCallback_t *receive_callback*, void * *pUserData*)

Implements open for CellularCommInterface_t

Parameters

[in]	receive_callback	Callback to call upon receiving data
[in]	pUserData	Pointer to user data to be passed through callback
[in]	p_instance_ctrl	Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t

Return values

IOT_COMM_INTERFACE_SUCCESS	Open succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Send()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t *commInterfaceHandle*, const uint8_t * *pData*, uint32_t *dataLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataSentLength*)

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pData	Pointer to data to send
[in]	dataLength	Length of data to send
[in]	timeoutMilliseconds	Timeout in MS to wait for data to send
[in]	pDataSentLength	Actual length of data sent

Return values

IOT_COMM_INTERFACE_SUCCESS	Send succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure
IOT_COMM_INTERFACE_TIMEOUT	Send operation timed out

◆ RM_CELLULAR_COMM_UART_AWS_Receive()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (CellularCommInterfaceHandle_t *commInterfaceHandle*, uint8_t * *pBuffer*, uint32_t *bufferLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataReceivedLength*)

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pBuffer	Pointer to buffer to receive to
[in]	bufferLength	Length of buffer
[in]	timeoutMilliseconds	Timeout in MS to wait for data reception
[in]	pDataReceivedLength	Actual length of data received

Return values

IOT_COMM_INTERFACE_SUCCESS	Receieve succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Close()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t *commInterfaceHandle*)

Implements close for CellularCommInterface_t

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open

Return values

IOT_COMM_INTERFACE_SUCCESS	Close succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure

◆ comm_uart_aws_callback()

void comm_uart_aws_callback (uart_callback_args_t * *p_args*)
Callback for UART driver **Parameters** [in] p_args — Arguments from UART RX/TX callback

4.2.11.13 Ethernet (r_ether)

Modules » Networking

Functions

fsp_err_t	R_ETHER_Open (ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg) After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open. More...
fsp_err_t	R_ETHER_Close (ether_ctrl_t *const p_ctrl) Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close. More...
fsp_err_t	R_ETHER_BufferRelease (ether_ctrl_t *const p_ctrl) Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease. More...
fsp_err_t	R_ETHER_RxBufferUpdate (ether_ctrl_t *const p_ctrl, void *const p_buffer) Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate. More...
fsp_err_t	R_ETHER_LinkProcess (ether_ctrl_t *const p_ctrl) The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess. More...

fsp_err_t	R_ETHER_WakeOnLANEnable (ether_ctrl_t *const p_ctrl) The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable. More...
fsp_err_t	R_ETHER_Read (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes) Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read. More...
fsp_err_t	R_ETHER_Write (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length) Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write. More...
fsp_err_t	R_ETHER_TxStatusGet (ether_ctrl_t *const p_ctrl, void *const p_buffer_address)

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ET0_LINKSTA Pin Status Flag	• Fall -> Rise • Rise -> Fall	Fall -> Rise	Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal.
Link Signal Change Flag	• Unused • Used	Unused	Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal)

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ether0	Module name.
General > Channel	0	0	Select the ether channel number.
General > MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
General > Zero-copy Mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
General > Flow control functionality	• Disable • Enable	Disable	Enable or disable flow control.
Filters > Multicast Mode	• Disable • Enable	Enable	Enable or disable multicast frame reception.

Filters > Promiscuous Mode	• Disable • Enable	Disable	Enable this option to receive packets addressed to other NICs.
Filters > Broadcast filter	Must be a valid non-negative integer with maximum configurable value of 65535.	0	Limit of the number of broadcast frames received continuously
Buffers > Number of TX buffer	Must be an integer from 1 to 8	1	Number of transmit buffers
Buffers > Number of RX buffer	Must be an integer from 1 to 8	1	Number of receive buffers
Buffers > Allocate RX buffer	• Disable • Enable	Enable	Allocates the RX buffer when generating the configuration structure
Buffers > Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Buffers > Padding size	• Disable • 1 Byte • 2 Bytes • 3 Bytes	Disable	The padding size that is automatically inserted into the received packets
Buffers > Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
Interrupts > Interrupt priority	MCU Specific Options		Select the EDMAC interrupt priority.
Interrupts > Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

Interrupt Configuration

The first R_ETHER_Open function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6E1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA

Note

1. *When using ETHERC, the PCLKA frequency is in the range 12.5 MHz <= PCLKA <= 120 MHz.*
2. *When using ETHERC, PCLKA = ICLK.*

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_ETHER_Open function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

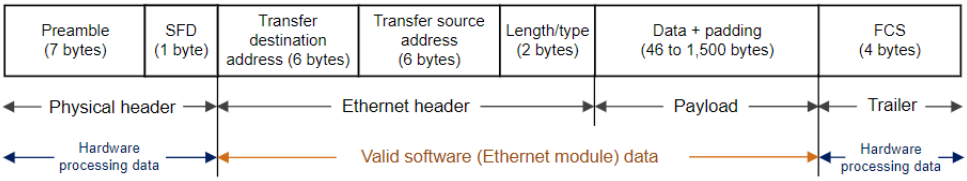

Figure 215: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

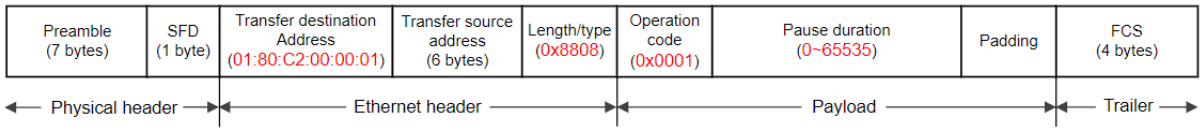

Figure 216: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

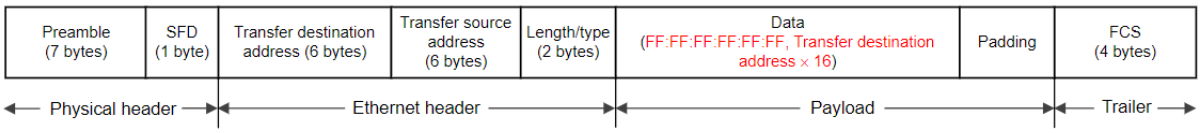

Figure 217: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for R_ETHER_RxBufferUpdate when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

MCU	Has Security Extension	Support Flat project	Support TZ project	
			Secure	Non-Secure
RA6M2	-	x	-	-
RA6M3	-	x	-	-
RA6M4	- *1	x	-	x
RA6M5	- *1	x	-	x

Note

1. ETHERC/EDMAC is always Non-secure peripheral in this MCU.

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

◆ ether_link_change_t

enum ether_link_change_t	
Enumerator	
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.

◆ ether_magic_packet_t

enum ether_magic_packet_t	
Enumerator	
ETHER_MAGIC_PACKET_NOT_DETECTED	Magic packet is not detected.
ETHER_MAGIC_PACKET_DETECTED	Magic packet is detected.

◆ ether_link_establish_status_t

enum ether_link_establish_status_t	
Enumerator	
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.

Function Documentation

◆ R_ETHER_Open()

fsp_err_t R_ETHER_Open (ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg*)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Close()

fsp_err_t R_ETHER_Close (ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_BufferRelease()

fsp_err_t R_ETHER_BufferRelease (ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.

◆ R_ETHER_RxBufferUpdate()

fsp_err_t R_ETHER_RxBufferUpdate (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*)

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	All descriptor is active.

◆ R_ETHER_LinkProcess()

fsp_err_t R_ETHER_LinkProcess (ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ R_ETHER_WakeOnLANEnable()

fsp_err_t R_ETHER_WakeOnLANEnable (ether_ctrl_t *const *p_ctrl*)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Read()

fsp_err_t R_ETHER_Read (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes*)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.

◆ R_ETHER_Write()

fsp_err_t R_ETHER_Write (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length*)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ R_ETHER_TxStatusGet()

fsp_err_t R_ETHER_TxStatusGet (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address*)

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

Return values

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

Detailed Description

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support

- Flow control support
- Link status check support

Configuration

Build Time Configurations for r_ether_phy

The following build time configurations are defined in fsp_cfg/r_ether_phy_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Select PHY	• Default • Other • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894	Default	Select PHY chip to use. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ether_phy0	Module name.
Channel	• 0 • 1	0	Select the Ethernet controller channel number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	• MII	RMII	Specify whether to use

	• RMII		MII or RMII.
MII/RMII Register Access Wait-time	Specify a value between 0x1 and 0x7FFFFFFF.	8	Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.
Flow Control	• Disable • Enable	Disable	Select whether to enable or disable flow control.

Usage Notes

Note

See the example below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type	MII and RMII management frame							
	Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.

- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
    - KSZ8091RNB
    - KSZ8041
    - DP83620
    - ICS1894

Examples

ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ether_phy0_ctrl.open   = 0U;
    g_ether_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
```

```
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                            &g_ether_phy0_line_speed_duplex,
                                            &g_ether_phy0_local_pause,
                                            &g_ether_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	ether_phy_instance_ctrl_t

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

struct ether_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg	Pointer to initial configurations.
volatile uint32_t *	p_reg_pir	Pointer to ETHERC peripheral registers.
uint32_t	local_advertise	Capabilities bitmap for local advertising.

Function Documentation

◆ R_ETHER_PHY_Open()

fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ R_ETHER_PHY_Close()

fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_PHY_StartAutoNegotiate()

fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

Return values

FSP_SUCCESS	ETHER_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause*)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed

◆ R_ETHER_PHY_LinkStatusGet()

fsp_err_t R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.

4.2.11.15 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

Modules » Networking

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the Ethernet (r_ether) driver.

Please refer to the FreeRTOS Plus TCP documentation for further details.

Configuration

Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

Configuration	Options	Default	Description
Print debug messages	• Disable • Enable	Disable	If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging messages.
Print info messages	• Disable • Enable	Disable	Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages.
Byte order of the target MCU	pdFREERTOS_LITTLE_ENDIAN	pdFREERTOS_LITTLE_ENDIAN	Define the byte order of the target MCU
IP/TCP/UDP checksums	• Disable • Enable	Enable	If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations.
Receive Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket,

			using setsockopt().
Send Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt().
DNS caching	• Disable • Enable	Enable	DNS caching
DNS Request Attempts	Value must be an integer	2	When a cache is present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small timeouts.
IP stack task priority	Manual Entry	configMAX_PRIORITIES - 2	Set the priority of the task that executes the IP stack.
Stack size in words (not bytes)	Manual Entry	configMINIMAL_STACK_SIZE * 5	The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack.
Network Events call vApplicationIPNetworkEventHook	• Disable • Enable	Enable	vApplicationIPNetworkEventHook is called when the network connects or disconnects.
Max UDP send block time	Manual Entry	15000 / portTICK_PERIOD_MS	Max UDP send block time
Use DHCP	• Disable • Enable	Enable	If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server.
DHCP Register Hostname	• Disable • Enable	Enable	Register hostname when using DHCP
DHCP Uses Unicast	• Disable • Enable	Enable	DHCP uses unicast.
DHCP Send Discover After Auto IP	• Disable • Enable	Disable	DHCP Send Discover After Auto IP
DHCP callback function	• Disable • Enable	Disable	Provide an implementation of the DHCP callback function (xApplicationDHCPHook)

Interval between transmissions	Manual Entry	120000 / portTICK_PERIOD_MS	When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISCOVER_TX_PERIOD.
ARP Cache Entries	Value must be an integer	6	The maximum number of entries that can exist in the ARP table at any one time
ARP Request Retransmissions	Value must be an integer	5	ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted.
Maximum time before ARP table entry becomes stale	Value must be an integer	150	The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale
Use string for IP Address	• Disable • Enable	Enable	Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters
Total number of available network buffers	Value must be an integer	10	Define the total number of network buffer that are available to the IP stack
Set the maximum number of events	Please enter a valid function name without spaces or funny	ipconfigNUM_NETWORK_BUFFER_DESCRIPTORS + 5	Set the maximum number of events that can be queued for

	characters		processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers
Enable FreeRTOS_sendto() without calling Bind	• Enable • Disable	Disable	Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding the socket to a port number from the range socketAUTO_PORT_ALLOCATION_START_NUMBER to 0xffff. If ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted.
TTL values for UDP packets	Value must be an integer	128	Define the Time To Live (TTL) values used in outgoing UDP packets
TTL values for TCP packets	Value must be an integer	128	Defines the Time To Live (TTL) values used in outgoing TCP packets
Use TCP and all its features	• Disable • Enable	Enable	Use TCP and all its features
Let TCP use windowing mechanism	• Disable • Enable	Disable	Let TCP use windowing mechanism
Maximum number of bytes the payload of a network frame can contain	Value must be an integer	1500	Maximum number of bytes the payload of a network frame can contain
Basic DNS client or resolver	• Disable • Enable	Enable	Set ipconfigUSE_DNS to 1 to include a basic DNS client/resolver. DNS is used through the FreeRTOS_gethostbyname() API function.
Reply to incoming ICMP echo (ping) requests	• Disable • Enable	Enable	If ipconfigREPLY_TO_INCOMING_PINGS is set to 1 then the IP stack

			will generate replies to incoming ICMP echo (ping) requests.
FreeRTOS_SendPingRequest() is available	• Disable • Enable	Disable	If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available.
FreeRTOS_select() (and associated) API function is available	• Disable • Enable	Disable	If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the FreeRTOS_select() (and associated) API function is available
Filter out non Ethernet II frames.	• Disable • Enable	Enable	If ipconfigFILTER_OUT_NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments
Responsibility of the Ethernet interface to filter out packets	• Disable • Enable	Disable	If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest.
Send RST packets, when receive unknown packets.	• Disable • Enable	Enable	TCP will not send RST packets in reply to TCP unknown or out-of-order packets
Block time to simulate MAC interrupts	Please enter a valid function name without spaces or funny characters	20 / portTICK_PERIOD_MS	The windows simulator cannot really simulate MAC interrupts, and needs to block occasionally to allow other tasks to run
Access 32-bit fields in the IP packets	Value must be an integer	2	To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit fields are 32-bit-aligned, plus 16-bit

Size of the pool of TCP window descriptors	Value must be an integer	240	Define the size of the pool of TCP window descriptors
Size of Rx buffer for TCP sockets	Value must be an integer	3000	Define the size of Rx buffer for TCP sockets
Size of Tx buffer for TCP sockets	Value must be an integer	3000	Define the size of Tx buffer for TCP sockets
TCP keep-alive	• Disable • Enable	Enable	TCP keep-alive is avaiable or not
TCP keep-alive interval	Value must be an integer	120	TCP keep-alive interval in second
The socket semaphore to unblock the MQTT task (USER_SEMAPHORE)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (WAKE_CALLBACK)	• Disable • Enable	Enable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (USE_CALLBACKS)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (TX_DRIVER)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (RX_DRIVER)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
Possible optimisation for expert users	• Disable • Enable	Disable	Possible optimisation for expert users - requires network driver support. It is is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time.

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

- Configure an r_ether instance and provide a pointer to the instance of the NetworkInterface as follows:

```
/* Reference used by the NetworkInterface to access the ethernet instance. */
extern ether_instance_t const * gp_freertos_ether;
...
/* Make it reference the configured ether instance. */
ether_instance_t const * gp_freertos_ether = &g_ether_instance;
```

- Follow the TCP stack initialization procedure as described here: FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack

Note

The MAC address passed to FreeRTOS_IPInit must match the MAC address configured in the r_ether instance.
g_ether_instance must have vEtherISRCallback configured as the callback.
The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets.
To connect to a server using an IP address the macro ipconfigINCLUDE_FULL_INET_ADDR must be set to 1.

Limitations

- Zero-copy is not currently supported by the NetworkInterface.

4.2.11.16 NetX Duo Ethernet Driver (rm_netxduo_ether)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the Ethernet Interface.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_netxduo_ether_0	Module name.
IP MTU	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured ether_cfg_t::ether_buffer_size. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

ether_cfg_t::ether_buffer_size is calcualted from the IP MTU using the following formula:

ceil((rm_netxduo_ether_cfg_t::mtu + Ethernet Header (14) + Padding Bytes (2)) / 32) * 32

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
```

```
BSP_ALIGN_VARIABLE(4);
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
 /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
    UINT status;
    nx_system_initialize();
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool,
                          rm_netxduo_ether0,
                          &g_ip_stack_memory[0],
 sizeof(g_ip_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
```

```
(g_ip_arp_cache_memory));
    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

4.2.11.17 NetX Duo WiFi Driver (rm_netxduo_wifi)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - TCP/IPv4
  - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

Configuration	Options	Default	Description
IP MTU (bytes)	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- rm_wifi_onchip_silex_open() should be called to initialize the WiFi module driver.
- rm_wifi_onchip_silex_scan() should be used to scan for access points.
- rm_wifi_onchip_silex_connect() should be used before opening a NetX IP instance in order to connect it to a network.
- rm_wifi_onchip_silex_network_info_get() should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the rm_wifi_onchip_silex driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the rm_wifi_onchip_silex driver, thus the software DHCP stack is unsupported.

On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling rm_wifi_onchip_silex_dns_query.
- ICMP: The user can perform a ping by calling rm_wifi_onchip_silex_ping.
- SNTP: The WiFi module has multiple public APIs for time related functions:
    - RM_WIFI_ONCHIP_SILEX_EpochTimeGet
    - RM_WIFI_ONCHIP_SILEX_LocalTimeGet
    - RM_WIFI_ONCHIP_SILEX_SntpEnableSet
    - RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet
    - RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)

#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)

#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)

#define NETXDUO_EXAMPLE_PACKET_NUM (100U)

#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +

NETXDUO_EXAMPLE_PACKET_SIZE) * \

  NETXDUO_EXAMPLE_PACKET_NUM)

#define NETXDUO_EXAMPLE_SSID "ssidName"
```

```
#define NETXDUO_EXAMPLE_PASSWORD "password"
static NX_IP g_ip0;
static NX_PACKET_POOL g_packet_pool0;
static uint8_t g_ip0_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool0_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;
void rm_netxduo_wifi_example ()
{
    UINT      status;
 fsp_err_t err;
    nx_system_initialize();
 /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
 /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUO_EXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUO_EXAMPLE_PASSWORD);
    assert(FSP_SUCCESS == err);
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool0_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_wifi driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip0,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool0,
```

```
                        rm_netxduo_wifi,
                        &g_ip0_stack_memory[0],
 sizeof(g_ip0_stack_memory),
                        0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_tcp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
    status = nx_udp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
}
```

TLS Example

This is a basic example of connecting a TLS socket.

```
#define NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE (18000U)

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
  - Master mode
  - Slave mode
- Peer-to-peer
- End-to-end
- Frame fromats
  - Ethernet II frames
  - IEEE802.3 + LLC + SNAP frames

    - IPv4 + UDP
- Clock correction modes
    - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
    - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

Configuration	Options	Default	Description
Clock Properties > Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Clock Properties > Class	Value must in the range [0,255].	248	Class field advertised in generated announce packets.
Clock Properties > Accuracy	Value must in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Clock Properties > Variance	Value must in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Clock Properties > Priority 2	Value must in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Clock Properties > Time Source	Value must in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet > Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are

			received by the ETHERC EDMAC.
Ethernet > Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
Ethernet > PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.
IP > Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
IP > PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
IP > Event Message TOS	Value must in the range [0,255].	0	The IP packet TOS for event messages.
IP > General Message TOS	Value must in the range [0,255].	0	The IP packet TOS for general messages.
IP > Primary Message TTL	Value must in the range [0,255].	1	The IP packet TTL for primary messages.
IP > PDelay Message TTL	Value must in the range [0,255].	1	The IP packet TTL for p_delay messages.
IP > Event Port	Value must in the range [0,65535].	319	The UDP port for event messages.
IP > General Port	Value must in the range [0,65535].	320	The UDP port for general messages.
Synchronization Detection > Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Synchronization Detection > Count	Value must in the range [0,255].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection > Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.
Synchronization Lost Detection > Count	Value must in the range [0,255].	5	The number of times the calculated offsetFromMaster value

			must be greater than the threshold in order to lose synchronization with the master.
Interrupts > Callback	Name must be a valid C symbol	ptp0_user_callback	Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
Interrupts > MINT Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Interrupts > Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC IPLS priority.
Name	Name must be a valid C symbol	g_ptp0	Module name.
Ethernet PHY Interface Type	• MII • RMII	RMII	The interface type used to communicate with the Ethernet PHY.
Frame Filter	• Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast	Unicast	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.
Frame Format	• Ethernet II • Ethernet II | IPv4 | UDP • IEEE802.3 | LLC | SNAP • IEEE802.3 | LLC | SNAP | IPv4 | UDP	Ethernet II	The format of the frames that encapsulate the PTP messages.
Clock Domain	Value must in the range [0,255].	0	The PTP clock will only respond to clocks in its domain.
Clock Domain Filter	• Enable • Disable	Enable	Filter out PTP messages from other clock domains.
Buffer Size	Value must in the range [64,1536].	1536	The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC.
Number of transmit buffers	Value must in the range [1,16].	4	The number of transmit buffers in the packet

			queue.
Number of receive buffers	Value must in the range [1,16].	4	The number of receive buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	• PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	• Clock Correction Mode 1 • Clock Correction Mode 2	Clock Correction Mode 1	Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.
Gradient Worst10 Interval	Value must in the range [0,255].	32	The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4

- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the Ethernet (r_ether) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

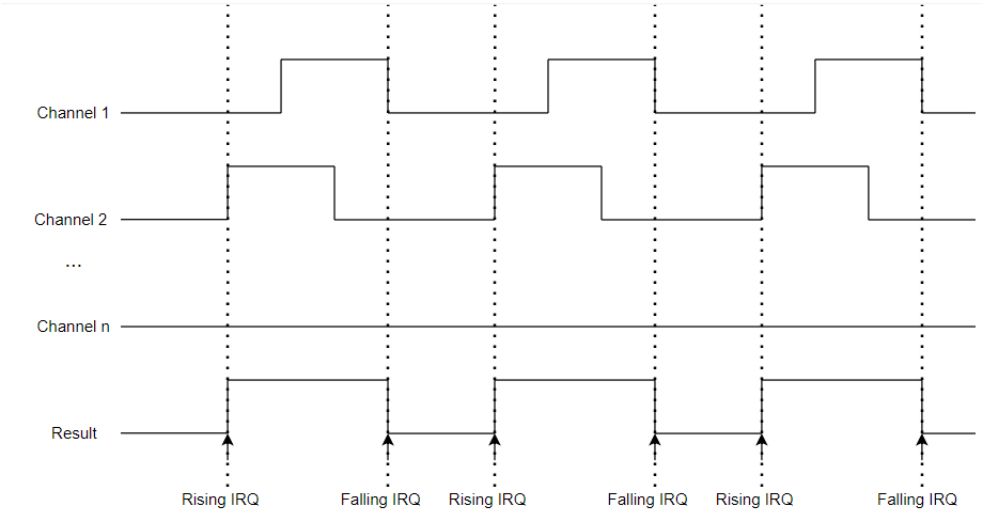

Figure 218: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by Ethernet (r_ether). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by Ethernet (r_ether).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by Ethernet (r_ether).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by Ethernet (r_ether). All multicast frames that match ptp_synfp_cfg_t::p_multicast_addr_filter are received by Ethernet (r_ether).
- Unicast - Only Unicast frames destined for the PTP are received by Ethernet (r_ether).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize Ethernet (r_ether). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)), however this means the application must execute the Ethernet (r_ether) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. This is to guarantee that PTP register accesses are atomic.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
 /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (!g_first_announce_message_received && --timeout)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
 /* When a master clock is found, change to the slave state to start synchronizing
  * the local clock to the master clock. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
```

```
    assert(FSP_SUCCESS == err);
 /* Wait for local clock to be synchronized with the master clock. */
    timeout = EXAMPLE_TIMEOUT;
 while (!g_sync_acquired && --timeout)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
 /* The local clock is now synchronized with the grand master clock. */
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case PTP_EVENT_SYNC_ACQUIRED:
     {
 /* The offsetFromMaster value is now within the configured threshold to be
  * synchronized with the master clock.
  */
           g_sync_acquired = true;
 break;
     }
 case PTP_EVENT_MESSAGE_RECEIVED:
     {
 static ptp_message_t g_current_master_announce_message;
 switch (p_args->p_message->header.message_type)
     {
 case PTP_MESSAGE_TYPE_ANNOUNCE:
     {
                 int8_t comparison = 0;
 if (!g_first_announce_message_received)
     {
 /* If this is the first announce packet, immediately switch to this master clock. */
```

```
                        comparison = 1;
                        g_first_announce_message_received = true;
     }
 else
     {
 /*
  * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
  * packet is better than the current master clock.
  */
 fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                                        p_args->p_message,
                                                        &comparison);
     assert(FSP_SUCCESS == err);
     }
 if (1 == comparison)
     {
 /* Save the message as the new master announce message. */
                        g_current_master_announce_message = *p_args->p_message;
 /* Set the master clock ID and sourcePortID in the PTP instance so that it
  * synchronizes with the new best master clock.
  */
 fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                                          g_current_master_annou
nce_message.header.clock_id,
                                                          g_current_master_annou
nce_message.header.source_port_id);
     assert(FSP_SUCCESS == err);
     }
 break;
     }
 default:
     {
 break;
```

```
     }
     }
 break;
     }
 default:
     {
 break;
     }
   }
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
   assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
   err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
   assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
   err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
   assert(FSP_SUCCESS == err);
 /* Get the current time from an external time source (Eg. RTC). */
 ptp_time_t current_time;
   get_current_time_example(&current_time);
 /* Set the PTP local time to the current time. */
   err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
   assert(FSP_SUCCESS == err);
 /* Set the currentUtcOffset field in announce messages. */
   err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
```

```
    assert(FSP_SUCCESS == err);
 /* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
 ptp_message_flags_t flags;
    flags.value = 0;
    flags.value_b.currentUtcOffsetValid = 1;
    flags.value_b.ptpTimescale          = 1;
    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);
 /*
  * The master clock is now operational and will automatically generate announce and
sync messages
  * as well as respond to delay_req messages.
  */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)
static uint32_t g_transmit_complete = 0U;
```

```
void send_message_example (void)
{
 static ptp_message_t message;
 static uint8_t       p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
 /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
 /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
 sizeof(ptp_message_management_t) +
 sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
 /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id         = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops          = 1;
    message.management.action                = PTP_MANAGEMENT_ACTION_GET;
 /*
  * Fill in TLV data (Note that TLV data is big endian).
  *
  * Type (Management)
  */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
 /* Length */
    p_tlv_data[2] = 0;
    p_tlv_data[3] = 2;
 /* Management ID (Clock Description) */
```

```
    p_tlv_data[4] = 0;
    p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
 /* Send the message. */
 fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
    assert(FSP_SUCCESS == err);
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (0U == g_transmit_complete && --timeout)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
    }
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
     {
           g_transmit_complete = 1U;
 break;
     }
 case PTP_EVENT_MESSAGE_RECEIVED:
     {
 switch (p_args->p_message->header.message_type)
     {
 case PTP_MESSAGE_TYPE_MANAGEMENT:
     {
 /* Handle the response message. */
 break;
     }
 default:
     {
 break;
```

```
      }
      }
      }
 default:
      {
 break;
      }
    }
}
```

Data Structures

struct	ptp_instance_ctrl_t

Data Structure Documentation

◆ ptp_instance_ctrl_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

Function Documentation

◆ R_PTP_Open()

fsp_err_t R_PTP_Open (ptp_ctrl_t *const *p_ctrl*, ptp_cfg_t const *const *p_cfg*)

This function initializes PTP. Implements ptp_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers acording to the configuration.
- Initialize the control structure for use in other PTP Interface functions.

Return values

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ R_PTP_MacAddrSet()

fsp_err_t R_PTP_MacAddrSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr*)

This function sets the MAC address for the PTP instance. Implements ptp_api_t::macAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_IpAddrSet()

fsp_err_t R_PTP_IpAddrSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *ip_addr*)

This function sets the IP address for the PTP instance. Implements ptp_api_t::ipAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state.

◆ R_PTP_LocalClockIdSet()

fsp_err_t R_PTP_LocalClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*)

This function sets the local clock ID for the PTP instance. Implements ptp_api_t::localClockIdSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.
Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_MasterClockIdSet()

fsp_err_t R_PTP_MasterClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*, uint16_t *port_id*)

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements ptp_api_t::masterClockIdSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageFlagsSet()

fsp_err_t R_PTP_MessageFlagsSet (ptp_ctrl_t *const *p_ctrl*, ptp_message_type_t *message_type*, ptp_message_flags_t *flags*)

This function sets the flags field for the given message type. Implements ptp_api_t::messageFlagsSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_CurrentUtcOffsetSet()

fsp_err_t R_PTP_CurrentUtcOffsetSet (ptp_ctrl_t *const *p_ctrl*, uint16_t *offset*)

This function sets the currentUtcOffset value in announce messages. ptp_api_t::currentUtcOffsetSet .

Return values

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PortStateSet()

fsp_err_t R_PTP_PortStateSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *state*)

This function changes the current state of the PTP instance. Implements ptp_api_t::portStateSet.

Return values

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageSend()

fsp_err_t R_PTP_MessageSend (ptp_ctrl_t *const *p_ctrl*, ptp_message_t const *const *p_message*, uint8_t const *const *p_tlv_data*, uint16_t *tlv_data_size*)

This function sends a PTP message. ptp_api_t::messageSend.

Return values

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ R_PTP_LocalClockValueSet()

fsp_err_t R_PTP_LocalClockValueSet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t const *const *p_time*)

This function sets the local clock value. Implements ptp_api_t::localClockValueSet.

Return values

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_LocalClockValueGet()

fsp_err_t R_PTP_LocalClockValueGet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t *const *p_time*)

This function gets the local clock value. Implements ptp_api_t::localClockValueGet.

Return values

FSP_SUCCESS	The local clock value has been written in p_time.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_PulseTimerCommonConfig()

fsp_err_t R_PTP_PulseTimerCommonConfig (ptp_ctrl_t *const *p_ctrl*, ptp_pulse_timer_common_cfg_t *const *p_timer_cfg*)

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements ptp_api_t::pulseTimerCommonConfig.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PulseTimerEnable()

fsp_err_t R_PTP_PulseTimerEnable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*, ptp_pulse_timer_cfg_t *const *p_timer_cfg*)

This function enables a pulse timer channel. Implements ptp_api_t::pulseTimerEnable.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PulseTimerDisable()

fsp_err_t R_PTP_PulseTimerDisable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*)

This function disables a pulse timer channel. Implements ptp_api_t::pulseTimerDisable.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_Close()

fsp_err_t R_PTP_Close (ptp_ctrl_t *const *p_ctrl*)

Disable the PTP instance. Implements ptp_api_t::close.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_BestMasterClock()

fsp_err_t R_PTP_BestMasterClock (ptp_message_t const *const *p_announce1*, ptp_message_t const *const *p_announce2*, int8_t *const *p_comparison*)

This function compares two clocks to determine which one is the better master clock.

p_comparison:

- Set to -1 if p_announce1 defines the best master clock.
- Set to 1 if p_announce2 defines the best master clock.
- Set to 0 if p_announce1 and p_announce2 define the same clock.

Return values

FSP_SUCCESS	The valid result has been written to p_use_announce_clock.
FSP_ERR_ASSERTION	An argument was NULL.

4.2.11.19 SPP BLE Abstraction (rm_ble_abs_spp)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

Features

The Bluetooth Low Energy Abstraction module with SPP supports the following features:

- Common functionality
  - Open/Close the BLE protocol stack.
  - Setting Transmit Power Level.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
  - SPI Interface
  - UART Interface

Target Devices

The Bluetooth Low Energy Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking.
Reset Port	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin port for the MCU.
Reset Pin	Refer to the RA Configuration tool for available options.	10	Specify the module reset pin for the MCU.
UART/SPI Select Port (PB5)	Refer to the RA Configuration tool for available options.	03	Specify the module PB5 port for the MCU.
UART/SPI Select Pin (PB5)	Refer to the RA Configuration tool for available options.	11	Specify the module PB5 pin for the MCU.
SPI Software SSL Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the port to use for controlling SSL using the ioport module.
SPI Software SSL Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the pin to use for controlling SSL using the ioport module.
Transmit Power Level (in dBm)	Refer to the RA Configuration tool for available options.	4.57	Specify the module transmit power in dBm.

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_ble_abs0	Module name.
General > GAP callback	Name must be a valid C symbol	gap_cb	If QE is used, set to NULL.
General > Vendor specific callback	Name must be a valid C symbol	vs_cb	If QE is used, set to NULL.
General > GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	If QE is used, set to NULL.
General > GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
General > GATT client	Name must be a valid	gs_abs_gattc_cb_param	Set GATT client

callback parameter	C symbol		callback parameter. If QE is used, set to NULL.
General > GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.

Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- UART Interface : RX/TX Pins
- SPI Interface : MOSI/MISO/SCK/SSL Pins
    - Data Ready Pin : When the SPI Interface is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
    - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware[1].

Note

1. The Software SSL Pin is required when using the SPI (r_sci_spi) driver.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication

- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the E2 Studio Configurator is 4.5 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
```

```
    {
 case BLE_GAP_EVENT_STACK_ON:
     {
           g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_ON:
     {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
           g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
           g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_OFF:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
      }
 case BLE_GAP_EVENT_CONN_IND:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
      }
     {
 /* Do nothing. */
 break;
        }
 default:
 break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
```

```
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the FreeRTOS Secure Sockets and WiFi interfaces using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: Secure Sockets API or Wifi API.

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the Silex Web Site

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports a BSD style Secure Socket interface.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	

Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
STNP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
STNP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	• Enabled • Disabled	Disabled	Specify if daytime savings should be used for local time calulation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The rm_wifi_onchip_silex_connect() function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call WIFI_Scan(), WIFI_Ping(), SOCKETS_GetHostByName(), WIFI_GetMAC(), or WIFI_GetIPInfo(). Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
    WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = "password",
       .ucSSID                     = "access_point_ssid",
       .xPassword.xWPA.ucLength = 8,
       .ucSSIDLength            = 17,
```

```
      .xSecurity               = eWiFiSecurityWPA2,
   };
   SocketsSockaddr_t addr            = {0};
   int32_t          number_bytes_rx = 0;
   int32_t          number_bytes_tx = 0;
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
   WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
   assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Do a DNS Query for IP address of server */
   addr.ulAddress = SOCKETS_GetHostByName("www.renesas.com");
   addr.usPort    = SOCKETS_htons(80);
/* Initialize the Socket Interface */
   BaseType_t sock_err = SOCKETS_Init();
   assert(pdPASS == sock_err);
/* Create a socket instance */
   Socket_t socket1 = SOCKETS_Socket(SOCKETS_AF_INET, SOCKETS_SOCK_STREAM,
```

```
SOCKETS_IPPROTO_TCP);
    assert(NULL != socket1);
 /* Connect to an server using address */
    sock_err = SOCKETS_Connect(socket1, &addr, sizeof(SocketsSockaddr_t));
    assert(pdPASS == sock_err);
 /* Send a HTTP Get call to server */
    number_bytes_tx = SOCKETS_Send(socket1, HTTP_GET_string, strlen(HTTP_GET_string),
0);
    assert(number_bytes_tx > 0);
 /* Receive the HTTP GET call reply */
    number_bytes_rx = SOCKETS_Recv(socket1, g_socket_recv_buffer,
SX_WIFI_SOCKET_RX_BUFFER_SIZE, 0);
    assert(number_bytes_rx > 0);
 /* Close the socket connection */
    SOCKETS_Close(socket1);
 /* Shutdown the WIFI and Socket Interfaces */
    WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
```

```
 /* Setup Access Point connection parameters */
    WIFINetworkParams_t net_params =
    {
        .ucSSID                    = "access_point_ssid",
        .ucSSIDLength              = 17,
        .xPassword.xWPA.cPassphrase = "password",
        .xPassword.xWPA.ucLength    = 8,
        .ucChannel                 = 0,
        .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
    WIFI_On();
 /* Connect to the Access Point */
    WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
 /* Get the local time string */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
    WIFI_Disconnect();
 /* Change the IP address of the server */
 RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet((uint8_t *)
ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet(-7, 0,
WIFI_ONCHIP_SILEX_SNTP_DAYLIGHT_SAVINGS_ENABLE);
 /* Connect back to the access point */
    WIFI_ConnectAP(&net_params);
```

```
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
    WIFI_Disconnect();
    WIFI_Off();
}
```

UDP example

An example of using a UDP client socket to send and receive data from UDP server.

```
/*
 * Example of the use of an UDP client with Wifi. It is assumed for this test that
the UDP server that is connected to is an echo server.
 *

Data Structure Documentation

◆ wifi_onchip_silex_cfg_t

struct wifi_onchip_silex_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uint32_t	num_sockets	Number of sockets to initialize.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.
const uart_instance_t *	uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const wifi_onchip_silex_sntp_enable_t	sntp_enabled	Enable/Disable the SNTP Client.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_timezone_offset_from_utc_hours	Timezone offset from UTC in (+/-) hours.
const uint32_t	sntp_timezone_offset_from_utc_minutes	Timezone offset from UTC in minutes.
const wifi_onchip_silex_sntp_daylight_savings_enable_t	sntp_timezone_use_daylight_savings	Enable/Disable use of daylight saving time.
void const *	p_context	User defined context passed

		into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ ulpgn_socket_t

struct ulpgn_socket_t		
Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.
uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

◆ wifi_onchip_silex_instance_ctrl_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.

uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GAteway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ sx_ulpgn_socket_status_t

enum sx_ulpgn_socket_status_t
Silex ULPGN Wifi socket status types

◆ sx_ulpgn_socket_rw

enum sx_ulpgn_socket_rw
Silex socket shutdown channels

◆ wifi_onchip_silex_sntp_enable_t

enum wifi_onchip_silex_sntp_enable_t
Silex WiFi module enable/disable for SNTP

◆ wifi_onchip_silex_sntp_daylight_savings_enable_t

enum wifi_onchip_silex_sntp_daylight_savings_enable_t
Silex WiFi module enable/disable for SNTP

Function Documentation

◆ RM_WIFI_ONCHIP_SILEX_EpochTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * *p_utc_time*)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

[out]	p_utc_time	Returns the epoch time in seconds.

Return values

FSP_SUCCESS	Successfully retrieved the system time from module.
FSP_ERR_ASSERTION	The parameter utc_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ RM_WIFI_ONCHIP_SILEX_LocalTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_ONCHIP_SILEX_SntpEnableSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet (wifi_onchip_silex_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Can be set to enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * *p_ip_address*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet (int32_t *hours*, uint32_t *minutes*, wifi_onchip_silex_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

4.2.12 Power

Modules

Detailed Description

Power Modules.

Modules

Low Power Modes (r_lpm)

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

4.2.12.1 Low Power Modes (r_lpm)

Modules » Power

Functions

fsp_err_t	R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)
fsp_err_t	R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)
fsp_err_t	R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the follwowing low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

	• Disabled		included in the build.
Standby Limit	• Enabled • Disabled	Disabled	If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call.

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_lpm0	Module name.
General > Low Power Mode	MCU Specific Options		Power mode to be entered.
General > Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Standby Options > Wake Sources	MCU Specific Options		Enable wake from standby from these Sources.
Standby Options > Snooze Request Source	MCU Specific Options		Select the event that will enter snooze.
Standby Options > Snooze End Sources	MCU Specific Options		Enable wake from snooze from these sources.
Standby Options > DTC state in Snooze Mode	• Disabled • Enabled	Disabled	Enable wake from snooze from this source.
Standby Options > Snooze Cancel Source	MCU Specific Options		Select an interrupt source to cancel snooze.
Deep Standby Options > I/O Port Retention	MCU Specific Options		Select the state of the IO Pins after exiting deep standby mode.
Deep Standby Options > Power-Supply Control	MCU Specific Options		Select the state of the internal power supply in deep standby mode.
Deep Standby Options	MCU Specific Options		Enable wake from deep

> Cancel Sources		standby using these sources.
Deep Standby Options > Cancel Edges	MCU Specific Options	Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge.

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the Systick interrupt used by the RTOS scheduler.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

Deep Software Standby Mode is only available on some MCU devices. The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occured after coming out of deep

sofware standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the R_LPM_IoKeepClear API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
 fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
```

```
{
 fsp_err_t err;
    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Check the Deep Software Standby Reset Flag. */
 if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
 /* Clear the IOKEEP bit to allow I/O Port use. */
       err = R_LPM_IoKeepClear(&g_lpm_ctrl);
      assert(FSP_SUCCESS == err);
    }
 /* Add user code here. */
 /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
 /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
  * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	lpm_instance_ctrl_t

Data Structure Documentation

◆ lpm_instance_ctrl_t

struct lpm_instance_ctrl_t
LPM private control block. DO NOT MODIFY. Initialization occurs when R_LPM_Open() is called.

Function Documentation

◆ R_LPM_Open()

fsp_err_t R_LPM_Open (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Perform any necessary initialization

Return values

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerReconfigure()

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

FSP_SUCCESS	Low power mode successfuly applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerModeEnter()

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const *p_api_ctrl*)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: • HOCO was not system clock when using snooze mode with SCI0/RXD0. • HOCO was not stable when using snooze mode with SCI0/RXD0. • MOCO was running when using snooze mode with SCI0/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCI0/RXD0. • PLL was running when using snooze mode with SCI0/RXD0. • Unable to disable ocillator stop detect when using standby or deep standby.

◆ R_LPM_IoKeepClear()

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const *p_api_ctrl*)

Clear the IOKEEP bit after deep software standby

Return values

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

◆ R_LPM_Close()

fsp_err_t R_LPM_Close (lpm_ctrl_t *const *p_api_ctrl*)
Close the LPM Instance **Return values** FSP_SUCCESS — LPM driver closed FSP_ERR_NOT_OPEN — LPM instance is not open FSP_ERR_ASSERTION — Null Pointer

4.2.13 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

Azure RTOS ThreadX Port (rm_threadx_port)

ThreadX port for RA MCUs.

FreeRTOS Port (rm_freertos_port)

FreeRTOS port for RA MCUs.

4.2.13.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at https://docs.microsoft.com/en-us/azure/rtos/threadx/ for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

Configuration	Options	Default	Description
General > Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Error Checking	• Enabled • Disabled	Enabled	The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined.
General > Max Priorities	Value must be a multiple of 32 or empty	32	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
General > Minimum Stack	Value must be greater than 0 or empty	200	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
General > Stack Filling	• Enabled • Disabled	Enabled	Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each thread's stack. This is used by debuggers

			with ThreadX-awareness and by the ThreadX run-time stack checking feature.
General > Preemption Threshold	• Enabled • Disabled	Disabled	Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.
General > Notify Callbacks	• Enabled • Disabled	Disabled	Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.
General > Inline Thread Resume Suspend	• Enabled • Disabled	Disabled	Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.
General > Not Interruptable	• Enabled • Disabled	Disabled	Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.
General > IAR Library Support	• Enabled • Disabled	Disabled	Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option --threaded_lib. In the IAR IDE, this can be

			enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
General > BSD Support	• Enabled • Disabled	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
General > FileX Pointer	• Enabled • Disabled	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.
Timer > Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer > Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Thread Priority	Value must be greater than 0 or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer > Timer Process In ISR	• Enabled • Disabled	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system timer thread or directly in the timer ISR. When disabled, the timer

			thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.
Timer > Reactivate Inline	• Enabled • Disabled	Disabled	Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.
Timer > Timer	• Enabled • Disabled	Enabled	Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.
Trace > Event Trace	• Enabled • Disabled	Disabled	Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.
Trace > Trace Buffer Name	Name must be a valid C symbol	g_tx_trace_buffer	Name of trace buffer symbol, only used if Event Trace is enabled.
Trace > Memory section for Trace Buffer	Manual Entry	.bss	Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled. To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and

			open it with Microsoft Azure RTOS TraceX.
Trace > Trace Buffer Size	Value must be greater than 0	65536	Trace buffer size in bytes, only used if Event Trace is enabled
Trace > Trace Buffer Number of Registries	Value must be greater than 0	30	Number of registries available to TraceX, only used if Event Trace is enabled
Performance > Block Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers block pool performance information.
Performance > Byte Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers byte pool performance information.
Performance > Event Flags Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers event flags performance information.
Performance > Mutex Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers mutex performance information.
Performance > Queue Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers queue performance information.
Performance > Semaphore Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers semaphore performance information.
Performance > Thread Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers thread performance information.
Performance > Timer Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers timer performance information.
RA > Hardware Thread Stack Monitoring	MCU Specific Options		Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.

Interrupts > SysTick Interrupt Priority	MCU Specific Options	Select the Systick interrupt priority.
Interrupts > Maximum Interrupt Priority	MCU Specific Options	The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See Low Power Modes (r_lpm) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
```

```
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the thread to a while(1) loop. */
```

```
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling tx_thread_secure_stack_allocate before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
 /* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
  * to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
  * This function can be called when the thread is created or in the thread before an
non-secure callable function is
  * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
    rm_threadx_port_nsc_function();
}
```

4.2.13.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at https://www.freertos.org/Documentation for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General > Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
General > Use Preemption	• Enabled • Disabled	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled to use the cooperative RTOS scheduler.
General > Use Port Optimised Task Selection	• Enabled • Disabled	Disabled	Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port. The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all

			FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities. A port specific method: Is not available for all ports. Is used when Use Port Optimized Task Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.
General > Use Tickless Idle	• Enabled • Disabled	Disabled	Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.
General > Cpu Clock Hz	Manual Entry	SystemCoreClock	Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly

			configure timer peripherals.
General > Tick Rate Hz	Must be an integer and greater than 0	1000	The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required. More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the 'time slice' given to each task.
General > Max Priorities	Must be an integer and greater than 0	5	The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.
General > Minimal Stack Size	Must be an integer and greater than 0	128	The size of the stack used by the idle task.

			Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).
General > Max Task Name Len	Must be an integer and greater than 0	16	The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.
General > Use 16-bit Ticks	Disabled	Disabled	Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type. Using a 16-bit type will greatly improve

			performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.
General > Idle Should Yield	• Enabled • Disabled	Enabled	This parameter controls the behaviour of tasks at the idle priority. It only has an effect if: The preemptive scheduler is being used. The application creates tasks that run at the idle priority. If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application

tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

This situation can be avoided by:

If appropriate, using an idle hook in place of separate tasks at the idle priority.
Creating all application tasks at a priority greater than the idle priority.
Setting Idle Should Yield to Disabled. Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time

			slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.
General > Use Task Notifications	• Enabled • Disabled	Enabled	Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build. Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build. Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.
General > Use Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.
General > Use Recursive Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.

General > Use Counting Semaphores	• Enabled • Disabled	Enabled	Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.
General > Queue Registry Size	Must be an integer and greater than 0	10	The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for vQueueAddToRegistry( ) and vQueueUnregisterQueue() for more information.
General > Use Queue Sets	• Enabled • Disabled	Disabled	Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or

			Disabled to omit queue set functionality.
General > Use Time Slicing	• Enabled • Disabled	Disabled	If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.
General > Use Newlib Reentrant	• Enabled • Disabled	Disabled	If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.
General > Enable Backward Compatibility	• Enabled • Disabled	Disabled	The FreeRTOS.h header file includes a set of #define macros that

			map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.
General > Num Thread Local Storage Pointers	Must be an integer and greater than 0	5	Sets the number of indexes in each task's thread local storage array.
General > Stack Depth Type	Manual Entry	uint32_t	Sets the type used to specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use.
General > Message Buffer Length Type	Manual Entry	size_t	FreeRTOS Message buffers use variables of type Message Buffer

		Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.
General > Library Max Syscall Interrupt Priority	MCU Specific Options	The highest interrupt priority that can be used by any interrupt service routine that makes calls to interrupt safe FreeRTOS API functions. DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values) Below is explanation for macros that are set based on this value from FreeRTOS website. In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above configMAX_SYSCALL_INTERRUPT_PRIORITY and therefore never be delayed by the RTOS kernel execution.

A special note for ARM Cortex-M users: Please read the page dedicated to interrupt priority settings on ARM Cortex-M devices. As a minimum, remember that ARM Cortex-M cores use numerically low priority numbers to represent

			HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above config MAX_SYSCALL_INTERRUPT_PRIORITY. The lowest priority on a ARM Cortex-M core is in fact 255 - however different ARM Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest priority you can specify is 15 - and the highest priority you can specify is 0.
General > Assert	Manual Entry	assert(x)	The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT()

defined.

The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (__FILE__ and __LINE__ are standard macros provided by most compilers). This is just for demonstration as vAssertCalled() is not a FreeRTOS function, configASSERT() can be defined to take whatever action the application writer deems appropriate.

It is normal to define configASSERT() in such a way that it will prevent the application from executing any further. This if for two reasons; stopping the application at the point of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining configASSERT() will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the configASSERT() definition in FreeRTOSConfig.h.

			/* Define configASSERT() to call vAssertCalled() if the assertion fails. The assertion has failed if the value of the parameter passed into configASSERT() equals zero. */ #define configASSERT((x)) if((x) == 0) vAssertCalled(__FILE__, __LINE__) If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed. /* Define configASSERT() to disable interrupts and sit in a loop. */ #define configASSERT((x)) if((x) == 0) { taskDISABLE_INTERRUPTS(); for(;;); }
General > Include Application Defined Privileged Functions	• Enabled • Disabled	Disabled	Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer

needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.

Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can be encapsulated in a privileged function using the following code:

```
void MPU_debug_printf( const char *pcMessage )
{
/* State the privilege level of the processor when the function was called. */
BaseType_t xRunningPrivileged = prvRaisePrivilege();

/* Call the library function, which now has access to all RAM. */
debug_printf( pcMessage );
```

			/* Reset the processor privilege level to its original value. */
			portRESET_PRIVILEGE(xRunningPrivileged);
			}
			This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Hooks > Use Idle Hook	• Enabled • Disabled	Enabled	Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.
Hooks > Use Malloc Failed Hook	• Enabled • Disabled	Disabled	The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed. If Use Malloc Failed

			Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Dosab;ed then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below. void vApplicationMalloc FailedHook(void);
Hooks > Use Daemon Task Startup Hook	• Enabled • Disabled	Disabled	If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task (also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function. void void vApplicationD aemonTaskStartupHoo k(void);
Hooks > Use Tick Hook	• Enabled • Disabled	Disabled	Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook.
Hooks > Check For Stack Overflow	• Enabled • Disabled	Disabled	The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable

			the RA hardware stack monitor instead.
Stats > Use Trace Facility	• Enabled • Disabled	Disabled	Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing.
Stats > Use Stats Formatting Functions	• Enabled • Disabled	Disabled	Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStates() from the build.
Stats > Generate Run Time Stats	• Enabled • Disabled	Disabled	The Run Time Stats page describes the use of this parameter.
Memory Allocation > Support Static Allocation	• Enabled • Disabled	Enabled	If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap. If Support Static Allocation is left undefined it will default to 0. If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplicationGetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use

Timers is Enabled) vAp
plicationGetTimerTask
Memory() to provide
memory for use by the
RTOS Daemon/Timer
Service task. Examples
are provided below.

/* Support Static
Allocation is Enabled,
so the application must
provide an
implementation of vAp
plicationGetIdleTaskMe
mory() to provide the
memory that is
used by the Idle task. */
void vApplicationGetIdl
eTaskMemory(
StaticTask_t **ppxIdleT
askTCBBuffer,
StackType_t **ppxIdleT
askStackBuffer,
uint32_t
*pulIdleTaskStackSize)
{
/* If the buffers to be
provided to the Idle
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xIdleTaskTCB;
static StackType_t
uxIdleTaskStack[config
MINIMAL_STACK_SIZE];

/* Pass out a pointer to
the StaticTask_t
structure in which the
Idle task's
state will be stored. */
*ppxIdleTaskTCBBuffer
=

/* Pass out the array
that will be used as the
Idle task's stack. */

```
*ppxIdleTaskStackBuffe
r = uxIdleTaskStack;

/* Pass out the size of
the array pointed to by
*ppxIdleTaskStackBuffe
r.
Note that, as the array
is necessarily of type
StackType_t,
configMINIMAL_STACK_
SIZE is specified in
words, not bytes. */
*pulIdleTaskStackSize
= configMINIMAL_STAC
K_SIZE;
}
/*-----------------------------
-----------------------------*/

/* Support Static
Allocation and Use
Timers are both
Enabled, so the
application must
provide an
implementation of vAp
plicationGetTimerTask
Memory()
to provide the memory
that is used by the
Timer service task. */
void vApplicationGetTi
merTaskMemory(
StaticTask_t **ppxTime
rTaskTCBBuffer,<br>
StackType_t **ppxTime
rTaskStackBuffer,<br>
uint32_t
*pulTimerTaskStackSiz
e )
{
/* If the buffers to be
provided to the Timer
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xTimerTaskTCB;
```

```
static StackType_t
uxTimerTaskStack[ con
figTIMER_TASK_STACK_
DEPTH ];

/* Pass out a pointer to
the StaticTask_t
structure in which the
Timer
task's state will be
stored. */
*ppxTimerTaskTCBBuff
er =

/* Pass out the array
that will be used as the
Timer task's stack. */
*ppxTimerTaskStackBu
ffer =
uxTimerTaskStack;

/* Pass out the size of
the array pointed to by
*ppxTimerTaskStackBu
ffer.
Note that, as the array
is necessarily of type
StackType_t,
configTIMER_TASK_STA
CK_DEPTH is specified
in words, not bytes. */
*pulTimerTaskStackSiz
e = configTIMER_TASK_
STACK_DEPTH;
}
```

Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.

See the Static Vs Dynamic Memory Allocation page for more information.

Memory Allocation > Support Dynamic Allocation	• Enabled • Disabled	Disabled	If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM

			that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer. See the Static Vs Dynamic Memory Allocation page for more information.
Memory Allocation > Total Heap Size	Must be an integer and greater than 0	1024	The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.
Memory Allocation > Application Allocated Heap	• Enabled • Disabled	Disabled	By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t array with the exact name and dimension as shown below. The

			array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation. uint8_t ucHeap[configTOTAL_HEAP_SIZE];
Timers > Use Timers	• Enabled • Disabled	Enabled	Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the FreeRTOS software timers page for a full description.
Timers > Timer Task Priority	Must be an integer and greater than 0	3	Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Timers > Timer Queue Length	Must be an integer and greater than 0	10	Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description.
Timers > Timer Task Stack Depth	Must be an integer and greater than 0	128	Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Optional Functions > vTaskPrioritySet() Function	• Enabled • Disabled	Enabled	Include vTaskPrioritySet() function in build
Optional Functions > uxTaskPriorityGet() Function	• Enabled • Disabled	Enabled	Include uxTaskPriorityGet() function in build

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD_STACK_HIGH_ADDRESS as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE_SECURE_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN_UP_TCB(pxTCB) macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_SECTION_STACK);
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
```

```
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the task to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
 /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
  * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

4.2.14 Security

Modules

Detailed Description

Security Modules.

Modules

	AWS Client Credentials This module provides the AWS MQTT integration documentation.
	AWS Device Provisioning AWS Device Provisioning example software.
	Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto) Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.
	Mbed Crypto HW Acceleration (rm_psa_crypto) Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

	SCE Protected Mode Driver for the Secure Crypto Engine (SCE9) on RA MCUs.
	Secure Crypto Engine (r_sce_protected_cavp) Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.
	TinyCrypt TRNG (rm_tinycrypt_port) AES128 Hardware acceleration for TinyCrypt on the RA2 family.

4.2.14.1 AWS Client Credentials

Modules » Security

This module provides the AWS MQTT integration documentation.

Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: coreMQTT.

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server
- Unsecure MQTT connections to Mosquitto servers. This is not recommended for production and should only be done to a local server for testiing.

Configuration

Memory Usage

The AWS MQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provde as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Noteable values are:

AWS IoT Common

- IoT Thread Default Stack Size
- IoT Network Receive Task Stack Size

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

The AWS MQTT library utilizes a system taskpool to queue up messages. This system task pool must be created before calling into the MQTT library. iot_init.c has been provided for easy initialization of this taskpool via IotSdk_Init().

The AWS MQTT Demo has been provided to easily demonstrate MQTT functionality. An example of initializiing the system taskpool and running the MQTT demo has been provided below.

Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- The IoT Thread must have a higher priorty than the Network Receive Thread.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to AWS Secure Sockets.

Examples

Non-secure connection to a Mosquitto server

```
#define IOT_LOG_STACK_SIZE (256)
const uint8_t g_ip_address[4] = {169, 254, 57, 49};
const uint8_t g_net_mask[4] = {255, 255, 0, 0};
const uint8_t g_gateway_address[4] = {169, 254, 57, 49};
const uint8_t g_dns_address[4] = {8, 8, 8, 8};
const uint8_t g_mac_address[6] = {0x66, 0x66, 0x66, 0x66, 0x66, 0x66};
void mqtt_non_secure_example ()
{
 /* Initialize IOT FreeRTOS Libraries */
    SYSTEM_Init();
 /* Initialize the crypto hardware acceleration. */
 mbedtls_platform_setup(NULL);
    xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);
 /* Start up the network stack. */
    FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);
 while (pdFALSE == FreeRTOS_IsNetworkUp())
    {
```

```
      vTaskDelay(1);
   }
 /* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
*/
 /* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}
```

Secure connection to a Mosquitto server

Note

MbedTLS must be initialized and key provisioning must be done before starting a secure connection. Refer to AWS Secure Sockets.

```
#define keyCLIENT_CERTIFICATE_PEM \
  "-----BEGIN CERTIFICATE-----\n" \
  "example_certificate_formatting\n" \
  "-----END CERTIFICATE-----"
#define keyCLIENT_PRIVATE_KEY_PEM \
  "-----BEGIN RSA PRIVATE KEY-----\n" \
  "example_certificate_formatting\n" \
  "-----END RSA PRIVATE KEY-----"
void mqtt_secure_example ()
{
 /* Initialize IOT FreeRTOS Libraries */
   SYSTEM_Init();
 /* Initialize the crypto hardware acceleration. */
 mbedtls_platform_setup(NULL);
   xLoggingTaskInitialize(IOT_LOG_STACK_SIZE, 1, 10);
   ProvisioningParams_t params;
 /* Write the keys into a secure region in data flash. */
   params.pucClientPrivateKey       = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
   params.pucClientCertificate      = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
   params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);
   params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
```

```
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
 /* Start up the network stack. */
    FreeRTOS_IPInit(g_ip_address, g_net_mask, g_gateway_address, g_dns_address,
g_mac_address);
 while (pdFALSE == FreeRTOS_IsNetworkUp())
    {
       vTaskDelay(1);
    }
 /* AWS MQTT APIs can now be called. Please refer to the documentation linked above.
*/
 /* If using the MQTT Wrapper IotSdk_Init() must be called prior to using MQTT. */
}
```

4.2.14.2 AWS Device Provisioning

Modules » Security

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example, Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This

signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the X.509 format which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between service providers. There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality .Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an example of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal rm_aws_pkcs11_pal module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (aws_dev_mode_key_provisioning.c) exposes two functions:

1. vDevModeKeyProvisioning()
2. vAlternateKeyProvisioning()

Both of these functions require that the device credentials be provided in PEM format. Using either of these example functions as is in production is not recommended; but vAlternateKeyProvisioning() provides more flexibility because of the ability to provide credentials as arguments.

Credentials can be created as follows:

- Create your own CA and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example Register your CA with AWS.
- Use AWS to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```
#define keyCLIENT_CERTIFICATE_PEM \
  "-----BEGIN CERTIFICATE-----\n" \
  "MIIDETCCAfkCFHwd2yn8zn5qB2ChYUT9Mvbi9Xp1MA0GCSqGSIb3DQEBCwUAMEUx\n" \

that case. */
    params.pucClientPrivateKey       = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
    params.pucClientCertificate      = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
    params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);
    params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
}
```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

4.2.14.3 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

Modules » Security

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

Overview

Please refer to the NetXDuo - NetX Crypto documentation for further details.

HW Overview

Crypto Peripheral version	Devices

SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

Note

NetX Crypto hardware acceleration is unsupported on 'SCE5' and 'AES Engine' crypto peripherals listed above.

Features

This module provides SCE9 hardware support for the following NetX Crypto operations

- SHA256 calculation
- SHA224 calculation
- MAC Operations
  - HMAC with SHA224
  - HMAC with SHA256
- AES
  - Keybits - 128, 192, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated
GCM	Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

- Random number generation
- ECC
  - ECDSA: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
  - ECDH: Supported Curves - SECP384R1, SECP256R1, SECP224R1.
- RSA
  - Signature Generation - RSA 2048 (Plain or Wrapped private) key. (This can be used for decryption)
  - Signature Verification - RSA 2048, RSA 3072 and RSA 4096 keys. (This can be used for encryption)
  - Supported encoding scheme: PKCS1V15 This module provides SCE7 hardware support for the following NetX Crypto operations
- AES
  - Keybits - 128, 256
    - Encryption and Decryption.
    - Chaining Modes: CBC, CTR, GCM mode

AES Chaining Mode	HW Acceleration
CBC	Fully accelerated
CTR	Fully accelerated

GCM	Only block cipher unit is HW accelerated
CCM	Only block cipher unit is HW accelerated

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	• 1024 • 2048 • 3072 • 4096	4096	

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDSA Scratch Buffer Size (Bytes)	Value must be an integer	3016	Sets value of NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE
Hardware Acceleration > Public Key Cryptography (PKC) > ECC > ECDH Scratch Buffer Size (Bytes)	Value must be an integer	2464	Sets value of NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE

Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA	MCU Specific Options		Enables/Disables RSA HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support
Hardware Acceleration > Public Key Cryptography (PKC) > RSA > RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE
Hardware Acceleration > TRNG	• Enabled • Disabled	Enabled	Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT.
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT must be defined in the configuration file. By default SHA256 is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1, SECP256R1 and SECP224R1, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be must be defined in the configuration file:

Configuration Macro	Feature / Operation
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT	Signature Verification (Encryption Only)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

_nx_crypto_initialize() must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer Azure RTOS NetX Crypto API description for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the _nx_crypto_method_aes_operation must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in Using Advanced Encryption Standard (AES) Counter Mode With IPsec Encapsulating Security Payload (ESP) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to _nx_crypto_method_aes_operation through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the _nx_crypto_method_aes_operation during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannnot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE and NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key
Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key
ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under RFC5480
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral. (Qx and Qy are zero padded for 224 bit curves).

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during _nx_crypto_method_rsa_init API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_rsa_operation API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of _nx_crypto_method_pkcs1_v1_5_init are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_pkcs1_v1_5_operation API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is eanbled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */
   err = _nx_crypto_initialize();
   assert(NX_CRYPTO_SUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTO_METHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
```

```
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void netx_secure_crypto_sha256_example (void)
{
 size_t   actual_hash_len = RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared

secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPTO_METHOD crypto_method_ecdh;

int	mbedtls_platform_setup (mbedtls_platform_context *ctx)
void	mbedtls_platform_teardown (mbedtls_platform_context *ctx)
fsp_err_t	RM_PSA_CRYPTO_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes) Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer. More...

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the ARM PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the Mbed TLSversion 2.24.0 which conforms to the PSA Crypto API 1.0 specification. Consult the ARM documentation at https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface for further information. *FSP 3.0 onward adopts a change by ARM where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1

Features

The PSA_Crypto module provides hardware support for the following PSA Crypto operations

- SHA256 calculation
- SHA224 calculation
    - MAC Operations
- AES
    - Keybits - 128, 192, 256
    - Plain-Text Key Generation
    - Wrapped Key Generation
    - Encryption and Decryption with no padding and with PKCS7 padding.
    - CBC, CTR, CCM and GCM modes
    - MAC operations
    - Export and Import for Plaintext and Wrapped keys
- ECC
    - Curves:

        - SECP256R1
        - SECP256K1
        - Brainpool256R1
        - SECP384R1
        - Brainpool384R1
    - Plain-Text Key Generation (Unavailable on SCE9)
    - Wrapped Key Generation
    - Signing and Verification
    - Export and Import for Plaintext and Wrapped keys
    - ECDH Support
- RSA
    - Keybits - 2048. Verification only for 3072 and 4096 bits
    - Plain-Text Key Generation (Unavailable on SCE9)
    - Wrapped Key Generation
    - Signature Generation
    - Verification
    - Encryption and Decryption with PKCS1V15 and OAEP padding
    - Export and Import for Plaintext and Wrapped keys
- Random number generation
- Persistent Key Storage

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration > Key Format > AES	MCU Specific Options		Select AES key formats used
Hardware Acceleration > Key Format > ECC	MCU Specific Options		Select ECC key formats used
Hardware Acceleration > Key Format > RSA	MCU Specific Options		Select RSA key formats used
Hardware Acceleration > Hash > SHA256/224	MCU Specific Options		Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.
Hardware Acceleration > Cipher > AES	MCU Specific Options		Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > ECC	MCU Specific Options		Defines MBEDTLS_ECP_ALT

Hardware Acceleration > Public Key Cryptography (PKC) > ECDSA	MCU Specific Options		Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
Hardware Acceleration > Public Key Cryptography (PKC) > RSA	MCU Specific Options		Defines MBEDTLS_RSA_ALT.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072 Verify	MCU Specific Options		Enables RSA 3072 Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 Verify	MCU Specific Options		Enables RSA 4096 Verify.
Hardware Acceleration > TRNG	Enabled	Enabled	Defines MBEDTLS_ENTROPY_HARDWARE_ALT.
Hardware Acceleration > Secure Crypto Engine Initialization	Enabled	Enabled	MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT
Platform > Alternate > MBEDTLS_PLATFORM_EXIT_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_EXIT_ALT
Platform > Alternate > MBEDTLS_PLATFORM_TIME_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_ALT
Platform > Alternate > MBEDTLS_PLATFORM_FPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FPRINTF_ALT
Platform > Alternate > MBEDTLS_PLATFORM_PRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_PRINTF_ALT
Platform > Alternate > MBEDTLS_PLATFORM_SNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SNPRINTF_ALT
Platform > Alternate > MBEDTLS_PLATFORM_VSNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_VSNPRINTF_ALT
Platform > Alternate > MBEDTLS_PLATFORM_NV_SEED_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_ALT

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be

defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO, MBEDTLS_PSA_CRYPTO_STORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specifed as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
   {
/* Set the id to a positive integer. */
      psa_set_key_id(&attributes, (psa_key_id_t) 5);
   }
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS_CHECK_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_ENTROPY_HARDWARE_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

mbedtls_platform_setup() must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

Algorithm	Required Heap (bytes)
SHA256/224	None
AES	0x200
Hardware ECC	0x400
Software ECC	0x1800
RSA	0x1500

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

Limitations

- Only little endian mode is supported.

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it

usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

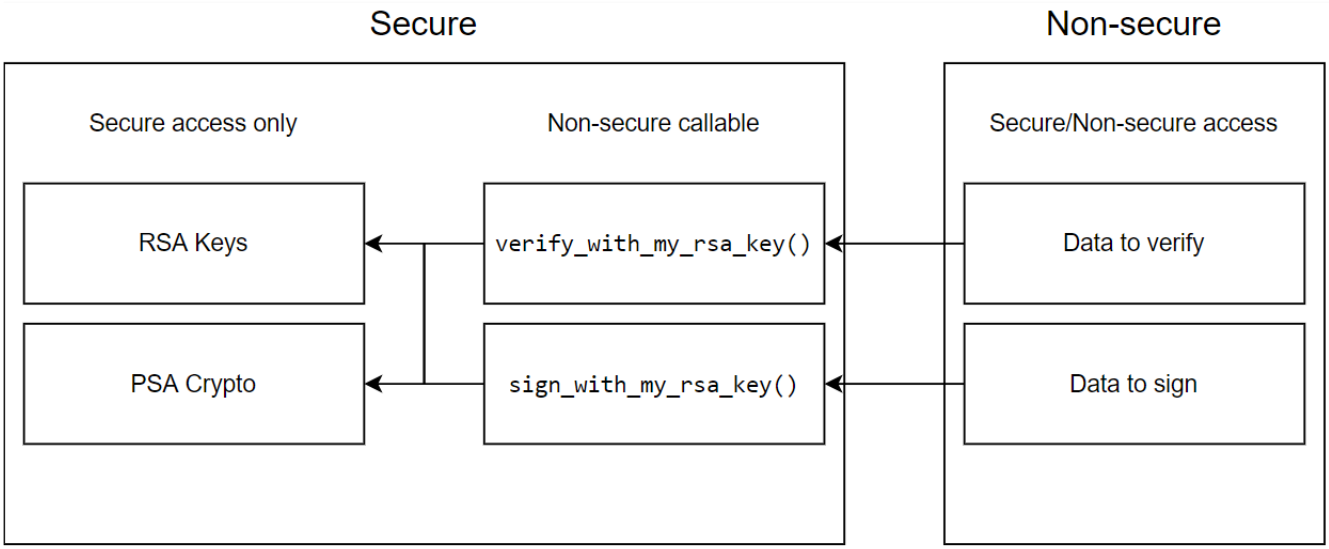

Figure 219: PSA Crypto Non-secure callable example

- Secure project
  - During secure project boot-up, psa_crypto_init() is called.
  - The RSA private key is programmed into secure flash either at the factory or by calling psa_generate_key() in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
  - psa_import_key()/psa_open_key() are called with the resultant handle held in secure RAM.
  - The Non-secure callable section contains the following **user-defined** functions
  - verify_with_my_rsa_key(input_signature, input_hash, verification_result)
  - The implementation of this function in secure region will call psa_verify_hash() and return the result via verification_result.
  - sign_with_my_rsa_key(input_hash, output_signature)
  - The implementation of this function in secure region will call psa_sign_hash() and return the signature via output_signature.

- Non-secure project
  - Calls verify_with_my_rsa_key() to verify a signature. The implementation will use the public key that is present in the secure project.
  - Calls sign_with_my_rsa_key() to generate a signature. The implementation will use the private key that is present on the secure project.

For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg              = PSA_ALG_SHA_256;
    psa_hash_operation_t operation        = {0};
 size_t              expected_hash_len = PSA_HASH_SIZE(alg);
    uint8_t             actual_hash[PSA_HASH_MAX_SIZE];
 size_t              actual_hash_len;
 mbedtls_platform_context ctx = {0};
 /* Setup the platform; initialize the SCE and the TRNG */
 if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
 /* Platform initialization failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
 /* Hash setup failed */
       debugger_break();
    }
```

```
 else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
sizeof(NIST_SHA256ShortMsgLen200)))
    {
 /* Hash calculation failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
    {
 /* Reading calculated hash failed */
       debugger_break();
    }
 else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
    {
 /* Hash compare of calculated value with expected value failed */
       debugger_break();
    }
 else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
    {
 /* Hash size compare of calculated value with expected value failed */
       debugger_break();
    }
 else
    {
 /* SHA256 calculation succeeded */
       debugger_break();
    }
 /* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
 mbedtls_platform_teardown(&ctx);
}
```

AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
 const uint8_t          * input,

/* Key generation failure */
      debugger_break();
   }
/* Steps to generate the MAC */
else if (PSA_SUCCESS != psa_mac_sign_setup(&operation, key_handle, alg))
   {
/* MAC Sign setup failed */
      debugger_break();
   }
else if (PSA_SUCCESS != psa_mac_update(&operation, input, input_size))
   {
/* MAC update failed */
```

```
      debugger_break();
   }
 else if (PSA_SUCCESS != psa_mac_sign_finish(&operation, AES_CMAC_mac, sizeof
(AES_CMAC_mac), &mac_ret))
   {
 /* MAC Sign operation failed */
      debugger_break();
   }
 else
   {
 /* All the operations succeeded for MAC generation */
   }
 /* Steps to verify the generated MAC */
 if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
   {
 /* MAC verification setup failure */
      debugger_break();
   }
 else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
   {
 /* MAC update failure */
      debugger_break();
   }
 else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
   {
 /* MAC verification failed */
      debugger_break();
   }
 else
   {
 /* All the operations succeeded for MAC verification */
   }
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
 * It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.
 * It then re-imports that key, and performs signing and verification operations. */
 unsigned char            payload[] = "ASYMMETRIC_INPUT_FOR_SIGN......";

Function Documentation

◆ mbedtls_platform_setup()

int mbedtls_platform_setup (mbedtls_platform_context * *ctx*)

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};
/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

◆ mbedtls_platform_teardown()

void mbedtls_platform_teardown (mbedtls_platform_context * *ctx*)

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the mbedtls_platform_setup() function, but currently is only a placeholder function.

Example:

```
 /* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
 mbedtls_platform_teardown(&ctx);
```

Return values

N/A	

◆ RM_PSA_CRYPTO_TRNG_Read()

fsp_err_t RM_PSA_CRYPTO_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*, uint32_t * *p_num_gen_bytes*)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

4.2.14.5 SCE Protected Mode

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit

- CBC 128/256bit
- GCM 128/256bit
- CCM 128/256bit

- Asymmetric Encryption/Decryption
  - RSA
    - RSAES-PKCS1-V1_5 1024/2048bit
    - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
    - RSASSA-PKCS1-V1_5 1024/2048bit
    - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
  - ECC
    - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
    - ECDH secp192r1/secp224r1/secp256r1/secp384r1
- Hash Functions
  - SHA-2
    - SHA-256

- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
```

```
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */

Data Structures

struct	sce_instance_ctrl_t

Data Structure Documentation

◆ sce_instance_ctrl_t

struct sce_instance_ctrl_t
SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called.

Function Documentation

◆ R_SCE_TLS_RootCertificateVerify()

fsp_err_t R_SCE_TLS_RootCertificateVerify (uint32_t *public_key_type*, uint8_t * *certificate*, uint32_t *certificate_length*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint8_t * *signature*, uint32_t * *encrypted_root_public_key*)

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

fsp_err_t R_SCE_TLS_CertificateVerify (uint32_t *public_key_type*, uint32_t * *encrypted_input_public_key*, uint8_t * *certificate*, uint32_t *certificate_length*, uint8_t * *signature*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint32_t * *encrypted_output_public_key*)

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

fsp_err_t R_SCE_TLS_MasterSecretGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_pre_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint32_t * *sce_master_secret*)

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value with SCE-specific conversion.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * *encrypted_public_key*, uint32_t * *sce_pre_master_secret*, uint8_t * *encrypted_pre_master_secret*)

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

fsp_err_t R_SCE_TLS_SessionKeyGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *nonce_explicit*, sce_hmac_sha_wrapped_key_t * *client_mac_wrapped_key*, sce_hmac_sha_wrapped_key_t * *server_mac_wrapped_key*, sce_aes_wrapped_key_t * *client_crypto_wrapped_key*, sce_aes_wrapped_key_t * *server_crypto_wrapped_key*, uint8_t * *client_initial_vector*, uint8_t * *server_initial_vector*)

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during

		communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

fsp_err_t R_SCE_TLS_VerifyDataGenerate (uint32_t *select_verify_data*, uint32_t * *sce_master_secret*, uint8_t * *hand_shake_hash*, uint8_t * *verify_data*)

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify (uint32_t *public_key_type*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *server_ephemeral_ecdh_public_key*, uint8_t * *server_key_exchange_signature*, uint32_t * *encrypted_public_key*, uint32_t * *encrypted_ephemeral_ecdh_public_key*)

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange sigunature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 (uint32_t * *encrypted_public_key*, sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

fsp_err_t R_SCE_AES128ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_EncryptUpdate() function and R_SCE_AES128ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

fsp_err_t R_SCE_AES128ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptFinal()

fsp_err_t R_SCE_AES128ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

fsp_err_t R_SCE_AES128ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

fsp_err_t R_SCE_AES128ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptFinal()

fsp_err_t R_SCE_AES128ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

fsp_err_t R_SCE_AES256ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256ECB_EncryptUpdate() function and R_SCE_AES256ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

fsp_err_t R_SCE_AES256ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptFinal()

fsp_err_t R_SCE_AES256ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

fsp_err_t R_SCE_AES256ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

fsp_err_t R_SCE_AES256ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptFinal()

fsp_err_t R_SCE_AES256ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

fsp_err_t R_SCE_AES128CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

fsp_err_t R_SCE_AES128CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptFinal()

fsp_err_t R_SCE_AES128CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

fsp_err_t R_SCE_AES128CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

fsp_err_t R_SCE_AES128CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptFinal()

fsp_err_t R_SCE_AES128CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

fsp_err_t R_SCE_AES256CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

fsp_err_t R_SCE_AES256CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptFinal()

fsp_err_t R_SCE_AES256CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

fsp_err_t R_SCE_AES256CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

fsp_err_t R_SCE_AES256CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptFinal()

fsp_err_t R_SCE_AES256CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

fsp_err_t R_SCE_AES128GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

fsp_err_t R_SCE_AES128GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

fsp_err_t R_SCE_AES128GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

fsp_err_t R_SCE_AES128GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

fsp_err_t R_SCE_AES128GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

fsp_err_t R_SCE_AES128GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES128GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES128GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

fsp_err_t R_SCE_AES256GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

fsp_err_t R_SCE_AES256GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

fsp_err_t R_SCE_AES256GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

fsp_err_t R_SCE_AES256GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_DecryptUpdate() function and R_SCE_AES256GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

fsp_err_t R_SCE_AES256GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

fsp_err_t R_SCE_AES256GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES256GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES256GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

fsp_err_t R_SCE_AES128CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

fsp_err_t R_SCE_AES128CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES128CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

fsp_err_t R_SCE_AES128CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES128CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes128CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

fsp_err_t R_SCE_AES128CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_DecryptUpdate() and R_SCE_AES128CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

fsp_err_t R_SCE_AES128CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES128CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptFinal()

fsp_err_t R_SCE_AES128CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES128GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes128CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

fsp_err_t R_SCE_AES256CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

fsp_err_t R_SCE_AES256CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES256CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

fsp_err_t R_SCE_AES256CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES256CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes256CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

fsp_err_t R_SCE_AES256CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

fsp_err_t R_SCE_AES256CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES256CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptFinal()

fsp_err_t R_SCE_AES256CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES256GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes256CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

fsp_err_t R_SCE_AES128CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_GenerateUpdate() function and R_SCE_AES128CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES128CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

fsp_err_t R_SCE_AES128CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

fsp_err_t R_SCE_AES128CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES128CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

fsp_err_t R_SCE_AES128CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES128CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

fsp_err_t R_SCE_AES256CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CMAC_GenerateUpdate() function and R_SCE_AES256CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES256CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateFinal()

fsp_err_t R_SCE_AES256CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES256CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

fsp_err_t R_SCE_AES256CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES256CMAC_VerifyUpdate() function and R_SCE_AES256CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES256CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyFinal()

fsp_err_t R_SCE_AES256CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES256CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature

		• message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp192r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Data length (byte units)

[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of

		secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be

		verified • message_hash->data : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp192r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be

		verified • message_hash->data : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

fsp_err_t R_SCE_ECDH_secp256r1_Init (sce_ecdh_handle_t * *handle*, uint32_t *key_type*, uint32_t *use_key_id*)

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, uint8_t * *public_key*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeySign() function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to public_key and the private key is output to wrapped_key.

If ECDH is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the public key input as ecc_public_wrapped_key is output to public_key and nothing is output to wrapped_key.

The succeeding function R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses the first argument, handle, as an argument. R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using key_id, input handle->key_id after running R_SCE_ECDH_secp256r1_Init().
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using key_id, key_id (8-bit) || public key (512-bit) || 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) || signature s (256 bits)" • signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, uint8_t * *public_key_data*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature (sce_ecdh_handle_t * *handle*, uint8_t * *public_key_data*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().
R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*)

The R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, ecc_public_wrapped_key, the public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify(). When key_type of R_SCE_ECDH_secp256r1_Init() is 0, input as the third argument, ecc_private_wrapped_key, the private wrapped key generated from a random number by R_SCE_ECDH_secp256r1_PublicKeySign(), and when key_type is other than 0, input the private wrapped key that forms a pair with the second argument of R_SCE_ECDH_secp256r1_PublicKeySign(). The subsequent R_SCE_ECDH_secp256r1_KeyDerivation() function uses shared_secret_wrapped_key as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify()
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation (sce_ecdh_handle_t * *handle*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*, uint32_t *key_type*, uint32_t *kdf_type*, uint8_t * *other_info*, uint32_t *other_info_length*, sce_hmac_sha_wrapped_key_t * *salt_wrapped_key*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_KeyDerivation() function uses the shared secret "Z (shared_secret_index)" calculated by the R_SCE_ECDH_secp256r1_SharedSecretCalculate() function as the key material to derive the wrapped key specified by the third argument, key_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, kdf_type. When SHA-256 HMAC is specified, the wrapped key output by the R_SCE_SHA256HMAC_EncryptedKeyWrap() function is specified as the seventh argument, salt_wrapped_key. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, other_info. A wrapped key corresponding to key_type is output as the eighth argument, wrapped_key. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: R_SCE_SHA256HMAC_GenerateInit() function and R_SCE_SHA256HMAC_VerifyInit() function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by R_SCE_ECDH_secp256r1_SharedSecretCalculate
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID || PartyUInfo || PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when kdf_type is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to key_type. When the value of key_type is 2, an SHA256-HMAC wrapped key is output. wrapped_key can be specified by casting the start address of the area

		reserved beforehand by the sce_hmac_sha_wrapped_key_t type with the (sce_aes_wrapped_key_t*) type.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init (sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

Parameters

[in,out]	handle	SHA handler (work area)

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update (sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final (sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length*)

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Open()

fsp_err_t R_SCE_Open (sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg*)

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

fsp_err_t R_SCE_Close (sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * *random*)

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp192r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp256r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall (uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key*)

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key*)

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies

		effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA

		private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify

		• message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS3072_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS4096_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify

		• message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

4.2.14.6 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.0.0

The version that appears on the Components tab of the FSP Configuration editor is v1.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The user documentation for the functions in this module.

- SCE Protected Mode

Overview

This module provides SCE CAVP Certified functions.

HW Overview

Obtained device certification with RA6M4.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)

                - RSASSA-PKCS1-V1_5 1024/2048bit
                - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
            - ECC
                - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
                - ECDH secp192r1/secp224r1/secp256r1/secp384r1
        - Hash Functions
            - SHA-2
                - SHA-256
- Message Authentication Code
    - HMAC-SHA256bit
    - AES-CMAC 128/256bit
- Key Support
    - AES 128/256bit
    - RSA 1024/2048bit
    - RSA 3072/4096bit (public key only)
    - ECC secp192r1/secp224r1/secp256r1/secp384r1
    - HMAC-SHA256bit
- TRNG
- TLS
    - SSL / TLS support function (TLS1.2 compliant)

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e2 studio or RA SC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
#include <string.h>
#include "r_sce.h"
#define BLOCK 16
void r_sce_example_aes();
sce_instance_ctrl_t sce_ctrl;
sce_cfg_t sce_cfg =
{
    .lifecycle = SCE_SSD
};
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
```

```
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
```

```
while (1)
     {
/* plain and plain_calculated are the same (correct) */
      }
   }
}
```

4.2.14.7 TinyCrypt TRNG (rm_tinycrypt_port)

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128
  - ECB, CBC, CTR, CCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke RM_TINCYRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in rm_tinycrypt_port must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the RM_TINCYRYPT_PORT_TRNG_Read() function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then RM_TINCYRYPT_PORT_TRNG_Read() can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the default_CSPRNG() function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement default_CSPRNG() if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in aes_encrypt.decrypt.c. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function default_CSPRNG() must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)
/*

CTR-PRNG Example

This is an example on using the CTR_PRNG module in TinyCrypt to obtain random data.

```
#define TC_ENTROPY_SIZE 64U
#define TC_CTRPRNG_OUTPUT_SIZE 32U
void tinycrypt_ctr_prng_example (void)
{
```

```
    TCCtrPrng_t cprng_ctx;
    uint8_t    seed[TC_ENTROPY_SIZE];
    uint8_t    ctr_prng_output_1[TC_CTRPRNG_OUTPUT_SIZE] = {0};
    uint8_t    ctr_prng_output_2[TC_CTRPRNG_OUTPUT_SIZE] = {0};
 /* Setup the platform; initialize the crypto engine. */
 if (0 != RM_TINCYRYPT_PORT_Init())
    {
       debugger_break();
    }
 /* Read random data from the TRNG to use as seed for the CTR_PRNG. */
 else if (FSP_SUCCESS != RM_TINCYRYPT_PORT_TRNG_Read(seed, sizeof(seed)))
    {
       debugger_break();
    }
 /* Initialize and seed the CTR_PRNG with the random data from the TRNG. */
 else if (TC_CRYPTO_SUCCESS != tc_ctr_prng_init(&cprng_ctx, seed, sizeof(seed), 0,
0))
    {
       debugger_break();
    }
 /* Read random data from the CTR_PRNG. */
 else if (TC_CRYPTO_SUCCESS !=
             tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1)))
    {
       debugger_break();
    }
 /* Check that the generated value is not 0. */
 else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1)))
    {
       debugger_break();
    }
 /* Read random data again from the TRNG. */
```

```
 else if (TC_CRYPTO_SUCCESS !=
             tc_ctr_prng_generate(&cprng_ctx, 0, 0, ctr_prng_output_1, sizeof
(ctr_prng_output_1)))
    {
       debugger_break();
    }
 /* Check that the generated value is different than the previous call. */
 else if (0 != memcmp(&ctr_prng_output_1[0], &ctr_prng_output_2[0], sizeof
(ctr_prng_output_1)))
    {
       debugger_break();
    }
 else
    {
 /* Operation successful. */
 while (1)
     {
           ;
     }
    }
}
```

Function Documentation

◆ RM_TINCYRYPT_PORT_Init()

fsp_err_t RM_TINCYRYPT_PORT_Init ( )
Initialize the SCE.

◆ RM_TINCYRYPT_PORT_TRNG_Read()

fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- HW_SCE_RNG_Read

◆ default_CSPRNG()

int default_CSPRNG (uint8_t * *dest*, unsigned int *size*)

Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt.

Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- RM_TINCYRYPT_PORT_TRNG_Read

4.2.15 Sensor

Modules

Detailed Description

Sensor Modules.

Modules

FS2012 Flow Sensor (rm_fs2012)

	Middleware to implement the FS2012 sensor interface. This module implements the FSXXXX Middleware Interface.
	HS300X Temperature/Humidity Sensor (rm_hs300x) Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.
	OB1203 Light/Proximity/PPG Sensor Middleware (rm_ob1203) Middleware to implement the OB1203 sensor interface. This module implements the OB1203 Middleware Interface.
	ZMOD4XXX Gas Sensor (rm_zmod4xxx) Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

4.2.15.1 FS2012 Flow Sensor (rm_fs2012)

Modules » Sensor

Functions

fsp_err_t	RM_FS2012_Open (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg) Opens and configures the FS2012 Middle module. Implements rm_fsxxxx_api_t::open. More...
fsp_err_t	RM_FS2012_Close (rm_fsxxxx_ctrl_t *const p_api_ctrl) Disables specified FS2012 control block. Implements rm_fsxxxx_api_t::close. More...
fsp_err_t	RM_FS2012_Read (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data) Reads ADC data from FS2012. Implements rm_fsxxxx_api_t::read. More...
fsp_err_t	RM_FS2012_DataCalculate (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data, rm_fsxxxx_data_t *const p_fs2012_data) Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic

	centimeter per minute) Implements rm_fsxxxx_api_t::dataCalculate. More...

Detailed Description

Middleware to implement the FS2012 sensor interface. This module implements the FSXXXX Middleware Interface.

Overview

Features

The FS2012 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Configuration

Build Time Configurations for rm_fs2012

The following build time configurations are defined in fsp_cfg/rm_fs2012_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	• FS2012-1020-NG • FS2012-1100-NG	FS2012-1100-NG	Select FS2012 device type.

Configurations for Sensor > FS2012 Flow Sensor (rm_fs2012)

This module can be added to the Stacks tab via New Stack > Sensor > FS2012 Flow Sensor (rm_fs2012).

Configuration	Options	Default	Description
Name	Manual Entry	g_fs2012_sensor0	Module name.
Callback	Name must be a valid C symbol	fs2012_callback	A user callback function can be provided.

Pin Configuration

This module uses SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

FS2012 datasheet is here. The module only supports FS2012-1020-NG and FS2012-1100-NG.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS2012 interface expects a bus instance to be opened before opening any FS2012 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of FS2012 sensor implementation in an application.

```
void rm_fs2012_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_fsxxxx_raw_data_t fs2012_raw_data;
 rm_fsxxxx_data_t    fs2012_data;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_fs2012_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
```

```
      *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
           xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                          (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
      tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                      p_extend->p_bus_recursive_mutex->p_mutex_name,
                      TX_INHERIT);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
      *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
           xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 while (true)
    {
       g_flag = 0;
 /* Read ADC Data from FS2012 */
 RM_FS2012_Read(&g_fs2012_ctrl,

Data Structures

struct	rm_fs2012_instance_ctrl_t

Data Structure Documentation

◆ rm_fs2012_instance_ctrl_t

struct rm_fs2012_instance_ctrl_t	
FS2012 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS2012 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_FS2012_Open()

fsp_err_t RM_FS2012_Open (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg*)

Opens and configures the FS2012 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS2012_Open(&g_fs2012_ctrl, &g_fs2012_cfg);
```

Return values

FSP_SUCCESS	FS2012 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_FS2012_Close()

fsp_err_t RM_FS2012_Close (rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS2012 control block. Implements rm_fsxxxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS2012_Read()

fsp_err_t RM_FS2012_Read (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*)

Reads ADC data from FS2012. Implements rm_fsxxxx_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS2012_DataCalculate()

fsp_err_t RM_FS2012_DataCalculate (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs2012_data*)

Calculates flow from ADC data. Unit of Gas flow is SLPM (Standard liter per minute) Unit of Liquid flow is SCCM (Standard cubic centimeter per minute) Implements rm_fsxxxx_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.15.2 HS300X Temperature/Humidity Sensor (rm_hs300x)

Modules » Sensor

Functions

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.

Overview

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for rm_hs300x

The following build time configurations are defined in fsp_cfg/rm_hs300x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	• Both humidity and temperature • Humidity only	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.
Programming Mode	• ON • OFF	OFF	If selected the programming mode can be entered.

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x)

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x).

Configuration	Options	Default	Description
Name	Manual Entry	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS300x datasheet is here.
If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter

function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_hs300x_raw_data_t hs300x_raw_data;
 rm_hs300x_data_t    hs300x_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
```

```
                            p_extend->p_blocking_semaphore->p_semaphore_name,
                            (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,

	Buffer for I2C communications.

Function Documentation

◆ RM_HS300X_Open()

fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_cfg_t const *const *p_cfg*)

Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open.

Example:

```
    err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_HS300X_Close()

fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const *p_api_ctrl*)

Disables specified HS300X control block. Implements rm_hs300x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_MeasurementStart()

fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_Read()

fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS300X. Implements rm_hs300x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_DataCalculate()

fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*, rm_hs300x_data_t *const *p_hs300x_data*)

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ RM_HS300X_ProgrammingModeEnter()

fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ResolutionChange()

fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_data_type_t const *data_type*, rm_hs300x_resolution_t const *resolution*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_SensorIdGet()

fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_sensor_id*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ProgrammingModeExit()

fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

fsp_err_t	RM_OB1203_PpgRead (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, uint8_t const number_of_samples) Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements rm_ob1203_api_t::ppgRead. More...
fsp_err_t	RM_OB1203_PpgDataCalculate (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_raw_data_t *const p_raw_data, rm_ob1203_ppg_data_t *const p_ob1203_data) Calculate PPG data from raw data. Implements rm_ob1203_api_t::ppgDataCalculate. More...

fsp_err_t	RM_OB1203_GainSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_gain_t const gain) Set gain. This function should be called after calling RM_OB1203_MeasurementStop(). In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::gainSet . More...
fsp_err_t	RM_OB1203_LedCurrentSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_led_current_t const led_current) Set currents. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::ledCurrentSet. More...
fsp_err_t	RM_OB1203_DeviceInterruptCfgSet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_device_interrupt_cfg_t const interrupt_cfg) Set device interrupt configurations. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::deviceInterruptCfgSet. More...
fsp_err_t	RM_OB1203_FifoInfoGet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_fifo_info_t *const p_fifo_info) Get FIFO information from OB1203 device. Implements rm_ob1203_api_t::fifoInfoGet. More...
fsp_err_t	RM_OB1203_DeviceStatusGet (rm_ob1203_ctrl_t *const p_api_ctrl, rm_ob1203_device_status_t *const p_status) Get device status from OB1203 device. Clear all interrupt bits. Implements rm_ob1203_api_t::deviceStatusGet. More...

Detailed Description

Middleware to implement the OB1203 sensor interface. This module implements the OB1203 Middleware Interface.

Overview

This module provides APIs for configuring and controlling the OB1203 sensor operation modes. Supported OB1203 sensor operation modes are below.

- Light mode
- Proximity mode
- Light Proximity mode
- PPG mode

Features

The OB1203 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start and stop a measurement at any time
- Get the ADC data from the sensor
- Calculate the Light/Proximity/PPG values.
- Software reset

Configuration

Build Time Configurations for rm_ob1203

The following build time configurations are defined in fsp_cfg/rm_ob1203_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203)

This module can be added to the Stacks tab via New Stack > Sensor > OB1203 Light/Proximity/PPG Sensor (rm_ob1203).

Configuration	Options	Default	Description
Name	Manual Entry	g_ob1203_sensor0	Module name.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Comms I2C Callback	Name must be a valid C symbol	ob1203_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	ob1203_irq_callback	A user IRQ callback function can be provided.

Configurations for Sensor > OB1203 Light mode (rm_ob1203)

Configuration	Options	Default	Description
Operation Mode	• LS mode • CS mode	LS mode	Set operation mode.
Interrupt Type	• Threshold • Variation	Threshold	Set interrupt type.
Interrupt Source	• Clear channel • Green channel • Red channel (CS mode only) • Blue channel	Clear channel	Set interrupt source.

	(CS mode only)		
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1 • 3 • 6	3	Set gain for detection range.
Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Variance Threshold	• +/- 8 counts • +/- 16 counts • +/- 32 counts • +/- 64 counts • +/- 128 counts • +/- 256 counts • +/- 512 counts • +/- 1024 counts	+/- 128 counts	Set variance threshold. New data varies by selected counts compared to previous result.

Configurations for Sensor > OB1203 Proximity mode (rm_ob1203)

Configuration	Options	Default	Description
Interrupt Type	• Normal • Logic	Normal	Set interrupt type.
The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Gain	• 1	1	Set gain of ADC output

	• 1.5 • 2 • 4		and noise.
LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Number of LED pulses	• 1 pulse • 2 pulses • 4 pulses • 8 pulses • 16 pulses • 32 pulses	8 pulses	Set number of LED pulses.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Moving Average	• Enabled • Disabled	Disabled	Set moving average.
Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

Configurations for Sensor > OB1203 PPG mode (rm_ob1203)

Configuration	Options	Default	Description
Operation Mode	• PPG1 mode • PPG2 mode	PPG2 mode	Set operation mode.
Interrupt Type	• Data • FIFO Almost Full	Data	Set interrupt type.

Gain	• 1 • 1.5 • 2 • 4	1	Set gain of ADC output and noise.
IR LED Current	Value must be a non-negative integer	0x366	Set Current for IR LED (10bits). Min = 0x000 and Max = 0x3FF
Red LED Current	Value must be a non-negative integer	0x1B3	Set Current for Red LED (9bits). Min = 0x000 and Max = 0x1FF
Power Save Mode	• Enabled • Disabled	Disabled	Set power save mode.
LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
IR LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
Red LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
Number of Averaged PPG Samples	• 1 (No averaging) • 2 consecutives samples are averaged • 4 consecutives samples are averaged • 8 consecutives samples are averaged • 16 consecutives samples are averaged • 32 consecutives samples are averaged	8 consecutives samples are averaged	Set number of averaged for PPG samples.
Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:130us. Measurement Period:1.25ms	Set pulse width and measurement period.
FIFO Rollover	• Enabled • Disabled	Enabled	Set FIFO rollover.
FIFO Almost Full Value	Value must be a non-	0x0C	Set the number of

	negative integer		empty FIFO words when the FIFO almost full interrupt is issued (4bits). Min = 0x0 and Max = 0xF. In PPG2 Mode, only even values must be used.

Configurations for Sensor > OB1203 Light Proximity mode (rm_ob1203)

Configuration	Options	Default	Description
General > Device Interrupt	• Light mode • Proximity mode	Light mode	Select an operation mode using device interrupt.
Light mode > Operation Mode	• LS mode • CS mode	LS mode	Set operation mode.
Light mode > Interrupt Type	• Threshold • Variation	Threshold	Set interrupt type.
Light mode > Interrupt Source	• Clear channel • Green channel • Red channel (CS mode only) • Blue channel (CS mode only)	Clear channel	Set interrupt source.
Light mode > The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Light mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Light mode > Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Light mode > Gain	• 1 • 3 • 6	3	Set gain for detection range.
Light mode > Resolution and Measurement Period	Refer to the RA Configuration tool for available options.	Resolution:18bit. Measurement Period:100ms	Set resolution and measurement period.
Light mode > Upper Threshold	Value must be a non-negative integer	0x00CCC	Set upper threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Light mode > Lower Threshold	Value must be a non-negative integer	0x00000	Set lower threshold value (20bits). Min = 0x00000 and Max = 0xFFFFF.
Light mode > Variance	• +/- 8 counts	+/- 128 counts	Set variance threshold.

Threshold	• +/- 16 counts • +/- 32 counts • +/- 64 counts • +/- 128 counts • +/- 256 counts • +/- 512 counts • +/- 1024 counts		New data varies by selected counts compared to previous result.
Proximity mode > Interrupt Type	• Normal • Logic	Normal	Set interrupt type.
Proximity mode > The Number of Similar Consecutive Interrupt Events	Value must be a non-negative integer	0x02	The number of similar consecutive Proximity mode interrupt events that must occur before the interrupt is asserted (4bits). Min = 0x0 and Max = 0xF
Proximity mode > Sleep after Interrupt	• Enabled • Disabled	Disabled	Set sleep after interrupt.
Proximity mode > Gain	• 1 • 1.5 • 2 • 4	1	Set gain of ADC output and noise.
Proximity mode > LED Current	Value must be a non-negative integer	0x100	Set Current for LED (10bits). Min = 0x000 and Max = 0x3FF
Proximity mode > LED Order	• IR LED first, Red LED second • Red LED first, IR LED second	IR LED first, Red LED second	Set LED order.
Proximity mode > LED Analog Cancellation	• Enabled (50% offset of the full-scale value) • Disabled	Disabled	Set analog cancellation level.
Proximity mode > LED Digital Cancellation	Value must be a non-negative integer	0x100	Set digital cancellation level (16bits). Min = 0x0000 and Max = 0xFFFF
Proximity mode > Number of LED pulses	• 1 pulse • 2 pulses • 4 pulses • 8 pulses • 16 pulses • 32 pulses	8 pulses	Set number of LED pulses.
Proximity mode > Pulse Width and Measurement Period	Refer to the RA Configuration tool for available options.	Pulse width:42us. Measurement Period:100ms	Set pulse width and measurement period.
Proximity mode > Moving Average	• Enabled • Disabled	Disabled	Set moving average.

Proximity mode > Hysteresis	Value must be a non-negative integer	0x00	Set hysteresis level (7bits). Min = 0x00 and Max = 0x7F.
Proximity mode > Upper Threshold	Value must be a non-negative integer	0x0600	Set upper threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.
Proximity mode > Lower Threshold	Value must be a non-negative integer	0x0000	Set lower threshold value (16bits). Min = 0x0000 and Max = 0xFFFF.

Pin Configuration

This module uses I2C Master, SCI I2C and IRQ drivers. Therefore, this module uses SDA and SCL pins of I2C Master and SCI I2C and an IRQ pin.

Usage Notes

OB1203 datasheet is here.
The OB1203 has four operation modes.

Light mode

Light mode has two operation modes.

Operation mode	Red	Green	Blue	Clear	Comp *1
LS mode		✓		✓	✓
CS mode	✓	✓	✓	✓	✓

*1 : Temperature compensation data

Light mode features are below.

- High lux accuracy over different light sources
- Absolute sensitivity: 0.06 lux to > 150000 lux
- Output resolution: 13 to 20 bits
- Three LS/CS gain modes: x1 to x6
- Highly linear output, 50Hz/60Hz light and fluorescent light flicker immunity
- Four parallel channels (red, green, blue, clear)
- Accurate Correlated Color Temperature (CCT)
- Accurate CIE 1931 XYZ (RGB) color measurement
- Very stable spectral response over angle of light incidence

Proximity mode

Proximity mode features are below.

- Integrated and trimmed LED source, driver, and photodetector
- Programmable pulsed LED up to 250mA output current
- High resolution (12 to 16 bits)
- Object movement detection (in/out)
- Ambient light suppression > 100klx sun light
- Crosstalk cancelation (analog and digital)

PPG mode

PPG mode has two operation modes.

Operation mode	Discription
PPG1 mode	Only one LED is used. This mode allows determination of parameters related to heart rate with an appropriate algorithm
PPG2 mode	Two LED are used. Second LED is used as a transmitter. This mode supports further analysis, such as SpO2 and respiration rate determination.

PPG mode features are below.

- SpO2 measurement behind visibly dark, IR transmissive ink
- Industry's smallest optical biosensor module
- Fully integrated and trimmed module, including two LEDs, 250mA maximum drive current, and photodetectors
- Output resolution PPG: 16 to 18 bits
- Data stored in 18-bit wide, 32-sample FIFO memory
- Integrated averaging function for higher signal-to-noise ratio(SNR) and data rate reduction
- Programmable measurement rate: up to 3200 samples per second
- High SNR

Light Proximity mode

Light mode and Proximity mode can be used in parallel.

Bus Initialization

The OB1203 interface expects a bus instance to be opened before opening any OB1203 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock for I2C bus are available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with RM_OB1203_Open().

From measurement start to data acquisition

After normal completion, start the measurement with RM_OB1203_MeasurementStart().

Light mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_THRESHOLD_CROSSED is received via IRQ callback.
2. Call RM_OB1203_LightRead(). This function will read the ADC data and clear the interrupt bits.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_LightDataCalculate(). This function will calculate light data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_LightRead(). This function will read the ADC data.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_LightDataCalculate(). This function will calculate light data from the ADC data.

Proximity mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_THRESHOLD_CROSSED or RM_OB1203_EVENT_OBJECT_NEAR is received via IRQ callback.
2. Call RM_OB1203_ProxRead(). This function will read the ADC data and clear the interrupt bits.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_ProxDataCalculate(). This function will calculate proximity data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_ProxRead(). This function will read the ADC data.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_ProxDataCalculate(). This function will calculate proximity data from the ADC data.

PPG mode

If IRQ is enabled

1. Wait until RM_OB1203_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
2. Call RM_OB1203_PpgRead(). This function will read the ADC data and clear the interrupt bits. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_PpgDataCalculate(). This function will calculate PPG data from the ADC data.

If IRQ is disabled

1. Wait for measurement period configured.
2. Call RM_OB1203_PpgRead(). This function will read the ADC data. In PPG2 mode, the number of read FIFO samples must be even value because two samples is one pair.
3. Wait until RM_OB1203_EVENT_SUCCESS is received.
4. Call RM_OB1203_PpgDataCalculate(). This function will calculate PPG data from the ADC data.

Light Proximity mode

Combination of the above Light mode and Proximity mode.

Getting device status

Call RM_OB1203_DeviceStatusGet(). This function will get device status over I2C.

- If power_on_reset_occur is true, the part has had a power-up event, either because the part was turned on or because there was a power-supply voltage disturbance.
- If light_interrupt_occur is true, Light mode interrupt condition has occurred.
- If light_measurement_complete is true, Light mode measurement is complete.
- If ts_measurement_complete is true, TS measurement is complete.
- If fifo_afull_interrupt_occur is true, FIFO almost full interrupt condition has occurred.
- If ppg_measurement_complete is true, PPG mode measurement is complete.
- If object_near is true, an object is near.
- If prox_interrupt_occur is true, Proximity mode interrupt condition has occurred.
- If prox_measurement_complete is true, Proximity mode measurement is complete.

Clearing interrupt bits

If interrupt bits are needed to clear without calling RM_OB1203_LightRead(), RM_OB1203_ProxRead() , RM_OB1203_PpgRead() and RM_OB1203_MeasurementStop(), please call RM_OB1203_DeviceStatusGet(). Interrupt bits are reset by STATUS_0 and STATUS_1 registers read.

Sleep after interrupt

Sleep after interrupt is valid in Light mode and Proximity mode. If a sleep after interrupt bit are set, a measurement will be stopped after an interrupt occurs. After STATUS_0 and STATUS_1 registers are read, a measurement will be started. please call RM_OB1203_DeviceStatusGet().

PPG FIFO

PPG FIFO data is stored in 18-bit wide, 32-sample FIFO memory.
The FIFO almost full interrupt is triggered when a certain number of free FIFO registers are remaining.
If FIFO informations (write index, read index, overflow counter, unread_samples) are got, Call RM_OB1203_FifoInfoGet().

- write_index is the FIFO index where the next sample of PPG data will be written in the FIFO.
- read_index is the index of the next sample to be read from the FIFO_DATA register.
- overflow_counter is the number of old samples (up to 15) which are overwritten by new data. If the FIFO Rollover is enabled, the FIFO overflow counter counts.
- unread_samples is the number of unread FIFO samples, which can be calculated by write index and read index.

Reconfiguration

The interface supports the following APIs for reconfiguration.

API	Discription
RM_OB1203_GainSet()	Set gain
RM_OB1203_LedCurrentSet()	Set LED currents. Proximity mode and Light Proximity mode: LED Current is 10bits. Min = 0x000 and Max = 0x3FF PPG mode: IR/Red LED currents are 10bits/9bits. Min = 0x000/0x000 and Max = 0x3FF/0x1FF
RM_OB1203_DeviceInterruptCfgSet()	Set interrupt configurations.

Relationship between APIs and registers

The relationship between APIs and registers accessed by the API is below.

API	Registers
RM_OB1203_MeasurementStart()	MAIN_CTRL_0 and MAIN_CTRL_1
RM_OB1203_MeasurementStop()	MAIN_CTRL_0, MAIN_CTRL_1 , STATUS_0, STATUS_1, FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT
RM_OB1203_LightRead()	LS_CLEAR_DATA, LS_GREEN_DATA, LS_BULE_DATA, LS_RED_DATA, COMP_DATA, STATUS_0 and STATUS_1
RM_OB1203_ProxRead()	PS_DATA, STATUS_0 and STATUS_1
RM_OB1203_PpgRead()	FIFO_DATA
RM_OB1203_DeviceStatusGet()	STATUS_0 and STATUS_1
RM_OB1203_GainSet()	LS_GAIN and PPG_PS_GAIN
RM_OB1203_LedCurrentSet()	PS_LED_CURR, PPG_IRLED_CURR and PPG_RLED_CURR
RM_OB1203_DeviceInterruptCfgSet()	INT_CFG_0, INT_CFG_1 and INT_PST
RM_OB1203_FifoInfoGet()	FIFO_WR_PTR, FIFO_RD_PTR and FIFO_OVF_CNT

Examples

Basic Example

These are basic examples of minimal use of OB1203 sensor implementation in an application.

Light mode

```
void rm_ob1203_light_mode_basic_example (void)
{
```

```
 fsp_err_t             err = FSP_SUCCESS;

uint16_t	ppg_red_led_current	PPG Red LED current.
rm_ob1203_power_save_mode_t	ppg_power_save_mode	PPG power save mode.
rm_ob1203_analog_cancellation_t	ppg_ir_led_ana_can	IR LED analog cancellations.
rm_ob1203_analog_cancellation_t	ppg_red_led_ana_can	Red LED analog cancellations.
rm_ob1203_number_averaged_samples_t	ppg_num_averaged_samples	Number of averaged PPG samples.
rm_ob1203_ppg_pulse_width_meas_period_t	ppg_width_period	PPG pulse width and measurement period.
rm_ob1203_fifo_rollover_t	ppg_fifo_rollover	FIFO rollover enable.
uint8_t	ppg_fifo_empty_num	the number of empty FIFO words when the FIFO almost full interrupt is issued. In PPG2 Mode only even values should be used. (4 bits)
uint8_t	ppg_number_of_samples	Number of PPG samples.

◆ rm_ob1203_instance_ctrl_t

struct rm_ob1203_instance_ctrl_t	
OB1203 Control Block	
Data Fields	
rm_ob1203_semaphore_t const *	p_semaphore
	The semaphore to wait for callback. This is used for another data read/write after a communication.
uint32_t	open
	Open flag.

rm_ob1203_cfg_t const *	p_cfg
	Pointer to OB1203 Configuration.
uint8_t	buf [8]
	Buffer for I2C communications.
rm_ob1203_init_process_params_t	init_process_params
	For the initialization process.
uint8_t	register_address
	Register address to access.
volatile rm_ob1203_device_status_t *	p_device_status
	Pointer to device status.
volatile rm_ob1203_fifo_info_t *	p_fifo_info
	Pointer to FIFO information structure.
volatile bool	fifo_reset
	Flag for FIFO reset for PPG mode.
volatile bool	prox_gain_update
	Flag for gain update for Proximity mode.
volatile bool	interrupt_bits_clear
	Flag for clearing interrupt bits.

rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
rm_ob1203_mode_extended_cfg_t *	p_mode
	Pointer of OB1203 operation mode extended configuration.
void const *	p_irq_instance
	Pointer to IRQ instance.
void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_ob1203_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_ob1203_callback_args_t *p_args)
	IRQ callback.

Function Documentation

◆ RM_OB1203_Open()

fsp_err_t RM_OB1203_Open (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_cfg_t const *const *p_cfg*)

Opens and configures the OB1203 Middle module. Implements rm_ob1203_api_t::open.

Example:

```
err = RM_OB1203_Open(&g_ob1203_ctrl, &g_ob1203_cfg);
```

Return values

FSP_SUCCESS	OB1203 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_OB1203_Close()

fsp_err_t RM_OB1203_Close (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Disables specified OB1203 control block. Implements rm_ob1203_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_OB1203_MeasurementStart()

fsp_err_t RM_OB1203_MeasurementStart (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Start measurement. Implements rm_ob1203_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_MeasurementStop()

fsp_err_t RM_OB1203_MeasurementStop (rm_ob1203_ctrl_t *const *p_api_ctrl*)

Stop measurement. If device interrupt is enabled, interrupt bits are cleared after measurement stop. If PPG mode, FIFO information is also reset after measurement stop. In RTOS and Light/Proximity/Light Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. In RTOS and PPG mode, if device interrupt is enabled, blocks 6 bytes on the I2C bus. If device interrupt is disabled, blocks 4 bytes on the I2C bus. Implements rm_ob1203_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LightRead()

fsp_err_t RM_OB1203_LightRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_light_data_type_t *type*)

Reads Light ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Light mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::lightRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LightDataCalculate()

fsp_err_t RM_OB1203_LightDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_light_data_t *const *p_ob1203_data*)

Calculate light data from raw data. Implements rm_ob1203_api_t::lightDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_ProxRead()

fsp_err_t RM_OB1203_ProxRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*)

Reads Proximity ADC data from OB1203 device. If device interrupt is enabled, interrupt bits are cleared after data read. In RTOS and Proximity mode, if device interrupt is enabled, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::proxRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_ProxDataCalculate()

fsp_err_t RM_OB1203_ProxDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_prox_data_t *const *p_ob1203_data*)

Calculate proximity data from raw data. Implements rm_ob1203_api_t::proxDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_PpgRead()

fsp_err_t RM_OB1203_PpgRead (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, uint8_t const *number_of_samples*)

Reads PPG ADC data from OB1203 device. One sample requires three bytes. 0 cannot set to the number of samples. Implements rm_ob1203_api_t::ppgRead.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_PpgDataCalculate()

fsp_err_t RM_OB1203_PpgDataCalculate (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_raw_data_t *const *p_raw_data*, rm_ob1203_ppg_data_t *const *p_ob1203_data*)

Calculate PPG data from raw data. Implements rm_ob1203_api_t::ppgDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_GainSet()

fsp_err_t RM_OB1203_GainSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_gain_t const *gain*)

Set gain. This function should be called after calling RM_OB1203_MeasurementStop(). In RTOS and Light Proximity mode, blocks 2 bytes on the I2C bus. Implements rm_ob1203_api_t::gainSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_LedCurrentSet()

fsp_err_t RM_OB1203_LedCurrentSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_led_current_t const *led_current*)

Set currents. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::ledCurrentSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_DeviceInterruptCfgSet()

fsp_err_t RM_OB1203_DeviceInterruptCfgSet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_device_interrupt_cfg_t const *interrupt_cfg*)

Set device interrupt configurations. This function should be called after calling RM_OB1203_MeasurementStop(). Implements rm_ob1203_api_t::deviceInterruptCfgSet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_FifoInfoGet()

fsp_err_t RM_OB1203_FifoInfoGet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_fifo_info_t *const *p_fifo_info*)

Get FIFO information from OB1203 device. Implements rm_ob1203_api_t::fifoInfoGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_OB1203_DeviceStatusGet()

fsp_err_t RM_OB1203_DeviceStatusGet (rm_ob1203_ctrl_t *const *p_api_ctrl*, rm_ob1203_device_status_t *const *p_status*)

Get device status from OB1203 device. Clear all interrupt bits. Implements rm_ob1203_api_t::deviceStatusGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

4.2.15.4 ZMOD4XXX Gas Sensor (rm_zmod4xxx)

Modules » Sensor

Functions

fsp_err_t	RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_cfg_t const *const p_cfg) This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open. More...
fsp_err_t	RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close. More...
fsp_err_t	RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart. More...
fsp_err_t	RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop. More...
fsp_err_t	RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck. More...
fsp_err_t	RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data) This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read. More...
fsp_err_t	RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_1st_data_t *const p_zmod4xxx_data) This function should be called when measurement finishes. To check

measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_iaq_2nd_data_t *const p_zmod4xxx_data)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_OdorDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_odor_data_t *const p_zmod4xxx_data)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::odorDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_sulfur_odor_data_t *const p_zmod4xxx_data)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_1st_data_t *const p_zmod4xxx_data)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq1stGenDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const p_api_ctrl, rm_zmod4xxx_raw_data_t *const p_raw_data, rm_zmod4xxx_oaq_2nd_data_t *const p_zmod4xxx_data)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate. More...

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const p_api_ctrl, float temperature, float humidity)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

	More...
fsp_err_t	RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck. More...

Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

Configuration

RM_ZMOD4XXX_CFG_OPERATION_MODE is set according to the library selected.

Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for rm_zmod4410_iaq_1st

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_lib_cfg.h:

Configuration	Options	Default	Description
[DEPRECATED] Power mode (This will be removed in FSP v4.0.0)	• Continuous • Low Power	Continuous	Select power mode

Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx)

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx).

Configuration	Options	Default	Description
Name	Manual Entry	g_zmod4xxx_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

Configurations for Sensor > ZMOD4410 IAQ 1st Generation (rm_zmod4xxx)

Configuration	Options	Default	Description
Operation Mode	• Continuous • Low Power	Continuous	Select the operation mode.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

ZMOD4410 datasheet is here.
The ZMOD4410 has five modes of operation.
The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO2, provides continuous data
IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO2, fixed sampling interval of 6 seconds

IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption
Odor	Control signal based on Air Quality Changes
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

ZMOD4510 datasheet is here.
The ZMOD4510 has two modes of operation.
The ZMOD4510 in OAQ 1st Gen operation will respond to typical outdoor gases after a warm-up time of 60 min, consisting of 20 min for stabilization and 40 min for baseline finding.
For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.
In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 1st Generation	Measurement of Air Quality
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power

A library corresponding to each of these modes is required. By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_ZMOD4XXX_Open(). One channel of timer is required to measure the waiting time at initialization.

From measurement start to data acquisition

After normal completion, start the measurement with RM_ZMOD4XXX_MeasurementStart(). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Call RM_ZMOD4XXX_MeasurementStart().

2. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
3. Call RM_ZMOD4XXX_Read(). This function will read the ADC data.
4. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
5. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
3. Call RM_ZMOD4XXX_StatusCheck(). This function will execute a status check over I2C.
4. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_ZMOD4XXX_StatusCheck() again.
5. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
6. Call RM_ZMOD4XXX_Read() and read the ADC data.
7. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
8. Call the DataCalculate API according to the mode.

Checking device error for IAQ 2nd Gen.

1. Call RM_ZMOD4XXX_DeviceErrorCheck(). This function will execute a device error check over I2C.
2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

Examples

Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;

Data Structures

struct	rm_zmod4xxx_init_process_params_t
struct	rm_zmod4xxx_instance_ctrl_t

Enumerations

enum	rm_zmod4xxx_lib_type_t

Data Structure Documentation

◆ rm_zmod4xxx_init_process_params_t

struct rm_zmod4xxx_init_process_params_t		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ rm_zmod4xxx_instance_ctrl_t

struct rm_zmod4xxx_instance_ctrl_t	
ZMOD4XXX control block	
Data Fields	
uint32_t	open
	Open flag.
uint8_t	buf [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]
	Buffer for I2C communications.

uint8_t	register_address
	Register address to access.
rm_zmod4xxx_status_params_t	status
	Status parameter.
volatile bool	dev_err_check
	Flag for checking device error.
volatile rm_zmod4xxx_event_t	event
	Callback event.
rm_zmod4xxx_init_process_params_t	init_process_params
	For the initialization process.
rm_zmod4xxx_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
rm_zmod4xxx_lib_extended_cfg_t *	p_zmod4xxx_lib
	Pointer of ZMOD4XXX Lib extended configuration.
void const *	p_irq_instance
	Pointer to IRQ instance.

void const *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Enumeration Type Documentation

◆ rm_zmod4xxx_lib_type_t

enum rm_zmod4xxx_lib_type_t
ZMOD4XXX Library type

Function Documentation

◆ RM_ZMOD4XXX_Open()

fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Unsupport product ID.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Close()

fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_ZMOD4XXX_MeasurementStart()

fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_MeasurementStop()

fsp_err_t RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_StatusCheck()

fsp_err_t RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Read()

fsp_err_t RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_ZMOD4XXX_Iaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate .

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_OdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_OdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::odorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_sulfur_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq1stGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_DeviceErrorCheck()

fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

4.2.16 Storage

Modules

Detailed Description

Storage Modules.

Modules

Block Media Custom Implementation (rm_block_media_user)

	Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.
	Block Media SD/MMC (rm_block_media_sdmmc) Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.
	Block Media SPI Flash (rm_block_media_spi) Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.
	Block Media USB (rm_block_media_usb) Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.
	FileX I/O (rm_filex_block_media) Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.
	FileX I/O (rm_filex_levelx_nor) Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.
	Flash (r_flash_hp) Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.
	Flash (r_flash_lp) Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.
	FreeRTOS+FAT Port for RA (rm_freertos_plus_fat) Middleware for the FAT File System control on RA MCUs.
	LevelX NOR Port (rm_levelx_nor_spi) Middleware for using Azure RTOS LevelX on NOR SPI memory.

	LittleFS on Flash (rm_littlefs_flash) Middleware for the LittleFS File System control on RA MCUs.
	OSPI Flash (r_ospi) Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	QSPI (r_qspi) Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	SD/MMC (r_sdhi) Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.
	Virtual EEPROM on Flash (rm_vee_flash) Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

4.2.16.1 Block Media Custom Implementation (rm_block_media_user)

Modules » Storage

Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.

Overview

Features

This module is for using Block media with user-selected media.

Configuration

Block Media User has no output config settings.
The user is required to create the config settings etc. in the application.
The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
```

```
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write    = RM_BLOCK_MEDIA_RAM_Write,
    .erase    = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close    = RM_BLOCK_MEDIA_RAM_Close,
};
extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

Note

If you use block_media_user, you need to create a function that matches the media you are using.
In the above example, this is the function with RM_BLOCK_MEDIA_.
Register the created function in rm_block_media_api_t.
The registered rm_block_media_api_t is registered in p_api, which is a member of rm_block_media_instance_t.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

Please refer to USB PMSC (r_usb_pmsc) for the PMSC application given as an example.

4.2.16.2 Block Media SD/MMC (rm_block_media_sdmmc)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_SDMMC_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)

fsp_err_t	RM_BLOCK_MEDIA_SDMMC_StatusGet (rm_block_media_ctrl_t *const p_api_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SDMMC_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.

Overview

Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
```

```
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SDMMC driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SDMMC_Open()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::open

◆ RM_BLOCK_MEDIA_SDMMC_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::mediaInit

◆ RM_BLOCK_MEDIA_SDMMC_Read()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements rm_block_media_api_t::read().

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::read

◆ RM_BLOCK_MEDIA_SDMMC_Write()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements rm_block_media_api_t::write().

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::write

◆ RM_BLOCK_MEDIA_SDMMC_Erase()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an SD card or eMMC device. Implements rm_block_media_api_t::erase().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::erase
- sdmmc_api_t::statusGet

◆ RM_BLOCK_MEDIA_SDMMC_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_BLOCK_MEDIA_SDMMC_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SDMMC_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SDMMC_Close()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes an open SD/MMC device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

4.2.16.3 Block Media SPI Flash (rm_block_media_spi)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void const *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.

Overview

Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

Note

By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.

Configuration

Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build

Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.
[DEPRECATED] Callback Context	Name must be a valid C symbol	NULL	A user specified context that will be provided back to the user when a callback occurs.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

Examples

Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
```

```
}
```

Non-Blocking Example

This is a basic example of using the optional SPI callback to impliment non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
}
/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
 * been blocked by the lower level SPI driver busy indication.
 */
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
```

```
/* TODO: Process operation complete. */
   }
else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
   {
rm_block_media_status_t status;
rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
     assert(FSP_SUCCESS == err);
if (true == status.busy)
     {
/* Run waiting tasks */
           vTaskSuspend(xTaskGetCurrentTaskHandle());
     }
   }
else
   {
      assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
/* TODO: Process Read, Write, or Erase error. */
   }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SPI_Open()

fsp_err_t RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements rm_block_media_api_t::open.

Return values

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::open

◆ RM_BLOCK_MEDIA_SPI_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SPI_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the Block Media SPI Flash device.

Implements rm_block_media_api_t::mediaInit.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SPI_Read()

fsp_err_t RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::read.

Return values

FSP_SUCCESS	SPI data read successfully
FSP_ERR_ASSERTION	p_ctrl or p_dest is NULL, or num_blocks is zero
FSP_ERR_NOT_OPEN	Block Media SPI module is not yet open
FSP_ERR_INVALID_ADDRESS	Invalid address range for read operation
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

◆ RM_BLOCK_MEDIA_SPI_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::statusGet

◆ RM_BLOCK_MEDIA_SPI_Write()

fsp_err_t RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::write.

Return values

FSP_SUCCESS	Flash write finished successfully.
FSP_ERR_ASSERTION	p_ctrl or p_src is NULL. Or num_blocks is zero.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range
FSP_ERR_NOT_INITIALIZED	Block Media SPI module is not yet initialized

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::write

◆ RM_BLOCK_MEDIA_SPI_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements rm_block_media_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by RM_BLOCK_MEDIA_SPI.

◆ RM_BLOCK_MEDIA_SPI_Close()

fsp_err_t RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the Block Media SPI device. Implements rm_block_media_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	One of the following parameters may be null: p_ctrl.
FSP_ERR_NOT_OPEN	Block media SPI Framework module is not yet initialized.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- spi_flash_api_t::close

◆ RM_BLOCK_MEDIA_SPI_Erase()

fsp_err_t RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *start_block*, uint32_t const *num_blocks*)

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::erase.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_INVALID_ADDRESS	Invalid address range

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- spi_flash_api_t::erase
- spi_flash_api_t::statusGet

4.2.16.4 Block Media USB (rm_block_media_usb)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)

fsp_err_t	RM_BLOCK_MEDIA_USB_StatusGet (rm_block_media_ctrl_t *const p_api_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.

Overview

Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_usb

The following build time configurations are defined in driver/rm_block_media_usb_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media USB (rm_block_media_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm_block_media_usb).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this

			callback function is provided, it will be called when a device is attached or removed.
Pointer to user context	Name must be a valid C symbol	NULL	A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed.

Note

RM_BLOCK_MEDIA_USB_MediaInit function must be called after receiving the insert event notification.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t       g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t       g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_USB driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 while (!g_usb_inserted)
    {
 /* Wait for a card insertion interrupt. */
    }
 /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
       g_usb_inserted = true;
    }
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
       g_usb_inserted = false;
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_USB_Open()

fsp_err_t RM_BLOCK_MEDIA_USB_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the USB device.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_USB_Read()

fsp_err_t RM_BLOCK_MEDIA_USB_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an USB device. Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Write()

fsp_err_t RM_BLOCK_MEDIA_USB_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an USB device. Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.
FSP_ERR_USB_FAILED	The message could not received completed successfully.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_Erase()

fsp_err_t RM_BLOCK_MEDIA_USB_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an USB device. Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void const *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Note

This function is currently unsupported for Block Media over USB.

Return values

FSP_ERR_UNSUPPORTED	CallbackSet is not currently supported for Block Media over USB.

◆ RM_BLOCK_MEDIA_USB_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_USB_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_USB_Close()

fsp_err_t RM_BLOCK_MEDIA_USB_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes an open USB device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.
- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_block_media

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_block_media_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_block_media)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_block_media_0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_block_media_0_callback	A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
Partition Number	• 0 • 1 • 2 • 3	0	The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector	Value must be greater		Specifies the maximum

Cache	than 0 or empty		number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
Threading > No Timer	• Enabled • Disabled (default)	Disabled (default)	Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading >	• Enabled	Disabled (default)	Enables FileX to be

Standalone	• Disabled (default)		used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Extra Features > Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
Extra Features > No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
Extra Features > 64-bit LBA	• Enabled • Disabled (default)	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Extra Features > Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.
Extra Features > File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Extra Features > Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Extra Features > Force Memory Operation	• Enabled (default) • Disabled	Enabled (default)	Enables or disables force memory operation, default is enabled.
Extra Features > Build Options	• Enabled (default)	Enabled (default)	Enables or disables build options, default is

	• Disabled		enabled.
Extra Features > One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
Extra Features > FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Extra Features > Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Extra Features > Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant > Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant > Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled

			separately.
Fault Tolerant > Fault Tolerant Boot Index	Value must be greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on Block Media

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.
Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired

			partition.
Total Sectors	Total Sectors must be an integer greater than 0	3751936	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Bytes per Sector	Bytes per Sector must be multiple of 32	512	Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is rm_block_media_spi (SPI blocks on read/write operations):

- The user will receive RM_BLOCK_MEDIA_EVENT_POLL_STATUS in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is rm_block_media_sdmmc (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive RM_BLOCK_MEDIA_EVENT_WAIT in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive RM_BLOCK_MEDIA_EVENT_WAIT_END in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send RM_BLOCK_MEDIA_EVENT_POLL_STATUS to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

Partitioned Media

When using fx_format to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

Unused User Callback Events

Certain events are defined in rm_block_media_event_t but not returned by the FileX Block Media user callback:

- RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE: This event is handled internally and operation success is indicated by FileX API calls returning FX_SUCCESS.
- RM_BLOCK_MEDIA_EVENT_ERROR: This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"

#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)

#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
```

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_block_media_instance_t g_filex_block_media0;
extern rm_filex_block_media_instance_ctrl_t g_filex_block_media0_ctrl;
extern rm_filex_block_media_cfg_t g_filex_block_media0_cfg;
extern FX_MEDIA g_fx_media0;
extern uint8_t g_fx_media0_memory[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE];
extern uint8_t g_file_data[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_block_media_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,

    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
```

```
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```
TX_SEMAPHORE g_operation_wait_semaphore;
/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
 /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
       tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
 /* Interrupt has occurred for operation, post semaphore so that wait will end. This
will be called from an interrupt context. */
       tx_semaphore_put(&g_operation_wait_semaphore);
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
    {
 /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.
  * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
       tx_thread_sleep(1);
    }
}
```

```
void rm_filex_block_media_callback_pend_example (void)
{
 /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
```

```
// Sectors per track
    handle_fx_error(fx_err);
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
       g_rm_filex_block_media_insertion_events++;
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
       g_rm_filex_block_media_removal_events++;
    }
}
void rm_filex_block_media_media_insertion_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
 while (0U == g_rm_filex_block_media_insertion_events)
    {
 /* Wait for media insertion. */
    }
```

```
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                             &g_filex_block_media0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}
```

Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with rm_filex_block_media the custom implementation must call rm_filex_block_media_memory_callback upon the completion of a read/write operation. This callback should be called with an event of RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE and p_context of rm_filex_block_media_instance_ctrl_t *. The following example shows how this should be done in the context of a demo RAM block media read function.

```
#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
                                          uint8_t * const
              p_dest_address,
                                          uint32_t const
block_address,
                                          uint32_t const               num_blocks)
{
 FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
          (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
          (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
 /* Notify FileX port of operation complete through calling the callback, this is
```

```
required for custom block media/FileX port integration */
 rm_block_media_callback_args_t args;
    args.event    = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context = (void *) &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
 return FSP_SUCCESS;
}
```

Data Structures

struct	rm_filex_block_media_instance_ctrl_t

Data Structure Documentation

◆ rm_filex_block_media_instance_ctrl_t

struct rm_filex_block_media_instance_ctrl_t

Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_BLOCK_MEDIA_Open is called.

Function Documentation

◆ RM_FILEX_BLOCK_MEDIA_Open()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Open (rm_filex_block_media_ctrl_t *const *p_ctrl*, rm_filex_block_media_cfg_t const *const *p_cfg*)

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements rm_filex_block_media_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_Close()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Close (rm_filex_block_media_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_filex_block_media_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_FILEX_BLOCK_MEDIA_BlockDriver()

void RM_FILEX_BLOCK_MEDIA_BlockDriver (FX_MEDIA * *p_fx_media*)

Access Block Media device functions open, close, read, write and control.

The RM_FILEX_BLOCK_MEDIA_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

4.2.16.6 FileX I/O (rm_filex_levelx_nor)

Modules » Storage

Functions

void	RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media) Access LevelX NOR device functions open, close, read, write and control. More...

Detailed Description

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

Configuration

Build Time Configurations for rm_filex_levelx_nor

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.

Configurations for Storage > FileX I/O (rm_filex_levelx_nor)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_filex_levelx_nor0	Module name.
Callback	Name must be a valid C symbol	g_rm_filex_levelx_nor_0_callback	A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality.
LevelX NOR Name (String)	Manual Entry	g_rm_filex_levelx_nor_0	String name to be input into LevelX API.

Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

Configuration	Options	Default	Description
Common > Max Long Name Len	Value must be greater than or equal to 13 and less than or equal to		Specifies the maximum file name size for FileX. If left blank the default

	256, or empty		value is 256. Legal values range between 13 and 256.
Common > Max Last Name Len	Value must be greater than or equal to 13 and less than or equal to 256, or empty		This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256.
Common > Max Sector Cache	Value must be greater than 0 or empty		Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2.
Common > Fat Map Size	Value must be greater than 0 or empty		Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors.
Common > Max Fat Cache	Value must be greater than 0 or empty		Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2.
Threading > Update Rate (Seconds)	Value must be greater than 0 or empty		Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds.
Threading > No Timer	• Enabled • Disabled	Disabled (default)	Eliminates the ThreadX timer setup to update

	(default)		the FileX system time and date. Doing so causes default time and date to be placed on all file operations.
Threading > Single Thread	• Enabled • Disabled (default)	Disabled (default)	Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread.
Threading > Standalone	• Enabled • Disabled (default)	Disabled (default)	Enables FileX to be used in standalone mode (without Azure RTOS).
Extra Features > Don't Update Open Files	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX does not update already opened files.
Extra Features > Media Search Cache	• Enabled (default) • Disabled	Enabled (default)	When disabled, the file search cache optimization is disabled.
Extra Features > Direct Data Read Cache Fill	• Enabled (default) • Disabled	Enabled (default)	When disabled, the direct read sector update of cache is disabled.
Extra Features > Media Statistics	• Enabled (default) • Disabled	Enabled (default)	When disabled, gathering of media statistics is disabled.
Extra Features > Single Open Legacy	• Enabled • Disabled (default)	Disabled (default)	When enabled, legacy single open logic for the same file is enabled.
Extra Features > Rename Path Inherit	• Enabled • Disabled (default)	Disabled (default)	When enabled, renaming inherits path information.
Extra Features > No Local Path	• Enabled • Disabled (default)	Disabled (default)	When enabled, removes local path logic from FileX, resulting in smaller code size.
Extra Features > 64-bit LBA	• Enabled • Disabled (default)	Disabled (default)	When enabled, 64-bits sector addresses are used in I/O driver.
Extra Features > Cache	• Enabled (default) • Disabled	Enabled (default)	Enables or disables the cache, default is enabled.

Extra Features > File Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables file close, default is enabled.
Extra Features > Fast Close	• Enabled (default) • Disabled	Enabled (default)	Enables or disables fast open, default is enabled.
Extra Features > Force Memory Operation	• Enabled (default) • Disabled	Enabled (default)	Enables or disables force memory operation, default is enabled.
Extra Features > Build Options	• Enabled (default) • Disabled	Enabled (default)	Enables or disables build options, default is enabled.
Extra Features > One Line Function	• Enabled (default) • Disabled	Enabled (default)	Enables or disables one line function, default is enabled.
Extra Features > FAT Entry Refresh	• Enabled (default) • Disabled	Enabled (default)	Enables or disables FAT entry refresh, default is enabled.
Extra Features > Consecutive Detect	• Enabled (default) • Disabled	Enabled (default)	Enables or disables consecutive detect, default is enabled.
Extra Features > Enable exFAT	• Enabled • Disabled (default)	Disabled (default)	Enables exFAT support in FileX.
Fault Tolerant > Fault Tolerant Service	• Enabled • Disabled (default)	Disabled (default)	When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA.
Fault Tolerant > Fault Tolerant Data	• Enabled • Disabled (default)	Disabled (default)	When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant	• Enabled • Disabled	Disabled (default)	When enabled, FileX immediately passes

	(default)		write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately.
Fault Tolerant > Fault Tolerant Boot Index	Value must be greater than or equal to 116 and less than or equal to 119		Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification.
Error Checking	• Enabled (default) • Disabled	Enabled (default)	

Configurations for Storage > Azure RTOS FileX on LevelX NOR

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fx_media0	Symbol used for media_ptr parameter in FileX APIs
Volume Name	Name must be a valid C symbol	Volume 1	Volume name string, which is a maximum of 11 characters.
Number of FATs	Number of FATs must be an integer greater than 0	1	Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time.

Directory Entries	Number of Directory Entries must be an integer greater than 0	256	Number of directory entries in the root directory.
Hidden Sectors	Number of Hidden Sectors must be an integer	0	Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition.
Total Sectors	Total Sectors must be an integer greater than 0	3751936	Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info.
Sectors per Cluster	Sectors per Cluster must be an integer greater than 0	1	Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system.
Volume Serial Number (exFAT only)	Volume Serial Number must be an integer greater than 0	12345	Serial number to be used for this volume. exFAT only.
Boundary Unit (exFAT only)	Boundary unit must be an integer greater than 0	128	Physical data area alignment size, in number of sectors. exFAT only.
Working media memory size	Memory size must be an integer greater than or equal to the size of one sector	512	Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector.

Usage Notes

Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an

OS-specific thread wait. This callback will also pass up block erase events.

Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

Examples

Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)

// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
 if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
void rm_filex_levelx_nor_callback_wait_example (void)
{
 /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,         // Total sectors
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

Data Structures

struct	rm_filex_levelx_nor_cfg_t
struct	rm_filex_levelx_nor_instance_ctrl_t
struct	rm_filex_levelx_nor_instance_t

Macros

#define	VOID

Enumerations

enum	rm_filex_levelx_nor_event_t

Data Structure Documentation

◆ rm_filex_levelx_nor_callback_args_t

struct rm_filex_levelx_nor_callback_args_t		
Callback function parameter data		
Data Fields		
rm_filex_levelx_nor_event_t	event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data.

◆ rm_filex_levelx_nor_cfg_t

struct rm_filex_levelx_nor_cfg_t
FileX LevelX configuration

Data Fields	
UINT(*	nor_driver_initialize)(LX_NOR_FLASH *)
	Pointer to the initialization function.
LX_NOR_FLASH *	p_nor_flash
	NOR Flash instance.
CHAR *	p_nor_flash_name
	NOR Flash instance name.
fsp_err_t(*	close)()
	Pointer to underlying driver close.
void(*	p_callback)(rm_filex_levelx_nor_callback_args_t *p_args)
	Pointer to callback function.
void const *	p_context
	Placeholder for user data.

◆ rm_filex_levelx_nor_instance_ctrl_t

struct rm_filex_levelx_nor_instance_ctrl_t		
FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_LEVELX_NOR_Open is called.		
Data Fields		
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to instance configuration.

◆ rm_filex_levelx_nor_instance_t

struct rm_filex_levelx_nor_instance_t
This structure encompasses everything that is needed to use an instance of this interface.
Data Fields

rm_filex_levelx_nor_instance_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
rm_filex_levelx_nor_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.

Macro Definition Documentation

◆ VOID

#define VOID
Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file.

Enumeration Type Documentation

◆ rm_filex_levelx_nor_event_t

enum rm_filex_levelx_nor_event_t	
Options for the callback events.	
Enumerator	
RM_FILEX_LEVELX_NOR_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_FILEX_LEVELX_NOR_DeviceDriver()

void RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA * *p_fx_media*)

Access LevelX NOR device functions open, close, read, write and control.

The RM_FILEX_LEVELX_NOR_DeviceDriver function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

None	

Returns

Nothing, but updates FileX media control block.

4.2.16.7 Flash (r_flash_hp)

fsp_err_t	R_FLASH_HP_Close (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_HP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void const *const p_context, flash_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The R_FLASH_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_hp

The following build time configurations are defined in fsp_cfg/r_flash_hp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Code Flash Programming Enable	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming Enable	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

Configurations for Storage > Flash (r_flash_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	• Enabled • Disabled	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.
Flash Error Interrupt	MCU Specific Options		Select the flash error

Priority interrupt priority.

Clock Configuration

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_hp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the

corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000  /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

```
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
```

```
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
    .irq            = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};
void r_flash_hp_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
```

```
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x00200000. */
 /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
  * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
```

```
/* Handle any errors. */
   assert(FSP_SUCCESS == err);
/* Handle any pre-reset operations here */
/* Reset the MCU to swap to the other bank */
   __NVIC_SystemReset();
}
```

Data Structures

struct	flash_hp_instance_ctrl_t

Enumerations

enum	flash_bgo_operation_t

Data Structure Documentation

◆ flash_hp_instance_ctrl_t

struct flash_hp_instance_ctrl_t	
Flash HP instance control block. DO NOT INITIALIZE.	
Data Fields	
uint32_t	opened
	To check whether api has been opened or not.
flash_bgo_operation_t	current_operation
	Operation in progress, for example, FLASH_OPERATION_CF_ERASE.

Enumeration Type Documentation

◆ flash_bgo_operation_t

enum flash_bgo_operation_t
Possible Flash operation states

Function Documentation

◆ R_FLASH_HP_Open()

fsp_err_t R_FLASH_HP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initializes the high performance flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

Example:

```
/* Open the flash hp instance. */
fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ALREADY_OPEN	The flash control block is already open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.

◆ R_FLASH_HP_Write()

fsp_err_t R_FLASH_HP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Writes to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_Erase()

fsp_err_t R_FLASH_HP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erases the specified Code or Data Flash blocks. Implements flash_api_t::erase by the block_erase_address.

Note

Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified. If the address is in code flash then code flash programming must be enabled.
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.

◆ R_FLASH_HP_BlankCheck()

fsp_err_t R_FLASH_HP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Performs a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blank check operation completed with result in p_blank_check_result, or blank check started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_BLANK_CHECK_FAILED	Blank check operation failed.

◆ R_FLASH_HP_StatusGet()

fsp_err_t R_FLASH_HP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH peripheral for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	FLASH peripheral is ready to use.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The Flash API is not Open.

◆ R_FLASH_HP_IdCodeSet()

fsp_err_t R_FLASH_HP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID Code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowSet()

fsp_err_t R_FLASH_HP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().

Implements flash_api_t::accessWindowSet.

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_AccessWindowClear()

fsp_err_t R_FLASH_HP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements flash_api_t::accessWindowClear.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_Reset()

fsp_err_t R_FLASH_HP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_PE_FAILURE	Failed to enter or exit P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_StartUpAreaSelect()

fsp_err_t R_FLASH_HP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements flash_api_t::startupAreaSelect.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_BankSwap()

fsp_err_t R_FLASH_HP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. flash_api_t::bankSwap.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_PE_FAILURE	Failed to enter or exit Code Flash P/E mode.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_INVALID_MODE	Cannot switch banks while flash is in Linear mode.
FSP_ERR_WRITE_FAILED	Flash write operation failed.
FSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of having received an illegal command.

◆ R_FLASH_HP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_FCLK	FCLK is not within the acceptable range.

◆ R_FLASH_HP_InfoGet()

fsp_err_t R_FLASH_HP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

◆ R_FLASH_HP_Close()

fsp_err_t R_FLASH_HP_Close (flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_NOT_OPEN	The control block is not open.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

◆ R_FLASH_HP_CallbackSet()

fsp_err_t R_FLASH_HP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void const *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements flash_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_FLASH_LP_BankSwap (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_LP_InfoGet (flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info)
fsp_err_t	R_FLASH_LP_Close (flash_ctrl_t *const p_api_ctrl)
fsp_err_t	R_FLASH_LP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void const *const p_context, flash_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.

Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

Configuration

Build Time Configurations for r_flash_lp

The following build time configurations are defined in fsp_cfg/r_flash_lp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

	• Disabled		included in the build.
Code Flash Programming	• Enabled • Disabled	Disabled	Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API.
Data Flash Programming	• Enabled • Disabled	Enabled	Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API.

Configurations for Storage > Flash (r_flash_lp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_lp).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_flash0	Module name.
Data Flash Background Operation	• Enabled • Disabled	Enabled	Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background.
Callback	Name must be a valid C symbol	NULL	A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors.
Flash Ready Interrupt Priority	MCU Specific Options		Select the flash ready interrupt priority.

Clock Configuration

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Code Flash Precautions

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

Note

The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).

Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of

reprogramming/erasure cycles than code flash.
- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

Examples

Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000  /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void R_FLASH_LP_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
```

```
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
    .irq            = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};
```

```
void R_FLASH_LP_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
```

```
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

Data Structures

struct	flash_lp_instance_ctrl_t

Data Structure Documentation

◆ flash_lp_instance_ctrl_t

struct flash_lp_instance_ctrl_t
Flash instance control block. DO NOT INITIALIZE. Initialization occurs when R_FLASH_LP_Open() is called.

Function Documentation

◆ R_FLASH_LP_Open()

fsp_err_t R_FLASH_LP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initialize the Low Power flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

Note

Providing a callback function in the supplied p_cfg->callback field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	NULL provided for p_ctrl, p_cfg or p_callback if BGO is enabled.
FSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
FSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
FSP_ERR_ALREADY_OPEN	Flash Open() has already been called.
FSP_ERR_TIMEOUT	Failed to exit P/E mode after configuring flash.
FSP_ERR_INVALID_STATE	The system is not running from the required clock.

◆ R_FLASH_LP_Write()

fsp_err_t R_FLASH_LP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

Return values

FSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
FSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
FSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
FSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
FSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.

◆ R_FLASH_LP_Erase()

fsp_err_t R_FLASH_LP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erase the specified Code or Data Flash blocks. Implements flash_api_t::erase.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
FSP_ERR_INVALID_ADDRESS	Invalid address specified
FSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	The Flash API is not Open.
FSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
FSP_ERR_ERASE_FAILED	Status is indicating a Erase error.

◆ R_FLASH_LP_BlankCheck()

fsp_err_t R_FLASH_LP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Perform a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
FSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
FSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_BLANK_CHECK_FAILED	An error occurred during blank checking.

◆ R_FLASH_LP_StatusGet()

fsp_err_t R_FLASH_LP_StatusGet (flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status*)

Query the FLASH for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

Return values

FSP_SUCCESS	Flash is ready and available to accept commands.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_AccessWindowSet()

fsp_err_t R_FLASH_LP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory. Implements flash_api_t::accessWindowSet .

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block (inclusive) –> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear().

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Parameters

	p_api_ctrl	The p api control
[in]	start_addr	The start address
[in]	end_addr	The end address

Return values

FSP_SUCCESS	Access window successfully configured.
FSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_AccessWindowClear()

fsp_err_t R_FLASH_LP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is configured in the Code Flash. Implements flash_api_t::accessWindowClear. On successful return from this call all Code Flash is writable.

Return values

FSP_SUCCESS	Access window successfully removed.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_IdCodeSet()

fsp_err_t R_FLASH_LP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Write the ID code provided to the id code registers. Implements flash_api_t::idCodeSet.

Return values

FSP_SUCCESS	ID code successfully configured.
FSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.

◆ R_FLASH_LP_Reset()

fsp_err_t R_FLASH_LP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

FSP_SUCCESS	Flash circuit successfully reset.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.

◆ R_FLASH_LP_StartUpAreaSelect()

fsp_err_t R_FLASH_LP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Select which block is used as the startup area block. Implements flash_api_t::startupAreaSelect.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.
FSP_ERR_UNSUPPORTED	Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false.

◆ R_FLASH_LP_BankSwap()

fsp_err_t R_FLASH_LP_BankSwap (flash_ctrl_t *const *p_api_ctrl*)

Unsupported flash_api_t::bankSwap.

Return values

FSP_ERR_UNSUPPORTED	Module does not support Bank Swap.

◆ R_FLASH_LP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

Return values

FSP_SUCCESS	Start-up area successfully toggled.
FSP_ERR_IN_USE	Flash is busy with an on-going operation.
FSP_ERR_FCLK	Invalid flash clock source frequency.
FSP_ERR_ASSERTION	NULL provided for p_ctrl
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_TIMEOUT	Timed out waiting for the FCU to become ready.

◆ R_FLASH_LP_InfoGet()

fsp_err_t R_FLASH_LP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

FSP_SUCCESS	Successful retrieved the request information.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.
FSP_ERR_NOT_OPEN	The flash is not open.

◆ R_FLASH_LP_Close()

fsp_err_t R_FLASH_LP_Close (flash_ctrl_t *const *p_api_ctrl*)

Release any resources that were allocated by the Flash API. Implements flash_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	Flash API has not yet been opened.
FSP_ERR_IN_USE	The flash is currently in P/E mode.

◆ R_FLASH_LP_CallbackSet()

fsp_err_t R_FLASH_LP_CallbackSet (flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void const *const *p_context*, flash_callback_args_t *const *p_callback_memory*)

Stub function Implements flash_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	Function has not been implemented.

4.2.16.9 FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Modules » Storage

fsp_err_t	RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the FAT File System control on RA MCUs.

Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system: https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html

Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF_Disk_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

Configuration

Build Time Configurations for rm_freertos_plus_fat

The following build time configurations are defined in fsp_cfg/middleware/rm_freertos_plus_fat_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_freertos_plus_fat0	Module name.
Total Number of Sectors	Must be a non-negative integer	31293440	Enter the total number of sectors on the device. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Sector Size (bytes)	Must be a power of 2	512	Select the sector size.

	multiple of 512		Must match the underlying media sector size and at least 512. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit().
Cache Size (bytes)	Must be a power of 2 multiple of 512	1024	Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size.
Partition Number	Must be a non-negative integer	0	Select the partition number for this disk.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Usage Notes

Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.

Also, update the Malloc function to malloc and the Free function to free in the Common configurations.

Examples

Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"

#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
```

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
```

```
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_freertos_plus_fat_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
```

```
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Try to mount the disk. If the disk is not formatted, mount will fail. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
 if (FF_isERR((uint32_t) ff_err))
    {
 /* The disk is likely not formatted. Partition and format the disk, then mount
again. */
       FF_PartitionParameters_t partition_params;
       partition_params.ulSectorCount   =
g_rm_freertos_plus_fat_disk_cfg.device.sector_count;
       partition_params.ulHiddenSectors = 1;
       partition_params.ulInterSpace    = 0;
       memset(partition_params.xSizes, 0, sizeof(partition_params.xSizes));
       partition_params.xSizes[RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER] =
            (BaseType_t) partition_params.ulSectorCount - 1;
       partition_params.xPrimaryCount = 1;
       partition_params.eSizeType    = eSizeIsSectors;
       ff_err = FF_Partition(&disk, &partition_params);
      handle_ff_error(ff_err);
       ff_err = FF_Format(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER,
pdFALSE, pdFALSE);
      handle_ff_error(ff_err);
       ff_err = FF_Mount(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
      handle_ff_error(ff_err);
    }
}
```

Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
#if 2 == BSP_CFG_RTOS
static EventGroupHandle_t xUSBEventGroupHandle = NULL;
#else
volatile uint32_t g_rm_freertos_plus_fat_insertion_events = 0;
volatile uint32_t g_rm_freertos_plus_fat_removal_events = 0;
#endif
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_freertos_plus_fat_test_callback (rm_freertos_plus_fat_callback_args_t *
p_args)
{
#if 2 == BSP_CFG_RTOS
 /* Post an event if FreeRTOS is available. */
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    xEventGroupSetBitsFromISR(xUSBEventGroupHandle, p_args->event,
&xHigherPriorityTaskWoken);
    portYIELD_FROM_ISR(xHigherPriorityTaskWoken);
#else
 /* If FreeRTOS is not used, set a global flag. */
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED)
    {
       g_rm_freertos_plus_fat_insertion_events++;
    }
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_REMOVED)
    {
       g_rm_freertos_plus_fat_removal_events++;
    }
#endif
}
void rm_freertos_plus_fat_media_insertion_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
```

```
    xUSBEventGroupHandle = xEventGroupCreate();
    TEST_ASSERT_NOT_EQUAL(NULL, xUSBEventGroupHandle);
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
                                                       pdTRUE,
                                                       pdFALSE,
                                                       portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
 /* Wait for media insertion. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
```

```
}
```

Media Insertion Example for USB

This shows how to use the callback to read and write to USB media.

```
void rm_freertos_plus_fat_usb_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the USB media to be attached. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
                                                       pdTRUE,
                                                       pdFALSE,
                                                       portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
 /* Wait for the USB media to be attached. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
```

```
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
```

```
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

Data Structures

struct	rm_freertos_plus_fat_instance_ctrl_t

Data Structure Documentation

◆ rm_freertos_plus_fat_instance_ctrl_t

struct rm_freertos_plus_fat_instance_ctrl_t

FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when RM_FREERTOS_PLUS_FAT_Open is called.

Function Documentation

◆ RM_FREERTOS_PLUS_FAT_Open()

fsp_err_t RM_FREERTOS_PLUS_FAT_Open (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_cfg_t const *const *p_cfg*)

Initializes lower layer media device.

Implements rm_freertos_plus_fat_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_OUT_OF_MEMORY	Not enough memory to create semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- rm_block_media_api_t::open

◆ RM_FREERTOS_PLUS_FAT_MediaInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_device_t *const *p_device*)

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements rm_freertos_plus_fat_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::mediaInit
- rm_block_media_api_t::infoGet

◆ RM_FREERTOS_PLUS_FAT_DiskInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_disk_cfg_t const *const *p_disk_cfg*, FF_Disk_t *const *p_disk*)

Initializes a FreeRTOS+FAT disk structure. This function calls FF_CreateIOManger.

Implements rm_freertos_plus_fat_api_t::diskInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.
FSP_ERR_INTERNAL	Call to FF_CreateIOManger failed.

◆ RM_FREERTOS_PLUS_FAT_DiskDeinit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*)

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF_DeleteIOManger.

Implements rm_freertos_plus_fat_api_t::diskDeinit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module has not been initialized.

◆ RM_FREERTOS_PLUS_FAT_InfoGet()

fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*, rm_freertos_plus_fat_info_t *const *p_info*)

Get partition information. This function can only be called after rm_freertos_plus_fat_api_t::diskInit() .

Implements rm_freertos_plus_fat_api_t::infoGet().

Return values

FSP_SUCCESS	Information stored in p_info.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.
FSP_ERR_NOT_FOUND	The value of p_iomanager is NULL.

◆ RM_FREERTOS_PLUS_FAT_Close()

fsp_err_t RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_freertos_plus_fat_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- rm_block_media_api_t::close

Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: https://docs.microsoft.com/en-us/azure/rtos/levelx/

Configuration

Build Time Configurations for rm_levelx_nor_spi

The following build time configurations are defined in fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Write Verify	• Enabled • Disabled	Disabled	When enabled reads back data written to SPI memory in order to verify it.
Page Buffer Size (bytes)	Size should be greater than zero	256	When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source locaiton also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to temporarily store data

to write out.

Configurations for Storage > LevelX NOR Port (rm_levelx_nor_spi)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_levelx_nor_spi0	Module name.
Memory Start Adress Offset (bytes)	Offset should be greater than or equal to zero	0	Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset.
Memory Size (bytes)	Size should be greater than zero	33554432	Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory.
Poll Status Count	Poll Status Count should be greater than or equal to zero	0xFFFFFFFF	Number of times to poll for operation complete status for blocking memory operations.

Build Time Configurations for lx

The following build time configurations are defined in fsp_cfg/azure/lx/lx_user.h:

Configuration	Options	Default	Description
NOR > Direct Read	• Enabled (default) • Disabled	Enabled (default)	When enabled, this option bypasses the NOR flash driver read routine in favor or reading the NOR memory directly, resulting in a significant performance increase.
NOR > Free Sector Data Verify	• Enabled • Disabled (default)	Disabled (default)	When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones.
NOR > Extended Cache	• Enabled (default) • Disabled	Enabled (default)	Enables the extended NOR cache.
NOR > Extended Cache Size	Manual Entry		If not set this value defaults to 8, which represents a maximum

			of 8 sectors that can be cached in a NOR instance.
NOR > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
NAND > Sector Mapping Cache Size	Value must be greater than or equal to 8 and a power of 2, or empty		If not set this value defaults to 128 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2.
NAND > Flash Direct Mapping Cache	• Enabled • Disabled (default)	Disabled (default)	When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device.
Thread Safe	• Enabled • Disabled (default)	Disabled (default)	When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API.
Standalone Mode	• Enabled • Disabled (default)	Disabled (default)	When enabled, allows LevelX to be used in standalone mode (without Azure RTOS).

Usage Notes

Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

Closing the driver

When lx_nor_flash_close is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. g_rm_levelx_nor_spi0_close) in order to close out the driver instance.

Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on lx_nor_flash_open due to any areas in flash memory that have been written/set.

Examples

Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t               read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t               write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
```

```
      err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                               (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
     assert(FSP_SUCCESS == err);
      status.write_in_progress = true;
 while (status.write_in_progress)
     {
          err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
     assert(FSP_SUCCESS == err);
      }
   }
   err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
   assert(FSP_SUCCESS == err);
 /* Initialize LevelX */
   lx_nor_flash_initialize();
   UINT lx_err = lx_nor_flash_open(&g_lx_nor_flash0, "LX_NOR_SPI_EXAMPLE",
g_levelx_nor_spi0_initialize);
   handle_lx_error(lx_err);
 /* Write test value to sector 0 then read back to verify */
   lx_err = lx_nor_flash_sector_write(&g_lx_nor_flash0, 0, write_buffer);
   handle_lx_error(lx_err);
   lx_err = lx_nor_flash_sector_read(&g_lx_nor_flash0, 0, read_buffer);
   handle_lx_error(lx_err);
   assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}
```

Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by LevelX NOR SPI driver needs to wait on operation. */
```

```
void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
 if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
```

Data Structures

struct	rm_levelx_nor_spi_callback_args_t
struct	rm_levelx_nor_spi_cfg_t
struct	rm_levelx_nor_spi_instance_ctrl_t

Enumerations

enum	rm_levelx_nor_spi_event_t

Data Structure Documentation

◆ rm_levelx_nor_spi_callback_args_t

struct rm_levelx_nor_spi_callback_args_t		
RM_LEVELX_NOR_SPI callback arguments definitions		
Data Fields		
rm_levelx_nor_spi_event_t	event	LevelX NOR driver callback event.
void const *	p_context	Placeholder for user data.

◆ rm_levelx_nor_spi_cfg_t

struct rm_levelx_nor_spi_cfg_t	
SF_EL_LX_NOR Config Block Type	
Data Fields	
spi_flash_instance_t const *	p_lower_lvl
	Lower level memory pointer.
LX_NOR_FLASH *	p_lx_nor_flash

	Pointer to the LevelX nor flash instance.
uint32_t	base_address
	Base address of memory mapped region.
uint32_t	address_offset
	Offset to use subset of available flash size if desired.
uint32_t	size
	Size of the partitioned region.
uint32_t	poll_status_count
	Number of times to poll for operation complete status before returning an error.
void const *	p_context
	Placeholder for user data. Passed to the user callback.
void(*	p_callback)(rm_levelx_nor_spi_callback_args_t *p_args)
	Callback function.

◆ rm_levelx_nor_spi_instance_ctrl_t

struct rm_levelx_nor_spi_instance_ctrl_t		
SF_EL_LX_NOR Control Block Type		
Data Fields		
rm_levelx_nor_spi_cfg_t const *	p_cfg	Pointer to instance configuration.
uint32_t	start_address	Start address of partition to use within memory mapped region.
uint32_t	minimum_erase_size	Minimum erase size of SPI memory.

uint8_t	page_buffer[RM_LEVELX_NOR_SPI_CFG_BUFFER_SIZE]	Page buffer for situations when writing to SPI memory from a source within SPI memory.
uint32_t	open	Used to determine if module is initialized.

Enumeration Type Documentation

◆ rm_levelx_nor_spi_event_t

enum rm_levelx_nor_spi_event_t

Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events.

Enumerator	
RM_LEVELX_NOR_SPI_EVENT_BUSY	Pending operation, user can define their own wait functionality.

Function Documentation

◆ RM_LEVELX_NOR_SPI_Open()

fsp_err_t RM_LEVELX_NOR_SPI_Open (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, rm_levelx_nor_spi_cfg_t const *const *p_cfg*)

Initializes LevelX NOR SPI port read/write and control.

Calls lower level SPI memory functions.

Parameters

[in,out]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_cfg	Configuration for LevelX NOR SPI port.

Return values

FSP_SUCCESS	LevelX NOR driver is successfully opened.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:open

◆ RM_LEVELX_NOR_SPI_Read()

fsp_err_t RM_LEVELX_NOR_SPI_Read (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_dest*, ULONG *word_count*)

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

Return values

FSP_SUCCESS	LevelX NOR flash sector read successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_dest is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Write()

fsp_err_t RM_LEVELX_NOR_SPI_Write (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_src*, ULONG *word_count*)

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in,out]	p_flash_addr	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

Return values

FSP_SUCCESS	LevelX NOR flash sector write successful.
FSP_ERR_ASSERTION	p_ctrl, p_flash_addr or p_src is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.
FSP_ERR_WRITE_FAILED	Verification of Write operation failed.
FSP_ERR_INVALID_ADDRESS	Write address or size falls outside of flash memory range.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:write

◆ RM_LEVELX_NOR_SPI_BlockErase()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErase (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*, ULONG *erase_count*)

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

Return values

FSP_SUCCESS	LevelX NOR flash block erase successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.
FSP_ERR_TIMEOUT	Timeout occurred while waiting for operation to complete.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:erase

◆ RM_LEVELX_NOR_SPI_BlockErasedVerify()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*)

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.
[in]	block	Specifies which block to verify that it is erased.

Return values

FSP_SUCCESS	LevelX flash block erase verification successful.
FSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
FSP_ERR_NOT_ERASED	The block is not erased properly.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes.

◆ RM_LEVELX_NOR_SPI_Close()

fsp_err_t RM_LEVELX_NOR_SPI_Close (rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*)

LevelX NOR driver close service.

This is responsible for closing the driver properly.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR SPI instance.

Return values

FSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

Returns

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:close

4.2.16.11 LittleFS on Flash (rm_littlefs_flash)

Modules » Storage

Functions

fsp_err_t	RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg)
fsp_err_t	RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl)

Detailed Description

Middleware for the LittleFS File System control on RA MCUs.

Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

Configuration

Build Time Configurations for rm_littlefs_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > LittleFS on Flash (rm_littlefs_flash)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_littlefs0	Module name.
Read Size	Must be a non-negative integer	1	Minimum size of a block read. All read operations will be a multiple of this value.
Program Size	Must be a non-negative integer	4	Minimum size of a block program. All program operations will be a multiple of this value.

Block Size (bytes)	Must be a multiple of 64	128	Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes.
Block Count	Manual Entry	(BSP_DATA_FLASH_SIZE_BYTES/128)	Number of erasable blocks on the device.
Block Cycles	Must be an integer	1024	Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling.
Cache Size	Must be a non-negative integer	64	Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size.
Lookahead Size	Must be a non-negative multiple of 8	16	Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is

			stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8.

Common LittleFS Configuration

Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

Configuration	Options	Default	Description
Custom lfs_util.h	Manual Entry		Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Thread Safe	• Enabled • Disabled	Disabled	Enables thread safety in LittleFS.
Use Malloc	• Enabled • Disabled	Enabled	Configures the use of malloc by LittleFS.
Use Assert	• Enabled • Disabled	Enabled	Configures the use of assert by LittleFS.
Debug Messages	• Enabled • Disabled	Disabled	Configures debug messages.
Warning Messages	• Enabled • Disabled	Disabled	Configures warning messages.
Error Messages	• Enabled • Disabled	Disabled	Configures error messages.
Trace Messages	• Enabled • Disabled	Disabled	Configures trace messages.
Intrinsics	• Enabled • Disabled	Enabled	Configures intrinsic functions such as __builtin_clz.
Instance Name for STDIO wrapper	Name must be a valid C symbol	g_rm_littlefs0	The rm_littlefs instance name to use with the STDIO wrapper.

Usage Notes

Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

Limitations

This module is not thread safe.

Examples

Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
 int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
```

```
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /*********************************************************************************
**********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  *********************************************************************************
**********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
 /* Apply butter to toast 10 times. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
 if (lfs_err < 0)
```

```
      {
      handle_lfs_error(lfs_err);
       }
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
 /* Unmount the filesystem. */
    lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
    handle_lfs_error(lfs_err);
 /* Remount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);
 /* Verify the toast is buttered the correct amount. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
```

```
    lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

Function Documentation

◆ RM_LITTLEFS_FLASH_Open()

fsp_err_t RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg*)

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

Return values

FSP_SUCCESS	Success.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_SIZE	The provided block size is invalid.
FSP_ERR_INVALID_ARGUMENT	Flash BGO mode must be disabled.
FSP_ERR_INTERNAL	Failed to create the semaphore.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- flash_api_t::open

◆ RM_LITTLEFS_FLASH_Close()

fsp_err_t RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

Return values

FSP_SUCCESS	Media device closed.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	Module not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- flash_api_t::close

4.2.16.12 OSPI Flash (r_ospi)

Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes
- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device
- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read amd write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

Note

For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.

Configuration

OSPI Flash:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DMAC Support	• Enable • Disable	Disable	Enable DMAC support for the OSPI module.

Configurations for Storage > OSPI Flash (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the read idle time.
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	100	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_ospi0	Module name.
General > Channel	Channel should be 0 or 1	0	Specify the OSPI chip select line to use.
General > Flash Size	Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF	0x04000000	Specify the OctaFlash size in bytes.
General > SPI Protocol	• SPI • Single data rate OPI • Dual data rate OPI	SPI	Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using R_OSPI_DirectTransfer( ).
General > Address Bytes	• 3 • 4	4	Select the number of address bytes.
OPI Mode > Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
OPI Mode > Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
OPI Mode > Command Definitions > Page Program Command	Must be a 16-bit OSPI Page Program Command under OPI Mode|Command Definitions	0x12ED	The command to program a page in OPI mode.
OPI Mode > Command Definitions > Read Command	Must be a 16-bit OSPI Read Command under OPI Mode|Command Definitions	0xEC13	The command to read in SOPI mode (8READ).
OPI Mode > Command Definitions > Dual	Must be a 16-bit OSPI Dual Read Command	0xEE11	The command to read in DOPI mode (8DTRD).

Read Command	under OPI Mode|Command Definitions		
OPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under OPI Mode|Command Definitions	0x06F9	The command to enable write in OPI mode.
OPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under OPI Mode|Command Definitions	0x05FA	The command to query the status of a write or erase command in OPI mode.
OPI Mode > OM_DQS Enable Counter > SOPI	Must be an integer between 0 and 255	9	OM_DQS enable counter for memory access. Setting for SOPI mode.
OPI Mode > OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	6	OM_DQS enable counter for memory access. Setting for DOPI mode.
OPI Mode > Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
OPI Mode > Memory Read Dummy Cycles	Must be an integer between 6 and 10	10	Memory read dummy cycles
OPI Mode > DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2	Byte0, Byte1, Byte2, Byte3	Byte order on the external bus
SPI Mode > Command Definitions > Page Program Command	Must be a 8-bit OSPI Page Program Command under SPI Mode|Command Definitions	0x12	The command to program a page in SPI mode.
SPI Mode > Command Definitions > Read Command	Must be a 8-bit OSPI Read Command under SPI Mode|Command Definitions	0x13	The command to read in SPI mode.
SPI Mode > Command Definitions > Write Enable Command	Must be a 16-bit OSPI Write Enable Command under SPI Mode|Command Definitions	0x06	The command to enable write in SPI mode.
SPI Mode > Command Definitions > Status Command	Must be a 16-bit OSPI Status Command under SPI Mode|Command Definitions	0x05	The command to query the status of a write or erase command in SPI mode.
Common Command	Must be a value	0x21DE	The command to erase

Definitions > Sector Erase Command	greater than or equal to 0		a sector. Set Sector Erase Size to 0 if unused.
Common Command Definitions > Block Erase Command	Must be a value greater than or equal to 0	0xDC23	The command to erase a block. Set Block Erase Size to 0 if unused.
Common Command Definitions > Chip Erase Command	Must be a value greater than or equal to 0	0xC738	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Common Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Common Command Definitions > Write Enable Bit	Must be an integer between 0 and 7	1	Which bit contains the write enable status returned from the Write Enable Command.
Common Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Common Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Chip Select Timing Setting > Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped write command execution interval setting in OCTACLK units
Chip Select Timing Setting > Command Interval	• 2 • 5 • 7 • 9	2	Command execution interval setting in OCTACLK units

	• 11 • 13 • 15 • 17		
Chip Select Timing Setting > Memory Mapped Read Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Memory mapped read signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-up Timing	• 2 SPI/SOPI, 1.5 DOPI • 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI • 6 SPI/SOPI, 5.5 DOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	2 SPI/SOPI, 1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Pull-up Timing	• 5 SPI/SOPI • 6 SPI/SOPI • 7 SPI/SOPI, 6.5 DOPI • 8 SPI/SOPI, 7.5 DOPI • 9 SPI/SOPI, 8.5 DOPI	5 SPI/SOPI	Signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5 DOPI • 5 SPI/SOPI, 4.5 DOPI	3 SPI/SOPI, 2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Pull-down Timing	• 3 SPI/SOPI, 2.5 DOPI • 4 SPI/SOPI, 3.5	3 SPI/SOPI, 2.5 DOPI	Signal pull-down timing setting in OCTACLK units

DOPI
- 5 SPI/SOPI, 4.5 DOPI

Note

The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.

OSPI RAM:

Build Time Configurations for r_ospi

The following build time configurations are defined in driver/r_ospi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > OSPI RAM (r_ospi)

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r_ospi).

Configuration	Options	Default	Description
General > Single Continuous Mode > Read Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the read idle time.
General > Single Continuous Mode > Write Idle Time	Must be an integer greater than 0 with maximum configurable value of 127	127	Specify the write idle time.
General > Name	Name must be a valid C symbol	g_ospi_ram0	Module name.
General > Channel	Channel should be 0 or 1 [Channel 0 recommended]	0	Specify the OSPI chip select line to use.
General > RAM Size	Must be an integer greater than 0 with maximum configurable value of 0x00800000	0x00800000	Specify the OctaRam size in bytes.
General > SPI Protocol	Dual data rate OPI	Dual data rate OPI	Select the initial SPI protocol. OctaRAM only supports DOPI mode.
General > Address Bytes	4	4	Select the number of address bytes. OctaRAM only supports 4 byte addresses in

			DOPI mode.
Auto-Calibration > Data latching delay	Must be a valid non-negative integer with maximum configurable value of 0xFF	0x80	Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C
Auto-Calibration > Auto-Calibration Address	Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF	0x00	Set the address of the read/write destination to be performed for auto-calibration.
Command Definitions > Memory Read Command	Must be a 16-bit OSPI Dual Read Command under Command Definitions	0xA000	The command to read in DOPI mode.
Command Definitions > Memory Write Command	Must be a 16-bit OSPI Write Command under Command Definitions	0x2000	The command to write in DOPI mode.
OM_DQS Enable Counter > DOPI	Must be an integer between 0 and 255	3	OM_DQS enable counter for memory access. Setting for DOPI mode.
Chip Select Timing Setting > Memory Mapped Read Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped read command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Memory mapped write command execution interval setting in OCTACLK units
Chip Select Timing Setting > Command Interval	• 2 • 5 • 7 • 9 • 11 • 13 • 15 • 17	2	Command execution interval setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Memory mapped read signal pull-up timing setting in OCTACLK units

Chip Select Timing Setting > Memory Mapped Write Pull-up Timing	• 1.5 DOPI • 2.5 DOPI • 3.5 DOPI • 4.5 DOPI • 5.5 DOPI • 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	1.5 DOPI	Memory mapped write signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Pull-up Timing	• 6.5 DOPI • 7.5 DOPI • 8.5 DOPI	6.5 DOPI	Signal pull-up timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Read Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped read signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Memory Mapped Write Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Memory mapped write signal pull-down timing setting in OCTACLK units
Chip Select Timing Setting > Pull-down Timing	• 2.5 DOPI • 3.5 DOPI • 4.5 DOPI	2.5 DOPI	Signal pull-down timing setting in OCTACLK units
Command Length Bytes	Must be an integer between 1 and 2	2	Command length in bytes
Memory Read Dummy Cycles	Must be an integer between 3 and 8	4	Memory read dummy cycles
Memory Write Dummy Cycles	Must be an integer between 3 and 8	4	Memory write dummy cycles
DOPI Byte Order	• Byte0, Byte1, Byte2, Byte3 • Byte1, Byte0, Byte3, Byte2	Byte1, Byte0, Byte3, Byte2	Byte order on the external bus
Chip Select Maximum Low Time (us)	Must be an integer greater than or equal to 0	4	Chip Select Maximum Low Time (tCSM).

Clock Configuration

PCLKB is the Octal-SPI bus interface, and PCLKA is used to set OSPI registers.

The signals to the OSPI device are derived from OCTASPICLK. The OMSCLK signal is OCTASPICLK / 2. Data can be output at the OCTASPICLK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTASPICLK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTASPICLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

Note

Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.
Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.

Usage Notes

Usage Notes for OctaFlash support

Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer Transfer (r_dmac).

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_Open() with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using R_OSPI_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_Write() API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_Open().

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_Open().

OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

Usage Notes for OctaRAM support

OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call R_OSPI_Open() without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. R_OSPI_AutoCalibrate() should be then called to perform auto-calibration.

Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

Limitations

Developers should be aware of the following limitations when using the OSPI driver:

OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).
- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMSCLK greater than 50MHz.

Examples

OSPI Flash:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)

uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];

/* Place data in the .ospi_flash section to flash it during programming. */

const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi_flash") =

"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
```

```
/* Place code in the .code_in_ospi section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_ospi")
__attribute__((noinline));
void r_ospi_example_function (void)
{
 /* Add code here. */
}
void r_ospi_basic_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_Open() and any required device specific intiialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
}
```

Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
       .command       = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
```

```
      .command_length = 1U,
      .address_length = 0U,
      .data_length    = 0U,
      .dummy_cycles   = 0U
   };
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
   assert(FSP_SUCCESS == err);
 /* Write Enable */
   err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
   assert(FSP_SUCCESS == err);
 /* Read Status Register */
   ospi_test_direct_transfer.command    = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
   ospi_test_direct_transfer.data_length = 1U;
   err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
   assert(FSP_SUCCESS == err);
 /* Check if Write Enable is set */
 if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
   {
      __BKPT(0);
   }
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
```

```
0xF7, 0x00, 0xF7
};
void ospi_example_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_auto_calibrate_example (void)
{
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_example_wait_until_wip();
 /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

Octaclk Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

OSPI RAM:

Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
/* Place uninitialized data buffers in the ospi_device_0_no_load section.
 * Use ospi_device_1_no_load section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi_device_0_no_load");
void r_ospi_ram_basic_example (void)
{
 /* Open the OSPI instancee.
  * Ensure valid setting of the 'Data latching delay' field in the configurator.
```

```
 * To successfully perform OSPI RAM reads this value must not be 0.
 */
fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
   assert(FSP_SUCCESS == err);
/* After R_OSPI_Open() and any required device specific intiialization, data can be
read from or written to directly from the OSPI RAM. */
   memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
   memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
   assert(FSP_SUCCESS == err);
/* OctaRAM Configuration Register (cr) read and write command definition */
spi_flash_direct_transfer_t read_cr =
   {
      .command       = 0xC000U,    // NOLINT(readability-magic-numbers)
      .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
      .data          = 0U,
      .command_length = 2U,
      .address_length = 4U,
      .data_length    = 2U,
/* Dummy Cycles set to the default value specified in the OctaRAM device
Configuration Register */
```

```
       .dummy_cycles   = 5U
    };
 spi_flash_direct_transfer_t write_cr =
    {
       .command       = 0x4000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
       .dummy_cycles   = 0U
    };
 /* Read OctaRAM device Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
    uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &
~OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK) |
                                      ((uint16_t)
(OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING <<
                                                          OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENC
Y_COUNTER_POS) &
                                        OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MA
SK));
 /* Write Configuration Register */
    write_cr.data = (uint32_t) config_reg;
    err          = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &write_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
    read_cr.data = 0;
 /* Set Dummy Clocks to value configured above (4 Clocks) */
    read_cr.dummy_cycles = 4U;
 /* Read Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
```

```
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Confirm the intended Configuration Register value */
    assert(config_reg == (uint16_t) (read_cr.data & UINT16_MAX));
 volatile uint32_t * ram_addr = (uint32_t *) OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS;
 /* Write the auto-calibration preamble pattern for DOPI mode as specified by the
Hardware Manual */
    ram_addr[0] = 0xFFFF0000;          // NOLINT(readability-magic-numbers)
    ram_addr[1] = 0x0800FF00;          // NOLINT(readability-magic-numbers)
    ram_addr[2] = 0xFF0000F7;          // NOLINT(readability-magic-numbers)
    ram_addr[3] = 0x00F708F7;          // NOLINT(readability-magic-numbers)
    err = R_OSPI_AutoCalibrate(&g_ospi_ram0_ctrl);
    assert(FSP_SUCCESS == err);
 /* After Auto-calibration data can be read from or written to directly from the OSPI
RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

Data Structures

struct	ospi_instance_ctrl_t

Enumerations

enum	ospi_device_number_t
enum	ospi_device_type_t
enum	ospi_command_cs_pullup_clocks_t
enum	ospi_command_cs_pulldown_clocks_t
enum	ospi_dopi_byte_order_t

Data Structure Documentation

◆ ospi_instance_ctrl_t

struct ospi_instance_ctrl_t
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called

Enumeration Type Documentation

◆ ospi_device_number_t

enum ospi_device_number_t	
Enumerator	
OSPI_DEVICE_NUMBER_0	Device connected to Chip-Select 0.
OSPI_DEVICE_NUMBER_1	Device connected to Chip-Select 1.

◆ ospi_device_type_t

enum ospi_device_type_t	
Enumerator	
OSPI_DEVICE_FLASH	Device Memory type OctaFlash.
OSPI_DEVICE_RAM	Device Memory type OctaRAM.

◆ ospi_command_cs_pullup_clocks_t

enum ospi_command_cs_pullup_clocks_t	
Enumerator	
OSPI_COMMAND_CS_PULLUP_CLOCKS_2	1.5 clocks DOPI mode; 2 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_3	2.5 clocks DOPI mode; 3 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_4	3.5 clocks DOPI mode; 4 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_5	4.5 clocks DOPI mode; 5 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_6	5.5 clocks DOPI mode; 6 Clocks all other modes; Unsupported for DOPI Read
OSPI_COMMAND_CS_PULLUP_CLOCKS_7	6.5 clocks DOPI mode; 7 Clocks all other modes
OSPI_COMMAND_CS_PULLUP_CLOCKS_8	7.5 clocks DOPI mode; 8 Clocks all other modes
OSPI_COMMAND_CS_PULLUP_CLOCKS_9	8.5 clocks DOPI mode; 9 Clocks all other modes

◆ ospi_command_cs_pulldown_clocks_t

enum ospi_command_cs_pulldown_clocks_t	
Enumerator	
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_3	2.5 clocks DOPI mode; 3 Clocks all other modes
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_4	3.5 clocks DOPI mode; 4 Clocks all other modes
OSPI_COMMAND_CS_PULLDOWN_CLOCKS_5	4.5 clocks DOPI mode; 5 Clocks all other modes

◆ ospi_dopi_byte_order_t

enum ospi_dopi_byte_order_t	
Enumerator	
OSPI_DOPI_BYTE_ORDER_0123	DOPI byte order byte 0, byte 1, byte 2, byte 3.
OSPI_DOPI_BYTE_ORDER_1032	DOPI byte order byte 1, byte 0, byte 3, byte 2.

Function Documentation

◆ R_OSPI_Open()

fsp_err_t R_OSPI_Open (spi_flash_ctrl_t * *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements spi_flash_api_t::open.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_ctrl.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to open the driver with an invalid SPI protocol for OctaRAM.

◆ R_OSPI_DirectWrite()

fsp_err_t R_OSPI_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements spi_flash_api_t::directWrite.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectRead()

fsp_err_t R_OSPI_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements spi_flash_api_t::directRead.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_DirectTransfer()

fsp_err_t R_OSPI_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements spi_flash_api_t::directTransfer.

Example:

```
 /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_OSPI_XipEnter()

fsp_err_t R_OSPI_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters Single Continuous Read/Write mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_XipExit()

fsp_err_t R_OSPI_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_Write()

fsp_err_t R_OSPI_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Example:

```
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	Another Write/Erase transaction is in progress.
FSP_ERR_INVALID_SIZE	Write operation crosses page-boundary.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_Erase()

fsp_err_t R_OSPI_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_DEVICE_BUSY	The device is busy.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.
FSP_ERR_WRITE_FAILED	The write enable bit was not set.

◆ R_OSPI_StatusGet()

fsp_err_t R_OSPI_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Example:

```
      err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaRAM.

◆ R_OSPI_BankSet()

fsp_err_t R_OSPI_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access.

Implements spi_flash_api_t::bankSet.

Return values

FSP_ERR_UNSUPPORTED	API not supported by OSPI.

◆ R_OSPI_SpiProtocolSet()

fsp_err_t R_OSPI_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_INVALID_ARGUMENT	Attempting to set an invalid SPI protocol for OctaRAM.

◆ R_OSPI_AutoCalibrate()

fsp_err_t R_OSPI_AutoCalibrate (spi_flash_ctrl_t * *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern.

Note

The preamble pattern must be written to the configured address before calling this API. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_CALIBRATE_FAILED	Failed to perform auto-calibrate.
FSP_ERR_UNSUPPORTED	API not supported by OSPI - OctaFlash.

◆ R_OSPI_Close()

fsp_err_t R_OSPI_Close (spi_flash_ctrl_t * *p_ctrl*)
Close the OSPI driver module. Implements spi_flash_api_t::close. **Return values** FSP_SUCCESS — Configuration was successful. FSP_ERR_ASSERTION — p_instance_ctrl is NULL. FSP_ERR_NOT_OPEN — Driver is not opened.

Detailed Description

Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

Overview

Features

The QSPI driver has the following key features:

- Memory mapped read access to the QSPI flash
- Programming the QSPI flash device
- Erasing the QSPI flash device
- Sending device specific commands and reading back responses
- Entering and exiting QPI mode
- Entering and exiting XIP mode
- 3 or 4 byte addressing

Configuration

Build Time Configurations for r_qspi

The following build time configurations are defined in driver/r_qspi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support Multiple Line Program in Extended SPI Mode	• Enabled • Disabled	Disabled	If selected code for programming on multiple lines in extended SPI mode is included in the build.

Configurations for Storage > QSPI (r_qspi)

This module can be added to the Stacks tab via New Stack > Storage > QSPI (r_qspi).

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_qspi0	Module name.

General > SPI Protocol	• Extended SPI • QPI	Extended SPI	Select the initial SPI protocol. SPI protocol can be changed in R_QSPI_Direct().
General > Address Bytes	• 3 • 4 • 4 with 4-byte read code	3	Select the number of address bytes. Selecting '4 with 4-byte read code' converts the default read code determined in Read Mode to the 4-byte version. If 4-byte mode is selected without using 4-byte commands, the application must issue the EN4B command using R_QSPI_Direct().
General > Read Mode	• Standard Read • Fast Read • Fast Read Dual Output • Fast Read Dual I/O • Fast Read Quad Output • Fast Read Quad I/O	Fast Read Quad I/O	Select the read mode for memory mapped access.
General > Dummy Clocks for Fast Read	Refer to the RA Configuration tool for available options.	Default	Select the number of dummy clocks for fast read operations. Default is 6 clocks for Fast Read Quad I/O, 4 clocks for Fast Read Dual I/O, and 8 clocks for other fast read instructions including Fast Read Quad Output, Fast Read Dual Output, and Fast Read
General > Page Size Bytes	Must be an integer greater than 0	256	The maximum number of bytes allowed for a single write.
Command Definitions > Page Program Command	Must be an 8-bit QSPI Page Program Command under Command Definitions	0x02	The command to program a page. If 'Support Multiple Line Program in Extended SPI Mode' is Enabled, this command must use the same number of data lines as the selected read mode.

Command Definitions > Page Program Address Lines	• 1 • 2 • 4	1	Select the number of lines to use for the address bytes during write operations. This can be determined by referencing the datasheet for the external QSPI. It should either be 1 or match the number of data lines used for memory mapped fast read operations.
Command Definitions > Write Enable Command	Must be an 8-bit QSPI Write Enable Command under Command Definitions	0x06	The command to enable write.
Command Definitions > Status Command	Must be an 8-bit QSPI Status Command under Command Definitions	0x05	The command to query the status of a write or erase command.
Command Definitions > Write Status Bit	Must be an integer between 0 and 7	0	Which bit contains the write in progress status returned from the Write Status Command.
Command Definitions > Sector Erase Command	Must be an 8-bit QSPI Sector Erase Command under Command Definitions	0x20	The command to erase a sector. Set Sector Erase Size to 0 if unused.
Command Definitions > Sector Erase Size	Must be an integer greater than or equal to 0	4096	The sector erase size. Set Sector Erase Size to 0 if Sector Erase is not supported.
Command Definitions > Block Erase Command	Must be an 8-bit QSPI Block Erase Command under Command Definitions	0xD8	The command to erase a block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase Size	Must be an integer greater than or equal to 0	65536	The block erase size. Set Block Erase Size to 0 if Block Erase is not supported.
Command Definitions > Block Erase 32KB Command	Must be an 8-bit QSPI Block Erase 32KB Command under Command Definitions	0x52	The command to erase a 32KB block. Set Block Erase Size to 0 if unused.
Command Definitions > Block Erase 32KB Size	Must be an integer greater than or equal to 0	32768	The block erase 32KB size. Set Block Erase 32KB Size to 0 if Block Erase 32KB is not

			supported.
Command Definitions > Chip Erase Command	Must be an 8-bit QSPI Chip Erase Command under Command Definitions	0xC7	The command to erase the entire chip. Set Chip Erase Command to 0 if unused.
Command Definitions > XIP Enter M7-M0	Must be an 8-bit QSPI XIP Enter M7-M0 command under Command Definitions	0x20	How to set M7-M0 to enter XIP mode.
Command Definitions > XIP Exit M7-M0	Must be an 8-bit QSPI XIP Exit M7-M0 command under Command Definitions	0xFF	How to set M7-M0 exit XIP mode.
Bus Timing > QSPKCLK Divisor	Refer to the RA Configuration tool for available options.	2	Select the divisor to apply to PCLK to get QSPCLK.
Bus Timing > Minimum QSSL Deselect Cycles	Refer to the RA Configuration tool for available options.	4 QSPCLK	Define the minimum number of QSPCLK cycles for QSSL to remain high beween operations.

Clock Configuration

The QSPI clock is derived from PCLKA.

Pin Configuration

The following pins are available to connect to an external QSPI device:

- QSPCLK: QSPI clock output
- QSSL: QSPI slave select
- QIO0: Data 0 I/O
- QIO1: Data 1 I/O
- QIO2: Data 2 I/O
- QIO3: Data 3 I/O

Note

It is recommended to configure the pins with IOPORT_CFG_DRIVE_HIGH.

Usage Notes

QSPI Memory Mapped Access

After R_QSPI_Open() completes successfully, the QSPI flash device contents are mapped to address 0x60000000 and can be read like on-chip flash.

Limitations

Developers should be aware of the following limitations when using the QSPI driver:

- Only P305-P310 are currently supported by the J-Link driver to flash the QSPI.
- The default J-Link downloader requires the device to be in extended SPI mode (not QPI mode).

Examples

Basic Example

This is a basic example of minimal use of the QSPI in an application.

```
#define QSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[QSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .qspi_flash section to flash it during programming. */
const uint8_t g_src[QSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".qspi_flash") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .code_in_qspi section to flash it during programming. */
void r_qspi_example_function(void) BSP_PLACE_IN_SECTION(".code_in_qspi")
__attribute__((noinline));
void r_qspi_example_function (void)
{
 /* Add code here. */
}
void r_qspi_basic_example (void)
{
 /* Open the QSPI instance. */
 fsp_err_t err = R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Send device specific initialization commands. */
    r_qspi_example_init();
 /* After R_QSPI_Open() and any required device specific intiialization, data can be
read directly from the QSPI flash. */
    memcpy(&g_dest[0], &g_src[0], QSPI_EXAMPLE_DATA_LENGTH);
 /* After R_QSPI_Open() and any required device specific intiialization, functions in
the QSPI flash can be called. */
    r_qspi_example_function();
}
```

Initialization Command Structure Example

This is an example of the types of commands that can be used to initialize the QSPI.

```
#define QSPI_COMMAND_WRITE_ENABLE (0x06U)
#define QSPI_COMMAND_WRITE_STATUS_REGISTER (0x01U)
#define QSPI_COMMAND_ENTER_QPI_MODE (0x38U)
#define QSPI_EXAMPLE_STATUS_REGISTER_1 (0x40)
#define QSPI_EXAMPLE_STATUS_REGISTER_2 (0x00)
static void r_qspi_example_init (void)
{
 /* Write status registers */
 /* Write one byte to enable writing to the status register, then deassert QSSL. */
    uint8_t   data[4];
 fsp_err_t err;
    data[0] = QSPI_COMMAND_WRITE_ENABLE;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
 /* Write 3 bytes, including the write status register command followed by values for
both status registers. In the
  * status registers, set QE to 1 and other bits to their default setting. After all
data is written, deassert the
  * QSSL line. */
    data[0] = QSPI_COMMAND_WRITE_STATUS_REGISTER;
    data[1] = QSPI_EXAMPLE_STATUS_REGISTER_1;
    data[2] = QSPI_EXAMPLE_STATUS_REGISTER_2;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 3, false);
    assert(FSP_SUCCESS == err);
 /* Wait for status register to update. */
 spi_flash_status_t status;
 do
    {
       (void) R_QSPI_StatusGet(&g_qspi0_ctrl, &status);
    } while (true == status.write_in_progress);
 /* Write one byte to enter QSPI mode, then deassert QSSL. After entering QPI mode on
the device, change the SPI
```

```
  * protocol to QPI mode on the MCU peripheral. */
    data[0] = QSPI_COMMAND_ENTER_QPI_MODE;
    err     = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, false);
    assert(FSP_SUCCESS == err);
    (void) R_QSPI_SpiProtocolSet(&g_qspi0_ctrl, SPI_FLASH_PROTOCOL_QPI);
}
```

Reading Status Register Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define QSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_qspi_direct_example (void)
{
 /* Read a status register. */
 /* Write one byte to read the status register. Do not deassert QSSL. */
    uint8_t   data;
 fsp_err_t err;
    data = QSPI_COMMAND_READ_STATUS_REGISTER;
    err = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data, 1, true);
    assert(FSP_SUCCESS == err);
 /* Read one byte. After all data is read, deassert the QSSL line. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data, 1);
    assert(FSP_SUCCESS == err);
 /* Status register contents are available in variable 'data'. */
}
```

Querying Device Size Example (R_QSPI_DirectWrite, R_QSPI_DirectRead)

This is an example of using R_QSPI_DirectWrite followed by R_QSPI_DirectRead to query the device size.

```
#define QSPI_EXAMPLE_COMMAND_READ_ID (0x9F)
#define QSPI_EXAMPLE_COMMAND_READ_SFDP (0x5A)
void r_qspi_size_example (void)
{
```

```
 /* Many QSPI devices support more than one way to query the device size. Consult the
datasheet for your
  * QSPI device to determine which of these methods are supported (if any). */
    uint32_t device_size_bytes;
 fsp_err_t err;
#ifdef QSPI_EXAMPLE_COMMAND_READ_ID
 /* This example shows how to get the device size by reading the manufacturer ID. */
    uint8_t data[4];
    data[0] = QSPI_EXAMPLE_COMMAND_READ_ID;
    err    = R_QSPI_DirectWrite(&g_qspi0_ctrl, &data[0], 1, true);
    assert(FSP_SUCCESS == err);
 /* Read 3 bytes. The third byte often represents the size of the QSPI, where the
size of the QSPI = 2 ^ N. */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &data[0], 3);
    assert(FSP_SUCCESS == err);
    device_size_bytes = 1U << data[2];
 FSP_PARAMETER_NOT_USED(device_size_bytes);
#endif
#ifdef QSPI_EXAMPLE_COMMAND_READ_SFDP
 /* Read the JEDEC SFDP header to locate the JEDEC flash parameters table. Reference
JESD216 "Serial Flash
  * Discoverable Parameters (SFDP)". */
 /* Send the standard 0x5A command followed by 3 address bytes (SFDP header is at
address 0). */
    uint8_t buffer[16];
    memset(&buffer[0], 0, sizeof(buffer));
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 16 bytes (1 dummy byte followed by 15 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 16);
    assert(FSP_SUCCESS == err);
 /* Read the JEDEC flash parameters to locate the memory size. */
 /* Send the standard 0x5A command followed by 3 address bytes (located in big endian
```

```
order at offset 0xC-0xE).
  * These bytes are accessed at 0xD-0xF because the first byte read is a dummy byte.
*/
    buffer[0] = QSPI_EXAMPLE_COMMAND_READ_SFDP;
    buffer[1] = buffer[0xF];
    buffer[2] = buffer[0xE];
    buffer[3] = buffer[0xD];
    err       = R_QSPI_DirectWrite(&g_qspi0_ctrl, &buffer[0], 4, true);
    assert(FSP_SUCCESS == err);
 /* Read out 9 bytes (1 dummy byte followed by 8 data bytes). */
    err = R_QSPI_DirectRead(&g_qspi0_ctrl, &buffer[0], 9);
    assert(FSP_SUCCESS == err);
 /* Read the memory density (located in big endian order at offset 0x4-0x7). These
bytes are accessed at 0x5-0x8
  * because the first byte read is a dummy byte. */
    uint32_t memory_density = (uint32_t) ((buffer[8] << 24) | (buffer[7] << 16) |
(buffer[6] << 8) | buffer[5]);
 if ((1U << 31) & memory_density)
    {
 /* For densities 4 gigabits and above, bit-31 is set to 1b. The field 30:0 defines
'N' where the density is
  * computed as 2^N bits (N must be >= 32). This code subtracts 3 from N to divide by
8 to get the size in
  * bytes instead of bits. */
       device_size_bytes = 1U << ((memory_density & ~(1U << 31)) - 3U);
    }
 else
    {
 /* For densities 2 gigabits or less, bit-31 is set to 0b. The field 30:0 defines the
size in bits. This
  * code divides the memory density by 8 to get the size in bytes instead of bits. */
       device_size_bytes = (memory_density / 8) + 1;
    }
 FSP_PARAMETER_NOT_USED(device_size_bytes);
```

```
#endif

}
```

Data Structures

struct	qspi_instance_ctrl_t

Enumerations

enum	qspi_qssl_min_high_level_t
enum	qspi_qspclk_div_t

Data Structure Documentation

◆ qspi_instance_ctrl_t

struct qspi_instance_ctrl_t
Instance control block. DO NOT INITIALIZE. Initialization occurs when spi_flash_api_t::open is called

Enumeration Type Documentation

◆ qspi_qssl_min_high_level_t

enum qspi_qssl_min_high_level_t	
Enumerator	
QSPI_QSSL_MIN_HIGH_LEVEL_1_QSPCLK	QSSL deselected for at least 1 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_2_QSPCLK	QSSL deselected for at least 2 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_3_QSPCLK	QSSL deselected for at least 3 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_4_QSPCLK	QSSL deselected for at least 4 QSPCLK.
QSPI_QSSL_MIN_HIGH_LEVEL_5_QSPCLK	QSSL deselected for at least 5 QSPCLK.

Function Documentation

◆ R_QSPI_Open()

fsp_err_t R_QSPI_Open (spi_flash_ctrl_t * *p_ctrl*, spi_flash_cfg_t const *const *p_cfg*)

Open the QSPI driver module. After the driver is open, the QSPI can be accessed like internal flash memory starting at address 0x60000000.

Implements spi_flash_api_t::open.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with the same p_instance_ctrl.

◆ R_QSPI_DirectWrite()

fsp_err_t R_QSPI_DirectWrite (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write*)

Writes raw data directly to the QSPI.

Implements spi_flash_api_t::directWrite.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_DirectRead()

fsp_err_t R_QSPI_DirectRead (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Reads raw data directly from the QSPI. This API can only be called after R_QSPI_DirectWrite with read_after_write set to true.

Implements spi_flash_api_t::directRead.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function must be called after R_QSPI_DirectWrite with read_after_write set to true.

◆ R_QSPI_DirectTransfer()

fsp_err_t R_QSPI_DirectTransfer (spi_flash_ctrl_t * *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction*)

Read/Write raw data directly with the OctaFlash/OctaRAM device. Unsupported by QSPI.

Implements spi_flash_api_t::directTransfer.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI.

◆ R_QSPI_XipEnter()

fsp_err_t R_QSPI_XipEnter (spi_flash_ctrl_t * *p_ctrl*)

Enters XIP (execute in place) mode.

Implements spi_flash_api_t::xipEnter.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_XipExit()

fsp_err_t R_QSPI_XipExit (spi_flash_ctrl_t * *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_Write()

fsp_err_t R_QSPI_Write (spi_flash_ctrl_t * *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count*)

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Return values

FSP_SUCCESS	The flash was programmed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_Erase()

fsp_err_t R_QSPI_Erase (spi_flash_ctrl_t * *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count*)

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

Return values

FSP_SUCCESS	The command to erase the flash was executed successfully.
FSP_ERR_ASSERTION	p_instance_ctrl or p_device_address is NULL, or byte_count doesn't match an erase size defined in spi_flash_cfg_t, or device is in XIP mode.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.
FSP_ERR_DEVICE_BUSY	The device is busy.

◆ R_QSPI_StatusGet()

fsp_err_t R_QSPI_StatusGet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_status_t *const *p_status*)

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Return values

FSP_SUCCESS	The write status is in p_status.
FSP_ERR_ASSERTION	p_instance_ctrl or p_status is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_MODE	This function can't be called when XIP mode is enabled.

◆ R_QSPI_BankSet()

fsp_err_t R_QSPI_BankSet (spi_flash_ctrl_t * *p_ctrl*, uint32_t *bank*)

Selects the bank to access. A bank is a 64MB sliding access window into the QSPI device flash memory space. To access chip address 0x4000000, select bank 1, then read from internal flash address 0x60000000. To access chip address 0x8001000, select bank 2, then read from internal flash address 0x60001000.

This function is not required for memory devices less than or equal to 512 Mb (64MB).

Implements spi_flash_api_t::bankSet.

Return values

FSP_SUCCESS	Bank successfully selected.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_QSPI_SpiProtocolSet()

fsp_err_t R_QSPI_SpiProtocolSet (spi_flash_ctrl_t * *p_ctrl*, spi_flash_protocol_t *spi_protocol*)

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

Return values

FSP_SUCCESS	SPI protocol updated on MCU peripheral.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.
FSP_ERR_INVALID_ARGUMENT	Invalid SPI protocol requested.

◆ R_QSPI_AutoCalibrate()

fsp_err_t R_QSPI_AutoCalibrate (spi_flash_ctrl_t * *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern. Unsupported by QSPI. Implements spi_flash_api_t::autoCalibrate.

Return values

FSP_ERR_UNSUPPORTED	API not supported by QSPI

◆ R_QSPI_Close()

fsp_err_t R_QSPI_Close (spi_flash_ctrl_t * *p_ctrl*)

Close the QSPI driver module.

Implements spi_flash_api_t::close.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	Driver is not opened.

fsp_err_t	R_SDHI_Close (sdmmc_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.

Overview

Features

- Supports the following memory devices: SDSC (SD Standard Capacity), SDHC (SD High Capacity), SDXC (SD Extended Capacity) and eMMC (embedded Multi Media Card)
    - Supports reading, writing and erasing SD memory devices
    - Supports 1, 4 or 8-bit data bus (8-bit bus is supported for eMMC only)
    - Supports detection of device write protection (SD cards only)
    - Supports high speed mode
- Automatically configures the clock to the maximum clock rate supported by both host (MCU) and device
- Supports hardware acceleration using DMAC or DTC
- Supports callback notification when an operation completes or an error occurs

Configuration

Build Time Configurations for r_sdhi

The following build time configurations are defined in fsp_cfg/r_sdhi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Unaligned Access Support	• Disabled • Enabled	Enabled	If enabled, code for supporting buffers that are not aligned on a 4-byte boundary is included in the build. Only disable this if all buffers passed to the driver are 4-byte aligned.
SD Support	• Disabled • Enabled	Enabled	If selected code for SD card support is included in the build.
eMMC Support	• Disabled • Enabled	Disabled	If selected code for eMMC device support is included in the build.

Configurations for Storage > SD/MMC (r_sdhi)

This module can be added to the Stacks tab via New Stack > Storage > SD/MMC (r_sdhi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_sdmmc0	Module name.

Channel	Value must be a non-negative integer	0	Select the channel.
Bus Width	MCU Specific Options		Select the bus width.
Block Size	Value must be an integer between 1 and 512	512	Select the media block size. Must be 512 for SD cards or eMMC devices. Must be 1-512 for SDIO.
Card Detection	• Not Used • CD Pin	CD Pin	Select the card detection method.
Write Protection	• Not Used • WP Pin	WP Pin	Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Access Interrupt Priority	MCU Specific Options		Select the access interrupt priority.
Card Interrupt Priority	MCU Specific Options		Select the card interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Interrupt Configurations:

The following interrupts are required to use the r_sdhi module:

Using SD/MMC with DTC:

- Access Interrupt
- DTC Interrupt

Using SD/MMC with DMAC:

- Access Interrupt
- DMAC Interrupt (in DMAC instance)

The Card interrupt is optional and only available on MCU packages that have the SDnCD pin (n = channel number).

Clock Configuration

The SDMMC MCU peripheral (SDHI) uses the PCLKA for its clock source. The SDMMC driver selects the optimal built-in divider based on the PCLKA frequency and the maximum clock rate allowed by the device obtained at media initialization.

Pin Configuration

The SDMMC driver supports the following pins (n = channel number):

- SDnCLK
- SDnCMD
- SDnDAT0
- SDnDAT1
- SDnDAT2
- SDnDAT3
- SDnDAT4 (not available on all MCUs)
- SDnDAT5 (not available on all MCUs)
- SDnDAT6 (not available on all MCUs)
- SDnDAT7 (not available on all MCUs)
- SDnCD (not available on all MCUs)
- SDnWP

The drive capacity for each pin should be set to "Medium" or "High" for most hardware designs. This can be configured in the **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection -> Ports.

Usage Notes

Card Detection

When Card Detection is configured to "CD Pin" in the RA Configuration editor, interrupt flags are cleared and card detection is enabled during R_SDHI_Open().

R_SDHI_StatusGet() can be called to retrieve the current status of the card (including whether a card is present). If the Card Interrupt Priority is enabled, a callback is called when a card is inserted or removed.

If a card is removed and reinserted, R_SDHI_MediaInit() must be called before reading from the card or writing to the card.

Note

R_SDHI_StatusGet() should be used to initially determine the card state after opening the interface.

DMA Request Interrupt Priority

When data transfers are not 4-byte aligned or not a multiple of 4 bytes, a software copy of the block size (up to 512 bytes) is done in the DMA Request interrupt. This blocks all other interrupts that are a lower or equal priority to the access interrupt until the software copy is complete.

Timing Notes for R_SDHI_MediaInit

The R_SDHI_MediaInit() API completes the entire device identification and configuration process. This involves several command-response cycles at a bus width of 1 bit and a bus speed of 400 kHz or less.

Limitations

Developers should be aware of the following limitations when using the SDHI:

Blocking Calls

The following functions block execution until the response is received for at least one command:

- R_SDHI_MediaInit
- R_SDHI_Erase

Once the function returns the status of the operation can be determined via R_SDHI_StatusGet or through receipt of a callback.

Note

Due to the variability in clocking configurations it is recommended to determine blocking delays experimentally on the target system.

Data Alignment and Size

Data transfers should be 4-byte aligned and a multiple of 4 bytes in size whenever possible. This recommendation applies to the read(), write(), readIoExt(), and writeIoExt() APIs. When data transfers are 4-byte aligned and a multiple of 4-bytes, the r_sdhi driver is zero copy and takes full advantage of hardware acceleration by the DMAC or DTC. When data transfers are not 4-byte aligned or not a multiple of 4 bytes an extra CPU interrupt is required for each block transferred and a software copy is used to move data to the destination buffer.

Examples

Basic Example

This is a basic example of minimal use of the r_sdhi in an application.

```
uint8_t g_dest[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[SDHI_MAX_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void r_sdhi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < SDHI_MAX_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the SDHI driver. */
 fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
    err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
 /* Wait for transfer. */
    }
}
/* The callback is called when a transfer completes. */
void r_sdhi_example_callback (sdmmc_callback_args_t * p_args)
{
 if (SDMMC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = 1;
    }
}
```

Card Detection Example

This is an example of using SDHI when the card may not be plugged in. The card detection interrupt must be enabled to use this example.

```
bool g_card_inserted = false;
void r_sdhi_card_detect_example (void)
{
 /* Open the SDHI driver. This enables the card detection interrupt. */
 fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Check if card is inserted. */
 sdmmc_status_t status;
    err = R_SDHI_StatusGet(&g_sdmmc0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 if (!status.card_inserted)
    {
 while (!g_card_inserted)
      {
 /* Wait for a card insertion interrupt. */
      }
    }
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card after card insertion is detected. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
}
/* The callback is called when a card detection event occurs if the card detection
interrupt is enabled. */
void r_sdhi_card_detect_example_callback (sdmmc_callback_args_t * p_args)
{
 if (SDMMC_EVENT_CARD_INSERTED == p_args->event)
    {
       g_card_inserted = true;
```

```
    }
 if (SDMMC_EVENT_CARD_REMOVED == p_args->event)
    {
       g_card_inserted = false;
    }
}
```

Function Documentation

◆ R_SDHI_Open()

fsp_err_t R_SDHI_Open (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_cfg_t const *const *p_cfg*)

Opens the driver. Resets SDHI, and enables card detection interrupts if card detection is enabled. R_SDHI_MediaInit must be called after this function before any other functions can be used.

Implements sdmmc_api_t::open().

Example:

```
/* Open the SDHI driver. */
fsp_err_t err = R_SDHI_Open(&g_sdmmc0_ctrl, &g_sdmmc0_cfg);
```

Return values

FSP_SUCCESS	Module is now open.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
FSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this MCU.

◆ R_SDHI_MediaInit()

fsp_err_t R_SDHI_MediaInit (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_device_t *const *p_device*)

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements sdmmc_api_t::mediaInit().

Example:

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = R_SDHI_MediaInit(&g_sdmmc0_ctrl, NULL);
```

Return values

FSP_SUCCESS	Module is now ready for read/write access.
FSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512. Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_INIT_FAILED	Device was not identified as an SD card, eMMC device, or SDIO card.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_Read()

fsp_err_t R_SDHI_Read (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements sdmmc_api_t::read().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Example:

```
err = R_SDHI_Read(&g_sdmmc0_ctrl, g_dest, 3, 1);
```

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.

◆ R_SDHI_Write()

fsp_err_t R_SDHI_Write (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements sdmmc_api_t::write().

A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written and the device is no longer holding DAT0 low to indicate it is busy.

Example:

```
err = R_SDHI_Write(&g_sdmmc0_ctrl, g_src, 3, 1);
```

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_WRITE_FAILED	Write operation failed.

◆ R_SDHI_ReadIo()

fsp_err_t R_SDHI_ReadIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*)

The Read function reads a one byte register from an SDIO card. Implements sdmmc_api_t::readIo().

This function blocks until the command is sent and the response is received. p_data contains the register value read when this function returns.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_WriteIo()

fsp_err_t R_SDHI_WriteIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*, sdmmc_io_write_mode_t const *read_after_write*)

Writes a one byte register to an SDIO card. Implements sdmmc_api_t::writeIo().

This function blocks until the command is sent and the response is received. The register has been written when this function returns. If read_after_write is true, p_data contains the register value read when this function returns.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	Handle or Source address is NULL.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_ReadIoExt()

fsp_err_t R_SDHI_ReadIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *function*, uint32_t const *address*, uint32_t *const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Reads data from an SDIO card function. Implements sdmmc_api_t::readIoExt().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.

◆ R_SDHI_WriteIoExt()

fsp_err_t R_SDHI_WriteIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *function*, uint32_t const *address*, uint32_t const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Writes data to an SDIO card function. Implements sdmmc_api_t::writeIoExt().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written.

Return values

FSP_SUCCESS	Card write finished successfully.
FSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_WRITE_FAILED	Write operation failed.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.

◆ R_SDHI_IoIntEnable()

fsp_err_t R_SDHI_IoIntEnable (sdmmc_ctrl_t *const *p_api_ctrl*, bool *enable*)

Enables or disables the SDIO Interrupt. Implements sdmmc_api_t::ioIntEnable().

Return values

FSP_SUCCESS	Card enabled or disabled SDIO interrupts successfully.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_DEVICE_BUSY	Driver is busy with a previous operation.
FSP_ERR_UNSUPPORTED	SDIO support disabled in SDHI_CFG_SDIO_SUPPORT_ENABLE.

◆ R_SDHI_StatusGet()

fsp_err_t R_SDHI_StatusGet (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_status_t *const *p_status*)

Provides driver status. Implements sdmmc_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Driver has not been initialized.

◆ R_SDHI_Erase()

fsp_err_t R_SDHI_Erase (sdmmc_ctrl_t *const *p_api_ctrl*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Erases sectors of an SD card or eMMC device. Implements sdmmc_api_t::erase().

This function blocks until the erase command is sent. Poll the status to determine when erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	A required pointer is NULL or an argument is invalid.
FSP_ERR_NOT_OPEN	Driver has not been initialized.
FSP_ERR_CARD_NOT_INITIALIZED	Card was unplugged.
FSP_ERR_CARD_WRITE_PROTECTED	SD card is Write Protected.
FSP_ERR_RESPONSE	Device did not respond or responded with an error.
FSP_ERR_DEVICE_BUSY	Device is holding DAT0 low (device is busy) or another operation is ongoing.

◆ R_SDHI_CallbackSet()

fsp_err_t R_SDHI_CallbackSet (sdmmc_ctrl_t *const *p_api_ctrl*, void(*)(sdmmc_callback_args_t *) *p_callback*, void const *const *p_context*, sdmmc_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements sdmmc_api_t::callbackSet. **Return values** FSP_SUCCESS — Callback updated successfully. FSP_ERR_ASSERTION — A required pointer is NULL. FSP_ERR_NOT_OPEN — The control block has not been opened. FSP_ERR_NO_CALLBACK_MEMORY — p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SDHI_Close()

fsp_err_t R_SDHI_Close (sdmmc_ctrl_t *const *p_api_ctrl*)
Closes an open SD/MMC device. Implements sdmmc_api_t::close(). **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — The parameter p_ctrl is NULL. FSP_ERR_NOT_OPEN — Driver has not been initialized.

Detailed Description

Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

Overview

This VEE module emulates basic EEPROM capabilities. Support is provided for reading and writing both common records and reference data (originally programmed during product assembly or test). A count of the number of segments erased throughout the lifetime of the application is maintained and can be accessed at any time. Wear leveling is handled automatically by the driver.

Features

- Writing and reading user defined records of any length to data flash.
- Wear leveling is handled automatically.
- Reference data such as calibration data programmed at assembly or test time is preserved.
- Reference data can be updated at run time.
- Fault resilient design.

Data Flash Segmentation

Wear leveling is handled by changing the location in the data flash where a record is stored every time that it is updated. This change in physical location of the record is transparent to the user. Any time an update for a specific record ID is written, it is written to the next unused location in data flash and its location is stored in RAM for quick look-up later. When required, only the most recent version of these records is automatically copied to the next blank segment in data flash. The data flash area is divided into a number of equal-size segments. There is only one segment active at a time. A segment contains two areas- the record area (which is the vast majority of the segment) and

the reference data area which contains optional data typically programmed during assembly or final test. Records and updated reference data are written to this segment until one of the two areas becomes full. The record area must be able to hold at least one of every record ID possible and still have space left over for record updates.

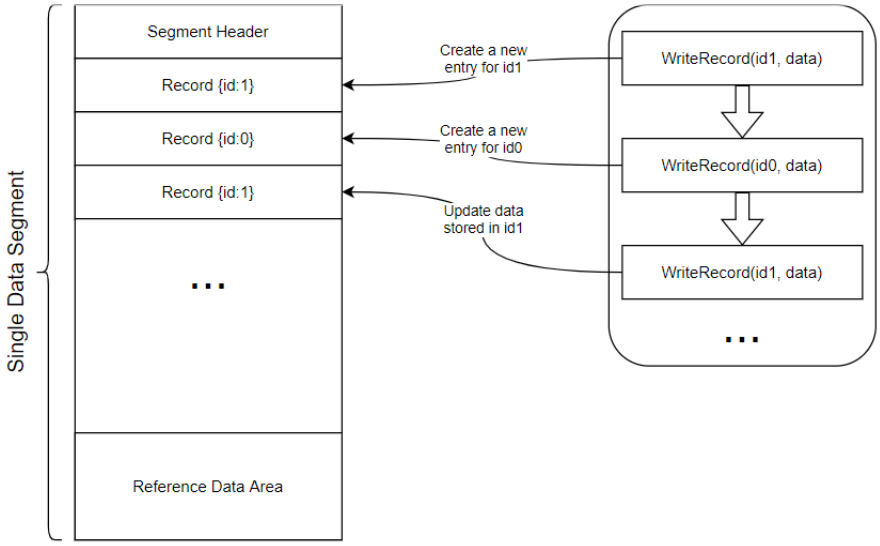

Figure 220: Segment Data Format

When a segment does not have sufficient space for additional records or updated reference data, a Refresh occurs. This process copies the most recent record for each ID as well as the latest version of reference data (if any) to the next segment. The very first time VEE runs on an MCU, it marks the last segment as active whether there is reference data configured or not. The end of VEE data flash area is used to provide an easily identified physical flash address that can be used while programming reference data without requiring Virtual EEPROM middleware.

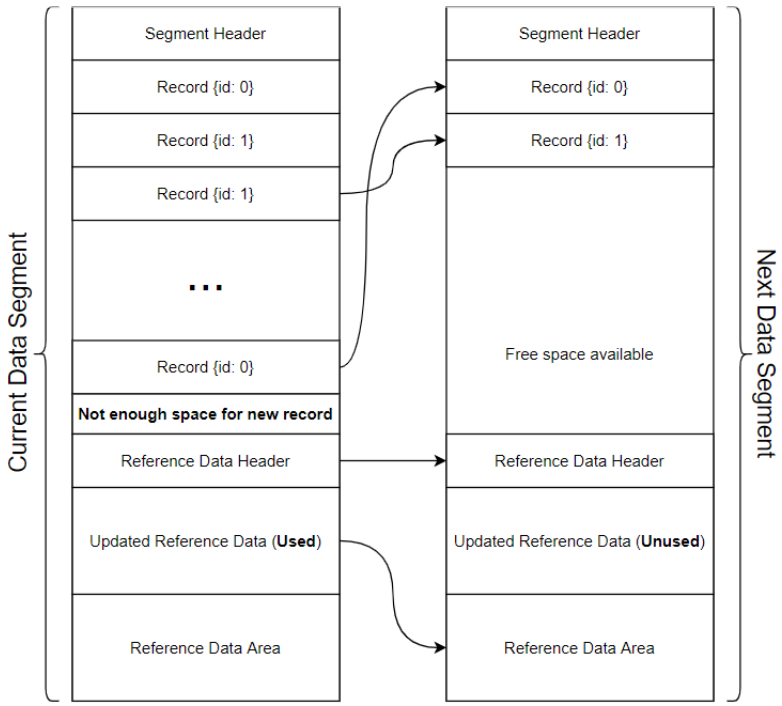

Figure 221: Refresh Operation

Record Format

Each record begins with a header that contains the record size, followed by the data, and the trailer. The trailer contains a validation code which is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the record data passed to the driver. Padding is added between the end of user data and the trailer to ensure the trailer is aligned properly.

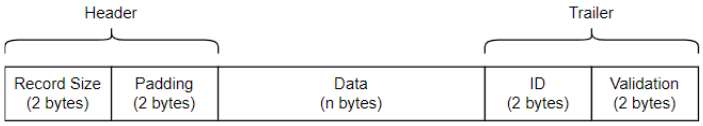

Figure 222: Record Format

Reference Data Area

VEE can be configured for the presence of reference data. The original programmed reference data must be located at the end of the VEE data flash area. An area of equal size is reserved below this in case updated reference data becomes available later. Below that is a header which indicates whether the update area has been written to.

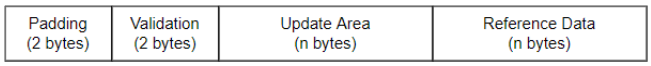

Figure 223: Reference Data Area Format

Just as with records, the validation code is used for internal purposes only and is not a 16-bit CRC or ECC value. If that level of error checking is desired, the user should include that in the updated reference data passed to the driver.

Fault Tolerance

The Virtual EEPROM has a fault tolerant design. If for any reason an operation fails before it is completed the next time the module is opened a refresh will occur. Any corrupted data will be discarded.

Configuration

Build Time Configurations for rm_vee_flash

The following build time configurations are defined in fsp_cfg/rm_vee_flash_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Reference Data Support	• Enabled • Disabled	Disabled	Support writing reference data to the end of the segment.

Refresh Buffer Size	Value must be an integer greater than 0 and a multiple of 4 bytes.	32	The size of the internal buffer used to copying data from one flash segment to another during a refresh operation. This is required because data flash to data flash transfers are not supported by the hardware.

Configurations for Storage > Virtual EEPROM on Flash (rm_vee_flash)

This module can be added to the Stacks tab via New Stack > Storage > Virtual EEPROM on Flash (rm_vee_flash). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_vee0	Module name.
Record Max ID	Value must be an integer.	16	Set this value to the highest record ID in use.
Number of Segments	Value must be an integer.	2	Set value to number of segments desired in data flash (minimum 2). The fewer the segments, the fewer refreshes occur, but the longer refreshes take to complete (erase time).
Start Address	Manual Entry	BSP_FEATURE_FLASH_DATA_FLASH_START	Start address of the flash area used by Virtual EEPROM.
Total Size	Manual Entry	BSP_DATA_FLASH_SIZE_BYTES	The total size (In bytes) of the flash area used by Virtual EEPROM.
Reference Data Size	Value must be an integer.	0	The size of the reference area (In bytes) used by Virtual EEPROM.
Callback	Name must be a valid C symbol	vee_callback	A user callback function can be provided. If this callback function is provided, it will be called from the flash interrupt service

routine (ISR).

Clock Configuration

There is no clock configuration for the RM_VEE_FLASH module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

A refresh buffer is required to copy data between segments. Data flash cannot be simultaneously read from and written to. Data will be temporarily copied into RAM during refresh operations.

Examples

Basic Example

This is a basic example of minimal use of the RM_VEE_FLASH module in an application.

```
volatile bool callback_called = false;
/* Record ID to use for storing pressure data. */
#define ID_PRESSURE (0U)
/* Example data structure. */
typedef struct st_pressure
{
    uint32_t timestamp;
    uint16_t low;
    uint16_t average;
    uint16_t high;
} pressure_t;
void rm_vee_example ()
{
 /* Open the Virtual EEPROM Module. */
 fsp_err_t err = RM_VEE_FLASH_Open(&g_vee_ctrl, &g_vee_cfg);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Read pressure data from external sensor. */
```

```
    pressure_t pressure_data;
    get_pressure_data(&pressure_data);
 /* Write the pressure data to a Virtual EEPROM Record. */
    err = RM_VEE_FLASH_RecordWrite(&g_vee_ctrl, ID_PRESSURE, (uint8_t *)
&pressure_data, sizeof(pressure_t));
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Wait for the Virtual EEPROM callback to indicate it finished writing data. */
 while (false == callback_called)
    {
       ;
    }
 /* Get a pointer to the record that is stored in data flash. */
    uint32_t    length;
    pressure_t * p_pressure_data;
    err = RM_VEE_FLASH_RecordPtrGet(&g_vee_ctrl, ID_PRESSURE, (uint8_t **)
&p_pressure_data, &length);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
 /* Close the Virtual EEPROM Module. */
    err = RM_VEE_FLASH_Close(&g_vee_ctrl);
 if (FSP_SUCCESS != err)
    {
       error_handler();
    }
}
void rm_vee_tests_callback (rm_vee_callback_args_t * p_args)
{
    callback_called = true;
 FSP_PARAMETER_NOT_USED(p_args);
```

```
}
```

Data Structures

struct	rm_vee_flash_cfg_t
struct	rm_vee_flash_instance_ctrl_t

Data Structure Documentation

◆ rm_vee_flash_cfg_t

struct rm_vee_flash_cfg_t		
User configuration structure, used in open function		
Data Fields		
flash_instance_t const *	p_flash	Pointer to a flash instance.

◆ rm_vee_flash_instance_ctrl_t

struct rm_vee_flash_instance_ctrl_t
Instance control block. This is private to the FSP and should not be used or modified by the application.

Function Documentation

◆ RM_VEE_FLASH_Open()

fsp_err_t RM_VEE_FLASH_Open (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_cfg_t const *const *p_cfg*)

Open the RM_VEE_FLASH driver module

Implements rm_vee_api_t::open

Initializes the driver's internal structures and opens the Flash driver. The Flash driver must be closed prior to opening VEE. The error code FSP_SUCCESS_RECOVERY indicates that VEE detected corrupted data; most likely due to a power loss during a data flash write or erase. In these cases, an automatic internal Refresh is performed and the partially written data is lost.

Return values

FSP_SUCCESS	Successful. FSP_SUCCESS_RECOVERY changed to FSP_SUCCESS
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_ALREADY_OPEN	This function has already been called.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Interrupts disabled outside of VEE
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.
FSP_ERR_INVALID_ARGUMENT	The supplied configuration is invalid.

◆ RM_VEE_FLASH_RecordWrite()

fsp_err_t RM_VEE_FLASH_RecordWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t const *const *const *p_rec_data*, uint32_t const *num_bytes*)

Writes a record to data flash.

Implements rm_vee_api_t::recordWrite

This function writes num_bytes of data pointed to by p_rec_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes. This includes exiting the calling function when the data buffer is a local variable (stack may be used by another function and corrupt the data buffer contents).

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_ARGUMENT	An argument contains an illegal value.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RefDataWrite()

fsp_err_t RM_VEE_FLASH_RefDataWrite (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Writes new Reference data to the reference update area.

Implements rm_vee_api_t::refDataWrite

This function writes VEE_CFG_REF_DATA_SIZE bytes pointed to by p_ref_data to data flash. This function returns immediately after starting the flash write. BE SURE NOT TO MODIFY the data buffer contents until after the write completes.

Return values

FSP_SUCCESS	Write started successfully.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_RecordPtrGet()

fsp_err_t RM_VEE_FLASH_RecordPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint32_t const *rec_id*, uint8_t **const *pp_rec_data*, uint32_t *const *p_num_bytes*)

Gets a pointer to the most recent record data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the record data in flash. Flash cannot be accessed for reading and writing at the same time. Therefore, reading the data at p_ref_data must be completed prior to initiating any type of Flash write.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	p_ref_data is NULL.
FSP_ERR_INVALID_ARGUMENT	Record data not configured.
FSP_ERR_NOT_FOUND	The record associated with the requested ID could not be found.

◆ RM_VEE_FLASH_RefDataPtrGet()

fsp_err_t RM_VEE_FLASH_RefDataPtrGet (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t **const *pp_ref_data*)

Gets a pointer to the most recent reference data.

Implements rm_vee_api_t::recordPtrGet

This function sets the argument pointer to the most recent version of the reference data in flash. Flash cannot be accessed for reading and writing at the same time.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_UNSUPPORTED	Reference data is not supported in the current configuration.
FSP_ERR_NOT_FOUND	No reference data was found.

◆ RM_VEE_FLASH_Refresh()

fsp_err_t RM_VEE_FLASH_Refresh (rm_vee_ctrl_t *const *p_api_ctrl*)

Manually start a refresh operation

Implements rm_vee_api_t::refresh

This function is used to start a segment Refresh at any time. The Refresh process by default occurs automatically when no more record or reference data space is available and a Write is requested. However, the app may desire to force a refresh when it knows it is running low on space and large amounts of data are about to be recorded.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed in hardware.
FSP_ERR_INVALID_MODE	The operation cannot be started in the current mode.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_Format()

fsp_err_t RM_VEE_FLASH_Format (rm_vee_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_ref_data*)

Start a manual format operation.

Implements rm_vee_api_t::format

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_IN_USE	Last API call still executing.
FSP_ERR_PE_FAILURE	This error indicates that a flash programming, erase, or blankcheck operation has failed
FSP_ERR_ASSERTION	An input parameter is NULL.
FSP_ERR_TIMEOUT	Flash write timed out (Should not be possible when flash bgo is used).
FSP_ERR_NOT_INITIALIZED	Corruption found. A refresh is required.

◆ RM_VEE_FLASH_CallbackSet()

fsp_err_t RM_VEE_FLASH_CallbackSet (rm_vee_ctrl_t *const *p_api_ctrl*, void(*)(rm_vee_callback_args_t *) *p_callback*, void const *const *p_context*, rm_vee_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Implements rm_vee_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_VEE_FLASH_StatusGet()

fsp_err_t RM_VEE_FLASH_StatusGet (rm_vee_ctrl_t *const *p_api_ctrl*, rm_vee_status_t *const *p_status*)

Get the current status of the driver.

Implements rm_vee_api_t::statusGet

This command is typically used to verify that the last Write or Refresh command has completed before attempting to perform another API call.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

◆ RM_VEE_FLASH_Close()

fsp_err_t RM_VEE_FLASH_Close (rm_vee_ctrl_t *const *p_api_ctrl*)

Closes the Flash driver and VEE driver.

Implements rm_vee_api_t::close

Return values

FSP_SUCCESS	Successful.
FSP_ERR_NOT_OPEN	The module has not been opened.
FSP_ERR_ASSERTION	An input parameter is NULL.

4.2.17 System

Modules

Detailed Description

System Modules.

Modules

Clock Generation Circuit (r_cgc)

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

	Event Link Controller (r_elc) Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.
	I/O Port (r_ioport) Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.

4.2.17.1 Clock Generation Circuit (r_cgc)

fsp_err_t	R_CGC_Close (cgc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CGC peripheral on RA MCUs. This module implements the CGC Interface.

Note

This module is not required for the initial clock configuration. Initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor. The initial clock settings are applied by the BSP during the startup process before main.

Overview

Features

The CGC module supports runtime modifications of clock settings. Key features include the following:

- Supports changing the system clock source to any of the following options (provided they are supported on the MCU):
  - High-speed on-chip oscillator (HOCO)
  - Middle-speed on-chip oscillator (MOCO)
  - Low-speed on-chip oscillator (LOCO)
  - Main oscillator (external resonator or external clock input frequency)
  - Sub-clock oscillator (external resonator)
  - PLL/PLL2 (not available on all MCUs)
- When the system core clock frequency changes, the following things are updated:
  - The CMSIS standard global variable SystemCoreClock is updated to reflect the new clock frequency.
  - Wait states for ROM and RAM are adjusted to the minimum supported value for the new clock frequency.
  - The operating power control mode is updated to the minimum supported value for the new clock settings.
- Supports starting or stopping any of the system clock sources
- Supports changing dividers for the internal clocks
- Supports the oscillation stop detection feature

Internal Clocks

The RA microcontrollers have up to seven internal clocks. Not all internal clocks exist on all MCUs. Each clock domain has its own divider that can be updated in R_CGC_SystemClockSet(). The dividers are subject to constraints described in the footnote of the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual.

The internal clocks include:

- System clock (ICLK): core clock used for CPU, flash, internal SRAM, DTC, and DMAC
- PCLKA/PCLKB/PCLKC/PCLKD: Peripheral clocks, refer to the table "Specifications of the Clock Generation Circuit for the internal clocks" in the hardware manual to see which peripherals are controlled by which clocks.
- FCLK: Clock source for reading data flash and for programming/erasure of both code and data flash.
- BCLK: External bus clock

Configuration

Note

*The initial clock settings are configurable on the **Clocks** tab of the RA Configuration editor.*
There is a configuration to enable the HOCO on reset in the OFS1 settings on the BSP tab.
The following clock related settings are configurable in the RA Common section on the BSP tab:

- *Main Oscillator Wait Time*
- *Main Oscillator Clock Source (external oscillator or crystal/resonator)*
- *Subclock Populated*
- *Subclock Drive*
- *Subclock Stabilization Time (ms)*

The default stabilization times are determined based on development boards provided by Renesas, but are generally valid for most designs. Depending on the target board hardware configuration and requirements these values may need to be adjusted for reliability or startup speed.

Build Time Configurations for r_cgc

The following build time configurations are defined in fsp_cfg/r_cgc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Clock Generation Circuit (r_cgc)

This module can be added to the Stacks tab via New Stack > System > Clock Generation Circuit (r_cgc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cgc0	Module name.
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if oscillation stop detection is used. If this callback function is provided, it is called from the NMI handler if the main oscillator stops.

Clock Configuration

This module is used to configure the system clocks. There are no module specific clock configurations required to use it.

Pin Configuration

The CGC module controls the output of the CLOCKOUT signal.

If an external oscillator is used the XTAL and EXTAL pins must be configured accordingly. When running from an on chip oscillator there is no requirement for the main clock external oscillator. In this case, the XTAL and EXTAL pins can be set to a different function in the RA Configuration editor.

The functionality of the subclock external oscillator pins XCIN and XCOUT is fixed.

Usage Notes

NMI Interrupt

The CGC timer uses the NMI for oscillation stop detection of the main oscillator after R_CGC_OscStopDetectEnable is called. The NMI is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during R_CGC_Open() is called.

Starting or Stopping the Subclock

If the Subclock Populated property is set to Populated on the BSP configuration tab, then the subclock is started in the BSP startup routine. Otherwise, it is stopped in the BSP startup routine. Starting and stopping the subclock at runtime is not recommended since the stabilization requirements typically negate the negligible power savings.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take up to several seconds to stabilize. RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. In this case the default wait time is 1000ms (1 second). When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation. Because there is no hardware stabilization status bit for the subclock R_CGC_ClockCheck cannot be used to optimize this wait.

Changing the subclock state during R_CGC_ClocksCfg() is not supported.

Low Power Operation

If "Use Low Voltage Mode" is enabled in the BSP MCU specific properties (not available on all MCUs), the MCU is always in low voltage mode and no other power modes are considered. The following conditions must be met for the MCU to run in low voltage mode:

- Requires HOCO to be running, so HOCO cannot be stopped in low voltage mode
- Requires PLL to be stopped, so PLL APIs are not available in low voltage mode
- Requires ICLK <= 4 MHz
- If oscillation stop detection is used, dividers of 1 or 2 cannot be used for any clock

If "Use Low Voltage Mode" is not enabled, the MCU applies the lowest power mode by searching through the following list in order and applying the first power mode that is supported under the current conditions:

- Subosc-speed mode (lowest power)
  - Requires system clock to be LOCO or subclock
  - Requires MOCO, HOCO, main oscillator, and PLL (if present) to be stopped
  - Requires ICLK and FCLK dividers to be 1
- Low-speed mode
  - Requires PLL to be stopped
  - Requires ICLK <= 1 MHz
  - If oscillation stop detection is used, dividers of 1, 2, 4, or 8 cannot be used for any clock

- Middle-speed mode (not supported on all MCUs)
  - Requires ICLK <= 8 MHz
- High-speed mode
  - Default mode if no other operating mode is supported

Refer to the section "Function for Lower Operating Power Consumption" in the "Low Power Modes" chapter of the hardware manual for MCU specific information about operating power control modes.

Note

The DCDC regulator (if present) is only available in Middle- and High-speed modes. The BSP will automatically switch between DCDC and LDO when switching between compatible and incompatible modes if the DCDC regulator is in use. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).

When low voltage mode is not used, the following functions adjust the operating power control mode to ensure it remains within the hardware specification and to ensure the MCU is running at the optimal operating power control mode:

- R_CGC_ClockStart()
- R_CGC_ClockStop()
- R_CGC_SystemClockSet()
- R_CGC_OscStopDetectEnable()
- R_CGC_OscStopDetectDisable()

Note

FSP APIs, including these APIs, are not thread safe. These APIs and any other user code that modifies the operating power control mode must not be allowed to interrupt each other. Proper care must be taken during application design if these APIs are used in threads or interrupts to ensure this constraint is met.

No action is required by the user of these APIs. This section is provided for informational purposes only.

Examples

Basic Example

This is a basic example of minimal use of the CGC in an application.

```
void cgc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to LOCO for power saving. */
 /* Start the LOCO. */
```

```
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
    assert(FSP_SUCCESS == err);
 /* Wait for the LOCO stabilization wait time.
  *
  * NOTE: The MOCO, LOCO and subclock do not have stabilization status bits, so any
stabilization time must be
  * performed via a software wait when starting these oscillators. For all other
oscillators, R_CGC_ClockCheck can
  * be used to verify stabilization status.
  */
 R_BSP_SoftwareDelay(BSP_FEATURE_CGC_LOCO_STABILIZATION_MAX_US,
BSP_DELAY_UNITS_MICROSECONDS);
 /* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
 cgc_divider_cfg_t dividers =
    {
 /* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
 /* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
 /* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
 /* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
    };
 /* Switch the system clock to LOCO. */
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
    assert(FSP_SUCCESS == err);
}
```

Configuring Multiple Clocks

This example demonstrates switching to a new source clock and stopping the previous source clock in a single function call using R_CGC_ClocksCfg().

```
void cgc_clocks_cfg_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the CGC module. */
    err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Change the system clock to PLL running from the main oscillator. */
 /* Assuming the system clock is MOCO, switch to HOCO. */
 cgc_clocks_cfg_t clocks_cfg;
    clocks_cfg.system_clock                    = CGC_CLOCK_PLL;
    clocks_cfg.pll_state                       = CGC_CLOCK_CHANGE_NONE;

}
```

Oscillation Stop Detection

This example demonstrates registering a callback for oscillation stop detection of the main oscillator.

```
/* Example callback called when oscillation stop is detected. */
void oscillation_stop_callback (cgc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) If the MCU was running on the main oscillator, the MCU is now running
on MOCO. Switch clocks if
  * desired. This example shows switching to HOCO. */
```

```
    err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_HOCO, NULL);
    assert(FSP_SUCCESS == err);
 do
    {
 /* Wait for HOCO to stabilize. */
       err = R_CGC_ClockCheck(&g_cgc0_ctrl, CGC_CLOCK_HOCO);
    } while (FSP_SUCCESS != err);
 cgc_divider_cfg_t dividers =
    {
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4,
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4,

    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	cgc_instance_ctrl_t

Data Structure Documentation

◆ cgc_instance_ctrl_t

struct cgc_instance_ctrl_t	
CGC private control block. DO NOT MODIFY. Initialization occurs when R_CGC_Open() is called.	
Data Fields	
void const *	p_context

Field Documentation

◆ p_context

void const* cgc_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in cgc_callback_args_t.

Function Documentation

◆ R_CGC_Open()

fsp_err_t R_CGC_Open (cgc_ctrl_t *const *p_ctrl*, cgc_cfg_t const *const *p_cfg*)

Initialize the CGC API. Implements cgc_api_t::open.

Example:

```
/* Initializes the CGC module. */
   err = R_CGC_Open(&g_cgc0_ctrl, &g_cgc0_cfg);
```

Return values

FSP_SUCCESS	CGC successfully initialized.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CGC_ClocksCfg()

fsp_err_t R_CGC_ClocksCfg (cgc_ctrl_t *const *p_ctrl*, cgc_clocks_cfg_t const *const *p_clock_cfg*)

Reconfigures all main system clocks. This API can be used for any of the following purposes:

- start or stop clocks
- change the system clock source
- configure the PLL/PLL2 multiplication and division ratios when starting the PLL
- change the system dividers

If the requested system clock source has a stabilization flag, this function blocks waiting for the stabilization flag of the requested system clock source to be set. If the requested system clock source was just started and it has no stabilization flag, this function blocks for the stabilization time required by the requested system clock source according to the Electrical Characteristics section of the hardware manual. If the requested system clock source has no stabilization flag and it is already running, it is assumed to be stable and this function will not block. If the requested system clock is the subclock, the subclock must be stable prior to calling this function.

The internal dividers (cgc_clocks_cfg_t::divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

Do not attempt to stop the requested clock source or the source of a PLL if the PLL will be running after this operation completes.

Implements cgc_api_t::clocksCfg.

Example:

```
/* Assuming the system clock is MOCO, switch to HOCO. */
```

```
cgc_clocks_cfg_t clocks_cfg;
   clocks_cfg.system_clock                      = CGC_CLOCK_PLL;
   clocks_cfg.pll_state                         = CGC_CLOCK_CHANGE_NONE;
   clocks_cfg.pll_cfg.source_clock              = CGC_CLOCK_MAIN_OSC; // unused
   clocks_cfg.pll_cfg.multiplier                = CGC_PLL_MUL_10_0;   // unused
   clocks_cfg.pll_cfg.divider                   = CGC_PLL_DIV_2;      // unused
   clocks_cfg.divider_cfg.sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1;
   clocks_cfg.divider_cfg.sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.divider_cfg.sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_4;
   clocks_cfg.mainosc_state                     = CGC_CLOCK_CHANGE_NONE;
   clocks_cfg.hoco_state                        = CGC_CLOCK_CHANGE_START;
   clocks_cfg.moco_state                        = CGC_CLOCK_CHANGE_STOP;
   clocks_cfg.loco_state                        = CGC_CLOCK_CHANGE_NONE;
   err = R_CGC_ClocksCfg(&g_cgc0_ctrl, &clocks_cfg);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock configuration applied successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_NOT_STABILIZED	PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStart()

fsp_err_t R_CGC_ClockStart (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_pll_cfg_t const *const *p_pll_cfg*)

Start the specified clock if it is not currently active. The PLL configuration cannot be changed while the PLL is running. Implements cgc_api_t::clockStart.

The PLL source clock must be operating and stable prior to starting the PLL.

Example:

```
/* Start the LOCO. */
   err = R_CGC_ClockStart(&g_cgc0_ctrl, CGC_CLOCK_LOCO, NULL);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Clock initialized successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	The clock source is not stabilized after being turned off or PLL clock source is not stable.
FSP_ERR_PLL_SRC_INACTIVE	PLL clock source is not running.
FSP_ERR_CLOCK_ACTIVE	PLL configuration cannot be changed while PLL is running.
FSP_ERR_OSC_STOP_DET_ENABLED	PLL multiplier must be less than 20 if oscillation stop detect is enabled and the input frequency is less than 12.5 MHz.
FSP_ERR_INVALID_STATE	The subclock must be running before activating HOCO with FLL.

◆ R_CGC_ClockStop()

fsp_err_t R_CGC_ClockStop (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Stop the specified clock if it is active. Implements cgc_api_t::clockStop.

Do not attempt to stop the current system clock source. Do not attempt to stop the source clock of a PLL if the PLL is running.

Return values

FSP_SUCCESS	Clock stopped successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	Attempt to stop the current system clock or the PLL source clock.
FSP_ERR_OSC_STOP_DET_ENABLED	Attempt to stop MOCO when Oscillation stop is enabled.
FSP_ERR_NOT_STABILIZED	Clock not stabilized after starting.

◆ R_CGC_SystemClockSet()

fsp_err_t R_CGC_SystemClockSet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*, cgc_divider_cfg_t const *const *p_divider_cfg*)

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD, BCLK, and FCLK. Implements cgc_api_t::systemClockSet.

The requested clock source must be running and stable prior to calling this function. The internal dividers are subject to constraints described in the hardware manual table "Specifications of the Clock Generation Circuit for the internal clocks".

The internal dividers (p_divider_cfg) are subject to constraints described in footnotes of the hardware manual table detailing specifications for the clock generation circuit for the internal clocks for the MCU. For example:

- RA6M3: see footnotes of Table 9.2 "Specifications of the clock generation circuit for the internal clocks" in the RA6M3 manual R01UH0886EJ0100
- RA2A1: see footnotes of Table 9.2 "Clock generation circuit specifications for the internal clocks" in the RA2A1 manual R01UH0888EJ0100

This function also updates the RAM and ROM wait states, the operating power control mode, and the SystemCoreClock CMSIS global variable.

Example:

```
/* Set divisors. Divisors for clocks that don't exist on the MCU are ignored. */
cgc_divider_cfg_t dividers =
   {
```

```
 /* PCLKB is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkb_div = CGC_SYS_CLOCK_DIV_64,
 /* PCLKD is not used in this application, so select the maximum divisor for lowest
power. */
       .sckdivcr_b.pclkd_div = CGC_SYS_CLOCK_DIV_64,
 /* ICLK is the MCU clock, allow it to run as fast as the LOCO is capable. */
       .sckdivcr_b.iclk_div = CGC_SYS_CLOCK_DIV_1,
 /* These clocks do not exist on some devices. If any clocks don't exist, set the
divider to 1. */
       .sckdivcr_b.pclka_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.pclkc_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.fclk_div = CGC_SYS_CLOCK_DIV_1,
       .sckdivcr_b.bclk_div = CGC_SYS_CLOCK_DIV_1,
    };
 /* Switch the system clock to LOCO. */
    err = R_CGC_SystemClockSet(&g_cgc0_ctrl, CGC_CLOCK_LOCO, &dividers);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
FSP_ERR_NOT_STABILIZED	The clock source has not stabilized

◆ R_CGC_SystemClockGet()

fsp_err_t R_CGC_SystemClockGet (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *const *p_clock_source*, cgc_divider_cfg_t *const *p_divider_cfg*)

Return the current system clock source and configuration. Implements cgc_api_t::systemClockGet.

Return values

FSP_SUCCESS	Parameters returned successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

◆ R_CGC_ClockCheck()

fsp_err_t R_CGC_ClockCheck (cgc_ctrl_t *const *p_ctrl*, cgc_clock_t *clock_source*)

Check the specified clock for stability. Implements cgc_api_t::clockCheck.

Return values

FSP_SUCCESS	Clock is running and stable.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_STABILIZED	Clock not stabilized.
FSP_ERR_CLOCK_INACTIVE	Clock not turned on.

◆ R_CGC_OscStopDetectEnable()

fsp_err_t R_CGC_OscStopDetectEnable (cgc_ctrl_t *const *p_ctrl*)

Enable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectEnable.

The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Example:

```
/* Enable oscillation stop detection. The main oscillator must be running at this
point. */
    err = R_CGC_OscStopDetectEnable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_LOW_VOLTAGE_MODE	Settings not allowed in low voltage mode.

◆ R_CGC_OscStopDetectDisable()

fsp_err_t R_CGC_OscStopDetectDisable (cgc_ctrl_t *const *p_ctrl*)

Disable the oscillation stop detection for the main clock. Implements cgc_api_t::oscStopDetectDisable.

Example:

```
/* (Optional) Oscillation stop detection must be disabled before entering any low
power mode. */
    err = R_CGC_OscStopDetectDisable(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
    __WFI();
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.

◆ R_CGC_OscStopStatusClear()

fsp_err_t R_CGC_OscStopStatusClear (cgc_ctrl_t *const *p_ctrl*)

Clear the Oscillation Stop Detection Status register. This register is not cleared automatically if the stopped clock is restarted. Implements cgc_api_t::oscStopStatusClear.

After clearing the status, oscillation stop detection is no longer enabled.

This register cannot be cleared while the main oscillator is the system clock or the PLL source clock.

Example:

```
 /* (Optional) Clear the error flag. Only clear this flag after switching the MCU
clock source away from the main
  * oscillator and if the main oscillator is stable again. */
    err = R_CGC_OscStopStatusClear(&g_cgc0_ctrl);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Operation performed successfully.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CLOCK_INACTIVE	Main oscillator must be running to clear the oscillation stop detection flag.
FSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.
FSP_ERR_INVALID_HW_CONDITION	Oscillation stop status was not cleared. Check preconditions and try again.

◆ R_CGC_CallbackSet()

fsp_err_t R_CGC_CallbackSet (cgc_ctrl_t *const *p_api_ctrl*, void(*)(cgc_callback_args_t *) *p_callback*, void const *const *p_context*, cgc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements cgc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CGC_Close()

fsp_err_t R_CGC_Close (cgc_ctrl_t *const *p_ctrl*)

Closes the CGC module. Implements cgc_api_t::close.

Return values

FSP_SUCCESS	The module is successfully closed.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Driver for the ELC peripheral on RA MCUs. This module implements the ELC Interface.

Overview

The event link controller (ELC) uses the event requests generated by various peripheral modules as source signals to connect (link) them to different modules, allowing direct cooperation between the modules without central processing unit (CPU) intervention. The conceptual diagram below illustrates a potential setup where a pin interrupt triggers a timer which later triggers an ADC conversion and CTSU scan, while at the same time a serial communication interrupt automatically starts a data transfer. These tasks would be automatically handled without the need for polling or interrupt management.

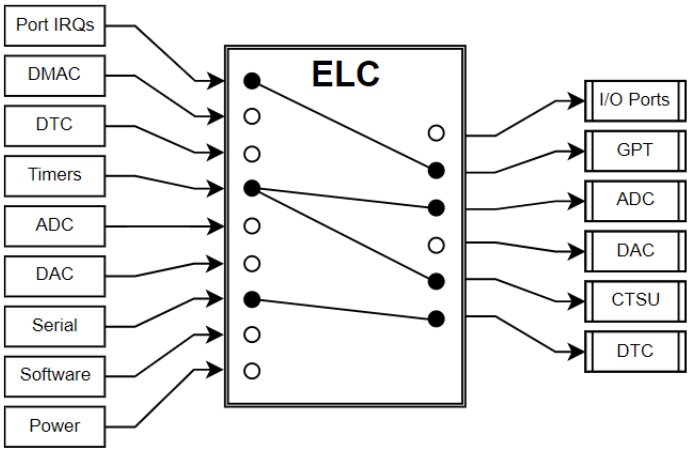

Figure 224: Event Link Controller Conceptual Diagram

In essence, the ELC is an array of multiplexers to route a wide variety of interrupt signals to a subset of peripheral functions. Events are linked by setting the multiplexer for the desired function to the desired signal (through R_ELC_LinkSet). The diagram below illustrates one peripheral output of the ELC. In this example, a conversion start is triggered for ADC0 Group A when the GPT0 counter overflows:

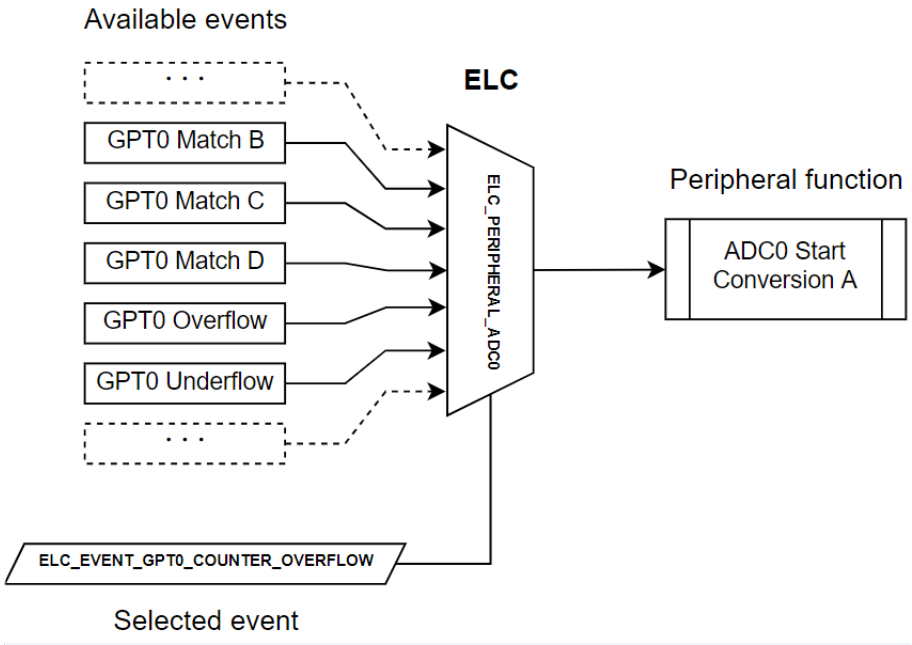

Figure 225: ELC Example

Features

The ELC HAL module can perform the following functions:

- Initialize the ELC to a pre-defined set of links
- Create an event link between two blocks
- Break an event link between two blocks
- Generate one of two software events that interrupt the CPU
- Globally enable or disable event links

A variety of functions can be activated via events, including:

- General-purpose timer (GPT) control
- ADC and DAC conversion start
- Synchronized I/O port output (ports 1-4 only)
- Capacitive touch unit (CTSU) measurement activation

Note

The available sources and peripherals may differ between devices. A full list of selectable peripherals and events is available in the User's Manual for your device.
Some peripherals have specific settings related to ELC event generation and/or reception. Details on how to enable event functionality for each peripheral are located in the usage notes for the related module(s) as well as in the User's Manual for your device.

Configuration

Note

Event links will be automatically generated based on the selections made in module properties. To view the currently linked events check the Event Links tab in the RA Configuration editor.
Calling R_ELC_Open followed by R_ELC_Enable will automatically link all events shown in the Event Links tab.

To manually link an event to a peripheral at runtime perform the following steps:

1. Configure the operation of the destination peripheral (including any configuration necessary to receive events)
2. Use R_ELC_LinkSet to set the desired event link to the peripheral
3. Use R_ELC_Enable to enable transmission of event signals
4. Configure the signaling module to output the desired event (typically an interrupt)

To disable the event, either use R_ELC_LinkBreak to clear the link for a specific event or R_ELC_Disable to globally disable event linking.

Note

The ELC module needs no pin, clocking or interrupt configuration; it is merely a mechanism to connect signals between peripherals. However, when linking I/O Ports via the ELC the relevant I/O pins need to be configured as inputs or outputs.

Build Time Configurations for r_elc

The following build time configurations are defined in fsp_cfg/r_elc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > Event Link Controller (r_elc)

This module can be added to the Stacks tab via New Stack > System > Event Link Controller (r_elc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	ELC instance name must be g_elc to match elc_cfg_t data structure created in elc_data.c	g_elc	Module name. Fixed to g_elc.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the ELC:

- To link events it is necessary for the ELC and the related modules to be enabled. The ELC cannot operate if the related modules are in the module stop state or the MCU is in a low power consumption mode for which the module is stopped.
- If two modules are linked across clock domains there may be a 1 to 2 cycle delay between event signaling and reception. The delay timing is based on the frequency of the slowest clock.

Examples

Basic Example

Below is a basic example of minimal use of event linking in an application.

```
/* This struct is automatically generated based on the events configured by
peripherals in the RA Configuration editor. */
static const elc_cfg_t g_elc_cfg =
{
    .link[ELC_PERIPHERAL_GPT_A]   = ELC_EVENT_ICU_IRQ0,
    .link[ELC_PERIPHERAL_IOPORT1] = ELC_EVENT_GPT4_COUNTER_OVERFLOW
};
void elc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Software-Generated Events

This example demonstrates how to use a software-generated event to signal a peripheral. This can be useful when the desired event source is not supported by the ELC hardware.

```
/* Interrupt handler for peripheral event not supported by the ELC */
void peripheral_isr (void)
{
 fsp_err_t err;
 /* Generate an event signal through software to the linked peripheral. */
```

```
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
}
void elc_software_event (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Link ADC0 conversion start to software event 0. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application code here. */
    }
}
```

Data Structures

struct	elc_instance_ctrl_t

Data Structure Documentation

◆ elc_instance_ctrl_t

struct elc_instance_ctrl_t
ELC private control block. DO NOT MODIFY. Initialization occurs when R_ELC_Open() is called.

Function Documentation

◆ R_ELC_Open()

fsp_err_t R_ELC_Open (elc_ctrl_t *const *p_ctrl*, elc_cfg_t const *const *p_cfg*)

Initialize all the links in the Event Link Controller. Implements elc_api_t::open

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set or clear an individual link use R_ELC_LinkSet and R_ELC_LinkBreak respectively.

Example:

```
/* Initializes the software and sets the links defined in the control structure. */
   err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl or p_cfg was NULL
FSP_ERR_ALREADY_OPEN	The module is currently open

◆ R_ELC_Close()

fsp_err_t R_ELC_Close (elc_ctrl_t *const *p_ctrl*)

Globally disable ELC linking. Implements elc_api_t::close

Return values

FSP_SUCCESS	The ELC was successfully disabled
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_SoftwareEventGenerate()

fsp_err_t R_ELC_SoftwareEventGenerate (elc_ctrl_t *const *p_ctrl*, elc_software_event_t *event_number*)

Generate a software event in the Event Link Controller. Implements elc_api_t::softwareEventGenerate

Example:

```
/* Generate an event signal through software to the linked peripheral. */
   err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	Invalid event number or p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkSet()

fsp_err_t R_ELC_LinkSet (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*, elc_event_t *signal*)

Create a single event link. Implements elc_api_t::linkSet

Example:

```
/* Create or modify a link between a peripheral function and an event source. */
   err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0,
ELC_EVENT_GPT4_COUNTER_OVERFLOW);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_LinkBreak()

fsp_err_t R_ELC_LinkBreak (elc_ctrl_t *const *p_ctrl*, elc_peripheral_t *peripheral*)

Break an event link. Implements elc_api_t::linkBreak

Return values

FSP_SUCCESS	Event link broken
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Enable()

fsp_err_t R_ELC_Enable (elc_ctrl_t *const *p_ctrl*)

Enable the operation of the Event Link Controller. Implements elc_api_t::enable

Return values

FSP_SUCCESS	ELC enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_ELC_Disable()

fsp_err_t R_ELC_Disable (elc_ctrl_t *const *p_ctrl*)

Disable the operation of the Event Link Controller. Implements elc_api_t::disable

Return values

FSP_SUCCESS	ELC disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

fsp_err_t	R_IOPORT_PortWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t value, ioport_size_t mask)
fsp_err_t	R_IOPORT_PinWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t level)
fsp_err_t	R_IOPORT_PortDirectionSet (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t direction_values, ioport_size_t mask)
fsp_err_t	R_IOPORT_PortEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t *p_event_data)
fsp_err_t	R_IOPORT_PinEventInputRead (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t *p_pin_event)
fsp_err_t	R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_t port, ioport_size_t event_data, ioport_size_t mask_value)
fsp_err_t	R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const p_ctrl, bsp_io_port_pin_t pin, bsp_io_level_t pin_value)

Detailed Description

Driver for the I/O Ports peripheral on RA MCUs. This module implements the I/O Port Interface.

Overview

The I/O port pins operate as general I/O port pins, I/O pins for peripheral modules, interrupt input pins, analog I/O, port group function for the ELC, or bus control pins.

Features

The IOPORT HAL module can configure the following pin settings:

- Pin direction
- Default output state
- Pull-up
- NMOS/PMOS
- Drive strength
- Event edge trigger (falling, rising or both)
- Whether the pin is to be used as an IRQ pin
- Whether the pin is to be used as an analog pin
- Peripheral connection

The module also provides the following functionality:

- Read/write GPIO pins/ports
- Sets event output data
- Reads event input data

Configuration

The I/O PORT HAL module must be configured by the user for the desired operation. The operating state of an I/O pin can be set via the RA Configuraton tool. When the project is built a pin configuration file is created. The BSP will automatically configure the MCU IO ports accordingly at startup using the same API functions mentioned in this document.

Build Time Configurations for r_ioport

The following build time configurations are defined in fsp_cfg/r_ioport_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for System > I/O Port (r_ioport)

This module can be added to the Stacks tab via New Stack > System > I/O Port (r_ioport).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ioport	Module name.
Port 1 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT1
Port 2 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT2
Port 3 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT3
Port 4 ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORT4
Port B ELC Trigger	MCU Specific Options		ELC source that will

Source			trigger PORTB
Port C ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTC
Port D ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTD
Port E ELC Trigger Source	MCU Specific Options		ELC source that will trigger PORTE
Pin Configuration Name	Name must be a valid C symbol	g_bsp_pin_cfg	Name for pin configuration structure

Clock Configuration

The I/O PORT HAL module does not require a specific clock configuration.

Pin Configuration

The IOPORT module is used for configuring pins.

Usage Notes

Port Group Function for ELC

Depending on pin configuration, the IOPORT module can perform automatic reads and writes on ports 1-4 on receipt of an ELC event.

When an event is received by a port, the state of the input pins on the port is saved in a hardware register. Simultaneously, the state of output pins on the port is set or cleared based on settings configured by the user. The functions R_IOPORT_PinEventInputRead and R_IOPORT_PortEventInputRead allow reading the last event input state of a pin or port, and event-triggered pin output can be configured through R_IOPORT_PinEventOutputWrite and R_IOPORT_PortEventOutputWrite.

In addition, each pin on ports 1-4 can be configured to trigger an ELC event on rising, falling or both edges. This event can be used to activate other modules when the pin changes state.

Note

The number of ELC-aware ports vary across MCUs. Refer to the Hardware User's Manual for your device for more details.

Examples

Basic Example

This is a basic example of minimal use of the IOPORT in an application.

```
void basic_example ()
{
 bsp_io_level_t readLevel;
 fsp_err_t      err;
```

```
 /* Initialize the IOPORT module and configure the pins
  * Note: The default pin configuration name in the RA Configuraton tool is
g_bsp_pin_cfg */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Call R_IOPORT_PinsCfg if the configuration was not part of initial configurations
made in open */
    err = R_IOPORT_PinsCfg(&g_ioport_ctrl, &g_runtime_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Set Pin 00 of Port 06 to High */
    err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, BSP_IO_LEVEL_HIGH
);
    assert(FSP_SUCCESS == err);
 /* Read Pin 00 of Port 06*/
    err = R_IOPORT_PinRead(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, &readLevel);
    assert(FSP_SUCCESS == err);
}
```

Blinky Example

This example uses IOPORT to configure and toggle a pin to blink an LED.

```
void blinky_example ()
{
 fsp_err_t err;
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure Pin as output
  * Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00,
IOPORT_CFG_PORT_DIRECTION_OUTPUT);
```

```
    assert(FSP_SUCCESS == err);
 bsp_io_level_t level = BSP_IO_LEVEL_LOW;
 while (1)
    {
 /* Determine the next state of the LEDs */
 if (BSP_IO_LEVEL_LOW == level)
      {
            level = BSP_IO_LEVEL_HIGH;
       }
 else
      {
            level = BSP_IO_LEVEL_LOW;
       }
 /* Update LED on RA6M3-PK */
       err = R_IOPORT_PinWrite(&g_ioport_ctrl, BSP_IO_PORT_06_PIN_00, level);
      assert(FSP_SUCCESS == err);
 /* Delay */
 R_BSP_SoftwareDelay(100, BSP_DELAY_UNITS_MILLISECONDS); // NOLINT
    }
}
```

ELC Example

This is an example of using IOPORT with ELC events. The ELC event system allows the captured data to be stored when it occurs and then read back at a later time.

```
static elc_instance_ctrl_t g_elc_ctrl;
static elc_cfg_t g_elc_cfg;
void ioport_elc_example ()
{
 bsp_io_level_t eventValue;
 fsp_err_t      err;
 /* Initializes the software and sets the links defined in the control structure. */
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Create or modify a link between a peripheral function and an event source. */
    err = R_ELC_LinkSet(&g_elc_ctrl, (elc_peripheral_t) ELC_PERIPHERAL_IOPORT2,
ELC_EVENT_ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Globally enable event linking in the ELC. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize the IOPORT module and configure the pins */
    err = R_IOPORT_Open(&g_ioport_ctrl, &g_bsp_pin_cfg);
    assert(FSP_SUCCESS == err);
 /* Call the R_IOPORT_PinCfg if the configuration was not part of initial
configurations made in open */
    err = R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
IOPORT_CFG_PORT_DIRECTION_INPUT);
    assert(FSP_SUCCESS == err);
 /* Generate an event signal through software to the linked peripheral. */
    err = R_ELC_SoftwareEventGenerate(&g_elc_ctrl, ELC_SOFTWARE_EVENT_0);
    assert(FSP_SUCCESS == err);
 /* Read Pin Event Input. The data(BSP_IO_LEVEL_HIGH/ BSP_IO_LEVEL_LOW) from
BSP_IO_PORT_02_PIN_00 is read into the
  * EIDR bit */
    err = R_IOPORT_PinEventInputRead(&g_ioport_ctrl, BSP_IO_PORT_02_PIN_00,
&eventValue);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ R_IOPORT_Open()

fsp_err_t R_IOPORT_Open (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Initializes internal driver data, then calls pin configuration function to configure pins.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_IOPORT_Close()

fsp_err_t R_IOPORT_Close (ioport_ctrl_t *const *p_ctrl*)

Resets IOPORT registers. Implements ioport_api_t::close

Return values

FSP_SUCCESS	The IOPORT was successfully uninitialized
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The module has not been opened

◆ R_IOPORT_PinsCfg()

fsp_err_t R_IOPORT_PinsCfg (ioport_ctrl_t *const *p_ctrl*, const ioport_cfg_t * *p_cfg*)

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements ioport_api_t::pinsCfg.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the Pins tab of the RA Configuration editor or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and testing.

Return values

FSP_SUCCESS	Pin configuration data written to PFS register(s)
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

◆ R_IOPORT_PinCfg()

fsp_err_t R_IOPORT_PinCfg (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, uint32_t *cfg*)

Configures the settings of a pin. Implements ioport_api_t::pinCfg.

Return values

FSP_SUCCESS	Pin configured
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

◆ R_IOPORT_PinRead()

fsp_err_t R_IOPORT_PinRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_value*)

Reads the level on a pin. Implements ioport_api_t::pinRead.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PortRead()

fsp_err_t R_IOPORT_PortRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_port_value*)

Reads the value on an IO port. Implements ioport_api_t::portRead.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

Return values

FSP_SUCCESS	Port read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortWrite()

fsp_err_t R_IOPORT_PortWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *value*, ioport_size_t *mask*)

Writes to multiple pins on a port. Implements ioport_api_t::portWrite.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. For example, value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Return values

FSP_SUCCESS	Port written to
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointerd

Note

This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

◆ R_IOPORT_PinWrite()

fsp_err_t R_IOPORT_PinWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *level*)

Sets a pin's output either high or low. Implements ioport_api_t::pinWrite.

Return values

FSP_SUCCESS	Pin written to
FSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid
FSP_ERR_NOT_OPEN	The module has not been opene
FSP_ERR_ASSERTION	NULL pointerd

Note

This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

◆ R_IOPORT_PortDirectionSet()

fsp_err_t R_IOPORT_PortDirectionSet (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *direction_values*, ioport_size_t *mask*)

Sets the direction of individual pins on a port. Implements ioport_api_t::portDirectionSet().

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Return values

FSP_SUCCESS	Port direction updated
FSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventInputRead()

fsp_err_t R_IOPORT_PortEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t * *p_event_data*)

Reads the value of the event input data. Implements ioport_api_t::portEventInputRead().

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Port read
FSP_ERR_INVALID_ARGUMENT	Port not a valid ELC port
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventInputRead()

fsp_err_t R_IOPORT_PinEventInputRead (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t * *p_pin_event*)

Reads the value of the event input data of a specific pin. Implements ioport_api_t::pinEventInputRead.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

FSP_SUCCESS	Pin read
FSP_ERR_ASSERTION	NULL pointer
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_INVALID_ARGUMENT	Port is not valid ELC PORT.

Note

This function is re-entrant.

◆ R_IOPORT_PortEventOutputWrite()

fsp_err_t R_IOPORT_PortEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_t *port*, ioport_size_t *event_data*, ioport_size_t *mask_value*)

This function writes the set and reset event output data for a port. Implements ioport_api_t::portEventOutputWrite.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Return values

FSP_SUCCESS	Port event data written
FSP_ERR_INVALID_ARGUMENT	Port or Mask not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinEventOutputWrite()

fsp_err_t R_IOPORT_PinEventOutputWrite (ioport_ctrl_t *const *p_ctrl*, bsp_io_port_pin_t *pin*, bsp_io_level_t *pin_value*)

This function writes the event output data value to a pin. Implements ioport_api_t::pinEventOutputWrite.

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Return values

FSP_SUCCESS	Pin event data written
FSP_ERR_INVALID_ARGUMENT	Port or Pin or value not valid
FSP_ERR_NOT_OPEN	The module has not been opened
FSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

4.2.18 Timers

Modules

Detailed Description

Timers Modules.

Modules

	Port Output Enable for GPT (r_poeg) Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.
	Realtime Clock (r_rtc) Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.
	Three-Phase PWM (r_gpt_three_phase) Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the Three-Phase Interface.

	Timer, General PWM (r_gpt) Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.
	Timer, Low-Power (r_agt) Driver for the AGT peripheral on RA MCUs. This module implements the Timer Interface.

4.2.18.1 Port Output Enable for GPT (r_poeg)

fsp_err_t	R_POEG_Close (poeg_ctrl_t *const p_ctrl)

Detailed Description

Driver for the POEG peripheral on RA MCUs. This module implements the POEG Interface.

Overview

The POEG module can be used to configure events to disable GPT GTIOC output pins.

Features

The POEG module has the following features:

- Supports disabling GPT output pins based on GTETRG input pin level.
- Supports disabling GPT output pins based on comparator crossing events (configurable in the Comparator, High-Speed (r_acmphs) driver).

- Supports disabling GPT output pins when GTIOC pins are the same level (configurable in the Timer, General PWM (r_gpt) driver).
- Supports disabling GPT output pins when main oscillator stop is detected.
- Supports disabling GPT output pins by software API.
- Supports notifying the application when GPT output pins are disabled by POEG.
- Supports resetting POEG status.

Configuration

Build Time Configurations for r_poeg

The following build time configurations are defined in fsp_cfg/r_poeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Port Output Enable for GPT (r_poeg)

This module can be added to the Stacks tab via New Stack > Timers > Port Output Enable for GPT (r_poeg). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_poeg0	Module name.
General > Channel	Must be a valid POEG channel	0	Specify the hardware channel.
General > Trigger	MCU Specific Options		Select the trigger sources that will enable POEG. Software disable is always supported. This configuration can only be set once after reset. It cannot be modified after the initial setting.
Input > GTETRG Polarity	• Active High • Active Low	Active High	Select the polarity of the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.
Input > GTETRG Noise Filter	• Disabled • PCLKB/1 • PCLKB/8 • PCLKB/32 • PCLKB/128	Disabled	Configure the noise filter for the GTETRG pin. Only applicable if GTETRG pin is selected under Trigger.

Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) when GPT output pins are disabled by POEG.
Interrupts > Interrupt Priority	MCU Specific Options		Select the POEG interrupt priority.

Clock Configuration

The POEG clock is based on the PCLKB frequency.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, or GTETRGD as an input signal to disable GPT output pins.

Usage Notes

POEG GTETRG Pin and Channel

The POEG channel number corresponds to the GTETRG input pin that can be used with the channel. GTETRGA must be used with POEG channel 0, GTETRGB must be used with POEG channel 1, etc.

Limitations

The user should be aware of the following limitations when using POEG:

- The POEG trigger source can only be set once per channel. Modifying the POEG trigger source after it is set is not allowed by the hardware.
- The POEG cannot be disabled using this API. The interrupt is disabled in R_POEG_Close(), but the POEG will still disable the GPT output pins if a trigger is detected even if the module is closed.

Examples

POEG Basic Example

This is a basic example of minimal use of the POEG in an application.

```
void poeg_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the POEG. */
    err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

POEG Callback Example

This is an example of a using the POEG callback to restore GPT output operation.

```
/* Example callback called when POEG disables GPT output pins. */
void poeg_callback (poeg_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 /* (Optional) Determine the cause of the POEG event. */
 poeg_status_t status;
    (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
 /* Correct the cause of the POEG event before resetting POEG. */
 /* Reset the POEG before exiting the callback. */
    (void) R_POEG_Reset(&g_poeg0_ctrl);
 /* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
  * again. */
 do
    {
      (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
    } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
 /* Alternatively, if the POEG cannot be reset, disable the POEG interrupt to prevent
it from firing continuously.
  * Update the 0 in the macro below to match the POEG channel number. */
    NVIC_DisableIRQ(VECTOR_NUMBER_POEG0_EVENT);
}
```

Data Structures

struct	poeg_instance_ctrl_t

Data Structure Documentation

◆ poeg_instance_ctrl_t

struct poeg_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when poeg_api_t::open is called.

Function Documentation

◆ R_POEG_Open()

fsp_err_t R_POEG_Open (poeg_ctrl_t *const *p_ctrl*, poeg_cfg_t const *const *p_cfg*)

Initializes the POEG module and applies configurations. Implements poeg_api_t::open.

Note

The poeg_cfg_t::trigger setting can only be configured once after reset. Reopening with a different trigger configuration is not possible.

Example:

```
/* Initializes the POEG. */
   err = R_POEG_Open(&g_poeg0_ctrl, &g_poeg0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	poeg_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_POEG_OutputDisable()

fsp_err_t R_POEG_OutputDisable (poeg_ctrl_t *const *p_ctrl*)

Disables GPT output pins. Implements poeg_api_t::outputDisable.

Return values

FSP_SUCCESS	GPT output pins successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_Reset()

fsp_err_t R_POEG_Reset (poeg_ctrl_t *const *p_ctrl*)

Resets status flags. Implements poeg_api_t::reset.

Note

Status flags are only reset if the original POEG trigger is resolved. Check the status using R_POEG_StatusGet after calling this function to verify the status is cleared.

Example:

```
/* Correct the cause of the POEG event before resetting POEG. */
/* Reset the POEG before exiting the callback. */
   (void) R_POEG_Reset(&g_poeg0_ctrl);
/* Wait for the status to clear after reset before exiting the callback to ensure
the interrupt does not fire
 * again. */
do
   {
     (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
   } while (POEG_STATE_NO_DISABLE_REQUEST != status.state);
```

Return values

FSP_SUCCESS	Function attempted to clear status flags.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_StatusGet()

fsp_err_t R_POEG_StatusGet (poeg_ctrl_t *const *p_ctrl*, poeg_status_t *const *p_status*)

Get current POEG status and store it in provided pointer p_status. Implements poeg_api_t::statusGet.

Example:

```
/* (Optional) Determine the cause of the POEG event. */
poeg_status_t status;
   (void) R_POEG_StatusGet(&g_poeg0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current POEG state stored successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_POEG_CallbackSet()

fsp_err_t R_POEG_CallbackSet (poeg_ctrl_t *const *p_ctrl*, void(*)(poeg_callback_args_t *) *p_callback*, void const *const *p_context*, poeg_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements poeg_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_POEG_Close()

fsp_err_t R_POEG_Close (poeg_ctrl_t *const *p_ctrl*)

Disables POEG interrupt. Implements poeg_api_t::close.

Note

This function does not disable the POEG.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

4.2.18.2 Realtime Clock (r_rtc)

fsp_err_t	R_RTC_CallbackSet (rtc_ctrl_t *const p_ctrl, void(*p_callback)(rtc_callback_args_t *), void const *const p_context, rtc_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the RTC peripheral on RA MCUs. This module implements the RTC Interface.

Overview

The RTC HAL module configures the RTC module and controls clock, calendar and alarm functions. A callback can be used to respond to the alarm and periodic interrupt.

Features

- RTC time and date get and set.
- RTC time and date alarm get and set.
- RTC alarm and periodic event notification.

The RTC HAL module supports three different interrupt types:

- An alarm interrupt generated on a match of any combination of year, month, day, day of the week, hour, minute or second
- A periodic interrupt generated every 2, 1, 1/2, 1/4, 1/8, 1/16, 1/32, 1/64, 1/128, or 1/256 second(s)
- A carry interrupt is used internally when reading time from the RTC calender to get accurant time readings.

Note

See section "23.3.5 Reading 64-Hz Counter and Time" of the RA6M3 manual R01UH0886EJ0100 for more details.

A user-defined callback function can be registered (in the rtc_api_t::open API call) and will be called from the interrupt service routine (ISR) for alarm and periodic interrupt. When called, it is passed a pointer to a structure (rtc_callback_args_t) that holds a user-defined context pointer and an indication of which type of interrupt was fired.

Date and Time validation

"Parameter Checking" needs to be enabled if date and time validation is required for calendarTimeSet and calendarAlarmSet APIs. If "Parameter Checking" is enabled, the 'day of the week' field is automatically calculated and updated by the driver for the provided date. When using the calendarAlarmSet API, only the fields which have their corresponding match flag set are written to the registers. Other register fields are reset to default value.

Sub-Clock error adjustment (Time Error Adjustment Function)

The time error adjustment function is used to correct errors, running fast or slow, in the time caused by variation in the precision of oscillation by the sub-clock oscillator. Because 32,768 cycles of the sub-clock oscillator constitute 1 second of operation when the sub-clock oscillator is selected, the clock runs fast if the sub-clock frequency is high and slow if the sub-clock frequency is low. The time error adjustment functions include:

- Automatic adjustment
- Adjustment by software

The error adjustment is reset every time RTC is reconfigured or time is set.

Note

RTC driver configurations do not do error adjustment internally while initiliazing the driver. Application must make calls to the error adjustment api's for desired adjustment. See section 26.3.8 "Time Error Adjustment Function" of the RA6M3 manual R01UH0886EJ0100) for more details on this feature

Configuration

Build Time Configurations for r_rtc

The following build time configurations are defined in fsp_cfg/r_rtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Set Source Clock in Open	• Enabled • Disabled	Enabled	If enabled RTC source clock is initialized in R_RTC_Open. If disabled, R_RTC_ClockSourceSet must be called to set the RTC source clock. Disable if user wants to control the setting of RTC source clock after warm start.

Configurations for Timers > Realtime Clock (r_rtc)

This module can be added to the Stacks tab via New Stack > Timers > Realtime Clock (r_rtc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rtc0	Module name.
Clock Source	• Sub-Clock • LOCO	LOCO	Select the RTC clock source.
Frequency Comparision Value (LOCO)	Value must be a positive integer between 7 and 511	255	Frequency comparison value when using LOCO
Automatic Adjustment Mode	• Enabled • Disabled	Enabled	Enable/ Disable the Error Adjustment mode
Automatic Adjustment	• 10 Seconds	10 Seconds	Select the Error

Period	• 1 Minute • NONE		Adjustment Period for Automatic Adjustment
Adjustment Type (Plus-Minus)	• NONE • Addition • Subtraction	NONE	Select the Error Adjustment type
Error Adjustment Value	Value must be a positive integer less than equal to 63	0	Specify the Adjustment Value (the number of sub-clock cycles) from the prescaler
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Alarm Interrupt Priority	MCU Specific Options		Select the alarm interrupt priority.
Period Interrupt Priority	MCU Specific Options		Select the period interrupt priority.
Carry Interrupt Priority	MCU Specific Options		Select the carry interrupt priority.

Note

See 23.2.20 Frequency Register (RFRH/RFRL) of the RA6M3 manual R01UH0886EJ0100) for more details

Interrupt Configuration

To activate interrupts for the RTC module, the desired interrupts must be enabled, The underlying implementation will be expected to handle any interrupts it can support and notify higher layers via callback.

Clock Configuration

The RTC HAL module can use the following clock sources:

- LOCO (Low Speed On-Chip Oscillator) with less accuracy
- Sub-clock oscillator with increased accuracy

The LOCO is the default selection during configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

System Initialization

- RTC driver does not start the sub-clock. The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

- Carry interrupt priority must be set to avoid incorrect time returned from calendarTimeGet API during roll-over.
- Even when only running in Periodic Interrupt mode R_RTC_CalendarTimeSet must be called successfully to start the RTC.
- In case of warm start or a hard reset (when VBATT powers RTC in case of power loss), user might not want to reinitialize the clock source after reset. In this case, disable the Set Source Clock in Open property for RTC and call R_RTC_ClockSourceSet() only when RTC clock source needs to be set. Application should check for the reset type and should accordingly call the R_RTC_ClockSourceSet().

Limitations

Developers should be aware of the following limitations when using the RTC:

- R_RTC operates in 24-hour mode.
- Binary-count mode is not supported.
- The R_RTC_CalendarTimeGet() cannot be used from an interrupt that has higher priority than the carry interrupt. Also, it must not be called with interrupts disabled globally, as this API internally uses carry interrupt for its processing. API may return incorrect time if this is done.

Examples

RTC Basic Example

This is a basic example of minimal use of the RTC in an application.

```
/* rtc_time_t is an alias for the C Standard time.h struct 'tm' */
rtc_time_t set_time =
{
    .tm_sec = 10,
    .tm_min = 11,
    .tm_hour = 12,
    .tm_mday = 6,
    .tm_wday = 3,
    .tm_mon = 11,
    .tm_year = YEARS_SINCE_1900,
};
rtc_time_t get_time;
```

```
void rtc_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module */
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* Set the calendar time */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Get the calendar time */
 R_RTC_CalendarTimeGet(&g_rtc0_ctrl, &get_time);
}
```

RTC Clock Source Set Example

This is an example of how to handle call to set the RTC clock.

```
void rtc_clock_source_set_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* This condition can differ based on use case. */
 if (R_SYSTEM->RSTSR0 == 1)
    {
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
    }
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
```

```
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Periodic interrupt example

This is an example of periodic interrupt in RTC.

```
void rtc_periodic_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 /* R_RTC_CalendarTimeSet must be called at least once to start the RTC */
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time);
 /* Set the periodic interrupt rate to 1 second */
 R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
 /* Wait for the periodic interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Alarm interrupt example

This is an example of alarm interrupt in RTC.

```
void rtc_alarm_irq_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
    err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 R_RTC_CalendarAlarmSet(&g_rtc0_ctrl, &set_time1);
 /* Wait for the Alarm interrupt */
 while (1)
    {
 /* Wait for interrupt */
    }
}
```

RTC Error Adjustment example

This is an example of modifying error adjustment in RTC.

```
void rtc_erroradj_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /*Open the RTC module*/
 R_RTC_Open(&g_rtc0_ctrl, &g_rtc1_cfg);
 /* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
 R_RTC_ClockSourceSet(&g_rtc0_ctrl);
 R_RTC_CalendarTimeSet(&g_rtc0_ctrl, &set_time1.time);
 /* Modify Error Adjustment after RTC is running */
```

```
    err = R_RTC_ErrorAdjustmentSet(&g_rtc0_ctrl, &err_cfg2);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	rtc_instance_ctrl_t

Data Structure Documentation

◆ rtc_instance_ctrl_t

struct rtc_instance_ctrl_t	
Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called	
Data Fields	
uint32_t	open
	Whether or not driver is open.
const rtc_cfg_t *	p_cfg
	Pointer to initial configurations.
volatile bool	carry_isr_triggered
	Was the carry isr triggered.

Function Documentation

◆ R_RTC_Open()

fsp_err_t R_RTC_Open (rtc_ctrl_t *const *p_ctrl*, rtc_cfg_t const *const *p_cfg*)

Opens and configures the RTC driver module. Implements rtc_api_t::open. Configuration includes clock source, and interrupt callback function.

Example:

```
/* Open the RTC module */
   err = R_RTC_Open(&g_rtc0_ctrl, &g_rtc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_Close()

fsp_err_t R_RTC_Close (rtc_ctrl_t *const *p_ctrl*)

Close the RTC driver. Implements rtc_api_t::close

Return values

FSP_SUCCESS	De-Initialization was successful and RTC driver closed.
FSP_ERR_ASSERTION	Invalid p_ctrl.
FSP_ERR_NOT_OPEN	Driver not open already for close.

◆ R_RTC_ClockSourceSet()

fsp_err_t R_RTC_ClockSourceSet (rtc_ctrl_t *const *p_ctrl*)

Sets the RTC clock source. Implements rtc_api_t::clockSourceSet.

Example:

```
/* This condition can differ based on use case. */
if (R_SYSTEM->RSTSR0 == 1)
   {
/* Set the RTC clock source. Can be skipped if "Set Source Clock in Open" property
is enabled. */
R_RTC_ClockSourceSet(&g_rtc0_ctrl);
   }
```

Return values

FSP_SUCCESS	Initialization was successful and RTC has started.
FSP_ERR_ASSERTION	Invalid p_ctrl or p_cfg pointer.
FSP_ERR_NOT_OPEN	Driver is not opened.

◆ R_RTC_CalendarTimeSet()

fsp_err_t R_RTC_CalendarTimeSet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

FSP_SUCCESS	Calendar time set operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.

◆ R_RTC_CalendarTimeGet()

fsp_err_t R_RTC_CalendarTimeGet (rtc_ctrl_t *const *p_ctrl*, rtc_time_t *const *p_time*)

Get the calendar time.

Warning

Do not call this function from a critical section or from an interrupt with higher priority than the carry interrupt, or the time returned may be inaccurate.

Implements rtc_api_t::calendarTimeGet

Return values

FSP_SUCCESS	Calendar time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmSet()

fsp_err_t R_RTC_CalendarAlarmSet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Set the calendar alarm time.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

FSP_SUCCESS	Calendar alarm time set operation was successful.
FSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_CalendarAlarmGet()

fsp_err_t R_RTC_CalendarAlarmGet (rtc_ctrl_t *const *p_ctrl*, rtc_alarm_time_t *const *p_alarm*)

Get the calendar alarm time.

Implements rtc_api_t::calendarAlarmGet

Return values

FSP_SUCCESS	Calendar alarm time get operation was successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_PeriodicIrqRateSet()

fsp_err_t R_RTC_PeriodicIrqRateSet (rtc_ctrl_t *const *p_ctrl*, rtc_periodic_irq_select_t const *rate*)

Set the periodic interrupt rate and enable periodic interrupt.

Implements rtc_api_t::periodicIrqRateSet

Note

To start the RTC R_RTC_CalendarTimeSet must be called at least once.

Example:

```
/* Set the periodic interrupt rate to 1 second */
R_RTC_PeriodicIrqRateSet(&g_rtc0_ctrl, RTC_PERIODIC_IRQ_SELECT_1_SECOND);
```

Return values

FSP_SUCCESS	The periodic interrupt rate was successfully set.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.
FSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid

◆ R_RTC_InfoGet()

fsp_err_t R_RTC_InfoGet (rtc_ctrl_t *const *p_ctrl*, rtc_info_t *const *p_rtc_info*)

Set RTC clock source and running status information ad store it in provided pointer p_rtc_info

Implements rtc_api_t::infoGet

Return values

FSP_SUCCESS	Get information Successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_ErrorAdjustmentSet()

fsp_err_t R_RTC_ErrorAdjustmentSet (rtc_ctrl_t *const *p_ctrl*, rtc_error_adjustment_cfg_t const *const *err_adj_cfg*)

This function sets time error adjustment

Implements rtc_api_t::errorAdjustmentSet

Return values

FSP_SUCCESS	Time error adjustment successful.
FSP_ERR_ASSERTION	Invalid input argument.
FSP_ERR_NOT_OPEN	Driver not open for operation.
FSP_ERR_UNSUPPORTED	The clock source is not sub-clock.
FSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.

◆ R_RTC_CallbackSet()

fsp_err_t R_RTC_CallbackSet (rtc_ctrl_t *const *p_ctrl*, void(*)(rtc_callback_args_t *) *p_callback*, void const *const *p_context*, rtc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements rtc_api_t::callbackSet

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to RTC control block is NULL or the RTC is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

4.2.18.3 Three-Phase PWM (r_gpt_three_phase)

Modules » Timers

Functions

fsp_err_t	R_GPT_THREE_PHASE_Open (three_phase_ctrl_t *const p_ctrl, three_phase_cfg_t const *const p_cfg)
fsp_err_t	R_GPT_THREE_PHASE_Stop (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const p_ctrl)
fsp_err_t	R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const p_ctrl, three_phase_duty_cycle_t *const p_duty_cycle)
fsp_err_t	R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const p_ctrl, void(*p_callback)(timer_callback_args_t *), void const *const p_context, timer_callback_args_t *const p_callback_memory)
fsp_err_t	R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const p_ctrl)

Detailed Description

Driver for 3-phase motor control using the GPT peripheral on RA MCUs. This module implements the

Three-Phase Interface.

Overview

The General PWM Timer (GPT) Three-Phase driver provides basic functionality for synchronously starting and stopping three PWM channels for use in 3-phase motor control applications. A function is additionally provided to allow setting duty cycle values for all three channels, optionally with double-buffering.

Features

The GPT Three-Phase driver provides the following functions:

- Synchronize configuration of three GPT channels
- Synchronously start, stop and reset all three GPT channels
- Set duty cycle on all three channels with one function

Configuration

Build Time Configurations for r_gpt_three_phase

The following build time configurations are defined in fsp_cfg/r_gpt_three_phase_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Timers > Three-Phase PWM (r_gpt_three_phase)

This module can be added to the Stacks tab via New Stack > Timers > Three-Phase PWM (r_gpt_three_phase). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_three_phase0	Module name.
General > Mode	• Triangle-Wave Symmetric PWM • Triangle-Wave Asymmetric PWM • Triangle-Wave Asymmetric PWM (Mode 3)	Triangle-Wave Symmetric PWM	Mode selection. Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough. Triangle-Wave Asymmetric PWM:

			Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.
General > Period	Value must be a non-negative integer less than or equal to 0x40000000000	15	Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000, which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the generated timer_cfg_t structures for each timer.
General > Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Kilohertz	Unit of the period specified above
General > GPT U-Channel	Value must be an integer greater than or equal to 0	0	Specify the GPT channel for U signal output.
General > GPT V-Channel	Value must be an integer greater than or equal to 0	1	Specify the GPT channel for V signal output.

General > GPT W-Channel	Value must be an integer greater than or equal to 0	2	Specify the GPT channel for W signal output.
General > Callback Channel	• U-Channel • V-Channel • W-Channel	U-Channel	Specify the GPT channel to set a callback for when using R_GPT_THREE_PHASE_CallbackSet.
General > Buffer Mode	• Single Buffer • Double Buffer	Single Buffer	When Double Buffer is selected the 'duty_buffer' array in three_phase_duty_cycle_t is used as a buffer for the 'duty' array. This allows setting the duty cycle for the next two crest/trough events in asymmetric mode with only one call to R_GPT_THREE_PHASE_DutyCycleSet.
General > GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
General > GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Extra Features > Dead Time > Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during up counting. This value also applies during down counting for the GPT32 and GPT16 variants.
Extra Features > Dead Time > Dead Time Count Down (Raw Counts) (GPTE/GPTEH only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting. This value only applies to the GPT32E and GPT32EH variants.

Clock Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Pin Configuration

Please refer to the Timer, General PWM (r_gpt) section for more information.

Usage Notes

Warning

Be sure the GTIOCA/B stop level and dead time values are set appropriately for your application before attempting to drive a motor. Failure to do so may result in damage to the motor drive circuitry and/or the motor itself if the timer is stopped by software.

Initial Setup

The following should be configured once the GPT Three-Phase module has been added to a project:

1. Set "Pin Output Support" in one of the GPT submodules to "Enabled with Extra Features"
2. Configure common settings in the GPT Three-Phase module properties
3. Set the crest and trough interrupt priority and callback function in **one** of the three GPT submodules (if desired)
4. Set the "Extra Features -> Output Disable" settings in each GPT submodule as needed for your application

Note

Because all three modules are operated synchronously with the same period interrupts only need to be enabled in one of the three GPT modules.

Buffer Modes

There are two buffering modes available for duty cycle values - single- and double-buffered. In single buffer mode only the values specified in the duty array element of three_phase_duty_cycle_t are used by R_GPT_THREE_PHASE_DutyCycleSet. At the next trough or crest event the output duty cycle will be internally updated to the set values.

In double buffer mode the duty_buffer array values are used as buffer values for the duty elements. Once passed to R_GPT_THREE_PHASE_DutyCycleSet, the next trough or crest event will update the output duty cycle to the values specified in duty as before. However, at the following crest or trough event the output duty cycle will be updated to the values in duty_buffer. This allows the duty cycle for both sides of an asymmetric PWM waveform to be set at only one trough or crest event per period instead of at every event.

Examples

GPT Three-Phase Basic Example

This is a basic example of minimal use of the GPT Three-Phase module in an application. The duty cycle is updated at every timer trough with the previously loaded buffer value, then the duty cycle buffer is reloaded in the trough interrupt callback.

```
void gpt_callback (timer_callback_args_t * p_args)
{
 fsp_err_t                err;
 three_phase_duty_cycle_t duty_cycle;
 if (TIMER_EVENT_TROUGH == p_args->event)
    {
 /* Update duty cycle values (example) */
       duty_cycle.duty[THREE_PHASE_CHANNEL_U] =
```

```
get_duty_counts(THREE_PHASE_CHANNEL_U);
       duty_cycle.duty[THREE_PHASE_CHANNEL_V] =
get_duty_counts(THREE_PHASE_CHANNEL_V);
       duty_cycle.duty[THREE_PHASE_CHANNEL_W] =
get_duty_counts(THREE_PHASE_CHANNEL_W);
 /* Update duty cycle values */
       err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
       assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Handle crest event. */
    }
}
void gpt_three_phase_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
}
```

Data Structures

struct	gpt_three_phase_instance_ctrl_t

Data Structure Documentation

◆ gpt_three_phase_instance_ctrl_t

struct gpt_three_phase_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when three_phase_api_t::open is called.

Function Documentation

◆ R_GPT_THREE_PHASE_Open()

fsp_err_t R_GPT_THREE_PHASE_Open (three_phase_ctrl_t *const *p_ctrl*, three_phase_cfg_t const *const *p_cfg*)

Initializes the 3-phase timer module (and associated timers) and applies configurations. Implements three_phase_api_t::open.

Example:

```
/* Initializes the module. */
   err = R_GPT_THREE_PHASE_Open(&g_gpt_three_phase_ctrl, &g_gpt_three_phase_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	A required input pointer is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_GPT_THREE_PHASE_Stop()

fsp_err_t R_GPT_THREE_PHASE_Stop (three_phase_ctrl_t *const *p_ctrl*)

Stops all timers synchronously. Implements three_phase_api_t::stop.

Return values

FSP_SUCCESS	Timers successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Start()

fsp_err_t R_GPT_THREE_PHASE_Start (three_phase_ctrl_t *const *p_ctrl*)

Starts all timers synchronously. Implements three_phase_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_THREE_PHASE_Start(&g_gpt_three_phase_ctrl);
```

Return values

FSP_SUCCESS	Timers successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_Reset()

fsp_err_t R_GPT_THREE_PHASE_Reset (three_phase_ctrl_t *const *p_ctrl*)

Resets the counter values to 0. Implements three_phase_api_t::reset.

Return values

FSP_SUCCESS	Counters were reset successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_THREE_PHASE_DutyCycleSet()

fsp_err_t R_GPT_THREE_PHASE_DutyCycleSet (three_phase_ctrl_t *const *p_ctrl*,
three_phase_duty_cycle_t *const *p_duty_cycle*)

Sets duty cycle for all three timers. Implements three_phase_api_t::dutyCycleSet.

In symmetric PWM mode duty cycle values are reflected after the next trough. In asymmetric PWM mode values are reflected at the next trough OR crest, whichever comes first.

When double-buffering is enabled the values in three_phase_duty_cycle_t::duty_buffer are set to the double-buffer registers. When values are reflected the first time the single buffer values (three_phase_duty_cycle_t::duty) are used. On the second reflection the duty_buffer values are used. In asymmetric PWM mode this enables both count-up and count-down PWM values to be set at trough (or crest) exclusively.

Note

It is recommended to call this function in a high-priority callback to ensure that it is not interrupted and that no GPT events occur during setting that would result in a duty cycle buffer load operation.

Example:

```
/* Update duty cycle values */
      err = R_GPT_THREE_PHASE_DutyCycleSet(&g_gpt_three_phase_ctrl, &duty_cycle);
      assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	One or more duty cycle count values was outside the range 0..(period - 1).

◆ R_GPT_THREE_PHASE_CallbackSet()

fsp_err_t R_GPT_THREE_PHASE_CallbackSet (three_phase_ctrl_t *const *p_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback for the GPT U-channel with the option to provide memory for the callback argument structure. Implements three_phase_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_GPT_THREE_PHASE_Close()

fsp_err_t R_GPT_THREE_PHASE_Close (three_phase_ctrl_t *const *p_ctrl*)

Stops counters, disables output pins, and clears internal driver data. Implements three_phase_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

Detailed Description

Driver for the GPT32 and GPT16 peripherals on RA MCUs. This module implements the Timer Interface.

Overview

The GPT module can be used to count events, measure external input signals, generate a periodic interrupt, or output a periodic or PWM signal to a GTIOC pin.

This module supports the GPT peripherals GPT32EH, GPT32E, GPT32, and GPT16. GPT16 is a 16-bit timer. The other peripherals (GPT32EH, GPT32E, and GPT32) are 32-bit timers. The 32-bit timers are all treated the same in this module from the API perspective.

Features

The GPT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Supports count source of PCLK, GTETRG pins, GTIOC pins, or ELC events.
- Supports debounce filter on GTIOC pins.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.
- Supports start, stop, clear, count up, count down, and capture by external sources from GTETRG pins, GTIOC pins, or ELC events.
- Supports symmetric and asymmetric PWM waveform generation.
- Supports One shot synchronous pulse waveform generation.
- Supports automatic addition of dead time.
- Supports generating ELC events to start an ADC scan at a compare match value (see Event Link Controller (r_elc)) and updating the compare match value.
- Supports linking with a POEG channel to automatically disable GPT output when an error condition is detected.
- Supports setting the counter value while the timer is stopped.
- Supports enabling and disabling output pins.
- Supports skipping up to seven overflow/underflow (crest/trough) interrupts at a time
- Supports generating custom PWM waveforms by configuring the pin's output level at each compare match and cycle end.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes.
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock.

Configuration

Build Time Configurations for r_gpt

The following build time configurations are defined in fsp_cfg/r_gpt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled • Enabled with Extra Features	Disabled	Enables or disables support for outputting PWM waveforms on GTIOCx pins. The "Enabled with Extra Features" option enables support for Triangle wave modes and also enables the features located in the "Extra Features" section of each module instance.
Write Protect Enable	• Enabled • Disabled	Disabled	If selected write protection is applied to all GPT channels.
Clock Source	MCU Specific Options		Select either the synchronous clock (PCLKD) or asynchronous clock (GPTCLK) as the source for the GPT core clock and PWM delay circuit.

Configurations for Timers > Timer, General PWM (r_gpt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, General PWM (r_gpt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.
General > Channel	Channel number must exist on this MCU	0	Specify the hardware channel.
General > Mode	• Periodic • One-Shot • PWM • One-Shot Pulse • Triangle-Wave Symmetric PWM	Periodic	Mode selection. Periodic: Generates periodic interrupts or square waves. One-shot: Generate a single interrupt or a pulse wave. Note: One-

		• Triangle-Wave Asymmetric PWM • Triangle-Wave Asymmetric PWM (Mode 3)	shot mode is implemented in software. ISRs must be enabled for one-shot even if callback is unused. PWM: Generates basic PWM waveforms. Triangle-Wave Symmetric PWM: Generates symmetric PWM waveforms with duty cycle determined by compare match set during a crest interrupt and updated at the next trough. Triangle-Wave Asymmetric PWM: Generates asymmetric PWM waveforms with duty cycle determined by compare match set during a crest/trough interrupt and updated at the next trough/crest.
General > Period	Value must be a non-negative integer less than or equal to 0x40000000000	0x100000000	Specify the timer period in units selected below. Setting the period to 0x100000000 raw counts results in the maximum period. Set the period to 0x100000000 raw counts for a free running timer or an input capture configuration. The period can be set up to 0x40000000000, which will use a divider of 1024 with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a

			comment in the generated timer_cfg_t structure.
General > Period Unit	• Raw Counts • Nanoseconds • Microseconds • Milliseconds • Seconds • Hertz • Kilohertz	Raw Counts	Unit of the period specified above
Output > Custom Waveform > GTIOA > Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxA.
Output > Custom Waveform > GTIOA > Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at cycle end.
Output > Custom Waveform > GTIOA > Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxA at compare match.
Output > Custom Waveform > GTIOA > Retain Output Level at Count Stop	• Disabled • Enabled	Disabled	Retain the current GTIOxA output level when counting is stopped.
Output > Custom Waveform > GTIOB > Initial Output Level	• Pin Level Low • Pin Level High	Pin Level Low	Set the initial output level of GTIOCxB.
Output > Custom Waveform > GTIOB > Cycle End Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at cycle end.
Output > Custom Waveform > GTIOB > Compare Match Output Level	• Pin Level Retain • Pin Level Low • Pin Level High • Pin Level Toggle	Pin Level Retain	Set the output level of GTIOCxB at compare match.
Output > Custom Waveform > GTIOB > Retain Output Level at Count Stop	• Disabled • Enabled	Disabled	Retain the current GTIOxB output level when counting is stopped.
Output > Custom Waveform > Custom Waveform Enable	• Disabled • Enabled	Disabled	Enable custom waveform configuration.
Output > Duty Cycle	Value must be between	50	Specify the timer duty

Percent (only applicable in PWM mode)	0 and 100		cycle percent. Only used in PWM mode.
Output > GTIOCA Output Enabled	• True • False	False	Enable the output of GTIOCA on a pin.
Output > GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Output > GTIOCB Output Enabled	• True • False	False	Enable the output of GTIOCB on a pin.
Output > GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
Input > Count Up Source	MCU Specific Options		Select external source that will increment the counter. If any count up source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Count Down Source	MCU Specific Options		Select external source that will decrement the counter. If any count down source is selected, the timer will count the external sources only. It will not count PCLKD cycles.
Input > Start Source	MCU Specific Options		Select external source that will start the timer. For pulse width measurement, set the Start Source and the Clear Source to the trigger edge (the edge to start the measurement), and set the Stop Source and Capture Source (either A or B) to the opposite edge (the edge to stop the measurement). For pulse period measurement, set the Start Source, the Clear Source, and the Capture Source (either A or B) to the trigger

			edge (the edge to start the measurement).
Input > Stop Source	MCU Specific Options		Select external source that will stop the timer.
Input > Clear Source	MCU Specific Options		Select external source that will clear the timer.
Input > Capture A Source	MCU Specific Options		Select external source that will trigger a capture A event.
Input > Capture B Source	MCU Specific Options		Select external source that will trigger a capture B event.
Input > Noise Filter A Sampling Clock Select	• No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64	No Filter	Select the input filter for GTIOCA.
Input > Noise Filter B Sampling Clock Select	• No Filter • Filter PCLKD / 1 • Filter PCLKD / 4 • Filter PCLKD / 16 • Filter PCLKD / 64	No Filter	Select the input filter for GTIOCB.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function can be specified here. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the timer period elapses
Interrupts > Overflow/Crest Interrupt Priority	MCU Specific Options		Select the overflow interrupt priority. This is the crest interrupt for triangle-wave PWM.
Interrupts > Capture A Interrupt Priority	MCU Specific Options		Select the interrupt priority for capture A.
Interrupts > Capture B Interrupt Priority	MCU Specific Options		Select the interrupt priority for capture B.
Interrupts > Underflow/Trough Interrupt Priority	MCU Specific Options		Select the interrupt priority for the trough interrupt (triangle-

			wave PWM only).
Extra Features > Output Disable > POEG Link	• POEG Channel 0 • POEG Channel 1 • POEG Channel 2 • POEG Channel 3	POEG Channel 0	Select which POEG to link this GPT channel to.
Extra Features > Output Disable > Output Disable POEG Trigger	• Dead Time Error • GTIOCA and GTIOCB High Level • GTIOCA and GTIOCB Low Level		Select which errors send an output disable trigger to POEG. Dead time error is only available GPT channels that have GTINTAD.GRPDTE.
Extra Features > Output Disable > GTIOCA Disable Setting	• Disable Prohibited • Set Hi Z • Level Low • Level High	Disable Prohibited	Select the disable setting for GTIOCA.
Extra Features > Output Disable > GTIOCB Disable Setting	• Disable Prohibited • Set Hi Z • Level Low • Level High	Disable Prohibited	Select the disable setting for GTIOCB.
Extra Features > ADC Trigger > Start Event Trigger (Channels with GTINTAD only)	• Trigger Event A/D Converter Start Request A During Up Counting • Trigger Event A/D Converter Start Request A During Down Counting • Trigger Event A/D Converter Start Request B During Up Counting • Trigger Event A/D Converter Start Request B During Down Counting		Select which A/D converter start request interrupts to generate and at which point in the cycle to generate them.
Extra Features > Dead Time > Dead Time Count Up (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295	0	Select the dead time to apply during up counting. This value also applies during

	(0xffffffff).		down counting for channels that do not have GTDVD.
Extra Features > Dead Time > Dead Time Count Down (Raw Counts) (Channels with GTDVD only)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the dead time to apply during down counting.
Extra Features > ADC Trigger (Channels with GTADTRA only) > ADC A Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG A event.
Extra Features > ADC Trigger (Channels with GTADTRB only) > ADC B Compare Match (Raw Counts)	Must be a valid non-negative integer with a maximum configurable value of 4294967295 (0xffffffff).	0	Select the compare match value that generates a GPTn AD TRIG B event.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Interrupt to Count	• None • Overflow and Underflow (sawtooth) • Crest (triangle) • Trough (triangle)	None	Select the count source for interrupt skipping. The interrupt skip counter increments after each source event. All crest/overflow and trough/underflow interrupts are skipped when the interrupt skip counter is non-zero.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Interrupt Skip Count	• 0 • 1 • 2 • 3 • 4 • 5 • 6 • 7	0	Select the number of interrupts to skip.
Extra Features > Interrupt Skipping (Channels with GTITC only) > Skip ADC Events	• None • ADC A Compare Match • ADC B Compare Match • ADC A and B Compare Match	module.driver.timer.interrupt_skip.adc.none	Select ADC events to suppress when the interrupt skip count is not zero.
Extra Features > Extra Features	• Enabled • Disabled	Disabled	Select whether to enable extra features on this channel.

Clock Configuration

The GPT clock is based on the PCLKD frequency. You can set the PCLKD frequency using the **Clocks**

tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use GTETRGA, GTETRGB, GTETRGC, GTETRGD, GTIOCA and GTIOCB pins as count sources.

This module can use GTIOCA and GTIOCB pins as output pins for periodic or PWM signals.

This module can use GTIOCA and GTIOCB as input pins to measure input signals.

Usage Notes

Maximum Period for GPT32

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units and clock speed.

When the selected period unit is "Raw counts", the maximum period setting is 0x40000000000 on a 32-bit timer or 0x0x4000000 on a 16-bit timer. This will configure the timer with the maximum period and a count clock divisor of 128.

Note

When manually changing the timer period counts the maximum value for a 32-bit GPT is 0x100000000. This number overflows the 32-bit value for timer_cfg_t::period_counts. To configure the timer for the maximum period, set timer_cfg_t::period_counts to 0.

Updating Period and Duty Cycle

The period and duty cycle are updated after the next counter overflow after calling R_GPT_PeriodSet() or R_GPT_DutyCycleSet(). To force them to update before the next counter overflow, call R_GPT_Reset() while the counter is running.

One-Shot Mode

The GPT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one PCLKD cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

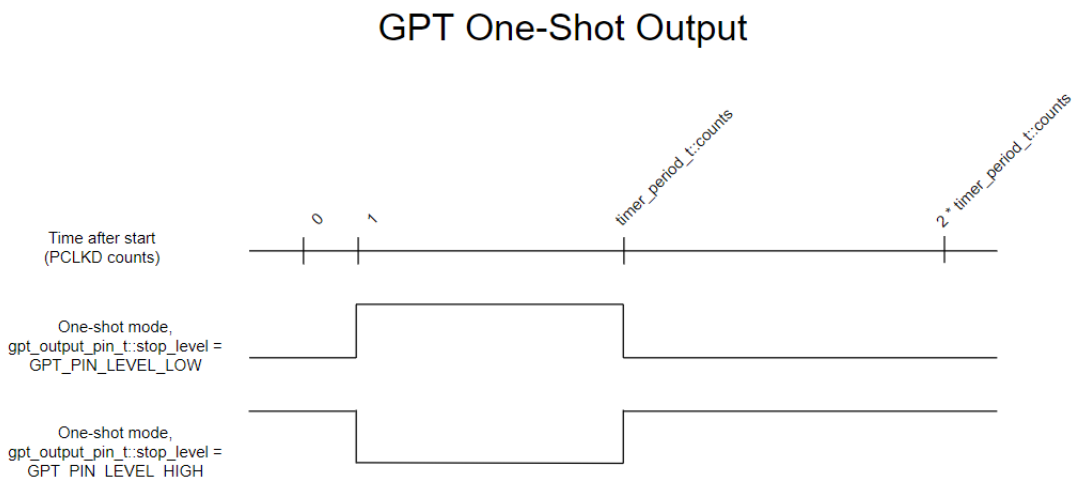

Figure 226: GPT One-Shot Output

One-Shot Pulse Mode

The one-shot pulse mode is an asymmetric PWM mode that provides more control over the rising and falling edges of the output. The user provides a period and initial output level and controls the signal by specifying compare match values for the leading and trailing edges each period.

Note

Despite its name, the One-Shot Pulse Mode operates continuously and does not stop after the first period.

One-Shot Pulse Mode Output

Examples of PWM signals that can be generated by this module are shown below. The leading and trailing edge match values can be modified using R_GPT_DutyCycleSet() in the overflow interrupt.

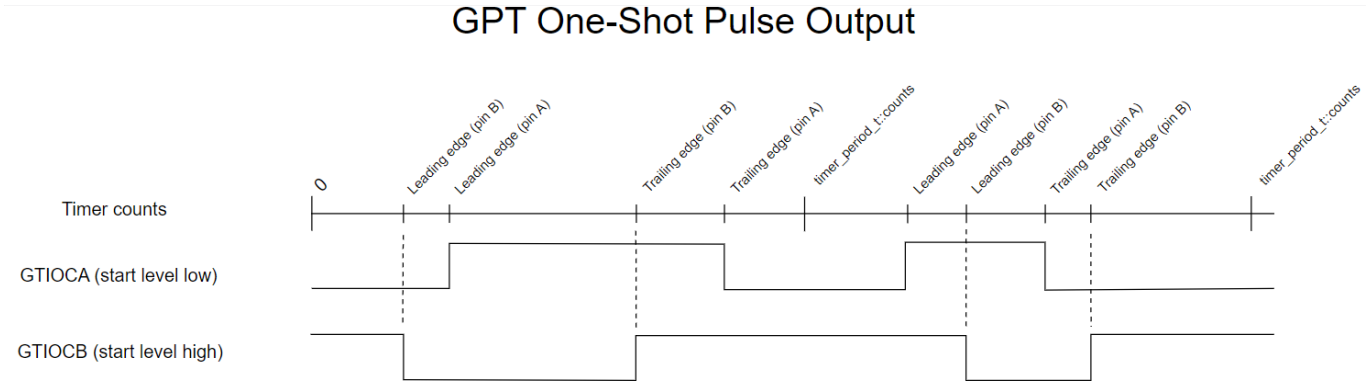

Figure 227: GPT One-Shot Pulse Output (without dead time)

If dead time is enabled only match values for GTIOCnA need to be set; the match values for GTIOCnB will be automatically configured in hardware.

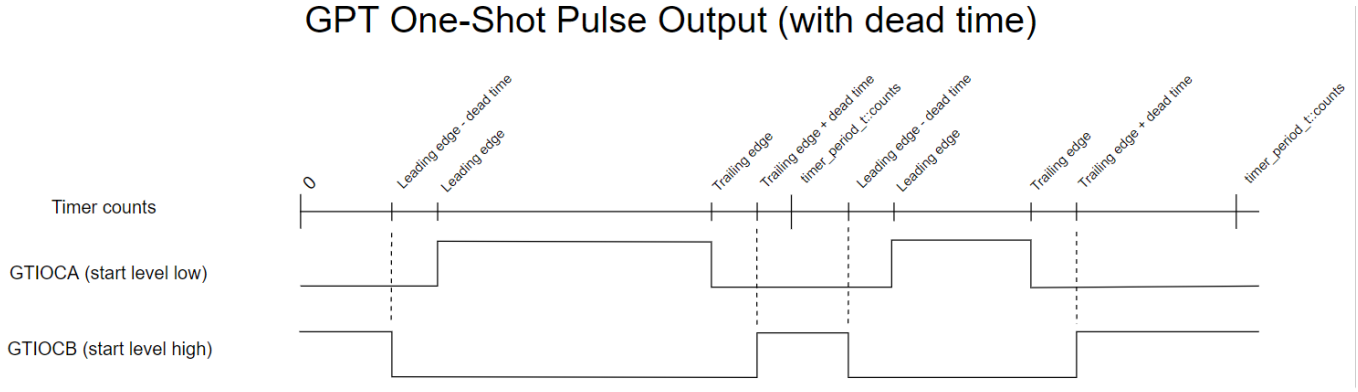

Figure 228: GPT One-Shot Pulse Output (with dead time)

Periodic Output

The GTIOC pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square wave (from rising edge to rising edge) matches the period of the GPT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

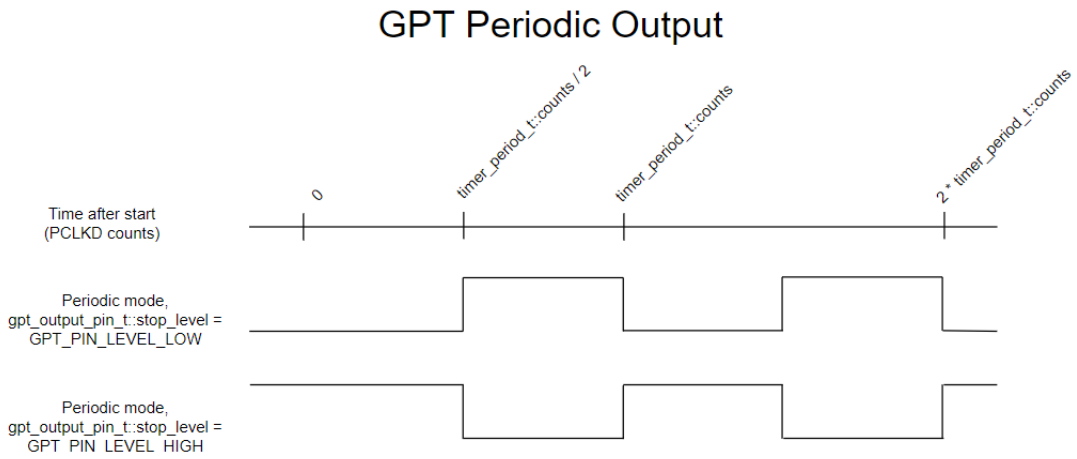

Figure 229: GPT Periodic Output

PWM Output

The PWM output signal is high at the beginning of the cycle and low at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

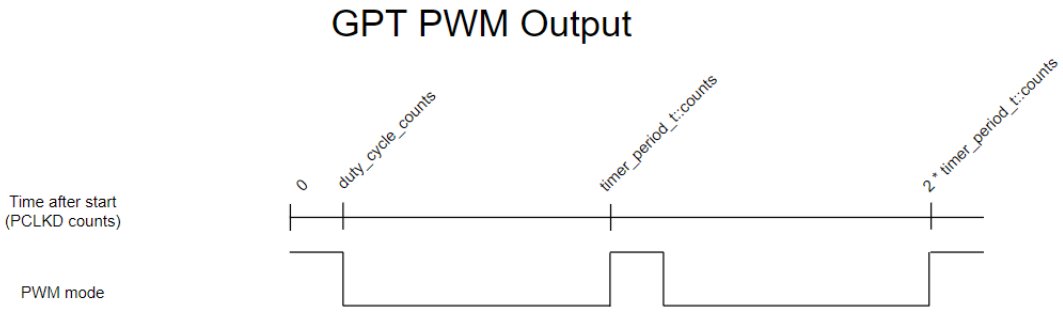

Figure 230: GPT PWM Output

Triangle-Wave PWM Output

Examples of PWM signals that can be generated by this module are shown below. The duty_cycle_counts can be modified using R_GPT_DutyCycleSet() in the crest interrupt and updated at the following trough for symmetric PWM or modified in both the crest/trough interrupts and updated at the following trough/crest for asymmetric PWM.

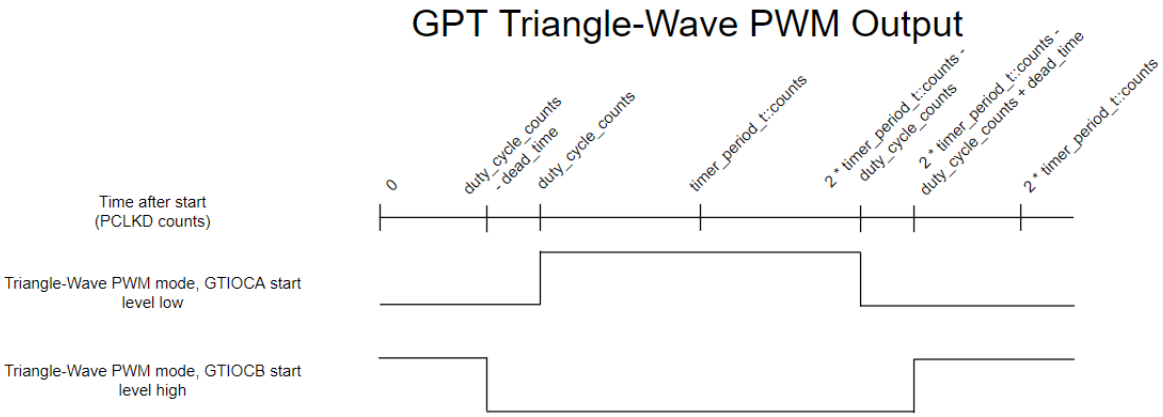

Figure 231: GPT Triangle-Wave PWM Output

PWM Output Delay Circuit

On select MCUs, an additional PWM output delay circuit can be configured in order to fine tune the rising and falling edge delays in increments of 1/32 times the period of the GPT core clock. The PWM output delay function must be configured prior to initializing the GPT channels using R_GPT_PwmOutputDelayInitialize.

Note

1. In Saw-wave PWM mode, the output delay setting cannot be changed while the capture compare setting (GTCCRn) is greater than or equal the period setting (GTPR) - 2.
2. In Triangle PWM modes, the output delay setting cannot be changed while the counter is counting down, and the capture compare setting (GTCCRn) is less than or equal to 2.
3. When the PWM Output Delay Circuit is enabled, the PWM signal is delayed by 3 GPT core clock cycles.
4. When the GPTCLK is used as the GPT core clock, the following delay is required between writes to the rising or falling edge output delay setting for a given pin: Write_Interval[ns] = Period_of_PCLKA [ns] × 6 + Period_of_GPTCLK [ns] × 4).

Event Counting

Event counting can be done by selecting up or down counting sources from GTETRG pins, ELC events, or GTIOC pins. In event counting mode, the GPT counter is not affected by PCLKD.

Note

In event counting mode, the application must call R_GPT_Start() to enable event counting. The counter will not change after calling R_GPT_Start() until an event occurs.

Pulse Measurement

If the capture edge occurs before the start edge in pulse measurement, the first capture is invalid (0).

Controlling GPT with GTETRG Edges

The GPT timer can be configured to stop, start, clear, count up, or count down when a GTETRG rising or falling edge occurs.

Note

The GTETRG pins are shared by all GPT channels.
GTETRG pins require POEG to be on (example code for this is provided in GPT Free Running Counter Example).
If input filtering is required on the GTETRG pins, that must also be handled outside this module.

Controlling GPT with ELC Events

The GPT timer can be configured to stop, start, clear, count up, or count down when an ELC event occurs.

Note

The configurable ELC GPT sources are shared by all GPT channels.
The event links for the ELC must be configured outside this module.

Triggering ELC Events with GPT

The GPT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Enabling External Sources for Start, Stop, Clear, or Capture

R_GPT_Enable() must be called when external sources are used for start, stop, clear, or capture.

Interrupt Skipping

When an interrupt skipping source is selected a hardware counter will increment each time the selected event occurs. Each interrupt past the first (up to the specified skip count) will be suppressed. If ADC events are selected for skipping they will also be suppressed except during the timer period leading to the selected interrupt skipping event (see below diagram).

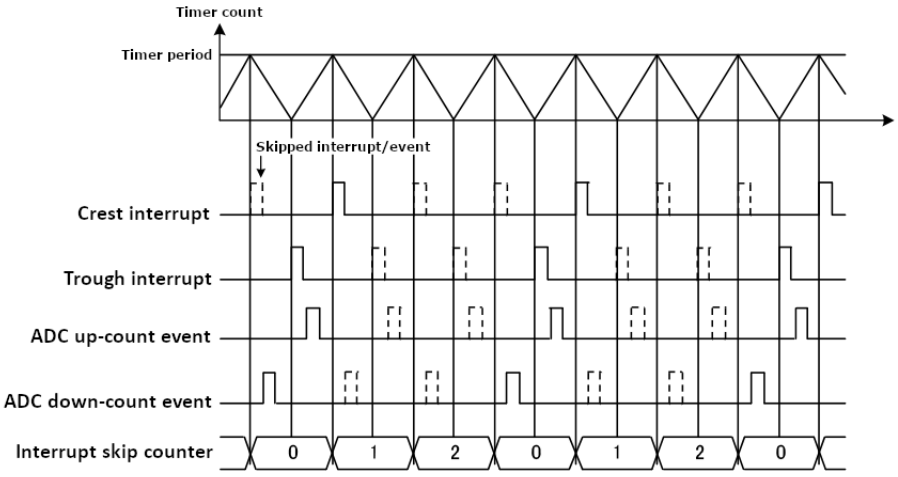

Figure 232: Crest interrupt skipping in triangle-wave PWM modes (skip count 2)

Complementary Output

By using the Custom Waveform option the output pins can be made to output complementary waveforms. To ensure these waveforms stay in sync, the duty cycle for both pins can be set simultaneously by calling R_GPT_DutyCycleSet once with a pin parameter of GPT_IO_PIN_GTIOCA_AND_GTIOCB.

Note

The pin level for 0% and 100% duty cycle is determined by the Cycle End Output Level in normal PWM mode and the Initial Output Level in triangle PWM modes. 100% duty will output the configured level and 0% will output the opposite. Do not use Pin Level Toggle or Pin Level Retain for the Cycle End Output Level if normal PWM waveforms are desired.

Examples

GPT Basic Example

This is a basic example of minimal use of the GPT in an application.

```
void gpt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
```

GPT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

GPT Free Running Counter Example

To use the GPT as a free running counter, select periodic mode and set the the Period to 0xFFFFFFFF for a 32-bit timer or 0xFFFF for a 16-bit timer.

```
void gpt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) If event count mode is used to count edges on a GTETRG pin, POEG must
be started to use GTETRG.
  * Reference Note 1 of Table 23.2 "GPT functions" in the RA6M3 manual
R01UH0886EJ0100. */
 R_BSP_MODULE_START(FSP_IP_POEG, 0U);
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_GPT_Stop(&g_timer0_ctrl);
```

```
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
}
```

GPT Input Capture Example

This is an example of using the GPT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
{
 if ((TIMER_EVENT_CAPTURE_A == p_args->event) || (TIMER_EVENT_CAPTURE_B ==
p_args->event))
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
       uint64_t period = info.period_counts;
 /* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
  * timer_info_t::period_counts. */
 if (0U == period)
      {
            period = UINT32_MAX + 1U;
      }
       g_captured_time    = (period * g_capture_overflows) + p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
```

```
       g_capture_overflows++;
    }
}
void gpt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_GPT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_GPT_Disable(&g_timer0_ctrl);
}
```

GPT Period Update Example

This an example of updating the period.

```
#define GPT_EXAMPLE_MSEC_PER_SEC (1000)
#define GPT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void gpt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
```

```
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

GPT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define GPT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void gpt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_GPT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
  * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
prevent this. The cast is
  * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
       (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                   GPT_EXAMPLE_MAX_PERCENT);
 /* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
}
```

GPT A/D Converter Start Request Example

This is an example of using the GPT to start the ADC at a configurable A/D converter compare match value.

```
#if ((1U << GPT_EXAMPLE_CHANNEL) & (BSP_FEATURE_GPTEH_CHANNEL_MASK |
BSP_FEATURE_GPTE_CHANNEL_MASK))
/* This example shows how to configure the GPT to generate an A/D start request at an
A/D start request compare
 * match value. This example can only be used with GPTE or GPTEH variants. */
void gpt_adc_start_request_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize and configure the ELC. */
```

```
    err = R_ELC_Open(&g_elc_ctrl, &g_elc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure the ELC to start a scan on ADC unit 0 when GPT channel 0. Note: This is
typically configured in
  * g_elc_cfg and already set during R_ELC_Open. */
    err = R_ELC_LinkSet(&g_elc_ctrl, ELC_PERIPHERAL_ADC0, ELC_EVENT_GPT0_AD_TRIG_A);
    assert(FSP_SUCCESS == err);
 /* Globally enable ELC events. */
    err = R_ELC_Enable(&g_elc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize the ADC to start a scan based on an ELC event trigger. Set
adc_cfg_t::trigger to
  * ADC_TRIGGER_SYNC_ELC. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable ELC triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Initializes the GPT module. Configure gpt_extended_pwm_cfg_t::adc_trigger to set
when the A/D start request
  * is generated. Set gpt_extended_pwm_cfg_t::adc_a_compare_match to set the desired
compare match value. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start the timer. A/D converter start request events are generated each time the
counter is equal to the
  * A/D start request compare match value. */
    (void) R_GPT_Start(&g_timer0_ctrl);
}
#endif
```

GPT One-Shot Pulse Mode Example

This example demonstrates the configuration and use of one-shot pulse mode with GPT timer.

```
/* Example callback called when timer overflows. */
void gpt_overflow_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Use R_GPT_DutyCycleSet() API to set new values for each cycle.
  * - Use GPT_IO_PIN_ONE_SHOT_LEADING_EDGE to set the leading edge transition match
value (GTCCRC or GTCCRE register).
  * - Use GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE to set the trailing edge transition match
value (GTCCRD or GTCCRF register).
  */
    }
}
#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRD_GTCCRF (0x1000U)
#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRC (0x800U)
#define GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRE (0x100U)
void gpt_one_shot_pulse_mode_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the duty cycle for One-Shot-Pulse mode */
 /* GPT_IO_PIN_ONE_SHOT_LEADING_EDGE sets the initial value for the GTCCRC register
if GTIOCnA is the selected pin for output. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl,
                             GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRC,
 GPT_IO_PIN_GTIOCA | GPT_IO_PIN_ONE_SHOT_LEADING_EDGE);
    assert(FSP_SUCCESS == err);
 /* GPT_IO_PIN_ONE_SHOT_LEADING_EDGE sets the initial value for the GTCCRE register
if GTIOCnB is the selected pin for output. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl,
```

```
                            GPT_ONE_SHOT_EXAMPLE_DUTY_CYCLE_GTCCRE,

Data Structure Documentation

◆ gpt_output_pin_t

struct gpt_output_pin_t		
Configurations for output pins.		
Data Fields		
bool	output_enabled	Set to true to enable output, false to disable output.
gpt_pin_level_t	stop_level	Select a stop level from gpt_pin_level_t.

◆ gpt_gtior_setting_t

struct gpt_gtior_setting_t
Custom GTIOR settings used for configuring GTIOCxA and GTIOCxB pins.

◆ gpt_instance_ctrl_t

struct gpt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ gpt_extended_pwm_cfg_t

struct gpt_extended_pwm_cfg_t		
GPT extension for advanced PWM features.		
Data Fields		
uint8_t	trough_ipl	Trough interrupt priority.
IRQn_Type	trough_irq	Trough interrupt.
gpt_poeg_link_t	poeg_link	Select which POEG channel controls output disable for this GPT channel.
gpt_output_disable_t	output_disable	Select which trigger sources request output disable from POEG.
gpt_adc_trigger_t	adc_trigger	Select trigger sources to start A/D conversion.
uint32_t	dead_time_count_up	Set a dead time value for counting up.
uint32_t	dead_time_count_down	Set a dead time value for counting down (available on GPT32E and GPT32EH only)
uint32_t	adc_a_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_A.
uint32_t	adc_b_compare_match	Select the compare match value used to trigger an A/D conversion start request using ELC_EVENT_GPT<channel>_AD_TRIG_B.
gpt_interrupt_skip_source_t	interrupt_skip_source	Interrupt source to count for interrupt skipping.
gpt_interrupt_skip_count_t	interrupt_skip_count	Number of interrupts to skip between events.
gpt_interrupt_skip_adc_t	interrupt_skip_adc	ADC events to skip when interrupt skipping is enabled.
gpt_gtioc_disable_t	gtioca_disable_setting	DEPRECATED - Select how to configure GTIOCA when output is disabled.
gpt_gtioc_disable_t	gtiocb_disable_setting	DEPRECATED - Select how to

		configure GTIOCB when output is disabled.

◆ gpt_extended_cfg_t

struct gpt_extended_cfg_t		
GPT extension configures the output pins for GPT.		
Data Fields		
gpt_output_pin_t	gtioca	DEPRECATED - Configuration for GPT I/O pin A.
gpt_output_pin_t	gtiocb	DEPRECATED - Configuration for GPT I/O pin B.
gpt_source_t	start_source	Event sources that trigger the timer to start.
gpt_source_t	stop_source	Event sources that trigger the timer to stop.
gpt_source_t	clear_source	Event sources that trigger the timer to clear.
gpt_source_t	capture_a_source	Event sources that trigger capture of GTIOCA.
gpt_source_t	capture_b_source	Event sources that trigger capture of GTIOCB.
gpt_source_t	count_up_source	Event sources that trigger a single up count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_source_t	count_down_source	Event sources that trigger a single down count. If GPT_SOURCE_NONE is selected for both count_up_source and count_down_source, then the timer count source is PCLK.
gpt_capture_filter_t	capture_filter_gtioca	
gpt_capture_filter_t	capture_filter_gtiocb	
uint8_t	capture_a_ipl	Capture A interrupt priority.
uint8_t	capture_b_ipl	Capture B interrupt priority.
IRQn_Type	capture_a_irq	Capture A interrupt.
IRQn_Type	capture_b_irq	Capture B interrupt.
gpt_extended_pwm_cfg_t const *	p_pwm_cfg	Advanced PWM features, optional.
gpt_gtior_setting_t	gtior_setting	Custom GTIOR settings used for

		configuring GTIOCxA and GTIOCxB pins.

Enumeration Type Documentation

◆ gpt_io_pin_t

enum gpt_io_pin_t	
Input/Output pins, used to select which duty cycle to update in R_GPT_DutyCycleSet().	
Enumerator	
GPT_IO_PIN_GTIOCA	GTIOCA.
GPT_IO_PIN_GTIOCB	GTIOCB.
GPT_IO_PIN_GTIOCA_AND_GTIOCB	GTIOCA and GTIOCB.
GPT_IO_PIN_TROUGH	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_CREST	Used in R_GPT_DutyCycleSet when Triangle-wave PWM Mode 3 is selected.
GPT_IO_PIN_ONE_SHOT_LEADING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRC and GTCCRE registers when One-Shot Pulse mode is selected.
GPT_IO_PIN_ONE_SHOT_TRAILING_EDGE	Used in R_GPT_DutyCycleSet to set GTCCRD and GTCCRF registers when One-Shot Pulse mode is selected.

◆ gpt_buffer_force_push

enum gpt_buffer_force_push	
Forced buffer push operation used in One-Sot Pulse mode with R_GPT_DutyCycleSet().	
Enumerator	
GPT_BUFFER_FORCE_PUSH	Used in R_GPT_DutyCycleSet to force push the data from GTCCRn registers to temporary buffer A or B when One-Shot Pulse mode is selected.

◆ gpt_pin_level_t

enum gpt_pin_level_t	
Level of GPT pin	
Enumerator	
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.

◆ gpt_source_t

enum gpt_source_t	
Sources can be used to start the timer, stop the timer, count up, or count down. These enumerations represent a bitmask. Multiple sources can be ORed together.	
Enumerator	
GPT_SOURCE_NONE	No active event sources.
GPT_SOURCE_GTETRGA_RISING	Action performed on GTETRGA rising edge.
GPT_SOURCE_GTETRGA_FALLING	Action performed on GTETRGA falling edge.
GPT_SOURCE_GTETRGB_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGB_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTETRGC_RISING	Action performed on GTETRGC rising edge.
GPT_SOURCE_GTETRGC_FALLING	Action performed on GTETRGC falling edge.
GPT_SOURCE_GTETRGD_RISING	Action performed on GTETRGB rising edge.
GPT_SOURCE_GTETRGD_FALLING	Action performed on GTETRGB falling edge.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_SOURCE_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_SOURCE_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.

GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_SOURCE_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_SOURCE_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_SOURCE_GPT_A	Action performed on ELC GPTA event.
GPT_SOURCE_GPT_B	Action performed on ELC GPTB event.
GPT_SOURCE_GPT_C	Action performed on ELC GPTC event.
GPT_SOURCE_GPT_D	Action performed on ELC GPTD event.
GPT_SOURCE_GPT_E	Action performed on ELC GPTE event.
GPT_SOURCE_GPT_F	Action performed on ELC GPTF event.
GPT_SOURCE_GPT_G	Action performed on ELC GPTG event.
GPT_SOURCE_GPT_H	Action performed on ELC GPTH event.

◆ gpt_capture_filter_t

enum gpt_capture_filter_t

Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.

Enumerator	
GPT_CAPTURE_FILTER_NONE	None - no filtering.
GPT_CAPTURE_FILTER_PCLKD_DIV_1	PCLK/1 - fast sampling.
GPT_CAPTURE_FILTER_PCLKD_DIV_4	PCLK/4.
GPT_CAPTURE_FILTER_PCLKD_DIV_16	PCLK/16.
GPT_CAPTURE_FILTER_PCLKD_DIV_64	PCLK/64 - slow sampling.

◆ gpt_adc_trigger_t

enum gpt_adc_trigger_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_TRIGGER_NONE	None - no output disable request.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at up counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_A	Request A/D conversion from ADC unit 0 at down counting compare match of gpt_extended_pwm_cfg_t::adc_a_compare_match.
GPT_ADC_TRIGGER_UP_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at up counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.
GPT_ADC_TRIGGER_DOWN_COUNT_START_ADC_B	Request A/D conversion from ADC unit 1 at down counting compare match of gpt_extended_pwm_cfg_t::adc_b_compare_match.

◆ gpt_poeg_link_t

enum gpt_poeg_link_t	
POEG channel to link to this channel.	
Enumerator	
GPT_POEG_LINK_POEG0	Link this GPT channel to POEG channel 0 (GTETRGA)
GPT_POEG_LINK_POEG1	Link this GPT channel to POEG channel 1 (GTETRGB)
GPT_POEG_LINK_POEG2	Link this GPT channel to POEG channel 2 (GTETRGC)
GPT_POEG_LINK_POEG3	Link this GPT channel to POEG channel 3 (GTETRGD)

◆ gpt_output_disable_t

enum gpt_output_disable_t	
Select trigger to send output disable request to POEG.	
Enumerator	
GPT_OUTPUT_DISABLE_NONE	None - no output disable request.
GPT_OUTPUT_DISABLE_DEAD_TIME_ERROR	Request output disable if a dead time error occurs.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_HIGH	Request output disable if GTIOCA and GTIOCB are high at the same time.
GPT_OUTPUT_DISABLE_GTIOCA_GTIOCB_LOW	Request output disable if GTIOCA and GTIOCB are low at the same time.

◆ gpt_gtioc_disable_t

enum gpt_gtioc_disable_t	
Disable level options for GTIOC pins.	
Enumerator	
GPT_GTIOC_DISABLE_PROHIBITED	Do not allow output disable.
GPT_GTIOC_DISABLE_SET_HI_Z	Set GTIOC to high impedance when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_LOW	Set GTIOC level low when output is disabled.
GPT_GTIOC_DISABLE_LEVEL_HIGH	Set GTIOC level high when output is disabled.

◆ gpt_adc_compare_match_t

enum gpt_adc_compare_match_t	
Trigger options to start A/D conversion.	
Enumerator	
GPT_ADC_COMPARE_MATCH_ADC_A	Set A/D conversion start request value for GPT A/D converter start request A.
GPT_ADC_COMPARE_MATCH_ADC_B	Set A/D conversion start request value for GPT A/D converter start request B.

◆ gpt_interrupt_skip_source_t

enum gpt_interrupt_skip_source_t	
Interrupt skipping modes	
Enumerator	
GPT_INTERRUPT_SKIP_SOURCE_NONE	Do not skip interrupts.
GPT_INTERRUPT_SKIP_SOURCE_OVERFLOW_UNDERFLOW	Count and skip overflow and underflow interrupts.
GPT_INTERRUPT_SKIP_SOURCE_CREST	Count crest interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the trough interrupt fires before the crest interrupt.
GPT_INTERRUPT_SKIP_SOURCE_TROUGH	Count trough interrupts for interrupt skipping. Skip the number of crest and trough interrupts configured in gpt_interrupt_skip_count_t. When the interrupt does fire, the crest interrupt fires before the trough interrupt.

◆ gpt_interrupt_skip_count_t

enum gpt_interrupt_skip_count_t	
Number of interrupts to skip between events	
Enumerator	
GPT_INTERRUPT_SKIP_COUNT_0	Do not skip interrupts.
GPT_INTERRUPT_SKIP_COUNT_1	Skip one interrupt.
GPT_INTERRUPT_SKIP_COUNT_2	Skip two interrupts.
GPT_INTERRUPT_SKIP_COUNT_3	Skip three interrupts.
GPT_INTERRUPT_SKIP_COUNT_4	Skip four interrupts.
GPT_INTERRUPT_SKIP_COUNT_5	Skip five interrupts.
GPT_INTERRUPT_SKIP_COUNT_6	Skip six interrupts.
GPT_INTERRUPT_SKIP_COUNT_7	Skip seven interrupts.

◆ gpt_interrupt_skip_adc_t

enum gpt_interrupt_skip_adc_t	
ADC events to skip during interrupt skipping	
Enumerator	
GPT_INTERRUPT_SKIP_ADC_NONE	Do not skip ADC events.
GPT_INTERRUPT_SKIP_ADC_A	Skip ADC A events.
GPT_INTERRUPT_SKIP_ADC_B	Skip ADC B events.
GPT_INTERRUPT_SKIP_ADC_A_AND_B	Skip ADC A and B events.

◆ gpt_pwm_output_delay_setting_t

enum gpt_pwm_output_delay_setting_t	
Delay setting for the PWM Delay Generation Circuit (PDG).	
Enumerator	
GPT_PWM_OUTPUT_DELAY_SETTING_0_32	Delay is not applied.
GPT_PWM_OUTPUT_DELAY_SETTING_1_32	Delay of 1 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_2_32	Delay of 2 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_3_32	Delay of 3 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_4_32	Delay of 4 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_5_32	Delay of 5 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_6_32	Delay of 6 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_7_32	Delay of 7 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_8_32	Delay of 8 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_9_32	Delay of 9 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_10_32	Delay of 10 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_11_32	Delay of 11 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_12_32	Delay of 12 / 32 GTCLK period applied.

GPT_PWM_OUTPUT_DELAY_SETTING_13_32	Delay of 13 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_14_32	Delay of 14 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_15_32	Delay of 15 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_16_32	Delay of 16 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_17_32	Delay of 17 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_18_32	Delay of 18 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_19_32	Delay of 19 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_20_32	Delay of 20 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_21_32	Delay of 21 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_22_32	Delay of 22 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_23_32	Delay of 23 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_24_32	Delay of 24 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_25_32	Delay of 25 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_26_32	Delay of 26 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_27_32	Delay of 27 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_28_32	Delay of 28 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_29_32	Delay of 29 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_30_32	Delay of 30 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_31_32	Delay of 31 / 32 GTCLK period applied.
GPT_PWM_OUTPUT_DELAY_SETTING_BYPASS	Bypass the PWM Output Delay Circuit.

◆ gpt_pwm_output_delay_edge_t

enum gpt_pwm_output_delay_edge_t	
Select which PWM Output Delay setting to apply.	
Enumerator	
GPT_PWM_OUTPUT_DELAY_EDGE_RISING	Configure the PWM Output Delay setting for rising edge.
GPT_PWM_OUTPUT_DELAY_EDGE_FALLING	Configure the PWM Output Delay setting for falling edge.

Function Documentation

◆ R_GPT_Open()

fsp_err_t R_GPT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the timer module and applies configurations. Implements timer_api_t::open.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a gpt_extended_cfg_t extension parameter.

Example:

```
/* Initializes the module. */
   err = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the source divider is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_IRQ_BSP_DISABLED	timer_cfg_t::mode is TIMER_MODE_ONE_SHOT or timer_cfg_t::p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use one-shot mode or callback.
FSP_ERR_INVALID_MODE	Triangle wave PWM is only supported if GPT_CFG_OUTPUT_SUPPORT_ENABLE is 2. Selected channel does not support external count sources. External and event count sources not are available in this mode.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in the p_cfg parameter is not available on this device.

◆ R_GPT_Stop()

fsp_err_t R_GPT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_GPT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Start()

fsp_err_t R_GPT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_GPT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer successfully started.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Reset()

fsp_err_t R_GPT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Note

This function also updates to the new period if no counter overflow has occurred since the last call to R_GPT_PeriodSet().

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Enable()

fsp_err_t R_GPT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_GPT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_Disable()

fsp_err_t R_GPT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Note

The timer could be running after R_GPT_Disable(). To ensure it is stopped, call R_GPT_Stop().

Example:

```
/* (Optional) Disable captures. */
   (void) R_GPT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PeriodSet()

fsp_err_t R_GPT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
 /* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
  * - If the PCLKD frequency has not changed since reset, the source clock frequency
is
  * BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
  * - Use the R_GPT_InfoGet function (it accounts for the divider).
  * - Calculate the current PCLKD frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) and right shift
  * by timer_cfg_t::source_div.
  *
```

```
  * This example uses the 3rd option (R_FSP_SystemClockHzGet).
  */
    uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
GPT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. */
    err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value written successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_DutyCycleSet()

fsp_err_t R_GPT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Sets duty cycle on requested pin. Implements timer_api_t::dutyCycleSet.

Duty cycle is updated in the buffer register. The updated duty cycle is reflected after the next cycle end (counter overflow).

Example:

```
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. Note that if the
period could be larger than
  * UINT32_MAX / 100, this calculation could overflow. A cast to uint64_t is used to
```

```
prevent this. The cast is
  * not required for 16-bit timers. */
    uint32_t duty_cycle_counts =
       (uint32_t) (((uint64_t) current_period_counts *
GPT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                   GPT_EXAMPLE_MAX_PERCENT);
 /* Set the calculated duty cycle. */
    err = R_GPT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, GPT_IO_PIN_GTIOCB);
    assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to instance control block.
[in]	duty_cycle_counts	Duty cycle to set in counts.
[in]	pin	Use gpt_io_pin_t to select GPT_IO_PIN_GTIOCA or GPT_IO_PIN_GTIOCB

Return values

FSP_SUCCESS	Duty cycle updated successfully.
FSP_ERR_ASSERTION	p_ctrl was NULL or the pin is not one of gpt_io_pin_t
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_ARGUMENT	Duty cycle is larger than period.
FSP_ERR_INVALID_MODE	GPT_IO_PIN_TROUGH, and GPT_IO_PIN_CREST settings are invalid in the this mode.
FSP_ERR_UNSUPPORTED	GPT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_GPT_InfoGet()

fsp_err_t R_GPT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_GPT_InfoGet(&g_timer0_ctrl, &info);
      uint64_t period = info.period_counts;
/* The maximum period is one more than the maximum 32-bit number, but will be
reflected as 0 in
 * timer_info_t::period_counts. */
if (0U == period)
    {
          period = UINT32_MAX + 1U;
    }
```

Return values

FSP_SUCCESS	Period, count direction, frequency, and ELC event written to caller's structure successfully.
FSP_ERR_ASSERTION	p_ctrl or p_info was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_StatusGet()

fsp_err_t R_GPT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Get current timer status and store it in provided pointer p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_GPT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current timer state and counter value set successfully.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_CounterSet()

fsp_err_t R_GPT_CounterSet (timer_ctrl_t *const *p_ctrl*, uint32_t *counter*)

Set counter value.

Note

Do not call this API while the counter is counting. The counter value can only be updated while the counter is stopped.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_IN_USE	The timer is running. Stop the timer before calling this function.

◆ R_GPT_OutputEnable()

fsp_err_t R_GPT_OutputEnable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Enable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is enabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_OutputDisable()

fsp_err_t R_GPT_OutputDisable (timer_ctrl_t *const *p_ctrl*, gpt_io_pin_t *pin*)

Disable output for GTIOCA and/or GTIOCB.

Return values

FSP_SUCCESS	Output is disabled.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_AdcTriggerSet()

fsp_err_t R_GPT_AdcTriggerSet (timer_ctrl_t *const *p_ctrl*, gpt_adc_compare_match_t *which_compare_match*, uint32_t *compare_match_value*)

Set A/D converter start request compare match value.

Return values

FSP_SUCCESS	Counter value updated.
FSP_ERR_ASSERTION	p_ctrl or p_status was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelaySet()

fsp_err_t R_GPT_PwmOutputDelaySet (timer_ctrl_t *const *p_ctrl*, gpt_pwm_output_delay_edge_t *edge*, gpt_pwm_output_delay_setting_t *delay_setting*, uint32_t const *pin*)

Set the Output Delay setting for the PWM output pin.

Return values

FSP_SUCCESS	The output delay was set.
FSP_ERR_ASSERTION	An input parameter was invalid.
FSP_ERR_NOT_OPEN	The instance is not opened.
FSP_ERR_INVALID_CHANNEL	The channel does not support this feature.
FSP_ERR_NOT_INITIALIZED	The PWM Output Delay Circuit has not been initialized.
FSP_ERR_INVALID_STATE	The PWM Output Delay setting cannot be updated in the current state.
FSP_ERR_UNSUPPORTED	This feature is not supported on this MCU.

◆ R_GPT_CallbackSet()

fsp_err_t R_GPT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_GPT_Close()

fsp_err_t R_GPT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_GPT_PwmOutputDelayInitialize()

fsp_err_t R_GPT_PwmOutputDelayInitialize ( )

Initialize the PWM Delay Generation Circuit (PDG). This function must be called before calling R_GPT_PwmOutputDelaySet.

Note

This function will delay for 20 microseconds.

Return values

FSP_SUCCESS	Initialization sequence completed successfully.
FSP_ERR_INVALID_STATE	The source clock frequnecy is out of the required range for the PDG.
FSP_ERR_UNSUPPORTED	This feature is not supported.

4.2.18.5 Timer, Low-Power (r_agt)

Modules » Timers

fsp_err_t	R_AGT_Close (timer_ctrl_t *const p_ctrl)

Detailed Description

Driver for the AGT peripheral on RA MCUs. This module implements the Timer Interface.

Overview

Features

The AGT module has the following features:

- Supports periodic mode, one-shot mode, and PWM mode.
- Signal can be output to a pin.
- Configurable period (counts per timer cycle).
- Configurable duty cycle in PWM mode.
- Configurable clock source, including PCLKB, LOCO, SUBCLK, and external sources input to AGTIO.
- Supports runtime reconfiguration of period.
- Supports runtime reconfiguration of duty cycle in PWM mode.
- Supports counting based on an external clock input to AGTIO.
- Supports debounce filter on AGTIO pins.
- Supports measuring pulse width or pulse period.
- APIs are provided to start, stop, and reset the counter.
- APIs are provided to get the current period, source clock frequency, and count direction.
- APIs are provided to get the current timer status and counter value.

Selecting a Timer

RA MCUs have two timer peripherals: the General PWM Timer (GPT) and the Asynchronous General Purpose Timer (AGT). When selecting between them, consider these factors:

	GPT	AGT
Low Power Modes	The GPT can operate in sleep mode.	The AGT can operate in all low power modes (when count source is LOCO or subclock).
Available Channels	The number of GPT channels is device specific. All currently supported MCUs have at least 7 GPT channels.	All MCUs have 2 AGT channels.
Timer Resolution	All MCUs have at least one 32-bit GPT timer.	The AGT timers are 16-bit timers.
Clock Source	The GPT runs off PCLKD with a configurable divider up to 1024. It can also be configured to count ELC events or external pulses.	The AGT runs off PCLKB, LOCO, or subclock with a configurable divider up to 8 for PCLKB or up to 128 for LOCO or subclock.

Configuration

Build Time Configurations for r_agt

The following build time configurations are defined in fsp_cfg/r_agt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Pin Output Support	• Disabled • Enabled	Disabled	If selected code for outputting a waveform to a pin is included in the build.
Pin Input Support	• Disabled • Enabled	Disabled	Enable input support to use pulse width measurement mode, pulse period measurement mode, or input from P402, P402, or AGTIO.

Configurations for Timers > Timer, Low-Power (r_agt)

This module can be added to the Stacks tab via New Stack > Timers > Timer, Low-Power (r_agt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General > Name	Name must be a valid C symbol	g_timer0	Module name.

General > Channel	Channel number does not exist	0	Physical hardware channel.
General > Mode	• Periodic • One-Shot • PWM	Periodic	Mode selection. Note: One-shot mode is implemented in software. ISR's must be enabled for one shot even if callback is unused.
General > Period	Value must be non-negative	0x10000	Specify the timer period based on the selected unit. When the unit is set to 'Raw Counts', setting the period to 0x10000 results in the maximum period at the lowest divisor (fastest timer tick). Set the period to 0x10000 for a free running timer, pulse width measurement or pulse period measurement. Setting the period higher will automatically select a higher divider; the period can be set up to 0x80000 when counting from PCLKB or 0x800000 when counting from LOCO/subclock, which will use a divider of 8 or 128 respectively with the maximum period. If the requested period cannot be achieved, the settings with the largest possible period that is less than or equal to the requested period are used. The theoretical calculated period is printed in a comment in the timer_cfg_t structure.
General > Period Unit	• Raw Counts • Nanoseconds • Microseconds	Raw Counts	Unit of the period specified above

	• Milliseconds • Seconds • Hertz • Kilohertz		
General > Count Source	• PCLKB • LOCO • SUBCLOCK • AGT Underflow • P402 Input • P403 Input • AGTIO Input	PCLKB	AGT counter clock source. NOTE: The divisor is calculated automatically based on the selected period. See agt_count_source_t documentation for details.
Output > Duty Cycle Percent (only applicable in PWM mode)	Value must be between 0 and 100	50	Specify the timer duty cycle percent. Only used in PWM mode.
Output > AGTOA Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOA output.
Output > AGTOB Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTOB output.
Output > AGTO Output	• Disabled • Start Level Low • Start Level High	Disabled	Configure AGTO output.
Input > Measurement Mode	• Measure Disabled • Measure Low Level Pulse Width • Measure High Level Pulse Width • Measure Pulse Period	Measure Disabled	Select if the AGT should be used to measure pulse width or pulse period. In high level pulse width measurement mode, the AGT counts when AGTIO is high and starts counting immediately in the middle of a pulse if AGTIO is high when R_AGT_Start() is called. In low level pulse width measurement mode, the AGT counts when AGTIO is low and could start counting in the middle of a pulse if AGTIO is low when R_AGT_Start() is called.
Input > Input Filter	• No Filter • Filter sampled at PCLKB • Filter sampled at PCLKB / 8	No Filter	Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode.

	• Filter sampled at PCLKB / 32		The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.
Input > Enable Pin	• Enable Pin Not Used • Enable Pin Active Low • Enable Pin Active High	Enable Pin Not Used	Select active edge for the AGTEE pin if used. Only applies if the count source is P402, P403 or AGTIO.
Input > Trigger Edge	• Trigger Edge Rising • Trigger Edge Falling • Trigger Edge Both	Trigger Edge Rising	Select the trigger edge. Applies if measurement mode is pulse period, or if the count source is P402, P403, or AGTIO. Do not select Trigger Edge Both with pulse period measurement.
Interrupts > Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the timer period elapses.
Interrupts > Underflow Interrupt Priority	MCU Specific Options		Timer interrupt priority.

Clock Configuration

The AGT clock is based on the PCLKB, LOCO, or Subclock frequency. You can set the clock frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Pin Configuration

This module can use the AGTOA and AGTOB pins as output pins for periodic, one-shot, or PWM signals.

For input capture, the input signal must be applied to the AGTIOn pin.

For event counting, the AGTEEn enable pin is optional.

Timer Period

The RA Configuration editor will automatically calculate the period count value and source clock divider based on the selected period time, units, and clock speed.

When the selected unit is "Raw counts", the maximum allowed period setting varies depending on the selected clock source:

Clock source	Maximum period (counts)
LOCO/Subclock	0x800000
PCLKB	0x80000
All other sources	0x10000

Note

Though the AGT is a 16-bit timer, because the period interrupt occurs when the counter underflows, setting the period register to 0 results in an effective period of 1 count. For this reason all user-provided raw count values reflect the actual number of period counts (not the raw register values).

Usage Notes

Starting and Stopping the AGT

After starting or stopping the timer, AGT registers cannot be accessed until the AGT state is updated after 3 AGTCLK cycles. If another AGT function is called before the 3 AGTCLK period elapses, the function spins waiting for the AGT state to update. The required wait time after starting or stopping the timer can be determined using the frequency of AGTCLK, which is derived from timer_cfg_t::source_div and agt_extended_cfg_t::count_source.

The application is responsible for ensuring required clocks are started and stable before accessing MCU peripheral registers.

Warning

The subclock can take seconds to stabilize. The RA startup code does not wait for subclock stabilization unless the subclock is the main clock source. When running AGT or RTC off the subclock, the application must ensure the subclock is stable before starting operation.

Low Power Modes

The AGT1 (channel 1 only) can be used to enter snooze mode or to wake the MCU from snooze, software standby, or deep software standby modes when a counter underflow occurs. The compare match A and B events can also be used to wake from software standby or snooze modes.

One-Shot Mode

The AGT timer does not support one-shot mode natively. One-shot mode is achieved by stopping the timer in the interrupt service routine before the callback is called. If the interrupt is not serviced before the timer period expires again, the timer generates more than one event. The callback is only called once in this case, but multiple events may be generated if the timer is linked to the Transfer (r_dtc).

One-Shot Mode Output

The output waveform in one-shot mode is one AGT clock cycle less than the configured period. The configured period must be at least 2 counts to generate an output pulse.

Examples of one-shot signals that can be generated by this module are shown below:

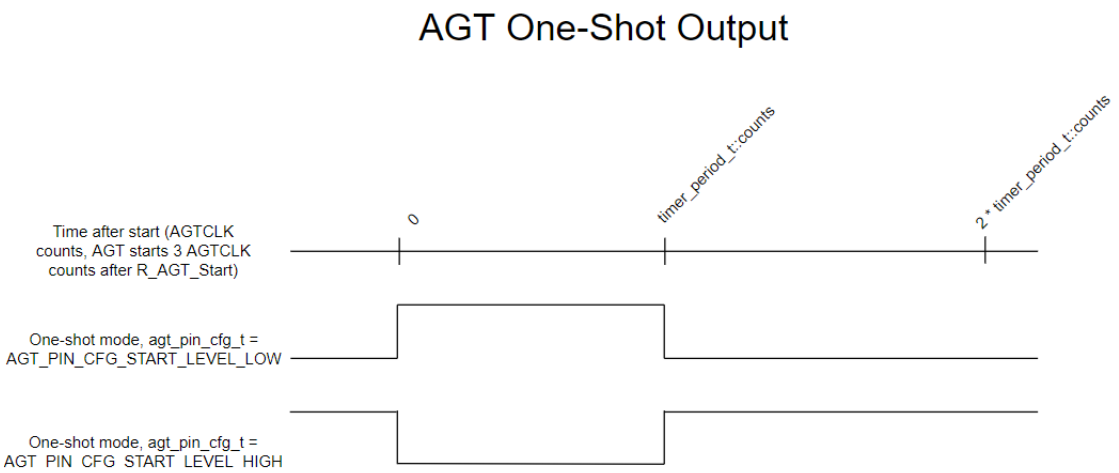

Figure 233: AGT One-Shot Output

Periodic Output

The AGTOA or AGTOB pin toggles twice each time the timer expires in periodic mode. This is achieved by defining a PWM wave at a 50 percent duty cycle so that the period of the resulting square (from rising edge to rising edge) matches the period of the AGT timer. Since the periodic output is actually a PWM output, the time at the stop level is one cycle shorter than the time opposite the stop level for odd period values.

Examples of periodic signals that can be generated by this module are shown below:

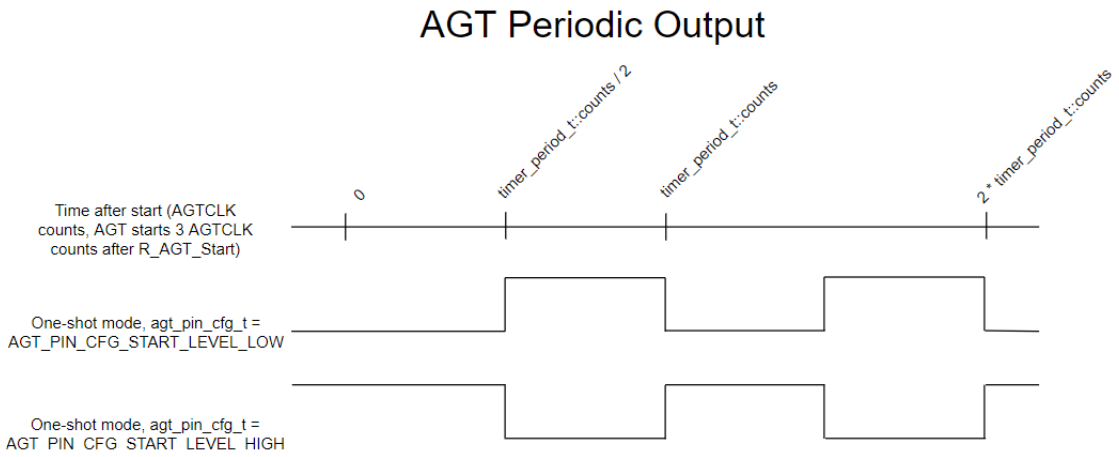

Figure 234: AGT Periodic Output

PWM Output

This module does not support in phase PWM output. The PWM output signal is low at the beginning of the cycle and high at the end of the cycle.

Examples of PWM signals that can be generated by this module are shown below:

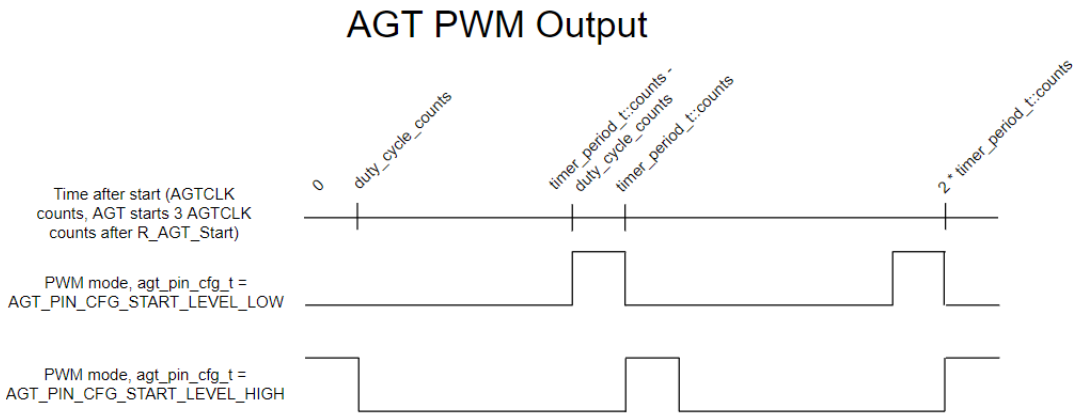

Figure 235: AGT PWM Output

Triggering ELC Events with AGT

The AGT timer can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

Examples

AGT Basic Example

This is a basic example of minimal use of the AGT in an application.

```
void agt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
}
```

AGT Callback Example

This is an example of a timer callback.

```
/* Example callback called when timer expires. */
```

```
void timer_callback (timer_callback_args_t * p_args)
{
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* Add application code to be called periodically here. */
    }
}
```

AGT Free Running Counter Example

To use the AGT as a free running counter, select periodic mode and set the the Period to 0xFFFF.

```
void agt_counter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* (Optional) Stop the timer. */
    (void) R_AGT_Stop(&g_timer0_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
}
```

AGT Input Capture Example

This is an example of using the AGT to capture pulse width or pulse period measurements.

```
/* Example callback called when a capture occurs. */
uint64_t g_captured_time    = 0U;
uint32_t g_capture_overflows = 0U;
void timer_capture_callback (timer_callback_args_t * p_args)
```

```
{
 if (TIMER_EVENT_CAPTURE_A == p_args->event)
    {
 /* (Optional) Get the current period if not known. */
 timer_info_t info;
       (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
       uint32_t period = info.period_counts;
 /* Process capture from AGTIO. */
       g_captured_time    = ((uint64_t) period * g_capture_overflows) +
p_args->capture;
       g_capture_overflows = 0U;
    }
 if (TIMER_EVENT_CYCLE_END == p_args->event)
    {
 /* An overflow occurred during capture. This must be accounted for at the
application layer. */
       g_capture_overflows++;
    }
}
void agt_capture_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable captures. Captured values arrive in the interrupt. */
    (void) R_AGT_Enable(&g_timer0_ctrl);
 /* (Optional) Disable captures. */
    (void) R_AGT_Disable(&g_timer0_ctrl);
}
```

AGT Period Update Example

This an example of updating the period.

```
#define AGT_EXAMPLE_MSEC_PER_SEC (1000)
#define AGT_EXAMPLE_DESIRED_PERIOD_MSEC (20)
/* This example shows how to calculate a new period value at runtime. */
void agt_period_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
  * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
  * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
  * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
  * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
  * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
  * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
  * by timer_cfg_t::source_div.
  *
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
```

```
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
}
```

AGT Duty Cycle Update Example

This an example of updating the duty cycle.

```
#define AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT (25)
#define AGT_EXAMPLE_MAX_PERCENT (100)
/* This example shows how to calculate a new duty cycle value at runtime. */
void agt_duty_cycle_calculation_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the timer. */
    (void) R_AGT_Start(&g_timer0_ctrl);
 /* Get the current period setting. */
 timer_info_t info;
    (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
    uint32_t current_period_counts = info.period_counts;
 /* Calculate the desired duty cycle based on the current period. */
    uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                 AGT_EXAMPLE_MAX_PERCENT;
 /* Set the calculated duty cycle. */
    err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
    assert(FSP_SUCCESS == err);
```

```
}
```

AGT Cascaded Timers Example

This an example of using underflow from an even AGT channel as the count source for the next channel (in this case, AGT0 and AGT1).

```
/* This example shows how use cascaded timers. The count source for AGT channel 1 is
set to AGT0 underflow. */
void agt_cascaded_timers_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the timers in any order. */
    err = R_AGT_Open(&g_timer_channel0_ctrl, &g_timer_channel0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_AGT_Open(&g_timer_channel1_ctrl, &g_timer_channel1_cfg);
    assert(FSP_SUCCESS == err);
 /* Start AGT channel 1 first. */
    (void) R_AGT_Start(&g_timer_channel1_ctrl);
    (void) R_AGT_Start(&g_timer_channel0_ctrl);
 /* (Optional) Stop AGT channel 0 first. */
    (void) R_AGT_Stop(&g_timer_channel0_ctrl);
    (void) R_AGT_Stop(&g_timer_channel1_ctrl);
 /* Read the current counter value. Counter value is in status.counter. */
 timer_status_t status;
    (void) R_AGT_StatusGet(&g_timer_channel1_ctrl, &status);
}
```

Data Structures

struct	agt_instance_ctrl_t
struct	agt_extended_cfg_t

Enumerations

enum	agt_clock_t
enum	agt_measure_t

enum	agt_agtio_filter_t
enum	agt_enable_pin_t
enum	agt_trigger_edge_t
enum	agt_output_pin_t
enum	agt_pin_cfg_t

Data Structure Documentation

◆ agt_instance_ctrl_t

struct agt_instance_ctrl_t
Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

◆ agt_extended_cfg_t

struct agt_extended_cfg_t		
Optional AGT extension data structure.		
Data Fields		
agt_clock_t	count_source	AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
union agt_extended_cfg_t	__unnamed__	
agt_pin_cfg_t	agto: 3	Configure AGTO pin. *Note* *AGTIO polarity is opposite AGTO*
agt_measure_t	measurement_mode	Measurement mode.
agt_agtio_filter_t	agtio_filter	Input filter for AGTIO.
agt_enable_pin_t	enable_pin	Enable pin (event counting only)
agt_trigger_edge_t	trigger_edge	Trigger edge to start pulse period measurement or count external event.

Enumeration Type Documentation

◆ agt_clock_t

enum agt_clock_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	PCLKB count source, division by 1, 2, or 8 allowed.
AGT_CLOCK_LOCO	LOCO count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_AGT_UNDERFLOW	Underflow event signal from next lowest AGT channel, division must be 1.
AGT_CLOCK_SUBCLOCK	Subclock count source, division by 1, 2, 4, 8, 16, 32, 64, or 128 allowed.
AGT_CLOCK_P402	Counts events on P402, events are counted in deep software standby mode.
AGT_CLOCK_P403	Counts events on P403, events are counted in deep software standby mode.
AGT_CLOCK_AGTIO	Counts events on AGTIOn, events are not counted in software standby modes.

◆ agt_measure_t

enum agt_measure_t	
Enable pin for event counting mode.	
Enumerator	
AGT_MEASURE_DISABLED	AGT used as a counter.
AGT_MEASURE_PULSE_WIDTH_LOW_LEVEL	AGT used to measure low level pulse width.
AGT_MEASURE_PULSE_WIDTH_HIGH_LEVEL	AGT used to measure high level pulse width.
AGT_MEASURE_PULSE_PERIOD	AGT used to measure pulse period.

◆ agt_agtio_filter_t

enum agt_agtio_filter_t	
Input filter, applies AGTIO in pulse period measurement, pulse width measurement, or event counter mode. The filter requires the signal to be at the same level for 3 successive reads at the specified filter frequency.	
Enumerator	
AGT_AGTIO_FILTER_NONE	No filter.
AGT_AGTIO_FILTER_PCLKB	Filter at PCLKB.
AGT_AGTIO_FILTER_PCLKB_DIV_8	Filter at PCLKB / 8.
AGT_AGTIO_FILTER_PCLKB_DIV_32	Filter at PCLKB / 32.

◆ agt_enable_pin_t

enum agt_enable_pin_t	
Enable pin for event counting mode.	
Enumerator	
AGT_ENABLE_PIN_NOT_USED	AGTEE/AGTWEE is not used.
AGT_ENABLE_PIN_ACTIVE_LOW	Events are only counted when AGTEE/AGTWEE is low.
AGT_ENABLE_PIN_ACTIVE_HIGH	Events are only counted when AGTEE/AGTWEE is high.

◆ agt_trigger_edge_t

enum agt_trigger_edge_t	
Trigger edge for pulse period measurement mode and event counting mode.	
Enumerator	
AGT_TRIGGER_EDGE_RISING	Measurement starts or events are counted on rising edge.
AGT_TRIGGER_EDGE_FALLING	Measurement starts or events are counted on falling edge.
AGT_TRIGGER_EDGE_BOTH	Events are counted on both edges (n/a for pulse period mode)

◆ agt_output_pin_t

enum agt_output_pin_t	
Output pins, used to select which duty cycle to update in R_AGT_DutyCycleSet().	
Enumerator	
AGT_OUTPUT_PIN_AGTOA	AGTOA.
AGT_OUTPUT_PIN_AGTOB	AGTOB.

◆ agt_pin_cfg_t

enum agt_pin_cfg_t	
Level of AGT pin	
Enumerator	
AGT_PIN_CFG_DISABLED	Not used as output pin.
AGT_PIN_CFG_START_LEVEL_LOW	Pin level low.
AGT_PIN_CFG_START_LEVEL_HIGH	Pin level high.

Function Documentation

◆ R_AGT_Open()

fsp_err_t R_AGT_Open (timer_ctrl_t *const *p_ctrl*, timer_cfg_t const *const *p_cfg*)

Initializes the AGT module instance. Implements timer_api_t::open.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional agt_extended_cfg_t extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is used and the output pins are disabled.

Example:

```
/* Initializes the module. */
   err = R_AGT_Open(&g_timer0_ctrl, &g_timer0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful and timer has started.
FSP_ERR_ASSERTION	A required input pointer is NULL or the period is not in the valid range of 1 to 0xFFFF.
FSP_ERR_ALREADY_OPEN	R_AGT_Open has already been called for this p_ctrl.
FSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the vector table.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel number is not available on AGT.

◆ R_AGT_Start()

fsp_err_t R_AGT_Start (timer_ctrl_t *const *p_ctrl*)

Starts timer. Implements timer_api_t::start.

Example:

```
/* Start the timer. */
   (void) R_AGT_Start(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer started.
FSP_ERR_ASSERTION	p_ctrl is null.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Stop()

fsp_err_t R_AGT_Stop (timer_ctrl_t *const *p_ctrl*)

Stops the timer. Implements timer_api_t::stop.

Example:

```
/* (Optional) Stop the timer. */
   (void) R_AGT_Stop(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Reset()

fsp_err_t R_AGT_Reset (timer_ctrl_t *const *p_ctrl*)

Resets the counter value to the period minus one. Implements timer_api_t::reset.

Return values

FSP_SUCCESS	Counter reset.
FSP_ERR_ASSERTION	p_ctrl is NULL
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_Enable()

fsp_err_t R_AGT_Enable (timer_ctrl_t *const *p_ctrl*)

Enables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::enable.

Example:

```
/* Enable captures. Captured values arrive in the interrupt. */
   (void) R_AGT_Enable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully enabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_Disable()

fsp_err_t R_AGT_Disable (timer_ctrl_t *const *p_ctrl*)

Disables external event triggers that start, stop, clear, or capture the counter. Implements timer_api_t::disable.

Example:

```
/* (Optional) Disable captures. */
   (void) R_AGT_Disable(&g_timer0_ctrl);
```

Return values

FSP_SUCCESS	External events successfully disabled.
FSP_ERR_ASSERTION	p_ctrl was NULL.
FSP_ERR_NOT_OPEN	The instance is not opened.

◆ R_AGT_PeriodSet()

fsp_err_t R_AGT_PeriodSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *period_counts*)

Updates period. The new period is updated immediately and the counter is reset to the maximum value. Implements timer_api_t::periodSet.

Warning

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and an AGT underflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter underflow after processing completes.
Stop the timer before calling this function if one-shot output is used.

Example:

```
/* Get the source clock frequency (in Hz). There are several ways to do this in FSP:
 * - If LOCO or subclock is chosen in agt_extended_cfg_t::clock_source
 * - The source clock frequency is BSP_LOCO_HZ >> timer_cfg_t::source_div
 * - If PCLKB is chosen in agt_extended_cfg_t::clock_source and the PCLKB frequency
has not changed since reset,
 * - The source clock frequency is BSP_STARTUP_PCLKB_HZ >> timer_cfg_t::source_div
 * - Use the R_AGT_InfoGet function (it accounts for the clock source and divider).
 * - Calculate the current PCLKB frequency using
R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) and right shift
 * by timer_cfg_t::source_div.
 *
```

```
  * This example uses the last option (R_FSP_SystemClockHzGet).
  */
    uint32_t timer_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKB) >>
g_timer0_cfg.source_div;
 /* Calculate the desired period based on the current clock. Note that this
calculation could overflow if the
  * desired period is larger than UINT32_MAX / pclkb_freq_hz. A cast to uint64_t is
used to prevent this. */
    uint32_t period_counts =
       (uint32_t) (((uint64_t) timer_freq_hz * AGT_EXAMPLE_DESIRED_PERIOD_MSEC) /
AGT_EXAMPLE_MSEC_PER_SEC);
 /* Set the calculated period. This will return an error if parameter checking is
enabled and the calculated
  * period is larger than UINT16_MAX. */
    err = R_AGT_PeriodSet(&g_timer0_ctrl, period_counts);
    assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Period value updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the period was not in the valid range of 1 to 0xFFFF.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_DutyCycleSet()

fsp_err_t R_AGT_DutyCycleSet (timer_ctrl_t *const *p_ctrl*, uint32_t const *duty_cycle_counts*, uint32_t const *pin*)

Updates duty cycle. If the timer is counting, the new duty cycle is reflected after the next counter underflow. Implements timer_api_t::dutyCycleSet.

Example:

```
/* Get the current period setting. */
timer_info_t info;
   (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
   uint32_t current_period_counts = info.period_counts;
/* Calculate the desired duty cycle based on the current period. */
   uint32_t duty_cycle_counts = (current_period_counts *
AGT_EXAMPLE_DESIRED_DUTY_CYCLE_PERCENT) /
                                AGT_EXAMPLE_MAX_PERCENT;
/* Set the calculated duty cycle. */
   err = R_AGT_DutyCycleSet(&g_timer0_ctrl, duty_cycle_counts, AGT_OUTPUT_PIN_AGTOA
);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Duty cycle updated.
FSP_ERR_ASSERTION	A required pointer was NULL, or the pin was not AGT_AGTO_AGTOA or AGT_AGTO_AGTOB.
FSP_ERR_INVALID_ARGUMENT	Duty cycle was not in the valid range of 0 to period (counts) - 1
FSP_ERR_NOT_OPEN	The instance control structure is not opened.
FSP_ERR_UNSUPPORTED	AGT_CFG_OUTPUT_SUPPORT_ENABLE is 0.

◆ R_AGT_InfoGet()

fsp_err_t R_AGT_InfoGet (timer_ctrl_t *const *p_ctrl*, timer_info_t *const *p_info*)

Gets timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Example:

```
/* (Optional) Get the current period if not known. */
timer_info_t info;
      (void) R_AGT_InfoGet(&g_timer0_ctrl, &info);
      uint32_t period = info.period_counts;
```

Return values

FSP_SUCCESS	Period, count direction, and frequency stored in p_info.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_StatusGet()

fsp_err_t R_AGT_StatusGet (timer_ctrl_t *const *p_ctrl*, timer_status_t *const *p_status*)

Retrieves the current state and counter value stores them in p_status. Implements timer_api_t::statusGet.

Example:

```
/* Read the current counter value. Counter value is in status.counter. */
timer_status_t status;
   (void) R_AGT_StatusGet(&g_timer0_ctrl, &status);
```

Return values

FSP_SUCCESS	Current status and counter value provided in p_status.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

◆ R_AGT_CallbackSet()

fsp_err_t R_AGT_CallbackSet (timer_ctrl_t *const *p_api_ctrl*, void(*)(timer_callback_args_t *) *p_callback*, void const *const *p_context*, timer_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements timer_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_AGT_Close()

fsp_err_t R_AGT_Close (timer_ctrl_t *const *p_ctrl*)

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

FSP_SUCCESS	Timer closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance control structure is not opened.

4.2.19 Transfer

Modules

Detailed Description

Transfer Modules.

Modules

Transfer (r_dmac)

	Driver for the DMAC peripheral on RA MCUs. This module implements the Transfer Interface.
	Transfer (r_dtc) Driver for the DTC peripheral on RA MCUs. This module implements the Transfer Interface.

4.2.19.1 Transfer (r_dmac)

Modules » Transfer

Functions

fsp_err_t	R_DMAC_Open (transfer_ctrl_t *const p_api_ctrl, transfer_cfg_t const *const p_cfg)
fsp_err_t	R_DMAC_Reconfigure (transfer_ctrl_t *const p_api_ctrl, transfer_info_t *p_info)
fsp_err_t	R_DMAC_Reset (transfer_ctrl_t *const p_api_ctrl, void const *volatile p_src, void *volatile p_dest, uint16_t const num_transfers)

fsp_err_t	R_DMAC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DMAC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Direct Memory Access Controller (DMAC) transfers data from one memory location to another without using the CPU.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
  - Repeat-Block transfer (Not available on all MCUs)
- Address increment, decrement, fixed, or offset modes
- Triggered by ELC events
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dmac

The following build time configurations are defined in fsp_cfg/r_dmac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Transfer > Transfer (r_dmac)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dmac).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Mode	• Normal • Repeat • Block • Repeat-Block	Normal	Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after

			Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Offset addition • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.
Number of Transfers	Value must be a non-negative integer	1	Specify the number of transfers for repeat and normal mode or block size for repeat-block transfer mode.
Number of Blocks (Valid only in Repeat,Block or Repeat-Block Mode)	Value must be a non-negative integer	0	Specify the number of blocks to transfer in Repeat,Block or Repeat-Block mode.
Activation Source	MCU Specific Options		Select the DMAC transfer start event. If no ELC event is chosen then software start can be used.
Callback	Name must be a valid C symbol	NULL	A user callback that is called at the end of the transfer.
Context	Manual Entry	NULL	Pointer to the context structure passed through the callback argument.
Transfer End Interrupt Priority	MCU Specific Options		Select the transfer end interrupt priority.
Interrupt Frequency	• Interrupt after	Interrupt after all	Select to have interrupt

	all transfers have completed • Interrupt after each block, or repeat size is transfered	transfers have completed	after each transfer or after last transfer.
Offset value (Valid only when address mode is \'Offset\')	Value must be a 24 bit signed integer.	1	Offset value is added to the address after each transfer.
Source Buffer Size	Value must be a non-negative integer	1	Specify the size of whole source buffer (valid only for Repeat-Block transfer mode with source address update mode other than offset addition).

Clock Configuration

The DMAC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build, or by using the CGC module at run-time.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Transfer Modes

The DMAC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transfered every time the configured ELC event is received by the DMAC channel. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment, decrement, or add an offset to the next data unit after each transfer. A 16-bit counter decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the ELC event and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,1024]. When the transfer counter reaches 0, the counter is reset to its configured value, the repeat area (source or destination address) resets to its starting address and the block count remaining will decrement by 1. When the block count reaches 0, transfers will no longer be triggered by the ELC event and the CPU may be interrupted to signal that all transfers have finished.
- **Block Mode** - In block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.
- **Repeat-Block Mode** - In repeat-block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,1024]. The number of blocks to transfer can be configured to a 16 bit number. If the destination address mode is offset mode, maximum configurable number of blocks is 0xFFFF for block size(length) of one with data

transfer size as byte,0x7FFF for block size of one with data transfer size as half word and 0x3FFF for block size of one with data size as word. After each block transfer the source address and the destination address will be incremented or decremented to the next block address. In case of offset address mode for source address, the source address size is the total size of source buffer after which the source area is rolled over, block size can be smaller than the source buffer size.For source address mode as offset mode, the maximum configurable source buffer size is 0xFFFF for transfer data size of a byte,0x7FFF for transfer data size of half word and 0x3FFF for transfer data size of word. Repeat-block mode can be used to implement single ring buffer to multiple ring buffer transfer type design.

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever • Max repeat size is 256 x 4 bytes	• Configurable number of repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)
Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.

Offset Address Mode

When the source or destination mode is configured to offset mode, a configurable offset is added to the source or destination pointer after each transfer. The offset is a signed 24 bit number.

Examples

Basic Example

This is a basic example of minimal use of the DMAC in an application. In this case, one or more events have been routed to the DMAC for handling so it only needs to be enabled to start accepting transfers.

```
void dmac_minimal_example (void)
{
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the DMAC so that it responds to transfer requests. */
    err = R_DMAC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

CRC32 Example

In this example the DMAC is used to feed the CRC peripheral to perform a CRC32 operation.

```
volatile bool g_transfer_complete = false;
void dmac_callback (dmac_callback_args_t * cb_data)
{
 FSP_PARAMETER_NOT_USED(cb_data);
    g_transfer_complete = true;
}
void dmac_crc_example (void)
{
    uint8_t p_src[TRANSFER_LENGTH];
 /* Initialize p_src to [ABC..OP] */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       p_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Set transfer source address to p_src */
    g_transfer_cfg.p_info->p_src = (void *) p_src;
 /* Set transfer destination address to the CRC data input register */
    g_transfer_cfg.p_info->p_dest = (void *) &R_CRC->CRCDIR;
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DMAC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable DMAC transfers. */
    (void) R_DMAC_Enable(&g_transfer_ctrl);
 /* Open the CRC module. */
    err = R_CRC_Open(&g_crc_ctrl, &g_crc_cfg);
    assert(FSP_SUCCESS == err);
 /* Clear the transfer complete flag. */
    g_transfer_complete = false;
 /* Trigger the transfer using software. */
    err = R_DMAC_SoftwareStart(&g_transfer_ctrl, TRANSFER_START_MODE_SINGLE);
    assert(FSP_SUCCESS == err);
```

```
while (!g_transfer_complete)
   {
/* Wait for transfer complete interrupt */
   }
/* Get CRC result and perform final XOR. */
   uint32_t crc32;
   (void) R_CRC_CalculatedValueGet(&g_crc_ctrl, &crc32);
   crc32 ^= CRC32_FINAL_XOR_VALUE;
/* Verify that the CRC32 is calculated correctly. */
/* CRC32("ABCD...NOP") = 0xE0E8FF4D. */
const uint32_t expected_crc32 = 0xE0E8FF4D;
if (expected_crc32 != crc32)
   {
/* Handle any CRC errors. This function should be defined by the user. */
      handle_crc_error();
   }
}
```

Data Structures

struct	dmac_instance_ctrl_t
struct	dmac_callback_args_t
struct	dmac_extended_cfg_t

Macros

#define	DMAC_MAX_NORMAL_TRANSFER_LENGTH
#define	DMAC_MAX_REPEAT_TRANSFER_LENGTH
#define	DMAC_MAX_BLOCK_TRANSFER_LENGTH
#define	DMAC_MAX_REPEAT_COUNT
#define	DMAC_MAX_BLOCK_COUNT

Data Structure Documentation

◆ dmac_instance_ctrl_t

struct dmac_instance_ctrl_t

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

◆ dmac_callback_args_t

struct dmac_callback_args_t		
Callback function parameter data.		
Data Fields		
void const *	p_context	Placeholder for user data. Set in r_transfer_t::open function in transfer_cfg_t.

◆ dmac_extended_cfg_t

struct dmac_extended_cfg_t	
DMAC transfer configuration extension. This extension is required.	
Data Fields	
uint8_t	channel
	Channel number, does not apply to all HAL drivers.
IRQn_Type	irq
	DMAC interrupt number.
uint8_t	ipl
	DMAC interrupt priority.
int32_t	offset
	Offset value used with transfer_addr_mode_t::TRANSFER_ADDR_MODE_OFFSET.
uint16_t	src_buffer_size
elc_event_t	activation_source
void(*	p_callback)(dmac_callback_args_t *cb_data)

void const *	p_context

Field Documentation

◆ src_buffer_size

uint16_t dmac_extended_cfg_t::src_buffer_size

Source ring buffer size for TRANSFER_MODE_REPEAT_BLOCK.

◆ activation_source

elc_event_t dmac_extended_cfg_t::activation_source

Select which event will trigger the transfer.

Note

Select ELC_EVENT_NONE for software activation in order to use softwareStart and softwareStart to trigger transfers.

◆ p_callback

void(* dmac_extended_cfg_t::p_callback) (dmac_callback_args_t *cb_data)

Callback for transfer end interrupt.

◆ p_context

void const* dmac_extended_cfg_t::p_context

Placeholder for user data. Passed to the user p_callback in dmac_callback_args_t.

Macro Definition Documentation

◆ DMAC_MAX_NORMAL_TRANSFER_LENGTH

#define DMAC_MAX_NORMAL_TRANSFER_LENGTH

Max configurable number of transfers in TRANSFER_MODE_NORMAL.

◆ DMAC_MAX_REPEAT_TRANSFER_LENGTH

#define DMAC_MAX_REPEAT_TRANSFER_LENGTH

Max number of transfers per repeat for TRANSFER_MODE_REPEAT.

◆ DMAC_MAX_BLOCK_TRANSFER_LENGTH

#define DMAC_MAX_BLOCK_TRANSFER_LENGTH

Max number of transfers per block in TRANSFER_MODE_BLOCK

◆ DMAC_MAX_REPEAT_COUNT

#define DMAC_MAX_REPEAT_COUNT
Max configurable number of repeats to trasnfer in TRANSFER_MODE_REPEAT

◆ DMAC_MAX_BLOCK_COUNT

#define DMAC_MAX_BLOCK_COUNT
Max configurable number of blocks to transfer in TRANSFER_MODE_BLOCK

Function Documentation

◆ R_DMAC_Open()

fsp_err_t R_DMAC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Configure a DMAC channel.

Return values

FSP_SUCCESS	Successful open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The configured channel is invalid.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.

◆ R_DMAC_Reconfigure()

fsp_err_t R_DMAC_Reconfigure (transfer_ctrl_t *const *p_api_ctrl*, transfer_info_t * *p_info*)

Reconfigure the transfer with new transfer info.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Reset()

fsp_err_t R_DMAC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers.

Return values

FSP_SUCCESS	Transfer reset successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_ENABLED	DMAC is not enabled. The current configuration must not be valid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_SoftwareStart()

fsp_err_t R_DMAC_SoftwareStart (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

If the mode is TRANSFER_START_MODE_SINGLE initiate a single transfer with software. If the mode is TRANSFER_START_MODE_REPEAT continue triggering transfers until all of the transfers are completed.

Return values

FSP_SUCCESS	Transfer started written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
FSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

◆ R_DMAC_SoftwareStop()

fsp_err_t R_DMAC_SoftwareStop (transfer_ctrl_t *const *p_api_ctrl*)

Stop software transfers if they were started with TRANSFER_START_MODE_REPEAT.

Return values

FSP_SUCCESS	Transfer stopped written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Enable()

fsp_err_t R_DMAC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfers for the configured activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_Disable()

fsp_err_t R_DMAC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfers so that they are no longer triggered by the activation source.

Return values

FSP_SUCCESS	Counter value written successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

◆ R_DMAC_InfoGet()

fsp_err_t R_DMAC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_info*)
Set driver specific information in provided pointer. **Return values** FSP_SUCCESS — Information has been written to p_info. FSP_ERR_NOT_OPEN — Handle is not initialized. Call R_DMAC_Open to initialize the control block. FSP_ERR_ASSERTION — An input parameter is invalid.

◆ R_DMAC_Close()

fsp_err_t R_DMAC_Close (transfer_ctrl_t *const *p_api_ctrl*)
Disable transfer and clean up internal data. Implements transfer_api_t::close. **Return values** FSP_SUCCESS — Successful close. FSP_ERR_ASSERTION — An input parameter is invalid. FSP_ERR_NOT_OPEN — Handle is not initialized. Call R_DMAC_Open to initialize the control block.

fsp_err_t	R_DTC_Close (transfer_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the DTC peripheral on RA MCUs. This module implements the Transfer Interface.

Overview

The Data Transfer Controller (DTC) transfers data from one memory location to another without using the CPU.

The DTC uses a RAM based vector table. Each entry in the vector table corresponds to an entry in the ISR vector table. When the DTC is triggered by an interrupt, it reads the DTC vector table, fetches the transfer information, and then executes the transfer. After the transfer is executed, the DTC writes the updated transfer info back to the location pointed to by the DTC vector table.

Features

- Supports multiple transfer modes
  - Normal transfer
  - Repeat transfer
  - Block transfer
- Chain transfers
- Address increment, decrement or fixed modes
- Can be triggered by any event that has reserved a slot in the interrupt vector table.
  - Some exceptions apply, see the Event table in the Event Numbers section of the Interrupt Controller Unit chapter of the hardware manual
- Supports 1, 2, and 4 byte data units

Configuration

Build Time Configurations for r_dtc

The following build time configurations are defined in fsp_cfg/r_dtc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Linker section to keep DTC vector table	Manual Entry	.fsp_dtc_vector_table	Section to place the DTC vector table.

Configurations for Transfer > Transfer (r_dtc)

This module can be added to the Stacks tab via New Stack > Transfer > Transfer (r_dtc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_transfer0	Module name.
Mode	• Normal • Repeat • Block	Normal	Select the transfer mode. Select the transfer mode. Normal: One transfer per activation, transfer ends after Number of Transfers; Repeat: One transfer per activation, Repeat Area address reset after Number of Transfers, transfer repeats until stopped; Block: Number of Blocks per activation, Repeat Area address reset after Number of Transfers, transfer ends after Number of Blocks.
Transfer Size	• 1 Byte • 2 Bytes • 4 Bytes	2 Bytes	Select the transfer size.
Destination Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the destination.
Source Address Mode	• Fixed • Incremented • Decremented	Fixed	Select the address mode for the source.
Repeat Area (Unused in Normal Mode)	• Destination • Source	Source	Select the repeat area. Either the source or destination address resets to its initial value after completing Number of Transfers in Repeat or Block mode.
Destination Pointer	Manual Entry	NULL	Specify the transfer destination pointer.
Source Pointer	Manual Entry	NULL	Specify the transfer source pointer.

Interrupt Frequency	• After all transfers have completed • After each transfer	After all transfers have completed	Select to have interrupt after each transfer or after last transfer.
Number of Transfers	Value must be a non-negative integer	0	Specify the number of transfers.
Number of Blocks (Valid only in Block Mode)	Must be a valid non-negative integer with a maximum configurable value of 65536. Applicable only in Block Mode.	0	Specify the number of blocks to transfer in Block mode.
Activation Source	MCU Specific Options		Select the DTC transfer start event.

Clock Configuration

The DTC peripheral module uses ICLK as the clock source. The ICLK frequency is set by using the **Clocks** tab of the RA Configuration editor prior to a build or by using the CGC module at runtime.

Pin Configuration

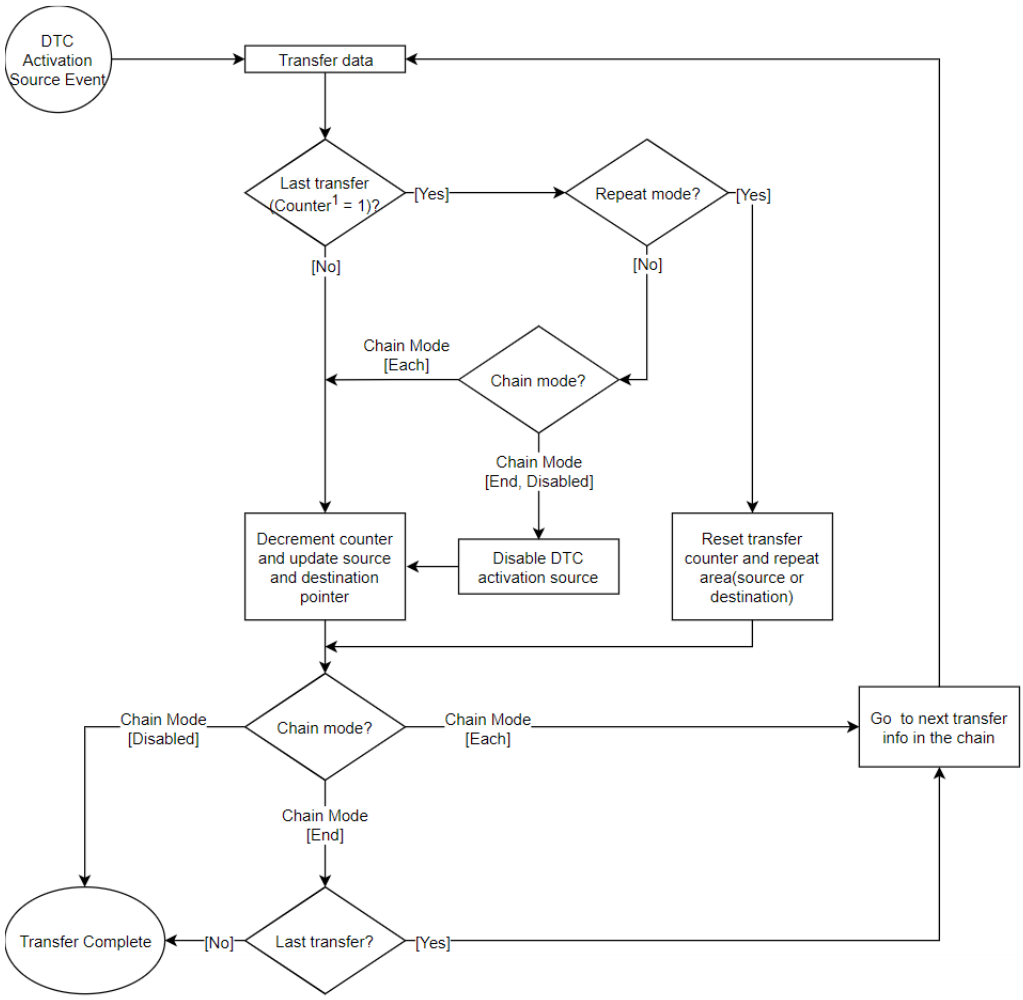
This module does not use I/O pins.

Usage Notes

Transfer Modes

The DTC Module supports three modes of operation.

- **Normal Mode** - In normal mode, a single data unit is transfered every time an interrupt is received by the DTC. A data unit can be 1-byte, 2-bytes, or 4-bytes. The source and destination addresses can be fixed, increment or decrement to the next data unit after each transfer. A 16-bit counter (length) decrements after each transfer. When the counter reaches 0, transfers will no longer be triggered by the interrupt source and the CPU can be interrupted to signal that all transfers have finished.
- **Repeat Mode** - Repeat mode works the same way as normal mode, however the length is limited to an integer in the range[1,256]. When the tranfer counter reaches 0, the counter is reset to its configured value and the repeat area (source or destination address) resets to its starting address and transfers will still be triggered by the interrupt.
- **Block Mode** - In block mode, the amount of data units transfered by each interrupt can be set to an integer in the range [1,256]. The number of blocks to transfer can also be configured to a 16-bit number. After each block transfer the repeat area (source or destination address) will reset to the original address and the other address will be incremented or decremented to the next block.



Note

1. The source and destination address of the transfer must be aligned to the configured data unit.
2. In normal mode the length can be set to [0,65535]. When the length is set to 0, than the transaction will execute 65536 transfers not 0.
3. In block mode, num_blocks can be set to [0,65535]. When the length is set to 0, than the transaction will execute

65536 transfers not 0.

Chaining Transfers

Multiple transfers can be configured for the same interrupt source by specifying an array of transfer_info_t structs instead of just passing a pointer to one. In this configuration, every transfer_info_t struct must be configured for a chain mode except for the last one. There are two types of chain mode; CHAIN_MODE_EACH and CHAIN_MODE_END. If a transfer is configured in CHAIN_MODE_EACH then it triggers the next transfer in the chain after it completes each transfer. If a transfer is configured in CHAIN_MODE_END then it triggers the next transfer in the chain after it completes its last transfer.

1. **Counter** refers to transfer_info_t::**length** in normal and repeat mode and transfer_info_t::**num_blocks** in block mode.

Figure 236: DTC Transfer Flowchart

Selecting the DTC or DMAC

The Transfer API is implemented by both DTC and the DMAC so that applications can switch between the DTC and the DMAC. When selecting between them, consider these factors:

	DTC	DMAC
Repeat Mode	• Repeats forever	• Configurable number of

	• Max repeat size is 256 x 4 bytes	repeats • Max repeat size is 1024 x 4 bytes
Block Mode	• Max block size is 256 x 4 bytes	• Max block size is 1024 x 4 bytes
Channels	• One instance per interrupt	• MCU specific (8 channels or less)
Chained Transfers	• Supported	• Not Supported
Software Trigger	• Must use the software ELC event	• Has support for software trigger without using software ELC event • Supports TRANSFER_START_MODE_SINGLE and TRANSFER_START_MODE_REPEAT
Offset Address Mode	• Not supported	• Supported

Additional Considerations

- The DTC requires a moderate amount of RAM (one transfer_info_t struct per open instance + DTC_VECTOR_TABLE_SIZE).
- The DTC stores transfer information in RAM and writes back to RAM after each transfer whereas the DMAC stores all transfer information in registers.
- When transfers are configured for more than one activation source, the DTC must fetch the transfer info from RAM on each interrupt. This can cause a higher latency between transfers.
- The DTC interrupts the CPU using the activation source's IRQ. Each DMAC channel has its own IRQ.

Interrupts

The DTC and DMAC interrupts behave differently. The DTC uses the configured IELSR event IRQ as the interrupt source whereas each DMAC channel has its own IRQ.

The transfer_info_t::irq setting also behaves a little differently depending on which mode is selected.

Normal Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	N/A
TRANSFER_IRQ_END	Interrupt after last transfer	Interrupt after last transfer

Repeat Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each transfer	Interrupt after each repeat
TRANSFER_IRQ_END	Interrupt after each repeat	Interrupt after last transfer

Block Mode

	DTC	DMAC
TRANSFER_IRQ_EACH	Interrupt after each block	Interrupt after each block
TRANSFER_IRQ_END	Interrupt after last block	Interrupt after last block

Note

DTC_VECTOR_TABLE_SIZE = (ICU_NVIC_IRQ_SOURCES x 4) Bytes

Peripheral Interrupts and DTC

When an interrupt is configured to trigger DTC transfers, the peripheral ISR will trigger on the following conditions:

- Each transfer completed (transfer_info_t::irq = TRANSFER_IRQ_EACH)
- Last transfer completed (transfer_info_t::irq = TRANSFER_IRQ_END)

For example, if SCI1_RXI is configured to trigger DTC transfers and a SCI1_RXI event occurs, the interrupt will not fire until the DTC transfer is completed. If the DTC transfer_info_t::irq is configured to only interrupt on the last transfer, than no RXI interrupts will occur until the last transfer is completed.

Note

1. The DTC activation source must be enabled in the NVIC in order to trigger DTC transfers (Modules that are designed to integrate the R_DTC module will automatically handle this).
2. The DTC prioritizes activation sources by granting the smaller interrupt vector numbers higher priority. The priority of interrupts to the CPU is determined by the NVIC priority.

Low Power Modes

DTCST must be set to 0 before transitioning to any of the following:

- Module-stop state
- Software Standby mode without Snooze mode transition
- Deep Software Standby mode

Note

1. R_LPM Module stops the DTC before entering deep software standby mode and software standby without snooze mode transition.
2. For more information see 18.9 and 18.10 in the RA6M3 manual R01UH0886EJ0100.

Limitations

Developers should be aware of the following limitations when using the DTC:

- If the DTC is configured to service many different activation sources, the system could run in to performance issues due to memory contention. To address this issue, it is reccomended that the DTC vector table and transfer information be moved to their own dedicated memory area (Ex: SRAM0, SRAM1, SRAMHS). This allows memory accesses from different BUS Masters (CPU, DTC, DMAC, EDMAC and Graphics IPs) to occur in parallel.

Examples

Basic Example

This is a basic example of minimal use of the DTC in an application.

```
void dtc_minimal_example (void)
{
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the DTC to handle incoming transfer requests. */
    err = R_DTC_Enable(&g_transfer_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	dtc_extended_cfg_t
struct	dtc_instance_ctrl_t

Macros

#define	DTC_MAX_NORMAL_TRANSFER_LENGTH
#define	DTC_MAX_REPEAT_TRANSFER_LENGTH
#define	DTC_MAX_BLOCK_TRANSFER_LENGTH
#define	DTC_MAX_BLOCK_COUNT

Data Structure Documentation

◆ dtc_extended_cfg_t

struct dtc_extended_cfg_t		
DTC transfer configuration extension. This extension is required.		
Data Fields		
IRQn_Type	activation_source	Select which IRQ will trigger the transfer.

◆ dtc_instance_ctrl_t

struct dtc_instance_ctrl_t
Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

Macro Definition Documentation

◆ DTC_MAX_NORMAL_TRANSFER_LENGTH

#define DTC_MAX_NORMAL_TRANSFER_LENGTH
Max configurable number of transfers in NORMAL MODE

◆ DTC_MAX_REPEAT_TRANSFER_LENGTH

#define DTC_MAX_REPEAT_TRANSFER_LENGTH
Max number of transfers per repeat for REPEAT MODE

◆ DTC_MAX_BLOCK_TRANSFER_LENGTH

#define DTC_MAX_BLOCK_TRANSFER_LENGTH
Max number of transfers per block in BLOCK MODE

◆ DTC_MAX_BLOCK_COUNT

#define DTC_MAX_BLOCK_COUNT
Max configurable number of blocks to transfer in BLOCK MODE

Function Documentation

◆ R_DTC_Open()

fsp_err_t R_DTC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Configure the vector table if it hasn't been configured, enable the Module and copy the pointer to the transfer info into the DTC vector table. Implements transfer_api_t::open.

Example:

```
/* Open the transfer instance with initial configuration. */
fsp_err_t err = R_DTC_Open(&g_transfer_ctrl, &g_transfer_cfg);
```

Return values

FSP_SUCCESS	Successful open. Transfer transfer info pointer copied to DTC Vector table. Module started. DTC vector table configured.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_ALREADY_OPEN	The control structure is already opened.
FSP_ERR_IN_USE	The index for this IRQ in the DTC vector table is already configured.
FSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.

◆ R_DTC_Reconfigure()

fsp_err_t R_DTC_Reconfigure (transfer_ctrl_t *const *p_api_ctrl*, transfer_info_t * *p_info*)

Copy pointer to transfer info into the DTC vector table and enable transfer in ICU. Implements transfer_api_t::reconfigure.

Return values

FSP_SUCCESS	Transfer is configured and will start when trigger occurs.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned corrrectly. Transfer destination address is NULL or is not aligned corrrectly.

Note

p_info must persist until all transfers are completed.

◆ R_DTC_Reset()

fsp_err_t R_DTC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers. Implements transfer_api_t::reset.

Return values

FSP_SUCCESS	Transfer reset successfully (transfers are enabled).
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_NOT_ENABLED	Transfer source address is NULL or is not aligned corrrectly. Transfer destination address is NULL or is not aligned corrrectly.

◆ R_DTC_SoftwareStart()

fsp_err_t R_DTC_SoftwareStart (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

Placeholder for unsupported softwareStart function. Implements transfer_api_t::softwareStart.

Return values

FSP_ERR_UNSUPPORTED	DTC software start is not supported.

◆ R_DTC_SoftwareStop()

fsp_err_t R_DTC_SoftwareStop (transfer_ctrl_t *const *p_api_ctrl*)

Placeholder for unsupported softwareStop function. Implements transfer_api_t::softwareStop.

Return values

FSP_ERR_UNSUPPORTED	DTC software stop is not supported.

◆ R_DTC_Enable()

fsp_err_t R_DTC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfers on this activation source. Implements transfer_api_t::enable.

Example:

```
/* Enable the DTC to handle incoming transfer requests. */
   err = R_DTC_Enable(&g_transfer_ctrl);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Transfers will be triggered by the activation source
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_UNSUPPORTED	Address Mode Offset is selected.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

◆ R_DTC_Disable()

fsp_err_t R_DTC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfer on this activation source. Implements transfer_api_t::disable.

Return values

FSP_SUCCESS	Transfers will not occur on activation events.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_InfoGet()

fsp_err_t R_DTC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_properties*)

Provides information about this transfer. Implements transfer_api_t::infoGet.

Return values

FSP_SUCCESS	p_info updated with current instance information.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
FSP_ERR_ASSERTION	An input parameter is invalid.

◆ R_DTC_Close()

fsp_err_t R_DTC_Close (transfer_ctrl_t *const *p_api_ctrl*)

Disables DTC activation in the ICU, then clears transfer data from the DTC vector table. Implements transfer_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

4.2.20 TrustZone

Modules

Detailed Description

Arm TrustZone Modules.

Modules

ARM TrustZone Context RA Port (rm_tz_context)

RTOS Context Management for RA MCUs.

4.2.20.1 ARM TrustZone Context RA Port (rm_tz_context)

Modules » TrustZone

RTOS Context Management for RA MCUs.

Overview

Add this module to a secure TrustZone project to allow the associated non-secure project to use an RTOS. It is used by an RTOS port for RA MCUs (for example, the FreeRTOS Port (rm_freertos_port), which is automatically added to RA projects when FreeRTOS is selected during project creation).

Note

The RTOS Context Management module does not provide any interfaces to the user. To use this module to port an RTOS, consult the Arm documentation at https://arm-software.github.io/CMSIS_5/Core/html/group__context__trustzone__functions.html for further information.

Configuration

Build Time Configurations for rm_tz_context

The following build time configurations are defined in fsp_cfg/rm_tz_context_cfg.h:

Configuration	Options	Default	Description
Process Stack Slots	Value must be a non-negative integer greater than 0	8	The maximum number of threads that can allocate a secure context. For applications using FreeRTOS, the Idle task requires 1 context as well.
Process Stack Size	Value must be a non-negative multiple of 8	256	The maximum stack size of all non-secure callable functions.

Clock Configuration

This module does not use peripheral clocks.

Pin Configuration

This module does not use I/O pins.

Usage Notes

TrustZone Integration

When using an RTOS in a TrustZone project, ARM recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context. To allocate a secure context, reference the documentation for the RTOS port used. For example, reference TrustZone Integration when FreeRTOS is used.

Sealing the Process Stack

This module seals each process stack by placing the value 0xFEF5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": https://developer.arm.com/documentation/100720/0300.

4.3 Interfaces

Detailed Description

The FSP interfaces provide APIs for common functionality. They can be implemented by one or more modules. Modules can use other modules as dependencies using this interface layer.

Modules

ADC Interface	Interface for A/D Converters.
ADPCM Decoder Interface	Interface for ADPCM decoder.
AUDIO PLAYBACK Interface	Interface for the Audio Playback.
BLE ABS Interface	Interface for Bluetooth Low Energy Abstraction functions.
BLE Interface	Interface for Bluetooth Low Energy functions.
BLE Mesh Access Interface	Interface for Bluetooth Low Energy Mesh Access functions.

	BLE Mesh Bearer Interface Interface for Bluetooth Low Energy Mesh Bearer functions.
	BLE Mesh Bearer Platform Interface Interface for Bluetooth Low Energy Mesh Bearer Platform functions.
	BLE Mesh Health Server Interface Interface for Bluetooth Low Energy Mesh Model Health Server functions.
	BLE Mesh Interface Interface for Bluetooth Low Energy Abstraction functions.
	BLE Mesh Lower Trans Interface Interface for Bluetooth Low Energy Mesh Lower Trans functions.
	BLE Mesh Model Client Interface Interface for Bluetooth Low Energy Mesh Model Model Client functions.
	BLE Mesh Model Configuration Client Interface Interface for Bluetooth Low Energy Mesh Model Configuration Client functions.
	BLE Mesh Model Server Interface Interface for Bluetooth Low Energy Mesh Model Model Server functions.
	BLE Mesh Network Interface Interface for Bluetooth Low Energy Mesh Network functions.
	BLE Mesh Provision Interface Interface for Bluetooth Low Energy Mesh Provision functions.
	BLE Mesh Scene Server Interface

	Interface for Bluetooth Low Energy Mesh Model Scene Server functions.
	BLE Mesh Upper Trans Interface Interface for Bluetooth Low Energy Mesh Upper Trans functions.
	Block Media Interface Interface for block media memory access.
	CAC Interface Interface for clock frequency accuracy measurements.
	CAN Interface Interface for CAN peripheral.
	CEC Interface Interface for CEC peripheral.
	CGC Interface Interface for clock generation.
	CRC Interface Interface for cyclic redundancy checking.
	CTSU Interface Interface for Capacitive Touch Sensing Unit (CTSU) functions.
	Communicatons Middleware Interface Interface for Communications Middleware functions.
	Comparator Interface Interface for comparators.
	DAC Interface

	Interface for D/A converters.
	DOC Interface Interface for the Data Operation Circuit.
	Display Interface Interface for LCD panel displays.
	ELC Interface Interface for the Event Link Controller.
	Ethernet Interface Interface for Ethernet functions.
	Ethernet PHY Interface Interface for Ethernet PHY functions.
	External IRQ Interface Interface for detecting external interrupts.
	FSXXXX Middleware Interface Interface for FSXXXX Middleware functions.
	FileX Block Media Port Interface Interface for FileX Block Media port.
	Flash Interface Interface for the Flash Memory.
	FreeRTOS+FAT Port Interface Interface for FreeRTOS+FAT port.
	HS300X Middleware Interface Interface for HS300X Middleware functions.

	I/O Port Interface Interface for accessing I/O ports and configuring I/O functionality.
	I2C Master Interface Interface for I2C master communication.
	I2C Slave Interface Interface for I2C slave communication.
	I2S Interface Interface for I2S audio communication.
	I3C Interface Interface for I3C.
	IIR Interface Interface for IIR filter functionality.
	JPEG Codec Interface Interface for JPEG functions.
	Key Matrix Interface Interface for key matrix functions.
	LittleFS Interface Interface for LittleFS access.
	Low Power Modes Interface Interface for accessing low power modes.
	Low Voltage Detection Interface Interface for Low Voltage Detection.

	Motor 120-Degree Control Interface Interface for motor 120 control functions.
	Motor 120-Degree Driver Interface Interface for motor driver functions.
	Motor Interface Interface for Motor functions.
	Motor angle Interface Interface for motor angle and speed calculation functions.
	Motor current Interface Interface for motor current functions.
	Motor driver Interface Interface for motor driver functions.
	Motor position Interface Interface for motor position functions.
	Motor speed Interface Interface for motor speed functions.
	OB1203 Middleware Interface Interface for OB1203 Middleware functions.
	OPAMP Interface Interface for Operational Amplifiers.
	PDC Interface Interface for PDC functions.
	POEG Interface

	Interface for the Port Output Enable for GPT.
	PTP Interface Interface for PTP functions.
	RTC Interface Interface for accessing the Realtime Clock.
	SCE Interface Interface for Secure Crypto Engine (SCE) functions.
	SD/MMC Interface Interface for accessing SD, eMMC, and SDIO devices.
	SLCDC Interface Interface for Segment LCD controllers.
	SPI Flash Interface Interface for accessing external SPI flash devices.
	SPI Interface Interface for SPI communications.
	Three-Phase Interface Interface for three-phase timer functions.
	Timer Interface Interface for timer functions.
	Touch Middleware Interface Interface for Touch Middleware functions.
	Transfer Interface Interface for data transfer functions.

	UART Interface Interface for UART communications.
	USB HCDC Interface Interface for USB HCDC functions.
	USB HHID Interface Interface for USB HHID functions.
	USB HMSC Interface Interface for USB HMSC functions.
	USB Interface Interface for USB functions.
	USB PCDC Interface Interface for USB PCDC functions.
	USB PHID Interface Interface for USB PHID functions.
	USB PMSC Interface Interface for USB PMSC functions.
	USB PPRN Interface Interface for USB PPRN functions.
	Virtual EEPROM Interface Interface for Virtual EEPROM access.
	WDT Interface Interface for watch dog timer functions.

	ZMOD4XXX Middleware Interface Interface for ZMOD4XXX Middleware functions.

4.3.1 ADC Interface

Interfaces

Detailed Description

Interface for A/D Converters.

Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

Implemented by: ADC (r_adc)

Data Structures

struct	adc_status_t
struct	adc_callback_args_t
struct	adc_info_t
struct	adc_cfg_t
struct	adc_api_t
struct	adc_instance_t

Typedefs

typedef void	adc_ctrl_t

Enumerations

enum	adc_mode_t
enum	adc_resolution_t
enum	adc_alignment_t
enum	adc_trigger_t

enum	adc_event_t
enum	adc_channel_t
enum	adc_group_id_t
enum	adc_group_mask_t
enum	adc_state_t

Data Structure Documentation

◆ adc_status_t

struct adc_status_t		
ADC status.		
Data Fields		
adc_state_t	state	Current state.

◆ adc_callback_args_t

struct adc_callback_args_t		
ADC callback arguments definitions		
Data Fields		
uint16_t	unit	ADC device in use.
adc_event_t	event	ADC callback event.
void const *	p_context	Placeholder for user data.
adc_channel_t	channel	Channel of conversion result. Only valid for r_adc ADC_EVENT _CONVERSION_COMPLETE.
uint64_t	channel_mask	Channel mask for conversion result. Only valid for r_adc_b.
adc_group_mask_t	group_mask	Group Mask.

◆ adc_info_t

struct adc_info_t		
ADC Information Structure for Transfer Interface		
Data Fields		
__I void *	p_address	The address to start reading the data from.
uint32_t	length	The total number of transfers to read.

transfer_size_t	transfer_size	The size of each transfer.
elc_peripheral_t	elc_peripheral	Name of the peripheral in the ELC list.
elc_event_t	elc_event	Name of the ELC event for the peripheral.
uint32_t	calibration_data	Temperature sensor calibration data (0xFFFFFFFF if unsupported) for reference voltage.
int16_t	slope_microvolts	Temperature sensor slope in microvolts/degrees C.
bool	calibration_ongoing	Calibration is in progress.

◆ adc_cfg_t

struct adc_cfg_t	
ADC general configuration	
Data Fields	
uint16_t	unit
	ADC unit to be used.
adc_mode_t	mode
	ADC operation mode.
adc_resolution_t	resolution
	ADC resolution.
adc_alignment_t	alignment
	Specify left or right alignment; ignored if addition used.
adc_trigger_t	trigger
	Default and Group A trigger source.
IRQn_Type	scan_end_irq
	Scan end IRQ number.

IRQn_Type	scan_end_b_irq
	Scan end group B IRQ number.
uint8_t	scan_end_ipl
	Scan end interrupt priority.
uint8_t	scan_end_b_ipl
	Scan end group B interrupt priority.
void(*	p_callback)(adc_callback_args_t *p_args)
	Callback function; set to NULL for none.
void const *	p_context
	Placeholder for user data. Passed to the user callback in adc_callback_args_t.
void const *	p_extend
	Extension parameter for hardware specific settings.

◆ adc_api_t

struct adc_api_t	
ADC functions implemented at the HAL layer will follow this API.	
Data Fields	
fsp_err_t(*	open)(adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)
fsp_err_t(*	scanCfg)(adc_ctrl_t *const p_ctrl, void const *const p_extend)
fsp_err_t(*	scanStart)(adc_ctrl_t *const p_ctrl)

fsp_err_t(*	scanGroupStart)(adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)
fsp_err_t(*	scanStop)(adc_ctrl_t *const p_ctrl)
fsp_err_t(*	scanStatusGet)(adc_ctrl_t *const p_ctrl, adc_status_t *p_status)
fsp_err_t(*	read)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)
fsp_err_t(*	read32)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)
fsp_err_t(*	calibrate)(adc_ctrl_t *const p_ctrl, void const *p_extend)
fsp_err_t(*	offsetSet)(adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)
fsp_err_t(*	callbackSet)(adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)
fsp_err_t(*	close)(adc_ctrl_t *const p_ctrl)
fsp_err_t(*	infoGet)(adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)

Field Documentation

◆ open

fsp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.

Implemented as

- R_ADC_Open()
- R_ADC_B_Open()
- R_SDADC_Open()

Precondition

Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ scanCfg

fsp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, void const *const p_extend)

Configure the scan including the channels, groups, and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_ScanCfg()
- R_ADC_B_ScanCfg()
- R_SDADC_ScanCfg()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	See implementation for details

◆ scanStart

fsp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)

Start the scan (in case of a software trigger), or enable the hardware trigger.

Implemented as

- R_ADC_ScanStart()
- R_SDADC_ScanStart()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanGroupStart

fsp_err_t(* adc_api_t::scanGroupStart) (adc_ctrl_t *p_ctrl, adc_group_mask_t group_mask)

Start the scan group (in case of a software trigger), or enable the hardware trigger.

Implemented as

- R_ADC_B_ScanGroupStart()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	group_mask	Mask of groups to start

◆ scanStop

fsp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.

Implemented as

- R_ADC_ScanStop()
- R_SDADC_ScanStop()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanStatusGet

fsp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl, adc_status_t *p_status)

Check scan status.

Implemented as

- R_ADC_StatusGet()
- R_ADC_B_StatusGet()
- R_SDADC_StatusGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_status	Pointer to store current status in

◆ read

fsp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint16_t *const p_data)

Read ADC conversion result.

Implemented as

- R_ADC_Read()
- R_ADC_B_Read()
- R_SDADC_Read()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ read32

fsp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, uint32_t *const p_data)

Read ADC conversion result into a 32-bit word.

Implemented as

- R_ADC_Read32()
- R_ADC_B_Read32()
- R_SDADC_Read32()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	p_data	Pointer to variable to load value into.

◆ calibrate

fsp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void const *p_extend)

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_Calibrate()
- R_ADC_B_Calibrate()
- R_SDADC_Calibrate()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	Pointer to implementation specific arguments

◆ offsetSet

fsp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_channel_t const reg_id, int32_t const offset)

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.

Implemented as

- R_SDADC_OffsetSet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_channel_t)
[in]	offset	See implementation for details.

◆ callbackSet

fsp_err_t(* adc_api_t::callbackSet) (adc_ctrl_t *const p_api_ctrl, void(*p_callback)(adc_callback_args_t *), void const *const p_context, adc_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Implemented as

- R_ADC_CallbackSet()
- R_ADC_B_CallbackSet()

Parameters

[in]	p_ctrl	Pointer to the ADC control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

fsp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Implemented as

- R_ADC_Close()
- R_ADC_B_Close()
- R_SDADC_Close()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ infoGet

fsp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.

Implemented as

- R_ADC_InfoGet()
- R_ADC_B_InfoGet()
- R_SDADC_InfoGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_adc_info	Pointer to ADC information structure

◆ adc_instance_t

struct adc_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
adc_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adc_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
void const *	p_channel_cfg	Pointer to the channel configuration structure for this instance.
adc_api_t const *	p_api	Pointer to the API structure for

		this instance.

Typedef Documentation

◆ adc_ctrl_t

typedef void adc_ctrl_t
ADC control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ adc_mode_t

enum adc_mode_t	
ADC operation mode definitions	
Enumerator	
ADC_MODE_SINGLE_SCAN	Single scan - one or more channels.
ADC_MODE_GROUP_SCAN	Two trigger sources to trigger scan for two groups which contain one or more channels.
ADC_MODE_CONTINUOUS_SCAN	Continuous scan - one or more channels.

◆ adc_resolution_t

enum adc_resolution_t	
ADC data resolution definitions	
Enumerator	
ADC_RESOLUTION_12_BIT	12 bit resolution
ADC_RESOLUTION_10_BIT	10 bit resolution
ADC_RESOLUTION_8_BIT	8 bit resolution
ADC_RESOLUTION_14_BIT	14 bit resolution
ADC_RESOLUTION_16_BIT	16 bit resolution
ADC_RESOLUTION_24_BIT	24 bit resolution

◆ adc_alignment_t

enum adc_alignment_t	
ADC data alignment definitions	
Enumerator	
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

◆ adc_trigger_t

enum adc_trigger_t	
ADC trigger mode definitions	
Enumerator	
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_ASYNC_EXTERNAL	External asynchronous trigger; not for group modes.

◆ adc_event_t

enum adc_event_t	
ADC callback event definitions	
Enumerator	
ADC_EVENT_SCAN_COMPLETE	Normal/Group A scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_B	Group B scan complete.
ADC_EVENT_CALIBRATION_COMPLETE	Calibration complete.
ADC_EVENT_CONVERSION_COMPLETE	Conversion complete.
ADC_EVENT_CALIBRATION_REQUEST	Calibration requested.
ADC_EVENT_CONVERSION_ERROR	Scan error.
ADC_EVENT_OVERFLOW	Overflow occurred.
ADC_EVENT_LIMIT_CLIP	Limiter clipping occurred.
ADC_EVENT_FIFO_READ_REQUEST	FIFO read requested.
ADC_EVENT_FIFO_OVERFLOW	FIFO overflow occurred.
ADC_EVENT_WINDOW_COMPARE_A	Window A comparison condition met.
ADC_EVENT_WINDOW_COMPARE_B	Window B comparison condition met.

◆ adc_channel_t

enum adc_channel_t	
ADC channels	
Enumerator	
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.

ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.
ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.

ADC_CHANNEL_SELF_DIAGNOSIS	Self-Diagnosis channel.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.
ADC_CHANNEL_DA0	D/A Converter Channel 0.
ADC_CHANNEL_DA1	D/A Converter Channel 1.
ADC_CHANNEL_DA2	D/A Converter Channel 2.
ADC_CHANNEL_DA3	D/A Converter Channel 3.
ADC_CHANNEL_0	ADC channel 0.
ADC_CHANNEL_1	ADC channel 1.
ADC_CHANNEL_2	ADC channel 2.
ADC_CHANNEL_3	ADC channel 3.
ADC_CHANNEL_4	ADC channel 4.
ADC_CHANNEL_5	ADC channel 5.
ADC_CHANNEL_6	ADC channel 6.
ADC_CHANNEL_7	ADC channel 7.
ADC_CHANNEL_8	ADC channel 8.
ADC_CHANNEL_9	ADC channel 9.
ADC_CHANNEL_10	ADC channel 10.
ADC_CHANNEL_11	ADC channel 11.
ADC_CHANNEL_12	ADC channel 12.
ADC_CHANNEL_13	ADC channel 13.
ADC_CHANNEL_14	ADC channel 14.
ADC_CHANNEL_15	ADC channel 15.
ADC_CHANNEL_16	ADC channel 16.

ADC_CHANNEL_17	ADC channel 17.
ADC_CHANNEL_18	ADC channel 18.
ADC_CHANNEL_19	ADC channel 19.
ADC_CHANNEL_20	ADC channel 20.
ADC_CHANNEL_21	ADC channel 21.
ADC_CHANNEL_22	ADC channel 22.
ADC_CHANNEL_23	ADC channel 23.
ADC_CHANNEL_24	ADC channel 24.
ADC_CHANNEL_25	ADC channel 25.
ADC_CHANNEL_26	ADC channel 26.
ADC_CHANNEL_27	ADC channel 27.
ADC_CHANNEL_28	ADC channel 28.
ADC_CHANNEL_DUPLEX_A	Data duplexing register A.
ADC_CHANNEL_DUPLEX_B	Data duplexing register B.
ADC_CHANNEL_DUPLEX	Data duplexing register.
ADC_CHANNEL_TEMPERATURE	Temperature sensor output.
ADC_CHANNEL_VOLT	Internal reference voltage.

◆ adc_group_id_t

enum adc_group_id_t	
Enumerator	
ADC_GROUP_ID_0	Group ID 0.
ADC_GROUP_ID_1	Group ID 1.
ADC_GROUP_ID_2	Group ID 2.
ADC_GROUP_ID_3	Group ID 3.
ADC_GROUP_ID_4	Group ID 4.
ADC_GROUP_ID_5	Group ID 5.
ADC_GROUP_ID_6	Group ID 6.
ADC_GROUP_ID_7	Group ID 7.
ADC_GROUP_ID_8	Group ID 8.

◆ adc_group_mask_t

enum adc_group_mask_t	
Enumerator	
ADC_GROUP_MASK_NONE	Group Mask Unknown or None.
ADC_GROUP_MASK_0	Group Mask 0.
ADC_GROUP_MASK_1	Group Mask 1.
ADC_GROUP_MASK_2	Group Mask 2.
ADC_GROUP_MASK_3	Group Mask 3.
ADC_GROUP_MASK_4	Group Mask 4.
ADC_GROUP_MASK_5	Group Mask 5.
ADC_GROUP_MASK_6	Group Mask 6.
ADC_GROUP_MASK_7	Group Mask 7.
ADC_GROUP_MASK_8	Group Mask 8.
ADC_GROUP_MASK_ALL	All Groups.

◆ adc_state_t

enum adc_state_t	
ADC states.	
Enumerator	
ADC_STATE_IDLE	ADC is idle.
ADC_STATE_SCAN_IN_PROGRESS	ADC scan in progress.

4.3.2 ADPCM Decoder Interface

Interfaces

Detailed Description

Interface for ADPCM decoder.

Summary

The ADPCM decoder interface provides functionality to decode the 4bit ADPCM data to 16bit PCM output.

Implemented by: ADPCM Decoder (rm_adpcm_decoder)

Data Structures

struct	adpcm_decoder_cfg_t
struct	adpcm_decoder_api_t
struct	adpcm_decoder_instance_t

Typedefs

typedef void	adpcm_decoder_ctrl_t

Data Structure Documentation

◆ adpcm_decoder_cfg_t

struct adpcm_decoder_cfg_t
Audio Decoder general configuration

◆ adpcm_decoder_api_t

struct adpcm_decoder_api_t	
Audio Decoder interface API.	
Data Fields	
fsp_err_t(*	open)(adpcm_decoder_ctrl_t *const p_ctrl, adpcm_decoder_cfg_t const *const p_cfg)
fsp_err_t(*	decode)(adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)
fsp_err_t(*	reset)(adpcm_decoder_ctrl_t *const p_ctrl)
fsp_err_t(*	close)(adpcm_decoder_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* adpcm_decoder_api_t::open) (adpcm_decoder_ctrl_t *const p_ctrl, adpcm_decoder_cfg_t const *const p_cfg)

Initialize Audio Decoder device.

Implemented as

- RM_ADPCM_DECODER_Open()

Note

To reconfigure after calling this function, call adpcm_decoder_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ decode

fsp_err_t(* adpcm_decoder_api_t::decode) (adpcm_decoder_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint32_t src_len_bytes)

Decodes the compressed data and stores it in output buffer.

Implemented as

- RM_ADPCM_DECODER_Decode()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_src	Pointer to a source data buffer from which data will be picked up for decode operation. The argument must not be NULL.
[out]	p_dest	Pointer to the location to store the decoded data.
[in]	p_dest	Number of bytes to be decoded.

◆ reset

fsp_err_t(* adpcm_decoder_api_t::reset) (adpcm_decoder_ctrl_t *const p_ctrl)

Resets the ADPCM driver.

Implemented as

- RM_ADPCM_DECODER_Reset()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ close

fsp_err_t(* adpcm_decoder_api_t::close) (adpcm_decoder_ctrl_t *const p_ctrl)

Close the specified Audio decoder modules.

Implemented as

- RM_ADPCM_DECODER_Close()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ adpcm_decoder_instance_t

struct adpcm_decoder_instance_t		
This structure encompasses everything that is needed to use an instance of this interface.		
Data Fields		
adpcm_decoder_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
adpcm_decoder_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
adpcm_decoder_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ adpcm_decoder_ctrl_t

typedef void adpcm_decoder_ctrl_t

Audio Decoder control block. Allocate an instance specific control block to pass into the Audio Decoder API calls.

Implemented as

- adpcm_decoder_instance_ctrl_t

4.3.3 AUDIO PLAYBACK Interface

Interfaces

Detailed Description

Interface for the Audio Playback.

Defines the API and data structures for the Audio Playback implementation.

Summary

This module provides common interface for Audio Playback.

Implemented by: Audio Playback PWM (rm_audio_playback_pwm)

Data Structures

struct	audio_playback_callback_args_t
struct	audio_playback_cfg_t
struct	audio_playback_api_t
struct	audio_playback_instance_t

Typedefs

typedef void	audio_playback_ctrl_t

Enumerations

enum	audio_playback_event_t

Data Structure Documentation

◆ audio_playback_callback_args_t

struct audio_playback_callback_args_t		
Callback function parameter data		
Data Fields		
void *	p_context	Placeholder for user data.
audio_playback_event_t	event	Event that triggered the callback.

◆ audio_playback_cfg_t

struct audio_playback_cfg_t	
Audio Playback configuration parameters.	
Data Fields	
void const *	p_extend
	Hardware dependent configuration.
void(*	p_callback)(audio_playback_callback_args_t *p_args)
void *	p_context

Field Documentation

◆ p_callback

void(* audio_playback_cfg_t::p_callback) (audio_playback_callback_args_t *p_args)
Callback called when play is complete.

◆ p_context

void* audio_playback_cfg_t::p_context
Placeholder for user data. Passed to the user callback in audio_playback_callback_args_t.

◆ audio_playback_api_t

struct audio_playback_api_t	
Audio Playback functions implemented by the Audio Playback drivers will follow this API.	
Data Fields	
fsp_err_t(*	open)(audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)
fsp_err_t(*	start)(audio_playback_ctrl_t *const p_ctrl)

fsp_err_t(*	stop)(audio_playback_ctrl_t *const p_ctrl)
fsp_err_t(*	play)(audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)
fsp_err_t(*	close)(audio_playback_ctrl_t *const p_ctrl)

Field Documentation

◆ open

fsp_err_t(* audio_playback_api_t::open) (audio_playback_ctrl_t *const p_ctrl, audio_playback_cfg_t const *const p_cfg)

Open a audio playback module.

Implemented as

- RM_AUDIO_PLAYBACK_PWM_Open()

Parameters

[in]	p_ctrl	Pointer to memory allocated for control block.
[in]	p_cfg	Pointer to the hardware configurations.

◆ start

fsp_err_t(* audio_playback_api_t::start) (audio_playback_ctrl_t *const p_ctrl)

Start audio playback hardware.

Implemented as

- RM_AUDIO_PLAYBACK_PWM_Start()

Parameters

[in]	p_ctrl	Pointer to control block.

◆ stop

fsp_err_t(* audio_playback_api_t::stop) (audio_playback_ctrl_t *const p_ctrl)

Stop audio playback hardware.

Implemented as

- RM_AUDIO_PLAYBACK_PWM_Stop()

Parameters

[in]	p_ctrl	Pointer to control block.

◆ play

fsp_err_t(* audio_playback_api_t::play) (audio_playback_ctrl_t *const p_ctrl, void const *const p_buffer, uint32_t length)

Play audio buffer.

Implemented as

- RM_AUDIO_PLAYBACK_PWM_Play()

Parameters

[in]	p_ctrl	Pointer to control block.
[in]	p_buffer	Pointer to buffer with PCM samples to play. Data must be scaled for audio playback hardware.
[in]	length	Length of data in p_buffer.

◆ close

fsp_err_t(* audio_playback_api_t::close) (audio_playback_ctrl_t *const p_ctrl)

Close the audio driver.

Implemented as

- RM_AUDIO_PLAYBACK_PWM_Close()

Parameters

[in]	p_ctrl	Pointer to control block initialized in audio_playback_api_t::open.

◆ audio_playback_instance_t

struct audio_playback_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

audio_playback_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
audio_playback_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
audio_playback_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ audio_playback_ctrl_t

typedef void audio_playback_ctrl_t
Audio Playback control block. Allocate an instance specific control block to pass into the AUDIO_PLAYBACK API calls. **Implemented as** ◦ audio_playback_pwm_instance_ctrl_t

Enumeration Type Documentation

◆ audio_playback_event_t

enum audio_playback_event_t	
Callback event types.	
Enumerator	
AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE	Audio playback complete event.

4.3.4 BLE ABS Interface

Interfaces

Detailed Description

Interface for Bluetooth Low Energy Abstraction functions.

Summary

The BLE ABS interface for the Bluetooth Low Energy Abstraction (BLE ABS) peripheral provides Bluetooth Low Energy Abstraction functionality.

The Bluetooth Low Energy Abstraction interface can be implemented by:

- BLE Abstraction (rm_ble_abs)

Data Structures

struct	ble_device_address_t
struct	ble_gap_connection_parameter_t
struct	ble_gap_connection_phy_parameter_t
struct	ble_gap_scan_phy_parameter_t
struct	ble_gap_scan_on_t
struct	ble_abs_callback_args_t
struct	ble_abs_pairing_parameter_t
struct	ble_abs_gatt_server_callback_set_t
struct	ble_abs_gatt_client_callback_set_t
struct	ble_abs_legacy_advertising_parameter_t
struct	ble_abs_extend_advertising_parameter_t
struct	ble_abs_non_connectable_advertising_parameter_t
struct	ble_abs_periodic_advertising_parameter_t
struct	ble_abs_scan_phy_parameter_t
struct	ble_abs_scan_parameter_t
struct	ble_abs_connection_phy_parameter_t
struct	ble_abs_connection_parameter_t
struct	ble_abs_cfg_t
struct	ble_abs_api_t
struct	ble_abs_instance_t

Macros

#define	BLE_ABS_ADVERTISING_PHY_LEGACY Non-Connectable Legacy Advertising phy setting.

Typedefs

typedef void(*	ble_gap_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_evt_data_t *p_event_data)
typedef void(*	ble_vendor_specific_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_vs_evt_data_t *p_event_data)
typedef void(*	ble_gatt_server_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gatts_evt_data_t *p_event_data)
typedef void(*	ble_gatt_client_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gattc_evt_data_t *p_event_data)
typedef void(*	ble_abs_delete_bond_application_callback_t) (st_ble_dev_addr_t *p_addr)
typedef void	ble_abs_ctrl_t

Enumerations

enum	ble_abs_advertising_filter_t
enum	ble_abs_local_bond_information_t
enum	ble_abs_remote_bond_information_t
enum	ble_abs_delete_non_volatile_area_t

Data Structure Documentation

◆ ble_device_address_t

struct ble_device_address_t		
st_ble_device_address is the type of bluetooth device address(BD_ADDR).		
Data Fields		
uint8_t	addr[BLE_BD_ADDR_LEN]	bluetooth device address.
uint8_t	type	the type of bluetooth device address.

◆ ble_gap_connection_parameter_t

struct ble_gap_connection_parameter_t		
ble_gap_connection_parameter_t is Connection parameters included in connection interval, slave latency, supervision timeout, ce length.		
Data Fields		
uint16_t	conn_intv_min	Minimum connection interval.

uint16_t	conn_intv_max	Maximum connection interval.
uint16_t	conn_latency	Slave latency.
uint16_t	sup_to	Supervision timeout.
uint16_t	min_ce_length	Minimum CE Length.
uint16_t	max_ce_length	Maximum CE Length.

◆ ble_gap_connection_phy_parameter_t

struct ble_gap_connection_phy_parameter_t		
ble_gap_connection_phy_parameter_t is Connection parameters per PHY.		
Data Fields		
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.
ble_gap_connection_parameter_t *	p_conn_param	Connection interval, slave latency, supervision timeout, and CE length.

◆ ble_gap_scan_phy_parameter_t

struct ble_gap_scan_phy_parameter_t		
Scan parameters per scan PHY.		
Data Fields		
uint8_t	scan_type	Scan type.
uint16_t	scan_intv	Scan interval.
uint16_t	scan_window	Scan window.

◆ ble_gap_scan_on_t

struct ble_gap_scan_on_t		
Parameters configured when scanning starts.		
Data Fields		
uint8_t	proc_type	Procedure type.
uint8_t	filter_dups	Filter duplicates.
uint16_t	duration	Scan duration.
uint16_t	period	Scan period.

◆ ble_abs_callback_args_t

struct ble_abs_callback_args_t		
Callback function parameter data		
Data Fields		

uint32_t	channel	Select a channel corresponding to the channel number of the hardware.
ble_event_cb_t	ble_abs_event	The event can be used to identify what caused the callback.
void const *	p_context	Placeholder for user data. Set in ble_abs_api_t::open function in ble_abs_cfg_t.

◆ ble_abs_pairing_parameter_t

struct ble_abs_pairing_parameter_t		
st_ble_abs_pairing_parameter_t includes the pairing parameters.		
Data Fields		
uint8_t	io_capabilitie_local_device	IO capabilities of local device.
uint8_t	mitm_protection_policy	MITM protection policy.
uint8_t	secure_connection_only	Determine whether to accept only Secure Connections or not.
uint8_t	local_key_distribute	Type of keys to be distributed from local device.
uint8_t	remote_key_distribute	Type of keys which local device requests a remote device to distribute.
uint8_t	maximum_key_size	Maximum LTK size.
uint8_t	padding[2]	padding

◆ ble_abs_gatt_server_callback_set_t

struct ble_abs_gatt_server_callback_set_t		
GATT Server callback function and the priority.		
Data Fields		
ble_gatt_server_application_callback_t	gatt_server_callback_function	GATT Server callback function.
uint8_t	gatt_server_callback_priority	The priority number of GATT Server callback function.

◆ ble_abs_gatt_client_callback_set_t

struct ble_abs_gatt_client_callback_set_t		
GATT Client callback function and the priority.		
Data Fields		
ble_gatt_client_application_callback_t	gatt_client_callback_function	GATT Client callback function.

uint8_t	gatt_client_callback_priority	The priority number of GATT Client callback function.

◆ ble_abs_legacy_advertising_parameter_t

struct ble_abs_legacy_advertising_parameter_t		
st_ble_abs_legacy_advertising_parameter_t is the parameters for legacy advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising Data. If the p_advertising_data is specified as NULL, Advertising Data is not included in the advertising PDU.
uint8_t *	p_scan_response_data	Scan Response Data. If the p_scan_response_data is specified as NULL, Scan Response Data is not included in the advertising PDU.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_interval parameter. Time(ms) =

		slow_advertising_interval * 0.625. If the slow_advertising_interval parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	fast_advertising_period	The period which advertising with the fast_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the fast_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the fast_advertising_period parameter is 0x0000, advertising with the fast_advertising_interval parameter is not performed.
uint16_t	slow_advertising_period	The period which advertising with the slow_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the slow_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the slow_advertising_period parameter is 0x0000, the advertising continues.
uint16_t	advertising_data_length	Advertising data length(byte). Valid range is 0-31. If the advertising_data_length is 0, Advertising Data is not included in the advertising PDU.
uint16_t	scan_response_data_length	Scan response data length (in bytes). Scan Response Data(byte). Valid range is 0-31. If the scan_response_data_length is 0, Scan Response Data is not included in the advertising PDU.
uint8_t	advertising_channel_map	The channel map used for the advertising packet

<table>
<tr><td></td><td></td><td>transmission.
It is a bitwise OR of the following values.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_CH_37(0x01)</td><td>Use 37 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_38(0x02)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_39(0x04)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_ALL(0x07)</td><td>Use 37 - 39 CH.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>advertising_filter_policy</td><td>Advertising filter policy.
If the p_peer_address parameter is NULL, the advertising is performed according to the advertising filter policy.
If the p_peer_address parameter is not NULL, this parameter is ignored.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY(0x00)</td><td>Process scan and connection requests from all devices.</td></tr><tr><td>BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST(0x01)</td><td>Process scan and connection requests from only devices in the White List.</td></tr></table></td></tr>

</table>

		registered in Resolving List, public address is used.
uint8_t	own_bluetooth_address[6]	Own Bluetooth address.
uint8_t	padding[3]	padding

◆ ble_abs_extend_advertising_parameter_t

struct ble_abs_extend_advertising_parameter_t		
st_ble_abs_extend_advertising_parameter_t is the parameters for extended advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_addr parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_addr parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	fast_advertising_interval	Advertising with the fast_advertising_interval parameter continues for the period specified by the fast_advertising_period parameter. Time(ms) = fast_advertising_interval * 0.625. If the fast_advertising_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint32_t	slow_advertising_interval	After the elapse of the fast_advertising_period, advertising with the slow_advertising_interval parameter continues for the period specified by the slow_advertising_period parameter. Time(ms) =

		fast_advertising_interval * 0.625. If the fast_advertising_period parameter is 0, this parameter is ignored. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	fast_advertising_period	The period which advertising with the fast_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the fast_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the fast_advertising_period parameter is 0x0000, the fast_advertising_interval parameter is ignored.
uint16_t	slow_advertising_period	The period which advertising with the slow_advertising_interval parameter continues for. Time = duration * 10ms. After the elapse of the slow_advertising_period, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the slow_advertising_period parameter is 0x0000, the advertising continues.
uint16_t	advertising_data_length	Advertising data length (in bytes). Valid range is 0-229. If the adv_data_length is 0, Advertising Data is not included in the advertising PDU.
uint8_t	advertising_channel_map	The channel map used for the advertising packet transmission. It is a bitwise OR of the following values. macro: description BLE_GAP_ADV_CH_37(0x01): Use 37 CH. BLE_GAP_ADV: Use 38 CH.

		_CH_38(0x02) BLE_GAP_ADV_CH_39(0x04) Use 38 CH. BLE_GAP_ADV_CH_ALL(0x07) Use 37 - 39 CH.
uint8_t	advertising_filter_policy	Advertising filter policy. If the p_peer_address parameter is NULL, the advertising is performed according to the advertising filter policy. If the p_peer_address parameter is not NULL, this parameter is ignored. macro / description BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY(0x00) Process scan and connection requests from all devices. BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST(0x01) Process scan and connection requests from only devices in the White List.
uint8_t	own_bluetooth_address_type	Own Bluetooth address type. Select one of the following. macro / description BLE_GAP_ADDR_PUBLIC(0x00) Public Address BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02) Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used.
uint8_t	own_bluetooth_address[6]	Own Bluetooth address.
uint8_t	primary_advertising_phy	Primary advertising PHY. In this parameter, only 1M PHY

<table>
<tr><td></td><td></td><td>and Coded PHY can be specified, and 2M PHY cannot be specified.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Primary Advertising PHY.
When the adv_prop_type field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY as Primary Advertising PHY.
Coding scheme is configured by R_BLE_VS_SetCodingScheme().</td></tr></table></td></tr>

Select one of the following.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Secondary Advertising PHY.</td></tr><tr><td>BLE_GAP_ADV_PHY_2M(0x02)</td><td>Use 2M PHY as Secondary Advertising PHY.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY(S=8) as Secondary Advertising PHY.
Coding scheme is configured by R_BLE_VS_SetCodingSchem</td></tr></table></td></tr>
</table>

		e().
uint8_t	padding[3]	padding

◆ ble_abs_non_connectable_advertising_parameter_t

struct ble_abs_non_connectable_advertising_parameter_t		
st_ble_abs_non_connectable_advertising_parameter_t is the parameters for non-connectable advertising.		
Data Fields		
ble_device_address_t *	p_peer_address	The remote device address. If the p_peer_address parameter is not NULL, Direct Connectable Advertising is performed to the remote address. If the p_peer_address parameter is NULL, Undirect Connectable Advertising is performed according to the advertising filter policy specified by the filter parameter.
uint8_t *	p_advertising_data	Advertising data. If p_adv_data is specified as NULL, advertising data is not set.
uint32_t	advertising_interval	Advertising with the advertising_interval parameter continues for the period specified by the duration parameter. Time(ms) = advertising_interval * 0.625. If the duration parameter is 0x0000, the advertising with the advertising_interval parameter continue. Valid range is 0x00000020 - 0x00FFFFFF.
uint16_t	advertising_duration	The period which advertising with the advertising_interval parameter continues for. Time = advertising_duration * 10ms. After the elapse of the advertising_duration, BLE_GAP_EVENT_ADV_OFF event notifies that the advertising has stopped. Valid range is 0x0000 - 0xFFFF. If the advertising_duration parameter is 0x0000, the

<table>
<tr><td></td><td></td><td>advertising continues.</td></tr>
<tr><td>uint16_t</td><td>advertising_data_length</td><td>Advertising data length (in bytes).
If the primary_advertising_phy parameter is BLE_ABS_ADVERTISING_PHY_LEGACY(0x00), the valid range is 0-31.
If the primary_advertising_phy parameter is the other values, the valid range is 0-1650.
If the advertising_data_length parameter is 0, Advertising Data is not included in the advertising PDU.</td></tr>
<tr><td>uint8_t</td><td>advertising_channel_map</td><td>The channel map used for the advertising packet transmission.
It is a bitwise OR of the following values.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_CH_37(0x01)</td><td>Use 37 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_38(0x02)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_39(0x04)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_ALL(0x07)</td><td>Use 37 - 39 CH.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>own_bluetooth_address_type</td><td>Own Bluetooth address type.
Select one of the following.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADDR_PUBLIC(0x00)</td><td>Public Address</td></tr><tr><td>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</td><td>Resolvable Private Address.
If the IRK of local device has not been registered in Resolving List, public address is used.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>own_bluetooth_address[6]</td><td>Own Bluetooth address.</td></tr>
</table>

<table>
<tr><td>uint8_t</td><td>primary_advertising_phy</td><td>Primary advertising PHY.
In this parameter, only 1M PHY and Coded PHY can be specified, and 2M PHY cannot be specified.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_ABS_ADVERTISING_PHY_LEGACY(0x00)</td><td>Use 1M PHY as Primary Advertising PHY for Non-Connectable Legacy Advertising.
If Periodic Advertising is performed, this value shall not set to the adv_phy parameter.</td></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Primary Advertising PHY.
When the adv_prop_type field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M.</td></tr><tr><td>BLE_GAP_ADV_PHY_CD(0x03)</td><td>Use Coded PHY as Primary Advertising PHY.
Coding scheme is configured by R_BLE_VS_SetCodingScheme().</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>secondary_advertising_phy</td><td>Secondary advertising Phy.
Select one of the following.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x0</td><td>Use 1M PHY as Secondary</td></tr></table></td></tr>
</table>

		1)	Advertising PHY.
		BLE_GAP_ADV_PHY_2M(0x02)	Use 2M PHY as Secondary Advertising PHY.
		BLE_GAP_ADV_PHY_CD(0x03)	Use Coded PHY(S=8) as Secondary Advertising PHY. Coding scheme is configured by R_BLE_VS_SetCodingScheme().
uint8_t	padding[2]	padding	

◆ ble_abs_periodic_advertising_parameter_t

struct ble_abs_periodic_advertising_parameter_t		
st_ble_abs_periodic_advertising_parameter_t is the parameters for periodic advertising.		
Data Fields		
ble_abs_non_connectable_advertising_parameter_t	advertising_parameter	Advertising parameters.
uint8_t *	p_periodic_advertising_data	Periodic advertising data. If p_perd_adv_data is specified as NULL, periodic advertising data is not set.
uint16_t	periodic_advertising_interval	Periodic advertising interval. Time(ms) = periodic_advertising_interval * 1.25. Valid range is 0x0006 - 0xFFFF.
uint16_t	periodic_advertising_data_length	Periodic advertising data length (in bytes). Valid range is 0 - 1650. If the periodic_advertising_data_length is 0, Periodic Advertising Data is not included in the advertising PDU.

◆ ble_abs_scan_phy_parameter_t

struct ble_abs_scan_phy_parameter_t
st_ble_abs_scan_phy_parameter_t is the phy parameters for scan.

Data Fields		
uint16_t	fast_scan_interval	Fast scan interval. Interval(ms) = fast_scan_interval * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	slow_scan_interval	Slow Scan interval. Slow Scan interval(ms) = slow_scan_interval * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	fast_scan_window	Fast Scan window. Fast Scan window(ms) = fast_scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	slow_scan_window	Slow Scan window. Slow Scan window(ms) = slow_scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
uint8_t	scan_type	Scan type. macro: description BLE_GAP_SCAN_PASSIVE(0x00): Passive Scan. BLE_GAP_SCAN_ACTIVE(0x01): Active Scan.
uint8_t	padding[3]	padding.

◆ ble_abs_scan_parameter_t

struct ble_abs_scan_parameter_t		
st_ble_abs_scan_parameter_t is the parameters for scan.		
Data Fields		
ble_abs_scan_phy_parameter_t *	p_phy_parameter_1M	Scan parameters for receiving the advertising packets in 1M PHY. In case of not receiving the advertising packets in 1M PHY, this field is specified as NULL. p_phy_parameter_1M or p_phy_parameter_coded field shall be set to scan parameters.
ble_abs_scan_phy_parameter_t *	p_phy_parameter_coded	Scan parameters for receiving the advertising packets in Coded PHY. In case of not receiving the advertising packets in Coded PHY, this field is specified as

		NULL. p_phy_parameter_1M or p_phy_parameter_coded field shall be set to scan parameters.
uint8_t *	p_filter_data	Data for Advertising Data filtering. The p_filter_data parameter is used for the advertising data in single advertising report. The advertising data composed of multiple advertising reports is not filtered by this parameter. If the p_filter_data parameter is specified as NULL, the filtering is not done.
uint16_t	fast_scan_period	The period which scan with the fast scan interval/fast scan window continues for. Time(ms) = fast_scan_period * 10. Valid range is 0x0000 - 0xFFFF. If the fast_scan_period parameter is 0x0000, scan with the fast scan interval/fast scan window is not performed. After the elapse of the fast_scan_period, BLE_GAP_EVENT_SCAN_TO event notifies that the scan has stopped.
uint16_t	slow_scan_period	The period which scan with the slow scan interval/slow scan window continues for. Time = slow_scan_period * 10ms. Valid range is 0x0000 - 0xFFFF. If the slow_scan_period parameter is 0x0000, the scan continues. After the elapse of the slow_scan_period, BLE_GAP_EVENT_SCAN_TO event notifies that the scan has stopped.
uint16_t	filter_data_length	The length of the data specified by the p_filter_data parameter. Valid range is 0x0000-0x0010. If the filter_data_length parameter is 0, the filtering is not done.
uint8_t	device_scan_filter_policy	Scan Filter Policy. Select one of

the following.
.

- Address type setting (Field [7:4])

macro	description
BLE_GAP_ADDR_PUBLIC(0x00)	Use Public Address.
BLE_GAP_ADDR_RAND(0x01)	Use Random Address.
BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)	If the IRK of local device has been registered in Resolving list, use RPA. If not, use Public Address.
BLE_GAP_ADDR_RPA_ID_RANDOM(0x03)	If the IRK of local device has been registered in Resolving list, use RPA. If not, use Random Address.

- White list setting (Field [3:0])

macro	description
BLE_GAP_SCAN_ALLOW_ADV_ALL(0x00)	Accept all advertising and scan response PDUs except directed

				advertising PDUs not addressed to local device.
			BLE_GAP_SCAN_ALLOW_ADV_WLST(0x01)	Accept only advertising and scan response PDUs from remote devices whose address is registered in the White List. Directed advertising PDUs which are not addressed to local device is ignored.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED(0x02)	Accept all advertising and scan response PDUs except directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the

				target address is the local resolvable private address are accepted.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST(0x03)	Accept all advertising and scan response PDUs. The following are excluded. • Advertising and scan response PDUs where the advertiser's identity address is not in

			the White List. • Directed advertising PDUs whose the target address is identity address but doesn't address local device. However directe

		d advertising PDUs whose the target address is the local resolvable private address are accepted.
uint8_t	filter_duplicate	Filter duplicates. Maximum number of filtered devices is 8. The 9th and subsequent devices are not filtered by this parameter. macro: description BLE_GAP_SCAN_FILT_DUPLIC_DISABLE(0x00): Duplicate filter disabled. BLE_GAP_SCA: Duplicate

		N_FILT_DUPLIC_ENABLE(0x01) filter enabled. BLE_GAP_SCAN_FILT_DUPLIC_ENABLE_FOR_PERIOD(0x02) Duplicate filtering enabled, reset for each scan period.
uint8_t	filter_ad_type	The AD type of the data specified by the p_filter_data parameter. The AD type identifier values are defined in Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers).
uint8_t	padding[3]	Padding.

◆ ble_abs_connection_phy_parameter_t

struct ble_abs_connection_phy_parameter_t		
st_ble_abs_connection_phy_parameter_t is the phy parameters for create connection.		
Data Fields		
uint16_t	connection_interval	Connection interval. Time(ms) = connection_interval * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	connection_slave_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	supervision_timeout	Supervision timeout. Time(ms) = supervision_timeout * 10. Valid range is 0x000A - 0x0C80.
uint8_t	padding[2]	Padding.

◆ ble_abs_connection_parameter_t

struct ble_abs_connection_parameter_t		
st_ble_abs_connection_parameter_t is the parameters for create connection.		
Data Fields		
ble_abs_connection_phy_parameter_t *	p_connection_phy_parameter_1M	Connection interval, slave latency, supervision timeout for 1M PHY. The p_connection_phy_parameter_1M is specified as NULL, a connection request is not sent with 1M PHY.

<table>
<tr><td>ble_abs_connection_phy_parameter_t *</td><td>p_connection_phy_parameter_2M</td><td>Connection interval, slave latency, supervision timeout for 2M PHY.
The p_connection_phy_parameter_2M is specified as NULL, a connection request is not sent with 2M PHY.</td></tr>
<tr><td>ble_abs_connection_phy_parameter_t *</td><td>p_connection_phy_parameter_coded</td><td>Connection interval, slave latency, supervision timeout for Coded PHY.
The p_connection_phy_parameter_coded is specified as NULL, a connection request is not sent with Coded PHY.</td></tr>
<tr><td>ble_device_address_t *</td><td>p_device_address</td><td>Address of the device to be connected.
If the filter field is BLE_GAP_INIT_FILT_USE_WLST(0x01), this parameter is ignored and please fill p_device_address.addr with 0x00.</td></tr>
<tr><td>uint8_t</td><td>filter_parameter</td><td>The filter field specifies whether the White List is used or not, when connecting with a remote device.
.
Address type setting (Field [7:4])<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADDR_PUBLIC(0x00)</td><td>Use Public Address.</td></tr><tr><td>BLE_GAP_ADDR_RAND(0x01)</td><td>Use Random Address.</td></tr><tr><td>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</td><td>If the IRK of local device has been registered in Resolving list, use RPA. If not, use Public Address.</td></tr></table></td></tr>
</table>

		BLE_GAP_ADDR_RPA_ID_RANDOM(0x03) If the IRK of local device has been registered in Resolving list, use RPA. If not, use Random Address. • White list setting (Field [3:0]) macro / description BLE_GAP_INIT_FILT_USE_ADDR(0x00) White List is not used. The remote device to be connected is specified by the p_addr field is used. BLE_GAP_INIT_FILT_USE_WLST(0x01) White List is used. The remote device registered in White List is connected with local device. The p_addr field is ignored.
uint8_t	connection_timeout	The time(sec) to cancel the create connection request. Valid range is 0 <= connection_timeout <= 10. If the connection_timeout field

		is 0, the create connection request is not canceled. .
uint8_t	padding[2]	Padding.

◆ ble_abs_cfg_t

struct ble_abs_cfg_t	
BLE ABS configuration parameters.	
Data Fields	
uint32_t	channel
	Select a channel corresponding to the channel number of the hardware. More...
ble_gap_application_callback_t	gap_callback
	GAP callback function.
ble_vendor_specific_application_callback_t	vendor_specific_callback
	Vendor Specific callback function.
ble_abs_gatt_server_callback_set_t *	p_gatt_server_callback_list
	GATT Server callback set.
uint8_t	gatt_server_callback_list_number
	The number of GATT Server callback functions.
ble_abs_gatt_client_callback_set_t *	p_gatt_client_callback_list
	GATT Client callback set.
uint8_t	gatt_client_callback_list_number
	The number of GATT Client callback functions.

ble_abs_pairing_parameter_t *	p_pairing_parameter
	Pairing parameters.
flash_instance_t const *	p_flash_instance
	Pointer to flash instance.
timer_instance_t const *	p_timer_instance
	Pointer to timer instance.
void(*	p_callback)(ble_abs_callback_args_t *p_args)
	Callback provided when a BLE ISR occurs.
void const *	p_context
	Placeholder for user data. Passed to the user callback in ble_abs_callback_args_t.
void const *	p_extend
	Placeholder for user extension.

Field Documentation

◆ channel

uint32_t ble_abs_cfg_t::channel
Select a channel corresponding to the channel number of the hardware. the parameters for initialization.

◆ ble_abs_api_t

struct ble_abs_api_t
BLE ABS functions implemented at the HAL layer will follow this API.
Data Fields

fsp_err_t(*	open)(ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg)
fsp_err_t(*	close)(ble_abs_ctrl_t *const p_ctrl)
fsp_err_t(*	reset)(ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback)
fsp_err_t(*	startLegacyAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startExtendedAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startNonConnectableAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startPeriodicAdvertising)(ble_abs_ctrl_t *const p_ctrl, ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter)
fsp_err_t(*	startScanning)(ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t const *const p_scan_parameter)
fsp_err_t(*	createConnection)(ble_abs_ctrl_t *const p_ctrl, ble_abs_connection_parameter_t const *const p_connection_parameter)
fsp_err_t(*	setLocalPrivacy)(ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk, uint8_t privacy_mode)
fsp_err_t(*	startAuthentication)(ble_abs_ctrl_t *const p_ctrl, uint16_t connection_handle)
fsp_err_t(*	deleteBondInformation)(ble_abs_ctrl_t *const p_ctrl, ble_abs_bond_information_parameter_t const *const p_bond_information_parameter)

fsp_err_t(*	importKeyInformation)(ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)
fsp_err_t(*	exportKeyInformation)(ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)

Field Documentation

◆ open

fsp_err_t(* ble_abs_api_t::open) (ble_abs_ctrl_t *const p_ctrl, ble_abs_cfg_t const *const p_cfg)

Initialize the BLE ABS in register start mode.

Implemented as

- RM_BLE_ABS_Open()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ close

fsp_err_t(* ble_abs_api_t::close) (ble_abs_ctrl_t *const p_ctrl)

Close the BLE ABS.

Implemented as

- RM_BLE_ABS_Close()

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ reset

fsp_err_t(* ble_abs_api_t::reset) (ble_abs_ctrl_t *const p_ctrl, ble_event_cb_t init_callback)

Close the BLE ABS.

Implemented as

- RM_BLE_ABS_Reset()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	init_callback	callback function to initialize Host Stack.

◆ startLegacyAdvertising

fsp_err_t(* ble_abs_api_t::startLegacyAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_legacy_advertising_parameter_t const *const p_advertising_parameter)

Start Legacy Connectable Advertising.

Implemented as

- RM_BLE_ABS_StartLegacyAdvertising()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for Legacy Advertising.

◆ startExtendedAdvertising

fsp_err_t(* ble_abs_api_t::startExtendedAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_extend_advertising_parameter_t const *const p_advertising_parameter)

Start Extended Connectable Advertising.

Implemented as

- RM_BLE_ABS_StartExtendedAdvertising()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for extend Advertising.

◆ startNonConnectableAdvertising

fsp_err_t(* ble_abs_api_t::startNonConnectableAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_non_connectable_advertising_parameter_t const *const p_advertising_parameter)

Start Non-Connectable Advertising.

Implemented as

- RM_BLE_ABS_StartNonConnectableAdvertising()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for non-connectable Advertising.

◆ startPeriodicAdvertising

fsp_err_t(* ble_abs_api_t::startPeriodicAdvertising) (ble_abs_ctrl_t *const p_ctrl, ble_abs_periodic_advertising_parameter_t const *const p_advertising_parameter)

Start Periodic Advertising.

Implemented as

- RM_BLE_ABS_StartPeriodicAdvertising()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_advertising_parameter	Pointer to Advertising parameters for periodic Advertising.

◆ startScanning

fsp_err_t(* ble_abs_api_t::startScanning) (ble_abs_ctrl_t *const p_ctrl, ble_abs_scan_parameter_t const *const p_scan_parameter)

Start scanning.

Implemented as

- RM_BLE_ABS_StartScanning()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_scan_parameter	Pointer to scan parameter.

◆ createConnection

fsp_err_t(* ble_abs_api_t::createConnection) (ble_abs_ctrl_t *const p_ctrl, ble_abs_connection_parameter_t const *const p_connection_parameter)

Request create connection.

Implemented as

- RM_BLE_ABS_CreateConnection()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_connection_parameter	Pointer to connection parameter.

◆ setLocalPrivacy

fsp_err_t(* ble_abs_api_t::setLocalPrivacy) (ble_abs_ctrl_t *const p_ctrl, uint8_t const *const p_lc_irk, uint8_t privacy_mode)

Configure local device privacy.

Implemented as

- RM_BLE_ABS_SetLocalPrivacy()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_lc_irk	Pointer to IRK to be registered in the resolving list.
[in]	privacy_mode	privacy_mode privacy mode.

◆ startAuthentication

fsp_err_t(* ble_abs_api_t::startAuthentication) (ble_abs_ctrl_t *const p_ctrl, uint16_t connection_handle)

Start pairing or encryption.

Implemented as

- RM_BLE_ABS_StartAuthentication()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	connection_handle	Connection handle identifying the remote device.

◆ deleteBondInformation

fsp_err_t(* ble_abs_api_t::deleteBondInformation) (ble_abs_ctrl_t *const p_ctrl, ble_abs_bond_information_parameter_t const *const p_bond_information_parameter)

Delete bond information.

Implemented as

- RM_BLE_ABS_DeleteBondInformation()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_bond_information_parameter	Pointer to bond information parameter.

◆ importKeyInformation

fsp_err_t(* ble_abs_api_t::importKeyInformation) (ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)

Import local identity address, keys information to local storage.

Implemented as

- RM_BLE_ABS_ImportKeyInformation()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_local_identity_address	Pointer to local identiry address.
[in]	uint8_t	p_local_irk Pointer to local IRK
[in]	uint8_t	p_local_csrk Pointer to local CSRK

◆ exportKeyInformation

fsp_err_t(* ble_abs_api_t::exportKeyInformation) (ble_abs_ctrl_t *const p_ctrl, ble_device_address_t *p_local_identity_address, uint8_t *p_local_irk, uint8_t *p_local_csrk)

Export local identity address, keys information from local storage.

Implemented as

- RM_BLE_ABS_ExportKeyInformation()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_local_identity_address	Pointer to local identiry address.
[out]	uint8_t	p_local_irk Pointer to local IRK
[out]	uint8_t	p_local_csrk Pointer to local CSRK

◆ ble_abs_instance_t

struct ble_abs_instance_t

This structure encompasses everything that is needed to use an instance of this interface.

Data Fields

ble_abs_ctrl_t *	p_ctrl	Pointer to the control structure for this instance.
ble_abs_cfg_t const *	p_cfg	Pointer to the configuration structure for this instance.
ble_abs_api_t const *	p_api	Pointer to the API structure for this instance.

Typedef Documentation

◆ ble_gap_application_callback_t

typedef void(* ble_gap_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_evt_data_t *p_event_data)

ble_gap_application_callback_t is the GAP Event callback function type.

◆ ble_vendor_specific_application_callback_t

typedef void(* ble_vendor_specific_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_vs_evt_data_t *p_event_data)

ble_vendor_specific_application_callback_t is the Vendor Specific Event callback function type.

◆ ble_gatt_server_application_callback_t

typedef void(* ble_gatt_server_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gatts_evt_data_t *p_event_data)
ble_gatt_server_application_callback_t is the GATT Server Event callback function type.

◆ ble_gatt_client_application_callback_t

typedef void(* ble_gatt_client_application_callback_t) (uint16_t event_type, ble_status_t event_result, st_ble_gattc_evt_data_t *p_event_data)
ble_gatt_client_application_callback_t is the GATT Server Event callback function type.

◆ ble_abs_delete_bond_application_callback_t

typedef void(* ble_abs_delete_bond_application_callback_t) (st_ble_dev_addr_t *p_addr)
ble_abs_delete_bond_application_callback_t is the delete bond information Event callback function type.

◆ ble_abs_ctrl_t

typedef void ble_abs_ctrl_t
BLE ABS control block. Allocate an instance specific control block to pass into the BLE ABS API calls. **Implemented as** ◦ ble_abs_instance_ctrl_t

Enumeration Type Documentation

◆ ble_abs_advertising_filter_t

enum ble_abs_advertising_filter_t	
Advertising Filter Policy	
Enumerator	
BLE_ABS_ADVERTISING_FILTER_ALLOW_ANY	Receive a connect request from all devices.
BLE_ABS_ADVERTISING_FILTER_ALLOW_WHITE_LIST	Receive a connect request from only the devices registered in White List.

◆ ble_abs_local_bond_information_t

enum ble_abs_local_bond_information_t	
Local keys delete policy	
Enumerator	
BLE_ABS_LOCAL_BOND_INFORMATION_NONE	Delete no local keys.
BLE_ABS_LOCAL_BOND_INFORMATION_ALL	Delete all local keys.

◆ ble_abs_remote_bond_information_t

enum ble_abs_remote_bond_information_t	
Remote keys delete policy	
Enumerator	
BLE_ABS_REMOTE_BOND_INFORMATION_NONE	Delete no remote device keys.
BLE_ABS_REMOTE_BOND_INFORMATION_SPECIFIED	Delete the keys specified by the device address.
BLE_ABS_REMOTE_BOND_INFORMATION_ALL	Delete all remote device keys.

◆ ble_abs_delete_non_volatile_area_t

enum ble_abs_delete_non_volatile_area_t	
Deletion policy for non-volatile memory	
Enumerator	
BLE_ABS_DELETE_NON_VOLATILE_AREA_DISABLE	Delete no keys stored in storage.
BLE_ABS_DELETE_NON_VOLATILE_AREA_ENABLE	Delete the keys stored in storage.

4.3.5 BLE Interface

Interfaces

Functions

ble_status_t R_BLE_Open (void)

	Open the BLE protocol stack. More...
ble_status_t	R_BLE_Close (void) Close the BLE protocol stack. More...
ble_status_t	R_BLE_Execute (void) Execute the BLE task. More...
uint32_t	R_BLE_IsTaskFree (void) Check the BLE task queue is free or not. More...
ble_status_t	R_BLE_SetEvent (ble_event_cb_t cb) Set event. More...

Detailed Description

Interface for Bluetooth Low Energy functions.

Summary

The BLE interface for the Bluetooth Low Energy (BLE) peripheral provides Bluetooth Low Energy functionality.

The Bluetooth Low Energy interface can be implemented by:

- BLE Driver (r_ble_extended)
- BLE Driver (r_ble_balance)

Macro Definition Documentation

◆ BLE_VERSION_MAJOR

#define BLE_VERSION_MAJOR
BLE Module Major Version.

◆ BLE_VERSION_MINOR

#define BLE_VERSION_MINOR
BLE Module Minor Version.

◆ BLE_LIB_EXTENDED

#define BLE_LIB_EXTENDED
BLE Protocol Stack Library Extended type.

◆ BLE_LIB_BALANCE

#define BLE_LIB_BALANCE
BLE Protocol Stack Library Balance type.

◆ BLE_LIB_COMPACT

#define BLE_LIB_COMPACT
BLE Protocol Stack Library Compacy type.

Typedef Documentation

◆ ble_event_cb_t

ble_event_cb_t
ble_event_cb_t is the callback function type for R_BLE_SetEvent(). **Parameters** [in] void **Returns** none

Function Documentation

◆ R_BLE_Open()

ble_status_t R_BLE_Open (void)
Open the BLE protocol stack. This function should be called once before using the BLE protocol stack. **Return values** BLE_SUCCESS(0x0000) Success

◆ R_BLE_Close()

ble_status_t R_BLE_Close (void)
Close the BLE protocol stack. This function should be called once to close the BLE protocol stack. **Return values** BLE_SUCCESS(0x0000) — Success

◆ R_BLE_Execute()

ble_status_t R_BLE_Execute (void)
Execute the BLE task. This handles all the task queued in the BLE protocol stack internal task queue and return. This function should be called repeatedly in the main loop. **Return values** BLE_SUCCESS(0x0000) — Success

◆ R_BLE_IsTaskFree()

uint32_t R_BLE_IsTaskFree (void)
Check the BLE task queue is free or not. This function returns the BLE task queue free status. When this function returns 0x0, call R_BLE_Execute() to execute the BLE task. **Return values** 0x0 — BLE task queue is not free 0x1 — BLE task queue is free

◆ R_BLE_SetEvent()

ble_status_t R_BLE_SetEvent (ble_event_cb_t *cb*)

Set event.

This function add an event in the BLE protocol stack internal queue. The event is handled in R_BLE_Execute just like Bluetooth event. This function is intended to be called in hardware interrupt context. Even if calling this function with the same cb before the cb is invoked, only one event is registered. The maximum number of the events can be registered at a time is eight.

Parameters

cb	The callback for the event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_ALREADY_IN_PROGRESS(0x000A)	The event already registered with the callback.
BLE_ERR_CONTEXT_FULL(0x000B)	No free slot for the event.

◆ R_BLE_GetVersion()

uint32_t R_BLE_GetVersion (void)

Get the BLE FIT module version.

This function returns the BLE FIT module version.
The major version(BLE_VERSION_MAJOR) is contained in the two most significant bytes, and the minor version(BLE_VERSION_MINOR) occupies the remaining two bytes.

Return values

BLE_VERSION_MAJOR | BLE_VERSION_MINOR	

◆ R_BLE_GetLibType()

uint32_t R_BLE_GetLibType (void)
Get the type of BLE protocol stack library. This function returns the type of BLE protocol stack library. **Return values** BLE_LIB_EXTENDED(0x00) — Extended BLE_LIB_BALANCE(0x01) — Balance BLE_LIB_COMPACT(0x02) — Compact

4.3.5.1 GAP

Functions

ble_status_t	R_BLE_GAP_Init (ble_gap_app_cb_t gap_cb) Initialize the Host Stack. More...
ble_status_t	R_BLE_GAP_Terminate (void) Terminate the Host Stack. More...
ble_status_t	R_BLE_GAP_UpdConn (uint16_t conn_hdl, uint8_t mode, uint16_t accept, st_ble_gap_conn_param_t *p_conn_updt_param) Update the connection parameters. More...
ble_status_t	R_BLE_GAP_SetDataLen (uint16_t conn_hdl, uint16_t tx_octets, uint16_t tx_time) Update the packet size and the packet transmit time. More...
ble_status_t	R_BLE_GAP_Disconnect (uint16_t conn_hdl, uint8_t reason) Disconnect the link. More...
ble_status_t	R_BLE_GAP_SetPhy (uint16_t conn_hdl, st_ble_gap_set_phy_param_t *p_phy_param) Set the phy for connection. More...

ble_status_t	R_BLE_GAP_SetDefPhy (st_ble_gap_set_def_phy_param_t *p_def_phy_param) Set the default phy which allows remote device to change. More...
ble_status_t	R_BLE_GAP_SetPrivMode (st_ble_dev_addr_t *p_addr, uint8_t *p_privacy_mode, uint8_t device_num) Set the privacy mode. More...
ble_status_t	R_BLE_GAP_ConfWhiteList (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t device_num) Set White List. More...
ble_status_t	R_BLE_GAP_GetVerInfo (void) Get the version number of the Controller and the host stack. More...
ble_status_t	R_BLE_GAP_ReadPhy (uint16_t conn_hdl) Get the phy settings. More...
ble_status_t	R_BLE_GAP_ConfRslvList (uint8_t op_code, st_ble_dev_addr_t *p_addr, st_ble_gap_rslv_list_key_set_t *p_peer_irk, uint8_t device_num) Set Resolving List. More...
ble_status_t	R_BLE_GAP_EnableRpa (uint8_t enable) Enable/Disable address resolution and generation of a resolvable private address. More...
ble_status_t	R_BLE_GAP_SetRpaTo (uint16_t rpa_timeout) Set the update time of resolvable private address. More...
ble_status_t	R_BLE_GAP_ReadRpa (st_ble_dev_addr_t *p_addr) Get the resolvable private address of local device. More...
ble_status_t	R_BLE_GAP_ReadRssi (uint16_t conn_hdl) Get RSSI. More...

ble_status_t	R_BLE_GAP_ReadChMap (uint16_t conn_hdl) Get the Channel Map. More...
ble_status_t	R_BLE_GAP_SetRandAddr (uint8_t *p_random_addr) Set a random address. More...
ble_status_t	R_BLE_GAP_SetAdvParam (st_ble_gap_adv_param_t *p_adv_param) Set advertising parameters. More...
ble_status_t	R_BLE_GAP_SetAdvSresData (st_ble_gap_adv_data_t *p_adv_srsp_data) Set advertising data/scan response data/periodic advertising data. More...
ble_status_t	R_BLE_GAP_StartAdv (uint8_t adv_hdl, uint16_t duration, uint8_t max_extd_adv_evts) Start advertising. More...
ble_status_t	R_BLE_GAP_StopAdv (uint8_t adv_hdl) Stop advertising. More...
ble_status_t	R_BLE_GAP_SetPerdAdvParam (st_ble_gap_perd_adv_param_t *p_perd_adv_param) Set periodic advertising parameters. More...
ble_status_t	R_BLE_GAP_StartPerdAdv (uint8_t adv_hdl) Start periodic advertising. More...
ble_status_t	R_BLE_GAP_StopPerdAdv (uint8_t adv_hdl) Stop periodic advertising. More...
ble_status_t	R_BLE_GAP_GetRemainAdvBufSize (uint16_t *p_remain_adv_data_size, uint16_t *p_remain_perd_adv_data_size) Get buffer size for advertising data/scan response data/periodic advertising data in the Controller. More...

ble_status_t	R_BLE_GAP_RemoveAdvSet (uint8_t op_code, uint8_t adv_hdl) Delete advertising set. More...
ble_status_t	R_BLE_GAP_CreateConn (st_ble_gap_create_conn_param_t *p_param) Request for a link establishment. More...
ble_status_t	R_BLE_GAP_CancelCreateConn (void) Cancel the request for a link establishment. More...
ble_status_t	R_BLE_GAP_SetChMap (uint8_t *p_channel_map) Set the Channel Map. More...
ble_status_t	R_BLE_GAP_StartScan (st_ble_gap_scan_param_t *p_scan_param, st_ble_gap_scan_on_t *p_scan_enable) Set scan parameter and start scan. More...
ble_status_t	R_BLE_GAP_StopScan (void) Stop scan. More...
ble_status_t	R_BLE_GAP_CreateSync (st_ble_dev_addr_t *p_addr, uint8_t adv_sid, uint16_t skip, uint16_t sync_to) Request for a periodic sync establishment. More...
ble_status_t	R_BLE_GAP_CancelCreateSync (void) Cancel the request for a periodic sync establishment. More...
ble_status_t	R_BLE_GAP_TerminateSync (uint16_t sync_hdl) Terminate the periodic sync. More...
ble_status_t	R_BLE_GAP_ConfPerdAdvList (uint8_t op_code, st_ble_dev_addr_t *p_addr, uint8_t *p_adv_sid_set, uint8_t device_num) Set Periodic Advertiser List. More...
ble_status_t	R_BLE_GAP_AuthorizeDev (uint16_t conn_hdl, uint8_t author_flag)

	Authorize a remote device. More...
ble_status_t	R_BLE_GAP_GetRemDevInfo (uint16_t conn_hdl) Get the information about remote device. More...
ble_status_t	R_BLE_GAP_SetPairingParams (st_ble_gap_pairing_param_t *p_pair_param) Set the parameters using pairing. More...
ble_status_t	R_BLE_GAP_SetLocIdInfo (st_ble_dev_addr_t *p_lc_id_addr, uint8_t *p_lc_irk) Set the IRK and the identity address distributed to a remote device. More...
ble_status_t	R_BLE_GAP_SetLocCsrk (uint8_t *p_local_csrk) Set the CSRK distributed to a remote device. More...
ble_status_t	R_BLE_GAP_StartPairing (uint16_t conn_hdl) Start pairing. More...
ble_status_t	R_BLE_GAP_ReplyPairing (uint16_t conn_hdl, uint8_t response) Reply the pairing request from a remote device. More...
ble_status_t	R_BLE_GAP_StartEnc (uint16_t conn_hdl) Encryption the link. More...
ble_status_t	R_BLE_GAP_ReplyPasskeyEntry (uint16_t conn_hdl, uint32_t passkey, uint8_t response) Reply the passkey entry request. More...
ble_status_t	R_BLE_GAP_ReplyNumComp (uint16_t conn_hdl, uint8_t response) Reply the numeric comparison request. More...
ble_status_t	R_BLE_GAP_NotifyKeyPress (uint16_t conn_hdl, uint8_t key_press) Notify the input key type which a remote device inputs in the passkey entry. More...

ble_status_t	R_BLE_GAP_GetDevSecInfo (uint16_t conn_hdl, st_ble_gap_auth_info_t *p_sec_info) Get the security information about the remote device. More...
ble_status_t	R_BLE_GAP_ReplyExKeyInfoReq (uint16_t conn_hdl) Distribute the keys of local device. More...
ble_status_t	R_BLE_GAP_SetRemOobData (st_ble_dev_addr_t *p_addr, uint8_t oob_data_flag, st_ble_gap_oob_data_t *p_oob) Set the oob data from a remote device. More...
ble_status_t	R_BLE_GAP_CreateScOobData (void) Create data for oob in secure connection. More...
ble_status_t	R_BLE_GAP_SetBondInfo (st_ble_gap_bond_info_t *p_bond_info, uint8_t device_num, uint8_t *p_set_num) Set the bonding information stored in non-volatile memory to the host stack. More...
void	R_BLE_GAP_DeleteBondInfo (int32_t local, int32_t remote, st_ble_dev_addr_t *p_addr, ble_gap_del_bond_cb_t gap_del_bond_cb) This function deletes the bonding information in Host Stack. When a function for deleting the bonding information stored in non-volatile area is registered by the gap_del_bond_cb parameter, it is deleted as well as the bonding information in Host Stack. More...
ble_status_t	R_BLE_GAP_ReplyLtkReq (uint16_t conn_hdl, uint16_t ediv, uint8_t *p_peer_rand, uint8_t response) Reply the LTK request from a remote device. More...

Detailed Description

(end addtogroup BLE_API)

enum	e_ble_gap_evt_t GAP Event Identifier. More...

Data Structure Documentation

◆ st_ble_evt_data_t

struct st_ble_evt_data_t

st_ble_evt_data_t is the type of the data notified in a GAP Event.

Data Fields		
uint16_t	param_len	The size of GAP Event parameters.
void *	p_param	GAP Event parameters. This parameter differs in each GAP Event.

◆ st_ble_dev_addr_t

struct st_ble_dev_addr_t

st_ble_dev_addr_t is the type of bluetooth device address(BD_ADDR).

Note
The BD address setting format is little endian.
If the address is "AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.

Data Fields		
uint8_t	addr[BLE_BD_ADDR_LEN]	BD_ADDR.

uint8_t	type	Bluetooth address type. macro: BLE_GAP_ADDR_PUBLIC(0x00) — Public Address. BLE_GAP_ADDR_RAND(0x01) — Random Address.

◆ st_ble_gap_ext_adv_param_t

struct st_ble_gap_ext_adv_param_t		
Advertising parameters.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to be set the advertising parameters. Valid range is 0x00 - 0x03. In the first advertising parameters setting, the advertising set specified by adv_hdl is generated. The Advertising Set ID(Advertising SID) of the advertising set is same as adv_hdl.
uint16_t	adv_prop_type	Advertising packet type. Legacy advertising PDU type, or bitwise or of Extended advertising PDU type and Extended advertising option. category: Legacy Advertising PDU type macro: BLE_GAP_LEGACY_PROP_ADV_IND(0x0013) — Connectable and scannable undirected Legacy Advertising Packet BLE_GAP_LEGACY_PROP_ADV_DIRECT_IND(— Connectable directed (low duty

				0x0015)	cycle) Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_HDC_DIRECT_IND(0x001D)	Connectable directed (high duty cycle) Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_SCAN_IND(0x0012)	Scannable undirected Legacy Advertising Packet
				BLE_GAP_LEGACY_PROP_ADV_NONCONN_IND(0x0010)	Non-connectable and non-scannable undirected Legacy Advertising Packet
			Extended Advertising PDU type	BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_UNDIRECT(0x0001)	Connectable and non-scannable undirected Extended Advertising Packet
				BLE_GAP_EXT_PROP_ADV_CONN_NOSCAN_DIRECT(0x0005)	Connectable and non-scannable directed (low duty cycle) Extended Advertising Packet
				BLE_GAP_EXT_PR	Connectable and

			OP_ADV_CONN_NOSCAN_HDC_DIRECT(0x000D) non-scannable directed (high duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_UNDIRECT(0x0002) Non-connectable and scannable undirected Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_DIRECT(0x0006) Non-connectable and scannable directed (low duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_SCAN_HDC_DIRECT(0x000E) Non-connectable and scannable directed (high duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_UNDIRECT(0x0000) Non-connectable and non-scannable undirected Extended Advertising

				Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_DIRECT(0x0004)	Non-connectable and non-scannable directed (low duty cycle) Extended Advertising Packet
			BLE_GAP_EXT_PROP_ADV_NOCONN_NOSCAN_HDC_DIRECT(0x000C)	Non-connectable and non-scannable directed (high duty cycle) Extended Advertising Packet
		Extended Advertising Option	BLE_GAP_EXT_PROP_ADV_ANONYMOUS(0x0020)	Omit the advertiser address from Extended Advertising Packet.
			BLE_GAP_EXT_PROP_ADV_INCLUDE_TX_POWER(0x0040)	Indicate that the advertising data includes TX Power.
uint32_t	adv_intv_min	Minimum advertising interval. Time(ms) = adv_intv_min * 0.625. Valid range is 0x00000020 - 0x00FFFFFF.		
uint32_t	adv_intv_max	Maximum Advertising interval.		

<table>
<tr><td></td><td></td><td>Time(ms) = adv_intv_max * 0.625.
Valid range is 0x00000020 - 0x00FFFFFF.</td></tr>
<tr><td>uint8_t</td><td>adv_ch_map</td><td>The adv_ch_map is channels used in advertising with primary advertising channels.

It is a bitwise OR of the following values.
<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_CH_37(0x01)</td><td>Use 37 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_38(0x02)</td><td>Use 38 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_39(0x04)</td><td>Use 39 CH.</td></tr><tr><td>BLE_GAP_ADV_CH_ALL(0x07)</td><td>Use 37 - 39 CH.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>o_addr_type</td><td>Own BD Address Type.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADDR_PUBLIC(0x00)</td><td>Public Address</td></tr><tr><td>BLE_GAP_ADDR_RAND(0x01)</td><td>Random Address</td></tr><tr><td>BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)</td><td>Resolvable Private Address.
If the IRK of local device has not been registered in Resolving List, public address is used.</td></tr><tr><td>BLE_GAP_ADDR_RPA_ID_RANDOM(0x03)</td><td>Resolvable Private Address.
If the IRK of local device has not been registered in Resolving List, the random</td></tr></table></td></tr>
</table>

		address specified by the o_addr field is used.
uint8_t	o_addr[BLE_BD_ADDR_LEN]	Random address set to the advertising set, when the o_addr_type field is BLE_GAP_ADDR_RAND. When the o_addr_type field is other than BLE_GAP_ADDR_RAND, this field is ignored. *Note* *The BD address setting format is little endian.* *If the address is "AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.*
uint8_t	p_addr_type	Peer address type. When the Advertising PDU type is other than directed or the o_addr_type is BLE_GAP_ADDR_PUBLIC or BLE_GAP_ADDR_RAND,this field is ignored. macro: BLE_GAP_ADDR_PUBLIC(0x00) — Public Address macro: BLE_GAP_ADDR_RAND(0x01) — Random Address
uint8_t	p_addr[BLE_BD_ADDR_LEN]	Peer address. When the Advertising PDU type is other than directed or the o_addr_type is BLE_GAP_ADDR_PUBLIC or BLE_GAP_ADDR_RAND,this field is ignored. *Note* *The BD address setting format is little endian.* *If the address is*

<table>
<tr><td></td><td></td><td>"AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.</td></tr>

<tr><td>uint8_t</td><td>adv_phy</td><td>Primary ADV PHY.

In this parameter, only 1M PHY and Coded PHY can be specified, and 2M PHY cannot be specified.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_ADV_PHY_1M(0x01)</td><td>Use 1M PHY as Primary Advertising PHY.
When the adv_prop_typ</td></tr></table></td></tr>
</table>

		e field is Legacy Advertising PDU type, this field shall be set to BLE_GAP_ADV_PHY_1M. BLE_GAP_ADV_PHY_CD(0x03) Use Coded PHY(S=8) as Primary Advertising PHY. Coding scheme is configured by R_BLE_VS_SetCodingScheme().
uint8_t	sec_adv_max_skip	Secondary ADV Max Skip. Valid range is 0x00 - 0xFF. When this field is 0x00, AUX_ADV_IND is sent before the next advertising event. When the adv_prop_type field is Legacy Advertising PDU, this field is ignored.
uint8_t	sec_adv_phy	Secondary ADV Phy. When the adv_prop_type is Legacy Advertising PDU, this field is ignored. macro / description BLE_GAP_ADV_PHY_1M(0x01) Use 1M PHY as Secondary Advertising PHY. BLE_GAP_ADV_PHY_2M(0x02) Use 2M PHY as Secondary Advertising PHY. BLE_GAP_ADV_PHY_CD(0x03) Use Coded PHY(S=8) as Secondary Advertising PHY. Coding scheme is configured by R_BLE_VS_SetCodingScheme().
uint8_t	scan_req_ntf_flag	Scan Request Notifications Flag.

		When the adv_prop_type field is non-scannable Advertising PDU, this field is ignored. macro / description BLE_GAP_SCAN_REQ_NTF_DISABLE(0x00) — Disable Scan Request Notification. BLE_GAP_SCAN_REQ_NTF_ENABLE(0x01) — Enable Scan Request Notification. When a Scan Request Packet from Scanner has been received, the BLE_GAP_EVENT_SCAN_REQ_RECV event is notified.

◆ **st_ble_gap_adv_data_t**

struct st_ble_gap_adv_data_t		
Advertising data/scan response data/periodic advertising data.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to be set advertising data/scan response/periodic advertising data. Valid range is 0x00 - 0x03.
uint8_t	data_type	Data type. macro / description BLE_GAP_ADV_DATA_MODE(0x00) — Advertising data. BLE_GAP_SCAN_RSP_DATA_MODE(0x01) — Scan response data. BLE_GAP_PERD_ADV_DATA_MODE(0x02) — Periodic advertising data.
uint16_t	data_length	The length of advertising

<table>
<tr><td></td><td></td><td>data/scan response data/periodic advertising data (in bytes).

In case of Legacy Advertising PDU, the length is 0 - 31 bytes.
In case of Extended Advertising PDU, the length is 0 - 1650 bytes.
Note that the length of the advertising data/scan response data in the BLE_MAX_NO_OF_ADV_SETS_SUPPORTED number of the advertising sets may not exceed the buffer size(4250 bytes) in Controller.

In case of periodic advertising data, the length is 0 - 1650 bytes.
Note that the length of the periodic advertising data in the BLE_MAX_NO_OF_ADV_SETS_SUPPORTED number of the advertising sets may not exceed the buffer size(4306 bytes) in Controller.

When this field is 0, the operations specified by the zero_length_flag is executed.</td></tr>
<tr><td>uint8_t *</td><td>p_data</td><td>Advertising data/scan response data/periodic advertising data.

When the data_length field is 0, this field is ignored.</td></tr>
<tr><td>uint8_t</td><td>zero_length_flag</td><td>Operation when the data_length field is 0.

If the data_length is other than 0, this field is ignored.

<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_DATA_0_CLEAR(0x01)</td><td>Clear the advertising data/scan response data/periodic advertising data in the advertising set.</td></tr></table></td></tr>
</table>

		BLE_GAP_DATA_0_DID_UPD(0x02) Update Advertising DID without changing advertising data. If the data_type field is BLE_GAP_ADV_DATA_MODE, this value is allowed.

◆ st_ble_gap_perd_adv_param_t

struct st_ble_gap_perd_adv_param_t		
Periodic advertising parameter.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to be set periodic advertising parameter. Valid range is 0x00 - 0x03.
uint16_t	prop_type	Periodic ADV Properties. The prop_type field is set to the following values. If the type of the periodic advertising data cannot be applied from the following, set 0x0000. macro: BLE_GAP_PERD_PROP_TX_POWER(0x0040) — description: Indicate that periodic advertising data includes Tx Power.
uint16_t	perd_intv_min	Minimum Periodic Advertising Interval. Time(ms) = perd_intv_min * 1.25. Valid range is 0x0006 - 0xFFFF.
uint16_t	perd_intv_max	Maximum Periodic Advertising Interval. Time(ms) = perd_intv_max * 1.25. Valid range is 0x0006 - 0xFFFF.

◆ st_ble_gap_scan_phy_param_t

struct st_ble_gap_scan_phy_param_t

Scan parameters per scan PHY.

In case of start scanning with both 1M PHY and Coded PHY, adjust scan windows and scan intervals according to the following.
p_phy_param_1M->scan_window / p_phy_param_1M->scan_intv + p_phy_param_coded->scan_window / p_phy_param_coded->scan_intv <= 1

Data Fields

uint8_t	scan_type	Scan type. macro: description BLE_GAP_SCAN_PASSIVE(0x00): Passive Scan. BLE_GAP_SCAN_ACTIVE(0x01): Active Scan.
uint16_t	scan_intv	Scan interval. interval(ms) = scan_intv * 0.625. Valid range is 0x0000 and 0x0004 - 0xFFFF.
uint16_t	scan_window	Scan window. window(ms) = scan_window * 0.625. Valid range is 0x0000 and 0x0004 - 0xFFFF.

◆ st_ble_gap_ext_scan_param_t

struct st_ble_gap_ext_scan_param_t

Scan parameters.

Data Fields

uint8_t	o_addr_type	Own BD Address Type. In case of passive scan, this field is ignored. macro: description BLE_GAP_ADDR_PUBLIC(0x00): Public Address BLE_GAP_ADDR_RAND(0x01): Random Address

		BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02)	Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used.
		BLE_GAP_ADDR_RPA_ID_RANDOM(0x03)	Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, the random address set by R_BLE_GAP_SetRandAddr() is used.
uint8_t	filter_policy	Scan Filter Policy.	
		macro	description
		BLE_GAP_SCAN_ALLOW_ADV_ALL(0x00)	Accept all advertising and scan response PDUs except directed advertising PDUs not addressed to local device.
		BLE_GAP_SCAN_ALLOW_ADV_WLST(0x01)	Accept only advertising and scan response PDUs from remote devices whose address is registered in the White List. Directed advertising PDUs which are not addressed to

				local device is ignored.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED(0x02)	Accept all advertising and scan response PDUs except directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.
			BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST(0x03)	Accept all advertising and scan response PDUs. The following are excluded. • Advertising and scan response PDUs where the advertiser's identity address is not in the White

		List. • Directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.
st_ble_gap_scan_phy_param_t *	p_phy_param_1M	Scan parameters 1M PHY. When this field is NULL, Controller doesn't set the scan parameters for 1M PHY.
st_ble_gap_scan_phy_param_t *	p_phy_param_coded	Scan parameters Coded PHY. When this field is NULL, Controller doesn't set the scan parameters for Coded PHY.

◆ st_ble_gap_scan_on_t

struct st_ble_gap_scan_on_t

Parameters configured when scanning starts.

Data Fields

uint8_t	proc_type	Procedure type. macro: description BLE_GAP_SC_PROC_OBS(0x00): Observation Procedure. Notify all advertising PDUs. BLE_GAP_SC_PROC_LIM(0x01): Limited Discovery Procedure. Notify advertising PDUs from only devices in the limited discoverable mode. BLE_GAP_SC_PROC_GEN(0x02): General Discovery Procedure. Notify advertising PDUs from devices in the limited discoverable mode and the general discoverable mode.
uint8_t	filter_dups	Filter duplicates. macro: description BLE_GAP_SCAN_FILT_DUPLIC_DISABLE(0x00): Duplicate filter disabled. BLE_GAP_SCAN_FILT_DUPLIC_ENABLE(0x01): Duplicate filter enabled. BLE_GAP_SCAN_FILT_DUPLIC_ENABLE_FOR_PERIOD(0x02): Duplicate filtering enabled, reset for each scan period

uint16_t	duration	Scan duration. Time(ms) = duration * 10. Valid range is 0x0000 - 0xFFFF. If this field is set to 0x0000, scanning is continued until R_BLE_GAP_StopScan() is called. When the period field is zero and the time specified the duration field expires, BLE_GAP_EVENT_SCAN_TO event notifies the application layer that scanning stops.
uint16_t	period	Scan period. Time(s) = N * 1.28. Valid range is 0x0000 - 0xFFFF. If the duration field is set to 0x0000, this field is ignored.

◆ st_ble_gap_conn_param_t

struct st_ble_gap_conn_param_t		
Connection parameters included in connection interval, slave latency, supervision timeout, ce length. This structure is used in R_BLE_GAP_CreateConn() and R_BLE_GAP_UpdConn(). Set the fields in this structure to match the following condition. Supervision_timeout(ms) >= (1 + conn_latency) * conn_intv_max_Time(ms) conn_intv_max_Time(ms) = conn_intv_max * 1.25 Supervision_timeout(ms) = sup_to * 10		
Data Fields		
uint16_t	conn_intv_min	Minimum connection interval. Time(ms) = conn_intv_min * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	conn_intv_max	Maximum connection interval. Time(ms) = conn_intv_max * 1.25. Valid range is 0x0006 - 0x0C80.
uint16_t	conn_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Supervision timeout.

		Time(ms) = sup_to * 10. Valid range is 0x000A - 0x0C80.
uint16_t	min_ce_length	Minimum CE Length. Valid range is 0x0000 - 0xFFFF.
uint16_t	max_ce_length	Maximum CE Length. Valid range is 0x0000 - 0xFFFF.

◆ st_ble_gap_conn_phy_param_t

struct st_ble_gap_conn_phy_param_t		
Connection parameters per PHY.		
Data Fields		
uint16_t	scan_intv	Scan interval. Time(ms) = scan_intv * 0.625. Valid range is 0x0004 - 0xFFFF.
uint16_t	scan_window	Scan window. Time(ms) = scan_window * 0.625. Valid range is 0x0004 - 0xFFFF.
st_ble_gap_conn_param_t *	p_conn_param	Connection interval, slave latency, supervision timeout, and CE length.

◆ st_ble_gap_create_conn_param_t

struct st_ble_gap_create_conn_param_t		
Connection parameters used in R_BLE_GAP_CreateConn().		
Data Fields		
uint8_t	init_filter_policy	This field specifies whether the White List is used or not, when connecting with a remote device. macro: BLE_GAP_INIT_FILT_USE_ADDR(0x00) — description: White List is not used. The remote device to be connected is specified by the *remote_bd_addr* field and the

		remote_bd_addr_type field is used. BLE_GAP_INIT_FILT_USE_WLST(0x01): White List is used. The remote device registered in White List is connected with local device. The *remote_bd_addr* field and the *remote_bd_addr_type* field are ignored.
uint8_t	remote_bd_addr[BLE_BD_ADDR_LEN]	Address of the device to be connected. *Note* *The BD address setting format is little endian. If the address is "AA:BB:CC:DD:EE:FF", set the byte array in the order {0xFF, 0xEE, 0xDD, 0xCC, 0xBB, 0xAA}.*
uint8_t	remote_bd_addr_type	Address type of the device to be connected. BLE_GAP_ADDR_PUBLIC(0x00): Public Address or Public Identity Address BLE_GAP_ADDR_RAND(0x01): Random Address or Random (Static) Identity Address
uint8_t	own_addr_type	Address type which local device uses in creating a link with the remote device. BLE_GAP_ADDR_PUBLIC(0x0: Public Address

		0) BLE_GAP_ADDR_RAND(0x01) Random Address BLE_GAP_ADDR_RPA_ID_PUBLIC(0x02) Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, public address is used. BLE_GAP_ADDR_RPA_ID_RANDOM(0x03) Resolvable Private Address. If the IRK of local device has not been registered in Resolving List, the random address set by R_BLE_GAP_SetRandAddr().
st_ble_gap_conn_phy_param_t *	p_conn_param_1M	Connection parameters for 1M PHY. If this field is set to NULL, 1M PHY is not used in connecting.
st_ble_gap_conn_phy_param_t *	p_conn_param_2M	Connection parameters for 2M PHY. If this field is set to NULL, 2M PHY is not used in connecting.
st_ble_gap_conn_phy_param_t *	p_conn_param_coded	Connection parameters for Coded PHY. If this field is set to NULL, Coded PHY is not used in connecting.

◆ st_ble_gap_rslv_list_key_set_t

struct st_ble_gap_rslv_list_key_set_t		
IRK of a remote device and IRK type of local device used in R_BLE_GAP_ConfRslvList().		
Data Fields		

uint8_t	remote_irk[BLE_GAP_IRK_SIZE]	IRK of a remote device to be registered in the Resolving List.
uint8_t	local_irk_type	IRK type of the local device to be registered in the Resolving List. macro: BLE_GAP_RL_LOC_KEY_ALL_ZERO(0x00) — All-zero IRK. macro: BLE_GAP_RL_LOC_KEY_REGISTERED(0x01) — The IRK registered by R_BLE_GAP_SetLocIdInfo().

◆ st_ble_gap_set_phy_param_t

struct st_ble_gap_set_phy_param_t

PHY configuration parameters used in R_BLE_GAP_SetPhy().

Data Fields

uint8_t	tx_phys	Transmitter PHY preference. The tx_phys field is set to a bitwise OR of the following values. All other values are ignored. macro: BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01) — Use 1M PHY for Transmitter PHY. macro: BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02) — Use 2M PHY for Transmitter PHY. macro: BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04) — Use Coded PHY for Transmitter PHY.
uint8_t	rx_phys	Receiver PHY preference. The rx_phys field is set to a bitwise OR of the following values. All other values are ignored. macro | description

		BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01) Use 1M PHY for Receiver PHY. BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02) Use 2M PHY for Receiver PHY. BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04) Use Coded PHY for Receiver PHY.
uint16_t	phy_options	Coding scheme used in Coded PHY. Select one of the following. macro / description BLE_GAP_SET_PHYS_OP_HOST_NO_PREF(0x00) No preferred coding. BLE_GAP_SET_PHYS_OP_HOST_PREF_S_2(0x01) Use S=2 coding. BLE_GAP_SET_PHYS_OP_HOST_PREF_S_8(0x02) Use S=8 coding.

◆ st_ble_gap_set_def_phy_param_t

struct st_ble_gap_set_def_phy_param_t		
PHY preferences which allows a remote device to set used in R_BLE_GAP_SetDefPhy().		
Data Fields		
uint8_t	tx_phys	Transmitter PHY preferences which a remote device may change. The tx_phys field is set to a bitwise OR of the following values. All other values are ignored. macro / description BLE_GAP_SET_PHYS_HOST_ Allow a remote device

		PREF_1M(0x01) to set 1M PHY for transmitter PHY. BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02) Allow a remote device to set 2M PHY for transmitter PHY. BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04) Allow a remote device to set Coded PHY for transmitter PHY.
uint8_t	rx_phys	Receiver PHY preferences which a remote device may change. The rx_phys field is set to a bitwise OR of the following values. All other values are ignored. macro / description BLE_GAP_SET_PHYS_HOST_PREF_1M(0x01) Allow a remote device to set 1M PHY for receiver PHY. BLE_GAP_SET_PHYS_HOST_PREF_2M(0x02) Allow a remote device to set 2M PHY for receiver PHY. BLE_GAP_SET_PHYS_HOST_PREF_CD(0x04) Allow a remote device to set Coded PHY for receiver PHY.

◆ st_ble_gap_auth_info_t

struct st_ble_gap_auth_info_t		
Pairing parameters required from a remote device or information about keys distributed from a remote device.		
Data Fields		
uint8_t	security	Security level.

		value / description 0x01 The remote device requests Unauthenticated pairing. 0x02 The remote device requests Authenticated pairing.
uint8_t	pair_mode	Pairing mode. value / description 0x01 The remote device requests Legacy pairing. 0x02 The remote device requests Secure Connections.
uint8_t	bonding	Bonding policy. value / description 0x00 The remote device does not store the Bonding information. 0x01 The remote device stores the Bonding information.
uint8_t	ekey_size	Encryption key size.

◆ st_ble_gap_key_dist_t

struct st_ble_gap_key_dist_t		
Keys distributed from a remote device.		
Data Fields		
uint8_t	enc_info[BLE_GAP_LTK_SIZE]	LTK.
uint8_t	mid_info[BLE_GAP_EDIV_SIZE +BLE_GAP_RAND_64_BIT_SIZE]	Ediv and rand. The first two bytes is ediv, the remaining bytes are rand.

uint8_t	id_info[BLE_GAP_IRK_SIZE]	IRK.
uint8_t	id_addr_info[BLE_GAP_ID_ADDR_SIZE]	Identity address. The first byte is address type. The remaining bytes are device address.
uint8_t	sign_info[BLE_GAP_CSRK_SIZE]	CSRK.

◆ st_ble_gap_key_ex_param_t

struct st_ble_gap_key_ex_param_t		
This structure includes the distributed keys and negotiated LTK size.		
Data Fields		
st_ble_gap_key_dist_t *	p_keys_info	Key information.
uint8_t	keys	Type of the distributed keys. This field is a bitwise OR of the following values. Bit Number / description 0 LTK and Master Identification. LTK is distributed in Secure Connections, even if the bit is 1. 1 IRK and Identity Address Information. 2 CSRK
uint8_t	ekey_size	The negotiated LTK size.

◆ st_ble_gap_pairing_param_t

struct st_ble_gap_pairing_param_t		
Pairing parameters used in R_BLE_GAP_SetPairingParams().		
Data Fields		
uint8_t	iocap	IO capabilities of local device. Select one of the following. macro / description BLE_GAP_IOC Output

			AP_DISPLAY_ONLY(0x00)	function : Local device has the ability to display a 6 digit decimal number. Input function : None
			BLE_GAP_IOCAP_DISPLAY_YESNO(0x01)	Output function : Output function : Local device has the ability to display a 6 digit decimal number. Input function : Local device has the ability to indicate 'yes' or 'no'
			BLE_GAP_IOCAP_KEYBOARD_ONLY(0x02)	Output function : None Input function : Local device has the ability to input the number '0' - '9'.
			BLE_GAP_IOCAP_NOINPUT_NOOUTPUT(0x03)	Output function : None Input function : None
			BLE_GAP_IOCAP_KEYBOARD_DISPLAY(0x04)	Output function : Output function : Local device has the ability to display a 6 digit decimal number. Input function : Local device has the ability

<table>
<tr><td></td><td></td><td>to input the number '0' - '9'.</td></tr>
<tr><td>uint8_t</td><td>mitm</td><td>MITM protection policy.

Select one of the following.

<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_SEC_MITM_BEST_EFFORT(0x00)</td><td>MITM Protection not required.</td></tr><tr><td>BLE_GAP_SEC_MITM_STRICT (0x01)</td><td>MITM Protection required.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>bonding</td><td>Bonding policy.<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_BONDING_NONE(0x00)</td><td>Local device doesn't stores Bonding information.</td></tr><tr><td>BLE_GAP_BONDING (0x01)</td><td>Local device stores Bonding information.</td></tr></table></td></tr>
<tr><td>uint8_t</td><td>max_key_size</td><td>Maximum LTK size(in bytes).

Valid range is 7 - 16.
This field shall be set to a value not less than the min_key_size field.</td></tr>
<tr><td>uint8_t</td><td>min_key_size</td><td>Minimum LTK size(in bytes).

Valid range is 7 - 16.
This field shall be set to a value not more than the max_key_size field.</td></tr>
<tr><td>uint8_t</td><td>loc_key_dist</td><td>Type of keys to be distributed from local device.

The loc_key_dist field is set to a bitwise OR of the following values.

<table><tr><th>macro</th><th>description</th></tr><tr><td>BLE_GAP_KEY_DIST_ENCKEY</td><td>LTK</td></tr></table></td></tr>
</table>

		(0x01) BLE_GAP_KEY_DIST_IDKEY(0x02) IRK and Identity Address. BLE_GAP_KEY_DIST_SIGNKEY(0x04) CSRK
uint8_t	rem_key_dist	Type of keys which local device requests a remote device to distribute. The rem_key_dist field is set to a bitwise OR of the following values. macro / description BLE_GAP_KEY_DIST_ENCKEY(0x01) LTK. In case of Secure Connections, LTK is notified even if this bit is not set. BLE_GAP_KEY_DIST_IDKEY(0x02) IRK and Identity Address. BLE_GAP_KEY_DIST_SIGNKEY(0x04) CSRK
uint8_t	key_notf	Support for Key Press Notification in Passkey Entry. macro / description BLE_GAP_SC_KEY_PRESS_NTF_NOT_SPRT(0x00) Not support for Key Press Notification. BLE_GAP_SC_KEY_PRESS_NTF_SPRT(0x01) Support for Key Press Notification.
uint8_t	sec_conn_only	Determine whether to accept only Secure Connections or not. macro / description BLE_GAP_SC_BEST_EFFORT(0x00) Accept Legacy pairing and Secure

			Connections.
		BLE_GAP_SC_STRICT(0x01)	Accept only Secure Connections.

◆ st_ble_gap_oob_data_t

struct st_ble_gap_oob_data_t		
Oob data received from the remote device. This is used in R_BLE_GAP_SetRemOobData().		
Data Fields		
uint8_t	legacy_oob[BLE_GAP_LEGACY_OOB_SIZE]	OOB data used in Legacy Pairing.
uint8_t	sc_cnf_val[BLE_GAP_OOB_CONFIRM_VAL_SIZE]	OOB confirmation value used in Secure Connections.
uint8_t	sc_rand[BLE_GAP_OOB_RANDOM_VAL_SIZE]	OOB rand used in Secure Connections.

◆ st_ble_gap_ver_num_t

struct st_ble_gap_ver_num_t		
Version number of host stack.		
Data Fields		
uint8_t	major	Major version number.
uint8_t	minor	Minor version number.
uint8_t	subminor	Subminor version number.

◆ st_ble_gap_loc_ver_info_t

struct st_ble_gap_loc_ver_info_t		
Version number of Controller. Refer Bluetooth SIG Assigned Number(https://www.bluetooth.com/specifications/assigned-numbers).		
Data Fields		
uint8_t	hci_ver	Bluetooth HCI version.
uint16_t	hci_rev	Bluetooth HCI revision.
uint8_t	lmp_ver	Link Layer revision.
uint16_t	mnf_name	Manufacturer ID.
uint16_t	lmp_sub_ver	Link Layer subversion.

◆ st_ble_gap_loc_dev_info_evt_t

struct st_ble_gap_loc_dev_info_evt_t

Version information of local device.		
Data Fields		
st_ble_dev_addr_t	l_dev_addr	Bluetooth Device Address.
st_ble_gap_ver_num_t	l_ver_num	Version number of host stack in local device.
st_ble_gap_loc_ver_info_t	l_bt_info	Version number of Controller in local device.

◆ st_ble_gap_hw_err_evt_t

struct st_ble_gap_hw_err_evt_t		
Hardware error that is notified from Controller.		
Data Fields		
uint8_t	hw_code	The hw_code field indicates the cause of the hardware error.

◆ st_ble_gap_cmd_err_evt_t

struct st_ble_gap_cmd_err_evt_t		
HCI Command error.		
Data Fields		
uint16_t	op_code	The opcode of HCI Command which caused the error.
uint32_t	module_id	Module ID which caused the error.

◆ st_ble_gap_adv_rept_t

struct st_ble_gap_adv_rept_t		
Advertising Report.		
Data Fields		
uint8_t	num	The number of Advertising Reports received.
uint8_t	adv_type	Type of Advertising Packet. valuer: 0x00 — description: Connectable and scannable undirected advertising(ADV_IND). valuer: 0x01 — description: Connectable directed advertising(ADV_DIRECT_IND).

<table>
<tr><td></td><td></td><td>0x02 Scannable undirected advertising(ADV_SCAN_IND).
0x03 Non-connectable undirected advertising(ADV_NONCONN_IND).
0x04 Scan response(SCAN_RSP).</td></tr>
<tr><td>uint8_t</td><td>addr_type</td><td>Address type of the advertiser.<table><tr><th>value</th><th>description</th></tr><tr><td>0x00</td><td>Public Address.</td></tr><tr><td>0x01</td><td>Random Address.</td></tr><tr><td>0x02</td><td>Public Identity Address which could be resolved in Controller.</td></tr><tr><td>0x03</td><td>Random Identity Address which could be resolved in Controller.</td></tr></table></td></tr>
<tr><td>uint8_t *</td><td>p_addr</td><td>Address of the advertiser.

Note
The BD address setting format is little endian.</td></tr>
<tr><td>uint8_t</td><td>len</td><td>Length of Advertising data(in bytes).

Valid range is 0 - 31.</td></tr>
<tr><td>int8_t</td><td>rssi</td><td>RSSI(in dBm).

Valid range is -127 <= tx_pwr <= 20 and 127.
If the tx_pwr is 127, it means that RSSI could not be retrieved.</td></tr>
<tr><td>uint8_t *</td><td>p_data</td><td>Advertising data/Scan Response Data.</td></tr>
</table>

◆ st_ble_gap_ext_adv_rept_t

struct st_ble_gap_ext_adv_rept_t		
Extended Advertising Report.		
Data Fields		
uint8_t	num	The number of Advertising Reports received.
uint16_t	adv_type	Type of Advertising Packet. Bit Number: description 0: Connectable advertising. 1: Scannable advertising. 2: Directed advertising. 3: Scan response. 4: Legacy advertising PDU. 5-6: The status of Advertising Data/Scan Response Data. Data Status: 00b = Complete 01b = Incomplete, more data come 10b = Incomplete, data truncated, no more to come All other bits: Reserved for future use
uint8_t	addr_type	Address type of the advertiser. value: description 0x00: Public Address. 0x01: Random

<table>
<tr><td></td><td></td><td>Address.

0x02 Public Identity Address which could be resolved in Controller.

0x03 Random Identity Address which could be resolved in Controller.

0xFF Anonymous advertisement.</td></tr>
<tr><td>uint8_t *</td><td>p_addr</td><td>Address of the advertiser.

Note
The BD address setting format is little endian.</td></tr>
<tr><td>uint8_t</td><td>adv_phy</td><td>The primary PHY configuration of the advertiser.

The primary PHY configuration of the advertiser.

value | description
0x01 1M PHY
0x03 Coded PHY</td></tr>
<tr><td>uint8_t</td><td>sec_adv_phy</td><td>The secondary PHY configuration of the advertiser.
value | description
0x00 Nothing has been received with Secondary Advertising Channel.

0x01 The Secondary Advertising PHY configuration was 1M PHY.

0x02 The Secondary Advertising</td></tr>
</table>

		PHY configuration was 2M PHY. 0x03 The Secondary Advertising PHY configuration was Coded PHY.
uint8_t	adv_sid	Advertising SID included in the received Advertising Report. Valid range is 0 <= adv_sid <= 0x0F and 0xFF. If the adv_sid is 0xFF, there is no field which includes SID.
int8_t	tx_pwr	TX power(in dBm). Valid range is -127 <= tx_pwr <= 20 and 127. If the tx_pwr is 127, it means that Tx power could not be retrieved.
int8_t	rssi	RSSI(in dBm). Valid range is -127 <= tx_pwr <= 20 and 127. If the tx_pwr is 127, it means that RSSI could not be retrieved.
uint16_t	perd_adv_intv	Periodic Advertising interval. If the perd_adv_intv is 0x0000, it means that this advertising is not periodic advertising. If the perd_adv_intv is 0x0006 - 0xFFFF, it means that this field is the Periodic Advertising interval. Periodic Advertising interval = per_adv_intr * 1.25ms.
uint8_t	dir_addr_type	The address type of Direct Advertising PDU. value: description 0x00: Public Address. 0x01: Random Address.

		0x02 Public Identity Address which could be resolved in Controller. 0x03 Random Identity Address which could be resolved in Controller. 0xFE Resolvable Privacy Address which could not be resolved in Controller.
uint8_t *	p_dir_addr	Address of Direct Advertising PDU. *Note* *The BD address setting format is little endian.*
uint8_t	len	Length of Advertising data(in bytes). Valid range is 0 - 229.
uint8_t *	p_data	Advertising data/Scan Response Data.

◆ st_ble_gap_perd_adv_rept_t

struct st_ble_gap_perd_adv_rept_t		
Periodic Advertising Report.		
Data Fields		
uint16_t	sync_hdl	Sync handle. Valid range is 0x0000 - 0x0EFF.
int8_t	tx_pwr	TX power(in dBm). Valid range is -127 <= tx_pwr <= 20 and 127. If tx_pwr is 127, it means that Tx power could not be retrieved.
int8_t	rssi	RSSI(in dBm). Valid range is -127 <= rssi <=

		20 and 127. If rssi is 127, it means that RSSI could not be retrieved.
uint8_t	rfu	Reserved for future use.
uint8_t	data_status	Reserved for future use. value: 0x00 — Data Complete. 0x01 — Data incomplete, more data to come. 0x02 — Data incomplete, data truncated, no more to come.
uint8_t	len	Length of Periodic Advertising data(in bytes). Valid range is 0 - 247.
uint8_t *	p_data	Periodic Advertising data.

◆ st_ble_gap_adv_rept_evt_t

struct st_ble_gap_adv_rept_evt_t		
Advertising report.		
Data Fields		
uint8_t	adv_rpt_type	Data type. value: 0x00 — Advertising Report. 0x01 — Extended Advertising Report. 0x02 — Periodic Advertising Report. If the BLE Protocol Stack library type is "extended", the adv_rpt_type field in a Legacy Advertising Report event is 0x01.

union st_ble_gap_adv_rept_evt_t	param	Advertising Report.

◆ st_ble_gap_adv_rept_evt_t.param

union st_ble_gap_adv_rept_evt_t.param		
Advertising Report.		
Data Fields		
st_ble_gap_adv_rept_t *	p_adv_rpt	Advertising Report.
st_ble_gap_ext_adv_rept_t *	p_ext_adv_rpt	Extended Advertising Report.
st_ble_gap_perd_adv_rept_t *	p_per_adv_rpt	Periodic Advertising Report.

◆ st_ble_gap_adv_set_evt_t

struct st_ble_gap_adv_set_evt_t		
Advertising handle.		
Data Fields		
uint8_t	adv_hdl	Advertising handle specifying the advertising set configured advertising parameters.

◆ st_ble_gap_adv_off_evt_t

struct st_ble_gap_adv_off_evt_t		
Information about the advertising set which stops advertising.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set which has stopped advertising. Valid range is 0x00 - 0x03.
uint8_t	reason	The reason for stopping advertising. value: 0x01 — description: Advertising has been stopped by R_BLE_GAP_StopAdv(). value: 0x02 — description: Because the duration specified by R_BLE_GAP_StartAdv() was expired, advertising

		has terminated. 0x03 Because the max_extd_adv_evts parameter specified by R_BLE_GAP_StartAdv() was reached, advertising has terminated. 0x04 Because the connection was established with the remote device, advertising has terminated.
uint16_t	conn_hdl	Connection handle. If the reason field is 0x04, this field indicates connection handle identifying the remote device connected with local device. If other reasons, ignore this field.
uint8_t	num_comp_ext_adv_evts	The number of the advertising event that has been received until advertising has terminated. If max_extd_adv_evts by R_BLE_GAP_StartAdv() is not 0, this parameter is valid.

◆ st_ble_gap_adv_data_evt_t

struct st_ble_gap_adv_data_evt_t		
This structure notifies that advertising data has been set to Controller by R_BLE_GAP_SetAdvSresData().		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set to which advertising data/scan response data/periodic advertising data is set.

uint8_t	data_type	Type of the data set to the advertising set. value: BLE_GAP_ADV_DATA_MODE(0x00) — Advertising data BLE_GAP_SCAN_RSP_DATA_MODE(0x01) — Scan response data BLE_GAP_PERD_ADV_DATA_MODE(0x02) — Periodic advertising data

◆ st_ble_gap_rem_adv_set_evt_t

struct st_ble_gap_rem_adv_set_evt_t		
This structure notifies that an advertising set has been removed.		
Data Fields		
uint8_t	remove_op	This field indicates that the advertising set has been removed or cleared. value: 0x01 — The advertising set has been removed. 0x02 — The advertising set has been cleared.
uint8_t	adv_hdl	Advertising handle identifying the advertising set which has been removed. If the advertising set has been cleared, this field is ignored.

◆ st_ble_gap_conn_evt_t

struct st_ble_gap_conn_evt_t		
This structure notifies that a link has been established.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the created link.
uint8_t	role	The role of the link.

		value / description 0x00 Master 0x01 Slave
uint8_t	remote_addr_type	Address type of the remote device. value / description 0x00 Public Address 0x01 Random Address 0x02 Public Identity Address. It indicates that the Controller could resolve the resolvable private address of the remote device. 0x03 Random Identity Address. It indicates that the Controller could resolve the resolvable private address of the remote device.
uint8_t	remote_addr[BLE_BD_ADDR_LEN]	Address of the remote device. *Note* *The BD address setting format is little endian.*
uint8_t	local_rpa[BLE_BD_ADDR_LEN]	Resolvable private address that local device used in connection procedure. The local device address used in creating the link when the address type was set to BLE_GAP_ADDR_RPA_ID_PUBLIC or BLE_GAP_ADDR_RPA_ID_RANDOM by

		R_BLE_GAP_SetAdvParam() or R_BLE_GAP_CreateConn(). If the address type was set to other than BLE_GAP_ADDR_RPA_ID_PUBLIC and BLE_GAP_ADDR_RPA_ID_RANDOM, this field is set to all-zero. *Note* *The BD address setting format is little endian.*
uint8_t	remote_rpa[BLE_BD_ADDR_LEN]	Resolvable private address that the remote device used in connection procedure. This field indicates the remote resolvable private address when remote_addr_type is 0x02 or 0x03. If remote_addr_type is other than 0x02 and 0x03, this field is set to all-zero. *Note* *The BD address setting format is little endian.*
uint16_t	conn_intv	Connection interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv * 1.25.
uint16_t	conn_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Supervision timeout. Valid range is 0x000A - 0x0C80.Time(ms) = sup_to * 10.
uint8_t	clk_acc	Master_Clock_Accuracy. value / description 0x00 500ppm 0x01 250ppm 0x02 150ppm 0x03 100ppm 0x04 75ppm 0x05 50ppm

		0x06	30ppm
		0x07	20ppm

◆ st_ble_gap_disconn_evt_t

struct st_ble_gap_disconn_evt_t		
This structure notifies that a link has been disconnected.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link disconnected.
uint8_t	reason	The reason for disconnection. Refer Core Specification Vol.2 Part D ,"2 Error Code Descriptions".

◆ st_ble_gap_rd_ch_map_evt_t

struct st_ble_gap_rd_ch_map_evt_t		
This structure notifies that Channel Map has been retrieved by R_BLE_GAP_ReadChMap().		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link whose Channel Map was retrieved.
uint8_t	ch_map[BLE_GAP_CH_MAP_SIZE]	Channel Map.

◆ st_ble_gap_rd_rssi_evt_t

struct st_ble_gap_rd_rssi_evt_t		
This structure notifies that RSSI has been retrieved by R_BLE_GAP_ReadRssi().		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link whose RSSI was retrieved.
int8_t	rssi	RSSI(in dBm). Valid range is -127 < rssi < 20 and 127. If this field is 127, it indicates that RSSI could not be retrieved.

◆ st_ble_gap_dev_info_evt_t

struct st_ble_gap_dev_info_evt_t

This structure notifies that information about remote device has been retrieved by R_BLE_GAP_GetRemDevInfo().

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device whose information has been retrieved.
uint8_t	get_status	Information about the remote device. This field is a bitwise OR of the following values. Bit Number: description bit0: Address bit1: Version, company_id, subversion bit2: Feature All other bits: Reserved for future use
st_ble_dev_addr_t	addr	Address of the remote device.
uint8_t	version	The version of Link Layer of the remote device. Refer to Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers) regarding defined number.
uint16_t	company_id	The manufacturer ID of the remote device. Refer to Bluetooth SIG Assigned Number (https://www.bluetooth.com/specifications/assigned-numbers) regarding defined number.
uint16_t	subversion	The subversion of Link Layer.
uint8_t	features[BLE_GAP_REM_FEATURE_SIZE]	LE feature supported in the remote device. Refer to Core Spec Vol 6, Part B 4.6 FEATURE SUPPORT.

◆ st_ble_gap_conn_upd_evt_t

struct st_ble_gap_conn_upd_evt_t

This structure notifies that connection parameters has been updated.

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the connection whose parameters has been updated.
uint16_t	conn_intv	Updated Connection Interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv * 1.25.
uint16_t	conn_latency	Updated slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Updated supervision timeout. Valid range is 0x000A - 0x0C80. Time(ms) = sup_to * 10.

◆ st_ble_gap_conn_upd_req_evt_t

struct st_ble_gap_conn_upd_req_evt_t

This structure notifies that a request for connection parameters update has been received.

Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link that was requested to update connection parameters.
uint16_t	conn_intv_min	Minimum connection interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv_min * 1.25.
uint16_t	conn_intv_max	Maximum connection interval. Valid range is 0x0006 - 0x0C80. Time(ms) = conn_intv_max * 1.25.
uint16_t	conn_latency	Slave latency. Valid range is 0x0000 - 0x01F3.
uint16_t	sup_to	Supervision timeout. Valid range is 0x000A - 0x0C80. Time(ms) = sup_to * 10

◆ st_ble_gap_conn_hdl_evt_t

struct st_ble_gap_conn_hdl_evt_t

This structure notifies that a GAP Event that includes only connection handle has occurred.		
Data Fields		
uint16_t	conn_hdl	Connection handle.

◆ **st_ble_gap_data_len_chg_evt_t**

struct st_ble_gap_data_len_chg_evt_t		
This structure notifies that the packet data length has been updated.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link that updated Data Length.
uint16_t	tx_octets	Updated transmission packet size(in bytes). Valid range is 0x001B - 0x00FB.
uint16_t	tx_time	Updated transmission time(us). Valid range is 0x0148 - 0x4290.
uint16_t	rx_octets	Updated receive packet size(in bytes). Valid range is 0x001B - 0x00FB.
uint16_t	rx_time	Updated receive time(us). Valid range is 0x0148 - 0x4290.

◆ **st_ble_gap_rd_rpa_evt_t**

struct st_ble_gap_rd_rpa_evt_t		
This structure notifies that the local resolvable private address has been retrieved by R_BLE_GAP_ReadRpa().		
Data Fields		
st_ble_dev_addr_t	addr	The resolvable private address of local device.

◆ **st_ble_gap_phy_upd_evt_t**

struct st_ble_gap_phy_upd_evt_t		
This structure notifies that PHY for a connection has been updated.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying

		the link that has been updated.
uint8_t	tx_phy	Transmitter PHY. value: description 0x01: The transmitter PHY has been updated to 1M PHY. 0x02: The transmitter PHY has been updated to 2M PHY. 0x03: The transmitter PHY has been updated to Coded PHY.
uint8_t	rx_phy	Receiver PHY. value: description 0x01: The receiver PHY has been updated to 1M PHY. 0x02: The receiver PHY has been updated to 2M PHY. 0x03: The receiver PHY has been updated to Coded PHY.

◆ st_ble_gap_phy_rd_evt_t

struct st_ble_gap_phy_rd_evt_t		
This structure notifies that the PHY settings has been retrieved by R_BLE_GAP_ReadPhy().		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link that has been retrieved the PHY settings.
uint8_t	tx_phy	Transmitter PHY. value: description 0x01: The transmitter

		PHY has been updated to 1M PHY. 0x02 The transmitter PHY has been updated to 2M PHY. 0x03 The transmitter PHY has been updated to Coded PHY.
uint8_t	rx_phy	Receiver PHY. value: description 0x01: The receiver PHY has been updated to 1M PHY. 0x02: The receiver PHY has been updated to 2M PHY. 0x03: The receiver PHY has been updated to Coded PHY.

◆ st_ble_gap_scan_req_recv_evt_t

struct st_ble_gap_scan_req_recv_evt_t		
This structure notifies that a Scan Request packet has been received from a Scanner.		
Data Fields		
uint8_t	adv_hdl	Advertising handle identifying the advertising set that has received the Scan Request.
uint8_t	scanner_addr_type	Address type of the Scanner. value: description 0x00: Public Address. 0x01: Random Address. 0x02: Public Identity Address which could be resolved in

		Controller. 0x03 Random Identity Address which could be resolved in Controller.
uint8_t	scanner_addr[BLE_BD_ADDR_LEN]	Address of the Scanner. *Note* *The BD address setting format is little endian.*

◆ st_ble_gap_sync_est_evt_t

struct st_ble_gap_sync_est_evt_t		
This structure notifies that a Periodic sync has been established.		
Data Fields		
uint16_t	sync_hdl	Sync handle identifying the Periodic Sync that has been established.
uint8_t	adv_sid	Advertising SID identifying the advertising set that has established the Periodic Sync.
uint8_t	adv_addr_type	Address type of the advertiser. value: description 0x00 Public Address. 0x01 Random Address. 0x02 Public Identity Address which could be resolved in Controller. 0x03 Random Identity Address which could be resolved in Controller.
uint8_t *	p_adv_addr	Address of the advertiser. *Note* *The BD address setting format is little endian.*

uint8_t	adv_phy	Advertising PHY. value: 0x01 — Advertiser PHY is 1M PHY. 0x02 — Advertiser PHY is 2M PHY. 0x03 — Advertiser PHY is Coded PHY.
uint16_t	perd_adv_intv	Periodic Advertising Interval. Valid range is 0x0006 - 0xFFFF. Time(ms) = perd_adv_intv * 1.25.
uint8_t	adv_clk_acc	Advertiser Clock Accuracy. value: 0x00 — 500ppm 0x01 — 250ppm 0x02 — 150ppm 0x03 — 100ppm 0x04 — 75ppm 0x05 — 50ppm 0x06 — 30ppm 0x07 — 20ppm

◆ st_ble_gap_sync_hdl_evt_t

struct st_ble_gap_sync_hdl_evt_t		
This structure notifies that a GAP Event that includes only sync handle has occurred.		
Data Fields		
uint16_t	sync_hdl	Sync handle.

◆ st_ble_gap_white_list_conf_evt_t

struct st_ble_gap_white_list_conf_evt_t		
This structure notifies that White List has been configured.		
Data Fields		
uint8_t	op_code	The operation for White List. value / description

		0x01 A device was added to White List. 0x02 A device was deleted from White List. 0x03 White List was cleared.
uint8_t	num	The number or devices which have been added to or deleted from White List.

◆ st_ble_gap_rslv_list_conf_evt_t

struct st_ble_gap_rslv_list_conf_evt_t

This structure notifies that Resolving List has been configured.

Data Fields

uint8_t	op_code	The operation for Resolving List. value: description 0x01: A device was added to Resolving List. 0x02: A device was deleted from Resolving List. 0x03: Resolving List was cleared.
uint8_t	num	The number or devices which have been added to or deleted from Resolving List.

◆ st_ble_gap_perd_list_conf_evt_t

struct st_ble_gap_perd_list_conf_evt_t

This structure notifies that Periodic Advertiser List has been configured.

Data Fields

uint8_t	op_code	The operation for Periodic Advertiser List. value: description 0x01: A device was added to Periodic Advertiser List.

		0x02 A device was deleted from Periodic Advertiser List. 0x03 Periodic Advertiser List was cleared.
uint8_t	num	The number or devices which have been added to or deleted from Periodic Advertiser List.

◆ **st_ble_gap_set_priv_mode_evt_t**

struct st_ble_gap_set_priv_mode_evt_t		
This structure notifies that Privacy Mode has been configured.		
Data Fields		
uint8_t	num	The number or devices which have been set privacy mode.

◆ **st_ble_gap_pairing_req_evt_t**

struct st_ble_gap_pairing_req_evt_t		
This structure notifies that a pairing request from a remote device has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that sent the pairing request.
st_ble_dev_addr_t	bd_addr	The address of the remote device.
st_ble_gap_auth_info_t	auth_info	The Pairing parameters of the remote device.

◆ **st_ble_gap_passkey_display_evt_t**

struct st_ble_gap_passkey_display_evt_t		
This structure notifies that a request for Passkey display in pairing has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that requested Passkey display.
uint32_t	passkey	Passkey. This field is a 6 digit decimal number(000000-999999).

◆ **st_ble_gap_num_comp_evt_t**

struct st_ble_gap_num_comp_evt_t		
This structure notifies that a request for Numeric Comparison in pairing has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that requested Numeric Comparison.
uint32_t	numeric	The number to be confirmed in Numeric Comparison. This field is a 6 digit decimal number(000000-999999).

◆ st_ble_gap_key_press_ntf_evt_t

struct st_ble_gap_key_press_ntf_evt_t		
This structure notifies that the remote device has input a key in Passkey Entry.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that input a key.
uint8_t	key_type	Type of the key that the remote device input. value: description 0x00: Passkey entry started. 0x01: Passkey digit entered. 0x02: Passkey digit erased. 0x03: Passkey cleared. 0x04: Passkey entry completed.

◆ st_ble_gap_pairing_info_evt_t

struct st_ble_gap_pairing_info_evt_t		
This structure notifies that the pairing has completed.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that the pairing has been done with.
st_ble_dev_addr_t	bd_addr	Address of the remote device.

st_ble_gap_auth_info_t	auth_info	Key information exchanged in pairing. If local device supports bonding, store the information in non-volatile memory in order to set it to host stack after power re-supply.

◆ st_ble_gap_enc_chg_evt_t

struct st_ble_gap_enc_chg_evt_t		
This structure notifies that the encryption status of a link has been changed.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the link that has been changed.
uint8_t	enc_status	Encryption Status. value: description 0x00: Encryption OFF. 0x01: Encryption ON. 0x03: Encryption updated by Encryption Key Refresh Completed.

◆ st_ble_gap_peer_key_info_evt_t

struct st_ble_gap_peer_key_info_evt_t		
This structure notifies that the remote device has distributed the keys.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device that has distributed the keys.
st_ble_dev_addr_t	bd_addr	Address of the remote device.
st_ble_gap_key_ex_param_t	key_ex_param	Distributed keys. If local device supports bonding, store the keys in non-volatile memory and at power re-supply set to the host stack by R_BLE_GAP_SetBondInfo().

◆ st_ble_gap_ltk_req_evt_t

struct st_ble_gap_ltk_req_evt_t		
This structure notifies that a LTK request from a remote device has been received.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device which requests for the LTK.
uint16_t	ediv	Ediv.
uint8_t *	p_peer_rand	Rand.

◆ **st_ble_gap_ltk_rsp_evt_t**

struct st_ble_gap_ltk_rsp_evt_t		
This structure notifies that local device has replied to the LTK request from the remote device.		
Data Fields		
uint16_t	conn_hdl	Connection handle identifying the remote device to be sent the response to the LTK request.
uint8_t	response	The response to the LTK request. value: 0x00 — description: Local device replied with the stored LTK. value: 0x01 — description: Local device rejected the LTK request, because the LTK was not found.

◆ **st_ble_gap_sc_oob_data_evt_t**

struct st_ble_gap_sc_oob_data_evt_t		
This structure notifies that OOB data for Secure Connections has been generated by R_BLE_GAP_CreateScOobData().		
Data Fields		
uint8_t *	p_sc_oob_conf	Confirmation value(16 bytes) of OOB Data.
uint8_t *	p_sc_oob_rand	Rand(16bytes) of OOB Data.

◆ **st_ble_gap_bond_info_t**

struct st_ble_gap_bond_info_t

Bonding information used in R_BLE_GAP_SetBondInfo().		
Data Fields		
st_ble_dev_addr_t *	p_addr	Address of the device which exchanged the keys.
st_ble_gap_auth_info_t *	p_auth_info	Information about the keys.
st_ble_gap_key_ex_param_t *	p_keys	Keys distributed from the remote device in paring.

Macro Definition Documentation

◆ BLE_BD_ADDR_LEN

#define BLE_BD_ADDR_LEN
Bluetooth Device Address Size

◆ BLE_MASTER

#define BLE_MASTER
Master Role.

◆ BLE_SLAVE

#define BLE_SLAVE
Slave Role.

◆ BLE_GAP_ADDR_PUBLIC

#define BLE_GAP_ADDR_PUBLIC
Public Address.

◆ BLE_GAP_ADDR_RAND

#define BLE_GAP_ADDR_RAND
Random Address.

◆ BLE_GAP_ADDR_RPA_ID_PUBLIC

```
#define BLE_GAP_ADDR_RPA_ID_PUBLIC
```

Resolvable Private Address.

If the IRK of local device has not been registered in Resolving List, public address is used.

◆ BLE_GAP_ADDR_RPA_ID_RANDOM

```
#define BLE_GAP_ADDR_RPA_ID_RANDOM
```

Resolvable Private Address.

If the IRK of local device has not been registered in Resolving List, random address is used.

◆ BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST

```
#define BLE_GAP_SCAN_ALLOW_ADV_EXCEPT_DIRECTED_WLST
```

Accept all advertising and scan response PDUs.
The following are excluded.

- Advertising and scan response PDUs where the advertiser's identity address is not in the White List.
- Directed advertising PDUs whose the target address is identity address but doesn't address local device. However directed advertising PDUs whose the target address is the local resolvable private address are accepted.

◆ BLE_GAP_IOCAP_DISPLAY_ONLY

```
#define BLE_GAP_IOCAP_DISPLAY_ONLY
```

Display Only iocapability.

Output function : Local device has the ability to display a 6 digit decimal number.
Input function : None

◆ BLE_GAP_IOCAP_DISPLAY_YESNO

```
#define BLE_GAP_IOCAP_DISPLAY_YESNO
```

Display Yes/No iocapability.

Output function : Output function : Local device has the ability to display a 6 digit decimal number.
Input function : Local device has the ability to indicate 'yes' or 'no'

◆ BLE_GAP_IOCAP_KEYBOARD_ONLY

#define BLE_GAP_IOCAP_KEYBOARD_ONLY
Keyboard Only iocapability. Output function : None Input function : Local device has the ability to input the number '0' - '9'.

◆ BLE_GAP_IOCAP_NOINPUT_NOOUTPUT

#define BLE_GAP_IOCAP_NOINPUT_NOOUTPUT
No Input No Output iocapability. Output function : None Input function : None

◆ BLE_GAP_IOCAP_KEYBOARD_DISPLAY

#define BLE_GAP_IOCAP_KEYBOARD_DISPLAY
Keyboard Display iocapability. Output function : Output function : Local device has the ability to display a 6 digit decimal number. Input function : Local device has the ability to input the number '0' - '9'.

Typedef Documentation

◆ ble_gap_app_cb_t

ble_gap_app_cb_t

ble_gap_app_cb_t is the GAP Event callback function type.

Parameters

[in]	event_type	The type of GAP Event.
[in]	event_result	The result of API call which generates the GAP Event.
[in]	p_event_data	Data notified in the GAP Event.

Returns

none

◆ ble_gap_del_bond_cb_t

ble_gap_del_bond_cb_t

ble_gap_del_bond_cb_t is the type of the callback function for delete bonding information stored in non-volatile area.
This type is used in R_BLE_GAP_DeleteBondInfo().

Parameters

[in]	p_addr	The parameter returns the address of the remote device whose keys are deleted by R_BLE_GAP_DeleteBondInfo(). If R_BLE_GAP_DeleteBondInfo() deletes the keys of all remote devices, the parameter returns NULL.

Returns

none

◆ st_ble_gap_adv_param_t

typedef st_ble_gap_ext_adv_param_t st_ble_gap_adv_param_t

Advertising parameters.

See also

st_ble_gap_ext_adv_param_t

◆ st_ble_gap_scan_param_t

typedef st_ble_gap_ext_scan_param_t st_ble_gap_scan_param_t

Scan parameters.

See also

st_ble_gap_ext_scan_param_t

Enumeration Type Documentation

◆ e_ble_gap_evt_t

enum e_ble_gap_evt_t

GAP Event Identifier.

Enumerator	
BLE_GAP_EVENT_INVALID	Invalid GAP Event. **Event Code: 0x1001** **Event Data:** none
BLE_GAP_EVENT_STACK_ON	Host Stack has been initialized. When initializing host stack by R_BLE_GAP_Init() has been completed, BLE_GAP_EVENT_STACK_ON event is notified. **Event Code: 0x1002** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** none
BLE_GAP_EVENT_STACK_OFF	Host Stack has been terminated. When terminating host stack by R_BLE_GAP_Terminate() has been completed, BLE_GAP_EVENT_STACK_OFF event is notified. **Event Code: 0x1003** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_STATE(0x0008) When function was called, host stack has not yet been initialized. **Event Data:** none
BLE_GAP_EVENT_LOC_VER_INFO	Version information of local device.

	When version information of local device has been retrieved by R_BLE_GAP_GetVerInfo(), BLE_GAP_EVENT_LOC_VER_INFO event is notified. **Event Code: 0x1004** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_loc_dev_info_evt_t
BLE_GAP_EVENT_HW_ERR	Hardware Error. When hardware error has been received from Controller, BLE_GAP_EVENT_HW_ERR event is notified. **Event Code: 0x1005** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_hw_err_evt_t
BLE_GAP_EVENT_CMD_ERR	Command Status Error. When the error of HCI Command has occurred after a R_BLE GAP API call, BLE_GAP_EVENT_CMD_ERR event is notified. **Event Code: 0x1101** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_cmd_err_evt_t
BLE_GAP_EVENT_ADV_REPT_IND	Advertising Report. When advertising PDUs has been received after scanning was started by R_BLE_GAP_StartScan().

	Event Code: 0x1102 **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_adv_rept_evt_t
BLE_GAP_EVENT_ADV_PARAM_SET_COMP	Advertising parameters have been set. Advertising parameters have been configured by R_BLE_GAP_SetAdvParam(). **Event Code: 0x1103** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) The advertising type that doesn't support advertising data/scan response data was specified to the advertising set which has already set advertising data/scan response data. BLE_ERR_INVALID_OPERATION(0x0009) The reason for this error is as follows. • Advertising parameters were configured to the advertising set in advertising. • The sec_adv_phy field in adv_paran was not

	specified when Periodic Advertising was started. **Event Data:** st_ble_gap_adv_set_evt_t
BLE_GAP_EVENT_ADV_DATA_UPD_COMP	Advertising data has been set. This event notifies that Advertising Data/Scan Response Data/Periodic Advertising Data has been set to the advertising set by R_BLE_GAP_SetAdvSresData(). **Event Code: 0x1104** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) The reason for this error is as follows. • The advertising set that doesn't support advertising data/scan response data was set to the data. • The advertising set that supports legacy advertising was set to advertising data/scan response data larger than 31 bytes.

	• The advertising set that has advertising data/scan response data greater than or equal to 252 bytes was set the data in advertising . • The advertising set that has periodic advertising data greater than or equal to 253 bytes was set the data in advertising . BLE_ERR_MEM_ALLOC_FAILED(0x000C) Length exceeded the length that the advertising set could be set. BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_SetAdvSresData() has not been created. **Event Data:** st_ble_gap_adv_data_evt_t
BLE_GAP_EVENT_ADV_ON	Advertising has started. When advertising has been started by R_BLE_GAP_StartAdv(), this event is notified to the application layer. **Event Code: 0x1105**

result:

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows. • The advertising data length set to the advertising set for connectable extended advertising was invalid. • If o_addr_type field in adv_param used in R_BLE_GAP_SetAdvParam() is 0x03, the address which is set in o_addr field of adv_param has not been registered in Resolving List.
BLE_ERR_INVALID_OPERATION(0x0009)	Setting of advertising data/scan response data has not been completed.
BLE_ERR_INVALID_HDL(0x000E)	The advertising set specified by R_BLE_GAP_StartAdv() has not been created.

	BLE_ERR_LIMIT_EXCEEDED(0x0010) When the maximum connections are established, a new connectable advertising tried starting. **Event Data:** st_ble_gap_adv_set_evt_t
BLE_GAP_EVENT_ADV_OFF	Advertising has stopped. This event notifies the application layer that advertising has stopped. **Event Code: 0x1106** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_StopAdv() has not been created. **Event Data:** st_ble_gap_adv_off_evt_t
BLE_GAP_EVENT_PERD_ADV_PARAM_SET_COMP	Periodic advertising parameters have been set. This event notifies the application layer that Periodic Advertising Parameters has been configured by R_BLE_GAP_SetPerdAdvParam(). **Event Code: 0x1107** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) The advertising set was the setting for anonymous advertising. BLE_ERR_INVALID_OPERATION(0x0009) The advertising set was configured to the parameters in

	periodic advertising. BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_SetPerdAdvParam() has not been created. **Event Data:** st_ble_gap_adv_set_evt_t
BLE_GAP_EVENT_PERD_ADV_ON	Periodic advertising has started. When Periodic Advertising has been started by R_BLE_GAP_StartPerdAdv(), this event is notified to the application layer. **Event Code: 0x1108** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) The periodic advertising data set in the advertising set has not been completed. BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_StartPerdAdv() has not been created. **Event Data:** st_ble_gap_adv_set_evt_t
BLE_GAP_EVENT_PERD_ADV_OFF	Periodic advertising has stopped. When Periodic Advertising has terminated by R_BLE_GAP_StopPerdAdv(), this event is notified to the application layer. **Event Code: 0x1109** **result:** BLE_SUCCESS(0x0000) Success

	BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_StopPerdAdv() has not been created. **Event Data:** st_ble_gap_adv_set_evt_t
BLE_GAP_EVENT_ADV_SET_REMOVE_COMP	Advertising set has been deleted. When the advertising set has been removed by R_BLE_GAP_RemoveAdvSet(), this event is notified to the application layer. **Event Code: 0x110A** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) When the advertising set was in advertising, R_BLE_GAP_RemoveAdvSet() was called. BLE_ERR_INVALID_HDL(0x000E) The advertising set specified by R_BLE_GAP_RemoveAdvSet() has not been created. **Event Data:** st_ble_gap_rem_adv_set_evt_t
BLE_GAP_EVENT_SCAN_ON	Scanning has started. When scanning has started by R_BLE_GAP_StartScan(), this event is notified to the application layer. **Event Code: 0x110B** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) The reason for this error is as follows:

	• Scan interval or scan window was invalid. • When filter_dup field in scan_enable was BLE_GAP_SCAN_FILT_DUPLIC_ENABLE_FOR_PERIOD(0x02), period field in scan_enable was 0. • duration field in scan_enable was larger than period in scan_enable. BLE_ERR_INVALID_OPERATION(0x0009) In scanning, R_BLE_GAP_StartScan() was called. **Event Data:** none
BLE_GAP_EVENT_SCAN_OFF	Scanning has stopped. When scanning has been stopped by R_BLE_GAP_StopScan(), this event is notified to the application layer. **Event Code: 0x110C** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** none
BLE_GAP_EVENT_SCAN_TO	Scanning has stopped, because duration specified by API expired.

	When the scan duration specified by R_BLE_GAP_StartScan() has expired, this event notifies scanning has stopped. **Event Code: 0x110D** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** none
BLE_GAP_EVENT_CREATE_CONN_COMP	Connection Request has been sent to Controller. This event notifies a request for a connection has been sent to Controller. **Event Code: 0x110E** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) The reason for this error is as follows: • Scan interval or scan windows specified by R_BLE_GAP_CreateConn() is invalid. • Although the own_addr_type field in p_param was set to 0x03, random address had not been registered in Resolving

	List. BLE_ERR_INVALID_OPERATION(0x0009) — R_BLE_GAP_CreateConn() was called while creating a link by previous R_BLE_GAP_CreateConn() call . BLE_ERR_LIMIT_EXCEEDED(0x0010) — When the maximum connections are established, R_BLE_GAP_CreateConn() was called. **Event Data:** none
BLE_GAP_EVENT_CONN_IND	Link has been established. This event notifies a link has been established. **Event Code: 0x110F** **result:** BLE_SUCCESS(0x0000) — Success BLE_ERR_INVALID_HDL(0x000E) — The request for a connection has been cancelled by R_BLE_GAP_CancelCreateConn(). **Event Data:** st_ble_gap_conn_evt_t
BLE_GAP_EVENT_DISCONN_IND	Link has been disconnected. This event notifies a link has been disconnected. **Event Code: 0x1110** **result:** BLE_SUCCESS(0x0000) — Success **Event Data:** st_ble_gap_disconn_evt_t

<table>
<tr>
<td>BLE_GAP_EVENT_CONN_CANCEL_COMP</td>

BLE_GAP_EVENT_CREATE_SYNC_COMP	The request for establishing a periodic sync has been sent to Controller. This event notifies the application layer that Controller has received a request for a Periodic Sync establishment. **Event Code: 0x1126** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) When R_BLE_GAP_CreateSync() was called, this event for previous the API call has not been received. BLE_ERR_ALREADY_IN_PROGRESS(0x000A) The advertising set specified by R_BLE_GAP_CreateSync() has already established a periodic sync. **Event Data:** none
BLE_GAP_EVENT_SYNC_EST	The periodic advertising sync has been established. This event notifies the application layer that a Periodic sync has been established. **Event Code: 0x1127** **result:** BLE_SUCCESS(0x0000) Success

	BLE_ERR_NOT_YET_READY(0x0012) The request for a Periodic Sync establishment was cancelled by R_BLE_GAP_CancelCreateSync(). **Event Data:** st_ble_gap_sync_est_evt_t
BLE_GAP_EVENT_SYNC_TERM	The periodic advertising sync has been terminated. This event notifies the application layer that the Periodic Sync has been terminated by R_BLE_GAP_TerminateSync(). **Event Code: 0x1128** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) While establishing a Periodic Sync by R_BLE_GAP_CreateSync(), R_BLE_GAP_TerminateSync() was called. BLE_ERR_INVALID_HDL(0x000E) The sync handle specified by R_BLE_GAP_TerminateSync() was not found. **Event Data:** st_ble_gap_sync_hdl_evt_t
BLE_GAP_EVENT_SYNC_LOST	The periodic advertising sync has been lost. This event notifies the application layer that the Periodic Sync has been lost. **Event Code: 0x1129** **result:** BLE_SUCCESS(0x0000) Success

	Event Data: st_ble_gap_sync_hdl_evt_t
BLE_GAP_EVENT_SYNC_CREATE_CANCEL_COMP	The request for cancel of establishing a periodic advertising sync has been sent to Controller. This event notifies the request for a Periodic Sync establishment has been cancelled by R_BLE_GAP_CancelCreateSync(). **Event Code: 0x112A** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_OPERATION(0x0009) When R_BLE_GAP_CancelCreateSync() was called, a request for a Periodic Sync establishment by R_BLE_GAP_CreateSync() has not been sent to Controller. **Event Data:** none
BLE_GAP_EVENT_PERD_LIST_CONF_COMP	The Periodic Advertiser list has been configured. When Periodic Advertiser List has been configured by R_BLE_GAP_ConfPerdAdvList(), this event is notified to the application layer. **Event Code: 0x112B** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) The advertiser has already been registered in Periodic Advertiser List. BLE_ERR_INVALID_STATE(0x0008) The add or delete operation was

	called, before the previous clear operation has been completed. BLE_ERR_INVALID_OPERATION(0x0009) When establishing a periodic sync by R_BLE_GAP_CreateSync(), R_BLE_GAP_ConfPerdAdvList() was called. BLE_ERR_MEM_ALLOC_FAILED(0x000C) Periodic Advertiser List has already registered the maximum number of devices. BLE_ERR_INVALID_HDL(0x000E) The device specified by R_BLE_GAP_ConfPerdAdvList() was not found. **Event Data:** st_ble_gap_perd_list_conf_evt_t
BLE_GAP_EVENT_PRIV_MODE_SET_COMP	Privacy Mode has been configured. This event notifies the application layer that the Privacy Mode has been configured by R_BLE_GAP_SetPrivMode(). **Event Code: 0x112B** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_INVALID_ARG(0x0003) Address type or privacy mode is out of range. BLE_ERR_INVALID_OPERATION(0x0009) While advertising, scanning, or establishing a link with resolvable private address, R_BLE_GAP_SetPrivMode() was called. BLE_ERR_INVALID_HDL(0x000E) The address specified by

	R_BLE_GAP_SetPrivMode() has not been registered in Resolving List. **Event Data:** none
BLE_GAP_EVENT_PAIRING_REQ	The pairing request from a remote device has been received. This event notifies the application layer that a pairing request from a remote device has been received. **Event Code: 0x1401** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_pairing_info_evt_t
BLE_GAP_EVENT_PASSKEY_ENTRY_REQ	The request for input passkey has been received. This event notifies that a request for Passkey input in pairing has been received. **Event Code: 0x1402** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_conn_hdl_evt_t
BLE_GAP_EVENT_PASSKEY_DISPLAY_REQ	The request for displaying a passkey has been received. This event notifies that a request for Passkey display in pairing has been received. **Event Code: 0x1403** **result:** BLE_SUCCESS(0x0 Success

	000) **Event Data:** st_ble_gap_passkey_display_evt_t
BLE_GAP_EVENT_NUM_COMP_REQ	The request for confirmation with Numeric Comparison has received. This event notifies that a request for Numeric Comparison in pairing has been received. **Event Code: 0x1404** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_num_comp_evt_t
BLE_GAP_EVENT_KEY_PRESS_NTF	Key Notification from a remote device has been received. This event notifies the application layer that the remote device has input a key in Passkey Entry. **Event Code: 0x1405** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_key_press_ntf_evt_t
BLE_GAP_EVENT_PAIRING_COMP	Pairing has been completed. This event notifies the application layer that the pairing has completed. **Event Code: 0x1406** **result:** BLE_SUCCESS(0x0000) Success BLE_ERR_SMP_LE_PASSKEY_ENTRY_F PassKey Entry is failed.

AIL(0x2001)	
BLE_ERR_SMP_LE_OOB_DATA_NOT_AVAILABLE(0x2002)	OOB Data is not available.
BLE_ERR_SMP_LE_AUTH_REQ_NOT_MET(0x2003)	The requested pairing can not be performed because of IO Capability.
BLE_ERR_SMP_LE_CONFIRM_VAL_NOT_MATCH(0x2004)	Confirmation value does not match.
BLE_ERR_SMP_LE_PAIRING_NOT_SPRT(0x2005)	Pairing is not supported.
BLE_ERR_SMP_LE_INSUFFICIENT_ENC_KEY_SIZE(0x2006)	Encryption Key Size is insufficient.
BLE_ERR_SMP_LE_CMD_NOT_SPRT(0x2007)	The pairing command received is not supported.
BLE_ERR_SMP_LE_UNSPECIFIED_REASON(0x2008)	Pairing failed with an unspecified reason.
BLE_ERR_SMP_LE_REPEATED_ATTEMPTS(0x2009)	The number of repetition exceeded the upper limit.
BLE_ERR_SMP_LE_INVALID_PARAM(0x200A)	Invalid parameter is set.
BLE_ERR_SMP_LE_DHKEY_CHECK_FAIL(0x200B)	DHKey Check error.
BLE_ERR_SMP_LE_NUM_COMP_FAIL(0x200C)	Numeric Comparison failure.
BLE_ERR_SMP_LE_DISCONNECTED(0x200F)	Disconnection in pairing.
BLE_ERR_SMP_LE_TO(0x2011)	Failure due to timeout.
BLE_ERR_SMP_LE_LOC_KEY_MISSING(0x2014)	Pairing/Encryption failure because local device lost the LTK.

	Event Data: st_ble_gap_pairing_info_evt_t
BLE_GAP_EVENT_ENC_CHG	Key Notification from a remote device has been received. This event notifies the application layer that the encryption status of a link has been changed. **Event Code: 0x1407** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_enc_chg_evt_t
BLE_GAP_EVENT_PEER_KEY_INFO	Keys has been received from a remote device. This event notifies the application layer that the remote device has distributed the keys. **Event Code: 0x1408** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_peer_key_info_evt_t
BLE_GAP_EVENT_EX_KEY_REQ	The request for key distribution has been received. When local device has been received a request for key distribution to remote device, this event is notified to the application layer. **Event Code: 0x1409** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_conn_hdl_evt_t

BLE_GAP_EVENT_LTK_REQ	LTK has been request from a remote device. When local device has been received a LTK request from a remote device, this event is notified to the application layer. **Event Code: 0x140A** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_ltk_req_evt_t
BLE_GAP_EVENT_LTK_RSP_COMP	LTK reply has been sent to Controller. When local device has replied to the LTK request from the remote device, this event is notified to the application layer. **Event Code: 0x140B** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_ltk_rsp_evt_t
BLE_GAP_EVENT_SC_OOB_CREATE_COMP	The authentication data to be used in Secure Connections OOB has been created. This event notifies OOB data for Secure Connections has been generated by R_BLE_GAP_CreateScOobData(). **Event Code: 0x140C** **result:** BLE_SUCCESS(0x0000) Success **Event Data:** st_ble_gap_sc_oob_data_evt_t

Function Documentation

◆ R_BLE_GAP_Init()

ble_status_t R_BLE_GAP_Init (ble_gap_app_cb_t *gap_cb*)

Initialize the Host Stack.

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback function is registered with this function. In order to receive the GAP event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event.

Parameters

[in]	gap_cb	A callback function registered with this function.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	gap_cb is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • Host Stack was already initialized. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_Terminate()

ble_status_t R_BLE_GAP_Terminate (void)

Terminate the Host Stack.

Host stack is terminated with this function. In order to reset all the Bluetooth functions, it's necessary to call this function. The result of this API call is notified in BLE_GAP_EVENT_STACK_OFF event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	Host stack hasn't been initialized.

◆ R_BLE_GAP_UpdConn()

ble_status_t R_BLE_GAP_UpdConn (uint16_t *conn_hdl*, uint8_t *mode*, uint16_t *accept*, st_ble_gap_conn_param_t * *p_conn_updt_param*)

Update the connection parameters.

This function updates the connection parameters or replies a request for updating connection parameters notified by BLE_GAP_EVENT_CONN_PARAM_UPD_REQ event. When the connection parameters has been updated, BLE_GAP_EVENT_CONN_PARAM_UPD_COMP event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link to be updated.
[in]	mode	Connection parameter update request or response. macro: description BLE_GAP_CONN_UPD_MODE_REQ (0x01): Request for updating the connection parameters. BLE_GAP_CONN_UPD_MODE_RSP (0x02): Reply a connection parameter update request.
[in]	accept	When mode is BLE_GAP_CONN_UPD_MODE_RSP, accept or reject the connection parameters update request. If mode is BLE_GAP_CONN_UPD_MODE_REQ, accept is ignored. macro: description BLE_GAP_CONN_UPD_ACCEPT (0x0000): Accept the update request. BLE_GAP_CONN_UPD_REJECT (0x0001): Reject the update request.
[in]	p_conn_updt_param	Connection parameters to be updated. When mode is BLE_GAP_CONN_UPD_MODE_RSP and accept is

		BLE_GAP_CONN_UPD_REJECT, p_conn_updt_param is ignored.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	When accept is BLE_GAP_CONN_UPD_ACCEPT, p_conn_updt_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following is out of range. • mode • accept • conn_intv_min field in p_conn_updt_param • conn_intv_max field in p_conn_updt_param • conn_latency in p_conn_updt_param • sup_to in p_conn_updt_param • conn_hdl
BLE_ERR_INVALID_STATE(0x0008)	Not connected with the remote device.
BLE_ERR_CONTEXT_FULL(0x000B)	Sending a L2CAP command, an error occurred.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_SetDataLen()

ble_status_t R_BLE_GAP_SetDataLen (uint16_t *conn_hdl*, uint16_t *tx_octets*, uint16_t *tx_time*)

Update the packet size and the packet transmit time.

This function requests for changing the maximum transmission packet size and the maximum packet transmission time. When Controller has received the request from host stack, BLE_GAP_EVENT_SET_DATA_LEN_COMP event is notified to the application layer. When the transmission packet size or the transmission time has been changed, BLE_GAP_EVENT_DATA_LEN_CHG event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose the transmission packet size or the transmission time to be changed.
[in]	tx_octets	Maximum transmission packet size. Valid range is 0x001B - 0x00FB.
[in]	tx_time	Maximum transmission time(us). Valid range is 0x0148 - 0x4290.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_Disconnect()

ble_status_t R_BLE_GAP_Disconnect (uint16_t *conn_hdl*, uint8_t *reason*)

Disconnect the link.

This function disconnects a link. When the link has disconnected, BLE_GAP_EVENT_DISCONN_IND event is notified to the application layer.

Parameters

[in]	conn_hdl	Connection handle identifying the link to be disconnected.
[in]	reason	The reason for disconnection. Usually, set 0x13 which indicates that a user disconnects the link. If setting other than 0x13, refer the error code described in Core Specification Vol.2 Part D ,"2 Error Code Descriptions".

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_SetPhy()

ble_status_t R_BLE_GAP_SetPhy (uint16_t *conn_hdl*, st_ble_gap_set_phy_param_t * *p_phy_param*)

Set the phy for connection.

This function sets the PHY preferences for the connection. The result of this API call is notified in BLE_GAP_EVENT_PHY_SET_COMP event. When the PHY has been updated, BLE_GAP_EVENT_PHY_UPD event is notified to the application layer.

After PHY update, the PHY accept configuration of local device is the same as the values in BLE_GAP_EVENT_PHY_UPD event.
For example, after calling R_BLE_GAP_SetPhy(), if tx_phy, rx_phy by BLE_GAP_EVENT_PHY_UPD event are updated to 2M PHY, the PHY accept configuration is 2M PHY only.
Therefore after receiving BLE_GAP_EVENT_PHY_UPD event, if local device wants to accept the other PHY configuration, it needs to call R_BLE_GAP_SetPhy() with the desired PHY accept configuration.

Because the maximum transmission packet size or the maximum transmission time might be updated by PHY update, if the same packet size or transmission time as the previous one is desired, change the maximum transmission packet size or the maximum transmission time by R_BLE_GAP_SetDataLen().

Parameters

[in]	conn_hdl	Connection handle identifying the link whose PHY to be updated.
[in]	p_phy_param	PHY preferences.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_phy_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl or option field in p_phy_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetDefPhy()

ble_status_t R_BLE_GAP_SetDefPhy (st_ble_gap_set_def_phy_param_t * *p_def_phy_param*)

Set the default phy which allows remote device to change.

This function sets the PHY preferences which a remote device may change. The result of this API call is notified in BLE_GAP_EVENT_DEF_PHY_SET_COMP event.

Parameters

[in]	p_def_phy_param	The PHY preference which a remote device may change.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_def_phy_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	tx_phys or tx_phys field in p_def_phy_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetPrivMode()

ble_status_t R_BLE_GAP_SetPrivMode (st_ble_dev_addr_t * *p_addr*, uint8_t * *p_privacy_mode*, uint8_t *device_num*)

Set the privacy mode.

This function sets privacy mode for the remote device registered in Resolving List. By default, Network Privacy Mode is set.
The result of this API call is notified in BLE_GAP_EVENT_PRIV_MODE_SET_COMP event.

Parameters

[in]	p_addr	An array of identity address of the remote device to set privacy mode. The number of elements is specified by device_num.
[in]	p_privacy_mode	An array of privacy mode to set to remote device. The number of elements is specified by device_num. The following value is set as

		the privacy mode. macro: BLE_GAP_NET_PRIV_MODE (0x00) — Network Privacy Mode. BLE_GAP_DEV_PRIV_MODE (0x01) — Device Privacy Mode.
[in]	device_num	The number of devices to set privacy mode. Valid range is 1-BLE_GAP_RSLV_LIST_MAX_ENTRY.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr or p_privacy_mode is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following parameter is out of range. • The address type in p_addr. • The privacy mode specified by p_privacy_mode. • device_num
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • While configuring privacy mode, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ConfWhiteList()

ble_status_t R_BLE_GAP_ConfWhiteList (uint8_t *op_code*, st_ble_dev_addr_t * *p_addr*, uint8_t *device_num*)

Set White List.

This function supports the following operations regarding White List.

- Add the device to White List.
- Delete the device from White List.

- Clear White List.

  The total number of White List entries is defined as BLE_GAP_WHITE_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_WHITE_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for White List. macro: BLE_GAP_LIST_ADD_DEV(0x01) — Add the device to the list. BLE_GAP_LIST_REM_DEV(0x02) — Delete the device from the list. BLE_GAP_LIST_CLR(0x03) — Clear the list.
[in]	p_addr	An array of device address to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.
[in]	device_num	The number of devices add / delete to the list. Valid range is 1-BLE_GAP_WHITE_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.

Return values

BLE_SUCCESS(0x0000)	Success

BLE_ERR_INVALID_PTR(0x0001)	When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	op_code or address type field in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • While operating White List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating the White List.

◆ R_BLE_GAP_GetVerInfo()

ble_status_t R_BLE_GAP_GetVerInfo (void)

Get the version number of the Controller and the host stack.

This function retrieves the version information of local device. The result of this API call is notified in BLE_GAP_EVENT_LOC_VER_INFO event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ReadPhy()

ble_status_t R_BLE_GAP_ReadPhy (uint16_t *conn_hdl*)

Get the phy settings.

This function gets the PHY settings for the connection. The result of this API call is notified in BLE_GAP_EVENT_PHY_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose PHY settings to be retrieved.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ConfRslvList()

ble_status_t R_BLE_GAP_ConfRslvList (uint8_t *op_code*, st_ble_dev_addr_t * *p_addr*, st_ble_gap_rslv_list_key_set_t * *p_peer_irk*, uint8_t *device_num*)

Set Resolving List.

This function supports the following operations regarding Resolving List.

- Add the device to Resolving List.
- Delete the device from Resolving List.

- Clear Resolving List.

In order to generate a resolvable private address, a local IRK needs to be registered by R_BLE_GAP_SetLocIdInfo(). If communicating with the identity address, register all-zero IRK as local IRK. In order to resolve resolvable private address of the remote device, the IRK distributed from the remote device needs to be added to Resolving List. The total number of Resolving List entries is defined as BLE_GAP_RESOLV_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_RSLV_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for Resolving List. macro: BLE_GAP_LIST_ADD_DEV(0x01) — Add the device to the list. BLE_GAP_LIST_REM_DEV(0x02) — Delete the device from the list. BLE_GAP_LIST_CLR(0x03) — Clear the list.
[in]	p_addr	An array of Identity Addresses to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.
[in]	p_peer_irk	The remote IRK and the type of local IRK added to Resolving List. If op_code is other than BLE_GAP_LIST_ADD_DEV, p_peer_irk is ignored. The number of elements is

		specified by device_num.
[in]	device_num	The number of devices add / delete to the list. Valid range is 1-BLE_GAP_RSLV_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: • When added to or deleted from the list, p_addr is specified as NULL. • When added to the list, p_peer_irk is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: • op_code is out of range. • When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, device_num is out of range. • When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, address type field in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • While operating Resolving List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating the Resolving List.
BLE_ERR_INVALID_HDL(0x000E)	The specified Identity Address was not found in Resolving List.

◆ R_BLE_GAP_EnableRpa()

ble_status_t R_BLE_GAP_EnableRpa (uint8_t *enable*)

Enable/Disable address resolution and generation of a resolvable private address.

This function enables or disables RPA functionality. The RPA functionality includes the following.

- Generation of local resolvable private address
- Resolution of remote resolvable private address

In order to do advertising, scanning or creating a link with local resolvable private address, the RPA functionality needs to be enabled. After enabling the RPA functionality and the identity address of remote device and the IRKs of local/remote device is registered, local device can generate own resolvable private address in the time interval set by R_BLE_GAP_SetRpaTo(), and can resolve a resolvable private address of a remote device. It is recommended that the RPA functionality is called immediately after the initialization by R_BLE_GAP_Init(). The result of this API call is notified in BLE_GAP_EVENT_RPA_EN_COMP event.

Parameters

[in]	enable	Enable or disable address resolution function. macro: description BLE_GAP_RPA_DISABLED (0x00): Disable RPA generation/resolution. BLE_GAP_RPA_ENABLED(0x01): Enable RPA generation/resolution.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	enable is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetRpaTo()

ble_status_t R_BLE_GAP_SetRpaTo (uint16_t *rpa_timeout*)

Set the update time of resolvable private address.

This function sets the time interval to update the resolvable private address. The result of this API call is notified in BLE_GAP_EVENT_SET_RPA_TO_COMP event.

Parameters

[in]	rpa_timeout	Time interval to update resolvable private address in seconds. Valid range is 0x003C - 0xA1B8. Default is 900s.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ReadRpa()

ble_status_t R_BLE_GAP_ReadRpa (st_ble_dev_addr_t * *p_addr*)

Get the resolvable private address of local device.

This function retrieves the local resolvable private address. Before getting the address, enable the resolvable private address function by R_BLE_GAP_EnableRpa(). The result of this API call is notified in BLE_GAP_EVENT_RD_RPA_COMP event.

Parameters

[in]	p_addr	Identity address registered in Resolving List.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	Address type in p_addr is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows. • When retrieving the local resolvable private address, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ReadRssi()

ble_status_t R_BLE_GAP_ReadRssi (uint16_t *conn_hdl*)

Get RSSI.

This function retrieves RSSI. The result of this API call is notified in BLE_GAP_EVENT_RSSI_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose RSSI to be retrieved.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ReadChMap()

ble_status_t R_BLE_GAP_ReadChMap (uint16_t *conn_hdl*)

Get the Channel Map.

This function retrieves the channel map. The result of this API call is notified in BLE_GAP_EVENT_CH_MAP_RD_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the link whose channel map to be retrieved.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	conn_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetRandAddr()

ble_status_t R_BLE_GAP_SetRandAddr (uint8_t * *p_random_addr*)

Set a random address.

This function sets static address or non-resolvable private address to Controller. Refer to Core Specification Vol 6, PartB, "1.3.2 Random Device Address" regarding the format of the random address. Resolvable private address cannot set by this API. The result of this API call is notified in BLE_GAP_EVENT_RAND_ADDR_SET_COMP event.

Parameters

[in]	p_random_addr	Static address or non-resolvable private address. The BD address setting format is little endian.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_random_addr is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetAdvParam()

ble_status_t R_BLE_GAP_SetAdvParam (st_ble_gap_adv_param_t * *p_adv_param*)

Set advertising parameters.

This function sets advertising parameters. It's possible to do advertising where the advertising parameters are different every each advertising set. The number of advertising set in the Controller is defined as BLE_MAX_NO_OF_ADV_SETS_SUPPORTED. Each advertising set is identified with advertising handle (0x00-0x03). Create an advertising set with this function before start advertising, setting periodic advertising parameters, start periodic advertising, setting advertising data/scan response data/periodic advertising data. The result of this API call is notified in BLE_GAP_EVENT_ADV_PARAM_SET_COMP event.

Parameters

[in]	p_adv_param	Advertising parameters.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_adv_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The below p_adv_param field value is out of range. • adv_handle • adv_intv_min/adv_intv_max • adv_ch_map • o_addr_type • p_addr_type • adv_phy • sec_adv_phy • scan_req_ntf_flag
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetAdvSresData()

ble_status_t R_BLE_GAP_SetAdvSresData (st_ble_gap_adv_data_t * *p_adv_srsp_data*)

Set advertising data/scan response data/periodic advertising data.

This function sets advertising data/scan response data/periodic advertising data to the advertising set. It is necessary to create an advertising set by R_BLE_GAP_SetAdvParam(), before calling this function. Set advertising data/scan response data/periodic advertising data, after allocating the memory for the data. The following shall be applied regarding the adv_prop_type field and the data_type field in st_ble_gap_adv_param_t parameter specified in R_BLE_GAP_SetAdvParam().

The following shall be applied regarding the adv_prop_type field and the data_type field in st_ble_gap_adv_param_t parameter specified in R_BLE_GAP_SetAdvParam().

- When adv_prop_type is Legacy Advertising PDU type,
    - it's possible to set advertising data/scan response data up to 31 bytes.
    - advertising data/scan response data can be updated by this function in advertising.
- When adv_prop_type is Extended Advertising PDU type,
    - it's possible to set at most 1650 bytes of data as advertising data/scan response data per 1 advertising set.
    - the total buffer size in Controller for advertising data/scan response data is 4250 bytes. Therefore please note that more than 4250 bytes of advertising data/scan response data can not be set to all the advertising sets. Please refer to Figure 1.1 and Figure 1.2 about examples of setting advertising data/scan response data.
    - it's possible to update advertising data/scan response data in advertising, if the data_length field in st_ble_gap_adv_data_t parameter is up to 251 bytes.

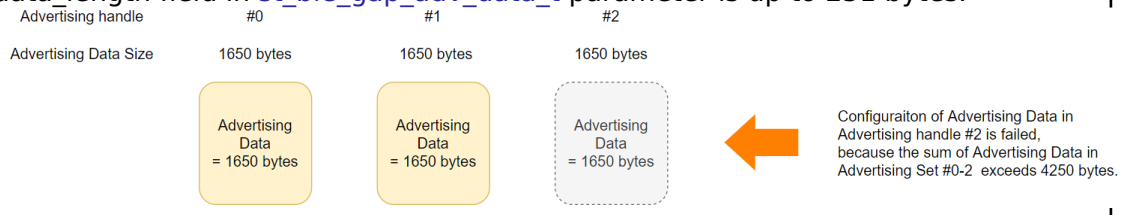

Figure 237: Figure 1.1

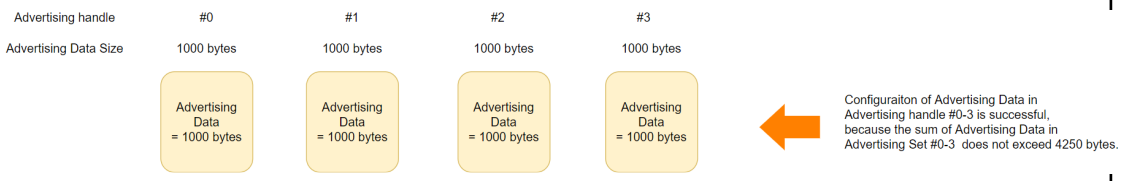

Figure 238: Figure 1.2

- When periodic advertising data is set,
  - At most 1650 bytes of data can be set to 1 advertising set.
  - The total buffer size in Controller for periodic advertising data is 4306 bytes. Therefore please note that more than 4306 bytes of periodic advertising data can not be set to all the advertising sets.
  - it's possible to update periodic advertising data in advertising, if the data_length field in st_ble_gap_adv_data_t parameter is up to 252 bytes.

The result of this API call is notified in BLE_GAP_EVENT_ADV_DATA_UPD_COMP event.

Parameters

[in]	p_adv_srsp_data	Advertising data/scan response data/periodic advertising data.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: • p_adv_srsp_data is specified as NULL. • data_length field in p_adv_srsp_data parameter is not 0 and p_data field is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following field in p_adv_srsp_data parameter is out of range. • adv_hdl • data_type • data_length • zero_length_flag
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StartAdv()

ble_status_t R_BLE_GAP_StartAdv (uint8_t *adv_hdl*, uint16_t *duration*, uint8_t *max_extd_adv_evts*)

Start advertising.

This function starts advertising. Create the advertising set specified with adv_hdl by R_BLE_GAP_SetAdvParam(), before calling this function. The result of this API call is notified in BLE_GAP_EVENT_ADV_ON event.

Parameters

[in]	adv_hdl	The advertising handle pointing to the advertising set which starts advertising. The valid range is 0x00 - 0x03.
[in]	duration	The duration for which the advertising set identified by adv_hdl is enabled. Time = duration * 10ms. When the duration expires, BLE_GAP_EVENT_ADV_OFF event notifies that advertising is stopped. The valid range is 0x0000 - 0xFFFF. The duration parameter is ignored when the value is set to 0x0000.
[in]	max_extd_adv_evts	The maximum number of advertising events that be sent during advertising. When all the advertising events(max_extd_adv_evts) have been sent, BLE_GAP_EVENT_ADV_OFF event notifies that advertising is stopped. The max_extd_adv_evts parameter is ignored when the value is set to 0x00.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StopAdv()

ble_status_t R_BLE_GAP_StopAdv (uint8_t *adv_hdl*)

Stop advertising.

This function stops advertising. The result of this API call is notified in BLE_GAP_EVENT_ADV_OFF event.

Parameters

[in]	adv_hdl	The advertising handle pointing to the advertising set which stops advertising. The valid range is 0x00 - 0x03.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetPerdAdvParam()

ble_status_t R_BLE_GAP_SetPerdAdvParam (st_ble_gap_perd_adv_param_t * *p_perd_adv_param*)

Set periodic advertising parameters.

This function sets periodic advertising parameters. Create the advertising set which supports Non-Connectable, Non-Scannable advertising by R_BLE_GAP_SetAdvParam() before setting periodic advertising parameters. The result of this API call is notified in BLE_GAP_EVENT_PERD_ADV_PARAM_SET_COMP event.

Parameters

[in]	p_perd_adv_param	Periodic advertising parameters.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_perd_adv_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following field in the p_perd_adv_param parameter is out of range. • adv_hdl • perd_intv_min or perd_intv_max • prop_type is neither 0x0000 nor 0x0040(BLE_GAP_PERD_PROP_TX_POWER)
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StartPerdAdv()

ble_status_t R_BLE_GAP_StartPerdAdv (uint8_t *adv_hdl*)

Start periodic advertising.

This function starts periodic advertising. Set periodic advertising parameters to the advertising set, before starting periodic advertising. The result of this API call is notified in BLE_GAP_EVENT_PERD_ADV_ON event.

Parameters

[in]	adv_hdl	Advertising handle identifying the advertising set which starts periodic advertising.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StopPerdAdv()

ble_status_t R_BLE_GAP_StopPerdAdv (uint8_t *adv_hdl*)

Stop periodic advertising.

This function stops periodic advertising. If the return value of this API is BLE_SUCCESS, the result is notified in BLE_GAP_EVENT_PERD_ADV_OFF event.

Parameters

[in]	adv_hdl	Specify the handle of Advertising Set to stop Periodic Advertising.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_GetRemainAdvBufSize()

ble_status_t R_BLE_GAP_GetRemainAdvBufSize (uint16_t * *p_remain_adv_data_size*, uint16_t * *p_remain_perd_adv_data_size*)

Get buffer size for advertising data/scan response data/periodic advertising data in the Controller.

This function gets the total size of advertising data/scan response data/periodic advertising data which can be currently set to Controller(all of the advertising sets). The application layer gets the data sizes via the parameters. By this API function call, no events occur.

Parameters

[out]	p_remain_adv_data_size	The free buffer size of Controller to which advertising data/scan response data can be currently set.
[out]	p_remain_perd_adv_data_size	The free buffer size of Controller to which periodic advertising data can be currently set.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_remain_adv_data_size or p_remain_perd_adv_data_size is specified as NULL.

◆ R_BLE_GAP_RemoveAdvSet()

ble_status_t R_BLE_GAP_RemoveAdvSet (uint8_t *op_code*, uint8_t *adv_hdl*)

Delete advertising set.

This function deletes an advertising set or deletes all the advertising sets. The result of this API call is notified in BLE_GAP_EVENT_ADV_SET_REMOVE_COMP event.

Parameters

[in]	op_code	The operation for delete or clear. macro: BLE_GAP_RMV_ADV_SET_REM_OP(0x01) — Delete an advertising set. BLE_GAP_RMV_ADV_SET_CLR_OP(0x02) — Delete all the advertising sets.
[in]	adv_hdl	Advertising handle identifying the advertising set deleted. If op_code is BLE_GAP_RMV_ADV_SET_CLR_OP, adv_hdl is ignored.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: • op_code is out of range. • When op_code is BLE_GAP_RMV_ADV_SET_REM_OP(0x01), adv_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CreateConn()

ble_status_t R_BLE_GAP_CreateConn (st_ble_gap_create_conn_param_t * *p_param*)

Request for a link establishment.

This function sends a connection request to a remote device to create a link. When Controller has received a request for establishment of a link from host stack, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified to the application layer. When the link is established, BLE_GAP_EVENT_CONN_IND event is notified to the application layer.

Parameters

[in]	p_param	Connection parameters.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: • p_param is specified as NULL. • p_conn_param_1M field and p_conn_param_2M and p_conn_param_coded field in p_param are specified as NULL. • When creating a link with 1M PHY, p_conn_param in p_conn_param_1M field in p_param is specified as NULL. • When creating a link with 2M PHY, p_conn_param in p_conn_param_2M field in p_param is specified as NULL. • When creating a link with coded MPHY, p_conn_param in p_conn_param_coded field in p_param is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: • init_filter_policy in p_param is out of range. • remote_bd_addr_type field or own_addr_type address field in p_param is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CancelCreateConn()

ble_status_t R_BLE_GAP_CancelCreateConn (void)

Cancel the request for a link establishment.

This function cancels a request for establishing a link. When Controller has received the cancel request from host stack, BLE_GAP_EVENT_CONN_CANCEL_COMP event is notified to the application layer. When the cancel procedure has completed, BLE_GAP_EVENT_CONN_IND event is notified to the application layer.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetChMap()

ble_status_t R_BLE_GAP_SetChMap (uint8_t * *p_channel_map*)

Set the Channel Map.

This function sets the channel map. The result of this API call is notified in BLE_GAP_EVENT_CH_MAP_SET_COMP event.

Parameters

[in]	p_channel_map	Channel map.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_channel_map is specified as NULL.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StartScan()

ble_status_t R_BLE_GAP_StartScan (st_ble_gap_scan_param_t * *p_scan_param*, st_ble_gap_scan_on_t * *p_scan_enable*)

Set scan parameter and start scan.

This function starts scanning. When scanning for the first time, set the p_scan_param. Setting scan parameters can be omitted by specifying p_scan_param as NULL after next time. The result of this API call is notified in BLE_GAP_EVENT_SCAN_ON event. Advertising report is notified in BLE_GAP_EVENT_ADV_REPT_IND event. Figure 1.3 shows the relationship between scan period, scan duration, scan interval and scan window.

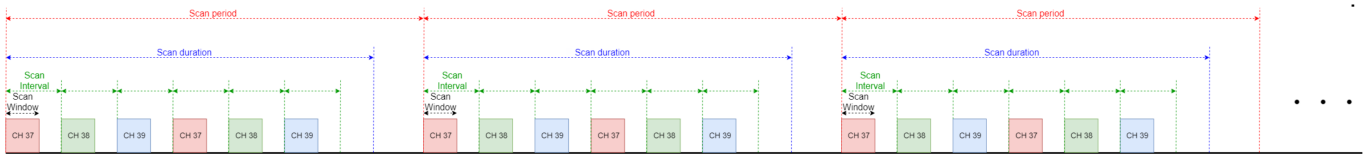

Figure 239: Figure 1.3

When scan duration is non-zero, scan period is zero and scan duration expires, BLE_GAP_EVENT_SCAN_TO event is notified to the application layer.

Parameters

[in]	p_scan_param	Scan parameter. When p_scan_param is specified as NULL, host stack doesn't set scan parameters and start scanning with the previous parameters.
[in]	p_scan_enable	Scan period, scan duration, duplicate filter and procedure type.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows: • p_scan_enable is specified as NULL. • p_phy_param_1M field and p_phy_param_coded field in p_scan_param are specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The reason for this error is as follows: • proc_type field in p_scan_enable is out of range. • filter_dups in p_scan_enable is out of range. • o_addr_type in p_scan_param is out of range. • filter_policy in p_scan_param is out of range. • scan_type of p_scan_param's p_phy_param_1M or p_phy_param_coded is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_StopScan()

ble_status_t R_BLE_GAP_StopScan (void)

Stop scan.

This function stops scanning. The result of this API call is notified in BLE_GAP_EVENT_SCAN_OFF event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CreateSync()

ble_status_t R_BLE_GAP_CreateSync (st_ble_dev_addr_t * *p_addr*, uint8_t *adv_sid*, uint16_t *skip*, uint16_t *sync_to*)

Request for a periodic sync establishment.

This function sends a request for establishment of a periodic sync to a advertiser. In order to create a periodic sync, scan needs to be starting by R_BLE_GAP_StartScan(). When Controller has received the request from host stack, BLE_GAP_EVENT_CREATE_SYNC_COMP event is notified to the application layer. When the periodic sync is established, BLE_GAP_EVENT_SYNC_EST event is notified to the application layer.

Parameters

[in]	p_addr	The address of periodic advertiser.When p_addr is specified as NULL, local device creates a periodic sync with the advertiser registered in Periodic Advertiser List.
[in]	adv_sid	Advertising SID. When p_addr is specified as NULL, adv_sid is ignored. Valid range is 0x00 - 0x0F.
[in]	skip	The number of consecutive periodic advertising packets that local device may skip after receiving a periodic advertising packet. Valid range is 0x0000 - 0x01F3.

[in]	sync_to	The maximum permitted time between successful receives.When sync_to expires, the periodic sync is lost. Time(ms) = sync_to * 10. Valid range is 0x000A - 0x4000.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_addr is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	The following parameter is out of range. • address type in p_addr • adv_sid • skip • sync_to
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_CancelCreateSync()

ble_status_t R_BLE_GAP_CancelCreateSync (void)

Cancel the request for a periodic sync establishment.

This function cancels a request for establishing a periodic sync. The result of this API call is notified in BLE_GAP_EVENT_SYNC_CREATE_CANCEL_COMP event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_TerminateSync()

ble_status_t R_BLE_GAP_TerminateSync (uint16_t *sync_hdl*)

Terminate the periodic sync.

This function terminates a periodic sync. The result of this API call is notified in BLE_GAP_EVENT_SYNC_TERM event.

Parameters

[in]	sync_hdl	Sync handle identifying the periodic sync to be terminated.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	sync_hdl is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_ConfPerdAdvList()

ble_status_t R_BLE_GAP_ConfPerdAdvList (uint8_t *op_code*, st_ble_dev_addr_t * *p_addr*, uint8_t * *p_adv_sid_set*, uint8_t *device_num*)

Set Periodic Advertiser List.

This function supports the following operations regarding Periodic Advertiser List.

- Add the device to Periodic Advertiser List.
- Delete the device from Periodic Advertiser List.

- Clear Periodic Advertiser List.

  The total number of Periodic Advertiser List entries is defined as BLE_GAP_PERD_LIST_MAX_ENTRY. The result of this API call is notified in BLE_GAP_EVENT_PERD_LIST_CONF_COMP event.

Parameters

[in]	op_code	The operation for Periodic Advertiser List. macro: BLE_GAP_LIST_ADD_DEV(0x01) — Add the device to the list. BLE_GAP_LIST_REM_DEV(0x02) — Delete the device from the list. BLE_GAP_LIST_CLR(0x03) — Clear the list.
[in]	p_addr	An array of device address to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_addr is ignored.
[in]	p_adv_sid_set	An array of SID of the advertiser to add / delete to the list. The number of elements is specified by device_num. If op_code is BLE_GAP_LIST_CLR, p_adv_sid_set is ignored.
[in]	device_num	The number of devices add / delete to the list.

		Valid range is 1-BLE_GAP_PERD_LIST_MAX_ENTRY. If op_code is BLE_GAP_LIST_CLR, device_num is ignored.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	When op_code is BLE_GAP_LIST_ADD_DEV or BLE_GAP_LIST_REM_DEV, p_addr or p_adv_sid_set is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	op_code or address type field in p_addr or p_adv_sid_set or device_num is out of range.
BLE_ERR_UNSUPPORTED(0x0007)	Not supported.
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • While operating Periodic Advertiser List, this function was called. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	There are no memories for operating periodic advertiser.

◆ R_BLE_GAP_AuthorizeDev()

ble_status_t R_BLE_GAP_AuthorizeDev (uint16_t *conn_hdl*, uint8_t *author_flag*)

Authorize a remote device.

User authorizes a remote device by this function. This function is used when a remote device accesses a GATT Characteristic in local device which requests user authorization. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to be authorized or not by user.
[in]	author_flag	Authorize or not the remote device. macro: description BLE_GAP_NOT_AUTHORIZED(0x00): Not authorize the remote device. BLE_GAP_AUTHORIZED(0x01): Authorize the remote device.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	author_flag is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_GetRemDevInfo()

ble_status_t R_BLE_GAP_GetRemDevInfo (uint16_t *conn_hdl*)

Get the information about remote device.

This function retrieves information about the remote device. The information includes BD_ADDR, the version number and LE features. The result of this API call is notified in BLE_GAP_EVENT_GET_REM_DEV_INFO event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device whose information to be retrieved.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetPairingParams()

ble_status_t R_BLE_GAP_SetPairingParams (st_ble_gap_pairing_param_t * *p_pair_param*)

Set the parameters using pairing.

This function sets the parameters used in pairing. The parameters set by this API are sent to the remote device when pairing occurred. The result of this API call is returned by a return value.

Parameters

[in]	p_pair_param	Pairing parameters.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	The following field in p_pair_param is out of range. • iocap • max_key_size • mitm • bonding • key_notf • sec_conn_only

◆ R_BLE_GAP_SetLocIdInfo()

ble_status_t R_BLE_GAP_SetLocIdInfo (st_ble_dev_addr_t * *p_lc_id_addr*, uint8_t * *p_lc_irk*)

Set the IRK and the identity address distributed to a remote device.

This function registers local IRK and identity address of local device in host stack. The IRK and the identity address are distributed to a remote device in pairing. The result of this API call is returned by a return value.

Parameters

[in]	p_lc_id_addr	Identity address to be registered in host stack.
[in]	p_lc_irk	IRK to be registered in host stack.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_lc_id_addr or p_lc_irk is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	Address type field in p_lc_id_addr is out of range.

◆ R_BLE_GAP_SetLocCsrk()

ble_status_t R_BLE_GAP_SetLocCsrk (uint8_t * *p_local_csrk*)

Set the CSRK distributed to a remote device.

This function registers local CSRK in host stack. The CSRK is distributed to a remote device in pairing. The result of this API call is returned by a return value.

Parameters

[in]	p_local_csrk	CSRK to be registered in host stack.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_local_csrk is specified as NULL.

◆ R_BLE_GAP_StartPairing()

ble_status_t R_BLE_GAP_StartPairing (uint16_t *conn_hdl*)

Start pairing.

This function starts pairing with a remote device. The result of this API call is returned by a return value. The result of pairing is notified in BLE_GAP_EVENT_PAIRING_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which local device starts pairing with.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	While generating OOB data, this function was called.
BLE_ERR_CONTEXT_FULL(0x000B)	While pairing, this function was called.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_ReplyPairing()

ble_status_t R_BLE_GAP_ReplyPairing (uint16_t *conn_hdl*, uint8_t *response*)

Reply the pairing request from a remote device.

This function replies to the pairing request from the remote device. The pairing request from the remote device is notified in BLE_GAP_EVENT_PAIRING_REQ event. The result of this API call is returned by a return value. The result of pairing is notified in BLE_GAP_EVENT_PAIRING_COMP event.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which local device starts pairing with.
[in]	response	Accept or reject the pairing request from the remote device. macro / description BLE_GAP_PAIRING_ACCEPT(0x00) — Accept the pairing request. BLE_GAP_PAIRING_REJECT(0x01) — Reject the pairing request.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	While generating OOB data, this function was called.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, host stack has not yet received BLE_GAP_EVENT_PAIRING_REQ event.

◆ R_BLE_GAP_StartEnc()

ble_status_t R_BLE_GAP_StartEnc (uint16_t *conn_hdl*)

Encryption the link.

This function starts encryption of the link. In case of master device, the local device requests for the encryption to a remote device. In case of slave device, the local device sends a Security Request to a remote device. After receiving the Security Request, the remote device requests for the encryption to the local device. The result of the encryption is returned in BLE_GAP_EVENT_ENC_CHG event.

Parameters

[in]	conn_hdl	Connection handle identifying the link which is encrypted.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • Pairing has not been completed. • The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_ReplyPasskeyEntry()

ble_status_t R_BLE_GAP_ReplyPasskeyEntry (uint16_t *conn_hdl*, uint32_t *passkey*, uint8_t *response*)

Reply the passkey entry request.

When BLE_GAP_EVENT_PASSKEY_ENTRY_REQ event is notified, the response to passkey entry is sent by this function. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which the reply to passkey entry is sent.
[in]	passkey	Passkey. The valid range is 000000 - 999999 in decimal.
[in]	response	Active or negative reply to passkey entry. macro / description BLE_GAP_PAIRING_ACCEPT(0x00) — Accept the passkey entry pairing. BLE_GAP_PAIRING_REJECT(0x01) — Reject the passkey entry pairing.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	passkey or response is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_ReplyNumComp()

ble_status_t R_BLE_GAP_ReplyNumComp (uint16_t *conn_hdl*, uint8_t *response*)

Reply the numeric comparison request.

When BLE_GAP_EVENT_NUM_COMP_REQ event is notified, the response to Numeric Comparison is sent by this function. The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which the reply to Numeric Comparison is sent.
[in]	response	Active or negative reply in Numeric Comparison. macro: BLE_GAP_PAIRING_ACCEPT(0x00) — The number displayed in the local is the same as the one of the remote. macro: BLE_GAP_PAIRING_REJECT(0x01) — The number displayed in the local is differs from the one of the remote.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	When this function was called, host stack has not yet received BLE_GAP_EVENT_NUM_COMP_REQ event.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_NotifyKeyPress()

ble_status_t R_BLE_GAP_NotifyKeyPress (uint16_t *conn_hdl*, uint8_t *key_press*)

Notify the input key type which a remote device inputs in the passkey entry.

This function notifies the input key type to the remote device in passkey entry. The result is returned from this API.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to which the key notification is sent.
[in]	key_press	Input key type. macro / description BLE_GAP_LESC_PASSKEY_ENTRY_STARTED(0x00) — Notify that passkey entry started. BLE_GAP_LESC_PASSKEY_DIGIT_ENTERED(0x01) — Notify that passkey digit entered. BLE_GAP_LESC_PASSKEY_DIGIT_ERASED(0x02) — Notify that passkey digit erased. BLE_GAP_LESC_PASSKEY_CLEARED(0x03) — Notify that passkey cleared. BLE_GAP_LESC_PASSKEY_ENTRY_COMPLETED(0x04) — Notify that passkey entry completed.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_ARG(0x0003)	key_press parameter is out of range.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_GetDevSecInfo()

ble_status_t R_BLE_GAP_GetDevSecInfo (uint16_t *conn_hdl*, st_ble_gap_auth_info_t * *p_sec_info*)

Get the security information about the remote device.

This function gets the parameters which has been negotiated with the remote device in pairing. The parameters can be retrieved after pairing. The result is returned by p_sec_info.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device whose bonding information is retrieved.
[in]	p_sec_info	Return the security information which has been negotiated in pairing.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_sec_info is specified as NULL.
BLE_ERR_INVALID_STATE(0x0008)	The remote device bonding information has not been set to host stack.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

◆ R_BLE_GAP_ReplyExKeyInfoReq()

ble_status_t R_BLE_GAP_ReplyExKeyInfoReq (uint16_t *conn_hdl*)

Distribute the keys of local device.

When key exchange request is notified by BLE_GAP_EVENT_EX_KEY_REQ event at pairing, keys of the local device are distributed. The result is returned from this API.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device to which the key is distributed.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.
BLE_ERR_NOT_YET_READY(0x0012)	When this function was called, pairing has not yet started.

◆ R_BLE_GAP_SetRemOobData()

ble_status_t R_BLE_GAP_SetRemOobData (st_ble_dev_addr_t * *p_addr*, uint8_t *oob_data_flag*, st_ble_gap_oob_data_t * *p_oob*)

Set the oob data from a remote device.

This function registers the OOB data received from a remote device. When oob_data_flag indicates that the OOB data has been received, the setting regarding OOB data is reflected in pairing. In order to do OOB pairing, set the OOB data received from the remote device before pairing. The result is returned from this API.

Parameters

[in]	p_addr	The remote device address.
[in]	oob_data_flag	This parameter indicates whether the local device has received the OOB data from the remote device or not. macro: BLE_GAP_OOB_DATA_NOT_PRESENT(0x00) — Reply that No OOB data has been received when pairing. macro: BLE_GAP_OOB_DATA_PRESENT(0x01) — Reply that the OOB data has been received when pairing.
[in]	p_oob	The OOB data received from the remote device.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The reason for this error is as follows. • p_addr is specified as NULL. • oob_data_flag is BLE_GAP_OOB_DATA_PRESENT and p_oob is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	oob_data_flag is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	There is no room to register the OOB data received from a remote device.

◆ R_BLE_GAP_CreateScOobData()

ble_status_t R_BLE_GAP_CreateScOobData (void)

Create data for oob in secure connection.

This function generates the OOB data distributed to a remote device in Secure Connections. The result of this API call is notified in BLE_GAP_EVENT_SC_OOB_CREATE_COMP event.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_STATE(0x0008)	The reason for this error is as follows: • This function was called in pairing. • The task for host stack is not running.
BLE_ERR_ALREADY_IN_PROGRESS(0x000A)	This function was called in creating OOB data.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.

◆ R_BLE_GAP_SetBondInfo()

ble_status_t R_BLE_GAP_SetBondInfo (st_ble_gap_bond_info_t * *p_bond_info*, uint8_t *device_num*, uint8_t * *p_set_num*)

Set the bonding information stored in non-volatile memory to the host stack.

Set the bonding information of the remote device in the host stack. After power re-supply, when the remote device bonding information stored in non-volatile memory is set to host stack, this function is used. Host stack can be set the number specified by the device_num parameter of bonding information.

Parameters

[in]	p_bond_info	An array of bonding information. The number of elements is specified by device_num.
[in]	device_num	The number of the devices of which host stack registers bonding information.
[in]	p_set_num	The number of the devices whose bonding information was registered in host stack.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_bond_info or p_set_num is specified as NULL.
BLE_ERR_INVALID_ARG(0x0003)	device_num is out of range.
BLE_ERR_CONTEXT_FULL(0x000B)	Host stack already has the maximum number of bonding information.

◆ R_BLE_GAP_DeleteBondInfo()

void R_BLE_GAP_DeleteBondInfo (int32_t *local*, int32_t *remote*, st_ble_dev_addr_t * *p_addr*, ble_gap_del_bond_cb_t *gap_del_bond_cb*)

This function deletes the bonding information in Host Stack.
When a function for deleting the bonding information stored in non-volatile area is registered by the gap_del_bond_cb parameter, it is deleted as well as the bonding information in Host Stack.

Parameters

[in]	local	The type of the local bonding information to be deleted. macro: description BLE_GAP_SEC_DEL_LOC_NONE(0x00): Delete no local keys. BLE_GAP_SEC_DEL_LOC_IRK(0x01): Delete local IRK and identity address. BLE_GAP_SEC_DEL_LOC_CSRK(0x02): Delete local CSRK. BLE_GAP_SEC_DEL_LOC_ALL(0x03): Delete all local keys.
[in]	remote	The type of the remote bonding information to be deleted. macro: description BLE_GAP_SEC_DEL_REM_NONE(0x00): Delete no remote device keys. BLE_GAP_SEC_DEL_REM_SA(0x01): Delete the keys specified by the p_addr parameter. BLE_GAP_SEC_DEL_REM_NOT_CONN(0x02): Delete keys of not connected remote devices. BLE_GAP_SEC_DEL_REM_ALL(0x03): Delete all remote device keys.

[in]	p_addr	p_addr is specified as the address of the remote device whose keys are deleted when the rem_info parameter is set to BLE_GAP_SEC_DEL_REM_SA(0x01).
[in]	gap_del_bond_cb	This parameter is a callback function which deletes the bonding information stored in non-volatile area. After deleting the bonding information stored in Host Stack, the callback function is called. If no bonding information is stored in non-volatile area, specify the parameter as NULL.

Return values

none	

◆ R_BLE_GAP_ReplyLtkReq()

ble_status_t R_BLE_GAP_ReplyLtkReq (uint16_t *conn_hdl*, uint16_t *ediv*, uint8_t * *p_peer_rand*, uint8_t *response*)

Reply the LTK request from a remote device.

This function replies to the LTK request in BLE_GAP_EVENT_LTK_REQ event from a remote device. The result of the LTK reply is returned in BLE_GAP_EVENT_LTK_RSP_COMP event. When the link encryption has completed, BLE_GAP_EVENT_ENC_CHG event is notified.

Parameters

[in]	conn_hdl	Connection handle identifying the remote device which sent the LTK request.
[in]	ediv	Ediv notified in BLE_GAP_EVENT_LTK_REQ event.
[in]	p_peer_rand	Rand notified in BLE_GAP_EVENT_LTK_REQ event.
[in]	response	Response to the LTK request. If

		"BLE_GAP_LTK_REQ_ACCEPT " is specified, when no LTK has been exchanged in pairing, reject the LTK request. macro / description: BLE_GAP_LTK_REQ_ACCEPT(0x00) — Reply for the LTK request. BLE_GAP_LTK_REQ_DENY(0x01) — Reject the LTK request.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	p_peer_rand is specified as NULL in case of legacy pairing.
BLE_ERR_INVALID_ARG(0x0003)	response is out of range.
BLE_ERR_INVALID_STATE(0x0008)	The task for host stack is not running.
BLE_ERR_MEM_ALLOC_FAILED(0x000C)	Insufficient memory is needed to generate this function.
BLE_ERR_INVALID_HDL(0x000E)	The remote device specified by conn_hdl is not found.

Function Documentation

◆ R_BLE_GATT_GetMtu()

ble_status_t R_BLE_GATT_GetMtu (uint16_t *conn_hdl*, uint16_t * *p_mtu*)

This function gets the current MTU used in GATT communication.

Both GATT server and GATT Client can use this function.
The result of this API call is returned by a return value.

Parameters

[in]	conn_hdl	Connection handle identifying the GATT Server or the GATT Client.
[in]	p_mtu	The Current MTU. Before MTU exchange, this parameter is 23 bytes. After MTU exchange, this parameter is the negotiated MTU.

Return values

BLE_SUCCESS(0x0000)	Success
BLE_ERR_INVALID_PTR(0x0001)	The mtu parameter is NULL.
BLE_ERR_INVALID_HDL(0x000E)	The GATT Server or the GATT Client specified by conn_hdl was not found.

struct	st_ble_gatts_db_attr_cfg_t A structure that defines the detailed information of the attributes. More...
struct	st_ble_gatts_db_attr_list_t The number of attributes are stored. More...
struct	st_ble_gatts_db_char_cfg_t A structure that defines the detailed information of the characteristics. More...
struct	st_ble_gatts_db_serv_cfg_t A structure that defines the detailed information of the characteristics. More...
struct	st_ble_gatts_db_cfg_t This is the structure of GATT Database that is specified in R_BLE_GATTS_SetDbInst(). More...
struct	st_ble_gatts_evt_data_t st_ble_gatts_evt_data_t is the type of the data notified in a GATT Server Event. More...

Macros

#define	BLE_GATT_DEFAULT_MTU GATT Default MTU.
#define	BLE_GATT_16_BIT_UUID_FORMAT GATT Identification for 16-bit UUID Format.
#define	BLE_GATT_128_BIT_UUID_FORMAT GATT Identification for 128-bit UUID Format.
#define	BLE_GATT_16_BIT_UUID_SIZE

	GATT 16-bit UUID Size.
#define	BLE_GATT_128_BIT_UUID_SIZE GATT 128-bit UUID Size.
#define	BLE_GATT_INVALID_ATTR_HDL_VAL GATT Invalid Attribute Handle Value.
#define	BLE_GATT_ATTR_HDL_START_RANGE GATT Attribute Handle Start Range.
#define	BLE_GATT_ATTR_HDL_END_RANGE GATT Attribute Handle End Range.
#define	BLE_GATTS_CLI_CNFG_NOTIFICATION GATT Client Configuration values. Enable Notification.
#define	BLE_GATTS_CLI_CNFG_INDICATION GATT Client Configuration values. Enable Indication.
#define	BLE_GATTS_CLI_CNFG_DEFAULT GATT Client Configuration values. Default value or disable notification/indication.
#define	BLE_GATTS_SER_CNFG_BROADCAST GATT Server Configuration values. Enable broadcast.
#define	BLE_GATTS_SER_CNFG_DEFAULT GATT Server Configuration values. Default value.
#define	BLE_GATTS_MAX_CB GATT Server Callback Number.
#define	BLE_GATTS_OP_CHAR_VALUE_READ_REQ

	Characteristic Value Local Read Operation.
#define	BLE_GATTS_OP_CHAR_VALUE_WRITE_REQ Characteristic Value Local Write Operation.
#define	BLE_GATTS_OP_CHAR_VALUE_WRITE_WITHOUT_REQ Characteristic Value Local Write Without Response Operation.
#define	BLE_GATTS_OP_CHAR_CLI_CNFG_READ_REQ Characteristic Client Configuration Local Read Operation.
#define	BLE_GATTS_OP_CHAR_CLI_CNFG_WRITE_REQ Characteristic Client Configuration Local Write Operation.
#define	BLE_GATTS_OP_CHAR_SER_CNFG_READ_REQ Characteristic Server Configuration Local Read Operation.
#define	BLE_GATTS_OP_CHAR_SER_CNFG_WRITE_REQ Characteristic Server Configuration Local Write Operation.
#define	BLE_GATTS_OP_CHAR_PEER_READ_REQ Characteristic Value Peer Read Operation.
#define	BLE_GATTS_OP_CHAR_PEER_WRITE_REQ Characteristic Value Peer Write Operation.
#define	BLE_GATTS_OP_CHAR_PEER_WRITE_CMD Characteristic Value Peer Write Command.
#define	BLE_GATTS_OP_CHAR_PEER_CLI_CNFG_READ_REQ Characteristic Client Configuration Peer Read Operation.
#define	BLE_GATTS_OP_CHAR_PEER_CLI_CNFG_WRITE_REQ Characteristic Client Configuration Peer Write Operation.

#define	BLE_GATTS_OP_CHAR_PEER_SER_CNFG_READ_REQ Characteristic Server Configuration Peer Read Operation.
#define	BLE_GATTS_OP_CHAR_PEER_SER_CNFG_WRITE_REQ Characteristic Server Configuration Peer Write Operation.
#define	BLE_GATTS_OP_CHAR_PEER_USR_DESC_READ_REQ Characteristic User Description Peer Read Operation.
#define	BLE_GATTS_OP_CHAR_PEER_USR_DESC_WRITE_REQ Characteristic User Description Peer Write Operation.
#define	BLE_GATTS_OP_CHAR_PEER_HLD_DESC_READ_REQ Characteristic Higher Layer Defined Descriptor Peer Read Operation.
