A Note on Using High-performance Embedded Workshop

Please take note of the following problem in using High-performance Embedded Workshop (IDE):

- With referencing member variables defined in a nested unnamed union

1. Description

If member variables of a nested unnamed union are defined using High-performance Embedded Workshop and any of the following debuggers, these member variables cannot be referenced by the debugger:

- Simulator debugger for the SuperH RISC engine family
- Simulator debugger for the H8SX, H8S, and H8 families
- E8 emulator software
- E10A-USB emulator software
- E10T-USB emulator software
- E200F emulator software
- E6000H emulator software
- E6000 emulator software

2. Conditions

This problem occurs if the following conditions are all satisfied:
(1) Load modules are created in the ELF/DWARF2 object format.
(2) an unnamed union is nested.

2.1 Example in Type Declaration

```c
union {
    unsigned char digit2[2];
    unsigned short word2;
    union {
        unsigned char digit_nested[2]; *
        unsigned short word_nested; *
    };
};
```
*The debugger cannot reference the member variables of these nested unnamed unions.

3. Solution
This problem has been fixed in the High-performance Embedded Workshop V.4.03.00.
For details see RENESAS TOOL NEWS Document No. 070701/tn3, issued on July 1, 2007, in this series of news.
