To our customers,

---

**Old Company Name in Catalogs and Other Documents**

On April 1\textsuperscript{st}, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: [http://www.renesas.com](http://www.renesas.com)

April 1\textsuperscript{st}, 2010
Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation ([http://www.renesas.com](http://www.renesas.com))

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.

2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.

4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.

5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.

6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors or omissions from the information included herein.

7. Renesas Electronics products are classified according to the following three quality grades: “Standard”, “High Quality”, and “Specific”. The recommended applications for each Renesas Electronics product depends on the product’s quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as “Specific” without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as “Specific” or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is “Standard” unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.

   “Standard”: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.

   “High Quality”: Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.

   “Specific”: Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.

8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.

9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.

10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.

(Note 1) “Renesas Electronics” as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.

(Note 2) “Renesas Electronics product(s)” means any product developed or manufactured by or for Renesas Electronics.

Keep safety first in your circuit designs!

1. Renesas Technology Corp. puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

1. These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corp. product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corp. or a third party.
2. Renesas Technology Corp. assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
3. All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corp. without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor for the latest product information before purchasing a product listed herein. The information described here may contain technical inaccuracies or typographical errors. Renesas Technology Corp. assumes no responsibility for any damage, liability, or other loss resulting from these inaccuracies or errors. Please also pay attention to information published by Renesas Technology Corp. by various means, including the Renesas Technology Corp. Semiconductor home page (http://www.renesas.com).
4. When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corp. assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
5. Renesas Technology Corp. semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corp. or an authorized Renesas Technology Corp. product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
6. The prior written approval of Renesas Technology Corp. is necessary to reprint or reproduce in whole or in part these materials.
7. If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination. Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
8. Please contact Renesas Technology Corp. for further details on these materials or the products contained therein.

</tr>
</tbody>
</table>

Note: Additional document for the MPUs supported by the emulator is included. Check the target MPU and refer to its additional document.
1.2  Connecting the Emulator with the User System

To connect the E10A-USB emulator (hereinafter referred to as the emulator), the H-UDI port connector must be installed on the user system to connect the user system interface cable. When designing the user system, refer to the recommended circuit between the H-UDI port connector and the MPU. In addition, read the E10A-USB emulator user's manual and hardware manual for the related device.

Table 1.2 shows the type number of the emulator, the corresponding connector type, and the use of AUD function.

<table>
<thead>
<tr>
<th>Type Number</th>
<th>Connector</th>
<th>AUD Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>HS0005KCU02H</td>
<td>36-pin connector</td>
<td>Available</td>
</tr>
<tr>
<td>HS0005KCU01H, HS0005KCU02H</td>
<td>14-pin connector</td>
<td>Not available</td>
</tr>
</tbody>
</table>

The H-UDI port connector has the 36-pin and 14-pin types as described below. Use them according to the purpose of the usage.

1. 36-pin type (with AUD function)
   - The AUD trace function is supported. A large amount of trace information can be acquired in realtime. The window trace function is also supported for acquiring memory access in the specified range (memory access address or memory access data) by tracing.

2. 14-pin type (without AUD function)
   - The AUD trace function cannot be used because only the H-UDI function is supported. For tracing, only the internal trace function is supported. Since the 14-pin type connector is smaller than the 36-pin type (1/2.5), the area where the connector is installed on the user system can be reduced.
1.3 Installing the H-UDI Port Connector on the User System

Table 1.3 shows the recommended H-UDI port connectors for the emulator.

Table 1.3 Recommended H-UDI Port Connectors

<table>
<thead>
<tr>
<th>Connector</th>
<th>Type Number</th>
<th>Manufacturer</th>
<th>Specifications</th>
</tr>
</thead>
<tbody>
<tr>
<td>36-pin connector</td>
<td>DX10M-36S, DX10M-36SE, DX10G1M-36SE</td>
<td>Hirose Electric Co., Ltd.</td>
<td>Screw type, Lock-pin type</td>
</tr>
<tr>
<td>14-pin connector</td>
<td>2514-6002</td>
<td>Minnesota Mining &amp; Manufacturing Ltd.</td>
<td>14-pin straight type</td>
</tr>
</tbody>
</table>

Note: When designing the 14-pin connector layout on the user board, do not place any components within 3 mm of the H-UDI port connector. When designing the 36-pin connector layout on the user board, do not connect any components under the H-UDI connector.

1.4 Pin Assignments of the H-UDI Port Connector

Figures 1.1 and 1.2 show the pin assignments of the 36-pin and 14-pin H-UDI port connectors, respectively.

Note: Note that the pin number assignments of the H-UDI port connector shown on the following pages differ from those of the connector manufacturer.
1. Input to or output from the user system.
2. The slash (/) means that the signal is active-low.
3. The emulator monitors the GND signal of the user system and detects whether or not the user system is connected.
4. If the VccQ pin is not connected to the UVCC, the I/O voltage of the user system interface will be fixed to 3.3 V.
5. The /ASEMD0 pin must be 0 when the emulator is connected and 1 when the emulator is not connected, respectively.
   (1) When the emulator is used: /ASEMD0 = 0
   (2) When the emulator is not used: /ASEMD0 = 1
   To allow the /ASEMD0 pin to be GND by connecting the user system interface cable, connect pin 22 directly to the /ASEMD0 pin. Do not round the pin.

Notes:

Figure 1.1 Pin Assignments of the H-UDI Port Connector (36 Pins)
Notes:
1. Input to or output from the user system.
2. The slash (/) means that the signal is active-low.
3. The emulator monitors the GND signal of the user system and detects whether or not the user system is connected.
4. If the VccQ pin is not connected to the UVCC, the I/O voltage of the user system interface will be fixed to 3.3 V.
5. The /ASEMD0 pin must be 0 when the emulator is connected and 1 when the emulator is not connected, respectively.
   (1) When the emulator is used: /ASEMD0 = 0
   (2) When the emulator is not used: /ASEMD0 = 1
   To allow the /ASEMD0 pin to be GND by connecting the user system interface cable, connect pin 9 directly to the /ASEMD0 pin. Do not ground the pin.
6. This pin can be connected to GND.

Figure 1.2 Pin Assignments of the H-UDI Port Connector (14 Pins)
1.5 **Recommended Circuit between the H-UDI Port Connector and the MPU**

1.5.1 **Recommended Circuit (36-Pin Type)**

Figure 1.3 shows a recommended circuit for connection between the H-UDI and AUD port connectors (36 pins) and the MPU when the emulator is in use. Figure 1.4 shows a circuit for connection when UVCC is not connected.

Notes:
1. Do not connect anything to the N.C. pins of the H-UDI port connector.
2. The /ASEMD0 pin must be 0 when the emulator is connected and 1 when the emulator is not connected, respectively.
   (1) When the emulator is used: /ASEMD0 = 0
   (2) When the emulator is not used: /ASEMD0 = 1
   Figures 1.3 and 1.4 show examples of circuits that allow the /ASEMD0 pin to be GND (0) whenever the emulator is connected by using the user system interface cable. When the /ASEMD0 pin is changed by switches, etc., ground pin 22. Do not connect this pin to the /ASEMD0 pin.
3. When a network resistance is used for pull-up, it may be affected by a noise. Separate TCK from other resistances.
4. The pattern between the H-UDI port connector and the MPU must be as short as possible. Do not connect the signal lines to other components on the board.
5. When the power supply of the user system is turned off, supplying VccQ of the user system to the UVCC pin reduces the leakage current from the emulator to the user system. A level shifter that is activated by the internal power supply or user power supply (changed by the switch) is installed in the interface circuit of the emulator. If the user power is supplied to the UVCC pin, the level shifter is not activated as long as no user power is supplied. When the power supply of the user system is turned off, no current flows from the user interface. The I/O voltage level of the user system interface can be the same as that of the VccQ. To operate the emulator with low voltage (lower than 3.3 V), the VccQ must be supplied to the UVCC pin. Make the emulator’s switch settings so that the VccQ will be supplied (SW2 = 1 and SW3 = 1) (as shown in figure 1.3).
6. The resistance values shown in the figures are for reference.
7. For the pin processing in cases where the emulator is not used, refer to the hardware manual of the related MPU.
When the circuit is connected as shown in figure 1.3, the switches of the emulator are set as SW2 = 1 and SW3 = 1. For details, refer to section 3.8, Setting the DIP Switches, in the SuperH™ Family E10A-USB Emulator User’s Manual.

Figure 1.3 Recommended Circuit for Connection between the H-UDI Port Connector and MPU when the Emulator is in Use (36-Pin Type UVCC Connected)
When the circuit is connected as shown in figure 1.4, the switches of the emulator are set as SW2 = 0 and SW3 = 1. For details, refer to section 3.8, Setting the DIP Switches, in the SuperH™ Family E10A-USB Emulator User’s Manual.

![Diagram](image)
Note: When UVCC is not connected and the user system is turned off, note that the leakage current flows from the emulator to the user system.
1.5.2 Recommended Circuit (14-Pin Type)

Figure 1.5 shows a recommended circuit for connection between the H-UDI and AUD port connectors (14 pins) and the MPU when the emulator is in use. Figure 1.6 shows a circuit for connection when UVCC is not connected.

Notes:
1. Do not connect anything to the N.C. pins of the H-UDI port connector.
2. The /ASEMD0 pin must be 0 when the emulator is connected and 1 when the emulator is not connected, respectively.
   (1) When the emulator is used: /ASEMD0 = 0
   (2) When the emulator is not used: /ASEMD0 = 1
   Figures 1.5 and 1.6 show examples of circuits that allow the /ASEMD0 pin to be GND (0) whenever the emulator is connected by using the user system interface cable. When the /ASEMD0 pin is changed by switches, etc., ground pin 9. Do not connect this pin to the /ASEMD0 pin.
3. When a network resistance is used for pull-up, it may be affected by a noise. Separate TCK from other resistances.
4. The pattern between the H-UDI port connector and the MPU must be as short as possible. Do not connect the signal lines to other components on the board.
5. When the power supply of the user system is turned off, supplying VccQ of the user system to the UVCC pin reduces the leakage current from the emulator to the user system. A level shifter that is activated by the internal power supply or user power supply (changed by the switch) is installed in the interface circuit of the emulator. If the user power is supplied to the UVCC pin, the level shifter is not activated as long as no user power is supplied. When the power supply of the user system is turned off, no current flows from the user interface. The I/O voltage level of the user system interface can be the same as that of the VccQ. To operate the emulator with low voltage (lower than 3.3 V), the VccQ must be supplied to the UVCC pin. Make the emulator’s switch settings so that the VccQ will be supplied (SW2 = 1 and SW3 = 1) (as shown in figure 1.5).
6. The resistance values shown in the figures are recommended.
7. For the pin processing in cases where the emulator is not used, refer to the hardware manual of the related MPU.
When the circuit is connected as shown in figure 1.5, the switches of the emulator are set as SW2 = 1 and SW3 = 1. For details, refer to section 3.8, Setting the DIP Switches, in the SuperH™ Family E10A-USB Emulator User’s Manual.

![Figure 1.5 Recommended Circuit for Connection between the H-UDI Port Connector and MPU when the Emulator is in Use (14-Pin Type UVCC Connected)](image-url)
When the circuit is connected as shown in figure 1.6, the switches of the emulator are set as SW2 = 0 and SW3 = 1. For details, refer to section 3.8, Setting the DIP Switches, in the SuperH™ Family E10A-USB Emulator User’s Manual.

Figure 1.6  Circuit for Connection between the H-UDI Port Connector and MPU when the Emulator is in Use (14-Pin Type UVCC Not Connected*)

Note: When UVCC is not connected and the user system is turned off, note that the leakage current flows from the emulator to the user system.
Section 2  Software Specifications when Using the SH7660 or SH7660A

2.1  Differences between the SH7660, SH7660A, and the Emulator

1. When the emulator system is initiated, it initializes the general registers and part of the control registers as shown in table 2.1. The initial values of the actual SH7660 or SH7660A registers are undefined. When the emulator is initiated from the workspace, a value to be entered is saved in a session.

2. The emulator uses the H-UDI; do not access the H-UDI.

3. Low-Power States (Sleep, Software Standby, and Module Standby)
   For low-power consumption, the SH7660 or SH7660A has sleep, software standby, and module standby states.
   The sleep, software standby, and module standby states are switched using the SLEEP instruction. When the emulator is used, only the sleep state can be cleared with either the normal clearing function or with the [STOP] button, and a break will occur.
   Note: The memory must not be accessed or modified in sleep state.

4. Reset Signals
   The SH7660 or SH7660A reset signals are not set to the SH7660 or SH7660A during emulation started with clicking the GO or STEP-type button. If these signals are input from the user system in command input wait state, a TIMEOUT error will occur. Do not input reset signals after the user system is initiated by the emulator.
   Note: Do not break the user program when the /RESETP, /BREQ, or /WAIT signal is being low. A TIMEOUT error will occur. If the /WAIT or /BREQ signal is fixed to low during break, a TIMEOUT error will occur at memory access.

5. Direct Memory Access Controller (DMAC)
   The DMAC operates even when the emulator is used. When a data transfer request is generated, the DMAC executes DMA transfer.

6. Memory Access during User Program Execution
   When a memory is accessed from the memory window, etc. during user program execution, the user program is resumed after it has stopped in the E10A-USB emulator to access the memory. Therefore, realtime emulation cannot be performed.
   The stopping time of the user program is as follows:
   Environment:
   - Host computer: 800 MHz (Pentium® III)
   - SH7660: 60 MHz (CPU clock)
   - JTAG clock: 10 MHz (TCK clock)
   When a one-byte memory is read from the command-line window, the stopping time will be about 45 ms.

7. Memory Access during User Program Break
   The emulator can download the program for the flash memory area (refer to section 6.22, Download Function to the Flash Memory Area, in the SuperH™ Family E10A Emulator User’s Manual). Other memory write operations are enabled for the RAM area. Therefore, an operation such as memory write or BREAKPOINT should be set only for the RAM area.
8. Cache Operation during User Program Break
   When cache is enabled, the emulator accesses the memory by the following methods:
   - At memory write: Writes through the cache, then writes to the memory.
   - At memory read: Does not change the cache write mode that has been set.
   Therefore, when memory read or write is performed during user program break, the cache state will be changed.

9. UBC
   When [User] is specified in the [UBC mode] list box in the [Configuration] dialog box, the UBC can be used in the user program.
   Do not use the UBC in the user program as it is used by the emulator when [EML] is specified in the [UBC mode] list box in the [Configuration] dialog box.

10. Loading Sessions
    - Information in [JTAG clock] of the [Configuration] dialog box cannot be recovered by loading sessions. Thus the TCK value will be 2.5 MHz.

11. [IO] Window
    - Display and modification
      Do not change values of the User Break Controller because it is used by the emulator.
      For each watchdog timer register, there are two registers to be separately used for write and read operations.

<table>
<thead>
<tr>
<th>Register Name</th>
<th>Usage</th>
<th>Register</th>
</tr>
</thead>
<tbody>
<tr>
<td>WTCSR(W)</td>
<td>Write</td>
<td>Watchdog timer control/status register</td>
</tr>
<tr>
<td>WTCNT(W)</td>
<td>Write</td>
<td>Watchdog timer counter</td>
</tr>
<tr>
<td>WTCSR(R)</td>
<td>Read</td>
<td>Watchdog timer control/status register</td>
</tr>
<tr>
<td>WTCNT(R)</td>
<td>Read</td>
<td>Watchdog timer counter</td>
</tr>
</tbody>
</table>

- The watchdog timer operates only when the user program is executed. Do not change the value of the frequency change register in the [IO] window or [Memory] window.
• The internal I/O registers can be accessed from the [IO] window. However, note the following when accessing the SDMR register of the bus-state controller. Before accessing the SDMR register, specify addresses to be accessed in the I/O-register definition file (SH7660.IO) and then activate the High-performance Embedded Workshop. After the I/O-register definition file is created, the MPU’s specification may be changed. If each I/O register in the I/O-register definition file differs from addresses described in the hardware manual, change the I/O-register definition file according to the description in the hardware manual. The I/O-register definition file can be customized depending on its format. Note that, however, the emulator does not support the bit-field function.

• Verify

In the [IO] window, the verify function of the input value is disabled.

12. Illegal Instructions

If illegal instructions are executed by STEP-type commands, the emulator cannot go to the next program counter.
2.2 Specific Functions for the Emulator when Using the SH7660 or SH7660A

The SH7660 or SH7760A does not support the following functions:

- MMU-related functions (The SH7660 or SH7660A does not mount the MMU.)
  - VPMAP-related command
  - Virtual and Physical specification in the [Configuration] window
  - Virtual and Physical specification on the command-line function
  - Virtual and Physical specification in the [Breakpoint] window
  - LDTLB instruction execution break function
  - MEMORYAREA_SET command

In the SH7660 or SH7660A, a reset must be input when the emulator is activated. Do not use the activation method described in item 12 of section 3.11 in the SuperH™ Family E10A-USB Emulator User’s Manual.

2.2.1 Break Condition Functions

In addition to BREAKPOINT functions, the emulator has Break Condition functions. Three types of conditions can be set under Break Condition 1, 2, 3. Table 2.3 lists these conditions of Break Condition.
<table>
<thead>
<tr>
<th>Break Condition Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address bus condition (Address)</td>
<td>Breaks when the SH7660 or SH7660A address bus value or the program counter value matches the specified value.</td>
</tr>
<tr>
<td>Data bus condition (Data)</td>
<td>Breaks when the SH7660 or SH7660A data bus value matches the specified value. Byte, word, or longword can be specified as the access data size.</td>
</tr>
<tr>
<td>X-Bus or Y-Bus condition (Address and data)</td>
<td>Breaks when the X-Bus or Y-Bus address bus or data bus matches the specified value.</td>
</tr>
</tbody>
</table>
| Bus state condition (Bus State) | There are two bus state condition settings:  
Read/Write condition: Breaks when the SH7660 or SH7660A RD or RDWR signal level matches the specified condition.  
Bus state condition: Breaks when the operating state in an SH7660 or SH7660A bus cycle matches the specified condition.  
Types of buses that can be specified are listed below.  
- L-bus (CPU-ALL): Indicates an instruction fetch and data access, including a hit to the cache memory.  
- L-bus (CPU-Data): Indicates a data access by the CPU, including a hit to the cache memory.  
- I-bus (CPU.DMA): Indicates a CPU cycle when the cache memory is not hit, and a data access by the DMA. |
| Internal I/O break condition | Breaks when the SH7660 or SH7660A accesses the internal I/O. |
| Count | Breaks when the conditions set are satisfied the specified number of times. |

Note: When U-RAM or X/Y-RAM is accessed from the P0 space, the I-bus must be selected, and when accessed from the P2 space, the L-bus must be selected. When cache fill cycle is acquired, the I-bus must be selected.
Table 2.4 lists the combinations of conditions that can be set under Break Condition 1, 2, 3.

**Table 2.4 Dialog Boxes for Setting Break Conditions**

<table>
<thead>
<tr>
<th>Dialog Box</th>
<th>Type</th>
<th>Address Bus Condition (Address)</th>
<th>Data Bus Condition (Data)</th>
<th>Bus State Condition (Bus Status)</th>
<th>Count Condition (Count)</th>
<th>Internal I/O Break</th>
</tr>
</thead>
<tbody>
<tr>

<td>X</td>
</tr>
<tr>
<td>[Break Condition 3] dialog box</td>
<td></td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>X</td>
<td>O</td>
</tr>
</tbody>
</table>

Notes: 1. O: Can be set in the dialog box.
   X: Cannot be set in the dialog box.
   2. For Break Condition 2, X-bus and Y-bus conditions cannot be specified.

2.2.2 Trace Functions

The emulator supports the trace functions listed in Table 2.5.

**Table 2.5 Trace Functions**

<table>
<thead>
<tr>
<th>Function</th>
<th>Internal Trace</th>
<th>AUD Trace</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch trace</td>
<td>Supported (eight branches)</td>

</tr>
<tr>
<td>Range memory access trace</td>
<td>Not supported</td>
<td>Supported</td>
</tr>
<tr>
<td>Software trace</td>
<td>Not supported</td>
<td>Supported</td>
</tr>
</tbody>
</table>

Table 2.6 shows the type numbers that the AUD function can be used.

**Table 2.6 Type Number and AUD Function**

<table>
<thead>
<tr>
<th>Type Number</th>
<th>AUD Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>HS0005KCU01H</td>
<td>Not supported</td>
</tr>
<tr>
<td>HS0005CU02H</td>
<td>Supported</td>
</tr>
</tbody>
</table>
AUD Trace Functions: This function is operational when the AUD pin of the device is connected to the emulator. Table 2.7 shows the AUD trace acquisition mode that can be set in each trace function.

Table 2.7  AUD Trace Acquisition Mode

<table>
<thead>
<tr>
<th>Type</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Continuous trace occur</td>
<td>Realtime trace</td>
<td>When the next branch occurs while the trace information is being output, all the information may not be output. The user program can be executed in realtime, but some trace information will be lost.</td>
</tr>
<tr>
<td></td>
<td>Non realtime</td>
<td>When the next branch occurs while the trace information is being output, the CPU stops operations until the information is output. The user program is not executed in realtime.</td>
</tr>
<tr>
<td>Trace buffer</td>
<td>Trace continue</td>
<td>This function overwrites the latest trace information to store the oldest trace information.</td>
</tr>
<tr>
<td>full</td>
<td>Trace stop</td>
<td>After the trace buffer becomes full, the trace information is no longer acquired. The user program is continuously executed.</td>
</tr>
</tbody>
</table>
To set the AUD trace acquisition mode, click the [Trace] window with the right mouse button and select [Setting] from the pop-up menu to display the [Acquisition] dialog box. The AUD trace acquisition mode can be set in the [AUD mode1] or [AUD mode2] group box in the [Trace mode] page of the [Acquisition] dialog box.

![Figure 2.1  [Trace mode] Page](image)

When the AUD trace function is used, select the [AUD function] radio button in the [Trace type] group box of the [Trace mode] page.
(a) Branch Trace Function
The branch source and destination addresses and their source lines are displayed.
Branch trace can be acquired by selecting the [Branch trace] check box in the [AUD function] group box of the [Trace mode] page.
The branch type can be selected in the [AUD Branch trace] page.

(b) Window Trace Function
Memory access in the specified range can be acquired by trace.
Two memory ranges can be specified for channels A and B. The read, write, or read/write cycle can be selected as the bus cycle for trace acquisition.

[Setting Method]
(i) Select the [Channel A] and [Channel B] check boxes in the [AUD function] group box of the [Trace mode] page. Each channel will become valid.
(ii) Open the [Window trace] page and specify the bus cycle and memory range that are to be set for each channel.
Notes: 1. When the [L-bus] or [I-bus] radio button is selected, the following bus cycles will be traced.
   - L-bus: A bus cycle generated by the CPU is acquired. A bus cycle is also acquired when the cache has been hit.
   - I-bus: A bus cycle generated by the CPU or DMA is acquired. A bus cycle is not acquired when the cache has been hit. The address information acquired by the I-bus is 28 bits and the upper 4 bits are displayed as ‘**’. The source cannot be displayed in the [Trace] window.

When U-RAM or X/Y-RAM is accessed from the P0 space, the I-bus must be selected, and when accessed from the P2 space, the L-bus must be selected. When a cache fill cycle is acquired, I-bus must be selected.

2. Address setting when X/Y-bus is selected
   To trace both the X/Y-bus when the X/Y-bus is accessed at the same time, the X-bus condition must be set in channel A, and the Y-bus condition must be set in channel B.
(c) Software Trace Function

Note: This function can be supported with SHC/C++ compiler (manufactured by Renesas Technology Corp.; including OEM and bundle products) V7.0 or later.

When a specific instruction is executed, the PC value at execution and the contents of one general register are acquired by trace. Describe the Trace(x) function (x is a variable name) to be compiled and linked beforehand. For details, refer to the SHC manual.

When the load module is downloaded on the target system and is executed while a software trace function is valid, the PC value that has executed the Trace(x) function, the general register value for x, and the source lines are displayed.

To activate the software trace function, select the [Software trace] check box in the [AUD function] group box of the [Trace mode] page.

Notes on AUD Trace:

1. When the trace display is performed during user program execution, the mnemonics, operands, or source is not displayed.
2. The AUD trace function outputs the differences between newly output branch source addresses and previously output branch source addresses. The window trace function outputs the differences between newly output addresses and previously output addresses. If the previous branch source address is the same as the upper 16 bits, the lower 16 bits are output. If it matches the upper 24 bits, the lower 8 bits are output. If it matches the upper 28 bits, the lower 4 bits are output.
   The emulator regenerates the 32-bit address from these differences and displays it in the [Trace] window. If the emulator cannot display the 32-bit address, it displays the difference from the previously displayed 32-bit address.
3. If the 32-bit address cannot be displayed, the source line is not displayed.
4. In the emulator, when multiple loops are performed to reduce the number of AUD trace displays, only the IP counts up.
5. In the emulator, the maximum number of trace displays is 65534 lines (32767 branches).
   However, the maximum number of trace displays differs according to the AUD trace information to be output. Therefore, the above pointers cannot be always acquired.
6. The AUD trace acquisition is not available when [User] is selected in the [UBC mode] list box of the [Configuration] dialog box. In this case, close the [Trace] window.
7. Do not use the AUD full-trace mode for the VIO function.
8. If a completion-type exception occurs during exception branch acquisition, the next address to the address in which an exception occurs is acquired.
**Internal Trace Function:** This function is activated by selecting the [Internal trace] radio button in the [Trace type] group box of the [Trace mode] page. This function traces and displays the branch instructions. The branch source address and branch destination address for the eight latest branch instructions are displayed. See figure 2.1, [Trace mode] Page.

Notes: 1. If an interrupt is generated at the program execution start or end, including a step operation, the emulator address may be acquired. In such a case, the following message will be displayed. Ignore this address because it is not a user program address.

   *** EML ***

2. If a completion-type exception occurs during exception branch acquisition, the next address to the address in which an exception occurs is acquired.

3. Trace information cannot be acquired for the following branch instructions:
   - The BF and BT instructions whose displacement value is 0
   - Branch to H'AO000000 by reset

4. The internal trace acquisition is not available when [User] is selected in the [UBC mode] list box of the [Configuration] dialog box. In this case, close the [Trace] window.

---

2.2.3 **Notes on Using the JTAG (H-UDI) Clock (TCK) and AUD Clock (AUDCK)**

1. Set the JTAG clock (TCK) frequency to lower than the frequency of the SH7660 or SH7660A peripheral module clock (CKP).

2. Set the AUD clock (AUDCK) frequency to 50 MHz or lower. If the frequency is higher than 50 MHz, the emulator will not operate normally.

3. The set value of the JTAG clock (TCK) is initialized by executing [Reset CPU] or [Reset Go]. Thus the TCK value will be 2.5 MHz.

---

2.2.4 **Notes on Setting the [Breakpoint] Dialog Box**

1. When an odd address is set, the next lowest even address is used.

2. A BREAKPOINT is accomplished by replacing instructions of the specified address. Accordingly, it can be set only to the RAM areas in CS0 to CS6 and the internal RAM areas.

   A BREAKPOINT cannot be set to the following addresses:
   - ROM areas in CS0 to CS6
   - Areas other than CS0 to CS6 except for the internal RAM
   - A slot instruction of a delayed branch instruction
   - An instruction in which Break Condition 2 is satisfied

3. During step operation, BREAKPOINTs are disabled.
4. Conditions set at Break Condition 2 are disabled when an instruction to which a BREAKPOINT has been set is executed. Do not set a BREAKPOINT to an instruction in which Break Condition 2 is satisfied.

5. When execution resumes from the address where a BREAKPOINT is specified, single-step operation is performed at the address and execution is continued from the next PC value. Therefore, realtime operation cannot be performed.

6. When a BREAKPOINT is set to the slot instruction of a delayed branch instruction, the PC value becomes an illegal value. Accordingly, do not set a BREAKPOINT to the slot instruction of a delayed branch instruction.

7. When a BREAKPOINT is set to the cacheable area, the cache block containing the BREAKPOINT address is filled immediately before and after user program execution.

8. Note on DSP repeat loop:
   A BREAKPOINT is equal to a branch instruction. In some DSP repeat loops, branch instructions cannot be set. For these cases, do not set BREAKPOINTS. Refer to the hardware manual of the target MPU for details.

9. If an address of a BREAKPOINT cannot be correctly set in the ROM or flash memory area, a mark \( \bullet \) will be displayed in the [BP] area of the address on the [Editor] or [Disassembly] window by refreshing the [Memory] window, etc. after Go execution. However, no break will occur at this address. When the program halts with the break condition, the mark \( \bullet \) disappears.

2.2.5 Notes on Setting the [Break Condition] Dialog Box and the BREAKCONDITION_SET Command

1. When [Go to cursor], [Step In], [Step Over], or [Step Out] is selected, the settings of Break Condition 2 are disabled.

2. Break Condition 2 is disabled when an instruction to which a BREAKPOINT has been set is executed. Accordingly, do not set a BREAKPOINT to an instruction which satisfies Break Condition 2.

3. When a Break Condition is satisfied, emulation may stop after two or more instructions have been executed.

4. If a PC break address condition is set to the slot instruction after a delayed branch instruction, user program execution cannot be terminated before the slot instruction execution; execution stops before the branch destination instruction.

5. Break Condition 1,2 is used as the measurement range in the performance measurement function when [PA-1 start point] and [PA-1 end point] are displayed on the [Action] part in the [Break condition] sheet of the [Eventpoint] window. This applies when the Break Condition is displayed with the BREAKCONDITION_DISPLAY command in the command-line function. In this case, a break does not occur when Break Condition 1,2 is satisfied.
6. A break will not occur with the execution counts specified on the execution of the multi-step instruction.

2.2.6 Note on Setting the UBC_MODE Command

In the [Configuration] dialog box, if [User] is set while the [UBC mode] list box has been set, the STEP-type commands that use Break Condition 2 for implementation cannot be used.

2.2.7 Performance Measurement Function

The emulator supports the performance measurement function.

1. Setting the performance measurement conditions

To set the performance measurement conditions, use the [Performance Analysis] dialog box and the PERFORMANCE_SET command. When any line on the [Performance Analysis] window is clicked with the right mouse button, the popup menu is displayed and the [Performance Analysis] dialog box is displayed by selecting [Setting].

Note: For the command line syntax, refer to the online help.

(a) Specifying the measurement start/end conditions

The measurement start/end conditions are specified in the [Mode] drop-down list box in the [Performance Analysis] dialog box. Three conditions can be set as shown in table 2.8.

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal break</td>
<td>Measurement is started by executing a program and ended when a break condition is satisfied.</td>
</tr>
<tr>
<td>Break Condition 1 -&gt; 2</td>
<td>Measurement is started from the satisfaction of the condition set in Break Condition 1 to the satisfaction of the condition set in Break Condition 2.</td>
</tr>
<tr>
<td>Break Condition 2 -&gt; 1</td>
<td>Measurement is started from the satisfaction of the condition set in Break Condition 2 to the satisfaction of the condition set in Break Condition 1.</td>
</tr>
</tbody>
</table>
(b) Measurement range

One of the following ranges can be specified. This depends on the item selected for [Mode] in the [Performance Analysis] dialog box.

1. From the start to the end of the user program execution (When Normal Break is selected for [Mode])

2. From the satisfaction of the condition set in Break Condition 1 to the satisfaction of the condition set in Break Condition 2 (When Break condition 1->2 is selected for [Mode])

3. From the satisfaction of the condition set in Break Condition 2 to the satisfaction of the condition set in Break Condition 1 (When Break condition 2->1 is selected for [Mode])

(In the second and third ranges, [PA-1 start point] and [PA-1 end point] are displayed on the [Action] part in the [Break condition] sheet of the [Eventpoint] window.)

For measurement tolerance,

- The measured value includes tolerance.
- Tolerance will be generated before or after a break.

For details, see table 2.10.
Notes: 1. When the second and third ranges are specified, execute the user program after the measurement start condition is set to Break Condition 1 (or Break Condition 2) and the measurement end condition to Break Condition 2 (or Break Condition 1).

2. Step operation is not possible when Break condition 1->2 or Break condition 2->1 is selected for the PERFORMANCE_SET command or in [Mode] of the [Performance Analysis] dialog box.

3. When Break condition 1->2 or Break condition 2->1 is selected in [Mode] of the [Performance Analysis] dialog box, specify one or more items for measurement. When there is no item, the error message “Measurement item does not have specification. Please set up a measurement item.” will be displayed. When no item is specified for the PERFORMANCE_SET command, the settings of Break condition 1->2 or Break condition 2->1 will be an error.

(c) Measurement item

Items are measured with [Channel 1 to 4] in the [Performance Analysis] dialog box. Maximum four conditions can be specified at the same time. Table 2.9 shows the measurement items (Options in table 2.9 are parameters for <mode> of the PERFORMANCE_SET command. They are displayed for CONDITION in the [Performance Analysis] window).
<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Each measurement condition is also counted when conditions in table 2.10 are generated.

Table 2.10  Performance Measurement Conditions to be Counted

<table>
<thead>
<tr>
<th>Measurement Condition</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-on counting</td>
<td>Accessing the non-cacheable area is counted less than the actual number of cycles and counts. Accessing the cacheable, X/Y-RAM, and U-RAM areas is counted more than the actual number of cycles and counts.</td>
</tr>
<tr>
<td>Branch count</td>
<td>The counter value is incremented by 2. This means that two cycles are valid for one branch.</td>
</tr>
</tbody>
</table>

Notes: 1. In the non-realtime trace mode of the AUD trace, normal counting cannot be performed because the generation state of the stall or the execution cycle is changed.
2. Since the clock source of the counter is the CPU clock, counting also stops when the clock halts in the sleep mode.

2. Displaying the measured result
The measured result is displayed in the [Performance Analysis] window or the PERFORMANCE_ANALYSIS command with hexadecimal (32 bits).

Note: If a performance counter overflows as a result of measurement, “********” will be displayed.
3. Initializing the measured result
   To initialize the measured result, select [Initialize] from the popup menu in the [Performance Analysis] window or specify INIT with the PERFORMANCE_ANALYSIS command.
