The QCIOT-HS4001POCZ board enables quick prototyping of the HS4001 High-Performance Relative Humidity and Temperature Sensor in a custom system design. The board provides a standard Pmod™ Type 6A (extended I2C) connection for the onboard sensor to plug into any required MCU evaluation kit with a matching connector.

The QCIOT-HS4001POCZ features Pmod connectors on both sides of the board to allow additional Type 6/6A boards to be connected in a daisy-chained solution with multiple sensors on the same MCU Pmod connector. Software support present in the Renesas IDE (e2 studio) provides code generation to connect the sensor and the MCU, thereby significantly reducing development time. With its standard connector and software support, the QCIOT-HS4001POCZ is ideal for the Renesas Quick-Connect IoT to rapidly create an IoT system.

Kit Contents
- QCIOT-HS4001POCZ Board

Features
- Relative humidity HS4001 sensor sample mounted:
  - RH accuracy: ±1.5%RH
  - ±0.2°C, typical (-10°C to +80°C)
  - Very low current consumption: 0.3μA average (8-bit resolution, 3.3V supply)
- Standardized type 6A Pmod connector supports I2C extended interface
- Dual connectors allow pass-through signals for daisy-chained solutions
- Software support in e2 studio minimizes development time with one-click code generation

1. Setup

1.1 Required or Recommended User Equipment

The following additional lab equipment (sold separately) is required for using the board:

- Any MCU board that supports Type 6A Pmod.
- US082-INTERPEVZ interposer board if using one of the Renesas MCU kits shown in Table 1.

Table 1. Renesas MCU Evaluation Kits\(^\text{1}\) Capable of Supporting Type 6A PMODs When Used with the US082-INTERPEVZ

\(^1\) This table is not a comprehensive list of supported MCU Kits. Refer to the evaluation kit hardware manual to confirm Pmod pinout.

1.2 Software Installation and Usage

Visit the Renesas website for the latest version of the e2 studio installer. The minimum FSP version supporting the HS400x sensor blocks is FSP 3.8.0. For the latest sensor support, ensure that the latest release is used.

Visit the Renesas Quick-Connect IoT webpage for more information about creating your customized system solution.

1.3 Kit Hardware Connections

Follow these procedures to set up the kit as shown on Figure 2.

1. Ensure the MCU evaluation kit being used has a Pmod connector set to Type 6A (refer to the kit hardware manual if unsure).
   a. If no Type 6A Pmod is available, ensure the MCU evaluation kit can use the US082-INTERPEVZ interposer board and insert the board into the MCU connector before adding any sensor boards.
2. Plug in the QCIOT-HS4001POCZ to the Type 6A connector, being careful to align Pin 1 on the sensor board and MCU kit.
3. Connect the J3, J4 and J5 jumpers to place 4.7k\(^\Omega\) pull-up resistors on the IRQ# and I\(^2\)C bus lines.
   a. Only one set of I\(^2\)C pull-up resistors should be used on the bus. If multiple sensor boards are used, only one board should have the jumpers present.
   b. If multiple modules use the IRQ# line on the PMOD, only one pull-up jumper should be present.
   c. MCU kits typically do not have pull-up resistors present on the bus lines but be sure to check for them.
4. The sensor is now ready to be used in the system. Follow the MCU kit instructions for connecting and powering up the evaluation kit.

2. Usage Guide

The QCIOT-HS4001POCZ functions as a sensor building block to create a custom system solution. It can be used individually or with a combination of other sensors using the Pmod Type 6A interface. See the Renesas Quick-Connect IoT webpage for a list of available Pmod sensor boards. Along with a simple hardware connection, the software sensor block in the Renesas software package allows the user to generate all the necessary glue code between the sensor and the MCU with the simple click of a button.

![Image of QCIOT-HS4001POCZ Pmod Board Features]

2.2 Programming Interface

Programming of the system can be accomplished through Renesas' IDE, e2 studio. See the MCU evaluation kit documentation to set up the initial project in e2 studio. As the project is initialized, adding the HS4001 sensor to the project only takes a few steps.

1. Navigate to the FSP Configuration View / file. In the case shown in Figure 4, select the r_hs4001_rx.
2. Select the HS4001 Stack and edit the configuration values for required operation.
3. Click the Generate Code icon and the system generates the code to configure the sensor with the MCU.
4. Sample calls are shown in Figure 5. This shows the function to open the sensors, similar calls are required for the I²C bus. Review the manual related to FSP configuration and function APIs for additional information.

   **Note:** User is recommended to download and review Sample projects that are available on the Renesas website.

5. Use the data in your given application.
/* Quick setup for g_hs400x_sensor0. */
void g_hs400x_sensor0_quick_setup(void)
{
    fsp_err_t err;

    /* Open HS400X sensor instance, this must be done before calling any HS400X API */
    err = RM_HS400X_Open(g_hs400x_sensor0.p_ctrl, g_hs400x_sensor0.p_cfg);
    assert(FSP_SUCCESS == err);
}

Figure 5. Example Code to Start the Sensor after Configuration in FSP

For more information on creating your full system design, further information on software development, and additional hardware availability, visit the Renesas Quick-Connect IoT webpage.
