

# An Ultra-small, 22.5 m $\Omega$ , 2.5 A Load Switch with Reverse Blocking

#### **General Description**

The SLG59M1563V is a 22.5 m $\Omega$ , 2.5 A single-channel load switch that is able to switch 1 V to 5 V power rails. The product is packaged in an ultra-small 1.0 x 1.6 mm package.

#### **Features**

- 1.0 x 1.6 x 0.55 mm STDFN 8L package (2 fused pins for drain and 2 fused pins for source)
- Logic level ON pin capable of supporting 0.85 V CMOS Logic
- 22.5 m $\Omega$  RDS<sub>ON</sub> while supporting 2.5 A
- · Power Good Output
- Pb-Free / Halogen-Free / RoHS compliant
- Operating Temperature: -40 °C to 85°C
- Operating Voltage: 1.5 V to 5.5 V

#### **Pin Configuration**

#### **Applications**

- Notebook Power Rail Switching
- Tablet Power Rail Switching
- Smartphone Power Rail Switching

### **Block Diagram**

# An Ultra-small, 22.5 m $\Omega$ , 2.5 A Load Switch with Reverse Blocking

Pin #	Pin Name	Туре	Pin Description
1	VDD	Power	VDD supplies the power for the operation of the load switch and internal control circuitry. Bypass the VDD pin to GND with a 0.1 $\mu F$ (or larger) capacitor.
2	ON	Input	A low-to-high transition on this pin initiates the operation of the SLG59M1563V's state machine. ON is a CMOS input with ON_V <sub>IL</sub> < 0.3 V and ON_V <sub>IH</sub> > 0.85 V thresholds. While there is an internal pull-down circuit to GND (~4 M $\Omega$ ), connect this pin directly to a general-purpose output (GPO) of a microcontroller, an application processor, or a system controller.
3, 4	D	MOSFET	Drain terminal connection of the n-channel MOSFET (2 pins fused for D). Connect at least a low-ESR 0.1 $\mu F$ capacitor from this pin to ground. Capacitors used at D should be rated at 10 V or higher.
5, 6	S	MOSFET	Source terminal connection of the n-channel MOSFET (2 pins fused for S). Connect a low-ESR capacitor from this pin to ground and consult the Electrical Characteristics table for recommended $C_{LOAD}$ range. Capacitors used at S should be rated at 10 V or higher.
7	PG	Output	A push pull output. PG is asserted HIGH when $V_S > 95\%$ of $V_D$ .
8	GND	GND	Ground connection. Connect this pin to system analog or power ground plane.

### **Ordering Information**

Part Number	Туре	Production Flow
SLG59M1563V	STDFN 8L	Industrial, -40 °C to 85 °C
SLG59M1563VTR	STDFN 8L (Tape and Reel)	Industrial, -40 °C to 85 °C

#### SLG59M1563V Power-Up/Power-Down Sequence Considerations

To ensure glitch-free power-up under all conditions, apply V<sub>DD</sub> first, followed by V<sub>D</sub> after V<sub>DD</sub> exceeds 1 V. Then allow V<sub>D</sub> to reach 90% of its max value before toggling the ON pin from Low-to-High. Likewise, power-down in reverse order.

If  $V_{DD}$  and  $V_D$  need to be powered up simultaneously, glitching can be minimized by having a suitable load capacitor. A 10  $\mu$ F  $C_{LOAD}$  will prevent glitches for rise times of  $V_{DD}$  and  $V_D$  higher than 2 ms.

If the ON pin is toggled HIGH before  $V_{DD}$  and  $V_D$  have reached their steady-state values, the load switch timing parameters may differ from datasheet specifications.

# An Ultra-small, 22.5 m $\Omega$ , 2.5 A Load Switch with Reverse Blocking

### Layout Guidelines:

- 1. The VDD pin needs a 0.1 µF and 10 µF external capacitors to smooth pulses from the power supply. Locate these capacitors as close as possible to the SLG59M1563V's PIN1.
- 2. Since the D and S pins dissipate most of the heat generated during high-load current operation, it is highly recommended to make power traces as short, direct, and wide as possible. A good practice is to make power traces with <u>absolute minimum</u> <u>widths</u> of 15 mils (0.381 mm) per Ampere. A representative layout, shown in Figure 1, illustrates proper techniques for heat to transfer as efficiently as possible out of the device;
- 3. To minimize the effects of parasitic trace inductance on normal operation, it is recommended to connect input  $C_{IN}$  and output  $C_{LOAD}$  low-ESR capacitors as close as possible to the SLG59M1563V's D and S pins;
- 4. The GND pin should be connected to system analog or power ground plane.

#### SLG59M1563V Evaluation Board:

A GreenFET Evaluation Board for SLG59M1563V is designed according to the statements above and is illustrated on Figure 1. Please note that evaluation board has D\_Sense and S\_Sense pads. They cannot carry high currents and dedicated only for RDS<sub>ON</sub> evaluation.

Please solder your SLG59M1563V here

Figure 3. Typical connections for GreenFET Evaluation.

#### **EVB** Configuration

- 1. Connect oscilloscope probes to D/VIN, S/VOUT, ON, etc.;
- 2.Turn on Power Supply 1 and set desired  $V_{\text{DD}}$  from 1.5 V…5.5 V range;
- 3.Turn on Power Supply 2 and set desired  $V_{D}$  from 1  $V \ldots V_{DD}$  range;
- 4.Toggle the ON signal High or Low to observe SLG59M1563V operation.
