# 3. Host Interface

This document describes how an external processor system, "External Host", communicates with the DA16200 with SPI and SDIO physical interface protocols. It also includes the AT Command Protocol that can be used with the External Host.

## 3.1 UART Host Interface

## 3.1.1 Pin MUX Configuration

The DA16200 can use two interfaces, UART1 and UART2, and the DA16600 can use only UART2. UART1 can be assigned to GPIOA[1:0], GPIOA[3:2], GPIOA[5:4], or GPIOA[7:6], and UART2 is to GPIOA[11:10] or GPIOC[7:6]. UART1 can use the hardware flow control with GPIOA[5:4] PIN, but there is no available pin for UART2 hardware flow control.

Examples:

- Assign GPIOA[5:4] as UART1 interface. da16x io pinmux(PIN CMUX, CMUX UART1d); //GPIOA 4: UART1 TXD, and GPIOA 5: UART1 RXD
- Assign GPIOC[7:6] as UART2 interface.

\_da16x\_io\_pinmux(PIN\_UMUX, UMUX\_UART2GPIO); //GPIOC\_6: UART2 TXD, GPIOC\_7: UART2 RXD, GPIOC\_8(GPIO)

UART interface	GPIO	Signal name
UART1	GPIOA[0] (Note 1)	TXD
	GPIOA[1]	RXD
	GPIOA[2]	TXD
	GPIOA[3]	RXD
	GPIOA[4]	TXD
	GPIOA[5]	RXD
	GPIOA[6]	TXD
	GPIOA[7]	RXD
UART1 Hardware flow control	GPIOA[4]	RTS
	GPIOA[5]	CTS
UART2	GPIOA[10]	TXD
	GPIOA[11]	RXD
	GPIOC[6]	TXD
	GPIOC[7]	RXD

## Table 1. Pin MUX configuration – UART

**Note 1** See Ref. [3] for more information.

## 3.2 SPI Host Interface

## 3.2.1 Pin MUX Configuration

GPIOA[1:0], GPIOA[3:2], GPIOA[7:6], GPIOA[9:8] and GPIOA[11:10] can be assigned to SPI slave interface in the DA16200.

For example, assign GPIOA[3:2] and GPIOA[9:8] as SPI slave interface.

- \_da16x\_io\_pinmux(PIN\_BMUX, BMUX\_SPIs);
- //GPIOA\_2: CS, GPIOA\_3: CLK
- \_da16x\_io\_pinmux(PIN\_EMUX, EMUX\_SPIs);
- //GPIOA\_8: MISO, GPIOA\_9: MOSI

#### Table 2. Pin MUX configuration – SPI

GPIO	Signal name
GPIOA[0]	MISO
GPIOA[1]	MOSI
GPIOA[2]	CS
GPIOA[3]	CLK
GPIOA[6]	CS
GPIOA[7]	CLK
GPIOA[8]	MISO
GPIOA[9]	MOSI
GPIOA[10]	MISO
GPIOA[11]	MOSI

## 3.2.2 SPI Protocol

#### 3.2.2.1 Message Format

The format of the messages sent/received to/from the external processor is the DA16200 protocol format over SPI physical interface. Message format and parameters included in the DA16200 are outlined in Figure 1.

Address	CMD	Length	Data
4 bytes	1 byte	3 bytes	N bytes(4 Bytes Aligned)
Header			Payload

Figure 1. Basic format – SPI

#### 3.2.2.1.1 Address

Table 3 shows the address list used by External Host.

#### Table 3. SPI address list

Address type	Address
General Command (Write request)	0x50080254
AT Command	0x50080260
Response Command	0x50080258
Buffer Address	Received from slave in response message.

#### 3.2.2.1.2 CMD

The format of CMD fields is outlined in Table 4.

#### Table 4. SPI CMD format

Bit	Field	Description
7	Auto_Inc	<ol> <li>1: Internal address auto-increment.</li> <li>0: Address fixed (Not used).</li> </ol>
6	Read/Write	1: Read 0: Write
5:2		Not Used.
1:0	CHIP_ID[1:0]	00: CHIP #0 (Default).

#### 3.2.2.1.3 Length

Payload length of the data field.

#### 3.2.2.2 Write Sequence

Host to Slave write operations are performed in three SPI transactions as shown in Figure 2.

Figure 3. Write operation structure

- 1. The Host sends a WRITE\_REQ command (0x80, red rectangle in Figure 3) to the General Command address (0x50080254) (yellow rectangle in Figure 3).
- 2. The Host should wait for GPIO interrupt line is High from slave.
- 3. The Host reads the Write Response message by Response Command address (0x50080258, blue rectangle in Figure 3) and parse it using struct \_st\_host\_response (see Section 3.2.2).
- 4. The Host sends data to address (BUFF\_ADDR) which is received from the Slave in the Write Response message (green rectangle in Figure 3).

#### NOTE

Buffer Length field contains the length of Data field, and it should be a multiple of 4. The padding field contains a number of padded bytes in the Data field because of the 4-byte aligned. For example, if the length of the actual data is 11 bytes, the Buffer Length is 12 (multiples of 4) and Padding field is 1.

Buffer Length (12) = Actual data length (11) + number of padded bytes (1)

The Host can get the length of actual data using Buffer Length and Padding fields.

In addition, the usage of Padding field is applied to the SDK v3.2.8.0 or later.

An interval of several hundred microseconds is required between the "3" and "4" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval depends on the type of application or CPU load. Roughly, when the CPU clock is 120 MHz, an interval of around 300  $\mu$ s is required.

#### Example

When the host wants to write 8-byte data (0x8877665544332211) to the DA16200:

- 1. The Host sends (0x50-0x08-0x02-0x54)-(0x80)-(0x00-0x00-0x04)-(0x08-0x00-0x80-0x00).
- 2. The Host waits until GPIO interrupt line is high from the DA16200.
- The Host sends (0x50-0x08-0x02-0x58)-(0xC0)-(0x00-0x00-0x08), then reads responses from the DA16200. Assume the buffer address from Slave is 0x12345678 for easy description. Then, the read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x81-0x00.
- 4. The Host sends (0x12-0x34-0x56-0x78)-(0x80)-(0x00-0x00-0x08)-(0x11-0x22-0x33-0x44-0x55-0x66-0x77-0x88).

#### NOTE

The payload data is transmitted MSB first and little-big endian system (see Figure 10).

#### 3.2.2.3 Read Sequence and Structure

Figure 4 shows a Slave device transmitting data to the Host when payload is available. This sequence is performed in two SPI transactions.

#### Figure 5. Read operation structure

- 1. The Slave toggles the interrupt line to go High to inform Host when it wants to send data to Host.
- 2. The Host reads the response message from Response Command address (0x50080258, blue rectangle in Figure 5) and parses it using struct \_st\_host\_response (see Section 3.2.6).
- 3. The Host reads data from address (BUFF\_ADDR) which is received from Slave in the response message (green rectangle in Figure 5).

#### NOTE

Buffer Length field contains the length of Data field, and it should be a multiple of 4. The padding field contains a number of padded bytes in the Data field because of the 4-byte aligned. For example, if the length of the actual data is 11 bytes, the Buffer Length is 12 (multiples of 4) and Padding field is 1.

Buffer Length (12) = Actual data length (11) + number of padded bytes (1)

The Host can get the length of actual data using Buffer Length and Padding fields. In addition, the usage of Padding field is applied to the SDK v3.2.8.0 or later.

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the Host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "2" and "3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. Roughly, when the CPU clock is 120 MHz, an interval of around 300 µs is required.

#### Example

1. When the Host becomes high on GPIO interrupt line from the DA16200, the Host sends:

(0x50-0x08-0x02-0x58)-(0xC0)-(0x00-0x00-0x08), then reads response from the DA16200.

Assume the buffer address from Slave is 0x12345678 for easy description and the data length to be sent from the DA16200 is 8 bytes.

2. The read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x83-0x00.

The Host sends (0x12-0x34-0x56-0x78)-(0xC0)-(0x00-0x00-0x08), then reads data from the DA16200.

The read data is transmitted MSB first and little-big endian system (see Figure 11).

### 3.2.3 AT Command – Sequences and Structures

AT commands are instructions used to control a modem. AT is the abbreviation of Attention. Every command line starts with **AT** or **at**. Start AT is the prefix that informs the modem about the start of a command line. It is not part of the AT command name.

Figure 6 shows how to use the AT Command through SPI on the DA16200. This is because AT command uses a predetermined address, and the maximum size of data is defined.

Al	Writ	te Request						
	SPI MOSI	ATCMD_ADDR (4bytes)	CMD (1byte)	Length (3bytes)	AT Command ( 4bytes alligned)			
A3 B2	Read	Response						
	SPI MOSI	RESP_ADDR (4bytes)	CMD (1byte)	Length (3bytes)				
	SPI MISO				Buffer Address (4bytes)	Buffer Length (2bytes)	Response (1byte)	Padding (1byte)
A4 B3	A4 B3 Read Data							
	SPI MOSI	BUFF_ADDR (4bytes)	CMD (1byte)	Length (3bytes)				
	SPI MISO					Data ( 4bytes alligr	ned)	

Figure 7. AT command structure

A1: The Host sends an AT command to AT Command address.

A2: The Host waits for GPIO interrupt line to go high.

A3: The Host reads the response message from address and parses it using struct \_st\_host\_response.

A4: The Host reads OK/Error, or data from address (BUF\_ADDR), depending on the command type.

#### Example

To write AT+VER command to the DA16200, the host sends:

(0x50-0x08-0x02-0x60)-(0x80)-(0x00-0x00-0x08)-('A'-'T'-'+'-'V'-'E'-'R'-0x00-0x00)

The read sequence after writing is the same as the following examples of B1~B3.

#### NOTE

The payload data is transmitted MSB first and little-big endian system (see Figure 10).

B1: The Slave toggles the interrupt line to go High to inform Host when it wants to send data to Host.

**B2**: The Host reads the response message from Response Command address and parses it using struct \_st\_host\_response.

B3: The Host reads data from address (BUF\_ADDR) parsed from the response message.

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the Host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "A3" and "A4" stages, "B2" and "B3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. Roughly, when the CPU clock is 120 MHz, an interval of around 300 µs is required.

#### Example

When the host becomes high on GPIO interrupt line from the DA16200, the host sends:

(0x50-0x08-0x02-0x58)-(0xC0)-(0x00-0x00-0x08), then read response from the DA16200.

Assume the buffer address from Slave is 0x12345678 for easy description and the data length to be sent from the DA16200 is 8 bytes.

The read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x83-0x00.

The Host sends: (0x12-0x34-0x56-0x78)-(0xC0)-(0x00-0x00-0x08), then read data from the DA16200.

#### NOTE

The read data is transmitted MSB first and little-big endian system (see Figure 11).

## 3.2.4 ESC Command – Sequences and Structures

Figure 8 shows how to use the ESC Command through SPI on the DA16200. This is because ESC command uses a predetermined address, and the maximum size of data is defined.

- A1: The Host sends an ESC command to the AT command address.
- A2: The Host waits for GPIO interrupt line to go high.

**A3**: The Host reads the response message from address and parses it using struct \_st\_host\_response. The result for esc command is sent to the host as the response field of struct \_st\_host\_response. The response field is a 1-byte decimal value. The value of 0x20 is a result of OK. All other values are ERROR. And in this case, the value of the buf\_address field is read as 0xffffffff, and the value of the host\_length field is read as 0x0. Therefore, the subsequent Read Sequence is not required.

#### Example

To write <ESC>S010,192.168.0.18,43310,abcde12345 command to the DA16200, the host sends:

(0x50-0x08-0x02-0x60)-(0x80)-(0x00-0x00-0x24)-(<ESC>-'S'-'0'-'1'-'0'-','-'1'-'9'-'2'-'.'-'1'-'6'-'8'-'.'-'0'-'.'-'1'-'8'-','-'4'-'3'-'3'-'1'-'0'-','-'a'-'b'-'c'-'d'-'e'-'1'-'2'-'3'-'4'-'5'-0x00)

The read sequence after writing is the same as the following examples of B1~B2.

The payload data is transmitted MSB first and little-big endian system (see Figure 10).

B1: The Slave toggles the interrupt line to go High to inform Host when it wants to send data to Host.

**B2**: The Host reads the response message from Response Command address and parses it using struct \_st\_host\_response.

**B3**: The Host reads data from address (BUF\_ADDR) parsed from the response message.

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the Host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "B2" and "B3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. When the CPU clock is 120 MHz, an interval of around 300 µs is required.

#### Example

When the Host becomes high on GPIO interrupt line from the DA16200, the Host sends:

(0x50-0x08-0x02-0x58)-(0xC0)-(0x00-0x00-0x08), then read response from the DA16200.

Assume the buffer address from Slave is 0x12345678 for easy description and the data length to be sent from the DA16200 is 8 bytes.

The read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x83-0x00.

The Host sends (0x12-0x34-0x56-0x78)-(0xC0)-(0x00-0x00-0x08), then reads data from the DA16200.

NOTE
The read data is transmitted MSB first and little-big endian system (see Figure 11).

### 3.2.5 Header Format

#### 3.2.5.1 Write Request (Host to Slave)

Figure 10. SPI signals for write request

#### 3.2.5.2 Read Response (Slave to Host)

Figure 11. SPI signals for read response

## 3.2.6 SPI Definition and Structure

#### 3.2.6.1 SPI Definition

#define HOST_MEM_WRITE_		
#define HOST_MEM_WRITE_	RES (0x81)	
#define HOST_MEM_READ_H	REQ (0x8	32)
#define HOST_MEM_READ_H	RES (0x8	33)

#define FC9K_RESP_ADDR	(0x50080258)	) //Address to Read Response
#define FC9K_ATCMD_ADDE	₹ (0x50080260)	) //Address to Send AT Command
	(020000200)	

#### 3.2.6.2 SPI Response Structure

```
typedef struct _st_host_response
{
    u32 buf_address;
    u16 host_length;
    u8 resp;
    u8 durmy;
} st_host_response;
```

#### 3.2.6.3 SPI Request Structure

```
typedef struct _st_host_request {
    ul6 host_write_length;
    u8 host_cmd;
    u8 dummy;
} st_host_request;
```

## 3.3 SDIO Host Interface

## 3.3.1 Pin MUX Configuration

SDIO slave is assigned to GPIOA[9:4] in the DA16200. For interruption, the D1 port of SDIO can be used, but in some cases, GPIO can also be used.

The following pin MUX initialization codes are used for SDIO interface.

_dal6x_io_pinmux(PIN_CMUX,	CMUX_SDs);	//GPIOA_4 : CMD, GIPOA_5 : CLK
_dal6x_io_pinmux(PIN_DMUX,	DMUX_SDs);	//GPIOA_6 : D3, GPIOA_7 : D2
_dal6x_io_pinmux(PIN_EMUX,	EMUX_SDs);	//GPIOA_8 : D1, GPIOA_9 : D0

If GPIO is used as interruption instead of SDIO D1, the following PAD MUX Setting is additionally required.

dal6x io pinmux(PIN FMUX,	FMUX GPIO);	//GPIOA 10 : GPIO, GPIOA 11 : GPIO	

#### Table 5. Pin MUX configuration – SDIO

GPIO	Signal name
GPIOA[4]	CMD
GPIOA[5]	CLK
GPIOA[6]	D3
GPIOA[7]	D2
GPIOA[8]	D1
GPIOA[9]	D0

### 3.3.2 SDIO Protocol

#### 3.3.2.1 Message Format

The format of the messages sent/received to/from the external processor is the DA16200 protocol format over SDIOI physical interface. The format and the parameters included are outlined in Figure 12. For more information about SDIO header configuration, see its official SDIO specification. When using SDIO protocol of the DA16200, data should be aligned in units of 4-byte length.

#### Basic Format

SDIO Header	Data N bytes(4 Bytes Aligned)				
Header	Payload				

#### Figure 12. Basic format – SDIO

#### 3.3.2.1.1 Address (Included in Header)

Table 6 shows the address list used by External Host.

#### Table 6. Address list

Address type	Address			
General Command (Write request)	0x50080254			
AT Command	Received from slave in initial stage			
Response Command	0x50080258			
Buffer Address	Received from slave in response message			

#### 3.3.2.1.2 Length (Included in header)

Payload length to follow.

#### 3.3.2.1.3 Interrupt

According to SDIO Specification, Slave can cause Interrupt to Host by using D1 port. However, if the host cannot receive an interrupt using the D1 port, it must use the GPIO to generate the interrupt. The interrupt line used in the sequence diagram of this document means that the D1 port or GPIO is used.

#### 3.3.2.2 Write Sequence

Host to Slave write operations are performed in three SDIO transactions.

v	Vrite Seque	nce							
5			Clock	3	CI	ock	4	Cloc	k
S	DIO Data		WRITE_REQ"		"W	RITE_RES"		DATA (He	ader included)
1	nterrupt _			2 2: Figure 13.		igger interru equence	ipt when it?	s ready.	
1	Write R	<b>equest</b> SDIO Header		Data Length 2 bytes	CM 1 by				Filled @ Host Side, HW Decoded Filled @ Host Side Filled @ Slave Side
3	Write Re	sponse							
		SDIO Header		Buffer Address (4bytes		Buffer Length (2bytes)	Response (1byte)	Padding (1byte)	
4	Write	Data							
		SDIO Header				Data			
				Ciauro 4	4 04-				

#### Figure 14. Structure

- 1. The Host sends a WRITE\_REQ command (0x80, red rectangle in Figure 3) to the General Command address (0x50080254).
- 2. The Host should wait for Interrupt from slave.
- 3. The Host reads the Write Response Message by Response Command address (0x50080258) and parse it using struct \_st\_host\_response (see Section 3.2.6).
- 4. The Host sends data to address (BUFF\_ADDR) which is received from the Slave in the Write Response message (green rectangle in Figure 14).

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "3" and "4" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. Roughly, when the CPU clock is 120 MHz, an interval of around 300 µs is required.

#### Example

When the host wants to write 8-byte data (0x88776655,0x44332211) to the DA16200:

- The Host sends (SDIO Write-0x50080254, 4 bytes) (0x08-0x00-0x80-0x00).
- The Host waits for interrupt triggering from the DA16200.
- The Host sends:
  - (SDIO Read-0x50080258, 8 bytes), and then read response from the DA16200.
  - Assume the buffer address from Slave is 0x12345678 for easy description.
  - Then, the read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x81-0x00.

The Host sends (SDIO Write-0x12345678, 8 bytes)-(0x55-0x66-0x77-0x88-0x11-0x22-0x33-0x44).

#### 3.3.2.3 Read Sequence and Structure

Figure 15 shows a Slave device transmitting data to the Host when payload is available. This sequence is performed in two SDIO transactions.

Read	d Sequence		*	Trigger Interrup Data to Se		Device prepared
SDIO		Clock	Clo	ck		
SDIO D		"READ_RES"		ader included)		
Interru	ipt		errupt if it wants to sen e 15. Read sequence	d data to hos	t.	
2	Read Resp	onse				
	SDI	0 Header	Buffer Address to Read (4bytes)	Buffer Length (2bytes)	Response (1byte)	Padding (1byte)
3	Read Da	ta				
	SDI	0 Header		Data		
		Fi	gure 16. Structure			

- 1. The Slave triggers interrupts to inform the Host when data is available.
- 2. The Host reads the response message from Response Command address (0x50080258, blue rectangle in Figure 16), and parse it using struct \_st\_host\_response (see Section 3.2.6).
- 3. The Host reads data from address (BUFF\_ADDR) which is received from Slave in the response message (green rectangle in Figure 16).

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "2" and "3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. Roughly, when the CPU clock is 120 MHz, an interval of around 300 µs is required.

#### Example

When the host received an interrupt from the DA16200,

- Host sends:
  - (SDIO Read-0x50080258, 8 bytes) and then read response from the DA16200.
  - Assume the buffer address from Slave is 0x12345678 for easy description and the data length to be sent from the DA16200 is 8 bytes. The read data should be 0x78-0x56-0x34-0x12-0x08-0x00-0x83-0x00.
- Host sends (SDIO Read-0x12345678, 8 bytes) then reads data from the DA16200.

### 3.3.3 AT Command – Sequences and Structures

AT commands are instructions used to control a modem. AT is the abbreviation of Attention. Every command line starts with **AT** or **at**. The starting AT is the prefix that informs the modem about the start of a command line. It is not part of the AT command name.

To use AT commands, read the address of AT (ESC) Command Buffer in the initial stage. Therefore, read the value of address 0x50080264 after SDIO is initialized, and write the command to that address when sending AT command afterwards.

Figure 17 illustrates how to use the AT command through SDIO in the DA16200. This is because AT command uses a predetermined address, and the maximum size of data is defined.

Figure 18. Structure

Descriptions of Figure 17 and Figure 18 are as follows.

A1: The Host sends an AT or ESC command to AT Command address.

- **A2**: The Host waits for interrupt trigger.
- A3: The Host reads the response message from address and parses it using:

struct \_st\_host\_response.

- A4: The Host reads OK, Error or data from address (BUF\_ADDR), depending on the type of command.
- B1: The Slave toggles the interrupt line to go High to inform Host when it wants to send data to Host.
- **B2**: The Host reads the response message from Response command address and parses it using: struct \_st\_host\_response.
- B3: The Host reads data from address (BUF\_ADDR) parsed from the response message.

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "A3" and "A4" stages, "B2" and "B3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. When the CPU clock is 120 MHz, an interval of around 300 µs is required.

## 3.3.4 ESC Command – Sequences and Structures

To use ESC commands, read the address of AT (ESC) command Buffer in the initial stage. Therefore, read the value of address 0x50080264 after SDIO is initialized, and write the command to that address when sending AT command afterwards.

Descriptions of Figure 19 and Figure 20 are as follows.

- A1: The Host sends an ESC command to AT (ESC) Command address.
- A2: The Host waits for interrupt trigger.
- A3: The Host reads the response message from address and parses it using:

struct \_st\_host\_response.

The result for ESC command is sent to the host in the response field of struct \_st\_host\_response. The response field is a 1-byte decimal value. The value of 0x20 is a result of OK. All other values are an ERROR. And in this case, the value of the buf\_address field is read as 0xffffffff, and the value of the host\_length field is read as 0x0. Therefore, the subsequent Read Sequence is not required.

B1: The Slave toggles the interrupt line to go High to inform Host when it wants to send data to Host.

B2: The Host reads the response message from Response Command address and parses it using:

struct \_st\_host\_response.

B3: The Host reads data from address (BUF\_ADDR) parsed from the response message.

There is a 200 ms timeout between reading the response after the interrupt occurs and reading the data after reading the response. If the host requires more than 200 ms between each interval, change the timeout value accordingly.

An interval of several hundred microseconds is required between the "B2" and "B3" stages. If the interval between the two stages is too short, there is a possibility that two Interrupt Events are recognized as one. The interval differs depending on the type of application or CPU load. When the CPU clock is 120 MHz, an interval of around 300 µs is required.

## 3.3.5 SDIO Definition and Structures for Implementation

### 3.3.5.1 SDIO Definition

(0x80)
(0x81)
(0x82)
(0x83)
(0x50080254) //Address to Write Command
(0x50080258) //Address to Read Response

#### 3.3.5.2 SDIO Response Structure

```
typedef struct _st_host_response
{
    u32 buf_address;
    u16 host_length;
    u8 resp;
    u8 dummy;
} st_host_response;
```

#### 3.3.5.3 SDIO Request Structure

```
typedef struct _st_host_request
{
    u16 host_write_length;
    u8 host_cmd;
    u8 dummy;
} st_host_request;
```

# 4. AT Commands

## 4.1 Overview

Configuration and control of the DA16200/DA16600 are provided through an ASCII based command string called "AT Command". AT command is a standard that was originally defined by Hayes Microcomputer for controlling smart modems and is widely used in many products.

AT is an abbreviation of "Attention", which means to take note of or fix one's sight upon something. An example of an AT command is "ATZ" which instructs a modem to become initialized and return to a state with no command input. An AT command has a very simple structure consisting of a prefix "AT" concatenated with a command string. This is a very convenient method for sending a series of commands over a serial interface such as UART. Commands may consist of capital letters, lowercase letters, spaces, and some special characters.

## 4.2 Add AT Command Feature in SDK

This section describes how to include AT command feature in SDK. In SDK, open the file ~/SDK/apps/da16x00/get\_started/include/user\_main/config\_generic\_sdk.h using the editor tool and search the string #undef \_\_SUPPORT\_ATCMD\_\_.

To enable AT command feature in SDK, change #undef to #define and save the file. Rebuild the SDK package, and then, newly generated image works as AT command module.

```
//------
//AT Command Features
//------
//
    //Enable/Disable AT command module
    //
    //Enable/Disable AT command module
    //
    //When enabling this feature, more detailed sub-features are supported.
    //User can check all AT commands in ~/core/system/src/at_cmd/atcmd.c.
    //
    #undef __SUPPORT_ATCMD_
```

For AT command module, the default interface type is UART1 as shown in the following example. If you want to use UART2, change <code>#undef ATCMD IF UART2 to #define ATCMD IF UART2</code>.

#if defined ( \_\_SUPPORT\_ATCMD\_\_ )
//
//Default interface of DA16200 EVK is UART1.
//User can change a type of host-interface among four types listed below.
//
#define \_\_ATCMD\_IF\_UART1\_\_\_\_\_\_\_\_\_\_\_\_//AT command over UART1
#undef \_\_ATCMD\_IF\_UART2\_\_\_\_\_\_\_\_//AT command over UART2
#undef \_\_ATCMD\_IF\_SPI\_\_\_\_\_\_\_\_//AT command over SPI
#undef \_\_ATCMD\_IF\_SDIO\_\_\_\_\_\_//AT command over SDIO

## 4.2.1 Execute AT Commands on SPI

AT command is configured to use the UART1 interface by default and can be configured to use the SPI interface. To enable the AT commands over SPI interface, modify config\_generic\_sdk.h:

```
...
// AT command service
#define _SUPPORT_ATCMD_
...
#if defined ( _SUPPORT_ATCMD_ )
#undef _ATCMD_IF_UART1______// AT command over UART1
#undef _ATCMD_IF_UART2______// AT command over UART2
...
#undef _USER_UART_CONFIG____// Support Customer's UART configuration
#define_ATCMD_IF_SPI_____// AT command over SPI
```

To configure and use the AT commands over SPI interface, see Section 3.2.

## 4.2.2 Execute AT Commands on SDIO

The AT command can also be configured to use the SDIO interface. To enable the AT commands over SDIO interface, modify config\_generic\_sdk.h:

To configure the AT commands over SDIO interface, see Section 3.3.

#### 4.2.2.1 Example Sequence for SDIO Interface

An example of the sequence used to initiate a command through the SDIO interface is shown in Figure 21.

#### Figure 21. Example sequence to initiate AT command through SDIO interface

When using the SDIO interface, both the DA16200 and the SDIO master devices must be initialized before initiating an AT command. The SDIO master device must send **AT+HOSTINITDONE** immediately after initialization is completed.

#### NOTE

For details on how to use the SDK package, see Ref. [2].

## 4.3 AT Command Format

## 4.3.1 Basic Command

#### 4.3.1.1 Set Command

The set command sets parameters or execute commands.

- Command format: ATXX
  - Example command: ATZ
  - Example response: OK

#### 4.3.1.2 Get Command

The get command queries parameters or get status of the commands.

- Command format: ATXX=?
  - Example command: ATQ=?
  - Example response: OK

## 4.3.2 Extended Command

#### 4.3.2.1 Set Command

The set command sets parameters or execute commands with additional parameters.

- Command format: AT+XXX=<param1>,<param2>,<param3>,<param4>...<paramN>
  - Example command: AT+NWIP=0,172.16.0.100,255.255.255.0,172.16.0.1
  - Example response: OK

If the SSID contains a comma or single quote, the SSID must be enclosed in single quotes.

#### For example:

```
SSID = MY,SSID'CS
sec = 4
idx = 2
Password = N12345678
```

#### Is encoded as:

OK

```
AT+WFJAP='MY,SSID'CS',4,2,N12345678'
```

#### NOTE

It is prohibited to use a single quote followed by a comma in a parameter. For example, AT+WFJAP='MY,SSID',CS',4,2,N12345678 is invalid.

#### 4.3.2.2 Get Command

The get command queries parameters or get status of the commands with additional parameters.

- Command format: AT+XXX=?
  - Example command: AT+NWIP=?
  - Example response: +ANIP:172.16.0.17,255.255.255.0,172.16.0.1

OK

#### NOTE

Not all commands support the AT+XXX=? query functions such as AT+RESTART and ATF. Check the command table for the valid operation of each command.

### 4.3.3 Response

#### 4.3.3.1 Start-up Response

This code is received when the DA16200/DA16600 is rebooted.

<CR><LF>+INIT:DONE,<mode><CR><LF>

The AT command responses when the DA16200/DA16600 wakes up from DPM LPM.

### 4.3.3.2 Basic Response

Basic response gives the command result and is accompanied by a carriage return and a line feed. <<cr><LF>+INIT:WAKEUP,<type><<CR><LF></cr>

#### 4.3.3.3 Normal Response

This code is received for normal operations.

<CR><LF>OK<CR><LF>

#### 4.3.3.4 Error Response

This code is received when an operation fails for some reason.

<CR><LF>ERROR:<error code><CR><LF>

#### 4.3.3.5 Extended Response

Extended response gives the command setting values and is followed by a basic response.

<CR><LF>+XXX:[value1],[value2],... <CR><LF>OK<CR><LF>

#### NOTE

When an MCU (AT Command Host) waits for a response of a command (for those commands that give extended response as well) to take the next action, it should wait for both normal response (**OK** or **ERROR**) and extended response (also known as **Operation Result**).

Error response codes: See Appendix I.

#### NOTE

There are major changes in Error response code in SDK v3.2.5.0 and later versions. The examples in this document were updated based on the changes.

# 5. AT Command Sets

## 5.1 Basic Function Commands

	<ul> <li>The configuration is stored in NVRAM.</li> <li>The <sec> parameter must be a multiple of 60 seconds. If the value for <sec> is not a multiple of</sec></sec></li> </ul>		
	60 seconds, then the rer		
AT+DEFAP	(none)	All profiles in NVRAM are removed and set up in Soft AP mode with the default configuration. To initialize the Soft AP interface, the system	
		reboots automatically.	
		Response: OK or ERROR (reboot)	

Parameter	Description	Conditions	
	Example		
	AT+DEFAP		
	OK		
	+INIT:DONE,1		
	Note:		
	Enabled by default in the	SDK.	
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	Default configuration:		
	<ul> <li>SSID: DA16200/DA16600_XXXXXX (for example, 9FFCF3: the last three hexadecimal values of the board's MAC address)</li> </ul>		
	Authentication: WPA2	/CCMP	
	• IP address: 10.0.0.1		
	• Netmask: 255.255.255	5.0	
	• Gateway: 10.0.0.1		
	• PSK: 12345678		
	DHCP server started		
	• DHCP range: 10.0.0	0.2 ~ 10.0.0.11	
	<ul> <li>DHCP DNS: 8.8.8.8</li> </ul>		
	<ul> <li>To query the configura</li> </ul>	tion status, AT+WFSAP and/or AT+NWDHR can be used.	
AT+DEFCCRNT	(none)	All profiles in NVRAM are removed and set up Concurrent mode:	
		Soft AP + STA with the default configuration. To initialize the Concurrent interfaces, the system reboots automatically.	
		Response: OK or ERROR (reboot)	
	Example		
	AT+ DEFCCRNT		
		24G,4,2,12345678	
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	<ul> <li>AT+ DEFCCRNT sets AT+DEFAP, AT+WFMODE=2, and AT+RESTART.</li> </ul>		
		and connect the STA, "AT+WFJAP" should be used.	
AT+BIDX	<idx></idx>	Set Boot index.	
		<id>&gt;: Boot index (0 or 1)</id>	
		Response: OK or ERROR	
	?	Get the current Boot index.	
		Response: +BIDX:<0 1>	
	AT+BIDX=?		
	+BIDX:0		
	OK		
	AT+BIDX=1		
	OK		
	ОК		
	OK AT+BIDX=?		

Parameter	Description	Conditions		
	Note:			
	Enabled by default in t	the SDK.		
	<ul> <li>System restart is required for changes to take effect. "AT+RESTART" command can be used to restart the system.</li> </ul>			
AT+DPM	<dpm> [,<nvm_only>]</nvm_only></dpm>	Set DPM on/off. System restart is required for DPM mode (On/Off) to take effect.		
		<dpm>: 0 (Off), 1 (On)</dpm>		
		<nvm_only>:</nvm_only>		
		1 (write DPM mode to NVRAM only, and not reboot)		
		0 or not specified (change DPM mode and reboot)		
		Response: OK or ERROR		
	?	Get the current DPM setting.		
		Response: +DPM:<0 1>		
	Prerequisite			
	Station mode			
	Example			
	AT+DPM=?			
	+DPM:0			
	ОК			
	AT+DPM=1 OK	//DPM enabled, and system reboots automatically		
	+INIT:DONE,0			
	AT+DPM=1,1 OK	//DPM enabled without system reboots		
	AT+DPM=?			
	+DPM:1			
	ОК			
	Note:			
	Enabled by default in the SDK.			
	DPM configuration is stored in NVRAM.			
	<ul> <li>The DA16200/DA16600 is restarted if the "<nvram_only>" parameter is zero or not specified and AT command response is OK.</nvram_only></li> </ul>			
	<ul> <li>+INIT:DONE,0 message is sent when the DA16200/DA16600 boots up.</li> </ul>			
	<ul> <li>If the usage of the AT command is not valid, then the DA16200/DA16600 sends an ERROR message without restarting.</li> </ul>			
	If the "nvram_only" parameter is "1", then restart the system manually using "AT+RESTART".			
	<ul> <li>When the DA16200/DA16600 reboots, the DA16200/DA16600 tries to connect to the AP if the Wi- Fi connection information is available in the NVRAM.</li> </ul>			
	<ul> <li>+WFJAP:0,<reason> or +WFJAP:1,'<ssid>',<ip address=""> as result of Wi-Fi connection.</ip></ssid></reason></li> </ul>			
	<ul> <li>If Wi-Fi connection fails during boot-up because of unexpected conditions (for example, AP is offline, temporary communication issue with AP, and wrong password is stored), +WFJAP:x may not be sent immediately and takes some time, in which case, wait until +WFJAP:x is received. When a timeout occurs, depending on the application use case, either cancel the connection attempt (AT+WFQAP) or retry the connection with the right info (AT+WFJAP/AT+WFJAPA).</li> </ul>			

Parameter	Description	Conditions		
	<ul> <li>If MQTT is configured, the DA16200/DA16600 tries to connect to the MQTT broker after a Wi-Fi connection is established. The Operation Result – +NWMQCL:0, +NWMQCL:1 or +NWMQCL:2 – is sent as a result.</li> </ul>			
	<ul> <li>The DA16200/DA16600 operates DPM if it is set to 1 (TRUE).</li> </ul>			
	<ul> <li>If Wi-Fi connection is connection retry state.</li> </ul>	NOT established in DPM mode, the DA16200/DA16600 enters the DPM		
	DPM connection retry	process:		
	<ul> <li>While the DA16200/DA16600 operates in DPM mode, the DA16200/DA16600 executes the process for making connection reestablished if the DA16200/DA16600 is in a "disconnected state with the specified AP for some reason. See Ref. [6] for more details.</li> <li>If the Wi-Fi connection is established but MQTT connection is NOT established (if MQTT is enabled), the DA16200/DA16600 tries to connect to the MQTT broker several times and e DPM LPM based on MQTT's abnormal DPM operation.</li> </ul>			
AT+DPMKA	<period></period>	Set DPM keepalive period.		
		<period>: Keepalive period (millisecond, 0 ~ 600000)</period>		
		Response: OK or ERROR		
	?	Get DPM keepalive period.		
	(none)	Response: +DPMKA= <millisecond></millisecond>		
	Example			
	AT+DPMKA			
	+DPMKA:30000			
	OK			
	AT+DPMKA=500	0		
	ОК			
	AT+DPMKA=?			
	+DPMKA:5000			
	OK			
	Note:			
	Enabled by default in the	e SDK.		
	The configuration is stor	ed in NVRAM.		
	<ul> <li>System restart is require</li> </ul>	d for changes to take effect.		
AT+DPMTIMWU	<count></count>	Set DPM TIM wake-up count.		
		<count>: TIM wake-up count (1 ~ 6000)</count>		
		Response: OK or ERROR		
	?	Get DPM TIM wake-up count.		
	(none)	Response: +DPMTIMWU= <count></count>		
	Example			
	AT+DPMTIMWU			
	+DPMTIMWU:10			
	OK			
	AT+DPMTIMWU=20			
	ОК			
	AT+DPMTIMWU=	=?		
	+DPMTIMWU:20			

Parameter	Description	Conditions		
	ОК			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>			
	System restart is require	d for changes to take effect.		
AT+DPMUSERW	<time></time>	Set DPM user wake-up time.		
U		<time>: User wake-up period (millisecond, 0 ~ 86400000)</time>		
		Response: OK or ERROR		
	?	Get DPM user wake-up time.		
	(none)	Response: +DPMUSERWU= <millisecond></millisecond>		
	Example			
	AT+DPMUSERW	'U		
	+DPMUSERWU:0			
	ОК			
	AT+DPMUSERW	'U=300		
	ОК			
	AT+DPMUSERWU=?			
	+DPMUSERWU:300			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> <li>The configuration is stored in NV/RAM</li> </ul>			
	<ul><li>The configuration is stored in NVRAM.</li><li>System restart is required for changes to take effect.</li></ul>			
AT+CLRDPMSLP	(none)	Set the user application not to enter DPM LPM.		
EXT		Response: OK or ERROR		
	Proroquisito			
	Prerequisite DPM enabled			
	Example			
	AT+CLRDPMSLPEXT			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	A host should execute this command within 200 ms after waking up the DA16200/DA16600			
	through the external wake-up pin, otherwise, the DA16200/DA16600 goes into DPM LPM.			
AT+SETDPMSLP	(none)	Set the user application ready to enter DPM LPM.		
EXT		Response: OK or ERROR		
	Prerequisite			
	DPM enabled			
	Example			
	AT+SETDPMSLPEXT			
	ОК			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>If the DA16200/DA16600 is woken up by an external wake-up signal and the "AT+CLRDPMSLPEXT" command is executed, this command should be issued when every job is</li> </ul>			

Parameter	Description	Conditions	
	done. If this command is not run after the job is done, the DA16200/DA16600 does not enter DPI LPM.		
	When joining AP is in progress, this command should be issued after getting "+WFJAP" response.		
AT+GETFASTCO NN	(none)	Get the Wi-Fi Fast-reconnection mode status value.	
		Response: +GETFASTCONN:<0 1>	
	Example		
	AT+GETFASTCONN		
	+GETFASTCONN:0 OK		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	<ul> <li>See Appendix G for "Wi-Fi Fast-reconnect" for the DA16200/DA16600.</li> </ul>		
AT+SETFASTCO NN	<flag></flag>	Enable/Disable the Wi-Fi Fast-reconnection mode.	
		<pre><mode>: 0 (Disable), 1 (Enable)</mode></pre>	
		Response: OK or ERROR	
	Example		
	AT+SETFASTCONN=1		
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	<ul> <li>The configuration is removed/stored from/in NVRAM.</li> </ul>		
	See Appendix G for "Wi-Fi Fast-reconnect" for the DA16200/DA16600.		
AT+MCUWUDON E	(none)	Notify that the MCU wakes up completely. When this command is	
		received, the DA16200/DA16600 starts to send messages to the MCU (that is, MCU should send this command immediately after executing	
		"External wake-up").	
		Response: OK or ERROR	
	Example		
	AT+MCUWUDONE		
	ОК		
	Note:		
	Enabled by default in the SDK.		
	• When the DA16200/DA16600 receives the command, it starts to send messages to the MCU.		
	<ul> <li>MCU should send this command immediately when it receives a notification like "+INIT:WAKEUP,UC".</li> </ul>		
	If the "DPM_TEST_WITHOUT_MCU" is defined, then MCU does not need to send this command which means it is assumed that MCU is always ready to read a message(response) from the DA16200/DA16600.		
AT+HOSTINITDO NE	(none)	Notify the DA16200 that the MCU has completed initialization (For SDIO interface, the MCU must send this command immediately after	
		initialization.). The DA16200 returns its initialization status as a	
		response. See Table 8.	
		Response: +INIT:DONE, <mode></mode>	
		or +INIT:WAKEUP, <type>)</type>	
	Example		
	Note: Enabled by default in the SDK.		

Parameter	Description	Conditions
AT+DPMABN	<connection_retry_state< td=""><td>Enable or disable entering Sleep mode 3 followed by DPM connection retry process. <connection_retry_state>: 0 (Off), 1 (On) 1: Use the DPM connection retry state. See Ref. [6] for details. 0: Keep trying to scan the AP and make connection established without entering Sleep mode 3. Response: OK or ERROR</connection_retry_state></td></connection_retry_state<>	Enable or disable entering Sleep mode 3 followed by DPM connection retry process. <connection_retry_state>: 0 (Off), 1 (On) 1: Use the DPM connection retry state. See Ref. [6] for details. 0: Keep trying to scan the AP and make connection established without entering Sleep mode 3. Response: OK or ERROR</connection_retry_state>
	?	Get the current DPM connection retry state.
	Prerequisite Station mode Example AT+DPMABN=? +DPMABN:0 OK	
	AT+DPMABN=1 OK Note: • Enabled by default in the	
	The configuration is removed/stored from/in NVRAM.     count>     Set Wi-Fi Connection Retry counts until the system enters DPM	
AT+DPMABNWF CCNT		Abnormal Sleep. <count>: 0 (This feature not used. DPM Abnormal sleep scheme is followed), 1 to 6 (Wi-Fi Connection Retry count) Response: OK or ERROR</count>
	?	Get the current DPM Abnormal Wi-Fi Connection Retry counts set. Response: +DPMABNWFCCNT: <count></count>
	Example //If Wi-Fi connection attempts are not successful two times in a row, the system goes to DPM Abnormal sleep. AT+DPMABNWFCCNT=2 OK AT+DPMABNWFCCNT=? +DPMABNWFCCNT:2 OK Note: Disabled by default in the SDK. IfWF_CONN_RETRY_CNT_ABN_DPM is enabled in the SDK (config_generic_sdk.h), this command should be enabled. The configuration is stored in NVRAM.	
	<ul> <li>If the cause of the Wi-Fi connection failure is "Wrong password" input, and if the application wants to cancel the auto-reconnect attempt right away,</li> <li>WIFI_CONN_RETRY_STOP_AT_WK_CONN_FAIL should be defined in sys_common_features.h.</li> </ul>	
#### Table 8. Initiation response list

Parameter	Description	Conditions
+INIT	DONE, <mode></mode>	The DA16200/DA16600 booting is complete:
		<mode>: 0 (STA), 1 (Soft AP)</mode>
		For example: +INIT:DONE,0
	WAKEUP, <type></type>	The DA16200/DA16600 wake-up is complete from DPM LPM. <type> wake-up type</type>
		<ul> <li>UC: Unicast packet received</li> <li>NOBCN: No beacon from the connected AP</li> </ul>
		<ul> <li>DEAUTH: Disconnected from the connected AP</li> </ul>
		<ul> <li>EXT: External wake-up</li> </ul>
		<ul> <li>RTC: By a timer registered</li> </ul>
		For example: +INIT:WAKEUP,UC

# 5.2 Network Function Commands

#### Table 9. Network function command list

Parameter	Description	Conditions	
AT+NWIP	<iface>,<ip_addr>, <netmask>,<gw></gw></netmask></ip_addr></iface>	Set the IP address. <iface>: WLAN interface. 0 (WLAN0, STA), 1 (WLAN1, Soft AP) <ip_addr>: IP Address <netmask>: Subnet mask <gw>: Gateway</gw></netmask></ip_addr></iface>	
		Response: OK or ERROR	
	?	Get the IP address of the current WLAN interface.	
	(none)	Response: +NWIP: <iface>,<ip_addr>,<netmask>,<gw></gw></netmask></ip_addr></iface>	
		Example AT+NWIP=0,192.168.0.100,255.255.0,192.168.0.1 OK	
	AT+NWIP +NWIP:0,192.168.0.100,255.255.255.0,192.168.0.1 OK		
	At+NWIP=? +NWIP:0,192.168 OK	3.0.100,255.255.255.0,192.168.0.1	
	Note:		
	Enabled by default in the SDK.		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	<ul> <li>In Soft AP mode, after changing the IP address, DHCP server pool range should also be updated based on the class of the changed IP address. Use AT+NWDHR to re-define DHCP server pool range after running AT+NWIP.</li> </ul>		
	<ul> <li>In Soft AP mode, if the IP configuration is changed while the DHCP server is running, then the DHCP server must be restarted using the AT+RESTART or AT+NWDHS=0 &gt; AT+NWDHS=1 command.</li> </ul>		
AT+NWDNS	<dns_ip></dns_ip>	Set the DNS server IP address of STA interface.	
		<dns_ip>: DNS server IP address</dns_ip>	
		Response: OK or ERROR	

Parameter	Description	Conditions		
	?	Get the DNS server IP address of STA interface.		
	(none)	Response: +NWDNS: <dns_ip></dns_ip>		
	Example			
	AT+NWDNS=8.8	3.8.8		
	OK			
	AT+NWDNS			
	+NWDNS:8.8.8.8	3		
	ОК			
	Note:			
	Enabled by default in th	e SDK.		
	The configuration is store	red in NVRAM.		
	data regardless of any [ "Not configured") can be	under DHCP mode, it returns the DNS IP address from DHCP provision DNS IP address set with AT+NWDNS= <dns_ip>. ERROR:-7 ("No result" or e returned if there is no DHCP provision data existing.</dns_ip>		
	<ul> <li>If AT+NWDNS=? is run under Static IP mode, it returns the DNS IP address from AT+NWDNS=<dns_ip> that run previously or default one.</dns_ip></li> </ul>			
	<ul> <li>If AT+NWDNS=<dns_ip mode, it requires a systematic</dns_ip </li> </ul>	is run under DHCP mode and the changes to take effect in Static IP em restart.		
AT+NWDNS2	<dns_ip></dns_ip>	Set the 2 <sup>nd</sup> DNS server IP address of STA interface.		
		<dns_ip>: DNS server IP address</dns_ip>		
		Response: OK or ERROR		
	?	Get the 2 <sup>nd</sup> DNS server IP address of STA interface.		
	(none)	Response: +NWDNS2: <dns_ip></dns_ip>		
	Example	·		
	AT+NWDNS2=8	.8.8.8		
	ОК			
	AT+NWDNS2			
	+NWDNS2:8.8.8	.8		
	OK	-		
	Note: Enabled by default i	n the SDK.		
AT+NWHOST	<name></name>	Get the host IP address by name.		
		<name>: Domain name</name>		
		Response: +NWHOST: <ip></ip>		
	Example			
	-	AT+NWHOST=www.renesas.com		
	+NWHOST:54.19	+NWHOST:54.192.175.64		
	OK			
	Note:			
	Enabled by default in the SDK.			
	The configuration is store	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
AT+NWPING	<iface>,<dst_ip>,</dst_ip></iface>	Ping test.		
	<count></count>	<iface>: WLAN interface. 0 (WLAN0), 1 (WLAN1)</iface>		
		<dst_ip>: Target IP address</dst_ip>		
		<count>: The number of ICMP message transmissions</count>		
		Response: +NWPING: <sent_count>,<recv_count>,</recv_count></sent_count>		

Parameter	Description	Conditions	
		<avg_time>,<min_time>,<max_time></max_time></min_time></avg_time>	
	Example		
	AT+NWPING=0,192.168.0.1,4		
	+NWPING:4,4,0,0,0		
ОК			
	Note: Enabled by default in	n the SDK.	
AT+NWDHC	<dhcpc></dhcpc>	Start/Stop the DHCP client.	
		<dhcpc>: 0 (stop), 1 (start)</dhcpc>	
		Response: OK or ERROR	
	?	Get the DHCP client status.	
	(none)	Response: +NWDHC: <dhcpc></dhcpc>	
	Prerequisite	I	
		16600 should be connected to AP.	
	Example		
	AT+NWDHC=1		
	ОК		
	AT+NWDHC		
	+NWDHC:1		
	OK		
	Note:		
	Enabled by default in the SDK.		
	The configuration is stor	ed in NVRAM.	
AT+NWDHCLT	(none)	Show the information of the DHCP lease time, renew time, and elapse time.	
		Response: OK or ERROR	
		When the response is OK, the following response comes first before OK.	
		+ NWDHCLT: <lease time="">, <renew time="">, <elapse time=""></elapse></renew></lease>	
		<li><lease time="">: The total duration (in seconds) for which an IP address is assigned to a client by the DHCP server.</lease></li>	
		<renew time="">: The time at which the client begins the process of renewing its lease.</renew>	
		<elapse time="">: The time that the client was using the current lease.</elapse>	
	Prerequisite		
	DHCP client connected to the DHCP server.		
	Example		
	AT+NWDHCLT		
	+NWDHCLT:864	00,43200,13	
	OK	1	
AT+NWDHCHN	<hostname></hostname>	Store the DHCP client host-name.	
		<hostname> DHCP client host-name</hostname>	
		Response: OK or ERROR	
	?	Get the DHCP client host-name which is stored by user.	
	(none)	Response: +NWDHCHN= <hostname></hostname>	
	Example	1	
	AT+NWDHCHN=TEST_DHCP*HOSTNAME		

Parameter	Description	Conditions	
	ERROR:-615		
	AT+NWDHCHN=TEST-DHCP-HOSTNAME		
	ОК		
	Note: Enabled by default in the SDK.		
	The configuration is stor	ed in NVRAM.	
	<ul> <li>The hostname can conta and minus sign (-).</li> </ul>	ain only uppercase letters (A-Z), lowercase letters (a-z), numbers (0-9),	
AT+NWDHCHND	(none)	Delete DHCP client host-name which was stored by user.	
EL	Example		
	AT+NWDHCHND	EL	
	ОК		
	Note: Enabled by default in	n the SDK.	
AT+NWDHR	<start_ip>,<end_ip></end_ip></start_ip>	Set an IP address range of the DHCP server.	
		<start_ip>: Starting IP address assigned by the DHCP server</start_ip>	
		<end_ip>: Ending IP address assigned by the DHCP server</end_ip>	
		Response: OK or ERROR	
	?	Get an IP address range of the DHCP server.	
	(none)	Response: +NWDHR: <start_ip>,<end_ip></end_ip></start_ip>	
	Prerequisite		
	Soft AP mode		
	Example		
	AT+NWDHR=10.0.0.2,10.0.0.11		
	OK		
	AT+NWDHR		
	+NWDHR:10.0.0.2,10.0.0.11		
	ОК		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	<ul> <li>DHCP server restart (AT to take effect.</li> </ul>	+RESTART or AT+NWDHS=0 > AT+NWDHS=0) is required for changes	
AT+NWDHLT	<lease_time></lease_time>	Set an IP lease time (in seconds) of the DHCP server.	
		<lease_time>: IP lease time (from 60 to 86400 seconds)</lease_time>	
		Response: OK or ERROR	
	?	Get an IP lease time of the DHCP server.	
	(none)	Response: +NWDHLT: <lease_time></lease_time>	
	Prerequisite		
	Soft AP mode		
	Example		
	AT+NWDHLT=1800		
	OK		
	AT+NWDHLT		
	+NWDHLT:1800		
	ОК		

#### DA16200 DA16600 Host Interface and AT Command

Parameter	Description	Conditions			
	Note:				
	Enabled by default i	n the SDK.			
	<ul> <li>The configuration is stored in NVRAM.</li> <li>DHCP server restart (AT+RESTART or AT+NWDHS=0 &gt; AT+NWDHS=0) is required for chart to take effect.</li> </ul>				
AT+NWDHS	<dhcpd></dhcpd>	Start/Stop DHCP server.			
		<dhcpd>: 0 (stop), 1 (start)</dhcpd>			
		Response: OK or ERROR			
	<dhcpd>,</dhcpd>	Start the DHCP server with options.			
	<start_ip>,<end_ip>,</end_ip></start_ip>	<dhcpd>: 1 (start)</dhcpd>			
	<lease_time></lease_time>	<start_ip>: Starting IP address for the DHCP client</start_ip>			
		<end_ip>: Ending IP address for the DHCP client</end_ip>			
		<lease_time>: IP lease time (optional, in second, default is 1800)</lease_time>			
		Response: OK or ERROR			
	?	Get the DHCP client status.			
	(none)	Response: +NWDHS: <dhcpd></dhcpd>			
	Prerequisite	· · ·			
	Soft AP mode	Soft AP mode			
	Example				
	AT+NWDHS=1				
	ОК				
	AT+NWDHS:	AT+NWDHS=1,10.0.0.2,10.0.0.10,1800			
	ОК	ОК			
	AT+NWDHS				
	+NWDHS:1,10.0.0.2,10.0.0.10,1800 OK

	<ul> <li>The configuration is stored in NVRAM.</li> </ul>				
AT+NWDHIP	(none)	Show the information of the DHCP Client(s) connected.			
ATTINUDITIF	(none)	Response: OK or ERROR			
		When the response is OK, the following response comes first before OK.			
		+NWDHIP: <mac_addr_1>,<ip_addr_1>;<mac_addr_2>,<ip_addr_2></ip_addr_2></mac_addr_2></ip_addr_1></mac_addr_1>			
	Evample				
	-	Example			
	//When DHCP client is in a connected state. AT+NWDHIP				
	+NWDHIP:80:35:c1:79:c1:da,10.0.0.2				
	OK				
	//Two DHCP clients are in a connected state.				
	AT+NWDHIP				
	+NWDHIP:80:35:c1:79:c1:da,10.0.0.2;b4:f1:da:b4:27:11,10.0.0.3				
	ОК				

Parameter	Description	Conditions		
	AT+NWDHIP	•		
	ERROR:-622 //C	lients are not connected		
	Note: • Enabled by default in the SDK.			
	Use this command whe	n DHCP server is running.		
AT+NWSNS	<server_ip></server_ip>	Set the SNTP server IP address/domain name.		
AT+NWSNS1		<server_ip>: SNTP server IP address/domain name</server_ip>		
AT+NWSNS2		Response: OK or ERROR		
	?	Get the SNTP server IP address.		
	(none)	Response: +NWSNS: <sntp></sntp>		
	Example	•		
	AT+NWSNS=8.8	.8.8		
	ОК			
	AT+NWSNS			
	+NWSNS:8.8.8.8	3		
	OK			
	Note:			
	Enabled by default in the SDK.			
	The configuration is stored in NVRAM.			
	<ul> <li>Up to three SNTP servers can be specified by users; an SNTP server is contacted in round robin manner if the DA16200/DA16600 fails to synchronize the system time with a server.</li> </ul>			
	If not specified, default	If not specified, default SNTP server is used.		
AT+NWSNUP	<period></period>	Set the SNTP client update period (in seconds).		
		<pre><period>: SNTP client update period (from 60 to 129600 seconds)</period></pre>		
		Response: OK or ERROR		
	?	Get the SNTP client update period.		
	(none)	Response: +NWSNUP: <period></period>		
	Example			
	AT+NWSNUP=86400			
	OK			
	AT+NWSNUP			
	+NWSNUP:86400			
	ОК			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	The configuration is stored			
AT+NWSNTP	<sntp></sntp>	Start/Stop the SNTP Client.		
AT+NWSNTP1		<sntp>: 0 (stop), 1 (start)</sntp>		
AT+NWSNTP2		Response: OK or ERROR		
	<sntp>,</sntp>	Start the SNTP client with options.		
	<server_ip>,</server_ip>	<sntp>: 1 (start)</sntp>		
	<period></period>	<pre><server_ip>: SNTP server IP address (or domain)</server_ip></pre>		
	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>			
		Response: OK or ERROR		

Parameter	Description	Conditions		
	?	Get the SNTP status.		
	(none)	Response: +NWSNTP: <sntp></sntp>		
	Example			
	-	AT+NWSNTP=0		
	ОК			
	AT+NWSNTP=1,pool.ntp.org,86400			
	OK			
	AT+NWSNTP	al ata ara 96400		
	+NWSNTP:1,po OK	J. 11(P. 01(9, 60400		
	Note:			
	<ul> <li>Enabled by default in th</li> </ul>	e SDK.		
	<ul> <li>The configuration is sto</li> </ul>			
	specified. <sntp>=1 als</sntp>	ent is started immediately and tries to do time sync with the server o enables "auto start" of the SNTP client if the DA16200/DA16600 reboots. o start" flag from NVRAM, so the DA16200/DA16600 does not try to sync		
AT+NWCCRT	(none)	Check if certificates exist.		
		There are three sets of certificates:		
		<ul> <li>Set #1: for MQTT</li> </ul>		
		Root CA (bit 2)/Cert (bit 1)/Key (bit 0)/DH param (bit 9)		
		<ul> <li>Set #2: for HTTPS client for OTA Root CA (bit 5)/Cert (bit 4)/Key (bit 3)/DH param (bit 10)</li> </ul>		
		<ul> <li>Set #3: for WPA Enterprise</li> </ul>		
		Root CA (bit 8)/Cert (bit 7)/Key (bit 6)/DH param (bit 11)		
		For example: if the DA16200/DA16600 has the Root CA and Cert in Set #1, the return value is 6.		
		Response: +VER: <cert></cert>		
	Example			
	AT+NWCCRT			
	+NWCCRT:6	//MQTT		
	OK			
	AT+NWCCRT			
	+NWCCRT:56	//HTTPS		
	OK			
	Note: Enabled by default in the SDK.			
AT+NWDCRT	(none)	Delete all TLS certificates including private key.		
		Response: OK or ERROR		
	Example			
	AT+NWDCRT			
	OK			
	Note: Enabled by default in the SDK.			

#### Table 10. Certificate commands

Parameters	Description	
<cert_id>,<content><et X&gt;</et </content></cert_id>	Store certificate or private key. <esc>C: To enter certificate input mode, type in <esc>(0x1B) and C keys together. <cert_id>: Certificate ID There are three sets of certificates: Set #1: for MQTT 0 (Root CA)/1 (Client Certificate)/2 (Private Key) Set #2: for HTTPS client for OTA</cert_id></esc></esc>	
	3 (Root CA)/4 (Client Certificate)/5 (Private Key) Set #3: for WPA Enterprise 6 (Root CA)/7 (Client Certificate)/8 (Private Key) <content>: Certificate data. Copy and paste cert ascii text. Max length is 2048. <etx>: Indication of the end of content (Ctrl+C, 0x03) Response: OK or ERROR For example: <esc>C1, BEGIN CERTIFICATEMIIodknvfano923nf/ <etx></etx></esc></etx></content>	
Example <esc>C0,Root CA<etx> OK <esc>C1,Client CA<etx> OK <esc>C2,Provate Key<etx> OK Note: Enabled by default in the SDK</etx></esc></etx></esc></etx></esc>		
<pre><module>, <certificate type="">, <mode>[,     <format>, <length>,     <content>]</content></length></format></mode></certificate></module></pre>	Store or delete certificate/CA/private key/DH params. <esc>CERT: To enter certificate input mode:         <module>: Module ID. 0 - MQTT, 1 - HTTPs client for OTA, 2 - WPA         Enterprise         <certificate type="">: Certificate type, 0 - CA certificate, 1 - Certificate, 2 -         Private key, 3 - DH params         <mode>: Input mode. 0 - Store, 1 - Deletion         <format>: Certificate format, 0 - DER, 1 - PEM if mode is 0 (Store)         <length>: Length of certificate if mode is 0 (Store)         <content>: Certificate data if mode is 0 (Store)         Response: OK or ERROR         For example:         <esc>CERT,0,1146, BEGIN CERTIFICATEMIIDFDCCAf</esc></content></length></format></mode></certificate></module></esc>	
OK <esc>CERT,0,1 OK</esc>	,0,1,980,BEGIN CERTIFICATE ,0,1,990,BEGIN CERTIFICATE

# 5.3 Wi-Fi Function Commands

Table 11. Wi-Fi function command list

Command	Parameters	Description	
AT+WFMODE	<mode></mode>	Set the Wi-Fi mode.	
		<mode>: 0 (STA), 1 (Soft AP), 2 (Concurrent Mode)</mode>	
		Response: OK or ERROR	
	?	Get the current Wi-Fi mode.	
	(none)	Response: +WFMODE: <mode></mode>	
	Example AT+WFMODE=0 OK	//Set Station mode	
	AT+WFMODE=1 OK	//Set Soft AP mode	
	AT+WFMODE +WFMODE:1 OK	//Get current Wi-Fi mode	
	AT+WFMODE=? +WFMODE:1 OK	//Get current Wi-Fi mode	
	<ul> <li>Enabled by default in the SDK.</li> <li>W(F) is stored in NV/DAM</li> </ul>		
	<ul> <li>Wi-Fi mode is stored in NVRAM.</li> <li>Sustant social for charges to take affect.</li> </ul>		
	<ul> <li>System restart is required for changes to take effect.</li> <li>To use the consumption mode, complete the following store:</li> </ul>		
	<ul> <li>To use the concurrent mode, complete the following steps:</li> <li>AT+DEFAP</li> </ul>		
	<ul> <li>AT+DEFAP</li> <li>AT+WFMODE=2</li> </ul>		
	AT+RESTART		
	<ul> <li>AT+RESTART</li> <li>AT+WFJAPA=SSID,PASSWORD (or AT+WFJAPA=SSID,X,X,PASSWORD).</li> </ul>		
AT+WFMAC		Write a user MAC address in the NVRAM.	
	<mac></mac>	Response: OK or ERROR	
	?	Get the current MAC address of the activated WLAN interface.	
		4	
	(none) Response: +WFMAC: <mac></mac>		
	Example AT+WFMAC=EC:9F:0D:9F:FA:64 OK		
	AT+WFMAC=? +WFMAC:EC:9F:0D:9F:FA:64 OK		
	AT+WFMAC		

Command	Parameters	Description	
	+WFMAC:EC:9F:0		
	ОК		
	AT+WFMAC=? //In Soft AP mode		
	+WFMAC:EC:9F:0		
	OK Note:		
		n even number to be a valid MAC address.	
	<ul> <li>Enabled by default in the</li> </ul>		
		tored in NVRAM, and a system restart is required for changes to take	
	effect.		
		provides three types of MAC addresses, and the priority is in the MAC address, User MAC address, OTP MAC address.	
	<ul> <li>When reading the MAC a + 1.</li> </ul>	address in Soft AP mode, it becomes the MAC address that was written	
AT+WFMACERASE	(none)	Erase a user MAC address in NVRAM.	
		Response: OK or ERROR	
	Example		
	AT+WFMACERAS	SE	
	Note:		
	Enabled by default in the SDK (available from SDK v3.2.9.0 or later).		
	The configuration is eras	ed from NVRAM.	
AT+WFSPF	<mac></mac>	Write the spoofing MAC address in the NVRAM.	
		Response: OK or ERROR	
	Example		
	AT+WFSPF=EC:9F:0D:90:00:48		
	ОК		
	AT+WFSPF=?		
	+WFSPF:EC:9F:0D:90:00:48		
	ОК		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> <li>Either odd or even number last digit of MAC address is accepted. Use this command only in STA</li> </ul>		
	<ul> <li>Either odd or even number last digit of MAC address is accepted. Use this command only in STA mode.</li> </ul>		
	<ul> <li>A spoofing MAC address is stored in NVRAM, and a system restart is required for changes to take effect.</li> </ul>		
	<ul> <li>The DA16200/DA16600 provides three types of MAC addresses, and the priority is in the following order: Spoofing MAC address, User MAC address, OTP MAC address.</li> </ul>		
	The AT+WFMAC=? command can be used to read back the spoofing MAC address as this command does not support query.		
AT+WFOTP	<mac></mac>	Write the MAC address in the OTP memory.	
		Response: OK or ERROR	
		The MAC address written in the OTP is used as WLAN0 MAC address and MAC address + 1 is used as WLAN1 MAC address.	
	Example		
	AT+WFOTP=EC:9F:0D:90:00:48		
	ОК		
	AT+WFMAC=?		
	AI+WFIVIAC=?		

Command	Parameters	Description	
	+WFOTP:EC:9F:0	D:90:00:48	
	ОК		
	Note:		
	The last digit should be a	in even number to be a valid MAC address.	
	<ul> <li>Enabled by default in the SDK.</li> <li>An OTP MAC address is stored in OTP and system restart is required for changes to take ef</li> </ul>		
		ne OTP is invalidated if it exists.	
		ress slots available in OTP. It is possible to write the OTP MAC address	
	four times in total in produ	uction.	
	order: Spoofing MAC add	provides three types of MAC address, and the priority is in the following dress, User MAC address, OTP MAC address.	
	<ul> <li>The AT+WFMAC=? command does not support</li> </ul>	mand can be used to read back the OTP MAC address as this ort query.	
	<ul> <li>When reading the MAC a + 1.</li> </ul>	address in Soft AP mode, it becomes the MAC address that was written	
AT+WFSTAT	(none)	Get Wi-Fi configuration.	
		Response: +WFSTAT: <wi-fi interface=""><var></var></wi-fi>	
	Example	<u>, ·</u>	
	AT+WFSTAT		
	+WFSTAT:sta0		
	mac_address= ec:9f:0d:9f:fa:64		
	wpa_state=DISCONNECTED		
	disconnect_reasor		
	ОК		
	AT+WFSTAT		
	+WFSTAT:softap1	I	
	mac_address=ec:	9f:0d:9f:fa:65	
	wpa_state=DISCC	UNNECTED	
	disconnect_reasor	1=0	
	ОК		
	AT+WFSTAT		
	+WFSTAT:sta0		
	mac_address=ec:	9f:0d:9f:fa:64	
	bssid=70:5d:cc:32	:15:32	
	ssid=MY_AP_SSII	D	
	id=0		
	mode=STATION		
	key_mgmt=WPA2	-PSK	
	pairwise_cipher=C	CMP	
	group_cipher=CC	MP	
	channel=3		
	wpa_state=COMP	LETED	

Command	Parameters	Description		
	ОК			
	Note: Enabled by default in the SDK.			
	<ul> <li>A response can be different of the second sec</li></ul>	erent depending on the current the DA16200/DA16600 status or mode.		
AT+WFPBC	(none)	Run the WPS PBC method.		
		Response: OK or ERROR		
	Example			
	AT+WFPBC			
	ОК			
		_APS_SSID',192.168.0.3		
	Note:	_AI 3_001D,192.100.0.0		
	<ul> <li>Enabled by default in the</li> </ul>	he SDK.		
	-	pressed after issuing the command.		
	<ul> <li>A router should suppor</li> </ul>	-		
AT+WFPIN	<pin></pin>	Run the WPS PIN method.		
	(none)	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>		
	(none)	(none): Generate a random PIN		
		Response: +WFPIN: <pin></pin>		
		OK or ERROR		
	?	Get the current PIN.		
		Response: +WFPIN: <pin></pin>		
	Example			
	AT+WFPIN=13557799			
	+WFPIN:13557799			
	OK			
	AT+WFPIN			
	+WFPIN:36269112 //Generate random number.			
	ОК			
	AT+WFPIN=?			
	+WFPIN:36269	112		
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>An AP should support WPS PIN.</li> </ul>			
AT+WFCWPS	(none)	Cancel WPS (both PBC and PIN).		
		Response: OK or ERROR		
	Prerequisite			
	WPS should be in progress.			
	Example			
	AT+WFCWPS			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	Return error if WPS is	<ul> <li>Return error if WPS is not in progress.</li> </ul>		

Command	Parameters	Description		
AT+WFCC	<code></code>	Set a country code.		
		<code>: Country code (defined by ISO 3166-1 alpha-2 standard) such</code>		
		as KR, US, JP, and CH Response: OK or ERROR		
	?	Get the current country code.		
	-	Response: AT+WFCC= <code></code>		
	(none)			
		/P		
	AT+WFCC=KR OK			
	OR			
	AT+WFCC			
	+WFCC:KR			
	ОК			
	AT+WFCC=	?		
	+WFCC:KR			
	ОК			
		Note:		
	-	Enabled by default in the SDK.		
	<ul> <li>A country code is stored in the NVRAM.</li> <li>A country code consists of two characters</li> </ul>			
	<ul> <li>A country code consists of two characters.</li> <li>If a country is invalid, the DA16200/DA16600 returns an error code that is –113.</li> </ul>			
	<ul> <li>If a country is invalid, the DAT6200/DAT6600 returns an enor code that is -115.</li> <li>System restart is required for changes to take effect.</li> </ul>			
	If this command is run in Soft AP mode with a new country code and the operating channel			
		range of the new country does not cover the operating channel currently set, the operating channel is automatically switched to channel 1.		
AT+WFRSSI	[ <timeout>]</timeout>	Get the current RSSI value within a timeout.		
		<timeout>: timeout in seconds</timeout>		
		Response: +RSSI: -34		
	Prerequisite			
	The DA16200/DA16600 should be connected to AP.			
	Example	Example		
	AT+WFRSSI			
	+RSSI:-41	+RSSI:-41		
	OK			
	AT+WFRSSI=2			
	+RSSI:-25			
	OK			
	(If there is no connection to an AP,)			
	AT+WFRSSI			
	+RSSI:NOT_	CONN		
	ERROR:-400	)		
	<i>(</i> <b>1</b> ,	result within a timeout)		

Command	Parameters	Description	
	ERROR:-801		
	Note:		
	Enabled by default in the	SDK.	
	<ul> <li>The DA16200/DA16600 responds "+RSSI:NOT_CONN" with error (-400) if the connection is</li> </ul>		
	established.		
	The DA16200/DA16600	responds with error (-801) if the RSSI is not received within a timeout.	
AT+WFSCAN	[ <ssid>]</ssid>	Scan APs.	
		<ssid>: Scan a hidden AP through direct probe request (optional)</ssid>	
		Response: +WFSCAN: <bssid>&lt;\t&gt;<frequency>&lt;\t&gt;<signal< td=""></signal<></frequency></bssid>	
		strength><\t> <flag>&lt;\t&gt;<ssid><lf></lf></ssid></flag>	
	Prerequisite		
	The country code	should be set with AT+WFCC.	
	Example		
	AT+WFSCAN		
	+WFSCAN:70:5d:		
	IPTIME_N604BLA		
	b4:a9:4f:62:39:46	2422 -32 [WPA-PSK-CCMP+TKIP][WPA2-PSK- S][ESS] SK_WiFiGIGA0123	
	CCMP+TKIP][WP		
	OK		
	Note:		
	<ul><li>Enabled by default in the SDK.</li><li>An SSID can be missed in case of hidden AP.</li></ul>		
AT+WFPSCAN			
AT+WFP5CAN	<channel limit="" time="">, <ch><ch></ch></ch></channel>	Get the passive scan result for the given parameters. <channel limit="" time="">: Channel scan time limit (should be more than</channel>	
		30000 microsecond)	
		<pre><ch>: Carrier frequency (from 0 to14)</ch></pre>	
		Response: BSSID Wi-Fi_Channel RSSI SSID Security Type	
	Prerequisite		
	The country code should be set with AT+WFCC.		
	Station mode.		
	Example		
	AT+WFPSCAN=120000,1,3,5		
	X11W1100/1120000,1;0;0		
	70:5d:cc:8b:49:8e	2412 -47 Gen_Port_*.5_AP [WPA2-PSK-CCMP][WPS][ESS]	
		2412 -47 IPTIME_A3004NS-M_Bell [WPS][ESS]	
	+PSCAN:TIMEOUT		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	-	be typed in <ch> as example ("0" means all channel).</ch>	
AT+WFPCDTMIN	<bssid>,</bssid>	Set the passive scan minimum RSSI threshold condition.	
	<min_threshold></min_threshold>	<pre>                          &lt;</br></br></br></pre>	
		<pre><min_threshold>: minimum threshold (from -10 to -100)</min_threshold></pre>	
		Response: OK or ERROR	
	?		
	-	Get the current condition.	
	(none)		

0	D		
Command	Parameters	Description	
	Prerequisite Station mode. Example AT+WFPCDTMIN OK	=72:5d:cc:d0:82:bc,-80	
	AT+WFPCDTMIN +WFPCDTMIN: 72 OK Note: Enabled by default in	2:5d:cc:d0:82:bc,-80 the SDK v3.2.3.0 or later.	
AT+WFPCDTMAX	<bssid>, <max_threshold></max_threshold></bssid>	Set the passive scan maximum RSSI threshold condition. <bssid>: BSSID <max_threshold>: maximum threshold (from -10 to -100) Response: OK or ERROR</max_threshold></bssid>	
	? (none)	Get the current condition.	
	Prerequisite Station mode. Example AT+WFPCDTMAX=72:5d:cc:c0:82:bc,-20 OK		
	AT+WFPCDTMAX +WFPCDTMAX: 7 OK Note: Enabled by default in	2:5d:cc:c0:82:bc,-20	
AT+WFPSTOP	(none)	Stop passive scan. Response: OK or ERROR	
	Prerequisite Station mode. Example AT+WFPSTOP OK Note: Enabled by default in		
AT+WFJAP	<ssid>,<sec>[,<hidden>] (sec=0 5) <ssid>,<sec>, <idx>,<key>[,<hidden>] (sec=1)</hidden></key></idx></sec></ssid></hidden></sec></ssid>	Connect to an AP. <ssid>: AP SSID <sec>: Security protocol. 0 (OPEN), 1 (WEP), 2 (WPA), 3 (WPA2), 4 (WPA+WPA2), 5 (WPA3 OWE), 6 (WPA3 SAE), 7 (WPA2 RSN &amp; WPA3 SAE) <idx>: Key index for WEP. 0~3</idx></sec></ssid>	
	<ssid>,<sec>, <enc>,<key>[,<hidden>] (sec=2 3 4 6 7)</hidden></key></enc></sec></ssid>	<pre><li><lock>: Rey Index for WEP. 0~3 </lock></li></pre> <pre></pre>	

Command	Parameters	Description
		+WFJAP: <ops_result>,<reason>,[<reason_code>]</reason_code></reason></ops_result>
		<ops_result>: 1 (SUCCESS), 0 (FAILED)</ops_result>
		If <ops_result>: 1</ops_result>
		<ssid>: The SSID is surrounded by single quotation mark</ssid>
		<ip_address>: Assigned IP address and format is xxx.xxx.xxx.xxx</ip_address>
		If <ops_result>: 0</ops_result>
		<reason>: well-known reason in text</reason>
		<reason_code>: if &lt; REASON &gt; is OTHER, this shows the reason</reason_code>
		code
		For details about <reason> or <reason_code>, see Table 12.</reason_code></reason>
	?	Get the AP provisioning information.
	(none)	Operation Results:
		If provisioning data is available:
		+WFJAP:' <ssid>',<sec>,<enc>,'<passphrase>'</passphrase></enc></sec></ssid>
		If provisioning data is not available:
		ERROR:-410 (No SSID is found)
	Example	
	AT+WFJAP=MY	(_AP_SSID,0 //Open security
	OK	
	+WFJAP:1,'MY_	_AP_SSID',192.168.43.32
	AT+WFJAP=M	(_AP_SSID,0,1 //Open security + hidden SSID
	OK	
	+WFJAP:1,'MY_	_AP_SSID',192.168.43.32
	AT+WFJAP=M	/_AP_SSID,1,0,12345 //WEP security
	ОК	
	+WFJAP:1,'MY	_AP_SSID',192.168.0.7
	AT+WFJAP=M	Y_AP_SSID,1,0,12345,1 //WEP + hidden AP
	ОК	
	+WFJAP:1,'MY_	_AP_SSID',192.168.0.7
		Y_AP_SSID,4,2,N12345678 //WPA2 security
	OK	
		_AP_SSID',192.168.0.7

		for both command response OK or ERROR and Operation Result; wait for cSSID>', <ip address=""> for successful connection.</ip>	
		<ul> <li>Depending on the network condition, it may take more time to get an Operation Result because of internal connection re-tries.</li> </ul>	
	No system reboot is re	equired after running this command.	
	The AP configuration	parameters (AP Profile) are stored in NVRAM.	
AT+WFCAP	(none)	Connect to an AP with the current WLAN0 interface configuration.	
		Response: OK or ERROR	
	Prerequisite		
		meters should be in NVRAM.	

Command	Parameters	Description		
	Example			
	AT+WFCAP			
	OK			
	+WFJAP:1,'MY_AP_SSID',192.168.0.7			
	AT+WFCAP			
	ERROR:-503	//Failed to connect AP. (for example, No AP profile found)		
	AT+WFCAP			
	ERROR:-460 Note:	//Already connected		
		the SDK		
	<ul> <li>Enabled by default in</li> <li>An AB profile can be a</li> </ul>	stored in NVRAM by issuing the "AT+WFJAPA" or "AT+WFJAP" command.		
	•	e found, the DA16200/DA16600 returns an error (-503).		
		600 is already in connection with an AP, it returns an error (-460).		
AT+WFQAP	(none)	Disconnect from the currently associated AP.		
		Response: OK or ERROR		
	Prerequisite			
		The DA16200/DA16600 should be connected to AP.		
	Example			
	AT+ WFQAP			
	OK			
		Note:		
	Enabled by default in			
		already disconnected from an AP.		
AT+WFSTA	(none)	Check Wi-Fi connection.		
		Response: +WFSTA: <status></status>		
		<status> 1 (Connected), 0 (disconnected)</status>		
	Prerequisite			
	Station mode.			
	Example			
	AT+WFSTA			
	+WFSTA:0			
	OK			
	AT+WFSTA			
	+WFSTA:1			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	-	600 runs the command in Soft AP mode, it returns an error (-100).		
AT+WFROAP	<roam></roam>	Operate the STA roaming.		
		<roam>: 1 (run), 0 (stop)</roam>		
		Response: OK or ERROR		
	?	Get the roaming status.		

Command	Parameters	Description		
	Prerequisite			
	Station mode			
	Example			
	AT+WFROAP=1			
	OK			
	AT+WFROAP=0			
	OK			
	AT+WFROAP=?			
	+WFROAP:1			
	OK			
	Note:			
	Enabled by default in SD	К.		
<ul> <li>This command enables "simple" roaming. The roaming configuration consists of or called the roaming threshold (set to AT+WFROTH, -65 by). Assume that the DA16 is connected to an AP, and there are other APs that have the same SSID and secu around the DA16200/DA16600. As the DA16200/DA16600 is not fixed, if the RSSI currently connected AP is lower than the specified threshold, it tries to connect to a higher RSSI (same SSID and security). If the condition is met, the DA16200/DA1660 switches to the new AP without a disconnection event.</li> </ul>		hold (set to AT+WFROTH, -65 by). Assume that the DA16200/DA16600 and there are other APs that have the same SSID and security settings 16600. As the DA16200/DA16600 is not fixed, if the RSSI value of the solver than the specified threshold, it tries to connect to an AP with a and security). If the condition is met, the DA16200/DA16600 silently		
	<ul> <li>The auto roaming start flag is stored in NVRAM when <roam> is set to 1, and roamin is enabled if the flag setting is not changed regardless of system reboot. If <roam> is roaming flag is removed from NVRAM, and roaming is disabled.</roam></roam></li> </ul>			
		upported in DPM mode. So, setting DPM mode with command he auto roaming start flag."		
AT+WFROTH	<rssi></rssi>	Set the STA roaming threshold.		
		<rssi>: Roaming threshold value (from 0 to -95 dBm)</rssi>		
		Response: OK or ERROR		
	?	Get the STA roaming threshold.		
	(none)	Response: +WFROTH: <rssi></rssi>		
	Prerequisite			
	Station mode			
	Example			
	AT+WFROTH=-55			
	ОК			
	AT+WFROTH=?			
	+WFROTH:-55			
	OK Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>This command writes a roaming threshold in NVRAM.</li> </ul>			
		s run, the roaming is enabled with the new threshold.		
AT+WFDIS	<pre><disabled></disabled></pre>	Set the Wi-Fi STA profile unused. If set to 1, the DA16200/DA16600 does not start to connect to the configured AP when rebooting.		
		<pre><disabled>: 1 (Unused), 0 (Used)</disabled></pre>		
		Response: OK or ERROR		
	?	Get the status of the Wi-Fi profile.		
	-			

Command	Parameters	Description	
	(none)	Response: +WFDIS: <disabled></disabled>	
	Example	•	
	AT+WFDIS=1		
	ОК		
	AT+WFDIS=?		
	+WFDIS:1		
	OK		
	<ul><li>Note:</li><li>Enabled by default in the</li></ul>	a SDK	
	<ul> <li>The "unused" flag is stor</li> </ul>		
	-	6200/DA16600 during boot-up procedure. System restart is required for	
	changes to take effect.		
AT+WFSAP	<ssid>,<sec>,</sec></ssid>	Set up Soft AP interface.	
	<ch>,<code></code></ch>	<ssid>: AP SSID. Max 32 characters are allowed</ssid>	
	(sec=0 5)	<sec>: Security protocol. 0 (OPEN), 2 (WPA), 3 (WPA2), 4 (WPA+WPA2) ), 5 (WPA3 OWE), 6 (WPA3 SAE), 7 (WPA2 RSN &amp; WPA3 SAE)</sec>	
		<enc>: Encryption. 0 (TKIP), 1 (AES), 2 (TKIP+AES)</enc>	
		<key>: Passphrase. 8 ~ 63 characters are allowed</key>	
		<ch>: Operating channel (optional). Default is 1 or uses the current channel if Soft AP is operating</ch>	
		<code>: Country code (optional). If exists, <ch> is essential</ch></code>	
		Response: OK or ERROR	
	?	Get the Soft AP interface configuration.	
	(none)	Response:	
		+WFSAP:' <ssid>',<auth>,<enc>,'<key>',<ch>,<code></code></ch></key></enc></auth></ssid>	
		Operation Result:	
		+WFSAP: <ssid> is printed on success</ssid>	
	Example AT+WFSAP=DA16200_MY_SSID,0,1,KR //Open mode +WFSAP:DA16200_MY_SSID OK		
	AT+WFSAP=?	00_MY_SSID',0,1,KR	
	OK	00_WT_000D,0,1,KK	
	AT+WFSAP=DA	16200_MY_SSID,3,1,12345678,1,KR //WPA2-AES

	OK		
	AT+WFSAP=?		
		00_MY_SSID',3,1,'12345678',1,KR	
	OK AT+WFSAP='DA16200,MY_SSID',3,2,'12345678',1,KR //WPA2-AES		
	+WFSAP:DA1620	00,MY_SSID	

Command	Parameters	Description	
	OK		
	AT+WFSAP=?		
		10,MY_SSID',3,1,'12345678',1,KR	
	OK Note:		
	<ul> <li>Enabled by default in the</li> </ul>	SDK	
	•	n parameters are stored in NVRAM.	
	If the command is issued	in station mode, a reboot is required to start as Soft AP mode. (If the ft AP mode, then no system restart is required).	
		ed in the SSID string and the SSID is enclosed with a single quotation	
	WPA3 Personal is enable	ed by default in the SDK v3.2.5.0 or later. See the example.	
	<ul> <li>If <sec> is set to 6 (WPA) because WPA3 SAE allo</sec></li> </ul>	3 SAE) or 7 (WPA2 RSN & WPA3 SAE), 1 (AES) is only valid as <enc> ws only CCMP.</enc>	
AT+WFOAP	(none)	Operate Soft AP interface.	
		Response: OK or ERROR	
	Prerequisite		
	A Soft AP profile should be stored in NVRAM.		
	Example		
	AT+WFOAP		
	OK		
	<ul><li>Note:</li><li>Enabled by default in the</li></ul>	SDK	
	<ul> <li>Run this command in Sof</li> </ul>		
		/RAM, it returns an error (-522).	
	<ul> <li>The DA16200/DA16600 returns an error (-522) if it already operates as Soft AP.</li> </ul>		
AT+WFTAP	(none)	Stop the Soft AP interface.	
		Response: OK or ERROR	
	Prerequisite		
	Soft AP mode		
	Example		
	AT+WFTAP		
	ОК		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> <li>This command is valid while the DA16200/DA16600 is running in Soft AP mode.</li> </ul>		
Additional note for A l Example:	T+WFSAP, AT+WFOAP, AT+	VVFIAF.	
-	e after running ATF command	4	
	e and raining /tri command	·	
AT+WFSAP	=DA16200_OPEN,0 //Set up	Soft AP	
	TART //Reboot to start in the		
DUT star	ts as Soft AP		
	AP //Stop Soft AP if required		

Command	Parameters	Description	
	DAP //Start Soft AP if required		
AT+WFRAP	(none)	Restart the Soft AP interface.	
,		Response: OK or ERROR	
	Prerequisite		
	-	P should be stored in NVRAM.	
	Example		
	AT+WFRAP		
	ОК		
	Note:		
	Enabled by default in the	SDK.	
	This command is valid in	Soft AP mode.	
	<ul> <li>If it runs in station mode,</li> </ul>	the DA16200/DA16600 returns an error (-100).	
AT+WFLCST	(none)	Get connected station information.	
		Response: +WFLCST: <mac><lf><flags><lf><var></var></lf></flags></lf></mac>	
	Example		
	AT+WFLCST		
	+WFLCST:a6:f2:7c:d4:53:1c		
	flags=[AUTH][ASS	OC][AUTHORIZED][SHORT_PREAMBLE][WMM][MAYBE_WPS][HT]

	<ul> <li>The configuration is store</li> <li>System restart is required</li> </ul>	
AT+WFAPCH	<ch></ch>	Set the operating channel number for the Soft AP interface.
		<ch>: Operating channel (from 0 to 13, 0 is auto)</ch>
		Response: OK or ERROR
	?	Get the operating channel number for the Soft AP interface.
	(none)	Response: +WFAPCH: <ch></ch>
	Example	
	AT+WFAPCH=5	
	ОК	
	AT+WFAPCH=? +WFAPCH:5	
	OK	
	Note:	
	<ul> <li>Enabled by default in the</li> </ul>	SDK.
	<ul> <li>The configuration is store</li> </ul>	
	<ul> <li>System restart is required for changes to take effect.</li> </ul>	
AT+WFAPBI	<interval></interval>	Set the AP beacon interval.
		<interval>: Beacon interval (ms)</interval>
		Response: OK or ERROR
	?	Get the AP beacon interval.
	(none)	Response: +WFAPBI: <interval></interval>
	Example	
	AT+WFAPBI=200	
	ОК	
	AT+WFAPBI=?	
	+WFAPBI:200	
	ОК	
	Note:	
	Enabled by default in the	
	The configuration is store	
	<ul> <li>System restart is required</li> </ul>	d for changes to take effect.

Command	Parameters	Description		
AT+WFAPUI	<timeout></timeout>	Set station disconnection timeout in Soft AP mode.		
		<timeout>: Disconnection timeout (sec)</timeout>		
		(from 30 to 86400, step = 10)		
		If 0, the default value (300 seconds) is used		
		Response: OK or ERROR		
	?	Get station disconnection timeout in Soft AP mode.		
	(none)	Response: +WFAPUI: <timeout></timeout>		
	Example			
	AT+WFAPUI=60	JOK		
	AT+WFAPUI=?			
	+WFAPUI:60			
	OK			
	Note:			
	Enabled by default in the			
		<ul> <li>Within the specified time, if an STA does not send any frame, Soft AP sends a NULL frame after the timeout is expired to check STA's inactivity. If no ACK is received from the STA, Soft AP removes the STA.</li> </ul>		
	The configuration is stor	The configuration is stored in NVRAM.		
	<ul> <li>System restart is require</li> </ul>	d for changes to take effect.		
AT+WFAPRT	<threshold></threshold>	Set the AP RTS threshold (octets).		
		<threshold>: RTS threshold (from 1 to 2347)</threshold>		
		Response: OK or ERROR		
	?	Get the AP RTS threshold.		
	(none)	Response: +WFAPRT: <threshold></threshold>		
	Example			
	AT+WFAPRT=21	00		
	ОК			
	AT+WFAPRT=?			
	+WFAPRT:2100			
	OK			
	Note:			
	Enabled by default in the SDK.			
	<ul> <li>If a frame that is bigger than the RTS threshold specified is to be sent, RTS/CTS frames are sent</li> </ul>			
	first to avoid collision in the air. By default, the RTS threshold is 2347.			
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>			
	<ul> <li>System restart is require</li> </ul>	d for changes to take effect.		
AT+WFAPDE	<mac></mac>	Send de-authentication frame to the connected station.		
		<mac>: MAC address of the connected station</mac>		
		Response: OK or ERROR		
	Prerequisite			
	The DA16200/DA16600 should be connected to AP.			
	Example			
	AT+WFAPDE=E6:0D:E5:A5:5D:B3			
	+WFDST:e6:0d:e5:a5:5d:b3			
	OK			

Command	Parameters	Description		
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>Use this command in Soft AP mode.</li> </ul>			
		<ul> <li>Check the MAC address of an STA that needs to send de-authentication frame by using the command "AT+WFLCST".</li> </ul>		
		<ul> <li>If the operation is not successful (for example, a wrong MAC address is specified), the operation result (+WFDST:<mac_addr>) does not come.</mac_addr></li> </ul>		
AT+WFAPDI	<mac></mac>	Send the disassociation frame to the connected station.		
		<mac>: MAC address of the connected station</mac>		
		Response: OK or ERROR		
	Prerequisite			
	The DA16200/DA	A16600 should be connected to AP.		
	Example			
	AT+WFAPDI=E	6:0D:E5:A5:5D:B3		
	+WFDST:e6:0d	l:e5:a5:5d:b3		
	ОК			
	Note:			
	Enabled by default in the second s	he SDK.		
	Use this command in \$	Soft AP mode.		
	<ul> <li>Check the MAC addre command "AT+WFLC</li> </ul>	ss of an STA that needs to send disassociation frame by using the ST".		
	<ul> <li>If the operation is not successful (for example, a wrong MAC address is specified), n results (+WFDST:<mac_addr>) are sent.</mac_addr></li> </ul>			
AT+WFWMM	<wmm></wmm>	Set WMM on/off.		
		<wmm>: 0 (off), 1 (on)</wmm>		
		Response: OK or ERROR		
	?	Get the WMM status.		
	(none)	Response: +WFWMM: <wmm></wmm>		
	Prerequisite			
	Soft AP mode.			
	Example			
	AT+WFWMM=	1		
		UK		
	AT+WFWMM=?			
	+WFWMM:1			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>WMM is enabled by default. If WMM is enabled, Beacon/Probe Rsp/Assoc frames have WMM information. WMM enables QoS in the AC category.</li> </ul>			
		<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
AT+WFWMP	<pre><wmmps></wmmps></pre>	Set WMM-PS (WMM Power Save) on/off.		
		<wmmps>: 0 (off), 1 (on)		
		Response: OK or ERROR		
	?	Get the WMM-PS status.		
		Response: +WFWMP: <wmmps></wmmps>		

Command	Parameters	Description
	Prerequisite	
	Soft AP mode.	
	Example	
	AT+WFWMM=0	
	ОК	
	AT+WFWMM=?	
	+WFWMM:0	
	OK	
	Note:	
	Enabled by default in the	SDK.
		isabled. If WMM-PS is enabled, Beacon/Probe Rsp/Assoc Rsp frames U-APSD flag set. For WMM and WMM-PS to properly work, the STA and WMM-PS certified.
	The configuration is store	d in NVRAM.

Table 12. Wi-Fi function response list

Response	Parameters	Description
+WFJAP	<result>,<ssid>,<ip></ip></ssid></result>	The result of AP connection in STA mode (The result of AT+WFJAP or AT+WFJAPA or AT+WFCAP).
	<result>,</result>	<result>: 0 (failed), 1 (succeeded)</result>
	<well-known-reason></well-known-reason>	For <result>: 1</result>
	[, <reason_code>]</reason_code>	<ssid>: SSID of the AP when succeeded</ssid>
	[,	<ip>: IP address of the station when succeeded</ip>
		For <result>: 0</result>
		<well-known-reason>: Reason for connection attempt failure in text format, TIMEOUT/WRONGPWD/ACCESSLIMIT/OTHER.</well-known-reason>
		<ul> <li>TIMEOUT: Connection attempt failed after continuous connection attempts</li> </ul>
		<ul> <li>WRONGPWD: WPA 4-Way Handshake failed, pre-shared key (password) may be incorrect</li> </ul>
		<ul> <li>ACCESSLIMIT: Disconnected because the authorized access number limit was reached</li> </ul>
		<ul> <li>OTHER: Other reasons</li> </ul>
		<reason_code>: If <well-known-reason> is OTHER, this field shows which reason caused the connection attempt failure.</well-known-reason></reason_code>
		See Appendix E.
		For example:
		+WFJAP:0,TIMEOUT
		+WFJAP:1,'ap_test',192.168.0.10 //The Wi-Fi connection is established, and the assigned IP address is 192.168.0.10.
+WFDAP	<reserved>,</reserved>	Disconnected from the AP.
	<well-known-reason></well-known-reason>	<reserved>: 0</reserved>
	[, <reason_code>]</reason_code>	<well-known-reason>: disconnection reason in text format,</well-known-reason>
		AUTH_NOT_VALID/DEAUTH/INACTIVITY/APBUSY/OTHER.
		<ul> <li>AUTH_NOT_VALID: Previous authentication no longer valid</li> </ul>
		DEAUTH: De-authenticated as STA is leaving
		<ul> <li>INACTIVITY: Disassociated because of inactivity</li> </ul>
		<ul> <li>APBUSY: Disassociated because AP is unable to handle all currently associated STAs</li> </ul>

Response	Parameters	Description	
		<reason_code>: If <well-known-reason> is OTHER, this field shows which reason caused the disconnection.</well-known-reason></reason_code>	
		See Appendix E.	
		For example:	
		+WFDAP:0,INACTIVITY	
		+WFDAP:0,DEAUTH	
		+WFDAP:0,OTHER,8	
+WFCST	<mac></mac>	A Wi-Fi station connected in Soft AP mode.	
		<mac>: MAC address of the connected station</mac>	
+WFDST	<mac></mac>	The Wi-Fi station disconnected in Soft AP mode.	
		<mac>: MAC address of the disconnected station</mac>	

### 5.4 Wi-Fi Function Commands for WPA3

You can configure the DA16200/DA16600 as WPA3 STA or WPA3 Soft AP. WPA3 Personal is enabled by default in the SDK v3.2.5.0 or later. For older SDKs, WPA3 is not enabled by default, contact Renesas Electronics. Syntax of all the Wi-Fi function commands is the same as described in Table 13 apart from the following commands where it needs to specify WPA3 specific parameters.

Table 13. WPA3-related	Wi-Fi function	command list
------------------------	----------------	--------------

Command	Parameters	Description		
AT+WFJAP	See AT+WFJAP			
	Example			
	AT+WFJAP=	MY_AP_SSID,5	//WPA3 OWE	
	ОК			
	+WFJAP:1,'N	/IY_WPA3_AP_SSID',192.168.0.	7	
	AT+WFJAP=	MY_AP_SSID,5,1	//WPA3 OWE + hidden SSID	
	ОК			
	+WFJAP:1,'N	/IY_AP_SSID',192.168.43.32		
	AT+WFJAP=	MY_AP_SSID,6,1,N12345678	//WPA3 SAE security	
	ОК			
	+WFJAP:1,'MY_WPA3_AP_SSID',192.168.0.7			
	AT+WFJAP=MY_AP_SSID,6,1,12345678,1 //WPA3 SAE + hidden AP			
	ОК			
	+WFJAP:1,'N	/IY_AP_SSID',192.168.0.7		
	AT+WFJAP=	MY_AP_SSID,7,1,N12345678	//WPA2(RSN)+WPA3 SAE security	
	ОК			
	+WFJAP:1,'MY_WPA3_AP_SSID',192.168.0.7			
	AT+WFJAP=	?		
		'_AP_SSID',6,1,'N12345678'		
	ОК			
AT+WFJAPBSSID	See AT+WFJAPBSSID			

Command	Parameters	eters Description	
	Example AT+WFJAPBSSID=01:02:03:04:05:06,MY_AP_SSID,5 //WPA3 OWE OK +WFJAP:1,'MY_WPA3_AP_SSID',192.168.0.7		
	AT+WFJAPBSSID=01:02:03:04:05:06,MY_AP_SSID,5,1 //WPA3 OWE + hidden SSID OK +WFJAP:1,'MY_AP_SSID',192.168.43.32		
	+WFJAP:1, MY_AP_SSID, 192.168.43.32 AT+WFJAPBSSID=01:02:03:04:05:06,MY_AP_SSID,6,1,N12345678 //WPA3 SAE security OK		
	+WFJAP:1,'N	IY_WPA3_AP_SSID',192.168.0.7	
	AT+WFJAPB hidden AP OK	SSID=01:02:03:04:05:06,MY_AP_SSID,6,1,12345678,1 //WPA3 SAE +	
	+WFJAP:1,'M	IY_AP_SSID',192.168.0.7	
	AT+WFJAPBSSID=01:02:03:04:05:06,MY_AP_SSID,7,1,N12345678 //WPA2(RSN)+WPA3 SAE security OK		
	-	IY_WPA3_AP_SSID',192.168.0.7	
	AT+WFJAPBSSID=? +WFJAP:'MY_AP_SSID',6,1,'N12345678',01:02:03:04:05:06 OK		
AT+WFJAPA3	<wpa3_flag>,<ssid> [,<key>][,<hidden>]</hidden></key></ssid></wpa3_flag>	Connect to an AP which includes WPA3 type. <ul> <li><wpa3_flag>: WPA2/WPA3 AP-type If 1, WPA3-AP.</wpa3_flag></li> <li>If 0, WPA/WPA2-AP.</li> </ul>	
		<ul> <li>If <key> exists, security protocol is WPA+WPA2 and encryption is TKIP+AES.</key></li> </ul>	
		<ul> <li>If <key> is omitted, security protocol is OPEN.</key></li> <li><hidden>: 1 (<ssid> is hidden), 0 or [not specified] (<ssid> is NOT hidden)</ssid></ssid></hidden></li> </ul>	
		<ul> <li>If <hidden> is omitted, <ssid> is not hidden.</ssid></hidden></li> <li><ssid>: AP SSID</ssid></li> </ul>	
		<ul> <li><key>: Passphrase. 8 ~ 63 characters are allowed</key></li> <li>Response: OK or ERROR</li> <li>Operation Results:</li> </ul>	
		+WFJAP: <ops_result>[,'<ssid>','<ip_address>'] +WFJAP:<ops_result>,<reason>,[<reason_code>] <ops_result>: 1 (SUCCESS), 0 (FAILED)</ops_result></reason_code></reason></ops_result></ip_address></ssid></ops_result>	
		<ul> <li>If <ops_result>: 1</ops_result></li> <li><ssid>: The SSID is surrounded by single quotation mark</ssid></li> <li><ip_address>: Assigned IP address and format is xxx.xxx.xxx</ip_address></li> </ul>	
		<ul> <li>If <ops_result>: 0</ops_result></li> <li><reason>: well-known reason in text</reason></li> </ul>	

Command	Parameters	Description
		• <reason_code>: if &lt; REASON &gt; is OTHER, this shows the reason code.</reason_code>
		For an explanation of <reason> or <reason_code>, See Table 12.</reason_code></reason>
	?	Get the AP profile information (SSID and Passphrase only).
	(none)	Operation Results:
		If Wi-Fi connection is success:
		+WFJAPA3:' <ssid>','<passphrase>'</passphrase></ssid>
		If Wi-Fi connection fails:
		ERROR:-425 (No SSID found)
	Example	
	AT+WFJ/	APA3=0,WPA2_AP_SSID //Open mode
	OK	
	+WFJAP:	1,'WPA2_AP_SSID',192.168.0.2
		APA3=0,WPA2_AP_SSID,1 //Open mode + hidden SSID
	OK	
	+WFJAP:	1,'WPA2_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=0,WPA2_AP_SSID,N12345678 //WPA2 security
	OK	
	+WFJAP:	1,'WPA2_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=0,WPA2_AP_SSID,N12345678,1 //WPA2 security + hidden AP
	OK	
	+WFJAP:	1,'WPA2_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=1,WPA3_AP_SSID //WPA3-OWE
	OK	
	+WFJAP:	1,'WPA3_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=1,WPA3_AP_SSID,N12345678 //WPA3-SAE security
	OK	
	+WFJAP:	1,'WPA3_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=1,WPA3_AP_SSID,N12345678,1 //WPA3-SAE + hidden AP
	OK	
	+WFJAP:	1,'WPA3_AP_SSID',192.168.0.2
	AT+WFJ/	APA3=?
	+WFJAP/	A3:'MY_AP_SSID','N12345678'
	OK	
	Note:	
	Enabled by defa	
		wait for both command response OK or ERROR and Operation Result; wait = JAP:1,' <ssid>',<ip address=""> for successful connection.</ip></ssid>
	Depending on the second sec	ne network condition, it may take more time to get an Operation Result because ection reattempts.
		ot happens after running this command.

Command	Parameters	Description	
	The AP configuratio	n parameters (AP Profile) are stored in NVRAM.	
	WPA3 Personal is enabled by default in the SDK v3.2.5.0 or later.		
AT+WFJAPA3BSSID	<wpa3_flag>, <bssid>,<ssid></ssid></bssid></wpa3_flag>	Connect to an AP which includes WPA3 type and matches the given BSSID. <ul> <li><a href="mailto:wpa3_flags:wpa2/wpa3_ap-type">wpa3_flags:wpa3_flags:wpa3_flags</a></li> </ul>	
	[, <key>][,<hidden>]</hidden></key>	If 1, WPA3-AP. If 0, WPA/WPA2-AP.	
		<ul> <li>If <key> exists, security protocol is WPA+WPA2 and encryption is TKIP+AES.</key></li> </ul>	
		<ul> <li>If <key> is omitted, security protocol is OPEN.</key></li> </ul>	
		<ul> <li><hidden>: 1 (<ssid> is hidden), 0 or [not specified] (<ssid> is NOT hidden)</ssid></ssid></hidden></li> </ul>	
		<ul> <li>If <hidden> is omitted, <ssid> is not hidden.</ssid></hidden></li> </ul>	
		• <bssid>: BSSID</bssid>	
		• <ssid>: AP SSID</ssid>	
		<ul> <li><key>: Passphrase. 8 ~ 63 characters are allowed</key></li> </ul>	
		Response: OK or ERROR	
		+WFJAP: <ops_result>[,'<ssid>','<ip_address>']</ip_address></ssid></ops_result>	
		+WFJAP: <ops_result>,<reason>,[<reason_code>]</reason_code></reason></ops_result>	
		<pre><ops_result>: 1 (SUCCESS), 0 (FAILED)</ops_result></pre>	
		<ul> <li>If <ops_result>: 1</ops_result></li> <li>COID = The COID is compared at the size of a most stice most stice.</li> </ul>	
		SSID>: The SSID is surrounded by single quotation mark	
		IP_ADDRESS>: Assigned IP address and format is xxx.xxx.xxx	
		• If <ops_result>: 0</ops_result>	
		<reason>: well-known reason in text</reason>	
		<reason_code>: If &lt; REASON &gt; is OTHER, this shows the reason code.</reason_code>	
		For an explanation of <reason> or <reason_code>, See Table 12.</reason_code></reason>	
	?	Get the AP profile information (SSID, Passphrase and BSSID).	
	(none)	Operation Results:	
		If Wi-Fi connection is success:	
		+WFJAPA3BSSID:' <ssid>','<passphrase>',<bssid></bssid></passphrase></ssid>	
		If Wi-Fi connection fails:	
		ERROR:-425 (No SSID found)	
	Example		
	AT+WFJAPA	3BSSID=0,01:02:03:04:05:06,WPA2_AP_SSID //Open mode	
	ОК		
	+WFJAP:1,'WPA2_AP_SSID',192.168.0.2		
	AT+WFJAPA3BSSID=0,01:02:03:04:05:06,WPA2_AP_SSID,1 //Open mode + hidden SSID		
	ОК		
	+WFJAP:1,'WPA2_AP_SSID',192.168.0.2		
	AT+WFJAPA3BSSID=0,01:02:03:04:05:06,WPA2_AP_SSID,N12345678 //WPA2 security OK		
	OK +WFJAP:1,'WPA2_AP_SSID',192.168.0.2		
	+VVFJAP:1,V	VFA2_AF_JJU, 192. 100.U.2	

Command	Parameters	Description	
		AT+WFJAPA3BSSID=0,01:02:03:04:05:06,WPA2_AP_SSID,N12345678,1 //WPA2	
	security + hidden AP OK		
		+WFJAP:1,'WPA2_AP_SSID',192.168.0.2 AT+WFJAPA3BSSID=1,01:02:03:04:05:06,WPA3_AP_SSID //WPA3-OWE	
	AT+WFJAF OK		
	-	'WPA3_AP_SSID',192.168.0.2	
	security	PA3BSSID=1,01:02:03:04:05:06,WPA3_AP_SSID,N12345678 //WPA3-SAE	
	OK +WFJAP:1,	'WPA3_AP_SSID',192.168.0.2	
	AT+WEJAE + hidden Af OK	PA3BSSID=1,01:02:03:04:05:06,WPA3_AP_SSID,N12345678,1 //WPA3-SAE	
		'WPA3_AP_SSID',192.168.0.2	
	AT+WFJAF	PA3BSSID=?	
		BBSSID:'MY_AP_SSID','N12345678',01:02:03:04:05:06	
	<ul> <li>OK</li> <li>Note:</li> <li>Enabled by default in the SDK and this command is available in SDK v3.2.9.0 or later.</li> <li>The host should wait for both command response OK or ERROR and Operation Result for OK, and +WFJAP:1,'<ssid>',<ip address=""> for successful connection.</ip></ssid></li> <li>Depending on the network condition, it may take more time to get an Operation Result of internal connection reattempts.</li> </ul>		
	<ul> <li>No system reboot happens after running this command.</li> </ul>		
	The AP configurat	ion parameters (AP Profile) are stored in NVRAM.	
AT+WFSAP	See AT+WFSAP	-	
	Example AT+WFSAP=DA16200_MY_SSID,5,1,KR //WPA3 OWE +WFSAP:DA16200_MY_SSID		
	OK		
	AT+WFSAP=DA16200_MY_SSID,7,1,12345678,1,KR //WPA2 RSN & WPA3 SAE, AES +WFSAP:DA16200_MY_SSID		
	OK		
	AT+WFSAF	D_7	
		-=: DA16200_MY_SSID',7,1,'12345678',1,KR	
	OK		

### 5.5 Wi-Fi Function Commands for WPA Enterprise

AT commands of the DA16200 provide Wi-Fi commands that can be used as STA in WPA-Enterprise environment. To connect to the WPA-Enterprise AP, the DA16200 needs to have profile information for the WPA-Enterprise AP and user account information.

Table 14. WPA-enterprise Wi-Fi function commands

Command	Parameters	Description	
AT+WFENTAP	<ssid>,<auth>,<enc>, <phase1>,<phase2> [,<hidden>] (phase1=0 1 2 4) <ssid>,<auth>,<enc>, <phase1>[,<hidden>] (phase1=3 5)</hidden></phase1></enc></auth></ssid></hidden></phase2></phase1></enc></auth></ssid>	Create Enterprise profile to NVRAM. <ul> <li><ssid>: Enterprise AP SSID</ssid></li> <li><auth>: Authentication mode for WAP-Enterprise. 8 (WPA-EAP), 9 (WPA2-EAP), 10 (WPA/WPA2-EAP).</auth></li> <li><enc>: Encryption Type. 0 (TKIP), 1 (AES), 2 (TKIP+AES)</enc></li> <li><phase1>: Phase #1 EAP type. 0 (Mixed), 1 (PEAP0), 2 (PEAP1), 3 (FAST), 4 (TTLS), 5 (TLS)</phase1></li> <li><phase2>: Phase #2 EAP type. 0 (Mixed), 1 (MSCHAPV2), 2 (GTC). 3 (TLS)</phase2></li> <li><hidden>: 1 (<ssid> is hidden), 0 or [not specified] (<ssid> is NOT hidden)</ssid></ssid></hidden></li> <li>Response: OK or ERROR</li> <li>Operation Results: +WFENTAP:<ssid></ssid></li> </ul>	
	?	Get the WPA-Enterprise configuration.	
	(none)	Response: +WFENTAP: <ssid>,<auth>,<enc>,<phase1>,<pahse2></pahse2></phase1></enc></auth></ssid>	
	OK +WFENTAP:'MY_ AT+WFENTAP=N OK +WFENTAP:'MY_	MY_AP_SSID,10,2,0,0 //Phase#1, #2 Mixed mode _AP_SSID' MY_AP_SSID,10,2,0,0,1 //Phase#1, #2 Mixed mode + hidden AP	
	AT+WFENTAP=N OK +WFENTAP:'MY_ Note:	MY_AP_SSID,10,2,4,3 //Phase #1 (TTLS), #2 (TLS) mode _AP_SSID'	
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	<ul> <li>WPA-Enterprise profile is stored in NVRAM.</li> </ul>		
	"EAP-FAST" type for <phase1> is not supported in SDK 3.2.3.0 and earlier SDK.</phase1>		
	<ul> <li>If <phase1> is set to 5 (TLS) or <phase2> is set to 3 (TLS), the certificate for WPA enterprise is stored in SFlash (See Table 10).</phase2></phase1></li> <li>The mixed type of <phase1> selects one of Extensible Authentication Protocol (EAP) that is PEAP,</phase1></li> </ul>		
	FAST, or TTLS, except TLS.		
	The mixed type of <phase2> selects one of EAP that is MSCHAPV2 or GTC, except TLS.</phase2>		
	<ul> <li>If EAP-TLS or EAP-PEAP-TLS is required, it should be manually selected.</li> </ul>		
	Need user account to co	nnect to WPA-Enterprise AP. See "AT+WFENTLI" command.	

Command	Parameters	Description
	<ul> <li>System restart is required for changes to take effect.</li> </ul>	
AT+WFENTLI	<id>[,<pw>]</pw></id>	Set User-ID/Password for WPA-Enterprise user account.
		<id>: Login-ID for WPA-Enterprise user account</id>
		<pw>: Login-Password for WPA-Enterprise user account</pw>
		Response: OK or ERROR
	?	Get current saved User-ID/Password for WPA-enterprise user account.
	(none)	Response: OK or ERROR
		Operation Result: +WFENTLI: <id>,<pwd></pwd></id>
	Example	
	AT+WFENTLI='USER_ACCOUNT_ID','USER_ACCOUNT_PWD'	
	OK	
	AT+WFENTLI	
	+WFENTLI='USE	R_ACCOUNT_ID','USER_ACCOUNT_PWD'
	AT+WFENTLI=?	
	+WFENTLI='USER_ACCOUNT_ID','USER_ACCOUNT_PWD'	
	Note:	
	Enabled by default in the SDK.	
	<ul> <li>User account ID and password are stored in NVRAM.</li> </ul>	
	<ul> <li>System restart is required for changes to take effect.</li> </ul>	

#### Table 15. WPA-enterprise network function command

Command	Parameters	Description	
AT+NWTLSV	<ver></ver>	Set the minimum accepted TLS protocol version when Phase#1 EAP type is TTLS or TLS of WPA Enterprise. The maximum accepted TLS protocol version is TLSv1.2.	
		For example, If TLSv1.0 is set up, the version of TLS session can be TLSv1.0, TLSv1.1 or TLSv1.2.	
		<ver>: Enterprise AP SSID. 0 <tlsv1.0>, 1 <tlsv1.1>, 2 <tlsv1.2> Response: OK or ERROR</tlsv1.2></tlsv1.1></tlsv1.0></ver>	
	?	Get the currently saved TLS version.	
	(none)	Response:	
		+NWTLSV: <tls_version></tls_version>	
	Example AT+NWTLSV=NEW_TLS_VER OK		
	AT+NWTLSV +NWTLSV:2 OK		
	AT+NWTLSV=? +NWTLSV:2 OK		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	<ul> <li>TLS Version number is stored as internal value.</li> </ul>		
		<ul> <li>The default minimum accepted TLS protocol version is TLSv1.2.</li> </ul>	
	<ul> <li>System restart is required for changes to take effect.</li> </ul>		
# 5.5.1 WPA-Enterprise Connection Example

Create WPA-Enterprise profile and restart the DA16200/DA16600 to start Wi-Fi connection. For all cases, WPA-Enterprise user account information is needed.

```
Case #1, "Mixed" mode for EAP-type.
In this case, Encryption-type is configured as "Mixed" mdoe.
EAP-type and Encryption type are selected automatically.
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 0
AT+WFENTLI='WPA-Ent User ID', 'WPA-Ent PWD'
AT+RESTART
Case #2, "Mixed" mode for EAP-type and Encryption type.
EAP-type and Encryption type are selected automatically.
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 0, 0
AT+WFENTLI='WPA-Ent User ID', 'WPA-Ent PWD'
AT+RESTART
Case #3, in case of PEAPO and MSCHAPV2 for WPA-Enterprise.
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 1, 1
AT+WFENTLI='WPA-Ent_User_ID', 'WPA-Ent_PWD'
AT+RESTART
Case #4, "Mixed" mode for EAP-type and set with TLS v1.0.
In this case, Encryption-type is configured as "Mixed" mdoe.
EAP-type and Encryption type are selected automatically.
AT+NWTLSV=1
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 0
AT+WFENTLI='WPA-Ent User ID', 'WPA-Ent PWD'
AT+RESTART
Case #5, "EAP-TLS mode" and set with TLS v1.0.
In this case, Encryption-type is configured as "TLS" mode (passwordless).
ATT+NWTT.SV=1
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 5
AT+WFENTLI='WPA-Ent User ID'
AT+RESTART
Case #6, "EAP-PEAPO-TLS mode" and set with TLS v1.0.
In this case, EAP-Encryption types are configured as "PEAPO" and "TLS" mode (passwordless).
AT+NWTLSV=1
AT+WFENTAP='WPA-Ent-AP-SSID', 10, 2, 1, 3
AT+WFENTLI='WPA-Ent User ID'
AT+RESTART
```

# 5.6 Advanced Function Commands

# 5.6.1 MQTT Commands

The commands in Table 16 are for configuring MQTT Client parameters. Restart the MQTT client for the configuration to take effect after running the commands.

# NOTE

In DPM mode, stop the MQTT Client (AT+NWMQCL=0) first before running the configuration commands. If any configuration commands are running in DPM mode without stopping MQTT Client, it returns ERROR:-635.

#### Table 16. MQTT configuration command list

Command	Parameters	Description
AT+NWMQBR	<host_name>,<port></port></host_name>	Set the host name (or IP address) and the port number of the MQTT Broker.
		<host_name>: Broker's domain name, or IP address</host_name>
		<port>: Broker's port number</port>

Command	Parameters	Description	
		Response: OK or ERROR	
	?	Get the host name or IP address and the port number of the MQTT	
	(none)	Broker.	
		Response: +NWMQBR: <host_name>,<port></port></host_name>	
	Prerequisite		
		Id be disabled (+NWMQCL:0).	
	Example AT+NWMQBR=1	92 168 0 65 1884	
	OK	52.100.0.00,1004	
	AT+NWMQBR=?		
	+NWMQBR:192.1	168.0.65,1884	
	OK		
	Note:		
	Enabled by default in the SDK.		
		or IP address) and port configured are stored in the NVRAM.	
		for the new configuration to take effect.	
AT+NWMQQOS	<qos></qos>	Set the MQTT QoS level.	
		<qos>: 0 (at most once), 1 (at least once), 2 (exactly once) Response: OK or ERROR</qos>	
	?	Get the MQTT QoS level. Response: +NWMQQOS: <qos></qos>	
	(none)		
	Prerequisite		
	Example	Id be disabled (+NWMQCL:0).	
	AT+NWMQQOS=	-1	
	OK		
	AT+NWMQQOS		
	+NWMQQOS:1		
	OK		
	Note:		
Enabled by default in			
	<ul> <li>The configuration is store</li> <li>MOTT restart is required</li> </ul>	ed in NVRAM. I for the new configuration to take effect.	
AT+NWMQTLS	<tls></tls>	Enable/disable the MQTT TLS function. <tls>: 1 (enable), 0 (disable)</tls>	
		Response: OK or ERROR	
	?	Get MQTT TLS status.	
	(none)	Response: +NWMQTLS: <tls></tls>	
	Prerequisite		
	-	d be stored. See Table 10.	
		Id be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQTLS=	1	

Command	Parameters	Description	
	ОК		
	AT+NWMQTLS		
	+NWMQQOS:1		
	ОК		
	Note:		
	Enabled by default in the SDK.		
	The configuration is stored in NVRAM.		
		for the new configuration to take effect.	
AT+NWMQCS	<clean_session></clean_session>	Set clean session mode.	
		<pre><clean_session>: 1(session cleared), 0(session retained)</clean_session></pre>	
		Response: OK or ERROR	
	?	Get clean session status.	
	(none)	Response: +NWMQCS: <clean_session></clean_session>	
	Prerequisite		
		ld be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQCS=1		
	OK		
	AT+NWMQCS=? +NWMQCS:1		
	+NVMQCS:1 OK		
	Note:		
	<ul> <li>Enabled by default in SE</li> </ul>	VK v3.2.3.0.	
	<ul> <li>The configuration is store</li> </ul>		
	<ul> <li>To disable/enable this fe</li> </ul>	ature, useMQTT_CLEAN_SESSION_MODE_SUPPORT in	
	config_generic_sdk.h.		
	<ul> <li>IfMQTT_CLEAN_SES to a MQTT broker in Cle</li> </ul>	SSION_MODE_SUPPORT is not defined, MQTT client always connects anSession=1 mode.	
	<ul> <li>MQTT reconnection is required for this new configuration to take effect.</li> </ul>		
	See MQTT Example: Us	ing CleanSession=0.	
AT+NWMQTS	<num>,<topic#1>,</topic#1></num>	Set the topic(s) of the MQTT subscriber.	
	<topic#2>,</topic#2>	<num>: Number of topics</num>	
		<topic#n>: MQTT subscriber topic(s). Max topic length = 64</topic#n>	
		Response: OK or ERROR	
	?	Get the MQTT subscriber topic(s).	
	(none)	Response: +NWMQTS: <num>,<topic#1>,<topic#2>,</topic#2></topic#1></num>	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQTS=?		
	ERROR:-654		
	AT+NWMQTS=1,	da16k_sub	
	ОК		

Command	Parameters	Description	
	AT+NWMQTS=?		
	+NWMQTS:1,"da	16k_sub"	
	OK Note: • Enabled by default in the SDK.		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
		hen there is no subscriber topic set.	
	<ul> <li>After this command is run, the previously configured subscriber topic(s) is(are) cleared and set to the new one(s).</li> </ul>		
	<ul> <li>MQTT restart is required</li> </ul>	for the new configuration to take effect.	
AT+NWMQATS	<topic></topic>	Add the specified topic to MQTT configuration.	
	Prerequisite		
	MQTT client shou	Id be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQATS=	ABCD	
	OK		
	AT+NWMQTS=?		
	+NWMQTS:1,"AE	3CD"	
	ОК		
	Note:		
	Enabled by default in the		
	-	The configuration is stored in NVRAM.	
	topic.	WMQATS=?) not supported. If AT+NWMQATS=? Is run, "?" is added as a	
AT+NWMQDTS	<topic></topic>	Delete the specified topic from MQTT configuration.	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQTS=?		
	+NWMQTS:2,"ABCD","EFGH"		
	ОК		
	AT+NWMQDTS=ABCD		
	ОК		
	AT+NWMQTS=?		
	+NWMQTS:1,"EFGH"		
	OK		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	The configuration is eras		
AT+NWMQTP	The configuration is eras <topic></topic>	Set a topic of the MQTT publisher.	
AT+NWMQTP	-	Set a topic of the MQTT publisher. <topic>: MQTT publisher topic</topic>	
AT+NWMQTP	<topic></topic>	Set a topic of the MQTT publisher. <topic>: MQTT publisher topic Response: OK or ERROR</topic>	
AT+NWMQTP	-	Set a topic of the MQTT publisher. <topic>: MQTT publisher topic</topic>	

Command	Parameters	Description	
	Prerequisite		
	MQTT client shou	ld be disabled (+NWMQCL:0).	
	Example AT+NWMQTP=?		
	ERROR:-662		
	AT+NWMQTP=da OK	пок_рир	
	AT+NWMQTP=?		
	+NWMQTP:da16k_pub		
	ОК		
	Note:		
	Enabled by default in the	SDK.	
	The configuration is store		
	"ERROR:-662" means "N	-	
	•	for the new configuration to take effect.	
	<ul> <li>There is one slot for storing a publish topic so that the stored topic is replaced with new one if the AT command is re-issued.</li> </ul>		
AT+NWMQV311	<use_v311></use_v311>	Use MQTT protocol v3.1.1. The default is v3.1.	
		<use_v311>: 1 (v3.1.1)/0 (v3.1)</use_v311>	
	?	Show the MQTT protocol version currently set.	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQV311=	?	
	+NWMQV311:0		
	OK		
	AT+NWMQV311=	1	
	OK		
	AT+NWMQV311=?		
	+NWMQV311:1		
	OK		
	Note:		
	Enabled by default in the SDK.		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	<ul> <li>MQTT restart is required for the new configuration to take effect.</li> </ul>		
AT+NWMQPING	<period></period>	Set MQTT ping period.	
		<period>: Ping period (second)</period>	
		Response: OK or ERROR	
	?	Get the current MQTT ping period.	
	(none)	Response: +NWMQPING: <period></period>	
	Prerequisite		
	-	ld be disabled (+NWMQCL:0).	
	Example		

Command	Parameters	Description	
	AT+NWMQPING		
	+NWMQPING:6	00	
	ОК		
	AT+NWMQPING=300		
	OK		
	AT+NWMQPING	3	
	+NWMQPING:300		
	OK		
	Note:		
	Enabled by default in the second s	ne SDK.	
	The configuration is sto		
	<ul> <li>MQTT restart is require</li> </ul>	ed for the new configuration to take effect.	
AT+NWMQCID	<client_id></client_id>	Set the MQTT Client ID.	
		<client_id>: Client ID</client_id>	
		Response: OK or ERROR	
	?	Get the current MQTT Client ID.	
	(none)	Response: +NWMQCID: <client_id></client_id>	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQCID=?		
	+NWMQCID:da16x_CCA4 //Generate a default CID if there is no CID stored in NVRAM.		
	AT+NWMQCID=client-1		
	ОК		
	AT+NWMQCID		
	+NWMQCID:client-1		
	ОК		
	Note:		
	Enabled by default in the SDK.		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	<ul> <li>MQTT restart is required for the new configuration to take effect.</li> </ul>		
AT+NWMQLI	<name>,<pw></pw></name>	MQTT login information.	
		<name>: ID</name>	
		<pw>: Password</pw>	
		Response: OK or ERROR	
	?	Get the MQTT login information.	
	(none)	Response: +NWMQLI: <name>,<pw></pw></name>	
	Prerequisite		
		ould be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQLI=?		
	ERROR:-673		

Command	Parameters	Description	
	AT+NWMQLI=da <sup>•</sup> OK	16k_user,12345678	
	AT+NWMQLI +NWMQLI:da16k_user,12345678 OK		
	Note: • Enabled by default in the SDK.		
	<ul> <li>The configuration is stored in NVRAM.</li> <li>"ERROR:-673" means "No user name exists".</li> </ul>		
	<ul> <li>MQTT restart is required</li> </ul>	for the new configuration to take effect.	
AT+NWMQAUTO	<auto></auto>	Enable/Disable auto-start of MQTT Client at reboot. <auto>: 1 (Enable), 0 (Disable)</auto>	
	?	Get the MQTT Client's auto start configuration status.	
	(none)	Response: +NWMQAUTO: <auto></auto>	
	Prerequisite MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQAUTO=? +NWMQAUTO:0		
	OK		
	AT+NWMQAUTO=1 OK		
	AT+NWMQAUTO +NWMQAUTO:1		
	OK Note:		
	Enabled by default in the SDK.		
	The configuration is store	ed in NVRAM.	
	Default is 0 (disable).		
<ul> <li>MQTT restart is required for the new control</li> </ul>			
AT+NWMQWILL	<topic>,<msg>,<qos></qos></msg></topic>	Set MQTT Will message.	
		<topic>: Will topic</topic>	
		<msg>: Will message <qos>: Will QoS. 0 (at most once), 1 (at least once), 2 (exactly once)</qos></msg>	
		Response: OK or ERROR	
	?	Get the MQTT Will message.	
	(none)	Response: +NWMQWILL: <topic>,<msg>,<qos></qos></msg></topic>	
	Prerequisite		
		ld be disabled (+NWMQCL:0).	
	Example	· · ·	
	AT+NWMQWILL=	?	
	ERROR:-664		

Command	Parameters	Description	
	Or		
	ERROR:-665		
	AT+NWMQWILL=da16k_will,bye,0		
	OK		
	AT+NWMQWILL		
	+NWMQWILL:da16k_will,bye,0		
	ОК		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	The configuration is store		
		neans topic or message is missing.	
	<ul> <li>MQTT restart is required</li> </ul>	for the new configuration to take effect.	
AT+NWMQDEL	(none)	Reset the MQTT configurations.	
		Response: OK or ERROR	
	Prerequisite		
	MQTT client shou	ld be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQDEL		
	ОК		
	Note:		
	<ul> <li>This command resets all MQTT configurations.</li> </ul>		
	The configuration is eras	ed from NVRAM.	
	<ul> <li>If the MQTT client is run AT+NWMQCL=0.</li> </ul>	ning, run this command after the MQTT client is disabled by	

# Table 17. MQTT operation command list

Command	Parameters	Description	
AT+NWMQCL	<mqtt_client></mqtt_client>	Enable/disable the MQTT client.	
		<mqtt_client>: 0 (disable), 1 (enable)</mqtt_client>	
		Response: OK or ERROR	
	?	Get the MQTT client status.	
	(none)	Response: +NWMQCL: <mqtt_client></mqtt_client>	
	Prerequisite		
	The DA16200/DA16600 should be connected to AP.		
	Example		
	AT+NWMQCL=1		
	ОК		
	(If MQTT connection is established)		
	AT+NWMQCL		
	+NWMQCL:1		
	ОК		
	(If MQTT connection under progressing)		
	AT+NWMQCL		
	+NWMQCL:2		

Command	Parameters	Description	
	ОК		
	(If MQTT connection failed)		
	AT+NWMQCL		
	+NWMQCL:0		
	ОК		
	Note:		
	Enabled by default in the	SDK.	
	<ul> <li>If the system restarts, then the MQTT client is not started automatically as this command is just to start/stop the MQTT client.</li> </ul>		
		ion parameters such as MQTT broker IP, port number, and subscriber nplete before issuing this command.	
AT+NWMQMSG	<msg>[,<topic>,<retain>]</retain></topic></msg>	Publish an MQTT message.	
		<msg>: Message to be published</msg>	
		<topic>: MQTT topic (optional)</topic>	
		<retain>: Retain flag (optional)</retain>	
		Response: OK or ERROR	
		Operation Results:	
		Send Success: +NWMQMSGSND:1	
		Send Failure: +NWMQMSGSND:0, <err_code></err_code>	
	Prerequisite		
		Prerequisite MQTT client should be enabled (+NWMQCL:1).	
	Example		
	AT+NWMQMSG=	Hello world III	
	OK		
	+NWMQMSGSNI	٦·1	
		5.1	
	AT+NWMOMSG=	-'{"car":"red", "type":"bus"}'	
	OK		
	+NWMQMSGSNI	۲·1	
	AT+NWMQMSGSND:1		
	OK		
	-	D:0,-6 //Failed to send because MQTT is not in connected state	
	<ul> <li>Note:</li> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> <li>If a single quotation is used in a message, it is surrounded by double quotation marks.</li> <li>In the default AT command image, the maximum total combined string length allowed for &lt; <topic> should be less than or equal to 2066. So, if it needs to send a max length <msp> (2 bytes long) with an explicit <topic> specified, the <topic> length should be 18 characters lo less. If it needs to send a message with the maximum length topic allowed (which is 64), se 2002 bytes <msp> in maximum.</msp></topic></topic></msp></topic></li> </ul>		
		(+NWMQMSGSND:1 or +NWMQMSGSND:0, <err_code>):</err_code>	
	Depending on network	conditions, a message publishing transaction (Qos 0, 1, 2) may take	
	A new async response	+NWMQMSGSND:1 or +NWMQMSGSND:0 that comes after "OK" etion of a publish transaction or failure.	
	In CleanSession=1 mo	ode, if mqtt is disconnected, the host can immediately get but in CleanSession=0 mode, +NWMQMSGSND:0 is not sent but instead	

Command	Parameters	Description	
	the transaction resum CleanSession=0.	es when MQTT client reconnects. See MQTT Example: Using	
AT+NWMQUTS	<topic></topic>	Unsubscribe from the specified topic.	
	Prerequisite MQTT client should be enabled (+NWMQCL:1). Example AT+NWMQUTS=ABCD OK Note: • Enabled by default in the SDK (available from SDK v3.2.3.0 or later). • The configuration is erased from NVRAM.		
	This command should be	e run while the MQTT client is in a connected state with Broker.	
AT+NWMQTT	<host_name>,<port>, <sub_topic>, <pub_topic>, <qos>,<tls> [,<username>, <password>, <run_reboot>]</run_reboot></password></username></tls></qos></pub_topic></sub_topic></port></host_name>	Run the MQTT Client with options. After entering this command, the system reboots automatically. At reboot, the DA16200/DA16600 tries to connect to the MQTT broker after the Wi-Fi connection is successfully established. • <host_name>: Broker's domain name or IP address • <port>: Broker's port number • <sub_topic>: MQTT subscriber topic • <pub_topic>: MQTT publisher topic • <qos>: MQTT QoS level. • <tl>&gt; <tl>&gt; tlashe/disable MQTT TLS. 1 (enable), 0 (disable) • <username>: Login ID (optional) • <run_reboot>: Device reboot option enable/disable (optional). 1 (reboot), 0 (mqtt configuration reflected without reboot), default (reboot). Response: OK or ERROR</run_reboot></username></tl></tl></qos></pub_topic></sub_topic></port></host_name>	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0). Example AT+NWMQTT=192.168.0.65,1884,da16k_sub,da16k_pub,0,0 //The following examples are logs after the DA16200 reboots. +INIT:DONE,0		
	+WFJAP:1,'test_ap_ssid',192.168.0.88 +NWMQCL:1 Note:		
	Enabled by default in th	e SDK.	
	The configuration is store	red in NVRAM.	
	<ul> <li>After the system reboots</li> </ul>	s, the operation result is sent, see "+NWMQCL" response.	

Table 18 shows optional MQTT configuration commands for the MQTT brokers that require TLS ALPN, SNI, or Cipher Suite information from MQTT Client at the connection stage. These commands are enabled by default in SDK v3.2.3.0 or later.

# Table 18. MQTT optional configuration commands

Command	Parameters	Description	
AT+NWMQALPN	<num>,</num>	Set the TLS ALPN protocol name for MQTT.	
	<alpn#1>,</alpn#1>	<num>: Number of ALPNs. The maximum number of ALPN is three.</num>	
	<alpn#2>, <alpn#3></alpn#3></alpn#2>	<alpn#n>: TLS ALPN protocol name. The maximum length of each ALPN protocol name is 24.</alpn#n>	
		Response: OK or ERROR	
	?	Get the TLS ALPN(s) that was set.	
		Response: +NWMQALPN: <num>,<alpn#1>,<alpn#2>,<alpn#3></alpn#3></alpn#2></alpn#1></num>	
	Prerequisite MQTT client shou	Ild be disabled (+NWMQCL:0).	
	Example		
	AT+NWMQALPN=?		
	ERROR:-644		
	AT+NWMQALPN=2,alpn-protrol-name-an,alpn-protocol-name-ax OK		
	AT+NWMQALPN		
	+NWMQALPN:2,	"alpn-protrol-name-an","alpn-protocol-name-ax"	
	OK		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	The configuration is stored in NVRAM.		
	IfMQTT_TLS_OPTIO	NAL_CONFIG is enabled in the SDK, this command should be enabled	
	"ERROR:-644" means "I	No ALPN is set".	
AT+NWMQSNI	<sni></sni>	Set TLS SNI for MQTT.	
		<sni>: Server Name Indication. The maximum length of SNI is 64.</sni>	
		Response: OK or ERROR	
	?	Get the TLS SNI that was set.	
		Response: +NWMQSNI: <sni></sni>	
	Prerequisite		
	MQTT client should be disabled (+NWMQCL:0).		
	Example		
	AT+NWMQSNI=?AERROR:-648		
	AT+NWMQSNI=a38a9rhiu3roqb-ats.myserver.com		
	OK		
	AT+NWMQSNI		
	+NWMQSNI: a38a9rhiu3roqb-ats.myserver.com		
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	<ul> <li>The configuration is stored in NVRAM.</li> </ul>		
	IfMQTT_TLS_OPTIONAL_CONFIG is enabled in the SDK, this command should be enabled		
	"ERROR:-648" means "I	No SNI is set".	
AT+NWMQCSUIT	<cipher 1="" suite="">,</cipher>	Set TLS Cipher suites.	

Command	Parameters	Description
	<cipher 2="" suite="">,</cipher>	<cipher suite="">: A hex decimal value of cipher suite. See Appendix D.</cipher>
		The maximum number of cipher suites is 17.
		Response: OK or ERROR
	?	Get TLS cipher suites that were set.
		Response: +NWMQSNI: <number cipher="" of="" suites="">,<cipher 1="" suite="">,<cipher 2="" suite="">,</cipher></cipher></number>
	Prerequisite	
	MQTT client shou	uld be disabled (+NWMQCL:0).
	Example	
	AT+NWMQCSUI	T=?
	ERROR:-650	
	or	
	ERROR:-651	
	AT+NWMQCSUI	T=c024,c023,c00a,c009,c00d,c032
	ОК	
	AT+NWMQCSUI	т
	+NWMQCSUIT:6	,c024,c023,c00a,c009,c00d,c032
	OK	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	<ul> <li>The configuration is stor</li> </ul>	ed in NVRAM.
	<ul> <li>IfMQTT_TLS_OPTIC enabled.</li> </ul>	DNAL_CONFIG is enabled in the SDK, this command should be
	"ERROR:-650 or -651"	means "No CSUIT info is set".

		does not support all the cipher suites because of memory limitation. onics for using other cipher suites that are not specified in Appendix D.

## Table 19. MQTT response list

Response	Parameters	Description
+NWMQCL	<result></result>	The result of the MQTT client connection.
	[,TOO_LONG_MSG_RX]	<result>: 0 (disconnected), 1 (connected)</result>
		For example:
		+NWMQCL:1
		MQTT connection to the MQTT broker is successfully established
		+NWMQCL:2
		<ul> <li>MQTT connection to the MQTT broker is under progressing</li> </ul>
		+NWMQCL:0
		<ul> <li>The MQTT connection is NOT successfully established</li> </ul>
		+NWMQCL:0,TOO_LONG_MSG_RX
		Can be sent when the MQTT is disconnected by unsupported message length only if the current MQTT connection is with clean_session=0 and QoS greater than or equal to 1.
	Example	
	//When MQTT cor	nnection to the MQTT broker is successfully established,
	+NWMQCL:1	

Response	Parameters Description				
	//When MQTT broker is down,				
	+NWMQCL:0				
	Note:				
	<ul> <li>The DA16200/DA16600 Debug Console log (UART0).</li> </ul>				
	<ul> <li>When MQTT connection to the MQTT broker is successfully established, the DA16200/DA16600 sends "+NWMQCL:1" message to MCU (or AT command console). At this moment, the following log appears:</li> <li>&gt;&gt; MQTT Client connection OK</li> </ul>				
	<ul> <li>When the MQTT broker is down, the DA16200/DA16600 sends "+NWMQCL:0" message to MCU (or AT command console) after retrying connection. In the console log, the following logs appear:</li> </ul>				
	Failed to receive pkt. (0x38)				
	Failed to read pkt(0x7880)				
	MQTT Client disconnected (state=6)				
	[SUB] REQ mqtt_restart (count=1)				
	Connecting FAIL (0x38)				
	Unable to connect (The connection was refused.)				
	[SUB] REQ mqtt_restart (count=5)				
	Connecting FAIL (0x38)				
	Unable to connect (The connection was refused.)				
	[SUB] MAX Retry (Retry Cnt=6).				
	<ul> <li>To get this Operation Result, it may take more time if the DA16200/DA16600 connection reattempt happens depending on the test network condition.</li> </ul>				
	<ul> <li>This message is also sent after AT+NWMQTT is run or if any MQTT configuration command is run and then the system is restarted.</li> </ul>				
	<ul> <li>The DA16200/DA16600 restarts if the AT command format is OK.</li> </ul>				
	<ul> <li>+INIT:DONE,0 message is sent as the DA16200/DA16600 boots up.</li> </ul>				
	<ul> <li>If usage of the AT command is not valid, the DA16200/DA16600 sends an ERROR message without restarting.</li> </ul>				
	The DA16200/DA16600 tries to connect to the AP after rebooting.				
	<ul> <li>+WFJAP:0,<reason> or +WFJAP:1,'<ssid>',<ip address=""> as result of the Wi-Fi connection.</ip></ssid></reason></li> </ul>				
	<ul> <li>If the Wi-Fi connection information such as SSID or key is NOT stored correctly in the DA16200/DA16600 NVRAM, +WFJAP:x response is NOT sent and the MQTT connection is NOT attempted as well. Because the MQTT connection needs a successful Wi-Fi connection first.</li> </ul>				
	<ul> <li>The DA16200/DA16600 tries to connect to the MQTT broker after the Wi-Fi connection is established. The MQTT broker information is stored in NVRAM. Connection result.</li> </ul>				
	<ul> <li>+NWMQCL:0 or +NWMQCL:1 – is sent over UART1 as a result.</li> </ul>				
	<ul> <li>NWMQCL:0 is sent when the Wi-Fi Link goes down because of the following conditions.</li> </ul>				
	<ul> <li>Sometimes, the host can get an unsolicited +NWMQCL:0 message when DPM wake-up under poor signal conditions with the AP connected. An example is when Wi-Fi connection with AP becomes unstable – such as when DPM Keepalive fails, Beacon loss detected. In these cases, as STA, the DA16200/DA16600 tries to get "Wi-Fi link" down and up to reconnect with AP (while doing this, Wi-Fi is disconnected and then reconnected). MQTT client, when this kind of situation is detected, tries to reconnect to Broker after forcing disconnection. When MQTT disconnection occurs, +NWMQCL:0 is sent to the host. On receipt of this unsolicited message, the host should wait for +NWMQCL:1.</li> </ul>				
	+NWMQCL:0,TOO_LONG_MSG_RX				
	<ul> <li>If the current mqtt_client connection with Broker is configured with clean_session=0 and qos is greater than or equal to 1, +NWMQCL:0,TOO_LONG_MSG_RX can be sent to the host (exceptional case). This message indicates that mqtt_client is disconnected by receiving a message that exceeds the message length limit (2048) of da16x MQTT client. What the host</li> </ul>				

Response	Parameters	Description		
	should do, in this situation, is configure clean_session to 1 and connect to Broker to delete the message and then disconnect from Broker and reconnect with clean_session=0 again to start over (a kind of Recovery). According to MQTT Spec, Broker keeps sending a message that was not Acked by the client. In this case, the long message (valid for Broker, but not valid for da16x MQTT client) can repeatedly be sent to da16x MQTT client unless connection with clean_session=1 is made from da16x MQTT client.			
	<ul> <li>This response mess</li> </ul>	sage is enabled by default in SDK v3.2.3.0.		
	<ul> <li>Example recovery fl</li> </ul>	ow on receipt of +NWMQCL:0,TOO_LONG_MSG_RX.		
	//MQTT client is d	isconnected by receiving a message with unsupported length		
	+NWMQCL:0,TO	O_LONG_MSG_RX		
	AT+NWMQCS=1	//Set clean_session=1		
	ОК			
		er (to clear the invalid long message)		
	AT+NWMQCL=1			
	OK			
	+NWMQCL:1			
	AT+NWMQCL=0 //Disconnect from Broker			
	+NWMQCL:0			
	ОК			
	AT+NWMQCS=0 //Set clean_session=0			
	OK			
	AT+NWMQCL=1 //Connect to Broker with clean_session=0			
	ОК			
	+NWMQCL:1			
+NWMQMSG	<msg>,<topic>,<length></length></topic></msg>	Receive the MQTT message.		
		<pre><msg>: Message data</msg></pre>		
		<pre><topic>: Received topic</topic></pre>		
	<length>: Message length</length>			
	Example			
	//When the DA16200/DA16600 receives a message from the MQTT publisher, the following message is sent from the DA16200/DA16600 to AT command console:			
	+NWMQMSG:He	llo world!!!!,da16k_sub,15		
	Note: MQTT client is in a c	onnected state with the broker (+NWMQCL:1).		

# 5.6.1.1 MQTT Client Connection Example

Configure the parameters and start the MQTT Client (After Wi-Fi Connection): AT+NWMQBR=172.16.0.1,1884 AT+NWMQTS=1,da16k\_sub AT+NWMQTP=da16k\_pub AT+NWMQAUTO=1 (Optional, if DPM mode is used, setting this parameter is needed) AT+NWMQCL=1 If the connection is successful, the following is shown: +NWMQCL:1 If DA16K receives a PUBLISH from a broker, the following is shown: +NWMQMSG:Hello World,da16k,11 DA16K can send a PUBLISH to a broker. Type the following command: AT+NWMQSG='Hello I'm DA16K'

# 5.6.1.2 MQTT TLS Connection Example

#### 5.6.1.3 MQTT Example with DPM

#### Figure 22. Example sequence to initiate MQTT protocol with DPM

Figure 22 is an example sequence to initiate the MQTT protocol with DPM in the DA16200/DA16600. In the normal BOOT state, connect to an AP (AT+WFJAPA) and change its run mode to DPM mode (AT+DPM=1,1. It is an optional parameter and "1" means writing DPM mode to NVRAM and does not reboot. To make DPM mode take effect, a reboot is required).

To configure the MQTT connection information, enter command AT+CLRDPMSLPEXT and type the following as an example:

AT+NWMQTT=test.mosquitto.org,1883,sub\_topic,pub\_topic,0,0

Figure 23. Procedure to send MQTT messages

Figure 23 shows the procedure to send an MQTT message in Sleep mode. When MCU wakes up the DA16200/DA16600, the response +INIT:WAKEUP,EXT is sent. The MCU sends the command AT+MCUWUDONE to inform that MCU is ready to operate. To prevent the DA16200/DA16600 entering DPM LPM, MCU should send command AT+CLRDPMSLPEXT before an MQTT PUBLISH is sent. To make the DA16200/DA16600 enter DPM LPM again, send a PUBLISH with command AT+NWMQMSG, and then enter command AT+SETDPMSLPEXT.

Figure 24. Procedure to process MQTT messages

Figure 24 shows how to process a received MQTT message while in Sleep mode. When the DA16200/DA16600 wakes up by a PUBLISH message from an MQTT broker, the response +INIT:WAKEUP,UC is sent. The MCU sends the AT+MCUWUDONE to inform that it is ready to operate. Next, the DA16200/DA16600 sends the received PUBLISH to the MCU and enters DPM LPM again.

# 5.6.1.4 MQTT Example: Changing Subscription Topic when Running

Assume that the Wi-Fi/MQTT connection is configured properly and DPM is set to 1 (TRUE). The following example is the recommended sequence and double quotation marks are used.

```
Trigger RTC WAKE UP Event (by MCU)
Wait for "+INIT:WAKEUP,EXT" Response. Send AT+MCUWUDONE, and wait for "OK"
Run "AT+CLRDPMSLPEXT" command
Wait for "OK" response
loop running "AT+NWMQCL=?"
if responses are "+NWMQCL:0" and "OK"
     then, goto E. to run "AT+NWMQCL=?" command
else if responses are "+NWMQCL:1" and "OK"
     then, goto next, F.
else if response is "ERROR:x"
     then, Run "AT+SETDPMSLPEXT"
           Wait for "OK" response
           return
Run "AT+NWMQCL=0"
Wait for "+NWMQCL:0" and "OK" response
Run "AT+NWMQTS=<New MQTT Subscription Topic>"
Wait for "OK" response
Run "AT+RESTART"
Wait for "+INIT:DONE,0" response
Wait for "+WFJAP:1, '<SSID>', <IP ADDRESS>"
Wait for "+NWMQCL:1" response
```

# 5.6.1.5 MQTT Example: Reading Subscription Topic when Running

Assume that the Wi-Fi/MQTT connection is configured properly and DPM is set to 1 (TRUE). The reading of the MQTT publishing topic should be similar. The following example is the recommended sequence and double quotation marks are used.

Trigger RTC\_WAKE\_UP Event Wait for "+INIT:WAKEUP,EXT" Response. Send AT+MCUWUDONE, and wait for "OK" Run "AT+CLRDPMSLPEXT" command Wait for "OK" response Run "AT+NMMQTS=?" Wait for "+NWMQTS:<MQTT Subscription Topic>" and "OK" response Note that there are possibilities to receive the ERROR response if the format of the command has some errors. Run "AT+SETDPMSLPEXT" Wait for "OK" response

Assume that the Wi-Fi/MQTT connection is configured properly and DPM is set to 1 (TRUE). The reading of the MQTT publishing topic should be similar. The following example is the recommended sequence and double quotation marks are used.

Trigger RTC\_WAKE\_UP Event Wait for "+INIT:WAKEUP,EXT" Response. Send AT+MCUWUDONE, and wait for "OK" Run "AT+CLRDPMSLPEXT" command Wait for "OK" response Run "AT+NMMQTS=?" Wait for "+NWMQTS:<MQTT Subscription Topic>" and "OK" response Run "AT+SETDPMSLPEXT"

### 5.6.1.6 MQTT Example: Using CleanSession=0

### 5.6.1.6.1 CleanSession=0 Mode

When an MQTT Client (MQTTC) establishes connection with an MQTT Broker (Broker), there are two types of session: CleanSession=1 and CleanSession=0.

**CleanSession=1**: default session type. When Broker gets a connect request from an MQTTC that tries to connect with an option "CleanSession=1" (which is default config on DA16x), Broker treats the connection as a "new" session. If there is any existing session associated with the same client\_id found, Broker clears that previous session and creates a new one with the client id.

**CleanSession=0**: when Broker gets a connect request from an MQTTC that tries to connect with an option "CleanSession=0", Broker tries to find a session (session data) with the same client\_id first. If it finds one, it keeps using that session for the new MQTTC.

While MQTTC is in operation with Broker, there may be times when the TCP connection gets unstable and disconnected (for example, MQTT ping failed) which may cause some messages that were published to Broker at that specific disconnected time may not be delivered to a subscriber. If new messages (with QoS > 0) are published to Broker and for sessions that were configured in "CleanSession=0", Broker retains and re-send them when the MQTTC is reconnected. MQTTC (if CleanSession=0 is enabled) also should retain the state of the unfinished/unacked messages until reconnection.

	New connection from 192.168.0.2 on port 8883.
1647307743:	New client connected from 192.168.0.2 as da16x_D9CC (c1, k60).
1647307743:	Sending CONNACK to da16x_D9CC (0, 0)
1647307743:	Received SUBSCRIBE from da16x_D9CC
1647307743:	SUB_TOPIC (QoS 2)
1647307743:	da16x_D9CC 2 SUB_TOPIC
1647307743:	Sending SUBACK to da16x_D9CC

Figure 25. Broker console – CleanSession=1 connection

1647307743:	New connection from 192.168.0.2 on port 8883.
1647307743:	New client connected from 192.168.0.2 as da16x_D9CC (c1, k60).
1647307743:	Sending CONNACK to da16x_D9CC (0, 0)
1647307743:	Received SUBSCRIBE from da16x_D9CC
1647307743:	SUB_TOPIC (QoS 2)
1647307743:	da16x_D9CC 2 SUB_TOPIC
1647307743:	Sending SUBACK to da16x_D9CC

Figure 26. Broker console – CleanSession=0 connection

Even with CleanSession=0 connection, Broker does not maintain session data if MQTT is disconnected in the following cases.

- If a new message is published with QoS 0 after MQTT is disconnected
- If MQTTC connection QoS is 0

DA16x supports CleanSession=0 mode in the following way.

- CleanSession=0 feature" is enabled by default in SDK v3.2.3.0 or later.
- If a customer application decides that QoS 1 or QoS 2 and CleanSession=0 is used in their application, the message (payload) size (both TX and RX) should be pre-decided (because there is limitation in DPM user pool size). By default, 100 bytes are defined.

#define MQTT\_MSG\_TBL\_PRESVD\_MAX\_PLAYLOAD\_LEN 100

- Depending on the application's expected maximum payload size while operation, other values can be defined.
- DPM User Pool has a limited amount (about 8K in total) in the system.
- Check available "free" DPM User Pool size first (by using the console command "dpm user\_pool") and then calculate the max payload length and message number for the application if needed.
- The default configuration (payload\_len: 100, max\_count: 10) allocates about 1.9 kB of DPM user pool (Check mq\_msg\_tbl\_presvd\_t for more information).
- Search for the following compiler options in config\_generic\_sdk.h.

//max payload length of a preserved message

#define MQTT\_MSG\_TBL\_PRESVD\_MAX\_PLAYLOAD\_LEN 100

//max number of preserved messages

#define MQTT\_MSG\_TBL\_PRESVD\_MAX\_MSG\_CNT

.....

10

Supported command to set CleanSession mode: AT+NWMQCS=<1|0>.

# CleanSession and QoS Matrix Table for PUBLISH RX

# Table 20. CleanSession and QoS matrix in message RX

	Subscriber		Unacked message delivery	QoS	Publisher
Case	Clean session	QoS	(After MQTT reconnection)	(Effective actual)	message's QoS
1	1	0	Х	0	0
2	1	1	Х	0	0
3	1	2	Х	0	0
4	1	0	Х	0	1
5	1	1	Х	1	1
6	1	2	Х	1	1
7	1	0	Х	0	2
8	1	1	Х	1	2
9	1	2	Х	2	2
10	0	0	Х	0	0
11	0	1	Х	0	0
12	0	2	Х	0	0

	Subscriber		Unacked message delivery	QoS	Publisher
Case	Case Clean QoS session		(After MQTT reconnection)	(Effective actual)	message's QoS
13	0	0	Х	0	1
14	0	1	0	1	1
15	0	2	0	1	1
16	0	0	Х	0	2
17	0	1	0	1	2
18	0	2	0	2	2

With CleanSession=1, no unacked message delivery happens when MQTT reconnects occur (marked as x). With CleanSession=0, only case 14, 15, 17, and 18 make message redeliveries for messages that were delivered to Broker while the MQTTC was offline (marked as O).

# CleanSession and QoS Matrix Table for PUBLISH TX

Expectation 1	An application assumes that it failed to send a message and waits until MQTT gets reconnected.
Behavior 1	An application sends messages again.
Expectation 2	An application assumes that it failed to send a message but resumes sending the message when MQTT reconnected.
Behavior 2         An application simply waits as MQTT sends the message automatically.	

#### Table 21. CleanSession and QoS matrix in message TX

Publisher			Expectation if MQTT gets disconnected (while QoS	
Case	Case Clean QoS Session		1/2 message is not fully acked or QoS 0 Send is being sent)	
1	1	0	Expectation 1	Behavior 1
2	1	1	Expectation 1	Behavior 1
3	1	2	Expectation 1	Behavior 1
4	0	0	Expectation 1	Behavior 1
5	0	1	Expectation 2	Behavior 2
6	0	2	Expectation 2	Behavior 2

When publishing a message from DA16x, the application's expectation and action/behavior may be different if CleanSession=0 and QoS 1 or 2 are used in some specific cases.

In normal network conditions, there is no difference in message send behavior between CleanSession=0 and CleanSession=1.

In some abnormal cases where QoS ½'s ACK message (PUBACK, PUBREC, PUBREL, or PUBCOMP) get lost because of some bad network conditions (which can cause MQTTC reconnection), CleanSession=0 can recover the previous message state and resume the communication with Broker.

However, if CleanSession=1 is used, when MQTTC is disconnected, it can safely re-transmit the message when MQTTC is reconnected. Depending on use cases of applications/host applications, either approach (CleanSession=0 or CleanSession=1) can be utilized.

# 5.6.1.6.2 How to Connect with CleanSession=0

```
AT+NWMQQOS=2
OK
AT+NWMQCS=0
OK
AT+NWMQCL=1
OK
+NWMQCL:1
```

To activate "CleanSession=0 support mode" in DA16x, QoS should be 1 or 2 and CleanSession option should be set to 0. If either option (CleanSession and QoS) is not set as above, CleanSession=0 support mode is disabled.

# 5.6.1.6.3 How to Restart CleanSession=0 Test

If it needs to re-test (fresh new test) with CleanSession=0 mode, depending on the previous session type, it may need Broker to clear the previous session.

The reason is that since MQTTC connects with CleanSession=0, Broker does not delete the session data until MQTTC reconnects with CleanSession=1.

Case 1: Previous session is CleanSession=1 and need to restart a new CleanSession=0 test.

AT+NWMQCL=0 OK AT+NWMQCS=0 OK AT+NWMQCL=1 OK

Case 2: Previous session is CleanSession=0 and needs to re-test another CleanSession=0 test run.

```
AT+NWMOCL=0
+NWMOCL:0
OK
AT+NWMOCS=1
OK
AT+NWMQCL=1
OK
+NWMQCL:1
AT+NWMQCL=0
+NWMQCL:0
OK
AT+NWMQCS=0
OK
AT+NWMQCL=1
OK
+NWMQCL:1
```

# 5.6.1.6.4 PUBLISH RX Test Steps

Test steps are as follows under Non-DPM and DPM mode.

### Non-DPM Mode:

- DA16x: connect to Broker
- Publisher: send one or two messages
- DA16x: check if the messages are received

- DA16x: disconnect from Broker
- Publisher: send one or two messages (let say msg\_A)
- DA16x: reconnect to Broker
- DA16x: check if msg\_A (sent while DA16x is offline) is received.

### **DPM Mode:**

- DA16x: connect to Broker. Enter DPM LPM
- Publisher: send one or two messages
- DA16x: check if the messages are received
- DA16x: turn off AP. Do not turn on AP, but wait for the MQTT keepalive period (to make sure Broker recognizes the MQTTC disconnection)
- Publisher: send one or two messages (let say msg\_A)
- DA16x: turn on AP. Wait until DA16x is connected to AP
- DA16x: reconnected to AP and check if msg\_A (sent while DA16x is offline) is received.

#### NOTE

- Mosquitto broker (Broker), Mosquitto publisher (Publisher), and DA16x (Subscriber) are used for the test.
- Message length from publisher should be less than or equal to 100. If longer messages are sent, they may not be restored properly when MQTT is reconnected.

#### 5.6.1.6.5 PUBLISH RX Test Steps – Example 1 (Non-DPM)

The following examples are the test steps for case 15 (Non-DPM mode).

[DA16x] connect Mqttc with CleanSession=0 and QoS 2.

AT+NWMQQOS=2 OK AT+NWMQCS=0 OK AT+NWMQCL=1 OK +NWMQCL:1

## [Other Publisher] publish messages.

```
C:\mosquitto>mosquitto_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB_TOPIC -m "Hello_q2"
```

C:\mosquitto>mosquitto\_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB\_TOPIC -m "Hello\_q2\_2"

#### [DA16x] check that the messages are successfully received.

+NWMQMSG:Hello\_q2,SUB\_TOPIC,8

+NWMQMSG:Hello q2 2,SUB TOPIC,10

### [DA16x] disconnect from Broker.

AT+NWMQCL=0 +NWMQCL:0

OK

#### [Other Publisher] publish two messages (while DA16x is in disconnected state)

```
C:\mosquitto>mosquitto_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB TOPIC -m "Hello q2 3"
```

C:\mosquitto\_mosquitto\_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB TOPIC -m "Hello q2 4"

[DA16x] reconnect to Broker and check if the two messages that were published while DA16x is in disconnected state are received successfully.

AT+NWMQCL=1 OK

+NWMQCL:1

+NWMQMSG:Hello\_q2\_3,SUB\_TOPIC,10

+NWMQMSG:Hello\_q2\_4,SUB\_TOPIC,10

### 5.6.1.6.6 PUBLISH RX Test Steps - Example 2 (DPM)

The following examples are the test steps for case 18 (DPM mode). Mosquitto broker and Mosquitto publisher are used for tests.

#### [DA16x] Connect with CleanSession=0 and QoS 2.

AT+NWMQQOS=2 OK AT+NWMQCS=0 OK AT+RESTART OK +INIT:DONE,0 +WFJAP:1,'SYN\_TEST\_AP',192.168.1.195 +ATPROV=STATUS 0

+NWMQCL:1

[Other Publisher] Publish messages.

C:\mosquitto\_mosquitto\_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB\_TOPIC -m "Hello q2 1"

C:\mosquitto>mosquitto\_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB TOPIC -m "Hello q2 2"

#### [DA16x] check that the messages are successfully received.

```
+INIT:WAKEUP,UC
```

+ATPROV=STATUS 0

+NWMQMSG:Hello\_q2\_1,SUB\_TOPIC,10

+INIT:WAKEUP,UC

+ATPROV=STATUS 0

+NWMQMSG:Hello\_q2\_2,SUB\_TOPIC,10

# NOTE

At wake-up time, the host should send AT+CLRDPMSLPEXT to get +NWMQMSG after which AT+SETDPMSLPEXT should be sent by the host to let DA16x enter DPM LPM.

#### [DA16x] Turn OFF AP.

+INIT:WAKEUP,NOBCN

+ATPROV=STATUS 0

+WFDAP:0, INACTIVITY

. . .

. . .

# [Broker] make sure MQTTC is disconnected.

1647405247: Socket error on client da16x\_D9CC, disconnecting.

#### [Other Publisher] publish two messages (while DA16x is in disconnected state).

```
C:\mosquitto>mosquitto_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB_TOPIC -m "Hello_q2_3"
```

C:\mosquitto\_mosquitto\_pub -h 192.168.0.230 -p 8883 --cafile cas.pem --cert wifiuser.pem --key wifiuser.key --tls-version tlsv1 --insecure -q 2 -t SUB TOPIC -m "Hello q2 4"

### [DA16x] Turn ON AP

[DA16x] Wait until AP is connected and see whether "hello\_qos\_3" and "hello\_qos\_4" are received.

```
+INIT:DONE,0
```

```
+WFJAP:1,'SYN_TEST_AP',192.168.1.195
```

+ATPROV=STATUS 0

```
+NWMQCL:1
```

# 5.6.1.6.7 PUBLISH Tx Test Steps

Test steps are as follows:

- DA16x: connect to Broker
- DA16x: send messages
- DA16x: check if the message sent is successful.

```
NOTE
```

Message length from the DA16200/DA16600 should be less than or equal to 100 bytes for case 5 and 6 configuration. Sending longer messages returns failure. For cases other than case 5 or 6, message length limit is 2048 bytes.

# 5.6.1.6.8 PUBLISH TX Test Steps – Example

The following examples are the test steps for case 6 (Non-DPM mode).

```
AT+NWMQQOS=2
OK
AT+NWMQCS=0
OK
AT+NWMQCL=1
OK
+NWMQCL:1
AT+NWMQMSG=hello_q2
OK
```

+NWMQMSGSND:1

# 5.6.2 HTTP-Client Commands

# Table 22. HTTP-Client command list

Command	Parameters	Description			
AT+NWHTC	<url>,<method>(,<body></body></method></url>	Start the HTTP client with options.			
	)	<url>: HTTP server address</url>			
		<method>: GET, POST or PUT</method>			
	Prerequisite				
		16600 should be connected to AP.			
	Example 1:				
	AT+NWHTC=http	://httpbin.org/get,get			
	ОК				
	Example 2:				
	AT+NWHTC=http OK	://httpbin.org/post,post,HTTP-Client POST method sample test!			
	For JSON type,				
		://httpbin.org/post,post,'{username: "aaa", password: "1234"}'			
	OK	$\pi$			
	Note:				
	<ul> <li>Enabled by default in the</li> </ul>	SDK v3 2 3 0 or later			
	<ul> <li>IfSUPPORT_HTTP_CLIENT_FOR_ATCMD is enabled in the SDK, this command should be enabled.</li> </ul>				
	See Section 5.6.2.1 for results	esult of GET, POST and PUT method examples.			
	<url>,message,&lt;'header</url>	Users can directly input header and body as plain text.			
	+body'>	Line feeds and carriage returns are inserted as \r\n.			
		<url>: HTTP server address</url>			
		message: Use the message as a fixed option (not the http method)			
		<'header+body'>: Enter a plain text string in the form of 'header+body'			
	Prerequisite				
	The DA16200/DA	16600 should be connected to AP.			
	Example 1: GET method re	equest (header).			
		://httpbin.org/get,message,'GET /get HTTP/1.1\r\nHost: inection: Close\r\n\r\n'			
	ОК				
	HTTP/1.1 200 OK				
	Date: Tue, 11 Mar 2025 02:54:18 GMT				
	Content-Type: application/json				
	Content-Length: 197				
	Connection: close				
	Server: gunicorn/19.9.0				
	Access-Control-A	llow-Origin: *			
	Access-Control-A	llow-Credentials: true

	The configuration is sto	red in NVRAM.	
	It must be set up before	e connecting to the server.	

Table 23. HTTP-Client response list

Command	Parameters	Description
+NWHTCSTATUS	<status></status>	Return status along with the received payload according to the requested method.
		<status>: 0x00 is success</status>
		See Appendix B.
		For example: +NWHTCSTATUS:0x00
+NWHTCDATA	<data size,=""></data>	Insert size information of data received only from AT+NWHTCH command.
		An integer data size and a comma are inserted, and the actual received data is after that.
		For example, +NWHTCDATA:426,

# 5.6.2.1 HTTP-Client Connection Example

# GET method request:

```
AT+NWHTC=https://httpbin.org/get,get
OK
HTTP/1.1 200 OK
Date: Tue, 07 Dec 2021 01:19:49 GMT
Content-Type: application/json
Content-Length: 457
Connection: keep-alive
Server: gunicorn/19.9.0
Access-Control-Allow-Origin: *
Access-Control-Allow-Credentials: true
{
  "args": {},
  "headers": {
    "Accept": "*/*",
    "Accept-Encoding": "identity",
    "Accept-Language": "ko-KR, Ko; q=0.9, en-US; q=0.8, en; q=0.7",
    "Host": "httpbin.org",
    "User-Agent": "Mozilla/5.0 (windows NT 6.1; Win64; x64) AppleWebkit/537.36 (KHTML, like Gecko)

  },
  "json": null,
 "origin": "124.50.108.25",
  "url": "https://httpbin.org/put"
}
+NWHTCSTATUS:0x00
```

# 5.6.3 HTTP-Server Commands

# Table 24. HTTP-Server command list

Command	Parameters	Description
AT+NWHTS	<flag></flag>	Start or stop the HTTP server depending on the option.
		<start>: 1 (start), 0 (stop)</start>
		Response: OK or ERROR
	Prerequisite The DA16200/DA Example AT+NWHTS=1 OK Note: Enabled by default in	16600 should be connected to AP.
AT+NWHTSS	<flag></flag>	Start or stop the HTTPS server depending on the option.
		<start>: 1 (start), 0 (stop)</start>
	<b>D</b>	Response: OK or ERROR
	Prerequisite The DA16200/DA16600 should be connected to AP. Example AT+NWHTSS=1 OK Note: • Enabled by default in the SDK v3.2.3.0 or later. • IfSUPPORT_HTTP_SERVER_FOR_ATCMD is enabled in the SDK, this command should be enabled.	

# 5.6.3.1 HTTP/HTTPS-Server Start Example

HTTP start:

AT+NWHTS=1

### HTTPS start:

AT+NWHTSS=1

# 5.6.4 WebSocket-Client Commands

# Table 25. WebSocket-Client command list

Command	Parameters	Description	
AT+NWWSC	<operation>, <uri> (<msg>), <subprotocol></subprotocol></msg></uri></operation>	Start the WebSocket client with options.	
		<operation> connect, send, or disconnect</operation>	
		<uri>: WebSocket server address</uri>	
		<msg>: Request message</msg>	
		subprotocol>: (optional) subprotocol field	
	Prerequisite		
	The DA16200/DA16600 should be connected to AP.		
	Example 1		
	AT+NWWSC=connect,ws://192.168.86.182:8080		
	+NWWSC:1		
	Example 2		
	AT+NWWSC=ser	nd,Send Message Test	
	OK		
	Example 3		
	AT+NWWSC=disconnect		
	+NWWSC:0		
	Option 1		
	AT+NWWSC= advanced_cfg, <ping_intv_sec>,<ping_time_out_sec>[,<buffer_size>]</buffer_size></ping_time_out_sec></ping_intv_sec>		
	This command is optional, if not provided, it takes default values.		
	<pre><pre><pre><pre><pre><pre><pre><pre></pre></pre></pre></pre></pre></pre></pre></pre>		
	<pre><ping_time_out_sec>: Period before connection is aborted because no PONGs received. Default is 120 seconds.</ping_time_out_sec></pre>		
	+NWWSC:0		
	Option 2		
	AT+NWWSC= header_ext, <header_length>[,<extended header="">]</extended></header_length>		
	This command is used for adding a WebSocket extension header. This is an optional configuration.		
	<header_length>: length of the header extension. If 0, it clears the previously configured header extension.</header_length>		
	This command can only set one WebSocket extension header at a time, but it can be set multiple times to support multiple different WebSocket request headers.		
	<pre><extended header="">: WebSocket additional headers</extended></pre>		
	+NWWSC:0		
	Option 3		
	AT+NWWSC=subprotocol, <set_flag>[,<subprotocol>]</subprotocol></set_flag>		
	This command is	used to configure the subprotocol. It is an optional command.	
	<set_flag>: if 1, it</set_flag>	adds the subprotocol provided in the command.	
	If 0, it clears previ	ously configured subprotocol.	
	<subprotocol>: W</subprotocol>	ebSocket subprotocol.	

Command	Parameters	Description
		n only set one subprotocol at a time, but it can be set multiple times to ifferent WebSocket subprotocols.
	Note: IfSUPPORT_WEBSOCKET_CLIENT is enabled in SDK, this command should be enabled.	

# Table 26. Web Socket-Client response list

Response	Parameters	Description
+NWWSC	C <status>(,<opcode>,<rec< td=""><td>Return status along with the received payload.</td></rec<></opcode></status>	Return status along with the received payload.
	eived msg	status>
	length>, <received msg="">)</received>	0 is disconnected.
		• 1 is connected.

# 5.6.5 OTA Commands

# Table 27. OTA command list

Command	Parameters	Description
AT+NWOTADWS	<fw_type>,<uri>[,<fw_na< td=""><td>Start downloading firmware from an OTA server.</td></fw_na<></uri></fw_type>	Start downloading firmware from an OTA server.
TART	me>]	<fw_type>: Set the type of firmware to be downloaded</fw_type>
		<uri>: Server URL where firmware exists</uri>
		<ul> <li><fw_name>: Optional. The maximum input size of fw_type is 7 bytes. MCU_FW is stored by default if not specified. (Only for MCU Firmware)</fw_name></li> </ul>
		Response: +NWOTADWSTART:0x00
	Prerequisite	
	The DA16200/D/	A16600 should be connected to AP.
	Example	
	//RTOS download	
	AT+NWOTADWS	TART=rtos,https://server/DA16200_RTOS-GEN01-01-1111-000000.img
	OK	
	+NWOTADWSTA	RT:0x00
	//Bluetooth <sup>®</sup> LE fir	mware download (DA16600 only)
	AT+NWOTADWS	TART=ble_fw,https://server/ble_firmware.img
	ОК	
	+NWOTADWSTA	RT:0x00
	//MCU firmware d	ownload
	AT+NWOTADWS	TART=mcu_fw,https://server/mcu_firmware.img

Command	Parameters	Description	
	ОК		
	+NWOTADWSTART:0x00		
	<pre>//MCU firmware download (Enter the name of MCU firmware within 8 characters. Default is "MCU_FW")</pre>		
	AT+NWOTADWS	AT+NWOTADWSTART=mcu_fw,https://server/mcu_firmware.img,ver01	
	OK	OK	
	+NWOTADWSTA	RT:0x00	
	//Bluetooth <sup>®</sup> LE fir		
	AT+NWOTADWS mg	TART=ble_fw,https://server/pxr_sr_coex_ext_531_6_0_14_1114_2_ota.i	
	OK		
	+NWOTADWSTA	RT:0x00	
	//Cert Key downlo	ad:	
	AT+NWOTADWS OK	TART=cert_key,https://server/ca.pem	
	+NWOTADWSTA	RT·0x00	
	Note:		
	Enabled by default in the	<ul> <li>Enabled by default in the SDK.</li> </ul>	
	<ul> <li>The parameter, fw_type</li> </ul>		
	<ul> <li>Bluetooth<sup>®</sup> LE firmware download is available on SDK V3.2.3.0 or later.</li> </ul>		
AT+NWOTAREN	(none)	Reboot with updated firmware.	
EW	Prerequisite		
	Download RTOS or Bluetooth <sup>®</sup> LE images.		
	Example		
	AT+NWOTARENEW		
	+NWOTARENEW:0x00		
	Note:		
	Enabled by default in the SDK.		
	<ul> <li>System reboots automatically after renewing is completed.</li> </ul>		
	<ul> <li>Bluetooth<sup>®</sup> LE image is s can be supported.</li> </ul>	supported in SDK V3.2.3.0 or later, either RTOS or Bluetooth <sup>®</sup> LE, or both	
AT+NWOTADWP	<fw_type></fw_type>	Get progress status of firmware download.	
ROG		<fw_type>: Set a firmware type among rtos, ble_fw, mcu_fw, or cert_key</fw_type>	
		Response: +NWOTADWPROG:100	
	Example		
	//Progress status of downloading RTOS:		
	AT+NWOTADWPROG=rtos		
	+NWOTADWPRC	DG:100	
	ОК		
	//Progress status of downloading MCU firmware:		
	AT+NWOTADWP	ROG=mcu_fw	
	+NWOTADWPROG:100		
	ОК		

Command	Parameters	Description	
	//Progress status	of downloading Bluetooth <sup>®</sup> LE firmware (DA16600 only):	
	AT+NWOTADWF	PROG=ble_fw	
	+NWOTADWPROG:100 OK		
	•	of downloading Cert Key:	
	AT+NWOTADWF +NWOTADWPRO	-	
	OK	99.100	
	Note: Enabled by default ir	the SDK.	
AT+NWOTADWS	(none)	Stop while downloading firmware.	
TOP	Example		
	AT+NWOTADWS	TOP	
	OK		
AT+NWOTAFWN	(none)	Read a name in the header of the MCU firmware (Only for MCU	
AME		firmware).	
	Example		
	AT+NWOTAFWN	AME	
	+NWOTAFWNAN	1E:MCU	
	ОК		
	Note:		
	Enabled by default in the		
	IfOTA_UPDATE_MCU_FW is enabled in the SDK, this command should be enabled.		
AT+NWOTAFWSI ZE	(none)	Read a size in the header of the MCU firmware (Only for MCU firmware).	
	Example		
	AT+NWOTAFWS	IZE	
	+NWOTAFWSIZE	E:4128	
	OK		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	IfOTA_UPDATE_MC	U_FW is enabled in the SDK, this command should be enabled.	
AT+NWOTAFWC RC	(none)	Read a CRC in the header of the MCU firmware (Only for MCU firmware).	
	Example		
	AT+NWOTAFWCRC		
	+NWOTAFWCRC:5aa8b6c4		
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	IfOTA_UPDATE_MC	U_FW is enabled in the SDK, this command should be enabled.	
AT+NWOTAREA DFW	<read addr="">, <read_size></read_size></read>	Read the MCU firmware as much as the <i>read_size</i> from the <i>read_addr</i> and transmit it (Only for MCU firmware).	
		<read_addr>: Hexadecimal without "0x" prefix</read_addr>	
		<read_size>: Decimal</read_size>	
		MCU_FW default address	
		- DA16200: 0x003A_D000	
Command	Parameters	Description	
---------------------	--	---	--
		- DA16600: 0x003C_2000	
	Example		
		DFW=3ad000,128	
	DA16FMCUğ2345678901234561234567890123456123456789012345612345612345678901 2345612345678901234561234567890123456		
	+NWOTAREADF	W:COMPLETE	
	ОК		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	IfOTA_UPDATE_MC	U_FW is enabled in the SDK, this command should be enabled.	
AT+NWOTATRA NSFW	(none)	Transmit the downloaded MCU firmware to the MCU. Transmission is failed if no header (16 bytes) information exists (Only for MCU firmware).	
	Example		
	AT+NWOTATRAI	NSFW	
	MCU		
	23456123456789	5678901234561234567890123456123456789012345612345678901 01234561234567890123456123456789012345612345678901234	
	+NWOTATRANS		
	OK		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	-	U_FW is enabled in the SDK, this command should be enabled.	
AT+NWOTAERA SEFW	(none)	Erase the MCU firmware stored in a serial flash of the DA16200/DA16600. (Only for MCU firmware).	
OLI W	Example		
	Example AT+NWOTAERASEFW		
	+NWOTAERASE	-	
	OK		
	Note:		
	<ul> <li>Enabled by default in the</li> </ul>	SDK v3.2.3.0 or later.	
	<ul> <li>IfOTA_UPDATE_MCU_FW is enabled in the SDK, this command should be enabled.</li> </ul>		
AT+NWOTASETA	<pre><sflash_addr></sflash_addr></pre>	Designate an address where data can be downloaded within the range	
DDR		SFlash area.	
		MCU_FW/CERT_KEY default address	
		DA16200: 0x003A_D000	
		<ul> <li>DA16600: 0x003C_2000</li> </ul>	
		CERT_KEY should be copied to the operating area if downloaded to the user area, which is the default address.	
		CERT_KEY area address	
		DA16200/DA16600: 0x003A_3000	
	Example		
	AT+NWOTASETADDR=3ad000		
	+NWOTASETAD	DR:0x00	
	OK		
	Note: Enabled by default in	the SDK.	
AT+NWOTAGET	<fw_type></fw_type>	Return the value set with NWOTASETADDR.	
ADDR		MCU_FW/CERT_KEY default address.	

Command	Parameters	Description	
		<ul> <li>DA16200: 0x003A_D000</li> </ul>	
		DA16600: 0x003C_2000	
	Example		
	AT+NWOTAGETADDR=mcu_fw		
	+NWOTAGETAD		
	OK		
	AT+NWOTAGET	ADDR=cert key	
	+NWOTAGETAD	-	
	OK		
	Note: Enabled by default in	the SDK.	
AT+NWOTAREA	<pre><sflash_addr>,<size></size></sflash_addr></pre>	Read as much as size from sflash_addr.	
DFLASH	<siiasii_auui>,<si2e></si2e></siiasii_auui>	MCU_FW default address	
-		<ul> <li>DA16200: 0x003A_D000</li> </ul>	
		<ul> <li>DA16200: 0x003A_D000</li> <li>DA16600: 0x003C_2000</li> </ul>	
		- DA10000. 0x003C_2000	
	Example		
		DFLASH=3ad000,128	
	MCU_FW 2"ZDA16FMCU <b>X</b> 2	23456789012345612345678901234561234567890123456123456789	
		8901234561234567890123456	
	ОК		
	Note: Enabled by default in	n the SDK.	
AT+NWOTAERA	<sflash_addr>,<size></size></sflash_addr>	Delete as much as size from sflash_addr.	
SEFLASH	_ ,	MCU_FW default address	
		<ul> <li>DA16200: 0x003A_D000</li> </ul>	
		<ul> <li>DA16600: 0x003C_2000</li> </ul>	
	Example		
		SEFLASH=3ad000,1000	
		FLASH:COMPLETE	
	OK		
	Note:		
	<ul> <li>Enabled by default in the</li> </ul>	SDK	
	<ul> <li>It is erased in 4 kB increased</li> </ul>		
AT+NWOTACOP	<pre><dest_sflash_addr>,<src< pre=""></src<></dest_sflash_addr></pre>	Copy as much as size from src_sflash_addr to dest_sflash_addr.	
YFLASH	_sflash_addr>, <size></size>	MCU_FW default address:	
		<ul> <li>DA16200: 0x003A_D000</li> </ul>	
		<ul> <li>DA16600: 0x003C_2000</li> </ul>	
		D/10000.0x0000_2000	
		VELASH-202000 204000 1000	
		YFLASH=3c2000,3ad000,1000	
	OK	LASH:COMPLETE	
	<ul> <li>Note:</li> <li>Enabled by default in the SDK.</li> </ul>		
	It is copied in 4 kB increased in 4 kB increa		
AT+NWOTATLSA	<tls_auth_mode></tls_auth_mode>	Set the certificate verification mode.	
UTH		#define MBEDTLS_SSL_VERIFY_NONE 0	
		#define MBEDTLS_SSL_VERIFY_OPTIONAL 1	

Command	Parameters	Description	
		#define MBEDTLS_SSL_VERIFY_REQUIRED 2	
	Example AT+NWOTATLSAUTH=1		
	OK		
	Note:		
	Enabled by default in th	e SDK v3.2.5.0 or later.	
	The configuration is store	red in NVRAM.	
AT+NWOTABYM CU	rtos, <full_size></full_size>	Transmit the RTOS stored in the MCU to the DA16200/DA16600 when there is no network access.	
		If the AT+NWOTABYMCU= rtos, <full_size> command is OK, RTOS is transmitted as much as the partial size with tx_size=<partial_size>,<binary data="">. Every transmission sends "OK" as a response unless there is an error. If an error occurs or transmission is complete, it responds with +NWOTABYMCU:0x00 including status.</binary></partial_size></full_size>	
		Note: Only RTOS can be downloaded.	
	Example		
	AT+NWOTABYM	ICU=rtos,1335408	
	OK		
	tx_size=4096,4643394BDA4F2784000000000000000000000000000000000000		
	 tx_size=112,00000000000000000000000000000000000		
	Note:		
	<ul> <li>Enabled by default in th</li> </ul>	e SDK v3.2.5.0 or later.	
	<ul> <li>IfOTA_UPDATE_MCU_FW is enabled in the SDK, this command should be enabled.</li> </ul>		

NOTE
When DPM mode is enabled and OTA update is in progress (firmware download is in progress), it does not enter DPM LPM because of SFlash write operation. After downloading the firmware, the DA16200 resumes to enter DPM LPM.
Table 28. OTA response list

Response	Parameters	Description	
+NWOTADWSTA RT	<status></status>	Return the status of firmware download. <status>: 0x00 is success. See Table 29 for other status values. For example: +NWOTADWSTART:0x00</status>	
+NWOTARENEW	<status></status>	Return the status of firmware RENEW. <status>: 0x00 is success. See OTA Response Code List for others For example: +NWOTARENEW:0x00</status>	
+NWOTADWPRO G	<progress></progress>	Return the percentage value (%) of the firmware download progress. <progress>: Print download progress in percent For example: +NWOTADWPROG:100</progress>	
+NWOTADWSTO P	<status></status>	Return the status of firmware download stop. <status>: 0x00 is success. See Table 29 for other status values For example: +NWOTADWSTOP:0x00</status>	
+NWOTATRANS FW	COMPLETE or FAIL	Return result of MCU firmware transmission (Only for MCU firmware). For example: +NWOTATRANSFW:COMPLETE	

Response	Parameters	Description
+NWOTAFWNAM	<name></name>	String entered by a user (Default is MCU_FW).
E		Returns "(NULL)" if there is no MCU firmware.
		(Only for MCU firmware)
+NWOTAFWSIZE	<size></size>	Downloaded MCU firmware size.
		It returns 0 if there is no MCU firmware.
		(Only for MCU firmware)
+NWOTAFWCRC	<crc></crc>	Downloaded MCU Firmware CRC.
		It returns 0 if there is no MCU firmware.
		(Only for MCU firmware)
+NWOTAREADF	COMPLETE or FAIL	Success: COMPLETE
W		Failure: FAIL
		(Only for MCU firmware)
+NWOTAERASE	COMPLETE or FAIL	Success: COMPLETE
FW		Failure: FAIL
		(Only for MCU firmware)
+NWOTASETAD	<status></status>	<status>: 0x00 is success</status>
DR		See Table 29 for other status values.
+NWOTAGETAD DR	<sflash_addr></sflash_addr>	Return the value of sflash_addr.
(AT+NWOTAREA DFLASH)	(Binary)	Return binary data as much as entered SFlash address and size.
+NWOTAERASE	COMPLETE or FAIL	Success: COMPLETE
FLASH		Failure: FAIL
+NWOTACOPYF	COMPLETE or FAIL	Success: COMPLETE
LASH		Failure: FAIL
+NWOTABYMCU	<status></status>	<status>: 0x00 is success</status>
		See Table 29 for other status values.

# Table 29. OTA response code list

Return value	Description
0x00	Return success.
0x01	Return fail.
0x02	SFlash address is wrong.
0x03	Firmware type is unknown.
0x04	Server URL is unknown.
0x05	The firmware size is too big.
0x06	CRC is not correct.
0x07	Firmware version is unknown.
0x08	The firmware version is incompatible.
0x09	Firmware not found on the server.
0x0A	Failed to connect to the server.
0x0B	All new Firmware were not downloaded.
0x0C	Failed to allocate memory.
0xA1	The Bluetooth LE firmware version is unknown.

## 5.6.5.1 OTA Download Example

```
RTOS download:

AT+NWOTADWSTART=rtos,https://server/DA16200_RTOS-GEN01-01-1111-000000.img

Bluetooth® LE FW download: (DA16600 only)

AT+NWOTADWSTART=ble_fw,https://server/ble_firmware.img

MCU FW download:

AT+NWOTADWSTART=mcu_fw,https://server/mcu_firmware.img

AT+NWOTADWSTART=mcu_fw,https://server/mcu_firmware.img,ver01

Cert Key download:

AT+NWOTADWSTART=cert_key,https://server/ca.pem
```

## 5.6.5.2 OTA Download Progress Example

```
RTOS download progress:
AT+NWOTADWPROG=rtos
Bluetooth® LE FW download progress: (DA16600 only)
AT+NWOTADWPROG=ble_fw
MCU FW download progress:
AT+NWOTADWPROG=mcu_fw
Cert Key download progress:
AT+NWOTADWPROG=cert_key
```

#### 5.6.5.3 OTA Renew Example

Renew Firmware (reboot with updated FW): AT+NWOTARENEW

## 5.6.5.4 MCU Firmware Transport Example

MCU FW transmission: AT+NWOTATRANSFW Get MCU FW name: AT+NWOTAFWNAME Get MCU FW size: AT+NWOTAFWSIZE Get MCU FW CRC: AT+NWOTAFWCRC Read MCU FW as much as specified size: AT+NWOTAREADFW=3ad000,128 Delete MCU FW stored in the DA16200/DA16600 SFlash: AT+NWOTAERASEFW

#### 5.6.5.5 SFlash User Area Address Setting Example

SET ADDR: AT+NWOTASETADDR=3ad000 GET ADDR: AT+NWOTAGETADDR=mcu\_fw AT+NWOTAGETADDR=cert\_key

#### 5.6.5.6 SFlash READ/COPY/ERASE Example

SFlash Read: AT+NWOTAREADFLASH=3ad000,128 SFlash Copy: AT+NWOTACOPYFLASH=3ad000,0x3c2000,128 SFlash Erase: AT+NWOTAERASEFLASH=0x1f2000,128

### 5.6.5.7 TLS Certificate Verification Mode Setting Example

SET MBEDTLS\_SSL\_VERIFY\_NONE: AT+NWOTATLSAUTH=0 SET MBEDTLS\_SSL\_VERIFY\_OPTIONAL: AT+NWOTATLSAUTH=1 SET MBEDTLS\_SSL\_VERIFY\_REQUIRED: AT+NWOTATLSAUTH=2

## 5.6.5.8 RTOS by MCU Download Example

Initialization: AT+NWOTABYMCU=rtos,1335408 Data transmission: tx\_size=4096,4643394BDA4F278400000000000000000...

# 5.6.6 Zeroconf Commands

#### Table 30. Zerocont command list

Command	Parameters	Description	
AT+NWMDNSST ART	<mode></mode>	Start the mDNS module. The mDNS module is communicated through multicast. The DA16200/DA16600 could frequently be changed from/to DPM LPM and wake-up states. It may consume more power.	
		<mode>: The mode in which the WLAN interface is running, 0 (Station) or1 (Soft AP).</mode>	
	Prerequisite		
	The DA16200/DA	16600 should be connected to AP.	
	The host name of	mDNS module should be set up.	
	Example		
	AT+NWMDNSST	ART=1	
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	The configuration is store		
	IfSUPPORT_ZERO_0	CONFIG is enabled in the SDK, this command should be enabled.	
	?	Get the string representing the status of mDNS module, "started" or "not started".	
	Example		
	AT+NWMDNSST	ART=?	
	+NWMDNSSTAR	T:started	
AT+NWMDNSHN REG	<host name=""></host>	Register the host name in the mDNS module. mDNS supports one configured host name only, to change or set a new mDNS host name. mDNS service must be stopped and started again.	
		<host name="">: The name of the host to be registered.</host>	
	Example		
	AT+NWMDNSHNREG=da16x		
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	The configuration is store	ed in NVRAM.	
	IfSUPPORT_ZERO_	CONFIG is enabled in the SDK, this command should be enabled.	
AT+NWMDNSSR	<instance< td=""><td>Register a service in the mDNS module.</td></instance<>	Register a service in the mDNS module.	
VREG	name>, <protocol>,</protocol>	Instance name>: The instance name of service to be registered.	

Command	Parameters	Description	
	<port>[,<text record="">]</text></port>	Protocol>: The protocol and the type of the service to be registered.	
		<port>: The port number of the service to be registered.</port>	
		<ul> <li><text record="">: The text record of the service that must be registered and mentioned in "Key=Value" format. Multiple pairs of text records should be separated using a ",".</text></li> </ul>	
	Prerequisite	•	
		16600 should be connected to AP.	
	The host name of	f mDNS module should be set up.	
	Example		
	AT+NWMDNSSR	VREG=_WEBAPP,_http,_tcp,80,LIGHT=OFF,FAN=ON	
	OK		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	The configuration is stor	ed in NVRAM.	
	IfSUPPORT_ZERO_	CONFIG is enabled in the SDK, this command should be enabled.	
AT+NWMDNSSU	<text record=""></text>	Update the text record of a service in the mDNS module.	
PDATETXT		<text record="">: The text record of the service to be updated.</text>	
	Example		
	AT+NWMDNSUF	PDATETXT=LIGHT=OFF,FAN=ON	
	OK		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	<ul> <li>The configuration is sto</li> </ul>		
	IfSUPPORT_ZERO_	CONFIG is enabled in the SDK, this command should be enabled.	
AT+NWMDNSSR VDEREG	(None)	Unregister a service in the mDNS module.	
VDEREG		Response: OK or ERROR	
		For example: AT+NWMDNSSRVDEREG	
	Prerequisite		
	The DA16200/DA16600 should be connected to AP.		
	The mDNS module should be running.		
		e mDNS module should be registered.	
	Example		
	AT+NWMDNSSRVDEREG		
	OK		
	Note:	SDK v2 2 2 0 or later	
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> <li>The configuration is erased from NVRAM.</li> </ul>		
	· ·	CONFIG is enabled in the SDK, this command should be enabled.	
AT+NWMDNSST OP	(None)	Stop the mDNS module.	
	Prerequisite		
	The DA16200/DA16600 should be connected to an AP.		
	The mDNS module should be running.		
	Example		
	AT+NWMDNSST	OP	
	OK		
	Note:		

Command	Parameters	Description
	Enabled by default in the SDK v3.2.3.0 or later.	
	The configuration is erased from NVRAM.	
	IfSUPPORT_ZERO_CONFIG is enabled in the SDK, this command should be enabled.	
	?	Get the string representing the status of the mDNS module, "stopped" or "running".
	Example	
	AT+NWMDNSSTOP +NWMDNSSTOP:stopped	

## 5.6.6.1 Zeroconf Example

Configure the parameters and start the mDNS module (After Wi-Fi Connection):

AT+NWMDNSHNREG=da16x

AT+NWMDNSSTART=0

If the mDNS module is started successfully, the following response is shown:

OK

Register a service in the mDNS module:

AT+NWMDNSSRVREG=\_WEBAPP,\_http.\_tcp,80,LIGHT=OFF,FAN=ON

If the service is registered successfully, the following response is shown:

OK

Registered service and host name can be discovered by other mDNS services. In this example, Bonjour service (https://support.apple.com/kb/DL999?viewlocale=en\_US&locale=zh\_TW) on Windows is used to discover them.

To discover the DA16200/DA16600 mDNS, the "-G" option can be used:

C:> dns-sd -0	G v4 da	al6x.local		
Timestamp	A/R E	Flags if Hostname	Address	TTL
18:04:04.474	Add	2 24 dal6x.local.	192.168.0.4	120

To discover the service, the "-L" option can be used like the following:

C:>dns-sd -L \_WEBAPP \_http.\_tcp local Lookup \_WEBAPP.\_http.\_tcp.local 18:04:29.453 \_WEBAPP.\_http.\_tcp.local. can be reached at da16x.local.:80 (interface 24) LIGHT=OFF FAN=ON

# 5.6.7 Provision Commands over Wi-Fi

The provision commands over Wi-Fi are used for starting to provision procedure and getting provisioning status. To use these commands, \_\_\_PROVISION\_ATCMD\_\_ feature should be enabled in SDK.

 Table 31. Provision command list

Command	Parameters	Description
AT+PROVSTART	(none)	Removed all profile data in NVRAM and configure appropriate profile such as Soft AP and concurrent profile and perform Software reboot.
		Response: "+INIT:DONE,2"
	Example	
	AT+PROVSTART	
	+INIT:DONE,2	
	Note:	
	Enabled by default in the SDK v3.2.3.0 or later.	

Command	Parameters	Description	
	The configuration is store	The configuration is stored in NVRAM.	
	IfPROVISION_ATCM	D is enabled in the SDK, this command should be enabled.	
	<ul> <li>After restarting, the system is ready for the provisioning procedure in concurrent mode for the SDK v3.2.6.0 or later, and Soft AP mode for SDK v3.2.4.0 and former versions (the response is "INIT:DONE,1").</li> </ul>		
	<ul> <li>This command supports Wi-Fi based provisioning. See Ref. [5] for provisioning over Bluetooth® LE.</li> </ul>		
AT+PROVSTAT	(none)	Get status of provisioning.	
		Response: OK or ERROR	
	Example		
	AT+PROVSTAT		
	+ATPROV=STATUS 1		
	ОК		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	IfPROVISION_ATCMD is enabled in the SDK, this command should be enabled.		
	<ul> <li>The list of provision status can be found in the thread_atcmd.h. Check the atcmd_provision_stat enumeration.</li> </ul>		

Table 32. atcmd\_provision\_stat enumeration

Value	Name	Description
0	ATCMD_PROVISION_IDLE	Not running or finishing
1	ATCMD_PROVISION_START	Start
101	ATCMD_PROVISION_SELECTED_AP_S UCCESS	Receive AP information
102	ATCMD_PROVISION_SELECTED_AP_FA	
103	ATCMD_PROVISION_WORNG_PW	AP connection fails because of the wrong PW
104	ATCMD_PROVISION_NETWORK_INFO	Get network information from Mobile App
105	ATCMD_PROVISION_AP_FAIL	AP connection fails
106	ATCMD_PROVISION_DNS_FAIL_SERVE R_FAIL	Check network connection
107	ATCMD_PROVISION_DNS_FAIL_SERVE R_OK	
108	ATCMD_PROVISION_NO_URL_PING_FA	
109	ATCMD_PROVISION_NO_URL_PING_OK	
110	ATCMD_PROVISION_DNS_OK_PING_FA IL_N_SERVER_OK	
113	ATCMD_PROVISION_DNS_OK_PING_N_ SERVER_FAIL	
111	ATCMD_PROVISION_DNS_OK_PING_O K	
112	ATCMD_PROVISION_REBOOT_ACK	Reboot after provisioning

While provisioning over Wi-Fi with the mobile application as described in Ref. [5], the DA16200 provides responses to MCU regarding provisioning status. See the following examples.

+ATPROV=STATUS 0 +ATPROV=STATUS 1 +WFCST:<MAC Address> +ATPROV=STATUS 101 +WFDST:<MAC Address> +WFJAP:1,'<SSID>',<IP Address>

For the DA16600, the following responses are provided to MCU regarding provisioning status while provisioning over Bluetooth<sup>®</sup> LE. See the following examples.

```
+ATPROV=STATUS 104
+ATPROV=STATUS 101
+WFJAP:1,'<SSID>',<IP Address>
+ATPROV=STATUS 111
+ATPROV=STATUS 112
+INIT:DONE,0
```

#### NOTE

See Table 12 for details of +WFCST, +WFDST, and +WFJAP response.

# 5.6.8 Bluetooth<sup>®</sup> LE Commands

The Bluetooth<sup>®</sup> LE commands are available when the DA16600 is running the Bluetooth enabled version of the firmware. Select and build the DA16600 project from the SDK to use these commands.

#### Table 33. Bluetooth® LE command list

Command	Parameters	Description	
AT+BLENAME	<device name=""></device>	Change the device name of the DA16600/Bluetooth <sup>®</sup> LE device.	
		Response: OK or ERROR	
	?	Get the device name of the DA16600/Bluetooth <sup>®</sup> LE device.	
	(none)	Response: +BLENAME: <device name=""></device>	
	Example		
	AT+BLENAME=D	DA16600-BLE	
	OK		
	AT+BLENAME		
	+BLENAME:DA16600-BLE		
	ОК		
	AT+BLENAME=?		
	+BLENAME:DA16600-BLE		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	Enabled getting the device name by default in the SDK v3.2.5.0 or later.		
AT+ADVSTOP	(none)	Stop advertising of DA16600/Bluetooth <sup>®</sup> LE device.	
		Response: OK or ERROR	
	Example		
	AT+ADVSTOP		
	ОК		
	Note: Enabled by default in	n the SDK v3.2.3.0 or later.	
AT+ADVSTART	(none)	Start advertising of DA16600/Bluetooth <sup>®</sup> LE device.	
		Response: OK or ERROR	
	Example		

Command	Parameters	Description
	AT+ADVSTART	
	ОК	
	Note: Enabled by default in	the SDK v3.2.3.0 or later.

# 5.6.9 Transfer Function Commands

# 5.6.9.1 Socket Commands

# Table 34. Socket command list

Command	Parameters	Description	
AT+TRTS	<local_port>[,<max< td=""><td>Open a TCP server socket.</td></max<></local_port>	Open a TCP server socket.	
	allowed connection>]	<local_port>: Local port number of the socket.</local_port>	
		<max allowed="" connection="">: It is optional. Set maximum allowed TCP session. Total available client sessions are 7.</max>	
		Response: OK (with '+TRCTS:*** '	
		See Table 35 or ERROR.	
		Async message: CID(+TRTS: <assigned cid="">)</assigned>	
	Prerequisite		
	The DA16200/DA	16600 should be connected to AP.	
	Example		
	//Open first TCP s	server	
	AT+TRTS=10194		
	+TRTS:0		
	ОК		
	//Open second TCP server		
	AT+TRTS=10195		
	+TRTS:3		
	ОК		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	<ul> <li>CID number 0 (TCP server), 1 (TCP client), and 2 (UDP) are pre-assigned numbers. The new CID started from 3 is assigned in the order of the opening new session.</li> </ul>		
	<ul> <li>The <max allowed="" connection=""> parameter is supported by SDK v3.2.5.0 or later. The new CID of peer device that is connected to a running TCP server is not assigned but counted as a session. It is up to 7 sessions (a total of 8 sessions including TCP server).</max></li> </ul>		
	later. A total of eight ses	d async messages with assigned CID are supported by SDK v3.2.5.0 or sions can be created for the transfer function. But it depends on the configuration. Basically, the DA16200/DA16600 can be created eight	
AT+TRTC	<server_ip>,</server_ip>	Open a TCP client socket and connect to a TCP server.	
	<server_port>[,</server_port>	<server_ip>: IP address of TCP server to be accessed</server_ip>	
	<local_port>]</local_port>	<server_port>: Port number of TCP server</server_port>	
		<local_port>: Local port number of the socket (optional, 0: auto)</local_port>	
		Response: OK or ERROR	
		Async message: CID(+TRTC: <assigned cid="">)</assigned>	
	Prerequisite		
	The DA16200/DA16600 should be connected to AP.		
	Example AT+TRTC=192.168.0.18,1025,1024		
		JU.V. 10, 102J, 1024	

Command	Parameters	Description		
	+TRTC:1			
	ОК			
	AT+TRTC=192.1	68.0.18,1025,1025		
	+TRTC:3			
	OK			
	Note:			
	Enabled by default in the	e SDK.		
		ver), 1 (TCP client), and 2 (UDP) are pre-assigned numbers. The new CID ed in the order of the opening new session.		
	<ul> <li>Total available sessions</li> </ul>	are a maximum of 8.		
	later. A total of eight ses	async messages with assigned CID can be supported by SDK v3.2.5.0 or sions can be created for the transfer function. But it depends on the configuration. Basically, the DA16200/DA16600 can be created eight		
AT+TRUSE	<local_port></local_port>	Open a UDP socket.		
		<local_port>: Local port number of the socket</local_port>		
		Response: OK or ERROR		
		Async message: CID(+TRUSE: <assigned cid="">)</assigned>		
	Example			
		ional, run this first if "ERROR" is responded)		
	AT+TRUSE=1019			
	+TRUSE:2			
	ОК			
	AT+TRUSE=1019	96		
	+TRUSE:3			
	ОК			
	Note:			
	Enabled by default in the	e SDK.		
		ver), 1 (TCP client), and 2 (UDP) are pre-assigned numbers. The new CID ed in the order of the opening new session.		
	<ul> <li>Total available sessions are maximum 8.</li> </ul>			
	or later. A total of eight s	nd async messages with assigned CID can be supported by SDK v3.2.5.0 sessions can be created for the transfer function. But it depends on the C configuration. Basically, the DA16200/DA16600 can be created eight		
AT+TRUR	<remote_ip>,</remote_ip>	Set remote IP and port of the UDP socket.		
	<remote_port></remote_port>	<pre><remote_ip>: Remote IP address</remote_ip></pre>		
		<pre><remote_port>: Remote port number</remote_port></pre>		
		Response: OK or ERROR		
		Async message: CID(+TRUR:2)		
	Example			
	•			
	+TRUR:2	AT+TRUR=192.168.0.18,1027 +TRUR <sup>-</sup> 2		
	OK			
	Note:			
	Note:  Enabled by default in the SDK.			
	<ul> <li>It is only for the CID 2.</li> </ul>			

Command	Parameters	Description		
AT+TRPRT	<cid></cid>	Get session information by CID.		
		<cid>: Assigned CID</cid>		
		Response: <cid>,[TCP UDP],<remote_ip>,<remote_port>,</remote_port></remote_ip></cid>		
		<local_port></local_port>		
	Prerequisite			
	A UDP socket sh	ould be opened (AT+TRUSE).		
	Example			
	AT+TRPRT=2			
	+TRPRT:2,UDP,192.168.0.18,10194,10195			
	OK			
	Note:	Note:		
	Enabled by default in the	Enabled by default in the SDK.		
		ver), 1 (TCP client), and 2 (UDP) are pre-assigned numbers. The new CID ed in the order of the opening new session.		
	Total available sessions	are a maximum of 8.		
AT+TRPALL	(none)	Get all session information.		
		Response: <cid>,[TCP UDP],<remote_ip>,<remote_port>,</remote_port></remote_ip></cid>		
		<local_port><lf></lf></local_port>		
	Prerequisite			
		The target system should be connected to any UDP or TCP server.		
	Example			
	AT+TRPALL			
	+TRPALL:2,UDP,192.168.0.18,10194,10195			
	ОК			
	Note: Enabled by default in	n the SDK.		
AT+TRTRM	<cid></cid>	Close (terminate) a session by CID. If CID is 0 (TCP server), remote_ip,		
	[, <remote_ip></remote_ip>	and remote_port are input, the session with the specific remote is		
	, <remote_port>]</remote_port>	closed.		
		• <cid>: Assigned CID</cid>		
		<remote_ip>: Remote IP address connected to TCP server. It is only allowed in TCP server</remote_ip>		
		<remote_port>: Remote port number connected to TCP server. It is</remote_port>		
		only allowed in TCP server Response: OK or ERROR		
		Response. On of Error		
	-	Prerequisite		
	• •	The target system should be connected to any UDP or TCP server.		
	Example			
	AT+TRTRM=2			
	OK			
	AT+TRTRM=0,192.168.0.18,10194			
	OK Note:			
	<ul> <li>Note:</li> <li>Enabled by default in the SDK.</li> </ul>			
	-			
AT TOTA::		bte_port parameters are only supported in SDK v3.2.3.0 or later.		
AT+TRTALL	(none)	Close (terminate) all sessions.		
		Response: OK or ERROR		
	Example			

Command	Parameters	Description
	AT+TRTALL	
	OK	
	Note: Enabled by default in	the SDK.
AT+TRSAVE	(none)	Save status of all sessions to NVRAM.
		Response: OK or ERROR
	Example	
	AT+TRSAVE	
	ОК	
	Note:	
	Enabled by default in the	SDK.
	The configuration is store	ed in NVRAM.
AT+TCPDATAMO	<mode></mode>	Set the mode of the received TCP data.
DE		<mode></mode>
		0: text mode (default)
		1: hex string mode
		In text mode, data is returned as an ascii string: "0123ABCD"
		In hex mode, the data is returned as a hex encoded text string "3031323341424344"
		Response: OK or ERROR
	Example	
	AT+TCPDATAMO	DDE=1
	ОК	
	Note: Enabled by default in the SDK v3.2.2.1 or later.	
able 35. Socket co	nnection response list	

Response	Parameters	Description	
+TRCTS	<cid>, <remote_ip>,</remote_ip></cid>	When sending the AT command (AT+TRTS=40000), receive this response if there is no error.	
	<remote port=""></remote>	<cid>: Assigned CID for TCP server</cid>	
		<pre><remote_ip>: TCP client IP address</remote_ip></pre>	
		<pre><remote_port>: TCP client port number</remote_port></pre>	
	Example		
	+TRCTS:0,192	2.168.0.18,41014	
+TRXTS	<cid>, <remote_ip>,</remote_ip></cid>	A remote TCP client is disconnected from the TCP server that was opened by AT+TRTS.	
	<remote_port></remote_port>	<cid>: Assigned CID for TCP server</cid>	
		<pre><remote_ip>: TCP client IP address</remote_ip></pre>	
		<pre><remote_port>: TCP client port number</remote_port></pre>	
	Example		
	//When a remote	//When a remote peer is disconnected	
	+TRXTS:0,192.	168.0.18,41014	
+TRXTC	<cid>,</cid>	The TCP client socket that was opened by AT+TRTC is disconnected.	
	<remote_ip>,</remote_ip>	<cid>: Assigned CID for TCP client</cid>	
	<remote_port></remote_port>	<pre><remote_ip>: TCP server IP address</remote_ip></pre>	
		<pre><remote_port>: TCP server port number</remote_port></pre>	
	Example		
	//When the TC	P client socket is disconnected	

Response	Parameters	Description
	+TRXTC:1,192.168.0.18,1025	

## 5.6.9.1.1 Data Transfer Commands

## Table 36. Data transmission command

Escape sequence	Parameters	Description		
<esc>S</esc>	<cid><length>,</length></cid>	Transmit data through a socket with the CID specified.		
	<remote_ip>,</remote_ip>	ESC>S: To enter data input mode, type in <esc> (0x1B) and S keys together</esc>		
	<remote_port &gt;,[<mode>,]<data></data></mode></remote_port 	<ul> <li><cid>: Assigned CID</cid></li> </ul>		
	>,[ <mode>,]<uala></uala></mode>	<ul> <li><li><length>: Data length. Data length can be 0 in only text mode. If this is 0, data is read until "\r" or "\n" is met. In raw mode, data is read until the length</length></li> </li></ul>		
		<pre><remote_ip>: Remote IP address</remote_ip></pre>		
		<remote_port>: Remote port number</remote_port>		
		For TCP Server, <remote_ip> and <remote_port> of a TCP Client should be given. A maximum of four TCP Clients can be connected to the TCP Server.</remote_port></remote_ip>		
		For TCP Client, 0,0 is given (as the destination is the server).		
		For UDP, if 0,0 is given, the data is sent to the destination that AT+TRUR has specified. If non-0 <remote_ip> and <remote_port> are given, UDP temporarily sends to the destination <remote_ip> and <remote_port> specified.</remote_port></remote_ip></remote_port></remote_ip>		
		<ul> <li><mode>: Transmit data in raw or text mode. It is optional. If there is no option, data is transmitted in text mode. This option is allowed only for UART communication.</mode></li> </ul>		
		<ul> <li>r: The raw mode is active. In raw mode, Data is read until data length. The data length is specified in <length> parameter.</length></li> </ul>		
		• t: The text mode is active. In text mode, the data can be affected if it has unprintable control codes like backspace(0x08).		
		Response: OK or ERROR		
	Prerequisite			
	The target syster	The target system should be connected to any UDP or TCP server/client.		
	Example1 – To s	Example1 – To send data to TCP client		
	<esc< td=""><td>&gt;S010,192.168.0.18,43110,abcde12345</td></esc<>	>S010,192.168.0.18,43110,abcde12345		
	ОК			
	Example2 – To s	Example2 – To send data to TCP server		
	<esc< td=""><td colspan="3"><esc>S110,192.168.0.18,1025,abcde12345</esc></td></esc<>	<esc>S110,192.168.0.18,1025,abcde12345</esc>		
	OK			
	Example3 – To s	end data to TCP server with "0, 0" as the destination/server		
	<esc< td=""><td colspan="3"><esc>S110,0,0,abcde12345</esc></td></esc<>	<esc>S110,0,0,abcde12345</esc>		
	OK	ОК		
	Example4 – To s	Example4 – To send data to UDP receiver		
	<esc< td=""><td colspan="3"><esc>S210,192.168.0.18,1024,abcde12345</esc></td></esc<>	<esc>S210,192.168.0.18,1024,abcde12345</esc>		
	ОК	ОК		
	Note:			
	Enabled by default in f	the SDK.		
	atcmd.h for SDK v3.x.	of data depends on TX_PAYLOAD_MAX_SIZE definition. It is defined in TX_PAYLOAD_MAX_SIZE includes all parameters of AT command. um length of "length" parameter depends on the length of other parameters.		

Escape sequence	Parameters Description		
	<ul> <li>TX_PAYLOAD_MAX_SIZE is defined 4,096 bytes in the SDK v3.2.3.0 or later.</li> </ul>		
	For ATCMD over SPI or SDIO:		
	The result for this command is sent to the host as the "response" field of "struct _st_host_response". The "response" field is a 1-byte decimal value. A value of 0x20 is a result of "OK". All other values are an "ERROR".		
	<ul> <li>Recommended to use <esc>H command if UART baud rate is over 230400 bps. There might be data loss during the DA16200/DA16600 parses this AT command.</esc></li> </ul>		
<esc>M</esc>	<pre><cid>,<length>,</length></cid></pre> Transmit data through a socket with the CID specified.		
	<pre><remote_ip>, &lt;= SC&gt;M: To enter data input mode, type in <esc>(0x1B) and M key together</esc></remote_ip></pre>		
	>,[ <mode>,]<data></data></mode>		
	<ul> <li><length>: Data length. Data length can be 0 in only text mode. If this 0, data is read until "\r" or "\n" is met. In raw mode, data is read until the length</length></li> </ul>		
	<remote_ip>: Remote IP address</remote_ip>		
	<remote_port>: Remote port number</remote_port>		
	For TCP Server, <remote_ip> and <remote_port> of a TCP Client shou be given.</remote_port></remote_ip>		
	For TCP Client, 0,0 is given (as the destination is the server).		
	For UDP: if 0,0 is given, the data is sent to the destination that AT+TRUR has specified. If non-0 <remote_ip> and <remote_port> are given, UDP temporarily sends to the destination <remote_ip> and <remote_port> specified.</remote_port></remote_ip></remote_port></remote_ip>		
	Response: OK or ERROR		
	Prerequisite		
	The target system should be connected to any UDP or TCP server/client.		
	Example1 – To send data to TCP client		
	<esc>M0,10,192.168.0.18,43110,abcde12345</esc>		
	ОК		
	Example2 – To send data to TCP server		
	<esc>M1,10,192.168.0.18,1025,abcde12345 OK</esc>		
	Example3 – To send data to TCP server with "0, 0" as the destination/server		
	<esc>M1,10,0,0,abcde12345 OK</esc>		
	Example4 – To send data to UDP receiver		
	<esc>M2,10,192.168.0.18,1024,abcde12345 OK</esc>		
	Note:		
	<ul> <li>Enabled by default in the SDK.</li> </ul>		
	<ul> <li>The maximum length of data depends on TX_PAYLOAD_MAX_SIZE definition. It is defined in atcmd.h for SDK v3.x, TX_PAYLOAD_MAX_SIZE includes all parameters of AT command. Therefore, the maximum length of "length" parameter depends on length of other parameters.</li> <li>TX_PAYLOAD_MAX_SIZE is defined 4,096 bytes in the SDK v3.2.3.0 or later.</li> </ul>		
	<ul> <li>For ATCMD over SPI or SDIO: The result for this command is sent to the host as the "response" field of "struct _st_host_response". The "response" field is a 1-byte decimal value. A value of 0x20 is a result of "OK". All other values are an "ERROR".</li> </ul>		
	<ul> <li>Recommended to use <esc>H command if UART baud rate is over 230400 bps. There might be data loss during the DA16200/DA16600 parses this AT command.</esc></li> </ul>		

Escape sequence	Parameters	Description		
<esc>H</esc>	<cid>,<length>,</length></cid>	Transmit data through a socket with the CID specified. The host must send data after getting a response OK.		
	<remote_ip>, <remote_port></remote_port></remote_ip>	<esc>H: To enter data input mode, type in <esc>(0x1B) and H key together</esc></esc>		
		<cid>: Assigned CID</cid>		
		<length>: Data length. Data is read until the length after getting OK response</length>		
		<remote_ip>: Remote IP address</remote_ip>		
		<remote_port>: Remote port number</remote_port>		
		<ul> <li>For TCP Server, <remote_ip> and <remote_port> of a TCP Client should be given.</remote_port></remote_ip></li> </ul>		
		<ul> <li>For TCP Client, 0,0 is given (as the destination is the server).</li> <li>For UDP: if 0,0 is given, the data is sent to the destination that AT+TRUR has specified. If non-0 <remote_ip> and <remote_port> are given, UDP temporarily sends to the destination <remote_ip> and <remote_port> specified.</remote_port></remote_ip></remote_port></remote_ip></li> </ul>		
		Response: OK or ERROR		
	Prerequisite	· ·		
	The target system should be connected to any UDP or TCP server/client.

	abcde	e12345		
	ОК			
	Example4 – To send data to UDP receiver			
	<esc< td=""><td colspan="3">- <esc>H2,10,192.168.0.18,1024</esc></td></esc<>	- <esc>H2,10,192.168.0.18,1024</esc>		
	ОК			
	abcde12345			
	OK			
	Note:			
	<ul> <li>Enabled by default in the SDK.</li> </ul>			
	<ul> <li>The maximum length of data depends on TX_PAYLOAD_MAX_SIZE definition. It is defined in atcmd.h for SDK v3.x, TX_PAYLOAD_MAX_SIZE includes all parameters of AT command. Therefore, the maximum length of "length" parameter depends on the length of other parameters.</li> </ul>			
	<ul> <li>TX_PAYLOAD_MAX_SIZE is defined 4,096 bytes in the SDK v3.2.3.0 or later.</li> </ul>			
	Not supported over S	PI or SDIO.		

### Table 37. Data reception responses

Response	Parameters	Description
+TRDTS	<cid>,</cid>	Receive data through TCP server socket.
	<src_ip>,<src_port>,</src_port></src_ip>	<cid>: Assigned CID</cid>
	<length>,<data></data></length>	<src_ip>: Source IP address</src_ip>
		<src_port>: Source port number</src_port>
		<length>: Data length</length>
		<data>: Received data</data>
	Example	
	//When data is se	ent from a TCP client
	+TRDTC:1,192.1	68.0.18,1025,4,test
+TRDTC	<cid>,</cid>	Receive data through TCP client socket.
	<src_ip>,<src_port>,</src_port></src_ip>	<cid>: Assigned CID</cid>
	<length>,<data></data></length>	<pre>src_ip&gt;: Source IP address</pre>
		<pre>src_port&gt;: Source port number</pre>
		<length>: Data length</length>
		<data>: Received data</data>
	Example	
	//When TCP clier	nt receives data,
	+TRDTC:1,192.168.0.18,1025,4,test	
+TRDUS	<cid>,</cid>	Receive data through UDP socket.
	<src_ip>,<src_port>,</src_port></src_ip>	<cid>: Assigned CID</cid>
	<length>,<data></data></length>	<pre>src_ip&gt;: Source IP address</pre>
		<pre>src_port&gt;: Source port number</pre>
		<length>: Data length</length>
		<data>: Received data</data>
	Example	
	//When UDP s	ession receives data,
	+TRDUS:2,192	.168.0.18,10194,4,test

#### 5.6.9.1.2 Data Transfer with DPM

#### **TCP Server**

After a connection to an AP is made in the normal BOOT state, open a TCP server socket, and save the config to NVRAM.

#### AT+TRTS=32000

AT+TRSAVE

The TCP server socket that was opened should be closed before switching to DPM mode.

AT+TRTRM=0

Change the DA16200/DA16600 state to DPM mode (AT+DPM=1). When the DA16200/DA16600 starts the session on DPM mode successfully, the following is shown:

+INIT:DONE,0

+WFJAP:1,'WI-FI\_AP',192.168.5.19

+TRPALL:0,TCP,0.0.0,0,32000

When a TCP client connects to the DA16200/DA16600, the following is shown:

+INIT:WAKEUP,UC

To receive +TRCTS message, send AT+MCUWUDONE immediately after "+INIT:WAKEUP,UC"

+TRCTS:0,192.168.0.1,42000

When the DA16200/DA16600 receives a message from a client, the following is shown:

+INIT:WAKEUP,UC

+TRDTS:0,192.168.0.1,42000,10,1234567890

To send a TCP message, send AT+MCUWUDONE immediately after "external wake-up" is triggered (+INIT:WAKEUP,EXT). To prevent that the DA16200/DA16600 entering DPM LPM, MCU should send AT+CLRDPMSLPEXT before a message is sent. The DA16200/DA16600 can send data to a TCP client with the command "<ESC>S". Finally, to enter DPM LPM, send "AT+SETDPMSLTEXT".

```
+INIT:WAKEUP,EXT //External wake-up
AT+MCUWUDONE
AT+CLRDPMSLPEXT
...
<ESC>S...
...
AT+SETDPMSLPEXT
```

When a TCP client disconnects from the DA16200/DA16600, the following is shown:

+INIT:WAKEUP,UC

To receive +RTXTS message, send AT+MCUWUDONE immediately after "+INIT:WAKEUP,UC"

+TRXTS:0,192.168.0.1,42000

#### **TCP Client**

After a connection is made to an AP in the normal BOOT state, connect the TCP client of the DA16200/DA16600 to a TCP server and save the config to NVRAM. (To save TCP client config information, the DA16200/DA16600 should connect to the server successfully beforehand.)

AT+TRTC=192.168.5.1,34000

AT+TRSAVE

Before switching to DPM mode, disconnect the TCP Client:

AT+TRTRM=1

Change the DA16200/DA16600 state to DPM mode (AT+DPM=1). When the DA16200/DA16600 starts the session on DPM mode successfully, the following is shown:

+INIT:DONE,0

+WFJAP:1,'WI-FI\_AP',192.168.5.19

+TRPALL:1,TCP,192.168.5.1,34000,30000

The procedure to exchange TCP data is the same as in Section 5.6.9.1.2. When the DA16200/DA16600 receives a message from the server, the following is shown:

+INIT:WAKEUP,UC

+TRDTC:1,192.168.5.1,34000,10,1234567890

#### **UDP Session**

After a connection is made to an AP in the normal BOOT state, open a UDP socket and save the config to NVRAM:

AT+TRUSE=48000

AT+TRSAVE

Before switching to DPM mode, disconnect TCP Client:

AT+TRTRM=2

Change the DA16200/DA16600 state to DPM mode. When the DA16200/DA16600 starts the session in DPM mode successfully, the following is shown:

+INIT:DONE,0

+WFJAP:1,'WI-FI\_AP',192.168.5.19

+TRPALL:2,UDP,0.0.0,0,48000

The procedure to exchange UDP data is the same as in Section 5.6.9.1.2. When the DA16200/DA16600 receives a message from the server, the following is shown:

+INIT:WAKEUP,UC

+TRDUS:2,192.168.5.23,35000,10,1234567890

#### 5.6.9.2 Secure Socket Commands

#### Table 38. Secure socket command list

Command	Parameters	Description
AT+TRSSLINIT	<role></role>	Initialize the SSL module. The DA16200/DA16600 allows to create a module of TLS client.
		<role>: The role of SSL, 1 – Client</role>
	Example AT+TRSSLINIT= +TRSSLINIT:0 OK Note: • Enabled by default in the • IfSUPPORT_ATCME	
AT+TRSSLCFG	<cid>,<configuration ID&gt;,<configuration value&gt; Prerequisite CID should be obtained</configuration </configuration </cid>	Configure SSL connection. <cid>: The CID obtained after issuing the AT+TRSSLINIT command <configuration id="">: The configuration ID available in the following list of configurations: • 0, 1 – Invalid configuration parameter • 2 – To set SSL CA Certificate • 3 – To set SSL CA Certificate • 6 – To set the SNI • 9 – To enable/disable server validation • 10 – To set the Incoming buffer length • 11 - To set the Outgoing buffer length • 11 - To set the Outgoing buffer length <configuration value="">: Value to the configuration provided in configuration ID CONF_ID:CONF_VAL • 0, 1 - Invalid • 2 - SSL CA Certificate Name • 3 - SSL Certificate Name • 6 - To Set the SNI (supported only for TLS client) • 9 - To enable/disable server validation • 0: Disables server validation • 10 - To set the Incoming buffer length • 11 - To set the outgoing buffer length • 11 - To set the outgoing buffer length • 11 - To set the outgoing buffer length</configuration></configuration></cid>
		and SSL certificate should be set up.
	Example	

Command	Parameters	Description	
	AT+TRSSLCFG=	-	
	ОК		
	AT+TRSSLCFG=0,3,CERT		
	OK AT+TRSSLCFG=0,6,da16x		
	OK		
	AT+TRSSLCFG=	0,9,0	
	ОК		
	AT+TRSSLCFG=	0,10,6144	
	ОК		
	AT+TRSSLCFG=	0,11,6144	
	ОК		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	IfSUPPORT_ATCMD	_TLS is enabled in the SDK, this command should be enabled.	
AT+TRSSLCO	<cid>,<server ip<="" td=""><td>Connect to an SSL server.</td></server></cid>	Connect to an SSL server.	
	Address>, <server port<br="">number&gt;</server>	<cid>: The CID obtained after issuing the AT+TRSSLINIT command.</cid>	
	number>	Server IP Address>: The IP Address of the server to connect. Only	
		supported IPv4 address.	
		Server Port>: The port number of the SSL server to connect.	
	Prerequisite		
	CID should be obta	ined (AT+TRSSLINT).	
	Example		
	AT+TRSSLCO=0,192.168.0.11,30000 OK		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> <li>IfSUPPORT_ATCMD_TLS is enabled in the SDK, this command should be enabled.</li> </ul>		
AT+TRSSLWR	<cid>,[<server ip<="" td=""><td>Send the data to the SSL server that is already established.</td></server></cid>	Send the data to the SSL server that is already established.	
	Address>, <server port<="" td=""><td><cid>: The CID obtained after issuing the AT+TRSSLINIT command.</cid></td></server>	<cid>: The CID obtained after issuing the AT+TRSSLINIT command.</cid>	
	number>, <mode>,]<data length&gt;,<data></data></data </mode>	Server IP Address>: The IP Address of the SSL server is already	
		established. If there is no input, the IP address internally is used to the SSL server IP address.	
		Server Port number>: The port number of the SSL server is already	
		established. If there is no input, the Port number is internally used to	
		the SSL server port number.	
		<mode>: Transmit data in raw or text mode. It is optional. If there is no option, data is transmitted in text mode.</mode>	
		<ul> <li>r: The raw mode is active. In raw mode, Data is read until data length. The data length is specified in <length> parameter.</length></li> </ul>	
		• t: The text mode is active. In text mode, the data can be affected if it has unprintable control codes like backspace (0x08).	
		<ul> <li><data length="">: The length of data to send.</data></li> </ul>	
		<ul> <li><data>: The data to send. The input can be closed by <ctrl>+C or</ctrl></data></li> </ul>	
		reaching data length.	
	Prerequisite		
		ined (AT+TRSSLINT).	
	Example		
		,10,0123456789 <ctrl> + C</ctrl>	
	ОК		

Command	Parameters	Description	
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	IfSUPPORT_ATCMD_TLS is enabled in the SDK, this command should be enabled.		
	atcmd.h for SDK v3.x. T	data depends on TX_PAYLOAD_MAX_SIZE definition. It is defined in X_PAYLOAD_MAX_SIZE includes all parameters of AT command.	
		Close the SSL connection.	
AT+TRSSLCL	<cid></cid>		
	-	<cid>: The CID obtained after issuing AT+TRSSLINIT command</cid>	
	Prerequisite		
		ined (AT+TRSSLINT).	
	AT+TRSSLCL=0 OK		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	IfSUPPORT_ATCMD	_TLS is enabled in the SDK, this command should be enabled.	
AT+TRSSLCERT LIST	<certificate type=""></certificate>	Show a list of certificates or a list of CA data available in SFlash memory.	
		<certificate type="">: The value of the certificate. 0 – CA Certificates, 1 – Client/Server Certificates</certificate>	
	Example		
	AT+TRSSLCERTLIST=0		
	+TRSSLCERTLIST=0,CA_CERT		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	IfSUPPORT_ATCMD		
AT+TRSSLCERT	<certificate type="">,</certificate>	Store a certificate and CA list data in SFlash memory.	
STORE	<sequence>, <format>, <name>, [<data length="">, ]<data></data></data></name></format></sequence>	<certificate type="">: The value of the certificate. 0 – CA Certificates, 1 – Client/Server Certificates.</certificate>	
		<sequence>: If the value of certificate type is 0 (CA), the number of certificates in the sequence is 1-5. If the certificate type is 1 (Client/Server certificate), then several certificates in a sequence is 1-SSL cert or 2-SSL key.</sequence>	
		<format>: The value of the CA/Certificate/Key0 – DER, 1 – PEM.</format>	
		<name>: The name of the certificate. While loading certificate and key file separately, the same name should be used in both commands.</name>	
		<data length="">: The length of certificate data. If certificate is DER format, data length parameter is mandatory.</data>	
		<data>: The certificate data to be stored.</data>	
	Example		
	AT+TRSSLCERTSTORE=0,1,1,CA_CERT,BEGIN CERTIFICATE		
	END CERTIFICATE <ctrl>+C</ctrl>		
	OK		
	Enabled by default in the Enabled by default		
		D_TLS is enabled in the SDK, this command should be enabled.	
AT+TRSSLCERT	<certificate< td=""><td>Delete a certificate or CA list data in SFlash memory.</td></certificate<>	Delete a certificate or CA list data in SFlash memory.	
DELETE	Type>, <name></name>	<certificate type="">: The type of the certificate. 0 – CA Certificates, 1 – Client/Server Certificates.</certificate>	

Command	Parameters	Description
		<name>: The name of the certificate.</name>
	Example	
	AT+TRSSLCERT	DELETE=0,CA_CERT
	ОК	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	IfSUPPORT_ATCMD	_TLS is enabled in the SDK, this command should be enabled.
AT+TRSSLSAVE	(none)	Store the current SSL module's configuration in NVRAM.
	Example	
	AT+TRSSLSAVE	
	ОК	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
The configuration is sto		ed in NVRAM.
	IfSUPPORT_ATCMD	_TLS is enabled in the SDK, this command should be enabled.
AT+TRSSLDELE	(none)	Delete the stored SSL module's configuration in NVRAM
TE	Example	
	AT+TRSSLDELETE	
	OK	
	Note:	
	Enabled by default in the SDK v3.2.3.0 or later.	
	The configuration is eras	
	IfSUPPORT_ATCMD	_TLS is enabled in the SDK, this command should be enabled.

Table 39. Secure socket response list

Response	Parameters	Description
+TRSSLDTC	<cid>,</cid>	It sends the response when receiving data from SSL server.
	<remote_ip>,</remote_ip>	<cid>: The CID obtained after issuing the AT+TRSSLINIT command.</cid>
	<local_port>,</local_port>	<remote_ip>: SSL server IP address.</remote_ip>
	<length>,</length>	<local_port>: Local port number of the secure socket.</local_port>
	<data></data>	<length>: Data length.</length>
		<data>: Received data.</data>
	Example	
// When SSL client received data from secure server		t received data from secure server
	+TRSSLDTC:0,192.168.0.3,31200,5,Hello	
+TRSSLXTC	<cid>,</cid>	It sends the response when secure socket connection is closed.
	<remote_ip>,</remote_ip>	<cid>: The CID obtained after issuing the AT+TRSSLINIT command.</cid>
	<local_port></local_port>	<remote_ip>: SSL server IP address.</remote_ip>
		<local_port>: Local port number of the secure socket.</local_port>
	Example	
	// When secure so	ocket connection is closed
	+TRSSLXTC:0,19	02.168.0.3,31200

# 5.6.10 RF Test Function Commands

# Table 40. RF test command list

Command	Parameters	Description	
AT+TMRFNOINIT	<flag></flag>	Set boot mode.	
		<flag>: 0 (normal boot), 1 (RF test mode boot)</flag>	
		Response: OK or ERROR	
	Example		
	AT+TMRFNOINIT	<b>[</b> =1	
	ОК		
	AT+RESTART		
	OK		
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	The configuration is store		
	DA16200/DA16600 (AT-		
		6600 is restarted, "!!! TEST MODE !!!" log is displayed.	
	***	DA16200 SDK Information	
	* – CPU Type	: Cortex-M4 (80MHz)	
	* - OS Type * - Serial Fl		
	* - SDK Versi * - F/W Versi	on : RTOS-GEN01-01-14245-000000

		<pre><greenfield>: [on off]. Set greenfield mode on/off</greenfield></pre>	
		<preambletype>: [short long]. Preamble type @ DSSS mode</preambletype>	
		<qosenable>: [on off]. MAC header QoS control</qosenable>	
		<ackpolicy>: [NO NORM BA CBA]</ackpolicy>	
		<scrambler>: N/A</scrambler>	
		<aifsnval>: [0 ~ 15]. Indicate the AIFS in units of slots after SIFS that hardware should wait for before starting backoff, for access category</aifsnval>	
		<ant>: [0]. Fixed</ant>	
	Response: OK or ERROR		
	Prerequisite		
		Start RF test mode (AT+RFTESTSTART).	
		I MCS7, 2412 MHz and power grade as "0" (max power)	
	AT+RFTX 2412,0	,U,1UUU,N65,U	
	OK Note: Enabled by default ir	the SDK v3.2.3.0 or later.	
AT+RFTXSTOP	(none)	Stop RF TX test	
	Prerequisite		
		AT+RFTX).	
	Start RF TX test (AT+RFTX). Example		
	AT+RFTX 2412,0,0,1000,n65,0		
	,	, , , , , , , , , , , , , , , , , , , ,	

Command	Parameters	Description	
	ОК		
	AT+RFTXSTOP		
	ОК		
	AT+RFTX 2442,0	),0,1000,n65,0	
	ОК		
	Note:		
	Enabled by default in the AT DETYOTOD is more IN THE		
		red before testing other items.	
AT+RFCWTEST	<ch>,</ch>	Start CW test.	
	<bw>,</bw>	<ch>: Carrier frequency (2412 ~ 2484 MHz)</ch>	
	<txpower>,</txpower>	<bw>: [0]: Fixed. Carrier bandwidth. 20 MHz fixed</bw>	
	<ant>,</ant>	<txpower>: TX power (0 ~ 15), 0.8 dB step</txpower>	
	<cwcycle></cwcycle>	<ant>: [0]. Fixed</ant>	
		<cwcycle>: 1 MHz fixed</cwcycle>	
		Response: OK or ERROR	
	Prerequisite		
	Start RF test mode (AT+RFTESTSTART).		
	Example		
	AT+RFCWTEST 2442,0,2		
	OK		
	CW TX test with 2442 MHz and power grade as 2		
		h the SDK v3.2.3.0 or later.	
AT+RFCWSTOP	(none)	Stop CW tests.	
		Response: OK or ERROR	
	Prerequisite		
	Start RF CW test (AT+RFCWTEST).		
	Example AT+RFCWTEST 2442,0,2		
		2442,0,2	
	OK		
	AT+RFCWSTOP OK		
	ŬK.		
	AT+RFCWTEST 2472,0,2		
	OK	, _ , _	
	Note:		
	Enabled by default in the SDK v3.2.3.0 or later.		
	<ul> <li>AT+RFCWSTOP is required before testing other items.</li> </ul>		
AT+RFCONTSTA	<txrate>,</txrate>	Start RF continuous TX test.	
RT	<txpower>,</txpower>	<ul> <li><txrate>: Data rate. See the AT+RFTX command</txrate></li> </ul>	
	<ch></ch>	<ul> <li><txpower>: TX power (0 ~ 15), 0.8 dB step</txpower></li> </ul>	
		<ul> <li><ch>: Carrier frequency (2412 ~ 2484 MHz)</ch></li> </ul>	
		Response: OK or ERROR	
	Prerequisite	. ·	
		le (AT+RFTESTSTART).	

Command	Parameters	Description	
	Example	-	
	//Continuous TX to	est with 11G 54 MHz, 2472 MHz and power grade as 2	
	AT+RFCONTSTART g54,2,2472		
	OK		
	Note: Enabled by default in	the SDK v3.2.3.0 or later.	
AT+RFCONTSTO P	(none)	Stop RF continuous TX test.	
F		Response: OK or ERROR	
	Prerequisite		
		us TX test (AT+RFCONTSTART).	
	Example AT+RFCONTSTA	RT a54 2 2412	
	OK	1(1 90+,2,2+12	
	AT+RFCONTSTC	)P	
	ОК		
	AT+RFCONTSTART g54,2,2472		
	OK Nata: Enabled by default in		
	Note: Enabled by default in		
AT+RFCHANNEL	<ch></ch>	Change RF channel for PER test. <ch>: Carrier frequency (2412 ~ 2484 MHz)</ch>	
		Response: OK or ERROR	
	Prerequisite		
	Start RF test mode (AT+RFTESTSTART).		
	Example		
	AT+RFCHANNEL 2412		
	OK		
	Note: Enabled by default in	the SDK v3.2.3.0 or later.	
AT+RFPERRESE	(none)	Reset PER count.	
I		Response: OK or ERROR	
	Prerequisite		
	Start RF test mode (AT+RFTESTSTART).		
	Example AT+RFPERRESET		
	OK		
	Note: Enabled by default in the SDK v3.2.3.0 or later.		
AT+RFPER	(none)	Display PER state.	
		Indicate the number of Valid packets, FCS Errors packets, PHY Errors	
		packets, and Overflow Errors.	
		Response: OK or ERROR	
	Prerequisite		
	Start RF test mode (AT+RFTESTSTART).		
	Example AT+RFPER		
	20 0 0 0		
	OK		
	Note: Enabled by default in the SDK v3.2.3.0 or later.		

Command	Parameters	Description
AT+RFTESTSTO	(none)	Stop RF test mode.
Р	Example	
	AT+RFTESTSTOP	
OK		
	Note: Enabled by default in the SDK v3.2.3.0 or later.	

Table 41. RF test examples

Test step	Command	Description
ECHO on	ATE	ECHO on
Set boot mode	AT+TMRFNOINIT=1	Set boot mode as RF test mode
Restart DA16200/ DA16600	AT+RESTART	Reboot as RF test mode
ECHO on	ATE	ECHO on
Start RF test mode	AT+RFTESTSTART	Start RF test mode
TX Test @ 11B 1 Mbps	AT+RFTX 2412,0,0,200,b1,0	11B 1 Mbps/Channel 1
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2442,0,0,200,b1,0	11B 1 Mbps/Channel 7
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2472,0,0,200,b1,0	11B 1 Mbps/Channel 13
	AT+RFTXSTOP	Stop TX
TX Test @ 11G 54 Mbps	AT+RFTX 2412,0,0,1000,g54,0	11G 54 Mbps/Channel 1
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2442,0,0,1000,g54,0	11G 54 Mbps/Channel 7
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2472,0,0,1000,g54,0	11G 54 Mbps/Channel 13
	AT+RFTXSTOP	Stop TX
TX Test @ 11N MCS7	AT+RFTX 2412,0,0,1000,n65,0	11N MCS7/Channel 1
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2442,0,0,1000,n65,0	11N MCS7/Channel 7
	AT+RFTXSTOP	Stop TX
	AT+RFTX 2472,0,0,1000,n65,0	11N MCS7/Channel 13
	AT+RFTXSTOP	Stop TX
RX Test	AT+RFCHANNEL 2412	Change RF channel to 1
	AT+RFPERRESET	Reset PER count
	AT+RFPER	Display PER state
	AT+RFCHANNEL 2442	Change RF channel to 7

Test step	Command	Description
	AT+RFPERRESET	Reset PER count
	AT+RFPER	Display PER state
	AT+RFCHANNEL 2472	Change RF channel to 13
	AT+RFPERRESET	Reset PER count
	AT+RFPER	Display PER state
Stop RF test mode	AT+RFTESTSTOP	Stop RF test mode

#### NOTE

Renesas Electronics provides the AT GUI tool to test RF performance easily. The tool and manual are available on the Renesas website (https://www.renesas.com/us/en/products/wireless-connectivity/wi-fi/low-power-wi-fi). See Ref. [4]. The 2.4 GHz band is divided into 14 channels at 5 MHz intervals centered at 2.412 GHz, starting with channel 1. The last channel (CH 14) has additional restrictions or cannot be used for all regulatory areas.

TX power setting value range: 0x0 ~ 0xB

Setting value for unsupported channel: 0xF

# 5.6.11 System and Peripheral Function Commands

## 5.6.11.1 SPI Commands

#### Table 42. SPI command list

Command	Parameters	Description
AT+SPICONF	<clockpol>,</clockpol>	Configure SPI.
	<clockpha></clockpha>	<clockpol>: Clock polarity [0 1]</clockpol>
		<clockpha>: Clock phase [0 1]</clockpha>
	Example	
	AT+SPICONF=1,	1
	OK	
	AT+SPICONF=0,	1
	OK	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	IfSUPPORT_PERI_C	MD is enabled in the SDK, this command should be enabled.
	as the period when CS is CS is low and transitionin clock phase. Depending	polarity of the clock signal during the idle state. The idle state is defined s high and transitioning to low at the start of the transmission and when ng to high at the end of the transmission. The <clockpha> selects the on the <clockpha>, the rising or falling clock edge is used to sample the of the DA16200/DA16600 are clockpol,0 and clockpha 0.</clockpha></clockpha>

Command	Parameters	Description	
		Mode 0 First Edge Sampling	Mode 1 Second Edge Sampling
		Clock Idle Low	Clock Idle Low
		CPOL = 0 , CPHA = 0 Mode 2 First Edge Sampling	CPOL = 0 , CPHA = 1 Mode 3 Second Edge Sampling
		Clock Idle High	Clock Idle High
		CPOL = 1 , CPHA = 0	CPOL = 1 , CPHA = 1

# 5.6.11.2 OTP Commands

#### Table 43. OTP command list

Command	Parameters	Description		
AT+UOTPRDASC	<addr>,<cnt></cnt></addr>	Read OTP data.		
		<addr>: OTP address to read 4-byte aligned</addr>		
		<cnt>: Bytes to read</cnt>		
		Response: OK or Error		
		A string of four-bit HEXA value represented by the ASCII code.		
	Example			
	//Reading 4 bytes	at offset h180 (h180 * 4 = h600).		
	//If data "1234567	'8" is written to 0x600, can read the values.		
	AT+UOTPRDASC	C=600,4		
	12345678			
	OK			
	Note:			
	Enabled by default in the SDK v3.2.3.0 or later.			
	IfSUPPORT_PERI_CMD is enabled in the SDK, this command should be enabled.			
	<ul> <li>The physical OTP offset range of the DA16200/DA16600 is h0~h1FF; at each offset, 4 bytes are stored or read.</li> </ul>			
	<ul> <li>For accessing OTP usin h0, h4, h8</li> </ul>	g this command, a 4-byte aligned address should be given. For example:		
AT+UOTPWRAS	<addr>,<cnt>,<value></value></cnt></addr>	Write OTP data.		
С		<addr>: OTP address to write 4-byte aligned</addr>		
		<cnt>: Bytes to write</cnt>		
		<value>: A string of four-bit HEXA value represented by the ASCII code</value>		
		Response: OK or Error		
		Important		
		For MAC address read or write, AT+WFOTP (write) and AT+WFMAC (read) must be used. Do not use AT+UOTPRDASC or AT+UOTPWRASC for this purpose.		
		OTP offset from $0x00 \sim 0x2b$ should not be written as this section is for "secure" boot.		
	Example			
	//Writing h123456	78 to OTP Address 0x600:		
	//To write "123456	678" data into the 0x600,		
	AT+UOTPWRAS	C=600,4,12345678		

Command	Parameters	Description
	OK	
	//To read written	Data with UOTPRDASC
	AT+UOTPRDAS	C=600,4
	12345678	
	OK	
	Note:	
	Enabled by default in th	e SDK v3.2.3.0 or later.
	IfSUPPORT_PERI_0	CMD is enabled in the SDK, this command should be enabled.
	<ul> <li>Physical OTP offset ran stored or read.</li> </ul>	ge of the DA16200/DA16600 is h0~h1FF; at each offset, 4 bytes are
	<ul> <li>For accessing OTP usin h0, h4, h8</li> </ul>	ng this command, a 4-byte aligned address should be given. For example:

The DA16200/DA16600 provides four (4) slots to store MAC addresses, and 8 bytes are allocated for each slot.

#### Table 44. OTP address for XTAL offset

Slot	OTP address	Description	Size (Byte)
MAC Address #0	0x100	MAC Address Low	4
MAC Address #0	0x101	MAC Address High	4
MAC Address #4	0x102	MAC Address Low	4
MAC Address #1	0x103	MAC Address High	4
MAQ Address #0	0x104	MAC Address Low	4
MAC Address #2	0x105	MAC Address High	4
MAC Address #2	0x106	MAC Address Low	4
MAC Address #3	0x107	MAC Address High	4

The DA16200/DA16600 provides two slots to store XTAL offset in the OTP memory. Slot #0 is the primary slot while Slot#1 is for back-up, which is used when overriding Slot #0.

#### Table 45. Memory size by XTAL offset

Slot	OTP address	Description	Size (Byte)
XTAL Offset #0	0x10A	XTAL Offset #0 value	1
XTAL Offset #1	0x10B	XTAL Offset #1 value	1

#### 5.6.11.3 XTAL Commands

These commands are used for XTAL calibration, and the usage is described in the DA16200/DA16600 Mass Production Guide. See Ref. [7].

#### Table 46. XTAL command list

Command	Parameters	Description
AT+XTALWR	<value></value>	Write XTAL Offset to the DA16200/DA16600 system register.
		<value>: Seven-bits to write [h'1 ~ h'7f]</value>
		Response: OK or Error
	Example	
	AT+XTALWR=7f	
	ОК	
	AT+XTALWR=80	

Command	Parameters	Description
	ERROR	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	IfSUPPORT_PERI_C	CMD is enabled in the SDK, this command should be enabled.
AT+XTALRD	(none)	Read XTAL offset from the DA16200/DA16600 system.
		Response:
		<cr><lf><a ascii<br="" by="" hexa="" of="" represented="" seven-bit="" string="" the="" value="">Code&gt;<cr><lf>OK<cr><lf></lf></cr></lf></cr></a></lf></cr>
		or Error
	Example	
	AT+XTALRD	
	0x7f	
	ОК	
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	IfSUPPORT_PERI_C	CMD is enabled in the SDK, this command should be enabled.

# 5.6.11.4 Flash Dump Commands

 Table 47. Flash dump command list

Command	Parameters	Description
AT+FLASHDUMP	<address>,</address>	Dump serial flash data.
	<length></length>	<address>: Start address [h'0 ~ h'3ffff]</address>
		<length>: Data length [d']</length>
		Response:
		<cr><lf></lf></cr>
		<dump data=""></dump>
		<cr><lf>OK<cr><lf></lf></cr></lf></cr>
		or Error
	Example	
	//The following ex	ample reads 32 kB from 0x00, (1024*32 = 32768)
	AT+FLASHDUMF	2=0,32768
	Note:	
	Enabled by default in the	e SDK v3.2.3.0 or later.
	IfSUPPORT_PERI_C	MD is enabled in the SDK, this command should be enabled.

# 5.6.11.5 GPIO Commands

#### Table 48. GPIO command list

Command	Parameters	Description
AT+GPIOSTART	<port>,</port>	Configure the GPIO pin MUX and the direction of a GPIO.
	<pin>,</pin>	ort>: GPIO port number
	<direction></direction>	• 0: GPIOA
		• 2: GPIOC
		<ul> <li><pin>: GPIO pin number. This is a hexadecimal value and indicates a GPIO bitmap</pin></li> </ul>
		• GPIOA: GPIOA0 ~ GPIOA11
		GPIOC: GPIOC6 ~ GPIOC8
		direction>: GPIO pin direction

Command	Parameters	Description	
		0: Set the pin as an input	
		• 1: Set the pin as an output	
		Response: OK or Error	
	Example		
		PIOA [3:0] output with UART interface:	
	-	//GPIO (0, 1, 2, 3) is set to binary 1 (0000 0000 0000 1111).	
	AT+GPIOSTART		
	ОК		
	//To configure GF	PIOA [3:0] output with using SPI interface:	
	//Avoid reassignir	//Avoid reassigning default SPI-pin.	
	//GPIO (4, 5, 6, 7	) is set to binary 1 (0000 0000 1111 0000).	
	AT+GPIOSTART	=0,f0,1	
	ОК		
	//To configure GF	PIOC [8:6] input:	
	//GPIO (6, 7, 8) is	s set to binary 1 (0000 0001 1100 0000).	
	AT+GPIOSTART	=2,1c0,0	
	OK		
	Note:		
	Enabled by default in the	e SDK v3.2.3.0 or later.	
	IfSUPPORT_PERI_C	CMD is enabled in the SDK, this command should be enabled.	
AT+GPIORD	<port>,</port>	Read the GPIO input level.	
	<pin></pin>	ort>: GPIO port number	
	•	• 0: GPIOA	
		• 2: GPIOC	
		<ul> <li><pin>: GPIO pin number. This is a hexadecimal value and indicates a GPIO bitmap</pin></li> </ul>	
		Response:	
		<read value="">: [h'0 ~ h'1fff]</read>	
		OK or Error	
	Example		
	//Configure GPIOC[8:6] as output and set to High.		
	AT+GPIOSTART=2,1c0,1		
	OK		
	AT+GPIOWR=2,1c0,1		
	OK		
	//Read back the status of the pins:		
	AT+GPIORD=2,1c0		
	0x01c0		
	OK		
	Note:		
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>		
	<ul> <li>IfSUPPORT_PERI_CMD is enabled in the SDK, this command should be enabled.</li> </ul>		
	<ul> <li>The read value indicates GPIO bitmap. If the value is 0x1c0, it means GPIO #6, #7, and #8 are High.</li> </ul>		

Command	Parameters	Description
AT+GPIOWR	<port>,</port>	Configures the output level of GPIO pins.
	<pin>,</pin>	ort>: GPIO port number
	<level></level>	• 0: GPIOA
		• 2: GPIOC
		<ul> <li><pin>: GPIO pin number. This is a hexadecimal value and indicates a GPIO bitmap</pin></li> </ul>
		<level>: GPIO output level</level>
		• 0: Low
		• 1: High
		Response: OK or Error
	Prerequisite	
	Change the direction of GPIO to output (AT+GPIOSTART).	
	Example	
	//Configure GPIOC[8:6] as output and set to High.	
	AT+GPIOSTART=2,1c0,1	
	ОК	
	AT+GPIOWR=2,1c0,1	
	OK	
	Note:	
	<ul> <li>Enabled by default in the SDK v3.2.3.0 or later.</li> </ul>	
	-	MD is enabled in the SDK, this command should be enabled.
AT+SAVE_PININ	(none)	Save pin MUX information.
FO		Response: OK or Error
	Example	
	AT+SAVE_PININ	FO
	OK	
	Note:	
	Enabled by default in the SDK v3.2.3.0 or later.	
	IfSUPPORT_PERI_CMD is enabled in the SDK, this command should be enabled.	
	It saves the current pin MUX configuration.	
AT+RESTORE_PI	(none)	Restore pin MUX information.
NINFO		Response: OK or Error
	Example	
	AT+RESTORE_PININFO	
	OK	
	Note:	
	Enabled by default in the SDK v3.2.3.0 or later.	
	IfSUPPORT_PERI_CMD is enabled in the SDK, this command should be enabled.	

# 5.6.11.6 LED Commands

# Table 49. LED command list

Command	Parameters	Description
AT+LEDINIT	<none></none>	Configure GPIOC_6 (LED1), GPIOC_7 (LED2), and GPIOC_8 (LED3) pins to GPIO output.
		Response: OK or Error

Command	Parameters	Description
	Example	
	AT+LEDINIT	
	+OK	
	Note: Enabled by default in	n the SDK v3.2.2.1 or later.
AT+LEDCTRL	<port>,</port>	Set LED1/2/3 (GPIOC_6/7/8) pin to output High or Low.
	<status></status>	<port>: GPIO port number</port>
		1: GPIOC_6
		2: GPIOC_7
		3: GPIOC_8
		<status>: LED status</status>
		off: LED off
		on: LED on
		Response: OK or Error
	Example	
	AT+LEDCTRL=1	off
	ОК	
	Note: Enabled by default in	n the SDK v3.2.2.1 or later.

#### 5.6.11.7 PWM Commands

#### Table 50. PWM command list

Command	Parameters	Description
AT+PWMINIT	<none></none>	Configure GPIOA_10 pin to PWM output.
		Response: OK or Error
	Example	
	AT+PWMINIT	
	+OK	
	Note:	
	Enabled by default in the SDK v3.2.2.1 or later.	
	IfATCMD_IF_UART1	is enabled in the SDK, this command should be enabled.
AT+PWMSTART	<channel>,</channel>	Start PWM output (GPIOA_10) with given period and duty.
	<period>,</period>	channel>: PWM channel, fixed as 0
	<duty></duty>	eriod>: period of one clock (microsecond)
	<mode cycle=""></mode>	duty>: duty as percentage
		<mode cycle="">: fixed as 0</mode>
		Response: OK or Error
	Example	
	AT+PWMSTART=0,40,50,0	
	OK	
	Note:	
	Enabled by default in the SDK v3.2.2.1 or later.	
	<ul> <li>IfATCMD_IF_UART1 is enabled in the SDK, this command should be enabled.</li> </ul>	
AT+PWMSTOP	<none></none>	Stop PWM output.
		Response: OK or Error
	Example	
	AT+PWMSTOP	
	OK	

Command	Parameters	Description
	Note:	
	Enabled by default in the SDK v3.2.2.1 or later.	
	<ul> <li>IfATCMD_IF_UART1 is enabled in the SDK, this command should be enabled.</li> </ul>	

# 5.6.11.8 ADC Commands

# Table 51. ADC command list

Command	Parameters	Description	
AT+ADCINIT	<none></none>	Configure GPIOA_0, GPIOA_1, GPIOA_2, GPIOA_3 to analog input pins for ADC.	
		GPIOA_0: ADC channel 0	
		GPIOA_1: ADC channel 1	
		GPIOA_2: ADC channel 2	
		GPIOA_3: ADC channel 3	
		Response: OK or Error	
	Example		
	AT+ADCINIT		
	OK		
	Note:		
	Enabled by default in the	e SDK v3.2.2.1 or later.	
	IfATCMD_IF_UART1	is enabled in the SDK, this command should be enabled.	
AT+ADCCHEN	<channel>,</channel>	Enable given ADC channel.	
	< resolution >	<channel>: ADC channel number [0 1 2 3]</channel>	
		<resolution>: ADC resolution. fixed as 12-bit</resolution>	
		Response: OK or Error	
	Example		
	AT+ADCCHEN=0	,12	
	OK		
	Note:		
	Enabled by default in the SDK v3.2.2.1 or later.		
	IfATCMD_IF_UART1	is enabled in the SDK, this command should be enabled.	
AT+ADCSTART	<divider></divider>	Start ADC function.	
		<divider>: divider ADC sampling rate</divider>	
		For example, when divider is 1, 1 MHz/(divider (1) + 1) = 500 kHz.	
		Response: OK or Error	
	Example		
	AT+ADCSTART=	1	
	ОК		
	Note:		
	Enabled by default in the	e SDK v3.2.2.1 or later.	
	IfATCMD_IF_UART1	is enabled in the SDK, this command should be enabled.	
AT+ADCREAD	<channel>,</channel>	Read ADC value.	
	<sample count=""></sample>	<channel>: ADC channel number [0 1 2 3]</channel>	
		<sample count="">: count of sample to read</sample>	
		Response:	
		<read value="">: [sample count]</read>	
		Response: OK or Error	
Command	Parameters	Description	
-----------------------	---	--	--
	Example AT+ADCREAD=0,16 [ 279 275 269 271 270 268 268 274 274 277 276 269 271 276 264 274 ] OK		
	Note:		
	Enabled by default in the SDK v3.2.2.1 or later.		
	IfATCMD_IF_UART1	is enabled in the SDK, this command should be enabled.	
AT+ADCSTOP	(none)	Stop ADC function.	
Response: OK or Error		Response: OK or Error	
	Example		
	AT+ADCSTOP		
	Enabled by default in the	e SDK v3.2.2.1 or later.	
	IfATCMD_IF_UART1 is enabled in the SDK, this command should be enabled.		

#### 5.6.11.9 I2C Commands

#### Table 52. I2C command list

Command	Parameters	Description		
AT+I2CINIT	<none></none>	Configure GPIOA_8 (I2C_SDA), GPIOA_9 (I2C_SCL) pins to I2C pins.		
		Response: OK or Error		
	Example			
	AT+I2CINIT			
	OK			
	Note: Enabled by default in the SDK v3.2.2.1 or later.			
AT+I2CREAD	<slave address="">,</slave>	Read values from registers of I2C device.		
	<register>,</register>	<slave address="">: 8-bit slave address of I2C device (hex)</slave>		
	<length></length>	<register>: register value to read (hex)</register>		
		<length>: data length to read (decimal)</length>		
		Response:		
		<read values=""> (hex)</read>		
		Response: OK or Error		
	Example			
	AT+I2CREAD=d0	,10,1		
	66			
	OK			
	Note: Enabled by default in the SDK v3.2.2.1 or later.			
AT+ I2CWRITE	<slave address="">,</slave>	Write values to I2C register of I2C device.		
	<register>,</register>	<slave address="">: 8-bit slave address of I2C device (hex)</slave>		
	<length>,</length>	<register>: register value to write (hex)</register>		
	<values></values>	<length>: data length to write (decimal)</length>		
		<values>: data to write (hex)</values>		
		Response: OK or Error		
	Example			
	AT+I2CWRITE=d	0,10,3,670292		
	OK			

Command	Parameters	Description
	Note: Enabled by default in the SDK v3.2.2.1 or later.	

#### 5.6.11.10 Sleep Commands

#### Table 53. Sleep command list

Command	Parameters	Description	
AT+SETSLEEP2E	<period>,<use_retentio< td=""><td>Enter Sleep mode 2 for the period specified.</td></use_retentio<></period>	Enter Sleep mode 2 for the period specified.	
ХТ	n_memory>	<period>: wake-up timeout, in millisecond. Min. period: 1000 msec. Max. period: 2097151000 (about 24 days)</period>	
		<use_retention_memory>: 1 (retain), 0 (not retain)</use_retention_memory>	
		Response: OK or ERROR	
	Example		
	AT+SETSLEEP2EXT=10000,0		
	OK		
	+INIT:DONE,0		
	Note:		
	Enabled by default in t	he SDK.	
	<ul> <li>The DA16200/DA16600 can be woken up by RTC_WAKE_UP while in sleep by AT+SETSLEEP2EXT.</li> </ul>		
	The DA16200/DA16600 sends "+INIT:DONE,0" when it wakes up.		
	<ul> <li>A value of 0 for the <period> parameter sets the system to wake up only when an RTC_WAKE_UP event occurs.</period></li> </ul>		
	<ul> <li>This command should be run in Non-DPM mode only, therefore, if you want to run this command in DPM mode, disable DPM first (AT+DPM=0,1), and run this command. When this command is run in DPM mode enabled, it returns ERROR (-316).</li> </ul>		
	<ul> <li>The use of 1 as <use_retention_memory> is obsolete. If you want to use 1 as <use_retention_memory>, use AT+SETSLEEP3EXT command instead.</use_retention_memory></use_retention_memory></li> </ul>		
AT+SETSLEEP3E	<period></period>	Enter Sleep mode 3 for the period specified.	
ХТ		<period>: wake-up timeout, in millisecond. Min. period: 1000 msec. Max. period: 2097151000 (about 24 days)</period>	
	Example		
	AT+SETSLEEP3EXT=10000		
	OK		
	+INIT:DONE,0		
	Note:		
	Enabled by default in the SDK.		
	<ul> <li>Retention memory is ON during Sleep mode 3.</li> </ul>		
	<ul> <li>The DA16200/DA16600 can be woken up by RTC_WAKE_UP while in sleep by AT+SETSLEEP3EXT.</li> </ul>		
	The DA16200/DA16600 sends "+INIT:DONE,0" or "+INIT:WAKEUP," when it wakes up.		
	<ul> <li>A value of 0 for the <period> parameter sets the system to wake up only when an RTC_WAKE_UP event occurs.</period></li> </ul>		
	<ul> <li>This command can be used in DPM mode or Non-DPM mode.</li> </ul>		

### 5.6.11.11 CALWL Commands

### Table 54. CALWL command list

Command	Parameters	Description	
AT+CALWR	<gmode_tx_rf_proc>,</gmode_tx_rf_proc>	Change RF TX GAIN Calibration register for test.	
	<txpga_gmode_cal></txpga_gmode_cal>	<gmode_tx_rf_proc></gmode_tx_rf_proc>	

Command	Parameters	Description		
		7 bits hexadecimal without "0x" prefix		
		Offset = bit[5:0] x 0.8 dB		
		MSB[6] bits 0 then TX gain is decreased		
		MSB[6] bits 1 then TX gain is increased		
		<txpga_gmode_cal></txpga_gmode_cal>		
		0: 0 dB offset		
		1: -0.2 dB offset		
		2: -0.4 dB offset		
		3: -0.6 dB offset		
	Example			
	1. TX measured +14 dB	m and changed to +13 dBm.		
	AT+CALWR=1	AT+CALWR=1,1		
	OK

	IfSUPPORT_PER	I_CMD is enabled in the SDK, this command should be enabled.		

# 6. AT Command Example

### 6.1 Data Transfer Test

This section describes how to test the transfer function commands with a data terminal emulator. Some of the terminal applications to be used for this purpose are:

- Hercules for Windows: https://www.hw-group.com/software/hercules-setup-utility
- Packet Sender for Windows/Linux/MacOS: https://packetsender.com/
- TCP UDP Server & Client for Android: TCP UDP Server & Client Apps on Google Play
- UDP/TCP/REST Network Utility for iOS: UDP/TCP/REST Network Utility on the App Store

The following sections describe test procedures for socket communication between the DA16200/DA16600 and a PC with Hercules. Run the DA16200/DA16600 AT commands on a serial terminal application on the local PC. The terminal must be connected to the UART1 interface of the DA16200/DA16600.

### 6.1.1 TCP Server Socket Test

- 1. DA16200/DA16600 AT command:
  - a. AT+TRTS=1234  $\leftarrow$  Open a TCP server socket with the port number 1234.
- 2. Hercules Software:
  - a. Select TCP Client (#1, Figure 27).
  - b. Enter the IP address and the port number of DA16200/DA16600 (#2, Figure 27).
  - c. Click Connect to connect the socket (#3, Figure 27).
- 3. DA16200/DA16600 AT command:
  - a. +TRCTS:0,192.168.0.2,50166 ← A TCP client socket connected, and IP address is 192.168.0.2 and port is 50166.
- 4. Hercules Software:
  - a. Send data (#4, Figure 27).
- 5. DA16200/DA16600 AT command:
  - a. +TRDTS:0,192.168.0.2,50166,24,Renesas IoT WiFi DA16200 ← Received 24 bytes of data: Renesas IoT WiFi DA16200.

### 6.1.2 TCP Client Socket Test

- 1. Hercules Software:
  - a. Select TCP Server (#1, see Figure 28).
  - b. Enter the port number to be used (#2, see Figure 28).
  - c. Click Listen to start to Listen (#3, see Figure 28).
- 2. DA16200/DA16600 AT command:
  - a. AT+TRTC=192.168.0.2,1234,2300 ← Open a TCP client socket and set the server IP (192.168.0.2), port (1234), and the local port (2300).
  - b. <ESC>S18,0,0,12345678 ← Send 8 bytes of data: 12345678.
- 3. Hercules Software:
  - a. Receive 8 bytes data.
  - b. Send data (#4, see Figure 28).
- 4. DA16200/DA16600 AT command:
  - a. +TRDTC:1,192.168.0.2,1234,24,Renesas IoT WiFi DA16200 ← Received 24 bytes of data: Renesas IoT WiFi DA16200.

# **Appendix C User UART Configuration**

# C.1 How to Run AT Command on UART2

AT command is configured to use the UART1 interface by default and can be configured to use the UART2 interface. To configure AT command to use the UART2 interface, modify config\_generic\_sdk.h as shown in the following example.

```
//AT command service
      #define ____SUPPORT_ATCMD
. . .
      #if defined ( SUPPORT ATCMD
                                          )
                 #undef __ATCMD_IF_UART1___
#define __ATCMD_IF_UART2___
                                                             //AT command over UART1
                                                             //AT command over UART2
                  . . .
                 #undef __USER_UART_CONFIG__ //Support Customer's UART configuration
                 #undef __ATCMD_IF_SPI__
#undef __ATCMD_IF_SDIO
                                                         //AT command over SPI
                           ATCMD_IF_SDIO___
                                                             //AT command over SDIO
        #endif /* __SUPPORT_ATCMD___*/
. . .
```

## C.2 User UART Configuration

There is a feature called User UART Configuration that is enabled by \_\_USER\_UART\_CONFIG\_\_. When the SDK is built with \_\_USER\_UART\_CONFIG\_\_ defined, the UART settings for the AT command interface can be configured. In this case, ATB is not available. For example, to run AT command on UART2 with a static baud rate of 230400, the SDK should be configured as shown in the following example.

```
//config_generic_sdk.h
. . .
      //AT command service
     #define
             SUPPORT ATCMD
. . .
     \# if defined ( \_SUPPORT\_ATCMD\_ )
              //AT command over UART1
                                            //AT command over UART2
              #define USER UART CONFIG //Support Customer's UART configuration
       #endif /* SUPPORT ATCMD */
. . .
//user interface.c
#if defined ( USER UART CONFIG )
/*
* Customer configuration for AT command UART
*/
uart info t ATCMD UART config info =
{
     UART BAUDRATE 230400,
                                     /* baud */
                           /* bits */
     UART_DATABITS_8,
     UART PARITY NONE,
                            /* parity */
                            /* stopbit */
     UART STOPBITS 1,
                            /* flow control */
     UART FLOWCTL OFF
};
#endif// __USER_UART_CONFIG___
. . .
```

With the changes, when the DA16200/DA16600 boots, AT command is initialized in baud rate of 230400 by default and cannot be changed at run time.

## C.3 Use Case

// \_\_USER\_UART\_CONFIG\_\_ disabled

- Baud rate (and other parameters) configurable by NVRAM.
- ATB available, UART Setting can change at run-time without SDK rebuild.
- Example Use case
  - MCU: Run on UART in baud rate of 115200.
  - MCU: Run ATF
  - DA16200/DA16600: AT command is initialized in 115200.
  - MCU: ATB=230400
  - MCU: Now it should change its UART baud rate to 230400 to communicate with the DA16200/DA16600.
- // \_\_USER\_UART\_CONFIG\_\_ enabled
- AT Command UART's baud rate (and other parameters) is configurable statically.
- ATB NOT available
- Example Use Case
  - DA16200/DA16600: The DA16200/DA16600 boots and AT command is initialized in 230400 by default.
  - MCU: Start on UART in baud rate of 230400.
  - MCU: AT command operation.

# Appendix D DA16200/DA16600 Cipher Suites

# **Appendix F Fast Reconnect Function**

When Wi-Fi STA tries to connect to an AP again after waking up from Sleep Mode 2, it needs time to establish a Wi-Fi connection. To shorten the time of reconnection, simply use Fast Reconnect function, which is available without additional setup when AT command feature is enabled.

### F.1 Technical Overview

### F.1.1 Direct Probe Request for Wi-Fi SCAN

During the Wi-Fi SETUP processing after running ATF command, associated channel number is saved in NVRAM automatically after success Wi-Fi connect.

After saving the connected channel number to NVRAM, when reconnecting to Wi-Fi is attempted, the total Wi-Fi SCAN time to connect is reduced because only the registered channel number is scanned without performing full-channel scan for Wi-Fi connection.

### F.1.2 Network Address without DHCP Client Procedure

The DA16200/DA16600 obtains an IP address by DHCP Client procedure when the first Wi-Fi connection is completed after running ATF command. The DHCP Client operation may take a lot of time in some cases.

To reduce DHCP Client procedure time, the DA16200/DA16600 saves the IP address, subnet mask, gateway address, and DNS address information in NVRAM after a successful DHCP client procedure, and changes to STATIC IP mode internally. STATIC IP mode removes DHCP processing time and improves connection speed.

# Appendix G Bluetooth<sup>®</sup> LE Coexistence Feature

The Bluetooth® LE Coexistence feature is defined as follows:

- DA16200 AT command image: Bluetooth® LE Coexistence feature is disabled
- DA16600 AT command image: Bluetooth® LE Coexistence feature is enabled (3-pin interface).

If the Bluetooth® LE Coexistence feature or the 1-pin interface are required, the SDK must be rebuilt. For more information, see Ref. [2].

# Appendix H Wi-Fi Passive-Scan

A client can use two scanning methods: active and passive. During an active scan, the client radio sends a probe request and receives a probe response from an AP. With a passive scan, the client radio listens to beacons periodically sent by the AP on each channel. A passive scan generally takes more time, since the client must listen and wait for a beacon, than actively probing to find an AP. Another limitation with a passive scan is that if the client does not wait long enough on a channel, then the client may miss an AP beacon.

The DA16200/DA16600 supports active scan and passive scan. It accepts both probe responses and beacons. The DA16200 passive scan consists of frequency and time remaining on the channel, and the result is delivered to the host firmware within 10 ms.

## H.1 Passive-Scan with Specified Channel and Scan-Time Limit

The Wi-Fi component should be able to perform a passive Wi-Fi scan that only scans a given list of channels in given time limit. The DA16200 provides passive scan command with ATCMD.

Related command is AT+WFPSCAN

### H.2 Passive-Scan Result

During a passive scan, the Wi-Fi component should be able to report each beacon signal to the host firmware within 10 ms received because of the passive scan. The format which is reported to host firmware is:

BSSID SSID RSSI Security Type Wi-Fi Channel

## H.3 Passive-Scan Stop

The Wi-Fi component should be able to stop an ongoing passive Wi-Fi scan, and any power use associated with the scan within 100 ms of receiving a Wi-Fi beacon signal that meets the following criteria. Beacon BSSID matches the given pattern AND either of the following:

- Beacon RSSI is greater than the minimum threshold OR
- Beacon RSSI is less than the maximum threshold
- When it stops scanning by condition, it prints out "+PSCAN:CONDITIONMET".

Related commands are "AT+WFPCDTMIN", "AT+WFCDTMAX" and "AT+WFPSTOP".

## H.4 Passive-Scan Sequence

This section describes basic procedure for passive scan between the DA16200/DA16600 and a personal computer. Run the DA16200 AT commands on a serial terminal application on the local PC. The terminal must be connected to the UART1 interface of the DA16200.

- Enable ATCMD feature in "config\_generic\_sdk.h": #define SUPPORT ATCMD
- Set passive scan condition using ATCMD: ATCMD: AT+WFPCDTMIN=72:5d:cc:d0:82:bc,-80
- Start passive scan using ATMD: ATCMD: AT+WFPSCAN=120000,1,3,5
- 4. Stop passive scan using ATMD:

ATCMD: AT+WFPSTOP

5. Check passive scan report; see Figure 30.

# **Appendix I Detailed Error Codes for AT Command**

### Table 58. AT command error codes

Category	Value	Error code	Description
Common	0	AT_CMD_ERR_CMD_OK	OK, no error
	-1	AT_CMD_ERR_UNKNOWN_CMD	Unknown command
	-2	AT_CMD_ERR_INSUFFICENT_ARGS	Insufficient parameter
	-3	AT_CMD_ERR_TOO_MANY_ARGS	Too many parameters
	-4	AT_CMD_ERR_WRONG_ARGUMENTS	Wrong parameter value
	-5	AT_CMD_ERR_NOT_SUPPORTED	Unsupported function
	-6	AT_CMD_ERR_NOT_CONNECTED	Not connected to an AP
	-7	AT_CMD_ERR_NO_RESULT	No result
	-8	AT_CMD_ERR_TOO_LONG_RESULT	Response buffer overflow
	-9	AT_CMD_ERR_INSUFFICENT_CONFIG	Function is not configured
	-10	AT_CMD_ERR_TIMEOUT	Command timeout
	-11	AT_CMD_ERR_NVR_WRITE	NVRAM write failure
	-12	AT_CMD_ERR_RTM_WRITE	Retention memory write failure
	-13	AT_CMD_ERR_SYS_BUSY	System busy
	-14	AT_CMD_ERR_MEM_ALLOC	Memory allocation failure
	-20	AT_CMD_ERR_DATA_TX	Data TX failure
	-22	AT_CMD_ERR_IP_ADDRESS	IP address get failure
	-100	AT_CMD_ERR_COMMON_SYS_MODE	Wrong system running mode
	-110	AT_CMD_ERR_COMMON_ARG_TYPE	Wrong argument type
	-111	AT_CMD_ERR_COMMON_ARG_RANGE	Argument int-value range error
	-112	AT_CMD_ERR_COMMON_ARG_LEN	Argument value length error
	-113	AT_CMD_ERR_COMMON_WRONG_CC	Wrong country-code
	-114	AT_CMD_ERR_COMMON_WRONG_MAC_ADDR	Wrong MAC address
	-999	AT_CMD_ERR_UNKNOWN	Undefined Error
Flash	-170	AT_CMD_ERR_SFLASH_READ	SFlash driver read failure
	-171	AT_CMD_ERR_SFLASH_WRITE	SFlash driver write failure
	-172	AT_CMD_ERR_SFLASH_ERASE	SFlash driver erase failure
	-173	AT_CMD_ERR_SFLASH_ACCESS	SFlash driver access failure
NVRAM	-180	AT_CMD_ERR_NVRAM_READ	NVRAM driver read failure
	-181	AT_CMD_ERR_NVRAM_WRITE	NVRAM driver write failure
	-182	AT_CMD_ERR_NVRAM_ERASE	NVRAM driver erase failure
	-183	AT_CMD_ERR_NVRAM_DIGIT	
	-184	AT_CMD_ERR_NVRAM_SAME_M AC	
	-185	AT_CMD_ERR_NVRAM_CANCEL ED	
	-186	AT_CMD_ERR_NVRAM_INVALID	
	-187	AT_CMD_ERR_NVRAM_UNKNO WN	
	-188	AT_CMD_ERR_NVRAM_NOT_SAVED_VALUE	NVRAM name does not exist

Category	Value	Error code	Description
Basic	-200	AT_CMD_ERR_BASIC_ARG_NULL_PTR	Not used in AT command module
	-201	AT_CMD_ERR_BASIC_ARG_DATE	Argument "Date" format failure
	-202	AT_CMD_ERR_BASIC_ARG_TIME	Argument "Time" format failure
	-203	AT_CMD_ERR_BASIC_ARG_TIME_ETC	Argument Time value failure
UART	-220	AT_CMD_ERR_UART_INTERFACE	Not defined UART type
	-221	AT_CMD_ERR_UART_BAUDRATE	Argument "BaudRate" failure
	-222	AT_CMD_ERR_UART_DATABITS	Argument "DataBits" failure
	-223	AT_CMD_ERR_UART_PARITY	Argument "Parity" failure
	-224	AT_CMD_ERR_UART_STOPBIT	Argument "StopBits" failure
	-225	AT_CMD_ERR_UART_FLOWCTRL	Argument "FlowCtrl" failure
	-226	AT_CMD_ERR_UART_BAUDRATE_NV_WR	NVRAM Write failure - Baudrate
	-227	AT_CMD_ERR_UART_DATABITS_NV_WR	NVRAM Write failure - DataBits
	-228	AT_CMD_ERR_UART_PARITY_NV_WR	NVRAM Write failure - Parity
	-229	AT_CMD_ERR_UART_STOPBIT_NV_WR	NVRAM Write failure - StopBit
	-230	AT_CMD_ERR_UART_FLOWCTRL_NV_WR	NVRAM Write failure - FlowCtrl
DPM	-300	AT_CMD_ERR_DPM_MODE_DISABLED	DPM operation is not enabled
	-301	AT_CMD_ERR_DPM_SLEEP_STARTED	DPM LPM is already running
	-302	AT_CMD_ERR_DPM_FAST_CONN_EN	Fast-connection function is enabled
	-303	AT_CMD_ERR_DPM_USER_RTM_ALLOC	Failed to allocate memory in user area of RTM
	-304	AT_CMD_ERR_DPM_USER_RTM_DUP	Same task name already exists
	-305	AT_CMD_ERR_DPM_MODE_ARG	Wrong argument type: DPM flag
	-306	AT_CMD_ERR_DPM_NVRAM_FLAG_ARG	Wrong argument type: NVRSM flag
	-309	AT_CMD_ERR_DPM_SLP2_PERIOD_TYPE	Wrong argument type: Period
	-310	AT_CMD_ERR_DPM_SLP2_PERIOD_RANGE	Wrong argument value range: Period
	-311	AT_CMD_ERR_DPM_SLP2_RTM_FLAG_ARG	Wrong argument type: RTM flag
	-312	AT_CMD_ERR_DPM_SLP1_RTM_FLAG_RANGE	Wrong argument value range: RTM flag
	-313	AT_CMD_ERR_DPM_SLP1_RTM_FLAG_ARG	Wrong argument type: RTM flag
	-314	AT_CMD_ERR_DPM_SLP1_RTM_FLAG_RANGE	Wrong argument value range: RTM flag
	-315	AT_CMD_ERR_DPM_ABN_ARG	Wrong argument type: DPMABN

Category	Value	Error code	Description
	-316	AT_CMD_ERR_DPM_SLP2_DPM_MODE_ENABLED	Wrong system mode: DPM mode
	-317	AT_CMD_ERR_DPM_SLP3_PERIOD_TYPE	Wrong argument t type: Period
	-318	AT_CMD_ERR_DPM_SLP3_PERIOD_RANGE	Wrong argument value range: Period
Wi-Fi	-400	AT_CMD_ERR_WIFI_NOT_CONNECTED	Not connected to AP
	-401	AT_CMD_ERR_WIFI_RUN_MODE_TYPE	Wrong argument type
	-402	AT_CMD_ERR_WIFI_RUN_MODE_RANGE	Wrong argument value range
	-403	AT_CMD_ERR_WIFI_MAC_ADDR	Wrong string type for MAC address
	-404	AT_CMD_ERR_WIFI_WPS_PIN_NUM	Wrong PIN number for WPS connection
	-406	AT_CMD_ERR_WIFI_SCAN_UNSUPPORTED	SCAN command not supported
	-407	AT_CMD_ERR_WIFI_PSCAN_FREQ_RANGE	Wrong argument value range: Frequency
	-408	AT_CMD_ERR_WIFI_PSCAN_CMAX_RANGE	Wrong argument value: Max RSSI threshold
	-409	AT_CMD_ERR_WIFI_PSCAN_CMIN_RANGE	Wrong argument value: Min RSSI threshold
	-410	AT_CMD_ERR_WIFI_JAP_SSID_NO_VALUE	SSID information not found in NVRAM
	-411	AT_CMD_ERR_WIFI_JAP_SSID_LEN	Too long SSID string (Max length: 32 bytes)
	-412	AT_CMD_ERR_WIFI_JAP_SECU_ARG_TYPE	Wrong argument type: Auth

	-795	AT_CMD_ERR_SSL_CERT_EMPTY_CERT	No certificate
	-796	AT_CMD_ERR_SSL_CERT_INTERNAL	Internal error
	-797	AT_CMD_ERR_SSL_CONN_TIMEOUT_RANGE	Invalid timeout value
	-801	AT_CMD_ERR_RSSI_TIMEOUT	RSSI value not received within a timeout

# Appendix J AT Command Development Environment Configuration

## J.1 How to Connect DA16200/DA16600 Board

This section describes the installation procedure for the drivers, the configuration of the serial port, and all necessary steps to set up and check the connection with computer.

#### Figure 31. AT command development environment

When connecting to a host computer with Microsoft Windows as operating system, the system detects several devices and installs automatically all necessary drivers. If the driver is not automatically installed, then get the driver from the following URL: <a href="https://ftdichip.com/drivers/d2xx-drivers/">https://ftdichip.com/drivers/d2xx-drivers/</a>.

There are two virtual COM ports created by the Windows driver. The first COM port (lower number, COM69 in Figure 32) provides a UART interface for debugging or firmware download between the PC and the DA161200. The second (higher number, COM70 in Figure 32 is used for AT command.

Figure 32. Check COM ports on device manager

## J.2 Configure Serial Port for UART

On a Windows Host, the utility Tera Term is used to connect. See Ref. [1].

Tera Term is a free terminal emulator (communication program) that supports multiple communication including serial port connections.

- 1. Download Tera Term from https://teratermproject.github.io/index-en.html.
- 2. Run the teraterm-x.yy.exe.
- 3. Follow the installation wizard.

To make sure that the communication between the DA16200/DA16600 EVK and the host PC is established correctly, check the UART connection between the two nodes. Do the following steps:

- 1. Use a USB cable to connect the DA16200/DA16600 EVK to the PC.
- 2. Make sure that the PC discovered the two serial ports in Windows Device Manager as shown in Figure 32. The higher COM port number is connected to UART1.
- 3. Open Tera Term from the Windows Start menu.
- 4. In the Tera Term: New connection Renesas Electronics:
  - a. Select Serial.
  - b. Select the COM Port to use.
  - c. Click OK.
- 5. Select Setup > Serial Port and configure the UART port with the parameters as shown in Figure 33. Select the higher COM port number as discovered in step 2.

SCOM70:115200baud - Tera Term VT				
File Edit Setup Control Window Help				
+ INIT: DONE, 0 You get this log when	Tera Term: Serial port setup	COM70	~	×
the EVK is booted up		COM69		
+WFJAP:1,'AP-NAME',192.168.0.:	Port:	COM70		OK
Type'AT'here,	Baud rate:	115200	~	
OK then Enter	Data:	8 bit	~	Cancel
	Parity:	none	~	
	Stop:	1 bit	~	Help
	Flow control:	none	~	
	Transmit delay	char 0		msec/line

Figure 33. Initial setup to start with AT command

### J.3 Configuration for MCU Wake-Up (Optional)

Depending on the application scenarios, both MCU and the DA16200/DA16600 may want to be in the Sleep state and MCU wants to awake (by the DA16200/DA16600) when the DA16200/DA16600 wakes up from DPM LPM. This can be achieved with the MCU wake-up feature of the DA16200/DA16600.

To use the MCU wake-up feature, connect pin GPIO\_11 of the DA16200/DA16600 to the wake-up pin on the MCU. Then, when the DA16200/DA16600 wakes up, GPIO\_11 becomes an Output and is set to High (Active High) to trigger the wake-up of the MCU. The wake-up pin of MCU should be configured to detect the rising edge of GPIO\_11 for wake-up.

# **Appendix K Deprecated AT Commands**

Table 59 shows AT commands that are deprecated and no longer used.

#### Table 59. Deprecated commands

Command	Parameters	Description	
AT+SETSLEEP1EXT	<retain_< td=""><td>Enter Sleep mode 2.</td></retain_<>	Enter Sleep mode 2.	
	dpm_memory>	<retain_dpm_memory>: 1 (retain), 0 (not retain)</retain_dpm_memory>	
		Response: OK or ERROR	
	Example		
	AT+SETS	SLEEP1EXT=1	
	OK		
	+INIT:DO	NE,0	
	Note:		
	<ul> <li>Deprecated com</li> </ul>	imand.	
	It recommends u	using the AT+SETSLEEP2EXT command instead of this one.	
	<ul> <li>The DA16200/D assigned as a w</li> </ul>	A16600 can only be woken up by RTC_WAKE_UP or GPIO which was ake-up source.	
	The DA16200/D	A16600 sends "+INIT:DONE:0" when it wakes up.	
AT+SLEEPMS	<period></period>	Force the DA16200/DA16600 enter Sleep mode 3 and wake up after <period> milliseconds.</period>	
		<period>: Wake-up time in milliseconds. Max period: 2097151000 (about 24 days)</period>	
	Example		
	AT+SLEE	EPMS=5000	
	+INIT:DO	NE,0	
	Note:		
	<ul> <li>Deprecated command.</li> </ul>		
	IfSUPPORT_	PERI_CMD is enabled in the SDK, this command is available.	

# 7. Revision History

Revision	Date	Description
3.6	May 15, 2025	<ul> <li>Move the AT+SETSLEEP1EXT and AT+SLEEPMS in the sleep commands section to Appendix K Deprecated AT Commands section.</li> </ul>
		<ul> <li>Updated the examples for AT+NWHTC command.</li> </ul>
3.5	Feb 7, 2025	<ul> <li>Updated sleep commands and Appendix B</li> </ul>
		<ul> <li>Added AT+DEFCCRNT, AT+WFMACERASE, AT+WFJAPBSSID, AT+WFJAPABSSID and AT+WFJAPA3BSSID commands.</li> </ul>
		<ul> <li>Updated parameter for AT+WFSCAN command.</li> </ul>
		<ul> <li>Updated notes for AT commands that have NVRAM or SFlash write/erase operation.</li> </ul>
		<ul> <li>Added note for AT+SETDPMSLPEXT command.</li> </ul>
		<ul> <li>Added the description of phase 2 TLS types in WPA enterprise.</li> </ul>
		Added the examples for EAP-TLS and EAP-PEAP0-TLS mode.
		<ul> <li>Updated and added error codes for AT commands.</li> </ul>
		<ul> <li>Updated AT+TRSSLCFG command as SSL version configuration is invalid.</li> </ul>
		<ul> <li>Added table for secure socket response list.</li> </ul>
3.4	June 21, 2024	Updated the description in AT+PROVSTART and AT+DPMABN
3.3	May 29, 2024	Changed TCP/UDP test tool from IO Ninja to Hercules
		Added free TCP/UDP test tool for Linux/MacOS/Android/iOS
		<ul> <li>Updated AT command error codes</li> </ul>
		<ul> <li>Updated description for ATF/factory reset, AT+WFMODE and AT+NWMQTP</li> </ul>
		AT+TRSSLCFG: Updated SSL protocol version settings
		<ul> <li>AT+SETSLEEP2EXT, AT+SETSLEEP3EXT: updated minimum value for <period></period></li> </ul>
3.2	Sept 18, 2023	Updated AT command error codes
3.1	Aug 18, 2023	Updated AT+GPIOSTART and AT+LEDCTRL examples
		<ul> <li>Added error code to Detailed Error Codes for AT Command</li> </ul>
		<ul> <li>AT+SETSLEEP2EXT, AT+DPMUSERWU: changed the time input unit from seconds to milliseconds</li> </ul>
		AT+WFENTAP: updated hidden AP settings
		AT+TRSSLCERTSTORE: added data length parameter
		<ul> <li>AT+TRSSLWR: fixed incorrect optional parameter</li> </ul>
		AT+WFENTLI: fixed incorrect optional parameter
		<ul> <li>AT+NWCCRT: added DH param for Set #1 and 2, and Set #3 for WPA Enterprise</li> </ul>
		ESC>C: added Set #3 for WPA Enterprise
		<esc>CERT: added new AT command in Certificate Command table</esc>
		AT+SETSLEEP2EXT: description updated
		AT+SETSLEEP3EXT added
		<ul> <li>Updated the usage of padding field in SPI protocol</li> </ul>
3.0	June 30, 2023	<ul> <li>Updated OTA commands and descriptions in Secure Socket Command List table</li> </ul>
		AT+WFCC: additional note added
		AT+WFJAP, AT+WFSAP: additional note added on <sec> <enc> for WPA3</enc></sec>
2.17	Apr 10, 2023	Corrected examples and descriptions of OTA commands
2.16	Feb 10,2023	Corrected the range of AT+SETSLEEP2EXT command

Revision	Date	Description
2.15	Jan 27, 2023	Added ESC Command Sequence
2.14	Jan 12, 2023	Merged user guides and changed the titles.
		UM-WI-003, DA16200 DA16600 AT Command
		UM-WI-020, DA16200 SPI Host Interface
		UM-WI-053, DA16200 SDIO Host Interface
2.13	Dec 16, 2022	AT+NWHTCH added
		AT+NWHTCTLSAUTH added
		AT+WFCC: note is added
		AT+NWMQMSG: note updated on max length
		AT+WFAPUI: description updated
		AT+NWIP: note added
		AT+WFAPCH: valid range changed
		AT+WFWMP: note updated
		AT+BLENAME: added to get the BLENAME.
		AT+WFJAPA3: added to connect to the WPA3-AP
		<ul> <li>MQTT Commands re-arranged: split to MQTT configuration command and MQTT operation commands.</li> </ul>
		Pre-requisite added for MQTT Configuration commands.
		Updated DA16200/DA16600 Cipher Suites
		<ul> <li>New added Appendix J AT commands error codes Typo fixed in the example - AT+WFSPF, AT+WFOTP, <esc>S</esc></li> </ul>
2.12	Aug 08, 2022	<ul> <li>Updated Appendix for running AT command through SDIO or SPI.</li> </ul>
2.12	, kug 00, 2022	<ul> <li>Added the section of Wi-Fi Function Commands for WPA Enterprise</li> </ul>
2.11	June 14, 2022	<ul> <li>AT+SDKVER added</li> </ul>
2.11	00110 14, 2022	<ul> <li>Added the Command Format section</li> </ul>
		<ul> <li>Added AT+HOSTINITDONE</li> </ul>
		<ul> <li>Added Appendix E</li> </ul>
		<ul> <li>Added more info on AT+TZONE</li> </ul>
		<ul> <li>Info updated or typo fixed: ATQ, ATB, AT+NWDHIP, AT+WFRSSI</li> </ul>
		<ul> <li>Changed default status by some features are enabled</li> </ul>
		Added AT+CHIPNAME, AT+CALWR
		AT+NWMQMSG : operation response added (+NWMQMSGSND)
		Updated +WFJAP:0 and +WFDAP:0 (reason parameter is added)
		Updated AT+NWMQBR, AT+NWMQTT
		<ul> <li>Updated MQTT optional configuration commands (enabled by default in SDK v3.2.3.0)</li> </ul>
		Added AT+NWMQCS, and CleanSession=0 Guide.
		AT+WFJAP/AT+WFJAPA/AT+WFSAP : passphrase range added
		<ul> <li>AT+TRTS example updated</li> </ul>
		Added AT+NWMQUTS
		<ul> <li>Updated Note : AT+NWIP, AT+NWDHR, AT+NWDHLT, AT+NWMQMSG, <esc>S</esc></li> </ul>
		+NWMQCL updated
		<ul> <li>Added Appendix H</li> </ul>
		<ul> <li>Added AT+NWWSC</li> </ul>
		Added note for <esc>S : for ATCMD on SPI</esc>
2.10	Mar 22, 2022	Updated logo, disclaimer, and copyright.
-	. ,	1

Revision	Date	Description	
		Added LED/PWM/ADC/I2C related AT commands	
2.9	Dec 14, 2021	<ul> <li>AT+NWMQMSG, AT+NWMQTS: updated max length info on topic and added message</li> </ul>	
		Added AT+NWDNS, HELP, ATE, and ATQ information	
2.8	Dec 08, 2021	Updated OTP Size Reduced (changed 8 kB to 2 kB) in OTA section	
		<ul> <li>Updated Data Transfer Commands section</li> </ul>	
		<ul> <li>Updated AT+TRSSLWR</li> </ul>	
		<ul> <li>Added AT+NWMQATS, AT+NWMQDTS, AT+NWMQV311, and AT+NWDHIP</li> </ul>	
		<ul> <li>Added AT+ NWHTCSNI, AT+ NWHTCALPN, AT+NWHTCSNIDEL, and AT+NWHTCALPNDEL</li> </ul>	
2.7	Nov 25, 2021	Changed the title	
2.6	Oct 28, 2021	Added AT+WFAPUI: <timeout> valid value range</timeout>	
		Updated TCP Client Socket Test section	
		<ul> <li>Updated TCP Server section</li> </ul>	
		Updated: 5th parameter removed from AT+NWDHS	
		Added: AT+NWDNS2	
		AT+XTALRD, AT+FLASHDUMP: <cr><lf> is appended to data</lf></cr>	
2.5	Sept 07, 2021	<ul> <li>Updated table format of ATCMD (Prerequisite, example, note added)</li> </ul>	
		<ul> <li>Added Zeroconf Commands</li> </ul>	
		<ul> <li>Added Secure Socket Commands</li> </ul>	
2.4	June 17, 2021	<ul> <li>Updated MQTT commands (MQTT Client Connection Example and MQTT TLS Connection Example)</li> </ul>	
		<ul> <li>AT+NWDHDNS deleted (not needed as WAN Port is not available in Soft AP mode)</li> </ul>	
		<ul> <li>Added AT+NWMQALPN, AT+NWMQSNI, AT+NWMQCSUIT, AT+SETDPMSLP1EXT, AT+DPMABNWFCCNT</li> </ul>	
		Updated AT+WFJAP, AT+WFJAPA : Optional parameter <hidden> added</hidden>	
2.3	Apr 01, 2021	Added OTA update command	
		<ul> <li>Added support for SDK V3.x.x.x</li> </ul>	
2.2	Mar 15, 2021	Added Appendix B HTTP API Return Values	
	,	<ul> <li>Added Appendix C</li> </ul>	
		<ul> <li>Added AT+NWMQAUTO and ATB</li> </ul>	
2.1	Jan 13, 2021	Added Wi-Fi Function Commands for WPA3, and updated minor changes	
2.0	Dec 08, 2020	<ul> <li>Added additional description on the following commands:</li> </ul>	
2.0	000 00, 2020	<ul> <li>AT+WFSAP, AT+WFOAP, AT+WFTAP, ATF, AT+WFJAPA, AT+NWMQTT, +NWMQCL, AT+DPM</li> </ul>	
		<ul> <li>Added new sections:</li> </ul>	
		Added MQTT Example: Changing Subscription Topic while running	
		<ul> <li>Added MQTT Example: Reading Subscription Topic while running</li> </ul>	
1.9	Nov 11, 2020	<ul> <li>AT+NWCCRT, <esc>C updated</esc></li> </ul>	
		<ul> <li>AT+NWSNS updated</li> </ul>	
		<ul> <li>AT+NWHTS updated</li> </ul>	
		<ul> <li>AT+NWHTSS updated</li> </ul>	
1.8	Aug 18, 2020	<ul> <li>Added SNTP commands in Network Function Commands</li> </ul>	
		<ul> <li>Added HTTP-client command in HTTP-Client Commands</li> </ul>	
		<ul> <li>Added MCU firmware update command using OTA in OTA Commands</li> </ul>	

Revision	Date	Description	
1.7	June 30, 2020	<ul> <li>Added Configuration for MCU Wake-up</li> </ul>	
		<ul> <li>Correct typos and wordings</li> </ul>	
1.6	Apr 29, 2020	Added AT+WFDIS and AT+SETDPMSLP2EXT	
		<ul> <li>Updated MQTT commands to operate with one-port</li> </ul>	
		<ul> <li>Updated to process the comma in the parameters</li> </ul>	
1.5	Apr 03, 2020	<ul> <li>Added AT+BIDX for changing boot index</li> </ul>	
		<ul> <li>Added example code of MQTT commands</li> </ul>	
		<ul> <li>Updated RF Test function commands</li> </ul>	
		<ul> <li>Updated GPIO commands</li> </ul>	
1.4	Oct 21, 2019	<ul> <li>Updated Serial Port configuration steps</li> </ul>	
		<ul> <li>Removed draft status</li> </ul>	
1.3	Oct 15, 2019	Error correction	
		Added explanation to serial program	
1.2	Oct 07, 2019	Editorial review and add code: UM-B-111	
1.1	July 25, 2019	Added OTP Memory Address for writing MAC address	
1.0	July 03, 2019	Preliminary DRAFT Release	

#### **Status Definitions**

Status	Definition
DRAFT	The content of this document is under review and subject to formal approval, which may result in modifications or additions.
APPROVED or unmarked	The content of this document has been approved for publication.

#### **ROHS COMPLIANCE**

Renesas Electronics' suppliers certify that its products are in compliance with the requirements of Directive 2011/65/EU of the European Parliament on the restriction of the use of certain hazardous substances in electrical and electronic equipment. RoHS certificates from our suppliers are available on request.

#### IMPORTANT NOTICE AND DISCLAIMER

RENESAS ELECTRONICS CORPORATION AND ITS SUBSIDIARIES ("RENESAS") PROVIDES TECHNICAL SPECIFICATIONS AND RELIABILITY DATA (INCLUDING DATASHEETS), DESIGN RESOURCES (INCLUDING REFERENCE DESIGNS), APPLICATION OR OTHER DESIGN ADVICE, WEB TOOLS, SAFETY INFORMATION, AND OTHER RESOURCES "AS IS" AND WITH ALL FAULTS, AND DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING, WITHOUT LIMITATION, ANY IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, OR NON-INFRINGEMENT OF THIRD-PARTY INTELLECTUAL PROPERTY RIGHTS.
