M16C Series, R8C Family
C Compiler Package V.5.45
C Compiler User’s Manual

NOTICE:
There are corrections in TableC.3 NC30 Specifications on page 175.
There are additions in -fbit(-FB) on page 88 and -Wlarge_to_small(-WLTS)
on page 99.
Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.

2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.

4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.

5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.

6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.

7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.

8. You should use the Renesas Electronics products described in this document in the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.

9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.
Preface

NC30 is the C compiler for the Renesas M16C Series, R8C Family. NC30 converts programs written in C into assembly language source files for the M16C Series, R8C Family. You can also specify compiler options for assembling and linking to generate hexadecimal files that can be written to the microcomputer. Please be sure to read the precautions written in this manual before using NC30.

- Microsoft, MS-DOS, Windows and Windows NT are either registered trademarks or trademarks of Microsoft Corporation in the United States and other countries. HP-UX is a registered trademark of Hewlett-Packard Company.
- IBM and AT are registered trademarks of International Business Machines Corporation.
- Intel and Pentium are registered trademarks of Intel Corporation.
- Adobe and Acrobat are registered trademarks of Adobe Systems Incorporated.

All other brand and product names are trademarks, registered trademarks or service marks of their respective holders.

Terminology

The following terms are used in this manual.

<table>
<thead>
<tr>
<th>Term</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NC30</td>
<td>Compiler system included in this compiler</td>

Chapter 1  Introduction to NC30

This chapter introduces the processing of compiling performed by NC30, and provides an example of program development using NC30.

1.1  NC30 Components

NC30 consists of the following executable files:

1. nc30............................... Compile driver
2. cpp30............................... Preprocessor
3. ccom30........................... Compiler
4. aopt30 ............................ Assembler Optimizer
5. as30............................... Assembler System
6. sbauto ............................ SB register automatic changeover utility
7. ln30............................... Linkage Editor
8. util30............................. SBDATA declaration & SPECIAL page Function declaration Utility
9. genmap.......................... Map-information generating tool for the High-performance Embedded Workshop
10. gensni ......................... Stack calculation utility for the Call Walker
1.2 NC30 Processing Flow

Figure 1.1 illustrates the NC30 processing flow.
1.2.1 NC30

NC30 is the executable file of the compile driver.
By specifying options, NC30 can perform the series of operations from compiling to linking. You can also specify for the as30 relocatable macro assembler and four for the ln30 linkage editor by including the -as30 and -ln30 command line options when you start NC30.

1.2.2 cpp30

cpp30 is the executable file for the preprocessor.
cpp30 processes macros starting with # (#define, #include, etc.) and performs conditional compiling (#if-#else-#endif, etc.).

1.2.3 ccom30

ccom30 is the executable file of the compiler itself.
C source programs processed by cpp30 are converted to assembly language source programs that can be processed by AS30.

1.2.4 aopt30

aopt30 is the assembler optimizer.
It optimizes the assembler codes output by ccom30.

1.2.5 as30

as30 is an assembler system, which assembles the assembler code output by ccom30.

1.2.6 sbauto

sbauto analyzes the number of times external variables are referenced in a function based on the inspector information that was output by the compiler, and outputs optimum SB relative.

1.2.7 ln30

ln30 is a linkage editor, which links multiple relocatable files and library files to generate absolute-module files (.x30).

1.2.8 utl30

utl30 is the execution file for the SBDATA declaration utility and SPECIAL page Function declaration Utility.
By processing the absolute module file (.x30), utl30 generates a file that contains SBDATA declarations (located in the SB area beginning with the most frequently used one) and a file that contains SPECIAL page function declarations (located in the SPECIAL page area beginning with the most frequently used one).
To use utl30, specify the compile driver startup option -finfo when compiling, so that the absolute module file (.x30) will be generated.

1.2.9 genmap

genmap is a utility that allows the use of the mapping facility of the High-performance Embedded Workshop. genmap is automatically executed when the mapping facility is activated.
The mapping facility of the High-performance Embedded Workshop loads the .map file output by genmap and graphically shows the memory map after linkage.
If you wish to use the mapping facility of the High-performance Embedded Workshop, specify "-finfo" (which is an option to start up the compile driver) at the time of compilation and generate an absolute-module file
1.2.10 gensni

gensni is a utility that analyzes the information required for the Call Walker. The Call Walker loads the stack information file (.sni) output by gensni and indicates the stack size. If you wish to use the Call Walker and gensni, specify "-finfo" (which is an option to start up the compile driver) at the time of compilation so that inspector information will be appended to the absolute-module file (.x30).
1.3 Notes

Renesas Electronics Corp. are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Electronics Corp., Renesas Solutions Corp., or an authorized Renesas Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

1.3.1 Notes about Version-up of compiler

The machine-language instructions (assembly language) generated by NC30 vary in contents depending on the startup options specified when compiling, contents of version-up, etc. Therefore, when you have changed the startup options or upgraded the compiler version, be sure to reevaluate the operation of your application program.

Furthermore, when the same RAM data is referenced (and its contents changed) between interrupt handling and non-interrupt handling routines or between tasks under real time OS, always be sure to use exclusive control such as volatile specification. Also, use exclusive control for bit field structures which have different member names but are mapped into the same RAM.

1.3.2 Notes about the M16C's Type Dependent Part

When writing to or reading a register in the SFR area, it may sometimes be necessary to use a specific instruction. Because this specific instruction varies with each type of MCU, consult the user's manual of your MCU for details.

In this compiler, the instructions which cannot be used may be generated for writing and read-out to the register of SFR area. When you describe like the following examples as C language description to a SFR area, in this compiler may generate the assembler code which carries out operation which is not assumed since the interrupt request bit is not normal.

When accessing registers in the SFR area in C language, write the instruction directly in the program using the asm function. In this case, make sure that the same correct instructions are generated as done by using the asm functions, regardless of the compiler's version and of whether optimizing options are used or not.

```c
#pragma ADDRESS TA0IC 006Ch /* M16C/60 MCU's Timer A0 interrupt control register */

struct {
    char ILVL : 3;
    char IR : 1;  /* An interrupt request bit */
    char dmy : 4;
} TA0IC;

void wait_until_IR_is_ON(void)
{
    while (TA0IC.IR == 0)  /* Waits for TA0IC.IR to become 1 */
    {
    }
    TA0IC.IR = 0;  /* Returns 0 to TA0IC.IR when it becomes 1 */
}
```

Figure 1.2 C language description to SFR area
1.4 Example Program Development

Figure 1.3 shows the flow for the example program development using NC30. The program is described below.

(Items [1] to [4] correspond to the same numbers in Figure 1.3)

(1) The C source program AA.c is compiled using NC30, then assembled using as30 to create the re-locatable object file AA.r30.

(2) The startup program ncrt0.a30 and the include file sect30.inc and nc_define.inc, which contains information on the sections, are matched to the system by altering the section mapping, section size, and interrupt vector table settings.

(3) The modified startup program is assembled to create the relocatable object file ncrt0.a30.

(4) The two relocatable object files AA.r30 and ncrt0.a30 are linked by the linkage editor ln30, which is run from nc30, to create the absolute module file AA.x30.
AA.x30 : ncrt0.a30 AA.r30
   nc30 -oAA ncrt0.r30 AA.r30
ncrt0.r30 : ncrt0.a30
   as30 ncrt0.a30
AA.r30 : AA.c
   nc30 -cAA.c

Figure 1.4 Example make File

Figure 1.5 shows the command line required for NC30 to perform the same operations as in the make file shown in Figure 1.4.

% nc30 -oAA ncrt0.a30 AA.c<RET>

%: Indicates the prompt
<RET>: Indicates the Return key

*Specify ncrt0.a30 first ,when linking.

Figure 1.5 Example NC30 Command Line
1.5 NC30 Output Files

This chapter introduces the preprocess result C source program output when the sample program sample.c is compiled using NC30 and the assembly language source program.

1.5.1 Introduction to Output Files

With the specified command line options, the NC30 compile driver outputs the files shown in Figure 1.6. Below, we show the contents of the files output when the C source file smp.c shown in Figure 1.7 is compiled, assembled, and linked.

See the AS30 User Manual for the relocatable object files (extension .r30), print files (extension .lst), and map files (extension .map) output by as30 and ln30.
```c
#include <stdio.h>
#define CLR  0
#define PRN  1

void main(void)
{
    int flag;
    flag = CLR;

    #ifdef PRN
    printf( "flag = %d\n", flag );
    #endif
}
```

Figure 1.7   Example C Source File (sample.c)

### 1.5.2 Preprocessed C Source Files

The cpp30 processes preprocess commands starting with #. Such operations include header file contents, macro expansion, and judgements on conditional compiling.

The C source files output by the preprocessor include the results of cpp30 processing of the C source files. Therefore, do not contain preprocess lines other than #pragma and #line. You can refer to these files to check the contents of programs processed by the compiler. The file extension is .i.

Figure 1.8 and Figure 1.9 are examples of file output.

```c
typedef struct _iobuf {
    char _buff;
    int _cnt;
    int _flag;
    int _mod;
    int (*_func_in)(void);
    int (*_func_out)(int);
} FILE;
```

Figure 1.8   Example Preprocessed C Source File (1)
extern int getc(FILE _far *);       (1)
extern int getchar(void);
extern int putc(int, FILE _far *);
extern int putchar(int);
extern int feof(FILE _far *);
extern int ferror(FILE _far *);
extern int fgetc(FILE _far *);
extern char _far *fgets(char _far *, int, FILE _far *);
extern int fprintf(FILE _far *, const char _far *, ...);
extern int fscanf(FILE _far *, const char _far *, ...);
extern int fprintf(FILE _far *, const char _far *, ...);
extern int fscanf(FILE _far *, const char _far *, ...);
extern int feof(FILE _far *);
extern int ferror(FILE _far *);

extern int printf(const char _far *, ...);
extern int fprintf(FILE _far *, const char _far *, ...);
extern int sprintf(char _far *, const char _far *, ...);

 extern int init_dev(FILE _far *, int);
 extern int speed(int, int, int, int);
 extern int _sget(void);
 extern int _sput(int);
 extern int _pput(int);
 extern const char _far * _print(int(*)(), const char _far *, int _far * _far *, int _far *);

void main(void)        (2)
{
    int flag;

    flag = 0 ;           ← (3)
    printf("flag = %d\n", flag );    ← (4)

}
1.5.3 Assembly Language Source Files

The assembly language source file is a file that can be processed by AS30 as a result of the compiler ccom30 converting the preprocess result C source file. The output files are assembly language source files with the extension .a30.

Figure 1.10 and Figure 1.11 are examples of the output files. When the NC30 command line option “-dsource (-dS) ” is specified, the assembly language source files contain the contents of the C source file as comments.
Figure 1.10 Example Assembly Language Source File (1) "sample.a30"
Figure 1.11 Example Assembly Language Source File (2) "sample.a30"

Let’s look at the contents of the assembly language source files. Items (1) to (2) correspond to (1) to (2) in Figure 1.10.

1. Shows status of optimization option, and information on the initial settings of the near and far attribute for ROM and RAM.
2. When the NC30 command line option "-dsource (-dS)" is specified, shows the contents of the C source file(s) as commen
Chapter 2  Basic Method for Using the Compiler

This chapter describes how to start the compile driver nc30 and the command line options.

2.1 Starting Up the Compiler

2.1.1 nc30 Command Format

The nc30 compile driver starts the compiler commands (cpp30 and ccom30), the assemble command as30 and the link command ln30 to create a absolute module file. The following information (input parameters) is needed in order to start nc30:

1. C source file(s)
2. Assembly language source file(s)
3. Relocatable object file(s)
4. Command line options (optional)

These items are specified on the command line.

Figure 2.1 shows the command line format. Figure 2.2 is an example. In the example, the following is performed:

1. Startup program ncrt0.a30 is assembled.
2. C source program sample.c is compiled and assembled.
3. Relocatable object files ncrt0.r30 and sample.r30 are linked.

The absolute module file sample.x30 is also created. The following command line options are used:

- Specifies machine language data file sample.x30....................... option -o
- Specifies output of list file (extension .lst) at assembling........... option -as30 "-l"
- Specifies output of map file (extension .map) at linking............. option -ln30 "-ms"

% nc30<command-line-option>[assembly-language-source-file-name]
   [relocatable-object-file-name]<C-source-file-name>

% : Prompt
<> : Mandatory item
[] : Optional item
Δ : Space

Figure 2.1  nc30 Command Line Format
2.1.2 Command File

The compile driver can compile a file which has multiple command options written in it (i.e., a command file) after loading it into the machine. Use of a command file helps to overcome the limitations on the number of command line characters imposed by PC, etc.

a. Command file input format

```
% nc30 [command-line-option] < @file-name > [command-line-option]
```

% : Prompt
< > : Mandatory item
[ ] : Optional item
Δ : Space

Figure 2.3 Command File Command Line Format

```
% nc30 -c @test.cmd -g<RET>
```

<RET> : Return key
* Always specify the startup program first when linking.

Figure 2.4 Example Command File Command Line

Command files are written in the manner described below.

```
Command File description
ncrt0.a30<CR>
sample1.c sample2.r30<CR>
-g -as30 -l<CR>
-o<CR>
sample<CR>
```

<CR>: Denotes carriage return.

Figure 2.5 Example Command File description
b. Rules on command file description

The following rules apply for command file description:
- Only one command file can be specified at a time. You cannot specify multiple command files simultaneously.
- No command file can be specified in another command file.
- Multiple command lines can be written in a command file.
- New-line characters in a command file are replaced with space characters.
- The maximum number of characters that can be written in one line of a command file is 2,048. An error results when this limit is exceeded.

c. Precautions to be observed when using a command file

A directory path can be specified for command file names. An error results if the file does not exist in the specified directory path.
Command files for ln30 whose file name extension is ".cm$" are automatically generated in order for specifying files when linking. Therefore, existing files with the file name extension ".cm$", if any, will be overwritten. Do not use files which bear the file name extension ".cm$" along with this compiler. You cannot specify two or more command files simultaneously.
If multiple files are specified, the compiler displays an error message "Too many command files".

2.1.3 Notes on NC30 Command Line Options

a. Notes on Coding nc30 Command Line Options

The nc30 command line options differ according to whether they are written in uppercase or lowercase letters. Some options will not work if they are specified in the wrong case.

b. Priority of Options for Controlling Compile driver

Priority of Options for Controlling Compile driver:

```
-E  -P  -S  -c
  High  Priority  low
```

Therefore, if the following two options are specified at the same time, for example,
- "-c": Finish processing after creating a relocatable module file (extension .r30)
- "-S": Finish processing after creating an assembly language source file (extension .a30) the -S option has priority. That is to say, the compile driver does not perform any further processing after assembling.

In this case, it only generates an assembly language source file. If you want to create a re-locatable file simultaneously with an assembly language source file, use the option "-dsource(shortcut -dS)".
2.1.4 nc30 Command Line Options

a. Options for Controlling Compile Driver

Table 2.1 shows the command line options for controlling the compile driver. The details of each optional note please refer to Appendix A.

Table 2.1 Options for Controlling Compile Driver

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-c</td>
<td>Creates a relocatable module file (extension .r30) and ends processing.</td>
</tr>
<tr>
<td>-Didentifier</td>
<td>Defines an identifier. Same function as #define.</td>
</tr>
<tr>
<td>-dsource</td>
<td>Generates an assembly language source file (extension &quot;.a30&quot;) with a C</td>
</tr>
<tr>
<td>(Short form</td>
<td>language source list output as a comment. (Not deleted even after</td>
</tr>
<tr>
<td>-dS)</td>
<td>assembling.)</td>
</tr>
<tr>
<td>-dsource_in_list</td>
<td>In addition to the “-dsource” function, generates an assembly language</td>
</tr>
<tr>
<td>(Short form</td>
<td>list file (.lst).</td>
</tr>
<tr>
<td>-dSL)</td>
<td></td>
</tr>
<tr>
<td>-E</td>
<td>Invokes only preprocess commands and outputs result to standard output.</td>
</tr>
<tr>
<td>-Idirectory</td>
<td>Specifies the directory containing the file(s) specified in #include. You</td>
</tr>
<tr>
<td></td>
<td>can specify up to 256 directories.</td>
</tr>
<tr>
<td>-P</td>
<td>Invokes only preprocess commands and creates a file (extension .i).</td>
</tr>
<tr>
<td>-S</td>
<td>Creates an assembly language source file (extension .a30) and ends</td>
</tr>
<tr>
<td></td>
<td>processing.</td>
</tr>
<tr>
<td>-silent</td>
<td>Suppresses the copyright message display at startup.</td>
</tr>
<tr>
<td>-Upredefined macro</td>
<td>Undefines the specified predefined macro.</td>
</tr>
</tbody>
</table>

b. Options Specifying Output Files

Table 2.2 shows the command line option that specifies the name of the output machine language data file.

Table 2.2 Options for Specifying Output Files

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-dir directory-name</td>
<td>Specifies the destination directory of the file(s) (absolute module file, map file, etc.) generated by ln30.</td>
</tr>
<tr>
<td>-ofile-name</td>
<td>Specifies the name(s) of the file(s) (absolute module file, map file, etc.) generated by ln30. This option can also be used to specify the destination directory. Do not specify the filename extension.</td>
</tr>
</tbody>
</table>

---

1 If you do not specify command line options -c, -E, -P, or -S, nc30 finishes at ln30 and output files up to the absolute load module file (extension .x30) are created.
### c. Version and command line Information Display Option

Table 2.3 shows the command line options that display the cross-tool version data and the command line informations.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-v</td>
<td>Displays the name of the command program and the command line during execution.</td>
</tr>
<tr>
<td>-V</td>
<td>Displays the startup messages of the compiler programs, then finishes processing.(without compiling)</td>
</tr>
</tbody>
</table>

### d. Options for Debugging

Table 2.4 shows the command line options for outputting the symbol file for the C source file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-g</td>
<td>Outputs debugging information to an assembler source file (extension .a30). Therefore you can perform C language-level debugging.</td>
</tr>
<tr>
<td>-genter</td>
<td>Always outputs an enter instruction when calling a function. Be sure to specify this option when using the debugger's stack trace function.</td>
</tr>
<tr>
<td>-gno_reg</td>
<td>Suppresses the output of debugging information for register variables.</td>
</tr>
<tr>
<td>-gbool_to_char</td>
<td>This option outputs bool-type debugging information as the char type.</td>
</tr>
<tr>
<td>-gold</td>
<td>This option outputs debugging information in Rev.E format. When this option specifies, the “gno_reg” option and the “fauto_128” option are automatically specified.</td>
</tr>
</tbody>
</table>
e. Optimization Options

Table 2.5 shows the command line options for optimizing program execution speed and ROM capacity.

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-OR</td>
<td>None</td>
<td>Optimization of ROM size.</td>
</tr>
<tr>
<td>-OS</td>
<td>None</td>
<td>Optimization of speed.</td>
</tr>
<tr>
<td>-OR_MAX</td>
<td>-ORM</td>
<td>Places priority on ROM size for the optimization performed.</td>
</tr>
<tr>
<td>-OS_MAX</td>
<td>-OSM</td>
<td>Places priority on speed for the optimization performed.</td>
</tr>
<tr>
<td>-Ocompare_byte_to_word</td>
<td>-OCBTW</td>
<td>Compares consecutive bytes of data at contiguous addresses in words.</td>
</tr>
<tr>
<td>-Oconst</td>
<td>-OC</td>
<td>Performs optimization by replacing references to the const-qualified external variables with constants.</td>
</tr>
<tr>
<td>-Oforward_function_to_inline</td>
<td>-OFPTI</td>
<td>Expands all inline functions in-line.</td>
</tr>
<tr>
<td>-Oglob_jmp</td>
<td>-OGJ</td>
<td>Global jump is optimized.</td>
</tr>
<tr>
<td>-Oloop_unroll[=loop count]</td>
<td>-OLU</td>
<td>Unrolls code as many times as the loop count without revolving the loop statement. The &quot;loop count&quot; can be omitted. When omitted, this option is applied to a loop count of up to 5.</td>
</tr>
<tr>
<td>-Ono_asmopt</td>
<td>-ONA</td>
<td>Inhibits starting the assembler optimizer &quot;aopt30&quot;.</td>
</tr>
<tr>
<td>-Ono_bit</td>
<td>-ONB</td>
<td>Suppresses optimization based on grouping of bit manipulations.</td>
</tr>
<tr>
<td>-Ono_break_source_debug</td>
<td>-ONBSD</td>
<td>Suppresses optimization that affects source line data.</td>
</tr>
<tr>
<td>-Ono_float_const_fold</td>
<td>-ONFCF</td>
<td>Suppresses the constant folding processing of floating point numbers.</td>
</tr>
<tr>
<td>-Ono_logical_or_combine</td>
<td>-ONLOC</td>
<td>Suppresses the optimization that puts consecutive OR together.</td>
</tr>
<tr>
<td>-Ono_stdlib</td>
<td>-ONS</td>
<td>Inhibits inline padding of standard library functions and modification of library functions.</td>
</tr>
<tr>
<td>-Osp_adjust</td>
<td>-OSA</td>
<td>Optimizes removal of stack correction code. This allows the necessary ROM capacity to be reduced. However, this may result in an increased amount of stack being used.</td>
</tr>
<tr>
<td>-Ostack_frame_align</td>
<td>-OSFA</td>
<td>Aligns the stack frame on an every boundary.</td>
</tr>
<tr>
<td>-Ostatic_to_inline</td>
<td>-OSTI</td>
<td>A static function is treated as an inline function.</td>
</tr>
<tr>
<td>-O5OA</td>
<td>None</td>
<td>Inhibits code generation based on bit-manipulating instructions when the optimization option “-O5” is selected.</td>
</tr>
</tbody>
</table>
f. Generated Code Modification Options

Table 2.6 to Table 2.7 shows the command line options for controlling nc30-generated assembly code.

Table 2.6 Generated Code Modification Options (1)

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fansi</td>
<td>None</td>
<td>Makes &quot;-fnot_reserve_far_and_near&quot;, &quot;-fnot_reserve_asm&quot;, and &quot;-extend_to_int&quot; valid.</td>
</tr>
<tr>
<td>-fchar Enumerator</td>
<td>-fCE</td>
<td>Handles the enumerator type as an unsigned char type, not as an int type.</td>
</tr>
<tr>
<td>-fconst not ROM</td>
<td>-fCNR</td>
<td>Does not handle the types specified by const as ROM data.</td>
</tr>
<tr>
<td>-fdouble_32</td>
<td>-fD32</td>
<td>This option specifies that the double type be handled in 32-bit data length as is the float type.</td>
</tr>
<tr>
<td>-fenable_register</td>
<td>-fER</td>
<td>Make register storage class available.</td>
</tr>
<tr>
<td>-fextend_to_int</td>
<td>-fETI</td>
<td>Performs operation after extending char-type data to the int type. (Extended according to ANSI standards.)</td>
</tr>
<tr>
<td>-ffar_RAM</td>
<td>-fFRAM</td>
<td>Changes the default attribute of RAM data to far.</td>
</tr>
<tr>
<td>-finfo</td>
<td>None</td>
<td>Outputs the information required for the &quot;Call Walker&quot;, &quot;Map Function&quot;, and &quot;utl30&quot; to the absolute module file (.x30).</td>
</tr>
<tr>
<td>-fJSRW</td>
<td>None</td>
<td>Changes the default instruction for calling functions to JSR.W.</td>
</tr>
<tr>
<td>-fbit</td>
<td>-fB</td>
<td>Generates code assuming that bitwise manipulating instructions can be executed using absolute addressing for all external variables mapped into the near area.</td>
</tr>
<tr>
<td>-fno carry</td>
<td>-fNC</td>
<td>Suppresses carry flag addition when data is indirectly accessed using far-type pointers.</td>
</tr>
<tr>
<td>-fauto 128</td>
<td>-fA1</td>
<td>Limits the usable stack frame to 128 bytes.</td>
</tr>
<tr>
<td>-ffar_pointer</td>
<td>-fFP</td>
<td>Change the default attribute of pointer-type variable to far.</td>
</tr>
<tr>
<td>-fnear ROM</td>
<td>-fNROM</td>
<td>Change the default attribute of ROM data to near.</td>
</tr>
<tr>
<td>-fno align</td>
<td>-fNA</td>
<td>Does not align the start address of the function.</td>
</tr>
<tr>
<td>-fno even</td>
<td>-fNE</td>
<td>Allocate all data to the odd section, with no separating odd data from even data when outputting.</td>
</tr>
<tr>
<td>-fno switch_table</td>
<td>-fNST</td>
<td>When this option is specified, the code which branches since it compares is generated to a switch statement.</td>
</tr>
<tr>
<td>-fnot address volatile</td>
<td>-fNAV</td>
<td>Does not regard the variables specified by #pragma ADDRESS (#pragma EQU) as those specified by volatile.</td>
</tr>
<tr>
<td>-fnot reserve asm</td>
<td>-fNRA</td>
<td>Exclude asm from reserved words. (Only _asm is valid.)</td>
</tr>
<tr>
<td>-fnot reserve far and near</td>
<td>-fNRFAN</td>
<td>Exclude far and near from reserved words. (Only _far and _near are valid.)</td>
</tr>
<tr>
<td>-fnot reserve inline</td>
<td>-fNRI</td>
<td>Exclude far and near from reserved words. (Only _inline is made a reserved word.)</td>
</tr>
<tr>
<td>-fsmall_array</td>
<td>-fSA</td>
<td>When referencing a far-type array whose total size is unknown when compiling, this option calculates subscripts in 16 bits assuming that the array's total size is within 64 Kbytes.</td>
</tr>
<tr>
<td>-fswitch_other_section</td>
<td>-fSOS</td>
<td>This option outputs a ROM table for a 'switch' statement to some other section than a program section.</td>
</tr>
<tr>
<td>-fchange_bank always</td>
<td>-fCBA</td>
<td>This option allows you to write multiple variables to an extended area.</td>
</tr>
</tbody>
</table>

2 char-type data or signed char-type data evaluated under ANSI rules is always extended to inttype data. This is because operations on char types (e.g., a char* x; for example) would otherwise result in an overflow and failure to obtain the intended result.
Table 2.7 Generated Code Modification Options (2)

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fauto_over_255</td>
<td>-fAO2</td>
<td>Changes the stack frame size per function that can be reserved to 64K bytes.</td>
</tr>
<tr>
<td>-fsize_t_16</td>
<td>-fS16</td>
<td>Change the type definition size_t from type unsigned long to type unsigned int</td>
</tr>
<tr>
<td>-fptrdiff_t_16</td>
<td>-fP16</td>
<td>Change the type definition ptrdiff_t from type signed long to type signed int</td>
</tr>
<tr>
<td>-fuse_DIV</td>
<td>-fUD</td>
<td>This option changes generated code for divide operation.</td>
</tr>
<tr>
<td>-fuse_MUL</td>
<td>-fUM</td>
<td>This option changes generated code multiple operation.</td>
</tr>
<tr>
<td>-R8C</td>
<td>None</td>
<td>Generates object code for R8C Family.</td>
</tr>
<tr>
<td>-R8CE</td>
<td>None</td>
<td>Generates code suitable for the R8C Family with 64-KB or larger ROM.</td>
</tr>
</tbody>
</table>

Table 2.8 Library Specifying Option

<table>
<thead>
<tr>
<th>Option</th>

h. Warning Options

Table 2.9 shows the command line options for outputting warning messages for contraventions of nc30 language specifications.

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-Wall</td>
<td>None</td>
<td>Displays message for all detectable warnings. (however, not including alarms output by -Wlarge_to_small and &quot;-Wno_used_argument&quot;)</td>
</tr>
<tr>
<td>-Wcom_max warnings = Warning Count</td>
<td>-WCMW</td>
<td>This option allows you to specify an upper limit for the number of warnings output by ccom30.</td>
</tr>
<tr>
<td>-Werror_file&lt;file name&gt;</td>
<td>-WEF</td>
<td>Outputs error messages to the specified file.</td>
</tr>
<tr>
<td>-Wlarge_to_small</td>
<td>-WLTS</td>
<td>Outputs a warning about the tacit transfer of variables in descending sequence of size.</td>
</tr>
<tr>
<td>-Wmake_tagfile</td>
<td>-WMT</td>
<td>Outputs error messages to the tag file of source file by source file.</td>
</tr>
<tr>
<td>-Wnesting_comment</td>
<td>-WNC</td>
<td>Outputs a warning for a comment including &quot;/*&quot;.</td>
</tr>
<tr>
<td>-Wno_stop</td>
<td>-WNS</td>
<td>Prevents the compiler stopping when an error occurs.</td>
</tr>
<tr>
<td>-Wno_used_argument</td>
<td>-WNUA</td>
<td>Outputs a warning for unused argument of functions.</td>
</tr>
<tr>
<td>-Wno_used_function</td>
<td>-WNUF</td>
<td>Displays unused global functions when linking.</td>
</tr>
<tr>
<td>-Wno_used_static_function</td>
<td>-WNUSF</td>
<td>For one of the following reasons, a static function name is output that does not require code generation.</td>
</tr>
<tr>
<td>-Wnon_prototype</td>
<td>-WNP</td>
<td>Outputs warning messages for functions without prototype declarations.</td>
</tr>
<tr>
<td>-Wstdout</td>
<td>None</td>
<td>Outputs error messages to the host machine's standard output (stdout).</td>
</tr>
<tr>
<td>-Wstop_at_link</td>
<td>-WSAL</td>
<td>Stops linking the source files if a warning occurs during linking to suppress generation of absolute module files. Also, a return value &quot;10&quot; is returned to the host OS.</td>
</tr>
<tr>
<td>-Wstop_at_warning</td>
<td>-WSAW</td>
<td>Stops compiling the source files if a warning occurs during compiling and returns the compiler end code &quot;10&quot;.</td>
</tr>
<tr>
<td>-Wundefined_macro</td>
<td>-WUM</td>
<td>Warns you that undefined macros are used in #if.</td>
</tr>
<tr>
<td>-Wuninitialize_variable</td>
<td>-WUV</td>
<td>Outputs a warning about auto variables that have not been initialized.</td>
</tr>
<tr>
<td>-Wunknown pragma</td>
<td>-WUP</td>
<td>Outputs warning messages for non-supported #pragma.</td>
</tr>
</tbody>
</table>

i. Assemble and Link Options

Table 2.10 shows the command line options for specifying as30 and ln30 options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-as30&lt; Option&gt;</td>
<td>Specifies options for the as30 link command. If you specify two or more options, enclose them in double quotes.</td>
</tr>
<tr>
<td>-ln30&lt; Option&gt;</td>
<td>Specifies options for the ln30 assemble command. If you specify two or more options, enclose them in double quotes.</td>
</tr>
</tbody>
</table>
2.2 Preparing the Startup Program

For C-language programs to be "burned" into ROM, NC30 comes with a sample startup program written in the assembly language to initial set the hardware (M16C/60), locate sections, and set up interrupt vector address tables, etc. This startup program needs to be modified to suit the system in which it will be installed. The following explains about the startup program and describes how to customize it.

2.2.1 Sample of Startup Program

The NC30 startup program consists of the following two files:

- ncr0.a30
  Write a program which is executed immediately after reset.
- nc_define.inc
  This file defines the sizes of the stack and heap areas and the addresses of the variable vector and special-page vector.
- sect30.inc
  Included from ncr0.a30, this file defines section locations (memory mapping).

Figure 2.6 to Figure 2.10 show the ncr0.a30 and nc_define.inc source program lists.

```
[ncr0.a30]
;==================================================================
; heap area initialize
;==================================================================
.if __HEAPSIZE__ != 0
    .glb __mnext
    .glb __msize
    mov.w #(heap_top&0FFFFH),__mnext
    mov.w #(heap_top>>16),__mnext+2
    mov.w #__HEAPSIZE__&0FFFFH, __msize
    mov.w #__HEAPSIZE__>>16, __msize+2
.endif

(1) initializes the heap area.
[nc_define.inc]

__HEAPSIZE__ .equ 0300H ; HEEP SIZE definition

(2) defines the heap size.
```

Figure 2.6  Startup Program List (1) (ncr0.a30 and nc_define.inc)
[nc_define.inc]

__STACKSIZE__ .equ 0300H ; STACK SIZE definition ←(3)
__ISTACKSIZE__ .equ 0300H ; INTERRUPT STACK SIZE definition ←(4)
__VECTOR_ADR__ .equ 0ffd00H ; INTERRUPT VECTOR ADDRESS definition ←(5)
__SPECIAL_PRG__ .equ 0f8000H ; Special page program address ←(6)

[ncrt0.a30]
:---------------------------------------------------------------------
: include files
:---------------------------------------------------------------------
.list OFF
.include nc_define.inc ←(7)
.include sect30.inc ←(8)
.list ON

(3) defines the user stack size.
(4) defines the interrupt stack size.
(5) defines the start address of interrupt vector table.
(6) defines the start address of the special-page vector table.
(7) Includes nc_define.inc
(8) Includes sect30.inc

Figure 2.7  Startup Program List (2) (ncrt0.a30, nc_define.inc)
interrupt section start

.start S, 0
.glb start
.section interrupt
start:

after reset, this program will start

ldc #istack_top, isp ; set istack pointer
mov.b #02h, 0ah
mov.b #00h, 04h ; set processor mode

mov.b #00h, 0ah
.if __STACKSIZE__ != 0
ldc #0080h, flg
.endif
ldc #stack_top, sp ; set stack pointer
ldc #data_SE_top, sb ; set sb register
ldintb #__VECTOR_ADR__

NEAR area initialize.

bss zero clear

N_BZERO bss_SE_top, bss_SE
N_BZERO bss_SO_top, bss_SO
N_BZERO bss_NE_top, bss_NE
N_BZERO bss_NO_top, bss_NO

initialize data section

N_BCOPY data_SEI_top, data_SE_top, data_SE
N_BCOPY data_SOI_top, data_SO_top, data_SO
N_BCOPY data_NEI_top, data_NE_top, data_NE
N_BCOPY data_NOI_top, data_NO_top, data_NO

(9) After a reset, execution starts from this label (start)
(10) Sets processor operating mode
(11) Switches between the user stack and interrupt stack.
(12) Clears the near bss section (to zero).
(13) Transfers the initial value of the data section in the near area to the RAM.

Figure 2.8 Startup Program List (3) (ncrt0.a30)
;=============================================================
; FAR area initialize.
;=============================================================
;if __FAR_RAM_FLG__ != 0
BZERO bss_FE_top,bss_FE
BZERO bss_FO_top,bss_FO
.endif

;=============================================================
; initialize data section
;=============================================================
;if __FAR_RAM_FLG__ != 0
BCOPY data_FEI_top,data_FE_top,data_FE
BCOPY data_FOI_top,data_FO_top,data_FO
.if __STACKSIZE__ != 0
ldc #stack_top,sp
.else
ldc #istack_top,isp
.endif
.stk -40
.endif

;================================================================
; heap area initialize
;=================================================================
;if __HEAPSIZE__ != 0
.glb __mnext
.glb __msize
mov.w #(heap_top&0FFFFH),__mnext
mov.w #(heap_top>>16),__mnext+2
mov.w #(__HEAPSIZE__&0FFFFH),__msize
mov.w #(__HEAPSIZE__>>16),__msize+2
.endif

;=================================================================
; Initialize standard I/O
;=================================================================
;if __STANDARD_IO__ == 1
.glb __init
.call __init,G
.jsr.a __init
.endif

;=================================================================
; Call main() function
;=================================================================
 ldci #0h,fb ; for debugger
.glb _main
.jsr.a _main

(14) Clears the far bss section (to zeros).
(15) Moves the initial values of the far data section to RAM.
(16) Initializes the heap area. Comment out this line if no memory management function is used.
(17) Calls the init function, which initializes standard I/O. Comment out this line if no I/O function is used.
(18) Calls the 'main' function.
* Interrupt is not enable, when calls 'main' function. Therefore, permits interrupt by FSET command, when uses interrupt function.

Figure 2.9 Startup Program List (4) (ncrt0.a30)
;====================================================================
; exit() function
;====================================================================

.reit
.end

(19) exit function.
(20) Dummy interrupt processing function.

Figure 2.10  Startup Program List (5) (ncrt0.a30)
2.2.2 Customizing the Startup Program

a. Overview of Startup Program Processing

(1) About ncrt0.a30

This program is run at the start of the program or immediately after a reset. It performs the following process mainly:

- Sets the top address (__SB__) of the SBDATA area (it is accessing area to used the SB relative addressing mode).
- Sets the processor's operating mode.
- Initializes the stack pointer (ISP Register and USP Register).
- Initializes SB register.
- Initializes INTB register.
- Initializes the data near area.
  
  bss_NE bss_NO bss_SE and bss_SO sections are cleared (to 0).
  
  Also, the initial values in the ROM area (data_NEI, data_NOI, data_SEI, data_SOI) are transferred to RAM (data_NE, data_NO, data_SE and data_SO).

- Initializes the data far area.
  
  bss_FE and bss_FO sections are cleared (to 0).
  
  Also, the initial values in the ROM area (data_FEI, data_FOI) storing them are transferred to RAM (data_FE, data_FO).

- Initializes the heap area.
- Initializes the standard I/O function library.
- Initializes FB register .
- Calls the 'main' function.
b. Modifying the Startup Program

Figure 2.11 summarizes the steps required to modify the startup programs to match the target system.

![Diagram showing steps to modify startup programs]

c. Examples of startup modifications that require caution

(1) Settings When Not Using Standard I/O Functions

The init function initializes the M16C/80 Series I/O. It is called before main in ncrt0.a30. Figure 2.12 shows the part where the init function is called.

If your application program does not use standard I/O functions, set the __STANDARD_IO__ macro within nc_define.inc to 0.

```asm
;====================================================================
; Initialize standard I/O
;---------------------------------------------------------------------
.if __STANDARD_IO__ == 1
.glb __init
.call __init,G
.jsr.a __init
.endif
```

Figure 2.12 Part of ncrt0.a30 Where init Function is Called

If you are using only sprintf and sscanf, the init function does not need to be called.

---

3 The init function also initializes the microcomputer (hardware) for standard input/output functions. By default, the M16C/80 and the R8C Family is assumed to be the microcomputer that it initializes. When using standard input/output functions, the init function, etc. may need to be modified depending on the system in which the microcomputer is to be used.
(2) Settings When Not Using Memory Management Functions

To use the memory management functions calloc and malloc, etc., not only is an area allocated in the heap section but the following settings are also made in ncrt0.a30.

(1) Initialization of external variable char * _mnext
   Initializes the heap_top label, which is the starting address of the heap section.

(2) Initialization of external variable unsigned _msize
   Initializes the “HEAPSIZE” expression, which sets at “2.2.2 e heap section size”.

Figure 2.13 shows the initialization performed in ncrt0.a30.

```asm
;====================================================================
; heap area initialize
;---------------------------------------------------------------------
.if __HEAP__ != 0
.glb _mnext
.glb _msize
.mov.w #(heap_top&0FFFFH), _mnext
.mov.w #(heap_top>>16), _mnext+2
.mov.w #(HEAPSIZE&0FFFFH), _msize
.mov.w #(HEAPSIZE>>16), _msize+2
.endif
```

Figure 2.13 Initialization When Using Memory Management Functions (ncrt0.a30)

If your application program does not use memory-management functions, set the __HEAPSIZE__ macro within nc_define.inc to 0. This saves the ROM size by stopping unwanted library items from being linked.

(3) Notes on Writing Initialization Programs

Note the following when writing your own initialization programs to be added to the startup program.

(1) If your initialization program changes the U, or B flags, return these flags to the original state where you exit the initialization program. Do not change the contents of the SB register.

(2) If your initialization program calls a subroutine written in C, note the following two points:
   * Call the C subroutine only after clearing them, B and D flags.
   * Call the C subroutine only after setting the U flag.

d. Setting the Stack Section Size

A stack section has the domain used for user stacks, and the domain used for interruption stacks. Since stack is surely used, please surely secure a domain. stack size should set up the greatest size to be used. Stack size is calculated to use the stack size calculation utility Call Walker.

---

* The stack is used within the startup program as well. Although the initial values are reloaded before calling the main0 function, consideration is required if the stack size used by the main0 function, etc. is insufficient.
e. Heap Section Size

Set the heap to the maximum amount of memory allocated using the memory management functions calloc and malloc in the program. Set the heap to 0 if you do not use these memory management functions. Make sure that the heap section does not exceed the physical RAM area.

```
.HEAPSISE .equ 0300H ; HEAP SIZE definition
```

Figure 2.14 Example of Setting Heap Section Size (nc_define.inc)

f. Setting the interrupt vector table

Set the top address of the interrupt vector table to the part of Figure 2.15 in nc_defineinc. The INTB Register is initialized by the top address of the interrupt vector table.

```
_VECTOR_ADR .equ 0ffd00H ; INTERRUPT VECTOR ADDRESS definition
_SPECIAL_PRG .equ 0f8000H ; Special page program address
```

Figure 2.15 Example of Setting Top Address of Interrupt Vector Table (nc_define.inc)

The sample startup program has had values set for the tables listed below.

0FFD00H - 0FFDFFH: Interrupt vector table
0FFE00H - 0FFFFFFH: Special page vector table and fixed vector table

Normally, these set values do not need to be modified.
### Setting the Processor Mode Register

Set the processor operating mode to match the target system at address 04H (Processor mode register) in the part of ncrt0.a30 shown in Figure 2.16.

```assembly
; after reset, this program will start
mov.b #00h, 04h ; set processor mode
```

Figure 2.16 Example Setting of Processor Mode Register (ncrt0.a30)

See the User’s Manual of microcomputer you are using for details of the Processor Mode Register.

### Customizing for NC30 Memory Mapping

#### Structure of Sections

In the case of a native environment compiler, the executable files generated by the compiler are mapped to memory by the operating system, such as UNIX. However, with cross-environment compilers such as this compiler, the user must determine the memory mapping.

With this compiler, storage class variables, variables with initial values, variables without initial values, character string data, interrupt processing programs, and interrupt vector address tables, etc., are mapped to Micro Processor series memory as independent sections according to their function.

The names of sections consist of a base name and attribute as shown below:

<table>
<thead>
<tr>
<th>Section Base Name</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>data</td>
<td>Stores data with initial values</td>
</tr>
<tr>
<td>bss</td>
<td>Stores data without initial values</td>
</tr>
<tr>
<td>rom</td>
<td>Stores character strings, and data specified in #pragma ROM or with the const modifier</td>
</tr>
</tbody>
</table>

Table 2.11 shows Section Base Name and Table 2.12 shows Attributes.
Table 2.12  Section Naming Rules

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Meaning</th>
<th>Target section base name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Section containing initial values of data</td>
<td>data</td>
</tr>
<tr>
<td>N/F/S</td>
<td>near attribute(^b)</td>
<td>data, bss, rom</td>
</tr>
<tr>
<td></td>
<td>far attribute</td>
<td></td>
</tr>
<tr>
<td>E/O</td>
<td>Even data size</td>
<td>data, bss, rom</td>
</tr>
<tr>
<td></td>
<td>Odd data size</td>
<td></td>
</tr>
</tbody>
</table>

Table 2.12 shows the contents of sections other than those based on the naming rules described above.

Table 2.13  Section Names

<table>
<thead>
<tr>
<th>Section name</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>fvector</td>
<td>This section stores the contents of the Micro Processor's fixed vector.</td>
</tr>
<tr>
<td>heap</td>
<td>This memory area is dynamically allocated during program execution by memory management functions (e.g., malloc). This section can be allocated at any desired location of the Micro Processor RAM area.</td>
</tr>
<tr>
<td>program</td>
<td>Stores programs</td>
</tr>
<tr>
<td>program_S</td>
<td>Stores programs for which #pragma SPECIAL has been specified.</td>
</tr>
<tr>
<td>stack</td>
<td>This area is used as a stack. Allocate this area at addresses between 0400H to 0FFFFH.</td>
</tr>
<tr>
<td>switch_table</td>
<td>The section to which the branch table for switch statements is allocated. This section is generated only with the &quot;-fSOS&quot; option.</td>
</tr>
<tr>
<td>vector</td>
<td>This section stores the contents of the Micro Processor's interrupt vector table. The interrupt vector table can be allocated at any desired location of the Micro Processor's entire memory space by intb register relative addressing. For more information, refer to the Micro Processor User's Manual.</td>
</tr>
</tbody>
</table>

These sections are mapped to memory according to the settings in the startup program include file sect30.inc. You can modify the include file to change the mapping.

Figure 2.18 shows the how the sections are mapped according to the sample startup program's include file sect30.inc.

\(^b\) near and far are NC30 modifiers, used to clarify the addressing mode.

near........ accessible from 000000H to 00FFFFH
far.......... accessible from 000000H to 0FFFFFH
b. Outline of memory mapping setup file

(1) About sect30.inc

This program is included from ncr0.a30. It performs the following process mainly:

- Maps each section (in sequence)
- Sets the starting addresses of the sections
- Defines the size of the stack and heap sections
- Sets the interrupt vector table
- Sets the fixed vector table
c. Modifying the sect30.inc

Figure 2.19 summarizes the steps required to modify the startup programs to match the target system.

Figure 2.19 Example Sequence for Modifying Startup Programs

2.2.2 Customizing the Startup Program

d. Map (order) each section and set starting addresses.

e. Set the interrupt vector table.

f. Set the special page vector table.

d. Mapping and Order Sections and Specifying Starting Address

Map and order the sections to memory and specify their starting addresses (mapping programs and data to ROM and RAM) in the sect30.inc include file of the startup program.

The sections are mapped to memory in the order they are defined in sect30.inc. Use the assembler pseudo instruction .ORG to specify their starting addresses.

Figure 2.20 is an example of these settings.

```
.section program
.org 0F0000H  ← Specifies the starting address of the program section
```

Figure 2.20 Example Setting of Section Starting Address

If no starting address is specified for a section, that section is mapped immediately after the previously defined section.
(1) Rules for Mapping Sections to Memory

Because of the effect on the memory attributes (RAM and ROM) of Micro Processor memory, some sections can only be mapped to specific areas. Apply the following rules when mapping sections to memory.

(1) Sections mapped to RAM

- stack section
- data_SE section
- data_NE section
- bss_SE section
- bss_NE section
- bss_FE section
- heap section
- data_SO section
- data_NO section
- bss_SO section
- bss_NO section
- bss_FO section

(2) Sections mapped to ROM

- program section
- fvector section
- rom_NO section
- rom_FO section
- data_SOI section
- data_NOI section
- data_FEI section
- data_FOI section
- interrupt section
- rom_NEI section
- rom_FEI section
- data_NEI section
- data_FEI section

Note also that some sections can only be mapped to specific memory areas in the Micro Processor memory space.

(1) Sections mapped only to 0H - 0FFFFH (near area)

- data_NE section
- data_SE section
- bss_NE section
- bss_SE section
- rom_NE section
- stack section
- data_NOI section
- data_SOI section
- bss_NO section
- bss_SO section
- rom_NO section

(2) Sections mapped only to 0F0000H - 0FFFFFH

- program_S section

(3) Sections mapped to any area.

- program section
- data_NEI section
- data_FEI section
- data_SEI section
- bss_FE section
- rom_FE section
- vector section
- data_NOI section
- data_FOI section
- data_SEI section
- bss_FO section
- rom_FO section
If any of the following data sections have a size of 0, they need not be defined.

- `data_SE` section
- `data_SO` section
- `data_NE` section
- `data_NO` section
- `data_FE` section
- `data_FO` section
- `bss_NE` section
- `bss_FE` section
- `bss_SE` section
- `rom_NE` section
- `rom_FE` section
- `data_SEI` section
- `data_SOI` section
- `data_NEI` section
- `data_NOI` section
- `data_FEI` section
- `data_FOI` section
- `bss_NO` section
- `bss_FO` section
- `bss_SO` section
- `rom_NO` section
- `rom_FO` section

(2) Example Section Mapping in Single-Chip Mode

Figure 2.21 to Figure 2.24 are examples of the sect30.inc include file which is used for mapping sections to memory in single-chip mode.
Figure 2.21  Listing of sect30.inc in Single-Chip Mode (1)
You can remove this part, because it is unnecessary.
In this case, you need to remove the initialize program in the far area of ncr0.a30.

e. Setting Interrupt Vector Table

For programs that use interrupt processing, set up the interrupt vector table by one of the following two methods:

1. Set up the interrupt vector table for the vector section in sect30.inc.

The content of the interrupt vector varies with each type of microcomputer, and must therefore be set up to suit the type of microcomputer used.

For details, refer to the user's manual included with your microcomputer.

1. When setting up the interrupt vector table in sect30.inc

For programs that use interrupt processing, change the interrupt vector table for the vector section in sect30.inc.
Figure 2.25 shows an example interrupt vector table.

```
; ---------------------------------------------------------------
; variable vector section
; ---------------------------------------------------------------
.section vector,ROMDATA ; variable vector table
.org VECTOR_ADR
.lword dummy_int ; BRK (software int 0)

.lword dummy_int ; uart2 trance/NACK (software int 33)
.lword dummy_int ; uart2 receive/ACK (software int 34)
.: (omitted)
.lword dummy_int ; software int 63

* dummy_int is a dummy interrupt processing function.
```

Figure 2.25 Interrupt Vector Address Table
The contents of the interrupt vectors varies according to the machine in the M16C/60 series and R8C Family. See the User Manual for your machine for details.

Change the interrupt vector address table as follows:

1. Externally declare the interrupt processing function in the .GLB as30 pseudo instruction.

2. The labels of functions created by NC30 are preceded by the underscore (_). Therefore, the names of interrupt processing functions declared here should also be preceded by the underscore.

3. Replace the names of the interrupt processing functions with the names of interrupt processing functions that use the dummy interrupt function name dummy_int corresponding to the appropriate interrupt table in the vector address table.

Figure 2.26 is an example of registering the UART1 send interrupt processing function uarttrm.

```
.lword dummy_int ; uart0 receive (for user)
.glb _uarttrn
.lword _uarttrn ; uart1 trance (for user) ← Process (1) above
(omitted)
```

Figure 2.26 Example Setting of Interrupt Vector Addresses
Chapter 3  Programming Technique

This chapter describes precautions to be observed when programming with the C compiler, NC30.

3.1  Notes

Renesas Electronics Corp. are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Electronics Corp., Renesas Solutions Corp., or an authorized Renesas Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.

3.1.1  Notes about Version-up of compiler

The machine-language instructions (assembly language) generated by NC30 vary in contents depending on the startup options specified when compiling, contents of version changes, etc. Therefore, when you have changed the startup options or upgraded the compiler version, be sure to reevaluate the operation of your application program.

Furthermore, when the same RAM data is referenced (and its contents changed) between interrupt handling and non-interrupt handling routines or between tasks under real-time OS, always be sure to use exclusive control such as volatile specification. Also, use exclusive control for bit field structures which have different member names but are mapped into the same RAM.

3.1.2  Notes about the M16C's Type Dependent Part

When writing to or reading a register in the SFR area, it may sometimes be necessary to use a specific instruction. Because this specific instruction varies with each type of MCU, consult the user's manual of your MCU for details.

In this compiler, the instructions which cannot be used may be generated for writing and read-out to the register of SFR area. When you describe like the following examples as C language description to a SFR area, in this compiler may generate the assembler code which carries out operation which is not assumed since the interrupt request bit is not normal.

When accessing registers in the SFR area in C language, write the instruction directly in the program using the asm function. In this case, make sure that the same correct instructions are generated as done by using the asm functions, regardless of the compiler's version and of whether optimizing options are used or not.
#pragma ADDRESS TA0IC 006Ch /* M16C/60 MCU's Timer A0 interrupt control register */

```c
struct{
  char ILVL : 3;
  char IR : 1;  /* An interrupt request bit */
  char dmy : 4;
} TA0IC;

void wait_until_IR_is_ON(void)
{
  while(TA0IC.IR == 0)  /* Waits for TA0IC.IR to become 1 */
  {
    ;
  }
  TA0IC.IR = 0;  /* Returns 0 to TA0IC.IR when it becomes 1 */
}
```

Figure 3.1 C language description to SFR area

### 3.1.3 About Optimization

**a. Regular optimization**

The following are always optimized regardless of whether optimization options are specified or not.

1. **Meaningless variable access**

   For example, the variable `port` shown below does not use the readout results, so that readout operations are deleted.

   ```c
   extern int port;
   void func(void)
   {
    port;
   }
   ```

   Figure 3.2 Example of a Meaningless Variable Access (Optimized)
Although the intended operation in this example is only to read out port, the readout code actually is not optimized before being output. To suppress optimization, add the volatile qualifier as shown in Figure 3.3

```c
extern int volatile port;

void func(void)
{
    port;
}
```

Figure 3.3 Example of a Meaningless Variable Access (Optimization Suppressed)

(2) Meaningless comparison

```c
int func(char c)
{
    int i;
    if(c != -1)
        i = 1;
    else
        i = 0;
    return i;
}
```

Figure 3.4 meaningless Comparison

In the case of this example, because the variable c is written as char, the compiler treats it as the unsigned char type. Since the range of values representable by the unsigned char type is 0 to 255, the variable c will never take on the value -1.

Accordingly, if there is any statement which logically has no effect like this example, the compiler does not generate assembler code.

(3) Programs not executed

No assembler codes are generated for programs which logically are not executed.

```c
void func(int i)
{
    func2(i);
    return;
    i = 10; \(\rightarrow\) Fragment not executed
}
```

Figure 3.5 Program Not Executed
(4) Operation between constants

Operation between constants is performed when compiling.

```c
int func(void)
{
    int i = 1 + 2; // Operation on this part is performed when compiling
    return i;
}
```

Figure 3.6  Program Not Executed

(5) Selection of optimum instructions

Selection of optimum instructions as when using the STZ instruction or outputting shift instructions for division/multiplications, is always performed regardless of whether optimization options are specified or not.

b. About the volatile qualifier

Use of the volatile qualifier helps to prevent the referencing of variables, the order in which they are referenced, the number of times they are referenced, etc. from being affected by optimization. However, avoid writing statements like those shown below which will be interpreted ambiguously:

```c
int a;
int volatile b, c;

a = b = c; /* whether a = c or a = b? */
a = ++b; /* whether a = b or a = (b + 1)? */
```

Figure 3.7  Example of Ambiguously Interpreted volatile qualifier
3.1.4 Precautions on Using register Variables

a. register qualification and compile option "-fenable_register(-fER)"

If the compile option "-fenable_register(-fER)" is specified, the variables that are register-qualified so as to satisfy specific conditions can be forcibly assigned to registers. This facility is provided for improving generated codes without relying on optimization. Because improper use of this facility produces negative effects, always be sure to examine generated codes before deciding to use it.

b. About register qualification and optimization options

When optimization options are specified, variables are assigned to registers as one optimization feature. This assignment feature is not affected by whether the variables are register-qualified.
3.2 For Greater Code Efficiency

3.2.1 Programming Techniques for Greater Code Efficiency

a. Regarding Integers and Variables

(1) Unless required, use unsigned integers. If there is no sign specifier for int, short, or long types, they are processed as signed integers. Unless required, add the 'unsigned' sign specifier for operations on integers with these data types.¹

(2) If possible, do not use >= or ≦ for comparing signed variables. Use != and = = for conditional judgments.

b. far type array

The far type array is referenced differently at machine language level depending on its size.

(1) When the array size is within 64K bytes

Subscripts are calculated with unsigned 16-bit integers. This ensures efficient access for arrays of 64K bytes or less in size.

(2) When the array size is greater than 64K bytes or unknown

Subscripts are calculated in 32-bit width.

Therefore, when it is known that the array size does not exceed 64K bytes, explicitly state the size in extern declaration of far type array as shown in Figure 3.8 or add the compile option "-fsmall_array(-fSA)"² before compiling. This helps to increase the code efficiency of the program.

| extern int far | array[];          | ← Size is unknown, so subscripts are calculated as 32-bit values. |
| extern int far | array[10];        | ← Size is within 64KB, so access is more efficient. |

Figure 3.8 Example extern-Declaration of far Array

¹ If there is no sign specifier for char-type or bitfield structure members, they are processed as unsigned.
² When the compile option "-fsmall_array(-fSA)" is specified, the compiler assumes an array of an unknown size to be within 64K bytes as it generates code. In the entry version, this option cannot be specified.
c. Using Prototype declaration Efficiently

NC30 allows you to accomplish an efficient function call by declaring the prototype of a function. This means that unless a function is declared of its prototype in NC30, arguments of that function are saved on the stack following the rules listed in Table 3.1 when calling the function.

<table>
<thead>
<tr>
<th>Data type(s)</th>
<th>Rules for saving on stack</th>
</tr>
</thead>
<tbody>
<tr>
<td>char</td>
<td>Expanded into the int type when stacked.</td>
</tr>
<tr>
<td>signed char</td>
<td>Expanded into the int type when stacked.</td>
</tr>
<tr>
<td>float</td>
<td>Expanded into the double type when stacked.</td>
</tr>
<tr>
<td>otherwise</td>
<td>Not expanded when stacked.</td>
</tr>
</tbody>
</table>

For this reason, NC30 may require redundant type expansion unless you declare the prototype of a function. Prototype declaration of functions helps to suppress such redundant type expansion and also makes it possible to assign arguments to registers. All this allows you to accomplish an efficient function call.

d. Using SB Register Efficiently

Using the SB register-based addressing mode, you can reduce the size of your application program (ROM size). NC30 allows you to declare variables that use the SB register-based addressing mode by declaring #pragma SBDATA as shown in Figure 3.9.

```c
#pragma SBDATA val
int val;
```

Figure 3.9 Example of variable declaration using SB-based addressing mode
e. Compressing ROM Size Using Compile Option -fJSRW

When calling a function defined outside the file in NC30, the function is called with the JSR.A instruction. However, if the program is not too large, most functions can be called with the “JSR.W” instruction. In this case, ROM size will be reduced by doing as follows:
First, Compile with the -fJSRW option and check functions which are indicated as errors at link-time. Then change declarations for the error functions only into declarations using “#pragma JSRA function-name”. When you use the OJ option, the JMP instruction at the time of a link is chosen.

f. Other methods

In addition to the above, the ROM capacity can be compressed by changing program description s as shown below.

1. Change a relatively small function that is called only once to an inline function.
2. Replace an if-else statement with a switch statement. (This is effective unless the variable concerned is a simple variable such as an array, pointer, or structure.)
3. For bit comparison, use ‘&’ or ‘|’ in place of ‘&&’ or ‘||’.
4. For a function which returns a value in only the range of char type, declare its return value type with char.
5. For variables used overlapping a function call, do not use a register variable.
3.2.2 Speeding Up Startup Processing

The ncrt0.a30 startup program includes routines for clearing the bss area. This routine ensures that variables that are not initialized have an initial value of 0, as per the C language specifications. For example, the code shown in Figure 3.10 does not initialize the variable, which must therefore be initialized to 0 (by clearing the bss area) during the startup routine.

```c
static int i;
```

Figure 3.10 Example Declaration of Variable Without Initial Value

In some instances, it is not necessary for a variable with no initial value to be cleared to 0. In such cases, you can comment out the routine for clearing the bss area in the startup program to increase the speed of startup processing.

```
;====================================================================
; NEAR area initialize.
;====================================================================
; bss zero clear
;--------------------------------------------------------------------
; BZERO bss_SE_top,bss_SE
; BZERO bss_SO_top,bss_SO
; BZERO bss_NE_top,bss_NE
; BZERO bss_NO_top,bss_NO

;====================================================================
; FAR area initialize.
;====================================================================
; bss zero clear
;--------------------------------------------------------------------
; BZERO bss_SE_top,bss_SE
; BZERO bss_SO_top,bss_SO
```

Figure 3.11 Commenting Out Routine to Clear bss Area

---

1 The external variables in RAM which do not have initial values are referred to as "bss".
3.3 Linking Assembly Language Programs with C Programs

3.3.1 Calling Assembler Functions from C Programs

a. Calling Assembler Functions

Assembler functions are called from C programs using the name of the assembler function in the same way that functions written in C would be. The first label in an assembler function must be preceded by an underscore (_). However, when calling the assembly function from the C program, the underscore is omitted. The calling C program must include a prototype declaration for the assembler function. Figure 3.12 is an example of calling assembler function asm_func.

```c
extern void asm_func( void ); // Assembler function prototype declaration

void main()
{
    ...
    ...
    asm_func(); // Calls assembler function
}
```

Figure 3.12 Example of Calling Assembler Function Without Parameters(sample.c)

```assembly
.glob _main
_main:
    ...
    ...
    jsr _asm_func // Calls assembler function(preceded by '_')
    rts
```

Figure 3.13 Compiled result of sample.c(sample.a30)
When assigning arguments to assembler functions

When passing arguments to assembler functions, use the extended function “#pragma PARAMETER”. This #pragma PARAMETER passes arguments to assembler functions via 32-bit general-purpose registers (R2R0, R3R1), 16-bit general-purpose registers (R0, R1, R2, R3), or 8-bit general-purpose registers (R0L, R0H, R1L, R1H) and address registers (A0, A1).

The following shows the sequence of operations for calling an assembler function using #pragma PARAMETER:

1. Write a prototype declaration for the assembler function before the #pragma PARAMETER declaration. You must also declare the parameter type(s).
2. Declare the name of the register used by #pragma PARAMETER in the assembler function's parameter list.

Figure 3.14 is an example of using #pragma PARAMETER when calling the assembler function asm_func.

```c
extern unsigned int asm_func(unsigned int, unsigned int);
#pragma PARAMETER asm_func(R0, R1)

void main(void)
{
    int i = 0x02;
    int j = 0x05;
    asm_func(i, j);
}
```

Figure 3.15 Compiled result of sample2.c(sample2.a30)

c. Limits on Parameters in #pragma PARAMETER Declaration

The following parameter types cannot be declared in a #pragma PARAMETER declaration.
  - structure types and union type parameters
  - 64bit integer type (flong long) parameters
  - Floating point type (double) parameters and long double parameters

Furthermore, return values of structure or union types cannot be defined as the return values of assembler functions.
3.3.2 Writing Assembler Functions

a. Method for writing the called assembler functions

The following shows a procedure for writing the entry processing of assembler functions.

(1) Specify section names using the assembler pseudo-command .SECTION.
(2) Global specify function name labels using the assembler pseudo-command .GLB.
(3) Add the underscore (_) to the function name to write it as label.
(4) When modifying the B and U flags within the function, save the flag register to the stack beforehand.⁴

The following shows a procedure for writing the exit processing of assembler functions.

(5) If you modified the B and U flags within the function, restore the flag register from the stack.
(6) Write the RTS instruction.

Do not change the contents of the SB and FB registers in the assembler function. If the contents of the SB and FB registers are changed, save them to the stack at the entry to the function, then restore their values from the stack at the exit of the function.

Figure 3.16 is an example of how to code an assembler function. In this example, the section name is program, which is the same as the section name output by NC30.

```
.section program
.glb _asm_func
_asm_func:
pushc FLG
mov.w SYM1, R1
mov.w SYM1+2, R3
popc FLG
rts
.END
```

Figure 3.16 Example Coding of Assembler Function

⁴ Do not change the contents of B and U flags in the assembler function.
b. Returning Return Values from Assembler Functions

When returning values from an assembler function to a C language program, registers can be used through which to return the values for the integer, pointer, and floating-point types. Table 3.2 lists the rules on calls regarding return values. Figure 3.17 shows an example of how to write an assembler function to return a value.

Table 3.2 Calling Rules for Return Values

<table>
<thead>
<tr>
<th>Return value type</th>
<th>Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>_Bool type</td>
<td>R0L register</td>
</tr>
<tr>
<td>char type</td>
<td>R0 register</td>
</tr>
<tr>
<td>int type</td>
<td>The 16 low-order bits are stored in the R0 register and the 16 high-order bits are stored in the R2 register as the value is returned.</td>
</tr>
<tr>
<td>near pointer type</td>
<td>The value is stored in 16 bits each beginning with the MSB in order of registers R3, R2, R1, and R0 as it is returned.</td>
</tr>
<tr>
<td>float type</td>
<td>The 16 low-order bits are stored in the R0 register and the 16 high-order bits are stored in the R2 register as the value is returned.</td>
</tr>
<tr>
<td>long type</td>
<td>The value is stored in 16 bits each beginning with the MSB in order of registers R3, R2, R1, and R0 as it is returned.</td>
</tr>
<tr>
<td>far pointer type</td>
<td>The value is stored in 16 bits each beginning with the MSB in order of registers R3, R1, R2, and R0 as it is returned.</td>
</tr>
<tr>
<td>double type</td>
<td>Structure Type</td>
</tr>
<tr>
<td>long double type</td>
<td>Union Type</td>
</tr>
<tr>
<td>long long type</td>
<td>Immediately before calling the function, the far address indicating the area for storing the return value is pushed to the stack. Before the return to the calling program, the called function writes the return value to the area indicated by the far address pushed to the stack.</td>
</tr>
</tbody>
</table>

Figure 3.17 Example of Coding Assembler Function to Return long-type Return Value
c. Referencing C Variables

Because assembler functions are written in different files from the C program, only the C global variables can be referenced.

When including the names of C variables in an assembler function, precede them with an underscore (_). Also, in assembler language programs, external variables must be declared using the assembler pseudo instruction .GLB.

Figure 3.18 is an example of referencing the C program's global variable counter from the assembler function _asm_func.

C program:

```c
unsigned int counter; // C program global variable

void main(void)
{
    ...
    (omitted)
    ...
}
```

Assembler function:

```assembly
.glb _counter // External declaration of C program's global variable

asm_func:
    ...
    (omitted)
    ...
    movw _counter, R0 // Reference
```

Figure 3.18 Referencing a C Global Variable
d. Notes on Coding Interrupt Handling in Assembler Function

If you are writing a program (function) for interrupt processing, the following processing must be performed at the entry and exit.

1. Save the registers (R0, R1, R2, R3, A0, A1 and FB) at the entry point.
2. Restore the registers (R0, R1, R2, R3, A0, A1 and FB) at the exit point.
3. Use the REIT instruction to return from the function.

Figure 3.19 is an example of coding an assembler function for interrupt processing.

```
.section program
.glob _func
_int_func:
pushm R0,R1,R2,R3,A0,A1,FB    ← Save registers
mov.b #01H, R0L
:                             :
popm R0,R1,R2,R3,A0,A1,FB    ← Pull registers
reit                         ← Return to C program
.END
```

Figure 3.19 Example Coding of Interrupt Processing Assembler Function

e. Notes on Calling C Functions from Assembler Functions

Note the following when calling a function written in C from an assembly language program.

1. Call the C function using a label preceded by the underscore (_) or the dollar ($).
2. The contents of the registers in use are not saved at the entry point of C-language functions. For this reason, you need to save these contents before calling a C-language function from an assembly-language program.
3.3.3 Notes on Coding Assembler Functions

Note the following when writing assembly language functions (subroutines) that are called from a C program.

a. Notes on Handling B and U flags

When returning from an assembler function to a C language program, always make sure that the B and U flags are in the same condition as they were when the function was called.

b. Notes on Handling FB Register

If you modified the FB (frame base) register in an assembler function, you may not be able to return normally to the C language program from which the function was called.

c. Notes on Handling General-purpose and Address Registers

The general-purpose registers (R0, R1, R2, R3) and address registers (A0, A1) can have their contents modified in assembler functions without a problem.

d. Passing Parameters to an Assembler Function

Use the #pragma PARAMETER function if you need to pass parameters to a function written in assembly language. The parameters are passed via registers. Figure 3.20 shows the format (asm_func in the figure is the name of an assembler function).

```c
unsigned int  asm_func(unsigned int, unsigned int); // Prototype declaration of assembler function
#pragma PARAMETER  asm_func(R0, R1)
```

Figure 3.20 Prototype declaration of assembler function

#pragma PARAMETER passes arguments to assembler functions via 16-bit general-purpose registers (R0, R1, R2, R3), 8-bit general-purpose registers (R0L, R0H, R1L, R1H), and address registers (A0, A1). In addition, the 16-bit general-purpose registers are combined to form 32-bit registers (R3R1 and R2R0) for the parameters to be passed to the function. Note that an assembler function's prototype must always be declared before the #pragma PARAMETER declaration.

However, you cannot declare the following parameter types in a #pragma PARAMETER declaration:

- struct or union types
- 64-bit integer type (flong long) parameters
- floating point type (double) argument and long double argument

You also cannot declare the functions returning structure or union types as the function's return values.
3.4 Other

3.4.1 Precautions on Transporting between NC-Series Compilers

NC30 basically is compatible with Renesas C compilers "NCxx" at the language specification level (including extended functions). However, there are some differences between the compiler (this manual) and other NC-series compilers as described below.

a. Difference in default near/far

The default "near/far" in the NC series are shown in Table 3.3. Therefore, when transporting the compiler (this manual) to other NC-series compilers, the near/far specification needs to be adjusted.

<table>
<thead>
<tr>
<th>Compiler</th>
<th>RAM data</th>
<th>ROM data</th>
<th>Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>NC308</td>
<td>near</td>
<td>far</td>

Appendix A  Command Option Reference

This appendix describes how to start the compile driver nc30 and the command line options. The description of the command line options includes those for the as30 assembler and ln30 linkage editor, which can be started from nc30.

A.1 nc30 Command Format

```
% nc30 [%command-line-option] [%assembly-language-source-file-name] %
          [%relocatable-module-file-name] %<C-source-file-name>
```

- % : Prompt
- < > : Mandatory item
- [] : Optional item
- \ : Space

Figure A.1  nc30 Command Line Format

```
% nc30 -osample -as30 "-f" -ln30 "-ms" ncrt0.a30 sample.c<RET>
```

- <RET> : Return key
- *Always specify the startup program first when linking.

Figure A.2  Example nc30 Command Line
A.2 nc30 Command Line Options

A.2.1 Options for Controlling Compile Driver

Table A.1 shows the command line options for controlling the compile driver.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
</table>
| -c                      | Creates a relocatable module file (extension .r30) and ends processing  
|                         | 1                                                                 |
| -Didentifier            | Defines an identifier; Same function as #define.                          |
| -dsoure                 | Generates an assembly language source file (extension '.a30') with a C  
| (Short form -dS)        | language source list output as a comment. (Not deleted even after        
|                         | assembling.)                                                             |
| -dsoure_in_list         | In addition to the "-dsoure(-dS)" function, generates an assembly       
| (Short form -dSList)    | language list file (.lst).                                               |
| -E                      | Invokes only preprocess commands and outputs result to standard output.  |
| -Idirectory             | Specifies the directory containing the file(s) specified in #include.    
|                         | You can specify up to 256 directories.                                   |
| -P                      | Invokes only preprocess commands and creates a file (extension .i).       |
| -S                      | Creates an assembly language source file (extension .a30) and ends       
|                         | processing.                                                              |
| -silent                 | Suppresses the copyright message display at startup.                     |
| -Upredefined macro      | Undefines the specified predefined macro.                                 |

---

**-C**

**Compile driver control**

**Function:** Creates a relocatable module file (extension .r30) and finishes processing.

**Notes:** If this option is specified, no absolute module file (extension .x30) or other file output by ln30 is created.

**-Didentifier**

**Compile driver control**

**Function:** The function is the same as the preprocess command #define.

Delimit multiple identifiers with spaces.

**Syntax:**

```
n30 -D identifier [=constant] <C source file>
```

`[= constant]` is optional.

**Notes:** The number of identifiers that can be defined may be limited by the maximum number of characters that can be specified on the command line of the operating system of the host machine.

---

1 If you do not specify command line options -c, -E, -P, or -S, nc30 finishes at and output files up to the absolute load module file (extension .x30) are created.
-dsource

Function: Generates an assembly language source file (extension ".a30") with a C language source list output as a comment (Not deleted even after assembling).

Supplement: (1) When the -S option is used, the option "-dsource(-dS)" is automatically enabled. (2) The generated files ".a30" and ".r30" are not deleted. Use this option when you want to output C-language source lists to the assembly list file.

-dsource in list

Function: In addition to the "-dsource(-dS)" function, generates an assembly language list file (filename extension ".lst").

-E

Function: Invokes only preprocess commands and outputs results to standard output.

Notes: When this option is specified, no assembly source file (extensions .a30), relocatable module files (extension .r30), absolute module files (extension .x30), or other files output by ccom30, as30, or ln30 are generated.

-Idirectory

Function: Specifies the directory name in which to search for files to be referenced by the preprocess command #include. Max specified 256 directory.

Supplement: An example of specifying two directories (dir1 and dir2) for the "-I" option is shown below.
% nc30 -Idir1 -Idir2 sample.c<RET>
%: Indicates the prompt <RET>: Indicates the Return key

Syntax: nc30∆-Idirectory∆<C source file>

Notes: The number of directories that can be defined may be limited by the maximum number of characters that can be specified on the command line of the operating system of the host machine.
-P  
**Compile driver control**

**Function:** Invokes only preprocess commands, creates a file (extension .i) and stops processing.

**Notes:**
1. When this option is specified, no assembly source file (extensions .a30), relocatable module files (extension .r30), absolute module files (extension .x30) or other files output by ccom30, as30, or ln30 are generated.
2. The file (extension .i) generated by this option does not include the #line command generated by the preprocessor. To get a result that includes #line, try again with the -E option.

-S  
**Compile driver control**

**Function:** Creates assembly language source files (extension .a30 and .ext) and stops processing.

**Notes:** When this option is specified, no relocatable module files (extension .r30), absolute module files (extension .x30) or other files output by as30 or ln30 are generated.

-silent  
**Compile driver control**

**Function:** Suppresses the display of copyright notices at startup.

-U predefined macro  
**Compile driver control**

**Function:** Undefines predefined macro constants.

**Syntax:** nc30\-Upredefined macro\<C source file>

**Notes:** The maximum number of macros that can be undefined may be limited by the maximum number of characters that can be specified on the command line of the operating system of the host machine. _STDC_, _LINE_, _FILE_, _DATE_, and _TIME_ cannot be undefined.
A.2.2 Options Specifying Output Files

Table A.2 shows the command line option that specifies the name of the output machine language data file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-dirdirectory-name</td>
<td>Specifies the destination directory of the file(s) (absolute module file, map file, etc.) generated by ln30.</td>
</tr>
<tr>
<td>-ofile-name</td>
<td>Specifies the name(s) of the file(s) (absolute module file, map file, etc.) generated by ln30. This option can also be used to specify the destination directory. This option can also be used to specify the file name includes the path. Do not specify the filename extension.</td>
</tr>
</tbody>
</table>

- **-dirdirectory-name**
  
  **Function:** This option allows you to specify an output destination directory for the output file.
  
  **Syntax:** `nc30 -dirdirectory-name`
  
  **Notes:** The source file information used for debugging is generated starting from the directory from which the compiler was invoked (the current directory). Therefore, if output files were generated in different directories, the debugger, etc. must be notified of the directory from which the compiler was invoked.

- **-ofile-name**
  
  **Function:** Specifies the name(s) of the file(s) (absolute module file, map file, etc.) generated by ln30. This option can also be used to specify the file name includes the path. You must not specify the filename extension.
  
  **Syntax:** `nc30 -ofile-name <C source file>`
A.2.3 Version Information Display Option

Table A.3 shows the command line options that display the cross-tool version data.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-v</td>
<td>Displays the name of the command program and the command line during execution.</td>
</tr>
<tr>
<td>-V</td>
<td>Displays the startup messages of the compiler programs, then finishes processing (without compiling).</td>
</tr>
</tbody>
</table>

**-v**

**Function:** Compiles the files while displaying the name of the command program that is being executed.

**Notes:** Use lowercase v for this option.

**-V**

**Function:** Displays version data for the command programs executed by the compiler; then finishes processing.

**Supplement:** Use this option to check that the compiler has been installed correctly. The “M16C Family C Compiler package Release Notes” list the correct version numbers of the commands executed internally by the compiler.

If the version numbers in the Release Notes do not match those displayed using this option, the package may not have been installed correctly. See the “M16C Family C Compiler package Release Notes” for details of how to install the NC30 package.

**Notes:**
1. Use uppercase V for this option.
2. If you specify this option, all other options are ignored.
A.2.4 Options for Debugging

Table A.4 shows the command line options for outputting the symbol file for the C source file.

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-g</td>
<td>Outputs debugging information to an assembler source file (extension .a30). Therefore you can perform C language-level debugging.</td>
</tr>
<tr>
<td>-genter</td>
<td>Always outputs an enter instruction when calling a function. Be sure to specify this option when using the debugger's stack trace function.</td>
</tr>
<tr>
<td>-gno_reg</td>
<td>Suppresses the output of debugging information for register variables.</td>
</tr>
<tr>
<td>-gbool_to_char</td>
<td>This option outputs bool-type debugging information as the char type.</td>
</tr>
<tr>
<td>-gold</td>
<td>This option outputs debugging information in Rev. E format.</td>
</tr>
<tr>
<td></td>
<td>When this option specifies, the “-gno_reg” option and the “-fauto_128” option are automatically specified.</td>
</tr>
</tbody>
</table>

-g
Outputting debugging information

Function: Outputs debugging information to an assembler source file (extension .a30).

Notes: When debugging your program at the C language level, always specify this option. Specification of this option does not affect the code generated by the compiler. When “-finfo” option is specified, this option becomes effective.

-genter
Outputting enter instruction

Function: Always output an enter instruction when calling a function.

Notes: (1) When using the debugger's stack trace function, always specify this option. Without this option, you cannot obtain the correct result.

(2) When this option is specified, the compiler generates code to reconstruct the stack frame using the enter command at entry of the function regardless of whether or not it is necessary. Consequently, the ROM size and the amount of stack used may increase.
<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
<th>Supplement</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-gno_reg</code></td>
<td>Suppresses the output of debugging information for register variables.</td>
<td>Use this option to suppress the output of debugging information about register variables when you do not require that information. Suppressing the output of debugging information about the register variables will speed up downloading to the debugger.</td>
</tr>
<tr>
<td><code>-gbool_to_char</code></td>
<td>This option outputs bool-type debugging information as the char type.</td>
<td>This option is necessary if you are using an old PDB30 that does not support the bool type.</td>
</tr>
<tr>
<td><code>-gold</code></td>
<td>Outputs debugging information in previous format.</td>
<td>This option outputs debugging information in Rev.E format. When this option specifies, the “-gno_reg” option and the “-fauto_128” option are automatically specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>With the increase in the maximum number of auto variables, starting with NC30 V.2.00, the format of debugging information has changed (from xxx.r30 and xxx.x30 format). The new format is known as the Rev. F format. The executable objects in the new format (xxx.x30) are compatible with the following debuggers:</td>
</tr>
</tbody>
</table>
|           |                                                                           | (1) PDB30 V.2.00 and later  
(2) PDB30SIM V.2.00 and later  
(3) High-performance Embedded Workshop V.4.00 and later  
Use the `-gold` option when compiling if you are using a debugger that cannot load executable objects in the new format (xxx.x30). |
A.2.5 Optimization Options

Table A.5 shows the command line options for optimizing program execution speed and ROM capacity.

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-OR</td>
<td>None</td>
<td>Optimization of ROM size.</td>
</tr>
<tr>
<td>-OS</td>
<td>None</td>
<td>Optimization of speed.</td>
</tr>
<tr>
<td>-OR_MAX</td>
<td>-ORM</td>
<td>Places priority on ROM size for the optimization performed.</td>
</tr>
<tr>
<td>-OS_MAX</td>
<td>-OSM</td>
<td>Places priority on for the optimization performed.</td>
</tr>
<tr>
<td>-Ocompare_byte_to_word</td>
<td>-OCBTW</td>
<td>Compares consecutive bytes of data at contiguous addresses in words.</td>
</tr>
<tr>
<td>-Oconst</td>
<td>-OC</td>
<td>Performs optimization by replacing references to the const-qualified external variables with constants.</td>
</tr>
<tr>
<td>-Oforward_function_to_inline</td>
<td>-OFPTI</td>
<td>Expands all inline functions in-line.</td>
</tr>
<tr>
<td>-Oglobjmp</td>
<td>-OGJ</td>
<td>Global jump is optimized.</td>
</tr>
<tr>
<td>-Oloop_unroll[=loop count]</td>
<td>-OLU</td>
<td>Unrolls code as many times as the loop count without revolving the loop statement. The &quot;loop count&quot; can be omitted. When omitted, this option is applied to a loop count of up to 5.</td>
</tr>
<tr>
<td>-Ono_asmopt</td>
<td>-ONA</td>
<td>Inhibits starting the assembler optimizer &quot;aopt30&quot;.</td>
</tr>
<tr>
<td>-Ono_bit</td>
<td>-ONB</td>
<td>Suppresses optimization based on grouping of bit manipulations.</td>
</tr>
<tr>
<td>-Ono_break_source_debug</td>
<td>-ONBSD</td>
<td>Suppresses optimization that affects source line data.</td>
</tr>
<tr>
<td>-Ono_float const_fold</td>
<td>-ONFCF</td>
<td>Suppresses the constant folding processing of floating point numbers.</td>
</tr>
<tr>
<td>-Ono_logical_or_combine</td>
<td>-ONLOC</td>
<td>Suppresses the optimization that puts consecutive OR together.</td>
</tr>
<tr>
<td>-Ono_stdlib</td>
<td>-ONS</td>
<td>Inhibits inline padding of standard library functions and modification of library functions.</td>
</tr>
<tr>
<td>-Osp_adjust</td>
<td>-OSA</td>
<td>Optimizes removal of stack correction code. This allows the necessary ROM capacity to be reduced. However, this may result in an increased amount of stack being used. Please specify this option with –O[1-5].</td>
</tr>
<tr>
<td>-Ostack_frame_align</td>
<td>-OSFA</td>
<td>Aligns the stack frame on an even boundary.</td>
</tr>
<tr>
<td>-Ostatic_to_inline</td>
<td>-OSTI</td>
<td>A static function is treated as an inline function.</td>
</tr>
<tr>
<td>-OSOA</td>
<td>None</td>
<td>Inhibits code generation based on bit-manipulating instructions when the optimization option “-OS5” is selected.</td>
</tr>
</tbody>
</table>

The effects of main optimization options are shown in Table A.6.

</tbody>
</table>

² -OSFA adjust address of stacks of each function entry to an even-numbered address. Therefore, if a function has no auto variable declaration, because enter #00H is always added, the processing.
Function: Optimizes speed and ROM size. This option can be specified with -g options. -O3 is assumed if you specify no numeric (no level).

- O1: Some representative optimization items executed by this option are the following.
  - Allocate the register the variable.
  - Delete a meaningless conditional expression.
  - Deletion of statement not logically executed.

- O2: Makes no difference with "-O1".

- O3: Execute some optimization items addition to "-O1".
  Some representative optimization items executed by this option are the following.
  - Grouping of bit manipulations.
  - Constant folding processing of floating point numbers.
  - Inline padding of standard library functions.

- O4: Execute some optimization items addition to "-O3".
  Some representative optimization items executed by this option are the following.
  - Replace the reference to the variable declared in the const-qualifier with constants.

- O5: Execute some optimization items addition to "-O4".
  Some representative optimization items executed by this option are the following.
  - Optimization of address computations such as pointers and structures (if the option "-OR" is concurrently specified).
  - Strengthen the optimization of the pointer (if the option "-OS" is concurrently specified).

However, a normal code may be unable to be outputted when fulfilling the following conditions.
  - With a different variable points out the same memory position simultaneously within a single function and they point to an identical address.

Example:

```c
int a = 3;
int p = &a;

void test1(void)
{
  int b;
  *p = 9;
  a = 10;
  b = *p;  /* By applying optimization, "p" will be transposed to "9". */
  printf("b = %d (expect b = 10)\n", b);
}

result:

b = 9 (expect b = 10)
```
-O[1-5]

Options:

When the "-O5" optimizing options is used, the compiler generates in some cases "BTSTC" or "BTSTS" bit manipulation instructions. In M16C, the "BTSTC" and "BTSTS" bit manipulation instructions are prohibited from rewriting the contents of the interrupt control registers.

However, the compiler does not recognize the type of any register, so, should "BTSTC" or "BTSTS" instructions be generated for interrupt control registers, the assembled program will be different from the one you intend to develop.

When the "-O5" optimizing options is used in the program shown below, a "BTSTC" instruction is generated at compilation, which prevents an interrupt request bit from being processed correctly, resulting in the assembled program performing improper operations.

```c
C sauce which must not use an optimization option at the time of compile:

#pragma ADDRESS TA0IC 006Ch /* M16C/60 MCU's Timer A0 interrupt control register */
struct {
    char ILVL : 3;
    char IR : 1;   /* An interrupt request bit */
    char dmy : 4;
} TA0IC;

void wait_until_IR_is_ON(void)
{
    while (TA0IC.IR == 0)  /* Waits for TA0IC.IR to become 1 */
    {
    }
    TA0IC.IR = 0;  /* Returns 0 to TA0IC.IR when it becomes 1 */
}
```

Please compile after taking the following measures, if the manipulation instructions is generated to bit operation of SFR area. Make sure that no "BTSTC" and "BTSTS" instructions are generated after these side-steppings.

- Optimization options other than "-O5" are used.
- An instruction is directly described in a program using an ASM function
- Add the "-O5OA" option.

-OR

Function:

Optimizes ROM size in preference to speed. This option can be specified with "-g" and "-O" options.

Notes:

When this option is used, the source line information may partly be modified in the course of optimization. Therefore, if this options is specified, when your program is running on the debugger, your program is a possibility of different actions. If you do not want the source line information to be modified, use the "-One_break_source_debug(-ONBSD)" option to suppress optimization.
Function: Although the ROM size may somewhat increase, optimization is performed to obtain the fastest speed possible. This option can be specified along with the "-g" option.
-OR MAX

Function: Places priority on ROM size for the optimization performed.

Explanation:

(1) The compile options listed below are enabled.
   - -O5
   - -OR
   - -O5OA
   - -Oglb_imp (-OGJ)
   - -fchar_enumerator (-fCE)
   - -fdouble_32 (-fD32)
   - -fno_align (-fNA)
   - -fno_carry (-fNC)
   - -fsmall_array (-fSA)
   - -fuse_DIV (-fUD)

(2) If this option is used in the integrated development environment or
    High-performance Embedded Workshop, be sure to enable "Size or speed:" on the C
    tab of the Renesas M16C Standard Toolchain and then select "ROM size to the
    minimum".

Notes:

(1) The source line information may partly be modified in the course of optimization.
    Therefore, if this option is specified, when your program is running on the
    debugger, your program is a possibility of different actions. If you do not want the
    source line information to be modified, use the compile option
    "-One_break_source_debug (-ONBSD)" to suppress optimization.

(2) Please make sure to specify link option "-JOPT".

(3) The enum type may not be referenced correctly in some debugger.

(4) A function prototype must always be expressly written. Without a prototype
    declaration, the compiler may not be able to generate the correct code.

(5) The debug information of the type double is processed as the type float. So, the data
    of the type double is displayed as the type float on C watch window and global
    window of Debug tool.

(6) When far-type pointers are used to indirectly access memory dynamically allocated
    using the malloc function, etc., or ROM data mapped to the far area, be sure that
    the data is not accessed spanning a 64K bytes boundary.

(7) The function of compiler option "-fno_carry (-fNC)" is invalid when it is used in
    conjunction with "-R8C" or "-R8CE".

(8) If the divide operation results in an overflow, the compiler may operate differently
    than stipulated in ANSI.
Function:
Places priority on speed for the optimization performed.

Explanation:
(1) The compile options listed below are enabled.
   • -O4
   • -OS
   • -Oforward_function_to_inline(-OFFT)
   • -Oglob_jmp (-OGJ)
   • -Oloop_unroll=10 (-OLU=10)
   • -Ostatic_to_inline (-OSTI)
   • -Osp_adjust(-OSA)
   • -fchar_enumerator (-fCE)
   • -fdouble_32 (-fD32)
   • -fno_carry (-fNC)
   • -fsmall_array (-fSA)
   • -fuse_DIV (-fUD)

(2) If this option is used in the integrated development environment or
    High-performance Embedded Workshop, be sure to enable “Size or speed:” on the C
    tab of the Renesas M16C Standard Toolchain and then select “ROM size to the
    minimum”.

Notes:
(1) Please make sure to specify link option "-JOPT".
(2) The ROM size increases for reasons that the for statement is revolved.
(3) The assembler code to description of substance of the static function which became
    inline function treatment is always generated.
(4) About a function, it is compulsorily. In treating as an inline function, it is in a
    function. Please make an inline declaration.
(5) The enum type may not be referenced correctly in some debugger.
(6) A function prototype must always be expressly written. Without a prototype
    declaration, the compiler may not be able to generate the correct code.
(7) The debug information of the type double is processed as the type float. So, the data
    of the type double is displayed as the type float on C watch window and global
    window of Debug tool.
(8) When far-type pointers are used to indirectly access memory dynamically allocated
    using the malloc function, etc., or ROM data mapped to the far area, be sure that
    the data is not accessed spanning a 64K bytes boundary.
(9) The function of compiler option "-fno_carry(-fNC)" is invalid when it is used in
    conjunction with "-R8C" or "-R8CE".
(10) If the divide operation results in an overflow, the compiler may operate differently
     than stipulated in ANSI.
(11) When specifying an inline storage class for a function, be sure that inline storage
     class and this body definition are written in the same file where the function is
     written.
(12) No structures or unions can be used as the parameter of an inline function. If this
     is attempted, a compilation error occurs.
(13) No indirect calls of an inline function can be made. If this is attempted, a
     compilation error occurs.
(14) No recursive calls of an inline function can be made. If this is attempted, a
     compilation error occurs.
### -Ocompare_byte_to_word -OCBTW

**Function:**
Compares consecutive bytes of data at contiguous addresses in words.

**Notes:**
This option is only valid if you specify option -O[1 to 5], -OR, -OR_MAX(-ORM), -OS or -OS_MAX(-OSM).

### -Oconst -OC

**Function:**
Optimizes code generation by replacing reference to variables to declared by the const-qualifier with constants.
This is effective even when other than the "-O4" option is specified.

**Supplement:**
Optimization is performed when all of the following conditions are met:
1. Variables not including bit-fields and unions.
2. Variables for which the const-qualifier is specified but are not specified to be volatile.
3. Variables that are subject to initialization in the same C language source file.
4. Variables that are initialized by constant or const-qualified variables.

### -Oforward_function_to_inline -OFFTI

**Function:**
Expands all inline functions in-line.

**Supplement:**
Although inline functions require that an inline function be called after its entity definition can be made, use of this option allows the entity definition of an inline function to be made after calling it.

**Notes:**
1. When specifying inline storage class for a function, be sure that inline storage class and this body definition is written in the same file as the function is written.
2. The parameter of an in line function cannot be used by "structure" and "union". It becomes a compile error.
3. The indirect call of an in line function cannot be carried out. It becomes a compile error when an indirect call is described.
4. The recursive call of an in line function cannot be carried out. It becomes a compile error when a recursive call is described.
## -Oglb_jmp

**Function:**
Global jump is optimized.

**Notes:**
When you use this function, please make sure to specify link option “JOPT”

## -Oloop_unroll[=loop count]

**Function:**
Unrolls code as many times as the loop count without revolving the loop statement. The “loop count” can be omitted. When omitted, this option is applied to a loop count of up to 5.

**Supplement:**
Unrolled code is output for only the "for" statements where the number of times they are executed is known. Specify the upper-limit count for which times for is revolved in the target for statement to be unrolled.
By default, this option is applied to the for statements where for is revolved up to five times.

**Notes:**
The ROM size increases for reasons that the for statement is revolved.

## -Ono_asmopt

**Function:**
Inhibits starting the assembler optimizer "aopt30".

## -Ono_bit

**Function:**
Suppresses optimization based on grouping of bit manipulations.

**Supplement:**
When you specify -O (or -OR or -OS or -OR_MAX or -ORM or -OS_MAX or -OSM), optimization is based on grouping manipulations that assign constants to a bit field mapped to the same memory area into one routine.
Because it is not suitable to perform this operation when there is an order to the consecutive bit operations, as in I/O bit fields, use this option to suppress optimization.

**Notes:**
This option is only valid if you specify option -O[3 to 5], -OR or -OS or -OR_MAX or -ORM or -OS_MAX or -OSM.
-Ono_break_source_debug

Suppression of optimization

Function: Suppresses optimization that affects source line data.

Supplement: Specifying the "-OR" or "-O" option performs the following optimization, which may affect source line data. This option ("-ONBSD") is used to suppress such optimization.

Notes: This option is only valid if you specify option -O[3 to 5], -OR or -OS or -OR_MAX or -ORM or -OS_MAX or -OSM.

-Ono_float_const_fold

Suppression of optimization

Function: Suppresses the constant folding processing of floating point numbers.

Supplement: By default, NC30 folds constants. Following is an example.

| before optimization: | (val/1000e250)*50.0 |
| after optimization:  | val/20e250          |

In this case, if the application uses the full dynamic range of floating points, the results of calculation differ as the order of calculation is changed. This option suppresses the constant folding in floating point numbers so that the calculation sequence in the C source file is preserved.

-Ono_logical_or_combine

Suppression of optimization

Function: Suppresses the optimization that puts consective ORs together.

Supplement: If one of three options "-O3 or greater, -OR, or -OS" is specified when compiling as in the example shown below, the compiler optimizes code generation by combining logical ORs.

Example:

```
if ( a & 0x01 || a & 0x02 || a & 0x04 )
```

(Optimized)

```
if ( a & 0x07 )
```

In this case, the variable a is referenced up to three times, but after optimization it is referenced only once. However, if the variable a has any effect on I/O references, etc., the program may become unable to operate correctly due to optimization. In such a case, specify this option to suppress the optimization to combine logical ORs. Note, however, that if the variable is declared with volatile, logical ORs are not combined for optimization.
-Ono_stdlib -ONS

Function: Suppresses inline padding of standard library functions, modification of library functions, and similar other optimization processing.

Supplement: This option suppresses the following optimization.
- Optimization for replacing the standard library functions such as "strcpy()" and "memcpy()" with the SMOVF instructions, etc.
- Optimization for changing to the library functions that conform to the arguments near and far.

Notes: Specify this option, when make a function which name is same as standard library function.

-Osp_adjust -OSA

Function: Optimizes code generation by combining stack correction codes after function calls.

Supplement: Because the area for arguments to a function normally is deallocated for each function call made, processing is performed to correct the stack pointer.
If this option is specified, processing to correct the stack pointer is performed collectively, rather than for each function call made.

Example:
```
long func1(long, long);
long func2(long);
void main( void ) {
    long i = 1;
    long j = 2;
    long k,n;
    k = func1( i, j );
    n = func2( k );
}
```

Notes: Use of the option "-Osp_adjust" helps to reduce the ROM capacity and at the same time, to speed up the processing. However, the amount of stack used may increase.
Please specify this option with -O[1-5], -OR, or -OS.
-Ostack_frame_align

Function: Aligns the stack frame on an even boundary
In the entry version, this option cannot be specified.

Supplement: When even-sized auto variables are mapped to odd addresses, memory access requires one more cycle than when they are mapped to even addresses. This option maps even-sized auto variables to even addresses, thereby speeding up memory access.

Notes:
1. The following functions specified in #pragma are not aligned.
   - #pragma INTHANDLER
   - #pragma HANDLER
   - #pragma ALMHANDLER
   - #pragma CYCHANDLER
   - #pragma INTERRUPT
2. Be sure that the stack point is initialized to an even address in the startup program. Also, be sure to compile all programs using this option.

3 In order that there may be no guarantee the number of whose values of the stack pointer in the timing which interruption generated is even, alignment is not performed to an interruption function. For this reason, processing speed may become slow when "Ostack_frame_align" option is specified to the function called from an interruption function.
Function:  A static function is treated as an inline function and the assembling code which carried out inline deployment is generated.

Supplement:  When the following conditions are fulfilled, a static function is treated as an inline function and the assembling code which carried out inline deployment is generated.

1. Substance is described before the function call. It is aimed at a static function.
   - A function call and the body of that function must be written in the same source file.
   - When you specify “-Ofoward_function_to_inline” or “-OFFTT” option, ignore this condition.

2. When address acquisition is omitted in the program to the static function.
3. When the recursive call of the static function has not been carried out.
4. When construction of a frame (reservation of an auto variable etc.) is not performed in the assembling code output of a compiler.
   - The situation of the existence of frame construction changes with combined use with the contents of description of the target function, and another optimization option.
   - When you specify “-Ofoward_function_to_inline” or “-OFFTT” option, ignore this condition.

Below, inline deployment is carried out. The example of description of a static function is shown.

```
extern int i;
static int func(void)
{
    return i++;
}

void main(void)
{
    int s;
    s = func();
    s = func();
}
```

Notes:  
1. The assembler code to description of substance of the static function which became inline function treatment is always generated.
2. About a function, it is compulsorily. In treating as an inline function, it is in a function. Please make an inline declaration.
Function: Inhibits code generation based on bit-manipulating instructions (BTSTC and BTSTS) when the optimization option “-O5” is selected.

Notes: The bit-manipulating instructions (BTSTC and BTSTS) cannot be used to read or write to the registers in the SFR area. Select this option if when the optimization option “-O5” is selected codes are generated using bit-manipulating instructions for read or write to the registers in the SFR area.
### A.2.6 Generated Code Modification Options

Table A.7 to Table A.8 shows the command line options for controlling nc30-generated assembly code.

#### Table A.7 Generated Code Modification Options (1)

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fansi</td>
<td>None</td>
<td>Makes &quot;-fnot_reserve_far_and_near&quot;, &quot;-fnot_reserve_asm&quot;, and &quot;fextend_to_int&quot; valid.</td>
</tr>
<tr>
<td>-fchar_enumerator</td>
<td>-fCE</td>
<td>Handles the enumerator type as an unsigned char type, not as an int type.</td>
</tr>
<tr>
<td>-fconst_not_ROM</td>
<td>-fCNR</td>
<td>Does not handle the types specified by const as ROM data.</td>
</tr>
<tr>
<td>-fdouble_32</td>
<td>-fD32</td>
<td>This option specifies that the double type be handled in 32-bit data length as is the float type.</td>
</tr>
<tr>
<td>-fenable_register</td>
<td>-fER</td>
<td>Make register storage class available.</td>
</tr>
<tr>
<td>-fextend_to_int</td>
<td>-fETI</td>
<td>Performs operation after extending char-type data to the int type. (Extended according to ANSI standards.)^4</td>
</tr>
<tr>
<td>-ffar_RAM</td>
<td>-fFRAM</td>
<td>Changes the default attribute of RAM data to far.</td>
</tr>
<tr>
<td>-finfo</td>
<td>None</td>
<td>Outputs the information required for the &quot;Call Walker&quot;, &quot;Map Function&quot;, and &quot;utl30&quot; to the absolute module file (.x30).</td>
</tr>
<tr>
<td>-fJSRW</td>
<td>None</td>
<td>Changes the default instruction for calling functions to JSR.W. When specify –OGJ, do not necessary to specify this option.</td>
</tr>
<tr>
<td>-fbit</td>
<td>-fB</td>
<td>Generates code assuming that bitwise manipulating instructions can be executed using absolute addressing for all external variables mapped into the near area.</td>
</tr>
<tr>
<td>-fno_carry</td>
<td>-fno_carry</td>
<td>Suppresses carry flag addition when data is indirectly accessed using far-type pointers.</td>
</tr>
<tr>
<td>-fauto_128</td>
<td>-fA1</td>
<td>Limits the usable stack frame to 128 byte.</td>
</tr>
<tr>
<td>-ffar_pointer</td>
<td>-fFP</td>
<td>Change the default attribute of pointer-type variable to far.</td>
</tr>
<tr>
<td>-ffnear_ROM</td>
<td>-fNROM</td>
<td>Change the default attribute of ROM data to near.</td>
</tr>
<tr>
<td>-fno_align</td>
<td>-fNA</td>
<td>Does not align the start address of the function.</td>
</tr>
<tr>
<td>-fno_even</td>
<td>-fNE</td>
<td>Allocate all data to the odd section, with no separating odd data from even data when outputting.</td>
</tr>
<tr>
<td>-fno_switch_table</td>
<td>-fINST</td>
<td>When this option is specified, the code which branches since it compares is generated to a switch statement.</td>
</tr>
<tr>
<td>-fnot_address_volatile</td>
<td>-fNAV</td>
<td>Does not regard the variables specified by #pragma ADDRESS (#pragma EQU) as those specified by volatile.</td>
</tr>
<tr>
<td>-fnot_reserve_asm</td>
<td>-fNRA</td>
<td>Exclude asm from reserved words. (Only_asm is valid.)</td>
</tr>
<tr>
<td>-fnot_reserve_far_and_near</td>
<td>-fNRFAN</td>
<td>Exclude far and near from reserved words. (Only_far and nearest are valid.)</td>
</tr>
<tr>
<td>-fnot_reserve_inline</td>
<td>-fNRI</td>
<td>Exclude far and near from reserved words. (Only_inline is made a reserved word.)</td>
</tr>
<tr>
<td>-fsmall_array</td>
<td>-fSA</td>
<td>When referencing a far-type array whose total size is unknown when compiling, this option calculates subscripts in 16 bits assuming that the array's total size is within 64 Kbytes.</td>
</tr>
</tbody>
</table>

---

^ char-type data or signed char-type data evaluated under ANSI rules is always extended to inttype data.  
This is because operations on char types (c1=c2*2/c3; for example) would otherwise result in an overflow and failure to obtain the intended result.
<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fswitch_other_section</td>
<td>-fSOS</td>
<td>This option outputs a ROM table for a ‘switch’ statement to some other section than a program section.</td>
</tr>
<tr>
<td>-fchange_bank_always</td>
<td>-fCBA</td>
<td>This option allows you to write multiple variables to an extended area.</td>
</tr>
<tr>
<td>-fauto_over_255</td>
<td>-fAO2</td>
<td>Changes the stack frame size per function that can be reserved to 64 Kbytes.</td>
</tr>
<tr>
<td>-fsizet_16</td>
<td>-fS16</td>
<td>Change the type definition size_t from type unsigned long to type unsigned int</td>
</tr>
<tr>
<td>-fptrdiff_t_16</td>
<td>-fP16</td>
<td>Change the type definition ptrdiff_t from type signed long to type signed int</td>
</tr>
<tr>
<td>-fuse_DIV</td>
<td>-fUD</td>
<td>This option changes generated code for divide operation.</td>
</tr>
<tr>
<td>-fuse_MUL</td>
<td>-fUM</td>
<td>This option changes generated code for multiplication operation.</td>
</tr>
<tr>
<td>-fSB_auto</td>
<td>-fSBA</td>
<td>Changes SB registers from one to another before generating SB relative, one function at a time.</td>
</tr>
<tr>
<td>-R8C</td>
<td>None</td>
<td>Generates code suitable for the R8C Family.</td>
</tr>
<tr>
<td>-R8CE</td>
<td>None</td>
<td>Generates code suitable for the R8C Family with 64-KB or larger ROM.</td>
</tr>
</tbody>
</table>
-fansi

Function: Validates the following command line options:
- `fnot_reserve_asm`: Removes `asm` from reserved words
- `fnot_reserve_far_and_near`: Removes `far` and `near` from reserved words
- `fnot_reserve_inline`: Removes `inline` from reserved words

Supplement: When this option is specified, the compiler generates code in conformity with ANSI standards.

-fchar_enumerator

Function: Processes enumerator types not as int types but as unsigned char types.

Notes: The type debug information does not include information on type sizes. Therefore, if this option is specified, the enum type may not be referenced correctly in some debugger.

-fconst_not_ROM

Function: Does not handle the types specified by `const` as ROM data.

Supplement: The `const`-specified data by default is located in the ROM area. Take a look at the example below.

```c
int const array[10] = { 1,2,3,4,5,6,7,8,9,10 };
```

In this case, the array "array" is located as ROM area. By specifying this option, you can locate the "array" in the RAM area. You do not normally need to use this option.
-fdouble_32 -fD32

Function: This option specifies that the double type be handled in 32-bit data length as is the float type.

Supplement:
(1) For this option to be used, a function prototype must always be expressly written. Without a prototype declaration, the compiler may not be able to generate the correct code.
(2) When you specify this option, the debug information of the type double is processed as the type float. So, the data of the type double is displayed as the type float on C watch window and global window of Debug tool.
(3) Mathematical functions are replaced with single-precision mathematical functions.

-fenable_register -fER

Function: Allocates variables with a specified register storage class to registers.

Supplement:
When optimizing register assignments of auto variables, it may not always be possible to obtain the optimum solution. This option is provided as a means of increasing the efficiency of optimization by instructing register assignments in the program under the above situation.
When this option is specified, the following register-specified variables are forcibly assigned to registers:
- Integral type variable
- Pointer variable

Notes: Because register specification in some cases has an adverse effect that the efficiency decreases, be sure to verify the generated assembly language before using this specification.
-fextend_to_int

Modify generated code

Function: Extends char type or signed char type data to int type data to perform operation (extension as per ANSI rules).

Supplement: In ANSI standards, the char-type or signed char-type data is always extended into the int type when evaluated. This extension is provided to prevent a problem in char-type arithmetic operations, e.g., \( c1 = c2 \times 2 / c3 \); that the char type overflows in the middle of operation, and that the result takes on an unexpected value. An example is shown below.

```c
void main(void)
{
    char c1;
    char c2 = 200;
    char c3 = 2;
    c1 = c2 * 2 / c3;
}
```

In this case, the char type overflows when calculating \([c2 \times 2]\), so that the correct result may not be obtained.

Specification of this option helps to obtain the correct result. The reason why extension into the int type is disabled by default is because it is conducive to increasing the ROM efficiency any further.

-ffar_RAM

Modify generated code

Function: Change the default attribute of RAM data to far.

Supplement: The RAM data (variables) are located in the near area by default. Use this option when you want the RAM data to be located in other areas than the near area (64K bytes area).

Notes: This option cannot be used in conjunction with the “-R8C” or “-R8CE” option.

-finfo

Modify generated code

Function: Outputs the information required for the "Call Walker", "Map Function", and "utl30".

Supplement: When using "Call Walker", "Map Function", or "utl30", the absolute module file ".x30" output by this option is needed.

Notes: No check is made for the use of global variables in the asm function. For this reason, use of the asm function even in "utl30" is ignored. `-finfo` includes `-g`. 
-fJSRW
Modify generated code

<table>
<thead>
<tr>
<th>Function:</th>
<th>Changes the default instruction for calling functions to JSR.W.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplement:</td>
<td>When calling a function that has been defined external to the source file, the &quot;JSR.A&quot; command is used by default. This option allows it to be changed to the &quot;JSR.W&quot; command. Change to the &quot;JSR.W&quot; command helps to compress the generated code size. This option is useful when the program is relatively small not exceeding 32K bytes in size or ROM compression is desired.</td>
</tr>
<tr>
<td>Notes:</td>
<td>Conversely, if a function is called that is located 32K bytes or more forward or backward from the calling position, the &quot;JSR.W&quot; command causes an error when linking. This error can be avoided by a combined use with &quot;#pragma JSRA&quot;.</td>
</tr>
</tbody>
</table>

-fbit -fB
Modify generated code

<table>
<thead>
<tr>
<th>Function:</th>
<th>Generates code assuming that bitwise manipulating instructions can be executed using absolute addressing for all external variables mapped into the near area.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplement:</td>
<td>If the near external variables subject to bit manipulations are located in the M16C Series ,R8C Family memory space 0000h through 1FFFh, specification of this option helps to increase the code efficiency generated by the compiler. If in single-chip applications the RAM is located in the above memory space, specifying this option should prove effective. If an attempt is made to operate on variables that are located in any other memory space, an error will result when linking.</td>
</tr>
</tbody>
</table>

-fno_carry -fNC
Modify generated code

<table>
<thead>
<tr>
<th>Function:</th>
<th>Suppresses carry flag addition when data is indirectly accessed using far-type pointers</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplement:</td>
<td>When accessing structures or 32-bit data indirectly using far-type pointers, this option generates code that does not perform carry addition to the high 16 bits of far-type pointers (32-bit pointer), assuming that the data is not mapped across the 64K bytes boundary. As a result, the code will be more efficient.</td>
</tr>
<tr>
<td>Notes:</td>
<td>When far-type pointers are used to indirectly access memory dynamically allocated using the malloc function, etc., or ROM data mapped to the far area, be sure that the data is not accessed spanning a 64K bytes boundary. This option cannot used simultaneously with the “-R8C” or “-RSCE” option.</td>
</tr>
</tbody>
</table>

Precautions concerning the compiler option -fbit(-FB)
When you use the compiler option -fbit(-FB), pay attention to the following points.
The error in Supplement may be output as a warning.
"16-bits unsigned value is out of range"
-fauto_128

Function: Limits the usable stack frame to 128 bytes

-ffar_pointer

Function: Change the default attribute of pointer-type variable to far. This option sets the default pointer size to 32-bits.

Supplement:
1. The pointer type variable in this compiler is a near attribute as a default attribute. This option is used when changing the default attribute of a pointer type variable into a far attribute.
2. The pointer variable which described the near qualifier is not influenced of this option. It always becomes a near attribute.

Example)
char near *p; // It processes as a near pointer.

-fnear_ROM

Function: Change the default attribute of ROM data to near.

Supplement: The ROM data (const-specified variables, etc.) are located in the far area by default. By specifying this option you can locate the ROM data in the near area. You do not normally need to use this option.

-fno_align

Function: Does not align the start address of the function.
-fno_even

Modify generated code

Function: When outputting data, does not separate odd and even data. That is, all data is mapped to the odd sections (data_NO, data_FO, data_INO, dataIFO, bss_NO, bss_FO, rom_NO, rom_FO).

Supplement: By default, the odd-size and the even-size data are output to separate sections. Take a look at the example below.

```
char  c;
int   i;
```

In this case, variable "c" and variable "i" are output to separate sections. This is because the even-size variable "i" is located at an even address. This allows for fast access when accessing in 16-bit bus width.

Use this option only when you are using the compiler in 8-bit bus width and when you want to reduce the number of sections.

Notes: When "#pragma SECTION" is used to change the name of a section, data is mapped to the newly named section.

-fno_switch_table

Modify generated code

Function: When this option is specified, the code which branches since it compares is generated to a switch statement.

Supplement: Only when code size becomes smaller when not specifying this option, the code which used the jump table is generated.

Notes: For such a large function whose code size is larger than 32 Kbytes, if code which contains a jump table for a switch statement is generated, the program may not be branched to an appropriate address.
In that case, be sure to specify this option.
Please note that when a code which cannot be branched properly because of not specifying this option is generated, the compiler, assembler and linkage editor do not output any warning or error message.
<table>

<tr>
<th>Option</th>
<th>Modifies generated code</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fnot_address_volatile</td>
<td>Modify generated code</td>
</tr>
<tr>
<td>Function:</td>
<td>Does not handle the global variables specified by &quot;#pragma ADDRESS&quot; or &quot;#pragma EQU&quot; or the static variables declared outside a function as those that are specified by volatile.</td>
</tr>
<tr>
<td>Supplement:</td>
<td>If I/O variables are optimized in the same way as for variables in RAM, the compiler may not operate as expected. This can be avoided by specifying volatile for the I/O variables. Normally #pragma ADDRESS or #pragma EQU operates on I/O variables, so that even though volatile may not actually be specified, the compiler processes them assuming volatile is specified. This option suppresses such processing.</td>
</tr>
<tr>
<td>Notes:</td>
<td>You do not normally need to use this option.</td>

<td>&quot;_inline&quot; that has the same function is handled as a reserved word.</td>
</tr>
</tbody>
</table>
### -fsmall_array

**Function:**
When referencing a far-type array whose total size is unknown when compiling, this option calculates subscripts in 16 bits assuming that the array's total size is within 64K bytes.

**Supplement:**
If when referencing array elements in a far-type array such as array data in ROM, the total size of the far-type array is uncertain, the compiler calculates subscripts in 32 bits in order that arrays of 64K bytes or more in size can be handled.

Take a look at the example below:

```c
extern int array[];
int i = array[j];
```

In this case, because the total size of the array array is not known to the compiler, the subscript “j” is calculated in 32 bits.

When this option is specified, the compiler assumes the total size of the array array is 64K bytes or less and calculates the subscript “j” in 16 bits. As a result, the processing speed can be increased and code size can be reduced.

Renesas recommends using this option whenever the size of one array does not exceed 64K bytes.

### -fswitch_other_section

**Function:**
This option outputs a ROM table for a 'switch' statement to some other section than a program section.

**Supplement:**
Section name is 'switch_table'

**Notes:**
This option does not normally need to be used.

### -fchange_bank_always

**Function:**
This option allows you to write multiple variables to an extended area.(with #pragma EXT4MPTR or _ext4mptr)

**Supplement:**
Specify this option when you declare multiple pointer variables to a 4M bytes space while at the same time using the #pragma EXT4MPTR or _ext4mptr feature.

**Notes:**
This option cannot be used in conjunction with the “-RSC” or “-R8CE” option.
-fauto_over_255

Function: Changes the stack frame size per function that can be reserved to 64K bytes. (The maximum value in the default of the stack frame is 255 bytes.)

Notes:
1. This option cannot be used in combination with #pragma SBDATA. If a file that contains a description of #pragma SBDATA is compiled, the warning shown below is output, with the description of #pragma SBDATA ignored.

```
[Warning(cocom):XX.c,line XX] compile option –fauto_over_255 is specified, #pragma SBDATA was ignored.

===> #pragma SBDATA xxx;
```

2. Specify this option for the files described below.
   a. When a function exists that requires a stack frame of 255 bytes or more

-fsizet_16

Function: Change the type definition size_t from type unsigned long to type unsigned int

Notes:
If this option is selected, be sure to use one of the standard function libraries listed below when linking.
- M16C/60 series
  nc30s16.lib
- R8C Family
  r8cs16.lib

-fptrdiff_t_16

Function: Change the type definition ptrdiff_t from type signed long to type signed int

Notes:
If this option is selected, be sure to use one of the standard function libraries listed below when linking.
- M16C/60 series
  nc30s16.lib
- R8C Family
  r8cs16.lib
-fuse_DIV -fUD

Modify generated code

Function: This option changes generated code for divide operation.

Supplement: For divide operations where the dividend is a 4-byte value, the divisor is a 2-byte value, and the result is a 2-byte value or when the dividend is a 2-byte value, the divisor is a 1-byte value, and the result is a 1-byte value, the compiler generates div.w (divu.w) and div.b (divu.b) microcomputer instructions.

Notes:
1. If the divide operation results in an overflow when this option is specified, the compiler may operate differently than stipulated in ANSI.
2. The div instruction of the M16C Series or R8C Family has such a characteristic that when the operation resulted in an overflow, the result becomes indeterminate. Therefore, when the program is compiled in default settings by NC30, it calls a runtime library to correct the result for this problem even in cases where the dividend is 4-byte, the divisor is 2-byte, and the result is 2-byte.

-fuse_MUL -fUM

Modify generated code

Function: This option changes generated code for multiplication operation.

Supplement: When 16 bits × 16 bits is stored in 32 bits, it should be Cast in 32 bits of the multiplier or the multiplicand because it obtains the result of high rank 16 bits. The result of 32bit can be obtained by specifying the option Cast.

-R8C

Modify generated code

Function: Generates code suitable for the R8C Family.

Supplement: The _fnear_ROM (-fNROM) option is set by default.

Notes: This option cannot be used in combination with the following options. If one of these options is specified, the option is ignored.
-ffar_RAM(-fFRAM), -fno_carry(-fNC), -fchange_bank_always(-fCBA)

-R8CE

Modify generated code

Function: Generates code suitable for the R8C Family.

Notes:
1. This option cannot be used in combination with the options listed below. If one of these options is specified, the option is ignored.
-ffar_RAM(-fFRAM)
-fno_carry(-fNC)
-fchange_bank_always(-fCBA)
2. When ROM area exceeds 64K boundary, it uses it.
Function: Changes SB registers from one to another before generating SB relative, one function at a time.

Supplement: Analyzes the number of times external variables are referenced in a function to generate optimum SB relative addressing, one function at a time.

```
int sym;
int a;
int data:
  :
int b:
  :
int func(void){
  a = x;
  sym = xx;
  sym = a * b;
  if(sym != 0)
    sym = sub();
  return sym;
}
int data1,data2;
int sub(void)
{
  data1 = sym1;
  data2 = data1/2;
  data1 = sub1(data2);
  :
  :
}
```

(1) The address of the symbol that was made the base point for SB relative is stored in the SB register.
(2) At the entry and exit to and from the function, code is generated for saving/restoring the SB register.
(3) Only external variables are effective.
(4) This option cannot be used in combination with -OR, -OS, -OR_MAX, -ORM, -OS_MAX and -OSM.
A.2.7 Library Specifying Option

Table A.9 lists the startup options you can use to specify a library file.

Table A.9 Library Specifying Option

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-libraryfilename</td>
<td>Specifies a library file that is used by ln30 when linking files.</td>
</tr>
</tbody>
</table>

-**library-file-name**

Function: Specifies a library file that is used by ln30 when linking files. The file extension can be omitted.

Syntax: `nc30 -lfilename <C source file name>`

Notes:

1. In file specification, the extension can be omitted. If the extension of a file is omitted, it is processed assuming an extension ".lib".
2. If you specify a file extension, be sure to specify ".lib".
3. NC30 links by default a library "nc30lib.lib" in the directory that is specified in environment variable LIB30. (NC30 links "r8clib.lib" when compiler option "-R8C" has been specified.)
4. If multiple libraries are specified, references to “nc30lib.lib” are assigned the lowest priority.
### A.2.8 Warning Options

Table A.10 shows the command line options for outputting warning messages for contraventions of nc30 language specifications.

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-Wall</code></td>
<td>None</td>
<td>Displays message for all detectable warnings. (however, not including alarms output by <code>-Wlarge_to_small</code> and <code>&quot;-Wno_used_argument&quot;</code>)</td>
</tr>
<tr>
<td><code>-Wccom_max_warnings</code></td>
<td><code>-WCMW</code></td>
<td>This option allows you to specify an upper limit for the number of warnings output by com30.</td>
</tr>
<tr>
<td><code>-Werror_file&lt;file name&gt;</code></td>
<td><code>-WEF</code></td>
<td>Outputs error messages to the specified file.</td>
</tr>
<tr>
<td><code>-Wlarge_to_small</code></td>
<td><code>-WLTS</code></td>
<td>Outputs a warning about the tacit transfer of variables in descending sequence of size.</td>
</tr>
<tr>
<td><code>-Wmake_tagfile</code></td>
<td><code>-WMT</code></td>
<td>Outputs error messages to the tag file of source file by source file.</td>
</tr>
<tr>
<td><code>-Wnesting_comment</code></td>
<td><code>-WNC</code></td>
<td>Outputs a warning for a comment including &quot;*/&quot;.</td>
</tr>
<tr>
<td><code>-Wno_stop</code></td>
<td><code>-WNS</code></td>
<td>Prevents the compiler stopping when an error occurs.</td>
</tr>
<tr>
<td><code>-Wno_used_argument</code></td>
<td><code>-WNUA</code></td>
<td>Outputs a warning for unused argument of functions.</td>
</tr>
<tr>
<td><code>-Wno_used_function</code></td>
<td><code>-WNUF</code></td>
<td>Displays unused global functions when linking.</td>
</tr>
<tr>
<td><code>-Wno_used_static_function</code></td>
<td><code>-WNUSF</code></td>
<td>For one of the following reasons, a static function name is output that does not require code generation.</td>
</tr>
<tr>
<td><code>-Wnon_prototype</code></td>
<td><code>-WNP</code></td>
<td>Outputs warning messages for functions without prototype declarations.</td>
</tr>
<tr>
<td><code>-Wstdout</code></td>
<td>None</td>
<td>Outputs error messages to the host machine's standard output (stdout).</td>
</tr>
<tr>
<td><code>-Wstop_at_link</code></td>
<td><code>-WSAL</code></td>
<td>Stops linking the source files if a warning occurs during linking to suppress generation of absolute module files. Also, a return value &quot;10&quot; is returned to the host OS.</td>
</tr>
<tr>
<td><code>-Wstop_at_warning</code></td>
<td><code>-WSAW</code></td>
<td>Stops compiling the source files if a warning occurs during compiling and returns the compiler end code &quot;10&quot;.</td>
</tr>
<tr>
<td><code>-Wundefined_macro</code></td>
<td><code>-WUM</code></td>
<td>Warns you that undefined macros are used in #if.</td>
</tr>
<tr>
<td><code>-Wuninitialize_variable</code></td>
<td><code>-WUV</code></td>
<td>Outputs a warning about auto variables that have not been initialized.</td>
</tr>
<tr>
<td><code>-WunknownPragma</code></td>
<td><code>-WUP</code></td>
<td>Outputs warning messages for non-supported #pragma.</td>
</tr>
</tbody>
</table>
**-Wall**

**Function:** Indicates all detectable alarms.

**Supplement:**
1. The alarms indicated here do not include those that may be generated when “Wlarge_to_small(-WLTS)” and “Wno_used_argument(-WNUA)” and “Wno_used_static_function(-WNUSF)” are used.
2. The alarms indicated here are equivalent to those of the options “Wnon_prototype(-WNP),” “Wunknown_pragma(-WUP),” “Wnesting_comment(-WNC),” and “Wuninitialize_variable(-WUV).”
3. Alarms are indicated in the following cases too:
   - When the assignment operator = is used in the if statement, the for statement or a comparison statement with the && or || operator.
   - When “==” is written to which ‘!’ should be specified.
   - When function is defined in old format.

**Notes:** These alarms are detected within the scope that the compiler assumes on its judgment that description is erroneous. Therefore, not all errors can be alarmed.

**-Wccom_max_warnings= Warning Count**

**Function:** This option allows you to specify an upper limit for the number of warnings output by ccom30.

**Supplement:** By default, there is no upper limit to warning outputs. Use this option to adjust the screen as it scrolls for many warnings that are output.

**Notes:** For the upper-limit count of warning outputs, specify a number equal to or greater than 0. Specification of this count cannot be omitted. When you specify 0, warning outputs are completely suppressed inhibited.

**-Werror_file <file-name>**

**Function:** Outputs error messages to the specified file.

**Syntax:**
```
c30\-Werror_file\<output error message file name>
```

**Notes:** The format in which error messages are output to a file differs from one in which error messages are displayed on the screen. When error messages are output to a file, they are output in the format suitable for the "tag jump function" that some editors have.
### -Wlarge_to_small

**Function:** Outputs a warning about the substitution of variables in descending sequence of size.

**Supplement:** A warning may be output for negative boundary values of any type even when they fit in the type. This is because negative values are considered under language conventions to be an integer combined with the unary operator (−). For example, the value 32768 fits in the signed int type, but when broken into "−" and "32768," the value 32768 does not fit in the signed int type and, consequently, becomes the signed long type. Therefore, the immediate value 32768 is the signed long type. For this reason, any statement like "int i = 32768;" gives rise to a warning.

**Notes:** Because this option outputs a large amount of warnings, warning output is suppressed for the type conversions listed below.
- Assignment from char type variables to char type variables
- Assignment of immediate values to char type variables
- Assignment of immediate values to float type variables

### -Wmake_tagfile

**Function:** Outputs error messages to the tag file of source-file by source-file, when an error or warning occurs.

**Supplement:** This option with "-Werror_file (-WEF)" option can't specify.

### -Wnesting_comment

**Function:** Generates a warning when comments include "/*".

**Supplement:** By using this option, it is possible to detect nesting of comments.

---

**Precautions concerning the compiler option -Wlarge_to_small(-WLTS)**

When you use the compiler option -Wlarge_to_small(-WLTS), pay attention to the following.

When compiled as a C program, a warning is output when the right side consists only of a variable.
**-Wno_stop**

**Function:** Prevents the compiler stopping when an error occurs.

**Supplement:** The compiler compiles the program one function at a time. If an error occurs when compiling, the compiler by default does not compile the next function. Also, another error may be induced by an error, giving rise to multiple errors. In such a case, the compiler stops compiling. When this option is specified, the compiler continues compiling as far as possible.

**Notes:** A system error may occur due to erroneous description in the program. In such a case, the compiler stops compiling even when this option is specified.

---

**-Wno_used_argument**

**Function:** Outputs a warning for unused arguments function.

---

**-Wno_used_function**

**Function:** Displays unused global functions when linking.

**Notes:** When selecting this option, be sure to specify the “-finfo” option at the same time. When -U option is specified when linking, this option is unnecessary.
-Wno_used_static_function -WNUSF

Function: For one of the following reasons, a static function name is output that does not require code generation.
- static functions are made inline by use of the "-Ostatic_to_inline(-OSTI)" option.
- The static function is not referenced from anywhere in the file.

Notes: (1) If any function name is written in an array initialize in the manner shown below, the compiler will process the function assuming that it will be referenced, even though it may not actually be referenced during program execution.

Example:
```c
void (*a[5])(void) = {f1,f2,f3,f4,f5};
for(i = 0; i < 3; i++) (*a[i])();
```

* In the above example, although functions f4 and f5 are not referenced, the compiler processes these functions assuming that they will be referenced.

-Wno_warning_stdlib -WNWS

Function: Specifying this option while "-Wnon_prototype" or "-Wall" is specified inhibits "Alarm for standard libraries which do not have prototype declarations".

-Wnon_prototype -WNP

Function: Outputs warning messages for functions without prototype declarations or if the prototype declaration is not performed for any function.

Supplement: Function arguments can be passed via a register by writing a prototype declaration. Increased speed and reduced code size can be expected by passing arguments via a register. Also, the prototype declaration causes the compiler to check function arguments. Increased program reliability can be expected from this. Therefore, Renesas recommends using this option whenever possible.
### `-Wstdout`

**Warning Options**

**Function:** Outputs error messages to the host machine’s standard output (stdout).

**Supplement:** Use this option to save error output, etc. to a file by using Redirect.

**Notes:** In this Compiler, errors from assembler and linkage editor invoked by the compile-driver are output to the standard output regardless of this option.

### `-Wstop_at_link` `-WSAL`

**Warning Options**

**Function:** Stops linking the source files if a warning occurs during linking to suppress generation of absolute module files. Also, a return value "10" is returned to the host OS.

### `-Wstop_at_warning` `-WSAW`

**Warning Options**

**Function:** Stops compiling the source files if a warning occurs during compiling and returns the compiler end code "10."

**Supplement:** If a warning occurs when compiling, the compilation by default is terminated with the end code "0" (terminated normally). Use this option when you are using the make utility, etc. and want to stop compile processing when a warning occurs.

### `-Wundefined_macro` `-WUM`

**Warning Options**

**Function:** Warns you that undefined macros are used in #if.
### -Wuninitialize_variable -WUV

**Function:** Outputs a warning for uninitialized auto variables. This option is effective even when "-Wall" is specified.

**Supplement:** If an auto variable is initialized in conditional jump by, for example, a if or a for statement in the user application, the compiler assumes it is not initialized. Therefore, when this option is used, the compiler outputs a warning for it.

### -WunknownPragma -WUP

**Function:** Outputs warning messages for non-supported #pragma.

**Supplement:** By default, no alarm is generated even when an unsupported, unknown "#pragma" is used. When you are using only the NC-series compilers, use of this option helps to find misspellings in "#pragma".

**Notes:** When you are using only the NC-series compilers, Renesas recommends that this option be always used when compiling.
A.2.9 Assemble and Link Options

Table A.11 shows the command line options for specifying as30 and ln30 options.

Table A.11 Assemble and Link Options

<table>
<thead>
<tr>
<th>Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-as30&lt; Option&gt;</td>
<td>Specifies options for the as30 link command. If you specify two or more options, enclose them in double quotes.</td>
</tr>
<tr>
<td>-ln30&lt; Option&gt;</td>
<td>Specifies options for the ln30 assemble command. If you specify two or more options, enclose them in double quotes.</td>
</tr>
</tbody>
</table>

**-as30 "Option"**

<table>
<thead>
<tr>
<th>Function:</th>
<th>Specifies as30 assemble command options</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax:</td>
<td><code>nc30 -as30 &quot;option1 option2&quot; &lt;C source file&gt;</code></td>
</tr>
<tr>
<td>Notes:</td>
<td>Do not specify the as30 options &quot;.&quot;, &quot;.C&quot;, &quot;.M&quot;, &quot;.O&quot;, &quot;.P&quot;, &quot;.T&quot;, &quot;.V&quot; or &quot;.X&quot;.</td>
</tr>
</tbody>
</table>

**-ln30 "Option"**

| Function: | Specifies options for the ln30 link command. You can specify a maximum of four options. If you specify two or more options, enclose them in double quotes. |
| Syntax:   | `nc30 -ln30 "option1 option2" <C source file name>` |
| Notes:    | Do not specify the ln30 options ".", ".G", ".O", ".ORDER", ".L", ".T", ".V" or ".@ file". |
A.3 Notes on Command Line Options

A.3.1 Coding Command Line Options

The NC30 command line options differ according to whether they are written in uppercase or lowercase letters. Some options will not work if they are specified in the wrong case.

A.3.2 Priority of Options for Controlling

If you specify both the following options in the NC30 command line, the ‘S’ option takes precedence and only the assembly language source files will be generated.

- "c": Stop after creating relocatable module files.
- "S": Stop after creating assembly language source files.
Appendix B  Extended Functions Reference

To facilitate its use in systems using the M16C Series, R8C Family, NC30 has a number of additional (extended) functions. This appendix B describes how to use these extended functions, excluding those related to language specifications, which are only described in outline.

Table B.1  Extended Functions (1)

<table>
<thead>
<tr>
<th>Extended feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| near/far qualifiers | Specifies the addressing mode to access data.  
  near..... Access to an area within 64K bytes (0H to 0FFFFH)  
  far......... Access to an area beyond 64K bytes (all memory areas).  
  * All functions take on far attributes. |
| asm function | (1) Assembly language can be directly included in C programs.  
  It can also be included outside functions.  
  Example: asm( " MOVW #0, R0" );  
  (2) You can specify variable names (within functions only).  
  Example1:  
  asm( " MOVW R0, $@[FB]",f);  
  Example2:  
  asm( " MOVW R0, $@",s );  
  Example3:  
  asm( " MOVW R0, $@",f);  
  (3) You can include dummy asm functions as a means of partially suppressing optimization (within functions only).  
  Example: asm(); |
| Japanese characters | (1) Permits you to use Japanese characters in character strings.  
  Example:  
  " 漢字 "  
  (2) Permits you to use Japanese characters for character constants.  
  Example:  
  " 漢 "  
  (3) Permits you to write Japanese characters in comments.  
  Example:  
  /* 漢字 */  
  * Shift-JIS and EUC code are supported, but can't use the half size character of Japanese KATA-KANA |
<table>
<thead>
<tr>
<th>Extended feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| Default argument declaration for function| Default value can be defined for the argument of a function.  
Example1: extern int func( int=1, char=0 );  
Example2: extern int func( int=a, char=0 );  
* When writing a variable as a default value, be sure to declare the variable used as a default value before declaring the function.  
* Write default values sequentially beginning immediately after the argument. |
| Inline storage class                     | Functions can be inline developed by using the inline storage class specifier: inline.  
Example: inline func( int i );  
* Always be sure to define the body of an inline function before using the inline function. |
| Extension of Comments                    | You can include C++-like comments ("//").  
Example: // This is a comment. |
| #pragma Extended functions               | You can use extended functions for which the hardware of M16C Series, R8C Family in C language. |
| macro assembler function                 | You can describe some assembler command as the function of C  
Example: char dadd_b( char val1, char val2 );  
Example: int dadd_w( char val1, char val2 ); |
B.1 Near and far Modifiers

For the M16C/60 series microcomputers, the addressing modes used for referencing and locating data vary around the boundary address 0FFFFFFH. NC30 allows you to control addressing mode switching by near and far qualifiers.

B.1.1 Overview of near and far Modifiers

The near and far qualifiers select an addressing mode used for variables or functions.

- **near modifier**........................... Area of 000000H to 00FFFFH
- **far modifier**............................ Area of 000000H to 0FFFFFH

The near and far modifiers are added to a type specifier when declaring a variable or function. If you do not specify the near or far modifiers when declaring variables and functions, NC30 interprets their attributes as follows:

- Variables ................................... near attribute
- const-qualified constants........ far attribute
- Functions.................................. far attribute

Furthermore, NC30 allows you to modify these default attributes by using the startup options of compile driver nc30.

B.1.2 Format of Variable Declaration

The near and far modifiers are included in declarations using the same syntactical format as the const and volatile type modifiers. Figure B.1 is a format of variable declaration.

```
| type specifier. near or far. variable; |
```

**Figure B.1** Format of Variable added near / far modifier

Figure B.2 is an example of variable declaration. Figure B.3 is a memory map for that variable.

```
int near in_data;
int far if_data;

void func(void)
{
    (remainder omitted)
    :
```

**Figure B.2** Example of Variable Declaration
**B.1.3 Format of Pointer type Variable**

Pointer-type variables by default are the near-type (2-byte) variable. A declaration example of pointer-type variables is shown in Figure B.4.

**Example:**

```
int * ptr;
```

*Figure B.4 Example of Declaring a Pointer Type Variable (1)*

Because the variables are located near and take on the pointer variable type near, the description in Figure B.4 is interpreted as in Figure B.5.

**Example:**

```
int near* near ptr;
```

*Figure B.5 Example of Declaring a Pointer Type Variable (2)*

The variable ptr is a 2-byte variable that indicates the int-type variable located in the near area. The ptr itself is located in the near area.

Memory mapping for the above example is shown in Figure B.6. Figure B.6 shows memory maps for above example.
When "near and far" is explicitly specified, determine the size of the address at which to store the "variable and function" that is written on the right side. A declaration of pointer-type variables that handle addresses is shown in Figure B.7.

Example1:
```c
int far * ptr1;
```
Example2:
```c
int * far ptr2;
```

As explained earlier, unless "near and far" is specified, the compiler handles the variable location as "near" and the variable type as "far." Therefore, Examples 1 and 2 respectively are interpreted as shown in Figure B.8.

Example1:
```c
int far * near ptr1;
```
Example2:
```c
int near * far ptr2;
```
In Example 1, the variable ptr1 is a 4-byte variable that indicates the int-type variable located in the far area. The variable itself is located in the near area. In Example 2, the variable ptr2 is a 4-byte variable that indicates the int-type variable located in the far area. The variable itself is located in the far area. Memory mappings for Examples 1 and 2 are shown in Figure B.9.

![Figure B.9 Memory Location of Pointer type Variable](image)

**B.1.4 Format of Function Declaration**

A function's near and far allocation attributes are always far. If you specify the near attribute in function declaration, the system outputs a warning message (function must be far) with your near declaration ignored.

**B.1.5 near and far Control by nc30 Command Line Options**

NC30 handles the attribute of far and the variable as near with the attribute of the function if you do not specify the near and far attributes. NC30's command line options allow you to modify the default attributes of functions and variables (data). These are listed in the table below.

<table>
<thead>
<tr>
<th>Table B.3 Command Line Options</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>-fnear_ROM(-fNROM)</td>
<td>Assumes near as the default attribute of ROM data</td>
</tr>
<tr>
<td>-ffar_RAM(-fFRAM)</td>
<td>Assumes far as the default attribute of RAM data</td>
</tr>
</tbody>
</table>
B.1.6 Function of Type conversion from near to far

The program in Figure B.10 performs a type conversion from near to far.

```c
int func( int far * );
int far *f_ptr;
int near *n_ptr;
void main(void)
{
    f_ptr = n_ptr;    /* assigns the near pointer to the far pointer */
    : (abbreviated)
    :
    func ( n_ptr );  /* prototype declaration for function with far pointer to parameter */
    /* specifies near pointer parameter at the function call */
}
```

Figure B.10 Type conversion from near to far

When converting type into far, 0 (zero) is expanded as high-order address.

B.1.7 Checking Function for Assigning far Pointer to near Pointer

When compiling, the warning message "assign far pointer to near pointer; bank value ignored" is output for the code shown in Figure B.11 to show that the high part of the address (the bank value) has been lost.

```c
int func( int near * );
int far  *f_ptr;
int near *n_ptr;
void main(void)
{
    n_ptr = f_ptr;   /* Assigns a far pointer to a near pointer */
    : (abbreviated)
    :
    func ( f_ptr );   /* prototype declaration of function */
    /* with near pointer in parameter */
    /* far pointer implicitly cast as near type */
    n_ptr = (near *)f_ptr;  /* far pointer explicitly cast */
    /* as near type */
}
```

Figure B.11 Type conversion from far to near

The warning message "far pointer (implicitly) casted by near pointer" is also output when a far pointer is explicitly cast as a near pointer, then assigned to a near pointer.
B.1.8 Declaring functions

In NC30, functions are always located in the far area. Therefore, do not write a near declaration for functions.

If a function is declared to take on a near attribute, NC30 outputs a warning and continues processing by assuming the attribute of that function is far. Figure B.12 shows a display example where a function is declared to be near.

```
%nc30 -S smp.c
M16C Series,R8C Family NC30 COMPILER V.X.XX Release XX
Copyright(C) XXXX(XXXX-XXXX). Renesas Electronics Corporation.
and Renesas Solutions Corp., All rights reserved.
smp.c
[Warning(ccom):smp.c,line 3] function must be far
===>
func
%
```

Figure B.12 Example Declaration of Function

B.1.9 Function for Specifying near and far in Multiple Declarations

As shown in Figure B.13, if there are multiple declarations of the same variable, the type information for the variable is interpreted as indicating a combined type.

```
extern int far idata;
int idata;
int idata = 10;
void func(void)
{
    (remainder omitted)
}

This Declaration is interpreted as the following:

extern int far idata = 10;
void func(void)
{
    (remainder omitted)
}
```

Figure B.13 Integrated Function of Variable Declaration

As shown in this example, if there are many declarations, the type can be declared by specifying "near or far" in one of those declarations. However, an error occurs if there is any contention between near and far specifications in two or more of those declarations.

You can ensure consistency among source files by declaring "near or far" using a common header file.
B.1.10 Notes on near and far Attributes

a. Notes on near and far Attributes of Functions

Functions always assume the far attribute. Do not declare functions with near. NC30 will output a warning when you declare the near attribute for a function.

b. Notes on near and far Modifier Syntax

Syntactically, the near and far modifiers are identical to the const modifier. The following code therefore results in an error.

```
int i;  // This is allowed
int far j;  // This is not permitted
```

Figure B.15 Example of Variable Declaration
B.2  asm Function

NC30 allows you to include assembly language routines (asm functions)\(^1\) in your C source programs.

B.2.1  Overview of asm Function

The `asm` function is used for including assembly language code in a C source program. As shown in Figure B.16, the format of the `asm` function is `asm(" ");`, where an assembly language instruction that conforms to the AS30 language specifications is included between the double quote marks.

```
#define ADDRESS
char

void func(void)
{
    // (abbreviated)
    ta0_int = 0x07;  // Permits timer A0 interrupt

    asm(" FSET I");  // Set interrupt enable flag
}
```

Figure B.16  Example of Description of asm Function (1)

Compiler optimization based on the positional relationship of the statements can be partially suppressed using the code shown in Figure B.17.

```
asm();
```

Figure B.17  Example of Coding asm Function(2)

The `asm` function used in NC30 not only allows you to include assembly language code but also has the following extended functions:

- Specifying the FB offset of storage class auto variables in the C program using the names of the variables in C
- Specifying the register name of storage class register variables in the C program using the names of the variables in C
- Specifying the symbol name of storage class extern and static variables in the C program using the names of the variables in C

The following shows precautions to be observed when using the `asm` function.

- Do not change the contents of registers within an `asm` function.
  The compiler does not check the inside of the `asm` function. If registers are going to be destroyed, write push and pop instructions using the `asm` function to save and restore the registers.

---

\(^1\) For the purpose of expression in this user’s manual, the subroutines written in the assembly language are referred to as assembler functions. Those written with `asm()` in a C language program are referred to as `asm` functions or inline assemble description.
B.2.2 Specifying FB Offset Value of auto Variable

The storage class auto and register variables (including arguments) written in the C language are referenced and located as being offset from the Frame Base Register (FB). (They may be mapped to registers as a result of optimization.) The auto variables which are mapped to the stack can be used in the asm function by writing the program as shown in Figure B.18 below.

```
asm( op-code R1, $$[FB]", variable name);
```

Figure B.18 Description Format for Specifying FB Offset

Only two variable name can be specified by using this description format. The following types are supported for variable names:
- Variable name
- Array name [integer]
- Struct name, member name (not including bit-field members)

```c
void func(void)
{
    int idata;
    int a[3];
    struct TAG{
        int i;
        int k;
    } s;

    asm(" MOV.W R0, $$[FB]", idata);
    asm(" MOV.W R0, $$[FB]", a[2]);
    asm(" MOV.W R0, $$[FB]", s.i);
    (Remainder omitted)
    asm(" MOV.W $$[FB], $$[FB]", s.i, a[2]);
}
```

Figure B.19 Description example for specifying

Figure B.20 shows an example for referencing an auto variable and its compile result.
C source file:

```c
void func(void)
{
    int idata = 1;  // auto variable (FB offset value = -2)
    asm("MOV.W \$[FB], R0", idata);
    asm("CMP.W #00001H, R0");
    // (remainder omitted)
}
```

Assembly language source file (compile result):

```
;## # FUNCTION func
;## # FRAME AUTO (idata) size 2, offset -2
    
;## # C_SRC : asm("MOV.W \$[FB], R0", idata);
;#### ASM START
    MOV.W -2[FB], R0  // Transfer FB offset value-2 to R0 register
    ; line 5
;## # C_SRC : asm("CMP.W \#00001H, R0");
;#### ASM END
    CMPW \#00001H, R0
    // (remainder omitted)
```

Figure B.20   Example for Referencing an auto Variables

You can also use the format show in Figure B.21 so that auto variables in an asm function use a 1-bit field.
(Can not operate bit-fields og greater than 2-bits.)

```
asm("op-code \$b[ FB ]", bit field name);
```

Figure B.21   Format for Specifying FB Offset Bit Position.
You can only specify one variable name using this format. Figure B.22 is an example.

```c
void func(void)
{
    struct TAG{
        char bit0:1;
        char bit1:1;
        char bit2:1;
        char bit3:1;
    } s;

    asm(" bset $b[FB].s.bit1");
}
```

Figure B.22  Example for Specifying FB Offset Position
Figure B.23 shows examples of referencing auto area bit fields and the result of compiling.

**C source file:**

```c
void func(void)
{
    struct TAG{
        char bit0:1;
        char bit1:1;
        char bit2:1;
        char bit3:1;
    } s;
    asm(" bset $b[FB]", s.bit1);
}
```

**Assembly language source file (compile result):**

```
;## # FUNCTION func
;## # FRAME AUTO (__PAD1) size 1, offset -1
;## # FRAME AUTO ( s) size 1, offset -2
;## # ARG Size(0) Auto Size(2) Context Size(8)
.section program, CODE, ALIGN
._file "bit.c"
.align
._line 3
.glob _func
._func:
    enter #02H
._line 10
;#### ASM START
bset 1,-2[FB] ; s
;#### ASM END
._line 11
.exitd
```

Figure B.23  Example of Referencing auto Area Bit Field

When referencing a bit field in the auto area, you must confirm that it is located within the range that can be referenced using bit operation instructions (within 32 bytes of the FB register value).
B.2.3 Specifying Register Name of register Variable

The storage class auto and register variables (including arguments) may be mapped to registers by the compiler. The variables mapped to registers can be used in the asm function by writing the program as shown in Figure B.24 below.1

```
asm(" op-code operand $$ ", Variable name);
```

Figure B.24 Description Format for Register Variables

You can only specify two variable name using this format. Figure B.25 shows examples of referencing register variables and the results of compiling.

● C Source file:

```c
void func(void)
{
    register int i=1;    // Variable "i" is a register variable
    asm(" mov.w $$,A1",i);
}
```

● Assembly language source file (compile result):

```
;## # FUNCTION func
;## # ARG Size(0) Auto Size(0) Context Size(4)
.section program,CODE,ALIGN
._file 'reg.c'
._align
._line 3
;## # C_SRC : {
    .glob _func
    .func
    _func:
    _line 4
    ;## # C_SRC : register int i=1;
    movw #0001H,R0 ; i
    _line 6
    ;## # C_SRC : asm(" mov.w $$,A1",i);
    ;#### ASM START
    movw R0,A1  // R0 register is transferred to A1 register
    ;#### ASM END
```

Figure B.25 An Example for Referencing a Register Variable and its Compile Result

In NC30, register variables used within functions are managed dynamically. At anyone position, the register used for a register variable is not necessarily always the same one. Therefore, if a register is specified directly in an asm function, it may after compiling operate differently. We therefore strongly suggest using this function to check the register variables.

---

1 *1 If the variables need to be forcibly mapped to registers using the register qualifier, specify the option -fenable_register (-fER) when compiling.
B.2.4 Specifying Symbol Name of extern and static Variable

extern and static storage class variables written in C are referenced as symbols. You can use the format shown in Figure B.26 to use extern and static variables inasm functions.

\[
\text{asm( " op-code operand, $ " , variable name );}
\]

Figure B.26 Description Format for Specifying Symbol Name

Only two variable name can be specified by using this description format. The following types are supported for variable names:

- Variable name
- Array name [integer]
- Struct name, member name (not including bit-field members)

```c
int idata;
int a[3];
struct TAG{
    int i;
    int k;
} s;

void func(void)
{
    ...
    asm(" MOV.W R0, $$", idata);
    ...
    asm(" MOV.W R0, $$", a[2]);
    ...
    asm(" MOV.W R0, $$", s.i);
    ...
}
```

Figure B.27 Description example for specifying

See Figure B.28 for examples of referencing extern and static variables.
C source file:

```c
extern int ext_val;

void func(void)
{
    static int s_val;
    asm("mov.w #01H, $$", ext_val);
    asm("mov.w #01H, $$", s_val);
}
```

Assembly language source file (compile result):

```assembly
_func:
  .line 7
  ;## # C_SRC : asm(" mov.w #01H, $$", ext_val);
  ;#### ASM START
  movw #01H, _ext_val
  ;#### ASM END

  .line 8
  ;## # C_SRC : asm(" mov.w #01H, $$", s_val);
  movw #01H, ___S0_s_val

  .line 9
  ;## # C_SRC :
  rts

E1:
  .glob _ext_val
  .section bss_NE, DATA
  ___S0_s_val: ;### C's name is s_val
  .blkb 2
  .END
```

Figure B.28 Example of Referencing extern and static Variables

You can use the format shown in Figure B.29 to use 1-bit bit fields of extern and static variables in asm functions. (Can not operate bit-fields og greater than 2-bits.)

```assembly
asm(" op-code $b", bit field name);
```

Figure B.29 Format for Specifying Symbol Names
You can specify one variable name using this format. See Figure B.30 for an example.

```c
struct TAG{
    char bit0:1;
    char bit1:1;
    char bit2:1;
    char bit3:1;
} s;

void func(void)
{
    asm(" bset $b",s.bit1);
}
```

Figure B.30  Example of Specifying Symbol Bit Position

Figure B.31 shows the results of compiling the C source file shown in Figure B.30.

```asm
;### # FUNCTION func
;### # ARG Size(0) Auto Size(0) Context Size(4)
.section program,CODE,ALIGN
._file 'kk.c'
.align
._line 10
;### # C_SRC : {
    .glb _func
    _func:
        .line 11
    ;### # C_SRC : asm("bset $b",s.bit1);
    ;#### ASM START
        bset 1,_s   ← Reference to bitfield bit0 of structure s
    ;#### ASM END
        .line 12
    ;### # C_SRC : }
    rts
E1:
    .section bss_NO,DATA
    .glb _s
    _s:
        .blkb 1
    .END
```

Figure B.31  Example of Referencing Bit Field of Symbol

When referencing the bit fields of extern or static variables, you must confirm that they are located within the range that can be referenced directly using bit operation instructions (within 0000H and 1FFFH).
B.2.5 Specification Not Dependent on Storage Class

The variables written in C language can be used in the asm function without relying on the storage class of that variable (auto, register\(^1\), extern, or static variable).

Consequently, any variable written in C language can be used in the asm function by writing it in the format shown in Figure B.32\(^2\):

\[
\text{asm}(" \text{op-code operand, @}", \text{variable name });
\]

Figure B.32 Description Format Not Dependent on Variable's Storage Class

You can only specify two variable name using this format. Figure B.33 shows examples of referencing register variables and the results of compiling.

<table>
<thead>
<tr>

Figure B.33 Example for Referencing Variables of Each Storage Class

\(^1\) It does not restrict being assigned to a register, even if it specifies a register qualified.

\(^2\) Whether it is arranged at which storage class should actually compile, and please check it.
B.2.6 Selectively suppressing optimization

In Figure B.34, the dummy asm function is used to selectively suppress a part of optimization.

```c
#pragma ADDRESS port 02H
struct port{
    char bit0:1;
    char bit1:1;
    char bit2:1;
    char bit3:1;
    char bit4:1;
    char bit5:1;
    char bit6:1;
    char bit7:1;
}port;

void func(void)
{
    port.bit0 = 0x01;     Optimization
    port.bit1 = 0x01;     or.b #03H,_port
    asm(); /*dummy*/     bset 00H,_port  
    port.bit0 = 0x01;     Optimization
    port.bit1 = 0x01;  
    bset 01H,_port  
    asm(); /*dummy*/     Optimization
}
```

Figure B.34 Example of Suppressing Optimization by Dummy asm

B.2.7 Notes on the asm Function

a. Extended Features Concerning asm functions

When using the asm function for the following processing, be sure to use the format shown in the coding examples.

1. Do not specify auto variables or parameters, or 1-bit bit fields using the offset from the frame base register (FB). Use the format shown in Figure B.35 to specify auto variables and parameters.

```c
asm(" MOVW #01H,$[FB]", i); ← Format for referencing auto variables  
asm(" BSET $[FB]", s.bit0); ← Format for checking auto bit fields
```

Figure B.35 Example Coding of asm Function (1)
(2) You can specify the register storage class in NC30. When register class variables are compiled with option -fenable_register (-fER), use the format shown in Figure B.36 for register variables in asm functions.

```assembly
asm(" MOV.W #0,$$$", i);
_FORMAT for checking register variables
```

Figure B.36  Example Coding of asm Function (2)

Note that, when you specify option -O[1-5], -OR, -OS, -OR_MAX, or -OS_MAX, parameters passed via the registers may, to improve code efficiency, be processed as register variables rather than being moved to the auto area. In this case, when parameters are specified in an asm function, the assembly language is output using the register names instead of the variable's FB offset.

(3) When referencing arguments in the asm function
The compiler analyzes program flow in the interval in which variables (including arguments and auto variables) are effective, as it processes the program. For this reason, if arguments or auto variables are referenced directly in the asm function, management of such effective interval is destroyed and the compiler cannot output codes correctly.
Therefore, to reference arguments or auto variables in the asm function you are writing, always be sure to use the "$$, $b, $@" features of the asm function.

```c
void func( int i,int j)
{
    asm (" mov.w 2[FB],4[FB]"); /* j = i; */
}
```

Figure B.37  Example cannot be referred to correctly

In the above case, because the compiler determines that "i" and "j" are not used within the function func, it does not output codes necessary to construct the frame in which to reference the arguments. For this reason, the arguments cannot be referenced correctly.

(4) About branching within the asm function
The compiler analyzes program flow in the intervals in which registers and variables respectively are effective, as it processes the program. Do not write statements for branching (including conditional branching) in the asm function that may affect the program flow.
b. About Register

- In assembly-language descriptions, do not write statements which will cause the register contents to be changed. If registers are going to be destroyed, use push and pop instructions to save and restore the registers.
- NC30 is premised on the condition that the SB register is used in fixed mode after being initialized by the startup program. If you modified the SB register, write a statement to restore it at the end of consecutive asm functions as shown in Figure B.38.

```asm
asm(" .SB 0");
asm(" LDC #0H, SB"); ← SB changed
asm(" MOV.W R0, _port[SB]");
    (abbreviated)
asm(" .SB __SB__");
asm(" LDC #__SB__,SB"); ← SB returned to original state
```

Figure B.38 Restoring Modified Static Base (SB) register

- Do not modify the FB register by the asm functions, because which use for the stack flame pointer.

c. Notes on Labels

The assembler source files generated by NC30 include internal labels in the format shown in Figure B.39. Therefore, you should avoid using labels in an asm function that might result in duplicate names.

- Labels consisting of one uppercase letter and one or more numerals
  Examples: A1:
  C9830:

- Labels consisting of two or more characters preceded by the underscore (_)
  Examples: __LABEL:
  ___START:

Figure B.39 Label Format Prohibited in asm Function
B.3 Description of Japanese Characters

NC30 allows you to include Japanese characters in your C source programs. This chapter describes how to do so.

B.3.1 Overview of Japanese Characters

In contrast to the letters in the alphabet and other characters represented using one byte, Japanese characters require two bytes. NC30 allows such 2-byte characters to be used in character strings, character constants, and comments. The following character types can be included:

- kanji
- hiragana
- full-size katakana
- half-size katakana

Only the following kanji code systems can be used for Japanese characters in NC30.

- EUC (excluding user-defined characters made up of 3-byte code)
- Shift JIS (SJIS)

B.3.2 Settings Required for Using Japanese Characters

The following environment variables must be set in order to use kanji codes. default specifies:

- Environment variable specifying input code system .....................NCKIN
- Environment variable specifying output code system ...................NCKOUT

Figure B.40 is an example of setting the environment variables.

Include the following in your autoexec.bat file:

```
set NCKIN=SJIS
set NCKOUT=SJIS
```

Figure B.40 Example Setting of Environment Variables NCKIN and NCKOUT

In NC30, the input kanji codes are processed by the cpp30 preprocessor. cpp30 changes the codes to EUC codes. In the last stage of token analysis in the ccom30 compiler, the EUC codes are then converted for output as specified in the environment variable.
B.3.3 Japanese Characters in Character Strings

Figure B.41 shows the format for including Japanese characters in character strings.

![Figure B.41 Format of Kanji code Description in Character Strings](image)

If you write Japanese using the format “라자文字列” as with normal character strings, it is processed as a pointer type to a char type when manipulating the character string. You therefore cannot manipulate them as 2-byte characters.

To process the Japanese as 2-byte characters, precede the character string with L and process it as a pointer type to a wchar_t type. wchar_t types are defined (typedef) as unsigned short types in the standard header file stdlib.h.

Figure B.42 shows an example of a Japanese character string.

![Figure B.42 Example of Japanese Character Strings Description](image)

Figure B.43 is a memory map of the character string initialized in (1) in Figure B.42.

![Figure B.43 Memory Location of wchar_t Type Character Strings](image)
B.3.4 Using Japanese Characters as Character Constants

Figure B.44 shows the format for using Japanese characters as character constants.

![Japanese Characters Format](image)

Figure B.44 Format of Kanji code Description in Character Strings

As with character strings, precede the character constant with L and process it as a wchar_t type. If, as in ‘文 守’, you use two or more characters as the character constant, only the first character “文” becomes the character constant. Figure B.45 shows examples of how to write Japanese character constants.

```c
#include <stdlib.h>
void func(void)
{
    wchar_t JC[5];
    JC[0] = L'文';
    JC[1] = L'守';
    JC[2] = L'定';
    JC[3] = L'数';
    (remainder omitted)
}
```

Figure B.45 Format of Kanji Character Constant Description

Figure B.46 is a memory map of the array to which the character constant in Figure B.45 has been assigned.

![Memory Map](image)
B.4 Default Argument Declaration of Function

NC30 allows you to define default values for the arguments of functions in the same way as with the C++ facility. This chapter describes NC30's facility to declare the default arguments of functions.

B.4.1 Overview of Default Argument Declaration of Function

NC30 allows you to use implicit arguments by assigning parameter default values when declaring a function's prototype. By using this facility you can save the time and labor that would otherwise be required for writing frequently used values when calling a function.

B.4.2 Format of Default Argument Declaration of Function

Figure B.47 shows the format used to declare the default arguments of a function.

```plaintext
Storage class specifier. Type declarator. Declarator([Dummy argument [=Default value or variable] ],...);
```

Figure B.47 Format for declaring the default arguments of a function

Figure B.48 shows an example of declaration of a function, and Figure B.49 shows a result of compiling of sample program which shows at Figure B.48.

```plaintext
int func( int i=1, int j=2 );  \(\Rightarrow\) Declares the default values of parameters in the arguments to the function func as first argument: 1 and second argument: 2.

void main(void)
{
    func();  \(\Rightarrow\) The actual argument consists of the first argument: 1 and the second argument: 2.
    func(3);  \(\Rightarrow\) The actual argument consists of the first argument: 3 and the second argument: 2.
    func(3,5);  \(\Rightarrow\) The actual argument consists of the first argument: 3 and the second argument: 5.
}
```

Figure B.48 Example for declaring the default arguments of a function
Figure B.49  Compiling Result of smp1.c(smp1.a30)

A variable can be written for the argument of a function. Figure B.50 shows an example where default arguments are specified with variables. Figure B.51 shows a compile result of the sample program shown in Figure B.50.

```
int near sym;
int func ( int i = sym); ↔ Default argument is specified with a variable.

void main(void) {
    func(); ↔ Function is called using variable (sym) as argument.
}
```

Figure B.50  Example for specifying default argument with a variable (smp2.c)
B.4.3 Restrictions on Default Argument Declaration of Function

The default argument declaration of a function is subject to some restrictions as listed below. These restrictions must be observed.

a. When specifying a default value for multiple arguments

When specifying a default value in a function that has multiple arguments, always be sure to write values beginning with the last argument. Figure B.52 shows examples of incorrect description.

```c
void func1(int i, int j=1, int k=2);  /* correct */
void func2(int i, int j, int k=2);   /* correct */
void func3(int i = 0, int j, int k);  /* incorrect */
void func4(int i = 0, int j, int k = 1);  /* incorrect */
```

Figure B.52 Examples of Prototype Declaration

b. When specifying a variable for a default value

When specifying a variable for a default value, write the prototype declaration of a function after declaring the variable you specify. If a variable is specified for the default value of an argument that is not declared before the prototype declaration of a function, it is processes as an error.
B.5 inline Function Declaration

NC30 allows you to specify the inline storage class in the similar manner as in C++. By specifying the inline storage class for a function, you can expand the function inline. This chapter describes specifications of the inline storage class.

B.5.1 Overview of inline Storage Class

The inline storage class specifier declares that the specified function is a function to be expanded inline. The inline storage-class specifier indicates to a function that the function declared with it is to be expanded in-line. The functions specified as inline storage class have codes embedded directly in them at the assembly level.

B.5.2 Declaration Format of inline Storage Class

The inline storage class specifier must be written in a syntactically similar format to that of the static and extern-type storage class specifiers when declaring the inline storage class. Figure B.53 shows the format used to declare the inline storage class.

```
inline. type specifier. function;
```

Figure B.53 Declaration Format of inline Storage Class

Figure B.54 shows an example of declaration of a function.

```
inline int func(int i) { return i++; }
void main(void) {
  int s;
  s = func(s); /* Definition of body of function */
}
```

Figure B.54 Example for Declaring inline Storage Class
Figure B.55  Compile Result of sample program (smp.a30)

B.5.3  Restrictions on inline Storage Class

When specifying the inline storage class, pay attention to the following:

(1) Regarding the parameter of inline functions
   The parameter of an in line function cannot be used by “structure” and “union”. It becomes a compile error.

(2) Regarding the indirect call of inline functions
   The indirect call of an in line function cannot be carried out. It becomes a compile error when a indirect call is described.

(3) Regarding the recursive call of inline functions
   The recursive call of an in line function cannot be carried out. It becomes a compile error when a recursive call is described.

(4) Regarding the definition of an inline function
   When specifying inline storage class for a function, be sure to define the body of the function before calling it. Make sure that this body definition is written in the same file as the function is written. The description in Figure B.56 is processed as an error in NC30.
inline void func(int i);
void main( void )
{
    func(1);
}

[Error Message]
[Error(ccom):sample.c,line 5] inline function's body is not declared previously
====> func(1);
Sorry, compilation terminated because of these errors in main().

Figure B.56 Example of inappropriate code of inline function (1)

Furthermore, after using some function as an ordinary function if you define that function as an inline function later, NC30 becomes an error. (See Figure B.57.)

int func(int i);
void main( void )
{
    func(1);
}
inline int func(int i)
{
    return i;
}

[Error Message]
[Error(ccom):in.c,line 9] inline function is called as normal function before
====>

Figure B.57 Example of inappropriate code of inline function (2)

(5) Regarding the address of an inline function

The inline function itself does not have an address. Therefore, if the & operator is used for an inline function, the software assumes an error. Figure B.58
inline int func(int i)
{
    return i;
}

void main(void)
{
    int (*f)(int);
    f = &func;
}

[Error Message]
[Error(ccom):sample.c,line 10] can't get inline function's address by '&' operator
====> f = &func;
Sorry, compilation terminated because of these errors in main().

Figure B.58  Example of inappropriate code of inline function (3)

(6) Declaration of static data
If static data is declared in an inline function, the body of the declared static data is allocated in units of files.
For this reason, if an inline function consists of two or more files, this results in accessing different areas.
Therefore, if there is static data you want to be used in an inline function, declare it outside the function. If a static declaration is found in an inline function, NC30 generates a warning. Renesas does not recommend entering static declarations in an inline function. Figure B.59

inline int func( int j)
{
    static int i = 0;
    i++;
    return i + j;
}

[Warning Message]
[Warning(ccom):smp.c,line 3] static valuable in inline function
====> static int i = 0;

Figure B.59  Example of inappropriate code of inline function (4)

(7) Regarding debug information
NC30 does not output C language-level debug information for inline functions. Therefore, you need to debug inline functions at the assembly language level.
B.6 Extension of Comments

NC30 allows comments enclosed between "//" and "*/" as well as C++-like comments starting with "//".

B.6.1 Overview of "//" Comments

In C, comments must be written between "/*" and "*/". In C++, anything following "//

B.6.2 Comment "/" Format

When you include "/" on a line, anything after the "/" is treated as a comment. Figure B.60 shows comment format.

```
// comments
```

Figure B.60 Comment Format

Figure B.61 shows example comments.

```
void func(void)
{
    int i;    /* This is comment */
    int j;    // This is comment
    :        // This is comment
    :        (omitted)
    :        :
}
```

Figure B.61 Example Comments

B.6.3 Priority of "//" and "*/"

The priority of "//" and "*/" is such that the one that appears first has priority. Therefore, a "*/" written between a "//" to the new-line code does not have an effect as signifying the beginning of a comment. Also, a "//" written between "/*" and "*/" does not have an effect as signifying the beginning of a comment.
B.7 #pragma Extended Functions

B.7.1 Index of #pragma Extended Functions

Following index tables show contents and formation for #pragma extended functions.

a. Using Memory Mapping Extended Functions

Table B.4 Memory Mapping Extended Functions

<table>
<thead>
<tr>
<th>Extended function</th>
<th>Description</th>
</tr>
</thead>
</table>
| #pragma ROM       | Maps the specified variable to rom  
|                   | Syntax : #pragma ROM variable_name  
|                   | Example : #pragma ROM val  
|                   | • This facility is provided to maintain compatibility with NC77 and NC79  
|                   | • The variable normally must be located in the rom section using the const qualifier |
| #pragma BIT       | Declares that the external variable resides in an area where a 1-bit manipulate instruction can be used in 16-bit absolute addressing mode (i.e., a variable residing in addresses from 00000H to 01FFFH).  
|                   | Syntax : #pragma BIT variable_name  
|                   | Example : #pragma BIT bit_data |
| #pragma SBDATA    | Declares that the data uses SB relative addressing.  
|                   | Syntax : #pragma SBDATA variable_name  
|                   | Example : #pragma SECTION bss nonval_data |
| #pragma SECTION   | Changes the section name generated by NC30  
|                   | Syntax : #pragma SECTION section_name new_section_name  
|                   | Example : #pragma SECTION bss nonval_data |
| #pragma STRUCT    | (1) Inhibits the packing of structures with the specified tag  
|                   | Syntax : #pragma STRUCT structure_tag unpack  
|                   | Example : #pragma STRUCT TAG1 unpack  
|                   | (2) Arranges members of structures with the specified tag and maps even sized members first  
|                   | Syntax : #pragma STRUCT structure_tag arrange  
|                   | Example : #pragma STRUCT TAG1 arrange |
| #pragma EXT4MPTR  | A functional extension which shows a variable is a pointer accessing 4-Mbyte expanded space ROM.  
|                   | Syntax : #pragma EXT4MPTR variable_name  
|                   | Example : #pragma EXT4MPTR sym |
| _ext4mptr         | A functional extension which shows a variable is a pointer accessing 4-Mbyte expanded space ROM.  
|                   | Syntax : _ext4mptr far variable name  
|                   | Example : _ext4mptr far *sym |

1 In the previous versions, words following #pragma (For example, ADDRESS, INTERRUPT, ASM, etc.) specifying a directive function (abbreviate as subcommand) needed to be described in uppercase. In this version, subcommand are case-independence, in which uppercase and lowercase are considered to be equivalent.
### b. Using Extended Functions for Target Devices

#### Table B.5  Extended Functions for Use with Target Devices (1)

<table>
<thead>
<tr>
<th>Extended function</th>
<th>Description</th>
</tr>
</thead>
</table>
| `#pragma ADDRESS` | Specifies the absolute address of a variable. For near variables, this specifies the address within the bank.  
Syntax: `#pragma ADDRESS variable-name absolute-address`  
Example: `#pragma ADDRESS port0 2H` |
| `#pragma BITADDRESS` | A variable is assigned to the bit position which the specified absolute address specified.  
Syntax: `#pragma BITADDRESS variable-name bit-position, absolute-address`  
Example: `#pragma BITADDRESS io 1,100H` |
| `#pragma INTCALL` | Declares a function written in assembler called in a software interrupt (int instruction).  
Syntax: `#pragma INTCALL INT-No.. function-name(registe-name)`  
Example: `#pragma INTCALL 25 func(R0, R1)`  
Example: `#pragma INTCALL func()`  
* Always be sure to declare the prototype of the function before entering this declaration. |
| `#pragma INTERRUPT` | Declares an interrupt handling function written in C language. This declaration causes code to perform a procedure for the interrupt handling function to be generated at the entry or exit to and from the function. Furthermore, by specifying switch `/B` it is possible to switch the register to a back register instead of saving it to a stack when calling the function.  
Syntax:  
`#pragma INTERRUPT [B | E | V] interrupt-handling-function-name`  
`#pragma INTERRUPT [B | E] interrupt-vector-number`  
`interrupt-handling-function-name`  
Example:  
`#pragma INTERRUPT int_func`  
`#pragma INTERRUPT /B int_func`  
`#pragma INTERRUPT 10 int_func`  
`#pragma INTERRUPT /E 10 int_func`  
`#pragma INTERRUPT int_func (vect=10)`  
`#pragma INTERRUPT /V int_func 0` |

B.7.2 Using Memory Mapping Extended Functions

NC30 includes the following memory mapping extended functions.

#pragma ROM

<table>
<thead>
<tr>
<th>Function</th>
<th>Maps specified data (variable) to rom section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>#pragma ROM. variable_name</td>
</tr>
<tr>
<td>Description</td>
<td>This extended function is valid only for variables that satisfy one or other of the following conditions:</td>
</tr>
<tr>
<td></td>
<td>- Non-extern variables defined outside a function (Variables for which an area is secured)</td>
</tr>
<tr>
<td></td>
<td>- Variables declared as static within the function</td>
</tr>
<tr>
<td>Rules:</td>
<td>(1) If you specify other than a variable, it will be ignored.</td>
</tr>
<tr>
<td></td>
<td>(2) No error occurs if you specify #pragma ROM more than once.</td>
</tr>
<tr>
<td></td>
<td>(3) The data is mapped to a rom section with initial value 0 if you do not include an initialization expression.</td>
</tr>
</tbody>
</table>

Example:

[C language source program]

```c
#define ROM i
unsigned int i;         // Variable i, which satisfies condition[1]

void func(void)
{
    static int i = 20;    // Variable i, which satisfies condition[2]
    ...
}
```

[Assembly language source program]

```assembly
.SECION rom_NE,ROMDATA
.S0_i: ;### C's name is i
.word 0014H
.glob _i
_i:
.byte 00H
.byte 00H
```

Figure B.62 Example Use of #pragma ROM Declaration

Note: This facility is provided to maintain compatibility with NC77 and NC79. The variable normally must be located in the rom section using the const modifier.
#pragma BIT

**Function:**
Declares an external variable that exists in an area where a one-bit manipulate instruction can be used in 16-bit absolute addressing mode.

**Syntax:**
```
#pragma BIT  variable_name
```

**Description:**
The M16C series, R8C Family allows you to use a one-bit manipulate instruction for external variables located in an area of addresses 00000H to 01FFFH in a ROM efficient, 16-bit absolute addressing mode.

The variable declared by #pragma BIT is assumed to be present in an area where a one-bit manipulate instruction can be operated on it directly.

**Rules:**
1. If #pragma BIT is used for anything other than an external variable, it is ignored as invalid.
2. When an external variable is declared in #pragma BIT and also has a bit width of 1 bit, always directly output 1-bit instructions.
   It is therefore the user's responsibility to ensure that, when #pragma BIT declarations are included, the variables are mapped between 0 and 01FFFH.

**Example:**
```
#pragma BIT bit_data
struct bit_data{
    char bit0:1;
    char bit1:1;
    char bit2:1;
    char bit3:1;
    char bit4:1;
    char bit5:1;
    char bit6:1;
    char bit7:1;
}bit_data;
func( void )
{
    bit_data.bit1 = 0;
}
```

**Figure B.63 Example Use of #pragma BIT Declaration**

**Note:**
1-bit instructions in a 16-bit absolute addressing mode are generated under the following either conditions:
1. When a -fbit(-fB) option is specified and the object to be operated on is a near-type variable
2. When the object to be operated on is a variable declared by #pragma SBDATA
3. When the object to be operated on is a variable declared by #pragma ADDRESS and the variable is located somewhere between address 0000H to address 01FFFH
4. When the object to be operated on is a variable declared by #pragma BIT
5. Variables mapped to areas within 32 bytes of the value of the FB register.
#pragma SBDATA

**Function:**
Declares that the data uses SB relative addressing.

**Syntax:**
#pragma SBDATA, valuable-name

**Description:**
The M16C series, R8C Family allows you to choose instructions that can be executed efficiently by using SB relative addressing. #pragma SBDATA declares that SB relative addressing can be used for the variable when referencing data. This facility helps to generate ROM-efficient code.

**Rules:**
1. The variable declared to be #pragma SBDATA is declared by the assembler's pseudo-instruction .SBSYM.
2. If #pragma SBDATA is specified for anything other than a variable, it is ignored as invalid.
3. If the specified variable is a static variable declared in a function, the #pragma SBDATA declaration is ignored as invalid.
4. The variable declared to be #pragma SBDATA is placed in a SBDATA attribute section when allocating memory for it.
5. If #pragma SBDATA is declared for ROM data, the data is not placed in a SBDATA attribute section.
6. Declaration of #pragma SBDATA is invalid when the -fauto_over_255 (-fAO2) option is specified. In such a case, NC30 outputs a warning message “compile option -fauto_over_255 is specified, #pragma SBDATA was ignored”.

**Example:**
```c
#pragma SBDATA sym_data
struct sym_data{
  char bit0:1;
  char bit1:1;
  char bit2:1;
  char bit3:1;
  char bit4:1;
  char bit5:1;
  char bit6:1;
  char bit7:1;
}sym_data;
void func( void )
{
  sym_data.bit1 = 0;
  ...
  (omitted)
  ...
```

**Figure B.64 Example Use of #pragma SBDATA Declaration**

**Note:**
NC30 is premised on an assumption that the SB register will be initialized after reset and will thereafter be used as a fixed quantity.
#pragma SECTION

**Function:** Changes the names of sections generated by NC30

**Syntax:**

```
#pragma SECTION. section name. new section name
```

**Description:**

Specifying the program section, data section and rom section in a #pragma SECTION declaration changes the section names of all subsequent functions.

Specifying a bss section in a #pragma SECTION declaration changes the names of all data sections defined in that file.

If you need to add or change section names after using this function to change section names, change initialization, etc., in the startup program for the respective sections.

- You can specify "#pragma SECTION bss", "#pragma SECTION rom", "#pragma SECTION data" and "#pragma SECTION program" two or more times in one file.
- All other sections cannot have their names changed twice or more.

**Example:**

[C source program]

```
#pragma SECTION program pro1  \ Changes name of program section to pro1
void  func( void );
    (remainder omitted)
```

[Assembly language source program]

```assembly
;### FUNCTION func
.section pro1  \ Maps to pro1 section
_file 'smp.c'
_line 9
.glb _func
_func:

[Change name of data section from data to data1]

```asm
#pragma SECTION data data1  \ Maps to data1_NE section
int i = 0;
void  func(void)
    {  \ (remainder omitted)
    }
```asm

```asm
#pragma SECTION data data2  \ Maps to data2_NE section */
int j =1;
void  sub(void)
    {  \ (remainder omitted)
    }
```asm

**Supplement:**

When modifying the name of a section, note that the section's location attribute (e.g., _NE or _NED) is added after the section name.
#pragma SECTION

Note: In this compiler V.3.10 or earlier, the data and rom sections, as with the bss section, could only have their names altered in file units. For this reason, the programs created with V.3.10 or earlier require paying attention to the position where #PRAGMA SECTION is written. String data is output with the rom section name that is last declared.

When a string other than program, data, rom, bss, and interrupt is specified as a section name, NC30 outputs a warning message and ignores this #pragma statement.
#pragma STRUCT

Function:
1. Inhibits packing of structures
2. Arranges structure members

Syntax:
1. #pragma STRUCT. structure_tag. unpack
2. #pragma STRUCT. structure_tag. arrange

Description and Examples:
In NC30, structures are packed by default. For example, the size of the structure in Figure B.66 is an odd number but there is no padding at the end of the structure for alignment.

When alignment is required, use #pragma STRUCT unpack to declare the structure. Members of the structure are always packed and, without any padding, arranged in the order they were declared.

Instead of padding, use #pragma STRUCT arrange to arrange the order of members so that the structure will be aligned.

```c
struct s {
    int i;
    char c;
    int j;
};
```

<table>
<thead>
<tr>
<th>Member name</th>
<th>Type</th>
<th>Size</th>
<th>Mapped location (offset)</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>int</td>
<td>16bits</td>
<td>0</td>
</tr>
<tr>
<td>c</td>
<td>char</td>
<td>8bits</td>
<td>2</td>
</tr>
<tr>
<td>j</td>
<td>int</td>
<td>16bits</td>
<td>3</td>
</tr>
</tbody>
</table>

Figure B.66 Example Mapping of Structure Members (1)

Rules:
1. Inhibiting packing of structures

This NC30 extended function allows you to control the alignment of the structure. Figure B.67 shows an example in which #pragma STRUCT is used to inhibit packing of the structure in Figure B.66.

```c
struct s {
    int i;
    char c;
    int j;
};
```

<table>
<thead>
<tr>
<th>Member name</th>
<th>Type</th>
<th>Size</th>
<th>Mapped location (offset)</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>int</td>
<td>16bits</td>
<td>0</td>
</tr>
<tr>
<td>c</td>
<td>char</td>
<td>8bits</td>
<td>2</td>
</tr>
<tr>
<td>j</td>
<td>int</td>
<td>16bits</td>
<td>3</td>
</tr>
</tbody>
</table>

Figure B.67 Example Mapping of Structure Members (2)

As shown Figure B.67, if the total size of the structure members is an odd number of bytes, #pragma STRUCT adds 1 byte as packing after the last member. Therefore, if you use #pragma STRUCT to inhibit padding, all structures have an even byte size.
#pragma STRUCT

**Description:**

(2) Arranging members

This NC30 extended function allows you to map the all even-sized structure
members first, followed by odd-sized members. Figure B.68 shows the offsets
when the structure shown in Figure B.66 is arranged using #pragma STRUCT.

```c
struct s {
  int i;
  char c;
  int j;
};
```

<table>
<thead>
<tr>
<th>Member name</th>
<th>Type</th>
<th>Size</th>
<th>Mapped location (offset)</th>
</tr>
</thead>
<tbody>
<tr>
<td>i</td>
<td>int</td>
<td>16bits</td>
<td>0</td>
</tr>
<tr>
<td>j</td>
<td>int</td>
<td>16bits</td>
<td>2</td>
</tr>
<tr>
<td>c</td>
<td>char</td>
<td>8bits</td>
<td>4</td>
</tr>
</tbody>
</table>

Figure B.68  Example Mapping of Structure Members (3)

You must declare #pragma STRUCT for inhibiting packing and arranging the structure
members before defining the structure members.

**Examples:**

```c
#pragma STRUCT TAG unpack
struct TAG {
  int i;
  char c;
} s1;
```

Figure B.69  Example of #pragma STRUCT Declaration
#pragma EXT4MPTR

**Definition:** A functional extension which shows a variable is a pointer accessing 4-Mbyte expanded space ROM.

**Syntax:**

```
#pragma EXT4MPTR pointer_name
```

**Description:** This feature is provided for extension mode 2 (4M bytes extension mode) which is available with some products in the M16C/62 group. Declare a pointer variable for accessing a 4M bytes space. When so declared, the compiler generates code for switching banks as necessary to access a 4M bytes space. This bank-switching code is generated one for each function in the place where the pointer is used first. In successive operations, therefore, the banks are set only once. When using multiple pointer variables, use the “-fchange_bank_always (-fCBA)” option which sets the banks each time the program accesses the 4M bytes space.

**Examples:**

```c
struct tagh{
    int bitmap;
    char code;
}far *pointer;
#pragma EXT4MPTR pointer
main()
{
    int data;
    data = pointer->bitmap;
}
movw_pointer, A0
movw_pointer+2, A1
movw A1, __BankSelect ← Change the bank
bclr 3, A1
bset 2, A1
ldw [A1A0], -2[FB]
```

**Note:**

1. Before using this feature, check to see if the microcomputer and the system (hardware) support 4M bytes extension space mode.
2. If the option -R8C or -R8CE is used, this declaration is ignored.
_ext4mptr
denition a data allocated on 4 Mbyte extension space ROM area

**Function:**
A functional extension which shows a variable is a pointer accessing 4-Mbyte expanded space ROM.

**Syntax:**
```
_ext4mptr far pointer_name
```

**Description:**
His feature is provided for extension mode 2 (4M byte extension mode) which is available with some products in the M16C/62 group. Declare a pointer variable for accessing a 4M-byte space. When so declared, the compiler generates code for switching banks as necessary to access a 4M-byte space. This bank-switching code is generated one for each function in the place where the pointer is used first. In successive operations, therefore, the banks are set only once. When using multiple pointer variables, use the "-fchange_bank_always (-fCBA)" option which sets the banks each time the program accesses the 4M-byte space.

**Examples:**
[C source program]
```c
struct tagh{
    int bitmap;
    char code;
};
struct tagh _ext4mptr *pointer;
main()
{
    int data;
    data = pointer->bitmap;
}
```

```
movw _pointer,A0
movw _pointer+2,A1
mov.w A1,__BankSelect  // Change the bank
bclr 3,A1
bset 2,A1
lde.w [A1A0],-2[FB]
```

**Figure B.71** Example Use of #pragma _ext4mptr Declaration

**Note:**
1. Before using this feature, check to see if the microcomputer and the system (hardware) support 4M-byte extension space mode.
2. If the option -R8C or -R8CE is used, this declaration is ignored.
B.7.3 Using Extended Functions for Target Devices

NC30 includes the following extended functions for target devices.

### #pragma ADDRESS

**Function:** Specifies the absolute address of a variable. For near variables, the specified address is within the bank.

**Syntax:**

```
#pragma ADDRESS variable-name absolute-address
```

**Description:**

The absolute address specified in this declaration is expanded as a character string in an assembler file and defined in pseudo instruction .EQU. The format for writing the numerical values therefore depends on the assembler, as follows:

- Append 'B' or 'b' to binary numbers
- Append 'O' or 'o' to octal numbers
- Write decimal integers only.
- Append 'H' or 'h' to hexadecimal numbers. If the number starts with letters A to F, precede it with 0.

**Rules:**

1. All storage classes such as extern and static for variables specified in #pragma ADDRESS are invalid.
2. Variables specified in #pragma ADDRESS are valid only for variables defined outside the function.
3. #pragma ADDRESS is valid for previously declared variables.
4. #pragma ADDRESS is invalid if you specify other than a variable.
5. No error occurs if a #pragma ADDRESS declaration is duplicated, but the last declared address is valid.
6. A warning occurs if you include an initialization expression and an initialization expression is invalid.
7. Normally #pragma ADDRESS operates on I/O variables, so that even though volatile may not actually be specified, the compiler processes them assuming volatile is specified.
8. The variable declared in #pragma ADDRESS declaration, external reference is impossible.
9. When the -fnot_address_volatile(-fNAV) option is specified, the volatile attribute for the variable defined with #pragma ADDRESS becomes invalid.
10. If a string that follows “#pragma ADDRESS” consists of white spaces or characters that cannot be a variable name (e.g. 123), or a specified address only consists of white spaces, NC30 outputs a warning message "#pragma ADDRESS format error, ignored" and ignores this statement.
11. If a string entered as the address contains a character whose 8th bit is 1, NC30 outputs a warning message "Kanji in #pragma ADDRESS" and ignores this statement.

**Examples:**

```
#pragma ADDRESS port 24H
int port;
void func(void)
{
    port = 10;
}
```

**Figure B.72 #pragma ADDRESS Declaration**
#pragma ADDRESS

Specify absolute address of I/O variable

Examples:

However, as follows, when the variable is used before specification of #pragma ADDRESS, specification of #pragma ADDRESS is invalid.

```c
char port;
void func(void)
{
    port = 0; /* Uses a variable before specifying #pragma ADDRESS */
}
#pragma ADDRESS port 100H
```

Figure B.73 Cases where the specification of #pragma ADDRESS has no effect
#pragma BITADDRESS

Function: A variable is assigned to the bit position which the specified absolute address specified.

Syntax: 
```
#pragma BITADDRESS variable-name bit-position absolute-address
```

Description: The absolute address specified in this declaration is expanded as a character string in an assembler file and defined in pseudo instruction .BITEQU. The format for writing the numerical values therefore depends on the assembler, as follows:

1. The bit position
   - It is the range of 0-65535. Only the decimal digit.

2. The Address
   - Append 'B' or 'b' to binary numbers
   - Append 'O' or 'o' to octal numbers
   - Write decimal integers only.
   - Append 'H' or 'h' to hexadecimal numbers. If the number starts with letters A to F, precede it with 0.

Rules:

1. Only a _Bool type variable can be specified to be a variable name. It becomes an error when variables other than _Bool type are specified.
2. All storage classes such as extern and static for variables specified in #pragma BITADDRESS are invalid.
3. Variables specified in #pragma BITADDRESS are valid only for variables defined outside the function.
4. #pragma BITADDRESS is valid for previously declared variables.
5. #pragma BITADDRESS is invalid if you specify other than a variable.
6. No error occurs if a #pragma BITADDRESS declaration is duplicated, but the last declared address is valid.
7. An error occurs if you include an initialization expression.
8. Normally #pragma BITADDRESS operates on I/O variables, so that even though volatile may not actually be specified, the compiler processes them assuming volatile is specified.
9. When the -fnot_address_volatile(-fNAV) option is specified, the volatile attribute for the variable defined with #pragma ADDRESS becomes invalid.
10. If a string that follows "#pragma ADDRESS" consists of white spaces or characters that cannot be a variable name (e.g. 123), or a specified address only consists of white spaces, NC30 outputs a warning message "#pragma ADDRESS format ignored" and ignores this statement.
11. If a string entered as the address contains a character whose 8th bit is 1, NC30 outputs a warning message "Kanji in #pragma ADDRESS" and ignores this statement.

Example:
```
#pragma BITADDRESS io 1, 100H
_Bool io;

void func(void)
{
    io = 1;
}
```

Figure B.74 #pragma BITADDRESS Declaration
## #pragma INTCALL

Declaration of a function called by the INT instruction.

### Function
Declares a function called by the INT instruction (by the int instruction).

### Syntax

1. `#pragma INTCALL INT-No. assembler-function-name (register-name, registername, …)`
2. `#pragma INTCALL INT-No. C-function-name ()`

### Description
This extended function declares the assembler function called by a software interrupt with the INT number.

### Rules

- **Declaring assembler functions**
  1. Before a `#pragma INTCALL` declaration, be sure to include an assembler function prototype declaration. If there is no prototype declaration, a warning is output and the `#pragma INTCALL` declaration is ignored.
  2. Observe the following in the prototype declaration:
     a. Make sure that the number of parameters in the prototype declaration matches those in the `#pragma INTCALL` declaration.
     b. You cannot declare the following types in the parameters in the assembler function:

     - Structure types and union types
     - double types, long double types
     - long long types
  3. You cannot declare the following functions as the return values of assembler functions:

     - Functions that return structures or unions
  4. You can use the following registers for parameters when calling:

     - float types, long types (32-bit registers)
     - R2R0 and R3R1
     - far pointer types (24-bit registers)
     - A0, A1, R2R0, and R3R1
     - near pointer types (16-bit registers)
     - A0, A1, R0, R1, R2, and R3
     - char types and _Bool types (8-bit registers)
     - R0L, R0H, R1L, and R1H

*There is no differentiation between uppercase and lowercase letters in register names.*

- **Declaring functions of which the body is written in C**
  1. Before a `#pragma INTCALL` declaration, be sure to include a prototype declaration. If there is no prototype declaration, a warning is output and the `#pragma INTCALL` declaration is ignored.
  2. You cannot specify register names in the parameters of functions that include the `#pragma INTCALL` declaration.
  3. Observe the following in the prototype declaration:

     a. In the prototype declaration, you can only declare functions in which all parameters are passed via registers, as in the function calling rules.
     b. You cannot declare the following functions as the return values of functions:

     - Functions that return structures or unions
  4. You can only use decimals for the INT Numbers.
#pragma INTCALL

Declare a function called by the INT instruction

Examples:

```c
int asm_func(unsigned long, unsigned int); \(\rightarrow\) Prototype declaration for
#pragma INTCALL 25 asm_func(R2R0, R1) \(\rightarrow\) the assembler function

void main(void)
{
    int i;
    long l;

    i = 0x7FFD;
    l = 0x007F;

    asm_func(l, i); \(\rightarrow\) Calling the assembler function
}
```

Figure B.75 Example of #pragma INTCALL Declaration(asm function) (1)

```c
int c_func(unsigned int, unsigned int); \(\rightarrow\) Prototype declaration for the C function
#pragma INTCALL 25 c_func(); \(\rightarrow\) You may NOT specify registers.

void main(void)
{
    int i, j;

    i = 0x7FFD;
    j = 0x007F;

    c_func(i, j); \(\rightarrow\) Calling the C function
}
```

Figure B.76 Example of #pragma INTCALL Declaration(C language function) (2)

**Note:**

To use the startup file included with the product, alter the content of the vector section before use. For details on how to alter it, refer to “Chapter 2 Preparing the Startup Program.”
#pragma INTERRUPT

Function : Declares an interrupt handler

Syntax :
1. #pragma INTERRUPT\[/B\]|/E\]|/V\]\interrupt-handler-name
2. #pragma INTERRUPT\[/B\]|/E\]\interrupt-vector-number\interrupt-handler-name
3. #pragma INTERRUPT\[/B\]|/E\]\interrupt-handler-name(vect=interrupt-vector-number)

Description :
1. By using the above format to declare interrupt processing functions written in C, NC30 generates the code for performing the following interrupt processing at the entry and exit points of the function.
   - In entry processing, all registers of the Micro Processor are saved to the stack.
   - In exit processing, the saved registers are restored and control is returned to the calling function by the REIT instruction.
2. You may specify either /B or /E of /V in this declaration:
   - /[B] Instead of saving the registers to the stack when calling the function, you can switch to the alternate registers. This allows for faster interrupt processing. When using registers on the back side, be sure that those back registers are not destroyed by an interrupt nest.
   - /[E] Multiple interrupts are enabled immediately after entering the interrupt. This improves interrupt response.
   - /[V] Generate vector table for fixed vector.
3. An interrupt vector number can be specified when declaring.

Rules :
1. A warning is output when compiling if you declare interrupt processing functions that take parameters.
2. A warning is output when compiling if you declare interrupt processing functions that return a value. Be sure to declare that any return value of the function has the void type.
3. Only functions for which the function is defined after a #pragma INTERRUPT declaration are valid.
4. No processing occurs if you specify other than a function name.
5. No error occurs if you duplicate #pragma INTERRUPT declarations.
6. You cannot specify both switch /E and switch /B at the same time.
7. If different interrupt vector numbers are written in the same interrupt handling function, the vector number declared later is effective.
8. You cannot specify /V and other switches at the same time.

```c
#pragma  INTERRUPT  intr(vect=10)
#pragma  INTERRUPT  intr(vect=20) /* The interrupt vector number 20 is effective. */
```

Figure B.77 Example for writing different interrupt vector numbers
#pragma INTERRUPT

Declare interrupt function

Rules:

(9) A compile warning occurs if you use any function specified in one of the following declarations in #pragma INTERRUPT:

- #pragma ALMHANDLER
- #pragma INTHANDLER
- #pragma HANDLER
- #pragma CYCHANDLER
- #pragma TASK

Example:

```c
extern int int_counter;

#pragma INTERRUPT /B i_func

void i_func(void)
{
    int_counter += 1;
}
```

Figure B.78 Example of #pragma INTERRUPT Declaration

Note:

(1) To use the startup file included with the product, alter the content of the vector section before use. For details on how to alter it, refer to “Chapter 2 Preparing the Startup Program.”
#pragma PARAMETER

**Function:** Declares an assembler function that passes parameters via registers.

**Syntax:**

```
#pragma PARAMETER assembler-function-name(register-name, register-name, ...)
```

**Description:** This extended function declares that, when calling an assembler function, its parameters are passed via registers.

- float types, long types (32-bit registers): R2R0 and R3R1
- far pointer types (24-bit registers): R2R0, R3R1, A1 and A0
- near pointer types (16-bit registers): A0, A1, R0, R1, R2, and R3
- char types and _Bool types (8-bit registers): R0L, R0H, R1L, and R1H
- Register names are NOT case-sensitive.
- The long long type (64-bit integer type), double type and long double type, as well as structure and union types cannot be declared. Furthermore, the following switch can be specified during declaration.

**Rules:**

1. Always put the prototype declaration for the assembler function before the #pragma PARAMETER declaration. If you fail to make the prototype declaration, a warning is output and #pragma PARAMETER is ignored.
2. Follow the following rules in the prototype declaration:
   (a) Note also that the number of parameters specified in the prototype declaration must match that in the #pragma PARAMETER declaration.
   (b) The following types cannot be declared as parameters for an assembler function in a #pragma PARAMETER declaration:
      - structure-type and union-type
      - double-type long-long-types long double-type
   (c) The assembler functions shown below cannot be declared:
      - Functions returning structure or union type
3. As for the output assembler name of the function specified by #pragma PARAMETER, the _(underscore) is added always previously.

**Example:**

```
int asm_func(unsigned int, unsigned int);  // Prototype declaration for the assembler function

#pragma PARAMETER asm_func(R0, R1)

void main(void)
{
    int i, j;
    i = 0x7FFD;
    j = 0x007F;
    asm_func(i, j);  // Calling the assembler function
}
```

Figure B.79 # Example of #pragma PARAMETER Declaration
#pragma SPECIAL

Declare a special page subroutine call function

Function : Declares a special page subroutine call (JSRS instruction) function

Syntax :
(1)  #pragma SPECIAL\[C\]\{number\}\{function-name()\}
(2)  #pragma SPECIAL\[C\]\{function-name\}\{number\}

Description :
(1)  Functions declared using #pragma SPECIAL are mapped to addresses created by
adding 0F0000H to the address set in the special page vector tables, and are
therefore subject to special page subroutine calls.
(2)  You may specify either /C in this declaration:
   By specifying switch [/c] it is possible to generate code to need the register to saving
   it to a stack at entry when calling the function. (only for NC308WA)

Rules :
(1)  Functions declared using #pragma SPECIAL are mapped to the program_S
section. Be sure to map the program_S section between 0F0000H and 0FFFFFFH.
(2)  Calls are numbered between 18 and 255 in decimal only.
(3)  As a label, "_SPECIAL_calling-number:" is output to the starting address of
functions declared using #pragma SPECIAL. Set this label in the special page
subroutine table in the startup file.\(^1\)
   Note that when the option -fmake_special_table (-fMST) is specified, the above
   setting is unnecessary.
(4)  If different call numbers are written in the function, the call number declared later
is effective.

<table>
<thead>
<tr>
<th>#pragma SPECIAL func(vect=20)</th>
</tr>
</thead>
<tbody>
<tr>
<td>#pragma SPECIAL func(vect=30) // Call number 30 is effective</td>
</tr>
</tbody>
</table>

Figure B.80 Example for writing different call numbers

(5)  If functions are defined in one file and function calls are defined in another file, be
sure to write this declaration in both files.

Example :

```c
#pragma SPECIAL 20 func()
void func(unsigned int, unsigned int);

void main(void)
{
    int i, j;

    i = 0x7FFD;
    j = 0x007F;

    func(i, j);
} // special page subroutine call
```

Figure B.81 Example of #pragma SPECIAL Declaration

---

\(^1\) If you are using the supplied startup file, modify the contents of the fvector section. For details of how to modify the startup file, see Chapter 2.2 "Modifying the Startup Program" in the Operation part of the NC30 User's Manual.
B.7.4 The Other Extensions

NC30 includes the following extended function for embedding assembler description inline.

**#pragma __ASMMACRO**

<table>
<thead>
<tr>
<th>Function</th>
<th>Declares defined a function by assembler macro.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax</td>
<td>#pragma __ASMMACRO . function-name(register name, …)</td>
</tr>
<tr>
<td>Rules</td>
<td>(1) Always put the prototype declaration before the #pragma __ASMMACRO declaration. Assembler macro function be sure to declare “static”.</td>
</tr>
<tr>
<td></td>
<td>(2) Can't declare the function of no parameter. Parameter is passed via register. Please specify the register matching the parameter type.</td>
</tr>
<tr>
<td></td>
<td>(3) Please append the underscore (“_”) to the head of the definition assembler macro name.</td>
</tr>
<tr>
<td></td>
<td>(4) The following is a return value-related calling rules. You can’t declare structure and union type as the return value.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>(5) If a function call precedes the declaration of #pragma __ASMMACRO, NC30 outputs an error message &quot;#pragma __ASMMACRO must be declared before use&quot;.</td>
</tr>
<tr>
<td></td>
<td>(6) If #pragma __ASMMACRO is declared for an identifier that is not a function, NC30 outputs a warning message &quot;#pragma __ASMMACRO not function, ignored&quot; and ignores this #pragma statement.</td>
</tr>
<tr>
<td></td>
<td>(7) If a functions is declared in a non-prototype form, NC30 outputs a warning message &quot;#pragma __ASMMACRO's function must be prototyped, ignored&quot; and ignores this #pragma statement.</td>
</tr>
<tr>
<td></td>
<td>(8) If you change the register's data, save the register to the stack in entry processing of assembler macro function and the saved register restore in exit processing.</td>
</tr>
</tbody>
</table>

**Example :**

```c
static long mul( int, int );  /* Be sure to declare “static” */

#pragma __ASMMACRO mul( R0, R2 )
#pragma ASM
  _mul     .macro
    mul.w R2,R0  ; The return-value is set to R2R0 register
  .endm
#pragma ENDASM

long l;
void test_func( void )
{
  l = mul( 2, 3 );
}
```

**Figure B.82 Example of #pragma __ASMMACRO**
#pragma ASM, #pragma ENDASM

Function : Specifies assembly code in C.

Syntax :  
   #pragma ASM
   assembly statements
   #pragma ENDASM

Description : The line(s) between #pragma ASM and #pragma ENDASM are output without modifying anything to the generated assembly source file. Writing #pragma ASM, be sure to use it in combination with #pragma ENDASM. This compiler suspends processing if no #pragma ENDASM is found the corresponding #pragma ASM.

Rules :  
(1) In assembly-language descriptions, do not write statements which will cause the register contents to be changed. When writing such statements, be sure to use the push and pop instructions to save and restore the register contents.
(2) Within the "#pragma ASM" to "#pragma ENDASM" section, do not reference arguments and auto variables.
(3) Within the "#pragma ASM" to "#pragma ENDASM" section, do not write a branch statement (including conditional branch) which may affect the program flow.
(4) If the number of characters in one line of assembly-language descriptions exceeds 1024 including the line-feed code, NC30 outputs a warning message "#pragma ASM line too long, then cut" and ignores the 1024th and subsequent characters and line-feed code.

Example :  
```c
void func(void)
{
    int i, j;
    for(i=0; i < 10; i++) {
        func2();
    }
}
```

```asm
#pragma ASM
FCLR I
LOOP1:
  MOV.W #0FFH,R0
  . (omitted)
  FSET I
#pragma ENDASM
```

Figure B.83 Example of #pragma ASM(ENDASM)

Suppliment : It is this assembly language program written between #pragma ASM and #pragma ENDASM that is processed by the C preprocessor.
#pragma JSRA

**Function:**
Calls a function using the JSR.A instruction.

**Syntax:**
```
#pragma JSRA function-name
```

**Description:**
Calls all functions declared using `#pragma JSRA` using the JSR.A instruction. `#pragma JSRA` can be specified to avoid errors in the case of functions that include code generated using the `-fJSRW` option and that cause errors during linking.

**Rules:**
This preprocessing directive has no effect when the `-fJSRW` option not specified.

**Example:**
```
extern void func(int i);
#pragma JSRA func()

void main(void)
{
    func(1);
}
```

Figure B.84  Example of `#pragma JSRA`
#pragma JSRW

**Function:**
Calls a function using the JSR.W instruction.

**Syntax:**
```
#pragma JSRW. function-name
```

**Rules:**
By default, the JSR.A instruction is used when calling a function that, in the same file, has no body definition. However, the #pragma JSRW-declared function are always called using JSR.W. This directive helps reduce ROM size.

**Rules:**
1. You may NOT specify #pragma JSRW for static functions.
2. When function call with the JSR.W instruction does not reach #pragma JSRW-declared function, an error occurs at link-time. In this case, you may not use #pragma JSRW.

**Example:**
```c
extern void func(int i);
#pragma JSRW func()

void main(void)
{
    func(1);
}
```

**Figure B.85** Example of #pragma JSRW

**Note:**
The #pragma JSRW is valid only when directly calling a function. It has no effect when calling indirectly.
Function:  Declares new-page position in the assembler-generated list file.

Syntax:  #pragma PAGE

Description:  Putting the line #pragma PAGE in C source code, the .PAGE pseudo-instruction is output at the corresponding line in the compiler-generated assembly source. This instruction causes page ejection assemblable-output assembly list file.

Rules:
(1) You cannot specify the character string specified in the header of the assembler pseudo-instruction .PAGE.
(2) You cannot write a #pragma PAGE in an auto variable declaration.

Example:
```c
void func(void)
{
    int i, j;
    for(=0; i < 10;i++){
        func2();
    }
    #pragma PAGE
    i++;
}
```

Figure B.86  Example of #pragma PAGE
B.8 assembler Macro Function

B.8.1 Outline of Assembler Macro Function

NC30 allows part of assembler commands to be written as C-language functions. Because specific assembler commands can be written directly in a C-language program, you can easily tune up the program.

B.8.2 Description Example of Assembler Macro Function

Assembler macro functions can be written in a C-language program in the same format as C-language functions, as shown below.

```c
#include <asmmacro.h> /* Includes the assembler macro function definition file */
long l;
char a[20];
char b[20];

void func(void)
{
    l = rmpa_b(0,19,a,b); /* asm Macro Function(rmpa command) */
}
```

Figure B.87 Description Example of Assembler Macro Function
B.8.3 Commands that Can be Written by Assembler Macro Function

The following shows the assembler commands that can be written using assembler macro functions and their functionality and format as assembler macro functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Syntax</th>
</tr>
</thead>
</table>
| ABS      | #include <asmmacro.h>  

static signed char abs_b( signed char val ); /* When calculated in 8 bits */  
static signed int abs_w( signed int val ); /* When calculated in 16 bits */

<table>
<thead>
<tr>
<th>Function</th>
<th>Syntax</th>
</tr>
</thead>
</table>
| DADC     | #include <asmmacro.h>  

static unsigned char dadc_b( unsigned char val1, unsigned char val2 ); /* When calculated in 8 bits */  
static unsigned int dadc_w( unsigned int val1, unsigned int val2 ); /* When calculated in 16 bits */

<table>
<thead>
<tr>
<th>Function</th>
<th>Syntax</th>
</tr>
</thead>
</table>
| DADD     | #include <asmmacro.h>  

static unsigned char dadd_b( unsigned char val1, unsigned char val2 ); /* When calculated in 8 bits */  
static unsigned int dadd_w( unsigned int val1, unsigned int val2 ); /* When calculated in 16 bits */
### DIV

**Function:**
Returns the quotient of a division where the dividend val2 is divided by the divisor val1 with the sign included.

**Syntax:**
```c
#include <asmmacro.h>

static signed char div_b(signed char val1, signed int val2);
/* 16 bits divided by 8 bits with signed */

static signed int div_w(signed int val1, signed long val2);
/* 32 bits divided by 16 bits with signed */
```

### DIVU

**Function:**
Returns the quotient of a division where the dividend val2 is divided by the divisor val1 with the sign not included.

**Syntax:**
```c
#include <asmmacro.h>

static unsigned char divu_b(unsigned char val1, unsigned int val2);
/* 16 bits divided by 8 bits with unsigned */

static unsigned int divu_w(unsigned int val1, unsigned long val2);
/* 32 bits divided by 16 bits with unsigned */
```

### DIVX

**Function:**
Returns the quotient of a division where the dividend val2 is divided by the divisor val1 with the sign not included.

**Syntax:**
```c
#include <asmmacro.h>

static signed char divx_b(signed char val1, signed int val2);
/* 16 bits divided by 8 bits with unsigned */

static signed int divx_w(signed int val1, signed long val2);
/* 32 bits divided by 16 bits with signed */
```
MOD, MODU

Function: Divide val1 by val2 and get mod.

Syntax:
#include <asmmacro.h>
static signed char mod_b(int val1,char val2); /* 16 bits divided by 8 bits with signed */
static signed int mod_w(long val1,int val2); /* 32 bits divided by 16 bits with signed */
static unsigned char modu_b(unsigned int val1,unsigned char val2); /* 16 bits divided by 8 bits with unsigned */
static unsigned int modu_w(unsigned long val1,unsigned int val2); /* 32 bits divided by 16 bits with unsigned */

NEG

Function: negate

Syntax:
#include <asmmacro.h>
static signed char neg_b(signed char val); /* When calculated in 8 bits */
static signed int neg_w(signed int val); /* When calculated in 16 bits */

NOT

Function: not

Syntax:
#include <asmmacro.h>
static signed char not_b(signed char val); /* When calculated in 8 bits */
static signed int not_w(signed int val); /* When calculated in 16 bits */
DSBB

Function: Returns the result of decimal subtraction with borrow on val2 minus val1.

Syntax:
```c
#include <asmmacro.h>

static unsigned char dsbb_b(unsigned char val1, unsigned char val2); /* When calculated in 8 bits */
static unsigned int dsbb_w(unsigned char val1, unsigned char val2); /* When calculated in 16 bits */
```

DSUB

Function: Returns the result of decimal subtraction with no borrow on val2 minus val1.

Syntax:
```c
#include <asmmacro.h>

static unsigned char dsub_b(unsigned char val1, unsigned char val2); /* When calculated in 8 bits */
static unsigned int dsub_w(unsigned char val1, unsigned char val2); /* When calculated in 16 bits */
```

MOVdir

Function: transfer to val2 from val1 by nibble

Syntax:
```c
#include <asmmacro.h>

static unsigned char movll(unsigned char val1,unsigned char val2); /* to low of val2 from high of val1 */
static unsigned char movlh(unsigned char val1,unsigned char val2); /* to high of val2 from low of val1 */
static unsigned char movhl(unsigned char val1, unsigned char val2); /* to low of val2 from high of val1 */
static unsigned char movhh(unsigned char val1, unsigned char val2); /* to high of val2 from high of val1 */
```
**RMPA**

**Function:**
Initial value: init; Number of times: count. The result is returned after performing a sum-of-products operation assuming p1 and P2 as the start addresses where multipliers are stored.

**Syntax:**
```c
#include <asmmacro.h>

static int rmpa_b(signed int init, unsigned int count, signed char *p1, signed char *p2);
/* When calculated in 8 bits */
static long rmpa_w(signed long init, unsigned int count, signed int *p1, signed int *p2);
/* When calculated in 16 bits */
```

---

**SMOVF**

**Function:**
Strings are transferred from the source address indicated by p1 to the destination address indicated by p2 as many times as indicated by count in the address-incrementing direction.
There is no return value.

**Syntax:**
```c
#include <asmmacro.h>

static void smovf_b(unsigned char *p1, unsigned char *p2, unsigned int count);
/*calculated in 8 bits */
static void smovf_w(unsigned int *p1, unsigned int *p2, unsigned int count);
/*calculated in 16 bits*/
```

---

**SHA**

**Function:**
The value of val is returned after arithmetically shifting it as many times as indicated by count.

**Syntax:**
```c
#include <asmmacro.h>

static unsigned char sha_b(signed char count, unsigned char val);
/* When calculated in 8 bits */
static unsigned int sha_w(signed char count, unsigned int val);
/* When calculated in 16 bits */
static unsigned long sha_l(signed char count, unsigned long val);
/* When calculated in 24 bits */
```
SHL

Function: The value of val is returned after logically shifting it as many times as indicated by count.

Syntax:
#include <asmmacro.h>

static unsigned char shl_b(signed char count, unsigned char val);
/* When calculated in 8 bits */
static unsigned int shl_w(signed char count, unsigned int val);
/* When calculated in 16 bits */
static unsigned long shl_l(signed char count, unsigned long val);
/* When calculated in 24 bits */

SMOVB

Function: Strings are transferred from the source address indicated by p1 to the destination address indicated by p2 as many times as indicated by count in the address-decrementing direction. There is no return value.

Syntax:
#include <asmmacro.h>

static void smovb_b(unsigned char _far *p1, unsigned char _far *p2, unsigned int count);
/*calculated in 8 bits */
static void smovb_w(unsigned int _far *p1, unsigned int _far *p2, unsigned int count);
/*calculated in 16 bits*/

SSTR

Function: Strings are stored using val as the data to store, p as the address to from val address which to transfer, and count as the number of times to transfer data. There is no return value.

Syntax:
#include <asmmacro.h>

static void sstr_b(unsigned char val, unsigned char _far *p, unsigned int count);
/*calculated in 8 bits */
static void sstr_w(unsigned int val, unsigned int _far *p, unsigned int count);
/*calculated in 16 bits*/
**ROLC**

**Function:** The value of val is returned after rotating it left by 1 bit including the C flag.

**Syntax:**
```
#include <asmmacro.h>

static unsigned char rolc_b(unsigned char val1);
/* When calculated in 8 bits */
static unsigned int rolc_w(unsigned int val1);
/* When calculated in 16 bits */
```

**RORC**

**Function:** The value of val is returned after rotating it right by 1 bit including the C flag.

**Syntax:**
```
#include <asmmacro.h>

static unsigned char rorc_b(unsigned char val);
/* When calculated in 8 bits */
static unsigned int rorc_w(unsigned int val);
/* When calculated in 16 bits */
```

**ROT**

**Function:** The value of val is returned after rotating it as many times as indicated by count.

**Syntax:**
```
#include <asmmacro.h>

static unsigned char rot_b(signed char count, unsigned char val);
/* When calculated in 8 bits */
static unsigned int rot_w(signed char count, unsigned int val);
/* When calculated in 16 bits */
static unsigned char rot_b(signed char count, unsigned char val);
```
Appendix C  Overview of C Language Specifications

In addition to the standard versions of C available on the market, C language specifications include extended functions for embedded system.

C.1  Performance Specifications

C.1.1  Overview of Standard Specifications

This compiler is a cross C compiler targeting the M16C Series, R8C Family. In terms of language specifications, it is virtually identical to the standard full-set C language, but also has specifications to the hardware in the M16C Series, R8C Family and extended functions for embedded system.

- Extended functions for embedded system (near/far modifiers, and asm function, etc.)
- Floating point library and host machine-dependent functions are contained in the standard library.

C.1.2  Introduction to NC30 Performance

This section provides an overview of NC30 performance.

a.  Test Environment

Table C.1 shows the standard PC environment.

<table>
<thead>
<tr>
<th>Item</th>
<th>Type of PC</th>
<th>OS Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>PC environment</td>
<td>IBM PC/AT or compatible</td>
<td>Windows XP</td>
</tr>
<tr>
<td>Type of CPU</td>
<td>Pentium IV</td>
<td></td>
</tr>
<tr>
<td>Memory</td>
<td>128MB min. (Without High-performance Embedded Workshop)</td>
<td></td>
</tr>
</tbody>
</table>

b.  C Source File Coding Specifications

Table C.2 shows the specifications for coding NC30 C source files. Note that estimates are provided for items for which actual measurements could not be achieved.

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of characters per line of source file</td>
<td>512 bytes (characters) including the new line code</td>
</tr>
<tr>
<td>Number of lines in source file</td>
<td>65535 max.</td>
</tr>
</tbody>
</table>
### c. NC30 Specifications

Table C.3 to Table C.4 lists the NC30 specifications. Note that estimates are provided for items for which actual measurements could not be achieved.

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of files that can be specified in NC30</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum length of filename</td>
<td>Depends on operating system</td>
</tr>
<tr>
<td>Maximum number of macros that can be specified in nc30 command line option -D</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of directories that can be specified in nc30 command line option -I</td>
<td>256max</td>
</tr>
<tr>
<td>Maximum number of parameters that can be specified in nc30 command line option -as30</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of parameters that can be specified in nc30 command line option -ln30</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum nesting levels of compound statements, iteration control structures, and selection control structures</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum nesting levels in conditional compiling</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Number of pointers modifying declared basic types, arrays, and function declarators</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Number of function definitions</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Number of identifiers with block scope in one block</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of macro identifiers that can be simultaneously defined in one source file</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of macro name replacements</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Number of logical source lines in input program</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of levels of nesting #include files</td>
<td>40max</td>
</tr>
<tr>
<td>Maximum number of case names in one switch statement (with no nesting of switch statement)</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Total number of operators and operands that can be defined in #if and #elif</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Size of stack frame that can be secured per function(in bytes)</td>
<td>64K bytes max</td>
</tr>
<tr>
<td>Number of variables that can be defined in #pragma ADDRESS</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of levels of nesting parentheses</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Number of initial values that can be defined when defining variables with initialization expressions</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of nesting modifier declarators</td>
<td>Depends on stack size of YACC</td>
</tr>
<tr>
<td>Maximum number of levels of nesting declarator parentheses</td>
<td>Depends on stack size of YACC</td>
</tr>
<tr>
<td>Maximum number of nesting operator parentheses</td>
<td>Depends on stack size of YACC</td>
</tr>
<tr>
<td>Maximum number of valid characters per internal identifier or macro name</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of valid characters per external identifier</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
<tr>
<td>Maximum number of external identifiers per source file</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
</tbody>
</table>

200 max

200 max
### Table C.4 NC30 Specifications (2)

<table>
<thead>
<tr>
<th>Item</th>
<th>Specification</th>

<tr>
<td>Maximum number of characters per character string</td>
<td>Depends on operating system</td>
</tr>
<tr>
<td>Maximum number of lines per file</td>
<td>No limit (Memory capacity dependence)</td>
</tr>
</tbody>
</table>
C.2 Standard Language Specifications

The chapter discusses the NC30 language specifications with the standard language specifications.

C.2.1 Syntax

This section describes the syntactical token elements. In NC30, the following are processed as tokens:

- Key words
- Constants
- Operators
- Identifiers
- Character literals
- Punctuators
- Comment

a. Key Words

NC30 interprets the followings as key words.

<table>
<thead>
<tr>
<th>TableC.5 Key Words List</th>
</tr>
</thead>
<tbody>
<tr>
<td>asm</td>
</tr>
<tr>
<td>_Bool</td>
</tr>
<tr>
<td>continue</td>
</tr>
<tr>
<td>enum</td>
</tr>
<tr>
<td>goto</td>
</tr>
<tr>
<td>near</td>
</tr>
<tr>
<td>signed</td>
</tr>
<tr>
<td>union</td>
</tr>
<tr>
<td>typedef</td>
</tr>
</tbody>
</table>

b. Identifiers

Identifiers consist of the following elements:

- The 1st character is a letter or the underscore (A to Z, a to z, or __)
- The 2nd and subsequent characters are alphanumeric or the underscore (A to Z, a to z, 0 to 9, or __)

Identifiers can consist of up to 200 characters. However, you cannot specify Japanese characters in identifiers.

c. Constants

Constants consists of the followings.

- Integer constants
- Floating point constants
- Character constants
(1) Integer constants

In addition to decimals, you can also specify octal and hexadecimal integer constants. TableC.6 shows the format of each base (decimal, octal, and hexadecimal).

<table>
<thead>
<tr>
<th>Base</th>
<th>Notation</th>
<th>Structure</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decimal</td>
<td>Start with a value other than 0 (zero)</td>
<td>0123456789</td>
<td>15</td>
</tr>
<tr>
<td>Octal</td>
<td>Start with 0 (zero)</td>
<td>01234567</td>
<td>017</td>
</tr>
<tr>
<td>Hexadecimal</td>
<td>Start with 0X or 0x</td>
<td>0123456789ABCDEF</td>
<td>0XF or 0xf</td>
</tr>
<tr>
<td></td>
<td></td>
<td>0123456789abcdef</td>
<td></td>
</tr>
<tr>
<td>Binary number</td>
<td>Start with 0b or 0B</td>
<td>01</td>
<td>0b1 or 0B1</td>
</tr>
</tbody>
</table>

Determine the type of the integer constant in the following order according to the value.

- Octal and hexadecimal and Binary number:
  - signed int → unsigned int → signed long → unsigned long → signed long long
  - unsigned long long
- Decimal:
  - signed int → signed long → signed long long

Adding the suffix U or u, or L or l, or LL or ll, results in the integer constant being processed as follows:

(1) Unsigned constants

Specify unsigned constants by appending the letter U or u after the value. The type is determined from the value in the following order:

- unsigned int → unsigned long → unsigned long long

(2) long-type constants

Specify long-type constants by appending the letter L or l. The type is determined from the value in the following order:

- Octal and hexadecimal and Binary number:
  - signed long → unsigned long → signed long long → unsigned long long
- Decimal:
  - signed long long → unsigned long long

(3) long long-type constants

Specify long long-type constants by appending the letter LL or ll. The type is determined from the value in the following order:

- Octal and hexadecimal Binary number:
  - signed long long → unsigned long long
- Decimal:
  - signed long long
(2) Floating point constants

If nothing is appended to the value, floating point constants are handled as double types. To have them processed as float types, append the letter F or f after the value. If you append L or l, they are treated as long double types.

(3) Character constants

Character constants are normally written in single quote marks, as in 'character'. You can also include the following extended notation (escape sequences and trigraph sequences). Hexadecimal values are indicated by preceding the value with ¥x. Octal values are indicated by preceding the value with ¥.

Table C.7 Extended Notation List

<table>
<thead>
<tr>
<th>Notation</th>
<th>Escape sequence</th>
<th>Notation</th>
<th>Trigraph sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>¥'</td>
<td>single quote</td>
<td>¥constant</td>
<td>octal</td>
</tr>
<tr>
<td>¥&quot;</td>
<td>quotation mark</td>
<td>¥xconstant</td>
<td>hexadecimal</td>
</tr>
<tr>
<td>¥/</td>
<td>backslash</td>
<td>??\</td>
<td>express &quot;&quot; character</td>
</tr>
<tr>
<td>¥?</td>
<td>question mark</td>
<td>??\</td>
<td>express &quot;¥&quot; character</td>
</tr>
<tr>
<td>¥a</td>
<td>bell</td>
<td>??\</td>
<td>express &quot;¥&quot; character</td>
</tr>
<tr>
<td>¥b</td>
<td>backspace</td>
<td>??\</td>
<td>express &quot;~&quot; character</td>
</tr>
<tr>
<td>¥f</td>
<td>form feed</td>
<td>??&lt;</td>
<td>express &quot;¥&quot; character</td>
</tr>
<tr>
<td>¥n</td>
<td>line feed</td>
<td>??&gt;</td>
<td>express &quot;¥&quot; character</td>
</tr>
<tr>
<td>¥r</td>
<td>return</td>
<td>??&gt;</td>
<td>express &quot;¥&quot; character</td>
</tr>
<tr>
<td>¥t</td>
<td>horizontal tab</td>
<td>??−</td>
<td>express &quot;~&quot; character</td>
</tr>
<tr>
<td>¥v</td>
<td>vertical tab</td>
<td>??=</td>
<td>express &quot;¥&quot; character</td>
</tr>
</tbody>
</table>

d. Character Literals

Character literals are written in double quote marks, as in "character string". The extended notation shown in Table C.7 for character constants can also be used for character literals.
e. Operators

NC30 can interpret the operators shown in Table C.8.

<table>
<thead>
<tr>
<th>Operators List</th>
<th>+</th>
<th>logical operator</th>
<th>&amp;&amp;</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-</td>
<td></td>
<td>!</td>
</tr>
<tr>
<td>monadic operator</td>
<td>++</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>--</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>-</td>
<td></td>
<td></td>
</tr>
<tr>
<td>binary operator</td>
<td>+</td>
<td>conditional operator</td>
<td>?</td>
</tr>
<tr>
<td></td>
<td>-</td>
<td>comma operator</td>
<td>,</td>
</tr>
<tr>
<td></td>
<td>*</td>
<td>address operator</td>
<td>&amp;</td>
</tr>
<tr>
<td></td>
<td>/</td>
<td>pointer operator</td>
<td>*</td>
</tr>
<tr>
<td></td>
<td>%</td>
<td>bitwise operator</td>
<td>&lt;&lt;</td>
</tr>
<tr>
<td>assignment operators</td>
<td>=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>+=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>-=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>*=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>/=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>%=</td>
<td></td>
<td></td>
</tr>
<tr>
<td>relational operators</td>
<td>&gt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>&gt;=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>&lt;</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>&lt;=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>==</td>
<td>sizeof operator</td>
<td>sizeof</td>
</tr>
<tr>
<td></td>
<td>!=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>&lt;&lt;=</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>&gt;&gt;=</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

f. Punctuators

NC30 interprets the followings as punctuators.

- {  
- }  
- :  
- ;  

g. Comment

Comments are enclosed between /* and */. They cannot be nested. 
Comments are enclosed between “//” and the end of line.

C.2.2 Type

a. Data Type

NC30 supports the following data type.

- character type  
- integral type  
- structure  
- union  
- enumerator type  
- void  
- floating type

b. Qualified Type

NC30 interprets the following as qualified type.

- const  
- volatile  
- restrict  
- near  
- far  
- _ext4mptr
c. Data Type and Size

Table C.9 shows the size corresponding to data type.

<table>
<thead>
<tr>
<th>Type</th>
<th>Existence of sign</th>
<th>Bit size</th>
<th>Range of values</th>
</tr>
</thead>
<tbody>
<tr>
<td>_Bool</td>
<td>No</td>
<td>8</td>
<td>0, 1</td>
</tr>
<tr>
<td>char</td>
<td>No</td>
<td>8</td>
<td>0 to 255</td>
</tr>
<tr>
<td>unsigned char</td>
<td>No</td>
<td>8</td>
<td>0 to 255</td>
</tr>
<tr>
<td>signed char</td>
<td>Yes</td>
<td>8</td>
<td>-128 to 127</td>
</tr>
<tr>
<td>int short</td>
<td>Yes</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>signed int</td>
<td>Yes</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>signed short</td>
<td>Yes</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>unsigned int</td>
<td>No</td>
<td>16</td>
<td>0 to 65535</td>
</tr>
<tr>
<td>unsigned short what_t</td>
<td>No</td>
<td>16</td>
<td>0 to 65535</td>
</tr>
<tr>
<td>long signed long</td>
<td>Yes</td>
<td>32</td>
<td>-2,147,483,648 to 2,147,483,647</td>
</tr>
<tr>
<td>unsigned long</td>
<td>No</td>
<td>32</td>
<td>0 to 4,294,967,295</td>
</tr>
<tr>
<td>long long</td>
<td>Yes</td>
<td>64</td>
<td>-9,223,372,036,854,775,808 to 9,223,372,036,854,775,807</td>
</tr>
<tr>
<td>signed long long</td>
<td>Yes</td>
<td>64</td>
<td>-9,223,372,036,854,775,808 to 9,223,372,036,854,775,807</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>No</td>
<td>64</td>
<td>18,446,744,073,709,551,615</td>
</tr>
<tr>
<td>float</td>
<td>Yes</td>
<td>32</td>
<td>1.17549435e-38F to 3.40282347e+38F</td>
</tr>
<tr>
<td>long double</td>
<td>Yes</td>
<td>64</td>
<td>2.2250738585072014e-308 to 1.7976931348623157e+308</td>
</tr>
<tr>
<td>near pointer</td>
<td>No</td>
<td>16</td>
<td>0 to 0xFFFF</td>
</tr>
<tr>
<td>far pointer</td>
<td>No</td>
<td>32</td>
<td>0 to 0xFFFFFFFF</td>
</tr>
</tbody>
</table>

- The _Bool type can not specify to sign.
- If a char type is specified with no sign, it is processed as an unsigned char type.
- If an int or short type is specified with no sign, it is processed as a signed int or signed short type.
- If a long type is specified with no sign, it is processed as a sign long type.
- If a long long type is specified with no sign, it is processed as a sign long long type.
- If the bit field members of a structure are specified with no sign, they are processed as unsigned.
- Can not specifies bit-fields of long long type.
### C.2.3 Expressions

Table C.10 and Table C.11 show the relationship between types of expressions and their elements.

<table>
<thead>
<tr>
<th>Type of expression</th>
<th>Elements of expression</th>
</tr>
</thead>
<tbody>
<tr>

C.2.4 Declaration

There are two types of declaration:
- Variable Declaration
- Function Declaration

a. Variable Declaration

Use the format shown in Figure C.1 to declare variables.

```
storage class specifier: type declarator: declaration specifier: initialization_expression;
```

Figure C.1 Declaration Format of Variable

(1) Storage-class Specifiers

NC30 supports the following storage-class specifiers.
- extern
- static
- typedef
- auto
- register

(2) Type Declarator

NC30 supports the type declarators.
- _Bool
- int
- long
- float
- unsigned
- struct
- enum
- long double
- char
- short
- long long
- double
- signed
- union
- wchar_t
(3) Declaration Specifier

Use the format of declaration specifier shown in Figure C.2 in NC30.

```
Declarator : Pointer opt declarator2
Declarator2 : identifier( declarator )
             declarator2[ constant expression opt ]
             declarator2( list of dummy arguments opt )
* Only the first array can be omitted from constant expressions showing the number of arrays.
* opt indicates optional items.
```

Figure C.2 Format of Declaration Specifier

(4) Initialization expressions

NC30 allows the initial values shown in Figure C.3 in initialization expressions.

```
integral types : constant
integral types array : constant, constant ....
character types : constant
character types array : character literal, constant ....
pointer types : character literal
pointer array : character literal, character literal ....
```

Figure C.3 Initial Values Specifiable in Initialization Expressions

b. Function Declaration

Use the format shown in Figure C.4 to declare functions.

```
• function declaration (definition)
  storage-class specifier: type declarator: declaration specifier: main program
• function declaration (prototype declaration)
  storage-class specifier: type declarator: declaration specifier:
```

Figure C.4 Declaration Format of Function

(1) Storage-class Specifier

NC30 supports the following storage-class specifier.

- extern
- static
(2) Type Declarators

NC30 supports the following type declarators.

- _Bool
- char
- short
- long long
- float
- double
- unsigned
- signed
- struct
- union
- enum
- wchar_t
- long double

(3) Declaration Specifier

Use the format of declaration specifier shown in Figure C.5 in NC30

Figure C.5 Format of Declaration Specifier

(4) Body of the Program

Use the format of body of the program shown in Figure C.6

Figure C.6 Format of Body of the Program
C.2.5 Statement

NC30 supports the following.
- Labelled Statement
- Expression / Null Statement
- Iteration Statement
- Assembly Language Statement
- Compound Statement
- Selection Statement
- Jump Statement

a. Labelled Statement

Use the format of labelled statement shown in Figure C.7

```
Identifier : statement
case constant : statement
default : statement
```

Figure C.7 Format of Labelled Statement

b. Compound Statement

Use the format of compound statement shown in Figure C.8

```
{ list of declarationsoptlist of statementsopt* }
* opt indicates optional items.
```

Figure C.8 Format of Compound Statement

c. Expression / Null Statement

Use the format of expression and null statement shown in Figure C.9

```
expression:
expression;
null statement:
;
```

Figure C.9 Format of Expression and Null Statement
d. Selection Statement

Use the format of selection statement shown in Figure C.10

```c
if( expression )statement
if( expression )statement else statement
switch( expression )statement
```

Figure C.10 Format of Selection Statement

e. Iteration Statement

Use the format of iteration statement shown in Figure C.11

```c
while( expression )statement
do statement while ( expression );
for( expression opt;expression opt;expression opt )statement;
```

* opt indicates optional items.

Figure C.11 Format of Iteration Statement

f. Jump statement

Use the format of jump statement shown in Figure C.12

```c
goto identifier;
continue;
break;
return expression opt;
```

*opt indicates optional items.

Figure C.12 Format of Jump Statement

g. Assembly Language Statement

Use the format of assembly language shown in Figure C.13

```c
asm( "Literals" );
literals : assembly language statement
```

Figure C.13 Format of Assembly Language Statement
C.3  Preprocess Commands

Preprocess commands start with the pound sign (#) and are processed by the cpp30 preprocessor. This chapter provides the specifications of the preprocess commands.

C.3.1  List of Preprocess Commands Available

Table C.12 lists the preprocess commands available in NC30.

<table>
<thead>
<tr>
<th>Command</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>#assert</td>
<td>Outputs a warning when a constant expression is false.</td>
</tr>
<tr>
<td>#define</td>
<td>Defines macros.</td>
</tr>
<tr>
<td>#elif</td>
<td>Performs conditional compilation.</td>
</tr>
<tr>
<td>#else</td>
<td>Performs conditional compilation.</td>
</tr>
<tr>
<td>#endif</td>
<td>Performs conditional compilation.</td>
</tr>
<tr>
<td>#error</td>
<td>Outputs messages to the standard output device and terminates processing.</td>
</tr>
<tr>
<td>#if</td>
<td>Performs conditional compilation.</td>
</tr>
<tr>
<td>#ifdef</td>
<td>Performs conditional compilation.</td>
</tr>
<tr>
<td>#ifndef</td>
<td>Performs conditional compilation.</td>

<tr>
<td>#include</td>
<td>Takes in the specified file.</td>
</tr>
<tr>
<td>#line</td>
<td>Specifies file's line numbers.</td>
</tr>
<tr>
<td>#pragma</td>
<td>Instructs processing for this compiler extended function.</td>
</tr>
<tr>
<td>#undef</td>
<td>Undefines macros.</td>
</tr>
</tbody>
</table>

C.3.2  Preprocess Commands Reference

The NC30 preprocess commands are described in more detail below. They are listed in the order shown in Table C.12.

#assert

Function: Issues a warning if a constant expression results in zero (0).

Format:  

#assert constant expression

Description: Issues a warning if a constant expression results in zero (0). Compile is continued, however.

[Warning(cpp30.82):x.c, line xx]assertion warning
#define

Function: Defines macros.

Format: (1) #define identifier lexical string opt
        (2) #define identifier (identifier list opt) lexical string opt

Description: (1) Defines an identifier as macro.
             (2) Defines an identifier as macro. In this format, do not insert any space or tab
                 between the first identifier and the left parenthesis '('.

The identifier in the following code is replaced by blanks.

```c
#define SYMBOL
```

- When a macro is used to define a function, you can insert a backslash so that the
code can span two or more lines.

- The following are reserved words for the compiler.

```c
_FILE_ ......................................... Name of source file
_LINE_ ......................................... Current source file line No.
_DATE_ ......................................... Date compiled (mm dd yyyy)
_TIME_ ......................................... Time compiled (hh:mm:ss)
```

The following are predefined macros in NC30.

```c
M16C (As for the time of "-R8C" option and -R8CE use, _-_R8C_ _ is defined instead.)
NC30
_NEAR_ (コンパイルオプション-R8C (使用時のみ))
```

- You can use the token string operator '#' and token concatenated operator '##' with
tokens, as shown below.

```c
#define debug(s,t) printf("x"#s" = %d x"#t" = %d",x ## s,x ## t)
```

When parameters are specified for this macro debug (s, t) as debug (1, 2), they are interpreted as
follows:

```c
#define debug(s,t) printf("x1 = %d x2 = %d", x1,x2)
```

- Macro definitions can be nested (to a maximum of 20 levels) as shown below.

```c
#define XYZ1 100
#define XYZ2 XYZ1
   : ...
#define XYZ20 XYZ19
```
#error

Function: Suspects compilation and outputs the message to the standard output device.

Format: `#error character string`

Description: - Suspects compilation.
- Lexical string is found, this command outputs that character string to the standard output device.

#if - #elif - #else - #endif

Function: Performs conditional compilation. (Examines the expression true or false.)

Format:
```
#if constant expression
#elif constant expression
#else
#endif
```

Description: - If the value of the constant is true (not 0), the commands #if and #elif process the program that follows.
- #elif is used in a pair with #if, #ifdef, or #ifndef.
- #else is used in a pair with #if. Do not specify any tokens between #else and the line feed. You can, however, insert a comment.
- #endif indicates the end of the range controlled by #if. Always be sure to enter #endif when using command #if.
- Combinations of #if - #elif - #else - #endif can be nested. There is no set limit to the number of levels of nesting (but it depends on the amount of available memory).
#ifdef - #elif - #else - #endif

Function: Performs conditional compilation. (Examines the macro defined or not.)

Format:

```c
#ifdef identifier
    #elif constant expression
    #else
    #endif
```

Description:

- If an identifier is defined, #ifdef processes the program that follows. You can also describe the following.

```c
#if defined identifier
#elif defined identifier
```

- #else is used in a pair with #ifdef. Do not specify any tokens between #else and the line feed. You can, however, insert a comment.

- #elif is used in a pair with #if, #ifdef, or #ifndef.

- #endif indicates the end of the range controlled by #ifdef. Always be sure to enter #endif when using command #ifdef.

- Combinations of #ifdef - #else - #endif can be nested. There is no set limit to the number of levels of nesting (but it depends on the amount of available memory).
#ifndef - #elif - #else - #endif

Function: Performs conditional compilation. (Examines the macro defined or not.)

Format:

```
#ifndef identifier
  #elif constant expression
  #else
  #endif
```

Description:

- If an identifier isn’t defined, #ifndef processes the program that follows. You can also describe the followings.

```
#ifndef defined identifier
#endif
```

- #else is used in a pair with #ifndef. Do not specify any tokens between #else and the line feed. You can, however, insert a comment.
- #elif is used in a pair with #if, #ifdef, or #ifndef.
- #endif indicates the end of the range controlled by #ifndef. Always be sure to enter #endif when using command #ifndef.
- Combinations of #ifndef - #else - #endif can be nested. There is no set limit to the number of levels of nesting (but it depends on the amount of available memory).
- You cannot use the sizeof operator, cast operator, or variables in a constant expression.
### `#include`

#### Function:
Takes in the specified file.

#### Format:
1. `#include <file name>`
2. `#include "file name"`
3. `#include identifier`

#### Description:
1. Takes in `<file name>` from the directory specified by `nc30`'s command line option `-I`. Searches `<file name>` from the directory specified by environment variable "INC30" if it's not found.
2. Takes in "file name" from the current directory. Searches "file name" from the following directory in sequence if it's not found.
   1. The directory specified by `nc30`'s startup option `-I`.
   2. The directory specified by environment variable "INC30"
3. If the macro-expanded identifier is `<file name>` or "file name" this command takes in that file from the directory according to rules of search [1] or [2].
   - The maximum number of levels of nesting is 40.
   - An include error results if the specified file does not exist.

### `#line`

#### Function:
Changes the line number in the file.

#### Format:
`#line integer  "file name"`

#### Description:
- Specify the line number in the file and the file name.
- You can change the name of the source file and the line No.
#pragma

**Function:**
Instructs the system to process NC30's extended functions.

**Format:**
(1) `#pragma ROM variable name`
(2) `#pragma SBDATA variable name`
(3) `#pragma SECTION predetermined section name, altered section name`
(4) `#pragma STRUCT tag name of structure unpack`
(5) `#pragma STRUCT tag name of structure arrange`
(6) `#pragma EXTMPTR name of pointer`
(7) `#pragma ADDRESS variable name absolute address`
(8) `#pragma BITADDRESS variable name bit position, absolute address`
(9) `#pragma INTCALL int No. assembler function name(register name, register name, ..)`
(10) `#pragma INTCALL int No. C language function name()`
(11) `#pragma INTERRUPT [/B|/E] interrupt handling function name`
(12) `#pragma PARAMETER assembler function name(register name, register name, ..)`
(13) `#pragma SPECIAL special No. function name`
(14) `#pragma ASM`
(15) `#pragma ENDASM`
(16) `#pragma JSRA function name`
(17) `#pragma JARW function name`
(18) `#pragma PAGE`
(19) `#pragma __ASMMACRO function name(register name)`
#pragma

Description:
(1) Facility to arrange in the rom section
(2) Facility to describe variables using SB relative addressing
(3) Facility to alter the section base name
(4) Facility to control the array of structures
(5) Facility to control the array of structures
(6) Facility to declare pointer for access 4M-byte ROM area
(7) Facility to specify absolute addresses for input/output variables
(8) Facility to specify absolute-with bit position addresses for input/output variables
(9) Facility to declare functions using software interrupts
(10) Facility to declare functions using software interrupts
(11) Facility to write interrupt functions
(12) Facility to declare assembler functions passed via register
(13) Facility to declare special page subroutine call functions
(14) Facility to describe inline assembler
(15) Facility to describe inline assembler
(16) Facility to declare functions calling with JSR.A instruction
(17) Facility to declare functions calling with JSR.W instruction
(18) Facility to output .PAGE
(19) Facility to declare Assembler macro function

- You can only specify the above 24 processing functions with #pragma. If you specify a character string or identifier other than the above after #pragma, it will be ignored.
- By default, no warning is output if you specify an unsupported #pragma function. Warnings are only output if you specify the nc30 command line option -Wunknown_pragma (-WUP).
#undef

Function: Nullifies an identifier that is defined as macro.

Format: #undef identifier

Description:
- Nullifies an identifier that is defined as macro.
- The following four identifiers are compiler reserved words. Because these identifiers must be permanently valid, do not undefine them with #undef.

<table>
<thead>
<tr>
<th>Identifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>FILE</em></td>
<td>Name of source file</td>
</tr>
<tr>
<td><em>LINE</em></td>
<td>Current source file line No.</td>
</tr>
<tr>
<td><em>DATE</em></td>
<td>Date compiled (mm dd yyyy)</td>
</tr>
<tr>
<td><em>TIME</em></td>
<td>Time compiled (hh:mm:ss)</td>
</tr>
</tbody>
</table>
C.3.3 Predefined Macros

The following macros are predefined in NC30:

- M16C (As for the time of “-R8C” option and –R8CE option use, _ _R8C_ _ is defined instead.)
- NC30
- __NEAR__(only when the compile option ‘R8C is in use)

C.3.4 Usage of predefined Macros

The predefined macros are used to, for example, use preprocess commands to switch machine-dependent code in non-NC30 C programs.

```c
#define NC30
#pragma ADDRESS port0 2H
#pragma ADDRESS port1 3H
#else
#pragma AD portA = 0x5F
#pragma AD portA = 0x60
#endif
```

Figure C.14 Usage Example of Predefined Macros
Appendix D  C Language Specification Rules

This appendix describes the internal structure and mapping of data processed by NC30, the extended rules for signs in operations, etc., and the rules for calling functions and the values returned by functions.

D.1 Internal Representation of Data

D.1.1 Integral Type

Table D.1 shows the number of bytes used by integral type data

<table>
<thead>
<tr>
<th>Type</th>
<th>Existence of sign</th>
<th>Bit size</th>
<th>Range of values</th>
</tr>
</thead>
<tbody>
<tr>
<td>_Bool</td>
<td>No</td>
<td>8</td>
<td>0, 1</td>
</tr>
<tr>
<td>char</td>
<td>No</td>
<td>8</td>
<td>0 to 255</td>
</tr>
<tr>
<td>signed char</td>
<td>Yes</td>
<td>8</td>
<td>-128 to 127</td>
</tr>
<tr>
<td>wchar_t</td>
<td>No</td>
<td>16</td>
<td>0 to 65535</td>
</tr>
<tr>
<td>int</td>
<td>No</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>short</td>
<td>Yes</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>signed int</td>
<td>No</td>
<td>16</td>
<td>0 to 65535</td>
</tr>
<tr>
<td>signed short</td>
<td>Yes</td>
<td>16</td>
<td>-32768 to 32767</td>
</tr>
<tr>
<td>unsigned int</td>
<td>No</td>
<td>32</td>
<td>-2147483648 to 2147483647</td>
</tr>
<tr>
<td>unsigned long</td>
<td>Yes</td>
<td>32</td>
<td>0 to 4294967295</td>
</tr>
<tr>
<td>long</td>
<td>No</td>
<td>64</td>
<td>-9223372036854775808 to 9223372036854775807</td>
</tr>
<tr>
<td>signed long</td>
<td>Yes</td>
<td>64</td>
<td>0 to 4294967295</td>
</tr>
<tr>
<td>long long</td>
<td>No</td>
<td>64</td>
<td>18446744073709551615</td>
</tr>
<tr>
<td>near pointer</td>
<td>No</td>
<td>32</td>
<td>0 to 0xFFFF</td>
</tr>
<tr>
<td>far pointer</td>
<td>No</td>
<td>32</td>
<td>0 to 0xFFFFFFFF</td>
</tr>
</tbody>
</table>

- The _Bool type can not specify to sign.
- If a char type is specified with no sign, it is processed as an unsigned char type.
- If an int or short type is specified with no sign, it is processed as a signed int or signed short type.
- If a long type is specified with no sign, it is processed as a sign long type.
- If a long long type is specified with no sign, it is processed as a sign long long type.
- If the bit field members of a structure are specified with no sign, they are processed as unsigned.
- Can not specifies bit-fields of long long type.
D.1.2 Floating Type

Table D.2 shows the number of bytes used by floating type data.

<table>
<thead>
<tr>
<th>Type</th>
<th>Existence of sign</th>
<th>Bit Size</th>
<th>Range of values</th>
</tr>
</thead>
<tbody>
<tr>
<td>float</td>
<td>Yes</td>
<td>32</td>
<td>1.17549435e-38F to 3.40282347e+38F</td>
</tr>
<tr>
<td>double</td>
<td>Yes</td>
<td>64</td>
<td>2.2250738585072014e-30 to 1.7976931348623157e+30</td>
</tr>
<tr>
<td>long double</td>
<td>Yes</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

NC30's floating-point format conforms to the format of IEEE (Institute of Electrical and Electronics Engineers) standards. The following shows the single precision and double precision floating-point formats.

1. Single-precision floating point data format

Figure D.1 shows the format for binary floating point (float) data.

![Single-precision floating point data format](image)

2. Double-precision floating point data format

Figure D.2 shows the format for binary floating point (double and long double) data.

![Double-precision floating point data format](image)
D.1.3 Enumerator Type

Enumerators have the same internal representation as unsigned int types. Unless otherwise specified, integers 0, 1, 2, are applied in the order in which the members appear. Note that you can also use the nc30 command line option -fchar Enumerator (-fCE) to force enumerator types to have the same internal representation as unsigned char types.

D.1.4 Pointer Type

Table D.3 shows the number of bytes used by pointer type data.

<table>
<thead>
<tr>
<th>Type</th>
<th>Existence of Sign</th>
<th>Bit Size</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>near pointers</td>
<td>None</td>
<td>16</td>
<td>0 to 0xFFFF</td>
</tr>
<tr>
<td>far pointers</td>
<td>None</td>
<td>32</td>
<td>0 to 0xFFFFF</td>
</tr>
</tbody>
</table>

Note that only the least significant 20 bits of the 32 bits of far pointers are valid.

D.1.5 Array Types

Array types are mapped contiguously to an area equal to the product of the size of the elements (in bytes) and the number of elements. They are mapped to memory in the order in which the elements appear. Figure D.3 is an example of mapping.
D.1.6 Structure types

Structure types are mapped contiguously in the order of their member data. Figure D.4 is an example of mapping.

![Figure D.4 Example of Placement of Structure (1)](image)

Normally, there is no word alignment with structures. The members of structures are mapped contiguously. To use word alignment, use the #pragma STRUCT extended function. #pragma STRUCT adds a byte of padding if the total size of the members is odd. Figure D.5 is an example of mapping.

![Figure D.5 Example of Placement of Structure (2)](image)
D.1.7 Unions

Unions occupy an area equal to the maximum data size of their members. Figure D.6 is an example of mapping.

![Diagram of union placement](image)

Figure D.6 Example of Placement of Union

D.1.8 Bitfield Types

Bitfield types are mapped from the least significant bit. Figure D.7 is an example of mapping.

![Diagram of bitfield placement](image)

Figure D.7 Example of Placement of Bitfield (1)
If a bitfield member is of a different data type, it is mapped to the next address. Thus, members of the same data type are mapped contiguously from the lowest address to which that data type is mapped.

Note:

1. If no sign is specified, the default bitfield member type is unsigned.
2. Can not specifies bit-fields of long long type.
D.2 Sign Extension Rules

Under the ANSI and other standard C language specifications, char type data is sign extended to int type data for calculations, etc. This specification prevents the maximum value for char types being exceeded with unexpected results when performing the char type calculation shown in Figure D.9

```c
void func(void)
{
    char c1, c2, c3;
    c1 = c2 * 2 / c3;
}
```

Figure D.9 Example of C Program

To generate code that maximizes code efficiency and maximizes speed, NC30 does not, by default, extend char types to int types. The default can, however, be overridden using the nc30 compile driver command line option `fansi` or `fextend_to_int` to achieve the same sign extension as in standard C.

If you do not use the `fansi` or `fextend_to_int` option and your program assigns the result of a calculation to a char type, as in Figure D.9 make sure that the maximum or minimum\(^1\) value for a char type does not result in an overflow in the calculation.

---

\(^1\) The ranges of values that can be expressed as char types in NC30 are as follows:
- unsigned char type: 0 - 255
- signed char type: -128 - 127
D.3 Function Call Rules

D.3.1 Rules of Return Value

When returning a return value from a function, the system uses a register to return that value for the integer, pointer, and floating-point types. Table D.4 shows rules on calls regarding return values.

<table>
<thead>
<tr>
<th>Type of Return Value</th>
<th>Rules</th>
</tr>
</thead>
<tbody>
<tr>
<td>char, _Bool</td>
<td>R0L Register</td>
</tr>
<tr>
<td>int, near pointer</td>
<td>R0 Register</td>
</tr>
<tr>
<td>float, long pointer</td>
<td>Least significant 16 bits returned by storing in R0 register. Most significant 16 bits returned by storing in R2 register.</td>
</tr>
<tr>
<td>double, long double</td>
<td>Values are stored in 16 bits beginning with the high-order bits sequentially in order of registers R3, R2, R1, and R0 as they are returned.</td>
</tr>
<tr>
<td>long</td>
<td>Values are stored in 16 bits beginning with the high-order bits sequentially in order of registers R3, R1, R2, and R0 as they are returned.</td>
</tr>
<tr>
<td>Structure Type</td>
<td>Immediately before the function call, save the far address for the area for storing the return value to the stack. Before execution returns from the called function, that function writes the return value to the area indicated by the far address saved to the stack.</td>
</tr>
<tr>
<td>Union Type</td>
<td></td>
</tr>
</tbody>
</table>

D.3.2 Rules on Argument Transfer

NC30 uses registers or stack to pass arguments to a function.

1. Passing arguments via register

When the conditions below are met, the system uses the corresponding "Registers Used" listed in Table D.5 and Table D.6 to pass arguments.

- Function is prototype declared and the type of argument is known when calling the function.
- Variable argument "..." is not used in prototype declaration.
- For the type of the argument of a function, the Argument and Type of Argument in Table D.5 and Table D.6 are matched.

<table>
<thead>
<tr>
<th>Argument</th>
<th>First Argument</th>
<th>Registers Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>First argument</td>
<td>char type, _Bool type</td>
<td>R0L register</td>
</tr>
<tr>
<td></td>
<td>int type</td>
<td>R0L register</td>
</tr>
<tr>
<td></td>
<td>near pointer type</td>
<td>R0 register</td>
</tr>
</tbody>
</table>

1 NC30 uses a via-register transfer only when entering prototype declaration (i.e., when writing a new format). Consequently, all arguments are passed via stack when description of K&R format is entered (description of old format). Note also that if a description format where prototype declaration is entered for the function (new format) and a description of the K&R format (old format) coexist in given statement, the system may fail to pass arguments to the function correctly, for reasons of language specifications of the C language.

Therefore, we recommends using a prototype declaring description format as the standard format to write the C language source files for NC30.
### Table D.6 Rules on Argument Transfer via Register (NC30)

<table>
<thead>
<tr>
<th>Argument</th>
<th>First Argument</th>
<th>Registers Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>First argument</td>
<td>char type, _Bool type</td>
<td>R1L register</td>
</tr>
<tr>
<td></td>
<td>int type</td>
<td>R1 register</td>
</tr>
<tr>
<td></td>
<td>near pointer type</td>
<td>R2 register</td>
</tr>
<tr>
<td>Second argument</td>
<td>int type</td>
<td>R2 register</td>
</tr>
<tr>
<td></td>
<td>near pointer type</td>
<td>R2 register</td>
</tr>
</tbody>
</table>

(2) **Passing arguments via stack**

All arguments that do not satisfy the register transfer requirements are passed via stack. The Table D.7 and Table D.8 summarize the methods used to pass arguments.

### Table D.7 Rules on Passing Arguments to Function (NC308)

### D.3.3 Rules for Converting Functions into Assembly Language Symbols

The function names in which functions are defined in a C language source file are used as the start labels of functions in an assembler source file.

The start label of a function in an assembler source file consists of the function name in the C language source file prefixed by _ (underbar) or $ (dollar).

The table below lists the character strings that are added to a function name and the conditions under which they are added.

### Table D.9 Conditions Under Which Character Strings Are Added to Function

<table>
<thead>
<tr>
<th>Added character string</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>$ (dollar)</td>
<td>Functions where any one of arguments is passed via register</td>
</tr>
<tr>
<td>_ (underbar)</td>
<td>Functions that do not belong to the above¹</td>
</tr>
</tbody>
</table>

¹ However, function names are not output for the functions that are specified by #pragma INTCALL.
The compile result of the above sample program is shown in the next page. Figure D.11 shows the compile result of program part[2] that defines function func_proto. Figure D.12 shows the compile result of program part[3] that defines function func_no_proto. Figure D.13 shows the compile result of program part[4] that calls function func_proto and function func_no_proto.
### Figure D.11 Compile Result of Sample Program (sample.c) (1)

In the compile result (1) of the sample program (sample.c) listed in Figure D.10, the first and second arguments are passed via a register since function func_proto is prototype declared. The third argument is passed via a stack since it is not subject to via-register transfer.

Furthermore, since the arguments of the function are passed via register, the symbol name of the function's start address is derived from "func_proto" described in the C language source file by prefixing it with $ (dollar), hence, "$func_proto."
Figure D.12 Compile Result of Sample Program (sample.c) (2)

In the compile result (2) of the sample program (sample.c) listed in Figure D.10, all arguments are passed via a stack since function func_no_proto is written in K&R format. Furthermore, since the arguments of the function are not passed via register, the symbol name of the function's start address is derived from "func_no_proto" described in the C language source file by prefixing it with _ (underbar), hence, "_func_no_proto."
Figure D.13 Compile Result of Sample Program (sample.c) (3)

Figure D.13, part[13] calls func_proto and part[14] calls func_no_proto.
D.3.4 Interface between Functions

Figure D.16 to D.18 show the stack frame structuring and release processing for the program shown in Figure D.14. Figure D.15 shows the assembly language program that is produced when the program shown in Figure D.14 is compiled.

```c
int func( int, int, int );

void main(void)
{
    int i = 0x1234; ← Argument to func
    int j = 0x5678; ← Argument to func
    int k = 0x9abc; ← Argument to func
    k = func( i, j, k );
}

int func( int x, int y, int z )
{
    int sum;
    sum = 0;
    sum = x + y + z ;
    return sum; ← Return value to main
}
```

Figure D.14 Example of C Language Sample Program
```assembly
:function main
.frame AUTO ( k) size 2, offset -6
.frame AUTO ( j) size 2, offset -4
.frame AUTO ( i) size 2, offset -2
.arg size(0) auto size(6) context size(5)

.section program, CODE, ALIGN
.align
.file 'sample.c'
.line 4
.glob _main
.main:
  enter #06H
  int i = 0x1234;
  mov.w #1234H,-2[FB] ; i
  int j = 0x5678;
  mov.w #5678H,-4[FB] ; j
  int k = 0x9abc;
  mov.w #9abcH,-6[FB] ; k
  k = func( i, j, k);
  push.w -6[FB] ; k
  mov.w -4[FB],R2 ; j
  mov.w -2[FB],R1 ; i
  jsr $func
  add.l #02H,SP
  mov.w R0,-2[FB] ; k
.exitd

.end

figure D.15 Assembly language sample program (1)
```assembly
FUNCTION func

FRAME AUTO (  sum) size 2, offset -6
FRAME AUTO (  y) size 2, offset -4
FRAME AUTO (  x) size 2, offset -2
FRAME ARG (  z) size 2, offset 5
REGISTER ARG (  x) size 2, REGISTER R1
REGISTER ARG (  y) size 2, REGISTER R2
ARG Size(2) Auto Size(6) Context Size(5)

.align
.line 13

C_SRC : {
.glb $func

$func:
.enter #06H
movw R1,-2[FB] ;  x x
movw R2,-4[FB] ;  y y

C_SRC :  sum=0;
movw #0000H,-6[FB] ;  sum
.line 17
C_SRC :  sum = x + y + z;
movw -2[FB],R0 ;  x
addw -4[FB],R0 ;  y
addw 5[FB],R0 ;  z
movw R0,-6[FB] ;  sum
.line 18
C_SRC :  return sum;
movw -6[FB],R0 ;  sum
.exitd

E2:
.END
```

Figure D.16 Assembly language sample program (2)
Figure D.16 to D.18 below show stack and register transitions in each processing in Figure D.15. Processing in[1], [2](entry processing of function main) is shown in Figure D.16. Processing[3], [4], [5], [6], [7](processing to call function func and construct stack frames used in function func) is shown in Figure D.17. Processing[8], [9], [10], [11](processing to return from function func to function main) is shown in Figure D.18.

Figure D.17 Entry processing of function main
Figure D.18  Calling Function func and Entry Processing
Figure D.19  Exit Processing of Function func
### D.4 Securing auto Variable Area

Variables of storage class auto are placed in the stack of the micro processor. For a C language source file like the one shown in Figure D.20, if the areas where variables of storage class auto are valid do not overlap each other, the system allocates only one area which is then shared between multiple variables.

```
void func(void)
{
    int i, j, k;

    for( i=0 ; i<=0 ; i++ )
    {
        process
    }  // scope of i

    for( j=0xFF ; j<=0 ; j-- )
    {
        process
    }  // scope of j

    for( k=0 ; k<=0 ; k++ )
    {
        process
    }  // scope of k
}
```

**Figure D.20 Example of C Program**

In this example, the effective ranges of three auto variables i, j, and k do not overlap, so that a two-byte area (offset 1 from FB) is shared. Figure D.21 shows an assembly language source file generated by compiling the program in Figure D.20.
As shown by [1], [2], and [3], the three auto variables share the FB offset -2 area.

Figure D.21 Example of Assembly Language Source Program

D.5 Rules of Escaping of the Register

The rules of Escaping of the register when call C function as follows:

1. The rules of Escaping of the register when call C function as follows:
   - Register which use in called C function

2. Register which should escaping in the entrance procedure of the called function.
   - None
Appendix E  Standard Library

E.1  Standard Header Files

When using the NC30 standard library, you must include the header file that defines that function. This appendix details the functions and specifications of the standard NC30 header files.

E.1.1  Contents of Standard Header Files

NC30 includes the 15 standard header files shown in Table E.1.

Table E.1  List of Standard Header Files

<table>
<thead>
<tr>
<th>Header File Name</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>assert.h</td>
<td>Outputs the program's diagnostic information.</td>
</tr>
<tr>
<td>ctype.h</td>
<td>Declares character determination function as macro.</td>
</tr>

E.1.2 Standard Header Files Reference

Following are detailed descriptions of the standard header files supplied with NC30. The header files are presented in alphabetical order.
The NC30 standard functions declared in the header files and the macros defining the limits of numerical expression of data types are described with the respective header files.

**assert.h**

Function: Defines assert function.

**ctype.h**

Function: Defines/declares string handling function. The following lists string handling functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>isalnum</td>
<td>Checks whether the character is an alphabet or numeral.</td>
</tr>
<tr>
<td>isalpha</td>
<td>Checks whether the character is an alphabet.</td>
</tr>
<tr>
<td>iscntrl</td>
<td>Checks whether the character is a control character.</td>
</tr>
<tr>
<td>isdigit</td>
<td>Checks whether the character is a numeral.</td>
</tr>
<tr>
<td>isgraph</td>
<td>Checks whether the character is printable (except a blank).</td>
</tr>
<tr>
<td>islower</td>
<td>Checks whether the character is a lower-case letter.</td>
</tr>
<tr>
<td>isprint</td>
<td>Checks whether the character is printable (including a blank).</td>
</tr>
<tr>
<td>ispunct</td>
<td>Checks whether the character is a punctuation character.</td>
</tr>
<tr>
<td>isspace</td>
<td>Checks whether the character is a blank, tab, or new line.</td>
</tr>
<tr>
<td>isupper</td>
<td>Checks whether the character is an upper-case letter.</td>
</tr>
<tr>
<td>isxdigit</td>
<td>Checks whether the character is a hexadecimal character.</td>
</tr>
<tr>
<td>tolower</td>
<td>Converts the character from an upper-case to a lower-case.</td>
</tr>
<tr>
<td>toupper</td>
<td>Converts the character from a lower-case to an upper-case.</td>
</tr>
</tbody>
</table>

**errno.h**

Function: Defines error number.
Function: float.h

Defines the limits of internal representation of floating point values. The following lists the macros that define the limits of floating point values.

In NC30, long double types are processed as double types. Therefore, the limits applying to double types also apply to long double types.

<table>
<thead>
<tr>
<th>Macro name</th>
<th>Contents</th>
<th>Defined value</th>
</tr>
</thead>
<tbody>
<tr>
<td>DBL_DIG</td>
<td>Maximum number of digits of double-type decimal precision</td>
<td>15</td>
</tr>
<tr>
<td>DBL_EPSILON</td>
<td>Minimum positive value where 1.0+DBL_EPSILON is found not to be 1.0</td>
<td>2.2204460492503131e-16</td>
</tr>
<tr>
<td>DBL_MANT_DIG</td>
<td>Maximum number of digits in the mantissa part when a double-type floating-point value is matched to the radix in its representation</td>
<td>53</td>
</tr>
<tr>
<td>DBL_MAX</td>
<td>Maximum value that a double-type variable can take on as value</td>
<td>1.7976931348623157e+308</td>
</tr>
<tr>
<td>DBL_MAX_10_EXP</td>
<td>Maximum value of the power of 10 that can be represented as a double-type floating-point numeric value</td>
<td>308</td>
</tr>
<tr>
<td>DBL_MAX_EXP</td>
<td>Maximum value of the power of the radix that can be represented as a double-type floating-point numeric value</td>
<td>1024</td>
</tr>
<tr>
<td>DBL_MIN</td>
<td>Minimum value that a double-type variable can take on as value</td>
<td>2.2250738585072014e-308</td>
</tr>
<tr>
<td>DBL_MIN_10_EXP</td>
<td>Minimum value of the power of 10 that can be represented as a double-type floating-point numeric value</td>
<td>-307</td>
</tr>
<tr>
<td>DBL_MIN_EXP</td>
<td>Minimum value of the power of the radix that can be represented as a double-type floating-point numeric value</td>
<td>-1021</td>
</tr>
<tr>
<td>FLT_DIG</td>
<td>Maximum number of digits of float-type decimal precision</td>
<td>6</td>
</tr>
<tr>
<td>FLT_EPSILON</td>
<td>Minimum positive value where 1.0+FLT_EPSILON is found not to be 1.0</td>
<td>1.19209290e-07F</td>
</tr>
<tr>
<td>FLT_MANT_DIG</td>
<td>Maximum number of digits in the mantissa part when a float-type floating-point value is matched to the radix in its representation</td>
<td>24</td>
</tr>
<tr>
<td>FLT_MAX</td>
<td>Maximum value that a float-type variable can take on as value</td>
<td>3.40282347e+38F</td>
</tr>
<tr>
<td>FLT_MAX_10_EXP</td>
<td>Maximum value of the power of 10 that can be represented as a float-type floating-point numeric value</td>
<td>38</td>
</tr>
<tr>
<td>FLT_MAX_EXP</td>
<td>Maximum value of the power of the radix that can be represented as a float-type floating-point numeric value</td>
<td>128</td>
</tr>
<tr>
<td>FLT_MIN</td>
<td>Minimum value that a float-type variable can take on as value</td>
<td>1.17549435e-38F</td>
</tr>
<tr>
<td>FLT_MIN_10_EXP</td>
<td>Minimum value of the power of 10 that can be represented as a float-type floating-point numeric value</td>
<td>-37</td>
</tr>
<tr>
<td>FLT_MIN_EXP</td>
<td>Maximum value of the power of the radix that can be represented as a float-type floating-point numeric value</td>
<td>-125</td>
</tr>
<tr>
<td>FLT_RADIX</td>
<td>Radix of exponent in floating-point representation</td>
<td>2</td>
</tr>
<tr>
<td>FLT_ROUNDS</td>
<td>Method of rounding off a floating-point number</td>
<td>(Rounded to the nearest whole number)</td>
</tr>
</tbody>
</table>
### limits.h

Defines the limitations applying to the internal processing of the compiler. The following lists the macros that define these limits.

<table>
<thead>
<tr>
<th>Macro name</th>
<th>Contents</th>
<th>Defined value</th>
</tr>
</thead>
<tbody>
<tr>
<td>MB_LEN_MAX</td>
<td>Maximum value of the number of multibyte character type bytes</td>
<td>1</td>
</tr>
<tr>
<td>CHAR_BIT</td>
<td>Number of char-type bits</td>
<td>8</td>
</tr>
<tr>
<td>CHAR_MAX</td>
<td>Maximum value that a char-type variable can take on as value</td>
<td>255</td>
</tr>
<tr>
<td>CHAR_MIN</td>
<td>Minimum value that a char-type variable can take on as value</td>
<td>0</td>
</tr>
<tr>
<td>SCHAR_MAX</td>
<td>Maximum value that a signed char-type variable can take on as value</td>
<td>127</td>
</tr>
<tr>
<td>SCHAR_MIN</td>
<td>Minimum value that a signed char-type variable can take on as value</td>
<td>-128</td>
</tr>
<tr>
<td>INT_MAX</td>
<td>Maximum value that a int-type variable can take on as value</td>
<td>32767</td>
</tr>
<tr>
<td>INT_MIN</td>
<td>Minimum value that a int-type variable can take on as value</td>
<td>-32768</td>
</tr>
<tr>
<td>SHRT_MAX</td>
<td>Maximum value that a short int-type variable can take on as value</td>
<td>32767</td>
</tr>
<tr>
<td>SHRT_MIN</td>
<td>Minimum value that a short int-type variable can take on as value</td>
<td>-32768</td>
</tr>
<tr>
<td>LONG_MAX</td>
<td>Maximum value that a long-type variable can take on as value</td>
<td>2147483647</td>
</tr>
<tr>
<td>LONG_MIN</td>
<td>Minimum value that a long-type variable can take on as value</td>
<td>-2147483648</td>
</tr>
<tr>
<td>LLONG_MAX</td>
<td>Maximum value that a signed long long-type variable can take on as value</td>
<td>9223372036854775807</td>
</tr>
<tr>
<td>LLONG_MIN</td>
<td>Minimum value that a signed long long-type variable can take on as value</td>
<td>-9223372036854775808</td>
</tr>
<tr>
<td>UCHAR_MAX</td>
<td>Maximum value that an unsigned char-type variable can take on as value</td>
<td>255</td>
</tr>
<tr>
<td>UINT_MAX</td>
<td>Maximum value that an unsigned int-type variable can take on as value</td>
<td>65535</td>
</tr>
<tr>
<td>USHRT_MAX</td>
<td>Maximum value that an unsigned short int-type variable can take on as value</td>
<td>65535</td>
</tr>
<tr>
<td>ULONG_MAX</td>
<td>Maximum value that an unsigned long int-type variable can take on as value</td>
<td>4294967295</td>
</tr>
<tr>
<td>ULLONG_MAX</td>
<td>Maximum value that an unsigned long long int-type variable can take on as value</td>
<td>18446744073709551615</td>
</tr>
</tbody>
</table>
locale.h

Function: Defines declares macros and functions that manipulate program localization. The following lists locale functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>localeconv</td>
<td>Initializes struct lconv.</td>
</tr>
<tr>
<td>setlocale</td>
<td>Sets and searches the locale information of a program.</td>
</tr>
</tbody>
</table>

math.h

Function: Declares prototype of mathematical function. The following lists mathematical functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>acos</td>
<td>Calculates arc cosine.</td>
</tr>
<tr>
<td>asin</td>
<td>Calculates arc sine.</td>
</tr>
<tr>
<td>atan</td>
<td>Calculates arc tangent.</td>
</tr>
<tr>
<td>atan2</td>
<td>Calculates arc tangent.</td>
</tr>
<tr>
<td>ceil</td>
<td>Calculates an integer carry value.</td>
</tr>
<tr>
<td>cos</td>
<td>Calculates cosine.</td>
</tr>
<tr>
<td>cosh</td>
<td>Calculates hyperbolic cosine.</td>
</tr>
<tr>
<td>exp</td>
<td>Calculates exponential function.</td>
</tr>
<tr>
<td>fabs</td>
<td>Calculates the absolute value of a double-precision floating-point number.</td>
</tr>
<tr>
<td>floor</td>
<td>Calculates an integer borrow value.</td>
</tr>
<tr>
<td>fmod</td>
<td>Calculates the remainder.</td>
</tr>
<tr>
<td>frexp</td>
<td>Divides floating-point number into mantissa and exponent parts.</td>
</tr>
<tr>
<td>labs</td>
<td>Calculates the absolute value of a long-type integer.</td>
</tr>
<tr>
<td>ldexp</td>
<td>Calculates the power of a floating-point number.</td>
</tr>
<tr>
<td>log</td>
<td>Calculates natural logarithm.</td>
</tr>
<tr>
<td>log10</td>
<td>Calculates common logarithm.</td>
</tr>
<tr>
<td>modf</td>
<td>Calculates the division of a real number into the mantissa and exponent parts.</td>
</tr>
<tr>
<td>pow</td>
<td>Calculates the power of a number.</td>
</tr>
<tr>
<td>sin</td>
<td>Calculates sine.</td>
</tr>
<tr>
<td>sinh</td>
<td>Calculates hyperbolic sine.</td>
</tr>
<tr>
<td>sqrt</td>
<td>Calculates the square root of a numeric value.</td>
</tr>
<tr>
<td>tan</td>
<td>Calculates tangent.</td>
</tr>
<tr>
<td>tanh</td>
<td>Calculates hyperbolic tangent.</td>
</tr>
</tbody>
</table>

mathf.h

Function: Includes math.h and defines a macro that validates single-precision mathematical functions.
### setjmp.h

**Function:**
Defines the structures used in branch functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>longjmp</td>
<td>Performs a global jump.</td>
</tr>
<tr>
<td>setjmp</td>
<td>Sets a stack environment for a global jump.</td>
</tr>
</tbody>
</table>

### signal.h

**Function:**
Defines/declares necessary for processing asynchronous interrupts.

###stdarg.h

**Function:**
Defines/declares the functions which have a variable number of real arguments.

###stddef.h

**Function:**
Defines the macro names which are shared among standard include files.
Function: Defines the FILE structure, stream name, and declares I/O function prototypes. Prototype declarations are made for the following functions.

<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialize</td>
<td>init</td>
<td>Initializes R8C family input/outputs.</td>
</tr>
<tr>
<td></td>
<td>clearerr</td>
<td>Initializes (clears) error status specifiers.</td>
</tr>
<tr>
<td>Input</td>
<td>fgets</td>
<td>Inputs one character from the stream.</td>
</tr>
<tr>
<td></td>
<td>getc</td>
<td>Inputs one character from the stream.</td>

### time.h

**Function:** Declares the functions necessary to indicate the current calendar time and defines the type.
E.2 Standard Function Reference

Describes the features and detailed specifications of the standard function library of the compiler.

E.2.1 Overview of Standard Library

NC30 provides a standard function library covering most functions. These functions are classified into the following categories.

1. **String Handling Functions**
   Functions to copy and compare character strings, etc.

2. **Character Handling Functions**
   Functions to judge letters and decimal characters, etc., and to covert uppercase to lowercase and vice-versa.

3. **I/O Functions**
   Functions to input and output characters and character strings. These include functions for formatted I/O and character string manipulation.

4. **Memory Management Functions**
   Functions for dynamically securing and releasing memory areas.

5. **Memory Manipulation Functions**
   Functions to copy, set, and compare memory areas.

6. **Execution Control Functions**
   Functions to execute and terminate programs, and for jumping from the currently executing function to another function.

7. **Mathematical Functions**
   * These functions require time.
   - Therefore, pay attention to the use of the watchdog timer.

8. **Integer Arithmetic Functions**
   Functions for performing calculations on integer values.

9. **Character String Value Convert Functions**
   Functions for converting character strings to numerical values.

10. **Multi-byte Character and Multi-byte Character String Manipulate Functions**
    Functions for processing multi-byte characters and multi-byte character strings.

11. **Locale Functions**
    Locale-related functions.
E.2.2 List of Standard Library Functions by Function

a. String Handling Functions

The following lists String Handling Functions.

<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy</td>
<td>strcpy</td>
<td>Copies a character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strncpy</td>
<td>Copies a character string (‘n’ characters).</td>
<td></td>
</tr>
<tr>
<td>Concatenate</td>
<td>strcat</td>
<td>Concatenates character strings.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strncat</td>
<td>Concatenates character strings (‘n’ characters).</td>
<td></td>
</tr>
<tr>
<td>Compare</td>
<td>strcmp</td>
<td>Compares character strings.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strcoll</td>
<td>Compares character strings (using locale information).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>stricmp</td>
<td>Compares character strings. (All alphabets are handled as upper-case letters.)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strncmp</td>
<td>Compares character strings (‘n’ characters).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strnicmp</td>
<td>Compares character strings (‘n’ characters).  (All alphabets are handled as upper-case letters.)</td>
<td></td>
</tr>
<tr>
<td>Search</td>
<td>strchr</td>
<td>Searches the specified character beginning with the top of the character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strspn</td>
<td>Calculates the length (number) of unspecified characters that are not found in the other character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strpbrk</td>
<td>Searches the specified character in a character string from the other character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strrchr</td>
<td>Searches the specified character from the end of a character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strspn</td>
<td>Calculates the length (number) of specified characters that are found in the other character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strstr</td>
<td>Searches the specified character from a character string.</td>
<td></td>
</tr>
<tr>
<td>Length</td>
<td>strlen</td>
<td>Calculates the number of characters in a character string.</td>
<td></td>
</tr>
<tr>
<td>Convert</td>
<td>strerror</td>
<td>Converts an error number into a character string.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>strxfrm</td>
<td>Converts a character string (using locale information).</td>
<td></td>
</tr>
</tbody>
</table>

* Several standard functions use global variables that are specific to that function. If, while that function is called and is being executed, an interrupt occurs and that same function is called by the interrupt processing program, the global variables used by the function when first called may be overwritten. This does not occur to global variables of functions with reentrancy (indicated by a ○ in the table). However, if the function does not have reentrancy (indicated by a X in the table), care must be taken if the function is also used by an interrupt processing program.
b. Character Handling Functions

The following lists character handling functions.

Table E.3 Character Handling Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>isalnum</td>
<td>Checks whether the character is an alphabet or numeral.</td>
<td>○</td>
</tr>
<tr>
<td>isalpha</td>
<td>Checks whether the character is an alphabet.</td>
<td>○</td>
</tr>
<tr>
<td>isntrl</td>
<td>Checks whether the character is a control character.</td>
<td>○</td>
</tr>
<tr>
<td>isdigit</td>
<td>Checks whether the character is a numeral.</td>
<td>○</td>
</tr>
<tr>
<td>isgraph</td>
<td>Checks whether the character is printable (except a blank).</td>
<td>○</td>
</tr>
<tr>
<td>islower</td>
<td>Checks whether the character is a lower-case letter.</td>
<td>○</td>
</tr>
<tr>
<td>isprint</td>
<td>Checks whether the character is printable (including a blank).</td>
<td>○</td>
</tr>
<tr>
<td>ispunct</td>
<td>Checks whether the character is a punctuation character.</td>
<td>○</td>
</tr>
<tr>
<td>isspace</td>
<td>Checks whether the character is a blank, tab, or new line.</td>
<td>○</td>
</tr>
<tr>
<td>isupper</td>
<td>Checks whether the character is an upper-case letter.</td>
<td>○</td>
</tr>
<tr>
<td>isxdigit</td>
<td>Checks whether the character is a hexadecimal character.</td>
<td>○</td>
</tr>
<tr>
<td>tolower</td>
<td>Converts the character from an upper-case to a lower-case.</td>
<td>○</td>
</tr>
<tr>
<td>toupper</td>
<td>Converts the character from a lower-case to an uppercase.</td>
<td>○</td>
</tr>
</tbody>
</table>
c. **Input/Output Functions**

The following lists Input/Output functions.

<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialize</td>
<td>_init</td>
<td>Initializes M16C Series's input/outputs.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>clearerror</td>
<td>Initializes (clears) error status specifiers.</td>
<td>x</td>
</tr>
<tr>
<td>Initialize</td>
<td>fgetc</td>
<td>Inputs one character from the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>getc</td>
<td>Inputs one character from the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>getchar</td>
<td>Inputs one character from stdin.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fgets</td>
<td>Inputs one line from the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>gets</td>
<td>Inputs one line from stdin.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fread</td>
<td>Inputs the specified items of data from the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>scanf</td>
<td>Inputs characters with format from stdin.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fscanf</td>
<td>Inputs characters with format from the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>sscanf</td>
<td>Inputs data with format from a character string.</td>
<td>x</td>
</tr>
<tr>
<td>Output</td>
<td>fputc</td>
<td>Outputs one character to the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>putc</td>
<td>Outputs one character to the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>putchar</td>
<td>Outputs one character to stdout.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fputs</td>
<td>Outputs one line to the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>puts</td>
<td>Outputs one line to stdout.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fwrite</td>
<td>Outputs the specified items of data to the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>perror</td>
<td>Outputs an error message to stdout.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>printf</td>
<td>Outputs characters with format to stdout.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fflush</td>
<td>Flushes the stream of an output buffer.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>fprintf</td>
<td>Outputs characters with format to the stream.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>sprintf</td>
<td>Writes text with format to a character string.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>vfprintf</td>
<td>Output to a stream with format.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>vprintf</td>
<td>Output to stdout with format.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>vsprintf</td>
<td>Output to a buffer with format.</td>
<td>x</td>
</tr>
<tr>
<td>Return</td>
<td>ungetc</td>
<td>Sends one character back to the input stream.</td>
<td>x</td>
</tr>
<tr>
<td>Determination</td>
<td>ferror</td>
<td>Checks input/output errors.</td>
<td>x</td>
</tr>
<tr>
<td></td>
<td>feof</td>
<td>Checks EOF (End of File).</td>
<td>x</td>
</tr>
</tbody>
</table>
d. Memory Management Functions

The following lists memory management functions.

Table E.5 Memory Management Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>calloc</td>
<td>Allocates a memory area and initializes it to zero (0).</td>
<td>×</td>
</tr>
<tr>
<td>free</td>
<td>Frees the allocated memory area.</td>
<td>×</td>
</tr>
<tr>
<td>malloc</td>
<td>Allocates a memory area.</td>
<td>×</td>
</tr>
<tr>
<td>realloc</td>
<td>Changes the size of an allocated memory area.</td>
<td>×</td>
</tr>
</tbody>
</table>

e. Memory Handling Functions

The following lists memory handling functions.

Table E.6 Memory Handling Functions

<table>
<thead>
<tr>
<th>Type</th>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initialize</td>
<td>bzero</td>
<td>Initializes a memory area (by clearing it to zero).</td>
<td>○</td>
</tr>
<tr>
<td>Copy</td>
<td>bcopy</td>
<td>Copies characters from a memory area to another.</td>
<td>○</td>
</tr>
<tr>
<td></td>
<td>memcpy</td>
<td>Copies characters (n bytes) from a memory area to another.</td>
<td>○</td>
</tr>
<tr>
<td></td>
<td>memset</td>
<td>Set a memory area by filling with characters.</td>
<td>○</td>
</tr>
<tr>
<td>Compare</td>
<td>memset</td>
<td>Compares memory areas (n bytes).</td>
<td>○</td>
</tr>
<tr>
<td></td>
<td>memcmp</td>
<td>Compares memory areas (with alphabets handled as uppercase letters).</td>
<td>○</td>
</tr>
<tr>
<td>Move</td>
<td>memmove</td>
<td>Moves the area of a character string.</td>
<td>○</td>
</tr>
<tr>
<td>Search</td>
<td>memchr</td>
<td>Searches a character from a memory area.</td>
<td>○</td>
</tr>
</tbody>
</table>

f. Execution Control Functions

The following lists execution control functions.

Table E.7 Execution Control Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>abort</td>
<td>Terminates the execution of the program.</td>
<td>○</td>
</tr>
<tr>
<td>longjmp</td>
<td>Performs a global jump.</td>
<td>○</td>
</tr>
<tr>
<td>setjmp</td>
<td>Sets a stack environment for a global jump.</td>
<td>○</td>
</tr>
</tbody>
</table>
g. Mathematical Functions

The following lists mathematical functions.

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>acos</td>
<td>Calculates arc cosine.</td>
<td>○</td>
</tr>
<tr>
<td>asin</td>
<td>Calculates arc sine.</td>
<td>○</td>
</tr>
<tr>
<td>atan</td>
<td>Calculates arc tangent.</td>
<td>○</td>
</tr>
<tr>
<td>atan2</td>
<td>Calculates arc tangent.</td>
<td>○</td>
</tr>
<tr>
<td>ceil</td>
<td>Calculates an integer carry value.</td>
<td>○</td>
</tr>
<tr>
<td>cos</td>
<td>Calculates cosine.</td>
<td>○</td>
</tr>
<tr>
<td>cosh</td>
<td>Calculates hyperbolic cosine.</td>
<td>○</td>
</tr>
<tr>
<td>exp</td>
<td>Calculates exponential function.</td>
<td>○</td>
</tr>
<tr>
<td>fabs</td>
<td>Calculates the absolute value of a double-precision floating-point number.</td>
<td>○</td>
</tr>
<tr>
<td>floor</td>
<td>Calculates an integer borrow value.</td>
<td>○</td>
</tr>
<tr>
<td>fmod</td>
<td>Calculates the remainder.</td>
<td>○</td>
</tr>
<tr>
<td>frexp</td>
<td>Divides floating-point number into mantissa and exponent parts.</td>
<td>○</td>
</tr>
<tr>
<td>labs</td>
<td>Calculates the absolute value of a long-type integer.</td>
<td>○</td>
</tr>
<tr>
<td>ldexp</td>
<td>Calculates the power of a floating-point number.</td>
<td>○</td>
</tr>
<tr>
<td>log</td>
<td>Calculates natural logarithm.</td>
<td>○</td>
</tr>
<tr>
<td>log10</td>
<td>Calculates common logarithm.</td>
<td>○</td>
</tr>
<tr>
<td>modf</td>
<td>Calculates the division of a real number into the mantissa and exponent parts.</td>
<td>○</td>
</tr>
<tr>
<td>pow</td>
<td>Calculates the power of a number.</td>
<td>○</td>
</tr>
<tr>
<td>sin</td>
<td>Calculates sine.</td>
<td>○</td>
</tr>
<tr>
<td>sinh</td>
<td>Calculates hyperbolic sine.</td>
<td>○</td>
</tr>
<tr>
<td>sqrt</td>
<td>Calculates the square root of a numeric value.</td>
<td>○</td>
</tr>
<tr>
<td>tan</td>
<td>Calculates tangent.</td>
<td>○</td>
</tr>
<tr>
<td>tanh</td>
<td>Calculates hyperbolic tangent.</td>
<td>○</td>
</tr>
<tr>
<td>acosf</td>
<td>Calculates single-precision arc cosine</td>
<td>○</td>
</tr>
<tr>
<td>asinf</td>
<td>Calculates single-precision arc sine</td>
<td>○</td>
</tr>
<tr>
<td>atanf</td>
<td>Calculates single-precision arc tangent</td>
<td>○</td>
</tr>
<tr>
<td>atan2f</td>
<td>Calculates single-precision arc tangent</td>
<td>○</td>
</tr>
<tr>
<td>ceilf</td>
<td>Calculates single-precision an integer carry value</td>
<td>○</td>
</tr>
<tr>
<td>cosf</td>
<td>Calculates single-precision cosine</td>
<td>○</td>
</tr>
<tr>
<td>coshf</td>
<td>Calculates single-precision hyperbolic cosine</td>
<td>○</td>
</tr>
<tr>
<td>expf</td>
<td>Calculates single-precision exponential function</td>
<td>○</td>
</tr>
<tr>
<td>fabf</td>
<td>Calculates single-precision absolute value</td>
<td>○</td>
</tr>
<tr>
<td>floorf</td>
<td>Calculates single-precision borrow value</td>
<td>○</td>
</tr>
<tr>
<td>fmodf</td>
<td>Calculates single-precision remainder</td>
<td>○</td>
</tr>
<tr>
<td>frexpf</td>
<td>Divides floating-point number into mantissa and exponent parts</td>
<td>○</td>
</tr>
<tr>
<td>logf</td>
<td>Calculates single-precision natural logarithm</td>
<td>○</td>
</tr>
<tr>
<td>log10f</td>
<td>Calculates single-precision common logarithm</td>
<td>○</td>
</tr>
<tr>
<td>modff</td>
<td>Calculates the division of a real number into the mantissa and exponent parts.</td>
<td>○</td>
</tr>
<tr>
<td>powf</td>
<td>Calculates single-precision the power of a number.</td>
<td>○</td>
</tr>
<tr>
<td>sinf</td>
<td>Calculates single-precision sine</td>
<td>○</td>
</tr>
<tr>
<td>sinhf</td>
<td>Calculates single-precision hyperbolic sine.</td>
<td>○</td>
</tr>
</tbody>
</table>
**Table E.9 Integer Arithmetic Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs</td>
<td>Calculates the absolute value of an integer.</td>
<td>○</td>
</tr>
<tr>
<td>bsearch</td>
<td>Performs binary search in an array.</td>
<td>○</td>
</tr>
<tr>
<td>div</td>
<td>Divides an int-type integer and calculates the remainder.</td>
<td>○</td>
</tr>
<tr>
<td>labs</td>
<td>Calculates the absolute value of a long-type integer.</td>
<td>○</td>
</tr>
<tr>
<td>ldiv</td>
<td>Divides a long-type integer and calculates the remainder.</td>
<td>○</td>
</tr>
<tr>
<td>qsort</td>
<td>Sorts elements in an array.</td>
<td>○</td>
</tr>
<tr>
<td>rand</td>
<td>Generates a pseudo-random number.</td>
<td>○</td>
</tr>
<tr>
<td>srand</td>
<td>Imparts seed to a pseudo-random number generating routine.</td>
<td>○</td>
</tr>
</tbody>
</table>
i. Character String Value Convert Functions

The following lists character string value convert functions.

Table E.10 Character String Value Convert Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>atof</td>
<td>Converts a character string into a double-type floatingpoint number.</td>
<td>○</td>
</tr>
<tr>
<td>atoi</td>
<td>Converts a character string into an int</td>
<td>○</td>
</tr>
<tr>
<td>atol</td>
<td>Converts a character string into a long</td>
<td>○</td>
</tr>
<tr>
<td>strtod</td>
<td>Converts a character string into a double</td>
<td>○</td>
</tr>
<tr>
<td>strtol</td>
<td>Converts a character string into a double</td>
<td>○</td>
</tr>
<tr>
<td>strtou</td>
<td>Converts a character string into an unsigned long-type integer.</td>
<td>○</td>
</tr>
</tbody>
</table>

j. Multi-byte Character and Multi-byte Character String Manipulate Functions

The following lists Multibyte Character and Multibyte Character string Manipulate Functions.

Table E.11 Multibyte Character and Multibyte Character String Manipulate Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>mblen</td>
<td>Calculates the length of a multibyte character string.</td>
<td>○</td>
</tr>
<tr>
<td>mbstowcs</td>
<td>Converts a multibyte character string into a wide character string.</td>
<td>○</td>
</tr>
<tr>
<td>mbtowc</td>
<td>Converts a multibyte character into a wide character.</td>
<td>○</td>
</tr>
<tr>
<td>wcstombs</td>
<td>Converts a wide character string into a multibyte character string.</td>
<td>○</td>
</tr>
<tr>
<td>wctomb</td>
<td>Converts a wide character into a multibyte character.</td>
<td>○</td>
</tr>
</tbody>
</table>

k. Localization Functions

The following lists localization functions.

Table E.12 Localization Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Contents</th>
<th>Reentrant</th>
</tr>
</thead>
<tbody>
<tr>
<td>localeconv</td>
<td>Initializes struct lconv.</td>
<td>○</td>
</tr>
<tr>
<td>setlocale</td>
<td>Sets and searches the locale information of a program.</td>
<td>○</td>
</tr>
</tbody>
</table>
E.2.3 Standard Function Reference

The following describes the detailed specifications of the standard functions provided in NC30. The functions are listed in alphabetical order. Note that the standard header file (extension .h) shown under "Format" must be included when that function is used.

<table>
<thead>
<tr>
<th>Function</th>
<th>Execution Control Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>abort</td>
<td>Terminates the execution of the program abnormally.</td>
</tr>
<tr>
<td>Format:</td>
<td><code>#include &lt;stdlib.h&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>void abort( void );</code></td>
</tr>
<tr>
<td>Method:</td>
<td>function</td>
</tr>
<tr>
<td>Variable:</td>
<td>No argument used.</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>No value is returned.</td>
</tr>
<tr>
<td>Description:</td>
<td>Terminates the execution of the program abnormally.</td>
</tr>
<tr>
<td>Note:</td>
<td>Actually, the program loops in the abort function.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Function</th>
<th>Integer Arithmetic Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs</td>
<td>Calculates the absolute value of an integer.</td>
</tr>
<tr>
<td>Format:</td>
<td><code>#include &lt;stdlib.h&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>int abs( n );</code></td>
</tr>
<tr>
<td>Method:</td>
<td>function</td>
</tr>
<tr>
<td>Variable:</td>
<td>int n; Integer</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>Returns the absolute value of integer n (distance from 0).</td>
</tr>
</tbody>
</table>
acos

Function: Calculates arc cosine.
Format:
```c
#include <math.h>

double acos( x );
```
Method: function
Variable: double x; arbitrary real number
ReturnValue:
- Assumes an error and returns 0 if the value of given real number x is outside the range of -1.0 to 1.0.
- Otherwise, returns a value in the range from 0 to π radian.

asin

Function: Calculates arc sine.
Format:
```c
#include <math.h>

double asin( x );
```
Method: function
Variable: double x; arbitrary real number
ReturnValue:
- Assumes an error and returns 0 if the value of given real number x is outside the range of -1.0 to 1.0.
- Otherwise, returns a value in the range from -π/2 to π/2 radian.
atan

<table>
<thead>
<tr>
<th>Mathematical Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function:</td>
</tr>
<tr>
<td>Format:</td>
</tr>
<tr>
<td>double atan( x );</td>
</tr>
<tr>
<td>Method:</td>
</tr>
<tr>
<td>Variable:</td>
</tr>
<tr>
<td>ReturnValue:</td>
</tr>
</tbody>
</table>

atan2

<table>
<thead>
<tr>
<th>Mathematical Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function:</td>
</tr>
<tr>
<td>Format:</td>
</tr>
<tr>
<td>double atan2( x , y );</td>
</tr>
<tr>
<td>Method:</td>
</tr>
<tr>
<td>Variable:</td>
</tr>
<tr>
<td>double y; arbitrary real number</td>
</tr>
<tr>
<td>ReturnValue:</td>
</tr>
</tbody>
</table>
**atof**

**Function:** Converts a character string into a double-type floating-point number.

**Format:**

```c
#include <stdlib.h>

double atof(s);
```

**Method:**

function

**Variable:**

const char _far *s;  
Pointer to the converted character string

**ReturnValue:** Returns the value derived by converting a character string into a double-precision floating-point number.

---

**atoi**

**Function:** Converts a character string into an int-type integer.

**Format:**

```c
#include <stdlib.h>

int atoi(s);
```

**Method:**

function

**Variable:**

const char _far *s;  
Pointer to the converted character string

**ReturnValue:** Returns the value derived by converting a character string into an int-type integer.

---

**atol**

**Function:** Converts a character string into a long-type integer.

**Format:**

```c
#include <stdlib.h>

long atol(s);
```

**Method:**

function

**Variable:**

const char _far *s;  
Pointer to the converted character string

**ReturnValue:** Returns the value derived by converting a character string into a long-type integer.
**Memory Handling Functions**

### bcopy

**Function:**
Copies characters from a memory area to another.

**Format:**
```
#include <string.h>
void bcopy( src, dtop, size );
```

**Method:**
function

**Variable:**
- `char *far *src;`: Start address of the memory area to be copied from
- `char *far *dtop;`: Start address of the memory area to be copied to
- `unsigned long size;`: Number of bytes to be copied

**ReturnValue:**
No value is returned.

**Function:**
Copies the number of bytes specified in size from the beginning of the area specified in src to the area specified in dtop.

---

**Integer Arithmetic Functions**

### bsearch

**Function:**
Performs binary search in an array.

**Format:**
```
#include <stdlib.h>
void _far *bsearch( key, base, nelem, size, cmp );
```

**Method:**
function

**Variable:**
- `const void *far *key;`: Search key
- `const void *far *base;`: Start address of array
- `size_t nelem;`: Element number
- `size_t size;`: Element size
- `int cmp0();`: Compare function

**ReturnValue:**
- Returns a pointer to an array element that equals the search key.
- Returns a NULL pointer if no elements matched.

**Note:**
The specified item is searched from the array after it has been sorted in ascending order.
### bzero

| Function: | Initializes a memory area (by clearing it to zero). |
| Format: | `#include <string.h>` | `void bzero( top, size );` |
| Method: | function |
| Variable: | `char _far *top;` | Start address of the memory area to be cleared to zero |
| | `unsigned long size;` | Number of bytes to be cleared to zero |
| ReturnValue: | No value is returned. |
| Description: | Initializes (to 0) the number of bytes specified in size from the starting address of the area specified in top. |
### calloc

#### Memory Management Functions

**Function:** Allocates a memory area and initializes it to zero (0).

**Format:**

```c
#include <stdlib.h>

void _far * calloc( n, size );
```

**Method:** function

**Variable:**
- `size_t n;` Number of elements
- `size_t size;` Value indicating the element size in bytes

**ReturnValue:** Returns NULL if a memory area of the specified size could not be allocated.

**Description:**
- After allocating the specified memory, it is cleared to zero.
- The size of the memory area is the product of the two parameters.

**Rule:** The rules for securing memory are the same as for malloc.

### ceil

#### Mathematical Functions

**Function:** Calculates an integer carry value.

**Format:**

```c
#include <math.h>

double ceil( x );
```

**Method:** function

**Argument:**
- `double x;` arbitrary real number

**ReturnValue:** Returns the minimum integer value from among integers larger than given real number x.
### clearerr

**Input/Output Functions**

**Function:** Initializes (clears) error status specifiers.

**Format:**
```c
#include <stdio.h>

void clearerr( stream );
```

**Method:** function

**Argument:**
- `FILE _far *stream;` Pointer of stream

**ReturnValue:** No value is returned.

**Description:** Resets the error designator and end of file designator to their normal values.

---

### cos

**Mathematical Functions**

**Function:** Calculates cosine.

**Format:**
```c
#include <math.h>

double cos( x );
```

**Method:** function

**Argument:**
- `double x;` arbitrary real number

**ReturnValue:** Returns the cosine of given real number x handled in units of radian.

---

### cosh

**Mathematical Functions**

**Function:** Calculates hyperbolic cosine.

**Format:**
```c
#include <math.h>

double cosh( x );
```

**Method:** function

**Argument:**
- `double x;` arbitrary real number

**ReturnValue:** Returns the hyperbolic cosine of given real number x.
### div

<table>
<thead>
<tr>
<th>Function:</th>
<th>Divides an int-type integer and calculates the remainder.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td>#include &lt;stdlib.h&gt;</td>
</tr>
<tr>
<td></td>
<td>div_t div( number, denom );</td>
</tr>
<tr>
<td>Method:</td>
<td>function</td>
</tr>
<tr>
<td>Argument:</td>
<td>int number: Dividend</td>
</tr>
<tr>
<td></td>
<td>int denom: Divisor</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>Returns the quotient derived by dividing &quot;number&quot; by &quot;denom&quot; and the remainder of the division.</td>
</tr>
<tr>
<td>Description:</td>
<td>● Returns the quotient derived by dividing &quot;number&quot; by &quot;denom&quot; and the remainder of the division in structure div_t.</td>
</tr>
<tr>
<td></td>
<td>● div_t is defined in stdlib.h. This structure consists of members int quot and int rem.</td>
</tr>
</tbody>
</table>
### exp

**Function:** Calculates exponential function.

**Format:**

```
#include <math.h>

double exp(x);
```

**Method:** function

**Argument:**

- `double x:` arbitrary real number

**ReturnValue:** Returns the calculation result of an exponential function of given real number `x.`
fabs

**Mathematical Functions**

Function: Calculates the absolute value of a double-precision floating-point number.
Format: 
```
#include <math.h>

double fabs(x);
```
Method: function
Argument: double x; arbitrary real number
ReturnValue: Returns the absolute value of a double-precision floating-point number.

feof

**Input/Output Functions**

Function: Checks EOF (End of File).
Format: 
```
#include <stdio.h>

int feof(stream);
```
Method: macro
Argument: FILE _far *stream; Pointer of stream
ReturnValue: 
- Returns "true" (other than 0) if the stream is EOF.
- Otherwise, returns NULL (0).
Description: 
- Determines if the stream has been read to the EOF.
- Interprets code 0x1A as the end code and ignores any subsequent data.
### ferror

**Function:** Checks input/output errors.

**Format:**
```
#include <stdio.h>

int ferror( stream );
```

**Method:** macro

**Argument:**
- `FILE _far *stream;` Pointer of stream

**ReturnValue:**
- Returns "true" (other than 0) if the stream is in error.
- Otherwise, returns NULL (0).

**Description:**
- Determines errors in the stream.
- Interprets code 0x1A as the end code and ignores any subsequent data.

### fflush

**Function:** Flushes the stream of an output buffer.

**Format:**
```
#include <stdio.h>

int fflush( stream );
```

**Method:** function

**Argument:**
- `FILE _far *stream;` Pointer of stream

**ReturnValue:** Always returns 0.
### fgetc

<table>
<thead>
<tr>
<th>Function:</th>
<th>Reads one character from the stream.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td><code>#include &lt;stdio.h&gt;</code>&lt;br&gt;<code>int fgetc( stream );</code></td>
</tr>
<tr>
<td>Method:</td>
<td>function</td>
</tr>
<tr>
<td>Argument:</td>
<td>FILE _far *stream;  Pointer of stream</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>• Returns the one input character.&lt;br&gt;• Returns EOF if an error or the end of the stream is encountered.</td>
</tr>
<tr>
<td>Description:</td>
<td>• Reads one character from the stream.&lt;br&gt;• Interprets code 0x1A as the end code and ignores any subsequent data.</td>
</tr>
</tbody>
</table>

### fgets

<table>
<thead>
<tr>
<th>Function:</th>
<th>Reads one line from the stream.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td><code>#include &lt;stdio.h&gt;</code>&lt;br&gt;<code>char _far * fgets( buffer, n, stream );</code></td>
</tr>
<tr>
<td>Method:</td>
<td>function</td>
</tr>
<tr>
<td>Argument:</td>
<td>char _far *buffer;  Pointer of the location to be stored in&lt;br&gt;int n;  Maximum number of characters&lt;br&gt;FILE _far *stream;  Pointer of stream</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>• Returns the pointer of the location to be stored (the same pointer as given by the argument) if normally input.&lt;br&gt;• Returns the NULL pointer if an error or the end of the stream is encountered.</td>
</tr>
<tr>
<td>Description:</td>
<td>• Reads character string from the specified stream and stores it in the buffer&lt;br&gt;• Input ends at the input of any of the following:&lt;br&gt;(1) new line character (<code>\n</code>)&lt;br&gt;(2) n-1 characters&lt;br&gt;(3) end of stream&lt;br&gt;• A null character (<code>\0</code>) is appended to the end of the input character string.&lt;br&gt;• The new line character (<code>\n</code>) is stored as-is.&lt;br&gt;• Interprets code 0x1A as the end code and ignores any subsequent data.</td>
</tr>
</tbody>
</table>
floor

Function: Calculates an integer borrow value.
Format: #include <math.h>
        double floor(x);
Method: function
Argument: double x; arbitrary real number
ReturnValue: The real value is truncated to form an integer, which is returned as a double type.

fmod

Function: Calculates the remainder.
Format: #include <math.h>
        double fmod(x, y);
Method: function
Argument: double x; dividend
          double y; divisor
ReturnValue: Returns a remainder that derives when dividend x is divided by divisor y.
**fprintf**

Function: Outputs characters with format to the stream.

Format:
```
#include <stdio.h>

int fprintf( stream, format, argument... );
```

Method: function

Argument:
- `FILE _far *stream`: Pointer of stream
- `const char _far *format`: Pointer of the format specifying character string

ReturnValue:
- Returns the number of characters output.
- Returns EOF if a hardware error occurs.

Description:
- Argument is converted to a character string according to format and output to the stream.
- Interprets code 0x1A as the end code and ignores any subsequent data.
- Format is specified in the same way as in printf.

**fputc**

Function: Outputs one character to the stream.

Format:
```
#include <stdio.h>

int fputc( c, stream );
```

Method: function

Argument:
- `int c`: Character to be output
- `FILE _far *stream`: Pointer of the stream

ReturnValue:
- Returns the output character if output normally.
- Returns EOF if an error occurs.

Description: Outputs one character to the stream.
### fputs

**Function:**
Outputs one line to the stream.

**Format:**
```c
#include <stdio.h>
int fputs ( str, stream );
```

**Method:**
function

**Argument:**
- `const char _far *str;`: Pointer of the character string to be output
- `FILE _far *stream;`: Pointer of the stream

**ReturnValue:**
- Returns 0 if output normally.
- Returns any value other than 0 (EOF) if an error occurs.

**Description:**
Outputs one line to the stream.

---

### fread

**Function:**
Reads fixed-length data from the stream

**Format:**
```c
#include <stdio.h>
size_t fread( buffer, size, count, stream );
```

**Method:**
function

**Argument:**
- `void _far *buffer;`: Pointer of the location to be stored in
- `size_t size;`: Number of bytes in one data item
- `size_t count;`: Maximum number of data items
- `FILE _far *stream;`: Pointer of the stream

**ReturnValue:**
Returns the number of data items input.

**Description:**
- Reads data of the size specified in size from the stream and stores it in the buffer. This is repeated by the number of times specified in count.
- If the end of the stream is encountered before the data specified in count has been input, this function returns the number of data items read up to the end of the stream.
- Interprets code 0x1A as the end code and ignores any subsequent data.
### free

**Memory Management Function**

**Function:** Frees the allocated memory area.

**Format:**
```c
#include <stdlib.h>
void free( cp );
```

**Method:** function

**Argument:**
- `void _far *cp;` Pointer to the memory area to be freed

**ReturnValue:** No value is returned.

**Description:**
- Frees memory areas previously allocated with `malloc` or `calloc`.
- No processing is performed if you specify NULL in the parameter.

### frexp

**Mathematical Functions**

**Function:** Divides floating-point number into mantissa and exponent parts.

**Format:**
```c
#include <math.h>
double frexp( x, prexp );
```

**Method:** function

**Argument:**
- `double x;` float-point number
- `int _far *prexp;` Pointer to an area for storing a 2-based exponent

**ReturnValue**
- Returns the floating-point number `x` mantissa part.
### fscanf

**Function:**
Reads characters with format from the stream.

**Format:**
```
#include <stdio.h>

int fscanf( stream, format, argument... );
```

**Method:**
function

**Argument:**
- `FILE _far *stream;` Pointer of stream
- `const char _far *format;` Pointer of the input character string

**ReturnValue:**
- Returns the number of data entries stored in each argument.
- Returns EOF if EOF is input from the stream as data.

**Description:**
- Converts the characters input from the stream as specified in format and stores them in the variables shown in the arguments.
- Argument must be a pointer to the respective variable.
- Interprets code 0x1A as the end code and ignores any subsequent data.
- Format is specified in the same way as in scanf.

### fwrite

**Function:**
Outputs the specified items of data to the stream.

**Format:**
```
#include <stdio.h>

size_t fwrite( buffer, size, count, stream );
```

**Method:**
function

**Argument:**
- `const void _far *buffer;` Pointer of the output data
- `size_t size;` Number of bytes in one data item
- `size_t count;` Maximum number of data items
- `FILE _far *stream;` Pointer of the stream

**ReturnValue:**
Returns the number of data items output

**Description:**
- Outputs data with the size specified in size to the stream. Data is output by the number of times specified in count.
- If an error occurs before the amount of data specified in count has been input, this function returns the number of data items output to that point.
getc

Function: Reads one character from the stream.
Format:  
```c
#include <stdio.h>
int getc( stream );
```
Method: macro
Argument: FILE _far *stream; Pointer of stream
ReturnValue:  
- Returns the one input character.
- Returns EOF if an error or the end of the stream is encountered.
Description:  
- Reads one character from the stream.
- Interprets code 0x1A as the end code and ignores any subsequent data.

getchar

Function: Reads one character from stdin.
Format:  
```c
#include <stdio.h>
int getchar( void );
```
Method: macro
Argument: No argument used.
ReturnValue:  
- Returns the one input character.
- Returns EOF if an error or the end of the file is encountered.
Description:  
- Reads one character from stream( stdin).
- Interprets code 0x1A as the end code and ignores any subsequent data.
### Gets

**Function:** Reads one line from stdin.

**Format:**

```c
#include <stdio.h>

char _far * gets( buffer );
```

**Method:** function

**Argument:**

```c
char _far *buffer; 
```

**ReturnValue:**

- Returns the pointer of the location to be stored (the same pointer as given by the argument) if normally input.
- Returns the NULL pointer if an error or the end of the file is encountered.

**Description:**

- Reads character string from stdin and stores it in the buffer.
- The new line character (`\n`) at the end of the line is replaced with the null character (`\0`).
- Interprets code 0x1A as the end code and ignores any subsequent data.
### Input/Output Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>init</td>
<td>Initializes the stream. Also calls speed and init_prn in the function to make the initial settings of the UART and Centronics output device. init is normally used by calling it from the startup program.</td>
</tr>
</tbody>
</table>

#### init

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>Initializes the stream.</td>
</tr>
<tr>
<td>Format:</td>
<td></td>
</tr>
</tbody>
</table>
#include `<stdio.h>`

void init( void ); |
| Method:  | function |
| Argument: | No argument used. |
| ReturnValue: | No value is returned. |

#### isalnum

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function</td>
<td>Checks whether the character is an alphabet or numeral (A·Z,a·z,0·9).</td>
</tr>
<tr>
<td>Format:</td>
<td></td>
</tr>
</tbody>
</table>
#include `<ctype.h>`

int isalnum( c ); |
| Method:  | macro |
| Argument: | int c; Character to be checked |
| ReturnValue: | 
- Returns any value other than 0 if an alphabet or numeral. |
- Returns 0 if not an alphabet nor numeral. |
| Description: | Determines the type of character in the parameter. |
isalpha

Function: Checks whether the character is an alphabet (A - Z, a - z).

Format: 
```c
#include <ctype.h>
int isalpha( c );
```

Method: macro

Argument: int c; Character to be checked

ReturnValue:  
- Returns any value other than 0 if an alphabet.
- Returns 0 if not an alphabet.

Description: Determines the type of character in the parameter.

iscntrl

Function: Checks whether the character is a control character (0x00 - 0x1f, 0x7f).

Format: 
```c
#include <ctype.h>
int iscntrl( c );
```

Method: macro

Argument: int c; Character to be checked

ReturnValue:  
- Returns any value other than 0 if a numeral.
- Returns 0 if not a control character.

Description: Determines the type of character in the parameter.
### isdigit

**Function:** Checks whether the character is a numeral (0 - 9).

**Format:**
```c
#include <ctype.h>

int isdigit( c );
```

**Method:** macro

**Argument:**
```
int c; Character to be checked
```

**ReturnValue:**
- Returns any value other than 0 if a numeral.
- Returns 0 if not a numeral.

**Description:** Determines the type of character in the parameter.

### isgraph

**Function:** Checks whether the character is printable (except a blank) (0x21 - 0x7e).

**Format:**
```c
#include <ctype.h>

int isgraph( c );
```

**Method:** macro

**Argument:**
```
int c; Character to be checked
```

**ReturnValue:**
- Returns any value other than 0 if printable.
- Returns 0 if not printable.

**Description:** Determines the type of character in the parameter.
islower

</tbody>
</table>
### ispunct

**Function:** Checks whether the character is a punctuation character.

**Format:**
```c
#include <ctype.h>

int ispunct(c);
```

**Method:** macro

**Argument:** int c; Character to be checked

**ReturnValue:**
- Returns any value other than 0 if a punctuation character.
- Returns 0 if not a punctuation character.

**Description:** Determines the type of character in the parameter.

### isspace

**Function:** Checks whether the character is a blank, tab, or new line.

**Format:**
```c
#include <ctype.h>

int isspace(c);
```

**Method:** macro

**Argument:** int c; Character to be checked

**ReturnValue:**
- Returns any value other than 0 if a blank, tab, or new line.
- Returns 0 if not a blank, tab, or new line.

**Description:** Determines the type of character in the parameter.
### isupper

**Function:** Checks whether the character is an upper-case letter (A - Z).

**Format:**

```c
#include <ctype.h>
int isupper(c);
```

**Method:** macro

**Argument:** int c; Character to be checked

**ReturnValue:**
- Returns any value other than 0 if an upper-case letter.
- Returns 0 if not an upper-case letter.

**Description:** Determines the type of character in the parameter.

### isxdigit

**Function:** Checks whether the character is a hexadecimal character (0 - 9, A - F, a - f).

**Format:**

```c
#include <ctype.h>
int isxdigit(c);
```

**Method:** macro

**Argument:** int c; Character to be checked

**ReturnValue:**
- Returns any value other than 0 if a hexadecimal character.
- Returns 0 if not a hexadecimal character.

**Description:** Determines the type of character in the parameter.
### labs

**Function:** Calculates the absolute value of a long-type integer.

**Format:**
```c
#include <stdlib.h>
long labs( n );
```

**Method:** function

**Argument:**
- `long n;` Long integer

**ReturnValue:** Returns the absolute value of a long-type integer (distance from 0).

---

### ldexp

**Function:** Calculates the power of a floating-point number.

**Format:**
```c
#include <math.h>
double ldexp( x, exp );
```

**Method:** function

**Argument:**
- `double x;` Float-point number
- `int exp;` Power of number

**ReturnValue:** Returns `x * (exp power of 2)`.
### Integer Arithmetic Functions

#### ldiv

<table>
<thead>
<tr>
<th>Function</th>
<th>Divides a long-type integer and calculates the remainder.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td><code>#include &lt;stdlib.h&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>ldiv_t ldiv( number, denom );</code></td>
</tr>
<tr>
<td>Method:</td>
<td>procedure</td>
</tr>
<tr>
<td>Argument:</td>
<td><code>long number;</code> Dividend</td>
</tr>
<tr>
<td></td>
<td><code>long denom;</code> Divisor</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>Returns the quotient derived by dividing &quot;number&quot; by &quot;denom&quot; and the remainder of the division.</td>
</tr>
<tr>
<td>Description:</td>
<td>- Returns the quotient derived by dividing &quot;number&quot; by &quot;denom&quot; and the remainder of the division in the structure <code>ldiv_t</code>.</td>
</tr>
<tr>
<td></td>
<td>- <code>ldiv_t</code> is defined in <code>stdlib.h</code>. This structure consists of members <code>long quot</code> and <code>long rem</code>.</td>
</tr>
</tbody>
</table>

#### localeconv

| Function: | Initializes `struct lconv`. |
| Format:   | `#include <locale.h>` |
|           | `struct lconv *localeconv( void );` |
| Method:   | function |
| Argument: | No argument used. |
| ReturnValue: | Returns a pointer to the initialized `struct lconv`. |
### log

<table>
<thead>
<tr>
<th>Function:</th>
<th>Calculates natural logarithm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td><code>#include &lt;math.h&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>double log(x);</code></td>
</tr>
<tr>
<td>Method:</td>
<td><code>function</code></td>
</tr>
<tr>
<td>Argument:</td>
<td><code>double x;</code> arbitrary real number</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>Returns the natural logarithm of given real number x.</td>
</tr>
<tr>
<td>Description:</td>
<td>This is the reverse function of exp.</td>
</tr>
</tbody>
</table>

### log10

<table>
<thead>
<tr>
<th>Function:</th>
<th>Calculates common logarithm.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format:</td>
<td><code>#include &lt;math.h&gt;</code></td>
</tr>
<tr>
<td></td>
<td><code>double log10(x);</code></td>
</tr>
<tr>
<td>Method:</td>
<td><code>function</code></td>
</tr>
<tr>
<td>Argument:</td>
<td><code>double x;</code> arbitrary real number</td>
</tr>
<tr>
<td>ReturnValue:</td>
<td>Returns the common logarithm of given real number</td>
</tr>
</tbody>
</table>

longjmp

| Function:       | Restores the environment when making a function call |
| Format:         | #include <setjmp.h> |
|                 | void longjmp(env, val); |
| Method:         | function |
| Argument:       | jmp_buf env: Pointer to the area where environment is restored int val: Value returned as a result of setjmp |
| ReturnValue:    | No value is returned. |
| Description:    | • Restores the environment from the area indicated in "env". • Program control is passed to the statement following that from which setjmp was called. • The value specified in "val" is returned as the result of setjmp. However, if "val" is "0", it is converted to "1". |
malloc

Memory Management Functions

Function: Allocates a memory area.
Format: 
   #include <stdlib.h>
   void _far * malloc( nbytes );
Method: function
Argument: size_t nbytes; Size of memory area (in bytes) to be allocated ....
ReturnValue: Returns NULL if a memory area of the specified size could not be allocated.
Description: Dynamically allocates memory areas
Rule: malloc performs the following two checks to secure memory in the appropriate location.
   (1) If memory areas have been freed with free
      • If the amount of memory to be secured is smaller than that freed, the area is secured from the high address of the contiguously empty area created by free toward the low address.
malloc

Memory Management Functions

**Rule:**
- If the amount of memory to be secured is larger than that freed, the area is secured from the lowest address of the unused memory toward the high address.

![Diagram of malloc and free functions](image)

1. If no memory area has been freed with `free`
   - If there is any unused area that can be secured, the area is secured from the lowest address of the unused memory toward the high address.

2. If there is no unused area that can be secured, `malloc` returns NULL without any memory being secured.

**Note:**
No garbage collection is performed. Therefore, even if there are lots of small unused portions of memory, no memory is secured and `malloc` returns NULL unless there is an unused portion of memory that is larger than the specified size.
### mblen

**Function:** Calculates the length of a multibyte character string.

**Format:**
```c
#include <stdlib.h>
int mblen ( s,n );
```

**Method:** function

**Argument:**
- `const char _far *s;`  Pointer to a multibyte character string
- `size_t n;`  Number of searched byte

**ReturnValue:**
- Returns the number of bytes in the character string if 's' configures a correct multibyte character string.
- Returns -1 if 's' does not configure a correct multibyte character string.

**Description:**
- Returns 0 if 's' indicates a NULL character.

### mbstowcs

**Function:** Converts a multibyte character string into a wide character string.

**Format:**
```c
#include <stdlib.h>
size_t mbstowcs( wcs,s,n );
```

**Method:** function

**Argument:**
- `wchar_t _far *wcs;`  Pointer to an area for storing conversion wide character string
- `const char _far *s;`  Pointer to a multibyte character string
- `size_t n;`  Number of wide characters stored

**ReturnValue:**
- Returns the number of characters in the converted multibyte character string.
- Returns -1 if 's' does not configure a correct multibyte character string.
mbtowc

Multi-byte Character String Manipulate Functions

Function: Converts a multibyte character into a wide character.

Format: #include <stdlib.h>

int mbtowc( wchar_t *wcs, const char *s, size_t n );

Method: function

Argument:
- wchar_t *wcs: Pointer to an area for storing conversion wide character string
- const char *s: Pointer to a multibyte character string
- size_t n: Number of wide characters stored

ReturnValue:
- Returns the number of wide characters converted if 's' configure a correct multibyte character string.
- Returns -1 if 's' does not configure a correct multibyte character string.
- Returns 0 if 's' indicates a NULL character.

memchr

Memory Handling Functions

Function: Searches a character from a memory area.

Format: #include <string.h>

void * memchr( const void *s, int c, size_t n );

Method: function

Argument:
- const void *s: Pointer to the memory area to be searched from
- int c: Character to be searched
- size_t n: Size of the memory area to be searched

ReturnValue:
- Returns the position (pointer) of the specified character "c" where it is found.
- Returns NULL if the character "c" could not be found in the memory area.

Description:
- Searches for the characters shown in "c" in the amount of memory specified in "n" starting at the address specified in "s".
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM the system may selects another functions with good code efficiency by optimization.
### memcmp

**Function:**
Compares memory areas (n' bytes).

**Format:**
```c
#include <string.h>

int memcmp( s1, s2, n );
```

**Method:**
function

**Argument:**
- `const void _far *s1;` Pointer to the first memory area to be compared
- `const void _far *s2;` Pointer to the second memory area to be compared
- `size_t n;` Number of bytes to be compared

**ReturnValue:**
- `Return Value = 0` The two memory areas are equal.
- `Return Value > 0` The first memory area (s1) is greater than the other.
- `Return Value < 0` The second memory area (s2) is greater than the other.

**Description:**
- Compares each of n bytes of two memory areas
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or –OSM the system may selects another functions with good code efficiency by optimization.

### memcpy

**Function:**
Copies n bytes of memory

**Format:**
```c
#include <string.h>

void _far * memcpy( s1, s2, n );
```

**Method:**
macro(default) or function

**Argument:**
- `void _far *s1;` Pointer to the memory area to be copied to
- `const void _far *s2;` Pointer to the memory area to be copied from
- `size_t n;` Number of bytes to be copied

**ReturnValue:**
Returns the pointer to the memory area to which the characters have been copied.

**Description:**
- Usually, the program code described by macro is used for this function. In using the function in a library, please describe it as #undef memcpy after description of #include <string.h>.
- Copies "n" bytes from memory "S2" to memory "S1".
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or –OSM, the system may selects another functions with good code efficiency by optimization.
**memicmp**

**Memory Handling Functions**

**Function:** Compares memory areas (with alphabets handled as upper-case letters).

**Format:**
```c
#include <string.h>
int memicmp( s1, s2, n);
```

**Method:** function

**Argument:**
- `char _far *s1;` Pointer to the first memory area to be compared
- `char _far *s2;` Pointer to the second memory area to be compared
- `size_t n;` Number of bytes to be compared

**ReturnValue:**
- `Return Value= =0` The two memory areas are equal.
- `Return Value>0` The first memory area (s1) is greater than the other.
- `Return Value<0` The second memory area (s2) is greater than the other.

**Description:**
- Compares memory areas (with alphabets handled as upper-case letters).
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.

**memmove**

**Memory Handling Functions**

**Function:** Moves the area of a character string.

**Format:**
```c
#include <string.h>
void _far * memmove( s1, s2, n);
```

**Method:** function

**Argument:**
- `void *s1;` Pointer to be moved to
- `const void *s2;` Pointer to be moved from
- `size_t n;` Number of bytes to be moved

**ReturnValue:** Returns a pointer to the destination of movement.

**Description:** When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.
memset

Function: Set a memory area.

Format: #include <string.h>

void _far * memset(s, c, n);

Method: macro or function

Argument:
- void _far *s: Pointer to the memory area to be set at
- int c: Data to be set
- size_t n: Number of bytes to be set

ReturnValue: Returns the pointer to the memory area which has been set.

Description:
- Usually, the program code described by macro is used for this function. In using the function in a library, please describe it as #undef memset after description of #include <string.h>.
- Sets "n" bytes of data "c" in memory "s".
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.

modf

Function: Calculates the division of a real number into the mantissa and exponent parts.

Format: #include <math.h>

double modf (val, pd);

Method: function

Argument:
- double val: arbitrary real number
- double *pd: Pointer to an area for storing an integer

ReturnValue: Returns the decimal part of a real number.
### perror

**Function:** Outputs an error message to stderr.

**Format:**
```c
#include <stdio.h>
void perror(s);
```

**Method:** function

**Argument:**
- `const char _far *s;` Pointer to a character string attached before a message.

**ReturnValue:** No value is returned.

---

### pow

**Function:** Calculates the power of a number.

**Format:**
```c
#include <math.h>
double pow(x,y);
```

**Method:** function

**Argument:**
- `double x;` multiplicand
- `double y;` power of a number

**ReturnValue:** Returns the multiplicand x raised to the power of y.
**printf**

**Input/Output Functions**

**Function:**
Outputs characters with format to stdout.

**Format:**

```
#include <stdio.h>

int printf( format, argument... );
```

**Method:**
function

**Argument:**

```
const char _far *format:     Pointer of the format specifying character string
```

The part after the percent (%) sign in the character string given in format has the following meaning. The part between [ and ] is optional. Details of the format are shown below.

```
Format: %[flag][minimum field width][precision][modifier (L, L, or h)] conversion specification character

Example format: %-05.8ld
```

**ReturnValue:**

- Returns the number of characters output.
- Returns EOF if a hardware error occurs.

**Description:**

- Converts argument to a character string as specified in format and outputs the character string to stdout.
- When giving a pointer to argument, it is necessary to be a far type pointer.
  1. Conversion specification symbol
     - d, i
       Converts the integer in the parameter to a signed decimal.
     - u
       Converts the integer in the parameter to an unsigned decimal.
     - o
       Converts the integer in the parameter to an unsigned octal.
     - x
       Converts the integer in the parameter to an unsigned hexadecimal. Lowercase "abcdef" are equivalent to 0AH to 0FH.
     - X
       Converts the integer in the parameter to an unsigned hexadecimal. Uppercase "ABCDEF" are equivalent to 0AH to 0FH.
     - c
       Outputs the parameter as an ASCII character.
     - s
       Converts the parameter after the string far pointer (char *) (and up to a null character ‘\0’ or the precision) to a character string. Note that wchar_t type character strings cannot be processed.¹
     - p
       Outputs the parameter pointer (all types) in the format 24 bits address.
     - n
       Stores the number of characters output in the integer pointer of the parameter. The parameter is not converted.

¹ In the standard library included with your product, the character string pointer is a far pointer. (All printf functions handle %s with a far pointer.)

Note that scanf functions use a near pointer by default.
printf

Input/Output Functions

Description:

- **e**
  Converts a double-type parameter to the exponent format. The format is [-]d.dddddde±dd.
- **E**
  Same as e, except that E is used in place of e for the exponent.
- **f**
  Converts double parameters to [-]d.ddddd format.
- **g**
  Converts double parameters to the format specified in e or f. Normally, f conversion, but conversion to e type when the exponent is ≤4 or less or the precision is less than the value of the exponent.
- **G**
  Same as g except that E is used in place of e for the exponent.
- **−**
  Left-aligns the result of conversion in the minimum field width. The default is right alignment.
- **+**
  Adds + or − to the result of signed conversion. By default, only the − is added to negative numbers.
- **Blank’ ’**
  By default, a blank is added before the value if the result of signed conversion has no sign.
- **#**
  Adds 0 to the beginning of o conversion.
  Adds 0x or 0X to the beginning when other than 0 in x or X conversion.
  Always adds the decimal point in e, E, and f conversion.
  Always adds the decimal point in g and G conversion and also outputs any 0s in the decimal place.

(2) Minimum field width

- Specifies the minimum field width of positive decimal integers.
- When the result of conversion has fewer characters than the specified field width, the left of the field is padded.
- The default padding character is the blank. However, '0' is the padding character if you specified the field with using an integer preceded by '0'.
- If you specified the − flag, the result of conversion is left aligned and padding characters (always blanks) inserted to the right.
- If you specified the asterisk (*) for the minimum field width, the integer in the parameter specifies the field width. If the value of the parameter is negative, the value after the − flag is the positive field width.

(3) Precision

Specify a positive integer after '. '. If you specify only '.' with no value, it is interpreted as zero. The function and default value differs according to the conversion type.

Floating point type data is output with a precision of 6 by default. However, no decimal places are output if you specify a precision of 0.
printf

Description:

- **d, i, o, u, x, and X conversion**
  1. If the number of columns in the result of conversion is less than the specified number, the beginning is padded with zeros.
  2. If the specified number of columns exceeds the minimum field width, the specified number of columns takes precedence.
  3. If the number of columns in the specified precision is less than the minimum field width, the field width is processed after the minimum number of columns have been processed.
  4. The default is 1
  5. Nothing is output if zero is converted by zero minimum columns.

- **s conversion**
  1. Represents the maximum number of characters.
  2. If the result of conversion exceeds the specified number of characters, the remainder is discarded.
  3. There is no limit to the number of characters in the default.
  4. If you specify an asterisk (*) for the precision, the integer of the parameter specifies the precision.
  5. If the parameter is a negative value, specification of the precision is invalid.

- **e, E, and f conversion**
  n (where n is the precision) numerals are output after the decimal point.

- **g and G conversion**
  Valid characters in excess of n (where n is the precision) are not output.

- **I, ll, L or h**
  - I: d, i, o, u, x, X, and n conversion is performed on long int and unsigned long int parameters.
  - h: d, i, o, u, x, and X conversion is performed on short int and unsigned short int parameters.
  - ll: d, i, o, u, x, X, or n conversion is performed on long long or unsigned long long parameters. If printf is specified for any other types of conversion, NC30 ignores this specification.
  - If I or h are specified in other than d, i, o, u, x, X, or n conversion, they are ignored.
  - L: e, E, f, g, and G conversion is performed on double parameters.

- **(5) When the –R8C option is in use**
  e, E, f, g, and G conversions are not possible.

---

1 In the standard C specifications, variables e, E, f, and g conversions are performed in the case of L on long double parameters. In NC30, long double types are processed as double types. Therefore, if you specify L, the parameters are processed as double types.
putc

Function: Outputs one character to the stream.
Format: #include <stdio.h>
        int putc( c, stream );
Method: macro
Argument: int c; Character to be output
          FILE _far *stream; Pointer of the stream
ReturnValue: ● Returns the output character if output normally.
             ● Returns EOF if an error occurs.
Description: Outputs one character to the stream.

putchar

Function: Outputs one character to stdout.
Format: #include <stdio.h>
        int putchar( c );
Method: macro
Argument: int c; Character to be output
ReturnValue: ● Returns the output character if output normally.
             ● Returns EOF if an error occurs.
Description: Outputs one character to stdout.
puts

Function:     Outputs one line to stdout.
Format:       #include <stdio.h>
               int puts( str );
Method:       macro
Argument:     char _far *str;  Pointer of the character string to be output
ReturnValue:  • Returns 0 if output normally.
               • Returns -1 (EOF) if an error occurs.
Description:  • Outputs one line to stdout.
               • The null character (\0) at the end of the character string is replaced with the new line character(\n).
## Integer Arithmetic Functions

### qsort

| Function: | Sorts elements in an array. |
| Format: | `#include <stdlib.h>` |
| | `void qsort(base, nelen, size, cmp(e1, e2));` |
| Method: | function |
| Argument: | `void _far *base;` Start address of array |
| | `size_t nelen;` Element number |
| | `size_t size;` Element size |
| | `int cmp();` Compare function |
| Return Value: | No value is returned. |
| Description: | Sorts elements in an array. |
### Integer Arithmetic Functions

**Function:**
Generates a pseudo-random number.

**Format:**
```
#include <stdlib.h>

int rand( void );
```

**Method:**
function

**Argument:**
No argument used.

**ReturnValue:**
- Returns the seed random number series specified in srand.
- The generated random number is a value between 0 and RAND_MAX.

---

### Memory Management Functions

**Function:**
Changes the size of an allocated memory area.

**Format:**
```
#include <stdlib.h>

void _far * realloc( cp, nbytes );
```

**Method:**
function

**Argument:**
- `void _far *cp;`: Pointer to the memory area before change
- `size_t nbytes;`: Size of memory area (in bytes) to be changed

**ReturnValue:**
- Returns the pointer of the memory area which has had its size changed.
- Returns NULL if a memory area of the specified size could not be secured.

**Description:**
- Changes the size of an area already secured using malloc or calloc.
- Specify a previously secured pointer in parameter "cp" and specify the number of bytes to change in "nbytes".
scanf

**Function:**
Reads characters with format from stdin.

**Format:**
```
#include <stdio.h>
#include <ctype.h>

int scanf( format, argument... );
```

**Method:**
```
function
```

**Argument:**
```
const char _far *format;    // Pointer of format specifying character string
```

The part after the percent (%) sign in the character string given in format has the following meaning. The part between [ and ] is optional. Details of the format are shown below.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%[*][maximum field width] [modifier (l, L, or h)]conversion specification character</td>
<td></td>
</tr>
<tr>
<td>Example format:</td>
<td>%*5ld</td>
</tr>
</tbody>
</table>

**ReturnValue:**
- Returns the number of data entries stored in each argument.
- Returns EOF if EOF is input from stdin as data.

**Description:**
- Converts the characters read from stdin as specified in format and stores them in the variables shown in the arguments.
- Argument must be a far pointer to the respective variable.
- The first space character is ignored except in c and [] conversion.
- Interprets code 0x1A as the end code and ignores any subsequent data.
**scanf**

<table>
<thead>
<tr>
<th>Description</th>
<th>Conversion specification symbol</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)</td>
<td>d</td>
<td>Converts a signed decimal. The target parameter must be a pointer to an integer.</td>
</tr>
<tr>
<td></td>
<td>i</td>
<td>Converts signed decimal, octal, and hexadecimal input. Octals start with 0. Hexadecimals start with 0x or 0X. The target parameter must be a pointer to an integer.</td>
</tr>
<tr>
<td></td>
<td>u</td>
<td>Converts an unsigned decimal. The target parameter must be a pointer to an unsigned integer.</td>
</tr>
<tr>
<td></td>
<td>o</td>
<td>Converts a signed octal. The target parameter must be a pointer to an integer.</td>
</tr>
<tr>
<td></td>
<td>x,X</td>
<td>Converts a signed hexadecimal. Uppercase or lowercase can be used for 0AH to 0FH. The leading 0x is not included. The target parameter must be a pointer to an integer.</td>
</tr>
<tr>
<td></td>
<td>s</td>
<td>Stores character strings ending with the null character &quot;\0&quot;. The target parameter must be a pointer to a character array of sufficient size to store the character string including the null character &quot;\0&quot;. If input stops when the maximum field width is reached, the character string stored consists of the characters to that point plus the ending null character.</td>
</tr>
<tr>
<td></td>
<td>c</td>
<td>Stores a character. Space characters are not skipped. If you specify 2 or more for the maximum field width, multiple characters are stored. However, the null character &quot;\0&quot; is not included. The target parameter must be a pointer to a character array of sufficient size to store the character string.</td>
</tr>
<tr>
<td></td>
<td>p</td>
<td>Converts input in the format data bank register plus offset (Example: 00:1205). The target parameter is a pointer to all types.</td>
</tr>
<tr>
<td></td>
<td>[]</td>
<td>Stores the input characters while the one or more characters between [ and ] are input. Storing stops when a character other than those between [ and ] is input. If you specify the circumflex (^) after [ only character other than those between the circumflex and ] are legal input characters. Storing stops when one of the specified characters is input. The target parameter must be a pointer to a character array of sufficient size to store the character string including the null character &quot;\0&quot;, which is automatically added.</td>
</tr>
<tr>
<td></td>
<td>n</td>
<td>Stores the number of characters already read in format conversion. The target parameter must be a pointer to an integer.</td>
</tr>
<tr>
<td></td>
<td>e,E,f,g,G</td>
<td>Convert to floating point format. If you specify modifier I, the target parameter must be a pointer to a double type. The default is a pointer to a float type.</td>
</tr>
</tbody>
</table>
### scanf

**Input/Output Functions**

**Description:**

1. *(prevents data storage)*
   - Specifying the asterisk (*) prevents the storage of converted data in the parameter.

2. **Maximum field width**
   - Specify the maximum number of input characters as a positive decimal integer. In any one format conversion, the number of characters read will not exceed this number.
   - If, before the specified number of characters has been read, a space character (a character that is true in function isspace()) or a character other than in the specified format is input, reading stops at that character.

3. **I, ll, L, or h**
   - I: The results of d, i, o, u, and x conversion are stored as long int and unsigned long int. The results of e, E, f, g, and G conversion are stored as double.
   - ll: The results of d, i, o, u, and x conversion are stored as short int and unsigned short int.
   - L: d, i, o, u, x, X, or n conversion is performed on long long or unsigned long long parameters. If printf is specified for any other types of conversion, NC30 ignores this specification.
   - If I or h are specified in other than d, i, o, u, or x conversion, they are ignored.
   - l: The results of e, E, f, g, and G conversion are stored as float.

### setjmp

**Execution Control Functions**

**Function:** Saves the environment before a function call

**Format:**

```c
#include <setjmp.h>

int setjmp( env );
```

**Method:**

```c
function
```

**Argument:**

```c
jmp_buf env;  // Pointer to the area where environment is saved
```

**ReturnValue:**

Returns the numeric value given by the argument of longjmp.

**Description:** Saves the environment to the area specified in "env".
### setlocale

**Function:** Sets and searches the locale information of a program.

**Format:**
```c
#include <locale.h>

char _far *setlocale( category, locale );
```

**Method:** function

**Argument:**
- `int category`: Locale information, search section information
- `const char _far *locale`: Pointer to a locale information character string

**ReturnValue:**
- Returns a pointer to a locale information character string.
- Returns NULL if information cannot be set or searched.

### sin

**Function:** Calculates sine.

**Format:**
```c
#include <math.h>

double sin( x );
```

**Method:** function

**Argument:**
- `double x`: arbitrary real number

**ReturnValue:** Returns the sine of given real number x handled in units of radian.
### sinh

**Function:**
Calculates hyperbolic sine.

**Format:**
```
#include <math.h>

double sinh(x);
```

**Method:**
function

**Argument:**
double x: arbitrary real number

**ReturnValue:**
Returns the hyperbolic sine of given real number x.

### sprintf

**Function:**
Writes text with format to a character string.

**Format:**
```
#include <stdio.h>

int sprintf(pointer, format, argument...);
```

**Method:**
function

**Argument:**
char _far *pointer; Pointer of the location to be stored
const char _far *format; Pointer of the format specifying character string

**ReturnValue:**
Returns the number of characters output.

**Description:**
- Converts argument to a character string as specified in format and stores them from the pointer.
- Format is specified in the same way as in printf.
# sqrt

**Function:** Calculates the square root of a numeric value.

**Format:**
```c
#include <math.h>

double sqrt( x );
```

**Method:** function

**Argument:**
- `double x`: arbitrary real number

**ReturnValue:**
Returns the square root of given real number `x`.

---

# srand

**Function:** Imparts seed to a pseudo-random number generating routine.

**Format:**
```c
#include <stdlib.h>

void srand( seed );
```

**Method:** function

**Argument:**
- `unsigned int seed`: Series value of random number

**ReturnValue:**
No value is returned.

**Description:** Initializes (seeds) the pseudo random number series produced by `rand` using `seed`. 
**sscanf**

**Input/Output Functions**

**Function:** Reads data with format from a character string.

**Format:**

```c
#include <stdio.h>

int sscanf( string, format, argument... );
```

**Method:** function

**Argument:**

- `const char _far *string;`  Pointer of the input character string
- `const char _far *format;`  Pointer of the format specifying character string

**ReturnValue:**

- Returns the number of data entries stored in each argument.
- Returns EOF if null character ('\0') is input as data.

**Description:**

- Converts the characters input as specified in format and stores them in the variables shown in the arguments.
- Argument must be a far pointer to the respective variable.
- Format is specified in the same way as in `scanf`.

---

**strcat**

**String Handling Functions**

**Function:** Concatenates character strings.

**Format:**

```c
#include <string.h>

char _far * strcat( s1, s2 );
```

**Method:** function

**Argument:**

- `char _far *s1;`  Pointer to the character string to be concatenated to
- `const char _far *s2;`  Pointer to the character string to be concatenated from

**ReturnValue:** Returns a pointer to the concatenated character string area(s1).

**Description:**

- Concatenates character strings "s1" and "s2" in the sequence s1+s2.
- The concatenated string ends with NULL.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX,-ORM,-OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.

---

1 There must be adequate space to accommodate s1 plus s2.
### strchr

**Function:**
Searches the specified character beginning with the top of the character string.

**Format:**
```
#include <string.h>

char _far * strchr( s, c );
```

**Method:**
function

**Argument:**
- `const char _far *s;` — Pointer to the character string to be searched in
- `int c;` — Character to be searched for

**Return Value:**
- Returns the position of character "c" that is first encountered in character string "s."
- Returns NULL when character string "s" does not contain character "c."

**Description:**
- Searches for character "c" starting from the beginning of area "s."
- You can also search for `\0`.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.

### strcmp

**Function:**
Compares character strings.

**Format:**
```
#include <string.h>

int strcmp( s1, s2 );
```

**Method:**
macro, function

**Argument:**
- `const char _far *s1;` — Pointer to the first character string to be compared
- `const char _far *s2;` — Pointer to the second character string to be compared

**Return Value:**
- `Return Value = 0` — The two character strings are equal.
- `Return Value > 0` — The first character string (s1) is greater than the other.
- `Return Value < 0` — The second character string (s2) is greater than the other.

**Description:**
- Usually, the program code described by macro is used for this function. In using the function in a library, please describe it as `#undef strcmp` after description of `#include <string.h>`.
- Compares each byte of two character strings ending with NULL.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.
strcoll

Function:    Compares character strings (using locale information).
Format:      #include <string.h>
             int strcoll( s1, s2 );
Method:      function
Argument:    const char _far *s1;    Pointer to the first character string to be compared
             const char _far *s2;    Pointer to the second character string to be compared
ReturnValue:  • ReturnValue= =0      The two character strings are equal
             • ReturnValue>0        The first character string (s1) is greater than the other
             • ReturnValue<0        The second character string (s2) is greater than the other
Description: When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.

strcpy

Function:    Copies a character string.
Format:      #include <string.h>
             char _far * strcpy( s1, s2 );
Method:      macro or function
Argument:    char _far *s1:    Pointer to the character string to be copied to
             const char _far *s2:    Pointer to the character string to be copied from
ReturnValue:  Returns a pointer to the character string at the destination of copy.
Description:  • Usually, the program code described by macro is used for this function. In using the function in a library, please describe it as #undef strcpy after description of #include <string.h>.
             • Copies character string "s2" (ending with NULL) to area "s1"
             • After copying, the character string ends with NULL.
             • When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects functions with good code efficiency by optimization.
### strcspn

**Function:**
Calculates the length (number) of unspecified characters that are not found in the other character string

**Format:**
```c
#include <string.h>

size_t strcspn(char *s1, char *s2);
```

**Method:**
function

**Argument:**
- `const char *s1;`  Pointer to the character string to be searched in
- `const char *s2;`  Pointer to the character string to be searched for

**ReturnValue:**
Returns the length (number) of unspecified characters.

**Description:**
- Calculates the size of the first character string consisting of characters other than those in 's2' from area 's1', and searches the characters from the beginning of 's1'.
- You cannot search for '\0'.

### stricmp

**Function:**
Compares character strings. (All alphabets are handled as uppercase letters.)

**Format:**
```c
#include <string.h>

int stricmp(char *s1, char *s2);
```

**Method:**
function

**Argument:**
- `char *s1;`  Pointer to the first character string to be compared
- `char *s2;`  Pointer to the second character string to be compared

**ReturnValue:**
- `ReturnValue=0`  The two character strings are equal.
- `ReturnValue>0`  The first character string (s1) is greater than the other.
- `ReturnValue<0`  The second character string (s2) is greater than the other.

**Description:**
Compares each byte of two character strings ending with NULL. However, all letters are treated as uppercase letters.

**strncat**

**String Handling Functions**

**Function:** Concatenates character strings (n' characters).

**Format:**

```c
#include <string.h>

char _far * strncat( s1, s2, n );
```

**Method:**

function

**Argument:**

- char _far *s1: Pointer to the character string to be concatenated to
- const char _far *s2: Pointer to the character string to be concatenated from
- size_t n: Number of characters to be concatenated

**ReturnValue:** Returns a pointer to the concatenated character string area.

**Description:**

- Concatenates character strings "s1" and "n" characters from character string "s2".
- The concatenated string ends with NULL.
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may select another function with good code efficiency by optimization.

---

**strcmp**

**String Handling Function**

**Function:** Compares character strings (n' characters).

**Format:**

```c
#include <string.h>

int strncmp( s1, s2, n );
```

**Method:**

function

**Argument:**

- const char _far *s1: Pointer to the first character string to be compared
- const char _far *s2: Pointer to the second character string to be compared
- size_t n: Number of characters to be compared

**ReturnValue:**

- ReturnValue=0 The two character strings are equal.
- ReturnValue>0 The first character string (s1) is greater than the other.
- ReturnValue<0 The second character string (s2) is greater than the other.

**Description:**

- Compares each byte of n characters of two character strings ending with NULL.
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may select another function with good code efficiency by optimization.
### strncpy

#### Function:
Copies a character string (n' characters).

#### Format:
```c
#include <string.h>

char _far * strncpy( s1, s2, n );
```

#### Method:
function

#### Argument:
- `char _far *s1;`  
  Pointer to the character string to be copied to
- `const char _far *s2;`  
  Pointer to the character string to be copied from
- `size_t n;`  
  Number of characters to be copied

#### Return Value:
Returns a pointer to the character string at the destination of copy.

#### Description:
- Copies "n" characters from character string "s2" to area "s1". If character string "s2" contains more characters than specified in "n", they are not copied and '\0' is not appended. Conversely, if "s2" contains fewer characters than specified in "n", '\0's are appended to the end of the copied character string to make up the number specified in "n".
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX,-ORM,-OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.

### strnicmp

#### Function:
Compares character strings ('n' characters). (All alphabets are handled as uppercase letters.)

#### Format:
```c
#include <string.h>

int strnicmp( s1, s2, n );
```

#### Method:
function

#### Argument:
- `char _far *s1;`  
  Pointer to the first character string to be compared
- `char _far *s2;`  
  Pointer to the second character string to be compared
- `size_t n;`  
  Number of characters to be compared

#### Return Value:
- `ReturnValue= =0`  
  The two character strings are equal.
- `ReturnValue>0`  
  The first character string (s1) is greater than the other.
- `ReturnValue<0`  
  The second character string (s2) is greater than the other.

#### Description:
- Compares each byte of n characters of two character strings ending with NULL. However, all letters are treated as uppercase letters.
- When you specify options -O[3 to 5], -OR, -OS, -OR_MAX,-ORM,-OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.
### strpbrk

**Function:** Searches the specified character in a character string from the other character string.

**Format:**
```c
#include <string.h>

char _far * strpbrk( s1, s2 );
```

**Method:**
```
function
```

**Argument:**
- `const char _far *s1;` Pointer to the character string to be searched in
- `const char _far *s2;` Pointer to the character string of the character to be searched for

**ReturnValue:**
- Returns the position (pointer) where the specified character is found first.
- Returns NULL if the specified character cannot be found.

**Description:**
- Searches the specified character "s2" from the other character string in "s1" area.
- You cannot search for \0.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.

### strrchr

**Function:** Searches the specified character from the end of a character string.

**Format:**
```c
#include <string.h>

char _far * strrchr( s, c );
```

**Method:**
```
function
```

**Argument:**
- `const char _far *s;` Pointer to the character string to be searched in
- `int c;` Character to be searched for

**ReturnValue:**
- Returns the position of character "c" that is last encountered in character string "s."
- Returns NULL when character string "s" does not contain character "c."

**Description:**
- Searches for the character specified in "c" from the end of area "s".
- You can search for \0.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.
**strspn**

**Function:**
Calculates the length (number) of specified characters that are found in the character string.

**Format:**
```c
#include <string.h>
size_t strspn( s1, s2 );
```

**Method:** function

**Argument:**
- `const char _far *s1;` Pointer to the character string to be searched in
- `const char _far *s2;` Pointer to the character string of the character to be searched for

**ReturnValue:**
Returns the length (number) of specified characters.

**Description:**
- Calculates the size of the first character string consisting of characters in 's2' from area 's1', and searches the characters from the beginning of 's1'.
- You cannot search for '\0'.
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.

---

**strstr**

**Function:**
Searches the specified character from a character string.

**Format:**
```c
#include <string.h>
char _far * strstr( s1, s2 );
```

**Method:** function

**Argument:**
- `const char _far *s1;` Pointer to the character string to be searched in
- `const char _far *s2;` Pointer to the character string of the character to be searched for

**ReturnValue:**
- Returns the position (pointer) where the specified character is found.
- Returns NULL when the specified character cannot be found.

**Description:**
- Returns the location (pointer) of the first character string "s2" from the beginning of area "s1".
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.
### strtod

**Character String Value Convert Functions**

**Function:** Converts a character string into a double-type integer.

**Format:**

```c
#include <string.h>

double strtod(s,endptr);
```

**Method:** function

**Argument:**

- `const char _far *s;`  Pointer to the converted character string
- `char _far * _far *endptr;`  Pointer to the remaining character strings that have not been converted

**ReturnValue:**

- `ReturnValue == 0L`  Does not constitute a number.
- `ReturnValue != 0L`  Returns the configured number in double type.

**Description:** When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.

### strtok

**String Handling Functions**

**Function:** Divides some character string from a character string into tokens.

**Format:**

```c
#include <string.h>

char _far * strtok( s1, s2 );
```

**Method:** function

**Argument:**

- `char _far *s1;`  Pointer to the character string to be divided up
- `const char _far *s2;`  Pointer to the punctuation character to be divided with

**ReturnValue:**

- Returns the pointer to the divided token when character is found.
- Returns NULL when character cannot be found.

**Description:**

- In the first call, returns a pointer to the first character of the first token. A NULL character is written after the returned character. In subsequent calls (when "s1" is NULL), this instruction returns each token as it is encountered. NULL is returned when there are no more tokens in "s1".
- When you specify options `-O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM`, the system may selects another functions with good code efficiency by optimization.
strtol

<table>
<thead>
<tr>
<th>Character String Value Convert Function</th>
</tr>
</thead>
</table>

**Function:** Converts a character string into a long-type integer.

**Format:**
```c
#include <string.h>
long strtol(const char *s, char **endptr, int base);
```

**Method:**
- `function`

**Argument:**
- `const char *s;`  Pointer to the converted character string
- `char *endptr;`  Pointer to the remaining character strings that have not been converted.
- `int base;`  Base of values to be read in (0 to 36)

**ReturnValue:**
- `Return Value = 0L`  Does not constitute a number.
- `Return Value != 0L`  Returns the configured number in long type.

**Description:** When you specify options `-O[3 to 5]`, `-OR`, `-OS`, `-OR_MAX`, `-ORM`, `-OS_MAX`, or `-OSM`, the system may selects another functions with good code efficiency by optimization.

---

strtoul

<table>
<thead>
<tr>
<th>Character String Value Convert Function</th>
</tr>
</thead>
</table>

**Function:** Converts a character string into an unsigned long-type integer.

**Format:**
```c
#include <string.h>
unsigned long strtoul(const char *s, char **endptr, int base);
```

**Method:**
- `function`

**Argument:**
- `const char *s;`  Pointer to the converted character string
- `char *endptr;`  Pointer to the remaining character strings that have not been converted.
- `int base;`  Base of values to be read in (0 to 36)

**ReturnValue:**
- `Return Value = 0L`  Does not constitute a number.
- `Return Value != 0L`  Returns the configured number in long type.

**Description:** When you specify options `-O[3 to 5]`, `-OR`, `-OS`, `-OR_MAX`, `-ORM`, `-OS_MAX`, or `-OSM`, the system may selects another functions with good code efficiency by optimization.
strxfrm

Function: Converts a character string (using locale information).

Format: #include <string.h>

size_t strxfrm(s1,s2,n);

Method: function

Argument:
- char_far *s1; Pointer to an area for storing a conversion result character string.
- const char_far *s2; Pointer to the character string to be converted.
- size_t n; Number of bytes converted

ReturnValue: Returns the number of characters converted.

Description: When you specify options -O[3 to 5], -OR, -OS, -OR_MAX, -ORM, -OS_MAX, or -OSM, the system may selects another functions with good code efficiency by optimization.
Mathematical Functions

### tan

**Function:** Calculates tangent.

**Format:**
```c
#include <math.h>

double tan( x );
```

**Method:** function

**Argument:**
- `double x;` arbitrary real number

**ReturnValue:** Returns the tangent of given real number x handled in units of radian.

### tanh

**Function:** Calculates hyperbolic tangent.

**Format:**
```c
#include <math.h>

double tanh( x );
```

**Method:** function

**Argument:**
- `double x;` arbitrary real number

**ReturnValue:** Returns the hyperbolic tangent of given real number x.
### tolower

**Function:** Converts the character from an upper-case to a lower-case.

**Format:**
```
#include <ctype.h>

int tolower( c );
```

**Method:** macro

**Argument:** int c; Character to be converted

**ReturnValue:**
- Returns the lower-case letter if the argument is an upper-case letter.
- Otherwise, returns the passed argument as is.

**Description:** Converts the character from an upper-case to a lower-case.

### toupper

**Function:** Converts the character from a lower-case to an upper-case.

**Format:**
```
#include <ctype.h>

int toupper( c );
```

**Method:** macro

**Argument:** int c; Character to be converted

**ReturnValue:**
- Returns the upper-case letter if the argument is a lower-case letter.
- Otherwise, returns the passed argument as is.

**Description:** Converts the character from a lower-case to an upper-case.
### ungetc

**Input/Output Functions**

**Function:**
- Returns one character to the stream

**Format:**
- `#include <stdio.h>

  int ungetc(c, stream);

**Method:**
- macro

**Argument:**
- `int c;`  |  Character to be returned
- `FILE _far *stream;`  |  Pointer of stream

**ReturnValue:**
- Returns the returned one character if done normally.
- Returns EOF if the stream is in write mode, an error or EOF is encountered, or the character to be sent back is EOF.

**Description:**
- Returns one character to the stream.
- Interprets code 0x1A as the end code and ignores any subsequent data.
### vfprintf

**Function:** Output to a stream with format.

**Format:**

```c
#include <stdarg.h>
#include <stdio.h>

int vfprintf(FILE *stream, const char *format, va_list ap);
```

**Method:** function

**Argument:**
- `FILE *stream`: Pointer of stream
- `const char *format`: Pointer of the format specifying character string
- `va_list ap`: Pointer of argument list

**ReturnValue:** Returns the number of characters output.

**Description:**
- Output to a stream with format.
- When writing pointers in variable-length variables, make sure they are a far-type pointer.

### vprintf

**Function:** Output to stdout with format.

**Format:**

```c
#include <stdarg.h>
#include <stdio.h>

int vprintf(const char *format, va_list ap);
```

**Method:** function

**Argument:**
- `const char *format`: Pointer of the format specifying character string
- `va_list ap`: Pointer of argument list

**ReturnValue:** Returns the number of characters output.

**Description:**
- Output to stdout with format.
- When writing pointers in variable-length variables, make sure they are a far-type pointer.
### vsprintf

**Function:** Output to a buffer with format.

**Format:**

```c
#include <stdarg.h>
#include <stdio.h>

int vfprintf(s, format, ap...);
```

**Method:**

function

**Argument:**

- `char _far *s;` Pointer of the location to be store
- `const char _far *format;` Pointer of the format specifying character string
- `va_list ap;` Pointer of argument list

**ReturnValue:** Returns the number of characters output.

**Description:** When writing pointers in variable-length variables, make sure they are a far-type pointer.
wcstombs

Function: Converts a wide character string into a multibyte character string.

Format:

```c
#include <stdlib.h>
size_t _far wcstombs( s, wcs, n );
```

Method: function

Argument:
- `char _far *s;`: Pointer to an area for storing conversion multibyte character string
- `const wchar_t _far *wcs;`: Pointer to a wide character string
- `size_t n;`: Number of wide characters stored

ReturnValue:
- Returns the number of stored multibyte characters if the character string was converted correctly.
- Returns -1 if the character string was not converted correctly.

wctomb

Function: Converts a wide character into a multibyte character.

Format:

```c
#include <stdlib.h>
int wctomb( s,wchar );
```

Method: function

Argument:
- `char _far *s;`: Pointer to an area for storing conversion multibyte character string
- `wchar_t wchar;`: wide character

ReturnValue:
- Returns the number of bytes contained in the multibyte characters.
- Returns -1 if there is no corresponding multibyte character.
- Returns 0 if the wide character is 0.
E.2.4 Using the Standard Library

a. Notes on Regarding Standard Header File

When using functions in the standard library, always be sure to include the specified standard header file. If this header file is not included, the integrity of arguments and return values will be lost, making the program unable to operate normally.

b. Notes on Regarding Optimization of Standard Library

If you specify any of optimization options -O[3 to 5], -OS, -OR, -OR_MAX, -ORM, -OS_MAX, or -ORM, the system performs optimization for the standard functions. This optimization can be suppressed by specifying -Ono_stdlib. Such suppression of optimization is necessary when you use a user function that bear the same name as one of the standard library functions.

(1) Inline padding of functions

Regarding functions strcpy and memcpy, the system performs inline padding of functions if the conditions in Table E.13 are met.

Table E.13 Optimization Conditions for Standard Library Functions

<table>
<thead>
<tr>
<th>Function Name</th>
<th>Optimization Condition</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>

<td>memcpy(str , fp, 6);</td>
</tr>
<tr>
<td></td>
<td>Third argument: constant</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
E.3 Modifying Standard Library

The NC30 package includes a sophisticated function library which includes functions such as the scanf and printf I/O functions. These functions are normally called high-level I/O functions. These high-level I/O functions are combinations of hardware-dependent low-level I/O functions.

In R8C Family and M16C series application programs, the I/O functions may need to be modified according to the target system's hardware. This is accomplished by modifying the source file for the standard library. This chapter describes how to modify the NC30 standard library to match the target system.

The entry version does not come with source files for the standard function library. Therefore, the standard function library cannot be customized for the entry version.

E.3.1 Structure of I/O Functions

As shown in Figure E.1, the I/O functions work by calling lower-level functions (level 2, level 3) from the level 1 function. For example, fgets calls level 2 fgetc, and fgetc calls a level 3 function.

Only the lowest level 3 functions are hardware-dependent (I/O port dependent) in the Micro Processor. If your application program uses an I/O function, you may need to modify the source files for the level 3 functions to match the system.

![Figure E.1 Calling Relationship of I/O Functions](image-url)
### E.3.2 Sequence of Modifying I/O Functions

Figure E.2 outlines how to modify the I/O functions to match the target system.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>a.</td>
<td>Modify the level 3 I/O function(s)</td>
</tr>
<tr>
<td>b.</td>
<td>Set the stream</td>
</tr>
<tr>
<td>c.</td>
<td>Compile the modified source program(s)</td>
</tr>
</tbody>
</table>

**Figure E.2 Example Sequence of Modifying I/O Functions**

#### a. Modifying Level 3 I/O Function

The level 3 I/O functions perform 1-byte I/O via the M16C series R8C Family I/O ports. The level 3 I/O functions include `_sget` and `_sput`, which perform I/O via the serial communications circuits (UART), and `_pput`, which performs I/O via the Centronics communications circuit.

1. **Circuit settings**
   - Processor mode: Microprocessor mode
   - Clock frequency: 20MHz
   - External bus size: 16 bits

2. **Initial serial communications settings**
   - Use UART1
   - Baud rate: 9600bps
   - Data size: 8 bits
   - Parity: None
   - Stop bits: 2 bits

*The initial serial communications settings are made in the init function (init.c).*

The level 3 I/O functions are written in the C library source file device.c. Table E.14 lists the specifications of these functions.
Table E.14 Specifications of Level 3 Functions

<table>
<thead>
<tr>
<th>Input functions</th>
<th>Parameters</th>
<th>Return value (int type)</th>
</tr>
</thead>
<tbody>
<tr>
<td>_sget</td>
<td>None</td>
<td>If no error occurs, returns the input character Returns EOF if an error occurs</td>
</tr>
<tr>
<td>_sput</td>
<td>None</td>
<td>Returns 1 Returns EOF if an error occurs</td>
</tr>
<tr>
<td>_pput</td>
<td>None</td>
<td>Returns EOF if an error occurs</td>
</tr>
</tbody>
</table>

Output functions | Parameters (int type) | Return value (int type) |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>_sput</td>
<td>Character to output</td>
<td>If no error occurs, returns 1 Returns EOF if an error occurs</td>
</tr>
<tr>
<td>_pput</td>
<td>Character to output</td>
<td>Returns EOF if an error occurs</td>
</tr>
</tbody>
</table>

Serial communication is set to UART1 in the M16C series's and R8C Family two UARTs. device.c is written so that the UART0 can be selected using the conditional compile commands, as follows:

- To use UART0:......................... #define __UART0__
- Specify these commands at the beginning of device.c, or specify following option, when compiling.
- To use UART0:............................ –D__UART0__

To use both UARTs, modify the file as follows:

1. Delete the conditional compiling commands from the beginning of the device.c file.
2. Change the UART0 special register name defined in #pragma ADDRESS to a variable other than UART1.
3. Reproduce the level 3 functions _sget and _sput for UART0 and change them to different variable names such as _sget0 and _sput0.
4. Also reproduce the speed function for UART0 and change the function name to something like speed0.

This completes modification of device.c.

Next, modify the init function (init.c), which makes the initial I/O function settings, then change the stream settings (see below).

b. Stream Settings

The NC30 standard library has five items of stream data (stdin, stdout, stderr, stdaux, and stdprn) as external structures. These external structures are defined in the standard header file stdio.h and control the mode information of each stream (flag indicating whether input or output stream) and status information (flag indicating error or EOF).

Table E.15 Stream Information

<table>
<thead>
<tr>
<th>Stream information</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>stdin</td>
<td>Standard input</td>
</tr>
<tr>
<td>stdout</td>
<td>Standard output</td>
</tr>
<tr>
<td>stderr</td>
<td>Standard error output (error is output to stdout)</td>
</tr>
<tr>
<td>stdaux</td>
<td>Standard auxiliary I/O</td>
</tr>
<tr>
<td>stdprn</td>
<td>Standard printer output</td>
</tr>
</tbody>
</table>
The stream corresponding to the NC30 standard library functions shown shaded in Figure E.3 are fixed to standard input (stdin) and standard output (stdout). The stream cannot be changed for these functions. The output direction of stderr is defined as stdout in #define. The stream can only be changed for functions that specify pointers to the stream as parameters such as fgetc and fputs.

Figure E.3  fRelationship of Functions and Streams

Figure E.4 shows the stream definition in stdio.h.
typedef struct _iobuf {
    char _buff;   /* Store buffer for ungetc */ ← [1]
    int _cnt;    /* Strings number in _buff(1 or 0) */ ← [2]
    int _flag;   /* Flag */ ← [3]
    int _mod;    /* Mode */ ← [4]
    int (*_func_in)(void); /* Pointer to one byte input function */ ← [5]
    int (*_func_out)(int); /* Pointer to one byte output function */ ← [6]
} FILE;
#define _IOBUF_DEF
extern FILE _iob[];
#define stdin (&_iob[0]) /* Fundamental input */
#define stdout (&_iob[1]) /* Fundamental output */
#define stdaux (&_iob[2]) /* Fundamental auxialiary input output */
#define stdprn (&_iob[3]) /* Fundamental printer output */
#define stderr stdout  /* NC no-support */

Figure E.4 Stream Definition in stdio.h

1. char _buff
   Functions scanf and fscanf read one character ahead during input. If the character is no use, function ungetc is called and the character is stored in this variable.
   If data exists in this variable, the input function uses this data as the input data.

2. int _cnt
   Stores the _buff data count (0 or 1)
(3) **int_flag**

Stores the read-only flag (_IOREAD), the write-only flag (_IOWRT), the read-write flag (_IORW), the end of file flag (_IOEOF) and the error flag (_IOERR).

- _IOREAD, _IOWRT, _IORW
  These flags specify the stream operating mode. They are set during stream initialization.
- _IOEOF, _IOERR
  These flags are set according to whether an EOF is encountered or error occurs in the I/O function.

(4) **int_mod**

Stores the flags indicating the text mode (_TEXT) and binary mode (_BIN).

- **Text mode**
  Echo-back of I/O data and conversion of characters. See the source programs (fgetc.c and fputc.c) of the fgetc and fputc functions for details of echo back and character conversion.
- **Binary mode**
  No conversion of I/O data. These flags are set in the initialization block of the stream.

(5) **int (*_func_in)()**

When the stream is in read-only mode (_IOREAD) or read/write mode (_IORW), stores the level 3 input function pointer. Stores a NULL pointer in other cases.

This information is used for indirect calling of level 3 input functions by level 2 input functions.

(6) **int (*_func_out)()**

When the stream is in write mode (_IOWRT), stores the level 3 output function pointer. If the stream can be input (_IOREAD or _IORW), and is in text mode, it stores the level 3 output function pointer for echo back. Stores a NULL pointer in other cases.

This information is used for indirect calling of level 3 output functions by level 2 output functions.

Set values for all elements other than char_buff in the stream initialization block. The standard library file supplied in the NC30 package initializes the stream in function init, which is called from the ncrt0.a30 startup program.

Figure E.5 shows the source program for the init function.
```c
#include <stdio.h>

FILE _iob[4];

void _init( void );

void _init( void )
{
    stdin->_cnt = stdout->_cnt = stdaux->_cnt = stdprn->_cnt = 0;
    stdin->_flag = _IOREAD;
    stdout->_flag = _IOWRT;
    stdaux->_flag = _IOWR;
    stdprn->_flag = _IOWRT;
    stdin->_mod = _TEXT;
    stdout->_mod = _TEXT;
    stdaux->_mod = _BIN;
    stdprn->_mod = _TEXT;
    stdin->_func_in = _sget;
    stdout->_func_in = NULL;
    stdaux->_func_in = _sget;
    stdprn->_func_in = NULL;
    stdin->_func_out = _sput;
    stdout->_func_out = _sput;
    stdaux->_func_out = _sput;
    stdprn->_func_out = _pput;

#ifndef UART0
    speed(_96, _B8, _PN, _S2);
#else /* UART1 : default */
    speed(_96, _B8, _PN, _S2);
#endif
    init_prn();
}
```

Figure E.5  Source file of init function (init.c)

In systems using the two M16C series, R8C Family UARTs, modify the _init function as shown below. In the previous subsection, we set the UART0 functions in the device.c source file temporarily as _sget0, _sput0, and speed0.

1. Use the standard auxiliary I/O (stdaux) for the UART0 stream.
2. Set the flag (_flag) and mode (_mod) for standard auxiliary I/O to match the system.
3. Set the level 3 function pointer for standard auxiliary I/O.
4. Delete the conditional compile commands for the speed function and change to function speed0 for UART0.

These settings allow both UARTs to be used. However, functions using the standard I/O stream cannot be used for standard auxiliary I/O used by UART0. Therefore, only use functions that take streams as parameters. Figure E.6 shows how to change the init function.
void _init( void )
{
    
    (omitted)
    
    stdaux->_flag = _IORW;     \[2\](set read/write mode)
    
    (omitted)
    
    stdaux->_mod = _TEXT;      \[2\](set text mode)
    
    (omitted)
    
    stdaux->_func_in = _sget0; \[3\](set UART0 level 3 input function)
    
    (omitted)
    
    stdaux->_func_out = _sput0; \[3\](set UART0 level 3 input function)
    
    (omitted)
    
    speed(_96, _B8, _PN, _S2); \[4\](set UART0 speed function)
    init_prn();
}

Figure E.6  Modifying the init Function

c.  Incorporating the Modified Source Program

There are two methods of incorporating the modified source program in the target system:

1. Specify the object files of the modified function source files when linking.
2. Use the makefile (under MS-Windows, makefile.dos) supplied in the NC30 package to
   update the library file.

In method [1], the functions specified when linking become valid and functions with the same names in the
library file are excluded.
Figure E.7 shows method(1). Figure E.8 shows method(2).

% nc30 -c -g -osample ncrt0.a30 device.r30 init.r30 sample.c<RET>
* This example shows the command line when device.c and init.c are modified.

Appendix F  Error Messages

This appendix describes the error messages and warning messages output by this compiler, and their countermeasures.

F.1  Message Format

If, during processing, this compiler detects an error, it displays an error message on the screen and stops the compiling process. The following shows the format of error messages and warning messages.

nc30:[error-message]

Figure F.1  Format of Error Messages from the Compile Driver

[Error(cpp30.error-No.): filename, line-No.] error-message
[Error(ccom): filename, line-No.] error-message
[Fatal(ccom): filename, line-No.] error-message

*1

Figure F.2  Format of Command Error Messages

[Warning(cpp30. warning-No.): filename, line-No.] warning-message
[Warning(ccom): filename, line-No.] warning-message

Figure F.3  Format of Command Warning Messages

*1. Fatal error message
This error message is not normally output. Please contact nearest Renesas office. with details of the message if displayed.
### F.2 nc30 Error Messages

Table F.1 and Table F.2 list the nc30 compile driver error messages and their countermeasures.

#### Table F.1 nc30 Error Messages (1)

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
</table>
| Arg list too long                                  | • The command line for starting the respective processing system is longer than the character string defined by the system.  
  ⇒ Specify a NC30 option to ensure that the number of characters defined by the system is not exceeded. Use the `-v` option to check the command line used for each processing block. |
| Cannot analyze error                               | • This error message is not normally displayed. (It is an internal error.)  
  ⇒ Contact Renesas Solutions Corp.                                                                         |
| command-file line characters exceed 2048.          | • There are more than 2048 characters on one or more lines in the command file.  
  ⇒ Reduce the number of characters per line in the command file to 2048 max.                                |
| Core dump(command_name)                            | • The processing system (indicated in parentheses) caused a core dump.  
  ⇒ The processing system is not running correctly. Check the environment variables and the directory containing the processing system. If the processing system still does not run correctly, please contact Renesas Solutions Corp. |
| Exec format error                                  | • Corrupted processing system executable file.  
  ⇒ Reinstall the processing system.                                                                            |
| Ignore option `-?`                                  | • You specified an illegal option (-?).  
  ⇒ Specify the correct option.                                                                                  |
| illegal option                                     | • You specified options greater than 100 characters for `-as30` or `-ln30`.  
  ⇒ Reduce the options to 99 characters or less.                                                                 |
| Invalid argument                                   | • It is an internal error. (This error message is not normally displayed.)  
  ⇒ Contact Renesas Solutions Corp.                                                                            |
| Invalid option `-?`                                | • The required parameter was not specified in option `-?`.  
  ⇒ `-?` Specify the required parameter after `-?`.  
  • You specified a space between the `-?` option and its parameter.  
  ⇒ Delete the space between the `-?` option and its parameter.                                                |
| Invalid option `-o`                                | • No output filename was specified after the `-o` option.  
  ⇒ Specify the name of the output file. Do not specify the filename extension.                               |
| Invalid suffix `.xxx`                              | • You specified a filename extension not recognized by NC30 (other than .c, .i, .a30, .r30, .x30).  
  ⇒ Specify the filename with the correct extension.                                                          |

### ccom30 Error Messages

Table F.7 to Table F.19 list the ccom30 compiler error messages and their countermeasures.

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
</table>
| #pragma PRAGMA-name functionname redefined | • The same function is defined twice in #pragma-name.  
⇒ Make sure that #pragma-name is declared only once. |
| #pragma PRAGMA-name function argument is long-long or double | • The arguments used for the function specified with the "#pragma program name function name" are the long long type or the double type.  
⇒ The long long type and double type cannot be used in the functions specified with the "#pragma program name function name." Use other types. |
| #pragma PRAGMA-name & function prototype mismatched | • The function specified by #pragma PRAGMA-name does not match the contents of argument in prototype declaration.  
⇒ Make sure it is matched to the argument in prototype declaration. |
| #pragma PRAGMA-name's function argument is struct or union | • The struct or union type is specified in the prototype declaration for the function specified by #pragma PRAGMA-name.  
⇒ Specify the int or short type, 2-byte pointer type, or enumeration type in the prototype declaration. |
| #pragma PRAGMA-name must be declared before use | • A function specified in the #pragma PRAGMA-name declaration is defined after call for that function.  
⇒ Declare a function before calling it. |
| #pragma BITADDRESS variable is not _Bool type | • The variable specified by #pragma BITADDRESS is not _Bool type  
⇒ Use the _Bool type to declare the variable. |
| #pragma INTCALL function's argument on stack | • When the body of functions declared in #pragma INTCALL are written in C, the parameters are passed via the stack.  
⇒ When the body of functions declared in #pragma INTCALL are written in C, specify the parameters are being passed via the stack. |
| #pragma PARAMETER function's register not allocated | • A register which is specified in the function declared by #pragma PARAMETER can not be allocated.  
⇒ Use the correct register. |
| 'const' is duplicate | • const is described more than twice.  
⇒ Write the type qualifier correctly. |
| 'far' & 'near' conflict | • far/near is described more than twice.  
⇒ Write near/far correctly. |
| 'far' is duplicate | • far is described more than twice.  
⇒ Write far correctly. |
| 'near' is duplicate | • near is described more than twice.  
⇒ Write near correctly. |
| 'static' is illegal storage class for argument | • An appropriate storage class is used in argument declaration.  
⇒ Use the correct storage class. |
### Table F.8 ccom30 Error Messages (2)

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
</table>
| 'volatile' is duplicate | • volatile is described more than twice.  
⇒ Write the type qualifier correctly. |
| (can't read C source from filename line number for error message) | • The source line is in error and cannot be displayed.  
The file indicated by filename cannot be found or the line number does not exist in the file.  
⇒ Check whether the file actually exists. |
| (can't open C source filename for error message) | • The source file in error cannot be opened.  
⇒ Check whether the file exists. |
| argument type given both places | • Argument declaration in function definition overlaps an argument list separately given.  
⇒ Choose the argument list or argument declaration for this argument declaration. |
| array of functions declared | • The array type in array declaration is defined as function.  
⇒ Specify scalar type struct/union for the array type. |
| array size is not constant integer | • The number of elements in array declaration is not a constant.  
⇒ Use a constant to describe the number of elements. |
| asm0's string must have only 1 $b | • $b is described more than twice in asm statement.  
⇒ Make sure that $b is described only once. |
| asm0's string must not have more than 3 $$ or $@ | • $$ or $@ is described more than thrice in asm statement.  
⇒ Make sure that $$ ($@) is described only twice. |
| auto variable's size is zero | • An array with 0 elements or no elements was declared in the auto area.  
⇒ Correct the coding. |
| bitfield width exceeded | • The bit-field width exceeds the bit width of the data type.  
⇒ Make sure that the data type bit width declared in the bit-field is not exceeded. |
| bitfield width is not constant integer | • The bit width of the bit-field is not a constant.  
⇒ Use a constant to write the bit width. |
| can't get bitfield address by ' & ' operator | • The bit-field type is written with the & operator.  
⇒ Do not use the & operator to write the bit-field type. |
| can't get inline function's address by ' & ' operator | • The & operator is written in an inline function.  
⇒ Do not use the & operator in an inline function. |
| can't get size of bitfield | • The bit-field type is written with the sizeof operator.  
⇒ Do not use the sizeof operator to write the bitfield type. |
| can't get void value | • An attempt is made to get void-type data as in cases where the right side of an assignment expression is the void type.  
⇒ Check the data type. |
| can't output to file-name | • The file cannot be wrote  
⇒ Check the rest of disk capacity or access right of the file. |
| can't open file-name | • The file cannot be opened.  
⇒ Check the permission of the file. |
| can't set argument | • The type of an actual argument does not match prototype declaration. The argument cannot be set in a register (argument).  
⇒ Correct mismatch of the type. |
| can't refer to the range outside of the stack frame. | • A location outside the stack frame area is referenced.  
⇒ Reference the correct location. |
## Table F.9  ccom30 Error Messages (3)

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>case value is duplicated</td>
<td>• The value of case is used more than one time.&lt;br&gt;⇒ Make sure that the value of case that you used once is not &lt;br&gt;used again within one switch statement.</td>
</tr>
<tr>
<td>conflict declare of variable-name</td>
<td>• The variable is defined twice with different storage classes each time.&lt;br&gt;⇒ Use the same storage class to declare a variable twice.</td>
</tr>
<tr>
<td>conflict function argument type of variable-name</td>
<td>• The argument list contains the same variable name.&lt;br&gt;⇒ Change the variable name.</td>
</tr>
<tr>
<td>declared register parameter function's body declared</td>
<td>• The function body for the function declared with #pragma PARAMETER is defined in C.&lt;br&gt;⇒ Do not define , in C, the body for such function .</td>
</tr>
<tr>
<td>default function argument conflict</td>
<td>• The default value of an argument is declared more than once in prototype declaration.&lt;br&gt;⇒ Make sure that the default value of an argument is declared only once.</td>
</tr>
<tr>
<td>default: is duplicated</td>
<td>• The default value is used more than one time.&lt;br&gt;⇒ Use only one default within one switch statement.</td>
</tr>
<tr>
<td>do while( struct/union ) statement</td>
<td>• The struct or union type is used in the expression of the do-while statement.&lt;br&gt;⇒ Use the scalar type for an expression in the dowhile statement.</td>
</tr>
<tr>
<td>do while( void ) statement</td>
<td>• The void type is used in the expression of the dowhile statement.&lt;br&gt;⇒ Use the scalar type for an expression in the dowhile statement.</td>
</tr>
<tr>
<td>duplicate frame position defined variable-name</td>
<td>• Auto variable is described more than twice.&lt;br&gt;⇒ Write the type specifier correctly.</td>
</tr>
<tr>
<td>Empty declare</td>
<td>• Only storage class and type specifiers are found.&lt;br&gt;⇒ Write a declarator.</td>
</tr>
<tr>
<td>float and double not have sign</td>
<td>• Specifiers signed/unsigned are described in float or double.&lt;br&gt;⇒ Write the type specifier correctly.</td>
</tr>
<tr>
<td>floating point value overflow</td>
<td>• The floating-point immediate value exceeds the representable range.&lt;br&gt;⇒ Make sure the value is within the range.</td>
</tr>
<tr>
<td>floating type's bitfield</td>
<td>• A bit-field of an invalid type is declared.&lt;br&gt;⇒ Use the integer type to declare a bit-field.</td>
</tr>
<tr>
<td>for(; struct/union;) statement</td>
<td>• The struct or union type is used in the second expression of the for statement.&lt;br&gt;⇒ Use the scalar type to describe the second expression of the for statement.</td>
</tr>
<tr>
<td>for(; void ;) statement</td>
<td>• The 2nd expression of the for statement has void.&lt;br&gt;⇒ Use the scalar type as the 2nd expression of the for statement.</td>
</tr>
<tr>
<td>function initialized</td>
<td>• An initialize expression is described for function declaration.&lt;br&gt;⇒ Delete the initialize expression.</td>
</tr>
<tr>
<td>function member declared</td>
<td>• A member of struct or union is function type&lt;br&gt;⇒ Write the members correctly.</td>
</tr>
<tr>
<td>Error message</td>
<td>Description and countermeasure</td>

</tbody>
</table>
| function returning a function declared            | • The type of the return value in function declaration is function type.  
|                                                   | ⇒ Change the type to “pointer to function” etc.                    |
| function returning an array                        | • The type of the return value in function declaration is an array type.  
|                                                   | ⇒ Change the type to “pointer to function” etc.                    |
| handler function called                            | • The function specified by #pragma HANDLER is called.             
|                                                   | ⇒ Be careful not to call a handler.                               |
| identifier (variable-name) is duplicated           | • The variable is defined more than one time.                      
|                                                   | ⇒ Specify variable definition correctly.                           |
| if (struct/union) statement                        | • The struct or union type is used in the expression of the if statement.  
|                                                   | ⇒ The expression must have scalar type.                            |
| if (void) statement                                | • The void type is used in the expression of the if statement.     
|                                                   | ⇒ The expression must have scalar type.                            |
| illegal storage class for argument, 'inline'      | • An inline function is declared in declaration statement within a function.  
| ignored                                           | ⇒ Declare it outside a function.                                   |
| illegal storage class for argument, 'interrupt'   | • An interrupt function is declared in declaration statement within a function.  
| ignored                                           | ⇒ Declare it outside a function.                                   |
| incomplete array access                           | • An attempt is made to reference an array of incomplete.          
|                                                   | ⇒ Define size of array.                                           |
| incomplete return type                            | • An attempt is made to reference an return variable of incomplete type.  
|                                                   | ⇒ Check return variable.                                          |
| incomplete struct get by [ ]                      | • An attempt is made to reference or initialize an array of incomplete structs or unions that do not have defined members.  
|                                                   | ⇒ Define complete structs or unions first.                        |
| incomplete struct member                          | • An attempt is made to reference an struct member of incomplete .  
|                                                   | ⇒ Define complete structs or unions first.                        |
| incomplete struct initialized                     | • An attempt is made to initialize an array of incomplete structs or unions that do not have defined members.  
|                                                   | ⇒ Define complete structs or unions first.                        |
| incomplete struct return function call            | • An attempt is made to call a function that has as a return value the of incomplete struct or union that does not have defined members.  
|                                                   | ⇒ Define a complete struct or union first.                        |
| incomplete struct / union's member access         | • An attempt is made to reference members of an incomplete struct or union that do not have defined members.  
|                                                   | ⇒ Define a complete struct or union first.                        |
| incomplete struct / union(tagname)' s member access| • An attempt is made to reference members of an incomplete struct or union that do not have defined members.  
|                                                   | ⇒ Define a complete struct or union first.                        |
| inline function have invalid argument or return code| • Inline function has an invalid argument or an invalid return value.  
|                                                   | ⇒ Write the argument or an invalid return value correctly.         |
Table F.11  ccom30 Error message (5)

<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
<tbody>
<tr>
<td>inline function is called as normal function before</td>
<td>• The function declared in storage class inline is called as an ordinary function.</td>
</tr>
<tr>
<td></td>
<td>⇒ Always be sure to define an inline function before using it.</td>
</tr>
<tr>
<td>inline function's address used</td>
<td>• An attempt is made to reference the address of an inline function.</td>
</tr>
<tr>
<td></td>
<td>⇒ Do not use the address of an inline function.</td>
</tr>
<tr>
<td>inline function's body is not declared previously</td>
<td>• The body of an inline function is not defined.</td>
</tr>
<tr>
<td></td>
<td>⇒ Using an inline function, define the function body prior to the function call.</td>
</tr>
<tr>
<td>inline function (function-name) is recursion</td>
<td>• The recursive call of an inline function cannot be carried out.</td>
</tr>
<tr>
<td></td>
<td>⇒ Using an inline function, No recursive.</td>
</tr>
<tr>
<td>interrupt function called</td>
<td>• The function specified by #pragma INTERRUPT is called.</td>
</tr>
<tr>
<td></td>
<td>⇒ Be careful not to call an interrupt handling function.</td>
</tr>
<tr>
<td>invalid environment variable: (environment variable 'name)</td>
<td>• The variable name specified in the environment variable NCKIN/NCKOUT is specified by other than SJIS and EUC.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check the environment variables used.</td>
</tr>
<tr>
<td>invalid function default argument</td>
<td>• The default argument to the function is incorrect.</td>
</tr>
<tr>
<td></td>
<td>⇒ This error occurs when the prototype declaration of the function with default arguments and those in the function definition section do not match. Make sure they match.</td>
</tr>
<tr>
<td>invalid push</td>
<td>• An attempt is made to push void type in function argument, etc.</td>
</tr>
<tr>
<td></td>
<td>⇒ The type void cannot be pushed.</td>
</tr>
<tr>
<td>invalid '?' operand</td>
<td>• The '?' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check each expression. Also note that the expressions on the left and right sides of '?' must be of the same type.</td>
</tr>
<tr>
<td>invalid '!=' operands</td>
<td>• The '!=' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check the expressions on the left and right sides of the operator.</td>
</tr>
<tr>
<td>invalid '&amp;&amp;' operands</td>
<td>• The '&amp;&amp;' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check the expressions on the left and right sides of the operator.</td>
</tr>
<tr>
<td>invalid '&amp;=' operands</td>
<td>• The '&amp;=' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check the expressions on the left and right sides of the operator.</td>
</tr>
<tr>
<td>invalid '&amp; 'operands</td>
<td>• The '&amp; ' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ Check the expression on the right side of the operator.</td>
</tr>
<tr>
<td>invalid '()' operand</td>
<td>• The expression on the left side of '(' is not a function.</td>
</tr>
<tr>
<td></td>
<td>⇒ Write a function or a pointer to the function in the left-side expression of '('</td>
</tr>
<tr>
<td>invalid '*' operands</td>
<td>• If multiplication, the '*' operation contains an error.</td>
</tr>
<tr>
<td></td>
<td>⇒ For a multiplication, check the expressions on the left and right sides of the operator.</td>
</tr>
<tr>
<td></td>
<td>If '*' is the pointer operator, the right-side expression is not pointer type.</td>
</tr>
<tr>
<td></td>
<td>⇒ For a pointer, check the type of the right-side expression.</td>
</tr>

</table>
| invalid `^=` operands         | • The `^=` operation contains an error.  
⇒ Check the expressions on the left and right sides of the operator.                                      |
| invalid `|=` operands         | • The `|=` operation contains an error.  
⇒ Check the expressions on the left and right sides of the operator.                                      |
| invalid `| |=` operands          | • The `| |=` operation contains an error.  
⇒ Check the expressions on the left and right sides of the operator.                                      |
| invalid `%=` operands         | • The `%=` operation contains an error.  
⇒ Check the expressions on the left and right sides of the operator.                                      |
| invalid `++` operands         | • The `++` unary operator or postfix operator contains an error.  
⇒ For the unary operator, check the right-side expression.  
⇒ For the postfix operator, check the left-side expression.                                           |
| invalid `--` operands         | • The `--` unary operator or postfix operation contains an error.  
⇒ For the unary operator, check the right-side expression.  
⇒ For the postfix operator, check the left-side expression.                                           |
| invalid `->` used             | • The left-side expression of `->` is not struct or union.  
⇒ The left-side expression of `->` must have struct or union.                                        |
| invalid `(? ;)’s condition`  | • The ternary operator is erroneously written.  
⇒ Check the ternary operator.                                                                        |
| invalid array type            | • Incomplete arrays cannot be declared.  
⇒ Specify the number of elements in the multidimensional array.                                        |
| invalid operation for pointer to incomplete type | • Invalid calculation for the pointer to an incomplete type.  
⇒ Define members of a structure or define complete structs.                                           |
| Invalid `#pragma OS Extended function interrupt number` | • The INT No. in `#pragma OS Extended function` is invalid.  
⇒ Specify correctly.                                                                                 |
| Invalid `#pragma INTCALL interrupt number` | • The INT No. in `#pragma INTCALL` is invalid.  
⇒ Specify correctly.                                                                                 |
| Invalid `#pragma SPECIAL special page number` | • The number or format specification written with `#pragma SPECIAL` is incorrect.  
⇒ Specify the number or format correctly.                                                             |
| Invalid `#pragma INTERRUPT vector number` | • The number or format specification written with `#pragma INTERRUPT` is incorrect.  
⇒ Specify the number or format correctly.                                                              |
| invalid CAST operand          | • The cast operation contains an error. The void type cannot be cast to any other type; it can neither be cast from the structure or union type nor can it be cast to the structure or union type.  
⇒ Write the expression correctly.                                                                      |
| invalid asm0’s argument       | • The variables that can be used in asm statements are only the auto variable and argument.  
⇒ Use the auto variable or argument for the statement.                                                  |
| invalid bitfield declare      | • The bit-field declaration contains an error.  
⇒ Write the declaration correctly.                                                                     |
| invalid break statements      | • The break statement is put where it cannot be used.  
⇒ Make sure that it is written in switch, while, dowhile, and for.                                      |
<table>
<thead>
<tr>
<th>Error message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
</table>
| invalid case statements                   | - The switch statement contains an error.  
⇒ Write the switch statement correctly.                                                                                                                      |
| invalid case value                        | - The case value contains an error.  
⇒ Write an integral-type or enumerated-type constant.                                                                                                      |
| invalid cast operator                     | - Use of the cast operator is illegal.  
⇒ Write the expression correctly.                                                                                                                             |
| invalid continue statements               | - The continue statement is put where it cannot be used.  
⇒ Use it in a while, do-while, and for block.                                                                                                                 |
| invalid default statements                | - The switch statement contains an error.  
⇒ Write the switch statement correctly.                                                                                                                       |
| invalid enumerator initialized            | - The initial value of the enumerator is incorrectly specified by writing a variable name, for example.  
⇒ Write the initial value of the enumerator correctly.                                                                                                 |
| invalid function argument                 | - An argument which is not included in the argument list is declared in argument definition in function definition.  
⇒ Declare arguments which are included in the argument list.                                                                                                    |
| invalid function's argument declaration   | - The argument of the function is erroneously declared.  
⇒ Write it correctly.                                                                                                                                         |
| invalid function declare                  | - The function definition contains an error.  
⇒ Check the line in error or the immediately preceding function definition.                                                                                   |
| invalid initializer                       | - The initialization expression contains an error.  
This error includes excessive parentheses, many initialize expressions, a static variable in the function initialized by an auto variable, or a variable initialized by another variable.  
⇒ Write the initialization expression correctly.                                                                                                           |
| invalid initializer of variable-name      | - The initialization expression contains an error.  
This error includes a bit-field initialize expression described with variables, for example.  
⇒ Write the initialization expression correctly.                                                                                                           |
| invalid initializer on array              | - The initialization expression contains an error.  
⇒ Check to see if the number of initialize expressions in the parentheses matches the number of array elements and the number of structure members.                  |
| invalid initializer on char array         | - The initialization expression contains an error.  
⇒ Check to see if the number of initialize expressions in the parentheses matches the number of array elements and the number of structure members.                  |
| invalid initializer on scalar             | - The initialization expression contains an error.  
⇒ Check to see if the number of initialize expressions in the parentheses matches the number of array elements and the number of structure members.                  |
| invalid initializer on struct             | - The initialization expression contains an error.  
⇒ Check to see if the number of initialize expressions in the parentheses matches the number of array elements and the number of structure members.                  |
| invalid initializer, too many brace       | - Too many braces { } are used in a scalar-type initialization expression of the auto storage class.  
⇒ Reduce the number of braces { } used.                                                                                                                      |

</table>
| restrict is duplicate | • A restrict is defined twice.  
⇒ Make sure that a restrict is defined only once. |
| size of incomplete array type | • An attempt is made to find sizeof of an array of unknown size. This is an invalid size.  
⇒ Specify the size of the array. |
| size of incomplete type | • An undefined structure or union is used in the operand of the sizeof operator.  
⇒ Define the structure or union first.  
• The number of elements of an array defined as an operand of the sizeof operator is unknown.  
⇒ Define the structure or union first. |
| size of void | • An attempt is made to find the size of void. This is an invalid size.  
⇒ The size of void cannot be found. |
| Sorry, stack frame memory exhaust, max. 64(or 255) bytes but now nnn bytes | • A maximum of 128 bytes of parameters can be secured on the stack frame. Currently, nnn bytes have been used.  
⇒ Reduce the size or number of parameters. |
| Sorry, compilation terminated because of these errors in functionname. | • An error occurred in some function indicated by function-name. Compilation is terminated.  
⇒ Correct the errors detected before this message is output. |
| Sorry, compilation terminated because of too many errors. | • Errors in the source file exceeded the upper limit (50 errors).  
⇒ Correct the errors detected before this message is output. |
| struct or enum's tag used for union | • The tag name for structure and enumerated type is used as a tag name for union.  
⇒ Change the tag name. |
| struct or union's tag used for enum | • The tag name for structure and union is used as a tag name for enumerated type.  
⇒ Change the tag name. |
| struct or union, enum does not have long or sign | • Type specifiers long or signed are used for the struct/union/enum type specifiers.  
⇒ Write the type specifier correctly. |
| switch's condition is floating | • The float type is used for the expression of a switch statement.  
⇒ Use the integer type or enumerated type. |
| switch's condition is void | • The void type is used for the expression of a switch statement.  
⇒ Use the integer type or enumerated type. |
| switch's condition must integer | • Invalid types other than the integer and enumerated types are used for the expression of a switch statement.  
⇒ Use the integer type or enumerated type. |
| syntax error | • This is a syntax error.  
⇒ Write the description correctly. |

### F.6 c com30 Warning Messages

Table F.20 to Table F.28 list the com30 compiler warning messages and their countermeasures.

<table>
<thead>
<tr>
<th>Warning message</th>
<th>Description and countermeasure</th>
</tr>
</thead>
</table>
| #pragma pragma-name & HANDLER both specified | *Both #pragma pragma-name and #pragma HANDLER are specified in one function.*  
⇒ Specify #pragma pragma-name and #pragma HANDLER exclusive to each other. |
| #pragma pragma-name & INTERRUPT both specified | *Both #pragma pragma-name and #pragma INTERRUPT are specified in one function.*  
⇒ Specify #pragma pragma-name and #pragma INTERRUPT exclusive to each other. |
| #pragma pragma-name & TASK both specified | *Both #pragma pragma-name and #pragma TASK are specified in one function.*  
⇒ Specify #pragma pragma-name and #pragma TASK exclusive to each other. |
| #pragma pragma-name format error | *The #pragma pragma-name is erroneously written.*  
Processing will be continued.  
⇒ Write it correctly. |
| #pragma pragma-name format error, ignored | *The #pragma pragma-name is erroneously written.*  
This line will be ignored.  
⇒ Write it correctly. |
| #pragma pragma-name not function, ignored | *A name is written in the #pragma pragma-name that is not a function.*  
⇒ Write it with a function name. |
| #pragma pragma-name's function must be predeclared, ignored | *A function specified in the #pragma pragma-name is not declared.*  
⇒ For functions specified in a #pragma pragma-name, write prototype declaration in advance. |
| #pragma pragma-name's function must be prototyped, ignored | *A function specified in the #pragma pragma-name is not prototype declared.*  
⇒ For functions specified in a #pragma pragma-name, write prototype declaration in advance. |
| #pragma pragma-name's function return type invalid, ignored | *The type of return value for a function specified in the #pragma pragma-name is invalid.*  
⇒ Make sure the type of return value is any type other than struct, union, or double. |
| #pragma pragma-name unknown switch, ignored | *The switch specified in the #pragma pragma-name is invalid.*  
⇒ Write it correctly. |
| #pragma pragma-name variable initialized, initialization ignored | *The variable specified in #pragma pragma-name is initialized. The specification of #pragma pragma-name will be nullified.*  
⇒ Delete either #pragma pragma-name or the initialize expression. |
| #pragma ASM line too long, then cut | *The line in which #pragma ASM is written exceeds the allowable number of characters = 1,024 bytes.*  
⇒ Write it within 1,024 bytes. |

</tbody>
</table>
| meaningless statements deleted in optimize phase | • Meaningless statements were deleted during optimization.  
⇒ Delete meaningless statements. |
| meaningless statement                        | • The tail of a statement is "=".  
⇒ You may confuse "=" with '!='. Check on it. |
| mismatch function pointer assignment        | • The address of a function having a register argument is substituted for a pointer to a function that does not have a register argument (i.e., a nonprototyped function).  
⇒ Change the declaration of a pointer variable for function to a prototype declaration. |
| multi-character character constant          | • A character constant consisting of two characters or more is used.  
⇒ Use a wide character (L'xx') when two or more characters are required. |
| near/far is conflict beyond over typedef     | • The type defined by specifying near/far is again defined by specifying near/far when referencing it.  
⇒ Write the type specifier correctly. |
| No hex digit                                | • The hex constant contains some character that cannot be used in hex notation.  
⇒ Use numerals 0 to 9 and alphabets A to F and a to f to describe hex constants. |
| No initialized of variable name             | • It is probable that the register variables are used without being initialized.  
⇒ Make sure the register variables are assigned the appropriate value. |
| No storage class & data type in declare, global storage class & int type assumed            | • The variable is declared without storage-class and type specifiers. It will be handled as int when processed.  
⇒ Write the storage-class and type specifiers. |
| non-initialized variable “variable name” is used | • It is probable that uninitialized variables are being referenced.  
⇒ Check the statement description. This warning can occur in the last line of the function. In such a case, check the description of the auto variables, etc. in the function. If the description is correct, ignore this warning. |
| non-prototyped function used                | • A function is called that is not declared of the prototype. This message is output only when you specified the -Wnon_prototype option.  
⇒ Write prototype declaration. Or delete the option "-Wnon_prototype". |
| non-prototyped function declared            | • A prototype declaration for the defined function cannot be found. (Displayed only when the -Wnon_prototype option is specified.)  
⇒ Write a prototype declaration. |
| octal constant is out of range              | • The octal constant contains some character that cannot be used in octal notation.  
⇒ Use numerals 0 to 7 to describe octal constants. |
| octal_character is out of range             | • The octal constant contains some character that cannot be used in octal notation.  
⇒ Use numerals 0 to 7 to describe octal constants. |

</table>
| overflow in floating value converting to integer | A very large floating-point number that cannot be stored in integer type is being assigned to the integer type.  
⇒ Reexamine the assignment expression. |
| old style function declaration | The function definition is written in format prior to ANSI (ISO) C.  
⇒ Write the function definition in ANSI (ISO) format. |
| prototype function is defined as non-prototype function before. | The non-prototyped function is redefine prototype-declaration.  
⇒ Unite ways to declare function type. |
| redefined type | Redfine typedef.  
⇒ Check typedef. |
| redefined type name of (qualify) | The same identifier is defined twice or more in typedef.  
⇒ Write identifier correctly. |
| register parameter function used before as stack parameter function | The function for register argument is used as a function for stack argument before.  
⇒ Write a prototype declaration before using the function. |
| RESTRICT qualifier can set only pointer type. | The RESTRICT qualifier is declared outside a pointer.  
⇒ Declare it in only a pointer. |
| section name 'interrupt' no more used | The section name specified by "pragma SECTION uses 'interrupt'.  
⇒ A section name 'interrupt' cannot be used. Change it to another. |
| size of incomplete type | An undefined structure or union is used in the operand of the size of operator.  
⇒ Define the structure or union first. |
| size of incomplete array type | The number of elements of an array defined as an operand of the size of operator is unknown.  
⇒ Define the structure or union first. |
| size of void | An attempt is made to find the size of void. This is an invalid size.  
⇒ The size of void cannot be found. |
| standard library "function-name()" need “include-file name” | This standard library function is used without its header file included.  
⇒ Be sure to include the header file. |
| static variable in inline function | Static data is declared within a function that is declared in storage class inline.  
⇒ Do not declare static data in an inline function. |
| string size bigger than array size | The size of the initialize expression is greater than that of the variable to be initialized.  
⇒ Make sure that the size of the initialize expression is equal to or smaller than the variable. |
| string terminator not added | Since the variable to be initialized and the size of the initialize expression are equal, "\0" cannot be affixed to the character string.  
⇒ Increase a element number of array. |

| Unknown optimize option (-mx) | - The option -mx cannot be specified.  
⇒ Specify the option correctly. |
| Unknown optimize option (-Ox) | - The option -Ox cannot be specified.  
⇒ Specify the option correctly. |
| Unknown option (-x) | - The option -x cannot be specified.  
⇒ Specify the option correctly. |
| unknown pragma pragma-specification used | - Unsupported #pragma is written.  
⇒ Check the content of #pragma.  
*This warning is displayed only when the Unknown pragma (WUP) option is specified. |
| wchar_t array initialized by char string | - The initialize expression of the wchar_t type is initialized by a character string of the char type.  
⇒ Make sure that the types of the initialize expression are matched. |
| zero divide in constant folding | - The divisor in the divide operator or remainder calculation operator is 0.  
⇒ Use any value other than 0 for the divisor. |
| zero divide, ignored | - The divisor in the divide operator or remainder calculation operator is 0.  
⇒ Use any value other than 0 for the divisor. |
| zero width for bitfield | - The bit-field width is 0.  
⇒ Write a bit-field equal to or greater than 1. |
| no const in previous declaration | - The function or variable declaration without const qualification is const-qualified on the entity definition side.  
⇒ Make sure the function or variable declaration and the const qualification on the entity definition side are matched. |
| xxx was declared but never referenced | - There is a declaration that is not referenced.  
⇒ Delete the declaration. |
Appendix G  The SBDATA declaration & SPECIAL page Function declaration Utility (utl30)

How to startup the SBDATA declaration & SPECIAL page function declaration utility (utl30) and how the startup options works are described here.

G.1  Introduction of utl30

G.1.1  Introduction of utl30 processes

The SBDATA declaration & SPECIAL page Function declaration Utility utl30 processes the absolute module file (having the extension.x30).

The utl30 generates a file that contains SBDATA declarations (located in the SB area beginning with the most frequently used one, "#pragma SBDATA") and a file that contains SPECIAL page function declarations (located in the SPECIAL page area beginning with the most frequently used one, "#pragma SPECIAL").

To use utl30, specify the compile driver startup option -finfo when compiling, so that the absolute module file (.x30) will be generated.

Figure G.1 illustrates the NC30 processing flow.
Figure G.1 NC30 Processing Flow
G.2 Starting utl30

G.2.1 utl30 Command Line Format

For starting utl30, you have to specify the information and parameter that required.

![utl30 Command Line Format](image)

Before utl30 can be used, the following startup options of the compiler must both be specified in order to generate an absolute module file (extension .x30):

- `-finfo` option to output an inspector information
- `-g` option to output debugging information

The following utl30 options are also specified:

- `-o` option to output of information (SBDATA declaration or SPECIAL page Function declaration)

(By default, information is output to the standard output device.)
G.2.2 Selecting Output Informations

To select outputs between “SBDATA declaration” and “SPECIAL page function declaration” in utl30, specify the options described below. If neither option is specified, an error is assumed for utl30.

1. Output SBDATA declaration
   - Option "-sb30"

2. Output SPECIAL page Function declaration
   - Option "-sp30"

Figure G.3 shows the sbutl command line options.
### G.2.3 utl30 Command Line Options

The following information (input parameters) is needed in order to start utl30. Table G.1 shows the utl30 command line options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Short form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-all</td>
<td>None</td>
<td>[When used simultaneously with the -sb30 option] Because the usage frequency is low, SBDATA declaration is output in the form of a comment for even the variables that are not placed in the SB area. [When used simultaneously with the -sp30 option] Because the usage frequency is low, SPECIAL declaration is output in the form of a comment for even the functions that are not placed in the SPECIAL page area.</td>
</tr>
<tr>
<td>-fsection</td>
<td>None</td>
<td>The variables and functions specified by #pragma SECTION are also included among those to be processed.</td>
</tr>
<tr>
<td>-fover_write</td>
<td>-fOW</td>
<td>Forcibly writes over the output file name specified with the -o option.</td>
</tr>
<tr>
<td>-o</td>
<td>None</td>
<td>Outputs the result of SBDATA declaration or SPECIAL Page Function declaration to a file. With this option not specified, outputs the result to the host machine's (either EWS or personal computer) standard output device. No extensions can be specified. If the specified file already exists, the result is written to the standard output device.</td>
</tr>
<tr>
<td>-sb30</td>
<td>None</td>
<td>-sb30 -&gt; Outputs SBDATA declaration. -sp30 -&gt; Outputs SPECIAL page function declaration. To use utl30, always specify one of the two options. If neither option is specified, an error is assumed.</td>
</tr>
<tr>

<tbody>
<tr>
<td>-all</td>
</tr>
</tbody>
</table>

- When used simultaneously with the -sb30 option
  Because the usage frequency is low, SBDATA declaration is output in the form of a comment for even the variables that are not placed in the SB area.
- When used simultaneously with the -sp30 option
  Because the usage frequency is low, SPECIAL declaration is output in the form of a comment for even the functions that are not placed in the SPECIAL page area.

Supplement: Use of this option helps to find the functions which are not called, even for once in program execution. However, the functions which are called only indirectly require the user's attention, because such functions are indicated to have been called 0 times.

-fower_write

Function:

- Does not check whether the output file specified by -o already exists. If such file exists, it is overwritten.
- This option must be specified along with the -o option.

-fsection

Function:

- The variables and functions located in areas whose section names have been altered by #pragma SECTION are also included among those to be processed.

Notes:

- If #pragma SECTION is used for an explicit purpose of locating a particular variable or function at a given address, do not specify this option, because the variable or function may be located at an unintended different address by SBDATA or SPECIAL page declaration.
### -o

<table>
<thead>
<tr>
<th>Outputs the declared SBDATA result display file</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function:</strong> Outputs the result of SBDATA declaration or SPECIAL Page Function declaration to a file. With this option not specified, outputs the result to the host machine's (either EWS or personal computer) standard output device. If the specified file already exists, the result is written to the standard output device.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
G.3 Notes

(1) In using utl30, .sbsym declared in files described in assembler cannot be counted. For this reason, you need to make adjustment, if a "sbsym" declared in assembler is present, so that the results effected after having executed utl30 are put in the SB area.

(2) In using utl30, SPECIAL Page Function declared in files described in assembler cannot be counted. For this reason, you need to make adjustment, if a SPECIAL Page Function declared in assembler is present, so that the results effected after having executed utl30 are put in the SPECIAL Page area.

G.4 Conditions to establish SBDATA declaration & SPECIAL Page Function declaration

G.4.1 Conditions to establish SBDATA declaration

Variables give below are excluded from SBDATA declaration.

- variables positioned in sections worked on by #pragma SECTION
- variables defined by #pragma ADDRESS
- variables defined by #pragma ROM
- const-qualified variables (except when -fconst_not_ROM or -fCNR has been specified for compilation)

If variables declared by use #pragma SBDATA have already been present in a program, the declaration is given a higher priority in using utl30, and variables to be allocated are picked out of the remainder of the SB area.

G.4.2 Conditions to establish SPECIAL Page Function declaration

The functions to be processed by utl30 are only those external functions that are listed below.

- Functions which are not declared with static
- Functions which are called four times or more

Note, however, that even the above functions may not be processed if they belong to one of the following:

- functions positioned in sections worked on by #pragma SECTION
- functions defined by any #pragma

If variables declared by use #pragma SPECIAL have already been present in a program, the declaration is given a higher priority in using utl30, and variables to be allocated are picked out of the remainder of the SB area.
G.5 Example of utl30 use

G.5.1 Generating a SBDATA declaration file

a. Generating a SBDATA declaration file

You can output a SBDATA declaration file by means of causing the SBDATA declaration utility utl30 to process files holding information as to the state of using variables. Figure G.4 shows an example of making entries in utl30, and Figure G.5 shows an example of SBDATA declaration file.

```bash
% utl30 -sb30 ncrt0.x30 -osbdata<RET>

%: Prompt
ncrt0.x30 : Name of absolute file
```

Figure G.4 Example utl30 Command Line

```c
/*
 * #pragma SBDATA Utility
 */

/* SBDATA Size [255] */
#pragma SBDATA data3  /* size = (4) / ref = [ 2] */
#pragma SBDATA data2  /* size = (1) / ref = [ 1] */
#pragma SBDATA data1  /* size = (2) / ref = [ 1] */

/*
 * End of File
 */

(1) Size() is size of data
(2) ref() is access count of the variables
```

Figure G.5 SBDATA declaration File (sbdata.h)
You include the SBDATA declaration file generated above in a program as a header file. Figure G.6 shows an example of making setting in a SBDATA file.

Figure G.6 shows an example of making setting in a SBDATA file.

```c
#include "sbdata.h"

void func(void)
{
    (commit)

    // Other code...
}
```

Figure G.6 Example of making settings in a SBDATA
b. Adjustment in an instance in which SB declaration is made in assembler

If the SB area is used as a result of the .sbsym declaration in an assembler routine, you need to adjust the file generated by utl30.

```
[assembler routine]
    .sbsym _sym
    (omitted)
    .glob _sym
    _sym:
    .blkb 2

[generated file by utl30]
    */
    */ #pragma SBDATA Utility
    */
    /* SBDATA Size [255] */
    #pragma SBDATA    data3 /* size = (4) / ref = [ 2] */
    #pragma SBDATA    data2 /* size = (1) / ref = [ 1] */
    (omitted)
    #pragma SBDATA    data1 /* size = (2) / ref = [ 1] */
    */
    /* End of File */
    */

Since 2-byte data are SB-declared in an assembler routine, you subtract 2 bytes of SBDATA declaration from the file generated by utl30.

Example)
    (omitted)
    // #pragma SBDATA    data1 /* size = (2) / ref = [ 1] */ /* Comments out*/
```

Figure G.7 Example of adjust the file generated by utl30
G.5.2 Generating a SPECIAL Page Function declaration file

a. Generating a SPECIAL Page Function declaration file

It is possible to output SPECIAL page function declaration and SPECIAL page vector definition files by having the absolute module file (generated by using the option -finfo when compiling) processed by utl30, the SBDATA Declaration & SPECIAL Page Function Declaration Utility.

Figure G.8 shows an example of input for utl30. Figure G.9 shows an example of a SPECIAL page function declaration file. Figure G.10 shows an example of a SPECIAL page vector definition file.

```
% utl30  -sp30  ncrt0.x30  -o special<RET>

% : Prompt
ncrt0.x30 : Name of absolute file
```

Figure G.8 Example utl30 Command Line

```
/*
 * #pragma SPECIAL PAGE Utility
 */
/* SBDATA Size [255] */
#pragma SPECIAL  255  func1  /* size = (100) / ref = [ 10] */
#pragma SPECIAL  254  func2  /* size = (100) / ref = [ 7] */
#pragma SPECIAL  253  func3  /* size = (100) / ref = [ 5] */
(1)    (2)
/*
 * End of File
 */

(1) Indicates the function size.
(2) Indicates the reference frequency of function.
```

Figure G.9 SPECIAL Page Function declaration File (special.h)
You include the SPECIAL Page Function declaration file generated above in a program as a header file. Figure G.10 shows an example of making setting in a SPECIAL Page Function declaration File.

```c
#include  "special.h"
void func(void) {
    (ommit)
};
```

Figure G.10 Example of making settings in a SPECIAL Page Function File
G.6 utl30 Error Messages

G.6.1 Error Messages

Table G.2 lists the utl30 calculation utility error messages and their countermeasures.

Table G.2 sbutl Error Messages

<table>
<thead>
<tr>
<th>Error message</th>
<th>Contents of error and corrective action</th>
</tr>
</thead>
<tbody>
<tr>
<td>ignore option '??'</td>
<td>• You specified an option that cannot be in used utl30. ⇒ Specify a proper option.</td>
</tr>
<tr>
<td>Illegal file extension'.XXX'</td>
<td>• Extension of input file is illegal. ⇒ Specify a proper file.</td>
</tr>
<tr>
<td>No input &quot;x30&quot; file specified</td>
<td>• No map file ⇒ Specify map file.</td>
</tr>
<tr>
<td>cannot open &quot;x30&quot; file 'file-name'</td>
<td>• Map file not found ⇒ Specify the correct input map file.</td>
</tr>
<tr>
<td>cannot close file 'file-name'</td>
<td>• input file cannot be closed ⇒ Specify the correct input file-name.</td>
</tr>
<tr>
<td>not enough memory</td>
<td>• The extended memory is insufficient ⇒ Increase the extended memory</td>
</tr>
<tr>
<td>since 'file-name' file exist, it makes a standard output</td>
<td>• The 'file-name' specified with -o already exist. ⇒ Check the output file name. The file can be overwritten by specifying -fover_write simultaneously with the options.</td>
</tr>
</tbody>
</table>

G.6.2 Warning Messages

Table G.3 lists the sbutl utility warning messages and their countermeasures.

Table G.3 sbutl Warning Messages

<table>
<thead>
<tr>
<th>Warning Message</th>
<th>Contents of warning and corrective action</th>
</tr>
</thead>
<tbody>
<tr>
<td>conflict declare of variable</td>
<td>• The variable shown here is declared in multiple files with different storage classes, types, etc. ⇒ Check how this variable is declared.</td>
</tr>
<tr>
<td>conflict declare of function</td>
<td>• The function shown here is declared in multiple files with different storage classes, types, etc. ⇒ Check how this function is declared.</td>
</tr>
</tbody>
</table>
Appendix H Using gensni or the stack information File Creation Tool for Call Walker

Before Call Walker or the stack analysis tool of the High-performance Embedded Workshop can be used, you must have stack information files as the input files for it. You use gensni or the stack information file creation tool for Call Walker to create these stack information files from the absolute module file.

H.1 Starting Call Walker

To start Call Walker, select “Call Walker” that is registered to the High-performance Embedded Workshop or select the tool from the Tools menu of the High-performance Embedded Workshop. After starting Call Walker, choose Import Stack File from the File menu and select a stack information file as the input file for Call Walker. Values indicated by Call Walker are not strictly accurate so simply use them for reference when you examine the size of the stack space. Careful evaluation is needed if you have decided the actual size of the stack space according to the information indicated by Call Walker.

H.2 Outline of gensni

H.2.1 Processing Outline of gensni

gensni is the tool to create stack information files for Call Walker. gensni generates a stack information file by processing the absolute module file (extension .x30). Before gensni can be used, there must be an absolute module file (extension .x30) available. Specify the compile option “-finfo”, “-g” during compilation to generate that file. The processing flow of NC30 is shown in Figure H.1.
H.3 Starting gensni

If Call Walker is started from the High-performance Embedded Workshop, gensni is automatically executed. However, if Call Walker is started from other than the High-performance Embedded Workshop, gensni is not automatically executed. In this case, start gensni from the Windows command prompt.

H.3.1 Input format

To start gensni, specify an input file name and startup option according to the input format shown below.
To use gensni, specify both of the following in the startup options of this compiler:

- Inspector information output ......................................................... -finfo option
- Information output to a specified file ........................................... -o option

(By default, the information is output to a file named after the input file by changing the file extension from "x30" to "sni".)

Generate an absolute module file:

```
% nc30 -finfo ncr0.a30 sample.c <RET>
```

Generate stack information file:

```
% gensni -o sample ncr0.x30<RET>
```

sample.sni is created.
H.3.2 Option References

The startup options of gensni are listed in Table H.1.

<table>
<thead>
<tr>
<th>gensni Command option</th>
<th>short form</th>
<th>function</th>
</tr>
</thead>
</table>
| -o file name          | None       | Specify a stack information file name.  
  * If this option is not specified, stack information file is named after the input file by changing its file extension to “.sni.”  
  * If an extension is specified stack information file name, the specified extension is changed to “.sni.” If no extensions are specified, the extension “.sni” is assumed. |
| -V                    | None       | Shows the startup message of gensni and terminates processing without performing anything.  
  No stack information files are generated. |

- **-o file**
  - **Specify a stack information file name**
  - **Function:**  
    * If this option is not specified, stack information file is named after the input file by changing its file extension to “.sni.”  
    * If no extensions are specified, the extension “.sni” is assumed.  
  - **Description:** Use of this option permits you to change stack information file name as necessary.  
    The extension can also be changed.

- **-V**
  - **Terminate processing after showing the startup message of gensni**
  - **Function:**  
    * Shows the startup message of gensni and terminates processing without performing anything.  
    * No stack information files are generated.
